j. dickinson, j. paterson, e. whiteside, wilson and sons, and brodie and dowding.

1819.
THE CYCLOPAEDIA, which has been the production of the incessant labour of almost twenty years, is now completed, very much to the relief of the Editor’s mind, and, as he hopes, to the satisfaction of the Public. To the candid judgment of its numerous readers, the Editor submits the work, assuring them, that, on his part, no pains have been wanting to render it worthy of their approbation. If he had foreseen the time and attention which the compilation and conduct of it required, and the unavoidable anxiety which it has occasioned, he would probably never have undertaken it. But habits of application, and some degree of experience in a work of this nature, disposed him to embark in it, and enabled him to overcome the difficulties that presented themselves to his view in his further progress. He hopes that he may be allowed to say, that an early and long-continued attachment to scientific pursuits, and a desire of serving the cause of Literature and Science, had no inconsiderable influence in directing his views to this object, and encouraging his perseverance in the accomplishment of it. He ought also to acknowledge, that the candour with which his labours, on this as well as on a former similar occasion, were received by the Public, and the expressions of approbation with which they were honoured in the course of sixteen years, afforded a very powerful inducement to unremitting assiduity and exertion. The Proprietors also, who had undertaken this work without any patronage besides that of the Public, and who were advancing large sums towards rendering it worthy of that patronage, were liberal in their co-operation, and in enabling the Editor to procure every kind of assistance, which he might find to be necessary and useful. They employed artists of the first reputation in their respective departments, whose performances have given a peculiar character to this work. The Proprietors and Editor were likewise honoured by connection and acquaintance with persons, eminently distinguished in those branches of science to which they had devoted their talents; and these persons not only consented to be co-adjutors, but to give celebrity to the work by allowing their names to be annexed to it, whilst they were enhancing its importance and value by their contributions. Although the Editor cannot decline availing himself of the reputation which the Cyclopaedia must acquire from the established and well-known character of his associates,
and with this view presenting their names to the Public, he does not wish to rob them of any portion of fame that belongs to them, in order to enrich himself. Notwithstanding all the assistance which he has received, and which he thus gratefully and respectfully acknowledges, his own responsibility furnishes a large demand on the candour of the Public; nor will those who duly consider, that he has devoted almost twenty years of his life, measured not by fragments of time, but by whole days of twelve or fourteen hours, to the completion of his undertaking, and in so doing impaired his health and constitution, be indisposed to exercise that liberality in their estimate of his labours which he solicits. He is not unapprised of defects and imperfections; and if he were to begin the Cyclopædia de novo, he could improve it. Science is progressive; and since the commencement of this work, its advances in several departments have not been inconsiderable. The Editor has endeavoured to watch its steps, and to incorporate in his pages every discovery and improvement that has attended its progress. He now presents his work, in its finished state, at the bar of the Public, anxiously but not timidly waiting a favourable decision. He begs leave, however, to suggest, that he does not consider himself as responsible for the opinions advanced by his co-adjutors in the articles which they have furnished, any more than for those which occur in extracts from printed works. Some of these seem to him to be erroneous; and they are actually controverted and contradicted in other parts of the Cyclopædia, where the mention of them occurs. As he could not prescribe limits to the articles supplied by his co-adjutors, he could not presume to prohibit a statement of their own sentiments on the subjects of the articles which they contributed. In every case the reader will form his own judgment.

The names of most of his co-adjutors have been already published on the covers of several parts of the work; but after he has again recited them, every reader will be able to assign to each, so well known in the circle of science, the articles of any extent and of principal importance, which he has furnished. Under each head, the arts and sciences being arranged in alphabetical order, will be mentioned the names of those to whom the Editor is indebted for contributions; though in some cases the number is small and the articles are short, whilst in others they are more numerous and more extended. Many of these articles have been considerably enlarged in consequence of the Editor’s own researches. His own additions are so incorporated with the communications of his friends, that it would not be easy to distinguish them without a minuteness of detail, which, as he conceives, would be tedious and uninteresting. Agriculture, Dr. Dickson. — Algebra and Analysis, Barlow, Bonnycastle, and Pond. — Anatomy and Physiology,
Abernethy and Lawrence. — Comparative Anatomy, Macartney, Lawrence, and Clarke. — Annuities, W. Morgan. — Antiquities, H. Ellis and Strutt. — Architecture, Porden, E. Aikin, P. Nicholson, Dr. Milner, and Webster. — Astronomy, Bonnycastle and Pond. — Astronomical Instruments, Rev. Dr. Pearson. — Biography, Sir J. E. Smith, Dr. Burney, Dr. Malkin, and Dr. T. Rees. — Botany, Sir J. E. Smith, Dr. Woodville, Rev. Mr. Wood. — Canals, Farey, senior. — Chemistry, Aikin, Sylvester, Dalton, Brande, Dr. Marece, Sir Humphrey Davy, Dr. C. Taylor, and Dr. Davy. — Conic Sections and Curvilinear Geometry, Ivory. — Drawing, Howard. — Dynamics, Cavallo. — Education, Dr. Carpenter. — Electricity, Cavallo and Cuthbertson. — Engraving, Landseer. — Entomology, Conchology, and several other articles of Natural History, Donovan. — Exchange, Standard, Coinage, and Weight, Dr. Kelly. — Blast and Blowing Furnaces, Mushett. — Geology, Koenig, Bakewell. — Geography, Tooke, Hinckes. — Geometry, Barlow, Ivory. — Grammar, Dr. Jones. — Heraldry, Sir G. Naylor. — History, English, S. Turner and Owen Pugh. — Horology, Rev. Dr. Pearson. — Language, Dr. Carpenter, Dr. Jones. — Magnetism, Cavallo. — Manufactures, Duncan, J. Thomson, Parkes, and Farey, junior. — Mechanics and Machinery, Cavallo, Farey, junior. — Medicine, Dr. Bateman and Dr. Henderson. — Mental Derangement, Dr. Haslam. — Meteorology, L. Howard, Dalton, and Dickson. — Midwifery, Dr. Bland. — Mineralogy, Koenig, Bakewell. — Mining, Taylor. — Naval Architecture, Glover. — Navigation, Mackay. — Music, Dr. Burney and Farey, senior. — India Mythology, Major Moor. — Mental and Moral Philosophy, Dr. Carpenter. — Painting, Russell, Opie, Ottley, and Phillips. — Prosody, H. Parker. — Sculpture, Flaxman, P. Hoare, and Bacon. — Surgery, Blair, who also furnished the article Cipher, and S. Cooper. — Topography, Britton. — Versification, H. Parker; — and a variety of Miscellaneous articles by Joyce, Ellis, Fletcher, Howard, Clarkson, and several other gentlemen, who were occasional contributors, and whose names it is needless to mention. To Mr. S. Bevan and some other literary and scientific friends, the Editor is indebted for the assistance which they have afforded him in suggesting articles that had been omitted, and that have been supplied in the Addenda. Dr. Thomas Rees has, towards the close of the work, paid particular attention to the arrangement of the Plates. He has also drawn up a digested catalogue of them, together with an alphabetical index of the subjects which they comprise; and added such explanations, and corrections of references, as appeared to be necessary or desirable, after a minute and careful collation, made in conjunction with the Editor, of every Plate, with the printed letter-press to which it pertained. The Editor and Proprietors of this work are also indebted to
Mr. Donovan, for the General Systematic Arrangement of the Plates of Natural History.

The general plan upon which this work has been conducted, and which was stated in the Advertisement that announced the publication of it, seemed to the Editor, after some experience in this department of literary labour, and after consulting several competent judges, the most suitable to the nature and design of a Scientific Dictionary. Whatever may be the advantage resulting from separate dictionaries appropriate to each particular science, which is the plan of the French Encyclopædia, or from distinct treatises introduced in a dictionary of one alphabet, according to some modern compilations of this kind, the inconvenience and perplexity that attend the multiplication of alphabets, whether they occur in different serieses of volumes, or in the form of an index at the close of each treatise, will furnish an objection against this mode of arrangement, which it will not be easy to obviate. In a work of such magnitude as the French Dictionary, consisting already of between 100 and 200 volumes, and of undetermined extent, the best treatises that have been written, or that may be written, on each subject, may be introduced, and the work itself may be a complete library, and supersede the necessity of recurring to any other. But in a publication of limited compass, such as booksellers may undertake, and the general class of readers purchase, it is hardly possible to combine separate articles, sufficiently instructive, with treatises equally comprehensive and complete. To those who usually consult dictionaries for information, this plan, we are persuaded, is by no means the most eligible. If they wish to extend their knowledge beyond the limits to which a dictionary must necessarily restrict it, they will recur to appropriate treatises for the purpose; and the dictionary should furnish them with the necessary references. A dictionary is intended for communicating knowledge in an easy and expeditious manner; and it is desirable that the several articles should be so full and comprehensive, as to afford sufficient instruction on the subjects to which they relate, without the necessity of recurring to another dictionary, or to an index, for further information. It may be said, indeed, that the sciences are thus mutilated and mangled; and that it is impossible to preserve their unity without discussing each in a separate treatise. We readily allow, that this is an inconvenience, inseparable from the form of a dictionary; but at the same time we think that this may be remedied in a considerable degree by that kind of ramification of the principal subject, which, with suitable references, will lead the reader to subordinate articles, that form, by their mutual connection and dependence, an aggregate or whole, superseding in all common cases the necessity of a distinct treatise. These
references, when judiciously distributed and arranged, will serve, like the
index of a book, but much more effectually, to conduct the reader from one
subject to another: they will enable him to perceive their relation to each
other; and they will direct him how to collect and combine the dispersed
parts of any science into one entire and regular system. Each article will
afford him, as it were, a distinct lecture; and he may pursue the same
course of study by the means now suggested, or vary it as he thinks proper.
Upon the whole, the advantage of separate treatises under each head of
science, such as the limits of a dictionary will allow, seems to be more
imaginary than real; more especially as the want of them may be supplied
in the manner that has been mentioned.

In conformity to our proposed plan, it has been our endeavour to give,
under each distinct head of science, an historical account of its rise, pro-
gress, and present state, concisely and yet as comprehensively as our limits
and our sources of information would allow; to refer to those articles in
which the discussion of them occurs, and to point out such publications as
afford further information. References of this kind are introduced under
each separate article, wherever they are thought to be necessary and useful;
and thus the reader is able to form his judgment concerning the authorities
upon which the compilers of the several articles depend; and if he shall
have opportunity or inclination, he may recur to them for himself.

 Whilst the Editor and his co-adjutors in this work have availed themselves
of the assistance which other similar dictionaries have afforded them, they
have not contented themselves with mere transcripts; they have resorted as
much as possible to original writers, which they have been enabled to do by
the facility of their access to large libraries; and by the citations which
they subjoin to the several articles, the Public will judge of the extent of
their research, and of the industry and labour which they have bestowed
on this compilation. In their account of the arts and manufactures, they
have consulted the artisans and manufacturers themselves, and derived from
them every kind of information that was likely to conduce to the credit and
utility of the work: and this they have not been able to do without incur-
ing a very considerable expence.

Some apology may, perhaps, be thought necessary for the extension of
this work beyond the limits first proposed. When it was determined to
introduce biography, as well as geography, topography, and history, upon a larger scale than the Proprietors and Editor had at first intended, principally in compliance with the wishes of intelligent and esteemed subscribers, the enlargement of it became indispensable. To his co-adjutors, whose assistance was highly important, the Editor could not presume to prescribe limits, which would have depreciated the value of the articles which they contributed, and within which, for their own reputation, they would not have consented to be confined, and of course the work would have been deprived of the benefit of their contributions. This circumstance could not fail to occasion an enlargement of the Cyclopaedia; but it was proportionally enhanced in value; and the Editor is satisfied, that the purchasers will not ultimately regret the augmentation of expense. The plates likewise have been multiplied far beyond the original intention of the Proprietors, because new and unthought-of subjects were introduced in the progress of the work; but as these plates constitute a character of excellence peculiar to this Cyclopaedia, it is thought that the circumstance of their being additional embellishments of the work, besides that of their being indispensable as explanatory of the articles to which they refer, will be a sufficient apology for the increase of their number; more especially when it is considered, that the augmented number of plates, as well as the enlargement of the work, have occasioned a diminution of profit to the Proprietors. It would have been more their interest, as well as more gratifying to the Editor, to have compiled a Cyclopaedia in fewer volumes, and to have contented themselves with a smaller number of plates; as in all probability the sale would have been greater, and the sum of money expended upon it would of course have been much less. The Editor must do the booksellers concerned in this Cyclopaedia the justice to say, that they have consented to forego part of the possible profit that might have accrued from it for the sake of its reputation and utility.
May be considered, I. as a letter; II. as a word; and III. as an abbreviation.

1. Our broad A resembles the sound marked by the German a, and is found in many of our monosyllables, as all, call, call, fall, where it is pronounced as in cause and fault, or as in low. It is probable that this broad sound was that which our Saxon ancestors expressed by the character A, as it still, almost uniformly, retained the rustic pronunciation and northern dialects of our language; as talk for talk, man for man, hand for hand, &c.

2. The open A of the English, is not unlike the A of the Italians in adagio, and is the sound marked by this letter in father, rather, &c.

3. The slender sound marked by the character A is peculiar to the English language, and resembles the sound of the French e maussine, or of their diphthong ai in pain; perhaps it is a middle sound between them, or between the a and e. Such we have in the words place, face, waive, and in all those that terminate in ation; as salvation, preservation, &c.

The sounds of which A is the character in our language, are sometimes short; as in the words glass, grain, braze, &c. at other times long; as in glaze, grave, &c. Their length is commonly denoted by an immediately subjoined to the a; as in plain, rain, &c., or by an e added at the end of the word; as in plane, erate, &c.

Some contend that there are four; others, that there are five distinct sounds, denoted by the character A in the English language. There are, perhaps, little variations and distinctions in the sounds marked by the character A, as well as by the other vowel letters in our alphabet; but they are so local or arbitrary, or, after all, so nice and subtle, that they entirely escape the notice of foreigners, and are hardly distinguishable by the natives. Those who desire to enter more deeply into the first formation of sounds, and to see the elementary principles of speech treated with philosophical accuracy, will find satisfaction in the ingenious treatises of Wallis and Holder.

In burlesque poetry, the letter A is sometimes added after words; it lengthens them a syllable, without altering their sense; as line a, for line, in Dryden, &c. It is sometimes redundant, when prefixed to words, as arise, awake; the same with rise, awake, &c.

In our Calendar, A is the first of the dominical letters which were introduced in imitation of the eight sundial letters of the Romans, of which the A was one.

II. A is a word. This first simple sound is used in our language to express most of the vehement emotions of the soul. We naturally use it on all sudden occasions of admiration, joy, anguish, apprehension of danger, &c. and where the emotion is very great, the A is enforced by adding an aspirate to it, as ah!

It is sometimes a noun; for we say great A and little a; but it is most commonly a definite, or an indefinite article. It is definite, and denotes the number one, as, a man is coming, that is, no more than one.

It is also used as an indefinite noun.
definite article; so we say, a man may come this way; that is, any man.

A, used as an article, has no plural signification; before a word beginning with a vowel, y and w excepted, and before a silent b preceding a vowel, it is written an, of which a is the contraction; as an harbour, an ox, an hour, &c. A seems to be a true and genuine preposition, in the three following cases: 1. When it is put before a participle or participial noun, denoting some action not yet accomplished, as I am a writing. 2. When it is placed before local adverbs, as Thomas à Becket. 3. When it is used in composition; e.g. about, asleep, &c. Dr. Wallis supposes it to be a contraction of at; but Dr. Lovel thinks, that it is the preposition an, and sometimes of. At, he says, has relation chiefly to place; on has a more general relation, and may be applied to action, and many other things, as well as place.

In some instances, A has a peculiar signification, denoting the proportion of one thing to another; as such income a year, to many hours a day, to much a man, &c.

III. A is also an abbreviation. A put to bills of exchange, is in England an abbreviation for accepted, and in France for the word accepté. It is likewise usual among merchants to mark their bills of lading with the letters A, B, C, instead of the numbers 1, 2, 3, &c.

In the Roman inscriptions, the sense of the A is to be collected chiefly from the connection of the words, and the scope of the inscription. A fingly stands for Arbus, Antibes, Agostina, aiunti, antae, are; addit, aditus, arenarius, auro, animalis, antea, at, atque, &c. and, by a more modern abbreviation, for artium. Thus, A. M. stands for Artium Magnific, Mifler of Acts, and A. B. for Artium Baccalauri, Bachelor of Arts, &c. A. A. signifies agnuli, and A A A. stands for auro, argentae, &c. A. B. stands for auro, auro, &c. A. C. for atae aecilis, &c. On the Greek and Roman medals, A denotes commonly the name of the place where they were struck, as Athens, Argos, Antioch, Aquileia. On French coins A is the mint of the nant of Paris, and A A signifies their coinage at Metz.

The Romans in their trials used their A to denote abolution; whence Cicero calls it licea falsaria, the lying letter. Their manner was this: Three ballots were given to each judge, marked one with an A, for abolvo, I absolve; a second with a C, for condemn, I condemn; and the third with N. L. which flood for non legit, it is not clear. One or other of these judges, according to his judgment, put into an urn; and the prater acquitted or condemned the criminal, according to the respective number of those letters. If the suffrages for acquitting and condemning were equal, the accused was always acquitted.

The Romans also made use of the letter A in collecting their suffrages in cases of legislation. When a new law was proposed, or an amendment of an old one was in agitation, each voter had two ballots put into his hand, the one marked A, signifying antiqua, that is, old; the other marked U. R. for ut recogno, as you desire; and his suffrage was given, by putting the one, or the other, into the urn. A, in the days of Roman barbarism, was one of the numeral letters, and signified five hundred; when written with a dash over it, thus A, it denoted five thousand. The letter A is also used by Chronologers and Historians, as an abbreviation for anno instead of of, as A. M. for anno M. D. or anno Domini, &c.

The Romans dated from the building of Rome; and in their writings A. U. C. stands for anno ab urbe condita. The Greeks used a, a, prefixed to a word, as a privative particle. With them it was also a numeral letter denoting unit.

Among Logicians, A denotes an universal affirmative proposition; according to the verbe.

Affirm, A, negat E, and the first letters of the alphabet, represent known quantities; and the last letters represent quantities that are unknown.

In the pretensions of physicians, A or a, or a, denotes equal parts of the ingredients specified, and is a contraction of the proposition aequus, which is used in the same sense by medicinal writers in the Greek tongue.

Among Chemists, A A signifies an amalgam, or the operation of amalgamating.

In Heraldry, the letter A is used as a bearing in armor.

AA, Peter Vander, in Biography, an eminent bookseller at Leyden, who was living in 1726. He published an atlas of 200 charts compiled after the long voyages from 1246 to 1666. They are not deemed very accurate. They are included in the Galerie Agricola du Monde, in 60 vols. folio.

A. Continues Gravis's Thesaurus, or an account of the modern Italian writers, in six other volumes, with the Thesaurus Antiquitatum Siciliae.

A A, in Hydrography, the name of several rivers; one in Wiltshire, which rises near Munster and falls into the river Embre; another, that has its source in the department of Somme in France, becomes navigable by means of sluices near St. Omer. Passes on to Gravillons, and discharges itself into the English Channel; a third in Livonia, that falls into the gulph of Riga; and a fourth in Switzerland, that rises in Mount Bung, and falls into the lake Lucerne.

AACH, in Geography, a small town in Germany, in the circle of Suabia and Landgrawate of Nellenburg, near the source of the river Aach, which falls into the lake of Zell. It belongs to the House of Austria. E. long. 9° W. lat. 47° 55' N. lat. 47° 55' W.

AAGARD, Nicholas and Chrifian, in Biography, two brothers born at Viborg in Denmark in the beginning of the 17th century. The former is known for his philosophical works and other tracts, particularly his disputations upon Tacitus; the latter for his excellent poetry.

AAGGI-DOGI, in Geography, a mountain of Amaia in Turkey, on the frontiers of Persia, which is crossed by the Caravans in their way from Constantinople to Ifpham.

AAG-HOLM, a small island on the coast of Norway, near the mouth of the river Lendevand.

AAHUS, or AMAHUS, i.e. house on the Aa, a small town in the circle of Wiltphalia, and bishoprick of Munster. It is the capital of the prefeture of Aahus, and has a citadel. E. long. 7° W. N. lat. 5° 10' W.

AAKIRAR, a prefecture of the diocece of Aarhuus, containing 16 parishes.

AAKRKE, a town in the island of Bornholm, which has the privileges of a city, and in which are held the provincial court and the synod. E. long. 14° 50'. N. lat. 55° 15' N.

AALBURG, the capital of a diocece of the same name in North Jutland, in Denmark, and a bishop's see. It derives its name from the number of eels that are taken there. This city is large and populous, and next to Copenhagen, the most opulent and best built in the kingdom. It carries on a considerable trade in herrings and grain, and has different manufactures of muskets, pithows, saddles, and gloves. It has an exchange for merchants; as well as a safe and deep harbour. The population of this diocece amounts to 80,872 persons. E. long. 9° 46'. N. lat. 56° 50'.

AALEN, or Ahlen, a free Imperial town belonging to the bench of Suabia, and so called from the number of eels which are in that part of the river Kocher that runs
runs through it. This city is Lutheran. It was formerly under the dominion of the kings of Bohemia, and fold to Ebbrecht, Count of Wintherberg. The Emperor Charles IV. recovered it, and restored it to the empire in 1360. This, and similar cities that are almost in a ruined state, prefer their francisques and immunities with care. E. long. 5° 36'. N. lat. 48° 48'.

AALST, or AELST, Everard, in Biography, a painter, was born at Delft in 1602, and died in 1678. He excelled in fruit pieces, dead game, and armoury. His nephew, named William, surpassed his uncle. He was born in 1630 and died in 1789. His pictures are chiefly known in Holland.

AALST, or AELST, in Geography, the capital of a county of the same name in the district of Ghent and circle of Burgundy, and lying between the rivers Sellecks and Dender. This city lies on the latter of these rivers. E. long. 3° 54'. N. lat. 50° 58'.

AAM, or Haam, a liquid measure generally used by the Dutch; it contains 1.758 imperial gallons, each gallon weighing about 36 ounces avoirdupois; and consequently the Aam is equal to 1481-pints of Paris, or to 288 pints of English measure; the Paris pint weighing 31 ounces, and that of England 16 ounces.

AAMA, in Geography, a province of Barbary in Africa, about 15 days journey from Tunis.

AANSIRE, a small island on the coast of Norway, opposite to AAG-HOLM.

AAR, or Arene, in Hydrography, a large river of Switzerland, which has its source in Mount Grimsel in the south of the canton of Bern, and pursuing a circuitous course towards the north-west, passes through the lakes of Brienz and Thun to Bern, and afterwards changing its direction towards the north-east, flows to Solothurn and Brugg, and being joined by the Reuss and Limmatt, discharges itself into the Rhine near Waldshut. There is another smaller river of the same name in Welsphalia.

AAR, in Geography, the name of a small island in the Baltic.

AARASSUS, in Ancient Geography, a town of Luidia in Asia, which some have supposed to be the Aansius of Ptolemy. Strabo, Geog. tom. ii. p. 837.

AARAW, in Geography, a town and bailiwick in the canton of Bern in Switzerland. E. long. 7° 10'. N. lat. 43° 2'.

AARDENBORG, a small town in Flanders situated on a canal which communicates with the Zwin. It was once a fortress; but its works were totally razed in 1760. E. long. 3° 14'. N. lat. 51° 17'.

AARHUUS, the capital of a diocese of the same name in North Jutland, extending from that of Viburg along the Cattegat, about 15 miles in length and 8 or 9 in breadth. This diocese is extremely fertile, and diversified with woods, bays, and lakes abounding with fish. It is watered by several rivers, the chief of which is the Guden. The town lies in a fine plain between the sea and a lake, from which a stream of water passes through it. It is large and populous, has 6 gates, 2 principal churches, 2 market places, an university, a free school, and a well endowed hospital. It carries on a good trade. The number of inhabitants in this diocese is estimated at 117,942. E. long. 10°. N. lat. 56° 6'.

AARON, in Scripture History, the son of Amram and Jochebed, and the grandson of Levi, was born A.M. 2430, before the Christian era 1574. He was three years older than his brother Moses, and appointed to aid him under the character of his advocate and interpreter, as well as prophet, in his intercourse with Pharaoh, and in the rescue of the Israelites from their bondage in Egypt. With this view they both went together into Egypt; and after many attempts to overcome the opposition of the Egyptians and the obliquity of Pharaoh, they accomplished their object A.M. 2513, ante A.D. 1491. After the Exodus of Israel, and during their peregrination in the Wilderness, Aaron and his sons exercised the office of priests by a divine appointment; and as soon as the Tabernacle was built, Aaron was consecrated by Moses with the holy oil, and invested with the pontifical ornaments. When Moses went up to the Mount to receive the law, Aaron, accompanied by the 70 elders, followed him; but during his continuance for 40 days on the Mount, the people became impatient and tumultuous, and Aaron, yielding to their solicitations, melted down their pendants, and the ear-rings of their wives and children, and formed the golden calf, to which they paid homage. He afterwards humbled himself for this offence, obtained forgiveness, and was continued in the priesthood. In a subsequent period, viz. A.M. 2515, Korah aspired to the priestly office, and Dathan and Abiram claimed a share with Moses in the sovereign authority; for which act of rebellion, as their history informs us, they were ignominiously punished. Aaron was afterwards confirmed in the priesthood by the miracle of the almond-rod, which blossomed, and which was deposited in the most holy place, in order to perpetuate his title, and the remembrance of this prodigy. He married Elisba, the daughter of Amminadab of the tribe of Judah, by whom he had four sons: two of whom were destroyed by fire, and from the other two the race of the high priests of the Jews was continued from Aaron in regular succession. When the period of Aaron's service was completed, he ascended Mount Hor near the encampment of the Israelites at Moab, disrobed himself of the pontifical ornaments in the view of the people, and put them upon Eleazar his eldest son, and his successor in the high priesthood. He then died in the arms of Moses and his son, at the age of 123 years, in the 40th year after the Exodus; and they buried him in a cave of this mountain: but the place of his interment was concealed, probably under an apprehension that in future ages he might become an object of superstitious worship. For a farther account of Aaron the reader is referred to Exodus, Leviticus, and the book of Numbers to the 24th verse of the 33rd chapter; and for an abridgment, with remarks on several circumstances pertaining to his station, character, and office, to Calmet's Dictionary of the Bible.

AARON, in Church History, a British martyr, who suffered a cruel death, together with Julius, under the persecution of Diocletian, in the year 303. It does not appear what were the British names of these two martyrs; as the Christian Britons took new names from the Latin, Greek, or Hebrew, at the time of their baptism. They were buried at Carlisle, and each of them had a church dedicated to his memory in that city. In the Roman martyrology their feast was fixed on the 7th of July. Bp. Brit.

AARON, a presbyter and physician of Alexandria, author of 30 books in the Syriac tongue, containing the whole practice of physic, called the Paedex, chiefly collected from the Greek writings, and supposed to be written before A.C. 620. They were translated into Arabic by a Syrian Jew physician about A.D. 681. He is the first author that mentions, and that has clearly described, the small-pox and measles, which probably first appeared at Alexandria in Egypt A.D. 640, and were brought thither by the Romans when they took that city. He directed the vein under the tongue to be opened in the cure of the jaundice, and observed that the faces in that disease are of a white colour. The above-mentioned work and its translations are lost; and
we have only fragments remaining, collected by Mohammed Rhasis in his "Continens."

Aaron, or Harun, in Ramadan, General Biography, a celebrated caliph of the Saracen empire.

Aaron Avilecan, a learned Rabbi and Caraita in the thirteenth century, who wrote an Hebrew grammar, printed at Constantinople in 1581. He was probably the same as Aaron, who wrote a commentary on the Pentateuch, which is in MS. in the French king's library, and translated by Dion in 1710; and MSS. annotations on the Old Testament. There was another Aaron, distinguished from the former by the epithet Hacharon, i.e. potter, who was born at Nacomedia in 1346. His writings are esteemed canonical by the Caraita Jews. The Garden of Eden, containing the doctrines and customs of his nation, is the principal.

Aaron, a Levite of Barcelon, was the author of 613 precepts on Moæs in Hebrew, printed at Venice in 1523. He died in 1529.

Aaron, Ben Chaim, was chief of the synagogue of Fuz and Morocco in the beginning of the seventeenth century. His commentary on the Prophets, intitled the heart of Aaron, one on the Syphra, and another on the Law, were printed at Venice in 1600, folio.

Aaron, Ben a'fer, was a celebrated Rabbi, who is said to have invented the Hebrew points and accents towards the fifth century. His Hebrew grammar was printed by Bomberg in 1545, folio.

Aaron, in Geography. See St. Maloes.

AARONSBURGH, in Geography, a town of America, lying at the head of Penn's creek, in the county of Northumberland, 10 miles W. of Louisburg, 40 W. by N. from Sunbury.

AARSENS, Francis, Lord of Sommeldyk and Spyck, one of the greatest minificers for negotiation in the United Provinces. He was sent by Barneveld, who preceded over the provinces, as agent into France, and was the first person recognised, in 1609, as Dutch ambassador by the French court. He was the first of three extraordinary ambassadors sent to England in 1620, and the second of those who were deputed in 1641, to negotiate the marriage of Prince William, son to the Prince of Orange. After having been employed in several other important missions, he died in an advanced age, very rich, and left on record memoirs of all the embassies in which he had been engaged.

AARSENS, or AERTSEN, Peter, denominated from his stature by the Italians Pietro Longo, a celebrated painter, was born at Amsterdam in 1519. He excelled in painting a kitchen with its furniture, and his altar-pieces were particularly admired. A famous piece of this kind was destroyed in the insurrection of 1566; and because he complained of this outrage, he was in danger of being murdered by the populace. He died in 1575.

AARTGEN, or AERTGEN, a painter of eminence, who was born at Leyden in 1498, and pursued his father's trade of a woodcutter to the age of eighteen. He voluntarily lived in meanness and obscurity; and declined offers of advancement, alleging that he found more sweet in his poverty than others did in their riches. He never worked on Monday, chusing to devote that day, with his disciples, to the bottle. It was his practice to stroll about the streets in the night, playing on the German flute; and in one of these frolics he was drowned in 1564.

AASAR, in Ancient Geography, a town of Palestine, situated between Azotus and Alcalon, which in the time of Jerome was a hamlet.

AATTER, a district of the northern part of Arabia Felix on the Red Sea.

AVORA, in Natural History, the fruit of a sort of large palm tree in the West Indies, and in Africa. It is of the size of a hen's egg, and included, with several more, in a large shell. In the middle of the fruit there is a hard nut, about the size of a peach stone, which contains a white almon, very alligint and proper to check a diarrheea.

Ab, in the Hebrew Chronology, the eleventh month of the civil year, and the fifth of the ecclesiastical year, which begins with Nisan. This month answered to the moon of July, comprising part of July and of August, and contained thirty days.

The first day of this month is observed as a fast by the Jews, in memory of Aaron's death; and the ninth, in commemoration of the destruction of the temple by Nebuchadnezzar, in the year before Ciril 587. Josephus observes, that the burning of the temple by Nebuchadnezzar, happened on the same day of the year on which it was afterwards burned by Titus. The fast day was remarkable for Adrian's edict, which prohibited the Jews to continue in Judea, or to look towards Jerusalem and lament its desolation. The eighteenth day is also kept as a fast, because the sacred lamp was extinguished that night, in the reign of Abas. On the twenty-fifth, or according to Scaliger, the twenty-second day, was a feast called Xylophoria, from their laying up the necessary wood in the temple; and on the twenty-fourth, a feast in commemoration of the abolishing of a law by the Aimonæus, or Maccabees, which had been introduced by the Sadducees, and which enacted, that both sons and daughters should alike inherit the estates of their parents.

An, in the Syriac Calendar, is the name of the last summer month.

An, prefixed to the names of places, generally denotes that they belong to some abbey.

ABA, or Aba, Hanifah. See Hanifah.

ABA, or ABA, in Ancient Geography, a mountain of Greater Armenia, situated between the mountains Niphates and Nibarnas. According to Strabo, (Geog. tom. ii. p. 739) the Euphrates and Araxes flow from this mountain; the one towards the west, and the other to the east. But Thaustius and Dionysius Periegetes, call this mountain, which is part of mount Taurus, Achsas.

ABA, or Albs, a city of Phocis in Greece, near Helicon, famous for an oracle of Apollo, more ancient than that at Delphi, and also for a rich temple, plundered and burnt by the Persians. Strabo's Geog. tom. i. p. 647, and the authors there cited.

ABACA, in Botany, a kind of flax or hemp, gathered in some of the Manillas or Philippine Islands. This plant is grown every year; being gathered, it is steeped in water, and beaten as hemp is. It is of two kinds, the white and the grey. The white abaca is used for making very fine linen; but the grey is employed for nothing but cordage.

ABACA, in Geography, one of the Philippine Islands in Asia.

ABACENA, in Ancient Geography, a town of Mečia, and another of Cana in the Higher Asia.

ABACENUM, a town of Sicily, the ruins of which are supposed to be near Trippi, a castrum on a steep mountain near Messina. Its inhabitants were called Abacenes. Stephan. de Uribirum, tom. i. p. 2.

ABACAY, in Natural History, a name given by the people of the Philippine Islands to a species of parrot, called also Calangay.

ABACH, in Geography, a market town of Bavaria, situated on the Danube. It has an old castle, in which Henry II. is said to have been born, and is much frequented.
A B A

quented on account of its mineral waters. E. long. 11° 59'.
N. lat. 45° 53'.

ABACINARE, or ABACINAR, derived either from the
Italian abacino, a bason, or abaco, a dark place, in Writers
of the Middle Age, a species of punishment, confining in the
blinding of the criminal, by holding a red hot bason, or bowl,
before his eyes. Du-Cange.

ABACK, in Sea Language, signifies the situation of the
falls, when their surfaces are flatted against the masts by
the force of the wind. They may be brought aback, either
by a sudden change of the wind, or an alteration in the
ship's course. They are laid aback to effect an immediate
retreat, without turning either to the right or left, in order
to avoid some imminent danger, in a narrow channel, or
when the has advanced beyond her station in the line of
battle, or otherwise. The falls are put in this position by
blackening their lee-braces, and hauling in the weather-
ones.

ABACOA, in Geography, one of the Bahamas islands,
about 54 miles in length, and 21 miles in breadth. See
Providence.

ABACOCHEE, a river of America, called also Coosa.
ABACOT, a cap of plate, wrought up in the form of
two crowns, worn by our ancient British kings.

ABACTOR, formed of ab, from, and ader, a driver,
from area, to drive, (called by the Roman lawyers Abigitus
or Abigeus), one who drives off cattle in herds; in con-
distinction to one who deals a single sheep, &c. only, who is
called a thief. Nam qui omen unam furripues, ut fur cor-
certu, qui gregem ut Abactor. The punishment of Abigeat
was more severe than that of Furtum; viz. condemnation
to the mines, banishment, or even death itself, according
to the quality of the offender. But sometimes in Spain
the punishment was more severe than elsewhere, the people there
being more addicted to it.

ABACTUS, or ABIGEATUS, among the Ancient Phy-
sicians, was used for a mischance procured by art, or force
of medicines, in contradiction to abortus, which is
natural. But the moderns know no such distinction. See
Abortion.

ABACUS, among the Ancients, was a kind of cupboard,
or buffet.

The word is formed from the Greek ἀβάκος, which, among
that people, signified the same thing.

Abacus, among the Mathematicians, was a little table
strewed over with dust, on which they drew their schemes
and figures.

In this sense, the word seems formed from the Phoenician
פו, abak. duh.

Abacus Pythagorica, a table of numbers, contrived for
the ready learning of the principles of arithmetic; so deno-
minated from its inventor, Pythagoras.

Hence also, from an agreement in point of use, the names
Abacus and Abaco are used, among Latin and Italian writers,
for an alphabet, or ABC, &c.

The Abacus Pythagorica was, in all probability, no other
than what we call a multiplication-table.

Ludolphus and Wolthus give us methods of performing
multiplication without the help of the abacus; but they are
too operose in ordinary cæses for practice. See Multipli-
cation.

The abacus for facilitating the operation of arithmetic,
is an instrument almost as ancient, and extensive, as the art
of arithmetic itself; if it be later than the methods of com-
puting by the fingers, and by lapsus, or fomes (which ob-
tained among the Egyptians), it is at least much prior to the
use of numeral letters or figures, wrought with the pen.

We find it in use, under some variations, among the
Greeks, Romans, Chineses, Germans, French, &c. It
exceeds in point of facility, and neatness of operation, as
working without any strokes or blots of the pen, or waite
of paper; some also give it the preference in point of ex-
pedition.

The abacus is a variety contrived; that chiefly used in
European countries is made by drawing any number of
parallel lines at pleasure, at a distance from each other,
equal to twice the diameter of a calculus, or counter. Here
a counter placed on the first or lowermost line, signifies 1;
on the second, 10; on the third, 100; on the fourth, 1000;
on the fifth, 10,000; and so on. In the spaces between
the lines, the same counters signify half of what they signify
on the next superior line; viz. the space between the first
and second lines, 5; between the second and third, 50;
between the third and fourth, 500; and so on. Thus the
counters on the abacus, in the figure here subjoined, make
the sum of 73922. — The abacus is also divided cross-wise
into areoles, by means whereof subtractions are made. Wolf.

The Grecian abacus αβάκος, or counting-board, was an ob-
long frame, divided by several brass-wires stretched parallel
to one another, and mounted with an equal number of
little ivory balls, like the beads of a necklace. By the
arrangement of these balls, distinguishing the numbers into
different classes, and observing the relations of the lower
to the upper, all kinds of computations were easily performed.

The Roman abacus was much the same with the Grecian,
except that instead of rings, or wires, and beads, in the
Roman, we had pins and groves for them to slide in.
It is described by several authors; but notwithstanding all
these descriptions, we should have had a very obscure idea
of the ancient manner of reckoning, if figures of it had not
been found among the ancient marbles. Phil. Trans. N° 180.

The Chinesian abacus consists, like the Grecian, of several
series of beads strung on brass wires, extended from the top
to the bottom of the instrument, and divided in the middle
by a cross-piece from side to side; so that in the upper row
each string has two heads, which are each reckoned for
five; and in the lower row, each string has five beads of
different values; the first being reckoned as 1; the second,
as 10; the third, as 100, &c. as among us. Add, that
instead of four pins for digits, or units, in the Roman
abacus, the Chinese has five beads.

We have two different figures, and descriptions, of the
Chinesian abacus, one given by F. Martinins, who had lived
many years in China; the other by Dr. Hooker, who copied
it from a Chinesian dictionary of the count-language. See
Shwan-Pan.

Abacus logificus is a right-angled triangle, whose sides,
forming the right angle, contain the numbers from 1 to
60; and its area, the products of each two of the op-
posite numbers. This is also called a canon of sexagesi-
males.

Abacus & palmæ, in the Ancient Musar, denote the
machinery,
A B A

machinery, whereby the strings of the polypylea, or instruments of many strings, were strung, with a plectrum made of quills.

Abacus harmonicus is used by Kircher for the structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

Abacus, or Abaciscus, in Architecture, is the uppermost member of the capital of a column; serving as a kind of crowning, both to the capital and the whole column.

Vitruvius, and others after him, who give the history of the orders, tell us, the abacus was originally intended to represent a square tile laid over an urn, or rather over a balfet. — An Athenian old woman happening to place a balfet thus, covered over the root of an acanthus: that plant shooting up the following spring, encompassed the balfet all round, till meeting with the tile, it curled back, in a kind of scroll. Callimachus, an ingenious sculptor, passing by, took the hint, and immediately executed a capital on this plan: representing the tile by the abacus, the leaves by the volutes, and the balfet by the vase, or body of the capital. There is some difference in the form of the abacus in different orders. In the Tuscan, Doric, and ancient Ionic, it is a flat, square member, well enough representing its original tile: whence the French call it talloir, tenceur. In the richer orders it loses its native form; its four sides or faces being arched, or cut inwards, with some ornament, as a rofe, or other fower, or a fish's tail, in the middle of each arch. See Corinthian and Composite. But some architects take other liberties in the abacus, in respect of its name, place, and office. Thus, in the Tuscan order, where it is the largest and most massive, as taking up one-third of the height of the whole capital, it is sometimes called the eye of the capital. — In the Doric it is not always the uppermost member of the capital; a cymatium being frequently placed over it. — In the Ionic, fome make it a perfect ogea, and crown it with a fillet. — The proportion of the abacus, as prescribed by Vitruvius, is, that its diagonal (from corner to corner) be twice its height; but the moderns dispence with this proportion.

Scamozzi applies the term abacus to a concave maulding in the capital of the Tuscan pedentia, and Palladio calls the plinth above the echnion, or bullion, in the Tuscan and Doric orders, by the fame name. — In the Ancient Architects, abacus is used to denote certain compartments in the internal decoration of the walls of native rooms, mosaic pavements, and the like. There were abaci of marble, porphyry, jasper, alabaster, and even glafs; shaped variously, square, triangular, and the like.

Abada, in Zoology, a singular kind of wild animal in Benguela, in Africa. It is about the size of a half-grown Colt, thy, and swift-footed. It has two horns, one in its forehead, and another in the nape of its neck, which are of different length and bulk. The head and tail of this animal resemble those of an ox, and its feet are cloven like those of a fag, but much thicker. The front horn is deemed an antidote in many diforders; and the pulverized bones are made into a poultice, and recommended by the natives as a sovereign remedy against all aches and pains, and as effectual for purifying the blood and humours. Mod. Un. Hist. v. 13. p. 8. See Rhinosceros.

Abaj, in Geography, a town of Asia, on the gulph of Perlas, and near the mouth of the river Tigris. It is dependent on Basora. E. long. 47° 15'. N. lat. 29° 20'.

Abadavine, in Ornithology. See Spinus.

Abaddon, Heb. corresponding to Apoclypon, Gr. i. e. Destroyer, in Scripture-History, is represented, Rev. ix. 11. as king of the locusts, and the angel of the bottomles pit, who has been thought by many interpreters to be Satan, or the devil. Dr. More (Theol. Works, p. 130.) interprets this title as referring to the profecion which the Mahometans should make of maintaining the doctrine of the unity. Le Clerc and Dr. Hammond understand by the locusts in this passage, the zealots and robbers who infilled and defolated Judea before Jerufeum was taken by the Romans, and by Abaddon, John of Gischala, who having treacherously left that town before it was surrendered to Titus, came to Jerufeum and headed those of the zealots who acknowledged him as their king, and involved the Jews in many grievous calamities. The learned Grotius concurs in opinion, that the locusts are designed to represent the feet of the zealots, who appeared among the Jews during the siege, and at the time of the destruction of Jerufeum. Mr. Jos. Mede remarks, that the title Abaddon alludes to Obodas, the common name of the ancient monarchs of that part of Arabia, from which Mahomet came; and considers the passage as descriptive of the inundation of the Saracens. Mr. Lowman (Paraphr. on Rev. p. 118, &c.) adopts and confirms this interpretation. He flews that the rife and progress of the Mahometan religion and empire exhibit a signal accomplishment of this prophecy. All the circumstances here recited correspond to the character of the Arabians, and the history of the period that extended from A. D. 568 to A. D. 675. In conformity to this opinion, Abaddon may be understood to denote either Mahomet, who infilled the abysses, or the care of Hera, to propagate his pretended revelations, or, more generally, the Saracen power. Mr. Bryant supposes Abaddon to have been the name of the Ophite deity, the worship of whom prevailed very anciently and very generally. See Serpent.

Abadir, in the Roman Theology, the flone which Saturn swallowed, believing it his new born fon Jupiter, and which at length became defied, and the object of religious worship. The Carthaginians gave this title to gods of the first order.

A.B.E. See Aba.

Abat', in the Sea Language, is used in speaking of things placed or done towards the stern, or hinder part of a veffel; called alfo aft, and flands oppofite to fore. — Thus they fay a thing is abat the fore-mall, when it is behind it, or nearer the ftern. The poulk of the mailer, captain, and other officers, is abat the mainmall. — The flern, ftrictly speaking, is only the outflde; abat includes both inlde and out.

Abat the beam, denotes the relative situation of any object with the fhip, when the object is placed in any part of that arch of the horizon which is contained between a line at right angles with the keel and that point of the compass which is directly oppofite to the fhip's courfe.

Abagi, the fame thing with Abasis, although of dif- ferent value; it is worth at Taffis, and throughout all Georgia, about 36 fols French money; four chausiirs, which are called fans, make one abagi.

Abaka Il Khan, in Biography, the 8th emperor of the Moguls, of the race of Zingis, who preceded his father Hulaku, and commenced his reign, A. D. 1251. He was prudent and learned, and possessed many amiable qualities which endeared him to his subjefts, and rendered his government prosperous. He joined the Chirilians in celebrating Easter-day at Hamadan, whence fome have erroneously inferred that he was a Chirilian. He reigned 17 years. Mod. Un. Hist. v. 1, p. 188.

Abakansto, in Geography, a garrison town of the province of Yeufice, in Siberia. It flands on the river Jenifei, and is fo called from the river Abaken, which falls into the Jenifei at no considerable distance from it. E. long. 94° 5'. N. lat. 53° 5'.

Abalak, a small town in Siberia, about two miles from
From Tobolits, famous for an image of the Virgin Mary, to which many pilgrims resort, and which is annually visited in procession to Tobolits. E. long. 68° 23' N. lat. 58° 14'.

ABALIENATION, from ab and alienare, to alienate, in the Roman Law, denotes a species of alienation; whereby those goods called res mancipi, such as cattle, flocks, lands, and possessions, within the territory of Italy, were transferred to persons legally capable thereof, either by a formula, called irradito necis, or a surrender in open court.

ABALINATUS, alienated from, a medical term, which, when applied to the body, signifies that the part so spoken of, is in a state that requires amputation; and when applied to the fenes, denotes their total destruction.

ABALITES. See Abalites.

ABALLABA, in Geography, the ancient name of Appleby, a town in Westmoreland, remarkable only for having been a Roman station. W. long. 1° 4'. N. lat. 55° 30'.

ABALUS, an island, as the ancients supposed, in the German ocean, called by Timaeus Bithynia, and by Xenophon Lamplus, a Bithynia, now the peninsula of Scandinavia. Amber, according to Pliny (Hist. Nat. tom. ii. p. 772, ed. Hardi,) was thrown on the shores of this island by the waves of the sea; and he reports, that some persons thought this sublimity dropped from the trees in the adjacent mountains.

ABAN LA VILLE, a town in the bailiwick of Quingeys, situate between the town of that name and Lieu Dieu, in Franche Comte. E. long. 6° 15'. N. lat. 47° 10'.

ABANA, a river of Phoenicia, which rising from Mount Hermon, washed the south and west sides of Damascus, and fell into the Phoenician sea, to the north of Tripolis. The Abana was one branch of the Barady, called by the Greeks Obrorbus. This river is mentioned by Naaman, 2 Kings, v. 12.

ABANGA. See Ady.

ABANO, a village near Padua, in Italy, famous for its warm baths. In one of these baths the patients are covered with the warm mud. E. long. 10° 47'. N. lat. 45° 30'.

ABANTES, in Ancient History, a warlike people who came originally from Thrace, and settled in Phocis, a country of Greece, where they built a town, called ABA, after the name of their leader. Some ancient authors say, that the Abantes afterwards settled in the island Euboea, now called Negropont: others say these Abantes came from Athens. Their people are called Homer (II. i. ii. v. 542.) ἀθηναῖοι καστελλοι, from wearing their long hair behind. They were called Curates from their cutting it short before.

ABANTIA, or ABANTIS in Ancient Geography, a name given to the island Euboea, in the Egene sea; extending along the coast of Greece, from the promontory Sunium of Attica to Thessaly, and separated from Boeotia by a narrow strait called Eurybos. It derived its name from the Abantes, according to Strabo, tom. iv. p. 63. Others say, that the inhabitants were called Abantes. From this their leader, who had the reputation of the island; and Reinaucus supposes that they were Arabians, who followed Cadmus into Euboea, and settled there.

ABAPTISTA, or ABAPTISTON, in Surgery, derived from the privative α and βαπτῖντος, to plunge: the shoulder of a trepanning instrument. This term is employed by Galen, Fabricius ab Aquapendente, Scultetus, and others, to denote the conical saw with a circular edge (otherwise called modiolus or terébrum,) which was formerly used by surgeons to perforate the cranium. Modern practitioners, however, have usually preferred the cylindrical form. Various contrivances are recommended, to avoid the danger that may arise from want of dexterity in the operation of trepanning, and a new instrument has been lately delineated for this purpose, by Mr. Rodman of Pailey; (Philosophical Magazine for April 1809;) but as no invention can compensate for a defect of skill in the surgeons, these precautions are not in general attended to. For a more particular account of this instrument, see Trepan and Trephine.

ABARA, in Geography, a town in the greater Armenia, under the dominion of the Turks. E. long. 46° 15'. N. lat. 39° 45'.

ABARANER, a town of Turcomania, in Asia, situated on the river Alignana, and twenty miles north of Nakhivan. It is said that 300. Roman Catholics reside here. E. long. 46° 30'. N. lat. 39° 50'.

ABARCA, an ancient kind of stove used in Spain to pass the mountains, made of raw hides, and bound with cords, which secured them against the snow.

ABARIM, in Scripture Geography, a ridge of high mountains situate between the rivers Arnon and Jordan, and nearly opposite to Jericho, in the land of Canaan. The Abarim were tipped so as to have been a famous mountain, formed a part of this extensive range of steep hills. Here the Israelites encamped for the last time but one, before they passed over Jordan into the promised land. The name Abiram was applied to part of this ridge of mountains in the time of Ezeckiel and Jerome. Well's Geog. of the O. T. vol. ii. p. 152, &c.

ABARIDON, in Ancient Geography, a valley of Scythia, at the foot of mount Imaus, the inhabitants of which, according to Pliny, (Hist. Nat. tom. i. p. 370.) were Anthropophagi, little superior in their habits and manners to the wild beasts with which they associated. Their feet were turned backwards, and yet they were very swift.

ABARIS, in Biography, the famous Hyperborean sage, who is said to have been the disciple and friend of Pythagoras, and to have performed a great number of singular exploits. His history is so fabulous, that Herodotus contents himself with relating (lib. iv. cap. xxxvi. p. 256. ed. Wellesley,) that he travelled through the world on an arrow, without any sustenance. Hypacon (art. Abaris) informs us, that he was sent by his countrymen as an ambassador to Athens, in conformity to an order of Apollo, who being consulted at the time of a destructive plague that generally prevailed, replied, that the Athenians should offer up prayers on behalf of all other nations; on this occasion, as we learn from Diodorus Siculus, (lib. ii. c. xlvii. p. 159. ed. Wiclif.) he renewed the friendship and intercourse between his countrymen and the people of Delos, which had been interrupted. He also visited Laedemon, where some writers say, as we are informed by Paufanias, (lib. ii. cap. xiii. p. 258. ed. Kuhnii.) he built a temple consecrated to Proserpine the Salutary. Abaris performed this long voyage with safe and expedition, being transported through the air, over rivers, seas, and mountains, on an enchanted arrow, which, says Jamblichus, (Vit. Pythag.) which he had received as a present from Apollo. Some have supposed that this arrow denoted his skill in astronomy, by which he directed his course. He is said by Strabo (lib. vii. tom. i. p. 462.) to have gained the esteem of the learned men of Greece by his politeness, eloquence, and wisdom. He particularly excelled, says Jamblichus (cap. xix. p. 131.) in the arts of magic and divination, of which he exhibited the most illusory proofs in all the countries through which he travelled. He adds, that he was taught by Pythagoras to find out all truth by the science of arithmetic. Porphyry (Vit. Pythag.) informs us, that he was capable of foretelling earthquakes, driving away plagues, laying storms, &c. Abaris, says Bayle, constructed the famous palladium of the bones of Pelops, and told it to the people
people of Troy. After he had visited many countries, and collected a great quantity of gold, he set out on his return home; and in his way had an interview with Pythagoras at Crotona, in Italy. Suidas enumerates various books which he is said to have written; and Himerius the Sophist applauds him for speaking pure Greek, which he acquired by means of the intercourse that subsisted between the Greeks and Hyperboreans. In his various perorations he imposed upon the vulgar by false pretensions to supernatural powers; delivering oracular predictions, healing diseases by incantations, and practising other arts of imposture. Hence the fabulous stories concerning Abaris grew up into an entire history written by Herodotus. Some of the later Platonists, says Brucker, (History of Philosophy, by Enfield, vol. i. p. 103.) in their zeal against Christianty, collected these and other fables, and exhibited them, not without large additions from their own fertile imaginations, in opposition to the miracles of Christ. He concludes upon the whole, that Abaris has a better title to be placed among impostors than among philosophers, and that the time in which he flourished may, with some degree of probability, be fixed about the third olympiad, or B. C. 708. The age of Pythagoras is no less uncertain, otherwise it is not likely that they should be contemporaries. Mr. Toland, in his Polym翰rous works (vol. i. p. 101.), premising that theἙβρίται were the Hyperboreans of Diodorus, infers that Abaris was both of that country, and likewise a Druid, having been the priest of Apollo. Suidas, says this writer, who knew not the distinction of Inferior Hyperboreans, makes him a Scythian; whereas Diodorus has truly fixed his country in the island, and not on the continent. Notwithstanding the fictions and errors that have been blended with the history of Abaris, it is certain, (as he apprehends,) that he travelled over Greece, and from thence into Italy, where he familiarly conversed with Pythagoras, who favoured him beyond all his discipies, by imparting his doctrines to him (especially his thoughts of nature), in a more plain and compendious method than to any others. The Hyperborean in return presented the Samarion, as if he had equalled Apollo himself in wisdom, with the fanced arrow, on which he had transferred seas and mountains; as the vulgar, particularly in the Hebrides, ill believe, that wizards and witches waft themselves whither they please upon broom-sticks. According to the account given by Himerius, and cited by Toland, (p. 182, &c.) Abaris the sage was by nation an Hyperborean, a Grecian in speech, and resembling a Scythian in his habit and appearance. He came to Athens, holding a bow, having a quiver hanging from his shoulder, his body wrap'd in a plaid, gilt about his loins with a gilded belt, and wearing trojfers reaching from his waist downward. His habit, therefore, was not that of the Scythians, who were always covered with fkins; but he appeared at Athens in the native garb of an aboriginal Scot. As for what regards his abilities, Himerius relates, that he was affable and pleasant in conversation, in dispatching great affairs secret and industrious, quicklighted in present exigencies, in preventing future dangers circumspect, a searcher after wisdom, defvrours of friendship, trufling indeed little to fortune, and having every thing trufted to him for his prudence. Neither the Academy nor the Lyceum, says Mr. Toland, could furnish a man with fitter qualities to go fo far abroad, and to fuch fvice nations, about affairs no lefs arduous than important. But if we attentively consider his moderation in eating and drinking, the ufe of all tho' things which our natural appetites ineffectually crave, adding the confuion and fimplicity of his manners, with the folidity and wisdom of his anfwers, all which we find sufficiently attested; it muft be owned, that the world at that time, had few to compare with Abaris. One of our most industrious historians has adopted the opinion of Mr. Toland, and taken great pains to prove that Abaris was a native of Britain, or of one of the British ifles. See Carre's Gen. Hist. Eng. vol. i. p. 52, &c. cited by Dr. Henry in his History of Great Britain, vol. ii. p. 79, 80.

A B A R N U S, or A B A R N I S, in Ancient Geography, a city, country, and promontory of Pariana, near the Hellespont. Mileus, in his description of Afa, says, it was a promontory of Lampacus; and it is said to have been so denominated from Abaris, a Phociam, by the Phocians, who built Lampacus. Some writers have called it Abarins. Stephan. de Uribus, tom. i. p. 4.

A B A R T I C U L A T I O N, in Anatomy. See Dia-

T R O P H I S.

A B A S, a weight used in Persia for weighing pearls; being an eighth part lighter than the European carat.

A B A S, in Mythology, the son of Hypotheon and Mega-

nira, who entertained Ceres, and offered a sacrifice to that goddess; but Abaris ridiculing the ceremony, and giving her opprobrious language, the sprinkled over him a certain mixture which she held in her cup, that transformed him into a newt or water-lizard.

A B A S, or A B A S I A, in Entomology, a species of the Bom-

bus of Fabricius, and of the Phalana f Linnæus, with brown spreading wings, the hinder wings cinereous, and the ocellus reddish. It is found in Surinam.

A B A S A, in Geography, a small town of Romania, in European Turkey, 12 miles from Adrapore, in the road to Constantinople. N. lat. 42° 8'. E. long. 26° 35'.

A B A S E D, A B A SÉ, in Heraldry, is applied to the vol, or wings of eagles, &c. when the tip or angle looks downwards towards the point of the fikd; or when the wings are fmit; the natural way of bearing them being fpread, with the tip pointing to the chief, or the angle. A che-

rion, a pale, bend, &c. are also faid to be abased, when their points terminate in, or below the centre of the shield. Again, an ordinary is faid to be abased, when it is below its due situation.

A B A S C I A, or A B A C S I A, in Geography, the northern diith of the western division of Georgia, in Afa. The in-

habitants are poor and treacherous. They trade in furs, the skins of the buck and tyger, linen yarn, box-wood, and bees-wax; but their principal traffic confifts in the fale of their own children to the Turks, and to one another. They are Christians only in name; but their customs refembe those of the Mincvians. The men are robust and active, and the females fair and beautiful. E. long. from 50° to 43°. N. lat. from 45° to 42°. See A B A S S A and A B A R E S.

A B A S C U S, a river of Afiatic Sarmatia, which rises in

mount Caucasus, and falls into the Euxine, between Pityus to the east and Nofis to the west.

A B A S I T I S, a tract of Afiatic Myia, in which was

fitted the ancient city of Ancyra.

A B A S K A J A, a town in Siberia, on the river Ifchim. It has a church encompassed by ramparts, and guarded by dragoons. E. long. 60° 5'. N. lat. 50° 10'

A B A S S A, the fnaller and the great, two diiths in the vicinity of the Caucafant mountains. The former, according to the account lately given by Pallas in his journey to the southern departments of Russia, is inhabited by fix tribes, who were formerly Chriftians, but their nobles now ac-

knowledge the Mahomtan religion; their manners, clothing, and way of life, reembling tho'fe of the Circassians; and there is some fimilitude in the language. They likewise practice agriculture, though they live more

by pasturage. They are celebrated on account of their large and fine breed of horfes; and they would be rich (in their own estimation) if they were not incessantly plagued,
plagued by the encroachments of the Circassian princes. The most powerful inhabitants of the great Abassia are the 
Abaschkan. See ABBAS AND ABBAS.

Abassia, a silver coin current in Persia, worth two 
manapunds, or four chayes; the chaye being estimated 
in nine annas of silver.
ABATIS, or ABATTIS, in Writers of the Barbarous Age, denotes an officer of the flabellaries, who had the care and distribution of the provender. The name is derived from *Batum*, which denoted an ancient measure of corn. Du Cange.

ABATIS, or ABATTIS, from the French, *abattre*, to pull down, in the Military Art, denotes a heap of large trees thrown together either lengthways or with boughs to boughs, and designed to guard entrenchments, to cover the passage of a river, to obstruct roads, &c. See Line.

ABATON, a structure erected at Rhodes, as a fence to the trophy of Artemisia, queen of Halicarnassus, Coos, &c. in memory of her victory over the Rhodians, or rather for concealing the disgrace of the Rhodians from the public eye, as the effacing, or destroying the trophy is, in their estimation, a point of religion.

ABATOR, in Law. See Abate.

ABATOS, in Ancient Geography, an island in the lake Moeris, famous for its papyrus, and for being the burial-place of Osiris.

ABAUVI, LEBAVO, or ABUVAM, a large tree in Ethiopia, which bears a fruit like a gourd. See Adansonia.

ABAUZIT, Firmin, in Biography, was born at Ufuz, in Languedoc, on the 11th of November, 1679. As his parents were protestants, he was obliged to leave France by the revocation of the edict of Nantes, and to wander among the mountains of Cevennes, till at length he found an asylum in Geneva. His mother, who had suffered much, expended the whole of her fortune in his education. His chief attention was directed to the study of mathematics and natural history, whilst he made a considerable progress in every department of literature. In 1698 he visited Holland, and became acquainted with Bayle, Jurien, and the Bafingers. He afterwards came to England, and conformed to St. Evremond and Sir Isaac Newton. "You," says Sir Isaac, in an epistolary correspondence, "are a very fit person to judge between Leibnitz and me." King William, to whom he became known, attempted, by a liberal offer, to detain him in England; but he chose to return to Geneva; where, in 1715, he entered into the society formed for translating the New Testament into the French language; and where, in 1725, the university offered him the chair of philosophy, which he refused on account of the weakness of his constitution, and of his talents. In 1727 he was presented with the freedom of the city, and appointed to the office of his librarian. There are few persons, whose mental endowments, natural and acquired, and whose moral and Christian virtues merit higher estimation than those of Abauzit. Of his mathematical and philosophical knowledge he gave ample evidence in his defence of Newton against father Caflé, and in his discovery of an error in the *Principia*, which the author corrected in a second edition of that admirable work; a work which at the time of its first publication few were able to understand. He was also an excellent linguist, geographer, and historian, and intimately conversant with medals and ancient MSS. Such were not only the extent and accuracy of his knowledge, but the tenacities of his memory, that he could readily avail himself of the knowledge he had acquired. To this purpose it is mentioned, that when Rousseau published his Dictionary of Music, he found that Abauzit, who had not directed his attention to the music of the ancients for thirty years, could give him a clear and satisfactory account of the subject which he himself had investigated with so much labour. To this circumstance it was probably owing, that the only panegyric which Rousseau ever wrote upon a living person, and one of the finest of his edges, was addressed to Abauzit. Voltaire is also said to have paid him a very high and delicate compliment. A stranger having told the poet of Ferney, that he was come to Geneva to see a great man, Voltaire asked him, Whether he had seen Abauzit? We may naturally imagine, that the esteem and attachment of these sceptical philosophers would not be diminished by the liberty of his theological sentiments. On a subject that has been much controverted, Abauzit is said to have adopted and promoted the Arian doctrine. He also employed himself in discovering errors in the various translations of the Bible; and conceiving mathematical demonstration to be necessary in matters of testimony, he was led to divest the Scriptures of several miracles. But whatever may have been his occasional doubts, and the result of his inquiries on particular topics, he was, as a valuable biographer, delineates his character, religious by principle, and a Christian upon conviction. He defended religion to the time of his death, and employed some of his last days in establishing its evidence. Pious without hypocrisy, virtuous without austerity, he loved mankind; he sought to be useful to them; and he never blamed others for thinking differently from himself. His love of simplicity appeared in all his actions; he flung ceremony, and retired from flattery. His conversation, always heard with respect, was delivered without ostentation. Even the exterior of his house, and of his person, discovered an unaffected dislike of parade and luxury. Always himself, he was always the model, the wife Abauzit." This valuable man died, lamented by the republic, and regretted by the learned, on the 20th of March, 1767, at the advanced age of 87 years. He published, in 1739, a much improved edition of Spence's History and State of Geneva. As a citizen, he was active in the diffusions of 1734; and though he was attached to the aristocratic party, he possessed a great degree of republican zeal. The writings he left behind him were chiefly theological. Of these the principal was, "An Essay upon the Apocalypse," written to shew that its canonical authority is doubtful, and to apply the predictions to the defection of Jerusalem. This work was translated by Dr. Twells, and refuted so much to the satisfaction of the author, that it flopped an impression of it, which had been intended. It was, however, afterwards introduced by the Dutch editors into their edition of his works, which also comprehends "Reflections on the Eucharist;" "On Idolatry;" "On the Mysteries of Religion;" "Paraphrases and Explanations of sundry Parts of Scripture;" several critical and antiquarian pieces, and various letters. An edition, without the Essay on the Apocalypse, was printed at Geneva, in 1806, in 1770. Gen. Biog. by Dr. Aikin and Enfield. Bioj. Dict.

ABAY, in Geography, a name given to the Nile, in the territory of Guzman; which some derive from *Ab*, father, under which appellation this river, or perhaps the spirit refining in it, is an object of worship; but Mr. Bruce (Travels, vol. iii. p. 655.) says, that Abay in the Amharic language signifies, "the river that suddenly swells, or overflows periodically with rain."

ABB, among Clothiers, denotes the yarn of a weaver's warp, whence the wool of which it is made is called Abbevel.

ABBA, in Ancient Geography, a town of Africa, near Carthage.

ABBA, in the Syriac and Chaldee languages, literally signifies a father; and figuratively a superior, reputed as a father in respect of age, dignity, or affection. This appellation was not allowed to be used by slaves, when addressing the head of a family, and this circumstance adds peculiar force to the expression of the apostle, Rom. xii. 15. It may also be
be observed, that St. Paul and St. Mark used the Syriac abba, which was understood in the synagogues and primitive assemblies of Christians, but added to it, when writing to foreigners, by way of interpretation, the term father. The Jews assumed this denomination as a title of dignity; in allusion to which, our Saviour forbade his disciples to call any man his father on earth.

It was also anciently used as a title of honour, which some great men, it is said, still retain in the Pyrenean mountains.

**ABBADIE, JAMES,** in Biography, an eminent protestant divine, was born at Nay in Berne, in 1615, or 1618. He studied in various places, but received his degree of Doctor of Divinity at Sedan. Discouraged from the exercise of his profession in France, on account of the differted circumstances of the protestants, he first settled at Berlin under the patronage of the Elector of Brandenburg, about the year 1680 or 1681, where he resided for many years with great reputation. In 1688 the Elector died, and he accompanied Marshal Schomburg, first to Holland, and then to England with the Prince of Orange. Losing his patron, whom he attended to Ireland, in 1690, he returned to England, and became minister of the French church at the Savoy. He afterwards went to Ireland, and, by the recommendation of King William, he obtained the deansy of Killalo, with some other preferments. He was strongly attached to the cause of his royal master, as appears by his elaborate defence of the Revolution, and his history of the affillation-plot. In 1726 he removed again to England, and died in the parish of Mary-le-bone, in London, in the following year, at the age, as some say, of 69, and according to others 73. He was a zealous protestant, and one of the most eloquent men of the period in which he lived. But his imagination and memory, which was singularly retentive, as well as his learning and eloquence, seem to have been inferior to his judgment. His works were numerous, and much approved at the time of their publication; the chief of them were the following, viz.:—

"T. de la Verité de la Religion Chrétienne," Rotterdam, 1684, 2 tomes, 8vo; which work has been translated into English and High Dutch, and has passed through several editions. Mr. Bayle commends this book, as one of the most perfect in its kind.—"Traité de la Divinité de notre Seigneur Jésus Christ," Rotterdam, 1689, 8vo.—"L'Art de se connoître soi-même, ou la Recherche des Sources de la Morale," Rot., 1692, 12mo.—"Défense de la Nation Britannique, &c," à Londres, 1692, 8vo.—"Histoire de la Conspiration dernière d'Angleterre, &c," Londres, 1696, 8vo. This book was written by order of King William III. and the original papers for compiling it were furnished by the Earl of Portland and Sir William Tromball, secretary of state.—"La Verité de la Religion Reformée," Rot., 1718, 8vo. 2 tomes.—"La Triomphe de la Providence et de la Religion, ou l'Ouverture des sept Sceaux pour le Fils de Dieu, &c," Amst. 1723, 4 tomes, 12mo. Biog. Brit.

**ABBAGUMBA,** in Ornithology. See ERKROOM.

**ABBASSEUR,** in Anatomy, a name given by Win-

flow, and other French writers, to one of the muscles of the eye, called by others the depressor inferior; and by Fabricius, the rectus inferior; Cowper and Albinus call it the depressor oculi; and it is one of the quatuor recti oculi of the last author.

**ABBAS,** in Biography, son of Abdalmotalleb, and uncle of Mahomet, was at first hostile to his nephew as an impostor and traitor to his country; but being taken prisoner in the second year of the Hegira, at the battle of Beder, and a large ransom being demanded, he represented to Mahomet that the payment of it would ruin him, and reduce his family to dishonour. Mahomet, however, had heard that he had secreted money, and inquired for the purses of gold which he had left with his mother at Mecca. Abbas was thus led to regard him as a prophet, and to embrace his religion. He afterwards saved his life at the battle of Hosain, soon after the reduction of Mecca. Abbas was not only a great commander, but an eminent doctor of the Mussulman law, and read lectures upon every chapter of the Koran, as Mahomet pretended to receive them from heaven. He died in 653, and his memory is held in veneration among the Mussulmans to this day.

**ABBAS ABDULLAH,** Eln, was the grandson of Abdalmotalleb, and the most confiderable of all the doctors among the Mussulmans. He is said to have acquired from the angel Gabriel a perfect knowledge of the Koran, when he was ten years of age, and was honoured with the title of Targuman al Koran, or interpreter of the Koran. He died in the 68th year of the Hegira, and was very much lamented.

**ABBAS I., Shah,** surnamed the Great, was the third son of Khodabande, and the 7th king of Perfa of the race of the Sufis. He succeeded Thmael III. who had murdered their eldest brother Amir Hamzeh, and who was himself put to death after a short reign of eight months, in the year 1385. These two princes are not commonly reckoned in the number of Perjan kings. His first thoughts and actions, after he ascended the throne, were to destroy the empire, and to recover the provinces which the Turks and Tartars had taken from his predecessors. By a series of victories he defeated Abdallah, khan of the Ubecks, who invaded Khorasan, and the Othman Turks, from whom he took Tauris; subdued the provinces of Shirwan and Ghilan; took possession of the kingdom of Sar, comprizing a great part of Perfa proper; invaded and secured Georgia, and captured Bagdad, and Ormuz in the Perian gulf. After a prosperous reign of 45 years, during which he had the division of the empire, and a considerable augmentation of his dominions, he was seized with a dangerous distemper at Ferabul, in the province of Mazendaran, supposed to have been the effect of poison, and closed a life of 70 years in 1668. Having appointed his grandson for his successor, he left orders for concealing his own death till the throne was secure to him; and for this purpose he directed that his funeral obsequies should be performed at three different places at once, and that his body should be exposed every day in the hall of justice, seated in a chair of state, with the eyes open, and his back to the hangings, behind which was a person who contrived to answer any questions that were proposed. By this artifice his death was kept secret for six weeks. The memory of Shah Abbas has been held in high veneration by the Perians, and they speak of him as the greatest prince their country has produced for many ages. He was wise and valiant, attentive to the poor, and rigorous in the administration of justice. He adopted all possible measures for promoting the wealth and good government of his dominions; and took great pains to intro-

C 2
duce and encourage commerce among his subjects. Having made Ipahan the metropolis of Perâia, he built the royal moleque and palæe, and caused the mountains at the distance of 50 leagues to be cut through, in order to augment the Zandereth, which runs through the city, by turning into it the stream another river. He also adorned several of his other cities with magnificent structures. Nevertheless, his cruelty, of which many notorious instances are recorded in his history, entitles him to rank with those ferocious eastern tyrants, whom Providence seems to find into the world to harass, aggrieve, and destroy the human race. Mod. Un. Hist. vol. v. p. 118, &c.

Abbas, Shab, II. the 9th king of Perâia, of the Sod race, was the great granddson of the former, and succeeded his father in 1642, at the age of thirteen years. His cruel and tyrannical father had ordered him to be deprived of sight; but the enmity, who was charged with the office, more compassionate than the favage parent, refrained from executing it. The father relented, and rejoicing to find, when he was dying, that his command had been disobeyed, appointed him for his successor. The successful expedition of this prince, when he was 18 years of age, for the recovery of Candahar, which had been surrendered to the Great Mogul in the time of his father, and his defence of it against an army of 300,000 men, seem to have been the principal events of his reign. His character has been very differently represented by those who have professed to give an account of his life. Whilst some have extolled his justice and clemency, and spoken in the highest terms of his talents and military exploits; others have reproached him for his cruelty and debauchery. Upon the whole, he seems to have been more kind and tolerant to strangers than to his own subjects, and especially to the Christians, whom he distinguished by his protection and favour. He was very much addicted to drinking, and governed by passion: and after a reign of about 24 years, fell a sacrifice to his intemperance, and died in 1666. The Jews were very severely persecuted during his reign; because, as it is pretended, the Messiah did not appear, according to the assurances which they are said to have given to Abbas the Great, and which was the stipulated condition of their toleration. See Mod. Univ. Hist. vol. v. p. 150, 300.

Abbas III. was succeeded by the famous Kul Khan.

ABBASSIDES, in History, a race of Caliphs, who were thirty-seven in number, and succeeded one another from between A.D. 746 and 750, for about 523 years without interruption. They were so called from Abul Abbas, surnamed Saghâr, with whom this dynasty commenced, according to Dr. Blair, (Chronology, pl. 33.) A.D. 749.

ABBASSUS, in Ancient Geography, a town of the greater Phrygia, on the borders of the Topâbûbâji, a people who inhabited the northern parts of Galatia in Asia.

ABBE, in a modern French, the name with which the English have styled the abbot, prior, or other superiors of monasteries, which has been popular in France, but was not known among the Romans till about a century and a half ago. Abbés are persons who have not obtained any fixed settlement either in church or state, but they are expectants of any office that may occur. Their dress is rather that of an academic, or of a professed scholar, than of an ecclesiastical. They are a numerous and useful body. In colleges they are the instructors of youth, and tutors in the private families; and many of them obtain a decent subsistence by their writings. They are persons of universal talents and learning, and are held in esteem and respect by people of various descriptions, and particularly by the female sex to whom they are devoted.

ABBFIORD, in Geography, a sea-port town of Norway, about 60 miles south-west of Christiana, situate on a small bay in which are three islands.

ABER-LOUGH, a lake of Lorne, in Argyleshire, in Scotland.

ABBESS, the superior of an ABBEY, or convent of NUNS. The abbess has the same rights and authority over the nuns, that the abbots regular have over their monks. Her sex indeed does not allow her to perform the spiritual functions annexed to the priesthood; but in some instances abbesses have the privilege of consecrating a priest to act for them; and they have even a kind of episcopal jurisdiction.

F. Martene, in his treatise on the rights of the church, observes, that some abbesses have formerly conferred their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity of checking it.

Sr. Balf, in his rule, allows the abbess to be present with the prior at the confession of her nuns.

Before the conquest abbesses were summoned to the Wittenagemot, and they affilied in the deliberations of ecclesiastical councils.

ABBEVILLE, in Geography, a city of France, the capital of the department of the Somme. The town contains 18,572, and the two cantons 22,004 inhabitants. Its territory comprehends 1074 kilometres, and 13 communes. It lies in a pleasant valley, and is divided into two parts by the river Somme. This town carries on a considerable trade in grain, oil, hemp, flax, cordage, soap, &c. by means of the Somme, in which the tide rises fix feet, and by which ships may come to the middle of the town. The woollen manufacture was established here in 1665, and has succeeded so well, that its cloths are deemed little inferior to those of England and Holland. In this respect it has been aided by the clandestine importation of English and Irish wool, and of workmen from this country. It is conveniently situated for a fortification, and as it has never been taken, it is sometimes called the maiden town. It has a collegiate church, thirteen parish churches, and other public buildings. It is 52 miles south of Calais, and 80 N. by W. of Paris. E. long. 1° 49' 45". N. lat. 50° 7' 14".

ABBEVILLE is also the name of a county in the district of Ninety-fix, in South Carolina, bounded on the N.E. by the Saluda, and on the S.W. by the Savannah; 35 miles in length, and 21 in breadth, containing 1917 inhabitants, of whom 1665 are whites.

ABBEY, or ABBEY, a monastery, or religious house, governed by a superior under the title of ABBOT, or ABBEES.

In our ancient statutes the word is sometimes also written abbathy. By 31 H. VIII. e. xii. abbaties are given to the king.

Abbey differs from PRIORIES, in that the former are under the direction of an abbot, and the latter of a prior: but abbot and prior (we mean a prior conventual) are much the same thing, and differ in little but the name.

One-third of the bell benefices in England were annually by the pope's grants, appropriated to abbeys, and other religious houses; which, upon their dissolution under king Henry VIII. became lay-fees. For a farther account and an estimate of the number and value of religious houses abdicated and surrendered in this reign, see MONASTERY.

ABBEE-LANDS. See PREMUNIRE and TITHE.

ABBEYBOYLE, in Geography, a town of Ireland, in the county of Roscommon, and province of Connacht, famous for an old abbey. See BOYLE.

ABBEYFOLD, a town in Cumberland, so called from an abbey built by David king of Scots. It is situate on an arm of the sea, and is 16 miles S.W. of Carlisle. W. long. 3° 59'. N. lat. 54° 53'.

ABBEE.
ABB EY MILTON, or MIDDLETON, an ancient, but
mean town in Dorsetshire, which had formerly an
Abbey and a market, and which is 12 miles N. E. of
Dorchester. W. long. 2° 24’. N. lat. 50° 51’.
ABBIA N Y, a town on the coast of Guinea, in Af-
frica, at the distance of three leagues from Tebbo.
ABBII TI, Filippo, in Biography, an eminent painter,
who was born at Milan in 1645, and died in 1715,
at the age of 75 years. He was distinguished by fertility of
invention and correctness of design. His hand was free,
and his touch light; he executed with expedition, and per-
formed with equal beauty, in fresco and in oil. Pilkington’s
Dictionary.
ABBON, in Biography, a monk of St. Germain-des-
Prés, who composed, in barbarous Latin verses, a relation
of the siege of Paris by the Normans towards the close
of the 9th century. He was more distinguished as a faithful
historian than as a good poet. His poem is published in the
second volume of Duchesne’s collection, and has since been
more correctly printed, with notes, by Duplessis, in 1753.
Biog. Dict.
ABBON, DE FLEURY, was born in the territory of Or-
leans. After devoting himself with ardour to the study of
almost every art and science, and obtaining distinguished
reputation in the schools of Paris and Rheims, he was elected
abbot of the monastery of Fleury, of which he was a monk.
He wrote an apology for his conduct against the accusa-
tions of his enemies, which was addressed to the kings Hugh
and Robert; to whom he also dedicated a collection of canons
on the duties of kings and subjects. The collection of his
letters and canons, and his apology, were published in
1687, in folio. He was slain in a quarrel that arose between
the French and Gascons at Reole in Gascony, in 1604.
Gen. Dict.
ABBOT, or ABBAT, originally derived from the Hebrew
Ab, father, signifies the superior of a monastery of
monks erected into an abbey or prelacy.
Abbots were really distinguished from the clergy, though
frequently confounded with them, because they were a
degree above laymen. St. Jerome, writing to Heliodorus,
says expressly, Hallel:orum sibi caulu, alia clericiorum.
In those early days the abbots were subject to the bishops,
and the ordinary pastors. Their monasteries being remote
from cities, and built in the farthest solitudes, they had no
share in ecclesiastical affairs. They went on Sundays to the
parish-church with the rest of the people: or, if they were
too remote, a priest was sent to them, to administer the
sacraments, till, at length, they were allowed to have
priests of their own body. The abbot, or archimandrite, was
usually the priest; but his function extended no farther
than to the spiritual assistance of his monastery, and he remained
still in obedience to the bishop. In process of time, as
many of them were persons of learning, they opposed the
heretics that sprang up, which induced the bishops to fix
them near and in the cities.

The abbots soon laid aside their former plainness and sim-
plicity, and endeavoured to be independent of the bishops,
which occasioned some severe laws to be made against them
at the council of Chalcedon; notwithstanding this, in time,
many of them carried the point of independence, and got
the appellation of lord, with other badges of the episcopate,
particularly the mitre.

Hence arose new species and distinctions of abbots: mitred,
and not mitred; crooned, and not crooned; ecclesiastical
abbots, cardinal abbots, &c.

Abbots, Mitred, were those privileged to wear the
mitre; and also allowed a full episcopal authority within
their several precincts.—Among us, these were also called
abbots foreign, and abbots general; and they were lords
of parliament. Of these Sir Edward Coke reckons twenty-
seven, and Selden twenty-six, in England, beside two mit-
tered priors.
The rest, who were not mitred, were subject to the dio-
cesan.

Abbots, Croziers, are those who bear the crozier, or
pastoral staff.

Abbots were likewise distinguished into abbots elective,
and abbots prefentative; but are now chiefly distinguished in
regular and sacramental.

Abbots, Regular, are real monks, or religious, who
have taken the vows, and wear the habit of the order.

Abbots in commendam, are seculars; though they have
undergone the tonsure, and are obliged, by their bulls, to
take orders when they come of age.

Though the term commendam infinuates, that they have
only the administration of their abbey for a time; yet do
they hold, and reap the fruits of them for ever, as well as
the regular abbots.

Their bulls give them a full power in spiritualibus
quam in temporibilibus; and yet it is true that the commenda-
tory abbots do not perform any spiritual offices; nor have
they any spiritual jurisdiction over their monks. So that
the phrase in spiritualibus, is rather something of the Roman
style than a reality.

The ceremony whereby abbots are erected, isproperly called
benediction; or sometimes, though improperly, consecration.
It is not so often in clothing them with the habit called
cuculla, a cowl; putting the pastoral staff in their hands,
and the crozes called pedales, or palaes, on their feet. These
particulars we learn from the Ordo Romanus of Theodore, arch-
bishop of Canterbury.

Abbot is also a title, which has been given to certain bi-
shops, because their fees had originally been abbey's; and
they were even elected by the monks: such are those of
Canterbury and Montreal in Sicily.

Abbot is also an appellation sometimes given to the su-
periors or generals of some congregations of regular canons;
and that of St. Genevieve at Paris.

Abbot is also a title borne by several magistrates, and
other persons.—Among the Genevieve, one of their prin-
cipal magistrates was called the abbot of the people.

In France, particularly about the time of Charlemagne,
there were several lords and courtiers, who having the super-
tendancy of certain abbey's committed to them, were styled
abdoniates, or abbots, &c.

Abbot, George, in Biography, Archbishop of Canter-
bury, was born Oct. 29, 1652, at Guildford in Surrey. Having
passed through the rudiments of literature in his native town,
he was removed, in 1578, to Balaclan college at Oxford. In
1583, he was elected probationer fellow of his college;
and having passed through the usual course of graduation,
he took orders and became a celebrated preacher in that
university; and in 1597 he was elected Master of Uni-
versity College. In 1600, and again in 1603, he was Vice-
chancellor of the university, and discharged the duties of
this office with general approbation. In the succeeding year
the translation of the Bible, now in use, was undertaken by
the direction of king James; and Dr. Abbot was the second
of eight learned divines in the university of Oxford, to whom
the care of translating the whole New Testament (excepting
the epistles) was committed. In 1605 he was again Vice-
chancellor. After the decease of his patron, the Earl of
Dorset, in 1608, he became chaplain to Geo. Hume, Earl
of Dunbar, and accompanied him this year to Scotland,
to assist in establishing an union between the Scots and
English churches; and in conducting this business he ac-
quired
quired a character for prudence and moderation, which laid the foundation of all his future preferments. From this time he stood so high in the king's favour, that he was consecrated bishop of the united sees of Litchfield and Coventry in 1609, and in the beginning of the next year he was translated to London; and in 1611 he was preferred by his majesty to the arch-episcopal see of Canterbury. Thus, before he had arrived at the age of fifty, he was exalted to the highest dignity in the church, and celebrated by Godwin, (de Preful. Anglic. p. 295) one of his contemporaries, for his learning, eloquence, and indefatigable diligence in preaching and writing, notwithstanding the various duties of his high office, of the high com-missioncourt, over which he presided, and of his regular attendance on the privy-council. He was at this time in the highest favour both with prince and people, and chiefly concerned in all the great transations of church and state. His great solicitude for the protestant religion induced him zealously to promote the match between the Elector Palatine and the Princez Elder, Elizabeth, which was solemnized on the 14th of February 1613, the archbishop performing the ceremony in the royal chapel. During the agitation of the divorce between the Lady Frances Howard, daughter of the Earl of Suffolk, and Robert Earl of Essex, which has been considered as one of the greatest blemishes of King James's reign, the archbishop added much to the reputation he had acquired for inflexible integrity. He refilled the divorce, though the king was very dextrous of its taking place, and published his reasons for perilling in his opinion, to which the king himself thought fit to reply. Sentence was given in the lady's favour. In 1618 the king's declaration for permitting sports and pastimes on the Lord's day gave the archbishop great uneasiness; and happening to be at Croydon on the day when it was ordered to be read, he had the courage to forbid its being read. This year he did great service to the protestant religion, by employing Mr. In. Brent to procure the MS. of Father Paul's excellent History of the Council of Trent. In 1619, when his health began to decline, he prepared to execute the benevolent design in favour of his native town of Guildford, which he had long meditated; he attended when Sir Nicholas Kempe laid the first stone of his hospital, and afterwards nobly endowed it. Towards the close of this year, when the Elector Palatine accepted the crown of Bohemia, he took part with those who thought, that natural affection for his son and daughter, and a just concern for the protestant interest, ought to have engaged his majesty warmly to support that natural election. Being under a necessity of using exercice, he made a tour into Hanover, and when he was hunting in the park of Lord Zouch at Bramall, he had the misfortune of killing his lordship's keeper by an arrow from a cross-bow, which he shot at one of the deer. This accident threw him into a deep melancholy. The day on which it happened he kept as a monthly fast ever afterwards, and he settled an annuity of 20l. on the widow. This accident excited prejudices against him in the minds of many prebends, though his majesty declared, that "an angel might have miscarried in this fort," and wrote him with his own hand a consolatory letter. A commissioin of ten prebends was appointed to inquire into this matter, and the refult of the whole was, that a pardon and dispensation palled the Great Seal, and he was declared capable of all metropolitical authority, as if this affair had not happened. In the parliament that met on the 19th Feb. 1623-4, the archbishop took an active part in the measures which were then purpored for purifying the king to diffuse his treasuries with Spain, relating to the marriage and the patrimony. Though, on account of his increasing infirmities he seldom attended at council, yet in the king's last sickness he constantly attended, and was near him when he expired on the 27th of March 1625. He performed the duty of his rank in putting the crown on the head of king Charles I.; but he visibly declined in the king's favour, and the Duke of Buckingham watched for an opportunity of testifying the severity of his displeasure against him. An occasion soon presented itself in consequncne of his refusing to licencse a sermon, preached by Dr. Sibthorpe, to justify and promoe a loan, which the king had demanded. Accordingly he was suspended from all his functions as primate, and they were exerced by com-mission appointed by the king. But a parliament being necessary, he was again restored to his authority and juridiction. His presence at court, however, was unwelcome; and Laud, who directed the rigorous measures of the church party, which the archbishop disapproved, had the honour, as dean of the chapel, of baptizing the young prince, afterwards Charles II. The archbishop being worn out with cares and infirmities, died at Croydon on the 4th of Augst in 1653, at the age of seventy-one. He was buried at Guildford, where a statel monument was erected over his grave, with his effigy in his robes. He was distinguished by his natural talents, and by a considerable portion of acquired literature, as the various works which were written by him testify. He manifested, in many circumstances, a great degree of moderation to all parties; and he was dextrous that the clergy should engage the respect of the laity by the fanciful of their manners and the uprightness of their behaviour, rather than claim it as necessity attached to their function. But his sentiments and conduct have not escaped reflections; nor has even Lord Clarendon done justice to his memory. Dr. Welwood has more truly appreciated his abilities and merit. There was another writer of the same name, who published a paraphrase on Job, a Vindication of the Sabbaths, and a Paraphrase on the Psalms. He died about the year 1650, and had been a member of the parliament that was then sitting. Biog. Brit.

ABBOT, ROBERT, was brother to the former, born at Guildford in 1560, and completed his studies at Bahol college in Oxford. He took his degree of Master of Arts in 1582, and became a distinguished preacher, to which his preferment was owing. In 1594 he became no less eminent for his writings. In 1597 he took his degree of Doctor in Divinity; and in the beginning of the reign of King James he was appointed chaplain in ordinary to his majesty, who ordered the doctor's book, "De Antichristo," to be printed with his own commentary on the Apocalypse. He was elected master of Bahol college in 1620, and in 1622 his majesty appointed him regius professor of divinity at Oxford. The reputation which he acquired by his lectures induced his majesty to name him for the see of Salisbury, and he was consecrated by his brother at Lambeth, Dec. 3, 1615. He found the cathedral falling into decay, and applied the sum of 500l. which he obtained from the prebendaries, towards repairing it. Here he devoted himself with exemplary affibility to the duties of his function; but his close application to study brought upon him the gravel and stone, which terminated his life on the 2d of March 1617, in the 38th year of his age. He was buried there against the bishop's seat in the cathedral. Dr. Fuller (in his Worthies of England) says, speaking of the two brothers, "that George was the more plausible preacher, Robert the greater scholar; George the abler statesman, Robert the deeper divine; gravity did flow in George, and finick in Robert." His writings were numerous, and many of his MSS. were given by Dr. Corbet, who married his grand-daughter, to the Bodleian library.

There was another Robert Abbots, a minister, and author of several devout pieces, who was scarcely a writer before the bishop died.
ABBOTS-BROMLEY, in Geography, a town of Staffordshire, with a market on Tuesday. W. long. 1° 32'. N. lat. 51° 5'.

ABBOTSBURY, a small town in Dorsetshire, with a market on Thursday. W. long. 1° 17'. N. lat. 50° 40'. The abbey near this town was founded by a Norman lady about the year 1086; and Edward the Confessor and William the Conqueror were benefactors to it.

ABBOT'S-CASTLE, or ABBEY-WOOD CASTLE, an old fortification, in Staffordshire, seven miles from Wolverhampton, on the north side of the road from Shrewsbury to London, situated on a lofty round promontory, and a steep ridge of hills, which extend a mile in length, and are supposed to have been one continued fortification, and a work of the ancient Britons.

ABBOT'S-LANGLEY, a village in Herts, four miles from St. Albans, famous as the birth-place of Pope Adrian IV.

ABBREVIATE of ADJUDICATION, in Scots law, an abstract or abridgment of a decree of adjudication, which is recorded in a register kept for that purpose.

ABBREVIATION, or ABBREVIATURE, a contraction of a word, or passage, made by dropping some of the letters, or by substituting certain marks, or characters, in their place.

ABBREVIATORS, or ABBREVIATORS, on the subject of grammar distinguishes the parts of speech into words, necessary for the communication of our thoughts, which are the noun and verb, and abbreviations, employed for the sake of dispatch. These latter, however, are in the strict sense of the term, parts of speech, because they are all useful in language, and each has a distinct manner of signification. He inclines, however, to allow that rank only to the necessary words; and to include all the others, which are not necessary to speech, but merely substitutes of the first sort, under the title of abbreviations.

Words, he says, have been called worded, whence the title of this work, viz. _via_ quidem; and they well deserve that name, when their abbreviations are compared with the proverbs which speech could make without these inventions; but compared with the rapidity of thought, they have not the smallest claim to that title. Abbreviations are employed in language three ways; in terms, in forts of words, and in construction. Mr. Locke's Essay is the best guide to the first; and the authors who have given particular explanations of the last are numberless; the province of this author is confined to the second class of Abbreviations. See _Leta Letae Letae Letae_;

ABBREVIATION, in Geography, a promontory of Berwickshire in Scotland, in the southern extremity of the Firth of Forth. N. lat. 55° 55'. W. long. 1° 56'.

ABBTT, Thomas, in Biography, was born in 1738, at Ulm, and died in 1766, at Bückeberg, a privy-councillor of the Count of Schaumburg-Lippe. Beside his translation of Salutau into German, he also published a volume "Concerning Merit," and another "Concerning Death for one's country," which are well esteemed. He is one of the earliest German writers, who retain a classical rank, and would have probably excelled as an historian, if his life had been prolonged. Gen. Biog.

ABBTENAU, in Geography, a market town in the archbishopric of Salzburg, about twenty miles S. E. of the city of Salzburg. N. lat. 47° 32'. E. long. 15° 50'.

ABCDAEY, ABCDAEY, or ABCDAEY, is sometimes applied to compositions whose parts are disposed in the order of the letters of the alphabet. In this sense _abcdae_ is synonymous with _alphabetical_. Thus we meet with _abcdae_ psalms, laments, prayers, and the like; chiefly among Hebrew writers; which makes it probable they were the inventors of this species of composition.

This is the first and most manifest indication of verse in the Hebrew poetical books. Poems of this kind consist of 22 lines, or syllables of lines, or periods, or _flanazas_, according to the number of the letters in the alphabet; and every line, or _flanaza_, begins with each letter in order. This artificial contrivance was intended for the assistance of the memory, and was chiefly employed in subjects of common use, as maxims of morality and forms of devotion. There are still extant in the books of the Old Testament twelve of these poems, viz. Psalms xxv. xxxiv. xxxvii. cxxi. cxxix. cxlv. Prov. xxxiv. 10—31. Lament. i. ii. iii. iv. Three of these, viz. cf. cxvi. Lam. iii. are perfectly alphabetical in which every line is marked by its initial letter; in the other nine every _flanaza_ only is so distinguished. With respect to the three former it may be observed, that the whole poem is distributed into _flanazas_; two of them, viz. cf. cxxix. into ten _flanazas_ each, all of two lines, except the two last _flanazas_ in each, which are of three lines; and the third, viz. Lam. iii. consists of twenty-two _flanazas_, of three lines, the initial letter of every _flanaza_ being also the initial letter of every _flanaza_.

ABBREVIATIONS, in Music. Though many abbreviations have been long since adopted in writing and printing music, yet the term does not appear to have had admission in a dictionary. It seems as if there should be no contractions in single parts, particularly the principal, if difficult. Tartini, however, more than 50 years ago in the violin principale of his first concertos, has reduced to chords very difficult divisions in semiquavers. This kind of short hand is very convenient for a composer in his first sketch, or _prima intentione_, in filling up his figures; it saves time, and prevents his imagination from cooling.

ABBREVIATION of Fractions, in Arithmetic and Algebra, is the reduction of them to lower terms. See _FRACTION_.

ABBREVIATOR, in a general sense, a person who abbreviates any large book into a more narrow compass.

ABBREVIATOR is more particularly used for an officer in the court of Rome, appointed an affiant to the vice-chancellor, for drawing up the pope's briefs, and reducing petitions, when granted by the pontiff, into proper form, for being converted into bulls. The Abbreviators are supported by Ciampini, in his two volumes on their institution, office, &c. to be the secundaries either of the cancellarii in the imperial household, or of the _severalnotarii_, so to be granted by pope Clement I. in the seven quarters of Rome, to write down the acts of the martyrs within their several dirctors. They form a college of seventy-two persons, divided into two ranks: one called _abbreviatori di parco maior_, who are twelve in number, all prelates; the other _abbreviatori di parco minor_, called also _examinatoria_, who may be laymen.

ABBES HEAD (St.), in Geography, a promontory of Berwickshire in Scotland, in the southern extremity of the Firth of Forth. N. lat. 55° 55'. W. long. 1° 56'.
every line of that stanza. In these three poems, the lines thus determined by the initial letters, in the same poem, are remarkably equal to one another in length, in the number of words nearly, and probably in the number of syllables, and the lines of the same stanza correspond one with another, in the matter and the form, in the fene and the constru-Action of the other nine poems, viz. Pf. xxxv. xxxiv. cxxi. Prov. xxx. Lam. iv. confid of flanzas of two lines; two, viz. Lam. i. ii. of flanzas of three lines; and one, viz. Pf. xxxviii. of flanzas of four lines; allowing for irregularities, which are probably owing to the mistakes of transcribers. These flanzas likewise naturally divide themselves into their distinct lines, the fene and constru-Action pointing out their limits, and the lines corresponding one with another in matter and form, as in the poems more per-0fectly alphabetical. In these however, two of them, viz. Pf. cxxi. cxxi. have the lines shorter than these of the third, Lam. iii. by about one-third, or almost half; and of the other nine poems, the flanzas of which are only alphabetical, three, viz. Lam. i. ii. iv. confid of the longer lines, and the fix others of the shorter.

From these examples it may be inferred, that the poems, perfectly alphabetical, confid of verses properly so called, regulated by some regard to harmony or cadence, measure, numbers, or rhythm. The other poems, which are divided into flanzas by the initial letters, are compositions of the same kind, and equally confid of verses. We may also con-clude from these perfectly alphabetical poems, that the Hebrew verse did not confid in rhyme, or similar and corre-35pondent sounds at the ends of the verses, but in some form of rhythm, probably some form of metre, the laws of which are altogether unknown and undevelopable. Neverthe-less the peculiar form of composition is so observable, as plainly to discriminate in general the parts of the Hebrew scriptures which are written in verse from those which are written in prose. See Lowth's Preliminary Differtation to his Isaiah, p. 4. &c.

ABEDE or Abcede, from acced, to keep eider, a term in Surgery, signifying nearly the same thing as to suppurate. An acceded surface, is a part whose texture has been altered, vitiated, or separated by the formation of purulent matter. The mere contagion of purulent matter to a solid part of the living body, will sometimes effect a diffolition of its natural structure: this may arise either from the acrimonious quality, or the mechanical preface, of the confid pus. See Abcedentia, Abces, Pus, and Supfuration.

ABCOURT, in Geography, a town near St. Germain, four leagues from Paris, famous for a brisk chalybeat water, impregnated with fixed air and the foffil alkali, and resemb-ling that of Spa.

ABDALLAH, formed of abd, slave, and allah, God, and denoting the slave of God, in Biography, a younger son of Abd-Motalleb, and the father of Mahomet. He was the most beauti-ful and model of the Arabian youth, and when he married Amina, of the noble race of the Zahirites, 200 virgins are said to have expired of jealousy and despair. Gibbon's Hist. vol. ix. p. 255.—Several other eminent Abrahains bore the same name.

Abdallah, Ebn Salem, was a Jew, intimate with Mahomet, and an early convert to his religion. He is said to have assisted him in compiling his pretended revelations.

Abdallah, Ebn Zobeir, having ingratiated himself with the inhabitants of Mecca and Medina, by his religious zeal and engaging behaviour, was proclaimed Caliph, A. D. 682. Heg. 6]. He was recognized in all the provinces of the empire, except Syria and Palæstine; and enjoyed his dig-nity nine years, till the 72d year of his age, and 73d of the Hegira. At this juncture Mecca was besieged, and the Caliph's spirits were supported by the attention of his mother Aefma, grand-daughter to the Caliph Abuekeher, who, at the age of 50, administered refreshment to him and his soldiers at the breach with her own hand. At length, how-ever, he took leave of his mother, and fell out on the enemy. Having killed many with his own hand, he was at last overpowered; and when he found the blood trickling down his face and beard, he is said to have repeated this verse from an Arabian poet: "The blood of our wounds falls not upon our heels, but our feet;" and he soon died. The avarice of this Abdallah gave rise to the proverb: "That there was never a brave man who was not liberal, till Abdallah the son of Zobeir." He is reported to have been fo pious and so intent on his devotions, that a pigeon once alighted on his head, whilist he was thus employed, and fat long there without his perceiving it. Gen. Dict.

ABDAlMALSEC, the son of Mirwan, and fifth caliph of the race of the Ommiades, succeeded his father in the 65th year of the Hegira, A. D. 685; and reigned 21 years. At the commencement of his reign he converted the temple of Jerusalem into a mosque, and directed his subjects to perform their pilgrimage to this place; because Abdallah Ebn Zobeir, who had been elected caliph by the Arabs, re-55 tained possession of Mecca. In the progress of his reign he concluded a treaty with the Greek emperor, reduced Perisa, or rather Irak, under his dominion, and having failed to engage the submission of Abdallah by amicable conference, bid siege to Mecca, and took it. By this event he acquired possession of the peninsula of the Arabs, and became sole and absolute master of the Moslem empire. In the 76th year of the Hegira, he caused dinars, and dirhems, to be struck, with Arabic inscriptions upon them, which pro-claimed the unity of the God of Mahomet. Before his time the former, or gold coins, had Greek, and the latter, or silver money, had Perisc characters upon them. On this oc-45 casion he established a mint for coinage in his own dominions. Abdalmalec was deemed brave, learned, and wise, and was much more powerful than any of his predecessors; having subdued Abdallah Ebn Zobeir, and annexed Arabia to his empire; reduced to his obedience the federals of the empire, who had been accustomed to involve his territories in arms against him; conquered Indi4a, or at least a considerable part of that vast region in the East; and in the west, penetrated with his victorious troops as far as Spain. He was buried at Damascus; and the go55 vernment devolved on Al Walid, the eldest of his sixteen sons, who extended the Moslem conquests, and rebuilt the temple of Medina in a style of extraordinary magnificence. Under the reign of this caliph the Greek language and cha-racters were excluded from the accounts of the public re-venue. If this change (says Mr. Gibbon, Hist. of the De-55 cline and Fall of the Roman Empire, vol. x. p. 8. 8vo.) was productive of the invention, or familiar use of our pre-60 4sent numerals, the Arabi or Indian ciphers, a regulation of office has promoted the most important discoveries of arithmetic, algebra, and the mathematical sciencces. Abdalmalec was aversive to such a degree as to be denominated by some of his subjects, in derision, the fweet of a fane; and his breath was so fetid, that the flies which accidentally lighted upon his lips were poisoned by it; from which cir-cumstance he was called the father of flies. Mod. Un. Hist. ab. ii. p. 32. 8vo.

ABDOLMOTALLEB, or Abdol Motalleb, the son of Halihe, the father of Abdallah; and grandfather of Mahomet, was, according to Abulfedah, prince, or chief of the Kordief, during the war of the Elephant. Upon the death of the father of Mahomet, he took charge of his grandfaV
grandson; and at his decease committed the care of him to his son Abu Taleb, who was the guide and guardian of his youth. The life of Abdul Motalleb is said to have been prolonged to the age of 110 years; and he was the father of six daughters and thirteen sons.

ABDALONYMUS, descended from king Cinyras, and of the royal family of Sidon, lived in obscurity, and subsisted by cultivating a garden, when Strato had possession of the crown of Sidon. Alexander the Great having deposed Strato, wished to restore the race of Cinyras, and having found Abdalonymus, he was convinced of his high descent by the apparent dignity of his person. Interrogating him as to how he bore his poverty, Abdalonymus replied, "I wish I may bear my new condition as well. These hands have supplied my necessities. I have had nothing, and I have wanted nothing;" Alexander was so much pleased with this reply, that, besides bestowing upon him what belonged to Strato, he augmented his dominions, and gave him a large prent to the Persian spoils.

ABDALS, in the Eastern countries, a kind of faints supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic abdallah, the servant of God. The Persians call them dvnoch khatara, agreeably to the Latin word of speaking of their prophets and lybids, q. d. foreates Deo, raging with the God.

The Abads are often carried by excess of zeal, especially in the Indies, to run about the streets, and kill all they meet of a different religion. The English sailors call this running a man, from the name of the instrument, a fort of poignard, employed on this occasion. D'Herbel. Bib. Or. p. 6.

ABDELAVI, in Botany, an Egyptian plant very like a melon, except that the fruit is more oblong, and acute at the extremities.

ABDELEUR, in Geography, an island in Africa, situated in the country of Auiian, in the Indian Sea. N. lat. 11° 55'; E. long. 51° 45'.

ABDERA, or Abdara, in Ancient Geography, a town of Bactia in Spain, a Phoenician colony; now Adra or Aladra, to the west of Almeria in Granada.

Abdera, a maritime town of Thrace, not far from the mouth of the river Nettus, on the east side. Solinus lays that Abdera was founded by the father of Diomedes, and took her name; but Stephanius (de Urb. tom. 1. p. 5.) describes the name to Abderus, one of the companions of Hercules, who was devoured by the fabulous horse of Diomedes. Herodotus (lib. 1. p. 68.) informs us, that Timaeus, the Cretian, attempted to lay the foundation of it, but he was prevented by the Thracians from accomplishing his purpose. The Ticians afterwards succeeded and settled in this place, in order to avoid the contumacy of the Persians, which gave occasion to its being called "Abdera puicbra Tjurum colonia," signifying, that brave men will live anywhere rather than suffer oppression and servitude. To this laying some fopuilo that Cicero alludes in his epistles to Atticus, lib. 4. 7. The horses that fed on the grass in the neighbourhood of this city were feised with madness, according to Pliny (Hist. Nat. tom. 2. p. 374, Ed. Hard.) In the reign of Caius Fander, king of Macedon, it was so infested with frogs and rats, that the inhabitants were obliged, for a time, to quit it. The Abderites were for some months in the reign of Lyramachus, afflicted with a singular dace. It was a kind of burning fever, according to the description of it given by Lucian, (Op. tom. 2. p. 1. Ed. Reitz.) which came to a crisis on the seventh day. During its continuance, the imaginations of those who were feised with it were distracted, and they fancied themselves players; and they continued reciting verses from some tragedy, particularly out of the Andromeda of Euripides, till the cold of winter terminated their delirium. Of the cause of this disease, Lucian gives the following account. Archelaus performed the tragedy of Andromeda before the Abderites in a very hot summer; several perfoms were attacked with the fever on their leaving the theatre; and their imaginations being fully possemed with the dramatic incidents which had been exhibited, they could not forbear imitating Archelaus's action and declamation; and from them the fever was communicated to others by infection.

The Abderites were reproached for want of wit and judgment; nevertheless many eminent persons, as Protagoras, Democritus, Anaxarchus, Hecatus the historian, Nicxenius the poet, and several others, were born in this city. It was formerly famous for its gold and silver mines; but it is now reduced to a mean place, on the Archipelago, called Polyblito, Alpera, and Afrizzza. There was another city of the same name in Iberia, built by the Phoenicians, and now called Almiera.

ABDERAHMA, Abdirachman, or Abdarrahman, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had several successors of the same name.

A viceroy and captain-general of this name led the Saracen and their followers into France, ravaging the country wherever they came; but at length he was met at Tours by Charles Martel, who had been reinforced by a body of Germans and Gepide; and, after many skirmishes, a general action took place, in which the Saracen army was totally defeated, and Abderahma was killed, with 37,400 Moors. This great event, which first broke the Saracen power, and taught the Europeans that they were not invincible, is placed by most writers in the year 733, Hig. 114. Mariana (Hist. Spain, i. 7. c. 2.) dates this battle in the year 734, twenty-one years after the conquest of Spain.

ABDERANA. See ARIANA.

ABDEST, among the Malabatinas, a peculiar manner of walking, before prayer, entering the mosque, and the Alcoran; practised with some difference both by Turks and Perians. The word is compounded of the Persian ab, water, and defh, hand.

ABDAS of Babylon, in Biography, a legend-writer, who had the effrontery to boast, that he had seen Christ, which was one of the 70 disciples, had been eye-witnesses of the actions and prayers of several of the apostles at their death, and had followed St. Simon and St. Jude into Peria, by whom he had been made the first bishop of Babylon. But his forgery is easily detected; as he mentions Hecaleps and Jul. Africanus, one of whom lived about 150, and the other 221 years after our Lord's ascension. His book, intitled "Historia Certaminis Apostolici," was published by Wulfgang Lazius at Batz, in 1551, and has passed through several editions in other places. It may be seen, with notes, in Fabr. Codex. Apocr. N. T. part 2. p. 588.

ABDICARIA propostio, in Logic, is used for a negative proposition.

ABDICATION, Abdicatio, derived from abdicare, to renounce, the act whereby a magistrate, or person in office, renounces, and gives up the same, before the legal term of service is expired.

Abdication is frequently confounded with resignation; but, strictly speaking, there is a difference; abdication being done purely and simply; whereas resignation is done in favour of some other person.

In this sense, Dioclesian is said to have abdicated the crown; but Philip IV. of Spain resigned it. The parliament of England voted that king James IL having endea-
voured to subvert the constitution of the kingdom, by breaking the original contract between king and people, and having, by the advice of Jesuits and other wicked persons, violated the fundamental laws, and withdrawn himself out of the kingdom, has abdicated the government, and that the throne is thereby vacant. This vote was passed by a great majority of the commons; but was opposed in the house of lords. They particularly objected to the word abdicated, and it was carried, that deferred was more proper. The commons adhered to their vote, and by their perseverence obliged the lords to comply. The Scots convention voted that king James, by his mal-administration and his abuse of power, had forfeited (from fortis-fato) all title to the crown.

Abdication, among Roman Writers, is more particularly used for the act whereby a father discarded or disclaimed his son, and expelled him the family.

In this sense the word is synonymous with the Greek ἀποκάλλυς, and the Latin a familia alienata, or sometimes ablatius, and negatio; and stands opposed to adoption. It is distinguished from ehemæatio, or disinheritance, in that the former was done in the father’s life-time, the latter by will at his death: so that whoever was abdicated, was also disinherited, but not vice versa.

ABDITÆ Confes, are the secret or remote caufes of dillempers, which physicians of the dogmatic, or rational sect, affirmed, were necessary to be known, in order to establish a right method of cure.

Abdomen, in Anatomy, derived from addere, to hide, the lower Belly, or the cavity that is bounded at its upper part by the diaphragm, or midrib, by which it is separated from the thorax; and at its lower part it is distinguished from the pelvis by a circular ridge of bone, which is confidered as the brim of the latter cavity. The spine and lumbar muscles form the back part of the abdomen, while the fides and front are completed by muscles, named abdominal. The abdominal muscles are the oblique external and internal, the recti transversi, and pyramidalles. This great cavity is divided by anatomists into certain regions or districts, that they may be easily and accurately to determine the situation of the contained viscera. The divisions are in a great degree arbitrary; one imaginary line is drawn across from the greatest convexity of the cartilage of the 7th or half true rib; another from those projecting points of the hip-bones, named the anterior and superior spinoous processes. That part of the cavity, which is situated above this line, is termed the epigastric region; that below the lower one, the hypogastric. The space included between the lines, is called the umbilical region. These regions are again subdivided, the sides of the epigastric region, which extend beneath the cartilages of the ribs, being named hypochondria, and the small depression at the upper part, just over the cartilage cartilage, being called scrobiculæ cordis by Latin writers, and the pit of the stomach commonly by the English. The sides of the umbilical region are named the ilia or flanks, and the back part the loins. The sides of the hypogastric region are the groins, and the lower part in front, the pubes. The boundaries of the abdomen are every where lined by a thin and elastic membrane, named peritonæum, which is also spread over the contained viscera. From the smooth glossy surface of this membrane, a small quantity of a serous fluid is poured forth, which keeps the bowels separate from each other, and from the sides of the cavity in which they are contained. All the abdominal viscera, except the kidneys, are employed in the digestion of our food, the conversion of it into chyle, and the expulsion of the refuse. The viscera more directly employed in the chyleopotic function, are the stomach, and the small and large intestines. The small intestines are divided into the duodenum, the jejenum, and the ilium; the large into the cecum, colon, and rectum. The liver, with its gall bladder, the spleen, and pancreas, are subfervient to the functions of the alimentary canal. Behind the peritonæum in the loins, we find the kidneys, which are also abdominal viscera. Several processes of peritonæum present themselves in the cavity of the abdomen, and claim attention, as the great and small omentum, the mesentery, and others of less importance.

The abdominal viscera are pressed upwards towards the hollow cavity of the chest, by the abdominal muscles, in expiration; they are pulled down again by the action of the diaphragm during inspiration. When both the diaphragm and abdominal muscles act at the same time, a pre- 2. fure is made on all the abdominal viscera, which is occasion- ally employed to aid particular parts in performing their office; to assist, for instance, in the expulsion of urine and feces, and in parturition. The effort by which this preasure is made, we call straining, and it is often so forcible as to protrude some of the viscera from their natural situation in the cavity of the abdomen. The parts thus protruded form external tumors, and are called herniae or ruptures. Coughing, in which the abdominal muscles alone comprefs the viscera, and tend to diminish the cavity of the abdomen, produces, in a gradual manner, such protrusions.

The principal nutrient arteries of the parietes of the abdomen, are the lower intercostal, the lumbar, and circumflex arteries of the ilium, at the sides; the epigastric, and internal mammary arteries are distributed in front, and communicate by their minute branches with the former vessels. These arteries have corresponding veins. The nerves supplying the parietes of the abdomen arise from the lower dorsal and lumbar nerves, and their branches are distributed in a circular manner round that cavity. For an account of the large arteries, veins, nerves, and abornts, which are found at the back part of the abdomen, in their progress to supply the contained viscera, and also the pelvis and lower extremities, see Ramifications of Arteries, Veins, and Nerves, and Distribution of the Absorbing Vessels.

Abdomen, in Medicine. This part of the body is liable frequently to become the seat of several important and dangerous Diseases. Some of these are real affections of this cavity, while others, though commonly referred to it by the patient, more properly belong to the prime visæ, or the organs of generation and urine.

All these diseases, with the manner of treating them, will be found under some of the following heads or terms, viz.

1. Inflammations of the abdominal viscera, including Inflammation of the Diaphragm, see Diaphragmitis; of the Liver, Hepatitis; of the Stomach, Gastritis; of the Peritonëum, Peritonitis; of the Intestines or Mesenteries, Enteritis; of the Bladder, Cystitis; of the Kidneys, Nephritis; and of the Womb, &c. Hysteritis.

2. Painful or Spasmodic Affections, referred to the abdomen by the patients, and not attended by inflammation or fever, will be found under Cardialgia or Gastrodynia; pain in the region of the womb, under Enterodynia, Colic, Jaundice, Calculi, Scirrhus, Ulceria, Gout, and Worms.

3. Other Diseases of the Prime Visæ, or Intestines, will be included under Vomiting, Cholera, Diarrhoea, Lithenteria, and Dysenteria.

4. Dropsies of the abdomen will be treated of under Ascites, Hydrops curvis, and Tympanites.
ABDOMEN, Chirurgical Diseases and Operations of the. We do not here propose to treat at large of all the local disorders to which the belly is liable, but only to enumerate those of more frequent occurrence, and the operations necessary for their removal. They may be divided into internal and external. The latter affect the muscles and common integuments chiefly; the former are principally Gated by the abdominal viscera. Many diseases, however, are common both to the internal and external parts of the abdomen; as inflammation, suppuration, ulcers, hemorrages, tumors, and wounds of various kinds, &c. See each of these articles in their respective places.

The abdomen and its contents are subject to certain diseases, either of a peculiar nature or requiring peculiar treatment on account of their situation. When the external teguments, from being dilated or ruptured in any part, permit the bowels to force their way through them, an hernia is formed, which must be replaced in its natural position. See hernia. When an accumulation of fluid happens within the belly, to as to prove inconvenient or dangerous, the operation of tapping, technically named paracentesis, is required for its evacuation. See Dropsey. Sometimes the intestinal canal is prettichantly contracted, forming a stercorator; or is distended with flatums, which constitutes the tympanites; or is reflected within itself, forming the disease called intestusception. The liver often inflames and suppures, or becomes indurated and febrirous. The womb is liable to be ulcerated and cancerous, or may suffer during parturbation. See scirrhus and cancer. The glands of the menesterly will likewise inflame, suppurate, and enlarge to a great degree. Collections of pus may form upon the muscles of the joints; calciuni within the kidneys, or the urinary and gall-bladder; varicoe swellings and aneurism in the blood-veinlets, &c. &c. See Psosas or lumbar abscess, lithotomy, varicocele, and aneurism. Several chirurgical operations are also peculiar to the abdomen and its contents; for example, gastrectomy, gas- troscopy, lithotomy, and the casarean section.

All these several disorders and operations are particularly explained in other parts of this work, under their appropriate denominations, in which we therefore refer our readers.

ABDOMEN of Infants. See Insects.

ABDOMINAL Ring. In Anatomy, an aperture through which the peritoneal vessels pass in men, and the ligamentum rotundum uteri in women. It is formed by the tendinous fibres of the myctorus oblique externus abdominis, which are separated from each other near the os pubis. See obli-

ABDOMINALES, in the Linnaean System of Ichthyology, an order of fish, having the ventral fins placed behind the pectoral in the abdomen, and the branchia ossified, and comprehending sixteen genera, and one hundred and ninety-five species.

ABDUCENS labiorum. In Anatomy, a name given by Spigelius to a muscle, which he also calls the secundus ad latera trochan. This is thelevator anguli oris of Albinus, and the caunis elevator or levator laborum communis of others.

ABDUCENT. In Anatomy. See Abductor.

ABDUCTION. In Lora. See Forceful Abduction, kidnapping, and ravishment.

Abduction, in Logic, a kind of argumentation, by the Greeks called apagoge; wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the lesser extreme as not to require some farther medium or proof, to make it appear.

It is called aboduction, from ab, from, and ducere to draw; because from the conclusion, it draws us on to prove the proposition affirmed.

Thus, in the syllogism, "All whom God absolves are free of sin: but God absolves all who are in Christ: therefore, all who are in Christ are free of sin." The major is evident; but the minor, or affirmation, is not so, without some further proposition to prove it; as, "God received littu-"
the heel, and tendinous from the same bone, where it joins with the os naviculare; and is inserted tendinous into the internal os tarsomalleum and root of the first joint of the great toe. Its use is to pull the great toe from the road. This is the Tendon of Window.

Abductor medio digitii pedis, arises tendinous and flibly from the inside of the root of the metatarsal bone of the middle toe internally; and is inserted tendinous into the inside of the root of the first joint of the third toe. Its use is to pull the middle toe inwards.

Abductor tertii digitii pedis, arises tendinous and flibly from the inside and inferior part of the root of the metatarsal bone of the third toe, and is inserted tendinous into the inside of the root of the first joint of the third toe. Its use is to pull the third toe inwards.

The thigh has also strong and remarkable adductor muscles, which are interposed between the dorsum of the thigh and the trochanter of the femur; the form and bulk of which are visible in the external lineaments of the body. These muscles will be described under Gluteus medius et minimus.

Abductores, or abducens nervi, are names which have been given to the 6th pair of nerves, on account of their being distributed to the abductor muscles of the eye.

ADEC Flute. See Flute.

ABECEDARIAN. See Abecary.

Abeille, Gaspar, in Biography, was born at Riez, in Provence, in 1648. He was much admired at Paris, in early life, for the brilliancy of his wit. He obtained the confidence of Marshal Luxemburg, who appointed him as his secretary; and he was employed, by his lively and animated conversation, to the amusement of the prince of Conti and the duke de Vendome. A very ugly wrinkled countenance, susceptible of a variety of comic expressions, gave a zest to his bon-mots and stories, and enabled him to produce mirth on various occasions. Abeille enjoyed a priory, and a place in the French academy. He wrote some odes and epistles, several tragedies, one comedy, and two operas. A certain prince observed of his tragedy of Cato, that if Cato of Utica should return from the grave, he would be no more Cato than that of the Abbé Abeille. He was held in low estimation as a poet. He died at Paris, May the 24th, 1718. His brother, Scipio, who died in 1697, was also a poet. He has left a good history of the bones, published in 1653; and he also published, in 1699, a treatise, in 12mo, suitable to his office as surgeon-major, under the title of the "Complete Army Surgeon." Abeille, in Scripture History, the second son of Adam and Eve, born in the second year of the world. His history is comprised in a very narrow compass. He was a fliberd, and offered to God the furnishings of his flock, and his facrice was accepted; whilst that of Cain, his brother was rejected. This distinction exasperated Cain, so that he slew his brother. Although no religious respect is paid to his memory in the Greek churches, which have established feasts for every other patriarch and prophet, and his name does not occur in any one of the Roman martyrologies before the 10th century; he, as well as other saints, is made the object of worship in several Roman litanies, designed for persons at the point of death. Some calendars commemorate him on the 25th of March: others on the 2d of January; and others on the 26th of July. Among the Ethiopians he is honoured on the 28th of December. The poem, entitled "The Death of Abel," written in German by Gfener, and translated into various languages, has been much admired.

Abeil, Frederick Gottfried, M. D. the son of Caphar Abiel, the historian, was a fellow of the college of physicians, and member of the literary society at Halberstadt.

He was born July 5th, 1714, and after a classical education, became a student of theology in 1731, under Mofheim, and afterwards at Halle, under Wolff and Baumgarten, where he often preached with great applause. He declined the theological professor, and applied to medicine at Halle, and in 1744 was admitted to the degree of doctor at Konigsberg in Prussia. On his return to Halberstadt he practiced as a physician for half a century, and died Nov. 25, 1794. His poetical translation of Juvenal into German, was published in 1788. One of his sons, viz. John Abel, a physician of Dusseldorf, has distinguished himself as a writer. Gen. Biog.

Abeil, Charles Frederick, an eminent musical composer and performer, was a native of Germany, and a disciple of Sebastian Bach. He left Dresden to a destitute condition in 1751, and travelled through Germany, suppling his necessities by his talents, till at length he arrived in England in 1759, where he soon gained notice and recompense, both as a public performer, and as a private teacher. He had a salary of 200l. a year as chamber musician to his majesty, and his weekly concert, in conjunction with Bach, was liberally supported. He performed on several instruments; but he was chiefly attached to the violin da gamba. Dr. Burney, in the 4th volume of his History of Music, has given the following account of his composition and performance: "His compositions were easy and elegantly simple; for he used to say, 'I do not chuse to be always struggling with difficulties, and playing with all my might. I make my pieces difficult whenever I please, according to my disposition and that of my audience.' Yet, in nothing was he so superior to himself, and to other musicians, as in writing and playing an adagio: in which the most pleasing, yet learned modulation, the richest harmony, and the most elegant and polished melody, were all expressed with such feeling, taste, and science, that no musical production or performance, with which I was then acquainted, seemed to approach nearer perfection. The knowledge Abel had acquired in Germany, in every part of musical science, rendered him the umpire in all musical controversies, and caused him to be consulted in all difficult points. His concertos and other pieces were very popular, and frequently played on public occasions. The taste and science of Abel were rather greater than his invention, so that some of his later productions, compared with those of younger composers, appeared somewhat languid and monotonous. Yet be preferred a high reputation in the profession till his death." Abel was irascible in his temper, and apt to be overbearing. He loved his bottle; and by excess of drinking, when he was labouring under a fmitting of blood, he put an end to his complaint and to his life. He died in London, June 20, 1787.

Abeil-Keramim, or the Vineyards, in Geography, mentioned Judges, x.l., was, according to Enaebim, six miles from Philadelphia, otherwise Rabbath, the capital of the Ammonites. It was remarkable for its vines, whence the name; and it was probably the same with Abeila, between Jabez and Gadara, near Pella; and the Abeila, mentioned by Polybius, (Hist. lib. v. p. 414. cd. Calapha,) among other cities of Galatia. See Abilene.

Abeil-Melahab, the country of Elithia, 1 Kings, xix. 16, about sixteen miles south of Scythopolis according to Enaebim. Near this place Gideon obtained a victory over the Midianites. Judges, vii. 22.

Abeil-Mizraim, the mourning of the Egyptians in allusion to the lamentation for Jacob, called also the thrice-thrusting floor of Atad, Gen. I. ii. was thought by Jerome, and some others, to be the place afterwards called Beth a gla, at some distance from Jericho and Jordan westward.

Abeil-Shittim, or Abel-shittim, was situated in the plains of...
of Moab, opposite to Jericho, not far from Jordan. Here Moses encamped before the Israelites passed the Jordan under Joshua. Here also, seduced by Balak, they worshipped Baal-Peor, and were punished by the instrumentality of the Levites. Num. xxvi. 1. &c. xxviii. 40.

ABEL-TREE, or ABEL-TREE, in Botany, a species of Poplar, with large leaves. This tree may be propagated by layers or cuttings, and also by suckers. Many advantages might be derived from planting it in boggy fields, where few other trees will thrive. The wood of it is useful for flooring or rainproofing rooms; and it is preferred for turfery-wear to any other, on account of its peculiar whiteness. The quickness of its growth, inasmuch that it will yield shoots of eighteen or twenty feet long in a year, renders it eligible in plantations that are designed for shade or shelter.

ABELARD, Peter, an eminent scholastic philosopher of the 12th century. He was the son of Berenger, of noble descent, and born at Palais, near Nautes in Brittany, in the year 1079. At the age of 19 he had acquired, under Roffeline, the founder of the sect of the nominalists, a considerable acquaintance with metaphysics and logic; together with a subtlety of thought and a fluency of expression, which qualified him for the literary contests in which he was afterwards engaged. Ardent in the profession of fame, and of that kind of science, which then prevailed, he settled at Paris, in the 20th year of his age, and devoted himself to the study of dialectics under William de Champeaux, called the venerable doctor. The master and the pupil were for some time much attached to each other; but when the disciple preferred to contradict his teacher, and to enter into disputations with him, in which, according to the judgment of his fellow-students, he was victorious, the vanity of Abelard was inflamed, and the jealousy of Champeaux excited; and a separation became necessary. Thus flattened and encouraged, and polishing superior talents, both by nature and in consequence of sedulous application, Abelard, at the age of 22, determined to open a public school for himself; and the place which he selected was Melun, a town distant from Paris about ten leagues, where the court at that time often resided. Notwithstanding the competition and hostility of Champeaux, the young lecturer's school was thronged with auditors, who were highly gratified by his public performances. Further emboldened by this success, he approached nearer to Paris, and removed his school to Corbeil, where he had an opportunity of triumphing over his former master, and of compelling him to retire. His application and activity, however, impaired his health, and rendered it necessary for him to withdraw from the public scene of literary contest into his native country. After an absence of two years, he returned to Corbeil; where he renewed his lectures with much reputation, that the scholars of Champeaux deserted him; and where he obtained fresh triumphs over his envy and opposition. In the height of his victory was fo complete, that Champeaux, who had assumed the monastic habit among the regular canons in the convent of St. Victor, and who was afterwards preferred to the see of Châlons, was constrained to relinquish the control and to yield to the acknowledged superiority of his rival. Upon this Abelard quitted the school which he had established at the abbey of St. Genevieve, and directing his views to the study and profession of theology, removed to Laon, and placed himself under the tuition of Anselm. Here again the disciple, by the superiority of his talents and acquirements, excited the jealousy of this celebrated theologian; and after establishing his reputation by the lectures which he delivered, he was compelled to retire from Laon, and to remove to Paris. His lectures in this city, both in theology and philosophy, were attended by a great number of students, who resorted to his school, not only from various parts of France, but from Spain, Italy, Germany, Ponthiers, and Great Britain. At the age of forty Abelard sacrificed the reputation which he had acquired, as an able disputant and popular preceptor, to the love of pleasure, and disgraced himself by forming and executing a delusive plan for the seduction of female innocence. During his residence at Paris, where he was acquiring a fortune as well as renown, he boarded in the house of Fulbert, a canon of the cathedral church, who had a niece called Heloise, about the age of 18 years, and equally celebrated for her beauty and literary attainments. The avaricious canon, willing to have his niece instructed without expense, employed Abelard as her preceptor; but instead of improving her in the sciences, he betrayed his trust, taught her to love, and determined to seduce her. From this time Abelard became remiss in the performance of his public functions, and wrote nothing but amorous verses. The canon, deluded by his respect for the preceptor of his niece, remained ignorant of an amour, which became the subject of general conversation. In a little while, however, the pregnancy of Heloise discovered the culpable conduct of her lover, and roused the resentment of the infuriated uncle. She was soon removed to the house of Abelard's sister in Brittany, and there delivered of a son. When the child was born, Abelard made a proposal to Fulbert of privately marrying his niece, to which the canon consented. Heloise, however, hesitated in accepting the offer, partly from a regard to the honour of Abelard, whose profession bound him to celibacy, and partly from a romantic notion, that her passion ought not to submit to ordinary restraints. Abelard at last prevailed, and they were privately married at Paris; though it is said, that he protested to her uncle that she was not married, and that this was one cause of his unkind and severe treatment of her. Abelard made this a plea for removing her from his house to the abbey of Benedictine nuns, in which she had been educated. The uncle meditated revenge, and hired ruffians, who forced their way into his chamber by night, and inflicted on his person a disgraceful and cruel mutilation. Abelard resolved that, as Heloise could no longer be his, he should never be another's, and demanded from her a promise to devote herself to religion. She submitted to the felth and harsh injunction, and professed herself in the abbey of Argenteuil. On this occasion he exclaimed, in the words of Cornelia:

--- O maxime conjux! O thalamis indigae mea, hoc juris habebit
In tantum fortunae caput! cur impia nupisti,
Si miserum factura fuli, nunc accepis puenas,
Sed quos sponte lanum.

"Ah! my once great lord! Ah! cruel hour!
Is thy victorious head in fortune's pow'r?
Since miseries my baneful love pursues,
What did I weep thee, only to undo?
But seek to death my willing neck I bow;
Atone the angry gods by one kind blow."  
Rowe.

Soon after this event Abelard assumed the monastic habit in the abbey of St. Denis. His scholars in Paris, however, intrusted him to return to his school; and after some deliberation,...
beration and delay he resumed his lectures at a small village in the country, and regained his popularity. But his reputation excited envy and expostulated him to a variety of persecutions. About this time he published a treatise, intitled, "The Theology of Abelard," which was said to contain some heretical tenets concerning the Trinity. The work was condemned to be burnt, by a decree of the synod at Soissons, held in 1121, and Abelard was ordered to throw it into the flames. He was also required to read, as his own confession of faith, the Athanasian creed, and to be confined in the convent of St. Medard. His preachers became ashamed of their conduct, which occasioned general dissatisfaction; and Abelard was soon permitted to return to St. Denis. Here again he was persecuted by his enemies; and having ascertained, that the patron of the convent and of the French nation was not Dionysius the Areopagite, but another St. Dionysius, bishop of Athens, he accosted the bishop and the king, as a calumniator of the order and an enemy to his country. On this occasion he made his escape, and fled to the convent of St. Ayoul at Provins in Champagne, the prior of which was his intimate friend. Hence he soon retired to a retreat in the forest of Champagne, near Nogent upon the Sene, where, in 1125, he erected a small oratory, which he dedicated to the Trinity, and which was afterwards enlarged and consecrated to the third person, the Comforter of Paraclete. His pupils in this retreat numbered 650; but he was compelled to withdraw from this solitude, and, by the interceding of the duke of Brittany, he was elected superior of the monastery of St. Gildas, in the diocese of Vannes, where he remained for several years. The nuns of the convent of Argenteuil being dissatisfied about this time, Abelard invited Heloise, with her eight companions, to take possession of the Paraclete. Heloise accepted the invitation; was chosen abbess of the new institution that was established; and in 1127, the donation was confirmed by the king. Whilst Abelard refited at St. Gildas, the interesting correspondence occurred between him and Heloise, which is still extant; and he then wrote the memoirs of his life, which came down to the year 1134. The letters of Heloise in this correspondence abound with proofs of genius, learning, and talent, which might have grace a better age. Upon these letters Mr. Pope has formed his "Epistle from Eloisa to Abelard," a piece that has been highly celebrated for its poetical merit, but which deviates in many particulars from the genuine character and spirit of Heloise, and culpably violates moral propriety, as Mr. Berrington (Hist. Abelard, p. 240, &c.) has shewn in his judicious critique. Abelard was, in this situation, accosted by pope Innocent II. of noxious errors and malicious designs. His accuser, the Abbot of St. Thierry, was challenged by Abelard to make good his accusation in a public assembly; and upon delivering the heads of his accusation, Abelard, probably apprehending a popular tumult, rose up and exclaimed, "I appeal to Rome." The pope, in consequence of some person's intrigues, anticipated his arrival by pronouncing his opinions heretical, and sentencing him to perpetual silence and confinement. Abelard, in his way to Rome, called at Cluni, a monastery on the confines of Burgundy, where he was kindly received by Peter Maurice, the abbot; and here a reconciliation was effected between him and Bernard, abbot of Cluny, who had prejudiced the pope against him. Peter interposed with the pope in his favour, and obtained his pardon; and he was permitted to end his days in the monastery of Cluni. In this monastery, the eloquent philosopher was retired, studious and devout; and his lectures were renewed and heard with applause. But his health and spirits were too feeble to bear the exertions which this service required. Although he was removed to the pure air of the priory of St. Marcellus, near Charton, his debility and decay increased, and terminated his life in his 63d year, on the 21st of April 1142. His body was sent to Heloise to be interred in the convent of the Paraclete. Heloise survived her husband 21 years, a pattern of conjugal affection and monastic virtue. Of the character of Abelard, we shall join the following extract from Field's account of him in the General Biography, vol. 1. "The amours, which has given Abelard so much celebrity in the annals of gallantry, will certainly not entitle his name to a place in the tablet of moral merit; it will remain an eternal blot upon his memory. In Heloise, the criminality, though not obliterated, was palliated by youthful ardour and innocence; and extreme sensibility, romantic attachment, noble generosity, and disinterested invincible constancy, united to throw a veil over human frailty. In Abelard, every circumstance, instead of exciting, aggravated the offense. At forty, "the day of the blood is tame, and waits upon the judgment." It was not a juvenile indiscretion of which Abelard was guilty, but, according to his own confession, the seduction of innocence, deliberately planned, and refutedly executed. It was accompanied with breach of confidence, violation of duty, and degradation of character. Except in the grant of the Paraclete as an asylum to Heloise and her father, an uniform selfishness appears in Abelard's conduct of which admission he was not excusable; unless we transfer the blame from the man to the profession and reprobate that system of suiposition, which, by the unnatural injunction of clerical celibacy, has given birth to innumerable irregularities and enormities. Viewed apart from this disgraceful affair, Abelard appears with more advantage. His writings, indeed, will not give the reader a high idea of his genius or taste; but it cannot be questioned, that the man, who could foil the first masters of the age at the weapons of logic, could draw round him crowded and admiring auditories, and could collect scholars from different provinces and countries, wherever he chose to form a school, must have possessed extraordinary talents. He must be allowed the credit, not only of having made himself master of the philosophy and theology of the age, such as they were, but of having boldly advanced, beyond the time, into the region of new opinions. Had his love of truth been equal to his thirst of fame, and had his courage in adhering to his principles been equal to his ingenuity in defending them, his sufferings and persecutions might have excited more regret, and his title to honourable remembrance would have been better established. Upon the whole, of Abelard it may be said, perhaps, with truth be said, that he was too vain to be truly great, and too selfish to be eminently good, and that his character is rather adapted to excite admiration than to command respect." His principal works, written in Latin, are: "An Address to the Paraclete on the Study of the Scriptures," "Problems and Solutions," "Sermons on the Festivals," "A Treatise against Herefies," "An Exposition of the Lord's Prayer," "A Commentary on the Romans," "A System of Theology," and his letters to Heloise and to others. These, with some other pieces, were collected and edited from the MSS. of Amboise, in 140 to Paris, in 1616. Bayle. Moreri. Berrington's Hist. of the Lives of Abelard and Heloise. Gen. Biog.

ABELIANS, Abelines, or Abelites, in Ecclesiastical History, a sect in Africa, not far from Hippo, mentioned by St. Augustin, (Oper. tom. vi. p. 14.) and supposed to have commenced in the reign of Arcadius and terminated in that of Theodosius. Their differing tenet and practice were to marry, and yet live with their wives in a professed abstinence, without having any carnal commerce together.
together. 1 Cor. vii. 29. The learned have taken great
pains to ascertain the principle upon which they acted, and the
reason of their denomination, to very little purpose. But,
in effect, it is more than probable, they took their name
from Abel for no other reason, but because, like that pa-
trarch, they had no issue; not that he lived in continence
after marriage; but because he was killed before he had
married, or died without issue. In order to perpetuate the
Act, St. Aulphin informs us (ubi supra), that when a man
and woman entered into this society, they adopted a boy
and girl, who were to be their heirs, and to marry under
the same obligation of continence, and of adopting two
children of different sexes.

ABELCEA, in Betany, the name of a very tall tree,
growing principally in Crete, called also pantalus adulterina,
and psudofalbantum.

ABELL, John, in Biography, an English musician,
who belonged to the chapel of Charles II. and continued in it
to the revolution, when he was discharged, because he was a
papist. After many rambles on the continent, and singular
adventures, he returned to England; and, in 1701, published
a collection of fongs in several languages, which is dedi-
cated to king William. It is said that this artist polishing
the fpecies of furnishing the natural tone of his voice to ex-

ABELLA, in Ancient Geography, a municipal town of
Campania, near the river Clania, mentioned by Virgil, (lib.
vii. v. 740.) and by Silius (lib. viii. v. 544.) and inhabited,
according to Jullin, (lib. xx. cap. i.) by a colony of Chal-
cidians. The wex Asculana, or hazle-nut, takes its name,
according to Macrobeus, from this town. It is now a heap
of ruins, near the town and castle of Avella. The ancient
walls enclose a circuit of near three miles, and in the middle
are the fragments of an amphitheatre; the environs are
remarkable for the excellent quality of their fruit and honey.
Swinburne's Trav. vol. i. p. 162.

ABELLI, Lewis, in Biography, bishop and count of
Rhodes, was born in the Vexin Frangais, in 1603. Quitting
his episcopal foon after his promotion, he retired to St.
Lazare, where he died in 1691, at the age of 88 years. His
"Medulla Theologica," in 2 vols. 12mo. is a book which has
been often cited by Protestant divines against Dofinet, because it
supplied them with weapons against the catholic creed of making
converts. He wrote other books in Latin and French. Gen.
Duf.

ABELLINUM, in Ancient Geography, a town of the
Hirpini, a people of Apulia, near the river Sabbato,
both Benvenuto and Salernum. Pliny calls the inhabi-
ants Avelinates Protopi, in order to distinguish them from
the Avelinates Marthi. It is now Avellino. E. long. 15°
20'. N. lat. 21°

ABELMOLUCH, a species of the ricinus, or Palma
Chrifti.

ABELMOSCH, or ABELMUS, the milk feed; a
small odoriferous seed brought from Egypt, chiefly used in
perfumes. The bulb comes from Martinico. The plant
which produces it is the Hibiscus Abelmoschus of Linnaeus.

ABENAS, in Geography, a town in France, in Lan-
guedoc, and in the Lower Vivarais, situated on the river
Ardeche, at the foot of the Cevennes. E. long. 4° 43'.
N. lat. 43° 46'.

ABENDANA, Jacob, in Biography, a learned Spanish
Jew, prefect of a synagogue in London; known as the
author of a Spicilegium of explanations on sacred passages
of Scripture in Hebrew. Aml. 1675, fol. He died in 1 85.

ABENEL CAUBY, a fixed star of the second or third
magnitude, in the fourth scale of the constellation Libra.

ABENEZRA, Abraham, in Biography, a celebrated
Rabbi, born at Toledo, in Spain, and called by the Jews
the wife, great, and admirable doctor, was a very able
interpreter of the Holy Scriptures, and well skilled in gram-
mar, poetry, philosophy, astronomy, and medicine. He
was also a perfect master of the Arabic. His principal work
is "Commentaries on the Old Testament," which are much
elaborated, and printed in Bomberg's and Buxtorf's Hebrew
Bibles. His style is clear, elegant, concise, and much like
that of the Sacred Writings. He generally adheres to the
literal sense, and always manifests genius and judgment;
though his sentiments are sometimes erroneous. His "Elucid
Mora," which recommends the study of the Talmud, is the
most rare of all his writings. His Poem on the game of Chefs
was translated by Dr. Hyde. Many other theological, gram-
matical, mathematical, and astrological works of this author
remain in ancient libraries, and have not yet been edited.
He died at Rhodes in 1174, or 1190, aged 75. Macfcl.

ABEN-MELEK, a learned Rabbi, whose work, in-
titled, "The Perfection of Beauty," printed at Amsterdam,
1661, fol. in Hebrew, and translated into Latin in 166 and
in 8vo. is a Commentary on the Bible, in which he confines
himself to the explanation of the grammatical sense.

ABENOW, in Geography, a mountain of Snahia, thir-
teen miles from Triburg, remarkable as the source of the
Danube, and for giving name to a chain of mountains ex-
tending from the Rhine to the Neckar, and from the forest-
towns to the city of Thorshiem.

ABENRAD, a town of Denmark, in Skelwick, in a
territory of its own name. It is situated on a spacious bay
of the Baltic, surrounded by three high mountains, and has
been lately much improved. E. long. 9° 14'. N. lat. 56° 6'.

ABENSBERG, a small town in the circle of Bavaria,
on the river Abens, near the Danube. E. long. 11° 35'.
N. lat. 48° 46'.

ABER, in Natural History, the name given by Adanfon
to the Mystes panicus of Linnaeus, with a gibusus acu-
mated shell, 15 furrows, and a dentated margin. It is found
on the western shore of Africa.

ABERTARY. See CARDIGAN BAY.

ABERAVON, a small borough-town in Glamorgan-
shire, in Wales, governed by a portreeve. It is now an
inconsiderable village, situated at the mouth of the river Avon,
where its name; Aber, in the ancient Britsh, denoting such
a situation. W. long. 3° 48'. N. lat. 51° 35'.—The copper-
works established near this place have given it importance,
and increased its population.

At a small distance from this town is the charming feat of
Lord Vernon, at Briton ferry, where the Neath river, infus-
ing from the bold hills which enclofe its vale, passes be-
tween several majestic groves, and precipitates itself into the
sea.

ABERBROTICK, or ARBROATH, one of the Royal
Burghs of Scotland, situated in the county of Angus, about
forty miles N.N.E. of Edinburgh, at the discharge of the
river Brete into the sea. It is a small well built town,
and is gradually improving. Its manufactures confeit of
coarse brown linen, failcloth, and thread. Its export
trade consists of these articles, barley, and wheat; and its
import goes is wax and timber from the Baltic. Coals and
lime form its coaling trade. This port is very ancient, and
it is famous for the ruins of an abbey, founded by William
the Lion, in 1178, and dedicated to Thomas a Becket.
The monks were of the Tyronian order, and the lard ab-
bout was cardinal Beaton. This town has a chalybeate wa-
ter, containing iron difolved in fixed air, and used as a di-
urcic and corborative. W. long. 2° 25'. N. lat. 56° 36'.

ABERCONWAY. See CONWAY.

8 ABER.
ABERDEEN, a small town of Georgia, in America, on the Savannah river, about thirteen miles N.W. of Savannah.

ABERDEEN, Thomas, M.D. in Biography, was born at Forfar, in the county of Angus, in 1656, and educated at St. Andrew's and Leyden, in which latter place he took his degree in 1685. Upon his return, he renounced his religion at the request of James II. and was appointed one of the count-physicians. After the revolution he applied to the study of antiquities, and wrote the "Martial Achievements of Scotland," in 2 vols. fol. His Treatise on Wit is not much esteemed. He died at Edinburgh in 1726, aged 70. Biog. Dict.

ABERDEEN, David, in Biography, a Scotch physician, published, in 1684, a Treatise on the Venereal Disease, under the title, "Tuta et efficac Luis Venereus, faepe abique Mercurio, et temper abique Salvatione Mercuriali, curande Methodus," Svo. This was followed by another book on the same subject, in the year 1687. He also published, "De Pulfus Variations," an. 1685; and in the same year, "Ars explorandi medicus facultates Planatarum, ex folo fapere." His works, however, are of little value.

ABERDARON Bay, in Geography, is situated within the S.W. point of Caernarvon county in Wales, and N.E. from the English shire of Flint.

ABERDAVINE, in Ornithology, a name sometimes given to a species of Fringilla, more generally called Siskin. See Spinis.

ABERDEEN, in Geography, the name of two cities in Scotland, called the Old and New Town, situated on the German ocean. This is a place of great antiquity; as it appears that privileges were conferred upon it in the reign of Gregory, about the year 893; and a bithopric founded by Malcolm II. in 1004, at a place in Banffshire, was transferred to old Aberdeen by David I.; and, in 1163, a new charter was obtained from Malcolm IV. Another charter was granted by Alexander II. in 1217.

Old Aberdeen lies at the mouth of the river Don, over which is a fine Gothic bridge of a single arch, reeling upon two opposite rocks, which has been much admired, and which is said to have been built about the year 1290. The principal building in this town is the King's College, which is built round a court-square, with cloisters on the south side. This college was founded in 1494, and from the circumstance of King James IV. claiming the patronage of it, it derives its present name. This and the Marischal College in the new town form one university, called the University of King Charles. The library is large, but has not many curiosities. The first principal was Hector Botethus, who was sent hither from Paris on an annual salary of 40 Scots marks, at thirteen pence each.

The New Town is the capital of the shire of Aberdeen, and exceeds in extent, trade, and appearance, any town in the north of Scotland. It is situated about one mile from the old town, on a rising ground, in a small bay formed by the river Dee, deep enough for a ship of 200 tons, and about two miles in circumference. There is an elegant bridge over the river, consisting of seven arches, which is said to have been built by Dunbar, who was bishop about the year 1500. The chief public building is this town is the Marischal College, founded by George Keith, Earl Marischal, in 1594, and augmented since by many additional buildings. In this college there are about 150 students, who are instructed, as well as those of the king's college, by able professors. Besides two parish-churches, and the college-kirk, there is an elegant episcopal chapel, with several meeting-houses. The other public buildings are a handsome town house, a grammar-school, Gordon's hospital, and an infirmary. The harbour is defended by a strong stone pier, lately erected under the direction of Mr. Simson. The trade of Aberdeen is now considerable, and capable of improvement by an attention to the white fisheries. Its imports are from the Baltic, and a few merchants trade to the West Indies and North America. Its exports are flockings, thread, fustian, cotton, and pickled pork. The two first articles are very important branches of manufacture in this town and neighbourhood. The salmon fisheries on the Dee and Don, and particularly those of the Dee, are very productive; and Mr. Knox observes, that if the merchants would, in addition to the fish supplied by thee, export the cargoes of 50 or 60 vessels, constantly employed in the herring and white fisheries, the port of Aberdeen would in a few years become the most celebrated mart of fish now existing. The number of inhabitants in Old and New Aberdeen is estimated at 25,000. There are two springs near this town, one of pure water, and another of a quality resembling the German Spa. Aberdeen, with Aberbrothick, Brechin, Montrose, and Inverness, returns one member to parliament. Aberdeen is 84 miles N.E. of Edinburgh. W. long. 2° 8'. N. lat. 53° 9'.

ABERDEENSHEIRE, a county of Scotland, which comprises the districts of Mar, Garloch, Strathbogie, and the greater part of Buchan. It is washed on the east and north by the German ocean, and abounds in sea-ports, which are convenient for commerce. The rivers are numerous, and the banks exhibit many natural woods and extensive plantations. In the high parts there is much excellent pasture, and in the level tracts, called Strathbogies, there are many well cultivated fields. This county sends one member to parliament.

ABERDOVEY, a small sea-port in Merionethshire, at the discharging of the river Dovey into the bay of Cardigan. Its export trade, which is not considerable, consists of flannels, Welch webs, oak bark, and other productions of the vale of Dovey.

ABERDOUR, a small town in Fifeshire, in Scotland, on the Frith of Forth, about ten miles N.W. of Edinburgh.

ABEREMURDER, in Ancient Local Books, denotes murder that has been proved, or made manifest by a judicial proceeding.

The word is Anglo-Saxon, compounded of eber, proved or clear, and morth, killing or homicide.

In this sense, aberemurder, called also abermurder, amounts to the fame word probatum murdrum, or murder which needed proof; and stands opposed to open murder, which was murder sufficiently known by the notoriety of the fact.

Lambard explains aberemurder by manifestum murdrum; and Spelman, by eadem manifesta; others, by apertum murdrum. Aberemurder was one of those crimes which could not be expiated by money, as most others might be.

ABERFORD, in Geography, a market-town in the west riding of Yorkshire, 184 miles N.N.W. of London. W. long. 1° 21'. N. lat. 53° 30'.

ABERFRAW, a village in the isle of Anglesey, where the princes of North Wales had formerly a palace. W. long. 4° 36'. N. lat. 53° 53'.

ABERCAVENNY, an irregularly built town of Monmouthshire, beautifully situated in the midst of a range of meadows, at the confluence of the rivers Usk and Gavenny, and surrounded by several projecting hills. It contains about 500 houses. Its public buildings consist chiefly of a long Gothic bridge, the imperfect fragments of a castle, and an ancient church adjoining to the priory. It is a place of re-
Aberavonny seems to have been the Gillianium of Antonius, and Usk his Eurinum. At the distanc of a few miles from this town are the ruins of Llanitony Abbey, situated in one of the deepest recesses of the black mountains, founded on the site of a chapel, supposed to be the residence of St. David, the tutelary saint of Wales. It was rebuilt, and the monastery formed for Augustine monks by Sir Will. de Lacy, in 1108.

DABERMAI, a passage at the S. W. end of the Mem- nai istmus, separating Carnarvonshire from Anglesea.

ABERNETHY, a town in Strachens, a district of Perthshire, in Scotland. It is situated on the river Tay, and said to have been the residence of the Pieth kings, and the site of an archbishop, since transferred to St. Andrew's. It is now much decayed.

ABERNETHY, John, in Biography, an eminent presby- terian divine, was born at Coleraine, in Londonderry, on the 15th of October 1680. His father was a dissenting minister in that town. After continuing under the care of his parents for nine years, he was separated from them by a concurrence of circumstances, which in the event proved favourable. His father had business in London, and his mother removed to Derry. Their son accompanied a relation to Scotland, who removed thither to avoid the troubles occasioned by the insurrection in Ireland; and he thus escaped the danger attending the siege of Derry, in which Mrs. Abernethy lost all her other children. At the early age of thirteen he was sent to the college at Glasgow, where he remained till he had taken the degree of Master of Arts. In conformity to the advice of his friends, he declined the profecution of phy- sic, to which his views were at first directed, and devoted himself to the study of divinity under Prof.or Campbell at Edinburgh. Such was his success in the prosecution of this object, that he was licenced to preach by the Prebendary of Route before he was twenty-one years of age. In 1703, after having been for some years at Dublin with a view to farther improvement, he was ordained at Antrim; where his public performances were much admired, and where his general conduct and distinguished attainments recommended him to the effeem of all who knew him. He was much re- spected not only by his brethren in the ministry, but by many of the laity, who were pleased with the vivacity of his disputation, and the urbanity of his manners. His talents and virtues gave him a considerable ascendency in the Synod, so that he had a large share in the management of public affairs. As a speaker, he was considered as their chief ornament; and he maintained his character in these respects, and his interest in their esteem, to the last, when a change of his religious sentiments had excited the opposition of many violent antagonists. In 1716 he attempted to remove the prejudices of the native Irish in the neighbourhood of Antrim, who were not of the popish perfu- sion, and to engage them to embrace the protestant religion. His labours in this laudable design were not without suecess. Several of them were induced to renounce popery, and continued firm in their attachment to protestant principles; though others, to his great discouragement, reverted to their former persuasion. In the following year he received two invitations, one from Dublin, and another from Belfast; and the Synod, whose authority was very great, advised his removal to Dublin. Such, however, was his attachment to his congregation at Antrim, that he determined to continue there, at the risk of incurring the displeasure of the Synod. The interference of this assembly was repugnant to those sentiments of religious freedom which Mr. Abernethy had been led to entertain, by the exercise of his own vigorous faculties, and by an attention to the Bangorian controversy, which prevailed in England about this time. Many other ministers in the north of Ireland formed more enlarged ideas of Chriftian liberty and charity than they had been accustomed to do, by means of the writings of Dr. Headly and his associates. With a view to the improvement of useful knowledge, they instituted a society, whose profeced aim was to bring things to the test of reason and scripture. This laud- able design was probably suggested by Mr. Abernethy. However he was very active in promoting it. As the gentle- men who concurred in this scheme met at Belfast, the society derived its appellation from the place in which they assembled. In the progress of this business, and in confe- quence of the debates and difcussions that were occa- sioned by it, several persons withdrew from the society; and those who adhered to it were distinguished by the title of non-sub- scribers. Their avowed principles were these:—"First, That our Lord Jesus Christ hath in the New Testament determined and fixed the terms of communion in his church; that all Christians who comply with these have a right to communicate and that no man, or set of men, have power to add any other terms to those settled in the gospel. Secondly, That it is not necessary, or advisable, or wise, to set up rules of foundeins in the faith, that candidates for the ministry should subscribe the Westminster Confession, or any unmis- timed form of articles, or confession of faith, as the term upon which they shall be admitted; and that no church has a right to impose such a subscription upon them. Thirdly, That to call upon men to make declarations concerning their faith, upon the penalty of cutting them off from communion, if they should refuse it, and this merely upon suspicion and jealousies, while the persons required to purge themselves by such declarations, cannot be fairly convicted upon evidence of any error or hes- rify, is to exercise an exorbitant and arbitrary power, and is really an inquisition." Mr. Abernethy was justly con- sidered as the head of the non-subscribers, and he became of course a principal object of reproach and persecution. In an early period of this controversy, viz. in 1719, he published a sermon from Romans, xiv. 5, in which he explained the rights of private judgment, and the foundations of Chris- tian liberty. He afterwards published a small piece, inti- tled, "Seafonable Advice to the contending Parties in the North," which was accompanied with a Preface by the Reverend Meifters. W. l'd, Boyfe, and Chappin, of Dublin. The design of this publication was to prove, that there ought to be no breach of communion among the Protestant Dillenters on account of their different sentiments and prac- tices concerning subscription to the Westminster Confeffion. The Synod, however, determined, in 1726, that the non- subscribers should no longer be of their body, and revived, with additional force, the act of 1705, requiring the candi-dates for the ministry to subscribe the Westminster Confeffion. From that time the excluded members formed them- selves into a separate Prebendary, and prepared to encounter many difficulties and hardships. Mr. Abernethy fought that his justly acquired reputation, which he had uniformly main- tained by a most exemplary life, was no security to him against these evils. Some of his congregation deserted him, and under the influence of the Synod formed themselves into a distinct society; and though most of his old friends ad- hered to him, he thought it most advisable to accept an invitation which he received from the congregation of Wood- street, in Dublin; and accordingly he removed thither in 1732. At Dublin he prosecuted his studies with renewed diligence; and deviated from a practice which he had pur- sued in the north, by writing his sermons at full length, and constantly using his notes in the pulpit. The dilenters in
ABERRATION.

Ireland being at this time defrons of emancipating themselves from the incapacities devolved upon them by the Titl Act, Mr. Abernethy, in 1731, wrote a paper, in subterfiveness to this design, with a view of shewing the uncalculable bene and injustice of all those laws, which, upon account of mere difference in religious opinions and forms of worship, excluded men of integrity and ability from serving their country, and debarked them of those privileges and advan-
tages to which they had a natural and just title as free-born subjects. He particularly insisted that, considering the date of Ireland, it was a great error, in point of policy, to con-
tinue restraints which weakened the protestant interest, and were prejudicial to the government. In 1733, the Irish dif-
ficenti made an attempt for obtaining the repeal of the ob-
nxious Act, and Mr. Abernethy again appeared from the pre-
s in favour of the scheme; but the design miscarried. He
continued his labours in Wood-lreet for ten years, and en-
joyed great satisfaction in the society and esteem of his
friends. From the strength of his constitution, the vi-
gour of his spirit, and the uniform temperance of his life,
time was reason to hope, that his usefulness would have
been prolonged. But a sudden attack of the gout in the
head, to which disorder he had been subject, frustrated the
expectations of his friends, and he died, December, 1749,
in the 60th year of his age. For this event he was fully
prepared, and he met it with great composure and firmness of
mind, with a cheerful acquiescence in the will, and a fixed
truth in the power and goodness of the Almighty. Mr.
Abernethy was twice married; first, soon after his settlement
at Antrim, to a lady of excellent character, of whom he was
deprieved in 1712; and again, after his removal to Dublin,
to another lady, with whom he lived, in all the tenderness
of conjugal affection, to his death. The most celebrated
of Mr. Abernethy's writings were his two volumes of Dis-
courses on the Divine Attribures, which were much ad-
mirèd at the time of their publication, and honourably re-
commanded by the late excellent archbishop Herring; and which
are still held in the highest esteem by those who are disposed
to approve the most liberal or manly sentiments on the great sub-
jects of natural religion. Four volumes of posthumous Ser-
mons were likewise published, the two first in 1748, and the
others in 1757; to which is prefixed the Life of the Author, written, as is generally understood, by Dr. Duchal. A volume, intitled, "Scarcé and valuable Tracts and Sermons, &c." was published in 1751. He also left
behind him a Diary of his life, consisting of six large volumes in 4to, of which the author of his life has given a
large account, and from which he has made many valu-
able extracts, which bear ample testimony to the singular

ABERRATION, in Astronomy, an apparent motion in the
cellular bodies, occasioned by the progressive motion
of light, and the earth's annual motion in its orbit: the
theory of which is explained by Dr. Bradley: for an account of
which, see LIGHT and STAR.

This theory may be illustrated and applied in the follow-
ing manner. If light be supposed to have a progressive
motion, the position of the telescope, through which any cele-
drial object is viewed, must be different from that which it
would have been, if light had been intangible; and there-
fore the place measured in the heavens will be different from
the true place. Thus, if S be a fixed star (Astronomy,
plate 1. fig. 2.), VF the direction of the earth's motion, S'F
the direction of a particle of light, entering the axis ac of a
telecope at a, and moving through dF whilst the earth
moves fr. m. e to F, and if the telescope be kept parallel to
itself, the light will defend in the axis. For, let the axis
nm, FsW, continue parallel to sa; and if each motion be
considered as uniform, that of the spheator, occasioned
by the earth's rotation, being disregarded, because it is so small
as to produce no effect, the spaces described in the same
time will preserve the same proportion; but xF and xF being
described in the same time, and as we have Fs : Fs : en to av,
and en and av will be described in the same time; and therefore
when the telescope is in the situation nm, the particle of
light will be at s in the telescope; and the case being the
same in every moment of its defcent, the place measured
by the telescope at F is s' and the angle S'F is the aberra-
tion, or the difference between the true place of the star, and
the place measured by the instrument. Hence it appears, that
if we take FS : Fs : the velocity of light : the velocity
of the earth, join Sf and complete the parallelogram FSFS,
the aberration will be equal to FSF, S will be the true place
of the star, and s the place measured by the instrument: and
this latter is the same with the apparent place of the object, as
it would be seen by the naked eye. In order to prove this, let
it be considered, that if a particle of light fall upon the eye
in motion, its relative motion with regard to the eye will be
the same as if equal motions, in the same direction, were
impressed upon each at the moment of contact; for it is well
known to be a principle in mechanics, that equal motions
in the same direction, impressed upon two bodies, will not affect
their relative motions, and consequently the effect of one upon
the other will not be altered. Let VF then be a tangent to
the earth's orbit at F, and represent the direction of the
earth's motion at F, and S' a star; join SF, and produce it to
G, and take FG : Fn : the velocity of light : the velocity
of the earth in its orbit; complete the parallelogram FGH, and
draw the diagonal FH. Since FG and FN represent the
motions of light and of the earth, if we conceive a motion
FN equal and opposite to NF, to be impressed upon the eye
at F, and upon the particle of light, then the eye will be at
F, and the particle of light, by two motions FG and FN,
will describe the diagonal FH, which is its relative motion
with respect to the eye itself. Hence it follows, that the
object appears in the direction HF, and consequently that
its apparent place differs from its true place by the angle
GFH = FSF.

But by trigonometry, fine FSF : fin. FSF : : Fr : Fs : the
velocity of the earth : the velocity of light, and therefore
the sine of aberration = fin. FSF x vel. of earth
and if these
velocities be considered as constant, the sine of aberration,
or the aberration itself, which never exceeds 20'', varies as the
sine of FSF, and is therefore greatest when FSF is a right
angle. Let s then express the fine of FSF, and we shall have
1 (radius) : 1 : : 20'' : s x 20'', the aberration. Hence
when Fr coincides with FSF, or the earth is moving directly
to or from a star, there is no aberration. And since FSF =
20'' when FSF = 90'', we shall have the velocity of the
It appears that the aberration S' lies from the true place of
a star in a direction parallel to that of the earth's motion,
and towards the same part.

M. de Maupertuis, in his Elements of Geography, familiarly explains the aberration by the direction in which a gun
must be pointed in order to shoot a bird in its flight. In-
stead of pointing directly to the bird, the bowler directs the
gun a little before it in the path of its flight; and so much
the more as the flight of the bird is more rapid with respect
to that of the shot. M. Clairaut too, in the Mem. of the
Acad. Science, for 1746, explains the aberration by suppos-
ing drops of rain to fall quickly and rapidly after each other
from a cloud, under which a person moves with a very nar-
row
row tube; in which case it is evident that the tube must have a certain inclination, in order to admit a drop which enters at the top, to fall freely through the axis of the tube, without touching the sides of it: and this inclination must be greater or less according to the velocity of the drops in respect to that of the tube. In this case the angle made by the direction of the tube, and that of the falling drops, is the aberration arising from the combination of these two motions.

To find the aberration in latitude and longitude. Let $ABCD$ (Astron. pl. i. fig. 2.) be the earth's orbit, supposed to be a circle, with the fun in the centre at $S$, let $P$ be in a line drawn from $x$ perpendicular to $ABCD$, and represent the pole of the ecliptic; let $S$ be the true place of the sun, and $A$ the circle of aberration parallel to the ecliptic, and $abcd$ the ellipse into which it is projected; let $q$ be an arc of the ecliptic, and $PSG$ a secondary to it, which will coincide with the lesser axis $bd$, into which the diameter $pg$ is projected; draw $GCxA$, which is parallel to $pg$, and $BxD$ perpendicular to it to be parallel to the greater axis $ac$: then, when the earth is at $A$, the sun is in conjunction, and in opposition when the earth is at $C$.

But as the place of the sun in the circle of aberration is always $90^\circ$ before the earth in its orbit, when the earth is at $A$, $B$, $C$, $D$, the apparent places of the sun in the circle will be at $a$, $b$, $c$, $d$: and to find the place of the sun in the circle, when the earth is at any point $E$, take the angle $PS = EXB$, and $r$ will be the corresponding place of the sun in the circle; and to find the projected place in the ellipse, draw $v$ perpendicular to $Sv$, and $w$ perpendicular to $Sw$ in the plane of the ellipse, and $t$ will be the apparent place of the sun in the ellipse; join $s$ and $t$, and $st$ will be perpendicular to $wv$, because the projection of the circle into the ellipse is in lines perpendicular to the ellipse; draw the secondary $PSK$, which will, as to be seen, coincide with $vt$, unless the sun is very near to the pole of the ecliptic. Now as $svS$ is parallel to the ecliptic, $S$ and $v$ must have the same latitude; hence $w$ is the aberration in latitude; and as $G$ is the true, and $K$ the apparent place of the sun in the ecliptic, $GK$ is the aberration in longitude. To find these, put $m$ and $n$ for the sine and cosine of the angle $PSv$, or $EXB$, the distance of the earth from the sun, radius being 1; and as the angle $svw$ is the complement of the sun's latitude, the angle $svw = svt$ the sun's latitude, for the sine and cosine of which put $v$ and $w$, and put $r = Sv$, or $Sv$: then in the right angled triangle $Svr, 1 : m : r : sv = rm$; and therefore in the triangle $svw, 1 : v : rm : tw = rm$, the aberration in latitude. Also in the triangle $Svr, 1 : n : r : vs = rn$; hence $w : 1 : n : GK = rm$, the aberration in longitude. When the earth is in conjunction, $m = a$, therefore there is no aberration in latitude; and as $n$ is then greatest, there is the greatest aberration in longitude. If the earth be at $A$, or the sun in conjunction, the apparent place of the sun is at $a$, and reduced to the eclipse at $H$; therefore $GH$ is the aberration, which diminishes the longitude of the sun, the order of the signs being $\varphi$ $GT$. In this case the angle $AHE$ described by the earth from conjunction, or the angle $aSx$, shows the elongation of the sun from the fun. But when the earth is at $C$, or the sun in opposition, the apparent place $e$ reduced to the ecliptic is at $F$, and the aberration $GF$ increases the longitude: hence the longitude is the greatest when the sun is in opposition, and least when in conjunction. When the earth is in quadratures at $D$ or $B$, then $n = e$, and $m$ is greatest, therefore there is no aberration in longitude, but the greatest in latitude; when the earth is at $D$, the apparent place of the sun is at $d$, and the latitude is there increased; but when the earth is at $B$, the apparent place of the sun is at $b$, and the latitude is diminished; hence the latitude is least in the quadratures before opposition, and greatest in quadratures after opposition. From the mean of a great number of observations, Dr. Bradley determined the value of $r$ to be $20^\circ$.

From the principles above stated and explained it appears, that the greatest aberration in latitude is equal to $20^\circ$ multiplied by the sine of the sun's latitude; and that the aberration in longitude for any time is equal to $20^\circ$ multiplied by the sine of the sun's latitude, and multiplied also by the sine of the elongation found for the same time. The aberration is subtractive before the opposition, and additive after it. The greatest aberration in longitude is equal to $20^\circ$ divided by the cosine of its latitude; and the aberration for any time is equal to $20^\circ$ multiplied by the cosine of the elongation of the sun, and divided by the cosine of its latitude. This aberration is subtractive in the first and last quadrant of the argument, or of the difference between the longitudes of the sun and fun, and additive in the second and third quadrants. The application of these rules will be seen in the following examples:

1. To find the greatest aberration of $15^\circ$ Ursae minoris, whose latitude is $75^\circ 13'$. Here $m = 1$, $n = .9669$ the fin. $75^\circ 13'$; consequently $20^\circ \times .9669 = 19.34^\circ$ the greatest aberration in latitude. Also, $n = 1$, $u = .2551$; and 

$$20^\circ \times .2551 = 78.4^\circ$$ the greatest aberration in longitude.

2. To find the aberration of the same sun, when the earth is $30^\circ$ from conjunction. Here $m = .5$, and therefore $10^\circ, 34 \times .5 = 9.67^\circ$ the aberration in latitude. If the earth be $30^\circ$ beyond conjunction or before opposition, the latitude is diminished; but if it be $30^\circ$ after opposition or before conjunction, the latitude is increased. Also, $n = .866$; consequently $78.4^\circ \times .866 = 67.89^\circ$ the aberration in longitude. If the earth be $30^\circ$ from conjunction, the latitude is diminished; but if it be $30^\circ$ from opposition, it is increased.

3. For the sun, $m = a$, $n = 1$, and $u = 1$: hence it has no aberration in latitude, and the aberration in longitude $r = 20^\circ$ constantly; and this quantity of aberration answers to the sun's mean motion in $8^\circ 7^\circ 30'$, which is therefore the time which the light takes to move from the sun to us at its mean distance. Hence the fun always appears $20^\circ$ more backward than its true place.—The following table will expedit the calculations:

To find the aberration in longitude, multiply the quantities taken from this table by the fine of the star’s latitude.

Ex. Let the longitude of the sun be 7° 5° 18′, the long. of a star 5° 18′ 14′, and its latitude 3° 10′.

1° 7′ 4″ — 1° 7′ 4″ = 30′ 10 Sec. — 1.189

Aberration in longitude —15. 92 Product.

Aberration in latitude —75. 5 Product.

To find the aberration in declination and right ascension, Dr. Bradley has annexed to his theory the rules of formulae for this purpose; and these rules have been variously de...
ABERRATION.

Use of the Tables.

\[ A = \text{the right ascension of the star}, \]
\[ D = \text{the declination}, \]
\[ S = \text{the longitude of the sun}, \]

Enter Table I. with the argument \( A - S \) and Table II. with \( A + S \), and the sum of the two corresponding numbers multiplied by the secant of \( D \) will be the aberration in Right Ascension.

Enter Table I. with the argument \( A - S + 3 \) signs, and Table II. with \( A + S + 3 \) signs, and the sum of the two corresponding numbers multiplied by the sine of \( D \) will be the first part of the aberration in declination.

Enter Table III. with the arguments \( S + D \) and \( S - D \), and you will have two other parts of the aberration in declination; and the sum of these three parts will give the whole aberration in declination.

If the declination of the star is south, add six signs to \( S + D \) and \( S - D \).

Ex. To find the aberration of a star, on May 10, 1795, at 12 o'clock in the evening:

\[ A = 10^h\, 34^m\, 12^s, \]
\[ D = 20^\circ\, 30' \]

\[ A - S = 8^\circ\, 5' \]
\[ A + S = 11^\circ\, 15' \]

Table I.

Aberration in Declination

The aberration of a star applied to its apparent place gives the true place. On the subject of this article, see Dr. Malteblyne's rules for finding the aberration of a star, and Vince's Alcotron, vol. i. chap. 23. p. 311-330.

Aberration of a Planet, in Astronomy, is its geocentric motion, or the space through which it appears to move as seen from the earth, during the time of light's passing from the planet to the earth. Let \( S \) (Astron. pl. i. fig. 2) be the fun, \( T \) the earth, \( P \) the corresponding place of the planet, and let the earth be supped to move in the direction \( T \), parallel to which draw \( PQ \), and let it be equal to the space through which the earth has moved, whilst light paffes from \( P \) to \( T \), and \( Q \) will be the apparent place of the planet. If \( PP \) represent the motion of the planet in the same time, \( Q \) being the apparent, and \( P \) the corresponding true place, the angle \( QTP \) will be the aberration arising from the progressive motion of light and the motion of the planet. Since \( PQ \) and \( PP \) represent the motions of the earth and planet, \( P \) will represent their relative motions; and hence the motion of the planet about the earth in the time which light takes to pass from the planet to the earth, is the aberration. With respect to the fun, the aberration in longitude is constantly 20', that being the space moved through by the fun, or by the earth, in the time of 8° 7' 5", which is the time in which light paffes from the fun to the earth. In like manner, if we know the distance of any planet from the earth, we shall obtain its aberration. For let \( ST = r \), \( PT = d \), and \( m \) is the angle described by the planet about the earth, or its geocentric motion, in latitude, longitude, right ascension or declination, in 24 hours: then \( r + d = 8° 7' 5'', \) the time in which light moves from \( P \) to \( T \); consequently \( 24 \times 8° 7' 5" = m \) : the aberration = \( 8° 7' 5" \).

This by taking the geocentric motion from the Nautical Almanac, and eliminating the diurnal, in doing which no great accuracy is required, we shall find the aberration of a planet in latitude, longitude, right ascension or declination. When \( m = 0^\circ \), or the planet is stationary, the aberration is evidently equal to nothing.

Ex. 1. On May 1, 1791, at noon, What is the aberration in longitude of Mars? Here \( ST = 1, 5237 \) the mean distance, the longitude of the sun is \( 11^\circ 11' \), and the geocentric longitude of Mars \( 0^\circ 20^\prime \); and therefore the angle \( PTS = 11^\circ 41' \), and consequently \( PT = 2.98 \) \( d \), and \( m = 44^\prime \, 50'' = 0.0564 \) \( d \) in the Nautical Almanac; hence \( 0.0564 \times 24 \times 8° 7' 5" \) the aberration in longitude.

Ex. 2. For the Moon, \( d = 0.00253 \) the mean distance, \( m = 13^\circ\, 10'\, 35'' = 47° 43' 5" \) the mean diurnal motion: hence \( 0.00253 \times 47° 43' 5" \) the aberration, which is so small that it may be neglected.

It is evident that the aberration will be greatest in the longitude, and very small in latitude, because the planets deviate very little from the plane of the ecliptic, so that this aberration is almost insensible and disregarded: the greatest is in Mercury being only about 40" and much less in the other planets. As to the aberrations in declination and right ascension, they must depend upon the situation of the planet in the zodiac. The aberration in longitude, being equal to the geocentric motion, will be greater or less according to this motion. It will be greatest in the fixed stars, the sun, Jupiter, Saturn, &c. when they are in opposition to the fun, but in the inferior planets Venus and Mercury, the aberration is greatest at the time of their superior conjunction. These maxima of aberration for the several planets, when their distance from the fun is least, are as follows, viz. Georgian or Herchell 25"; Saturn 27°, Jupiter 26°, Mars 3°, Venus 4° 5', Mercury 5° 5', and the Moon 3°. Between these numbers and nothing the aberrations in longitude vary according to the situation of the planets. That of the Sun, however, is invariable, being constantly 20°; and this may alter his declination by a quantity which varies from 3° to 9", being the greatest, or 8°, about the equinoxes, and vanishing in the solstices. The methods and formulae of computation are given by M. Clairaut in the Mem. Acad. Sc. for 1746, and by Mr. Euler in the Berlin Mem, vol. ii. for 1746. M. de la Lande has calculated a table showing the aberrations of the planets at various degrees of elongation from the fun, by means of which the apparent place may be determined from the true place. When the planet is stationary, there is no aberration; when its motion is direct, the aberration is negative, and when retrograde, positive. This table is published by Mr. Vince. It has been already stated, that the
The aberration is \( \approx 0.00564 \, dm \), if the earth’s distance be suppos’d 1; and if this distance be represented by 10, the aberration will be \( \approx 0.000564 \, dm \), upon which supposition the following table was constructed. If the distance be greater than 10, e.g. 37, find the value for 10, multiply it by 3, and add to the product the value for 7.

Suppose the distance of a comet to be 43, and its apparent motion in 24 hours to be 2° 15' in longitude, and it be required to find the aberration in longitude. If we enter the table with the distance 10 and daily motion 2° 15', we thus get 45.68°, which multiplied by 4, gives 182.72°, and by entering with the distance 3, we obtain 13.7°; and therefore the aberration is 196.4°.

For reducing the place of the body computed from the table, to the apparent place, add the aberration, if the latitude, longitude, right ascension, or declination of the body decrease, but subtract, if it increase; and the contrary, to reduce the apparent to the true place. See Vincen’s Astronomia, vol. 1. p. 332—338. See remarks on the effects of aberration on the transit of Venus over the sun by Dr. Price in Phil. Trans. vol. ix. art. 47. p. 536.

### Aberration

**ABERRATION.** In Medicine, signifies a deviation from the ordinary course of nature.

**Aberration, in Optics,** is used to denote that error or deviation of the rays of light when refracted by a lens or speculum, whereby they are hindered from meeting or uniting in the same point, called the **geometrical focus.** It is either lateral or longitudinal. The lateral aberration is measured by a perpendicular to the axis of the speculum, produced from the focus, to meet the reflected or refracted ray: the longitudinal aberration is the distance of the focus from the point in which the same ray intersects the axis. If the focal distance of any lenses be given, their apertures be small, and the incident rays homogenous and parallel, the longitudinal aberrations will be as the squares, and the lateral aberrations as the cubes of the linear apertures.

There are two species of aberration, distinguished by their different causes: one arising from the figure of the glass or speculum; the other from the unequal refrangibility of the rays of light. The second species of aberration is sometimes called the Newtonian, from its having been discovered by Sir I. Newton. With regard to the former species of aberration we may observe, that if rays proceed from a point at a given distance, they will be reflected into the other focus of an ellipse when the luminous point is in one focus, or directly from the other focus of a hyperbola; and if the luminous point be indefinitely distant, so that the rays are parallel, they will be reflected by a parabola into its focus: but in both cases they will be diffused by leaves of other figures. Spectra of the former kind are made with difficulty; and therefore curved specula are commonly of a spherical figure, which have no accurate geometrical focus. Let BVE (Optics Pl. i. fig. 1.) represent a concave spherical speculum, whose centre is C; and let AB, EF be two incident rays parallel to the axis CV. As the angle of refraction is equal to the angle of incidence, if CB and CF be drawn to the points of incidence, and the lines BD and FG be drawn so as to make the angles CBD and CFG respectively equal to CBA and CFE, BD and FG will be the reflected rays, and D and G the points in which they meet the axis. Because the triangles CBD and CFG are isosceles, the angles at the base being equal, the fides CD, DB, and CG, GF, are respectively equal, and therefore the points of coincidence with the axis are equally distant from the point of incidence and the centre. Hence it appears, that if B be indefinitely near the vertex V, D will be in the middle of the radius CV; and the nearer the incident rays are to the axis, so much the nearer will the reflected ray be to the middle of the radius, and vice versa. So that the aberration of any incident ray increases, as it is farther removed from the axis, till the distance VI become 60 degrees, in which case the reflected ray is equal to the radius, its point of interference coincides with the vertex, and the aberration is equal to the radius. This illustration shews us why specula are made of very small segments of spheres, viz. that all their reflected rays may intersect the axis near the middle point of the radius, and thus suffer the least aberration, and render the image more distinct. The case is the same with regard to rays refracted through lenses.

In different spherical lenses M. Huygens has demonstrated that the aberration from the figure is as follows: 1. In all plano-convex lenses, having their plane surface exposed to parallel rays, the longitudinal aberration of the extreme ray, or that remotest from the axis, is equal to \( \frac{3}{2} \) of the thickness of the lens.

2. In all plano-convex lenses, having their convex surface exposed to parallel rays, the longitudinal aberration of the extreme ray is equal to \( \frac{3}{4} \) of the thickness of the lens; the aberration in this case being about \( \frac{1}{4} \) of that in the former, or in proportion to it, as 7 to 27.

3. In all double convex lenses of equal spheres, the aberration of the extreme rays is equal to \( \frac{3}{4} \) of the thickness of the lens.

4. In a double convex lens, the radius of whose spheres are as 1 to 6, if the more convex surface be exposed to parallel rays, the aberration from the 6, are is less than in any other spherical lens, being no more than \( \frac{1}{12} \) of its thickness.
M. Huygens has also shown, that the same aberration is produced by concave lenses as by similar convex ones.

However this species of aberration is altogether inconsiderable, compared with the latter; inasmuch that if the object-glas of a telecope be plano-convex, and the plain side be turned towards the object, and the diameter of the sphere to which the convex side of the glafs is ground, be 100 feet, the semidiameter of the aperture be two inches, and the ratio of the fine of incidence out of glafs into air be to that of refraction as 20 to 31; the diameter of the circle of aberrations will in this case be only \( \frac{961}{7200000} \) parts of an inch. But the diameter of the little circle, through which the same rays are refracted by unequal refrangibility, will be about the 55th part of the breadth of the aperture of the object-glas, which is here four inches; and therefore the error arising from the spherical figure of the glafs is to the error arising from the different refrangibility of the rays as \( \frac{961}{7200000} \) to \( \frac{1}{4} \), that is, as 1 to 5449. See Newton's Optics, p. 82. 8vo. (apud oper. tom. iii. 347. tom. iv. p. 56..Ed. Hurll.) or Smith's Optics, book ii. chap. 6. (vol. 1. p. 39.) where this proposition is demonstrated. That objects should appear through telecopes so distinct as they do may seem surprising. Newton accounts for the fact by observing, that the rays are not uniformly dispersd over the whole circular space; in the centre they are more dense, and they become more and more rare towards the circumference, and on this account they are not visible, except those of them that are in or near the centre.

In conquence of the discovery of the unequal refrangibility of light, and the apprehension, that equal refractions must produce equal divergencies in every fort of medium, it was imagined, that all spherical object-glafs of telecopes would be equally affected by the different refrangibility of light, in proportion to their aperture, of whatever materials they might be constructed; and therefore, that the only improvement of which refraction telecopes were capable, was that of increasing their length. On this account Sir Isaac Newton, and others after him, despairing of success in the manufacture and use of refraction lenses, directed their chief attention to the conduction of reflecting telecopes. However, about the year 1747, M. Euler applied himself to the subject of refraction, and pursuing a hint suggested by Sir Isaac Newton, formed a scheme of making object-glafs with two lene of glafs, inclining water between them; hoping, that by constructing them of different materials, the refractions would balance one another, and prevent the usual aberration. Mr. J. Dollond, an ingenious optician of London, examined this scheme, and found that M. Euler's principles were unsatisfactory. M. Clairaut likewise concurred in opinion, that his speculations were more ingenious than useful.

This controversy, which promised to be of great importance in the science of optics, engaged the attention of M. Klingenhufnæ of Sweden, and induced him carefully to examine the eighth experiment in the second of Newton's Optics, with the conclusions which he draws from it. He found, that the rays of light, in the circumstances there supposed, did not lose their colour, as Sir Isaac imagined. This hint of the Swedish philosopher led Mr. Dollond to re-examine the fame experiment; and it appeared, after accurate trials, that different substances made the light to diverge very differently, in proportion to their general refractive power: therefore, in the year 1757, he procured wedges of different kinds of glafs, and applied them together, so that the refractions might be made in contrary directions, in order to discover, whether the refractions and divergency of colours would vanish together. The result of his first trials encouraged him to persevere; for he discoverd a difference far beyond his hopes in the refractive qualities of different kinds of glafs, with respect to their divergency of colours. The Venice glafs and the English crown glafs were found to be nearly allied in this respect; the common English plate glafs made the light diverge more, and the English flint glafs moit of all. Without inquiring into the cause of this difference, he proceeded to adapt wedges of crown glafs, and of white flint glafs, ground to different angels, to each other, so as to refcraft in different directions, till the reflected light was entirely free from colours. Having measured the refractions of each wedge, he found that of the white glafs to be to that of the crown glafs nearly as two to three; and he deduced this general conclusion, that any two wedges, made in this proportion, and applied together so as to refcraft in contrary directions, would refcraft the light without any aberration of the rays. Mr. Dollond's next object was to make similar trials with spherical glafs of different materials; and he found that, in order to obtain a refraction of light in contrary directions, one must be concave and the other convex; the latter, which was to refcraft the moth, that the rays might converge to a real focus, was made of crown glafs, and the former of white flint glafs; and, the refractions of spherical glafs being in an inverse ratio of their focal distances, it was necessary that the focal distances of the two glafs should be inverfe to the ratios of the refraction of the wedges; for being thus proportioned, every ray of light that passes through this combined glafs, at any distance from its axis, will constantly be refcrafted by the difference between two contrary refractions, in the proportion required; and therefore the different refrangibility of the light will be entirely removed.

But in the applications of this admirable discovery to practice, many difficulties occurred. At length, however, by repeated trials, and resolute perseverance, Mr. Dollond succeeded so far as to construct refcrafting telecopes much superior to any that had before been used; representing objects with great diffincnfs, and in their true colours.

M. Clairaut, who intereeted himself betimes in this discovery, endeavoured to ascertain the principles of Mr. Dollond's theory, and to lay down rules for facilitating the construction of these new telecopes. With this view he made several experiments, in order to determine the refractions of different kinds of glafs, and the proportion in which they separated the rays of light; and from these experiments he deduced several theorems and problems of general utility. M. D'Alembert likewise made a great variety of calculations to the fame purpose; and shewed how to correct the errors to which these telecopes are subject, by placing the object-glafs, in some cases, at a small distance from one another, and sometimes by using eye-glafs of different refraactive powers. But though foreigners were hereby supplied with the most accurate calculations, they were very defective in practice. The English telecopes, made, as they imagined, without any exact rule, were generally superior to the best of their construction.

M. Euler, who first gave occasion to this important and useful inquiry, was very reluctant in admittting Mr. Dollond's improvements, because they militated against a pre-conceived theory of his own. At last, however, convinced of their reality and importance by M. Clairaut, he assented; and soon after received farther satisfaction from the experiments of M. Zeiber, of Peterburgh.

M. Zeiber demonstrated, that it is the kind, in the composition of glafs, which gives this remarkable property; so that, while the refraction of the mean rays is nearly the same, that of the extreme rays considerably differs; and by increasing
increasing the lead, he produced a kind of glafs, which oc-
casioned a much greater separation of the extreme rays than
the flint glafs which Mr. Dollond had made nfe of, and at
the fame time considerably increased the mean refraction.
M. Zeischer, in the course of his experiments, made glafs
of arimimum and flint, with a mixture of alkaline salts; and
found that this mixture greatly diminished the mean refra-
cition, without making hardly any change in the difpersion;
and he at length obtained a kind of glafs greatly superior to
the flint glafs of Mr. Dollond for the construction of tele-
copes; since it occasioned three times as great a difpersion
of the rays as the common glafs, whilst the mean refraction
was only as 1.61 to 1.

Other kinds of metallic glafs, as well as that of lead, po-
ff is the fame useful property of difpersion. Some philo-
fofers have, indeed, imagined, that there is a conflant rela-
tion between the specific gravity of glafs and its difpersion;
but it ought to be confidered, that the difpersion in ether
and spirit of wine is stronger than that produced in water,
which is a much heavier fluid. The object which optics
have generally proposed by using flint and common glafs in
the construction of achromatic telescopes, might be attained
by using glafs of other transparent fubftances, both folid and
fluid.
Mr. Blair of Edinburgh has lately eivined this fact.
Flint glafs was found to reflect the green light confiderably
lefs than crown glafs, in proportion to the whole refraction
of red and violet light; fo that when the divergency of the
red and that of the violet light, caufed by the refraction of
the two mediums, are equal, the divergency of the red and
green light is always greater in the crown than in the flint
glafs, and the divergency of the violet and green is always
lefs in the crown than in the flint glafs. After a variety of
experiments, Mr. Blair discovered that the muriatic and
nitríc acids, which are difpervative fluids of confiderable ftrength,
instead of refrafing the green light lefs than crown glafs,
in proportion to the whole refraction of the red and violet
light, refrafed the green light more than crown glafs, in
proportion to the whole refraction of red and violet light.
He, therefore, mixed thefe two kinds of difpervative mediums,
and thus obtained a medium, which difpifes the rays much
more than crown glafs, and yet caufes them all to diverge
accurately in the fame proportion in which they are made
to diverge by the refraction of crown glafs; which entirely re-
moves the aberration from the unequal refrangibility of
light.

In 1758, Mr. Dollond made a farther improvement in
telescopes, by introducing two object-glafles of crown glafs
and one of flint. For various papers on the subjedt of
this article, see Phil. Trans. vols. 35. 48. 50. 51. 52. 55. 60.

fracing telescopes of the achromatic or aplanatic kind, see
Telescope.

Aberbation, crown of, is a luminous circle surrounding
the real disc of the fun, and depending on the aberration of
the folar rays, whereby his apparent diameter is enlarged.
Abersperg, in Geography, anciently Abufina or
Aventinum, a small town and caflle in Upper Bavaria, fited
on the river Umfa, and containing a convent of Carmelites.
It is famous as the birth place of Johannes Aventinus.
Aberville river, a branch of the Mill fippi, in New
Orleans, communicating with the lakes which fall into St.
Louis bay.
Aberystwith, a market town of Cardiganshire
in Wales, on the Rhydol, near its confluence with the
Yfwith, where it falls into the sea. It is fitude on a
bold eminence overhanging the sea, or bay of Cardigan.
The streets are flEEP and ill-paved, and the houses are
covered with the black flate of the country. It carries on
a trade in lead, calamine, and fish, particularly herrings,
which left branch has lately declined; and a few manu-
ufactured goods, fuch as webs, flannels, and flocking.
Of late it has been improving, and is becom BOCTH OF
for fishing. Its walls and caflle are in ruins. The caflle
was built by Gilbert de Strongbough, in the reign of Henry 1.
and commands the whole coast with the contiguous mouths
of the Yfwith and Rhydol on one fide, and a beautiful view
of the vale which defends with the river on the other.
A mint for the coinage of silver was eflabHed in this place by
King Charles in 1637, and the coin was to be flar ped on
both fides with the feathers, in order to fhew that it was
coin'd in Wales. It is 203 miles W. N. W. of London.
W. long. 4°. N. lat. 53° 5'.
ABESTA, or Avesfa, the name of one of the fared
books of the Perfian Magi; which they attribute to their
great founder Zoroafer, or Zerdutht.

The Abefa is a commentary or expiffion of two of
their religious books, called Zend and Pazend; the three
together include the whole fyttem of the ignicole, or wor-
Rel. vet. Perf. c. 2.

According to Dr Perron, the Avelta signifies the lan-
Sc. Par. 1762. See SANSKRIT and SHASTAH.

AESTON. See AesTos.

Aethancourt, Jacob, in Biography, a phyfi-
cian at Rouen, published " Nova penitentialis quadrige-
mum, et Purgariorum in Morbnum Gallicum, five venereum,
una cum Dialogo Aquae Argenti, ac Ligni Guinacis collatu-
num super dicit Morbi Curationis prefntura." Opus fruitiferum
Parisio, 1527, in 8vo.

He is the first French phyfiitian who wrote on the vene-
real difeafe. Perhaps, M. Eloy fays, because the difeafe
appeared at Rouen before it was communicated to other
parts of the kingdom.

Aettor, or Abettor, in Law, one who incites
or encourages another to perform fomething criminal; or by
fome way afifts him in the performance itfelf. It is the
fame with art and part in the Scotis law.

Thus thofe who procure others to fue out false appeals
or murder, againft men, to render them infamous, are
particularly denoted abettors.

So abettors in murder are fuch as advife or procure a
murder to be committed, or are accifary thereto.

There are abettors in felony, but not in treason.
The law looking on all thofe concerned in treafon as princi-
pants.

Abevacuation, in Medicine, denotes a partial
evacuation of the peccant humours, either by nature or art.
Aex, or Abes, in Geography, a country of Ethiopia
in Africa, bordering on the Red Sea, which bounds it on the
eaf.t. It has Nubia on the north, Abyssinia on the west and
south. Its principal towns are Suanem and Arkeko. It
has the name of Beglerbeg of Habeleth, and is fubjedt to
the Turks. It is a fandy, barren, unhealthy country, about
500 miles in length, and 100 in breadth. Being very moun-
tainous, it abounds with wild beafs; and in its forests there
are many eloby-trees. See ANIAN.

Aeyance, Ablanee, or Aveyance, in Law-
books, something that only exists in expectation, or in the
intendment, or reminoration of the law.

Aveyance, in our law, amounts to much the fame with her-
roldas.
AGB
reditas iaceut among the Romans, and \( \eta \epsilon \varsigma \alpha \nu \varsigma \tau \alpha \) among the Greeks; i.e., \( \rho \epsilon \nu \epsilon \beta \iota \iota \) or \( \epsilon \nu \epsilon \beta \iota \iota \), or rather \( \nu \epsilon \nu \omega \varsigma \alpha \iota \mu \iota \nu \iota \alpha \) dominion expectant. As civilising
say lands and goods \( \iota \epsilon \alpha \kappa \) to common lawyers say, that things
in like condition are in abeyance.

It is a maxim in law, that of every land, either there is a
fee simple in somebody, or it is in abeyance. If a church
become vacant by the death of a patron, the freehold is
\( \epsilon \nu \epsilon \beta \iota \iota \) to be in abeyance, till a new patron be
inducted, for the patron has not the fee, but only the-right of
prefenting to it, the freehold itself being in the incumbent thus presented,
and therefore till such presentation, in nobody.

ABGARUS, in Biography, a name given to several of the
kings of Edessa; one of whom is said to have been contempo-
rary with Christ; who, hearing of his miracles, and labouring
under a grievous distemper, incurable by human skill, applied
him to, by letter, for relief. It is also said, that our
Saviour returned him a written answer, promising to send
one of his disciples to cure him, and that Thaddeus was
commissioned for that purpose. Eusebiius (Eccl. Hist. lib. i.
chap. 13.) relates this story, and says, that the evidence of
it existed in the records of the city of Edessa. Abgarus's
letter, which was sent to our Saviour at Jerusalem by the
courier Ananias, is as follows:

"Abgarus, scribe (or prince) of Edessa, to Jesus the
good Saviour, who has appeared at Jerusalem, endowed
with healing: I have heard of thee, and of thy cure, per-
formed without herbs or other medicines. For it is re-
ported that thou maketh the blind to see, and the lame to
walk; that thou cleanseltest lepers, and callest out unclean
spirits and demons, and healeth those who are torment-
ed with diseases of a long standing, and raiseth the dead.
"Having heard of all these things concerning thee, I con-
cluded in my mind of these two things:—either that
thou art God come down from heaven to do these things,
or else thou art the Son of God, and so performest
them. Wherefore I now write unto thee, in treating thee
to come to me, and to heal my distemper. Moreover, I
hear that the Jews murmur against thee, and plot to do
thee mischief. I have a city, small indeed, but neat,
which may suffice for us both." The following is our
Lord's answer, returned by the same courier: "Abgarus,
thus art happy, forasmuch as thou hast believed in me,
though thou hast not seen me. John, xx. 29. "For it is
written concerning me, that they who have seen me
should not believe in me, that they who have not seen me
might believe and live. As for what thou hast written to
me, desiring me to come to thee, it is necessary that all
these things, for which I am sent, should be fulfilled by
me, and that after fulfilling them, I should be received up
three miles from the place where we met. Then, therefore, I shall be
received up, I will send to thee one of my disciples, that he
may heal thy distemper, and give life to thee, and to
those who are with thee." Thrice these epistles are subjoined
many particulars recited by Eusebius. After the ascension of
Christ, Thomas, one of the apostles, he says, moved by a
divine impulse, sent Thaddeus, one of Christ's 70 disciples,
to Edessa to be a preacher and an evangelist of Christ's doc-
trine, by whom all things promised by our Saviour were
fulfilled. This was done, A. D. 43. The authenticity of
these letters, and of the history to which they relate, has
been allowed by Parker, Cave, Grabe, Wake, Tillemont,
Addison, and others; but rejected as false and fabulous by
the Bishops, Spinheim, Le Clerc, Fabricius, Dupin, Jones,
Lardner, &c. The two last writers have produced reasons to
prove the whole story to be fictitious, which are un-
ananswerable. Allowing that the particulars recited by
Eusebius, who flourished at the beginning of the 4th century,
or before, were recorded in the archives of Edessa, it does
not appear that Eusebius was ever at this city and took the
account from the archives himself. Besides, it is remark-
able, that this story is not mentioned by any writer before
Eusebius; that it is not much taken notice of by succeeding
writers; that the whole affair was unknown to Chrysost's ap-
pelles, and to the Chrysostomians their contemporaries, as is mani-
fested from the story of the dispute about the method of receiving
Gentile converts into the church, which he relates, had it
been true, must have entirely decided. As to the letters,
no doubt can be made of their spuriousness, since, if Chrysost
had written a letter to Abgarus, it would have been a part
of sacred scripture, both in the epistle to Abgarus, and in the
history, which are liable to exception. Not to add, that it
was the opinion of many of the most learned and ancient
Christians, that our Lord never wrote any thing. See Jones's
Canon of the New Test. vol. ii. p. 1. and Lardner's Works,
vol. vii. p. 223. 231.

AGBILLUS, John, surnamed Prefer John, was son to
a king of the Frifilis, and from the authorty of his life ob-
tained the name of Prefcr, or priest. He attended Chorle-
magne's in his expedition to the Holy Land; but instead of
returning with that monarch to Europe, it is pretended
that he gained a mighty conquest, and founded the empire of the
Byzantins, called from his name the empire of Prefer. John.
It is said to have been the heart of Charlemagne's
journey into the Holy Land, and of his own into the Indies;
but they are more probably trizing romances, written in the
ages of ignorance.

ABHEL, in Botany, a name given by some to fustin,
an ever-grene gardeh-shrub, well known in phytic in many
intentions.

ABHER, in Geography, a town of the Perfian Irak, or
ancient Parthis, in Afs, delightfully situated, and adorned
with fine gardens and elegant public buildings. It is about
26 miles S. E. from Sultania.

ABHORRERS, in English History, a denomination
given to a party about the year 1680, formed in opposition
to those called Petitioners. In order to restrain the prevail-
ing practice of petitioning against grievances, the church
and court party framed addresses, containing the highest
expressions of regard to the king, the most entire acquiescence
in his wisdom, the most dutiful submission to his perrogative,
with the deepest abhorrence of those who endeavour to en-
croach on it by preferring to him any time for assembling
the parliament. Thus the nation came to be distinguished into
petitioners and abhorrers. But these appellations were
soon forgotten, though, when the parliament assembled, great
numbers of the abhorrers, says Home, (Hist. vol. viii. p. 170.)
from all parts of England, were fared by order of the com-
mons and committed to custody.

ABI, in Biography, a learned rabb of Alexandria, who
wrote a treatise on the intelligence which move the heavens,
and on the influence of the planets. He flourished in Egypt
about the year 1150.

ABIAD, in Geography, a town of Africa, on the bor-
ers of Apex, situated on a high mountain, and remarkable
for its trade in ebony and aromatic plants.

ABiad, or white river, flows into the Nile, and is sup-
popled, by some, to be the Nile itself.

ABIAGRASSO, a small town in Italy, seated on a
channel, in the duchy of Milan. E. long. 9° 24'. N. lat.
45° 30'.

ABIANS, in Ancient History, a people of Thrace, or,
as others say, of Scythia, who derived their name from the
negative particle \( \eta \), and \( \sigma, \) life, probably because they had no
Every person is supposed to be able, i.e. to have the power of taking and disposing of effects, whom the law does not disfable.

The king's issue are of ability to inherit in England wherefover born; and children of subjects born beyond sea, may inherit, if their birth were within the allegiance of the king.

ABIMELECH, in Scripture History, the name of two kings of Gerar, a country of the Philistines, one of whom was contemporary with Abraham, who took away Sarah and determined to marry her, but being warned of his danger, restored her to her husband. She was Abraham's sister, as well as wife, being of the same father, but by another mother. He afterwards made considerable presents to Abraham; and they entered into a mutual covenant at Beer-sheba. Gen. ch. xx. xxi. A. M. 2107, ante A. D. 1807. The other Abimelech was, probably, the son and successor of the former. Isaac employed the same artifice which had been practiced by his father Abraham, in order to preserve Rebekah from the danger to which she was exposed. But when Abimelech, who was captivated by her beauty, discovered that she was his wife, he forbade his subjects upon pain of death, from doing any injury to Isaac or Rebekah. The frequent prosperity of Isaac excited the envy of the Philistines, upon which Abimelech ordered him to depart from them. However, he afterwards formed a covenant with him, A. M. 2120, ante A. D. 1804.

Abimelech was also the name of the natural son of Gideon, by his concubine. His violent acts and death are recorded in Judges, ch. ix. A. M. 2769, ante A. D. 1235.

ABINEAU, in Geography, a port of America, on the north side of the lake Erie, and about 13 miles W. S. W. from Fort Erie.

ABINGDON, a market town of Berks, situated on the Thames. It derives its name from an ancient abbey. The aitches, fiefs, and county meetings are often held here. It has a good hall for the aitches, &c. Here are two churches said to have been erected by the abbots of Abingdon. The streets are well built, and centre in a spacious corn-market. It sends one member to parliament. Great quantities of malt are made here and sent in barges to London. It is four miles S. of Oxford, and 56 W. of London. This town is said to have been built by Caesar, king of S DEF, A. D. 517, and suppofed by Bishop Gibson to be the place called in the Saxon annals, Croyfno, where two synods are said to have been held, one in 742, and the other in 822. W. long. 1° 16' 37" N. lat. 51° 40' 30".

Abingdon is also the name of the chief town of Washington county in Virginia, about 246 miles in a direct line from Richmond. N. lat. 36° 32'.

Abingdon is also a town of Harford county in Maryland, 12 miles S. W. from Havre de Grace, and 20 N. E. from Baltimore. Cockebury college, instituted by the Methodists in 1784, is in this town.

ABINGTON, a township in Plymouth county, Massachusetts; 22 miles S. E. from Boston; containing 1453 inhabitants.

AB-INTESTATE, in the Civil Law, is applied to a person who inherits from one who died intestate.

ABI, in Biography, an Italian physician and alchemist, who lived towards the end of the 15th century and beginning of the 16th. His Dialogue upon Alchemy, 410 Venice, 1544, has been put into the Index Expurgatorium. 

ABIPONIANS, in History, a tribe of American Indians, who formerly inhabited the district of Chaks in Paraguay; but who have since been compelled by the holiness of the Spaniards to remove southward, into the territory lying between Santa Fe and St. Jago. M. Dubrizzholfer lived seven years in their country, and published an account of them in 1785. He says, their number is small, and does not exceed 5000.

Settled habitations and regular means of subsistence. They led a wandering life, and carried all their possessions with them in wagons, which were their houses. Their food was the flesh of their flocks and herds, milk, and cheese, and chiefly mare's milk. They were unacquainted with commerce, and though they possessed lands, did not cultivate them. From others, who performed this office, they received a tribute sufficient to supply them with the mere necessaries of life. They never took arms but to oblige those to make good a promissive that was violated. They paid tribute to none of the neighboring states; and depended on their own strength and courage to repel any invasion. They were a people of great integrity. Thus Huc mer has described them, ANNALI TI DIONYSIO SEI. Strabo, tom. i. p. 145-5-460. 4. 48.

ABIATHAR, in Scripture History, the son of Ahimelech, and the tenth high-priest of the Jews. When Saul, relenting his father's kindness to David, massacred the priests, he alone escaped. Having attached himself to the interest of David, he became the high priest, though Saul conferred the office on Zadok. But afterwards, conspiring with Adonijah, Solomon deprived him of his office, and banished him. 1 Kings, ii. 36.

ABIB, in the Hebrew Chronology, the name of the first month of the ecclesiastical year. This month was afterwards called Nisan, and answers to part of our March and April.

ABIES, in Botany, a species of the Pinus. See Fir-tree.

ABIES marina, or Sea-fir, in Natural History, a name given to the Sylvestia abietis. The Cupressus, a species of this family, is by some writers denominated Ailis redia.

ABIGA · harbo, the ground-plane of Chalcopyrites.

ABIGEATUS. See ABACUS.

ABIHU, in Scripture History, one of the sons of Aaron, who, within eight days after the consecration of Aaron and his sons, and the dedication of the tabernacle, was consumed with fire, for offering incense with strange fire. Lev. v. 2.

ABII Seyth, in Ancient Geography, a people, suppofed by Strabo (tom. i. p. 454.) to be the European Sarmatii, bordering on the Thracians and Batarians; they are sometimes called Aroi, and are commended by Curtius (de Rebus Gestis Alex. Magni, tom. ii. p. 525. Ed. Sakenbow.) for their love of justice. See ARIANS.

ABJAH, in Scripture History, the son of Jeroboam, who was the first king of the ten tribes of Israel. Abijah predicted, that he would be the only person of his family who should receive funeral honours. 1 Kings, xiv. 13.

ABIJAM was the name of a king of Judah, who succeeded Rehoboam. After a reign of three years, during which he imitated the impiety and bad conduct of his father, he died, A. M. 3704, ante A. D. 975.

ABILA, in Ancient Geography. See Abel-Keranim, and Abel-Miton, and also the next article.

ABILENE, a small province in Cela-Syria, between Libanus and Abillabanus, whereof Lyfania was for some time tetrarch. Abila or Abila, the capital of this province, was N. of Damascus and of Pansac, and S. of Heliopolis. It is mentioned by Polybius, (Hist. i. xvi.) Pliny, (Hist. i. xx. c. 18.) and others. See Luke, iii. 1. Gibson (History of the Decline and Fall of the Roman Empire, vol. xx. p. 400. 8vo.) informs us, that the produce and manufactures of the country were annually collected in the fair of Abyla, about thirty miles from the city, and that they furnished a rich spoil to the Saracens after the conquest of Damascus, A. D. 634.

Ability is used, in Law, for a capacity of doing certain things, relating either to the acquisition of property, or the transferring of it.

Ability in this sense coincides with capacity, and stands opposed to disability or non-ability.
ABJ

5000, which he ascribes to the women’s destroying their infants, in order to prevent the infidelity of their husbands during the long time of their keeping them at the breast, which is not less than two years. They are naturally white, but acquire a brown colour by exposure to the air and smoke. They are strong and hardy, which, as this writer says, is owing to their not marrying before 30 years of age; and they are much celebrated for their chastity and other virtues. Though, according to our author, they have no knowledge of a Deity; and yet they admit the existence of an evil spirit, and believe that the soul exists for ever. They consider their diseases as the effects of sorcery and witchcraft; and this superstitious notion gives rise to frequent murders. They are ranged into distinct bodies, under their respective chiefs, and, by means of their wild horses, they make frequent and formidable incursions into the territories of the Spaniards; against whom they have conceived an invincible hatred. Their use of horses commenced in 1641; and they manage them with great agility, without stirrups, saddle, or piastras. The fraud and cruelty practised among them by the Spaniards, have induced the Jesuit missionaries to prohibit any of them from coming, without a formal permission, into any of their colonies. The foes of these missionaries, in their endeavours to convert them to the Christian faith, have been very inconsiderable. They are still, so ignorant and uncivilized, that they can proceed in reckoning no farther than the number three; and the Jesuits have failed in teaching them the simple use and expression of numbers.

ABIRAM, in Scripture History, a sedulous Levite, who rebelled against Moses and Aaron, with a view of obtaining a share in the government, and who, with Korah and Dathan, concerned with them, were swallowed up alive by the opening earth. Numb. xvi.

ABISHAI, the son of Zeruiah, and brother of Joab, was one of the most valiant warriors of his time, and principal general in the armies of David. His military exploits are recorded in 2 Sam. xxi. 17, xxiii. 18; but the time and manner of his death are not known.

ABISHERING, an ancient law term, denoting a being free, or exempt from all amerciments for transgressions of any kind.

The word in a charter or grant, is said not only to give the proprietor the forfeitures and amercements of all others for transgressions committed within his fee, but also to exempt him from all such contravent by any within that compass.

ABITIBI, in Geography, the name of a small lake in Upper Canada, to the S. of which is a settlement called Frederick, in N. lat. 46°. W. long. 79° 40′. It is also the name of a river, which runs N. and joins Moose river, near its mouth at James’s bay.

ABITIBIS, a lake to the N. of Nipissing lake, on the N. E. boundary of Canada in New South Wales, which communicates with James’s bay, near Moose fort. W. long. 78° 5′. N. lat. 59° 5′.

ABIU, a small town of Beira in Portugal. W. long. 7° 16′ N. lat. 40° 20′.

ABJURATION, compounded of ab, oron, and jurare, to swear, in a general sense, the act of denying, or renouncing a thing in a solemn manner, and even with an oath.

Among the Romans, abjuration signified the denying a debt, pledge, deposit, or the like, true, by a false oath. In which sense, abjuration coincides with perjuratio; and stands distinguished from ejuration, where the oath is suppofed jull.

Abjuration, more particularly, is used for a solemn re-
cantation, or renunciation of some doctrine, or opinion, as false and pernicious. Thus it is used in the phrase, abjuration of heresy.

In our own laws, to abjure a person, is to renounce all authority or dominion of such a person. By the oath of abjuration, a person binds himself not to own any regal authority in the person called the Pretender, or ever to pay him the obedience of a subject. 1 W. and M. 13 W. III. 1 Geo. I.

