Over this river the soldiers of Cesar built a bridge in one day.

ARARAT, a mountain of Alia, in Armenia, on which the ark of Noah rested after the effaision of the deluge. Concerning the etymology of the name, Dr. Bryant ob-serves (Anc. Myth. v. in. p. 2.), that it is a compound of Ar-drat, and significs "the mountain of descent," being equivalent to 777-777, Har-ird, of the Hebrews.

Of the precise sitution of this mountain different accounts have been given. Some have supposed that it was one of the mountains which divide Armenia on the south from Mesopotamia and that part of Affria inhabited by the Cords, from whom those mountains took the name of Cardue, or Cardu; by the Greeks denominated Gorgyzi. It is called by the Arabs Al-Jadui, and also Thamannin. In confirmation of this opinion, it is alleged that the remains of the ark were to be seen on these mountains; and it is said, that Beroulus and Ibadenus both declare, that such a report existid in their time. Epiphanius pretends, if we may credit his assertion, that the relics of the ark were to be seen in his time; and we are further told, that the emperor Herachius went from the town of Thamannin, up the mountain Al-Jadui, and saw the place of the ark. Others maintain, that mount Ararat was situated towards the middle of Armenia, near the river Araxes, or Aras, about twelve miles from it, according to Tournefort, above 290 miles distant from Al-Jadui, to the north-eaft. This mountain is called "Mafa" by the Armenians, and by the Turks "Agirgah," or the heavy and great mountain; and stands about twenty leagues to the south-eaft of Erivan, and of Ejmiadzin, from which it is distant about two short days' journey; four leagues from the Aras, and ten to the south-west of Naxuan, or Nachidhevan, or Nashi, of M. D'Anville, and the Naxuan of Ptolomy. Near this city is another small town, mentioned by William de Rubriquis, who travelled through Armenia in 1533, and called Cemainum, which is by interpretation eight, and as he says, so called from the eight persons who came out of the ark and built it. This is supposed to be the fame with Shemainum or Shemunum, formed of the Hebrew שמעון, eight, or the Thamannin and Thammanim of Elmarcieri and others, which was said to have been built by Noah. Ararat seems to be a part of that vall chain of mountains called Caucasia and Taurus; and upon these mountains and in the adjacent country, were preferred more authentic accounts of the ark than in almost any other part of the world. The region about Ararat, called Araratia, was esteemed among the ancients as nearly a central part of the earth; and it is certainly as well calculated as any other for the accommodation of its first inhabitants, and for the migration of
of colonies, upon the increase of mankind. The soil of the country was very fruitful, and especially of that part where the patriarch made his first settlement. The country also was very high, though it had fine plains and valleys between the mountains. Such a country, therefore, must, after the flood, have been the home of the Noah of that place and the place of which the Patriarch was the lord, and that country would be as fertile as it is now.

Strabo, who was a native of Asia Minor, speaks expressly of the fertility of Armenia, and especially (lib. xi. t. ii. p. 503) of the region opposite the place of which he particularly mentions as productive of olive.

It is not certain when the descendants of Noah migrated into this country. Many of the fathers of the Parsee race, tradition says, that they did not leave it for some ages. According to Ephiphanus (Hær. Ebr. i. p. 5.), they remained in the vicinity of Ararat for five generations, during the space of 659 years. Probably Noah might never depart from it; nor have we any account of his sons leaving it till the general migration.

The mountain has still the name of Ararat, which it has retained through all ages. Tournefort (vol. ii. 267, &c.) has particularly described it, and from his account it seems to consist chiefly of free, fine, or calcareous sandstone. It is a detached mountain in form of a sugar-loaf, in the midst of a very extensive plain, consisting of two summits; the latter more firm and pointed, the highest, which is of the ark, lies north west of it, and raifies its head far above the neighbouring mountains, and is covered with perpetual snow. When the air is clear, it does not appear to be above two leagues from Erivan, and may be seen at the distance of four or five days journey. Its being visible at such a distance, however, is ascribed not so much to its height, as to its lonely situation, in a large plain, and upon the most elevated part of the country. The ascent is difficult and fatiguing. Tournefort attempted it; and after a whole day's toil, he was obliged, by the snow and intense cold, to return without accomplishing his design, though in the middle of summer. On the side of the mountain that looks towards Erivan, is a prodigious precipice, very deep with perpendicular sides, and of a rough black appearance, as if tinged with smoke.

Arrat, Mount, or the stone head, is the name of a short range of mountains on the northern front of North Carolina, in a north-east direction from Ararat river, which is a north-west branch of Yadkin river.

Arraubina, in Ornithology, a species of Psittacus. Above blue, beneath yellow; cheeks naked, with feathered linses. Gmelin, &c. The length of this bird is two feet seven inches. Its bill is black; forehead to the crown and sides of the head dull green, the rest of the body above fine blue to the coverts of the tail; cheeks and throat covered with a bare white fleck; each cheek marked with black lines composed of very short feathers, which arise at the angles of the mouth, and pass beneath the eyes towards the back of the head; the eye-lids are edged with black; irides pale yellow; beneath, the body is of a pale cinnamon colour, and in some there is an intermixture of this colour on the wing coverts; the tail is blue above, and the inner margins of the feathers violet, except the two in the middle; it is wedge-shaped; the legs cinnaeous, and the claws black.

This bird inhabits Jamaica, Guiana, Brazil, and Surinam.

Another parrot, nearly resembling this, is described by different authors; it has not the feathered lines on the cheeks which are so conspicuous in this species, and the top of the head is blue instead of green. Gmelin calls it a variety (5), though he gives it a specific name erubescus; blue parrot, or macaw; psittacus maximus erubescus varius, cauda producua, Brown. Jam. & Gmel. This bird inhabits the same places as the other, but is more uncommon. The natives know the two birds by their cry, and they say the latter does not pronounce the word aru so distinctly as the blue and red macaw, or parrot.

Arrat, in Geography, a river of South America, which runs into the Northern Sea, in the province of Tamara.

Arras, the ancient Arrates, a river of Asia, which rises in the Caucasian mountains, and after traversing Armenia and part of Persia, discharges itself into the Kur, or Cyrus. Arraseng, a town of Persia, in the province of Irak, ten leagues south of Casrin.

Arrasissi, a merchant town of Italy in the state of Genoa. It is a place of some trade, and well peopled, and here vessels may be hired for Genoa or any port of Italy. N. lat. 44° 2'. E. long. 7° 20'.

Arratiea, in Antiquity, a yearly festival celebrated at Sicyon, on the birth-day of Aratus, wherein divers honours were paid by a priest consecrated to this service, who for dedication's sake wore a ribbon beseamed with white and purple spots.

The arrasia were solemnized with much pomp of music, the choirs of Bacchus attending. Potter, Archael. lib. ii. cap. 20.

Arrathapescow, in Geography, an Indian tribe, inhabiting the shores of the lake and river of that name, in the north-west part of North America, between N. lat. 57° and 59°. North of the abode of this nation, and near the Arctic circle, is lake Edland, around which live the dog-ridden Indians.

Arato-Ababenh, in Afronomy, a fixed star of the second magnitude in the head of the Dragon.

Aratum terra, in our Ancient Law Books, as much land as can be yearly tilled with one plough.—Hoc manorium et 50 aratuum.

Arratura terra, an ancient service which the tenant was to do his lord, by ploughing his land.

Aratus, in Biography and Ancient History, a famous general of the Acheans, was the son of Clinias of Sicyon, and born about the year before Christ 273. When his father and several of his kindred and friends were either massacred or banished by the tyrant Abantidas, Aratus, being then about seven years of age, made his escape, and found an asylum in the house of the tyrant's father; after concealing him for some time, the sent him privately to his friends at Argos. Here he received a liberal education, and distinguished himself by his skill and strength in athletic exercises. Having conceived becomes a detestation of tyrants, he had fearlessly attained his 20th year he before formed a plan of refusing Sicyon, his native place, from Nicholas, who was then its tyrant. With his view he fealed the walls by night, and at day-break invited the citizens, by the voice of a herald, to refuse their ancient liberty. The summons was joyously obeyed, and the city regained its freedom by a revolution, which did not cost a single life. For its future security against the partisans of Nicholas, he found it necessary to unite this city with the confederacy, called the Achaean league; and having been enrolled with supreme constitutional power in Sicyon, he exercised it in a manner which gained him universal eileem, and contributed
to the establishment of order and tranquility. In the office of pretor, or general of this league, to which he was afterwards advanced, he recovered the citadel of Corinthus from a Macedonian garrison, by a military intregacy that has been highly applauded, and thus induced other cities to join the confederacy. Aratus also removed Argos from its tyrant Artilus, by perceiving his weakness and valuing Sicily, according to others to Tarus; and flourished about the 25th Olympiad, or about 275 years before Christ. Having received instructions from Memocrates the Ephesian grammian, and the philosophers Tiron and Menedemus, Dionysius Heracotnes, and Perfeus the Boeot, he was patronized by Antigonus Gonatas king of Macedon, who encouraged him in his studies and appointed him his physician. He went to Macedon at the time of the celebration of the murtials of Antigonus and Phila the daughter of Antipater, and continued at his court during the remainder of his life. Of his poetical works, which were his chief productions, the only piece extant is an astronomical heroic poem, in Greek, entitled "Phaenomena." In this poem he treats of the nature and motions of the heavenly bodies, the figures of the constellations, their relative situations in the sphere, their rising and setting, and the fables connected with their names. Cicero, when young, translated this poem into Latin verse, and highly commended the poetry, though he does not allow that he understood astronomy. De Orat. lib. i. For the materials of this poem, it is said, that he was indebted to Eudoxus. Grotius thinks, that he transferred into his poem the observations of various authors in different climates, and for want of astronomical knowledge, confounded them. Among the ancient this poem had many admirers, and it has had numerous commentators: Virgil has copied it in his "Georgies," and St. Paul has made a quotation from it. Acis, xvii. 28. The words "Τα γης και χυς αδενον," for we are also his offspring, are a part of the fifth line of this poem; and other passages, to which this citation has been referred, in Cleanthes's hymn to Jupiter, Pythagoras's golden verses, and Oppian's Halieutica, though they agree in sentiment, vary in expression. Quineticus (Inblit. Orat. l. x. c. 1.) observes, that the subject of this poem has nothing of the pathos, no variety, no fictitious persons introduced speaking, with the other ornaments which have so great an effect in other kinds of poetry; however that the author was very capable of executing the design he undertook. Besides Cicero's translation of Aratus, of which a few fragments remain, we have an entire version in Latin hexameters, by Caesar Germanicus, and another by Avienus. In later times, the poem of Aratus has been translated into Latin by Aelius, printed in 480. at Paris, in 1613; and in 480. by Grotius at Leyden, in 1603; and also into various modern languages. The principal editions of the Greek original are in 480. by Morell, at Paris, 1539; in folio, by H. Stephens, at Paris, in 1570; in 8vo, at Oxford, by bishop Fell, in 1674; in 480. at Leyden, in 1603; at Paris, in 1480; at Bologna, in 1649; in 8vo, by Salvius, in Greek, Latin, and Italian, at Florence in 1765. It is also contained in the editions of the ancient astronomers. Facs. Bib. Grac. l. iii. c. 18. t. 2. p. 490, &c. Gen. Diet.

ARAVA, in Geography, a fortress of Upper Hungary, in a country and upon a river of the same name. Lat. 49° 20'. E. long. 20°.

ARAVACOURCHY, a town of Hindustan, in the Mysore country, 17 miles south-west of Carrol, and 23 north of Dindigul. Lat. 10° 45'. E. long. 75° 1'.

ARAUCO, a fortress and town of Chiti in S. America, situate in a fine valley on a river of the same name, north by west from Baldivia. The native Indians, called Arauques or
or Araceens, are so brave that they drove the Spaniards out of their country, though deficient of fire-arms. A peace was concluded between them and the Spaniards in 1659, which was celebrated in a poem by Alonzo de Ercilla.

S. lat. 32°. 30. W. long. 73° 20'.

ARAVITA, a town of Spain, in the country of Cordova, 16 leagues from Cordova.

ARABUS, now Ervat, in Ancient Geography, a river of Gallia Narbonensis, called by Strabo, Araura.

ARAUSA, a town of Iltras, placed in the itinerary of Antoninus, 20 miles from Blancom, in the way to Salamina.

ARAUO, Civitas Araruentara, or Araruentara, called Caelonia Scenodorum, because the veterans of the second legion were settled there, the capital of the Cavares in Gallia Narbonensis. This is now Orange in the west of Provence, on an arm of the River Rhone, which soon after falls into the Rhone, from which it is distant about a league to the east, at the foot of a mountain. An ancient amphitheatre is still to be seen in this place. N. lat. 44° 10'. E. long. 4° 46'.

ARAZONZA, a town of Illyria, according to Ptolemy.

ARAW, or ARAU, in Geography, a town of Switzerland, in the Argow, and canton of Berne, situate on the river Aar, in a fertile country, and containing about 1700 inhabitants. The principal manufactures are cotton, cotton stuffs, printed linens, cutlery, and tanning. It is a large and handsome town; 21 miles south-east of Bale. The treaty of peace concluded in 1712, at Araz, between the protestant and catholic cantons, is one of the fundamental principles of the Helvetic union, or of the code of public law between the combined republics of Switzerland. N. lat. 47° 25'. E. long. 4° 06'.

ARAXA, a river of Spain, which runs into the Oro to Toloba.

ARAXA, in Ancient Geography, a town of Asia, in Lycia, according to Ptolemy and Stephan. Byz.

ARAXAI, in Geography, a river of South America, in Brazil; its course was towards the prefecture of Parara, where it discharged itself into the river Mongagua.

ARAXES, in Ancient Geography, now Aras, a river of Armenia Major, which rofs in a mountain called by Strabo Abos (Ice Aras), and by others Capotes and Achos, a part of the Caucasus; continued its course eastward to the city of Atropatane, and thence inclining north-westward flowed near Azara and Artax, and fell at length, as Strabo and other geographers say, into the Caspian Sea, near the mouth of the Cyrus; but according to Plutarch, Pliny, and Arias, with whom our modern geographers agree, into the Cyrus. Ptolemy, indeed, divides the Araxes into two branches, and represents one as falling into the Cyrus and the other into the Caspian Sea. Its impetuous course, which would not admit of a bridge, is described by Virgil, En. viii. 466:

"Poncim dignatus Araxes."

On the banks of this river have appeared, at different times, the most renowned warriors of antiquity, Xerxes, Alexander, Lucullus, Pompey, and Mithridates. See ABAAS. Roland and Calmet are of opinion, that the Araxes is the Gihon of Genesis; and the name of Gihon signifying, according to its Hebrew etymology, the impetuous, eruptive river, confirms this opinion. However, the Gihon of the Arabian was the Oxus, and not the Araxes of the ancients. There are two rivers which bear the name of Araxes, one in Media and the other in Persia, which have been sometimes confounded. The first is that above described; the other runs through Persia, washes the walls of Schiras, and is now distinguished by the name of Bend-Emir, or BUNDAMIR.

ARAXUM, a promontory of Achaia, bearing towards the north-west.

ARAYA, in Geography, a celebrated cape of South America, in S. lat. 14° 2', situated in Trinidad and New Andalusia; and forming the gulf called by the Spaniards "Gulf de Caracoa."

ARAZ, a mountain of Arica within the province of Gigeri or Jigel, bordering on the Nandiin Desert; which stretches between 25 and 30 leagues in length from north to south, and is very where very difficult of access. The inhabitants are a race of Arabs, called Cabyleans: a was-like people, who made this ridge the last refuge of their liberty, and have preferred it ever since by the natural strength of their Physicians. Before the year 1664, they used to traffic with the French factory at Gigeri, and carried thither hides, corn, and wax; but upon the breaking out of a war between France and Algeria, a fort was built on the sea-coast to be a check on these Arabs. The French admiral was attacked during the work, and the fort demolished; and since this time they have occasionally plundered all strangers that are wrecked upon their coasts, and indiscriminately made slaves of their prisoners, though they have belonged to nations in amity with Algiers and the Porte; the Morocanians only are discharged, and sent home with a small vicissitude.

ARBA, in Ancient Geography, a name given to Hebron, first polluted by giants of the race of Anak; and afterwards given to the tribe of Judah, and the property of it to Caleb. The rabbins pretend that Hebron had the name Arba, signifying four, because the four most illustrious patriarchs, Adam, Abraham, Isaac, and Jacob, were buried there; or, as others say, with as little reason, because four of the most celebrated matrons of antiquity were interred there; viz. Eve, Sarah, Rebecca, and Leah.

ARBA, now Arba, an island and city of Illyria, now belonging to the states of Venice, and situate in the gulf of Quaruaro on the coast of Dalmatia. The city is a bishop's see. Although this island is not larger in circumference than about 30 miles, wholly uncultivated, and in some parts uninhabitable, the city has always, from the time of the Romans, maintained its reputation. In the eleventh century, gold and silk were not rare among the inhabitants. It became subjeet to the kings of Hungary, and afterwards dependent on Venetian feudatories, and at length was reduced under the dominion of the republic, which appoints a governor with the title of count and captain. The whole number of people in the island does not exceed 3500, who are nevertheless obliged to maintain three convents of friars, and as many of nuns, and near 60 priests. The climate is very variable, and subject to tremendous and destructive storms, which are very fatal to the sheep that are kept in the pastures of the mountain, and no less injurious, when they occur, to the plants and corn. The air, however, is upon the whole favorable, and the aspect of the island is very pleasant. On the east it has a high mountain, at the foot of which, towards the west, are fruitful plains interspersed with little hills which are very productive. At the northern extremity is a delightful promontory called Loparo, that stretches into the sea, and that includes a cultivated plain; near which are two small islands called S. Gregorio and Goli, very useful to shepherds and fishermen. The coast that faces the Moracca mountains is steep and inaccessible, and the channel between them is very dangerous. The long and narrow island, called Dolin, lying parallel to Arba, along the coast of Barbado, forms a channel less dangerous. In the vicinity of the city of Arba there are several harbours, by which the trade of the belt part of the island is facilitated. The city stands on an eminence between two harbours, which form a peninsula, and contains about a thousand inhabitants.
inhabitants. At the foot of the Moraca, the soil towards the shore is nothing but marble; but in the district of Barbado it is gravelly and fit for vines, which yield a wine that is much esteemed. Below the ruins of Coletno, the land bears vines, olives, mulberry, and other fruit-trees; and also in the lower parts, corn. The island is well supplied with springs of water, and would furnish its inhabitants with ample subsistence, if they were not in the extreme languid and indolent. It produces, however, fire-wood, of which quantities are annually conveyed to Venice; corn, oil, wine, brandy, and silk; and also hogs, wool, sheep, hogs, and horses of a good breed. It has likewise abundance of good flat; and the fisheries of tunny and mackerel supply no considerable articles of trade. The island, notwithstanding these advantages, is poor, because much of the land remains uncultivated, and the peasants are lazy.

Arba, Aftab, a river of Aria in Persia. Its source is in the vicinity of the town of the kings of Parthia, while the Tigris, and falls suddenly in the night on Sardana-palus, drove him from his camp; upon which this prince retired to Nineveh, and entrusted the command of his army with Sisamanus, his wife's brother, who was overpowered by the confederates, and left almost the whole of it. The confederates proceeded to besiege Nineveh, and after ineffectual efforts, for two years, for reducing it, a considerable breach was made in the wall by the inundation of the river Tigris, and thus they were enabled to enter and take possession of the city. Upon this success, Sardana-palus retired into his palace, and placed himself, his companions, and his treasures, on a pile of wood, to which he set fire, and they were thus all destroyed. This event terminated the Assyrian empire about the year 820 before Christ, according to Eusebius; but according to Justin and others, in the year 900 before Christ; and Arbaces was declared king. With him commenced the monarchy of the Medes, and he reigned 28 years. He is represented as a prince of great generosity and gratitude; and Dr. Prideaux supposes that Tiglath-Pileser and Arbaces are the same person, under different names; whereas archbishop Uther distinguishes them, and assigns to the one the polition of Media, and to the other that of Assyria. Prid. Conn. pt. i. b. 1. See Media.

Arbæjyn, in Geography, a town of Arabia, 12 miles north of Zebl. See Craft Bow, and Ballista.

Arbal, in Ancient Geography, a Sarmatian nation, according to Ptolemy, and supposed to have inhabited the part of Aria which is near the Wolga.

Arbana, the name of an island in the vicinity of Taphroban, according to Ptolemy.

Arbaniun, a town placed by Stephan. Byz. in the neighbourhood of the Enuine sea. See Craft Bow, and Ballista.

Arbasera, a town of Aria Minor, towards Galatia. Arbatiss, a town of Palestine in Galilee, taken and destroyed by Simon Maccabees. 1 Mac. v. 23.

Arbega, in Geography, a town and castle of Spain in Catalonia, 10 miles call of Lerida.

Arbeggen, a town of Transylvania, seven miles north of Stolzenburg.

Arbelesa, now called Erbol or Erbol, in Ancient Geography, a city of Aria, in the province of Arlabene, and district of Arbel, famous for the complete victory gained by Alexander the Great in the battle with Darius Commanus, which was fought at the village of Gaugamela in its neighbourhood. Ptolemy places it on the river Capros; but Strabo at an equal distance from that river and the Lyca, near mount Nicatorus, so called by Alexander, from the above-mentioned victory. Diodorus Siculus and Curtius call it a village; but Arrian (l. vii. p. 351.) dignifies it with the name of a city; and from this the adjacent country was denominated Arbelis and Arbelitis. This battle was fought in the month of October, in the second year of the 14th Olympiad, or 334 years before Christ. According to Arrian (De Exp. Ales. l. iii. p. 115. ed. Gronov.) the army of Darius consisted of a million of foot, and 40,000 horse; but according to Diodorus (l. xix. vol. ii. p. 205. ed. Weilinger.) of 250,000 foot, and 800,000 horse. Plutarch (Oper. t. i. p. 682.) says that the whole army consisted of a million; and Julius (x. c. 13.) rates the number at half that of Diodorus. The Macedonian army consisted of 40,000 foot, and 7000 horse. Arrian (ubi supra) and Curtius (l. iv. c. 27. &c.) have given a particular description of this famous battle. We shall here subjoin the account of it given by Dr. Gillies, in his "History of Greece.

Alexander, when apprized of the great strength of the enemy, expressed neither surprise nor apprehension. When advised by Parmenio to attack Darius's camp in the night, he replied, that it did not become Alexander to steal a victory, and therefore he was resolved to fight and conquer in broad day-light. Darius, he also said, by bringing all his forces into one place, had freed him from the trouble of thinking how he might purify them into different countries. "Having commanded a halt (says Dr. Gillies,) he encamped four days, to give his men rest and refreshment. His camp being fortified by a good intrenchment, he left in it the sick and infirm, together with all the baggage; and, on the evening of the fourth day, prepared to march against the enemy with the effective part of his army, which was said to consist of 40,000 infantry and 7000 horse, unincumbered with any thing but their provisions and armour. The march was undertaken at the second watch of the night, that the Macedonians, by joining battle in the morning, might enjoy the important advantage of having an entire day before them to reap the full fruits of their expected victory. About half way between the hostile camps, some envoys intercepted the view of either army. Having ascended the rising ground, Alexander first beheld the Barbarians drawn up in battle array, and perhaps more skillfully marshalled than he had reason to apprehend. Their appearance, at least, immediately determined him to change his first resolution. He again commanded a halt, summoned a council of war; and different measures being proposed, acceded to the single opinion of Parmenio, who advised that the foot should remain stationary until a detachment of horse had explored the field of battle, and carefully examined the disposition of the enemy. Alexander, whose conduct was equalled by his courage, and both surpassed by his
his activity, performed these important duties in person at the head of his light horse and royal cohort. Having returned with unexampled celerity, he again assembled his captains, and encouraged them by a short speech. Their ardour corresponded with his own; and the folders, confident of victory, were commanded to take call and refreshment.

Meanwhile Darius, perceiving the enemy's approach, kept his men prepared for action. Notwithstanding the great length of the plain, he was obliged to contract his front, and form in two lines, each of which was extremely deep. According to the Persian custom, the king occupied the centre of the first line, surrounded by the princes of the blood and the great officers of his court, and defended by his horse and foot guards, amounting to 15,000 chosen men. These splendid troops, who seemed better for parade than battle, were flanked on either side by the Greek mercenaries and other warlike battalions, only, which could be selected from the whole army. The right wing consisted of the Medes, Parthians, Hyrcanians, and Sceæ; the left was chiefly occupied by the Bactrians, Persians, and Cappadocians. The various nations composing this immense host were differently armed, with swords, spears, clubs, and hatchets; while the horse and foot of each division were promiscuously blended, rather from the result of accident than by the direction of design. The armed chariots fronted the first line, whose centre was farther defended by the elephants. Chosen squadrons of Scythian, Bactrian, and Cappadocian cavalry advanced before either wing, prepared to bring on the action, or, after it began, to attack the enemy in flank and rear. The unexpected approach of Alexander within the sight of his tents prevented Darius from fortifying the whole extent of his camp; and, as he dreaded a nocturnal assault from enemies who often veiled their designs in darkness, he commanded his men to remain all night under arms. This unusual measure, the gloomy silence, the long and anxious expectation, together with the fatigue of a restless night, discouraged the whole army, but inspired double terror into those who had witnessed the formidable disasters on the banks of the Granicus and the Ilus.

At daybreak, Alexander disposed his troops in a manner suggested by the superior numbers and deep order of the enemy. His main body consisted in two heavy-armed phalanxes, each amounting to above 16,000 men. Of these the greater part formed into one line; behind which he placed the heavy-armed men, reinforced by his targeters, with orders that when the out-spread wings of the enemy prepared to attack the flanks and rear of his first line, the second should immediately wheel to receive them. The cavalry and light infantry were disposed on the wings, that while one part resisted the shock of the Persians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were posted at proper intervals, as affording the best defence against the armed chariots, which (as Alexander well knew) must immediately become useless whenever their conductors or horses were wounded.

Having thus arranged the several parts, Alexander with equal judgment led the whole in an oblique direction towards the enemy's left; a movement which enabled the Macedonians to avoid contend when at once with superior numbers. When his advanced battalions, notwithstanding their carpets to the enemy, fell flanked towards the right, Darius also extended his left, till, fearing that by continuing this movement his men should be drawn gradually off the plain, he commanded the Scythian squadrons to advance, and prevent the farther extension of the hostile line. Alexander immediately detached a body of horse to oppose them. An equilibrant combat ensued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then flung forth with immeasurable violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their assault harmless. Darius next moved his main body, but, with too little order, that the horse, mixed with the infantry, advanced, and left a vacuity in the line, which his generals wanted time or vigilance to supply. Alexander fixed the decisive moment, and penetrated into the void with a wedge of squadrons. He was followed by the nearest sections of the phalanx, who rushed forward with loud shouts, as if they had already pursued the enemy. In this part of the field, the victory was not long doubtful: after a feeble resistance, the barbarians gave way; and the pugnacious Darius was foremost in the flight.

The battle, however, was not yet decided. The more remote divisions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant space was thus left in the Macedonian line, through which some squadrons of Persian and Indian horse penetrated with celerity, and advanced to the hostile camp. It was then that Alexander derived signal and well-earned advantages from his judicious order of battle. The heavy-armed troops and targters, which he had skillfully posted behind the phalanx, speedily faced about, advanced with a rapid rep, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus surprised, were destroyed on the spot. Meanwhile, the danger of his left wing recalled Alexander from the pursuit of Darius. In advancing against the enemy's right, he was met by the Parthians, Indian, and Persian horse, who maintained a sharp conflict. Sixty of the Companions fell; Hephæestion, Cœrus, and Memiæus were wounded. Having at length dissipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the business was already effected, chiefly by the Thébaians horse; and nothing remained to be done, but to purify the fugitives, and to render the victory as decisive as possible.

According to the least extravagant accounts, with the loss of 600 men he destroyed 40,000 of the barbarians, who never thenceforth assembled in sufficient numbers to dispute his dominion in the East. The valuable provinces of Babylonia, Susiana, and Persis, with their respective capitals of Babylon, Susa, and Peripolis, formed the prize of his skill and valour. The gold and silver found in those cities amounted to thirty millions sterling; the jewels and other precious spoils, belonging to Darius, sufficed, according to Plutarch, to load 20,000 mules and 3000 camels.

Arebla, a town of Sicily mentioned by Steph. Byz. and also by Suidas.

Arebla, a village of Palestine on the other side of Jordan, dependent upon Pella, according to Eusebius.—Alfo a place of Galilee, in the vicinity of Sephoris, according to Josephus, Antiq. i. 12.—Also, a village of Upper Galilee, near which were caverns, where thieves retired for concealment.

Arbængian, in Geography, a town of Tartary, in the country of Zagatai, and territory of Samarcand.

Arber, a town of Switzerland, in the canton of Berne, situated on the river Ar, which almost encompasses it. N. lat. 47°. E. long. 17°. 15′.

Arberœue, the name of one of the seven dittrics that compose lower Navarre, containing seven parishes.

Arbespach, a town of Germany, in the archduchy of Austria, six miles south-west of Zwettl.
ARBESTAAL, a town of Germany, in the archiduchy of Austria, five miles south of Bragg.

ARBBI, a small country of South America, near the Andes, between Popayan and New Granada.

ARBIA, a small river of Italy, which rises in the territory of Florence, passes through that of Sienne, and discharges itself into the Onombrna.

ARBICA, a town of Spain, in Navarre, ten leagues W. N. W. of Pampluma.

ARBIL, in Ancient Geography, a people of Afi, in Ge- drofia, mentioned by Piny (H. N. I. vi. c. 23.), being the same that are placed by Strabo near the mouth of the Indus.

ARBIS, a river of Afi, which ran, according to Piny, between the Ox and Indians, and after watering a town of the same name, fell at a small distance from it into the Indian Ocean.—Afi, the name of a town of Gedrjia, belonging to the Arbhi, and situated on a river of the same name.

ARB, in Geography, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Caflilhe, seventeen miles south-east of Bourdeaux.

ARBITER, in the Civil Law, a judge nominated by the magistrates, or chosen voluntarily by two contending parties, on whom they confer a power, by compromise, of deciding their differences according to law.

The Romans sometimes submitted to a single arbitrator; but ordinarily they chose several, and those always of an uneven number.

In matters wherein the public was concerned, as crimes, marriages, affairs of state, &c. it was not allowed to have recourse to arbiters: nor was it permitted to appeal from an arbitral sentence; the effect of an appeal being to suspend the authority of a jurisdiclion, not of a compact.

The arbitrator, among the Romans, judged in those causes which were called "bono fide," and arbitrary, and was not restricted by any law or form; hence he was called "honorarius." A person chosen by two parties by compromise to determine a difference, without the appointment of the pre- tor, was also called arbitrator, but more properly "compromi- larius."

Among the moderns, there are properly divers kinds of arbiters; some obliged to decide by the rigour of the law; and others are authorized by the contending parties to relax, or give way to natural equity; these are properly called arbi- trators.

The ancient Romans, at their feasts, appointed a perfon to preside, by throwing the dice, whom they called "arbi- ter bibendi," and who directed every thing at his pleasure. Vid. Hor. Od. I. 4. 18. II. 7. 25.

ARBITRARY, in a general sense, that which is not defined or limited by any certain express law or constitution, but is left solely to the judgment and discretion of another. Thus arbitrary punishments denote such as are left by the statute to the discretion of the judges. Arbitrary fines or mulcts are usually called amercements.

The word is formed from arbitrium, will; whence also arbitrator, arbitrator.

ARBITRARY power. See Despotism, Monarchy, &c.

ARBITRATION, or Arbitrage, the referring of a cause or dispute concerning any personal chattels or personal wrong, to the decision of two or more indifferent persons, under the quality and denomination of arbitrators or arbitrators.

If in deciding the controversy, these do not agree, it is usual to add that another person be called in as umpire (imperator, or inpar), to whose determination the cause is thereby referred; or frequently there is only one arbitrator originally appointed. This decision, in any this case, is called an award. Thus the question is actually determined, and the right transferred or settled, as it could have been by the agreement of the parties, or the judgment of a court of justice. But the right of real property cannot pass by a mere award: yet, doubtless, an arbitrator may now award a conveyance or a release of land; and it will be a breach of the arbitration bond to refuse compliance. For, though originally the submission to arbitration required to be by word, or by deed, yet both of these being revocable in their nature, it is now become the practice to enter into mutual bonds, with condition to bind to the award or arbitration of the arbitrators or umpire therein named. And experience having shown the great value of these peaceable and domestic tribunals, especially in settling matters of account and other mercantile transactions, which are difficult and almost impossible to be adjusted on a trial at law; the legislature has now established the use of them, as well in controversies where causes are depending, as in those where an action is brought, enacting by statute 6 & 10 W. III. c. 15., that all merchants and others, who desire to avoid any controversy, suit, or quarrel, for which there is no other remedy but by personal action or suit in equity, may agree, that their submission to the suit to arbitration or amparage shall be made a rule of any of the king's courts of record, and may invert such agreement in their submission, or promise, or condition of the arbitration bond; which agreement being proved upon oath by one of the witnesses thereto, the court shall make a rule that such submission and award shall be conclusive; and, after such rule made, the parties disobeying the award shall be liable to be punished, as for contempt of the court; whereas such award shall be set aside for corruption or other malbehaviour in the arbitrators or umpire, proved on oath to the court, within one term after the award is made.

And, in confederation of this statute, it is now become a considerable part of the business of the inferior courts, to set aside such awards when partially or illegally made; or to enforce their execution when legal, by the same processes of contempt as is awarded for disobedience to those rules and orders which are fixed by the courts themselves. Black. Comm. b. i. vol. iii. p. 16.

The power of arbitrators is to be regulated by the com- promise between the parties, as to what concerns the differ- ences they are to determine; and whatever they decide beyond that is of no effect.

Among the Athenians, any one who submitted his cause to arbitration, was to abide by its sentence. Arbitrators were to swear before verdict was given. If the plaintiff did not appear before such oath, he might be fined; and appeal might be made from arbitrators chosen by lot to other courts of justice. The office of arbitrators was annual, and if they were found guilty of corruption, they were punished with banishment, infamy.

ARBITRATOR, an extraordinary judge or commissioner, in one or more causes between party and party, chosen by their mutual consent.

The civilians make a difference between arbitrator and arbitrator: though both ground their power on the compro- mise of the parties, yet their liberty is divers; for an arbit- rator is tied to proceed and judge according to the forms of law; whereas an arbitrator is permitted wholly to use his own discretion, without solemnity of process, or course of judgment, to hear and accommodate the controversy committed to him; so he be justi arbitrarius boni vii. See Epitopius.
ARBITRIO, in Music, is equivalent to ad libitum, at

fair arbitrio, at your pleasure, ad fair commendo, at your con-

venience. In lefions and folos, and in the solo parts of con-

certos, where all the other parts wait at a pause or close on the

pleASURE of the principal performer, these notices are

given. See Ad libitum.

ARBoga, or ARBOGEN, in Geography, a town of

Sweden, in the province of Västmanland, situate on the

river Stora. Within a quarter of a mile is the canal of Ar-

boga, begun in the reign of Christian, widened and deep-

ened by Charles XII, and finished under the reign of his son

Charles XII. which joins the lake of Hedemar with that of

Medan. In this place a syruo was held in 1297, under

Nicholas, archbishop of Upps.

ARBouis, a town of France, in the department of Jura,

and principal town of the district of Poligny, celebrated for

the excellent wine made in its environs. The place contains

6414, and the canton 12,385 inhabitants; the territory in-

cludes 150 kilometres and 14 communes. N. lat. 46° 55',

E. long. 5° 30'.

ARBON, a town of Switzerland, in the Turgov, situate

on the south side of the lake of Constance. The inhabi-

tants are chiefly Protestants. N. lat. 47° 35', E. long. 9°

30'.