The refusers of the oath enjoined by these statutes are liable to sundry penalties, forfeitures, &c. The oath of abjuration by the 6th G. III. cap. 53. “I A.B. do truly and sincerely acknowledge, profess, testify, and declare in my conscience, before God and the world, that our sovereign lord king George is lawful and rightful king of this realm, and all other his majesty’s dominions thenceunto belonging. And I do solemnly and sincerely declare, that I do believe in my conscience, that not any of the descendants of the person who pretended to be Prince of Wales during the life of the late king James the Second, and since his decease pretended to be, and took upon himself the title of king of England, by the name of James the Third, or of Scotland, by the name of James the Eighth, or the title and style of king of Great Britain, hath any right or title whatsoever to the crown of his realm, or any other the dominions thenceunto belonging. And I do renounce, refuse, and abjure any allegiance or obedience to any of them. And I do swear, that I will bear faith and true allegiance to his majesty king George, and him will defend, to the utmost of my power, against all traitorous conspiracies, and attempts whatsoever, which shall be made against his person, crown, and dignity. And I will do my utmost endeavours to diflodge and make known to his majesty, and his successeurs, all treasons and traitorous conspiracies which I shall know to be against him or any of them. And I do faithfully promise, to the utmost of my power, to support, maintain, and defend the succession of the crown against the defendants of the said James, and against all other persons whatsoever; which succession, by an act, intituled, An act for the further limitation of the crown, and better securing the rights and liberties of the subject, is and stands hallowed to the prince’s Sophia, electress and duchess dowager of Hanover, and the heirs of her body, being protestants. And all these things I do plainly and sincerely acknowledge and swear, according to these express words by me spoken and according to the plain and common sense and understanding of the same words, without any equivocation, mental evaflion, or secret reservation whatsoever. And I do make this recognition, acknowledgment, abjuration, renunciation, and promise heartily, willingly, and truly, upon the true faith of a Christian. So help me God." Abjuration is also used in our Ancient Cynlons, for an oath taken by a person guilty of felony; who, flying to a place of sanctuary, would swear to forfike the realm for ever, in lieu of other punishment. We also find instances of temporary abjuration, viz. for three years, for one year and a day, and the like. This, in some cases, was admitted from criminals in lieu of death. The devotion for the church was so warm, from the time of Edward the Confessor to the Reformation, that if a man, having committed felony, could recover a church or church-yard before he was apprehended, it was an asylum from which he could not be brought to take his trial at law; but confessing his crime to the justices, or coroner, and abjuring the kingdom, he was at liberty.

By Stat. 21 Jac. I. all use of sanctuaries, and consequently of abjuration, is taken away.

ABKHAS, in History, one of the seven nations in the countries
countries comprehended between the Black Sea and the Caspian. Their principal and most ancient establishments are on the southern declivity of the mountains that lie between the river Cuban and the Black Sea. They are tributary to the Turks, and are divided into two governments, the eastern and the western; each of which is subject to a bakhaw. The capital is Anacopia, formerly Nicopis. They speak a language peculiar to themselves, but bearing a remote affinity to that of the Circassians. Some have supposed that it is a dialect of the Celt. They have little religion, though they preserve some traces of Chaldeism. See ABLAQUATION, ABLAQUEATION.

A BLACTATION, the weaning of a child from the breast.

The proper time for weaning a child must be determined by the state of health of the child, and of the parent, but particularly of the latter. The helpless infants, and the late period at which they get their teeth, seem to indicate that nature intended they should derive the greater part of their food, for the first two years, from the breast. This, doubtless, was universally the case in the early periods of the world; as before the culinary art had obtained some degree of perfection, it must have been difficult to have found a sufficient quantity of such kinds of food as the children could properly masticate or digest, without the aid of the breast. And even now we know this to be the practice in rude and uncivilized countries. The negroes, Mr. Park says in his Travels in the interior Parts of Africa, suckle their children three years. A similar practice prevails among the poorer part of the inhabitants of this, and, perhaps, of every other country in Europe. These people also, previous to weaning their children, and for some time after, chew for them such parts of their food as they are incapable of masticating. In families which are destitute, and who are capable of providing for their children proper nourishment, they are usually weaned when they have attained eight or nine months, although they have then rarely more than the eight first teeth, the incisors or fore-teeth. They are therefore necessarily fed for some months after with bread or biscuit softened with milk, or with broth made of beef, mutton, or veal. Pieces of cruit of bread, or of flesh, are also given them to chew, which is suppos'd not only to accelerate the cutting the remainder of their teeth, but by exciting a flow of saliva, to affist in digerating the new kind of food they are now gradually to be accustomed to take. See Weaning.

A BLACTATION, in the Ancient Agriculture, is a method of engraving; wherein the cyno of one tree, being united for some time to the block of another, is afterwards cut off, and, as it were, weaned from its mother-tree.

Among the modern writers, ablactation is more usually called INARCHING, OR GRAFTING BY APPROACH.

ABLANCEOURT. See PELOT.

ABLAINA, in Botany. See TRICHOCARPUS.

A BLAQUEATION, a name used by the ancient writers of Agriculture for an operation in gardening, whereby the earth is dug from about a vine, or other fruit-tree, and its roots are laid bare, to expose them more to the sun, rain, and air, in order to promote its fecundity. — The proper reason for ablaquation is autumn, for the benefit of the winter rain, and snow water. Bradley fixes it in January. But experience having shown the practice to be dangerous, it is now generally laid aside.

A BLATION, formed from auro, to take away, in Surgery, the removal of whatever might be injurious or useless to the animal body.

A BLATIVE, in Grammar, the fifth case of Latin nouns. The word is formed from auro, to take away. Priscian also calls it the comparative case; as it served among the Latins, for comparing, as well as taking away.

The ablative is opposite to the dative; the first expressing the action of taking away, and the latter that of giving.

The ablative hardly answers to the just idea of a case; at least it is more vague than any other. It will be shown in its place that the English, and other modern tongues, have properly no such thing as cases; unless we except the nominative and genitive or possessive, which are the only cases that admit of different terminations. But even in the ancient languages, from which the notion of cases is borrowed, it is supplied, that the ablative is only a sort of supernumerary, or supplement to the rel. The five proper cases not being found sufficient to express all the relations of things to each other, recourse was had to an expedient: viz. the putting a preposition before some of the other cases; and thus made the ablative.

It may be added, that in the plural number the ablative is still more obscure, as it is being only the dative repeated. In English, French &c. there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, the magnitude of the city, and he spoke much of the city; we say, that the city in the first is genitive, and in the latter ablative: because it would be fo, if the two phrases were expressed in Latin.

The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians, Frischlin and Crufius; the former of whom maintained, and the latter opposed the reality of it.

Thus disputat is not yet decided. Sansius, and the Port-royalists, maintained the affirmative; Perizonius the negative. The chief reason alleged by Sanctius is, that the Roman writers often joined Greek words with the Latin prepositions, which govern ablative cases, as well as with nouns of the same case. To which Perizonius answers, that the Latins anciently had no ablative themselves; but instead thereof, made use, like the Greeks, of the dative case; till at length they formed an ablative, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same terminations, as they still have in many instances; but that this was afterwards changed in certain words. It is no wonder then, that the Latins sometimes join prepositions which govern an ablative case, or nouns in the ablative case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablative. See Cases.

ABLATIVE ABSOLUTE, in Grammar, is a word or phrase detached and independent of the rest of the discourse; neither governing, nor being governed of any other thing. This is frequent among the Latins; in imitation of whom the modern languages have likewise adopted it.

ABLAV, in Geography, a country in Great Tartary, the inhabitants of which, called Buchars or Bacherars, are subject to Russia, for the sake of obtaining its protection, but whose chief is a Calmuck. It lies east of the river Iriss, and extends 500 leagues along the southern frontiers of Siberia. E. long. from 73° to 83°. N. lat. from 51° to 54°.

ABLE, or AYBL, Thomas, in Biography, chaplain to queen Catharine, con sort of king Henry VIII., who distinguished himself by his zeal in opposing the proceedings of the king, and particularly the divorce of his royal mistress. For this purpose he wrote treatises, intitled, "Tractatus de non diffendo Henri et Catharinae Matrimonio," or, according to Tanner, "Invicula Viribus," though some suppose thefere are the titles of different works. He took his degree of A. B. at Oxford
A B L

Oxford in 1513, and that of A. M. in 1516. In 1534, he was prosecuted for his concern in the affair of Elizabeth Barton, called, The Holy Maid of Kent, who was burned by the monks to extreme disgrace, to exhibit a variety of fictitious miracles, and to expunge the gift of prophecy, by which means the attached many respectable persons to her interest; but she was afterwards attainted of treason in parliament, condemned, and executed, together with her chief accomplices, whose names she disclosed. Albe was also adjudged guilty of misprision of treason, by Stat. 25 Henry VIII. He was also one of those who denied the king's supremacy over the church, for which he was apprehended and imprisoned, and afterwards hanged, drawn, and quartered, in Smithfield, on the 25th of July, 1540. Douchet gives him the character of a very learned man, and tells us that he taught the queen music and the languages. Bdg. Brit.

ABLECTI, in Antiquity, a choice and select part of the guards in the Roman armies, picked out of those called Extraordinary.

ABLEGMINA, those choice parts of the entrails of victims which were offered in sacrifice to the gods.

Some authors make ablegmina to denote all those parts of the victims which were offered to the deities; contrary to the authority of Felicus, who restrains ablegmina to the extis, or entrails only.

The extis being found good, were to be profected, or parted; i.e. the extremes or prominent parts cut off, as ablegmina, to be sprinkled with flour, and burnt by the priests on the altar, pouring wine on them.—Turcullian ralies the heathens for thus serving the gods with creams and offals.

ABLET, or Allen, in Ichthyology, a name given by seme to the common bleak, a small fresh-water fish, called in Latin Alburnus.

ABLEE, in Geography, a town of Little Tantary, lying between the river Dnieper and the Black Sea. E. long. 33° 15', N. lat. 46° 20'.

ABLEUENTS, in Medicine, a name which some authors give to a sort of diluting medicines, suited to wash off from the external or internal surfaces of the body, any substanines improperly adhering to them; they are either water or other fluids, and they are administered in the form of lotion, gargam, or injection. They are more commonly known by the names of Abstergents, Detergents, and Diluents.

ABLUTION, from ablue, quas ab & lavo, I wash away, in Antiquity, a religious ceremony in use among the Romans; being a sort of purification, performed by washing the body, before they entered on sacrifice.

Sometimes they washed their hands and feet, sometimes the head, and oftentimes the whole body; for which purpose, at the entrance into their temples, were placed marble vials filled with water.

Ablutions appear to be as old as any ceremonies, and external worship itself. Moesiers enjoined them; the heathens adopted them; and Mahomet and his followers have continued them; thus they have been introduced among most nations, and make a considerable part of most established religions.—The Egyptian priests had their diurnal and nocturnal ablutions: the Greeks, their sprinklings: the Romans, their lustralions and lavations: the Jews, their washings of hands and feet, beside their baptisms: the ancient Christians had their ablutions before communion, which the Roman church still retains before their masses, some times after: the Syrians, Copts, &c. have their solemn washings on Good Friday: the Turks, their greater and lesser ablutions: their gait and wonden: their aman, tabarut, gutaf, and abdel, &c.

A B O

Ablution is particularly used in the Roman church, for a cup of wine and water, which the communicants anciently took after the host, to wash it down, and help to digest.

The same term also signifies the water which serves to wash the hands of the priest who consecrated it.

Ablution, in Pharmacy, is a preparation which divers remedies undergo, by washing them in water, or some other liquid, to clean or free them of their impurities, and so to exalt their powers.

The usual way of doing this, is by cohabitation, or pouring the liquor distilled from the body, upon it again: and repeating this as often as it is necessary. See Deputation.

Ablution, in Surgery, a term signifying the washing or cleansing a body. This is performed by injecting with a syringe, or by repeated affluence of a proper liquor, or by plunging the part itself into the fluid.

Abnakis, in History, Indians of North America, between New England and Canada, who are averse from labour, and take no pains in cultivating the ground.

Aber, in Scripture History, the son of Nef, and general of Saul's armies, who adhered to Saul during his reign, but was afterwards at his throne, and supported him for seven years at Mahanaim, beyond Jordan, against the forces of David, who then reigned at Hebron, in Judah. He afterwards conceived a prejudice against Illicholoth, and went over to David, with the chiefs of the army and the elders of Israel. David received him with tokens of affection, which offended Joab, by whom he was treacherously killed; avenging himself, by this murder, of the death of his brother Abihail. His funeral was solemnized by David, who composed a mournful song in honour of him. Abner died A. M. 2956, ante a. D. 1248.

Abo, in Geography, a maritime town in Sweden, and the capital of the province of Swedish Finland, is situated at the present in which the gulf of Bothnia and Finland unite, and on the river Aura, which runs through this city. This is the most considerable town in the whole country, and has a good harbour. It has many good brick houses; but they are generally built of wood, painted red. In 1226, it was erected into a bishop's see. In 1688, Gullvas Adolphus founded a gymnasium or seminary, which queen Christinna converted into an academy in 1640, and endowed with the same privileges as that of Upsal. In 1779, it contained about 300 students. The only royal high court of judicature in Finland is held at this place; and here the governor of the province usually resides. The export trade consists of linen, corn, deals, flax, and iron. Abo is the 3rd voting town in the Diet. It is 140 miles N. E. of Stockholm. E. long. 22° 17' 10". N. lat. 6° 27' 10". The result of 12 years observations, viz. from 1750 to 1761, both included, gives the mean annual temperature at this place, 40° Fahrenheit. Kirwan's Estimate of the Temperature of different Latitudes, p. 60.

Abo-Slot, or Abö-Castle, is one of the most ancient fortifications in Finland. It stands on a peninsula near the mouth of the river Aura. In the 16th century king Eric XIV. was confined in this castle. It has often suffered both by the enemy and by fire. Bosphing.

ABOARD, in Sea-language. See Board.

ABOASAR, in Geography, a village in Lower Egypt, said to be the ancient Busiris.

ABOCIS, in Ancient Geography, the Abuces of Poloe, a town of Ethiopia, situate on the western side of the Nile, not far from the greater Cataract.

ABOCRIS, or ABOREL, in Geography, a town near the river
ABBY or Caligula, public. which frequently or which. 
the cavity. with which he feels for several professors in presence of the people. who tell their joy and gratitude by lifting up their hands towards heaven. The legend is, Regia vetera H.S. nominis aboio.
ABOLLA, in antiquity, a warm kind of garment, lined or doubled, used by the Greeks and Romans chiefly out of the city, in following the camp.

The word is Latin, formed, as some imagine, from bulle, on the supposition that this vellum was garnished with thoe ornaments called bulle. Others, denying this circumstance, derive it from the Greek abolla, of abulla, abulith, abulathing.

The abolla seems rather to have faced opposed to toga, which was a garment of peace, as the abolla was of war; at least Varro and Martial place them in this opposite light. Some, after Nonius, hold it to have been a military gown; others, after Papirius, a senatorial; and Sallustus particularly supposes it to have been worn by the proconsuls in the provinces, and even by the prefects of the city when they administered justice; which Pittius endeavours to refute. Others will also have the abolla to have been used by the philosophers, particularly the Stoics, Cynics, &c. Lastly, others reconcile all the varieties by making divers kinds of bolbe, accommodated to different occasions and professions. Even kings appear to have used the abolla; Caligula was adorned at King Ptolemy for appearing at the feasts in a purple abolla, and by the eunuchs turning the eyes of the spectators from the emperor upon himself.

ADOMASUS, ABOBAS, or ABOMASUS, in Comparative Anatomy, a name given by old anatomists to one of the somachus or ventricles of animals of the ruminating kind. See Ruminant and Ruminating.

Beasts that chew the cud are found to have four somachae; viz. the rumen, or magnus venter, or somachus, properly so called; the reticulum, omasum, and abomasus. The abomasus, properly called the marus, is the last of the four; being the place where the chyle is formed, and from which the food descends immediately into the intestine.

It is full of a fort of leaves, like the omasus; but its leaves have this peculiarity, that, beside the membranes they contain, they contain a great number of glands, not found in any of the art.

It is in the abomasus of calves and lambs that the rennet, or earing is formed, with which milk is curdled.

ABOMINATION, in Scripture History, a term used with regard to the Hebrews, who, being shepherds, are said to have been an abomination to the Egyptians; because they sacrificed the faceless animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as abominations, or things unlawful. The term is also applied in the sacred writings to idolatry and idols, not only because the worship of idols is in itself an abominable thing, but likewise, because the ceremonies of idolaters were always attended with licentiousness, and with actions of an infamous and abominable nature. To this purpose, Chrysostom (Opera, vol. i. p. 645).
The abomination of desolation foretold by the prophet Daniel, (ch. x. 27. xi. 31.) is supposed by some interpreters to denote the statue of Jupiter Olympius, which Antiochus Epiphanes caused to be erected in the temple of Jerusalem. See 1 Maccab. i. 54. 59. ch. iv. 58. 2 Maccab. vi. 2. The second of the passages above cited may probably refer to this circumstance, as the statue of Jupiter did, in fact, make desolate, by banishing the true worship of God, and those who performed it, from the temple. But the former passage, considered in its whole connection, bears more immediate reference to that which the Evangelists have denominated the abomination of desolation. Matt. xxiv. 15. 16. Mark, xiii. 14. This, without doubt, signifies the enigmas of the Roman armies under the command of Titus, during the last siege of Jerusalem. The images of their gods and emperors were delineated on these enigmas; and the enigmas themselves, especially the eagle, which was carried at the head of every legion, were objects of worship, and, according to the usual style of Scripture, they were called an abomination. These enigmas were placed upon the ruins of the temple after it was taken and demolished; and as Josephus informs us, (De Bell. Jud. l. vii. e. 6. apud Oper. tom. ii. p. 391.) Ed. Havercamp.) the Romans sacrificed to them there. The horror with which the Jews regarded them sufficiently appears from the account which Josephus (Antiq. l. xvii. c. 4. § 1. ßc. c. 5. § 2. apud Oper. tom. i. p. 884. 875. Ed. Haver.) gives of Pilate's introducing them into the city, when he left his army from Caesarea into winter-quarters at Jerusalem, and of Vitellius's propoing to march through Judea, after he had received orders from Tiberius to attack Aretas, king of Petra. The people supplicated and remonstrated, and induced Pilate to remove the army, and Vitellius to march his troops another way. The Jews apply the above passage of Daniel to the Romans, as we are informed by Jerome is loc. The learned Mr. Mele (See his Works, b. iv. epil. 41. p. 797. and b. iii. p. 667. 672.) concurs in the same opinion. Sir Isaac Newton (Obit. on Daniel, c. ix. and also c. xii. See his Works by Horsley, vol. v. p. 356. 416.) observes, that in the 16th year of the emperor Adrian, A.C. 132, the Romans accomplished the prediction of Daniel by building a temple to Jupiter Capitolinus, where the temple of God in Jerusalem had stood. Upon this occasion the Jews, under the conduct of Barchochab, rose up in arms against the Romans, and in the war had 50 cities demolished, 985 of their chief towns destroyed, and 380,000 men slain by the sword; and in the end of the war, A.C. 136, they were banished from Judea upon pain of death; and thenceforth the land remained desolate of its old inhabitants. Others again have applied the prediction of Daniel to the invasion and desolation of Christ-endom by the Mohammedans, and to their conversion of the churches into mosques. From this interpretation they infer, that the religion of Mohammed will prevail in the cell 1200 years, and be succeeded by the restoration of the Jews, the destruction of antichrist, the full conversion of the Gentiles to the church of Christ, and the commencement of the millennium. See Newton on the Prophecies, in his Works, vol. viii. p. 197. 8vo.

ABON, ABONIS, or ABONIS, in Ancient Geography, a town and river of Albion. According to Camden, the town is ABONIS, and the river ABON or ABON. But by Antoninus's Itinerary, the distance is nine miles from the Venta Silurum, or Caerwent; and therefore, others take the town to be Porflut, at the mouth of the river ABON, near Brittol. ABON or ABON, in the Celtic language, denotes a river.

ABONIS, in Geography, a town in the interior part of Africa, near the Slave coast, which gives name to a province that is rich in gold.

ABONOTICA, or ABONOTICHOS, i.e. ABONIS TOWN, in Ancient Geography, a small fortified town of Papalonia, whose situation is determined by Arrius and Ptolomy. This is the habitation of the emperor Alexander, whom Lucian (Pseudop. Oper. tom. ii. p. 215. &c.) has particularly described. On the coin of Antoninus Pius it is denoted by a double serpent, the attribute of Aesculapius. This town was called Anepolis after the time of Alexander.

ABORAS, called by Xenophon Araxes, a river of Mecopotamia, which rose near the Tigris, was increased a few miles below Nisibis by the little stream of the Mydonius, passed under the walls of Singara, and fell into the Euphrates at Circeum. It was fixed as the boundary between the Roman and Persian empires, in the negotiation between Diocletian and Narses, towards the close of the 3d century, A.D. 297.

ABORIGINES, or ABORITIONES, in History, a name sometimes given to the primitive inhabitants of a country, or those who had their original in it; in contradistinction to colonies, or new races of inhabitants, derived from other places.

The term Aborigines is famous in antiquity. — Though now an appellative, it was originally a proper name given only to a certain people in Italy; and both the reason and origin of it are greatly disputed among the learned.

Aborigines then primarily denoted a nation in Italy, which inhabited the ancient Lattium, or country now called Romana, or Campagna di Roma.

In which sense the Aborigines are distinguished from the Janicenae, who, according to the sable Berofus, inhabited the country before them; from the Siculi, whom they expelled; from the Greeks, from whom they descended; from the Latins, whose name they assumed, after their union with Eneas and the Trojans; and lastly, from the Antonii, Volsci, Oenotri, &c. neighbouring nations in other parts of the country.

Whence this people came by the appellation is much disputed.

S. Jerome says, they were so called, as being, ab origine origenis, the primitive planters of the country after the flood. Dionysius of Halicarnassus, (Antiq. Rom. l. i. c. 10. apud Op. tom. i. p. 8. c. 11. ed. Oxon.) relates several opinions as to the origin of the appellation. Some, he says, allege that they owe their name to their being original inhabitants of the country, and because they were the founders of the race that occupied it, and that the denomination is familiar to the Greek term γαμενοι and περαζονομος. Others consider the appellation as synonymous with Aborigines, and others again conceive them to have been originally Arcadian, and that their ancestors were the Oenotri, who migrated from Greece seventeen generations before the Trojan war, and settled in that country above 400 years before the Trojan war, and that they derived their name either from the mountains of Arcadia, or of the natives of the mountains, or because they gave origin to the Latins, who being descended from them, called them Aborigines; that is, the people from whom they derived their origin; and to this opinion he himself inclines.

Aurelius Victor (de Orig. Roman.) suggests, that they were called Aborigines, quod Aborigines, from ab, from, and errare, to wander; as having been before a wandering people, who, coming from different countries, met accidentally in Italy, and lived there by rapine; to which opinion Ptolus gives some credit. It is added, that the appellation of Pelagians, another name sometimes given them, is of the fame import, and denotes vagabonds, like cranes.
ABORTION.

Parthenium thunb. (Grec. Decript. p. 633, ed. Kuhnii,) that italy was counted by Oenotrius, an Arcadian; and hence it may be inferred that, as Arcadia abounded with high mountains, the appellation might have been derived, 

Parthenium, from mountains; which opinion seems confirmed by Virgil, who, speaking of Saturn, the legislator of this people, says:

Parthenium, ut quidcumque mutans altis
Compugno, legendae delph.

The Aborigines were either the original inhabitants of the country, settled there by Janus, as some imagine, or by Saturn, or Cham, as others, not long after the dispersion; or even, as some think, before it; or they were a colony sent from some other nation; who, expelling the Siciuli, who (according to Dion. Hal. lib. i. Ant. Rom. tom. i. p. 7) were the original inhabitants, settled in their place; but whether these Siciuli were not, in their origin, Arcadians, first brought into Italy by Oenotrius, son of Lycaus, more than 400 years before the Trojan war, is not certain. Some have maintained that this party, a second from Theffaly, a third under Evander, 60 years before the Trojan war, and another under Hercules, and another of Lacedemonians, who fled from the severe discipline of Lycurgus, uniting together, constituted the Aborigines; others trace their origin in Scythia; others again in Gaul; and others will have them to be Canaanites expelled by Joshua.

ABORSEL. See Aborsel.

ABORTION, Abortio, Abortus, formed of al, from, and error, to be born, in Midwifery, the premature exclusion of a fetus. It has been usual to affign names to abortions, occurring at different periods of utero-genitation. Thofe happening within the frift seven or eight days, before the fetus or membranes have acquired such a confidence as to retain their dilinct form when excluded, are called effufions; from that period to about the fixth or seventh month, they are called abortions, or miscarriages; from the fixth month, to any time before the end of the ninth month, premature labour.

Abortion may be occasioned by too full, or too sparing a diet, or by taking food that is too rich and spirited; by blows or falls; hidden frights, or any thing violently agitating the mind, whether joy or grief; frequent coitus; hine abortus primis gravidatis mulieris non infrequent venas uteri, generis acidoribus; by diseases, particularly fever; by profuse evacuations, as from large discharges of blood, whether happening spontaneously, or procured by art, and used in the cure of some acute disfife, as phlegm; or by long continued and violent purging. Vomiting, if occurring spontaneously, though extremely violent, and continuing through the whole course of pregnancy, rarely occasions abortion; but when excited by the exhibition of haps, acid, or poisonous drugs, it usually continues until the fetus is excluded.

There are other causes of abortion, depending on the peculiarity of the constitution of the uterus or of the fetus. Thus some women, who are prone to breeding, are incapable of retaining their offspring longer than the fourth, fifth, fixth, seventh, or eighth month. In these cases, the fetus usually dies three or four weeks before the periods here mentioned; at the end of that time the separation of the blighted ovum from the uterus being completed, it is expelled by the pains, and ordinarily with as little difficulty or danger as a living and healthy fetus. The cause of this peculiarity is not known, neither has any appropriate remedy or means of preventing it been discovered. Sir Richard Maningham supposes it to arise from an incapacity in the uterus to bear more than a certain degree of distention. Si nullus fetus abortus factus, he says, (Aplog. med.) et exceptam temporum, ut sit 40o vel 50o, mensis, uti uteri angustia accidit, quo accidit fetus animus continuo non potest. The same effect, however, would follow perfection in the structure of the fetus, incapacitating it to live or induce beyond a certain time. We know there are children who, owing to a malformation of some of their organs, never live beyond twelve, fifteen, eighteen, or some definite number of months. Whatever may be the cause, it not unfrequently happens that women who have parted with five or six fetuses prematurely, shall afterwards go to their full time, and bear living and healthy children. Women who have miscarried once or twice will be prone to the same accident, at whatever period it happened; it becomes necessary therefore, when approaching that time, that they should use the utmost caution that nothing may occur to agitate or disturb them.

By some writers, women have been suppos'd to be more subject to abortions than brute animals, in consequence of the erect position of their bodies. That they more frequently suffer abortion than such animals seems well ascertained; but as this disposition is more incident to women living in large towns, and treating themselves too delicately, to those following sedentary and exhausting occupations, or to those who are compelled to labour hard for their living, it seems likely that the accident is occasioned by those circumstances, rather than from any vice in their constitution.

From a very early period, attempts have been made to devise means of procuring abortion, without injuring the constitutions of the women, by the exhibition of certain drugs, as favin, colocynth, &c. but without success. It is remarkable, that although Hippocrates prohibited physicians from asiphling in procuring abortion, he relates the case of a young woman whom he had recommended to dance and use other violent exercises for that purpose, in whom it produced the effect, and without materially injuring the woman. The more ordinary consequences, however, to be expected from such efforts, or from taking acrid and drastic medicines, are pain and inflammation of the womb, violent hemorrhage, which, though ultimately terminating in abortion, not unfrequently destroys the life of the woman also. These modes being found to be dangerous to the woman, and not certain in producing the proposed effect, endeavours have been used to destroy the birth by a more direct method, viz. by introducing a balsam, or some sharp instrument, into the uterus, which piercing the membranes, and thence giving vent to the liquor amniis, uterine contractions, or labour pains were produced, which continued until the fetus with its involucrum were ejected. At what time this mode of procuring abortion was discovered is not known; no traces of it appearing in any of our old medical or chirurgical writers. Ovid, it is probable, alludes to it, in the following lines:

—Sine etsi certe nata.

Et patrem ille visse dixit.

Vos qui ad effectu simulata visera teneis;

Et nomen natiis dira venena datis?

Amor. 1. 2. Eleg. 14. apud ep. tom. i. p. 444. Ed. Burman. Tertullian repugnates the practice, and mentions the kind of instrument with which the operation of breaking the membranes and destroying the fetus was performed, which he says was not uncommon in his time. Et clium even unum solutum, (fays this father, De Anima apud oper. p. 328, ed. Rigalt.) quo jugulatio ipsa dirigatur, caro latencion ut motus exappellant, utique venenat infantis perperatorium. Guy Patin says, a midwife was hanged at Paris.
PARIS, for occasioning the death of a lady there, by an attempt to procure abortion by this method. On her trial she said she had frequently practised it with success; but, in this case, it seems, the instrument had pierced the body of the uterus, instead of passing through the os internum.

This operation will be again noticed, when treating of those kinds of laborious parturition, where the difficulty is occasioned by the bones of the pelvis being so distorted, and the cavity thence so reduced in size, as to render the passage of a full grown fetus through it totally impracticable. In those cases, it has been lately discovered, the operation may be performed with perfect safety, and with equal advantage both to the child and to the mother. See LABOUR.

A peculiar delicacy, or irritability of habit, distinct from weaknefs, though perhaps rarely occurring, but in debilitated constitutions, may be also reckoned among the causes of abortion. This habit of body terms in a peculiar manner, and almost exclusively, to belong to persons living in the higher ranks of life, who use late hours, frequent large and crowded assemblies, lie much in bed, and indulge in rich and delicate food. The sudden opening of a door, or appearance of a person not expected, or any thing exciting the least surprise, will often, in such constitutions, be sufficient to produce abortion. That this is not occasioned merely by weaknefs of constitution is evident, as very weakly, and even consumptive persons, are found to conceive more frequently, to be more tedious of their offspring, and generally to produce larger and stronger children, than many women of superior general health.

As the causes of abortions, and the constitutions most prone to it, are so various, the modes of preventing it, or of conducting persons through it, must vary likewise. One of the earliest symptoms announcing an approaching abortion, is a lefse of fulness, of weight, or heaviness, at the lower part of the abdomen; this is soon followed by pains in the loins and thighs, and if these pains increase, which is not uncommonly the cafe, a discharge of blood, more or less profuse, according to the constitution of the woman, takes place; this, if accompanied with pains, recurring at intervals similar to those of labour, usually continues until the ovum is excluded. Sometimes the discharge of blood abates, or entirely ceases for fix, eight, ten, or more days, and then recurs again, usuallv with greater violence; and intermissions of this kind sometimes happen three or more times, before the fruit is excluded. On the other hand, it sometimes happens, that after a woman has suffered two, three, or more effusions of blood in this way, they cease; the part of the placenta that had been detached remaining itself to the uterus, and the woman goes on to her full time. These circumstances only happen in those abortions that occur within the first three, four, or at the latest five months, which are rarely attended with danger. Discharges of blood occurring at a later period, although they allo for times cease, and recur again at intervals, never completely leave the woman until the fetus and involucrum are excluded, which ordinarily does not happen until so much blood has been lost as to destroy the life of the fetus, and to put that of the mother also into extreme danger.

If a pregnant woman of a frigide temperament, should be seized with pains in the loins, and with discharges of blood from the vagina, fix or eight ounces of blood may be advantageously drawn from the arm, which will divert the current of blood from the part. The bowels are next to be opened with some mild purgative; the mift be kept quiet, but not confined to the bed; be put upon a cooling regimen, and take a powder consisting of twenty grains of nitre, and the same quantity of the compound powder of gum tragacanth, twice or three times in the day, mixed with barley water. A tea-spoonful may be taken every night, of an eleuoratory confining of, kiesime eleuorary, two ounces; cream of tartar, and flowers of sulphur, of each two drams; jalap, one dram; syrup of rofe, a sufficient quantity to give it a proper confidence. For those women who are easily moved, a scruple, or half a dram of jalap, may be sufficient, or thirty grains of rhubarb may be substituted for the jalap. If the woman should be only three or four months advanced in her pregnancy, and the fetus should not be dead, or the ovum entirely separated from the uterus, the above may be sufficient to preserve it, and prevent the abortion. In the cases of women of more relaxed and delicate constitutions, the bleeding must be omitted, but the eleuoratory with the rhubarb must be given every night, and instead of the powder with nitre and gum tragacanth, a decoction of bark, with a few drops of the vitriolic acid may be given; or the following:

R. Mistchag, stemm arabici 3 j.  
Oleum eborac., gtt. x.  
Syrop. albi 3 j., aquae f.  
Spirit. nucis moschati 3 j. m. capiat aq. cochlearia ter die in die.

If nausea prevails, so that the stomack with difficulty retains either food or medicines, or if the bowels are too loose, twelve or fifteen grains of ipecacuanha may be given in a spoonful of water, as an emetic, and the following draught at night:

R. Pulv. radicis rhei gr. vj. Confectionis aromaticae 3i.  
Spt. nucis moschati 3 j. Tinctura opij gtt. xii.  
Aquae f. m.

Under this treatment, if the fetus cannot be preserved, the hemorrhage will be restrained, and the abortion will happen without doing any material injury to the constitution.

 Abortions occurring at the times we have mentioned, are rarely attended with danger, and never require manual assistance. Those occurring later, viz. after the sixth month, if the hemorrhage should not be removed by the means here proposed, or should return, which usually happens, often require manual assistance, and must be treated in the same manner as when hemorrhage occurs in women who have attained the full term of gestation. See LABOUR.

Persons administering drugs to pregnant women, with the view of procuring abortion, or even women taking medicines, or using means for that purpose, have in most civilized countries, and from a very early period, been subjected to certain penalties.

The ancient Greek legislators, Solon and Lycurgus, prohibited the practice of producing abortion. Whether or not it was permitted among the Romans, has been much disputed, between two learned modern civilians. It is certain the practice, which was by them called vicerelus vivi inferret, was frequent enough: but whether there was any penalty annexed to it, before the emperors Severus and Antonine, is the question. Noodt maintains the negative; and farther, that those princes only made it criminal in one particular case; viz. of a married woman's practising it out of resentment against her husband, in order to deprive him of the comfort of children; this was ordered to be punished by a temporary exile: figua pregnancies vivi vicerelus facti intolerabili ne inimico mari tirem furi praebeat, temporali exilio coercetur. He adds, that there was no general prohibition of the practice before Gratian and Valens. It is true we find in

G Cicero.
Cicero an earlier instance, of a woman punished for this fact; but it was in Mikia, a country not subject to the Roman laws.

Drinkerhoeck however denies, that a woman was allowed to drink the *poculum abortivum, impium*; and the reason he gives, is, that the womb was the husband's property, which was declared, by the laws, the sole efigas of it; to prevent his being impoed on in the children he was to bring up. But then this does not affect women who had been impregnated by others, who were not their husbands.

The foundation on which the practice is laid to have been allowed, was, that the *fetus*, while in utero, was reputed as a part of the mother, ranked as one of her own vixera, over which she had the same power as over the rest; besides, that it was not reputed as a man, *homo* nor to be alive, other-wise than as a vegetable: consequently, the crime amounted to little more than that of plucking unripe fruit from the tree. *V. Juv. Sat. vi. v. 552.* &c. Senece. Confolat. ad Heliam Matronam, c. 12.

This last cited author represents it as a peculiar glory of Helvia, that she had never, like other women, whole elfe's fuddy is their beauty and shape, destroyed the fetus in her womb. *Nunquam te fortunabilis tu quaes expièsuræst estas, sedit: nunquam noster aliusamen quisque omnem comminato ex forma poëtur, tranfentem ut ramo abstrahit quisque indecum annu, nec inter ovi vasa tuas conceptas fies horumvium.** By the decreals of the canon law, (Part ii. Capil. 32. quæsit. i. c. 8.) *Non est homicida. ut ab urdim procurari, uterum anima corporis sit infirt.*

The primitive fathers, Athenagoras, Tertullian, Minullus Felix, Auguftin, &c. declared loudly against the practice, as virtual murder: *Homicidiut ujus intentionis, says Tertullian, (Apolog. spud Oper. p. 10.) prohiberur non refert, tantum quas eripit animam, ut animen dysferat.* Several coun-
cils have declared again it. That the fetus in the mother's womb is without life, and that it is not animated before it is born; and also that it is lawful for a young woman, her life or character being at stake, to procure an abortion, are pro-
positions which pope Innocent X. in a general council in 1675, condemned as false and scandalous. Yet we are told that the modern Romish ecclesiastical laws allow of dispensations for it. Egan mentions the rates at which a dispensa-
fion for it may be had.

Fodere says, (Traites de Medicine Légale,) in the Introduc-
tion, the emperors Severus and Antonine, decreed, that wo-
men procuring abortion. forty days after they had conceived, at which time they imagined the fetus was completely form-
ed, and ended with life, should be put to death; but earlier than that period, and before the fetus was supposed to be living, they should only suffer a temporary banishment. Our law seems to have adopted a principle similar to this, but it extends the punishment to any person (maliciously or intentionally, we suppose,) being instrumental in occasioning a woman to miscarry.

"Si aliquis materem praegnantem peruocirr," says Bravton, *lib.iii. c. 28. *vol. v. c. 10. d.* *vol. v. c. 10. d. sueter absorbebat, &c.* surnam hominem, et maxime si fuerit animam, *fisci hocdidium.** "Life," says Blackstone, (Commentaries, book i. chap. 1. vol. i. p. 129. Svo.) *is the immediate gift of God, a right inherent by nature in every individual; and it begins, in contemplation of law, as soon as an infant is able to air in the mother's womb. For if a woman is quick with child, and by a potion, or otherwife, killet it in her womb; or if any one beat her, whereby the child dieth in her body, and she is delivered of a dead child, this, though not murder, was by ancient law homicide, or mad-
slaughter." But, he goes on to obferve, *"The modern law doth not look upon this offence in quite so atrocious a ligit, but merely as a hicinus mifdemelleror." 5 Inf. 50.

Abortion, among Gardeners, signifies such fruits as are pro-
tuced too early, and never arrive at maturity.

ABORTIVE, something come before its due time, or be-
fore it has arrived at its maturity and perfection.

The term is applied by some writers on the materia medica
to medicines that occasion an abortion in pregnant women. Medicines of this kind have also been denominated Ambiotica and Ecboias; and they have been commonly supposed to prevent the power of promoting the natural birth, of forcing off the placenta, and even of expelling a dead fetus. But their powers, ascribed to medicines by the ancients, are now deemed imaginary, and such medicines are now hardly ever employed. Cal/us's *Med. M. v. i. p. 402.*

Abortive corn, in Agriculture, a delimeter of corn mentioned by M. Tillet, and suspected to be occasioned by infests. It appears long before harvest, and may be known by a de-
formity in the flalk, the leaves, the ear, and even the grain.

Abortive flux. See Abortion.

Abortive willum, is made of the skin of an abortive calf.

ABORTIVES, or Abodrites, in History, a people bordering upon Bulgaria, in that part of Dacia contiguous to the Danube. Henry I. of Germany, famanued the Fowler, in his zeal for the propagation of the christian faith, undertook, and actually effected the conversion of the king of these people. The kingdom of the Abodrites was a part of the ancient Vandals, and is now called Meck-
lenburg.

ABOU HANES, in Ornithology, a bird of Abyssinia, so called, because it appears on St. John's day; the terms sig-
ifying, father John. This is the seafon when the fresh water of the tropical rains is first known in Egypt to have mixed with the Nile, and to have rendered it lighter, sweeter, and more exhalable in dew; and accordingly it is the seafon when all water-fowl, that are birds of paitage, refort in great numbers to Ethiopia. This bird, according to Mr. Bruce, (Travels, &c. vol. v. p. 175.) is the Ibis of the ancients. Its back refembles in shape that of a curlew, and the colour of the upper part is green, and of the lower part black; and it is four and a half inches in length. The bone of the leg is round and strong, six inches long, and the length of the thigh-part is five and a half inches. The height of the body, as it stands, from the sole of the foot to the middle of the back is nineteen inches. Its feet and legs are black; it has three toes before, armed with sharp strong claws, and a toe behind. The head and back part of the neck are brown: the throat, breast, back, and thighs are white. The largest feathers of the wings are a deep black for thirteen inches from the tail, and a space of six inches in length from the end of the tail along the back is also of the same colour. The measure and colours correspond to those of the embalmed Ibis.

ABOUALLI, in Hydrography, a river of Palestine, which rifes in mount Libanus, and flows with a rapid current into a romantic valley, where it is concealed by trees.

ABOUILLON. See Apollonia.

ABOUKIR, in Geography, a small town of Egypt, situate in the detart between Alexandria and Rosetta. It is the ancient Canopus, and diltauant, according to Mr. Sav-
ary, (Letters on Egypt, v. i. p. 40.) fixes leagues from Pha-
ros. Pliny, (N. H. l. v. c. 31. tom. 1. p. 285. ed. Hard.) who had collected the testimonies of antiquity, says, that it was formerly an island. Its local appearance makes this cre-

The grounds around it are so low, that the sea still covered a part of them in the time of Strabo, (ib. viii. tom. 2. p. 431.) The town, built upon a rock, which forms a handsomc road for shipping, was out of the reach of inundations. Aboukir has been lately (se. in 1794,) rendered famous by the battle between the English and French fleets, in which the British admiral, Nelson, obtained a signal victory, and for which he has been honoured with a peacock. The place itself, though well fortified, and vigorously defended by the Turks, was taken by the French in 1799, and retaken by the English in 1801.

ABOUT, in some languages, the situation of a ship immediately after she has touched, or changed her course by going about and standing on the other tack. About ship is the order to the ship's crew for tacking.

ABOUTIGE, or ABUTISH, in Geography, a town in Upper Egypt, near the Nile, where they make the best opium in the Levant. It was formerly a large, but is now a mean place, though governed by an Emir. It stands on the site of Abzis, mentioned by Stephanus Byzantius; the burchr of Settese, a little above it, represcnts the final city of Apollo. N. lat. 26° 50'.

ABRA, a silver coin in Poland, nearly equivalent to the English halfpenny. It is current in several parts of Germany, and through the dominions of the Grand Signior, at the value of one fourth of the Holland's dollar or eflan. See Covan.

ABRABANEL, ABRABANEL, or ABRAYANEL, ISAAC, in Biography, a learned Rabbi, said to be the same as King David, and born at Lisbon, A.D. 1437. He was obliged to leave Spain with the other Jews, after having been confessor to Alphonso V. king of Portugal, and to Ferdinand the Catholic. He refided at Naples, Corfu, and several other cities, and died at Venice in 1508, aged 71. Among the Jews he was denominated the sage, the prince, and the great politician. Some writers say, (See Accl. Lipp. Nov. 1626, p. 530.) that, by negotiating bills of exchange, which was the business he followed at Corfu, after he fled from Lisbon, and by practicing the several arts and frauds of the Jewish people, he amassed prodigious wealth; that he oppressed the poor; that he apired after the most illustrious titles, such as the nobled houses in Spain could not attain; and that being a sworn enemy to the christian religion, he was the principal cause of that foom which fell upon him and the relick of his nation in 1522, when they were driven out of the Spanish dominions. His Commentary on the Old Testament, which is scarce, is written in a clear, though diffuse, style; and adheres principally to the literal sense. This book, which consists of detached parts, composed at different times, abounda with so much raocour against the Christians in general, and the Roman Catholic in particular, that father Bartolocci was of the opinion that the Jews should be prohibited the perusal of it; and they were not allowed to read or keep in their houses his commentaries on the latter prophets. Bibl. Rabbin. tom. iii. p. 876, 879. Of his other works are, A Treatise on the World against Arithlile, who maintains its eternity; a Treatise on the Explication of the Prophecies relating to the Messiah against the Christians; a Book concerning Articles of Faith; and some others of his note. The various perfections which he, and other Jews suffered, foured his temper, and produced an implacable hatred against the Christians, which he has manifested in his writings; though, in company with them, he behaved with great politeness, and was cheerful in conversation. He was an affable friend, and a very ready writer.

ABRACADABRA, or ABRASADABRA, a magical word, recommended by Serenus Samonicus, preceptor to the younger Gordian, as a charm, or amulet, in curing agues, and preventing other diseases, particularly the fever called by the physicians hemipneus. See Seren. Samon. de Medic. N. 57. p. 1598. fol. Mattaire.

To have this effect, the word must be written on paper, and repeated, omitting each time the last letter in the former, so that the whole may form a kind of inverted cone, (as in the margin,) in which there is this property, that which way ever the letters be taken, beginning from the apex and descending from the left to the right, they make the same word, or as some would have it, the same sentiment, as is found in the first whole line. This paper must be suspended about the neck by a linen thread. According to Julius Africanus, another ancient writer, the pronouncing of the word in the same manner, will do as well.

ABRACADABRA is said to have been the name of a god worshipped by the Tyrans, so that wearing his name was a kind of invocation of his aid; a practice not more superstitious than that of some christians, who bear various things about them in expectation of their operating by sympathy.

ABRAHAM, in Scripture History, the celebrated patriarch, who was the father and founder of the Jewish nation, though it was never called by his name. He was the son of Terah, and the 16th in his paternal line, by his second son Simeon, who lived till Abraham was 175 years old. He was born 372 years after the flood, and A. M. 2528, according to the Hebrew chronology, in Ur of the Chaldees, in the 13th, and not, as some have supposed, in the 7th year of his father's life, and removed with him, at the age of 70 A. M. 2598, into Haran, where Terah died at the age of 283 years. At the age of 75, i.e. 427 years after the flood, A. M. 2983, he migrated into Canaan, in consequence of the divine order and promise, recorded in the first five verses of the 12th chapter of Genesis. Nicolaus (Conn. v. cii. p. 741.) supposes, that this promise was made to the patriarch before he dwelt in Haran (see Acts viii. 3), and that it was 450 years before the law. (See Gal. iv. 17.) But the interval from the birth of Isaac to the law was 450 years; and therefore he concludes, that the promise was made at Ur, thirty years before the birth of Isaac, who was born when Abraham was 100 years old, and that it took place much about the time of his removal to Haran. Of the Opinions (see Taylor's Scheme of Scripture Divinity, PI. 250.) as the promise to Abraham at the time of his removal to Canaan A. M. 2587, ante A. D. 1921, and they reckon 450 years from that period to the Exodus. Compare Exod. 41, with Gal. iii. 17. See Blair's Chronology, PI. 1. This promise, however, was the foundation of that grand scheme for preventing the universal prevalence of idolatry, and for preserving among mankind the knowledge and worship of the only true God, which, under several variations and improvements, was to reach to the end of time. For this purpose Providence selected the family of Abraham, which was afterwards formed into a nation, instructed in religious knowledge by God himself, and favored with such extraordinary privileges and honors, among all other nations of the earth, as were in their own nature adapted to engage them, by the most rational motives, to adhere to God and his worship. The ground of this noble and extensive scheme, and of God's singular regard to Abraham and his posterity, was the Constitution of Grace, the promise or grant of favours and blessings to mankind in Jesus Christ, our Lord. In the conduct and accomplishment of this scheme, God required the patriarch to call himself

G 2

wholly
ABRAHAM.

wholly upon his Providence, by removing at his special command, from his own kindred and country, to an unknown distant land, which he would shew him, affuring him of his presence and special blessing. Accordingly, soon after his settlement in Canaan, probably within two or three years, notwithstanding the renewal of the divine promise, that this land should be given to his posterity, he was forced by a grievous famine to remove into Egypt. Many chroniclers fix the commencement of the 430 years, during which the Israelites continued in this country, at this period. Here Sarah, though she had previously consented, for her own security and that of Abraham, to be called his sister, was forcibly taken away by the king of Egypt; who captivated by her beauty, designed to have made her his wife. But the king was punished in an extraordinary manner for the injustice of his conduct, restored her without violation, and gave orders, that Abraham, and his wife, with all that belonged to them, might safely depart from his dominions. The famine having caused in Canaan, he returned to the situation near Bethel, which he had left, and where he had erected an altar, and devoutly acknowledged his happy deliverance. Abraham, being under the necessity of separating from Lot, his nephew, on account of the increase of their subjugation, and the contention of their respective herdsmen, removed to the plain of Mamre, in Hebron. Here he formed an alliance with three of the principal persons of the country, by whose assistance he rescued Lot, who had been taken captive, and restored him, his family, and his whole property, to his former habitation. A.M. 2097. At his return, as he passed near Salem, supposed to be the city afterwards called Jerusalem, he met Melchizedec, who was king of that city, and "priest of the Most High God," and received from him tokens of special favour. Soon after this event the divine promise was again renewed to him, and accompanied with circumstances of peculiar encouragement. It was particularly revealed to him, that his posterity should be fojourn, and be afflicted in a strange land 430 years; at the expiration of which, God would interpose for the punishment of their oppressors, and for their rescue. These years are to be reckoned, not from their coming into Egypt, but from the birth of Isaac. For during the whole time of their sojournning in the land of Canaan and elsewhere, they were in a strange land, in which they had not a foot of ground, it we except the cave of Machpelah. The meaning of this prophecy to Abraham, therefore, can only be this, that his seed from Isaac forward should be strangers in a land that was not theirs, for the space of 430 years, during which they should be oppressed, and at some part of which they should be afflicted, under bondage; this term being expired, they should find a happy deliverance. After the renewal of this promise, Abraham married Hagar, who was recommended to him by Sarah, and whose children she designed to adopt and educate as her own, according to the custom which was common in those times. By Hagar he had a son, who was called Ishmael, A.M. 2094. When the patriarch had attained the age of 90 years, A.M. 2107, ante A.D. 1897. God was pleased to ratify his former covenant with him, by changing his name from Abram, formed of אָבָרָם, father and רָם, exalted, into Abraham, derived from אָבְרָהָם, father of a great multitude, signifying him that he would make him the father of many nations. Gen. xvii. 5. As a token and confirmation of the covenant now made with him, he enjoined him to be circumcised, and to circumcise all the males of his family; and he promised that, within a year, he should have a son by his wife, whose name was now changed from Sarah, q. d. my princess, to Sarah, the princess. This son was to be called Isaac; to him belonged the covenant and promise; and in his seed all the nations of the earth were to be blessed. The promise of a son was again renewed by those celestial messengers, who announced to him the destruction of Sodom. His intercession on behalf of this devoted city, though in the issue unavailing, forms a distinguishing circumstance in his history. Soon after this event, Abraham removed to the country of the Philistines, and sojourned in Gerar, where an incident occurred similar to that which had happened in Egypt. See ABINIDIA. Isaac was born at the appointed season, 433 years after the flood, and A.M. 2108. But within 25 years after this joyful event, upon which depended the accomplishment of the divine promise, and of the patriarch's hopes, Isaac was demanded as a burnt-offering, and Abraham was ordered to present the offering on mount Moriah. The event, with all the circumstances that attended it, is well known. The order was countermanded, and the patriarch, in consequence of this signal trial of his faith and obedience, obtained a solemn renewal of all the divine covenants and promises. In the year 488 after the flood, A.M. 2144, Sarah died at Hebron, and was buried in the cave of Machpelah, which Abraham purchased as a burying-place, of the sons of Heth, for 400 pieces of silver, amounting at the rate of 3s. for a shackle, to 60l. of our money. This purchase was made, according to the custom of ancient times, at the gates of Hebron. Abraham having married his son Isaac to Rebekah, the daughter of Nahor, his brother, at the age of 141 years, took another wife, named Keturah, by whom he had six sons. Thrice he portioned, that they might not interfere with Isaac's inheritance; and they went to the east of Beer-sheba, and the land of Canaan, and settled in both Arabia, the Petraen and Deleteria, where some traces of their names are still to be perceived. This venerable patriarch died in the 175th year of his age, 547 years after the flood, A.M. 2183, and was buried by his two sons, Isaac and Ishmael, in the cave of Machpelah, near Sarah, his wife.

1. To the above abstract of the history of Abraham, recorded in the book of Genesis, it may not be improper to subjoin a few particulars collected from other sources. Terah, the father of Abraham, it is said, (Suidas in voc. Ἀβραὰμ and Ἠσυχ, Lex. tom. i. & ii.) made statues and images for the purposes of that idolatrous worship, which had been transmitted to him from his ancestor Scrug, and which he encouraged by example and exhortation. Some Jewish authors relate (apud Genebrard. in Chron.) that Abraham pursued the same occupation; and Maimonides (More Nevochim, c. 29.) says, that he was educated in the religion of the Sabaens, who acknowledged no deity but the stars, and that he was led by his own reflection to the belief of an intelligent Creator and Governor of the universe; but that he did not renounce paganism till the 50th year of his age. That he was brought up in the religion of the Sabæans is an opinion adopted by Spencer, de Leg. Heb. Rituali lib. ii. c. i. § 2, vol. i. 279. See SABAISM. Suidas (ubi supra) informs us, that at 16 years of age he cautioned his father against seducing men to idolatry for the sake of pernicious gain, and taught him that there is no other God besides him who dwells in heaven, and created the whole world. It is added, that he destroyed the statues and images of his father, and departed with him from Chaldæa. Others relate (Heidegger Hilt. Patriarch, tom. iii. p. 36.) that his father deputed Abraham to fell his statues in his absence, and that a man, who pretended to be a purchaser, having ascertained that he was 50 years of age, remonstrated with him for adoring at such an age, a being which is but a day old. Abraham, impert and confounded by this remonstrance, destroyed them all, excepting the largest, before
before his father's return; and he told him, that having presented an oblation of flour to the idols, the Roonletes of them, in whose hand he had placed a hatchet, hewed the others to pieces with that weapon. Terah replied, that this was but of the idolai religion, because the idols had not blemish to act in this manner; upon which Abraham retorted these words upon his father against the worship of such gods. But he was delivered up by Terah to Nimrod, the sovereign of the country, and because he refused to worship the fire, according to his order, he was thrown into the midst of the flames, from which he escaped uninjured. Mr. David Levi, in his "Lingua Sacra," has given an account of this tradition, extracted from Medraoth Bersibidi; and it is related by Jerome; (Trad. Hebraica in Genelin,) who seems to admit its general credibility. The vulgar translation of 2 Efdras ix. 7. expresses that he was delivered from the fire of the Chaldeans; but the ambiguity of the word Ûr, which denotes fire, as well as the birth-place of Abraham, seems to have given rise to this opinion. However, if we allow that Abraham, being born and educated in an idolatrous country and family, might have been addicted in very early life to that superstition, it is certain that he renounced it, and that he was providentially removed from a scene of danger, and that he contributed to propagate full sentiments concerning the Deity wherever he journeyed. The fame of his wisdom, piety, and virtue, spread far and wide among the nations of the world: this appears from the testimonies of Berofus, Hecateus, Nicholas of Damaseus, cited by Iophenus, (Antiq. l. i. c. 7. apud Opri. tom. ii. p. 12. ed. Hare,) and also from what is said of him by Alexander Polycleitus, Eusebius, Artapanus, and others, whose testimonies may be found in Eusebius's Preap. Evang. lib. ix. cap. 16, 17, 18, 19. His name is mentioned with honour all over the East to this day. Iophenus (Antiq. l. i. c. 8. tom. ii. p. 30.) informs us, that he taught the Egyptians arithmetic and astronomy; and we learn from others, (see Eusebius and Suidas,) that he also instructed the Phenicians in astronomy; that he invented the Hebrew characters and language; and that he wrote several books. Traditionary truth and fiction seem to have been blended in the accounts that are given of this eminent patriarch by the Jews, Arabsians, and Indians. Of the books ascribed to him, the principal seems to have been the tractate called Jetzirah, or the Creation, of which it gives an account. This is mentioned in the Talmud, and held in high estimation by several learned Rabbis. It was printed at Paris in 1553, and translated into Latin by Polet; and also translated into Latin, with remarks, in 1642, by Rittangel, a converted Jew, and professor at Amsterdlam. A book, called Abraham's Revelation, was dispersed by an ancient sect, under the denomination of Sethians. Abraham's Assumption is mentioned by Athanasius in Syaggeis; and Origen takes notice of a tractate, pretended to be written by him, in which two angels are introduced disputing about his salvation. The Jews also represent him as the composer of some prayers, and of the 156th Psalm, and of a tractate against Idolatry. Fabricius (Biblic. Græc. tom. ii. p. 516.) informs us, that some astrological books of Abraham, which are now lost, are commended by Vettius Valens and Jul. Firmicus; and from Kirchen's Tractate of Libraries, p. 142, we learn, that all the several words, which Abraham composed in the plains of Mamre, are contained in the library of the monastery of the Holy Cross on Mount Amara, in Ethipia. The Indians believe this patriarch to have been the same with their great prophet Zoroaster. According to the Arabians, who have given us a history of Abraham, very different from that of the Bible, he was the son of Azar, and grandson of Terah; and the eastern heathens have a long tradition concerning Abraham's life, which differs very much from that of Moses. In a book, said to be in the French king's library, No. 792, which was written by Ephrem the Syrian, and translated from the Syriac into Arabic, upon Abraham's journey into Egypt, there is a sermon on his death, preached by St. Athanasius, on the 26th of March; on which day the Coptic and Egyptian Chalrilians observe his festival. Among the Mahometans, the memory of Abraham is held in great veneration, and his name frequently occurs in the Koran. See Arab. We are told by Emb Shoban, (ad Ann. Hebraicar. p. 518, cited by D'Herbelot Bibl. Orient. Art. Abraham, p. 174.) that in the beginning of the 12th century, the tomb of Abraham having been discovered near Hebron, his body, as well as those of Isaac and Jacob, were found entire and uncorrupted. There were likewise some gold and silver lamps hung up in the cave, which was visited by multitudes. The Moflems have made a reverence for this place, that they make it one of their four pilgrimages, the three others being those of Mecca, Medina, and Jerusalem; and the Christians built a church over the cave, which the Turks afterwards converted into a mosque, and prohibited Chalrilians from approaching. The emperor Alexander Severus, (Lamp. in Sever.) who knew Abraham only by the extraordinary circumstances related by Jews and Christians, conceived to high an opinion of him, that he ranked him with Jesus Christ among his gods.

Abraham, Rabâth, in Biography, was prince of the Jewish nation, and tutor to Abenazer. He foretold that the Messiah would be born under the same constellation or conjunction of Jupiter and Saturn, with Moses the Jewish lawgiver. According to his calculation, this was to happen 2859 years after the former, i.e. A.D. 1494; and two such conjunctions are said to have actually occurred within the 15th century, viz. in 1444 in Canaan, and 20 years after in Pices; but instead of deliverance, the Jews experienced only disaster and difficulties.

Abraham, R. Ijac Ben, a Jewish writer, who lived about the beginning of the 15th century. He was by nation a Polander, but spent most of his time in the courts of Germany. His book, intitled, Chafuk Emunah, i.e. Munim Fidei, was a violent attack on the Christian religion, in which he examines the whole gospel, and endeavours to explode all the proofs of it, and to confute the objections of Christians against the Jews. This book, which was composed against the disciples of Luther, was published in 1610, from a MS. which was become very scarce. It was translated into Spanish, and very widely dispersed. The African Jews held it in high estimation, and from them it was brought into Germany by Wagenfeld, who invented a Latin translation of it in his Telia Ignea Sataris.

Abraham Usque, a Portuguese Jew, supposed by some to be a Christian, who, with Tobias Athins, translated the Bible out of Hebrew into Spanish. It was printed at Ferrara in 1555, and reprinted in Holland in 1620. The first edition of this Bible, which is the most valuable, is marked with stars at certain words, which are designed to shew that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

Abraham, or Abram, Nicholas, a learned Jesuit, was born in the diocese of Toul in Lorraine in 1590. He was made divinity professor in the university of Pont a Mousson, which office he held 17 years, and died Sept. 7, 1655. He wrote notes on Virgil and Nonnus, a Commentary on some of Cicero's Orations, in 2 vols. fol. a collection of theological pieces, intitled, Phæbus Vetus Tert. and some other works.
ABRAHAM, Israel Pitarc, a Jewish rabbi, who flourished at Amsterdam about the middle of the 17th. He wrote a book intituled, the Sceptre of Judah, which is an exposition of the prophecy of Jacob, and intended to confute the notion of the Messiah’s having actually appeared. This work has given a particular account of this book, which he saw in MS. Hall, des Juifs, i. ix. c. 16. § 14–21.

ABRAM, Isle of. See St. Mary.

ABRAHAMANS, or ABRAHAMITES, in Ecclesiastical History, a sect of heretics, who renewed the error of the Paulicians.

They took their names from that of their leader Abraham, a native of Antioch, by the Arabs called Ibrahim; whence also the name Ibrahimish, given by them to this sect. The Abrahamins arose about the close of the eighth century, and were opposed by Cyril, patriarch of Antioch.

The same denomination is also applied to a party of monks, who suffered death for the worship of images, under Theophilies.

ABRAHAMSDORF, in Geography, a populous large village in Upper Hungary. E. long. 10° 52′. N. lat. 46° 26′.

ABRAM’s Creek, a creek which falls into Hudon’s river in America, near the city of Hudon.

ABRAMBOE, a town in the kingdom of Feni on the African coast, in which is held a brilliant assembly of the natives from all parts of the kingdom, to celebrate, by dancing, and other diversions, the birthday of the king.

ABRAMES, in Italic History, a name given by Bellonius and others to the Cyprisian pan, of Erema.

ABRANTES, in Geography, a town of Ebramadura in Portugal, seated on an eminence near the river Tejo, and encompassed with delightful gardens and olive-yards. It contains about 3500 inhabitants, four convents, and an hospital. It was fortified by Peter II., raised to a county by Alphonso V., and promoted to a marquisate by John V., in 1718. W. long. 3° 18′. N. lat. 39° 11′.

ABRASA, in Surgery. See Abrasion.

ABRASAAXAS. See Abbraxas.

ABRASION, composed of the Latin ab, and radis, to shave, or scrape off, a superficial excoriation or ulceration of any part of the body; but the term is generally applied to a surface which has been rubbed off by external violence. The minute portions of abrascd skin are not to be hastily taken away; as, by careful re-application, they may often adhere and unite, thus preventing the consequences of a recent wound. See Adhesion and Agglutination of Wounds.

Sores attended with excoriation are denominated abraxis. The part rubbed off is technically named abrason. Vide Orthphi de Morb. Curat. I. iii. c. 16.

ABRAVANNUS, in Ancient Geography, the name of a promontory and river of Galloway, in Scotland, so called from Abr, which, in Civic, denotes the mouth of a river, and abenas, a river. It is probably that small river which falls into the bay of Glenluce, a little to the south of the mouth of Galloway.

ABRAUM, in Natural History, a name given by some writers to a species of red clay, used in England by the cabinet-makers, &c. to give a red colour to new mahogany wood; we have it from the Isle of Wight, but it is also found in Germany and Italy.

ABRAXAS, a barbarous word, denoting a power which presides over three hundred and sixty-five others, the number of days in the year.

Abraxas is a word of obscure origin: it is supposed to be technically compounded of the Greek letters, considered as numeral characters: according to the custom of the Greeks, who expressed their numbers by letters of the alphabet; the values of which in the present word stand thus: Α 1, Β 2, Π 100, Α 1, Σ 100; which added together make the number 365.

The word is usually written, among modern authors, abracas, though as some hold, by a corrupt transposition of the letters Α and Σ, for abraxis, as it is found in all the Greek fathers, as well as on ancient stones. Irrelevant (lib. i. c. 23, p. 90, ed. Grabe) has abracas, but the reason may be, that the chapter in which the word occurs is only extant in Latin: fa th thought he be in Greek characters, the orthography is of Latin copyists or translators. — In frankness the word ought to be written in Greek character, λαραθακας; since, besides that the inventor of it spoke that language, the word does not contain the number 365, when written in the Latin character. Hence a farther error in moft books, which occurs in the smaller or running character, on account of the Greek sigma; this having in ancient inscriptions the same figure with the Latin С, is often rendered by a Roman C instead of С; whence abracas, or abraxis.

Beauchef (Hall de Manich. tom. ii. p. 55, 56) conjectures, with a very great degree of probability, that abracas, or abraxis, is derived from two Greek words, which signify magnificent Saviour. For the epithet abraxis, the full part of abraxis, is particularly applied, in the sense of magnificent or splendid, to Apollo and Bacchus, who, according to Macrobias, (Sst. i. i. c. 18.) are the same deities; and the second word of which abracas is composed is koumas, which is used by Homer for kouma, or ka, which denotes salvation.

Many learned moderns affirm, that the Balsilians used to call the supreme God Abraxas. For this they have the authority of Jerome (Adv. Lucif. p. 304.), and of the author of the additions to Tertullian’s Book of Prelections, c. 36. But that these writers are mistaken, we may conclude from the better authority of Irenaeus (lib. i. c. 23.), who informs us, that their opinion was, that the Father of all was invisible, or without a name, and that abraxas was the first of their 367 heavens, or the prince of the angels that reigned in them. It is probable that they applied this term to the arcsana of their philosophy, and not to their theology. Accordingly, Jerome affirms us, (ubi supra,) that it is the same with Mythras, or the Sun, which is the deity worshipped by the Persians. Hence we learn, why abraxas is said to be the chief of the 365 heavens, or angels who reign in them, and rule over the 365 days of the year; for the fun, may, according to their doctrine, be said to reign over all the days of the year, and in the hieroglyphical language, to contain in himself the parts of which the year is composed, and to rule over it. Abraxas is, therefore, a technical term, much in the spirit of the caballistic or oriental philosophies; which, joined with that hieroglyphical disposition for which the Egyptians were remarkable, will account for the emblematical figures that appear on several of these gems, called by Montfaucon (Valkog, Grac. i. ii. c. 8) abraxas. But there is no sufficient evidence that these belonged to the Balsilians.

Several have even suspected that they discover some trace of the gospel trinity concealed in this word; which they explain, by supposing it compounded of the initial letters of the Hebrew words Ab ben ronah, q. d. Father, son, and spirit. Wendelin, canon of Tournay, and Father Har- donin, have given more precise explications of the word, according to this fyllem. The former makes it stand for patri, filius, spiritus sanctus, filius, etc.: the latter, im-
proving somewhat on the explanation, makes it represent as
below,

Abraxas is also used, among Antiquaries, for a species
of graven gem, on which the word abræs is usually inscribed;
supposed to have been worn by the ancient Gnostics, 
Basililians, and Carpocrates, as an amulet or talisman
against diseases.

If the above explanation of the meaning of the term
abraaxas be just, we can easily account for the introduction
of this practice. In the fخام of ancient mythology,
Apollo and the Sun were the same, and Apollo was the
god of healing. Hence, in the true spirit of hieroglyphics
and mythology, these gems were undoubtedly used by the
heathen, and probably by some superstitious Christians,
who being lately converted, retained a reliquy for their former
aburdities, as amulets, or charms, to drive away aegres and
other diseases; and this also gave rise to the use of the word
Abraxas for the same purpofe. It is not unlikely
that they were found among the oracles as well as among
the Basililians and other reputed hieroglyphs.

Abraxas is of divers figures and types: sometimes in
that of rings to be worn on the finger; in which form they
were supposed of great efficacy for driving away flies.

Abraxas frequent in the cabinets of the curious: a
collection of them, as complete as possible, has been much
defired by several. There is a fine one in the abbey of St.
Genevieve, which has occasioned much inquiry. They are
chiefly of the third century; most of them seem to have
come from Egypt, whence they are of considerable use for
explaining the antiquities of that country. But they are
much too numerous and too costly to have been the production
and possession of the Christians of the three first centuries,
though they had all taken delight in such things.

Macarius, Chifflet, Capello, and Montfaucon, have written
expressly on abraxas; the latter has given 36 plates of
them, well filled, and he has divided them, for the sake of
order and perplicity, into seven different claffes.

Abraxas have sometimes no other inscription besides
the word; but more usually some symbol annexed to it.
Besides which, we sometimes find other marks and words
adjoined, as the names of sains, angels, apostles, and the ineffable
name Jehovah itself, either at length, or in the abbreviatior 1A8;
sometimes the words αβρααρα, Αβραάμ, Εβραίον, or the names of other gods as Mithras, or Mithra; 
Αβρααρα, Αβραάμ, Εβραίον, or Scaples, the one Jupi-
tes, and the like. Sometimes we observe this fitting on a
lotus, or Aphis, surronded with stars; Oloris, Scaples, Har
praces, Canopus; the cock, the dog, the lion, the ape,
and the sphinx, which are well known symbols of heathen
deities; sometimes monstrous compositions of animals, ob-
scene images, Phalli, and Ithyphalli; in a word, every kind
of thing which the Egyptians placed among their gods.
The graving of abraxas is not uniform, rarely good; the reverse,
which is the word, is said to be sometimes of a lower
and a more modern talle than the face. The characters are
usually Greek, sometimes Hebrue, Coptic, or Hetrurian;
and sometimes of a mongrel kind, forged as it should seem
in purpose to make their import imperceivable. It is disputed,
whether or not the Veronica or Montreuil, or the Granite
oboliff, mentioned by Gori, be abræs. Dr. Lardner, who, with an indiyinity and accuracy
for which he was distinguished, and by which he has ccnumently
served the cause of Christianity, has examined the particular
class of these gems given by Montfaucon, and clearly
proved that they are of heathenish origin. Many of the
figures and inscriptions on them are exceedingly obscene and
idolatrous, and could not be the production of any Christian
fact whatever; but they must be pagan, and for the most
part Egyptian. To this purpose, Beaufobre (Add. fidg, cap. 4) observes, that it is altogether incredible, that a
gem, which made profession of Christianity, should have adopted
the monsters adored by the Egyptians; or that a man who
breathed of driving his doctrine from Matthew, and from an
interpreter of St. Peter, and who received the godhead and
the epistles of St. Paul, should make images of the deity;
at a time when Christians had the most efficace aovation to
all forms of images, even the most innocent. This learned
writer has also urged a variety of irrefragable arguments
against the opinion of others, who maintain that these gems
were the invention of the Basililians. From many of the
figures themselves, produced by Chifflet, it appears that
they are pagan, and of Egyptian origin, and could not be
among any sects of Christians; and as for those gems, which
have the names of Abraham, Isaac, or Jacob on them, or
the God of the patriarchs, or the words, Sabaoth, Adonis,
or Elos, the fays, are the inventions of the Cabba-
liahs, or of the Egyptian magicians; and he has thus
explained, from his observations on Chifflet's figures, the fame
conclusion, which Dr. Lardner has drawn from those of Mont-
faucon. As for the names of angels, which Montfaucon
afferts (Pal. Græc. l. ii. c. 8. p. 172.) to have been in use
among the Basililians, it is evident, that those which he
mentions were derived from the Ophiites, as Origin (Cantab.
vol. i. p. 295. *) and Montreuil, (he
paraphras an ws. After a elaborate investigation of this
controversied subject, Dr. Lardner concludes in words familiar
to those of Beaufobre; 1. That Ab was not the name of the
Basililians. 2. That this name signifies nothing but
the fun, which was never worshipped by them. 3. That the
figures, both in Chifflet and Montfaucon, are, for the most
part, Egyptian. 4. That there is no kind of proof that any
of them belonged to the Basililians. 5. That those which have Iao, Sabaoth, &c. upon them, were the works
of magicians, who never made any profession of Christianity.
6. That none of these figures derived their origin from the
Simonians and Ophites, who were not Christians either
in belief or profession. See Lardner's Works, vol. i. p. 
290--364.

ABREAST, a Marine term, expressing the situation
of two or more ships, that lie with their sides parallel to each
other, and their heads equally advanced. But if their sides
do not parallel, then that ship, which is in a line with the
beam of the other, is said to be abreast of her. When a
line of battle at sea is formed abreast, the whole squadron
advances uniformly, the ships being equally distant from,
and parallel to each other; so that the length of each ship
forms a right angle with the extent of the squadron, or line
abreast. See Line. Abreast, within the ship, denotes a line
with the beam, or by the side of any object aboard.

Abreast of any place, means off or directly opposite to it.

ABREVO, in Geography, a small town of Tras-
Montes in Portugal, in a district, which, according to Bu-
fling, consists of one parthi. W. Long. 7° 10'. N. Lat. 41° 20'.

ABRUTTENE, in Ancient Geography, a district of
Myia in Aen. Hence, according to Strabo (Geog. tom. ii. 
p. 861),
ABRIDGE

p. 851.), the epithet Abredenous, given to Jupiter, whose priest was Cleon, who, after being the leader of a gang of robbers, received signal favours from Antony, and in the Actian war deserted him and went over to Caesar. The people were called Abredenous, and inhabited the country that lies between Ancyra of Phrygia and the river Rhynacis. Cellarius.

**ABRIDGING, in Algebra, is the reducing a compound quantity, or equation, to its more simple expression.**

To abridge the equation
\[ n^3 - ax^2 + abx - abc = 0 \]
\[ -b + ac \]
\[ -c + bx. \]

All the known quantities \(-a-b-c\) of the second term are supplied equal to some single letter \(-n\) all the known quantities \(+ab+ac+bc\) of the third term, equal to another letter \(+p\); and all the known quantities \(-abc\) of the fourth term, equal to a single letter \(-q\). By which means we have \(n^3-ax^2+\)

\[ = p - 2 = 0, \]

instead of the equation.

An equation thus abridged, is called a formula.

This is done either to save room, or the trouble of writing a number of symbols, or to simplify the expression for relieving the attention and memory, or rendering the formula more easy and general.

**ABRIDGMENT, in Literature, a summary or contradiction of a discourse: wherein the less material things being more briefly infilled on, the whole is brought into a lesser compass. The Abbé Guéjart has published an elaborate work in 2 vols. 4to, intitled, A Method of Making Abridgments.**

Abridgments of books are numerous. They are usually said to have had their rise in the times of ignorance; to have been one of the first fruits of that barbarism which ensued on the decline of the Roman empire; and to have been unknown in those happy days, when letters flourished among the Greeks and Romans: yet we have some traces of them in those times. Lord Bolingbroke, speaking of those who are employed in this way, says, that "they do neither honour to themselves, nor good to mankind; for surely the abridger is in a form below the translator: and the book, at least the history, that wants to be abridged, does not deserve to be read. They have done, anciently, a great deal of hurt, by substituting many a bad book instead of a good one; and by giving occasion to men, who contended themselves with extracts and abridgments to neglect, and, through their neglect, to lose, the invaluable originals." See Epitome. Notwithstanding this reflection, abridgments are in many cases necessary and useful; though it is a difficult task, and it requires peculiar talents to perform the office of an abridger well; to preserve the original author's facts, reasoning, manner, and spirit, and to omit nothing that is essential either in argument or illustration, and at the same time to rectify what is redundant, to restrain needless amplification, and to avoid irritable or useless digressions, are objects of unquestionable importance. When these objects are duly regarded, abridgments cannot fail to make knowledge of various kinds more easily of access and of attainment, and by reducing the expense and labour of acquiring it, to extend its diffusion and prevalence. To readers of various classes and descriptions, compendious epitomes of voluminous works will be acceptable and useful. The practice of abridging books that are read, or the lectures of public professors in the various departments of science, is a method of study, which has been recommended by those who have experienced its utility, and which has contributed in no small degree to assist both the judgment and the memory. Those who have accustomed themselves to this practice have also acquired a facility of composition, of which they have availed themselves on various occasions; whatever may have been the employment or profession to which they have been devoted. We shall here subjoin two excellent specimens of this kind of abridgment which we have recommended.

In the Essay on Miracles, Mr. Hume's design is to prove, that miracles which have not been the immediate objects of our senses, cannot reasonably be believed upon the testimony of others. His argument is:

"That experience, which in some things is variable, in others uniform, is our only guide in reasoning concerning matters of fact. Variable experience gives rise to probability only; an uniform experience amounts to proof. Our belief of any fact from the testimony of eye-witnesses is derived from no other principle than our experience of the veracity of human testimony. If the fact attested by our miraculous here arisen consists of two opposite experiences, or proof against proof. Now a miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as complete as any argument from experience can possibly be imagined; and if so, it is an undeniable consequence, that it cannot be supported by any proof whatever derived from human testimony."

In Dr. Campbell's Dissertation on Miracles, the author's principal aim is to shew the fallacy of Mr. Hume's argument; which he has most successfully done, by another single argument, in the following manner:

"The evidence arising from human testimony is not solely derived from experience; on the contrary, testimony hath a natural influence on belief antecedent to experience. The early and unlimited assent given to testimony by children, then gradually contracts as they advance in life: it is, through the various conditions of life, a difference in testimony is the result of experience, that human faith in it has this foundation. Besides, the uniformity of experience in favour of any fact, is not a proof against its being revered in a particular instance. The evidence arising from the single testimony of a man of known veracity, will go farther to establish a belief in its being actually reversed. If his testimony be confirmed by a few others of the same character we cannot withhold our assent to the truth of it. Now, though the operations of nature are governed by uniform laws, and though we have not the testimony of our senses in favour of any violation of them; still, if in particular instances we have the testimony of thousands of our fellow-creatures, and these too men of strict integrity, swayed by no motives of ambition or interest, and governed by the principles of common sense, that they were actually witnesses of these violations, the conclusion of our nature obliges us to believe them."

These two examples contain the substance of about 400 pages.

For abridgments of the common law and the statutes, see Digest, Law, and Statutes.

**Abridgement, in Law, is particularly used for the shortening a count or declaration, by substracting some of the substance of it.**

A man is said to abridge his plaint in affile, or a woman her demand in an action of dower, when, having put any lands therein which are not in the tenure of the tenant or defendant; and non-tenure, or the like, is pleaded to that land in the abatement of the writ; they are brought to abridge, i.e. to defile from and leave that parcel out of the demand; and pray that the tenant may answer to the rest, to which he has not yet pleaded any thing.---Though the demandant has
ABR has abridged his plaint, or demand; yet the writ still remains good for the rett. The reason is, that such writs run in general, and do not specify particulars. See 21 H. VIII. c. 3.

ABRICATARUM opithum, in Ancient Geography, the town of the Abrincati or Abrincaus, now Avanches, in France, situated on an eminence in the south-west of Normandy, near the borders of Brittany, on the English Channel. W. long. 1° 10'. N. lat. 48° 40'.

ABRIZAN, or Abrizopian, derived from Abrie, which signifies in Perian, a vessel proper for pouring out water; the name of a feast observed by the old Perians on the 13th day of the month Tir, which nearly corresponds to our September, with abundance of idolatrous superstitious. This heathenish festival was apparently preparatory to the descent of the rain in those countries, being about the time of the autumnal equinox, and has been partly adopted by the Mahometans. Mr. Harmer (Observations on Scripture, vol. iii. p. 100) has alluded himself of the practice at this feast, to explain the Jewish ceremony of pouring out water at the feast of tabernacles, alluded to by our Saviour, John, ch. vii. After the return of the Jews from their captivity in Babylonia and Zechariah (ch xiv. xvii.) connects attending the feast of the tabernacles with obtaining the rains of autumn, which are of such consequence after the drought of a Syrian summer; and therefore (says the ingenious writer) this rite was probably then practised, and the pouring out of water in the temple, with solemnity, as before God, understood to be a religious prognostic of the approach of rain, or a morally instrumental and procuring cause of its speedy coming. Might not (he adds) the returning Jews think of adding some memorial of Jehovah's being the giver of rain to that ancient national solemnity that had been enjoined by Moses, to be observed just about the same time of the year with that of the Persian festival, which that people solemnly ascribed to some deity they worshipped, but which the Jews knew was the gift of Jehovah?

ABROCHMENT, or Abrochment, Abrocmenzum, in some ancient Law-writers, denotes the act of ingrossing or buying up commodities by wholesale, before they come into the open market, in order to sell them off dear by retail, otherwise called forefalling.

ABROGATION, from the Latin abrogus, I repeal, the act of abolishing a law, by authority of the maker. In which sense the word is synonymous with abolition, repealing, and revocation. Abrogation stands opposed to ratification: it is distinguished from derogation, which implies the taking away only some part of a law; from fraudgation, which denotes the adding a clause to it; from abrogation, which implies the limiting or restraining it; from dispension, which only sets it aside in a particular instance; and from antigenation, which is the refusing to pass a law.

ABROHANI, or Mallemolli, the name of a kind of muflin, or clear white cotton cloth, brought from the East Indies, particularly from Bengal; being in length sixteen French ells and three quarters, and in breadth five eighths.

ABROJOS, or Bassos de Babuca, in Geography, a bank formed by several small rocks and isles, east of Turk's Island. W. long. 69° 42'. N. lat. 21° 5'. A deep channel of the breadth of three leagues lies between this bank and the island.

ABROKUS, in Botany, a name used by some of the Latin writers, for the bromus, or ovum flexile, the wild oat; and by others for the orbus, or bitter vetch. The Greeks originally used the word, and that not only for these two vegetables, but in a much larger sense, understanding by it any herb resembling the plants cultivated for the use of the table, but not eminent. The Greeks and Romans had a way of expressing the boiling of pulse or herbs, by words signifying the wetting of them: thus the Greeks expressed boiled things by brochus, or bros, and the Romans by muditus. Virgil uses the word for the peas, and Plantus, for all eminent things that were boiled: hence these ballard pens and oats were called abrocha, non mudita, not fit for boiling or eating.

ABROLOS, in Geography, dangerous shoals about 50 miles from the coast of Brazil, and about the island of St. Barbe. S. lat. 13° 22'. W. long. 38° 45'.

ABROMA, in Botany, formed of µ and σμ, q. d. not fit for food, is used in opposition to Theobroma, viz. a genus of plants belonging to the natural order of Cucurbitaceae, the Malvaec of Jussieu, and the 13th class of polyanthododendraria. The generic characters are as follows: the calyx is a five-leaved perianthium, with lanceolate, acute, spreading, and permanent leaflets; the corolla has five petals, larger than the calyx, with obovate, arched, concave, oblong, hairy, waved, and often, placating, dilute borders, contracted at the base into recurved little claws, on which the chief claws are placed, and a small pincher-shaped nectary, divided into five segments, which are obcordate, hairy, crenate, recurved, and arched; the stamens are five, membranaceous, very small filaments, growing on the nectary between the segments, emarginate, tridentate, with three anthers on each filament, that are twin and kidney-form; the pistil has a cylindroidal gynostylus, with five subulate styles, and acute stigma; the paracygium is an ovate, membranaceous, five-winged, five-beaked, and five-celled capsule, with folded partitions; and the seeds are numerous and subovate, within an oblique membranaceous aril, fixed in a double row to the central edge of the partition, which is thickened and longitudinally bearded, and without a receptacle. There are two species, viz. the Maple-leaved abroma, which is a tree, with a straight trunk, yielding a gum when cut, and filled with a white pith like the elder; it flowers in July to November, and its fruit ripens in December and October; it is a native of New South Wales and the Phillipine islands, and was introduced into Kew gardens about 1770, and is a pot-house plant, requiring great heat, and much water:—and Wheler's Abroma, fo called by Koenig, in compliment to Edward Wheler, Esq. of the Supreme Council in Bengal; this is a shrub with a brown bark, a native of the East Indies, and is not known in Europe. Miller's Dict. by Martyn.

ABRONO, in Botany, a name given by Serapon, and others, to the heart-pea; called also abragi.

ABROSTOLIA, in Ancient Geography, a town in Phrygia, which, according to Ptolemy and the Ptolemaic Table, is about 23 miles from Amorium. Cellarius, vol. ii. p. 80.

ABROTANOIDES, in Botany. See Artemisia, Protea, and Serephium.

ABROTANOIDES, in Natural History, a name given by Bauhin to the Madrepors marica of Linneus and others.

ABROTANUM or Abrotanum maj. See Artemisia, and Southernwood. Abrotanum subtilia. See Santolina, and Lavender-Cotton. See also Eriocophalus and Tanacetum.

ABROTANUM, in Ancient Geography, a town and harbour on the Mediterranean, in the district of Syrtes Parva, in Africa; one of the three cities that formed Tripoly.
ABRUG-Banyas, in Geography, a populous town of Transylvania, in the district of Weissenburg, the residence of the Mine office, and the chief of the metal towns. It is situated amongst mines of gold and silver. E. long. 23° 24'. N. lat. 46° 50'.

ABRUPTION, in Surgery, a term of the same signification with Abduction.

ABRUS, in Botany, of acris, soft, or delicate, so called from the extreme tenderness of the leaves, is a genus of the natural order of Leguminosæ, and the 17th class of Dipsacinae. Its generic characters are, that the calyx has a one-leafed, bell-shaped, obscurely four-lobed perianthium, with blunt teeth, the upper one broader than the rest; the corolla is papilionaceous, with a roundish banner, flattert at the sides, longer than the wings and keel, oblong blunt wings, and oblong sickle-shaped gibbous keel; the stamens are nine filaments united in a sheath, claven above, with oblong erect anthers; the pistil is a cylindrical hairy gametophyllum, with fumulate style, shorter than the stamens, and small stigma in form of a head; the pericarpium is a legume or pod, like a thumb, compressed, conarose, bivalved, with four or five cells, and a fumulate delphic claw; and the seeds are solitary and subglobea. There is one species, viz. the Abrus precatorius, formerly the Glycine abrun of Linnaeus, the Phascolus of Sloane, and Orbus Americusans, &c. of Tournefort. It grows naturally in both Indies, Guinea, and Egypt. It is a perennial plant, rising to the height of eight or ten feet. Its leaflets have the taste of liquorice, whence it is called in the West Indies Jamaica wild liquorice, and used for the same purpose. There are two varieties, one with a white, and the other with a yellow seed. The seeds are commonly drunck, and worn as ornaments in the countries, where the plant grows wild; and they are frequently brought to Europe from Guinea, and the East and West Indies, and wrought into various forms with other hard seeds and shells. They are also used for weighing precious commodities, and drunck as beads for rosaries, whence the epithet precatorius. They are frequently thrown, with other West Indian seeds, on the coast of Scotland. This plant was cultivated by Bishop Compton at Fulham before 1680. It is propagated by seeds, fowm on a good hot-bed in spring, and previously soaked for 12 or 14 hours in water. When the plants are two inches, each of them should be transplanteed into a separate pot of light earth, and plunged into hot-beds of tanners' bark, and shaded from the sun. They will flower the second year, and sometimes ripen their seeds in England. Miller by Martyn.

ABRUS, in the Materia Medica, the name of a seed produced by one of the phaenola, or kidney-beans, and commonly called Angola seeds.

ABRUZZO, in Geography, a province of Naples, deriving its name from the ancient city of Termos, which was so called. This name was applied by the Greeks, Lombards, and Normans, to a small domain, denominated the country of Abruzeo, or Abrutius. Under the Swabian government it was extended to the whole country that now bears this appellation. It is divided by the river Pescara into two parts, one of which is denominated Ulterior, or Ultra, having Aquila for its capital, and the other Ceterior or Citra, whole capital is Chieti. The tribunals of government in this country were fixed, on the acclimation of the house of Arragon, at Aquila and Chieti. But in the last century it was found expedient to divide that of Aquila into two jurisdictions; and a third tribunal was established at Teramo. In this province there are, besides the Appenine mountains, two others called Monte Cavallo and Monte Maelio, the top of the last of which is always covered with snow, and many more of inferior note. Although Abruzzo is a cold country, it is fertile in corn, rice, fruit, oil, and wine, which afford not only a sufficient supply for the natives, but artick for exportation. Wool is also a staple commodity, which is furnished by the flocks that pass summer on the fine pastures of the mountains, and are driven in winter to the plains of Puglia, and other parts near the sea coast, where the snow does not lie. Saffron was formerly produced in great abundance in the territory of Aquila, but since the culture of it in Lombardy, it has been neglected in Abruzzo. Liquorice-roots are exported from the maritime districts of this country; and in the province of Teramo there is a manufactory of pottery-ware, which is valued in Germany, and conveyed thither by the way of Treltje; but this is sinking into decay. This country, which is naturally fertile and productive, needs only industry and labour, under the protection and encouragement of a good government, to render it important and prosperous. But delicte of internal improvement and convenient sea-ports, it is, in most parts of it, desolate and wretched. Feludatory estates abound; but the towns are thinly inhabited, and the face of the country exhibits traces of inattention and neglect. The antiquity and naturalist may travel through this province with pleasure and advantage. The most interesting monuments are those of Monte-Corno and Majella. The inhabitants bear a great resemblance to their northern progenitors, who were first Lombards, and afterwards Normans, post-filling the same goodness of heart with great indulgence, and an indolentia to active exertions. Among the mountaineers there are evident traces of the Frank and Teutonic languages. In this province is the lake Cerano. Swinhorne's Travels, iv. p. 378.

ABYSAL, in Scripture History, the son of David, by Maccabah, daughter of Talmah, king of Gezul, and brother of Tamor, who was dishonoured by Amnon, David's son by another mother. For this injury, Amnon was afflicted by Abfilm at a feast which he prepared for the royal family. He then took refuge with Talmah, in the country of Gezul; and soon after he was restored to favour, he engaged the Israeleites to revolt from his father. Having been proclaimed king at Hebron, his father was under a necessity of leaving Jerusalem, where Abfilm was received by the people. He and his army, however, were soon routed by David's forces under the command of Joab; and flying into the forest of Ephraim, his hair was entangled in the branches of an oak, and in this situation he was killed by Joab and his armour-bearer, A. M. 2986, ante A. D. 1074. David, who had ordered his life to be preferred, lamented his death with excessive grief. The extraordinary weight of Abfilm's hair, which is stated (2 Sam. xiv. 26) at '200 shekels after the king's weight,' has been considered by critics and commentators as a difficulty, which is not easily solved. If we allow with Dr. Cumberland, (Effay on weights, &c. p. 103) that the Jewish shekel of silver was equal to half an ounce avoirdupois, 200 shekels would be equal to 64 pounds. Josephus (Op. t. 1. p. 386) supposes the 200 shekels to be 5 minae, and each mina to be 24 pounds, and consequently the weight of the hair to be 125 pounds, which is still more incredible. For the solution of this difficulty some have supposed that the shekel in this passage denoted a weight in gold equal to the value of the silver shekel, or half an ounce, and thus reduce the weight of the hair to about 5 ounces. Others suppose, that the 200 shekels signify not the weight, but the value of the hair. Others, again, are of opinion, that there has been an error in transcribing the Hebrew copy; so that the number of shekels being expressed by the letter ש, which denotes 20, was mislaken for , 200, or that 1, which fig-
A B S C E S S.

This morbid state is always preceded by an inflammation of the vessels from whence the pus has issued. If the purulent matter be well formed, there has been a previous increase of arterial action, a throbbing in the parts adjacent, an exquisite degree of fenibility, augmented animal heat, dilatation of the minute blood vessels, edema of the mucular fibres, and an effusion of serum, or of coagulable lymph from the arteries immediately affected. These phenomena are followed by a gradual diminution of the pain, heat, redness, tension, and throbbing, with a deposition of purulent fluid into the surrounding cellular membrane. Actual suppuration having now taken place; if the pus lies near the surface of the body, a cream-like whitish froth will soon be perceived in some particular point, near the middle, or towards the inferior side of the abscess: an elevation or prominence next occurs, and a fluctuation may be felt underneath, which becomes more distinct as the matter approaches the surface; the pain also is considerably abated, the brilliant appearance of the skin declines; and, if the collection of matter be large, there is usually an attack of shivering, accompanied with irritable symptoms, &c.

The general Seat of Abscesses.

In general, if not always, the matter of an abscess is primarily deposited in the cellular membrane, which surrounds or lies contiguous to the inflamed vessels; except when the secreting arteries terminate and empty themselves in a natural cavity; for example, in the thorax or abdomen. As the texture of the cellular substance admits of easy dilatation, the pus gradually diffuses itself, and forms an extensive reservoir, which either ruptures spontaneously, in a part affording the least resistance, or is evacuated by an artificial opening. When pus is confined by a firm adhesion, or by an aponoeutic, or is situated very deeply among parts that resist its pressure, one or more incisions will be sometimes formed of considerable extent; the aperture of which may be at a distance from the original seat of the disease; and if the matter should exist in a very large quantity, the gravitating force of the fluid will give it a tendency to some depending spot. Thus it happens, that matter formed under the temporal muscle may be discharged into the mouth, or pus accumulating in the lungs may descend to the lower part of the thigh. We are, therefore, not to imagine the point where the pus makes its appearance by a protrusion externally, to be always the focus or centre of the abscess; although it is generally the most proper place for its evacuation. Some judicious remarks on this subject, by the late Dr. W. Hunter, are contained in the Medical Observations and Enquiries, vol. ii. p. 57, &c.

General Indications in the Treatment of Abscesses.

When a practitioner has ascertained, from the preceding and concomitant symptoms, that an abscess exists, (for this disease has sometimes been confounded with an hernia or aneurism,) he should carefully determine whether or not the confined pus ought to be evacuated, and what intermediate reps should be purged. It may be a question, in some cases, if the suppuration be complete, or sufficiently advanced for an operation. In other cases it may happen, that the tumor ought not to be opened, though the maturation be perfect. At other times the matter, from its situation, ought to be evacuated speedily, lest it should injure the contiguous parts. Regard must also be had to the general state of the patient’s health, especially if the suppuration under which he labours be extensive, and has arisen spontaneously. In cases of this kind, which occur after a fever, it will be indispensably necessary to administer such medicines as are adapted to the nature of the internal complaint, as well as to employ appropriate topical remedies to the abscess. When it has been determined to open the tumor, the surgeon should consider in what manner this may be best accomplished, whether by the scalpel, the cautery, or the feto; whether by a single opening, or several; by discharging the pus at once, or at different times.

The various Methods of opening Abscesses.

i. The ancients, and especially Albuscaus, used to open abscesses by the application of an actual cautery. But the unnecessary and terrific apparatus of hot-irons being now laid aside, all the advantages of producing a further degree of inflammation, &c. previously to evacuating the pus, may be obtained by milder remedies. When an abscess is seated in a glandular part, and has been very tardy in advancing to a state of maturation, (as is particularly the case with sebaceous and venereal tumors,) it will be often better to open them with a cautery than by any other means. The chief grounds of preference in favour of the cautery are, that it tends to augment the inflammation and suppuration; it diminishes the subjacent glandular swelling; it gives free vent to the confined matter; it promotes healthy granulations; it is much less likely to be followed by troublesome fistulas, or by a bone with loose and callous edges, than when a simple puncture or incision has been had recourse to; and it may be employed with patients who have an infirm or unstable state of the skin. An unfeeling fear is, however, a not unfrequent consequence of the cautery; and on this account, it is not so eligible in the face or neck, where a cicatrix ought, if possible, to be avoided. The method of preparing and applying caustic substances, in
this and other chirurgical cases, is explained under the term Caustic.

2. An incision or a puncture is employed rather than the caustic, where the surgeon proposes to let out only a part of the contents of the abscess at once; where it is necessary to limit the extent of the artificial opening to certain dimensions; where the pus lies too deep for the precarious operation of an escharotic substance; where an immediate outlet is required, and danger is apprehended from delay; or, where it is requisite to make a wide incision, for the purpose of facilitating the discharge, or applying external medicaments to the bottom of the form. The precise circumstances requiring a variety in the plan of treatment, will be explained in the paragraphs which follow, while we describe the different kinds of abscesses that occur in several parts of the body.

3. Another mode of opening abscesses is by the fenotomy, which consists in passing a skin of soft thread or silk through the parietes of the tumor, by means of a se-

TREATMENT OF ABSCESS.

There are certain general principles in the management of abscesses, from which surgeons do not greatly deviate in common cases; such, for example, as the applying of warm and stimulating applications to the part afflicted, where the intention is to accelerate the suppuration: when the pus is to be evacuated, they not only make an artificial opening, but allow the daily discharge by compresses or by lightly filling the orifice with easy dressings; and, when there is a tendency in the fore to granulate, they remove all external obstructions, and use gentle means as are calculated to aid the healing processes of nature; at the same time internal remedies are administered, according to the nature of the symptoms, and the state of the patient's constitution. But, we shall proceed to illustrate these general remarks by an example.

Suppose an extensive inflammation of the phlegmonous kind to have taken place in a robust young peron, upon a fibrous part of the body. If no effective topical means have been used to allay the pain, heat, and tension; if no general or local bleeding has been employed; if the patient be not ablemious in his diet, nor has had recourse to purgative remedies; under such circumstances it is very probable the inflammation will advance rapidly, and terminate in complete suppuration. In this latter stage of the case, warm emollient poultices and fomentations should be applied three or four times a day; and, if the inflammatory symptoms become excessive, the cooling regimen, with moderate bleedings, and mild saffire purgatives, may be advantageously employed. These last should, however, be cautiously and sparingly used, lest the suppuring process be too far checked or interrupted. When the pus has forced its way towards the surface of the limb, and is nearly ready to burst from the tumor, (which will be known by a palpable fluctuation of the matter, and by the integument becoming thin,) prudence suggests that a sufficient opening should be made for the free and perfect evacuation of the contents of the abscesses. But there are circumstances which sometimes forbid our waiting till this critical period; the matter may be confined within a cell; it may be retained by a thick and firm fascia lying over it; for want of an outlet, it may be actually re-absorbed into the general system, and circulating with the blood, may produce very serious concomitances to the patient's health; in order, therefore, to prevent the inconveniences which might ensue from long waiting, a judicious surgeon foreseeing the evil, will evacuate the pus by an early opening. In making his incision, it should be an invariable rule to cut in the direction of the muscular fibres; left, by a transverse wound, some important part be deprived of its action through life; by neglecting to observe this rule in an impolishing of the forehead, an ignorant operator deprived his patient of the power of opening his eyes, so that he was obliged to pate up his eye-brows with adhesive plasters, in order to enjoy the benefit of vision. It is also necessary, in using the scalpel, to recollect the situation of neighbouring blood-vessels and nerves; taking the precaution to employ a grooved director, whenever there is the smallest danger of cutting these organs. The haustulent dressings, bandages, &c. &c. will be nearly the same as are required in common ulcers. For those, for which they may be considered as peculiar, we refer the reader to those articles. But it will now be proper to point out the plan of treatment to be adopted in some peculiar kinds of abscesses.

Abscess of the maxillary sinus. The cavity of the cheek, Antrum Highmoreanum, is lined with a delicate vascular membrane, which, when it inflames and suppures, produces great pain in the upper teeth, nofe, and the eye of the side affected; it is also very common for people with this complaint to have a severe pain in the forehead, where the frontal sinusses are placed; but all these symptoms are not sufficient to distinguish the disease. Time must disclose the true cause of the pain, for it will frequently continue longer than that which arises from a diseased tooth, and will become more and more severe; after which, a redness will be observed on the forepart of the cheek, somewhat higher than the roots of the teeth, and an induration at the fame place, which will be considerably circumfered; this hard- ness must be felt rather highly situated on the inside of the lip. The method of cure consists in extracting one of the dentes molares from the afflicted side; and then perforating through the focket into the bony cavity. A mild injection may afterwards be employed to cleanse the sinus, and be repeated as occasion requires. Consult Gruoch's, Fachen, Hunter on the Teeth, and Bernfein's Handbuch.

Abscess near the Anus. Any of the causes of inflammation, whether internal or external, may produce this disease. It is generally low and insidious in its progress, involving the rectum, and adjacent cellular membrane in its ravages; for the most part it is painful and tedious, occaoning deep, fistulous, and callous orifices, which demand prompt attention from the surgeon. See Fistula. The chief indications are, to alleviate the pain by gyllers, fomentations, and emollient poultices; to make a free opening as soon as the pus is fairly within reach of the knife; to divide all the fistuloses, if they communicate with each other, so as to effect one general outlet; and, when the intestine has been laid bare or perforated, by the confined matter lying upon it, to rip it up with a curved billory, guided by the operator's forefinger. Recourse must also be had to internal medicines whenever the patient's health is deranged; and indeed, without such collateral aid, the surgeon's efforts will frequently be in vain. Mr. Pott's observations on this sub-
ABSCESS.

Abscess in the Groin and Arm Pit. The inflammation and tumefaction which occur in these situations, generally arise from a disease in the aborbing glands; sometimes they are occasioned by an injury sustained by a distant lymphatic vessel, communicating with the inflamed gland; and, more frequently such glandular affections are the consequence of a malignant constitutional disorder, such as the Plague or Venereal Disease, when they are denominated Tuboes. See these terms in their respective places. From whatever cause abscesses arise in the aborbing system, they are mostly tedious and difficult to cure. See Absorbents, and their effects. But when they happen in the groin or axilla, it is especially requisite to avoid making deep incisions, on account of the large blood vessels there situated; in other respects they require no peculiar management, except that, being very low to fuppurate, it will often be necessary to apply stimulating plasters or cataplasm itself; and when they arrive at a state of perfect maturation, it will much accelerate the cure to evacuate the pus by a caudal instead of a puncture or mere incision. A ferosous habit of body very commonly gives rise to glandular enlargements; in such cases it will, therefore, be proper to employ the appropriate internal means, without which external remedies will often prove useless. See Scrofulous Tumors and Ulcers.

Abscess in the Loins; otherwise called the Psoas or Lumbar Absces. The large mufcles situated within the loins, and their connecting cellular subfurance, are very liable to inflame, and form extensive collections of pus. These are so important and serious, even under the most favourable circumstances, that comparatively few persons recover from their effects. This consideration should urge practitioners to adopt decisive means of relief in the earliest period of the complaint, and never to make light of the symptoms which indicate a fixed inflammation in the lumbar region. When pus has actually formed, we ought not absolutely to despair, but the principal hope lies in preventing its formation; it is, therefore, of great consequence to aertain the exact state of the patient when he first applies to the surgeon. An incipient lumbar abscess may be suppressed, if the patient has been lately exposed to any of the exciting causes of inflammation; if a dull and constant pain affects him in the deep seated mufcles of the loins; if this pain be aggravated in rising and rotating the thigh; if a fene of tightness or confinement be felt within the belly, or near the groin, accompanied with external tenderness to the touch; if there be much difficulty in standing erect, or in lying at full length; and if, in addition to these symptoms, the patient be of a delicate and feroous habit of body. When matter is formed in considerable quantity, a new set of symptoms and a more decided character will be attached to this disease: the sufferer will experience nocturnal exacerbations of fever, with frequent rigors, languor, and loss of appetite, waiting of the body, night sweats, hectic complaints, and an external protuberance in the vicinity of the abscesses. The matter, however, does not uniformly fluctuate in any particular spot, but may be felt sometimes about the loins, near the hip, or in the groin, and sometimes at the anus, or towards the bottom of the thigh. This tumor will generally diminish, owing to the retrocession of the pus, on placing the patient in a horizontal position. During the increafe of the suppuration, there will often be such a remission of the symptoms, that the patient imagines himself in a state of recovery, until a spontaneous rupture takes place in the swelling, or it requires an artificial opening. Now and then some of the lumbar vertebrae become cavious, from the pressure of the contiguous pus, and the lower extremities are paralyzed; the large blood-vessels may be eroded, and thus, a speedy termination is put to the patient's existence.

The early remedies to be employed in this disease, before suppuration has commenced, are free topical bloodletting, by the repeated use of fifteen or twenty leeches, or by the scarificator and cupping-glass; the exhibition of faine purgatives; and, if vegetable diet is perfect tranquility and rest, with repeated bleeding, or a large cauda, over the afflicted part of the loins. But, as suppuration advances, the diet is to be improved; some animal food and wine must be allowed; tonic and acid medicines are to be employed; with country air, moderate bodily exercise, warm sea-bathing, and cheerful company. When the suppuration is far advanced, if it be judged proper to make an outlet, the bell method is to evacuate the pus by a very small oblique aperture, with a broad lancet or trocar. Mr. Abernethy advises us to empty the abscess early and completely; then to bring the lips of the wound in contact, and by means of lint and flicking plaster to keep them together; and over these to apply a suitable bandage. The wound heals, in general, without much difficulty, and requires dressing only once or twice days. When the skin again projects, from the preflure of the subjacent matter, another puncture may be made; and thus, the evacuation is to be repeated as often as shall be necessary, avoiding any permanent exposure of the cavity of the abscess. Among the means which have been successfully employed on these occasions, are emetics, injections, opium, cinchona, and electricity: but for a more detailed account of the treatment, we recommend the perusal of Mr. Abernethy's Essays, and Mr. Bell's System of Surgery.

Abscess in the Muscles of the Belly. The principal object in this case, is to prevent the matter from bursting internally; since such an event might prove fatal. The surgeon should therefore open the abscess early, and endeavour to use those kinds of bandages, or compresses, which may obviate future collections, and the formation of firm absceses.

Abscess of the Urinary Bladder. When an accumulation of pus or mucus occurs in the bladder, mild emollient injections may be used by means of a syringe and catheter. This practice has been lately taken notice of as new; but it was recommended by the Arabian physicians, and by some of the oldest European practitioners, who perhaps took the hint from Alhucains. Abscess under the Cranium, and within the cylindrical bones. No other remedy can be here advised, for giving free vent to the confined matter, than perforating the bone with a trephine.

Abscess under the Sternum. When pus lies immediately under the chest-bone, within the duplicature of the mediastinum, the surgeon will not hesitate to apply a trephine. An interesting paper on this subject may be seen in the 15th number of the London Medical Review and Magazine. Mr. Blair's Observations on a successful case of this kind, are likewise contained in the 4th volume of that work, page 319.

Abscess of the Thorax. See Empyema.

Abscess of the Breast. The mammary abscess may be produced by any of the remote causes of inflammation, but is most commonly occasioned by a redundancy of milk soon after parturition. In general it might be prevented by an immediate application of the infant to the breasts after delivery, or at least before they are turgid with milk. See Inflammation of the Breast. When pus is actually formed, a soft, warm, emollient poultice, composed of bread and milk, or of a decoction of poppies and linseed meal, should be constantly kept upon the part, and renewed every three or four hours:
ABSCESS.

at the same time carefully suspending the enlarged breast, with an handkerchief spread under it, and tied behind the neck. It is very rarely proper to make any artificial opening in these abscesses: they should be permitted to burst of themselves, and be poulticed as long as the hardnefs of inflammation continues. During this painful period, the child must be fucced by the healthy breast; for it rarely happens that the milk is pure during a flate of inflamation, or that the mother can bear the irritation of her child's attempting to draw the nipple.

It is here necessary to apprise mothers that the true milk-abscess never degenerates into a cancer, as many persons have ignorantly imagined. Thofe pells of society, called cancer-curers, often impose on anxious wives, and persuade them they have cured cancers of the breast, when none ever existed! At other times, they keep up a false alarm, to the great detriment of women's health, and the furtherance of their own base designs. See the articles Cancer and Scirrhus.

During the tedious suppurating process, if the patient be not fanguine and robust, it will sometimes be proper for her to live on strong nourifhing broths, with animal food, and porter, and to have daily recourse to tonic medicines. Without these means all external applications may prove fruitless. When the abscefs leaves a deep ulcer, it fhould be dreffed very lightly with mild warm differentes; and cold air must be guarded againft in the convalescent stage, after all the dressings shall have been dilfed. The hardnefs within the breast, or around the cicatrix will generally subflife of itself; but if it fhould not, a little oil of sweet almonds, either alone or mixed with palm oil, fhould be gently rubbed over the breast twice a day. In lieu of these, a piece of fresh butter may answer the purpofe. Sometimes, however, it is neceffary to administer cicuta and calomel to reduce the glandular indurations; now and then superadding the mercurial liniment. But the treatment much vary according to circumstances.

ABSCESS of the Eye. See Hypopyon.

ABSCESS of the Ear. See Otalgia.

ABSCESS of the Gums. Simple gum-boils require no peculiar management: they may be opened with a lancet when the matter lies superficial; but, if they arrive from decayed teeth, or a carious jaw-bone, the tooth affected, or the decayed portion of bone, must be removed before the cure can be effected. The mouth may be frequently rinsed, in order to keep the parts clean, and the breath fweet, with a mixture of warm wine, honey, and diluted vinegar; or with some tincture of myrrh and water. See the article Teeth.

ABSCESS in the Hip-joint and its Involution. Spontaneous difeafes of the hip are very invidious and dangerous. The firft symptoms of an approaching disorder in this part too often pafs unobferved, or fliated, even by the patient himself. Perhaps it begins with a trifling degree of weakness, lameness, and waiting of the limb; which, if it be attentivey examined, will be found a little elongated, and likewife depreffed on the nates of the affected fide. After fome time, there will be a pain felt as if it were fitten up in the knee, efpecially during the night; but this joint, neverthelefs, remains in a state of perfect foundnefs. The patient foon begins to favour the difeafed limb, by bearing chiefly on the other leg, and by vary ing the bed of the affected fide. As his strength fells, he will be fen to graf the difordered thigh during the act of walking; and before night he will be complaining of unaccounted wearinefs. Though he may be naturally alert and cheerful, he will, as the complaint augments, fhew a great averted to move; and, in aiming to produce quick exertions, there will be a fudden halting, or even danger of falling. The affected limb will afterwards be kept in a bended position as much as poflible, and a tenderness is complained of in the vicinity of the hip-joint. In furceleous fubjefts, the inflammation fometimes advances more rapidly, the general health fuffers in proportion to its vifage, the appetite fails, debility and emanation fuccede, night sweats, colliquative diarrhoea, and other hectic symptoms fupervene; in fhort, the local complaints become aggravated, fuppuration then difcovers itself, the exterior part of the thigh enlarges, the concealed pus fluctuates, the limb fhortens and is contracted, the curions joint yields a folid puriform discharge, and he head of the thigh bone becomes displaced, or forms an immovable Anchylosis.

Now and then the progres of this difeafe varies from the course we have defcribed: there may be no external outlet for the matter; fuppuration may not be differently perceptible; the febrile symptoms may not be very urgent; and the patient may be carried through the different stages of his complaint, with but a small share of bodily pain. This difeafe, however, moft frequently goes on to a fatal termination; involving the ligaments, the cartilages, and bones of the joint in one dreadful deftitution.

The general curative means to be purfued in thofe cafes, refemble thofe we advised in the humar abscefs; but, too commonly, the aid of the furgeon proves ineffectual. If the subjef of an hip difeafe be furceleous, it may be proper in its incipient state, to administer the vegetable tonics, with prepared natron, and small doses of calomel; at the fame time, preferving the warm fca-bath, country air, local bleeding, parifive motion, abfolute from wine, milk diet; and, if the complaint advances, the ufe of perpetual bliflers, cafticles, ifufes, or fetons, are to be efpecially relied on. See the treatment of Arthropaufis and White-swelling.

M. Petit, De Haen, Pott, and others, have written on this fubjeft; but, the moft satisfactory treatife we have ever, is that of Mr. Ford, intitled, "Observations on the Difeafe of the Hip-Joint," 8vo. London, 1704.

ABSCESS of the Abdominal Vifera. Any of the contents of the belly may be the seat of an abcefs: the moft frequent and remarkable are, a fuppuration of the Liver, the Kidneys, and the Mefentery. In these cafes, the peculiar symptoms will diftinguifh the part affected, and the general principles before laid down muft be attended to. When the pus fluctuates externally, and there is a well grounded hope of its being evacuated by an artificial opening, no time fhould be lofd; as it might prove fatal to fuffer the spontaneous rupture of a large abcefs into the cavi ty of the abdomen. If there be any particular constitutional affection, the medical treatment adapted for fuch difeafes muft be alikewife have re coucrc to. See Hepatitis, Icterus, Scrofula, Tabes, Mesenterica, Empyema, Nephritis, Gastritis, Cystitis, Enteritis, &c.

ABSCESS of the Thoracic Vifera. As all abcefles are preceded by infimation, the peculiar nature and order of the symptoms which precede the formation of pus in the thorax, or its contents, will guide the practitioner in his diagnosis. See the articles Carditis, Pneumonia, Pleuritis, Vomica, Phthisis, &c. If matter be formed in the interior infulation of the lungs, it will probably find its way into the bronchia, and be coughed up from time to time, but if the pus lies near the surface of that viscus, it is more likely to be discharged into the cavity of the chef, forming an Empyema. As an evacuation into the bronchia is most defirable, we fhould ufe our endeavours to soliciting a discharge of the pus in that way. The chirurgical operation
operation for an empyema is described in its proper place.

From what has been said in the foregoing paragraphs, it will not be difficult to determine on the plan of treatment in other cases of abscesses. The principal authors to be consulted on this subject are Severinus, Hildanus, Wileman, Heiller, Van Swieten, Sharp, Pott, Bell, and Kirkland. Some curious cases are also related, or referred to, in the Bibliothèque Choix de Médecine; the compilations of Mantegus, Bohnstein, and James—the Memoirs and Translations of different learned Societies; and in the works of Bonetus, Forellus, Livitanus, Tulpius, Hildanus, Morgagni, Hornius, Stalparte Vonder Wel, &c. &c.

ASCISSE, ABScess, in Conic, a part of the diameter or tranverse axis, of a conic section, intercepted between the vertex, or some other fixed point, and a semidiameter.

Such are the lines AP, AP, &c. (Tab. Conics, fig. 20.) intercepted between the vertex A, and the semidiameters PM, PM, &c. which are called absciss, of the Latin ab- as a prefix, and derae, to cut off; as being parts cut off from the axis. Others call them figurinae, q. d. arrows.

Abéssin, in a more general sense, is a part or segment of a line, terminated at some certain point, cut off by an ordinate of a curve. As the absciss may commence either at the vertex of the curve, or at any other fixed point; it may be also taken either upon the axis or diameter of the curve, or upon any other line drawn in a given position. Hence there may be an infinite number of variable abscisses, terminated at the same fixed point at one end, whilst the other end is at any point of the given line or diameter. In the parabola, each ordinate has one abéssin; in the ellipse, or circle, it has two, lying on the opposite sides of it, and in the hyperbola also two, both of which lie on the same side of it. It may be observed, in general, that a line of the second order, or a curve of the first kind, may have two abéssins to each ordinate; a line of the third order may have three abéssins to each ordinate; a line of the fourth order may have four; and so on. The use of the absciss is, in conjunction with the ordinate, to express the nature of the curves, either by some proportion or equation including the absciss and its ordinate, with some other indeterminate line or lines; and hence every different curve has its own peculiar equation or proportion by which it is expressed or defined. When the nature and properties of curves are expressed by algebraic quantities, the absciss is commonly denoted by the letter x.

In the parabola the absciss is a third proportional to the parameter and semidiameter; and the parameter a third proportional to the absciss and semidiameter.

In the ellipsis, the square of the semidiameter is equal to the rectangle of the parameter, into the absciss, subtracting another rectangle of the same absciss, into a fourth proportional to the axis, parameter, and absciss.

In the hyperbola, the squares of the semidiameters are to each other as the rectangles of the absciss into another line, composed of the absciss and the transverse axis. See Conic section, Ellipse, Hyperbola, and Parabola. See also Circle and Curve.

ABSCISSION, in Rhetoric, is a figure of speech, when beginning to say a thing, we break off short, as supposing the matter sufficiently digested, by what has been already laid. Cicero, ad Heren. lib. iv. cap. 57.

For an influence: one of her sex, age, and beauty, to be seen alone, at such an hour, with a man of his character—I need say no more.

Absision is a species of Ellipsis, or Suppression. Sculler distinguishes it from precission and supfension.
wood, Achilles, Anthenis, Parthenium, Senecio, and Tanacetum.

Aphis is also a name given to other plants, by different authors; as to dwarf psalmire, with leaves divided after the manner of wormwood; also to the Alpine Rachel, with furrowedwood leaves.

Aphis. See Aphis.

Absolute, in a general sense, something that stands free or independent.

Absolute, in Metaphysics, denotes a being whose whole essence does not consist in a mere habit or relation to another.

In which sense absolute stands opposed to relative, or reflection.

Absolute is more particularly understood of a thing which does not proceed from any cause, or does not fulfill by virtue of any other being, considered as its cause.

In which sense God alone is absolute.

Absolute, in this sense, is synonymous with independent, and stands opposed to dependent.

Absolute also denotes a thing's being free from conditions or limitations.

In this sense, the word is synonymous with unconditional.

We say, an absolute decree, absolute promise, absolute obedience.

Absolute government, that wherein the prince is left solely to his own will, being not limited to the observance of any laws, except those of his own discretion.

When the Danes made their king absolute, in 1660, they declared him absolute from his coronation oath.

Absolute number, in Algebra, is the known quantity or number which constitutes one entire side, or part of an equation; and it is that which Vieta calls homogeneum compositioni.

Thus, in the equation 4x + 16x = 36, the absolute number is 36; which is equal to a multiplied by itself, and added to 16 times a.

Absolute equation, in Astronomy, is the sum of the optic and excentric equations.

The apparent inequality of a planet's motion, arising from its not being equally distant from the earth at all times, is called its optic equation; and this would fulfill if the planet's real motion were uniform. The excentric inequality is caused by the planet's motion not being uniform. For the illustration of this, conceive the sun to move, or appear to move, in the circumference of a circle, in whose centre the earth is placed. It is manifest, that if the sun move uniformly in this circle, then he must appear to move uniformly to a spectator at the earth; and, in this case, there would be no optic or excentric equation. But suppose the earth to be placed out of the centre of the circle; and then, though the sun's motion should be really uniform, it would not so appear, when seen from the earth; and in this case, there would be an optic equation, but not an excentric one. Imagine farther, the sun's orbit to be, not circular, but elliptical, and the earth to be in its focus, it is evident that the sun cannot appear to have an uniform motion in such ellipse; and therefore, his motion will be subject to two equations, viz. the optic and the excentric equation. See Optical Inequality.

Absolute Gravity, motion, place, space, time. See the respective substantives.

Absolute Attributes, in Grammar. See Absolute.

Absolutely, in a general sense, stands opposed to relatively. It is also used for infinitely and unconditionally. In which sense, the schoolmen oppose it to secundum quid.

Moreover, it is used by Divines, in opposition to declaratively.

The church of Rome holds, that a priest can forgive sins absolutely; the Protestants say, only declaratively, and militantly.

Absolutely, in Geometry, is taken for entirely, or completely. Thus we say such a thing is absolutely round; in contradistinction from that which is only partly so; as a sphereoid, cycloid, &c.

Absolutely, in Grammar; we say, a word is taken absolutely, absolute sumptus, when it has no regimen, or government. Thus, in the phrase, We should pray without ceasing. The word pray is taken absolutely, as it governs nothing.

Absolute, in the Civil Law, is a definitive sentence, whereby a person accused of any crime, is acquitted, and declared innocent.

Among the Romans, the ordinary method of pronouncing judgment was this: after the cause had been pleaded on both sides, the praeco used the word discretion, q. d. that they had said what they had to say; then three ballots were distributed to each judge, marked as mentioned under the article A; and as the majority fell of either mark, the accused was absolved or condemned. If he were absolved, the prior dismissioned him with a vestrum non facile, or veere videntur seculi.

Absolute, in the Canon Law, is a juridical act, whereby a priest, as a judge, remits the sins of such, upon confession, appear to have the conditions requisite for this purpose.

The Romanists hold absolution a part of the sacrament of penance; the council of Trent, in their xiv. cap. iii. and that of Florence, in the decrees ad Arminius, declare the form of the efficacy of the sacrament to lie in the words of absolution. I absolve thee of thy sins.

The form of absolution used by Tetzel, in Germany, is preferred in Secund. Comment. lib. i. p. 14. and a translation of it is given by Robertson in his Hist. of Ch. V. vii. p. 117. It is extended to all ecclesiastical censures, and to all sins, however enormous; it remitted all punishment in purgatory, and restored those who were supposed to have the benefit of it to the holy sacraments of the church, to the unity of the faithful, and to the innocence and purity which they possessed at baptism; so that when they died the gates of punishment should be shut, and those of the paradise of delight opened; and if they did not die immediately, this grace remained in full force when they were at the point of death.

The formula of abolution, in the Romish church, is absolutum: in the Greek church, it is deprecatory; and in the churches of the reformed, declarative.

In the church of Rome there are divers other political absolutions; as,

Absolutum a favis, which is necessary when a person has been witness to the execution of sentence of death on a criminal, or has any other way disqualified himself for the holding of a benefice.

Absolutum ad cautelam, is that granted to a person who has lodged an appeal against a sentence of excommunication, by which the force of the censures is suspended.

It being a maxim, in the papal jurisprudence, that the sentence stands good, notwithstanding any appeal; this sort of absolution is sometimes granted until the issue of his appeal be known: by means hereof, some articles, at least, of his excommunication, are taken off; imputing that person
IONS may convey with him without danger: and besides, in case of death, his sentence is supposed to be of some avail to him.

Absolution is chiefly used among Protestants for a sentence, whereby a person, who stands excommunicated, is released or freed from that punishment.

Absorbsents, from absorbere, to drink up, in a general sense, denote substances which partake the faculty of absorbing, or swallowing up others; such are ashes, cloves, plants, &c.; and earths of various kinds. Ashes are absorbent with respect to water, though not in the degree supposed by Aristotle, from whom we derive a vulgar error, that a pot full of ashes will fill a vessel as much water as it will require, if it were empty. Cloves are absorbent to a degree, that we are told, if care be not taken in importing them, to keep water, wine, and other liquids at a distance from them, a certain quantity of clove will, in two days' time, drain a whole hoghead of wine. See Absorbents in the Materia Medica.

Absorbsents, of Absorbing Vessels, in Anatomy, denote a minute kind of vessels found in animal bodies, which attract and imbibe any fluid that is brought near their mouths. These vessels are so minute and transparent as not to be discovered in ordinary dissection; but by great labour they have at length been detected to abound in every tribe of animals. As these vessels are transparent, their contents are visible, which circumstance occasioned them to receive the different denominations of lacteals and lymphatics. The former were so called, because they imbibed the chyle, a milky fluid, from the bowels; whilst the latter, containing much lymph, which they had taken up from all the interstices of the body, were therefore named lymphatics.

The lacteal vessels were first noticed at the Alexandrian school by Erasistratus, who observing that they extended from the region of the liver to the bowels, erroneously concluded that they were a peculiar system of vessels, defined for the nourishment of those organs. They were not, however, particularly noticed till Aselli, in Italy, in 1622, perceiving that the contents of the interstines, and these vessels were similar, rightly conjectured that they absorbed the fluid which they contained from the bowels.

Pecquet, in France, shortly after the publication of the discoveries of Aselli, on opening the large veins near the heart, discovered the chyle not yet incorporated with the blood, and the vessel by which it was poured into the left subclavian vein, and which proved to be the principal trunk of the lacteal and lymphatic vessels, and was named from its situation, by Bartholome, the Thoracic Duct. A little afterwards, in 1651, Rudbec a Swedisch, and Bartholome a Dutch anatomist, discovered vessels resembling the lacteals in structure and office in other parts of the body, and which they named, from their contents, lymphatic vessels.

In Haller's time, although great numbers of lymphatic absorbing vessels had been discovered throughout the body, they did not appear to him completely adequate to perform the function of absorption. They had not then been discovered in birds or fishes, and therefore that great anatomist still retained the idea that the veins performed, in part, the important office of absorption.

The merit of first demonstrating the absorbing vessels in these tribes of animals belongs to Mr. Hewfon, who alluded in the labours of the first eminent anatomical school in London, in which anatomy was most ably taught by Dr. Hunter.

Mr. John Hunter undertook, by experiments, to determine whether the veins afforded in any degree in the office of absorption. Having conveyed milk, coloured with indigo or saffron, or fleeced with musk, into the small interstines of an

Absorbsents, after a short interval the lacteals were found full of these fluids; but on opening the veins of the interstines at the same time, and suffering the blood to separate into serum and erittementum, the serum was neither coloured nor fleeced. When irritating substances are imbied, the absorbing vessels always become inflamed, whilst the veins suffer no kind of irritation. Of late, also, the absorbing vessels have been injected in such great abundance, that they appear fully adequate to perform the office for which they seem so admirably adapted. Anatomists at present, therefore, are warranted in believing that they are the only vessels engaged in performing that very important function in the animal body.

Mr. Cruikshank published a systematic account of these vessels, chiefly taken from the preparations and observations that were made in the school established by Dr. Hunter.

Macedini, in Italy, by employing a new artifice in injecting these vessels, has been able to exhibit them in a more complete and satisfactory manner than any former anatomist. The extremity of a glass tube, like that of the barometer, being melted, is drawn out to any required degree of tenuity, in which state it still remains pervious, or tubular, and affords an opportunity of conveying quicksilver into the minute vessel decipherable by the eye. If these vessels be the only ones, which perform the office of absorption, they must exist in very part of the body. For there is no spot on the surface of the skin from which ointment may not be taken up, nor any internal part, from which blood, accidentally diffused, is not absorbed; nor, the very matter composing the texture of the body is undergoing continual removal and renovation. These vessels, therefore, must be supposed to begin by open orifices, very generally throughout the body, though their commencement can only be demonstrated upon the inner surface of the interstines. They appear to the unaided eye, in that situation, fine and pointed tubes; but by the microscope, their mouths are discerned to be patent, and like a cup, which circumstances have been well described by Leiberkauyn. The beginning absorbents soon join together, and after some time form minute vessels, capable of being injected by anatomists; these again conjoin, and form larger vessels, which are still discoverable with great difficulty.

In structure and arrangement these vessels have great similitude to veins; they have, in consequence, been named by some anatomists the lymphatic veins. Like the veins, their sides are thin and transparent, though of considerable strength: like the veins, they frequently communicate with each other, or, as it is technically termed, anastomose. The advantage derived from these communications is obvious; for by these means the different matters which they take up from various parts are mixed together, and blended with the lymph, which they imbibe from the interstices of the body, and which serves as a vehicle for such heterogeneous particles: they also prevent accidental preasure made on a few vessels from obstructing the progress of the absorbed fluids, which are in that case conveyed forward by collateral channels. Like the veins also, these vessels, by conjoining, form a tube of smaller area, than the united areas of the vessels before their junction. The effect of this contraction is the same as in the veins, that is, an acceleration in the current of the lymph, in proportion as it comes nearer to the trunks of the absorbing vessels. The diameter of the thoracic duct bears a small proportion to the united diameters of the minute absorbents in the body, and when this duct has been opened, the lymph has flowed from it with a force and jet like that with which the blood issues from a large vein. Like the veins, the absorbents are
furnished with numerous valves, which prevent any retrograde motion of their fluids, and also prevent any portion of the vessel from retaining the weight of more fluid than it contains between its valves. The absorbents however differ from the veins in one very material circumstance, viz. that they have a power of contraction, and are able of themselves, to propel their contents. Whoever reflects on the phenomena of absorption, can scarcely doubt that the mouths of these vessels have a contractile power, by which they refuse admission to nutritious substances, whilst they readily imbibe those that are sanguinary. If these vessels are observed in the mctenar, when turgescent with the absorbed chyle, their contents will disappear in a certain tract of the vessel, and again become visible; a phenomenon which cannot be explained, unless by supposing the vessel to contract at that part, and urge forwards its contents. Haller found that the thoracic duct contracted when tumefied, so that there can be little doubt of these vessels being vrticular throughout their whole extent. The absorbents are found in considerable numbers beneath the skin of the extremities, and when they arrive at the groins and armpits, they pass through little hollows about the size of small beans, which are called lymphatic glands. The absorbent vessels, as they approach the gland, generally separate into several branches, which terminate in that body, and again about an equal number of absorbents emerge from the gland, conjoin, and form one or more principal absorbing vessels. The absorbents which enter the gland are usually denominated \textit{vasa inferentia}, and those which go out of it, \textit{vasa efferentia}. If quick-filer be poured into the former vessels, the gland willsvell, and a great deal of quick-filer appears to be deposited in it; and afterwards, if the power propelling the injection be continued, it is seen coming out of the gland by the vasa efferentia. It seems therefore probable, that the progres of the absorbed fluid is checked a little in these glands, and it is probable that some change is effected in it during its passage through them. This opinion is confirmed by observing that these glands abound with blood-vessels, which probably pour some fresh animal juices into those which are contained in the lymphatic vessels.

The lymphatic glands are found in great numbers in the groins, armpits, and by the side of the neck, apparently serving like barriers to the absorbents of the head and extremities, as they approach to the large veins of the trunk. The absorbents of the intellines, which contain the chyle, a scarcely animalized fluid, sometimes pafs through three or four fets of glands before they arrive at the thoracic duct; hence they are called \textit{vasa lacteae pruni}, fecundii, tertii, and quarti generis. The place where the lacteals conjoin, and meet with the lymphatics from the lower parts of the body to form the thoracic duct, appears in animals like a reservoir, and has been named the receptaculum chyli. The velfel thus formed by the junction of the lacteals, with the trunks of absorbents from the lower parts of the body, having passed through the diaphragm, is there named the thoracic duct. In this situation it lies close upon the vefterbè of the back, between the veins axygos and the aorta, receiving in its passage the absorbents of all parts in its vicinity. As it approaches the neck, it leaves the bone to get to the left subclavian vein, in which it terminates just at its commencement. As, however, the absorbents of the right side of the head, and right arm, would have to deviate considerably were they to end in this chief trunk of the absorbing system, they conjoin and form a similar velfel on the right side, which empties itself into the correponding part of the right subclavian vein. Thus all the old materials of the body, which the absorbents are continually removing, all

the new matter imbibed from the surface, all the redundant lymph taken up from the interfaces of the body, and all the chyle occasionally obtained from the bowels, are conveyed into the large veins near the heart. It is, in short, chiefly by this system of vessels that the blood is augmented in quantity or altered in quality; they replenish the body with nutriment, and they also occasionally taint it with infection.

Absorbing Vessels, Distribution of the, throughout the body.—The absorbents of the foot have been injected in considerable numbers from the spaces between the toes; those of the inner side ascend over the inner ankle, and accompany the vena saphena interna. Being joined by others in this course, the trunks thus formed appear like network on the inside of the calf of the leg. These vessels continue in company with the vena saphena interna; and like it, ascend over the inside of the knee and thigh, where their numbers and size increase, and at last they terminate in the inguinal glands. These glands vary considerably in number; the greater part of them is placed above the fæcia of the thigh, but some are found beneath it, in the hollow between the iliacus internus, triceps, and sartorius muscles. Those glands which are highest and nearest to the pubes, receive also the absorbents of the genitals. The absorbents of the outside of the foot pass behind the outer ankle, and accompany the vena saphena externa up the back of the leg to the ham, where they terminate in the poplitical glands. They, however, communicate by some branches with the superficial absorbents on the inside of the leg.

The deep-seated absorbents of the leg accompanying the several arteries, which branch off from the popliteal, also arrive at, and end in the glands of the ham, which are small and few, in number, forming exteriorly three. The absorbents of the femoral vessels, emerging from these glands, are large and their extremity is near the femoral artery to the groin, to terminate in the inguinal glands. Other deep-seated absorbents of the thigh, however, enter the pelvis at the inferior apertures of that cavity, and communicate with the velfels and glands contained in it. The large vasa saphena of the inguinal glands pass beneath Poupart's ligament, and accompany the external iliac artery to the loins. There is a series of glands placed in the course of the external iliac vessels which are named the external iliac glands, with which these absorbents are connected. Having arrived at the lumbar vertebrae, and being increased in size by the accessory absorbents, which they are continually receiving, they terminate in the lumbar glands. These are much more numerous than any of the clades of glands hitherto mentioned, and quite cover the aorta and vena cava.

The absorbents of the genitals terminate, as has been said, in the upper and innermost of the inguinal glands. Some have been injected on the sides of the penis, and others on the middle, accompanying the vena dorsalis; by their junction they form two trunks, which diverge, and proceed to either groin. The absorbents of the ferotum accompany the cutaneous veins to the groin, and terminate in the inguinal glands. The telciles abound in absorbents, some of which join with those of the ferotum, and go to the inguinal glands; but the greater part, confiding of large and numerous vessels, pass up the perineal chord, and along the external iliac vessels to terminate in the lumbar glands. The absorbents of the clitoris, and external parts of the organs of generation in females form two divisions, one of which goes, as in the male, to the inguinal glands, the other vessels either pass with the round ligament of the uterus through the abdominal rings, and along the psoas muscle to the lumbar glands, or entering the pelvis at the inferior aperture, they join the absorbents of the uterus. The absorbents of the hips
hips and nates also pursue a twofold course; some bend round the trochanter, and go to the inguinal glands, whilst the greater number enter the pelvis with the glutal and sciatic arteries at the sacro-ischiatric foramina, and go to the internal iliac plexus of glands. Thus we have traced the absorbents of the lower extremities and of the parts of generation, and find them either entering the abdomen, and running along the lower part of that cavity to the loins, or ascending through the inferior apertures of the pelvis, and joining the absorbents of that cavity, which we next proceed to describe.

In the pelvis there is a numerous plexus of glands, situated in the course of the internal iliac vessels, and continued to ward the obturator foramen; there are also many absorbent glands lying in the hollow of the sacrum. The absorbents of the bladder, after passing through small glands, placed by the side of that viscus, proceed to the internal iliac plexus.

The absorbents of the rectum proceeding through the fecal glands pass on to those of the loins. The absorbents of the uterus form two sets, according with the blood-vessels in this respect; those which accompany the uterine vessels pass through glands by the side of the vagina, and proceed to the internal iliac plexus. Those which accompany the spermatic vessels terminate, as in the male, in the lumbar absorbents.

The absorbents of the kidney pursue the same course as the renal blood-vessels, and terminate in the lumbar glands. The absorbents of the intercostes, commonly called the lacteals, are extremely numerous on account of the function which they have to perform, and abound more in the jejunum than elsewhere, as the chyle is chiefly absorbed from that intestine. The course of these vessels is through the mesentry, where they communicate with glands, the number of which is stated to be between 100 and 150.

The lacteal vessels have been traced through four or five series of these glands, and have been denominated vasa lactea primi, secundi, tertii, et quarti generis.

The lacteal vessels form one or more large trunks as they approach the superior mesenteric artery, which join the thoracic duct. The absorbents of the large intestines pass through glands situated near them, which are very small, and not numerous. Those vessels which arise from the ascending and transverse arch of the colon terminate in the lacteals near the root of the mesentry. Those absorbents which arise from the descending and sigmoid flexure of the colon proceed to the lumbar glands and thoracic duct. Having thus described the principal absorbents that contribute to the formation of the thoracic duct, that vessel may in the next place be attended to. Large trunks of absorbents may be traced in the course of the iliac vessels, converging to form this duct; to these are joined the large trunks of the lacteals, and they unite low down upon the loins. In animals, and particularly in dogs, they terminate in a dilated pyriform cell, which is called receptaculum chyli. This appearance, though sometimes observed, is more frequently wanting in the human subject. At the first vertebra of the loins the thoracic duct gets above the diaphragm, and lies between the vena azygos and aorta on the right side of the bodies of the vertebrae; it is sometimes double, and then the second branch lies beneath the aorta on the left side; all times large lymphatics are found also in this situation.

The dimensions of the thoracic duct gradually lessen till it has reached the middle of the back, and then again enlarge. At about the 8th dorso vertebra it generally divides, and afterwards reunites. Having got above the arch of the aorta, it leaves the spine, ascending and inclining to the left side to reach the subclavian vein, in which it is to terminate. It passes beyond the vein and again descends, and empties itself into the veins of the veins at the angle made by the junction of the internal jugular and axillary veins, as they unite to form the left subclavian vein. At the termination of the thoracic duct we find valves, which prevent the blood contained in the veins from falling into that vessel.

During this course, the thoracic duct receives the absorbents from various parts of the body, of which we now proceed to give some account. It may be proper first to mention that there is a similar duct on the right side of the body, generally less than half an inch in length, which terminates in the corresponding node, made by the junction of the right internal jugular and axillary veins. This duct is formed by the confluence of the absorbents of the right arm, the right side of the head, and those accompanying the right internal mammary vessels.

The absorbents of the omentum pass through very small glands, situated near the root arch of the stomach, and there join with those belonging to that viscus. The absorbents of the stomach accompany its arteries; those communicatant to the left gastric join those of the spleen and pancreas, and terminate in glands, extending themselves along the pancreas and splenic vessels. Those vessels join, in company with the right gastric artery, pass beneath the dia- phragm, and terminate in the same glands with the deep-seated absorbents of the liver, to which they are conjoined. Those vessels which accompany the coronary artery on the lesser curvature of the stomach, pass through glands situated about that part; they then in general descend to the glands beneath the duodenum, and terminate in the thoracic duct; others, however, may be traced through the cardia to the thoracic duct. The absorbents of the spleen and pancreas, when they arise from those vasa, pass through glands extending along the splenic vessels, and are afterwards continued to the thoracic duct. The absorbents of the liver, which are extremely large and numerous, proceed from its convex surface through the right and left, and suprarenal ligaments of that viscus; some of their branches descend upon the diaphragm, and terminate in the thoracic duct near the celiac artery; others penetrate the diaphragm and go to glands on the outside of the pericardium, from which veins they proceed through the anterior mediastinum to the thoracic duct; others accompany the internal mammary vessels on the inside of the sternum, and those of the right side end in the right trunk of the absorbents. Some of the absorbents from the interior part of the liver, emerge from its posterior edge, and join those superficial absorbents.

The deep-seated absorbent vessels of the liver ramify in its substance like the vena portae; they come out here where a vessel enters the gland, and being joined by the superficial absorbents of the concave surface of the liver, they pass through numerous glands situated in the capsula Glissonii, and afterwards join the thoracic duct. The absorbents of the diaphragm are numerous, and join with, and augment those large trunks, which arise from the liver and penetrate that muscle. Both these sets of vessels are connected with glands, situated towards the front of the thoracic surface of the diaphragm, on each side of the pericardium. The absorbents of the heart are found in company with its nutrient vessels; the trunk of absorbents belonging to the right coronary artery passes by the side of the aorta to a gland near the origin of the right carotid, and terminates in the right trunk of the absorbing fifteen. The absorbents accompanying the left coronary artery, which are much larger than the former, proceed with the pulmonary artery to glands near the trachea, are there conjoined with the pulmonary absorbents, and empty themselves into the thoracic duct.
thoracic duct near its termination. The absorbents of the heart pass through the cardiac glands, which are situated about the arch of the aorta.

The absorbents of the lungs may be distinguished into the superficial and deeper seated. Those on the surface are distributed in the areolae, surrounding the small lobules of the pulmonary organs, and appear like the fibres of network. The deeper seated absorbents which communicate with the others, emerge where the air-veins enter the lungs, and both clasps terminate in the bronchial glands, which are numerous, and surround the bronchi. These glands are also connected with those belonging to the heart, so that both sets of glands frequently participate in the same disease. Three or four large trunks of pulmonary absorbents proceed more immediately, or more remotely, to pour their contents into the thoracic duct; the upper ones do not reach that vessel till it approaches its place of infection in the venous system.

Numerous absorbents have been seen upon the eosophagus, and there are many glands placed along the course of that tube. The absorbents of the eosophagus conjoin with those of the heart and lungs. Absorbents have been injected in company with the intercostal blood-veils, which pass through two small glands, situated near the head of each rib, and then enter the thoracic duct. The superficial absorbents of the upper extremity accompanies the vein from the palm and outside of the hand, near the little finger, run up with the ulnar veins over the internal condyle, and then accompany the bicipital vein to the axilla, when they enter numerous glands situated in that part. These absorbents, however, previously are connected with several glands, which are situated in the course of the bicipital vein, one of which is found as low as the internal condyle of the os brachii. The absorbents of the thumb, and the outside of the hand in its vicinity accompany the radial veins to the elbow, and then ascend on the outside of the biceps musculce with the cephalic vein. Arriving at the deltoid muscle they head along its inner edge, and pass between it and the pectoral muscle to glands situated beneath the clavicle. Other cutaneous absorbents have been injected from the palm of the hand, accompanying the median veins in the forearm between these two sets, which afterwards terminate in those, which accompany the venae basilica. The deep-seated absorbents of the arm are found by the sides of the large arteries, and go to the glands of the axilla. The absorbents of the hand accompany the fine in the forearm glands. The axillary glands, and those beneath the clavicle are connected together, and their vasa efferiens conjointing form a large trunk, which terminates in the thoracic duct on the left side, and is one of the principal vessels forming the corresponding trunk of absorbents on the right side.

Absorbents have been injected on the outside of the head in company with all the principal arteries: for instance, the temporal, occipital, external, and internal maxillary arteries; those from the temple pass through small glands found on the parotid gland as high as the zygoma; those from the face in glands, situated in the checks and outside of the jaw; those from the occipit in glands, situated behind the mastoid process. They afterwards converge, and with the deeper-seated absorbents terminate in the most numerous chlatur of glands found in any part of the body, excepting only those of the mufcletary. They have been named glandulae concentrace, and extend beneath the jaw, over the side of the neck, where the external jugular veins are found, and all along the internal jugular to its termination. No absorbents can with certainty be said to have been injected in the brain. The absorbents of each side of the neck having by conjunction formed a common and large trunk, it terminates on the left side in the thoracic duct near its insertion, and on the right it contributes to form the corresponding trunk. The absorbents of the thyroid gland form two vellae of considerable size, which end in these two ducts near their termination. Some of the absorbents of the brachial, which are very numerous in females, proceed to the axillary glands, being previously connected with some small glands, situated midway between the breast and axilla; others pass over the pectoral muscle to the glands, beneath the clavicle, and others from the back part of the breast penetrate the intercostal muscles, and join the absorbents and glands, which accompany the internal mammary blood-veils.

Naturalists, as Malpighi, Leeuwenhoek, De la Hire, &c., speak of similar absorbents in plants; the fibrous or hairy roots of which are considered as a kind of vasa absoberentia, which attract and imbibe the nutritious juices from the earth and air. From the sap-veils they pass into the whole cellular tissue, composed of vessels and closely interwoven with the whole vascular part of the plant. Thence they enter the vasa propria and glands, which contain and prepare the fluids and secretions peculiar to the species. See Plants and Vegetation.

Absorbents. Disseet of the, in Surgery. When we consider how recently the structure and uses of the absorbent vessels have been explained, it is not surprising that practitioners are too negligent of this branch of pathology. Until these last five years, we have not met with one publication on the diseases of the absorbent system; and even to the present day we do not possess a single work upon this subject in the English language. A few scattered hints, indeed, are contained in the writings of several authors; but it still remains a desideratum, to point out—What are the peculiar morbid affections of the lymphatic glands and vessels, and what are their appropriate remedies? To solve this enquiry in a satisfactory manner, would occupy an entire volume. We can, therefore, only throw out a few casual hints, and recommend the farther prosecution of the subject among medical men.

1. Of morbidous fluids contained in the absorbent system.

We know, from the experiments of physiologists, and especially of Mr. Abernethy, that the absorbents which open on the surface of our bodies imbibe both aqueous and gaseous matters derived from the atmosphere, or from effusions lying in contact with the skin. It is defirable to have the precise nature of these matters ascertained in health and disease; and to determine what means are advisable, in order to regulate their quantities or qualities. If our health may be affected by the absorption which goes on upon the external surface of the skin, there is equal reason to believe we are sometimes influenced by the nature of the vapours that must be constantly exhaled from the cavities, refermors, or interstices of the body. When the synovia, the milk, the bile, semen, and other secreted fluids become impregnated, this change arises from the more watery parts having been absorbed and carried into the lymphous system by the lymphatic vessels. When serum, pus, or blood has been diffused among the cellular membrane, its disappearance is entirely owing to the activity of the absorbents. In a dropsy or an emphysema, the same agents are occasionally set to work, and will effect a removal of the disease. Other examples might be adduced to illustrate the different ways in which the absorbent vessels may be irritated and undergo a morbid change from the quality of their contents, not
to mention the noxious vapours applied to them by means of contagious disorders.

II. Of irregular action in the absorbent vessels.

The irritability or contractile power of the absorbents may be preternaturally weakened; and in that case, probably, there will be an accumulation of the secreted fluids in one or more of the different natural cavities or interstices of the body; for, unless the action of the absorbents keep pace with that of the exhaling or secreting arteries, the natural equilibrium must inevitably be destroyed. Thus it happens in dropsy: either the arteries deposit a larger quantity of serum than can be carried off by the natural power of the absorbents; or the latter are defective in their action, and cannot take up their usual proportion of fluid. The different causes and remedies of diminished or increased action in this system of vessels is, therefore, an important object of enquiry.

III. Sensible changes in the structure of absorbents.

Anatomists have taught us to look for various alterations in the structure of absorbent vessels and glands, under particular circumstances of disease. The diameter of these vascular bodies is often entirely obliterated by external compression and other causes. They may be ruptured, wounded, facerated, or eroded. They may be thickened in their coats, or rendered unfit for use by excessive inflammation and suppuration.

It would be entering into a very wide field of enquiry, to consider what changes the absorbent glands and lymphatics undergo in consequence of the absorption of morbid poisons; for example, in cancer, in syphilis, in the yaws, in the various, morbidious, and vaccine diseases, &c. &c. On this subject, we particularly recommend the perusal of professor Sommerswing's Dissertation, De morbis venorum absorbentium corporis humani, Svo. 1705; Dr. Bailie's Morbid Anatomy, 2d edition; Magacquin's splendid work, De Vitis Lymphaticis; Mr. Cruikshanks's book on the Anatomy of the absorbing vessels, 2d edition, 4to: Adams on Morbid Poisons; and the concluding part of Dr. Darwin's Zoënomia, vol. 1. 3d edition, Svo.

Connected with this subject it may also be worth while to peruse a curious original piece, intitled, An Essay on External Remedies, wherein it is considered whether all the curable distempers incident to human bodies may not be cured by outward means. By P. Kennedy, Chir. Med. Svo. London, 1715. Refecting the latter work, the author says, "there has never, as yet, any "thing been attempted of this kind." Introd. p. 5.

Absorbents, or Absorbent Earths, in Chemistry, are those earthy substances which are capable of imbuing by capillary attraction a large proportion of water: such are magnesia, lime, and clay. It is however, only when these bodies are dry and porous, that they exhibit this property; for certain gums, which are pure argil, and calcareous spar, which, chemically speaking, is the same with chalk, are not in the least degree absorbent. Hence appears the impropriety of this term in chemical nomenclature. Indeed it is at present almost discarded.

Absorbents, in the Materia Medica, comprehend those medicinal substances, which, taken inwardly, or applied externally, are adapted to dry up or absorb redundant or acid humours. They are sometimes called driers and sweeteners, and by the Latin writers the word is synonymous with imbibentia and saturas. The term has been occasionally confounded with alkali, because alkali have the effect of absorbents with respect to acids. It is now almost restricted to certain earths, which are distinguishable from others by their solubility in acids, and which are fitted to imbibe acids, and at the same time to destroy their acid quality. In reference to this property, some have referred them to the class of Antacids. Of the absorbents we may reckon the mineral calcareous earths, as chalk; the animal calcareous earths, as crabs-claws, oyster-shells, egg-shells, pearl, coral, and coralline; and animal earths, not calcareous, as crabs-eyes and burnt hartshorn. The obvious and immediate virtue of these sublunaries is to obtain acid humours in the fist passages, and thus to relieve the cardialgia and other complaints occasioned by them; and they possess different properties, and produce different effects, according to the materials which they absorb, and by which they are refined. The relief they give is often merely temporary, as they serve to absorb the acid actually generated, without correcting the indisposition which tends to produce it. In some cases they are injurious, for if there be no acid humours in the stomach and intestines, these earthy bodies not being soluble by any other kind of fluid, concrete with the vitious contents of the stomach, and form with them indigestible mafles, which may be very hurtful. Hence have proceeded indigestion, loss of appetite, nausea, vomiting, obstructions of the bowels, and other disorders. Sometimes they have formed a kind of crust on the stomach and intestines, which has prevented the separation of the gastric liquor, and obstructed the passage of the chyle through the orifices of the lachrymal vessels into the mass of blood. The taking of an immediate quantity of crabs-eyes and other absorbents for the heart-burn, has sometimes been attended with fatal consequences. See Phil. Trans. No. 459. Sect. 2.

It is observed that absorbents are of more general use in infancy than in adult age. Young children are more subject to acidities than adult persons, because their food is chiefly of the vegetable aliment kind, and produces acidities, which are attended with alarming symptoms, and productive of various disorders. When infants, or persons of mature age, but of a feeble constitution, indicate complaints of this kind by four eruptions, paleness of the face, and in the cafe of children by the four smell and green colour of the alvine faces, absorbent medicines may be very properly administered. The other cordial, alexipharmic, anti-febrile, and similar virtues ascribed to these medicines, seem to be founded on an erroneous theory, which attributes the acute diseases of adults to a morbid acid; diseases which instead of being produced, are more successfully subdued by acids. The use of absorbents, says Dr. Lewis (Mat. Med. p. 643.), in different kinds of fevers, is nevertheless still continued, and sometimes perhaps with advantage; for though the earths of themselves are apparently rather injurious than beneficial, yet as acids are often given freely at the former time, the solution of the earth in the acid may prove a medicine more serviceable in particular cases than the acid unaltered. Different absorbents have been selected and recommended for particular purposes. If it be the intention to absorb, confringe, and strengthen at the same time, chalk, coral, oyster or egg shells, are esteemed the most efficacious absorbents; if for restraining a seminal flux, some prefer the cuttle-bone; for provoking urine, crabs-eyes; for promoting perspiration, burnt-harshorn; and for dissolving coagulated blood, crabs-eyes diffused in vinegar. But all these differences have not yet been sufficiently determined by experience, because the earths have rarely been given in a diffused or soluble state. It is most probable, says Dr. Lewis, that they all act, when diffused, as mild cooling re-stringsents; for when they are given in substance, as absorbents, in cases of acidities, they all tend to restrain fluxes of the belly, or to bring on corrections; an effect which should be regarded in the use of them. It is, therefore, a necessary caution to drink diluting liquors with them, and also
to take gentle purges, as well for some time after they are left of, as during the use of them. Dr. Cullen (Mat. Med. vol. ii. p. 130) observes that chalk, and the several tellurics, may be safely used for correcting acidities of the prime vice, in large quantities: and says that if, upon being joined with the acid of the vomit, they become astringent, it is an effect which he has not observed, and which, if it ever happen, must rarely occur. Their utility in diarrhea he ascribes, not to their astringent quality, but merely to their correcting acidity, which, by being mixed with the bile, had occasioned the disease. Burnt hartshorn, he says, is the weakest of all the absorbents; and he thinks it has not any peculiar virtues. Van Swieten, in his Commentaries on Boerhaave's Aphorisms, observes, that these absorbent powders ought not to be ground too fine, but rather left somewhat coarse, as they will be left to concrete and prove dangerous. The college of Berlin, however, sensible of the advantage of having the earths, when administered in febile cases, previously disdosed, or reduced to a soluble saline form, directs them to be digested in distilled vinegar with a gentle heat, till the menstruum ceases to act, and the filtered solution be inipollated to dryness. This preparation, says Dr. Lewis, is greatly preferable to that simple incubation with vinegar or lemon-juice recommended by some; as by this last management the earth is made soluble only in part, and in an undeterminable proportion. Absorbents are sometimes applied to ulcers; but it is to be observed, that the iniquid terrestrious absorbents, such as coral, &c. put into an ulcer, where a bone is carious, can have little effect besides that of inhibiting the matter of the ulcer; if they fall into any coverdale of the corrupted bone, they may remain fo long there, that the matter imbied by them may become acid. Lith is an absorbent, which has not this disadvantage. See Mono in Med. Eff. Edinb. vol. v. art. 24.

Experiments have been made for determining the comparative strength of different absorbents, or the quantities of acid they are capable of fatiating. Longius (Op. Med. Lipi. 1704. p. 452.) reports, that 10 grains of crabs-claws destroyed the acidity of 40 drops of spirit of salt; that egg-shells, crabs-eyes, and mother-of-pearl, taken in the same quantity, fatuated 70 drops each; red coral, white coral, and mixed alkaline salt, 80 drops each; volatile alkaline salt and pearl, 80 drops each; chalk, 100 drops; oyster shells, 120; and some lime-stones, 160. These experiments cannot be much relied on, as earths have different habitudes to different acids. Accordingly Homberg concludes from his experiments, (Mem. Acad. Royal. de Paris, pour l'an. 1700.) that oyster-shells require for their solution more of the marine acid than coral does; whereas the cale is the receive with the nitrous acid. But neither of these acids is that which absorbents are designed for fatiating in the human stomach. The vegetable acids, and the acid of milk, are molt analogous to those which are generated in the animal body; and on trying those with the several substances above enumerated, the differences in their absorbent powers appear not to be very great. Lewis Mat. Med. 645.

ABSORBING, the act of sucking up, or imbizing another body. Sir Isaac Newton shows that black bodies absorb all the rays they receive, and that those rays of light which impinge against the solid particles of bodies are absorbed and lost; but it appears from some later experiments and observations of M. Bouguer, that this effect is to be attributed, not to the impact of light on the solid parts of bodies, but to the action of some power diffused over their surfaces. He found by repeated trials on the reflection of light, from the surface of water, and of different pieces of crystal, that a confiduruant quantity of light, when the angles of incidence were small, was actually extinguished. This effect, he observed, was diminished by increasing the incidence; so that at an inclination to crystal of about 49° 45', every small part of the ray was absorbed, while in few were lost, when they fell perpendicularly on the reflecting surface. See his Traite d'Optique. Paris 1760.

ABSORPTION, in the Animal Economy, is the function performed by the absorbent vessels above described. The only opportunity which animals have hitherto met with of observing the orifices of these vessels, is upon the villous coat of the intestines. The accounts which have been given of them in that situation are so various, and delivered with such little confidence as not to warrant the intimation of any description. The internal coat of the intestine is seen speckled with chylo conglutated in the mouths of these vessels, in persons who have died when the absorption of that fluid was carrying on. The evident reluctance with which the absorbents admit noxious matter has led to the general belief, that their mouths are irritable, and have the power of denying admission to irritating substances. Various theories have been formed to account for the admission of matter into the orifices of the absorbing vessels; but whichever theory be adopted, it is generally necessary to admit a corresponding aptitude in the vessel to receive, and in the matter to be received. This being granted, some physiologists have imagined that the absorbent attracted matter into its mouth, in the same manner that capillary tubes imbibe fluids. A little reflection is sufficient to shew that the absorbing vessels are not circumnated like capillary tubes (the sides of which are rigid) immerged in a fluid. Besides, were such attraction the cause of absorption, that process should be carried on with regularity. On the contrary, absorption is occasionally very deficient when an abundance of fluids, as in edema, is prefent to the mouths of the vessels. This fact may indeed be explained by supposing the orifices of the vessels to be in a contracted state, but the contrary problem is more difficult of solution. In the course of one night a pint of pus may be imbied from the cavity of an abcede, and functioning absorption is so efficacious that the very substance of the body is in parts removed, and chains in consequence created.

Other physiologists have endeavoured to discover some propelling power which should prostrate the matter subject to absorption into the mouths of these vessels. The propre of the atmosphere on the surface of the body has been considered adequate to this effect, and the deposition of new matter by the secreting artery has been ascribed to the cause of the propulsion of the old particles into the orifice of the abundant. Were this theory correct, secretion and absorption should more exactly correspond than they are known to do; like the former theory, it appears inadequate to account for the facts above related.

Mr. John Hunter who contemplated the facts of natural and morbid absorption in animal bodies with the most idle attention, acknowledged that he was unable to account for the effects produced, unless by attributing to the mouths of these vessels powers similar to those which a caterpillar exerts when feeding upon a leaf. This idea, however, has generally been considered as too wild and chimerical.

Doctor Fullarton, in his ingenious Thesis on absorption, published at Glasgow in 1800, attributes to the absorbing orifices a power of suction, which opinion he supports not only by arguments but by analogies. The umbilical tube of the embryo of the fleece and polypi is said, on the authoruty
authority of Albinius, to absorb by action. The prob-
oscis of the papilionaceous flies acts in the same man-
ner. And the absorbents of the echinus marinus have
this power in so great a degree as to enable the animal
to attach itself to any substance which it may
 happen to touch. It may be right to remind the reader
that the difficulty in accounting for the function of these vesicles
exists only at its commencement, for when the imbibed
matter has gone beyond the first valve it must proceed, and it
will be powerless carried forward by the contractile force of
the vesicle, and by every occasional pressure which is applied
to it. Some physiologists believe that the absorbents can-
not take up any matter that is not fluid. If this opinion
were true, the solids of our bodies must be converted into
fluids before they could become subjects for absorption. A
small addition of phosphoric acid might indeed render the
earth of bones soluble, and it is in this state, that it is car-
eous of the circulating fluids by the urinary secretion.
No liquid has been conceived capable of diffusing such solids
could perform the mucular fibers, but one that resembles in
qualities the gastric juices. Dr. Stringham, in his Thesis on
the absorbing vessels published in Edinburgh, and Mr. Smith in
London, imagined they had discovered that such a fluid capa-
able of diffusing flesh could be secreted in various parts of
the body. See Duncan's Med. Com. vol. x. p. 374. Su-
ofuse experiments have, however, been followed by con-
trary consequences. See Dr. Fullarton's Thesis on absorp-
tion, published at Glasgow, A.D. 1805. Indeed it is un-
like the simplicity observable in other parts of the animal
ecology, should such a double secretion take place; first,
the secretion of solid materials to compose the structure of
the body, and then the secretion of a fluid to dissolve them.
It seems bel, in such difficult investigations to note facts
rather than to form theories, and whoever contemplates the
things done in the animal body will be astonished at the pow-
ers of the vesicles by whole agency they must be effected.
As an illustration, the following may be mentioned. A whole
bone may perish, it may be encased by a new one; and by the
vacular lining of the new bone, the original dead bone
may be altogether removed.

Absorption in Chemistry. It is a well known chemical
fact, in molc cakes of combination of gaseous substances,
either with other gasses or with liquids or solids, that a very
considerable diminution of volume is experienced. This
effect is called absorption, to distinguish it from the de-
crease of bulk occasioned by condensation. The conden-
sation of a gas: whether by mechanical pressure, or by lowering
its temperature, merely increases its specific gravity,
without destroying that state of elastic fluidity which is
essential to its existence as a gas. On the contrary, the ab-
sorption of a gas implies such an intimate union with the ab-
sorbent as wholly destroys its gaseous state of existence, and
reduces it to a liquid or a solid. Thus carbonic acid and
ammoniacal gasses, if inclosed in separate vessels, may be
condensed by mechanical means, till they are of much
greater specific gravity than ordinary, but yet retaining all the
physical properties of air: as soon however as these
gasses are brought into contact with each other, a great
absorption takes place, and a solid is produced containing
all their gravitating matter, but wholly deprived of the
essential character of the gas. In pneumatic chemistry, or that branch of the science
which treats of the aereiform substances, the apparatus for
containing the gasses consists of jars or other glass vessels in-
verted in water or quicksilver; now on account of the great
difference in specific gravity between these fluids, whenever
a jar partly filled with air, and the rest of its capacity with
quicksilver, is transferred from a basin of quicksilver to one
of water, the metal descends, and is replaced by a column
of water, at the same time that an apparent absorption takes
place: this fallacy has no doubt often vitiated the results of
experiments, and therefore deserves to be particularly cau-
tioned against. For example, if an inverted jar 14 inches
high contains eight inches of air, and fix of mercury, (the
barometer standing at 29,2,) the pressure of the atmosphere
on the confined air becomes 30 inches of mercury — 6 inches
24 inches; but if the jar, with its contents, be removed into
a basin of water, the quicksilver sinks down and is replaced
by water, in consequence of which the atmospheric pre-
sure on the confined air becomes 30 inches of mercury —
6 inches of water, or (the specific gravity of mercury to
water being 14 : 1) = 20.572 inches. The difference
here amounts to full one fifth of the whole atmospheric
pressure, and therefore the inclosed air occupies less space than
before, although no real absorption has taken place. See
Pneumatic Chemistry.

Absorption of the earth, in Natural History, a term
used by Kircher and others, for the sinking in of large tracts
of land, by means of subterranean commotions, and many
other accidents.

Pliny (Hist. Nat. tom. i. p. 115. Ed. Harl.) tells us,
that in his time the mountain Cibritum, with the town of
Curitas, which float on its sides, were wholly absorbed into
the earth, so that not the least trace of either remained:
and he records the like fate of the city of Tantalis in
Magnea, and after it of the mountain Syrpalis, both thus
absorbed by a violent opening of the earth. Galanis
and Cameles, towns once famous in Phocis, are recorded to
have shared the same fate: and the vall promontory, called
Pheidias, in Æthiopia, after a violent earthquake in the
night-time, was not to be seen in the morning, the whole
having disappeared, and the earth having closed over it.
These and many other histories, attested by authors of
greater credit among the ancients, abundantly prove the
fact in the earlier ages, and there have not been wanting
too many instances of more modern date. Kircher's Mund.
Subter. p. 77.

The mountain Picus, in one of the Molucca isles, was so
lofty, that it appeared at great distances as an immense co-
lumn reared erect in the air, and served as a landmark to
navigators; an earthquake in this island destroyed it; at one
instant the whole mountain was absorbed into the bowels of
the earth, and no mark of its place remained, but a vall
large lake of water exactly answering to the shape of the base
of the mountain. A like accident, but of a more terrible
kind, happened in China, in the year 1556, when a whole
province of the mountainous parts of that kingdom was in
one moment absorbed into the earth, and all the towns bur-
ried, the whole number of the inhabitants linking with it,
and an immense lake of water remaining in its place to this
time. Of much later date is the destruction of a city in the
confinse of Switzerland: but this, though generally said to
have been swallowed up into the earth, was not properly an
absorption, for the whole city was buried by the fall of a
mountain upon it.

The burning mountains, VESUVUS and STRONGYLIUS,
both once very high, have in length of time lost half their
heights, the upper part having been undermined by the
burning, and having fallen into, and been absorbed by the
under part and the sea. And in the year 1646, during the
terrible earthquake in the kmgdom of Chili, several whole
mountains in the ANDES disappeared, and were one after
another wholly absorbed in the earth.

These, and a thousand other accidents of the like kind,
prove the truth of absorptions in general; some of them leaving level ground in the place of the things absorbed, some immense chains and cracks, and some lakes of fresh or salt water; and it may be that many immense lakes were formed in ages, of which we have no histories, by the like absorptions.

Pliny gives many accounts of the refilling of places thus abolished, but later observations do not give an equal credit to those parts of this history.

There are instances, however, of islands being produced, though we cannot affirm them to have appeared in the place of any which have been absorbed.

In the year 1668, an island was raised near St. Michael’s in the Atlantic ocean, by subterranean fires, which threw flames and other subterranean productions, in such quantities that they formed an island of five miles in length. The mountain raised in one night, in the sea near Puzzolli, is another instance of this sudden production of these mountains: this appeared after one night’s violent subterranean conflict, and still keeps its place, and is known by the name of Mons Sanctus. See Iceland.

ABSTEINEN, in Geography, a district near the river Memel, in Little Lithuania. It is a mountainous and pleasant country, and on account of its fertility in corn and pasture, called the land of Lithuania. It abounds with flocks of sheep, various kinds of grain, and excellent horses.

ABSTEMII, in Ecclesiastical History, a name given to persons who could not partake of the cup of the Eucharist, on account of their natural aversion from wine.

ABSTEMIOUS, is properly understood of a person who refrains absolutely from all use of wine.

It is compounded of abs, from, and ritum, wine.

The history of Mr. Wood, in the Medic. Transf. vol. ii. p. 201. art. 18, is a very remarkable exemplification of the very high abstinence which may be effected on the human body, by a strict course of abstinence.

The Roman ladies, in the first ages of the republic, were all enjoined to be abstemious; and that it might appear, by their breath, whether or not they kept up to the injunction, it was one of the laws of the Roman civility, that they should kiss their friends and relations whenever they accosted them.

ABSTEMIUS, Laurentius, in Biography, a native of Macerata, in Italy, who made a very considerable progress in polite literature, to which he devoted himself in early life. He taught the belles lettres at Urbino, where he was librarian to Duke Guido Ubaldo, under the pontificate of Alexander VI. His works are noted on different pages of ancient authors: Hecatomthymum, or a Collection of 100 Fables, which have been often printed with those of Ælop, Phedrus, Gabrias, Avienus, 8c. and a preface to the edition of Aurelius Victor, published at Venice, in 1505.

ABSTEMIUS, among Civilians, is understood of an heir with heir, by his tutor from, taking on him an inheritance. Among Ecclesiastical Writers, the word is also used for a person excommunicated.

ABSTERGENTS, or Abstensive medicines, more usually called among physicians Detergents, are medicines which not only wash off adhering substantias, as ablutions, but are supposed to polifh a power of revolving and loosening their cohesion. But the terms are too general, and are often erroneously applied upon a false supposition, that they have a power of revolving vivid substantias, which water simply, as an ablution, cannot effect.

ABSTINENCE, derived from ablinores, formed of abs, from, and tenere, to hold, in a general sense, the act or habit of refraining from something to which we have a propensity, or in which we find pleasure.

The Jews were obliged to practice various kinds of abstinence by their law. The Pythagoreans were reformed, upon being initiated into the fraternity of the select companions and friends of Pythagoras, to abstain from animal food, except the remains of the sacrifices, and to drink nothing but water, unless in the evening, when they were allowed a small portion of wine. Some of the primitive christians also abstained from the use of particular kinds of food, whilst others treated their abstinence with contempt. See Rom. xiv. The council of Jerusalem, which was held by the apologists, enjoined the christian converts to abstain from meats flangled, blood, fornication, and idolatry. Acts xv. 20. The abstinence, called ritual, which consisted in abstaining from particular meats at certain feasts, was introduced by the Romish church, by prescription, under the title of Rogations, and groftly shiled. The church of England also recommends certain days of fasting and abstinence.---Abstinence from fish has been enjoined by statute even since the Reformation, particularly on Fridays and Saturdays, and on Vigils, and all commonly called fish-days, 2 and 3 Ed. VI. c. 19.---The like injunctions were renewed under queen Elizabeth, but at the same time it was declared, that this was done, not out of motives of religion, as if there were any different in meats, but in favour of the consumption of sea-fish, and to multiply the number of fishermen and mariners, as well as spare the flock of sheep. 5 Eliz. c. 15.---The great fast, says St. Augustine, is to abstain from sin. See Past.

The ancient Athlete lived in a perpetual abstinence from all kinds of sensible pleasure, to render their bodies more robust and hardy.

Abstinence is more particularly used for a spare diet, or a slender parsonious use of food. It is a subject of the effects of abstinence in the cure of many disorders, and in protracting the term of life. The noble Venetian Coraro, after all imaginable means had proved vain, so that his life was despaired of at forty, recovered, and lived to near a hundred, by mere dint of abstinence, as he himself gives the account.

Many of the christians of the east, who retired from persecution into the desarts of Arabia and Egypt, lived in health and cheerfulness to a very advanced age on very little food. According to Cassian, the common allowance for twenty-four hours was twelve ounces of bread, and water; and yet with this sufficiency St. Anthony lived 105 years, James the Hermit 104, Artemius, tutor of the emperor Arcadius, 120; Epiphanius 115; Simeon the Stylite 111; and Romauld 126. Buchanan informs us, that one Laurentian attained to 140, by temperance and labour; and Spotwood mentions one Kentigern, called St. Mungah or Munpo, who lived to 185, by the same means. See Longevity.

Most of the chronic diseases, infirmities of old age, and the short lives of Englishmen, are owing, according to Dr. Cheyne, to repletion; and may be either cured, prevented, or remedied, by abstinence.

Abstinence, however, should be maintained with discretion, and with a due regard to age, sex, climate, exercise, disposition to corpulence in the individual, and various other circumstances; without a reference to which, it may be pursued to a very hurtful extreme. It is certain, that many persons have irreparably injured their constitutions by excessive parsimony; and those who, either by design or accident, have failed long, seldom enjoy good health afterwards.

Among the brute creation, we see extraordinary infirmities of long abstinence.---It is the natural course of divers species
to pass four, five, or six months, every year, without either eating or drinking; accordingly the tortoise, dormouse, serpent, &c. are observed regularly to retire, at certain seasons, to their respective cells, and hide themselves; some get into the caverns of rocks, or ruins; others dig holes under ground; others get into the woods, and lay themselves up in the chefts of trees; others bury themselves under water, &c. See Sleepers.

The serpent kind bear abstinence to a very great degree. We have seen rattlesnakes that have subsisted many months without any food, yet still retain their vigour and fierce-ness. Dr. Shaw (Trav. p. 411.) speaks of a couple of cerastes (a sort of Egyptian serpents), which had been kept five years, in a large chrysalid vessel, without any sort of food, unless a small quantity of sand, wherein they coiled themselves up in the bottom of the vessel, may be reckoned as such; yet, when he faw them, they had just cast their skins, and were as brisk and lively as if just taken.

Indeed, several species of birds, the whole tribe almoft of insects, and many among the other tribes, are able to subsist all through the winter, not only without food, but many of them in a state of apparent insensibility and torpor.—This furnishes an admirable instance of the wisdom of the Creator: the proper food of these creatures, especially the insect tribe, being then wanting, there is provision for them to live without it. When the fields are divested of their flowery furniture, and the trees and plants are dripped of their fruits, what would become of such animals as are subsisted only by the produce of the spring and summer, and of others which are incapable of bearing severe cold? To prevent the total destruction and extirpation of many species of animals, the Author of nature has provided, that creatures, bereaved by the fall of their food, should be likewise impa-ient of cold: that they might thus be led to shelter themselves out of the way of danger; and that when arrived in a place of safety, the natural texture and viscidity of their blood should dispoze it, by a farther degree of cold, to stagnate in the vessels: so that the circulation stopping, and the animal functions being, in a great measure, suspended, there is no sensible waste or consumption of parts, but they re- main in a kind of droisy neutral state, between life and death, till the warm sun revives both them and their food to-gether, by thawing the congealed juices, both of such animals and vegetables. The fact, however, is unquestionable; and will be more particularly considered hereafter.

It is more than probable, that all motion of the animal juices is extinct in flies and other insects, when thus asleep; because, though they are cut in pieces, they do not awake, nor does any fluid ooze out of the wound, unless some extraordinary degree of warmth had been first applied to unbind the congealation. See Hodge-Hidg. The sleep of such animals is little else than death, and their waking a refur-diption.—For if life does not confit in a circulation of the blood, we do not know in what it consists.

Hence it is no wonder that tortoises, dormice, &c. are found as fat and fleathy, after some months abstinence, as before. Sir G. Ent weighed his tortoise several years suc- cessively, at it its going to earth in October, and coming out again, in March; and found that of four pounds four ounces, it only used to lose about one ounce. Phil. Trans. No. 104.

We have some instances of men who have pasted several weeks, and even months in abstinence without injury. The records of the Tower mention a Scottman, imprisoned for felony, and strictly watched for six weeks; during which time he did not take the least sufficiency; on which account he obtained his pardon. There are many cases of abstinence from morbid causes, that are related in the different periodical Memoirs, Transactions, Ephemerides, &c.

It is to be added, that in most of the instances of long abstinence related by naturalists, there were apparent marks of a texture of blood and humours, much like that of summer beasts and insects; though it is no improbable opinion that the air itself may furnish something for nutrition. It is certain, there are substanccs of all kinds, animal, vegetable, &c. floating in the atmosphere; which must be continually taken in by respiration; and that an animal body may be nourished thereby, is evident in the instance of vipers: which, if taken when first brought forth, and kept from every thing but air, will yet grow very consider-ably in a few days. So the eggs of lizards are also ob- served to increase in bulk, after they are produced, though there be nothing to furnish the increment but air alone; after the like manner as the eggs or spawn of fishes grow, and are nourished with the water. And hence, some say, it is, that cooks, turnspit dogs, &c. though they eat but little, yet are usually fat.

Abstinence is also used sometimes to signify a suppres-sion. Thus in Celsus Aurelianus, abstinensulabiris, signifies a suppression of sweat. Sometimes in this author it means a compreffion; as Spiritus ob abstinensulazlas, means the wind shut up in the intellines by compreffion, thereby caufing the ills apellation.

ABSTINATIONES, in Ecclesiastical History, a fort of people, who carried abstinence and mortification so far, that they had been put into the catalogue of heretics: though it is not known in what their error confistted.

Some represent them as the fame with those otherwise called Conimttmz, and that they particularly enjoined abf- tenience from the use of marriage; others say, from flesh, and others from wine. Others will have them a branch of the Gnostics. Some make them the fame with the Hieratics; others with the Encratites. They are said to have rife in Spain and France towards the clofe of the third century.

ABSTOTTEN, in Geography, a small market town, belonging to the bishop of Pallau, in the circle above the foref of Wiener, in Austria.

ABSTRACT, in General Sense, any thing separated from something else.

Abstract of a fact, in Law. See Fine.

Abstract idea, in Metaphysics, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside or abstractive from the rest. But among those who adopt the system of Mr. Locke, an abstract idea denotes an idea formed in the mind, when we consider a thing simply in itself, without respect to the sub-fiect wherein it resides; or it is a simple idea detached and separated from any particular subject or complex idea, for the sake of viewing and considering it more distinctly.

Thus, magnitude and humanity are abstract ideas, when considered in themselves, and without being at-tached to any particular body, or person; though they cannot have any real subsistence without such subjects, nor the subjects without them.

Whiteness is an abstract, in such as it does not denote any one white object, but that colour, or idea in the general, wherever found.

Abstract ideas are opposed to those which are concrete; the concrete denoting a general or abstract idea's being at-tached to some particular subject, or considered as combined with some other ideas; as, great bones, white wall. All our simple ideas, says Mr. Locke, have abstrac, as well as con-c rate names: as whitecefs, white; sweetness, sweet, &c. The

like
Like also holds in our ideas of modes, and relations: as justice, just; equality, equal, &c.

But as to our ideas of substance, we have very few abstract names at all. Those few that the schools have forged, as Animalitas, Humanitas, &c. bear no proportion to the infinite number of substances; and could never get admittance into common use, or obtain the licence of public approbation; which seems to intimate a confusion of mankind, that they have no ideas of the real essences of substances; since they have not names for such ideas.

Indeed the reality and existence of all abstract ideas, and of any such faculty in the mind as abstraction, have of late been controverted, and actually denied by persons of very considerable eminence as metaphysicians and philosophers. It will appear in what sense they use the terms abstract ideas under the article Abstraction.

Abstract terms, are those made use of to denote abstract ideas. In which sense the words abstractions, animality, justice, crookedness, &c. are abstract or abstract terms.

Abstract mathematics. See Mathematics.

Abstract numbers, are assemblages of units considered in themselves, and not applied to denote any collections of particular sorts of things.

Abstract, in Literature, is a copious view, or epitome of a larger work, and is supposed to be somewhat shorter, and more superficial than an edition.

ABSTRACT, abstracted, in Church History, is a name given to a sect among the Lutherans, under the lead of Helmhins, a Prussian bishop, who asserted against Beza, "that Christ was to be adored not only in the concrete, as the Son of God, but that his flesh in the abstract was an object of adoration." Wigandius prevailed so far against Helmhins as to get him deposed; afterwards the Abstracti gained the ascendant, and Wigandius was silenced. Micrael. Hist. Ecc. I. iii. f. 2. &c. Budd. Inst. Hist. Theol. i. ii. c. 7.

ABSTRACTION, in Chemistry, properly means the act of taking from or separating, by means of heat, one part of a compound from the other. If the part abstracted is collected, the operation is synonymous with distillation. If it is not collected, the term has the same meaning with evaporation. At present, however, it is almost entirely appropriated to the repeated distillation of nitrous acid off any substance; in which case it is said to have been abstracted with the acid.

ABSTRACTION, in Metaphysics, an operation of the mind, whereby we separate things naturally conjunct, or exiling together; and form, and consider, ideas of things thus separated: or, as others define it (see Dunscomb's Elements of Logic, p. 51.), abstraction is that operation of the mind, by which we separate from any of our conceptions all those circumstances that render it particular, or the representative of a single determinate object; so that, instead of standing for an individual, it is made to denote a whole rank or class of things. In this manner we acquire our general ideas, that serve as standards by which we may rank and denominate particular objects. Thus, in viewing a figure, or circle, we leave out the consideration of every thing that is peculiar to them, except their figure and size. Whenever, therefore, we meet with a figure answering to that shape and form, which we had laid up in our understandings, it is immediately referred by the mind to this pattern, and called by its name, which by this means becomes proper to the whole species. Thus, a square and circle are universal terms, common to all figures of that particular shape, and alike applicable to them wherever they exist; in like manner as the ideas themselves are general, and representatives of all of the kind.

The faculty of abstraction stands directly opposite to that of compounding. By composition we consider those things together, which in reality are not joined together in one existence. And by abstraction we consider those things separately and apart, which in reality do not exist apart.

Abstraction is chiefly employed in these three ways. First, when the mind considers any one part of a thing in some respect distinct from the whole; as a man's arm, without the consideration of the rest of the body. Secondly, when we consider the minds of any substance, omitting the substance itself, or when we separately consider several modes which fulfill together in one subject. This abstraction the Geometers make use of, when they consider the length of a body separately, which, they call a line; omitting the consideration of its breadth and depth. Thirdly, it is by abstraction that the mind frames general, or universal ideas; omitting the modes and relations of the particular objects whence they are formed. Thus, when we would understand a thinking being in general, we gather from our sensations what it is to think; and omitting the consideration of those things which have a peculiar relation to our mind, or to the human mind, we conceive of a thinking being in general.

Ideas framed thus, which are what we properly call abstract ideas, become general representatives of all objects of the same kind; and their names applicable to whatever exists conformable to such ideas. Thus, the colour that we receive from chalk, snow, milk, &c. is a representative of all that kind; and has a name given it, abstractions, which signifies the same quality, wherever found or magnified. It is this ill faculty, or power of abstracting, according to Mr. Locke, that makes the great difference between men and brutes; even these latter must be allowed to have some share of reason; that they really reason in some cases, seem almost as evident as that they have senses; but it is only in particular ideas. They are confined to those narrow bounds; and do not seem to have any faculty of enlarging them by abstraction. Essay on Human Understanding, book ii. c. 11. § 9, 10, 11. book iii. c. 3. § 9. Such is the doctrine of abstract ideas, as it has been delivered by that excellent author. From him it became, for a considerable time, a prevailing opinion, that the mind has such a power or faculty of framing abstract ideas or notions of things; and on such ideas a great part of the writings of philosophers is founded. These are fupposed in all their systms; and they are more especially reputed the objects of logic, mathematics, and metaphysics, and of every thing that passes under the notion of the most abstracted and sublime learning.

However, an eminent and ingenious author, Dr. Berkeley, has contested the reality of any such ideas; and led the way towards overturning the whole system, and consequentally towards setting philosophy on a new foundation. See a Treatise concerning the Principles of Human Knowledge, first printed in 1710.

The qualities or modes of things, it is on all hands agreed, says that learned prelate, do never really exist apart, and separated each from all others, but are constantly mixed and combined together, several in the same object. But, say the philosophers, the mind being able to consider each quality singly, or abstracted from other qualities with which it is united, does by that means frame a itself abstract ideas, of a different nature and kind from the sensible ones.

For example, when the eye perceives an object extended, coloured, and moved, the mind resolves this compound idea into
into its simple constituent parts; and viewing each by itself, exclusive of the rest, frames abstract ideas of extension, colour, and motion. Not that it is possible for such colour and motion to exist without extension; but only that the mind can frame to itself, by abstraction, the idea of colour exclusive of extension; and of motion, exclusive both of colour and extension.

Again, say the same philosophers, the mind having observed that in the particular extensions perceived by sense, there is something common, and alike in all; and some other things peculiar; as, this, or that figure, or magnitude, which distinguishes them one from another: it can consider apart, or single out by itself, that which is common; making thereof a general abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely abstracted from them all. So, likewise, by leaving out of the several colours perceived by sense, that which distinguishes them one from another, and only retaining what is common to all, it makes an idea of colour in the abstract, which is neither red, nor blue, nor white, &c.—After the same manner by considering motion abstractedly, both from the body moved, and from the figure it describes, and all particular directions and velocities; an abstract idea of motion is framed, which equally corresponds to all motions whatever.

The abstract idea which the mind frames abstract ideas of qualities or modes, do so it by the same faculty, obtain abstract ideas of the more compound beings, which include much coexistent qualities. For example; Having observed that Peter, James, John, &c. resemble each in shape, and other qualities; we can leave out of the complex idea we had of Peter, James, &c. that which is peculiar to each, retaining only what is common to all, and so make an abstract idea, wherein all the particulars equally partake. And thus it is we are supposed to obtain the abstract idea of man, or of humanity, or human nature; wherein there is indeed included colour, because there is no man that has not some colour; but it is neither white, nor black, nor brown; because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall nor low, nor yet middle stature, but something abstracted from all these; and of the rest.

Farther yet, there being a general property of other creatures, which partake in some parts, but not all, of the complex idea of man; the mind leaving out those parts which are peculiar to men, and retaining only those which are common to all living creatures, frames the idea of animal; which abstracts not only from all particular men, but also from all birds, beasts, fishes, and insects.

The constituent parts of such abstract idea of animal, are body, life, sense, and spontaneous motion. By body is meant, body without any particular shape, or figure; there being no one common to all animals; without covering, either of hair, or feathers, or scales; nor yet naked; hair, feathers, scales, and nakedfeet, being the distinguishing properties of particular animals, and for that reason left out of the abstract idea. Upon the same account, the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion. But what the motion is, it is not easy to conceive. "I will not affirm," says Dr. Berkeley, "that other people have not this wonderful faculty of abstracting their ideas; but I am confident I have it not myself. I have, indeed, a faculty of imagining, or representing to myself the ideas of things I have perceived, or of variously compounding or dividing them: I can imagine a man with two heads, or the upper parts of a man joined to the body of a horse. I can consider the hand, the eyes, the nose, each by itself, abstracted or separated from the rest of the body. But then, whatever hand or eye I imagine, it must have some particular shape and colour. So again, the idea of a man I frame to myself, must be either of a white, or a black, or a tawney, a straight, or a crooked, a tall, or a low, or a middle-sized man. I cannot by any effort of thought, conceive the abstract idea above described; and it is equally impossible for me to form the abstract idea of motion, distinct from the body moving, and which is neither swift nor slow, curvilinear nor rectilinear. And the like may be said of all other abstract general ideas whatever."

Since all things that exist are only particulars, "Whence," says Mr. Locke, "is it, that we come by general words, 'expulsive of a thousand individuals'? His answer is, terms only become general, by being made the signs of abstract and general ideas; so that the generality of abstract ideas should follow from the reality of general words.—But, according to Dr. Berkeley, a word becomes general, by being made the sign not of an abstract general idea, but of several particular ones, any of which it indiscriminately suggests to the mind.—For example, when I say, that whatever has extension is divisible; the proposition is to be understood of extension in general; not that I must conceive any abstract general idea of extension, which is neither line, surface, nor solid, neither great nor small, &c. To make this more evident, suppose a geometricalian to be demonstrating a method of dividing a line into two equal parts: with this view, he draws, for instance, a black line, an inch long; and this, which in itself is a particular line, is nevertheless, with respect to its signification, general; since it represents all lines whatever; so that what is demonstrated of this one will hold of all others.—And as that particular line becomes general by being made a sign, so does the name line, and the idea of a line in the imagination, either of which, taken absolutely, is particular, by being signs become general likewise; and as the former owes its generality, not to its being the sign of an abstract or general line, but of any or all particular right lines that may possibly exist; so must the latter, both the name and the idea, derive their generality from the same cause, of the various particular lines which each of them indifferently denotes.

But to this reasoning it has been replied, that the universal infills the idea; and not merely in the name as used to signify, and represent the mind, a variety of particular things, referring that which is the immediate object of reflection; because had we no previous fixed notion what the name signifies, we could not know what particular things to apply it to, or assign any reason for applying it to one thing rather than another. All that can be pictured in the imagination, as well as all that we take notice of by our senses, is indeed particular. And whenever any general notions are present in the mind, the imagination, at the same time, is commonly engaged in representing to itself some of the particulars comprehended under them. But it would be a very strange inference from hence, that we have none but particular ideas. As well almost might we conclude, that we have no other notion of any thing than of its name, because they are so appurtenant in our minds, that we cannot separate them; or of the sun, than as a white bright circle such as we see in the heavens, because this idea or phantasm is apt to accompany all our thoughts of it. See Dr. Price's Review of the principal Questions and Difficulties in Morals, p. 43.

Dr. Cudworth observes, that abstract ideas are implied in the cognitive power of the mind; and he pronounces the opinion, that they are only singular ideas annexed to a com-
ABSTRACTION.

Mr. Locke, (Eff. b. iv. c. 7. § 9.) speaking of the difficulty of forming abstract ideas, says: "does it not require some pains and skill to form the general idea of a triangle?" which yet is none of the most abstract and comprehensive; for it must neither be oblique, nor rectangular; neither equilateral, isosceles, nor scaleno; but all, and none of these at once. In effect, it is something imperfect, not that cannot exist; an idea, wherein some parts of several different and inconsistent ideas are put together."

Now, let any man look into his thoughts, and try whether he has, or can attain to an idea of a triangle correspondent to this description.

Dr. Campbell, in his Philosophy of Rhetoric, vol. ii. p. 105. expresses his apprehension, that the bare mention of this hypothesis is equivalent to a confutation of it, since it really confutes itself. He adopts the sentiments of Berkeley on this subject, and will allow to the mind no other power of abstraction, if the term be retained, before that by which a particular idea is regarded, as representing a whole. Mr. Locke, he says, has on former occasions erroneously committed the same opinion: in proof of which he refers to his Essay, book iii. chap. 3. § 17.

In this section Mr. Locke maintains, that not only words but ideas are made signs; and a particular idea is made general, not by any change produced in it (for then it would no longer be the same idea), but by being set up as the representative of many particular things. Universality, he observes, as it belongs not to things, belongs not even to those words and ideas, which are all of them particular in their existence, but general in their signification. Again, the general nature of those ideas is nothing but the capacity they are put into by the understanding of signifying or representing many particulars; and, if possible, more explicitly, the signification they have is nothing but a relation, (no alteration in their essence,) that by the mind of man is added to them. "If such an extraordinary faculty," as abstraction, says Dr. Campbell, (Abf. Dr. p. 110.) "were possible, I cannot for my part conceive what purpose it would serve. An idea hath been defined by some logicians, the form or resemblance of a thing in the mind, and the whole of its power and use in thinking is supposed to arise from an exact conformity to its archetype. What then is the use or power of that idea, to which there neither is, nor can be, any archetype in nature, which is merely a creature of the brain, a monster that bears not the likenesses of anything in the universe."

The late Lord Bolingbroke likewise contended against the existence of abstract ideas. He apprehends that the disputes about abstraction may after all be considered as verbal, and owing to the want of making a proper distinction between ideas and notions, which have been used, he says, both by Mr. Locke and his antagonist the Bishop of Clonmel, as if they were synonymous. "We might avoid the confusion arising from this ambiguity, he prelumes, if we conceived the former to be particular in their nature, and general only by their application; and the latter to be general in their nature, and particular only by their application. In another place he observes, that much confusion and error have arisen from the improper use of the word abstraction. There is a very practicable operation of the mind, by which we are said to abstract ideas, and by which we do, in effect, generalize them in a certain manner, and to a certain degree, by sublating one as representative of many. There is another supposed, but impracticable operation of the mind, by which some philosophers have made themselves and others believe, that they abstract, from a multitude of particular ideas, the idea of one general nature or essence, which is all of them, and none of them; whereas, in truth, though they can define general natures or essences in very clear propositions, they cannot frame an idea of any general nature, which is not a particular idea of that nature. Bolingbroke's Works by Mallet, vol. iii. p. 438. and vol. v. p. 17. &c.

The acute Mr. Hume has also attacked the system of abstraction. He affords, (Essays, vol. ii. p. 165,) that it is unintelligible, and even absurd, to conclude, that the ideas of primary qualifications are obtained by abstraction. An extension, that is neither tangible nor visible, cannot possibly be conceived: and a tangible or visible extension, which is neither hard nor soft, black nor white, is equally beyond the reach of human conception. Let any man try to conceive a triangle in general, which is neither isosceles, nor scalene, nor has any particular length or proportion of sides, and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas. Mr. Hume has pursued Berkeley's reasoning to an extent which he himself never proposed, and represented all his arguments as merely hypothetical, because they admit of no answer, and "produce no conviction." -Dr. Reid, in his valuable Essays on the Intellectual Powers of Man, (Ess. v. p. 444,) has discussed the subject of abstraction, and examined the various opinions that have been formed concerning it, in a very diffuse and elaborate manner. This ingenious writer apprehends, that we cannot, with propriety, be said to have abstract and general ideas, either in the popular or philosophical sense of that word. In the former sense, an idea is a thought, or an act of the mind in thinking, or in conceiving any object; and this must be an individual act. In the latter sense, an idea is an image in the mind, or in the brain, which in Mr. Locke's system is the immediate object of thought, and in the system of Berkeley and Hume, the only object of thought; and as he believes there are no such ideas, there can be no abstract general ideas. If they existed, they could not be general, because every thing that really exists is an individual. Universals are neither acts of the mind, nor images in the mind. They cannot be the objects of imagination when the word is taken in its strict and proper sense. We cannot imagine a man, without colour, or stature, or shape. But though Dr. Reid denies the reality of abstract ideas in the sense above stated, he maintains the same doctrine by merely substituting the term conception for idea. As general words are necessary in language, there must, he says, be general conceptions, of which these are the signs; and they take this denomination, not from the act of the mind in conceiving, which is an individual act, but from the object or thing conceived, which is general. Thence general words express either the attributes of things, or the genera and species, into which we divide and subdivide them; and of both these we may have clear and distinct conceptions. As to the operations of the understanding, by which we form these general conceptions, he apprehends that they are the three following; viz. 1. The analysing, or resolving a subject into its known attributes, and giving a name to each attribute, signifying that attribute, and no more. 2. The observing one or more such attributes to be common to many subjects. The first act is by philosophers called abstraction: the second may be called generalising: but both are commonly included under the name of abstraction. We cannot generalise, he says, without some degree of abstraction; but we may abstract without generalising. For what hinders me from attending to the whiteness of the paper before me, without applying that
that colour to any other object. The whiteness of this individual object is an abstract conception; though not a general one, while applied to one individual only. To this reasoning it might be replied, that if whitenefs be separated in his conception of it from the paper, it is no longer the whitenefs of that object; and he must either conceive it as abstracted from all objects, which is impossible, or as pertaining to some other object: and thus neither the quality of whitenefs, nor his conception of it, is abstract and general, but concrete and particular. 3. A third mental operation, by which we form abstract conceptions, is, according to Dr. Reid, the combining into one whole a certain number of those attributes, of which we have formed abstract notions, and giving a name to that combination. It is thus we form abstract notions of the genera and species of things. With regard to abstraction strictly so called, the difficulty of which was acknowledged by Mr. Locke, this author says, "I can perceive nothing in it that is difficult either to be understood or practiced." "What can be more easy," as he proceeds, "than to distinguish the different attributes which we know to belong to a subject? In a man, for instance, to distinguish his size, his complexion, his age, his fortune, his birth, his profession, and twenty other things that belong to him." But in this case, it may be alleged, that though we separate one or more of these attributes from the others in our conception of them, we cannot abstract them from the individual person without transferring them to some other, so that our conceptions will be still concrete and particular. Dr. Reid adds farther, that attributes which are in their nature absolutely inseparable from their subject, and from one another, may be disjoined in our conception. In a body we can distinguish its solidity from its extension, and its weight from both; and in extension we can distinguish length, breadth, and thickness; and yet none of these can be separated from the body, or from one another. But can we conceive solidity, as separated from all extension and weight? Can we conceive solidity or extension, separated from all bodies? Those who cannot do this will still contend that there is no abstraction strictly so called. Without pursuing this ingenious writer's reasoning any farther, or giving in detail his answers to the various objections of Berkeley and Hume, we shall close our abstract of what he says on this subject with the following general conclusions, which he has deduced from his account of abstract and general conceptions. 1. It is by abstraction, he says, that the mind is furnished with all its most simple and most distinct notions. Abstraction analyses the objects of sense, as well as those of memory, and of conciseness. 2. Our most distinct complex notions are formed by compounding the simple notions got by abstraction. 3. Without the powers of abstracting and generalising, it would be impossible to reduce things into any order and method, by dividing them into genera and species. 4. Without these powers there could be no definition, which can only be applied to universals, as no individual can be defined. 5. Without abstract and general notions, there can be neither reasoning nor language. 6. As brute animals shew no signs of being able to distinguish the various attributes of the same subject of being able to class things into genera and species; to define, to reason, or to communicate their thoughts by artificial signs, as men do; "I must think," says this author, "with "Mr. Locke, that they have not the powers of abstracting and generalising; and that, in this particular, nature has made a specific difference between them and the human species." The notion of abstract ideas, which, according to Dr. Berkeley, has contributed to render speculation intricate and perplexed, and to occasion innumerable errors and difficulties in almost all parts of knowledge, led men, in his opinion, first to suppose, that bodies have an existence of their own, exclusively and independently of the mind which perceives them.—Can there be a greater strain of abstraction, says he, than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived?—If there were external bodies, he says, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. His principal argument may be reduced to the following syllogism: whatever may be perceived by sense, is an idea; sensible things are immediately perceived by sense; for the proof of which he appeals to experience; therefore sensible things are ideas: and consequently exist only in the mind. See his dialogue between Hylas and Philonous.

Mr. Hume concurs with Dr. Berkeley in denying the existence of matter; and advances a step farther, maintaining that the soul is merely a bundle of perceptions, and that there is nothing in the universe but impressions and ideas.

Some late Scots writers, Doctors Reid, Beattie, and Oswald, with a view of obviating those sceptical inferences, which had been deduced from the principles of Mr. Locke, have, in opposition to those, offered a new system respecting the nature and origin of our ideas, the outlines of which, with remarks, will be inferred under their proper heads, in the course of this work. See Ideas, Intuition, and Common Sense.

We shall only add, that abstracting, on the common system, is no more than generalising; it is making one thing stand for a hundred, by omitting the consideration of the differences between them: it is taking several different, i.e. different combinations, setting aside the peculiarities in each, and considering only what is found alike in all.—Thus it is that I say, I love my friend, love my mistress, love myself, my bottle, my book, my caye, &c.—Not that it is possible, I should have the same perception with respect to so many different sorts of things, things that stand in such different relations to me; but only that there appearing something in them all that bears a resemblance to the rest, in some circumstance or other, I chuse to express all by one name, love.

For if I consider the tendency and effects of them all, I shall find they lead me very different ways, to very different actions; all the analogy there is between them, is a sort of pleasure or satisfaction, arising upon the application of the particular object to its proper organ, or sense.—The abstract idea of love, then, will terminate in the idea of pleasure: but it is certain, there can be no idea of pleasure without a thing pleasant to excite it. Any other abstract idea of pleasure will amount to no more than a view or perception of the circumstances wherewith our pleasures have been attended; but these are mere externals foreign to the pleasurable sensation itself; which nothing but an object applied in such and such a manner can excite.—To suppose an idea of pleasure produced indirectly, by any other than by the proper cause, is as absurd as to suppose an idea of sound, produced without a resonant object. The mind has no power of making any ideas, call them what you will, whether abstrait or concrete, or general, or particular: its activity goes no farther than to the perceiving of such as are presented to it; so that its action is really no other than a degree of passion.

ABSTRACTITIOUS, or ABSTRACTIVE, is applied by some modern Chemists to a spirit drawn from vegetables without fermentation.

ABSTRACT, abstr/itfus, formed of abs, from, and tru. I stru/, denotes something deep, hidden, or far removed from
from the common apprehensions, and more intelligible ways of conceiving; in opposition to what is obvious and palpable.

In this sense Metaphysics is an abstruse science; and many speculations of Mathematicks are likewise abstruse.

ABSORB, Absurdiun, is a term applied to any action or sentiment that thwarts, or goes contrary to some evident truth.

Thus, a proposition would be absurd, that should affirm that two and two make five; or that should deny them to make four.

The Logicians and Mathematicians have a way of proving the truth of a proposition in this indirect manner, by shewing that the contrary is absurd.

This they call Reductio ad absurdam, or arguing ex absurdum.

Absurdity, when applied to actions, is synonymous with ridicules.

ABSORDITY, a kind of error or offence against some evident or generally allowed truth or principle.

The greatest of all absurdities is CONTRADICTION.

This should arise from two species of absurdities—The one absolute, or which is repugnant to the common sense of mankind; the other relative, viz. which contradicts one, or more philosophers, or persons of great weight and authority.

In this sense the doctrine of a vacuum is an absurdity; as being contrary to Aristotle; and that of a plenum, as being contrary to Sir Isaac Newton. In effect, there is scarce one truth of any moment, that is not an absurdity in this sense; as being repugnant to the system of some fects, or party.

As reason conflits in the due use of names and words, absurdity conflits in the abuse of them. Hobbes assigns absurdity as a privilege peculiar to man, and which no other creature is capable of; he adds, that of all men, those called philosophers are most exposed to it. Whence the saying of Cicero, there is nothing to absurd but has been said by a philosopher, nihili tam abjecti nisi patet; quod non dicitur a philosopho. The reason seems to be, that of all men they reason, and discourse most. Yet a nearer and more apposite cause may be assigned, viz. their neglect at setting out, to define the terms they make use of, i.e. to assign the precise idea each is made to represent: which is much like a man's undertaking to number, without knowing the value of the numeral figures; reasoning, according to the author first cited, being no other than computing. Divers absurdities also arose from the wrong connecting of names into propositions; as first, when the names of bodies are applied to accidents; or the names of accidents to bodies; as in that proposition, "faith is infused or in spired:" since nothing is either fusible, or inspirable, but body: and the fame absurdity the Cartesians fall into, when they make extenu to constitute body, &c. Secondly, when the names of accidents inherent in external bodies are attributed to accidents of our own bodies; as when it is said, that colour is in the object, found in the air, &c. Thirdly, when the names of bodies are attributed to words, or conceptions; as is done by those who affirm that there are universal things, that animal is a genus, &c. Fourthly, when the names of accidents are given to words, and propositions; as when it is said, that the definition is the nature of the thing, or a person's command is his will. Fifthly, when in lieu of proper words, metaphors and tropes are made use of; as, the way leads to such a place, the proverb says this or that; which though allowable on ordinary occasions, yet is of mischievous consequence in reasoning and searching after truth. Lastly, when names are taken at random, and used without meaning, as transubstantiation, confutation, entelechy, &c.

He that can avoid these rocks will not easily fall into an absurdity, except in a very long chain of reasoning, when he may be apt to forget some proposition before laid down. Hobbs. Lev. P. i. c. 5. p. 22.

ABSUS, the Egyptian Lotus of Ray. See CASSIA.

ABSYRTIDES, or ABSYRTUS, in Ancient Geography, islands in the Adriatic, on the coast of Illyricum, mentioned by Strabo, Pliny, Mela, and Ptolemy, to which pertain Apuria or Apsyrtum, and Alborm or Absyrnus; so called according to Strabo (tom. i. p. 484.), and Pliny, (tom. i. p. 181.) from Absyrnus, Medea's brother, who was slain there. They are separated by a channel, and are now called Cherfo and Osfer.

ABSYRTUS, in Mythology, the son of Octa and Hypsea, and brother of Medea. When Medea ran away with Jason, whom she stilled in carrying off the golden fleece, he was pursued by her father; but in order to retard his progress, the tore Absyrnus in pieces, and drew his limbs in the way.

ABTHANES, in History, a title of honour anciently used in Scotland, denoting the high order of thanes, or king's minislers, in contradiction to the lower, called underthanes.

ABUBEKER, or Abu Beer, i.e. the father of the girl or virgin, viz. Ayeha, who was of this description when Mahomet married her, the first caliph, and successor of Mahomet. His original name was Abdal Abi, the servant of the Cave, denoting his piety; which name was changed by Mahomet on his conversion, into Abdal Abi, the servant of God; and on the prophet's marriage with his daughter, he assumed the appellation of Abubekeer. He was eminently useful to this impositor at the commencement of his undertaking, as he vouched for his veracity in every thing he related concerning his revelations, and his nocturnal journey to heaven; and very much exerted himself in augmenting the number of his followers. On this account the prophet gave him the surname of Al Ceddik, which denotes the faithful witness, and the appellation Atik, or preferred, &c. favored from hell-fire, thus intimating that he was one of the elect. At the time of Mahomet's death, two powerful parties, called the Mohajerin and the Anfars, claimed the right of nominating his successor. The former founded their pretensions on their having attended the prophet in his flight to Medina, and declared themselves in his favour before any of the other Arab's joined him; whilst the latter pleaded, that they supported him when he was expelled his native city, and enabled him to surmount opposition, when he and his followers were in a state of perplexion. At length, however, by the interpolation of Omar, they concurred in the election of Abu Beer, A. D. 632. As many of the Arabs had renounced their old religion, and returned to paganism, Judaism, or Christianity, towards the close of Mahomet's life, and after his death, they were unwilling to pay the customary tribute which he exacted of his followers, and made attempts for throwing off the yoke which he had imposed upon them. Abu Beer's first attention was engaged in reducing these rebels, whom he defeated, and whose children he made slaves. This service was conducted by Khaled, or Califd, an excellent general; who afterwards by his conduct and bravery conquered Syria, and greatly contributed to the establishment of the Mahometan religion and policy. On the day, however, of the reduction of Damascus, Abu Beer died, in the 15th year of the Hegira, hav-
ing attained the age of 63, and reigned only two years and three months. A little time before he expired he made his will, and appointed Omar to his successor. He dictated it to his secretary in the following terms: "In the name of the most merciful God. This is the testament of Abdallah Ebn Abu Kharafa, when he was in the full hour of this world, and the full of the next: an hour in which the infidel shall believe, the wicked profaner be assured of the reality of those things that he denied, and the liar speak the truth. I appoint Omar Ebn Al Khattab my successor: therefore hearken to him and obey him. If he acts right he will answer the opinion I have always entertained of him; if otherwise, he must be accountable for his own conduct. My intention herein is good, but I cannot foresee future events. However, those who do ill shall hereafter be made fully sensible of the consequences of their behaviour. Fare ye well, and may ye always be attended by the divine mercy and benediction." Before he expired, he prayed God to bless the choice he had made; to inspire the Mo-mens with sentiments of Concord and unanimity; to render their affairs prosperous and flourishing; and to enable them to propagate the doctrines of the Koran in the most effectual manner, as by the prophet Mahomet, in his last moments, they had been most strictly enjoined. Among other sayings of Abu Beer that are recorded, the following are worthy of notice: "Good actions are a guard against the blows of adversity;" and "Death is the end of all things after it, and the end of all things before it." Such was the liberality of his disposition, that on the Friday of each week, he distributed the residue of his own and the public money, after appropriating a very small sum to his own maintenance; first, to the most worthy, and then to the most indigent, of the Mo-mens. Gibbon's Hist. vol. ix. 358. 8vo.

ABUCARAS, Theodore, was bishop of Charre, or Haran in Mesopotamia, and lived in the eighth century. At first he adhered to the party of Photius, and in connection with Zachary, bishop of Chalendon, undertook an embassy to the emperor Lewis II. for the purpose of presenting Photius's book against pope Nicholas, and inducing him to throw off the papal yoke. He afterwards abandoned the interest of Photius, and was restored, after humiliating submission, to his place in the council of Constantinople, from which he had been excluded. Several treatises bearing the name of Abucaras, written against Jews, Mahometans, and Heretics, have been collected by Gretzer, and published in 4to. at Ingollstadt, in 1605. Another treatise by Abucaras, intitul'd, De Unione & Incarnatione, was found by Mr. Arnold in the Bodleian library, and published at Paris in 1683, in 8vo. Some have doubted whether Abucaras, the friend of Photius, and the author of these treatises, be the same person. Bayle.

ABUCATUA, in Ichthyology, the name given by Mare-grave to the Zeux gallus of Linnaeus.

ABUCCO, Abuco, or Abuuchi, a weight used in the kingdom of Pegu. One abucco is twelve tseccals and a half; two abuccos make an agarra, which is also called giro; two giri make half a bizza; and a bizza weighs a hundred tseccals; that is, two pounds and five ounces the heavy weight, or three pounds nine ounces light weight of Venice.

ABUDHAHER, or Abu Thamer, succeeded his brother Abu safd, in the 311th year of the Hegira, at the age of eighteen, as chief of the sect of the Karmathians; and proceeded with a large army to Balsora, which they took and pillaged. The next year he intercepted and plundered a caravan returning from Mecca to Bagdad; and having been refused the sovereignty of Baffora, he pillaged Cufa in the following year, and put many of its inhabitants to the sword. He afterwards threatened Bagdad, but was obliged to retreat. However, in the 316th year of the Hegira, he seized the towns of Rahaba and Karkisfa in Mesopotamia. In the 317th year, he had war with Mecca, plundered the pilgrims and the inhabitants, killed 73,000 of whom 17,000 were murdered within the walls of the Caiba; and having procured this holy place, he carried off the black stone, which remained in the custody of the Karmathians for twenty-two years; but finding that the temple was still venerated and restored to by pilgrims, they restored it. Abudhaher ridiculed the Mahometan religion, and insulted its votaries; reproaching them with the folly of calling the edifice at Mecca God's house, which he was allowed to profane, without being destroyed by the thunder of the Almighty. Six years after these outrages he made a treaty with the Caliph Al Radi, who granted him an annual tribute of 1,000,000 dinars, on condition of his pernitting the pilgrims to pass to Mecca without molestation. This chief reigned at Hajar in Yemen, where he built a palace, and lived till the year of Chrif 953, in the peaceable possession of a large territory. Bayle. Mod. Univ. Hist. vol. ii. p. 311, &c.

ABU JAAFAR AL TABARI, an Imam of great piety, as well as of very extensive reading and erudition, was born at Amu, or Amol, the capital of Tabreez, whence his name, in the year of the Hegira 224; and though he was a fireuous defender of the koran, he was confuted at Bagdad as a heretic or fiirite. His work, intitul'd, Al Tarikh Al Tabari, is held in high esteem, and considered as the basis of all the other histories of the Mo-mens. What we now have is only an abridgment of a much larger work. It began with the creation of the world, and continued, according to Abulfedaa, to the year of the Hegira 502; or, as others say, to the time of the author's death, in the year 310. The Tarikh was translated into Peric and Turkish, and continued by different writers to the year of the Hegira 531. Mr. Ockley says, that an imperfect MS. copy of it, in Arabic, is preferred in the Bodleian library at Oxford. Mod. Univ. Hist. vol. ii. p. 309.

ABU KEBIS, Sir Ashlan.