ARBOR, in Botany, Gardening,  &c. signifies a tree or

perennial plant that has the property of ruling with a simple

woody and durable stem or trunk to a considerable height

and thickness. These last circumstances, in some mea-

sure, form a distinction between trees and shrubs, which last

are supposed to be of a smaller growth, and to have generally

several stems proceeding from the root, or the same stem di-

viding near to it, into different smaller ones; and also from

herbaceous plants, whose stems are soft, often succulent, and

mostly rife in spring, and perish in autumn. This is not,

however, general.

It has, indeed, been observed by Linneaus, that this dis-

tinction between trees and shrubs is by no means universally

observed. Nature, says he, has put no limits between trees

and shrubs; for to say that trees are taller than shrubs is,

in fact, saying nothing; unless a certain inmutable standard

was previously established. Besides, every thing respecting

dimensions is so variable in its nature, and depends so much

upon the difference of climate, soil, and culture, that no

certain standard or boundary can, with propriety, be fixed

between them, since the same plant, in different countries,

often attains very different growths: thus the arbutus and

laurel, in warm climates, grow to large trees; while in this

country, they are generally considered as shrubs. See

Frutex.

ARBOR Camphorifera. See Laurus.

ARBOR cyprium. See Hura.

ARBOR judae. See Cercis.

ARBOR, in Chemistry.—ARBOR philippica is a name

common to several metallic crystalizations; thus called

from their ramifications resembling a tree.

ARBOR Diane.—ARBOR mineralis philippica.—Arbre de

Diane.—Dianenbaum, Sibberbaum. It is the property of sil-

ver, lead, and tin, when combined with an acid into a read-

dily solvable salt, to be easily separable in the reguline flate

from such acid by the superior affinity of zinc, mercury,

&c.; and while precipitating, to arrange themselves in a

branching filamentous mass. Hence they were called by

the ancient chemists arbores, trees. Silver being denoted in

alchemical language by the moon, Luna, or Diane, the term

Arbor Diææ means therefore metallic silver brought by art

into an arborescent form. As this is a very beautiful pre-

paration, and susceptible of great varieties of figure, a mul-

titude of receipts are to be found in different writers, all of

which, however, may be reduced to two. The first consists

in the decomposition of a solution of pure nitrat of silver

by mercury: the second varies from the first in the silver

being amalgamated with mercury previously to solution in

nitrous acid. The latter of these methods is the most ancient,

being described by Homburg (Mem. de l'Acad. de Paris, 1692)
in the following terms: " Make an amalgam without heat of

four drams of silver filings, or still better of silver leaf,

and of two drams of mercury (see MERCURY, Allloy of);-

disolve this amalgam in four ounces or a sufficient quantity

of nitrous acid, pure and moderately strong; dilute this

solution with about a pint and a half of distilled water, shake

the mixture, and preserve it in a bottle with a glass stopper.

When this preparation is to be used, an ounce of it is to be

put into a vial together with about the size of a pea of an

amalgam of gold or silver about as soft as butter, and the

whole is to remain at rest: soon afterwards small filaments

will be seen issuing from the amalgam, which quickly

incr ease, branch out on both sides, and take the form of

sheds.

" The simpler method appears to have been first mentioned

by Lemery (Cours de Chimie, 1726). He advises to dis-

solve an ounce of fine silver in a sufficient quantity of pure

nitrous acid, and afterwards to mix the solution in a flask

with about twenty ounces of distilled water: add to this

solution 20 grains of mercury, and let the whole remain

at rest. In about forty days a kind of silver tree will be

formed upon the mercury with branches resembling vege-

table ramifications. The two essential conditions for the

complete success of this experiment are, first, that the nitrat of

silver should be free from any excess of acid; and secondly,

that the silver should have a firm base to adhere to as soon as

it begins to be precipitated. To ensure the first, it is ad visable to

proportion the acid to the silver, that a very minute portion

be left undissolved, and then by concentrating the solution to

disperse it to crystallize. The crystals thus obtained, be-

ing dried on blotting paper, should be dissolved in distilled

water, the proportions of which may be varied at pleasure,

provided the solution is not, on the one hand, so strong as
to deposit crystals by staking, and, on the other hand, so

dilute as to require many days before the experiment is com-

plered: from five to twelve times as much water as nitrat of
silver is upon the whole the most convenient proportion.

The fibres of the precipitate will be crowded and short,

when the process is brought about rapidly; but long and

branched, if a greater time is allowed.

The mercury that is added to effect the precipitation

should be mixed with silver so as to destroy its fluidity; for

when pure mercury is poured in, the first portions of silver

that are deposited unite with and dissolve in the mercury till

it is thus brought to a proper consistence.

The tree or arborealistent precipitate thus obtained is an

amalgam of silver, the proportions of which appear subject
to some variations. For the theory of this and similar phe-

nomena, see Precipitation, and Metallic Precipitates.

Maquer's Chemisches Worterbuch, art. Dianenbaum. En-

cyclopedia Method, art. Arbres de Diane, &c.

ARBOR plumis, is the result of a beautiful vegetation of

lead. For producing it, two drams of acetate of lead are

dissolved in fix ounces of distilled water; the filtered solu-

tion is poured into a cylindrical glass, and a thin roll of

zinc being hung in it, the whole is left standing at rest.

The lead precipitates, adhering to the zinc in metallic leaves,

ARBOR Genalogia, tree of confangunity, signifies a li-

4 H ence
neage drawn out under the figure or resemblance of root, flock, branches, &c.

**ARB**

*Arbor Porphyriaea*, among the schoolsmen, denotes a scale of beings; or a figure consisting of three rows or columns of words; the middlemost whereof contains the series of genera and species, and bears some analogy to the trunk; and the extremes, containing the differences, to the branches of a tree.

**SUBSTANCE**

Thinking

**BODY**

Extended

Inanimate

**MAN**

That

**PLATO**

The *arbor porphyriaea* is otherwise called *scala praedicamentalis*.

**ARB Vitas**, in Botany. See *Thuja*.

**ARB** is also figuratively used in *Mechanics*, for the principal part of a machine, which serves to sustain the mill.—It is also used for a spindle, or axis, wherein a machine turns; thus, *arbore* of a crane, a mill, windmill, &c.

**ARBorea**, in Entomology, a species of *Podylia* described by Scopoli and others. It inhabits trees in Europe; is oblong and black; legs and fork white. *Linnæus. Gmelin*.

**ARBorea**, in Ornithology, a species of *Anas*, that inhabits Jamaica, and is called by Ray, Sloane, and Edwards, the black-billed whistling duck. It is brown; the head slightly crested; and the abdomen spotted with black and white. *Gmelin*. This is also *Anas flustris Jamaicensis* of Brönn; *Canard flustris de la Jamaïque* of Buffon Pl. Enl.; and *flustris* a beec noc. *Nat. Hist. Oil.* of the same author.

The most remarkable circumstances of this duck are, that it builds its nest in trees, and makes a whistling noise. It is supposed to frequent Carolina in winter, at least one of the same name is said to be found on those coasts at that time by Lawton and Catchby. A bird of this kind is in the British Museum, and is called the Opano Duck, which is the name it bears at Guiana.

In size it is less than the Mallard, and stands high upon its legs; the neck is also long and slender. The bill is black; the irises hazel; crown of the head dusky, somewhat erethed behind, and of a rufous brown; hind part of the neck brown; back and feapulars the same, but the feathers margined with rufous; rump and upper tail-coverts darker; sides of the head and throat white; fore-part of the neck white spotted with black; the breast pale rufous spotted also with black; belly, thighs, and vent much like the forepart of the neck, but the spots are smaller and most numerous on the sides; the wing-coverts rufous spotted with black; quills and tail dusky; legs lead-colour; claws black.

**ARBorea**, a species of the *Alauda* genus. See *Alauda*.

**ARBorea**, in Zoology, a species of *Rana*, called the tree frog, and thus defined by Gmelin: body granulated beneath, and the feet cleft. *Linnaeus* describes it as having the body smooth; the underpart beft with contiguous tiberculations; the feet cleft, and the toes terminated in orbicular dilated tips. Gmelin enumerates eight supposed varieties of this species, which are as follows:

- *Hyla viridis* of Laurent. Amph.—*Rana pedibus fistis*, palmis tetradactylis, plantis pentadactylis, geniculis tubibus tuberoöis. *Ameen. Acad.*. p. 135. (Frog with eftf feet, four toes on the anterior, and five on the posterior feet; and the knees warded beneath.)
- *Hyla viridis*, linea flava unioque texta. Laurent. and Catchby. (Green, with a bright yellow line on each side.)
- *Rana americana rubra*. Sch. Mul. 2. t. 7e. f. 4.
- *Hyla viridis* fusa. Laurent. Amph. p. 34. n. 29.

Dr. Shaw gives a new specific character to this creature: *Rana arborœa*; viridis, fistis albidis. linea laterali nigranti, abdomen granulato, pedibus fistis. (Green frog, whitish beneath, with black lateral line, granulated abdomen, and unwedged feet.

"In the beauty of its colours, as well as in the elegance of its form, and the agility of its movements, the tree frog exceeds every other European species. It is a native of France, Germany, Italy, and many other European regions, but is not found in the British islands. Its principal residence, during the summer months, is on the upper parts of trees, where it wanders among the foliage in quest of insects, it catches with extreme celerity, flying softly towards its prey in the manner of a cat towards a mouse, and when at a proper distance seizing it with a sudden springing, frequently of more than a foot in height. It often pursues itself by its feet or abdomen to the under parts of the leaves, thus continuing concealed beneath their shade. Its fize is smaller than any other European frog, except the fire frog. Its colour, on the upper parts, is green, more or less bright in different individuals; the abdomen is whitish, and marked by numerous granules; the under surface of the limbs is reddish; and the body is marked on each side by a longitudinal blackish or violet-coloured streak, separating the green of the under parts from the white colour of the lower; the inferior edge of this dark lateral stripe is tinged with yellow. The body is smooth above, and moderately short or plump; the hind legs are very long and slender; the fore feet have four, and the hind five toes, all which terminate in rounded, flat, and dilated tips, the under surface of which being soft and glutinous, enables the animal to hang with perfect security from the leaves of trees, &c. The scent of the abdomen is also admirably calculated by nature for this peculiar power of adhesion, being covered with small granular granules in such a manner as to detain closely even to the most polished surface; and the animal can adhere at pleasure to that of glass, in whatever position or inclination it be placed, by merely pressing itself against it." Dr. Shaw, Zoö. &c.

It is further remarked by this and other authors, that though the tree frog inhabits the woods during the summer months, on the approach of winter it retires to the water, where it conceals itself in the soft mud or banks, and remains in a state of torpidity till the spring; when it again emerges; and, like the reptile of this genus, deposits its spawn in the water at that season. The male, at this period, inflates its orbicular gular pouch in a furprizing manner, and emits a loud and sharp croak, which may be heard at a vast distance; they make the same noise on the approach of rain while they live among the trees, and may be considered, in some measure, as a kind of living barometers, more especially the males, which, if kept in glasses and fopplied with proper food, will afford an infallible preage of the changes of weather." In the German Ephemerides, Linnæus, *Sylloge*. Curatorum
Curiosiform, we meet with an account of one which was kept in this manner for the space of seven years.

ARBOROUS, ARBOREUS, is applied by some naturalists to such excercices, funguses, inoffensive parasites, as grow on trees; in contradistinction to such as grow on the ground; such are the heliobases and sporae.

ARBORESCENCENS, in Natural History, a species of DOnis (Vernicis Molinae), that inhabits the Norway forests. The feelers are ramose; back gibbosus, and fact with protuberances. Mill. Zool. Ginnch.

ARBORESCENT, a term used to denote any thing that sprouts or grows up in form of a tree, which gradually becomes firm and woody; and arboreus is that which resembles a tree, having a permanent woody stem.

Botanists speak of arborecent shrubs and plants, &c. Mineralists treat of arborecent metals, arborecent silver, arborecent iron, arborecent flints, &c. The fungus minos is ranked by some in the class of arborecent floors; the chemists produce arborecent crystallizations, which they call philosophical trees. Phil. Trans. N° 198, N° 311, and N° 129.

Zoologists give influences of arborecent animals, particularly fishes.

The arborecent eel, delta arborecent, a species of Asterias, is one of the curiosities of nature found in several cabinets of natural rarities.

ARBORETI, in Entomology, a species of Curculio, that inhabits Cayenne. It is of a cinerous colour; thighs of the anterior legs toothed; wing-cages frillfled with punctures. Fabr. Ginnch.

ARBOREUM, in Natural History, a species of Alcyonum (Vermes Zoophyta), found in the Norway and Indian fens. The item is arborecent, with obtuse branches and papillary pores. This is Lithoxylon Norvegicum of Mol. Telfin.; Alcyonum ramosum, poris papilarius in tubera lateralia terminalique congesti of Pallas; Arbucula marinai coralloides of Cufinius; Planta marina coraloides rubra, J. Boub.; and Accaroba gubba-guber. J. Accarbaa bouzy, Amblyonythus Hapalop, Rumphius.

ARBOREUM, in Entomology, a species of Cinex described by Degeer. Above it is brown-green, beneath yellowish; a tralverse yellow line across the thorax; wing-cages bordered with red; tail of the same colour, and biidentate. This is a small insect, being only five lines in length, and lives in trees. Ginnch.

ARBORIBONZES, in Modern History, priests of Japan, who live an erratic life, and subsist on fish. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBORIS PECTEN. See Pecten.

ARBORIST, ARBORISTA, a person skilled in trees, their forms, nature, &c.

Arborist is an appellation of less extent than botanist.

ARBOR SCIENTIFICA, a general distribution or scheme of science or knowledge.

ARBUC, in Geography, a town of Arabia, 116 miles northeast of Mecca.

ARBUCAVE, a town of France, in the department of Landes; four leagues south-east of St. Sever, and 45° E. N. E. of Orthez.

ARBOURS, in Gardening, are small compartments formed with various sorts of trees and shrubs, in such order as to include a certain space, and make a kind of reeds or shady retreat for the hot summer months. They were formerly held in much higher estimation than at present, and were commonly formed of evergreens, as yews, planted very close, the fides trained crect fix, eight, or ten feet high, and the tops formed like vaults or trained archways, over arched frames or lattice-work of wood or iron; having arched openings or arcades formed on the sides, the whole being closed annually to keep them in due order, which in many cases appeared very ornamental, according to the ancient style of gardening. They were also frequently formed of deciduous trees, particularly the elm, and sometimes with the horn-beam, beech, and lime, which were conically shorn every summer. The forms of both the ever-green and deciduous kinds, were either square, hexagonal, octagonal, or round, and their dimensions generally from ten to fifteen feet in width and height; the tops were mowed made either pavilion, turret, or dome-shaped, and sometimes terminated by a globe, pyramid, or other figure, formed of the extreme branches.

The authors of the "Universal Gardener" observe, that covered arbours or bowers may be formed very quickly, even in one season, with several sorts of shrubby herbaceous climbing plants; some of which will advance fifteen or twenty feet in one summer. It is likewise added, that they should, if possible, be erected upon a somewhat rising ground, for the greater advantage of free air, and to enjoy the prospect of the garden and adjacent country.

They are also sometimes formed in the heads of single large trees, particularly elms, where the trunks have divided at the height of ten or twelve feet, into several leffer spreading limbs, so as to admit of erecting a small platform between them, cutting down the large boughs, and training the phable branches archways over lattice-work, till those on each side meet; then clipping the fides annually, the tops may either be cut, or permitted to grow up, or the whole suffer to advance in a natural growth. They may likewise be formed on the ground in this manner: plant some of the tallest-growing flowering shrubs round the inside, to form the dimensions of the arbour; then, on the outside of thefe, others of somewhat leffer growth; so continue three or four ranges, diminishing gradually in stature from the arbour outwardly, permitting the whole to take their natural growth; so that at a distance it may assume the appearance of one of the common shrubbery clumps.

The bottoms of them when on the ground, should be well gravelled, and garden chairs placed in them during the summer.

ARBRE DES, in Geography, an island in the north part of lake Michigan in Upper Canada. N. lat. 45° 25'. W. long. 85° 18'.

ARBRESLE, L', a town of France, in the department of the Rhone and Loire, and chief place of a canton in the district of Lyon; nine miles north-west of Lyons. The place contains 8,71 and the canton 11,997 inhabitants; the territory includes 170 kilometres, and 17 communies.

ARBOETH. See ABERBROCHIE.

ARBUCLE, JAMES, M. A. in Biography, was born at Glasgow, in 1709, and educated in the university of that city, and afterwards kept an academy in the north of Ireland. His poems were published in one volume, 12mo.; but his translation of Virgil, which he undertook, was never finished. He was a person of fine talents, and much esteemed by the learned in general. He died in 1754. Biog. Diet.

ARBUCULA is used by Bradley to denote a little, or dwarf-tree, above the rank of shrubs, but below that of trees, such e. gr. as the elder.

ARBUCULA marina coralloides alta. Valent. Ind. 4. 4 H 2. 1. 55.
ARB

1. 52. f. D. D. This is \textit{Madderora maruicta} of Gmel.

\textbf{ARBUSTIVA}, in \textit{Botany}, an order of plants in the Fragments Methodi Naturae of Linnæus.

\textbf{ARBUSTORUM}, in \textit{Conchology}, a species of \textit{Helix}; a land snail found in hedges and thistles in Europe. This shell may be better characterized in the words of Da Cola than Linnæus; for the latter neglects to include in its specific character the single spiral line which is invariably found upon this species. It is thus defined by Da Cola; the shell somewhat umbilicated, spotted, with a single narrow spiral band along the middle of the breadth of whorls.—\textit{Tellus umbilicata convexa acuminata; aperture tubii-bacularii bimarginata; antecuriis longa}. \textit{Linn.}, \textit{Sp.} SW.—The shell is brown with yellow lines, or yellowish with brown lines, in little irregular dashes, and the spiral streak is dark. Vide Donov. Brit. Shells.

\textbf{ARBUSTORUM}, in \textit{Entomology}, a species of \textit{Musca}, \textit{(Serphus, Fabr.)} that inhabits Europe, and lives in trees. The thorax is grey; abdomen black, except the front joint and sides of the tergum, which are rufous. \textit{Linnæus, Gmelin}.

\textbf{ARBUSTUM} implies a number or multitude of trees planted for the sake of the fruit.

The word was more peculiarly applied to a place planted with trees for fattening vines to, which are hence called by Columella, \textit{arbileuma}.

\textbf{ARBUSTUM} is sometimes also used to denote an orchard or field wherein trees are planted at such a distance, that there is room for ploughing and growing corn between them.

\textbf{ARBUTELLA}, in \textit{Entomology}, a species of \textit{Phalaena} \textit{(Tinea Linn.)}. The wings are rufous, with streaks of silver, the middle ones bïd. \textit{Fabricius}.

\textbf{ARBUTHNOT, ALEXANDER}, in \textit{Biography}, an eminent Scots divine, was the son of the baron of Arbuthnot, and born in the year 1538. Having studied the languages and philosophy in the university of Aberdeen, and civil law under Cujacius at Bourges in France, he took ecclesiastical orders, and became a zealous advocate and promoter of the reformation. In 1568, he affixed as a member of the general assembly at Edinburgh; and by this assembly he was entrusted with the charge of revising a book, intitled, "The Fall of the Roman Church," which had given great offence, and which incurred the censure of the assembly, chiefly on account of the adhesion contained in it, "that the king was the supreme head of the church." On this occasion the assembly, in direct opposition to the principles of the reformation, to which they professed a zealous attachment, issued an order that no book should be published for the future, till it should be licensed by commissioners of their own appointment. In the following year, Mr. Arbuthnot was advanced to the office of principal of the king's college at Aberdeen. In 1572, he was a member of the general assembly held at St. Andrews, which strenuously opposed a scheme of church government called "the book of policy," and which was formed by some ratcmen for the purpose of restoring the old tithes in the church, and retaining among themselves all the temporalities annexed to them.

In the general assemblies held at Edinburgh in 1573 and 1577, Mr. Arbuthnot was moderator; and he seems to have been constantly employed, on the part of the church of Scotland, for conducting the controversy concerning the plan of ecclesiastical jurisdiction to be adopted in this church. By the course he pursued in this business, and also by his publication of Buchanan's History of Scotland, he gave offence to James VI.; and a royal order was issued, forbidding him to absent himself from his college at Aberdeen. The clergy, who were likely to be thus de-prived of his important and useful services, remonstrated; but the king was inflexible, and the clergy submitted. By this persecution Arbuthnot's health and spirits were affected; and in the next year, viz. 1583, he sank into a decline, and died. Arbuthnot appears to have possessed a degree of good sense and moderation, which eminently qualified him for the conduct of public business. Possessed of a considerate share of learning, he patronized and promoted it, and contributed to revive in Scotland a taste for polite literature. The only literary work which he has left is a learned and elegant treatise in Latin, intitled, "Orationes de origine et dignitate juris," printed at Edinburgh, in 1572, in 4to. Brit. Hist.

\textbf{ARBUTHNOT, JOHN, M.D.} rot lefs celebrated for his wit than for his learning, was son of an episcopal clergyman in Scotland, and born at Arbuthnot, near Montrose, soon after the restoration. He received his education at the university of Aberdeen, where he took his degree of Doctor of Medicine. He then came to London, and taught mathematics, in which he was well skilled. In 1657, he published "An Examination of Dr. Woodward's "Account of the Deluge." This first brought him into public notice, and the reputation thence acquired was increased by his "Treatise on the Usefulness of Mathematical Learning," which soon followed. In 1704, he communicated a paper to the Royal Society, which is published in their Transactions for that year, "On the conformability observed in the births of both sexes." Though there is a small disparity, the males exceeding the females by about one in twenty, yet as the males are engaged in occupations of greater hazard and danger, he supposes their number to be nearly equal, at an adult age. Whence he concluded, "that polygamy is contrary to the law of nature and justice, and to the propagation of the human race:" an argument affording a complete answer to the doctrine contained in the Thalysphora, a publication by the late Mr. Madison. On the credit of this paper he was made fellow of the Royal Society, and obtained a more intimate connection with the principal literary characters in the country. Being soon after called to attend prince George of Denmark, who was taken ill at Epsom, where the Doctor happened to be at the time, his success in relieving him to health brought him into favour with queen Anne; and in 1709, Dr. Hames being induced, he was made her physician in ordinary, and admitted Fellow of the Royal College of Physicians. This would have attended of course with an increase of professional fame and employment; but it does not appear he was ever popular as a physician, or had much general practice, as on the death of queen Anne, in 1714, he found himself so much neglected, as to have leisure to go to Paris. On his return he thanks Mr. Pope for "taking notice of a poor old diffireted country:" and tells him, "that his friends shall find the fame welcome at Martin's Office in Dover-street, they had met at his house in St. James's, and that he can ill afford to give them half a pint of claret." His fondness for the conversation of Pope, Swift, Gay, and the other wits of the time, and their affectionate attachment to him, although contributing to his pleasures, as most congenial to his disposition, was probably the real cause of the little estimation he was in as a physician, except among his friends. For though Apollo is called the father of medicine as well as of verse, yet those who, addicted themselves to him in his latter capacity, rarely attain eminence in the first. This was afterwards exemplified in the fate of Armbrong and Alexander, whose fame as physicians decreased in proportion to their increasing celebrity as poets.

Arbuthnot had been for some time engaged with Pope
and Swift in writing the "Memoirs of Martinus Scriblerus," intended as a general satire on the abuses in human learning; but which was never completed. It was in allusion to this, that he called his house in Dorrinstreet Martin's Office (see his letter to Pope in 1714), which shows also that he had no inconsiderable share in that exquisitely witty production. "The life of that solemn and absurd pedant, Dr. Scriblerus" Watson says (Introduction to the Memoirs), "of which Johnson speaks too contemptuously, is the only true and genuine imitation we have in our language of the serious and pompous manner of Cervantes." Besides the large share Arbuthnot contributed to these memoirs, he is upon good authority suppos'd to have written "The history of John Bull," "A Treatise on the Coaling of the Ancients," and "The Art of Political Lying." There is also a philosophical poem written by him, remarkable for its philosophical sentiment, in Dodgley's collection the title "Know thyself," but his principal work is, "Tables of ancient Coins, Weights, and Measures," consisting of several dissertations on these subjects, which he collected together and published in 1790. In 1727; they are still held in esteem. In 1732, now in the decline of life, he published a treatise "On the Choice of Aliments," and in the following year, "On the effect of Air on the Body according to ancient and modern writers, on the doctrine of Bacchus, the prevailing flem of the time. Among his fatichical pieces should be mentioned his "Epitaph on Charters," a noted usher of the time. "Here continues to rot, &c." It is written with uncommon pertinacity, but not more than the subject demanded. In almost all his fatichical poems there is a good-humoured vein of pietas, which confirms the character given of him by Swift to a lady who defined his opinion of him: "he has more wit than all our race, and his humanity is equal to his wit." Although they are strongly tinged with party, yet they are generally free from the gall and rancour that too often afflicts party writings. If indeed the "Memoir of the six days preceding the death of a late Right Reverend," (meaning Bishop Burnet) he has not, in this instance, he acquitted of skilling his personal dislike to get the better of his humanity. Dr. Arbuthnot was also a skilful musician; and sir J. Hawkins mentions an anthem, and a burlesque song of his composition. (Hist. Muf. vol. v. p. 126.) The two volumes published in 1720. In 1751, and entitled, "The Miscellaneous Works of the late Dr. Arbuthnot," contain some of his genuine productions; but as for the greater part of them, they are George Arbuthnot, Esq., upon whose judgment and probity we may depend, says that they were not written by his father. He had been long afflicted with an alman, to which a drop of wine was now added. With a view of obtaining relief under this accumulated distress, for he did not, he told his friends, expect a cure, he removed to Hampstead, a village in the neighbourhood of London; but, finding little advantage from change of situation, he soon returned to his house in town, where he died Feb. 27, 1755; and supposing him to have been thirty, when his "Examination of Woodward's Account of the Deluge" appeared, in the 68th year of his age. Dr. Arbuthnot paid his days amidst the endurances of domestic life, and the affliction of his friends; and bore, with resignation and cheerfulness, the afflictions that fell to his lot. His literary associates, by whom he was beloved, have recorded their mutual friendship, and dedicated to him an epistle, called "A Prologue to the Satires!" and Swift feelingly laments, in one of his poems, that he is "Far from his kind Arbuthnot's aid, / Who knows his art, but not his trade."

During his last illness, his senility supported by habitual piety, never deserted him; and these qualities, with an ardent love of virtue and disdain of meaner and vice, are beautifully displayed in his last letters.

Species. 1. A. humilis, common strawberry-tree: trim arboreous: leaves oblong-lanceolate; panicles smooth, nodding. This tree rises to the height of twenty or thirty feet and usually puts out branches very near the ground. It is in conflagrant verdure: for, during the whole winter, it retains its leaves till pushed off by those which appear in the spring. In the months of October and November, the arbutus makes a very beautiful appearance, as, at this time, its fresh flowers and fruit of the preceding year are in their utmost perfection: hence it becomes a very desirable tenant in shrubberies, producing a pleasing contrast with most other plants, whose season of beauty is past. Mr. Aiton enumerates the following varieties, viz. a. Common white-flowered strawberry-tree. B Red-flowered strawberry-tree. C Double-flowered strawberry-tree. Besides these varieties the nurseries make others founded upon the shape and size of the leaves. It is a native of the Isthmus of Europe and of Asia. This arbutus, we are told, is also a native of some parts of Ireland, especially about the lake Killarney. 2. A. laurifolia, laurel-leaved strawberry-tree: stem arboreous: leaves oblong, acuminate, sharply serrate, smooth; racemes axillary, long, ranked, pellate, foliaceous. This tree is very like the common arbutus, but differs in its sharp cipitate ferratures, and its axillary, very simple racemes, shorter than the leaves, with the flowers all directed the same way. A native of North America. 3. A. arborea, oriental strawberry-tree: stem arboreous, leaves ovate, entire, and ferrate; panicles pubescent, erect. This also has some resemblance to the common arbutus, but the bark is not rough; some of the leaves are not ferrate; the panicle is viscid. It grows to a middle-sized tree, with large smooth leaves. The flowers resemble those of the first species, but grow more thinly on the branches. The fruit is oval, and the seeds flat. It grows abundantly in the EaB, about Magnesia. Cultivated in 1724, by Dr. Sheard, at Eitham. 4. A. ferruginea, long-flowered strawberry-tree: stem arboreous; leaves oblong, obtuse, smooth, entire; racemes terminal, Branches singular, smooth; leaves alternate, petiolar; racemes axillary, solitary, terminating the branches; flowers remote, nodding, longer than those of the other species. Found in America by Mitch. 5. A. macrantha, pointed-leaved strawberry-tree; stem thorny; leaves alternate, obviate, ferrate, pointed: pedicels axillary, one-flowered. This is a very thorn shrub.
Leaves flat, stiff, callous at the edge, with four<br>petioles on each side, on very short pedicels; pedicelles<br>short, one-flowered. Found in Terra del Fuego, by Back.<br>6 A. pamult, dwarf strawberry-tree; stems diffuse; leaves<br>alternate, dilated, oblong, entire; flowers solitary, solitary.<br>A few shrubs, with leaves like those of *Eugenia* trons, very smooth above, keeled beneath. It is a native of the same country<br>as the fifth species, 7 A. Bicliei, Acanth. strawberry-tree; stems procumbent; leaves ovate, suberect; flowers<br>glandular, in small blood-red calyx, about twice the<br>size and, when ripe, the colour of a flower. It grows in alpine<br>situations in the northern parts of Europe; and with us, on<br>many of the highland mountains of Scotland. 9 A. *novi<br>zebi*, bear-herb or trailing arbutus; stems procumbent;<br>leaves entire. Branches trailing upon the ground to the<br>extent of two or three feet round the root; leaves like those<br>of the preceding species, firm and rigid like those of box;<br>flowers of a flesh-colour, in small clusters at the ends of the<br>branches, upon short red pedicelles; berries, when ripe, are<br>red, and of the size of a holly-berry. Common in many<br>mountainous parts of the continent, and in the north of<br>England and Scotland. Eng. Bot. 714. W. Med. Bot. 70.<br>These leaves of this plant, about the middle of the last<br>century, acquired great celebrity, not only for their efficacy<br>in gravelly complaints, but also for the great esteem for their<br>ornamental beauty. They are usually given in powder from a<br>ferule to a dram, two or three times a day. This plant has<br>been used in tanning leather, and also in dyeing an ash<br>colour. 10 A. *myrsinfolia*, thyme-leaved arbutus. Aiton.<br>Hort. Kew; stems procumbent; leaves oval, acute, ob-<br>seously ferrata, trigone underneath; flowers axillary, eight-<br>flamened. This has the structure of the *Saxicum* erectum, or<br>craberry, but all the parts are larger. The stem is im<br>briate, with bristle-shaped scales. A native of North<br>America, in swamps, and extremely abundant there. The<br>berries are brought to market at Philadelphia late in<br>autumn, and used for tarts and other kinds of pastry. Con<br>siderable quantities of them are exported to Europe and<br>the West Indies. They are much used by our pastry-cooks<br>in London, though thought to be inferior to the cranberries<br>of British growth. The plant was introduced by Dr. Fothergill<br>in 1776.<br>A. *novi zebi*, trailing. See *Eugenia*.<br>A. *arbutus*, in *Ornamental Gardening*, is applied to a genus<br>of plants, the different species of which supply the finest<br>evergreens for the principal situations in shrubberies and<br>pleasure-grounds. They are four as may be set out in<br>the open ground or in pots, but in whatever mode of<br>planting it is designed to employ them, they should be<br>placed in so detached a manner, as to appear conspicuous<br>at all times, and be permitted to take their own natural<br>growth. The best season for transplanting all sorts of tide<br>shrub in is in the end of September or October and begin<br>ning of November, or in March and April.<br>The propagation of the different species is effected most<br>commonly by seed; they will, however, sometimes grow by<br>layers and cuttings, though in the latter mode rather more<br>reliably; but the seed grows freely, from which the hand<br>somest plants are frequently obtained. To continue the<br>double-flowered and scarlet kinds with certainty, it<br>must be done either by layers, cuttings, grafting, or in<br>arching, as these varieties will not retain their difference if<br>continued from seed. From the seed of either the common<br>oval or round-framed kinds some of both sorts may be expected;<br>but that of the former is rather to be preferred for forcing.<br>The berries containing the seed may be had of the nursery<br>men and seedmen in October, November, and Spring; and<br>the seeds may either be sown in pots in autumn, and shel<br>tered in a frame all winter, or be preserved in dry land until<br>March, and then sown in pots of light dry earth, and cov<br>ered about a quarter of an inch deep; if the pots are<br>then plunged into a hot-bed, it will greatly forward the<br>germination of the seed, that the plants will rise in a month<br>or six weeks; when they must have plenty of air admitted to<br>them, moderate waterings, and be injured by degrees to<br>the full air in summer, at which season the pots should<br>be plunged into the common ground until October, and<br>then be set in a green-house or frame, to have shelter from<br>the frost, till March, at which time it is advisable to trans<br>plant the seedlings singly into small pots, which if directly<br>plunged into a flender hot-bed, shielded and shaded far<br>onally with mats, giving moderate waterings, they will<br>quickly take root, when the pots may be plunged into a bed<br>of common earth in a sheltered place, to remain two or<br>three years, indulging the plants with larger pots and pro<brtection from severe frosts, till they are two or three feet<br>high; then transplanting them with balls of earth about<br>their roots into the full ground.<br>Propagate them by layers, the young shoots must be<br>employed, otherwise they rarely emit roots in less than two<br>years. Cuttings will send out roots by the aid of heat;<br>procumbent. To this view plant a number of the short young shoots in<br>pots in spring and summer, and plunge them into a sub<br>stantial hot-bed of tan and dung.<br>Inarching or grafting is performed in the usual way upon<br>roots of any of the varieties. See Inarching, and In<br>arching.<br>A. *archi*, Arch, or Ark, formed of argus, a bow. See<br>Arch and Ark.<br>A. *ark*, in *Biography*, called also "the Maid of<br>Orleans," an extraordinary heroine, was the daughter of a<br>peasant of Domremi, near Vaucouleurs, on the borders of<br>Lorraine, and born about the beginning of the 15th century.<br>At the age of twenty-seven years, she was servant in a small<br>inn, where she was accustomed to tend horses, and to per<br>form other menial offices which commonly fall to the share of<br>men-servants. About this time King Charles VII. was reduced to<br>the most distressed condition by the English; but the siege<br>of Orleans, which was bravely defended by the garrison and<br>inhabitants, in some measure retarded their progress. Joan par<br>took of the feelings of sympathy with the besieged, that very<br>generally prevailed, and determined to make some move in<br>relieving her sovereign in its present distresses. Whilst she<br>was indulging these feelings, her companion led her to fancy<br>that she was visioned and heard voices exhorting her to re<br>establish the throne of France, and to expel the foreign in<br>vaders.
vaders. Under the strong impulse of 

inspiration, she obtained admission to Baudricourt, the 
governor of Vaucouleurs, who after being informed of her 
inspiration and intentions, treated her for some time with 

neglect; but, in consequence of her renewed and importun

ate solicitations, he gave orders that she should be con-
ducted to the French court, which then resided at Chinchon.
It is pretended that Joan, immediately on her admittance, 
knew the king, though she had never seen his face before, and 

though he purposely kept himself in the crowd of court-
tiers, and hid from every thing in his apparel that might 

seem to distinguish him; and that she offered, in the name 
of the supreme creator, to raise the siege of Orleans, and to 

conduct him to Rheims to be there crowned and anointed.
In order to remove his doubts of her mission, it is said, that 

she disclosed a secret, known only to herself, and which the 

milk had derived from heavenly inspiration. She also 
demanded, as the instrument of her future victories, a par-
cular sword which was kept in the church of St. Catha-
nine of Foribus, and which, though she had never seen it, 

she described by all its marks, and by the place in which it 

had long lain neglected. Her intrepid and determined mode 
of address excited attention, and gained confidence; and she 

was referred to matrons for proofs of her virginity, and to 
doctors of the church for evidence of her inspiration; their 
report being favourable, she was sent to the parliament at 

Poitiers; but they, considering her as insane, demanded 
from her a miracle. Her reply was, that she would soon 

exhibit one at Orleans. Accordingly she was at length 
completely armed, mounted on horseback in the presence of 

the multitude, and sent amidst the loudest acclamations to 
join the army defined to the relief of Orleans. Upon 
joining the army, consisting of 10,000 men, the ordered all 
the folders to confide themselves before they set out on the 
enterprise; she bated from the camp all women of bad 
fame; she displayed in her hands a consecrated banner, 
representing the Supreme Being as grasping the globe of 

earth, and surrounded with flower de dieces; and for this 
communicating to the folders a great degree of that enthu-
siasm by which she herself was actuated, she advanced to-
wards Orleans. The English besiegers were overawed by 
her orders and menace, dictated in the name of the Al-
mighty Creator; and she entered Orleans arrayed in her mi-

itary garb, and displaying her consecrated standard, and 
was received by all the inhabitants as a celestial deliverer.
The convoy approached without finding any resistance on the 
part of the besiegers; the waggons and troops passed with 
out interruption between the redoubts of the English; and 
a dead silence and astomishment reigned among them, 
former so elated with victory, and so fierce for the combat. 
Joan, having thus far succeeded, ordered the garrison, at 
the same time encouraging them with the promise of heav-

ily avenged, first, to attack the English redoubts, in which 
measure they were successful; and then to fall upon the 
main body of the English in their entrenchments. In 
one of the later attacks the French were repulsed, but the 
intrepid maid led them back to the charge and overpowered 
the English. In one of these attacks, she was wounded in the neck with an arrow; but after retreating behind the assailants, she put it out with her own hands, 
had the wound quickly dried, and hastened back to head 

the troops, and to plant her victorious banner on the ramp-
arts of the enemy. In consequence of these successes, at-
tended with a glee to the English of more than 6000 men, 
their courage and confidence gave way to amazement and 

dispair. The French, in order to magnify the wonder of all 
these prosperous events, represent the maid, as not only 
active in combat, but as performing the office of general; 
directing the troops, conducting the military operations, 
and faying the deliberations in all the councils of war. But 
whatever the policy of the French court might suggest for 
maintaining this opinion among the multitude, it is much 
more probable that this inexperienced country girl was 
prompted in all her measures by the wiser commanders. 
Having raised the siege of Orleans, Joan now inquired that 
the should proceed to the accomplishment of the second 
part of her promise, which was that of crowning the king at 
Rheims. The king, accompanied by the victorious maid, 
marched at the head of 12,000 men towards Rheims; re-
ceiving the submission of the towns through which he passed 
till at length arriving near Rheims, a deputation met him 
with the keys of the city, and he was admitted into it with 
transport. Here the ceremony of his coronation was per-
formed with the holy oil of Clovis; and the maid florid by 
his side in complete armour, and displayed her faced banner. 
When the ceremony was finished, she threw herself at the 
king's feet, embraced his knees, and with a flood of tears 
she congratulated him on this singular and marvellous event. 
Charles testified his gratitude by ennobling the family of 
Joan, giving it the name of du Lys, probably in allusion to 
the lilies of her banner, and assigning to her a suitable estate 
in land. Having accomplished both the objects which she 
 had promised, the maid of Orleans expressed her wish to 
return to her former condition, and to the occupation and 
course of life which became her sext; but the French gen-

eral Dunois urged her continuance with the army, till the 

English should be completely expelled, and her predictions 
fully accomplished. Overpowered by his advice, she threw 
herself into the town of Compiègne, which was then be-
fiegled by the duke of Burgundy and the English; where, 
on a failing, having twice driven the enemy from their en-
trenchments, and having their number increasing, she or-
dered a retreat; but was defeated by her friends, surround-
ed by the enemy, and taken prisoner by the Burgundians. 
Instead of treating Joan as a prisoner of war, with the cour-
tely and good usage, which, as such, she was entitled, and 
which civilized nations practise towards enemies on occa-
sions of this kind, she was purchased from the captors by the 
regent duke of Bedford, and a criminal prosecution was in-
lstituted against her on the charges of sorcery, impiety, idol-
asty, and magic. The clergy in his interest, and even the 
university of Paris, concurred in the accusation. An 
ecclesiastical commission was held at Rouen for her trial, and 
the maid, clothed in her former military apparel, but loaded 
with irons, was produced before this tribunal. Her trial 
lasted four months; and in the course of that time, many 
captious interrogatories were put to her, which she an-
swered with firmness and dignity. Upon being asked, whether 
she would submit to the church the truth of her pretended vi-
sions, revelations, and intercourse with departed saints? 
She replied, that she would submit them to God, the foun-
dation of truth; and when she was charged with being a he-
retic, and denying the authority of the church, she appealed 
to the pope; but her appeal was rejected. When she was 
asked, why she put her trust in her standard, which had 
been consecrated by magical incantations? She answered, that 
she put her trust in the Supreme Being alone, whose image 
was imprinted upon it. When it was demanded, why she 
was carried in her hand that standard at the dedication and 
coronation of Charles at Rheims? She replied, that the person 
who had shared the danger was entitled to share the glory. 
When she was accused of going to war, she scrupled not to 
declare, that her sole object was to defend the English, and to 
expel the kingdom. In the issue, however, she 
was
was condemned for all the crimes of which she had been accused, aggravated by heresy, her revelations were declared by the council of Tours to be inventions of the devil to seduce the people; and she was sentenced to be delivered over to the Germans and burning. At length her resolution failed her; and through dread of the punishment to which she was sentenced, she declared that she was willing to recant; and, accordingly, the acknowledged the illusion of those revelations which the church had rejected; and the promise never more to maintain them. Upon this her sentence was mitigated; and she was condemned to perpetual imprisonment and to be fed during life on bread and water. But with this vengeance her enemies were not satisfied. In order to justify the verdict maximes against her, they industriously placed in her apartment a list of men's apparel; upon the sight of this garb, in which she had acquired so much renown, and alluded to, as the once beloved, by the appointment of heaven, her former ideas and passions revived, and the ventura in her lifetime to put on the forbidden dres. In this apparel she was detected; it was regarded as a relapse into heresy; her recantation became void; her partial pardon was revoked; and she was to be burned in the market-place of Rouen. In June 1331, this barbarous sentence, much more ignominious to those who inflicted it than to her who was the object of it, was executed. This admirable heroine, to whom the more generous sentiments of the ancients would have erected altars, was, on pretence of heresy and magic, delivered over alive to the flames, and expired, by that dreadful punishment, the signal visitation which she had rendered to her prince and to her native country. She met her fate with resolution, and the English themselves beheld the scene with tears. The King made no effort for avenging her cause; he merely procured a revision of the process, and a restoration of her memory ten years afterwards by the pope, in an act which styled her a "Martyr to her religion, her country, and her king." Her countrymen, more prompt in the tribute of their respect, propagated many tales relating to her execution; and some of them would not even allow her to be dead, but professed to expect her speedy return to conduct them again to victory. Of the character and conduct of this singular heroine, the most probable opinion is, that of her being an honest and devoted enthusiast, of whose fancies and passions the principal portion in the interest of Charles availed themselves for deluding and rousing into exertion the passions of the people, at a crisis of peculiar importance; in which the maid of Orleans was instrumental in giving a decisive turn to the contest between the French and English. The exploits of Joan of Arc have been celebrated both in prose and verse. Of the latter, the fervid poem of Chaucer has been much less successful than the burlesque and licentious one of Voltaire; but the injury done by it to her memory has been in some degree repaired in England, by Southey's sublime and spirited poem of "Joan of Arc," which exhibits her in the brightest colours of virtue and heroism. Hume's Hist. of Engl. vol. iii. p. 141, &c. Nouv. Dict. Hilar. art. Jeanne.

Arc, in Geography, a rapid river of Savoy, which rises in the northern part of mount Cenis, on the confines of Aosta, traverses the country of Marianne, and discharges itself into the lake about four miles from Montmlan.

Aroe, or Ar, a river of France, rises on the side of Porcius, traverses the plain of Pourieres, where Marius defeated the Cimbri; passes by Aix, and loses itself in the lake of Martigues in the department of the mouths of the Rhone. Some have supposed this to be the Caunum fluxum of Ptolemy.

Arc en Barres, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Chaumont, fourteen miles north-west of Langres. The place contains 1768, and the canton 5733 inhabitants. The territory includes 25,516 hectares, and 9 communes.

Arc for Title, a town of France, in the department of the Côte-d'Or, and chief place of a canton in the district of Dijon, on the river Tille, five miles east of the rail of Dijon.

Arc, in Ancient Geography, a town of Africa in Numidia on the south of the river Medjer, and towards 35° 32' N. lat.

Arc, a town of Phrygia, at the foot of mount Libanus, between Antaresus and Tripolis, upon a small river about half a league from the sea coast. This was the city of the Arcites, who were the offspring of Canna and Sisander, and said to have been founded by Arcas, one of her sons. The inhabitants consecrated a temple in this place to Alexander the Great; and the city was celebrated in honour of the Roman Emperors, and on account of its situation, "Cecaera of Libanus," which name, as is seen in medals, it had borne a century before the time of Alexander Severus. Shaw, in his travels (p. 270) speaks of the ruins of Arc, and says, that the situation of this ancient city was very delightful; having to the north the prospect of an extensive plain, diversified with a great variety of towns and villages, ponds and rivers; so that the view might be seen from the sea, and to the east rising over a long and distant chain of mountains. The citadel was erected upon the summit of an adjacent mountain of a conical form, and in former times has been impregnable. Water was conveyed from the mountains to the city by an aqueduct, whose principal arch could not have been less than 100 feet in diameter.

Arc, Cape d', in Geography, lies on the coast of Africa, E. S. E. from the N. E. end of the island of Fortevertuna, the most southerly of the Canaries. It is about N. lat. 27° 15', and W. long. 12° 10'.

Arc cordis is used by some Anatomists, to denote the pericardium.

Arc, in Anatomy, a genus of Bivalves, the animal of which is supposed to be a Calyx: the valves are equal; and the hinge befeet with numerous sharp teeth, inserted between each other. The species are arranged in two sections, viz. the first has an entire margin, and in the other the margin is crenulated: each of these sections is subdivided into two parts, the first having the beaks recurved, and in the second they are infected. The species enumerated by Gmelin arc, tortuosa, noae, barbata, modiolus, pella, ovata, pellicida, roblata, frurata. pulchella, afra, floruis, cancellata, minuta, hesia, nodulosa, antiquata, fenilis, granosa, corbicula, cuneispalla, acünatera, pallens, cucullus, magnella, reticulata, candida, indica, jadeanenis, campechienæ, late, f. negalenis, undata, pectunculus, pelinina, glycerinae, pilafa, nummara, nucleus, rhomboidea, marmorea, angulosa, lispaha.

ARCADE, in Architecture, is used to denote any opening in the wall of a building formed by an arch.

ARCADES, or Arcadia, in Ancises Geography, a town on the west side of the island of Crete.

ARCADIA was one of the six districts into which the Peloponnesus was divided. Its name is said to have been derived from Arcas their fourth king, and it was anciently called Pelagi, being inhabited by the Pelagi, who boated of their descent from Pelagis. The Pelagi,ins were found in several parts of Greece; but their chief and primitive seat is generally supposed to have been Arcadia, where inhabitants are universally allowed to be the most ancient people in Greece. Bound on the north by Elys, on the east by Argolis, on the south by Laconia, and on the west by Mefenia, Arcadia occupied a central situation, and was the only district of the Grecian peninsula which was not maritime.
time. It consisted chiefly of mountainous regions, embosoming valleys which were often intersected by rivers and streams; but in certain places these deflected from the mountains too abundant waters, which finding no outlet in the plain, suddenly precipitated themselves into profound gulphs, purifying their course for some distance through subterraneous caverns, and at length burst forth and again appeared above the earth. The foil, in most parts extremely fertile, was peculiarly favourable to pastoral, and nourished a race of herdsmen, who, like other highlanders, invigorated by the exercise and efforts which the rugged scenes of their occupation often required for subsistence, and emboldened by the danger of the chase, encountered not merely for amusement but for the security of their flocks, were strong and courageous; and their courage was increased by the confidence which the natural bulwarks of their country afforded against foreign invasion.

Arcadia was divided into upper and lower, the former on the north, and the latter on the south; and this was the most mountainous of the two, was famous for its breed of horses and asses, whence the name of these animals was denominated the Arcadian nightside. Both these districts abounded with cities, of which the following have been recorded, viz. Megalopolis, now Leontari, Mantinea, now Goriza, Palantium, Messenius, Tegea, Orchomenus, Clitorium, Nanactus, Iphiis, now Dimazana, Hiera on the river Alpheus, Stymphalus on the lake and river of its name, in which there was a temple of Minerva, and Phiala or Phigala on the river Neda. The chief mountains were Cillene, Phoeb, now Xiria, Stymphalus, now Pogli, Pharia, and Lycus, called also Olympus, by Pauninus Cerausus, and by the present inhabitants Miteuia.

At first the Arcadians were a savage people, living in the woods and fields, and feeding promiscuously on the products of the ground. At last they were taught by Pelaugus, the founder of their monarchy, to build huts, to live sociably, to exchange their common food for nuts, acorns, or beechnuts, and to clothe themselves with the skins of wild beasts. They began afterwards to feed cattle, being invited to it by the fertility of their soil. The shepherds of Arcadia, amidst their numerous flocks and herds, were distinguished by the tuneful strains of their vocal and instrumental music, and for the worship which they paid to their god Pan.

Affording few temptations to commercial adventures, they had very little of the intercourse of peace with surrounding principalities. The secure and insular position of their territory long prevailed the Arcadians, on the one hand unimproved by the advancing refinement of Greek civilization, and on the other infected by Greek degeneracy; and when other states had exhibited the highest exertions of genius, and were advanced to eminence in the arts, accommodations, and luxuries of life, the Arcadians were distinguished by the innocent simplicity of their manners and by their fond attachment to pastoral retirement. "The exuberant fertility of the Dodona district, the inland situation, the generous warmth, yet lively verdure, together with the picturesque and animating scenery of this delightful region, seemed peculiarly adapted to inspire, and to gratify, the love of rural happiness; and to afford in all their elegance and dignity, those sublime and sacred joys of the country, which the genius of ancient poets has felt and described with such affecting sensibility." 1

Lycus, the son of the founder of the Arcadians, improved what his father had done towards civilizing them, by introducing among them the worship of Jupiter. Each of his sons built a city, which they called respectively by their own names; in them the people acquired the habits of social life; and in the next reign they began to know corn, make bread, spin wool, and manufacture cloth for garments; so that in four generations, the Arcadians, from being but one remove from wild beasts, became civilized, industrious, and attached to society, husbandry, and a regular police.

Arcadia, like other states of Greece, was at length governed by kings. Of these kings they reckon twenty-five from Pelaugus, the founder of their monarchy, to Aristocrates II. with whom it terminated. This last king was murdered by his subjects for his treachery to the Macedonians his allies, whom he betrayed to the Spartans, then at war with them. This event happened in the first year of the 58th Olympiad, or the 665th year before Christ; and if Pelaugus was contemporary with Creopse, the founder of Athens, as Sir Isaac Newton supposes, and we refer him, with Blair in Tab. ii. of his Chronology, to the year 1550 before Christ, the duration of the Arcadian monarchy will be about 888 years. But about the commencement of this period there is a considerable difference of opinion among chroniclers. However this be, the kings of Arcadia possessed only limited authority, but afterwards constituted a federal republic, of which the several departments respectively deputed to the states general.

But the ambition of neighbouring states, and especially the rivalry of the two chief powers of Greece, Athens and Sparta, which involved intermediate and adjacent countries in their contentions, reached the mountains of Arcadia, and compelled the inhabitants frequently to change the track for the sword. When obliged by necessity, or excited by honour, the Arcadian invaders took the field, they displayed such valorous valour, and exerted such efforts of vigour and activity, as made their services eagerly desired, and purchased with emulation, by the surrounding states. They commonly appeared clad with the skins of wolves and bears, and carried either a little bundle of javelins, or a lance in their hands, which they used with a peculiar dexterity. Their women also became at length such expert warriors, that they have sometimes by their own valorous feats decided a doubtful victory. Hence such offers were made to them as induced many, when their own country was at peace, to serve as mercenaries in foreign armies. The warfare in which the Arcadians were engaged, first from necessity, and afterwards from choice, made a very important change in their internal situation. From farms and villages they assembled into walled towns; they fortified Tegea, and afterwards Mantinea.

The Arcadians of Tegea joined the Greek patriots of Athens and Sparta, in vindicating the freedom and independence of their native land against the attempts of Oriental despotism, and bore an important share in the battle of Plataea, which consummated the victories of liberty. In the Peloponnesian war, Arcadia, situated between the contending parties, was involved in their hostilities. The Spartans, after having vanquished their principal rival, endeavored to subjugate the Arcadians, but though sometimes victorious, yet they were never completely successful. At length, after the peace of Antalcidas had withdrawn their chief enemies from the field, they directed their efforts against Mantinea, and that city, become the capital of Arcadia, was after a gallant defence compelled to submit. The Arcadians however were not ultimately subdued; Epaminondas, in vindicating the liberties of his own country, affixed the independence of other states against the overbearing domination of Sparta. In the

* Vol. II. *
first invasion of Laconia, the Arcadians joined the pumilier
of their impious opperflora. Now so much accustomcd to the
conflicts of war, they also partook of its rapacity, and
instead of the honn't simplicity of theirheirs, imbued the
plundering spirit of mercenary soldiers. Auxiliaires to the
Thucian hero, they had profited by his yucces: encouraged
by their advantages, and the deep influence and illustre of Sparta,
they gave scope to their ambition, and planted the flagst affha
of the whole peninnsa. Acquiring the policy as well
as views of their changed national charactet, to pave the way
for the total conquest of the Peloponnæus, they began by
wresting several places from the Elians, the leat warlike 
and moll wealthy of their neighbours. But the arduous
of rapacious avarice operating with too much violence and pre-
cipitation, by raving confederate reliance, ultimately de-
feated the purposes of ambition. Injustice and robbery they
aggravated by impatience and facrilege; they directed their de-
predations against the temple of Olympia, containing the
collected treasures of many centuries, the rich gifts of va-
nity and superstition. Not only neighbouring powers but
many of their own countrymen cenferred this fpoliait; in-
ternal discord arose between the plunderers and those who
reprobated the deed, and their schemes of boundless aggran-
difement proved abortive. The Arcadians now intermingling
so much in the wars and intrigues of the Grecian states, ac-
accompanied them in their declension from patriotism to felitic
Corruption, from corruption to cenvration and the decay of
military prowess, until they became dependent and tributary
appendages of the Macedonan kings, and afterwards pro-
vinces of the Roman empire. Since that time all traces of
Arcadia are lost, and the country is only known as a part of
the Grecian or the Turkish empire. Several colonies of Ar-
cadians migrated at different periods from their own country,
and settled in Lavier; and may therefore be justly reckoned
among the first inhabitants of Italy. Paufanias in Arcad.
p. 64, &c.

ARCADIA, or CVPARISSA, in Geography, a sea-port town
of European Turkey, in the Morea, situate on a gulf to
which it gives name, open to the Mediterranean sea, fix
leagues to the north of Navarin. N. lat. 37° 24'. E. long.
21° 47'.

ARCADIUS, in Biography and History, an emperor of
the calf, and eldest fon of Theodorus the Great, was born
in Spain, A.D. 377, and invelled by his father with the purple at
the age of six years, A.D. 383. At his death, in 395, The-
odorus divided the empire between his two sons, Arcadius and
Honourius; allotting to the former Thrace, Aasia Minor,
Syria, and Egypt, with Dacia, Macedonia, and half of Il-
llyricum. Arcadius poiffessed none of those qualities that
were adapted to his station, and to the extensive dominion
which was assigned him; and he had the misfortune, at the
commencement of his reign, to be under the direction of
his father's unworthy favourite, Rufinus, whose ambition
led him to aspire to the sovereignty itself. In order the more
effectually to secure his influence over the young
prince, he concerted a marriage between Arcadius and his
doughter: but the enmity Eutropius contrived to attach
the emperor's affections to Eudoxia, and he was married to
her in the first year of his reign. Rufinus being cut off by
an untimely death, Eutropius, who was even a worse man
than Rufinus, succeeded to the ministerial power, and by
fraud or violence, removed from the view of Arcadius all
those in whom he placed any confidence. This minister,
however, did not long enjoy the power which he acquired
by artifice, and which he exercised merely to serve the pur-
poffs of his own ambition and avarice. Having fomented
discard between ArcADIUS and his brother Honorius, and
persuaded Gildo to transfer the allegiance of Aries from
the latter to the former, he calked the emperor A.D. 397,
with a view to his own security and that of his adherents,
to pail an unjust and cruel law of treason, extending the
crime to all practices against the ministers and subjects of the
empire, and inflicted the punishment of it on descendants. His
power was at length overthrown by the rebellion of Tribi-
gild, the Oltragoth, A.D. 399, and by the concurs of
influence of the empress Eudoxia, by whom he was suc-
ceded in the absolute direction and government of the fecile
Arcadians. She assumed the title of "Augusta," and had
her image borne through all the provinces of the empire,
which was honoured with the respect bellowed on that of
the emperor himself. By her perverted the venerable
Chrysolotom, who was banished and died in exile, because
he too freely exposed the vices of the court, and of the
empress, Eudoxia excited illusions at Constantinople;
but in the bloom of youth the died of a mischance, A.D.
404. Arcadius survived her a few years, and witnessed the
calaminities that were accumulating on the eastern empire.
At length in his thirty-first year, he died at Constan-
tinople; A.D. 408, after having reigned twelve years with his
father, and nearly fourteen years after his death. He had
one fon, viz. Theodorus, who at the time of his decease
was eight years of age, and four daughters. Arcadius
was a prince of very moderate talents; being indolent,
and also addicted to pleasure, he was harmfully imposed
upon, and entirely governed by his ministers and the
empress, who, under the faction and by an abuse of his au-
thority, oppressed the people in the most despotic and ty-
ranical manner. "It is impossible," says Mr. Gibbon,
"to delineate his character; since, in a period very co-
piously furnished with historical materials, it has not been
possible to remark one action that properly belongs to the
fon of the great Theodorus."

The supposed testament of Arcadius, by which he ap-
pointed Jezedegd, the Persian monarch, guardian of his
fon, and which is mentioned by Procopius, is not authen-

ARCADIUS, in Entomology, a species of Papilio
(P. Nymph. Fab.) The wings are very entire; the anterior
ones black with blue and white spots; posterior ones fuc-
cous, beneath cheetip-brown. This kind inhabits Africa.
Fabricius. Obs. Gmelin overlooked this new species in his
Syst. Nat.

ARCE Caflors, in Ecclesiastical Antiquity, a title formerly
given to the archdeacon, on account of his having the cuf-
mody of the church's clerics, or treasurers.

ARCGANTES, in Ancient Geography, called also
Liligantes and Limigantes, were Sarracens, who, being
expelled their own country, took possession of some parts
of the Roman territory.

ARCALU, in Geography, the name of a small princi-
pality of the Tartar Mongols, on the river Hoamko; where
the great wall of China commenced.

ARCAN, a town of Asia, in Tartary, upon the fron-
tiers of Mawaranáhtra, situate upon the river Casima, and
called also Adcreand.

ARCANE, a small town of Asiatic Turkey, in Natolia,
upon the coast of the Black Sea, between Siapiæ, or
Sinapæ, and the Cape Pifello.

ARCAGIS, in the Turkish Armies, an inferior kind of
infantry, which serve as infans parvis, and to harass and
pillage the enemies' frontiers.

The Archagis are an order inferior to the Janizaries;
and, when any of them distinguish themselves, are usually preferred in the Juniorites order. They have no pay, but are to subsist on their plunder.

ARCANI, in Geography, a town of Armenia, at the mouth of a river of the same name, supposed to be the ancient Apaurus.

ARCANIOUS, in Entomology, a species of Papilio (Dan. Fel.). The wings are very entire, squinuous beneath, on the anterior pair one occluded spot; on the posterior pair five, the first of which is separated from the others by a band. Fabricius. This is Papilio Angius of Scopoli and Poda, and inhabits Europe. It is produced from a green larva, which has an obscure line along the back, yellow on the sides, and bidentated at the tail.

ARCANA, a kind of red chalk, called by physiologists rubricus faberis, as being used by carpenters to colour their lines for marking timber, &c.

ARCANO, in Geography, a town of Italy, belonging to the Venetian states, in the province of Triul, eleven miles west of Udina.

ARCANUM literally signifies a secret; and is therefore very pertinently applied by quacks and impostors in medicine, who conceal their ignorance and fraud under the pretence of secrecy. Hence a multitude of arcanae.

ARCANUM Duplicatum. This term was invented by Glauber, and applied by him to the salt remaining after the distillation of nitrous acid, from nitre and sulphuric acid. It is the same as afterwards known by the name Vitriolated Tartar; or, according to the modern nomenclature, Sulphat of Potash.

ARCAS, in Astronomy, a name given by some old writers to the star Arcturus, in the constellation Bootes. Arcas, the son of Calixio by Jupiter, it is said, when he was about to kill his mother in the shape of a bear, was, together with her, snatched up into heaven; where she was converted into the constellation of the Great Bear; others say into this single star.

ARCAS, in Entomology, a species of Papilio. The wings are very entire and fulvous; margin and spots black; posterior ones beneath grey, and without spots. Inhabits the Cape of Good Hope. Fabricius and Gmelin.

ARCAS, in Ancient Geography, a town of Armenia Minor, according to the Antonine Itinerary.

ARCAS, in Geography, a small place of Spain, in Cæstile, the Arcabria of the ancients.

ARCAS, an island in the Gulf of Mexico, in the bay of Campeachy. N. lat. 20°. W. long. 92° 50'.

ARCASSON Bay, lies on the coast of France, 18 leagues south-westly from the river of Bourdeaux to Cape Ferret, its north entrance; and before it lies the island Tergy, with a channel on each side.

ARCAS-TE, an island on the west coast of Africa, south of the river Gambia, and of Cape Rojo.

ARCATIS Regia Sara, in Ancient Geography. Arcate, a town in the interior of the Indian peninsula, on this side the Ganges, and the capital of a country called Soretanum Parala.

ARC-BOUTANT, in Buildings, a kind of flat arch, or part of an arch, abutting against the feet of an arch, or rims of a vault, to support, and prevent their giving way.

The name is French; formed of arc and bouder, to abut. Arc-boutants are only arched buttresses.

ARCE, in Ancient Geography, also called Rakem and Petra, the capital of Arabia Petraea.

ARCE. See ARCANA and ARCAEANS.

ARCE, in Geography, a town of Italy, in the kingdom of Naples, and country of Lavora, six miles south of Sora.

ARCEGOVINA, a province of Dalmatia, between the country of the Dulcignotes to the south, the republic of Ragusa to the north-west, a part of Bolinia to the north-east, and the Adriatic sea to the south-west. The principal towns are Ripano, Cafel-Danovo, Cataro, and Budova, which are all fortified; and the river Moracico traverses the country, which abounds with mountains, and yet is very fertile, from the north-west to the south-west. The Venetians possess the greatest part of it, and the rest belongs to the Turks.

ARCELES, a town of France, in the department of the Eastern Pyrenees, and chief place of a canton, in the district of Ceret, four leagues south-east of Perpignan, and four east-north-east of Ceret.

ARCELLA, in Entomology, a species of Phalena (Zerba); wings pure white, with a common arched mark, and two marginal spots of brown. Fabricius, Gmelin. Inhabits Germany.

ARCE-EN-QUEUE, in Ornithology, the name of the Linnean Oryolus Annulatus, in Buffon's Hist. Nat. des Oise. ARCES, in Geography, a town of France, in the department of the Eastern Pyrenees, and chief place of a canton, in the district of Ceret, seven leagues south-west of Perpignan, and three south-west of Ceret.

ARCEILS, in Biography, a Greek philosopher, the founder of the Middle Academy, was a native of Aesol, and born in the first year of the 116th Olympiad, or the 316th year before Christ. He followed his first preceptor, Astylyco, the mathematician, to Sardis; but he afterwards went to Athens, where he studied music under Xanthus, geometry under Hipponicus, and philosophy under Theophratius, Aristotle, Polemon, and Crantor. With the latter, and also with Zeno, the founder of the Stoic sect, he formed an intimate friendship. Poetry was his favourite amusement, and he was so familiarly acquainted with Homer and Pindar, in particular, that he often cited in conversation pertinent passages from their works; and it was his practice every night before he went to sleep, to read a portion of Homer. After having in early life been initiated in mathematics and polite literature, he was desirous for the profession of the law, but he rather chose to devote himself to philosophy. After the death of Crates, he took possession of the academic chair, and his method of instruction was universally admired. However, the innovations which he introduced into the Platonic school, gave rise to a new school, called, in reference to Plato's school, the Second Academy, and with respect to a subsequent innovation by Carneades, the Middle Academy. See Academy.

The school of Arcellaus was founded upon the principle of the uncertainty of knowledge; and it was instituted in opposition to the Dogmatists, and particularly the Stoics, whose doctrine was different from that of Plato. This philosopher, under the influence of Socrates and Plato, and without explicitly avowing the doctrine of universal scepticism as taught in the school of Pyrrho, maintained, that whatever certainty there may be in the nature of things, every thing is uncertain to the human understanding. He, therefore, taught his disciples not with confidence to assert their own opinions, but to controvert those of others; that truth has no certain characters by which it may be distinguished from error; and therefore he suspended his judgment, and disputed merely with a view of convincing himself.
self that opposite opinions may be supported by arguments of equal weight. Hence his school became a theatre of unprofitable contention, in which his disciples were allowed to propose and to maintain their opinions; and then the master, by his skill in disputation, and by his captivating power of address, alienated the audience by courting them. Thus the point in debate seemed to be determined, till the same ingenuity was employed on the opposite side of the question.

Arcelianus has been compared to Thibrias Graecus, as a disturber of the peace, who endeavoured to overturn the established philosophy, without the merit of that political reformer; who attempted the correction of abuses and errors; for he brought the world of science into a worse state of confusion than that in which he found it. Accordingly his doctrine of uncertainty alarmed not only philosophers but civil magistrates; and he was considered as a common enemy to science and to society; and unquestionably his tenets seem needlessly to destroy the foundations of virtue, and to introduce uncertainty and indifference with regard to the obligations of morality. When Arcelianus was once reproached by an enemy for living according to his principles. Cleaneus, though a Stoic, justified him, and averred, "that though he destroyed morals by his doctrine, he established them by his conduct." "You flatter," said Arcelianus. "Is this flattery," replied Cleaneus, "to affect, that you say one thing and do another?" This, however, was a mere compliment, to which Arcelianus was not entitled; for, according to the representation of Diogenes Laertius, he was addicted to the most shameful intemperance and lewdness, and deferved the character of the corruptor of youth; so that the pernicious tendency of his principles was exemplified in his own practice. He died, in the 4th year of the 13th Olympiad, 231 years before Christ, though at the age of 75, a martyr to his licentious conduct; for the cause of his death was a delirium produced by excessive drinking. On many occasions, however, he manifested a generous and liberal spirit. When one of his pupils expressed a predilection in favour of a Peripatetic philosopher, named Hicetonymus, Arcelianus took him by the hand, and conducting him to his school, requested the philosopher to treat him in a manner suitable to his merit. When Cleaneus, who was the successor of Zeno, the professed adversary of Arcelianus, was afforded by one of his pupils, he would not restore him to his school till he had made a satisfactory acknowledgment for the offence. Having lent some silver vessels to a friend for an entertainment, when he found that he was poor, he would not allow them to be returned. Visiting a sick friend, whom he observed to be in poverty, he silently conveyed a purse of gold under his pillow. When the sick man discovered it, he said with a smile, "This is one of the generous frauds of Arcelianus." He is said to have spent a great part of the ample income arising from an estate at Pitane, the place of his birth, in similar acts of liberality. None of the writings of this philosopher have descended to our times. During his life he was honoured, and after his death the Athenians paid respect to his memory by a magnificent funeral. Two Christian fathers, viz. Numerins and Laclantius, have inveighed against his doctrine. Diogenes Laertius, l. iv. p. 28, &c. Suidas. Athen. Athen. vii. p. 278. Cic. Acad. Quis. l. i. c. 5—12. 24. De Fin. i. ii. c. 1. l. vi. c. 31. Esch. Prep. Evang. l. iv. c. 6. 9. Laclantius, l. iii. c. 4. Gen. Diet. Brucker's Hist. Philos. by Enfield, vol. i. p. 244, &c.

ARCESINE, in Ancient Geography, a town formerly situate in the island Amorgus, one of the Cyclades.

ARCESIUM, a cavern of mount Ida, in the isle of Crete.

ARCEUTUM, a river of Syria, which watered the territory of Antioch, according to Strabo.

ARCEUTUM, is used in some Ancient Law-Writers, for a procuration due to a bishop, abbot, or archdeacon, from their clergy, in time of entertainment.

ARCH, Arc, Arcus, in Geometry, a part of any curve line; e. g. of a circle, an ellipse, or the like. The arc of a circle is any part of its circumference. Such is A F B, Plate III. Geometry, fig. 35.

The base or line A B, that joins the two extremes of the arc, is called the chord; and A D, half of the chord bisected by the diameter at right angles, is the sine of half the said arc, viz. A E.

All angles are measured by arcs. For this purpose an arc is described, having its center in the point or vertex of the angle; and as every circle is supposed to be divided into 360 degrees; an arc is estimated according to the number of degrees which it contains. Thus an arc is said to be of 30, of 80, or 100 degrees. However, the measure of angles by the arc of a circle is founded upon the uniform curvature of the circle.

Arcs, concentric, are those which have the same center.

Arcs, equal, are such arcs of the same or equal circles, as contain the same number of degrees. Hence, in the same or equal circles, equal chords subtend equal arcs. And hence, again, arcs intercepted between parallel chords are equal.

A radius, C E, fig. 35, which bisects the chord in D, does also bisect the arc in E; and is perpendicular to the chord; and on the contrary. And hence the problem, to bisect an arc, is solved, by drawing a line C E from the center perpendicular to the chord in D. Equal arcs have equal chords, lines, tangents, &c.

Arcs, similar, or like, are those which contain the same number of degrees of unequal circles. Such are the arcs A B and D E, fig. 35, or fig. 1. Plate VI. Architecture.

Two radii being drawn from the center of two concentric circles, the two arcs intercepted between them bear the same ratio to their respective peripheries, and their radii; and also the two sectors to the areas of their respective circles. Similar arcs and other like curves are also like parts of the whole, or determined by line parts alike pointed.

Arc of a circle, the length of an, may be found by the following rule: viz. as 180 is to the number of degrees in the arc, so is 3.1416 times the radius to its length. Or, as 5 is to the number of degrees in the arc, in is. 0174533 times the radius to its length. For, when the radius is 1, half the circumference is 3.14159265, &c. Consequently 3.14159265, &c. = 0.01745332599, &c. = the length of 180 degrees an arc of 1 degree; hence r × .01745, &c. = the length of r² to the radius r, and, therefore, .01745, &c. × r × number of degrees in any arc = the length of that arc: e. g. let the length of the arc A D B (fig. 37), whose chord A B is 6, the radius being 9, be required. By trigonometry, 9 (A C) : 3 (A P) = r (radius of the tables): 1 2 3 4 5 . = line of the angle ACP, or arc A D, to the radius r; and the degrees in the table of lines answering to the fine arc 49. 47 12 960, the double of which is 98.9444142, or the degrees in the whole arc A B. Then, by the rule, 38.9424 492 × .0174533 × 9 = 0.117606 = the length of the arc required. Dr. Hutton has given several other theorems, with
with their demonstrations, for finding the lengths of circular arcs in his "Treatise of Menuration," p. 124, &c. ; some of which are as follow. Let the radius of a circle be 1, any arc \( a \), tangent \( t \), line \( s \), cosine \( c \), and verfcd line \( v \); and we shall have,

\[
a = t - \frac{1}{3} t^3 + \frac{1}{5} t^5 - \frac{1}{7} t^7 + \frac{1}{9} t^9 &c.
\]

\[
a = \frac{t}{c} - \frac{1}{3} \frac{t^3}{c^3} + \frac{1}{5} \frac{t^5}{c^5} - \frac{1}{7} \frac{t^7}{c^7} &c.
\]

\[
a = t + \frac{1}{2} \frac{t^3}{3} + \frac{1}{2} \frac{t^5}{2.4.5} + \frac{1}{2} \frac{t^7}{2.4.5.7} &c.
\]

\[
\frac{a}{\sqrt{2} \times x + \frac{1}{2} \frac{t}{2} + \frac{1}{2} \frac{t^3}{2.4.5} + \frac{1}{2} \frac{t^5}{2.4.5.7} &c.}
\]

\[
a = \frac{3.14159}{180}, \quad \text{&c. } d = .01745329, \quad \text{&c. } \times d, \text{ where } d
\]

denotes the number of degrees in the given arc ; \( a = \frac{B - C}{3} \) nearly, when \( C \) is the chord of the arc, and \( \varepsilon \) the chord of half the arc, whatever be the radius.