A BULFARAGIUS, or Abul Farai, or Abulpharagius, Gregory, in Biography, for to Aaron, a Christian physician, was born in 1226, in the city of Malatia, near the Source of the Euphrates, in Armenia. He practiced physic with success, but was more distinguished by his study of the Greek, Syrias, and Arabic languages, as well as philosophy and divinity. The commendations of his contemporaries are dictated in the style of the highest panegyric; and he is intitled, the king of the learned, the most excellent of those who excelled, the example of his times, the phoenix of his age, the glory of the wife, and the crown of the virtuous. He wrote a history in Arabic, divided into ten dynasties, which is an epitome of universal history, from the creation of the world to his own time, and which does honour to his memory. The parts relating to the Saracens, Tartar Mogoils, and the conquests of Jenghis Khan, are the most valuable. It was published with a Latin translation, in two small quartos, at Oxford, in 1655, by Dr. Pococke, who annexed to it a brief continuation relating to the history of the eastern princes. He had, in 1656, published an extract from this work, intitul'd, "Specimen Hist. Arabum," &c. Abulfaragius was ordained bishop of Cuba at twenty years of age, by Ignatius, the patriarch of the Jacobites; and, about the year 1266, he was elected their private in the east; which dignity he possessed till his death, in 1286, which happened at the time when he is said to have predicted,
predicted, and expected it. Considering the age in which he lived, it is not wonderful that miracles were ascribed to him; but it is needless to record them in this place. Abulfaragius wrote about 30 tracts, besides the history above mentioned, which are recited by Al-Biruni. The learned Poecoke vindicates him from the charge of having renounced Chirilianity. There was another Abulfaragius, surnamed Abdallah Ebn Attiba, who died A. D. 1043. He was a Nestorian monk, a learned man, and a philosopher. He wrote a commentary on the Old and New Testament, in Arabic: he also explained the works of Aristote, and removed the Nestorian patriarchs for their neglect of ecclesiastical learning.

**ABUL FAZL, i. e. the father of excellence, the title which was given to the secretary and vizier of the Mogul emperor Akbar. He was deemed the most learned and best writer in the East. He was murdered by order of Sultan Schim, on suspicion of his having occasioned a misunderstanding between him and the emperor his father. His death was much lamented by Akbar, and many others, who had any regard for literature. He wrote a history of the Mogul emperors, which he continued to the 38th year of Akbar's reign, A. D. 1594. His official correspondence formed three volumes, and was much esteemed. Thafer's Kuli Khan, p. 11.

**ABULFEIDA, ISMAEL, prince of Hamah, a city of Syria, was born in the year of the Hegira 672, A. D. 1273, and was the sixth in lineal descent from Ayub or Job, the father of the famous Saladin. He was a lover of study, and particularly of geography, which may be inferred from a work, intitled, "Chorafelie & Mawara-nahze, h. e. Regio-

**nnum extra flavium Oxnem descriptio, ex tabulis Abulfedae Ismaelis, Principis Hamah." It was printed in London in 1620, by our learned countryman John Greaves, who has added to the Arabic original a Latin translation, with a preface, informing us that he confined five MSS. At the conclusion of this work it is said to have been finished in the 721st year of the Hegira, or A. D. 1321. The tables are given in the order of the climates, with the degrees of longitude and latitude. Abulfeda is said to have discovered the true longitude of the Caliphs' court, concerning which Procliemy was mistaken. A new edition of this work was published at Oxford in 1712, by M. Gagnier, in the third volume of Hudson's "Geographie veteris Scriptores Graeci minoris;" and another at London, in 1732, fol. Abulfeda wrote other works, which manifested his general literature; for he is said to have been acquainted with jurisprudence, phyfie, philology, saltology, history, and poetry, as well as geography. His "General History," from the beginning of the world to his own time, was continued to the year 750, or A. D. 1350. He also wrote "A Short system of the Mohammedan civil law;" "A Treatise of Physic;" and some poems. He is also supposed to be the author of the "Al-antonomical Tables," of which there is a copy in the Bodleian library. His "Life of Mahomet," was published in Arabic and Latin, at Oxford in 1723; and his treatise of the "Life and Actions of Saladin," was printed, with a Latin translation, at Leyden, in 1732, fol.

**ABULFEIDA was no less a military man, than a fluent. He served under his father in several expeditions, and he was present at the forming of Trupoli, A. D. 1289; and at the capture of Acca or Ptolemais, A. D. 1291, as well as on other occasions, when he distinguished himself, by his skill and valour. He died about the 75th year of the Hegira, A. D. 1332. We are cautioned by the editors of the General Dictionary from confounding Abulfeda with Ismael, surnamed Shakinsalah, the compiler also of a General History, which is mostly transcribed verbatim from the work of that prince.

**ABULGHAZI, BATATORI, khan of the Tartars, was born in the city of Urga, capital of the country of Karazm, in the year of the Hegira 1014, A. D. 1605. He was descended both by his father's and mother's side, in a direct line from Zingsik Khan, or Jenghizkhan. After experiencing many misfortunes in early life, he became sovereign of Karazm, in the year of the Hegira 1054, and having reigned twenty years, and by his courage and conduct rendered himself formidable to his neighbours, he resigned the throne to his son some time before his death, in order to devote the remainder of his life to the service of God. In his retreat he wrote the famous genealogical history of the Turks, but being prevented by his death, in the year 1074 of the Hegira, from finishing it, he left it in charge with his son and successor to complete it, which was done in two years afterwards. It is written in the Mogul, or Turkish language, and divided into nine parts; the first treat of the khans and tribes descended from Turk, the son of Japhet, to the time of Jenghizkhan; the third relates the life and actions of that conqueror; the fifth relates those of his sons and successors in the ninth treat of the khans of Karazm to the death of the author. This history was procured by Straulkeng, while prisoner in Siberia, and has been translated into Russian, German, French, and English. As this book is one of the chief funds which afford materials for the history of the Turks and Tartars, it will not be improper to mention the authority on which it is founded. The grandson of Jenghizkhan, being desirous of preserving the memory of the Mogul tribes, and the signal exploits of his ancestors, sent a nobleman, skilled in the Mogul language, into Tartary, in order to collect materials for this purpose. At his return his memoirs were digested, under his own inspection and arrangement, into a work, which consisted of three folio volumes, and was finished in the year of the Hegira 702. The first volume is in the Library at Paris, and was translated by De la Croix, the son, but not published. It was chiefly from this history that Abulgazi extracted his work, excepting that part which relates to the Ubecks of Great Bukhara and Karazm. A French translation appeared at Leyden in 1726, 12mo. Mod. Un. Hist. v. iii. p. 233.

**ABUL OLA AHMED, one of the most celebrated of all the Arabian poets, was born at Maara, a town of Syria, A. D. 973. He left his fight by the small-pox, at three years of age; at forty-five he left off the use of animal food, in conformity to the tenets of the Brahins, and also of the eggs and milk, and lived only on vegetables. He died in 1057. He was not esteemed by the orthodox, as a found Muffulman, for one of his sayings was, "The Chri-

**"tians wander here and there in their paths, and the Maho-

**"nets are entirely out of the way." Another of his apothegms is, "The world is divided between two forts of persons, of whom some have fevere without religion, others without life." The inscription which he order-

**ed for his tomb confirmed the fulsion of his orthodoxy: "This crime did my father commit against me, but I have not committed the same again." Gen. Dict.

**ABU MOSLEM, a governor of Khurasan in the second century of the Hegira, who, A. D. 747, caused the dignity of caliph to pass from the race of the Ommiades to the family of Abbas; and who, in accomplishing and maintaining this revolution, is said to have killed 600,000 perons. Notwithstanding the services which he had rendered to Al-

**manor, this caliph, A. D. 759, ordered him to private-
ABU

By affinimated, as some say: or, as others report, to be thrown into the Tigris. His character has been variously repreffed by different writers. Some fay, that he was a fierce brutal ftorder: and by others, he is defcribed as dif- erect and merciful. Some extol his acquaintance with the poets of the courfey, and with the moral precepts of his re- ligion; and others degrade his character as a glutton and fcanfuiit. Bayle fays, that he was added to magic, and of a ftel similar to that of Spinoza. Of his wives he was fo jealous, that he confined them in a cuffle, to which none besides himself had access, and where they were fupplied with provisions through the windows. Bayle. Mod. Un. Hift. vol. ii. p. 124, &c.

ABUNA, among the Chriftian Arabs, is the title or ap- pellation of a religious character.

The word, which is Arabic, is fometimes alfo written aboua, awbauna, and by some abuana, or abonna; it literally denotes—our father, and is more particularly used for the archbishop or metropolitian of the Abyssinian church. Fabr. Lux. Evang. c. 45. Ludolf. Hift. Ethiop. lib. iii. c. 7.

ABUNDANCE. See ABUNDANTIA.

ABUNDANT Numbers, are those whole aliquot parts added together, excefed the number itself whereof they are parts.

Thus the number 12 is abundant, its aliquot parts, 1, 2, 3, 4, and 6, amounting to 16. In oppofition to abundant numbers land deficient ones.

ABUNDANTION, in Lexicon, is that which includes more marks and characters than are neceffary to diftinguifh it from others.

Thus, we may be faved to give an abundant notion of a rectilinear triangle, when we defcribe it as a fpaces terminated by three right lines, and containing three angles. Inasmuch as the number of its angles is determined by that of its fides; fo that the bare mention of its three fides was fufficient to have defined it.

ABUNDANTIA, in Mythology, a heathen divinity, re- pefted on ancient monuments under the figure of a woman with a pleafing aspect, crowned with garlands of flowers, pouring all forts of fruit out of that which he holds in her right hand, and fattering grain with her left, taken pro- mcifuous from a flieaf of corn. On a medal of Trajan, she is repreffed with two cornucopias.

ABUNOWAS, in Geography, a celebrated Arabian poet, who was born in the city of Bagia, in 762, left feveral works collected by different perfons, and died A.D. 810.

ABU OBEIDAH, one of the companions of Mahomet, who was appointed by Abubeker to the supreme command in Syria, and afterwards fuperfeded by Caled, under whom he ferved at the famous fiage of Damafcus. He reftrained the violence of Caled on this occafion, and obtained leave for the citizens to capitulate, and for the chriftians to depart with their effects. Omar, on his accession, reftored Abu Obeidah to the chief command, and Caled fubmitted to ferve under him. He took Balaab, Emefia, and Jerufalem; and affumning the government of northern Syria, he took Aleppo and Antioch. Whilft he was purfuing his conquests in Pafhine, a grievous pelfidence proved fatal to many of the Mahometan officers, and also to Abu Obeidah, who died A.D. 639, Hegira 19; which year was called the year of deftruction. The civil and moral virtues of this commander are more diftinguifhed than his military talents; but he fucceeded in confequence of the impression made upon the minds of his enemies by his eloquence and good faith. Mod. Un. Hift. vol. i. p. 215; &c.

ABUS, in Ancient Geography, a river of Britain, formed VOL. I.

by the confluence of the Ure, the Derwent, Trent, &c. falling into the German Sea between Yorkshire and Lincolnshire, and forming the mouth of the Humber. See also ABA.

ABU SAID, in History, fultan of the Moguls, succeeded his father Aljan, at the age of twelve, A.D. 1317. He died in 1335, at Sultanis, where he was crowned, and which was the place of his usual refidence. His valor was fo diftinguifhed, that he was called Dahander, or bravour. Having fallen in love with the daughter of Emir Juban, who was married to the Emir Haffan, and who was deemed the greatest beauty in Asia; and the father resifling to confent to her divorce from her husband, Abu Said conceived a pre- judice againft him, which terminated in his death. Haffan, however, acquiefced in a divorce, and fent her to the fultan, on whom she obtained a great accendance. Abu Said was the left monarch of the race of Jenghizkhan; and after his death, that happened in the year in which Tamerlane was born, the empire was dismembered, and became a scene of blood and defolation. Gen. Diet.

ABUSCHEHH, in Geography. See BUSHEHR.

ABUSE, compounded of ab, from, and yusa, use, an ir- regular use of a thing, or the introducing of something con- trary to the true intention thereof.

An Agramm, to apply a word abusively, or in an abusive fence, is to misapply, or pervert its meaning.

A permutation of benefices, without the confent of the bishop, is deemed abusive, and consequently null.

ABUSINA, See ABERSPERG.

ABU TEMAM, in Biography, sprung from an Arabian tribe, furnamed Tay, and confidered as the prince of the Ar- abian poets, was born in the 1oth year of the Hegira, A.D. 859, or as others fay, in 188, or 192 Heg. i.e. A. D. 853, or 857; or in 172 Heg. i.e. A. D. 788, at Jaffem, a little town situated between Damofcus and Tberias. He was educated in Egypt, and died at Mawfel, near the spot where ancient Nineveh flourished, in the 23d year of the Hegira, A.D. 845, or in 228 or 232 Heg. i.e. A. D. 842, or 846. His poetical compositions were collected with thofe of others, into a volume, and intitled Al Hamofab. Having written an elegy on the death of another, the following eulo- gium was given Abu Temam:

The man whose virtues thus affend the sky,

Prais'd (mighty Bard) by thee, can never die. Gen. Diet.

ABUTILO, in Botany, the trivial name of feveral spe- cies of the Sida. See also Hibiscus, Melochia, Malva, and Napea.

ABUTTALS, among Law-writers, denote the bu- ttings or boudnings of a piece of land; expressing on what other lands, highways, or the like, the feveral extremes thereof do abut, or terminate. In this fence the word is fometimes alfo written corruptly abuttals or abutals.—In old surveys, we often find them called haUlands. Abuttals amount to the fame with what Latin writers call capita; Marcullus, froniis; the French, bontes. In Coke, the plaintiff is faid to fail in his abuttals, that is, in fettling forth how the land is bounded.

ABUTUA, in Geography, a kingdom in the south of Africa, to the north of the country of the Hottentots, and adjoining to the province of Ohila, which is faid to be rich in gold mines.

ABYDENUS, in Biography, a celebrated historian, au- thor of the history of the Chaldeans and Assyrians, of which only fome fragments have been transmitted to us by Eufchius, in his Preparatio Evangelica, Cyrilus, and Syncellus; which have been illustrated with feveral notes by Scaliger in his book De Emendatione Temporum.

ABYDON.
A BY

ABYDON. See Abydon.

ABYDOS, in Ancient Geography, a town built by the Milesians, in Asia, on the Hellespont, where, according to L. Bruin (Voyage au Levant), the freight is only half a mile, other freight two miles wide, opposite to Selin on the European side; both of which, according to some geographers, are not called the Dardanelles; but others say, that Selin was much nearer the Propontis than Abydos; and Strabo, (l. xiii. p. 465,) reckons 3720 passes from the port of Abydos to that of Selin. Abydos was situated midway between Lampacus and Bium, and was famous for Xerxes's bridge, mentioned by Herodotus, l. vii. c. 34.; and by Lucan, Phar. lib. ii. v. 672.; also for the loves of Leander and Hero, recorded by Micaeus and others, and celebrated for its oysters by Virgil and Ennius. The inhabitants were effeminate, and also addicted, according to Stephanus, of the Castal fountain, to calumny; whence the proverb, Ne temere Abydon calumine, when we would caution against danger. This city was formerly very important, as it commanded the freights, and made those who were poached of it masters of the communication between the Euxine sea and the Archipelago. It was defended by its inhabitants with great courage and obstinacy against the attack of Philip of Macedon, but at length surrendered amidst the horrors of almost universal slaughter, A. M. 3803. Ant. J. C. 201. Fifty of the citizens were compelled to take an oath, in the presence of all the inhabitants, that when they saw the enemy march on the inward wall, they would kill the men and children, set fire to the galleries laden with their effects, and throw into the sea all their gold and silver and, then, in the presence of the priests, they took another oath, either to conquer or die sword in hand. After the surrender of the city, this dreadful resolution was executed to such an extent, that the individuals of every family killed one another, and none escaped but those who by violent restraint were prevented from destroying themselves. Abydos was taken by the Turks, through the treachery of the governor's daughter, in the year 1352.

ABYDUS, an inland town of the Thasians in Upper Egypt, between Ptolemais and Diospolis Parva, towards Syene, famous for the palace of Memnon and the magnificent temple of Osiris built by Imaundes, into which no fingers or dancers were allowed to enter. Here the Egyptians revered the oracle of the God Besa, which was one of the most ancient oracles of Egypt, and famous even in the time of the emperor Constantius. Strabo, vol. ii. p. 1167-1169. Pliny, l. v. c. 9. Stephanus (Urb. vol. i. p. 94) says, that it was a colony of Milesians. The city, reduced to a village, under the empire of Augustus, presents in our time nothing but a heap of ruins without inhabitants; about three miles well of the Nile, in the place, as Pococke (Descrip. Eait. p. 53.) conjectures, where the present village El-Derbi is situated, but to the well of these ruins is still found the celebrated monument of Imaundes. The entrance is under a portico, 62 feet high, and supported by two rows of masy columns. This leads into a temple 300 feet long, and 145 wide. There are several other spacious apartments, which communicate with one another, both by passages and stair-cases. The solidity of the edifice, the huge masses of marble which compose it, and the hieroglyphics that cover the walls, evidently testify that it is a work of the ancient Egyptians. In the multitude of human figures, which are intermixed with those of other animals, there may be discovered women fackling their children, and men presenting offerings to Venus. There are also the divinities of India, such as they are represented in the temples of Hindostan. Six lions' heads, placed on the two sides of the temple, serve as spouts to carry off the water. The stair-case is formed of blocks inlaid in the wall, and projecting fix feet from it, so that being supported only at one end, they appear to be suspended in the air. The walls, roof, and columns of this stupendous edifice, have suffered nothing from the injuries of time; and its solidity will refit the natural decay of many ages. Except the colossal figures, whose heads serve as a ornament to the capitals of the columns, and which are sculptured in relief, the other hieroglyphics, which cover the inside, are carved in stone. To the left of the great building, there is another much smaller, with an altar at the bottom of it, which was probably the sanctuary of the temple of Osiris. Savary has minutely described this structure in his letters on Egypt, vol. ii. p. 5 & c.

ABYLA. One of Hercules's pillars, on the African side, called by the Spaniards Sierra de las Monas, or against Calpe, in Spain, the other pillar. These were supposed to have been formerly joined, but separated by Hercules, in order to make an entrance into the sea, now called the Mediterranean. This, according to Pliny, (Proem. iii. 2.) was the limit of the labours of Hercules. The Hebrew בָּבֶל, denotes a thick cloud, and also a column, and might therefore be applied to a high mountain, or to the pillar of Hercules. See Bochart. Oper. tom. i. p. 731-733. Edit. Vulcm. See the other authors Strabo, Mela, and Ptolemy, cited by Cellarius, tom. ii. p. 136.

ABYLA. See Abila.

ABYO, or ABYUO, in Geography, one of the Philippine islands, in the East Indies, between Mindanao and Luzon, where the Spaniards have a fort. E. long. 122° 15'. N. lat. 10° 0'.

ABYSS, in a general sense, denotes something profound, and, as it were, bottomless. The word is originally Greek, αἰβώος: compound of the privative αὐτός, and εἴβω, bottom; q. d. without a bottom.

ABYSS, in a more particular sense, denotes a deep mafs, or fund of waters. In this sense the word is particularly used, in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by the deep. Thus it is that darkness is said to have been on the face of the abyss.

ABYSS is also used for an immense cavern in the earth, where God collected all those waters on the third day; which, in our version is rendered the deep, and elsewhere, the great deep.

Dr. Woodward has made several observations and conjectures with reference to this great abyss, in his Natural History of the Earth. He afferts, that there is a vast collection of waters enclosed in the bowls of the earth; constituting a huge orb in the interior or central part of it; and over the surface of this water he supposes the terrestrial flata to be expanded. This, according to him, is what Moses calls the great deep, and what most authors render the great abyss.

The water of this vast abyss, he alleges, communicates with that of the ocean, by means of certain hiatuses, or chains passing betwixt it and the bottom of the ocean: and this and the abyss he supposes to have one common centre, around which the water of both is placed; but so that the ordinary surface of the abyss is not level with that of the ocean, nor at so great a distance from the centre, as the other, it being, for the most part, restrained and depressed by the flata of earth lying upon it; but wherever those flata are broken, or are so lax and porous, that water can
can pervade them, there the water of the abyss ascends, fills up all the clefts and fissures into which it can get admittance; and saturates all the interstices and pores of the earth, stone or other matter, all round the globe, quite up to the level of the ocean.

The existence of an abyss or receptacle of subterraneous waters, is controverted by Camerarius, (Diff. Taur. Act. Erud. Sup. tom. vi. p. 244.) and defended by Dr. Woodward, chiefly by two arguments; the first, drawn from the vast quantity of water, which covered the earth in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to show are occasioned by the violence of the waters in this abyss. A great part of the terrestrial globe has been frequently shaken at the same moment; which argues, that the waters, which were the occasion thereof, were co-extensive with that part of the globe. There are even instances of universal earthquakes; which show that the whole abyss must have been agitated: for so general an effect must have been produced by as general a cause; and that cause can be nothing but the subterraneous abyss.

This abyss is no useless thing; when once established, it serves to solve several difficult phenomena; as the origin of springs and rivers; the level maintained in the surface of different fers, and their not overflowing their banks. To the clefts emitted from this abyss come even attribute all the diversities of weather, and changes in our atmosphere; and, what is more, the origin of every thing in the earth; or in its surface. Dr. Woodward has an epistle on the economy of the great abyss hid in the bowels of the earth, and the perpetual communication between it and the atmosphere. Ray, (Physico-Theological Discourses, p. 76. ed. 4.) and other authors, ancient as well as modern, suppose a communication between the Cappian sea and the ocean, by means of a subterraneous abyss: and to this they attribute it, that the Cappian does not overflow, notwithstanding the great number of large rivers it receives; of which Klappe reckons above fifty, in the compass of sixty miles. But the daily evaporation may be sufficient for this purpose. See Evaporation, Sea, and Spring.—The different arguments concerning this subject, are collected by Cockerum in his Inquiry into the truth and certainty of the Mosiacal deluge, p. 271. See Deluge, Earth, and Volcano.

Abyss is also used to denote the cavernous belly of a hollow mountain.

In which sense Mr. Tournefort describes the abyss of Mount Ararat. This, and similar gulphs, or precipices in mountains, M. Buffon, and others, suppose to be the craters of extinguished volcanoes.

Abyss is also used to denote hell. In which sense the word is synonimous with what is otherwise called Barathrum, Erebus, and Tartarus: in the English Bible, the bottomless pit.

Abyss is more particularly used, in Antiquity, to denote the temple of Phrephine.

It was thus called on account of the immense fund of gold and riches deposited there; some fay 'ill under ground.

Abyss is also used in Heraldry, to denote the centre of an Escutcheon.

In which sense, a thing is said to be borne in abyss, en abyss, when placed in the middle of the shield, clear from any other bearing; he bears azure, fleur de lys, in abyss. Colombiere.

Abyss is also used metaphorically, for a thing not to be known or comprehended, on account of its immense extent, or profundity.

In which sense it coincides with secret, ininteratable, incomprehensible, &c.—The judgments of God are called a great abyss.

Abyss, in Hydrography, is synonymous with Gulph.

Abyssinia, or, as it is sometimes called, Abassia, Abyssinian, and Upper Ethiopia, in Geography and History, an empire of Africa, situated in the Torrid Zone, and mostly comprehended between 8° and 16° N. lat. and 44° and 40° E. long. As to the etymology of this name, some have sought for it in the fruitful spots amongst rugged deserts with which the country abounds, and which the Egyptians call abasis; and others have traced it to Abasa, the capital of the kingdom of Adel, whose monarchs were once masters of Abyssinia; but Ludolphus, and many who have adopted his opinion, ascribe the origin of the appellation to the Arabic Habkis, which has the same meaning with the Latin Cenitra, and signifies a number of distinct people meeting together accidentally in one place. This etymology, it is alleged, corresponds with the manner in which this country was originally inhabited. For the appellation of Prior or Presbyter John's empire, which the Portuguese gave to this country, there is no sufficient foundation, as there was no peron of this denomination that was ever known in Abyssinia. See Peters John.—The imaginary limits of this country have been erroneously extended by ancient geographers far beyond the equatorial line, and its real boundaries have been in later times very much reduced by the invasion of a barbarous people, denominated Gallus, of whom we shall give an account under that article. It is at present bounded on the N. by the kingdom of Sennaar, on the E. and N. E. by the Red Sea, on the S. by the Gallus, and a vall chain of mountains extending with little interruption from 34° to 44° E. long. and between 8° and 9° N. lat. and on the S. E. by the kingdom of Adel, and on the W. by the Nile, and some adjacent provinces. But its boundaries have suffered many irritations and encroachments, that they are not easily ascertained.

At the time of Lobo's mission, in 1624, it extended from the Red Sea to the kingdom of Congo, and from Egypt to the Indian Sea, containing forty provinces. At Maluah, i.e. on the coast of the Red Sea, lays Mr. Bruce, begins an imaginary division of Abyssinia, into two parts; the first is called Tigré, between the Red Sea and the river Tacazze; the second is Amhara, between that river and the Nile, wellward, where it bounds the Gallus. But this division respects language, rather than territory; and it is, in neither view of it, sufficiently precise and determinate. The provinces now comprehended under the empire of Abyssinia are the following; viz. Masfah; Tigre; Sire; Senen; Waldubba; Begemder; bordering upon Angot, which is almost wholly conquered by the Gallus; Amhara; and between the rivers Gezen and Samba, a low, unhealthy, but fertile province, called Walakta; and to the S. of the latter the Kifahr Shoa; Gogam; Danot; Maftah; the province of the Agowa; Dembe on the north of Gojdar, and Waggora, a small province on the call, which are altogether town with wheat, and are the granaries of Abyssinia; and to the south of Dembea, Kuara. There are many other small provinces which are occasionally annexed, and sometimes separated, such as Gnejque to the east of Kuara; Waldubba, between the rivers Guanze and Angrab; Tzegadé and Walkayt on the west of Waldubba; Abergali and Schaw, near Begemder; Tumban, Dobas, Giannemara, Bar, and Engare, in the neighbourhood of Tigre, &c. Such was the rate of the country at the time when Mr. Bruce visited it. These L 2 provinces
provinces form one empire, subject to a monarchy, hereditary in one family, but elective in that line, and disputatious; of which the capital was formerly Axum, but is now Gondar.

The surface of this country is generally rugged and mountainous; it abounds with forests and morasses; and it is also interlaced with many fertile valleys and plains, that are adapted both to丈夫 and cattle breeds. The rivers of Abyssinia, which are numerous and large, contribute very much to its fertility. Besides the Nile, which has its source in Gebeh, an elevated district of this country, there are also the Tacezzé, the Kibber, or as the Portuguese call it, Zebbe, which lies beyond the extent of Abyssinia, as has been above alluded to, the Mareb, the Hoax or Hawash, the Coror, which rises in Agout and empties itself into the Tacezzé, the Anguea and Lidda, which form branches of the March, the Andona, which rises near the source of the Tacezzé, is continued under the name of the Hanazo, through the kingdom of Damaro, and discharges itself near the bay of Zeyla, the Bahllo, Loha, Ghefta, Samba, Jema, Roma, Bolo, Rahad, and Dender, which, rising in provinces bordering on the Nile, empty themselves into that river; the Angah, Lakel, and Guanque, which flow into the Tacezzé, &c. The principal collection of water in this country, is the lake of Taza, 9, as it is generally called, the lake or sea of Dembba. The climate of Abyssinia, though, like other parts of the torrid zone, it was formerly thought to be uninhabit-able, is not only tolerable, but in general temperate and healthy. In this respect, however, the uneven surface of the country exposes different situations to the effects of heat and cold, of dryness and moisture, and of a free circulation or stagnation of the atmosphere in very various degrees. On the mountains, and in the higher parts of the country, the sky is clear and serene, the air is cool and refreshing, and the people are healthy and sprightly; whilst those who live in some of the valleys, in the vicinity of marshes, and in sandy deserts, cannot but experience the pernicious influence of excessive heat, and of a moist, stagnant, and suffocating air; so that the climate depends upon soil and situation as much as upon the latitude; and therefore no description of it will equally suit the several provinces. Mr. Bruce (Travels, vol. iii. p. 662.) observes, that on the highest mountain of the ridge called Lamalmon, the thermometer stood at 32° in the depth of winter, the wind being N. W. clear and cold, but attended only with hoar frost. This, he adds, vanished, into dew after a quarter of an hour’s sun; nor did he ever see any sign of congelation upon the water upon the top of that, or any other hill. The barometer stood at 19° 5' at noon of the same day, and the therm. was at 78°. He observed hail to lie for three hours in the forenoon on the mountains of Amid Amid. From an examination of Mr. Bruce’s register of the barometer and thermometer, &c. kept at Gondar, from February 19, 1770, to May 31, 1774, it appears, that the greatest height of the barometer was 22° 11' 4", on April 29, at 6° 9' M. the therm. being 65°, and wind S. The hail height was 20° 1' 2", March 29, at 24° N. therm. 75°, wind E. The greatest height of the thermometer was 81°, April 19, at 12 N.—Wind W. W. N. The last height was 54°, July 7, at 12 N. barom. 21° 6' 7", wind W. The rainy season commences in April or the beginning of May, when the sun becomes vertical, and ends in September. The rains generally cease about the 8th of September; a sickly season follows till they begin again, about the 20th of October; they then continue constant but moderate, till the 8th of November. All epidemic diseases cease with the end of these rains. In order to avoid the inconveniences that attend the overflowing of their rivers during this season, as well as on account of the greater fulness of elevated situations, the Abyssinians have built many of their towns and villages on the mountains. Their houses are generally very mean, consisting only of adobe, and constructed with straw and thatch, earth and lime, through which there are some of stone, and better materials. It is a mistaken notion, however, that they live in tents, and not in houses. In a climate like that of Abyssinia, subject to scourging weather for fix months, and to deluges of rain, storms of wind, thunder and lightning, and hurricanes, such as are unknown in Europe, for the other six, it is not probable that they should chuse to live in tents, after having known how to build such cities as Axum. In many of the towns and villages, the houses are separated by hedges, which being always green and intermixed with flowers and fruit-trees, at certain distances, afford an agreeable prospect, and contribute also to their fulness. Notwithstanding every caution, the Abyssinian climate, more especially in particular situations, exposes the inhabitants to a variety of diseases. They have among them a fever called fevers, which commonly prove fatal on the third day. Those who survive to the fifth day often recover, merely by drinking cold water, and by repeatedly throwing cold water upon them in their beds. The bark is the most effective remedy; which, in critical cafes, (says Mr. Bruce, vol. iii. p. 54.) should be frequently repeated in small dozes, and perfect abstinence observed, unless from copious drughts of cold water. Another common disease in Abyssinia, is the tertian fever, which is in no respect different from our tertian, and is successfully treated in the same manner. All fevers terminate in intermittent, and if they continue long, in dysenteries, which are always tedious, and very frequently mortal. Bark and ipecacuanha, in small quantities, water, and fruit not overripe, have been found the most effectual remedies. The dyerent, commencing with a confoant diarrhea, is seldom cured, if it begins with the rainy season; otherwise small dozes of ipecacuanha either remove it, or change it into an intermittent fever, which yields to the bark. Another endemic disease is called hanzeer, the hogs or the fwine, and is a fwellings of the glands of the throat, and under the arms, which by ineftual attempts for producing fuppuration, and opening the tumors, becomes a running fource, and fembles the evil. In connection with this diorder, we may mention three fwellings, to which the whole body is fubjeft, and particularly incident to the arms, thighs, and legs, sometimes accompanied with ulcers in the node and mouth, which deface the smoothnefs of the skin, and which, on this account, are much dreaded by the Abyssinians. The two laft diseases sometimes yielded to mercurials; but the laft is fpeedily and completely cured by antimonial. Another complaint afflicts those who are in the habit of drinking fagnant water. It is called Parentis, or the worm of Pharaoh, and appears in all parts of the body, but most frequently in the legs and arms. It is a worm with a small black head and a hooked back, of a whitish colour, and a white body of a filly texture, refembling a small tendon. The natives feize it by the head and wind it gently round a piece of filk, or a bird’s feather, and thus by degrees they extract it without any inconvenience or permanent fear. Mr. Bruce suffered much from this complaint, and the breaking of the worm in the operation of extracting it. The molt terrible of all the diseases of this climate is the Elephantias. The ciucio, mercury, and tar-water, were unsuccessfully tried in this complaint: the greatest benefit was derived from why made
made of cow's milk. To the alternation of scorching heat and chilling cold, thin clothing, the use of stagnant putrid water for four months, and other such causes, these diseases may be partly, if not wholly, ascribed. The small-pox was introduced into Abyssinia at the time of the siege of Mecca, about the year 536, and the Abyssinian army was the first victim to it. The diseases and other inconveniences to which the Abyssinians are subject from the nature of their climate, are in some degree countered-balanced by substantial advantages, if they would avail themselves of them by industry and activity. Their soil, though in many places thin and poor, is rendered fertile by the rare showers of rain which fall upon them by their rains and rivers. Wherever it can be tilled and well watered, it yields very large crops of wheat, barley, millet, and other grain. The inhabitants have two and often three harvests in the year; and where they have a supply of water, they may live in all seasons; many of their trees and plants retain their verdure, and yield fruit or flowers throughout the year; the west side of a tree blossoms first, and bears fruit, then the south side, next the north side, and last of all the east side goes through the same process towards the beginning of the rainy season. Their rivers abound with various kinds of fish; and their pastures are covered with flocks and herds; and yet for want of application and exertion, notwithstanding the almost spontaneous productions of nature which their country affords them, they are in general poor and wretched. Though they have plenty of wheat, and some of excellent quality, the chief grain they use is that called Tiff. They have grains in abundance, but they neglect to make hay of it; and therefore they are obliged to supply this defect by feeding their cattle with barley, or some other grain. Notwithstanding the plenty, and frequent return of their crops, they are sometimes reduced almost to famine, either by the devastations of the locusts or grasshoppers, which infest the country, or by the more destructive ravages of their own armies, and those of their enemies. They cultivate the vine, peach, pomegranate, sugar-cane, almonds, citrus, and oranges; and they have many roots and herbs, which grow spontaneously; and their oil, if properly managed, would produce many more. However, they make little wine; but content themselves with the liquor which they draw from the sugar cane, and their honey, which is excellent and abundant. They have also the coffee-tree, and a plant called Ensete, which produces an edible nourishing fruit. The country also produces many other fruits and products that are adapted both for domestic and medicinal uses: such as the Kolquall, Papyrus, Wanzez, Balessan, Woggoodos, Cusso, Sussa, Ergett, Sena, Cardamon, and Ginger. Here is also plenty of cotton, which grows on shrubs, like the Indian. Flowers in a rich variety adorn the banks of their rivers, and encircle their houses; some of which are common with us, and others unknown in Europe. Their forests likewise abound with trees of various descriptions, particularly the Rack, Baobab, Cedar, Sycamore, &c. This country produces a great number of animals, both domestic and wild. Amongst the former we may enumerate horses, some of which are of a very fine breed, mules, asses, camels, dromedaries, oxen, cows, sheep, and goats; and these constitute the principal wealth of the inhabitants. Amongst the wild animals we may reckon the antelope, the buffalo, the wild boar, the jackall, the elephant, the rhinoceros, the lion, the leopard, the hyena, the lynx, apes and baboons, which are very destructive to the fields of millet, as well as the common rats; the zecc or wild mule, and the wild ass; the jerboa, the fennec, aikokoro hare, &c. The hare, as well as the wild boar, is deemed unclean, and not used as food. To the amphibious kind we may refer the crocodile and hippopotamus, and the water-lizard, called Anecho by the natives, and by the Italians coudrivers. Of the vast variety of fish with which their lakes and rivers teem, we shall only mention the Torpedo and the Penny. Amongst the birds, we might enumerate the eagle, hawk, and many of the vulture kind; the ostrich, the flamingo, the walla, and many other species of pigeons which are birds of passage, the Erkoon, the Auez-Hannes, the Moree, or honey-bird, &c. The swallows that are known in Europe, appear in passage there when they take their flight from hence. In the island of Mafzah, they lighted, and carried two days, and then proceeded with moon-light nights to the south-west. Mr. Bruce saw no sparrows, magpies, nor hawks; nor many water-fowl, nor any geese, except the golden goose or goose of the Nile, which is common in every part of Africa; but there are finches in the marshes. The Locusts of this country are very destructive; they have also a species of ants, that are injurious; but from their bees they derive a rich supply. Of their vipers and serpents we shall take notice under the articles Ceraastes and Boa. For a peculiar fly, see Tsaaltsalva.

The inhabitants of Abyssinia are Christians, Jews, Mahometans, and Pagans. The Christians are of the Abyssinian church, of whom we shall give some account in the next article. — The Jews have been settled in this country from time immemorial. Of these four have been voluntary probelies to Christianity; others have been compelled to embrace the profession of it, in order to avoid persecution, and to enjoy the benefits of manufacture and commerce; and those that remain Jews have been, for the most part, forced to reside in the inaccessible and mountainous parts of the country; and even here they retain the ancient distinction of Caritics and Talmudists, with invincible pertinacity. Besides these two sects, there is a third sort of them, (says Ludolf, l. i. c. 14. p. 73.) who inhabit the Abyssinian frontiers, between them and the Caffres, who dwell along the Nile. These are supposed to be descended either from those whom the kings of Zephyria and Babylon carried away captive, or from those who were dispersed over the world, or were fold by Titus Vespasion, after the destruction of Jerusalem. They were never incorporated with the original Jews that came hither, as tradition has, with Benelius, the foe of Solomon, but were looked upon as aliens, and the descendants of the Sidonians, &c. Strangers or exiles. They retain their Hebrew bible is the corrupt Talmudic dialect, and their synagogal worship. — The Mahometans are reckoned to amount to about one third part of the inhabitants of Abyssinia, and are very much intermixed with the Christians. Some of them apply to agriculture; but the richest and most prosperous are the factors, who, since the Abyssinians have been deprived of their sea-ports on the Red Sea by the Turks, have, by favour of the Mussulmans, engrossed that trade very much to themselves. — The Pagans are chiefly the Gallees; besides some others who are dispersed through several of the provinces of the Abyssinian empire. Amidst this variety of nations, there must be supplied a corresponding variety of language, disposition, customs, and government. The Jews speak a kind of corrupt Hebrew. The Moors use their own Arabic in an impure state. The dialect of the count is that of Amhara; that of Tigré, however, approaches nearest to the old Ethiopic, which is called Lachboni Gore, the learned language, and is still used, not only in all their literary and religious books, but also in the king's letters patent, and all their records. See specimens in Bruce's Travels, vol. 1.
ABYSSINIA.

With regard to arts and sciences, and general literature, the Abyssinians are commonly very unenlightened and likely to continue so, not only from the form of their government and natural indolence, but as long as they are in a great degree secluded from intercourse with nations that are better instructed than themselves.

As to their persons, the Abyssinians, are in general, tall and well made; their features are duly proportioned, their eyes large, and of a sparkling black colour, their noses rather high than flat, their lips small, and their teeth extremely white and handsome. With respect to their natural tempers, they are said to be good-humoured, mild, and placable; unless we except those of Tigre, who, according to the accounts of the Jesuits, not indeed always to be credited, are of a fickle, cruel, treacherous, and vindictive disposition. In their common conduct, they are sober and temperate. They have both a capacity, and an inclination for acquiring knowledge, but have hitherto wanted the necessary means. To, religion, or rather to superstition and ceremonial observances, they are much inclined, and deference to their priests is considered by them as one of their first duties. But inward as they are to war and shedding of blood, and to feeding on raw, and even living flesh, they cannot avoid contracting an obscurity of temper, and remaining in a state of barbarity.

The drabs of perfons of quality, is a long fine veil either of silk or cotton, tied about the middle with a rich scarf. The common people have only a pair of cotton drawers, and a kind of scarf, or piece of the same linen with which they cover the rest of their body. In some parts of the country, more especially near the coast, and in the adjacent provinces, men and women have no kind of covering. Indeed, their drabs is suited to the climate, so that the cloth which covers their bodies, and their drawers, are made fo wide and long, as to admit as much air as possible. The habit of the women, particularly of the superior classes, is formed of the richest silks, garnished, according to their rank, with trinkets and jewels, images, and relics of various kinds. They are allowed to appear in public, and to converse freely with the men, without any of those restrictions to which the Turkish women are commonly subject. The women of superior condition are not very guarded in their conduct, but those of inferior rank are more faithful to their husbands; and they also submit to the meaner and more laborious offices of domestic life. It is their business to grind corn for the family, which they perform daily by means of hand-mills. Every kind of intercourse (says Mr. Bruce, vol. iii. p. 304.) is permitted with absolute freedom. In this particular they resemble the Cynics of old, of whom it was said: "Omnia quae ad Backumet Venenm pertinuerint in publico fasere." They bear children, and are delivered with little pain and inconvenience. Although we read from the Jesuits, continues this author, a great deal about marriage and polygamy, yet there is nothing which may be averred more truly, than that there is no such thing as marriage in Abyssinia, unless it be that which is contracted by mutual consent, without other form, fulfilling only till dissolved by dissent of one or other, and to be renewed or repeated as often as it is agreeable to both parties; who, when they please, cohabit together as man and wife, after having been divorced, and having had children by others, or whether they have been married, or had children by others or not. Upon separation they divide the children. The eldest son falls to the mother's first choice, and the eldest daughter to the father. If, after the first election, the remaining number be unequal, the rest are divided by lot. There is no such distinction as legitimate and illegitimate children from the king to the beggar. The king in his marriage dies no other ceremony than this: he leads an Azage, or officer, to the house where the lady lives, who announces to her, that it is the king's pleasure she should instantly remove to the palace. She then dresses herself in the broid manner, and obeys. From this time an apartment is assigned her in the palace, and a houfe is given to her wherever else she chuses. When he makes her ftrege, the form seems to be the most resemblance to marriage; for, whether it be in the court, or in the camp, he orders one of his judges to pronounce in his presence, that he, the king, has chosen his hand-maid, naming her, for his queen; upon which the crown is put upon her head; but she is not anointed. Whatever be the forms of marriage in this country, and such are entered into at a very early period, when the males are ten, and the females younger; polygamy is allowed, divorces frequently occur, and adultery is compensated by an easy fine. Their funeral are attended with many superfluous ceremonies. The relations, friends, and a number of hired mourners, bewail the dead for many days together, with shrinks and lamentations, clapping of hands, fasting their faces and breasts, and uttering a variety of afflicting expressions in the most dolorous tone. They express their concern at hearing the death of a relation or friend, not only by violent exclamations, but by throwing themselves on the ground with such force as to do themselves great injury.

Whenever a near relation dies, every woman in Abyssinia, with the nail of her little finger, which the leaves long on purpose, cuts the skin of both her temples, about the size of a sixpence; and, therefore, you see a wound, or fear, on every fair face in the country; and in the dry season, when the camp is out, from the lips of friends, they are seldom allowed to heal till peace and the army return with the rains.

The food of the Abyssinians is plain and coarse. Their bread, which is indifferently prepared, of wheat, peafl, millet, tefl, or any other grain, is made into flat cakes or apas, which serves for dinners, plates, and spoons, and even for napkins and table-cloths. They wash their hands before they sit down to their meals, and this is the more necessary, as they touch every thing they eat. The rich have their victuals cut for them, and conveyed to their mouths by pages, who attend them. All their sauces are rich, greasy, and highly seasoned. They never drink till they have finished their meals, alleging an old rule, that you must plant firft and then water. When the tables are cleared, they indulge themselves freely in circulating the globes. The common liquor is hydromel, made of five or six parts of water to one of honey, with a handful or two of parched barley meal, which causes it to ferment; to which they add some chips of a wood, called faro, in order to take off the luscious taste of the honey, and to make it palatable and wholesome. At a feast, which Mr. Bruce attended, there was excellent red wine, brought from Karoota, which is the wine country, good new brandy, hydromel, and a kind of beer, called bouza; both the laft of which were fermented with herbs or leaves of trees, and thus made very hearty and intoxicating. The Abyssinians neither eat nor drink with strangers; and they break, or purify, every vessel which has been used by them. This custom they seem to have derived from the Egyptians. The Abyssinians eat their flesh raw; and they have a method of obtaining it, which at the first report seems to be hardly creditable; but, upon farther enquiry, is an undoubted fact. In the neighbourhood of Axum, Mr. Bruce met with some travellers, who were driving a cow before them. He afterwards found that they cut flecks from the higher part of the buttock; they then closed the wound by drawing the skin over it, and applied to it a cataplasm of clay. They then drove the animal before them, in order to supply them and their companions.
companions with another meal. At their feasts they have a bull or cow, one or more, according to the number of guests, which are tied at the door of the house in which they are assembled. After letting out a few drops of blood from the dew-lap under the throat, they cut through the skin on each side of the spine, and flinging off the hide of the animal half way down the ribs, and as far as the buttock, they cut out the solid flesh from the buttocks in square pieces, and the roasting of the animal, during this savage operation, is a signal for the guests to feast themselves at table. These pieces are served up on round cakes of unleavened bread made of wheat. Three or four of these cakes of a whiter fорт are placed uppermost, and designed for food; and four or five of a blacker kind are under the others, and serve the malters to wipe his fngers upon, and afterwards the fevant eats them as bread at his dinner. As no person of any fashion feeds himself, or touches his own meat, the men take the fteak, while the motion of the fbers is distinctly fcn, cut it into small pieces, well pepper them, and wrap them up in the ftef bread, like fo many cartridges. In this form they are put into the mouths of the guests, who, like firds fed by their dam, are opening their mouths to receive the morsels that are ready as fll as they can be prepared for them. The females, after having thus supplied the male guests, eat till they are fatised, and then all drink together. The victim is fnll bleeding, writhing, and roaring at the door. When the animal has bled to death, the canibilfes tear the remaining flesh from the thighs with their teeth like dogs. Such, in brief, is the description of an Abyssinian feast.

For a fuller account, see Bruce's Travels, vol. iii. p. 302. &c.

The offering of meat and drink in Abyssinia, is an affurance that your life is not in danger; and it is also the constant practice to wash the feet of those that come from Cairo, and who are understood to have been pilgrims at Jerusalem. Many of the customs in Abyssinia resemble those of the ancient Persians and Egyptians. For particular instances, we refer to Bruce's Travels, vol. iii. p. 268—294.

The capital punishments in Abyssinia are the crofs, hanging, burning alive, floning to death, and plucking out of the eyes. The dead bodies of criminals ffl are for treason, murder, and violence on the highway at certain times, are seldom buried. The fcrews of Gondar are fiwed with pieces of their dead carcases, which bring the wild beafs, and particularly the hyaenas, in multitudes into the city as foon as it becomes dark, fo that it is hardly possible to walk about with safety in the night; and the dogs bring pieces of human bodies into the houfes and yards that they may devour them in greater fecurity.

The Abyssinians have few manufactures, though their country produces, or is capable of producing, ample materials for them. Before the discovery of the Cape of Good Hope, and before the Turfes took possession of the ports of the Red Sea, there was a confiderable intercourse of a commercial kind between Abyssinia with its adjacent provinces, and various parts of Arabia and of India. Mafnak was then a harbour of great repute, and had a large quantity of exports brought to it from an extensive tract of mountainous country behind it, in all ages very inhospitable, and almost inaccessible to strangers. Gold and ivory, elephants, and buffaloes' hides; and, above all, flaves, of much greater value, made the principal articles of exportation from this port. There is still a considerable trade carried on from this place; but the hand of power restrains and discourages every exertion, and the interfe rence of it renders every kind of property infecuf. The goods imported from the Arabian fide are blue cotton, Surat cloths, and cochineal dito, fine cloth from different markets in India, cotton unfof in bales, Venetian heds, cry$tal, drinking and looking glaffes, and crude antimony. Old copper is also a gainful article, and imported in large quantities. To the wealth of Gondar they wear bracelets of it; and near the country of Gonga and Guba it has been foul, weight for weight with gold. The Bantins were once the principal merchants of this port; but their number is now reduced to fix, and they forcibly gain a fubfifence, as filversmiths, by making earrings, and other ornaments for the women on the continent, and aflaying of gold. The fame coin is current here as on the Arabian fide, and it is valued by the Venetian fquin. But glass-heads, called Contaria, of all kinds and colours, perfect and broken, pafs for fmall money, and are called, in their language, Bonjoke. The Venetian fquin is = ½ pataka; the pataka, or imperial dollar = 28 harf or dahab; the harf = 4 diwani, or 110 grains of beads; the diwani = 10 kibeir; and the kibeir = 3 bonjoke, or grains. They have no gold in Abyssinia; and in lieu of fmall money, they frequently make ufe of rock-falt as white as snow, and as hard as fhone. This falt is also applied to the fame purpofes as common falt. With this mineral falt they purchase fkins, articles, and flilk flufs, which are brought to them by the Indians in their ports on the Red Sea. Cardamoms, ginger, alifes, myrhis, caffia, cinet, elephant dufk, ivory, wax, honey, cotton, and linen of various forts and colours, may be procured from Abyssinia; to which may be added, fugar, hemp, flax, and excellent wines, if they had the art and indufly to prepare them. The merchants above fpecified are more for foreign than for inland trade. The emeralds of this country have been efimated at a high value. Their domestic commerce confifs chiefly in falt, honey, but kwheet, grey-feafe, citrons, oranges, lemons, and other provifions, with fruits and herbage neceflary for the fupport of life. Antimony, large needles, goat fkins, coarse fcifons, razors, and feet, for flaking fire, as well as buges and fads, are articles of barter in feveral of the provinces. Thofe places which the Abyssinian merchants moftly frequent are Arabia Felix and the Indies, particularly Goa, Cambaye, Bengal, and Surathra. With regard to their ports on the Red Sea, to which foreign merchants commonly resort, the moft confiderable are thofe of Saumam, Ched, Moghul, Maffnak, Maffnak, Suez, Azab, and Caffa. The trade of the Abyssinians by land is inconfiderable. There are, however, hands of them who arrive yearly in Egypt, particularly at Cairo, laden with gold-dulf, which they bring to barter for the merchandifes of that country, or of Europe. Thofe cuflas, or caravans, formed of a few perfons who afocicate for their mutual fafety, are commonly three or four months in their route, traversing forests and mountains, in order to exchange their gold for neceffaries for their families, and return immediate ly with the greatefl part of their merchandife on their backs. One of the principal branches of the Abyssinian commerce is that of their flasses, who are highly esteemed in India and Arabia; and who, enraptured by the merchants, as their factors, and found worthy of confidence, obtain their liberty and a fittable recompence.

The government of Abyssinia has been always monarchial and defpotic, and it has exercised an absolute dominance over the lives, liberties, and fortunes of its subjects, and uncontrollable authority in all matters ecclesiastical as well as civil. This empire has ever been delitute of written laws to restrain the royal power, or to secure the property and privileges of the subject; so that the will of the sovereign is the universal law. The princes of Abyssinia claim descent from Menilek, the fon of Solomon, by the queen
of Sheba. Accordingly it is maintained by many learned men, and in conformity to the Abyssinian records, of which Mr. Bruce has availed himself, that Sheba, or rather Saba, Azaz, or Azaza, signifying South, was the same country with Abyssinia, whatever might have been its extent; and that it was the kingdom of queen Candace, whose enmity or prime minister, came to worship at Jerusalem; and who, on his return homewards, was baptized by Philip the deacon, and from whom the Abyssinians acknowledge they afterwards received the gospel. See Acts viii. 27–28. This country, say Pliny (l. v. c. 20), and Strabo (l. xvi. xvi. 1. 2. p. 1116. 1175) was commonly governed by queens; and, it is said, that Candace was a name common to them all, as Pharaoh was to the kings of Egypt; the term Candace importing their sovereignty authority. The queen of Sheba or Saba, having heard of Solomon's fame, determined to pay him a visit at Jerusalem. She was there converted, as the Abyssinians say, from heathenism to the Jewish religion, and had a son by Solomon, who was named Menelik. With this son she returned to her own country, and after some time sent him back to Jerusalem to be instructed by his father. Having been anointed and crowned king of Ethiopia in the temple of Jerusalem; and having also, at his inauguration, assumed the name of David, he returned to Azab with a colony of Jews, among whom were many learned doctors of the law, and particularly one of each tribe, from whom the present Umbers, or supreme judges, three of whom always attend the king, are supposed to be descended. Azarias, the son of Zadok, the priest, was one of the number, and he brought with him a Hebrew copy of the law, which was committed to his custody as high priest, and which was burnt with the church of Axum in the Moorish war of Adel. By the last act of the queen of Saba's reign, she settled the mode of succession in her country for the future: enacting, 1st, That the crown should be hereditary in the family of Solomon for ever: 2dly, That, after her, no woman should be capable of wearing that crown, or being queen, but that it should descend to the heir-male, however dashing; and that these two articles should be considered as fundamental and immutable laws of the kingdom: and 3dly, That the heirs-male of the royal house should always be first prisoners to a high mountain, where they were to continue till their death, or till the succession should open to them. This custom, however, of having women for sovereigns, never prevailed among the neighbouring kingdoms till the last century, and may possibly prevail in some of them to this day. It obtained in Nubia, and the kingdom of Meroë, till the time of Augustus, when Petronius, his lieutenant, subdued the country, and took and delivered Napata, the residence of queen Candace; and this queen, Mr. Bruce, (v. i. p. 477) supposes, was succeeded by the Candace above-mentioned. Whatever was the origin of the last regulation, it seems to have been necessary in order to prevent the confusion that must have arisen from various claimants, in a country where polygamy was allowed, and where the heir to it must have been numerous; as the crown was to be hereditary in one family, but elective as to the person. Whilist they are confined in a good climate, on a high mountain, they are taught merely to read and write, and the flate allows to the amount of 32,000 dollars for their maintenance. However, they are other times treated, and in times of tumult, put to death up in the slightest misinformation. It is another rule of the sovereignty in Abyssinia, that no person who is married shall inherit the crown. The queen of Saba having established the laws now received, and reigned forty years, died in the year 958 before Christ; and was succeeded by her son Meench or Meinelkech, i.e. Another self; whose politic, according to the annals of Abyssinia, have ever since reigned. The device of these kings is a lion rampant, proper upon a field gules, and their motto, "No Analyis an Neideet Solomon am Negade Judef," i.e. "The lion of the race of Solomon and tribe of Judah hath overcome." Instead of the lion rampant, the Portuguese missionaries introduced a lion rampant, in order, as it is supposed, to put a cross in the paw of this Jewish lion; but the lion rampant is restored. In virtue of this noble defeat, the Abyssinian monarchs assume the title of Nagufh, and are always addressed either by that of Nagufha Nagafa, king of kings, or by that of Nazaghef, equivalent to the French Sire. They are approached with adoration; when seated in council, they are concealed; they are attended by a splendid retinue; their camp is extensive and magnificent, and they wear a very rich and costly crown. The imperial revenue chiefly arises from the four following sources: the tribute paid by those provinces which have gold mines, or which trade with the Caffres and other neighbouring nations, which amounts to about 5 or 6000 ounces per annum; the second source of revenue is, the sale of all the great places in the empire, the annual tax on holding them and their appendages, the amount of which from two provinces, one the largest, and the other the richest, is about 75,000 French livres; the third source is, a tenth, levied every third year, upon the products of the cattle in the kingdom; the fourth is also laid upon every loom of cotton cloth, which, if it belongs to a Christian, pays one piece of cloth, and if to a Malometan, a piece of eight per annum. This revenue, the whole amount of which is not easily estimated, falls far short of what might be expected from an empire of which the sovereignty is the sole proprietor and dipther.

The military force of Abyssinia has been greatly exaggerated. Mr. Bruce does not imagine that any king of this country ever commanded 40,000 effective men at any time, or upon any cause whatever, exclusively of his household troops, which are about 8000 infantry; 2000 of these last carry firelocks, and supply the place of archers; bows having been laid aside for near a hundred years, and being now used only by the Wato Shangaila, and some other incorrigible barbarous nations. As they are in a state of almost continual war, either among themselves, or with their neighbours, the face of the country is fretted with dead bodies; and as they bury neither their friends nor enemies, and their beards of barley are perpetually dying under the load of baggage which they carry, the army is followed by an immense number of birds and beasts of prey, who devour the putrefying carcases when scattered over the ground; and the surrounding trees are covered with them; and they form a kind of dark canopy over the marching army.

The Abyssinians in computing time, have continued the use of the solar year. Thirty days constitute their month, to which they add five days and a quarter, and thus they complete their year. The five days are added to the month of August, and to every fourth year they add a sixth day. They begin their year with the 29th or 30th of August, i.e. the 1st of September; the 25th of August being the fall of their month Makaram. The common epoch which the Abyssinians use is from the creation of the world, and they reckon 5500 years from the creation to the birth of Christ, reckoning the odd eighty years of the Greeks, who make this period 5508 years. They have also many other epochs, such as from the council of Nice and Ephesus. In their ecclesiastical computations they make use of the golden number and epact. The first use of epacts among them was not earlier, according to Scaliger, than the time of Dionysian; but Mr. Bruce observes, (vol. iii. p. 352.) that this
this is contrary to the positive evidence of Abyssinian history, which says expressly, that the epitaph was invented by Demetrius of Alexandria. This Demetrius was the 12th patriarch of Alexandria, and elected about the 105th year of Christ, or in the reign of Severus, and consequently long before the time of Dioecletian. The Abyssinians have another mode of computing time, that is peculiar to themselves. They read the whole of the evangelists, in order, every year in their churches; and when they speak of an event, they write the day of the month, then the hour, then the minute, and lastly, in the first word of the verse, the hour of the day. This is the mode of calculating the day; and they compute the time of the day in a very arbitrary manner. The twilight being very short, is selected for the beginning of their day; this they call Nagro, which comprehends the duration of twilight. Mefet expresses the moment when the evening twilight begins. Mid-day is called Kater, which signifies culmination. All the other parts of time they describe, in conversation, by pointing at the place in the heavens where the sun was, when the event, which they are describing, happened. After all, nothing can be more inaccurate than the Abyssinian calculations. This is a circumstance which renders the historical records of Abyssinia very confused and indeterminate. Besides, the earlier part of their history is, on account of its remoteness, involved in a considerable degree of obscurity and uncertainty; and in later ages, the access into this country was difficult, and the intercourse with it very rare and limited. For that kind of knowledge of this country, in modern times, which is attended with any degree of certainty, we are first indebted to the discoveries of the Portuguese. But the zeal of their missionaries to convert the Abyssinians to the Catholic faith, involved them in difficulties and persecutions, and barred the access of other Europeans, for a considerable time, into this country. The first history of Abyssinia was written by Alvarez, who accompanied an ambassador sent thither by Emanuel king of Portugal; and it was printed at Lisbon in 1550. It is preserved in Purchas's collection. Father Bermudez, who also visited the country, has given some account of it, intermixed with much fable. His relation was printed in 1555. Father Pais, who resided there for a considerable time, and died there in 1562, wrote an account, which extends from 1556 to his death. Father Almeida, who travelled through the inland provinces; Father Mendez, who resided there ten years; and Father Jerome Lobbo, who arrived in Abyssinia in 1624, resided there nine years, and travelled above 38,000 miles in this empire, and whose history was published by M. le Grand at Paris 1738, have given distinct details of the provinces, produce, customs, and inhabitants of Abyssinia. From these several sources, and the letters of the Abyssinian missionaries to the college of Jesuits at Lisbon, Father Balthazar Telker derived materials for his general history, which was published in the Portuguese language in 1660. Peronnet, a physician, who was sent by the French confidant of Cairo into Abyssinia, to cure the emperor of an obstinate disease, in 1666, published an account of the religion, laws, and customs of the Abyssinians; but his personal observation was very restricted, and of course he must have depended very much upon the report of those with whom he conversed. The Jesuit writers have concurred to degrade and vilify him without sufficient reason; but his account is in general just and credible, and is held in good estimation. The history of Ludolph, in folio, is the most comprehensive of any that had been written at his time. It is chiefly compiled from the Portuguese authors above mentioned; though he relies too implicitly in many instances on the authority of the Abbot Gregory, whose learning, capacity, and integrity, did not warrant the confidence repose in him. Ludolph's history was deciphered by the Jesuits. M. Marlet, in his description of Egypt, hath given some account of this country, but it is more sectional than direct and circumstantial. But the most comprehensive account of Abyssinia is that published by James Bruce, Esq. F. R. S. in 5 vols. 4to. in 1760, after a residence of several years in the country. His work is intitled, "Travels to discover the source of the Nile, in the years 1768, 1769, 1770, 1771, 1772, and 1773." Of this work we have freely availed ourselves in the compilation of this article. The chronicle of Axum, which is the most ancient repository of the antiquities of the country, and which, according to Mr. Bruce, is a book elicited the first in authority after the Sacred Scriptures, says, that Abyssinia had never been inhabited till 1086 years before Christ; and 350 years after that, or in the year 1620 before Christ, it was laid waste by a flood, and the face of the country was much changed and deformed, so that it was denominated at that time Outre-Mer, or the country laid waste; or, as it is called in Scripture itself, a land which the waters and floods had spoiled. It is the concurrent opinion of many authors, ancient and modern, that Abyssinia, called also Ethiopia, was first peopled by the early descendants of Cush, the eldest son of Ham; and it is a tradition among the Abyssinians, which they pretend to have had from time immemorial, that almost immediately after the flood, Cush, grandson of Noah, with his family, ploughing through Athbara from the low country of Egypt, then without inhabitants, came to the ridge of mountains, which still separate the flat country of Athbara from the more mountainous and higher lands of Abyssinia. Their tradition says, that terrified by the late dreadful event, the flood still recent in their memories, and apprehending a similar calamity, they chose for their habitations caves in the sides of these mountains, rather than trust themselves again on the plain. This apprehension would be naturally increased by the tropical rains of this climate. In these mountains, therefore, the Cushites first resided; and as they became more populous, they extended their borders to those other mountains that were near them, spreading the industry and arts which they cultivated, as well towards the cusses as the western ocean, but never venturing to quit their hallowed residence on the mountains, and to settle at a distance from them in the plains and valleys. The Abyssinian tradition adds, that they built the city of Axum at an early period, in the days of Abraham. Soon afterwards, without utterly forswearing their first habitations in the mountains, they pulled their colony to Athbara, and built another city called Meroe. This they did, says Mr. Bruce, partly to avoid a fly, named Zyme, which was very troublesome both to them and to their cattle. From thence they advanced to Thibest, and, by degrees, as they proceeded, they ascended to a greater degree of courage, and a still confidence in their own security. Whist they were thus ascending towards a new seat in the central and northern territory of the country, their brethren to the south were not idle. Having extended themselves along the mountains that run parallel to the Arabian gulf towards Saba, or Azabu, answering Saba, which was an appropriate appellation, because it was on the south coast of the Arabian gulf, and the first land to the southward that bounded the Airian continent, they enjoyed the perfumes and aromatics of the cist, myrrh, frankincense, and cassia. The Cushites, in travelling southward towards the mountains of Sofala, opposed by Mr. Bruce to be the Orin of Scripture, found mines of gold and silver, which became gradually ample sources of commerce and wealth. But be-
ABYSSINIA.

ing fully occupied, in consequence of the discoveries they had made, they needed carriers to dispose of their commodities to other provinces of the continent. These they found in a nation that existed in their neighbourhood, and that had been distinguished by the appellation of Shepherd, in this employment they gradually advanced to great wealth and power. Their numbers increased, and the extent of their territory was enlarged. Whilist they extended themselves along the Indian ocean, and afterwards along the Red Sea, for the convenience of trade; the principal fact of their residence and power was the level part of Africa, between the northern tropic and the mountains of Abyssinia, a country now called Beja. This country reaches from Mafraah along the coast to Snakem; then turning westward, continues in that direction, having the Nile on the south, the tropic of Cancer on the north, with the deferts of Sehima and Libya on the west. The next district belonging to these people was Meroe, now called Atbara. A third district, now called Darkin, is a small plain lying between the river Mareb on the call, and Atbara on the west. But the most noble and warlike of the Shepherds were those who possessed the mountains of Habab, reaching from the vicinity of Mafraah to Snakem, which district they still inhabit. The settled inhabitants of Carthage, bordering on the Nile, employed as carriers in the interests of commerce, and of course their power. The country of the Shepherds to the Egyptians originated principally in religious differences; for the latter worshipped the animals which the former used as food; and the Shepherds worshipped the heavenly bodies, whereas the Egyptians practised the greatest idolatry.

Besides these Cuthites and Shepherd, who were the first settlers in Abyssinia, the above cited Chronicle of Axum mentions, among other particulars, that about the year 1400 before Christ, it was taken possession of by a variety of people, speaking different languages, who, as they were in friendship with the Agaazi, or Shepherds, possessing the high country of Tigre, came and took down before them in a peaceable manner, each occupying the lands that were before him. This settlement the chronicle calls Angaba, the entry and establishment of these nations, which finished the peopling of Abyssinia. Tradition farther says, that they came from Palestine. Many approved writers are of opinion, that some of the early descendants of Cuthites, who settled in the land bordering on the Nile, and in the eastern side of the Red Sea, moving gradually from thence to the southern extremity of Arabia; and afterwards, by means of the easy passage over the straits of Babreland, transplanted themselves into Ethiopia. This migration, according to Eusebius, happened whilst the Israelites were in Egypt; but Syncellus places it in the time of the Judges. These Arabian Cuthites were called Abafeni, and formed a great part of the Sabæans or Homerites; and the Ethiopians were distinguished by the same name, agreed in many particulars with the others, and were believed by most of the Asiatic nations in Josephus's time, to have had the same origin. Out of these new settlers, Mr. Bruce (vol. i. p. 392.) gives a somewhat different account. When Joshua had subdued the Jordon, and destroyed Jericho, a panic seized the whole people of Syria and Palestine. These petty states, many in number, and diversified by language, fought for safety from the conqueror by flight or emigration. Having already carried on a commercial intercourse with the Shepherds of Abyssinia and Atbara, they directed their views to them for protection, and obtained settlements among, or near them. The curse of Canaan. (Gen. ix. 25, 26, 27.) says Mr. Bruce, seems to have followed them, as they have obtained no principality, but served the kings of the Agaazi, or Shepherds, and to

they still continue. The first and most considerable of these nations settled in Amhara; the second were the Agows of Damot, one of the southern provinces of Abyssinia; and the third are the Agows of Lalla, a separate branch, living in caves, and paying nearly the same worship to the Siris or Tacaži, that those of Damot pay to the Nile; the fourth is a nation near Damot, called Gatra; the situation of the fifth is not precisely ascertained, unless it be intermixed with the Galla and Falasha. From this recital, we may perceive the propriety of the appellation Haplog or Ottovens, denoting separate nations settled together, as affording the most satisfactory etymology of Abyssinia. The inhabitants who possessed Abyssinia from its southern boundary to the tropic of Cancer, or frontiers of Egypt, were the Cuthites, a polished people, living in towns, being first Troglodytes, and having their habitations in caves. The next were the Shepherds. After these were the nations who, according to Mr. Bruce, came from Palestine. If the account we have now given of the origin of the Abyssinians be just, they might very well vie with the Egyptians, and even be deemed superior to them with respect to antiquity, since Cuthil, their great ancestor, was the elder brother of Ham, the eldest son of Shem. The Cuthites, therefore, had that ancient antiquity with the Egyptians, as from the kingdom of Midian the Cuthites penetrated both into the southern parts of the peninsula of the Arabs and Ethiopia. The communication between Egypt and Ethiopia, as well as the proximity of blood of Cuthil and Mizrāim, introduced that similitude of laws and manners that is observable among their respective inhabitants. The Ethiopians, or Abyssinians, account for this mutual resemblance, by ascertaining, that Egypt, when recovered from the Nile, and made habitable, was first peopled by colonies that migrated out of their country, and they again were civilised by the Egyptians. Mr. Bruce endeavours to prove, that the Abyssinians in ancient times were not only the most learned people in the world, but that they spoke the original language, and were the inventors of writing. How they, as well as the Egyptians, came to lose this character, and to sink into their present state of degeneracy and barbarity, is not easy to explain. But the nature of their respective governments will serve in some measure to relieve the difficulty. According to some authors, Moses resolved the Cuthites of Israel to march into the Lower Egypt, and drove them back into their capital Meroe, which, being surrounded by three rivers, the Nile, Asopus, and Allabariæ, was deemed impregnable. This city, however, was betrayed by a young woman, who fell in love with Moses, and delivered it up to him on condition of his marrying her. He then ravaged the country, and having reduced the inhabitants to such a state that they were incapable of any further hostile attempts for a long time, he returned in triumph to Egypt, after an absence of ten years. Without attempting to fill up the chasm that occurs in the history of Abyssinia from this period to the time of Solomon, and without recurring again to the story of the queen of Sheba, and her son Menick, from whom the kings of Abyssinia derive their descent, we shall proceed to observe, that the Ethiopians, or Abyssinians, after the accession of Menick, were invaded by Sefac, or Soffiris, who plundered their rich temple at Sabba, and probably occasioned the removal of the imperial seat to Tigri, Ethiopia, or as least a considerable part of it, became subject to this monarch. The Ethiopians, according to Sir James Newton, drownd the succesor of Sefac in the Nile, and seized upon Egypt, and obtained Libya in connection with it. However, they were defeated by Afa king of Judah. Upon this the people of the Lower Egypt revolted, and obliged
obliged Mennon, supposed to be the same with Menes and Aменон., to retire first to Memphis, and then into Ethiopia. In about thirteen years heretofore, with his son Rameses, at the head of a large army, and compelled the Cannanite forces to abandon the Lower Egypt; and this event is denominated by the Egyptian writers the second expedition of the Shepherds. Sir Isaac Newton supposes, that the Menmon just mentioned built, or at least fortified Memphis, in order to prevent the Egyptians from penetrating into Ethiopia; and that he died in the second year of his reign, 2559, after the decease of Solomon. In his time the African expedition is said to have happened. He was succeeded by Rameses; and his successor Moeris adorned Memphis, and made it the capital of his empire, about two generations after the Trojan war. Cheops, Caphrenus, Mycerinus, and his son Nitosis, succeeded one another; and in the reign of Afcheis, the successor of Nitocris, Ethiopia and Affyria revolted from Egypt, which being partitioned into several small kingdoms, was soon subdued by Sabacon or So, the emperor of Ethiopia. This monarch, forming an alliance with Holheca, king of Israel, occasioned his revolt from the Assyrians; in consequence of which, an end was put to the kingdom of Israel by Shalmaneser king of Assyria, in the 24th year of the era of Nabonassar, and the 72nd before the commencement of the Christian era. Sabacon was succeeded by Sethon, who, marched with a powerful army against Sennacherib king of Assyria, and defeated him. In the 76th year of the era of Nabonassar, Ethiopia was subdued by Esar-Haddon king of Assyria, who overran both those countries for three years, when the Ethiopians asserted their independence, which they preferred till the time of Cyrus, whose dominion, according to Xenophon, extended to Ethiopia. After his death the Ethiopians revolted; and their empire was so powerful, that Cambyses found it impracticable to penetrate into the country; though Sir Isaac Newton suggests that he subdued them about the year 223, or 224, of Nabonassar. But others are of a different opinion. Herodotus afferts, that they reduced some of the provinces contiguous to Egypt; and it appears, that the Persians proceeded as far as Cyrene; but it is not probable that they brought under subjection the whole Ethiopia Propria of the ancients, which comprehended Sennar, Abassia, and other countries. We have no account of any expedition undertaken by Alexander the Great against Ethiopia, though he was very desirous of exploring the source of the Nile. With this view Ptolemies Euergetes advanced into the country; but if he made any conquests, he does not seem to have long retained them, for nothing of importance relating to Ethiopia occurs till the days of Augustus. About this time, i.e. the year of Rome 727, Candace, queen of Ethiopia, or rather of the kingdom of Merol, made an irruption into the province of Thebaïs, and being repulsed by Petronius, was obliged to sue for peace, which, as we have already mentioned, was granted to her by Augustus. From this time the Romans considered themselves as masters of Ethiopia. Menilek, according to the Abyssinian records, succeeded to the throne in the 456th year before Christ, and they reckon twenty-two kings from Menilek to Bazen, the eighth year of whose reign coincides with the era of the birth of Christ. But this account must be very erroneous, because each reign will amount to more than forty-four years, which is impossible. In the reign of Heliogabalus, about the year of Christ 226, there seems to have been an intercourse between the Roman empire and the Ethiopians; and we learn from Procopius, (De Dell. Perf. l. i. c. 16.) that before the reign of Diocletian, the frontiers of the Roman empire extended so far into Ethiopia, that they were not above twenty-three days journey distant from the capital. Nothing remarkable occurs in the history of the Ethiopians from the time of this emperor to the period of their conversion to Christianity, which event took place under Abreha and Atzheba, or as they are also called Abara and Aba, who are considered by Mr. Bruce as one prince, and by others as joint sovereigns, about 333 years after Christ. Frumentius was consecrated bishop of Axum by St. Athanasius, and deputed by him to propagate the religion of Christ. Of this Frumentius it is said, that whilst he was young, he accompanied Meropius, a philosopher of Tyre, who, in a voyage on the Red Sea to India, was cast away on the coast of Abyssinia. Meropius was slain by the natives, but Frumentius, who had been liberally educated, was conducted to Axum, where the court then resided. Here he was entrusted by the queen with the education of the young prince; and having instructed him in various parts of learning, and impressed his mind with a veneration for the Christian religion, he found him disposed to embrace Christianity on his return from Alexandria in discharge of the commission entrusted with him by Athanasius. The greatest part of Abyssinia followed the example of their prince, and the church of Ethiopia continued in unity with this bishop to the time of his death. When Constantius the emperor embraced Ariamn, an attempt was made to depose Frumentius, because he refused to sanction it with his example and authority. About this time an expedition into Arabia Felix produced, what the Arabian writers, and Mahomet in the Koran, have called the War of the Elephant. The occasion was this: the temple of Mecca had been in high veneration for 1400 years, because, as the Arabs say, Adam, when expelled from Paradise, pitched his tent upon this spot; and they also slew a black fome, where Jacob reposed when he saw the vision, mentioned Genesis xxviii. 12. But Mr. Bruce thinks it is to be much more probable, that this temple was built by Solomon, and that he was worshipped here under the title of Olibria. This temple, venerated by neighbouring nations, was made the emporium of the trade between India and Africa, but Abreha willing to render it more convenient for his dominions, built a very large church or temple in the country of the Horemites, and nearer the Indian ocean, and extended to it all the privileges belonging to the Pagan temple of Mecca. A tribe of Arabs, called Behi Koraf, who had the care of the Caaba at Mecca, alarmed by the prospect of having their temple defected, entered Abreha's temple, burned every part of it that could be consumed, and polluted the relié by besmirching it with human excrement. This infult exasperated Abreha, who, mounted upon a white elephant at the head of a large army, resolved to destroy the temple of Mecca. The temple, however, was miraculously preferred, according to the Arabian writers; but the more probable account is, that the Abyssinian army fell a sacrifice to the small-pox and measles, with which they were infected at this siege. This happened about the year 356. Abreha's church, near the Indian ocean, was finally destroyed in the kalifat of Omar. In the year 532, Julian, the Greek emperor, sent an embassy to Caleb, or Eliaibas, king of Abyssinia, intreating his interference in favour of the Chaldaicians in Arabia, who were severely persecuted by Phineas, a Jewish prince, and others of the same profession, then in possession of the country. Phineas was defeated by Arefas, an Arabian prince, before Abreha, Caleb's general arrived; but the Jewish kingdoms were not wholly overturned, as some of them continued till after the Hegira. To this period, or the reign of Eliaibas, the Arabian historians refer the War of the Elephant, and the miraculous discomfiture of the Abyssinian army. The con-
fusions of names will account for the difference between the Arabian and Abyssinian records; for if this Abreha was the prince who had intercourse with Abou Thalek, Mahomet's grandfather, to whom the eulogy of the Quba was committed, and who was defeated before Mecca, the smallpox was introduced among the Abyssinians about the year 521, or 100 years before the Hegira; and thus the Arab historians and African accounts must be made to correspond. Some historians have failed to show the Abyssinian records as having embraced the doctrines of Mahomet, soon after the appearance of this impostor; but this account has been considered as improbable. It is more certain, however, that Najashi, who was the Ethiopian governor of Yemen, and who was related to the royal family of Abyssinia, was professed to the Mahometan faith. On this occasion the Abyssinians lost their territories in Arabia, and were forced to seek refuge on the side of Africa, where they established several kingdoms, such as Adel, Mər, Jadæn, Auffa, Wypo, Taxhith, and other states, which acquired permanent power and importance. The Jews being at this time oppressed by the caliphs, sought an asylum in Abyssinia; and they contributed to augment and strengthen an independent sovereignty, which had been preferred in one family of Jews on the mountain of Samen, the royal residence having been fixed upon a high-pointed rock, called the Jews' rock. Judith, a very beautiful and intriguing queen of the Jews, had made a strong party, that she resolved to attempt the subversion of Christianity, and also the succession in the line of Solomon. Having malieced the royal family, the took possession of the throne, in defiance of the law of the queen of Saba; but the infant king, the only remaining prince of his race, fortunately escaped into the province of Shoan, and thus the royal family was preferred to be again restored. Judith and her descendants maintained their usurpation for more than 500 years; but no part of their history is recorded in the Abyssinian annals, except that of Lalibala, who lived at the close of the 12th, or beginning of the 13th century, and was reputed to be a saint. This appellation he probably acquired from the protection which he afforded to the Christians, who, persecuted by the Saracens in Egypt, fled for refuge to Abyssinia. Lalibala employed them in forming various works in the boldly rocks, some traces of which remain to this day; and in unsuccessful attempts to divert the Nile out of its course, so that it might no longer be the cause of the fertility of Egypt, which was then in possession of the enemies of his religion. The race of Solomon, which had been restricted to the sovereignty of Shoan, was unexpectedly restored in the person of Tekla Amalaca, to whom Nacasaeto Lab, grandson of Lalibala, by the mediation of Teca Haimanou, a monk and native of Abyssinia, who had ordained Abuna, and who was highly esteemed for his sanctity and patriotism, resigned the kingdom of Abyssinia. Amongst other articles of the treaty between them, one was, that no native Abyssinian should for the future be chosen Abuna; and this article between Icon Amlaca and the house of Zaguc was observed for near 500 years. Icon Amlaca continued to reside at Tequnah in Shoan, from his accession in 1298, and his reign lasted fifteen years. After a rapid succession of princes, Amsa Sion ascended the throne in 1312. This sovereign professed Christianitv, but disgraced it by his conduct. During a reign of thirty years, this prince was almost incessantly engaged in various wars with the Moors, who inhabited different provinces of Abyssinia and its vicinity; but at last, weary with conquest and carnage, he returned in triumph to his capital, and having never felt a red defeat in any battle, he ended his days, and transmitted the crown to his son, Sel' Amad. The only transaction that distinguished this reign, is the relief afforded to the Capite patriarch, whom the sultan of Egypt had thrown into prison, with a view of extorting money from him. Of Zara Jacob, whose reign commenced in 1414, and continued thirty-four years, Mr. Bruce observes, that he was regarded in Abyssinia as another Solomon, and a model of what the loft of sovereigns should be, though he was not justly entitled to this high encomium. This prince lent an embassy to the council of Florence, which formed a fact for a picture in the Vatican, and he obtained from the pope a faceval at Rome for the use of the Abyssinians. From this period a party was formed in favour of the church of Rome; and this body of sovereigns was the sect who introduced religious persecution into his dominions. Although the ciabahsed religion in Abyssinia was that of the Greek church, many different superstitions prevailed in every part of the country. An accuation having been brought against some families for worshipping the cow and the serpent, they were tried by order of the king, capitally convicted, and executed. This severity was followed by a proclamation, declaring, that any person who did not, upon his right hand, carry an amulet, with these words, I renounce the devil for Christ our Lord, should forfeit his personal estate, and be liable to corporal punishment. Before the close of his reign, persecution was suppressed, and he employed himself in repairing the churches which had fallen into decay, or which had been destroyed in various parts of the country in the wars with the Mahometans. In the next reign, which commenced in 1458, the old law for confining the royal children, by which had been discontinued from the reign of Judith, in the tenth century, was revived; and they were sent to the high mountain of Geffhen, on the confines of Ambara and Bejzender, where the continued to be the slave-prison till a slaughter occasioned the defection of Geffhen. Baza Mariam, having ingratiated himself with his people, by clemency towards those who had been banished for various offences in the former reign, commenced a war with the Dobas, who made inroads into his country; and he also turned his arms against the kingdom of Adel; but being feized with a pain in his bowels, which occasioned his death, all his plans and enterprises terminated. About this time Henry of Portugal, a scientific and adventurous prince, formed the project of discovering a passage to India, by doubling the cape of Africa, and thus of sharing with the Venetians, and others, the profits of the commerce that was carried on with that country. A plan was also concerted for penetrating into India through the interior parts of Africa. The practicability of this latter scheme was rendered probable, by the report of some monks who returned from Jerusalem and to Alexandria, and who were the subjects of a christian prince, said to be a priest, whose dominions were said to extend through the African continent from the east to the west sea. This report had been confirmed at the court of Demoy, the foreign reign of the Jafones, on the west coast of Africa, and of Benin, another negro country; though it was somewhat confused and precarious, in consequence of the account given by Marco Paolo, a Venetian traveller, who said that, in his travels into Tartary, he met with a christian prince, who was a priest, and who was called Prebyter, or Preifer John. The king of Portugal, however, resolved to send Peter Ccviian and Alphonso de Paiva, as ambassadors to this unknown prince. The object of their mission was to explore the sources of the Indian trade, the principal marke for spice and pepper, and the channels of their conveyance to Europe; and to ascertain the country whence gold and silver were obtained, and the possibility of arriving at the East Indies by falling along the southern promontory of Africa.
ABYSSINIA.

Africa. Having proceeded on their journey together from Alexandria to Cairo, thence to Suez, and afterwards to Aden, a rich trading town, without the limits of Babelmandeb, they separated from one another. De Paiva soon lost his life; but Covillan felt for India, and having visited Calicut and Goa, and crossed the Indian ocean to inspect the mines of Sofala, returned to Aden, and thence to Cairo, where he heard of the death of his companion. Here he found two Jesuits, who had accompanied the king of Abyssinia, which induced him to return to Aden; whence he crossed to the dominions of that prince, whose name was Alexander, and whom he accompanied to Siena, where the court resided. Covillan settled in the country, became rich and powerful, and no more returned to Europe. But the intelligence he transmitted from time to time to the court of Portugal was important and useful. He described the Indian ports which he had seen, the situation and riches of the mines of Sofala, the disposition of the princes, and the wealth and populousness of the country where he dwelt; and he exhorted the king to prosecute the discovery of the passage round Africa, affirming, that the cape itself was well known in India, and accompanying his communication with a chart, which he had obtained from a Moor in India, and which exhibited the exact situation of the Cape, and the cities round the coast. Covillan came into Abyssinia in the year 1495, and the reigning prince, Alexander, or Ifcander, to whom he was introduced, died by violence, in 1495. He was succeeded by an infant son, who reigned seven years, after which his younger brother, Moos, was elevated king by the unanimous voice of the people; and, having, by his courage and prudence, delivered himself from the fear of a foreign war, he applied with diligence to reform internal abuses, and to cultivate the arts of peace. After a reign of thirteen years, he died in 1508, and was succeeded by his son David III., an infant of eleven years of age, who was set on the throne by the interest of Helmin, widow of Dada Mariam. At the commencement of this reign, the Turks, with a view of sharing the profits of the trade of the country, took possession of Zeyla, a small island in the Red Sea, opposite to the coast of Adel; but their desire of possessing India diverted their views from Adel and Abyssinia. It was thought desirable, in the present situation of the country, to form an alliance with the Portuguese, and for this purpose Matthew, an Armenian merchant, was deputed as an ambassador. The principal object of the embassy was to obtain a force sufficient to destroy the Turkish power; and, it is said, that a third part of Abyssinia was offered as an acknowledgment. During the progress of this embassy, the Turks renewed their depredations on the Abyssinian territories. David prepared to resist them; and, at length, succeeded in completely defeating and routing them. On the day in July, 1516, when he obtained a decisive victory over the Moors, the island of Zeyla was taken, and the town burnt by the Portuguese fleet under Lopez Suarez de Alberguiera, who had brought back Matthew, and with him an ambassador, from Portugal. The two ambassadors, accompanied by fifteen Portuguese, set out on a very difficult and perilous journey for the emperor's court. Matthew died of an epidemic fever in the course of the journey; but the Portuguese ambassador arrived in 1520, within three miles of the Abyssinian camp. His reception was not favourable; and it was not till after a delay of five years, that the business of the embassy was completed, and he was allowed to depart for Portugal. This long intercourse between two distant nations, alarmed the Mahometeran powers; and the Adhabs, afflicted by the Turks, defeated the emperor in several sucessive battles, and over-ran the empire, plundering and burning the towns and villages, and carrying away the people for slaves. This destructive war continued till the year 1537. In the next year the affairs of Abyssinia seemed to revive, and a new embassy to Portugal was projected. John Bermudes, one of the attendants of Rodrigo, the Portuguese ambassador, was deputed, who was invested with the ecclesiatical authority of Abuna. Being a bigot to the popish religion, he declined accepting the office, and his ordination should be continued; this was indirectly submitting the church of Abyssinia to that of Rome; and this submission on the part of David gave the pope inexpressible pleasure, at a time when no king or dominos in the west were revolting from his supremacy. Having in his way through Italy obtained the pope's function, he proceeded to Lisbon, and was acknowledged by the king as patriarch of Alexandria, Abyssinia, and of the sea; and he succeeded in obtaining the succours which he requested. When these succours arrived, they took the town of Arcceko, killed the governor, and massacred all the people in the town whom they could find. The delay, however, had reduced the Abyssinians to great distress. A Mahometan chief had made an attack upon the rock Gehmen, where the royal family had been kept, and massacred them; and David, sinking under a complication of disasters, died in the year 1534, and was succeeded by his son Claudius. On his accession, the Moors formed a league against him, but were defeated. Aided by the Portuguese forces, which had joined thee of the empire, Claudius freed himself from his apprenticeship of foreign enemies; and he then directed his attention to the internal state of the country. John Bermudes, insolent in his disposition, and invested with ample ecclesiastical powers, attempted the conversion of Claudius, and instilled that he should establish the popish religion through his dominions, as his father David had promised to do; but Claudius was invincible, and the altercation terminated in the expulsion of the catholics, and the discontinuance of all intercourse with the Europeans; and Bermudes himself was obliged to leave Abyssinia, and return to Portugal. In 1558, the pope sent a new deputation of priests; but, though they were civilly received by Claudius, they seemed to have had little success with respect to the principal object of their mission. The thoughts of Claudius were now employed about a successor; and as he had no son, it was proposed to ransom his youngest brother, the prince Menas, who had been taken prisoner by the Moors in the time of David. This business having been settled, Claudius's premature and violent death made way for the advancement of Menas to the throne in 1559. After a short reign, embroiled by internal rebellion, and the feilicious practices of the popish missionaries, he closed his life in 1567, and was succeeded by his son Sertza Denghal, who, after various conflicts with the Moors, and with the Oella and Falasha, two neighbouring nations, in which he was generally victorious, died in consequence of eating fish of a poisonous nature, in 1595. Before his death he nominated Za Denghal, his nephew, for his successor. The affections of his people were alienated from this prince on account of his attachment to the church of Rome, whose interest in Abyssinia had much declined, in consequence of the death of Ovidio, and the other missionaries, and through want of a fresh supply of Catholic preachers. In the year 1600, Peter Paez, or Pao, was sent on this mission. He was learned, diligent, and active. The emperor was engaged by his manners and discourses to embrace the Catholic religion; he issued orders for prohibiting the observance of the Jewish Sabbath, and sent letters to pope Clement VIII. and Philip III. of Spain, requesting a supply of mechanics to instruct his people in the useful arts, and
and of Jesuits to teach them religion. This imprudent conduct on the part of the emperor, excited a rebellion among his subjects; he was excommunicated by the Abuna; and having been deserted by his troops, he was overwhelmed and slain. The succession was for some time disputed. At length Socinios, called also Sufneus and Malec Segued, was fully established on the throne; and having declared to Paez his purpose of embracing the Romanist religion, he addressed two letters, one to the pope, and the other to the king of Portugal, supplanting allegiance against the invasions of the Galla. In the mean while he defeated these people, and also a body of rebels assembled to support the claims of an impeller, who pretended to be the late emperor Jacob, that had contended with him for the crown. While he was meditating the establishment of religion in the empire, a new rebellion demanded his attention, and his thoughts were wholly employed in various military expeditions. In 1616, he issued a very severe order against the Jews, whom he determined totally to exterminate. His conduct towards them was in the highest degree cruel and unjust. The consequence of his measures was the almost entire extinction of the Jewish religion, the professors of which were commanded to renounce their religion, and be baptized, under pain of death. Paez was at the same time affidous and successful, in his endeavours to profligate the Abyssinians to the Catholic faith, and Socinios having received letters from the pope and the king of Spain, with assurances of such support as each of them, in his respective province, could afford him, required to make a formal submission to the pope, and to announce for ever his connection with the Greek church. Ambassadors were appointed to go to Europe, to communicate this intelligence, and to finish the negotiation between the pope and the Abyssinians; but these ambassadors were obliged to return; and this unprofitable occurrence prevented the establishment of popery in Abyssinia. The attempts of Socinios to change the religion of the country, occasioned a variety of seditions and rebellious associations against his government; but the obstinate emperor persevered. Though the Abyssinian ambassadors had been constrained to return, many favourable accounts of the state of religion in Abyssinia had been transmitted to Europe; and new missionaries were sent under the direction of Alphons Mendez, who arrived at Gorgora, the royal residence, in the beginning of the year 1629. Socinios, after the ill audience, takes an oath of submission to the pope, and the ceremony was attended with circumstances of peculiar severity. It was followed by a proclamation, that all priests should embrace the Catholic faith on pain of death, that Lent and Easter, and the other movable feasts, should be observed according to the rules of the Romish church, and that the clergy should be re-ordained, the churches consecrated anew, the people re-baptized, and circumcision, polygamy, and divorce abrogated. The emperor, however, soon perceived the injurious effects of these measures, and found it necessary to relax the severity of his proceedings. He proceeded to grant an universal toleration; and having reformed the Alexandrian faith, ceremonies, and worship, he resigned the crown and empire to his son Facihidas, or as he is sometimes called Fluidides; and soon after his proclamation for this purpose, he died, in 1632, and with him all the hopes of the Jesuits were extinguished. Facihidas was an inveterate enemy to the Catholic faith, and he adopted every method in his power to suppress and eradicate it. He first banished and then executed his uncle Achis Chritols, who had been active in promoting it, expelled the European missionaries, and refused the attempts of the Jesuits for introducing others. The spirit of rebellion in Abyssinia, and the neighbouring provinces, was still active; nor could the efforts of Facihidas totally subdue it. However, he left the empire at his death, in 1632, in a much more peaceful and prosperous state, than that in which it was devolved upon him by his father. He was succeeded by his son Hannes I., who had the address to preserve peace during his whole reign, if we except some feeble expeditions against Lala and the Shangala; and, in 1685, his son Yakou II. ascended the throne with the approbation of the whole kingdom. This prince is said to have polished all those abilities and dispositions which form the character of a great and good monarch. In this reign attempts were made to revive European missions. They were occasioned by a report that, on the expulsion of the Jesuits from Abyssinia, many catholic christians had fled into the adjacent countries of Nubia and Senmaar, where they were grievously oppressed by the Mahometans. The canic of these christians was exiled to Rome, and the pope dispatched a mission for their relief, under the title of the Eritheic Mission. The missionaries were instructed to penetrate as far as possible into Abyssinia, and to maintain the catholic faith as far as they were able, till an opportunity offered of converting the whole empire; and for their protection and encouragement, a convent was established at Achimim, in Upper Egypt. At the same time, Louis XIV. of France appointed five Jesuits to the same mission, and furnished them with suitable presents for the emperor and the principal nobility. The admission of these missionaries was solicited by a dangerous fecubistic disorder, which had attacked Yafous and his son, and for which they wished to have the advice of an European physician. Maillet, the French consular at Cairo, willing the Jesuits to have the honour of the mission, disappointed the views of Friars Pachal and Anthony, two Franciscans, who were first thought of, and recommended Charles Ponset, a Frenchman, who had been bred a chemist and apothecary, and Father Brevedent as his servant, to Hagi Ali, a Mahometan factor at Cairo, for the desired purpose. The Franciscans attempted the delusion of Ponset and his attendants; but Ponset arrived safe at Gondar on the 21st of July, 1699, and having perfectly cured his royal patient, set out on the 24th of May, 1700, on his return for Europe, and arrived in safety at Mauhuh. Brevedent died at Gondar soon after their arrival. An embassy on the part of the Abyssinian monarch was defeated by the interference of Maillet; but the Jesuits concerted another mission from France, and the person appointed as ambassador was M. de Roule, vice-consul at Damietta. This mission was very judiciously conducted, and it succeeded in what it relit it; the Franciscans obstructed it, and it terminated in the murder of the ambassador in the province of Senmaar. Yafous, the emperor, had been previously affiliated, in 1704, by a conspiracy of his wife and son, Tecla Haimanou, who was himself affiliated in 1706, and succeeded by his uncle Tibis, or Theophilus. After the death of this monarch, in 1709, the line of Solomon, by the queen of Sheba, was set aside, by the influence of the conspirators who had contributed to the murder of Yafous and Tecla, and a stranger, called Yeulias, was seated on the Abyssinian throne. Yulias was soon deposed; and David, son of Yafous, was proclaimed king of Abyssinia, and crowned at Gondar on the 30th of January, 1714. The diffusions among the Abyssinian clergy, that occurred in this reign, produced a dreadful massacre, and ended in the death of the king, who died, by poison, in 1719. He was succeeded by his brother, Bacuffa; and Bacuffa, in 1729, by his son Yafous II. His reign was disturbed by frequent seditions and rebellions, in one of which Gondar, the capital, was set on fire, and almost entirely ruined. He died in 1753.
not without the suspicion of having been poisoned, and was succeeded by his son Joas. The whole empire, in this reign, was divided into two powerful factions, the causes and effects of which are particularly recited by Mr. Bruce, who was witness of the confusion and tumult which they produced. In the process of this contention, Joas was assassinated; and, at his death, in 179, Hannes, brother to the late king Bacuvia, was appointed emperor. Hannes, however, being maimed by the loss of his hand, was deemed incapable of assume the sovereignty: he was removed by poison, and his son Tecla Haimanout II. was advanced to the throne. From, and even before the ascension of Joas, Michael Ras, who had been appointed Ras or Governor of Tigre, and other provinces, and who was become master of almost one half of Abyssinia, had the principal direction and influence in the government of the country. His marriage with Ozoro Ebiher, a very beautiful and accomplished princess, and the widow of Mariam Barea, the most distinguished nobleman of the country, had very much augmented both his dignity and power. Hannes was established on the throne by his authority, and when he found that he was not likely to answer his purpose, he is supposed to have made way by poison, for his successor Tecla Haimanout. This prince treated him, from the moment of his accession, with the affections and respect of a son; and this influence of Michael was very considerable in preferring the attachment and submission of his subjects, as well as in conducting the military operations of his reign. Of these Mr. Bruce has given a very minute detail, for which we must refer the reader to the 4th volume of his elaborate and comprehensive work.

Abyssinian, in Ecclesiastical History, is used as the name of a sect in the christian church, established in the empire of Abyssinia.

The Abyssinians are a branch of the Copts, or Jacobites; with whom they agree in admitting only one nature in Jesus Christ, and rejecting the council of Chalcedon: whence they are also called Monophysites, and Egyptian.

Some learned men are of opinion, that the Abyssinians, or Ethiopians, embraced the sentiments of the Monophysites in the ninth century, in consequence of the exhortations addressed to them by the doctors of that sect who resided in Egypt. But Molhem (Eccl. Hist. v. ii. p. 363, 8vo.) says, it is certain that the Abyssinians, who were accustomed to receive their spiritual guide from the bishop of Alexandria, commenced Monophysites in the seventh century, if not sooner. For in that period the Arabs made themselves masters of Egypt, oppressed the Greeks, and granted to the Monophysites such a powerful protection, as enabled them to reduce under their jurisdiction almost all the churches that had been established in Egypt. The Abyssinians are, strictly speaking, a distinct body from the Copts, who comprehend those Christians who dwell in Egypt, Nubia, and the adjacent countries, and whose condition is truly deplorable. They surpas the latter considerably in numbers, power, and opulence; nor is this surprising, when it is considered that they live under the dominion of a Christian emperor.

The Abyssinian church is governed by a bishop, or metropolitau, styled Abuna, and sometimes, though improperly, patriarch, sent them by the Coptic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests. The first person who possessed the episcopal dignity was Frumentius, who converted the Abyssinians to Christiainity in the beginning of the fourth century. Some, indeed, have supposed, that they were converted by the apostles; others have affected, that the Eunuch, baptized by Philip, upon his return to Candaee, became the apostle of Abyssinia. But, if the Abyssinians were converted at so early a period, it is not likely that they should have continued without bishops, and without any kind of church-government for 500 years, and that they should have had no intercourse with neighbouring churches during this long period. Besides, we know, in fact, that the Christian religion had not penetrated into the court of Candaee, which was much nearer to Egypt, in the time of Philip, and it therefore could not reach into the more distant mountainous country of Abyssinia. The Ethiopia, where Candaee reigned, could not have been the same with Abyssinia; because, if this were the case, the queen of Saba must be rejected as fabulous, as there must have been a woman sitting upon the throne of that country for 500 years, after she had been excluded by a fundamental law of the land. But we are assured by credible writers, that this Candaee reigned upon the Nile, in Atbara, much nearer to Egypt. Her capital was taken in the time of Augustus, as we have already mentioned under the article Abyssinia, and her successors and kingdom existed in the reign of the Abyssinian kings, long after the Mahometan conquest, and they exist there to this day. To which we may add, that the Abyssinians are known to have continued Jews and Heathens above 500 years after the time of the apostles. The ground upon which some ecclesiastical writers have attributed the conversion of the Abyssinians to the apostles, is a canon of a council, said to be that of Nice, found, or pretended to have been found, in Alexandria. This canon is written in Arabic, and is so unintelligible, says Mr. Bruce, who had seen it, that it scarcely conveys any sense at all. But this canon regulated the precedence of the Abuna of Ethiopia in all succeeding councils, and places him immediately after the prelate of Silenca. The Jesuits have availed themselves of this canon, in order to vindicate the honourable antiquity of the church of Abyssinia. The Abyssinian history informs us, that a queen reigned in Abyssinia, when Frumentius came into this country. Mr. Bruce observes, that though women are excluded from the Abyssinian throne, there exists a law, or custom, that the queen upon whose head the king shall have put the crown during his life, is regent of the kingdom, and guardian of every minor king, as long as he shall live. If such a queen should have a son, he would have the care of the kingdom, and of the king, during his minority: and if her son should die, and a minor, who was not in relation to her, should succeed, the queen would be regent, nor would her office cease till he came of age. This regent for life, is called Iteghe. Such was probably the case at the time of Frumentius's settlement in Abyssinia. The history of the Abunas is very imperfectly known for many years after their appointment. The first of them, who is particularly mentioned, is Abuna Tecla Haimanout, who distinguished himself by the restoration of the royal family, and by the regulations made by him both in church and state. He established the law, that the Abyssinians should not have it in their power to change one of their own countrymen as Abuna. The Arabic canon above mentioned, may probably be attributed to this Abuna; and is a forgery, or very soon after, his time. Tecla Haimanout was a native of Abyssinia, and therefore the prohibition had not taken place before his time; but as no Abuna was afterwards chosen to this office, the canon must be a work of his time; for it is impossible a canon should have been made by the council of Nice, setting the rank of a bishop in a nation which, for above 200 years after that general council, were not Christians. As the Abuna Kedom understands the language of the country, he has no share of the government.
A BY

ABY

He is much sunk in general estimation from what he was formerly, chiefly by his intrigues, ignorance, avarice, and want of Russell. His principal employment is in the ordination of priests, deacons, and monks. Some of these Abunans have been merely lay-monks, without so much as priestly orders. Their revenue arises from the sale of dignities, and of ordination, and from certain lands in the kingdom of Tyre, Gozam, and Dambis, of which they are the sole possessors; to which we may add, a kind of public collection of salt and cloth annually made for them through the empire, which amounts to a considerable value.

The order next, if not in rank and dignity, yet in general estimation, to the Abuna, is that of the Debatars, who are neither priests nor deacons, but a kind of Jewish Levites or chanters, who assist at all public offices of the church, and particularly in the conduct of all their musical performances. Besides these, every parochial church has a presb, subordinate to the Abuna, called Kemos, or Hegumenos, or Arch-prebiter, who has all the inferior priests and deacons, and all the secular affairs of the parish, under his inspection and government. The deacons occupy the lowest rank of the priesthood; they assist at divine service, and have their respective duties and vestments when they officiate. All these orders are allowed to marry; but the monks, who are very numerous, vow celibacy; and, it is said, with a preference. Le Grand says, they make a promise, before their superior, to keep chastity, but add in a low voice, as you keep it.

The monks are divided into two classes; those of Debra Libanos, and those of St. Eulalius. The head of the latter, who are grossly ignorant, is the superior of the convent of Mahabar Sahafi, in the north-west corner of Abyssinia, near Kounto, and the Shangalla, towards Semnaru and the river Dender. The chief of the former is the Itceghue, who is ordained by two chief priests, holding a white cloth, or veil, over him, while mother says a prayer; and they then lay all their hands on his head, and join in psalms together. This Itceghue is, in troublesome times, of much greater consequence than the Abuna. The monks do not live in convents, but in separate houses round their church, and each cultivates a part of the property they have in land.

The churches in Abyssinia are very numerous. Every great man that dies thinks he has abased all his wickedness, if he leaves a fund to build a church, or has built one during his life. The king builds many. The situation of a church is chosen near running water, for the convenience of their purifications and ablutions, in which they strictly observe the Levitical law. The churches are placed on an eminence, and surrounded by rows of Virginia cedar, which form very pleasing objects along the face of the country. All the churches are round buildings, with conical summits, and thatched roofs, and on the outside encompassed with pillars of cedar, to which the roof projects about five feet beyond the wall, so as to form an agreeable walk in hot weather, or in rain. The inside of the church is partitioned in the manner preferred by the Mosaic law. In the first and outer circular apartment the congregation fit and pray. Within this is a square, divided by a veil or curtain, in which is another small division answering to the holy of holies, and so narrow, that none but the priests can enter it. Persons of both sexes, under Jewish disqualifications, are prohibited from going within the outer cell of the church, and must perform their devotion at an awful distance among the cedars; and those who enter the church must put off their shoes, and take care they are not flown by the priests and monks before they return; kiss the threshold and two door-poles, say any prayer which they think proper, and thus their duty is finished. As for the doctrinal religion of the Abyssinians, it is that of the Greek church, which they received on their conversion to Christianity by Frumentius, about the year 335; and every rite or ceremony in the Abyssinian church may be traced to its origin in the Greek church, whilst both of them were orthodox. Frumentius preserved it untainted with hereby whilst he lived. Afterward's Arianism, and a number of other heresies, as they are called, were brought by the monks from Egypt, and infected the church of Abyssinia. Many of these were owing at first to the various use of the two words, nature and person, than which no words were ever more equivocal in every language in which they have been translated. For some time the Abyssinians had free access to Cairo and Jerusalem, where their books were revised and corrected, and many of the principal orthodox opinions inculcated. But since the conquest of Arabia and Egypt by Sultan Selim in 1516, their intercourse with those countries has been interrupted; and they are now, says Mr. Bruce, with regard to doctrine, as great heretics, and with respect to morals, as corrupt as the Jews have represented them. But though he concurs with the Jews in condemning their sentiments and practice, he disapproves of their mode of reforming them. The eucharist is received by the Abyssinians in both kinds; for this purpose they use unleavened bread and the embroidered chalice, and forming a kind of mandrake, is sufficed for wine, though an excellent long wine is made at Dredda, about thirty miles south west of Gondar. The communicant after receiving, drinks a large draught of water, and turning his face to the wall of the church, repeats some prayer in private with apparent decency and attention. Whether the Abyssinians believe the doctrine of transubstantiation or not, is not absolutely certain. Ludolph (l. iii. c. 5. §) thinks, that the words of consecration prove their disbelief of this doctrine. Mr. Bruce maintains the contrary opinion; though he tells us, that a priest declared to him, with great earnestness, that he never did believe that the elements in the eucharist were converted, by consecration, into the real body and blood of Christ. This, he said, was the Roman Catholic faith, but it never was his, and he conceived the bread to be bread, and the wine to be wine, even after consecration. With respect to the state of souls before the resurrection of the body, the opinion generally prevailing is, that there is no third state, but that the souls of good men enjoy the beatific vision immediately upon their separation from the body. However, their practice and their books contradict this opinion; for when any person dies, alms are given, and prayers are offered for the souls of these departed.

Upon the whole, we may observe, that the religion of the Abyssinians, in the present state of it, is unworthily dignified with the name of Christianity, since it consists in a motley collection of traditions and tenets, which have not any influence on practice. This people, of all ranks, of either sex, and of every age, are habitually liars, drunkards, gluttons, impecunious in their repentance, faithless in their dealings, and cruel in their vengeance. The king has unlimited power; and a minster, in the king's name, executes that power with the most licentious cruelty. The Abyssinians are totally illiterate; the arts cultivated among them remain in a state of great imperfection; and, which is a defect peculiar to themselves, they have not even an idea of marriage. Their bloody feasts, and their profane amours, are too disgusting for description. Every thing in their country wears an air of witchcrafts and incantations. Such are the reflections of an anonymous writer in the Monthly Review, vol. ii. p. 423. New Series.

The
The Abyssinians have divers times expressed an inclination to be reconciled to the see of Rome; but rather out of interest of date than any other motive. See Abyssinia.

Several missionaries accuse the Abyssinians of Judaifm, in regard to the many Jewish observances still in use among them: some have even doubted, whether they are more Christian, or Jews. Lobo says expressly, they are only Chalrians in name: they practice circumcision on females as well as males. But different opinions are held in different provinces with regard to the origin and obligation of this rite, as well as the time and mode of performing it. The Abyssinians of Tigré profess to have derived it from Imhāel's family and his descendents, with whom they were in trade at an early period in their trading voyages; and they say, that the queen of Sheba, and all the women of that coast, had suffered excitation at the usual time of life, before puberty, and before her journey to Jerusalem. The Palaisa declare, that their circumcision was that commonly practiced at Jerusalem in the time of Solomon, and in use among them when they left Palesline, and came into Abyssinia. They perform it on the 5th day, as a religious rite, according to the first institution by God to Abraham. The Abyssinians pretend theirs is not of this kind, and that they practice it because Christ and the apostles were circumcised, though they do not hold it necessary to salvation. But none of them pretend that circumcision arises from any kind of necessity, or from any impediment to procreation, or that it is necessary for cleanliness, or from the heat of the climate; and therefore it is probable, that it was originally derived from a divine command, and as such, transmitted to them. See Circumcision.

The Abyssinians can no means prohibited by the law of Moses. Women are obliged to the legal circumanction. Brothers marry their brothers’ wives, &c. They abate from hug's flesh, blood, meats unangled, &c., and observe both Saturday and Sunday sabbath, according to the custom of the primitive church: all of them marks of Judaism; though by some resolved into more human institution, and usage. They celebrate the Epiphany with peculiar festivity, in memory of Christ's baptism; when they plunge and sport in ponds and rivers, which has occasioned some to affirm that they were baptized anew every year. This is positively asserted by Alvarez, but as positively contradicted by Mr. Bruce, (vol. ii. p. 324, &c.) who has given a very ample account of this ceremony, which is an old observance of the eastern church, formerly performed publicly in Egypt, as it is now in Ethiopia. Many falsehoods have been propagated with regard to the mode of baptism in Abyssinia, in order to impugn the validity of it, and to excuse the rash conduct of the Jefuits in rebaptizing all the Abyssinians, as if they had been a Jewish and Pagan people that had never been baptized at all. Among the saints-days, which are very numerous, is one consecrated to Pilate and his wife; because Pilate washed his hands before he pronounced sentence on Christ; and his wife defined him to have nothing to do with the blood of that just persom. They have four Saints: the great one commences ten days earlier than ours, and is observed with much severity, many abatting therein even from fish, because St. Paul says there is one kind of flesh of men, and another of fishes. They allow of divorce, which is easily granted among them, and by the civil judge: nor do their civil laws prohibit polygamy. They have at least as many miracles, and legends of saints, as the Romish church; which proved no small embarrasment to the Jefuit missionaries, to whom they produced so many miracles, wrought by their saints, in proof of their religion, and those so well circumstanced and attested, that the Jefuits were obliged to deny miracles to be any sufficient proof of a true religion; and to allege the same arguments against the Abyssinians, who protestants in Europe allege against the papists. They pray for the dead, and invoke saints and angels; and have to great a veneration for the Virgin, that they charged the Jefuits with notrendering her honour enough. Images in painting they venerate, and pictures have been used in their churches from the earliest age of Christianity, but they abhor all those that are embossed and in relief; nor do they use a cross on the top of the ball of the Sandbeck or standard, because it calls a flame. They hold that the soul of man is not created, because, say they, God finished all his works on the sixth day. They have the fame books of scripture with us; though few are able to purchase entire copies either of the Old or New Testament. The Revelation of St. John is a favourite book with them. The Song of Solomon is also much esteemed by the old priests, but the reading of it is prohibited to the young ones, the deacons, laymen, and women. The Abyssinians believe that this song was made by Solomon in praise of Pharaoh's daughter: but they do not think, with some of our divines, that it contains any mystery or allegory respecting Christ and the church. They also admit the apocryphal books, and the canons of the apostles, as well as the apostolical constitutions, for genuine. Their liturgy is given by Alvarez, and in English by Pagit; their calendar by Ludoff; the answers to abbe Gregory to certain questions, proposed by the author last cited, are published by Fabricius, under the title of Tholozia XEthiopica.

**Abyssian Music.** See Music.

**Aca, Acco, and Acon, in Ancient Geography, a town of Phoenicia, on the Mediterranean; afterwards called Pol- lemais, now Acre, which see.**

**ACABIS, a small town in Cyrenaica, mentioned by Ptolemy.**

**ACACALOTL, in the Materia Medica, the name given by some authors to the *Ligurva foetidissima*, or wild carob. Dale.**

**ACACA, in Orchidology, the name of an American bird, which is the Tantalus Mexicans, of Gemelin, and called by some *corpus aquaticus*, or the water-raven.**

**ACACIUM, a city of Arcadia, so called from Acaca the son of Lycaon. It is mentioned by Pausanias, i. 8.**

**ACACLIA, of Acacia, Martín, in Biography, was born at Chalons sur Yonne, about the year 1530. He studied at Paris under the celebrated Mont. Brillot, and was made Professor of Medicine and Surgery there, and acquired considerable reputation as a teacher in those sciences.**

He published commentaries on several of the works of Galen, in the years 1548 and 1552, and two books de Morbus Muliebris, inserted in the Gymnecia by Spachicus. He died in the year 1588.

**ACACIA, in Botany. See Guilandina, Guaiacum, Mimosa, Poinciana, and Spartium.**

The flowers of a species of the acacia are used by the Chinefe in making that yellow, which, we see, bears wathing in their flks and flufhs; and appears with so much elegance in their painting on paper. The method is this: They gather the flowers before they are fully open; these put into a clean earthen vessel over a gentle heat, and stir them continually about, as they do the tea-leaves, till they become dry and of a yellowish colour; then to half a pound of the flowers they add three spoonfuls of fair water.
water, and after that a little more, till there is just enough to hold the flowers incorporated together: they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; then they take it from the fire and strain it through a piece of coarse silk. To the liquor they add half an ounce of cumin seed, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine lathing yellow they have to long used.

The dyers of large pieces use the flowers and seeds of the acacia for dyeing three different sorts of yellow. They roast the flowers, as before observed; and then mix the seeds with them, which must be gathered for this purpose when full ripe: by different admixture of these, they give the different shades of colours; only for the deepest of all, they give a small mixture of Brazil wood.

M. Geoffroy attributes the origin of bezoar to the seeds of this plant; which being brouded by certain animals, and vellitating the stomach by their great forness and alarbage, cause a condenation of the juices, till at length they become coated over with a flamy matter, which we call BEZOAR, or BEZORD.

Acacia, bastard, or foul, in Botany. See ROBINIA.
Acacia Indica, flowers TAMARIND.
Acacia, three-lobed, See GLIDITISIA.
Acacia Zeppelin, signifies LOGWOOD.

Acacia, in the Materia Medica, is a subfrangint gummy substance, prepared by infusing into a due confluence the juice expressed from the unripe pods of the Acacia foliis foetidioribus leguminosae of Buhaine, or the Mimosa Nilotica of Linnaeus. For an account of the pods, and manner of preparing the juice, see Murray's Apparatus Med. vol. ii. p. 412. This substance is brought from Egypt, in roundish masses, wrap it in thin bladder from four to eight ounces in weight. It is outwardly of a blackish brown colour, and inwardly of a reddish or yellowish brown. This juice totally dissolves in water; but rectified spirit produces little or no effect upon it; it is therefore truly of the gummy kind. It has no smell, and applied to the tongue it soon softens, and manifestly fits a moderately rough and then a smoothed taste.

This mild gummy astringent may be given to advantage in disorders arising from laxity and acrimony, as habitual diarrhoea, uterine fluxes, and catarharal coughs. By the Egyptians it is used against spitting of blood, in doses of a dram; and also in collyria for strengthening the eyes, in garganisms for quinsies, and glysters for diarrhoea. Among us it is seldom otherwise used than as an ingredient in mithridate or thircaria. The above substance has been called Acacia vera, by way of distinction from the German Acacia, which is a counterfeit of the other, and often sold for it in the shops. This is the infiltrated juice of unripe floes, formed by boiling the juice to the confluence of a solid extract. It is distinguished from the true Acacia chiefly by its colour, which is as black as that of Spanish liquorice, and also by being harder and heavier, and of a sharper taste, and by giving out its astringency to rectified spirit. This is administered in fluxes, that indicate the want of phytic medicines, in doses from a fezere to a dram. Lewis, Mrt. Med.

Acacia, among Antiquaries, denotes something resembling a kind of roll or bag, seen on medals in the bands of several of the consuls and emperors from the time of Anastasius.

According to Du-Cange, the acacia, properly so called, was a purple bag filled with earth, or sand, and borne by the prince in his left hand, to remind him of his frailty and mortality; and thus to prevent his being too much elated with his station.

But authors are not agreed, either about the use of this roll, or about the substance whereof it consists; some taking it for a handkerchief rolled up, which the person who preceded at the games threw out as a signal for their beginning; whilst others rather imagine it intended to represent a roll of memoria, or petitions.

ACACIANS, in Church History, the followers of Acacius, bishop of Caesarea, who flourished about the middle of the fourth century. He succeeded his preceptor, the famous Eufebius, in 340, wrote his life, and several other works, viz. 17 books upon Ecclesiastics, six books of Mifcellaneous Quotations, and a book against Marcellus, and died about the year 396. He was sturned Luficus, or Monophysites, because he could see only with one eye. He is generally reckoned a man of untedy principles, but was sensible and eloquent, and a skilful disputant. Some of the Acacians maintained, that the Son was not of the fame, but of a similar substance with the Father: others held that he was of a different substance from the Father. This was likewise the denomination of another sect, derived from the name of their leader, a patriarch of Constantinople, in the fifth century, who favoured the opinion of Eutyches. See EUTCYCHIANS, and MONOPHYSITES.

It was by the advice of this Acacius, who succeeded Genadius in 471, and died in 489, that the HENOTICON was published, by the emperor Zeno, in 482. In this connection we cannot forbear introducing a circumstance, that redounds much to the honour of another Acacius, bishop of Amida, in 420, whose name, says Gibbon, (Hist. Decl. and Fall of the Rom. Emp. vol. v. p. 427, 8vo.) might have dignified the faintly calendar. Boldly declaring that cups of gold and silver are ufeles to a god, who neither eats nor drinks, this generous prelate fold the plate of the church of Amida; employed the price in the redemption of 7000 Persian captives; supplied their wants with affectionate liberality; and dignified them to their native country, to inform the king of the true spirit of the religion which he persecuted. The king, it is faid, was fo affected with this act of benevolence, that he wished to fee the Bishop; and the interview produced a peace between this prince, Venarius, and Theodolus I.

ACACIUS, a name given to several bishops, and other eminent persons besides those mentioned under the preceding article; particularly a martyr under the emperor Decius; a patriarch of Antioch, who succeeded Basil in 458, and died in 459; a bishop of Miktum in the 5th century; another bishop of Beroca in Syria, who was present at the council held at Constantinople in 381, the friend of Eiphanias Flavius, and the enemy of John Chrysolom, bishop of Constantanople, whom he caufed to be deposed, and who, at the age of 110 years, advised Theodorus the younger, to confirm the sentence pronounced against Nef- torinus, and also against Cyril, bishop of Alexandria: he was eminent for widom and luicuty, fays Theodore, and died in 436 — and a famous rhetorician in the reign of the emperor Julian.

ACADA, see PORTO Bello.

ACADEMIA, Ital. in Italy and Spain denotes a Con- c.erte, which fee.

ACADEMICS, a fect of philosophers who followed thedoctrine of Socrates and Plato, as to the uncertainty of knowledge, and the incomprehensibility of truth. Academic, in this fene, amounts to much the fame with Platonizt; the difference between them being only in point of time. They who embraced the fystem of Plato, among the ancients, were called Academici; whereas those who did not the fame, fince the reforation of learning, have added the denomination of Platonists.

We
We usually reckon three sects of Academicians; though some make five. The ancient Academy was that which was founded by Plato; and consisted of those followers of this eminent philosopher, who taught the doctrine of their master without mixture or corruption. The first of these was Socrates; he was succeeded by Xenocrates. After his death the direction of the academy devolved upon Polemo, and then upon Crantor. After the death of Crates, a new tribe of philosophers arose, who on account of certain innovations in their manner of philosophizing, which in some measure receded from the Platonic system, without entirely departing from it, have been distinguished by the appellation of the Second or Middle Academy. The first preceptor, who appears in this class, and who, in consequence of the innovations which he introduced into the Platonic school, has been commonly considered as the founder of this Academy, is Arcesilaus.

In order to conceive justly concerning the nature and causes of this revolution, it will be proper to advert to the state of opinions in the preceding period. It had been very generally maintained by both the Greek and Barbaric philosophers, that there can be no certain knowledge of things to variable and fluctuating as those material objects which fall under the notice of the senses. But they did not imagine, that human reason was wholly incapable of arriving at truth; nor was the doctrine of universal scepticism introduced in the infancy of philosophy. In excluding material objects from the department of science, the first philosophers discovered an inclination to inquire with modesty concerning the nature of things, to divest themselves of prejudice, and to satisfy themselves with a sober assent to those truths which lay within the reach of the human understanding. Besides, the Barbaric philosophers, and after them the Greeks, held two kinds of doctrine, the popular for the amusement of the vulgar, and the concealed, which was communicated in the confidence of mere private instruction to their professed disciples. Such was the state of philosophy, when Socrates appeared, and exerted himself in regulating the conduct of the human mind. In opposition to the Sophists, who boasted that they knew every thing, he confessed that he knew nothing; by which acknowledgement he did not mean to affect the universal uncertainty of human knowledge, but merely to convince his followers of the futility of those speculations, which do not rest upon the firm foundation of experience, and to teach them modestly in their inquiries, and diffidence in their assertions. Among the sects who sprung out of the school of Socrates, the greater number deviated into the mazes of disputations, and refined the Socratic mode of arguing on either side of every question that was proposed. Plato inclined to a stricter method of philosophizing; and in his public disputations after the Socratic manner, whilst he rebutted the opinions of others, and let his hearers undecided concerning his own, he fully explained the principles of his philosophy to those pupils who were indulged with his private and confidential instruction. His doctrine was, that no certain knowledge can be obtained concerning the varying forms of natural bodies, and that ideas are the only objects of science. This doctrine was universally taught in the Old Academy; but before the time of Arcesilaus, it was never denied, that useful opinions may be deduced from the senses. Cic. Acad. l. 1. c. 8. tom. ii. Ed. Olivet. Two sects arose about this time, which threatened the delirious method of the Platonists. One was founded by Pyrroh, who held the doctrine of universal scepticism, and the other by Zeno, which maintained the certainty of human knowledge, and taught with great confidence, a doctrine essentially different from that of Plato. In this situation, Arcesilaus thought it necessary to exercise a cautious reserve with regard to the doctrine of his master, and to conceal his opinions from the vulgar, under the appearance of doubt and uncertainty. Professing to derive his doctrine concerning the uncertainty of knowledge from Socrates, Plato, and other philosophers, he maintained, that though there is a real certainty in the nature of things, every thing is uncertain to the human understanding, and consequently that all confident assertions are unreasonable. He thought it disgraceful to all philosophy, to affix to any proposition, the truth of which is not fully established, and maintained that, in all questions, opposite opinions may be supported by arguments of equal weight. He disputed against the testimony of the senses, and the authority of reason; acknowledging at the same time, that they furnish probable opinions sufficient for the conduct of life. However, his secret design seems to have been to establish the doctrine of Plato, that the knowledge derived from sensible objects is uncertain, and that the only true science is that which is employed upon the inmutable objects of intelligence, or ideas.

After the death of Arcesilaus, the Platonic school was successively under the care of Lacydes, who is said to have founded a new school, merely because he changed the place of instruction, and held it in the garden of Attalus, within the limits of the Academy grove, and of Evander and Egellinus. Arcesilaus, however, had opposed the Jews and other dogmatistical philosophers, with much violence, and extended his doctrine of uncertainty so far, as to alarm not only the general body of philosophers, who treated him as a common enemy to philosophy, but even the governors of the state, who apprehended that his opinions would dis robe all the bonds of social virtue and of religion. His successor, therefore, found it difficult to support the credit of the academy; and Carneades, one of the disciples of this school, relinquished, at least in words, some of the most obnoxious tenets of Arcesilaus.

From this period the Platonic school assumed the appellation of the New Academy, which may be reckoned the third in order from its first establishment. It was the doctrine of this Academy, that the senses, the understanding, and the imagination, frequently deceive us, and therefore cannot be infallible judges of truth; but that, from the impressions produced on the mind, by means of the senses, called by Carneades phantasies, or images, we infer appearances of truth, or probabilities. These images do not always correspond to the real nature of things, and there is no infallible method of determining when they are true or false; and consequently they afford no certain criterion of truth. But, with respect to the conduct of life and the pursuit of happiness, probable appearances are a sufficient guide, because it is unreasonable not to allow some degree of credit to those witnesses who commonly give a true report. See Probability. According to the doctrine of the New Academy, the judgments arising from the operation of the mind in estimating the different degrees of probability, are not science, but opinion, which is all the knowledge that the human mind is capable of attaining. The chief point of difference between the Middle and the New Academy, seems to have been, that the latter taught the doctrine of uncertainty in less exceptionable terms than the former. Dr. Warburton, however, offers several reasons to show that both these Academies were in reality the same, and that they were as real sceptics, as the sect which was so denominated. See Div. Leg. of Moles, vol. ii. p. 117, 118. 4th ed. Arcesilaus, in his zeal for overturning all other sects, furnished his opponents with a pretext for charging N 2
him with attempts to undermine the whole foundation of morals. Carnedus, availing himself of probability, afforded
sufficient scope for practical conduct of conduct. Acricus
was chiefly employed in opposing the tenets of other
philosophers in logic and physics, and paid little attention
to ethics. Carnedus, whilst he inculcated the necessity of
sub stance in speculative researches, prescribed rules for the
direction of life and manners. The immediate successor of
Carnedus, in the New Academy, was CLITOMACHUS. He
was succeeded by PHILO of Laris, who is considered by
some writers as the founder of a fourth Academy; and a fifth
is laid to have been established by ANTIORUS of Alexium,
who was the last preceptor of the Platonic school, and who
attempted to reconcile the tenets of the different sects, and
maintained that the doctrines of the Stoics were to be
found in the writings of Plato. After his time the pio-
efors of the Academic philosophy were dispered by the
contentions of war, and the school itself was transferred to
Rome. Here the philosophy of the Old Academy, revived
and corrected by Antiorus, found many advocates.
Amongst the most eminent of these we may reckon
Lucullus, Marenus Brutas, M. Terentius Varro, and M.
Piso. The Middle Academy had likewise its patrons in this
city; as it was founded upon a conviction of the imbecility
of human reason, without running, with the Pyrrho-
nists, into the extravagance of an entire suspension of opin-
ion, it became a favorite sect among the Romans. Cicer-
on, to whose profession, as a public pleader, whose busi-
ness was to collect arguments from all quarters on oppo-
site sides of every doubtful question, it was peculiarly
adapted, addicted himself to this sect; and having himself
been instructed by Philo, he would not find it difficult to
induce others to follow his example. Cicero De Off. 1. 2.

astics, Platonists, and Sceptics. For the difference
between the Academicians and Sceptics, &c. Sceptics,
Academics, Aestheticians, or Academists, is also
used among us for the members of the modern academicians,
or instituted societies of learned persons.
ACADEMY, Academy, in Antiquity, a public grove,
or villa, situated in one of the suburbs of Athens, about six
stadia, or 2 of a mile from the city; where Plato, and the
wife men who followed him, held assemblies for disputing
and philosophical conference, and which gave the denomina-
tion to the sect of Academicians.
It took its name academy, from one Academus, or Eco-
demus, a citizen of Athens, to whom it originally be-
longed; and who appropriated it to gymnastic sports or
exercises. He lived in the time of Theseus.
Some, erroneously, derive its name and origin from Cad-
mus the Phoenician, as being the first who introduced learn-
ing, and the use of letters, among the Greeks.
The academy was further improved and adorned by Cic-
on, with fountains, trees, shady walks, &c. for the con-
venience of the philosophers and men of learning who here
met to confer, dispute, &c. — Hipparchus, the son of
Pithagoras, built a wall round it; and, in order to defray
the charges, laid to heavy a tax on the people, that ever
after September was used proverbially for any expen-
sive business. It was also the burying place of illustrious
persons, who had deserved well of the republic. Of this
recess, so well adapted to philosophy and the muses, Hor-
ace speaks, Epit. II. 45:

"Atque inter silvas Academi quaerere verum:"

"Mitul' academic groves to search for truth."

Within this inclosure Plato possessed, as a part of his
humble patrimony, purchased at the price of three thousand
drachmas, or about 11 cl. res. 6d. herling, a small garden, in
which he opened a school for the reception of those who
might be disposed to attend his instructions.
Here he taught his philosophy; and from this circum-
stance all public places, defined for the assemblies of the
learned and ingenious, have been since called academies.
Sylla sacrificed the delicious groves and walks of the aca-
demy, planted by Cicero, to the laws of war; and em-
ployed those very trees to make machines with which to
batter the city. Cicero also had a villa, or country retire-
ment near Puzzalon, which he called by the same name
academia; where he used to entertain his philosophical
friends. — It was here he composed his Academic Ques-
tions, and his book De Natura Deorum.

ACADEMY is more frequently used among the moderns,
for a regular society, or company of learned persons;
instituted generally under the protection of a prince, for
the cultivation and improvement of arts or sciences.

Ptolemy Soter, in order to encourage and improve the
liberal arts in his dominions, founded an academy at Alex-
andria, or a society of learned men, who devoted thema-
to the study of philosophy, and all other sciences; and
he provided them with a collection of books, which became by
degrees the finniest library in the world, and has been known
under the name of the Alexandrian library.

Theodosius the younger, founded an academy at Con-
stantinople, which he furnished with able professors of
every science, intending it as a rival Institution to that at Rome,
which, with other literary feminaries, had been destroyed by
Alaric and the Goths, towards the close of the fourth,
and beginning of the fifth centuries.

Some authors confound academy with university; but
though much the same in Latin, they are very different
things in English. — An university is, properly, a body com-
posed of graduates in the several faculties; of professors
who teach in the public schools; of regents or tutors, and
students who learn under them, and aspire likewise to de-
grees. Whereas, an academy is not intended to teach or
profess any art, such as it is, but to improve it: it is not
for novices to be instructed in, but for those that are more
knowing; for persons of distinguished abilities to confer in,
and communicate their lights and discoveries to each other,
for their mutual benefit and improvement.

The first academy we read of, was established by Charle-
magne at the motion of Alcuin: it was composed of the
chief wits of the court, the emperor himself being a mem-
ber. — In their academical conferences, every person was to
give an account of what ancient authors he had read; and
each of them assumed the name of some ancient author who
pleased him most, or some celebrated person of antiquity.
Alcuin, from whose letters we learn these particulars, took
that of Phæbus, the surname of Horace; a young lord
named Augilbert, took that of Homer; Adalard, bishop of
Corbie, was called Augulitin; Riculf, bishop of Mentz,
was Dametas; and the king himself, David.

Most nations have now their academies; but Italy has the
greatest number.
Academies of Antiquities; as

The Academy at Cortona, established for the study of the Hetrurian antiquities; which are numerous and extensive. Their head is called Lucumon, a name taken from the ancient governors of Hetruria. One of their laws is to give audience to poets only one day in the year; another is, to fix their fusions, and impose a tax of a dissertation on each member in his turn.

The Academy of Antiquities at Upsal, owes its rise to queen Christina, but its establishment chiefly to Charles Gustavus, who gave it for illuminating the northern languages, and the antiquities of the country, as stones, coins, and the like monuments; in which notable discoveries have been made by it. The more eminent of its members have been Verelius, Loffeinati, Scheffer, Rudbeck, Keder, Salin, Penkland, &c.

Academy of Architecture, was established at Paris by M. Colbert, in 1671, confining to a company of skilful artists, under the direction of the Superintendant of the buildings.

Academy, Royal, of Arts, was instituted in London for the encouragement of designing, Painting, Sculpture, &c. &c. in the year 1763. This academy is under the immediate patronage of the king, and under the direction of forty artists of the first rank in their several professions. It furnishes, in winter, living models of different characters to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians are annually elected out of the forty, whose business it is to attend by rotation, to select the figures, to examine the performances of the students, and to give them necessary instructions. There are likewise four professors of Painting, of Architecture, of Anatomy, and of Perspective, who annually read public lectures on the subjects of their several departments; besides a president, a council, and other officers.

The admission to this academy is free to all students, properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit.

The Academy of Arts at Peterburgh, was established by the empress Elizabeth in 1758, and annexed to the Academy of Sciences. At the suggestion of count Shuvolof, the empress Catharine in 1764, formed it into a separate institution, enlarged the annual revenue from 4,000 to 12,000l. and augmented the number of scholars from 40 to 300. She also constructed, for the accommodation of the members, a large circular building, which fronts the Neva. The scholars are admitted at the age of 16, and continue to 19; and they are lodged, clothed, fed, and taught, at the expense of the crown. All of them are instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of 14, they may chuse any of the following arts, which are distributed into four classes: 1. Painting in all its branches of history, portrait, battle, and landscape; architecture, mosaic; enamelling, &c. 2. Engraving on copper-plates, seal-cutting, &c. 3. Carving in wood, ivory, and amber. 4. Watch-making, turnery, instrument-making, casting statues in bronze and other metals, imitating gems and medals in paste and other compositions, gilding, and varnishing. Prizes are annually distributed among those who excel in any particular art; and from those who have obtained four prizes 12 are selected, who are sent abroad to the public charge. Their travelling expenses are defrayed; and when they settle in any town, they receive an annual salary of 150l. for four years. There is an allotment of paintings and models for the use of the scholars.

Academies, of Painting, Sculpture, and Architecture; as those celebrated ones, anciantly at Florence and Milan, called allo schools; and that other at Bologna, incorporated into the new Institute, to which may be added the academy of painting and sculpture at Paris and Vienna; another at designing at Rome.

Academy of Painting and Sculpture at Paris, was first projected by Le Brun, Sarazin, Corelle, &c. for which they obtained an arret of council in 1648, and established in 1654 and 1655, under the Cardinal Mazarin, first protector thereof; and the chancellor Seguerier vice-protector. In 1655, a pension of 4000l. was granted to the academy by the interposition of M. Colbert. It consists, besides, of a director, a chancellor, four rectors, a treasurer, and four professors, one of anatomy, and another of geometry; adjuncts to the rectors and professors; counsellors; a secretary; an historiographer, and two others.

Perfons are here admitted either in quality of painters or sculptors, who model from a naked person.—The painters are admitted according to their respective talents; there being a distinction made between those who work in history, and those who only paint portraits, or landscapes, or flowers, or flowers, or paint in miniature; or only design, or engrave, or carve, &c.

In the Academy of painting there are 12 professors, each of whom attends a month in the year, and their place is supplied by 12 adjuncts. The professor upon duty places the naked man as he thinks proper, and sets him in two different attitudes every week. This they call setting the model. In one week of this month he sets two models together, which is called setting the group. The paintings and models made after this model are denominated academies, or academy-figures. They have likewise a woman who stands for a model in the public school. Three prizes for design are distributed every three months among the eleves or scholars; two others for painting, and two for sculpture every year. An account of this academy has been published by Guerin, under the following title, Descript. De l'Acad. Roy. de Peinture & Sculpt.

There is also a French academy of painting, sculpture, &c. at Rome, established by Lewis XIV., wherein those who have won the annual prizes in the like academy at Paris, are received and entertained for three years with a view to farther improvement.

An Academy of painting and sculpture was established at Manheim, by Charles Theodore, elector Palatine, in 1775, with a view of encouraging and promoting the fine arts.

The Academy of painting and sculpture, at Stockholm, has nine professors, and commonly about 400 scholars. This academy annually distributes three large and three small medals; and the students who most distinguish themselves, are permitted to travel into France and Italy, at the expense of the institution.

The Academy of painting, sculpture, and architecture at Vienna, was founded in the year 1705.

Academies of Belles Lettres, those wherein eloquence and poetry are chiefly cultivated. Italy abounds with these; and in France there are not a few; such are

The Academy of Umidi at Florence, called afterwards La Florentina, in honour of the grand-duke Cosimo I. who declared himself its protector in 1549, is illustrous both for the works it has produced, and its members; which for these two last ages have included most of the eminent men, not only in Tuscany, but in all Italy. Their chief attention is to the Italian poetry.

Academy of Humorists, Umoristi, had its origin at Rome, from the marriage of Lorenzo Mancini, a Roman gentleman, at which several perfons of rank were guests; and
and it being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, and comedies, first, ex tempore, and afterwards pren ditatory; which gave them the denomination of Belli Humori. After some experience, coming more and more into the taste of these exercises, they resolved to form an academy of Belli Letters; and changed the title of Belli Humori for that of Humori; choosing for their device a cloud, which, after being formed of the Ehme exhalations of the sea, returns in a gentle sweet shower, with the motto from Lucretius, reddi agmine dulci.

Academy of Arcadi was established at Rome in 1690, for revising the flood of poetry, and the Belli lettera com posed many of the political wits in Italy, of both sexes; many princes, cardinals, and other ecclesiastics: to avoid all disputes among whom, about pre-eminence, it is widely provided, that all appear masked, after the manner of shepherds of Arcadia. Within ten years from its first establishment, the number of Academici amounted to 600. They hold assemblies seven times a year, in a meadow or grove; or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems, and verses of the Arcadi. The seventh meeting is set apart for the compositions of foreign, or absent members; in which there is more entertainment than in all the rest; because the pieces produced here are written in all the different styles and dialects of Italy. The government of this academy is wholly democratical, allowing no prince or protector, but only a cyclos, who represents the whole society, chosen each olympiad, that is, every four years; with a power of electing twelve others yearly, to assist him in the administration. Under these are two fabuladores, one vicar or procylus, and four deputies or superintendents, annually chosen. There are five ways of electing members; the first called acclamation, used when sovereign princes, cardinals, and ambassadors of kings, desire to be admitted; in which case the votes are given scia voce; the second, annunation, introduced in favour of ladies and academical colonies; where the votes are taken privately; the third, representation, established in favour of colleges and universities, where the young gentry are bred; who have each a privilege of recommending one, or two members, privately to be ballotted for; the fourth, juroration, whereby new shepherds are inducted in the room of those dead, or expelled: the last, definition, whereby, when there is no vacancy of members, persons of poetical merit have the title Arcadi conferred on them, till such time as a vacancy shall happen. All the members of this body at their admission, assume new pastoral names, in imitation of those of the ancient Arcadians. The academy has divers colonies of Arcadi established in other cities in Italy, all regulated after the same manner.

Academy of Physicians. At Caen, was established by letters patent in 1705; it has its five first years earlier in private conferences, held first in the house of M. de Brieux. M. de Segrais retiring to this city, to spend the rest of his days, restored and gave new life to their meetings. In 1707, M. Foucault, intendant of the generality of Caen, procured the king's letters patent for erecting them into a perpetual academy, of which M. Foucault was to be protector for the time, and the choice afterwards left to the members, the number of whom was fixed to thirty, and the choice of them, for this time, left to M. Foucault. Besides the thirty, leave is given to add some supernumerary members, not exceeding six, from the ecclesiastical communities in that city.

An assembly of men of letters was formed at Lyons, which merely wanted letters patent to constitute a royal academy, inferior to few in France. It consisted of twenty academici, with a director at their head, and a secretary who is perpetual. F. Lombard, a Jesuit, one of the members here read a learned dissertation on infinity.

There is an Academy of Belles Lettres, History, and Antiquities at Stockholm, the Memoirs of which are published in the Swedish language.

Academia, Chirurgical; as that first instituted at Paris in 1731, and finally established by letters patent from the king in 1743; the members of which are not only to publish their own and correspondents' observations and improvements, but to give an account of all that is published in surgery, and to compose a complete histori of this art, by their extracts from all the authors, ancient and modern, who have wrote on it. A question in surgery is to be proposed by the academy yearly; and a prize of a gold medal of five hundred livres value to be given to him who furnishes the most satisfactory answer.

Academy of Surgery was instituted in 1732 at Vienna by the emperor, under the direction of the celebrated Brambilla, who delivered an oration on the occasion. It had at first only two professors, who had the charge of instructing 120 young men, of whom thirty had been surgeons in the army. But the number both of teachers and pupils has been much increased. They are provided with a large edifice in Vienna, which affords habitation for the teachers and students, and also for pregnant women, and patients for clinical lectures, and new arts. They have also a medical library, a complete set of chirurgical instruments, an apparatus for experiments in natural philosophy, a collection of specimens in natural history, a number of anatomical and pathological preparations, and a variety of other useful articles. Adjoining to the building, there is also a good botanical garden. Three prize-medals, of the value of forty florins each, are annually bestowed on the students who return the best answers to the questions proposed in the preceding year.

Academia, Cifmographic; as that of the Argonauts at Venice, instituted at the solicitation of F. Coronelli, for the improvement of Geography. The design of the Academia Cisographic is to procure exact maps, geographical, topographical, hydrographical, and ichnographical, of the celestial as well as terrestrial globe, and the several regions and parts thereof, together with geographical, historical, and astronomical descriptions: in order to which, the several members oblige themselves, by their subscription, to take one or more copies of each piece, published under the direction of the academy; and to advance the money, or part of it, in order to defray the charge of publication. To this end, three societies were settled at Venice, Paris, and Rome; the first under F. Moro, provincial of the Minorites of Hungary; the second under the abbot Laurence au Rue Pauvren au Marais; the third, under F. Ant. Baldigiani, Jesuit, professor of Mathematics in the Roman college; to whom those addresse themselves, who are willing to engage in this design. The number of members in the several countries of Europe has been considerable; their device is the terraqueous globe, with the motto, plus ultra. At the expence of this academy, all the globes, maps, and geographical writings of F. Coronelli have been published.

Academy of Dancing. One of this kind was instituted by Louis XIV. with extraordinary privileges.

Academia, Ecclesiastical; as that at Bologna, instituted in 1687, and employed in the examination of the doctrine, discipline, and history of each age of the church.

Academia, Historical; as the Royal Academy of Portugal.
ACADEMY.

Guest History at Lisbon, which was instituted by king John V. in 1728, as appears by a medal struck by the academy, on the front whereof is that prince's effigy, with the inscription "Johanne V. Luastarum Rex"; and on the reverse, the same prince standing is represented supporting and raising History, almost prostrate before him, with the legend "Historia Refugis"; underneath are the following words in abbreviation, REGIA ACADEMIA HISTORICUS LUSITANAE INSTITUTA VI. Idus Decembris MDCCXX.

This academy consists of a director, four censors, a secretary, and fifty members; to each of whom is assigned some part either of the ecclesiastical, or civil history of the nation; which he is to treat either in Latin, or Portuguese.

Academy of Swedish History, at Tubingen, was established by some learned men, for publishing the bell historical writings, the lives of the chief historians, and compiling new memoirs, on the several points and periods thereof.

Academies of Language, are called by some, Grammatical Academies: as the Academia della Crusca, Academia Fisica of Firenze, or the Brain Academy, alluding probably to the end of their institution, which is to sift out and reject as hulks or bran, all Italian words that are not good Tuscan, is famous for its vocabulary of the Italian tongue, and was formed at Florence, in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors of note confounded this with the Florentine academy. The famous Torricelli delivered many of his philosophical discourses in this academy. This academy is now united with two others, viz. the Fiorentina and the Apatifi, under the name of Reale Accademia Fiorentina.

Academy of Frußfîlo had its rise in 1617, at an assembly of several princes and nobility of the country who met with a delign to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen prelates. In 1668, the number of members arose to upwards of nine hundred. The history of this academy is written in the German tongue by George Neumark.

Academy, French, had its rise in a private meeting of men of letters in the house of M. Conrat, in the year 1628. Cardinal Richelieu, in 1635, at the instance of M. Chapelain, erected it into an academy for refining and ascertaining the French language and style. The number of the members was limited to forty, out of whom a director, a chancellor, and secretary, are to be chosen; the two former hold their post for two months, the secretary is perpetual. Several privileges and immunities were conferred on the new academy, particularly the droit de commnuniter, or a privilege of not appearing to answer before any court, but that of the king's household. Their first assemblies were held in the cardinal's apartment; after his death, in that of the chancellor Seguier. At last an apartment was given them in the Louvre, now called Académie Françêlo. They meet three times a week in the Louvre; at breaking up, forty silver medals are distributed among them, having on one side the king of France's head, and on the reverse, Trésorier de l'Académie, with a laurel and this motto, a l'immortalité. By this distribution, the attention of the academists is secured: those who are present receiving the surplus, otherwise intended for the absent.

As to the employments of the academy: its design being not only to give rules but examples of good writing; they began with making speeches on subjects taken at pleasure, each member in his turn; twenty of these have been printed. Their next work was a critique of the Cid. of M. Corneille, a tale enjoined them by the cardinal. They next set about a dictionary of the French tongue, which, after about fifty years spent in it, in order to settle the words and phrases to be used in writing, &c. was published in 1691; having in the mean while given occasion to some smart disputes with M. l'Abbe Furetto, one of their own members.

Their history is written with great elegance to the year 1712, by M. Pelbon; improved and continued to the year 1700, by M. l'Abbe d'Olivet: the same is given rhythmically, by F. le Camus.

A similar Academy was founded at Petersburg by the late emperors, in 1783, upon a plan proposed by the princes Dahekof, and a fund provided for its establishment and support. It is to consist of 60 members.

The royal Swedish Academy was formed on the plan of the French academy by Galvanius III., who attached a pension to some of its members. Its object is the improvement of the Swedish language, poetry, and eloquence.

Academy, Royal Spaniâle, is an academy for cultivating the Castilian tongue, established at Madrid on the model of the French academy. The design of this was laid by the duke d'Ecausses, and approved of by the king in 1714, who declared himself protector thereof. It consists of twenty-four academists; including the director and secretary. Its device is a crucible on the fire, with this motto, limpie, pija, y da esfondar; i.e. it purifies, fixes, and gives brightness; which some have criticized. Their object, as marked out by the royal declaration, is to cultivate and improve the national language; in order to which, they are to begin with choosing carefully such words and phrases, as have been used by the best Spanish writers: noting the low, barbarous, or obsolete ones, and composing a dictionary, wherein these may be distinguished from the former, &c. by which means, adds that prince, it will clearly appear; that the Castilian tongue is inferior to none of those most esteemed in the world; and may be employed with advantage either in teaching the arts and sciences, or in expressing the most perfect Latin or Greek originals in exact translations. The academy is to have its own printer; yet not to put any thing to press without the permission of the council. For further encouragement all privileges and immunities enjoyed by the domestic officers, actually in the king's service, and the royal palace, are granted the academists.

Academies of Laws: as that famous one at Berynt, and that of the Sitientes at Bologna.

Academy of Medals and Inscriptions at Paris, was set on foot by M. Colbert in 1663, and distinguished by its present appellation, in 1691, for the study and explanation of ancient monuments, and perpetuating great and memorable events, especially those of the French monarchy, by coins, relieves, inscriptions, &c. The number of members at first was confined to four or five, but in 1701 was increased to forty, whereof ten were to be honoraries, ten pensioners, ten associates, and the same number of novices or electors, which has since annexed to the chiefs of eleves. The king nominates their president and vice-president yearly; but their secretary and treasurer are perpetual. The royal-examine the members themselves, agreeably to the constitutions given them on that behalf. Their chief work is a kind of medallion history of the reign of Louis XIV., which, after some interruptions, was continued to the advancement of the duke of Anjou to the crown of Spain. Beside which we have several volumes of their effays, under the title of memoirs: and their history, written and continued by their secretaries. Their motto is "Vitat mori.

Academies, Medical, as that of the Nature Curiosi in Germany: that founded at Palermo, in 1645; another at Venice,
ACADEMY.

To Venice, in 1701, which meets weekly in a hall near the grand hospital, at St. Mark's, in the house of M. le Clerc. The colleges of physicians at London and Edinburgh, are also by fame ranked in the number of medical academies.

Academy of Nature Curiosiorum, in Germany, was first founded in 1652, by M. Bruch, a physician, who invited all physicians to communicate their extraordinary cases, and was elected president. Their works were at first published separately; but in 1670, it was proposed to publish a volume of observations every year. The first volume appeared in 1684, under the title of Ephemerides, which was continued with some interruptions, and variations of the title, &c. In 1687, this academy was taken under the protection of the emperor Leopold, who granted the members several privileges, and particularly that their presidents should be counts palatine of the Roman empire. From him it has been sometimes designated the Leopoldine academy.

This academy differs from all others, in that it has no fixed residence, or regular assemblies; instead whereof is a kind of bureau, or office, first established at Brauweiler, afterwards moved to Muenster, where letters, observations, &c., from members and correspondents are taken in. The academy consists of a president, two adjutants, or secretaries, and colleagues or members. The colleagues, at their admission, oblige themselves to two things; first, to choose some subject out of the animal, vegetable, or mineral kingdom to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the annual Ephemerides. Each member is here to bear a symbol of the academy, viz. a gold ring, whereon, instead of a stone, is a book open, and on the face thereof an eye: on the other side the motto of the academy, namque at fur, i.e. never idle. See the history, laws, &c., of this academy, with the names of its members, and the titles of its pieces, in Ephem. Germ. dec. 1. an. 1, & 2. Pref. and the continuation of the fame in the prefaces and appendices to the ensuing volumes.

Academy, Musical, consists of the managers and directors of the opera.

An academy of this kind, called the Academy of Ancient Music, was established in London in 1710, by several persons of distinction, and other gentlemen, in conjunction with the most eminent masters of the time, with a view to the study and practice of vocal and instrumental harmony. This institution, which had the advantage of a library, consisting of the most celebrated compositions both foreign and domestic, in manuscript and in print, which was aided by the performances of the gentlemen of the chapel royal, and the choir of St. Paul's, with the boys belonging to each, continued to flourish for many years. In 1731, a charge of plagiarism brought against Bononcini, a member of the academy, for claiming a madrigal of Lotti of Venice as his own, interrupted the harmony, and threatened the existence of the institution. Dr. Greene, who had introduced the madrigal into the academy, took part with Bononcini, and withdrew from the society, taking with him the boys of St. Paul's. In 1734, Mr. Gates, another member of the society, and master of the children of the royal chapel, retired in disgust, and it was thus deprived of the affluence which the boys afforded it in singing the operas parts. From this time the academy became a seminary for the instruction of youth in the principles of music, and the laws of harmony. Dr. Pepusch, who was one of its founders, was active in accomplishing this measure; and by the expedients of educating boys for their purpose, and admitting auditor members, the subsistence of the academy was continued.

The royal academy of Music was formed by the principal nobility and gentry of the kingdom for the performance of opera, composed by Mr. Handel, and conducted by him at the theatre in the Haymarket. The subscription amounted to 50,000l, and the king, besides subscribing 100l, allowed the society to assume the title of Royal Academy. It consisted of a governor, deputy governor, and twenty directors. On occasion of a contest between Handel and Senesino, one of the performers, in which the directors took the part of the latter, the academy was dissolved, after having fulfilled with reputation for more than nine years.

Academy, Naval; as that of Petersburg, and those in England. See Academy.

Academy, Political, such as that of Paris, composed of six persons, who met on certain days each week at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. Here they perused such papers as were put in their hands, by order of the secretary for foreign affairs, who acquainted the king with the progress they made, and the capacities of each, that his majesty might employ them accordingly.

Academies of Sciences chiefly denote those erected for improving natural and mathematical knowledge; otherwise called philosophical and physical academies: such as the Academy Secretissimam Naturae, formed at Naples in the house of Bapstilla Porta, about the year 1560, the first academy of the philosophical kind. It was succeeded by the Academy of Lynce, founded at Rome by prince Frederic Celi, towards the close of the same century; several of whose members rendered it famous by their discoveries: the celebrated Galileo Galilei was of the number.

Several other academies contributed also to the advancement of the sciences; but it was by speculations, rather than by repeated experiments on the phenomena of nature: such were the academy of Buffon at Rome, and that of Laurence de Medecis at Florence, in the sixteenth century; in the sixteenth, that of Inamati at Padua, of Vegnà, Paul in Rome, of Ottolani in Placentia, and of Umiati at Florence. The spirit of these flushed fire and pyrotechnia; the second, wine and vineyards; the third, gardens and pot herbs; the fourth, water and hydraulics. Add to these, that of Venice, called La Veneta, founded by Frederic Dabadur, a noble Venetian; another in the same city, whereof Campegio, bishop of Feltro, appears to have been the chief; and that of Cofenza, or la Contantina, where of Bernadino Tiefio, Sor Adivo, Ropstoi, Paulus Aquis, Julio Cavalcanti, and Fabio Cicali, celebrated philosophers; were the chief members.

The compositions of all these academies of the sixteenth century were good in their kind, but none of them comparable to those of the Lyncei.

Academy del Cimento made its appearance at Florence some years after the death of Torricelli, under the protection of prince Leopold, afterwards cardinal de Medecis. Galileo, Torricelli, Aggiunti, and Viviani, prepared the way for it; and some of its chief members were Paul del Buono; who, in 1657, invented the instrument for evincing the fupposed incomprehensibility of water, which was a thick globular shell of gold; Alphonso Borelli, Candide del Buono, brother of Paul; Alexander Marfili, Vivent Vini, Francis Redi, and confident Laurence Magalotti, were some of its chief members. The latter was secretary of this academy, and published a volume of curious experiments in 1677; under the title of Saggi di Naturali Esperienze: a copy of which being presented to the Royal Society, was translated into English by Mr. Waller, and published at London, in 1678.
The Academy of Apisiti, or Imperial Academy, at Florence, which comprehends within the extent of its plan all arts and sciences, holds from time to time public meetings, where any person, whether academist or not, may read his works, on any subject, and in any language: the academy receiving all with the greatest impartiality.

Academy dell' Iniustì, at Bologna, incorporated afterwards into that Della Traccia in the same city, followed the example of the above: its meetings were at the house of the abbot Antonio Sampieri. Here Geminiano Montanari, one of the chief members, made excellent discourses on physical and mathematical subjects, part whereof was published in 1697, under the title of Pensieri Fisico-Matematici. This academy afterwards met in an apartment of Endechio Manfredi; and afterwards in that of Jacob Sandrini. Among the works were held in the palace Marulli. Some writers have represented Manfredi as the founder of this academy in 1590. Its motto was, *Mens agitat.* In 1705, J. B. Morgagni new-modelled the academy, and received Manfredi into his house. Several learned men became members of it, and it was united with the *Institutus,* founded by Manfredi, in the year 1712, under the title of the *Academy of the Institutus.* The arts of painting, statuary, and architecture, introduced by Manfredi, were at first considered as distinct and separate from the plan of the Academy of Institutus; but they were afterwards incorporated with it; and the university finally acquired the name of *Academia Clementina,* from its patron Clement XI. A printing-office was added to the academy by the munificence of Benedict XIV. In this Institutus, not only the learned of each field were admitted as members, but several ladies have been promoted to professorships. Among these may mention the celebrated Anna Mauaudini, professor of anatomy, and Laura Buffi, who died in 1778, renowned for her knowledge in the abstruse sciences. Of this lady we have a particular account in the 6th volume of the *Comment. Bonon.* The philosophical apparatus is large. This academy, in an early period of its existence, published the *Aetas Bononfiana.*

Academy of Roffano, in the kingdom of Naples, called *La Società Scientifica Rossanese dell' Incorvati,* was founded about the year 1540, under the name of *Naviganti,* and received under that of *Spenerfati* by Camillo Tucano, about the year 1600. It was transformed from an academy of belles lettres into an academy of sciences, at the solicitation of the learned abbot Don Giaunto Gimma; who being made president under the title of *promoter-general* thereof, in 1635, gave a new fet of rules. He divided the academists into several classes, viz. grammarians, rhetoricians, poets, historians, philosophers, physicians, mathematicians, lawyers, and divines, with a class apart for cardinals and personages of quality. To be admitted a member, a man must have degrees in some faculty. The members are not allowed to take the title of *academist,* in the beginning of their books, without a written permission from the president, which is not granted till the work has been examined by the censors of the academy. This permission is the greatest honour the academy can confer; since hereby they, as it were, adopt the work; and are answerable for it against all critiques which may be made of it. The president or promoter himself is subject to this law. Add, that no academist is allowed to publish any thing against the writings of another, without leave from the society.

There have been several other academies of sciences in Italy, which have not published long, for want of being supported by the princes. Such were at Naples that of the *Investiganti,* founded about the year 1679, by the Marquis d'Areana, Don Andrea Cocucletto; and that which met in 1698, in the palace of the duke of Molina, Don Lewis della Creda, viceroys of Naples. At Rome, that of *Fisico-Matematici,* which met in 1686, in the house of Sig. Cannini: at Verona, that of *Aleogli,* founded the same year by Sig. Joseph Gazoh, which met in the house of the Count Rechigni della Cucca: at Brescia, that of *Fisichesi,* founded the same year for the cultivation of physics and mathematics, and ended the year following: that of F. Francesco Lana, a Jesuit of great skill in those sciences; lately, that of *Fisico-Critici,* at Siena, founded in 1691, by Sig. Peter Maro Gabrielli. Some other academies still subsisting in Italy, have repaired with advantage the loss of the former. One of the principal is the academy of *Filamonti,* at Verona, liberally supported by the Marquis Scipio Maffei, one of the most learned men in Italy, in honour of whom the members of the academy erected a marble statue over the entrance of the palace, with an appropriate inscription: and in 1544, the *Incantati* of Ancora were incorporated with this academy. Though the members of this body apply themselves to the belles lettres, they do not neglect the sciences. The academy of *Rivettati,* at Padua, has long subsisted with reputation; in it, learned discourses have been held from time to time on physical subjects; such, for instance, is that which the celebrated Sig. Antonio Vallinieri, first professor of physics in the university of that city, delivered here on the origin of springs, since printed. The like may be said of the academy of the *Muti de Reggi,* at Modena; to which the fame Sig. Vallinieri, a native of that city, presented an excellent discourse on the scale of created beings, since inserted in his History of the Generation of Man and Animals; printed at Venice in 1721. In the number of these academies may also be ranked the academy of learned men, which met at Venice in the house of Sig. Chiappino Martinelli, a noble Venetian, and great patron of learning. Among the new academies, the first place after the institute of Bologna, is given to that of the countess Donna Clelia Grillo Borromeo. one of the most learned ladies of the age, to whom Sig. Gimma dedicates his Literary History of Italy. She had lately established an academy of experimental philosophy in her palace at Milan; of which Sig. Vallinieri was nominated president, and had already drawn up the regulations of it, though we do not find it took place. There are likewise many other academies of less note in Italy; Jarchius enumerates 550, of which the names are very curious. F. Merfenne is laid to have given the first idea of a philosophical academy in France, towards the beginning of the seventeenth century, by the conferences of naturalists and mathematicians, occasionally held at his lodgings; at which Guffendi, Des Cartes, Hobbes, Roberval, Pascal, Blondel, and others asisted. F. Merfenne proposed to each certain problems to examine, or certain experiments to be made. These private assemblies were succeeded by more public ones, formed by M. Montmort and M. Tlevenot, the celebrated traveller. The French example animated every Englishman of distinction and learning, to erect a kind of philosophical academy at Oxford, towards the close of Cromwell's administration: which, after the reformation, was erected by authority into a Royal Society. The English example in its turn animated the French. Lewis XIV. in 1666, assisted by the counsels of M. Colbert, founded an academy of sciences at Paris, called the *Academy, Royal, of Sciences,* for the improvement of physics, mathematics, and chemistry. In the year 1699, it had as it were a second birth; the same prince, by a regulation, dated the 16th of January, giving it a new form, and
and putting it on a new and more solemn footing. In virtue of that regulation, the academy was to be composed of four kinds of members, viz. *honorary, penitent, associates, and eleves.*—The first class to consist of ten persons; and the rest of twenty each.—The honorary academists to be all inhabitants of France; the penitentists all to reside at Paris eight of the associates allowed to consist of foreigners, and the eleves all to live at Paris. The officers, to be a president, named every year by the king, out of the class of honorary academists; and a secretary and treasurer, to be perpetual.

Of the penitentists, or those who receive salaries, three to be geometerians, three astronomers, three mechanics, three anatomists, three chemists, three botanists; the remaining two, secretary and treasurer.—Of the twenty associates, two to apply themselves to geometry, two to botany, and two to chemistry.—The eleves to apply themselves to the same kind of science with the penitentists they are attached to; and not to speak, except when called upon by the president.—No regular or religious to be admitted, except into the class of honorary academists; nor any person to be admitted, either for associate or penitentist, unless known by some considerable printed work, some machine, or other discovery.—Farther, no person to be allowed to make use of his quality of academist, in the title of any of his books, unless such book have been read to, and approved by the academy.

The establishment of this academy, as well as of that of the Belles Lettres, was confirmed by royal patent in 1713.

In the year 1716, the duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honorary, and of associates capable of being foreigners, to twelve; admitting regulars among such associates; supplying the class of eleves, and establishing it on the model of a new class of twelve adjuncts, to the fix several kinds of sciences cultivated by the academy; and, lastly, appointing a vice-president, to be chosen yearly by the king, out of the honorary members; and a director, and sub-director, out of the penitentists.

In the year 1783, the king further confirmed by letters patent, the establishment of this academy; added classes of agriculture, natural history, mineralogy, and physics; and incorporated the associates and adjuncts, limiting to fix the members of each class, viz. three penitents, and three associates. The academy, by this regulation, was made to consist of eight classes, viz. geometry, astronony, mechanics, general physics, anatomy, chemistry and metallurgy, botany and agriculture, and natural history and mineralogy. Each class was to remain irrevocably fixed at six members, viz. three penitents, and three associates, besides a perpetual secretary and treasurer; twelve free associates, and eight associate foreigners; and the adjunct geographer was henceforth to be called the associate-geographer. These several classes were filled with persons whose names have been respectable in the commonwealth of letters. Their meetings, which were formerly held in the king’s library, have since 1699 been held in a fine hall in the Old Louvre.

This academy has done great things for the service of learning, by the continuation of the *meridian,* by sending penitents to different parts of the world for making observations; but especially by the excellent writings they have published, either in a separate, or in a joint capacity; particularly their memoirs. These have been regularly published every year, some late years excepted, ever since the re-establishment of the academy in 1699. To each volume is prefixed the history of the academy, or an extract of the memoirs; and, in general, of whatever has been read or said at the academy. At the close of the volume are eulogiums on such academists as have died in the course of the year. A general index to the volumes has been published every ten years. In the volume for 1783, &c. the extracts from the regillers are omitted, but the eulogies of distinguished men lately deceased are continued. M. l’Abbé Rozier has published, in four quarto volumes, an excellent index of the contents of all the volumes, and the writings of all the members, from the commencement of their publications to the year 1770. M. Rosville de Mellay founded two prizes, one of 5000, and the other of 2000 livres, which are alternately distributed every year; the subjects for the first must relate to physical astronomy, and those for the latter, to navigation and commerce. Indeed they have an advantage over most academies, in being defrayed their expenses, and even paid for time and attendance. Their history to the year 1697 was written by M. du Hamel; and since that time continued from year to year by M. de Fontenelle, under the following titles: *Da Hierm Historia Regia Academia Scientiarum,* Paris, 4to. *Histoire de l’Académie Royale des Sciences, avec les Memoires de Mathe-matique et de Physique tirés des Registres de l’Académie,* Paris, 4to. *Histoire de l’Académie des Sciences et des Arts,* Paris, 4to. *Histoire de l’Académie des Sciences,* Paris, 4to.

A new history, from the institution of the academy to the period from whence M. de Fontenelle commences, has been formed; with a series of the works published under the name of this academy, during the first interval.—Their motto is *invict & perfic.* This academy was suppressed; and, in 1793, abolished by the Convention of France; the last volume of its memoirs being that for 1793; and other institutions of various kinds have been established; see Institution.

The memoirs of the academy, abolished by the edict of the Convention, because it was a royal institution, and royalty was overthrown, are comprehended in 139 volumes in quarto: 11 from the foundation of the academy in 1666 to its renewal in 1669; 52 from 1669 to 1750; the year 1772 containing two: 11 of memoirs prefixed to the academy; 9 of prizes; 9 of tables to 1780; and 7 of drawings of machines.

The French have also considerable academies in most of their great cities; as, the academy at Caen, established by letters patent in 1705; the royal society of sciences in 1706, at Montpellier, which, since 1708, formed one body with the royal academy of sciences at Paris; *academie des jeules floruss* at Toulouse, besides the academy of sciences and belles lettres, founded in 1750; and other academies at Bordeaux, founded in 1703; at Soissons in 1754, at Marseille in 1726, at Lyons in 1706, at Tarascon in 1721, at Montauban in 1744, at Angers in 1785, at Amiens in 1750, at Villefranche in 1758, at Dijon in 1740, at Lyons in 1708; at Chalon-sur-Saône in 1755, at Rochelle in 1753, at Beziers in 1725, at Rouen in 1744, at Metz in 1750, at Arras in 1773, &c. &c.

**Academy, Royal, of Sciences, at Berlin,** was founded by Frederic, L. of Prussia in 1700, on the model of that of England, excepting that, besides natural knowledge, it likewise comprehends the belles lettres. A new form, and a new set of statutes were given it in 1710; by which it is ordained, that the president shall be one of the counsellors of state, and nominated by the king. The members were divided into four classes: the first, for professing physics, medicine, and chemistry; the second for mathematicks, astronomy, and mechanics; the third, for the German language, and the history of the country; the fourth, for Oriental learning, particularly as it may concern the propagation of the Gospel among infidels. Each class to elect a director for themselves, who
who shall hold his post for life. Their meeting to be in the
castle called New Marshal; one class to meet every week in
their turns. The members of any of the classes to have free
admission into the assemblies of any of the rest. The great
promoter of this institution was the celebrated M. Leibnitz,
who accordingly was made the first director. The academy
has published several volumes of its transactions in Latin,
under the title of Miscellanea Berolinensia. The first volume
was published in 1719; and, though undistinguished by any
peculiar tokens of royal favour, they continued to publish
new volumes in 1723, 1727, 1734, 1737, and 1740. At
last, however, viz. in 1743, Frederic III. gave new vigour
to this academy, by inviting foreigners of literary merit to
Berlin, encouraging the culture of science among his subjects,
by suitable rewards, and conferring the honour of president
of the academy on M. Maupertuis. He also proposed new
regulations for the academy, and assumed the title of its
protector. The members held two public assemblies annu-
ally; at the latter of which, viz. in May, is given a gold
medal, of fifty ducats value, as a prize for a dissertation, the
subject of which shall be successively natural philosophy,
mathematics, metaphysics, and general literature. Since
1743, this academy has published several volumes of its trans-
actions in French, under the title of Histoire de l'Académie
Royale des Sciences et Belles Lettres, a Berlin.

Some new arrangements relating to this academy were
proposed by his Britannic Majesty, in the year 1774. The
economical commission of the academy, which had subsisted
to this time, was abolished, and its place supplied by a direct-
ory, which should be formed of a president, the four direc-
tors of the classes, and two members, to be chosen not from
the academy, but men of business, equally distinguished by
their literary merit, and capable of preserving the necessary
order in the economical state of the academy. The mem-
bers of the academy were to be either honorary or ordinary.
The latter members were divided as before, into four clas-
s; and each class composed of a director and six mem-
bers, forming an aggregate of 24 academicians, besides the
members of the directory. It was proposed that this num-
ber should continue invariable, and that no new members
should be admitted except in the case of vacancies. The
right of electing members is preferred to the academy; with-
what the king reserves to himself the right of confirming
or rejecting. The large public library at Berlin, as well as
the collection of natural curiosities, are united to the aca-
demy, and intrusted to its direction. The grand design of
the new regulators is to direct the attention of the aca-
demy to objects of real utility; to humanize it, as the king
expresses himself in his letter to the academy, by giving en-
couragement to efforts that contribute to the happiness of
common life, to the improvement of every thing that con-
sists its wants, and to its conveniences, by the constant ap-
lication of the theory of the sciences to things rather than
to speculative meditations; to excite the national industry,
by furnishing it with the principles suited to that art, which
it exercises; to purify the different systems of moral and li-
terary education, from many vague and erroneous principles,
which fashion, and the imagination of some enthusiastic pe-
dagogues, have introduced, and which must degrade future
generations; and to combat the prejudices and delusions of
the people, as well as the licentious and destructive effors
of the false philosophers of the present day.

There are other academical institutions at Berlin, and
other parts of the north; several of which have distinguished
themselves by their journals, epheemerides, &c. The reader
will find some account of them under the article Journal.

Academy, Imperial, of Sciences, at Petersburg, was pro-
jected by the czar Peter the Great, who, during his travels in
1717, having observed the utility of institutions of this kind,
determined to establish a similar one in his own country. Wolf
and Leibnitz were consulted as to the regulations
which were proper to be adopted. The death of Peter,
however, prevented the execution of the plan which he had
drawn up and signed in 1744. At the close of 1725, his
design was happily executed by the munificence of the em-
rine, Catharine I., his wife and successor, on the model nearly
of the academy of Paris, whereof the czar was a member.
The academy held its first public meeting on the 27th of
December, 1725, in the presence of the duke of Holstein,
and a large appearance of persons of distinction. The
empress settled a fund of 45821 fr. per annum for its support;
and 15 members, eminent for their talents and learning,
were admitted and pensioned under the title of Professors,
in the various branches of literature and science; among
whom were Nicholas and Daniel Bernouilli, the two De
Lunes, Billinger, and Wolf. In 1741, a gymnium was
subjoined to the academy, and with them was connected an
university, the professors of which were to give lectures in
the several branches of science. The academy languished
under Peter II., and was again revived by the empress Anne,
who gave it its statutes. After the accession of Elizabeth,
the original plan was enlarged, and an academy of arts
was associated with it in 1738, but separated from it by Cath-
arine II., in 1764. Afterwards the academy acquired reputa-
tion and vigour by the influx of several learned foreigners.
The annual income, arising from the printing-office, the sale
of books and maps, almanacks and gazettes, amounted to be-
tween 50 and 80,000 rubles.

The late empress took this society under her own imme-
diate protection; corrected many of its abuses, and infused
a new spirit into the researches of its members. In order
to encourage ingenious professors to visit the various prov-
inces of her dominions, she granted an extraordinary benef-
action of 20,000 fr., which she occasionally renewed. These
travelers were instructed by the academy, to prosecute
their inquiries into the different arts of soil and water, the
best methods of cultivating barren and desert spots, the lo-
cal disorders incident to men and animals, and the best
means of relieving them, the breeding of cattle, and especi-
ally of sheep, the rearing of bees and silk-worms, the pro-
per places for fishing and hunting, the various minerals
and plants, and the arts and trades. They were also enjoined
to rectify the latitude and longitude of the chief towns, to
execute astronomical, geographical, and meteorological ob-
servations, to trace the course of rivers, to take the most exact
charts, and to observe the manners and customs of the dif-
ferent people, their dress, language, antiquities, traditions,
history, and religion; and, in a word, to obtain every infor-
mation which might tend to illustrate the real state of
the whole Russian empire. These expeditions have produced,
in the course of a few years, a great variety of excellent
publications on the several objects above enumerated.

The first transactions of this society were published in
1728, and intitled Commentaríi Academici Scientiarum
Imperialis Petropolitanae ad Ann. 1726. The publication
was continued till the year 1747, when its transactions
were called Novi Commentarii Academici, &c. In 1777,
the title was again changed into Nova Acta Academici
Scientiarum Imperialis Petropolitanae. Of the commen-
taries 14 volumes were published. The first of the new
commentaries appeared in 1750, and the 26th in 1776.
About 30 volumes have been published, and two are
printed in the Latin language, every year, all of which
abound with important and useful disquisitions upon
various parts of science, and natural history. This aca-
demy, from the mal-administration of some of its direc-
tors,
tors, was, for several years, torn by internal diffusions, which retarded the labours of the academicians, and put a stop to the usual publication of its collections. By an edict of the emperors, the government of the academy was new-modelled; and the academy resolved to begin a new series of publications. From this era the history commences, which is prefixed to Vol. I. of the Nova Acta, &c. published in 1787. The academy is composed of 15 professors, besides a president and director. Each professor has a house and an annual stipend, from 2000l. to 600l. There are also four adjuncts, who are permitted, attend the meetings of the faculty, and succeed to the first vacancies. The ordinary af-

filiates are held twice a week, and public or solemn ones thrice in the year; wherein an account is given of what has been done in the private ones. The building, apparatus, &c. of this academy, are extraordinary. They have a fine library, containing of 36,000 books and manuscripts; an extensive museum; an observatory, &c. Their motto is paul

laim, and their device, a tree bearing fruit not ripe.

Academy of Sciences, called the Institute of Bologna, was founded by count Murigli, in 1712, for the cultivating of physics, mathematics, anatomy, medicine, chemistry, and natural history. Its history was written by M. de Limiters, from memoirs furnished by the founder himself, and published at Amsterdam in 1723. The academy founded not long before by pope Clement XI. for architecture and painting, was incorporated with this; and for its further encouragement the city purchased and appropriated to its use the palazzo Celsi, that the library, museum, observatory, schools, and the apartments of the professors, might be under the same roof. On the entrance of this edifice is the following inscription: Domus Insecurum et Artium Ins-

titutum, ad publicum totius orbis usum.

Academy, Imperial and Royal, of Sciences and Belles Lettres, at Brussels, was founded in 1773; and several volumes of their memoirs have been published.

Academy, Royal, of Sciences, at Stockholm, derived its origin from six persons of distinguished learning, one of whom was the celebrated Linnaeus; who, in 1730, formed a private society for reading dissertations on literary subjects. As their number increased, it attracted public notice; and the society was incorporated by the king, in 1741, under the title of the Royal Swedish Academy. Though it has no pension from the crown, its fund has gradually augmented to a large sum by legacies, and private donations. The only persons who receive salaries, are a professor of experimental philosophy and two secretaries. Each member resident at Stockholm becomes president by rotation, and continues in office three months. The members, both native and foreign, are admitted without fees. The dissertations read at each meeting are written in the Swedish language, and are collected and published four times in the year; and the annual publications make a volume in 8vo. The first 40 volumes, which were finished in 1779, are called the Old Transactions; for in the next year, the title was changed into that of New Transactions. Any person who lends a treatise, which is thought worthy of publication, receives the transactions for one quarter gratis, and a silver medal of the value of three shillings. All papers relating to agriculture are published separately, under the title of Oeconomica Acta. Annual premiums in money and gold medals are distributed by the academy, principally for the encouragement of agriculture and inland trade. The meetings of this academy are sometimes attended by the king.

Academy, Royal, of Sciences, at Copenhagen, took its rise from the occasional meetings of six literati, whom Christian VI. in 1742, employed in arranging his cabinet of medals. With these persons others gradually associated; and they formed a society, under the patronage of the count of Holstein, whose immediate object was to make researches into the antiques and history of their country, and to explain them. In 1743, his Danish majesty took the society under his protection, gave it its name, endowed it with a fund, and directed the members to extend their pursuits to natural history, physics, and mathematics. The academy has published 15 volumes in the Danish language; some of which have been translated into Latin.

Academy, Royal, of Sciences, at Lisbon, was founded in the year 1772, by the Duke de Louloun, uncle to the queen. The foreigner is the immediate patron, and the founder is president. Twenty-four effective members, divided into three classes, viz. natural sciences, mathematics, and national literature, form the main body of the society; and the residue is composed of 36 free-members; a small number of literary foreigners, and a larger one of great personages of the nation, as honorary members; some veteran members; and a considerable proportion of extra correspondents. Government allows them a revenue, by means of which they have established an observatory, a museum, a library, and a printing-office. The academy has hitherto directed its attention to the encouragement of many objects, which do not, in other countries require the care of an academy of sciences. The first volume of its memoirs was published at Lisbon in 1797. The memoirs commence at 1780. The Academy, of Arts and Sciences, American, was established in 1780, by the council and house of representatives of the city of Philadelphia, for promoting and encouraging the knowledge of the antiques of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for promoting and encouraging medical discoveries, mathematical disquisitions, philosophical inquiries, and experiments, astronomical, meteorological, and geographical observations, and improvements in agriculture, manufactures, and commerce; and in short for cultivating every art and science, which might tend to advance the interest, honour, dignity, and happiness of a free, independent, and virtuous people. The members of this academy are never to be more than 200, nor less than 40.

Academy, Royal Irish, sprang out of a society, established at Dublin, about the year 1782, and consisting of an indefinite number of gentlemen, most of whom belonged to the university, who held weekly meetings, and alternately read essays on various subjects. The members of this society, anxious to make their labours subservient to the honour and advantage of their country, formed a more extensive plan, and admitting only such names as might add dignity to their new institution, became the founders of the Royal Irish Academy, which professes to unite the advancement of science with the history of mankind and polite literature. The first volume of their transactions for 1787 was published in 1788, and the publication has been occasionally continued. We shall here add, that a society was formed in Dublin, similar to the Royal Society in London, as early as the year 1693; but the distracted state of the country was unpropitious to the cultivation of philosophy and literature. The plan was resumed about the beginning of the present century, and the earl of Pembroke, then Lord Lieutenant, was president of a philosophical Society established in Dublin College. In the year 1740, there was instituted a Physico-historical Society; of which two volumes of minutes are extant; but this society soon declined.

Academy, of Sciences, at Manheim, was established in 1763 by Charles Theodore, elector Palatine, according to a plan of the learned Schulz, and divided into two classes, viz. the Historical and Physical. The latter class was sub-

divided,
ACADemies were also used among us as a kind of collegiate school or seminary; where youth are instructed in the liberal arts and sciences in a private way; now indeed it is used for all kinds of schools.

There were two public academies in the Roman empire: one at Rome, founded by Adrian, in which all the sciences were taught; and the other at Berytus in Phoenicia, which was principally designed for the education of youth in the science of law. In consequence of the protection that was given to the sciences in the 15th century, academies were erected in various parts of Europe, peculiar privileges of several kinds were granted to the youth that frequented them; and the learned societies acquired, at length, the form of political bodies: i.e. they were invested with a certain jurisdiction, and were governed by their own laws and statutes.

In the public schools or academies that were founded at Padua, Modena, Naples, Cepau, Thoulouche, Salamanca, Lyons, and Cologne, the application of the youth was restricted to certain branches of learning, and thus the course of academical education remained imperfect. The academy of Paris, which surpassed all the rest, both with respect to the number and abilities of its professors, and the multitude of students by whom it was frequented, was the first learned society which extended the sphere of education, comprehended all the sciences, and appointed masters for every branch of education. Hence it was distinguished, before any other academy, with the title of University, to denote its embracing the whole circle of science; and in process of time, other schools of learning were ambitions of forming themselves upon the same model, and of being honoured with the same title. In the 16th century, academies were founded by the Lutherans at Jena, Helmstadt, and Altorf; by the Calvinists at Franeker, Leyden, Geneva, under Calvin and Beza, and many other places.

Frederic I. king of Prussia, established an academy in Berlin in 1703, for the education of the young nobility of the court, suitable to their extraction. The expense of the students was very moderate, the king having undertaken to pay the extraordinary. This illustrious school, which was then called the Academy of Prussia, has now lost much of its first splendor.

The Roman had a kind of military academies established in all the cities of Italy, under the name of Catnli Maritii. Here the youth were admitted to be trained for war at the public expense. The Greeks, beside academies of this kind, had military professors called Tactici, who taught all the higher offices of war, &c. &c.

We have two royal academies of this kind: one at Portsmouth, for teaching navigation, drawing, &c, which may be styled a naval or maritime academy, founded by George I. in 1722, and under the direction of the board of admiralty, which gives salaries to two masters; and another at Woolwich, where youth are taught fortification, gunnery, and such branches of the mathematics as are necessary to qualify them for engineers. This was established by George II. in 1741, and is under the direction of the master-general and board of ordnance. None are now educated in this academy, but the gentlemen-cadets, to the number of 90 or 100. The masters are now 12; viz, a professor of mathematics, and two other mathematical masters, a professor of fortification and an assistant, two drawing masters, a French master, with masters for fencing, dancing, and chemistry. This institution is important, and admits of improvement. It has now the benefit of the valuable services of Dr. Hutton and Mr. Bonnycastle, whose names are well known among men of science. The royal academy of marine at Breda, in France, was established in 1752.

The nonconformist ministers, &c. are bred up in private academies, as not approving the common university education. The principal of their academies are those in London, York, Exeter, Wymondely in Herts, Rochester, Carmarthen, and Wrexham.

Academies is likewise a name given to a riding school, where young gentlemen are taught the great horse, and other suitable exercises, as fencing, &c. See Manège.

Academies is also used in speaking of the schools of the Jews; i.e. those seminaries where the rabbis, or doctors, instruct the youth of their nation in the Hebrew tongue; explain to them the Talmud; teach them the Cabalistic, &c.

Soon after the destruction of Jerusalem, and the dispersion of the Jews, they are said to have existed academies at Japhne, Lydda, Babylon, and Tiberias; which last place is particularly famous for its learned men, such as the compilers of the Mishna, and the Maimonides. According to Buxtorf, this academy subsisted in Jerome's time. See Steuphanus de Urb. vol. ii. p. 379.

Of the Babylonian schools, the most famous in later times were those which were established in the cities of Sora, Nahardea, and Pumbeditha. Saadias, a celebrated grammarian, was rector of the academy at Sora in 1377. But these academies were demolished by the Maimonides, kings of Persia, about the year 1040. See Maleki's Gram. Heb. vol. ii. p. 14.

Academy, or Academy Figure, in Painting, is a drawing, or design made after a model of a naked man or woman, taken after the life; which is usually done on paper, with red or black chalk, and sometimes with pastels or crayons.

Acaell or Acadia, in Geography, a name formerly given to Nova Scotia, or New Scotland in America. The name was first applied to a tract of country between the 40th and 46th degrees of latitude, granted to De Mon in 1603, by Henry IV. of France.

Acaena, or Acaena, in Antiquity, a Grecian decemved, or ten-foot-red, used in measuring of their lands. See SYNTAG. De Ponderibus, p. 140. Riccius. Geo. i. ii. c. 4. Salme, Ex. in Solm. p. 634.

Acaena, in Botany, a genus of the tetrandria, monogynia class, and order of palms; the generic characters of which are these: the calyx is a four-leaved perianthium, with ovate, concave, equal, permanent leaflets; there is no corolla, unless the calyx be considered as such: the flamina of equal filaments, of middle length, opposite to the calyx, and the anthers are quadrangular, twin, and erect; the piliillum has an obvate, hispid germ, a very small infected style, and the stigma is a small thickish, colored membrane, divided into many segments; the pericarpium is a dry, obturate, single-celled berry, with spines that are bent backwards; and the seed is tingle. There is only one species, which is a Mexican plant. Miller's Dict. by Martyr.

Acajuna, in Geography, a mountain on the coast of Peru, in the South Sea, about four leagues S. E. from the river Hilo, and as far N. W. from the river Sama. It is a good sea-mark; but a strong surge lies on the coast, so that ships should not keep too near, till they are sure of an entrance into some port.

Acajou, and Acajoua, in Botany. See Anacardium.
ACALANDRA. See Calandra.

ACALANDRUS, in Ancient Geography, a river falling into the bay of Tarentum, not far from the Metapontum. This river is mentioned by Piny (Hist. Nat. l. iii. c. 10., tom. i. p. 165.), and by Strabo (Geog. tom. i. p. 439.). It is now Fiume de Rotolo.

ACALEPIE, a nectar. It also signifies a certain fish, the flints of which is very tender. Likewise a sea-fowl mentioned by Naturalis, and a sea-anemone, mentioned by Cellius. 

ACALOT, an abridgment of Acalottta.

ACALYPHA, in Botany, a genus of plants belonging to the monoxica monodia class, and the natural order of Triceras, called by Doerhame, and others. Rincuncyporos or Tili-fruit. It derives its name Acalyp, from its not being pleasant to handle, i.e. soxop 76 μονή κελκυ κεδρος. Its characters are these: the male flowers are crowded about the female ones: the calyx is a three or four leaved perianthium, with roundish, concave, equal leaflets: it has no corolla; the flamina have from eight to sixteen filaments, which are short, crowded, and connected at the base, with roundish anthera. The female flowers are fewer, and received into a larger divided involucrem. The calyx is a three-leaved perianthium, with fimbrous, concave, converging, small permanent leaflets; there is no corolla; the pericarpium has a roundish genus, three, flayed, branching, usually tripartite, and long, and the figments are spinae; the pericarpium has a roundish, three-furred, three-celled capsule, the valves opening in two ways, and the seeds are solitary, roundish, and very large. There are fourteen species.

The first sort, or A. Virginica, grows naturally in Virginia, several parts of North America, and also in Ceylon: the second, or A. virginiana, is a native of the warmest countries, and grows plentifully in Jamaica, and its leaves resemble those of the annual nettle, and sting as much: the third, or Indian Acalypha, was discovered in great plenty by Dr. Houblon at La Vera Cruz, and is also found upon dunghills in the East Indies, and its leaves are like those of Mercury, whence these plants have sometimes been called three-seeded Mercury: the fourth, or Vilicus Acalyp, is found in the woods about Carthagena; the fifth is a native of South America, whence it has its name: the root is a native of the West Indies. These plants have beauty to recommend them, and are preserved in some botanic gardens merely for the sake of variety. Martya's Miller. In the last edition of Linnaeus's Syn. Nat. by Gmelin, the Acalypha is made a genus of the monodaphia monodia class and order, and includes twenty-one species.

ACALIZEKE, a town and seat of Anse Turkey. N. lat. 42° 30'. E. long. 44° 15'.

ACAM. See Acam, and Acam.

ACAMACU, or Acamary, in Ornithology, the Pnlian name of the crested Moucherolle of Buffon; the crested Brazilian Flycatcher of Brilliant, and the crested Brilllian Todus, or variety of the Todus Paradisaeus of Gmelin, and of the Muscicap Paradi of Linnaeus. It is found in Africa and Madagascar.

ACAMANTIS, in Ancient Geography, the name of the island of Cyprus, taken from its western promontory, called Ácamas and Cacamo, now Cape Phialo, or Eupinari, where there was formerly a town of the same name, now a village, called Cruco. The wood in this part of the island (keys Mr. Bruce, Travels, vol. i. p. 4.) remains as thick and impervious as at the first discovery; and in these woods large flags, and wild boars of a monstrous size, shelter themselves in perfect security.

ACAMAS, in Ancient History, the son of Thefeus, who followed the other Grecian princes to the siege of Troy, and was deputed with Diomedes to restore Helen. Laodice, Priam's daughter, had a son by him, called Municus. He was one of the heroes who were concealed in the wooden horse. One of the tribes of Athens was called Acamantides from him, by the desire of the oracle; and he founded a city in Phrygia Major, called Acamantus. Homer (Haid. i. 827, and l. xiv. 475.) mentions two other heroes of this name: one a Thracian prince, who came to succour Priam; and another, a son of Antenor.

ACAMATOS, among Phrygians, means that disposition of a limb, which is equally distant from fixation and extention.

ACAMBOU, in Geography. See Aquambo.

ACAMEA, in Ancient Geography, a town of Assyria, in the province of Sittacens.

ACANCIOUS, see Acanthaceous.

ACANGA, in Botany. See Bromelia.

ACANGIS, i.e. Ravengers, or Adventurers, a name given by the Turks to theirbuffars, or light troops, who are generally sent out in detachments to procure intelligence, harass the enemy, or ravage the country.

ACANNY, or Acammi. See Acmem.

ACANOR, a particular sort of chemical furnace. See Acanon.

ACANOS, in Botany. See Onopordum.

ACANTHUS, formed from an, point, and wo, flower, in a general sense, a spine or prickly, chiefly of plants of the thorny kind.

Acantha, in a more particular sense, denotes a spine, or quill of certain fishes, as the echinus marinus, or sea-hedge-hog. Hence the thorn-back, a species of the raja, is by some called acanthus, from the two prickles on its back. Rondelet, de Pfliech, lib. xiii. c. 2.

Acantha, among some Anatomists, is applied to the hind or posterior protruberances of the vertebræ of the back; forming what we call the spinæ dors. 

ACANTHABOLUS, compounded of acanths, a thorn, and boleus, a tree, in Surgery, an instrument, wherein to extract foreign bodies, which by the sharpness of the points have penetrated, and entered any part of the body.

The acanthabulus is the same with the instrument which is otherwise called wolfa. Its chief use is for extracting fish-bones, or the like, sticking in the esophagus; as also, the fragments of weapons, bones, hair, &c. remaining in wounds. Its figure resembles that of a pair of pincers; sometimes it is also made crooked, for more commodious application to the fauces. Cellius, lib. vii. c. 30.

Acanthabolus is also sometimes used for an instrument, wherewith people pull out the hairs from their eye-brows.

ACANTHACEOUS, among Botanists, a term applied to a class of plants, that are armed with prickles; popularly known under the name of the thistle kind.

ACANTHALZUC, the same as echinopus, or globe thistle.

ACANTHARIS, in Entomology, a species of the Cimex, in the Linnean sytem, and of the Redevius, in the arrangement of Fabricius, the characters of which are, that it has a spinous thorax, and a dilated abdomen, with spines. It is found in Jamaica.

Acanthe, in the Materia Medica of the ancients, a name given to the plant we now call the artichok.

Acanthe Arbatica, in Botany, a name given by some of the Greek writers to a plant called allo leucanthe, and by the Arabian physicians banon. It was a prickly plant, whose roots were somewhat like those of the cyperus, and composed of several knobs or joints, and of a bitter taste. It was brought for medicinal use from the East Indies, and some
some parts of Arabia, and was the root of the omegas of Avicenna and others.

ACANTHIA, in Entomology, a genus of the class of Rynotota, in the distribution of Fabricius, and forming a division in the arrangement of the Cimexx by Gmelin, in his edition of Linnaeus. The acantha of Fabricius have no lip, and Gmelin comprehends under this division the apertis, the coleopra, and the membranarci.

ACANTHIAS, in Ichthyology, a name given by some authors to the fish, the skin of which is used by our artificers in polishing, and called by them simply filth-ikin. In the Linnaean system it is a species of squalus, and the picked dog-fish of the British zoology. A variety of this is mentioned by Gmelin, and described under the name of Squalus Ermantinus. Its dorsal fins are spine-like, and the body round and ocellated. It is found in all seas, and rarely in the Baltic. Its length is about three and a half feet. Acanthus is also a species of Gasterosteus, with four small spines before the dorsal fin, and three rays appertaining to the branchiopoegous membrane. It is found in the Danish seas. See Galeus Acanthias.

ACANTHINE, in Ancient Geography, an island mentioned by Ptolemy, in the Arabian gulf on the fide of Egypt. Acanthus, acanthinus, denotes a thing relating to, or resembling the herb acanthus.

In this sense, we read of acanthina sermenta, acanthine garments, of which we have two different explanations. Some underléad by it a kind of embroidery, wrought in imitation of the Egyptian acanthus or thorn, whose small spurs are much interlaced. Others will have it a peculiar kind of skilful stuff, made of the lango, or down of a plant of the thistle kind, growing in Sicily and the East. Plin. Hift. Nat. i. xxv. c. 12. Hard. Not. tom. ii. p. 343.

Acanthium lignum is used by some writers for Brazil wood.

Acanthion, among Naturalistes, a plant of the thorn, or rather of the thistle kind; whose down, being cleained from the prickles, was manufactured into a kind of fluff, not unlike flik. Plin. ubi supra. See Ongoporum.

Acanthis, in Ornithology. See Goldfinch.

Acanthocephalus, in Natural History, a name given to the Echinorhynchus carpentis, a species of worm which is found in the intestines of the carp.

Acanthopterygii, derived from acanthis, a thorn, or prickle, and ἀπτηρ, a fin, in Natural History, a term used by Arctedi to express one of the general chaffs or families of fishes; the character of which is, that the rays of the fins are bony, and some of them prickly at the extremities.

Acanthos, Acanthus, or Acaenthus, in Ancient Geography, a town of Egypt, near Memphis, now Biflita; or, according to Savary (s. i. p. 484), corresponding with the ancient Dachbour, which the Mastors of the Nile are conducted by a canal, and which is near the summit of the temple of Ciris, and to the west of it a great pyramidal. (Strabo, tom. ii. 1163.) Also a maritime town of Macedonia, a colony of Andrians; now Erifi: near which was shewn Xeres's ditch of seven stadia, in order to separate Mount Athos from the continent, and convey his ships, without doubting Athos, into the Scythisic bay. Herodotus, i. vii. c. 121, &c. Pliny, Nat. Hift. tom. i. p. 202.

Acanthus is also a town of Epirus.

Acanthrus, in Natural History, a name given to the Echinorhynchus candidus, which is found in the intestines of many different species of fish.

Acanthus, Bear's Breech or Branc-Urson, is Bentany, a genus of the didynamia angiofora class, and belonging to the natural order of Perisone; of which the generic characters are these: the calyx is a perianthus, with leaflets in three alternate pairs, unequal and permanent; the corolla is single-petalled and unequal, having a short tube closed with a beard, no upper-lip, very large under-lip, which is flat, straight, very broad, three lobed, obtuse, and of the length of the upper-lip of the calyx; the flamin have four filaments, subdivite, shorter than the corolla, the two upper rather longer, recurved, and incurved at the top; the anthers are oblong, comprized, obtuse, the lateral ones parallel, and villous before; the pistillum has a conical germ, filiform filke, of the length of the flaunts, and two acute, and flagmas; the pericarpium in a subulate pointed capillus, two-celled and two-valved, with a conical portion, alternate claws, curved, and fastened to the partition; the seed is ovate, and gibbous, and fragile; sometimes double. There are ten species: 1. The fiiow acanthus, with white flowers, proceeding from about the middle to the top of the stalk, is the species used in medicine under the name of Branca urson or Brankfurte. It is a native of Italy, about Naples, of Sicily, Provence, and the isles of the Archipelago, and is cultivated in our gardens, and flowers in June and July. Turner (the Herbal of Hort. Kew,) informs us, that it was cultivated in Sian gardens so long ago as the year 1551. The leaves, and particularly the roots, abound with a soft, inutilip mucilage, which may be readily extracted, either by boiling, or by infusion. Rectified spirit, digested on the leaves, extract from them a fine deep green tincture, which is more durable than that which is communicated to spirit by other herbs. Branc urson iseldom or ever used medicinally in this country. But where it is common, it is employed for the same purposes to which the Althea or Marsh-marigold is used, the roots and vegetables are applied among us. In foreign countries the cow-parsley is used in accompaniments, though it possesses very different properties. The last edition of Linnaeus by Gmelin contains twelve species.

The ancients have not only called the herb bear's breech by this name, but also a thorny tree growing in Egypt.

An accurate examination of the ancient writers will, however, show very plainly, that they meant two very different vegetables under this name. Virgil has two very different plants under the same name. The acanthus with which he adorns the handles of Alcenor's cups, in the 3d Eclogue, and places in the Corycian's garden, in the 4th George, and the Egyptian acanthus of Theophrastus, are two very different plants. Virgil mentions another acanthus as being an ever-green plant, and producing berries, or a small round fruit; baccas semper frondentis acanthi, are his words; and Theophrastus tells us, that his Egyptian acanthus is a prickly tree, and bears pods like thole of beans. The Greek sculptors adorned their works with the figure of the latter; the ancient Gothic did with that of the former, which they represented not only in their capitals, but also in other ornaments. It is plain, that the acanthus of Theophrastus is the acacin, a tree, from some specie of which we have the gum arabic now in use: and the acanthus of Virgil, mentioned in the places above cited, is a garden herb, described by Dioscorides, under the name of Acanthis, which is supposed to be the species of acanthus already noticed, though Linnaeus takes it to be the fourth specie. The other acanthus, mentioned by Virgil in the fourth Eclogue, and second George, is the acanthus of Theophrastus. See Professor J. Martyn's notes on Virgil.

The leaves of this species of acanthus accidentally growing round a basket covered with a tile, gave occasion to

Calil.
Callimachus to invent the Corinthian capital. See ABAECUS. For the appearance of the farina of boar's breech in the microscope, see Pluteus Microscopical. 2. The _Acacia Leucophyllum_ was found by Sparman at the Cape of Good Hope, and has many leaves, proceeding immediately from the root, reseeming those of the thistle. 3. The _Acacia Leucophyllum_ grows wild in Italy and Provence, and flowers from July to September. Its leaves are divided into segments, terminated with a sharp spine, which renders this plant troublesome to those who handle it. 4. The _Acacia Leucophyllum_ is propagated by young roots, cuttings, or seeds, and _Cope acanthus_ are natives of the Cape of Good Hope. 5._The Madura acanthus_ is a native of the East Indies.

The smooth and prickly acanthus are perennial plants, and may be propagated either by seeds, which should be sown in a light dry loam towards the end of March, and left to grow, about six inches from the root, till autumn, when they should be transplanted where they are to remain; or by seeds, which may be either transplanted in spring or autumn for the third year; but the others must only be removed in the spring, because they are transplanted in autumn, they may be in danger of being destroyed by cold winter. These plants take deep root, and when they are once established in a garden, they cannot be easily eradicated. The 5th and 10th species are too tender to thrive out of a flower in England, and cannot be propagated, except by seeds, which do not ripen in Europe. The other sorts must be treated in the same manner with Cape plants.

Acanthus, in Architecture, an ornament in the Corinthian and Composite orders; being the representation of the leaves of an acanthus-like plant, in the capitala thereof. See Tab. Archit.

_Acanthus_ Attica, in Ornithology, the name given by Geller to the _Pengilla_ genus of Linnaeus, or Sisken of others. See Spinus.

_Acanthus_, in Ancient Geography. See Chalcidica.

_Acanthus_, in Entomology, a species of Papilio, in the division of Pobeli, with entire brown wings, blue bands underneath, and yellow limb; found in Surinam.

_Acapala_, or _Acapula_, a town in the province of Chiapas, in New Spain. It is situated on the Tabasco river, five leagues north-west from Chiapas.

_Acapari_, or _Acaparapi_, a town of Asia, on the Euxine sea.

_Acapatl_, in Botany, a name used by some authors for the plant which produces the long pepper, used in medicine. De Lact. Ind. Occ. p. 231.

_Acapan_, from a and _acap_; a name of the species of Hymenius, in Attica, both by Pliny, l. xii. c. 16, and Strabo, tom. i. p. 613, from the mode of its preparation.

_Acapon_, from a and _acap_; a name of the _Sampsuchus_, or _Maringan_; also of dry wood.

_Acapulco_, in Geography, a considerable town and harbour in Mexico, situate on a bay of the South Sea, and distant from the city of Mexico about 210 miles, south-east. The haven is large and commodious, and capable of containing several hundred ships; and the entrance is feared by a small island, which runs across it, and forms at each end a deep channel of sufficient breadth for the largest vessels. The only inconvenience is, that ships must enter by the sea-breeze in the dry-time, and go out by the land-breeze in the night, which seldom fails to succeed each other alternately, so that they are frequently blown off to sea, after repeated attempts to make the harbour. Acapulco itself is a mean and ill-built town, and derives its importance and extent from the great trade carried on with the East Indies and Peru, and the number of warehouses and habitations for strangers which this commerce requires. The houses are slightly constructed on account of the frequent earthquakes to which this country is exposed; and good buildings are the least necessary, as the principal inhabitants retire from the sea-coast, when business does not demand their immediate attendance. Besides, the climate is exceedingly unhealthy, and very prejudicial to strangers. Upon the arrival of the gales, the town is populous and gay, being crowded with the richest merchants of Mexico, Peru, and even of Chili, who provide themselves with tents in the vicinity of the town, and form a kind of large encampment. For the trade of this town, see Manila Calleon. Opposite to the town, on the east side, is a strong caleid, said to be provided with forty pieces of cannon, and the platform at the end of the town is also mounted with guns; and ships ride near the bottom of the harbour; so that this place is not so easily accessible as some have imagined. The port is a haven surrounded with very high mountains. Two islands, off the port, parallel to the port, are to be left on the larboard, and within the harbour is a small island near the shore, on the larboard. Within a league of the coast of the town, is a very good harbour, called Port Marquis, where the ships from Peru generally run in contraband goods.

Acapulco, in _Ichthyology_, the name of a fish caught in the fresh waters in the Brazil, and esteemed a very delicate and well-tafted one. It seldom exceeds three or four inches in length, and has a high back like the _Pacara._ Its mouth is small, and its jaws rough like a file. It has one long back-fin, which is supported by a great number of rigid and prickly rays, and reaches to the tail. Its scales are large; its back is of a glossy brown; its sides and belly white; its tail is not forked. It has a large black spot on the middle of each side, and another near the tail. Its fins are all brown. _Marigra._

ACAARAYA, the name of a fish caught on the Brazilian shores, and by some called _Gerrana._ It grows to three feet in length, and is of the shape of our carp. Its lower jaw is furnished with an even range of sharp teeth, like little needles. Its upper jaw has two very long ones, and beside these, a multitude of other very short ones. Its eyes are large, and their iris red. Its tail is broad, and a little forked. Its scales are of a moderate size, and of a silver hue, with an admixture of purple. Its belly, and the under part of its head, are wholly white; and its fins of a fine pale red, except those under the belly, which are white, with a flight edge of red. It is eaten in Brasil, both fresh and salted. _Marigra._

ACARAI, in Geography, a town of Paraguay, in South America, built by the Jesuits in 1624. N. lat. 26°. W. long. 51° 5'.

_Acaramucu_ of _Marigra_ and Willughby, in _Ichthyology_, is the _Balistes Monoceros_ in the Linnean system by Gmelin. See _Monoceros._

ACARABA, the name of an American fish, called also by some _Brosci._ It has a somewhat broad and flat body, covered with large scales of a fine silver whitens. It grows to a foot in length, and to four or five fingers in breadth. It has a large mouth, but without teeth; and its tail is forked. It has one long black fin, the anterior rays, or naves, of which are rigid and prickly, the hind naves soft and
and flexible. The fins are all like the rest of the body, of a pure white. This fish seems to be a kind of *smaris*, Meregrave.

ACARAPINIMA, the name of a Brazilian fish, of the *canthus* kind, and seeming to be of the same species with the *contapara* of the Mediterranean. Ray.

ACARAPITAMBA, the name of a fish caught in the Brazilian seas, of an oblong figure, resembling the mullet, and growing to two feet or more in length. Its mouth and teeth are very small. It has one long fin on the back, running very nearly to the tail, which is supported by rigid and prickly rays. Its tail terminates in two oblique horns. Its scales are large, and of a purplish colour, with a fine admixture of blue; and along the middle of each side there runs, from the gills to the tail, a very broad and beautiful gold-coloured line. Its back, down to this line, is variegated also with small gold-coloured spots; and the sides under the line are very beautifully variegated with small and fine longitudinal, but short gold-coloured lines, of a somewhat paler colour than the broad one. Its belly is white, and the ventral fins are very large. Meregrave.

ACARAPUCUCU, the name of a Brazilian fish, caught in the fresh waters, and growing to sixteen inches in length. It is of a rounded body; and its mouth is small, and not prominent. It has lips, which it can hide, or_futter_ to appear, at pleasure, and has no teeth. Its tail is long and forked; its scales are all of a silvery hue. On the back it has a fine golden gloss, shining in the whiteness; and on the sides five or six large blue spots. Its back and side fins are of a pale blue, as is also the tail; the belly fins are yellowish. It is a well-tailed fish. Meregrave.

ACARANA, of Meregrave, Willughby, Ray, and Jonston, is the *cheto don viverron* of Linnaeus, with a sub-bifid tail, nine spines in the dorsal fin, and a lateral spine on each side of the bifid tail. Its eyes are large, with a silvery iris; the teeth in each mandible are from ten to fifteen, cylindrical, and narrow in the lower part, and above wider, very hard, sub-pellucid, and disposed in a series. The fore-teeth, being the longest; the tongue is short and thick. The operculum of the gills is long and narrow; the lateral line proceeds from it in a direction parallel to the back: most of the fins have ramose rays; the pectoral and caudal are crenaceous, the ventral black; the dorsal and anal white. They are in parts of a dusky hue, and they have bifurcated radii. This fish is found in the Indian, Brasil, and Red Seas, and grows to the length of two feet; it is covered with small scales, blackish above and whitish beneath, and brown on the sides. It feeds on young crabs and tethracous fish.

The small black *Acarnna* of Willughby is the *cheto don auratus* of Linnaeus, with an entire tail, eight spines in the dorsal fin, and four white arches, and is called by Meregrave and Ray, Guapetia. The *Acarnna altera major* of Willughby and Ray, is the *cheto don utilisis* of Linnaeus, with an entire tail, fourteen spines in the dorsal fin, spinose opercula, and ciliated scales. This fish is found in India; it is of a crenaceous colour, white beneath, the iris of the eyes is reddish; the mouth very small, the lips strong, the mandible equal; the operculum of the gills large, the operculum furnished with three spines, the lateral line near the back and parallel to it, the anus in the middle of the body, and the fins brown at their end, with ramose rays, and a black ring before the dorsal fin.

The *Acarnna multilata* is the *cheto don bicolor.* It is allied to the perch, of an oblong shape, thick body, part of which, and the tail, are white, and the other parts brown. It is found in South America and India. Linn. Syll. Nat. by Gmelin, tom. i. pt. 3. p. 1243-1245-1253-1258.

ACARI Port, in Geography, lies on the coast of Peru.

Vol. 1.

S. lat. 15° 50'. W. long. 74° 40'. To the N. W. is the headland of *Morro de Acre*. This port is sometimes called Port Lomo.

ACARNA, in Botany, a name by which Tacopraflan, and some other writers, express the common *arctia*. See Aractylus, Cardius, Carlina, and Cyanus.

ACARNAN, in *Isb.**, the name of a small sea-fish very common in the Mediterranean, and brought to market among the rubellus, or erythrinus, and called by the fishermen by the name *farinella*, or *phreglinio*. It very much resembles the erythrinus in shape; but as that is of a fine red, this, on the contrary, is of a silvery white. Its mouth is moderately large; its teeth slender and pointed; and its eyes large, having fine yellow irises. Its fins are white, but have each a black spot at their origin. It seems doubtful whether this be really any way different from the erythrinus, except in colour, which alone is not distinction sufficient to make a species. Rondellet.

ACARNA, Acarnia, in *Gent. Geogr.*, the first country of Free Greece, or Greece Proper, bounded by the Sinus Ambracius, and the river Acheus; the latter of which separates it from Aetolia, on the east; and the former from Epirus, on the west. Prot. Geo. Liri. c. x. Strabo l. x. Pliny l. iv. c. 1. Thucyd. l. ii. Paulan. l. viii. Acarnania was a free state, and governed by a praxtor, or general assembly, and other subordinate magistrates, of the same description and authority as those of the Achæans and Aetolians. The inhabitants of this country were called Acarnanes, as some say, from *acara*, or *e. c. people unfirm*, as the Curetes on the other side of the Acheus were so called from *xiphon*, i. e. *firma*, but Paulanians say, that they were thus denominated from Acarnanes, the son of Alexmen. Stephan. de Urb. vol. i. p. 49. Strabo Geo. tom. ii. p. 660—714. According to Lucian (Dial. Meret. apud Op. Tom. iii. p. 290.) they were noted for effeminacy and inconstancy, whence the proverb, *ρακαρανας ἀκρυρον*; *φορείς* *Acarnanians* is proverbial to denote any thing excellent in its kind, because this country was famous for its breed of horses. It is now called *La Carina* and *Il Dopoletto.*

The Acarnanians are represented by Polybius (l. iv. p. 290. ed. Calaib.) as faithful to their promise, and extremely jealous of their liberty. They derived their origin from different nations, but assimilated in a general confederacy, and were almost always at war with their neighbours the Aetolians. They were the only people of any note that did not appear amongst the Grecian forces in their expedition against Troy. They were, more than all the other Greeks, attached to the kings of Macedon, and principally to Philip, the father of Perseus, and valued themselves upon an inviolable fidelity in the observance of treaties. The Romans made many attempts to withdraw them from their allegiance, and to deprive Philip of his only support. After more gentle efforts had failed, Lucius Flaminius resolved to reduce them by force, and laid siege to *Leucas*, their capital. It was at length betrayed by some Italian exiles, who, being acquainted with the place, had introduced many Romans into the city. The Acarnanians were surrounded, and those who refused to submit were put to the sword. The reduction of the capital struck such terror into the whole nation, that they deserted Philip, and submitted to the Romans, under whose protection they lived according to their own laws till the destruction of Corinth, when Acarnania became part of the province of Achaia. Liv. l. xxxii. c. 4.