To investigate the length of the arc of any curve, put \( x = \) the abscissa, \( y = \) the ordinate of the arc \( z \) of any curve whatever, put \( z = \sqrt{x^2 + y^2} \); then, by means of the equation of the curve, find the value of \( x \) in terms of \( y \), or of \( y \) in terms of \( x \), and substitute that value instead of it in the above expression \( z = \sqrt{x^2 + y^2} \); and hence, taking the fluxes, they will give the length of the arc \( z \) in terms of \( x \) or \( y \). See Rectification.

If the radius be not unity, the length may be found by proportion. Thus, unity :: radius :: the length here found : the length required.

See a table of circular arcs for each degree, minute, second, and third, of the meridian, in Hutton's Tables, p. 340. See a paper on an elementary manner of expressing the fluxes of circular arcs, by Monf. L'huillier in the Phil. Trans. for 1796, pt. i. p. 142-163.

To find the center of gravity of an arc of a circle; see Center of gravity.

For the fluxs, tangents, &c. of arcs, see Sine, Tangent, &c.

Arc, in Astronomy, has various denominations according to the circle to which it is applied.

Arc, Diurnal, of the sun's part of a circle parallel to the equator, described by the sun in his course betwixt rising and setting. The half of this being between the meridian and horizon, is called the semidurnal arc, and by means of this the time of his rising and setting is easily ascertained. Tables of semidurnal arcs may be found in most of our astronomical almanacs or ephemerides. The term is also applied to other celestial bodies, as the planets and stars. His nocturnal arc is of the same kind, excepting that it is described by his setting and rising.

The latitude and elevation of the pole are measured by an arc of the meridian; and the longitude, by an arc of a parallel circle.

Arch of precession or direction, is an arc of the ecliptic, which a planet seems to pass over, when its motion is direct, or according to the order of the signs.

Arch of retrogradation, is an arc of the ecliptic, described while a planet is retrograde, and moves contrary to the order of the signs.

Arch between the centers is an arc, as \( \Delta I \) (Plate I. Astronomy, fig. 11.), falling from the center of the earth's shadow, \( A \), perpendicular to the moon's orbit, \( OB \), and meeting her center at the middle of an eclipse. See Eclipse.

If the aggregate of the arc between the centers \( \Delta I \), and the apparent semi-diameter of the moon, be equal to the semidiameter of the shadow, the eclipse will be total without any duration; if less, total with some duration; and if greater, yet less than the sum of the semidiameters of the moon and the shadow, partial.

Arch of position, or angle of position, is the same with the horary angle. See Position.

Arch of vision is the sun's depth below the horizon, at which a star, before hid in his rays, begins to appear again.

However, the quantity of this arch is not always the same; but varies with the latitude, declination, right ascension or declination, and distance of any planet or star. With respect to Venus, it is sometimes reduced to nothing, as she is sometimes invisible when near from the sun's position, and above the zodiac. From this, it would appear that the arch is a dilated arc.

Arches are used in large intercolummations of spacious buildings, in porticoes, both within and without temples; in public halls; as ceilings, the courts of palaces, cloisters, theatres, and amphitheatres. They are also used to cover the cellars in the foundation of houses, and under magazines; also as buttresses and counterforts to support large walls laid deep in the earth; for triumphal arches, gates, windows, &c.; and, above all, for the foundations of bridges and aqueducts, and they are supported by piers, buttresses, &c.

Arches are of several kinds, and are commonly denominated from the figure or curve of them, as circular, elliptical, cycloidal, cyotomy, &c. according to their curve, in the form of a circle, or ellipse, cycloid, catenary, &c.

There are also other denominations of circular arches, according to the different parts of a circle, or manner of placing them; thus,

* Semicircular arches, which are those that make an exact semicircle, having their center in the middle of the span or chord of the arch; called also by the French builders, perfect arches, and arches on plain centre. The arches of Wilmont bridge are semicircular.

Scheme arches, or skene, are those which are lks than semicircles, and are consequently flatter arches, containing 120 or 90 or 60 degrees; &c.; they are also called imperfect and diminished arches.

Ark of the third and fourth point, or Gothic arches, or, as the Italians call them, di terzo and quarto acuto, because they always meet in an acute angle at top, consist of two eccentric circular arches meeting in an angle above, and drawn from the division of the chord into three or four, or more parts at pleasure; of this kind are many of the arches in churches and other old Gothic buildings.

Elliptical arches usually consist of semicircles, and were formerly much used instead of mantles in chimneys, and are now much used, from their bold and beautiful appearance, for many purposes, particularly for the arches of a bridge, like that at Blackfriars, on account of their strength, beauty, convenience, and cheapness.

Straight arches are those which have their upper and under edges parallel straight lines instead of curves; these are chiefly used over doors and windows, and have their ends and joints all pointing toward one common center.

The term arch is peculiarly used for the space between two piers of a bridge, intended for the passage of water, boats, &c.

Arch of equilibration, is that which is in equilibrium in all its parts, having no tendency to break in any one part more than in another, and which is therefore safer and stronger than any other figure, the materials and all other circumstances being alike.

An investigation of the nature and property of arches of equilibration will be found in the following propositions and examples:

**Problem I.** (Plate VI. Architecture, fig. 1.) The nature of the curve ABD, forming an arch, being given to find the nature of the extrados or curve PSR, bounding the top of the wall APRD, supported by that arch, by the pressure or weight of which wall all the parts of the arch are kept in equilibrio.—1st. Let several equal right lines AB, BC, CD, &c. (fig. 2.) placed in a vertical plane, be movable round the angles A, B, C, D, &c. whilst the points A, G at the base remain fixed and immovable; through B, C, D, &c. draw the lines Bi, Cm, Dp, &c. perpendicular to the horizon, and complete the parallelogram BbCd, and make Cl = Bb, and complete the parallelogram Clmn. In like manner make Do = Con and Ek = op, Fr = rt, and complete all the parallelograms in the figure as at first.—2d. Let several weights which are to one another as the lines Bi, Cm, Dp, &c. be respectively on the points B, C, D, &c.; now the force BI is equivalent to Bb, Bc, acting in the directions BA, BC; the force BC is destroyed by the resistance of the point A, but Bc endeavour to move the point B towards C, in like manner the force CM is equivalent to Cl and Cn; the force Do to Dp, op, &c.; now the forces Bb, acting towards C, and Cl, acting towards B, being equal by construction, destroy one another; and in like manner the forces Cn and Dp, and En and Ft, &c. destroy one another; and the point G, being fixed, is it manifest the figure ABCD, &c. will not be moved by the incumbent weights Bi, Cm, Dp, &c. but all its parts will remain in equilibrio.—3d. The force Bc: force Bb or Cl :: sine 1/2 Bb or iBC: S, sine ABi = 1/2 S ABi

\[
\frac{1}{S \cdot iBC} \quad \text{or} \quad \frac{1}{S \cdot mCB'}
\]

Likewise the force Cl: force Cn or

\[
\frac{1}{S \cdot mCD} \quad \text{or} \quad \frac{1}{S \cdot pDC}
\]

and so on; whence it is plain, in general, that any force CI is as S \cdot zmCB; now since Cn = S Cln \times CI

\[
S \cdot mCD \times CI
\]

therefore the force Cm is as

\[
S \cdot BCx \times CI
\]

1. Now let the number of the lines AB, BC, CD, &c. be increased and their lengths diminished ad infinitum, that the figures may obtain the form of a curve, and the presure will then act on all parts of it; and the angle BCx will then become the angle of contact, and the lines of mCD and mCD become equal to the lines of mCD; therefore drawing the tangent An (fig. 5.); the pressure on any point A to preserve the equilibrium will be as the angle of contact at A directly, and the square of the line of the angle mAn reciprocally; but the angle of contact is as the curvature, or reciprocally as the radius of curvature, therefore the pressure is reciprocally as that radius, and the square of the line of that angle mAn. —2. Cor. 1. If a weight like a wall mPSR, be incumbent on the arch ABD, standing
ARCH.

ing in a vertical plane, and all the parts kept in equilibrio, then the weight $A_g$, on any point $A$, is as the curvature at $A$ directly, and the cube of the sine of $ATC$ reciprocally; $AT$ being a tangent at the point $A$, meeting the axis $BC$ produced in $F$; for the weight on the given part of the arch is as

$$C \cdot \frac{\text{S.A.T.C.}}{C},$$

$C$ being the curvature at $A$, and the weight of the column $Ag$ is as $Ag \times Ar = Ag \times Ar \times \text{S.A.T.C.} = Ag \times \text{S.A.T.C.}$, because $Ar$ is given; therefore $Ag \times \text{S.A.T.C.}$ is as

$$C \cdot \frac{\text{S.A.T.C.}}{C},$$

and $Ag$ as $C \cdot \text{S.A.T.C.}$ to keep the parts in equilibrio. — Cor. 2. If $R$ be the radius of curvature in $A$, then the weight $Ag$ is as $\frac{1}{R \times \text{S.A.T.C.}}$. — Cor. 3.

If $BC = x$, $AC = y$, $BA = z$, then $Ag$ is as $\frac{x^3}{y^2}$, where $x$ is constant; for $\frac{z}{x} : \frac{y}{z} = \text{AT} : \text{AC} = \frac{1}{x}$, and $R$ may be found by supposing either $\frac{x}{y}$ or $\frac{y}{z}$ given. If $\frac{x}{y}$ be given, $R = \frac{z^2}{x^2} \cdot \frac{x^3}{y^2}$, therefore $Ag$ is as $\frac{x^3}{y^2} \cdot \frac{x^3}{y^2}$.

Problem II. The nature of the curve $ABD$ (fig. 3.) being given for the figure of an arch to find the height $Ag$ of the wall infilling thereon, at every point $A$, so that all the parts shall remain in equilibrio. Draw the ordinate $AC$, and let $BC = x$, $AC = y$, Arch $BA = z$, $BS$ the height of the wall at the vertex $a$, and $R$ = rad. curvature in $A$, draw the tangent $AT$, which will be found from the nature of the curve; find the $S$, angle $ATC$; then take $Ag$ as

$$\frac{1}{R \times \text{S.A.T.C.}} \left(\frac{x^3}{y^2} \cdot \frac{x^3}{y^2}\right)$$

for the height.

Example I. Let $AB$ (fig. 4.) be the arch of a circle, radius $r$, $BC = x$, cot. $BC = c$, $BS = a$, then $c = S$.

ATC, whence $Ag$ is as $\frac{1}{r^3}$ or as $\frac{1}{c^3}$ which at $B$ is

$$\frac{1}{r^3},$$

therefore $\frac{r}{c^3} : a = Ag = \frac{ar^3}{c^3}$. Let $BO = ON$, $BS = a$ (fig. 4.). Then as rad. $r$ = cot. $BA = c$:: $BO = CO$ and $r^3 : c^3 :: BO^3 : CO^3$, where $r^3 = BO^3$ and $c^3 = CO^3$, and $\frac{ar^3}{c^3} = aBS$.

$$BO^3 = \frac{BS \times BS}{CO^3} = Ag = BS \text{ when } CO = BO,$$

and when $CO = a$, $Ag$ is infinite; hence $8gM$ is a curve running up to an infinite height towards $M$, the perpendicular $NM$ being an asymptote to it, and the curve is as accurately as represented in the figure, when the thickness $BS$ at the top is about 1.5th of the span diameter. If a circular arch, and a right line at the top was necessarily required, the proportion of $BS$ to the radius $BO$ may be found, so as the arch may be nearly in equilibrio thus:

—When $8g$ is a right line, then $SQ$ in the figure must be nothing, or rather when the curve crosses the horizontal line, then $SQ$ is equal to nothing. Now to find that point from the general equation:

$$Ag = \frac{ar^3}{c^3} = \frac{BS \times BS}{CO^3} = \frac{BS \times BS}{BO \times BO} = \frac{BS \times BS}{BO \times BO}.$$

Put $BC = x$, then

$$\frac{ar^3}{c^3} = \frac{ar^3}{c^3} = Ag.$$
by 56.01, cubed equal to 7.8248; if BC be equal to 10, AC will be equal to 10.368, and so on, whatever number BC be taken.

For the ellipsoid, let NABD (fig. 6.) be an ellipsoid with the longer axis NH horizontal and semitransverse NO = 48.29 semi-conjugate BO = 41.04 feet; then if we suppose AD to be the span of the arch ABD, its height BC will be 50 feet; and when AD = 83; nearly, let BS be taken = 6 feet. Then the general equation for any height AG of the wall is \[ \frac{BS \times BO}{CO^3} \]. Suppose BC = 10, then

\[ CO = 31.04, \text{ and AG in this case is equal to } \frac{6 \times 41.04}{31.04} = 13.86; \text{ again suppose BC = 20, then AG} = \frac{6 \times 41.04}{21.04} = 44.53, \]

and by cubing the value of CO for a denominator to the constant numerator, \( 6 \times 41.04 \), the value of AG in every point of the arch may be readily found.

For the method of determining the figure of the extrados of the parabola, hyperbola, and catenary, see Dr. Hutton's Principles of Bridges, sect. 2, from page 31 to 40. Emerson's Miscellanies, p. 156, &c.

**Problem III.** Having the form of the extrados given to find the intrados; that is, having given the form of the line bounding the top of a wall supported by an arch, to find the figure of that arch, so that by the pressure of the superincumbent wall, the whole may remain in equilibrium. When the extrados is an horizontal line, Dr. Hutton and Mr. Emerson have both determined the nature of the curve, and calculated tables for constructing it, where the height, the span, and the thickness at the crown are given. Dr. Hutton supposes the span NH = 100, height BO = 40, and the thickness BE at the crown = 6. Put a or BE = 6, b or NO = OH = 50, and r or BO = 40. Then the equation of the curve is thus expressed:

\[ y = b \times \text{hyp. log. of } \frac{a + x + \sqrt{2ax + x^2}}{a} \]

Then the corresponding values of ED and DA, or horizontal and vertical lines, will be as in this table.

</table>

**TABLE for constructing the curve of equilibration.**

The chief properties of arches of different curves may be seen in sect. 2. of Dr. Hutton's "Principles of Bridges," above quoted. It there appears that none, except the mechanical curve of the arch of equilibration, can admit of a horizontal line at top; that this arch is of a form both graceful and convenient, as it may be made higher or lower at pleasure, with the same span or opening; that all other arches require extrados that are curved, more or less, either upwards or downwards; of these, the elliptical arch approaches the nearest to that of equilibration for strength and convenience; and it is also the best form for most bridges, as it can be made of any height to the same span, its hinges being at the same time sufficiently elevated above the water, even when it is very flat at top. Elliptical arches also appear holier and lighter, are more uniform in form, and are much cheaper than most others, as they require less materials and labour. Of the other curves, the cycloidal arch is first in quality to the elliptical one for these properties, and lastly the circle. As to the others, the parabola, hyperbola, and catenary, they are quite inadmissible in bridges of several arches; but may, in some cases, be employed for a bridge of one single arch which may be intended to rise very high, as in such cases they are not much loaded at the hinges. The weight of the arch, the pressure on the abutment, &c. &c. will all be considered under the article Bridge.

**ARCH.**

In buildings, is a number of stones placed together over a hollow space, in the form of some curve, as a part of a circle, of an ellipsis, a parabola, hyperbola, &c., having the joints so formed that it is supported without falling, by the piers or abutments from which it springs. Of circular and elliptical arches, some confit of semicircles or semiellipses, others are composed of segments of these curves.

Arches are chiefly used for bridges, entrances to cities and large buildings, and in general for the covering of any very large opening in walls; as also for smaller apertures, as doors, windows, &c.

The decoration of arches is various according to the nature and delineation of the building, but it generally consists of mouldings surrounding the curve, called an archivolt.

For the application of arches to particular purposes, see Bridge, Triumphal Arch, Gate, Door, Window, Dome, Vault.

**ARCH, triumphal,** is a gate or passage into a city, built of stone or marble, and magnificently adorned with architecture, sculpture, inscriptions, &c., serving not only to adorn a triumph at the return from a victorious expedition, but also to preserve the memory of the conqueror to posterity.

These arches were at first very simple, being built of brick, such as that of Romulus; or of roughly hewn stone, as that of Camillus; and they were also for a long time of a semicircular figure, and hence called "fornices" by Cicero. In process of time they acquired a greater degree of magnificence; and they were constructed of the finest marble, and of a square figure, with a large arched gate in the middle, and two small ones on each side, adorned with columns and statues, and various figures executed in sculpture. From the vault of the middle gate hung small winged images of victory, with crowns in their hands, which they let down on the victor's head as he passed in triumph. This kind of magnificence commenced under the first emperors; so that Pliny (H. N. xxxiv. 6 p. 12) calls it "novenium inventum." During the time of the republic, arches were appropriate to generals who obtained victories over
over the enemies of Rome; and none were erected in honour of the dead. But when Augustus became emperor, this was one species of adulation that was rendered him; and the Roman Senate proposed to him to have a triumphal arch erected in honour of Nero Drusus who died in Germany. He approved the proposal; and an arch of marble, adorned with trophies, was erected on the Via Appia. Caligula was the second on whom this honour was conferred after his death by the Pisans, to whom he had lent a colony. Germanicus was the third. This honour was afterwards extended to women; which Dion considers as an evidence of the degeneracy and fertility of the Romans: it was granted to Livia after her decease.

Antiquarians have reckoned 36 triumphal arches in Rome. The most celebrated of the ancient arches now remaining at Rome, are those of Titus, of Septimius Severus, and of Constantine; of which we have figures given us by Des Godetz.

The arch of Titus, placed between the forum and the colonnade, was erected, as some have thought, by the Senate and Roman people, to Titus and his father Vespasian, in honour of their victories; but it was more probably dedicated to Titus after his death and apotheosis, as the epitaph "divo," applied to him in the inscription still extant, signifies; and its chief design seems to have been to commemorate the conquest of Judea, and the destruction of Jerusalem. The frieze of this arch, which is of the Composite order, is supported by two columns, and upon it is represented the triumphal procession of Titus, including a figure of the river Jordan, with captives and animals, as well as instruments of sacrifice, in sculpture. On the inner sides of the arch are two bas-reliefs, one of which exhibits the emperor drawn in his triumphal car, drawn by six horses; the latter accompany the chariot; and victory follows, holding in her left hand a branch of palm, and in her right hand a crown of laurel over his head: the horses are conducted by a figure representing the city of Rome, with a helmet and spear; and she is followed by magistrates, &c. bearing branches of laurel. The other bas-relief represents the table of flour, the trumpets, the golden candelabrum, the flowers, the garlands, the fountains, the tables of the law, the ark of the covenant, and other utensils, brought as spoils by the conqueror from the temple of Jerusalem.

The arch of Septimius Severus was erected by the Roman people, as the inscription intimates, in honour of his victory over the Parthians and other barbarous nations, that were enemies of Rome. This arch stands near the back part of the Capitol, and though it is much sunk in the earth and mutilated, several bas-reliefs are still distinguishable. On the two sides of the vault of the grand arch are two winged victories bearing trophies, two genii with perfumes, flowers, and fruits, symbolical of the provinces subdued by Septimius, and four rivers. Eight fluted columns, of the Corinthian order, support the frieze that bears the inscription. A florid case of marble led to its summit, on which were placed Caracalla with his father and brother, in a triumphal chariot drawn by six horses, and at their sides ranks of soldiers who accompanied the triumph. The inscription imports that this arch was erected in honour of Marcus Antonius, as well as of S. Severus, "in acknowledgment of the reparation of the fakity of the Hiate, and the aggrandizement of the Roman empire, by their valor and eminent virtues."

The arch of Constantine informs almost entirely, and is much the finest of the three. It was erected by the Senate and Roman people in honour of Constantine after his victory over Maxentius, and stands in the Appian Way at the junction of the Cælian and Palatine mounts. The inscription on both arches of the architrave imports, that it was dedicated to the emperor Cæsar Flavius Constantinus Augustus, the greatest, the pious, and the happy: because, by a divine impulse, the greatness of his courage, and the aid of his army, he avenged the republic by his just arms, and, at the same time, rescued it from the tyrant and his whole faction."

On one side of the arch are the words "Liberator urbis," to the deliverer of the city; and on the other, "Fundatoris quietis," to the founder of public tranquility. Antiquarians have observed that some of the bas-reliefs, and other carvings upon this arch, appear to have been borrowed from the forum of Trajan, and that they represent that emperor's victories over the Daedaeans. This was the case with respect to the eight mutilated statues, whose heads were Lorenzo de Medicis broke off and conveyed away to Florence. This theft might not, perhaps, have been so notorious to posterity, if the arris of Constantine's time had not added some figures which make the fraud apparent, and by their maimed inferiority enliven the great decline of the arts in the interval between the reigns of those emperors. Although the decree for erecting this arch was, without doubt, passed immediately after the defeat of Maxentius, it appears from the monument itself, that the building was not finished and dedicated till the tenth year of Constantine's reign, or the year of Christ 315 or 316.

Triumphal arches were not confined to Rome and its environs. Two arches, with statues of the natural size, were erected on the Flaminian way, one on the bridge of Tiber, and the other at Rimini, in honour of Augustus, who made this way from Rome to Rimini; and another arch was constructed on the summit of Mount St. Bernard in the Alps, in honour of the victory which Augustus obtained over the inhabitants of those mountains. The triumphal arch of Ancona was erected in honour of Trajan, the emperor Plotina and her sister Marciana. One of the gates of Orange is a triumphal arch of C. Marius, supposed to have been erected in honour of the victory obtained by him and Catulus over the Teutones, Cimbri, and Ambraones. The gates, Peyro at Montpellier, and of St. Denis, St. Martin, and St. Antoine, at Paris, may also be reckoned triumphal arches of the moderns.

For China, triumphal arches are very numerous. They are erected not only in all the cities, but on the mountains and eminences along the roads; and were originally designed for the commemoration of their illustrious heroes, such as princes, generals, philosophers, and ministers of state. The number is computed to exceed 1000, among which there are nearly 200 of exquisite beauty and grandeur. Some few, less noble and beautiful, are erected to their most distinguishes females. The height of these arches is commonly between 20 and 25 feet, and they are decorated with figures of men, gods, and birds, placed in various attitudes, festoons and other ornaments, which are but indifferently carved; but in some the reliefs are so bold, that they seem to be separated from the work.

Arch, Mural. See Mural.

Arch, in the Scripture History. See Ark.

Arch, or Arca, in Geography, a small town of Germany in the Tyrol, seated on the Sarca, with a citadel standing on a mountain. It is the capital of a county, founded in 1413 by the emperor Sigismund. It is distant five leagues south-west from Trent, and twelve north-west from Verona.

Arch, or Arcus, formed of arcus, arcus, whence arcus, arcus, chief, is also a term without any meaning of itself, but which becomes very significant in composition with other words; as it heighen and exaggerates them; and has the force of a superlative, to shew the greatest degree or eminence of any thing.

Vol. II. 4 K
Thus we say, arch-bishop, arch-treasurer, arch-angel, arch-evangel, arch-heretic, &c. to denote such as have a preeminence over others. So also arch-king, arch-chaplain, &c. to express folly and knavery in the utmost degree.

In English, we usually cut off the final i, from archi, though with very ill effect, as the words with which it is joined sound much harder on that account, than they would do, were it preferred entire, as in its own mother tongue.

ARCHABIS, in Ancient Geography, a river of Asia, in the territory of Colchis, which, according to Arrian, discharged itself into the Circene fa.

ARCHAD, or Archad, was built by Nimrod after he had founded Babylon, from which it was not far distant. Bocchare supposed that it was sited on the banks of the Arquad, which flowed by the walls of Sitace; and indeed he suggests that they were the same city under different names.

ARCHADIA POLIS, an epithet of Asia, mentioned in the fifth council of Constantinople.

ARCHELA, the name of a city of Asia, in the district of Eolis, according to Pausanias.

ARCHEOGRAPHIA, the art of describing or explaining antiquities. See ANTIQUE.

ARCHENOPOlis, a city of Asia Minor, in Ionia, according to Pliny, in whole time it was destroyed, after having been often rebuilt. It was also called Cobe, Sipyrum, and Lebade.

ARCHENPOLIS, a town of the territory of Colchis, and metropolis of Lazica, seated, says Procopius, on a barren hill, and watered by a river that flowed from an adjacent mountain.

ARCHILEOTA, a keeper of ancient records.

ARCHIEUS. See ARCHUS.

ARCHAIS, properly denotes a phrase or dictum now obsolete and out of use, though anciently deemed good, or passable.

ARCHAISM, etymologicus, archasismus etymologicus, is when either an obsolete word, declension, or conjugation, is used.

ARCHAISM, syntacticus, archasismus syntacticus, is an unusual and obsolete construction in discourse.

ARCHAMA, in Ancient Geography, a town of Cappadocia, in the state of Cilicia, according to Ptolemy.

ARCHANDROPOLIS, a city of Egypt, according to Herodotus and Stephan. Byz. but not mentioned by Ptolemy, and probably not existing in his time.

ARCHANGEL, compounded of the Greek αρχας, prince, and αγγελός, angel, an intellectual subsance or angel, placed in the ninth order among the blessed spirits which compose the celestial hierarchy. See ANGEL.

The scripture (says lord King, Prim. Church. p. 735) mentions but two orders of angels; viz. archangels, preceding the angels; and the angels, obeying and attending on the archangels. Indeed, we have no account in scripture but of one exalted spirit, and anciently styled archangel (see 1 Theff. iv. 16.); though it is not improbable that as there are different degrees of glory in the celestial state, there may be different ranks, and corresponding denominations and offices among these superior beings.

ARCHANGEL, in Botany. See LAMLIUM.

ARCHANGEL, brown-leaved. See MELITIS.

ARCHANGEL, yellow. See GALEOPSIS.

ARCHANGEL, in Geography, a sea-port town of Russia, and capital of the government to which it gives name. This government is bounded on the north by the Frozen Ocean, on the east by the government of Tobolsk, on the south by the governments of Oolonetz and Vologda, and on the west by the White Sea and the dominions of Sweden. It was formerly included in the government of Vologda, but separated by a late partition of Catherine II. Accordingly it contains 5 districts; viz. Archangel, on the Dvina, about 70 versts from its mouth; Kolomjorion, on the Dvina; Schenkursk, on the river Vaga; Pinsk, on the right side of the Dvina, where the river Pomga falls into it; Oenga, on the river Oenga, in Ruffian Lapland; Kola, on the river Kola, near the bay of Kola, in the frozen Ocean; and Melein, on the river Melen, falling into the frozen Sea. The town of Archangel is sited on the river Dvina, near its mouth, where it forms the gulph of Archangel in the White Sea. It was discovered in 1773, on occasion of the first entrance of the English for opening a trade with Russia, by Richard Chancellor, who, under Sir Hugh Willughby, had the command of a small fleet of 13 ships, defiling for deliverance a northward passage to China and India. Two of these ships were forced by fogs of weather into the bay of the river Arzina, in Ruffian Lapland; and Sir Hugh Willughby, together with both crews, were frozen to death. Chancellor, discovering the country bordering on the White Sea, landed near the mouth of the Dvina, in a bay which he denominated the bay of St. Nicholas, from a convent near the present port of Archangel. Soon after this, the tsar Ivan Vassilevitch II. caust the harbour of the Archangel Michael to be constructed; granted several privileges to the English nation; and thus grew up at length the trading port of Archangel: the commerce from mercantile, and with some occasional interruptions, Archangel continued the sole port for the exports and imports of Russia, until the building of St. Petersburg, when Peter the Great removed the commerce of the White Sea, to the havens of the Baltic. From 1691 to 1701, the exports, on a yearly average, amounted to the value of 1,174,251 pounds sterling; whereas the imports from England were limited at only 58,884 pounds sterling. The revenue of the crown at Archangel amounted annually to about 100,900 rubles; a sum which, according to the value of money at that time, may be deemed very considerable. The principal articles of export were then potatoes, caviar, tallow, wax, hides, hemp, feathers, tar, yarn, beef, rharbar, silk (probably Chinese and Persian), cork, bacon, cordage, furs, bristles, &c. all rough commodities. In 1752, Elizabeth again restored the ancient immunities of Archangel, and its present trade is not inconsiderable. To the former articles of exportation, several others of importance are added, such as corn, linen, iron, flax, tar, oil, tallow, tar, hemp, coarse linen, cordage, hides, masts, tallow, which are mostly conveyed by the Dvina: and it also forms a principal communication with the northern and western parts of Siberia, whence furkins and iron are procured. A ship goes every year from Archangel to winter at Spitzbergen; and at least one frequently goes to Novaya Zemlia, for the benefit of the fishery.

From a flattening of the port-du-taxes, given by Mr. Tooke for 1773, it appears that the imports of Archangel amounted to 281,747 rubles, 63 kopecks; its exports to 1,367,926 rubles, 58½ kopecks; and duties to 144,914 rubles, 84½ kopecks. The water of the sea near Archangel is so briny, that quantities of sea-salt are prepared from it, though that of the White Sea in general contains proportionably but little salt. The fishery here, and on other parts of this sea, is very considerable, particularly of fockfish, herrings, whales, morles, porpoises, sea-dogs, &c. The dock-
dox-yards of Archangel are not in the town, but at the distance from it of five versts, on an island in the Dvin, named Solombol, which is pretty large, and inhabited by people belonging to the town. The ships are built in docks, and then launched from the stocks; and the timber of which they are constructed is that of the larch-tree, which is very cheap: a quantity sufficient for a ship of 60 guns costs there, if carefully and honestly purchased, somewhat more than 5000 rubles. The oak timber, which is used for particular parts of the vessel, is brought thither from the precincts of Catan.

In the government of Archangel, and particularly in the southern parts, the breeding of cattle is carried on with great success; and every where about the town there is a fine breed of large cows, brought originally from Holland, and which are not found in the kaff to degenerate. In the district of Archangel is also found a good kind of poney, fleet and lanky; but the genuine breed begins to be rare.

Mr. Coxe informs us, that the most honest and intelligent persons of the mercantile and trading order among the Russians are the inhabitants of Archangel and its environs: most of them are able to read, write, and call accounts: many of them are much employed at Petersburg by the members of the British factory, to superintend their warehouses, and they have the general character of industrious and faithful servants. This ingenious traveller traces the dilligent character of the inhabitants of Archangel and its environs, to this town's having been, during a considerable period, the great emporium of Russia; so that many of them, being connected with foreign merchants, who required great exactness in their dealings, were gradually trained to business. By a kind of local enthusiasm, and traditional instruction, they have continued to distinguish themselves among their countrymen, by acquiring the rudiments of arithmetic, and by a diligent discharge of their trust. Archangel is situated in N. lat. 64° 34'. E. long. 38° 55'.

ARCHANGELICA, in Botany. See Angelica.

ARCHANGELICA, in Entomology, a species of Aphis, found on the plant Angelica Archangelica, and described by Scopoli: it is black, beak and abdomen greenish. Gmelin.

ARCHANGELSKOJ, in Geography, a town of Siberia, in the government of Ikutzak, at the conflux of the Tungus and the Oka, 116 miles north-west of Udiak. N. lat. 59° 20'. E. long. 101° 47'.

ARCHARD, in Commerce, a kind of green fruit, pickled in vinegar, and much valued throughout the East Indies.

The bell are those brought from Persia, in bottles, much like small cucumbers among us.

ARCHASIA, in Entomology, a species of Papilio found in Java. The wings are dentated, brown, with a common fulvous band, the first half of which is blue on the anterior wings. Gmelin. Giff. This author is indebted to Fabricius for his description, and by him this species is called Arcisia. It is the same fize as Papilio Atalanta.

ARCHBISHOP, Archiepiscopus, a metropolitan prelate, having several suffragan bishops under him.

Archbishops were not known in the East till about the year 320; and though there were some soon after this who had the title, yet that was only a personal honour, by which the bishops of considerable cities were distinguished. It was not till of late that archbishops became metropolitans, and had suffragans under them.

Athanasius appears to be the first who used the title archbishop, which he gave occasionally to his predecessor.

Gregory Nazianzen, in like manner, gave it to Athanasius; not that either of them was entitled to any jurisdiction, or any precedence, in virtue of it.

Among the Latins, Idoreo Hifpalensis is the first that speaks of archbishops. He distinguishes four orders or degrees in the ecclesiastical hierarchy, viz. patriarchs, archbishops, metropolitans, and bishops.

In the fourth century, when Constanitine the Great modelled the ecclesiastical government according to the civil, new gradations of eminence and rank were introduced among the bishops, corresponding to those that were established in the late. Before this period, three prelates seem to have enjoyed a certain degree of pre-eminence above the rest of the episcopal order; these were the bishops of Rome, Antioch, and Alexandria; and to these the bishop of Constantine was added, when the imperial residence was transferred to that city. These four prelates answered to the four prorogate prefects-created by Constanitine; and it is possible that in this century they were distinguished by the Jewish title of patriarchs. After these followed the exarchs, who had the inspection over several provinces, and answered to the appointment of certain civil officers who bore the same title. In a lower class were the metropolitans, who had only the government of one province, under whom were the archbishops, whose inspection was confined to certain districts; but in this gradation the bishops brought up the rear. Moh. Eccl. Hist. v. i. p. 349. See Bishop.

ARCHBISHOPPRICK, Archiepiscopatus, the dignity of archbishop, or the province under his jurisdiction.

There are now two archbishopricks in England; viz. of Canterbury and York; the prelates whereof are called pri- mates, and metropolitans; with this only difference, that the former is called primate of all England, and the latter, simply, primate of England.

The latter yields likewise in prerogative and jurisdiction to the former. The archbishoprick of York extends over the counties of Northumberland, Durham, Cumberland, Westmoreland, Chefiire, Lancashire, and the Isle of Man, besides its proper and peculiar diocese of the greatest part of York- shire and Nottinghamshire. That of Canterbury comprehends the other counties, and has its peculiar diocese, being a great part of Kent. The archiepiscopal office is then a dignity above a jurisdiction; and the primates rarely interfere in any dioceses except their own. They are appointed by the king, in the same manner as the bishops, by what is called a congé d’eüire.

The archbishop, before the inspection of the bishops and inferior clergy in the province over which he preaches, exer- cises episcopal jurisdiction in his own diocese. As arch- bishop, he, upon receipt of the king’s writ, calls the bishops and clergy of his province to meet in convocation; but he cannot assemble them without the king’s writ. To him all appeals are made from inferior jurisdictions within his province; and, as an appeal lies from the bishops in person to him in person, so it also lies from the consistory courts of each diocese to his archiepiscopal court. He is guardian of the spiritualities of any vacant see in his province, as the king is of the temporalities; and exercises ecclesiastical jurisdiction in it. He is entitled to present by lapse to all the ecclesiastical livings in the disposal of his diocesan bishops, if not filled within six months. He has likewise a customary prerogative upon consecrating a bishop, to name the papal, dean, or chaplain to be made for by such bishop; in lieu of which it is now usual to accept an option. He is said to be enthroned when vested in the archbishoprick; whereas bishops are said to be installed.

4 K 2 Arch-
ARCHBISHOPRICS, as well as bishoprics, may become void by death, deprivation for any gross and notorious crime, and reformation, wherein, on the part of an archbishop, must be made to the king himself. When an archbishopric is vacant, the dean and chapter are the spiritual guardians, ever since the office of prior of Canterbury was abolished at the Reformation.