ACARNANIA was also the name of a town in Sicily, famous for a temple of Jupiter. See Acheronte.

ACARON, in Geography. See Acellane.

ACARON, in Botany, the wild Myrtle.

P. Acraron.
ACARON, in Geography. See Accaron.
ACARON Bay. See Birkley's Sound.
ACARUS, the Tick or Mite, in Natural History, so called, probably from a priv. and to be cut, because it is deemed so small that it cannot be cut, is a genus of insects belonging to the order of acarina, in the Linnean system, and the eighth class called annulata in the distribuition of Fabricius. The distinguishing characters of this genus are, that the mouth has no proboscis, that the haustellum orucker is included in a bivalve, cylindric sheath; that the feelers are two in number, equal, and of the length of the haustellum; that the eyes are two, placed at the side of the head, and that it has eight legs. Fabricius reckons forty, *and Gmelin, in the last edition of Linnet's system, eighty-two species; of which, some are inhabitants of the earth, others of water; some live on trees and plants, others among stones, and others on the bodies of other animals, and even under their skin. They are as follow; viz. elephantinus, with an orbicular, depressed, livid body, and a black ovated spot at the base, found in India: Epygus, ovated and black, with a white margin, a native of Egypt: Reduvis: Inclus, oval and ferrugineus, with a black ovated spot at the base, found in South America and India: Americanae, obvated and ruddy, with white feutellum and joints of the legs, found on the cattle and horses of America: Sanguis: Ricinus or Ticks: creatipes, with a fecond pair of legs very thick, nimble, gregarious, and found in the foil of Europe, and frequently in that of gardens: Peperillius, with an angulated thorax and ungualuated legs longer than the body, called the bat-longue, and found on the marine bat: Rapiferus, found on various sparrows, and called the sparrow-longue: muscarius, of a yellow colour, and with its first legs very long and adapted for swift running, found on muffinums: Aphiophilus, red, with the fore-legs long and fit for running; and the hinder part of the abdomen terminating in two horns; and lodging in the putrefaction weed of Europe: coelograpthus, black, with acute-angled sides, found under the bark of trees in Europe: telarius, of a greenish yellow colour, with a brown spot on each side of the abdomen, found on plants in Europe that are not much exposed to the wind, or placed in a hot-house, which it penetrates with its fling, and suffocates; and frequent on the leaves of the lime-tree in autumn: Siro or Mite: laticis, with an ovated, obtuse abdomen, and the hinder part having four declining bristles as long as the body, found in four cream and unwashed milk-vessels: dysenteriae, with two bristles to the legs, and four horizontal bristles at the hinder end of the ovated abdomen, of the length of the body, found in beer-casks, &c.: centnerans, with very long fexacous legs, and the two fore-legs short, suppoed by some to be the caufe of the itch, and neiling in the ulcers of this disease, but by others not to be sufficiently diffinil from the A. fculptura, black, with two gibbous joints of the thighs, found on the dead branches of trees: tumulosus, with a red hairy abdomen, the hinder part obtuse, and the anterior tibia of a paler colour, a native of Surinam and Guinea, and lately introduced into the practice of dyeing: aquaticus, with a fanguineous depressed abdomen, covered with a velvet down, obtuse behind, found swimming briskly in the fresh waters of Europe: kolofricus, with an abdomen like that of the former species, and found in dry situations in Europe and America, generally under the surface of the earth, and sometimes among hay: boecrium, with a dilated red abdomen, and fides of a darker hue, found on berries, and particularly currants and gooseberries: maferum, with a red abdomen, and hinder legs very long and filiform, found on the mofles of Europe: Eustas: gymnopterum, with a red abdomen, and two crimson-coloured spots on the fides, found on bees, wasps, the libellula, aphids, and other insects: coleopterum, with an ovated red body and whitish anus, frequent on beetles, whence the common black beetle is sometimes called the louly beetle: rubifricus, brown, with a dorsal line of two colours, frequent under the fomes of Europe: longicornis, red, with bifid antenna longer than the rostrum, found in the rocks of Europe: literola, ovated and red, with a tubulated extended rostrum, found among the rocks on the shores of Europe: fungarum, of a dark-brown colour, with a sub-gibbous, smooth, unspotted abdomen, gregarious, and moving slowly on different fungi: tremella, sub-gibbous, of a black-blueish colour, found on the Thunella juniperana: scaber, depressed and ash-coloured, and rough sides, found in the earth at the beginning of spring: fulgens, red, with a double brown dorsal line, and in the fore-part bifurcated: found swiftly running on the willows: erucus, yellow, with a red spot on the sides of the thorax, found on the galls of the willow: Usellus: gregalis, ovated, somewhat depressed, of an olive-brown colour, with a blackish feutellum, and the base and apex of a golden copper colour, found on the animals of South America, and suppoed to be the same with the elephantinus: undotus, orbicular and black, with wavy of white on the sides, and a black spot, found in New Holland: Lophus, ovated and brown, with a thick margin, found at Ley配资ng: Iguanae, ovated and spotted with gold, with the margin of the abdomen flared and somewhat jagged, fixing itself to the throat of the lacerta iguanae: Cayenesis, ovated, and varied with grey and white, with the hinder margin elevated and flared, a native of Cayenne: Iunctus, ovated and ferrugineus, with two white wavy lines, found in America: auroculans, obvated and brown, with two small lines and a palmated spot on the hinder part, of a green and gold colour, a native of America: keratopus, ovated and ferrugineus, with a brown thorax: papillos, ovated and brown, with the antennae and legs of a pale white: bisopus, ovated and black, with ferrugineus legs and white joints, found in Barbary: Hirmo: vibrans, roundish, tectaceous, and without spots, with the fore-legs longer than the others, found in Cayenne: domesticus, white, with two brown spots, an ovated body contracted in the middle, very long hairs, and equal legs, found in the houfes of Europe, but suppoed not to be different from the fry: nachitus, with redh-coloured, and the hinder having four very long bristles, and much less than the fry, and found in the uercs of persons infected with the itch, exciting irritation, and suppoed to be either the caufe, or rather a fymptom of the disease: xopera, roundish and whitish, with a red abdomen, found in the fuci of the Norwegian fcas: phalangii, ovated and red, with an extended rostrum and long legs, frequent on the phalangii and spiders: phaetonius, ovated, and behind acuminate, with the legs fapeculated at their apex, found on the placent of the Ocean: fraxenus, pale-coloured, with two black lines and the hinder legs very flort and bent, found on the fuci of the fcas of Norway: rubigus, ovated and white, with ferrugineus legs, found in Europe: libenius, with the first and fourth pair of legs longer, and the second thick, found on the lower surface of the libenius: lecanurus, with the second legs very thick, a tectaceous body, and a pale-coloured anus, found on caracaces: locusta, with four bristles in the hinder part, and as many on the fides: converus, ovated and brown, with the second joint of the legs small, and the third furred at its apex with a long bristle, found in the filaments of the convera under water, but dying out of the water: eoloscurum, with a body formed with two lobes and four long bristles to the hinder part of the body, found on the caracaces of infects: defkuruer, ovated, with many long bristles
bristles to the anus, and one to the legs, found on the exuviae of insects in moist places: erudius, with the fore pair of legs very thick, and clawed, and the second having two very long bristles at their apex, found in books that are kept in moist places: alauda, with the hinder part of the anus emarginated, found on the Aulaca arvensis: graminum, red, with the legs of the fore pair very long, and the hinder part of the abdomen jagged, found on the leaves of grasses: appendiculatus, tub-globose and crimson-coloured, with long legs of a paler line, and the hinder legs longer, found under the Helen pulmonariae: vitis, ovated, secole and red, with equal legs and several bristles, found twisted running on the vine; piper, red, with paler legs, and the hinder part of the abdomen furnished with small bristles, found on moss: dimiciculaus, with four teeth to the anterior part of the body, found under garden-pots: tepidum, with a smooth abdomen, lodged in the foil at the commencement of spring: rubens, red, ovato-oblung, with subequal legs, found under moss: preyana, red, globose and very smooth, scarce visible to the naked eye, found in the foil in spring: musca, concous, hairy and black, found on moss: limicium: fimbrialis, ovated, greenish and brilly, with unequal legs, found in the earth: carduelis, ovated, greenish and blackish, naked, with unequal inflated legs, found on the fringilles: coenius, ovated and of a crimson colour, with a frail body, lodged on various insects: vegetum, castaneous, brown, emarginated and convex, and plain beneath, found on various insects of the coleoptera order: lamprica, red, with pale legs and feelers, with long bristles scattered over the body and legs, found slowly moving on the leaves of the black elder: varum, found on the umbris: accarum, hemispheric, pale-coloured and smooth, with equal legs, found on the acorus grasses: carduatus, ovated, downy and red, black below between the legs, and furnished with an ovated black furlentum, found on mosses in the groove adjoining to the Hague.—Habitat, (Hist. Anim. l. v. c. 32. Oper. tom. i. p. 857. Ed. Du Val.) mentions the acarus bred in wax, as the lead object of human fight. These insects, which are often very troublesome on plants and in hot-houses, may be effectually destroyed by the mixture recommended for destroying those on the Pine-apple. The following mixture will be also equally efficacious: Take two ounces of lust green soap, one ounce of common turpentine, and one ounce of flowers of sulphur; pour upon these ingredients a gallon of boiling water, and work the whole together with a whisk, and let the mixture be used warm. This mixture may also be of use for preventing the mildew on the peach and apricot. However, this method should never be practised on fruit-trees near the time when their fruits are ripening. A strong ley made of wood-ashes will likewise destroy the Acri; but plants are greatly injured by this, and other briny and spirituous compositions. The Acri may be also destroyed in plants, by brushing them with a common painting brush, by often dusting them with flowers of sulphur, by keeping a hot-houte in a moitt flate, by dipping the tops of plants frequently in clear water in which flowers of sulphur and tobacco have been infused, in the hot fumier months, and always keeping the hot-house clean.

Acarus is the name given by Brown (Jam. 418.) to the Pulex pertenuis of Linneus. It is also a species of the Triphana, in the order of Infusoria, and class of Worms.

ACASABASTIAN, in Geography, a river in the province of Vera Paz, in Mexico, whose source is not far from the South Sea, which runs into the Golfo Dolic. There is a town of the same name situated on its banks.

ACASATHULIA, a sea-port situated on a point of land, in the province of Guatimal Proper, in Mexico, on a bay of the South Sea, about four leagues from Trinidad. It receives the greatest part of the treasures from Peru and Mexico. There are three volcanoes in its vicinity. N. lat. 12° 50'. W. long. 97°.

ACASTA, in Entomology, a species of Papilio, found in India, with roundish wings, having five: transverse spots, and brown specks, and the under part yellow.

ACAT, in Mythology, one of the nymphs, called OCEANIDES.

ACASTUS, in Classical History, the son of Pelias king of Thessaly, and one of the most famous hunters in his time. He married Atalanta, according to Suidas, or Albydanea, as his annotator calls her, who, falling in love with Peleus her son-in-law, and not having her wishes gratified by him, accused him to her husband of a rape; upon which he made war against Acastus, and slew his wife. Suidas, tom. i. p. 305.

ACASTUS, in Entomology, a species of Papilio, with black wings, the fore-wings having a snowy band, and the hind green beneath, marked with yellow: ridges; found in Surinam. It is also a name given by Grammer to the Papilio Phidias.

ACATALECTIC, Acatalcticus, formed of the privative a and βαταλτικός, from βαταιτικός, to cause or end, in the Ancient Poetry, a term applicable to such verses as have all their feet and syllables, and are in no respect lame or defective at the end. In the following trope of Horace, the two first verses are acataleptic, and the last catalectic:

Solvitur aequa hymnis, gratia vice

Vròs & Favonii:

Trepidante focis machina caroris

ACATELPSIA, Acatelepsy, compounded of the privative a and καταληπτικός, to deprive, to find out, in Philosophy, an impossibility of a thing's being conceived or comprehended.

Acatelepsia is synonymous with incomprehensibility.

ACATALUS, in Botany, a Juniper berry.

ACATCHATOS, formed of a and κατατομή, in-constant, is a physical term, anciently applied to irregular fevers, whose paroxysms are uncertain, and which are indicated by frequent changes in the urine. It is likewise applied to those flithering fits in fevers, which have no constant return, and to turdial urines, that deposits no regular sediment.

ACATECHILI, or Acatechichtli, in Ornithology, the Fringilla mexicana of Omelin, and the Mexican Stix of Latham, is about the size of the flick, and has the same long, and feeds on the same frutices. Its head and the upper part of its body are a greenish brown, and the throat and under part white, shaded with yellow. Its Mexican name Acatechichtli signifies the bird that rubs itself against the reeds, and may allude to some of its habits.

ACATERY, or Acatery, in the king's household, a kind of check between the clerks of the kitchen and the purveyors.

ACATHARIA, of a and καθαρός, to cleanse, in Medicine, denotes an impurity of the blood or humours.

ACATHISTUS, καθαρός, in an ecclesiasticus fest, a solemn hymn, or vigil, anciently sung in the Greek church on the Saturday of the fifth week in Lent, in honour of the Virgin, for having thrice delivered Constantinople from the invasions of barbarous nations.

It was called καθαρός, i.e. without fitting, because it was celebrated standing: the people stood all night, singing the praises of their deliverer. The same name is also given to the
the day whenon it was performed, which is called the feast
of Tabernacles.

ACCATUM, in the ancient Navigation, a kind of boat
or pinnace used for military purposes.

The acatium was a species of fish called acteria naves,
I.e. such as were wrought with oars. It was sometimes made
use of in battle. Strabo represents it as a kind of privateer,
or pirate ship; and Suidas, as a fishing vessel.

ACCAULIS, and ACCAULOS, in Botany, a term applied
to certain plants, the flowers of which have no stalk or pedi-
cle to support them, but rest immediately on the ground: of
this kind are the carline thistle, and some others.

ACABAB, in Ornithology, a name given by the people of
the Philippine islands to a bird very like our common hen,
which is very frequently wild among them. It lives on rice,
and other vegetables, and does a great deal of mischief; but
is short-winded, and does not fly well, so that it is easily de-
stroyed.

ACBAR, in Mythology, the name of an idol of enormous size,
which the Arabsian are said formerly to have worshipped.
It was with difficulty that Mahomet restrained them from this

ACBARRABAD, in Geography. See Agra.

ACCA (St.) in Biography, bishop of Haguallad, or Hex-
ham, in Northumberland, who succeeded Wilfrid in 709.
Besides ornamenting the cathedral, he erected a noble library,
containing chiefly of cical-falical learning, and a collection of
the lives of the saints. He was accredited a very able divine,
and famous for his skill in church music. He wrote several
books, particularly "Passiones Sanctorum," and "Pro illustran-
dis Scripturis ad Bedam." He died in 740, under Egbert. Simeon of Durham relates several miracles performed
by his relics.

ACCCA, in Geography, the name given by the Arabs
to a chain of mountains near the Red Sea; and which formed
the easternmost range of the 35th 29' of Ptolemey. The
cattle of Acca are situated below these mountains on the
Elanitic point of the Red Sea. See Hor.

ACCAABAR, in Natural History, the Ibis Orchacea of
Linnaeus, the red Indian coral of Ellis.

ACCAABAR is also a name given to the Antipater Par-
naces of Linnaeus.

ACCAABARium, in Natural History, a name given by
Rumphian to the Madreporae Scalata of Linnaeus, or the
white coral of the loops; and also to the Isis Hippuris of
the same author.

ACCAD, or Accad, or as the LXX has it Archah, in
Scripture Geography, a town in the kingdom of Nimrod or
Babylonia, to the east of the Tigris. Wells (Geog. O. T.
vol. i. p. 228) supposes that the city Sittace or Piattace
was formerly called by this name, and that Artacene,
mentioned by Strabo, was formed from Arcaul.

ACCADEMIA, in Musical Language, a term used in
Italy to denote a private concert.

ACCALLA, in Antiquity, Solenn feasts, held in honour
of Acca Laurentia, wife of the shepherd Faustulus, and
nurse or foster mother of Romulus. She was deified by
the Romans, and the flamin of Jupiter once a year of-
fers her a grand festival which he on a holiday instituted to her
honour.

These were otherwise called Laurentalia.—To the same
Acca is also attributed the institution of the Flutres Arn

ACCAPITARE, ACCAPITARE, ACCAPITARE, in ancient
Law-books and records, the act of becoming vassal of a lord,
or of yielding homage or obedience to him.

The word is compounded of the Latin ad, to; and caput,
head; because vassals owned their lords for their head.
Whence also the lords are sometimes called domini capitales
or those who command in an army are called capitanei, capi-
tains; and in old French, chevalerain, chieftain, in respect of
their followers.

ACCAPITUM, a sum of money paid to a vassal, upon
his admission to a feud.
The word is also written accapitum, accapitamentum, acapite,
captavia, and capetum.

ACCAVARA, in Natural History, the Gorgonia
Syaffo of Linnaeus, and also the Acctonium arborum
of the same author.

ACCAVARIUM, the Gorgonia Antipathes of
Linnaeus, or the black coral of other authors.

ACCARISI, Francis, in Biography, an ancient civilian
in the 16th and 17th centuries, who was born at Ancona,
and obtained celebrity as a professor of civil law in the
university of Sienna. At first he lectures confided of illuminations
of Julinian's Institutes; they were afterwards extended to the
Pandects; and at length comprehended civil law in general.
After having occupied the chair of law-professor at Sienna
with high reputation for twenty years, and refuting many
advantageous offers from other Italian universities, he was
induced to accept the proposals of the duke of Parma, who,
besides pecuniary recompense, tempted him with the title of
his counsellor; and he removed to Parma. However, he
was soon recalled by the Grand Duke of Tuscany, who
affigned him the first professorship in law at Pisa. He died at

ACCARON, in Scripture Geography, a town of Judea
called Ekron, in Sam. vi. 17., vii. 14. and mentioned in Jofe-
phus, Ant. i. vi. c. 1. It was the boundary of Philistia to
the north, not far from the sea, and from Bethshemem,
(Joh. xvi. 11, 46.) and famous for the idol Baalzebub, who
was worshipped here under the same attribute with Achor,
the god of flies, from which, according to Bryant (Mytho-
ology, vol. i. p. 83.), this city derived its name. It was about
thirty-four miles from Jerusalem. It first fell to the lot of
Judah, and was afterwards given to the tribe of Dan.
N. lat. 31° 55'. E. long. 34° 57'.

ACCAS Island, in Geography, lies off the mouth of An-
cobar river, on the coast of Guinea, and extends far near the
shore on each side as to render the channel very narrow.

ACCEDAS AD CURIAM, in Law, an original writ, which
lies for the removing suits in any court baron, except the
county court, into the king's court; upon apprehension of
partiality, or false judgment in the other.

A like writ lies for him who has received false judgement in
the county court; where it is called de falsa judicio.

An Accedas ad Curiam lies also for justice delayed, as well
as falsely given; and is a species of the writ Recordari.

Accedas ad Vicecomitum, is a writ directed to the coroner,
commanding him to deliver a writ to the sheriff, who having a
writ delivered to him, suppresses it.

ACCELERANDO, in Music, is an Italian term for
accelerating the time in the middle of a piece of music,
as usually as for retardation. This last is a fashionable
effect lately introduced in the performance of music, and
much abused by the excess and too frequent use of it.
The gradual change of measure, when practiced in the midst
of a regular movement, seldom produces any other effect on
common hearers than that of breaking time. Perhaps in a
very pathetic and expressive passage, even in an allegro,
when very delicately done from real feeling, the effect may
be approved; but the imitators of the licences and refine-
ments
ments of great masters disgrace the compositions which they
mean to embellish, and disgust their hearers. During imita-
tors of the bold modulation of Haydn, and of the rapid
running up and down the keys in half notes, as Mozart did
in his juvenile days, have deformed melody, and corrupted
harmony. These great masters knew when to fliep; but their
apes think they never can feaon their productions
too highly; and, it is to be feared, that the loves of sim-
plicity will never be indulged again with plain food,
even by those who have no means of gratifying them with
luxuries.

ACCELERATING Force, in Mechanics. See FORCE.
ACCELERATION, in Mechanics, the increase of ve-
locity in a moving body.

Accelerated motion is that which continually receives fresh
accelerations of velocity, and is either equally or unequally ac-
celerated. If the accelerations of velocity be always equal in
equal times, the motion is said to be equally or uniformly
accelerated; but if the accelerations in equal times either in-
crease or decrease, the motion is unequally or variably ac-
celerated. Acceleration tends directly to retardation, which
denotes a diminution of velocity.

ACCELERATION is chiefly used in Physics, in respect of
falling bodies, i.e. of heavy bodies tending towards the
centre of the earth by the force of GRAVITY.

That natural bodies are accelerated in their descent, is evi-
dent from various considerations, both à priori and posteriori.

—Thus, we actually find that the greater height a body
defends from, the greater impression it makes, and the more
velociously does it strike the plane or other obstacle on
which it falls.

Various are the systems and opinions which philosophers
have produced to account for this acceleration. Some at-
tribute to it the pressure of the air: the farther, say they, a
body falls, the greater load of atmosphere is consequently
incumbent on it: and the pressure of a fluid is in propor-
tion to the perpendicular altitude of the column thereof.

Add, that the whole body of the fluid pressing in innume-
rable right lines, which all meet in a point, viz. the centre
of the earth; that point, by the meeting of those lines, suf-
tains, as it were, the pressure of the whole mass: con-
sequent to the nature a body approaches to it, the effect or
preference of more united lines must it feel.

But what overthrows this account is, that as the pressure of
the air downwards increases; so, by the known laws of
statics, does the resistance, or the force wherewith the same
fluid tends to repel, or drive the body upwards again.

Others insist, that the incumbent air is the groffer and more
vaporous, the nearer the earth; and filled with more ho-
teregenous particles, which are not true elastic air: and
hence, say they, a descending body, meeting continually
with less resistance from the elasticity of the air, and having
the same force of gravity still setting on it, must necessaril-
ly be accelerated. Hobbes (Philos. Prob. cap. i. p. 3.) at-
tributes acceleration to a new impulsion of the caufe which
makes bodies fall; which, on his principles, is also the air.

As part of this mount, part also must descend; for reasons
drawn from the motion of the earth, which is compounded
of two motions, one circular, the other progressive; con-
sequently the air descends, and circulates at once. As the
body, in its fall, receives a new pressure in every point of
its descent, its motion, he says, must needs be acceler-
ated.

But what overthrows all accounts where the air or atmo-
sphere is concerned, is, that the acceleration holds in vacuo,
and even more regularly than in air. See VACUUM.

The Peripatetic account is worse than this: the motion of
heavy bodies downwards, say they, arises from an intrin-

sic principle, which makes them tend to the centre, as their
proper seat or element, where they would be at rest: hence,
add they, the nearer bodies approach to it, the more is their
motion accelerated.

The Gaffendiis, on the other hand, hold that the earth
emits a sort of attractive effluvia, immeasurable threads
whereof continually ascend and descend; which threads, proce-
ceeding like radii from a common centre, diverge the more the
farther they go: so that the nearer a heavy body is to the
centre, the more of these magnetic threads it receives; and
hence the more is its motion accelerated. But this is re-
puted by an easy experiment: for if a ball be let fall out of
the lowest window of a high tower, and also out of the
highest, the acceleration will be very nearly the same in both
cases, notwithstanding the greater vicinity to the centre in
the one, than in the other case.

The Cartesians account for acceleration, from the repeated
pulses of a subtle ethereal matter, which is continually ac-
ting on the falling body, and impelling it downwards.

After all, the immediate cause of acceleration is not
myterious; the principle of gravitation being once ad-
mitted, will determine the body to descend, and its motion
will be accelerated by necessary consequence.

Suppose a body let fall from on high; the primary caufe of
its beginning to descend, is doubtless the power of gra-
vity; but when once the descent is commenced, that caufe
becomes in some measure natural to the body: so that if left
to itself, it would persevere in it for ever, even though the
action of the first caufe should cease: as we see in a stone
cafed with the hand, which continues to move after it is left
by the caufe that gave it motion.

But, beside the propensity to descend, impressed by the
first caufe, and which of itself were sufficient to continue
the same degree of motion once begun, in infinitum; there is
a constant accession of subsequent efforts of the same
principle, gravity, which continues to act on the body al-
ready in motion, in the same manner as if it were at rest.

Here, then, being two causes of motion; and both acting
in the same direction, the motion they jointly produce must
necessarily be greater than that of any one of them. —And
the velocity thus increased having the same caufe of in-
crease still perilling, the defect must of course be contin-
ually accelerated.

For, supposing gravity, whatever it be, to act uniformly
on all bodies, at equal distances from the earth's centre;
and that the time in which a heavy body falls to the earth
be divided into equal parts indefinitely small: let this gravity
incline the body towards the earth's centre, while it moves
in the first indefinitely small part of the time of its descent;
if after this, the action of gravity be supposed to cease, the
body would proceed uniformly towards the earth's centre,
with a velocity equal to that which results from the force
of the first impression.

But now, since the action of gravity is here supposed
till to continue; in the second moment of time, the
body will receive a new impulse downwards, equal to
what it received at first; and thus its velocity will be
double of what it was in the first moment; in the third
moment it will be triple; in the fourth quadruple, and so
continually; for the impulsion made in one moment, is not
at all altered by what is made in another: but the two are,
as it were, aggregated or brought into one sum.

Wherefore, since the particles of time are supposed in-
definitely small, and all equal to one another; the velocity
acquired by the falling body will be every where propor-
tioned to the times from the beginning of the descent; and
the velocity will be consequtively proportional to the time
in which it is acquired.

Thus,
Thus, if a body, by means of this constant force, acquire a velocity of $32\frac{1}{2}$ feet in one second of time, it will acquire a velocity of $64\frac{1}{2}$ feet in two seconds, of $96\frac{1}{2}$ feet in three seconds; and all bodies, whatever be their quantity of matter, will acquire, by the force of gravity, the same velocity in the same time. For every equal particle of matter being subjected to an equal impelling force, in gravity or weight, the sum of all the forces, in any compound mass of matter, will be proportional to the sum of all the weights or quantities of matter to be moved; consequently, the forces and masses moved, being thus constantly increased in the same proportion, the velocities generated will be the same in all bodies, great or small: i. e. a double force moves a double mass of matter, with the same velocity that the single force moves the single mass, &c. or, the whole compound mass falls together with the same velocity, and in the same manner, as if its particles were not united, but as if each fell by itself, and all were separated from one another; and being put into motion at once, they would fall together, just as if they were united into one mass.

Galileo, who first discovered the above-mentioned law of the descent of falling bodies, illustrated it nearly in the following manner.

The space passed over by a moving body in a given time, and with a given velocity, may be considered as a rectangle made by the time and the velocity.—Suppose a $A$ (Plate I. Mechanics, fig. 1) a heavy body descending, and let $AB$ represent the time of its descent; which line we may suppose to be divided into any number of equal parts, $AC$, $CE$, $EG$, &c. representing the intervals, or moments of the given time.—Let the body descend through the first of these divisions, $AC$, with a certain equable velocity arising from the proposed degree of gravity: this velocity will be represented by $AD$; and the space passed over, by the rectangle $CAD$.

Now, as the action of gravity in the first moment produced the velocity $AD$, in the body before at rest at $A$; in the second moment, the same will produce, in the body so moving, a double velocity, $CF$; in the third moment, to the velocity $CF$ will be added a farther degree, which, together with the velocity $EF$, which is triple of the first, and so of the rest. So that in the whole time $AB$, the body will have acquired a velocity $BK$. Again, taking the divisions of the line, e. g. $AC$, $CE$, &c. for the times, the spaces gone through will be the areas or rectangles $CD$, $EF$, &c. So that in the whole time $AB$, the space described by the moveable body, will be equal to all the rectangles, i. e. to the described figure $ABK$.

Such would be the case, if the accelerations of velocity only happened in certain given points of time, e. g. in $C$, in $E$, &c. so that the degree of motion should continue the same till the next period of acceleration occurs.—If the divisions or intervals of time were supposed less, e. g. by half; then the dentures of the figure would be proportionally smaller; and it would approach so much the nearer to a triangle.—If they were infinitely small, i. e. if the accelerations of velocity were supposed to be made continually, and in every point of time, as really the case; the rectangles thus successively produced will make an exact triangle, e. g. $ABE$ (fig. 2).—Here, the whole time $AB$ consisting of the little portions of time $A$, $1$, $2$, &c. and the area of the triangle $ABE$, of the sum of all the little triangular surfaces answering to the divisions of the time; the whole area or triangle expresses the space moved through in the whole time $AB$; and the little rectangles $A$, $1$, $2$, &c. the spaces gone through in the divisions of time $A$, $1$, &c.

But these triangles being similar, their areas are to one another, as the squares of their homologous sides $AB$, $A$, $1$, &c. and consequently, the spaces moved are to each other as the squares of the times.

If the velocity were uniform, the space would be equal to the product of the velocity and time; i. e. by an obvious notation $S = V \times T$, but in the cases here considered, it increases from $0$ till it becomes equal to $V$, and therefore the space described must be equal to half the above product; i. e. $S = \frac{1}{2} V \times T$, and $S = \frac{1}{2} V \times T$, and $S = \frac{1}{2} V \times T$.

Hence we may easily infer the great law of acceleration, viz. "That a descending body uniformly accelerated, describes, in the whole time of its descent, a space which is just half of what it would have described in the same time, with the accelerated velocity it has acquired at the end of its fall." For, the whole space the falling body has moved through in the time $AB$, we have already shown, will be represented by the triangle $ABE$; and the space the body would move through in the same time with the velocity $BE$, will be represented by the rectangle $ABF$. But the triangle is known to be equal to just half the rectangle.—Therefore the space moved is just half of what the body would have moved with the velocity acquired at the end of the fall. Hence we infer, that the space moved with the last acquired velocity $BE$, in half the time $AB$, is equal to that really moved by the fallen body in the whole time $AB$.

From the preceding principles and reasoning we deduce the following general laws of uniformly accelerated motions: viz.

1. That the velocities acquired are constantly proportional to the times.

2. That the spaces are proportional to the squares of the times; so that if a falling body describe any given length in a given time, in double that time it will describe four times that length, in thrice the time nine times the length, &c.; and universally, if the times be in arithmetical proportion, $1$, $2$, $3$, $4$, &c. the spaces described will be $1$, $4$, $9$, $16$, &c.

3. Thus a body, which falls by gravity through $16\frac{1}{2}$ feet in the first second of time, will fall through four times as many, or $44\frac{1}{2}$ feet, &c. And since the velocities acquired in falling are as the times, the spaces will be as the squares of the velocities; and both the times and velocities will be in a subduplicate ratio, or as the square roots of the spaces.

4. The spaces described by a falling body in a series of equal moments or intervals of time, will be as the odd numbers, $1$, $3$, $5$, $7$, $9$, &c. which are the differences of the squares or whole spaces, i. e. a body which has fallen through $16\frac{1}{2}$ feet in the first second, will fall in the next second through $48\frac{1}{2}$ feet, and in the third second through $80\frac{1}{2}$ feet, &c.

5. Retaining the above notation, $S = \frac{1}{2} T$, or $S = V$; and $V = T$; or $T = V$; and $S = T$. The spaces will be reciprocally as the velocities, and directly as the times; for $S = \frac{1}{2} T$; $V = T$; and $S = T$. Consequently $T = \frac{1}{2} V$; and the accelerating forces are different, but constant, the spaces will be as the products of the forces into the squares of the times; and the times will be in the subduplicate ratio of the spaces directly, and of the forces inversely. For when the force is given, the velocity $(V)$ is as the time $(T)$; when the forces are different, but constant, and the time is given, the velocity $(V)$ will be as the force $(F)$. But when neither the force nor the time is given, the velocity $(V)$ will be partly as the time and partly as the force, or as their product $(F \times T)$. Thus, $V = \frac{T}{F}$.
Hence it appears, that when the constant force $t$ is the natural force of gravity, then the distance $g$ descended in the first second, in the latitude of London, is $16\frac{2}{3}$ feet, but if it be any other constant force, the value of $g$ will be different in proportion as the force is greater or less. See Hutton’s Dict. Art. Acceleration, where two propositions are introduced, which were communicated to the author by Mr. Abram Robertson of Christ Church College, Oxford, in which the laws of accelerated motion are demonstrated in a manner somewhat different from that which is above given.

See farther on this subject, Laws of the Descent of Bodies, and Laws of Motion, uniformly accelerated and retarded.

Having above illustrated the laws of accelerated motion, when the accelerating forces are constant, and deduced the formula for expressing them in finite determinate quantities, we shall now subjoin those that pertain to the cases of variably accelerated motions. Here the formula will be fluxionary expressions, the fluxes of which, adapted to particular cases, will give the relations of time, space, velocity, &c.

Let $t$ denote the time of motion, $v$ the velocity generated by any force, $s$ the space passed over, and $2g$ the variable force at any part of the motion, or the velocity which the force would generate in one second of time, if it should continue invariably like the force of gravity during that one second, and the value of this velocity $2g$ will be in proportion to $3\frac{2}{3}$ feet, as that variable force is to the force of gravity. Then, because the force may be supposed constant during the indefinitely small time $t$, and the spaces and velocities, in uniform motions, are proportional to the times, we shall have two fundamental propositions, viz. $s = 2gt$, or $t = \frac{s}{2g}$; and $v = 2gt$, or $t = \frac{v}{2g}$, from which are deduced the following formulæ, in which the values of each quantity is expressed in terms of the rest:

\[
\begin{align*}
1. & \quad t = \frac{v}{2g} \\
2. & \quad v = 2gt = \frac{2gs}{t} \\
3. & \quad s = \frac{v^2}{2g} \\
4. & \quad g = \frac{v^2}{2s}
\end{align*}
\]

These theorems are equally applicable to the destruction of motion and velocity, by means of retarding forces, as to the generation of them by means of accelerating forces. Hutton’s Dict. Phil. p. 50.

The motion of a body ascending, or impelled upwards, is diminished or retarded from the same principle of gravity acting in a contrary direction, in the same manner as a falling body is accelerated. See Retardation.

A body, thus projected upwards, rises till it has loft all its motion; which it does in the same time that a falling body would have acquired a velocity equal to that with which the body was thrown up. Hence, the body thrown up, will rise to the same height from which, if it fell, it would have acquired the velocity with which it was projected upwards. And hence the heights to which bodies thrown up with different velocities ascend, are to one another as the squares of those velocities.

Acceleration of bodies on inclined planes. The same general law obtains in this case, as in bodies falling perpendicularly; viz. that the velocities are as the times, and the spaces descended down the planes are the squares of the times or of the velocities. But the velocities are less, according...
to the line of the plane's inclination, and the spaces left according to the square of the line. See Inclined Plane.

**Acceleration of the Motion of Pendulums.** See Pendulum.

**Acceleration of the Motion of Projectiles.** See Projectile.

**Acceleration of the Motion of Compressed Bodies.** in expanding or relloring themselves. See Compression, Dilatation, and Elasticity.

**Acceleration in Astronomy.** is a term applied to the fixed stars. Thus, the diurnal acceleration is the time by which the stars, in one diurnal revolution, anticipate the mean diurnal revolution of the sun, which is 3° 55½' of mean time, or nearly 3 minutes 36 seconds; i.e. a star rises or sets, or passes the meridian, 3° 56' sooner each day. This apparent acceleration of the stars is owing to the real retardation of the sun; and this depends upon his apparent motion towards the east, which is at the rate of about 59' 8½' of a degree every day. In consequence of the apparent retardation of the sun, which passed the meridian at the same moment with the sun yesterday, it is to day about 59' 8½' beyond the meridian to the west, when the sun arrives at it; and this disance it will require about 3° 56' for him to pass over; and therefore the star will anticipate the motion of the sun at this rate every day. The true quantity of this anticipation or acceleration, is found by the following proportion, viz. *360° : 59' 8½' : : 24 hours : 3° 55½';* the acceleration required. This diurnal acceleration serves to regulate the lengths and vibrations of pendulums. If the pendulum marks 59' 8½' in 24 hours, it is found that an apparent retardation of 3° 56' is the case. The pendulum may be inferred that such a pendulum is truly regulated, or justly measures mean time. See Clock.

**Acceleration of the Moon, is a term used to express the increase of the moon's mean motion from the sun, compared with the diurnal motion of the earth; so that it is now a little faster than it was formerly. Dr. Halley (Phil. Trans. No. 218.) was the first who made this discovery; and he was led to it by comparing the ancient eclipses observed at Babylon with those observed by Alba-tegrinus in the ninth century, and some of his own time. He was not able to ascertain the quantity of this acceleration, because the longitudes of Bagdat, Alexandria, and Aleppo, where the observations were made, had not been accurately determined. But since his time, the longitude of Alexandria has been ascertained by Chazelles, and Babylon, according to Ptolemy's account, lies 50' east from Alexandria. From these data, Mr. Dunthorne (Phil. Trans. No. 492. abr. vol. x. p. 84, &c.) compared several ancient and modern eclipses, with the calculations of them by his own tables, and thus verified Dr. Halley's opinion; for he found, that the same tables represent the moon's place in the ancient eclipses behind her true place, and before it in later eclipses; and though partly inferred, that her motion in ancient times was slower, but in latter times quicker than the tables give it; and therefore, that it must have been accelerated. But he did not content himself with merely ascertaining the fact. He proceeded to determine the quantity of the acceleration; and by means of the most ancient eclipse of which any authentic record remains, observed at Babylon in the year before Christ 721, he concluded that the observed beginning of this eclipse was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could precade her place by computation but little more than 30' of a degree at that time. Admitting the accelleration to be uniform, and the aggregate of it as the square of the time, it will be at the rate of about 10° in 100 years. M. de la Lande makes it 9°.886. In Mayer's Tables it is 9', beginning from 1700.

Dr. Long (Alfron. vol. ii. p. 436.) attributes the acceleration above described to one or more of these causes: other, 1. the annual and diurnal motion of the earth continuing the fame, the moon is really carried round the earth with a greater velocity than it was formerly; or, 2. the diurnal motion of the earth, and the periodic revolution of the moon continuing the fame, the annual motion of the moon round the sun is a little retarded; which makes the sun's apparent motion in the ecliptic a little slower than it formerly was; and consequently, the moon, in falling from any conjunction with the sun, spends less time before the same overtakes the sun, and forms a subequent conjunction; in both these cases, the motion of the moon from the sun is really accelerated. This acceleration is thus shortened: or, 3. the annual motion of the earth, and the periodic revolution of the moon continuing the fame, the rotation of the earth round its axis is a little retarded; in this case, days, hours, minutes, seconds, &c. by which all periods of time must be measured, are of a longer duration; and, consequently, the synodical month will appear to be shortened, though it really contain the fame quantity of absolute time as it always did. If the quantity of matter in the body of the sun be laffened by the particles of light continually streaming from it, the motions of the earth round the sun may become faster; if the earth increases in bulk, the motion of the moon round the earth may be thus quickened. M. de la Place (Mem. de l'Acad. Roy. des Sciences. for 1786) has evinced this acceleration of the moon's motion to arise from the action of the sun upon the moon, combined with the variation of the eccentricity of the earth's orbit. By the present diminution of the eccentricity, the moon's mean motion is accelerated; but, when the eccentricity is arrived at its minimum, the acceleration will cease; after which, the eccentricity will increase, and the moon's mean motion will be retarded. M. de Lambre found, by comparing the modern observations at about the distance of a century, that the secular mean motion of the moon in the last tables of Mayer was too great by 23'; and that the place of the moon calculated by those tables ought to be corrected by the quantity — 25° n + 2°, 135° 4° — 6°, 04398 n, n being the number of centuries from 1700. M. de la Lande, in his tables of the moon, has thus corrected Mayer's tables. Hence it appears, that the present acceleration of the moon is nothing more than an equation, the period of which is very long. It will be accelerated and retarded by the same quantity; and, therefore, if the mean motion be taken for the whole time of acceleration or retardation, it will be found never to vary. Vince's Alfron. vol. i. p. 261.

**Acceleration, in Music.** See Accelerando.

**ACCELERATORES Urine, called by Winslow Bulbo-cavernous, and by others Urine fluminatores and graphene femina, in Anus, a pair of muscles, whose office it is to expel the discharge of the urine and of the semen. These muscles may be laid to arise from jux, before the verge of the anus, where the sphincter ani terminates. They are spread over the bulb and a small portion of the corpus pugionum urethrae: having that appearance, which anatomists have termed a doubly penniform muscle. From the anterior part of the muscule a fascicula of frires proceeds on each side, by which the body of the penis is encurled. When
When these muscles act, they generally contract in a sudden and convulsive manner, and by this means expel in jets the last portions of urine, or any other fluid which may be contained in the urethra.

**ACCIDENTES, or ACCESSORS, in Eclectic, or Accidental writers, a lower order of ministers in the church of Rome, whose office it is to light, stuff, and trim the candles or tapers. The accendentes are much the same with those otherwise called acolythi and confratelli.

**ACCENDONES, or ACCEDONES, in Roman Antiquty, a kind of gladiators, whose office was to excit and animate the combatants, during the engagement.

**ACCENSIA, in Antiquty, an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of usher, ferrjeants, or tip-flavies, among us. They were thus called from action, to send for; one part of their office being to call assemblies of the people, summon parties to appear before the judges, &c.

**ACCENSIA also denote a kind of supernumerary soldiers in the Roman armies; whose office was to attend the motions of their principals, and supply the places of those who were killed or disabled by their wounds.

They were thus denominatet quia accendebantur, or ad crensum adfieiebantur: Vegetius calls them supernumerarii legi- mun: Cato calls them feruntarii, because they furnished those engaged in battle with weapons, drink, &c. Though Nonius suggests another reason of that appellation, viz. because they fought with staves, flings, and weapons, qua feruntar, fueli as are thrown, not carried in the hand. They were sometimes also called velletis, and velites, because they fought clothed, but not in armour; sometimes adscripti, and adscripti; sometimes rovarius. The access, Livy observed, were placed in the rear of the army, because no great matter was expected from them; they were taken out of the fifth class of citizens.

**ACCENSIA was also an appellation given to a kind of adjutants, appointed by the tribune to afflift each centurion and decurion. In which sense, accessus is synonymous with opis. — In an ancient inscription given by a Torre, we meet with accensus equitwm romanorum; an office nowhere else heard of; that author speaks it for a corruption, and instead thereof reads a census. A.C. Erud.

**Leip. 1701. p. 259.

**ACCENSION, ACCENSIS, in Physic, the act of kindling, or setting a body on fire. The word is formed of the Latin accendere, to kindle; a compound of ad, to, and candere, to glow. Though some grammarians suppose the primitive signification of accedentes, to have been, to render famous. Accension, or other occasions, is called Inflammation, Ignition, Conflagration, &c. and stands opposed to Ex- tinction.

Chemists furnish us with various inferences of the accension of cold liquors by bare mixture: as of the acid spirits of minerals, and the efflentia oils of plants.

**ACCENT, in its primitive sense, an affection of the voice, which gives each syllable in a word its due pitch, in respect of height or lowness. The word is originally Latin, accentus, a compound of ad, to, and cantus, to sing. In this sense, accent is synonymous with the Greek τον, the Latin tenor, or tenor, and the Hebrew צו lưu, to give, to sing. The accent, properly, only respects high and low, or acute and grave. — Though the modern grammarians use it also in respect to loud and soft, long and short; but this confounds accent with quantity. The difference between the two may be conceived from that which we observe between the beat of a drum, and the sound of a trumpet; the former expresses every thing belonging to loud and soft, and long and short; but so long as there is a monotony in the sound, there is nothing like accent.

The ingenious Mr. Harris (Philological Inquiries, p. 62.) compares quantity to musical tones differing in long and short, as upon whatever line they stand a semibreve differs from a minint; and accent to musical tones differing in high and low, as D upon the third line differs from G upon the fifth, whether its length be the same, or it be longer or shorter.

**Accent is also used in Grammar for a character placed over a syllable, to mark the accent, i.e. to show that it is to be pronounced in a higher or a lower tone, and to regulate the inflections of the voice in reading or in speaking. It is distinguished from emphasis, as the former regards the tone of the voice, the latter the strength of it. For other distinctions between accent and emphasis, see Emphasis.

It has been long disputed among the learned, whether accents were originally musical characters, or marks of Prosody; it is not easy to determine a question concerning which the arguments on both sides are so numerous. But as music, says Dr. Burney, (Hist. of Music, vol. 1. p. 12.) had characters different from accents so early as the time of Terpander, to whom the invention is ascribed by the Oxford marbles, which place this event about 679 years before Christ; and as accents for prosody are likewise proved to be of high antiquity, there seems to have been no necessity for the ancients to use the one for the other. Mr. Weft (Pindar, vol. ii. p. 194. 12mo.) maintains, that accents were originally musical notes, set over words, to direct the several tones and inflexions of the voice requisite to give the whole sentence its proper harmony and cadence. The names of the Greek accents, he says, express their musical origin, and correspond exactly to those terms made use of in our modern music; viz. harsh, flat, and a grave, called the tourn, and confounding, like the circumference, of a sharp and a flat note. The Abbé du Bos (Reflex. Crit. c. iii. p. 87.) afferts, that as poets originally set their own verses, they placed for this purpose a figure, or accent, over each syllable. The learned author of "The Origin and Progress of Language," has also taken pains to prove that the Greek accents were musical notes, invented and accommodated to raise, depress, and suspend the voice, according to a scale of musical proportions.

We reckon three grammatical accents in ordinary use all borrowed from the Greeks, viz. the acute, grave, and circumflex. The acute accent shows when the tone of the voice is to be raised and sharpened. In modern writings it is a small, or virgula, placed over the vowel, a little sloping or inclined in its descent from right to left, as ('). It is not ordinarily used either in English or Latin: the French indeed retain it; but it is only to mark the close of a masculine. The grave accent is used when the note or tone of the voice is to be depressed and flattened; and is figured thus (').

The circumflex accent is composed of both the acute and grave; it points out a kind of undulation of the voice, which is first raised and sharpened, and then depressed and flattened; or it is an acute tone dying away into a grave, and consequently lengthening the syllable. It is expressed thus (') or ('). Upon a nearer consideration of the subject, says a learned writer, "On the Profodies of the Greek and Latin Languages," it appears, that the acute accent, which is a sharp stroke of the voice upon some one syllable of the word, is in truth the only positive tone. The grave confists merely in a negation of this accent; and is not marked except it be upon the last syllable of certain words;
A C C

but is to be understood upon every syllable of the word, which carries neither the acute nor circumflex; and it seems to amount to no more than this, that what grammarians call the grave tone, consists in a mere negation of accent and of circumflexion, if that be different from accent. Accordingly, the general doctrine of accents is, that, with the exception of fourteen monosyllables in the Greek language, which carry no accent, unless it be in particular circumstances, and for that reason are called acron or gravis, some one syllable of every word, and one syllable only, bears an accent, either acute or circumflex.

If it be true, that the whole system of pronunciation depends upon three accents, it is no less true, that each of these three admits of several degrees. The acute accent, for instance, may be either higher or lower; may be simply acute, or very acute; and the like holds of the grave and circumflex. So that each of the three common accents is, as it were, a genus, including various particular species; though the ancient Grammarians have not thought fit to annex particular names and figures to all these differences.

Mr. Sheridan, in his Lectures on Eloquence, p. 53, observes, that the meaning of the term accent, among the ancients, was very different from what it is with us. They distinguished accents by certain inflexions of the voice like musical notes; but the manner in which they did it must remain for ever a secret to us; for, with the living tongue perished the tones also, which we in vain endeavour to explore in their visible marks. With us the term accent denotes a peculiar mode of distinguishing one syllable from the rest; and this distinction is made in various ways: either by dwelling longer upon one syllable than upon the rest, or by giving it a smarter percussive of the voice in utterance. Of the first of these we have inflexions in the words glas, fæther, boly; of the last in battle, habits, borrow. So that accent, with us, is not referred to tune, but to time; to quantity, not quality; to the mere equable or precipitate motion of the voice, not to the variation of notes or inflexions. He proceeds to observe, that the quantity depends upon the feet of the accent, whether it be on the vowel or consonant: if on the vowel, the syllable is necessarily long, as it makes the vowel long; if on the consonant, it may be either long or short, according to the nature of the consonant, or the time taken up in dwelling upon it. By changing the accent of the syllables above specified, we should change their quantity: if, instead of glas we should say glas, instead of fæther, fæther, instead of boly, boly, the first syllables would become short; and, on the other hand, if we were to dwell on the vowels instead of the consonants in the last inflexions, they would be changed from short to long, as battle for battle, habit, for habit, and borrow, for borrow. This, he says, is one of the chief sources of the difference between the Scotch and English gentlemen in the pronunciation of English, i.e. laying the accent on the vowel instead of the consonant, so as to make syllables long that are short with us. He adds, it is an uncertain rule, that whenever the accent is on the consonant, the preceding vowel has a short sound; and there is another infallible rule in our tongue, that no vowel ever has a long sound in an unaccented syllable: and therefore, if the accent were properly adjusted, it would prove a matter-key to the pronunciation of our whole tongue. In another place, (Art of Reading, vol. ii.) Mr. Sheridan says, that when the feature of the accent is on a vowel, the syllable is long; when on a consonant, short; and that all unaccented syllables are short.

But the use of accent in our language is not confined to quantity alone. It is also the chief mark by which words are distinguished from mere syllables. The essence of a word, says this author, consists in accent as well as articulation. The Greeks also distinguished words from mere syllables by a certain tone or note annexed to each word, which made their speech more musical or pleasing to the ear, than that of any other nation in the world. These tones they learned from their infancy, and they used them with such accuracy, that even the vulgar among the Athenians would have hissed an actor or actress from the stage, and an orator from the pulpitum, on account of a few mistakes in the enunciation of these notes. The wonderful effects of the harmonies of the Greek orators on the enraptured minds of their hearers were owing, in a considerate degree, to those artificial musical tones, by which their syllables were so happily diversified. To this purpose consult Dionysius Hal. de Compositions Verborum, apud Oper. tom. ii. p. 17. &c. Ed. Oxon. 1724. This harmony of utterance is not studied by any of the moderns, except the Chinese. Words are also distinguished from syllables by making a perceptible pause at the end of each word. Mr. Sheridan is of opinion, that the most evident and precise as well as the most easy and certain mode of distinction, is that of accent; and that it would contribute most effectually both to utility and to ornament.

As to public speakers, who can pronounce English properly, the only rule necessary to be observed by them is to lay the accent always on the same syllable, and the same letter of the syllable, which they usually do in common discourse, and to take care not to lay any accent or stress upon any other syllables. Such persons should recollect, that, in the English language, every word which consists of more syllables than one, has one accented syllable; and that there is seldom or never more than one such syllable in any English word, however long. See Pronunciation.

In the English language there is a remarkable peculiarity of throwing the accent farther back, that is, nearer the beginning of the word, than is done by any other nation. In Greek and Latin no word is accented farther back than the third syllable from the end, or what is called the antepenult. But, in English, we have many words accented on the fourth, some on the fifth syllable from the end, as memorable, communicative, &c. The general effect of this practice of hallowing the accent, or placing it so near the beginning of a word, is to give a brisk and spirited, but at the same time a rapid and hurried, and not very musical, tone to the whole pronunciation of a people.

The Hebrews have a grammatical, a rhetorical, and a musical accent; though the first and last seem, in effect, to be the same; both being comprised under the general name of tonic accents, because they give the proper tone to syllables; as the rhetorical accents are said to be euphoni, inasmuch as they tend to make the pronunciation more sweet and agreeable.

There are four euphonic accents, and twenty five tonic: however, authors are not agreed as to the number of either class. Of these, some are placed above, and others below the syllables: the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish the fections, periods, and members of periods, in a discourse, and to answer the same purposes with the points in other languages. Their accents are divided into emperors, kings, dukes, &c. each bearing a title answerable to the importance of the distinction it makes.—Their empor rules over a whole phrase, and terminates the sentence.
The use of the tonic or grammatical accents has been much controverted; some holding that they distinguish the sense, while others maintain that they are only intended to regulate the music or finging; alleging, that the Jews sing, rather than read, the scriptures in their synagogues.

The truth seems here to lie between the two opinions: for though we incline to think, that the primary intention of these accents was to direct the singing; yet, the singing seems to have been regulated according to the sense; so that the accents might serve not only to guide the singing, but also to point out the distinctions.—Though it must be confessed, that many of these distinctions are too subtle and incon siderable; nor can the modern writers, nor the editors of old ones, agree in opinion on this subject: some of them making twice as many of these distinctions as others. The Hebrew accents have, indeed, something common with those of the Greeks and Latins; and something peculiar to themselves. What they have in common is, that they mark the tone; showing how the voice is to be raised and sunk, in certain syllables. What they have peculiar is, that they perform the office of the points in other languages. The six following are of this latter kind, viz. Syllur, Athinach, Rebbiango, Segolta, Zakerpntan, and Zakerpntgadhni. To which we might also add, Tiphtha and Sanka, on account of their occasional application to the same purpose. It is certain the ancient Hebrews were not acquainted with these accents; so that, at best, they are not Jure Divino.—The opinion which prevails among the learned is, that they were invented by the Jewish doctors of the school of Tiberias, called the Mavorites. The learned Hennin affirms them to be of Arabic invention; and to have been adopted and transferred thence into the Hebrew by the Mavorites, especially by the celebrated Rabbi Ben Acher; and it is said they were introduced on occasion of the emperor Julian’s prohibiting the reading of their traditions in their synagogues, or about the middle of the sixth century. However, the revival of the sacred writings by Rabbi Acher on the part of the Western Jews, and by Rabbi Nepthali on that of the Eastern Jews, was solely employed about the accents and points; and these two Rabbis lived, according to some writers in the eleventh century, and according to others about the year 940. See Maffé’s Heb. Gram. vol. ii. p. 24. Hennin adds, that they were first brought to their degree of perfection by Rabbi Judah Ben David Ching, a native of Fez, in the eleventh century. It is indeed possible the Jews might borrow their points from the Arabs; but how they should have their accents from them it is not easy to conceive, since the Arabic language has no such thing as accents, either in prose or verse.

The introduction of accents by the Mavorites has been the source of great difficulty in learning the Hebrew language, and of equal confusion and error in the interpretation of it. Few of them have now any known use, except that of distinguishing periods. Biblical interpreters are divided concerning the position, necessity, and utility of them. The doctrine of Hebrew accents has occasioned much dispute amongst learned critics. See Buxtorf’s Theofruss, and Everard Vander Hought’s Pref. to the Bibles of Athias, 1705.

As to the Greek accents, now seen both in manuscript and printed books, there has been no less dispute about their antiquity and use, than about the use of these of the Hebrews. On the subject of this dispute we may observe, in general with a learned writer, Bishop Lowth, (Prelim. Diff. to his Isaiah, p. 10) that there were certain laws of Hebrew metre is very probable, and that the living Greek language was modulated by certain rules of accents is beyond dispute: but a man born deaf may as reasonably pretend to acquire an idea of found, as the critics of these days to attain to the true modulation of Greek by accent, and of Hebrew by metre. To which we may add, that though the ancient Greeks had no accentual marks, they learned those modifications of voice by practice from their infancy; and in pronunciation they are so observed to this day.

Isaac Volfin, in a treatise De Accentibus Graecorum, endeavours to prove that they are of modern invention, and that anciently they had nothing of this kind; but only a few notes in their poetry, which were invented by Aristophanes the Grammarian, about the time of Ptolemy Philopater; and that these were of musical, rather than of grammatical use, serving as aids in the singing of their poems; and very different from those which were afterwards introduced. This appears from inscriptions as well as manuscripts, none of which, till 170 years after Christ, have either accent, spirit, apostrophus, or staccatura. He adds, that Aristarchus, a disciple of Aristophanes, improved on his master’s art; but that the whole of what they both did was only designed to affih youth in the more readily making of verses. The same Volfin shows from several ancient Grammarians, that the manner of writing the Greek accents in those days was quite different from such as are now used in our books. It is alleged by others, that accentual marks, which, they say, were invented by Aristophanes, were not in common use till about the seventh century; at which time they were found in MSS. Amongst those who totally reject the accents, on the supposition that they would confound the quantity, as it is determined by the rules of prosody, we may reckon Beza, Scaliger, Spelman, Ger. Jo. Volfin (De Arte Gram. i. ii. p. 174), and Salmasius in Epist. ad Sarraulm.

Hen. Christl. Hennin thinks, (see his Chaldeus opuscul.; feu Differtatio Paradoxicæ, Graecam Languam non effe promuntiandam secundum Accentus, 1606.) that accents were the invention of the Arabs to late as the eighth century, and that they were only used in poetry; that they were intended to ascertain the pronunciation of the Greek, and to keep out that barbarism, which was then breaking in upon them; that the ancient accents of Aristophanes were perfectly agreeable to the genuine Greek pronunciation, but that the modern ones of the Arabs destroy it. Wetstein, Greek professor at Basle, in a learned Dissertation, endeavours to prove the Greek accents to be of an older standing; and that the Greeks, long before the birth of Christ, regulated their pronunciation by accents, very much like those that are now in use. He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the several parts of Greece: and he adds, that accents were not used except in the schools of grammarians, who occurred to them in reading the old poets. He brings several reasons â priori for the use of accents, even in the earliest days; as that, that they wrote wholly in capital letters equidistant from each other, without any distinction of words or phrases; so that without accents they could scarcely be intelligible; and that accents were necessary to distinguish ambiguous words, and to point out their proper meaning; and this sentiment he confirms from a dispute on a passage in Homer, mentioned by Ariostico in his Pastorii, ch. vi. Accordingly he observes, that
that the Syrians, who have tone, but no distinctive accents, have yet invented certain points, placed either above or below the words, to show their mood, tense, person, or case. See farther, in his Dissertatio Epitome de Accentuum Graecorum Antiquitatem et Ufu. Basii. 1686.

Montfaucon, (Pal. Grec. p. 33.) after observing that Aristophanes of Byzantium invented profody, or accents, adds, that the Greek language was not, before his age, totally destitute of accents and aspirates, because, without these, no language can be pronounced; but, that he directed the regulation of them, in place of the marks and forms by which they were to be expressed, and the place in which they were to be introduced. The same sentiments are likewise maintained by Dr. Foster, in his "Effay on the different Nature of Accent and Quantity. Eton. 1763, ed. 2d," who explores the notion that the Greek accent teaches the quantity of pronunciation; and who maintains, with many others, that it is a musical note. Professer Gecer, in a dissertation "De Accentuum genuina Pronuntiatione," printed in 1755, has laboured to remove the principal objections against the antiquity of accents, viz. that they do not coincide with the profody of the Greeks; and are, therefore, to be considered as a modern corruption of the Greek language. His opinion amounts to this, that the accents do not at all determine which syllable is to be pronounced longest; that the accent, e.g. of κατηγορίαν, being placed on the first syllable, does not oblige us to pronounce the word as a dactyl; that, as the Greeks spoke more musically than we, they pronounced some syllables more dactylically than others; that they raised their tone and dropped it; and that the elevation and fall of the tone were determined by the accents. See Monboddo's Origin and Progress of Language, vol. ii. b. 2. paffim. Mr. Marth, the learned translator of Michaelis's Introduction to the New Testament, informs us (vol. ii. p. 892) that Eugenius, a Greek priest and archbishop of Chiefon, in reading Greek, distinctly marked by his pronunciation both accent and quantity, lengthening the sound without raising the tone of his voice, when he pronounced a long syllable, which had not an acute accent, and raising the tone of his voice without lengthening the sound, when he pronounced a short syllable which had an acute accent; in the same manner as in music, where the highest note in a bar is frequently the shortest. Hence he infers, that the opinion advanced by Prof. Gecer and Dr. Foster, is not merely theoretical, but confirmed by actual experience. An example of this kind, however, is very rare; because the modern Greeks, in general, pronounce according to accent alone. In England the Greek accents are rejected; and quantity alone, as it is generally supposed, is regarded in pronunciation. But Mr. Marth observes, that we shall pronounce Greek according to accent, though according to rules different from those which are followed by the Greeks themselves. In reading Greek we observe the same rules with regard to the position of the tone, as in reading Latin; and here we do not regulate the tone of the voice merely by the length of the syllables. e.g. Ψυρίς, ψύρης, φύσις, φόνος, are pronounced in the same manner, though they differ in quantity; and κρίνων, κρίνων, κρίνων, κρίνων, are pronounced alike, though they vary in quantity. We are therefore directed in placing the accent, or raising the tone of the voice, by some principle distinct from that of quantity. The rule for placing the accent in Latin words, which has been laid down by Latin grammarians, is the following. In Latin diffyllables the accent is always on the first syllable, whether it be long or short. In polyyllables the accent is on the penultimate, whether this be long or short. See Diomedes de Accentibus, l. ii. p. 426, printed in the Grammatico Latinae Auctores Antiqui. Op. et Stud. Heleni Matthi, Hanov. 1695, 4to. See also Quinellian Inst. l. i. c. v. p. 59. Ed. Burman. According to this rule, there is only one case in which accent and quantity must coincide, and that is in polyyllables, which have the penultimate long; but in polyyllables which have the penultimate short, and in all diffyllables, it is merely accidental, whether accent and quantity coincide or not. This disagreement constitutes the harmony of Latin verse, which would be intolerable if accent and quantity always coincided; as any one will find, who makes an hexameter consisting of six words, of which the first five are dactyls: whereas, those verses are the most harmonious, in which the number of words, where accent and quantity disagree, is equal to the number of those in which they coincide. In the first line of Virgil's Bucolics, which is a very harmonious verse, accent and quantity coincide in τύτυρος and τεγύμινος, but disagree in ῦηιμνιμα and πατάκα. The Greeks adopted a very different principle from the Latins in determining the syllable which was to be elevated in speaking; for in έκασκενος they raised the antepenultimate, in έκασκενος they shortened the penultimate. Thus Diomedes (ubi supra, l. iii. p. 435.) observes, that the acute accent of the Greeks occupied three places, the ultimate, penultimate, and antepenultimate; but amongst the Latins only two places, viz. the penult and antepenult. Since we then, in order to avoid a method attended with some difficulty, regulate the tone of the voice in Greek as we do in Latin, it follows that we read Greek, neither according to Greek accent, nor Greek quantity; but according to the rules of the Latin accentuation. The whole difficulty of the Greek accents, say Melfra, Port Royal, consists in two points: the first, in knowing the quantity of the penultimate and ultimate, and the second, in knowing on what syllable the words should have their elevation by nature; because, even supposing the same quantity, the elevation may not be the same, which never happens among the Latins. This is a difficult and embarrassing business, for which grammarians have given a number of rules and a greater number of exceptions. See Port. Roy. Gr. Gram. vol. ii. p. 291. &c.

The best advocates for accents have not contended, that the ancient Greeks used them in common books, much less in letters, but only in their schools; and Michaelis apprehends that they do not occur in any copies of the New Testament till extant, which are antecedent to the 5th century, and but seldom in those which are more modern. He adds, they were not written by the Apollos; but were probably first added by Euthalios in the year 458. See Wetstein's Prolegomena, p. 73. His translator, however, has discovered both accents and marks of aspiration in several MSS. which he mentions; particularly the Vatican and the Claromontane. The Alexandrian, Cambridge, and four other MSS. are without accents. Marth's Transf. of Michaelis's Intro. vol. ii. p. 894. In a treatise de Rhythmo Grecorum, not long since published, and ascribed to a learned Prelate of the English church, the author controvert the opinion, adiun effa in soluta eratian francae rhythmicam, adiun in metris, in opposition to Faber, Dacier, Pearce, Clarke, and others. Another learned writer, supposed to be Bishop Horley, in his "Effay on the Profodies of the Greek and Latin languages," maintains, that the marks of the accents were introduced in the writing of the Greek language some time before the commencement of the Christian era, and that they exhibit the true speaking tones of the language; such as were used by the Greeks themselves, when it was a living language,
language, spoken in its purity. This writer ably refutes the fyllem of Mr. Primatt, who (in his "Accentus Redivivus," published in 1764,) is an advocate for the antiquity of the accents, and who defends the accented pronunciation of Greek prose; whilst he agrees with the opposers of the Greek accents, that they are not calculated to regulate the recitation of verse. According to Mr. P. verse and prose were pronounced, by the ancient Greeks, by two different rules: the one, by the rule of the Latin accent, which he, as well as most others who dispute the Greek accents, confider as an universal rule of quantity, or metrical recitation: the other, by the proper accents of the Greek language. He is thus reduced to the necessity of adopting the indefensible hypotheses, that it is the nature of the acute accent to lengthen the syllable on which it falls, and yet, with evident inconsistency, he admits, that, in music, length of sound and accent of tone are not always united. The learned prelate, just mentioned, condemns the rule, which has been functioned by some of the classical scholars of our two universities, that we are to read by accent in prose, and quantity in verse; and he observes, that it is not very probable, that any people should have had two pronunciations essentially different, one for prose, and another for verse. He equally condemns the position, that prose as well as verse in Greek must be read by quantity, that is, as he says, by the Latin accent, and thinking that the Greek accentual marks express, as we have already said, the true speaking tones of the language, he proposes rules of recitation, on the supposition that tone was not always laid on connected words, where the accentual marks appear; whole position, however, was not changed, to prevent the confusion which would follow from making the position of the written mark different in connected from what it is in isolated words; and he confines the printing of books unaccented. He also maintains, that, though in placing accent, regard is had to quantity, euphonia gratiss, and though it may therefore be a symptom of quantity, it is never a cause of it, and never creates it; and he calls the opinion of Mr. Primatt and others, that the acute accent lengthens the tone of the syllable on which it falls, a common prejudice. In order to prevent accent from interfering with quantity, he proposes to transpose it: as in the line, Μίαν απὸ τὴν περιβάλλων Ἀχιλῆς, the word Ἀχιλῆς must be pronounced Ἀχιλῆς.

An ingenious writer, viz. Mr. A. Browne, in his observations upon Greek accents, published in the 16th Translations, vol. viii. p. 339, &c., professes, that he never could adhere to a position contradictory to the testimony of his ear, as that of the acute accent not lengthening the syllable on which it falls; and that his mind was much impressed by an observation of Mr. Primatt, that it is one of the extraordinary powers of the acute accent, even to change the real quantity, and also with his attention, that the opinion of Mevra. De PortRoyal, viz. that the accent only raises the voice without giving any duration in pronouncing, is erroneous. Nevertheless, he is disposed to acquiesce in the sentiment, that the accents denote only tone, or elevation and depression of the voice. This writer, conceiving it of importance to ascerten the pronunciation of the modern Greeks, and their mode of using the accents, made some attempts for this purpose. The importance of this inquiry is obvious, because the Greek is at this day a living language; whereas the Latin has in this respect been extinct for 1500 years.

The result of his inquiry, after conversing with some modern Greeks, was, that they have not two pronunciations for prose and verse, and that in both they read by accent. But they make accent the cause of quantity, so as to govern and control it; and they make the syllable long on which the acute accent falls, and they allow the acute accent to change the real quantity. They pronounced οὐκρατος short, and οὐκρατος long, with a marked attention to the alteration of the accent with the variety of the case. Instead of καθώς they said καθώς, and for Σαμπονις they pronounced Σαμπονίς. He was assured by them, that verse as well as prose was read by accent, and not by quantity, and they exemplified their mode of reading by reciting several lines of Homer. Our author concludes, upon the whole, that the ancient Greeks as well as the modern read both verse and prose by accent, and that they allowed the accents to control and alter the quantity. Dacier, Pearce, and Clarke admit, that they read prose by accent, not by quantity: and the learned prelates, to whole opinion and writings we have referred, contend that they could not have had a different mode of reading prose and verse.

To these two propositions Mr. P. accedes, and the combination of them confirms his opinion. He diffents, however, from the inferences deduced from them by their advocates, viz. that verse is not to be read by accent, as the first mentioned gentlemen maintain; or as the prelates affirm, that, though it is, its quantity is not thereby affected. Our author adds, that the modern Greeks use for accents the word εξα, thus confirming the opinion, that there is properly no accent by the acute, the graces interfering the execution of accent; and that the word ώρομελετε in the ancient Greek language, is the term used for accents; which word, when translated into Latin, is accusus or accusus, implying elevation of voice, or a kind of fong, superadded or raised in the common tone of the voice, and cannot be applied to the grave, which is the negation of any departure from the usual level. He is of opinion, that the circumstance which has been mentioned as the peculiarity of the English, viz. that we always prolong the sound of the syllable in which the acute accent falls, is true with regard to every nation upon earth. It is true of the modern Italians and modern Greeks. In the English language quantity is not affected, because quantity and accent always agree. The cale is the same, as Sir William Jones has shown, among the Etruscans; and he observes, with respect to its position, that the Persians, like the French, usually accent the last syllable of the word. We shall here add a remark, though not immediately connected with the subject of this article, alluded to Mr. B. by his conversation with the modern Greeks, that we are much mistaken in our idea of the supposed lofty sound of ὄστρακον ἐλαρρας; as the borders on the coast of the Archipelago take their ideas from the gentle laving of the shore by a summer wave, and not from the roaring of a winter ocean; and they accordingly pronounced it Πολυβισθενον Θάλασσας.

The use of accents to prevent ambiguities is most remarkably perceived in some eastern languages, particularly the Sanscrit and Chinese. The Chinesc only reckon four accents; for which the missionaries of the following marks: a, a, a, to which they have added a fifth, thus a. They make a kind of modulation, so that by prolonging the duration of the sound of the vowel, they vary the tone, raising or falling it by a certain pitch of voice: and their talking is a sort of mimic or singing. The same found ye, according to the accent affixed to it, signifies God, a wall,
wall, excellent, fluidity, and a goos. If they deviate ever
so little from the accent, they fay quite a contrary thing to
what was intended. Thus, meaning to compliment the
perfon with whom you are converfing with the title of Sir,
you call him a beau with the fame word, by merely a flight
Mem. fur la Chine, tom. i. p. 275.

The Siamese are fometimes observed to fing rather than talk.
Their alphabet begins with characters, all only equivalent to K, but differently accented. For though in the pro-
nunciation the accents are naturally on the vowels, yet they have come to diverfify fuch of their confonants as are in
other refpects the fame. De la Loubierre du Royaume de
Siam, tom. ii. § 8.

As minutely as the accents of words have been studied,
foke of sentences feme to have been utterly overlooked;
yet it may be observed, that all mankind lower the voice at
the end of a period, and elevate it in interrogations and the
vol. ii.

Accent is applied, not very properly, to the characters
which mark the quantities of syllables, or the time during
which the voice is to dwell upon them. The fporious
accents answer to the characters of time in music, as crotchetts,
quavers, &c. The genuine accents rather answer to the
musical notes, fol, fa, &c. Such are the long accent,
which fhews that the voice is to fip on the vowel, and is
expreffed thus, ( ) ; and the fhort accent, which fhews
that the time of pronunciation ought to be fhorter, and is
marked thus ( ). Some even rank the hyphen, diafynes, and apo-
phages, among accents.

Accent also denotes a certain inflextion of the voice;
or a peculiar tone, and manner of pronunciation, contralzed
from the country, or province, where a perfon was bred.
In this fense, we fay, the Welsh tone or accent, the
Northern accent, the Gallican accent, Norman accent, &c.
See Pronunciation.

Accent is also a tone or modulation of the voice, fre-
quently used as a mark of the intention of the speaker,
and giving a good or evil fignification to his words. One may
give offence with the fofealta and mott footing words imagin-
able, by a proper management of the accent and manner of
pronouncing them. The accent frequently gives a contrary
fence to that which the words themfelves naturally im-
port.

Accent, in Music. In the mechanism of melody, or
meffared musical tones, musicians have long agreed to regard
the first and third notes of a bar, in common time,
whether vocal or instrumental, as accented, and the second
and fourth notes as unaccented. In triple time, divided
into three portions, the first note and third are accented, the
second unaccented. But thofe accents are variouly modi-
fled; often to produce some comic effect, as wantonly
lining to ridicule lameness. If the third note in triple
time is accented in serious music, it is always left forcibly
marked than the first. In the speech or elocution of the
natives of every country, and almmost in every province of a
country, there is a peculiar tone or tune, by which nice ob-
ervers discover the refidence of the speaker. A native of
Scotland, e. g. however carefully educated, and accurate his pronunciation, has a cantilene, a tone of voice, by which an
Englishman discovers his country. The language that is
the moft forcibly and frequently accented, is indisputably
the bell fitted to receive musical tones. When it was faid
in a conference with Metallatio on the fubject of languages,
that the Italian was the bell calculated for music of any
dialect in Europe, he cried out " &* musica flesis," it is music
itself. Another Italian (Eximenco) obferved, that the con-
version of a Roman matron, vol un avis, is equal to an air.
In letting fongs, the structure of the verse regulates the
musical accents; and instrumental music is but a fucced-
naum to vocal. It may be faid, therefore, that no music,
even for instruments, is fo generally pleasing as that which
can be sung. The genius of instruments, and abilities of per-
formers, require more notes to display their powers, than a
human voice can, with propriety, attempt to execute. In
very rapid divifions, accenting or defaccenting the fcale in
notes of equal length, no regard is had to accents; and,
though the execution may be neat and articulate, an Italian,
fond of simplicity, would fay of it, as of a fhake misapplied;
non dice niente, it fays nothing. Without accent there is
no more melody in fong, than in the humming of a bee;
and without the regular arrangement of long and fhort syll-
ables, there can be no verification. There are as many
differents accents in music as in speech, or modes of enforcing
or enfeebling the meaning of words. There is a yes that
fays no, and a no that fays yes. There are accents of spirit
and accents of violence, of tendernefs and of friendship.
The voice of a feeling finger can modulate all these shades,
or affect the hearer on the side of intellect as well as of
fence. Dionyfius Halcarn. regards accent as the fource of
all music. Accents is a poetical name for verse itclf.

"Winds on your wings to hear her accents bear
Such words as heav'n alone is fit to hear."

Pattions and affections are the food of vocal music. Dry-
den's Virgil, parf. iii.

"Give to the musician (fays Roufseau) as many images
and fentiments to express as possible; for the pattions fing,
the understanding only fpeaks."

"Accent, according to Holder (Elements of Speech),
as in the Greek names and usage, seems to have regarded
the tune of the voice; the acute accent railing it in fome
certain syllables to a higher, i. e. more acute pitch, or tone,
and the grave depreffing it lower, and both having fome
emphafis, i. e. more vigorous pronunciation." See Accent
in Grammar.

The variety of instrumental expreffion produced by the
different manner of bowing the fame paffage or groupe of
notes on the violin and violincello, on the flute by the
coup de langue, on the hautboiy by the preffure of the lip,
is beyond calculation. Articulation, emphafis, pointed
bowing, flurring, tonguing, &c. are all technical terms,
which will be ferverally explained, as connected with
accent.

Accent, in Poetry. See Ref and Versification.

Acceptance, the act of receiving or admitting.

Acceptance, among Civiilians, is the concurrence of the
will, or choice of the donee, which renders the act com-
plete; and without which the donor may revoke his gift at
pleasure.

In beneficiary matters, the canonifs hold, that the ac-
ceptance fhould be signed at the fame time with the refigna-
tion, not ex intermittis.

Acceptance, in Common Law, denotes a tacit agree-
ment to a preceding act, which might have been defeated
and avoided were it not for fuch acceptance.—If a man
and his wife, feifed of land in the right of the wife, make
a joint leaf, or foellment by deed, referring rent; the man
dying, and the wife receiving the rent; fuch receipt is de-
emed an acceptance, and fhall make the leaf good; fo that
the fhall be barred from bringing the writ, Cui in Vita.

So if a leffe for the term of twenty years, accept a leaf
of the fame land for ten years; by the leffe's acceptance
of the new lease, the term of twenty years is determined in law. 2 Roll Abr. 469.

Acceptance, in Commerce, is particularly used in respect of bills of exchange.—To accept a Bill of exchange, is to sign or subscribe it; and thereby become principal debtor of the sum contained therein: with an obligation to pay or discharge it at the time prefixed.

The acceptance is usually performed by him on whom the bill is drawn; upon its being preferred to him by the person on whose behalf it was drawn, or by some others by his order.

A small matter amounts to an acceptance, so that there is a right understanding between both parties; as, "Leave me your bill with me, and I will accept it," or, "call for it to-morrow, and it shall be accepted." This obliges as effectually by the custom of merchants, and according to law, as if the party had actually subscribed, or signed it, which is usually done.

But should a man say, "Leave your bill with me; I will overlook my accounts and books between the drawer and me, and call to-morrow, and accordingly the bill shall be accepted," this shall not amount to a complete acceptance; for this mention of his books and accounts was really intended to give him an opportunity of examining if there were effects in his hands to answer; without which perhaps he would not accept the same; and so it was ruled by the Lord Chief Justice Hale, at Guildhall, London.

A bill may be accepted for part; because the party, upon whom the same was drawn, had no more effects in his hands; which being usually done, there must be a protell, if not for the whole sum, yet at least for the residue; however, after payment of the full part, there must be a protest for the remainder.

Bills payable at sight are not to be accepted; as being to be accepted at their presenting; or in defect of payment, to be protested.—In bills drawn for a certain number of days after sight, the acceptance must be dated; because the time is to be accounted therefrom.—The form of this acceptance is accepted such a day: and then the signature.

Bills drawn, payable on a day named, or at usage, or double usage, need not be dated; usage being reckoned from the date of the bill itself.—On these it is sufficient to write, accepted, and the signature.

If the bearer of a bill be contented with an acceptance to be paid in twenty days after sight, where, in the bill itself, only eight days are expressed, he runs the risque of the twelve additional days: so that if the acceptor fail he has no remedy against the drawer. And if the bearer contents himself to receive a less sum than is expressed, in part, he is to stand the chance of the reft.

Acceptation, in Grammar, the signification of a word; or the sense wherein it is taken and received.

Acceptation, in the Civil Law, an acquittance given without receiving any money, or a declaration of the creditor in favour of the debtor, signifying, that he is satisfied for his debt, and forgives all further claim, or demand; though in reality no payment has been made.

Acceptor of a bill of exchange, the person who accepts the bill. See Acceptance.

Access, in a general sense, signifies the approach of a thing towards another. In which sense, access stands opposed to recesso.

We sometimes say, the access of bodies, the access of the sun, the moon, the planets, &c. but more frequently the approach of bodies, the appulse of the moon, the rising of the sun, &c. Geometricalians speak of a line called the curve of equal access, or approach.

Access, in a more particular sense, denotes entrance, or admittance. We say such a person has access to the prince: the access on that side was very difficult, by reason of rocks, &c.

Access, in Medicine, denotes a fit, or the periodical diseas[e]. We say an access of the gout, but especially of an ague, an intermitting fever, an epilepsy, &c. and an access of madness: sometimes also prophetic access, a cold access, &c. Access is frequently confounded with paroxysm: but they are different things; an access being the beginning or first onset of a disease, a paroxysm the height of it.

ACCESSIBLE, something that may be approached, or to which we may have access. Such a place, a fortress, is accessible from the seaward; i.e. the passage to it is practicable. See Fortification.

In surveying, it is such a place as will admit of having a distance measured from it: or such a height or depth as can be measured by a proper instrument: for doing which, see Altimetry, Altitude, Distance, Height, and Longimetry.

Accession, in a general sense, is the act of approaching or going to a place, person, or thing. It is more particularly used for the act whereby a thing is joined, or united to something that existed before.

Accession, in Politics, is used for the act of engaging and becoming a party, in a treaty before concluded between other powers; on the same conditions as if originally comprehended in the treaty itself: such as the accession of the States General to the treaty of Hanover, of the Czarina to the treaty of Vienna, &c. It likewise signifies a prince's succeeding to the government upon the death of his predecessor.

Accession, in the language of the Conclave, is a method of electing a pope, by procuring for some candidate two-thirds of the voices, upon which the rest are enrolled by way of accession.

Accession, in the Civil Law, denotes a method of acquiring property is certain things, by virtue of their connection with other things, which already belong to us.

Accession is effected divers ways, whence arise several species of it, simple and mixed, natural and artificial, discrete and concrete accession. See Alluvion, and Specification.

Accessorius Flexor digitorum pelvis, in Anatomy, a name given by Dr. Hunter to that portion of muscle which was described by Sylvius, and generally distinguished by the title of Mappa carnea Sybilli. See Sacroluembaris.

Accessory, or Accessory, something that accedes, or is added to another more considerable thing; in which sense the word stands opposed to Principal.

Accessory, in Grammar, is used by Mr. Harris to denote such words as are significant by relation in opposition to principal, which is applicable to words that are significant of themselves. See Word.

Accessory, or Accessory, in Common Law, is chiefly used for a person guilty of a felonious offence, not principally, but by participation; as, by advice, command, or concealment, &c.

There are two kinds of accessories: before the fact, and after it. — The first is he who commands, or procures another to commit felony, and is not present himself; for if he be present, he is a principal.

The second is he who receives, affilts, or comforts any man that has done murder, or felony, whereof he has knowledge. A man may also be accessory to an acccyory, by aiding, receiving, &c. an accessory in felony.

It is a general rule of the ancient law, that accessories shall
shall suffer the same punishment as their principals; if one be liable to death, the other is also liable. 3 Ind. 183. But though accessories and principals are liable to the same punishment, the distinction between them should be regarded, partly for the purpose of distinguishing the nature and denomination of crimes, that the accused may know how to defend himself; when indicted partly; because a distinction is made between them by the statutes relating to the benefit of clergy; accessories after the fact, being still allowed the benefit of clergy, in all cases (except horse-dealing, Stat. 31 Eliz. cap. 2. and dealing of linen from bleaching grounds, Stat. 19 Geo. II. cap. 27.) which is denied to the principals, and accessories before the fact, in many cases, such as petit treason, murder, robbery, and wilful burning; partly because no man formerly could be tried as accessory till after the principal was convicted, or at least he must have been tried at the same time with him, though that law is now much altered; and, moreover, because, though a man be indicted as accessory, and acquitted, he may afterwards be indicted as principal; but it is doubted, whether, if a man be acquitted as principal, he can be afterwards indicted as accessory before the fact. Nevertheless, it is clearly held, that one acquitted as principal may be indicted as accessory after the fact. See further on this subject of the trial of accessories, the article Aaron. In some cases, if the principal cannot be taken, then the accessory may be prosecuted for a misdemeanour, and punished by fine, imprisonment, &e. Stat. 1 Anne, cap. 9. Stat. 3 Anne, cap. 31. In the lowest and highest offences there are no accessories, but all are principals: as in riots, routs, forcible entries, and other trespas, which are the lowest offences.—So also in the highest offence, which is, according to our law, high treason, there are no accessories. 3 Indit. 178. 1 Hale's P. c. 613.

Accessories, in petty treason, murder, and in felonies of several kinds, are not to have their clergy. There can be no accessory before the fact in manslaughter; because that is sudden and unpremeditated.

Accessory by statute, is such a one as abets, advices, aids, or receives one that commits an offence, which is made felony by statute.

Accessory nerve, Accessorius Willisi, or Par Accessorium, in Anatomy, a pair of nerves, which, arising by several filaments from the medulla spinalis of the neck, and having advanced to the first vertebra, wherever each of them is fixed to the posterior side of the ganion of the nervous suboccipitalis, or tenth pair, ascend through the great foramen of the os occipitis into the cranium; and communicating with the 9th and 10th, pass out again close to the 8th pair. Afterwards turning backward, and perforating the muscle sternum-mastoideus, they terminate in the trapezus, having first distributed some branches to the rhomboidei. Physiologists have been at a loss to account for the singular origin and course of these nerves. The ancients considered them as branches of the 8th pair. Willis also considered them as appendages to that pair, and called them accessorii. They are sometimes called the spinal pair, but as this denomination comprehends the nerves of the spine indifferently, Willis's name is more appropriate, and therefore it has been generally preferred. See Origin and Course of the Nerves.

Accessory, among Painters, an epithet given to such parts of a history piece, as serve chiefly for ornament, and might have been wholly left out; such as veils, armour, &c.

ACCHO, in Geography, a port called by the Greeks Prolemias, and now Acre.

ACCI, in Ancient Geography, a town in the confines of Bactra, supposed to be Guadis, in the province of Gra nada, in Spain. It was also called Colonies Accitana, and its inhabitants were denominated Gen(mainis, and the colony Gemella, because it was formed from two legions, viz. the third and the fifth.

ACCIACATURA, in Muffe, is a term, as it should seem, by the little success of those who have attempted it, difficult to be defined by words, or to be exemplified in notes. It is putting down with any interval the half note below it, and instantly taking off (as if it were red hot) the finger which has struck the lowest of the two notes, continuing the sound of the other note, till the harmony is changed. An organism never puts down a single flow note on his instrument without touching, at the same time, the semi-tone below, and sometimes keeping it on, or making a beat with the forefinger, while the thumb remains firm on the principal sound. The term acciacatura, though not uncommon, is not new; as it occurs in "L'Armonico Pratico "al Cembalo," of the eminent opera composer Francisco Gasperini, the maker of Dominico Scarlatti, and of the celebrated singer la Pautina: this tract, which is in fact a treatise on accompaniment, was first published at Venice in 1703. The technical term acciacatura is derived from acciacare, to bruise, crush, or jam down. Gasperini compares it to the hard bite of an insect, that instantly flies away. See pl. No. 1. Muffe; some examples from the 15th edition of this excellent little tract, reprinted in 1764.

ACCIACOLI, Donatus, in Biography, a learned Florentine of the 15th century, was born in 1428, and distinguished by the honourable employments which were conferred on him in his native country, and by the probity and disinterestedness of his character. He published commentaries on the ethics and politics of Aristotle, which he collected from the lectures of Arrystratus the Byzantinian, and the translations of the lives of Alciabides and Democritus from Plutarch, to which were added those of Hannibal and Scipio, and of Aretino's twelve books of the history of Florence, printed at Venice in 1476. He also wrote an Abridgment of the Life of Charlemagne, and some other Treatises. Having been sent to France by the Florentines to sue for succour from Louis XI. against Pope Sixtus IV. he died on his journey at Milan, in 1473; but his body was carried to Florence, and buried in the church of the Carthusians. His daughters, like those of Aristides, were married, and portioned at the public expense, as an acknowledgment of his services. His funeral oration was pronounced by Chirillof Landini, and an elegant epitaph by Politian, was inscribed on his monument. Gen. Diet.

ACCIACOLI, Zenobius, a learned Dominican, of the same family with the former, continued to enjoy the office of librarian to the library-keeper to Pope Leo X. from the year 1518, to his death in 1520, as aforesaid, in 1537 according to others, at the age of 78. He learned Greek and Hebrew towards the close of his life, translated several of the fathers, and wrote several orations and poems, sermons on the Epiphanies, and some other pieces. He likewise collected a volume of Politian's Greek epigrams, which were published in 1495. D瑶le.

ACCIACOLI, Angelo, cardinal, legate, and archbishop of Florence, died in 1407. He preferred the Florentines in their obedience to the pontiff Urban VI. when attempts were made to seduce them in favour of Clement VII. He wrote a work, with a view of healing schism, which then rent the church.

ACCIACOLI, Renatus, descended from a noble family of Florence, achieved the conquest of Athens, Corinthus, and a part of Boeotia, at the beginning of the 15th century. Having no male issue by Eubois, his wife, he bequeathed Athens
ACCIDENCE, Accidens, a name chiefly used for a little book, containing the first elements or rudiments of the Latin tongue.

ACCIDENS, in Philosophy. See Accident.

Per Accidens, is frequently used among philosophers to denote what does not follow from the nature of a thing, but from some accidental qualities thereof, in which sense it stands opposed to per se, which denotes the nature and essence of a thing.

Thus fire is said to burn per se, or considered as fire, and not per accidens; but a piece of iron, though red hot, only burns per accidens, by a quality accidental to it, and not considered as iron.

Accident, in Grammar, denotes a property attached to a word, without entering into its essential definition. Thus every word, whatever be its signification, will be primitive, derivative, simple or compound, which are the accidents of words. Besides, each particular species of words has its accidents: e.g. those of the noun substantives are gender, declension, and number, and the adjective has another accident, viz. comparison.

Accident, in Heraldry, is an additional note or mark in a coat-armour, not necessarily belonging to it; but capable either of being retained, or omitted, without altering the essence of the armours. Such are Abatements, Differences, and Tinctures. Edmonston observes, that accidents of arms, though frequently mentioned by authors, can have no meaning in blazonry.

Accident, in Logic, something additional or superadded, to a substance; or not essentially belonging to it, but capable, indifferently, either of being or not being in it, without its destruction. The schoolmen distinguish three kinds of accidents, verbal, predicative, and predicamental. Verbal accident stands opposed to essence; and in this sense the adjective to a thing, though subsistences themselves, are denominated its accidents. Thus a man's clothes which are not essential, but adventitious or accessory to his person, are accidents. Predicatable accident is used in opposition to proper. Such is any common quality, as whiteness, heat, or the like. These are called in the schools, predicable accidents, because usually hid down and explained in the doctrine of predicables. They may either be taken in the abstract, as whiteness, learning; or in the concrete, as white, learned. If taken in the abstract, as is done by Periphy, the accident is defined as above, that which may either be present, or absent, without the destruction of its subject. If it be taken in the concrete, accident is usually defined by the schoolmen, to be something capable of being predicated contingently, of many, in respect of quality. As learning, which may probably be predicated of you, him, &c. Predicamental accident is a mode or modification of some creating subsistence, inhering or depending thereon, so as not to be capable of subsistence without the same. In this sense, accident is opposed to subsistence. Whence, as subsistence is defined a thing that subsists in itself, and the substantiation of accidents; so an accident is said to be that corpus esse illi nupta: and therefore Aristotle, who usually calls subsistences simply ousia, entities, beings; commonly calls accidents omen, entities of entity; requiring some subsistence wherein to reside, as their subject of adhesion. So that accident has an immediate and essential dependence on its subsistence; both as to its production, its continuation, and its effects; it arises or is deduced from its subject, is preferred or subsistified by it; and can only be affected by what alters, or affects, the subject. The old schoolmen, however, will not have accidents to be mere modes of matter, but entities really distinct from it: and in some cases, separable from all matter. But the notion of real accidents, and qualities, is now exploded. Aristotle and the Peripatetics make nine kinds of classes of predicamental accidents; others contract them into a less number. The term absolute accident is used in the Romish theology for a predicamental accident, which subsists, or may possibly subsist, at least miraculously, and by some supernatural power, without a subject. Such, they contend, were the accidents of the bread and wine in the eucharist, e.g. the colour, flavour, figure, &c. thereof, which remain after the subsistences they belonged to are changed into other subsistences of flesh.

The Cartesians universally confirm the notion of absolute accidents; it being their doctrine, that the essence of matter consists in extension; and that accidents are only modifications thereof, in no wise distinct from it; an accident therefore without a subject must be a contradiction. And hence Cartesianism is branded as contrary to the Roman Catholic faith. Various expedients have been invented by the Cartesians, to account for transubstantiation, &c. without the hypothesis of absolute accidents. Some hold that the usual impressions are made on the sense by the immediate agency of God; and without any thing remaining of the former nature. Others ascribe the whole to heterogeneous matter contained in the pores of the bread, &c. which remaining unaltered by the transubstantiation, produces the same sensations as the bread produced.

Accident, among Physicians, is sometimes used for what is more generally called Symptom.

ACCIDENTS, in Astrology, denote the most extraordinary occurrences in the course of a person's life: such are a remarkable infallibility of good success, a signal delivery, a dangerous sickness, &c.

ACCIDENTAL, in a general sense, signifies something that partakes of the nature of an accident; or, what is not essential to its subject, but is indifferent. Thus, whiteness is accidental to marble; and sensible heat to iron.

Accidental in Philosophy, is applied to that effect, which proceeds from a cause occurring by accident, without being subject, according to appearance, to general laws or regular returns. In this sense, accidental is opposed to constant and principal. Thus, the sun's left or greater distance from the earth is the constant and chief cause of the heat in summer, and cold in winter; whereas winds, snow or rain are accidental causes, which often alter and modify the action of the principal cause.

Accidental colours, so called by M. Buffon, are those which depend upon the affections of the eye, in contradistinction to such as belong to the light itself. The impressions made upon the eye by looking fixedly on objects of a particular colour are various, according to the single colour, or assemblage of colours, in the object; and they continue for some time after the eye is withdrawn, and give a false colouring to other objects which are viewed during their continuance. M. Buffon has endeavoured to trace the connection which these accidental colours have with those that are natural, in a variety of instances. The subject has likewise been considered by M. de la Hire, and M. Epinus; and M. d'Arcy has contrived a machine for measuring the duration.
duration of the above-mentioned impressions on the eye; and he inferred in the result of several trials, that the effect of the action of light on the eye continued about eight thirds of a minute. See Acc. Par. 1743, and 1765. Nov. Com. Petrop. vol. 10. And for an abstract, Priddley's Hist. &c. of Discoveries relating to Vision, &c. p. 631.

Accidental Point, in Perspective, is a point in the horizontal line, in which a right line, drawn from the eye, parallel to another right line, intersects the picture or perspective plane. This is also the accidental point of all other lines parallel to the original line, since the same line drawn from the eye is parallel to them all; and the representations of all these parallels, when produced, concur in the accidental point. See Perspective.

Accidental Dignities and Debilities, in Astrology, are certain casual dispositions and affections of the planets, whereby they are supposed to be either strengthened or weakened, by their being in such a house of the figure.

Accidental in Mufic, is an epithet added to such sharps, flats, and naturals, as occur not at the clef, and which imply some change of key or modulation different from that in which the piece began. In the key of C natural, for instance, an accidental C# implies the key of D minor; a D#, the key of E; an F#, that of G major; and g#, the key of A minor. In like manner a flat placed before B, implies the key of F major, or D minor.

Accipenser, in Ichthyology. See Accipenser.

Accipesius, a name given by Athenæus and others of the Greek writers to the Sturgeon, called by others Oniscus.

Accipiter, a name given by Gallius and some others to the fifth, called by others the milvus and buccerna. It is a species of trigla in the syllams of Artedi and Linnaeus.

Accipitres, or Rapacious Birds, in the Linnaean system of Ornithology, the first order of birds; the characters of which are, that the bill bends downwards, that the upper mandible is dilated a little on both sides towards the point, or armed with a tooth-like process, and that the nostrils are wide; the legs are short and strong; the feet are of the perching kind, having three toes forwards and one backwards; the toes are wanting under the joints, with claws hooked and sharp at the points. The body, head and neck are naked, and the skin very tough. The birds of this order subsist by preying on other animals, and on dead carcases, and they are unfit for food. They live in pairs, and are monogamous; and build their nests in lofty situations. The female is generally larger and stronger than the male, and usually lays four eggs at a time. This order corresponds to that of ferox and comprehends four genera, viz. vulturn, falco, strix, and lanius. Mr. Latham has removed this hilt genus to the order of picce.

Accipitrina, in Batona, a name by which some authors have expressed the hawkweed, and others, the fiskweed or foplia chrirgorum. See Hieracium and Sisymbrium.

Accissus, or Tafanis, in Biology, a Latin tragic poet, who, according to St Jerome, was born in the year of Rome, 581, B. C. 170. Several of his tragedies were founded on the most celebrated stories which had been represented on the Athenian stage, as Andromache, Andromeda, Areus, Cytemnestra, Medea, Melaner, Philoctetes, the civil wars of Thebes, &c. He also composed one didactic piece entirely Roman, called Brutus, which related to the expedition of the Tarquins. Some few that he wrote comedies; and the Wedding and the Merchant are ascribed to him. See Volusius de Poet. Latin. p. 7. Besides his dramatic writings, he left other works, particularly his Annals, mentioned by Macrobius, Priscian, Felius, and Nonius Marcellus. He was much applauded by Decimus Brutus, who was consul in the year of Rome 615, for the verses which he wrote in his praise; and he was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. However, he has been cenured by some for the harshness of his style, though he was generally allowed to be a very considerable poet. The particular character of Accius seems to have been that of vigour and simplicity. Horace styles him alius, elevated, and Ovid, animosus, spirited; the latter applies the epithet arteo, cruel, to his works, which is thought to refer to the subjects of them, or the great catastrophes treated of by the Greek Dramatists. Cicero (De Clar. Orat. p. 395, Eccl. Gen.) speaks with derision of one Accius, who had written history: and some have supposed that, as Accius had written Annals, he refers to him; but this is not probable, as Cicero himself, Horace, Quinctilian, Ovid and Paterculus have expressed themselves in terms of distinguished applause of the Accius that is the subject of this article.

There was also another Accius, or Attius, called Piscan-""
Acclamations were chiefly appropriated to emperors. On them it was bestowed to the most extravagant excess. The talk of applause was not abandoned to the rude and spontaneous voices of the crowd. Prayers of all factions and parties vied with each other on this occasion; and after conflicts which had shaken the capitol, inoffensively sunk into the emulation of servitude. From either side they echoed in responsive melody the praises of the emperor; their poets and musicians directed the choir, and long life and victory were the burren of every song. The fame acclamations were performed at the audience, the banquet, and the church; and they were repeated in all languages by the mercenaries, who sustained the real and fictitious character of the nations in whose respective languages they were pronounced. Constantine Porphyrogenitus has reduced this science of form and flattery into a pompous and trilling volume, which, says Mr. Gibbon, the vanity of succeeding times might enrich with an ample supplement. But this writer very justly observes, that the calmer reflection of a prince would surely fuggiit, that the fame acclamations were applied to every character, and every reign; and if he had risen from a private rank, he might remember that his own voice had been the loudest and most eager in applause, at the very moment when he envied the fortune, or conspired against the life of his predecessor. Decl. and Fall of the Rom. Emp. vol. x. p. 125. Svo. In proof of this it may be remarked, that the acclamations of the populace were conferred on the thrall Vitellius, and the cruel Nero, as well as on Trajan, who merited the title of optimus. In the latter instance, however, they were received with lively feelings of satisfaction and delight, to which the former were utter strangers. His subjects were frequently heard to exclaim in his presence, "Happy citizens! Happy emperor! "Long may he lead this great and virtuous life! "Long "may he hear our ardent wishes for him!" At which tender expressions Trajan blushed, and shed tears of joy; for he was sensible, it was to himself, and not to his fortune, that they were applied; and the senate, after obtaining the prince's leave with great difficulty, ordered such acclamations to be inscribed on plates of brass, that they might be a permanent monument and motive of emulation for succeeding emperors, and a lesson to teach them to distinguish between flattery and the language of the heart.

The honour of acclamations was not wholly restricted to emperors. It was also conferred on their children and favourites, and on the magistrates who prevailed at games. We have likewise instances of its being rendered to persons of distinguised merit, as in the case of Cato and Virgil, mentioned by Quintilian. The most usual forms of acclamations were, "Plector, longarem vitam, annos felices." The actors, and those who gained prizes in the games of the circus, were not excluded from this honour.

The Greeks were accustomed to practice acclamation on extraordinary occasions, as well as the Romans. Plutarch mentions an acclamation found, in consequence of Tiberius's restoring liberty to Greece, that the birds fell from the sky with the shout.

The Turks observe a similar ceremony on the fight of their Emperors and Grand Viziers to this day; and the practice of faluting kings, conquerors, and distinguished perons, with some forms of acclamation, is very general and prevailing.

Authors and poets, who recited their works in public, were always anxious to obtain this honour; and their admirers endeavoured to render it in the most solemn and respectful manner. Sometimes presents enforced the invitations that were designed for convening numerous assemblies for this purpose. "The acclamations, like those of the theatre, were attended with music, and they were adapted to the person, and to the subject; so that philosophers, orators, historians, and poets were differently distinguished. One of the most usual forms was nòs, nóchous, repeated three times; but Martial comprehends other eulogium forms in the following verse:

"Grauiter, eft, nepiter, Euge, Beati." Acclamations made also a part of the ceremony of marriage.

Acclamations, which were at first practised in the theatre, and which passed from hence into the senate, and other departments of civil society, were, in process of time, received into the acts of councils, and the ordinary assemblies of the church. Chrysofom reproved, and checked acclamations of this kind; but Augustine received them very willingly. Sermons were applauded with the hands and feet, by leaping up and down, and exclaiming "orthodox," and by shaking the loose garments, moving plumes, and waving handkerchiefs.

See Lardner's works, vol. iii. p. 81. But their principal use has always been at the solemn entries of princes and heroes; where they are usually attended with good wishes, prayers, vows, &c. Antiquity has transmitted to us several forms of acclamation, some of which we have already recited. The Hebrews used to cry, "Hosanna!" The Greeks, " contemplating the good "good fortune." The Romans addressed their princes, generals, &c. with such expressions as these: "Dii te nosis fervent; vosfors falus, vosfors salus!" i. e. "May the gods preserve you for us; your felicity, our felicity. The acclamations of the army were generally, "Ie triatur" " or " Salve Imperator," Schlemion de Acclam. Vetat. Gen. 4to. 1667. Piftec. lex Ant. tom. i. p. 12. Ferrar de Acclam. et Plan. lib. i. cap. 8. Suicer. Thef. verb. 435. Aquinas L. Milit. tom. i. p. 6. Bingham Orig. Ecclef. lib. xiv. cap. 4. § 27.

Acclamation is also applied among the antiquaries to certain medals, on which the people are represented expressing their joy for some considerable favour. In this sense acclamation is also used to denote the vows represented on medals, for the prosperity of the emperor and common-wealth. Acclamation also denotes a method of election, practised in the Academy of Areata.
ACCLA MATION, in Rhetoric, is a figure of speech, thus called by the Latins, and by the Greeks EVPHONEMA.
ACCLIVIS, in Anatomy, a muscle, otherwise called obliquus abdomen.

ACCLIVITY, the requisite of a line or plane inclined to the horizon, taken upwards. The ascent of a hill is an activity; the descent of the same, a declivity. Some writers of fortification use the term acclivity for talus.

ACCO, in Geography. See ACRE.

ACCOLA, compounded of ad, to, and color, to dwell, being formed of cot, to; and col, or column, neck.

Antiquaries are not agreed, wherein the accolade properly consisted. The generality suppose it to be the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection. Whence the word accolade, q. d. a clapping, or taking round the neck. A very ingenious author will rather have it to be a blow on the chin of the neck, given on the same occasion. Fauchet seems to reconcile the two opinions: he supposes it to be the kiss; but withal, imagines the kiss to be intended as a stroke on the cheek, En leur baillant par la joue—The ceremony being only an imitation of that practised among the Romans, in the manumission of their slaves, where it is known a blow was given. Skinner. Cafeneuve. Orig. Franc. Colomb. Theat. d'Honneur.

As for the accolé, or blow, John of Salisbury affirms, it was in use among the ancient Normans: by this it was that William the Conqueror conferred the honour of knighthood on his son Henry.

At first, it was given with the naked fist; thus Lambertus Ardenius, describing the manner in which Baldric, count de Guinc, was created knight by Thomas à Becket, says, 

\[\text{cecum comite in flagum militium gladium lateri et calcaris fuit militis pedibus adaptato, \& alupam collo suo inficit.}\]

But this was afterwards changed into a blow on the flat of the sword, on the shoulder of the knight.

Salmonet, and after him the continuators of Moreri, mention an order in England, called knights of the accolade; so called from the manner of their elevation. The order here meant is that of knights bachelors, or equites aurati. But the name, if ever, is now no longer known among us.

ACCOLEÉ is sometimes used as synonymous with ACCOLÉ.

Accolé is also used in Heraldry, in divers senses, when two things are joined together, as two shields divided at the flanks, they are said to be accolé. It is moreover applied to lions, dogs, and other animals, which have collars, or crowns about their necks; as the lion in the arms of Ogilvy; others use the term accolé, when two keys, battoons, maces, fowards, &c. are farther wise, behind the field. Nisbet's Elys on Armor. English heralds ordinarily say, collared, or gorged with an open crown, instead of accolé.

ACCOLTI, Benedict, the Younger, in Biography, was grandson of Benedict Accolti, the elder, who flourished about the year 1576, was born at Arezzo, in 1435, and was distinguished about 1450, when he is said to have succeeded Poggios as secretary to the Republic of Florence. He wrote "Four books concerning the war which the Christians carried on against the Infidels, in order to rec-
"that which was spoken by the prophet," or "this was done that it might be fulfilled which was spoken by the prophet." Metekein, in his note to Matth. i. 22, (vol. i. p. 237-8,) has produced, in support of this principle, an example from Ephrem Syrus, and similar expressions from other writers. This principle of accommodation has been adopted, not only by Meteikein, but by Grotius, by Neumull in his "Conference with a Truth" (vol. i. p. 377.) Michaeis in his "Introduction to the New Testament," (see Marth's Tranl. vol. i. p. 214.) and particularly by Dr. Sykes, who has illustrated, defended, and applied it in the introduction to his "Paraphrase on the Hebrews," 3. § 28. &c. and in his "Truth of the Christian Religion," ch. 13. 14. 15.

Dr. Eckermann, profeffor of divinity in the university of Kiel, extends the doctrine of accommodation to every quotation in the New Testament without exception, proceedings on the hypothesis, that the Old Testament contains no prophecy, which literally and immediately relates to the person of Jesus Christ. On the contrary, Dr. Owen in his "Modes of quotation used by the evangelical writers," § 5. entirely rejects the principle of accommodation, admitting, as many others have done, a typical meaning, in order to relieve the difficulties that occur in the explanation of particular passages. Dr. Sykes observes, that if we were better acquainted with the Jewish phileology, we should less hesitate in admitting the above mentioned principle. As for the particular term "fulfilled," he says, the Jewish writers often meant no more by it than the happening of a similar event, or an exact agreement in particular circumstances of latter things with former. An ingenious and much admired writer (see Paley's View of the Evidences of Christianity, vol. ii. p. 298.) speaking of those quotations in the Old Testament found in the New, some of which are applied in a sene and to events apparently different from that which they bear, and from these to which they belong in the original, observes, "it is probable to my apprehension, that many of these quotations were intended by the writers of the New Testament as nothing more than accommodations. They quoted passages of their scripture which suited, and fell in with, the occasion before them, without always undertaking to effect, that the occasion was in the view of the author of the words. "Such accommodation of passages from old authors, from books especially which are in everybody's hands, and which are common with writers of all countries; but in none, perhaps, were more to be expected than in the writings of the Jews, whose literature was almost entirely confined to their scriptures." This writer adds, "these prophecies which are alleged with more solemnly, and which are accompanied with a precise declaration, that they originally represented the event then related, are, I think, truly alleged. But, were it otherwise, it is the judgment of the writers of the New Testament, in interpreting passages of the Old, or sometimes, perhaps, in receiving established interpretations, so connected either with their veracity, or with their means of information concerning what was passing in their own times, as that a critical mistake, even were it clearly made out, should overthrow their historical credit? Does it diminish it? Has it any thing to do with it?"

The question of fact, whether the Jewish Rabbins, in quoting passages from the Old Testament with a formula of this kind, "In this the Scripture was fulfilled," did consider those passages as having themselves reference to the event to which they applied them, or grounded the quotation on a mere parity of circumstances, has been accurately examined by Surenfibus in his Epistle, published in Amsterdam in 1713. In his third thesis, "De formulis allegandis," he compares the expression "כּכָּלָה עַשָּׁה הָעֶהֶלֶת" with Rabbinical Hebrew formulas of a similar kind; and concludes upon the whole, that the expression is not only allusive, but demonstrative. See QUOTATION.

The primitive church accommodated multitudes of Jewish, and even Heathen ceremonies and practices, to Christian purposes; but the Jews had before done the same with regard to the Paraphrase on the Gentiles; some will even have circulation, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only accommodated by Moes to the purposes of Judaism. Siriuin's Differt. Old Test. tom. 1. p. 506. Spencer de Leg. Hebr. Difcri. i. lib. 3. p. 32. Middleton's Letters from Rome in his Works, vol. iii. p. 63. This accommodation, in the most extensive sense of the term, is the subject of two prize differtations in Teyler's Theological Society; and the discussion of it by Van Hamert, professor of philosophy and literature in the Society of Reemonstrants in Amsterdam, and De Vos, minifier of the Baptist congregation in the same city, may be found in the 21th volume of these Differtations. The learned Professor had prepared the way for this discussion by an offer, in which he had delivered upon being appointed to this office. In this discourse he maintains, that Christ, who was the wisest and best of all teachers, adapted both the manner and manner of his instruction to the capacity and habits of his hearers. With regard to the former there can be no dispute; and, as to the latter, he observes, that our Saviour manifested an evidently intended condescension to the ignorance, imbecility, and prejudices of his hearers. Whilst he avoided the discussion of subjects that were superior to the capacity of his disciples, and that philosophical train of reasoning, which would have been unintelligible to them; he made use of arguments, which, coinciding with their popular notions and national prejudices, were likely to make the deepest impression on their minds; without warranting them to conclude, that these notions were in themselves jurfal, or that he approved them as such. That our Saviour never attempted to correct those errors of his countrymen which related to opinions merely philosophical, is abundantly evident; but there were others that might be supposed to have a more intimate connection with religion, where, however, for wise reasons, he did not think fit to proceed to reform; either because he did not deem them of importance, or because, by opposing them, he might have unnecesarily irritated the minds of his hearers, and have rendered them averse from his instructions. In proof of this observation the Professor refers to the conversation of Christ with the woman of Samaria, his discourse with the Sadducees concerning the resurrection, his answer to the mother of Zebedee's children, and his reply to his disciples, when they believed his appearance to be that of a ghost, or spectre. He distinguishes, however, between what is essential to religion itself, and what relates merely to theology, or the mode of teaching it. The strict propriety and absolute necessity of this kind of accommodation he vindicates by a survey of the stupid ignorance and inerete prejudices of the Jewish nation. As proofs that our Saviour condescended to found his arguments even on the erroneous notions of his countrymen, when they suited his purpose, and did not interfere with the essential doctrines of the gospel, he refers to Matt. xxv. 26, Mark vii. 27; to his distinction of the precepts of the law into greater and lesser, Mat. v. 19; and to his using the term gelinoa, and the judicial style of the Sanhedrin, in Matt. v. 22. The apostles and evangelists also imitated his example, of which instances occur in 1 Theff. v. 23. Coloss. i. 16. Epeh. i. 21. iii. 16. Rom. viii. 38. 1 Pet. iii. 22. In relating facts, the writers of the New Testament conform to the
the popular opinion. Of this nature, (says this author) are all those passages which refer to demons and demonsies, and those which represent the devil as the principle of evil, inflicting mankind to sin. These, he adds, were opinions which properly related to philosophy, and did not materially affect religion; as long, at least, as it was believed that these malignant agents were under the control of divine power, and might be vanquished by good men. The Professor is of opinion, that the existence of such a malignant being, exerting an influence over the minds of men, and impelling them to vice and misery, is utterly inconsistent with the perfections of the Deity, with the wisdom of the divine government, and with the free and original agency of man. The Jews had derived from the Chaldeans a notion, that the air was peopled with demons, and that some of these were confined in dark prisons, in the infernal world; and some commentators have supposed, that what the apostles Peter and Jude have said concerning the punishment of angels, was borrowed from the apocryphal book of Enoch, which might probably have been written by some Hellenistic Jew. Of the acquiescence of the writers of the New Testament in the current, but erroneous notions of their countrymen, this author mentions St. John's account of the wonderful virtues of the pool of Bethesda, and what St. Luke says of the Sadducees in Acts xxii. 8. There are also many facts, in which Christ used, what logicians call, the argumentum ad hominem; of which there is a striking example in the answer given to the Pharisees, when they accused him of calling out devils by Beelzebub. Thus also, in the parable of the rich man and Lazarus, Christ founded his description of the future state of reward and punishment on the notions of the Jews concerning their past state and gehenna, which were nearly the same with those of the Greeks and Romans concerning the Elysian fields and Tartarus. See also Luke xxiii. 30. The acquiescence of Christ and his apostles in the prejudices of their countrymen is also evident in the quotations from the books of the Old Testament. These, as their classic authors, the Jews cited on every occasion; but being, like all the orientalists, very fond of allegory, they supposed that, beside the obvious and literal meaning of these writers, which they considered as comparatively of little value, there was a hidden and mysterious sense which referred to the Messiah and his kingdom. With this custom, says the Professor, though in itself injudicious, the writers of the New Testament judiciously complied. Hence, he adds, most of, if not all, the passages of the Old Testament, which are quoted in the New, are adduced in a sense very different from their primitive signification, and form a kind of argumentum ad hominem, founded on the principles of those to whom they were addressed. Of the same kind of accommodation to Jewish prejudices the author deems the condescension of St. Paul in adopting the puerile allegories of the rabbies concerning Sarah and Hagar in Gal. iv. 24; and that of the apostles Peter and Jude, in referring to a story, related in some apocryphal book, of a dispute between the archangel Michael and the devil about the body of Moses. Such are the outlines of the Dissertation above cited, in which the author produces other instances of accommodation. The Pharisees believed the metempsychosis or transmigration of souls (see Josephus Bell. Jud. iii. c. 8.); and M. Hemert imagines that they applied this hypothesis to the prophecy in Malachi iv. 5; and that our Lord did not contradict it in his discourse with his disciples, Matt. xvi. 14. And again, he apprehends, that in Matt. xiv. 14, Christ not only forbears to correct this notion of the Jews, but indirectly allows it, as what he did not at that time think proper to oppose; and shews them that, even on this hypothesis, the prophecy of Malachi was fulfilled. The blended accounts that are given of the destruction of Jerusalem, and of the resurrection and last judgment in Matt. xx. 34. &c. are considered by this writer as an acquiescence in the popular notion, with a view of animating the first Christians to confidence and diligence amid the peculiar difficulties which they had to encounter. The Professor having by such modes of reasoning flated the fact, proceeds to inquire how far this hypothesis of accommodation to popular notions may be extended, confidently with the view to inculcate the character of our Saviour and his apostles. Whilts our Lord generally left physical errors uncontradicted, he confidently opposed those prejudices and mistakes that were contrary to the perfusion of God's impartial love to all mankind, or detrimental to the nature and principles of practical piety and virtue. In answer to the objections which may be alleged again this hypothesis, the Professor begins with evincing the absurdities to which those have been reduced, who have endeavoured to vindicate the philosophical accuracy of the Scriptures. In accommodating their instruction to the different capacities of those to whom they were communicated, and adapting them to the peculiar character of their age and nation, as well as to their particular prejudices and habits, Christ and his apostles did no more than what might be expected from wise teachers, endowed with a divine commission; and they who on this account object to them, manifest an ignorance of the human heart, as well as of the office of an instructor of mankind. They also misapprehend the design of Christ's mission, which was not to make his hearers philosophers, nor even to instruct them in all those particular truths which may be considered as influencing religious opinions. Mankind in general, and the Jews in particular, were not qualified to receive such instruction. Without this accommodation the design of our Lord's mission would have been counteracted and defeated, if either he or his apostles had encountered every error of the age and nation to which they were sent. To those who allege that, among the instances cited by the author, of popular errors, in which Christ and his apostles were supposed to have acquiesced, there are some which relate to the essential doctrines of the gospel; he replies, that while he allows that important truths might sometimes be inculcated on the attention of the people, by arguments founded on their own erroneous notions, he absolutely denies that these notions themselves have any necessary connection with the essential truths of the gospel. Perhaps, he adds, it may be asked, whether the existence and power of the devil be not religious tenets—but by whom, or on what foundation, were these ever made articles of Christianity? Does the belief of such an enemy of mankind at all contribute to promote that integrity, and that sanctity of heart and conduct, which the Saviour came to establish? Or is not this notion rather calculated to fill the weak and superstitious with vain terrors? For this reason, says this professor, the apostles, though they did not contradict the popular notion, took care to obviate its pernicious consequences by always representing the devil as vanquished by Christ. Is the belief of demons that inhabit the air, that haunt the desert, or that INFUNE themselves into the bodies of men and afflict them with diseases, an essential doctrine of the gospel? May we not believe the Christian doctrine of a future state of retribution, without acquiescing in the notions of the Jews concerning paradise and gehenna, and cultivate a firm hope of the resurrection of the dead by Christ, without believing that the archangel will found a trumpet to awaken us from the sleep of death? Is it necessary to our belief that Jesus is the Christ of God, that
that we refer to him all those passages which the Jewish doctors, and, after their example, the Jewish converts to Christianity, from their love of allegories and types, explained as relative to him? &c. &c. In a word, if we consider the genuine nature of our religion, as taught by our divine maimer, we shall see, says the author, that none of the innuences, in which it has been here fupposed, that Christ and his apostles accommodated their intuitions to the prejudices and notions of their countrymen and contemporaries, have any necessary connection with the design of the gospel, or interfere with any of its essential truths. The Prefider proceeds to specify some rules by which we may discriminate those pages of scripture that may be considered as innuences in which the sacred writers accommodate, in popular prejudices; and he closes with some observations on the utility of this hypothesis of accommodation in explaining the scriptures. M. De Vos traces nearly the fame ground of argument; but without extending the hypothesis of accommodation so far or so intrepidly controverting received opinions; opinions which the reader of this article will not inadvertently reject, and without the previous hesitation and subsequent examination which they demand. In a work of this kind the editor, fearfuls of reproach from the judicious and candid, thinks it incumbent upon him to recite impartially different hypotheses pertaining to philosophical and theological subjects, and to submit them, on the authority of their proporcors, to the judgment of the reader; without being answerable either for their truth or falsehood, and without being supposed, on his own part, to admit or reject them.

ACCOMMODATION, in Law, is used for an amicable agreement or composition between two contending parties. Thus we say, the proces is become fo intricate and perplexed that there is no hope of getting out of it but by an accommodation. These accommodations are frequently effected by means of compromise and arbitration. See Arbitration.

ACCOMPANIMENT, something attending or added as a circumstance to another; either by way of ornament, or for the sake of symmetry, or the like.

ACCOMPANIMENT, accompanimento, accompagnatura, in Music, implies the instruments that accompany the voice, solo, or concerto, to sustain the principal part, whether vocal or instrumental, as well as to enrich the harmony.

The Crítica Dictionary gives no authority from early writers in Italian, of accompanimento, accompaniment, being used as a technical term. In the fourth and last acceptance of the verb accompagnare, it is only said, in general, to be a musical term, figuring "to play on an instrument in harmony with the voice." and this definition appears in no edition anterior to that of 1746.

Italian musical terms have now been adopted by all Europe; yet we are acquainted with no professed musical dictionary in that language. But the words peculiar to the art being taken from the common language of the country where it was first cultivated, they need no explanation to the natives; yet, in other countries, which have derived their knowledge, or at least, their taste, from the Italians, these words are become technical, and need a glossary.

To write, make, or compose, an accompaniment, are synonymous terms with musicians, for fetting, or adding parts for violins, flutes, or other instruments, to a melody, vocal or instrumental, in order to be performed with it. In the early operas the accommodations were very thin. In the first operas, indeed, none appeared, except in the symphonies and choruses; but, in process of time, as dramatic music advanced towards perfection, it was found that effects could be produced by the orchestra which were picturesque, coloured sentiments, and augmented auricular pleasure. A simple melody, unless performed by a great singer, became insipid. But, though much ingenuity and science appear in a rich and full accompaniment on paper, yet in performance, the composer and the orchestra frequently abuse their power, and tyrannize over the voice, which they should cherish, and dignify the poetry by complication and noise, which they should help to explain and enthrone. And it is a general complaint at the opera, when a cantilena, or vocal part is good, and performed by a singer of the finest clasps, that the accompaniments are too loud—troppo charger, say the French, and troppe varicato, cry the Italians.

Accompaniment is likewise another word for thorough-bass, by giving in chords the whole harmony on which the melody is built. These chords are expressed by figures over the base, which figures supply the place of a treble part for the right hand on keyed-instruments.

The rules for accompaniment are few, with respect to harmony, but their use depends on judgment and good taste. Some, fond of crowded harmony, think it can never be too loud or full; while others, who prefer a simple and beautiful melody to the most artful combinations of kindred sounds, almost think harmony a grievance. There are, who prefer a measure and monotonous accompaniment to solos; and others imagine that the voice is better supported by being accompanied in unison. But Roussel in enumerating the qualifications of an accompanist, has settled this point:

"Whoever undertakes to accompany a song or solo, should be a confammate musician, well skilled in harmony, and the construction of the several parts; should have a nice and cultivated ear, a hand prepared for all difficulties of execution in the base, and modulation into different keys, with a sound judgment and good taste. It is the business of the accompanist on the organ, harpsichord, or pianoforte, to give the pitch to the several instruments, and the time to the whole band; to have always under his hand the note which the singer is about to deliver, in order to correct, if faile, and enforce, if fcelable; and, at the beginning of an air or movement, to mark with energy and precision the several portions of the bar, that the orchestra, if a quick air, may proportion the rapidity to the abilities of the finger; and, whether quick or slow, indicate such a specific motion as suits the genius of the composition, and the design of the composer. But, above all, whatever is accompanying another to whom the principal melody is assigned, should remember, that he is a servant, a humble attendant on a temporary sovereign, and should suppress all ambition of shining at the expense of the voice or instrument which he accompanies."
right hand, instead of the chords, can completely qualify a performer on a keyed-instrument to accompany a good or a bad singer.

Rousselou, though no deep theorist, had a very good taste in music, and excellent views concerning its refinements and effects; and, in his "Letter on French Music," the bell piece of criticism on the art, perhaps, that has ever been written, speaking of accompaniment on the harpsichord, he says: "when burckita opera were first performed at Paris, every one was struck at hearing the manager's son, a child of ten years old at most, accompanying the fingers, and producing with this little fingers effects so different from those of M. Noblet, the usual performer on the harpsichord, a good harmonist, and exact in giving the full complement to each chord. But what was my surprise in watching the hands of the little man, and observing that he hardly ever gave the whole harmony to the bass; but supposing many chords, and frequently using only two fingers, with one of which he generally played the octave to the bass, and with the other the interval most important in the melody! What! says I to myself, has a multihued harmony more effect than one that is complete? And do our thorough-bass players, by giving the full chords, produce only a confused noise, while this child with fewer sounds enforces the melody more, and renders the accompaniment more useful and agreeable? This was a problem which I was unable to solve; but I became more sensible of its importance afterwards, by observing that all the Italians accompany good fingers in the same manner as this infant did; and upon the same principle as the composers have their scorns thin, often making the tenor play only in octaves above the bass, and the second violin in octaves below the first. I remembered that I had read somewhere in Ramen, that every concord had a different character, or power of affecting our sensibility, peculiar to itself; that the effect of the 3d was different from that of the 5th, the 4th from the 6th. In the same manner 3d and 6ths minor must produce different affections from those of 3d and 6ths major. These facts once established, it evidently follows, that even discords and every kind of interval will be included in the rule: an idea which reason confirms, since, when the relations are different, the imprefion cannot be the same."

The reasoning of the citizen of Geneva on this principle is very specious and ingenious. "I see clearly," continues he, "that, by adding concord to concord, injudiciously, though agreeable to the doctrine of chords, by augmenting the harmony, we may weaken and counteract the effect of each found. If the entire and pure effect of a 5th, be necessary for the expression which I want, I risk the weakening this impression by a 3d found, which, dividing the 5th into two 3ds of different kinds, though when struck together the harmonical effect is good, yet they may mutually diminish the peculiar effect of each other. In like manner, if the simultaneous impression of the 5th and two 3ds were necessary to my design, I should fail in producing the effect I intended by retrenching either of the 3ds from the chord. This reasoning becomes still more intelligible, applied to discords."—"It follows from all this, that, after having well studied the elementary rules of harmony, the musician should not hastily lavish it inconsiderately, nor believe himself a composer because he can crowd the chords with unmeaning notes; but, before he begins to combine founds, he should apply himself to a much longer and more difficult study: that of the different impressions which the concords, discords, and all the intervals make on the ear of sensibility, and often fay to himself, that the great art of a composer consists no less in differing what sounds occasionally to

suppress, than what to admit. It is in finding and turning over incessantly the matter-pieces of Italy, for vocal music, (and of Germany for instrumental, he would now have added) that a composer would learn to make this exquisite choice, if Nature has given him sufficient genius and taste to feel its necessity; for the difficulties of the art are only perceived by those who are able to vanquish them; and such will not treat with contempt the vacant lines in a score; but, seeing with what ease a mere Tyr might fill them up, they will fupleat, and seek the reasons for this seeming simplicity: for much the more admirable, as it conceals prodigies under a seemed negligence, and that, l'arte che tutto fa, nulla si fupprese. These seem to me (continues Rousselou) the caues of these surprizing effects which the Italian music produces, though much less crowded with harmony than ours, (that is, the old French music) of which the effects are so small and the labour so great. This does not imply that a score should never be full, but that it should be filled with choice and deferement; neither is it to say that to accomplish this, the musician should make all these reflexions; but that he should feel the result. It is his business to leave genius and taste to find these effects, and that of the theorist to seek and explain whence they arise."

To accompany recitative on a keyed-instrument, where no regular time is observed, and the finger utters in musical tones, a fableque or dialogue, under no more restraint, as to measure, than if he were declaiming in common speech, the instrumental accompaniment must attentively read the words, and strike the chord firmly which is given to the most accented and energetic part of a verse or period, exactly when it is pronounced by the finger, except at a close or termination of a scene or period, when two chords are given without the voice: one to the base of the 5th of a key, with a sharp 3d, and the other usually to the key note, in whatever key the modulation is carried; but this expectation is often disappointed, except at the close which immediately precedes the air.

We shall pursue the subject of Accompaniment further, under the articles Harmony, Chords, Thorough-base, Rule de l'octave, Figuring a base, and Recitative.

Accompaniments, in Heraldry, are all such things as are applied about the shield by way of ornament, as the belt, mantlings, supporters, &c. A thing is also liable to be accompanied when there are several bearings or figures about some principal one, as a falter, band, fes, chevron, or the like.

Accompaniments, in Painting, denote such objects as are added by way of aptitude or ornament to the principal figures; as dogs, guns, game, &c. in a hunting-piece.

ACCOMPILCE, compounded of ed, to, con, together, andpicare, to fold, in Law, one that has a concern in a business, or that is privy in the same design or crime with another. See Accessory.

By the law of Scotland, the accompile can only be prosecuted after the conviction of the principal offender; unless the accesion of the accompile be immediate, in ipso acta, fo as in effect to render them co-principal. By the general rule, the accompile suffers the fame punishment with the principal offender. Yet if he be remarkably less guilty, justice will not permit equal punishment. The council of Sen, and several other syndical statutes, expressly prohibit the revealing of accomplices. See Discovery of accomplices.

ACCOMPLISHMENT, in a general sense, the entire execution, achievement, or fulfilling of something proposed, or undertaken.
ACCUPLACEMENT, in Theology, is principally used in speaking of events foretold by the Jewish prophets, in the Old Testament, and fulfilled under the New. In the writings of biblical commentators and critics, we read of a literal, mythical, typical, single and double accomplishment. Prophecy may be accomplished either directly or by way of accommodation. See Accommodation, and Prophecy.

Accomplishment is more particularly used for any personal endowment, mental or corporeal.

ACCOUNT. See ACCORD.

ACCOUNTED, or ACCOUNTED, is a verbal agreement between two, at the least, to satisfy an offence which the one hath committed against the other; whether it be a trespass, or the like; for which the one agrees to make, and the other to accept, a certain satisfaction.—This, if executed, becomes a good bar in law to any suit to be brought for the same matter. Accord with satisfaction is a good plea in personal actions, where damages only are to be recovered, and in all actions, which suppose a wrong, vi et armis, where a capias and exequat lay at the common law, in trespass and ejectment, detinue, &c. So in an appeal of Maihem. But in real actions, it is not a good plea. 4 Rep. 1. 970. 9 Rep. 77. By several late statutes, particularly 11 Geo. II. c. 19, in case of irregularity in the method of dilinguing, and 24 Geo. II. c. 24, in case of mistakes committed by judges of the peace, even tender of sufficient amend to the party injured is a bar of all actions, whether he thinks proper to accept such amend or not. See Tender.

ACCOUNT. Accord. Myfics, is more usually called Concord. It is also used by older authors for Chord.

The word is formed, according to some, from the Latin ad, to, and cor, the heart; but others, with greater propriety, derive it from the French corde, a string; on account of the agreeable union between the sounds of two strings struck at the same time. Whence also some of the consonants in mufic are called tetrachord, hexachord, &c. which

Accord, in Painting, denotes the harmony that prevails among the lights and shades of a picture.

are a fourth and a sixth.

ACCORDARE. Ital. to tune instruments.

ACCODRE, Fr. to tune instruments.

ACCOUNTS, Stephen Tabouret, Seigneur des, in Biography, an advocate in the parliament of Dijon in France, was born in the year 1549. The lordship of Accords is an imaginary lieu or title, derived from the device of his ancestors, which was a drum, with the motto, 'a tous accords; "ching" with all." S. Accords was a man of genius and learning, but too much addicted to trilles, and to a licentious mode of writing. This appears from his piece entitled "Les Bigarrures," printed at Paris in 1582; and another called "Les Touches," published at Paris in 1585, which is a collection of witty poems indecorously written. Bayle.

ACCOSED, in Heraldry, a term not often used, but of the same signification with Cottised.

ACCOCHEUR, and ACCOCHUSE, Fr. a man or woman practising midwifery.

ACCOCHMENT, Fr. the act of delivery.

ACCOUNT, premature, AVERTEMENT, or PAVISSE COUCHE, Fr. the premature exclusion of a fetus.

ACCOUNT, or ACCOMPT, of ad, to, and computus, a computation, in Arithmetic, a calculation, or computation of the number or order of certain things; as the computation of time, &c. There are various ways of accounting, as by enumeration, or telling one by one; and by the rules of arithmetic, addition, subtraction, &c.

ACCOUNT, in Chronology, is nearly synonymous with Vol. I.

STYLE. We account time by years, months, &c. the Greeks accounted it by olympiads; the Romans by indicia, lulls, &c.

ACCOUNT is also used in respect of a company or society, when two or more persons have received or disbursed money for each other; or when this has been done by their order or commission. See Commission, and Company.

ACCOUNT, or ACCOUNTS, is also used collectively for the several books or registers which merchants keep of their affairs and negotiations. See Book-keeping.

There are divers kinds of accounts among merchants, as personal, real, imaginary, general, particular accounts, &c.

ACCOUNTS, personal, are those which discover what each person, or subject, with whom a man has dealings on credit, owes to, or has owing to him.

ACCOUNTS, real, are those whereby a dealer discovers what effects are on hand at any time, and what is gained or lost on each.

Every account is distinguished into two parts, for which two opposite pages are aligned on one folio or opening; the name of the person with whom a man has account being written on the top of each, with the word debtor on the left side, and creditor on the right.

ACCOUNT, personal, is to contain on the debtor side what the person owes me, and the payments I make to him; and on the creditor side, all that I owe to him, and the payments he makes of his debts to me.

ACCOUNTS, real, must contain on the debtor side the quantity and value of what was upon hand at the beginning of the account, and all afterwards received, with the costs and charges thereof; and on the credit side, the quantity and value of what is dispaid of or any way taken out of it, with the returns made by it.

ACCOUNTS, imaginary, are then brought in to make a balance between credit and debt, and in cases where the real and personal accounts will not in the articles belonging to them make, as they usually do, such balance.

The chief of these is the account of profit and loss; on the debtor side of which are entered all losses, and on the creditor side all gains. Such also is the flock account, &c.

ACCOUNTS, fundry, when one account is balanced by fundry, i.e. when one is debtor or creditor for a sum, and fundry accounts creditors or debtors for the parts of the sum; it is entered under the head of to, or by, fundry accounts. Accounts, general, are those where all the goods of the same name are put into one account.

ACCOUNTS, particular, are those where each species, or subdivision of things under the same name, have their separate account.

ACCOUNT, open, is used for an account not liquidated or settled.

ACCOUNT, in bankers, is a fund of money, which merchants, or others, place in the common cash of a bank, to be in readiness for the payment of bills of exchange, or promissory notes, purchases, and other debts contracted in the course of business.

ACCOUNT, current, amounts to the same with an open account.

ACCOUNT, opening an, with any one, signifies the placing him, for the first time, in the great book. This is done by writing his name, surname, and place of residence in large characters, and afterwards charging him with articles, either of debtor or creditor, as affairs turn up. When an account is opened with any person in the great book, his name is at the same time to be entered in the index or alphabet book, with the page wherein his account is to be found.

ACCOUNT, placing a sum to an, is to enter down in the
great book the several particulars for which a person becomes either debtor or creditor.

Account, consisting an, is the reading it exactly over, pointing the several articles, and verifying the computation, in order to find whether there be any error, and whether the sum total, or the balance, be just.

Account, casting up, or closing an, is the framing and settling of it, to find the balance: this is called also balancing or setting an account.

Accounts are closed in the great book, on two occasions: the first, when it is required to terminate an affair entirely, either with debtors or creditors, in order to learn what is due. The second, when it is necessary to carry on the account to another page of the same book, or to a new book, for want of room.

Account, balance of an, is the sum by which the debt exceeds the credit, or vice versa, upon stating or settling it.

Account of fails, is an account given by one merchant to another, or by a factor to his principal, of the disputes, charges, commissions, and net proceeds of certain merchandize, sent for the proper, or company, account of him, who configured the same to such factor or vender.

When the like account is inland or domestick, the same is transmitted in the current money of that country wherein the business is transacted. As from a Blackwell-hall factor to the clothiers in the country, or from the warehousesmen in town, who deal by commission for the country manufacturors.

Account, money of, is an arbitrary species, contrived for the facilitating and expediting the taking, and keeping of accounts. Such are pounds sterling in England; livres and sols in France; roupas in India; milres in Portugal.

Accounts, books of, of merchants and tradesmen, are considered as a sort of private instruments, and in the civil law, and law of merchants, are allowed to make a half proof. The reason is, that merchants are often under a necessity of dealing on trust without note or writing. Hence the superintendence of the merchant, with his book of accounts, is admitted abroad as a full proof against his chapman. But in England this is under some limitation. See ibid. 7 Jac. I., cap. 12. which confines this species of proof to such transactions as have happened within one year before the action brought; unless between merchant and merchant, in the usual intercourses of trade.

Account, or Accrue, in a legal sense, is a particular detail or enumeration, delivered to a court, a judge, or other proper officer or person, of what a man has received or expended on the behalf of another, whose affairs he had the management of.

In the remembrancer's office in the exchequer, are entered the flates of all the accounts concerning the king's revenues, for customs, excise, subsidies, &c.

The great accounts, as those of the mint, wardrobe, army, navy, tithes, &c. are called impress accounts.

All accounts which pass the remembrancer's office are brought to the office of the clerk of the pipe. See Tally and Auditor.

Account, in Common Law, denotes a writ or action which lies against a person, who by his office ought to give an account, but refuses.

A writ or action of account properly lies only against bailiffs, receivers, and guardians in socage; though others are also brought in as a secondary intendment.

By 4 and 5 Anne, actions of account may be brought against the executors and administrators of guardians, bailiffs, receivers, &c. and by one joint-tenant, &c. against the other, his executors and administrators, as bailiff, for receiving more than his share: however, actions of account are now very seldom used; the most ready and effectual way of settling matters of account being by bill in a court of equity.

Accounts, chamber of, in the former French policy, is a sovereign court of great antiquity, where the accounts relating to the king's revenue were delivered in, and registered. This answers pretty nearly to the court of exchequer in England.

There are presidents of accounts, masters of accounts, correctors of accounts, &c.

ACCOUNTANT, or Accountant, in a general sense, denotes a person skilled in accounts. In a more limited sense, it is used to a person, or officer, appointed to keep, or make up the accounts of a company, office, court, or the like.

Thus there are accountants in the custom-house, the excise, bank, South-sea, and East-India-house.

ACCOUNTANT-GENERAL, an officer in the court of Chancery appointed by act of parliament, to receive all monies lodged in court, instead of the masters, and convey the same to the bank of England for security. Counterfeiting the hand of the accountant-general is felony without clergy, by 12 Geo. I. c. 52.

ACCOUNTANTS' SHIP, the act of keeping and balancing accounts. See Book-keeping.

ACCOUNTS, Public, Commissions of, are five per cents appointed by letters patent under the act of 25 Geo. III. c. 52, who are invested with the powers formerly entrusted to the auditors of the impress, and who receive salaries paid out of the aggregate fund, not exceeding in the whole 4000l. They hold their office quodnamque, &c. except two of them, who are comptrollers of the army accounts, and who continue commissioners for long only as they are comptrollers. The Treasury likewise appoints officers, clerks, &c. to make up and prepare for declaration the public accounts of the kingdom, and all charges are allowed out of the aggregate fund to an amount not exceeding 5000l. per annum, which is paid in fees and perquisites. The purposes for which these commissioners are appointed are to examine and state in what manner, and at what times, the receipts, issues, and expences of the public monies are now accounted for; and to consider and report, by what means and methods the public accounts may, in future, be perfected, and the accountants compelled to pay the balances due from them, in a more expeditious, more effectual, and less expensive manner. The commissioners have already made a great number of reports.

ACCOUNTREMENT, an ancient term used for an habitation; or a part of the apparatus and furniture of a foliër, knight, or even of a gentleman.

The word is formed from the ancient German, buffer; whence cours, a name used of some cathedrals in France, e. g. at Bayeux, for the sacristan, or officer, who has the care of furnishing and setting out the altar, in the church; called in German, buster, or vormotz.

ACCRETION, of ad, to, and crescre, to grow, in Physics, the growth or increase of an organic body, by the accretion of new parts; also a growing together, as of the fingers to one another.

Accretion is of two kinds; the one consisting in an external apposition of new matter. This is what we otherwise call justicewort or; and it is thus, stones, shells, &c. are supposed to grow.

The other is by some fluid matter received into proper vessels, and gradually brought to adhere, or grow to the sides
fides thereof. This is what we call introduction; and it is thus that plants and animals are nourished.

Accretion, in the Civil Law, denotes the union or accession of a thing vague or vacant, to another already occupied or disposed of.

A legacy given to two persons jointly, tam re quarn velbus, falls wholly to him that survives the testator, by right of accretion. Accretion is another species of accretion.

Accretio, in Heraldry, denotes a thing being hooked into another. Coats Herald.

Accroching, in old Law books, the act of encroaching or usurping on another's right; and particularly the attempt to exercise royal power, which was a very vague charge, and led to a multitude of constructive treasons. There are limited and defined by flat. 25 Edw. III. cap. 2.

The word is originally French, accrocher, which signifies to fallen a thing by a hook.

Accrued, or Accrue, in Law, is understood of a part that accedes to, or follows the property of another part or person.

Accrued, in Heraldry, a term applied to a tree full-grown.

Accumulation, a pottage of the body, between fitting and living.

The word is compounded of ad, to, and cubo, I lie down. Accumulation, or accubitus, was the table pottage of the Greeks and Romans; whence we find the words particularly used for lying, or rather, as we call it, sitting down to meat.

The Greeks introduced this pottage. The Romans, during the frugal ages of the republic, were strangers to it. But as luxury got footing, this pottage was adopted, at least by the men; for as to women, it was reputed an indecency in them to lie down among the men; though afterwards this too was got over. But children did not lie down, nor servants, nor soldiers, nor persons of meaner condition; but took their meals fitting, as a pottage_lifts indulgent.

The Roman manner of disposing themselves at table was this; a low round table was placed in the comaculum, or dining-room, and about this usually three, sometimes only two beds, or couches; according to the number of which, it was called binarium, or trinimum. These were covered with a sort of bed-cloaths, richer or plainer, according to the quality of the person, and furnished with quilts and pillows. What the guests might lie the more commodiously. There were ordinarily three persons on each bed; to crowd more was effeemed forbad. In eating they lay down on their left sides, with their heads resting on their pillows, or rather on their elbows. The first lay at the head of the bed, with his feet extended behind the back of the second; the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third; and so of the third, or fourth. The middle place was esteemed the most honourable. Before they came to table they changed their cloaths. putting on what they called censatoria vestis, the dining garment, and pulled off their shoes, to prevent fouling the couch. Pitife. Lex Ant.

Accubitor, an ancient officer of the emperor of Constantinople; whose business was to lie near the emperor. The accubitor was the head of the youths of the bed-chamber, and had the cubicularius and precurrier under him.

Accumulation, compounded of ad, to, and cumulus, heap; the act of heaping, or amassing several things together.

Accumulation, in a legal sense, denotes a concurrence of several titles to the same thing; as when a person claims lands, a benefice, or the like, in virtue of several titles, or pretentions of different kinds; e. g. by death, by resignation, &c. On, it denotes a concurrence of several circumstances to the proof of one fact; thus, we read of accumulative treason; which is, where a fact is not treason in itself, but becomes so by an accumulation of circumstances.

The Earl of Strafford was condemned of accumulative treason; none of the facts alleged against him amounting singly to treason. But his attainder was reversed by 13 & 14 Car. II. cap. 29.

Accumulation, in the ancient Agriculture, denotes the operation of covering up the roots of trees, by throwing on them the earth that had been before dug from them; in which sense, accumulation stands opposed to ablation. Thuny Nat. Hist. vol. ii. p. 58. Ed. Hard.

Accumulation of arms, cumulatio armorum, in Heraldry, is what the moderns call quartering of arms. Nibet.

Accumulation of degrees, in an University, is used for the taking of several degrees together, and with fewer exercizes, or nearer to each other, than the ordinary rules allow of.

Accursed, something that lies under a curse, or sentence of excommunication.

In the Jewish idioms, accursed and crucified were synonyms. Among them, every one was accounted accursed, who died on a tree.

This serves to explain the difficult passage in Rom. ix. 3, where the apostle Paul wishes himself "accursed after the manner of Christ," i. e. crucified, if hapily he might by such a death save his countrymen. The preposition εκατοντας, here made use of, is used in the same sense, 2 Tim. i. 3, where it obviously signifies after the manner of.

Accurius, in Biography, a professor of law in the 13th century, born in Florence, who, on account of his great authority, was called the idol of the lawyers. Three other lawyers of eminence had the same name.

Accurius, Maxiangelus, a famous critic of the 16th century, born at Aquilo, in the kingdom of Naples. His "Diatirbe," printed at Rome in 1524, fol. on Aulius, Solinus, and Ovid, evince his distinguished erudition. In his edition of Ammianus Marcellinus at Augsburg, in 1535, there are five books more than in any preceding ones, and he lays that he had corrected 5000 errors. Although his predominant passion was the collecting of old MSS. he nevertheless made Latin and Italian verbs, was master of the French, German, and Spanish languages, and understood optics and music. Having been charged with plagiarism in his edition of Aulius, he purged himself by oath.

Bayle.

Accurius, or Accorso, Francis, the elder, an eminent lawyer, was born at Bagnolo, near Florence, in 1182, and became professor of law in the university of Bologna, where he had studied. He undertook the great work of forming into one confluent and harmonious whole, the numerous commentaries on the Code, the Institutes, and the Digests. This work, entitled, "A perpetual Commentary," was much valued, and is printed with the "Body of Law," published in six volumes folio, at Lyons, in 1627. Accorso died very rich in 1660. His son, the younger Francis Accorso, succeeded him in the chair of law; and, in 1738, accompanied Edward I. on his return from the crusades to England. Gen. Dib.

Accusat, among Physicians, is a word of the fame import as indicatio.
ACCUSATION, compounded of ad, to, and casuari, to plead, in the Civil Law, the charging any person with a criminal action, either in one’s own name, or on behalf of the public.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment, or abolition. Cato, who was esteemed the moit innocent person of his age, had been accused forty-two times, and abolished as often. But the accusation of private crimes was never received, unless from the mouths of those who were immediately interested in them. Thus, none but the husband could accuse his wife of adultery. Indeed, it was not properly an accusation, except in public crimes; in private ones, it was called simply action, or initiating an action, intendere actionem, or libat. When the accused the accuses the accuser, it is called recombination, which is not admitted till the accused has been first purged.

The ancient Roman lawyers distinguished between passatio, delatio, and accusation: for, first, leave was denied to bring a charge against any one, which was called passio; then he, against whom the charge was laid, was brought before the judge, which was called defere, or dominant delatio; lastly, the charge was drawn up and presented, which was properly the accusation. Vofl. Etym. Lat. The accusation properly commenced, according to Pausanias, when the rei, or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the delatio made by his opponent. Calv. Lex. Jur. p. 17.

The accusers, or actors, as they are called, were, by the laws of Pompey, A. U. C. 703, allowed two hours for pleading their cause, and the party charged three hours for a reply. Ditt. Cist. Lex. xi. tom. i. p. 275; Ed. Rem. They had a right to be heard in the court of property of those who were condemned, and they were frequently honoured with the superior offices of the State. Hb. tom. i. p. 100. 485. 867. 887, &c.

By the cruel laws of the Ιnquisition, the accused is forced to accuse himself of the crime objected to him. There are three ways of entering an information in the tribunal of the inquisition. The first, by way of inquisition, when a private person, applying to the inquisitor, declares he will neither be denunciator, nor accuser, but that common fame gives out, that such and such a person is a heretic; the second, by way of accusation, when the informer takes on him the office of accuser, which rarely happens, because in this cafe, the accuser is obliged to prove, and exposes himself to the lex telonias, if his information should prove false. The last, and most usual way, is by denunciation, that is by naming those who know the fact.

It has formerly been the custom in some parts of Europe, where the accusation was very heavy, either to decide it by combat, or at least to make the accused purge himself by oath; which, however, was not admitted, unless a certain number of his neighbours and acquaintance swore together with him.

In the old French law, none but the procureur general, or his deputies, could form an accusation, except for high treason, and coming, where accusation was open to every body. In other cases, private persons could only act the part of denouncers, and demand reparation for the offence, with damages.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law: none shall be vexed with any accusation, but according to the law of the land; and no man may be molested by petition to the king, &c. unless it be by indictment or pre-sentment of lawful men, or by process at common law. Promoters of suggelsions are to find security to pursue them; and if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No perfon is obliged to answer upon oath to a quiblion, whereby he may accuse himself of any crime.

Writers on politics treat of the benefits and inconveniences of public accusers. Various arguments are alleged, both for the encouragement and discouragement of accusations against great men. Nothing, according to Machiavel, tends more to the preservation of a state, than frequent accusations of persons tried with the administration of public affairs. This, accordingly, was strictly observed by the Romans, in the infallible of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, in the judgment of the same author, are not more beneficial than calumnies are pernicious, which is also confirmed by the practice of the Romans. Manlius, not being able to make good his charge against Camillus, was cast into prison. Mach. de Repub. 11. c. 7. p. 35. Solon facilitated public accusations, because they are more necessary in a democracy than under any other form of government. Without this formidable check, the general liberty would be perpetually endangered by the liberty of each individual. At Athens, if an accuser had not the fifth part of the votes on his side, he was obliged to pay a fine of a thousand drachmas. Thucydides, who accused Ctesiphon, was condemned to pay this fine. At Rome, a false accuser was, by the Roman law, branded with infamy, by marking the letter K on his forehead. Guards were also appointed to watch the accuser, in order to prevent his corrupting either the judges or the witnesses. See Montefq. Spirit of Laws, vol. i. p. 283.

ACCUSATIVE, in Grammar, the fourth case of nouns, which are declined. They may be known from this, that all verbs which express actions that pass from the agent, as, to beat, &c. must have subjuncts to receive these actions, or imply effects that are produced by them; so that such verbs evidently require after them a noun, name, to be the object of the action expressed. Hence, in all languages which have cases, the nouns have a termination, which they call accusative; as Achilles vulneravit Hecatom, Achilles wounded Hecatom here the accusative denotes the subject. Laqueus victus est: Laqueus was wounded here the accusative denotes the effect. In whatever other manner, says Mr. Harris, (Hermes, p. 283.) whether figuratively, or with prepositions, this case may have been nved, its first definition seems to have been that here mentioned, and hence he forms its character and description. Accordingly, the accusative is that case, which to an efficient nominative and a verb of action, subjoins either the effect or the passive subject. But it has been alleged, that this description does not give us an appropriate and discriminating character of the accusative, and sufficiently distinguishes it from the A TIVE. E. G. Antonius autem Cicerone, and Antonius nccuit Cicero, are expressions of the same import; and in each the action of hurting is conceived as proceeding from Antony to Cicero. It has, therefore, been reasonably affirmed, that the only thing essential to these two cases is the apposition or conjunction of one object with another; and they denote this much in the same manner, although from the custom of language they may not be indifferently subjoined to the same verb. See CASE.

In English, we have nothing to distinguish this case from the nominative; but as we ordinarily place words in their natural order, it is easily discovered: the nominative constantly preceding, and the accusative following the verb.

Thus,
Thus, when we say, "the prince loves the princess," and "the princess loves the prince," the prince is the nominative in the first, and the accusative in the last; and the princess the accusative in the first, and the nominative in the second.

ACE, a card or die, marked only with one point. Ace, in Ancient Geography, a name given by several of the ancient writers to the city afterwards called Ptolemais, and now Acre. Strabo. Geog. vol. ii. p. 399.

ACELA, a city of Lycia.

ACELDAMA, was a place without the south wall of Jerusalem, beyond the river of Silwan, and was called the Potter's field, (Matt. xxvi. 7-10.) because they dug out of it the earth of which they made their pots, and the Fuller's field, because they dried their cloth there; but being afterwards bought with the money by which the high priests and rulers of the Jews purchased the blood of Jesus Christ, it was, by the Providence of God, ordering it, called Akeldama, i.e. the field of blood. Acts i. 19.

ACELIUM, or Acetus, a town of the Venetian territory, now called Acuolo, or Ajolo, fituate to the west of Trebiz, at the mouth of the river, called Cenico. It is marked by N. Long. 15° 5', E. Lat. 45°.

ACENTETUM, or Acenteta, in Natural History, a name given by the ancients to the purest and finest kind of rock crystal. They used the crytal in many ways; sometimes engraving on it, and sometimes forming it into vases and cups, which were held next in value to the Murhina unja of those times. The crystall they obtained from the mines of Cyprus was much admired, but often faulty in particular parts, having hairs, cracks, and fonnelles, which they called faults, in the midst of the large pieces. Pliny tells us (N. H. v. ii. p. 570. Ed. Hard) that when it was used for engraving, the artist could conceal all these blemishes among the strokes of his work; but when it was to be formed into cups and precious vases, they always chose the acientem, i.e. the pure crystal, which had no flaws or blemishes.

ACEPHALI, or Acephalite, a term that frequently occurs in Ecclesiastical History, as the denomination of various sects; particularly—1. Of those who in the affair of the council of Ephesus, refused to follow either St. Cyril, or John Chrysostom, or Animotheus. 2. Of certain Christians in Asia, in the first century, who at first followed Peter Mongus, but afterwards abandoned him, upon his subordinating the council of Chalcodon, and were thus deprived of their chief; being generally of the opinion of Eutyches, that there was only one nature in Christ. This sect was afterwards divided into three other sects, who were called Anthropomorphites, Baranaphites and Esaianites; and these again, in the following century occasioned new factions, frequently mentioned by the ancient writers. However, these numerous branches of the Eutychian faction declined gradually in the next century; and the influence of the famous Barzaeus chiefly contributed to their extinction by the union which he established among the members of that sect. 3. Of the adherents of Severus of Antioch; and of all in general who refused to admit the council of Chalcodon.

ACEPHALI, in English History, a name given to the levellers in the reign of Henry I. who were reckoned to poor, that they had not a tenement by which they might acknowledge a superior lord. In this sense the term is used in our ancient law-books, for persons who held nothing in fee, either of kings, bishop, baron, or other feudal lord.

ACEPHALUS, or Acephalus, composed of the privative a, and φαος, head, something that wants a head. Pliny represents the Blemmyes as a headless, or apeachalous nation. Cuiñas and Solinus mention others in India, near the Ganges, without a head, and with their eyes in their shoulders. Mela, Suidas, Stephanus Byzantinus, Vopiscus, and other writers, furnish similar relations; and some modern travellers pretend that they have found people of the same description in America. The origin of this fable has been variously explained. Bartholin understands it metaphorically, affirming that the Acephali had let their brains, or conducted themselves with less prudence than others. In this opinion Boehart seems to have concurred. See Blemmyes. Olearius ascribes it to the fores of such persons; alleging, that the Sunegitans being short of stature, and covering their heads with hoods in winter, seemed at a distance as if they were without heads. Lasius says, that the term Acephali was merely a denomination of people whose heads were deprefed below their shoulders. Hufeland, in an epitome of Raleigh's voyage to Guiana, speaks of a people discovered by that traveller in the province of Tivipana, between the lakes of Panama and Calilip, who had no head or neck; and Hondius, in his map, marked the place, and delineates the figures of these monsters. However, De Lacet (Defer. Ameirc. l. xvii. c. 22.) rejects the story, and relates, that those who dwell on the banks of a river in Peru, call their heads so far back under their shoulders, that many believed they had their eyes in their shoulders, and their mouths in their breasts. But though the existence of a nation of Acephali be ill-warranted, naturalists furnish several instances of individuals born without heads, by some mutations or aberration of nature. Wepfer gives a catalogue of such acephalous births from Schenckius, Lietzow, Parus, Wolfius, Mauriceau, &c. Acephalous worms, or what are deemed such, are frequent. The humbricus latius, or joint worm, was long taken to be acephalous. The first who ascribed a head to it was Tulpus, and after him Fehr; the former even makes it biceps, or two-headed. See Taniya.

ACEPHALUS, Clerk. See Clerk.

ACEPHALUS is also used in Poetry, for a verse which is defective in the beginning. Some also give the name akephalos to all verses which begin with a short instead of a long syllable; as

In the beginning of this verse we have an lambus instead of a long syllable; as

ACE, Mapes, in Botany, so called, as some fay from aecis, denoting the hardness of the wood, or according to others, from aere ingeniwm, because the common maple was much employed by ingenious artificers in fine works, a genus of the massoca order and polypania clasts of plants, and belonging to the natural order of Trifiates. Its generic and essential characters are these: it hath hermaphrodite and male flowers on the same tree; the hermaphrodite calyx is one-leaved, fivespined, acute, coloured, flat, and entire at the base, permanent perianth; the corolla has five petals, ovate, broader outward, obtuse, greatly enlarged than the calyx, and spreading; the flamino conlit of eight or ten filamentous short filaments; the anther is simple, and the pollen cruciform; the pistil has a compressed germ, immersed in a convex, perforated, large receptacle: the style is filiform and daily progressive; the stigmas are two or three, pointed, slender, and reflex; the pericarpium is composed of as many capsules as stigmas, with one seed in each, coalescent at the base, roundish, compressed, and each terminated by a very large membranous spine; the feed are solitary and roundish: the male flowers are the same with the hermaphrodites, except that they have neither germ nor style, but only a biiid stigma. On the unfolding of the flower the stigma only appears, and a few days after, the style. The hermaphrodite flowers in
the same umbel are often of two kinds; the lower ones feminine hermaphrodites, of which the anthers do not burst, but the pisillus grows into a fruit; the upper ones masculine hermaphrodites, of which the anthers scatter their dust, and the pisillus do not grow, but fall off. Mr. Martyn in his much improved edition of Miller's Dictionary, enumerates and describes twenty species. In the last edition of Linnæus by Gmelin, the Acer is a genus of the Santinia mono-gynus class and order, including twenty species. For the properties and uses of the several species, and the method of propagating and cultivating them, see Maple and Sycamore.

**ACER.** See Banisteria and Thiopteris.

**ACERIS, Pholena.** in Natural History, 3 species of Phalera, found on the Acer, Eiculus and Juglans.

**ACERATOS, ACERNO, Meshetis, ACERIS, ACERNO.** of which the fruits of Acer, Eiculus, and Juglans is the term that is used in botany.

**ACERINA, in Ichthyology.** a name given by Plane, and others of the old naturalists, to the fish now called the Cerura and Atrurra Flavissilis, and in England the Ruff. The cerura of Flemish Linnaeus is a species of Perca, whose dorsal fin has 31 rays and 17 spines. It approaches to the Cerura in many respects, but differs from it in the number of rays and spines of the dorsal fin, and the size of its head, which is longer. It is found in the Euxine sea, and the lake of Mzotsis, and the rivers that run into them.

**ACERNO, in Geography.** a small city of Naples, with a bishop's see, about 12 miles N. E. of Salerno. E. long. 15° 0'. N. lat. 45° 45'.

**ACEROSIO, also the name given by the Portugese, on the first discovery of it in the 15th century, to the island now called the Isle of France.**

**ACEROSIOSE, LEAF.** in Botany. See LEAF.

**ACEROSIOUS, chafy, is an epithet, denoting the brownish and coarifell fort of bread, made of flour not separated from the bran.**

**ACEROSIOUS, in Natural History, a name given by Vogel in his Mineralogy to a species of Talc.**

**ACERRA, in Antiquity.** a kind of altar, erected among the Romans near the bed of a person deceased; on which his friends daily burned incense till the time of his burial. The Chinese have a similar custom. They erect an altar to the deceased in a room hung with mourning; and upon it they place an image of the dead person, to which every one that approaches it bows four times, and offers oblations and perfumes. The original intention of the practice was, without doubt, to overcome any offensive smell that might proceed from the corpse.

By the laws of the 12 tables, the erecting of acerra was prohibited.

The Acerra also signified a little pot, wherein the incense and perfumes were put, to be burnt on the altars of the gods, and before the dead. It appears to have been the name with what was otherwise called thuribilum and pyxis.

We find mention of acerra in the ancient church. The Jews also had their acerra, in our versions rendered cenfers; and the Romanists still retain them under the name of incence-pots. In Roman writers, we frequently meet with acerra plena, a full acerra; for understanding which it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains; the former poured out acerra full on the altar; the latter took out two or three bits with their fingers. Plin. Lex. Ant. Brilllon. de For. moral. 3.

**ACERRA, in Geography.** a walled town of Naples in the Terra di Lavoro, Situate on the river Agno, seven miles N. E. of Naples. It is the residence of a bishop, and has the title of an cardinal. E. long. 14° 30'. N. lat. 40° 55'.

**ACERRAE, in Ancient Geography.** the name of a town on the Clanibus in Campania, now Acerra. It was a Roman colony, and its inhabitants were reckoned a brave people: "Acerraeus plus armi, quam virium erat," says Livy, l. xxvii. c. 17. tom. iii. p. 730. Drakenb. This was also the name of another town, now called La Grotta, or Gherra, which retains some traces of the original name, in the territory and to the S. E. of Lodi, where the river Serio falls into the Adda, to the W. of Cremona, and N. of Piacenza. It was formerly a place of considerable importance. Its siege by the Romans is particularly described by Polybius, l. iii. p. 121. Ed. Caiab.

**ACERRA, a town of Spain, belonging to the Lacetani; pronounced Gerri.**

**ACES E and ACESANES, cities of Macedonia.**

**ACESCENT, a word used to denote any thing which is turning four or acid, or which is slightly acid.** It is only applied properly to denote the first of these two meanings. The second may be better expressed by either of the words acidulums, or fusacids.

**ACESINES, in Ancient Geography, a large and rapid river of India, which Alexander passed in his expedition into that country; and on the bank of which he built a city under the direction of Heptapont. The kingdom of Purnam, whom he vanquished, and which, according to Strabo, contained about 300 cities, lay between the Hydaspes and this river, which, after receiving the former and other considerable rivers, emptied itself into the Indus. Its situation is not precisely known. Arrian says, (De Exp. Alex. l. iv. p. 222. Ed. Gronov.) that, where Alexander passed it, its breadth was 15 fathoms, its course very rapid, and the channel full of large and sharp rocks. It was subject to extraordinary inundations, rising at the full moon, for 10 cubits and overflowing the adjacent plains. Theophrastus (Hift. l. iv. c. 12.) speaks of the reeds that grew near this river; and Pliny (H. N. l. xxxvii. c. 12. tom. ii. p. 796) says, that thia and the Ganges furnished gems. We read of trees near this river of such magnitude, that 50, some fay 400, horsemen might lodge under the spreading branches of one of them; and that they produced long pods of honey, which proved fatal to those who eat it. Strabo, Geog. vol. ii. 1014—1022. Some have supposed that the Acceans of Arrian was the river now called Rauvee; but major Rennell, in his Memoir, gives good reasons for concluding that the modern Jenaub was the Acceans of the ancients.

**ACESINUS, a river of Sarmatia, called by Pliny Panticapes.**

**ACESIUS, in Biography, a bishop of Constantiopole, in the reign of Constantius, was a disciple of Novatus, who founded a sect whole tenet was, that those who had fallen from the faith in time of persecution, or, who after baptism had committed any mortal sin, were not to be admitted to the communion of the church, even on their exhibiting tokens of sincere repentance. Constantius was so much displeased with the severity of this sect, which discouraged repentance, that, after questioning Acesius concerning it, he said, 'then, Acesius, make a ladder for yourself, and go up to heaven alone.' This story is related by Socrates (l. i. c. 10.) and Sozomen (l. i. c. 22); but disputed by Valens,
ACETARY is used for an inner part in the structure of certain fruits, thus called from the fournaux of its taste. The acetry of a pear is a globular part, lying within the calyx or chouk, and surrounding the core. It is of the same substance with the parenchyma, or pulp, only that the bladder of which it consists is smaller, and rounder than those of the parenchyma; from whence, however, it seems to be derived. On this account it is also sometimes called the inner parenchyma. The quince also has an acetry, resembling, though less than, that of a pear.

ACETI Spiritus, spirit of vinegar; made by drenching copper-filings with distilled vinegar, then evaporating it till the fumes of the vinegar cannot be smelt; the saturation and evaporation to be again repeated, till the menstruum be fatuated; which being then distilled, the spirit comes over. Its qualities and uses are much the same with those of the distilled vinegar; excepting that it is more powerful.

ACETIAM, in Law, a clause devised by the officers of the King’s Bench, and added to the usual complaint of trespass, in order to maintain the jurisdiction of this court over civil injuries without force; of which statute, 2, 13 Car. II. c. 2, had nearly deprived it. The bill of Middlesex having been framed only for actions of trespass, a defendant cannot be arraigned and held to answer upon it for breaches of civil contracts. To remedy this inconvenience in the latter case the clause was adopted: the bill of Middlesex commanding the defendant to be brought in to answer the plaintiff of a plea of trespass, ac etiam, and also, to a bill of debt; and thus the complaint of trespass gives cognizance to the court, and that of debt authorizes the arrest. In imitation of this Lord Chief Justice North directed, that in the common pleas, besides the usual complaint of breaking the plaintiff’s close, a clause of ac etiam might be added to the writ of Capias: and this was done in order to save the suitors of his court the trouble and expense of suit out of special originals.

ACETIC Acid, in Chemistry, Radical vinegar, Aci Acetici, Vinaigre radical, Vinaigre de Venus. If any quantity of crystallized acetate of copper (distilled verdigris) be distilled in a glass retort, with a regulated heat, till at length the bottom of the vessel is nearly red hot, the equilibrium of the affinity between the component parts of the salt will be delivroyed, and several new combinations in consequence produced. The proportion of these on 1000 parts of the salt, calculated to an accurate analysis of C. A. de, will be 436 acetic acid, 312 brown vitriol, copper mixed with charcoal, 118 hydrogen and carbonic acid gas, and about 50 acetate of copper, will remain undecomposed. In order to be fully aware of what takes place in these changes, it is necessary to observe, that the crystallized acetate of copper contains hydrogen and oxygen forming the water of crystallization, hydrogen, carbon, and oxygen forming acetic acid, and copper, with about 25 per cent. of oxygen. By the processes of distillation, the acetic acid appears to be decomposed by the separation of part of its hydrocarbonous bafe, and at the same time the oxd of copper is brought to a lower state of oxidation: part of the carbon becomes acidified at the expense of the copper, and, uniting with the hydrogen, forms hydrocarbonous gas; the remainder of the carbon is found in the retort, mixed with the oxyd of copper, and poifies the properties of a pyrophorus. Thus it appears that acetic acid differs from aceto, in a larger proportion of oxygen to the bafe, which is effected not by an addition of oxygen, but by a diminution of the bafe. Acetic acid may also be procured by distilling together acetate of lead, of soda, petralls, or borax, with sulphuric acid; the product is however, in this case, contaminated with sulphurous acid gas; but this may be in part prevented, by...
ACE

adding to the materials some black oxyd of manganese. M. Badollier proposes to obtain acetic acid, by distilling equal parts of sulphat of copper, and acetate of lead, the acid thus produced cools only a fourth of that which is formed from acetate of copper. In its general properties, acetic acid is very similar to acetous acid, yet differing from it in the following particulars. The active acid qualities of this fluid bring it to a near resemblance with some of the mineral acids; it is corrosive, and intensely acid to the taste, exhalis a pungent almost suffocating odour, and has nothing of the spirituous flavour of distilled vinegar; its specific gravity is 1.0626. With earthy and alkaline bases it unites readily, forming the genus of neutral and earthy acetats, the properties of which have been but very little examined. It dissolves copper, and certain other metals which are not soluble in acetic acid, and it is capable of partly decomposing and uniting with alcohol, forming acetic Ether.

This acid is of some use in the laboratory, and is employed occasionally in medicine, as a stimulant application to the nostrils in fainting fits; for this purpose some acetate of potash is put into a smelling-bottle, and a little sulphuric acid is poured upon it. Annales de Chimie, xxvii. 299. xxviii. 113. Fourcroy, Syll. des Connais. Chim. viii. Gren's Chem. ii.

This salt occurs native in the sap, and certain other vegetable juices, and also in the urine of some quadrupeds: it is prepared artificially by adding to pearls, or carbonat of potash, distilled vinegar, till the liquor contains a slight excess of acetic acid; if the salt is wanted in a solid state, evaporation in a glas or silver vessel must be had recourse to; when a pellicle appears on the surface, the procés should go on at a very gentle temperature, till all the moisture is exhausted; there will remain a white micaceous salt, which must immediately, while warm, be put into a well-closed vial. The salt may also be obtained cheap and pure, by adding sulphat of potash to acetate of lime, evaporating to dryness in a water-bath, and dissolving out the acetate of potash by hot alcohol.

Acetate of potash has a lively penetrating odour, and a sharp taste; but leaving an alkaline impression on the palate; it crystallizes in needles and plates, the form of which has not been ascertained. This salt has a strong affinity for water, deliquating readily in the air: it requires 1.021 parts of this fluid at 50° Fahrenheit for its solution, and, while dissolving, absorbs calorically from its hot faturated solution in alcohol, crysalts may be obtained by cooling.

Of the alkalies and alkaline earths, barytes alone is capable of decomposing acetate of potash, setting at liberty the alkali, and forming with the acid acetite of barytes.

The sulphuric, nitric, muriatic, fluoric, phosphoric, oxalic, tartaric, arsenic, fuscicum, and malic acids, are each capable of separating the acetous acid from its alkaline base: all the easily soluble sulphats, and several other neutral salts effect the same by double affinity.

Acetate of potash, subjected to dry distillation, yields hydrocarbonous gas, an ammoniacal liquid mixed with empyreumatic oil, sublimed crysaltals of carbonat, or acetite of ammonia, and there remains in the retort, charcoal, with potash, partly carbonated, and partly carbonized. The appearance of ammonia in this process, is a circumstance well worthy of accurate investigation: it was first observed by Beaumé, and afterwards by Morveau, and seems likely to throw much light on one of the two very important questions, viz. Is nitro a compound? Is ammonia one of the elements of potash? Ammonia confers on azot and hydrogen, but acetite of potash furnishes only oxygen, hydrogen, carbon, and potash; hence, it seems reasonable to suppose, either that these four substances contain the bases of azot, or that ammonia is one of the component parts of potash.

The above salt is applied to no use in the laboratory, or in the arts; it is an article of the Materia Medica, and possesses considerable diuretic qualities.

Acetite of Soda. Acetite de Soude. Terra soluta mineralis et crystallizata.

To any quantity of carbonated soda add distilled vinegar, leaving the liquor, however, till alkaline; evaporate gently to a pellicle, and by cooling, acetite of soda will be obtained in long f slightest prismatic crysallals, similar to those of phosphated soda, permanent in the air, soluble at a gentle temperature in their water of crystallization, and of a pungent bitterish taste.

Acetite of soda is easily soluble in water and alcohol, is decomposable with abstraction of the acid or alkaline base by potash, and the fume substances as the preceding salt: when kept in a long f f is converted into carbonat of soda by decomposition of its acid; if subjected to dry distillation it yields hydrocarbonous gas, empyreumatic oil and acid, and there remain in the retort charcoal and carbonated soda.

This salt is employed a little in France as a medicine—in this country is made no use of.

This is prepared in the liquid form by adding carbonated ammonia to distilled vinegar till saturation. On account of its great volatility, it is not very easy to obtain it in the crystalline form; the following method was successfully practiced by M. Delafon for this purpose: equal parts of chalk and fall-ammonia were mixed well together, and put into a retort, upon which was peared half their weight of concentrated acetic acid; by a gentle heat a white vaporous aroze, which condensed in beautiful crysallals in the receiver, and was acetite of ammonia. Another way of preparing this salt is by distilling equal parts of acetylated lead (sugar of lead), and muriated ammonia (fall-ammonia).

This substance is very deliquecant—has a hot pungent flavour—is decomposed by alcalies, by moist acids, and by double affinity in various ways; it is decomposed and spontaneously when in solution.

It is only employed in medicine, and is considered as a diaphoretic.

Acetite of Lime. Acetite de Chaux.—Salt of Chalk.—Salt of Coral.

This salt is readily procured, by adding distilled vinegar to chalk, marble, coral, oyster-shells, or any other substance that confiis chiefly of calcearious carbonate; the carbonic acid is disengaged with effervescence, and by evaporating the solution to a pellicle, and allowing it to cool gradually, crystallals of acetite of lime are deposited.

Calcearious acetite crysallals in white slender silky filaments, permanent in the air; its taste is bitter, acerb, rather caustic; it is soluble with ease in water, and in small proportion
proportion by alcohol. Barytes, and the fixed alkalies decompose it, by union with its acid; the stronger acids do the same, by combining with its earthy base: most of the carbonates and sulphates decompose it by compound affinity; when in solution, it is destroyed spontaneously by decomposition of the acid, and deposits carbonat of lime: in dry distillation it yields hydrocarbuncous gas, empyreumatic acid and oil, charcoal and carbonate carbonat. It is still admitted into the foreign pharmacopoeas as a fudorite and diuretic.

Acéte of Barytes. Acétè d' Baryt.

This salt is usually prepared by adding carbonat of barytes to distilled vinegar, in which case the acid is always in excess: when reduced by evaporation, to the confusion of a syrup, and allowed to cool gradually, it deposes a white opaque granular salt, and the sides of the vessel are covered with silky filaments of the same: a better way of procuring this substance, is by boiling for a few minutes the sulphat of barytes in a slight excess of acetic acid, (vide Acéte of Strontian) filtering the solution, and fletting it to evaporate spontaneously: transparent crystallals may thus be obtained in large flat thin plates. The salt formed by either of these methods is permanent in the air, and decomposable by moit of the mineral acids, the carbonated alkalies, and the sulphuric salts. Its only use is as a reagent, for ascertaining the presence of fulphuric acid in those cases where the mutrit or nitrat of barytes might affect the results of the analysis.

Acéte of Strontian. Acétè de Strontian.

To any quantity of warm distilled vinegar, add gradually sulphat of strontian, as long as any effervescence is perceived; then boil the liquor for a few minutes, and filter; add afterwards, drop by drop, a solution of acette of lead, (figur of lead) as long as any precipitate takes place, then suffer the liquor to stand for a few hours, and finally separate it from the dark sediment by filtration. This salt has not as yet been the subject of experiment; its properties are, in all probability, very similar to thoses of the Acet. Baryt. It is not made any use of.

Acéte of Magnesia. Acétè de Magnésie.

This is prepared by the improved distillation with carbonate magnesia, then boiling the liquor to separate the remains of carbonic acid and filtering it, if turbid, to get rid of the excess of carbonate magnesia.

The taste of acette of magnesia, is sweet, with a slight mixture of bitter; by evaporation, it is reduced to a viscous syrupy consistence, incapable of being crystallized; but by further concentration, and suffcient cooling, becomes solid, and deliquecent in the air; it is totally soluble in spirit of wine, and from the ease with which it is decomposed, the affinity between its elements appears to be extremely weak. The alkalies, and the reit of the alkaline earths, most of the mineral, vegetable, and animal acids are capable of decomposing this salt by abiration of its acid or earthy base. It is not made any use of.

Of all the acetic salts this is the most important, being absolutely essential to the improved state of the arts of Dyeing and Calico-printing. It is not easy to prepare this salt directly, distilled vinegar, even when concentrated, having no perceptible action on clay; the fresh precipitated and washed earth of alum is indeed soluble by

long distillation in a large excess of acetic acid; but the most economical and effectual way of producing the salt in question, is by means of the double affinities of common slum and figur of lead. For this purpose, to a blood-warm solution of alum in rain-water, is first of all to be cautiously added a solution of pearlash, or any other sufficiently pure alkali, till the liquor is just upon the point of becoming turbid, in order to saturate the excess of acid in common alum; a cold saturated solution of acette of lead (figur of lead) in rain-water is then to be filtered in as long as any precipitation takes place: by standing a few hours, the sulphat of lead entirely subsides, and the supernatant clear liquor, containing acette of alumine and potash, may be drawn off with a syphon. By washing the sediment with cold water a dilute solution of acette of alumine is obtained, which may be used instead of water in distilling alum for the next preparation of aluminous mordant.

Acette of alumine thus prepared has an acetic strongly flpytic taste: by gradual evaporation and cooling, it assumes the form of small needle-shaped crystallals, which are exceeding deliquecent: by a heat inferior to that of boiling water, the acid is almost wholly driven off. It is decomposed by magnesia, and by all the substances that decompose acette of magnesia. Its use is almost wholly confined to the dyes and calico-printers.

This is an uncrystallizable salt, which by evaporation becomes a gummy fumiduité consistence; its taste is sweet, and very alluring, with a flavour of vinegar; its other properties have not been examined into; it is not applied to any use. B, la Grange, 11. 452.

For the metallic acetites, see the respective metals.

ACETIFICATION is used by some Chemists to denote the action or operation, by which vinegar is made. See Acetous FERMENTATION.

ACETOSA, in Botany. See RUMEX and SORRELL.

ACETOSELLA. See RUMEX, OXALIS, and wood SORREL.

ACETOUS ACID.—Distilled vinegar.—Acide Acetius

—Acidum distillatum, Lond. et Edin. Pharm. in Chemifer, is produced from facchearine muillage, gum muillage, focula and vegetable liquors, through the medium of the acetous FERMENTATION: also in urine and dunghills during its spontaneous decomposition; from the dry distillation of wood, muillage, and tartar, from the action of sulphuric acid on many vegetable substances; and from the superoxgenation of moit of the other vegetable acids. It is prepared for use, however, in the large way, only by the former of these methods, and is called alegar, if made from mait liquor; but if from any other fermentable liquor, it bears the name of VI negAR.

Common vinegar never contains this acid in a state of purity, but always contaminated by mixture with tartar, muillage, and carbonaceous matter, which render it very liable to spontaneous decomposition; these subltances can only be got rid of by having recourse to distillation, which ought to be performed in glass or tinmed-copper vessels; the frist product of this operation is an odorous, faintly acid liquor containing alcohol; the next is less odorous and more acid; and what comes over towards the end of the operation is a still stronger acid, but with an empyreumatic flavour, and a flight tinge of colour; hence, in distilling four parts of vinegar, the first may be rejected as too much diluted, and the process may be stopped when three-fourths of the liquor is come over. If distilled vinegar is exposed to frost in a broad shallow vessel, and the ice removed as it forms, till it
A C E

it tastes nearly as four as the remaining liquor, a very strong and pure acetous acid will be obtained, in the proportion of about 7 or 8 per cent. to the distilled vinegar.

Acetous acid is a transparent colorless fluid, of the specific gravity of 1.0095, nearly as volatile as water, exhibiting a pungent fragrant odour, and of a lively agreeable acid taste.

When concentrated, it unites eagerly with water, either in the solid or liquid state; absorbing heat in the former cafe, so as to produce a considerable depression of the thermometer, and giving out heat in the latter cafe.

Upon fat oils it has little or no action, but camphor and most of the essential oils are readily soluble in it, giving their peculiar odours and increasing the inflammability of the liquor. With the empyreumatic oils of wood, tartar, &c. it forms the pyro-ligneous and pyro-tartareous acids.

At a temperature above that of boiling water it decomposes atmospheric air by abstracting its oxygen, and at the same time giving out flame, and producing carbonic acid and water; the same effect is produced more gradually, by exposing to the air a solution of the earthy or alkaline acetates; thus acetate of lime is converted into carbon of lime. Acetous acid is however capable of uniting to oxygen without experiencing such a total decomposition. If equal parts of acetate of lime, black oys of manganese and sulphuric acid are distilled together, a pungent volatile acid called Acetic acid will be produced together with hydrocarbonous gas: the same results are obtained from the distillation of crystallized verdigris, and the copper is found in the retort nearly in the metallic state.

Acetous acid unites easily with all the alkalies and alkaline earths, whether pure or carbonated, forming the genus of alkaline acetates, which contains seven species; viz. Acetite of potash, soda, ammonia, lime, barytes, fluorite, and magnesia.

It appears to have no action on silk, but combines with the other earths into Acetites of alumine and glycerine.

Excepting iron and zinc, the rest of the metals are difficultly or not at all soluble in acetic acid, their oxides, however, especially if carbonated, are easily so; hence results the large and important genus of metallic acetites.

On vegetable and animal colouring matter this acid appears to have little effect: it possibly indeed the property of reddening syrup of violets, and certain other vegetable blues, in common with all acids.

The component parts of acetic acid are oxygen, hydrogen, and carbon, but their relative proportions have not yet been ascertained. If acetic acid in vapour is passed through a red hot glass tube, it is decomposed into water, hydrogen, and carbonic acid.

The affinity of this acid is as follows:

Degree of attraction (by Guyton.) Order of Elective (by Parson.)
Barytes - 28 Barys
Potash - 26 Potash
Soda - 25 Soda
Lime - 19 Lime
Ammonia - 20 Ammonia
Magnesia - 17 Magnesia
Alumine - 15 Alumine

In the composition of:
In the metallic oxides
In the amoniacal water

Acetous fermentation. See Acetous Fermentation.

Acetum, formed of acer, to be history, the name with vinegar; the properties, uses, and preparations of which, see under the article Vinegar. There are several medicines in the shops of which this liquor is the basis: as, Acetum alkalivatum, made of distilled vinegar, with the addition of some alkaline, or volatile salt.

Acetum colchicum. See Colchicum.

Acetum dijilatatum. See distilled Vinegar, and Acetous acid.

Acetum efuriunt, distilled vinegar rectified by means of verdigris. It is made by distilling the common verdigris in fine distilled vinegar, then evaporating the solution, and recovering the verdigris again in form of crystals: and from this, by a proper degree of fire, distilling with a retrort an acid spirit, which is the richest acid that can by any art be prepared from vinegar. Boerhaave's Chem. p. 138.

Acetum fidebarium. See Acid of Lead.

Acetum Philosphorum, a four kind of liquor, made by distilling a little butter of antimony in a great deal of water. See Spirit of Venice.

Acetum Portabile. See Vinegar.

Acetum propylactium is a preparation made in the following manner. Rr. flor. lavand. et. roritim. fol. retus. abrith. falvitez. menth. a m. j. Aceti vini cong. j. infund. in B. A. per 8 dies. R. linus tincl. j. camph. 3 iij. m. f. This is also called the vinegar of the four thieves; for during the plague at Marseilles, four persons by the use of it, attended many of the sick unhurt; under the colour of their services they robbed the sick and the dead; but one of them was apprehended, saved himself from the gillows by discovering this remedy. Motherby's Dict. by Wallis.

Acetum rusticum, vinegar of roes, is made of rose buds infused in vinegar forty or fifty days; the roses are then pressed out, and the vinegar preferred. It is chiefly used by way of embrocation. Some ladies and temples in the head; after the like manner are made acetum fumicium, vinegar of elder; acetum anthophyllum, vinegar of rosemary flowers; acetum sallitum, vinegar of equis. The German dispensatories abound with medicated vinegars, chiefly aimed against pestilential diseases; but they are not used among us.

ACH, or ACHEN, John Van, in Biography, a painter of history and portrait, was born at Cologne, in 1556, and died aged 65, in 1621. Having studied and practiced portrait-painting for some time in his own country, he travelled to Venice, in order to obtain a more extensive knowledge of colouring; and with a view of perfecting his talent, and improving in correctness of design, he settled for some years at Rome. Here he painted a nativity for the church of the Jesuits, and a portrait of Madame Venuita, a celebrated performer on the lute, which is accounted one of his best performances. The best judges allow his colouring to be extremely good, his design correct, and that the air of his heads manifests much of the taste of Correggio. His talents and polite accomplishments, recommended him to several considerable princes of Europe; and under the patronage of the elector of Bavaria, he painted a grand design of the invention of the crosses, which is highly commended for the elegance of the composition, the correctness of the design, the graceful airs of the heads, and the attitudes of the figures. For this, and his portraits of the electoral family,
family, he was preferred by the electors with a chain and
medal of gold, as a peculiar token of his esteem. By the
emperor Rudolph he was invited to Prague, where he
executed a picture of Venus and Adonis, so much to the
emperor's satisfaction, that he was particularly distinguished
by him as long as he lived. His character was that of one
of the belter masters of his time. Pilkington's Diet.
ACHA, or Achaia, in Geography, a district of Africa, on
the confines of Libya; formerly rich and populous, but now
reduced: the chief produce is dates.
ACIALBYTUS, in Ancient Geography, a high mount-
inain in Rhodes, on the top of which stood a temple of
Jupiter.
ACHAC, in Ortschology, the name given by the people
of the Philippine islands to a bird common there. It is
of the size of a common hen; its belly, breast, and neck are
of a pale brown, and its back of a dull reddish colour; its
wings are extremely beautiful, being principally of a greenish
blue colour; the tail is white, short, and continually in
motion; the eyes are black, and the beak is thick and strong,
and is of a black colour, and of an obtuse figure; the legs
are reddish, and the claws black: when it makes any noise,
it seems to utter the word phi, phi, very often repeated.
It lives principally about the cultivated parts of the islands,
and feeds on rice and other vegetables, being properly of
the partridge kind.
ACHILLES, in Ancient Geography, a well fortified town
of the island of Rhodes, in the district of Jalyas, said to be
the first and most ancient of all, and to have been built by
the HELIADES, or children of the sun. Dio. Sicul. l. v.
ACHAEA was also a hamlet of Asiatic Sarmatia, on the
Euxine. The inhabitants were a colony of Orchosmenians,
and called Acher.
ACHAEANS, Achae, in Ancient History, the inhabitants of
ACHAIA Propria, so called from Achaia, the son of
Xuthus, who having been banished from Thebais, settled in
Athens, married Creusa, the daughter of Eretheus, and
had by her two sons, CIVIS, Achaean and Ion. Achaean,
putting himself at the head of a small number of Athenian
and Argivean forces, made an expedition into Thessaly, and
recovered his grandfather's kingdom; but having com-
mitted the crime of manslaughter, he was soon obliged to
fly to Lacedaemon, where he died, and where his property
remained, under the denomination of Achaean, till they were
expelled by the Dorae and Herculeans. On this occasion
they determined to lay claim to Achaia, and to expel the
Ionians. They founded their title on their descent from
the eldest son of Xuthus, and enforced it by collecting a
number of troops, and arranging themselves under their
brave king Tifames, the son of Orelles. The Ionians
were overpowered, and driven into Attica; and the Achae-
ans took possession of the kingdom, which consisted chiefly
of twelve cities. These cities were divided between the four
sons of Tifames; who, uniting with their cousin, the son
of Penthillus, and grandson of Orelles, and jointly reigning
over this new Achaian state for some time, agreed to form
an alliance with Preagenes, and his son Patrus, the sove-
ieigns of those Achaean, who had been banished out of
Lacedaemon, and gave them the sovereignty and territories
of a city, which from the last of these was called PATRE.
The Achaean fortified themselves so well in their new set-
tlement, after having expelled the Ionians, that they were
able to defend themselves against the Herculeans, and to
preserve their laws and liberty, even after all the rest of
Pelopennesus had been subdued by them, and under a series
of kings from Tifames to Ogygus; after which they
formed themselves into a kind of republic, or democracy.
As their country was poor, without commerce, and almost
without industry, its inhabitants enjoyed the liberty and
equality afforded them by a wise legislature. Strangers
to the desire of conquest, and having little connection with
the Roman states, they never employed fraud and falsehood
against their enemies; and as all their cities had the
same laws, and the same offices of magistracy, they formed
only one body, and one state, and the armaments that prevailed
among them prevailed every class of citizens.
The excellence of their constitution, and the probity of their
magistrates were so universally allowed, that the Greek
 cities of Italy addressed themselves to this people to become
their arbitrators, and some of them even formed a similar con-
 federacy. The Lacedaemonians and Thebans, who respec-
tively claimed the victory at Leuctra, referred their dispute,
in which their honour was so materially interested, and
which demanded the most impartial decision, to the deter-
mination of the Achaean. Having long retained their lib-
erties, they ceased not to aspire, when the necessity of public
deliberation required it, even when the rest of Greece
was threatened with wars and perfidy. Polybius observes,
that the Achaean so far gained the esteem and confidence
of all the Peloponnesians, that their name became common
to that whole country. The arms which these people
chiefly used were llings, in the use of which they were
trained from their infancy, and acquired such dexterity
that they struck惊奇 at which they aimed with for-
prizing exactness. The Achaean government was formed
in its democratic form from the expulsion of Ogygus or Gyges,
the last king of Achaia, to the time of Alexander the
GREAT; after whose death this little republic was involved
in all the calamities that are inseparable from discord,
and was confirmed to submit to the Macedonian yoke.
The Achaean then changed matters as often as Macedon changed
sovereigns, and were frequently enslaved by tyrants of their
own. Unable to bear this slavish subjection, in the 125th
olympiad, ante Chr. 280, when Pyrrhus invaded Italy, they
revived their ancient union. The first affronts of liberty
were the inhabitants of Patrae and Dyma, and they were
forced from by those of Aegium, Bura, and others. The
good order that reigned in this little republic, where liberty
and equality, with a sincere zeal for justice and the public
welfare, were the fundamental principles of their govern-
ment, induced several neighbouring cities to join them.
The Achaean league thus revived, and extending its influ-
ce, was first acceded to by the Sicilians, under the di-
cision of Aratus; they were followed by other states not
only of Peloponnesus, but by all Greece, except the Lase-
demonians, who first entered into a war against the Achaean.
By the Achaean league, all the cities subject to it were go-
vern'd by the great coucil, or general assembly of the na-
tion. To this assembly each of them had a right to send a
certain number of deputies, who were elected in their re-
spective cities by a plurality of voices. As the supreme and
legislative power was lodged in this assembly, it was con-
stantly convened, except on extraordinary occasions, twice
a-year; on which occasions they enacted laws, disposed of
vacant employments, declared war, made peace, and con-
cluded alliances; and the acts of the assembly were binding
on all the confederated cities. The chief magistrate of
the league, called by the Greeks strategos, and by the Latin
prætor, was chosen by the majority of votes. At first they
had two officers of this kind; but they were soon reduced
by one, who presided in the diet, and commanded the
army. The prætor, and other magistrates, continued in
the same office two years successively. The former was re-
Sponsable to the general assembly. The demiurges were
next in power to the prætor, and are therefore denominated

By
by Polybius and Livy, the supreme magistrates of the Achaeans. Their number was ten; they were chosen by the general assembly, and their office was to assist the prector, who was not allowed to propose any measure to the assembly, which had not been previously approved of by the majority of the deputies. In some extraordinary cases they were allowed to summon the general assembly. Such was the fundamental constitution of the Achaeans; and they had also several laws, which were religiously observed as long as the republic continued in a flourishing condition. Their peace and prosperity, however, were interrupted by the jealousy of neighbouring states; and particularly by the Lacedaemonians, who, about the year before Christ 227, commenced a war against them, which, from the name of Cleomenes their king, was called the Cleomenic war. The Achaeans, under the command of Aratus, were successively defeated, and reduced to such a state of distress, as to be under a necessity of engaging Antigonus, king of Macedon, to affist them. In a variety of subsequent contests, the Achaeans behaved with uncommon bravery, and Philopomen distinguished himself above the rest. Cleomenes was defeated; and Antigonus received the thanks of the deputies of each city conjoined under the Achæan league; and, by a decree of the council assembled at Argos, was declared in the=end, of Achaia. The Achæans afterwards took part with the Meffenes against the Ætolians; and, being overpowered by them, relicted to Philip of Macedon, who promised to assist them with the whole force of his kingdom. A confederacy was formed, and war, called from this circumstance the confederate war, was proclaimed against the common enemy. This war had terminated first in a treaty between Philip and the Achæans on one side, and the Ætolians, Lacedaemonians, and Eleans, on the other, and soon after in a peace: the Achæans returned to their ancient manner of life, rebuilt their city, temples, and altars, restored their worship, and repaired the various damages which they had sustained during the progress of the war. Philip, however, soon changed his conduct towards the Achæans, and disturbed that tranquillity which he had been the instrument of establishing. As they refused to concur with him in his purpose of subduing the Meffenes, who were members of the Achæan body, he accused their resistance to Aratus, whom he often prevailed upon the Achæans to elect him in the seventeenth time. When Aratus perceived the danger of his situation, he fled to an intimate friend who attended him "Behold, my dear Cephæon, the effect of friendship and love of kings." This distinguished magistrate closed his life at Ægium, in the 57th year of his age, and was interred with extraordinary pomp and solemnity at Sicyon, the place of his nativity; and the part of the city in which he was buried was from that time called Aratium, in honour of his memory. The Achæans also decreed, that divine honours should be paid him, and appointed a priest for that purpose. The conduct of Philopomen incensed the Achæans, and when a favourable opportunity occurred they testified their displeasure. In the mean while they concurred with him in carrying on the war with the Ætolians, who had formed an alliance with the Romans. Philopomen gained new honours; and in the year before Christ 219, was appointed, for the first time, commander in chief of the Achæan forces. After a very decisive victory over the Lacedaemonians, the Ætolians sued for peace, and obtained it; and the Romans also concluded a treaty of peace and amity with Philip and his allies. This peace was not of long duration. The Romans declared war against Philip, who was joined by the Achæans and Lacedaemonians. It was not long however before the Achæans formed an alliance with the Romans, to whom they maintained a steady attachment during the whole course of this war. At the conclusion of it, they were put into possession of Corinth; the Greeks were declared free by the Romans; and the Achæans amongst others, were delivered from every kind of servitude, and allowed to govern themselves by their own laws. Soon after the departure of the Romans, Nabis, who had been left in possession of Lacedaemon, began to raise insurrections in the maritime cities, which were garrisoned by the Achæans; and these hostilities obliged them to have recourse to the Romans, and to declare war against Nabis. The whole management of this war was committed to Philopomen. After a defeat by sea, and a very fortunate escape, this illustrious general obtained a complete victory over Nabis by land; and was thus enabled to unite the powerful city of Lacedaemon to the Achæan commonwealth in the year before Christ 197: by which means the Achæans eclipsed all the other States of Greece. Philopomen, with a disinterestedness and patriotism that served to establish his reputation more than all his military exploits, refused to accept a present of 120 talents, the produce of the palace and furniture of Nabis, which the Lacedaemonians offered him as a token of their gratitude. Recommending the application of this money to the purpose of concluding the disinterred, he said to those who urged his acceptance of it, "it is much more advisable to flop an enemy's mouth than a friend's; as for me, I shall always be your friend, and you shall reap the benefit of my friendship with experience." The Achæan republic, by the addition of Lacedaemon, and the protection of Rome, was now become very formidable. But internal disputes about the place of holding their assemblies, which were transferred by Philopomen from Ægium to Argos, and the more important quarrel with the Lacedaemonians, and their attempt to secede from the Achæan league, produced an interruption of their tranquillity, and exposed them to new dangers. Lacedaemon, indeed, was reduced by the Achæans; and Philopomen ordered them to demolish their walls, disband their mercenaries, drive out all the slaves whom the tyrants had set at liberty, receive the exiles, and renounce the laws of Lycurgus, and for the future govern themselves only by those of Achæa. At this time the Achæan league was in great repute all over the East, and the friendship of a state so powerful was courted by all the princes of Asia. The ancient alliance with Ptolemy, king of Egypt, and with Seleucus, king of Syria, was renewed. But the Romans became jealous of their increasing power, and interfered with their internal government. The city Meffene withdrew from the Achæan league; and Philopomen, in his desire to reclaim the rebels, was defeated, taken prisoner, and put to death. When he held the cup of poison in his hand, he inquired whether Lycortas and the Megalopolitan youth, who had accompanied him as volunteers, had got into a place of safety; and being informed, that they had all made their escape; he replied, "That is enough; I die content." Upon his death the glory of Achæa began to decline; so that Philopomen was not improperly called the last of the Greeks, as Brutus was afterwards styled the last of the Romans. Meffene was afterwards restored to the Achæan league; and the Romans incessantly urging the rebellion of the Lacedaemonians, the Achæans were obliged to submit. In the year before Christ 160, when a war broke out between the Romans and Peræus king of Macedon, the Achæans declared for the Romans, and Polybius was sent to the Roman general with the resolution of the Achæan diet. However, several of the Achæans favoured Peræus; and a thousand of them were summoned to appear before the Roman senate. These persons were kept...
kept close prisoners at Rome; and, notwithstanding repeated remonstrances, their trial was delayed. After a confinement of 17 years, 300 of them, who had survived the hardships which they experienced, were sent home. This treatment alienated the minds of the Achæans from the Romans; and, by degrees, brought on an open war, which ended in the reduction of Achæa, and the dissolution of the Achæan league. Commissioners were sent from Rome, in the year before Christ 147, who announced the orders of the Roman senate and people, that all the cities which were not formerly of the Achæan league, viz. Corinth, Lacedæmon, Argos, Heraclea, and Orchomenos, should be separated from the general alliance, and governed by their own laws, independently of the confederacy. The Achæan deputies, assembled at Corinth, as soon as they heard these words, left the assembly before Aurelius had finished his speech, and when they informed the people of the Roman decree, the whole city was in an uproar; and both the commissioners and Lacedæmonians were treated with the most outrageous insult and violence. The senate was incensed, but sent out new commissioners with proposals of accommodation. But these ambassadors having been treated with disrespect, returned with their complaints to the senate. Four other Romans were deputed by Metellus to negotiate with the Achæans; but their endeavours were ineffectual. The consequence of these unsuccessful efforts was an open rupture, and the declaration of war with Lacedæmon and the Romans. Metellus, without waiting for the orders of the senate, marched towards Achæa; and the Achæans, joined by the cities of Thebes and Chalcis, prepared to receive him. The greater number of them were struck with terror, and sent new deputies to Metellus to treat of peace. But the Achæans, now governed by magistrates, who had no other resort of conduct but their passions, and no other talent for war besides a savage fierceness, and a blind desire of revenge, seemed to be devoted to destruction. On this occasion, after Metellus had in vain endeavoured to settle the affairs of Achæa, Nummius arrived in Greece, and defeated the Achæans; and in the year before Christ 145, plundered Corinth of its rich spoils, and then reduced it to ashes; and under the ruins of this city the Achæan league seemed to be buried. Ten commissioners were sent from Rome, to regulate the affairs of Greece in general, and of Achæa in particular, in conjunction with the confederacy. These abolished popular government in all the cities, and established magistrates, who were to govern each city according to their respective laws, under the superintendence of a Roman proctor. Thus the Achæan league was dissolved, and Greece reduced to a Roman province, called the province of Achæa; because, at the taking of Corinth, the Achæans were the most powerful people of Greece. The whole nation paid an annual tribute to Rome; and the proctor who was sent thither every year, was charged with the care of collecting it. From this time Achæa was governed like the other Roman provinces till the reign of Nero, who restored the whole of Greece to the enjoyment of its ancient liberties; but it was afterwards restored by Vespasian to its former state of subjection. Under Nerva, some shadow of liberty was restored; but it was still governed by a Roman proctor. In this condition the Achæans remained till the time of Constandine the Great, who, in his new partition of the Roman provinces, subjected Achæa to the prefect of Illyricum. Upon the division of the empire, Achæa, with the rest of Greece, fell to the emperors of the East. Under Arcadius and Honorius, all these provinces suffered greatly by the incursions of the Goths, who, under their king Abaric, laid waste the whole country, and reduced the magnificent structures that were then remaining to heaps of ruins. In the reign of the emperor Emanuel, in the 12th century, Peloponnesus was divided into seven principalities, and he bestowed on them his seven sons. In the 13th century, when Constantinople was taken by the western princes, the maritime cities of Peloponnesus, with most of the islands, were allotted to the Venetians. In the 15th century, Constandine Dracopes, despot of Morea, being raised to the imperial throne, divided that province between his two sons, bequeathing Sparta on one of them, and Corinth on the other. Mahomet II., taking advantage of their divisions, stripped them both of their dominion. The Mahometans having gained possession of Morea, drove the Venetians from the cities which they possessed on the coast, and made themselves masters of that fruitful province, till they were expelled by the Venetians in 1687. By the treaty of Carlowitz, in 1699, thebarbarians yielded it to the republic of Venice; but retook it in 1715; and in their hands it still continues, being governed by a Sanguis, under the hegemony of Greece, who resides at Modon. On the subject of this article, see Polybus Hist. and Excerpt. leg. Index ord. Achæi, ed. Cafaub. Paufanias Græc. Defer. p. 521, &c. 558, &c. ed. Kuhnii. Strabo. Geom. tom. ii. Index ordin. Achaeorum, Achai and Achaia, ed. Cafaub. Plut. in Arat. Cleom. et Philipp. Livy, tom. iv. and u. ubi Index. &c. ver. Alex. Ed. Drakenb. Jull. i. xxxiv. ed. c. 1. Sueton. in Neron. et Vesp. tom. ii. utst. Philon. i. viii. Ep. 24. Herodot. p. 71. Ed. Wessell. Anc. Hist. vol. vi. p. 44—155. Anacharsis’s Travels, &c.; vol. iii. p. 401—406. &c. also so elaborate discourse on the origin, nature, and object, &c. of the Achæan league, compared with the Bölgische and Helvético confederacies, entitled, Discours qui a remporté le Prix de l’Academie Royale des Inscriptions et Belles Lettres, de Paris, in 1782, &c. by M. J. de Meerman, 4to. Hague, 1784,—and an abridgment of it in the Monthly Review, vol. xxxii. p. 531, &c.

ACHÆMENES, in Ancient History, was grandfather of Cambyses, and great grandfather of Cyrus the First, king of Persia. According to Herodotus, p. 515:—and according to the same historian, p. 190, § 7, there was a son of Darius I. king of Persia, and brother of Xerxes, who was of the same name. This Achæmenes governed Egypt, after Xerxes had restored them to their allegiance, and he commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece. Having been sent into Egypt to subdue a rebellion, which occurred after the death of Xerxes, he was vanquished and slain by Inaros, chief of the rebels. The term Achæmenus is a very common Persian epithet: Stephanus Byzantinus says, that Achæmenia is a part of Persia, so called from Achæmenes, son of Zerxes. According to Herodotus, p. 63, the Achæmenides were certain tribes from which the Persian kings sprang: and Strabo (vol. ii. p. 1059.) reckons the Achæmenides as one of the three principal nations of Persia. Horace (l. 2. od. 12.) mentions an Achæmenes who was very rich; and who is supposed, by his commentators, to have been one of the Persian monarchs.

ACHÆMENIA, in Ancient Geography, a part of Persia, according to Stephanus Byzantinus and Strabo, so called from its first king ACHÆMENES. It is sometimes used to signify Persia in general, particularly by Herodotus, who represents Cambyses, in an oration, calling his people Achæmenides.

ACHÆMENIS, in Botany, a species of the Tercium.

ACHÆORUM PORTUS, in Ancient Geography, a harbour of the Cheroneus Taurica, on the Tauric; and another mentioned
ACH

mentioned by Strabo (Geog. vol. ii. p. 892.); and also by Pliny, (Hist. Nat. vol. i. p. 232.) near Sigeum, into which the river Xanthus, after having been joined by the Simois, falls.

ACHIEUS, the son of Andromachus, whose wife was the sister of Seleucus Ceraunus, was offered the crown of Syria, as successor to Seleucus, but declined in favour of Antiochus, the brother of the deceased king, who was afterwards named the Great. All the provinces of Asia Minor were committed to the charge of Achæus. In this station he wrested from Attalus, king of Pergamus, all the countries in Asia which that prince had feized, and annexed them to the crown of Syria; when designs were formed against him, he feized the crown which he had before resigned, and was crowned at Laodicea, in Phrygia, assuming ever afterwards the regal title in all letters to the cities of Asia, and obliging them to give it him in all their addresses. Antiochus having succeeded in several enterprises, directed his attention towards carrying on the war in Asia Minor against Achæus; who being shut up in the castle of Sardis, was delivered to Antiochus, after he had taken the city. This prince was moved with compassion towards a person to whom he had once owed his crown; but motives of state prevailing over his natural tenderness, he ordered him to be put to death in the manner related by Polybius, i. viii. p. 526. Ed. Cuspin. For an account of Achæus the son of Xuthus, see ACHÆANS.

ACHAIL, in Ancient Geography, was used in three different senses. In the earlier ages it comprehended all the provinces of that great continent, which the geographers, strictly speaking, called Greece. It was afterwards confined to that narrow district of Peloponnesus, which was peopled by the Achæans in the more limited sense of the appellation, and which extended westward along the bay of Corinth, that lay to the north, and was bounded on the west by the Ionian sea, on the south by Elis and Arcadia, and on the east by Sicily. This was called Achæa propria, and it is now denominated Romania alta, and forms a part of Chalcisura or Chalcisura in the Morea. Its metropolis, according to foam, was Patra, and according to others Acium. In the Roman times the name of Achæa comprised not only all Peloponnesus, but such other cities beyond the islethmus as had entered into the Achæan league; upon the dissolution of which Greece was, by a decree of the Roman senate, divided into two provinces, viz. that of Macedonia, containing also Thessaly, and that of Achæa which included all the other states of Greece.

ACHAIÉ PREBYTERI, Prefbyters of Achæa, in Ecclesiastical History, those who were present at the martyrdom of St. Andrew the apostle, A.D. 59; and who are said to have written an epistle relating to it. Bellarmine, and other Romish writers allow it to be genuine; but Dupin (Hist. of Eccl. Writers, vol. i. p. 17.) and many others reject it.

ACHAIUS, in British History, the son of Ethwini, who was raised to the crown of Scotland, A.D. 783. At the death of the emperor Charlemagne, an alliance with him against the English, whose pirates infested the seas and interrupted commerce, was concluded in France upon conditions so advantageous to the Scots, that Achaius, to perpetuate the memory of it, added to the arms of Scotland a double field sown with lilies. He died in 819.

ACHALACTI, or, as Buffon has contracted the name, ALATLI, in Ornithology, the Alcedo torquata of Linnaeus and Gmelin, the cinereous King-Fisher of Latham, and the Collared-bird of Nieremberg, is one of the largest king-fishers, being near 16 inches long. Its specific characters are, that it is short-tailed, half-crested, hoary-blush, with a white collar, and its wings and tail spotted with white. The upper part of the body is bluish-grey, and this colour is variegated on the wings with white fringes in fimbriae at the points of the quills, the largest of which are blackish, and interlaced with whitish broad white indenings; those of the tail are marked with broad flaps of white; the under-part of the body is chestnut-rufous, diluted towards the breast, and there seared or nailed with grey; the throat is white, which colour forms an entire circuit on the neck; the whole head and nape of the neck are of the same bluish grey colour with the back. The beak is sharp, and about three fings breadth long; it is red, with a mixture of blackish brown at the base; and the feet are red. This bird is migratory; and at a certain time of the year visits the northern provinces of Mexico; and is also found in Martinique and the Antilles. It feeds on fish, whence its name Achalacti, i. e. devourer of fish.

ACHAM, in Geography, a country in Asia, bounded on the N. by Bounton, on the E. by China, on the S. by Burmah, and on the W. by Hindoostan. It is very little known to the Europeans.

ACHAMA, in Ancient Geography, the name of a people who inhabited that part of Lydia interior, which is near the mountain Arvaltes, and on the confines of the equinoctial line.

ACHAMELLA, in Botany. See ACMELLA.

ACHAN, in Scripture History, the son of Carmi, of the tribe of Judah; who, when Jericho was taken, concealed 200 shekels of silver, a Babylonian garment, and a wedge of gold, in direct violation of a divine prohibition. After the Israelites had been repulsed at Ai, they call lots in order to discover the offender, who had been accessory to this calamity; and when Achæan was found to be the guilty person, he and his children were stoned to death, and afterwards burned. Joshua, chap. vii. Some have supposed, that Achæan alone was put to death, and understand the words, "aand they stoned him," (v. 25) as it is in the Hebrew, and not him, as in our translation, of Achæan and his cattle. Grotius in loc. Others suppose, that Achæan's children were accomplices in his crime; St. Anian vindicates the justice of this act, on the ground of God's having a right to refuse the life he has given, when and how he pleases. Some have alleged, that the severity of this punishment was necessary to keep the people in awe, and to oblige them to a perfect submission to the divine commands.

ACHANCES, in Ichthyology, a name given by some to the Remora.

ACHANE, Axum, an ancient Persian corn-measure, containing 45 Attic medimi.

ACHANI. See ACHEM.