The archbishop of Canterbury had formerly, viz. till the year 1538, jurisdiction over all lands as well as over England, and was also a patriarch, and functionary auctoris archiepiscopi, and archiepiscopi Britanniæ pontificis. Matters were done and recorded in his name thus, anno pontificatus regis primus, &c. The first archbishop of Canterbury was Anhelm, appointed by King Ethelbert, on his conversion to Christianity, about the year 598. He also called legatus primus. See Legate. He even enjoyed some secular marks of royalty, as to be patron of a bishopric, which he was of Rochester; and to make knights, coin monies, &c. He is still the first peer of England, and the next to the royal family; having precedence of all dukes, and all great officers of the crown. It is his privilege, by custom, to crown the king and queens of this kingdom. He may retain and quality eight chaplains; whereas a duke is by statute allowed only six.

He has, by common law, the power of probate of wills and testaments, and granting letters of administration.

He has also (by Statute 25 Hen. VIII. c. 21) a power to grant licences and dispensations in all cases formerly fixed for in the court of Rome, and not repugnant to the law of God. He accordingly issues special licences to marry, to hold two livings, &c.; and he exercises the right of conferring degrees.

He is addressed with the title of Grace, and Most Reverend Father in God; and writes himself by Divine Providence; whereas bishops only use by Divine Permission.

He also holds several courts of judicature; as court of arches, court of audience, prerogative court, and court of peculiar.

The archbishop of York has the like rights in his province, as the archbishop of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor. He has also the right of a count palatine over Hexhamshire.

The first archbishop of York was Paulinus, appointed by pope Gregory about the year 622. He had formerly jurisdiction over all the bishops of Scotland; but in the year 1479, pope Sixtus the IV. created the bishop of St. Andrews, archbishop and metropolitan of all Scotland.

ARCH-BUTLER, Archipincerna, the great butler or skinner of the empire.

The king of Bohemia is archibutler; and his business as such is to present the first cup at an imperial entertainment; but he is not obliged to officiate with his crown on.

He has other prerogatives, are, that he precedes all other temporal electors; walks in procession immediately after the emperor, the empress and the electors of Münster and Cologne following next; and in the electoral college he has the third voice, &c. He has for vicar or deputy the hereditary prince of Limbourg.

ARCH-CHAMBERLAIN, Archicamerarius, an officer of the empire; much the same with what in England we call great chamberlain.

The elector of Brandenburg is archchamberlain of the empire, being so appointed by the golden bull; and in that quality, he bears the sceptre before the emperor, which he bears in his coat of arms, walking on the left hand of the elector of Saxony. At some solemnities he also serves on horseback like other electors, carrying a baionet with a towel in his hands; which, slighting, he sets for the emperor to walk. He may proceed with reference to his seat, principalities and towns, as with royal rights; and at his own pleasure impose new tolls, and erect mills on all the rivers.

He has his vicar, or subarch-chamberlain, who is prince of Liebenzell, of the house of Brandenburg, and also bears the sceptre in his arms.

ARCH-CHANCELLOR, Archichancellarius, a great chancellor who anciently presided over the notaries, that is, the secretaries of a court.

This office chiefly obtained in France, under the second races of their kings; and afterwards under the empire, as they had three electors, viz., Germany, Italy, and Arles; they had three arch-chancellors, and hence the three arch-chancellors still subsisting in France; the archbishop of Münster being arch-chancellor of Germany, the archbishop of Cologne of Italy, and the archbishop of Treves of Arles.

The arch-chancellor of Germany is also a dematous director, and also dean or dean of the electoral college. To him it belongs to notify the demit of a Roman emperor to the his co-electors, to pass the diet, to administer the oath of election to the whole body of electors or their envoys, to collect their voices, to proclaim the election, and also to anoint the elected emperor, when the coronation happens within his diocese. At the diet he bears the general direction, in which he acts without control; and before him or his envoys all the states of the empire, as well as of foreign princes, legitimate themselves. He names the vice-chancellor of the empire, or an able vice-chancellor, who is obliged to take an oath to him as well as to the emperor. He also app. into all the chancery officers of the empire, and has supreme jurisdiction over them, and also the inspection of its archives. By him the emperor cautions the aulic council of the empire to be visited. The arch-chancellor of Italy has the second voice at an election of a king of the Romans; and when the emperor is crowned at Aix-la-Chapelle, and in the archbishopric of Cologne, the right of performing the coronations belongs solely to him.

The arch-chancellor of the holy Roman empire in Gaul and Arles is at present only a bare title, without any power belonging to it. At an election of a king of the Romans, he has the first voice, and concomitantly precedes the elector of Cologne.

Bern. de Mallinor, in an express treaty De Archibancelliaris Imperii Romanici, shews that these three archbishops were arch-chancellors before they were electors.—We also read of arch-chancellors of Burgundy, &c.

ARCH-CHANTOR, Archichantor, the chief or president of the clantors of a church.

ARCH-COUNT, Archibonomes, a title anciently given to the Earl of Flanders, on account of his great power and riches.

ARCH-DEACON, Archichadseus, a church officer vested with ecclesiastical jurisdiction over the laity and clergy, next after the bishop, either through the whole diocese, or only a part of it.

He is usually appointed by the bishop himself, and hath a kind of episcopal authority, originally derived from the bishop, but now independent and distinct from his. He therefore visits the clergy, and has a separate court for punishment of offenders by spiritual censures, and for hearing all other causes of ecclesiastical cognizance.

The archdeacon, sometimes also called arch-levee, was originally the first and eldest of the deacons who attended on the bishop: whence his name.

But as the archdeacons, in their original institution, had no
no relation to the diocese, but only to the episcopal see, as it was by feudal right and degree. They attained to the power and honours enjoyed. At their first institution, their proper duties was to attend the bishop at the altar; to direct the deacons and other inferior officers in their several duties, for the orderly performance of divine service; to attend the bishop at ordinations; and to fill him in the management of the revenues of the church; but without any thing that could be called jurisdiction in the present sense of the word, either in the cathedral or out of it. Gibbon.

An archdeacon was not known before the council of Nica; his function has since become a dignity; and even set above that of priests; though anciently it was quiet otherwise. The archdeacon was the bishop's chief minister, for all external concerns, and particularly the administration of the temporalities. He took care that order and decency were observed in divine service; looked to the ornaments and utensils of the church; had the direction of the poor, and inspection of the manners and behaviour of the people: for which reason he was called the bishop's heart and eye; clavis ecclesiae, & cor ecclesiae. The archdeacon was the judge of priests, who had only spiritual functions. But he had no jurisdiction over them till the sixth century; though by that time he was become superior to the archimandrite, or rural dean.

In the tenth century, archdeacons were considered as having jurisdiction in their own right, or attached to their office; with a power of delegating it to others. But from that time measures were taken to lessen their power, by increasing their number. He whose diocese lay in the capital city, took the quality of great arch-deacon.

We have sixty archdeacons in England: their office is to visit every two years in three, to inquire into the reappings and moveables belonging to the church, reform abuses in ecclesiastical matters, and bring the more weighty affairs before the bishop: besides which they have also a power to confound, excommunicate, and in many places to prove wills, and in some to institute to benefices.

It is one part of the archdeacon's office to induce all clerks into their benefices within his jurisdiction; and, by the act of uniformity, he is now obliged to be in priest's order.

Many archdeacons, in old foundations, have, by prescription, their courts and officials, as bishops have. Archdeacons are commonly given by bishops, who do therefore prefer to the same by colation; but if an archdeacon be in the gift of a layman, the patron does present to the bishop, who substitutes in like manner as to another benefice; and then the dean and chapter do conduct him, that is, after some ceremonies, place him in a stall in the cathedral church to which he belongs, whereby he is said to have a place in the choir.

Arch-fabulac, archifabulacienus, the first or chief among the fabulacens, as the archdeacon is among the deacons. In some copies of the Roman ordinal, he is called fabularchideaconus.

ARCHI DRUID, archidruideus, the chief or pontiff of the ancient druids in a nation.

ARCHDUKE. Archidux, a duke vested with some quality, pre-eminence, and authority, above other dukes. The archduke of Austria is a very ancient title. There have also been archdukes of Lorraine and Brandenburg. Austria was erected into a marquisate by Otho I. in favour of his brother-in-law Leopold, or by Henry V in 944, who is said to have bestowed it on Leopold, called the "illustrious," and the first that brought the Austrian countries as an inheritance to his polity, under that dignity; and it was raised into a duchy by Frederic I. in 1156; but we do not well know when, or why, the title archduchy was given it. It is commonly maintained, that Frederic III. called the "Pacific," erected it into an archduchy for his son Maximilian, about the year 1477. Others say, that the title was conferred by the same emperor on Philip, the son of Maximilian; and that he was the first of the Hapsburg family distinguished by the appellation of Archduke. However this be, it is certain, that it has been uniformly used since the fourteenth century, and that considerable privileges are annexed to it.

The principal privileges of this state are, that the archduke shall distribute justice in his own dominions, without appeal; that he shall be judged to have received the investiture of his states, after having demanded it three times; and that he cannot be deprived of his countries, even by the emperor, and the states of the empire: that no affair of the empire can be concluded without his participation; and that he has a power of creating counts, barons, and gentlemen, throughout the whole empire; which are privileges to which the other dukes of the empire are entire strangers. Besides, he is a privy-councillor of the emperor; all attempts against his person are punished as crimes leve majestatis; he is exempt from challenge to single combat; may sit at the assemblies, or be absent, at pleasure; and he has the privilege of being exempt from contributions and public taxes; and ranks immediately after the electors. His subjects cannot be summoned out of his province, upon account of law-suits, or to give evidence, or to receive the investiture of fees; any lands of the empire may be alienated in his favour, even thole that are feudal; in the succession to his states, the right of birth takes place, and upon the failure of males, the females succeed according to the lineal right; and if no heir be found they may dispose of their lands, as they please.

Arch-mansteries, archimanofterium, an appellation sometimes given to the greater monasteries and abbeys.

Archanatry, archanatarius, the primicerius, or chief of the notaries.

This office is supposed by some to have differed from the arch-chancellor, though wherein the difference consists does not appear.

ARCH, πράξις, is a Greek word, importing the beginning.

ARCH, among Physicians, is the beginning or first period of disease.

ARCHE, L, in Geography, a town of France in the department of the Corrèze, and chief place of a canton, in the district of Brive, two leagues south-west of Brive.

ARCHED fountain. See FOUNTAIN.

ARCH, or, or, a, in Architecture, is used to denote a flat arch, less than a semicircular one.

ARCHED legs, is an imperfection in a horse, when being in his natural position, his legs bent forwards; so that his whole leg makes a kind of arch or bow.

This usually arises from excessive labour, whereby the back-bones are made to shrink up, so that the legs remain arched, and naturally tremble after a little riding; though the disorder is natural to some horses.

ARCHEGENTES, formed of apex, chief, and vapor, to conduct, in Mythology, a title of Apollo, under which he had an altar and worship in the ile of Naxos. The coins of this island bore a figure of Apollo's head with this appellation. In the island of Malta, H-resules had the same title, whither his worship was brought from Tyre.

ARCHERION, a name given by the Greeks to the most retired and secret place of their temples, where were deposited...
ford the richest treasurers pertaining to the duties, to whom they were consecrated, and also other valuable articles which they were devious of preserving secure. The Romans initiated the Greeks in this respect, and lodged their public treasure in the temple of Saturn.

ARCHELAUS, in *Ancient Geography*, a town of Cappadocia. Pliny says, that it was a Roman colony, and that it was near the river Halys.—Ato, a city of Judæa built by Archelaus, son of Herod the Great, before his exile. Probable place: it is the well of Jericho, and the Ptolemaic tables fix its situation between Jericho and Scythopolis.

ARCHELAUS, in *Biography*, a Greek philosopher, was born either at Miletus or at Athens. He was a disciple of Anaxagoras at Lampæus, occupied the chair of that philosopher after his death, and may be considered as the last preceptor of the original Ionic school. Afterward he removed to Athens, and with him the Ionic school was removed thither. Here he acquired distinguished reputation by publicly teaching the doctrines of Anaxagoras concerning natural bodies; whence he was denominated the natural philosopher. Among the tenets ascribed to him are the following: that similar parts were the material principles of all things; that the superintending mind, by collecting and uniting these, formed natural bodies; that the universe is infinite; that heat is the cause of action, and cold of rest; that the earth was originally a muddy mass, from which living animals were produced and nourished; and that animals have souls, differing in their powers according to the structure of the bodies in which they reside. In ethics, it was his fundamental principle, that there was in nature no essential distinction between right and wrong, but that it resulted from positive institution, and consequently that all actions were indifferent, till human laws declare them to be good or evil. This doctrine, so subversive of all moral obligation, gained little credit at the time it was proposed; and it has had few advocates either in ancient or in modern times. Amongst the scholars of Archelaus, who were numerous, Socrates was eminently distinguished; and under him philosophy assumed a new character. Diog. Laert. l. ii. § 17. T. ii. p. 89. Cic. Tufcul. Quæst. l. v. c. 4. T. ii. p. 454. ed. Olivet. Plut. de Plat. Philo. l. i. c. 3. T. ii. p. 876. August. de Civ. Det. l. xiii. c. 2. Sidus. Bruck-er's Hist. Phil. by Essef, vol. i. p. 133.

ARCHELAUS, a Chaldean, was bishop of Mefopotamia, and flourished under the emperor Probus, about the year 282. Of the author and authenticity of the work against the Manichees, entitled *The Acts of the Disputation of Archelaus with Mani or Manicheus,* ascribed to him by Jerom and others, and said to be written in the Syriac language, many different opinions are entertained. Ptolæus, on the authority of Heraclian, bishop of Chalcedon, ascribes it to Hegemonian; and hence Cave and others have been induced to consider Hegemonian as the translator. Fabricius conjectures, that this author, whose age is unknown, published an abridgment of the work of Archelaus. Dr. Lardner, who with his usual accuracy and impartiality has examined and weighed the evidence on this subject, inclines to the opinion of Beausobre, who thinks, that this work was originally written in Greek, near the end of the third or beginning of the fourth century; and that it contains some truths digested and mixed with manifest falsehoods. It was edited from a manuscript of the Latin translation found at Cæsarea, and from some fragments of the Greek in Cyril and Ephremius, by Zacagni, in his *Collectanea Monumentum Vet. Rom.* in 1698. The writer's respect for the scriptures now commonly received, says Lardner, is manifest from his very numerous and frequent quotations of them as decisive and of authority in all disputed points of religion. Cave, Bibl. Lit. vol. i. p. 142. Fabr. Bibl. Graec. l. v. c. ii. p. 31. T. v. p. 352. Lardner's Works, vol. i. p. 269.—74.75

ARCHELAUS, king of Judæa properly so called, together with Samaria and Idumæa, was the son of Herod the Great by Martaæ his fifth wife, and appointed by his will to succeed him in the 14th year of Christ, or the 65th year before the vulgar era. Notwithstanding a complimentary speech made by the new king on his accession to the throne, and some grants to the people, a tumult was raised, by which the pachal indemnity for that year was interrupted, and 700 of the mutineers lost their lives. After the suppression of this tumult, Archelaus proceeded to Rome, in order to obtain the ratification of his father's will, and a permanent establishment in the kingdom. Upon his arrival he found his brother Herod Antipas, who was his competitor for the crown, together with several of his family who favoured Herod's pretensions, not so much from love to him as from hatred to Archelaus. An embassy also of fifty of the principal persons of Jerusalem was sent to Rome with a petition to Augustus, that they might be permitted to live according to their own laws under a Roman governor; and these deputies were joined by above 8,000 Jews, that were resident in the city. Archelaus, however, by his humility and address, obtained the grant of half his father's kingdom, including Judæa Proper, Idumæa, and Samaria, under the title of Ethnarch, or governor of a nation, and also a promise of adding that of the king, as soon as he heard that his conduct merited that distinction. St. Matthew indeed (ch. ii. 23) says, "that Archelaus did reign in Judæa," and against this mode of expression there can be no just objection, because his father in his last will had appointed him his successor with the title of king; and Josephus (Antiq. l. 18.) calls him, notwithstanding the limitation of Augustus's decree, the king that succeeded Herod, and he has used (De Bell. l. ii. c. 7) the term reigning for the duration of his government. Archelaus immediately upon his return to Jerusalem began to betray some offensive tokens of his arbitrary and vindictive temper. He first deposed Joazar, and afterwards his successor Eleazar, from the high-priesthood; and, in direct opposition to the Mosiac law, he repudiated his wife Mariamne, and married Glaphyra, the widow of his brother Alexander, though she had several children. In other respects, his reign was tyrannical, and, Antipater excepted, he seems to have been the bane of all Herod's sons; and therefore in the tenth year of his government, A.D. 6, or 7, the chief of the Jews and Samaritans, not being able any longer to endure his cruelty and tyranny, presented complaints against him to Cæsar. Augustus sent for him and some of his chief accusers to Rome, and having heard both the charge and the defense, compelled him to be banished to Vienna or Vienna in Gaul, where he died, and all his goods to be confiscated. Upon this, Judæa was reduced to a province of the empire and annexed to Syria; and Cyrenæus, a consummated person, was sent by Cæsar to make an attempt in Syria, and to seize the estate of Archelaus. From different statements given by Josephus in his war (De Bell. l. ii. c. 7. § 3), Antiquities (l. xvii. c. 15. § 3), and Life (§ 1.), there is reason to conclude, that Archelaus reigned nine years complete, and that the tenth year was current when he was banished. And Dio (l. lv. p. 567) places Archelaus's banishment in the 759th year of Rome. If Herod did not die till the beginning of A. U. 753, the ninth year of Archelaus's reign could not be completed in the 759th year of Rome; but if it be supposed that Herod died in the beginning of A. U. 750, Josephus

A R C

Archelaus, king of Macedon, was the natural son of Pericles II; and though he obtained the crown by assassinating the lawful heirs, he determined to maintain it with valor and glory. With this view he fortified the principal towns of Macedon, dispirited its armies, and fitted out armed ships, which was a kind of force to which the Macedonians had not been accustomed. He also distinguished himself as a patron of literature and of the arts, and some of the most learned men of Greece frequented his court; with them he conversed in the most familiar manner, and some of his sayings at table are recorded amongst the apophthegms of antiquity. Euripides lived with him on terms of peculiar intimacy; and this is the more surprising, if we credit the tradition that he refused to write a tragedy, at his request, on some subject relating to himself, and offered this apology, that he did not wish to represent the enormities of a tyrant. When Socrates was invited by him, he declined paying him that respect, alleging, as Seneca says, "that he could not go to see a man from whom he might receive favours, without being able to return the like." and it is said, that Socrates enjoyed the great expense which he bestowed on his palace, which was painted by Zeuxis, whilst he had taken no pains to adorn his mind. Some have pretended that Aristophanes wrote his comedy of the Clouds, from envy of Socrates, because Archelaus took more notice of this philosopher than of himself. Archelaus instilled facetious and scenic games in honour of Jupiter and the nine muses; and a day was devoted to each muse. He also sent chariots to the Olympic and Pythonian games. The manner of his death and the duration of his reign are not precisely ascertained. It is generally supposed that he was assassinated by Craterus, the object of his laudable passion, in consequence of an affront. According to Diodorus Siculus, he began his reign in the 3d year of the 93d Olympiad, 406 years before Christ, and reigned seven years. Others have extended it to fourteen, sixteen, and even twenty-four years. Gen. Dict. Anc. Un. Hist. vol. iii. p. 269.

Archelaus, a famous sculptor, the son of Apollonius, was born at Priene, a town of Ionia. The marble monument of the apothecary of Homer is ascribed to him, and such is its distinguishing excellence, that, independently of his poems, it would have injured his immortality. It was dug up in 1558 in a field belonging to the princes of Colon, where it is said the emperor Claudius, in whose time it was executed, had a house of pleasur.

Archemorus, in Ancient Geography, a river of Greece in the Peloponnesus, which separated the territories of Sicily from those of Corinth. It is called Nema by Strabo.

Archery. Archery, is used by some to denote the art of transmuting less perfect metals into the more perfect. In which sense archery differs from alchemy, as a part from the whole.

Archenda, in the Ancient Physic, a kind of powder prepared of alecanum and leaves of the Egyptian Liegustrum, wherewith the people smeared their feet after bathing, as a preservative against sweating and rheum.

Archier, John, in Biography, an English physician, who practiced in London in the reign of Charles the Second, author of a manual, Every man his own physician, published in 1673; and though little noticed, it appears to have been not void of ingenuity. At the end of his works, he builds of three inventions, a vapour bath, of considerable efficacy in rheumatism, and various other diseases; an even "which doth with a small faggot bake, distil, boil a pot, or fly, all with the same charge of fire, time, and labour." and a chariot, so contrived, that the person sitting in it may move it at pleasure. It is not improbable that some of our modern inventors took hints from this book for their contrivances.

Archier, Edward, M.D. in Biography, was born in the borough of Southwark, in London, about the year 1712. He received his medical education partly at Edinburgh, and partly at Leyden, at which latter place he graduated in the year 1746, and gave for his thesis a dissertation De Scorbuto. In the year 1748 he was elected physician to the small-pox hospital in Cold Bath Fields, in the place of Dr. Poole, the first physician to that institution; and in 1752 he was admitted licentiate of the college of physicians, London. In the year 1752, the committee of the small-pox hospital, consisting of thirteen of the governors, prevailed on him to suffer a whole length portrait of him to be painted by Mr. Pine, for which they paid one hundred guineas, and placed it in the court-room as a mark of their respect, and of the high opinion they entertained of his abilities, and of his zeal for the institution. This, though he then accepted, yet he was mindful to return it; and therefore ordered by his will, that each of the contributors should be paid back the money they had advanced, with interest to the time of its being repaired. He also left 500l. to the hospital, where he refused to the time of his death, which happened on the 28th of April 1789, having now been physician to the institution forty-one years.

He was of an humane and benevolent disposition, and possesting an ample fortune, was never solicitous about practice; and during the latter part of his life, entirely declined all business, excepting his attendance on the patients in the hospital. To this he might in part be inclined from his corpulence, and from the nature of the complaint; a dropsy in the chelid, to which he at length fell a sacrifice, and which must make all motion particularly troublesome to him. He was a man of considerable learning, and had collected a magnificent and valuable library. This was sold a few months after his death by Meffrs. Leigh and Sothyby. He was buried at Woodford in Essex.

Archers, a kind of militia or fieldjery, armed with bows and arrows. The word is formed of arceus, a bow; whence arcarius, and even arque, and archite, as they are also denominated in the corrupt state of the Latin tongue. Archers were much employed in former times; but they are now laid aside, excepting in Turkey, and some of the eastern countries; where there are companies of archers still subsisting in their armies; and with which they did terrible execution at the battle of Lepanto. As an amusing exercise and trial of skill, the occasional practice of archery is still continued in many parts of Europe, and even in our own country.

The name archer is still retained even where the thing is lost: thus in France, the officers who attend the lieutenants de police, and provolets, to make captures, seizures, arrests, &c. are called archers; though their arms be only halberds or carabinies. In this sense they lay, the archers of the grand prefet de l'hotel; of the prefet des marchands; the city archers; the archers du guet, or of the watch, &c. Small parties of archers, called also gens de martieenne, have been employed to patrol on the great roads, to securn them against robbers. The carriages of Lyons, &c. are always escorted by...
by a party of archers. To the diligence of these archers, or marcher's men, it has been partly owing, that parties have travelled in all parts of France in such security; and that there have been fewer robberies on the highway in that whole kingdom in a year, than about London in a week. They have all their archers des poivres, archers of the foot, whose office it is to force such beggars as they find in the streets, and carry them to the hospitals.

ARCHERY, the art or exercise of shooting with bow and arrow.

Among the nations of antiquity, the bow was a principal implement of war. Its use may be traced to the very earlist times, and followed in the history of almost every country. In this article, however, we shall principally confine ourselves to the practice of archers in England, where it was once carried to a degree of perfection that it is even unrivalled.

Our ancestors used the bow for a double purpose: in time of war it was a dreadful instrument of slaughter; and in peace an object of amusement. That both the Anglo-Saxons and the Danes were well acquainted with it, is certain; and they must have derived its knowledge of it at an early period; as the Scandinavian fields, when praising the heroes of their country, enumerate among their acquisitions a superiority of skill in handling the bow. Among the Saxons and the Danes, however, it seems only to have been used for the purposes of food or pastime; and we are perhaps indebted to the Norman conquest for its introduction as a military weapon. The bow employed among the Saxons will be accurately described hereafter. That which the Normans used at the battle of Hastings was the arbalist or cross-bow; while no mention is made of archers on the side of Harold.

The exact time when shooting with the Long bow began is unsettled; and our chroniclers do not mention the use of archery as applied either to one bow or the other, till the death of King Richard the third in 1485, who was killed at the castle of Chaluz by an arrow, said to have proceeded from a cross-bow. From this time till that of Edward the second, our notices of archery are scanty; the king's baistarius, or cross-bow-man, is often mentioned, and it is in this reign that we met with sagittarius, a term which perhaps has particular relation to the shooters with the long-bow. Many of the soldiers employed in the unsuccessful expedition against Scotland in 1323 were of this description, as well as those who are sent the next year to the relief of Aquitain. Under Edward III, the glory of the English long-bow was at its zenith; and that monarch appears to have been very anxious that its lustre should remain unimpaired. In 1342 a precept was issued to the sheriffs of most counties in England, for providing 500 white bows and as many bundles of arrows, for the then intended war against France. And the king afterwards ordered a letter of complaint to be directed to the sheriffs of London, declaring that the skill in shooting with arrows was almost totally laid aside for the pursuit of various unlawful and unlawful games; and commanding them not only to prevent such idle practices in future, but to see that the leisure time upon holidays was spent in the recreations of archery. The battle of Crécy, in 1346, was attended by a circumstance that seems to have a particular reference to the use of the long-bow among the English. Previously to the battle, a shower of rain so slackened the flight of the Genoese cross-bows, that they became almost unserviceable; while the English were still capable of annoying their enemies with success. Both this victory, and that of Poitiers, ten years afterwards, were chiefly ascribed to the English in their archery. The decisive victory of 1415, against the Scots, in 1422, was achieved by them entirely; and the earl of Douglas found to his cost, that the English arrows were so swift and strong, and drenched with so much force, that no armour could resist them. In 1503, at the battle of Shrewsbury, where King Richard was slain, neither the English nor the Welsh fared ill, for they both made terrible execution: and the victory of Agincourt, in 1415, was entirely owing to their skill. Yet, notwithstanding the advantages which had evidently accrued to the English from the use of the long-bow, the French were still attached to the arbalist; for which reason Henry V, as duke of Normandy, confirmed the charters and privileges of the halleter, who had been long established as a fraternity at Rouen. Under Edward IV, an ordinance was made, that every Englishman and Irishman dwelling in England, should have a bow of his own height, to be made of yew, yew, hazel, ash, or oak. There were some yeomen good according to their power. Butts, alas, or mounds of earth, as ranges, were directed to be made in every township, and the inhabitants to practice archery, under certain penalties. In the sixteenth century of the date, it appears by Kyn’s Pedlar, that one thousand archers were to be sent to the doke of Burgundy, who was set at six pence a day: a circumstance which, considering the value of money at that time, proves very strongly the great estimation in which English archers were held: and even afterwards, when the use of what we now call Artillery gained ground, that of the bow and arrow were by no means neglected. In the 10th of Henry VII and the 6th and 25th of Henry VIII. the use of the cross-bow was entirely forbidden, and by the last-mentioned statute a penalty of ten pounds was to be inflicted on every one in whose house a cross-bow might be found. Other statutes, in the early part of Henry’s reign, afforded great encouragement to archery with the long-bow. One in his third year directs that every father shall provide a bow and two arrows for his son, when he shall be seven years old: and another was enacted in his 30th year to reduce the price of bows. Edward VI, as we learn from his own journal, was fond of archery; and in the succeeding reign, the statutes of Henry VIII for its promotion were much commended, with directions to enforce them. Under Elizabeth, James, and Charles I. other statutes were ordained. In 1566 the price of bows was again regulated; and in 1571 it was enacted, that bow flaves should be brought from the Hanse towns and the eastward. Ten years after this, a society of archers existed in London, who, from the fame which Arthur, elder brother to Henry VIII., had acquired at the long bow, were termed prince Arthur’s knights. John Lyon, who founded Harrow school in 1570, two years before his death, drew up rules for its direction, whereby the amusements of the scholars were confined to “driving a top, tolling a hand ball, running, and shooting;” the last mentioned diversion is in a manner reflect on by the founder, who requires all parents to furnish their children with bow-strings, shafts, and breeches, to exercise shooting.” A silver arrow used, till within these few years, to be shot for by the young gentlemen of Harrow school.

The last time the legislature interfered for the protection of archery, seems to have been in 1633, when Charles 1. issued a commission for preventing the fields near London being so enclosed as to intercept the necessary and profitable exercise of shooting; as also to lower the mounds where they prevented the view from one mark to another. The same commission directs that bridges should be thrown over...
over the dikes, and that all shooting marks which had been removed should be restored. During the grand rebellion, the practice of archery seems to have received no encouragement, but rather to have fallen into disrepute. Sir William Davenant, in a mock poem, entitled "the long vacation in London," describes the attorneys and proctors as making matches in Emsbury Fields:

"With loyines in canvas bow-cade tied,  
Where arrows stuck with mickle pride;  
Like ghosts of Adam Bell and Cymme,  
Soll sets for fear they'll shoot at him."

Adam Bell and Clym of the Cloagh were noted outlaws, whose skill in archery rendered them as famous in the north of England, as Robin Hood and his contemporaries were in the midland counties. In 1676, Catharine of Portugal, queen of Charles II., by the contributions of Sir Edward Hungerford and others, presented a silver badge, weighing 25 ounces, to the marshal of the archers' fraternity, on which was represented an archer drawing the string of a long-bow (in the proper manner) to his ear; with the following inscription: "Regina Catharina Sagittatarii." The supporters, two bowmen with the arms of England and Portugal. In 1689, there was a most magnificent cavalcade and entertainment given by the archers of Emsbury. Charles II. was present on this occasion, but the day being rainy, he was obliged soon to leave the field. Archery had by this time degenerated. From the glory of British warriors, it dwindled to a mere manly recreation; and the very name of archer seemed forgotten, till, in 1753, targets were erected in Emsbury-fields, during the Easter and Whit-Fun holidays, when the bow-shooter was filled captain for the ensuing year, and the second, lieutenant. Of the original members of this society, there were only two remaining when Mr. Barrington compiled his observations in the Archaeologia. It is now incorporated with the archers' division of the honourable the Artillery Company.

Archery, with the long bow, continues to be used as a manly exercise by the inhabitants of Geneva, and in many parts of Flanders; nor is it totally neglected in Great Britain. The most noted society of this kind, now existing, is the Royal Company of Archers in Scotland, who arose about the time of James I. During the last century, in England, many smaller societies had their origin, which have now dwindled. The chief that remain are the Archers' division of the Artillery Company, the Toxophiliæ, and the Kentish bowmen.

How effectual the long-bow must have been before the use of fire-arms, need hardly be suggested; and the neglect into which it occasionally fell must be solely attributed to the length of time that was required to train an expert archer, of which the preambles to many of our statutes are sufficient evidence. Why it continued in estimation so long after the use of gunpowder, will excite no astonishment in those who remember, that, till the last century, muskets were among the unwieldiest instruments of war; they were never used without a retail, had no bayonets, and could be discharged not so frequently as at present. Strutt's Sports and Pastimes, Archael. vol. vii. p. 46, &c. Henry's Hist. Brit. Ellis's Hist. of Shorestitch. See Arrow, Artillery, and Bow.

Archery, in our Ancient Caftans, a service of keeping a bow for the use of the lord to defend his castle.

ARCHES, or Court of Archers. See Court of Archers.

Arches, in Heraldry, are borne in coat-armour, both double and single; and they are drawn as springing from, or supported by, pillars.

Vol. II.
poet, lived about the year 60 before Christ, and is better known by the eloquent oration pronounced by Cicero for vindicating his right to the citizenship of Rome, than by the fragments of his works now extant. Cicero (pro Archia, apud oper. t. v. p. 297; ed. Olivet.) informs us, that he was a native of Antioch, and that his poetical talents, even in his youth, were generally acknowledged and admired in all the Greek cities of Asia and Europe which he visited. At Rome, where he arrived under the Confulships of Marius and Catullus, about the year before Christ 104, he was first received by the Lucullan family, and afterward highly favoured by the Metelli, Catulli, Cralli, and other persons of the most distinguished rank and character. Cicero speaks in terms of high commendation of his powers, which probably confided rather in facility and copiousness of verbling, than in the other superior qualities of a poet; and he says, that by previous study and meditation, his performances were equal to those of antiquity. Archias wrote a poem on the Cimbrian war, and began another on the confidate of Cicero, which was left unfinished. Some of his epigrams, now extant, are prefixed in the "Anthologia."

ARCHIATER. Archiatrus, formed of 

archia, princeipum, chief, and 

mures, medioces, a physician, properly denotes the chief physician of a prince who retains several.

On the real signification of the term, or on the office and denomination of the Archiater, authors are not agreed: some, as Heronimus Mercurialis, conferring it as a title given to the physician to the emperor or prince; others, as Alciatus, Melbomius, &c., as belonging to the principal physician in the country, who had some power or authority over the other physicians. It is remarkable that the word does not occur in Pliny, though he frequently mentions physicians both of his own and of earlier times, some of whom were said to have been dignified with the title; and that Galen, who had the care of the health of Marcus Aurelius and his sons, is no where called by it. Perhaps, as Le Clerc conjectures, "Histoire de Medicine," p. 593, the office did not exist until after their time: for though, he observes, we find the title affixed to the works of writers who lived anterior to the time of Pliny, it may be that the copies we are in possession of were written much later, and the transcribers may have honoured the authors with this title, to enhance the value of their works, and incense the sale of their manuscripts. However this may be, the office was under the later emperors for the greater honour, and its authority and privileges were sanctioned by the laws. Le Clerc, who has written a long dissertation on the subject, "Histoire de Medecins," p. 593, cites several laws concerning them: by these we find they had salaries appointed them, which were paid by the prince, or by the cities or provinces where they were established. They were exempt from all taxes through the whole of the Roman empire; their persons were protected; they were not obliged to entertain soldiers, &c. On the other hand, the Archiaters, not immediately in the service of the court, were obliged to give attendance to all sick persons indiscriminately, without exacting any fee for their attendance. They were also frequently enabled and made counsellors of state, an office or dignity not infrequently at this present time bestowed by many of the princes of Europe upon their physicians. Dr. Dimidale, who went to Ruffia in the year 1765, to inoculate the late emperors and the grand duke, was made physician and actual counsellor of state to his imperial majesty, and baron of the whole Ruffian empire.

ARCHIDANUS, the fon and successor of Agesilaus the Great, king of Sparta, commanded the Spartan army during the life of his father, before Christ 507, and obtained a victory over the Arcadians, without the loss of a single Lacedaemonian, whence this was called "the tearless battle." When Epanomondas afterwards attacked Sparta, he obliged the Theban general to retire. He succeeded his father in the throne in the year before Christ 361; and, in the sacred war, succoured the Phocians. To a bawdy message received from Philip of Macedon, who was elated with his successes, Archidamus replied, that "if he would measure his shadow, he would find it no longer than before:" and when he was asked how far the dominion of Sparta extended, his answer (indicating more his magnanimity than his sense of justice) was, "as far as they can stretch their hands." His life was prematurely terminated in a combat near the city of Mandonia in Italy, between the Messapians and Tarentines, to which Swabia he was destined by a public decree of his country, after a reign of fifteen years; and his character was distinguished by valour and public spirit. His statue was erected in the temple of Jupiter Olympius, an honour which none of the Spartan kings had enjoyed except himself, and which Paullanas supposed was granted to him because he died fighting against the Barbarians, and did not receive those eulogial honours which had been given to all his predecessors. He was succeeded by his son Ages. Aug. Un. Hist. vol. v. p. 48.