ACHANIA, in Botany, from σαχανία, non biam, because the corolla does not open; a genus of the monadelphus polyandria clafs, and the natural order of columnifers. The characters are, that the calyx has a double perianthium, the outer having many leaves, and the leaves being linear, permanent, and slightly coalecing at the base; the corolla is subulate and convoluted; and the petals are five, obovate-oblong, erect, with a lobe at the base on one side, involving the column of stamens; the stamens are numerous stamens, coalecing into a writhed tube longer than the corolla, free at top, and capillary; the anthers are oblong; the pistillum has a subglobular germen; the style is filiform, of the same length with the tube of the stamens, ten-clas at top, the segments spreading, the frigmas capitate; the pericarpium is a subglobular, fleshy, five-celled berry; the seeds are solitary, on one side convex, and angular on the other. There are three species, viz. the A. malviviflua, scarlet achania, or
or baldur hibiscus, which is a native of Mexico and Jamaica, cultivated here in 1714 by the clusehes of Beaufort, and flowering through the greatest part of the year; the melilot, or woolly achania, a native of South America and the West India Islands, found in Jamaica by Hourlouw, in 1730, and introduced in 1780 by B. Rennick, Esq. and flowering in August and September; and the ptilos, or hairy achania, a native of Jamaica, introduced in 1750 by Mr. G. Alexander, and flowering in November. Achania is generally propagated by cuttings, which are planted in pots of light earth, plunged into a gentle hot-bed, and kept from the air till they take root, when they should be gradually inured to the open air. They must be preferred in winter in a moderate stove; and kept warm in summer, they will flower, and sometimes ripe fruit. The achania, in the Linnaean System by Glænch, is made a species of Malva- tussus. Martyn’s Hill Dict.

ACHAVA, in the Materia Medica of the ancients, the name of an herb much cultivated in many different parts; which some have supposed to be what is called in Egypt Unne, an herb nearly resembling chamomile, but lower, and with broader leaves, approaching to those of feverfew, and of a faint, but not disagreeable smell. Avicenna seems, however, to have meant a different plant by this name, and probably the herb which we call MARUM. Proper. Alpin.

ACHARACA, in Ancient Geography, a town of Lydia, situated between Traile and Nyfa; in which were the temple of Pluto and Juno, and the cave Charonion, where patients slept in order to obtain a cure, either by the fissions of their own minds, or by those of others, who, during their sleep, were directed what effectual remedies to preferable. Strabo Geog. vol. ii. p. 960—i.

ACHARISTON, from σα, souβην, and ηυς, value, a denomination under which Galen describes some compositions of angular efficacy, which cured so quickly, that they were undervalued.

ACHARNA, in Ancient Geography, a town of Attica, near Cercopis; the largest of those towns, according to Thucydides, (I. ii. c. 16. p. 111. Ed. Duker) which were called θυσειαν, or villages. Pindar (Nem. Od. ii. v. 25. p. 133. Ed. WeIl and Wilted) says, it had been famous for brave men; and it was particularly celebrated as the birth-place of Themistocles. Corn. Nep. c. i.

ACHARON, in Entomology, a species of sphinx, of an azure colour, with brown wings, and red anus; found in New Holland.

ACHASA, in Ancient Geography, a country of Scythia beyond the mountain Imaus.

ACHAT, in our Law French, signifies a contract, or bargain; especially in the way of purchase. Purveyors were by act of parliament 34 Edw. III. ordained to be thenceforth called Achatens.

ACHATENS, in Geography, the companion and faithful friend of Aneas, who is celebrated by Virgil, and so called, says Servius, either in reference to some properties of the achatens or agate mentioned by Pliny, or from σάντος, the concern he felt on account of Aneas. Virgil, by Malvieux, v. i. p. 336, n. 178.

ACHATENS, in Entomology, a species of Papilio, with black wings, red at their base, and the hinder marked with a white spot; found in China.

ACHATES, in Ancient Geography, a river of Sicily, now the Drillo, which runs from N. to S. near, and almost parallel to, the Gela. Silius records it, (l. xiv. v. 229) “Et perfulacentem splendident gurgite Achaten,” and Pliny, (H. N. l. xxxvii. c. 10. p. 756, Ed. Hard.) says, that the achatens or agate was first found on the banks of this river. Bochart. (Geog. Sacr. i. i. c. 29. Oper. tom. i. 459, Ed. Villem.) supposes, that the name of the stone and river is derived from the Punic agate, varied or spotted, referring to the varied colours of the stone.

ACHATES, in Natural History, the stone called Agate.

ACHATINA, in Natural History, a species of Bulla, in the class of teneacous worms; with an ovated shell, fang- uineous, obtusated, aperture, and opex, and a truncated columnula. It has varieties, such as the white with yellow apex; the yellow or white with fangvineous columnella; and the white with clove bands, and a pale columnella. It is found in the American ocean. This is also the name of the Cyprea amathyes, in the Linnaean System, which is found in Madagascar.

ACH BOBBA, in Ornithology, a bird mentioned by Dr. Shaw (Travels, v. ii. p. 449), of which numerous stocks appear near the city of Cairo in Egypt, and feed upon the carrot and fith that are thrown out of the city. The name, in the Turkish language, signifies white father, and it is given to this bird partly from the reverence they have for it, and partly from the colour of its plumage. It is about the size of a large capon. This bird is called by Belon the Egyptian Sacre, and it is a variety of the Alpine Vulture, or Vultur pecorum of Linnaeus. It is of a red tawny ash-colour, with dusty spots, and its feet are naked. Belon concives that it is the Hierax, or Egyptian hawk of Herodotus, which, like the Ibis, was held in veneration by the ancient Egyptians, because both of them eat and destroy the serpents and other noxious reptiles, which infest Egypt. Buffon suggets that it may be the same with the Carian Vulture.

ACHE, or Achen, a painful ailment in any part of the body. Aches may be either eczematous or rheumatic, owing to violent pains, or the like. See Headach.

ACHE, in old authors, a name given to the plant called Ajun paludorum, or paludatum, in English Small- pepper.

ACHEN, Achen, or Achen, of Geography, a kingdom of Sumatra, lying on the N. W. part of the island. Its capital, of the same name, is situated on a river which empties itself near the N. W. point, or Achen-head, about two miles from the mouth. N. lat. 5° 22'. E. long. 95° 48'.
The town lies in a valley, formed like an amphitheatre by two lofty ranges of hills. The river discharges itself into the sea by several channels, and is very shallow at the bar. The houses, of which there are about 800, are built of bamboo and rough timber, and they are raised by means of pillars to some height above the ground, in order to preserve them from inundation and damps in the rainy season. In the centre of the town, which has neither wall nor moat, is the king’s palace, which is a large though rude edifice, and encompassed by a deep moat and strong walls. Though this place is no longer the mart of eastern commodities, it carries on a considerable trade with the nations of that part of the coast of Hindostan called Talung; by whom they are supplied with the cotton goods of the country, and who receive in return gold-dust, Japan wood, betel-nut, pepper, sulphur, camphor, and benzoin. The European traders supply the country with Bengal opium, iron, and other articles of merchandise. The inhabitants manufacture a considerable quantity of a thick kind of cotton-cloth, and of stuff for the flout drawers worn by the Malays and Acehnese. They also weave pieces of silk, of a particular form, for the Malayen drees. Acheen is deemed, comparatively, healthly, being less subject to complaints arising from woods and swamps than other parts of the island; and the soil is light and fertile, producing rice and cotton, and a variety of excellent fruits. The raw silk of the country is of inferior

quality.
but the little guard large supplies of food, and makes little people in the same. In their disposition and habits, they are more penetrating and sagacious, more active and industrious, and possess a greater stock of knowledge than their neighbours. With regard to religion, they are Mahometans; and their mosques and priists are numerous; and the forms and ceremonies of their worship are strictly observed. They are expert and bold navigators, and employ a considerable number of vessels for different purposes. Being instituted of convenient coins, they commonly make their payments in gold-dull, which they carry with them in pieces of bladder; and they use grain or seeds for weights. The government is an hereditary monarchy, and the king has usually a guard of 100 sepoys about his palace. The grand council of the nation consists of the king, four other officers, eight of a lower degree, who sit on his right hand, and sixteen who sit on his left. The king's pleasure is communicated by means of a woman, who sits at his feet, to an eunuch near her, and by him to an officer, who proclaims it to the whole assembly. Merchants and other strangers introduce themselves by presents to the king and his officers. Whenever an European enters the royal palace, he is obliged to take off his shoes. The royal throne was formerly made of ivory, and tortoise-shell; and, when queens governed, a curtain of gauze was hung before it. After the stranger has been introduced, he is entertained in a separate building of the country, and returns in the evening, attended by a prodigious number of lights. On high days the king goes in great state, mounted on an elephant richly caparisoned, to the great mosque; and he is preceded by officers armed very much after the European manner.

The country under the immediate jurisdiction of Acheen is divided into three districts; each of which is governed by a Panglemo, and subordinate officers. Crimes are severely punished, and without any commutation, by the Acheene laws. Petty theft incurs the supposition of the criminal from a tree, with a heavy weight tied to his feet, or the cutting off a finger, hand, or leg, according to the nature of the offence. Highway robbery, and house-breaking are punished by drowning, and exposing the body on a stake for some days. If an imam or pasha be murdered, the criminal is burned alive. The adulterer is delivered up to the friends and relations of the injured husband, who form a circle round him; and, if he be not fortunate enough to make his escape, he is presently cut to pieces, and buried without being admitted into any house, or the performance of any funeral rites. Notwithstanding these discouragements to iniquity, the Acheenes are represented by travellers as one of the most dishonest and flagitious nations of the east.

For other particulars, we must refer to Mr. Marfden's account of Sumatra. Acheen was visited by the Portuguese in 1509, but they could form no establishment in the country. Captain Lancinger was very differently received in 1602. He made a treaty in behalf of the English East India company, with the king of Acheen, and obtained for the company peculiar privileges. They had for many years a factory at Acheen. See Sumatra.

ACHEIROPITA, formed of a priv. Ache, hand, and may, to make, and denoting made without hands; an epithet given to an image of Christ in the Lateran church at Rome, which is said to have been designed and sketched by Luke, and finished by angels.

ACHEIROSUS, in Entomology, a species of Phalana, with irregulous wings, and the anterior marked with a white point and later, it is large, and found in America.

ACHEIROSUS, in Mythology, is said to have wrestled with Hercules for Deianira, the daughter of King Oeneus, and, aluming the flame of a bull, Hercules is said to have broken off one of his horns, which was reffered on condition of his giving the victor the horn of Amalea, the fame with the Cernuops, or horn of plenty, which Hercules failed with various presents, and consecrated to Jupiter. For the meaning of Acheirosus, see the next article.

ACHEIMOS, in Hydrography, a river of Acadania, which rises in 105° 40' E. and, dividing Achelus from Acadania, flows from N. to S. into the Sinus Cithaonius. It was improperly called Ἀκέλας on account of its impetuosity, and by Herodotus, (i. i. v. 104.) the king of rivers. The epithet Acheimos is used by Virgil, (ii. i. v. 91.) for aquas, the reason of which, according to Servius (in loc.) is, that Acheimos, on account of the antiquity of this river, was used by the ancients as a denomination of water in general. The ancient poets call rivers Tauriformes, either from the bellowing of their waters, or from their ploughing the earth in their course. The reference to the preceding article is explained by some in this manner, Acheimos being a rapid and winding river, roared like a bull, and often overflowed its banks; but Hercules, by dividing it into two channels, and restraining its inundations by mounds and ditches, broke off one of the bull's horns, and restored plenty to the country. Strabo (Geog. an. vol. ii, p. 703-4.) says, There are other rivers of this name in Achaia Properia, Thascal, and Asina Minor.

ACHEM, in Geography, a country of Africa, in that part denominated the Slave-coast. The extent of this country is unknown: the negroes assert that it reaches to the coast of Barbary. It is divided into great and little Achem, which were formerly united under one monarchy, but are now two separate republics: little Achem is denominated Acheni, or Achani. There is a town of the same name, sometimes called Aemony. N. lat. 8° 30'. E. long. 0° 30'. Most of the gold exported from this country is brought to the European forts at Ache.

The negroes of both these districts are of an intelligent and haughty character, valuing themselves on the superiority they once maintained in respect of their neighbours; but civil divisions have of late rendered them less formidable.

ACHEMENIS, in Botany, an herb mentioned by Pliny (H. N. i. xxii. c. 4.) as p. 392.) supposed by the ancients to have the property of exciting terror in their arms, and putting them to flight. The title may probably denote, that soldiers could not prosper in war with plants in their hands.

ACHEMOS, in Entomology, a species of Sphinx, yellow, with glaft-coloured wings, black at their apex, and to the fore wings yellow at their base; found in Jamaica.

ACHERI, Luke, in Biography, a learned Benedictine of the congregation of St. Maur, was born at St. Quintin in Picardy, in 1600, and made himself famous by printing several works, that excelled in MS. with prefaces and notes; such as Barnabas's Epistles, the works of Archbishop Lanfranc, the Life and Writings of Gubert Abbot of Nogent, and a collection of curious pieces, begun in 1655, and concluded in 1677, under the title of Spicilegiu, i.e. Teneings, in 13 volumes 4to. In 1723, it was reprinted by M. de
M. de la Barre, in three volumes folio. With regard to subjects of ecclesiastical history this may be an useful book of reference. The title of the Acts of the Saints, of the order of St. Benedict, also expressed, that they were collected and published by him and Malbon. He died at Paris April 25th, 1685, in the abbey of St. German, where he had been librarian. Gen. Diet.

ACHERNER, or ACHERNE, in Aftermarty, a star of the first magnitude in the southern extremity of the constellation Eriopius, but invisible in our latitude. It is marked off by Bayer. Its longitude for 1761 was X 1° 51' 19"; and latitude 55° 22' 48" S.

ACHERON, in Mythology, a river of Epirus, which the poets assigned to be the son of Ceres, whom the lid in hell for fear of the Titans, and converted into a river, over which souls departed were ferried in their way to Elysium. The Acheron of the lower regions is derived by Servius and others, from μεθέρης, without figs.

Acheron, in Ancient Geography, a river of Thessaly in Epirus, now Doliche, which, rising in the country of the Molossi and forming the lake of Acherusia, falls into the sea near the promontory of Chiron, to the west of the Sinus Ambracius, in a course from N. to S. Such is the account of Ptolemy, Strabo, and Thucydides. Pliny states, that it springs in the above-mentioned lake, and empties itself into the Ambracian gulf.

Acheron, or Acheron, is a river of the Brutii in Italy, now Sevonta, running from E. to W. In this river Alexander king of Epirus was slain by the Lucani, being deceived by the oracle of Delphi, which bade him beware of Acherusia, and of the city of Pandionis. Alexander, not knowing that in this country there were a river and city of the same names with those of Epirus, purfied his military operations without fear of danger. But, being driven by the enemy to the border of a river, which was overgrown with rain, he plunged it into an orchard; when one of his attendants, feending him in danger of being drowned, exclaimed, "Curled Acheron! thus art jutted by a fatal name!"

At these words Alexander recollected the admonition of the oracle; and, while he was hesitating whether he should proceed or not, he was treacherously put to death by one of the Lucani, who were appointed to be his guards. Livy, i. 44. 5. and ed. D� 30. 4. 4.

Acheronta, in Entomology, a species of Papilio, with detacted wings, the anterior being red at their base, and black at the apex, spotted with white. It is found in Brazil.

Acherontia, a small city of Apulia, now Ascraevus, situated on a hill, and thence called by Horace (Od. 3. 4.) a bird's nest.

Acheret, in English Antiquity, a measure of corn conjectured to be the same with our quarter or eight bushels. The monks of Peterborough had a weekly allowance of 12 ascheris de frumento, and 8 ascheris de brota, and 6 ascheris de fabris, &c. Sptman.

Acherusia pulvis, in Ancient Geography, a lake between Cumae and the promontory Milenum, now Il largo della Colonna, or del Fusaro. Some confound it with the lusus Lucrinus, and others with the lusus Acranus; but Strabo (vol. i. p. 374) and Pliny (H. N. i. ii. c. 5. vol. i. p. 154) distinguish them. The former supposes it to be an effusion of the sea; and therefore called by Lyconophor, (v. 655) Αχερουσία ἰπαλς. There is a lake of Epirus of this name, through which the Acheron runs. There is also an Acherusia, which is a peninsula of Bithynia on the Euxine, near Hercules; and a cave of the same name, through which Hercules is said to have descended into hell, to drag forth Cerberus.

Vol. I.

ACHATA, in Entomology, a name by which Linnaeus has distinguished the third family of the Oenopidae; the characters of which are, that they have two brushes situated above the extremity of the abdomen, and three hemes, and that the tars of young individuals. Seventy-eight species are enumerated in the new edition of the Systema Naturae. The leaves of this family feed upon the roots of plants. See Conopidae.

ACHIA, a kind of cane which grows in the East Indies, and is pickled there while green, with strong vinegar and pepper, together with some other tincture and preservatives.

ACHICHA, in Geography, a town of the province of Angélos or Tlapacal in Mexico.

ACHILANS, of Acheron, in Natural History, a word used by the ancients to express a flax or down, in the second year's age. In the first it was called nechus, in the third dicrates, and always after that eronis.

AChiar, is a Malay word, signifying all fruits or fruits and roots pickled with vinegar and spice. The Dutch import from Batavia all sorts of AChiar. The name is applied to whatever the AChiar is made of, as bamboo aChiar, &c.

AChicolium, is used to express the fornicus, tholus, or lobatum of the ancient botanists, which was a large worm, and which they used to fertil. It was also called cicatholus.

AChileas, or AChilicus, a plant, cultivated in France and Belgium, who is supposed to have acquired some knowledge of botany from his native Chiron; and to have used this plant for the cure of wounds and ulcers: a genus of the fam. for pigna, for sphenia, or class of plants, and of the natural order of convolvus clysteres: a genus with the common calyx is ovate, and inbriated, with ovate, acute, converging leaves; the compound corolla is radiate, the hermaphrodite corollae are tubular in the disk; and the males ligulate, being from five to ten in the ray; the proper corolla of the hermaphrodites is funnel shaped, five-cleft, and spreading; the female accumbent, spreading and triphid, the middle cleft being less than the others: the stamens in the hermaphrodites consist of five carpy, very short stamens, and the anther is cylindrical and tubular; the piliillum in the hermaphrodites has a small germ, a fine form of the length of the stamens, and an obtuse, conjeegate figma; in the females, a small germ, a form of a, of the same length in the stamens, and two obtuse, reflex figmas; there is no pericarp in the calyx: the calyx is rarely changed; the receptacle is tripartite, elongate as the disk: the seeds are of different length; the length of the calyx: the seeds are solitary, ovate, furnished with flocks, but without down; and the receptacle is chiefly and elevated; the chaff being lanceolate, of the length of the florets. There are 27 species, viz. 1. the Santolina or lavender cotton leaved Milfoil, with large yellow flowers standing singly on long peduncles, whose leaves when rubbed emit a strong oily odour, an inhabitant of the Levant, cultivated by Miller in 1759, and flowering in June and July; — 2. the Ageratum, sweet M. or maudslay: : the flower, or hickle-leaved M. a native of the east, where it is used in medicine; — 3. the tomentosum, or woolly M. which grows naturally in Spain, the South of France, and Italy, bears the open air in England, was cultivated in the Oxford garden in 1658, and bears flowers that retain their beauty for a considerable time; — 5. the pubescens, or downy M. without chaffs to the receptacle, a native of the Levant; and cultivated in the Chelsea garden in 1739; — 6. the abrotanum, or flower-yellow M. a native of the Levant, which was cultivated by Mr. Miller in 1759, and flowers from June and July; — 7. the blainiata, a native of the Levant; — 8. the ctenopus, with fine silver leaves, which make a good ap
A C H

parance through the year, a native of the Levant, and cultivated at Chelsea in 1712. All the preceding species have yellow corollas; the corollas of the following are white in the ray:—9. the macrophylla, or few-leaved M. whose leaves resemble those of the common feverfew, and some of the fize of those of the tansy; the scales of the calyx edged with black, the plant, and especially the flowers, smelling like feverfew; a native of the Alps, hardy, and thriving in any soil, and deferving a place in gardens; flowering in July and August, and cultivated by Mr. Miller in 1759:—10. the impatiens, with a deep red at bottom, and terminating in a handsome tuft of white flowers, and the florets in the ray elegantly cut, frequent in Siberia:—11. echinops, or silver-leaved M. the Abyssinian album of Gerard and Ray, a native of the Alps of Switzerland, Austria, Pannonia, and Carinthia, cultivated in 1683 by Mr. J. Sutherland:—12. pteronia, or feverfew M. growing wild in all the temperate parts of Europe, found in Britain not uncommonly in meadows, by the sides of ditches, on the banks of cornfields, in moist woods, and shady places; the flowers are put into fallets, and the roots, being hot and biting, are used for the tooth-ache, whence the plant has been called Bafford pulletory and, on account of the form of the leaf, goose tongue: the power of the dried leaves of this plant is said to provoke feezing; whence the name; in Siberia a decoction of the whole herb is said to be usefull in internal hemorrhages: of this plant there is a variety with double flowers called butcher's buttons; it flowers in July and August, and makes a tolerable appearance:—13. alpina, or Alpine M. resembling the last, and by some supposed to be a variety of it; a native of Switzerland. Savoy, and Siberia, very hardy, cultivated here by Mr. Miller in 1731:—14. ferraria, or notch-leaved M. appearing like pteronia, flowering in August and September, and introduced, with the next species, in 1754, by Mr. J. Grubb:—15. cripitata, or flender-branched M. a native of the East, flowering here in July and August:—16. atrata, or camomile-leaved or black M. found on the mountains of Switzerland, the Valsis, and Austria, and introduced here in 1774 by Drs. Pitcairn and Fothergill:—17. mejofeata, mulk M. or Swif's genipi, an excellent feudoric, but injurious in the plentiful attended with high fever, promising to be serviceable in disorders arising from a debility of the solids, and yielding a grateful food to cattle; it grows wild on the high Alps, in Piedmont, and at Vienna, and was introduced in 1775 by Dr. Fothergill and Pitcairn:—18. nova, or dwarf M. found on the high Alps of Switzerland, the Valsis, and Savoy, very hardy, thrives in any soil, loves an open exposure, and deserves a place in gardens:—19. magia, great M. or Yarrow, found in Italy, and cultivated here in 1683 by Mr. J. Sutherland:—20. millesifolium, common M. or Yarrow, abundant in pastures and by the fides of roads, flowering from June to September; mixed instead of hops, by the inhabitants of Dalecarlia, in their ale, in order to give it an inebriating quality; recommended by Anderson in his Essays on Agriculture, for cultivation, though thought to be a noxious weed in pastures; the bruised herb fresh is recommended by Linnaeus as an excellent vulnerary and styptic, and by foreign physicians in hemorrhages, and thought by Dr. Hill to be excellent in dyureties, when administered in the form of a ftrong decoction; an anointment is made of it for the piles, and for the leach in face; and a useless essential oil is extracted from the flowers, but it is not used in the present practice:—21. nonflora, a native of Italy, Germany, Switzerland, Narbonne, and Tartary, and cultivated in 1640 by Mr. J. Parkinon:—22. odorata, or scented M. thought by Gerard and Haller to be a variety of the former, and a native of the same place:—23. cretica, or Cretan M. a native of Crete:—24. pyrethrum, roughly-headed M. introduced in 1775 by Mr. Thouin:—25. barbita, esteemed among the peasants of the Alps as a fudorific against worms, flatulenties, and intermittent fevers:—26. risifola, marjoram-scented M. having a strong smell, as well as the leaf, like mauldin:—27. tanacetifolia, tansy-leaved M. a native of the Grisons, and not uncommon in the pastures and valleys of the Alps. In the last edition of Linnaeus, Gmelin enumerates 33 species, omitting the plant, and adding the lobata, capitata, corposporia, Halenia, micrantha, and pilotes.

All the species of the Achillea may be propagated by parting the roots either in spring or autumn. The seeds of many of them may be sown in March or April, and they may be transplanted at Michaelmas. They will flower the following summer. As they are mostly hardy, they will require little care in the cultivation. Miller's Dict. by Martyn.

Achillea inodora. See Athenasia.

Achillea montana. See Senecio.

Achillea tanacetifolia of Miller. See Chrysanthemum.

Achillea, in the Materia Medica of the ancients, a name given to the gum, which we at this time know by that of the Sanguis draconis, or Dragon's Blood. The ancient Greeks called this cinnamon, and the use of the word for the mineral which we now call cinnamon, was only because it had the same red colour with this gum. Avicenna, treating of the Achillea, says, it is otherwise called Sanguis draconis, and describes it as a real gum, universally known in his time.

Achillea, in Ancient Geography. See Leuce.

Achilles, or Achillus, in Literary History, a celebrated poem of Statius, of the epic kind, in which he propounded to deliver the whole life and actions of Achilles. It only comprehends his infancy; the poem being prevented from proceeding by death. It is a point controverted among critics, whether the whole life of a hero, e. g. of Achilles, be a proper subject of an epic poem?

Achilleon, in Ancient Geography, a town and promontory of the Chimerian Bosphorus, where anciently was the temple of a stock of Aehilleus.

Achilles, in Ancient History, the son of Peleus and Thetis, was one of the most celebrated heroes of Greece. He was born at Pthias in Thessaly. His mother, it is said, dipped him in the river Styx, by which his whole body became invulnerable, except the heel by which she had held him. This relation, however, is not universally received; for it appears by Homer's account, (H. I. xxi. v. 161, &c.) that he was actually wounded in the right arm by the lance of Aeneas, in a battle near the river Scamander. He was enthralled also by Thetis to the care of the centaur Chiron, who fed him with honey and the marrow of lions and wild boars, in order to fit him for enduring martial toil, and taught him horsemanship and the use of arms. When he attempted, by concealing him among young women at the court of Lycomedes, to prevent his going to the siege of Troy, where, as she had been warned by an oracle, he would be slain; Ulysses, being admonished by an old prediction that, without Achilles, the enterprise against Troy would be unsuccessful, discovered him, and persuaded him to follow the Greeks; his mother having procured for him an armoure made by Vulcan, which was impenetrable. During his concealment he is said to have debauched one of the king's daughters, of whom was born Pyrrhus, king of Epirus. Paulaner observes, that Homer has omitted this circumstance as dishonourable to his hero, though it has been
been recorded by all the other poets. At the siege of Troy Achilles distinguished himself by a variety of heroic actions; but being disqualified with Agamemnon for the loss of Briseis, he retired from the camp. When he afterwards returned to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged him thrice round the walls of Troy. The body was afterwards redeemed by the father with a large sum. At last wounded in the heel with an arrow by Paris the brother of Hector, whilst he was in the temple treating about his marriage with Philoxena, daughter to king Priam, the wound proved fatal to him; and he was interred on the promontory of Scylla. When Troy was taken, the Greeks sacrificed Philoxena on his tomb, in conformity to his request, that he might enjoy her company in the Elysian fields. It is said, that Alexander, when he saw this tomb, honoured it by placing a crown upon it; explaining at the same time, that "Achilles was happy in having, during his life, such a friend as Patroclus, and after his death, a poet like Homer," Achilles is supposed to have died 1154 years before the Christian era. Homer has been blamed for making his hero Achilles of too brutal and unamiable a character. This charge, Dr. Blair apprehends, is unjust to Achilles, and it is founded on an exaggerated representation of his character by Horace, de Arte Poet. p. 55. Ed. Wakelfield.

"Impiger, iracundus, inesorabilis, acer,
Jura neget fibi nata, nihil non arrogant armis."

The following brief account will serve to vindicate Homer, as well as his hero. "Achilles, says Dr. Blair, (Lect. on Rhet. &c. vol. iii. 240) is passionate, indeed, to a great degree; but he is far from being a contenter of laws and justice. In the contest with Agamemnon, though he came off in that struggle with as much honour on his side. He was notoriously wronged, but he submits; and resigns Briseis peaceably when the heralds came to demand her; only, he will fight no longer under the command of a leader who had affronted him. Besides his wonderful bravery and contempt of death, he has several other qualities of a hero. He is open and sincere. He loves his subjects, and reveres the gods. He is distinguished by strong friendships and attachments; he is, throughout, high spirited, gallant, and honourable; and, allowing for a degree of ferocity which belonged to the times, and enters into the characters of most of Homer's heroes, he is, upon the whole, abundantly fitted to raise high admiration, though not pure eëme." 

Achilles, Tatius. See Tatius.

Achilles, in Philosophy, a name which the school gives to the principal argument alleged by each sect of philosophers in behalf of their system. In this sense we say, this is his Achilles; that is, his master proof, alluding to the strength and importance of Achilles among the Greeks. Zeno's argument against motion, is peculiarly termed Achilles. That philosopher, and a companion between the swiftness of Achilles and the slowness of a tortoise, arguing, that if the tortoise were one mile before Achilles, and the motion of Achilles 100 times swifter than that of the tortoise, yet he would never overtake it; and thence he concluded, that there was no such thing as motion. But this is a mere sophism; and is easily solved by expressing the whole relative distance run by the tortoise before Achilles overtook him by the following series, \( \frac{1}{100} + \frac{1}{10000} + \frac{1}{1000000} \), &c. the sum of which is \( \frac{1}{99} \) of a mile; and the distance run by Achilles is one mile more; so that, when Achilles had run \( \frac{1}{99} \) of a mile, he would have overtaken the tortoise.

Achilles, island of, in Geography. See Leuc.

Achilles, in Entomology, a species of Papilio, with wings black on the upper part, a blue band, and brown beneath, and three or five ocelli; found in America.

Achilles, tendon of, chorda Achillii, in Anatomy, is a large tendon, formed by the union of the soleus and gastrocnemius extorsor muscles, which are inserted into the os calcis. See Tendo Achillis. It is so called because the fatal wound, by which Achilles is said to have been slain, was given there.

Achill Head, in Geography, is the W. point of the island of Achill on the W. coast of Ireland. N. lat. 53° 51'. W. long. 10° 45'. The coast between this head and the coast of Erris, is very indented. The point itself is called Achill, Arick, or Acharlodon point is eight leagues S. of this head, and thence to Slinde head, S. by E. eight miles more. Within land there is between these a high hill, called St. Patrick's hill, which may be seen at sea to a great distance. Achill-head is a very high point, and appears at a distance with a hollow in the middle. Within this are two high mountains; and these three appear at sea like three islands.

Achillini, Alexander, in Biography, a native of Bologna, and distinguished both as a philosopher and a physician. He flourished in the 15th and 16th centuries, and was called, by way of eminence, the great philosopher. His progress in his studies was so rapid, that he was promoted in early life to the honour of being a professor in the university. In the year 1506 he removed to Padua, where he filled the first chair of philosophy, and drew to his lectures a great number of students. When the war, in which the republic of Venice was engaged against the league of Cambray, constrained him to leave Padua, he returned to his native country, and was again appointed professor of philosophy in Bologna. He adopted and maintained the sentiments of Averroës; and was particularly distinguished for his acuteness in the conduct of private and public disputations. To him some have ascribed the discovery of the malleus and incus, two small bones in the organ of hearing. Achillini was a man of singular simplicity, and so unacquainted with the common modes of civility and address, that he was often ridiculed by the young scholars who attended him, though much and deservedly esteemed on account of his learning. He was the rival of Pomponacius, who sometimes acquired a superiority over his arguments by his wit and humour. He died at Bologna in 1512 at the age of 40 years; and was buried with great pomp in the church of St. Martin the great, belonging to the Carmelites friars. The following epitaph, composed by Janus Vitalis, was inscribed on his tomb: viz.

"Hospes, Achillini tumulo quiescit, in illo
Fallera: ille tuo junctus Arilothi
Elyium colit: et quas rerum hic dicere caesus
Vix potuit, plebis nunc vident occulis.
Tum, de longum, per terram picta
Memoria, necesse per die longum Vale.

He wrote several pieces on philosophical subjects, which he published and dedicated to John Bentivogli. His works are, 1. In Mundini Anatom. Annotationes. Venet. 1522, fol. 2. De Humani Corporis Anatomia, Venet. 1516, 1521, 410. In 1568, a collection of all his works, philosophical and medical, was published at Venice in folio.

Achillini, John Philotheus, a brother of the former, was the author of a poem entitled "Il Viridario," in which are found the eulogy of several Italian literati, and various liesions of morality. It was printed at Bologna in 1513. He was born at Bologna in 1476, and died in 1538. He was a man of talents and erudition, and conversant with the Latin and Greek classics, with music, philosophy, theology, and antiquities; of which last he has made simple collections.
ACHILLES, Dromoi, Δρόμοι, in Ancient Geography, a peninsula not far from LEUCUS, or the island of Achilles, and near the mouth of the Borylithenes, in the Euxine sea; so called from its being the place where the Grecian hero appropriated to his own use and that of his companions for various kinds of exercise, and particularly that of running; whence Δρόμος, to run. It is now called TIDONES.

ACHIMBASSI, the name of an officer, who prefers the practice of medicine at Cairo. His business is to examine persons offering to practise physic in that city, and to licence only such as are found to be duly qualified. This was, without doubt, the intention of the appointment; but as the Achimbassi purchases his office of the Baisi, the privilege of practising physic there is granted to the persons offering the largest fees, and not to those most distinguished by knowledge in their profession.

ACHINOU Pefs, in Geography, lies betwixt the island of Negropont and the main in the Archipelago sea. N. lat. 39° 40'. E. long. 23° 55'.

AChiotte, a red drug from America, used in dying, and in the preparation of chocolate. The word is Brabanian, and properly signifies the tree from which this matter is procured. Ray writes it Achiote. Achiotte is the same with what the French frequently call rouge, and the Dutch orlaante. It was formerly, and even by Mr. Ray himself, deemed a kind of argilla, or earth; but later observers find it to be a flower, or seed of a tree, which grows chiefly in hot countries, as Yucatan or Campeche, and Guatamala. It is about the size of a plum-tree, only more tufted; its branches being longer than the trunk. The fruit is inclosed in a rind like a chestnut, except that it is of an oval figure. It begins to open crosways from the middle to the top, and subdivides into four parts; having in the middle a beautiful carnation-coloured flower. The tree has no leaves; but instead of these shoots out filaments like those of fasson, only bigger and longer. Between these grow little soft vermilion-coloured grains, about the size of pepper-corns; which the Indians, separating from the filament, bake in cakes of about half a pound each; in which form the drug is brought into Europe. For the use to which it is applied, and the method of preparing it, see Anxotto and Roucou. See also Bixa Orelliana.

AChiropoetos. See AChiropteta.

AChivi, in Ancient History, a name given by the Romans to the people of Greece, or Achaia. See AChaeans. Homer (II. i. iii. v. 81) uses the term to express all the enemies of the Trojans.

AChleitizen, in Geography, a town of Germany, in the circle of Aultria, on the Danube, four leagues E.S.E. of Enns.

AChlet, a town of Great Armenia, situate on the north side of the lake Van, or Aeramar. This town, though small, is important to the Turks, because it lies on the frontier of their empire, and is well fortified. N. lat. 35°. E. long. 78° 20'.

AChlis, in Zoology, a name given by Pliny to the Cervus Alces, or Elk.

AChlys, σχιλος. literally signifying a kind of cloud, in Surgery, a darknes or dimes of sight. It also denotes a small scar or mark over the pupil, of a light blue colour, and is synonymous with caligo cornex, or blindness from opacity of the cornea. It is the leukemia nephelium of Sauvages, and is described to be a speck of the cornea, somewhat pellucid, which occasionally objects to appear as if seen through smoke, or a cloud, and therefore obscured. By oblique inspection it is discoverd to be different from the opacity of the aqueous humour, accompanying some difficulties of the eye. This species often arises from a various ophthalmia, or moid or, or whatever can render the cornea unstable. In infants, as they grow up, it often vanishes spontaneously. The juice of pimpernel, either the blue or purple, dropped into the eye twice-a-day for a week, and the juice of the common star-thistle and blue-cottage, are useful. Sugar-candy powdered is ofien sufficient. Emetic wine, which is the least hurtful, may be dropped into the eye with advantage. The vapours of annisfed, or funnel-feed water, are of service. See Wallis's Nefologia Methodica occultorum.

In a metaphorical sense, achlys also denotes a disorder of the womb, answering to what Latin authors call suffusio uteri.

AChlys, in Mythology, is applied by some Greek authors to the first Being, who existed before the creation of the world, of chaos, and of the gods.

AChmet, in Biography, an Arabian author, supposed to have lived about the fourth century, wrote a book "On the Interpretation of Dreams," according to the doctrine of the Indians, Persians, and Egyptians. The original is lost, but it has been preserved by curiosities, or superstitious credulity in Greek and Latin. It was published together with "Artemidorus on Dreams and Chiromancy," by M. Rigaud, at Paris, in 1603, 4to. Gen. Dict. and Gen. Biog.

AChmet I. emperor of the Turks, was third son and successor of Mahomet III. and ascended the throne before he had attained the age of fifteen. His reign was attended with various circumstances, both prosperous and adverse to the Turkish empire. The Asiatic rebels, who took refuge in Persia, involved the two empires in a war, during the progress of which Bagdad was taken from the Turks, and which lasted, with interruptions, for several years. In this reign Transylvania and Hungary were the scenes of warfare between the Turks and Germans; and the former were assisted by Bethlem Gabor and Potiak. The tranquillity of Achmet was disturbed by various disasters and calamities, which occurred both by sea and land, by a pretender to his throne, and by attempts on his life. His time, however, was chiefly devoted to the gratifications of the harem, in which he had 3000 women, and to the sports of the field, for which purpose he kept 40,000 falconers, and nearly as many huntsmen, in different parts of his dominions. He expended large sums in building, and particularly on a mosque which he erected in the Hippodrome. Achmet was less cruel than his predecessors; but he was haughty and ambitious. His constitution was strong, and his life was active; nevertheless he died at the age of 29, in 1617. His three sons successively ascended the throne after him. Mod. Un. Hist.

AChmet II. emperor of the Turks, son of Sultan Ibrahim, succeeded his brother Solymon, in 1691. This prince, though devout and inoffensive, chesful and condescending, just and amiable in private life, was destitute of the talents necessary for the exercise of sovereign power. He was fond of poetry and musick, in both of which he made some pro-
ACRH

proficiency. He died in 1695, at the age of 50,requiting his successor Multapha, to spare the life of his son. Mod.
Un. Hift.

ACHMET III, emperor of the Turks, son of Mahomet
IV, was raised to the throne on the deposition of his
brother Multapha II. in 1703. His first object, after removing
the malecontents, was to amass wealth; and with this
view he debased the coin, and laid new taxes. When
Charles XII. of Sweden, in 1709, after the battle of Pul-
tawa, took refuge in the Turkish dominions, he was re-
ceived with great hospitality; and under the influence of
the sultana mother, war was declared against Czar Peter,
which terminated by the peace of Pruth. The king, how-
ever, was at length obliged to quit the Turkish dominions.
Achmet recovered the Morea from the Venetians; but in
his expedition into Hungary, in 1716, his army was de-
fated by Prince Eugene, at the battle of Peterwaradin.
Achmet was led by his minions and favourites, and their
influence frequently occasioned political revolutions. He is
said, however, to have refrained in disgrace to public places,
in order to discover the sentiments of his subjects. At
length a fennent amongst the officers caused his dethron-
ment in 1720, and the elevation of his nephew Mahomet V.
He was confined in the apartment whence his successor had
been taken, and continued unmolested till he was removed
by an apoplexy in 1736, at the age of 74 years. Achmet
was a prince of moderate abilities, and good intentions; but
confidence in his viceroy obscured the lustre of his reign, and
brought it to a speedy termination. Mod. Un. Hift.

ACHMETSHET, in Geography, a town in the penin-
sula of the Crimea, the residence of the Sultan Galga, the
elder son of the Khan of Tartary. It stands on the largest
river in the country. N. lat. 45° 35'. E. long. 52° 20'.

ACHMIM, a large town of Upper Egypt, situated on
the eastern bank of the Nile: the Chemmis of Herodotus, and
Panopolis of Strabo. On a triumphal arch, situate a
few 100 yards south of the convent, and built of marble by
the emperor Nero, there is a Greek inscription, says Mr.
Bruce, 311. 312. The temple of this place, says Abulfeda,
is one of the most celebrated monuments of antiquity; being
contructed of stones of a prodigious size, on which are
sculptured innumerable figures. There may still be traced
four concentric circles in a square: the innermost of which
contains the sun; the two next are divided into twelve parts,
one containing twelve birds, and the other twelve animals
almost effaced, which appear to be the signs of the zodiac:
the fourth presents twelve human figures, which Savary
supposes to be the twelve gods representing the twelve
months of the year, as the Egyptians, according to Her-
odotus, (I. ii.) first divided the year into twelve months, and
the angles of the square, on the sides of which may be distin-
guished a globe with wings, are occupied by the four seasons.
This temple was probably dedicated to the sun; and those
various hieroglyphics mark his passage into the signs of the
zodiac: whence Savary infers, that the Egyptians possessed
the knowledge of astronomy from the remotest antiquity.
The serpent Haridj is the wonder of the neighbouring coun-
try: Scheilk Haridj, above a century ago, died in this
place; and as he was deemed a saint among the Mahome-
tans, they raised a monument in honour of him, and one of
their priests proclaimed the people, that the foul of Haridj
poised into the body of a serpent. This artful priest had
contrived to make a serpent obedient to his voice, and he
pretended to perform a variety of tricks, and to cure many
disorders by means of this serpent, which he confided to the
tomb, and made the instrument of great gain to himself.
The virtues of this serpent are acknowledged by the Chri-
tians of the country as well as by the Turks; and they
maintain, that it is the demon Asmodeus, who flew the
seven husbands of Tobit's wife, and that he was brought
by the angel Raphael to this place, after metamorphosing
him, and that God makes use of him to deceive the infidels.

Although Achmim had lost much of its ancient splendour, it
is still one of the most beautiful towns of Upper Egypt.
It is subject to a well regulated police. The streets are wide

and clean, and commerce and agriculture flourish in its
vicinity. It has a manufacture of cotton, fluffs, and pottery,
which are conveyed over the whole of Egypt. Bruce
(Travels, &c. vol. i. p. 68.) says, that the air is bad,
and the aspect of the inhabitants, of whom he speaks in very
degrading terms, yellow and unhealthy. See Savary's Let-
ters on Egypt, vol. i. p. 562, &c.

ACHMOUNAIN, a village in Upper Egypt, about
four miles to the north of Millowat, which is remarkable
for the ruins it contains, and particularly for a superb portico
in good preservation. On the frieze there are carved several
hieroglyphics, which probably exhibit the history of the
time, the place, and the deity in whose honour this monu-
ment was raised. It is particularly described by Savary.

ACHNE, in Geography, an ancient name given to one of
the islands of Rhodes, afterwards called Cafsos.

ACHNE, in Medicine. See ACROMY.

ACHOLLA, in Ancient Geography, a free city of Africa
Proper, mentioned by Strabo and Stephanus; called by
others Asilla. Polycren has fixed its situation between
Thapsus and Rufpes; and Dr. Shaw (Trav. p. 111.) sup-
poses it to be the present Alaha, lying upon the borders of
a fertile plain, which extends from Salecho to the vicinity
of Sheba.

ACHOMBONE, in Geography, the capital of the can-
ton of Axim, on the gold coast of Africa. It is defended
by a Dutch fort; and the houses are separated by avenues
planted with fruit-trees, which form elegant villas. The
river Axim runs through the town.

ACHONRY, a small town of Ireland, in the province of
Connaught, and county of Shigo, situate on the river
Shannon.

ACHOR, in Scripture Geography, a valley of Jericho,
lying along the river Jordan, not far from Gilgal; so called
from Achab, who was there stoned to death.

ACHOR, in Hebraology, the god of flies; to whom,
according to Pliny, the inhabitants of Cyrene sacrificed,
in order to obtain deliverance from these insects, and the
diseases occasioned by them.

ACID, in Surgery, a species of herpes, the cruelst lachæa
of some authors, and in England the field-head. It is a
fort of small running ulcer on the face and head, chiefly
of children while they suck, by which the skin is broke into
a number
ACHII

A number of little holes, out of which issues a viscid humour, like ichor, whence its name. When the discharge spreads, this serum dries, and forms a fcab. Achor differs from the favus and tinea only in the degree of virulence. When the perforations are large, it is called favus; and tinea, when they are like those which are made by moths in cloth. By tinea is generally understood a dry fcab on the hairy scalp of children, with thick scales, and an offensive smell; and when the disorder affects the face, it is called crusta lactea. Mr. Bell, in his treatise of ulcers, says, that both these may be reduced to the same species of herpes, viz. the herpes pululans, as they differ only in situation. Dr. Cullen considers this disease as a synonym of ulcer, where he also places the crusta lactea, in the clafs localis, and order dialyser. When it happens to children, otherwise healthy, it will be commonly sufficient to keep the belly moderately lax, to preserve cleanliness, and to restrict them to a moderate diet. The hair should be kept short, and the head washed with soap-fuds; and an issue may be of service. When the disorder is more violent, attended with much itching, papulæ of counter-rash, and other unpleasant symptoms, the same method of treatment will generally succeed. Small doses of calomel may be administered as an alterative, and the antimony wine, at proper intervals, as the stomach will bear. The unguentum e pice may be used externally two or three times a week; or cream mixed with chalk in fine powder. When the humour is repelled, warm fuddories should be used; and though the cold-bath should be avoided, the warm-bath will be beneficial. When the hair is short, the part may be washed with a lotion made of aq. pur. Bji. and gr. x. of hydrargyri mutia. Mother. Dist. by Wallis. See Acrimony and Tinea Capitis.

ACHHRADINA, or as Cicero has it, Acadrina, in Ancient Geography, one of the cities, or divisions of Syria-cuce, and the largest, most beautiful, most fertile, and best fortified of the five. The others were the islands Nafis, or Ortygia, Tyche, and Neapolis; to which was afterwards added the hill called Epipole. It was adorned, according to Cicero, (l. iv. c. 53, de Syracusiis,) with a very spacious forum, beautiful porticoes, a very elegant pyramide, a capacious female-house, and a superb temple of Jupiter Olympius. The rocks of this quarter of Syracuse, which are formed by marine depofitions, pollf the singular property of diffipating or abforbing the moisture of dead bodies fo speedily, that they are preferved in vaults excavated for the purpofe, in their proper form and habitations.

ACHIRAS, or Sapota-Plum, in Botany, a genus of the boandria monogynia clafs, and of the natural order of bomoae. The characters are; the calyx is a perianthium, confifing of fix ovate, concave, cærefal leaflets, the outer broader and shorter, and the inner coloured; the corolla is one-petalled, ovate, of the fame height with the calyx, with the border cut into fix fubovate flat divisions, and fcales at the jaws of the corolla, equal in length to the divifions, narrower, spreading, and emarginate; the flaminia have fix fhort awl-shaped filaments at the jaws of the corolla, alternate with the divifions, bent inwards, and the anthers are harp; the pellitium has a roundifi, flatted germen; the fyle is awl-hapced, and longer than the corolla; and the stigma is obtuse; the perianclum is a globofe, very fucculent pomum, with twelve cells; the seeds are foltary, ovate, fliumin, fcarred on one fide, and pointed at the bafe. There are four fpecies, viz. 1. The mammefa, or mammea sapota, otherwise called nippled S. or American marmelade, growing in America to the height of thirty or forty feet, with leaves a foot long, and three inches broad in the middle, cream-coloured flowers, and large oval fruit, containing a thick luscious pulp, called natural marmelade; this tree is planted for the fruit in Jamaica, Barbadoes, Cuba, and most of the West Indiailands, and was cultivated here by Mr. Miller in 1739; of this there is a variety, called the bully or nif-berry bully-tree, because it is the tallift of all the trees in the woods; it is esteemed one of the heif timber-trees in Jamaica. 2. The sapota, which grows to the height of fifty or seventy feet, without knots or branches, and bears a round, yellow fruit, bigger than a quince, which smells well, and is of an agreeable taste; it is common at Panama, and some other places in the Spanish West Indies, but not to be found in many of the English settlements; it was cultivated here by Mr. Miller, in 1739. 3. The diffelta, or cloven-flowered S. cultivated in Malabar for the fruit, which is of the form and size of an olive, having a pulp of a sweetifh acid flavour; its leaves are used for cataplafts to tumors, bruised and boiled with the root of curcumus and the leaves of ginger, suppoed to be a native of the Philippine iflands, and probably growing in China, and found by Forster, flowering in September, in the ifland of Tongatabu. 4. The jucifeta, or willow-leafed S. called in Jamaica white-bully tree, or gafmeta wood, which supplies good timber; cultivated here by Mr. Miller, in 1738. The bark of the sapota and mammefa is very arfiring, and is called cortex Jamiacensis. This was once suppoed to be the true Jefuit's bark, but its effeft on the negroes has been pernicious. These trees being natives of very warm climates, cannot be preferred in England, unless they are placed in the warmed houses, and managed with great care. Miller's Difcl. by Martyn.

Gmelin has added the kolata, with ovated oblong leaves, hoary underneath, and an oblong ovated pomum.

ACHRIDA. See Ochrida.

ACHRORIDES of Java, in Natural History, one of the genera of ferpents, in the second volume of Count de la Cepee's natural history. This genus is described by M. Horulfadt, a Swedish naturalist. Its body and tail are covered with little warts or tubeifcles; its back is black; its belly and fides are white; the latter are marked with black spots; the head is flat, and covered with small fcales; each jaw of the mouth, which has a small opening, is armed with a double row of teeth, but it has no poifonous fangs: the largest part of the body is near the anus, and the tail is remarkably fnder. The fpecimen from which this defcription was taken measured eight feet and three inches in length; its tail was eleven inches long; and the greater diameter of the body was above three inches. It was a female, and in it were found five young ones, completely formed, and nine inches long.

ACHROMATIC, composed of a pure and grey colour, and denoting without colour, a term, says M. de la Lande, frift introduced into his almanac, to denote telescopes of a new invention, contrived to remedy aberration and colours. See Aberration and Telescope.

ACHRONICAL, in Astronomy. See Achronyal.

ACHSTETERS, in Geography, a small town of the circle of Lower Saxony, in the duchy of Bremen, two leagues north of Bremen.

ACHSTETTEN, a town of Germany, in the circle of Swabia, two leagues N. W. of Augsburg.

ACHTELEING, a meafure for liquids used in Germany. Thirty-two achteling make a heem; four fclimens or fentins make an achteling.

ACHTIAR, in Geography, a small commodious haven near Inkerman in the Black Sea.

ACH-
ACHTIRKA, a town of Russia, in the government of Charkow, ten German miles W.S.W. of Charkov.

ACHTUBA, a river of Russia, which rises from the Volga, a little above the town of Tzaratzin, and runs parallel with that river to Krasnoijar, near which place it joins it, and flows with it into the Caiopian Sea.

ACHY, a species of Cassia, that grows in Arabia.

ACHYR, in Geography, a strong town and county of the Ukrain, subject to the Russians since 1607. It stands on the river Uorfsko, near the frontiers of Russia, 127 miles west of Kiow. N. lat. 45° 32'. E. long. 36° 0'.

ACHYRACANTHA, in Botany, a name given by Dillenius to the ACHYRANTHES of Linneus.

ACHYRANTHA, a species of illecebrum.

ACHYRANTHES, formed of axygos, stachis, and aloe, a flower, in Botany, a genus of the pentandra monogyjna class of plants, belonging to the natural order of meliaceous Linn. and of amaranthi Jaff. The characters are these: the calyx consists of an outer perianthium, that is three-leaved, lanceolate, acute, permanent, and of an inner one, that is scale-like and permanent; it has no corolla; the nectarium has five valves, surrounding the germ, bearded at the tip, concave and caducous: the Stamina are filiform filaments, of the length of the corolla, and the anthers are ovate and incumbent: the pistillum has a superior turbinate germ; the style is filiform, of the length of the Stamina, and the stigma is bifid and villous; the pericarpium is a capsule, roundish, one-celled, not gaping; and the seed is single and oblong. There are eleven species, viz. 1. affinis, or rough, of which there are two varieties; the Sicilian plant with oblong pointed leaves, growing near three feet high, and the Indian, found in Malabar, Ceylon, Jamaica, and almost every where within the tropics, with broader leaves, and on both sides smooth and green, cultivated here in 1713; 2. lappacea, or burry, a lofty plant, a native of Malabar and Ceylon, cultivated by Mr. Miller in 1759: 3. muricata or prickly, a native of India, introduced in 1777, by M. Thouin: 4. pennula or spreading: 5. alternifolia or alternate-leaved; both natives of the East Indies: 6. eorynchosa, formerly belonging to the Celosia of Linneus, a native of Ceylon: 7. dichotoma, a native of Virginia: 8. praecox, a native of India: 9. nivica or white, a native of the Canary islands, introduced here in 1756, by Mr. Maillen, and flowering from May to July: 10. oleifera or tall, climbing up trees to the height of twenty feet, common about Spanijo-town and Kinglong, in Jamaica, and in the woods of Domingo, and called by Browne faltard hoopwife: 11. polygonoides, found in Arabia and Malabar. Gmelin enumerates sixteen species; adding the papposa, villata, or illecebrum lanatum, paniculata, capitata, and decumbens, from Forlk. fl. sq. Arab. The several species have little beauty, and are only preferred in botanic gardens.

ACHYRONIA, in Botany, a name given by Van Royen to a genus of plants called by Linneus Aspaphethus.

ACHYROPHORS, the name given by Vaillant to the Hypocheris of Linneus.

ACHZIB, or Achazib, in Scripture Geography, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais; probably the same with that called by the Greeks Exkliphe, also, a town in the more southern parts of the tribe of Judah.

ACIA, formed of the vernacular name Atisoea in Guiana, in Botany, a genus of the monadelpho doctrinea class, and natural order of pomaceae. Its characters are: the calyx is a one-leaved, turbinate, curved perianthium, with a five-parted border, the parts roundish and spreading, the uppermost and two lowest larger, the two middle ones smaller: the corolla has five, oblong, rounded petals; the three upper longer, ascending; the two lower shorter: the stigma consists of twelve unequal filaments, uniting at bottom in a linear fleshy membrane, inserted into the calyx between the two smaller petals; the anthers are roundish and small: the pistillum has an ovate germ, above the base adhering by the membrane of the stigma to a rib internally prominent from the bottom of the calyx; the style filiform and curved; the stigma acute: the pericarpium is an ovate, fibrous, chinked, large drupe: the seed is an ovate nut, with a brittle shell. There is one species, which is a tree, whose trunk is sixty feet high, and three or four feet in diameter, covered with a smooth grey bark; the fruit is of the size of a walnut, including a large kernel, of an agreeable taint, and eaten by the creoles when brought to market in August at Cayenne: they also extract an oil from it, as sweet as that of almonds; the wood is hard and heavy, and of a yellowish white colour.

ACIA, a term in the Roman Surgery, concerning the meaning of which physicians and practitioners are much divided. Cellius, speaking of the healing of wounds, either by future, or by the fibula, says, each is best effected by means of a soft acia, not too much twisted, that it may fit the easier on the body. Texhornius will have the acia to be the acus of the fibula, or that part which is pinched in: in which view, acia mollis only imported, that it was not set fo as to pinch too much.

ACICOCA, in Botany, an herb that grows in Peru, and is sometimes used instead of the herb Paraguay, of which it is said to have all the properties.

ACICULA, in Natural History, a species of Bucicum, with a smooth, tubular, very thin shell, transversely ribbed with contiguous spiral windings. It is found in fresh waters. Acicula is also a species of Helix, with an oblong acuminate shell, longitudinally ribbed and transversely ribbed, and from oval aperture, found in Coromandel.

ACICULAE denote small spikes, or prickles, in form of needles, with which nature has armed several animals and plants.

ACID, in Chemistry, is used in common language as a generic name for all those substances which impress the organs of taste with a sharp four sensation. Since, however, there are certain bodies destitute of this property, which nevertheless are clasped by all chemical writers as acids, this popular characteristic must be abandoned as essential, for one which is more comprehensive.

Newton's well known definition of an acid, "that which strongly attracts, and is strongly attracted," would have required notice only in the history of chemical opinions, if it had not been implicitly adopted by one of the ablest chemists of the present age, Cit. Guyton Morveau. (Dict. Method. art. acid.) "Now if any one should ask me," says he "what is an acid, I reply, it is that which of all palpable substances is the most powerful solvent; that which acts on the greatest number of other bodies; that, as Newton has so well expressed it, which strongly attracts, and is strongly attracted." It is a greater fault for a definition to be too comprehensive than too circumfered, and that which has been just quoted not only includes alkalies as well as acids, as indeed Morveau allows, but all the active chemical agents, such as water, alcohol, hydrogen, oxygen, &c. for they are all powerful solvents, act on a great number.
number of other bodies, strongly attract, and are strongly attracted. In fact, there is no one property peculiar to the genus acid, and which belongs to each species, so that it is not possible to give a definition of the term; nevertheless, by combining together the general distinguishing qualities of acids, and noting at the same time the exceptions to these, a definition may be produced more illustrative than the most laboured definition.

Previously to the consideration of the general properties of acids, it will be an advantage to give a sketch of the opinions held by the old chemists concerning their origin and mode of action, and to examine more at large the theory of Lavoisier upon the same subject.

When the mechanical system was in vogue, according to which the chemical action of bodies was explained by the suppos'd figure and size of their respective molecule, acids were suppos'd to be a genus of salts, composed of extremely small and sharp spicules, which readily penetrated into the minutest pores of the fabulances subjected to their action, and thus separated from each other their component parts; while, at the same time, the acid became neutralized by its points being flexed in the pores of the body with which it was mixed. This explanation was, however, ably controverted by Boyle, and by Stahl in his work on salts; and, at length, together with other chemical phenomena, the solvent power of acids was arranged by Macquer and his contemporaries, under the general laws of elective attraction.

After a few of the acids were discovered, it was suppos'd by Paracelus, and several chemists of his age, that there existed an universal saline element, or principle of acidity common to all acids, which therefore differed from each other rather in mode than essence. Decker, though he allowed the unity of the cause of acidity, yet affirmed it to be composed of water and vitriifiable earth, and therefore not entitled to rank as an element. Stahl, in his valuable researches into the existence of phlogiston, and the composition of salts, was induced to believe that the sulphuric acid, or as it was then called the vitriolic, was the original acid, of which all the rest were only modifications. A similar opinion was held by Sage and Landriani, except that the former suppos'd the phlegmatic acid, and the latter the carbonic acid, to be the primary one. The discovery of dephlogisticated air, (oxygen gas) having been made by Priestley in 1774, a multitude of experiments were soon after instituted by the chemists of Europe on this interesting fabulence; and, in 1778, a memoir was presented to the royal academy of sciences at Paris, by Lavoisier, on the composition of the acid of sugar. In this, after having described the method of preparing the acid of sugar by means of nitrous acid, he concludes, that the conversion of nitrous acid into nitrous gas, is owing to the abstraction of part of its oxygen by the superior affinity of sugar for this fabulence, and that the sugar in consequence of its union with oxygen acquires the properties of an acid. Proceeding afterwards to generalize this inference, he maintains that oxygen is the universal acidifying element, and that by combining in certain proportions with combustible bakes without decomposing them, it thereby converts them into peculiar acids. This doctrine, simple and elegant, and plausible as it was, did not however at first meet with general concurrence; but, in the course of the controversy, it gradually acquired, and meritd new advocates from the accumulated testimonies of experiment in its confirmation. — The publication of Lavoisier's Elements of Chemistry, in 1789, contributed more than any thing else to settle the opinion of chemists upon the subject; in this work he demonstrates that phosphorus, charcoal, and sulphur, being separately inflamed in oxygen gas, combined with its base, acquire an additional weight equivalent to that of the air consumed, and are converted into the phlogistic, carbonic, and sulphuric acids.

Besides the synthetical arguments above alluded to, the Lavoisierian theory is supported by an equal number of analytical experiments, in which most of the known acids are decomposed into oxygen, and one or more combustible bakes. The most elegant specimen of both kinds of proof is furnished by the nitrous acid; if purified nitre, (nitrat of potash) previously deprived of its water of crystallization, be exposed in a silver retort to a low red heat, a large quantity of gas, consisting of oxygen and azot, in the proportion of about 80 of the former to 20 of the latter, will be given out, and pure potash will remain in the retort, whole weight together with that of the gasses will be equivalent to that of the original nitre; the mixed gasses are wholly deficient of acid properties, but by being forced into union by means of the electric spark, their volume is gradually diminished, and at length the whole is reduced to an acid liquor, possesssing all the qualities of nitrous acid; if this and the potash remaining in the first proceeds be mixed together, chemical union immediately ensues, and nitre is reproduced.

Three of the known acids are incapable of being decomposed by any method that we are at present acquainted with; it is therefore only from analogy that they are suppos'd to contain oxygen for their acidifying principle; this circumstance, however, is no peculiar objection to the theory of Lavoisier, for since all the decomposable acids may be resolved into oxygen and a simple or compound combustible base, it seems consistent with the principles of chemical philosophy to establish that as a general law, to which in the present state of our knowledge, there is not a single exception.

Substances, whose mutual affinity is considerable, may combine with each other in various proportions, and the resulting compounds will vary in their properties accordingly; this is the case with all the known acidifiable bases which in their lowest state of oxidation exhibit no acid properties whatever: nor is the development of an acid an evidence of the complete saturation of its base with oxygen, there being several acids capable of combining with additional quantities of oxygen, and thus acquiring new and more decided acid characters. — It is even suppos'd that some bases may be oxygenated in three different degrees, preferring in each the essential qualities of acids; hence results an important arrangement of acids according as they are oxygenated in the first, second or third degree. The reformed chemical nomenclature on the principles of Lavoisier and Moreux, has ingeniously distinguished these states by the terminations ox, and oxi, and the prefix oxy (for oxygenated); thus sulphur, at the lowest rate of oxygenation in which it acquires acid properties, is called sulphurous acid; when still further oxygenated it becomes sulphuric acid; thus also, muriatic acid, when raised to the third degree of oxygenation, becomes oxy-muriatic acid.

The old chemists divided acids into mineral, vegetable, and animal, according to their supposed origin; this, however, is not only an inconvenient, but an incorrect method of arrangement, as many of these bodies are found in all the three natural kingdoms. Upon the whole, perhaps, the best way of arranging them is the following:

**States**
The chemists of the last century seem to have been acquainted only with the three mineral acids, as they are called, viz. the sulphuric, nitric, and muriatic, and with the acetic acid or vinegar: the accuracy and industry of the moderns have increased the number of species to twenty-nine; how many more may be hereafter added to the list it is impossible to ascertain. Without adhering to the possibility of discovering new acidifiable bases, it is by no means improbable, however, that many of the simple combustible bodies as the metals, or the compound ones as phosphorated hydrogen, sulphurated hydrogen, the metallic phosphurites, &c. may be so far saturated with oxygen, as to become peculiar acids.

The characteristic properties of acids, i.e. the peculiar laws and effects of their action on other chemical substances, yet remain to be mentioned.

1. When taken into the mouth they occasion a sour taste.

The oxymuriatic acid alone is distinctive of this property; the rest pertain it in a greater or less degree according to their liquid or solid form, and the energy with which they act on the animal fibre, from the corrosive and intensely four sulphuric acid, to the boracic, whose taste can scarcely be perceived.

2. They change native vegetable blues to red.

Indigo is not turned red by any acid, nor does tannal paper yield to some of the weakest ones; but both these phenomena are artificial; the sulphureous and oxymuriatic acid discharge entirely the native vegetable blues, not however before having changed them to red.

3. They have a stronger affinity for alkalies than these have for any other sub stance. Therefore, all the soluble combinations of alkalies with metallic oxides, with earths, with sulphur, &c. are decomposed by any acid.

4. They combine with earths, with alkalies, and with metallic oxides, forming the numerous and very important classes of earthy, neutral, and metallic salts, most of which are susceptible of crystallization.

5. The property of incombusibility has been generally attributed to acids as a characteristic, but certainly; very erroneously. The most incombusible of the acids are no more so than the fixed alkalies, the earths, and the perfect metallic oxides; and all the acids with two or three radicals, and those with simple radicals in the first place of oxygen, are, strictly speaking, combustible, that is, they unite at a certain temperature with oxygen gas, during which combination heat, and in some cases light also, are extricated.

The medical effects of acids are considerable, and vary according to their degree of concentration; the most active, when pure, or nearly so, are used externally as caustics and febrifuges, and as powerful stimulants in some cases of palsy; if largely diluted with water, they may be safely employed internally in fevers, inflammations, and hemorrhages, as refrigerants and astringents.

For the particular acids, see them under their specific names.

ACIDALIUS, Valens, in Biographia, an eminent grammarian and critic, was born at Wiltlock, in Brandeburgh, and after visiting several academies on the continent, fixed his residence at Breflaw. Being disappointed of employment, he became a Roman Catholic, and was chosen rector of a school at Niefla. Thuanus informs us, that he was a very clofe fludent, and that his nocturnal studies, which were unreasonably prolonged, whilst he was composing his conjectures on Plautus, occasioned a distemper that terminated in his death, on the 25th of May 1595, when he was just turned of 28. He wrote a Commentary on Quintus Curtius; Notes on Tacitus; on the twelve Panegyrics; besides speeches, letters, and poems. A small piece, printed in 1595, and intitled, Medices non effe homines, or that “women were not of the human species,” was falsely ascribed to him. He only accidentally found the MS. and printed it. It is said, that in order to appease the wrath of some ladies, who reproached him as the author, he declared his opinion, that the author was a judicious person, the ladies being certainly more of the species of angels than of men. M. Baillet, who admits him among his Enfants celebres, says, that his comment on Plautus was written when he was not more than fifteen or eighteen years of age, and that he composed several Latin poems about the same period.

ACIDALUS, the name of a fountain in Orchomenos, a city of Boetia, in which the Graces, who are sacred to Venus, bathed: hence the epithet Acidalata given to Venus. See Virgil, Aen. i. 1. v. 724.

ACIDAVA, in Ancient Geography, a town of Dacia, towards the country of the Jazgy.

ACIDIFIABLE BASE, ACIDIFICATION, in Chemistry. The general theory of the formation of acids has already been explained under the term. An acidifiable base or Radical is any sub stance, whether fixed or compound, that is capable of uniting without decomposition, with such a quantity of oxygen as thereby to become posseffed of acid properties. All acids agree with each other in containing oxygen, but differ from each other in their radicals; hence it is the acidifiable base that determines the species of acid. This term was unknown in chemistry previously to the discoveries of Lavoisier on the composition of acids, because those bodies that are now proved to be convertible into
into acids by combination with oxygen, were supposed by Stahl and his followers to be already acids united to phlogiston: thus sulphur, which according to the present theory is a chemical element, and capable, by combination with oxygen, of being converted into sulphuric acid, was, by the Stahlians, considered as a compound of sulphuric acid and phlogiston.

The object of the reformed chemical nomenclature is to denote, as much as possible, the composition of bodies in the names appropriated to them; thus sulphuric, carbonic, and phosphoric acids express the perfect saturation of their respective bases, sulphur, carbon, and phosphorus, with oxygen. This rule, however, has by no means been uniformly adhered to; and the young student in chemistry, reading of the benzoic, succinic, or oleic acids would on this account be led into an error if he supposed that benzoe, amber, or fat, were the acidible bases of the acids that bear their names. Almost all substances are capable of combining with oxygen, but it does not therefore follow that they are acidible bases; that the process of acidification may take place a large proportion of oxygen seems essentially necessary, otherwise the result is only an oxysulphuric, phosphoric, or carbonic acid. Hence oxydable substances may be divided into those which are capable only of a low state of oxidation, or proper oxydable bases; and into those capable of a further combination with oxygen, by which they acquire acid properties, or acidifiable bases. Acidification may be performed in various ways according to the temperature and the affinity of the base for oxygen. The two great refinements from which nature procures her oxygen for the composition of acids are water and atmospheric air, the former confining of oxygen and hydrogen, and the other of oxygen and carbon. The chemist employs principally oxygen gas and atmospheric air at a high temperature, as in the formation of carbonic and phosphoric acids by combustion of charcoal and phosphorus, or the nitric acid as in the formation of the sulphuric and oxalic acids. The acidifying processes of art are generally more rapid than those of nature.

ACIDITY, the quality which constitutes or denominates a body acid, or that sensation of sharpness and sourness which acids excite upon the organ of taste.

ACIDON, a river of Peloponnese, called also Acidas, which united with Jardanus, near Argos.

ACIDOTON, in Botany, a genus of the monocotyledonous class and order; the characters of which are, that it has male and female flowers on the same, or a different tree; the calyx of the male is a five-lobed perianthium, and the leaves are ovate-lanceolate, and reflex; it has no corolla: the flaminia are numerous filaments from 35 to 40, placed on a globular receptacle, the outer shorter, the inner longer and upright; the anthers are cordate-ovate, upright and small; the calyx of the female is a fix-leafed perianthium, the leaves linear-lanceolate and spreading; it has no corolla: the pistilium is a three-cornered germen; the stiglie short, acute, thick and trifid at the top; the stigmas are tomentose and reflex: the pericarpium is a three-grained, hispid, threecelled capsule; and the seeds are solitary and ovate. There is one species, viz. A. ureus, a native of Jamaica, described by Sloane, though he never saw the flower and fruit, which grows to the height of eight or nine feet. Miller's Dict. by Martyn. This, in Gmelin's edition of Linnaeus, is a genus of the polyandra monocotylidae class and order.

ACIDOTON, is also a species of Adelia.

ACIDULA, in Ancient Geography, a fountain of Italy, near Litternum, to the waters of which, probably impregnated with fixed air, or carboinic acid, Pliny ascribes a salutary effect, as an antidote to stone and gravel.

ACIDULÆ, Eaux acidules, Fr. a species of mineral waters, distinguished by their sparkling appearance when poured from one vessel into another, and by their brisk acidulous taste; they contain a considerable quantity of free carbonic acid to which these properties are owing.

ACIDULATED, a term denoting any thing blended with acid juices, in order to give it a coolness and briskness.

ACIDULOUS denotes a thing that is slightly acid: it is synonymous with the word sub-acid.

ACIDULUM, Acidule, Fr. a term used in the new chemical nomenclature, to express a genus of native compound salts, in which the alkaline base is superfluousated with acid, and which are therefore employed in various chemical procedures, and for economic purposes as acids. We are at present acquainted with two species, the tartaric acidulum, or acidulus tartrite of potash, and the oxalic acidulum, or acidulus oxalat of potash.

ACIDUMPINGUE, Caulifíum—Acidulé, Fr. Fruitur Germ.

In the year 1764, when the abilities of Macquer, Bergman, Black, and Scheele, had already discovered many important chemical facts, which were with difficulty explicable on the Stahlian theory, and when the rigorous method of demonstration fo honourable to the present age had not as yet been universally affected to, there appeared in Germany a volume of Essays on the subject of Lime, by Fred. Meyer, an apothecary of Obnaburg, announcing the discovery of a new chemical agent, the acidum pingue, with an extensive theory dependent upon it, and, in many respects, essentially contrary to the conclusions of Dr. Black, from his admirable experiments on the same subject. Several of Meyer's countrymen became the zealous advocates of his system, and it was soon taught publicly in many of the German schools. At length, in 1769, Jacobin published an able indication of Black, intitled Examen chemicum doctrine Meyeriana de acido pingue, et Blackiana de acido fuxo regalis calcis. Hindebom. This work brought out in the course of the following year a reply by Granz, and another by Fourche, both of them strenuously defending the doctrine of Meyer. It does not appear that any thing more was expressly written on either side, but by the accumulation of the splendid discoveries of Lavoisier, Priestley, &c. the theory of Meyer was silently overwhelmed, and the conclusions of Black unequivocally established. Nearly the same hypothesis was afterwards revived by Sage in the effects attributed by him to an imaginary principle, the igneus acid (acide tyne) but which has not been since recognized by any chemical writer.

The facts upon which Meyer's doctrine is founded are the following: Mild calcareous earth being kept at a full red heat for a certain length of time is converted into quicklime; this change, which at present is accounted for by the volatilization of its water and carboinic acids, was by Meyer supposed to be owing to the combination of the acidum pingue with the calcarous base, and the consequent degagement of its water; hence originated a caustic earthy salt soluble in water; if to this lime water, a mild alkali be added, a decomposition takes place, the acidum pingue unites by preference with the alkali, making it caustic, while the calcareous earth combines with a portion of water, becomes insoluble, and is precipitated in the state of milk caulk. So far the theory of Meyer was supported by facts which, however equivocal and imperfect, had at least force plausibility. But in his attempt to raise this causticum to the rank of an acid, and of a prime agent in chemical phenomena, he deviates into the wilder conjectures without the shadow of a fact in their support. The following are the chief
chief of the properties which he ascribes to it. It is a compound elastic fluid, fusible, analogous to sulphur, nearly approaching to the purest matter of fire or light, indecomposable, consisting of a fatty acid principle and fire, compressible, capable of penetrating all vessels when red-hot, and sufficiently heavy. It has an afflignant force, and combines by means of fire with calcareous earth and the alkalies, and with metals when in the state of calx: from its uniting with sulphur, oils, and calcareous earth, he infers, that the acid is united with something fat or oily, (hence its name acidum pingue) and this oil so farreadonly its properties as to prevent the acidity of its taste, &c. Hence it is evident, that the properties of this imaginary fusible are in part purely fictitious, and for the rest a mixture of discordant qualities ejected from those of the pure alkalies, oxygen, and carbonic acid.

Effais de Chymie fur la Chaux, par M. Drex, (translated from the original German of Meyer.) Encycloped. Meth. art. Acidum pingue.—Macquer’s Chemical Dict.—Lavoisier’s Elysias.

ACIDUM wtrichs vingum. See Sulphuric Ether.

ACILA, in Ancient Geography, a steple or mart town in Arabia Felix, on the Perilus gulph, from which, according to Pliny, (H. N. v. i. p. 338.) the Scenite Sabzi fell fail for India. This is a different place from Oeclos, or Oclia.

ACILISENE, a district of Armenia, situated between Mount Taurus and the Euphrates, where it bends its course southward towards Mesopotamia. Strabo, vol. ii. p. 799.

ACILIUS, GLABRO MARCUS, in Ancient History, a confoul of Rome, who distinguished himself by his military skill and bravery on several occasions, and particularly in the victory which he gained over Antocles the Great, king of Syria, at the battles of Thermopylae. He built the temple of Pity at Rome, in consequence of a vow which he made before this battle.

ACINA, in Ancient Geography, a town of Africa, mentioned by Pliny H. N. vol. i. p. 345.

ACINACEA, the name of a people inhabiting Baetia.

ACINACES, in Antiquity, a kind of cutlass or scimtar, in use among the Perians.

ACINACIFORM leaf. See leaf.

ACINARIA, in Botany, a name given by some to the marsh whortle-berries, or vaccinia palustris.

ACINAS, in Ancient Geography, a river of Asia, at the southern extremity of Colchis, which discharges itself into the Euxine sea, between the Bathy and the Thes. In

ACINUM, a city of Pannonia, the situation of which is not precisely known. Some suppose it to have been at or near Duda.

ACINI, in Botany, small grains or berries, growing in bunches, after the manner of grapes. The berries of the elder, privet, ivy, &c. are of this kind, and so called. Anatomists have called some glands of a similar formation, acini glandulose.

ACINIFORMIS Tunica, the same with tunicus vasa of the eye. It is also called acinosa tunica.

ACINIPPO, in Ancient Geography, a town of Butica, of which the ruins called Randa la Viega are to be seen near Arunada, in the kingdom of Granada.

ACINODENDRON, in Botany, the name given by Barman, in his Thebaurus, to a genus of plants, afterwards called Melastoma. It is also the trivial name of a species of this genus.

ACINOS, a wild or wild Basil. See Thymus.

ACINTIL, in Ornithology. See Quaciltilo.

ACINUS, in Botany, properly signifies the grape. It is also the name of the Staphyloma.

ACIOJA. See Acia.

ACIPENSER, in Ichthyology, a genus of fish of the order of Chondropterygii; the characters of which are, that the head is obtuse, that the mouth is under the head, refrangible, and without teeth; that the four curvii are below the front, and before the mouth; that the aperture of the gills is at the side; and that the body is elongated, and angulated with many sericles of scuta or scaly protruberances. There are five species, viz. A. Sturio, or Sturgeon; A. Rutherum, or Sterlet; A. Huso; A. Scypha; and A. Stellatus, or Koster.

ACIPHAS, in Ancient Geography, one of the four cities of Phocis, on the river Pindus.

ACITHYLLA, in Botany, a species of Laspeyrium.

ACIRIS, in Ancient Geography, a navigable river of Italy, not far from the city of Heraclea, mentioned by Strabo, vol. i. p. 405. now a rapid, irregular torrent, called Agri.

ACIS, in Entomology, a species of Papilio, with bicaudated wings, the lower part of the fore-wings being green, sprinkled with gold; the hinder golden, spotted with green and black; found in Surinam.

ACIS, in Geography, a town of France, in the department of l’Aube, on the river Aube. N. lat. 48° 25’. F. long. 4° 10’.

ACIS, in Mythology, a beautiful shepherd of Sicily, the son of Pannus and the nymph Simachis; who, being beloved by Galatea, incurred the rage of Polyphemus, and had his brains dashed out against a rock by this giant. He was afterwards changed by Galatea into a river of the same name. The Sicilian authors say, that Acis was the name of a king, that reigned in this part of the island in a very ancient period; and, to this purpose, they allege an inscription found near the river Acis, Acis Callio. Tie is said to have been slain in a fit of jealousy by Polyphemus, one of the giants of Ætna; and thus they trace the origin of the fable.

ACIS, a river of Sicily, celebrated by the poets, viz. Theocritus, (Idyll. i. v. 69) Ovid, (Falli, i. 6. v. 468) and Silius (l. xiv. v. 222), which flows from a cold spring at the foot of mount Ætna, and runs into the sea at the distance of about a mile from its source. From the rapidity of an arrow, with which it pursues its course between verdant banks, its name is derived. Bochart (Geog. Sac. i. c. 28. apud op. tom. i. p. 529. Ed. Villerm.) deduces it from the Syrian άκής, akês, to bathe, or to be sooty, its water is clear, and to cold as to be dangerous to those who drink it; and never freezes, though it possesses a degree of cold greater than that of ice. It is said to acquire a poisonous quality from the vitriol with which it is impregnated; though it was formerly celebrated for the sweetness and fulness of its waters; which, according to Theocritus, were always held sacred by the Sicilian shepherds.

"Quoque per Ætnas Acis petit equora fines, Et dulce grandem Nereidae perluit unda."

This river is now called Il Fiume Friddo, and Aci, Jaci or Chiaci, according to the different Sicilian dialects. Antonius calls it Accius. Acis is also the name of a hamlet at the mouth of the river. There are several places in this district that take their names from the unfortunate shepherd Acis; such are, Aci Aquilia, Aci Catello, Aci Terra, &c. Brydone's Tour, vol. i. p. 118.

ACISANTHERA, in Botany, a species of Rhexia.

ACITANI, in Ancient Geography, a people of Spain, supposed to be the name with the Lacetani of Phyn.

ACITANIS, in Ancient Geography, a small river of Sicily, now Berigis.

ACITLX,
ACITLI, in Ornithology, the common Mexican name for the *Columbus rutilus*, or great ruffled Grebe, common to Europe and America, and called by authors the *Lepus aquas*, or water hare.

ACKEN, in Geography, a bailiwick of Magdeburg, in Germany, to which belongs a town of the same name, situated on the Elbe. It formerly belonged to the dukes of Saxony, and was hence called *Aquae Saxoniensia*. The revenues of the six vicarages of this town are at present levied by the dean of the cathedral of Magdeburg; but the church was given in 1711, to the Calvinists.

ACKER Sound, lies north-east from the Naze of Norway, and north-west by west from the island of South Wixholm. Siller's Island is also west by north from ACKER four leagues; and behind is the small port of Grafwick.

ACKMETCID Gulf, is on the west side of the Crimean, and the sea through which ships pass to Prekop, and the north-west part of the Black Sea. Its west cape is N. lat. 41° 57, and E. long. 52° 20'.

ACKLIN's Key lies about 150 miles south-east from Long Island, or Yuma, one of the Bahamas islands, having Long Key twelve miles to the north-west; and on the south-east side a chain of rocks. N. lat. 22° 10'. W. long. 73° 30'.

ACKNOWLEDGMENT Money, a sum paid in some parts of England by tenants on the death of their landlords, as an acknowledgment of their new lords.

ACKWORTH, a small village near Pontefract, in the county of York, which deferves mention on account of the benevolent institution supported in it for the education of the children of the Quakers. The original projector of this institution was Dr. Fothergill, who promoted a subscription for purchasing, improving, and furnishing an appropriate building, and an estate of eighty acres of land; and who, by his will, endowed it with a liberal bequest. This institution accommodates more than 300 children of both sexes under the same roof, who are furnished with all the necessary conveniences and comforts of life, properly clothed, and educated in every branch of knowledge, adapted to the stations in which they may be placed. It is conducted by a number of chosen guardians of ability, and of exemplary character, with a degree of order and decorum, which affords pleasure to persons of every description who occasionally visit it. The children are taught habits of regularity, of decency, and of respectful subordination to their superiors, of forbearance and affection to one another, and of reverence to their maker; and they are accustomcd to that kind of silence and recollection, which was practised in some of the ancient schools of philosophy, and which gives a peculiar and distinguishing character to the members of this society in the maturity of life.

ACLIDES, in the Roman military art, a kind of missile weapon, having a thong fixed to it, by which, after calling it out of the hand, it might be drawn back again. Servius describes the aclide as full of spikes, or elmines. As it was formed with spikes, it would injure both where it struck, and when it was withdrawn. Each warrior seems to have been furnished with two. V. C. Eutym. Aquin. lex. Milt. t. b p. 14. Pitie. Lex. Ant. t. b p. 17.

ACLowa, in Botany, the name of a plant common in Guinea, and used by the natives to cure the itch. They rub it on the body, as we do our nightsu. Petiver accounts it a species of coloda, and has named it the Guinea scorpioide coloda, with leaves like the gum tragacantha shrub. Phil. Trans. No. 268. abr. v. iv. p. 2. p. 322.

ACME, the height or top of any thing. The word is Greek, signifies point, and is more specifically used to denote the height, or utmost valence of a distemper.

Accordingly some institution-writers have divided diseases into four sorts or periods: 1. acute, the beginning or first attack; 2. smalls, the growth; 3. acute the height; and 4. paracme, which is the declension of the distemper.

ACMEILLA, or *Amamilla*, in Botany, a plant which grows in the island of Ceylon and Ternate, of which there are three species noted by botanists; two of which were formerly referred to the genus *Vermissa*, in the Linnean system. It is commended in naphhatic disorders, but very rarely used. It is the *Spiranthus Amellia* with ovated, serrated leaves, a straight stem, and radiating flowers. It became known in Europe by the letters of Horton, addressed to the Royal Society in 1701. Phil. Trans. vol. xxii. p. 760.

ACMODE, in Ancient Geography, seven islands in the British sea, supposed by Homer to be in Ilium, but by others, with greater probability, those of Helland and Shetland near the Orkneys, on the coast of Scotland. Phyn. N. v. i. p. 223.

ACMON, in Ancient History, the name of one of the *Dactyli Idris* according to Strabo, vol. ii. p. 726. Bryant says, (Mythology, vol. i. p. 515) that Acmon was a Cyclopian deity, under which title he was worshippers in Phrygia, whence the name of Acmonia. He was also revered by the Amazonians, and there was a sacred grove upon the Thermodon called aecomnion, and held in great repute. It is represented by Callimachus (Hyin. in Dian. v. 146.) as the tutelary god of Titys, an ancient city of Greece, whose towers are said to have been built by the Cyclopiana.

ACMONIA, or in Peutinger's map *Agmonia*, in Ancient Geography, a town of Phrygia Major, now in ruins. Cicero, pro Flacco, cap. 17, calls the inhabitants *Aemones. der*, and the city *Civitas Aemonesia*. There are many medals of this city in gold, bronze, and silver. There was also a city of the same name, according to Peutinger, in Illyria, upon the Danube, near the capital Sarmitz, which was the position of the Roman colony, called *Uphia Traiana*.

ACNIFA, formed of a priv., and *xvista, a nettle, Virginian hemp*, in Botany, a genus of the *dioecia* order, and *pantendria*, clas of plants, of the natural order of *scabioide and aristiques* of Jussieu, the characters of which are as follow: the calyx of the male is a five-leaved perianthium, and the leaflets are ovate, concave, acute, and membranaceous on the edge; it has no corolla; and the flamina are five, capillary, very short filaments; and the anthers are versatile, bilocular, and forked each way; the calyx of the female is a many-leaved, linear, deciduous involucre; the perianthium is two-leaved, linear, very small and permanent; it has no corolla; the pistillum has a superior, ovate, German; the stylos are five, long, reflex, and pubescent; the figmas are simples; the pericarpium is an ovate, compressed, many-angled fruit, rowed, and covered with the succulent calyx; the seed is solitary, round and compressed. There is one species, viz. *A. cannabina*, which is a native of Virginia, and some other parts of America, but seldom cultivated in Europe. It has little beauty, and is applied to no use. Martyn's Miller. In the Linnean system by Gmelin, it is a genus of the *pantendria perdagnostica* clas and order.

ACNUA, in Roman Antiquity, a measure of land about the quarter of an English acre.

ACO, in Geography, a town of Perin in S. America, in the jurisdiction of Guanaco. It is also a river of Africa, that rises in the mountains of Abyssinia, runs in a south-east direction, and discharges itself into the Indian Ocean.

ACO, in Ichthyology, a name given to a fish found in the Mediterranean, called also *agro, farcasbus, and faracibus.*

ACOEMETI, or *ACOMEMI* formed of a priv., and
ACOL, a town placed by Prolem in Media, on the borders of the Hircanian sea.

ACOL, in Ancient Geography, a town placed by Prolem in Media, on the borders of the Hircanian sea.

ACOL, in Geography, a river of France, which runs into the Loire, two leagues above Nevers.

ACOLCHICHI, in Oracology, the Mexican name of a bird described by Nieremberg under the name of the Protophenius Itharum. It is the Oriolus planctus of Linnaeus. The acolati of Seba is the Oriolus Novus Hispaniae of Gmelin, the Euterus Mexicanus of Brillson, and the Oriental Oriole of Latham. Its specific characters are, that it is yellow: the head, throat, wing-quills, and tail are black; the greater quills of the wings are yellow at the tip, and the lesser quills wholly black. This bird has a long yellow bill; and the tail and wings are ornamented with small feathers of a golden colour, which have a fine effect on the dark ground. Seba reckons it an American bird; and Gmelin refers it to New Spain.

ACOLHUCAN, in Geography, one of the three imperial cities of the ancient kingdom of Mexico.

ACOLIN, a river of France, which runs into the Loire two leagues below Decize.

ACOLIN, in Ornithology, the name of a bird of the partridge kind, common in the Spanish West Indies. It is no larger than a thrush; its legs and feet are of a pale greenish colour, and its toes very long; its beak is yellow, and somewhat long; its head small; its breast and belly are white; its sides are spotted with brown, and its back and tail of a dull yellow brown; its tail is very short, and both that and the back have some black spots, and some narrow streaks of white. It frequents the sides of lakes, and is suppos'd to feed on flies, worms, and other insects, which are found about watery places. It is a tolerably well-tailed bird.

ACOLUTHI, or AColythi, in Antiquity, a term applied to those persons as were ready and immoveable, in their resolutions.

The word Acolythos is compounded of the privative α; and κυλοθς, ς; way; and implies their stiff persisting in their way or course.

For this reason, the Stoics were called acolythi; because nothing could induce them to abandon their principles or alter their purposes.

Among the Ecclesiastical Writers, the term acolythos, or acolythis, is peculiarly applied to those young people, who in the primitive times aspired to the ministery; and for that purpose, continually attended the bishops; which solicitude occasioned their being distinguished by this appellation.

In the Roman Church, acolythi were of longer continuance; but their functions were different from those of their first institution. They were such as had only received the first of the four lesser orders, whose business was to light the tapers, carry the candelabres, the incense-pot, and preserve the wine and water.

At Rome there were three kinds of acolythi: viz. pilikia; who waited on the pope; factionii, who served in churches; and regiuntii, who, together with the deacon, officiated in other parts of the city.

ACOLUM, or acolythus, was also a title in the Grecian empire given to the captain or commander of the Varang, a body of guards appointed for the security of the emperor's palace.

ACOLUMThUS, Andrew, in Biography, was an arch-deacon, and prolific of the Oriental languages at Breflaw, his native city, and member of the academy of Berlin. He published, in 1685, a Treatise De Aquo Amari, in 4to. At Leipsic he published, in 1686, a Latin translation of the Armenian version of the Prophecy of Obadiah. He died at Breflaw in 1704.

ACOLUMTHIA, in the Greek church, denotes the office, or order of divine service.

The name is also given to the prayers, ceremonies, hymns, and the like, whereof the Greek service is composed.

ACOMA, and ACOMACH, in Geography. See ACOMA and ACOMACH.

ACOMAS, in History. See HOMALIUM.

ACOMINATUS, NICETAS, in Biography, secretary to Alexius Comnenus, and to Iacques Angelus, who wrote a history of the death of the former in 1118, where Zonaras ended his, to the year 1203, which is much approved.

ACON, an instrument used in the ancient exercises, like the slings.

Acon gave name to an ancient order of knighthood, who were afterwards united to the knights Hospitallers.

ACONE, in Ancient Geography, a small town of Bithynia, near Heraclia.

ACONCAGUA, in Geography, a village or town of Chili, in S. America, which gives denomination to a fertile province at the foot of the Cordilliers, situated on a river of the same name, that discharges itself into the pacific ocean. N. lat. 33° W. long. 75° 36'.

ACONCROBA, in Botany, a name given by the natives of Guiana to a plant, growing wild with them, and in great esteem for its virtues in the small pox. They give an infusion of it in wine. The leaves of this plant are opaque, and as full as those of the phileria; they grow in pairs, and stand on short foot stalks; they are small at each end and long in the middle; and the largest of them are about three inches in length, and an inch and a quarter in breadth in the middle. They somewhat resemble thistle of our bay. They are of a dullish colour on the upper side, and of a pale green underneath.

ACONE, in the Natural History of the ancients, the name of a stone used as a whetstone, and for several other purposes; but more usually known among the Romans by the name cotitula. It signifies also a mortar for the purposes of levigation.

ACONITE, in Botany. See ACONITUM.

ACONITE, Winter. See HELLEBORUS.

ACONITES, in Ancient Geography, a people placed by Strabo, (tom. i. p. 344) in the mountains of the island of Sardinia.

ACONITI,
ACONITI, **aconitum**, is an appellation given to some of the ancient *athletes*, but differently interpreted. Mercury underlines it of those who only anointed their bodies with oil, but did not smear themselves over with dust, as was the usual practice. M. Barett will have it to signify those who conquered easily without dust, q. d. *aconitum*, *aphani*, with little trouble.

**ACONITON** signifies not plaited, and is a name given to veifels not lined within.

**ACONITUM**, *aconite, Wolf’s-bane, or Monk’s-hood in Botany*, a genus of plants of the *Ranunculaceae* order and *polyandria* clas, pertaining to the natural order of *multiflora*. Some have derived its name from *Aconitum*, a city of Bithynia, where it grew in great abundance. Pliny ascribes its etymology to *Aconos*, a whiffetone. But the most probable origin of the appellation is *aconiti*, *without dust*; because this plant grows on rocks deficient of soil, agreeably to the description of Ovid:

"Quo quia nefacenitur *dana* vivacia caute,
\[Aconites Aconita vocant.\]"

The characters of this genus are, that it has no calyx; the corolla consists of five unequal petals, opposite in pairs; the highest being helmet-tubed, inverted and obsolete; the two lateral broad, roundish, opposite and converging; and the two lower oblong, and bending downwards: the nectaries are two, concealed under the first petal, filiform, nodding, with mouth oblique, and tail recurved, fitting on long budulate peduncles; in the same circle with the nectaries there are five little, very short, coloured feales: the filaments are budulate filaments, very small, broader at the base, inclining towards the frint petal; the anthers are erect and small; the pistillum has three (five) oblong germs, ending in filyles the length of the flofima; the ligmas are simple and reflex; the periancenum has as many capsules as the filyles, ovate-budulate, straight, one-valved, gaping inward: the seeds are many, angular and wrinkled. The species, enumerated and defined by Prof. Martyn in his edition of Miller’s Dictionary, are as follow: 1. *A. hypochondrium*, great yellow monk’s-hood, or wolf’s-bane, of which there are two varieties, viz. that of Linnaeus with a blufh ash-coloured flower, and the *aconitum allittum* of Miller. The common fort grows upwards of three feet high, but this, in gardens, is above four feet; its leaves are also broader and smooth, and the spikes of the flowers are longer. They both flower about the middle of June, and in a moderate season continue to blow till Auguft. In Sweden it is reckoned among the earliest flowering flowers. The mountains of Sweden, Lapland, Switzerland, Germany, Austria, Carniola, Italy and Siberia produce it in a wild state; and it was cultivated in this country by Gerard in 1596. A decoction, or powder of the root is used for destroying flies and other insects; but it is eaten in a province of Sweden without injury. It is milder than some of the other species, and eaten by goats and hares. The ancients believed that it was fatal to those who slept under it; and they dipped their venomous arrows in the juice of it. See Smith’s Linnae. Flor. Lappon. p. 152. 2. *A. japonicum*, or Japanese monk’s-hood, is a native of Japan, where it is called *Soo Ljoo*. 3. *A. napellus*, common monk’s-hood or wolf’s-bane, is found wild in Sweden, Switzerland, France, Germany, Austria, Carniola, Italy, Siberia, and Virginia; and was cultivated here in 1596 by Gerard. It blows in August, and would merit a place in every garden, if it were not for its noxious quality, which renders it dangerous to children and ignorant persons. There are two or three varieties with white, rofe-coloured, and variegated corollas. The forts which have blue flowers are more powerful than those with yellow or white flowers. The variety called by Miller *pyramidale* is the most common in English gardens, being preferred on account of the appearance of its long spikes of blue flowers, which are above two feet long. The plant rises to the height of near four feet, is hardy, and will grow in any soil or situation, and as it multiplies greatly by its roots, it has been admitted into most gardens and plantations of shrubs. It flowers in May and June; and the seeds ripen in September. 4. *A. pyreicium*, Pyrenean or fennel-leaved monk’s-hood, grows wild on the Pyrenees, and also in Tartary and Siberia, and was cultivated with us in 1739 by Mr. Miller. It grows to the height of about four feet, and the spike nodas before the time of flowering, which in our gardens is July. This species may be admitted among shrubs, to which children have no access. The four preceding species of *aconite* have three capsules, the following have five. 5. *A. authora*, falutory monk’s-hood, as it has been erroneously called, has a root confiding of from two to four angular, fleshy, bulbs, and a flem which rises from a foot to 18 inches in height. The flowers, which continue in beauty from the middle of Auguft to the middle of September, though not fo large as some of the other farts are of a sulphur colour, and make an agreeable appearance in the borders of the flower garden. This species grows naturally in the Pyrenees, the Alps, Austria, Siberia, &c. and was cultivated here in 1596 by Gerard. There is a variety of this with a white flower. 6. *A. variegatum*, variegated or small blue monk’s-hood, is a native of Italy and Bohemia, and was cultivated here in 1752 by Mr. Miller. It flowers at the end of June, and seldom grows to a greater height than two feet, with spikes of flowers much shorter than those of the first fort: the corollas change from variegated to plain. 7. *A. album*, white wolf’s-bane, was found by Tournefort in the Levant, and first rafed in the royal garden of Paris. Mr. Miller cultivated it here in 1739, and fays, that he has seen it upwards of fix feet high; and he characterizes it by its tall flem, palmate leaves, and large white flower. 8. *A. cammarum*, purple monk’s-hood, has flowers of a paler blue, a much longer helmet, and a shorter raceme than the *A. napellus*. Its stem is also higher, riling even to fix feet. This species is found wild in Switzerland, Austria, Storia, Piedmont, &c. and was cultivated in 1748 by Mr. Miller. Haller found it with a white flower, and others have observed it in Switzerland with flowers of a pale blue, variegated with white. The variety named by Mr. Miller *A. alpinus*, will grow in good ground to the height of five feet, with large flowers of a deep blue colour. 9. *A. unicinatum*, American monk’s-hood, is a native of Pennsylvania, with leaves approaching to those of the third fort, and blue flowers referring them of the leaf. It was cultivated in 1775, by Mr. James Gordon. In the late edition of Linnaeus by Gmelin, this genus comprehends 14 species; the five following being added to those above recited: viz. *vulgaris, fepientriolus, turritum, rosinatnum*, and *cornutum*. 

***Cultivation.*** All the forts of monk’s-hood are hardy perennials, require little attention, and as they bear handfome spikes of flowers, are desirable plants for shrubberies and wildernes quarters, where they are guarded from the accefs of those who are unapprehended of their pernicious quantities. They are propagated by seeds, sown in autumn, in a shady situation. The ground should be kept clean from weeds, and the plants should be watered in dry weather, till they are fit for being transplanted into shady borders, at the distance of 14 inches. If they are watered till they have taken root, they will require no other care, besides being kept free from weeds till the following autumn, when they
may be removed to the places where they are to remain. The italks should be cut down in autumn, after they have done flowering. The common monk’s-hood will grow under the shade of trees, and incafe by means of its creeping roots. The other forts may be propagated in the same way; but they will not thrive under the drip of trees, though they delight in shade.

Qualities. Most of the species of aconite have been deemed poifonous. The ancients were fo surprized at their pernicious effects, that they were afraid to touch the plant; and hence sprung many superstitions precautions about the manner of gathering them. Theophratus relates that there was a mode of preparing the aconite in his days, fo that it should only deftroy at the end of one or two years. But some have questioned whether the aconite of Theophratus, Dioscorides, Pliny, and other ancient writers be the fame with ours, or should be referred to the genus Ranunculus. Vid. Reinhold, Diff. § 1. It is confidently affirmed, that the huntsmen on the Alps, who hunt the wolves and other wild animals, dip their arrows into the juice of these plants, which renders the wounds occasioned by them mortal. A decoction of the roots has been used to kill hogs; and the powder digifuged in bread or some other palatable vehicle has been employed to deftroy rats and mice. The A. nptellus, or common monk’s-hood has been long known as one of the most virulent of all vegetable poifons. Linneus fays, that it is fatal to fwine and goats, but does no injury to horses that eat it dry. He also informs us from the Stockholm acts, that an ignorant furgeon died in con-quence of taking the leaf of this plant, which he preferred to a patient. The efflua of the herb in full flower have pro-duced swooning fits and a temporary lipo of fhight. The leaves and fhoots of this plant, ufed as falad instead of ce-bery, have proved fatal in feveral infances. But the mofl powerful part of the plant is the root. Matthiolus relates that it was given by way of experiment to four condemned criminals, two at Rome in 1724, and two at Prague in 1751, two of whom foon died, and the other two, with great difficulty, were recovered. The juice applied to the wound of a finger, not only produced pain in the arm and hand, but cardia-gia, anxiety, feafe of suffocation, fyncope, &c. and the wounded part phaphacelated before it came to fuppuration. Dodonzus fays, that five perfons at Anwerp died in conquence of eating it by mistake. The effects of this plant are convuptions, giddines, infancy, violent evacuations, both upwards and downwards, faint-ings, cold sweat, and even death itself. Nevertheless it has been ufed for medicinal purpofes. The Indians are faid to ufe aconite, correfted in cow’s urine, with good fucces-fes againft fervers. There is one species of it which has been deemed an antidote to thofe that are poifonous, called anthora, and thofe that are poifonous are called ibora. The tale of the root of the species denominated anthora, is sweet, with a mixture of bitterness and acrimony, and the fmak is pleafant. It purges violently when fresh, but lofes its qua-litics when dried. This is poifonous as well as the others, though in a fighter degree, and is difufed in the prefent practice. The firit perfon who ventured to introduce the common monk’s-hood into medicine was Dr. Storck; though it has been fuppofed by Haller and Bergius from the tale and figure of the plant which he ufed, that it was not the nptellus but the A. cammarum, which much resembles it. But others have fince maintained, that Storck’s plant was the A. napellus. He faw that the extract given to the quantity of 10, 20, and even 30 grains, excited a sweat without inconvenience, and by perfilling in the use of it, great relief was obtaimed in fixed rheumatic and arthritic pains, fihrous glandular tumours, veneral nodes, an-chemylofes, anauropifs, and other fimilar complaints. Other practitioners, after the publication of Storck’s Extraits in 1762, have experienced the fame good effects in fome de-grade, and the Edinburgh college has received the extract as an officinal. In this, as in all the other medicines of fufpi-cious and dangerous properties, it is most expedient to be-gin with very small doses, and incafe them as they can be borne. Storck recommends two grains of the extract to be reduced into a powder, with two grains of fugar, and to begin with 10 grains of this powder two or three times a day. The extract is often given from one grain to ten for a dose; and some have considerably increafed the quantity. Instead of the extract a tincture has been made of the dried leav, macerated in fix times their weight of spirits of wine, and 40 drops given for a dose. Martin’s Miller’s Dict. Lewis’s Med. 1784. Woodville’s Med. Bot. vol. i. p. 19. Murray’s Appar. Med. vol. iii. p. 6, &c.

ACONTIA, in Ancient Geography, a town of Spain, which Strabo (tom. ii. p. 228.) places near the Durius, and calls a city of the Vaccei.

ACONTIAS, a name ufed, by fome authors, for a fort of cornet, or meteor, whose head appears round or ob-long, and its tail very long and fnder, refembling a ja-velin.

It takes its denomination from a ferpent thus called, frequent in Calabria and Sicily; where it is also named fuctone (from figilla, an arrow) by reafon of its flying at paffengers, &c. Soon after, in order to wound the fcene to a tree, to spring thence with the greater violence. For the like reafon the Greeks call it aconitas, of woxow, a dart, or arrow.

It differs from the xiphias, in that it is longer, and more like a dart; and the other is shorter and broader in the middle.

ACONTIAS, in Zoology, the name of the Anguis juculas, a species of ferpent, called also JACULUM, or the dart-fnake, from its manner of vibrating its body in the manner of a dart. Bellonius found one of these in the illand of Rhodes, which he defcribed in this manner: it is about three hands-breadth long, and the thicknes of one’s little finger; its colour is a milky grey on the back, variegated with fmall black spots, like fo many eyes; and on the belly it is perfectly white; the neck is wholly black, and from that two milk-white creams run all the way along the back to the tail; the black spots also are each surrounded with a fmall circle of white. It is found in Egypt and Lybia, and in the illands of the Mediterranean. It is also called cornecras and cornecbrus. Ray.

ACONTISMA, in Ancient Geography, a city of Mace-donia, between the Strymon and Nefts.

ACONTIUM, in Ancient Writers, a kind of Grecian dart or javelin, somewhat refembling the Roman pilum.

ACONTIUM, or ACONZIO, JAMES, in Biography, a cele-brated philofopher, civilian, and divine, born at Trent in the 16th century. He embraced the Protestant religion, and was favourably received in England by queen Eliza-beth, who granted him a penfion as an engineer, which he repectfully acknowledges in the dedication of his well-known work, “The Stratagem of Satan.” This treatife was first printed at Basle in 1565; and the author died in England. Another edition of it was published in the fame city by James Grafferus in 1610; at Amsterdam in 1674, and a French translation was published in 1616, and reprint-ed at Delis in 1624; in the above edition is inserted Acon-tius’s letter to Wollius, “De ratione endorum librum,” containing excellent advice to authors. He wrote also a treatife
treatise on method, entitled "De Methodo, sive de Réétia naturali genetorum tradendarumque artium et scientiarum ratione," which was published at Utrecht in 1648, and infected in a collection of dictations, "De Studioribus amicis," printed at Utrecht in 1648; an Italian work on fortifying cities, translated by himself into Latin, but never published; and a treatise of Logic, which he did not live to finish. His religious principles differed from those of Calvin; and he was an avowed friend to toleration. He has been charged with scepticism in theology, and referred by Isaac Juynius, minister of Delft, to the same class with Socinians and the Remonstrants, who represents him as a person delirious in reducing all facts into one, and including them in the same ark, as Noah preferred all animals in his bow, though they lived on different food. Arminius says of him, "Acostius eicit divinum prudentiae ac moderationis lumen," and Amelius gives him this character. "Idem Acostius eicit doctrinam, qui semetanm ecclesiae Anglicanae calorem atit ore celesti solvit sedulo." Gen. Dict. Biog. Dict.

ACONTIUM, in Ancient Geography, a city of Peloponnesus, in Arcadia, which derived its name, according to Pausanias, from Acontius, the son of Lycaon. There was another town of the same name in the island of Euboea.

ACOINTUS Mon, a mountain of Boeotia, in Greece, in which was built the town of Orchomenes. Strabo, t. i. p. 637.

ACOOTAN Island, in Geography, lies north-east from the point of Onemak, or the south-west point of the continent of America; and between there is a channel.

ACOPA, in Botany, a name given by Dioscorides, and some other authors, to the Menaethes trifolata, or other plants.

ACOPA, derived from a privative, and other circumflexions, in Medicine, is also used to denote remedies against the ill consequences proceeding from latitude, occasioned by too violent labour, exercise, or the like; such as tensions, tumors, pains in the bones, &c. some being of a warm, and others of a mollifying nature. But the title is improperly applied to medicines, as none are adapted to this purpose, except by a general quality. Cullen's Mat. Med. vol. i. p. 162.

ACOPIS, or Acopa, a suffulcance classed by Pliny among the genus of which he gives the following account. Acopis resembles Natron, is porous, and spars with golden drops. Oil which has been boiled upon this, is used as an ointment to prevent the effect of fatigue. Pliny, Nat. Hist. xxxvii. 54.

ACOPIS, a plant mentioned by Pliny, said to be the same with the Acopis of Dioscorides, which Gerard says is the bean-trefoil; it signifies also Laburnum.

ACOR signifies lours, or acromy.

ACORACA, in Ancient Geography, a town of Chalcybitis, a prefecture of Syria.

ACORDINA denotes Indian tattle.

ACORIS, a small town of Egypt, in the nome of Cynopolis, in the province of Hectanomis.

ACORN, in Natural History and Agriculture, denotes the fruit of trees of the oak kind.

The acorn, according to Dr. Grew, is the nut of an oak, with this only difference, that besides the cup it stands in, it has only a leathern or parchment cover, instead of a shell. And hence it is, that whereas the kernel of a nut is sweet, that of an acorn is of a very rough and bitter taste; the aulcine parts of the sap, which in a nut are dried off into the shell, being here imbibed by the kernel itself. Writers on huskery give directions concerning feminities or nurseries of acorns, and the method of propagating, by sowing or planting them. For timber, those acorns are to be chosen as seed, which are most solid and heavy, and not those which are the largest. See Oak.

In the Phil. Trans. vol. lxvii. p. 75, we have a curious and important memoir by John Ellis, Esq., containing a method of preferring acorns in bees-wax for a whole year, in a flat fit for vegetation, by which other seeds may also be preferred; and such as are valuable may be brought from the East Indies, for the purpose of planting them in other countries. See Seed.

Acorns were the food of the last ages; but when corn was cultivated, acorns were neglected. They are of little use with us, except for fattening hogs and other cattle, and pigeons. The hogs that are fattened by them will be subject to conflux, and the disease called the garget, unless they are given sparingly, and mixed with some laxative substances; and during the use of them, the hogs should be allowed to run at large: for if they are confined to the flye, they will not grow fat with this kind of food. Among the Spaniards, the acorn, or Elan Inches, is said to have long remained a delicacy, and to have been served up in the form of a defect. In dearths, acorns have been sometimes dried, ground into meal, and baked as bread. Bartholin relates, that they are used in Norway for this purpose. The inhabitants of Chio held out a long siege, without any other food; and in 3 years of scarcity in France, A. D. 1709, they recourse to this food. But they are said to be hard of digestion, and to occasion head-aches, vomiting, and colics. In Smoland, however, many influences occur, in which they have supplied a salutary and nutritious food. With this view they are previously boiled in water and separated from their husks, and then dried and ground; and the powder is mixed with about one half or one third part of corn-flour. A decoction of acorns is reputed good against dysenteries and colics; and a pectoral of them is said to be useful in immoderate fluxes of the menses. Some have recommended the powder of acorns in intermittent fevers; and in Brundwick they mix it with warm ale, and administer it for producing a sweat in cafes of the erysipelas. Acorns roasted and bruised have restrained a virulent diarrhœa. For other medical ues to which they have been applied, see Murray's Appar. Medic. vol. i. p. 100.

From some late reports of the Academy of Sciences at Peterburgh, we learn that acorns are the best substitute to coffee that has been hitherto known. To communicate to them the only properties of coffee, the following process is recommended. When the acorns have been toasted brown, add fresh butter in small pieces to them, while hot in the hulks, and stir them with care, or cover the hulks and shake it that the whole may be well mixed. The acorns of the holm oak are formed at Venice into cups, about 1½ inch in diameter, and somewhat kis in depth. They are used for drizzling leather, and, instead of walls, for dyeing woolen cloths black.

Acorn, in Sea-language, denotes a little ornamental piece of wood in the shape of a cone fixed on the top of the spindle on the main head, above the vane, to keep it from coming off the spindle in a whirlwind, or when the ship leans much upon one side under sail. See Lepas.

ACORUS, derived from Acorum, the pupil, because it was esteemed good for disorders of the eye. Calamus Aromaticus, Sweet Flag, or Sweet Ruffles, in Botany, a genus of the monography order, and Alexandria chals of plants, and belonging to the natural order of piprites. The characters are that the calyx is a cylindric,imple flap, covered with florets, without flatus or perianthum; the corolla is composed of six petals, obtuse, concave, hoag, thicker at the top,
The root is an ingredient in the mithridate and tonics of the London pharmacopoeia, and in the aromatic and rosmarinic tinctures, and compound arum powder, of that of Edinburgh. The Turks casually it, and regard it as a prefervative against contagion. It is also said that it has cured agues, when the Peruvian bark has failed; and it has been recommended in vertigo, proceeding from a vitiated flomach. Some have pretended that it is efficacious in scorbute and hemorrhagic complaint, to which little credit will be given, and much left to its alexipharmac power. The preparations of it, enumerated by Murray, are a dry confection of the roots, a distilled water and oil, a spirituous and aqueous extract, and the chlorknax Matthiaii, and clorix avisii Mynfichiis. The leaves have a sweet fragrant smell, resembling that of the roots, but weaker. No cattle whatever will eat any part of the plant. Martyr's Miller. Lewis's Mat. Med. —Woodville's Med. Bot. vol. iii. p. 473. Murray's App. Med. vol. p. 19.

ACORUS, or BLUE CORAL, in Natural History. The true accrus of this kind is very scarce: some of it, however, is found on the coasts of Africa, particularly from Rio de Janeiro to the river of the Camarones. This coral is part of the merchantize which the Dutch trade with for the Camarones; that of the kingdom of Benin is much esteemed. It grows in form of a tree on a rocky bottom. Acorus is also a name for the greater galangal root.

ACORUS Adulcerinae, in the Materia Medica, the name of the root of the iris latu polystiri, or common yellow water-flag-flower.

ACOSTA, GABRIEL, in Biography, a canon and professor of theology at Coimbra, who died in 1616, and whose large Latin commentary on part of the old testament was printed in fol. in 1641. Lugd. Bat.

ACOSTA, JOSEPH, a celebrated Spanish author, born at Medina del Campo, about the year 1540. He was a missionary and provincial of the Jesuits in Peru, and died at Salamanca in 1600. Besides his "Natural and moral history of the Weft Indies," first printed in Spanish in 1592, and printed in French in 1602: he also wrote a treatise "De Procuranda Indorum salute," 8vo. Salam. 1595. "De Chirillo Revelato," 4to. Rom. 1599, and "De vera Scriptura," or precepts of life ratione, in the commentators of Menochius, &c. The general council of Lima is also adhered to some parts of his authority. Acosta, says Dr. Robertson, (Hist. Amer. vol. ii. p. 450) it is the first philosopher who endeavoured to account for the different degrees of heat in the old and new Continents, by the agency of the winds which blow in each.

ACOSTA, URIEL, was born at Oporto near the close of the 16th century. Having been educated in the Romish religion, though descended from one of those Jewish families which had submitted, as it were by constraint, to Christian baptism; he continued in the profession of it till the age of 25 years. His mind, however, had been perplexed by doubts previously to this period, in which he became treasurer in a collegiate church. At this time he directed his attention to the books of Moses and the Prophets, and the result was a conviction, that Judaism was the true religion. Fearing openly to profess it during his continuance in Portugal, he determined to resign his place, and embarked for Amsterdam with his mother and brothers, whom he had instructed in the principles of the Jewish faith. In this new situation they became members of the synagogue, and were circumcised according to the Jewish custom; and he changed his name of Gabriel for that of Uriel. He soon perceived that the Jews did not conform, either in

Vol. I.
their rites or morals, to the law of Moses; and disapproving of their conduct, he avowed his sentiments, and incurred the resentment of the chiefs of the synagogue. By them he was excommunicated and forbidden to hold any intercourse even with his own brothers. In these circumstances he wrote a book in his own justification; in which he endeavours to shew that the rites and traditions of the Pharisees are contrary to the writings of Moses: and he was soon led to adopt the opinion of the Sadducees, from a persuasion that the functions of the Jewish law related merely to the present life.

Acosta was reputed an atheist, and became an object of general odium and persecution. With the concurrence of the magistrates of Amsterdam he was thrown into prison; all the copies of his work were seized, and he was fined 300 guineas. His scepticism increased, and he proceeded to think that the Mosaic law was a political invention. With these ideas he boldly determined to sacrifice his conscience to this interest, and returned to the Jewish church after having been 15 years excommunicated, recanted what he had written, and subscribed what was enjoined. Accused by his nephew of not conforming to the laws of Moses in his private conduct, he found found that the unaccommodating defertion of principles which were his own availed; he was summoned before the grand council of the synagogue, and again expelled from their communion. After living in wretchedness for seven years, he declared his purpose of submitting to the sentence of the synagogue; and contrary to the expectations which he had been encouraged to entertain, he underwent a very severe penance. After making a public recantation, and a very humiliating acknowledgment of his offence, he was flung to the wait, and received 39 lashes with a whip. He was then abdufed from the excommunication, and laying himself down at the door of the synagogue, all who came out walked over him. This account is extracted from his treatise, intituled "Exemplar humanæ vitæ," published and refuted by Limborch, in his "Amica Catioium cum eruditissimo Judæorum de veritate religionis christianæ." This treatise he is supposed to have composed a few days before his death. Having failed in his attempt to kill his principal enemy, he put an end to his own life with a pistol in 1647, according to some, but as others say in 1640. Such was the termination of a life disgraced, not by the change of sentiments, in consequence of his conversion and conviction, but by a want of integrity in conduct, and by a mean and dastardly avowal, for purposes of self and interest, of principles which he did not believe.

Gen. Dict.

ACOSTAN, in Geography, a mountainous island in the North Sea, between Asia and America, observed by Captain Cook.

ACOTYLEDONES, in Botany, denote seeds without lobes, and of course when they vegetate, they produce no fernial leaves.

ACOUEZ, in Geography, the name of an Indian nation in Canada.

ACOUS, the principal, though small, town in the valley of Atpe and country of Bear in France. Near this place are several cold springs, particularly those of Ecolat. N. lat. 43° 5′. E. long. 0° 50′.

ACOUSMATICI, from acous, to hear, an appellation given to such among the disciples of Pythagoras, as were left under the probation of five years. They are also called by Latin writers acouschici. The acousmatici stood opposed to the mathematici, who were initiated into the secrets of science: and the acousmatici, philosoply to the mathematici. These distinctions corresponded to the exoteric and esoteric. To persons of this class, it was sufficient to appeal to the authority of Pythagoras, "Alo, 47a, ipse dixit," which decided every dispute. Some have denied the appellation of Pythagoreans to be due to the acousmatici; because many of these had their learning, not immediately from Pythagoras, but from Hippamus, who, according to some, was of Crotona, but according to others, of Metapontum.

ACOUSTIC, formed from acous, to hear, denotes in general any thing that relates to the ear, the sense of hearing, or the doctrine of sounds.

ACOUSTIC Duct, in Anatomy, is applied to the external passage of the ear; called also MEATUS AUDITIVUS.

ACOUSTIC INSTRUMENTS, or Auricular tubes, are such as are adapted to supply the defect of hearing. See also DEAFNESS and TRUMPET.

ACOUSTIC NERVES. See AUDITORY NERVES, and NERVES.

ACOUSTIC VOICES, in the ancient theatres, were a kind of voices made of brass, shaped, as some have said, like a bell, which being of all tones within the pitch of the voice, or even of instruments, rendered the sounds more audible, so that the actors could be heard through and past the noise from which they were not 400 feet in diameter. Vitruvius.

The acoustic voices, mentioned by Vitruvius as harmonically tuned, and placed in different parts of the ancient theatres, have been tried in the Opera-lounge at Turin, and other parts of Italy; but without the effect expected from them of augmenting the tone of the human voice, or of the instruments to which they were tuned.

ACOUSTICS is that branch of general science which illustrates the origin, propagation and perception of sound. Some writers have divided acoustics into diacoustics, which explains the properties of those sounds that proceed directly from the resonant body to the ear, and cataacoustics, which treat of reflected sounds. Sound originates in the percussion and vibration of the parts of a chitie substance: and it is transmitted by means of the density of the air, or of some other more subtile medium of a similar kind. How it is produced and propagated, and with what velocity it moves, are subjects of discussion which will be particularly investigated and explained in their proper place, under the article Sound. The reverberation of sounds will be illustrated under the articles ECHO, TRUMPET, and WHISPERING PLACES. For the manner by which they impress the organ of hearing; see Ear and Hearing. See also CHORD, PHONICS, STRING, VIBRATION, and VOICE.

Acoustics is properly the theoretical part of Music: it is that which gives, or ought to give, reasons for the pleasure which we receive from harmony and melody, which determines the relation of harmonical intervals, and which discovers the affections or properties of vibrating chords, &c. Rouleau. For an account of the amusing contrivances, connected with this branch of science, see ALOUS's Harp, ARMONICA, Communicative BUSTS, Automaton Harpsichord, Solar Sonata, Convergeur Statute, and Venitioi Symphony. See also Hooper's Recreations, vol. ii. p. 202, &c.

ACOUSTICS, or ACOMATIC MEDICINES, are remedies against the imperfections and disorders of the ear, or of the sense of hearing. Such general terms as acoustics, says Dr. Cullen (Mat. Med. vol. i. p. 163.) serve to mislead rather than instruct, and should, therefore, never be employed.

ACOQS, in Geography, a small town at the foot of the Pyrenees, in the department of Ariege, and late province of Foix in France, and so called from its hot waters. N. lat. 43° 42′. E. long. 1° 3′.

ACQS, or DAX, Aque Farbellese and Aque Angulius, is also the name of the same town, in the vicinage of the fame.
A QC

A CR

A name, and in the district of Arouba, on the river Adour. It is a bishop's see. In this place are six convents, one college, and an hospital. In the neighborhood are warm baths. N. lat. 43° 47'. E. long. 1° 6'.

ACQUA, a small place in Tuscany, noted for its hot baths. N. lat. 43° 45'. E. long. 12° 10'.

ACQUA della Fico, a town of Italy, in the kingdom of Naples and province of Calabria Ultra, 15 miles west of Squillace.

ACQUA Nea, a town in Italy in Mantua, 2 miles N. E. of Caneto. There is another town of the same name near the confluence of the Adda and Po, 3 miles west of Cremona.

ACQUASKNACK, or ACQUASKNANE, a town of America, on the W. side of Passaic river, in the county of Essex in New Jersey; 10 miles N. of Newark, and 17 N. W. from New York.

ACQUAPENDENT, a large town, now almost deserted, though a bishop's see, and containing 16 churches and convents, situate on a rocky eminence in the territory of Orvieto in Italy. N. lat. 43° 43'. E. long. 11° 5'.

ACQUARA, a town of Italy in the kingdom of Naples, 13 miles S.W. of Cangiano.

ACQUARIA, a small town of Italy in Frignano, a district of Modena, famous for its medicinal waters. N. lat. 44° 24'. E. long. 11° 17'.

ACQUA SPARTA, a town of Italy in Umbria, 10 miles W. of Spoleto.

ACQUAVIVA, an inconsiderable town in the county of Buri, a district of Apulia in Italy. N. lat. 43° 10'. E. long. 16° 20'. Another town of this name lies 8 miles N. of Rome, and another in the kingdom of Naples, 19 miles W. of Moletti; and again another in the marquisate of Ancona, 10 miles N.E. of Alcoli.

ACQUEST, or ACQUIST, formed of Fr. acquérir, from acquérir, to acquire, or get; is understood in a legal sense, of goods or effects, acquired either by purchase or donation. The French law makes a great difference between acquits and their corollary effects. The civil law allows none. See Heir.

ACQUIST is also popularly used for CONQUEST, or a place acquired by the sword.

ACQUETTA, in Geography. See Aquetta.

ACQU, a fortified town and bishop's see in the duchy of Montferrat in Italy. It is situated at a small distance from the Apennines, about 25 miles N.W. from Genoa, and has its name from its warm baths. N. lat. 44° 40'. E. long. 8° 30'.

ACQUI, a small Dutch fort to the E. of Ancobar in the gold coast of Africa. N. lat. 32° 32'. long. nearly the same with that of Greenwich.

ACQUETANDIS Plegit, in Lex, a word of justices lying for a surety against the creditor that refuses to acquit him after the debt is paid.

ACQUETARE, in ancient Law-books, signifies to discharge or pay the debts of a person deceased; as the heir then to his estate. See Acquisition.

ACQUISITION, the act of procuring a right or title to the enjoyment or property of a thing. Acquisition is also sometimes used for an Acquest.

ACQUITAL, a discharge, delivery, or setting free of a person from the guilt or suspicion of an offence. Acquittal is of two kinds; in lewe, and in fait. When two persons are appealed or indited for felony, one as principal, the other as acceczy; the principal being discharged, the acceczy is, by consequence, also freed; in which case, as the acceczy is acquysted by law, so is the principal in fait.

When a person is acquitted of a felony, and is questioned again for the same crime, he may plead autem duxit acquit; as his life cannot be twice exposed to danger for the same offence. But in murder, acquittal does not prevent an appeal; and the principal or acceczy, may be either remitted to prison or bailed by the court, till the year and day of appeal be past. If a person is lawfully acquitted on a malicious prosecution, he may bring his action for damages, after he hath had a copy of the indictment.

ACQUITTAL, is allowed where there is a lord mesne and tenant, and the tenant holds lands of the mesne, and the mesne holds over the lord paramount; here, the mesne ought to acquit the tenant of all services claimed by any other for the same lands; the tenant being to do service to the mesne only, and not to divers lords for one parcel of land.

ACQUITTANCE, or QUITTANCE, a release or discharge in writing, for a sum of money or other duty, which ought to be paid or done. No person is obliged to pay without an acquittance, and the acquittance of a servant accustomed to receive money for his master, is a good discharge. The verb acquit, the participle acquittance, and the noun acquitted, do all signify a discharge from an offence objected. In which case we meet with acquitted by proclamation.

ACRA, or ACRAB in Geography, a dependent and tributary district of the kingdom of AQUAMBOE, on the coast of Guinea, in Africa; where the English, Dutch, and Danes have strong forts, which are considered as the belt on the whole coast. That of the English is Fort James, situate on a rock, and capable of mounting 20 cannons. Near it is a salt-pit, which supplies a great part of the coast with this commodity, and yields a considerable revenue. The Dutch fort is Creveceur, standing on a rock and guarding the beach. The Danish fort is Christiansburgh, which is the only place the Danes possess on this coast. Each fort hath its adjacent village; though the general one is Acra, the name of the ancient kingdom, before it was subdued by the Aquamboans, and its inhabitants removed to Little Popo. N. lat. 5° 40'. E. long. 1° 20'.

ACRA, in Ancient Geography, one of the hilly isles of Jerusalem, on which stood the old or lower city, as that of a high city, called also the city of David, was situate on mount Zion to the south of Acra. This is supposed by some to be the same with Mount Moriah, on a part of which Solomon built his temple; and they allege, that Moriah in Hebrew, and Acra in Greek, have the same meaning, and signify an eminence. Wells's Sac. Geor. vol. iii. p. 76.

As there was a citadel or fortress built on this hill by Antiochus, in order to annoy the temple, which was afterwards taken and razed by Simon Macabeus, it is not improbable that the name was derived from this circumstance. Anc. U. H. vol. ii. p. 428. The Ammonian kings, not satisfied with having razed the citadel built by the Syrians, lowered the top of the mountain, and filled up the valley towards the eel, by which means the ground on which the temple flourished, or Mount Moriah, became higher than Acra, and thus the communication between them was rendered more easy.

ACRA, in Syria. See Acre.

ACRA Point. See Hadessiak.

ACRABA, a town of Mesopotamia in Asia, situate near the river Chaboras, about 36° 26'. N. lat.

ACRABATA, a town of Asia, towards the limits of Samaria.

ACRABATENE, the name of two districts of Judea; one extending itself between Schechem, now Napolis, and Jericho,
ACRACANUS, a river of Asia in Abydene, supposed by Kallius to be the same with Mairares.

ACRADINA. See Aceramia.

ACRE, an ancient town of Sicily, founded according to Thucydides (ib. 6. p. 35. Ed. Duker.) 70 years after Syracuse, built upon an eminence, as Sibylus (lib. 14. v. 207.) describes it, and inhabited by a people whom Piny (H. N. vol. i. p. 161.) denominates Acarnes. It was situated about 24 miles to the south of Syracuse, not far from the sea, and near the monastery which the Sicilians call Santa Maria d'Arina, between the cities of Noto and Avala. There are medals of this city in bronze, gold, and silver.

ACRE SELIANA, a district of Spain, S. E. of the promontory of Arthabum.

ACRE, was also an epithet of Diana, who was generally worshipped in high places.

ACREA, a surname of Jenu of Corinth, who had a temple in the citadel of the Sicilian Acre; and also a surname of Fortune for the same reason.

ACREPHIA, ACREPHIUM, or as Paulyas (lib. 9. c. 33. p. 755. Ed. Kohlii) calls it, Acrephium, was a city of Sicily, on the coast of Mount Pisa, where was a temple of Apollo. This place, according to Paulyas, afforded refuge to the Thicans, when Alexander demolished their city.

ACREUS, was a surname of Jupiter, who was honoured by the inhabitants of Smyrna in a temple on an eminence near the sea.

ACRAGAS, a town of Sicily, built upon a mountain, at the confluence of the rivers Acragas and Hypsas, and within two miles of the sea, by the people of Gela in the year before Christ 584. It took its name from the river Acragasia, now called Fiume di Gorgenti; whence other cities, enumerated by Stephanus (de Urb. vol. i. p. 53.) were denominated Acragantes. Acragasia was very strongly fortified. The inhabitants were luxurious in their diet, and magnificent in their dwellings; and they are represented by Empedocles, says Diogenes Laertius (tom. i. p. 534.) to be perfect, who lived to-day as if they were to the to-morrow, and who built, as if they were to live for ever. The adjacent country abounded with vines and olives, the produce of which afforded a lucrative commerce with Carthage. Acragasia has been more generally distinguished by its Roman appellation Agrigentum. The metals of this city were gold, silver, and bronze.

ACRA JAFYCA, a promontory in the kingdom of Naples, to the S. E. of Otranto, where was formerly a town now in ruins, on the Ionian Sea, opposite to the Montes aerocereanini of Epirus. Ptolemy called it Salentina, and it is now denominated Capo di San Maria di Luce.

ACRA of Sylcas, an island on the coast of Numidia, that forms the modern part of Harthage, under which vessels of the greatest burden may lie in safety. Stephanus (de Urb. vol. i. p. 53.) enumerates 10 cities under the appellation of Acras.

ACRAMAR, or VAN, in Geography, a town and lake of the Greater Armenia in Asia. 'N. lat. 46° 35'. E. long. 44° 14'. The town, which is the capital of the government of Van, is situated at the foot of the mountains of Darrbekir, and is said to have been built by Semiramis. It is large, populous, and commercial. In the adjoining lake, which abounds with fish, there are two small islands, inhabited by religious Armenians.

ACRASIA, formed of Α and ρασανον, to mix, is used by some writers in Philos., for the excess or predominant quality of one above another, either in artificial mixture, or in the constitution of the human body. The word is used by Hippocrates, and other Greek medical writers, to express excess of any kind, intemperance and imbecility.

ACRASUS, in Ancient Geography, a town of Asia Minor in Lydia. There are some imperial Greek medals of this city, which were struck under the pretors, in honour of Severus, Plantilla, Geta, Julia Paula, Alex. Severus, and Caracalla.

ACRATH, a town in Mauritania Tingitana, supposed to be the present Tefel de Gomara.

ACRATISMA, in Antiquity, a breakfast among the old Greeks, consisting of a morcel of bread toasted in pure unmixed wine.

ACRATOMELI. See Mulsum.

ACRATOPHORUS, a surname of Bacchus, under which he was honoured at Phigalia, a city of Arcadia.

ACRATOS, from a priv. and κεραθνη, to mix, denotes simple or unmixed. This term is very often used by Hippocrates, and applied to excrescences of different kinds, and is always of very bad preface. Thus, in his Pneumonies, he observes, that in all painful disorders of the pleura and lungs, the fopptle should appear mixed and yellow; and that it is a dangerous symptom, if it be altogether yellow, without any mixture; and if it be that, if the fopptle be so unmixed as to appear black, it is a very bad preface.

ACRE, or ACRE, in Geography, a sea-port town on the Phoenician coast in Syria. Its ancient Hebrew name was Acro or Accho, under which appellation it is mentioned as a place of considerable strength in the book of Judges, ch. i. 31, and it is still called by the Arabs Akka. It was afterwards denominated Ptolemais, from one of the Ptolemys in Egypt, and Aca, on account of its fortifications and importance; whence the knights of St. John of Jerusalem called it St. John d'Acre. The situation of Acre proffesses every possible advantage both of sea and land; as it is encompassed on the N. and E. by a spacious and fertile plain, on the W. by the Mediterranean, and on the S. by a large bay, extending from the city to Mount Carmel. This city successively under the dominion of the Romans and afterwards of the Moors, was for a long time the theatre of contention between the Christians and the Infidels in the progress of the crusades. It was taken by the victorious Saladin in 1187, and surrendered to the united arms of Philip Augustus of France, and Richard I. of England in 1191, after a siege of two years, which consumed a great multitude of forces, both of Europe and Asia. Although the Europeans thus acquired a strong town and convenient harbour, the advantage was very dearly purchased. It is said (see Gibbon's Hist. vol. xi. p. 144. 8vo.) that on this occasion more than 100,000 Christians were slain; that a far greater number was lost by disease or shipwreck; and that a small portion of an army, consisting of five or six hundred thousand person, returned in safety to their native countries. After the loss of Jerusalem in unsuccessful attempts for recovering the Holy Land from the possession of the Saracens, renewed by St. Louis with the co-operation of our Edward I. and other powers, Acre became the metropolis of the Latin Christians, and was adorned with strong and lofty buildings, with aqueducts, an artificial port and a double wall. Its population was increased by an influx of pilgrims and fugitives; and the trade of the East and West was attracted to this convenient station. At this time, however, the inhabitants were extremely corrupt; and the government, though exercised by many sovereigns, feeble and ineffectual to any purpose of salutary restraint. Adventurers issued from this city, under the banner of the crofs, to plunder the Mahometan villages; and
and though nineteen Syrian merchants were robbed, and ignominiously put to death, satisfaction was withheld. The Sultan Khalil refented this conduct, and marched against Acre, at the head of a large army, furnished with a tremendous train of artillery. After a siege of 33 days, the double wall was forced by the Moslems, the principal tower yielded to their engines, the city was stormed, and death or slavery was the lot of sixty thousand Christians. The fortresses of the Templars was destroyed, the grand master killed, and of 500 knights, 10 only survived: who probably suffered on a scaffold (says Gibbon) in the unjust and cruel profligation of the whole order. Few of the fugitives, among whom were the king of Jerusalem, the patriarch, and the great master of the hospital, escaped the dangers of the sea, and safely arrived in the island of Cyprus. This disastrous event happened (says Maundrel in his journey, & c. p. 55.) on May 19, 1291. He adds, that the abbeys of the nunneries, in order to avoid that violation which was apprehended from the licentiousness of the Saracen victors, ordered the young nuns under her care to mangle their faces, setting an example in her own person, that they might thus become the objects of aversion instead of brutal desire. The Saracens, disappointed and inflamed with resentment, put them all to the sword.

After the expulsion of the crusaders, Acre exhibited a scene of magnificent ruin, and remained in a great degree defoliated and deserted till about the year 1750, when it was fortified by Daher, an Arabian sheik, who obtained the appellation of Prince of St. John of Acre, and maintained his independence against the whole force of the Ottoman empire, till the year 1775, when he was basely assassinated by order of the Ottoman Porte, at the advanced-age of 86 years. He was adored by his people (says Savary, Letters, vol. ii. p. 200.) whom he had through life defended against the tyranny of the Pacha, and yet by this tyrant he was betrayed and murdered.

At a later period Acre has been rendered, by the works of Djezzar, one of the principal towns upon the coast. The most of this Pasha is much admired. The bazaar, or covered market, is not inferior to the bazaars of Aleppo, and its public fountain is superior in elegance to those of Damascus. These improvements were designed and executed by the Pasha himself. The place, however, though its fortifications had been often repaired, was very weakly defended; and in the spring of 1799, it was found necessary to strengthen its fortifications, in order to guard against the apprehended assault of the French army under Bonaparte. The Pasha Djezzar, who had actually evacuated Caïfa, a town at the foot of Mount Carmel, surrounded with a good wall, and flanked with towers, and who had disarmed the castle which defended the fort and road, had reason to distrust his security at Acre. He was therefore preparing to make good his retreat, and to convey away his women and treasure, when our gallant countryman Sir Sidney Smith anchored in the road of Caïfa with an English squadron, and deputed a French engineer (Col. Philipeaux) to aid him in fortifying the town. This engineer caused the fortresses to be repaired, which was completed after the model of the 18th century, with courtyards flanked with square towers. The Pacha, thus affrighted and animated, determined to co-operate with the English squadron in the defence of the town. Kléber, however, with the French advanced guard, had taken possession of Caïfa; and Bonaparte had completed the investment of Acre, when his battering-pieces and howitzers fell into the hands of the English. This lois decided the fate of the town; and though the French renewed and varied their attacks, they were repeatedly repulsed by the garrison in concurrence with the marines of the English squadron, under the command of the Commodore, Sir Sidney Smith. After multiplied and irreparable losses, it was found almost impossible to reduce a place, defended with so much intrepidity, and possessing a variety of advantages which it is besides our purpose minutely to detail. Bonaparte, at length, determined to raise the siege, and announced his resolution to the army, which began its march on the 26th of May, the 6th day after breaking ground. Djezzar did not perceive for two days that the trenches were evacuated, so that the French army had an opportunity of continuing its march without molestation, ravaging the country, burning the harvests, and destroying the defences of the ports, the magazines, and all the resources which the Turks might have used in approaching the frontiers of Egypt. Kléber formed the rear-guard with his division, which, after having crossed the defile, embarked at Ténès for Damietta. Bonaparte left a strong garrison at Cattieh, and entered Cairo with the rest of the army, 23 days after the raising of the siege.

The aspect of the field of carnage on this occasion was horrible. The ditches and the ruins of the parapets were filled with corpses, and the air itself was infected for want of an opportunity to remove the wounded whom the Turks left maimed, and to bury the dead. Notwithstanding the singular spirit and very extraordinary exertions manifested in this siege, both by the assailants and the besieged; humanity must lament the aggravated circumstances of cruelty and dittrefs that attended it.

The principal articles of commerce at Acre, are corn and cotton: but the trade is monopolized by the Pacha in his own hands. The French have usually had a consul in this place, and Russia a resident. Acre is situated 27 miles S. of Tyre, and about 70 miles N. of Jerusalem. N. lat. 32° 40'; E. long. 39° 25'.

Acre, is used in the dominions of the Mogul, with regard to his revenues, in the same sense with lack, for the sum of 100,000 rupees; eight rupees being equal to about one pound Sterling.

Acre denotes a quantity of land, containing four square roods, or 100 square poles or perchés. The word, perhaps, is formed from the Saxon acce, or Germanacker, field, or the Latin ager. Salmantius derives it from acre, used for acena, a land-measure among the Ancients, containing 10 acres. The term acre formerly meant any open ground or field, as Caillé-acre, Wall-acre, and not a determinate quantity of land.

By the cullum of countries, the perch differs in quantity, and consequently the acre of land: it is commonly 16 1/2 feet; but in Staffordshire it is 24 feet; in other counties 28 feet; and in some parts of England 18, 21 feet. According to the statute 34 Hen. VIII. concerning the sawing of flax, it is declared, that 100 perchés, i. e. 16 in length, and 10 in breadth, or in that proportion, make an acre; and the ordinance for measuring land, 35 Edw. I. agrees with this account. And therefore, as the statute length of a pole is 5 1/2 yards, or 16 1/2 feet, the acre will contain 360 square yards, or 3,600 square feet. Moreover, as the chain, used in measuring land, is four poles or 22 yards in length, the square chain will be 644 yards, and the acre will be 10 square chains. And a mile being 1760 yards, or 80 chains in length; the square mile will be 1760 x 1760 = 3,097,600 square yards, and contains 80 x 80 = 6400 square chains, or 640 acres. Some old farmers distinguish between feed-acres and statute acres: the former being a vague measure, determined by the proportion of seed used in sawing it, and therefore depending on the fertility or barrenness of the soil.
The Scotch acre contains 4 Scotch roods, and bears proportion to that of the English by statute, as 100,000 to 78,694, regard being had to the difference between the Scots and English foot. One square rood is 40 square falls; one square fall, 32 square ells; one square ell, 9 square feet, and 73 square inches; and a square foot, 144 square inches. The Scotch acre is also divided into ten square chains; the measuring chain being 24 ells in length, and consisting of 100 links, each link 892 28 inches; and each square chain will contain 10,000 square links. The English statute acre is about 3 roods and 6 falls, standard measure of Scotland.

The French acre, *arpent,* is different in various provinces; the acre of Paris contains 100 square perchs, the perch being 18 feet, or 3 toises; but in some places the perch is 20 feet, and in others 22. Allowing the proportion of the English square foot to be to that of the French, as 1000 to 1165, the acre of 100 square perchs, at 18 feet each, will be 32,400 French square feet, or about 36,774 English square feet, and the perch being 22 feet, the acre will be 48,940 French square feet, or 56,634 English square feet; and if the English acre being 43,560 square feet, it will be very easy to estimate the proportion of the one to the other. The Strafburg acre is about half an English acre. The Welsh acre contains commonly two English acres. The Irish acre is equal to 1 acre, 2 roods, 19 perches 72 inches, English.

Houghton gives a table of the number of acres to a horse in each county of South Britain, which is found to vary in the English counties from 33 acres, the proportion in Middlesex, and 174 in Surry, to 495 acres in Southampton; in the Welsh counties, from 51 acres, as it is found in Flintshire, to 193, as in Merionethshire.

Dr. Grew attempts to ascertain the number of acres in England; which, according to him, amounts to 40 millions and 80,000. Phil. Trans. No. 330, or Abr. vol. iv. p. 450. Sir William Petty reckons 28 millions; others 29 millions. And by an account of the number of acres in each county, supposed to be taken from some old registers, the number of acres in England amounted only to 39 millions. Others estimated the number of acres in England and Wales at 46,979,609, and in Scotland 22,600,000; whilst others again assert, that England and Wales contain no more than 38,500,000 acres; and that Scotland with its adjacent islands, contains about 21 millions of acres. Allowing with Zimmermann (Political Survey, p. 192.) that England and Wales contain 54,112 square miles, and Scotland 25,600 square miles; the number of acres in the former will be 34,631,680, and in the latter 16,384,000. Ireland, comprising 21,216 square miles, will contain 13,578,340 acres. See Great Britain, England, Ireland, and Scotland.

The United Provinces are said to contain 4,382,000 acres, but reckoning with Zimmermann (Political Survey, p. 164.) the area 10,000 square miles, the number of acres will be 6,400,000; and the province of Holland is estimated at one million of acres, or according to the same writer, 1,289,000 acres; and they were thought formerly to contain 2,400,000 persons, but according to a public account given in 1785, 2,758,632 persons. If England were as well peopled as the Kingdom, it is said that it would contain 46 millions of inhabitants, i.e. about seven or eight times as many as it now contains.

The area of France, according to the statement of Necker, is 157,524 square miles; and if this estimate be just, it contains 101,571,560 acres. Spain, according to Lopez's map, contains 189,448 square miles; and consequently 95,066,720 English acres. Portugal comprehends 27,376

ACR

The whole of Turkey in Europe, Asia, and Africa, estimated at 800,000 square miles, contains 512,400,000 acres. The European part of Russia is said to contain 1,194,976 square miles, and consequently 764,874,640 acres; and Asiatic Russia supposed to be 3,605,244 square miles, includes 236,815,620 acres. If Sweden contains 216,000 square miles, as Bufingh states it, its extent in English acres will be 138,520,000. Denmark, comprehending 182,400 square miles, will contain 167,736,000 acres. Poland and Lithuania, estimated at 160,800 square miles, will contain 102,912,000 acres. The kingdom of Prussia, including the countries that are independent of the German empire, is supposed to contain 57,600 square miles, comprising 36,864,000; and Prussia alone containing 22,144 square miles, includes 14,724,160 acres. Germany, estimated at 119,571 square miles, contains 122,605,440 acres. Switzerland, containing 15,269 square miles, has 9,789,440 acres. Italy, containing 50,000 square miles, has 57,600,000 acres. Hungary and Transylvania, having 52,112 square miles, include 58,051,682 acres. The number of square miles in Europe is estimated at 2,627,574, and consequently it contains 168,627,574 acres. The territory of the United States of America, according to the measurement and computation of Mr. Hutchins, geographer to the States, contains 380 millions of acres, exclusively of water, which is computed at 51 millions more. *Morse's Geog.* p. 35. See *Political Arithmetic.*

By a statute of 51 Eliz. it was ordained, that if any man erected a new cottage, he should add four acres of land to it; but this statute was repealed by 15 Geo. III. c. 32.

Acre-Fight, is an old sort of duel, fought by single combatants, English and Scotch, between the frontiers of their kingdoms, with sword and lance; and this duelling was also called camp-fight, and the combatants, champions, from the open field that was the stage of trial.

Acre-Tax, a tax laid on land at so much per acre. In some places this is also called acre-shot. Impositions on lands in the Great Level are to be raised by a proportionable acre-tax. 20 Car. II. cap. 8. An acre-tax of 26d. per acre, for draining Hadhamen level. 13 Geo. I. cap. 18.

ACRE, in *Ancient Geography,* a town placed by *Polybius* in Sicily. N. lat. 76° 40'. E. long. 39° 15'. See ACRE.

ACREDULLA, in *Zoology,* a species of the *Mus,* in the Linnean system; the migratory mouse of Pallas, with pouches to the cheeks, diminutive small cars, a grey body, with the lower part white. It is four inches long; with an annulated tail, the upper part of which is brown; found in the Orenburg district of Siberia, near the river Urgal.

ACREL, *Lotor,* in *Biography,* was born the 26th of November 1717, in a parish in the neighbourhood of Stockholm, where his ancestors had been ministers ever since the year 1580. He commenced his studies at Upsal; and in the year 1738, translated into the Swedish language some of the works of Boerhave. He then went to Gottingen, where he continued his studies, and afterwards to Srafbourg, and thence to Paris. In the year 1744, he served one campaign in the French army in Germany, whence returning to Stockholm, he was admitted a member of the Surgeons' company there. In 1746, he was elected into the academy of sciences; in 1751, he was made one of the foreign associates of the academy of surgery at Paris. In 1764, he was advanced to the degree of doctor of the faculty of medicine at Upsal, and admitted to the royal college of physic at Stockholm. He was in great reputation, and had a considerable share of practice, principally in surgery, and has left several works, all written in his own language, which
which are in great request among his countrymen. The
titles translated into English are, 1. A Treatise on Wounds. 2. A Discourse on the best method of constructing an
Hospital. He read this discourse at a meeting of the Royal
Academy at Stockholm when he was elected their pre-
dent. 3. A Dissertation on the Method of depurifying the
Cataract, 8vo. 1759, 1775, Stockholm. In this dis-
fertation he defends his practice against professor Walborn,
who had opposed him. A Discourse on some alterations
and improvements in performing certain operations in Sur-
gery, and the instruments used in performing them, was read
by him to the Royal Academy on his being elected pre-
dent a second time.

ACREME, a term sometimes used in ancient law-books
for ten acres.

ACREON, in Entomology, a species of Papilio, with
brown wings, the under part black and occluded; the hinder
wings having a white margin, marked with a red band
and ridge of gold-coloured points. It is found in the
South of Europe.

ACRI, in Geography, a town of Naples, in Calabria
Citra, five miles east of Scala.

ACRIBELA, a Greek term σκεβας, literally denoting
an exquisite or delicate accuracy; it is sometimes used in
our language for want of a word of equal significance.

ACRID, in Natural History, denotes any thing paper
or pungent to the taste. Ancient naturalists distinguished
two kinds of acid taints: the first proceeding from hot and dry,
as that of pepper; the second from that of hot and moist,
as that of garlic. Acrid, according to Dr. Grew, properly
belongs to the class of compound taints. It is not
nearly four or pungent: as there are bodies not acrid, which
nevertheless are pungent, e. g. arum; nor is it simply hot;
for there are many hot bodies which are not acrid, as the
roots of zedoary, yarrow, and corngewater. The characte-
ristic, therefore, of acrid substances in pungency is joined
with heat; proper bodies applied to the skin inflaming and
exacerbate it; when chewed, they produce saliva, and when
sniffed, sneezing. Acrida may be divided into classes,
according to the manner in which they yield their acrimony.

1. By distillation, as horseradish, mustard, &c. 2. By
infusion, as the greater Celandine, &c. 3. Neither by in-
fusion nor distillation, as arum, &c. Acrid medicines, as
to their general effect, serve to inflame the vesicles, and dis-
folve tenacious and viscid juices. In leucoplagmatical
habits they are powerful expeptorants, debilitants, diuretics,
and emmenagogues; and if the patient be kept warm, fu-
dorifics. In hot bilious tempers, plecthetic habits, in-
flammatory diptermes, and in cases where the juices are too
thin and acrimonious, or the vifcera unfound, acrids are in-
jurious. See Stimulants.

Some vegetables which are either inodorous, or emit a
weak smell, excite a local inflammation when applied fresh
to the skin, but lose their faculty in drying. When recently
gathered, and inwardly taken, they produce poisonous
effects. Of this kind are the fresh roots of squills, the
leaves of fox-glove, of wild amomene, of virgin's briers, of
wolf's-bane, or monk's-hood; the roots of blue orris, of
aphodel, or king's spear, of meadow saffron, of white bry-
ony, or wild vine, and of wave-rack, and the fruits of
wild cucumber. As these substances lose their acrimony by
being well dried, the acrid matter which produces their
irritating effect appears to be volatile; and this is farther
confirmed, by its being communicated to water and spirit of
wine, abstracted from them by distillation. Hence it may
be inferred, that this volatile matter is a particular, proxi-
mate, constituent part, belonging to the vegetable kingdom;
and in order to distil it from other principles of a simi-
lar kind, it has been denominated the acrid matter of plants.
Its action is not destroyed by acids nor by alkalies, and it is
not ammoniac in any form. In the antiscorbutic plants,
such as feurisy-grafs, water-cress, garlic, onions, horse-
radish, common radish, and mustard-seed, this acrid prin-
ciple is combined with oleaginous particles of an ethereal
nature, and its effects seem to be weakened by this union.
There are other plants which are not deprived by excsation
of the power of producing local inflammation, when out-
wardly applied to a living body; and in these plants it seems
to originate from their resinous parts; such are euphor-
bium, or wort-wort, various species of several species of
the gaphne, of the capricium annuum, or Guinea-pepper, of
the polliary of Spina, &c. The acrid matter of Spanish flicks
abundantly distills from the acrid matter of vegetables, as
it is not dissipated by drying, and cannot be extracted by
water; though it may be obtained by spirit of wine and
ether. It resembles the latter kind of acrid matter, and
seems to be of a resinous nature. See Green's Principles of

Acrid substances constitute one class of CONDIMENTS in
the Materia Medica of Dr. Cullen, vol. i. p. 427. He dis-
tributes them into two kinds, viz. aromatic, imbued with
peculiar and pretty strong odours; and the more simple
acids possessing little peculiar odour. Besides the Aroma-
tics, the acrid substances employed as condiments, are
especially taken from the class of tetradynamia plants; and
they are chiefly the mulard and horseradish. These stimu-
late the stomach and afflit digestion; and as they promote
perpiration and urine, they correct the putrefactive ten-
dency of the system, and hence vegetables of this class have
been denominated ANTISCORBUTIC. Because they posse-
s this quality, they are proper to be used with our animal
food, as the aromatics are the suitable condiments of our vegetable
food. The plants of the garlic tribe are endowed with a
similar acrimony. That is the milder kind, as the onion
and leek, more especially when deprived of their acrimony,
afford a considerable quantity of nutritious matter; and
these, together with the echalot, and others, are very pro-
per condiments. Garlic, used for the same purpose, strong-
ly stimulates the stomach, and promotes digestion. All the
plants of this order, as they serve to promote perspiration
and urine, are very properly joined with our animal food,
and may be referred to the class of antiscorbutics. Asa-
facida may be also considered as a condiment, that is
useful in promoting digestion. Of the more simple acids, the
capricium, or pepper is the most commonly used. The
eating of acid food, with a view to the effects above enume-
rated, was particularly called by the Greeks drimaphagia,
formed of ὄψις, acrid, and ἅλεως, to eat.

ACRIDE, in Entomology, the name by which Lin-
neaus has distinguished the first family of the Gryllus, the
Travassilers of Fabricius, or the cricket, properly so
called: the characters of which are that the head is conical
and longer than the thorax, and the antennae eniform or
favored-shaped. Of this family there are eight species, none
of which are found in Britain. The insects of this family
feed on other insects.

ACRIDOPHIAGI, compound of ἄγριος, local, and
ἐχθρός, to eat, in Ancient Geography, a nation or people of
Ethiopia, inhabiting near the deserts, &c. who are said to have
have fed on locusts. These people, as Diodorus Siculus (lib. iii. c. 29. tom. i. p. 195. Ed. Weiβling.) describes them, were of a low stature, and a meagre black aspect. In the spring they provided themselves with a supply of large locusts, by setting fire to wood and other combustible materials, which they deposited in a large and deep valley, so that when swarms of locusts were driven by the south-west winds over this valley, they were suffocated by the smoke. These locusts, which covered the ground to a considerable extent, were collected and salted, and in this state furnished a supply of food for the whole year: and, indeed, it was the only food upon which they subsisted, as they had neither herds nor flocks; and being far from the sea, they had no supply of fish. They were an active people, and ran with great swiftness; but the duration of their lives was short, not exceeding forty years; and they generally fell sacrilegiously to a malady of a very peculiar kind. They were devoured by winged insects of different species, and of very hideous forms, which were generated in their bodies, and which, inflamed in various parts, occasioning exquisite torture, and at length a very painful death. Whether this was due to this dreadful malady was owing to the food of the people, or to the peculiar climate in which they lived, it is not easy to determine. See Strabo, (Geog. l. xvi. tom. ii. p. 1118.) and St. Jerome against Jovinian, lib. ii. and on St. John, cap. iv. Pliny (H. N. tom. i. p. 609. Ed. Hard.) also speaks of Acridophagia, in Parthia, and St. Jerome, in Lybia. Although the circumstances of these people may in some respects be fabulous; yet may the Acridophobia be true; and to this day they are said to eat locusts in some parts of the coast. This is confirmed by the accounts of the Danish mission, in Niebuhr's Description de l'Arabie, p. 159, &c. In Abyssinia locusts are eaten, both fresh and salted. Some of them are dried in the sun, and thus prepared for use. In Arabia also, as Niebuhr informs us, they prefer locusts in the same manner. Dr. Shaw (Travels, &c. p. 188.) observes, that the Jews were allowed to eat them; and that when they are sprinkled with salt and fried, their taint resembles that of our fresh water cray-fish; and Ruffell (Hist. Aleppo, p. 62.) says, that the Arabs salt them, and eat them as a delicacy. From Hefellus, who travelled in Syria and Egypt as lately as the year 1752, we learn, that when wheat is scarce, the Arabians grind the locusts in hand-mills, or flette-mortars, and bake them in the form of cakes, which they use as bread; and that he has frequently seen them boiled and stewed with butter, and made into a kind of fritaccia. Amongst the Hotentots, as Dr. Sparrman informs us, (Voyage to the Cape, vol. i. p. 36.) they are made into a brown coffee-coloured soup, which acquires from the eggs of the females, that are chiefly used for this purpose, a fat and greasy appearance. These people compensate themselves for the damage done by the flights of locusts, by converting large quantities of them into a nutritious food. These facts remove every difficulty in determining the food of John the Baptist, who is said to have lived on locusts, αἰσχρᾶς, and wild honey. Matt. chap. iii. v. 4. Yet the rendering of αἰσχρᾶς by locusts, as the English translators have done, has been much controverted. Hidrae of Pelium, in his 123d epitile, speaking of this food of St. John, says, it was not animals, but the tops of herbs; and even charges those who understand the word otherwise with ignorance; but St. Augustine, Beda, Ludolphus, and others, are of a different opinion. Accordingly the Jevufits of Antwerp reject, with contempt, the opinion of the Ebi- 

nites, who, for αἰσχρᾶς put τρικταφία, a delicious diet prepared of honey and oil; that of some other innovators, who

A C R I O A M A,
ACROAMA, from ακροαμα, to hear, in Antiquity, a name given by the Romans to amusing tales, which they recited at their repasts. The appellation was also given to those who played on musical instruments, in contradistinction to those who sung.

ACROAMATIC, in a general sense, denotes a thing sublime, profound, or abstruse; and in this sense it is opposed to exoteric. There are few facts or propositions, that have not two modes of teaching, if not two forts of doctrine; an acroamatic for adepts and proficient, and an exoteric for novices. We find traces of this distinction among the heathens, as well as among christian divines, philosophers, and chemists. Hence proceeded the ceremonies of initiations and abductions, and the discipline of secrecy; and hence also the origin of fables, anagmas, parables, symbols, &c.

ACROAMATIC is sometimes also used for any thing kept secret, or remote from popular use: in which sense Reimanman gives the title Bibliotheca Acroramatic, to a description of the MSS. in the library of Vienna, abridged from the vast commentaries of Lambecius and Neflius.

ACROAMATICI, in Philosophy, a denomination given to the disciples or followers of Arilotle, &c. who were admitted into the secrs of the inner or acroamatic philosophy.

ACROATHON, in Ancient Geography, a town situated on the top of Mount Athos, where, according to Mela, cited by Cellarius, the age of the inhabitants was half as long again as that of those who lived in other countries. It is called by the modern Greeks, Λαος νας, and by the Italians, La Cima di Monte Samio.

ACROBATIC, a name given to Arilotle’s lectures in the more difficult and curious parts of philosophy, to which none but his disciples and intimate friends were admitted; whereas the exoteric were public or open to all: but there are other differences. The acrobatic were fet apart for the higher and more abstruse subjects; the exoteric were employed in rhetorical and civil speculations. Again, the acrobatics were more simple and exact, as they aimed at evidence and demonstration; the exoterics chiefly aimed at the probable and plausible. The former were the subject of the morning exercises in the Lyceum, the latter of those in the evening. Besides, the exoterics were published, whereas the acrobatics were kept secret, being either entirely concealed, or if they were published, it was in such obscure terms, that few but his own disciples would be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his acrobatics, and thus revealing what should have been reserved to his disciples; Arilotle answered, that they were made public and not public, because none who had not heard them explained by the author, would understand them. Plut. in Alex. Stanley’s Hist. Philos.

It has been supposed, by Dr. Gillies, in his translation of Arilotle’s Ethics and Politics, that in these two kinds of lectures, the Stagyrite maintained contradictory doctrines on the subjects of religion and morality. But the fact is far otherwise: his practical tenets were uniformly the same in both; but his exoteric, or popular treatises, nearly resembled the philosophic dialogues of Plato, or Cicero; whereas his acroatic writings contained, in a concise energetic style, peculiar to himself, those deep and broad principles on which all solid science is built.

ACROBATES, in Antiquity, a name given to ropecutters; of these there were four forts: the first vaulted or tumbled on a rope, sometimes suspending themselves by the neck or foot, &c; the second slid from a high station along a rope, upon which their breast rested, and with their arms and legs extended, as if they flew: others ran along a rope, which was obliquely extended from a low to a high station: and those of the last fort, danced, leaped, and performed other kinds of feats on a rope stretched horizontally many feet above the ground.

ACROBATIC, or ACROBATICUM, formed of ακρο, high, and βατος, or βατως, I go, an ancient engine, by which people were raised aloft, that they might see more conveniently about them. This was the same among the Greeks, with what they call teataramium among the Latins.

Authors are not agreed as to the use of this engine. Turchius and Barbarus suppos’d, that it was of the military kind; rais’d by besiegers high enough to overlook the walls, and discover the state of things on the other side. Baldus rather suppos’d it to be a kind of movable scaffold, or cradle, contriv’d for raising painters, plasterers, and other workmen to the tops of houses, trees, &c. Some suppos’t that it might have been used for both purposes. Vitruvius and Aquinas.

ACROCERAUNIA, in Ancient Geography, so called from ακρος, high, and σεραυζης, thunder, because they were lofty, and often thunder-like; mountains of Epirus, running out into the sea, under N. lat 40° 25’, extending from W. to E. as far as Pindus, and separating the Ionian sea from the Adriatic, now called Monti della Chierina. Virgil (Georg. i. 332, and Æn. iii. 506) calls them Ceratiana. They derived their name from the town of Acroceraunia, now called Chierina, which is at the foot of the mountain, in the gulf of Chierina. The inhabitants, called Chimerots, are savage robbers; they give their name to a promontory of the Adriatic coast.

ACROCHIRIDUS, am ακροπυρος, among the Ancients, a kind of gymnastic exercise, wherein the two parties contended only with their hands and fingers, without clothing, or engaging the other parts of the body.

The word is also written acrochirida, and acrochiria: it is originally Greek, formed from ακρος, high, the part employed in this combat, which some would needlessly refrain to the tips of the fingers; though the etymon does not make this necessary.

Some make this a distinct exercise from wresting, and suppos’d it to have given the denomination acrochirida to a peculiar sort of athlete who professed it. Others with more probability consider it only as a species of wrestling: some will have it to have been properly only a prelude to a wrestling match, wherewith the athlete began to try each other’s strength, and bring their arms into play. This exercise made part of the pancratium. Pausanias speaks of a famous pancratist, named Sophrates, who got the surname of Acrochiridus, or Acrochiriis, from his having overcome all his antagonists at the acrochiria.—It appears to have been in use at the age of Hippocrates, who ascribes it to a virtue of exterminating the rest of the body, and making the arms fleshy.

ACROCHORDON, a painful species of wart, very prominent and pendulous, having a large head with a small pedicle, or base.

These are also called penes verrucos, or hanging warts, and itand distinguished from selis verrucos, or myrmecia. Others describe the acrochordon, as a harder, rougher sort of wart, growing under the cutis, very callous and usually of the same colour with the skin; small at bottom, and bigger upwards, but rarely exceeding the size of a bean.

ACRICOLO, from ακρος, extreme, and κολος, a limb. These are the extremities of animals, which are used in the page you provided.
ufed in food, as the feet of calves, swine, sheep, oxen, or lambs, and of the broths of which jellies are made. They are recommended by Hippocrates as a proper food, where there is a tendency to a dropy. They are in general recommended as strengtheners for weak people.

ACROCOMES, in Antiquity, a people of Thrace, so called, from ακρον, head, and κομή, hair, because they had long hair before like females, in contradiction to the Athenians, who wore their hair long behind.

ACRO CORINTHIUS, in Ancient Geography, a high hill hauing over the city of Corinth, on which was erected a citadel, called also by the same name. This mountain separated the two continents of Greece and Peloponnesus, so that the fortrees cut off all communication by land from the innerpart of the Ilissus of Corinth, and when well garnished, kept all Greece in awe; on which account Philip of Macedon used to call it the letters of Greece. Augustus took this fortrees by surprise, with a design to divide Peloponnesus; but Aratus recovered it by an action equal, in the opinion of Plutarch, to any of the most celebrated enterprises of the ancient heroes of Greece. Having secured the citadel, he went into the city, and assembling the people in the theatre, acquainted them with the particulars of the Aegean league, and exhorted them to adhere to it. They unanimously agreed to join in the alliance; upon which Aratus referred to them the keys of the city, which had not been in their power since the time of Philip, the father of Alexander. On the top of this mountain flowed a temple of Venus, and from a lower part issued the fountain Pyrene.

ACROE, in Botany, the name given by the natives of Guinea to a kind of shrub, which they use in wine, as a refractive and analetic. It is of the trifoliate kind, and has somewhat of the appearance of the corallodendrons, but it is not prickly; the middle end or leaf stands on a pedicle of an inch long, the two other leaves have no pedicles at all.

ACROISSUS, in Ancient Geography, a fortrees of Illyria, in Dalmatia, situated on a mountain to the north of Lifius, of which it was the citadel. Polibius says, it was impregnable by Philip king of Macedonia.

ACROTHOS, in Antiquity, a colifal statue placed by Manlius, on an eminence, in the temple of Mars, in the city of Helicarnassus.

ACROCHIAS, in Ancient Geography, a promontory of Egypt; which, according to Strabo, was near the isle of Pharos.

ACROMION, ACROMIUM, in Anatomy, the upper proccs of the SCAPULA, or shoulder-blade.

The word is derived from ακρός, highfly, and μέσος, shoulder, q. d. the extremity of the shoulder.

Some have thought the acromion of a nature different from other bones; because, during infancy, it appears no more than a cartilage, which offiltes by little and little, and about the age of twenty years becomes hard and firm, like a common bone.

ACROMONGRAMATICUM, from ακρός, highfly, and μέγας, large, letter, in Poetry, denotes a kind of poem, or composition, wherein each subfquent verse commences with the letter with which the verse preceding terminates.

ACROMPHALION, from ακρός, highfly, and μέγας, large, the naval, or the tip of the navel.

ACRON, in Biography, a celebrated physician of Ancient Athens, in Sicily, where he practiced physic in the time of Empedocles, is said to have restrained the plague at Athens, by purifying the air with large fires, and by burning perfumes in the manner practised by the Egyptians.

When he required, some years after, as a reward for his services, that a piece of ground should be allotted him in the city for his tomb, Empedocles, with whom he had disputed, prevented his obtaining it. He lived about the middle of the fifth century before Christ. Stilbis mentions two tracks written by him, in the Doric dialect, the one a general treatise of physic, the other on abstinence or diet.

ACRON was also the name of an ancient scholar on Horace, in the seventh century, whose work is still extant in an old edition of Horace, printed at Basili, in 8vo. in 1527.

ACRON, in Botany, among the Antiquities, was used to signify the capitulum, top, or flower of plants of the thistle kind.

ACRON, in Geography, a district on the Gold coast of Guinea, extending along the sea coastward from Tassini to the Mount called Monte del Diabolo, or the Devil's Mount. It is divided into Great and Little Acadron; the former, which is the interior country, is a kind of republic; the latter, bounded on the Sth by the sea, is a pure monarchy. They are independent on each other, and yet strictly united under the protection of the Fantouns, who derive from the fertile Acrons a principal part of their maintenance. The only European settlement in this kingdom is a Dutch fort, built at Falmouth, in 1657, called Pounce, from the difficulties they encountered while they were building it. Appam is a small village and inhabited only by fishermen. The natives of Acron live in peace, cultivate their lands, and pursue their employments in security. Every year affords a plentiful harvest, which enables them to supply their protectors and adjacent countries with corn. The country abounds with game, with which the Dutch fort is plentifully supplied. The people, however, are poor, notwithstanding their industrious and the fertility of the soil, and extremely ignorant.

ACRON, in Scripture Geography, See Accaron.

ACRONIUS LACUS, in Geography, a small lake formed by the Rhine, soon after its rise out of the Alps, and after passing the greater lake, called Lacus, and now Boden, or the lake of Constance.

ACRONYCAL, ACRONYCAL, or ACRONICAL, in Acronymy, is applied to the rising of a star or other point, above the horizon, when the fun sets; or its setting when the fun rises. This is one of the three poetical risings and settings of the stars; and lands distinguished from ECLIPTICAL, and HELICICAL.

Among ancient writers, a star was properly said to be acronical, or to rise acronically, which rose in the evening when the fun was set. Greek writers, it is true, use the term acronical indifferently, in speaking either of evening or morning, by reason both are considered as an ακρός νυκτός, the extremities of the night. And hence, among them we find acronical applied to the rising and setting of the stars, either in the morning or evening. But the ancients were more distinct, and by the acronical rather meant the first beginning or approach of night, than the end or period of it; and accordingly among them, the stars which rose in the evening, not those in the morning, were said to rise acronically.

This word is sometimes ignorantly spelt acronial, from a miss-kenned notion of its being derived from άκρο, times.

ACRONYCHIA, in Botany, a species of Asiana.

ACRONYCTAE, the stars rising in the twilight about sun setting.

ACROPOLIS, in Ancient Geography, the citadel of Athens, which derived its name from the eminence on which
which it was erected, and which is accessible only at the entrance. The sanctuary is fortified by a wall, built on its extreme edge, and encompassing the whole upper surface, which is nearly level. The natural strength of its situation is said to have induced the first inhabitants to settle there: and as their number increased, they began to build on the adjacent ground, till the Acrropolis, being surmounted on every side, became the fortress of a large and populous city. It was richly adorned by the Athenians, in the days of their prosperity, with temples, statues, paintings, and votive gifts to their divinities, but is now in a most ruinous condition: though the remains of the famous Propylon, the little temple of victory without wings, the Doric temple of Minerva, called Parthenon and Erectheum, erected in the time of Pericles, under the direction of Phidias, and the Ionic temples of Erechtheus and Minerva Polias, with the cell of Pandroseus, are still to be seen. Its walls have, at different times, been rudely repaired, or rather rebuilt, as little of the ancient masonry remains; but numerous fragments of columns, cornices, and sculptures, are seen in several parts, which exhibit a ruinous appearance. The Turks keep a small garrison here; and it is the residence of the Difdar Aga, or governor of the fortress, and also of the Buya Aga, and other inferior officers. The Acr��polis formed one of the three divisions of Athens, the other two being the town and the port.

Acrropolis was also the name of a city of Libya, and also of Acdis, mentioned by Stephano de Uribius, vol. i. p. 54. There was a city of the same name in Albania, mentioned by Dion Cassius. Hist. Rom. lib. xxxvii. tom. i. P. 112. Ed. Reimar.

ACROPOLI TAR. George, in Biogrphy, one of the writers in the Byzantine history, was born in Constantinople in the year 1226, and educated at the court of the emperor John Ducas, at Nice. Having made a very distinguished proficiency in mathematics, logic, rhetoric, and poetry, he was employed in the most important affairs of the empire. Ducas deputed him to negotiate peace with Michael of Epirus, at Larissa: and he was appointed judge to try Michael Cemmens, on a suspicion of being engaged in a conspiracy. Having been advanced to the government of the western provinces of the empire by Theodore Lascaris, the son of John Ducas, he engaged in a war with Michael Angelus, in 1255, and was taken prisoner by him. In 1266, he was liberated by the intervention of the emperor Paleologus, who appointed him ambassador to Constantinople, prince of Bulgaria. Upon his return, he devoted himself wholly to the education of youth, in which employment he acquitted himself very honourably for many years. In 1272 he was one of the judges in the cause of John Vevcas, patriarch of Constantinople; and, in the following year, he concluded a reconciliation between the two churches with pope Gregory, and swore to it in the name of the emperor, at the second council of Lyons, in 1274. In 1282, he was sent ambassador to John, prince of Bulgaria, and died soon after his return. His works are, "A Continuation of the Greek history from the taking of Constantinople by the Latins, in 1222, to its recovery by Michael Paleologus, in 1261," which forms a part of the Byzantine history: "a treatise concerning faith, virtue, and the soul;" and "an exposition of the sermons of Gregory Nazianzen;" together with some other pieces. Gregorius Cyprus, the patriarch of Constantinople, lays of Acropolis, in the extravagance of praise, that he was equal to Aristotle in philosophy, and to Plato in divine things and dialectical sequence. His son, Constantine, flourished under Michael Paleologus, and Andronicus his son, by whom he was made Legislator, or chancellor, in 1294. He defended the cause of the Greeks; and wrote several books. Bayle, Fabr. Bibl. Græc. 1. v. s. c. 5. ; to tom vi. p. 418.

ACROPORA, in Natural History, a name given by some writers to two species of the Madrepora, viz. the cespitsola and acutila of Linnaeus.

ACROPOSTHILA, acrypta, or acrypta, from acrypto, extreme, and posthos, the prepuce, or slit, which covers the glans of the penis, denotes the extremity of the prepuce, which is cut off in circumcision.

ACORIA, in Ancient Geography, a country of Elis, in Greece, where Xenophon places the city Thraulum.

ACROSPERLOS, a name given to the wild-cat, grails, or brumes.

ACROSPERMUM, in Botany, a genus of the cryptogamia fungi clad.; the characters of which are, that the fungus is very simple, tuberculate, and discharging spores at the apex. There are six species.

ACROSPERMUM, is also a species of the Spermatia.

ACROSPIRE, in Natural History, &c. the same with Plumbule.

ACROSPIRED, or Acrospered, is used in respect of barley; which, in the operation of making malt, is apt, after coming or sprouting, at the lower or root-end, to become acrospered, i.e. to sprout also at the upper or blade-end.

By 6 Geo. I. cap. 21. Malt-makers are forbid to wet or water their malt when on the floor, or cooch; or to permit it to become acrospered.

ACROSTIC, in Poetry, a kind of poetical composition, the verses whereof are disposed in such a manner, as that the initial letters make up some person's name, title, motto, or the like. The word is derived from the Greek acris, a motto; but that is at one of the extremes; and e, a verse, or thesis. There are also acrostics, where the name or title is made up by the initial letters of the middle words, or the last of the final ones; and others which go backwards; beginning with the first letter of the last verse, and proceeding upwards. Some refiners in this trifling way, and in the exercise of this species of false wit, have even gone to pentacrostics; where the name is to be repeated five times. The Sybiline oracles were written, according to Cicero, in a kind of Acrostics. See Sybils.

ACROSTICS is also an appellation given by some authors to two ancient epigrams in the first book of the Anthology; the one in honour of Bacchus, the other of Apollo. Each consists of 35 verses, the first whereof is the proposition, or argument of the whole, and the other 24 composed of four epit烙s, beginning each with the same letter, and thus following in the order of the 24 letters of the Greek alphabet; so that the first of the 24 comprehends four epithets beginning with & the second as many, with & ; and so of the rest to a; which makes 96 epithets for each god.

Among Eucologistical Writers, acrostics denote the ends of verses of psalms, which the people sang by way of chorus, or responsory, to the psalms, the psalm of the psalm. This was called fusing acrostics, acrostichon, which was a species of psalmody usual in the ancient church.

Acrostic, in this sense, amounts to the same with lyrios, diphylma, acrostidion, and epigraphon, which are all terms of the same signification.

Though an acrostic properly signifies the beginning of a verse, yet it is sometimes also used for the end and close of it; as by the author of the constitutions, when he orders one to sing the hymns of David, and the people to sing after him the acrostics, or ends of the verses.

It does not, however, denote precisely the end of the
verfe, but something added at the end of a psalm, or something frequently repeated in the course of a psalm, anwering to our "gloria patri."

Some pretend to find acrostics in the psalms, particularly in those called alphabetical psalms.

**ACROSTICHUM**, formed of ωςως ροςω, χαμος ροτς, ταλας τις, ρυχτας, ρους, or forked fern, in Botany, a genus of the Cryptogramma family class and order; the character of which is, that the fructifications cover the whole inferior surface of the frond or leaf. Professor Martyn, in his edition of Miller's Dictionary, enumerates 44 and Gmelin 45 species, which are distributed into different classes, comprehending those with a frond simple, undivided and divided; and those with a compound frond, pinnate, sub-bipinnate, bipinnate, and suprapinnate. Under the first distribution with a frond simple, undivided, are included, A. lanceolatum, cirtisulium, heterophyllum, cirrinitum, punctatum, fisicatum, lingua, and bifatam; and those with a frond simple, divided, are A. septentrionalis, aspleni, pellitatum, digitatum, ferrugineum, and polypodioides. Under the second distribution, are comprehended the pinnate, viz. A. aruncum, rufum, punctatum, for- bicipitum, areolatum, marginatum, platycrurus, and trifoliatum; the sub-bipinnate, viz. A. filipodium, thalidoreas, maranta, ilvens, echinum, and furcatis: the bipinnate, viz. A. aculeatum, cruciatum, barberum, calanulans, viojparum, velleum, simplici, petiolarum, bifolium, villosum, milesium, ferrulatum, gramatoides, and fulpulcaram. Gmelin omits the viojparum, introduces the longifolium and filare, makes some difference in the arrangement of the species, and refers the aculeatum to a class with a suprapinnate frond. Of these species, two only are natives of Great Britain, viz. A. septentrionalis, forked or horned fern, with fronds, naked, linear, and lacinate, or jagged; the fructifications, in an immature state, are in short indefinite lines or dots, resembling an afplenum; but in an adult state, the lower surface of the leaf is totally covered with brown dusty capsules; from two to five inches high; found in crevices of rocks and old walls in Yorksh, Wilts, Warks, and Shropshire, and anciently used by the ancients in various uses, to cover the tops of temples, or other buildings. Sometimes they also denote those sharp pinnacles, or spiny battlements, which stand in ranges about flat buildings, with rails and balusters.

Acroteria, among ancient Physicians, were used to denote the great extremities of the body, as the head, hands, and feet.

Aristotle also uses acroteria for the tips or extreme parts of the fingers, covered by the nails; sometimes also for the eminences of the nose.

**ACROTERIASM** was anciently used for the amputation of any extremity.

**ACROTHYMIA**, in Surgery, the name of a large tumour in the flesh, rising in the shape of a wart, though sometimes depreved and flat, called thymus. Heifer. See *Neus*.

**ACROTYNI**, in Ancient Geography, a town placed by Stephanus Byzant. on the top of mount Athos. See **ACROATHON**.

**ACRYDIUM**, in Entomology, a name given by Degener to the Gaiulus brevior, and the G. formans of the Linnean system. The former is found in South America; and the latter, at the Cape of Good Hope.

Acsac, a meafure of capacity in use both in Asia and Egypt. See **LOG**.

**ACSOR**, in Geography, a town on the river Nile in Egypt, famed for its仓en wheare.

**ACSTED,**
ACSTED, a town in the Duchy of Bremen, in Germany, 24 miles N. of Bremen.

ACSU, the name of a small town of Asiatic Turkey, in Natolia, 3 leagues west of Haskak.

ACT, in general, denotes an effective exercise, or application of some power or faculty. In this sense all acts imply power, potentia, which is only the capacity of acting, but not the execution of that capacity. Though the word act, properly and primarily, be only applicable where the power might exist without being drawn forth into act; yet the schoolmen extend it farther; defining it by the presence of any power or perfection, even though it could not be absent. In which sense, God himself is said to be a most pure act; because his perfections are always and necessarily present. And thus, as in the Latin, an act is inact, as the presence thereof completes the power and perfection of matter. — Even existence is termed an act; because, when this is given to a being, nothing farther is wanted. The Greeks sometimes call act, πράγμα, a term denoting an actual possession of perfection, by the Latins finitiously rendered perfectio (perfectio).

All and power are distinguished by writers on Ontology three ways; viz. as actual being is distinguished from a power to be; actual doing or action, from a power to do; or actual suffering or passion, from a power to suffer. See Watts's Ontology in Works, vol. v. p. 647.

Metaphysicians give various divisions of all; viz. into infinite, as the act of creating; and finite, as the act of moving. — Transient, or those exercised in other beings, as heating; and immemorial, which remain in their own subject, as thinking. See Action.

Act, in Logic, is particularly understood of an operation of the human mind. Thus to discern, examine, and judge, are acts of the understanding; to affirm and chuse, are acts of the will. There are voluntary and spontaneous acts; the former are produced by the operation of the soul, the latter without its privity or participation.

Act, in a legal sense, is an instrument, or other matter in writing; of use to declare, or justify the truth of a thing. In which sense, feres, records, decrees, sentences, reports, certificates, &c. are called acts, authentic acts, solemn acts, &c. See 1 D. 45.

Act, in the Universities, a thesis maintained in public by a candidate for a degree; or, to show the capacity and proficiency of a student in the University.

The candidates for a degree of bachelor and master of arts are to hold philosophy acts; those for bachelor of divinity are to keep divinity acts, &c.

At Oxford, the time when the masters or doctors complete their degrees is also called the act; which is held with great solemnity: at Cambridge they call it the commencements. — All is also a collegiate appellation for the person who proposes questions that are the subjects of disputations in the excercises of the university schools. The persons with whom he contends in these questions are called opponents: and the discussion is propounded under the direction of the moderator at Cambridge. The distinguished men of the year appear eight times in this manner in the schools; twice as acts, and five times as opponents. One act and three opponents are kept before the former; and one act and three opponents in the term following the summer vacation.

Act of faith, Auto da fe, in the Romish church, is a solemn day held by the inquisition, for the punishment of heretics, and the abolition of the innocent accused.

They usually contrive the auto to fall on some great festi-
ACT

fo high, that the top of the flame seldom reaches higher
than the seat they sit on, so that they rather seem roasted
than burnt. There cannot be a more lamentable spectacle;
the sufferers continually crying out, while they are able,
\textit{mihi licet omne Dei amoris amor} yet it is beheld by all
eyes, and ages, with transports of joy and satisfaction: this joy
is not the effect of natural cruelty, but of the spirit of their
religion; for the deaths of other malefactors are tenderly
commemorated and lamented. Geddes's Misc. Tracts, tom. i.

\textit{Acts of Grace.} See Grace.

\textit{Acts} also denote the deliberations and resolutions of an
assembly, senate, council, or convention; taken down by
departments, notaries, actuaries, or the like, and entered in a regis-
ter. \textit{Acts} are also matters of fact transmitted to posterity
in certain authentic books, or memoirs, as the \textit{Acts} of the
Apostles, of the Martyrs, &c.; to this general class belong
acts of parliament, which are called \textit{statutes}; acts of
the Royal Society called \textit{transactions}; those of the late
royal academy of sciences at Paris, called \textit{memoirs}; those of
the societies of Lonicere, &c., called simply \textit{acts}, \textit{acts erudito-
rum, &c.}

\textit{Acts} of the Confessor, \textit{acta confessoris}, the edicts and
declarations of the council of state of the Roman emperors.
The senate and fathers often swore, either through abject
flatery or by compulsion, upon the edict of the emperor,
as we do upon the Bible; and the name of Apeius Merula
was erased from Nero by the regis of senators, because he
refused to swear upon the edicts of Augustus.

\textit{Acts of Council}, differed from canons, in that the latter
contained only the results, or the laws and regulations agreed
on, and drawn up in form; whereas the acts included the
preceding debates, motions, &c.

In the first collections of councils, only the bare canons
were delivered. Afterwards they began to give the acts as
well as the canons.

Hence we have two kinds of synodal collections: one
containing all the acts, or transactions, relating to matters of
faith and doctrine; the other, containing only the canons
relating to discipline, is called the \textit{book of canons}.

\textit{Acts of the people}, \textit{acta populi}, among the Romans, were
journals or registers of the daily occurrences, as assemblies,
trials, executions, buildings, births, marriages, deaths, &c.
of illustrious persons, and the like.

There were otherwise called \textit{acta publica}, and \textit{acta diurna},
or simply \textit{acts}.

\textit{The acts} only differed from annals, in that only the greater
and more important matters were in the latter, and those of
least note in the former. Tacit. Annal. xiii. 31.

Their origin is attributed to Julius Cæsar, who first or-
dered the keeping and making public the acts of the people;
from these they higher, to Servius Tullius, who, to the
cover the number of persons born dead, and alive, ordered
that the next of kin, upon a birth, should put a certain piece
of money into the treasury of \textit{fino Lucina}; upon a death,
into that of \textit{Venus Libitina}; the like was also to be done
upon affixing the \textit{toga virilis}, &c. Under Marcus Anto-
inus, this was carried farther; persons were obliged to
notify the birth of their children, with their names and sur-
names, the day, consul, whether legitimate or spurious,
to the prefects of the \textit{atrium Saturni}, to be entered in the
public acts: though before this time the births of persons
of quality appear to have been thus registered. Suetonius.

\textit{Acts, Public.} The knowledge of public acts has been
erected into a peculiar science, called the \textit{diplomatic}, of great
importance to an historian, statesman, chronologer, and even
critic. The preservation of them was the first occasion of
erecting libraries.

The style of acts is generally barbarous Latin. Authors
are divided as to the rules of judging of their genuineness,
and even whether there be any certain rule at all; F. Ger-
man will have the greater part of the acts of former ages to
be spurious. Fontainel affirms, that the number of forged
acts now extant is very small. It is certain that there were
severe punishments inflicted on the forgers and falsifiers of
acts.

The chief of the English acts, or public records, are pub-
lished by Rymer, under the title of \textit{Eadenda,} and continued
by Sanderfon; an extract whereof has been given in French
by Ranin, and translated into English, under the title of
\textit{Acts Regius.} Great commendations have been given to this
work, and some exceptions made to it; as that there are
many spurious acts, as well as errors in it; some have even
charged it with falsifications.

The public acts of France fell into the hands of the Eng-
lith after the battle of Poitiers, and are commonly said to
have been carried by them out of the country. But the
tradition is not supported by any sufficient testimony, and
has even been thrown by M. Bruflé to be false.

\textit{Acts of the Senate, acta senatus,} among the Romans,
were minutes of what passed, and was debated in the senate-
house.

There were also called \textit{commentarii}, and by a Greek name
\textit{komenta.} They had their origin in the confusilship of Ju-
lius Cæsar, who ordered them both to be kept and published;
and there was an officer, who was himself a senator, whose
province it was to compoite these \textit{acts}. The keeping of them
was continued under Augustus, but the publication was
abrogated. Afterwards all writings, relating to the decrees
or sentences of the judges, or what passed and was done be-
fore them, or by their authority, in any cause, were called
by the name \textit{acts}. In which fente we read of civil acts,
criminal acts, intervenient acts, \textit{acta civila, crimina/ia, inter-
venientia, &c.}

\textit{Acts, Clerk of the} is an officer of the navy. See

\textit{Clerk.}

\textit{Acts of the Apostles}, a canonical book of the New Testa-
ment, which contains great part of the lives of St. Peter
and St. Paul, and of the history of the Christian church;
and in the discourses at the elevation of our Saviour, and
continued to St. Paul's arrival at Rome, after his appeal
to Cæsar, comprehending in all about thirty years. St.
Luke has been allowed by all antiquity to be the author of
this book, and his principal design in writing it was to fur-
nish an authentic history of the first plantation of Chris-
tianity; and it thus serves to obviate the falsé \textit{acts}, and
false histories, which were afterwards dispersed through the
world. The exact time of his writing it has been ascer-
tained with a very considerable degree of accuracy; for it
must have been at least two years after St. Paul's arrival at
Rome, because it informs us that St. Paul dwelt two whole
years in his own hired house; perhaps he wrote it while
he remained with St. Paul, during the time of his impris-
oment.

It was written, according to Mill, in his Prolegomena, in
the year 64. And Dr. Lardner (works, vol. vi. p. 145) ob-
erves, that it could not have been written till after St.
Paul's confinement at Rome was come to a period, which
he supposes to have ended in the former part of the year
of Christ 63; and he thinks it probable, that St. Luke
finished this book the same, or the next year, either at Rome
or in Greece. That St. Luke was the author of it appears
from the general consent of the ancient Christian writers:

\textit{Acts, Public.}
Eusebius, and the fathers, the former, the latter.

The truth and divine original of Christianity may be deduced from the history of the Acts of the apostles. The general and particular doctrines contained in this book are so reasonable, and the evidences which the apostles gave of their doctrine, in their appeals to prophecies and miracles, and the various gifts of the spirit, were so numerous and so strong, and so widely adapted to all sorts of persons, that the truth of the religion, which they attest, cannot be reasonably disputed. The history itself is credible. It was written by a person who was acquainted with the various circumstances which he relates, and who was both able and inclined to give a faithful relation of every particular that occurred. St. Luke was a companion of the apostles; he was himself an eye and ear witness of the facts, and personally concerned in many of the incidents which he records.

The history itself there are no inconsistencies or contradictions. The miraculous facts related in it are neither impossible, when we consider the divine power, to which they are ascribed, nor improbable, if we attend to the grand design and occasion of them. The writer appears to have been honest and impartial; for he has recorded the objections made to Christianity, both by Jews and Heathens, and the reflections which enemies cast upon the religion itself and the first preachers of it. He has not concealed the weaknesses, faults, and prejudices either of the apostles or of their converts. The occasional hints that are dispersed through the epistles of St. Paul, harmonize with the facts related in the history; and much that the history is the belt guide to the study of the epistles. The other parts of the New Testament agree with the history, and confirm it. The Gospels close with references to the facts recorded in the Acts; and the epistles suppose that these facts had actually occurred which the history relates. The incidental circumstances mentioned by St. Luke correspond so exactly, and without any previous view to such a correspondence, and in cases where it could not possibly have been premeditated and precontrived, with the accounts that occur in the epistles, and with those of the best ancient historians both Jews and Heathens; that no person who had forged such an history, in later ages, could have had the same external confirmation; but must have betrayed himself, by alluding to some customs or opinions since sprung up; or by misrepresenting some circumstances, or using Luke phrase or expression, not then in use. The plea of forgery, therefore, in later ages, cannot be allowed; and if St. Luke had published such a history at so early a period, when some of the apostles, or many other persons concerned in the transactions which he has recorded, were alive, and his account had not been true, he would only have exposed himself to an easy confirmation, and to certain infamy.

If any history of former times deserves credit, the Acts of the Apostles ought to be received and credited. And if the history of the Acts of the Apostles be true, Christianity cannot be false. For a doctrine so good in itself, and attended with so many miraculous and divine testimonies, has all the possible marks of a true revelation. See Benso, ubi supra, p. 310-318: and an excellent work, distinguished by acute and original reasoning, and amply justifying the argument above suggested, by Archdeacon Paley, entitled Horae Paulinae, 8vo. 1792.

There are also several iparious acts of the Apostles: such as, 1. The acts of Audias, or the History of the Twelve Apostles, said to be composed by him in Hebrew, translated into Greek by his disciple Eutropius, and thence into Latin by Julius Africanus. 2. The Acts of St. Andrew, received by the Excortไร, Manichees, Apostolies, and Origenians. 3. The acts, received by the Ebionites, and mentioned by Justin. 4. The Acts of St. John, forged by Lecunus. 5. The Acts of the Apostles, under the names of Leucius, Lecinou, Lrontius, Leonides, and Leucion, names of the same person who lived in the fourth century, and who was a Manichee, and probably the father of those heretics, called by St. Augustine, Seleucius from the name Seleucus, which Mr. Jones thinks to be the same with Lecunus. This book contained the Acts of John, Andrew, Thomas, Peter, Paul, James, and others. 6. The acts of St. Matthias were probably written by Lecunus Charnus under this apostle's name, to which clas we may refer the acts used by the Manichees. 7. The acts of Paul, which Mill in his Prolegomena, sect. 120, supposes to have been compiled by some faithful Christians, about the year of Christ 69, to supply the imperfect accounts in the acts of the apostles, written by St. Luke, and which Whiston regards as in some sense a faked book, but which Eusebius reckons to be spurious, and Philostratus condemns as a fable book, abounding with strange stories. 8. The acts of Paul and Thecla, which was the work of some weak prebyster of Asia, and never had any authority in the Christian church. It is not certain when these acts were composed;
A C T

posed; but Dr. Lardner (vol. ii. p. 314) conjectures, that they were written in the latter part of the first, or the beginning of the second century. Dr. Grabe has published a book under this title from MSS. in the Bodleian library. If this be the same with the work mentioned by Tertullian, Jerome, &c. as Dr. Grabe supposes, it has undergone many interpolations; and Lardner conceives the number in both the Latin and Greek copies to be greater than Grabe allows.

9. The acts of St. Peter, the travels of Peter, or the signatures of Clement, which are rejected by Eusebius, Athanasius, Jerome, Epiphanius, &c. as apocryphal.
10. The acts of St. Philip, which were probably the work of Lucius Charinus, or an appendage to his work. Fabricius (Codex Aprocr. Nov. Teft. tom. iii. 656.) mentions a MS. of some acts under the name of Philip, in the Vatican. 11. The acts of Ecumenus, the name with those of Lucius, already mentioned. 12. The acts of Thomas, mentioned by Epiphanius, Athanasius, and Gelasius, are supposed by Fabricius, Mill, and others to be the same with the acts of Lucius; but Mr. Jones supposes, that as it was used by some sects of the Gnostics, who sprung up at an earlier period, it was interpolated and altered by Lucius. But the work is unquestionably apocryphal. See on this subject Jones’s Canon. vol. i. pallium; and Lardner’s Works: — Index under Acts.

Acts of Pilate, denote certain memoirs or reports concerning the trial and death, the resurrection and ascension of Jesus Christ, which were transmitted by Pilate to the emperor Tiberius, and communicated by him to the senate. Justin Martyr, in his Apology (Num. 36. p. 65. and Num. 48. p. 72. Bened.) prefented to Antoninus Pius, and the senate of Rome, about the year 140, after having mentioned on one occasion some of our Lord’s miracles, and on another his crucifixion, and some of the attendant circumstances, adds: “and that these things were done, you may know from the acts made in the time of Pontius Pilate.” Tertullian also, in his Apology, (c. 21. p. 24.) about the year 200, having spoken of our Saviour’s crucifixion and resurrection, his appearance to the disciples, and his ascension to heaven in their sight, adds this remark; “of all these things relating to Christ, Pilate, in his confidence a Christian, sent an account to Tiberius, then emperor.” In another place he says, that by an ancient decree, no person should be acknowledged as a deity, unless he were first approved by the senate. Tiberius having received from Pilate an account of such things as manifested our Saviour’s divinity, proposed to the senate, recommending the proposal by his own vote, that he should be placed among the gods. The senate refused, because he had himself declined that honour. Nevertheless the emperor perished in his own opinion, and ordered that if any accused the Christians they should be punished. Eusebius, in his Ecclesiastical History, (lib. ii. cap. 2.) relates the fact, and cites the authority of Tertullian. Many learned moderns have objected to the original testimonies of Justin Martyr and Tertullian. Dr. Lardner has investigated the subject with his usual accuracy and impartiality. He first alleges that Justin Martyr and Tertullian were writers of good repute. He then shows that it was the custom of the governors of provinces to compose acts, memoirs, and commentaries of the remarkable occurrences that happened in the places where they presided: and these acts or register were considered as public authorities, and therefore more decisive and satisfactory than some other accounts. Of this circumstance the ancient fathers were well apprised; and Eusebius admits the truth of what they report. In the time of the persecuting emperor Maximin, about A.D. 307, the heathen people forgave acts of Pilate, derogatory to the honour of our Saviour, which were very diligently circulated to unsettle Christians, or discourage them in the profession of their faith. The edict to this purpose was so negligently or ignorantly written, that our Saviour’s death was referred by it to the fourth consulate of Tiberius, &e. to the seventh of his empire, which is seven years before our Saviour’s passion, and five before Pilate was made governor of Judea. See Euseb. Hist. E. L. i. c. 9. 1. ix. c. 4. 5. 6. Rufinus, lib. i. c. 5. &c. It was also customary for governors of provinces to send to the emperor an account of remarkable transactions that occurred in the places where they presided. We may therefore conclude, though the acts of Pontius Pilate and his letter to Tiberius, which we now have, (see Fabric. Codex Aprocr. Nov. Teft. p. 290—372.) are manifestly spurious, that Pontius Pilate did compose some memoirs concerning our Saviour and send them to the emperor, whether Justin Martyr and Tertullian have given a just account of them or not. Dr. Lardner, after replying to other objections that have been urged against the relation of these ancient fathers, concludes with observing that they deserve some regard. See Lardner’s Works, vol. vii. c. 2. p. 231, &c.

Acts. in Poetry, are certain divisions, or principal parts, in a dramatic poem, contrived to give some relief both to the actors and spectators. In the interval between the acts the stage remains empty, and without any action visible to the spectators; though it is suppose all the while that there is one proceeding out of sight. It is not, however, merely for the sake of the relief that these acts are observed, but to give transactions a greater degree of probability, and render the intrigue more affecting. For the spectator, who sees the action prepared that is to pass in the interval, cannot forbear acting, in his imagination, the part of the absent actors; by which means he is the more agreeably surprised, when a new act coming upon the stage, he sees the effects of that action, which before he could only guess at. To this it may be added, that authors contrive to have the most dry and difficult part of the drama transferred between the acts, that the spectators may have no notion of them, excepting what their fancy presents them with at a distance; and that nothing may appear upon the stage but what is natural, probable, and entertaining. In this respect, says an approved writer, a dramatic or epic poem ought to resemble a sentence or period in language divided into sentences, that are distinguished from each other by proper pauses; or it ought to resemble a piece of music, having a full close at the end, preceded by imperfect closes that contribute to the melody. See Elem. of Criticism, c. 22.

The ancient Greek poets were unacquainted with this division of a play into acts, though their epodes, or choruses, served almost the same purpose. The word act never occurs in Aristotle’s Poetics, though he defines exactly every part of the drama. It is true the Greeks considered their pieces as consisting of certain parts or divisions, which they called próteis, epíteis, katakefes, and katakefropos: but there were no real interruptions or divisions answering to them in the representation. With them the stage was never empty, nor were the performers idle, so that when the choruses were incorporated in the piece, as in some of the tragedies of Sophocles, it may be said literally to consist of only one act.

The Romans first introduced acts into the drama, and filled up the intermediate space of time between these divisions with a chorus, a dance, or a song; and in Horace’s time, the five acts were established as a law. This appears from the following verses in his De Art. Poet.

‘Neve
"Neve minor, nee sit quinto producitor aetn Fabula, quix poeci vult, et spectator reponit."

If you would have your play deferre success,
Give it five acts complete, nor more nor less.

Francis.

This number was constant in the comedies of Terence, and tragedies of Seneca; and the law stands uncompleted to this day; though it seems to derive its force from the authority of Horace, rather than that of reason or nature. All plays are deemed irregular, that have either more or fewer than five acts. Some, indeed, have asserted, that every just action consists of five distinct parts; and have undertaken to mark out the precise share of the action, which each of the five acts ought to bear. The first, they say, is to propose the matter or argument of the fable, and to show the principal characters. This should be so managed as to awaken the curiosity of the spectators, and also furnish them with materials for understanding the sequel. It should make them acquainted with the personages who are to appear, with their several views and interests, and with the situation of affairs at the commencement of the play. In former times, the explication of the subject was made by a prologue, or by a single actor, who appeared to give full and direct information to the spectators. Some of Æschylus's and Euripides's plays are opened in this artificial manner, which is now totally abolished. The second act is to bring the affair or business upon the carpet. The third, to furnish obstructions and difficulties. The fourth, either points out a remedy for these difficulties, or finds new ones in the attempt. During these acts, the plot should gradually thicken; the action of the play ought to be advancing, and as it advances, the suspense and concern of the spectator should be raised more and more. It is the great excellence of Shake-speare, that his scenes are full of sentiment and action; and out of mere discourse; whereas it is frequently a fault of the best French tragedians, that they allow the action to languish for the sake of a long and artful dialogue. The fifth act puts an end to all by a discovery. This is the seal of the catastrophe, or the unravelling of the plot, in which the art and genius of the poet should be most fully displayed. See Catastrophe.

However, it is certain that, on the principles of the great master of the drama, Aristophanes, we may have a just and regular play, though it be only divided into three acts; and the number may be varied according to the taste of the author, or the nature of the subject; since the division is purely arbitrary. Nevertheless, every act ought to elapse with some incident that makes a pause in the action; without which there can be no pretext for interrupting the representation. Milton has deviated from this rule at the elope of the first, seventh, and tenth books of his Paradise Lost; in the first of which inferences he seems to have copied the Æneid, the two first books of which are divided in a similar manner. Homer, in the Iliad, has paid no great attention to this rule.

The acts of a drama are divided into scenes. Metafolia, in conformity to the precept of Aristophanes, with regard to the construction of a fable (See Action and Tragedy) divided his melodramas, or operas, into three acts; in order to constitute the beginning, middle, and end, which the Stagirite required. But at present this wise and rational delign is violated at our lyric theatre, by compreasing all the incidents of a drama, written in three acts, into two; by which means the bulnings of the piece is so precipitated or mantled, that the events lose all appearance of probability, and the spectator all chance of illusion. On this occasion, however, the trouble and expense of a third dance are hindred and avoided; but to compensate for this retrenchment, the two remaining dances are put to such a length as to preclude all desire in the most diffusated part of the public to be kept longer from home.

ACT I., in Antiquity, denoted among the Romans a pleasant garden formed near the bank of a river, in which they devoted themselves to pleasure, and even to debauchery. Cicero says of Verres (v. 25) "Tanetiis in Actis suis mulieribusJacobstcbrius." From Acta the ancients deduced actus, aeterni, to devote themselves to pleasure. Acta was sometimes used more generally to denote solitary rivers and shady coverts. Virgil Æn. v. ver. 613. Prudent. in Symmach. l. 135.

ACT I., in Ancient Geography, a town of Acrarnania, mentioned by Stephan. Byzant. and called a port in the Periplus of Scylax. Acta is also a town of Magnesia.

ACT II., in Antiquity, one of the fifty Nereids.

ACT III., or Acterus, was also one of the six envious and malicious genii, called by the Greeks Telechines.

ACT IV., in Botany, the Chrysophorina of Tournesol, and in the Linnean system, a genus of the polyanthus monogynia class and order, belonging to the natural order of multijfique and ranunculaceae of Jussieu. Its characters are, that the calyx is a perianthium of four leaves, with roundish, obtuse, concave, and caducous leaves; the corolla has four petals, acuminate at both ends, longer than the calyx and caducous; the flamina consist of numerous, usually about thirty, capillary filaments, broader at top; the anthers are roundish, twin and erect; the pistil has a superior ovate germen, no style, and a thickish, obliquely depreffed stigma; the pericarpium is an oval-globose, smooth, one-sixrowed and one-celled berry, and the seeds are many, semi orbicular, and lying over each other in two rows. There are four species: 1. A. Bicae, or common herb christopher, which grows naturally in the northern counties of England, and rides two feet and a half in height, with the foot-natts of the leaves springing from the root, and dividing into smaller foot-natts, each of which divides again into three, with three lobes each; the flowers grow in ramose spikes, and are of a pure white: they appear in May and June, and are succeeded by black thinning berries, about the size of peas, which ripen in autumn. This plant is a powerful repellent, and the root has been administered internally in some nervous cafes, but should be used with caution. Datur, says Pliny, (H. N. v. i. p. 425. Ed. Hard,) acetabu plena interiusius femininarum morbis. The berries are poisonous, and to the indirect use of them some have referred the explanation of the fable of Actaeon, and to this they have also applied the Latin adage;

Hic niger est, bunc in Romana corvus.

Hor. Sermon. I. s. 4, v. 85.

The juice of these berries, with alum, yields a black dye. Toads are said to refer to this plant, being allured by its fattiol smell, which, as Dr. Withering observes, may be owing to the damp shady situation in which it is found. This herb is poisonous to cattle, but it is happily scarce in England, and found only in the woods. Of this species there are three varieties, viz. the nigra, or common black,berry herb christopher, or bass-bery; the alba or American herb christopher, with white berries, whose leaves are lops deeply indented at the edges, flowers in a more compact spike, and roots composed of thick knobs; and the rosa, with red berries, differing only in the colour of its fruit. 2. A. racemosa, or American black or wild snake-root, with large compound leaves, rising immediately from the root, and branched like the hirl, flower-leaves ascending to the height of four or five feet, and white flowers in a long spike, reflex at the top, which appear in June or July, but not perfecting seeds in England. It deserves, on account of its flowers, a place in shady borders among shrubs, and will require no other atten-
tion than the shrubs themselves. This species is a native of North America; and the root is much used in that country, and said to be an antidote to poison, or the bite of the rattlesnake. 3. A. japonica, or Japanese herb Christopherson, differs from the second in having simple, not pinnate leaves; it has heart-shaped leaflets, petioles longer than the leaflets, and sessile flowers.

4. A. afra, or rough-leaved Christopherson, has a thorny climbing stem, sessile leaves, white flowers, and linear spikes, quadrilateral corolla and calyx, more than fifty stamens, and a gibusous berry, without juice. This species is a native of China near Canton, and the Chinese use the rough leaves in polishing, particularly their tin ware. These plants may be propagated by seeds, or by a thorny border soon after they are ripe, and transplanted in the following autumn into a thorny border, where they are to be left to flower. Martyr’s Miller’s Diet.

In the Linnaean system, by Gmelin, there are six species.

ACTAEA, in Botanology, is a species of Papilion, with expanded wings, brown above, the anterior marked with two ochre and two white points, and the hinder marbled beneath. It is found in the southern part of Russia.

ACTAEA, in Ancient Geography, a name formerly given to Attica. Pliny (1. 4. c. 7.) says it was also called Actae, an old name. Paulan, Attic, cap. xi.

ACTAEON, in Fabulous History, the son of Arilæus and Autonoba, and grand-son of Cadmus. Whilist he was pursuing his favourite exercise of hunting, he is said to have looked upon Diana, when she was bathing, to have been transformed by her into a stag, and devoured by his own dogs. The moral of the fable is applied to those who ruin themselves by keeping packs of dogs, or by too curious researches into nature.

ACTAEON is also the name of one of the horses that drew the chariot of the sun, in the fall of Phaeton. Actaeon formed of actus, a ray of the sun, signifies luminous, and takes its name from the splendour of the sun.

ACTAEON, in Natural History, a species of Sarracæus, or Beetles, called by Fromanerdm rhinoceros; the enca of Marcgrave; with a smooth body, bicorn thorax, the horn of the head undulated, with a bisap apex, and smooth elytra; the horns of the thorax are turned forward, and are conic. It is found in America, and is the largest of all known insects, except the cancer and monocus.

ACTAEON is also a species of Papilio, with tricuspidated bluish wings, black at the apex, and gold-coloured beneath, with very oblique parallel lines.

ACTIANIA, in Ancient Geography, an island mentioned by Pliny (H. N. tom. i. p. 231.) in the North Sea. It is situated to the west of Holstein and Diemermark, not far from the mouth of the Eyder and Elbe; is now called Heligoland.

ACIT, as in, denoted a pennisula. It was also a name given to the sea-crafts about Mount Athos, in which were six towns mentioned by Thucydiades, lib. iv. p. 302. Ed. Dukerus.

ACITE, in Botany, the elder-terce, which bee.

ACTIAN GAMES, Ludi Actiae, in Antiquity, solemn games instituted, or, according to some, only reformed by Augustus in memory of his victory over Mark Anthony at Actium. Stephonius (tom. i. p. 56.) and some others maintain, that they were held every third year: but the more common opinion is that of Strabo, who says (Geog. tom. i. p. 501.) that they only returned every fifth year, and were celebrated in honour of Apollo, since named Actian. By the way it is a great mistake in some authors to imagine, that Virgil infinates their having been instituted by Actaeus, from that passagé, Aen. iii. 280.

"Ataque Ilias celeberrmus litora luidus."

It is true the poet alludes to the Actian games; but he only does it by way of compliment to Augustus, to attribute that to the hero from whom he defended, which was done by the emperor himself, as Servius has observed in loc.

Hence Actian years were a series of years, commencing from the era of the battle of Actium; called the era of Augustus. See EPOCHA.

ACTIAE, in Geography, a town near Bucharia, lying on the western side of the peninsula of Chersonesus Taurica, which, in consequence of the convention of 1783 between the late Empress Catherine of Russia, and the Grand Signor, and the cession of territories by the Turks, was declared a free port, and denominated SERBESTPOLIS.

ACTINE, in Botany, a name of the herb BUNIAE, or NAUS.

ACTINE, in Ancient Geography, a town of the Thracian Doriphore.

ACTINIA, in Zoology, a genus of the mollusca order of worms, the characters of which are, that the body is rough or wrinkled, furnished with eccentric cirri, and with a single terminal aperture, and that it attaches itself by its base to rocks and other substances among which it is found. Of this genus Gmelin, in his edition of the Linnaean system, enumerates twenty-three species, which are as follow: viz. 1. A. rufus, of a reddish colour, with a rofaceous foramen and whitish cirri. This is the urchin marina libera of Aristotle, the urchin parva of other authors, the first species of Hill’s Medusa, and of Dicquemarre’s anemone. It is found in various parts of the ocean and of the Mediterranean Sea, adhering to rocks; of a variable form, sometimes cylindrical, or globular, or conical, and in some rare influences of a changeable colour: its cirri are whitish, flatter, flexile, and very movable, shorter than the diameter of the body and truncated at the apex. 2. A. crenatus, of a red colour, with conically extended cirri, found in the Atlantic, Mediterranean, Northern, and Icy Seas. This is the second species of Dicquemarre’s anemone, the priapus ruber, and the urchin rubra of other authors.

3. A. planiforis, with small tentacula and a ciliated margin. This is Dicquemarre’s fourth species of anemone, and called kettuperak by the Greenlanders. It is found in the European Ocean, and exhibits a variety of beautiful colours.

4. A. medusa, cylindrical, smooth and truncated; found in the Mediterranean Sea, and called by the inhabitants of Linguadoue polerv. 5. A. catenata, sub-cylindrical and angularly truncated; found in the ocean. 6. A. crenata, varied with white and red, with cylindrical annulated cirri; found rarely in the bays of Norway. 7. A. undata, conic and whitish, with duplicate wrinkled yellow flax; found adhering to fuel and mill-corn, in the bay of Christianfand in Norway. 8. A. viduata, of a grey colour, with longitudinal ridges, and white cirri; the urchin cina of Rondeletius, sometimes found in the fucus facchinarius in the Norvagina Sea. 9. A. truncata, of a reddish yellow colour, conical, smooth, and pulliced; the third species of Dicquemarre’s anemone.

10. A. nodosa, wrinkled and furrowed, enlarged at the ends, with short compressed crimson-coloured cirri; found on the rocks of the Greenland Sea. 11. A. spallallia, smooth and ficy-coloured, with thick cirri spotted with white and a radiated foramen; frequent in the caverns of rocks on the shores of Greenland. 12. A. digita, yellow, with fivel points of red, and floffy cirri, lodged in the fissures of rocks on the shores of the Northern Ocean. 13. A. gigantea, cincereous and greenish, with a folded fringe much wider than the body, and greenish papilliform tentacula; found on the shores of the Red Sea, hiding itself in the sandy clay. 14. A. alba, gelatinous, white and greenish,
with small papilliform oblong tentacula; found adhering to rocks on the shores of the Red Sea. 15. A. verdita, green and brown, with tentacula of the length of its own diameter; found attached to sub-marine rocks & Alexandria in Egypt, and called by the Arabs karoba. 16. A. prasus, with a cylindric body, dilated at the base, and spotted tentacula; found adhering to terebellid fish in the Red Sea, near the city Ghomfoda. 17. A. canis, found with a wrinkled horn, non-fluminous brightly tentaculat, ranged on the upper margin. 18. Bicarin, smooth, of an hemispheric oval figure. 19. A. volvus, with a cylindric body plane above, and six appendices to the orifice; found, as well as the two former species, in the Northern Ocean. 20. A. carpellus, red and brown, with small penciliform tentacula; found in the British Sea. 21. A. ovis, with body and tentacula obtuse and cylindric, the exterior red, the interior bluish, and the centre red. 22. A. fuscita, with longitudinal ridges transfervately fringed, and cylindric obtuse annulated tentacula; found, as well as the former species, in the Norwegian Sea. 23. A. pulchra, elliptic and smooth, with a double order of rays, the exterior of which is black at the apex, the size of a large pea; found in the ocean about the 57th degree of latitude.

The animal polenta of Pennant, and ceres of Solander and Ellis, which some suppose to be a variety of the A. unica, is the HYDRA ceres in the Linnaeus system by Gmelin. Pennant describes it as having a body marked with trifurcated sulci, and summit surrounded with long slender tentacula, from 120 to 200 in number; the color of the body is pale ochreous, and of the tentacula a sea-green varied with purple; it is found on the rocks of the Cornith and Angles. The A. pedunculata of Pennant, or A. bellus of Solander and Ellis, is the HYDRA bellus of the Linnaeus system. According to the description of Pennant, it has a long cylindric flalk, expanding at top and tuberculated; the tentacula are disposed in several ranges, short, and when open form a raduated angular circumference, like a beautiful flower, with a smooth polygonal disc; the colour of the flalk is a fine red, and that of the tentacula varied with several colours. This species, he says, is retractile, and inhabits Cornwall. The A. vernacula of this author, or A. nematocera of Solander and Ellis, is the HYDRA nematocera of Gmelin's Linnaeus system. According to Pennant, it has a long cylindric flalk, and is marked with elegant small tubercles, disposed in straight lines from top to bottom; the circumference of the mouth is fringed, surrounded with short petals, like those of the sun flower, and those again with white tentacula, barred with brown. When drawn in, it assumes the form of a bell; and the lines of the tubercles converge to the centre of the summit. Its body is a pale red; it inhabits Cornwall. The A. pennata, or cinquefoil of Pennant, is the A. dianthus of Ellis, with a circular contracted mouth; the disc divided into five lobes, covered with several series of short fruticulated tentacula, the flalk short and thick; when contracted it assumes the form of a long white fig; it inhabits the rocks near Hallings, Suffolk. The A. benevii, or button of Pennant, is the A. myobryarhynchos of Solander and Ellis, and the HYDRA myobryarhynchos of the Linnaeus system. It has a smooth short thick flalk; the edge of the disc surrounded with a single row of tubercles, the tentacula numerous and slender; the colour a dull crimson; the body retractile, and flinging itself into the form of a conoid button. It inhabits most of our rocky shores. Pennant's Zoology, vol. iv. p. 49, &c. The actinia have only one aperture both for the mouth and anus; they feed on fish and other small fish and marine animals, and are themselves edible; as they sometimes retract and sometimes extend their tentacula, in different degrees, their form is very variable; the parts that are cut off are renewed; they are acutely fendible of light, and most of them are viviparous. For a further account of these animals, see ANEMON, ANI- MLA FLOWER, and URTICA marina. See also HOLLANDIA and HYDRA.

ACTINOLITE, in Mineralogy. See STRAHLSTEIN.

ACTION, in a general sense, denotes the operation or exertion of an active power, and is synonymous with act. Grammarians, however, introduce some subtle disquisitions between these two terms; confiding the former to ordinary transmutations, and the latter to those which are more signal. The former, by others, relates chiefly to the person that acts, and the latter to the effects produced; and is therefore considered as the attribute of the other: e.g. "Preserve, or what may act: and in the latter, it is the same cause, only considered as acting, or connoting the effect it produces.

Actions are divided with respect to their principle, into universal, where the effect is of the same kind with the cause; as the production of man by man: and equivocal, where it is different, as the supposed production of frogs by the sun: and again into vital; as nutrition, respiration, the action of the heart, &c. and not-vital, as heating.

With respect to their subject, actions are divided into immanent; which are received within the agent that produced them; as are vital actions, cognition, &c. and transient, which pass into another, as a master loves his son, and feeds and clothes him, &c. Actions are also natural, as fire hardens clay; supernatural, as raising the dead; voluntary, as the potter's moulding his clay; and accidental, as a person's heedlessly dropping a glass and breaking it; necessary, as the sun warms the earth; and free, when a person chooses what food he likes, and eats it when he pleases. See LIBERTY AND NECESSITY.

In respect of duration, actions are again divided into instantaneous, where the whole effect is produced in the same moment, as the creation of light; and incessive, where the effect is produced by degrees; as corruption, fermentation, putrefaction, dissolution, &c.

ACTION, in Physiology, is applied to the actions or functions of the body, which are divided into the vital, natural, and animal. The vital are such as are essential to the subsistence of the individual; such are the motions of the heart and lungs, the secretion of spirits in the cerebrum, on which the motions of the heart and lungs depend; and the circulation of the blood and fluids in their proper vessels. Pulsa tion and respiration are the external signs of life.

The natural actions are such as are necessary to the continuance of the animal, but not so immediately, but that it may subsist some time under a suspension of them; as digestion of the aliment, and its conversion into blood.

Under animal actions are comprehended those which constitute the senses of touch, taste, smell, vision, hearing, perception, imagination, memory, judgment, ratiocination, affections.
affections of the mind, and voluntary motion; which are not absolutely necessary to the life of the animal, but conducive to its comfortable existence.

In the year 1752, Dr. White published an ingenious performance, under the title of an Essay on the vital and other voluntary Motions of Animals, 8vo; and in the same year Dr. Simpkin also published a book on Vital and Animal Actions, 8vo.

Action, in Mechanics, denotes either the effort which one body or power exerts against another, or the effect resulting from such effort; or more accurately, the motion which a body really produces, or tends to produce, in another. The action of a body becomes apparent only by its motion; and we cannot affix any precise idea to the term action besides that either of actual motion, or a simple tendency to motion. Leibnitz and his disciples, for want of duly attending to the proper and discriminating idea of the word action, have perplexed themselves and others with unprofitable and indecisive disputes concerning suo vivo, and suo mortuo. See Force.

The Cartesians resolve all physical action into metaphysical causation, according to them, bodies do not act upon one another; but the action occurs immediately from the Deity; the motions of bodies, which seem to be the cause, being only the occasions of it. See Occasional Cause. Action is either incontinent or continued; that is, either by percussion, or by pressure. These two sorts of action are heterogeneous quantities, and are not capable of mutual comparison any more than a line can be compared with a surface, or a surface with a solid. The least degree of percussion may be made to overcome the pressure of the greatest weight. These actions, therefore, cannot be measured one by the other; but each of them must have a measure of its own kind, as solids are measured by solids, and surfaces by surfaces; because time is concerned in the one, but not in the other.

It is one of the laws of nature, that action and re-action are always equal, and contrary to each other.

If a body be urged by equal and contrary actions, it will remain at rest. But if one of these actions be greater than its opposite, motion will ensue towards the parts least urged.

It is to be observed, that the actions of bodies on each other, in a space that is carried uniformly forward, are the same as if the space were at rest; and all powers or forces that act upon all bodies, so as to produce equal velocities in them in the same, or in parallel right lines, have no effect on the mutual actions, or relative motions. Thus the motions of bodies on board a ship, that is carried steadily and uniformly forward, are performed in the same manner as if the ship were at rest. The motion of the earth round its axis has no effect on the actions of bodies and agents at its surface, except so far as it is not uniform and rectilinear. In general, the actions of bodies upon each other depend not upon their absolute but relative motion.

For the actions of powers, see Friction, Force, Mechanics, Motion, Power, and Resistance. For the laws of the action of fluids, see Fluid, and Specific Gravity.

Action, quantity of, in Mechanics, an expression used by M. de Maupertuis, in the Mem. of the Acad. of Sciences of Paris for 1744. and in those of Berlin, for 1746, to denote the continual product of the mass of a body, by the space through which it runs, and by its celerity. He lays it down as a general principle, that, "whenever any changes happen in nature, the quantity of action necessary to produce this change is always the least possible." And this, he says, is a law indicating the highest wisdom. This principle he applies to the investigation of the laws of refraction, the laws of the collision of hard and elastic bodies, and even the laws of reff, as he calls them, that is of the equilibrium or equipollency of pressures; and, thus investigating the laws of motion, referring those and the laws of equilibrium to the same principle, and connecting the metaphysical consideration of final causes with the fundamental doctrines of mechanics, he deduces what he conceives to be a stronger proof of the existence of a Deity, or of a first intelligent cause, than the other arguments commonly alleged, and derived from the order of nature.

It may be observed, however, that the quantity of action, according to the definition of M. de Maupertuis, is in reality the same with the product of the means into the square of the celerity, when the space passed over is equal to that by which the celerity is measured; and therefore the force or quantity of motion will be proportional to the mass multiplied by the square of the velocity; since the space is measured by the velocity continued for a certain time.

In the same year that Maupertuis communicated his principle, Professor Euler also demonstrated, in the supplement to a treatise intitled "Methodus inveniendi Lineas curvas maximi et minimi proprietate gaudentes," that in the trajectories described by bodies urged by central forces, the velocity and phlil by what the foreign mathematicals call the element of the curve, is always a minimum; which Maupertuis considered as an application of his principle to the motion of the planets. For the manner in which this principle of a minimum may be deduced from the Newtonian theory of refraction; see Refraction.

Action, in Ethics, or moral Action, is a voluntary motion of a creature capable of distinguishing good and evil; whose effect, therefore, may be justly imputed to the agent.

A moral action may be more fully defined to be whatever a man did with the powers of understanding and willing, with respect to the end he ought to aim at, and the rule he is to regard in acting, resolves, thinks, does, or even omits to do; in such a manner as to become accountable for what is thus done or omitted, and the consequences thereof.

In the first philosophical sense, says Dr. Reid (Essays on the Active Powers of Man, p. 97) nothing can be called the action of a man, but what he previously conceived, and willed or determined to do. In morals the word is commonly employed in this sense, nor is any thing imputed to a man as his doing, in which his will was not interposed.

The foundation, then, of the morality of actions is, that they are done knowingly and voluntarily; and all moral actions may be divided, with respect to the rule, into good and evil.

But when moral imputation is not concerned, many things are called the actions of a man, which he previously neither conceived nor willed. Hence the actions of men have been distinguished into three classes, the voluntary, the involuntary, and the mixed. By the latter are meant such actions as are under the command of the will, but are commonly performed without any interposition of the will. See Active Power, Motive, Principles of Action, and Virtue.

Action, in Oratory, is an accommodation of the person of the orator to his subject; or a management of the countenance, voice, and gesture, suited to the matter spoken or delivered.

Action makes one of the greatest branches or divisions of rhetoric. The ancients usually call it Pronunciation.

ACTION
ACT

Action is a collateral or secondary method of expressing our ideas; and is susceptible of a kind of eloquence as well as the primary. In the infancy of Language, when words were few, or not easily connected, men would naturally recur to action for explaining and expressing their conceptions; and they would labour to make themselves understood, by varying their tones of voice, and accompanying their tones with the most significant gesticulations. At this day, when persons speak in a language which they possess imperfectly, they have recourse to all these supplemental methods, in order to render themselves more intelligible. Besides, in the gradual improvement and extension of language, a warm imagination would introduce into discourse a variety of voices, and a considerable degree of action. Thus Dr. Warburton accounts for so much speaking by action, as we find among the Old Testament prophets. Among the northern American tribes certain motions and actions are adopted in order to explain their meaning on all great occasions of intercourse with one another. The Chinese find it more easy to express different ideas by a variety of tones than to contrive words for all their ideas. The Greek and Roman languages also were pronounced with more numerous inflections of the voice, and more elaborate gestures than any to which we are accustomed. Accordingly we find, that this action was treated of by all the ancient critics, as the chief quality in every public speaker; and the orators and players of Grecce and Rome were distinguished by the vehemence of their action. This is, in all cases, an address to the external senses; which it endeavours to move, and bring into its party by well-concerted motion and modulation; at the same time that the reason and understanding are attacked by force of argument. Accordingly, Tully very pertinently calls it "fermo corporis," the discourse of the body; and "corporis eloquentia," the eloquence of the body. — The Roman mimes and pantomimes, we read, had such a compass even of mute action, that voice and language seemed useless to them: they could make themselves understood to people of all nations; and Roscius, the comedian, is particularly famed, as being able to express any sentence by his gestures, as significantly and variously as Cicero with all his oratory. Quintuslian gives us a system of the rules of action; taken not only from the writings of the ancient orators, but from the best examples of the forum.

What we usually attribute to eloquence, was really the effect of the action only, as some of the greatest matters in which we have the advantage. — Demosthenes expressly calls it, the beginning, the middle, and the end of the orator's office; and Cicero professes, that it is not of so much importance what the orator says, as how he says it.

The Greeks, who were attentive to multiply the means of influencing the passions, omitted nothing which might bring to perfection this first language of Nature. Poetry and music were always supported by the action of the performers. This action, which was acquired by a kind of dance that regulated the motions and different inflections of the body, animated the discourses of their orators, and sometimes the lessons of their philosophers. See Plut. in Demosth. tom. i. p. 837; Ed. Xylad. Id. in Rhet. Vit. tom. ii. p. 843; Plato de Leg. v. tom. ii. p. 816; Ed. Serrani. Athen. Deipn. l. c. 17. p. 27. Ed. Cafaub.

After all, it is a point of which will bear being controverted, whether action ought to be practised and encouraged at all? A thing that has so much command over mankind, it is certain, must be very dangerous; since it is capable of being turned to our disadvantage as well as to our advantage. It is putting a weapon in the hands of another, which, if he pleases, he may make use of to subdue and enslave us; and accordingly, history is full of the pernicious usages made of it. — For this reason, eloquence and action have been unkindly discouraged by modern policy; and both the bar and the pulpit have been brought to a more frigid way of delivery.

But this is an extreme, which no objection founded on the abuse of eloquence accompanied with action, and no apprehension of its pernicious effects, can justify. The benefits accruing from it amply counterbalance the mischief which it is capable of producing.

Perhaps the foundation of all action may be vicious and immoral. — Voice and gesture, we know, will affect brutes; not as they have reason, but as they have passions; so far as these are used in discourse, therefore, it does not regard an assembly of men more than it would a herd of quadrupeds; that is, their whole effort is spent, not on the rational faculties, which are out of the question, but on the animal ones, which alone they endeavour to possess and actuate, independently of reason. — Nay more, our reason, and the judgment itself, are intended to be baffled and inclined by them: action being only used as an indirect way of coming at the reason, where a direct and immediate one was wanting; i.e. where the judgment cannot be taken by the proper means, argument, it is to be taken indirectly by circuition and stratagem.

The natural order of things, then, is here inverted; our reason, which should go before and direct our passions, is dragged after them; instead of coolly considering, and taking cognizance of things; and according to what we believe therein, raising ourselves to the passions of grief, indignation, or the like, we are attacked the other way; the impression is to be carried backwards, by virtue of the natural connection there is between the reason and the passions: and thus the helm, the principle of our actions, is taken out of our own hand and given to another. See Passion.

The case is much the same here as in lenation and imagination: the natural and regular way of arriving at the knowledge of objects is by sense; an impression begins there is transmitted to the imagination, where the image is produced, similar to that which first struck on the organ. But the process is sometimes inverted: in hypochondria, lunatic, and other delirious cases, the image is first excited in the imagination; and the impression thereof communicated back to the organs of sense: by which means objects are seen which have no existence.

Upon the whole, action does not tend to give the mind any information about the subject which is discussed; nor is it designed to convey any arguments or ideas which the simple use of language would not convey. But is it not that upon which we should form our judgments? And can any thing help us to form a just judgment, beside that which in some way or other enlightens and convinces our understanding? When Ciceron made Cæsar tremble, turn pale, and let fall his papers, he did not apprize him of any new guilt which Cæsar did not know of: the effect had no dependence on Cæsar's understanding; nor was it any thing more than might have been produced by the unmeaning sounds of a monstrous instrument duly applied. However, action may be useful in awakening and fixing the attention, provided that it be accompanied with suitable argument and address. As there is no nation, nor hardly any person, so phlegmatic and dilletente of feeling, as not to accompany their words with some actions and gesticulations, whenever they are such in earnest, it would be unnatural in a public speaker, and inconsistent with that earnestness and ardour which he ought to manifest in all affairs of moment, to remain
The poet, says Buffon, should so begin his action, that, on one hand, nothing should be farther wanting for the understanding of what he afterwards delivers; and, on the other, that what thus begins require after it a necessary consequence. The end is to be conducted after the like manner, only with the two conditions transferred, so that nothing be expected after it; and that what ends the poem be a necessary consequence of something that went before it. Lastly, the beginning is to be joined to the end by a middle, which is the effect of something that went before it, and the cause of what follows.

In the causes of an action, one may observe two opposite designs; the first and principal is that of the hero; the second comprehends all the designs of those who oppose the pretensions of the hero. These opposite causes do all produce opposite effects, viz. the endeavours of the hero to accomplish his design, and the endeavours of those who are against it.—As the causes and designs are the beginning of the action, so those contrary endeavours are the middle of it, and form a difficulty, plot, or intrigue, which makes the greatest part of the poem; and the solution or clearing up of this difficulty makes the unravelling.

The unravelling of the plot, or intrigue, may happen two ways; either with a discovery or without.

The several effects which the unravelling produces, and the different states to which it reduces the persons, divide the action into so many kinds.—If it change the fortune of the principal person, it is said to be with a peripetia; and the action is denominated in acies, or mixed; if there be no peripetia, but the unravelling be a mere falling from trouble to repose, the action is simple. It has been debated among critics, whether the close of the action in an epic poem should be always prosperous or not? The general opinion and the general practice are on the side of a prosperous conclusion. But there are some exceptions. Lucan and Milton, two authors of great note, have purposed a contrary course; the one concluding with the subversion of the Roman liberty; the other with the expulsion of man from paradise.

Another property of the epic action is, that it be great, or sufficiently splendid and important both to fix our attention, and to justify the magnificent apparatus which the poet follows upon it. One circumstance which contributes to the grandeur of the action is, that it be not of a modern date. Antiquity is favourable to those high ideas, which epic poetry is designed to excite and cherish. Lucan and Voltaire have, in the choice of their subjects, transfigured this rule. As the action is rendered important, says Buffon, by giving a higher idea of the perfections that are introduced than any the readers can conceive from comparing them with those of the present time, and where heroism, says Dr. Blair, is the ground-work, and where the object in view is to excite admiration, ancient or traditional history is certainly the safest region. The distance of the period, or the remoteness of the scene, affords sufficient licence for fiction and invention. The importance of the action much depends on the dignity and importance of the persons concerned in it. Thus, the fame of Homer's heroes, and the conceptions of their diffusion, furnish a subject important in itself, and particularly important to his countrymen, who valued themselves on their descent from those heroes. The importance of the action itself should also be regarded. In this respect, the subject of the Æneid is greater than that of the Iliad, as it is the foundation of the most powerful empire that ever was established on the globe; which is an event of much greater moment than the destruction of a city, or the anger of a warrior. But in comparison of the great ones displayed in Paradise Lost, all other greatnesses,
fays Dr. Johnson, in his life of Milton, shrinks away.
The subject of the English poet is not the destruction of a
city, the conduct of a colony, or the foundation of an
empire: it is the fate of worlds; the revolutions of heaven and
earth; rebellion against the Supreme King, raised by the
highest order of created beings; the overthrow of their loft,
and the punishment of their crime; the creation of a new
race of reasonable creatures; their original happiness and
innocence, their forfeiture of immortality, and their refor-
tation to hope and peace.

Another property required in the action of an epic poem
is, that it be interesting. The subject should interest the
public; and therefore the poet should select for his hero,
one who is the founder, or deliverer, or favourite of his
nation; and he should direct the attention to achievements
that have been highly celebrated, or that have been con-
ected with important consequences to the public caufe.

But more than this, in the management of his subject, he
should contrive to interest not one age or country, but all
readers, by conjuring his plan so as to comprehend many
affecting incidents. He may sometimes be awful and au-
gust: he must oftentimes be tender and pathetic; and he must
give many pleasing figures of love, friendship, and affec-
tion; the more an epic poem abounds with situations which
awaken the feelings of humanity, the more interesting it is;
and these form, always, the favourite passages of the work.
No epic poets have been so happy in this respect as Virgil
and Tasso. It is needless to mention, that the subject of
the Paradise Lost is more universally interesting than that of
any other poem. The character of the heroes serves also, as
we have already observed, to render the action interesting.

As to the duration of the epic action, Aristotle observes
(De Poet. cap. v. p. 656.) it is not so limited as that of the
tragic action: the latter is confined to a natural day; but
the epic one, according to that critic, has no fixed time.—In
effect, tragedy being full of passion, and consequently of
violence, which cannot be supposed to last long, requires a
shorter time; and the epic poem, being for the habits which
proceed more slowly, requires a longer time, either for them
to take hold, or to be rooted up; and hence the difference
between the epic and dramatic action in point of duration.
Boslu lays it down as a rule, that the more vehement the
manners of the principal personages are, the less time ought
the action to last: accordingly, the action of the Iliad,
which is formed upon the wrath of Achilles, &c. lasts no
longer than forty-seven days; whereas that of the Odyssey,
where prudence is the reigning quality, computed from the
taking of Troy to the peace of Ithaca, extends to eight years
and a half; and that of the Æneid, where the prevailing
character of the hero is piety and mildness, computed from
the taking of Troy to the death of Turnus, includes about
six years.

But if we estimate the period only of the poet's own
narration, or compute from the time in which the hero
makes his first appearance till the conclusion, the duration
of both these last poems is brought within a much smaller
compass. The Odyssey, beginning with Ulysses in the
island of Calypso, comprehends fifty-eight days only; and
the Æneid, beginning with the storm, which throws Æneas
upon the coast of Africa, is reckoned to include, at the most,
a year and some months. See Blair's Lect. on Rhetoric,
&c. vol. iii. p. 211.—221.

Action is also used in Painting and Sculpture for the
poise of a figure, or the attitude it is supposed to be in;
expressed by the position of several parts of the body, or
by the passions a peering in the face. Thus we say, the action
of such a figure finely expresses the passions by which it is
agitased. The same expression is applied to animals.
When the word action is used by way of distinction from
motion, it may have respect to the figure's being repre-
sented in motion, as running, leaping, flitting, falling, &c.,
which the painter distinguishes from such as are at rest.

By removing from the centre the imaginary line of gravity
used in balancing his figures to some distance, before, behind,
or on one side, according to the degree of motion which he
means to express. It is evident, that if a man be running,
and we view him sideways, his head and chest will be thrown
as much before his feet, as immediately to suggest the idea
of his falling on his face, unless the hinder leg be quickly
brought forward to prevent it. See ATTITUDE and
Gravity.

M. Wattelet, after observing that, however terms may
resemble one another in signification, there are none which
are perfectly synonymous, proceeds to ascertain the differ-
cence between action, motion, and expression, as applied to
painting or sculpture. To this purpose he remarks, that
there are passions, or rather sensations, which, though they
immediately produce neither action nor motion, have their
characteristic expressions. Of this kind are dejection, vo-
luptuousness, and melancholy; the expression of which, be-
ing passive, arrest motion, and suspend action in those
who are under their influence. On the other hand, figures that
are engaged in any violent bodily exertion may be said to
have motion and action; though they are not affected by
those passions, to the external tokens of which the term ex-
pression is peculiarly adapted.

Action, he farther observes, requires a motion of some
parts of a figure, without supposing that the whole changes
its place, which is the idea suggested by the term motion.
These distinctions are illustrated by appropriate examples.
He supposes a picture of what is commonly called the
judgment of Solomon, in which the monarch is represented
seated on his throne, and extending his arm to command the
division of the infant. Such a figure, even though the face
were concealed, ought, in consequence of this gesture, to
be said to have action; and yet it could not with equal
accuracy be affirmed to have motion. Again: suppose a
woman represented as rushing forward to separate two con-
batants, every part of her appears to concur towards the
precipitance of her course, and is drawn in that position
which is requisite to the immediate effect of her intention;
so that the beholders are ready to imagine that they see her
change her place; such a figure may be more properly said
to have motion than action. Wattelet's and Levelque's
Diét. des Arts de Peinture, Sculpture et Gravure. art.
Action.

Action of the Mouth, in the Manege, denotes the agita-
tion of a horse's tongue, and mandible, or his champing
on the bit; which produces a white foam. This, with the
riding-masters, is esteemed not only a sign of health, vigour,
and mettle; but also of a tenible mouth. This action is
likewise supposed productive of a good mouth, whence
various means are made use of to keep a horse constantly
champing. Some perons put a large bit with several de-
tached moveable parts, called a flawing-bit, into his mouth
two hours before riding, and then turning his tail to the
manger fallen him between the hallo-polis; others make
use of a similar bit in common, and molt perons use it for
his watering exercise. There can be no doubt that this
action serves to keep the mouth tensive and alive, as it is
termed, especially when accompanied with a judicious bridle-
hand upon a horse: but it must be recollected that the bars
of a horse's mouth are covered with cuticle or epidermis,
which is the outer tenible skin of other parts, the nature of
which
which is to thicken upon pressure; therefore the following-bit put on to long before riding, though it may give temporary flexibility, will not conduct to permanent hardens.

Action, in the *Military Act,* is an engagement between two armies, or between different bodies of troops belonging to them. Although humanity and sound policy will induce the general of an army to avoid an action, when no considerable benefit is likely to accrue from it, yet there are certain circumstances that will direct him in the alternative either of commencing or avoiding it. Wildness will suggest the importance of bringing the enemy to an immediate action, when it will force to prevent the junction of his forces; to discourage the hostile declaration of a neutral power; when any advantage may be obtained by the diffusion of his forces; when there is reason for apprehending the insufficiency or actual withdrawal of allies; when defection, on account of an exciting or impending fear of money, or of the means of subsistence, is dreaded; when new allies may be thus gained, or those of the enemy may be induced to abandon him; and when a reasonable prospect is seen of securing a present advantage, without risking any loss or injury that shall in the event more than counterbalance it. The commencement of an action, when it is defirable, may be expedited by threatening, or actually besieging a port or place, which is of importance to the enemy; by attempting to relieve and succour a place that is besieged; by ravaging and laying waste the country; by presenting the allurement of booty; by depriving the enemy of forage or water; by exhibiting the appearance of an untenable post, or of a feeble force; and by feigning fear, the diminution of forces, the disorder of detachments, or a defection of part of the army, or prevailing discontent and a disposition to mutiny, or orders not to engage. The motives which will induce a prudent general to avoid to begin an action are such as these; the defect or the distance of his resources, the prospect of fresh supplies, the dread of defection, the augmentation of the enemy's allies, the disadvantage of ground, position, number, &c., want, defect, and defection in the opposing army, actual negotiations, or positive orders not to hazard an engagement.

The means of avoiding an action are the choice of polts and detachments, well concerted and well executed stratagems, the devastation of the country through which the hostile army must pursue that which is retreating, and from which it must draw some of its supplies; any movements that would cause a diversion, real or feigned negotiations, report of approaching succour, and the appearance of considerable force. These various circumstances are detailed at large, and illustrated by appropriate examples selected from the conduct of the most able commanders, both ancient and modern, in the Encyclopaedia, vol. x. or vol. i. *Art. Miliare.*

**Art. Action.**

This term is likewise used to signify some memorable act done by an officer, or commander of a body of troops.

**Art. Action, in Lexis,** is a right of demanding, and purifying in a court of judicature, what is any man's due.

Or, *action* is any kind of process or suit which a person enters for the recovery of his right. See *Cause.*

Actions are divided, by Justinian, into two different kinds: *real,* or those against the thing; and *personal,* or those against the person. For whoever brings an action, either does it against one obnoxious to him, in respect either of contract or offence; in which case arise actions against the person which require the party to do, or give something; or, he does it against one not obnoxious, yet with whom a controversy is arisen touching some matter; as if Caius hold a field which Julius claims as his property, and brings his action for the same. See the Justinian, lib. iv. t. 4. where the principal actions, introduced by the Roman law, are summarily explained.

In common law, from the two classes of *real* and *personal* actions, arises a third called a *mixed action,* which regards both the person and the thing.

**Art. Action, real, or,** as it is called in the *Mirror,* *judicial* action, is that which concerns real property, whereby the defendant claims title to lands or tenements, rents or common, in fee-simple, fee-tail, or for life; and these actions are either *ancilier* or *possessory.* *Ancilier* action is that which we have by some right descending from our ancestor.— *Possessory,* sometimes also called *personal* action, is that which hath its beginning in land and barony.

But real actions, formerly so numerous and considerable, as writs of right, of entry, &c. with their appendages as *grand capes, petit capes,* receipt, view, aid-prayer, voucher, counter-plies of voucher, counter-plies of warranty, and recovery of value, are now much out of use; on account of the great nicety required in the management of them, and the inconvenient length of their process: a much more expeditious method of trying titles being since introduced in other actions, *personal* and *mixed.* In a real action several lands held by several titles may not be demanded in the same writ; but in *personal* action several wrongs may be comprehended in one writ. A bar is perpetual in the latter actions, and the plaintiff has no remedy, except by writ of error or appeal; but, in the former, if the defendant be barred, he may commence an action of a higher nature, and try the same again.

**Art. Action, personal,** is that whereby a man claims a debt, or personal duty, or damages in lieu thereof; and likewise, whereby a man claims a satisfaction in damages for some injury done to his person or property. The former is said to be founded on *contract,* the latter upon *tort* or wrongs. Of the former nature are all actions upon debt or promissory of the latter all actions for trespasses, nuisances, affluents, defamatory words, and the like.

Many *personal* actions die with the person; but *real* actions survive. In all actions merely personal, arising *ex delicto,* for wrongs actually done by the defendant, as trespasses, battery, and slander, the action dies with the person. But in actions arising *ex contractu,* by breach of promise and the like, though the suits shall abate by the death of the parties, they may be revived by or against the executors who have affects to answer the demand; as they are rather actions against the property than the person.

**Art. Action, mixed,** is that which is indifferently for the thing detained, or against the *peron* of the detainer; being thus called, because it has a mixed respect, both to the thing, and to the person.

Others better define it, a suit given by law to recover the thing demanded, and damages for the wrong done.

Such is, *suit of novel dilsigin,* which, if the defendant make a feecism to another, the dilsigine shall have against the dilsigine, and the feecism, or other terre-tenant, to recover not only the land but damages also. And the like is action of *waste,* *quare impedita,* &c. See *Assise.*

Actions are also divided into *civil* and *criminal.*

**Art. Action, civil,** is that which only tends to the recovery of what, by reason of a contract, or other like cause, is a man's due. As, if a person by action seek to recover a sum of money formerly lent, &c.

**Art. Action, criminal,** is that the object of which is judgment of death, as appeals of death, robbery, &c. or judgment for damage to the party, fine to the king and imprisonment, as appeals of malice, &c. To this class belongs action *penal.*

**Art. Action,**
Action, penal, aims at some penalty upon the party sued, either corporeal or pecuniary.

Such is the Actio Legis Aquilina, in the Civil Law; and with us, the next friends or man feloniously slain, or wounded, shall pursue the law against the offender, and bring him to condign punishment.

Action is also distinguished, as it lies for the recovery of the simple value of the thing challenged; or of the double, treble, quadruple, &c.

Thus, a Delecta tautum lies against embracers; and against jurors that take money for their verdict, of either, or both parties.

To this class also belong all actions on a statute that punishes offence by retaliation, or fine proportionable to the transgression.

Action, again, is divided into prejudicial, called also preparatory, and principal.

Action, prejudicial, is that which arises from some question, or doubt in the principal one.

As, if a man sue his younger brother for land defenced from his father; and if it be objected, he is a bailiff, this point of bailiff must be tried, before the cause can proceed: whence this action is termed prejudicialis, quia post subjiciendum.

Action upon the case, Actio faciæ causam, is a general action, given for the recidive of a wrong done any man without force, and not especially provided for by law; in order to have satisfaction for damage.

This, of all actions, is now most in use.—Where there arises an occasion of suit, that has neither fit name, nor certain form already prescribed; the clerks of the chancery, anciently, conceived a proper form of action for the thing in question: which was called an action upon the case, by the civilians Actio in factum.

This is called an action of the case, because the whole cause or case, as much as in the declaration (except time and place), is set down in the writ; and there is no other action given in the case, except only where the plaintiff has his choice to bring this or another action. This action lies in a variety of instances; as for words spoken or written, which affect a person's life, reputation, office, or trade, or tend to his loss of preferment, in marriage or service, or to his disinheritance, or which occasion him any particular damage. Action on the case likewise lies upon an Assumption. It lies also, in all instances, wherein no general action could be framed: e.g., against Carriers, against a common inn-keeper for goods stolen in his house, for deceit in contracts, bargains, and fales, for neglect or malfeasance, for injuries done in common, for malicious prosecution and false arrests, against clerks for default in executing writs, permitting escapes, &c., for conspiracy, nuisances, &c., &c. See Comyns's Digest, art. Action, and Jacob's Law Dict. by Toninis, art. Action.

Action upon the statute, Actio faciæ statutum, is a writ of action, brought against a man, upon an offence against a statute, whereby an action is given that did not lie before.

Thus, where one commits perjury, to the prejudice of another, he who is damaged shall have a writ upon the statute, and a cause accordingly. Such action is now obsolete.

Action, popular, only differs from an action upon the statute, in that, whereas the statute gives the suit or action to the party injured, or otherwise to one single person certain, it is called an action upon the statute; and where the authority is given by the statute to every one that will sue, it is an action popular: and from the words used in the process, it is called a qui tam action. See Information.

Vol. I.
due, the several sums subscribed to the flock of the company, according to the several orders of council made for the creation of the new actions.

ACTIONARY, or Actionist, a term frequent in foreign newspapers; denoting the proprietor of an action or share in the company's stock.

ACTIVE, something that communicates motion or action to another. In this sense, the word stands opposed to passive. Thus we say, an active cause, active principles, &c.

The quantity of motion in the world, Sir Isaac Newton shews, must be always decreasing, in virtue of the vis inertiae, &c. So that there is a necessity for certain active principles to impart: such he takes to cause gravity to be, and the cause of fermentation: adding, that we see but little motion in the universe, except what is owing to these active principles.

Active principles, in Chemistry, are those which are supposed to act of themselves, and do not need to be put in action by others.

Salt, sulphur, and mercury, have been usually considered by the chemists as active principles; and phlegm and earth as passive ones.

Mr. Homerick, and some chemists after him, only make one active principle, viz. sulphur, or fire; which they take to be the source or principle of all the motion and action of the universe.

The term active principle, says Dr. Quincy, has been used to express certain divisions of matter, that are, by some particular modifications, comparatively active, in respect of others. But the progress of science, and particularly of experimental philosophy and chemistry, has introduced new and more rational ideas on this subject.

In a strict sense, all motion in matter is rather passion; and there is no active principle, unless we thus call the known powers of gravitation, attraction, and repulsion, on which the Newtonian philosophy is founded: so that let bodies exit under what modifications ever, there can be no alteration made of these universal properties.

Active, in Grammar, denotes a word having a significancy that serves to explain or define an action.

Thus we say a verb active, a conjugation active, &c. or an active participle.

Active verbs, are such as do not only signify doing, or acting, but have also nouns following them, to be the subjects of the action or impression; and they are thus distinguished from verbs neuter.

Thus, to love, to teach, are verbs active; because we can say, to love a thing, to teach a man.

Some grammarians, however, make three kinds of verbs active; the transitive, where the action passeth into a subject different from the agent; reflexive, where the action returns upon the agent; and reciprocal, where the action turns mutually upon the two agents who produced it. See Verb.

Active Power, in Metaphysics, is the power of executing any work of art or labour, in contradistinction to speculative powers. The exertion of this power is called action; and as every action produces some change, so every change must be caused by some exertion, or by the cessation of some exertion of power. That which produces a change by the exertion of its power, we call the cause of that change; and the change produced the effect of that cause; and that being in which the change is produced is said to be passive, or to be acted upon. Thus (says Dr. Reid, Ed. on the Active Powers of Man, p. 13.) we see, that action and passion, cause and effect, exertion and operation, have such a relation to active power, that if it be understood, they are understood of consequence; but if power be a word without any meaning, all those words which are related to it, must be words without any meaning. See Power.

Activity, the power of acting, or the active faculty. The activity of an action, a power, &c. Bodies according to Sir Isaac Newton, derive their activity from the principle of attraction.

Activity of a body, the sphere of, is the space which surrounds it, so far as its efficacy or virtue extends to produce any sensible effect.

ACTIUM, in Ancient Geography, a small town near a promontory of the same name in the mouth of the Ambracian gulf, on the coast of Acarnania, and opposite to Nicopolis on the other side of the bay. This place was famous for a temple of Apollo, mentioned by Thucydides (l. i. c. 29. p. 24. Ed. Duker), and by Strabo (l. vii. tom. i. p. 502. Ed. Cusab.) thence denominated Actius; (Virgil Aenid. viii. 704.) and afterwards for the victory obtained by Augustus over Antony and Cleopatra in a naval battle on the 2d of September, in the year of Rome 723. Nicopolis was built in order to commemorate this victory, and games were instituted called the Actian games. There were anciently fowk games at Actium, at which the Lacedaemonians used to preside, mentioned by Strabo, and alluded to by Virgil, Aen. iii. 258. The victory at Actium was also celebrated by games instituted at Rome. Sueton. Tib. vi. Dion. Cafs. Hift. Rom. lib. 19. lili. i. iv. 19. tom. i. pp. 649—656—749. Ed. Reim. The Actian era took its rise from the battle of Actium. The promontory is now called Capo di Figalo. The medals of Actium were silver, gold, and bronze; and the ordinary type is a flying pegasus.

ACTON, in Geography, a village about six miles West of London, where is a well of purging water, noted for the pungency of its falt. Its colour is whitish, its taste is sweetish, with a mixture of the falt bitter which is in the Epsom water. Its falt is not quite so falt, and is more calcareous than that of the Epsom water, being more of the nature of the falt of lime: it is however more nitrous than the other. A quantity of it being boiled high, and mixed with a solution of subflime in pure water, throws down a yellow sediment. It strikes a deep red or purple with the thinufure of log-wood in brandy, as is usual with nitrous farts. It does not precipitate filver out of the spirit of nitre, as common falt does; a pint and a half of the water yields forty-eight grains of falt. See Allen's History of Purging waters.

Acton, a township of Middlesex county in the Massachusetts, containing 853 inhabitants; 24 miles N. W. of Boston.

Acton Burnel, a village in Shropshire, about three miles from Great Wenlock, where a parliament was held in the reign of Edward I., when the famous act 11 Ed. I. A. D. 1283, called Statute-merchant, was renewed.

ACTOR, in Antiquity, was the name of a person who had the superintendence of all the goods of a Roman citizen. He was called "actor honorum, and actor praediorum fun- dorumque."

Actor Summarum, was a slave, to whom was committed the office of cask-keeper: and that he was a slave we may infer from the punishment of the crofs which Domitian caused to be inflicted on one of these actors. See Sueton. in Domit. c. x. t. 2. p. 1058.

Actor, in a general sense, one who performs any act.

Actor, among Civilians, the proctor or advocate in civil courts or causes: as actor ecclesiae has been sometimes used.
ACTORICUM, in Ancient Geography, a territory of Epidaurus, according to Suidas, which he says was afterwards called Lucania, belonging more properly to Acarnania.

ACTORION, or ACTTORIS, in Entomology, two species of papilio, found in Serinum; one with subcubalid brown wings; the anterior marked with a yellowish fascia, and the hinder with a blue spot and an ocellum underneath; the other, with wings of an uniform colour, marked with brown and white.

ACTORUM Tabulae, were tables inscribed by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturnus.

ACTRESS, Actrix, a female who acts, or does the office of an actor.

Actresses, or women actors, were unknown to the ancients, among whom men always performed the part of women; and hence one reason for the use of masks among them. Mem. Acad. Inscript. tom. vii. p. 188. Among the Greeks, the women only danced; and their place in tragedies and comedies was supplied by eunuchs, whose voice resembled theirs.

Actresses are said not to have been introduced on the English stage till after the restoration of king Charles II. who has been charged with contributing to the corruption of our manners, by importing this stage from abroad. But this can be but partly true: the queen of James I. acted a part in a play, and Prymus, her Hiftromatik, speaks of women actors in his time as whores; which was one occasion of the severe prosecution brought against him for that book. Whitlock, Mem. 1652. Wood's Athen. Oxon. tom. ii. p. 434.

ACTRIDA, in Ancient Geography, a town placed by Pliny in Arabia Felix.

ACTUAL, something that is real and effective; or that exists truly and absolutely. The philosophers use actual heat, or cold; in opposition to virtual or potential.

Actual heat, considered actively, is the act of producing heat; passively taken, it is the quality whereby a body is denominated hot.—Virtual or potential heat, actively taken, is the power or faculty of producing heat; passively taken, it should be the power or faculty of being heated, or receiving actual heat.

In medicinal language, actual is also opposed to potential, and is applied to any thing endowed with a quality which operates by an immediate power inherent in it. For example: a red-hot iron, or fire, is called an actual cauter, in contradistinction to cauteries, which have a power of producing the same effects on animal bodies, as an actual fire; and which are called potential cauteries or caufics. Boiling water is actually hot, and brandy is potentially hot.

Actual is that committed knowingly, by a person arrived at the years of discretion; in contradistinction to what theologians have called Original sin.

Actual possession and actual right of possession are terms used in Law, for the meaning of which see Possession.

ACTUARIA, naves, in Antiquity, a sort of long and light ships, thus denominated as being particularly contriven for swiftness and expedition; they answer to what the French call brigandines.

Cicero, in an epistle to Atticus, calls a ship decem scalam, or ten banks of oars, actuaria.

ACTUARIUS, or ACTARIUS, primarily denotes a notary, or officer appointed to write down the acts or proceedings of a court, assembly, or the like.

In the eastern empire, the actarii were properly officers, who kept the military accounts, received the corn from the sustores, or store-keepers, and distributed it to the fol-
ABU

ACUBENE, in Astronomy, a name given by some to a star of the fourth magnitude, in the southern claw of Cancer, marked α by Bayer.

ACUFIDA, in Ancient Geography, a town of Africa, in Mauritania.

ACUHYATI, in Zoology, the name of a large serpentine, of a poisonous quality, in America, more usually known by its name of cocomos, or curcuma.

ACUITION, in Grammar, Prophesy, and Medicine. See Acutation.

ACUL, in Geography, a small port on the north coast of the island of St. Domingo.

ACULEATUS longus, in Ichthiology, a name given by some to the Pugnatus marinus longus, a small prickly West-India fish. Willughby. See Stickel-back.

ACULEI, formed from acus, a needle, among Botanists, &c. denote the prickles or spines of plants of the thorny kind.

Acutong Zoology, aculus is also used for the sting of a bee, hornet, or the like. See Sting.

The word aculeus is also used for certain parts of the Echini or crown.

ACULEOSA, a name of the cardus polyanthus. See Gorteria.

ACULEUS, or Acutus, also the name of an herb which registered the acts and constitutions of the convocation.

ACUATE, to bring into act, or put a thing in action. Thus an agent is said, by the schoolmen, to actuate a power, when it produces an act in a subject. Thus the mind may be said to actuate the body. And thus a medicine, &c. is said by some ancient physicians, to be actuated, when, by means of the vital heat, it is made to produce its effect.

ACUTUS, in the Ancient Agriculture, the length of one furrow: or as far as a plough goes before it turns. Plin. lib. xviii. cap. 5. tom. ii. p. 97. Ed. Hard.

In English it may be rendered by a furrow. It is also used by Vitruvius as a determinate measure, containing 120 Roman feet.

Actus minimus, was 120 feet in length, and four in breadth; being equal to the sextans, or sixth part of the juggerum, or integer.

Actus major, called also actus quadratus, was the square of 120 feet, or 14,400, being the jinims, or half of the jiggerum. This was also denominated modius, and mina. Varro de Re Rust. lib. i. cap. 10.

Acts. Intercolae, a space of ground four feet in breadth, left between the lands as a path or way.

ACUANITES, Acanites, in Ecclesiatical History, are those called more frequently Maniches. They took the name from Acua, a disciple of Thomas, one of the twelve apostles. Bib. Univ. tom. xxv. p. 330.

ACUBA, in Botany, is a tree of St. Domingo, which, it seems, a great height, and yields an excellent fruit. The fruit is a kind of fig; resembling in taste the mulcudum pear, but so hard that it must be softened in water before it can be used. The wood is the hardest of any in the island. M. de Lamarck (Encyclopedie, vol. vi. p. 39.) apprehends, that it is a species of Chrysophyllum, and the name which is called Aucuba, and according to Plumiier denominated Acomas.

ACUBA, in Ancient Geography, a fountain or lake of Africa, in the Syrtis.
of the discoveries of this Jesuit, and his work became very scarce. The Spaniards were jealous of the Portuguese, and wished to prevent their deriving any advantage from the relation of Acuna. The work was translated by M. de Gomberville, in four volumes 12mo, in 1684; and, it is said, that only the copy of the original, besides which the translator used, is in the Vatican library. Gen. Diet.

ACUMEN, in Ancient Geography, a town of Pannonia, north-call of Sirmium.

ACUMEN is also the present Acona; supposed by M. d'Anville to be the Acclum of Ptolemy.

ACUPUNCTURE, a method of curing many diseases, by pricking several parts of the body with a needle, or instrument of that form; practised by the Chinese and Japanese, and other nations in that part of the world. They perform the operation with a large gold or silver needle, which they strike into the several parts of the body, either with their hand, or with a hammer made on purpose. This severe and dangerous operation is performed on the head and breast, as well as the abdomen, arms, legs, thighs, and other parts of the body, nay even in the abdomen of women with child, when the fetus is reliefs. The disease, for the relief of which this operation is chiefly performed, is ascribed by the Japanese physicians to the immediate use of the fauki, a strong wine made of rice, which gradually fills the abdomen and lower parts of the body with a noxious fluid, that occasions convulsions and exquisites pains. The place in which the puncture is commonly made, is the middle between the navel and the pit of the stomach; and the holes are distributed into three rows, with three punctures in each row, at the distance of about half an inch, and the whole disposed in the form of an oblong square. The needles are vended by the emperor's license.

Surgeons are furnished with images, wherein all the places in the body proper for the needle are described by marks. M. Ten Rhyn was an eye-witness of the use of this puncture on a soldier, who being afflicted with violent disorders of the stomach, and frequent vomitings at sea, suddenly relieved himself by pricking a thumb's breadth deep into four different places about the region of his pylorus. Ten. Ryn. Diff. de Acupunct. ap. Phil. Trans. N° 148. p. 231. Leq.

We sometimes also find mention of an acupunctura practised in Europe; but this amounts to no more than the perforating or opening a part, e.g. the cornea, with the point of a needle; which has been done with good success, for the cure of an hydrophobulina and hydrogen.

ACUR, in Ancient Geography, a town of Asia, according to Ptolemy, in lat. 15° 20'. Long. 124° 43'.

ACUROA, in Botany, a genus of the diadephia decamnchra class and order: the characters of which are, that the calyx is quinquenata: that it has five petals; and that the legumes are roundish, cacious, not gaping, with a single cell, and a sngle seed. There is one species, viz. A. violacea.

ACURON, a name given to the Alisma.

ACUS, in Jethology, the name of several species of fish, whose forms are long and slender, belonging to different genera in the Linnean System. The cygnus acus is distinguished by having no fin on the back, belly, and tail, and by an anal fin terminating before the apex of the tail, with fainty rays. It is found in the Mediterranean. The colour of the upper part is white, bledclouded with reddish and brown spots, and underneath it is bluish. It has no tentacula. The synangathus acus is of an hepagonal figure, and has a pinnated tail. This is the typhe of Gencer; and, according to Aldrovand, the acus of Arrilote, and the acus alter major species of Arrilote, according to Willughby and Ray. It is the harp-fit of Joufton. It is found in the northern ocean of Europe; in length, as stated by Gmelin, it is about two or three feet, and it is variegated with alternate spots and belts of a brown and light-oker colour. The acus of Arrilote, according to Rondeletius, Joufion, Willughby, and Ray, and the second species of Arrilote's acus according to Gesner, is the synangathus typhe of Linnea. This is the shorter pipe-fit of the British zoology, and the sead-fish of Burke. The acus vulnberi of Aldrovand, Willughby, and Ray, the acus of Oppian, and the acus 1st. species of Rondeletius and Gesner, is the belone of Arrilote; the esox belone of Linnea, the sea-fish of the British zoology, and the garfish of other authors. The acus maxima chineus, with a compressed body, is the pecularia chineus of Linnea. The acus maxima fluvialis or rutilus of Catesby, is the esox striatus of Gmelin's Linnea. Mr. Daines Barrington conceives, that a fish which he found near Chilthurch, in Hampshire, had the appearance of the scale of this fish, though it be a stranger to our seas. Bilb. Trans. vol. I. p. 171.

The acus lambriformis of Willughby and Ray, is the synangathus opilion of Linnea, and the little pipe-fit of the British zoology.

ACUS is also used by some authors for the amonyns, or sand-cel, a small cell caught in the sands.

ACUS, in Natural History, is a name given to the oblong cixem, with uniform antennae, or the cixem flagorum of Linnea, with a roundish black body, and two globular points in the middle of the thorax, which is very common in both of the lakes of England. Acus is also a species of acarias, strait, rigid, and angular, and bending at both ends. It is white, about two inches long, and found in the intellines of the pipe. Acus is also a species of the voluta-shell, marked with transverse stripes of red points, and terminating in a smooth pointed wreath. It is scarce an inch long, and of a white or yellowish colour.

A species of buccium, of a whitish colour, with horizontal undulated lines, withambil emulated rugs and windings, and the columnula spirally twisted, is called acus.

Acus Potoris, in Botany, a name of the scandix.

Acus Moschata, a name of the Geranium moschatum.

ACUSCHY, in Zoology, a species of Cavia. See Acouscy.

ACUS, in Botany, a species of apocynum.

ACUSILAUSS, in Biography, one of the most ancient Greek historians, was born at Cearca, near Aulis, not long before Pericles of Athens, and compiled genealogies of the ancient royal families from tables, which his father is reported to have found in digging the foundations of his house. He goes back to the ages before the war of Troy, and as far as Phoroneus, king of Argos. Suidas.

ACUSILAUSS is also the name of an Athenian orator, who went to Rome in the time of Gaius, where he practised rhetoric, and gained a large fortune of a hundred thousand drachmae, with which he returned to Athens, where he died. Suidas.

ACUSILORUM Colonia, now Ancona, in Ancient Geography, is situated, according to Lucas Holkcinus, between Orange and Valence, near Montmart, on the banks of the Rhine. It was called Acumen; and, according to Ptolemy, was one of the cities of the Cavari.

ACUTE Infusor, in Ancient Geography, are comprehend in the number of the Echinides. They are a little more to the south-west, in the south of the promontory of Araxum. M. d'Anville calls them Oxice infuso.

ACUTE;
ACUTE, sharp, something that terminates in a point, or edge; disposed either for piercing or cutting.

In this sense the word usually stands opposed to obtuse.

Acute angle, in Geometry, is that which is less than a right angle, or which does not subtend 90 degrees.

Such is the angle ACB (Plate Geometry, fig. 1.)

Acute-angled triangle, is that whose three angles are all acute, called also an equilateral triangle.

Such is the triangle ACB (Fig. Geometry, fig. 1.)

Acute-angled Cone, is that whose opposite sides form an acute angle at the vertex; or whose axes, in a right cone, makes less than half a right angle with the side. See Cone.

Pappus, in his mathematical collections, p. 164. Ed. P came, says, that this name was given to such a cone by Euclid, and the ancients before the time of Apollonius; and they called an

Acute-angular Section of a Cone, which was made by a plane, cutting both sides of an acute-angled cone, an ellipse; but they did not consider, before it was pointed out by Apollonius, that such a fection might be obtained in any cone whatever. See Conic Section.

Acute, in Music, is understood of a found, or tone, which is sharp, shrill, or high, in respect of some other; in which sense the word stands opposed to grave. Both these properties of sound depend on the quickness or slowness of the vibrations by which they are produced; and are independent of loudness or force, for a tone may be acute or high, without being loud, and vice versa. There are degrees of acuteness and gravity beyond our powers of appreciation. The warbling of birds is of this kind. No birds but the nightingale and cuckoo produce musical tones which we can imitate, or compare with those of our musical instruments. A bullfinch and canary bird can be taught tunes by our flageolets and bird-pipes; but their natural warble is incomparable with our scale. The grave additional tones in our large piano-fortes become the more difficult to tune as they ascend. The octave below double C can, with the utmost difficulty, be made to satisfy a nice ear by the most experienced tuner.

Sounds considered as acute and grave, that is, in the relation of gravity and acuteness, constitute what we call tunes, the foundation of all harmony.

Acute Accent, in Grammar. See Accent.

Acute Leaf. See Leaf.

Acute Disease. See Disease.

ACUTELLA, in Botany, a name used by some to express the common anemis, or red-barrow, a small prickly plant, with red or white flowers, and famous for its spreading and tough root. Ger. Emac. Ind. 2.

ACUITATOR, in writers of the barbarous ages, denotes a person that whets, or grinds cutting instruments: called also in ancient glossaries, acutus, acutinis, famius, calcaris, &c. Du-Cange.

In the ancient armies there were acuitores, a kind of smiths, retained for whetting or keeping the arms sharp.

Again.

ACUTITATION, or Acution, in a general sense, the same with acuating or sharpening.

Acuration, in Grammar, denotes the pronouncing, or marking a syllable with an acute accent.

Acution, or acutitus, in Medicine and Chemistry, is used for sharpening or increasing the force of any medicine.

ACWORTH, in Geography, a township of Cheshire county, in New Hampshire, incorporated in 1766, and containing 784 inhabitants. It is eight miles call-by-north from Charlestown, and 73 north-well-by-west from Port- mouth.

ACY, a town of France, in the department of the Aisne, one league south-east of Sultans.

ACYLIA, in Ancient Geography, a town of Italy, built by the Romans, to restrain the barbarians who inhabited the Alps. It was a Roman colony.

ACYPHIAS, a city of the Doric Tetrapolis, called by Strabo and others Pinintes.

ACYROLOGIA, compounded of acrye, improper, and logos, discourse, denotes an improper accretion, or expression, by which a word or phrase is used in some unusual or oblique sense, hardly reducible to the rules of language. Such, e.g. is the word spere, sometimes used in Roman writers for times. The acyrologia bears a near affinity to the catachresis, inasmuch that many terms and expressions alleged as infinities of the latter, are by others brought as examples of the former.

ACYTUS, in Ancient Geography, a small island near Cydonia, in the isle of Crete.

ACZUD, in Geography, a town of Moldavia, in European Turkey. N. lat. 47° 20'. E. long. 29° 10'.

AD, in Grammar, a Latin proposition signifying in, and often used fingly, and in composition to express the relation of one thing to another. Among all the eastern nations, Ad was a peculiar title; and according to the learned Mr. Bayle's opinion, was originally conferred upon the sun.

An hifian, in Antiquity, is underfoot of a kind of punishment of criminals, condemned to be thrown to wild beasts. The term was also applied in a sort of gladiators hired to fight with wild beasts.

These are otherwise called hifianii, Calv. Lex. Jor. p. 36.

An extera, a term used among School Divines, in speaking of the external operations of the Godhead.

Acts or operations ad extera, are properly those whose term or effect is not within the divine essence; by which they stand opposed to extera ad intra. Creation, preservation, regeneration, conversion, renovation, &c. are actions of God ad extera.

An intra, among School Divines, is underfoot of those acts of the Divine Being, whose term and effect is within his own essence. In which sense, acts or operations ad inutra are opposed to those ad extera.

An hominim, among Logicians, is underfoot of a kind of answer or drawn from the belief or principles of those who oppose with, and which of consequence must be conclusive to them, though otherwise disbelieved by us; or, it is where a disputant quits his own language and syllables, and borrows that of his opponent to convince him, by turning his own prejudices or errors against himself. This the schoolmen call argumentum ad hominem.

An libitum, used in Mu
er, for a piaster, when the principal performer is at liberty to give way to his conceptions, to change the measure from quick to slow, or the contrary, without accompaniment, and to manifest his abilities in effusions of fancy, satire, and brilliant passages. But this privilege is often abused in the length and dullness of these extemproaneous flights, as they are called, though generally prepared at home with great pains and application to very little purpose. None but performers of first-rate abilities should be permitted to obtrude their erudite, and often clamorous attempts on the public, interrupting the progress of, perhaps, an elegant or ingenious composition.

Ap ludea, in Antiquity, a Roman sentence, whereby criminals were condemned to entertain the people, either by fighting with beasts, or with each other, and thus executing justice on themselves. Kennet. Rom. Ant.

Ad metalla, the punishment of being doomed to work
in the mines. Criminals condemned to this, were called metallici.

It was to be wished that punishments of this kind could be infubstituted in lieu of our frequent executions; which are as repugnant to the principles of humanity as to those of found policy.

Ad quidditias, among schoolmen, include the relations, analogies, agreements, disagreements, similitudes, and difficulties of things.

Ad quidditias are properly those attributes of things, which answer to the question, ad quid? to what? By which they differ from mere quiddities, which answer to the question, quid fit? what is it? The latter enquire what things are in themselves; the former what they are, ad alia. Herb. de Verit. p. 233.

Ad volorem, is used in speaking of the duties, or customs, paid for certain commodities; some things are rated by the weight, measure, tale, or the like; others pay ad volorem, according to the value or worth, sworn to by the owner.

Ad Efe, in Ancient Geography, a town of Italy near the river Ems, between Sensogalla and Aega.

Ad Angers, a place remarkable for the martyrdom of St. Mark, and for a town thought to have been near Alexandria.

Ad Aquas, a name given to several places in Moetia, Dacia, Numidia, Spain, &c.

Ad Aquas calidias, a town of the Picentini, about ten miles from Ateoli.

Ad Aquas gratiatas, a town situated near Aquileia, and remarkable for the martyrdom of three brothers, of the illustrious family of Anicius.

Ad Aquas labodas, or Labodas, a place called Termam Sellonitae, in Sicily, famous for its baths, and situated near the mountain now called S. Calangero.

Ad Aquas, a denomination distinguishing several places in Mauritania, Attica, Gaul, and Italy.

Ad Atrias, the name given to various places, in which altars were erected; one in Asia between Tigrinia and Melantia, not far from the Euphrates; and another in Bocotia, in Spain, between Alligii and Corduba.

Ad Arnum, a place of Etruria, in Italy, west of Florentiae.

Ad Aureae, a place in Venetia, between Vicentia and Verona.

Ad Bassilicum, a place of Africa, in Numidia, between the colonies of Saldae and Agiligis.

Ad Bivium, a place in Italy, 30 miles from Rome, now Valmontone.

Ad Caballos, Bagnacavallo, in Italy, was also called Tiberiacum.

Ad Calculus, called by Aristotle Eageb, was situated in a small island near Etruria.

Ad Calem, Cagili, a place of Umbria in Italy, on the Flaminian way.

Ad Caleum, a place in Italy, between Salernum and Marcellianum in the Appian way, called also Ad Codorum.

Ad Caprae paludis, or Caprata, a country near Rome in which Romulus died.

Ad Capras, Caprae, Caprae, a district of Umbria in Italy, where Totila, king of the Goths, died of his wounds.

Ad Castra, a denomination given by the Romans to several places where they had castra or camps.

Ad Centenarius, a place of Gaul, about five miles from Summus Pirinccus, belonging to the Sardones.

Ad Centumvarum, a place in Italy, south-east of Aefenum, so called, because it was at the distance of 100 miles from Rome. The Romans, who paid great attention to the measurement of distances, denominated places by their distance from Rome, in miles.

Ad Centuriones, a place in Spain near the Pyrenees.

Ad Columnat, a place in Italy, five miles from Ravenna.

Ad Columna, was situated in Brutium, north of Rhegium, and opposite to the town of Neapolis, in Sicily.

Ad Confluentes, a place in Italy, between Cesena and Rimini: and another small place near Parma.

Ad Cottii, Corez, was situated between Verelle and Laumellum, in Italy.

Ad Greci, now Oran, a place of Mauritania Cilicia, in Africa.

Ad Dianum, a place of Numidia, in Africa, 32 miles from Hippo-regius.

Ad Draco, a place in Mauritania Cilicia, between Alumbula and Regia, south-west of Sigia: there was also a place of the same name in Armenia minor in Asia, between Otter and Ava.

Ad Duas Columnas, a place of Italy, between Laumellum and Tifernum.

Ad Druidecum, the name of a place in the Cottian Alps, south-east of Segusio, and of another in Italy, north-west of Patavium.

Ad Duridecum, a name applied to several places, one in Magna Graecia north of Hydruntum; another belonging to the Aedini, between Angitiodunum and Cabillonum; another in Gaul, between Divizardum and Decem Pagi, belonging to the Mediomatrici, and another, now Godward, between Noviomagnus and Lugdunum Batavorum.

Ad Duas Pontes, a place in Spain between Vicus Scarum and Grandinimum.

Ad Ensens, a small place in Umbria, north of Iguvia, in the Flaminian way between Hevillus and Cale.

Ad Fanum Martis, a place of Gaul in the Cottian Alps, west of Ocelium.

Ad Ferriam, a place near Mount Soracte, in the territory of the Falisci, north of Rome, where were a temple and grove consecrated to the goddess Ferona. There was another Ferona south-east of Luna, near the road to Luca.

Ad Ficium, or Fetas, a place of Numidia, south of Igligilis.

Ad Flaminia, a denomination given by the ancients to several places, because they were on the limits of a country. There were several places of this name in Italy, Belgium and Gaul. See Ad Fines.

Ad Flexum, a place in Italy, between Brixia and Ariolica, West of the lake Benacus.

Ad Flumen, a place in Pannonia, corresponding to that which is now called Saint-Veitam Flauin, in Croatia.

Ad Fromulas, a place of Norica.

Ad Gallum Gallinacium, a place of Africa proper, in the road from Utica to Carthage.

Ad Graces, a place of Italy, north of Clusium, and west of Cottone.

Ad Hercules, the name given to the port of Leghorn in Tuscany: also to a small place in the island of Sar-dania; and to another 12 miles from Gades, called Tempulum Herculis.

Ad Horrea, Canes, a place of Gaul, between Antipolis and Forum Julii, pertaining to the Oxbi.

Ad Interius, a place of Italy, belonging to the Senones, between Calam and Forum Sempronii.

Ad Latini, a place of Pannonia, in the route from Sirmium to Salona.

Ad Luminata, was situated between Varia and Carceoli in Italy, and belonged to the Aequi.
An *Lupus*, a place of Spain, between Ceclionica and Scenice.

An *Tauricius*, now *Argentea*, in Gaul, belonging either to the Morini or Ambiani.

An *Mora*, the name given to different places in Umbria, Etruria, and the Alps.

An *Matrona Magna*, a place belonging to the *Hirpini*, supposed to be the situation of the abbey on Mont Vergine.

An *Mole*, a name given to a place in the island of Sardinia, to another of Insubria in Italy, and to another, called *Meza*, in that part of Latium in Italy inhabited by the Volsci.

An *Morum*, was situated in the route from Carthage to Calabria, between Elicorea and Bali.

An *Novum*, a denomination given to several places, whose distance was nine miles from a more remarkable station; one north of *Boville* in the Appian way; another in Campania, nine miles from *Capua*; another, nine miles from *Mediolanum* or Milan, now *Mingan*, according to *Chivier*; another in *Venetia*, south-east of *Altinum*, another west of *Aemona*; and another, denoting a situation in Gaul among the Tologas, between *Tulfolis* and Badera.

An *Aquileia*, a place in Italy, near the mouth of the Rubicon, on the borders of the Adriatic gulf; another place in Italy belonging to the Sabines; another in Spain between Ilerda and *Tarracon*; another in Etruria, south-east of *Cofa*, and another north of *Chirum*; and another in Upper *Mafia*.

An *Oltysium*, an appellation denoting the distance of eight miles from a well-known and principal place; one in Italy belonging to the *Taurini*, and another in Umbria, partly occupied by the *Senones*; and another in *Dura Minor*.

An *Olivea*, a place of Africa, in Numidia, south-east of *Saldae*, and south of *Tubuscapus*; and also another in Sicily, in the route from *Agrigentum* to *Lilybaeum*.

An *Oppidens*, a place of Campania in Italy, near the sea, and three miles from *Pompeii* and *Stabiae*.

An *Paeum*, a place in Venetia upon the *Athesia*, four miles south of *Tridentum*.

An *Pericatia*, a place near *Ticinum* or *Popes*, still called *Sanctia Maria del Pertiche*.

An *Pinaea rubra*, or *ad fissa rubra*, a place near *Fidenae*, now *Borghezzia*.

An *Pirum*, a place of Italy in the *Apennines*, 12 miles from *Venetia*, in *Apulia*. Another is also in the extremity of Italy in the Juliana Alps, in the route from *Aquilaeia* to *Aemona*.

An *Pirum*, a place of Italy in the *Sannio*, and another, with the addition *Pulianem*, in the Adriatic gulf, between *Metaurus* and *Sena Gallica*.

An *Postum*, a denomination given to several places which had bridges: one in Great Britain, now *Lincoln*; another of *Boetica* in Spain, between *Gades* and *Corduba*; another *Zenini*, in *Vindellia*; another, *Ibisa* in *Noricia*; another, *Muri*, in *Noricia*, now *Muravia*; another, *Santii*, south-east of *Forum Julii*.

An *Puteum*, a place of Gaul, on the confines of the territories of the Allobroges and Centrones, between *Catusaria* *Mantala* and *Obitum*.

An *Quinum decimum*, a place in *Venetia*, E. of *Aemona*.

An *Quintum*, a place of *Magna Grecia*, in *Apulia*; and of Italy in *Lattium*, on the Latin way.

---

An *Regiana*, a place of Upper *Media*, on one of the streams which form the river *Cosus*.

An *Rheuma*, a place of *Numidia*, in *Africa*, between *Cirta* and *Lambrilla*.

An *Rutae*, a place of *Italy* belonging to the *Cenomani*.

An *Rubicon*, a place of *Boetica*, in *Spain*, belonging to the *Tardian*, and another of *Mauritania*, in *Africa*, between *Cabis* and *Ad Regias*.

An *Sicilia*, a place of *Scythia*, situated on the borders of the Black Sea, near the most southerly mouth of the Danube.

An *Salutricum*, now *Sparta*, a small place on the Adriatic gulf, between the confines of the *Preutii* and *Veflini*.

An *Sancta*, a place of *Italy*, situated according to *Chivier* in *Venetia*.

An *Septimania*, a place in *Spain*.

An *Septimania*, a name given to two places in Italy: one in the Claudian way, west of *Rome*, and south-east of *Veii*; and another in *Etruria*, west of *Sena*.

An *Septimania*, the name given to two places on the Adriatic gulf, 12 miles from *Sena Gallica*.

An *Sestum*, a name given to two places in Italy: one in the Claudian way, west of *Rome*, and south-east of *Veii*; and another in *Etruria*, west of *Sena*.

An *Silesia*, a place on the Adriatic gulf, belonging to the *Tridenti*, and another on the Adriatic gulf, between the Alps, the Danube, and the Pyrenees.

An *Silia* in *Africa*, a town called *Septia*, whence the modern *Centum*.

An *Septimania decimana*, a place of *Spain*, 17 miles from *Tarraco*.

An *Sex Insulae*, small islands, whose situation is not precisely ascertained; but *M. d'Anville* places them near a small promontory, south of *Malaen* in *Boetica*, and north-east of *Preutii*, on the coast of *Mauritania Cesaribrensis*.

An *Scotia*, or *Ad Scotiae*, a place situated by the Pontianian tables on the Adriatic gulf, 12 miles from *Sena Gallica*.

An *Sestum*, a name given to two places in Italy: one in the Claudian way, west of *Rome*, and south-east of *Veii*; and another in *Etruria*, west of *Sena*.

An *Silenus*, a place in Gaul, belonging to the *Sobaria*, in the south-west, and *Andecina* in the north-west, on the borders of the *Rutani* and *Gals*

An *Silvium*, or *Ad Silvium*, is a place of *M. d'Anville* in *Apulia*, between *Venetia* to the west, and *Ereta* to the south-east.

An *Sileria*, a place of *Etruria*, in *Italy*.

An *Sorona*, a place marked by *Antonius*, 25 miles from *Emerita Augusta*, in the road across *Spain* to *Cesar Augusta*.

An *Spesina*, a small place of *Italy*, in *Messapia*, in the sea-coast, west of *Brundisium*.

An *Sponsus*, a place of *Italy*, in the Appian way, between the postum of *Tres tabernae* and *Forum Appii*.

An *Stabulum*, a postum of *Gaul*, between *Illyria* to the north-east, and *Ad centuriones* to the south; situated at the foot of the *Pyrenees*, and belonging to the *Sardones*.

An *Statone*, a place of *Etruria*, in *Italy*, 25 miles from *Artium*, and 12 from *Clunium*; another between *Labium* and *Preutii*, in the *Labican* way; and another in *Pannonia* on the Danube, between *Lusitania* and *Ipsa*.

An *Tabernum frigidum*, a place of *Etruria*, in *Italy*.

An *Taraco*, a postum in *Taras*.

An *Templum*, a place of *Africa*, to the south of *Byzacene*.

An *Titulus*, a place of *Liburnia*, in the route from *Tergelia* to *Tarbatica*.

An *Tres Insulae*, small islands placed by *M. d'Anville* in a small gulf, south-east of *Rufus*, south-west of *Siga*, and nearly south of *Charidemum*, pertaining to *Boetica*.
An 

An *Tebanos*, a place in Italy on the Appian way, 17 miles from Aricia, called Cattello.

An *Ticinum* is situated 30 miles, as the name imports from Aquileia, now Treviso; another position in Gaul, 50 miles from Narbona Martius, whence the itinerary reckons the distances.

An *Tyrus*, a place in Italy in Brutium.

An *Turia*, a place of Sardinia, known by the name of Turris Libisonis. It is also the name of a place, called Turres, in a part of Gaul, called the third Narbonne, pertaining to the SUcteri, north-east of Mariilla, and south-east of Acque Sextiae.

An *Turris*, a place in Italy on the Aurilian way, in the territory of Cercit; another, on the Appian way in Brutium, north of Vibo; another at the extremity of the promontory Circeae: another, in Liburnia, on the road from Aquileia to Signia, south-east of Taras: another, in Spain, between Valletia and Carthago; and another between Auguita Eemira and Auguita Caearea. *Ad Turres alba*, is a place in Italy between Circeae and Antium.

An *Undretin*, a place of Venetia in Italy, west of Aquileia, in the road that leads to Altium.

An *Urbanus*, a place of Campania in Italy, between Capua and Teanum, called by M. d'Anville, after Pliny, Urbann, and also Colonia Silana, from the colony established here by Sylla.

An *Vigetum*, a place of Italy, 20 miles from Rome, on the Flaminian way, south-west of Capena; another, in Lucania, on the gulf of Tarcentum, north of Sybaris, and south of Hercules; another, in Asia Minor, in the road from Trapezus to Satala, in Armenia Minor; and another, called by M. d'Anville *Ad Vigetum*, south-east of Tolos, between Badera and Elufo.

An *Victorina*, a small place of Italy in the road from Mutina to Bononia.

An *Villam Seriolanum*, a place of Numidia in Africa, 20 miles from Hippo Regius, in the way to Cirta.

ADA, in Geography, a town of Africa, in the province of Caria.

ADA, in Geography, a town of Media.

ADA, in Geography, a lake whereon one of the branches of the Tigris flows.

ADACHA, a town of the Palmyrene region in Asia.

ADAJ, compounded of Ad with ida, was used, fays Mr. Bryant (Anal. Anc. Myth., vol. i. p. 23.) for a supreme title, with which both kings and deities were honoured.

Macrobius (Saturn. i. i. 23.) fays, that it signified one, and was so interpreted by the Alfeans, who gave this name to their supreme deity. 'Mr. Bryant supposes, that what Macrobius renders one, should be first or chief; and he observes, that it was a sacred title, and when single, was conferred upon a Babylonish deity, but when repeated, it denoted greater excellence. We read of Adad, king of Edom. Gen. xxxvi. 57. 1 Kings xi. 14. And there was another of the same name at Damascus, whose son and successor was denominated Benhadad, 1 Kings xx. 17. The kings of Syria, according to Nicolas Damaicas (see Joseph. Antiq. i. viii. c. 5.) for nine generations had the name of Adad. The god Rimmon was called Adad. Zechar. xii. 11. The feminine of Adad was Ada, and this was a sacred title, and appropriated by the Babylonians to their chief goddesses. The authors of the Ancient Universal History are of opinion, that Benhadad II. was deified by the Syrians, under the title of Adad or Adar. By Adad they meant the sun, and represented him with rays darting downwards to express his beneficence. But this honour would have been more fitting to the prosperity of Hazael than of Benhadad, who was often unfortunate. And Josephus (Antiq. i. vii. c. 6.) informs us, that they were both deified. Adad was not properly a Babylonian deity, but one who had been deified by the ancient Syrians, and probably revived again after the destruction of the Babylonian empire, whole new gods must have brought him into disfavour. Adad, thus degraded, and afterwards reinvited, was the sun, as well as Bel or Baal, Ominus and others. Anc. Un. Hist. vol. i. p. 443. vol. iii. p. 391. 8vo.

ADAJ, a city of Judah, situate in the plain of Megiddo, in the valley of Jezebel, in the half-tribes of Manasseh; where Josiah, king of Judah, was killed by Pharaoh Necho, king of Egypt. It was afterwards called Maximinopolis, in honour of the emperor Maximilian. It is 17 miles from Caearea in Palestine, and 10 miles from Jezebel Calmit.

ADADA, in Ancient Geography, was a town of Pisidia to the south-east of Seleucia. There was also a town of the same name in Syria, situate to the north-west of Palmyra, and at no great distance from it. We also find a place of this name mentioned by Josuah, (ch. xv. 22.) and lying in the south of Judah, towards the borders of Edom.

ADAL, a town of Phrygia, which Strabo places at the foot of Mount Ida.

ADAI, a people of Arabia, placed by Ptolemy in Egypt, in a country encompassed by mountains near the latter cataract of the Nile.

ADAGE, a testamentary provision or popular saying. Eresinus has made a large and valuable collection of Greek and Roman adages from their poets, orators, philosophers, &c. Mr. Ray has done the same with regard to the Anglo-Latin; and Kelly has made a collection of Scots proverbs.

ADAGIO, in Music, one of the words used by the Italians to denote a degree of distraction of time. Adagio expresses a slow time; the slowest of any, as some have said, except grave. Used simphonically, it signifies a slow movement. Sometimes this word is repeated, as adagio, adagio, to denote a still greater retardation in the time of the music.

Adagio has been laid by Rouille and others to be the slowest degree of time in musical measures, except grave; however, we think that exception erroneous. In Corelli's works and those of his contemporaries, we find that quavers in adagio, vocal and instrumental, are sung and played as slow as crotchets in grave. An adagio in a song or solo is generally, little more than an outline left to the performers abilities to colour; and the performer who is not enabled to interest an audience by the tone of his voice or instrument, and by taste and expression, should never be trusted with slow notes, in the performance of which the smallest defects are so easily discovered; and if not highly embellished, they soon excite languor and disgust in the listeners. The talent of executing an adagio well, in which performers of great powers of execution often fail, is a merit of the highest classes which a musician can possess.

ADAGUESA, in Geography, a town of Spain, in the province of Aragon, and diocese of Balbastro, situate on the Vero. N. lat. 41° 56'. E. long. 20° 4'.

ADAGUSUS, in Mythology, a Phrygian deity, whom Bochart takes to be Hermaphroditus, the son of Venus and Mercury, from the similitude of sound between Adagius and Androgyne.

ADAJA, in Geography, a river of Spain, which runs into the Duero between Simancas and Tordesillas. C e
ADAIA, Porte de, a large harbour on the north-east of the island of Minorca, well sheltered by the mountains from north-west winds. It is north-east of mount Toro.

ADAIR'S Harbour lies on the west side of Falkland found, and nearly opposite to Jordan's bay on the east coast. It is distinguished by a high hill to the north-west of it. Within the harbour the water is from eight to ten fathoms deep; but the numerous rocks and breakers on the coast are dangerous. This harbour is by some called Port Howard.

ADAL, in the sense of Paracelsus, signifies that part of plants in which their medicinal virtue consists; or the pure and active parts of plants, separate from the impure and inert.

ADALBERON, or ADELARD, in Biography, the son of count Bernard, grand-son of Charles Martel, and confid-german of Charlemagne, was born about the year 753. Having abandoned the court for the religious habit, he was nominated to the abbey of Corbie, and afterwards appointed prime minister to Pepin king of Italy. In 823, he founded the celebrated abbey of New Corbie, in Saxony; and died January 2, 866, at the age of 72, much lamented by the virtuous and the learned. He was an excellent linguist, and denominated the Augustine of his age. His principal work was, "A treatise concerning the order, or the state of the palaces, and of the whole French monarchy." Biog. Dict.

ADALBERON, ASCELINUS, was an ambitious prelate, and a fervile courtier. He was consecrated bishop of Laon in 977, and died in 1030. He is the author of a fa- timatical poem, dedicated to king Robert, of which an edition was published in 1653, by Svo. by Adrian Valois, at the end of the panegyric on the emperor Berenger. It contains several curious historical facts. Biog. Dict.

ADALBERT, a German divine of the tenth century, arch-bishop of Magdeburg, was educated in the monastery of St. Maximin of Treves, and was employed in 914, to preach the gospel to the Russians. He was more successful after his return from this embassy, in his labours among the Slavonians on the borders of the Elbe and Oder. He died in 981. Dupin's Eccl. Hist. 10th cent. vol. iv. p. 58.

ADALBERT, bishop of Prague, in the tenth century, was one of the first founders of the Christian religion in Hungary. He also preached the gospel in Prussia and Lithuania, where he was murdered by Sgo, a pagan priest. Dupin, ubi supra. Mohrme's Eccl. Hist. cent. 12. vol. ii. p. 378. Svo.

ADALIDES, in the Spanish policy, are officers of justice for matters that respect the military forces. In the laws of king Alphonus, the Adalides are mentioned as of- ficers appointed to guide and direct the marching of the forces in time of war. Lopez represents them as a sort of judges, who take cognizance of the differences arising upon excursions, the distribution of plunder, &c.

ADALUS, in Ichthyology, a name given by authors to the Sturgeon.

ADAM, in Biography, the first man whom God created, and the original parent of the whole human race. He was formed by an immediate act of divine power, out of the dust of the ground, as his name imports, on the fifth day in the scripture-arrangement of the works of creation; and God breathed into his nostrils vital breath, so that he became a liv- ing soul or person. Gen. ii. 7. We read also, Gen. i. 27, that God created man in his own image. He was then placed in the garden of Eden, a particular district which was previously ordained and adapted for his subsistence and accommodation. In process of time, probably after some experi- ence of the inconveniences of solitude, and after he had found that the various animals which had pased in review before him, and to which he had given names, afforded no proper companion, he was provided with a suitable helpmate; who, being formed of a rib taken out of his side, when he was in a deep sleep, as the history informs us, Gen. ii. 21, was called ה個人資料, or woman. Adam and Eve thus created as fit associates for each other, did not long enjoy, with the security and satisfaction of innocence, the happiness which was designed for them. In the garden, which was the appointed place of their residence, and from the productions of which they were to derive the means of their support, there was one tree, called the tree of the knowl- edge of good and evil, the fruit of which they were forbidden to eat; and the prohibition was enforced by the awful func- tion, that in the day they did eat of it they should surely die. Gen. ii. 17. The woman, deluded by the misrepresentation of the serpent, and by the alluring appearance of the fruit, disregarded the prohibition; and having herself tasted it, gave it to her husband, who likewise shared her guilt; and they both became obnoxious to the threatened doom. The consequences of their transgression were shame and fear. The man was also subjected to labour, and the woman to the pain of child-birth, and to the dominion of her husband. They were both excluded from paradise, and their return to it was prevented by an awful apparition, i. e. by cherubic and by a flaming sword. Gen. iii. 24.

After their expulsion from paradise, they had several children; but of these the scripture records the names only of three, viz. Cain, Abel, and Seth. The life of Adam was prolonged to the age of 930 years. The time of the death of Eve is not recorded in scripture; but some have presumed to say, that she survived her husband ten years. Such is the concise account which the scriptures give us of the origin of the human race: but this account, even if we allow Moses to have been the writer of it, was not compiled till about 5500 years after the creation; and, in the opinion of many, it is either wholly, or in part, confused with allegory, that it is not easy to give a satisfac- tory explication of every circumstance to which it alludes. Whether it be understood literally or allegorically, it suggests many curious questions, which have furnished scope for much learned criticism, and for a variety of fanciful conjectures.

As to the etymology of the name Adam, the greater number of biblical interpreters have derived it from.Adamathos, or Adamathos, signifying the earth or mould, or as some render it, the red earth, of which he was formed. According to Mr. Bryant, Ad denotes first, or chief; and in this sense it may be applied to the appellation Adam. This conjec- ture is confirmed by the use of the term protagons, or first made, in Sanchoniatho, which seems to be the Greek translation of the Egyptian title of Adam, taken, as this author professes, from the pillars of Thoth; and also by a hint of that ad- mirable lexicographer Sir William Jones, in his Asiatic Researches, who queries whether Adam may be derived from Adem, which in Sanscrit means the first, and is the name of the first Men. Mr. Parkhurst supposes the name Adam to be de- rived from מַעַן, damath, used for likenesses, (Gen. v. 1) and thus to denote the likeness of God, in which Adam was created. Ludolfus (Hist. Ethiopia, p. 77.) deduces it from the Ethiopic Adamab, which signifies beautiful, el- egrant, or pleasing, and refers it to the absolute perfection of his frame and shape, as being the master-piece, to speak more humano, of his creator. But whatever be the true etymology of the name, it is an appellative, rather than a proper name, and comprehends both the sexes.

The time of the year in which Adam was created has been
been also a subject of discussion. This has been most generally supposed to be the autumnal equinox, which is the era from which the year anciently commenced.

According to Blair, in his first chronological table, Adam and Eve were created on Friday the 28th October, ante Christum, 4004, and Adam died 3974 ante Christum, at the age of 930 years.

Another subject of inquiry has been the place where Adam was created, and in which his first habitation was assigned. See Eden.

A considerable difference of opinion has prevailed with respect to the vesture of Adam's intellectual faculties, and the degree of knowledge which he possessed at the time of his formation. We may reasonably imagine, that, as our first parents were created in an adult state, they were immediately capable of the full exercise of their natural powers and faculties; and there is a certain dignity of intellect, as well as rectitude of will, that is probably implied in the expressions "our image," and "our likeness," in which God is said to have created them. Mr. Shuckford, however, (Creation, &c. of Man, p. 74, &c.) refers this expression to the structure of his body, which was superior to that of other living creatures, agreeably to Ovid's description, Or hominlim fudine dedi.—Metam. or to Cicero's (De Leg. Lib. i.) Fugum corporis habemus a optum ingenio hominis dedi, &c. And he supposes that this is an Hebrew form of speech, which refers to God whatever is most excellent in its kind. He adds, that this expression denotes his designation for immortality, so that sin introduced death. But whatever were Adam's original powers, without exercise, and without experience, his actual knowledge must have been, in a very considerable degree, restricted and partial. It seems, therefore, unreasonable and unnecessary to suppose, that he was endowed with a much greater comprehension and vigour of mind, and with a greater compass of knowledge than any of his descendants; and that he was, in real attainment, as well as in capacity of improvement, little inferior to higher orders of beings. The knowledge that was adapted to his condition, and that was subservient to immediate use, was without doubt communicated to him at his first formation; and as he had no native prejudice and no irregular propensity or bias to mislead him, he possessed peculiar advantages for extending his knowledge, and more especially his moral improvement. But as religious principles, devout affections, and virtuous dispositions are established and strengthened by exercise and discipline, it may be supposed that, without some supernatural assistance, which his history does not mention, he would be liable to be seduced and overcome by a temptation, which the maturity of habit, and the wisdom of experience might have enabled him to withstand. See Fall of Man and Original Sin.

Adam possessed, without doubt, the necessary powers of articulation, and the faculty of speech; but in the exercise of these faculties he must have been puzzled and perplexed; nor is it easy to conceive, that the few words of which even the feint vocabulary that served his necessities consisted, could have been invented by him, nor the signification of that language, which was afterwards enlarged and improved, could have been devised by him without a supernatural communication. See Language.

How long our first parents continued in paradise before or after their fall is a question, for the solution of which we have no sufficient evidence, nor indeed such questions of any real importance. It is probable, that they were not removed to any great distance, and that they found scope enough for their attention and labour near the spot where they were first settled, and from which they were excluded, according to the literal acceptance of the scriptural history. The scriptures give us no information as to the place where Adam was buried. St. Jerome inclines to the opinion of those who think, that he was buried at Hebron, in the cave of Machpelah, afterwards bought by Abrahah for a burying-place. The eastern Christians say, that he gave orders to have his body embalmed, and deposited in a cave on the top of a mountain, which cave was called Al-kuss, from an Arabic word which signifies to lay up privately; and it is alleged, that this order was given to prevent his posthumity from worshipping his relics. It is added, that he ordered his body to be placed in the midst of the earth, because thence should proceed his salvation, and that of his posterity. The primitive fathers generally believed, that he died in the place where Jerusalem was afterwards built, and that he was interred on Mount Calvary, on the spot where Christ was crucified; and where a chapel was erected in honour of him. Some of the Arabians inform us, that he was buried on Mount Aboucais, near Mecca; but the ancient Persians say, that he was buried at Serendib, where his corpse was guarded by lions at the time of the war of the giants.

As to the reversion and fables of Jewish Rabbins and Mahometan writers, they are scarcely worthy of being received. As a specimen, however, the following particulars may be exhibited.

Some of the Rabbins say, that Adam was distinguished by his personal beauty, and that God, before he formed him, assumed a human body, after the pattern of which he was created. They also pretend, that his stature was so gigantic, that it reached even to the heavens, and extended from one end of the world to the other; and that it was reduced after his transgression, first to the measure of 100 ells; and, as others say, to 1002, or 900 cubits, which was done at the request of the angels, who were terrified at his enormous stature, or who were envious and jealous in this account. Thus they pretend he was able to pass through the ocean, which separated Eden from the other parts of the world. Similar to this is the description given of Polyphemus by Virgil, "Exs. I. iii. v. 604, and of Orestes, "Exs. I. x. v. 763." Writers of this class affirm, that Adam was at first both male and female, and that he confessed of two, and joined one to the other; and that Eve was formed by merely separating the human body from the animal. But more absurd even than this is the opinion of Parchelius, (vid. Vossium de Philos. c. ix.) Negoitum primae parentes ante lapum habuisse partes generationis hominis necessarias: credebant pedes saccatos, ut hominum gutteri. The Jews, in order to exalt the importance of the rite of circumcision, affirm, that Adam was created in this state, and that one part of his transgression consisted in his attempt to obliterate the traces of it. Some of them have also imagined, that Eve was the forbidden fruit, and that Cain was the production of the serpent, &c.

The Mahometan writers, in their account of the creation, and first state of man, blend many fables with the particulars, which they seem to have borrowed from the Jewish scriptures. They say, that Azrael, notwithstanding the pre-intimation which he had received of Adam's rebellion, executed the commission for creating him, though the other angels to whom it was proposed had declined the office, and for this reason he was called the angel of death. The earth of which he was formed was, as they say, carried into Arabia, to a place near Mecca, where it was prepared by the angels, and fashioned into the human form by God himself. The angel Eebits, afterwards the devil, dreading a superior, treated
treated the materials of the human frame, which were left to dry for forty days, or as some say, so many years, with contempt. The clay, it is said, was animated by the Almighty, and endowed with an intelligent soul; and Eve was formed after Adam had been placed in paradise, out of his left side. This paradise Mohammed conceives not to have been on earth, but in the seventh heaven. When our first parents were call from paradise, Adam is said to have fallen on the isle of Serendib, or Ceylon, and Eve near Mecca, and after a separation of 700 years, they were conducted to each other by the angel Gabriel, on a mountain near Mecca, and afterwards removed to Ceylon, where they propagated their species. In this island there is a mountain called Pico de Adam, on which they flew the print of Adam’s foot, of an enormous size. Salt’s Koran, c. ii. p. 4. &c. The Robbins and Muffulans give strange reports of Adam’s knowledge. They ascribe to him the invention of the Hebrew letters, and a degree of inspiration, which enabled him to write a great number of books on different subjects, particularly one on the creation, and another on the Deity. They say, that he was the author of the 92d psalm, which was composed immediately after his creation. We have also an account among the apocryphal writings of a book called the “Revelations of Adam;” and there is another mentioned by pope Gelasius, called “Adam’s Paradise.”

Adam and Eve are honoured among the Greeks on the Sunday preceding the festival of Christmas; and on Feb. 4, the first day of their Lent, they commemorate their exclusion from paradise with religious mourning and humiliation. In some Latin martyrologies there are fixed days for the commemoration of Adam; as March 25, April 24, and Dec. 24.

Of the opinion of Tatian concerning Adam, see TATIANITES.

Adam, Melchior, a writer of the 17th century, was born in the district of Grotkaw, in Sileia, and educated in the college of Brieg. He was appointed rector of a college at Heidelberg, where he published his first volume of illusory men, “Vita illusoriorum virorum,” in 1615. This volume consisted of philosophers, poets, writers on polite literature, historians, &c. It was succeeded by another, in 1619, which treated of divines; by another of lawyers; and by a fourth of physicians, both of which were published in 1620. The subjects of these volumes were the lives of learned men, who were either Germans or Flemings of the 16th, and beginning of the 17th centuries; in 1618, he published a volume containing the lives of twenty divines of other countries. All his divines, however, were protestants. The Lutherans thought him partial, and will not allow his work to be a standard of the learning of Germany. He wrote other works, such as: “Apographum monumen tum Heidelbergicum;” “Nota in orationem J. C. Scaligeri pro M. T. Cicero uno contra Ciceronianum Erafmi;” and “Paradox et metaphyras Horatianae.” The catalogue of the Bodleian library ascribes to him the “Histria ecle siat. Hamburg et Bremen,” which, according to Mr. Bayle, was written by Adam, a canon of Bremen, in the 11th century. This work begins with the reign of Charlemagne, and ends in the time of the emperor Henry IV. To this work is annexed a description of Denmark, and the other northern kingdoms, with an account of the religion and manners of the inhabitants. The last edition of it was printed at Helmstadt, in 40.; in 1670. Bayle gives to Melchior Adam the character of an industrious collector, and acknowledges himself much indebted to his writings. He died in 1622. Gen. Diét.

Adam, Scotus, a doctor of the Sorbonne, who lived in the 12th century. He was born in Scotland, and educated in the monastery of Lindisfarne, now called Holy Island, near Berwick upon Tweed. He afterwards went to Paris, and became a teacher of school divinity in the Sorbonne. Towards the close of his life he returned to his native country, and became a monk, first in the abbey of Melrose, and next in that of Durham, where he wrote the lives of Columbus, and of other monks in the 6th century. He also wrote the life of David I. king of Scotland, who died in 1153. His works were printed at Antwerp, in fol. in 1559. Gen. Diét.

Adam, Lambert Sigisbert, an eminent sculptor, was born at Nancy, in 1702, and first instructed by his father, who exercised the same profession. In 1719, he came to Paris for further improvement. From thence he went to Italy, where he spent ten years, and finished several considerable works, one of which, viz. the restoration of the mutilated group of the family of Lycomedes, discovered by cardinal Polignac, in the ruins of the villa of Marius, gained him great applause. He also formed a model for the fountain of Trevi, which was much approved, but he was prevented from executing it by the jealousy of the Italians. After being admitted a member of the academy of St. Luke, at Rome, he returned to Paris in 1733. Here he executed several designs for the decorations of palaces, gardens, &c. of which the most celebrated are a group representing the union of the rivers Seine and Marne, at the cascade of St. Cloud, two groups of hunting and fishing, Neptune calming the sea, the triumph of Neptune at Verfailles, the base-relief of the chapel of St. Adelise, St. Jerome, Poetry, and Mars cared for by Love. In 1754, he published a collection of ancient Roman and Greek sculptures, delineated by himself, and engraved by able artists, in folio. Excess of application brought on an apoplexy, of which he died in 1759. The style of his works is harsh and savage, resembling rocks by their deep cavities and asperities; but they manifest an acquaintance with the antique, and furnish specimens of patient thought and labour. Gen. Biog.

Adam, Nicholas Sebastian, second brother of the preceding, was born at Nancy, in 1705. From Paris, whither he went for improvement, he removed to Rome in 1725, and affidavtually applied for nine years to the study and imitation of the antique, devoting his leisure hours to painting. In 1734, he came to Paris, and by his models of Christ and the furniture of Iphigenia, obtained the applause of the academy of painting. He also admirably succeeded in his model of Prometheus chained to the rock. His base-relief for the chapel of Versailles, representing the martyrdom of St. Victoria, is reckoned one of his best performances. He afflicted his brother in executing the group of Neptune; and, in 1740, he obtained the apartment of the deceased Rouf sean, in the Louvre, which is a favour granted only to excellent artists. In 1747, he was urged, by liberal offers, on the part of Frederick king of Prussia, to remove to Berlin. His younger brother, to whom the offer was made by the elder Adam, accepted the proposal; and Nicholas remained at Paris, where he was employed by king Stanislaus in executing a monument for his queen in a mausoleum near Nancy. His last performance was the Prometheus, which was greatly admired. This artist was estimable for the simplicity, integrity, and mildness of his character, which conciliated the friendship of his brother artists. He lost his fight several years before his death, which happened in 1778, at the age of 74. Gen. Biog.

Adam, Gablard, was born at Nancy, in 1710, and pursued the fame course of studies with his brothers above-mentioned.
[Text content not visible]
that from the coast of Coromandel is of a foliated texture, and seems in fact to be confusedly crystallized, but its fp. gr. is only 2.73.

Adamantine spar is used throughout India and China for the purpose of polishing steel and gems, for which its great hardness renders it peculiarly well adapted. Of the mines of this stone, and the method of procuring it in China and Bengal we have no account, but some interesting topographical information respecting the corundum of the coast was procured by Mr. Greville in 1792. In the Myfory country, about four miles south of the river Cavery not far from Caramel, is an excavation from fix to sixteen feet deep, running east and west about a mile and a half in the direction of a vein of adamantine spar that traverses a hill of gritty granite. The matrix of the vein consists of granitic fragments cemented by corundum; masses of this, weighing several pounds, are cut out with iron crowns, and then broken to pieces, among which the crystals of corundum are found; these are loaded on horsecars and bullock, and distributed to the cast of fudukars or polishers throughout India; its price, at Madras, is about fix shillings a pound.

This mineral appears to have been first brought into Europe by Mr. Bulkeley, a correspondent of Dr. Woodward, who, in his catalogue of foreign fossils, published about 1719, has the following notices: — "Nella convivium is found in fields where the rice grows; it is commonly thrown up by field rats, and used, as we do emery, to polish iron." — "Tella convivium, Port St. George, Mr. Bulkeley. It is a tallowy spar, grey with a cast of green; it is used to polish rubies and diamonds." In Dr. Woodward's additional catalogue of foreign fossils, 1725; Nella convivium is found by digging at the foot of hills about five hundred miles to the southward of this place. They use it as emery to clean arms, &c. it serves also to grind rubies by making it like hard cement by the help of flick leather mixed with it. East India. Mr. Bulkeley." From this time no further information was obtained concerning it till about 1767, when Mr. Berry, a dealer in Edinburgh, received from Dr. Anderson of Madras a box of crystals, with information of their being the material used by the Indian lapidaries to polish crystal and all gems but diamonds. They were found by Mr. Berry to cutagate, cornelian, &c. but for minute engraving were not equal to diamonds, in consequence they were laid aside as curiosities. Dr. Black ascertained their difference from all the known European minerals, and their hardness gained for them the name of adamantine spar. In 1784, Mr. Greville obtained specimens from India, together with the native name corundum, which ascertained their identity with Dr. Woodward's specimens. A description of its external characters by M. de la Merihin and Hauy appeared in the Journal de physique for January and March 1787. Its chemical composition, however, still remained unknown till Klaproth was enabled by the liberality of Mr. Greville, in facilitating some specimens for the purpose, to undertake its analysis. The extreme hardness of the adamantine spar, rendered the first attempt to decompose it imperfect: by the strongest nitrico-muriatic acid, nothing was separated but the iron, which is accidentally diffused through the Chinesc variety, and after this the most concentrated acids were digested upon it in vain. Carbonated putrid ignited together with it for two hours, was perfectly ineffectual, and even eleven times repeated calcination and fusion with caustic soda produced only a partial decomposition. The results of the analysis were principally aluminous earth, together with a matter that appeared to be either a mixture of amorphous and silicious earth, or a new simple earth with peculiar properties. In this state of the inquiry Mr. Kirwan, and several other eminent chemists, were induced to consider the adamantine spar as containing an earth fui generis, which was called the adaman- tinum, or corundum earth. Soon after Klaproth, having improved his method of analysis by the use of caustic potash as a solvent, undertook a second time the analysis of this uncommonly refractory soil in which he completely succeeded, reducing the supposed adamantine earth to alumine and filers.

The Chinesc spar yielded

The Philosophical Transactions for 1798 contain a valuable paper on corundum by Mr. Greville, which is the last addition that has been made to our information on this subject; we here find the first authentic account of the corundum mine in the Myfory, the characteristic differences between the Chinesc and Indian varieties, the crysallography of the mineral by Count Bournon, and a comparison between the characters of corundum, topaz, ruby, and sapphire.

Corundum is said to have been found in France, in the Forez, by count Bournon, and in Bretagne by Morceau; of these, however, the latter at least is said by Hauy (Journ. des Mines.) to be titanicite. Perhaps a mineral found by M. Raphe at Tirez, one of the Hebrides, which was supposed to be jade, belongs more properly to adamantine spar; its specific gravity is 3.049, and in hardness it corresponds with the matrix of corundum, that is, it will scratch glass readily, but not rock-crystall. Greville cor- rondere on corundum, Philos. Trans. for 1798. Kirwan's Mineralogy, vol. i. art. Adamantine Spars. — Klaproth's Analytical Essays.

ADAMANTINE, in the Linnean system of Mineralogy, denote the fifth order of earths, which are chiefly composed of adamantine earth. To this order belongs one species, which is the adaman- tinum or corundum.

ADAMARA, in Geography, a district of Abyssinia, near the province of Wulubbe, containing several considerable villages, that are inhabited by Mahometans; but by their number and strength contribute to the safety of the monks in that part of the country. It is so called from Adamas, which in the Anbharic dialect signifies plainland, the name of an adjacent mountain. The river Ano runs in a contiguous valley. Bruce's Trav. vol. iii. p. 179.

ADAMAS, in Astrology, a name given to the moon.

ADAMAS, in Geography, a town of Cordova in Spain, seven leagues from Cordova. Adamas is also a river of India, the source of which is said to be in the mountains of Mount Uxentus, and its mouth in N. lat. 13° 7', and long. 14° 4'.

ADAMBEA, in Botany, a genus of the polyandria monogyna class and order; the characters of which are, that the corolla has five to seven petals, the calyx is hemispherical, and parted into five or seven divisions; the capsule is hemispherical, covered by the calyx, containing five or seven cells, and papyraceous. Glendin mentions one species; but L. Marx (Encyc. vol. i. p. 399) describes two, viz. A. glabra, which grows on the coast of Mahabar, in sandy and rocky places, rises to about seven feet, and sends forth
forth branches which are terminated by panicles of fine purple flowers, large, and resembling roses; and A. biflata, which grows on the mountains of Malabar to the height of about nine feet; its branches of flowers resemble those of the former species.

ADAMI, ANDREA, in Biography, maestro di cappella to the pope, published at Rome, in 1711; a work entitled "Osservazioni per ben regolare il coro dei cantori pontifici," a very instructive work on the progress of counterpoint and refined singing in the Roman school, from the time of Palestrina to the beginning of the 16th century. Here we have anecdotes of all the great composers and singers of that school, with etchings of the heads of many of the most illustrious.

ADAM, in Geography, a town of Judah, in the tribe of Naphthali. Joshua, xix. 33.

ADAM, POMM, in Anatomy, a protubrance in the fore-part of the throat. Some fancy, that it is thus called upon a strange conceit that a piece of the forbidden apple, which Adam eat, stuck by the way, and was the occasion of it. In reality it is only the convex part of the first cartilage of the larynx, called cartilagineous and thyroides. This is usually larger in the male than in the female subject.

The name, Adam's apple, is also given to a kind of fruit frequent in Italy, resembling a lemon, said to be a good remedy against the itch. See Citrus.

ADAMIC earth, is a name which some have given to common clay, called also terra loca, rebella, and lutum. Woodw. Method. Foss. p. 4. The occasion of the name is supposed to be, that this is taken for the adamah or reddish earth, of which the first man was formed. This application is likewise given to the mud deposited by sea-water, which is a sediment of the molt shiny and perfect parts contained in it.

ADAMITES, or ADAMIANs, in Ecclesiastical History, a sect of persons who took upon them to imitate the nakedness of Adam; as if man had been reinitiatted in his original innocence. They are supposed to have been a branch of the CARPOCRATIANS and BASILIDIANs. Prodicus was that author, according to the account given by Theodoret; though, according to Tertullian and Clement of Alexandria, the followers of Prodicus were never called by this name. Epiphanius is the first writer who speaks of the Adamites, and he places them towards the end of the second century.

He professes to have no certain account of these people; but he says, that they met together, both men and women, naked as they were born; and to performed their readings and prayers and other acts of religious worship. They are a kind of monks, who reject marriage, and they call their church a paradise. When they approached their places of worship, which were made warm for their accommodation, they took off their clothes; and when they left them, they clothed themselves again. Dr. Lardner is of opinion that there never were any such people; and to this purpose he alleges, that they are not mentioned by any ancient writer before Epiphanius, and that he had no certain account of them; nor does he give the least intimation of the country or period in which this sect appeared. He does indeed say, that the Gnostics praised naked; but they were a wicked people, and practiced lewdness in their assemblies; whereas he represents the Adamites as endeavouring to imitate Adam and Eve, not only in their nakedness, but likewise in the innocence of their original state. But Dr. Lardner thinks that Epiphanius's charge against the Gnostics is not true. Theodoret's account of this sect was borrowed from Epiphanius, as he had no knowledge of Prodicus, the reputed founder of it, but what he received from Clement of Alexandria, who does not say any such thing of him. Besides, it is said that Prodicus was against praying at all; and therefore the Adamite cultum of praying naked could not be derived from him. Lardner's Works, vol. ix. 345—346.

A similar sect appeared in the twelfth century, under the direction of one Taiman, known by the name of Tanchelin, who propagated his errors at Antwerp in the reign of the emperor Henry V. This was followed by the TURBINI.

In the fifteenth century Picard pretended to re-establish the law of nature, which, according to him, consisted in two things, viz. community of women and nakedness. His followers are said to have walked naked in the public places; whereas the original Adamites only put off their clothes in their assemblies. See BUCHARD, BRETHER of the free spirited, and PICARDS.

An ingenious writer, viz. Beaufobre, has shewn that the Adamitism, i.e. the nakedness of these people, is a mere calumny, forged by their adversaries, the Calixtines and Papists, at the time when the Vandals first appeared in that country. See Beaufobre's Differtation at the end of L'Enfant's History of the War of the Huns, and Bayle's Dict. Art. ADAMITES, PICARDS and PRODICUS.

Joseph and Morti speak of Adamites in England; and indeed the Remifi and reformed mutually reproach each other with having Adamites among them. ADAMITES, a name also given by some writers to the first patriarchs, the sons or descendants of Adam by Seth; in which sense Adamites are the name with Stithes, and stand distinguished from CAINITES. There are various traditions concerning the quarrds, wars, &c. between the Adamites and Cainites.

ADAMITES, Pat. See PRE-ADAMITES.

ADAMS, in Geography, a township of Berkshire county in the Massachusets, containing 2040 inhabitants, about 140 miles north-west of Boston. In the northern part of this district, the mill-stream, called Hudson's Brook, which rises in Vermont, and falls into the north branch of Hoquflick river, has formed a deep channel, about 30 or 40 rods in length, and in some places 60 feet deep, through a quarry of white marble; and over this channel the rocks form a natural bridge, about 12 or 15 feet long, 20 bread, and 62 feet above the water.

ADAMSDORF, a town in Germany, in the circle of Upper Saxony; 1 league east of Lipsheim.

ADAMSON, PATRICK, in Biography, a Scot, prelate, who was born March 15, 1536, at Perth, of mean but honest parents, and had his collegiate education at the university of St. Andrew's, where he obtained the degree of Master of Arts. In 1566, he set out for Paris as tutor to a young gentleman; and here he wrote a Latin poem on occasion of the birth of the prince, who was afterwards James VI. of Scotland, and first of England. In this poem he gave the titles of France and England to his own prince, which offended the French court, and occasioned his arrest and confinement. As soon as he was released, he retired with his pupil to Bourges, the capital of the duchy of Berry. During the massacre at Paris, he was concealed in this place, and very narrowly escaped suffering martyrdom for the protestant religion. In his sepulture, as he called it, he wrote two excellent Latin poems, which are still extant, viz. a poetical version of the book of Job, and the tragedy of Herod, who was smitten by an angel. In 1575, he returned to Scotland and entered into holy orders, and officiated as minister of Paisley. In 1575, he was appointed one of the commissioners
Theophilus for settling the jurisdiction and policy of the church, by the General Assembly; and being in the next year deputed to report their proceedings to the earl of Morton, then regent, he was named by this nobleman as one of his chaplains, and afterwards advanced by him to the archbishopric of St. Andrews's. This preeminence subjected him to various disputes with the General Assembly, which continued for several years. In 1577, he composed a catechism in Latin verse for the use of the younger princes, which was much admired and applauded in England, France, and the Low Countries, where the author was already known by his Latin translation of the Confession of Faith, which was printed in France, during his residence in France, at the hazard of his life. In 1582, he was seized with a disorder for the relief of which he took some simple medicine that was recommended to him by an old woman. This woman was charged with witchcraft, and within three or four years executed at Edinburgh; and the prelate was traduced by his enemies for applying to the devil in order to save his life. The archbishop, however, recommended himself to the favour of king James VI. by zealously defending the episcopal order; and he was sent as his ambassador to queen Elizabeth, which office required his residence in London for some years. Queen Elizabeth was jealous of his popularity, as a preacher, and dreading the impressions which he made on the minds of the people in favour of the young king his master, prohibited his preaching during his stay in her dominions. Soon after the execution of the first earl of Gowrie, viz. in 1584, the archbishop was recalled, and sat in the parliament held at Edinburgh, and concurred in enacting several laws for settling the peace of the kingdom, and for establishing the king's authority in ecclesiastical offices. Many attempts were full renci for degrading his reputation, and making him odious to the people; nor was the royal declaration of the reasons which induced those laws, sufficient to restrain them. At a provincial synod, held at St. Andrew's in 1586, the prelate was accused and excommunicated; but upon his submission at the next General Assembly at Edinburgh, he was absolved from the excommunication. In 1588, a commission was granted by the General Assembly, before which he was cited, for trying him on account of various crimes with which he was charged. In the beginning of next year, he published the Lamentations of Jeremiah in Latin verse, which he dedicated to the king, and in which he complained of his hard usage; and at the close of the year he published a familiar translation of the Apocalypse, together with a copy of Latin verses, addressed to his majesty, and deploring his difficulties. His application, however, was of no avail. The revenue of his fee was granted to the duke of Lenox, and the prelate, with his family, were literally reduced to the want of bread. The scanty relief he obtained was procured for him in the most humiliating manner; so that he lingered out a most cheerless existence till the latter end of the year 1591. His character has been very differently appreciated by persons of discordant sentiments in religion and politics. It is generally allowed that he supported, under the authority of the king, oppressive and injurious measures; and that his bigotry and timidity involved him in the difficulties and disgrace which beclouded the close of his life. During the reverse of his condition and the trials with which he was exercised, he manifested sentiments of pious resignation. Of his learning there is no question; and he is said to have been one of the most polite prelates of the age in which he lived. Besides those pious works, which were collected and published in a 4to. volume, by Mr. Wilson, this prelate wrote many things which were never published; such as six books on the Hebrew republic, various translations of the prophets into Latin verse, predictions on St. Paul's epistles to Timothy, various apologetical and funeral orations, and a very candid history of his own times. Biog. Brit.

ADAMSTOWN, in Geography, a town of Lancaster county in Pennsylvania, consisting of about 40 houses; 20 miles north-east of Lancaster.

ADAMS, in Antiquity, is said to signify the philosopher's stone, which persons addicted to this kind of science call an animal, and, as they say, has carried its invisible Eve in its body, ever since they were united by the creator.

ADANA, in Geography, a town of Nususia, or Asa Minor, in the province of Caramania. It is situated on the river Choquin; on the banks of which, is a small but strong castle, erected upon a rock. The water of the river is brought to the town by means of water-works, which convey it into the several fountains; and a bridge of 15 arches leads to these works. The climate is healthy, and the winter mild; but the summer is so hot as to render it necessary for the inhabitants to retire to the neighbouring mountains, and to shelter themselves in groves and grottos. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulte, and herbs of all sorts through the year; besides corn, wine, and fruits in their proper season. Adana is much resorted to by the inhabitants of the other towns of Cilicia, especially from the mountain side, for its vines, corn, and other fruits, which are hence diffused into the most barren parts. It is about 32 miles north-call of Tarsus. N. lat. 35° 10'. E. long. 36° 12'.

Adana, in Ancient Geography. See Aden.

ADANATES, a people of the Cottian Alps, called by Pliny Ednates.

ADANI Infule, two islands of the Red Sea, according to Ptolemy.

ADANO. See Sturgeon.

ADANSON, Michael, in Biography, was born at Aix in Provence, in April 1727, and at a proper age he was sent to Paris, where he professed his studies in medicine, botany, and alchemy with singular zeal. He was a pupil of the celebrated Reaumur. In the year 1748, he went to Senegal, where he spent five years in examining the productions found in the neighbourhood of the famous river of that name. In return for some valuable communications respecting the geography of the country, and on the plants and animals he had discovered there, which he sent to the Royal Academy, he was made one of their corresponding members. On the death of Reaumur, in the year 1759, he was elected a member in his place, and about the same time was made honorary member of the Royal Society of London. At the end of six years, he returned to Paris, where he published his "Histoire naturelle du Senegal," 4to. containing observations on the diffeents incident to hot climates; and in 1763, his "Famille des Plantes," 2 vols. 8vo.

In February 1775, he preferred to the academy a plan of a natural history which he did not live to perfect. The time of his death, which happened soon after, is not precisely known.

ADANSONIA, in Botany, the name of which is derived from Mr. Adanson, above mentioned, is a genus of the monadnactis order and polyandra class, and belongs to the natural order of columnifera and malvaceae of Jussieu. Its characters are, that the calyx is a one-leaved semiquinquefoil, cymathiform perianthium, with divisions revolute, and deciduous; the corolla consists of five roundish, nerved, revolute petals, connected by the claws with each other; and the stamina; the stamina have
have numerous filaments united at bottom into a tube, which they crown, expanding horizontally: the pedium has an ovate germen, very long, tubulous and variously inserted:yle the stigmate are many (10) prismatic, villous and radiate-expanded: the pericarpium is an ovate, woody, not gaping, ten-celled (from 10 to 14) capsula, with farinaceous pulp, and the partitions membraneous: the seeds are numerous, kidney-shaped, rather bony, and involved in a fragile pulp. The Adianthus digitalis, Ethiopian four-podded, or Monkies' bread, called also Abasso, Guanabaens and Bababie, is the only known species of this genus. See Adar.

ADAUS, in Geography, a people of Africa, residing on the ivory coast in the kingdom of Saska.

ADAPPER, in Chemistry. See Adept.

ADAR, in the Hebrew Chronology, the 12th month of the ecclesiastical year, and the 6th of the civil year. It contains only 29 days, and answers to our February, and sometimes enters into the month of March, according to the course of the moon. On the 7th and 13th days of this month, the Jews observe two fasts: the former on account of the death of Moses, and the latter called that of Esther, in commemoration of the conspiracy of Haman. On the 14th they have a fast in commemoration of the sin from between the schools of Shamai and Hillel. The 12th is a feast in honour of two prophets at Laodicea, who preferred death to the violation of the law; some observe the 13th as a fast in memory of the death of Nicajos, an enemy of the Jews. The feasts of Purim are celebrated on the 14th and 15th days; the latter on the 14th (Esth. 2. 11.) and the greater on the 17th day. The 17th is observed in commemoration of the Sages of Israel, who escaped from Kolbik, a city of Arabia, whither they were driven by the persecution of Alexander Janmous. The 20th is observed as a feast in remembrance of the rain obtained in a time of drought, during the reign of this prince. The dedication of the temple of Zerubbabel, was on the 23rd day, Ezra, viii. 15. and the 28th was observed in commemoration of the repeal of the decree by which the kings of Greece had forbidden the Jews to circumcise their children, to observe the Sabbath, and to declare foreign worship. Selden de Syed. l. iii. c. 13. Megillat, Tannith et Gemara.

As the lunar year is shorter than the solar by 11 days, which in three years amount to about a month, the Jews then insert a 13th month, which they call Veadar, or a second Adar, consisting of 29 days. This intercalation pollutes the great feasts, &c. a whole month.

ADAR, in Geography, a city in the tribe of Judah, Joshua xv. 3. Euclides places another town of this name in the neighborhood of Lidda or Dipolpos, in the district of Tannah. ADARCE, in the Materia Medica of the ancients, a salty humour, consisting of the salts of reeds and other vegetable matter, in form of incrustations. The ancients speak of adarce, as chiefly produced in Cappadocia and Galatia, though we also read of it in Italy; and also of a native kind produced in Indian reeds, much as sugar in the cane. Its colour is like that of the fine powder of the Asfian stone, or Sarcophas, and its substance is lax and porous, much like the butterm sponge; so that it might be called the butterm sponge of the marshes. It is a topic adapted to rub and cure the skin in a leprous, fun-burning, tetter, freckles, and similar blemishes, being on the whole of a serenous quality. Dr. Piot describes it in his natural history of Oxfordshire.

The incrustations often seen about our springs, are very different in their nature and qualities from the adarce of the Greek physicians. Vol. i.
ADD on the banks of this river, in which Flaminius was victo-
rious over the Infubian Gauls.

ADD is also the name of a small district in the duchy of
Milan, where Louis XII. gained a victory over the Ven-
tians in 1509.

ADD, Ll., in Zoology, a species of small lizard described
by Mr. Bruce, and represented as a native of Atbara be-
beyond the rains, in the situation to which he refers the an-
cient island and city of Meroe. Its length is six inches
and a half; its body is round, and tail of the same form, but
very sharp pointed; its forehead is flat, of a conical shape,
and rounded at the end: the head is darker than the body, and
its face covered with black lines crossing one another at
right angles: its eyes are small, and defended by a number
of long black hairs which serve for eye-hashes: its upper
jaw projects beyond the under, and its jaws are furnished
with several short and fine teeth: its ears are large, open,
and nearly round; its body is of a light yellow colour,
crested with eight black bands: the scales are close, and
largely along the back, and their surface is polished; its legs
from the shoulder to the middle toe are near one and three-
fourths of an inch long, and its feet have five toes, each of
which is furnished with a brown claw tift at its end with
black. Its motion is very swift, though it crawls with its
belly almost close to the ground. It burrows in the sand,
but comes out in the heat of the day to bask in the sun;
and when it is not much frightened, it will shelter itself
behind stones, or in the withered roots of the abietum when
they are dried so as to be nearly of its own colour. This
is one of the few lizards which the Arabs believe to be free
from poisonous qualities, and they ascribe to it many medi-
cinal virtues. It is thought to be a certain remedy for the
elephantiasis; and to be efficacious in cleaning the skin of
the body and the face, from cutaneous eruptions; and it is
also used against films and suffusions of the eyes. Such are
the virtues ascribed to it by Arabian authors.

ADDACA, in Geography, a town according to Ptolemy,
of Mefopotamia.

ADDACE, in Zoology, the name by which the Africans
call the common Antelope.

ADDIA, in Ancient Geography, a town of Asia in the
southern part of Mefopotamia, near the Euphrates; placed
by Ptolemy in lat. 34°, and long. 77° 15', and probably
the same with Anato.

ADDUS, a river of Asia, which is supposed to be
the Anamis of Arrian, and the Antamis of Ptolemy.

ADDEPHAGIA, compound of add, much, and φταίνει,
(at), in Medicina, a term used by some physicians to denote
a greediness in children, whereby they load themselves with
new food, before the old is digested. Some use Addephagia
as a more extensive sense for voracoufness in general, so as
to comprehend the Bulimia, Pica, and Malacia.

ADDER, in Zoology, a venomous reptile of the serpent
kind, more usually called a Viper. See Coluber. The
adder is sometimes confounded with the s pf: thus the deaf
adder, spoken of in the English Bible, is not properly the
adder, but the s pf. Coluber.

The adder differs from the snake, as the former is much
shorter for its bulk, and especially its tail below the vent;
that it is marked on the back with black lines or spots,
which the snake has not; that its belly is blackish, and of one
colour, whereas the snake's is party-coloured, of a pale yellow
and blue; that it never grows to the size of some snakes;
and lastly, that it is viviparous, whereas the snake is ovipar-
ous.

ADDER, Sea, in Ichthyology, the English name of the
Syngnathus Typhle. See Sea-adder.

ADDER, water, in Zoology, a name given to the Natrix.
See Coluber.

ADDER's Bank, in Geography, a shoal which lies off the
north-west point or entrance of the river Ilissibibo, in Gui-
ana, in South America, which, with some others, extends far
into the sea, and reaches to cape Nassau, or the east point
of the river Poonarum.

ADDER-Bolts, in Zoology. See Dragon-flies.

ADDERGIEY, in Geography, a village in the district of
Salent, or Talent, in Abissinia, not far from the river Ta-
cazzi, situate amongst rugged and barren mountains, and
surrounded by a thick wood in form of an amphitheatre,
which is full of lemons and wild citrons. The river maize-
rites near the village, and precipitating into a cataract 150
feet high, at some distance discharges itself into the Tacazzi,
N. lat. 13° 24' 56". E. long. 37° 57'. Bruce's Trav.
vol. iii. p. 170.

ADDER-stung is used with respect to cattle when stung,
whilst they are grazing, by any kind of venomous reptiles,
particularly the adder. Dogs are peculiarly liable when hunt-
ing to this accident; and if relief is not obtained it sometimes
proves fatal. The symptoms are great pain, anxiety, and
swelling of the wounded part; after which, the body swells,
universally.—Oil has been given with advantage, as likewise
onions: but the remedy most to be depended on is the
cautic volatile alkali, which is the eau de lice of cabinets,
the aqua ammonia pura of the college dispensatory, and the
vapour of the shops. To a horse or ox two moderate
table-spoonfuls may be given in half a pint of milk; to a
large horse three tea-spoonfuls in the same manner, and to a
keller dog or other small animal a proportional dose. What-
ever is given internally may with propriety be applied ex-
ternally to the wound.—The adder is perhaps the only ani-
mal in our island whose bite occasions any considerable
morbic concomitances; the goat-fuckor, the hedge-hog, and
the thrush-mole, are animals perfectly ineffectual, and in-
capable of inflicting any venomous wound.

ADDER's Tongue, in Botany, a medicinal plant, so called
either from its resembling, or its curing, the bite of a viper.
It is more commonly called Cephalocereus. This is a s pf
plant, and is only to be found in April and May. It is not
uncommon in wet meadows, and is easily distinguished among
the other spring plants by its spike or tongue. It is
exclude one of the best vulnerary herbs this country pro-
duces; but it is more in use among the common people
than in the shops. They give its juice internally, and use
the herb bruised, or an ointment prepared from it with
lard, or May-butter, externally, at the same time. Farriers, &c,
prepare an ointment of this herb, called adder's tongue oint-
ment, used as a remedy against the bites of venomous baits.
Phil. Trans. vol. xliii. pt. ii. no. 112. p. 853.

ADDER's Wort. See Distorta.

ADDENTRATORES, or ADDENTRAX, in the
court of Rome, denote to the pope's mitre-bearers. Some
suppose that they are thus called, on account of their
walking at the pope's right hand, when he rides to visit the
churches.

ADDICE. See ADE.

ADDICO. See ADEPTIO.

ADDICTIONI, in Antiquity, influent perfons, or those
who being sentenced to pay a debt, but unable to do it,
were adjudged to a temporary kind of servitude to the cre-
ditor. In this sense additio were a species of ficti: from
whom, however, they differed in this, that a slave, when
discharged, became a libertus; whereas an additio became
ingenious. Again, a slave could not be discharged without
the consent of his master; whereas the additio was dis-
charged...

ADDICTIO, Addiction, in the Roman Law, a transferring or palling of goods to another, either by sentence of a court, or in the way of fafe, to him that bids mott for them. The word standsopposed to additio, or addicitione. This is formed of additio, one of the dated words used by the Roman judges, when they allowed the delivery of the thing or person on whom judgment had passed. Hence goods thus adjudged by the prator to the right owner, were called bona additio; and the debtors delivered up, in like manner to their creditors to work out their debt, were called servit additio.

Additio in diem, denoted the adjudging of a thing to a person for a certain price; unless by such a day the owner or some other person gave more for it.

ADDINGTON, Anthony, in Biography, ministered his studies at Trinity College, Oxford, where he took his degree of doctor in medicine, 1744. He then settled at Reading, in Berkshire, and there acquired considerable reputation for his judicious and successful method of treating diseases. About the year 1754 he came to London, and in 1759 was made Fellow of the Royal College of Physicians, and soon attained that eminence in his profession, to which he was entitled by his genius and talents. In a few years after, the indifferent state of his health obliging him to quit London, he returned to Reading, where he opened a house for the reception of mortal patients. In 1739, he was sent for to visit his present Major, then labouring under a severe fever, and was the first of the physicians attending him, who gave a favourable prognostic of the event of the complaint, which was soon after verified, to the great satisfaction of the country. The doctor died at Reading, on the 21st of March, 1790. While practising in London he became acquainted with the great Mr. Pitt, afterwards Earl of Chatham, with whom he lived in the strictest intimacy. It was on the recommendation of his lordship's son, then Chancellor of the Exchequer, that he was called on to visit his Majesty. By the same interces Henry Addington, Esq. his chief son, was made first speaker of the House of Commons, and having filled that arduous office, nearly through two parliaments, with great reputation, he was raised by his Majesty, in March, 1804, to the high dignity of Chancellor of the Exchequer, which his friend and patron had resigned.

The only publication we have of the doctor's, is an essay on the tea feavy, printed 1753, containing an account of a method of preserving water sweet in long voyage. This was proposed to be effected by mixing a portion of the acid of tea silt, with the water. A more effectual mode has been since discovered by Mr. Henry of Manchester.

ADDISON, Lancelot, in Biography, the son of a clergyman of the same name; was born in the parish of Crowby Ravensworth, in Westmorland, in the year 1632. Having received the rudiments of classical learning in the grammar school of Appleby, he was sent to Queen's College, Oxford, in 1650, and admitted to the degree of bachelorm of arts in 1654; and distinguishing himself by his genius and application, he became master of arts in 1657, and in 1658, was elected to be one of the Twelve Socitor or the act which was celebrated in that year. As in the occasions delivered on this occasion he reflected on the persons then in power, he was obliged to recant and ask pardon on his knees. After this he soon retired from the university, and chose for his retreat the neighbourhood of Petworth in Sussex, where zealously propagated principles of loyalty to the king, and of attachment to the church. Upon the restoration of King Charles II, he was recommended to Dr. King, bishop of Chichester, who would have provided for him, if he had not previously engaged to go to Dunkirk, as chaplain to the garrison. When that place was delivered up to the French in 1662, he accepted the same office to the garrison of Tangier, being sent to England in 1669, and was made one of the chaplains in ordinary to the king. After struggling with some difficulties by the lot of his chaplainship at Tangier, he obtained a rectory in Wilts, and one of the probends in the cathedral church of Sarum; and in 1675, took the degrees of bachelor and doctor in divinity at Oxford. Thus advanced and decently provided for, he lived in the country with hospitality, discharged his parochial duty with diligence, and devoted his leisure hours to writing on behalf of religion and the established church. In 1683 he was installed into the deanship of Litchfield, and in 1684 collated to the archdeaconry of Coventry, which he held with his deanship in commendam. After the Revolution he might, it is said, have been made a bishop, if he had not, in the convocation of the preceding year, and on other occasions, manifested a degree of zeal for the church which afforded a pretext for misrepresenting him to persons in power. His industry, however, was unquestionable, and his literary reputation universally acknowledged. He departed this life on the 20th of April, 1703, in the 71st year of his age, and was buried in the church-yard of the cathedral at Litchfield. He was twice married, and had three sons and three daughters by his first wife; but by his second wife, who survived him, he left no issue. The treatises which he published are as follow: viz. 1. WeU Barbery, or a short Account of the Revolutions of the Kingdom of Pez and Morocco, &c. 1671, 8vo. 2. The present State of the Jews, &c. with an annexed Discours on the Mishna, Genara, and Talmud, 1675, 8vo. 3. The primitive Institution, or a reasonable Discours of Catechising, &c. 4. A modest Plea for the Clergy, &c. republished by Dr. Hicken in 1709, 8vo. 5. The first State of Mahometism, &c. 1678, 8vo. 6. An Introduction to the Sacrament, &c. 1681; republished with an appendix, called the Communicant's Assistant, &c. in 1696, 12mo. 7. A Discours of Tangier, &c. 1685, 4to, second edition. 8. The Catechumen, 1690, 12mo. 9. An historical Account of the happily, denying the Godhead of Christ, 1696. The Christian's daily Sacrifice, or right Performance of Prayer, 1698, 12mo. 11. An Account of the Millennium, the genuine Ufe of the two Sacraments, viz. Baptifm, and the Lord's Supper, with the Christian's Obligation frequently to receive the latter.

ADDISON, Joseph, the son of Dean Addison, the subject of the preceding article, was born at Milton, near Ambro-bury, in Wiltshire, May 1, 1672, and being unlikely to live, was baptized the same day. Mr. Tyers says, that he was laid out for dead as soon as he was born. At the Charter-House, whither he was removed at an early age, and where he was under the tuition of Dr. Ellis, he commenced an intimacy with Mr. afterwards Sir Richard Steele, which lasted during life. At the age of 15 he was enterer of Queen's College, in Oxford; and there he soon acquired an elegant Latin style, of which a specimen appeared in a copy of verses that fell accidentally into the hands of Dr. Lancelott, afterwards provost of Queen's College, in 1675, and which induced him to procure the election of Mr. Addison as a deacon of Magdalen College in 1599: where he took the degrees of bachelorm and master of arts. His Latin poetry, in the course of a few years, gained him the reputation of a great poet; and his poems in this language, eight of which were published in the second volume,

D d 2
volume of the *Encyclopædia Londinensis* were so much approved, not only in both universities, but among foreigners, that the celebrated Dryden was led to conceive a very favourable opinion of the English genius for poetry, from these specimens of it, and to break the author in high terms of commendation. The first exhibition of his talents in English poetry was a copy of verses addressed to Mr. Dryden in the 22d year of his age, which was very much admired by the beaux-frères. This was soon succeeded by a translation of the 23d of Virgil, highly commended by Mr. Dryden, and a Discourse on the Georgics, prefixed to Mr. Dryden's translation, which is allowed to possess the distinguishing characters of just criticism. Amongst other poems, which appeared in 1691, there was one which contained an account of the greatest English poets, addressed to Mr. H. Sacheverell, with whom he seems to have been intimate; and whose fair he is said to have courted, though their intimacy was afterwards interrupted by the author's adherence to the political principles which Mr. Sacheverell detested. The subject of his next performance was one of King William's campaigns; and this poem, which was addressed to the Lord Keeper, Sir John Sakers, and much approved by him, engaged the attachment and patronage of this eminent statesman.

Mr. Addison having relented urgent solicitations to enter into holy orders, and abandoned a resolution which he seems to have once formed, obtained, from the friendship of Lord Somers, an annual pension of 300l. which enabled him to gratify his inclination of making a tour to Italy, towards the close of the year 1699. In 1701, he transmigrated from Italy an epistolary poem to (Montague) Lord Halifax, which seems to have pronounced as the height of his performances. On his return he published, an account of his travels, dedicated to the Lord Somers. Upon the death of King William, his pension was discontinued, and in consequence of the exclusion of his friends from the ministry, he remained for a considerable time inactive and unremunerated. However, in 1704, Lord Halifax recommended him to the Lord Treasurer Godolphin, as a fit person to celebrate the Duke of Marlborough's victory at Blenheim. Mr. Addison was engaged in a manner peculiarly respectful to undertake this important office; and this produced the poem, intitled the *Campaign*; which was received with very loud and general applause, and which will be admired as long as the victory is remembered. In 1705 the author was appointed under-secretary of state; and about this time he composed his inimitable opera of *Rofamond*, and he also affiled Sir Richard Steele in his play called *The Tender Husband*, to which he wrote an humonous prologue. In 1709 he went over to Ireland as secretary to the Lord Lieutenant, the Marquis of Wharton, where her Majesty conferred upon him the office of Keeper of the Records in that kingdom, with an augmented salary. In this year the *Tatler* appeared; the author of which was discovered by Mr. Addison to be his friend Mr. Steele, by an observation on Virgil, which he had communicated to him. In consequence of this discovery he afforded to the author such assistance as induced him to lay of it, that he feared by this means, like a diffidient prince, who calls in a powerful neighbour to his aid; that is, that he was undone by his auxiliary. The *Tatler* being discontinued in 1711, was succeeded by the *Spectator* upon a plan concerted between Mr. Steele and Mr. Addison. It commenced March 1, 1711, and was concluded, September 6, 1712. Mr. Addison's papers in this work, the excellence of which time has very highly appreciated, are marked by the letters that form the name of the Male Cleio. It is said, that when his book-seller came to him for the *Spectator*, Dryden's Historical and Critical Dictionary always lay open before him; and that he was at his extreme necessity in his prose compositions, that when almost a whole impression of a *Spectator* was worked off, he would flop the press, to invent a new preposition or conjunction. Of the value of this publication, and of the good sense that directed the judgment and taste of the British nation at the period in which it was written, we shall form a very favourable opinion, when we consider that 30,000 copies were sometimes sold in a day. An attempt was made to continue it by other ingenious writers; but it proved unsuccessful. Eighty numbers were published, to which Mr. Addison contributed about a fourth part, and they formed an eighth volume. The *Guardian*, in which Mr. Addison had a principal concern, amused the town in the years 1713 and 1714: his papers are marked by a hand. Two numbers, in a paper called the *Letter*, were also written by him. During his travels, Mr. Addison executed a design, which he had conceived at an early age, of writing a tragedy; and in 1715 appeared his famous *Cato*, with a sublime prologue by Mr. Pope, and an humane apology by Mr. Carter. It had many nights; and it was read with a satisfaction and commendation equal to the eagerness and pleasure with which it was attended on the stage. It was translated into French, Italian, and German; and the jests at St. Omer made a Latin translation, where it was acted by their pupils with great magnificence. The folio of *Cato* was rendered into Latin verse by Bishop Atterbury, in a style worthy of the sublime original, and which would have been admired even by the critics in the count of Augustus. The author had intended to have written another tragedy, under the title of *The Death of Socrates*; but the offices and honours which were devoted upon him in his advancing years, prevented the accomplishment of his purpose. He was likewise under a necessity of declining another work which he had projected, viz. that of composing an English Dictionary upon the plan of the Italian Della Crusia; in his project for this purpose, he considered the writings of Archbishop Tillotson as the chief standard of our language. During the period in which the Earl of Sunderland was Lord Lieutenant of Ireland, he was his secretary; but on the removal of the Earl, he was appointed one of the Lords of Trade. In 1715 he began to publish the *Freeholder*, which is a kind of political spectator, and admirably conceived and executed, at a period of discord, for the purpose of removing prejudices, settling the government, and making his country happy. This admirable collection of papers contained fifty-five numbers, the last of which was published June 29, 1716. About this time he also published his verses to Sir Godfrey Kneller, on the King's picture, and another copy to the Princes of Wales, with his tragedy of *Cato*. In 1716 he married the Countess of Warwick, without deriving from the connection, as it has been said, any great addition to his happiness. In the following year King George I. appointed him one of his principal secretaries of state; but the application and parliamentary attendance which this office required, concurring with an impatient disorders, to which he was subject, in impairing his health, and hastening his dissolution; and he was, therefore, under a necessity of resigning it, in lieu of which he had a pension of 1500l. a year. His friends hoped that by recouping his public business, and the tranquility of retirement, his health would be re-established, and his life prolonged. For some time he seemed to experience the good effects of his new course of life; and he employed his hours of leisure in completing his Treatise of *The Christian Religion*, which
which he had begun long before, and of which the first part, in an unfinished state, is contained in his works. He intended likewise to have paraphrased some of the Psalms of David; but a long and painful relapse broke all his designs, and terminated the life of this excellent person, June 17th, 1719, in the 43rd year of his age. He died at Holland-House, near Kewington, leaving behind him an only daughter by the Countess of Warwick. After his decease Mr. Tickell, in pursuance to the injunctions which he had received, collected and published his works in four volumes, 4to. This edition contains, besides the pieces already mentioned, the "Dissertation upon Modern," for which the materials were collected in Italy, and digested at Vienna, in 1762; "The present State of the War, and the Necessity of an Augmentation comfortably," first published in the form of a pamphlet in 1707; "The Whig Examiner," published in 1710, of which five papers are attributed to Mr. Addison, and they are the most severe of his publications; they were written by way of reply to the "Examiner," published on the part of the Tories, and contain some hard animadversions on Dr. Sacheverell, Mr. Prior, and others. A similar piece, intitled, "The late Trial and Conviction of Count Tariff," and designed to expose the Tory ministry on the subject of the French commerce-bill, was published in 1713. The comedy of the "Drummer or Hanged Horse," though not noticed in this edition, was afterwards published as Mr. Addison's, by Sir Richard Steele. The following pieces have been also ascribed to Mr. Addison: viz. "Dissertatio de inauguiribus Romanorum Politis," written about 1692; "A Discourse on ancient and modern Learning," preferred among the MSS. of the late Lord Somers, and printed in 1739, 8vo.; and No. 1 and 2 of "The Old Whig," pamphlets, written in defence of the peerage bill, 1719.

The character of Mr. Addison, as a classical scholar, as a statesman, as a poet, and as an elegant writer, and as a man of religious principle and exemplary probity and virtue, has been delineated and ably defended against the attacks of prejudice and envy by many writers; and their testimonies have been collected and duly appreciated by Dr. Kippis, in the last edition of the Biographia Britannica. The Latin poems, which were his early productions, his discourse on the Georgics, and his dissertation on medals, afford ample evidence of his classical taste and erudition.

As a statesman he has been all the more against him, that his invincible modesty and timidity disqualify him for conducting any political debate in parliament; that he made a mean figure in the office of secretary of state; that he was unfit for active life; and that he was very deferentially removed from office to make way for a more able successor. Such are the contemptuous charges retailed by Sir John Hawkins, in his History of Mufie, (vol. v. p. 315,) who adds, that Dr. Mandeville, the author of the Fable of the Bees, called him, "a parson in a tye wig." In reply to these charges it has been urged, that Mr. Addison was gradually trained up to a qualification for the several employments in which he was engaged; that he was designed for the service of the state by Lord Somers and Lord Halifax; and that he occupied in succession various departments of public business without incurring the reproach of want of ability. As to his removal from public office, the true cause of it was his declining health; and that on his own part it was purely voluntary, appears from his intimate connection with Lord Sunderland and the Lord Viscount Stanhope, who were in office, and his friendship with Mr. Craggs who succeeded him, and from the zealous support which he gave to the ministry after his resignation. The reserve and diffusion charged upon him by Dr. Mandeville, if the story be true to which the anecdote refers, might possibly arise from his disposition to be free and intimate with a person whose principles and character he must have disliked.

As a poet, Mr. Addison was for a long time highly exalted; but his reputation has lately been upon the decline. He is ranked by Dr. Warum in the second class of our poetical authors, and joined with Dryden, Prior, Cowley, Waller, Darrell, Fenton, Gay, Denham, and Farnell; whilst the first class comprehends Speier, Shakespeare, and Milton. Others have degraded him to a still lower rank. Mr. Gilbert Cooper says, (Letters concerning Taste, p. 14,) that he has not so right to a pretension of being a good poet. Dr. Hurd (Critical Commentary and Dissertations, v. iii. p. 322.) speaks of him as one who had no want of natural talents for the greater poetry; which yet were so restrained and digested by his constant and superfluous study of the old classics, that he was, in fact, but a very ordinary poet. Although it should be allowed that Mr. Addison did not truly display, in his poetry, a truly vigorous imagination, yet there are many admirable excellencies in his poems, which intitle him, in the opinion of very competent judges, to a higher rank than even Dr. Hurd assigns him. In this connection it may not be improper to observe, that Captain Thompson, in his edition of Mr. Andrew Marvell's Works, (vol. i. Pref. p. 19, &c.) ascribes to Marvell the twofine hymns in N. 453 and 456 of the Spectator, which hitherto have been universally, and without doubt, justly ascribed to Mr. Addison. Whilst it is not to be disallowed that criticism was not a talent, in the exercise of which he excelled, nevertheless those who question his abilities as a critic concede that his taste was truly elegant, and that he may be ranked in this department of literature with Longinus, though he links below Aretide; and that, however defective he may be thought with regard to the philosophy of his criticisms, he determined judiciously from his feeling, and contributed by his critical remarks on the Georgics, on Ovid, and especially on Milton, more than any other man, to excite and propagate a good taste in the English nation. His Essay on the Pleasures of the Imagination should not be forgotten by those who dispute his critical sagacity; and the candid will recollect, that philosophically, Addison had not been cultivated at the period in which he lived, and that in this respect he was far superior to his contemporaries.

Whatever difference of opinion there may have been as to the rank and celebrity to which Mr. Addison is intitled as a poet and a critic, his distinguished and almost super-eminent excellence as a prose writer has been universally allowed. Those whose province it has been to mark his usual errors and defects, have concurred in paying him a tribute of high commendation. Many testimonies of this kind might be cited from the publications of Mr. Cooper, Dr. Hurd, Dr. Young, Mr. Milmouth, Dr. Warum, Dr. Johnson, Dr. Blair, and others. Under this head the following reflections may not be unacceptable to the reader. In various parts of Mr. Addison's prose essays, says Dr. Warum, are to be found many strokes of genuine and sublime poetry; many marks of a vigorous and exuberant imagination. After all, his chief and characteristic excellence was his humour; for in humour no mortal has excelled him, except Moliere; for which he refers to the character of Sir Roger de Coverly, for original, for natural, and so inviolably preferred; and to the Drummer, that excellent and neglected comedy. Dr. Young, in his Conjectures on Original Composition, describes his character as a writer at large; and upon a comparison of Addison with Swift and Pope, he
ADD

he remarks, that he polished a more refined, decent, judicious, and extilusive genius, than either of the latter writers. Swift, says he, is a singular wit. Pope a correct poet. Addison is a great author. Addison's crown was elective; he rejected by the public voice.

Per populos dar jura, vianique affectat Olympa.

Virgil.

Addison wrote little in verse, much in sweet, elegant Vergian prose. His compositions are built with the finest materials, in the style of the ancients, and on truly classic ground; and though they are the delight of the present art, yet I am persuaded (continues this author) that they will receive more justice from posterity. His admirers call him an elegant writer. That elegance which shines on the surface of his compositions seems to dazzle their understanding, and renders it a little blind to the depth of sentiment which lies beneath; thus (hard fate!) he loses reputation with them, by doubling his title to it. On subjects the most interesting and important, no author of his age has written with greater, I had almost said, with equal weight: and they who commend him for his elegance, pay him such a sort of compliment, as they would pay to Lucretia, if they should commend her only for her beauty. Young's Works, vol. iv. p. 93.

Truth and beauty of imagery (says Mr. Milmouth) is the characteristic distinction of Mr. Addison; and the principal point of eminence which raises his style above that of every author in any language that has fallen within my notice. He is everywhere highly figurative; yet, at the same time, he is the most easy and periphrastic writer I have ever perused. His images are selected with the utmost delicacy and judgment, from the most natural and familiar appearances. One is particularly mentioned, taken out of a thousand that might be named, which appears to me, says Mr. Milmouth, the finest and most expressive that ever language conveyed. It occurs in one of the immortal papers upon Paradise Lost, where Milton represents the fun in an eclipse; and at the same time a bright cloud in the western regions of the heavens, descending with a band of angels. The whole theatre of nature, says Mr. Addison, is described, that this glorious machinery may appear in all its lustre and magnificence. After other expressions of high commendation, Mr. Milmouth eulogizes—"In a word, one may justly apply to him what Plato, in his allegorical language, says of Aristo- phanes, that the grace having seized all the world for a temple, wherein they might for ever dwell, settled at last in the breast of Mr. Addison." Pittsborough's Letters, Let. xxiv. p. 112, &c. Let. xxix. p. 137.

Dr. Johnson, in delineating the literary character of Mr. Addison, observes with Tickell, that he employed wit on the side of virtue and religion. He not only made the proper use of wit himself, but taught it to others; and from his time it has been generally subordinated to the cause of reason and truth. He had emancipated the prejudice that had long connected genius with vice, and cauised of manners with luxity of principles. He has restored virtue to its dignity, and taught innocence not to be abashed. This is an elevation of literary character "above all Greek, above all Roman fame." No greater anxiety can genius attain than that of having purifed intellectual pleasure, separated mirth from indecency, and wit from licentiousness; of having taught a succession of writers to bring elegance and gaiety to the aid of goodness; and, to use expressions yet more awful, of having "turned many to righteousness." As a describer of life and manners, he must be allowed to stand perhaps the first of the first rank. His humour, which as Steele observes, is peculiar to himself, is so happily diffused as to give the grace of novelty to domestic scenes and daily occurrences. He never "outsteps the modesty of nature," nor raises merit or wonder by the violation of truth. His figures neither dazzle by dilution, nor amuse by aggravation. He copies life with so much fidelity, that he can hardly be said to invent; yet his exhibitions have an air so much original, that it is difficult to suppose them not merely the product of imagination. As a teacher of wisdom he may be confidently followed. His religion has nothing in it enthusiastic or superstitious; he appears neither weakly credulous, nor wantonly sceptical: his morality is neither dangerously lax nor impracticably rigid. All the enchantment of fancy, and all the elegance of argument, are employed to recommend to the reader his real interest, the care of pleasing the author of his being. Truth is shown sometimes as the phantom of a vision, sometimes appears half-veiled in an allegory; sometimes attracts regard in the robes of fancy, and sometimes steps forth in the confidence of reason: she wears a thousand dresses, and in all is pleasing. Johnson's Poets.

Among ourselves, says an anonymous writer, in the 26th number of the World, no writer has made so happy and judicious a mixture of plain and figurative terms as Addison, who was the first that hesitated from the English, as Boileau from the French, every species of bad eloquence and false wit, and opened the gates of the temple of taste to his fellow-citizens.

Dr. Blair observes, that of the highest, most correct, and ornamented degree of the simple style, Mr. Addison is, beyond doubt, the most perfect example; and therefore, though not without some faults, he is, on the whole, the facet model for imitation, and the fecul from comparable defects, which the language affords. Puristic and pure he is in the highest degree: his precision, indeed, is not very great, yet nearly as great as the subjects which he treats of require: the construction of his sentences, easy, agreeable, and commonly very musical, carrying a character of smoothness more than of strength. In figurative language he is rich, particularly in families and metaphors, which are so employed as to render his style splendid, without being gaudy. There is not the least affectation in his manner; we see no marks of labour, nothing forced or contrived; but great elegance joined with great ease and simplicity. He is, in particular, distinguished by a character of modesty and of politeness, which appear in all his writings. No author has a more popular and instructing manner; and the great regard which he everywhere shews for virtue and religion recommend him highly. If he fails in any thing, it is in want of strength and precision, which renders his manner, though perfectly suited to such essays as he writes in the Spectator, not altogether a proper model for any of the higher or more elaborate kinds of composition. Though the public have ever done much justice to his merit, yet the nature of his merit has not always been seen in its true light; for, though his poetry be elegant, he certainly bears a higher rank among the prose writers, than he is entitled to among the poets; and, in prose, his humour is of a much higher and more original strain than his philosophy. The character of his Roger de Coverley discovers more genius than the critique on Milton. Blair's Lectures, vol. ii. p. 41, &c.

Mr. Addison's character, as a man of probity and religious virtue, stands in high estimation. His attachment to his principles and his friends was inviable, and afforded the most convincing evidence, in times of political discord, of his inflexible integrity. It was, nevertheless, blended
with an amiable liberality and candour. Such, indeed, was his general popularity, that Dr. Swift says of him on a particular occasion, "Mr. Addison's election has passed easy and undisputed; and, I believe, if he had a mind to be chosen king, he would hardly be refused." The friendship that subsisted between these two gentlemen continued through life, without interruption, notwithstanding the difference in their political principles and connections: and nobly did Mr. Addison act on an occasion, in which he was desired by Lord Sunderland not to converse with some people in Ireland that were not agreeable to him, whilst he professed his great obligation to his Majesty for the honour intended him; (of being secretary to the Lord Lieutenant,) he declared, at the same time, he could not comply with his excellency's request; as he would not sacrifice his friendship for Dr. Swift, to be made chief governor of that kingdom. Suppl. to Swift's works, vol. iv. p. 426. His character for probity has not, however, escaped calumny and reproach. Dr. Johnson relates an anecdote, which every admirer of the distinguished merit of Mr. Addison will be very reluctant to believe; at least without some authority which Dr. Johnson has not produced, and especially in opposition to the evidence that has been alleged of its falsehood. Steele is said to have borrowed 100l. in a time of pressing exigence of his friend Addison, probably without much purpose of repayment; but Addison, being impatient of delay, claimed the loan by an execution. The following anecdote, which is of a very different kind, was told by the late Dr. Birch. Mr. Addison and Mr. Temple Stanyan were very intimate, and were accustomed to dispute each other's opinions. Mr. Stanyan, however, was reduced to the necessity of borrowing 50l. of Mr. Addison; the consequence of which was a severe and difficult, and an apparent acquiescence in the sentiments of his creditor on the part of Stanyan. A dispute occurred on a topic, with regard to which the latter had always been of opinion to oppose the former, but on this occasion Mr. Stanyan was silent and acquiescing, which conduct hurt Mr. Addison so much, that he said to his friend, "Either controul me, or pay me the money." It appears also by some particular recital concerning Mr. Addison, by a late sprightly writer, (Mr. Tyers) that upon his return to England, after his travels, he discharg'd the old debt amounted to Oxford, with ample interest; and that he refund'd a gratification of 500l. back post, and afterwards of a diamond ring of the same value, from a Major Dunsar, whom he had endeavoured to serve in Ireland by his interest with Lord Sunderland; and, it is probably on this occasion, that he wrote a letter: "Believe me, Sir, when I advise you not to do, or ever will, on any pretence whatever, take more than the third and customary fees of my office. I might keep the contrary practice concealed from the world, were I capable of it; but I could not do so from myself; and I hope I shall always fear the reproaches of my own heart more than those of all mankind." We are informed by the writer just mentioned, that having received encouragement from a married lady, of whom he had been formerly enamoured, he had the integrity to resist the temptation. Addison has been charged with manifesting a great degree of jealousy, envy, and malevolence in his conduct towards Mr. Pope. Dr. WarTon and Gibber seem to have given credit to this charge; and the accusation has been directly and circumstantially produced by Mr. Rafthead in his life or Pope, p. 154.-153. The late Judge Blackstone took great pains to investigate the grounds of it, and to evince its falsity. Besides the jealousy of Mr. Pope's superior talents, which constitutes part of the charge, Mr. Addison is accused of permitting Mr. Tickell, who was his dependent, to publish a translation of the first book of the Iliad, which some say was the juvenile work of Addison, and which others affirm was Tickell's, revised by him, just at the time when the fifth volume of Mr. Pope's work was delivered to his subscribers. After a very elaborate investigation of this business, published in the last edition of the Bag. Brit. the learned Judge closes with this paragraph: "As there are so many inconveniences in the story itself, which never found its way into print till near sixty years after it is said to have happened, it will be no breach of charity to suppose, that the whole of it was founded on some misapprehension in either Mr. Pope or the earl (Warwick); and unless better proof can be given, we shall readily acquit Mr. Addison of this, the most odious part of the charge." At the close of his life, and with the near views of his dissolution, he sent for the young earl of Warwick, and also for Mr. Gay. He told the latter that he had injured him; but if he recovered, he would reconcile him. Mr. Gay was ignorant of the circumstance to which he adverted, but supposed that some preferment had been designed for him, which Mr. Addison prevented his obtaining.

Of his interview with the young Earl, Dr. Young has given the following account. After a long and manly, but vain struggle with his distemper, he dismissed his physicians, and with them all hopes of life. But with his hopes of life he dismissed not his concern for the living, but sent for a youth, nearly related, and finely accomplished, but not above being the better for good impressions from a dying friend. He came; but life now glimmering in the socket, the dying friend was silent; after a decent and proper pause, the youth said, "Dear Sir! you sent for me; I believe, and hope, that you have some command; I shall hold them most sacred." May distant ages not only hear, but feel, the reply forcibly grasping the youth's hand, he softly said, "See in what peace a Christian can die." He spoke with difficulty, and soon expired. Mr. Addison, says his Biographer, notwithstanding the several things which have been advanced to leter him in the public opinion, will always be held in the highest estimation, as an amiable and excellent man in private life, as one of the brightest ornaments of, perhaps, the finest age of English literature; as one who greatly contributed to the spreading of good sense and good taste in the nation; as one of our most easy, elegant, and graceful writers; as having been singularly beautiful in his allegorical papers, and admirable for the vein of humour which runs through many of his compositions. Bag. Brit.

Addison County, in Geography, a county of Vermont in America, on the south side of lake Champlain, and divided nearly into equal parts by Otter Creek. It has Witsden county on the north, and Rutland county on the south; and contains 6449 inhabitants, dispersed in twenty-one townships. Its dimensions are about thirty miles by twenty-seven, and a range of the Green Mountains pasies through it. Its chief town is Middlebury.

Addison is also a town of the above county, lying on the lake Champlain, separated from New-haven, on the east, by Otter Creek. The Stowe Mountains are on the south-east. This town contains 701 inhabitants.

ADDITAMENT, in general sense, denotes a thing added to another. It signifies the same as Additamentum. ADDITION, in Physis and Cheesistr, are things super-added to the ordinary ingredients of any composition. ADDITION, the act of joining one thing to another, or of augmenting a thing, by the accession of others. ADDITION, in Arithmetic, is the first of the four fundamental rules, or operations, of that art. Addition remains in finding the amount of several numbers.

ADD

To add quantities which are unlike, with unlike figures: collect all the like quantities together by the fall rule, and set down those that are unlike one another, with their proper figures. Thus, \( 5xy + 4ax - xy - 4ac = 5xy + 2ax + 2/ax - 5\sqrt{ax} + 12\sqrt{ax} = 5\sqrt{ax} - 11\sqrt{ax} + 2\). And \( 6\sqrt{ac + b} + 6\sqrt{be} - 4\sqrt{ac} + 4\sqrt{ac - 2be + 7} - 4 = 2ab + 2b - 12\).

**Addition of irreducible quantities, or parts.** See **Surd**.

**Addition, in Law,** is that name, or title, which is given to a man over and above his proper name, and surname: to shew of what estate, degree, or mystery he is; and of what town, village, or county.

**Additions of Esquire,** or quality, are yeoman, gentleman, esquire, and such like.

**Additions of Degree,** are those we call names of dignity; as knight, lord, earl, marques, and duke.

**Additions of Mysterious,** are such as scrivener, painter, malon, and the like. See **Chopchurch**.

**Additions of Place are,** of Thorp, Dale, Woodlock, Where a man hath houshold in two places, he shall be liable to dwell in both; so that his addition in either may suffice. Know was anciently a regular addition.

By that, 1 Hen. V. cap. 5, it was ordained, that in all original writs of actions personal, appeals, and indictment, upon which process of outlawry may be awarded, such addition should be made to the name of the defendant, to shew his estate, degree, or mystery, and the place where he dwells; and that the writs, not having such additions, shall abate, if the defendant take exception thereto; but not by the office of the court. The reason of this ordinance was, to prevent any clandestine or ill-taken outlawry, by reducing to a specific certainty the person who is the object of its process.

If one be of the degree of a duke, earl, &c. he shall have the addition of the most worthy dignity. 2 Inft 669.

Such titles, however, are not properly additions, but names of dignity. The title of knight or baronet, is part of the party's name, and ought to be rightly used; but the title of esquire, gentleman, or yeoman, &c. being no part of the name, but additions, as people please to call them, may be used, or pot used, or if varied, it is not material. 1 Litt 34.

An earl of Ireland is not an addition of honour here in England; but such a person must be written by his Christian and surname, with the addition of esquire only; and the sons of English noblemen, although they have given them titles of nobility, in respect to their families, if you use them, they must be named by their Christian and surnames, with the addition of esquire; as—such-a-one, esquire, commonly called lord A, &c. 2 Inft 596 666.

No addition is necessary where processes of outlawry doth not lie. 1 Salk 5. If a city be a county of itself, wherein are several parishes, addition thereof, as de London, is sufficient; but addition of a parish not in a city, must mention the county, or it will not be good. 1 Danv 237.

**Addition, in Music,** is a dot placed on the right side of a note, to signify, that the time of the sound of such note is to be lengthened half as much more, as it would otherwise be.

A note of addition amounts to the same with what is by some old English authors called *prock of perfection*.

Thus a semibreve, when marked with a dot, is to be as long as three minims; the minim, with the like dot, to be as long as three crotchets; the crotchet, as three quavers, &c. See **Character**.

**Additions, in Heraldry,** denote a kind of bearings, in **Vol. I.**

coats of arms, wherein are placed rewards, or additional marks of honour. In which sense, additions stand opposed to abatements, or diminutions. See **Difference**.

Additions resemble, but differ from ordinaries. To the chiefs of additions belong a barbure, quarter, canton, gyron, pile, falque, flanche, voider, and an infeclment quile, called also an *elcutecher of pretence.* On any of these may an addition of honour be placed, according to the pleasure of the prince, or the fancy of the herald; which reward descends to none of the family, except the person's own direct line. In this manner the arms of a kingdom have been sometimes given, by way of addition to a private subject. The estimation in which these additions are held, has declined since the college has granted them to persons who apply, although neither they nor any of their ancestors have had any particular claim on marks of the royal favour.

**Additions, in Distillation,** a name given to such things as are added to the wahl, or liquor, while in a stage of fermentation, in order to improve the viscosity of the spirit, procure a larger quantity of it, or give it a particular flavour.

All things of whatever kind, thus added in the time of fermentation, or which are called by those of the business, who speak most intelligently, additions; but many confound them with things of a very different nature, under the name of **ferments**.

The additions used in the distillery may be reduced to four general heads. 1. Salts. 2. Acids. 3. Aromatics, and 4. Oils. A little tartar, nitre, or common salt finely powdered, may be added to the liquor while fermenting, especially in the beginning of the operation; or in their kind, a little of the vegetable, or finer mineral acids, may be dropped in at different times, when found necessary. These are of great use, especially in the fermenting solutions of treacle, honey, and the like sweet and rich vegetable juices, which either wholly want an acid in themselves, or have it in too small a proportion, or have been robbed or divested of it. The proper acids for this purpose are, the juice of Seville oranges, or lemons, or the spirit of sulphur, or Glauer's spirit of salt, or, what is greatly preferable to all these, a particular aqueous solution of tartar, a succedaneum for which may be tamarinds, or the robs of some very acid fruit, or the *media flabellina vini.* On this foundation stands that ingenious practice of using a suitable proportion of the full bottoms, or the remaining wath, in the sublimate brewing.

After the same manner, a very considerable quantity of any essential vegetable oil, may by proper management be converted into a surprizingly large quantity of inflammable spirit; but great care in this case must be had not to drop it in too fast, nor too much at a time; this might damp the fermentation; and, indeed, the adding a large quantity of oil at once, is the common way of slopping the fermentation at any point required.

The bell method of all, of introducing the oil, so as to avoid all inconvenience, is to reduce it first to an cleofacharum, by grinding it in a mortar, with a due quantity of fine grage in powder. The oil thus added, with its particles diffused, and in form of powder, will readily mix with the liquor, and immediately ferment with it.

A large proportion of rectified spirit, or of any other spirit, may, by prudent management, be also introduced into the fermenting liquor; and this will always come back with a large addition to the quantity of spirit, that would otherwise have arisen from the distillation. Shaw. See **Combinatory Distillation.**

**Additive,** denotes something to be added to another. E c Geome
ADD

Geometricians speak of additive ratios; astronomers of additive equations, &c.

Additive ratio is used, by some writers, for that whole terms are added to the addition, that is, to composition, in opposition to subtractive ratio, whose terms are subject to subtraction, i.e., to division. Phil. Trans. N° 257.

Suppose the line \( a \) divided in the points \( b \) and \( c \), and the ratio between \( a \) and \( b \) is additive; because the terms \( a + b \) and \( b + c \) compose the whole \( a + c \). But the ratio between \( a \) and \( b \) is subtractive, because \( a - b \) differ by the line \( a + b \).

Additive equations, in Astronomy, those which are to be added to the sum of mean anomaly, in order to find the true one. See Equation.

ADDIX, in Antiquity, a measure of capacity in Asia and Egypt. See Pioc.

ADDIXIT, or Addixentum, was the word by which they expressed the fav'ourable augur of the sacred birds. For an unfavourable augur, a negative was annexed.

ADDITURBORS, in Law. See Redubbors.

ADDRESS, in a general sense, is used for skill and good management, and of late has been adopted from the French, and is used in genteel phrase, and also in Commerce, as synonymous with direction to a person or place. The word is formed from the French verb addreffer, to direct any thing to a person.

Address, means also a discourse prefered to the king, in the name of a considerable body of his people; to express or notify their sentiments of joy, satisfaction, or the like, on some extraordinary occasion.

We say, the lords' addresse, the commons' address. Adresses were first let on foot under the administration of Oliver Cromwell.—At Paris, their office of intelligence was commonly called bureau d'adresse.

ADDRESS, in Rhetoric. See Apostrophe.

ADDUCENT Muscles, or Adductors, in Anatomy, are those which bring forward, close, or draw together, the parts of the body whereto they are annexed.

The word is compounded of add, to, and ductus, to draw, or bring.

Adductors, or adductors, stand opposed to abducent, or abductors.

ADDITION, in Anatomy, the motion or action of the adducous muscles, or adductors.

ADDUCTOR brevis femoris. See Triceps.

ADDUCTOR longus femoris. See Triceps.

ADDUCTOR magnus femoris. See Triceps.

ADDUCTOR Oculti arises from the inner side of the foramen opticum, between the obliquus superior and depressor, and is inserted into the globe of the eye opposite to the inner angle. It is from its situation the shortness of the four straight muscles of the eye. It will turn the eye towards the nose.

ADDUCTOR Ossa metacarpis minimi digitus manus, metacarpus of Winlow, arises from the os unciforme, and the ligament of the wrist, and is inserted in a tendinous form into the inner side and front of the metacarpal bone of the little finger. It will bring the metacarpal bone of this finger towards the palm, and will bend it.

ADDUCTOR minimi digitii pedis, arises from the inside of the metatarsal bone of the little toe, and is inserted into the inside of the root of the first joint of the little toe. It will bend the first joint of the little toe, and draw it inwards.

ADDUCTOR pollicis manus, has a broad flaky origin from the whole length of the metacarpal bone of the middle finger; its fibres are collected together to be inserted tendinous into the inner part of the root of the first bone of the thumb. It will pull the thumb towards the fingers.

ADDUCTOR pollicis pedis, the antithenar of Winlow, arises by a long tendon from the os calcis, from the os cuboides, from the os cuneiforme externum, and from the metatarsal bone of the second toe. It is inserted into the external hallucial bone of the great toe. Its use is to bring the great toe towards the other toes.

ADDUCTOR profilatus, a name given by Santorini to a muscle, which he also calls levator profilatus, and which Winlow calls profilatus superior. Albinius, from its office, had very properly called it compressor profilatus.

ADDUX, in Ancient Geography, a town of Palestine in the tribe of Judah.

ADDYME, a town of Africa, placed by Ptolemy in Mauritania Caæ里面enis.

ADEA, in Geography, a district of Abyssinia, called also Hadea.

ADEB, in Geography, the name of a large Egyptian weight, used principally for rice, and consisting of 212 okes, each of three rotulas, a weight of about two drams less than the English pound. But this is no certain weight: for at Rosetta, the aedeb is only 150 okes. Ptoleme, Egypt.

ADEBA, in Ancient Geography, a town of Hiipania Tarragonensis, placed by Ptolemy among the Illeracenes.

ADEBAREA, in Geography, a defect, hilly district of Abyssinia, called the country of the Slaves, as being in the vicinity of the Shangalla.

ADEDUS, in Ancient Geography, a town of Arabia Felix, on the borders of the Red Sea, placed by Ptolemy in long. 72° 15' and lat. 17° 16' among the Caffanii.

ADEGEM, in Geography, a town of Flanders, 5 leagues east of Bruges.

ADEL, a kingdom on the eastern coast of Africa, so called from its metropolis, and Zeila from an eminent feast, situated to the south of the Red Sea, the Straits of Bablmandel and Cape Guardius, and has the Indian ocean on the east, on the south the kingdoms of Magdazo and Ada; and on the west the country of the Gallis, or the kingdoms of Danfali, Dawaro, Bali, Fatigar, and other districts of Abyssinia. The exact extent of this kingdom is not known; but it is supposed from east to west to be about 160 leagues, and from north to south about 72 leagues. The interior part of Adel is very imperfectly described. The principal places in it are Adel the capital and royal residence, situated in the inland country, near the river Hawah, about 300 miles south of Mocha, N. lat. 8° 5'; E. long. 44° 20'; Aftam, a small town on the eastern coast, which furnishes provisions for mariners, but has no haven; Cape Guaéefius to the north of Aftam; Meta, the northern coast near the river Soal, Bakora and Zeila. Some geographers have mentioned other cities in this kingdom, viz. Aram, Bali, Doara, Comizara, Novorata, Socel, and Aufifluru, situated on a high hill in the centre of the kingdom. The whole coast to the fourth-east is desert. This kingdom is said to have been founded by a prince of Abyssinia, called Salatru, who, escaping from the prison in which the princes of the blood are confined in that country, took refuge in the province of Adel, and marrying the daughter of the king of Zeila, established himself in the possession of the united kingdom. Of all the enemies, with whom the Abyssinians have had occasion to contend, the kings of Adel have been highly powerful and inveterate; and, indeed, the history of this kingdom consists principally of details of alternate defeats and victories. The Adelians being Mohammedans, and the Abyssinians Christians, a mutual animosity has subsisted between them; and the ravages have increased.
increased in consequence of the succour given to the latter by the Portuguese, and the alarm occasioned by their submision to the authority of the Roman See. At length, however, the Portuguese were totally expelled, and the kingdom of Aedel became tributary to the Grand Signior.

The inhabitants of this country have been for a long time in high favour at the Porte, and dignified with the title of Saints, on account of their singular zeal, and frequent wars against the Christians. Nevertheless the Sultans have contrived to flip them of their most considerable maritime towns on the Red Sea: so that they have now no port left, except that of Zeila, the rest being all in the hands of the Turks. By these means the kings of Aedel are precluded from maintaining any intercourse with Europe.

The country, though it has seldom any rain, is so well watered by rivers and canals, that it is very fertile and productive. It has plenty of wheat, barley, and mellet; and a great variety of sheep, cows and other cattle. Some of the sheep have large tails, which weigh between 20 and 30 pounds. But the chief traffic of the inhabitants consists of gold dust, elephant’s teeth, frankincense and negro slaves, which they procure from Abyssinia with which they are almost always at war, and convey to the port of Zeila, where they find purchasers from Arabia, Cambaya, and other parts.

The Edelites, called Giberite, are a host and warlike people, and fight with surprising intrepidity against the Abyssinians, partly from a zeal for religion, and partly with the hope of plunder; and they are furnished by the Turks and Arabs with a variety of fire-arms. Their complexion, particularly on the northern coast, is of a tawny brown, and towards the south it is of a more deep black. Their drefs chiefly consists of a piece of cotton, which covers them from the girdle to the knee, the rest of the body being naked: but the king and nobles wear a kind of loose garment that covers the whole body, and a cap over the head. All, and especially the women, are fond of adorning their necks, arms, wrists, and ankles with bracelets of glafs, amber, and other similar trinkets.

Aedel, or Athelhard, in Biography, a benedictine monk of Bath, flourished about the year 1120, and for the sake of mathematical knowledge, travelled into France, Spain, Germany, Italy, Egypt, and Arabia, and is said to have settled at Paris, where he acquired reputation as a teacher of medicine. He translated Euclid, among other Greek writers, out of Arabic into Latin; and also an Arabic work, entitled "Eriechatem," upon the seven planets. He wrote a treatise on the seven liberal arts, comprehending, according to the language of the times, the mathema, and quadrivium. He is also said to have written many books of physic and medicine, which are lost. Wallis, in his Algebra (p. 6.) mentions the prefaces to two MS. books of Travels; one or both of which had noticed the travels of Athelardus, the B Kashmiri, which had been cited by Voss, who says that he was learned in all the sciences of his time; but these have since been cut out of the books in Corpus Christi and Trinity colleges, Oxford, and carried away:—a species of larceny, which, in the Republic of Letters, deserves to be treated as a capital offence.

Aedel. See Adalard.

Aedelberg, in Geography, a town of Germany, in the duchy of Wurttemberg; two leagues south-east from Schorndorf. See Adlesberg.

Aedelbold, in Biography, a monk of Lobes in the diocese of Liège, and afterwards bishop of Utrecht, wrote the life of his emperor Henry II. surnamed Claudius, with whom he was a favourite. He was made bishop of Utrecht in 1002, and died in 1027.

Aedel-Fish, in Ichthyology, a name given by some authors to the Lavaretus, or albula nobilis.

Aedelfors, in Geography, a gold-mine in the province of Smaland, in Sweden, discovered in 1738. Ducats are coined with its gold.

Aedelflenz, or Aedelitz, in Geography, a town of Germany in the circle of Trauelin.

Aedelia, formed of adela, uncertain or obsolete, in Botany, a genus of the diccia monadelphia class and order, of the natural order of triconce and aphyllophus of Jussieu. Its characters are, that the male calyx is a one-leaved, tripartite perianthium, with oblong and recurved leaflets; it has no corolla; and the flamina are numerous, capillary filaments of the length of the calyx, united into a cylinder at the base; and the anthers are roundish, the female calyx is a five-parted perianthium, the parts being oblong and permanent; no corolla; the pistillum has a roundish inerme, three very short divaricate styles, and thorn fitgmas; the pericarpium is a tricoccus, roundish, three-celled capsule; and the seeds are solitary and roundish. There are three species, viz. A. bernardia, the villos-leaved bernardia; A. rimbula, smooth-leaved bernardia; and A. acidata, or box-leaved adelia. These shrubs grow naturally in the island of Jamaica, and are nearly allied to the coton. The second grows to the height of eight or ten feet; the third resembles a young ebony, and does not rise above four feet high. They may be propagated by seeds brought from the countries where they grow. Martyn. In the last edition of Linnaeus by Gmelin, this genus is ranked under the monadelphia iconiandria class and order.

Aedeling. See Atheling.

Aedella, or Adalus and Adano, in Ichthyology, names given to the sturgeon.

Aedelum, in Ancient Geography, a town of Spain, north-west of Illicis.

Aedel, or Aedhelm, in Biography, son of Kenred, and nephew of Ina, king of the West Saxons, was a learned Englishman, who flourished about the year 680. He was first Abbot of Malmesbury, and afterwards bishop of Sherborne. He was much esteemed, and is said to have been the first Englishman who wrote in Latin, and the first who brought poetry into England. He composed several books, not only in theology, but in the mathematical sciences, as arithmetic, astronomy, and de discipulis philosophorum. He died in 759, in the monastery of Malmesbury, and is honourably mentioned by Bede and William of Malmesbury, and also by Bale and Camden. He was canonized, and many miracles are ascribed to him.

Aedelmannsfelden, in Geography, a town of Germany in the circle of Swabia, two leagues west of Elwangen.

Aedelnaug, or Odelnaug, a town of Poland, seven leagues south-west of Kalih.

Aedelphi, a small island in the Grecian Archipelago, about a league south-south-east of Scopelo.

Aedelphani, in Church History, a seat to called from their leader Aedelphius, who kept the sabbath as a fast.

Aedelscalp, in Ancient Cyprus, denotes the servant of the king. The word is also written Aedelcalp, and Aedelficus. It is compounded of the German adel or edel, noble, and sculus, servant. Among the Bavarians, adelscales appear to have been the same with royal thanes among the Saxons, and those called minftri regis, in ancient charters.

Aedelsdorff, in Geography, the name of two small towns.
ADE

ADE

towns of Franconia; one in the bishopric of Bamberg, and the other in the marquitage of Anspach.

ADEPTION, in the Civil Law, the revocation of a grant, donation, or the like. The ademption of a legacy may be either express, as when the testator declares in form, that he revoke what he had bequeathed; or tacit, as when he only revokes it indirectly or implicitly. Thus, if A. by will gives his daughter M. 1000L. to be paid after his debts, besides a share out of the dividend of his estate; and afterwards on her marriage, an agreement be made for what she should have out of A’s estate, that it should be only 100L., which should be in full of what was intended out of it: this agreement is an ademption of the legacy.

ADEN, a gland. See GLAND.

ADEN, in Geography, a celebrated mart, giving name to a country of which it is the capital, situate at the most southern extremity of Arabia Felix upon the Indian ocean, near the straits of Babismsnand. According to the Arabs, its founder was Adon the son of Saba and grandson of Abraham. Some suppose that the etymology of the name is the same with that of Eden, and that it was so called from the delightful country in which it was situated. It stands at the foot of several high mountains which surround it almost on all sides. The Arabs have erected forts on the summits of these mountains; and a large aqueduct conveys the water from thence into a large reservoir or canal, built about three-quarters of a mile from the city, which supplies the inhabitants. Galus supposes, that Adon is the Arabick Empire of Ptolemy; and it is without doubt the Aksa of Usan, mentioned by Stephanus, vol. i. p. 21.

The situation of the harbour of Aden, which opened an easy communication with Egypt, Ethiopia, India, and Persia, had rendered it for many ages one of the most flourishing factories in Asia. Fifteen years after it had repulsed the great Albuquerque, who attempted to demolish it in 1513, it submitted to the Turks, under Soliman II. in 1539, who did not long remain masters of it. The king of Yeman, who possessed the only district of Arabia that merited the appellation of happy, drove them thence and removed the trade to Mocha, which, till this circumstance occurred, was only a village. N. lat. 12° 40’. E. long. 46° 15’.

A. is also the name of a mountain in the kingdom of Fez.

ADENANTHERA, formed of the, glandular, and unctus, an anther, byfard flower-fence, in Botany, a genus of the dicentra monogynia class and order, of the natural order of lomentacae, and leguminae of Jullien; the characters of which are these: the calyx is a one-seeded, five-toothed, very small perianthium; the corolla is five-petalled and bell-shaped, the petals lanceolate, fleshy, convex inwards, and concave underneath; the stamens are filiform filaments, erect and somewhat shorter than the corolla; the anthers are roundish, incumbent, bearing a globose gland at the outer tip; the pistillum is an oblong germen, gibbous downwards, style filiform, and as long as the stamens, the stigma simple; the pericarpium is a long compressed membranaceous legume, and the seeds are very numerous, roundish, and remote. There are three species, viz. 1. A. pavonis, or poinciana, with leaves smooth on both sides, which is one of the largest trees in the East Indies. Its duration is 200 years, and its timber is much used on account of its solidity; the powder of the leaves is used in their ceremonies: the seeds are eaten and are also valued as weights, being each of them four grains; and beaten with water and borax, they form a cement, and the bruised leaves yield a liquor which is esteemed good against pains in the loins. This species must be raised on a hot-bed from seeds, and it must afterwards be placed in the dark-house. It has not yet flowered in England. Mr. Miller mentions a variety with scarlet seeds received from India, which is of a very slow growth. 2. A. falsa, with leaves tomentose underneath, is a native of the East Indies. 3. A. verdens is a native of Malacca, an island in the South Seas. These two species are little known with us, having never been cultivated in England.

ADENANTHERA, is also a species of Anthemis.

ADENBURG, or ADENDBURGH, a town of Welfphalia, in the duchy of Berg, subject to the elector Palatine; 12 miles north-east of Cologne. E. long. 7° 16’. N. lat. 51° 2’. 

ADENDA, in Geography, a town of Africa, in the empire of Morocco, and province of Temfica.

ADENIA, in Botany, a genus of the baccaria monogynia class and order; the characters of which are, that the corolla has six petals; the calyx is very long, and divided into six portions; the nectarium is composed of six linear scales. There is one species, viz. A. venenata, with palmar, leaves and spiked flowers. This species is mentioned by Farikal in his Flor. Egypt. And he says, that the powder of the young branches mixed in any kind of liquor, is a strong poison; and that the capparis pinafa is an antidote to it. The tree grows in Arabia.

ADENOGRAPHY, compounded of edon, gland, and sapo, I describe, that branch of Anatomy which describes the glands, and the glandular parts of the body.

Adenography, is the name with what some others call adenoby, or the adenoanalytic part of Anatomy.

ADENOIDES, q. d. glandulosus, an epithet applied to the prostate.

ADENOS, a kind of cotton, otherwise called marine cotton. It comes from Aleppo by the way of Marfelles, where it pays 20 per cent. duty, according to the tariff of the year 1795. Its valuation, by the same tariff, is of 76 livres 16 fols.

ADENOSUS alceifus, in Surgery, a crude, hard tubercle, difficult of dissection, and resembling the appearance of a gland. See Abscess.

ADENSEN, in Geography, a parochial village in the bailiwick of Calenberg, in Hanover, which formerly belonged to the lords of Adenos, whose male issue became extinct in 1571, and whose viles were defended by marriage to the counts of Hallermund.

ADEOMA, in Mythology, a goddef of glutony, as the name imports, to whom the Sicilians paid religious worship. In the temple erected to her, her statue was placed next to that of Ceres.

ADEPHAGUS, or voracious, an appellation of Hercules.

ADEPS, in Anatomy, the fat found in the abdomen. The term also denotes more generally any kind of fat.

ADEPS, ADEPT; from the verb adfcrb, to obtain, a denomination given to the professors in Alchemy, by which those chemists chose formerly to distinguish themselves who were engaged in experiments on the transmutation of metals, and researches after the universal medicine. The appellation is derived, according to Paracelsus (de alchimiae magni, lib. i.), from the Latin term philosophia adeps, philosophy acquired by contemplation, in opposition to that which
which was taught and transmitted in the schools *philosophia
elementaris*. Such is the nature, says Paracelsus, of this
higher philosophy, that it does not originate from man but
from heaven; and one mortal can no more communicate it
to another, than the paper on which letters are traced, can
of itself declare their meaning. Hence the antinomists who
gave themselves up to this kind of study, intitled them-
seft *philosophi adepit*, as they spoke of others by the name
of *philosophi tertium*. Van Helmont also says, “*vocantur
bi adepit quorum rerum ortus Dei est*,” (De magnet. vuln. curat.
119.) “Adepts are those who are guided by the spirit of
God.”

Originally, however, this flattering epithet was common
to several sciences, for Paracelsus expressly mentions adept
theology, adept geometry, adept medicine, &c. All these
sublime distinctions are however fallen into neglect, and the
believers in the philosopher’s doctrine have alone retained pos-
session of the title of adepts. The term therefore in the
vocabulary of the alchemists, means a person, who, besides
being a matter of all that has been written, or is current by
tradition, relative to the occult qualities of bodies, has by
contemplation, and in some mysterious manner, acquired an
insight into those secrets of nature, on which depend the
transmutation of metals, and the universal medicine. It was
a tradition among the adepts, that the number of persons
thus divinely initiated, was neither more or less than
twelve. The most celebrated of this fraternity are Ray-
mond Lully, Paracelsus, Van Helmont, and Isac Hol-
landus; men superior in real chemical knowledge to most of
their contemporaries, but who were led partly by their own
vanity and love of mysticism, and partly by the easy and
eager credulity of the public to be contented with the fame
of conjurers, when they might have deferred the notice of
polterity as philosophers.

The term *adept* is sometimes more generally applied to
those who are proficient in any kind of science.

ADEQUATANGIE Creek, in Geography, is the eastern
head water of Susquehanna river, in the state of New
York.

ADEQUATE, something equal to, or co-extended
with another; and filling the whole measure and capacity
thereof. In this sense the word stands opposed to INADEQUATE.

ADEQUATE, or total, in Logic, is applied to the objects
of science. The adequate object of a science includes the
material and formal object: the material object of a science
is that part which is common to it with other sciences; the
formal is that which is peculiar to itself.

Adequate ideas, or notions, in Metaphysics, are such
images or conception of an object, as perfectly represent it,
or answer to all the parts and properties of it.

M. Leibnitz defines an adequate notion to be that of whole
several characters we have distinct ideas.—Thus, a circle
being defined, a figure bounded by a curve line which returns
into itself, and whose points are all equally distant from
a certain intermediate point therein, our notion of a circle is
adequate, if we have distinct ideas of all these circumstances,
viz. a curve repeating upon itself, a middle point, an equal-
ity of distance, &c.

All simple ideas are adequate and perfect; and the fa-
culty, be what it will, that excites them, represents them
entire.

The ideas of modes are likewise adequate, or perfect;
except of those modes which occasionally become sub-
fiances; for when we speak of modes separately existing,
we only consider them separate from the substance by way of
abstraction.

All abstract ideas are also adequate and perfect; since
they represent all that part of the subject which we then
consider. Thus, the idea of roundness is perfect, or ade-
quate, because it offers to the mind all that is in roundness
in general.

Of the same kind are all ideas, of which we know no
original, or external object really existing out of the mind,
by occasion of which they were excited in us, and of which
we think them the images. Thus, when a dog is before us,
it is the external object without us which raises the idea in
our mind; but the idea of an animal in general, has no ex-
ternal object to excite it: it is created by the mind itself,
and must of necessity be adequate or perfect.

On the contrary, the ideas of all substances are inadequate
and imperfect, which are not formed at the pleasure of the
mind, but gathered from certain properties, which experi-
cence discovers in them.

This is evident, because our knowledge of substances is
very defective; and we are only acquainted with some of
their properties: thus, we know that silver is white, that
it is malleable, that it melts, &c. but we do not know what
other properties it may have; and we are wholly ignorant of
the material texture of the particles wherewith it con-
sists.—Our idea of silver, therefore, not representing to
the mind all the properties of silver, is inadequate and
imperfect.

ADER, Guillaume, in Biography, practised medicine at
Toulouff in the beginning of the 17th century; and
published "Exarationes de Eragros et Morbis in Evan-
gelia." Tolofoe, 1620, 4to. "De peffis Cognitions, Fre-
viis nec et Remedias." 1623, 4to.

ADER, EDER, HARD, or HERED, in Ancient Geography,
a town thus variously called, allotted to the tribe of Judah;
which, before that distribution was made, is said to have
been the capital of Arab, one of the Canaanitish kings.
This prince attacked and vanquished the Israelites before
their entrance into the promised land. The town was
situated to the south, and near the lake Apadites.

ADERAIN, See ADERAIN.

ADERANPATANAM Bay, lies about north-west by
west from Point Pedro, in the island of Ceylon, and west
north from Calimer Point, on the coast of Coromandel.

ADERBIGHAN, or ADERBEITZAN. See AIDERBIE-
ZAN.

ADERBOURG, a small town of the circle of Upper
Saxony, in Pomerania, belonging to the king of Prussia;
three leagues north-west of Stettin.

ADERBOURG, a small town in Germany, in the
marche of Brandenburg.

ADERCAN, a town of Persia, in the province of La-
rilcan; 20 leagues north-east of Laar.

ADERCO, in Ancient Geography, a town of Iberia.

ADERKAN, in Geography, a town of Persia, in the
province of Fariflian: 45 leagues south of Schiraz.

ADERNO, a small place in the Val di Dama in Sicily,
ancoyntly called Adrianum, and situated near the river
Fiume d’Aderno, at the foot of Mount Gibel. E. long. 15° 25'.
N. lat. 35° 5'. The remains of the walls of this ancient
city still retain an air of grandeur. The pretended temple
of Adrian in the vicinity of it is nothing more than a bath,
constructed of bricks and lava, in the lower period of anti-
vivuity, when both Sicily and the Roman empire had lost all
their eminent arts. See Flonel’s Voy. Pittorique des

ADERSELBEN, a town of Germany, in the prin-
cipality of Halberstadt; 16 miles south-east of Halberstadt.

ADES, or HADES, 286, from α and ἄδεια, 10,6, denotes the
invisible
Dr. Campbell observes, that the word ἀδεσις, ades, occurs eleven times in the New Testament, and is translated hell in all, except one, where it is translated grave. He thinks, however, that it ought never in Scripture to be rendered hell, at least in the form applied to that word by Christians. In the Old Testament, the corresponding word is ᾠδας, bades, which signifies the state of the dead in general, without regard to their character or to their condition, either of happiness or misery. The Seventy in their translation of the word, have almost invariably used ᾠδας. See Gen. xxxvii. 15. chap. xii. 28. Ps. xvi. 10. Acts ii. 27. Some biblical critics, however, among whom we may reckon father Simon, bishop Law, and Dr. John Taylor, have contended that the term, in the Old Testament at least, means no more than ᾠδας, sepulchre or grave. This opinion is examined by Dr. Campbell, and he alleges, that though our word grave may, in some cases, sufficiently express, not the import of the word bades, but the purport of the sentence; yet, in others, it gives but a feble, and sometimes an improper version of the original. He maintains, that with regard to the situation of bades, it seems always to have been conceived both by Jews and Pagans, as in the lower parts of the earth, and corresponding in depth to the height of the vifible heavens, both which are on this account contrasted in sacred writ. See Job. xi. 6. 9. Psal. xxxviii. 8. Amos, ii. 2. 3. Besides, the inhabitants of bades are, from their subterranean abode, denominated in the New Testament, (Phil. ii. 10.) ἀπόκαθιστα, a word of the same import with the phrase ἐν τοῖς νεκροῖς, under the earth, (Rev. v. 13.) which, with the εἰρυθρα and ἐκθέα, celestial and terrestial beings, include the whole rational creation. In proof of the coincidence of the Hebrew and Pagan notions concerning the situation of the place of departed spirits, he refers to the lines of Virgil, Æne. vi. v. 243, 8c.

Non fecus, ac si quâ penitus vi terra deliciens
Infernus referet fedes, et regna recludit
Pallida, diis invisa; superque immane barathrum
Cernatur, tridentique immenso lumine manes.

Dr. Campbell further observes, that kever, the Hebrew word for grave, is never rendered in the ancient translation σαρκα, but τοὺς νεκροὺς, some, or some equivalent term; whereas bades is never rendered τοὺς νεκροὺς, or μαρτυρα, but always ᾠδας. This word is also always singular in meaning, as well as in form; but the word grave is often plural: and the former never admits the possessive pronouns, being the receptacle of all the dead, and therefore incapable of an appropriation to individuals; the latter often. In bades all the dead are represented as present, without exception: but the cafe is quite different with the graves or sepulchres. If. vi. 14. chap. xiv. 9. See also Job. xxxviii. 17. in which the challenge to Job could have no relation to a sepulchre, the door or entry to which is always known to the living; whereas the cafe was very different with regard to the habitation of departed spirits. Upon the whole, Dr. Campbell concludes, that the word grave, or sepulchre, never conveys the full import of the Hebrew bades, or the Greek bades. This author proceeds to examine the sense of ᾠδας, bades, in the New Testament, and refers to Acts. ii. 27. in which he observes, that in using two expressions, one regarding the soul, the other the body, would undoubtedly adapt his language to the received opinions concerning each; and if this be the case, bades was as truly, in their account, the soul's destiny after death, as corruption was that of the body. Another clear proof from the New Testament, says Dr. Campbell, that bades denotes the intermediate state of souls between death and the general resurrection, occurs in Rev. xx. 14, where the expression denotes that death, and the state of souls intervening between death and judgment, i.e. bades, shall be no more; but that to the wicked these shall be succeeded by a more terrible death; hell, properly so called. See also ch. vi. 8. The apostle Paul, it is said, without naming bades, conveys the same ideas of the state of souls departed. Rom. x. 6. 7. Bades is often used figuratively to denote a humble and miserable state; and thus it is opposed to heaven. Matt. xix. 23. xvii. 18. Here it may be observed, with Grotius, (True of Christian Religion, p. 368. Clarke's edit,) and many others, that μετά ᾠδας, the gates of bades, are a very natural paraphrase for death. So the expression is used by the Seventy as a literal version of the Hebrew. If. xxxviii. 10. See also Wisdom of Solomon, xvi. 13. The classical use of this phrase is the same with that of the inspired writers. Homer makes Achilles say, as rendered by our English poet:

"Who can think one thing and another tell,
My foul detests him as the gates of hell!"

i. e. I hate him as death, or mortally.

To say then, that the gates of death shall not prevail against the church, is, in other words, to say, it shall never die, or be extinct. The only passage, says Dr. Campbell, in holy writ, which seems to countenance the opinion, that μετά ᾠδας, bades, means the same thing as μετά νεκροῖς, gehenna, or a place of punishment, is in Luke, xvi. 23. According to the explanation given of this passage, the rich man and Lazarus were both in bades, though in very different situations: the latter in the mansion of the happy, and the former in that of the wretched. When bades is represented as being under the earth, and heaven, or the seat of the blest, as being above the fars, these expressions should be regarded merely as attempts to accommodate what is spoken to vulgar apprehension and language. See Campbell's Four Gospels, translated from the Greek. Prelim. Diff. vol. i. p. 206—216. See Sleep of the Soul.

ADES, in Geography. See RHADES.

ADESA, or Adessa, a river of Lycia, in Asia Minor. A town of this name is placed by M. d'Anville, on a small river, which unites with a much larger, called Xanthus.

ADESSE, or Adesta road, lies on the west side of the island of Tenerife, and six leagues east from Gomera illand road, which is opposite. It is open to the south-west.

ADESSENIARII, formed of the verb adesti, to be present, in Ecclesiastical History, a name given to those who in the 16th century held that Jesus Christ is really present in the eucharist, but in a manner different from that which is maintained by the Romanists. The adestenars, called also impanisters, are divided into such as maintain four different opinions concerning this point. Some hold that the body of Jesus Christ is in the bread; others, that it is about the bread; others, that it is with the bread; and lastly, others, that it is under the bread. See Impanation.

ADECTED, or AFFECTED Equation, in Algebra, is that in which the unknown quantity is found in two or more different degrees or powers; e.g. $x^2-px+qx=a^2b$, which has 3 different powers of $x$, viz. $x^2$, $x$, and 1. See Equation. The term affected is sometimes used in speaking of quantities that have co-efficients. Thus, in $2a$, the quantity $a$ is said to be affected with the co-efficient 2: and an algebraic quantity is said to be affected with the sign + or —, or with a radical sign, if these signs are prefixed
ADH

to it. The term affected, or affected, is said to have been introduced by Vitellius.

ADHILATION is used to signify a Gothic custom, where a person remarrying, who has children by a former bed, renders them capable of inheriting equally with the common children of both parties. This is done by agreement, and is otherwise called by some adopio per matrimonium. This custom is still retained in Germany, under the name eindkindschaff, and unio prolium. But the learned Hinneccius observes, that the unio prolium is not an adoption.

AD FINES, in Ancient Geography, a town of Switzerland, supposed to be the modern Pfla, in the north of the district of Turgaw, on the river Dura, or Thur, not far from the borders of Swabia, about half way between Coufland and Fravennfeld. It is so called, because at the time when Cicecum, the general of the emperor Vitellius, with the auxiliary Rhetians, defeated the Helveti, the former extended their borders thus far; and in the time of the Romans, it was the last town of repute in this quarter.

ADGADNA, in Geography, a town in the Guan, one of the Marianas isles in the South Sea.

ADGE, AGDE, or AUGE, is a river that falls into the gulf of Lyons. It is north-east from Narboune, between Buziers and Montpelier, and forms a good bay.

ADHA, among the Mahometans. See BIRAM.

ADHAD EDDOULET, in History, second prince of the race of Buurah, or Dilamites, was born about A. D. 935, and succeeded his uncle, Amad-eddoulet, in the empire of Peruia; and by the additions he made to it, became the most powerful prince in the east. In 977, he became emir and master of Bagdad, and directed his attention to the improvement of his extensive dominions. He built hospitals, founded monasteries, cleaned the beds of rivers, and recovered and rendered more fabulous large tracts of land. He encouraged literature and poetry, and cultivated a taste for science, and a proficiency in that kind of knowledge which was most esteemed among the Arabs. By marrying one of his daughters to the caliph Al-Tay, he mingled the blood of the Buurahs with that of the ancient sovereigns of the Moslems. His ambition led him to commit occasional acts of severity; but his government was, upon the whole, wise and beneficent. He fell a sacrifice to repeated attacks of the ephelapy, at the age of 47, A. D. 952, and left four sons, who shared his dominions. When this prince was at the point of death, he is reported to have said, with a faltering tongue, "What have all my riches and prosperity availed me? My power and authority are now at an end;" and these words he continued repeating till he expired. Mod. Un. Hist. vol. ii. p. 410.

ADHATODA, in Botany, a species of Justicia. This name is given to it in the Zevanian tongue, from its supposed virtue of expelling the dead fetus, which it signifies.

ADHERENCE, action of, in the Scots Law, is an action competent to a husband or wife, to compel either party to adhere in case of defection.

ADHERGAT, in Geography, a town of Syria, on the frontiers of Arabia.

ADHESION, or Adherence, compounded of ad, to, andhere, to stick, in a general sense, the state of two bodies which are joined or fastened together, either by mutual attraction, the interposition of their own parts, or the impulsion or pressure of external bodies. Anatomists sometimes observe prophysyes, or adhesions of the lungs to the side of the thorax, the pleura, and diaphragm, which give occasion to various disorders. We also read of adhesions of the dura mater to the cranium; of the bone to the bladder, though some combat this last as a chimera; at least the existence of it are rare. We have also several cases of adhesions of the intestines, mentioned in the Philosophical Transactions, No. 481. The adhesion of two hollow hemispheres and of two polished planes exhibit other instances of adhesion. See ADHESION infra.

ADHESION, in Logic. The schoolmen distinguish two kinds of certitude; the one of speculation, which arises from the evidence of the thing; and the other of adhesion, or attachment, which does not depend on the evidence, but on the importance of the matter, and the interest we have in it.

ADHESION, or Adherence, is also used for the perishing in a former opinion or resolution. After the free conference between the two houses concerning the bill for preventing occasional conformity, when the Lords retired, and it came to the final vote of adhering, they were to equally divided, that in three questions put to different heads, the adhering was carried but by one vote in every one; and by a different person each time. The Commons likewise adhered; and thus the bill was lost.

ADHESION, adhesion, Fr. in Philosophy, and Chemistry, is a term generally made use of to express the property which certain bodies have of attracting to themselves other bodies, or the force by which they adhere together: thus, water adheres to the finger, mercury to gold, &c. Hence arises an important distinction between two words, that in a loose and popular sense are often confounded. Adhesion denotes an union to a certain point between two dissimilar substances, and cohesion that which retains together the component particles of the same mass. See COHESION.

Adhesion may take place either between two solids, as two hemispheres of glass, which, according to an experiment of Defaguilier, adhere to each other with a force equal to 19 ounces on a surface of contact of an inch in diameter; or between solids and fluids, as the suspension of water in capillary tubes; or lastly, between two fluids, as oil and water.

The proximate cause of adhesion has been variously stated by different philosophers. James Bernoulli, in his Dissertatio on the Weight of the Atmosphere, published in 1698, maintains, that the resistance which two pieces of polished marble oppose to their separation, is owing to the pressure of the air; in proof of which, he affirms as a fact (what in all probability he had himself never attempted to verify), that the two plates were equally parable in vacuo.

Dr. Brook Taylor having observed, in 1713, the ascent of water between two planes of glass, was induced to make several experiments on the adhesive power of surfaces, from which he concluded that the degree of this force might be measured by the weight required to separate them. About the same time Mr. Haukfle proved experimentally the error which Bernoulli had fallen into, in attributing the adhesion of surfaces and capillary attraction to the pressure of the atmosphere, (Philol. Trans. vol. xxv. xxxv. xxvii.) Nevertheless, in 1772, M. M. Lagrange and Cugna, taking for granted a natural repulsion between water and oily substances, imagined if there was an adhesion between water and oil, or tallow, that it must be occasioned by a cause different from attraction; and having ascertained the reality of the adhesion, they concluded that it was occasioned by the pressure of the air, and that Dr. Taylor's method was not well founded.

Such was the state of opinions on the subject, when, in 1773, Guyton Morveau made his celebrated experiments on adhesion.
adhesion in presence of the Dijon academy, (Journ. de Physique, i. p. 173 and 460) demonstrating, as indeed Haffkine had done before him, not only that water ascends between two parallel plane plates of tallow separated from each other by a line, but also that the atmospheric pressure is not in the least degree the cause of the phenomenon, which is solely attributable to attraction; in proof of this, a polished disk of glass, 20 lines in diameter, was suspended to the arm of a balance, and brought into contact with a surface of mercury; the counterpoise required to separate it was equivalent to 9 grms., and a few grains, and upon moving the apparatus into the receiver of an air-pump, and forming a perfect vacuum as possible, precisely the same counterpoise was required as before.

In the prosecution of his inquiries on this subject, which hitherto had principally interested the mathematical philosophers, Morveau was led to discoveries, which promised at first to reduce the intricate science of chemical affinities to the certainty of algebraic computation; and, if that hope has since been realized, it still remains an interesting object to the chemist, and affords much subsidiary assistance in the investigation of the general laws of chemical agency.

He observed, that the same disk of glass which, when in contact with phlegm, adhered to it with a force equal to 259 grms., required a counterpoise of only 219, in order to separate it from a solution of potash, notwithstanding the superior density of this last. This inequality of effects on equal diameters, and in an inverse order to that of the respective specific gravities of the two fluids, appeared not only to be decisive in favour of Dr. Taylor's method, but to encourage the hope of applying it to the calculation of chemical affinities.

In order to verify this proposition (Elémens de Chymie, de l'Académie de Dijon, vol. i. p. 63.) plates of the different metals in their highest state of purity were procured, perfectly round, an inch in diameter, of the same thickens, well polished, and furnished with a small ring in the centre of each so as to keep them suspended precisely parallel to the plane of the horizon. Each of these plates was in turn suspended to the arm of an alloy balance, and exactly counterpoised by weights placed in the scale attached to the opposite arm; the plate thus balanced was applied to the surface of some mercury in a cup about two lines beneath it, by sliding the plate over the mercury as in the fusing of mirrors, so as to exclude every bubble of air, and weights were then successively added till the adhesion between the plate and mercury was broken. Fresh mercury was used for each experiment. The following is the Table of results:

<table>
<thead>
<tr>
<th>Metal</th>
<th>Adhesion Force</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

The striking differences in the above Table show that the pressure of the atmosphere has no share in them, since in this respect the circumstances of each were precisely similar: nor do they depend on the respective specific gravities; for if so, silver should rank after lead, cobalt before zinc, and iron before tin.

The only order which agrees with the above is that of the chemical affinity of these metals, or the respective degrees of their solubility in mercury (see amalgam): it is highly probable, therefore, that at least the principal part of the adhensive force thus found by experiment is owing to chemical affinity, and that the above numerical series 446, 429, 418, 397, &c. is an approximation to the ratio of the relative affinities of gold, silver, tin, lead, &c. for mercury.

M. Achard, of Berlin, convinced by Morveau's discoveries of the accuracy of Dr. Taylor's method, followed them up by a great multitude of experiments which were published in 1780, along with other tracts in his Chemische Physische schriften. The results of these, if accurate, would make a considerable accession to the science of chemical philosophy, but as there are some rather suspicious circumstances, it will be necessary to investigate M. Achard's system with some minuteness.

He lays down three conditions as essential to the accuracy of each experiment. 1. That the solid, whose adhesion with the fluid is to be ascertained should be suspended by its true central point, in order to be in a truly horizontal position, and that the force employed to separate the adhesion should always form a right angle with the fluid. 2. That no air bubble should remain interposed between the solid and fluid; which is easily perceived when using disks of glass, but can only be inferred when using opaque solids; to obviate this cause of inaccuracy he has found no method answer so well as fiding the plates on the surface of the fluid as explained above. 3. In adding the counterpoise, especially towards the end, care must be taken to use very small weights, such as pieces of paper, a quarter of a grain each, and to place these in the scale, gently and gradually, so as to avoid any jerk or sudden action.

The first point to be ascertained was, whether the temperature remaining the same, the difference of atmospheric pressure, as evinced by the barometer, had any influence on the adhesion of surfaces; he found that in this respect there was no difference in the adhensive force between a plate of glass and distilled water.

The results, however, no longer uniform, when he operated at different temperatures with the same elevation of the barometer, nor did this variation arise from the different temperatures of the surrounding air, but solely from that of the water; purifying this train of experiment he found that the adhesion of solids to fluids is constantly in an inverse ratio to their temperature; and for the verification of his experiments he instituted a number of calculations from the following data. Let \( x \) be the temperature of the water; \( y \), the corresponding adhesion; \( a \), its co-efficient; and \( b \) the constant force; hence we have the equation \( x = a - by \). To find the value of \( a \) and \( b \) let he made use of two experiments, the one in which water at 104\(^\circ\) of Sulzer's thermometer (152\(^\circ\) 278 Fahrenheit) adhered to the glass disk with a force equal to 85 grains, the other where water at 56\(^\circ\) 8\(^\circ\), (56\(^\circ\), 764 Fahrenheit) adhered with a force equal to 89 grains. Proceeding from these two terms \( 104 = a - 80b \) \( 56 = a - 89b \) we have, \( a = 530 \) \( b = -\frac{48}{9} \)

Hence the relation of the temperature of the water to its adhesion to the glass, may be thus expressed \( x = 530 - \frac{48}{9} y \); and from this are deduced the corresponding values of \( x \) and \( y \) for all the adhesions of glasses to water at any temperature.

From these data, and the corresponding experiments, M. Achard
Achard formed the following Table of the adhesive force of a glass disk, \( \frac{1}{2} \) inch in diameter, to water at different temperatures.

</tbody>
</table>

Of the accuracy of this Table of M. Achard’s there seems no reason to doubt, since, in the individual instances, the difference between the force of adhesion found by experiment, and that ascertained by calculation, is so considerable as to exclude the idea of fiction; while, upon the general average, the difference is so small as to give a high opinion of the precision with which the inquiry has been conducted.

We learn from this Table, that for every degree of Sulzer’s thermometer \( (1.565 \text{ Fahrenheit}) \) taken in a descending series, the force with which a glass disk \( \frac{1}{2} \) inches in diameter adheres to the surface of water, is increased by \( 0.0876 \) grains according to calculation, or \( 0.1858 \) by experiment, in a uniform ratio; now two things take place during the cooling of the water, viz. a portion of calorick is separated, and the bulk of the water is thickened: each of these causes may account for the increased adhesive force, but upon different principles. It is owing to the escape of calorick, it may be accounted for in the following way. Water at any state of liquidity is, properly speaking, a compound of calorick and water, which combine together by a slight degree of affinity; and in proportion to this force resist the union of any third substance either with the calorick or the water; if part of the calorick is taken away, the water is more disposed to union with a third substance by the whole quickest affinity of the water and the abstracted calorick; therefore the force by which a plate of glass adheres to water is increased, exactly in proportion to the diminution of the temperature, or, in other words, the increase of weight is the exponent of the quickest affinity between the masses of water and the calorick taken away. According to Morveau’s observations on this same Table, “the adhesion is stronger when the water is colder, because containing more ponderable matter in a given volume, it “preyets to the glass-plate more points of contact; and “the force of adhesion being proportional to the sum of “these points, it ought to augment or diminish, as the fluid “is condened by cold, or rarified by heat.” These few words express the aim and object of all the experiments of Morveau on this subject; namely, that chemical affinity is only a modification of the attraction of cohesiveness, and in like manner subject to mathematical computation. The general reasons on which this opinion is founded will be discussed hereafter in the article chemical affinity; all that is necessary here, is to show, that the argument just mentioned, deduced from M. Achard’s Table, is liable to a very strong objection. The fact being allowed, that the adhesion becomes uniformly greater in proportion to the diminished temperature of the water, it follows, that if this adhesion is owing simply to the cohesive attraction of the proximate particles of the glass and water, the degree of this force will be according to the number of proximate particles in a given superficies; or, in other words, directly as the specific gravity. Now, by the experiments of Achard, the adhesion between the glass-plate and water at \( 92^\circ \) Fahrenheit, is equal to 80 grains, and at \( 96^\circ \) Fahrenheit, equal to 80 grains. From Kirwan’s experiments on specific gravity (Phil. Trans. vol. xxxv. pt. i. p. 267.) it appears, that the weight of a cubic inch of water at \( 92^\circ \) Fahrenheit is equal to 248.7 grains; and the same at \( 96^\circ \) Fahrenheit, equal to 252.47 grains; if, therefore, the adhesion is as the specific gravity, the adhesive force at \( 96^\circ \) Fahrenheit ought to be only 81.21, instead of 89; for

\[ 248.7 : 80 :: 252.47 : 81.21, \]

Having ascertained the influence of temperature on the adhesion of surfaces, the next object with M. Achard was to determine the ratio between the force of adhesion and the superficial magnitude of the body. For this purpose he procured round plates of glass of different diameters, from \( 1.5 \) inch to \( 7 \) inches, and having first determined the force of their adhesion with the different fluids, by the number of grains necessary to overcome it, he afterwards calculated the same by the following equation. Let \( p \) be the force of adhesion belonging to a disk of glass, whose diameter is \( a \); and \( y \) the adhesive force of a similar disk, whose diameter is \( b \), we shall then have

\[ \frac{b}{p} = \frac{a^2}{y}. \]

From these materials, the following Table has been constructed.
TABLE II.

The force of adhesion between glass disks of different diameters, and different kinds of fluids, determined by experiment and calculation.

</table>

Hence it appears, that the difference of adhesion manifested by different sized disks of glass with the same fluid, is in the ratio of the squares of their diameters; and this may be admitted as true, at the same time, that it may be doubted whether the Table expresses faithfully the result of the experiments. If we bear in mind the first of the conditions which M. Achard himself lays down, as essential for the correctness of the experiment, namely, that the disk should be suspended by the true centre of its mass and figure, and that the force employed to detach it should always form a right angle with the plane of the disk; and of the fluid, it will be obviously extremely difficult to procure the concurrence of these circumstances, when operating even with the smallest of the disks mentioned in the Table; and with larger disks, the causes of error must increase as at least in proportion to the squares of their diameters. By comparing the differences between experiment and calculation, when a disk 1.75 inch in diameter was used, with those that took place when a disk 7 inches in diameter was used, we shall find them to be according to the Table, 0.0999795 : 1.0000525; whereas, if the probable causes of error were only as the diameters, the proportion ought to be 0.9999795 : 4.000100; and if the squares of the diameters are admitted as the true proportion, then it should be 0.9999795 : 21.7000425.

Besides the experiments already mentioned, a series of 600 more was made by M. Achard, with different fluids formed into disks of equal diameters, and applied to the surface of some of the simpler and more compound fluids; unfortunately several of the fluids and fluids are as heterogeneous in their chemical composition as to afford few important results: those which are of most consequence are assembled in the following Table:

<table>
<thead>

It is manifest that the strength of adhesion is not owing either to the specific gravity of the solid or of the fluid, nor is it at all more conformit with the acknowledged order of chemical affinities. Why lead and brass should generally be the first in each column, and why sulphur and wax should be interposed between these and the rest of the metals, is wholly unaccountable, and contradictory to all known chemical facts. The column in the lead of which the acetate of lead, contains besides several peculiar difficulties. The plates of zinc, iron, and tin, would begin to decompose this salt as soon as they came in contact with it, and would in consequence be superficially covered with lead; the acquired weight of lead, therefore, and the loss of substance sustained by the metallic plates, would be two powerful disturbing causes in the performance of the experiment; besides, as each of the plates would be coated with lead, the greatest part of the adhesive force ought to be reckoned as belonging to the adhesion of lead to acetate of lead, and in consequence the three corresponding numbers in Tab. III. ought to be nearly equal, which they are not; the same objections, and perhaps with still greater force, apply to the column whose title is acetate of copper, on account of the more perfect adhesion of the revivified copper to the surface of the zinc and iron plates.