ARCHIDAPIFER, or chieffewer, is a great officer of the empire.

The elector of Bavaria is archidapifer. —The palace of the Rilene at one time pretended this office was annexed to his patriciate, but he has since desisted. At the peace of Baden, the office was finally restored to Bavaria. At the coronation of the emperor he carries before him the monte of the empire, which by virtue of his office he also bears in his arms, ranks next to Bohemia, places on the imperial table the silver dishes, and serves up the first course.

ARCHIDIUM, in Ancient Geography, a town of the island of Crete, according to Pauflanis, in Arcad.

ARCHIDONA, in Geography, a town of Spain, in the province of Andalusia, with an ancient caftle of Antequera.—Alfo, a town of South America, in Peru, built by the Spaniards, in the province of Chinchis.

ARCHEROSYNES, in the Grecian Antiquity, a highpriest vested with authority over the rest of the priests, and appointed to execute the more sacred and mytcrionous rites of religion.

ARCHIGALLUS, in Antiquity, the high-priest of Cebyle, or the chief of the cunouch-priests of that goddes, called Gallis. This officer was always chosen from among the most distinguished families.

ARCHIGENES APAMEUS, fo called from Apamea, the place of his birth, in Biography, a physician of eminence in the time of the emperors Donatian and Trajan. Galen speaks of him as delivering high credit for his diligence and ingenuity, and cites several of his works with commendation. Haller gives an epitome of his doctrines, and though he commends his practice in the care of many diseases, yet, from his fondness for amulets and charms, places him among the empirics. That he was in high repute, however, cannot be doubted, Juvenal having mentioned him several times in his satires, and always with honour. "Ocyus Archygenem quere, atque ene quad Mithridates compluit." Various fragments of his writings exist in the collections of Actius and Amida. Besides his writings on the subject of pharmacy, he also wrote treatises on local afeictions, on the cure of chronic diseases, on the nature and types of fevers, on pulses, &c. Le Clerc Hil. de la Med.

ARCHIGERONTES, in Antiquity, the chiefs or masters
markets of the several companies of artisans at Alexandria.

Some have mistaken the archigernotes for the arch-priests, appointed to take the confessions of those who were condemned to the mines.

ARCHIGEURNUS, ARCHIGERBERTA, OR ARCHIGERONI, in Antiquity, the commander of the imperial fleet, or that which the emperor was abroad of.

Some have contended the office of archigernus with that of prefeflaloctus, or admiral, but the former was under the command of the latter.

Potter takes the proper office of the archigernotes to have been to manage the marine affairs, to provide commodious harbours, and order all things relating to the failing of the fleet, except what related to war. Vid. Diod. Sicul. 26, 51.

ARCHIL, ARGEL, ARGLIA, RECOLA, LICORIN, RECOLE of Linn unus, or Orsillo, is a moat of a lightish or dark grey colour, which grows on the rocks in many parts of the Archipelago, and in the Canary and Cape de Verd islands; and, according to Linn unus's account, on the Wtern Coast of England. It belongs to the third of Dillenius's genus of corallides, and to the lichen fraunclofus of Linn unus. This moss grows uprightly, partly in finge, partly in double stems, which are about two inches in height; when it is old, these stems are crowned with a button, sometimes round and sometimes of a flat form, which Tournefort very properly compares to the excrences on the arms of the Sepia. The dark red palte formed of this moss has in commerce the fame name of Archil or Argel, and is much used in dying; that well-known substance called Lacmus, or Litmus, is also made of it. See Litmus. Those who prepare it for the use of the dyer grind it betwixt flones, so as to bruife it thoroughly without reducing it to powder, and then moisten it occasionally with strong spirit of urine, or urine itself, mixed with quicklime. Alkales extract a violent colour. In a few days it acquires a purplish red, and at length a blue colour. The dyers foldom use this drug by itself, because of its dearness and the perishableness of its beauty; but they chiefly employ it to give a bloom to other colours, as pinks, &c. and this is done by passing the dyed cloth, or silk, through hot water lightly impregnated with the archil. However, the bloom thus comminicated soon decays upon being exposed to the air; though, M. Hellot says, that by adding a small quantity of the solution of tin, the colour obtained from this drug changes towards a scarlet, and gives a durable dye. Prepared archil will readily yield its colour to water, to volatile spirits, and to spirit of wine; and it is accordingly used to colour the spirits of thermometers; but being confined from the air, the spirits lose their colour, and as M. l'abbé Nollet observes, regain it upon being exposed to the air. He repeated the experiment severall times with succefs. A solution of archil in water gives a durable stain of a beautiful violet or purplish blue colour to marble. M. du Fay informs us that he has seen pieces of marble stained with it, that preferred their colour for two years, without any sensible change. It sinks deep into the marble, and makes it more brittle. The dye yielded by this substance, it is suppos'd, was known as early as the days of Theophrastus. Theophrastus, Dioscorides, and Pliny, give the name of "Phycos thallafion" or "potion," to a moss which grew on the rocks of different islands, and particularly on those of Crete and Candiia. This moss had, in their time, been long used for dying wool, and the colour it gave, when fresh, was so beautiful, that it excelled the ancient purple, which was not red, as many suppose, but violet, Playf says, that with this substance the dyers gave the ground or frill tint to those cloths which they intended to dye with the coaly purple. Thus Hardouin and others understand the words "conchylis subfubritum," which the French dyers express by the phrase "dinner le pied." This "phycos thallafion" is suppos'd to Dillenius to be our argel; for at present, no species is known which communicates so excellent a colour, and which corresponds so nearly with the description of Theophrastus. Besides, it is still collected in the Grecian islands, and it appears that it has been used there since the earliest ages. Tournefort found this moss in the island Amsros, now called Mordo; and in his time it was sent to England and Alexandria, at the rate of 10 or 12 dollars per hundred weight; and he adds, that it was common in the other islands. He also states, from Sidiás, Julius Pollux, and other ancient writers, that this island was once celebrated for a kind of red linens, which in commerce had the name of the island; and he conjectures that it was dyed with this moss. Hence Beckman (Hist. Inventions, vol. i. p. 61.) concludes, that our argel was not unknown to the ancient Grecians; and he apprehends, that the Europeans, and frill of all the Florentines, were made acquainted with this dye-fluff, and its use, in the beginning of the fourteenth century. To this purpose he observes, that among the oldest and principal Florentine families is that known under the name of the Oricelarii, Rucellarii, or Rucellai; one of whom, in the year 1300, carried on a great trade in the Levant, and returning with great wealth to Florence, first made known in Europe, the art of dyeing with argel; and from this useful invention the family received the name of Oricelarii, from which, in process of time, was formed Rucellai. After that period, the Italians procured argel from the Levant for themselves, and afterwards for all Europe. But since the discovery of the Canary islands, about the end of the fourteenth or beginning of the fifteenth century, the greater part of this substance has been procured from them. In the islands of Canary, Teneriffe, and Palma, this moss belongs to the crown; and in 1730, it was let by the King of Spain for 1700 piastras. In the rest of the islands it belongs to private proprietors, who cause it to be collected on their own account. About the end of the year 1730, the captain of an English vessel brought a bag of argel from the Cape de Verd islands to Santa Cruz, by way of trial; and discovering his secret to some Spanish and Genoese merchants, they fitted out a ship in 1731 for these islands, whence they brought it in large quantities. The argel of the Cape de Verd island appears larger, richer, and longer than that of the Canaries, which, perhaps, is owing to its not being collected every year. Adamson, in 1749, found the greater part of the rocks in Magdalene island, near Senegal, covered with this moss. Although most of our argel is at present procured from the Canary and Cape de Verd islands, a considerable quantity is also brought from the Levant, from Sicily, and from the coast of Barbary; and some years ago the English merchants at Lesthorne, caufed it to be collected in the island of Eiba, and paid for it a high price. Our dyers do not purchase raw argel, but a pale made of it, which the French call orfelle en pate. The preparation of it was for a long time kept secret by the Florentines: the person who is suppos'd to have first made it known was Rolletti, a dyer at Florence. Some information concerning it was afterwards communicated by Invernati, and Micheli the botanist. In latter times this art has been much praticed in France, England, and Holland. Many druggists, instead of keeping this pale in a moist flate with urine, as they ought to do, suffer it to dry, and it has then the appearance
of lyric poetry, which required this mixture, and which, after his time, became a species of versification wholly distinct from heroic. To Archilochus is likewise ascribed the invention of epokes, considered as denoting small lyric poems, composed of trimeter-iambics, of six feet, and dimeters of four feet, alternately; such are those of the fifth book of the odes of Horace. Archilochus is generally ranked among the first victors of the Pythian games; and Pindar says, that he wrote hymns in praise of the gods and heroes. One of them in praise of Hercules, gained for him the acclamations of all Greece; for he sung it in full affably of the Olympic games, and received in recompence from the judges, the crown of victory. This hymn, or ode, was afterwards sung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits. The names of Homer, and of Archilochus, were equally revered and celebrated in Greece, as the two most excellent poets produced by the nation.

Cicero ranks him with poets of the first class, and in his "Epistles," (x. 16, ad Atticum) he says, that the Grammarian Artillophanes used to say, that the longest poem of Archilochus was, in his estimation, the most excellent of those composed by the Greeks, and, as he said, to be an imitator of the Greek bard, as to his style and manner, but not in his malignity; and he says, (Art. Poet.) that he was armed by the violence of his resentment with iambics; "Archilochus propriis rabies arnavit iambos." Ovid likewise refers to Archilochus: Paterculus and Quinctius below great priase on his poetry. The latter (i. e. c. 1.) says of him, that he had an uncommon force of expression, abounding with bold thoughts, and short but keen and piercing strokes, and that his lyke was singularly strong and nervous. The estimation in which he was held among the Greeks may be inferred from the conduct of the Delphic oracle, which expelled from the temple of Apollo, Cerax of Naxos, by whom he was killed, though he did it in open war. His fates, however, were not only unjustifiably severe, but offenсively licentious and indecent; and on this account his poems were prohibited at Sparta, as being more likely to corrupt the hearts and manners of young people, than to be useful in cultivating their understandings. Of the force of his fates, the following instance is frequently alluded to by the ancients. Lycomeaus, who had promised him his daughter in marriage, and who had violated his contract, together with his family, was rendered so infamous by a torrent of abuse and defamation, that he terminated his life by the halter; and one, if not all of his daughters, followed his example. Indeed, the rage of Archilochus" was proverbial in antiquity, which compared the provoking of this satyril to the treading upon a serpent. In the army, into which he entered, Archilochus incurred a degree of ignominy, which probably contributed to imbitter the resentment, and malignity of his writings. When he faced his life by his cowardly retreat in the first battle in which he was engaged, he alleged in excuse of his dastardly conduct; "I have lost my buckler, but I have saved my life; and it is much more easy to get a new buckler, than a new excellence." Some fragments of his writings may be found in the "Poeta Graeca" Generv. 1636 and 1614, 2 vol. folio. Nouv. Dict. Hillor. Burney's Hist. Mufc, vol. i. p. 303.

ARCHILEUTO, or ARCHILUTE, a large hute, differing little from the Thorobs, on which thorough-bafs used to be played in accompanying the voice. At the beginning of the last century, it was the favourite instrument all over Europe. Arrignonius, a famous lutetian, was employed in all Handel's early operas. And the office of lutetint remained till
till the last century in his majesty's chapel at St. James's. Gilber was the last who occupied the place and performed the duty.

ARCHIMAGUS, in the Ancient Persian Religion, the chief priest or head of the order of magi. The archimagus answered to the high-priest among the Jews, or the pope now among the Romans; being the head of the whole religion. The archimagus reigned in the fire temple, a place held in the same veneration among them as the temple of Mecca among the Mahometans, every person of the sect being under a kind of obligation to make a pilgrimage to it once in their lives. Zoroaster is ranked as the first archimagus, and he erected the first temple in the city of Balch. Here it remained till the seventh century, when the followers of Zoroaster, being driven by the Mahometans into Carmania, or Kerman, a southern province of Persia, another building of the same kind was reared, and there it hath continued to this day. The fire temple at Balch, was rebuilt by Darius Hystaspis, with a grandeur more suitable to its dignity, as it was the patriarchal temple of the sect; and from the name of its reboiler it was afterwards called Anzur Guhlap, i.e. the fire temple of Darius Hystaspis. In order to preserve its reputation, he added the office and title of archimagus, and as Persity immutable, he gave orders before his death, that among his other titles it should be engraved on his monument, that he was "a master of the Magians," which plainly implies the head of the sect among them. From hence it seems to have proceeded, that the kings of Persia were ever after regarded as the sacred and divine beings, and were always intimated into the sacred order of the Magians, before they were inaugurated into the kingdom. Prit. Conc. vol. i. p. 315, 322.

ARCHIMANDRITE, the superior of a monastery; amounting to what we now call Abbot.

Coovraivas observes, that the word literally denotes the chief or leader of a flock; in which sense it may be applied to any ecclesiastical superior, and accordingly we find the name sometimes attributed to archbishops. But among the Greeks, by whom it is chiefly used, it is always confined to the chief of an abbey. According to Lather Simon, man- drite is a Syrian term, signifying a solitary monk; and consequently archimandrite is the chief of monks of this description. In the Greek church, the archimandrite is the second dignity under the patriarch.

ARCHIMEDES, in Biography, one of the most celebrated mathematicians of antiquity, was born at Syracuse, according to Torelli, in the second year of the 132d Olympiad, corresponding to the 257th year before Christ; or, according to Rivalus, who has taken considerable pains in ascertaining the true year of his birth, the second year of the 132d Olympiad, answering to the 2918 year before Christ. If we may rely on the authority of Tzetzes, he lived 75 years; and Blair in his chronology, refers his death to the first year of the 142d Olympiad, or the 212th year before Christ. Plutarch informs us, that he was nearly related, by his father, to Hiero the Syracusian king, with whom he lived in habits of the most intimate friendship and intercourse; but his mother was of obscure origin; and this circumstance may probably account for the degrading terms "humblem homunculum," which Cicero applies to him in the fifth book of his Tufcian Questions, Oper. t. ii. p. 474. ed. Oliven. Unallured by those prospects of preferment which his connexion with Hiero might have presented, Archimedes devoted himself, with uncommon ardour and singular success, to the study of geometry, in his youth; and in his mature years he travelled into Egypt, whether the Greeks generally returned in the pursuit of science. After an absence of several years, which he spent in the society of Conon, and other eminent men, and during which time he exhibited very promising indications of his future fame, he returned to his own country, where he indefatigably prosecuted that course of application to mathematical and mechanical sciences, which led to the discussions and discoveries recorded in his works. Such, indeed, were the ardour and industry of his application, that he professed his studies, to the neglect of both food and sleep, and improved the most trifling circumstance that occurred into an occasion of making very important and useful discoveries. At the bath, it is said, he frequently drew geometrical figures in the ashes, or when, according to the custom, he was anointed, upon his own body. Of the ardour of his mind in the pursuit of science an instance occurs under the article HIERO'S CROWN; and was also manifest in his well-known declaration, pronounced in conference of his accurate acquaintance with the powers of the lever, "δίδονα βασιλεύοντα μου ταύτα, γι' αυτό επόμενον τινα μου αναθέματα," i.e. "Give me a place upon which to stand, and I will move the earth." Such was the pleasure he derived from having discovered the proportion between the sphere and its circumscribed cylinder, that as a memorial of this discovery, he requested his friends to place upon his tomb a cylinder containing a sphere, with an inscription expressing the proportion of the one to the other. Cicero, when he was a senator in Sicily, about 140 years after the death of Archimedes, discovered this monument in a neglected state, and, with great difficulty, wrought it up with brambles and brambles, which he ordered to be cleared away. Vit. Opera, ab epist. As an evidence to Hiero of the smouldering effect of mechanical powers, Archimedes is said to have drawn towards him, by means of a peal and pulleys, a galley manned and loaded, which lay in the shore. But his mechanical knowledge was applied to more substantial use, at the time when Syracuse was besieged by the confid Marcellus; for he thus contrived to arrest the efforts of the besiegers for eight months. Plutarch (in Marcell.) and Livy (l. xxiv. c. 34.) inform us, that, whether the vessels of the enemy were nearer to the walls of the city, or more distant from them, Archimedes annoyed them. When they approached the rampart, he suspended long branches, which probably acted like levers, and struck the galley's with a force that sunk them; by means of grappling hooks at the extremities of other levers, he raised up vessels in the air, and then dashed them to pieces against the walls or projecting rocks. With the they were more remote, he used instruments which threw large stones, that demolished the ships or the machines employed in the siege. For the use he made of his burning mirrors, see BURNING-GIPE.

Besides other inventions which Diodorus Siculus (l. v.) ascribes to Archimedes, he mentions that of the cochlear, or screw pump, which he communicated to the Egyptians. Livy also (l. xxiv. c. 23) records his distinguished excellence as an observer of the heavenly bodies and his talent for the contrivance and construction of warlike machines. His ingenuity in the solution of problems was, in Cicero's time, become proverbial, for in a letter to Atticus (l. xiii. ep. 25.), he alludes to the "προφήτης Αρχιμήδης," or "Archimedian problem," as one that was of singularly difficult solution. His machine for exhibiting the motions of the celestial bodies is either referred to or more expressly mentioned by the Latin poets. To this purpose Silvius Italicus (l. xiv. v. 341, p. 717, ed. Drakenb.) extols him: "Vir fuit: Helmiacis deors immortalis colonis, Ingenio facile ante aequor telluris alumnus, Nudus opus; sed cui celum terraeque patent." Claudian (l. vi.) in his epigram on this invention of Archi- medes, employs himself in the following strong terms: "Jupiter,
A R C

"Jupiter, in parvo cum eunerrert x therin vito," sic.

In English thus:

When in a glass's narrow sphere confin'd,
Jove saw the fabric of th' Almighty mud;
He smil'd and said: 'Can mortals' art alone
Our heavenly labours mimic with their own?
The Syracusan's brittle work contains
Th' eternal law that through all nature reigns.
From'd by his art, ice flaws unwinn'd hush,
And in their coursedd rolling orbs return;
His fun through various signs describes the year,
And every month his mimic moons appear.
Our rival's laws his little planets bind,
And rule their motions by a human mind.
Silents could our thunder imitate:
But Archimedes can a world create.'

Ovid (Fast. vi. 275.) mentions the same machine:

"Arte Syracosii fulgotur in aere chafo
Stat globus, immami parva figura phal."

Plutarch (in Vit. Marcelli, Oper. t. iii. p. 357.) expressly says of Archimedes, after recounting the machines which he had employed during the siege of Syracuse, that in the construction of them "he gained the reputation of a man endowed with divine rather than human knowledge;" but it is to be regretted that, as he adds, "no account of them was left in writing."

Among all the various objects of mathematical speculations on which his attention and inventive faculties were directed, one of the principal was the resolution of the conic sections. Unleas we except the lines of Hippocrates of Chios, he was the first who squared a curvilinear space; he also reduced the quadrature of the circle to the determination of the ratio between the diameter and the circumference; and though unable to obtain the precise value of it, he assigned an useful approximation to it by the numerical calculation of the perimeters of the inscribed and circumscribed polygons. See Circele, Diameter, and Quadrature. He determined the relation between the circle and ellipse; and likewise attempted the hyperbola, though from the nature of the case he was not likely to succeed. He also found the proportion of the area of the spiral to that of the circumscribed circle, and of that of their sectors; he determined the relations of spheres, spheroids, and conoids to cylinders and cones, and of paraboloids to rectilinear planes, whose quadratures were already known. In all his mathematical investigations, he imitated the example of his predecessor, Eucid; and, like him, was cautious in admitting any principles that were not strictly geometrical and unexceptionable.

No friend of science can forbear lamenting the premature death of this singularly eminent mathematician and philosopher, as well as the time and manner in which it happened. After he had been instrumental in protracting the siege of Syracuse for eight months, the city was at length taken by storm and devoted to the flame. Marcellus, indeed, respecting the character even of an enemy such as Archimedes had, was said to have ordered that his house and person should be inviolate; but he was surprised and put to death, says Livy (i. xxxv. c. 31.), by a soldier who was ignorant of his person and character, while he was intent on figures which he had delineated in the dust, and was altogether negligent of his own safety. The account of the manner of his death given by Plutarch (ubi supra) is somewhat different. He says, that Archimedes being in his museum, was so absorbed in his attention to his diagram, that he was assaulted by one of the soldiers before he knew that the city was taken, and that he refused to accompany him to Marcellus till he had finished his problem, upon which the enraged soldier dispatched him with his sword. However this be, Marcellus, it is said, lamented his death, paid respect to his memory by directing and superintending his funeral, and restrained the victorious army from offering any violence to his relations.

Of the numerous works of Archimedes many of them are lost, but the most valuable, as we have reason to believe, are preferred. Torelli has arranged and enumerated them in the following order: 1. "De Planorum Aquilibrivm," liber primus, cum commentariis Eutocii Alcibionita. 2. "Quadratura Parabolas." 3. "De Planorum Aquilibrivm," liber secundus, cum commentariis Eutocii Alcibionita. 4. "De Sphera et Cylindro, liber primus, cum commentariis Eutocii Alcibionita." 5. "De Sphera et Cylindro, liber secundus, cum commentariis Eutocii Alcibionita." 6. "Circuli Delineo, cum commentariis Eutocii Alcibionita." 7. "De Helixius." 8. "De Conoidibus et Spheroidibus, cum Torelli commentario, in Prol. 12." 9. "Areanuus." 10. "De ins qua in humulo voluntur, liber primus," 11. "De ins qua in humulo voluntur, liber secundus." 12. "Lemmata." 13. "Opera Mathematica, ut cufque mento ab antiquis scriptoribus fcta et." These latter works, with the Author's descriptions of them, are lost; they are as follow: 1. "An artificial sphere for exhibiting the celestial motions." 2. "Archimedes's method of investigating the mixture of gold and silver in Hiero's crown, mentioned by Vitruvius." 3. "His pneumatic and hydraulic engines, mentioned by Tzetzes, Pappus, and Theutullian." 4. "Archimedes's fleece, the structure and use of which are well known." 5. "The helix, by means of which, according to Athenaeus, he launched a large ship belonging to Hiero." 6. "A singular kind of locket, the account of which is imperfect." 7. "The tripping, by which large weights might be raised by a very small power." 8. "Various warlike machines, consisting of tormenta, balkis, catapults, fagittarii, forcipones, &c., which, according to Polybius, Livy, and Plutarch, were used in the defence of Syracuse." 9. "His burning-glaives, by the combination of which he is said to have set fire to the Roman ships."

When Conlantinople was taken at the middle of the fifteenth century, such writings of Archimedes as existed, together with the commentary of Eutocius, escaped the ravages of the conquerors, and were brought thence into Italy. Here they were found by the famous John Muller, better known by the appellation of Regiomontanus, who carried them into Germany, and they were soon afterwards, viz. in 1544, published in folio at Baille, in Greek and Latin, by Hervagius, with a preface by Thomas Gheauh. A Latin translation was published at Paris in 1577, by Palaclus Hemelans. An edition was published in folio, by Commandine at Venice, in 1588. The edition of Rivalius, in Greek and Latin, in folio, with new demonstrations and notes, and a life of Archimedes, was published at Paris in 1615. At the close of this edition is annexed an account of the other works of Archimedes that have been lost. Maurouius published an edition in folio, at Melina, in 1671; another by Borelli, was published at Palermo in 1655; and a Latin edition was published by Dr. Barrow in 4to. at London in 1675, with new illustrations and demonstrations. The last, most splendid and complete edition in folio, was printed at the Oxford prefs in 1752; this edition was prepared for the press by the learned Joseph Torelli of Venice, with a new Latin translation, Eutocius's commentary, with a preface and notes; an account of the life and writings of Torelli, by Clemens Sibillati, is prefixed, and a large appendix is added consisting of two parts, the first being a commentary on the paper of Archimedes, relating to bodies floating in fluids, by the Rev. Abram Robertson of Christ-Church College Oxford, who had the whole care of this edition; and
and the second, a large collection of various readings in the MS, copies of Archimedes's works, preferred at Florence and Paris, collated with the edition of Balf. The works of Archimedes form a principal part of the valuable collection of Greek mathematicians, published in folio at Paris, in 169; entitled "Mathematici veteres." Of distinct parts of the works of Archimedes we have various editions. The book "De dimensione circuli," was published in folio, at Paris, in 1761; and at Leipjig, in 1620; and in Octavo, at Oxford, by Dr Wallis, in 1669; and in the third volume of Wallis's works, in 1669. This work, together with the book "De sphare & cyldro," appeared at Paris in 1561; the book "De planis equiponderatis," was published in quarto at Paris, in 1565; "De conoidibus et de spheroidibus," at Palermo, in 1625; "De iis inumodo natant, &c," with the commentary of Commandine, in quarto, at Bologna, in 1565; and the "Arearum," by Wallis, at Oxford, Octavo, in 1676; of which an English translation by G. Anderson, was published in London, Octavo, in 1784, with notes and illustrations. Torelli Pref. Rivali Pref. Fabr. Bibb. Graec. l. iii. c. 22. t. ii. p. 543, &c.

Archimedes's Sympos. See Screw of Archimedes.
Archimedes's Burning-glass. See Burning-glass.

Archimime, Archimimus, archim, and archim, is the same thing in effect with archimallon or mimic. The archimimes, among the Romans, were persons who imitated the manners, gestures, and speech, both of people living, and of those who were dead.

At first they were only employed on the theatre; but were afterwards admitted to their halls, and at last to their funerals; where they walked after the corpse, counterfeiting the gestures and behaviour of the person who was carried to the funeral pile, as if he were still alive.

ARCHINARA, in Ancient Geography, a town of India, on the other side of the Ganges, according to Ptolem.

ARCHIPELAGO, in Geography, a sea interrupted by a great number of islands.

The word is formed by corruption of ἄρχιπελαγος, q. d. ἄρχιεν, which again is formed of ἄρχοντας ἄρχοντας, a name originally given it by the Greeks, but for what reason is not agreed on. See Archipelago.

The most celebrated Archipelago, and that to which the name ufed to be appropriated, and whence all other groups of islands have derived it, is that between Greece, Macedonia, and Asia; in which are the islands of the Arcadian sea, which is called the 'White Sea, in contradistinction to the Euxine, which they call the Black Sea. This part of the Mediterranean sea is bounded on the north by Rome, on the east by Natalia, on the west by Livadia and the Morea, and on the south by the isle of Cyprus. It divides, as far as it extends, Europe from Asia. All the islands contained in it, some of which lying on the coast of Natalia are called Laetic, and the others European, lie between the 35th and 40th degrees of north latitude, and 23d and 27th degrees of east longitude. Some of them are called Cyclades, because they form as it were a crown and circle round the isle of Delos; the others are called Sporades, as being dispersed without any order between Asia and the isle of Candiad.

The modern geographers mention other Archipelagos, as that of Lazarus near the coasts of Malabar and Malacca; the Archipelago of Mexico; and that of the Caribbean, wherein are many islands; that of the Philippines, called by some the "great Archipelago," containing several islands, and all thofe of the Moluccas, of Celebes, &c. Thefe Aefetic islands form a large group usually denominated the "oriental Archipelago," and extending from 10° S. lat. to 22° 4' N. lat. that is 33 degrees, or 21,000 geographical miles, while the length from 95° E. long. to 132°, gives 37° not far from the equator, nearly corresponding with the breadth. The "northern Archipelago," consists of four groups of islands between the efl coast of Kamtchatka in Asia and the west coast of America; the first, called Salagame, comprises five islands; that called Khano contains eight; the second consists of nine; and others there are called Aleutian Islands. The third group includes sixteen islands, called Andreana or Olrove, and the fourth, the Olrove, or Fox islands, which are fifteen in number. "Broughton's Archipelago," is a cluster of islands, rocky islets, and rocks, on the north-west coast of America, so called by Vancouver, after the name of their discoverer, and living about 50° 50', N. lat. and W. long. 126° 20'. The "dangerous Archipelago," or "labyrinth," is a name given to a group of islands discovered in the Pacific Ocean, called in the East Indies, by Quirós, Schouten, and Ie Maire, Roggewein, Byron, Wallis, Carteret, Bougainville, Cook, Edwards, Blair, Vancouver, Broughton, and Wilson, and is called from its intricacy and difficulty which they occasion to the navigation. They are divided from 14° to 27° S. latitude, and as far as 20° S. long. from 1676. To four of these islands Captain Cook, in 1766, gave the names of Resolution, in S. lat. 17° 24', W. long. 141° 39'; Doubtful island in S. lat. 17° 22', W. long. 141° 38'; Furneaux island in S. lat. 17° 4', W. long. 144° 16'; and Adventure island in S. lat. 17° 14', W. long. 145° 30'. All the inhabitants of these islands appear to be of the same race with the Society islanders, but are somewhat darker in their complexions, and more ferocious in their manners. "Archipelago of the great Cyclopes," is the cluster of islands first discovered by Bougainville in 1768, and called by captain Cook, who palled them in 1774, New Hереrids. "King George III.'s Archipelago" is a name given by Vancouver to a large group of islands, forming various channels, and lying on the north-west coast of America between 56° 10', and 59° 15', N. lat. and about 135° and 136° W. long. The exterior coast of this Archipelago from Cape Crof to Cape Edward has several openings that appeared likely to afford shelter, but the rocks and islets, some producing trees, and others altogether barren, that extend to the distance of three or four miles from the shore, must render the entrance of such harbours unpleasant and dangerous. till they are better known. That which seemed to be the eattif of access was noward of Cape Edward, in lat. 57° 34', and was considered by Vancouver as Portlock's harbour. Cape Edgumbe on this coast is situated in lat. 57° 24', and W. long. 143° 34'. This cape forms the north-west point of a spacious opening that branches into several arms, and is called by Mr. Dixon, the Norfolk Sound. One of the northern branches of this sound communicates with the land on which Mount Edgumbe islands, named by Captain Cook the Bay of Islands, and makes the intermediate part of the sea-coast an island. The utmost extremity of this Archipelago in lat. 56° 10', and W. long. 134° 23', constitutes a remarkable promontory that terminates in a high bluff rocky cliff, and becomes, on its eastern side, a narrow point of land, named by captain Coocets, Cape ommanoy; and the opening between this and Cape Diron, he called Chirilian Sound. Vancouver's Voyage, vol. iii. p. 257. A cluster of islands, or a single island, about twenty leagues in length, and lying between 53° and 54° N. lat. and about 130° W. long. was called by Vancouver, 'Pitt's Archipelago." On the north of this group was Chatam's Sound,
ARCHITECTURE, the art of erecting buildings of any kind.

Amongst the various arts cultivated in society, some are only adapted to supply our natural wants; others are necessities; some are instruments of luxury merely, and calculated to flatter our pride, or gratify our desires: whilst others tend at once to secure, to accommodate, delight, and give consequence to the human species. Architecture is of this latter kind; and when viewed in its full extent, may truly be said to have a very considerable part in almost every comfort or luxury of life. The advantages derived from houses only are great, they being the first steps towards civilization, and having certainly great influence both on the body and mind. Excluded from each other, inhabitants of woods, of caves, or wretched huts, exposed to the inclement vicissitudes of seasons, and the differing uncertainty of weather, men are generally indolent, dull, and listless, with faculties blemished, and views limited to the gratification of their most pressing necessities; but whatever societies are formed, and commodious dwellings are found, in which well sheltered they may breathe a temperate air, amid the summer's heat or winter's cold; deep, when nature calls, at ease and in security; truly unmolested, conversing, and telle the sweets of social enjoyments; there they are spirited, active, ingenious, and enterprising; vigorous in body, speculative in mind; agriculture and arts improve, they flourish among them; the necessities, the conveniences, and even the luxuries of life, become there abundant. Little strength however, even the feeblest perseverence, obtains with difficulty the defined produce; but inventions facilitate and shorten labour, multiplying productions so, as not only to supply domestic wants, but likewise to treasure up stores for foreign markets. Architecture then smooths the way for commerce; the forms commodious roads through marshes or other grounds naturally impracticable, fills up vales, unites, or levels mountains; throws bridges over deep or rapid rivers, turns aside or deadens the fury of torrents; confirms canals of navigation, builds ships, and contrives ports for their secure reception in the hour of danger: facilitating thus the intercourse of nations, the conveyance of merchandise from people to people. A well-regulated commerce is ever the source of wealth; and luxury has ever been attendant on riches. As the powers of gratification increase, fancy multiplies wants; till at length, indolence or pleasure, vanity and superfluous, fears and refinements, give birth to a thousand superfluous, a thousand artificial cravings; the greater part of which could not be gratified, without the assistance of architecture; for splendid palaces, magnificent temples, costly dwelling-houses, and amphitheatre, theatres, baths and porticos, triumphal arches and bridges, mausoleums, and an endless number of similar inventions, are all either necessaries of the human race; or fpiriting testimonies of wealth, of grandeur and pre-eminence; either present or past. Nor are there any other objects, whether necessary or superfluous, so certainly productive of their design; so permanent in their effects, or beneficial in their consequences, fine furniture, rich dresses, brilliant equipages, numerous domestics, are only secondary attractions at first; they soon feel the effect of time; and their value fluctuates, or dies with the fashion of the day. While the productions of architecture command general attention; are monuments, stretching beyond the reach of modes; and record to later posterity the consequence, virtues, achievements, and munificence of those who
they commemorate. The immediate and most obvious advantages of building are, employing many ingenious artisans, many indolent workmen and labourers of various kinds; converting materials of little value into the most splendid productions of human skill; beautifying the face of countries; and multiplying the conveniences and comforts of life. But these, however great, are not the most considerable: that numerous trains of arts and manufactures, contrived to furnish and adorn the works of architecture, which occupies thousands, and constitutes many lucrative branches of commerce; that certain concourse of strangers, to every country celebrated for flately structures; who extend your fame, adopt your fashions, give reputation, and create a demand for your productions; are considerations of the highest consequence: in short, the advantages of building extend to the remotest ages, and at this day, the ruins of ancient Rome, in a great measure, support the splendor of the present; by the number of travelers who flock from all nations, to visit the ancient remains and modern magnificence of that famous city; and who, in the course of a few centuries, have there expended incredible sums of money, by long residence; and in the purchase of old pictures, antique flutings, busts, half-reliefs, urns, and other curious productions of art; of which, by some extraordinary good management, there is a treasure never to be exhausted. Nor is architecture less useful in defending, than prosperous in adorning and enriching countries; the guards their coasts with ships of war, secures their boundaries, fortifies their cities, and by a variety of artful contrivances, controls the ambition and frustrates the attempts of foreign powers; curbs the insolence, and averts the danger, and the horror of internal commotions. Thus architecture, by supplying men with commodious habitations, procures that health of body and vigour of mind, which facilitate the invention of arts; and when, by the exertion of their skill or industry, productions multiply beyond domestic wants, the furnishes the means of transporting them to other markets; and whenever by commerce they acquire wealth, it points the way to employ their riches rationally, nobly, benevolently; in methods honourable and useful to themselves and their descendants; which add splendor to the state, and yield benefit both to their contemporaries and to posterity: the farther teaches them to defend their possessions, to secure their liberty and lives, from the attempts of lawless violence, or unrestrained ambition. An art so variously conducive to the happiness of man, to the wealth, lullure, and safety of nations, naturally commands protection and encouragement; in effect, it appears, that in all civilized times, and well regulated governments, it has been much attended to, and promoted with unremitting fidelity; and the perfection of other arts has ever been a certain consequence; for where building is encouraged, painting, sculpture, and all the inferior branches of decorative workmanship, must flourish of course; and these have an influence on manufactures, even to the minutest mechanical productions; for design is of universal benefit, and stamps additional value on the most trifling performances, the importance of which, to a commercial people, is obvious; it requires no illustration. Let it not however be imagined that building, merely considered as heaping stone upon stone, can be of great consequence; or reflect honour, either on nations or individuals: materials in architecture are like words in philology; having separately but little power; and they may be so arranged, as to excite ridicule, disgust, or even contempt; yet when combined with skill, expressed with energy, they actuate the mind with unbounded sway. An able writer can move even in vulgar language, and the mazy dispositions of a skilful artist will dignify the

man's materials; while the weak efforts of the ignorant, render the most costly enrichments despisable. To such, the compliment of Apelles may justly be applied; who, on seeing the picture of a Venus magnificently attired, said to the operator, "friend, though thou hast not been able to make her fair, thou hast certainly made her fine." See the preface to Sir W. Chambers's Treatise on Civil Architecture.

Architecture is divided into Civil, Military, and Naval Architecture, for which see the several heads.

ARCHITHELASSUS PRIMUS, in Conchology, a name given by Argenville to the shell called by Linnaeus Costas funatus.

ARCHITRAVE, in Architecture, the lower division of an entablature, or that part which rests immediately on the column.

In the most ancient buildings, which were probably of timber, the architrave was the beam which extended from column to column, to support the roof, whence the name, which is from arch, chief, and trave, a beam.

In all the ancient examples of the Doric order still existing in Greece, as those at Athens and Corinth, and also those at Pafalum, and in Sicily, it has only one facia, and is of great height, being nearly equal to the diameter of the column. In the Doric order of the temple of Marcellus at Rome, it has only one facia, but is much lower, being only equal to half a diameter of the column. The moderns, such as Vignola, Scamozzi, &c. have generally confined it to this proportion nearly, but have divided it into two facets, taking the idea from some ancient examples of the Doric order in Italy.

In one of the ancient examples of the Ionic order in Greece, such as the temple on the Ilissus near Athens, it has only one facia, which is quite plain, and of considerable height; while in others, such as the temple of Minerva Polias at Athens, and that of Bacchus at Teos, it is divided into three facets, and has the upper moldings enriched. In the Ionic order of the temple of Fortune, and at the theatre of Marcellus at Rome, it also has three facias. The moderns have generally given it two facets.

In the Corinthian and Composite orders, both the ancients and moderns have divided it into three facets, generally enriching the moldings.

The practice of architects differs exceedingly in the proportions of the architrave, as in all the other parts of the orders. Character and propriety, however, seem to require, that in the mazy and grave orders, such as the Doric and Ionic, this member, which represents a part subject to great pressure, should have a proportionate degree of strength; while in the gayer Corinthian and Composite, its appearance should be lighter and more ornamented.

In Gothic architecture there is no architrave, and this forms one of the most striking differences between this species of architecture and the Grecian. In the latter there is always a horizontal architrave over the columns, whereas from the tops of Gothic columns arches always spring. The Egyptian architecture is also characterized by horizontal architraves.

ARCHITRAVE Cornice. See Cornice.

ARCHITRICLINUS, in Antiquity, the mazer or director of a feast, charged with the order and economy of it, the covering and uncovering of the tables, the command of the servants, and the like.

The word architrucinus properly imports the chief or mazer of a tribulum or dining-room. His office properly differed from that of modinstructor, or arbiter bibendi, as the latter was appointed by the guests; the architrucinus, by the person who gave the feast.
The archivistus was sometimes also called fereus triebniarcus, and by the Greeks keraunon, i.e. reggulator, or foresitter. Potter also takes the archithecus for the same with the Symposiarcha.

ARCHITHEC. See Architec.

ARCHIVAL, in Architecture, the inner contour of an arch; or a band or frame adorned with mouldings, running over the faces of the arches, and bearing upon the impost. See this represented in the lines that bound the arch over E. See Basilic.

The word is French, archithee, where it signifies the same thing, formed of arcu caevelus.

It is different in the different orders. In the Tuscan, it has only a single face; it has two faces crowned in the Doric and Ionic; and the same mouldings with the architrave in the Corinthian and Composite.

ARCHIVE, or Archives, a chamber or apartment wherein the records, charters, and other papers and evidences of a state, house, or community are preferred, to be consulted occasionally.

A word comes from arcus, abbrev., or the Greek στεφανος, which Suidas ues in the same sense. In some Latin writers we meet with archivarium.

We say the archives of a college, a monastery, &c. The archives of ancient Rome were in the temple of Saturn; the archives of the court of chancery are in the Rolls office. In the code we meet with archivum publicum vel armarium publicum, uti utr. & libri expon. lati. Cod. de fil. infraim. auth. ad ben. xxx. q. 1.

ARCHIVIST, archivi, a keeper of an archive.

Under the emperors, the archivist was an officer of great dignity, held equal to the proconsuls, vested with the quality of a count, styled clariifimus, and exempted from all public offices and taxes. Among the ancient Greeks and Periand, the truth was committed to none but men of the first rank; among the Franks, the clerisy, being the only men of letters, kept the office among themselves. Since the erection of the electoral college, the archbishop of Mentz has had the direction of the empire.

ARCHIZUPANUS, a title given to the prince or de- 27
spot of Servia. The word is compounded of στεφα- 28
νος, and γειτον, neighbor. In an epitaph of pope Innocent II, he is called Magnus Iustinianus.

ARCH-MARSHAL, Archimarcuscallus, the grand marshal of the empire.

The elector of Saxony is arch-marshal of the empire; and in that quality he goes immediately before the emperor, bearing a naked sword, at the diet, and on other solemn occasions. He bears in his arms two swords placed crosswise. During the holding of the diets, he has jurisdiction over all electoral and other officers of the states of the empire, and also in criminal matters. His hereditary marshals are the counts of Pappenheim, who, by virtue of their office, bear the electoral swords of Saxony in their arms.

ARCH-MINISTER, derived from the Greek archon, and the Latin minister, the prime minister of a prince, or state. Charles the Bald having declared Boso his viceregent in Italy under the title of duke, made him also his first minister under that of arch minister.

ARCHION, archion, literally signifying a commander, in Antiquity, the chief magistrate of the city and commonwealth of Athens.

After the Athenians had abolished monarchy, they created archons, who were obliged to render an account of their administration to the people. Some of these were annual, and others perpetual. Mec俊, the son of Codos, was the first of the latter; and Creal, of the former, who entered upon his charge in the first year of the twenty-fourth Olympiad, or the 644th year before Christ. The occasion of their institution was this: Codrus, king of Athens, having devoted himself for the good of his people, in the war with the Heraclids; his sons, Mec俊 and Neles, deposed the crown between them; the Athenians took this occasion of dissolving their monarchy, and, in lieu of kings, created perpetual governors, under the name of archons. Mec俊, son of Codrus, was he who first had this charge, being appointed in the year 1070 before Christ; but required to render an account of his administration. He held it for twenty years, and his two descendants in regular succession (from him called Megalobus) enjoyed it for 287 years. But a perpetual magistracy seemed to this people too little an image of royalty, the very shadow whereof they related to abolish. Accordingly, the administration of an archon, which had before been perpetual, they reduced, in the first year of the seventh Olympiad, 1 or 73d year before Christ; or, according to Bihur, the third year of the sixh Olympiad, or 74th year before Christ: to ten years: and, about seventy years after, to one year: with a view of recovering as oft as possible the authority into their own hands, which they never transferred to the magistrates but with regret. The first of the decennial archons was Charopus, brother of Alemzezon and son of Megaceilus; and the last was Eryxias, who closed the race of Codrus. The chief magistrates of Athens, distinguished by this common appellation, were nine in number; though the name archon belonged, by way of eminence, to the chief of the nine, who was also called epimenus, cures, because the year was denominated from him. His jurisdiction comprehended both ecclesiastical and civil affairs. He determined all causes between men and their wives, parents and children, and disputes relating to wills, dowries, and legacies: he had the charge and direction of orphans, minors, tutors, and guardians. He had also the first cognizance of several public actions. He kept a court of judicature in the odeum to decide in trials relating to provisions and similar matters. He appointed epimenos, or curators, who took care of the due celebration of the feasts called ἀγορα, ἀλοα, and ἀντιεραιτος, or of the regulation of plays. He was punished with death if convicted of drunkenness during the time of his office. The second archon was called ἀνωτα, or king: to him pertained the superintendence of the religious ceremonies and feasts: he decided all disputes between the priests and families feared by inheritance, as the Cerecs and Erotobates: he punished all impurity and profanation of the holy mysteries or temples: he offered public sacrifices for the prosperity of the commonwealth: he had also some concern in secular affairs, as he took accusations of murder, and referred them to the Arapogates, among whom he had a right of suffrage; but during the trial, he laid aside the crown which was the badge of his office. His court of judicature was in the royal portico. It was required, that his wife, called ἱσμειας, khyfia, should be a legitimate citizen of Athens, and a virgin. The third was the ped- marchus, so called from τοῦκρατ, year, and archos, to command: to him belonged the care of strangers and sojourners, and the conduct of war; and he took care that the off-spring of those who died in the service of their country should be maintained from the public treasury. These magistrates were assisted by the Thaissi, or alliati, who were committed into office in the same mode, and under the same restrictions. The other six were called ἄσματο, from ἁμειας, law, and ἱσμειας, I gladiators. They formed a tribunal for judging concerning seductions, calumnies,
ties, bribery, &c. and for settling disputes between the citizens and foreigners, and all controversies in trade. They ratified all contracts and leagues, directed and guarded the establishment of laws, and formed a kind of barrier between the other magistrates and the people: they preferred the appeals to the people, publicly examined several of the magistrates, and took the votes in the assemblies, and prosecuted those who attempted to mislead the unwary into any act injurious to the commonwealth. They used to parcelate the city in the night, and to correct those who committed any disorder. The whole body had the power of life and death; they had a joint commission for confounding some magistrates and depthing others, when upon investigation, the fuluffles of the people, they were declared unworthy of their offices; they had also authority to assemble the people; and they were exempted from all taxes and contributions for building ships of war, in recompense of their service. They wore garrisons of myrtle; and any person who struck them, when they wore their garrisons, was punished with _aqua, insania._ They were elected by lot, and previously to induction into their office, they underwent a twofold trial, one in the forum, called _docimoia_; and the other in the senate house, denominated an _arrefis_; and in these trials, they were asked, who were their ancestors? whether by three of them were Athenian citizens? whether they were related to Apollo Patrius or Jupiter Hercerus? to what tribe and ward they belonged? whether they had been dutiful to their parents, had served the appointed time in the wars, had the estate which the law required, and were perfect in all their limbs? They were then conducted into the royal portico, where an oath was required of them, that they would administer justice without partiality, and never be corrupted by bribes. This custom was established by Solon, who also enacted that terrible law which condemned to death the archon who, after losing his reason in the pleasures of the table, should dare to appear in public with the ensigns of his dignity. Potter's Arch. Grce. vol. i. p. 71. Under the Roman emperors, several other Greek cities had two archons for chief magistrates, which were the same with the _daimonius_ in the colonies and _municipia._ Archon is also applied, by some authors, to divers officers, both civil and religious, under the eastern or Greek empire. Thus, bishops are sometimes called archontes; and the same may be paid of the lords of the emperor's court. We also read of the archon of the antemnens, archon of archons, grand archon, archon of churches, archon of the gospels, archon of the walls, &c.

Archon, Louis, in Biography, an antiquary, chaplain to Louis XIV., was born at Rouen in Normandy in 1615, and died at Rome in 1717. His "History of the chapel of the kings of France," in 2 vols. 4to, abounds with curious researches. Note, Dit. Hiller.

ARCHIVIT, in Church History, a sect which arose towards the close of the second century; thus called from the Greek _archivita_, q. d. _principalities, or hierarchies of angels;_ because they held the world to have been created not by the supreme God, but by certain subordinate powers, called archontes, or angels. The archontici were a branch of Valentinians.

ARCHONTIUM, _exepytov_, denotes a dignity of the Greek church.

ARCHOUS, in Ancient Geography, the name of a river in Asia, situated in Afyria. Allo, a place of Asia in Mesoopotamia, west of the Tigris, and near the wall of Semiramis.

ARCHPRIEST, Archpresbyter, a priest, or presbyter, established in some diocese, with a pre-eminence over the rest.

Anciently, the arch-priest was the first person after the bishop: he was seated in the church next after the bishop; and even acted as his vicar, in his absence, as to all spiritual concerns. In the sixth century, there were found several arch-priests in the same diocese; from which time some will have them to have been called deans.

In the ninth century, they distinguished two kinds of earls or parishes: the smaller guarded by simple priests; and the lapidary churches by arch-priests; who, beside the immediate concern of the cure, had the inspection of the other parishes, and gave an account of them to the bishop, who governed the chief, or cathedral church in person.

There are arch-presbyters still fulfilling in the Greek church, vested with most of the functions and privileges of archbishops, or rural deans.

ARCH-PRIOR, was a name sometimes given to the master of the order of Templars.

ARCH-CHAIRER, archibisflavaarius, the great treasurer of the German empire.

This office was erected with the eighth electorate, in favour of the elector Palatine, who had lost his former electorate, which was given to the duke of Bavaria by the emperor Ferdinand II. who took it away from Frederick V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. Since the treaty of Westphalia, the elector Palatine has been arch-treasurer. The elector is protector through all Germany of the order of St. John, can raise noblemen and gentlemen to the degree of counts, and also admit as bondmen, in places subject to his jurisdiction, all those that are illegitimately born, and other persons of foreign countries, on condition of their binding themselves to the duties of the electorate, and to the payment of a certain tribute and monies.

The dignity of arch-treasurer was contested between the elector of Brunswick, now king of Great Britain, who claimed it in virtue of his descent from the elector Frederic, and the elector Palatine. This elector still styles himself arch-treasurer, till another suitable arch-office be assigned him. He enjoys the ultimate succession in the bishopric of Osna- burg, together with some other rights and privileges. His electoral jurisdiction extends to the territories of Hanover, and to those of Zell. Although the illustrious house of Hanover was raised to the electoral dignity by the emperor Leopold, in 1692, it obtained neither voice nor seat in the electoral college till the year 1708.

ARCHYTAS, in Biography, a Pythagorean philosopher and distinguished mathematician of Tarentum, was a contemporary with Plato, who interpolated for his refuge from death, under the tyranny of Dionysius of Sicily; and the eighth preceptor of the Pythagorean school, in succession from Pythagoras. Accordingly, he flourished about the ninety-fifth Olympiad, or 400 years before Christ. Such was the celebrity of this philosopher, that among his disciples are reckoned Philolaus, Eudoxus, and Plato. Archytas was in such high esteem among his countrymen for wisdom and valor, that he was chosen seven times general of their armies, and chief magistrate of Tarentum, in direct opposition to an established law; and in the exercise of his office he invariably recommended himself by his moderation, and also by his ability and clemency. As a speculative philosopher, he followed the doctrine of Pythagoras: and Aristo, who is said to have borrowed from him the general arrangements known under the appellation of the "Ten Categories," To Archytas, this great philosopher was also indebted for many of his ethical principles and maxims; and more especially for the notion which he repeatedly inculcates, that virtue
virtue consists in avoiding extremes. Virtue, according to Archytas, is to be pursued for its own sake, in every condition of life; and he taught, that all excess is inconsistent with virtue; that the mind is more injured by prosperity than by adversity; that there is no excellence in permitting to human beings as pleasures; and that the love of it is a debilitative disease of the human mind. To his ingenuity, as a mathematician, we owe, according to Fabritius, the method of finding two mean proportionals between two given lines, and the duplication of a cube; and we derive, from his skill in mechanics, the invention of the screw, and crane, and various hydraulic machines; to say nothing of his flying pigeon, or winged automatons. See Aerostation. The astronomical and geographical knowledge of Archytas is celebrated by Horace in a beautiful ode, recording also his death, which was occasioned by a shipwreck on the coast of Apulia, where his unburied corpse was found:—

"Te maris et terrarum, numerorum carenis arenze
Menoporem cohibent, Archytas,
Pulvis exigui propeitus parva Matinum
Minera; nec quidquam tibi profert
Aeolias tentata donos, ammico rotundum
Percurrulte polum, martiruo."

Lib. I. Od. 28.

"Archytas, what availsth thy nice survey
Of ocean's countless sands, of earth and sea?
In vain thy mighty spirit once could soar
To orbs celestial, and their course explore,
If here, upon the tempted-beaten strand,
You lie confin'd, till some more liberal hand
Shall draw the pious dust in funeral rite,
And wing thee to the boundless realms of light."

Francis.

As to his moral disposition and conduct, Archytas was distinguished by modesty and self-command; and in his language he is said to have flown a degree of regard to decency, not often found among the ancients. He never chastised a servant, or punished an inferior in wrath. To one of his dependents, who had offended him, he said, "It is well for you that I am angry; otherwise I know not what you might expect." None of the writings of Archytas are extant, except a mathematical work, entitled "Hierarchia Sententiarum," or "On the universe," in which he distributes all things into ten classes or categories, written in the Doric dialect, and published in Greek and Latin at Venice, in 1571, 8vo. Several fragments on "Wisdom," and "On the good and happy Man," have been preferred by Stobaeus, and edited by Gale, apud Opofe, Mythol. p. 673. Laertius, l. vii. c. 79—86. Val. Max. l. v. c. 1. Strabo, l. vi. Anl. Gell. l. x. c. 12. Aelian, l. vii. c. 14. l. xii. c. 19. l. xiii. c. 55. l. xiv. c. 19. Suidas. Fabr. Bibl. Græca, l. i. c. 13. § 1. l. i. p. 493. Beuckler's Hist. Phil. by Enfield, vol. i. p. 470.

ARCHIDES, in Ancient Geography, a river of Italy in Bruttium, near Rhegium.

ARCILLAUS, a town of Spain in Betica, situate, according to Ptolemy, in the territory of the Turduli. — Also, a town of Hylpaian Tarragonensis, called Archipiana, in the territory of the Balitani, according to Ptolemy.

ARCILEUTO. See Archileuto.

ARCINA, in Ancient Geography, a town placed by Ptolemy in Dacia.

ARCHELLA, in Conelology, a species of Chamis found in the American ocean. It is grooved, muricate, and marked with excavated dots; hinge with a feelie calyx. Gmelin. The breadth is about two inches, and the length nearly the same; it is white, with the edges rarely of a rose colour; within it is yellowish; the margin crested; posterior excavation cordated, warted, rugose, and large, with an appendage in general on one side.

ARCIROESSA, in Ancient Geography, a town of Afa, upon the Ænian sea.

ARCI for Aera, in Ancient Geography, a town of France, in the department of the Aube, and principal place of a district, five leagues north of Troyes. The place contains 2,520, and the canton 9,330 inhabitants; the territory comprehends 77 kilometres and 21 communes. N. lat. 48° 2', Long. 4° 22'.

ARCISANA, a town of Italy in the Milanese, 11 miles west of Como.

ARCHES, in antiquity, birds which gave bad omen, either by their flight, noise, or manner of eating. They were called arces, sometimes also arcens, quia arcens ne quod secret, prevented or forbid things being done.

ARCO, in Geography. See Arch.

ARCOBRIGA, in Ancient Geography, a town of Spain in the country of the Celtiberians, between Segontia and Bilbilis. — Also, a town of Spain, in Lusitaniana, according to Ptolemy.

ARCONATO, in Geography, a town of Italy in the duchy of Milan, 18 miles W. from Milan.

ARCONCEY, a town of France, in the department of the Côte d'Or, and chief place of a canton in the district of Arras le Duc, five miles N. from Arras le Duc.

ARCOLS de la Frongera, a town of Spain, in the country of Seville, situated on a sharp rock near the river Garathale, and fortified by both art and nature; anciently Arcobriga: 40 miles S. S. W. from Seville. N. lat. 36° 49'. W. long. 4° 55'.

Arcos, a town of Spain in Old Calis, on the river Xalon, and at the foot of a mountain in the road from Siguenza to Saragossa, two leagues east from Murza-Cali.

ARCOS de Valdevez, a small town of Portugal, in the province of Entre-Minho and Douro. It is the ancient Arcibriga Lusitaniae of Ptolemy.

ARCOT, a city of Hindostan and capital of the Carnatic, is seated on the river Pabar, at 56.6 geographical miles in horizontal distance from Madras, according to the measurement of major Reuell, and in N. lat. 12° 51' 26", E. long. 79° 28' 15". It appears to be a place of great antiquity, because it is taken notice of by Ptolemy as the capital of the Sora, or Sora—mandalam; whence by corruption is derived Choromandell. Arcot is a pretty large city, and its citadel is esteemed a place of some strength for an Indian fortress. The defence of this place by Cave, in 1751, established the military fame of this nobleman. The Nabob of Arcot, or of the Carnatic, is an ally of the East India Company, and his dominions commence on the south of the Guntoo Circuit, and extend along the whole extent of Coromandel to Cape Comorin. See Carnatic. The revenue of the nabob is rated at about a million and a half sterling per annum; out of which he pays a subsidy of 163,000 L. per annum, to the East India Company, towards the expense of their military establishment. — Rees's Memoir, Pref. p. 137.

ARCHES, in a town of France in the department of the Var, and chief place of a canton, in the district of Draguignan, 10 miles from Frejus.

ARCTANES, in Ancient Geography, a people of Epirus.

ARCTAPELIOTES, in Cosmography, the wind which blows at the 43rd degree from the north toward the east. In this sense, arctapeliotes amounts to the same with that to which we call the north-east wind.

ARCTIC, in Astronomy, an epithet given to the north pole, or the pole raised above our horizon. It is called the arctic pole, on account of the constellation of the Little Bear, in Greek called σηλός, the tail star of the tail whereof of nearly points out the North Pole.

ARCTIC circle, is the lesser circle of the sphere, parallel to the
the equator, passing through the north pole of the ecliptic, and 23° 28′ distant from the north pole, from whence its name. This and its opposite, the antarctic, are called the two polar circles, and may be conceived to be described by the motion of the poles of the ecliptic, round the poles of the equator, or of the world. The arctic circle is the boundary of the north frigid zone.

ARCTICA, in Conchology, is a species of Mya that inhabits the north seas. The shell is heart-shaped, and keeled with two fleshy ridges; hinge without teeth, with. Gmelin, &c. This is Mya teflæ flustra, valvis carinis dorsi spatulatis, spatulis oblongis, umbilico oblongo dentato. O. Fabr. Fin. Groa. The length of this shell is from one line and half to seven lines; of a pale yellow colour; within, milky white. It refurnishes an Arc; the anterior part is impressed and rather flattened; very obtuse in front; and behind, shorter, and rather sharp.

Arctica, a species of Arctona that inhabits the Greenland seas. The specific character is concise. Shell perforated; keel entire. Gmelin. This is Clione bhecina of Pall. In spring and autumn it is seen swimming on the surface of the water; is very fragile, finely grooved; and about three lines and one half in diameter.

Arctica, in O. nitula, a species of Alca, known in England by the name of puffin. The bill is compressed, sharp-edged, with four grooves; orbits of eyes and temples white; with a sharp-pointed, and somewhat triangular protuberance upon the upper eye-rid; Linnæus. Pallis, Britaniæ, Gmelin, &c. This bird is called Pica Marina by Aldrovandus, Pfitzicum Marinius by Marten. Ipatsa by Kniph., Macarea by Buffon, and Puffis by Pennant, Latham, and Donovan, Brit. Birds, &c. The length from the point of the bill is twelve inches, breadth twenty-one; weight twelve ounces. The bill is an inch and a quarter long, and is of a singular shape, much compressed on the sides, and nearly an inch and a half deep at the base, from whence both mandibles tend to a point, which is a little curved; across the upper mandible are four oblique furrows; on the under, three; half of the bill next the point is red; that next the base is blue grey; and at the base is a fort of rifing, and full of minute holes: in the nostrils is a long and narrow slit on each side, near the edge of the upper mandible, and parallel to it; the irides are grey; the edges of the eye-lids crimson; on the upper a callous protuberance of a triangular shape; and on the under one, another callousity, but of an oblong form; the top of the head, hind part of the neck, and the upper part of the plumage are black, passing round the throat in a collar; the sides of the head, chin, and all the parts beneath, are of the purplish white; the legs are orange; in some birds there is a great portion of a dusky mixture on the cheeks, and a patch of the same on each side of the under jaw, and these have been supposed to be the females. They vary exceedingly in regard to the bill, according to age; in the first year it is small, weak, destitute of any furrow, and of a dusky colour; in the second, larger, stronger, and lighter coloured, with a faint veilage of a furrow at the base; but in those of a more advanced age the colour is brighter; hence these birds are supposed not to be perfect, or at least not to breed, till the third year; especially not as a single one has ever been observed at Prielholm which had not the bill of a uniform growth.

These birds are frequent upon several of the rocky coasts of England, as Prielholm Isle, the Needles, Isle of Wight, Beachy Head, &c. They are common in Ireland also, and in North Britain; inhabit Ireland and Greenland; frequent Carolina in America in winter; were met with by our late voyagers in Sandwich Sound, where the natives ornament the fore parts and collar of their seal-skin jackets with the beaks of them; and in Osnaburgha, where they make gowns of their skins. On the coast of Kamtschaka, and the Kurile islands they are common, even on the Penchinskai Bay almost as far as Ochotska; the nations of the two first wear the bills about their necks fastened to fraps, and, according to the superstition of these people, their shaman or priest must put them on with a proper ceremony, in order to procure good fortune.

The puffins arrive at their breeding places about the rocks of Prielholm the first week in May, and are wont to flood the rabbits to make of their own volition, feed their young, and are considered as a stupid race of birds. The female lays but one egg, which is of a white colour; the young are hatched in the beginning of July, and about the middle of August they take flight. The young that are hatched become the prey of the falcons and hawks that live on these rocks, for the old ones leave the place, to a single bird. Notwithstanding their neglect of the young at this time, on every other occasion they show great attention to them. They will suffer themselves to be taken by the hand, and use every means of defence in their power to save them; and if laid hold of by the wings, will give themselves most cruel bites on any part of their body within reach, as it was often by myself and when released, instead of flying away, will often hurry again into the burrow to their young. They feed on sprats, crabs, sea-weeds, &c. and the flish is exceedingly rank, though the young, when pickled, are admired by some people.

A variety of this species is described by Dr. Latham from a specimen in the collection of Sir Joseph Banks, that was met with at Bird island between Asia and America. The length is sixteen inches; the bill is two inches long, much the same colours as the last, but not so deep at the base; crown of the head, as far as the nape, ash-colour; sides of the head white; throat, neck, and all the upper parts of the body, wings, and tail, black; breast and under parts, white; legs, orange. The other sex has the bill more slender; the crown of the head, black brown; sides of the head white, poising backwards almost to the nape; thighs ash-coloured; and in other respects like the former species.

ARCTICUS, a species of Columbus, the head is hoary white; under the throat violaceous black, with a white interrupted band. Gmelin. This is Columbus (Arcticus) capite coloquio cinereus, gutture nigro-violaceo, dorso nigro maculis quadrangularibus albis; Brunnick. Columbus Arcticus, Linnæi, of Willughby. Columbus Arcticus, Hyniber. Ginger Act. Raro. Mergus guttur nitrogen Brifion, Hirundinis aquatica species exotica, Dill. mut. Linnæi, 1694. Columbus. Linnæi, of Worm. mut. Linnæe, ou petit plongeon de la mer du nord, of Buffon. Speckled Loon, of Edwards and Black-throated Diver, of Pennant and Latham.

The length of this bird is two feet; bill near an inch long, slender and black; the forepart of the head and throat black; hind part of the head and neck, ash-colour; sides of the half, white spotted with black; on the forepart of the neck a large patch of black, five inches in length, changing to purple and green in different lights; the back and upper parts black; feathers marked with square spots of white; wings cover the same, but the spots are round; breast and belly white; quills dusky; tail short and black; legs black, with a cast of red on the inside.

This bird is common in the northern parts of Europe, as Norway, Sweden, and Denmark. Frequent in the inland lakes of Siberia, especially those of the Artic regions; also in Ireland, Greenland, and the Ferro isles; and likewise, at
at Hudson's Bay in America. It is supposed to eat and be very relleis against rain; hence the Norwegian think it im-
pious to destroy this species; but the Swedes, less superfi-
tious, dress the skins, which, like all of this genus, are ex-
ceeding tough, and use them for gun-cases, and fancies for
winter cas. Vide Lathun, &c.

ARCTIUM (1795, Dioscor.), in Botany, Burdock. Lin.
ed at the end. Cor. compound, tubular, uniform; corol-
ules hemispheric, equal. Proper, monopetalous, tubular;
slow tender, very long; limb ovate, quinquefoil; divisions
linear, equal. Stam. filaments five, capillary, very short;
another cylindrical, tubular, the length of the corolla, five-
toothed. Pijf. germ oblong, with a villosa top. Style, fil-
iform, longer than the flamente. Style bisal, reflex. Per.
none. Calyx converging. Sepals foliates, vertically pyramidal,
with the two opposite organs obliterated, gibbous on the
outside. Dutya simple, shorter than the seeds. Rec. chaffy,
flat; chaffs facetuous. Eff. Gen. Char. Cal globular, the
seals at the end hooked, inflected.

Species 1. A. Lopha, common burdock or clot-burr; "leaves corolae umbratarius pasta." Curt. Lond. f. e. 4. 355. Woody. Med. Bot. 15. Bardana major. Ger. Pharm. Lond. &c. Root biennial, suffrutic. Stem three or four feet high, erect, brarched, round, grooved. Leaves alternate, large, rough, undulate. Flowers in panicles, terminal. The outer scales of the calyx by their hooks hold of animals, cloaths, or any soft substance with which they come in contact. Corolla purple. It is common on the sides of roads, flowering in July and August. There is a woolly-headed variety of this species: it also varies much in the size of the heads. Medicinal properties. The pharmacopoeias direct the root for medical use; it has no smell, but tastes sweetish and mixed as it were with a slight bitterness of roughness. Its virtues, according to Bergius, are cleaning, diuretic, and diaphoretic. It has been employed in chronic cafes, as febrile, rheumatic, gout, lues venera, and pul-
monic complaints. We have never had an opportunity of observing the effects of this root, except as a diuretic, and in this way it has proved very effectual in droptics. The seeds also possesses a diuretic quality, and have been given with advantage in the dole of a dram, in calculous and nephritic complaints; and in the form of emulsion, as a pectoral. The root is generally used in decoction, which may be made by boiling two ounces of the fresh root in three pints of water, two of which, in drophal cafes, should be taken in the course of twenty-four hours. Wood. Med. Bot. p. 421. 2. A. Perfonata, cut-leaved burdock. "Leaves decrentur, ciliat, epiny; root-leaves pinnate; stem-leaves oblong-ovate." Cardinus peronata, Jac. f. a. 4. 3. 3. 348. Root biennial, woody. Stem two feet high, angular leaves on the stem, tomentose beneath, fercate, spines at the edges. Lower leaves petioled, consisting of three or four pairs of pinna, with a very large leaf at the end. Flowers in terminal clusters on tomentose peduncles, armed with little spines. Scales of the calyx reflex at the point, but not hooked; flo-
rets fix or ferev, of a violet purple colour. A native of Swit-
zerland, Austria, Slavca, and Siberia; flowering in July and Augut. Introduced here in 1756 by J. N. de Jacquem, M.D. 3. A. Cardinata, "leaves pinnatifid prickly;" frum upright, prickly, grooved, about a cubit high; leaves lem-
clapling, deeply lacinate; calyces terminating, peduncled,
with linear brittle-shaped scales spreading and bending in-
wards. A native of the mountains in Upper Carniola, and
in Sibilia. These plants are seldom admitted into any but
botanic gardens, where they may be readily increased from
seed.

ARCTOMYS Palcfisbicornis, in Zoology, the name of an
animal of the rat kind, but very large, being of a middle
fire between the rat and the rabbit; it lives in caves, and
feeds on vegetables, and is a fierce and bold creature. It
ufes its fore-feet as hands, and has a calum of filling on
the buttocks, and in this posture looks very like a
bear. Rav.

ARCTONESUS, or ARCONIUS, in Ancient Geo-
graphy, a cefert island in the Aegean sea. Also, a town of
Alf, near Halacarnus, according to Strabo and Pliny.

ARCTONNESUS, a town of Cythicus, according to
Steph. Byz.

ARCTOPHYLAX, from ipro, Lett. and c?lEroz, I guard, in Astronomy, a constellation, otherwise called
Bootes.

ARCTOPUS, (arctos, the bear's-foot), in Botany, Lin.

Eff. Gen. Char. Male, Umbel, compound. Invol. five-
leafed. Cor. five-petalled. Stam. five. Pijf. two abortive. Female (or androgynous), on a distinct plant. Umbel
simple. Invol. four-parted, spiny, very large, containing very
many male flocculis in the disk, and four female ones in the
two. Seed one, bicocular, inferior.

Species 1. A. cebinatus, prickly-leaved Arctopus. A
handsome plant from the Cape of Good Hope; introduced
in 1774, by Mr. F. Maffion. The leaves are crowded, finu-
ate, and ciliate with spines on the upper surface disposed
darwinse at the sinuses; flowers terminating among the
leaves. It has the general appearance of Eryngo.

ARCTOSTAPHYLOS. See VACCINUM.

ARCTOTHECA. See GURONIA and ARCTOTIS.

ARCTOTIS, in Botany (from arctos, a bear, on account of
the thagone of the plant). Lin. g. 991. Schreb. 1. 42. Ruf.
Composites; corolla free. Julf. Gen. char. Cal. common, round;
with imbricate; lower scales more lax, falcate; middle ovate;
inmost oblong, scariole, rounded, and concave at the end.
Cor. compound, radiate; corollules hemispheric, very many
in the disk; females ligulate, near twenty, longer than the
diameter of the disk; proper of the hemisphericds funnel-
shaped; border quinquefoil; ends reflex, equal; of the fe-
male ligulate, lanceolate, very finely three-toothed; tube
very short. Stam. of the hemispheridae, flaments five,
capillary, very short; anther cylindric, tubular, five-toothed;
the length of the corolla. Pijf. of the hemispherides, germ
clearly visible; flyle cylindric, a little longer than the
corolla; fligma simple; of the females, germ ovate-four-
cornered, villos, crowned with its proper calycle; flyle fis-
liform; ligmas ovate, oblong, thickish, erect. Per. none.
Cal. unchanged. Seecl. in the hemispheridae none; in the
females, foliary, roundilh, villos, crowned with a calycle,
usually of five leaves; leaves flat, opening, spreading. Rec.
viilose or chalky, flatish. Obf. In some of the species the female
floccules of the ray are barred, and the floccules of the disk
fertile, while in others the former are fertile, and the latter
barren. The leaves of the calycle also vary from four to
eight.

Eff. Gen. Char. Rec. villose or chalky; down with a five-
leafed crown. Cal. imbricate, with scales scaricole at the
end.