In the Journal de Phystique (vols. xv. xvi. and xix.) is a series of papers by M. Dutour, on the subject of capillary attraction.
attraction, which contains some excellent observations on Dr. Taylor's method: he maintains, that the force of adhesion is then only truly expressed by the weight of the counterpoise, when upon raising the solid plate out of the fluid no particles of this last are found adhering to it; thus the adhesion of mercury to glass, to marble, to those metals with which it does not readily amalgamate, is accurately expressed by the weight necessary to counterpoise this adhesion; but where the solid comes out covered with a thin plate of the fluid, as is the case when a plate of gold or silver is applied to a surface of mercury, it is obvious that the separation of the solid and fluid does not take place at their plane of adhesion, but some way below it in the fulbarance of the mercury, so that the weight of the counterpoise is rather the expulsion of the cohesion of the mercury, than of the adhesion between it and the gold. Hence arises the necessity of taking into consideration the cohesive force of the fluids themselves in calculating with any accuracy the adhesion between solids and fluids; and this requires so much nicety, is so liable to be affected by small changes of temperature and other circumstances, as to preclude any great dependance upon it, in determining the comparative energy of different cases of chemical affinity.

Upon the whole then we may conclude that there exists a tendency to adhesion between any, and probably between all substances in nature, absolutely independent of atmospheric or any other external preiiure; that the force of this adhesion between solids and fluids is in an inverse ratio to the thermometrical temperature, and a direct ratio to the squares of the surfaces; that every solid adheres with a peculiar force to each fluid, and that the different degrees of adhesive force between the same fluid and equal surfaces of different solids form a series which corresponds with the order, and is perhaps the exponent of the proportion of their respective chemical affinities to the same fluid; that this force is truly expressed by the weight necessary to break the adhesion in all cases where the solid comes out clean from the fluid, but that whenever any particles of the fluid adhere to the solid, the weight of the counterpoise is then expressed by the mixed forces of the adhesion between the surfaces of the solid and fluid, and of the cohesion between the component particles of the fluid, which last is in the present state of our knowledge, cannot be depended on with any accuracy in the calculation of chemical affinities.

Some, however, have supposed, and others have allowed, that, although in the case of polished planes, brazen hemispheres and leaden bullets, which adhere to one another with a considerable force both in the air and in vacuo, the principal cause is their mutual attraction, yet the pressure of the air may contribute in a slight degree to their adhesion. But the effect of this cause is very inconsiderable, and, compared with the other, scarcely deserves notice.

Adhesion, in Surgery, the same as agglutination, a preternatural process, by which various parts of the body cohere together and become one mass. A partial coheion, for example, often takes place between the pleura of the lungs and ribs, between the heart and pericardium, the liver and diaphragm, or between other contiguous viscera, after an attack of inflammation. This process also follows if two abraded or ulcerated surfaces be applied for some time to each other, as when the fingers have been severely burnt and not kept together. What is called "healing of wounds, by the first intention," likewise comes under this denomination. The doctrine of adhesion is, therefore, of considerable importance in surgery, and should be carefully attended to. The right understanding of this doctrine has led to many of the greatest improvements in modern practice, especially in the extirpation of tumors, in the treatment of recent wounds and in amputation. The perfect union of living parts can only happen where there is a mutual elongation or inclusion of the blood-vessels at the two contiguous surfaces, or at least where the vessels from one part pivot into the adjacent substance, and thus keep up a vital communication.

ADHIL, in Astronomy, a star of the sixth magnitude, upon the garment of Andromeda, under the latter figure in her foot.

ADHOA, in Ancient Geography, denotes what we otherwise call relief. In which sense we also sometimes find the word written adhoba, adhobamentum, and adhobamentum.

Du-Cange.

ADJA, or AGGA, in Geography, a high and fort of Guinea, on the coast of Fantin, belonging to the Earl India Company.

ADIABA, in Ancient Geography, a town built by Simon Maccabaeus, in a plain, or ephemus, as a place of defence.

ADIABIDA, a town of Abia, in Albania, placed by Ptolemy in long. 70°, and lat. 45° 30'.

ADIAEBENE, the chief province of Affryia, which sometimes gave its name to the whole country. It was so called according to Ammianus, (l. xxxi. c. 20.) from the two rivers Diabba and Adiaba, which Valelius (in loc.) says, are more frequently denominated Zabas and Anzahas. Stephanius (de Urb. vol. i. p. 22.) confounds Adiabene with Mecopotamia. In this province, which was the richest and most fruitful of Affryia, Ptolemy (l. vi. c. 1.) and Ammianus place Ninus or Nineveh, Gaugamela, and Arbela; and with them Strabo (l. xvi. vol. 2. p. 1671) agrees; for though he places Ninus and Gaugamela in Aturia, and Arbela in a district of its own name, yet he makes both Aturia and Arbels parts of Adiabene. This province became a distinct kingdom in consequence of the disturbances that prevailed among the Seleucids, and was held by successive sovereigns in opposition to the Syrian kings, till they were expelled by the power of the Roman emperors. The first king mentioned in history, reigned in the time of the Mithridatic war, and joined Tigranes against Lucullus. In the reign of the emperor Claudius, Monoobazus, called also Bazos, ruled over the Adiabenians: who was succeeded by Izates, his son, by his father Helena, whom he married. Izates, being instructed in the Jewish religion (see Jos. Antiq. l. xx. c. 2. tom. 1. p. 957, &c. Ed. Havern.) introduced it among his subjects; upon which they conformed against him, and called in Abias the king of Arabia, to their assistance. Failing in this attempt, they solicited the assistance of Vologesef, king of the Parthians; he was equally unsuccessful; and Izates closed his life and reign in peace, and left five sons, who were educated under their grandmother Helena at Jerusalem, and there taught both the Jewish language and religion. Little is known concerning the affairs of this kingdom from the death of Izates, who was contemporary with the emperor Claudius, and who bequeathed his crown to his brother Monoobazus, until the reign of Trajan, when it was governed by one Mearbaspe, who joined Chlofas, king of the Persians, against the Romans. This war proved unsuccessful, and Mearbaspe was driven from the throne; and though Mansus king of Arabia, attempted to restore him to the kingdom, his enterprise for this purpose was ineffectual, and he was obliged to conclude a peace with Rome. Trajan, having obtained possession of Adenytrea, a fortified place of great strength, which was delivered to him by Senius, a centurion, who had escaped the treachery of
of Mebarhaps, formed a bridge over the river, Tigris, and made himself master of the whole kingdom of Adiabene, A. D. 368, or in the 15th year of the Chaldean, or 12th year of the Persian. However, vonmann had himself put to death by one Severus, A. D. 348, of this circumstance Codianicen. See Dion. Cass. Hist. Rom. vol. ii. p. 1177. Ed. Reimnir. In the reign of Sapor II. king of Persia, the Adiabeniens, as we learn from Sozomen (I. ii. c. 13.) embraced the Chaldean religion, and were on that account treated with great cruelty by this king, to whom they were subject.

Adjacent, or adjoining, of ad, to, and jacer, to lie, something situated near, or by the side of another. Adjacent angle. See Angle.

ADIADA, in Ancient Geography, a town of Palestine, in the tribe of Dan. See ADIABEN.

ADIANTUM, Maiden-hair, in Botany, the name of a genus of plants of the cryptogamia, filices clafs and order, the characters of which are these; that the fructifications are collected in oval spots, at the end of the fronds or leaves, which are folded back; or at the reflex tip of the frond underneath. Prof. Martyn enumerates thirty-five, and Gmelin forty-four, species; of these forne have a simple frond, viz. 1. A. reniforme, a native of the island of Madeira, and introduced here, in 1738, by Mr. F. Maffon. 2. A. sigittatum. 3. A. philippine, a native of the Philippine islands. 4. A. repons, native of the isle of France. 5. A. decurrent. Others have a compound frond, viz. 6. A. triquetrum, native of America. 7. A. radidatum, an elegant plant, with small fronds, a native of Jamaica and Dominica. 8. A. pedatum. 9. A. Josens. 10. A. captatum, native of the East Indies and Japan. 11. A. furcatum, native of Jamaica. 12. A. hystatum, native of the Cape of Good Hope. 13. A. lanceum, native of Surinam. 14. A. macrophyllum, native of Jamaica. 15. A. deltoideum, native of Jamaica. 16. A. puniceum, native of Jamaica. 17. A. cunctatum, native of Jamaica. 18. A. trilobatum, a beautiful little fern, found by Commeron in Buenos-Ayres. Thofe with a decomposed frond are; 19. A. denticulatum, native of Jamaica. 20. A. flabellatum, native of China. 21. A. trifolium, native of America. 22. A. cibisam, native of China. 23. A. capillus veneris. 24. A. truncatum. 25. A. guianense. 26. A. eritatum, native of South America. 27. A. furcatum. 28. A. fritillatum, native of Jamaica. 29. A. ferratum. 30. A. wilfordi, native of Jamaica. 31. A. pulverulentum, native of South America. 32. A. coxifolium. 33. A. fragrans, or Polyodium fragrans, native of Madeira, introduced here, in 1758, by Mr. F. Maffon. 34. A. fritillatum, native of Jamaica. 35. A. microphyllum, native of Jamaica. 36. A. barbicum. 37. A. telluroides. 38. A. fandens, native of Cochinchina. Thofe with a super-decomposed frond are; 39. A. fragile, native of Jamaica. 40. A. tenetrum, native of Jamaica. 41. A. chloratum, native of Dominica. 42. A. trapaniforme, native of New Zealand, and between the Tropics. 43. A. acutatum, native of Dominica and Jamaica. 44. A. hexagonum, or PTERIS heterophylla. 45. A. pteroides, native of the Cape of Good Hope, introduced in 1775, by Mr. F. Maffon. 46. A. Aethiopicum, native of the Cape of Good Hope and Japan.

Of all the species above enumerated one only belongs to Great Britain, viz. the A. capillus veneris, or true maiden-hair, which is found rarely in Scotland and Wales on rocks and moor walls, and which is a native of the south of Europe and the Levant. The fronds or leaves of this species are double compound; the leaflets or wings are alternate; the pinnae or leaflets are wedge-shaped, lobed, and pedicelled, or on leaf-flasks; it is perennial, and flowers from May to September. This is a very succulent plant, yielding almost its whole weight of juice; but neither its tafe nor smell promises any efficacy. If the syrup of capillaris, which is made from it, be good for any thing, it is from the high-flowering water that is put into it. The A. petasium, or Canadian maiden-hair, is a native of Canada, Japan, and the Society islands, and was brought into England from Virginia by John Tradescant, the son, before the year 1632. It flowers in August and September. In Canada this plant grows so plentifully, that the French, when they were in possession of that country, sent it to France in a package for goods, and the apothecaries at Paris used it instead of the true maiden-hair. The leaves of both these species have a slight sweetish roughish tafte, and a pleasant but weak smell, very perceptible when boiling water is poured upon them. Infusions, or decoctions of them infiltrated, yield a moderately rough, bitter, mucilaginous extract. Maiden-hair has been long esteemed good against disorders of the breast, for promoting expectoration, softening recent coughs, and allaying the tickling in the throat occasioned by defluxions of thin rheum. For these purposes a syrup of the true fern, flavoured with orange-flower water, has been usually brought from France; and a syrup of the Canadian fern, made with maple sugar, is sometimes received from America. Our confectioners prepare a syrup of the maiden-hair, which they sell under the name of capillaries. But the English maiden-hair, or ASPLENIUM, has been commonly substituted in the pectoral syrups and infusions made among us. The Canada species is said to be superior to both. But the virtue of the maiden-hair may be obtained to much greater advantage, by drinking an infusion of the herb as tea, sweetened either with sugar, or by the addition of a little liquorice. Lewis, Mat. Med.

Culture. The only species that have been cultivated with us are the 18, 20th, 30th, 40th, 42d, and 45th, in the above enumeration. The A. capillus veneris may be preserved in pots filled with gravel and lime-rubbhish, in which it will thrive much better than in good earth. The A. pedatum will live through the winter in the open air, if the feafon be moderate; but as severe frosts will sometimes destroy it, a plant or two should be kept under shelter. The A. wilfordi, and A. trapaniforme must be preserved in a fovee, and will afford by their shining black flacks, and odd-shaped leaves, an agreeable variety among other exotic plants. The A. reniforme, fragrans, and pteroides, may be kept in the green house.

ADIANTUM aureum. See POLYTRICHUM.

ADIANTUM nigrum, a species of ASPLENIUM. ADIANTUM, in Natural History. See TUBULARIA. ADIAPHORISTS, or ADIAPHORITI, compouged of a priv. and a diaphori, different, and denoting indifferent; in Ecclesiastical History, a name given in the 16th century to the moderate Lutherans, who adhered to the sentiments of Melanthon; and afterwards to those who subscribed the INTERIM of Charles V. Melanthon, whose sentiments were moderate, and temper mild and gentle, declared on this occasion, that, in his opinion, compliance was due to the Imperial edicts in matters of an indifferent nature: but both he and his associates ranked in this clafs many things which appealed to Luther and his disciples to be of the highest importance; particularly the doctrine of justification by faith alone, and the necessity of good works to eternal salvation, as well as the number of the sacraments, the jurisdiction claimed by the pope and the bishops, extreme union
unction, and the observation of religious festivals and superstitions. Hence sprang the adiaphoristic controversy, as it was called, which divided the church for many years, and obstructed the progress of the reformation. See Form of Concord.

ADIAPHOROUS is a denomination given by Mr. Boyle to a kind of spirit distilled from tarant and some other vegetable bodies, and which is neither acid, vinous, nor unctuous; but in many respects different from any other sort of spirit.

ADIAPNEUSIA, from α, αες, and μιν, I breathe, in Medicine, signifies defective perspiration, from dense pores, &c.

ADIAPTOTOS, a Greek word signifying form, and applied by some medical writers to a remedy for the colic, which is flene-parley, henbane-feed, white-pepper, &c. made into an electuary.

ADIARROLLAE, from α, εις, and ιερ, I flow, signifies a total suppression of all the necessary evacuations.

ADJAZZO. See Adjazzo.

ADICARA, in Ancient Geography, a town of Asia, near the Persian gulf, which Potemian places in long. 79°, and lat. 27°, 30'.

ADIECA, in Botany. See Nettle.

ADIDA, ADDIBA, or ADDIBA, in Ancient Geography, a city of Judea, not far from Jerusalem. Josephus says, (De Bell. Jud. l. iv. c. 9. tom. 2. p. 330.) Ed. Haverc.) that when Vespasian besieged Jerusalem, he established a camp and guards in this place as well as in Jericho. Simon Maccabaeus also encamped in this place to dispute the entrance into the country with Tryphon, who had brutally seized his brother Jonathan, at Potemian. 1 Maccab. xii. 13. ch. xii. 38. Jof. Ant. l. xiii. c. 6. § 14. tom. 1. p. 653. Adida is probably the same with Addius.

ADJECTIVE, in Grammar, a kind of noun joined with a substantive, either expressed or implied, to shew its qualities or accidents.

The word is formed of the Latin adjicere, to add to; as it is designed to be added to a substantive, without which it has no specific signification.

Father Bubbler defines adjectives in a manner somewhat different from other grammarians. — Nouns, according to him, are substantives, when the objects which they represent are considered simply, and in themselves, without any regard to their qualities; on the contrary, they are adjectives, when they express the quality of an object. Thus, when I say, simply, a heart, the word heart is a substantive, because none of its qualities are expressed; but when I say, a generous heart, the word generous is an adjective; because it adds a quality, or attribute, to the heart. Adjectives, then, appear to be nothing else but modificatives.

In effect, the end of an adjective being only to express the quality of an object; if that quality be the object itself whereof we speak, it becomes a substantive: e. g. If I say, this book is good; good here is an adjective; but if I say, good is always to be obeyed, it is evident good is the subject I speak of; and consequently good, there, is the substantive.

On the contrary, it often happens in other languages, and sometimes in our own, that a substantive becomes an adjective: as, for instance, in these words: the king, hero as he is, remembers he is a man, where the word hero, though ordinarily a substantive, is apparently an adjective. From this idea of an adjective, it appears that many of the nouns, which, in the common grammars, are accounted substantives, are really adjectives, and not verba: grammar in this, and a thousand other infinences, depending upon custom.

An adjective, according to the definition of Mr. Harris, (Hermes, p. 156.) has no affertilon, and only denotes such an attribute, as has not its essence either in motion or its privation. Thus in general the attributes of quantity, quality, and relation, such as many and few, great and little, black and white, good and bad, double, triple, quadruple, &c. are all denoted by adjectives. Every adjective may also be considered as capable of being resolved into a substantive, and an expression of connection equivalent to of, e. g. a good man, is a man of goodness: in which case the adjective expresses not only an attribute, but also the connection between the attribute and its substantive; and the particular kind of connection is ascertained by experience. In this view of the subject the adjective appears to have two uses. The first and principal is that of restricting or modifying a general term, as in the infinences above recited. The second is, when the abstrait substantive contained in the adjective is modified by the noun, with which, in the concrete or adjective form, that abstrait substantive is joined. The former may be called the direct, and the latter the inverse, acceptance of adjectives. In the following passage, Livy says, "Regnantum cett Rome ab urbe condita ad liberam annos ducentos quadraginta quattuor;" i. e. monarchs from the building of the city to its deliverance; here the participles, or adjectives, condita and liberam, are used inversely; i.e. the abstrait substantives contained in these words are modified or restricted by the substantives urbe and urbeon, with which they are suffixed to unite. Mr. Harris observes (ubi supra, p. 187) that attributes sometimes assume an affertilion, and appear as verbs: as abeo, or abus sum, tueas or tumidus est, and πανομονος and πανομονος is equal. Of these there are but few, and they may be called verbal adjectives. Participles likewise insensibly pass into adjectives, as bonus or learned, lose their power as participles, and mean a person possessed of an habitual quality. Thus also vir elegans denotes a person who poises the habit of speaking, and not a person now speaking. Substantives may also be converted into adjectives; when we say the party of Pompey, the fylle of Cicero, the philosophy of Socrates, the perfons perform the part of attributes, or stam and characterise their subjects; so that they assume the form of adjectives. And we accordingly say, the Pompeian party, the Ciceronian fyle, and the Socratic philosophy. Even pronominal substantives admit the like mutation. Instead of saying the book of me, of thee, and of him, we say, my book, thy book, and his book; or the country of us, of you, and of them, we fay our country, your country, and their country; which words may be called pronominal adjectives. In English the adjective is not varied on account of gender, number, or fale. Dr. Lowth, indeed, (Intro. to Eng. Grammar, p. 56.) excepts some few pronominal adjectives, which have the positive sile, as:

Teach me to feel another's woe.

Rope, and the adjectives former and latter, which may be considered as pronominal, and repre{enting the nouns, to which they rerer. The only variation which it admits of, is that of the degrees of comparison.

In the Greek and Latin, however, they have the same form with substantive nouns; and are declined, like them, by cases, and subjected to the like distinctions of number and gender. It is obvious, that neither number, nor gender, nor cafes, nor relations, have any thing to do, in a proper fenfe, with mere qualities, such as good or great, soft or hard: and yet bonus, magnus, and tener, have their singular and plural, their masculine and feminine, their genitives and datives, like any of the names of substantives, or perfons.

To account for this circumstance, Dr. Blair (Lectures, vol. i, p. 199.)
ADJ

p. 199.) directs us to consider the genius of those tongues. They avoided, as much as possible, regarding qualities separately, or in the abstract. They made the adjective depend on its substantive, and relapse it in termination, number, and gender, in order that the two might coincide the more intimately, and be joined in the form of expression, as they were in the nature of things. Thus also they favoured that liberty of transposition, which these languages allowed. In the English sentence "Beautiful wife of a brave man," the juxtaposition of the words prevents all ambiguity. But in the Latin, "Forma foris viri uxor," it is only in agreement in gender, number, and case, of the adjective "formae," which is the first word of the sentence with the substantive "uxor," which is the last word that declares the meaning.

The learned Maceflé observes (Gram. Heb. v. i. p. 56.) that in the Hebrew language, all those words are adjectives which are changed from the masculine into the feminine by the addition of the letter א, as בּלָל bonus, בנה, bona, &c. and therefore the Hebrews refer to the class of adjectives many words which we should rank as substantives. There are many distinguishing idioms of the Hebrew language that result from the use and application of the adjective; e.g. the substantive precedes it, as נָבָל נִמְלָל, manus foris; and when the contrary is the case, the verbal substantive is understood, as in Pf. xxxii. 4. Pf. xxxii. 10. except when numeral adjectives occur.

Again, the Hebrews often express their adjectives by substantives, with the prepositions ל, ב, prefixed; as בּלָל תּוֹרָה לִבֶּל תּוֹרָה Pl. xx. 1. כָּל לַעֲבַד כָּל לַעֲבַד Pl. xxxiv. 20. c.ὑπόθεσιας, c.ὑποθεσιας, Thus Hebrews occur in Matt. xxii. 16; Luke iv. 32; x Tim. ii. 3; 2 Pet. ii. 1; Mark v. 1; 1 John v. 9.

Moreover, the Hebrews sometimes express adjectives by substantives without any preposition, or in the language of grammarians, they use the abstractive for the concrete: as בּלָל תּוֹרָה לִבֶּל תּוֹרָה יֵנֶמְלָל יֵנֶm לִבֶּל תּוֹרָה יֵנֶm לִבֶּl. Similar to which are Eph. v. 8; Luke xvi. 15; John xvii. 17; 2 Cor. v. 21. When two substantives occur, one is sometimes taken for an adjective, and sometimes the other, as בּלָל תּוֹרָה לִבֶּל תּוֹרָה יֵנֶm לִבֶּl. Hebrews of this kind are found in 1 Cor. i. 21; Gal. iii. 14; 1 Cor. i. 25; Phil. iv. 5; 2 Pet. ii. 14. Adverbs are sometimes substituted for adjectives, as הָלִבְּל יֵנֶm. Similar expressions occur in Matt. vi. 34; Luke x. 29; 2 Pet. i. 9; and also in the Greek and Roman classics. See Maceflé, ubi sup. p. 256—266.

Adjectives, in Logic, are divided into four kinds; the nominal, the verbal, the numeral, and the pro-nominal. The nominal are those which distinguish certain species by some inherent and permanent quality, which arises either from the nature of the thing, or from its form or situation; such as good, black, round, external, &c. The verbal are those which denote some accidental or adventitious quality, which appears to be the effect of an action which passes, or has passed, in the thing under consideration, such as rampant, domincible, carrying, embelishing, &c. Numerical adjectives are those which rank any subject in numerical order, as first, second, last, &c. Pro-nominal are those which do not concern either species, action, or arrangement, but are merely indications of individuality; these adjectives are either personal, as mine, thine, &c. or they have a vague and indeterminate meaning, such as some, one, many, &c. or at length, they serve the purpose of mere indication, such as this, that, such, &c.

Verbal and nominal adjectives are also called concretes. Some distinguishing adjectives into physical and metaphysical, the former being used to distinguish physical effects: in consequence of the immediate impressions they make upon us; the latter to denote those which are metaphysical and abstracted, in consequence of some operations of our minds with regard to them.

ADIEUS, or ADINEUS, in Ancient Geography, a river which emptied itself into the Euxine Sea, probably near Colchis, in the territory of the Heniochi.

ADIEROUTE, in Geography, the name now given to the ancient Heropolis.

ADIGE, ADIGE, Anciently ATHENIEN, a river of Italy, which rises south of the lake Clare, in the Rhettian Alps, runs south by Trent, and falls by Verona, and falls into the gulf of Venice, north of the mouth of the Po. This river serves the purpose of peace between France and Austria, signed at Luneville, February 9th 1801, for the limit between the flats of his Imperial Majesty, and those of the French republic; and the freedom of its navigation is established, so that neither party shall be allowed to fix any toll upon it, or to have upon it any armed ship of war.

ADIL, a river of Hindustan, which discharges itself into the Hoogly, six miles west of Kilbengar, in the province of Bengal.

ADISING. See BUNDELA and RUEHA.

ADIL, in Zoology, a name given to the Canis AURUS of Linnaeus, and ADIVE of Buffon.

ADIMA, in Botany, a species of SAUVAGEA, with ramose filks.

ADIMAIN, a name given by Leo Africanus and Mar- mor, to a variety of sheep, called by Naturalists the African or Smugal sheep.

ADIMANTUS, in Biography, a disciple of Mani, who probably flourished about the close of the third century, and wrote a book against the law and the prophets, endeavouring to swell the disaggreement of the Old Testament, and that consequently the former could not be of God. This book was confuted by Augustin, who supposed this Manichaeon to be the same with Addas. Tillmount likewise, Lardner, and many others are of the fame opinion; but Cave (Hist. Lit. t. i. p. 145.) supposes them to be different persones. The book of Adimantus was every where confedered by the Manichees as one of their bell books. It was famous in Africa, and was also used by the Manichees in Aia, who ascrib'd it to Addas; but it is not now extant. Lardner's Works, vol. iii. p. 395.

ADIMARI, ALEXANDER, a descendant of the ancient and noble family of Florence, was born in that city A.D. 1579. He devoted himself in early life to the study of the Greek language, and also to poetry, translated Pindar into Italian verse, and wrote original poems. He was honoured by Ferdinand II. duke of Tuscany, and much esteemed by learned men. The troubles that befell him were alleviated by his taile for poetry, which was his occupation and delight. He died in 1649, at the age of 70 years. Gen. Dict.

ADIMARI, RAPHAEL, a native of Rimini, who lived towards the latter end of the 16th century; wrote a litology of his country, which is held in good estimation, though that of Clementine is preferred by the Italians. It was published in 1610 at Brescia in 1610, under the title of "Sito Rimesi."

AD INQUIRENDUM, in Law, a judicial writ, commanding
mending inquiry to be made of any thing touching a case depending in the king's court, for the better execution of justice: as of bailfast or the like. Reg. Judic.

ADINSEIK, in Geography, a town of Asiatic Turkey, three leagues south-east of Artaki.

ADJODIN, a town of Hindostan, in the Subah of Mooltan, 35 miles east of Mooltan, and 68 south of Lahore.

ADJOINING is particularly used for the assoication of a person to another, or appointing him a colleague or adjunct.

ADJOURNMENT, formed of ad, to, and Fr. jour, day, q. d. another day, in Law, the putting off of a court or meeting; and appointing it to be kept at another time or place: in which sense we meet with the phrase adjournment in court, for an appointment of a day when the juries in court intend to sit again. Adjournment of Parliament is a continuance of the session from one day to another, and is done by the authority of each house separatty, every day, and sometimes for a fortnight or month together; and differs from prorogation and dissolution. The adjournment of one house is no adjournment of the other. After an adjournment, all things continue in the same state as at the time of the adjournment, and may be proceeded on without any fresh commencement of a suit, whereas, after a prorogation, such bills as are only begun and not perfected, must be resumed if at all in a subsequent session.

ADIPOCIRE, Gras, matiere graisse, matiere adipo-cerueuse, is a term formed of adipex, fat, and cera, wax, and denotes a substance, the nature and origin of which are explained in the sequel of this article.

The changes which animal matter undergoes in its progress towards total decomposition, have been for many obvious reasons but little attended to: the disgusting circumstances by which they are accompanied, the real danger to health, and the decent reverence for the receptacles of the dead which prevails in all countries, have hitherto opposed almost insuperable obstacles to theinvestigations of science on this most interesting subject; it is therefore a peculiarly fortunate circumstanc when, from motives of police or general convenience, the great progress of the resolution of organised into inorganic matter, with all its various modifications, is submitted to the inspection of chemical philosophy. An opportunity of this kind was offered at Paris in 1786, and 1787, when the old burial ground of the Innocents was laid out for building upon, in consequence of which, the surface fell, and the animal remains contained therein, were removed. This cemetery having been for ages appropriated to the reception of the dead, in one of the most populous districts of Paris, was eminently well calculated to exhibit the various processes of animal decomposition; another favourable circumstance was, that it contained several of those large pits (fosse communes) in which the bodies of the poor are deposited by hundreds. These pits are cavities 30 feet deep, with an area of 20 feet square, in which the shells containing the bodies are closely packed in rows over each other, without any intermediate earth, and with only a flight superficial covering of soil, not more than a foot thick: each pit contained from 1200 to 1500 bodies, and may be considered as a mass of animal matter of the dimensions above-mentioned. M. M. Fourcroy and Thouret were present at the opening of several of these receptacles, and it is from a memoir by the former of these, that the principal part of this article is composed.

The first pit that was examined, had been filled and closed up 15 years before; on opening some of the coffins (for the wood was still quite found, only tinged of a yellow colour) the bodies were found within, shrunk so as to leave a considerable vacant space in the upper part of the coffin, and flattened as if they had been subjected to a strong compression; the linen which covered them adhered firmly, and upon being removed, presented to view only irregular masses of a soft dulicate greyish-white matter, apparently intermediate between fat and wax; these bones were enveloped in this and were found to be brittle.

The bodies thus changed, being but little offensive to the smell, a great number were dug up and minutely examined: in some this alteration had, as yet, only partially taken place, the remains of muscular fibres being still visible, but where the process had been complete, the bones throughout the whole body were found covered with this grey substance, generally soft and dulicate, sometimes dry, but always readily seperating into porous cavernous fragments, without the slightest trace of muscles, membranes, velvets, tendons, or nerves: the ligaments of the articulations had been in like manner changed, the connection between the bones was destroyed, and these last had become so yielding, that the grave-diggers, in order to remove the bodies more conveniently, rolled each upon itself from head to heels, without any difficulty. The whole contents of the abdominal cavity were wanting, and the muscles and integuments converted as above-mentioned, lay flat on the vertebral column; in like manner the heart and other viscera of the thorax were dissolved, nothing being left but a little white grumous matter. The glandular part of the breast in the female corporse frequently afforded this foamy matter of a homogeneous texture, and a pure white colour: the hair appeared to have undergone no alteration; the brain was not wanting in any, it was superficially of a blackish grey, and had experienced the same change as the integuments. According to the testimony of the grave-diggers, to whom the facts just mentioned had been long familiar, this conversion of animal matter is never observed in those bodies that are interred singly, but always takes place in the fosse communis; to effect this change nearly three years are required. The foamy matter of latest formation is soft, very dulicate, light and spungi, and contains much water: in 30 or 40 years it becomes much dryer, more brittle, and assumes the appearance of dense laminae, and where the surrounding earth has been dryer than usual, it is semitransparent, of a granulated texture, brittle, and bears a considerable resemblance to wax.

Animal matter having once passed into this state of decomposition, appears to refit for a long time any further alteration: some of these pits that had been closed above 40 years, were examined, found to be little else than a solid mass of foamy matter, nor is it yet ascertained how long in common circumstances it would continue unchanged, the burial ground of the Innocents being so small in comparison to the population of the district, as to require each pit in 30 or 40 years to be emptied of its contents, in order to receive a new facecition of bodies: it appears, however, that the exterior changes depend in a great measure on the quantity of moisiture draining through the mafs.

From the history of this singular substance, we proceed to an examination of its chemical properties. It was first, however, purified by gently heating in an earthen vessel, till it became of a pally consistence, and then rubbed through a fine hair sieve, by which means the hair, small bones, and remains of the muscular fibre were separated with tolerable exactness. In this state being exposed in an earthen vessel to the naked fire, it readily became soft, but did not liquify without considerable difficulty, rather fying as a piece of soap would do, and diffusing at the same time amoniacal vapours. Four pounds being put into a glass retort, and submitted to flow distillation in a water bath, afforded in the space of three weeks, eight ounces of a clear watery fluid,
fluid, with a fetid odour, turning syrup of violets green, and manifestly containing ammonia in solution; the foapy matter remaining in the retort had acquired a greater consistence, was become less fusible, of a deeper brown colour, and upon cooling, was evidently drier than before, though not admitting of being broken.

Two pounds of purified foamy matter were distilled by a very gradual fand heat; after two hours, the matter was melted, and in ebullition, it soon became covered with a blackish froth, and swelled greatly; during 36 hours nothing came over but water with ammonia in solution; at length, after 40 hours, crystals of carbonated ammonia began to line the adapter; those were soon after dissolved by a red-dish brown oil, which continued to come over till the experiment was stopped. Hence it appears that the component parts of this turbidity are water, ammonia, and a concrete oil. No effusive gas was disengaged during the whole process.

In order to ascertain the action of atmospheric air on this turbidity, several pieces being previously weighed were exposed to a warm and dry air during a whole summer; they were found by this to have become dry and brittle without being leached in their bulk, had acquired a whitier colour, and lost their peculiar odour; their upper surface was become friable, and almost fell into powder under the fingers; on subjection to analysis, it was found not only that the water, but a considerable part of the ammonia, had been evaporated by this long exposure, and the remaining oily matter on melting became semitransparent, brittle, and considerably resembling wax.

Some purified foamy matter was rubbed in a glass mortar with a little water; an immediate mixture took place, and the result was a kind of magna, or soft uniform paste; by a further addition of water an opaque liquor was produced exactly similar to a solution of soap; like this, it formed a strong lather, and by the addition of pump-water, acids, lime-water, or metallic salts, it curdled and threw up to the surface a quantity of white insoluble clots. With nitrate of mercury it gave a greyish-yellow precipitate, and the supernatant liquor became of a permanent red-purple. The aqueous solution being thrown on the filter deposited there almost the whole of the oily matter, and the clear liquor by evaporation yielded a little animal musculature and extract, and a small variable proportion of the phosphates of ammonia and soda. The combination with boiling water is not more permanent than that with cold, the whole of the oil and ammonia separating on the filter. When instead of fresh foamy matter, some which had been exposed during the summer to the action of the air was made use of, the liquor, though of a foamy appearance and feel, was much less so than what was made with the fresh mixture, and upon boiling the mixture a number of brown oily drops rose to the surface, which, on cooling, concreted to a semitransparent matter like wax, perfectly analogous to that obtained from the same by simple melting; hence it appears, that the solubility of the fresh foamy matter depends on the ammonia which it contains, as is also evinced by the perfectly clear solution which the addition of a further quantity of ammonia occasions.

Eight ounces of foamy matter, white and purified, were mixed with an equal weight of powdered quicklime, on the addition of a little water, the mass heated, swelled, and disengaged a very strongly ammoniacal vapour, accompanied by a peculiar putrefcent smell; a sufficiency of water being then added to bring the whole to the state of an emulsion, it was heated to ebullition, much ammoniacal vapour escaping at the same time; the liquor being thrown on a filter, palled perfectly clear and colourless, and appeared to be

only lime-water with a very small quantity of soap in solution; the matter remaining on the filter, being well washed, was beaten up with water, but showed no tendency to unite with it, bubbling after a time in the form of a white mass; this by drying for a few days in the open air, became grey and much reduced in volume: it was then mixed with diluted muriatic acid, which immediately decomposed it; and a number of white clots refer to the surface of the liquor. This last being obtained clear by filtration, yielded crystals of muriat of lime and a slight trace of phosphoric salt: the white clots being washed and dried, and afterwards melted in a water bath, cooled into a dry combustible oil matter, brittle, waxy, crystallizable, and perfectly insoluble in water, to which the name of adipocere has been appropriated. From this series of experiments with lime, it appears that the foamy matter is a true ammonical soap, with a bale of adipocere to which lime has a stronger affinity than ammonia, but which last composition is again in its turn decomposed by all the acids, leaving the adipocere in a state of purity. Pot-ash and soda produce effects perfectly analogous to those of lime.

The action of acids on this foamy matter is to decompose it, by uniting with the ammonia; the concentrated mineral acids, as the nitric and sulphuric, also deepen the colour of the adipocere, by the evolution of part of its carbonaceous bale.

Pure alcohol at the ordinary atmospheric temperature has no action on the foamy matter, but when boiling, it will with ease dissolve one fourth of its weight, of which all the ammoniacal soap will be deposited by cooling, and that portion of adipocere which is uncombined with ammonia, will be held in permanent solution. Hence alcohol is perhaps the best agent that can be used in the decomposition of the foamy matter; the phosphoric salts contained in it are not soluble in alcohol; the ammoniacal soap is wholly deposited by boiling, and the uncombined adipocere may be obtained afterwards by evaporating off the alcohol.

The most effectual way of procuring perfectly pure adipocere, is to mix well the foamy matter with twelve times its weight of warm water, and to decompose it by adding a slight excess of acetic or muriatic acid. This concrete animal oil thus prepared, as long as it holds much water between its particles, is of a pure white; by drying it acquires a brownish grey colour, which neither exposure to the air, nor the oxymuriatic acid will remove; while it retains water it is soft to the touch, and becomes brittle like wax by the warmth of the hand: when well dried and deprived of water, it assumes by flow congelation, a lamellar and crystaline texture, but when cooked quickly, has a compact granular appearance; in the light of these tlates, it greatly resembles spermaceti, yet differs from it in the following particulars. It requires a less heat for its fusion by few degrees of Fahrenheit; it is soluble in boiling alcohol in the proportion of one ounce to a half, to one ounce of the fluid, whereas the same quantity of alcohol at the same temperature will scarcely take up more than 30 grains of spermaceti; it separates also in cooling from this menstruum, in a much less decided crystaline form than spermaceti does; it unites eagerly with liquid ammonia in the cold, which spermaceti does not in the smallest degree.

To the foregoing experiments of Toussory, a few facts have since been added by Dr. Gibbes. The receptacle at Oxford for those bodies which have been used by the anatomical professor there for his demonstrations, is a hole dug in the ground to the depth of thirteen or fourteen feet, and a little stream is turned through it in order to remove all offensive smell: the flesh contained in this was found, on examination,
examination, to be quite white, and for the most part changed into the foamy matter above mentioned. From this hint, pieces of lean beef were inclosed in a perforated box, and placed in running water, and at the end of a month were found converted into a mass of fatty matters; this change was observed to take place much sooner and more completely in running than in stagnant water; in order to get rid of the fatty smell, nitrous acid was had recourse to, which immediately had the desired effect; a waxy film was perceived, and by melting the matter it was obtained nearly pure; the yellow colour which had been given to it by the nitrous acid, was wholly discharged by the oxyymuriatic acid. A similar conversion of muscular fibre takes place by maceration in very dilut ed nitrous acid. Dr. Gibbes has not mentioned whether the fatty matter produced by running water is pure adipocere or ammoniacal soap; it appears probable, however, that it is in the former state; where nitrous acid is the menstruum employed, it is obviously impossible that the adipocere should be combined with an alkali. Annales de Chimie, vol. iii. 180. v. 183. vii. 146. vili. 17. Philos. Trans. for 1794. (vol. lxxiv. p. 464.)

ADIPOSUS, fat or fatty, is a word chiefly used in Anatomy, as an epithet of certain cells, ducts, membranes, and vesicles; e. g. Membrana and vasa adipofa, Cellula adipofa, Duc tus adipofus, &c.

ADIPPE, in Entomology, a species of papilio, with dentated yellow wings, spotted with black, and underneath marked with 23 silver spots. This insect is found in Europe, and is called by some writers Conippe.

ADIPSIA, formed of a priv. and 3° of thirst, in Nephology, a genus of disease, which Dr. Cullen refers to the second order, called Dysfocesis, and the fourth class denominated locales. This he reckons to be always symptomatic of some dissenter affecting the fenocmum commune.

ADIPSON, a name given by Hippocrates to oxymel; who says also, that the pitifons, by its glutinousness, prevents or cures thirst. Medicines administered for allaying thirst are called by this name. This property led the Greeks to distinguish the glycyrrhiza glabra of Linnaeus, or liquorice, by this appellation.

ADIPSOS, signifies the Egyptian palm-tree, liquorice, and a pill or cataputum, composed of Atclepiades, and mentioned by Galen.

ADIRATUS, a price or value set upon things stolen or lost, as a recom pense to the owner.

ADIRIS, or Dyris, in Ancient Geography, a name given to the mountains of Atlas by the Indigenes, or first inhabitants. Bochart affirms (Geog. Sac. i. ii. c. 13. Oper. tom. i. p. 89.) that Atlas was called Duris and Dyris, by the Phoenicians; and this name might probably be derived from ἄδιρ, which signifies great or mighty.

ADISAGA, a town of India, placed by Ptolemy in long. 15° 30' and lat. 23°. 30'.

ADISALEM, a town of Gojam in Abyssinia, between the Nile and the lake Dambca. E. long. 34° 50'. N. lat. 10° 30'.

ADISAMUM, a town of the island of Taprobana.

ADISATHRA, a town of India, on this side of the Ganges, which Ptolemy places in long. 128° 30'; and lat. 24° 30'.

The Adiathri, who inhabited the surrounding country, had for their metropolis Sagida.

ADISATHRUS Moni, a mountain of India, near the gulf of Bengal, which Ptolemy called the Gangetic gulf: long. 132°, lat. 23°.

ADIT, ADITUS, formed from adire, to go to, in a general sense, denotes the approach to, or entrance of any thing: in which sense we meet with adit of a house, adit of a theatre, of a circus, &c.

Adit of a mine, the hole or aperture, whereby it is entered and dug, and by which the water and ores are carried away.

Adit of a mine, is nearly the same with caniceus, or drjμ, and is distinguished from airshaft. Phil. Trans. N° 69.

The adit is usually made on the side of a hill, towards the bottom thereof, about 4, 5, or 6 feet high, and 8 wide, in form of an arch; sometimes cut in the rock, and sometimes supported with timber, so conducted, as that the sole or bottom of the adit may answer to the bottom of the shaft, only somewhat lower, that the water may have a sufficient current to pass away without the use of the pump.

Dumps and the impurity of the air are the great impediments against driving adits above 20 or 30 fathoms, by reason of the necessity; in this case, of letting down of airshafts from the day to meet the adit, which are very often expensive, both on account of the deep depth of mines; and the hardness of the mineral strata, to be cut through.

The bell remedy against this is that practised in the coal mines near Liege, where they work their adits without airshafts: the manner of which is described by Sir Robert Moray. Vide Phil. Trans. N° 5.

Adit of a mine, is sometimes used for the airshaft itself, being a hole driven perpendicularly from the surface of the earth into some part of a mine, to give entrance to the air. In this sense we sometimes find it improperly written adit. Phil. Trans. N° 290.

To draw off the standing water in winter, in deep mines, they drive up an adit, or airshaft, upon which the air disengages itself from the water, when it begins to run with such violence, as produces a noise equal to the bursting of a cannon, dashes every thing in the way against the sides of the mine, and loosens the very rocks at a distance. Ibid. N° 26. See Mining.

Adit in ships, in Antiquity, was a space in the upper part, where the ship was wide, at which people entered, anciently called oare.

Adites of a theatre, aditus theatrori, in Antiquity, were doors on the flairs, whereby persons entered from the outer porticoes, and descended into the seats.

ADITES, or the tribe of Ad, in Ancient History, a very powerful tribe of the ancient Abians, are said to have been the descendants of Ad, the fon of Aw, or Us (Gen. x. 22, 23), the fon of Aram, the fon of Shem, the fon of Noah, and, after the confusion of tongues, to have settled in Al A had, or the wending lands, in the province of Hadramaut, where they greatly multiplied. In process of time, they abandoned the worship of the true God, and fell into idolatry; chiefly worshipping four deities, viz. Saka, Hasha, Razaika, and Salema; the first of whom, as they imagined, supplied them with rain, the second preferred them from all dangers abroad, the third provided food for their sustenance, and the fourth restored them to health when afflicted with sicknels, as their several names import. God, it is said, commissioned the prophet Hud, or Heber, to attempt their reformation; but they were obstinate and irreclaimable, and were therefore destroyed, a few of them excepted, by a suffocating wind. Those who escaped retired with Hud to another place. Before they were thus severely punished, they were visited with a drought of four years, by which their cattle perished, and they themselves were reduced to great diffi. They are often mentioned in
in the Koran, and some commentators on this work pretend, that they were of prodigious stature, the largest being 100 cubits high, and the leaf 60; for which they refer to the testimony of the Koran. Sale's Prelim. Disc. p. 6. Koran, chap. 7. p. 123.

ADITHA; or ADITHAIH, in Ancient Geography, a city belonging to the tribe of Judah. Joshua, xvi. 56. Eusebius mentions two cities named Adita, one towards Gaza, and another towards Lydda, east of this city.

ADJUDICATING, in Law, the act of passing a determinate sentence in behalf of a person.

ADJUDICATION, the act of adjudging the property of a thing to a person by a legal sentence, decree, or judgment.

ADJUDICATION is more particularly used for the addition, or conferring a thing fold by acquisition, or the like, to the highest bidder.

ADJUDICATION, in the Scots Law, the name of an action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself, either in payment or in security of his debt; or that action by which the holder of an heritable right, labouring under any defect in point of form, may supply that defect. Adjudications were substituted by act 1672. c. 19, in the place of appurposing, and they are carried on by way of action before the Court of Seffion. By that statute, the debtor must deliver to the creditor a valid right of the land to be adjudged, being such as are equivalent to the principal and interest of the debt, and a fifth part more in consideration of the creditor's taking land for his money; renounce the possession in his favour, and ratify the decree of adjudication. This is called a special adjudication: and the time within which the debtor may redeem is declared to be five years; but if the debtor does not produce a sufficient right to the land, or is not willing to renounce the possession and ratify the decree, it is lawful for the creditor to adjudge all right belonging to the debtor in the same manner as he could, by the former laws, have apprised it. In this general adjudication, as it is called, the creditor must limit his claim to the principal sum, interest and penalty, without demanding a fifth part more. Abbreviations are ordained to be made of all adjudications, which must be recorded within 60 days after the date of the decree. There are two kinds of adjudications, viz. those on a decree cognitionis causa, otherwise called contra hereditatem jacemem, and adjudications in implement. A new fort of adjudications has been lately introduced into the law of Scotland, by 23 Geo. III. for rendering the payment of the creditors of insolvent debtors more equal and expeditious.

ADIVE, in Zoology, an animal of the Jackal kind, the canis aureus of Linnaeus, mentioned by Buffon, something resembling a small fox. It is less than the common jackal, and is sometimes tamed, and kept in a domestic state. In the Arabic language, the name Adive signifies a wolf; and its figure, hair, and voracity are analogous to the name; but it is smaller than the fox, and very stupid. It yelps like this animal; and when one cries, the rest reply. It roams about in the night in search of food, and is naturally disposed to conceal itself in the day. The adives form large packs, enter hovels and churches, where they devour every thing they can find, and when they have been once accustomed to eat human bodies, they never fail to frequent church-yards in search of putrid carcasses, to dig into graves, to follow armies, and to attend the caravans in those eastern countries where they abound. The adives may be considered as the ravens among quadrupeds.

ADJUNCT, ADJUNCTUM, in Philosophy, something joined or superadded to a being from without; or, an accession to a thing, not essentially belonging to it, but only accidental to it.

There are two kinds of adjuncts: the one a substance (e.g. spirit or body) accidentally superadded to another, as its subject.—Such is water in a sponge, or vessel, and such is the soul in the body. The second an attribute or mode, accidentally likewise superadded to a substance, whether body or spirit. Such is figure in a body, knowledge in the mind, &c.

In ethics, they usually reckon seven adjuncts, popularly called circumstances; quis, quid, ubi, quibus auxilis, cur, quomodo, quando.

ADJUNCT, in Music, a word that is used to express the connection or relation between the principal mode, and the modes of its two-fifths, which, from the intervals that confluence the relation between them and it, are called its adjuncts.

ADJUNCTS, in Rhetoric and Grammar, are certain words or things added to others; to amplify the discourse, or augment its force.

Such are adjectives, attributes, and epithets, which are added to substantives, subject, &c. to express their nature, qualities, accidents, &c.

Arguments drawn from adjuncts, are supplements or enforcements of the proof arising from the circumstances of the fact.

ADJUNCT is also used in civil concerns, for a colleague, or fellow-officer, it is added to another, to assist him in his ministrations.

ADJUNCT, or ADJOINTS of the gods, in Mythology, among the Romans, were a kind of inferior deities, added as auxiliaries to the principal ones, to enfeal them in their function. Thus, to Mars was adjoined Bellona and Nemesis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares; to the Evil, the Lemures, &c.

ADJUNCTS, or ADJOINTS, in the Royal Academy of Sciences at Paris, denote a class of members attached to the pursuits of particular sciences. See Academy.

ADJUNCTION, the act of joining, or adding, of one thing to another. There are various species of adjunction; viz. by adhesion, apposition, adhesion, acculation, inculation, imposition, offension, &c.

AD JURA REGIS, is a writ that lies for the king's clerk, against him who endeavoured to eject him, to the prejudice of the king's title in right of his crown.

ADJURATION, a part of exorcism, wherein the devil is commanded, in the name of God, to depart out of the body of the possessed, or to declare something.

ADJUTAGE. See Adjutage.

ADJUTANT, formed of adjutare, to assist, in the Military Art, an officer in the army, whose business is to assist the major; otherwise called ad-major.

In the cavalry, each regiment has an adjutant, and in the infantry, each battalion, who receives the orders every night from the brigade-major, which, after he has carried to the colonel, he delivers out to the serjeants. When detachments are to be made, he gives the number each company must furnish, and affings the hour and place of rendezvous. He also places the guards, receives and distributes ammunition to the companies; and by the major's orders regulates the price of bread, beer, &c. See Adjutant-General.

ADJUTANT is sometimes also used by the French for the Aid of Camp.

ADJUTANTS-GENERAL, among the Jefuits, a select number of fathers residing with the general of the order, each of whom had a province, or country, under his care, as
ADL

France, England, &c. Their business was to inform the father-general of the occurrences of state in such counties; to which end, each of them had their correspondents, delegated emissaries, visitors, regents, provincials, &c. See Jesuits.

ADJUTOR, among the Romans, was an adjutant or assistant; and under this appellation they had many subordinate officers, who acted in the absence of their superiors, or by way of aiding them in the execution of their respective offices.

ADJUTORIUM, from adjutures, to help, in Anatomy, the humerus, or shoulder-bone.

Some authors use this word for a medicine intended only as auxiliary, or subordinated to another of great efficacy; in particular, after a due use of internals, for an external remedy applied to a part affected, to assist in, and complete the cure.

ADJUTRIX, prime legio, an appellation applied to a legion which often occurs in the Roman laws.

ADJUVANTIUM, formed of adjuto, I help, in Medicine. See Juvantia.

ADLE' Egg, that which is not fecundified by the cock's tread.

Adle egg is the same with that which is otherwise called a subventaneous one.

Adle eggs, after incubation, are found to contain a shapely, globule, ash-coloured body, not unlike a mole. Phil. Trans. No. 87.

ADLECTI, among the Romans, signified associates, or rather selected, and was applied to persons of various descriptions amongst the common soldiers, officers of state, and senators; there were gods of this denomination, who were deified men, and called by the Romans "di minorum gentium."

ADLEGATION, in the Public Law of the German empire, a right claimed by the states of the empire of adjoining pleni-potentiaries, in public treaties and negotiations, to those of the emperor, for the tranfacting of matters which relate to the empire in general.

In which sense adlegation differs from legation, which is the right of sending ambassadors on a person's own account.

Several princes and states of the empire enjoy the right of legation, who have not that of adlegation, and vice versa. The bishops, for instance, have the right of adlegation in the treaties which concern the common interest, but no right of legation for their own private affairs. The like had the duke of Mantua.

The emperor allows the princes of Germany the privilege of legation, but disputes that of adlegation. They challenge it as belonging to them jure regni, which they enjoy in common with the emperor himself. Ludwig has a difficult on the subject, wherein the controversy is treated at large.

ADLEN'TARE barham, in Antiquity, a phrase which denoted the care that was taken every day to comb the beard, and to render it soft and flexible.

ADLERFELDT, Gustavus, in Biography, a Swedish officer and historian, was born near Stockholm, studied at Upfal, where he was distinguished by his application and improvement, and then made the tour of Europe. On his return, Charles XII. appointed him a gentleman of his chamber. Having accompanied this monarch in his military course, and witnessed both his victories and defeats, he was qualified to compile his history, which terminates with the day of his death, at the battle of Pultawa, in 1709, and which was translated into French by his son, and printed in four volumes 12mo. at Amsterdam, in 1740.

ADLESBERG, in Geography, a well built market-town in the inner Carniola, in Austria, situate at the foot of a high rocky mountain, near the river Alben, on which stands a citadel, under which is a grotto of very considerable extent and capacity. Many curious figures of stones, natural stone theatres, stone bridges, &c. are to be seen in it; and near the entrance of the cavern, the river Pois, which, at about a mile's distance from it, issues out of a mountain, runs into an aperture in the rock, and then glides off under the cavern.

Adlesberg is called in Latin Posena. It is four leagues call-north-call from Pitec.

ADLOCUTIO, Adlocutio, in Antiquity, is chiefly underblood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find these adlocations expressed on medals, by the abbreviation ADLOCUT. COH.

The general is sometimes represented as placed on a tribunal; often on a bank or mound of turf, with the cohorts ranged orderly round him, in manipuli and turma. The usual formula in adlocations was, foris effet ac fidus. Petifc. Lex. Ant. tom. i. p. 27. Walk. on Coin. p. i. c. 10.

ADLWANG, in Geography, a town in the archduchy of Austria, three leagues south-west of Steyr.

ADLZREITER, John, in Biography, chancellor of Bavaria, an historian and lawyer, flourished in the 17th century. His annals of Bavaria, written in Latin, comprehended the history of the country from its beginning to the year 1652, compiled from authentic sources. This work first appeared in 1652, and was reprinted at Leipfie in 1716, by Leibnitz, in folio.

ADMAH, or ADAMA, in Scripture Geography, one of the cities involved in the destruction of Sodom and Gomorrah. It was situated between Zoehim and Gomorrah. Gen. x. 10. xiv. 2—8. Deut. xxix. 23. Hofen, xi. 8.

In which sense, admanuenses amount to the same as the laymen, and flan to priests, who were forbidden to swear on the book, their word being to be reputed as their oath: whence they were also denominated fide digni.

ADMEASUREMENT, Admensuration, in Law, a writ which lies for the bringing thos e to reason, or mediocrity, who usurp more of any thing than their share. This writ lies in two cases; termed Admeasurement of dowry, Admensuration doth, where the widow of the deceased holds more from the heir, or his guardian, on account of her dowry, than of right belongs to her. And Admeasurement of palfure, Admensuration palfure: this lies between those who have common of palfures appendent to their frehold, or common by vicinage, in case any of them forcharge the common with more cattle than they ought.

This is one of those writs that are called vicinities, being directed to the sherriff (vice-comiti), and not to be returned to any superior court, till finally executed by him. It recites a complaint, that the defendant hath forcharged the common, and therefore commands the sherriff to admonish and appertain it, that the defendant may not have more than belongs to him, and that the plaintiff may have his rightful share. Upon this suit, all the commoners shall be admonished, those who have not, as well as those who have forcharged the common; the plaintiff as well as the defendant. The execution of this writ must be by a jury of 12 men, who were upon oath to accertain, under the superintendence of the
the sheriff, what and how many cattle each commoner is entitled to feed; and the rule for this admistration is generally understood to be, that the commoner shall not turn more cattle upon the common than are sufficient to manure and flock the land to which his right of common is annexed. If, after the admistration has ascertained the right, the same defendant furnishes the common again, the plaintiff may have a writ of sequestration. Blackitt. Com. vol. iii. p. 238. Svo.

ADMETE, one of the nymphs called Oceanides.

ADMINICULE, or ADMINICULE, ADMINICULUM, a term used in some ancient statutes, for aid, help, or support. Stat. 1 Edw. IV. cap. 1.

In Scots law, this term signifies any writing or deed referred to by a party, in an action of law, for proving his allegations.

ADMINICULATOR, in Ech. Judicial Writers, denotes an ancient officer of the church, whose business was to defend the cause of widows, orphans, or others delitute of help. The admistrator is the name with what otherwise called Advocat of the poor. Du-Cange.

ADMINICULES, among Antiquaries, are applied to the attributes or ornaments wherewith Juno and some other figures are represented on medals.

ADMINICULUM, in the French Jurisprudence, signifies the opening of a proof; an imperfect proof; or a circumstance of conjecture, tending to form or fortify a proof.

ADMINISTRATION imports the government or direction of affairs; and particularly the exercice of distributive justice.

The two critions of a good administration in England, according to Tranchard, are, the keeping the nation out of foreign broils; and paying off the public debts; the latter of which depends on the former.

Administration, in the English Law, signifies the act or office of an administrator, in managing and disposing of a man's goods, or estate, that died intestate, or without any will; with an intent to give an account thereof. In this case, instrumets, or powers, called letters of administration, are taken out in the prerogative court.

These letters must be granted by the ordinary in pursuance of the statutes 31 Edw. III. c. 11. and 21 Hen. VIII. c. 5. 1. to the husband, or his representatives, of the wife's goods and chattels; 2. to the wife, of the husband's goods and chattels; 3. if there be no husband or wife, to the children, sons or daughters; 4. if there be no children alive, to the father or mother; 5. then to a brother or sister of the whole blood, or of the half blood (who, for this purpose, are of equal degree with the whole blood); 6. and if there be none fuch, to the next of kin, as grandfather, uncle, nephew or cousin, and the females of each class respectively; but of persons in equal degree, the ordinary may take which he pleases, and the nearness of degree shall be thus reckoned according to the computation of the civilians, and not of the canonists; 7. then, if none of the kindred take out administration, to a creditor of the deceased; 8. if the execution or dics intestate, to the residuary legatee, in exclusion of the next of kin; 9. and for want of all these, to any other person, at the discretion of the ordinary; or the ordinary may grant to a stranger letters ad colligendum bona de jure, to gather up the goods of the deceased; or may take them into his own hands to pay the deceased's debts, in such order as an executor or administrator ought to pay them. But it is said he or the stranger, who hath letters ad colligendum, cannot fell them, without making themselves executors of their own wrong, and action lies only against the ordinary, &c. Wood's Ent. 353.

By Stat. 21 Hen. VIII. widows, and next of kin, are to be appointed administrators, and a mother is to have administration of goods of a child, before a brother or sister, &c. But an administration may be granted to the father before the widow; and a residuary legatee ought to be preferred before the widow, in an administration cum resolven anno anno. 3 Salk. 21.

On granting administration, bonds with securities are to be taken for the administrator, to make and exhibit an inventory of the goods of the deceased, to render a full account thereof, and to make a distributio of the surpluse after the debts paid, according to law, &c. Stat. 22 and 23 Car. II. cap. 10. See Administrator, Executor, Intestate, Kindred.

Administration is sometimes also used for the direction of the affairs of a minor, a pupil, a lunatic, or the like.

Administration is also used in respect of ecclesiastical functions. — The parson has the administration of the sacra-ments to his parish. — Administration of the eucharist is prohibited to persons excommunicate.

In beneficary matters they distinguish two kinds of administration: temporal, which relates to the temporalities of a benefice, diocefe, &c. and spiritual, to which belong the power of excommunicating, &c.

Administration, in Anatomy, is used for the manner of dissecting the parts of the body, particularly the Muscles. In which sense, administration is synonymous with excisio, excrise, &c.

Anatomical administrations are not to be learned by oral precepts but require ocular inspection. — Galen, Harvey, and others, have described such under the title of the anatomical administrations.

Administration, in Commerce, is also used for a Spanish staple at Callao in Peru, a small town on the coasts of the South Sea, which is the port of Lima; where all ships, allowed to trade on the coast, are obliged to unload their European goods, and pay certain duties: i. e. 15 per cent. of the price for which they are sold, if the cargo be entire, and if otherwise 16 per cent. besides which, they pay three per 1000 duty, for consulsship, and some other small royal rights and claims.

ADMINISTRATOR, in Law, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor.

An action lies for or against an administrator, as for or against an executor; and he shall be accountable to the value of the goods of the deceased, and no further.—unless there be waite, or other abuse chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration.—If a stranger, who is neither administrator, nor executor, take the goods of the deceased, and administer, he shall be charged, and fixed as an executor, not as an administrator.

The origin of administrators is derived from the civil law. By the old law, the king was intituted to seize upon the goods of an intestate, as the pars pro patria and general trustee of the kingdom. This prerogative the king continued to exercise for some time, by his own ministers of justice, probably in the county court; and it was granted as a franchise to many lords of manors, and others, who have to this day a precriptive right to grant administration to their intellec-
prerogative; and the goods of the intestates were given to the
ordinary by the crown, who might seize and keep them
without waiting, and also give, alienate, or sell them at his
will, and dispose of the money in his or her.

The goods of the intestate being thus vested in the ordinary upon
solemn and notoriety, the revived estates were not ac-
countable to any, but to God and themselves, for their con-
duct. The ordinary, however, neglected to discharge his
trust; and the abuse was carried to such a length of impiety
that Innocent IV. in 1252, lays it down for established
canon law, that "in Britannia tertiae boraorum decessit
ab intestato in opus ecclesiae et pauperum dispensanda go."
The pope therefore clergy took to themselves, under the
ame of the church and poor, the whole residue of the estate of
the deceased, after the parta rationables, or two-thirds, of
the wife and children were deducted, without paying his
lawful debts or other charges thereon. For this reason it
was enacted, as the first check on the extortion power of
ordinaries by the flat. of Wilm. 2. 13 Edw. I. c. 19.
that the ordinary shall be bound to pay the debts of the in-
testate so far as his goods will extend. And in order to
prevent the ordinaries from keeping any longer the admin-
istration in their own hands, the statute 31 Edw. III. c. 11.
provides that, in case of intestacy, the ordinary shall de-
pone the nearest and most lawful friends of the deceased to
administer his goods; which administrators are put upon the
same footing with regard to suits and to accounting, as execu-
tors appointed by will. This is the original of administrators,
as they at present stand, who are only the officers of the
ordinary, appointed by him in pursuance of this statute.
The statute 21 Hen VIII. c. 5. enlarges a little more the
power of the ecclesiastical judge, and permits him to grant
administration either to the widow, or the next of kin, or
to both of them, at his own discretion; where two or
more persons are in the same degree of kinred, gives the
ordinary his election to accept whichever he pleases.

There are divers forts of administrators.

Administrator duramente mine ore acta, is where an infant is
entitled to administration of the goods of an intestate; in
which case administration is granted to another, until he is
the age of twenty-one years. Though where the infant is
made executor, such administration, during his minority,
causes at his coming of the age of seventeen, 5 Rep. 29.
6 Rep. 27.

Administrator cum testamento annexo, is one to whom admin-
istration, with the will annexed, is granted upon an execu-
tor's refusal to prove the testament, or upon his dying be-
fore the probate. 1 Inst. 113.

Administrator de bonis non, &c. is one to whom adminis-
tration is granted of the goods of a tetailor remaining un-
administered, by reason of his executor's dying intestate.
This administrator is the only legal representative of the
deceased in matters of personal property. But he may, as
well as an original administrator, have only a limited or spe-
cial administration committed to his care, viz. of certain
species, such as a term of years, or the like; the rest being committed to others. 1 Roll. Abr. 958. 2 Roll.
Atr. 957. There is also

Administrator pendente lite, and duramente abfinitia extra
reminiscitu.

If a woman have goods thus committed to her charge, or
administration, she is called administratrix; and is account-
able, &c. in like manner as an administrator.

Administrator, in Scott Law, a person legally im-
powered to act for another, whom the law presumes inca-
cpable of acting for himself. Thus tutors or curators are
sometimes styled administrators in law, to pupils, minors, or
futuous persons. But more generally the term is used to
imply that power which is conferred by the law upon a
father, over the persons and estates of his children during
their minority.

Administrator is also used for the advocate of a
church.

Administrator is also used for a person appointed to
receive, manage, and distribute the revenues of an hospital,
or religious house.

Administrator is also used for a prince who enjoys the
revenue of a secularised bishopric.

Yet this title does not hold universally: the king of Eng-
land, as elector of Brunswick-Luneburg, for instance, is
not called administrator, but duke of Bremen and Verden;
and the king of Prussia is not administrator, but duke of
Magdeburg, and prince of Hanover.

Administrator is also used for the regent or protector
of a kingdom, during the minority of its proper prince,
or even a vacancy of the throne.

The pope pretends to the administration of the empire
during the vacancy, by cenfeur, or suspension.

Administrator is sometimes used for the president of a
province.

ADMINISTRATRIX. See Administrator.

ADMIRAL, a great officer who commands the naval
forces of a kingdom or state, and takes cognizance by him-
self, or officers appointed by him, of all maritime causes.

Authors are divided about the origin and denomination of
this important officer, whom we find established, with some
variation, in most kingdoms that border on the sea. Spe-
man conceives, that the name and dignity were introduced
among us from the Saracens, by means of the Crusades;
and it is alluded, that there are no influences of admirals
in this part of Europe before the year 1254, or 1256, when
Philip of France, who had attended St. Lewis in the wars
against the Saracens, created an admiral. The title of this
officer once occurs in the history of France, in the year
535. And. Com. vol. i. p. 29. Du Cange affirms us,
that the Sicilians were the first, and the Genoese the next
after them, who gave the denomination admiral to the com-
manders of their naval armaments; and that they took it
from the Saracen, or Arabic amir, or emir, a general name
for any commanding officer.—Some say, that the first
admiral mentioned in English history was in the reign of
Edward I. in 1297; and that the first title of admiral of
England conferred upon a subject, was given by patent of
Rich. II. to the earl of Arundel and Surrey in 1387.

Spelman, however, is of opinion, that the title of admiral
was first used in the reign of Henry III. because it does not
occur in the laws of Oleron, enacted in 1266, nor is
mentioned by Bracton, who wrote about that time: and in
a charter, 8 Henry III. which granted the office to
Richard de Lacy, the title is not used; but in the 56th year
of the same reign, the historians used the appellation ad-
imiral, and it is found also in charters.

Three or four admirals were formerly appointed in the
English seas; these held their office duramente benth placitu,
and had particular limits from the mouth of the Thames,
to the north, south, or west, subject to their jurisdiction.
We had also admirals of the Cinque Ports as early as the
reign of Edward III. when William Latimer was called
Admiralis Anglie. But the title of Admiral was not frequent till the reign of Henry IV. when
the title was given to the king's brother; and after this
period it was granted in all commissions to succeeding admiral's.

The
ADM

The title of **locum tenens regis super mare**, the king’s Lieutenant-general of the sea, m-mintioned in the reign of Richard II., was superior to that of **admiral** of England. Before the appointment of **admiral** was introduced, the title of **cygus maris** was in use.

**Admiral of England**, the lord high, in some ancient records called *capitaneus maritimus*, is judge, or president, of the court of admiralty.

He takes cognizance, by himself, his lieutenant, or deputy, &c. in his court, of all crimes committed on the sea, or the coasts thereof; and all the civil and marine transactions relating thereto; as also of what is done in all great ships, riding in any great rivers, beneath the bridges thereof next the sea.

Anciently, the admiral had also jurisdiction in all causes of merchants and mariners; not only on the sea, but in all foreign parts.—To this great officer also belongs the government of the navy: by him all vice-admirals, rear-admirals, and sea-captains are commissioned; as well as all deputies for particular consuls, and coroners for viewing dead bodies found on the sea-coasts, or on the sea; and he appoints the judges for his court of admiralty, and courts martial for the trial of offences against the articles of war, and may imprison, release, &c.; every commander, officer, and soldier of ships of war shall observe the commands of the admiral, &c. on pain of death, or other punishment. Between high and low-water mark, the common law and admiralty bear jurisdiction by turns; one upon the water, and the other upon the land.

He hath also power not only over the seamen serving in his ships of war, but over other seamen, so that he may arrest them for the service of the state; and if any of them run away without leave, he may certify it to the sheriffs, mayors, bailiffs, &c. who shall cause them to be apprehended and imprisoned. The admiral, of right, had ancienaly a tenth part of all prize goods; but this is taken away by flat. 13 Geo. II. c. 4. See Prize. This statute also enables the admiralty to grant **Letters of Marque**.—

We have had no high admiral for some years; the office being put in commision, or under the administration of the lords commissioners of the admiralty, who, by W. and M. flat. II. c. 2. are declared to have the same authority, jurisdiction, and power, as the lord high admirall.

**Admiral** of Scotland, the lord high, one of the great officers of the crown, and supreme judge in all maritime cases within that part of Britain.

**Admiral** is also used for the commander in chief of a single fleet, or **squadron**; and is distinguished by a flag displayed at his main-top-mast-head.

Thus, we say, the admiral of the red; the admiral of the white; and admiral of the blue. See **Navy** and **Squadron**.

The term **admiral** is also applied to all flag-officers; in which sense it includes **vice admirals** and rear-admirals.

**Admiral, Rear**, is the admiral of the third, and last squadron of the royal fleet, and carries his flag at the mizen-top-mast-head.

**Admiral, Vice**, is one of the three principal officers of the royal navy; who commands the second squadron, and has his flag set up at the fore-top-mast-head.

**Admiral, Vice**, is also an officer appointed by the lord high admiral, in divers parts of the kingdom, with judges and marshals subordinate to him; for the exercising of jurisdiction in maritime affairs, within his respective limits. From their decisions and sentences, appeal lies to the court of admiralty in London.

There are also admirals of the galleys.

Monstrelet makes mention of an **admiral** of the archers, or crois-bow-men. See Alfred.
and 124° 15' W. long. On each point of the harbour, called by Mr. Vancouver Penn's cove, was a deserted village, in which were found several fpulchres in the form of cerny-boxes, containing small skeletons, and small bones, which were supposed to be intended by the inhabitants for pointing their arrows, spears, and other weapons. The surrounding country for several miles prefented a delightful prospect of fpacious meadows, adorned with clumps of trees, of which the oak, in 6 feet from to fix feet in circumference, was the principal. The meadows were well stocked with deer. The foil covered chiefly of a rich black vegetable mould, lying on a fandy or clayey substratum; the grafs grew to the height of about three feet, and the ferns were nearly twice as high. The natural productions of the country were luxuriant; and it was not ill supplied with streams of water. The number of its inhabitants were estimated at about 600. Here, on June 4th, 1792, Mr. Vancouver took possession of the coast from that part of New Albion, which lies in N. lat. 30° 20', and W. long. 124° 34' to the entrance of this inlet of the sea, together with the coaft, islands, &c. This interior sea was called the Gulf of Georgia; and the continent binding the faiul gulf, and extending S. to N. lat. 45°, was called New Georgia, in honour of his present Majesty. This branch of Admiralty inlet obtained the name of Puffion Sound; its weftern arm was denominated Port Gardner, out of respect to Sir Alan Gardner, and its smaller or easter rept was called Port Sufan. Vancouver's Voyage, vol. i. p. 287, &c.

Admiralty Island, an island to be called by Mr. Vancouver, settle within George the Third's archipelpgo, on the north-west coaft of new Norfolk in America, and between N. lat. 57° and 58° 30', and W. long. 134° and 135°. This island is about 60 leagues in circuit, affords many convenient bays, with freames of fresh water, and produces an uninterrupted forest of very fine timber-trees, chiefly of the pine tribe. Vane. Voyage, vol. iii. p. 277.

Admiralty's Island, an island that lies on the coaft of Nova Zemba, in the northern ocean. N. lat. 75° 5', E. long. 52° 45'.

Admiralty Islands, a cluster of between 20 and 30 islands lying to the north of New Britain, in about 25° 18', S. lat. and 146° 41' E. long. The largest of these is 18 leagues in length from eft to west. These islands were discovered by captain Carteret: he describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, intermixed with fots that have been cleared for plantations, groves of cocoa-nut trees, and habitations of the natives, who fom to be very numerous. He fuppofes that these islands produce feveral valuable articles of trade, particularly fpecies, as they lie in the fame climate and latitude as the Maluccas; but he was not in a condition to examine them.

Admiration, in Ethics, is that passion which is excited by the contemplation of excellence, that is rare or uncommon, either in kind or degree. The objective caufe of this admiration is anything that indicates a superior degree of wisdom, ingenuity, good fense, or benevolence. Such are the qualities to which it is properly confined. Power, abftractedly considered, is not the object of admiration; though the dignified or benevolent exertions of power for the production of good, may excite the highest degree of admiration, and render it a very ftrong emotion. It is obvious, fays an ingenious writer, that the range of admiration is from the fimple approbation of the mind up to the moft lively fenfation, according to our conceptions of the extent of excellence, and also the degrees of our interest in its effects. It is also blended with various other emotions according to different circumstances attendant upon the paflion. It is frequently introduced by surprife; when, for example, the discovery of these excellencies is sudden and unexpected; and then it becomes a vivid emotion. It is generally connected with fome degree of wonder; as we are frequently ignorant of the caufes which enabled any one greatly to excel ourselves or others; but as it is always excited by the real discovery of fome qualities, it is not to be confounded with an emotion that proceeds from ignorance and embarrassment, previous to the discovery. When the evidences of wisdom or goodness exceed our utmost comprehension, or proceed far beyond the usual extent of excellence itself, they may excite admiration. Cogan's Philosophical Tractate on the Passions.

Admiration, in Grammar, a note or character, intimating something worthy to be admired or wondered at. — It is exprefled thus (1). See Character.

Admission, in the Ecclelfiical Law, an act whereby a bishop, upon examination, admits or allows a clerk to be able or competently qualified for the office; which is done by the formula, adimito te habellam. All persons are to have epifcopal ordination before they are admitted to any parfonage or benefice; and if any shall presume to be admitted, not having such ordination, &c. he shall forfeit 100l. Stat. 14 Geo. II. c. 11.

No person is to be admitted into a benefice with cure of 30l. per ann. in the king's books, unless he is a bachelor in divinity, at leaft, or a preacher lawfully allowed by some bishop, &c.

Admissiones, in Antiquity, officers, whose duties it was to introduce persons to princes or to wealthy citizens. The office belonged to freed-men, and was much defired. The principal, that preceeded over each of the four decuries into which they were distributed, was called magister admissionum, and deemed highly honourable. Historians fay, that Vespasian, Antonine, and Alexander Severus, were fo early of access, that they needed no admissiones.

Admittero Clerico, is a writ granted to him who hath recovered his right of pretention against the bishop in the common pleas.

Admittero in Socium, is a writ for the afcription of certain persons to justices of assize formerly appointed.

Admonition, in Ecclelfiical Affairs, a part of discipline much used in the ancient church. It was the firft act, or flp, towards the punishment or expulion of delinquent. In case of public offences, it was performed according to the evangelical rule, privately: in case of public offence, openly before the church. If either of these took effect, for the recovery of the fallen perfon, all further proceedings, in the way of censure, ceafed; if they did not, recourse was had to excommunication. Bingh. Orig. Ecclel. tom. ii. lib. 15. cap. 3. § 5. p. 31. Calvin. Inl. lib. iv. cap. 12. § 2.

By the ancient canons, nine monitcries, or admonitions, at due dilance, are required before excommunication.

Admonition is also ufed, in writers of the barbarous age, for the citation of humbling a perfon to appear in a court of justice. See Summons, &c.

Admonitio Fyffium, a military punishment, among the Romans, resembling in some respects, our whipping, or lathing, but performed with a vine-branch. Schiltehr. Diff. de Pren. Mil. Rom. cap. 12.

Admont, in Geography, a town of Germany in Stiria, on the river Enz; two leagues north-eaft of Rottenmann. It depends upon the archbishoprick of Salzburg, and has a rich abbey of Benedictines in the high mountains.

Admortization, among Feudal Writers, the act of reducing lands to mortmain.

Adnata,
ADO

ADNATA, in Anatomy. See CONJUNCTIVA.

Adnata, or Adnascentia, among Gardeners, denote those offsets which, by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards become true roots.

Adnata is also a term used for such things as grow upon animal or vegetable bodies, whether inseparably, as hair, wool, horns, &c., or accidentally, as the several epipithal plants.

ADNATUM folium, in Botany, denotes the disk of the leaf projecting close to the stem of the plant; and adnata, in a general sense, denotes connected.

ADNOTATIO, in Antiquity, denoted the recension of a prince, signed by himself.

ADNOÜN, Adosen, or Adnem, is used by some Grammarians to express what we most usually call an ADJECTIVE, which see.

ADO, in Biography, archbishop of Vienne in Dauphiné, was born A.D. 862, and distinguished by his piety, industry, and learning. His "Universal Chronology," comprehends the whole extent of history to the year 879. It was printed in folio at Paris in 1572, in Gothic characters, and reprinted by Morel in 1597. A new edition of this valuable work was published in folio, at Rome, in 1745. ADO was also the author of a Martyrology, published by Rosweyde, a Jesuit, in 1613. Gen. Biog.

AD OCTO, q. d. to the eighth number; a term used by some ancient philosophers to denote the highest or superradative degree; hence, in their way of delineating qualities, they reckoned no degree above the eighth.

ADO, in Botany, the name which the Phoenicians gave to the king of their gods.

ADOLESCENS signifies the iron bars that support the fire, in a grate or furnace.

ADOLESCENCE, formed of adolescere, to grow, the state of growing youth; or that period of a person's age commencing from his infancy, and terminating at his full stature or manhood. The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. It is commonly computed to be between 13 and 25, or even 30 years of age; though, in different constitutions, its terms are very different.—The Romans usually reckoned it from 12 to 25 in boys, and to 21 in girls, &c. And yet, among their writers, juvenis and adolescens are frequently used indifferently, for any person under 25 years. The fibres, being arrived at a degree of firmness and tension sufficient to sustain the parts, no longer yield and give way to the efforts of the nutritive matter, to extend them; so that their further accession is stopped from the very laws of their nutrition.

ADOLPHECK, in Geography, a town of Germany, in the circle of the Upper Rhine; eight miles west of Idstein.

ADOLIA, in Botany, a genus of plants described by Rhede among the trees of Malabar, which bear a near relation, says M. La Maree, (Encycl. vol. i. p. 423.) to the RHAMNUS. The characters are, that each flower is composed of a calyx, divided to its middle in five equal notches; the corolla and stamens are unknown; the pistil is a small ovary situated at the center of the calyx, and which becomes, when ripe, a roundish berry, containing five oblong, triangular, obovate seeds. There are two species, viz. A. abii, with white flowers, which grows to the height of seven feet, and bears fruit twice a year; the berries when ripe are of a purple black colour; and A. rubra, with red flowers, which resembles the other; but the berries of this species, when ripe, are of an orange colour and of an acid taste.

ADO

ADOLPHUS. Frederick II., of Holstein-Gottorp, king of Sweden, was born in 1710, and succeeded his father Frederick in 1731. He married a sister of the king of Prussia in 1744. He faithfully pursued the good of his country, and his reign was upon the whole prosperous. He reformed the laws, cultivated science, promoted commerce, and for the most part preferred peace; though he could not prevent Sweden from joining the league against Prussia in 1757, a measure that contributed very little to its reputation. He instigated an academy of inscriptions and belles lettres in imitation of that of France, and erected a pyramid at Torneo in Lapland, to commemorate the labours of the French academicians, who were sent further to inscribe a degree of the meridian. He died much regretted in 1771; and was succeeded by his son Gustavus III. Nouv. Dict. Hist.

ADOLPHUS, Christian Michael, the son of Balthazar Adolphus, merchant of Hirschberg in Silesia, was born the 14th of August 1676. After studying the different branches of medicine under the most celebrated masters of his time, he graduated at Utrecht, and then went to Leipsic, where he acquired considerable reputation as a teacher. In 1747 he published, "Diflerentiae Physico-medicae feliciter" 4to. The titles of the Diflerentiae, which are very numerous, may be seen in the 4to. volume of Haller's Biblioth. Med. Prat.

ADOM, in Ancient Geography. See ADAM.

ADOM, in Modern Geography, one of the states or principalities, into which the maritime part of the gold coast in Africa is divided. It is bounded on the east by Manpa, on the south by Guafo, on the north by Vaffia, and on the north-east by Abramboe. This country extends along the river Schama, and has many fine islands belonging to it, which are covered with beautiful and populous villages; the government was formerly monarchical; but the supreme authority is now lodged in a council of five lords. Adom is populous, fertile and rich; abounding with corn, fruit, and animals, both wild and tame; but the peace and prosperity of the country are often interrupted by civil discord. The Adomees have it in their power to intercept the communication of the northern regions with the negroes of the coast, and oblige them to pay a duty which yields a large revenue. If these people were united and powerful within themselves, they would be the terror of surrounding nations. Adom adjoins to Anta, which is often disturbed by the incursions of the Adomees. These people generally trade with Axim and Bonny; and sometimes with Little Comoro. Med. Uni. Hist. vol. iii. p. 454.

ADOM, or Theben, a town of Hungary, situate on the Danube; four leagues south-west of Offen.

ADOMER, one of the states of the Gold-Coft, called also Soku and Avma, adjoining to Adom and Axim; and differing little from them in produce, trade, laws and customs.

ADON, a large populous village of Hungary, situate in the province of Stuhl-Weissenburg, or Alto regula, in a rich country on the banks of the Danube. L. long. 19° 29'. N. lat. 47° 26'.

ADONAI, one of the names of God in scripture. This word properly signifies my lord, in the plural number, as Adonis signifies ray lord, in the singular number. The Jews, who, either out of respect or superstitiion, do not pronounce the name of Jehovah, read Adonai in the room of it, as often as they meet with Jehovah in the Hebrew text. But the ancient Jews were not so superstitious; and there is no law which forbids them to pronounce the name of God. This superstitious commenced among the latter Jews after the Babylonish captivity; at least before the time of Jose-

phus.
pluss, who expressly says, that it was not lawful for him to speak the name of which God had revealed himself to Moses. See Geddes’s Critical Remarks, vol. i. p. 167.

ADONEA, in Mythology, the name of a divinity which preceded over voyages.

ADONI, in Geography, a district of Hindoostan, in the country of Gulconda. It is also the name of a town in this district, about 188 miles north of Seringapatam. E. long. 77° 18’. N. lat. 14° 50’.

ADONIA, in Antiquity, solemn feasts in honour of Venus, and in memory of her beloved Adonis, who is supposed to have been killed by a wild boar in the forest of mount Libanus, from which the river Adonis descends. Bishop Patrick (Com. in Exod. xii. 30.) ascribes the origin of these feasts among the Egyptians to the slaughter of the first-born in the time of Moses; and he, adopting the conjecture of Schaccus, an ancient writer, inclines to the opinion, that Pharaoh’s eldest son, who was now slain, had the name of Oulris; and that his sudden death on this occasion was lamented by all potters in one night of the year, at the time of full moon. Dr. Spencer (De leg. Heb. i. ii. c. 37. § 1. vol. i. p. 575.) conjectures, that these feasts had their origin with the Egyptians; but that the death of Oulris or Adonis, generally understood to be the fun, being the god that preluded over the fruits of the earth, or used symbolically for the fruits themselves, denoted their being cut off or separated from the earth in the time of harvest; which event was celebrated with mourning and lamentation: and as the Egyptians gathered the first fruits of the earth with this kind of unreasonable and exccessive sorrow, he thus accounts for the instruction recorded in Dent. xxvi. 14. To these feasts the prophet Ezekiel is supposed to refer, ch. viii. 14.; and if Tammuz or Thamus be the same with Oulris or Adonis, as learned men generally suppose, the circumstances above-mentioned accounts for this solemnity being kept in the month of Tammuz, answering to part of our June and July, because the harvest was finished in those hot countries by or before that time. See Lowth’s Com. in loc.

This idolatry, derived from the Egyptians, was afterwards adopted by other nations, as the Phcenicians, Lycians, Syrians and Greeks, and improved by the addition of a new fable, viz. Venus’s mourning for the death of Adonis. The scene of Adonis’s history is laid to be at Byblos in Phcenicia; and the signal for celebrating the Adonis was the change of the water of the river Adonis into blood, which happened once a year. Lucian (De Syria Dea, apud oper. tom. iii. p. 454. Ed. Reitzii) gives the following account of these feasts. The Syrians affirm, that what the boar is reported to have done against Adonis was transfigured in their country; and, in remembrance of this calamity, they annually beat themselves and wail, and celebrate frantic rites, and great lamentations are intiuished throughout the whole country. When they have had enough of lamentation and tears, they first perform funeral obsequies to Adonis, as to one that is dead: and afterwards, on a following day, they feign that he is alive, and ascend into the air or heaven, and thave their heads as the Egyptians do, on occasion of the death of their api. If any women will not consent to be shafted, they are obliged to prostitute themselves once to stranglers, and the money they thus earn is consecrated to Venus. Some of the Byblians, continues Lucian, are of opinion, that these orgies are performed in honour of Oulris, the Egyptian deity, and not of Adonis. The Egyptians, at the time of this feast, are said to convey a box made of rushes or papyrus, with an inclosed letter, informing the inhabitants of Byblos, about seven days journey from the coasts of Egypt, that their god Adonis, whom they apprehended to be lost, is discovered. The vessel always arrives safe at Byblos, at the end of seven days. Lucian says, he was a witness of this event. The women, who are the principal actors on this occasion, expect the arrival of the vessel with impatience, and are frantic with joy when it arrives. According to Menius, the two offices of lamentation and rejoicing made two distinct feasts, which were held at different times of the year, the one six months after the other; Adonis being supposed to pass half the year with Proserpine, and the other half with Venus. The lamentation they called adonias, or disappearance, and the rejoicing isias, or return. These feasts were observed at Alexandria in the time of St. Cyril, and at Antioch in the time of Julian the apologist, who happened to enter the city during the solemnity, which was interpreted as an ill omen.

— "lucrum monumenta manebunt,
Semper, Adoni, mei; repetitique mortis imago
Annae plangoris penetrit simulacra nolti.
At crvo in flore mutabilis."

Procopius, St. Cyril, and some other learned men are of opinion, that Hiaiah (ch. xxviii. 3.) refers to the circumstance abovementioned of sending a letter by sea to communicate the news of Adonis’s resurrection; whilst others, translating the Hebrew parrim, idols, suppose that the passage refers to the images of Isis, which the Egyptians carried from place to place in a fort of paper-vessel, or ark of bulrushes. The rites practised in the Adonis resemble those of the Orphic Arkonautica, and probably havethe fame origin and end. Bryant. Mythol. vol. i. p. 371.

The Adonis were otherwise called Salambo. The Abbé Bayle has a memoir on the history of the Adonia. Mem. Acad. Inscript. tom. iv.

ADONIC, in Poetry, denotes a short kind of verse, confiding of a dactyl and a spondee, or a trochee: as rara faucens. It takes its name from Adonis; as having been originally used in the Threnoi, or lamentations for that favourite. The chief use of the adonic verse is at the end of each strophe of sapphic verse; or among Arilophan Anapaeis in the ancient tragedy. But we meet with adonies by themselves without sapphics, as also sapphics without adonies. See an instance of adonic verses in Boetius, de Consol. Philos. lib. i. p. 24. Ed. Amstel. "Gaudia pelle," &c.

ADONIDES, in Botany, are those writers, who have given histories, or catalogues of the plants cultivated in some particular place.

ADONIUS, a name given by the Arabs to the sun, under which appellation they worshipped him, by daily offering to him incense and perfumes. This was also a name given to Bacchus.

ADONION, a species of southernwood, according to Correaus, which used to be set in pots, and served as an ornament for gardens.

ADONIS, in Antiquity, a dance of the ancient Greeks, which was a kind of ballet, in which a pantomime imitated Adonis, and bewailed his misfortune.

Adonis, flos Adonis, or Phoenian’s Eye, in Botany, a genus of the polyanthus polyanthus clafs and order, and of the natural order of multfligina and the ranunculaceae of Jullien. Its characters are, that the calyx is a five-leafed perianthium, and the leaflets are obtuse, concave, a little coloured and deciduous; the corolla has from five to fifteen, but most commonly eight, oblong, obtuse, finehailed petals: the filaments conflit of very short, fubulate filaments, and the anthers are oblong and indehiscent: the pildillium has numerous germes collected
collected in a head, no styles, and acute reflex stigmas: no pericarpium; an oblong, spiky receptacle: the seeds are numerous, irregular, angular, gilbous at the base, reflex at the top, a little prominent and naked. To this genus belong six species: viz. the *colvillei*, or tall, the *autumnalis*, or common, the *vernalis*, or spring, the *apennina*, the *capensis*, and the *vocatilia*, or bitter *adonis*. The first is by some botanists united to the second, although Dr. Smith separates them; it is a native of the southern countries of Europe, where it grows among corn: and a variety of it is mentioned by some authors. The second grows in Kent, near the river Medway, between Rochester and Maidstone, in fields sown with wheat; and the flowers are brought in great quantities to London, where they are sold under the name of *red morocco*. It is also found in Norfolk, Gloucestershire, about London, and about Dublin. It is annual, and flowers from May to October. The spring *adonis*, which is near akin to the apennina, so that La Marec considers it as a variety of the other, is a native of Switzerland, Switzerland, and various parts of Germany, where the root is often used for the true black hellebore. The fourth is found wild in the Apennines, and in Siberia. The fifth species is found wild near the Cape of Good Hope. The sixth is also a Cape plant, and used by the Africans for tying blisters. There is another species recorded in the Supplement of the Younger Linnaeus, there named *Adonis filis*, and considered as the daughter of the *Adonis expensis*.

The two first species are annual, and thrive best in a light soil: the seeds should be sown in autumn, sown in a warm, and others in a shady situation, that they may continue longer in flower: they will not bear being transplanted. The third and fourth are perennial, and the seeds should be sown in August, soon after they ripen: the ground should be kept clear from weeds, and in dry weather, watered; and in the autumn of the second year they should be transplanted into the situation where they are to remain. They may be increased by parting the roots, either in autumn or spring. They are hardy and showy, and therefore desirable plants for a garden. The Cape species must be managed as other plants from that country. Martyn's Miller. Glennial reckons eight species, adding to those already enumerated the *minista*, which he figgled not to be distinct from the *autumnalis*, and the *flammea*, with oecopetalous flowers, hairy calyx, and cylindrical fruit.

*Adonis*, in *Entomology*, a species of *tapilio*, with entire cæcalian wings, a black marginal ridge, underneath cinnereous, with numerous ochli; of which the latter have a white central spot. The larva is green, with dorsallines of yellow spots. It is found in Austria.

*Adonis*, in *Ancient Geography*, a river of Phœnicia, rising in Mount Libanus or Lebanon, and falling into the sea at Byblos, now Gibiel. The Turks call this river *Obrakim Bagh*. Maudrell, in his Journey, p. 34. 35, confirms the opinion of Lucian (Opera, tom. ii. p. 496. Ed. Reitzii) concerning the red colour of this river. At certain feast of the year, especially about the feast of Adonis, it is of a bloody colour, which the heathens attributed to a kind of sympathy in the river for the death of Adonis, who was killed by a wild boar in the mountain, out of which this stream rives. The water was flaved, says Maudrell, to a surprising redness, and as we observed in travelling had discoloured the sea for a considerable distance into a reddish hue, occasioned, without doubt, by a sort of minium, or red earth, walked into the river by the violence of the rain, and not by any flain from the blood of Adonis. This reddish tinge of the streams of water is not a singular phenomenon. Pococke (vol. i. p. 159) informs us, that when the river Nile is rising, its waters become red, and sometimes green. The same fact is confirmed by Mallet, and Volney (Travels in Syria, vol. ii. p. 293) relates, that at Tyre there is a well, which commonly affords excellent water, but becomes troubled in September, and continues for some days full of reddish clay. This season is observed as the festival by the inhabitants, who come in crowds to the well, and pour into it a bucket of sea-water, which, they say, has the virtue of restoring the clarity of the spring. An ingenious writer suggels, that the magicians of Egypt (Exod. vii. 22.) might, by their enchantments, have repeated some of the practices to which they were accustomed at the solemnity of this blessing Adonis; and if this was done at the feast of Adonis, they might persuade Pharaoh, that the miracle was wrought in favour of Adonis. Fragments in an Appendix to Calmet's Dict. vol. ii. pt. i. p. 20.

The river Adonis, according to Mr. Bryant (Myth. vol. i. p. 366.) is the same with *Exidanus;* and the circumstance of the change of the colour of its waters, and the death of Adonis or Thanatus, which was supposed to be the occasion of it, are pathetically described by Milton in the following lines of his Paradise Lost, B. i. v. 445:—

"Thanatus—Thanatus came next behind,\nWhole annual wound in Lebanon wild'd\nThe lybian damself to lament his fate;\nIn amorous ditties all a summer's day:\nWhile smooth Adonis from his native rock\nRan purple to the sea; suppos'd with blood\nOf Thanatus yearly wounded."

*Adonis* is the name of a river of Africa, which rives in the mountains south-west of Tetuan, and falls into the sea between Arzilla and Tangier.

*Adonis*, the name of a city in Thrace, called *Eidonis*. *Adonis*, in *Ichthyology*, the name of a small fish of the anguilliform kind, of a cylindrace shape, and about six inches long; it is of a gold colour, mixed with a greenish hue in some parts, and in others with a reddish. It has on each side a white straight line running from the gills to the tail. Its gills are remarkably small, and many have hence supposed that it had none. It is remarkable for sleeping on the surface of the water, and near the shores; and Rondelet affirms, that he has seen them sleeping upon dry rocks. Mr. Ray fuppsects this fish, which is also called *exocetus*, to be the same with the *exocetus* of Bellonius, or the *Gatterugine*. The adonis of Bellonius is the *Blennius gaterita* of the Limnean fytten.

*Adonis*, in *Mythology*, a beautiful youth, the son of Cinyras, an Assyrian, who founded the city of Paphos, in the island of Cyprus. Venus, it is said, was enamoured of him from his infancy, and committed the care of his education to Proserpine, who refused to deliver him when he was demanded by Venus. The dispute was decided by Jupiter, by decreeing that he should be one third of the year with Proserpine, another third with Venus, and the last third at his own disposal; but Adonis, captivated by the charms of Venus, spent two-thirds of his time with her. Diana, it is said, took offence, and sent a wild boar to destroy him. Others say, that Adonis was the son of Cinyras by his daughter Myrrha; that he was deceived for concealment to the mountains, and nursed by the nymphs; that Venus fell in love with him, and admitted him to her embraces; that Mars, being jealous, transformed himself into a wild boar, and slew the beautiful youth; that Venus followed him to the shades, and obtained the consent of Proserpine, that he should be half the year with her, and half the year with Proserpine; and that Venus, triumphing in her successes, appointed a festival to be celebrated in commemoration thereof.
ADO

of the event. This fable has been variously interpreted. 

Adonis, as some say, was the son of Venus, the upper hemisphere of the earth, and Proserpine, the inferiour; and therefore when he was in the six inferior signs he was with Proserpine, and during the remaining time he resided with Venus. The bear which flew Adonis was the winter. 

Macrobius, Saturn. l. i. c. 21. Others suppose that Adonis denoted the sign of the earth; and when the seed was flown in the ground, Adonis was gone to Proserpine; and that when it had vegetation and sprang up to view, he revived Venus. Hence they fowed corn, and made gardens for Adonis, which were adapted more for pleasure than profit. 

Voss. de Idolol. l. ii. c. 5. Theoritus, Idyll. 111. According to Plutarch (Symposion, J. iv. oper. tom. 2. p. 671. Ed. Xylander.) Adonis was the name with Bacchus; and Osiris was both the sun and Adonis. Some are of opinion, that the Ammonites and Moabites called him Baal-Pear, and that he was the name with the Hebrew Thammuz. 

Bryant (Mythol. v. i. p. 371.) supposes, that the Cannanites worshipped their chief deity the sun, under this title; and he says, that at Byblus, Berytus, Sidon, and afterwards at Tyre, they used particularly mournful dirges for the loss of Adonis or Thammuz, who was the name of Thammas, and Osiris in Egypt. Hence the children of Israel were forbidden to weep and make lamentation upon a festival. Nehem. viii. 9. 14. See Adonia.

The worship of Adonis was established by the emperor Adrian in the grots of Bethlehem, where it was supposèd our Saviour was born. 

Adonis pote, an ancient beverage or drink made of wine mixed with flour of roasted ador; the same with what was otherwise called Cyprus.

ADONISSTES, called by some Divinæs and Critics, a sect or party who contended that the Hebrew points ordinarily annexed to the confonnants of the word Jehovah, are not the natural points belonging to that word, nor express the true pronunciation of it; but that they are the vowel-points belonging to the words Adonai and Elohim, applied to the confonnants of the ineffable name Jehovah; to warn the readers, that instead of the word Jehovah, which the Jews were forbidden to pronounce, and the true pronunciation of which had been long unknown to them, they were always to read Adonai. These were opposed to Jehovahists; of whom the principal are Drusius, Capellus, Buxtorf, Alting, and Relan, who has published a collection of their writings on this subject. See Adoni and Jehovah.

ADOPISSUS, in Ancient Geography, a town of Afa Minor, which Ptolemy places in Lycaonia.

ADOPTEER, in Chemistry, a vessel with two necks placed between a retor and a receiver, and serving to increase the length of the neck of the former. They differ from aludelles, which were formerly used in the sublimation of several substances, both in their figure and in their situation. The adoptheer are tubes which become narrower at one end, from half a foot to three feet long, and are open at both ends. They are joined in a collabortive situation; whereas the aludelles were set upright. Chemistry, plate. See Distillation and Receiver.

ADOPTIANI, in Church History, a sect in the eighth century, which sprung up under Charlemagne, about the year 785, in consequence of the concursing opinion of Eilpand, archbishop of Toledo, and Felix, bishop of Urgel; whose disagreeing tenet was, that Chirilt, as to his human nature, was not the proper or natural, but only the adoptive son of God. Their doctrine was condemned by a council at Frankfort, in 794, and afterwards in a council at Rome under pope Leo III.

ADOPTION, an act by which any one takes another into his family, owns him for his son, and appoints him for his heir. The word is derived from adoptare; whence the Latin barbarous adoptare, to make a knight.

The custom of adopting was very familiar among the ancient Romans, who had an express formula for it. They first learned it from the Greeks, among whom it was called ékōma, filiation; and it was transmitted to them from the ancient Hebrews, Egyptians, and Assyrians, among whom it prevailed.

As adoption was a sort of imitation of nature, intended for the comfort of those who had no children; ékōma, was therefore not allowed to adopt, as being under an actual impotency of begotting children. Neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature; but it was even required, that the person who adopted should be eighteen years older than his adoptive son, that there might appear at least a probability of his being the natural father.

The Romans had two forms of adoption; the one before the praetor; the other at an assembly of the people, in the times of the commonwealth, and afterwards by a rescript of the emperor. In the first, the natural father addressed himself to the praetor, declaring that he emancipated his son, resigned all his authority over him, and contented that he should be translated into the family of the adopter. The latter manner of adoption was practiced, where the party to be adopted was already free; and this was called adopation. The person adopted changed all his names; assuming the prænomen, name and surname of the person who adopted him. When Augustus adopted his grand-children, the two sons of Agrippa and Julia, he adhered closely to the usual solemn formularies of the Roman law, and inscribed on their fathers making over to him, by a kind of sale, his right to the children; and he gave them his name, so that they called them Caius Caesar, and Lucius Caesar. In the reign of Nero, the senate passed a decree, ordaining that fraudulent adoptions should not avail such as made them, either to qualify themselves for honours, or to receive the whole of any inheritance that might fall to them.

Besides the formularies prescribed by the Roman law, divers other methods have taken place; which have given denominations to various species of adoptions among the Gothic nations, in different ages.

Adoption by arms, was when a prince made a present of arms to a peron, in consideration of his merit and valour. This it was that the king of the Heruli was adopted by Theodoric; Athalaric, by the emperor Julianus, and Cotroes, nephew of the king of Peru, by the emperor Justinian.

This method of adoption, practiced in Germany, was called barbarus, by way of opposition to the Roman custom.

The obligation here laid on the adoptive son was to protect and defend the father from injuries, sallrares, &c., and hence the ceremony of dubbing knights took its origin as well as name. Selden, Tit. of Hon. p. 868.

Adoption by baptism, is that spiritual affinity which is contraried by god-fathers and god-children in the ceremony of baptism.

This kind of adoption was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the Capitulars of Charlemagne.

In reality, the god-father was so far considered as adoptive father, that his god-children were supposed to be entitled
Adoption by hair, adoption per capillum, or erium, was performed by cutting off the hair of a person, and giving it to the adoptive father. It was thus that Pope John VIII. adopted Bofon king of Arles; which, perhaps, is the only instance in history, of adoption in the order of ecclesiastics; a law that, professes to imitate nature, not daring to give children to those in whom it would be thought a crime to beget any.

Adoption by marriage, is the taking of the children of a wife or husband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans; among whom it is more particularly known by the name of sinkiendaehaft; among their writers in Latin, by that of unio protium, or union of giving. But the more accurate writers observe, that this is no adoption. See Adoption.

Adoption by Substitute. See Levirate.

Adoption by Testament, that performed by adopting a person heir by will, on condition of his assuming the name, arms, &c. of the adopter.

Of whatever kind, we meet with divers instances in the Roman history.

Adoption was allowed among the Greeks to such as had no issue of their own; excepting those who were not their own mothers, e.g. slaves, women, madmen, infants, or persons under twenty years of age; who, being incapable of making wills, or managing their own estates, were not allowed to adopt heirs to them. Foreigners being incapable of inheriting at Athens, if any such were adopted, it was necessary first to make them free of the city. The ceremony of adoption being over, the adopted had his name enrolled in the tribe, and ward of his new father; for which entry a peculiar time was allotted, viz. the festival 25th Dec.

To prevent rash and inconsiderate adoptions the Lacedemonians had a law, that adoptions should be tranfacted, or at least confirmed, in the presence of their kings. The children adopted were invested with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceased to have any claim of inheritance, or kindred, in the family which they had left, unless they first renounced their adoption; which, by the laws of Solon, they were not allowed to do, unless they had first begotten children, to bear the name of the person who had adopted them: thus providing against the ruin of families, which would otherwise have been extinguished by the defection of those who had been adopted to prefer them. If the children adopted happen to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the adopter. It should seem that by the Athenian law, a person, after having adopted another, was not allowed to marry, without permission from the magistrate; in effect, there are instances of persons, who being ill used by their adoptive children, petitioned for such leave. However this be, it is certain some men married after they had adopted sons, in which case, if they begot legitimate children, their estates were equally shared between the begotten and adopted.

Among the Turks, by the law of Mahomet, adoption is no impediment of marriage. The ceremony of adoption is performed by obliging the person adopted to pass through the shirt of the adopter. Hence, among that people, to adopt is expressed by the phrase, to draw another through my shirt.

Du-Cange supposes that the adoption of Godfrey of Bouillon by Alexius, who named him champion of the empire, and dignified his personage with the title name and rites of adoption, was of this kind.

It is said that something like this has also been observed among the Hebrews; where the prophet Eliahu adopted Elia for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloak, or mantle, on him. 1 Kings, xix. 19. 2 Kings, ii. 15. But adoption, properly so called, does not appear to have been practised among the ancient Jews. Moses says nothing of it in his laws; and Jacob's adoption of his two grandsons, Ephraim and Manasseh (Gen. xlix. 1.) is rather a kind of substitution, by which he intended that the two sons of Joseph should have each his lot in Israel, as if they had been his own sons. Cunnet.

In the East, the practice of adoption is still continued. Pitts (Account of the Religion and Manners of the Mohammedans, p. 217, 225.) informs us that his patron, who was an old bachelor, being taken ill and likely to die in his pilgrimage to Mecca, took off his own girdle, and put it on his son, and at the same time put on himself the girdle of Pitts. In speaking of him afterwards, his patron called him his son; and occasionally said to him, though I never was married myself, yet you shall be married, in a little time, and then your children shall be mine. Lady Montague (Letter xlii. vol. ii. p. 189.) says, that adoption is very common amongst the Turks, and yet more common amongst the Greeks and Armenians. With this view, and in order to prevent their estates from falling into the Grand Signior's treasury, they chuse a child of either sex, among the meanest people, and carry the child and its parents before the Cadi, and there declare they receive it for their heir. The parents, at the same time, renounce all future claim to it; a writing is drawn and witnessed, and a child, thus adopted, cannot be disinherited.

By the Gentoo laws (Halbed's, p. 263.) information must be given to the magistrate, by the person who is desirous of adopting a child, and a jugg or sacrifice performed; and he is also to give gold and rice to the father of the child. A woman is not allowed to adopt a child without her husband's order: and he who has no son, or grandson, or great grandson, has liberty to adopt a son; but while he has one adopted son, he is not permitted to adopt a second.

Adoption is also used in Theology, for a federal act of God's free grace; whereby those that are regenerate by faith, are admitted into his household, and entitled to a share in the inheritance of the kingdom of heaven.

Adoption, in the more general scripture sense of the term, denotes that act of divine grace or favour, by which some of the human race are introduced into a peculiar relation to God, as his children and people. In this sense the privilege of adoption belonged only to the Israelites or Jews, before the coming of the Messiah. See Exod. iv. 22. Jer. xxxi. 9. Luke, i. 54. Rom. ix. 4. But the Jews forfeited this honourable distinction, and were deprived of the national privilege they had long enjoyed: and God determined to admit the Gentiles into the state of filthip or adoption independently of any legal observances, and merely on the condition of faith in Jesus Christ. It has, however, been a subject of debate among divines whether adoption belongs to Christians in general, in consequence of their
ADO

their faith in Christ, and outward profession of his religion; or is appropriate to those Christians in particular who conform in their disposition and practice to the precepts of the gospel, and are the special objects of divine favour. According to the scheme of Dr. Taylor, in his Key to the Apostolical Writings, prefixed to his Paraphrase, &c. the Epistle to the Romans, (chap. xii. p. 91.) adoption, as well as election, vocation, justification, &c. belong to the class of antecedent blessings, which, in a sense, belong at present to all Christians, even those, who for their wickedness shall perish eternally; and do not import an absolute, final state of favour and happiness; but are to be considered as principles or motives to engage us to holiness and obedience. He allows that some of the expressions, whereby the antecedent blessings are signified, may be used in a double sense; either, as they are applied to all Christians in general in relation to their being translated into the kingdom of God, and made his peculiar people, enjoying the privileges of the gospel; or as they signify the effects of those privileges, viz. either that excellent disposition and character which they are intended to produce, or that final state of happiness, which is the reward of it. See Locke's Works, vol. iii. p. 512. 570.

Adoption has a particular respect to that future resurrection and immortality to the hope of which Christians were begotten again by the doctrine and resurrection of Christ. See Whitby Comment. vol. ii. p. 44. 324. 339. 6th Edition.

Adoption is sometimes also used, in speaking of the ancient clergy, who had a custom of taking a maid or widow into their houses, under the denomination of an adoptive or spiritual father, or niece. Du Cange.

Adoption is also used in speaking of the admission of persons to certain hospitals, particularly that of Lyons; the administrators whereof have all the power and rights of parents over the children admitted.

Adoption is also used for the reception of a new academy into the body of an old one.

In which sense, adoption amounts to much the same with incorporation.

The French academy of Marsilles was adopted by that of Paris; on which account, we find a volume of speeches extant, made by several members of the academy of Marsilles, deputed to return thanks to that of Paris, for the honour.

In a sense not unlike this, adoption is also applied by the Greeks, to the admitting a monk or brother, into a monastic community; sometimes called spiritual adoption.

ADOPTIVE, ADOPTIVE, or ADOPTIVUS, denotes a person adopted by another.

Adoptive children, among the Romans, were on the same footing with natural ones; for which reason, they were either to be invested heirs, or expressly disinherited; otherwise the testament was null.

The emperor Adrian preferred adoptive children to natural ones; because we choose the former, but are obliged to take the latter at random.

M. Manes has published a book of elogies, or verses addressed to him; which he calls Liber Adoptivus, an adoptive book; and adds it to his other works.—Heinianus, and Furstenburg of Munster, have likewise published adoptive books. In Ecclesiastical Writers we find adoptive women or fathers, adoptive femine, or forores, used for those handmaids of the ancient clergy, otherwise called subintroducute.

ADOPTIVE arms are those which a person enjoys by the gift or concession of another, and to which he was not otherwise entitled. They stand contradistinguished from arms of alliance.

ADOPTIVE is also used to express a thing borrowed or taken from another. In which sense we sometimes meet with adoptive hair, by way of opposition to natural hair; and adoptive gods, by way of contradistinction to domestic ones. The Romans, notwithstanding the number of their domestic, had their adoptive gods, taken chiefly from the Egyptians; such were Isis, Osiris, Anubis, Apis, Harpocrates and Canopus.

ADOPTIVI, in Church History. See Adoptian.

ADOR signifies a species of corn called Sperla and Zera.

ADOR, OR ADORUM, in Ancient Geography, a city belonging to the tribe of Judah, not far from Mareph, in the southern part of Judah, on the confines of Idumea. These two cities were taken by Hyrcanus in his expedition into Syria, when he destroyed the Samaritan temple on Mount Garizim. Joseph. Antiq. apud op. tom. i. p. 659. ed. Haverc.

ADORATION, the act of rendering divine honours; or of addressing God or a being, as supposing it a god. See Worship. The word is compounded of ad, i.e. and or, mouth; and literally signifies to apply the hands to the mouth; manum ad ostendo, to kiss the hand; this being in the eastern countries, one of the great marks of respect and submission; and seeming, from the first books of Herodotus, to be of Persian origin. To this mode of idolatrous worship Job refers, chap. xxxi. 26, 27.—See also 1 Kings, xix. 18.

The ceremony of adoration among the ancient Romans was thus: the devotee having his head covered, applied his right hand to his lips, the fore-finger resting on the thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called ofulum laetatim; for ordinarily they were afraid to touch the images of their gods themselves with their prophanes lips. Sometimes, however, they would kiss their feet and even knees, it being held an in civility to touch their mouths; so that the affair paffed at some distance. Others pretend, that they first stretched out the hand, and afterwards drew it back to their lips; but it rather appears that the contrary order was observed. Saturn, however, and Hercules, were adored with the head bare; whence the worship of the last was called infinitum peregrinum, and ritus Graecus, as departing from the Roman culinary method, which was to commence and adorer, with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony, by the fight of unlucky objects.

Sometimes also prolifation, or falling on the face, and sometimes kneeling, were practiced; sometimes they turned towards the sun, and sometimes to the east.

Other circumstances of adoration were the putting on crowns, garlands, and the like, on the statues or images adored; sitting down by them, praying to them in soft trembling murmurs, to be favourable, favours milii.

The Romans practifed adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in, or out, to pay their respects to.

The Gauls, instead of turning about to the right hand, after
after the Roman manner, thought it more religious to turn to the left.

In the symbols of Pythagoras, adoration is enjoined to be performed in a sitting posture, genuflexion being then unknown.

The Jewish manner of adoration was by prostration, bowing, and kneeling. Phineas has a discourse expressly on the form of the Jewish adoration. The Christians adopted the Grecian rather than the Roman method, and adored always uncovered. The ordinary posture of the ancient Christians was kneeling, but on Sundays, standing. In this they conformed to the heathens, that a peculiar regard was had to the east, to which point they ordinarily directed their prayers; which occasioned a belief among the heathens that they adored the sun. Something of this usage is still retained, as appears by the position of our churches. A modern author has discovered an error of the builders in this respect; many of our ancient churches being found to vary several degrees from the true east and west. Plutarch's Hist. Staff. chap. ix. sect 35. p. 362. In the east it is still considered as a mark of the highest respect, to pull off one's shoes, and approach bare-footed to pay adorations. See Exod. chap. iii. 5. The Egyptians were singularly attentive to this practice; and the Mahometans take off their shoes before they enter the mosques. A similar practice is observed by the Roman Catholics, at the adoration of the cross on Good Friday, although not observed in this country.

When Mr. Wilkins wished to enter the inner hall of the College of Sotts, at Patna, he was told it was a place of worship, open to him and to all men; but at the same time it was intimated, that he must take off his shoes. Afris. Researches, vol. i. p. 259.

Adoration is also used for certain extraordinary civil honours or respects, which resemble those paid to the Deity, yet are given to men.

We read of adorations paid to kings, princes, emperors, popes, bishops, abbots, &c. Adorations paid to the purple, to the person; — adoration by kneeling, by falling prostrate, kneeling feet, hand, garment, &c. The Persian manner of adoration, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kneeling the ground. This was an indispensable condition on the part of foreign ministers and ambassadors, as well as the king's own vassals, of being admitted to audience, and of obtaining any favour. This notion of reverence was ordained to be paid to their favourites, as well as to themselves, as we learn from the history of Hannan and Mordecai, in the Book of Esther; and even to their statues and images; for Philostratus informs us, that, in the time of Apollonius, a golden statue of the king was exposed to all who entered Babylon, and none but those who adored it were admitted within the gates. The ceremony, which the Greeks called επαριστους, Conon refused to perform to Artaxerxes, and Callitheness to Alexander the Great, as rendering it impious and unlawful.

The adoration performed to the Roman and Grecian emperors, consisting in bowing or kneeling at the prince's feet, laying hold of his purple robe, and profanly withdrawing the hand, and clapping it to the lips. Some attribute the origin of this practice to Conflanius. They were only perquisites of some rank or dignity that were entituled to the honour. Bare kneeling before the emperor to deliver a petition, was also called adoration.

It is particularly said of Dioclesian, that he had gams fastened to his shoes, that divine honours might be more willingly paid him, by killing his feet. And this mode of adoration was continued and aggravated till the last age of the Grecian monarchy. See Gibbon's Decline and Fall of the Roman Empire, vol. x. p. 124, 8to. When any one pays his respects to the king of Achen in Sumatra, he first takes off his shoes and stockings, and leaves them at the door.

The practice of adoration may be said to have been killed, and its place taken by prostration in England, in the ceremony of kissing the king's or queen's hand, and in serving them at table, both being performed kneeling.

Adoration is also used in the court of Rome, for the ceremony of kissing the pope's feet.

It is not certain at what time this ceremony was introduced into the church; but it was probably borrowed from the Byzantine court, and accompanied the temporal power. Dr. Macaulee, in the chronological table which he has subjoined to his translation of Mosheim's Ecclesiastical History, places its introduction in the eighth century immediately after the grant of Pepin and Charlemane. Baronius traces it to a much higher antiquity, and pretends that examples of this homage to the vicar of Christ occur so early in the year 204.

These are, however, a vehement disposition in the people to fall down before them, and kiss their feet, performed crucifyes to be fastened on their slippers; be which fhefsholding, the adoration intended for the pope's feet, is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope; and Gregory XIII. claims this act of homage as a duty. We are told, that in the ancient church this ceremony was practised to all bishops; people kissed their feet, and saluted them with the phrase παταρος σας Ιλαρος.

Adoration is also particularly used for the ceremony of owning, or paying homage to a newly elected pope. The first election at which the ceremony is expressly recorded to have taken place, is that of Valentine, A. D. 827. The second is that of Leo IV. A. D. 847. Anthyllis in Valentin. cap. 653. in Leon. iv. cap. 697.

Stephen II. being chosen pope, A. D. 752, in the church of St. Mary ad Process, he was carried on men's shoulders from thence to the Lateran; and Polydore Virgil observes, that this is the first instance of this ceremony, which occurs in the history of the popes. See Bower, vol iii. p. 34.

Adoration properly is paid only to the pope, when placed on the altar, in which posture the cardinals, conclavists alone, are admitted to kiss his feet. The people are afterwards admitted to do the like at St. Peter's church; the ceremony is described at large by Guicciardini.

Adoration is also used for a method of electing a pope without surinity, or voting.—In the election by adoration, the cardinals rule hardly, as if agitated by fierce spirit, and fall immediately to the adoration of some one among them, and proclaim him pope.

In the election by surinity, adoration is the last thing, and follows the election; as in the other it is the election itself, or rather supercedes the election.

Adoration is more particularly used for kissing one's hand, in presence of another, as a token of reverence. The Jews adored by kissing their hands, and bowing down their heads; whence in their language kissing is properly used for adoration. Calmet.

Adoration is also used, among Roman writers, for a high species of applause, given to persons who had spoken or performed well in public. The method of expressing it was, by raising, putting both hands to their mouth, and then returning.
returning them towards the person intended to be honoured.

**Acclamation.**

Adoration is of divers kinds and qualities; *supreme* and subordination; mediate and immediate; absolute and relative; internal and external; secret and open.

Adoration, external, coincides with what is otherwise called ritual adoration.

Adoration, absolute, that rendered immediately to a being, in consideration of his own essential perfections, and terminating in himself. This coincides with immediate adoration, and flatters opposed to relative or mediate adoration.

Adoration, supreme, the highest degree of religious honour or worship rendered to a being, as supposing him the supreme God; in opposition to subordination worship given to inferior beings.

Adoration, absolute, that rendered immediately to a being, in consideration of his own essential perfections, and terminating in himself. This coincides with immediate adoration, and flatters opposed to relative or mediate adoration.

The members of the perpetual adoration answer to the *Acemiti* in the eastern church.

We find societies under this denomination in France, Germany, Italy, &c.

Adoration, barbarous, is a term used in the laws of king Canute, for that performed after the manner of the heathens, who adored idols.

The Phcenicians adored the winds, on account of the terrible effects produced by them; the same practice was adopted by most of the other nations, Persians, Greeks, Romans, &c.

The Troglodytes adored tortoises, as something peculiarly sacred; several people adored weapons, and instruments of war. The Scythians, &c. adored swords, the Romans axes, and the Arabs hones. The Indians adored vipers, the Bengalse and Canadees the sun; the latter of which nations is also said to adore the crofs. The Manta, a Peruvian people in the island of Puna, anciently adored a huge emerald, of the kind of an oiltree’s egg, by offering to it other emeralds of a lesser size. All which the priests kept for their own use; the doctrine, as Garcilaso observes, being founded on their avarice.

The Persians chiefly paid their adorations to the sun and fire. Some pray to rivers, the wind, &c.

The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage; the institution of the fire worship is usually referred to Zoroaster. The retainers to it are called *ignituli*; by the Persians, Ghebr, Arzefch, Perleh.

Dr. Hyde reduces the Persian fire-worship to a subordinate kind of honour, or service which he calls *prodilus*, defending that people from any charge of *proslatia*, or idolatry of fire. A traveller into these parts, Gemelli Careri, does the same.

The Greeks and Romans also adored fire under the name of *Vesta.* Play mentions the method of adoring lightning, which was by popp fans, or gentle clapping of the hands.

The Jews have been charged by heathens with adoring the vine, an afo’s head, &c. By Chalilans, with adoring the book of the law; a charge which one of their rabbins, Manah, Ben Israel, has been at the pains to remove.

The adoration of the *golden calf*, into which they fell in the wilderness, seems to have been borrowed, like many other of their ceremonies, from the Egyptians.

The Egyptians are said to have paid adoration to divers animals, plants, fishes, &c. the crocodile, the ibis, onions, &c. But these were only symbolical, or relative acts of homage; they adored the sun in a more peculiar manner, under the name of Osiris.

It is disputed whether the Chiefe pay divine or only civil honours to the statues of Confucius, and their ancestors. That people, however, appear to adore heaven; whence the inscription in all their temples, and which even the Chalilans are said to have retained in their churches, *king thin*, i.e. adore heaven.

The Indians are said to adore the devil. Some charge the same on the Brumins.

**Adorea, in Roman Antiquity, a word used in different senses; sometimes for all manner of grain, sometimes for a kind of cakes made of fine flour, and offered in sacrifices; and finally, for a dose or distillation of corn, as a reward for some service; whence by metonymy it is put for prais or rewards in general.**

**Adoreus Mons, in Ancient Geography, a mountain of the Abs Minor, mentioned by Livy (l. v. p. 196), and placed by M. d’Avville in Gallia, south-call of Amonium.**

**Adorian, in Geography, a small town of Upper Hungary, near the river Ets, north-west of Varadin, in a fine country.**

**Borysthenes, in the North, mentioned by Ptolemy, (l. xii. c. 15. t. i. p. 727.) whose situation is not ascertained.**

**Cellarius supposeth that they were the same with the Aspo, which Strabo ranks in the number of Scythian Nomades; and who probably inhabited the country which extended from Mount Horemus southward to the river northward.**

**Adosculation is used, by some Naturalists, for a species of copulation, or impregnation, by mere external contact between the genital parts of the two sexes, without intromission.**

Such is that of plants, by the falling of the *farina fecundans*, on the pistil, or uterus.

Divers kinds of birds and fishes are also impregnated by *adjection*. Grow. Anat. Of Plants, chap. v. $9.**

**Adossore is used, in Herod. Hyk. to denote two figures or bearings, placed back to back.**

The arms of the duchy of Bar are two bars *adosses.*

**Adou, in Geography, a river of France which rises in the mountains of Bigorre, in the department of the Upper Pyrenees, and running by “vires and Dax or Acca, falls into the Bay of Biscay, through an outlet called Bacault, near the walls of Bayonne, where it forms a bay, sometimes called Bayonne Bay. The sands in this Bay are often shifted by the tides, which come down from the mountains. The bar has not sometimes three feet at low water. It begins to be navigable about two leagues below Saint Sever.**

**Adowa, the capital of Tigre in Abyssinia, is situated on**
on the declivity of a hill, on the well side of a small plain, surrounded every where by mountains. Its name, signifying pafs or passages, is derived from its situation, on the flat ground immediately below the river Ribberiana, by which every body must pass in their way from Gondar to the Red Sea. This plain is watered by three rivulets, which act the rivers Tedo, Min and Gaby, and Ribberiana, which joins the other two, and falls into the river March, about twenty-two miles below Adowa. This town, which is now the capital and residence of the governor, consists of about 300 houses, each of which has an enclosure round it of hedges and trees. The mansion of the governor is situated upon the top of a hill, and is a kind of prison, inhabited by about 300 persons who are detained in irons, and in cages like wild beasts, some of whom have been confined for more than twenty years, with a view of extorting money from them, and who do not obtain liberation, even when the money is paid. There are two churches in the vicinity of this town, viz. Maram and Kedus Michael, and also a monastery, called Bet Abba Girmia, one of the most celebrated in Abyssinia, which was once a residence of one of their kings, whence some travellers have reported that the metropolis of Abyssinia was called Germé. Adowa is the seat of a very valuable manufactury of coarse cotton cloth, which circulates through Abyssinia instead of silver money; each web is 16 pcek long and 14 wide, and their value is a patak, i.e. ten for the ounce of gold. The houses in this town are all built with rough stone, cemented with mud instead of mortar; their roofs are of a conical form and thatched with a reedy sort of grass. The busses of thatching belong exclusively to the Falasha or Jews. The vicinity of Adowa is the only part of Tigre which has foil sufficient to yield corn, the whole of the province besides being one entire rock. They have here three harvests annually, which copt no falling, weeding, manure, or other expensive process; and yet the farmer in Abyssinia is always poor and miserable. N. lat. 14° 7. 57'. E. long. 35° 50'. Bruce's Travels, vol. iii. p. 118.

ADOXA, formed of a priv. and εις, glory, q. d. εις γενέσες, or of na florios, in Botany, a genus of the octandra tetragyna clafs and order, and of the natural order of fuculenta, and saxifraga of Juffieu; the characters of which are, that the calyx is an inferior, biffid or trisid, flat and permanent perianthium; the corolla is monopetalous, flat, and divided into four or five segments, with clefs ovate, acute, and longer than the calyx; the stamina are fubulate filaments, of the length of the calyx, and the anthers roundish; the pistillum has a germ below the receptacle of the corolla; the fylles are fimple, erect, of the length of the stamina, and permanent, and equal in number to the clefs of the corolla; the filigmas are fimple, the pericarpium is a globof berry, between the calyx and corolla, the calyx being united below with the berry, umbilicate, and four or five-celled; the feeds are solidary and compressed. There is one species, viz. the A. mofhiadellina, bulbous fumitory, hollow root, or tuberous molchatell, which grows naturally in shady places and woods, as in Hamptlead and Charlton woods; it is perennial, flowers in April and May, and the feeds ripen in May. The leaves which foon after decay and the flowers smell like mug, on which account it has been formerly called mug croifant. The roots muft be planted after the leaves are decayed, under shrubs, for if they are exposed to the fun, they will not thrive. Martyn's Miller's Dictionary. Smith's Flor. Brit. vol. i. p. 432.

ADPERCEPTION, in the Leibnizian fyle, denotes Vol. I. the act whereby the mind becomes conscious to itsfelf of a perception.

AD PON DUS Ornium, to the weight of the whole; an abbreviation among Physicians, &c. signifying that the laft preferved ingredient is to weigh as much as all the others put together.

ADPORINA, in Mythol. a furname of Cybele, under which the was acknowledged in one of her temples, eereed on a mountain of difficult access, near Pergamus.

ADPRESSUS, in Botany, denotes contiguous, prifled to, or laid to.

ADPREST LEAF. See LEAF.

ADQUISITUS, in some Ancient Latin Writers of Music, is used for the note or chord, which the Greeks called αρμογηνομενος. See DIAGRAM.

AD QUOD Damnium, in Law, a writ directed to the sheriff, commanding him to inquire what hurt may befal the king by granting a fair, or market, in any town or place.

The same writ also illnes for an inquiry to be made of what the king, or other person, may suffer, by granting lands in fee simple to a convent, chapter, or other body politic, by reason such lands fall into mortmain.

The writ Ad quod damnnum is also had for the turning and changing of ancient highways; which may not be done without the king's licence obtained by this writ; or inquisition found that such change will not be detrimental to the public. Vaugh. Rep. 341. Ways turned without this authority are not esteemed highways, so as to oblige the inhabitants of the hundred to make amends for robberies; nor have the subjects an interest therein to justify going there. 3 Cro. 267. If any one change a highway without this authority, he may flop the way at his pleasure. But see the statute 8 & 9 W. III. cap. 16, for enlarging of highways by order of justices of peace, &c. Where any common way shall be enclosed after a writ of Ad quod damnnum executed, any person aggrieved by such enclosure may complain to the justices at the next quarter sessions; but if no such complaint or appeal be made, then the inquisition and return, recorded by the clerk of the peace, shall be for ever binding. 8 & 9 W. III.

ADRA, or ADRA, in Ancient Geography, an episcopal fee in the northern part of Arabia Petraea, over which Proclus presided at the council of Chalcodon. Adra, though referred by Ptolemy to Arabia, which was considerably extended northward, was really situated in a small province of Palestine, called Batanea, near the river Hieromax, south-east of Capabitan. When it became an episcopal fee, it held the third rank under the metropolis of Bastra. It was also called Aderas and Aderatun.

ADRA, or HADRACH, was, according to Ptolemy, a town of Cilicia-Syria.

ADRA is also the name of a town, placed by Ptolemy in Liburnia; and this was the Adra of Illyria.

ADRA, in Geography, a fea-port town of Granada, in Spain, forty-seven miles south-east of Granada. W. long. 2° 37'. N. lat. 35° 42'.

ADRABE, Campi, in Ancient Geography, a canton of Germany, mentioned by Ptolemy, and now called, according to Martiniere, Marsfeld, and situated in Upper Austria, north-east of Vienna.

ADRABON, a small district of Gaul belonging to the Veneti, over against Bellisle, on the coast of Brittany.

ADRACHNE, in Botany, the strawberry-tree. See ARBUTUS. It is also called Adrachis.

ADRAGA, in Ancient Geography, by some called Dragas,
Draga, a place of Arabia, situated, according to Ptol. Geog., in long. 70° 10', and lat. 15° 15'.

ADRAGANTH, the name as Druagant. See Traga canth.

ADRAGNO, in Geography, a town of Sicily, twenty miles call-north-call of Mazaro.

ADRAISTIÆ, in Ancient Geography, the inhabitants of a district of India, which lay to the call of the rivers Acacines and Hydraotes.

ADRAMILÆ, a people placed by Ptolemy in Arabia Felix.

ADRAMMELECH, in Mythology, one of the gods adored by the inhabitants of Sepharvaim, who were settled in Samaria in the room of those Issachrites that removed beyond the Ephrates. The people of Sepharvaim made their children pass through the fire in honour of this false deity, and another called Ananmlech. Adrammelech, i.e., the magnificent king, is supposed to have represented the fun, and Ananmlech, i.e., the gentle king, the moon. Calmet.

ADRAMYTTIS, in Ancient Geography, an island of Asia Minor, on the coast of Lycia.

ADRAMYTTIUM, a famous city of Mycia Major, called also Pelopias, which, according to Strabo, (lib. xiii. tom. ii. p. 904.) was an Athenian colony, with a harbour and dock, situated at the foot of mount Ida, near the Caicus. It was so called, says Stephanus (de Urb. tom. i. p. 22.) from Adramyttus, the brother of Croesus, by whom it was built. Others say that it was founded by the Lydians, and derived its name from Hermon, one of their kings, who, in the Phrygian language, was called Adramys. This is the Adramyttium mentioned Acts, xxvii. 2, and not as St. Jerome and others suppose, a city of Egypt built by Alexander the Great, at the Canobic mouth of the Nile, and which has been supposed to be the same with Thbees. Whitby, Cem. vol ii. p. 751. Imperial Greek medals have been struck in this city in honour of severall of the Roman emperors. The medals are bronze, gold, and silver. This city was formerly famous for trade and shipping; but is now called La Andramit, and inhabited only by a few Greek fishermen. The Adramyttium-bay was a part of the Egean sea, on the coast of Mycia: the towns on the north-call of this bay are now in ruins. The Conventus Adramyttienses was the eighth in order of the conventus juridici of Asia.

ADRANA, a river of Germany, now the Eder, rises in Upper Hesse, waters the county of Waldeck and Lower Hesse, and falls into the Fulda about two miles from Carl. When Germanicus, at the head of the Roman legions, ravaged the country of the Catti, most of their youth escaped by swimming over this river; and attempted, though without success, to prevent the Romans from laying a bridge over it. Tacitus Annal. i. c. 55. vol i. p. 105. Ed. Gronov.

ADRANA, or Adrena, (Polybius, lib. xiii. p. 983. Ed. Caiusab.) a city of Thrace, situate a little above Bercine.

Adrena, was also a town of Asia Minor, in the Lower Mycia.

ADRAND, in Geography, a town, of Persea, in the province of Ible: ten leagues call of Amadan.

ADRANIS, Adrantis, or Adrans, in Ancient Geography, a town of Pannonia, in the more extended application of the term, situate in Noricum, north-call of Elmona, in the limits of Carnia and Noricum.

ADRANUM, now Aderno, a town of Sicily at the foot of Mount Etna, towards the north-call, near a river formerly bearing the name, which some now ascribe to it, Fiume d'Aderno. This city was built, says Diodorus Siculus (lib. xiv. c. 37. tom. i. p. 671. Ed. Weisbr.) by Dionysius the elder, and so called from the Temple of Adranus, the tutelary god of the Sicilians, and said by Hefychius to be the father of the Dii patricii. This temple was a place of great resort at flated feasons of the year by the worshippers of this deity; and Elian (de Nat. Anim. lib. xi. c. 3. tom. ii. p. 632. Ed. Gronov.) says, that a thousand dogs were kept here, who fawned on those who brought presents to the temple, and conducted drunken perons to their own house, whilft they fell furiously on thieves, and tore them in pieces. The medals of this city are bronze, gold, and silver.

ADRAPSIA, a town of Baetia, mentioned by Strabo, (lib. xv. tom. ii. p. 105.) but placed by Ptolemy in Hyrcania, beyond the river Maxara. It is also called Darapys, and seems to be that mentioned by Arrian (lib. iii. c. 2.) under the name of Drapsis.

ADRASTII, an episcopal see in the patriarchate of Antioch, and the eighteenth under the metropolis of Sicily.

ADRASTE, in Mythology, the daughter of Jupiter and Necesity, who, according to Plutarch, was the only fury that exerciseth the vengeance of the gods. The name is supposed to be deriv'd either from αδράστος, always adverst, or from αδράσσο, I fly. The Egyptian priests placed A德拉ste above the moon, where they observed the whole world, so that no guilty person escaped. See Nemesis. Adrastra or Andrastra, was the goddess of war and victory, among the ancient Britons; and as such invoked and acknowledged. This deity was probably the fame with the Astarta of the Phoenicians. Dion. Cafl. tom. ii. p. 1007. Ed. Reimari.

Adraeste was also one of the nymphs who nursed Jupiter in the cave of Dicht.

ADRASTIA, or Adrasta, an epitaph given to the goddess Nemesis, or Revenge. It is said to be taken from king Adrasteus, who first erected a temple to that deity.

ADRASTIA, in Ancient Geography, the name of a town of Asia, in the Traide, situate between Priapos and Parium, in a district of the same name, in which was an oracle of Apollo Acteius, and of Diana. It was built by king Adrastus. Strabo Geog. lib. xiii. tom. ii. p. 848.

ADRASTIA Ceritamia, in Antiquity, a kind of Pythian games, instituted by Adrastus king of Argos, A. M. 2702, in honour of Apollo at Sicyon. These are to be distinguishe from the Pythian games celebrated at Delphi.

ADRASTUS, in Ancient History, a kind of Argos, who distinguishe himself in the famous war of Thebes, was the son of Talaus and Lydiana, daughter of Polybus king of Sicyon. He reigned first in Sicyon, as successor to his father-in-law, and afterwards at Argos. Here he married his two daughters to Polynices and Tydeus, who took refuge in his court: the former of whom had been deprived by his brother Eteocles of his share of the sovereignty at Thebes. For the purpose of restoring him, this king, with the assistance of his children, marched against Thebes; and this was called the expedition of the seven worthies, which is placed about 1225 years before Christ, and has been celebrated by the poets. Adrastus alone escaped, being preferred by his horse Arion. See Statins Theb. lib. iv. v. 40, &c. p. 412. Ed. Varior. This war was revived within ten years by the sons of the deceased worthies, and called the war of the Epigones. It terminated with the taking of Thebes. Adrastus on this occasion lost his son Regaleus, and was so distressed by the event, that he died of grief at Megara, as he was conducting home his victorious army. His memory was much honoured at Megara and at Sicyon.
A D R

Sicily, at which place he had instituted the Pythian games.

Paulus, l. i. 725. l. i. 727. 8. 

There was another Adrastus, in Phrygia, at the time of the siege of Troy, who is said to have built a temple on the river Eileus, in Phrygia, in honour of Nemesis, the goddess of Revenge, hence called Adrastea.

Herodotus (lib. i. c. 35.) mentions an Adrastus, who fled for refuge to the court of Creusus, king of Lydia, and inadvertently killed his son.

ADRASUS, or Adrassus, in Ancient Geography, belonged to Iasus, and the metropolis of Selenea.

ADRASSO. See Arazzo.

ADRASTES, a people of India, subdued by Alexander.

See Quintus Curtius, lib. viii. c. 9.

ADRIA, or Hadriana, in Ancient Geography, the name of two towns in Italy; one of them was situated in the country of the Veneti, on the river Tatrurus, or Adria, between the Padus and the Athenis, and was called Adria by Ptolemy, and also by Pliny, (lib. iii. c. 16. tom. i. p. 173. Ed. Hard.) but denominated Adria by Strabo (lib. i. p. 82. —lib. ii. p. 163. —lib. v. p. 328.); the other was in the country of the Piceni, on the river Vomanaus, to which Antonine's Itinerary from Rome is directed, and which was the country of the ancestors of the emperor Adrian. This is now the dukedom of Atri, in Abruzzi. It has been a subject of dispute which of these two places gives its name to the Adriatic sea. The etymology is generally deduced from the Venetian Adria; and it is alleged, that the name is retained in the small town, that was destroyed by inundations and other calamities, now called Adria, which is a bishop's see, 25 miles south-west of Venice. N. lat. 4° 8'. E. long. 11° 5'. Archilus Victor deduces the name from the Hadriana of the ancient geographers; but he supposed, that the appellations should be Hadriciana, because the name of the emperor is inscribed on coins and stones Hadrianae. But if the origin of the name is traced to the Venetian Adria, which is the most ancient, and of which the other is merely a colony, the usual appellations is the most correct. Eutathius in Dionys. v. 92. traces it to Adrias, the son of Jon.

Adria, an archi-episcopal city, in the patriarchate of Jerusalem. St. Jerome mentions a small island of this name.

Adria, Jean Jacques, of Mazara, in Sicily, graduated at Salernum in 1510, and acquired such reputation for his skill in medicine, that he was made physician to the emperor Charles V. and appointed proto-medicus of Sicily. He left in manuscript the following: "De Preferentia Peltentiz," "De Medicinis ad Varios Morbos." "De Phlebotomia," dedicated to the emperor. "De Balsamis Sicilico,"

ADRIAN, or Hadrianus, Publius Aelius, the Roman emperor, was born, according to Spartan, (in Adr. p. 1.—5.) in Rome, on the 24th of January, in the 7th year of the Christian era. A. U. C. 829. His ancestors lived at Itala, in Spain, which was the native city of Trajan, whom he succeeded in the empire, and whose name on that occasion he assumed in addition to his own. At the death of his father, when he was ten years of age, he was left under the guardianship of Trajan and Caesius Titianus, or Attianus, a Roman knight. His proficiency in the Greek language was so considerable, that, at the age of fifteen, he was commonly called the young Grecian. When Trajan was adopted by Nerva, Adrian served as a tribune in the army in Lower Mesia, and was deputed to congratulate his guardian on the event; and when Nerva died, he was the first that communicated the news to Trajan, who was then in Lower Germany, and that fated him as emperor.

Trajan, however, conceived prejudices against him, on account of the levity of his mind, the voluptuousness and impiety of his temper, and the extravagance to which he was addicted; and though he manifested a flabby disposition, and made great acquirements in Greek and Latin, in philosophy and the law, Trajan had not been accustomed to estimate these endowments very highly, nor did he form any flattering expectation of the advantages that were likely to accrue from them in the military profession, and in the extension of empire, to which he was devoted. Adrian perceived that he was no favourite; and therefore endeavored to conciliate the favour of the empress Plotina, by an affability of manner, which, as Dion Cassius intimates, by the expression σκεψις δακέα (tom. ii. p. 110. Ed. Reymar) seems to have transferred the bounds of virtue. However, Adrian succeeded in securing the interest of the empress, and by her means, in obtaining the emperor's grand-niece, and next heir, Sabina, for his wife. This was the first step to his future advancement, and facilitated his ascent to the throne, much more than the assurance of the Melean astrologer, that the sovereign power was destined to him by the fates, or the prediction to the fame purpose of his great uncle Aelius Adrianus. Soon after his marriage he was appointed quaestor; and at the expiration of this office, he was employed in digetting the deliberations of the senate; but he soon surrendered this occupation, and followed Trajan to the war against the Dacians. Trajan having left his army in Syria, and proposing to return to Rome, after a variety of extensive and rapid conquests, gave the command of it to Adrian; but he had neither capacity nor zeal for retaining, much less for enlarging, the emperor's conquests. The conqueror's absence was the loss of all the advantages he had gained. His death was a misfortune to the state, for the time was gradually approaching, and opened prospects of ambition to Adrian; of which he was deft at availing himself. He had already been chosen by the city of Rome 822, tribune of the people in 856, praetor in 859, substitutus consul in 862, and consul in ordinary and commander in chief in the last year of Trajan's reign. He had also accompanied Trajan in most of his expeditions, had the command of a legion in the second Dacian war, and obtained for his valiant conduct a present from the emperor of the diamond which Nerva had given him, which he considered as a pledge of his future adoption. In the interval between his praetorship and consulship, he had been governor of Lower Pannonia, and discharged the duties of his various offices with universal satisfaction. Trajan, however, never loved Adrian, nor did he intend to adopt him. Accordingly, Dion Cassius affirms, (tom. ii. p. 1140.) that he never was adopted. Nevertheless he succeeds him in virtue of a feigned adoption. Upon the emperor's death at Schontum, in Cilicia, in his way to Rome, Plotina, affiled by Titian, who had been preceptor to Adrian in his youth, contrived to send notice to the Senate, that Trajan, whom he had attended at the time of his death, had adopted Adrian; and it is said, that he encountered a man, who perforated the dying emperor, and who with a feeble voice, declared that he adopted Adrian. This is certain, that Adrian, who was then at Antioch, received the news of his adoption on the 9th of August, and that of Trajan's death on the 11th. On this day, in the year 117, (A. U. C. 870, or according to Crevier, who follows Tellenmont, 868.) he was proclaimed emperor by the legions of Syria, and immediately wrote to the Senate to request a confirmation of the act of the soldiery; apologizing, at the same time, for the impatience of the legions, forbidding them to bellow upon him any titles of honour without his previous consent, promising that he would direct his govern-
ADRIAN.

ment to the public good, and bidding himself by an oath, never to put a senator to death. The senate very readily acceded to his request, and confirmed him in the empire to which he was elected. Adrian had now an opportunity of indulging that love of peace to which he was naturally inclined. Accordingly he abandoned the conquests of his predecessor in the east, and having withdrawn his troops from Armenia, Ancyra, and Mesopotamia, he agreed that the Ephesians should again be the boundary and barrier of the Roman empire. He determined also to surrender Dacia, but his friends prevailed with him to retain it for the sake of those Roman citizens who had settled in it. However, he demolished the bridges which Trajan had erected over the Danube, under the pretence of guarding the Roman territories from the incursions of the barbarians. In order to reduce the Jews to absolute subjection, he removed Lusius Quettus, whom Trajan had commissioned for this purpose, and whom he had made governor of Palestine, from his government, and appointed his friend Martius Turbo to succeed him; and he was also employed to quell the disturbances in Mauritania, which the removal of Lusius had probably occasioned. After having secured the tranquility of Dacia, by making peace with the Sarmatians and Roxolani, which he endeavoured to render permanent in the following year by pecuniary donations, granted also as the purchase of peace to other barbarous nations, he hastened to return to Rome; but did not arrive there till the year 119. During his voyage from Illyria, a conspiracy was formed against his life by four persons of consular dignity,viz. Domitius Nigrinus, Lusius Quettus, Palma, and Celtius, who were put to death by order of the Senate. This act, however, excited the public hatred against Adrian. It was different from the conduct of his predecessor; and it was considered as a violation of the oath which he had made on his accession to the empire. To remove these ill impressions from the public mind, he was liberal in his donations to the people. He remitted the debt due from cities and individuals to the imperial revenue, and to the public treaury, which is paid to have amounted to seven millions of our money, and burnt all the records which might afterwards serve to revive these claims. With a reference to this act of generosity, Adrian is represented on one of the medals, which has reached our times, with a torch in his hand setting fire to the bonds, with a legend, signifying, “He enriched the whole world.” He discharged Italy from the tax paid to victorious emperors for decorating their triumphs, and reduced the amount of it in the provinces: and besides making many presents of money, and various articles of usefulness and luxury to the Roman citizens, he increased the funds, appointed by Trajan, for the subsistence and education of children of both sexes. The sum appropriated by Adrian to these several purposes was immense; and his liberality was honoured with a monument, consecrated to his memory, and with an inscription which celebrated him, as having thus exhibited a singular example of goodness to the people. He was likewise affiduous in his attention to the Senate, and treated this body with a degree of deference and respect, which tended to remove the prejudices that had been conceived against him, and to engage their affectionate attachment. He afflicted those senators who were poor; he enabled others to defray the charge of their offices; and he granted the honour of a third consulate to those who defined it. Upon his return to Rome, he was received by all ranks of people with extraordinary demonstrations of joy; but he declined accepting the triumph which had been prepared for Trajan, and which was now decreed by the Senate to the new emperor. He had already on his accession refused the offer that had been made to him of the title of saviour of his country, and deferred the acceptance of it, after the example of Augustus, who had not taken it till he had governed a certain number of years.

In the following year Adrian was consul a third time, but he resigned the office after four months, and never afterwards resumed them. Having taken measures for establishing his power at home, he was under a necessity of leaving Rome, in order to check the incursions of the barbarians, who invaded Illyricum. The war was soon terminated; and Marcus Turbo, who was recalled from Mauritania, was appointed governor of Panoniam and Dacia. Towards the close of this year the emperor went into Campania, where he generously relieved the poor inhabitants of all the cities through which he passed. About this time he conceived a design of visiting all the provinces of the empire, and examining for himself the state of each country subject to Rome, that he might not be obliged to depend entirely on the reports of his ministers and governors; alleging, that an emperor ought to refresh the sun, which extends illumination to all the regions of the earth. Accordingly he began his travels in the third or fourth year of his reign; that is, in the 120th or 121st year of the Christian æra, A.D. 875, according to Tillemon. He first visited Gaul, where he displayed great liberality; and from thence he went into Germany, where the chief army of the empire was stationed, and the discipline of which he revived and established. In the following year he passed over into Britain, where he reformed many abuses. Although the greatest part of the island was subject to Rome, the northern nations, after the departure of Agricola, had revolted, and recovered their ancient liberty. Adrian, without entering into any new concern, proposed merely to secure the southern part, which belonged to the Romans, against the incursions of the warlike Caledonians, and, with this view, he caused a rampart, or wall, to be raised, extending from the Solway Firth on the west, to the mouth of the river Tyne, near Newcastle on the east, about eighty miles in length. In other places he supplied the defect of natural barriers by mounds of earth strengthened by stakes driven into the ground. Here he also disgraced and discharged his secretary, Suetonius Tranquillus, the historian, and Septicius Carius, captain of the praetorian guards, for their disreputable behaviour to the emperor Sabina. Upon his return to Gaul, he built at Nimes a magnificent palace in honour of Plotina, the widow of Trajan. From Gaul he proceeded to Spain, and wintered at Tarragona, where he rebuilt the temple of Augustus, founded by Iberius, and held a general assembly of the fates, in order to compose the differences occasioned by raising levies for the Roman armies. Here a slave, in a fit of insanity, attempted to kill him; but he fortunately escaped, and committing the unhappy maniac to medical care, took no farther notice of the affult. From Spain the emperor returned to Rome in April; and towards the end of this year, or the beginning of the next, he went, as some say, to Mauritania, and afterwards to Athens, where he built a bridge over the Cephisus; from Athens he proceeded to the extremities of the Roman empire in the east; and after having quieted the commotions of the Parthians, he returned through Asia, visiting the several provinces, and erecting edifices in several of their chief cities; and having paused through the islands of the Archipelago, he settled at Athens during the winter, and was there initiated into the Eleusinian mysteries. From Athens he went into Sicily to visit the top of Mount Etna, that he might observe the rising fun, which was said there to exhibit all the colours of the rainbow; and returned to Rome in the beginning
beginning of the following year, or the seventh year after his departure. The 11th and 12th years of Adrian's reign are quite barren of events. In the year 125 or 129, the cities of Nicomedia, Caesaarea, and Nicca, in Bithynia, were almost demolished by an earthquake, and they were rebuilt at the expense of the emperor, who was on this account denounced the refomer of Bithynia. In the course of this year he again departed for Africa; where, after a drought of five years, it rained upon his arrival, and the inhabitants, who received many favours from the emperor, subscribed thehlpling to his presence. From Africa, he returned in the same year to Rome, where he caused the obsequies of Plotina to be performed with extraordinary magnificence. He lamented her death with great sorrow, composed verses in her praise, and caused her to be ranked among the gods. In the year 131, he left Rome with a design to revisit the provinces of the east, and passing through Athens, purposed his journey into Asia, where he consecrated several temples. From Asia he passed into Syria, from thence into Palaistine and Arabia, and afterwards into Egypt, in the fourteenth year of his reign, when the famous colossus of Rhodes shook, according to the Alexandrian chronicle. During this, and the following year, he continued in Egypt. At Pelusium he visited the tomb of Pompey the Great, which he repaired: he also repaired the city of Alexandria, and restored their ancient privileges to the Alexandrians, whose disposition and character he disliked, and who recom- 

pens'd his kindness with violent lampoons after his departure. From Egypt he passed into Libya Cyrenaica, where he killed a lion of enormous size, that had committed many depredations in the country. During his stay in Egypt, the youth Antoninus, to whom Adrian was criminally attached, fell into the Nile, and was drowned. Dion Cassius says, (tom. ii. p. 1160. Ed. Reim.) that he was sacrificed by Adrian, who being addicted to magic, conceived that he should prolong his life by sacrificing a human victim to the infernal gods. In the following year Adrian returned to Syria, and having pass'd through Thrace and Macedon, he continued for some time at Athens. During his residence at Athens, the Jews revolted on occasion of the emperor's sending a Roman colony to Jerusalem, calling the city Edessa Capitolina, after the name of his family, and erecting a temple to Jupiter Capitolinus in the place where the ancient temple stood. The war with the Jews was attended by the invasion of the provinces of the empire by the Alani, or Maffinget, a people of Sarmatia. At Athens Adrian was much pleased with the customs and learning of the people. Here he assumed the habit peculiar to the dignity of Archon, celebrated the grand festival of Bacchus, and embellish'd it with many stately buildings, and particularly with a library of sublime structure; insomuch, that he was revered as the second founder of the city, and one quarter of it was from him called Adrianopolis. In the year 135, the emperor left Athens and returned to Rome. Here he fell into a lingering disease, attended with a bleeding at the nose, which terminated in a dropsy. Adrian, contrary to the universal expectation, and the remonstrance of his friends, adopted Commodus Verus, who was created praetor, appointed governor of Pannonia, and in the following year advanced to the consulhip. The emperor retired to Tibur, now Tivoli, where he erected a magnificent villa, but his disorder increas'd, and he was aggravated by his licentious life. He indulged his natural cruelty, and caused many illustrious per sons to be arraigned and executed, and others to be privately murdered. In the beginning of the year 138, Verus died, and was ranked by Adrian among the gods, and temples were built and statues er'ected to his memory by the orders of the emperor. Upon his death, Titus Antoninus was adopted; and after his adoption the empress Sabina died, suppos'd to be poison'd by Adrian, or so ill us'd, that the laid violent hands on herself. Adrian, however, caus'd her to be buried among the gods. The emperor's impatience increas'd with his disorder, and having put several senators to death, and ordered others for execution, whom Antoninus preferred, he attempted to destroy himself, but was prevented by Antoninus from executing his purpose. At length he removed from Rome to Baiae, in Campania, where he fulfill'd his death by his inde- 

perance; and here he died, on the 10th of July, in the year 138, after having lived 62 years, 5 months, and 17 days, and having reign'd 31 years and 11 months. His body was burnt at Puteoli, and his ashes were conveyed to Rome, where they were deposited in the magnificent mausoleum, which he had con struct'd for himself near the Tiber. The Senate intended to annul all his acts, but Antoninus opposed this measure; caus'd him to be deified, built a temple at Puteoli, and instituted annual sports to his honour, with pri efs, fraternities, and victims. No prince ever exercis'd so many public and private edifications as Adrian. The regulations which he established for the maintenance of discipline among the troops were afterwards regarded as the military laws of the Romans, and many of the laws which he enacted were observ'd till the end of the fourth century. He prohibited all those private work-houses, which were habitations of slavery and wretchedness; and he was not only a man of learning himself, but he encouraged literature and science. Many of his works, both in prose and verse, were published under his own name, and the names of other distinguished persons. His Greek poem, called the Alexandrian, has been quoted by some of the ancients. In his Cataracina, mentioned by Spartan, he pretended to imitate Antin- 

chus, whom he preferred to Homer. He was so ambitious of fame, that he wrote his own life in several books, some fragments of which are still extant. His reign was distin-

guished in the history of literature, by a very considerable number of learned men, among whom we may reckon Pole- 

gon, Favorinus, Epictetus, Arrian, Plutarch, Dio- 

nylus of Halicarnassus, Philo of Byblos, Suetonius, and Florus. 

Adrian's reputation for talents and learning has been uni-

versally allowed. His memory was so retentive, that he could repeat a whole book, after having once perus'd it; and he knew the name of every soldier in his army. He excelled in every branch of learning, and was, without doubt, the best orator, poet, grammarian, philosopher, and mathe-

matician of his time. He was eminent for drawing and painting, and for his skill in the theory and practice of 

music. He us'd at the same time to write, dictate to sev-

eral secretaries, give audience to his ministers, and discourse with them about affairs of the greatest importance: and his court was crowded with men distinguished in every branch of literature and science. In his natural disposition he was suspicious, envious, lascivious, and cruel; and his general character exhibited a strange composition of virtues and vices. To his friends he was courteous and affable, and his liberality was unbounded. But he was ever ready to give 

car to lancers, and to believe every tale that was whisper-

ed against him, so that those who were once most distin-

guished by his favour were disgrac'd, banish'd, and put to death. Capricious and unsteady in his attachment, and 

violent in his remonstrance, he was driv'd by his friends, and dread'd by his enemies. Nevertheless, the great and 

the rich did not suffer under his government from unjust 

condemnations and forfeitures. He knew how to pardon 

editions;
ADRIAN.

offences; and those who had been his enemies when he was in a private station, had no occasion to fear him when he was an emperor. When he arrived at the sovereign power, he said to one of those from whom he had received the most convincing proofs of his hatred, "Behold yourself in perfect safety." His vanity, however, was always predominant; and he was often induced, by the fear of infamy, or the desire of applause, to prefer at least the appearances of virtue. In his plans of public improvement, he was comprehensive and liberal, even to the extreme of needleless magnificence and culpable profusion. There was scarce a province, or a city, in which he did not leave substantial proofs of his attention to the benefit and convenience of its inhabitants. He repaired old edifices, and built new ones, baths, aqueducts, and harbours: and he expended large sums in embellishing the monuments of those who had distinguished themselves in former times, as in the case of Epaminondas's tomb at Mantinea, and in the monuments he paid to Pompey's remains. To Greece he was particularly favourable; and from the Greeks he received many expressions of gratitude. And yet dilapidated and extravagant as he was in his private expenses, and in his public disbursements, he was not never to have unjustly fined any man's property, nor did he ever receive legacies from persons who were not known to him, or from any of his friends who had children.

In his voyages, where he was at any city, he administered justice to all who applied to him, or fought the affiance of the ablest lawyers. Adrian, indeed, deserves to be particularly recognized for the administration of justice, and the wisdom of his laws, for establishing and maintaining peace among the citizens. He considered the termination of disputes, by equitable decisions, as one of the principal duties of a sovereign, and he was anxious in discharging it. His zeal for justice and good order led him to keep a strict eye over those who governed provinces under his authority; and he knew how to discover truth through all the acts of dissimulation. At Rome he made a very important reformation in the administration of justice. See perpetual Edict. He softened the rigour of servitude, and deprived matters of the arbitrary power of life and death over their slaves: he prohibited the sale of them, and their being rendered, according to their sex, victims of prostitution, or gladiators, without the authority of the judge; and he forbade the use of private prisons. From an attention to decency, he likewise prohibited the promiscuous use of baths for both sexes. He is also said to have renewed the ancient impudent laws enacted by Augustus; and he forbade the abominable custom of human sacrifices, though in the case of Antinous he seems to have violated his own law. He punished fraudulent bankrupts with severity, and ordered them to be whipped. He reformed the police in many inns with judgment; and the alterations he introduced in the general conduct of the empire, in the service of the palace, in the military discipline, and in the government of the empire, were confirmed by practice, and continued even to the reign of Constantine. To his soldiers he gave an example of simplicity and self-denial; and by his attention to them in various respects, he gained their love and confidence. He preferred none but men of courage, strength, and good character, saying, "such as the officers are, such will the soldiers soon be." Thus he revived the ancient military discipline, which, by the negligence of many princes, had been decaying since the time of Augustus. It may be observed in general, that the Roman empire was happy under his government. The maxim which he insinuated in the assembly of the people, and in the senate, de-
Poor little, pretty flattering thing,
Mute we no longer live together!
And doth thou prune thy trembling wing,
To take thy flight thou know'st not whither?
Thy luminous vein, thy pleasing folly,
Lies all neglected, all forgot:
And penitive, wand'ring melancholy,
Thou dread'st it and hast' it, thou know'st it not what.

Ah! see in spirit! wand'ring fire,
That long half warm'd thy tender breast,
Mute thou no more this frame inspire?
No more a pleasing cheerful grief!
Whither, whither art thou flying?
To what dark undiscover'd shore?
Thou feem'st all trembling, shiv'ring, dying,
And wit and humour are no more!

ADRIAN.

ADRIAN I. Pope, succeeded Stephen III. in the papal chair, A.D. 772. He was the son of Theodore, a Roman nobleman, and possessed considerable talents for bufiness. He maintained a friendly correspondence with Charlemagne, which provoked Desiderius, king of the Lombards, to invade the state of Ravenna, and to threaten Rome itself. Charlemagne recommenced his attack, by marching with a large army to his succour; and having gained many considerable advantages over Desiderius, and recovered the cities which he had taken, he visited the pope at Rome, confirming the grants made by his father Pepin, to which he added new donations, and formed a perpetual league of friendship between the growing power of France and the established supremacy of the Western Church. On this occasion he expressed his piety, by the humilitating ceremony of kissing each of the steps, as he ascended to the church of St. Peter. Pavia, during this visit, had been left in a state of siege; on his return it surrendered, and the dynasty of the Lombard princes, which had lasted 266 years, was terminated in the year 776. When fresh disturbances occurred by the interposition of the bishop of Ravenna, who claimed and feized the exarchate and the dukedom of Ferrara, which Charlemagne had, by a special grant of the pope, given to this prince renewed his visit, and settled the affairs of Italy. In return for these services, he obtained the title of king of the Lombards, and the rights of temporal sovereignty in the territory of the Roman see. Adrian now directed his attention to the affairs of the empire; and as Irene, who, in 780, assumed the regency at Constantinople, during the minority of her son Constantine, wished to reestablish and establish the worship of images, he applied to Adrian for his concurrence. The pontiff readily acquiesced in her proposal for calling a council, and commissioned two legates to attend it. The council, however, which held its first meeting in 786, was disturbed by an insurrection of the citizens. At the next meeting in the city of Nice, in 787, which was protected by a military force, a decree was passed for restoring the worship of images. Adrian approved the decree, but in the western church it was deemed heretical and dangerous. Charlemagne condemned the innovation, and the French and English clergy concurred in opposing it. A treatise, containing 120 heads of refutation, was catalogued, as the work of Charlemagne, under the title of "The Caroline Books," in opposition to the decree of the council. This work was presented to the pope by the king's ambassador, and the pope wrote a letter to Charlemagne by way of reply. The king, and also the Gallican and English churches, retained their sentiments; and in 794, a council was held at Frankfort on the Maine, consisting of about 300 western bishops, by which every kind of image-worship was condemned. Adrian did not live to see a termination of this contest; for after a pontificate of nearly twenty-four years, he died in 795. This pope does not appear to have possessed any considerable erudition, and few examples occur, during his pontificate, of ecclesiastical reformation. He seems to have directed his chief attention to the embellishment of the churches, and the improvement of the city of Rome; and he was probably furnished by Charlemagne, out of the plunder of his conquests, with ample means for this purpose. The king was much attached to him, and is said to have fheid tears on occasion of his death. He wrote his epitaph, which is still seen in St. Peter's at Rome, in thirty-eight Latin verses. Dupin. vol. v. p. 115. Lower. Gen. Bisg.

ADRIAN II. Pope, succeeded Nicholas I. A.D. 867. Having twice refused the dignity, he accepted it in the 70th year of his age, at the united request of the clergy, nobility, and people. The contést for power between the Greek and Latin churches had been very violent some years before his accession to the papal chair. Photius, who, in 858, had been appointed patriarch of Constantinople by the emperor Michael, had been excommunicated by pope Nicholas, and a council assembled at Rome in 862; and the pope himself had been, in 866, excommunicated by Photius. The pope, in order to avenge the injuries which Ignatius, who had been deprived of the patriarchate and exiled, demanded the restitution of several Greek provinces, which the patriarch of Constantinople had separated from the jurisdiction of the Roman pontiff. Basil, the new emperor, recalled Ignatius to the dignity of patriarch, and confined Photius in a monastery. The restoration of Ignatius was approved by a council held at Constantinople, in 869; and by the decrees of this council, the disputes between the Greek and Latin churches were suspended. But circumstances occurred which served to revive them. The Bulgarians had applied to this council for information, whether they should be subjected to the church of Rome, or that of Constantinople. The contest which this question produced, terminated in favor of the patriarchate; and Ignatius expelled the Latin missionaries from Bulgaria, and appointed Greeks in their room.

Adrian, during this contest for power with the eastern patriarchate, was extending his authority over the kings and princes of the west. He employed his whole interest to induce Charles the Bald, who had taken possession of the kingdom of Lorraine, and who had been crowned at Rheims by the archbishop Hincmar, to relinquish it in favor of the emperor; and he even sent legates to the king, after having attempted to engage Hincmar, the clergy, and the nobility to desert him, ordering him to surrender to the emperor's right. The king was invincible; and the pope was obliged to give up the contest. He also farther interfered in the concerns of princes, by taking Charles's rebellious son Carloman, and the younger Hincmar, bishop of Laon, under the protection of the Roman see. He proceeded in this business so far, that he was under a necessity of submitting without gaining his point. Bulgaria again claimed his attention, and he wished to restore the jurisdiction of it to the see of Rome; and he even terminated his ambitious projects and his life of inquietude. A.D. 877, after a pontificate of five years. Dupin's Ninth Century, vol. vii. p. 179. Moschini's Eccl. Hist. vol. ii. p. 351, &c. 5vo.
ADRIAN.

Adrian III. Pope, succeeded Marinus, A.D. 884.

This pope, during his own pontificate, took active steps to emancipate Italy and the papal see from the influence of the German emperors, and to raise his dignity. He was succeeded by Stephen, but did not succeed. The pope died in his bed at Worms, in 885. Bower.

Adrian IV. Pope, the only Englishman who ever had the honour to sit in St. Peter's chair. His name was Nicholas Breakspear or Breakspear; and he was born towards the close of the eleventh century, at Langley, near St. Albans, in Hertfordshire. He was deprived of the see and of the mansion of St. Albans, but was not able to provide for him. Being refused the habit for which he applied, he went to Paris, where he was distinguished both by his application and proficiency. From Paris he removed to the monastery of St. Rufus, in Provence; here he became a regular clerk; and upon the death of the abbot in 1197, he was chosen superior of that house, which he rebuilt. Of this dignity he was deprived in consequence of the complaints and accusations of the monks, who were dissatisfied with the government of a foreigner: but pope Eugenius III. having heard their charges, and his defence, declared him innocent, and advanced him, in 1196, to the higher station of cardinal bishop of Albe. In 1198, he was sent as apostolic legate, to Denmark and Norway, where, by his diligent instruction, he converted those barbarous nations to the Christian faith; and it is said that he erected the church at Upsal into an archiepiscopal see. Upon his return to Rome, he was much honoured by the pope and cardinals; and on the death of pope Anastasius, who had succeeded Eugenius, he was unanimously chosen to the papal chair in November 1198, and assumed the name of Adrian. As soon as the news of his promotion reached England, Henry II. sent a deputation of an abbot and three bishops to congratulate him on his elevation; and upon this occasion he granted considerable privileges to the monastery of St. Albans. But he refused the valuable presents which they offered him, saying jocously, "I will not accept your gifts, because, when I wished to take the habit of your monastery, you refused me." To which the abbott pertinently and shortly replied; "It was not for us to oppose the will of Providence, which had destined you for greater things." In the next year he gave Henry leave to undertake the conquest of Ireland, and sent him a bull for that purpose, in which he testified his approbation of the object of the expedition, and the enlargement of the boundaries of the Christian church, and commanded the people of that country to acknowledge him as their sovereign lord. He reminds the king, at the same time, of the rights of the Christian church; claiming all the islands which embraced Christianity, as St. Peter's right, and belonging to the holy Roman church; and exhorting to the regular payment of the Peter pence which he had promised. He admonishes him also to use his endeavours for reforming the manners of the people, and to commit the government of the churches to able and virtuous persons, so that he might thus deserve an everlasting reward in heaven, and transmit a glorious name to posterity. Adrian's indulgence to this prince was so great, that he consented to abdicate him from the oath he had taken, not to set aside any part of his father's will.

In the beginning of his pontificate he contrived the magistrates of Rome to abdicate the authority they had assumed in their efforts to recover the ancient liberty of the people under the consuls, and to leave the government of the city to the pope. In 1155 he drove the heretic Arnold of Brescia, and his followers, from Rome. He also excommunicated William king of Sicily, who ravaged the territories of the church, and abdulced his subjects from their allegiance. In his interview with Frederick king of the Romans, with whom he concluded a peace when he invaded Italy, this prince confided to him his affairs; and in the latter part of his pontificate, he was succeeded by his son, who assumed the titles of Frederick and Henry VI. Pope, A.D. 1254. Bower.

Adrian V. Pope, a Genoese, whose name was Ottoboni Fiefei, succeeded Innocent V. A.D. 1276. He was created by his uncle Innocent IV. cardinal deacon of St. Adrian, and in 1254 went by him to England, to settle the disputes between Henry III. and his barons; and he was employed again for the same purpose, by Clement III. when he issued a sentence of excommunication against the king's enemies. To those who congratulated him on his accession to the papal chair, he replied, "I wish you had found me a healthy cardinal, rather than a dying pope." From only after his election, he proceeded to Viterbo to meet the emperor Redolph, for the purpose of opposing the usurpation of Charles, king of the Two Sicilies; but died soon after his arrival, having enjoyed his dignity only thirty-eight days. He zealously encouraged the crusade to the Holy Land, and upon his election sent a large sum to Constantinople towards building galleys; and he also furnished further supplies. Bower.

Adrian VI. Pope, was a native of Utrecht, the son of a tapestry weaver, or, as some say, of a brewer's servant. He succeeded Leo X. A.D. 1522. He was educated gratuitously at Louvain, and distinguished himself by his application and proficiency. Through the interest of Margaret, widow of the duke of Burgundy, and sister of Edward IV. of England, he obtained the professorship of divinity in Louvain, the deanship of the cathedral, and the vice chancellorship of the university. Having been appointed tutor to Charles, the grandson of Maximilian, and the young prince preferring arms to letters, Adrian was employed by the emperor on an embassy to Ferdinand king of Spain, in consequence of which he obtained the bishopric of Tortosa. When Charles was left sole heir to the dominions of Ferdinand, he appointed Adrian regent during his minority; but as Cardinal Ximenes had been named for this office by Ferdinand, they both united in the government of the country. Ximenes, however, was the real, and Adrian merely nominal regent. In 1527 the emperor Maximilian
Maximilian recommended Adrian to Leo X. and he was preferred by that pontiff to the dignity of cardinal. In a contest with the Cardinals, when he inflamed the office of regent during the emperor's absence in 1520, he attempted to enforce, sublimity, by military power, but failed in the attempt; and he was under a pecuniary of withdrawing his forces, and to content himself with the mere shadow of authority. He was in a little time, and in a manner unexpectedly, removed from this unpleasant situation, and advanced to the highest dignity of the church. Upon the death of Leo X. in 1521, the conclave was divided about the choice of a successor. The younger members were attached to Julio, Cardinal de Medici, the nephew of Leo; but the old cardinals were averse from chusing a pontiff out of the powerful family of the Medici, and yet they were not agreed in their views with respect to any other person. By a manoeuvre, which was merely designed to gain time, the party of Jello voted for Cardinal Adrian in the preparatory canvass. The other party elided with them; and thus a stranger to Italy, and a man unqualified for the office, was elected, no less to their own surprise than to the astonishment of Europe. The election was probably the effect of intrigue, and of the secret interference of the imperial ambassador, John Manuel, who wished to obtain a pope devoted to his master's interest. See Robertson's Hist. Charles V. vol. ii. p. 216, &c. 8vo.

Adrian's disposition and virtues, as well as his principles and manners, were ill adapted to the office, that had been thus devolved upon him. At the time of his election Rome was afflicted with a pestilence, its finances were exhausted, and literature and the arts required liberal and judicious patronage. In these disadvantageous circumstances did Adrian ascend the papal chair. However he entered on his office with the best intentions. He began by avoiding every kind of expensive parade, and by exhibiting an example of moderation and temperance, which tended to correct and reform the dilatory manners of the court and city. He discouraged the ambitious and selfish expectations of his own relations, he annulled many ordinances which the cardinals had enacted for their own benefit, and he abolished many offices which Leo had created for the gratification of his favourites. With this pope it was a ruling maxim, that men were made for places, and not places for men. He restored the duchy of Urbino to its lawful proprietor, and surrendered to the Duke of Ferrara several places of which he had been unjustly deprived. He also issued a bull, requiring Christian princes to content to a truce for three years, so that the Imperial, French, and English ambassadors at Rome might deliberate on terms of pacification. Whilst he demanded a zealous execution of the imperial edict against Luther and his followers; he declared a disposition to exercise his spiritual authority for the reformation of the church. Notwithstanding the just claims on respect which resulted from the pontiff's general conduct, his best actions were misinterpreted; his economy was called parsimony, his plans of reform were imputed to unnecessary austerity, and his disinterested conduct to weakness and inexperience. His unpopularity was partly owing to his being a stranger in Italy; and to the attention which he paid to some of his former friends, whilst he declined repudiating his brethren in the conclave. He was also too much under the influence of Charles, and suffered his attachment to his former master to mislead his judgment. This led him to relinquish his plan of a general pacification, and to form an alliance with the emperor and the king of England against France. On the day when this confederacy was signed, Adrian was seized with a fever, which terminated his life and the anxieties of his elevated station in December 1523, after he had polled the papal dignity one year and ten months. He was buried in the church of St. Peter, and on his tomb was inscribed the following epitaph, which informs posterity, that the greatest misfortune which he had experienced in life, was, that he had been called to govern the church.

"Adrianus Papa VI. hic situs est.
Quid nihil ibi inficiens
In vita,
Quam quodd imperaret,
duxit."

Notwithstanding many excellencies that distinguished the character of Adrian, he was deficient of that firmness and energy of mind, which the duties of his high and arduous station required. Few men that have been so free from faults, incurred such unpopularity, and became obnoxious to so many conductions. The door of his physician, in the night after his decease, was adorned with garlands, and marked with this inscription; "To the deliverer of his country." However, this kind of reproach, on the part of the dissolute and licentious, redounds to his honour. The piety of Adrian, it has been observed, was more distinguished than his taste for the fine arts. From the statue of Laocoon, he turned away his head in token of his dislike of pagan images, and he expressed his contempt of painters, by calling them "Trimmers." With theology and scholastic philosophy he was well acquainted. While he was professor of divinity at Louvain he wrote "A Commentary upon the Book of Sentences, by Peter Lombard," "Epistles," and "Questions Quodlibetices," printed at Louvain in 1515, and at Paris in 1516 and 1531. Dupin's Hist. of the 16th century. Bowyer's Popes. Robertson's Charles V. vol. ii. b. i. p. 2. Gen. Biog.

ADRIAN, (De Caffello) bishop of Bath and Wells, in the reigns of Henry VII. and VIII. and cardinal priest of the Roman church, was deposed of an obscurum family, and born at Cornetto, a small town in Tuscany. Having distinguished himself by his parts and learning, he obtained several employments at the court of Rome. In 1488, he was sent by pope Innocent VIII. as his nuncio extraordinary, to appease the troubles in Scotland, and to exercise the office of queftor or treasurer to his holiness, in collective his tribute or Peter pence. He was also agent for the English affairs at the court of Rome, and in recompense of his services, was promoted first to the see of Wells in 1504, and afterwards to that of Bath and Wells. He favoured his bishopric and retired at Rome, in a magnificent palace which he erected, and which he bequeathed to Henry VII. whose name was inscribed upon the front of it, and to his successors. He was secretary and vicar-general to pope Alexander VI. and created by him in 1503, a cardinal priest, under the title of St. Chryfonogus; soon after which event he narrowly escaped being poisoned at a feast, to which he was invited by the pope and his son Caesar Borgia. In the pontificate of Julius II. he banished himself from Rome; but he returned till a conclave was held for the election of a new pope. Soon after the elevation of Leo X. he concurred in a conspiracy against his life; and being unable to pay the fine of 12,500 ducats, which was the penalty inflicted upon him, he withdrew from Rome, and was excommunicated, and deprived of his benefices and ecclesiastical orders, July 6th, 1518. Four years before this period, he had been removed from his office of the pope's collector in England by Henry VII. at the instigation of cardinal Wolsey, who employed him as his solicitor at Rome, and was betrayed by him in his attempts to obtain the dignity of cardinal.
cardinal. After his condemnation, it is said that he took refuge among the Turks in Asia. Polybore Virgil extols his talents and learning, and says that he was the first since the age of Cicero, who revived the purity of the Latin language, and taught men to draw their knowledge from the sources of the best and most learned authors. Biog. Brit.

ADRIAN, a learned Carthusian, who wrote a treatise intitled "De Remedii utriusque fortunae," the first edition of which was published at Cologne in 1471. To the book is a scarce and much esteemed.

ADRIANA, in Ancient Geography, an episcopal city of the Hellepont, under the metropolis of Cyzicus.

ADRIANEUM, Miles Adrian, the magnificent Mausoleum erected by Adrian in the lower field of Mars at Rome, over against that of Angulus, and connected with it by a bridge. It is of a square form, and in the midst of it there is a lofty round tower. It served as a citadel when Rome was besieged by Vigoes, king of the Goths, and the Romans defended themselves by calling fragments of the statues upon their enemies. Here Adrian was buried and all the Antiques.

ADRIANI, Joanni Ballista, in Biography, was born of a Paetian family, at Floreio, in 1517. He wrote a history of his own times in Italy, beginning in 1536, and terminating in 1551, and designed as a continuation of Curione and Chief, which Thuanus (Hist. I. 68.) acknowledges himself much indebted. He also composed six funeral orations, and is thought to have been the author of a long letter on ancient painters and sculptors, prefixed to the third volume of Vafiri. He died at Florence, in 1579. Biog. Dict.

ADRIANI, in Ancient Geography, surnamed Ad olympum, a city of Asia Minor, in Bithynia.

ADRIANOPLE, Miles Adrian, in Ancient History, a new tribe established by the Athenians in honour of Adrian, after the example of that which was formed in honour of Attalus, king of Pergamos, and comprehending the villages of Eleconta, Oba, and Phigira.

ADRIANISTS, in Ecclesiastical History, a branch of Anabaptists, the disciples of Adrian Hamlledius, in the 16th century, who taught fire in Italy, and afterwards in England. The Adrianists, besides the common dogma of Anabaptism, are said to have had some peculiar notations relating to the perfom of Christ.

Theodoret mentions a more ancient sect of this name, who were followers of Simon Magnus.

ADRIANO-A-SIERRA, in Geography, a mountain of Guipuscoa, in Biscaia, one of the highest of the Pyrenees. It is crooked in the way from Biscaia to Old Caiba.

ADRIANOPOLE, or Andrinople, in Geography, a city of Turkey in Europe, in the province of Romania, called anciently Oreis, and now Edrene or Edro, by the Turks, but deriving its name from the emperor Adrian, who founded or refitted it. It is situated on the Hebrus or Maris, at the confluence of the Tunfa and the Harda, and rises gently on the side of a small hill. It is about five miles in circumference, says Chihuall in his travels, p. 63. The form of it is circular, and it is surrounded with decayed walls and towers. The houses are generally built of mud and clay, and some of them of brick; and the streets are dirty and narrow. The bazar or market place, called Ali Paffa, is an arched building about half a mile long, with six gates, and a great number of shops that are occupied by Turks, Armenians, and Jews. There is also another bazar of meaier structure, about a mile long, containing many shops, and well flored with various commodities. And in another part of the town, there is a third market-place, called Lizgstein, covered like the former, and provided with a number of shops, in which are sold the manufactures of gold and silver, jewels, pictures, &c. There are four mosques, the principal of which is that of Sultan Schim, built by him of materials brought from the ruins of Famaguta, in the island of Cyprus. It is constructed like a theatre with one flatly room, terminating upwards in a cupola, and it is beautifully situated on the side of a hill, in the midst of the city. The emperor's seraglio stands in a plain near the river Tunfa or Tunizia. The grand vizier's palace is only a common house, after the Turkish manner of building, which is two miles in compass, and has seven gates besides those of the gardens, which are several miles in circumference. The objects most worthy of attention are, the mosques, the roofs of which are covered with copper, having also lofty turrets and colonnades, with pedicdals and chapters of cast brass, beautiful marble gates of exquitite sculpture, delightul fountains, flatly porcuses with gilded balls on the top, and curious tapistry; all which exhibit a very grand appearance. The city, which is said to contain 500,000 inhabitants, is under the government of a Mullah Cadi, who has an absolute authority in all civil and criminal matters. The commerce of this place, favoured by the river that waters it, has drawn hither people from all nations. It is now the residence of a Greek bishop, and the grand signeur sometimes visits this city, either for pleasure or safety, when the plague or war makes it necessary for him to leave Constantinople. In 1350 Sultan Amurath first took it from the Christians, from which time it became the seat of the Turkish emperor, till Constantinople was reduced in 1458. In 1754, it suffered greatly by fire. The adjacent country is very fertile, and supplies the town with all kinds of necessaries; and the wine, in particular, is reckoned the best in Turkey. Chihuall takes it to be that mentioned by Hefiod, in his Oper. and Dies. I. 2. v. 107, where he says, "Hiihi to stpou, kal Btupouo xiox." This is a fee of a Greek archbishop under the patriarch of Constantinople, N. lat. 4° 41', E. long. 26° 27'.

ADRIANOPLE, in Ancient Geography, i.e. the city of Adrian, a name given to various cities in different countries, that were either built or repaired by the emperor Adrian. The number of these cities is not less than nine. The city of Thrace still retains its name.

ADRIANOPOLE, a city of Epirus, South of Apollonia. This assumed the epappellation Julianipolis, after the emperor Julianus.

ADRIANOPOLE of Bithynia, in Asia Minor, called Boli, was situated upon the Biletau, well of Cratia.

ADRIANOTHERA, Adropan Speres, Adrian's chase, or hunt, a city of Mylia, which retained its name in the fifth century, and which was founded by Adrian in a district of Mylia, whither he returned for the pleasures of the chase. His foundation for these sports was so great, that he erected monuments for his dogs and horses; and he composed an epitaph for his horse Dorithenes, which he had often used in hunting. Dion. Cafl. tom. ii. p. 1159. Ed. Reim. This is probably the same city with Adriani, which was the birth-place of Ariphile the Sophist. There was another Ariadne or Adrianoopoli, in Lybia Cyrenaica.

ADRIANSEN, Alexander, in Biography, a painter who excelled in painting fruit, flowers, birds, and still-life, was born at Antwerp, about the year 1625. All his objects are well-coloured, with an agreeable effect, from the judicious management of the chiaro scuro, and with a remarkable transparence. Pilkington's Dict.

ADRIANUM or Adriaticum Mare, now the gulf of...
of Venice, in *Ancient Geography*, is a large bay in the Mediterranean, between Dalmatia, Salavonia, Greece, and Italy, and extending from south-east to north-west, between 45° and 45° 35' N. lat. about 200 leagues long, and 50 broad. Its entrance between Cenina and Otrante, is about 14 leagues wide. It is called by the Greeks *Adrias*; by the Latins variously, as *Adri*; by Horace, (ib. i. od. 3.) "Arbiter Adrian notus;" by Silvius, (lib. i. v. 54, p. 6. Ed. Drakenb.) *Adriacum pumum;" by Cicero, (in Pison, c. xxxviii. and lib. 13. Attic. Ep. 7.) "Hadrismum mare;" by Virgil, (Aen. xi. v. 405.) "Hadrigas undas." The Adriatic sea, fags Hythumus, is the same with the Ionian sea; and in order to solve a difficulty in the interpretation of Acts xxvii. 7. and to answer the question, how St. Paul's ship, which was near Malta, and, therefore, in the Lybian or Sicilian sea, could be in the Adriatic; it is allowed, that not only the Ionian, but even the Sicilian sea, was called the Adriatic. Strabo (ib. vii. tom. 2. p. 488.) informs us, that the Ionian gulf is a part of that which in his time was called the Adriatic sea. Whitby Com. vol. ii. p. 757. The principal rivers that ran into the Adriatic were the Panyus, *Ares*, the Lausus, or *Eas*, and the Celydhus. The state of Venice claims exclusive dominion over the Adriatic sea, in consequence of a circumstance mentioned under *Doxe;* and the ceremony of wedding it is now directed in lib. 13. Attic. Ep. 7, by which was printed maps at Cologne, in 1593. This work, besides a description of the Holy Land and of Jerusalem, contains a chronicle of the Old and New Testament, under the name of Chriilianus Crusius; and under this title, he published an *Antiwerp the Life of Christ,* and an oration, "De Chriiliana Beatitudine." Adriachnius died at Colonge, in 1505, and was buried in the convent of the camellists of Nazareth, where he had been for some years director. Bong. Diet.

*ADRIEN,* in *Geography,* a small town of the Low Country, in Flanders, on the river Dendre, two leagues from Alost, and four from Gand.

*ADRIET,* in *Sicil language,* denotes the state of a vessel broken from her moorings, and driven by the wind or waves.

*ADRIEN,* in *Geography,* a small town of Upper Hungary, upon the river Sebekkeres, at the foot of the mountains of Vedra, and north-west of the great Varadin. E. long. 37° 30'. N. lat. 47° 0'.

*ADRIIS,* in *Ancient Geography,* the name of a river in India, according to Ptolomy.

*ADRIUS Monti,* a chain of mountains which, according to Strabo, extended along Dalmatia, and divided it into the Mediterranean and Maritime.

*ADROBICUM,* a small place in Spain, on the bay called Magnus Portus.

*ADROCACTION,* in *Antiquity,* a species of adoption, whereby a person, who was capable of choosing for himself, was admitted by another into the relation of a son. The word is compounded of *ad*; *to*; and *regare*; to adopt; on account of a question put in the ceremony of it, whether the adopter would take such a person for his son? and another to the adoptive, whether he consented to become such a person's son?

*ADRON,* in *Ancient Geography,* a city of Arabia Petraea.

*ADROTTA,* a maritime town of Lydia, in Asia Minor.

*ADRU,* or *Adrou,* a town of Arabia Petraea, which Ptolemy places in long. 67°, and lat. 20° 55'.

*ADREMUTUM,* or *Hadremutum,* the capital of Byzaicum, in Africa, was a very ancient and famous city. It had a variety of names, being called by Strabo and Stephanus, *Adrama;* by Plutarch and Ptolemy, *Adrumetus; or Adrumettus;* by Appian, *Adrumetus;* by Caesar, *Hirtius;* by Pliny, *Adrumetum;* by Mela, *Hadrumetum;* and in Ptolemier's table, *Hedriti.* It was the Typhloniana of the middle empire, and the Heraclea of the lower. This city was large and populous, and built upon an hemispherical promontory, at the distance of two leagues to the south-east of the moras, which was the boundary, as Dr. Shaw supposes, between the Zeugitana and Byzaicum. It had at a small distance a cloister, *i. e.* a port, or little island, resembling that of Carthage. From its present situation and ruins, it seems to have been somewhat more than a mile in circuit, and a place of importance rather than of extent. That it was founded by the Phoenicians is attested by Sallust (in Bell. Jugurth. oper. tom. 1. p. 88. Ed. Haverc.) and others; and Bochart (Geog. fac. lib. i. c. 2. Oper. tom. 1. col. 478. Ed. Villem.) deduced its name from two Syrians, or Phoenician words, importing the land or country yielding an hundred-fold, *i. e.* of corn or grain. Diodorus Siculus (Bibl. Hist. tom. ii. p. 418. Ed. Welfling.) represents it as a fortified city, when it was besieged by Agathocles, in the third year of the 117th Olympiad. At present it is a barren and uncultivated tract, of a sandy foil, and incommoded with moras. Dr. Shaw has taken pains to prove, that its situation is that of the present *Herklia.* Travels, p. 106, 4to.

*ADSCENDENS Caulis,* in *Botany,* denotes a stalk or branch inclining upwards. The term is synonymous with *incursus.*

*ADSCRIPTS,* a term used by some Mathematicians for the natural tangents, called also by Vieta *proficiens.*

*ADSENTRI, in Antiquity,* a term used to express the affluence of the Roman soldiers to any propitiations that were made to them by their commanders, which they did by lifting up their hands with acclamation, and striking their bucklers upon their knees. Lucan, in his Pharsalia, (lib. i. 386.) refers to this practice.

*ADSERERE, ADsertio, ADsertor manu in liberta- m,* are terms that relate to one of the modes by which a slave was emancipated: he was taken by the hand, and this formula was pronounced: "Hunc liberari caufa manu adsero."

*ADSIDELA,* a table at which the flames fat, when they offered sacrifice.

*ADSIGNIFICATION,* among Schoolmen, the act of noting or signifying a thing, with the addition of the time when it happened.

*ADSON'S Town,* in *Geography,* lies near the north-east line of New Jersey, and south-east of the Drowned Lands; twenty-seven miles north-west of Morristown, and twenty-four north-west of Patterson.

*ADSTRICION,* among *Physicians,* is used to denote the too great rigidity and elongation of the eunomities of the body, particularly the pores of the skin; and also to signify...
signify the astringent quality of medicines. See **Astringents**.

**AD TERMINUM** *qui præteritid, in Latin*, is a writ of entry, which lies where a man having leased lands or tenements for terms of life, or years, is, after the time expired, held from them by the tenant, or other stranger, who enjoys the same, and defoeth the lefso. The same writ also lies for the lefso's heir.

**ADUACA Tungorum**, in Ancient Geography, Tungri, a city of Gaul, the capital of the Tungri. It was called by Cæsar *Atutium*, and by Ptolomy *Atutium*. It became an episcopal see; but after its destruction by Attila, in 431, there was transferred thirtieth to *Tricinium Mosel*, i.e. Mainzstrict, and afterwards to Liège.

**ADVANCE**, in Commerce, denotes money paid before goods are delivered, work done, or business performed. To pay a note of hand or bill by advance, is to pay the value before it becomes due; in which case, it is usual to allow a discount for the time it is pre-advanced.

**Advance Bay**, in Geography, lies on the east side of Hudson's Bay, in that part called "the new discovered sea," into which is also a passage to the south-west from Resolution islands, at the south-east end of Hudson's straits.

**Advance-Fosse, or Ditch**, in Fortification, denotes a ditch of water round the esplanade, or *clavis* of a place, to prevent its being surprized by the besiegers. The name is also given to that part of the lines or retenchment nearest the enemy, to prevent him from attacking them. The advance-fosse should be always full of water, or else it will serve to cover the enemy from the fire of the place, if he should become master of the fosse. Beyond this fosse, it is usual to construct lunettes, redouts, &c. See *Fosse*.

**Advance-Guard, or Vanguard**, in the Military Arts, is the first line, or division of an army, ranged or marshing in battle array, or that part of it which is next the enemy, or which marches first towards them. The whole body of an army is divided into advance-guard, rear-guard, and main body.

The word is also sometimes applied to a small party of horfe, viz. fifteen or twenty, commanded by a lieutenant, or sergeant, and in fight of the main-guard.

**Advancer**, among Sportmen, is one of the flarks, or branches on a buck's antler, between the back-antler and the palm.

**Aduar**, a kind of ambulatory village, which Arab families inhabit, in a sort of tents, moveable on occasion as forage and provisions suit. Some also write the word adüm or adunard. There are reckcted 30,000 aduars in the kingdom of Algiers.

**Advati**, in Ancient History, were the remains of those Cimbrians and Tettocines whom Marius had defeated in Italy. They had been left to the number of six thousand of the banks of the Rhine, to guard the baggage and booty of their countrymen, and had settled there after the defeat of the Cimbri. In less than five years they were in a condition to furnish 9000 fighting men for their contiguous to the league of the Belgæ, when they were attacked by Cæsar, in the year before Christ 57. When Cæsar adanced against the Advati, they pretended to give up their arms, and submit; but treacherously concealed a third part of them, and made an attack on the Romans in the night. This so provoked the general, that he broke down the gates of their city, supposing to have been Namur, put a great number to the sword, and sold the rest, to the number of about 53,000, for slaves. Cæsar de Bell. Gall. lib. ii. c. 29 — 32. tom. i. p. 90. Ed. Gray.

**ADVENT**, **Adventus**, in the Calendar, the time immediately preceding Christmas; anciently employed in pious preparation for the adventus, or coming on, of the feast of the Nativity.

Advent includes four Sundays, or weeks; commencing either from the Sunday which falls on St. Andrew's day, or that next before or after it, i.e. from the Sunday which falls between the 27th of November, and the third of December inclusive.—But it is to be noted, this rule has not always obtained.—In the Ambrosian office, there are four weeks marked for Advent; and St. Gregory in his Sacramentary allows five.

The first week of Advent, in our way of reckoning, is that wherein it begins; but it was anciently otherwise; the week next Christmas being reputed the first, and the numeration carried backwards.

Great authority was practised in the ancient church during this season.—At first they failed three days a week; but they were afterwards obliged to fast every day, whence the season is frequently called in ancient writers, **Lent**, and *Quadraginta S. Martini*.

The courts of justice were at one time all shut.

**Advent** is also one of the times, from the beginning whereof, to the end of the octaves of the Epiphany, the solemnising of marriage is forbidden, without express licence.

**Adventitia Cama**, in Antiquity, an entertainment made by the friends of a person who had been travelling, by way of welcome at his return. This was otherwise called cama adventoria. Picticus.

**Adventitious**, something accruing or befalling a person or thing from without.

Thus, adventitious matter is such matter as doth not properly belong to the body, but is casually joined to it.

**Adventitious**, in the Civil Law, is applied to such goods as fall to a man, either by mere fortune, or by the liberality of a stranger, or by collateral, not direct, succession.

In this sense the word stands opposed to *professitious*; by which are signified such goods as descend in a direct line, from father to son.

**Adventitious foils**, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong. Such are sea shells, &c.

**Adventum insignicium**, in Law. See **Ventum insignicium**.

**Adventure**, an extraordinary and surprising enterprise or accident, either real or fictitious.

The word is French, and literally denotes an event, or accident.

Novels, romances, &c. are chiefly taken up in relating the adventures of cavaliers, lovers, &c.

**Adventure Bill of**, in Commerce, is a writing signed by a merchant, attesting that the property of goods shipped, or sent away in his name, belongs to another, the adventure or chance whereof the said person is to stand with a covenant to account to him for the produce of it.

**Adventure Bay**, in Geography, a name given by captain Cook to a bay in which he anchored, in the southern part of New Holland, called Van Diemen's land, and on the shores of which they were supplied with wood and water in great abundance. The bottom of this bay was found to lie in S. lat. 43° 23', and E. long. 145° 30'. It is an excellent harbour, having through the bay from 18 to 5 fathoms water, which gradually decreases towards the shore. The road is safe, and sheltered from the north-east by Maria's islands. The variation of the compass, in 1778, was 5° 15' E.
ADVENTURE island, an island in the Pacific Ocean, discovered by captain Cook in the run from New Zealand to Oatham, and so called from the ship Adventure, in which captain Furneaux failed in this voyage. He supposed it to be one of the clusters of islands described by M. Bougainville, under the appellation of the Dangerous Archipelago. S. lat. 17° 4' 15". W. long. 140° 17' 45".

ADVENTURER, in a general sense, a person who engages in any undertaking with some risk or hazard.

ADVENTURERS more particularly denote an ancient company of merchants and traders, established for the discovery of lands, territories, trades, &c. unknown. See Ruhipa Company.

The society of merchant-adventurers, so called, because they ventured their merchandise into foreign parts, which was instituted for the improvement of the woolen manufacture, and the vending of the cloth abroad, particularly at Antwerp, is said to have sprung out of the guild of merchants of the city of London; and their origin in this country is traced to the close of the reign of King Edward I., when they attempted the commencement of a woolen manufacture in England. In the year 1296, they obtained privileges of John duke of Brabant, and stapled themselves at Antwerp, joining in society with themselves all other English merchants resorting thither. But this society had not the name of Merchant-Adventurers as a company, till the reign of King Henry VII. Some writers trace the rise of this society to an association of merchants, which was formed in 1358, under the appellation of the Brotherhood of St. Thomas à Becket; though a society of this name is known to have existed in the year 1248, and to have given rise to the merchants of the Staple of England. The privileges of the society of merchant-adventurers were successively confirmed by Edward III. and IV. Richard III. Henry IV. V. VI. who, in 1436, gave them a charter; and Henry VII. who, in 1505, gave them the appellation of Merchant-Adventurers by Henry VIII. Edward VI. and queen Elizabeth, who, in 1564, formed the company into an English corporation; and in 1583, confirmed former charters; by James I. in 1604 and 1617, who gave it new charters; by Charles I. in 1639, and their successors.

In the reign of Henry VII. there was a contest between two companies of Merchant-Adventurers, viz. those who called themselves the company of Merchant-Adventurers of London, and the merchants who resided in other cities and towns, and who were distinguished by the title of the Merchant-Adventurers of England. The London company had been long accustomed to impose a kind of tax on the English merchants residing in other places, for liberty to buy and sell in the great fairs of Flanders, Brabant, and other countries on the continent. This tax was at first only an old noble, (6s. 8d.) and was demanded by the London merchants, who called themselves the fraternity of St. Thomas Becket on a religious pretence, to enable them to do honour to their favourite saint, and thus gain his protection. But this impost had gradually increased, and it amounted at the period to which we refer to 40l. to the great discouragement of trade. The Merchant-Adventurers, resident in the out-ports, applied to parliament for a redress of this grievance, and an act was made A. D. 1497, reducing that sum to ten marks, or 6l. 13s. 4d. sterling. Stat. 1 Hen. VII. c. 6. The company of Merchant-Adventurers of England were much injured in their commerce by the German merchants of Steelyard, who formed a rich and powerful society, composed almost wholly of foreigners. Their complaints, however, during the whole reign of Henry VIII. were unavailing; but in the succeeding reign they obtained redress, when the privileges enjoyed by the merchants of the Steelyard were revoked, and their corporation abolished by the privy council.

Such was the influence of the English Merchant-Adventurers, that they prevented the emperor Charles V. from introducing the inquisition into Antwerp in the year 1550, when it was established in other parts of the Netherlands. See Hamburgh Company.

By our statutes, adventurers making settlements in any part of America, belonging to the enemy, may obtain a charter from the king. 13 Geo. II. c. 4. § 15.

ADVENTURER, Mine. See Mine-Adventurer.

ADVERB, Adverbium, in Grammar, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering; or to mark some circumstance or quality signified by them.

The word is formed from the preposition ad, to, and venom, a verb; and signifies literally a word joined to a verb, to show how, when, or where, one is, does, or suffers; as, the boy paints neatly, writes ill; the house stands there, &c.

Not that the adverb is confined purely to the verbs; but because it is most ordinary use; whence it becomes so denominated. We frequently find it joined to adjectives, and sometimes even to substantives, particularly where those substantives signify an attribute, or quality of the thing spoken of; v. gr. he is very sick; he is truly king.

An adverb is likewise joined sometimes to another adverb, to modify its meaning; v. gr. very devoutly, &c. Hence some grammarians chuse rather to call adverbs modificatives: comprising under this one general term, adverbs, conjunctions, prepositions, and even adjectives.

Adverbs are very numerous; but they may be understood under the general class of adverbs of time, place, order, dilance, motion, relation, quantity, both continuous and definite, quality, manner, affirmation, negation, demonstration, interrogation, diminution, doubling, exception, and comparison.

In English, says Dr. Lowth (Gram. p. 112.), they admit of no variation, except some few of them, which have the degrees of comparison, as soon, sooner, soonest; and those irregulars, derived from adjectives in this respect likewise irregular, as very much, not very, not very. He observes, however, that the formation of adverbs in general with the comparative and superlative terminations seems to be improper; at least that it is now become almost obsolete, as cferlier, stronger, harder, highest, rightstaff, though used by Hooker, Raleigh, Hobbes and Shaftesbury. In poetry, comparative adverbs are sometimes allowable.

Adverbs are denominated by Mr. Harris attributes of attributes, or attributives of the second order: and he defines an adverb, a part of speech, the natural appendage of verbs, extending the signification of the word verb properly so called, to participles and adjectives. After explaining the general nature of adverbs as attributes of attributes, and enumerating their principal forms, amongst which he reckon the adposition and remission, he shows that adverbs may be derived from almost every part of speech, from prepositions as afterwards, from participles, as knowingly, from adjectives, as virtuously, from substantives, as apishly, and from proper names, as Socratically. Adverbs, according to Græfa in his grammar, may be found in every one of the predicaments, and he thinks that the readiest way to reduce their infinitude, is to refer them by classes to those ten universal genera. The Stoics called the adverb by the name of ἀποδοξάζον, with a view to its multiform nature. Hermes, p. 192.

PARTICLES, one-like; lyft, •zf/;;/^... 

As arrived, i-xa Prime are m'M, thirdly, alio lu'tt, 26. and the in itfclf, the of its H^ytD. In of its Heb. Per. ...velociter. 

diversity and the grammarians; of participles, and other adverbial, that of which, &c.

...are adverbial of ...neleates, viz. of the Danish yer, signifying, harre, posfisf, or enjoy; yes is a contraction of a-yer, q. d. before or posfisf that in Danish, yer is to posfisf, and yta, denotes aye or yer. In Swedish the same verb is ega and the imperative yta, aye or yer. In German, yer signifies ad for yer. In Dutch, agiun is to posfisf, and ja is yer.

As to the negative no, and its abbreviation n, they are derived, by Greenwood, from the Latin, from Minfrew the Hebrew, and by Junius from the Greek. But Mr. Tooke discourses them in the Danish or Swedish nagep, and in the Dutch noede, noede and no, which signify overco or unsiilllnig. The adverbs once, twice, thrice, says Mr. Tooke, are merely the gentives of one, two, three, the futtabtive time or turn being omitted; and were formerly written ones, twice.

An ingenious writer suggests that adverbs seem to be principally produced from three sources; first, from a species of interjection, denoting an impulse of the mind, as now, then, not, &c; secondly, from a composition of two or three words into one, as always, altogether, &c; and thirdly, from adjectives, by adding a flexible void of signification itself, but which seems to denote that the word has changed its fate into that of an adverb, as greatly, &c. This argumentive syllable was originally a contraction of some word that denoted simultaneity or participation. Gregory's Essays, Historical and Moral, DE HILIA HILIOPOENTA, or, Divergions of Purley, p. 484, &c.

In the Hebrew language, most adverbs, and particularly those of time, are expressed by nouns, both substantive and adjectives, either simply or connected with a preposition: as יִבְּנָה וּלָטָלָל falso, falso, falso, &c. Thus, also in the Chaldee language, נְבָלָל denotes duplculus, and נְבָלָל confundulter. In the Syriac, adverbs of quality are formed of adjectives, and terminate in וְ, as תַּעַבּר Hebrews; and frequently of nouns with a preposition adjoined, as בַּעַבּר perfecti, and sometimes adjectives are flutluted for adverbs, as דַּעַבּר magi. In the Hebrew repetition of an adverb, or another of the same meaning, denotes the superlatice, as יִבְּנָה וּלָטָל f supra supra, i.e. valdi supera, Deut. xxviii. 43: and פַּתְיִי בַּעַבּר &c. Esa. xxii. 21. Adverbs of place repeated, signify diversity of place, דַּעַבּר &c. Exod. xii. 2. The adverbs in time and יִבְּנָה וּלָטָל often change the future into the preteterite, both perfect and imperfect: as Deut. iv. 41. Exod. xii. 24. Adverbs of time, that are definite, are used indefinitely: as יִבְּנָה וּלָטָל heri, yesterday, for past time in general. 2 Sam. xv. 2. If...xxx. 26. xxxvii. 30. Hence פַּתְיִי, always, Luke xviii. 1. denotes very often. See John xviii. 20. The adverb יִבְּנָה וּלָטָל, does not always include the time that follows the action which is spoken of. Psa. cx. 1. xxvii. 1. Is. xiv. 4. &c. Hence, they are derived the Hebrews that occur. Matt. i. 27. xxviii. 20. Acts. iii. 21. Rom. v. 13. 1 Tim. iv. 13. Adverbs of negation prefixed to verbs are used in the same fence with the privative alpha of the Greeks: as נְבָלָל וַיִּבְּנָה וּלָטָל non letatiber, i.e. doth not. Prov. x. 1. Hence, John xiv. 18. Heb. xi. 16. Rev. xi. 12. Adverbs of this kind prefixed to nouns have the same meaning, as נְבָלָל וַיִּבְּנָה וּלָטָל non faptis, i.e. inframit. Psa. xxxv. 25. Hence Matt. vi. 6. Rev. vi. 7. Absolute adverbs are used comparatively, as Joel ii. 13. Prov. vii. 10. 1 Sam. viii. 28. Hence are derived the Hebrews that occur in Matt. x. 20. Mark x. 26. Luke xiv. 12. John vii. 27. Acts v. 4. Cor. i. 7. Eph. vi. 22. On the other hand comparative adverbs are used for negative adverbs. Hof. vi. 6.—Luke xviii. 14. 1 Pet. iii. 17. The adverbs of negation נְבָלָל וַיִּבְּנָה וּלָטָל, and יִבְּנָה וּלָטָל joined to the nouns יִבְּנָה וּלָטָל, יִבְּנָה וּלָטָל, יִבְּנָה וּלָטָל, are universal negatives, so that non non is synonymous with nullus, &c. Psa. xliii. xx. 18. Prov. x. 6. Eccl. i. 9. Num. xxxi. 49. Gen. xxvii. 12. 2 Sam. xii. 30. Dan. xi. 37. Hence Matt. xxiv. 22. Luke x. 37. Rom. iii. 20. Rev. x. 4. The adverb of interrogative יִבְּנָה וַיִּבְּנָה וּלָטָל, answers the purpose of a negative in affirmative interrogations, and of an affirmative in those that are negative. 2 Sam. vii. 6. Chron. xxi. 17. This interrogative יִבְּנָה וַיִּבְּנָה וּלָטָל is sometimes omitted: as Gen. xxvii. 24. Job. ii. 10. The adverb of simultaneity יִבְּנָה וַיִּבְּנָה וּלָטָל prefixed to a word is sometimes doubled, and the one is supplied by the conjunction י. Prov. x. 25. xvii. 3. If. iii. 7. compared with Acts viii. 32. 1 Sam. xii. 15. Hence Matt. vi. 10. Mark iii. 26. John xx. 21. Acts vii. 51. This adverb is very frequently omitted, as Nah. iii. 12. Gen. xlix. 9. Psa. vii. 9. See also Exod. xiv. 4. 1 Sam. xiii. 1. Psa. cxvii. 2. Jer. xvii. 11. Job xvi. 15. Hence John xv. 17. Psa. xxvii. xi. The adverb יִבְּנָה וַיִּבְּנָה וּלָטָל, is sometimes omitted, as Psa. xlii. 13. Job xxx. 10. Num. xi. 1. Hof. iv. 4. Hence Matt. xiv. 5. John i. 14. Rom. ix. 20. Adverbs are sometimes used for adjectives. The biblical critic may find much more on this subject in the learned Father's Heb. Gram. vol. i. p. 352—365. ADVERBS, something relating to adverbs. We say an adverbial phrase, adverbial expression, &c. ADVERBS, sometimes used to denote once, twice, thrice, &c. ADVERBS, among the Ancients, was used for a book of accounts, like our journal or day-book. Hence, adverbial is sometimes also used among us for a common place book. Adverbial amounts to the same with epigraphia, inscriptions, or memorials, and it stands opposed to index, the former being for occasional matters which were taken down haphazardly, from which they were afterwards transferred into the latter, in a fair regular manner, for standing use. Morthof, Polyhist. lib. iii. capit. 1. ADVERSAIA is also a title given to divers books, containing collections of miscellaneous observations, remarks, &c.
In which sense, adverfaries amount to much in the same way with varie lectiones; varie observationes, commentarii, lectiones antiquas, hoc communem, geniales dies, reflexos, felicitas, edidisse, &c.

Adversaria is also used for a commentary on some text or writing. This was so called, because the notes were written on the adverse or opposite page.

ADVERSARY, formed of the Latin preposition adversus, against, and versus, to turn. See Antagonist.

ADVERSAIVE, in Grammar, a word or particle that expresses not only some difference, but some opposition, between what goes and what follows. Adverstive disjunctives are distinguished from those that are denominated simple in this respect; as the latter merely disjoin or express a diversity, whereas the former disjoin with a concomitant opposition, e.g. The proposition, “either it is day, or it is night,” is a simple disjunctive; and an adversative is when we say, “it is not day, but it is night.” Besides, the adverstives are definite; and the simple, indefinite. Thus, when we say, “the number of three is not an even number, but an odd,” we not only disjoin two opposite attributes, but we definitely affirm one, and deny the other. But when we say, “the number of Hector is either even or odd,” though we assert one attribute to be, and the other not to be, yet the alternative is left indefinite. With respect to adverstive disjunctives, it may be observed, that, though they imply opposition, there can be no opposition in the same attribute in the same subject; but the opposition must be either of the same attribute in different subjects, as “Brutus was a patriot, but Caesar was not”; or of different attributes in the same subject, as, “Gorgias was a sophist, but not a philosopher;” or of different attributes in different subjects, as, “Plato was a philosopher, but Hippasus was a sophist.” The conjunctions used for all these purposes may be called absolute adverstatives; but besides these, there are several others, recited by Mr. Harris, such as adverstatives of comparison, expressed by the words than and as, which mark not only opposition, but that equality or excess, which arises among subjects from their being compared. Such also are adverstatives adequate and inadequate, of which the principal are unles and although, e.g. “Troy will be taken, unless the Palladion be preserved.” “Troy will be taken, although the Palladion be preserved.” Every one of these (say Mr. Harris) is either adequate, or inadequate, when it endures without being effectual, and so in manner is every preventive. Adequate preventives are expressed by such adverstatives as unles; the inadequate are expressed by although. Hermes, p. 251—257.

On this subject, Mr. Horne Tooke, in his Diversions of Purley, has enabled us to form more clear, determinate, and satisfactory ideas than those which were furnished by former grammarians. The opposition in adverstive disjunctives, that has been usually referred to the conjunction but, is supposed to be marked by the words or sentences which are thus connected, and which have opposite meanings. Accordingly the ingenious writer abovementioned affixes two different acceptations to the word but in the beginning and in the middle of a sentence. In the former case it is a corruption of bos, the imperative of the Saxon verb botan, to boast, supereradic, or supply; and in the latter it is a contraction of le-bos, the imperative of be-bosan, to be out. This distinction is evinced by examples from ancient writers, one of which it will be sufficient to mention, taken from Gavio Douglas:

"But thy work shall endure in laude and glorie, but spot or faulte condigne eterne memorie."

The meaning of this couplet is "superadd (to something fail, or supposed to be laid before) thy work full endur in laude and glorie be out, (i.e. without) pot or fault ."

Thus, in the definite adverstive, "the number three is not an even number, but an odd," the opposition is not marked, at least directly, by the word but, but by the adjectives even and odd, which denote attributes in their own nature opposite; and the preposition, according to the first sense of the word but, will be synonymous with this, viz. "the number three is not an even number, superadd (it is) an odd number."

In the indefinite adverstive, "the number of the flurs is either even or odd," the word either is a distributive pronoun, and or is a contraction of the Saxon ed or q d. other, i.e. something different, and often contrary. As to the adverstives denominated by Mr. Harris adequate and inadequate, and marked by the conjunctions unles and although, he leads us to conceive that the whole difference between them consists in this, that the expression of the one is more forcible than that of the other. Whereas, the meaning of unles is directly opposite to that of although. They are both verbs in the imperative mood: the former signifying take away or dismiss; and the latter allow, permit, grant, yield, admit. Accordingly the sentence, "Troy will be taken unless the Palladion be preserved," is equivalent to: "Regal will be taken, although the Palladion be preserved," i.e. taking the palladion be preserved as an abstract noun, the opposition of the Palladion Troy will be taken. Again, "Troy will be taken although Hector defend it," is the same as "Troy will be taken although Hector to (or to) defend it." The idea, therefore, expressed by unles is that of the removal of one thing to make way for another; and the idea expressed by although is that of allowing one thing to coexist with another, with which it is apparently incompatible. The conjunction unles (says Mr. Tooke) even in the reign of queen Elizabeth was written unles or unles, and more anciently unles and unles: and unles is the imperative of the Anglo-Saxon verb unlesan, to dismiss or remove, les the imperative of lesan, which is synonymous with lesan, is also used by some old writers, instead of unles. And this imperative les has given to our language the adjectives lesphyls, reflps, &c. i.e. desphyls hope, reft, &c. The conjunction although (says the former writer) is compounded of al or all, and too, though, tho, or, in the vulgar pronunciation, the, tho, and thes. This is evidently the imperative that or thesis of the verb fes, to dismiss, to permis, &c. and thesis becomes that, though, in a variation of the same kind, and as easy as that by which baeve becomes baske. This etymology is confirmed by considering, that anciently they often used all be, aloke, all ad, all were, and all give, instead of although.

ADVERSATOR, in Antiquity, a servant sent to wait his master's returning from supper, and attend him home. The rich had servants of this quality, to apprise them of any danger. Plautus, (Mort. iv. 124.), and Terence, (Adelph. i. 12.) refer to such persons.

ADORSE. Leaves. See Leaf.

ADVERTISEMENT, formed from advertere, to consider, in a general sense, an intelligence or information given to persons interested in an affair.

Advertisement is more particularly used for the brief account of articles of private or public concern, inserted in the daily, or other public papers. By the statute of 25 Geo. II. cap. 36. and 28 Geo. II. cap. 46. the penalty for not inserting an advertisement with no objections to be asked, for the return of things lost or stolen; and likewise on the printers.

By 21 Geo. III. c. 49. any person advertising any pubi
ADU

lie meeting for debate on the Lord's day, to which persons are to be admitted by money or tickets sold, the printer shall forfeit 50l. for each offence. See LOTTERY.

ADVICE-Boat, a small vessel employed to carry express or orders with dispatch.

AD VITAM aut culpam, denotes an office to be held fo as to determine only by the death or delinquency of the possessor; or in other words, to be held quod dixi fe bene grati. Stat. 28 Geo. II. c. 7.

ADUGAK, one of the Fox islands in the northern Archipelago.

ADULA, in Ancient Geography, a mountain of Rhetia, or the country of the Grion, being a part of the Alps, in which are the mountains of the Rhine, Rhone, Nantz, Tellin and Aar, and from which flows the Adda or Adula. It is now called St. Gothard, and it is said to be the highest point of Europe. Strabo, Geog. tom. 1. p. 293.

Adula gives name to a country of the Alps between the Grions, Swiss, Villains, and Milanese. It is the highest part of the Alps and comprehends the Cripplaz, Vogelberg, Gotthard, Founche and Grinnel.

ADULA, in Modern Geography, a mountain of Navarre in Spain, betwixt Pomplona and St. Jean de Piz de port.

ADULARIA. See FELSAR.

ADULE or ADULIS, in Ancient Geography, a town of a city of Ethiopia, built according to Pliny, (L. vi. c. 34. tom. 4. p. 344.) by fugitive slaves of Egypt, and distant from its port on the Red Sea 20 stadia: and from the royal city of Axum about 50 leagues Pliny calls it Oppidum Adulitum, and the inhabitants Adulis. He represents it as the principal emporium of the Ethiopians, whence they exported ivory, the horns of the rhinoceros, the skins of the hippopotamos, and other articles of commerce. The monumentum adulitanum, or the pompous inscription of the statue of Ptolemy Euergetes, belonged to the city. The bay adjacent to it in the Red Sea was called Sinus Adulutus. It is now Ercoca on the coast of Abyss. The port of Adulis, according to Dr. Vincent, in his Periplius of the Erythraean Sea, can be no other than the celebrated harbour and city of Maffauh, so well known by the accounts of the Jesuits and of Bruce, as the most proper entrance into Abyssinia. Two islands are also mentioned in the bay of Adulis, which are now called Sheikh Sidda and Toalhout, abounding in fish.

ADULI, a village of the island of Orin in the Red Sea.

ADULLAM, in Scripture Geography, a city belonging to the tribe of Judah, in the southern part of this tribe, towards the Dead Sea. Eschias says it was a large town 10 miles from Eleutheropolis, eastward. Joh. xv. 35.

2 Chron. xi. 7. 8. Joh. xii. 15. 1 Sam. xxii. 1, 2.

ADULT, ADULTUS, formed from the verb adulare, to grow up, an appellation differing anything that is arrived at maturity; and applied to plants as well as to persons. An adult person is one who is arrived at years of discretion, and entered upon manhood, or the age of adulthood; and is old enough to have understanding and discernment.

Among Civilians, the appellation adult is applied to a youth between fourteen and twenty-five years of age.

In which sense adulus is synonymous with juvenia adulatis.

ADULT, in Mythology, was an epithet applied both to Jupiter and Juno: the former being called Jupiter adulus, and the latter Juno adulta.

ADULTERATION, in a general sense, the act of corrupting, or debasing a thing that was pure, by some improper admixture.

The word is Latin, formed of the verb adulare, to corrupt, by mingling something foreign to any substance. We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, beer, bread, wax, hair-powder, &c. See Stat. 13 W. III. cap. 5.—1 Geo. I. cap. 59.—1 Geo. I. cap. 46.—1 W. & M. cap. 34.—23 Eliz. cap. 8.—10 Anne cap. 26.—3 Geo. III. cap. 11.

For the method of detecting adulteration of liquors, see ESSAY, PROOF, &c.

ADULTERATION of coin properly imports the making or casting of a wrong metal, or with too base or too much alloy.

ADULTERATIONS of coins are effected divers ways, as by forgery another stamp, or inscriptions; or by mixing improper metals with the gold or silver; mott properly, by making use of a wrong metal, or an undue alloy, or too great an admixture of the bafier metals, with gold or silver. Counterfeiting the stamp, or clipping and lowering the weight, do not properly come under the denomination of adulterating.

ADULTERATION gives rules and methods, both of adulterating and detecting adulterating metals, &c.

ADULTERATION is somewhat less extensive than defacing, which includes diminishing, clipping, &c.

To adulater, or deface the current coin, is a capital crime in all nations. The ancients punished it with great severity: among the Egyptians both hands were cut off; and by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted that counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us. The adulterations of gems is a curious art, and the methods of detecting it are less useful. Nichols, Lapid. p. 18.

ADULTERATION, in Pharmacy, denotes a fraudulent corruption of drugs, or medicines, by substituting ingredients of lesf value, for the sake of greater gain.

This practice the dealers in all the parts of medicine are but too well acquainted with. Pharmaceutical authors give numerous instances of adulterations, both in simple and compound medicines.

ADULTERATION of wine. See WINE.

ADULTERESS, a woman who commits ADULTERY.

ADULTERINE, in a general sense, denotes any thing which has been adulterated, or that is spurious, or counterfeited; and it is thus applied to a fraudulent balance, to debased and counterfeit coins, to a false key, and to supposititious writings.

ADULTERINE, in the Civil Laws, is particularly applied to a child issued from an adulterous union, or commerce.

Adulterine children are more odious than the illegitimate offspring of single persons. The Roman law even refuces them the title of natural children; as if nature disowned them. Adulterine children are not easily dispensed with for admission to orders. Thos. are not deemed adulterine, who are begotten of a woman openly married, through ignorance of a former wife being alive. By a decree of the parliamont of Paris, adulterine children are declared not legitimated by the frequent marriage of the parties, even though a papal dispensation be had for such marriage, which is a claus of legitimation.

ADULTERINE guilds, in Briuih History, denoted those guilds or corporations that were set up without warrant from the king, in opposition to warranted or lawful guilds, and under this denomination they were amerced to the king in 1180. 26 Henry II. See GILD.

ADULTERINE marriages, in St. Augustine's sense, denote second marriages, contracted after a divorce.

ADULTERY, ADULTERIUM, in Ancient Law Books, called
A D U L T E R Y.

called Adultery) a crime committed by married persons, against the faith pledged to each other in marriage, by having carnal commerce with some other; or even by a person not married, who has the fame intercourse with another that is.

Moralists, canonists, and divines, have distinguished several species of adultery as,

Adultery, manifest, that wherein the parties are caught in the fact, or, as some express it, res in re.

On such occasions, strangers, or people not interested in the family, have been allowed to accuse, and prosecute women for adultery, either if committed during a husband's long absence, or through his connivance.

Adultery, occult or secret, that kept concealed from the knowledge of the world, and only divulged to a confessor, or the like.—In the canon law this is most favourably dealt with; persons were admitted to penance for this, and absolved, who were refuted for the open kind. Dange.

Adultery, presumptce, that which is only discovered or inferred from certain signs, or indications. Such are the parties being found in bed together, nuda cum nuda.

Adultery, interpretative, or reputed, denotes an act which though not properly included under the denomination, yet is reputed as equivalent to it, and punished as such. Thus mixed marriages between Chaldeans and Jews, e. gr., between a Chiluvian man and a Jewish woman, are put by the laws of Arcadius and Honorius, on the footing of adultery.

So also second marriages are called by some, as Athenagoras, and St. Ambrose, an honourable or better sort of adulteries.

Adultery, improper, includes other extraordinary cases and species; such are the commerce with a woman only eloped, not actually married; with a married woman, who lives as a common whore; with a married woman, taking her for a fiddle; with a putative wife, or concubine, taking her for a real wife; and with a nun, who by her vows is deemed eloped.

Adultery, figurative, that intended only to represent, or prefigure another fact, or convey some other instruction. This coincides with typical, or allegorical adultery, and stands opposed to actual. So the adultery of Mars and Venus is turned into an allegory by naturalists, moralists, alchemists, &c.

Adultery, single, is that where only one of the parties is married, in contradistinction from double adultery, which is, where both parties are married. This distinction is familiar and important in the canon law; but was unknown to the jurisprudence of the Code and Pandects.

Adultery, inchoate, that wherein the parties are related within the third degree of consanguinity.

Adultery, illicit, that not prohibited by any express or known law.

It has been disputed whether adultery be malum in se, or only malum prohibitus, i.e. evil in itself, or only rendered evil, by virtue of punitive laws and prohibitions. St. Ambrose and some others have maintained, that adultery was not criminal before the Mosaic law. Hobbes de Civ. cap. 6. § 16. Budd. Hag. lib. ii. cap. 4. See the close of this article.

It has been controverted, whether adultery may be lawfully committed in war, with the enemies' wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit adultery with the consent of her husband, and for the procuring some great good to him? St. Anfin apparently allows of it; at least, does not condemn it. De Serm. Dom. in Mont. lib. i. cap. 16. § 49. & De Civ. Delib. xvi. cap. 25.

It has likewise been a dispute, whether it be lawful for one of the parties married to commit adultery, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who, on this account, converted with Hagar; and likewise among the Greeks and Romans.

Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

Adultery, illicit, that which is expressly contrary to some obligatory law: such, according to the generality of caufuits, is all adultery, proper, improper, single, double, open, and occult; because of a natural barstain or turpitude in the thing, as well as its being a violation of conjugal faith, and injury to our neighbour.

Accordingly, punishments have been annexed to adultery in most ages and nations, though of different degrees of severity. In many it hath been capital, in others venial, and attended only with flight pecuniary multas. Some of the penalties are tedious, and even cruel; others of a jocose and humorous kind.

Among the ancient Egyptians, adultery by consent was punished in the man by a thousand hales, given with rods; and in the woman, with the loss of her nose. Nevertheless, adulteries were not unfrequent among the Egyptians.

The Grecian laws express great indignation against adultery. In the earlier times of Athens, the punishment of adultery seems to have been arbitrary. In other parts of Greece, adultery was severely punished.

Rich adulterers were sometimes allowed to redeem themselves with money, and the fine, called δακρός δυσευμα, was paid to the injured husband: and it was customary for the father of the adulterers to return the whole dowry which he had received of her husband. Homer Odys. I. 6. v. 317. 329.

In the later times of Greece it was ordered by Draco, that he who caught an adulterer in the fact might impose on him any arbitrary punishment; and this law was confirmed by Solon. Nevertheless it appeared to have been highly politic, as it gave full scope to private revenge, instead of leaving the punishment to the state.

It was by the Grecian law farther ordered, that if any one was injuriously confined upon fulpiotion of adultery, he should make his complaint by appeal to the θιμιμονήσεως, which if they found justifiable, he should be acquitted, and his fortunes discharged from their bail; but in case he were found guilty, the judges were to inflict on him what punishment they would, death only excepted; and the offender was obliged to procure friends to be responsible for his future charity.

The Spartans, indeed, may in one sense be said to have tolerated adultery, since they laughed at those who thought the violation of the marriage-bed an impotitable affront; they allowed other men the liberty of embracing their wives, which freedom they took with others in their turn. Nay, even strangers, as well as the citizens of Sparta, were allowed the same freedom with their wives. Yet we find that their kings were exempt from this custom, that the royal blood might be preserved unmixed, and the government remain in the same lineal descent.

But notwithstanding this liberty, which was founded on mutual consent, they accounted all other adulteries the most heinous crime in the world; and while they adhered to their ancient laws they were wholly strangers to them. Among the ancient Spartans was the idea of infidelity on the part...
ADULTERY.

part of the women to their husbands would have appeared as strange as that of displaying the leaf regard to finical ornaments in their dress. And Lycurgus, it is said, did not enact any law against adultery, because no such crime existed in Sparta. See Plut. Oper. tom. i. p. 49. tom. 2. p. 290. Ed. Xylanid. Potter's Arch. II. iv. cap. 12.

Plutarch tells us, that if any person discovered his father or daughter, while unmarried, in this crime, he was allowed by Salom's law to fell her for a slave. If a husband surpried his rival in the act of dishonouring him, he might put him to death, or oblige him by torments to render his life, but if the wife had only yielded to force, he could demand no more than a pecuniary fine at the discretion of the judges, in violation in such cases was left to be decided than deduction.

In the heroic ages, adulterers were flained to death; and the punishment was called being given, a fine cost. Homer Iliad, 1. v. Adulteresses were never permitted to adorn themselves with fine cloaths; and in case they appeared so to do, were liable to have them torn off by any that met them, and likewise be beaten. The same liberty was permitted to any that found them in the temples, which were thought to be polluted by the admittance of persons so infamous and detestable. Lastly, their husbands, though willing, were forbidden to exhibit any longer with them, upon pain of ignominy, execrations; but persons who prostituted women, were adjudged to die.

There were other remarkable punishments for adulterers among the Grecians; such, particularly, as putting out their eyes. And the Locrisians observed this custom in later ages, being compelled to the observance of it by Zaleucus, their lawyer; whose rigour in executing this law was very remarkable; for having caught his son in adultery, he resolved to deprive him of his sight, and remained a long time inexorable, notwithstanding the whole city was willing to remit the punishment, and requested him to spare the youth. At length, unable to resist the people's importunity, he mitigated his sentence, and redeemed one of his son's eyes, by causing one of his own to be put out; by this glorious act setting a memorable example both of justice and of mercy. Valer. Maxim. I vi. c. 5.

At Gortyn in Crete, they punished adulterers after another manner: they were covered with wool, an emblem of the softness and effeminacy of their disposition, and in that dress they were carried through the city to the magistrate's house, who imposed a fine and sentenced them to ignominy, whereby they were in a manner deprived of all their privileges, and their share in administering the public business. 'Ailian. Var. Hist. I. xii. c. 12. not. Perizon. tom. 2. p. 736. Ed. Gronov. For other punishments, see Onobatis and Parradimus.

There are various conjectures concerning the ancient punishment of adultery among the Romans.

By a law of Romulus, of which Plutarch makes mention, a man had the liberty of turning away his wife, either for poisoning his children, counterfeiting his private keys, or for adultery. Though some maintain that it was made capital, by a law of Romulus, and again by the Twelve Tables. Others, that it was sill made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in ancient times was very various, much being left to the discretion of the husband and patients of the adulterous woman, who exercised it differently, rather with the silence and countenance of the magistrate, than any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and as it were, with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far, but mitigating, or rather raging, cutting off the ears, noses, &c. were deemed sufficient. The punishment allotted by the lex Julia was not, as many have imagined, death; but rather banishment, or relegatio, with the loss, on the part of the wife, of half her dowry, and a third part of her other goods; and on the part of the husband, of half his goods: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. But though the Julian law left the accusation of adultery open to every body, yet strangers were seldom suffer'd to prosecute, where the husband made no complaint: but where the husband made a trade of his wife's infamy, or having seen her shame with his own eyes, patiently suffered the affront: in these cases, adultery became a crime of public concern; and the Julian law provides a punishment for such husbands as well as for their wives.

Under Augustus, the guilty parties, after the payment of heavy forfeitures and fines, were condemned to long or perpetual exile in two separate islands.

Under Macrobius, adulterers were burnt at a flake. Constantine, it is said by Noodt and others, first by law made the crime capital. Under Constantius and Constans, adulterers were burnt, or fewed in sacks, and thrown into the sea. Under Leo and Marcellian, the penalty was abated to perpetual banishment, or cutting off the nose.

By the civil law, as altered by Justinian, who, at the instance of his wife Theodora, mitigated the severity of the lex Julia, adultery is punished with whipping, and flutting up in a convent for two years; during which time, if the husband do not content to take her back again, she is hanged, and shut up for life.—This is called authentifying, as having been effablished by an authentic.

In France, however, the whipping is omitted, that the husband may be the iex avercar from the taking her back within the two years.

Under Theodosius, women convicted of this crime were punished after a very rigorous manner, viz. by a public confession by being locked up in a narrow cell, and forced to admit all the men to their embraces that would offer themselves. This custom was again abolished by the fame prince. It was controverted whether, among the Romans, adultery was allowed to be compounded?

By an edict of the emperor Antoninus, the husband was not allowed to bring an action of adultery against his wife, unless he himself were innocent; the reason given for it is very natural, per iniqum crim. adulterar esse ut pudicitiam vir & uxore exigat, quam ipse non exhibeat. By the Jewish law, adultery was punished by death in both parties, where they are both married, or only the woman. The Jews had a particular method of trying, or rather purging an adulterers, or a woman suspected of the crime, by making her drink the bitter water of jealousy; which, if she were guilty, made her fall. In Arabia Felix the punishment of adultery was death. Strabo Geog. tom. ii. p. 1130. By the laws of Jenghiz Khan, founder of the Mogul empire, adulterers were condemned to death; and a man was permitted to kill them when surpris'd in the act. Some of the people, however, disliked this law, because it was a custom with them to offer their wives and daughters to their friends who visited them, in token of respect and affection: and they petitioned to be continued in the exercise of
of this privilege, which was allowed. But they were regarded as depraved and infamous.

Among the Mingrelsans, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulterers, and the cuckold.

Chardin, Voy. tom. i. p. 47.

In former authorities, it is said, any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her, to have been rated so high. Montaigne's Ess. lib. iii. cap. 4.

Adultery is said to be so frequent at Ceylon, that not a woman but practises it, notwithstanding its being punishable with death. Bibl. Univ. tom. xxiii. p. 237.

Among the Chinefe, and divers other nations, adultery is only penal in the woman. Among the Abyssinians, the crime of the husband is said to be only punished on the innocent wife. In the Marian islands, on the contrary, the woman is not punishable for adultery; but if the man go away, he pays severely; the wife and her relations wait his lands, turn him out of his house, &c. Among the Chinese there is reason to conclude, that adultery is not capital; for it is said, that fond parents will make a contract with the future husbands of their daughters to allow them the gratification of a gallant. But without such precaution, the husband has power to inflict corporal punishment on a wife who transgresses, or to divorce her. Such, however, is the conjugal fidelity of the Chinese women, and so strictly are they guarded, that cafes of this kind of seldom happen. The Koran annexes the penalty of 100 stripes to the crime of fornication, in either sex; and in case of adultery, female slaves, whose punishment was half that of free women, received fifty stripes, and the latter were flogged. But, in order to convict a woman of adultery, the commentators on the Koran say, that the charge must be supported by four male witneses, and a false accuser was punished with eighty stripes, and his testimony was deemed for the future invalid.

In the kingdom of Benin, the punishment of adulterers among the lower classes, is the forfeiture of the personal and real estate of the gallant, which the husband feizes and enjoys; and he is therefore anxious to detect the intrigue, as soon as he has occasion to suspect it. The offending wife is driven out of the house with a cudgel, and deemed infamous. Among persons of superior condition, the crime is atoned by a sum of money, which the relations of the wife advance, to prevent the scandal annexed to adultery.—Among the governors and magistrates, the crime is punished with greater severity. The woman and her gallant are immediately put to death, if detected in the fact; and their bodies are thrown on the dunghills, as a prey to the birds and beasts, without process of law, or form of trial. Hence it is said, the violation of the marriage bed is less known in Benin than in any other country.

In Spain, they punished adultery in men by cutting off that part which had been the instrument of the crime.

In Poland, before Christianity was established, they punished adultery and fornication in a very particular manner: the criminal they carried to the market place, and there fastened him by the testicles with a nail; laying a razor within his reach, and leaving him under a peculiarity either of doing justice upon himself, or of perishing in that condition.

By the law of Scotland, simple adultery is distinguished from that which is notorious and manifest. Open and manifest adulterers, who continue incorrigible, notwithstanding the censures of the church, are punished capitally. The punishment of simple adultery, not being defined by statute, is left to the discretion of the judge; but custom has made the falling of the single echeat one of its penalties.

The Saxons formerly burnt the adulterers, and over her ashes erected a gibbet, whereon the adulterer was hanged. In this kingdom, likewise, adultery by the ancient laws was severely punished. By the laws of Ethelbert, any one who committed adultery with his neighbour's wife was obliged to pay him a fine, and buy him another wife. King Ed- mund the Saxon ordered adultery to be punished in the same manner as homicide; and Canute the Dane ordered that a man who committed adultery should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals. Lib. Hen. I. cap. 12. Doomsday, tit. Ceifr. Civit.

Adultery at present is only punished by fine and penance in the spiritual court; or by an action at common law of crim. con. as it is commonly called, for damages; which are assailed by the jury, under the direction of the court, in proportion to the heinousness of the crime and the circumstances of the offender; though some of our law-books speak of adultery as a thing temporal against the peace. If a man takes another in the act of adultery with his wife, he kills him directly upon the spot, though this was allowed by the laws of Solon, as likewise by the Roman civil law (if the adulterer was found in the husband's own house), and also among the ancient Goths; yet in England it is not absolutely ranked in the class of justifiable homicide, but it is manslaughter. It is, however, the lowest degree of it; and therefore the court in such a case directed the burning in the hand to be gently inflicted, because there could not be a greater provocation. Blacklt. Comm. vol. iv. p. 192, 8vo. As to the adulterers, by our law, she undergoes no temporal punishment whatever, except the loss of her dowry; and she does not even lose that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offence committed. 13 Ed. I. cap. 34.

It is to be observed, that adulteresses are such either by the Canon, or Civil Law.

According to the former, a woman is an adulteress, who either being herself married conveys carnally with another man, or being single herself conveys with a man that is married.

According to the latter, she is not an adulteress, if she be not herself in the married state, though she conveys with a man that is. The crime, in this case, was more properly called jpletum than adulterium.

Hence, among the Romans, the word adulbera, adulteresses, differed from pelle, which denoted a single woman, who co-habited with a married man; and pelle differed from concubina, which signified her who had only intercouerc with an unmarried man. The former was reputed infamous, and the latter innocent.

It is much disputed, whether adultery dissolves the bond of matrimony; and be a sufficient cause of divorce, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek, as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains.

The ecclesiastical courts in England so far agree with the papists, that they only grant a divorce a mensa & thoro, in case of adultery; so that a complete divorce, a vinculo matrimonii, 

L. 12
Adultery, to enable the parties to marry again, cannot be had without an act of parliament.

By a council of Nantes, marriage was declared dissolved by adultery, but the innocent party was not allowed second marriage. In after-times leave was given to the innocent party alone; and afterwards the same was allowed to the criminal party.

Adultery, in a moral view, is unquestionably a crime of an atrocious nature, and productive of very injurious consequences. On the part of the man who solicits the chastity of a married woman, it includes the crime of seduction, and is attended with the same mischief. The infidelity of the woman is aggravated by cruelty to her children, who are involved in her flame and made unhappy by the discord and separation of their parents. Should it be laid that the pernicious consequences result from the discovery, and not from the crime, it may be replied that the commission is never incurable from discovery; and that if undetected connections of this nature be allowed, the husband can have no security for his wife's chastity, independently of her principles and dispositions, besides her want of opportunity or temptation which would deter men from marrying, defeat the purposes of the conjugal connection, with respect to domestic order and happiness, and render marriage such a fact of jealousy and alarm to the husband, as must end in the slavery and confinement of the wife. Besides, the vow by which married persons engage their mutual fidelity is witnessed before God, and accompanied with circumstances of religious solemnity, which approach to the nature of an oath. The crime is therefore little short of perjury on the part of the offenders; and the seduction of a married woman is little less than subornation of perjury: and this guilt is altogether independent of a discovery. The usual and only apology for adultery is the prior transgression of the other party. This is a circumstance which can merely extenuate, but cannot justify the crime; unless it could be pleaded, that the obligation of the marriage vow depends upon the condition of reciprocal fidelity, for which plea there is no foundation. The way of considering the offence of one party as a provocation to the other, and the other as only retaliating the injury by repeating the crime, is a childish trifling with words.

"Thou shalt not commit adultery," was an interdict delivered by God himself; and in both the Old and New Testaments the crime of adultery is represented as difficult from, and accumulated upon that of fornication.

Some have been of opinion, that the history of the woman taken in adultery, recorded in the eighth chapter of St. John's Gospel, gives countenance to this crime. When Christ told the woman, "Neither do I condemn thee;" we must believe, it is said, that he deemed her conduct either not criminal, or not a crime, however, of a very heinous nature. A more attentive examination of this case (says Archdeacon Paley) will convince us that nothing can be concluded from it, as to Christ's opinion concerning adultery, either one way or the other. The design of the persons, whose conduct on this occasion is recorded, and who are laid to have tempted Christ, "that they might have to accuse him," was to draw him into an exercise of judicial authority, that they might be empowered to accuse him before the Roman governor of usurping or interfering with the civil government. Christ knew this to be their design, and determined to defeat it. When he asked the woman, "hath no man condemned thee?" he spoke, and was underlaid by her to speak of a legal and judicial condemnation; otherwise her answer, "No man, Lord!" was not true. In the same sense he uses the word condemn in his reply. "Neither do I condemn thee," i.e. I pretend to judicial character or authority over thee; it is no office or business of mine to pronounce or execute the sentence of the law. When Christ adds, "go and sin no more," he in effect tells her, that she had sinned already; but as to the degree or quality of the sin, or Christ's opinion concerning it, nothing is declared, or can be inferred in this way.—Paley's Principles of Moral and Political Philosophy, vol. i. p. 309.—

Elster (Observ. vol. i. 318.) and Suicer (Thelasur, vol. i. p. 285.) have shown, that the word ἁγνεύρητον, to, fin, is used by the mild elegant Greek class, as the corresponding word præcure is by the Latin, to signify the commission of adultery; and this strongly intimates, that even the light of nature taught many of the heathens the exceeding injuriousness of it.

If Christ had undertaken the decision of the case recorded in this history, he must, ipso facto, have rendered himself obnoxious to the Romans, as well as to the Sanhedrin; and if he had condemned her, a new occasion of offence must have arisen, in consequence of that to Pilate, if execution had been ordered without an application to him; and to the Jews, if Christ had directed such an application to be made. See Doddridge, and other Commentators, in loc.—and Lardner's Works, vol. i. p. 41. 8iv.

It is therefore needless to recur to the solution of the difficulty adopted by some biblical critics, who have disputed the genuineness of this passage. By such, however, it has been urged, that this history is wanting in the Syriac version, as well as in the Alexandrian and Bodleian copies, and indeed in most of the oldest MSS., and that it was not acknowledged by several of the Greek fathers, which induced Beza to question, and Le Clerc, with many others, to reject its authority. In favour of this history appeal is made to sixteen copies used by R. Stephens, to most of those consulted by Mills and Beza, to the Harmonies of Tatian and Ammonius, to the apoloetical confessions and the Synopsis of Athanasius, to many of the Latin fathers, to several ancient Syriac MSS. to the Greek and Latin printed copies, &e. Mill and Wetstein in loc. Whitby in loc. Fabricius's Codex Apoc. New Test. tom. i. p. 355, &c. See also Lardner's Works, vol. v. p. 67. &c. &c.

Adultery is also used in Ancient Cynics, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it.

In which sense, adulterium amounts to the same with what the Saxons called legervinta.

Adultery is sometimes used in a more extensive sense, for any species of impurity, or crime, against the virtue of chastity; and in this sense divines understand the seventh commandment.

Adultery is also used, especially in Scripture, for idolatry, or departing from the true God, to the worship of a false one.

Adultery is also used in Ecclesiastical Writers, for a person's invading, or intruding into a bishoprick, during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church.

The translation of a bishop from one see to another was also reputed a species of adultery: on the supposition of its being a kind of second marriage, which, in those days, was esteemed a degree of adultery. This conclusion was founded on that text of St. Paul, Let a bishop be the husband of one wife, by a forced constrution of church for wife, and of bishop for husband. Du-Cange.

Adultery.
ADULTERY is also used, by Ancient Naturalists, for the act of ingraining one plant upon another.

In which sense, Pliny speaks of the adulteries of trees, "arborum adulteria," which he represents as contrary to nature, and a piece of luxury, or needle's refinement.

ADULTERY is also used by law-fanciful Atronomers and ADUMBRATION, for an eclipse of the sun, or moon, happening in an unusual, and, as they suppose, irregular manner; as in the case of horizontal eclipses, where, though the sun and moon be diametrically opposite, yet they appear as if above the horizon at the same time.

ADUMBRATION, in Heraldry, denotes the shadow of any beafl or charge, outlined, and painted of a darker colour than the field. There is perhaps no instance of this bearing in any English coat; but it is often mentioned by French and German authors.

ADUMMIN, in Scripture Geography, a town and mountain in the tribe of Benjamin, which some place south and others north of Jericho. If, as some say, the road from Jerufalem to Jericho passed through this town, it must have been well of Jericho. Josh. xvi. 7.—xviii. 17. The mountain of Adummin, which Dr. Shaw assigns to the tribe of Judah, joins to the mountain of Quarantania, and through it, he says, is cut the road that leads from Jerufalem to Jericho; a difficult path, the mountain of blood, or the bloody road, as the name may import: where probably it was, from the nature of the situation, that the man fell among thieves, mentioned in Luke x. 30. Shaw's Trav. vol. ii 276.

ADUNA, a river of Sufiana, mentioned by Pliny, tom. 1. p. 314.

ADUNICATI, a people of Gaul, in that part which was called the Roman Province.

ADVOCARIA, in Middle Age Writers, a tax paid the lord for his protection; sometimes also called salva-

mentum.

ADVOCATE, Advovatus, compounded of ad, to, and vocare, to call, q. d. I call to my aid or defence, among the Romans, a person skilled in their law, and who undertook the defence of causes at the bar. The Roman advocates answered to one part of the office of a barrister among us, viz. the pleading part; for they never gave counsel, that being the business of the jurifconsults. The Romans, in the first ages of their state, held the profession of an advocate in great honour; and the fees of their bar were crowded with senatoral and consulas: they, whose voices commanded the people, thinking it an honour to be employed in defending them.

They were styled comites, honorati, clarissimi, and even patroni; as if their clients were not less obliged to them, than freed-men to their masters. See Patron.

The bar was not at that time venal.—Those who aspired to honours and offices, took this way of gaining an interest in the people, and always pleased gratia.

But no sooner were luxury and corruption brought into the commonswealth, than the bar became a faher in them.

—Then it was that the senators let out their voices for pay, and zeal and eloquence were fold to the highest bidder.

To put a fop to this abuse, the tribune Cincius procured a law to be passed, A. U. c. 50, called from him Lex Cincius, whereby the advocates were forbid to take any money of their clients.—Frd. Brunerus has published an ample com-

ment upon this law.

It had before this been prohibited the advocates to take any present or gratuities for their pleading. — The emperor Augustus added a penalty to it, subjeting those who took money to the forfeiture of four times the sum they received; notwithstanding which, the advocates played their part fo well, that the emperor Claudius thought it an extraordinary circumstance, when he obliged them not to take above as many sertices as are equivalent to eighty pounds Sterling, or upwards, for pleading each cause.

On occasion of Sullius's receiving four hundred thousand sertices for about 3200 L. from an illibustus knight, and afterwards betraying him, the lex cincius, revived by Augustus, which prohibited advocates from receiving either money or presents from their clients, was enforced; and Claudius, it is said, allowed advocates to take as much as ten thousand sertices, or about 800 L.; but if they took more they were to be prosecuted for extortion. This regulation passed into a law. Nero, in his first speech to the Senate, declared his purpose of reviving and enforcing the ancient laws, by which advocates were forbidden to receive fees. It was an apothegm of Thraseas, who suffered death under this Emperor, A. D. 66, that advocates should undertake only the causes of their friends, of people in distress, and such as might tend to fet good examples and purify the morals.

Pliny, Ep. vi. 29. Alexander Severus gave stipends to the advocates in the provinces, provided he was well assured that they pleaded without being fued by their clients. But the injunction which disallowed advocates from receiving any thing of their clients was found to be impracticable in its utmost rigour. Accordingly, Conflantine did not attempt to revive it; but he pronounces those advocates, who obliged their clients to make over to them by deeds the best part of their property in land, cattle, or slaves, or who prostituted their talents in this odious trade, unworthy to be admitted into the company of honeml men, and he excluded them from the bar. Cod. Theod. tit. 10. leg. 1.

ADVOCATE is still used in countries, and courts, where the civil law obtains, for those who plead and defend the causes of clients trusted to them.

In the English courts, advocates are more generally called COUNSEL.

In Scotland they have a college, or Faculty of Advocates, about 200 in number, appointed to plead in all causes before the Courts of Session, Juiiciary, and Exchequer. They are also intitled to plead in the House of Peers, and other supreme courts in England. A candidate for the office of advocate under-

goes three succesive trials; the first in Latin, upon the civil law, and Greek and Roman antiquities; the second in English, upon the municipal law of Scotland; and in the third, he defends a Latin thesis, which is impeached by three members of the faculty. Before he puts on the gown, he makes a short speech in Latin to the lords, and then takes the oaths to the government, and de fidelis. From this respectable body, all vacancies on the bench are generally supplied. In 1660, the faculty founded a library upon a very extensive plan, suggested by Sir George M'Kenzie, advocate to king Charles I., who enriched it with many valuable books. The collection has been gradually increasing, and it now consists of many valuable books on law and other subjects; several original MSS. and a great variety of Jewish, Grecian, Roman, Scots, and English coins and medals.

By the articles of the Union, none are to be named ordi-

nary lords of session, except those who have been advocates, or principal clerks of session for five years, &c.

In France, they had also two kinds of advocates, viz.

pleading advocates, avocats plaidants ; and counsel advocates, avocats confultants. This distinction was formed with a view to the two branches among the Romans, advocati, and jurif-

confulti.—Yet there is this difference, that the function of the jurifconfulti, who only gave their advice, was of a different kind from that of the advocatii: being a sort of private and
and perpetual magistrature, principally under the first emperors; and the advocate never became jurisconsult. Whereas, on the other hand, in France, after the advocates have attained to reputation and experience enough at the bar, they quit the province, and become a kind of chamber-counsel. — They had also their advocate general, and king's advocate, avocat du roy.

Advocate, Lord, or King's, in Scotland, one of the eight great officers of state, whose business is to give his advice about the making and executing of laws; to defend the king's right and interest in all public meetings; to prosecute all capital crimes before the judiciary; to concur in all pursuits before foreign courts for breaches of the peace; and also in all matters wherein the king, or his donor, has interest. — He inverts no process of treason, except by warrant of privy-council.

The lord advocate is sometimes an ordinary lord of session; in which case he only pleads in the king's cause; otherwise he is at liberty to plead in all causes.

He is the principal crown-lawyer in Scotland, and has the privilege of wearing his hat when he pleads in court. The office of king's advocate is not very ancient; having been established about the beginning of the 16th century. He had not originally the power of prosecuting crimes without the concurrence of a private party; but in 1597, he was authorized to prosecute crimes at his own instance.

Advocate of a city, or town, is a magistrate established in several places of Germany, for the administration of justice in that city, in the emperor's name. See Adovosse.

Advocate is more particularly used, in Church History, for a person appointed to defend the rights and revenues of a church or religious house.

The word advocate, or adovosse, is still retained, for what we usually call the patron, or him who has the advowson, or right of presentation, in his own name.

The abbots and monasteries had also all their advocates, or adovosse. See Adiminculator.

There are several other kinds of advocates; as

Advocate, confessorial, is an officer of the court of Rome, whose business it is to plead on the oppositions made to the provisions of benefices in that court. There are ten of these in number.

Advocates, elective, those chosen by the abbot, bishop, or chapter, a particular licence being had from the king, or prince, for that purpose. The elections were originally made in the presence of the count of the province.

Advocates, feudal, were of the military kind, who, to make them more zealous for the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. These were to lead the vassals of the church to war, not only in private quarrels of the church itself, but in military expeditions for the king's service, in which they were the standard-bearers of their churches.

Advocate, fiscal, fiscalis Advocatus, was an officer instituted by the emperor Adrian, to defend the cause and interests of the fiscus, or private treasury, in the several tribunals where that might be concerned.

Advocates, juridical, in the Middle Age, were those who from attending causes in the court of the comte, or court of the province, became judges themselves, and held courts of their vassals thrice a year, under the name of the tria placiad generalia.

In consideration of this farther service, they had a particular allowance of one third part of all fines, or mulcts, imposed on defaulters, &c. which was called tertia bonorum pars, terius damarius, tertia pars compositionem, tertia pars legum, or emendatorum, &c.; besides a proportion of diet for themselves and servants.

Advocates, matricular, were the advocates of the mother or cathedral churches.

Advocates, military, those appointed for the defence of the church, rather by arms and authority, than by pleading and eloquence.

These were introduced in the times of confusion, when every person was obliged to maintain their own property by force; bishops and abbots not being permitted to bear arms, and the scholastic or gowned advocates being equally unacquainted with them, recourse was had to knights, noblemen, soldiers, or even to princes.

Advocates, nominatives, those appointed by a king, or pope. Sometimes the churches petitioned kings, &c. to appoint them an advocate; at other times this was done of their own accord. By some regulations, no person was capable of being elected advocate, unless he had an estate in land in the same county.

Advocates, regular, those duly formed and qualified for their profession, by a proper course of study, the requisite oath, subscription, licence, &c.

Advocates, subordinate, those appointed by other superiors, acting under them, and accountable to them.

There were divers reasons for the creation of these subordinate advocates: as, the superior quality of the principal advocate, his being detained in war, or being involved in other affairs; but chiefly the too great distance of some of the church lands, and their lying in the dominions of foreign princes.

Advocates, supreme, or sovereign, were those who had the authority in chief, but acted by deputies, or subordinate advocates. These were also called principal, greater, and sometimes general advocates. — Such in many cases were kings, &c. when either they had been chosen advocates, or became such by being founders, or endowors of churches. Princes had also another title to advocate himself, some of them pretending to be advocati nati of the churches within their dominions.

ADVOCATIA, in the Fesdal Law, the procurement of some public business, committed by a superior to his substitute.

ADVOCATIA is also used for the patronage and protection of a church, college, monastery, and the like, in which sense it amounts to the same with ADYVOSSE.

ADVOCATIA is also used for the protection and defence of lay persons, estates, &c.

ADVOCATION, ADVOCATIO, in the Civil Law, the act of calling another to our aid, relief, or defence.

Advocation, bill of, in Scots law, a writing drawn up in the form of a petition; whereby a party, in an action before an inferior court, applies to the supreme court, or Court of Seffion, for calling the action from the inferior court before itself.

Advocation, letters of, in Scots law, the decree or warrant of the Court of Seffion, upon cognizance of the facts set forth in the bill, drawn up in the form of a summons, and passing under the signet, disfranchising the inferior judge, and all others from farther procedure in the cause, and advocating it to itself.

The grounds upon which these letters may be sought, are incompetency, comprehending defect of jurisdiction, and reasons for declining competent jurisdiction, arising from supposition of the judge, or privilege in the parties; and iniquity, which happens when the judge delays justice, or pronounces sentence contrary to law. No cause for a sum below twelve pounds can be advocated from an inferior court to the Court of
of Seftion, unless the inferior judge be incompetent, in which case the cause may be removed from him by advocation, however incomconsiderable the subject.

If after letters of advocation are intimated to the judge, he yet proceeds, his degree will be null, as given sumpio mandato. Mackenzie, Inf.

ADVOCATIONE Decimarum, a writ which lies for the claim of the fourth part, or upwards, of the tythes that belong to any church. Reg. Orig. 29.

ADVOCATURA, in Writers of the Middle and Barbary Ages, denotes an inferior kind of jurisdiction, exercised by advocates within the district of their respective churches, &c. The word is sometimes used as synonymous with advocatio. Du-Cange.

ADVOWEE, in Ancient Censoms, and Law Books, denotes the advocate of a church, religious house, or the like.

The word is otherwise written avoouee, advowee, and avowee; sometimes advowr; being derived from avow, to own, or acknowledge.

There are advocates of cathedrals, abbeys, monasteries, &c. Thus Charlemagne had the title of advowee of St. Peter's, and he is said to have been the first on whom the title of advowee was conferred by the pope, for having protected Italy and the church against the Lombards; king Hugh, of St. Riquier; and Bolandus mentions some letters of pope Nicholas, for which he constituted king Edward the Confessor, and his succession, advowees of the monastery of Westminister, and of all the churches in England.

The advowees were the guardians, protectors, and administrators of the temporal concerns of the churches, &c. and under their authority were paid all contracts which related to them.

It appears also, from the most ancient charters, that the donations made to churches were conferred on the persons of the advowees. They always pleased the cauës of the churches in court, and distributed justice for them, in the places under their jurisdiction. They also commanded the forces furnished by their monasteries, &c. for the war; and even were their champions, and sometimes maintained duchs for them.

This office is said to have been first introduced in the fourth century, in the time of Stillicco; though the Benedictines do not fix its origin before the eighth century.

By degrees, men of the first rank were brought into it, as it was found necessary, either to defend with arms, or to protect with power and authority. In some monasteries they were only called confessors; but these without the name had all the functions of advowees. The imperial advowse was a magistrate formerly established by the emperors to administer justice in their name, in the cities of the empire.

There were also sometimes several sub-advowees, or sub-advocates, in each monastery, who officiated instead of the advowees themselves; which, however, proved the ruin of monasteries; those inferior officers running into great abuses. Hence also, husbands, tutors, and every person in general who took upon him the defence of another, were denominated advowees, or advocates. Hence several cities had their advowees; which were established long after the ecclesiastical ones, and doubtless from their example. Thus, we read in history of the advowees of Augsburg, of Arras, &c.

The vidames, assumed the quality of advowees; and hence it is, that several historians of the eighth century confounded the two functions together.

Hence also it is, that several secular lords in Germany bear mitres for their crests, as having anciently been advowees of the great churches.

Speelman distinguishes two kinds of ecclesiastical advowees.

—The one, of cauës, or procelves, advocati consuern; the other, of territory, or lands, advocati foli.

The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries.

The other, who still subsist, and are sometimes called by their primitive name, advowees, though more usually patrons, were hereditary; as being the founders and endowers of churches, &c. or their heirs.

Women were sometimes advowees, advocatrices. And, in effect, the canon law mentions some who had this title, and who had the fame right of prelections, &c. in their churches, which the advowees themselves had.

In a flat, 25 Ed. III. we meet with advoures paramount, for the highest patron; that is, the king.

There are also advowees of counties and provinces,—In a charter of the year 1187, Berthold duke of Zerlingen is called advouee of Thuringia; and in the Notitia of the Belgian churches, published by Mirens, the count of Looyain is styled count and advouee of Brabant. In the 11th and 12th centuries we also meet with the advowes of Alhafia, of Susanta, &c.

ADVOWING, or AVOWING, ADVOCATE, in Law. See AVOWRY.

ADVOWSON. See ADVOCATIA.

ADVOWSON, or ADVOUZEN, in Common Law, signifies a right to present to a vacant benefice.

Advowson is so called, because the right of preenting to the church was first gained by such as were founders, benefactors, or maintainers of the church. viz. ratione fundationis, where the ancestor was founder of the church; or ratione donationis, where he endowed the church; or ratione fundis, where he gave the soil whereupon the church was built; and therefore they were called advocati. They were also called patroni, and thereupon the advowson is called jus patronatus; and he who has the right of advowson is called the patron of the church. An advowson is, strictly speaking, an incorporeal hereditament; for it is not itself the body possession of the church, and its appendages, but a right of giving to some other person a title to such body possession. The patronage can only be conveyed by operation of law, by verbal grant, either oral or written, which is a kind of invisible, mental transfer; and being so vested it lies dormant and unnoticed, till occasion call it forth; when it produces a visible, corporeal fruit, by eniting some clerk, whom the patron shall please to nominate, to enter and receive body possession of the lands and tenements of the church. 1 Inf. 119. Fleta, lib. v. cap. 14.

Though the nomination of fit persons to officiate in every diocese was originally in the bishop, yet they were content to let the founders of churches have the nomination of the persons to the churches so founded, referring to themselves a right to judge of the fitness of the persons so nominated.

Gibb. iii. ed. 756.

Advowsons are of two kinds. 1. Advowson in gross, or a right subsisting in itself, belonging to a person, and not adhering to any manor or lands as parcels thereof. 2. Advowson appendant, which depends on a manor, as appurtenant to it. This will pass, or be conveyed, together with the manor, as incident and appendant thereto, by a grant of the manor only, without adding any other words.

Advowsons formerly were most of them appendant to manors, and the patrons were parochial barons: the lordship of the manor, and patronage of the church, were seldom in different hands, until advowsons were given to religious houses.
hounes. But of late times, the lordship of the manor, and ad
dowfon of the church, have been divided.

Advowsons are also presentative, collative, or donative: presentative, where the patron pre
dents or offers his clerk to the bishop of the diocese, to be instituted in his church, if he be
found canonically qualified: collative, where the benefice is given by the bishop, as original patron thereof, or by means of the right he has acquired by life, in which case the bishop cannot preent to himself; but he does by the one act of collation or conferring the benefice, the whole that is done in common callis, by both presentation and
institutive; donative, as where the king, or any subject by his licence, founds a church or chapel, and ordains that it shall be merely in the gift or disposal of the patron, subject to his visitation only, and not to that of the ordinary, and vested absolutely in the clerk by the patron's deed of
donation without presentation, institution, or induction. This is said to have been ancienly the only way of conferring ecclesiastical benefices in England. See Institution.

If, as the law now stands, the true patron once waves this privilege of donation, and preents to the bishop, and his clerk is admitted and instituted, the advowson is now become for ever presentative, and shall never be donative any more.

Sometimes, ancienly, the patron had the sole nomination of the prelate, abbot, or prior; either by infeuiture (i.e. delivery of a pastoral staff,) or by direct presentation to the diocesan; and if a free election was left to the religious, yet a conge d'elire, or licence of election, was first to be ob
tained of the patron, and the person elected was confirmed by him.

If the founder's family became extinct, the patronage of the convent went to the lord of the manor. Unless the several colleges in the universities be restrained in the number of advowsons they may receive; it is argued they will in time acquire such a stock as to frustrate the design of their foundation, (which is the education of youth,) by creating too quick a succession of fellows; so that there will not be in the colleges a sufficient number of persons of competent age, knowledge, and experience to instruct and form the minds of the youth. In some colleges the number of advowsons is said to be already two-thirds, or more, of the number of fellows. It is objected, on the other side, that the succession of fellows may be too slow, as well as too quick; whereby persons well qualified may be detained too long in colleges, as not to have strength or activity enough left for the discharge of parochial functions.

Colleges holding more advowsons in number than a moiety of the fellows, are not capable of purchasing more. Grants of advowsons by papists are void. 9 Geo. II. c. 36. § 5. 11 Geo. II. c. 17. § 2.

Advowsons are temporal inheritances, and lay fees; they may be granted by deed or will, and are affect in the hands of heirs or executors. The recovery of advowsons, as temporal rights, was effectually provided for by one of the ex
cellent regulations of Edward I. Before his time the law, in this respect, was extremely deficient.

Presentations to advowsons, for money or other reward, are void. 13 Eliz. cap. 6. See Burn's Eccl. Law, vol. i.

Advowson of the Moiety of the Church, is where there are two several patrons and two several incumbents in the same church, the one of the one moiety and the other of the other moiety. A moiety of the advowson is where two must join in the presentation and there is but one incumbent. See Stat. 7 Anne, c. 18. In Scotland the right of advow
don is called Patronage.

ADVOWTRY. See Adultery.

ADUR, in Geography, a river of Sussex that falls into the sea at Shoreham, and admits ships of burden to go up to the town.

ADUST, ADUSTUS, formed of adustre, to burn, among Physicians, &c. is applied to such humours, as by long heat become of a hot and fiery nature.

Such is choler suppos'd to be. Melancholy is usually cons'd as black and adult bile.

Blood is said to be admitt, when, by reason of some extraordinary heat, its more subtile parts are all evaporated, leaving the grosser, with all the impurities therein, half torrified.

ADUSTION, in Surgery, is the same as Caustification, and signifies the application of any subtile to the animal body, which acts like fire. See Caustury and Caustic. The ancient turgons, especially the Arabians, were remarkably fond of having recourse to adustion in local diseases; but the use of actual heat is very rarely admitted by the moderous. See MOsa.

ADUSTION, among Physicians, is used for an inflammation of the parts about the brain, and its membranes, attended with a hollowness of the spine, and eyes, a pale colour, and dryness of the body; in which case the yolk of an egg, with oil of roses, applied by way of cataplasm is recommended; as are the leaves of turpoul, the parings of a gourd, the pulp of a pomepon, applied in the same manner with oil of roses.

ADY, in Natural History, a name given to the palm-tree of the island of St. Thomas. It is a tall tree with a thick, bare, upright stem, growing single on its root, of a thin light timber, and full of juice. The head of this tree is divided into a vast number of branches, which being cut off, or an incision being made therein, afford a great quantity of sweet juice, which, fermenting, supplies the place of water, among the Indians.

The fruit of this tree is called by the Portuguese canjores, and caraffes; and by the black natives ABANGA. This fruit is of the size and shape of a lemon, and contains a kernel, which is good to eat. The fruit itself is eaten roasted, and the raw kernels are often mixed with mandioec meal. These kernels are suppos'd very cordial. An oil is also prepared from the fruit, which answers the purpose of oil, or butter, in Europe.

This oil is also used for anointing stuff and contrasted parts of the body. Ray.

ADYLISUS, in Ancient Geography, a mountain which Pliny places in Barotia.

ADYNAMIA, in Medicine, formed of the primitive α- and δυνς, strength, debility or weakness from sickness. Accordingly Adynamus, denote those affections of the hu
mor body which form the second order of the second class in the arrangement of Dr. Cullen, and which he defines to be a diminution of the involuntary motions, whether vital or natural. This is a distinct class in the dissection of Vogel. It comprehends the genera of feçopse, dyspepsia, hypochondriasis, and choleris. Some naturalists place these under debilitates, and Linnaus calls them quietes. See Nosology.

ADYNAMON, among Ancient Physicians, a kind of weak flatulent wine, prepared from malt boiled down with water; to be given to patients, to whom genuine wine might be hurtful.

ADYRMACHIDES, or ADYRMACHITE, in Ancient Geography, a people of Libya, inhabiting the sea-coast, near the Canopic mouth of the Nile. Herodotus (l. iv. c. 168.) describes them as resembling the Egyptians in their customs and manners. Silius Italicus refers to them, lib. iii. v. 278. p. 149. Ed. Drakenb.
ADYTUM, a secret or retired place in the Pagan temples, where oracles were given, and into which none but the priests were admitted. Thus Seneca in his tragedy of Thycides (iv. 1. 679).
"Hinc orantibus
Responfa dant certa, cum ingenti fono
Laxantrum adyo fata."

The word originally signifies inaccessible; being compounded of a not, and bos, or bow, to enter.

The Santhum Santurum, or Holy of Holies, of the temple of Solomon was of the nature of the Pagan adytum, none but the high-priest being admitted into it, and he but once a year, on the great day of expiation. After the Babylonish captivity this place wanted the ark, the mercy seat, the cherubim of the divine presence, and the Urim and Thummim; the defect of these causing an imperfection in the Jewish worshipping, compared with the former state of it, a restoration of them is devoutly supplicated in the Jewish liturgy; particularly, in the maima rach of it, which they call Semachnot Elveh or, the eighteen prayers.

ADZE, or Adzice, a cutting tool, of the axe kind; having its blade made thin, and arching, and its edge at right angles to the handle; chiefly used for taking thin chips off timbers or boards, and for paring away certain irregularities which the axe cannot come at.

The adze is used by carpenters, but more by cooperers, as being convenient for cutting the hollow sides of boards, &c. It is ground from a base on its inside to its outer edge; so that when it is blunt they cannot conveniently grind it, without taking its helve out of the eye.

ADZELI, in Geography, a mean place in the government of Riga, subject to Ruffia. N. lat. 50°. 30'. E. long. 38°. 5'.

ADZENETA, a small town of Valencia, in Spain, leaved on the mountain Pegna Golfo, in which grow multitudes of esculent plants. N. lat. 40°. 30'. W. long. 7°. 16'.

ADZUD, a town of Moldavia in European Turkey, nine miles west-south-west of Birtsch, 7th. E. or A. E., a diphthong, or double vowel, compounded of A and E.

Authors are by no means agreed as to the use of the æ in English words.—Some out of regard to etymology, infilt on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; whilst others, from a consideration that it is no proper diphthong in our language, its found being no other than that of the simple e, contend that it ought to be entirely disused; and, in fact, the simple e has of late been adopted instead of the Roman æ; as in the word equator, &c.

ÆA, in Ancient Geography, a considerable and celebrated city and port of Colchis, near the river Phasis, and distant from the sea, according to Pliny, (H. N. i. vi. c. 4. t. l. p. 304.) 13 miles, but according to Stephanus (de Urb. p. 56.) more than 37 miles. It was encompassed by the rivers Hippos, so called from its rapidity, and Cyane, so denominated from its colour, near their confluence in the Phasis, and thus formed into a kind of peninsula. Some have conjectured that it was the fame with the Egeia of Ptolemy; and that it derived its name either from the Greek Æa, earth, or from the Hebrew Æ, island. The Circe obtained the appellation of Æa from this city. See Homer's Odys. i. ix. v. 37. and Virgil i. iii. v. 386. It is also repeatedly mentioned by Apollonius Rhodius, as a place to which the river was navigable. Argonautic i. ii. v. 423.-450. pp. 188. 250. Ed. Heelzlin. Ovid likewise (in his Metam. i. vii. v. 9. tom. ii. p. 446. Ed. Burman.) speaks of the
"Validus Ætas ignes."

Tradition ascribes its origin to the famous Setostoris, king of Egypt, who, after having traversed the whole of Asia with his army, left a colony in Colchis, and there erected pillars of stone upon which were engraved, according to Apollonius, the names and position of the countries through which he had passed. Phiny and Strabo also represent it as the abode of king Æa, and the theatre of the adventures of his daughter Medea. It had a temple dedicated to the god Mars, and another to Phryxus. It was anciently famous for its gold and silver, and other metals, which might have given occasion to the Argonautic expedition, first by Phryxus and afterwards by Jason. Strabo. Geog. tom. i. p. 37. &c. It is now Lipsopotamo.

There was another town called Æa, in Thessaly; and a fountain of this name in Macedon.

ÆAEA, the name of an island, which Mela (l. ii. c. 7.) supposes to have been situated in the bay of Sicily, and to have been the habitation of Calypso. Since he has probably considered the name of the island and with that of Æa above mentioned; as both the island of Calypso, or Ogygia, and that of Circe, or Æa, are far distant from the coast of Sicily.

ÆACEA, in Antiquity, a solemn feast and combat, celebrated in Ægina, in honour of Æacus, who had been their king, and who, on account of his singular justice upon earth, was supposed to have a commission given him to be a prince or judge, whose office it was to preside over Elyium, or the region of bliss. This Æacus, it is said, was the son of Jupiter and Ægina; and when his country was depopulated by a plague, he is reported to have obtained of Jupiter a supply of inhabitants, who, at his request, converted ants into men; whence they were called Myrmidons, from μυρμήνες, ants. The meaning of the fable seems to be that he drew them out of their caves into which they had retired for security, when they were invaded by pirates, and encouraged them to apply to agriculture and commerce; so that by their industry they recovered what they had lost.—See also ÆGAIA.

Æacus, in Entomology, a species of the sphinct, having fix yellow points on the fore wings, and the latter yellow, with the margin of an azure colour. It is found in Austria.

ÆAMENE, in Ancient Geography, a country of the Nabhazians, in Arabia.

ÆANA, a city of Macedonia, founded by Æanus, son of Elymus, king of the Tyrrhenians, who, leaving his own country, inhabited Macedonia.

ÆANIS, a fountain of Locoris, situated in the sacred grove called Æanina lacus, so called, according to Strabo, from a Greek named Æanes, who was killed there by Patroclus.

ÆANITIS, a country of the Nabhazians.

ÆANTIDES, a tribe of Attica, which comprehended six different people, viz. theofe of Marathon, Ænone, Phthia, Rhamnus, Titacide and Triceuthys.

ÆANTIVM, or AYTACUM, a small place in Asia, upon a promontory north-west of Rhethium. Here, it is said, Ajax was buried. His statue found in this place, was taken away by Marc Antony, and restored by Augustus.

ÆANTIVM was also a name given to Thapsus, in the extremity of the peninsula, which contained Magnesia, opposite to Thebes of Thessaly, and at the entrance of the Pelagic gulph.

ÆAS, a river of Greece, which sprang from Mount Pinthus, and flowed into the Adriatic sea, about 10 stadia from the city of Apollonia. This is supposed to have been the same with the river Aucus. Strabo. tom. i. p. 456.
ÆLIUS, in Entomologia, a species of Papilio, with the wings black above, cinereous beneath, waved with black, and with a yellow ocellated spot. It is found in Ambrovia.

ÆCULANUM, or AECULANUM, in Ancient Geography, a town of the Urpinii in Italy, situated between Beneventum and Tarentum. The inhabitants are called by Pliny (tom. i. p. 167) Aculani, and in an ancient inscription of Gruter Aculaneae. The town, according to Cluverius, is now called Fricento.

ÆDEA, in Entomologia, a species of Papilio, with wings dotted with white, the anterior greenish, the posterior marked with a yellow band; found in South America.

ÆDELITE. See Zeolite.

ÆDES Plutonis, baths of Aldeias, in Ancient Geography, the name of a city in the island of Euboea upon the western coast. The baths were consecrated to Hercules.

ÆDES, in Antiquity, a chapel, or inferior kind of temple, distinguished by this, that it was not consecrated by the Augurs, as those properly called Templum was. Such was the aurum, or treasury; called Ædes Satunis.

ÆIDESIUS, in Biography, the disciple and successor of Jamblichus, lived in Cappadocia, and, after the example of his master, pretended to supernatural communications with the Deity, and practiced theurgic arts. Of the events that occurred to him the most ludicrous is this: viz. That, in answer to his prayers, his future fate was revealed to him in hexameter verses, which suddenly appeared upon the palm of his left hand. Towards the close of his life, he committed his school at Cappadocia to the care of his disciple and friend Euthalitus, and removed to Pergamus, where he had a numerous train of followers. Brucker's Hist. Phil. by Eusfeld, vol. ii. p. 75.

ÆDICULA, in Antiquity, a term, denoting the inner part of the aedes or temple, in which the altar and statue of the deity were placed; but the term had various acceptations. It sometimes denoted a low small building, or aedes parva, consecrated to some divinity; it often signified a niche in the wall for receiving a statue, and those especially of the Lacin or Pentes; and sometimes the representations of temples, which were offered and suspended in the temples of the gods, and more especially in that of Diana of Ephesus.

ÆDICULUS, in Roman Mythology, the deity who presided over the construction and consecration of buildings.

ÆDILATE, in Antiquity, the dignity or magistracy of the Roman Ædiles. This is otherwise called Eciditus. In inscriptions we find it represented by the abbreviation. ÆD.

ÆDILE, ÆDELS, in Antiquity, a Roman magistrate, vested with divers functions, chiefly that of superintending the buildings both public and private; as baths, aqueducts, roads, bridges, caufeways, &c. The word is formed of aedes, temple, or house, on account of their having the care of temples, houses, &c.

The Ædiles at Rome corresponded to what the Greeks called agoras, or agironomis; they differed from ecretor, or arcarias, who were either receivers of the revenues; also from logia, curatures, & houses custoders.

To the Ædiles belonged the inspection of the weights and measures. They fixed the rate of provisions, and took care the people suffered no exactions. The inquiry and cognizance of debauchees, and disorder in public houses, likewise belonged to them; they were also to revive comedies; and it belonged to them to treat the people with grand games and spectacles, at their own expense. They were likewise to attend on the tribunes of the people.

To the Ædiles also belonged the custody of the plebeians, and the curfew and examination of books. They had the power,
power, on certain occasions, of inflicting ediles; and, by degree, they procured to themselves a considerable jurisdiction, the cognizance of various causes, &c.—This office ruined numbers by its exorbitant expenses; so that in Augustus’s time, even many senators declined it, on that account.

All these functions, which rendered the ediles so considerable, belonged at first to the ediles of the people, ediles plebei, or miniors: these were only two in number, and were first created in the same year as the tribunes: for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers, with whom they might intrust matters of less importance, and accordingly two ediles were created: and hence it was, that the ediles were elected every year, at the same assembly as the tribunes. These plebeian ediles continued in the sole possession of the office during the space of 137 years, from the year of Rome 261, when they were appointed, to the year 388. But these ediles having refused to celebrate the great games, on occasion of the reconciliation that took place between the senate and people in consequence of the grant that one of their order should be consul, because the celebration was attended with an expense which they were unable to support, the Patricians offered to undertake the charge, upon condition that they should obtain the honours of the edilship. Their offer was accepted with gratitude; and the senate passed a decree for the election of two ediles annually out of the order of the patricians. From this time there were two kinds of ediles at Rome; the one were called Plebian Ediles; the other were called Ediles Curules, or Magistri Sex. i.e. Curule Ediles, because they had the right of sitting in a Curule chair, adorned with ivory, when they gave audience: whereas the plebeian ediles sat on benches: and this chair was placed in the chariot in which they were carried; a distinction annexed to the great offices of the commonwealth.

It is not easy to describe exactly the different functions of these two kinds of ediles. It is probable, however, that the curule ediles shared all the ordinary functions with the plebeian; but their principal and distinguishing office pertained, according to Cicero, in the last of his orations against Verres, (Oper. t. 4. p. 504. Ed. Olivier) to their presiding in the games celebrated in honour of different divinities, to the care of the sacred ediles, and to the civil government of Rome in general. They were also appointed judges in all cases relating to the selling or exchanging of ediles. The distinctions which these ediles enjoyed were the right of giving their opinion in the senate, not according to the date of their admission into that body, but a more honourable rank, the robe called toga praestans, the curule chair, and the right of having images, which were set up in their halls and carried in pomp at their funerals; all of which were privileges that were annexed to the great offices of state.

The first curule dignity held at Rome was the edilship, and the age for entering into that office was 37. In two years it was succeeded by the praetorship, and after the like interval, by the office of consul. The manner in which the office of edile was fulfilled, and particularly in the exhibition of games, very much contributed either to gain or alienate the attachment of the people with respect to the other dignities. The expense attending the games and shows was, in some cases, enormous. Cicero was moderate, as he informs us in his Offices, I. 2. apud oper. tom. 3. p. 553. Ed. Olivier. But the expenses of others in that department of their office which respected the games were so exorbitant, as to give Livy reason for observing, that the revenues of the most opulent princes would hardly suffice to support them. Of this fact we have a memorable example in the edilship of M. Scaurus, in the 69th year of Rome; so that Pliny, (I. 56. c. 15.) from the almost incredible provision which this edile bestowed upon the theatre which he erected, took occasion to exclaim, that the edilship of Scaurus finally ruined and subverted the manners of the public.

Augustus transferred the care of the public shows and sports to the pretors, and would not allow them to be exhibited at their own charge; but obliged the people to contribute a part, and paid the rest out of the public treasury.

To raise these four first ediles Caesar created a new kind, called ediles cereales, as being deputed chiefly to take care of the corn, which was called donum Cereris; for the heathens honoured Ceres as the goddess who prefided over corn, and attributed to her the invention of agriculture. These ediles cereales were also taken out of the order of patricians. In the municipal cities there were ediles, with the same authority as at Rome.

We also read of an ediles alimentarius, expressed in abbreviature by Edil. alim. whose business seems to have been to provide diet for those who were maintained at the public charge, though others affin him a different office.

In ancient inscriptions we also meet with ediles of the camp, ediles camporum.

Adilis, in Entomology, a species of the Cerambyx with a spinice thorax, marked with four yellow spots, with obtuse nebulous elytra and very long antennae. It is found in the trunks of trees in Europe; and is also called Cupriomus Rufus.

Dilium, among the Romans, was that whereby a remedy was given a buyer, in case a vicious, or unfound beast, or slave, was sold him. It was called dilium, because the prevention of frauds in sales and contracts belonged especially to the curule ediles.

Dilium, in Antiquity, the keeper of a sacred mansion, who had the care of the offerings and ornaments of the deity to whom it was peculiarly devoted.

The word is compounded of edilis, and tuor, i.e. I defend, q. d. a tuenda edilus; originally it was written editum.

The adilus is the same with what Scévola calls hierophylus, the Latins sometimes edilus, and the Greeks Εὔτερος, answering to the sexton among us.

The edilii, among the Romans, were officers of distinction, being the depositaries not only of the treasuries, but of the public acts, or records.—The edilii had their several cells, near the temples, the custody of which was committed to them. Stru. Ant. Rom.

The female deities had a female officer of the same kind, under the denomination edilina.

Edilus, Martin, in Biography, born at Amsterdam, was first physician to Frederic II. king of Denmark. Adrien Jongshe, dedicated his treatise "De Coma" to him, published at Bâle in 1558, whence it appears that he was then in high repute.

Editas, the same name as Pudenda.

Edon, in Ancient Geography, an island of Marmora, on the borders of Egypt.

Edon, in Orthonology, a species of Muscicapæ.

Edou, in Ancient History, a denomination given to the most ancient and powerful people of Gaul, who were situated between the rivers Seine, Loire and Saone, within the 47th and 47th degree of latitude; and who were the only allies Caesar had at the time of his invading Gaul.

Their country was fruitful, and furnished abundance of corn. Their principal city was Bibracte or Augeulis, now Autun. The form of their government was aristocratic; and they chose their chief magistrate annually.
ÆGA

This government only till ed the establishment of the Romans in Gaul. The Ædui then occupied the countries comprehended in the dioceses of Autun, Chalon, Mâcon, and part of that of Dijon. Their allies and their subjects comprehended the rest of La Bourgogne, La Breffe, Le Lyonnais, Le Beaujolais, Le Forez, Le Bourbonnois, and Le Nivernais.

ÆODUSI, allies of the Romans, bordering upon Celtic Gaul.

ÆGA, in Ancient Geography, a river of Phocis: a town of Æmonia:—an island between Tenedos and Chios:—and a promontory of Asia Minor. ÆGADAE, ÆGADAE, or ÆGADAE Ænule, three islands lying north of Cape Laibyma, or on the west side of Sicily opposite to the main land between Marsella and Tarpani; viz. Phribantia, or Bucinia, as Pliny calls it, Ægusa Caprarisa, and Hieria, called also Maritima. The first is now called Lavenzo, the second Favigonna, which is very fruitful, and the third Maretamo. In these islands the Romans under the Consul L. Catulus obtained a signal victory over the Carthaginians, which terminated the first Punic war.

ÆGÆ, or ÆGÆAN, is derived, as some have supposed, from the genitive Ægoς of ἀέα, a goat. See ÆGEA. But several ingenious moderns, and particularly the Abbé Ber ger and M. Gebelin, tracing the origin of the name to its primitive roots ἀ, ἀ, ἂ, have found that these words, in the Pelasgic and Celtic languages, denote waters or maritime countries; and they have concluded, that the appellation Æge is derived from the vicinity of the places to which it is applied to waters, or from their being better adapted to maritime commerce than other places. Accordingly they add, that Neptune was particularly honoured in the Ægean countries.

ÆGE was a city of Cilicia on a promontory in the gulf of Issicus, having Illus to the north-east, and Mallos to the north-west:—it was also a town of Macedonia, called ÆGEA and ÆDessa:—a town of the Thracian Chermonesus, probably Ægos Potamia:—a town in the Myrhlina, a country of Æolia, south of Cuma and eall of Phoceas, on the border of the gulf, which town, as Tacitus informs us, was overwhelmed by an earthquake:—a town of Lydia:—another of Locria:—another of Æolia:—another of the island of Euboea, where they had a temple of Neptune:—and another of Achaea, on the gulf of Corinth, at the mouth of the river Crathis, (see Homer ii. 1. viii. v. 288.) In Æge of Cilicia there were medals of gold, bronze, and silver. The symbol was half a horse: and rich imperial medals were struck here in honour of several of the Roman emperors. In Æge of Macedonia, the medals were silver, gold, and bronze; and the common type was a goat. In Æge of Æolia, which was governed by priests, there were struck Greek imperial medals in honour of some of the Roman emperors.

ÆGÆUS, the name of a river, mentioned by Suidas, in the island of Coreya. Stephanus Byzantinus, and Euflatingus speak of a canton in Phocis, under the name of Campus Ægæus, (τῆς ἄγαιας) taken from a river Ægæus which runs there.

ÆGAGROPIILA or ÆGAGROPHILUS, in Natural History, and in Veterinary Medicine, is a ball generated in the stomachs of some animals. There are two species of intestinal collections that have this appellation, but which are entirely dissimilar. The one is composed of hair, and is very usually found in the stomach of the rupicapra, or chamois goat. The other species is truly a calculous concretion, which is found more frequently in the intestines of different animals, particularly of hares. It is this kind that is sometimes called bezoar Germanicum, or the German bezoar. The word is Greek, from ἄγας, the rupicapra or rock goat; and ἄγας, a ball. See BAlls, and Hair-Balls.

ÆGAGROPIlla, in Botany, a species of Conifera, with very ramose filaments closely united from the centre, and constituting a globe.

ÆGAGRUS, in Zoology. See Goat and Ibex.

ÆGALEUS Maen, in Ancient Geography, a mountain of Attica, near the Ille of Salamine:—a mountain also of Me fenia bears the same name.

ÆGARA, a town of Lydia, according to Ptolemy.

ÆGAS, a river of Phocis.

ÆGEA, a town of Mauritania Caesariensis, according to Ptolemy, who places it in long. 26°, and lat. 27° 10′.

ÆGEA or ÆDessa, now Vedena, was the ancient capital of Macedonia, the residence of Caranus, the first king of Macedon, and the burial-place of the kings of his line to the time of Alexander the Great. It derived its appellation, as it is pretended, from the following circumstance. Caranus, who was by birth an Argive, leaving his native country at the head of a considerable body of Greeks, was undetermined where they should settle. But upon consulting the oracle, he was instructed to establish his empire according to the direction of the goats. Ignorant of its meaning, he purposed his course to the country, afterwards called Macedon, and approached Edepha the capital of the small kingdom Αναθά, governed by king Mida. The fly was overcast, and a storm succeeded; upon which Caranus observed a herd of goats running for shelter into the city. This circumstance reminded him of the response of the oracle; and, commanding his men to follow him, he entered the city by surprise, and thus possessed himself of it and the whole kingdom. In gratitude to his conductors he changed the name of the place into Æges, and called his people Ægæus or Ægæadz; and introduced a goat into his standard in commemoration of the event. In the book of Daniel, the he-goat is the symbol of Macedonia. Pliny, l. iv. c. 10. tom. 1. p. 200. Ed. Hard. Medc's Works, B. iii. Comment. Apocal. p. 473.

ÆGÆAN Sea, a name given by the ancients to that portion of the Mediterranean, which extends from the promontory of Sunium and the island of Crête, as far as the Hellespont. It is now the Archipelago, separating Europe from Asia, walling on one side Greece and Macedon, and on the other Caria, Ionia and Phrygia. The origin of the appellation Ægean has been variously assigned. Pelus has recorded three etymologies; one that is derived from the numerous islands that are scattered over this sea, and which appear at a distance like a herd of goats; another, because the queen of the Amazonian population in it; and a third, because Ægæus the father of Theseus threw himself headlong into it. Vossius, however, and many other learned persons, are not satisfied with either of these etymologies; but conceive it to be derived from ἄγας Doric flatus; and that the waves are denominated Ægæus, i. e. goats, on account of the heaping motion of these animals. See ÆGEAN.

The navigation of this sea, which abounds with islands to the number of 53, from Tenedos to Crète, according to the enumeration of ancient geographers, and which are comprehended under the two general denominations of Cyclades and Sporades, is both difficult and dangerous: whence proceeds the proverb, he fails on the Ægean sea, or ἄγας μας; applied to a person who engages in a hazardous undertaking. The Ægean sea is usually divided into seven parts, viz. 1. The sea of Crète, between that island.
ÆGI

Island and the Peloponnesus. 2. The Myrtea sea, before Peloponnesus and Attica. 3. The sea of Greece, along the coast of Greece. 4. The sea of Macedonia, on the coasts of that kingdom and Thrace. 5. The Aegean sea, properly called between Euboea and Lemnos. 6. The Tarentian sea, towards the island of Icarus. 7. The Carpathian sea and that of Rhodes, lying between this island and that of Crete. The principal rivers running into this sea are the Aliakmon, Ergion, Aces, Stremon, and Nestus. The Aegean sea was peculiarly favourable to commerce by means of the spacious bays that were formed by it and the Asiatic coast, of which the most remarkable were the Strymonic, Sisicric, Thracian, and Thracian. 

ÆGIS, or EGIS, a tribe of Attica, so called from Ægeus the son of Pandion, contained 16 boroughs or towns.

ÆGELETHRON, in Botany, a name used by some authors for the common mercurialis, or English mercury, an estable wild herb.

ÆGELI, in Ancient Geography, a people of Media in Asia, supposed by some to be the name of the Ægili mentioned by Herodotus.

ÆGELICA, a town of Macedonia, which, as Livy informs us, was surprized by Attalus.

ÆGEON, in Entomology, a species of Scarabæus, of a red colour, with the horn of the thorax short and incurvated and bearded beneath; and that of the head recurved and subulate. It is found in South America and India.

ÆGEONIS, a promontory of the Euxine Sea, at the mouth of the river Rhynhachus, or on the confines of Myia and Bythia.

ÆGERI, or ÆGER, in Geography, a community of Switzerland, which forms with the town of Zug, and the community of Menfingen and Bar, the sovereignty of the canton of Zug. It is divided into two parishes; the higher Ægeri, where the council of the community is held, and lower Ægeri or Wilgeri near the lake Ægeri, which is a league in length and very deep, and abounds with fish. The river Lepus runs into it.

ÆGERIA, in Entomology, a species of Papilio, with dentated brown wings, spotted with yellow, and with an ocelus on both sides of the anterior wings, and four oceli on the upper side of the posterior wings, and four points under them. It is found on the graps in Europe.

ÆGESTA, a town of Sicily, called also Ægesta. It is now Barbares.

ÆGETA, ÆGETA, or ÆGITA, a town of Upper Mesia on the Danube, probably the Ægita of Ptolemy, is placed by M. d'Anville near Trajan's Bridge, south-west of Zernica.

ÆGUEUS, in Fabulous History, was king of Athens, and father of Theseus. Minos king of Crete, having subdued the Athenians, in a war occasioned by their murder of his son, inflicted upon them this penalty; that they should annually send into Crete seven of the noblest of the Athenian youths to be devoured by the Minotaur. After three years Theseus was sent; the young prince killed the Minotaur; but having forgotten to change the black face into white upon his return, according to the instructions given him by his father, Ægeus conceiving him to be dead, cast himself headlong into the sea, which, from this circumstance, says the fable, obtained the name of the Ægean sea. The Athenians decreed divine honours to Ægeus, and sacrificed to him as a marine deity, the adopted son of Neptune.

ÆGIGUS, or ÆGIOCHUS, in Mythology, a name given to Jupiter, on account of the goat Amalthea, by which he wasuckled.

ÆGIÆ, in Ancient Geography, a town of Laconia, south-west of Croesa: and a town allo of Ætolia, which, according to Diodorus, afforded fish.

ÆGIALA, a name anciently given to Achaia propria, or the kingdom of Sicily, and derived from Aegialus, the supposed founder and first monarch.

ÆGIALE, in Mythology, one of the three graces.

ÆGIALUS, in Ancient Geography, a small town of Asia Minor upon the Euxine, in the district belonging to the Henetii in Phylagnia; a place in Peloponnesus, between Seyone and Buphraum; a town of Thrace near Strimon; a town of Æthiopia, near the Nile: and a town of Sicily, afterwards called Mecone. In Ægialus of the Peloponnesus, Greek imperial medals were struck under the authority of the archons, in honour of Caracalla and Domna.

ÆGIAS, among the Ancient Greek Physicians, denotes a white speck on the pupil of the eye, occasioning a dimness of sight, either arising from an excrementitious humour, or from the relicà of the cicatricula of an ulcer on the part.

This is the same with what others write ægis and ægia.

ÆGICERAS, formed of æx, a goat, and xipx, a horn, in Botany, a genus of the class and order of pentandria monogynia; the characters of which are, that the calyx is a one-leaved, bell-shaped, half-five-cleft, coriaceous, permanent perianthium; the corolla has five petals; the stamina are five filaments, the pistillum is an oblong germen with a single style; the pentacarpiun is a bowed, coriaceous, one-celled, one-valved capsule, gripping on the convex side; and the seed is single. There are two species; one, a native of the Molucca islands, the rhizophora corniculata of Linnaeus; the other a native of Ceylon, Martyn.

ÆGICOREOS, in Ancient Geography, was one of the four first tribes of Attica.

ÆGIDA, the principal town on the north of the territory of Æthiopia in Italy, situated in a small island, joined to the land by a bridge. Phinis has preserved the ancient name, and in an inscription of Gruter, it is called Ægidis insula. It was afterwards called Jusinopolis, after the emperor Julian; and it is now Capo de Ætia. N. lat. 45° 50'. E. long. 14° 20'.

ÆGIDES, in Surgery, is a term employed by Hippocrates (Predicat. L. ii. artix) to denote an opacity of the cornea, which intercepts the rays of light passing through the pupil. See ALEUS, LEUCOMA, and OPHTHALMIA.

ÆGIDION, a name given to a collyrium for inflammations and defluxions of the eyes. It is also called æpidophasos.

ÆGIDION Insula, in Ancient Geography, a name given by Arrian to an island in the Indian Sea.

ÆGIDIVUS, PETRUS ALBENSIS, in Biography, was translated by Francis I. to visit the celebrated places in the East, and to learn their state. He was taken by pirates, but made his escape, and died of a fever in 1555, at the age of 65 years. His works are "De Scriptioriophori Thraciz," "De Scriptiori Urbis Constantinopolitani," "De Pichioe Maffilium nominibus Gallicis et Latinis," "De Elephanto." He likewise translated into Latin Theodorret's Commentary upon the twelve minor prophets, and Ælian's sixteen books of the history of animals.

ÆGIUS, furred Athens, was a Greek physician and philosopher under the emperor Tiberius II. in the eighth century. He became a Benedictine, and wrote several tracts, of which the principal are thofe; "De Puli- bus et de Venenis." Being accidentally wounded by an arrow,
ÆGI

arrow, he would not suffer the wound to be dressed, that he might exercise his fortitude in bearing pain.

ægidius de columna, a Roman monk of the Augustinian order, was preceptor to the sons of Philip III. of France, and taught philosophy and theology in the University of Paris with so much reputation, that he was honoured with the appellation of "The most profound Doctor." After being advanced to the rich bishopric of Berri, he died in 1316: leaving behind him on his monument the character of "Lux in lucem reductus dubia," i.e. the luminary that brought dark things to light; a character which his writings, on account of their profound and unanswerable obscurity, do not justify. Brucker's Hist. Philos. by Enfield, vol. ii. p. 370. His "Lucrations on the Sentences of Lombard," were printed at Bâil, in 1623. His work "On original Sin," in 4to. at Oxford, in 1479; and his "Questiones Metaphysicae et Quodlibeticae," at Venice in 1501.

ægidius cordekenzis, or Gilles de Cordeill, canon of Paris, was physician to Philip Augustus, king of France, and lived about the end of the twelfth century; "ex Salernitana Schola. Haller says, Medicus et Poeta." He wrote a treatise, "On Compound Medicines," in Latin verse, which has not been printed; also "Libror unus de Urimarum judiciis, et de Pulvisibus liber unus, Venetis impress, 1494," cum Expeditione et Commento M. Gentilis de Fulgenti: reprinted at Lyons 1495, and at Bâil 1579.

ægila, in Ascent Geography, a borough of Laconia, in the Peloponnese. Pausanias (p. 326.) informs us, that it had a temple of Ceres, in which Arilömenos, a general of the Macedonians, surprised an assembly of women, who were celebrating a feast in it; and that the women not only defended themselves, but repulsed him, without any arms beside the knives which they used for their sacrifices; and that he escaped merely by favour of Archidama, a Messenian female whose affection he had engaged.

ægila. See ægyla.

ægilia, one of the boroughs of the tribe of Antiochis in Attica.

ægilion, an island, called also caparia, now Carigotto.

ægilipsa, a place of Greece in the vicinity of Ithaca, huts near Crocyia of Æpirus. Homer's H. ii. v. 633.

ægilium. See ægilium.

ægilops, formed of ægos, goat's face, on account of its roughness, ægilops, in Botany, a genus of the monoeota order, and polygama class, and of the natural order of grammia or griffis; the characters are, that the hermaproditic calyx is a large bivalvular glume, often three flowers, and that the valves are ovate, truncate, fringed with various awns; the corolla is a bivalvular glume, the outer valve ovate, terminated by a double or triple awn, the inner lanceolate, erect, awnless, with the edge bent in longitudinally; the nectary two-leaved, with ovate, flat, transparent, very small leaflets; the flamina have three capillary filaments, with oblong anthers; the pistillum is a turbinate germen, the styles are two and reflex, with hairy ligulas; no pericarpium; and the seeds are oblong, convex on one side, grooved on the other, with the inner valve of the corolla adhering to it, and not opening. There are four species; viz. Ægilops, caulata, triuncialis, and squarrosa; to which Gmelin adds the aromatica and facetaria: and he ranks this genus under the triandria digyna clas and order. The first of these griffes is wild in the southern countries of Europe, and was cultivated in 1643, by Mr. James Sutherland; the second was found by M. Tournefort in Crete; the third grows about Montpicher, Marailles, Nice, and Smyrna, and was introduced in 1756 by M. Thouin; and the fourth was found by Tournesfort in the Levant, and by Cavalières in Spain. They all seem to be annual.—Martyr's Miller's Dict.

ægilos is also a name given to the holm-oak, a species of the Quercus; to the wild-oat, a species of the Avena; to a species of the Andropogon, and to a species of the Bromus. Ægilos incanus is a species of the Rotalia.

ægilos, or Ægyllops, in Surgery, an abscess in the flesh, in the vicinity of the eye, which is so called from its giving a call of that organ resembling a goat's eye, (from Ægils, a goat, and Ægios, the eye.) It has been noticed by Virgil, "Tranfuixit lentibus Hisae." The term which we now indiscriminately call fistula lachrymalis, in its incipient state, was named Ægilos by some of the ancients; but, in its stage of suppuration, it was termed ægyllops. For the description and treatment of this disorder, see Fistula Lachrymalis.

ægrimurus, in Ancient Geography, a small island in the Gulf of Carthage, about thirty miles from that capital. Pliny (H. N. tom. i. 251.) informs us, that there were two rocks near this island, called the ara ægimuri, or ægimora, which, according to Servius, were the remains of an island, some ages before his time, absorbed by the sea. This author likewise informs us, that they were called ara, because on them the Romans and Carthaginians concluded a treaty, and made them the limits of their respective dominions. Virgil refers to this in his Æneid. i. v. 148.

"Saxa vacant Italii, media quoque fucibus am." The modern Zemunovare, or the Limbra of our sea-charts, lying between Cape Zibeb and Cape Don or Ras-adjar, is the Ægimurus of the ancients. The gulph in which this island lies, is remarkable for its great depth as well as breadth, and on this account was jutly named by Virgil, Æneid, i. v. 163, fascibus longus, a long recess. Shaw's Trav. p. 76, 410.

æginæ, an island in the Saronic gulph, or bay of Engia. It was more anciently known by the names of Oenone or Onopia, (Plin. tom. i. 205,) and Myrmidonia, from its inhabitants the Myrmidons, so famous among the poets. It was called Ægina by Æneas, who regined in this island, from the name of his mother, the daughter of Ægeus, king of Byzantium, who being debauched by Jupiter, as fabulous history reports, in the fructitude of a bountiful flame, was removed from Ædipus to this desert island. It is now called Ægina, and is one of the islands of the Archipelago. It lies between the territory of Athens, and that of Ædipus, eighteen miles distant from the coast of Athens, and fourteen from Peloponnesus. It is about twenty-six miles in circuit, and had anciently a city of its own name, which being destroyed by an earthquake, the inhabitants were exempted by Tiberius, for the space of three years, from paying any kind of tribute. Pausanias (in Corinth. c. 12.) speaks of two magnificent temples in this island, the one consecrated to Venus, the other to Jupiter. The latter was built upon the summit of a mountain called Panhemellinus by Æneas, in order to propitiate Jupiter in a time of drought; who was supplicated under this epithet, and granted to his votaries rain. The temple was of the Doric order, and had six columns in front, and claims a very remote antiquity; its remains, in a very ruined state, indicate its original magnificence. The foil of this island was at first very flaky and barren; but being cultivated by the inhabitants it became very fruitful; and hence, says Strabo (tom. i. p. 576.) the inhabitants were called Myrmidons.
Mymidon, i.e. caias, from their industry. This island was first peopled by the Epidaurians, who were originally Dorians, and afterwards by colonies from Crete and Argos. Thence, in process of time, driven out by the Athenians, and the Athenians by the Laconians, who reduced the island to the ancient proprietors. The Argives applied themselves, in a very early period, to trade and navigation, and sent colonies into the neighbouring islands of Imbros and Crete, in the latter of which (says Strabo) they built and peopled the city of Cydon. The first money, according to the same writer, was coined in Enteria by one Phidion. Pliny (tom. ii. p. 642.) commands the bracts of this island, and affords that the famous statue of this metal, representing an ox, which floated in the forum boarium at Rome, was carried from hence to adorn that capital. The Argives were originally governed by kings; but afterwards introduced the republican system, which became so powerful as to vie even with Athens. Agesilaus, from whom sprang the Agesilaei, who reigned in different countries with reputation and power, was the second king of this island; and, according to Macrobius (Adv. rerum gent. l. vi. p. 131.), he lived about two generations before the Trojan war, and was the first who built a temple in Greece. Upon the dissolution of this monarchy, the Argives became subject to the Epidaurians; but applying themselves to navigation, they became powerful by sea, and revolted from their masters, ravaged their territory, and carried away the two famous statues of Danaus and Auxesias. This occasioned an irreconcilable enmity between the Agesilaus, and Athenians. This island was at last reduced by the Athenians, and continued subject to them, till, at the end of the Macedonian war, it was declared free by the Romans: but in the reign of Vespasian it underwent the same fate as the other states of Greece. In the year 1256 it was subdued by the Turks, after an obstinate resistance: the capital was plundered and burnt; and after a great slaughter of the inhabitants, the rebel were carried away into slavery. The population of this, as well as of other little states, in the times of their splendour, was immense. Enteria had once 400,000 slaves, the proportion of whom to freemen was, in ancient republics, according to the monopoly of wealth. In Greece it is supposed to have been about twenty to one. The most remarkable circumstance related by modern travellers concerning this island is, that it swarms with partridges, and that for preventing their interference the people go out every year to break their eggs; fearing, lest, by decreasing their corn, these birds should produce a famine. They have no hares, foxes, or wolves in this island. In summer the rivers are dry. The wainode or governor farms the revenue of the Great Seignior for twelve puries, or 6,000 paltrares. About half this sum is repaid annually by the carath-money, or poll-tax.

The town of Enteria, so called by corruption from Enteria, is said to consist of about 800 troops, and has a castle, and near it may be seen the remains of a magnificent structure, which was probably one of the celebrated temples which formerly graced this island. Imperial Greek medals were struck in this island, in honour of Elagabalus and Plautilla.

Enteria, Paulus, in Biography, a celebrated Surgeon of the island of Enteria, from which he derived his name. He is placed by Le Clerc in the fourth century, but by Abulfaragius in the seventh. He was eminently skilled in surgery, and his works are frequently cited by Fabricius ab Aequapendente, and indeed form the basis of this author's valuable treatise. He is the first author that takes notice of the cathartic quality of rhubarb. He begins his book with the description of women's diseases, and he is said to be the first person among the ancients that defended the application of a man-ouzifc. His works are Libri viii. de Re Medica, seu opera omnia, Greek, Vitenæ, 1524, fol.—Idem ex interpret. & cum Amm. I. Gent. in Andemuci Vitenæ, 1542, Svo.—Id. cum Amm. I. Gent. G. cupel. ex ed. & cum Schol. B. Bapt. Camotii, 1550, 8vo.

Enterias, in Antiquity Geography, a small town of Panaplagonia, and also a small river of the same province in Asia Minor.

Enterasia, in Biogy, a species of Orobanchæ, with a single-flowered stalk, and a subbiphasaceous flower.

Enterirnhard, in Biography, a native of Germany, who was educated by the munificence of Charlemagne, and who afterwards became his secretary, and as some suppose his son-in-law, by marrying his daughter Imma; but it has been lately proved that she was not the daughter of Charlemagne. He is said to have been carried through the snow on the shoulders of the affectionate Imma, that his footsteps might not be traced from her apartments by the emperor her father. This story was copied by Adulfus from an old German Chronicle, and admirably embellished by this elegant writer in the third volume of the Spectator. Enterirard, after the death of his wife, which he deplores in a letter still extant, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. His life of Charlemagne, his Annals from 741 to 839, and his letters, are inserted in the second volume of Duchofine's Scriptores Francorum. An improved edition, with the Annotations of Hermann Schmincke, was printed in 1711.

Enterimium, in Antiquity Geography, a town of Greece, in Thessaly, on the frontiers of the Tymphian mountains near the source of the Jorn, which here forms a small lake, and fourth-well of Azorna.

Enteriochius, a small place in the island of Crete, where Jupiter was nominiied by a goat, according to Diodorus. See Enterios.

Enteria, a town of Ethiopia, near the Nile.

Enteria, in Antiquity, a denomination given to Pan, and the Pans.

The ancients also give the name Enteria to a sort of monsters mentioned by Pliny, Solinus, and Pomp. Mela. Salmasius, in his notes on Solinus, takes Enteria to have signified the same, in Lyba, with Jf-thannes among the Romans.

Vossius rejects the opinion, and shews that the Enteria did not face like men, as the Sylvians had; but like goats. In Æther, the whole upper part of the body resembhed that animal; and as to the lower, they painted it with a fifth's tail. The monster represented on some medals of Augustus by antiquaries, called Capricornus, appears to be the true Enteria.

The word is derived from Ær, a goat; Pan being represented with the horns, feet, and legs of that animal.

Enteriphila, formed from Ær, and Æne, Goat's friend, a genus of the tetrandria monogynia class, and order, and the natural order of Vitices; the characters are, that the calyx is a one-leaved, bell-shaped, four-toothed, loose, very short, permanent perianthium; that the corolla is one-petalled, flat, equal, and clefts oblong; the
the Flamia are capillary filaments inserted into the mouth of the tube, erect, and anthers roundish; the pistillum is a roundish superior green, fnyne capillary deeply bilab, and figna simple; the pericarpium is a roundish two-celled berry, surrounded with the permanent calyx; and the seed is either in pairs or solitary. There are four species, viz. maritima, fluta, or the bocu of Brown, fathla, and trifida, for which are added in the last edition of Linneus's Sylenum, the villina, arborofen and levis. The fift is a shrub about five feet high with white flowers, which appear in November, a native of Martinico, and was introduced in 1783, by Mr. Francis Maffen. La Mark thinks this species ought to be chaffed with the Verbena. The other species are natives of Jamaica.

ÆGIPIUS, a river of Africa, which discharges itself into the Erueine, above Dioecus.

ÆGIPLANETUM, in Ancient Geography, a mountain of Greece, mentioned by Æchvius in his Agamemnon, and supposed to be in the vicinity of Corinth.

ÆGIRA, a town of Æchaia, supposed to be founded by Ægirus, the sixth king of Siccyon, and situate, according to Poulhins (l. iv. c. 37. p. 322. D. Ed. Caftab.) in that part of Peloponnesus that is called the Corinthian bay, between Ægium and Siccyon, opposite to Paros, and at the distance of seven fists from the sea. It was covered with steep and almost inaccessible hills; and adorned with several temples, one of which was appropriate to Venus erulis, into which no men were allowed to enter, and also with several pictures and statues. Pausanias (p. 593.) speaks of one of these pictures, which exhibited an aged man, who had received a mortal wound, and who was placed between three brothers and three sisters. The expression of concern and grief was so lively, that the picture was denounced ως σωματα. It is now a small village called Xyleoplo or Xyleoplo.

Ægira was also one of the names which the ancients gave to the island of Lesbos.

ÆGIRCIUS, Gery, a river of Gaul, which rofe in the Pyrenees, pafted to Aefil and Aefch, and discharfed itself into the Garumma.

ÆGIRUM, or ÆGIRUS, a town of the isle of Lesbos, on the caft fide between Mitylene and Metephya.

ÆGIRUS, a town of Lesb; and also of Megaria.

ÆGIS, in the Ancient Mythology, a name given to the shield or buckler of Jupiter and Pallus.

The goat Amalthea, which had buckled Jove, being dead, that god is faid to have covered his buckler with the skin thereof, whence the appellation Ægis, from άς, εγχος, fle- gnet.

Jupiter afterwards reftoring the beast to life again, covered it with a new skin, and placed it among the fars. As to his buckler, he made a prefent of it to Minerva; whence that goddefs's buckler is also called Ægis.

Minerva, having killed the Gorgon Medufa, nailed her head in the middle of the Ægis, whence henceforth had the faculty of converting into ftones all thofe who looked thereon; as Medufa herfelf had done during her life.

Others take the Ægis, not to have been a buckler, but a cuiraf, or breast-plate; and it is certain the Ægis of Pallas, described by Virgil, Æn. lib. viii. ver. 435. must have been a cuiraf; fince that poet fays efprefly, that Medufa's head was on the back of the goddef's. But the Ægis of Jupiter, mentioned a little higher, ver. 354. feems to have been a buckler: the words

"Cum cepit migrantem
Ægida concerteret dextra."

agreeing very well to a buckler; but not at all to a cuiraf, or breath-plate.

Servius makes the fame dilinition on the two passages of Virgil; for on verfe 354, he takes the Ægis for the buckler of Jupiter, made, as above-mentioned, of the skin of the goat Amalthea; and on verfe 435, he describes the Ægis as the armour which covers the back; and which, in speaking of men, is called cuiraf; and Ægis, in speaking of the gods. Many authors have overlooked these difinitions for want of going to the sources.

ÆGISUS, or ÆGYPTUS, in Ancient Geography. See ÆGYPTUS.

ÆGINIAE, a town of Italty in Brutium, call of Con- fentia, called by Pliny Aprufium.

ÆGISTHAE, a town which Petelcoy places in Arabia Felix; long. 35° 35' lat. 11° 45'.

ÆGISTHUS, in Entomology, a species of Papilis, with brown wings, spotted with a light green, found in China, and refembling the species called Agamemnon.

ÆGISTHUS, in Ancient History, the fon of Thrythle by his daughter Pelopenis, who, in order to conceal the inceft exposed the child in the woods; where he was found by a Shepherd and nourished with goat's milk, from which circumstance he derived his name. In mature life he killed his uncle, Ares, and kept Clytemstra, the wife of Agamemnon, during the absence of her husband at the hearing of Troy, and at his return murdered him; but was at laft himself slain by Orestes in revenge of his father's death. Ovid's Ep. viii. 53.

ÆGITHALLUS, in Ancient Geography, a promontory and citadel of Sicily, between Drepanum and the Emporium Ægithallum; afterwards called Aecillus, corruptly written Ægitharfon in Ptolomey, situate near mount erys, and now called Capo di Santo Teodoro.

ÆGITHIUM, a town of Etolia in Greece.

ÆGITTNA, a town of Gaul, belonging, according to Polybius (p. 562) to the Oxybius. The Romans besieged and took the town, and made slaves of the inhabitants; and on this account Q. Opinnius the consul obtained a triumph, A. C. 599.

ÆGIUM, a considerable town of Achaia Propria, 40 fists from the place where Helice flood, and famous for the council of the Achaen, who assembled there, either on account of the dignity of the place or the convenience of its situation, as we learn from Pausanias (l. vi. p. 24-34. p. 581. Ed. Kuhn.) and from Livy (l. 3S. c. 30. t. 5. p. 216. Ed. Drakenb.) It was also famous for the worship of the conventional Jupiter, Ψελθονυναι Χηρας, of the Panathenaeum Ceres, of Ecleiapureis, Lucina, Juno, and other deities. In this place there was a kind of chapel, in which were preferred the statues of Hercules, Jupiter and Minerva, called the Argia gods. Venus had also a temple in Ægium near the sea, and in it was a statue of Jupiter Hamyagiuns. The territory of Ægium was watered by two rivers, viz. Phænix and Meganites. The epichet derived from it is Ægiceta. There is a coin, fays Ceilarus (t. 1. p. 577) in the cabinet of the king of Prusia, with the inscription, AIT, and the figure of a to- tole, which is the fymbol of Peloponnexus, and afferts the place where it was struck. Greek imperial medas were struck in this city in honour of Plantilla, Commodus and Eligabalis.

ÆGLE, in Entomology, a species of Papilis, with black wings; the anterior and the disc of the posterior marked with greenish spots; found in India.

ÆGE, in Mythology, the mother of the Graeces; also, one of them; and according to Virgil (Ecl. vi. 21.) the most beautiful of the Naadias.

ÆGLEFINUS,
ÆGLEFINUS, in Ichthyology, a name given by authors to the Haddock. See Gadus.

ÆGLETE, in Ancient Geography, a place in the isle of Ampha, whence Apollo obtained the surname of Æglete.

ÆGLESTEAWICK, in Geography, a good harbour, half a mile from Soderfors, a town of Sudertorn in Sweden. E. long. 18° 20'; N. lat. 59° 20'.

ÆGLES, in Botany, a term derived from the Greek ἀιγίλη, and used by Galen to distinguish the white chamomile thistle, which was an efficacious and medicinal plant, from the erythronium, ἐρυθρόνη, which was what we call the black chamomile thistle, and was esteemed poisonous.

ÆGEBOLUS, in Antiquity, the sacrifice of a goat offered to Cybele. This was an expiatory sacrifice, which nearly resembled the taurobolium and cristolium, and seems to have been sometimes joined with them.

ÆGEBOLUS, a surname given to Bacchus, because infested of a young man who was sacrificed to him, he contented himself with a goat.

ÆGOCAPHALUS, in Ornithology, the name by which authors call the species of Scolopa, known in England by the name of the Godwit, or in some places the yearwash or ait-ship.

ÆGOCERAS, in Botany, a name given to Fenugreek, on account of its cornelicated fruit; the word signifying goat's horn.

ÆGOCERATOS. See Hugonia.

ÆGOCEROS, formed of ἀιγίλις, goat, and ἀγρόνομος, a name given to the constellation Capricorn. Thus, Lucan, I. 9. v. 537, and I. 10. v. 213.

— Varı mutator circulans anni

Ægocerous, caucumque tenet.

Pan, dignified by the poets and elevated to the flars, transformed himself into a goat, and was called Ægoceros.

ÆGOCETHRON, in Botany, a plant described by Pliny; which appears to be the same with what Tournefort describes under the name of chamzrodendros pontica maxima melipoli folio, flore luto. The ancient attribute dangerous qualities to it.

ÆGOMANTIA, in Antiquity, a species of divination performed by means of a goat.

ÆGON, in Entomology, a species of Papilio, with brown wings and spotted yellow facies; found in Jamaica. Ægon is also a name given by some writers to the Aegus.

ÆGONES, in Ancient Geography, a people of Gaul, transported according to Polybius (p. 195.) into that part of Italy called Cipadania, and placed between the Senones and Boii.

ÆGONICHUS, in Botany, a name mentioned by Pliny, as a synonym of the lithospermum or gromwell, and formed of ἀγός ἀγίλις, the clawn, or boof of a goat. The ancients also called it exonochon; and by these terms expressed it as like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and scaly nature of the feeds.

ÆGOPHAGA, in Mythology, a surname of Juno, because goats were sacrificed to her.

ÆGOPHATHALMUS, the goat's-eye stone, in Natural History, a name given by some authors, to those pieces of agat, or other semi-pellucid gems, which have circular spots resembling the eyes of that animal in colour, and in their round figures.

ÆGOPHATHALMUS, in the Linnean System by Gmelin, is a species of Helix, with an umbilicated shell of a greenish colour without spots; and having seven spiral turns. It is found in India, Barbary, and South America.

ÆGOPERODIUM, formed from ἀιγίλις, a goat, and πεδιλίς, a diminutive of πεδίλος, a foot, in Botany, a genus of the pentandria digynia clafs and order, and of the natural order of umbellate or umbellifera: the characters of which are, that the universal umbel of the calyx is manifold and convex, the partial similar, but flat; without involucres, and the proper perianthium femail oblonger: the universal corolla is uniform, with every floccule fertile; the particular has five obvate, concave petals, in a at the top and equal: the flamina consip of simple flaments, twice as long as the corolla, with roundish anthers; the pistillum has an inferior germ, simple erect styles of the length of the corolla, with headed stigma; no pericarpium; the fruit ovate-oblong, streaked and bipartile; the seeds are two, ovate, oblong, concave, and streaked on one side, and flat on the other. There is one species viz. AE. pediliorum, Herb Gerard, gout-weed, or acheweed, which is a perennial, creeping weed, with white flowers, that appear in May or June. It is aromatic, but not used in medicine. The Germans formerly recourse to it for alleviating the pains of the goat and pikes, whence its name gout-weed. Linnaeus says, that when it is tender in the spring, it is boiled for greens and eaten in Sweden. Cows, sheep, and goats eat it; but hares are not fond of it. It is found amongst rubbish in shady places, in cultivated grounds, and in the hedgerows.

ÆGOPERODIUM. See Circuta and Smyrnum.

ÆGOPERGRON, a name used by Tragus, and some others, for the common meadow-sweet or umbularia. See Spiræa.

ÆGOPERICRON, formed from ἀιγίλις, and ποιός, to face, or fulfill, but without any aſcertained meaning; in Botany, a genus of the monardia mandarindia clafs and order: the charactars are, that the male flowers are small, in an ovate ament; the calyx one-leaved, tubulous or trifold: no corolla; the flamina of one filament, longer than the calyx, erect, with an ovate anther: the female flowers are on the same plant and solitary; the calyx and corolla are the same as the male: the pistillum has an ovate superior germ, three divaricate styles, with simple permanent stigmas; the pericarpium is a globular berry, trioccous and trilocular within, with a hard point: the seeds are solitary, and angular on one side. There is one species, viz. AE. pedilinum, which is a tree very much branched, with wrinkled bark, and alternate leaves resembling those of myrtle. Dillenius noticed it in Suriæ, and Aublet in Guina. Martyn. Gmelin in the left edition of Linnaeus, refers this genus to the monardia tricynia clafs and order.

ÆGOSPORAMOS, q. d. Goat's river, in Ancient Geography and History, a river of the Thracian Chersonesus, falling with a north-eaft courfe into the Hellefpond, to the north of Seftos. There was also a town, called Ægos, and a naval station, at the mouth of this river, nearly opposite to Lampfacs. At this place, the Lacedæmonians under Lyfander, obtained a complete victory over the Athenians, commanded by Conan; and this victory, which was soon followed by the capture of Athens, put an end to the Peloponnesian war, and to the maritime power of the Athenians. The Athenian fleet, after the loss of Lampfacs, retired to this station, and here they halted over against the enemy, who were then at anchor before Lampfacs. The Hellefpond in this part of it is not above two thousand paces broad; and therefore the two armies, being so near each other, expected to come to an immediate battle. Lyfander, however, was cautious and wary; and determined, notwithstanding repeated infults on the part of the Athenians, to wait till the Athenians had debarked their forces. Alcibiades represented to the Athenian generals the inconveniences and danger...
AEGYPTUS, or AEGISUS, a town of Moesia near the river Iler. M. d'Anville refers it to the vicinity of the place on the Danube, where Darius Hyllaphis constructed a bridge, when he was engaged in a war with the Scythians. 

AEGYPT. See EGYPT.

AEGYPTIAC, in Botany, signifies the PAPYRUS.

AEGYPTIACUM, in Pharmacy, a name given to divers Unguents of the detergent or corrosive kind.

We meet with a black, a red, a white, a simple, a compound, and a magisterial Aegyptiacum.

The simple Aegyptiacum, which is that usually found in our shops, is a composition of verdigris, vinegar, and honey, boiled to a confidence; the prescription is Melaus.—It is usually supposed to take its name from its dullly colour, wherein it resembles that of the natives of Egypt. It is improperly called an unguent; as there is no oil, or rather fat, in it. Some chutel to call it Mel Egyptianum, and Oxy-belgicinctum. It is chiefly used in eating off rotten flesh, and cleansing foul ulcers; particularly verrucous ones in the throat, &c. It also destroys those cancerous erubitions apt to grow in children's mouths. 

Gmelin's App. Med. vol. i. 346.

The German dispensers have another composition called Aegyptiacum compostium magistrale, or Hildani, wherein treacle, mitridate, camphor, &c. are ingredients.

White Egyptianum is a composition of lily roots mixed up with aromatics; it is mentioned by Hippocrates, and is the same with what other ancients call sticium. It was used by the ladies of those days to smear over their faces, to preserve their complexion.

Hippocrates also speaks of another unguent under the same name, composed of the flowers of the Egyptian thorn.

Fairies make a red, as well as a black kind, of much the same ingredients, only with some difference in the proportions; used especially to soften the hoofs of a horse, when too hard.

AEGYPTIAN PEBBLE. See JASPER.

AEGYPTILIA, in Natural History, the name of a flower described by the ancients, and said, by some authors, to have the remarkable but imaginary quality of giving water the colour and taste of wine.

This flower was variegated with veins of black and white, or black and bluish, with a plate or vein of whitish red, and seems to have been of the onyx, fardonyx, or camek kind; none of which poisons the property which some fanciful writers have ascribed to it.

AEGYPTION, the name of a topic used by the ancients in uterine disorders.

AEGYPTUM, pharamcum ad aeris. Actius (Tetrab. ii. Serm. 2. e. 83.) speaks of this as excellent for deterring festid ulcers of the ears, which he says it cures, though the patient were born with them.

AEGYPTUS, in Phübóon, History, the son of Belus and brother of Danaus, who, having fifty sons, married them to the fifty daughters of his brother; and by their father's order, each of them, except one, flew her husband the first night. Lynceus, who escaped, disappointed his father Danaus of the kingdom, and reigned over the Argives for forty-nine years. See DANAIDES.

AEGYPTUS, in Ancient Geography, a name given by Homer to the Nile, and by which it was very anciently distinguished in Ethiopia. It has been commonly supposed, that
that this name was given to it on account of its black colour; but Mr. Bruce (Travels, vol. iii. p. 65) conceives, that as Egypt in the Ethiopic language is called Tępy, and an inhabitant of the country Gępy, which means the country of ditches or canals, drawn from the Nile on both sides at right angles with the river, nothing is more obvious than to write Tępy, whence Egypt, and with its termination as or aus, Eųpytus. See Nile. Plutarch (tom. ii. p. 1157*) says, it was first called Melas, from Melas the son of Neptune, and that it was afterwards called Eųpytus from Eųpytus the son of Vulcan and Leucippe who governed Egypt; and who was so distinguished by the sacrifice of his daughter Aganippe in obedience to the Pythian oracle, as a means of securing the fertility of the country by the retreat of the Nile, that he threw himself into the river; and from this circumstance it obtained the appellation.

Eęgys, a town of Laconia, which, according to Pausanius, was destroyed by the Lacedaemonians in the reign of Archelaus, whose reign commenced 957 years before Christ, and lasted forty years, because its inhabitants took part with the Arcadians.

Eęhotiullə, in Zoology. See Aęretulla.

Eęichyron, in Botany, a name given to the Sedum mansion; called also Eęithales.

Eęinauth, in Antiquity, senators of Miletus, who held their deliberations on board a ship, far from shore, and till matters were resolved upon, never returned to land. The Greek word αἰαστά signifies always mariners. Plut. in Quæst. Rom.

Eęizoön, αἰον, from αἰ with, and ζωή life, sempér¬vénüm is a name given to Sedum of House-leek.

Eęlana, or Elana, in Ancient Geography, a city of Arabia Petraea on the Red Sea, at the north end of the Ælanitic gulf. It is now called Aillaub.

Eęlanitıc, Ælantic, or Ælanitic gulph, a bay of the Red Sea, verging towards the north-east, and belonging to Arabia; it called from the city Ælana, situated near it. Eęlea, a small place of Dardania, S.W. of Sardica.

Eęlen, Eën, Aëla, Aqueligia, or Halcydes, in Geography, a large market town in the canton of Bern in Switzerland, which was greatly damaged by an inundation in 1741. It gives name to one of the four mandaments into which the government of Bern, or count of Ailen is divided. This district, which was for some time subject to Savoy, was afterwards given to the landholders of the Valais, who in 1536 exchanged it with the city of Bern for another district called Gunds. This lordship itself, which is now managed by a governor residing in a feast on an eminence in the town of Ailen, consists of a tract of fertile hills and vales, producing fine fruits and excellent wines; and the richness of its pastures is manifested by its large breeds of cattle.

Eęlfred, in Biography. See Alfred.

Eęlfrıc, an eminent ecclesiastic of the tenth century, who was the son of an earl of Kent, and who, after some imperfect instructions, received from an ignorant secular priest, assumed the habit of the Benedictine order of monks in the monastery of Abingdon, over which Athelwold presided. When Athelwold was created bishop of Winchester in 963, Eęlfrıc among other Abingdon monks was settled in his cathedral; and in order to tellify his gratitude, for the advantages which he had enjoyed under the tutelage of Athelwold, he conformed to the wishes of his benefactor in communicating instruction to the youth of his diocese. With this view, he compiled his Latin Saxon vocabulary, and some Latin Colloquies. The former work was published by Sumner, under the title of a glossary, at Oxford in 1650. Eęlfrıc also translated from the Latin into the Saxon language, most of the historical books of the Old Testament, part of which was printed at Oxford in 1698. At Winchester he also drew up his canons, a kind of charge to be delivered by the bishops to their clergy, which are preserved in the first volume of Spelman's Councils, and were composed, says his biographer, that infra) between the years 985 and 987. Upon his removal about the year last-mentioned to Cerne Abbey, he translated from the Latin fathers, the first volume of his Homilies. In 988 he was made abbot of St. Alban's, and composed a liturgy for the service of his abbey; and about the latter end of the year 991, when he was bishop of Wilton, he translated a second volume of Homilies. Here he also wrote his Latin-Saxon grammar, a supplement to his Homilies, a Tract dedicated to Sigward or Sigefrith, containing two epitaphs on the Old and New Testaments, which his biographer supposes to have been written between the years 987 and 991. In 994 Eęlfrıc was translated to the see of Canterbury, where, after exercising himself with laudable spirit and prudence for some years, in defending his diocese against the incursions of the Danes, he died Nov. 16th, in the year 1005. He was buried at Abingdon, but his remains were transferred to Canterbury in the reign of Canute. He is represented as the greatest prelate the Saxon church ever had since the days of St. Aulen; and as our first reformer next to king Alfred, by introducing the knowledge of the scriptures among the laity. For the times, it must be allowed, he was a man of considerable learning; his morals were irreproachable, and his faith was free from many of the corruptions which have disgraced religion. There was another Eęlfrıc, the son of Alfred, who was pupil of the former in the school established by Athelwold at Winchester, who was made archbishop of York in 1023, and died in 1051. Another of the same name was abbot of Malmesbury in 974, was created bishop of Crediton in 977, and died in 981. There were several other persons of this name. The celebrated antiquary Land has expressed his doubts, whether Eęlfrıc, the author of the Latin-Saxon grammar, was the same with the translator of the Homilies, or with the abbot of St. Alban's, who drew up the liturgy, which continued to be used there till his own times. Dale and Pitts have ascribed these three works to three different persons. Whereas, archbishops Uther, by confounding Eęlfrıc, archbishop of Canterbury, with Eęlfrıc, archbishop of York, and with Eęlfrıc, bishop of Crediton, has reduced into one person three men who were really distinct. See Edward-Rowell Moreci de Alfrico, Dorobrenem Archipilcopo, Commentarius; ed. per Dr. Thorkelin, 4to. 1789.

Eęlia, an appellation derived from one of the names of Adrian, and applied to several towns.

Eęlia aduna. See Zana.—Augusta mercurialica. See Thana.

Eęlia Capitolina, a name given by the emperor Adrian, from Eęlius that of his own family, and Capitolinus the epithet of Jupiter, to the new city, which he caused to be built about A. D. 134, near the spot where the ancient Jerusalem stood; and which, on its visit to the eastern parts of the Roman empire, he found in ruins. Here he settled a Roman colony, and dedicated a temple to Jupiter Capitolinus in the room of that of Jerusalem. This propagation of the holy place irritated the passions, increased the rebellions, and aggravated the sufferings of the Jews during the reign of Adrian. The city was once more taken

N m 2
taken by them and burnt. Adrian rebuilt it, re-established the colony, ordered the marble statue of a hog, which the Jews held in religious abhorrence, to be set up over the gate which opened towards Bethlehem, and published an edict, strictly forbidding any Jew on pain of death to enter the city, or even to look at it from a distance. He also fixed a vigilant garrison of a Roman cohort to enforce the execution of his orders. Christians, however, were permitted to remain; and they elected a bishop, who, being of the race of the Centurie, formed a flourishing church of Centurie converts; and these abolished the Jewish observances which had prevailed among the Christians that had been proselyted from the Jews; and in consequence of this total remunecation of the Jewish law, they obtained a free admission into the colony of Adrian. In this state the city remained till the time of Constantine, the first Christian emperor, who greatly improved it, and restored the name of Jerusalem, though that of Elia continued to be occasionally used by Greek, Latin, and Mahometan authors. The Jews, however, were not permitted to reside there. Attempting in vain to get possession of their capital, Constantine caused their ears to be cut off, their bodies to be marked as rebels, and dispersed them over all the provinces of the empire, as fugitives and slaves. The coins of Adrian, Antoninus Pius, and Marcus Aurelius, are inscribed with the characters COL. AEL. CAP. I. E. Colonia Aelia Capitoline. Latin medals were struck at Aelia in honour of Adrian and other Roman emperors. See RICINNA.

ELIAN, Claudius, in Biography, was born at Præneste in Italy, about the year 80, and taught rhetoric at Rome, where he lived in the time of the emperors Nerva, Trajan, Adrian, and Antoninus, according to the account of Voilius extracted from the Greek historians, but according to Periizonius, under the emperor Alexander Severus, who began his reign A. D. 225. Philostratus informs us, that he was a Roman citizen, and that his life was extended beyond sixty years. He was sworn name Μολυσματος or Μολυθρόγος, honey-mouthed and honey-speechd, on account of the peculiar sweetness of his style, both in his discourses and writings. Martial refers to this excellence, lib. xii. epigr. 24.

"O juuda, Covine, solitudo,
Carrucâ magis, effedoque gratum
Facendi mihi munus Eliani."

He was honoured with the appellation of Sophist, which was a title appropriate in that age to men of wisdom and learning; and with the office of pontifex, as Suidas informs us. He appears to have devoted himself with peculiar affinity to literary pursuits, and to the study and practice of eloquence. As a writer he acquired a high degree of reputation, and as a perfon of sound principles and integrity he has been much extolled. Eliaus greatly admired and diligently studied Plato, Aristotle, Isocrates, and Plutarch, and particularly the poets Homer, Anacreon, Archilochus, &c. and he expresses himself in terms of peculiar commendation of Hipparchus, the son of Philolatus, as the liberal patron of the poets. Such were his impartiality and candour, that though he was himself a Roman, he declares his preference of the Greek writers. His most celebrated works are his "Varia Historiar," of which we have an excellent edition in Greek and Latin by Gronovius, in two vols. 140; to which are annexed the "Fragments" of Eliaus, collected by Kuhnus, out of Suidas, Stobæus, and Eutychius: and his 17 books "De Natura Animalium," published by the same editor, two vols. 140, with the admirable versions of Cæsare, Trist, and Gronovius.

The style of the latter is more elegant than that of the former, which does not seem to have had the last revision of the author. Eliaus also wrote an acceand or inveclive against Echlogabulus, or, as some say, Donianus, under the fictitious name of Gymnas Tyrannus. He also composed a book against "Archehtis, or on Providence," which is much commended by Suidas, and another "On Divine Appearances, or the Declarations of Providence." Some attribute to him the work intitled "Tactica," addressed to Adrian; but Periizonius is of opinion, that the author of this work was a native of Greece, of the same name, and that he lived about a century before Eliaus. Those who wish to see more of the talents and writings of Eliaus, the age in which he lived, and the various editions of his works, may consult Periizonius's preface to the first volume of the Variae Historiar, by Gronovius.

ELIANUS Meccius, lived in the time of the emperor Adrian. Galen mentions him with respect. He had great confidence in the Tetrarcha, as a preventative and cure of the plague.

ELIUS Pont, in Ancient Geography, one of the fortresses in or near the wall built by Adrian, now Portland in Northumberland, between Newcastle and Morpeth.

ELIUS Pont, now Il ponte S. Angelo, a stone bridge at Rome over the Tyber, leading to the Bargo and Vatican from the city, along the mole built by the emperor Adrian.

ELIUS Maurus, in Biography, was a writer in the reign of the emperor Caracalla, who was then very old, and had been a slave to Phlegon, the freedman of the emperor Adrian. This writer is cited by Suidas in his account of the death of Severus.

ELLO, in Mythology, one of the three Harpies.

ELQUAPPE, in Ichthyology, the common name among the German nations of a fish of the mulleta kind, the viviparous Eulophus, called by Schonfeld mulleta vivipara, and in some places alepule, aelmoder, and selmutter.

ELAST, Evert Van, in Biography, a painter, was born at Delft in 1603, and died at the age of 56 in 1658. In painting dead game, fruit, armour, helmets with plumes of feathers, or vases of gold and silver, he exhibited a striking resemblance of nature, and gave an extraordinary lustre to the gold, silver, and镶el. Pilkington's Æst. of

ELAST, William Van, the nephew and disciple of the former, was born at Delft in 1620, and died in 1670. He excelled his master in the exercise of his art. His pencil was to light, and his touch so delicate, that the objects he painted seemed real. Before the year 1656, he executed his profession in France and Italy, and afterwards settled at Amsterdarm; where his works were much admired, and sold for a large price. The grand duke of Florence honoured him with a gold chain and medal, in acknowledgment of his merit. Pilkington's Æst.

ELAST, in Geography, an abbey of Benedictines upon the river Ilz, below Waffenburg, in Bavaria.

ELUSONES, in Ancient Geography, a people of Germany, mentioned by Prolemy, and called Hilleviones by Pliny, and Haller by Tacitus.

ELURI, a people placed by Suidas near the Alps, which separated them from the Gauls.

ELEUROPOLIS, formed of Ελευθερία, a cat, and πόλις, city, a town of Egypt, mentioned by Leucanvius.

ELURUS, in Mythology, the god of the cats: he is represented by the ancient Egyptians, sometimes as a cat, sometimes as a man with a cat's head. Such was the veneration with which cats were regarded by the Egyptians, that if a person killed any of them, with or without design, for
he was punished with death; and it is reported, that, in
time of a famine, which compelled the inhabitants to de-
vour one another, no person was accused of having tasted
any of these fated animals. See Diodor. Sicul. l. i. tom. i.
ÆLEKARIUS, in Zoology. See CIVET.
ÆLUS, in Ancient Geography, a borough of Arabia Pe-
lix, belonging, according to Proklemes, to the Ælefari.
ÆEM, AM, or AEM, a liquid measure used in most parts of
Germany; but different in different towns; the aem
commonly contains 20 vertics, or 80 maffes; that of Hei-
delberg is equal to 45 maffes; and that of Wirttemberg to
100 maffes. See AAM.
ÆMATHIA, or EMATHIA, in Ancient Geography, a
district of Macedonia, which received its appellation from
Æmathius, a prince of remote antiquity, and extended as
far as the Sinus Thermaicus, or gulf of Salonichi to the east.
It contained several considerable cities, particularly Ægela.
This district formerly gave name to the whole country of
Macedonia.
ÆMILIA, one of the 17 provinces of Italy in the later
divisions of the Roman empire, bounded on the north by
the Po, on the east by the Adriatic gulf, on the south by
the Apennines, and extending to the south-east as far as
Attinum.
ÆMILIAN way. See Roman ways.
ÆMILIANA, a town of Spain.
ÆMILIANI, Jerome, in Biography, was founder of the
regular clergies of St. Basil in the 16th century. See
Fathers of Sempaign.
ÆMILIANUS, ÆMILIUS, or C. JULIUS, a Moor of
mean descent, who, having served from his youth in the
Roman armies, raised himself to the first employments in
the state, and became first confid, and afterwards emperor.
Under Gallus he was governor of Pannonia and Moesia; and
in this station he rallied the intimidated and dispersed forces
of Rome, and by a signal victory routed the barbarians,
who were spreading devastation through the Illyrian prov-
cinces, and terror as far as the gates of Rome itself.
Having distributed as a donation the money collected for the
tribute, he was proclaimed emperor on the field of battle by
the acclamations of the soldiers. A. D. 253. Gallus, who
was at this time head of the public welfare, and indulging
himself in the pleasures of Italy, was rousted out of his lethargy
by information of the success, revolt and hostile approaches
of his aspiring lieutenant, now the declared emperor. Æmi-
lianus, by forced marches, hastened to Interamna, now Terni,
about 32 miles from Rome; and here he was met by Gal-
lus, and his son Volusianus, at the head of a formidable
army. The troops of the latter, comparing the ignominious
conduct of their sovereign with the glory of his rival, and
seduced by the offer of a considerable increase of pay, de-
fected from the Imperial standard; and having murdered
both Gallus and his son, united, with the followers of Æmi-
lianus, in proclaiming him emperor. The senate added their
legal function to the rights of conquest. To this assembly,
the new emperor addressed assurances, that he would renun
to their wisdom the civil administration, and referring to
himself the office of their general, that he would in a short
time assert the glory of Rome, and deliver the empire from
all the barbarians of the north and of the east. His pride
was flattered by the applause of the senate; and medals
are still extant, representing him with the names and attrib-
utes of Hercules the Victor, and Mars the Avenger.
When Valerian, who was conducting a numerous and well
disciplined body of troops to the assistance of Gallus, heard
at Rhedia that he was dead, he quickened his march, and
determined to revenge his death. The army of Æmilianus,
composed of traitors to their former sovereign, lay encamped
on the plains of Spoleto, and swed by the character and
forces of Valerian, he had no sooner arrived than they in-
brued their hands in the blood of a prince who had seen to
lately the object of their partial choice. Thus Valerian
obtained the possession of the throne, without waiting to it
through the blood of the Roman citizens. Æmilianus was
killed at a bridge in the vicinity of Spoleto, which Victor
the younger pretends was denominated, from this circumstance,
the bloody bridge. He died in the 41th year of his age,
after a short reign of three, or at most four months. Æmil-
ianus (i. vii. c. 10. p. 255) does not rank him among the
emperors; and in the chronicle of Alexandria and that of
Nicephorus, Valerian is placed immediately after Gallus.
According to Aurelius Victor (in Æmil.) he died a natural
Hist. vol. i. p. 498, 419, 8vo.
ÆMILIUS, PAULUS, the son of Lucius Paulus,
who was killed at the battle of Cannæ, was born about
the year of Rome 530, ante Chr. 221, and was
two confluent. He lived, says Plutarch, in an age that
abounded with great men, and took pains to be in
ferior to none of them. His first military command was
in Spain, whither he went as praetor in the war with
Antiochus, to quell a general revolt, in effecting which he
succeeded. In his first consular (ante Chr. 182.) he
triumphed over the Ligurians, and on his return lived pri-
vately, and superintended the education of his children;
and in the second, (ante Chr. 168.) subdued Perusia,
king of Macedonia, reduced that country to a Roman prov-
ce, and established a new form of government, from
which circumstance he obtained the name of Macadonius.
His behaviour, in consequence of his decisive victory, en-
hanced him to be a man of divine justice; for, according to the rules
of war, he gave the plunder of the camp to the infantry,
and that of the adjacent territory to the horse. The cities
he would not suffer to be touched; and as for the royal
treasures he conveyed every part of them to Rome, though
his integrity excited the ill-will of the army. In his progress
through Greece, with a view of settling the division of the
country, and establishing his new plan of government, he
went to Epirus for the purpose of executing a decree of
the Senate, which was so severe, that he could not read it
without tears, though he could not utter in obeying it.
This decree granted to the Roman army the pillage of the
whole of the country which had adhered to Perusius. Æmi-
lius distributed his troops in small bodies through the town,
under a pretence of securing their liberty; but when the ten
chiefs of the state had brought into the camp, in pursuance
of his orders, all the gold and silver they could find, he
allowed the soldiers, on a certain day and hour, to make
booty of the remaining property of the poor inhabitants;
whom 100,000 were made slaves, and sold for the benefit of
the republic.
His conduct towards Perusius, the vanquished and de-
graded sovereign, marvellous nobleness of mind. When the
king's ambassadors approached, he said to those that were
near him, "Mark the inconstancy of fortune; this man,
who but the other day thought the ample kingdom of
Macedon nothing, whilst he was hindered from subdividing
the Dardanians and Illyrians, now confined in a narrow
island, feuds these poor men to ask favours." When Per-
usius entered his tent, and would have thrown himself at the
feet of the confid, he rose hastily, gave him his hand, and
would
would not suffer him to kneel; and afterwards treated him with civility and respect. When Amilius returned to Rome, he obtained, after some hesitation, a triumph of three days, which was one of the most splendid spectacles Rome had ever beheld. The gold and silver carried in the procession amounted to a sum which was sufficient to free the people from all taxes for 125 years. Perceus was at this time confined in a common gaol; and the consul's reply to his request, that he might not be made a spectacle in his triumph was not so honourable to his humanity as his former conduct. "This (says he), is entirely in your own power; you need not ask the favour of us," intimating that the king might kill himself, and thus avoid the shame of being exposed. However, when the humiliating spectacle was finished, and the unfortunate Perceus confined, with circumstances of depression and cruelty, in the common gaol, Amilius ordered him to be released, and treated with greater decency. The consul did not long survive his triumph. Having accepted the office of censor, and discharged it with honour, he fell into a lingering illness, of which he died, in the 64th year of his age, ante Christ. 160. His funeral was conducted with great solemnity; and the races of those countries which he had conquered, who were then at Rome, attended the procession, contend for the honour of carrying his bier, and paid the tribute of their regret and praises to his humanity and integrity. To his children he only left at his death the pecuniary he had received from his ancestors, without having augmented it, says Plutarch, by a single drachma. One of his two sons, by his first marriage, was adopted into the family of the Scipions, and called Africanus Minor, and the other into another family; and of the two others by his second wife, who were the hopes of his family, one died five days before his triumph, and the other three days after it. "Fortune, says he, on this occasion, by placing my triumph between the funerals of my two children, as though she meant to divert herself with human events, overwhelms me indeed with trouble and sorrow, but avert a full security to my country, having emptied her whole quiver upon me. She has taken a pleasure in exposing the conqueror and the conquered alike, as a spectacle to all mankind; with this difference indeed, that the conquered Perceus had killed his children, but those of the conqueror Paulus Amilius had not. But the public benefactors alleviates my grief for my domestic misfortunes." His character, says a judicious biographer (See Alkin's Gen. Biog.), is that of a genuine Roman, adorned with letters, and humanized by philosophy. As a military man he may be estimated by the maxim delivered by him to his son Scipio: "A good general never gives battle but when led to it by absolute necessity, or by a very favourable opportunity." He was twice married, first to Papiria, the daughter of Papirius Mafo; and being divorced from her, he took a second wife. In early life his reputation was such that he obtained the adlileum against twelve competitors, who afterwards became consuls. The office of augur he faithfully executed, with a rigid attention to the performance of every rite enjoined by the religion of his country; nor was he less observant of that military discipline by which Rome had become victorious. Plut. in Paul. Amul. Oper. tom. i. p. 255, 8vo. ed. Xyland.

Amilius Macer, a poet of the Augustine age, wrote on the virtues of herbs. There are several editions of his works; but in general so altered and interpolated, Haller says, by the monks, that the genuine lines are fearfully to be distinguished. Many of his verses were infected in the popular work called the Schola Salenitana.

Amilius Parthenianus, one of the Latin historians, flourished under the emperor Marcus Aurelius. He composed a history of all those who attempted to usurp the sovereign power, and brought it down at least to the year 175, for he wrote the life of Avidius Cassius. He is quoted by Valerius Gallicanus, who lived under Diocletian. Voss. Hist. Lat. lib. iii.

Amilius, Paulus, a celebrated historian, was a native of Verona, and gained such reputation in Italy, that he was invited into France by Louis XI., in order to write a Latin history of the kings of France, and had a canonry granted him in the cathedral of Paris. He was thirty years in writing this history, and yet it was not completed at his death. Erasmus says of him, that he resembled the painter Protagoras, who thought he had never finished his pieces: thus, says he, Paulus Amilius is never satisfied with himself. It was his usual custom to revise and alter his own performances, that they would hardly be known to be the same; and this made him so low, that elephants could bring forth sooner than he could produce a work. Lipius speaks of his history and manner of writing in terms of high commendation. It is divided into ten books, and extends from Pharamond to the fifth year of Charles VIII. in 1498. The tenth book was left unfinished; but the history was continued in nine books to the close of the reign of Francis I. by Arnoldus Ferronius, and the continuation was published at Paris in 1650. Amilius, as to his private life, was a man of exemplary conduct and irreproachable reputation. He died at Paris in 1529, and was buried in the cathedral. Biog. Dict.

Amilius Pont, one of the bridges of Rome, called also Subliarius, because it was built on piles.

Amenesis Portus, were situated in a small island of Gaul, now called Embiez, between Tauroctum on the north-west, and the promontory Citharites.

Aminium, a town and river in Spain mentioned by Pliny (tom. i. p. 228.) now called Aguex. This town was situated in the province of Lusitania, near the northern bank of the Monda, a little to the south of Talabriga.

Amobolium, in Antiquity, the blood of a bull or ram, offered in the sacrifices, called taurobolia and cribofolia; in which the word occurs in ancient inscriptions. Remius and Vandake take it for a corruption, and refer it to Amobolium. M. de Boze defends the Amobolium.

Amode, or Emode, in Ancient Geography, islands of the Ocean to the north of Great Britain.

Amoana, Landbach or Laybach, a Roman colony and a fortified place in Italy to the east of the Julian Alps.

Amonia, one of the ancient names given to Theifaly.

An, or Ain, a village of Judea, belonging to the tribe of Judah, and afterwards comprehended in that of Simeon, and alligned to the Levites of this tribe.

Aena, or Aina, a town of Arabia Felix; and also a town of Macedonia.

Aeniad. See Aenidae.

Anaria, an island in the bay of Cumae, or opposite to Cumae in Italy. It derived its name, says Pliny (l. iii. c. 6. tom. i. p. 168.) from its being the flation of the ships of Aeneas. It is called Larnae by Virgil (Aen. v. 7.16.), by Ovid (Metam. l. xiv. v. 89. t. ii. p. 929. Ed. Burn.), and by Silius Italicus (L. viii. v. 543. p. 436. Ed. Drakenb.), and it is now Ischia. It has not been improbably conjectured that this island was, at some former period, violently separated from the continent by an earthquake. The evidences of such a disturbance are calcined rocks,
rocks, numerous caverns, and the nature of the soil, which yields a great quantity of alum. About the year 1459, Bartholomew Perdix, a Genoese merchant palling by this island, observed several alumineous rocks along the coast, some of which he calcined in a furnace, and thus obtained excellent alum. By this discovery he was enabled to revive the art of making alum, which had been neglected in Italy for many centuries, and which he brought from Roven, in Syria, where he traded for many years.

About 163 years before this period, it is said that the most pleasant and fruitful part of this island was destroyed by a volcano, and that a small town was consumed by the flames which issued from it, and afterwards swallowed up. Grævius Thefaur. Antiq. et Hist. Italic. vol. ix. p. 3. 88. For other authorities to the same purpose, see Beckman's Hist. Invent. et Ducov. vol. i. p. 303. &c.

Ænarrium, a grove of Achaia consecrated to Jupiter, where, as Strabo (tom. i. p. 593.) informs us, the Achaeans held their public assemblies.

Æneas, or Aenea, a city of Mygdonia in Macedonia, at the southern entrance of the Thebæonian Gulf near the island Pallene, is said to have been founded by Æneas. On the promontory adjoining to this city there was a temple of Venus, according to Dion. Halicarn. the foundation of which is attributed to the same person. See Dion. Halicarn. l. i. t. i. p. 39. Ed. Oxon. Livy, i. x. c. 4. t. v. p. 452. Ed. Drakenb. Stephan. de Urb. p. 44. Livy, (l. xlv. c. 10. t. v. p. 752.) places Æneas in a fruitful country, about fifteen miles from Thebæonia and opposite to Pydna; but this must be loosely interpreted, as Pydna was near the river Aliacmon, and Æneas was probably near the upper part of the Therman bay. Æneas has been sometimes erroneously confounded with Ænus.

Æneas, in Entomology, a species of Papilio, with black wings, a green spot on the upper part of the primaries, and a languid spot on the optics. It is found in India.

Æneas, in Fabulous History, was Trojan prince, the son of Venus and Anchites, who, at the destruction of Troy, is said, probably by poetical fiction, to have carried away away his father and his household gods on his back. Hence, it is alleged, Virgil distinguishes him by the epithet Pius. See Ælian, Var. Hist. tom. i. p. 264. He also led his son Aeneas by the hand, and thus fared his father and son, &c. from the Greeks; but he left his wife Creusa in the ecape. Somewhat that he and Antenor betrayed the city of Troy. But Virgil, defirous of maintaining his resemblance to Ulysses in all his adventures, excuses him. After the siege of Troy he landed in Africa, and was kindly received by Dido; but quitting her coasts, he arrived in Latium or Italy, where he married Lavina, the daughter of king Latinus, who thus secured to him the throne of Latium. The story of the loves of Dido and Æneas, though an interferting part of the Æneid, is allowed to be a mere poetical ornament, introduced by a grofs anachronism. Æneas, as a testimony of his gratitude to Latium and affection for Lavina, gave her name to the camp he had pitched, and instead of Troy, called it Lavinium. The Trojans followed the example of their leader, and by marriages, forming alliances with the Latin families, became, in a short time, one and the same people with the Latins. In the mean time Turnus, who had been contracted to Lavina, and who was disappointed in his expectations by her marriage with Æneas, went over to the Rutuli, and excited a battle between them and the Latins, in which both he and Latinus were killed. Thus Æneas, by the death of his father-in-law, and of his rival, obtained the quiet possession of the kingdom of Latium, which he governed with great wisdom, and transmitted to his posterity. Æneas is said to have reigned three years, in which time he established the worship of the gods of his own country, and to the religion of the Latins added that of Troy. The two Palladins, which had been the protectors of that city, became the tutelar deities of Lavinium, and in succeeding ages of the whole Roman empire. The worship of Vesta was likewise introduced by Æneas, and probably by his means Jupiter, Venus, and many other deities, who had been revered in Troy, became known to the Latins; from which circumstance some have supposed that the poets took occasion to represent him under the character of a pious hero. The Rutuli, in the mean while, entered into an alliance with Mezentius, king of the Tyrrhenians, and united with them in their attempts to drive out these new adventurers. Æneas engaged them in a battle, which lasted till night; when being driven to the banks of the Numicies that ran elye by Lavinium, he was forced into the river, and there drowned, in the year of the Julian period 3758, ante Christ. 1760. The Trojans concealed his body; and pretending that he had suddenly vanished away, made his credulous subjects regard him as a deity; and they accordingly erected a temple to him under the title of Jupiter Indiges. Virgil has immortalized this prince, by making him the hero of his Æneid.

Æneas was succeeded by his son Aeneas, so called from a river of Phrygia of that name, and denominated Julius from Ilius, formed from Ilium or Troy, who founded Alba Longa as the capital of his kingdom. See Dion. Halicarn. l. i. p. 54-51. tom. i. Ed. Oxon, 1704. Livy, i. i. c. 1. and 2. tom. i. p. 18.-21. Ed, Drakenb.

Æneas of Gaza, a sopher by profession, was originally a disciple of Herocles, and a Platonic philosopher, but afterwards became a Chirillian, and flourished about the year 487. He himself affurs us, that he had the African confellors, whose tongues were cut out by Hameric king of the Vandals, in 481, under the reign of the emperor Zeno, and that he heard them speak. This supernatural gift of the African confellors, who spoke without tongues, lays Mr. Gibbon (History of the Decline and Fall of the Roman Empire, vol. vi. p. 295, 380.) to command the affent of those, and of those only, who already believe that their language was pure and orthodox. But the Rubborn mind of an infidel is guarded by secret inconvertible perfipion; and the Arian, or Socinian, who has seriously rejected the doctrine of the Trinity, will not be shaken by the most plausible evidence of our Athanaian miracle. Æneas compiled a dialogue, entitled 'Theophratus,' on the immortalty of the soul, and the resurrection of the body; besides twenty-five epistles, still extant. The dialogue was first translated into Latin, and published at Basile in 1516, in Greek and Latin, at Basile in 1569, with other pieces, at Leipsic in 1658, with a translation and notes by Barthius, in 4to. See Bibl. Patrum, tom. viii. p. 654, 665. Cave's Hist. Liter. p. 297, and Fabricius Bibl. Graec. tom. i. p. 427, &c.

Æneas, Tacticus, one of the most ancient Greek authors who have written on the art of war. He lived about 320 years before the Chirillian era. The age in which he lived is settled by Caphabon, who informs us, that Cineas, who was a disciple of Epicurus, and an ambassador from Pyrrhus to Rome in the 125th Olympiad, composed an epitome of the works of Æneas. His work was published by Caphabon, in Greek and Latin, with notes, and it is annexed to his edition of Polybius, 7 printed
printed at Paris, fol. 1659. See also Fabr. Bibl. Grac. 1. iii. c. 50, fo. 19.

Sylvius Piccolomini was born on the 15th of October, 1409, at Cortona, a small town in the territory of Sienna, the name of which he afterwards changed into Piera. His mother, when she was pregnant with him, dreamed that she should be delivered of a mitred infant, and interpreting her dream by the mode of degrading clergymen, which at that time was crowning them with a paper mitre, she conceived her son would be a disgrace to her family. But the dream proved to be a pledge of his future advancement. Having been well educated, though in low circumstances, at a grammar-school in his native town, he was enabled, by the alliance of friends, to go to the University of Sienna, in 1425, where he made great proficiency, and published several pieces in the Latin and Tuscan languages. In 1431, he attended Cardinal Capranica, named De Fermo, to the Council of Basil, as his secretary. He occupied the same office under Cardinal Albergati, who sent him to Scotland to mediate a peace between the English and Scots. Upon his return, he was appointed Secretary to the Council of Basil, which he defended against the authority of the Pope, both by his speeches and writings. This Council was sent to him other offices of importance; and he was employed in various embassies; in one of which, to Strafburg, he is said to have had an intrigue with a lady, by whom he had a son. For this adventure he has made a humorous apology, in a letter to his father, preferred in Wharton’s Appendix to Cave’s Hill. Lit. p. 114, anno 1438. In 1439, he was crowned by the Emperor Frederic III. with the poetic laurel; and in 1442, appointed Secretary to the Empire, and advanced to the senatorial order. Having made peace with Pope Eugenius III., he was honoured with the office of secretary to his Holiness, which he was allowed to retain without reneging his pont under the emperor. Upon the decease of this pope, Zenes was chosen by the cardinals to preface in the concave till another pope should be elected. Pope Nicholas conferred upon him the bishopric of Trieste, and he was at the same time appointed counsellor to the emperor, and superintendent of the most important concerns of the empire. He afterwards became archbishop of Sienna; and, in 1452, attended Frederic to Rome, where he went to receive the Imperial crown. Upon his return, he was named legate of Bohemia and Austria. In 1456, he was made a Cardinal; and upon the decease of Calixtus III. in 1458, elected pope, by the name of Pius II. Upon his advancement to the papal chair, his views and sentiments, like those of others in finicular circumstances, underwent a total revolution. He published a bull, retraction all he had written in defence of the Council of Basil, mainly apologized for his former conduct, and became a strenuous advocate of the papal prerogatives.

"We exhort and advise you in the Lord, (says he) not to pay any regard to those writings which injure in any manner the authority of the apostolic see, and offer opinions which the holy Roman church does not receive. If you find any thing contrary to this in our dialogues or letters, or in any other of our works, desile such notions, reject them, follow what we maintain now. Believe what I assert now I am in years, rather than what I said when I was young; regard a pope rather than a private man; in short, reject Zenes Sylvius, and revere Pius II." On this occasion, he declared appeals from the pope to a council to be null, erroneous and detestable, and contrary to the sacred canons.

Although he declined, with all the powers of his eloquence against the Turkish war, who he was secretary to the emperor, and described, from his own experience, the repugnant state and spirit of Christendom; yet, when he was raised to the papal throne, he devoted his life to the prosecution of this war. With this view, he attended a convention of princes at Mantua; but when the pontiff appeared at Ancona, to embark in peril with the troops, engagements vanished in express; a precipie day was adjourned to an indefinite term; and his effective army consisted of some German pilgrims, whom he was obliged to disband with indulgences and alms. The French, who had incurred the pope's displeasure by appealing to a council in defence of the Pragmatic sanction, opposed this measure; but he seemed to have been placated by the consent of Louis XI., in 1461, to abolish that edict, which the parliament of Paris had so lately and so vigorously supported. In the following year, 1462, he interposed in a dispute which took place between the Cordeliers and Dominicans, and instilled a bull forbidding them to brand one another with the odious epithets of heretics. In the exercise of his high office, Pius exerted himself with spirit and activity in bringing many contiils to a peaceful termination, and in settling the claims of various princes. During his pontificate he received ambassadors from the Patriarchs of the caft; who professed their unanimous agreement to submit to the pope as viceregent of Jesus Christ. At Ancona, whether he repaired for the purpose of embarking in the prosecution of the Turkish war, he was seized with a fever, which terminated in his death, on the 14th of August, 1464, in the 50th year of his age.

Sponsanus in his ecclesiastical Annals, says, that he was inferior to none in learning, eloquence, dexterity, and prudence; and the cardinal of Pavia, in his speech to the conclave, concerning the choice of a successor, pronounces this eulogium on Pius II., that he was a pope who had all the virtues in his character; and that he had merited the utmost commendation by his zeal for religion, his integrity of manners, his bold judgment, and profound learning. Ambition, however, seems to have been his ruling principle; and his conduct furnishes an example, in addition to many others, of the verifiability which a change of circumstances produces in persons that are influenced by this principle. The verse of Virgil’s Aenid, (lib. i. v. 38.) which begins—Sum pius Zenes—and the end of the following verse—fama papai Aethera notus, have been applied to him.

A history of his life, supposed to have been written by himself, was published by his secretary, John Gobelin. It was printed at Rome in 1459, and 1584 and 1589, and at Frankfort, in folio, in 1614. We have an edition of Zenes Sylvius’s works, printed at Basil, in folio, in 1551. His life is prefixed to the edition of his works, printed at Helsinfeldt, in folio, in 1700. Some apothegms of Zenes are recorded, of which the following are a specimen: As a covetous man is never satisfied with money, so a learned man should not be with knowledge. — Common men should from learning as silver, noblemen prize it as gold, and princes as jewels. — The laws have power over the commonalty, but are feeble to the greater ones. — A citizen should look upon his family as subject to the city, the city to his country, the country to the world, and the world to God. — The chief place with kings is slippery. — And as all rivers run into the seas, so do all vices into the court. — The tongue of a hypocist is a king’s greatest plague. — A prince who would trust nobody
is good for nothing, and he who believed every body no better.—He who governs many should himself be ruled by many.—Those who go to law are the birds, the court the field, the judge the net, and the lawyers the fowlers.—Men ought to be preferted to dignities, not dignities to men.—A covetous man never pleases any body, but by his death.—To tell lies is a fland vice.

Loft follies and flames every age of man, but quite extin-
guish till age, Juno's did ever, the word is formed from æneus, on account of the brazen instruments used by them.

ÆNEID, in Literary History, the title of Virgil's cele-

brated epic poem. The subject of this poem is very hap-

pily chosen; as nothing could be more noble, to nothing could be more interesting to the Roman people, than Vir-

gil's tracing the origin of their state to a hero of such cele-

brity as Æneas. Whilt the object was splendid in itself, the

theme afforded the poet an opportunity of PURSING, by

means of the traditionary history of his country, the future

great exploits of the Romans, and of describing Italy and

the territory of Rome itself, in its ancient and fabulous

state. Dr. Blair thinks in general, the opinions of

some critics, that the Æneid is an allegorical poem, bearing a

contrat reference to the character and reign of Augustus Cæsar; or that Virgil's chief design in composing it was to reconcile the Romans to the government of that prince, who is portrayed under the character of Æneas. In this poem, unity of action is

perfectly preferred; one main object being always kept in

view, which was the settlement of Æneas in Italy, by order of

the Gods. The episodes are likewise sufficiently con-

nected with the main subject; and the nodes, or intrigue of

the poem, is, according to the plan of ancient machinery,

happily formed. The wrath of Juno, who opposes the Trojan

settlement in Italy, occasions all the difficulties which embar-

rass the undertaking of Æneas; and connects, throughout the

whole work, the human with the celestial operations. Hence

arise the tempt which throws Æneas on the African shore,

the passion of Dido, who endeavours to detain him at Car-

thage, and the efforts of Turnus, who opposes him in war.

At last, however, Juno's resentment is placated, upon a

composition with Jupiter, that the Trojan name should be

funk in the Latin, and the hero becomes victorious. The

poem, however, is not free from imperfections; one of

which is, that there are scarce any characters marked in the

Æneid. In this respect it is inferior to the Iliad, which

abounds with characters and action. The character of Æneas

himself is cold and tame, and not marked with any of those

strokes that touch the heart. His behaviour to Dido mani-

fests obduracy, which renders him unamiable. Dido's own char-

acter is well supported, and exhibits a figure more truly ani-

mated than any other which Virgil has chosen. Besides

this defect of character in the Æneid, the distribution and

management of the subject are, in some respects, exception-
table. Allowance indeed ought to be made for an in-

complete work; for it is said, that the fix last books did not

receive the finifhing hand of the author; on which ac-

count he ordered, by his will, the Æneid to be committed to

the flames, which was happily prevented by Augustus.

The wars with the Latins are inferior, in point of dignity,

to the destruction of Troy, the intrigue with Dido, and

the defeat into hell; and in the conduct of these wars, the

reader, as Voltaire observes, is tempted to take part

with Turnus against Æneas. This defect might have

been remedied by the poet's making Æneas, instead of

differting Latins, by killing her lover and occasioning her

mother's death, and embroiling her country in a war, deliver

her from the perfection of some rival, who was odious to

her and to the whole country. The distinguishing excel-
hence of Virgil is true genius. He wasendowed by nature

with exquisite sensibility; he felt every affecting circum-

stance in the scenes which he describes; and he knows how, by

a single stroke, to reach the heart. This, in an epic

poem, is the merit next to sublimity, and renders the com-

position interesting to every reader. The second book is

one of the greatest master-pieces that was ever executed;

and Virgil seems to have there exerted all the powers of

his genius, as the subject afforded a variety of scenes, both

of the awful and tender kind. The images of horror, pre-

sented by a city burning and sacked in the night, are finly

mixed with pathetic and affecting incidents. The death

of old Priam, and the family-pieces of Æneas, Aeneas, and

Creusa, are as tender as can be conceived. The fourth

book, relating the unhappy passion and death of Dido, has

been always most justly admired. The interview of Æneas

with Andromache and Helenus in the third book; the

episodes of Pallas and Evander, of Nisus and Eurynus, of

Lautes and Menecus, in the fifth book; the Italian wars, are

striking ins-

ances of the poet's power of raising the tender emotions.

The best and most finished books, upon the whole, are the

first, the second, the fourth, the sixth, the seventh, the
eighth, and the twelfth. Virgil's battles are, in point of fire

and sublimity, inferior to those of Homer; but there is one

important episode, the defeat into hell, in which he has

far exceeded Homer in his Odyssey. In all antiquity there

is nothing equal, in its kind, to the sixth book of the Æneid.

Through the whole description of the invisible world,

there is displayed a certain philosophical sublime, which

Virgil's plastic genius, and the enlarged ideas of the Aus-
gustan age, enabled him to support with a degree of ma-

jesty far beyond what the rude ideas of Homer's age al-

lowed him to attain. It is needless to lay any thing in

praise of the sweetnes and beauty of Virgil's numbers,

which are universally acknowledged. Elegance and tender-

ness are the distinguishing excellence of the Æneid. For

the feble passages of this poem, it ought to be admitted

as an excuse that the Æneid was an unfinished work. Blain's

A late writer, viz. M. la Harpe, in his Leks, or Lectures

at the Lyceum, does not allow Virgil to be the inventor of

a single incident, and scarcely of a verse, in his poem. He

is not only accused of imitating Homer in his plan, his

battles, and his principal events, as well as in his verses,

but of plagiarisms from the old poets Ennius, Pacuvius, Acius,

and Svevius, and from his contemporaries Lucraces, Cat-

ulus, Tibullus, Varius, and Pirius. It is confessed, how-

ever, that the 3d, 4th, and 6th books are great and admi-

rable productions. The excellence of Virgil, in the exclu-

sion of this author, rests upon the constant perfection of his

style, to surpass which seems impossible. It is at once,

he says, the delight and despair of all who wish to cultivate

poetry; so that if he has not equaled Homer in invention,

variety, or conftant interest, he has forfeited him in the

beauty of particular parts, and in the fine tale by which he

has embellished his narratives.

ÆNESIPPA, in Ancient Geography, called by Strabo Ænesippos, an island of the Mediterranean, on the coast of Lybia.

ÆNESIPHYRA, a promontory, according to Strabo, and a port, according to Ptolemy, at the extremity of the O o

Catabathmus
Cataebuthus magnus, terminating the Lybian name, to the north-east, near the frontiers of Marmara.

ÆNÍ, in Ancient Geography, an island of the Red Sea, placed by Ptolemy to the east of Hippo, and to the south of the Elmatic gulf.

ÆNIA, a city of the Perrhebi in Thessaly; and also the name of a small place of Asia Minor, in the Tröas, according to Strabo, about 50 stadia from Palecapis. See ÆNEA.

ÆNIADAE, the name of two cities; one in Acharnarnia, on the Ionian sea, near the mouth of the river Achelous, denominated by Strabo Ænicia, and now called by modern travellers Drapgylida; and another, according to Stephanus, in Macedon. See ÆNEA.

ÆNIANA, a fortified town of Asia, near the Caphian f.a.

ÆNÍANES, one of the southern part of Thessaly, who dwelt to the east of mount Oeta, upon the Sperchius. Many reckon them among the Ætolians.

ÆNIGALA, a proposition put in obscure, ambiguous, and generally contradictory terms to puzzle, or exercise the wit, in finding out its meaning; or, an obscure discourse covering some common and well known thing, under remote and uncommon terms.

The word is formed of ἀποκριμα, ἀποκρις inscr., to hint a thing darkly; of ἀποκρις, an obscure speech, discourse.

The Latinis sometimes call it fictitas, figuris, or figuratus.

The populace with us name it riddle; from the Belgic racten, or the Saxon racthan, to interpret.

Fra. Junius defines an enigma to be an obscure, parable, or allegory; and makes two kinds; the one greater, rendering the sentence more intricate and knotty, by a multitude of words; the other lesser, confuting of only one or two remote words, or allusions; as in Isaiah, ch. xi. 1, where Jesus Christ is called Ἱμάντος, falcatus, rod, or branch.

Fa. Bohours, in the memoirs of Treves, defines an enigma, a discourse, or painting, including some hidden meaning, which is proposed to be guessed.

Enigmata, obfuscated, are representations of the works of nature, or art, concealed under human figures, drawn from history or fable. Thus Jesus Christ, in the middle of the doctors, represents the Bible, &c.

A verbal enigma is a witty, artful, and abstruse description of any thing.

The use of enigmata was very great among the Egyptians. Gale thinks they might borrow their custom from the Hebrews, among whom, it is certain, enigmata were not left in use. Witness Samson's riddle, Judges xiv. 12, 13. I will now put forth a riddle to you, &c. ἔλαψας, i. e. according to Vatable, an enigmatical problem; the LXX. render it, κύριος. Solomon is said to have been particularly skilful in the solution of enigmata. Joseph, Antiq. lib. v. cap. 2. Clemens affirms us, that the Egyptians placed sphinges before their temples; to intimate that the doctrines of God and religion were enigmatical and obscure. See Hieroglyphic.

Some represent the enigma as the same with gryphus; but the more exact writers make a distinction; though wherein the difference lies is not agreed on. Some make it consist in this, that the enigma properly imports something merry or jocose, and gryphus a subjeéct more grave and profound. Others reduce the difference to this, that in the gryphus there is something captions, and capable of leading into a snare, which is not found in the enigma.

The REBUS is also ranked by some in the number of enigmata.

In a general sense, every dark saying, every difficult question, every parable may pass for an enigma. Hence obscure laws are called enigmata juris.

The alchemists are great dealers in the enigmatical language, their proceedings for the philosopher's stone being generally wrapped up in riddles; e. g. Fac ex mare et familia circum, unde quadrangular, binc triangulum fac circum et taballis lapidem philosopharum. Barchulsen has published an explication of the riddles of chemists, alchemists, physicians, &c.

Among the enigmata of Chemists, that called the fibulline enigma is famous, of which we had a copy in a MS. of Stephanus Alexandrinus.

ενικα γρηγματα τιτρυφε, πυθμανδρας ελκυ, κλεται.

Αι τρις αι προια δι gambling ικουρω ιαγων,

Η λαθοι δις τα λαθοι, και ειται άρκοσα τα πυγι.

Το πρόσοιδ τω άρθρω υπονοον ηλκυ, δι ησται,

Και τρις τρις διακονας και δις βρυχαι.

Τοις δι τις τις,

Ονκα ναμώνιο εν τω παρ' ημι σοφία.

Thus translited by M. Leibnitz:

Litteris uxor quadrifilius utis novenies:

Sydalis balat binas, utis qvee tute ultima ternar.

Vocalis guarer, quies non propria vos el.

Bis fitis; viduis umeris centum taciturn.

Ingredior, decadisfu novenies, tum bis tria. Si me

Novis, hic aditus ad juera noveta paint.

Stephanus gives a mystical solution of this enigma. Most of it will have it signify the name Jehovah, which, according to him, comprehends the number 1066, abating one, the number contained in the enigma. Brunius maintains that the whole sum amounts to 1711, and that it represents the word φανερον. The generality understand it of the word arkeon, and ΑΡΕΝΙΚΟΝ. M. Leibnitz gives a very artful solution of it in this sense, by only supposing the Α to stand for a thousand, and I for unity, as we sometimes find them used by grammarians.

The operation of cupping, performed in ancient days by a machine of brazs, is ingeniously represented by the following enigma:

Αἴτης ἐν οἴνος παν Ἑλλάδας ἐν μέσῳ γαλαζίας;

“I saw a man, who, unprovok'd with ire,

Στεκάθει γας ανάβοντος τοῦ άνέκα θηρίον.”

Aulus Gellius (xii. 6) has preferred a Latin enigma, which he also calls a firpus or firpos, debated (says Mr. Harris in his Philological Inquiries, p. 208.) with all the quibble of a barbarous age:

“Semel minime, an bis minus, non fat fecio.”

An utrumque corum (ut quondam audivi dicier).

Jovi ipi regi noluit concedere.”

It is thus translited by Mr. Harris: “Was it once minus, or twice minus, (I am not enough informed,) or was it not rather the two taken together, (as I have heard it said formerly) that would not give way to Jove himself, the foe of reign." The two taken together, that is, once minus, and twice minus, make, when so taken, bire minus; and bire minus in Latin is ter minus; which, taken as a single word, is Terminus, the god of boundaries. The meaning of the riddle coincides with the Pagan legend, which says, that when in honour of Jove the capitol was founded, the other gods confedered to retire, but the god Terminus refused. See Ovid’s Fasti, l. iii. 667, &c. t. iii. p. 157. Ed. Bury.

The
ÆNI

The moral of the fable is just and ingenious, viz. that boundaries are keinen, and never should be moved.

F. Menelikus has attempted to reduce the composition and resolution of enigmas to a kind of art, with fixed rules, and principles, which he calls the philosophy of enigmatic imagery.

Enigmas, the subject of an, should be something easily conceived, and generally known.

Enigmas, the form of it, consists in the words, which, whether they be in prose or verse, contain either some description, a question, or a prosopoeia. The last of the kind are the most pleasing, inasmuch as they give life and action to things, which otherwise have them not. They are commonly involved either in a pun or metaphor, or sometimes in both. In such fancies, contrary to the principles of good metaphor, and good writing, perplexity is caused, not by accident, but by design, and the pleasure lies in being able to resolve it. To make an enigma, therefore, two things are to be pitched on, which bear some resemblance to each other, as the fun, and a monarch; or a ship, and a house; and on this resemblance is to be raised a superstructure of contrarieties to amuse and perplex. It is easier to find great subjects for enigmas in figures than in words, inasmuch as painting attracts the eyes, and excites the attention to discover the sense. The subjects of enigmas in painting are to be taken either from history or fable; the composition here is a kind of metamorphosis, wherein, e.g. human figures are changed into trees, and rivers into metals. This conversion, however, does not depend merely on caprice; there must be something of suitableness, and even erudition to authorize it. Thus the battle of Constantine against Maxentius may be taken for the subject of an enigma, to represent the game of chefs: the sign which appeared in the heavens with the words, in hoc significavit, may properly enough represent the secret of this game, which confuses in faving the king. It is much easier to turn mythology into enigmas, than history. Accordingly several have imagined, that the conquest of the golden fleece was no other than the transmutation of metals; and that the fable of Circe was the art of chemistry in enigma. Enigmas of pure invention are a kind of poetry, and more subtile than those drawn from mythology; since here the matter itself is to be created; instead of adopting some history or received fable, something probable is feigned, the chief action whereof is known, e.g. a shipwreck, a conflagration, an amphitheatre, or the like. It is essential to enigmas, that the history or fable under which they are presented, be known to every body; otherwise it will comprehend two enigmas instead of one; the first of the history or fable, the second of the sense in which it is to be taken. Another essential rule of the enigma is, that it only admits of one sense. Every enigma which is lucifcent of different interpretations, all equally natural, is so far imperfect.

Enigmas, the solution or explanation of it, forms a kind of exercise, that is as difficult as it is amusing, and that affords scope for invention and penetration. By the solution of an enigma we are to understand the discovery of a motto corresponding to the action and persons represented in a picture, taken either from history or mythology. This motto must, either by itself or its attendant circumstances, divert the spectators, and furnish occasion for displaying wit, and introducing pieces of poetry to illustrate the subject and awaken the attention of the audience. Those enigmas which are expressed by figures, are more difficult of solution than such as consist of words, because images may have a greater variety of significations than words; so that to fix them to a particular sense, we must apply every situation, symbol, &c. without omitting a circumstance belonging to them. As there are few persons in history or mythology that have not some particular character, this character must be regarded, in order to determine what the figure in any painting signifies, and so discover how it agrees with the subject of which we would explain it. Thus, if Proteus be represented in a picture, it may be taken to denote metamorphosis, and applied either to a physical or moral subject, the character of which is mutability; e.g. an almanack which expresses the variable weather, feasons, heat, cold, storms, and the like. The colors of figures may also help to unriddle what they mean, e.g. white is an emblem of innocence, red of mortality, green of hope, black of sorrow, &c. When figures are accompanied with symbols, they are more determinate; these being, as it were, the soul of enigmas, and the key that opens the mystery of them. Of all the symbols that occur in the writings of those who have treated of the subject, those only of Pythagoras are truly enigmatical, which, under obscure proverbs, convey lessons of morality: as when he uses the phrase flatum nte tranfiles to signify, do injustice. Some enigmas are fo complicated, that no rules will serve for the solution of them, and that they occasion great perplexity to those who endeavour to interpret them. Such is that ancient and celebrated enigma, called Helia Leliae Crpis, which has puzzled many learned persons, who have directed their attention to subjects of this nature. There are two copies of it, each of which claims authenticity. The one, formerly engraved on marble and more lately cut in fresh characters, by order of Achilles Volta, is preferred by the family of Volta at Cafaralta near Bologna, and is as follows:

"D. M.
Ælia Lelia Crpis
Nece vise, nec mulier, nec androgyn, nec pudicia, nec omnia. Sed omnia.
Sublata
Neque fame, neque ferro, neque veneno, nec omnibus. Sed omnis.
Neque caali, neque meretricis, nec pudicia, nec omnia.

Sed omnia.
Sublata
Neque fame, neque ferro, neque veneno, nec omnibus. Sed omnis.
Neque caali, neque meretricis, nec pudicia, nec omnia.

Sed omnia.
Nece molen, ne pyramidem, nec sepulchrum, nec omnia.
Scit et necit cui poferiet."

Thus translated: "Ælia Lelia Crpis, who was neither man, female, nor hermaphroditic; neither a girl, nor a young woman, nor an old woman; neither chaste, nor a whore, nor a modest woman; but all these. She died neither by famine, nor sorrow, nor poison; but by all these. She lies neither in the air, nor in the water, nor in the earth; but everywhere. Lucas Agatho Priscus, neither husband, nor lover, nor relation, neither forsworn, nor repining, nor weeping, erected this, which is neither fabric, nor pyramid, nor tomb; but to whom, be known, and does not know.

The other copy of this enigma was found written in Gothic letters in a Ms. at Milan, introduced with A.M.P.P.D. instead of D.M. dito manibus, which an anonymous author (A.B. Enud. Liph. Mens. Mart. 1732) interpreting the middle of a monument erected by one of the Ælian family to his own soul, deciphers thus: Anima mea propria dies; at the end is the following addition: viz.
AENO

ÆOL

"Hoc est fcpelhurum intus cadaver non habebens, 
Hoc est cadaver fcpelhurum extra non habebens, 
Sed cadaver idem est et fcpelhurum fibi."

i. e. "Here is a fcpelhur without a corpe; here is a corpe without a fcpelhur: the corpe and fcpelhur are one and the same."

Of this enigma the solutions have been very numerous. On the four sides of the stone, on which it is inscribed, there are twelve different explanations, with the names of their faga- 
orous authors. Marcio Michael Angelo will have it to be rain; Lictus, the beginning and ending of friendship; Gevarius, love; Pontinus, the remains of three different perfons: Turris, the materia primus: Barnaud, an eunuch, or the philosopher's stone: Agathias Scholasticus, Niobe; R. Vitus, the rational soul, or the idea Platonis; Boxbourni, a shadow; Ovid Montalbanus, hemp; M. de Cicogne, pope Joan; Heurnmannus, Lot's wife; another anonymous perfon, the Christian church; Terronus, music; Vefmondus, a law- 
uit; and, to add no more, Comn Malvah, in a tractile intitled Ephi Lathia Crispos non nata refurgens, interprets it 
of a daughter promised to a perfon in marriage, who died 
pregnant with a male child before the celebration of her nup- 
tials. See Keyler's Travels, vol. iii. 264, &c. Svo.

ÆNITICAL, something that relates to, or partakes of the nature of enigmas.

The philosophy of the Druids was altogether enigmatical.

The ancient fages in general affected an enigmatical way of 
writing, to conceal their doctrines from the populace. 
The Romans in Nero's time were obliged to have recourse to the like method, though for different reasons. The enigma- 
tical characters of the Egyptians were a species of hieroglyphic, confilting of such as bore no natural resem- 
blance to the things they represented. Such was the beetle, 
used to express the fun: the serpent, to represent the flavs.

We read of an enigmatical medal presented by the 
Huguenots to Henry III. Schott has published an explication of an enigmatical coin of the emperor Augustus, concerning 
which antiquaries have long divided.

ÆNITMATOR, or Enigmatis, a maker or explainer of enigmas.

Hardon, Vander Hardt, &c. are great enigmatifs.

ÆNITMATORIHY, Enigmatica, com- 
ounded of ana and typs, to describe, the art of making 
and resolving, or collecting Enigmata.

Enigmatical, otherwise called enigmatology, may be divided into general and particular. The first givs rules 
concerning the nature, kinds, composition, and use of enig- 
mas; the second considers the enigmas in particular sciences, 
or languages, Greek, Latin, Hebrew, philological, philo- 
philical, theological, &c.

Nie. Reufier has a treatife, under the title of Ænigmatog- 
raphia.

ÆNIPPE, in Entomology, a species of Papilio, with round fih yelh wings, all of which are marked beneath with ocelated points; the fore wings with six, and the hinder with seven. It is found in China.

ÆNITTOLOGIUS, in Poetry, a kind of verse con- 
fiding of two dactyls, and three trochees. Such is, "Praela dura placent truci juvenes."

ÆNIUM, in Ancient Geography, a promontory near Ænia, 
on the Thermic gulf.

ÆNIUS, a small river of Dardania in Asia.

ÆNNUM, a small town of Egypt, mentioned by Pliny 
(t. i. p. 343,) called by others Philotera, and now Sygum. 
ÆNOLA, in Geography, a market town of Naples, in 
the province or jurifdiction of Terra di Lavora. N. lat. 
41° 15', E. long. 13° 22'.

ÆNONA, in Ancient Geography, a city of Liburnia, 
called by Pliny (t. i. p. 178.) Civitas Pafui, now Nona. It 
lies on the Adriatic, by which it is almost surrounded, over 
against the island Gillis, and distant from it about four miles 
from the sea. M. d'Anville places it to the south of Dalmata.

ÆNUS, a river of Vindelicia, in Germany, which rifes 
in the Rhetaian Alps, and discharges itself into the Danube. 
It is now the Inn. Near this river was the town called 
Ænus pontis of Antoine, from a bridge that connected Noricum 
with that part of Vindelicia, inhabited by the Boii. 
Ænus was also a river of the Cimbric Chericonesus.

Ænus was also a mountain of Cephalania, one of the 
Greece islands, where was a temple of Jupiter. 
Ænus, Ænus, or Ænus, a town of Thrace, built 
yays Strabo, cited by Stephanus (de Urb. p. 457.) by the 
Cumeans, but according to Mela, who seems to mistake 
this town for Ænus, by the exile Ænus. If it was founded 
by the Trojans, it was enlarged by the Cumeans. It is 
situated on one of the two mouths of the Hebrus. It was 
a free town, says Pliny (t. i. p. 264.) in which was the 
tomb of Polydorus; and was one of the towns, Maronea 
being the other, on the Ægean Sea, conquered by Philip, 
the father of Pericus, and upon the defeat of the latter by 
the Romans, promised to Eumenes, king of Pergamus 
but afterwards declared by the senate free and independent. 
Livy, i. xxxi. c. 16. c. 31. t. i. p. 534, 557. Ed. Diakon. 
from it is Ænus. It was also called Ap SYNTHUS. Here, 
according to Plutarch, (t. i. p. 763.) the brother of Cato of Utica died, and was honoured with a 
mummy of marble in the forum of the Ænus. This town 
is now Exo.

Stephanus mentions four other towns of this name; 
one built by Ænus, the brother of Gnesus; another, a city of Theifaly; a third, of the country of the Lucrians; 
and a fourth, between Thaphacus and the Euphrates. 
There is also an island of this name adjoining to Arabia Felix.

ÆOLIAN ISLANDS are seven islands, situate between 
Sicily and Italy, in the Tyrrhenian or Tufan sea; so 
called, according to Pliny, (t. i. p. 16.) Ed. Hardt,) be- 
cause Æolus reigned there in the time of the Trojan war. 
They were denominated by the Greeks Hepheistades, and 
by the Romans I'acanies, from their fiery eruptions. 
They were also called by Strabo, (t. i. p. 354.) Hepheistades, 
i. e. Lipocrates infuatur, from Lipara, the chief of them. 
Their names, according to Pliny, with whom Diodorus 
Siculus, (l. v. c. 7. t. i. p. 335. Ed. Wellford,) agree, 
are Lipara, Hirra, Strongyle, Didyne, Eritrea, Phoeneus, 
and Euonymos. They are now called, Isola di Lipari. Telemone 
mentions fifteen of these islands; but he includes in the 
number several other little islands, which are too far distant 
to be properly included under the denomination of the Æo- 
lian islands.

Æolic, in a general sense, denotes something belonging to Æolus.

Æолис, or Æolian, in Grammar, denotes one of the 
five dialects of the Greek tongue. It was first used in 
Boeotia; whence it passed into Æolia, and was that in 
which Sappho and Alcaeus wrote. We find also a mixture 
of it in the writings of Theocritus, Pindar, Homer, 
and many others. The Æolic dialect generally throws out 
the aspirate or sharp spirit, as φιλος for φιλος, day; draws back the
the accent, as τέμπεα for τεμπεῖα, river; changes α into αι, as μελάς for μελᾶς, black; and ει into οι, as μεσίον for μεσίον, and in the singular ι into οι, puts ους for ος, as τούθενοι for τούθενα; and β before μ, as βατίζω for πιάζω, a νοίει; changes two μμ into οι, as ουξάλεια for ουξάλητα, the eyes; and it agrees in so many things with the Doric dialect, that the two are usually confounded together, and have been almost entirely followed by the Latins.

The Eolice *dipumus* is a name given to the letter Ε, which the Eolians used to prefix to words beginning with vowels, as ΕΔος, for δος; and also to inflect between vowels, as Είς, for αἰς.

Eolus *vers*., *Carmina Eolicaum*, in Poetry, a kind of measure, confining, first of an Iambic or Spondee; then of two Anapests, divided by a long syllable; and, lastly, a common syllable. This is otherwise called *eulogia*; and from the chief poets who used it, *Archilochian* and *Pindaric*.

Its type is, "| |

e.g. "Ο Ἐρεύνησι condivor orbis,"

**ÆOLIPILE, ÆOLIPA**, in *Hydraulics*, is an instrument confining of a hollow metaline ball, with a slender neck, or pipe, arising from it. This, being filled with water, and thus exposed to the fire, produces a vehement blast of wind.

This instrument, Des Cartes, and others, have made use of, to account for the natural caule, and generation, of wind.—And hence its name, *Æolipa*, q. d. *pila Æoli, Æolus's ball*, or *Æolus's words*, the gates of Æolus; Æolus being reputed the god of the winds.

Sometimes the neck is made to pierce into the ball, which is the most commodious way; because, then, the cavity may the more readily be filled with water. If there be no screw, it may be filled thus:—Heat the ball red hot, and throw it into a vessel of water; the water will run in at the small hole, and fill about two thirds of the cavity.

If, after this, the Æolipile be laid on, or before the fire, so that the water and vessel become very much heated; the water being rarefied into vapour or clastic steam, will be forced out with very great violence and noise; but it will be by intervals, and not with a conluent and uniform blast. Care should be taken that the aperture of the pipe be not stopped, when the instrument is put on the fire, and that the ball be not set upon a violent fire with very little water in it, otherwise the Æolipile will burst with a great explosion, and may occasion much mischief. The Æolipile is sometimes placed in a small carriage with wheels, and a cork is thrust into the extremity of the pipe. When the vapour has acquired sufficient strength to force out the cork, it will rush out with violence in one direction, while the ball and carriage move the contrary way. See a figure of the apparatus for this purpose in Plate 1. *Pneumatics*, fig. 1.

Thee phenomena the reader will be easily enabled to solve, from what is shown under the articles, *Air*, *Water*, and *Rarefaction*, and *Rarefraction*.

Chauvin suggests some farther uses of the Æolipile.—*1. He thinks it might be applied, instead of a bellows, to blow the fire, where a very intense heat is required. This fact has been urged as an argument to prove the decomposition of water; but, in this case, it is not the steam which excites the fire, but the air which is driven before it; for an Æolipile will not produce this effect, but the contrary, unless a body of air be intercepted between its aperture and the fire. Accordingly, Dr. Lewis condemns substituting the Æolipile instead of a bellows, and says, that upon trial he always found that instead of exciting, it extinguished the fire. Com. Phil. Techn. p. 21.—2. If a trumpet, horn, or other fonorous instrument, were fitted to its neck, it might be made to yield music.—3. If the neck were turned perpendicularly upward, and prolonged by a tube or hollow cylinder fitted to it, and a hollow ball laid on the orifice of the tube, the ball would be blown up, and kept fluctuating, or playing up and down, as in the stream of a *Fountain*. And 4. It might serve to loom or fumigate a room, if filled with perfume, instead of common water. An Æolipile has been sometimes placed in a chimney, where it can be heated, the vapour of which serves to drive the smoke up the chimney. Dr. Plot gives an instance where the Æolipile is actually used to blow the fire: the lord of the manor of Effington is bound by his tenure to drive a goose every new year's day three times round the hall of the lord of Hilton, while Jack of Hilton (a brazen figure having the structure of an Æolipile) blows the fire.

In Italy it is said, that the Æolipile is commonly made use of to cure smoky chimneys; for being hung over the fire, the blast arising from it carries up the loitering smoke along with it.

This instrument was known to the ancients, and is mentioned by Vitruvius, lib. i. cap. vi. and it is also taken notice of by several modern authors; as Des Cartes, in his Meteor. cap. 1. apud Opera Philos. tom. i. p. 180. F. Mercerus, and some others have made use of this machine, to measure the gravity and degree of rarefaction of the air, by weighing the instrument, when red-hot, without water, and weighing it again when cold. But this method is liable to considerable objections. It supposes that there is no air in the ball when it is red-hot; whereas Varctlius (Geog. vol. i. p. 423.) has shewn, that the air is rarefied but about 70 times; and, consequently, the weight, obtained by the above process, will be about 1-rcath too small, or more or less, according to the intensity of the heat.

Some late authors have discovered a still more extraordinary use, to which the frauds of the heathen priesthood applied the Æolipile, viz. the working of sham miracles. Besides Jack of Hilton, which had been an ancient Saxon image, or idol, Mr. Weber shews, that *Phylfer*, a celebrated German idol, is also of the Æolipile kind; and in virtue thereof, could do noble feats; being filled with a fluid, and thus set on the fire, it would be covered with sweat, and as the heat increased would at length burst out into flames.

An Æolipile of great antiquity, made of brass, was lately dug up in the site of the Basingkloke canal, and presented to the antiquarian society of London. Instead of being globular, with a bent tube, it is in the form of a grotesque human figure, and the blast proceeds from its mouth.

**ÆOLIS** or **ÆOLIA**, in *Ancient Geography*, a country of Asia Minor, so called from the Æolians, who settled in this part of Asia, comprehended in former times the whole of Troas, and extended along the coast from Ionia to the Propontis; but in a more confined sense, it is situated between Troas to the north and Ionia to the south. According to Strabo (tom. 1. p. 872.) it extended from the promontory *Liatic* to the river Hermus, and contained 11 cities, mentioned by *Herodotus* (l. 1. p. 73. Ed. Weilheling.) who observes, that Smyrna was taken from the Æolians by the Ionians; Ptolemy, and after him M. d'Anville, affilg *Carybus* to the north, and *Hermus* to the south, as the limits of Æolis. The Æolians, according to Josephus, were descendent from *Eileith*, one of the sons of *Javan*; but according to the Greek historians from Æolus, the third son of *Ion*, son of *Heilen*, who was the son of *Deucalion*. They, as well as the Ionians
ÆOLIUM, a city of the Thracian Chersonesus. M. d'Aubl. places it at the entrance of the Hell-pont to the north, and calls it with Pliny, Elurus.

ÆOLUS, in Mechanic, denotes a portable machine, not long since invented by Mr. Tidd, for refreshing and changing the air in rooms.

This machine is adapted in its dimensions to supply the place of a square of glass in a sash window, and is executed in so small a compass, as to project but a little way from the sash, and in no neat a manner, says the inventor, as to be an elegant ornament to the place where it is fixed. It works without the least noise, requires no attendance, and occasions neither trouble nor expense to keep it in order. It throws in only such a quantity of air as is agreeable; and leaves off working, of its own accord, whenever the door or window is opened.

Æolus, in Heathen Mythology, the god of the winds, painted with swallow's checks, like one who with main force endeavours to blow a blast; also with two wings on his shoulders, and a high coloured fairy countenance. He is said to have been the son of Jupiter by Accaia, or Sigeia, the daughter of Hippotes: or, according to others, the son of Hippotes by Meneecca, daughter of Hillus, king of Lipara. He dwelt, as some say, in the island Strongyle now Strombolo, one of the Aeolian islands; or, as others say, either at Rhegium in Italy, or in Lipara. The government of the winds is said to be under his direction and control. Some mythologists explain the fables relating to Æolus by representing him as a wise and good prince, who was able in consequence of his skill in the sciences, by the flux and reflux of the tides, and the appearances of the volcano in the island Strongyle, to fortify forms and tempests. See Polybibl. Fragm. p. 988.

Æolus's Harp, in Music, an instrument so named, from its producing an agreeable harmony, merely by the action of the wind. — It is thus constructed. — Let a box be made of thin deal as possible, (Plate 1. Majus, fig. 1.) of the exact length answerning to the width of the window in which it is intended to be placed; five or six inches deep and seven or eight inches wide. Let there be glued upon it at a, two pieces of wainscot about half an inch thick; and a quarter of an inch thick, to serve as bridges for the strings; and with sides, at each end, under b, glue two pieces of beech, about an inch square, of length equal to the width of the box, which are to fill the pews. Into these fix as many pins, such as are used in a harpsichord, as there are to be strings in the instrument, half at one end, and half at the other, at equal distances. It now remains to fix some small catgut, or blue silk fiddle-strings, fixing one end to a small brass pin, as at ees (fig. 2.) and twining the other round the opposite pin at b.

When these strings are tuned unison, and the instrument placed with the strings outward, in the window to which it is fitted, it will, provided the air blows on that window, give a sound like a dilatory chord, increasing or decreasing, according to the strength of the wind.

The roof in the middle only represent found-holes; the thinner the top is, the better will the instrument perform. Mr. Thomson, in a note to his celebrated Ode on this instrument, ascribes the invention of it to Mr. Osvald; whereas it was known to Kircher above a hundred years ago; and the method of constructing and using it is described by him in a book intitled Magia Phonautatica et Phonurgia.

An improved form of this instrument is represented in
AEOL

AEON

for, the strings, instead of being on the outside, are fixed to a sounding-board or belly within a wooden case, and the wind is admitted to them through an horizontal aperture. In this form the instrument is portable, and may be used anywhere in the open air.

AEOLUS's harp produces all the harmonies of a single string, divided in harmonious proportion. See Harmonics. The tension of the strings must not be great; as the air, if gentle, has not sufficient power to make them vibrate; and, if it blows fresh, the instrument does not sing, but screams. Its crescendo and diminuendo, or the gradual advancing and retreating of its delicate tones, can only be described by the instrument itself.

Kircher has attempted to account for the phenomena of the AEolian harp, by supposing the current of air to strike on different portions of the string. But this is contrary to experience; for, if we suppose the AEolian note to be one-fifth above the original note of the string, that is, one-third of the whole, then, according to Kircher, the remaining part would be at rest, which is not the case; for an obstacle applied to any other point besides the quiescent points of division, will destroy the AEolian tone. The chords also that would arise on this theory are not such as really take place in nature; thus, where the chord consists of the notes F and A, the first note F is produced, according to Kircher, by the blasts striking on one fourth of the string; and in this case, the remaining part of the string must be at rest according to Kircher, which is contrary to experience; or, if it be agitated as one string, it must produce the note of three-fourths of the whole string, that is, a fourth above the base note; whereas, the note really produced is the double octave to the third above the base note.

Mr. Young, in order to ascertain the order of the notes in this instrument, took off all the strings but one; and, placing it in a proper situation, he was surprised to hear a great variety of notes, and frequently such as were not produced by any aliquot part of the string; and he often heard a chord of two or three notes from this single string. These complex and extraordinary phenomena at first perplexed him; and he at last despaired of being able to account for them on the principle of aliquot parts. On further examination, however, he found that they all flowed naturally and clearly from this principle. Having directed his attention to the effect of a current of air rushing against a stretched elastic string, he observed, that a blast against the middle point of the string moved the whole of it from its rectilinear position; and that the string, by its elasticity, returned to its former position; so as thus to continue vibrating and exciting pulses in the air, which produced the tone of the entire string. If the current of air be too strong and rapid, when the string is bent, it will retain its curvature. But though the whole string cannot perform its vibrations in this case, the subordinate aliquot parts may; and these will be of different lengths according to the rapidity of the blast. Thus, when the velocity of the current increases so as to prevent the vibration of the whole string, those particles which strike against the middle points of the halves of the string agitate those halves, as in the case of sympathetic and secondary tones; and as these halves vibrate in half the time of the whole string, though the blast may be too rapid to admit of the vibration of the whole, yet it can have no more effect in preventing the motion of the halves than it would have on the whole string if its tension were quadruple: for the times of vibrations in strings of different lengths, and agreeing in other circumstances, are directly as the lengths; and in strings differing in tension, and agreeing in other circumstances, inversely as the square roots of the tensions; and therefore, their vibrations may become strong enough to excite such pulses as will affect the drum of the ear; and the same may be said of other aliquot divisions of the string. Those particles which strike against such points of the string as are not in the middle of aliquot parts, will interrupt and counteract each other's vibrations, as in the case of sympathetic and secondary tones, and therefore will not produce a sensible effect. These principles are illustrated and applied by Mr. Young in his "Enquiry into the Principal Phenomena of Sound and Musical Strings," printed at London in 1784, 8vo.

AEON, Aion, age, literally signifies the duration of a thing. But the word has been used by Greek writers in different senses. It was first applied to the age of man, or the duration of human life. In succeeding times it was used by philosophers to express the duration of spiritual and invisible beings.

Xosome was used to denote the measure of corporeal and changing objects; and somas or soun, for the measure of such as were immovable and eternal. And, as God is the chief of spiritual and immovable beings, its eternal duration was expressed by this term, and thus it is now commonly understood. It was afterwards attributed to other spiritual and invisible beings; and the oriental philosophers, who lived about the time of Christ's appearance, and made use of the Greek language, understood by it the duration of eternal and immovable things, the space or period of time in which they exist. By a metonymy, the term was employed to signify the beings themselves. Thus, the Supreme Being was called sames, or AEON; and the angels also distinguished by the title of AEONS. Accordingly, the Gnostics, who had formed the notion of an invisible and spiritual world, composed of entities or virtues, proceeding from the Supreme Being, and succeeding each other at certain intervals of time, in order to constitute an eternal chain, of which our world was the terminating link, alluded to the beings that formed this chain a certain term of duration, and a certain sphere of action. These terms of duration were at first called sames, or soun, and they themselves were afterwards metonymically distinguished by that title. Molheim's Eccl. Hist. by Machine, vol. 1. p. 89. 8vo.

Some have affixed another idea to the word soun; in order to which they have made use of the philosophy of Plato, giving reality to the ideas which that philosopher had imagined in God; and even personifying them, and feigning them distinct from God, and to have been produced by him; some male, others female. See Platonicism.

Thee ideas they call soun, of an assemblage of which they compose their deity, calling it σύνεντες, a Greek word, signifying "friends." Some say that Simon Magnus was the first inventor of these souns, which seem, however, to have sprung from the oriental philosophy, and which were adopted by the Gnostics; afterwards brought to perfection by Valentine; who, refining on those who preceded him in this way, produced a long genealogy of souns, to the number of 30. The first, and most perfect, he particularly denominates Πρῶτον, Proton, that is, pre-existent; beside other names, the most usual whereof was that of Bythea, Bytheos, depth.

Thus Bythea, he says, continued long alone with Ewva, Ewva, Thought; whom Valentine also called Θεός, Grace, and Ιησοῦς, Χριστός. At length Bythea, with Σπυρο, produced Νοῦς, Nous, Understanding; and Πάθος, Truth, his filter. Νους begat two souns; λογος, λόγος, Words; and ζωή, Zωή, Life; which begat two others; ἄνθρωπος, ἄνθρωπος, Man; and Κυρίος, Church. And these eight souns were the chief of all the rest. The
ÆQUA, in the Medical Writings of the Ancients, is used for giddiness; which sort of exercise was often prescribed by the physicians of those days. Other exercises consisted principally in the motion of the body; but in the æora the limbs were at rest, while the body was carried about and moved from place to place, in such a manner as the physician prescribed. It had therefore the advantages of exercise, without the fatigue of it.

This exercise was promoted several ways: sometimes the patient was laid in a sort of hammock, supported by ropes, and moved backward and forward; sometimes his bed was run nimbly on its feet. And beside these, the several ways of travelling were accounted species of the æora, whether in the litter, in a boat or ship, or on even ground in a chariot.

Aeolopides was the first who brought giddiness into practice, which was used as a means to recover strength after a fever, &c.

ÆPEA, in Ancient Geography, a city of Laconica, according to Stephanius (de Urb. p. 46.), and of Messenia, according to Strabo (t. i. p. 553.), who calls it Thuria, and deduces its name from its situation on the top of a hill. It is one of the seven cities promised by Agamemnon to Achilles, and is mentioned by Homer, II. i. v. 152.

'Kαινον γ' Ἀπίον και Ποιδευκαματας.

Pulchramque Æpeam, Pedanuque vitiferam.'

Stephanius mentions another city of this name in Cyprus, built by Demophon, the son of Theseus, on mount Clarus, which was afterwards called Solos in honour of Solon; and another in Cretæ.

ÆPY, a city of Messenia, so called, says Stephanius, from its being fortified; but more probably from its elevated situation, to which Statius refers (Theb. l. iv. p. 421. Ed. Varior.)

"Et summis ingenuum montibus Æpy." 

ÆQUABONA, a town of Lucania, to the south of the Tagus, near its mouth, and in view of Philippi or Libon.

ÆQUANA, a town of Sicily, in the island of Specusia, in Napels, now called Montagna di Sorrento, denounced from the town Æquilus, which, being destroyed, was replaced by Vicus, now Vico di Sorrento, called also Æquia. Thus, Silius Italicus, Punic. l. v. p. 276. Ed. Drakenb.

"Æa felicis Baccho
Æquina, et Zephyro Surrentum molle fulubri." 

ÆQUADA Superficies, in Botany, denotes a surface devoid of all inequality; and differs from planus in not requiring the part to be level, or in a rectilinear direction, but often occurs in round bodies, as in the pedicels of Aegle.

ÆQUI, AEQUOLI, or AEQUULI, in Ancient History, inhabitants of Italy, who were situated between the Sabines and Latins, and whose capital city was Bolis. M. d'Anville places them on the banks of the Anio, with the Sammites to the north, and the Marrucini to the east; but others apprehend that their territory extended farther south, fo as to comprehend Algolium. They are mentioned under the different appellations above-mentioned, by the historians and poets; and are described as a hardy and valiant people, who were much employed in agriculture, and also in military exercises. Thus Virgil, Æn. l. i. v. 663.

"Æquilus, f. of the Sabines, says Scaliger, not only on account that in the ancient abbreviations Æ never stand for annus, unless when preceded by V for visit; and that it seems improbable they should put
era, and the letter A, without any discrimination, both for annus and Augusitus. Vitruvius, nevertheless, favours the conjecture, and judges it at least as probable as either that of Iliodoro, who derives era from στοιχεῖον, the tribute-money, wherewith Augustus taxed the world; or that of Scaliger himself, who deduces it likewise from στοιχεῖον, in a different manner. Era, he observes, was used among the ancients for an article, or item, in an account; and hence it came also to stand for a sum or number itself. From the plural eras, came by corruption era, erasum, in the singular; much as Othia, Othius, the name of a place, from Othia, the mouth of the Tyber.

Era amounts to the same with epocha; though some authors make a difference between them; but wherein it conficts they do not agree. A late critic affirms this difference, that in Latin of speech, epocha is that fixed point where an era made use of commencements. Bibl. Germ. tom. v. p. 172. Vellemon makes another difference, viz. that an epocha is a point fixed by chronologers, and an era a like point, only fixed by the popular usage of a country, or nation. Perhaps it might not be amiss if chronologers would keep to this difference, but it is certain most of them hitherto use the two words promiscuously. The proper idea of an era, as it is now generally understood, is that of a series of years, reckoned from a fixed point of time, called an epoch or epocha. Thus we say, that the Christian era began at the epoch of the birth of Christ, and any particular year is such a year, according to the date of it, of the Christian era. The particular eras are mentioned under epocha. See also Chronology.

Era is also used, in some writers of the barbarous age, for any year. In which sense, we meet with entering down the era, the eleven hundred and eighty era, etc.

ÆRA, in Ancient Geography, a town of Macedonia, and another of Ionia in Asia Minor, according to Stephanus, and a people of Asia towards Gedrosia or Germania, according to Prolemy.

ÆRARIVM, the public treasury of the Roman state. The temple of Saturn at Rome, being the great treasury of the state, was first called ararium; from (x, eris, copper; that being the only money in use before the year of Rome 485, when the silver began to be coined. It was first erected under Augustus, and maintained by a yearly voluntary contribution; but that proving insufficient, the twentieth part of all legacies and inheritances except of such as fell to the next of kin, or to the poor, were confined to this treasury.

For the custody hereof, three of the emperor's lifeguards were constituted prefìdxi ararí. Ararium differs from farius, as the first contained the public money, the second that of the prince. Yet the two are sometimes used indiscriminately for each other. Caiv. Lex. Jur.

Ararium sanctius, was an appendage to the former, added on occasion of the growth of the Roman state, when there was not room enough for lodging all the public monies, and the public acts, which were deposited with it. It was called sanctius, because placed in an inner and safer part of the temple; or because it was lodged the ararium viceministram, or twentieth, which was kept as a fund or reserve, for extreme necessity of the state. On which account it was also called ararium viceministram.

Ærarium lìbœ, or Ærarium lìberium, was erected by Servius Tullius, sixth king of the Romans, and composed of money paid in by parents for the birth of each child. The

ÆRARIVM Venetis, called Libitina, was for the custody of money paid into it for those who died; and the ararium juvenilis for the money deposited on account of those who arrived at the age of manhood. By these means he was able to furnish the population and wealth of the country. Dion. Hal. lib. iv. tom. i. p. 212. Ed. Oxon.

ÆRARIVM privatum, or the privy purse, contained the money and effects which the prince was master of before his accession to the empire. This was under the care of the comes rerum privatarum. We meet also with other jeffer treasuries, araria minoria, in the provinces.

ÆRARIVM Eclectus, the treasury, or bank of the church, was formed in the first century of the Christian era, of free gifts, which were collected and preferred in churches, partly for the purpose of defending the expanse of divine service, and partly to relieve the poor. Such capitals, which were considered as ecclesiastical funds, were by Rodentius (Hymn. ii. in honorem Laurentii) in the beginning of the fifth century, called monetas annonas, and araria minime. Tertullian (Apolog. c. 39. oper. p. 75. Ed. Rigalti.) calls them deposite pretia; and hence were formed the moneta pretia of later times. See Mounts of Piety.

ÆRARIVM, in Antiquity, an officer instituted by Alexander Severus, for the distribution of the money given in largesse to the soldiery, or people. Ptifie. Lex. Ant.

ÆRARIVM was also used for a person whose name was struck out by the censors from the roll, or list of his century, and was only considered as a citizen so far as to make him subject to pay taxes, era, without being entitled to any privileges, or advantages, from the common-wealth.

Hence the phrase, ararium fiscorum, Ærarium reformatum, etc.—Not only plebeians, to whom some have reimmured it, but also knights and senators, were subject to this kind of degradation.

The erarui were incapable of making a will, of inheritings, of voting in assemblies, of enjoying any poll of honour or profit; in effect, were only subject to the burdens, without the benefits of society; yet they retained their freedom, and were not reduced to the condition of slaves. To be made an ararius was a punishment inflicted for some offence, and reputed one degree more severe than to be expelled a tribe, tribus noveri. Concerning the precise meaning of these terms and the penalties denoted by them, which have been differentely understood by critics, see a note to c. xvii. l. 24. Livy, tom. iii. p. 859. Ed. Drakenb.

ÆRARIVM is also used for a person employed in coining, or working brafs.

These are sometimes called ararum fiscus: at other times ararius is distinguished from fiscus; the former answering to what we now call copper-smiths, the latter to founders.

ÆRARIVM is also applied to a soldier who receives pay. 
ÆRARIVM aquae. See Ziment water. 
ÆRARIVM. See Pyrmont water.

ÆRATIVM of soils, in Agriculture, denotes the impregnation of them with air, by ploughing, harrowing, and other means of pulverization, which serve to release the air in the interstices of the soils, and to form various kinds of new combinations.

ÆRDING, or Erding, in Geography, a small town of Lower Bavaria, seven leagues south of Landshut, on the river Sempt, in a district which produces the best grain of that country. It was set on fire by the Swedes in 1632, and in 1648 reduced by them to ashes.

ÆREA, in Antient Geography, a town of Thrace upon the Propontis, south of a small gulf, and north-west of Pernitsus. It is also a surname of Diana, taken from a mountain of Argolis, where she was worshipped.
AERVE collata, or conlata, in \textit{Roman Antiquity}, are terms found in inscriptions, which denote that the charges of erecting a tomb or monument were defrayed either by the friends of the deceased or by the people.

\textit{Aeræ dirai}, a phrase applied to soldiers, who were punished by being deprived of their pay.

\textit{Aerolus}, answering to the Greek \textit{xaoi}, was a weight according to Diodorus and Suidas equal to \textit{\textsc{qth}}, and according to others equal to \textit{\textsc{qth}} of the \textit{conulus}, which was \textit{\textsc{qg}} grains.

\textit{Aeria}, in \textit{Ancient Geography}, a town in that part of Gallia Narbonensis, which was inhabited by the Caviare. It was so called, says Strabo (t. i. p. 83.), because it was situated on an eminence. M. d'Anville places it south-east of Vafo, and north-east of Carpentoracte. This name was also given to one of the islands of Thrace, called \textit{Thaia}. Thekaly, and also Egypt, were anciently called \textit{Aria}. Apollon. Rhod. l. i. v. 580. p. 58. l. iv. 267. p. 400. Ed. Hoehlin. This name is also given by Hefychius to Ethiopia.

\textit{Aerial}, something that confuses, or has relation to, air. The \textit{Eisen}, the moll refined and rational sect among the Jews, held, that the human soul consisted of an aerial substance; and the Rosicrucians, and other visionaries, fill the atmosphere with aerial inhabitants.

\textit{Aerial Perspective}, is that which represents bodies weakened and diminished in proportion to their distance from the eye, and which judicial artists practice by diffusing a kind of thin vapour over them, that deceives the eye agreeably. Aerial perspective chiefly respects the colours of objects, whose force and luster it takes off more or less, to make them appear as if more or less remote. It is founded on this, that the longer column of air an object is seen through, the more feebly do the visual rays emitted from it affect the eye. Objects seen in a camera obscura sensibly exhibit this effect.

\textit{Aerial tribute}, in \textit{Antiquity}, was an annual gift of 120 thousand pounds, which the emperor Julianian accepted from his praisor prefect; and the means of payment were abdicated to the disposition of that powerful magistrate.

\textit{Aerians}, in \textit{Ecclesiastical History}, a religious sect denominated from Anir, an Armenian priest of the fourth century. The Aerians had much the same sentiments in respect of the Trinity as the Arians; beside which, they condemned prayers and offerings for the dead, flatted faiths and feasts, the celebration of Easter, and other rites of the same nature, in which the multitude think the life and soul of religion to consist; yet feasts they considered as Jewish ordinances, and they conceived that to observe Easter was to give heed to Jewish fables ('Titus, l. 14. 1 Tim. l. 4.). Though they sometimes failed on the fourth day of the week, as others did, it was not from a regard to any religious obligation, but merely of their own free will. That Epiphanius says of their chusing to fall on the Lord's day must therefore be a calumny. They also held, that there is no difference between priests and bishops, but that the priesthood and episcopate are absolutely one and the same order, or dignity: an opinion, says Mosheim, which was then for a time generally adopted by many modern divines and others. Anir built his doctrine chiefly on some passages in St. Paul's writings; and among others, on that in 1 Tim. iv. 14, where the apostle exhorts Timothy not to neglect "the gift he had received by the laying on of the hands of the presbytery." Here, observes Anir, is no mention of bishops; but Timothy evidently received his ordination from the prebishops or priests. Epiphanius zealously maintains the superiority of bishops against the Aerians. The word \textit{presbytery}, used by St. Paul, he observes, includes both bishops and priests; the whole senate, or assembly of the ecclesiastics of the place. Anir, and his followers, who have great purpose seems to have been of reducing Christianity to its primitive simplicity, met with great difficulties. They were excluded from churches, and cities, and villages; and being obliged to wander abroad, they suffered great hardships. Being thus generally and violently opposed, they could not increase to any great number, and in time they were reduced to nothing. Tillmont considers them as Calvinists; and it is certain, that their ideas of church government were formed very much upon the Presbyterian plan. Mokl. Eccl. Hist. vol. i. 387. Lardner's Works, vol. iv. p. 306, &c.

\textit{Aerica}, or \textit{Eriica}, in \textit{Ichthyology}, a name given by Galen and others to the common herring.

\textit{Aerii montes}, in \textit{Ancient Geography}, mountains of Sicily, called also \textit{Herci}, and considered by some as a branch of \textit{Etna}, extending to the north-west.

\textit{Aeriusa}, the ancient name for the sky-coloured \textit{Jasper}.

\textit{Aerites}, in \textit{Botany}, a name given to \textit{Anagallis}.

\textit{Aerena}, \textit{Avragnum}, in \textit{Geography}, a large walled town of the Valais in Switzerland, which is the court town of the tithing, and which has a council-house where its meetings are held. With this town is incorporated another small place on the Dufch hill, otherwise called \textit{Mons Dei}, at the foot of which hill is a lofty stone bridge over the Rhone. N. lat. 46° 19'. E. long. 8°. 36'.

\textit{Aerius}, a small river of Boeotia, rising in mount Cithe, and discharging itself into \textit{Aeporus}.

\textit{Aerography}, from \textit{aer}, \textit{air}, and \textit{graphos}, \textit{description}; a description of the \textit{air}, or \textit{atmosphere}, its limits, dimensions, properties, &c.

This name is applied to much the same with aerology, unless we suppose the latter to enter into the rationale, and the former to confine itself to a description of the more obvious affections thereof.

\textit{Aerology}, from \textit{aer}, and \textit{logicos}, \textit{discourse}; the doctrine or science of the air, and its phenomena, its properties, good and bad qualities, &c. See \textit{Air}.

\textit{Aerology}, called also the \textit{aerologica}, makes a part of the regimen of health, or the branch of medicine called by some \textit{meteorologia}, or the \textit{non-naturals}, which treats of air, its properties and use in the animal economy, and its efficacy in preserving and restoring health. See \textit{Air}.

\textit{Aeromancy, Aeromantia}, compounded of \textit{aer}, \textit{air}, and \textit{mantes}, \textit{divination}, an ancient species of divination performed by means of the air, and its phenomena. Aeromancy included the busines of \textit{augury}, and \textit{mantes}; the rules of prediction from uncommon winds, storms, showers, and other prodigies. Modern authors speak of a more rational aeromancy, meaning by it the art of foretelling the changes and variations in the air and weather, winds, storms, and the like.

Morfhe advances considerations for reducing aeromancy to a certainty, by means of a regular series of meteoro logical observations. But though many such have been inducted with great care in many parts, this art has hitherto made a very small progress. Of this kind is Huxham's book \textit{De Aeris}.

Barometers, thermometers, hygrometers, and anemometers, are of considerable use in this kind of aeromancy.

Mizolus has published a body of rules for foretelling storms, &c. drawn partly from vulgar observations, and the
the experience of mariners, partly from astrological considerations; under the title of "Aeromancy."" 

AEROMELI, a name given to honey, and also to manna. See Drosomeli. 

AEROMETRY, Aerometria, compounded of aer, air, and metron, to measure, the art of measuring the air, its powers, and properties; and including the laws of the motion, gravitation, pressure, elasticity, refraction, condensation, &c. of the atmospheric fluid. 

The word aerometry is but little used; in lieu hereof, we commonly call this branch of philosophy, pneumatics. C. W. Volusius, professor of mathematics at Hall, having reduced the various phenomena of this fluid to geometrical demonstration, first published Elements of Aerometry, at Leipzic, 1709, in high Dutch, and afterwards more largely in Latin, which have been twice inserted in his Cursus Mathematicus, in eight volumes 4to. 

AERONAUTICA, from aer, and nautica, derived from nauta, skip, the art of sailing a vessel through the air, or atmosphere, fulfilled as a ship in the sea. 

AEROPHOBIA, formed of aer, air, and phobos, fear, a term that has been sometimes used for the dread of fresh air. Dr. Franklin says, that he has been sometimes seized with this aerophobia, considering fresh air as an enemy, and excluding it from the rooms which he has occupied. But experience convinced him of his error, and taught him to regard fresh air as eminently conducive to health. Any air, he says, is preferable to that of a close chamber, which has been again and again respired without any change. The same singular feeling has occasionally rallied those valiant sailors, who, wrapping themselves in close garments, hurry from the narrow air of a close chamber with as much of it as they can carry with them into a close carriage, from which the external air is carefully excluded, and thus proceed to take the air for the benefit of their health. 

AEROPHYLACEA, in Natural History, denote subterraneous receptacles of air or wind. 

The word is compounded of aer, air, and phylyake, enveloping,—in which sense aerophyllacea stands contrariwise guilished from hydrophyllacea, wingcovered, &c. 

Kircher speaks much of aerophyllacea, or huge caverns, replete with air, dipped over under ground, from whence, through numerous occult passages, that element is conveyed either to subterraneous receptacles of water, which are hereby raised into springs or rivers, or into the funds of subterraneous fire, which are thus fed and kept alive for the repairation of metals, minerals, and the like. 

ÆROPUS, in Entomology, a species of Papiol, having brown wings marked with a yellow band and a single occlus at the base of the primores. It is found in India and South America. 

ÆROPUS, in Ancient Geography, a mountain of Macedonia. 

ÆROSIS, among the Ancient Physicians, denotes the act whereby the blood is attenuated and converted into an aura for the support of the vital spirits, and the maintenance of the flame of life. 

ÆROSTATICA, from aer, and staton, from statum, statu, is used by some authors for the science called by others aerometry. It is properly the doctrine of the weight, pressure, and balance of the air, and atmosphere. 

ÆROSTATION, formed of aer, and station, of station, I weigh, the science of weights, in its primary and proper sense, denotes the science of weights, suspended in the air; but in the modern application of the term, it signifies the art of navigation through the air, both in the principles and the practice of it. Hence also the machines, which are employed for this purpose, are called aerostatic, or aerostatic machines; and, on account of their round figure, air-balloons. The aeromant, formed of aer, and mantis, mantor, is the person who navigates through the air by means of such machines. 

ÆROSTATION, principles of. The fundamental principles of this art have been long and generally known; although the application of them to practice seems to be altogether a modern discovery. They are particularly illustrated in this Dictionary under the articles Weight of Air, Elasticity of Air, and Specific Gravity. 

It will be sufficient, therefore, to observe in this place, that any body, which is specifically, or bulk for bulk, lighter than the atmospheric air encircling the earth, will be buoyed up by it, and ascend; but as the density of the atmosphere decreases, on account of the diminished pressure of the superincumbent air, and the elastic property which it possesses, at different elevations above the earth, this body can rise only to a height in which the surrounding air will be of the same specific gravity with itself. In this situation it will either float, or be driven in the direction of the wind or current of air, to which it is exposed. An air-balloon is a body of this kind, the whole mass of which, including its covering and contents, and the several weights annexed to it, is of less specific gravity than that of the air in which it rises.