Species 1. A. calendulae, marygold-flowered Arctotis. Of
Of this species we find the following varieties, viz. *A. colchicum*, with "radiant florets twelve-fold, nearly entire." *A. hypophyllum*, with radiant florets tridif, the middle inflected. *A. triflum*, with "radiant florets four-parted." *A. coriaceus*, with "radiant florets three parted, the exterior one trifid. "*A. superba*, with "radiant florets barren, five parted; leaves uneccinate and rather tomentose." Of the frill, the peduncles are villose, nodding, becket with red bristles; ray yellow, purplish underneath, twisted during the night; the corollines of the disk black on the outside, and with black anthers; the outer scales of the calyx spreading, subulate, short, hirsut. Cultivated in 1725. by Miller. The second is supposed to be the same as *A. sulphureus* of Gaertner. The third has spreading bifide leaves, with reuninate thick terete leaves; disk of the flower black, with yellow flrets, black at noon, ray with four or five parted yellow florets, lead-coloured beneath. The fourth variety has not been described. Of the fifth the peduncles are villous, with hyaline bristles, decurrent in the night, but never a diing; ray growth descending, decurrent during the night; corollines of the disk yellow; anthers yellow. These are all annual, and, as well as all the other plants of this genus, are natives of the Cape of Good Hope. 2. A. ferrata, "radiant florets barren; leaves lanceolate, undivided, tooth-ferrate;" items upright, simple, woody, subpulbiferous; leaves fiddle, scarcely pubescent, somewhat crowded; peduncles terminating, rather very long; calyx fiddle, yellow; corolla yellow, crown of the seeds white. 3. A. tenuifolia, "radiant florets barren; leaves linear, undivided, naked;" items herbaclos, few; leaves filiform or linear, naked; peduncles long, solitary, naked, filiform, bract small, flliform; calyx imbricate; ray yellow; perennial. 4. A. grandisfera, "radiant florets fertile; leaves pinnatifid, toothed, coalesced, three-nerved;" ray very large; petals straw-coloured, with a tinge of red underneath, yellowish near the base, with a dark purple mouth; biennial. Introduced in 1774. Discerned by Maffion. 5. A. plantaginacea, plantain-leaved arctotis; 6. A. tenuiflora, "radiant florets fertile; leaves lanceolate-ovate, serrate, toothed, f1exu1ng; leaves tomentose underneath; disk barren; perennial; flowers from June till August. Cultivated by Miller in 1708. 6. A. argentii, silver arctotis; 7. A. triloba, "radiant florets fertile; leaves lanceolate-linear, entire tomentose;" flowers yellow, appearing in August; biennial. Found by Maffion, and introduced in 1774. 7. A. agrostisfons, "leaves oblong, toothed;" florets of the disk barren; receptacle very woolly. 8. A. tomentosa, a variety in which the whole plant is white, items creeping, and leaves hyrace with two teeth on each side. 9. A. affinis, white arctotis; 10. A. radiata; 11. A. pinnatifida, "radiant florets fertile; leaves pinnatifide, villous, divisions oblong, toothed; item fluff, perennial, villous, with purple streaks; leaves white underneath; corollas of the ray yellow, with red streaks underneath. There is a variety of this with narrow leaves and orange-coloured flowers. Cultivated in 1731, by Mr. Miller. The preceding eight species have the receptacle villous, but in those which follow it is fiddle. 9. A. paradoxus, chamomile-leaved arctotis; "radiant florets barren; e.flavish coloured, longer than the dish; leaves pinnatifide, linear;" flowers elongate, colored, almost the whole of the flowers; when the flowers appear to be a double one. Gaertner has removed this together with the twelfth and thirteenth species to a genus named Urfinia. This species was introduced here by Maffion in 1774. It flowers in August. 10. A. scariosa, southermwood-leaved Arctotis; "radiant florets barren; chaffy feathering the florets of the disk; leaves compound;" item shrubbery; by all the calyces leaflets obtuse, fiddle, fivelosed, f1exuous, spreading. It flower- from April till August, and was introduced in 1774, by Mr. Maffion. 11. A. palaestina, chaffy arctotis; "radiant florets barren; chaffy feathering the florets of the disk; leaves pinnatifide, linear;" item shrubbery, branching; peduncles axillary, long; with few linear simple leaves; calyx and corolla yellow, like a chrysanthemum; ray simple, barren. It was cultivated in 1758, by Miller. The flowers appear from April till August. 12. A. dentata, fine-leaved arctotis; "radiant florets barren; leaves pinnatifide, indented;" item branching; leaves alternate, somewhat rigid, and villous; petals recurved; peduncles long, one flowered; flowers small, with the ray purple beneath; annual; flowers appear in July. Introduced by Mr. Haneman, in 1787. 13. A. antitomesis; "chaffs shorter than the flowers; leaves supra-decompound, linear." This plant, as its name imports, resembles chamomile; ray barren, violet coloured. 14. A. parviflora; "radiant florets barren; leaves linear, undivided, smooth, item branching, brownish, smooth; leaves linear, the length of the finger, smooth; peduncles very long, one flowered, frequently to be transplanted into pots, which are to be placed in a shady situation, until the plants are now rooted; after which they may be exposed to the open air, till the latter end of October (or later, according to the state of the weather), when they must be removed into the green house. While they continue in the house they ought to have an open and dry situation, and be frequently sprinkled with water. They will also require to be shifted into other pots, two or three times every summer; and the pots should frequently be removed to prevent the plants from shrinking through the bushes into the ground. Several of these grow to the height of four or five feet, and as they send off several branches, they require to be frequently pruned. They are seldom without flowers, unless the winter be severe, which renders them very valuable, making a fine variety in the green-house or cape-love; and when placed out in the summer, they produce flowers in great abundance. See Miller's D.G. by Martyn.

**ARCTOTIS.** See **Gorteria.**

**ARCTOTUS, in Entomology, a species of Papilion (Dan. Faske) which inhabits Netherland. The wings are very cut, and brown; both above and beneath is an ocular bipalpiated mark on the anterior ones; and another on the posterior ones, which is very faintly papillated above. Fabri- cius, &c.**

**ARCTURUM infra, a small star of the seventh or eighth magnitude, to the south of arcturus; offered by Mr. Flam- fleed: and so named by him, whose place is not determined in the British Catalogue.**

**ARCTURUS, in Afronomy, a fixed star of the first magnitude, in the constellation of Arctophylax, or Bootes.**
The word is formed of *opercus*, and *opercus*, tail, q. d. bear's tail; as being very near it.

This flar was known to the ancients, as in the following verse of Virgil:

"Arcutus, pluviaque hyades, geminissque triones."

See also Job 9. xxxviii. 32. Scientists have doubted whether the Hebrew word *עַרְכָּלָא* or *עַרְכָּלָא* refers to this flar. For various opinions concerning its meaning, see Schultens, in Job, vol. i. p. 2-9.

Mr. Horneby concludes, that Arcutus is the nearest flar to our system visible in the northern hemisphere, because the variation of its place, in consequence of a proper motion of its own, is more remarkable than that of any other of the flars; and by comparing a variety of observations respecting both the quantity and direction of the motion of this flar, he infers that the obliquity of the ecliptic decreases at the rate of 5° in one hundred years; a quantity which nearly corresponds to the mean of the computation framed by Mr. Euler and M. de la Lande, upon the principles of attraction. Phil. Trans. vol. lxii. p. i. N° 14.

*Arcutus*, in Botany. See Celsia.

*Arcutus*, in Astronomy, a star given by the Greeks to two constellations of the northern hemisphere; by the Italians called Ursa Major and Minor, and by us the Greater and Lesser Bear.

*Arcutus*, in Entomology, a species of Coccus, that inhabits the seas in molt parts of the world. Its specific character is thus concisely defined: scales of the antennae ciliated, with spines. Fabricius and Gmelin. Off. To this may be added, that the front is recta, and armed with about ten unequal spines; the thorax oblong, and aculeated, and the posterior part oft, together with the upper part of the body, tuberculated, brown, and spotted with yellow. This is called Poliophylyxa, by Maregrave.

*Arcualia Ossa*, in Anatomy, a name used by some for the offa synccpitis, by others for the offa temporan. *Arcualis futura*, among Surgeons, denotes the coronal sutures.

*Arcuana*, in Entomology, a species of Phalaena (Tortrix) found in Europe. The wings are pale yellow; on the anterior pair are three curved black bands, and a spot of the same colour; with a black spot in the pink, having three silver dots upon it. Fabricius and Gmelin. Off. Linnaeus describes it as Phalaena Tortrix alta lutea, facieis tribus areuat, macula sigra, tripunctata lincolique dubus argentata. *Nyt. Nat. En. Su.* &c.

*Arcuanus*, in Lithology, a species of Chaledon, found on the Indian and Arabian sea coasts. The tail is bind; twelve spines in the dorsal fin, and body faciated with brown. This species inhabits the shores among the coral rocks, and feeds on marine worms; it is silvery, back cincereus, with a deep brown or black band on the head, another on the breast, and a third extending from the dorsal to the anal fin. The flesh of this kind is edible.

The head is large; front, and iris of the eye, white; gap narrow: jaws equal; teeth minute, and wedged; branchiostegous aperture ample; operculum simple, mucronate in the middle; ventral fins long, black; anal fin black; dorsal fins cincereus.

*Arcaria*, in Entomology, a species of Phalaena (Geometra). The wings are fuscus, with a thin sphen, and a lunated spot of white near the posterior margin. Gmelin. Inhabits Europe.

*Arcatua*, a species of Coeniaella. This is of an ovate form; wing-caves red, with four dots, two bands and a dot at the apex black. Inhabits China. Fabricius. It is of the middle size; the body black, and head whitish; thorax black, whitish in front and on the sides.

*Arcutula*, a species of Cassida, that inhabits Rio Janeiro. It is whitish, with a common black disk; border oval, ring, and arched mark behind, yellowish. This is about the middle size; and the head and abdomen are black.

*Arcuta*, a species of Lepidura, in the Linnean system; that inhabits Europe. The thorax is rounded; shells with four yellow bands, the first formed of three spots; the others curved downwards, Linn. and Donov. Brit. Inf. Gmelin has removed this, and some others of the Lepidura, to the Cerambyx genus; it is therefore Cerambyx Arcutus of that author, and is arranged in the division Calidium.

*Arcuta*, a species of Cicada (foliacea, Gmelin, Membracis, Fabricius). This insect inhabits Surinam. It is black brown; thorax comprised above, with a yellowish arch. Degeer, and Gmelin.

*Arcuta*, a species of Cimex, (oblungus, Gmelin). It is black; back arched; wing-caves white, with a white spot, and black arched mark, four of the tibias elevated and red. Degeer. Inhabits Surinam, and is the size of the common house-fly, Musca domestica, Gmelin.

*Arcuta*, a species of Phalaena, (notula). The wings are white, the curved mark in the middle, and marginal spot behind are black. Fabricius. This moth inhabits Transvaal, and in size and appearance somewhat resembles Phalaena albicollis.

*Arcuta*, a species of Vespula, that inhabits New Holland, and is described by Fabricius. The body is black, variegated with yellow; the pedis to the thorax and abdomen is incurred, and marked with four yellow spots.

*Arcuta*, a species of Musca, found in Germany. It is tenebrosa; with two spots and a black curve at the apex of the wing; and a white dot at the tip. Fabricius. This greatly resembles Musca hyalina. Gmelin also describes another insect under the name Musca arcutae (in the subdivision Syrphus). It is black, with long antenna; thorax spotted on the sides with yellow, and four curved belts of the same colour on the abdomen.

*Arcuta*, in Ornithology, a species of Fringilla, that inhabits the Cape of Good Hope, and is described by Dr. Latham as being of a chestnut colour above, beneath white; head and lower part of the neck black; collar and stripe behind the eyes white. This is also Fringilla arcutae of Gmelin, but his specific character is certainly less expressive than that of the preceding author: it is likewise Pusser Capitis Bona Spei, of Brieno; Crucaft, of Buffon; Meneau du Cap de Bonne Esperance, of the same author; Pl. ent. and crebcent finch of Latham, Gen. Syn.

It is the size of a house-fly; length six inches; bill black; head and neck before as far as the breast are also black; at the eye begins a streak of white, which pales down on each side of the neck, and growing broader, pales round the fore-part like a crecent; hind part of the neck pale brown; back, scapulars, and lesser wing-coverts, chestnut; the middle coverts black, tipped with white; the great covert and quilua brown, edged with grey; tail deep brown; legs brown.

*Arcuation, from arcus, a bow, is used by some writers in Surgery, for an incursion of the bones; such as we see in the case of rickets, &c.*

*Arcuation, in Gardening, a term formerly applied to the practice of raising trees by layers. Switzer observes that in his time, it was the general method of producing such trees as could not be raised from seeds; as the lime, elder, willow, &c.* See LAYING, and LAYING.

*Arcatus*, in Entomology, a species of Scarabeus, found in Saltsburg. It is black, and glossy; shield rufous,
in front; wing-cases frilled with punctures; future, marginal dot at the base, and abbreviated band inclined towards the future, reddish; base obscure; abdomen yellowish; palpi, antennæ, and legs sericeous. Moll. nat. Br. 1863. n. 7. Gmelin.

Arcatus, in Entomology, a species of Phaenodon, that inhabits Brazil. The tail is entire; eight spines in the dorsal line; and four white arched bands across the body. Gmelin. This is Cethosia fuscus arcatus 9 nigric. of Moll. ad Fr. Gmignone of Maregrave; Ascamedon nigra. &c. of Willughby. The length is about four inches. See ARACANU.

Arcatus, in Ornithology, a species of Turdus, that inhabits China, and was first described by Dr. Latham under the name of the Crescent Thrush. Gmelin gives us this specific character. Above chestnut; the eye-brows, lore, chin, and vast, white; cheeks, and creecent on the throat, white; tail rounded; towards the tip black; spec white. But as this author is indebted to Dr. Latham’s account of this bird, his character should have read "cheeks and crescent on the throat black." In the Index Ornithologicus the character runs thus:—rufu-fuscus. corpore fustus supercilii loriuque albus; cervix jugulo politerrae rubescens, genua lancilque fuscus nigros.

The length is eleven inches; bill lead-coloured, pale at the tip; upper parts of the body reddish brown; over the eye a white line; lore and chin white; cheeks black passing in a crescent on the fore part of the neck; on the middle of the back part behind the eye, a patch of loose white feathers; the hind part of the neck; and the breast reddish; belly reddish white; vent plain white; tail long; legs lead-coloured; claws white.

ARCUBALISTA, in the Military Arts, a kind of bajada, probably made after the fashion of a bow. It is mentioned by Vegetius, but the description it contains by him, as too well known then, though now hard to be guessed at.

Those who fought with this weapon were called arcaubalarites, sometimes manubalitarites.

Arucuicio, Arucio, a machine made of board, covered with pieces of horns like the tail of a waggon: used in Italy to prevent children from being overlaid and smothered by nurseries, or others.

Every nurse in Florence is obliged to lay her child in an arcuicio, under pain of excommunication. —See a figure and description of the arcuicio, given by Mr. St. John, in Phil. Trans. No. 442. Abhid. Vol. viii. part iv. p. 46.

Arucudio, Peter, in Biography, a learned Italian; born in the island of Corfu, and flourished in the seventeenth century. Having studied in the college of the Greeks at Rome, where he made great proficiency in literature, he so much recommended himself by his zeal for the holy see, that he was sent to Russia by Pope Gregory XIV. and by pope Clement VIII., in order to induce that nation to submit to the Roman pontiff; but in the course of twenty years, during which he remained in the country, his utmost efforts were only sufficient for obtaining some inducements for those who observed the Romish ritual. After his return he distinguished himself by his endeavours to refute the Protetants on the subject of the Sacraments; and for this purpose he published a work, intituled "On the harmony of the western and eastern churches in the administration of the seven sacraments," printed at Paris in 1672, 4to. Among his other works were, "On the existence of Purgatory," printed at Rome in 1672, 4to. "On the fire of Purgatory," Rome 1657, 4to; and "A collection of the Greek theologians on the procession of the holy spirits," Rome 1659, 4to. In all his performances he discovers talents and erudition, and at the same time strong traces of passion and bigotry. They are written in Greek; but without any pretension to Attic elegance. Arcudo was an indefatigable student, and his sole amusement was derived from his library. He died at Rome about the year 1672 or 1673. Nov. Dict. Hiflor. Fahr. Bib. Grec. l. v. c. 43. § 12. t. 1. p. 477.

Ardueil, in Geography, a town of France, one league from Paris.

Arcularia, in Conchology, a species of Buccinums, in the section Gallea, (that in which the pillar lip is dilated and thickened). It inhabits the Indian sea, and is thus described by Gmelin: shell plicated, and crowned with papilla. This shell is sometimes white, cinereous, or brown, with a white stripe; and is Acherata major of Rumphia, and Bucinum fosseolus of Cronovitis.

Arculphus, in Biography, a theologian of France, flourished about the year 610. Flavius gifted, on account of religion, the Holy Land, Constantinople, Alexandria, and other places, he was thrown by a storm, on his return to France, on the coast of Britain, and humbly entertained by Adamnon, an abbot. To him Arculphus communicated the result of his travels; and the account which he obtained from him in conversation formed three volumes, which were published under the title of "Libri de Situ Terrae Sancti," as Ingolstadt in 1619. Cave. Hist. Lit. t. i. p. 509.

Arcus, in Entomology, a species of Papilio (Dan. Felt.) The wings are very entire, and blue; anterior ones spotted with white; a large black spot, terminating in another of white near the margin of the posterior ones. This kind inhabits Surinam. Off. Papilio Arcus of Eiper is a different insect; viz. Papilio Attus of Gmelin.

Arda, a species of Termes, that inhabits Africa. We are chiefly indebted to Mr. Smethman, who discovered them in Sierra Leone, for the history of these destructive creatures. In their economy they greatly resemble Termes fulvus, and destructor; for like them they attack and devour provisions, clothes, and furniture, and indeed they are in such numbers, and so rapacious, that where they settle, few things can escape them. They can perforate a piece of timber of the greatest magnitude, and in a few hours leave nothing but a thin outer sheat of it. The neels are cylindrical, and from two to three feet high; they are formed of brown clay intermixed with grouts, and various other vegetables, and have a vaulted dome at top, with a prominent entire margin surrounding it. The larvae are the hewlers, and have a pale head; moniform antennæ; no eyes; jaws short and toothed; thorax and abdomen ovate; are of a cinereous lead colour; and the legs pale. The Papes are the soldiers to protect them; their head is large and tesselaceous, elevated and gibbons in front, and obtusely ovated behind; the jaws project, and are forked, black; antennæ moniform tesselaceous, as long as the head; no eyes; thorax small; abdomen ovate, cinereous lead colour; legs tesselaceous. Image, or perfect insect, is black; margins of the segments of the body white; wings incumbent, black, all the legs pale tesselaceous. Fabriscius. The character of this species, according to the last-mentioned author, is thus defined, black; segments of the abdomen white at the tips; legs pale. Gmelin adopts this Fabriescian description.

Arda, in Geography, a town of European Turkey, in Romanis, 60 miles south of Filippopoli—Also a river of European Turkey, which runs into the Mariza, 10 miles north of Trazanepuli.

Aradabigana, in Ancient Geography, a country of Asia, between Albitria and Persepolis, according to Procopius.

Aradachat, in Geography, a place in Armenia, so called from the name of Araxias, denominated in the east Ardechier; in which are seen some ruins of the ancient Aratakata.
ARDACHER, or ARDAGH, a town of Germany, in the arch diocese of Aulria, near the Danube, ten miles south-west of Lips.

ARDAGH, in the county of Longford in Ireland, so called from its elevated situation, at present an insignificant village, but formerly of so much consequence as to have given name to a barony, and to have been a bishop's see. The church is one of the most ancient in Ireland, but cannot be called a cathedral. The see was founded in the middle of the fifth century. In 1658, it was united to the bishopric of Killmore; from which it was separated in 1741, and has since been held in commendam by the archbishops of Tuam.

ARDAL, a town of Norway, 24 leagues north of Christiania.

ARDAMON, or ARDAMA, from ar, water, in antiquity, a vessel of water placed at the door of a person deceased till the time of burial, as a token that the family was in mourning, and to serve to sprinkle and purify persons as they came out of the house.

ARDANIS, in Ancient Geography, a town of Africa, in Mauritania, according to Ptolemy.

ARDASSES, in Commerce, the coarsest of all the filks of Persia; and, as it were, the refuse of each kind. In this silk, they say, the legs, the boughs, the end, and the pages are rifed, to signify the worst of those four sorts of Persian silk.

ARDASSINES, in Commerce, called in France ablaque; a very fine sort of Persian silks, little inferior in fineness to the four, or rather caroubis; and yet it is little used in the silk manufacturies of Lyons and Tours, because that kind of silk will bear hot water in the winding.

ARDATOF, or ARDATOV, in Geography, one of the thirteen districts of the government of Nihui-Nogvorod in Russia, situate on the river Teth, falling into the Oeas.— Alto, a town of this district, sixty miles S. S. W. of Nihui-Nogvorod. N. lat. 58° 20'. E. long. 45° 4'.— Alto, a district of the government of Simbirsk, situate on the Alator.— Alto, a town of this district, ninety-two miles west of Simbirsk. N. lat. 54° 45'. E. long. 45° 44'.

ARDAXANUS, in Ancient Geography, a river of Illyria near Liffis, according to Polybius.

ARDEA, a town of Persia, according to Ptolemy, and Ammianus Marcellinus.

ARDEA, a very ancient town situate on an eminence south-west of Lavium; at the time of the arrival of Xerxes, it was the capital of the Rutuli, governed by Turnus. The Romans established a colony in this place in the year 311. The territory of Ardea was marly and unhealthy. In its vicinities was a temple dedicated to Venus.

ARDENS, in Ornithology, a genus of the fourth order Grallæ. The bill is straight, pointed, long, flitely compressed, with a furrow extending from the nostrils towards the tip; nostrils linear; tongue acuminate; feet four-toed. Gmelin. Dr. Latham gives another character for this genus, viz. a long, strong, sharp-pointed bill; nostrils linear; tongue pointed; toes connected by a membrane, as far as the first joint; the middle claw of none of the species pediculated. Gmelin divides his genus into five sections; and the following are the characters of those sections, with the species respectively referred to each.

* Grifiles; rutilo vivipatra longiori (crested; bill feebly longer than the head.)—Pavonina & Virgo.

** Grus; capite calvo, (cranes; head bald) canadenisis grus, americana, antigone, & gigantea.

*** Cicione, orbitis nudis (storks; orbits naked) cicione, magnaria, & nigra.

**** Aderia; uoque intermedius interdum ferrato, (herons; middle claw ferrated inwardly, dubia, torquata, nycticorax, grifea, jamaicensis, colelanima, ceyxus, purpurea, major, cinerea, gazetta, leucogaster, infeica, uetro, aguia, cocco, johannae, boulo, bossus, herodias, luidovica, vesper, carula, rubiginosa, ludifina, conua, erythrophala, ohula, cyanophala, candidissima, calluna, aquitania, galata, ferruginea, erythropha, lilata, virens, vellaris, botaurus, solonensis, marigii, danubialis, undula, brasilienis, tigrina, lineata, flavus, monemius, alba, nivea, helia, fascia, atra, purpurata, sipadica, squamata, erasmus, leucophala, rufa, lineata, virgata, cana, carusulata, maculata, cinermonaca, punita, badia, philippinensis, nova guinea, cyanopus, maculata, gardeni, fregalesius, exilis & minuta.

***** rollo in medio hiante, (bill, gaping in the middle) pandionis, coromandeliana & scoleopaca. Which fee respectively.

ARDEA avicola auria, Petiver GEE. GS. t. 43; f. 2. This is the Linnæean Columba orizurica.

ARDDEA, in Natural History, the specific name of that kind of Echinorhynchus which infests ardea cinerea, (the common heron.) It is flattened, and has the proboscis clavated. Goeze. Gmelin, c. 282. The body is comically behind, and situated on each side in the middle.

ARDDEA, or ARDEA, in Geography, a town of Persia, in the province of Aderbittan, or Aderbija; situate in the midst of a large plain, and surrounded by mountains which form a kind of amphitheatre. It was formerly a strong city, and had considerable trade; but it was plundered and burnt by the troops of Jengiz Khan, about the year of the Hegira, 619. A. D. 1222. Its grand square, called "Miledan," has a caravanserai, and various conveniences for merchants, who frequent the city, from Turkey, Tartary, Hindostan, and other countries; and near it is a bazaar or market, in which are sold the most valuable merchandise of the produce and manufactures of the country, as well as other articles, European and Asiatic. The tomb of Scher Schi, a celebrated saint, is an inviolable asylum, frequented by pilgrims from all parts of Persia. Caravans are frequently passing through this town from and to Constantinople and Smyrna. N. lat. 37° 20'. E. long. 45° 5'.

ARDDEA, LITTLE, a town of Persia, in the province of Farsian, 18 leagues north of Schiras.

ARDDEC, a town of Persia, in the province of Isk; 43 leagues east of Isphahan.

ARDDECHE, one of the departments of France, derives its name from a river of the Vivarais, which rises near Vals, and discharges itself into the Rhone, near Pont St. Esprit. This department is one of the seven formed of Languedoc, Cominges, Neubian, and Riviere Verdun. It is bounded on the north by the departments of the Drome, Iere, and Lower and Upper Loire; on the east by that of the Drome, which is separated from it, from one extremity to the other, by the Rhone; on the south, by the department of Gard; and on the west by the departments of Noise and Upper Loire. Its superficies is about 1,077,925 square acres, or 550,054 hectares; the population consists of about 275,255 persons; and it is divided into three communal districts. The chief town is Peivas.

ARDDE, or ATHERDEE, a small town in the county of Louth in Ireland, much declined in importance. Near it is a mount of great magnitude called Castle-guard. It is artificial and encompassed with a double ditch. It is now all planted with wood, and has a very romantic appearance. The perpendicular height of the mount from the bed of its foundation, is nearly ninety feet, and the depth of the main trench betwixt thirty and forty. The circumference at the top is not less than 140; and round the foundation it is upwards of 600 feet. There appear, from foundations yet remaining, to have been two concentric octagonal buildings upon
ARD

upon the summit of it. The Danes are supposed to have been the original authors of this and similar mounts; the design of which, whether for defence, or for burial places, or for holding assemblies of the people, has not been ascertained. Latitude, from observation of Dr. J. Hamilton, 33° 50' 30".

ARDELICA or ARIOLICA, now Paphlagonia, in Ancient Geography, the place in Italy, at the confluence of the lake Benevent with the river Mincius, where Attila had an interview with Leo the Great, and the deliverance of Italy was purchased by the immense ransom or dowry of the princes Honorius.

ARDELL, MAC JAMES, in Biography, an eminent engraver, was born either in Ireland or in England, of Irish parents, and resided chiefly in London, where he died, June 2, 1765. Bufen calls him "one of the best engravers in Mazoziotive that England ever produced." His works are chiefly portraits, from the most celebrated painters of his time. His bell engravings are said to have been from Van- 
dyke. Two most beautiful prints from this master are, “Time clipping the wings of Love,” and “Moes in the ark of bulrush.”

ARDEN, OR ARDON, in Geography, a county of Swif-

ARDENBURGH, a town of Flanders, and formerly one of the most considerable maritime towns of the country; but now much decayed; four leagues N. E. of Bruges, and two S. E. of Sluys.

ARDENELLA, a town of Hindoostan, in the country of Coibatore, forty miles south of Serigapatam.

ARDENNES, a forest of France, of ancient fame for events of chivalry, extends from Rheims to Tournay, and in the north-east to Sedan. Its extent, however, has been very variously affirmed. From this forest one of the departments of France derives its name. It is one of the four composed of the former Champagne, Charleville, Sedan, Carignan or Mounfou, Philippeville, Mariembourg, Givet, and Charlemonl. It is bounded on the north by the department of Sambre and Meuse, and of尽快; on the east, by those of Sambre and Meuse, of the Forests, and of the Meuse; on the south, by those of the Meuse, the Marne, and the Aisne; and on the west, by those of the Aisne and of the Jamaica. Its superficies is about 1,029,150 square acres, or 352,181 hectares; the population consists of 353,602 persons; and it is divided into five communal districts. Its chief town is Mezieres.

ARDENSAEN, a town of Aisne, in the province of Al-

daux, thirty-eight miles north-west of Arzingeran.

ARDENT, ARDENS, from ardor, to burn, something hot, and as it were burning. Ardent fever is a burning fever, otherwise called causus.

ARDENT spirits are those distilled from fermented vege-

faces; thus called because they will take fire and burn; such as brandy, spirit of wine, rum, arrack, &c.

ARDENTES, in Middle Age Writers, an appellation given to those afflicted with the ignis facer, or erysipelas. They are thus called, as seeming to be seared or burnt with the diphtheria.

Hence also the abbey of St. Genevieve at Paris is called domus ardentium, because, as it is said, great numbers were cured of that distemper at the shrine of this saint, in the reign of Louis VI.

ARDEOLA, and ARDEOLA NACIJA, in Ornithology, the names by which Brisson calls the Linnean Ardea minuta.

ARDERN, JOHN, in Biography, contemporary with Guido of Chauliac, acquired considerable reputation for his skill in the practice of surgery and medicine. He was fe-
ted at Newark in the year 1349, when the plague broke out, and continued there until the year 1370, when the fame of his practice occasioned him to be called to London, where he was employed by persons of the first rank and con-
sequence. He was successful in the cure of fistula in ano, having very much improved the method of performing the operation for that complaint, which, before his time, was effected either by the actual cautery, or by sawing through the rectum with a thread, which must have been a very painful operation. His treatise on fistula in ano, the only part of his large work that has been printed, was translated and published by John Read in the year 1538. He invented a new instrument for giving gynery, upon which he valued himself much, and with reason, as it seems to have been pro-
ductive of much profit to him, "having gained much credit (he says) for his skill in injecting them an hundred times, and in distant places": whence we learn the practice of giving them was little used or understood in this country at that time. He was very careful to make a good bargain with his patients, before he entered on the cure; "to provide for as large a sum as he could get, and to take security for the payment;" a practice, Aikin observes, that prevailed in France at the beginning of the last century. We are told in the eloge of M. Marthou, published in the memoirs of the Royal Academy of Surgery, that when he was ap-
pointed full surgeon to Louis the Fourteenth, in the year 1703, he generously threw into the fire obligatory bonds from his patients, to the value of 20,000 livres. Friend's Hist. of Physic, vol. ii. p. 325. Aikin's Biog. Med. of Med.

ARDERO, in Geography, a town of Italy in the king-
dom of Naples, and province of Calabria Ultra, seven miles south of Gierace.

ARDERS, in Agriculture, a term provincially applied to signify fallowings or repeated ploughings of land.

ARDES, in Geography, a narrow peninsula in the county of Down in Ireland, formerly a county of itself. It lies between Strangford lough and the North Channel, and is reckoned tolerably fertile. The people of the whole dis-

ARDIFERT, in Geography, though now a small decayed village, was formerly the principal town of the county of Kerry in Ireland, and, till the union, retained the privilege of returning two members to parliament. It is also a bishop's see, which includes the whole county of Kerry and a small part of Cork. It is supposed to have been founded in the fifth century; and was at an early period incorporated with Aghadoe as to form but one diocese, which was sometimes called the bishopric of Kerry. In the civil 

ARDGLASS, a decayed town of the county of Down, in Ulter, Ireland; about seven miles from Downdistick, situated on a small harbour of the same name. It was, in

4 N 2 the
the reign of queen Elizabeth, a place of considerable trade; and gave the title of sail to a branch of the Cassandra family. The duke of Marlborough was last in turn to be called the beginning of Chalks the first reign. This name is very considerable. There is a large range of building, erected by the inhabitants, the New Works, though they have no tradition of its design or use. It extends 2,241 feet in length, but is only 90 broad. It has three towers in front joined to it, one at each angle, and one in the center. There are also the remains of several other towers, walls, and gates; and within the N. E. point of the harbor, there is a curious natural cave, with a large entrance on the shore. Tour through Ireland — Dublin, 1788.

ARDILA, or Ardhi, in Ancient Geography, a river of 11 km, according to Stephan. Byz. and Strabo.

ARDIERE, in Geography, a river of France, which runs into the St. Martin, in the principality of Durbu.

ARDILIA, a river which rises in Spain, and discharges itself into the Guadiana, near Moura, in Portugal.

ARDISIA, in Botany, Lin. g. Schults. 1755. Swartz. prod. 46. called into Angiullaria and Bifidae. Juss. 420. Cal. Lin. 1753. Horst. Gen. Char. Cal. punctum, one-leaved, five-clawed, leafy, fimbriate, obscure, coloured, permanent. Cor. one-petalled, tube short, the length of the calyx; border five-petalled; parts lanceolate, scented, spreading, at length reflex. Stam. filaments five, fimbriate, upright; anthers acute, upright, bifid at the base, converging at top round the style. Fil. germ superior, ovate, very small; style fimbriate, longer than the stamens, upright, at length spreading; stigma simple, acute, permanent. Per. berry roundish, large. Seed fingle, roundish, covered with a hard, bristly rind, like a nut.

Species 1. A. exsua, harel-leaved ardisia; anguillaria bahamensis. Garnt. H. 1. 1572. " Racemes axillary, simple; leaves ebovate, cartilaginous, ferrate at the edge; clefts of the corolla almost twice as long as the leaves of the calyx; flowers inserted into the corolla." This tree is a native of Madagascar, where it was discovered by Mathon, and introduced here in 1784. 2. A. exsua. Swartz. prod. Sloane jam. 2. 58. 1. 205. f. 2. " Flowers panicled; leaves elliptical, entire, serrated; fimbri obscureus." Leaves thick, oval, entire, evergreen, shining, very smooth, alternate, smooth, fimbriate, attenuated at the base; flowers at the top of the branches, in numerous racemes, wheel-shaped, with a long tube of a red colour; berries smaller than that of the preceding species. A native of Ceylon. 3. A. tenfifolia. Swartz. prod. Sloane jam. 2. 58. 1. 205. f. 2. " Flowers panicled; leaves elliptical, entire, serrated; fimbri obscureus." This tree rises to about 40 feet high, having an afro-coloured smooth bark; leaves very smooth, of a dark green, four inches long, on short foot-stalks; flowers purplish. A native of Jamaica. 4. A. coriacea; " flowers panicled; leaves oblong, entire, velvety, coriaceous." 5. A. floribunda; " flowers panicled; leaves oblong, lanceolate, acuminate, wrinkled; stem fimbrius. Pubescent." 6. A. latifolia; " racemes lateral, or axillary compound; leaves umbellate; leaves obovate, acuminate; entire; fimbri obscureus." 7. A. alpigena; " racemes axillary, simple; leaves fimbriate, lanceolate, ovate, marked with lines; stem fimbrius.

The four last-mentioned species are natives of the West Indies, and are hitherto only known from Swartz's catalogue.

ARDISTAMA, in Ancient Geography, a town of Afia, in Georgia, according to Ptolemy.

ARDMORE HEAD, in Geography, a noted promontory on the south coast of Ireland, in the county of Waterford, a little to the east of Youghal bay, N. lat. 51° 56', W. long. 7° 24'. Near this is the village of Ardmore, an ancient episcopal see, and thought to have been a Daithi settlement.

Its round tower is still in existence. The name Ardmore, signifies a great eminence. Smith's Waterford and Collect. de R. H. Hib.

ARDORIUS, a mountain in Nova Scotia, between Windsor and Halifax, 11 miles N.W. from the latter, reckoned the highest peak in the province, and affording a fine prospect of all the high and low lands about Windsor and Falmouth, and the distant country bordering the habit of Minaas.

ARDONI, a town of Italy, in the kingdom of Naples, and province of Capitanata, 12 miles north of Alcioli.

ARDORIUS, in Ancient Geography, a town of Ilyria, far from the sea, in the territory of the Labarumians, according to Ptolemy.

ARDONIUS, Geography, a town of France, in the department of Lys, and chief part of a canton in the district of Bruges. The place contains 6,875, and the canton 12,105 inhabitants: the territory includes 774 square kilometres and 4 communes.

ARDRAH, or Arder, in Geography, a kingdom of Africa, on the Slave coast, bordering on Whydad. This kingdom extends for a considerable distance into the northern and interior country, abounds with populous towns and villages, and is in general fertile and well cultivated. The inhabitants are warlike. It is bounded on the west by the Rio Volta on the call by the kingdom of Darien proper, on the south by the ocean, and on the north-north-west by the kingdoms of Oyo and Algheri or Ulcinum. To the south, or sea coast, Ardrah is very confused; and as it extends northward, widens into the form of a triangle. The coast, commencing four leagues east of Great Porto, and ending at Acqua, comprehends the space of twenty-five leagues, if the province of Jachen, which has a prince at present, is added to Ardrah, he included. Bofman and Barbier divide it into Great and Little Ardrah; comprehending the other parts of the maritime coast, and under the latter form a triangle. The coast is low and flat, but rises by a gentle ascent towards Jachen. North of Jachen, are Offra, Great Foro, and Afem, the capital of Ardrah. The other principal towns are Iago and Bai. Iago or Iago has two gates to the south, and is washed by the river on the north, that falls into the Rio de Formosa, or river of Darien, at Bai, where the Dutch have a small fishery. Between all the cities are great roads, and canals are cut from one river to another, which, by the canals that traverse them, indicate wealth and industry. The valleys of Ardrah are pleasant, and produce wheat, millet, yams, potatoes, lemons, oranges, cocoa-nuts, and palm-wine. In the low and marshy grounds near the sea, they make salt by evaporating the diluted water; and with this they carry on a considerable trade with both Oyo and Offra. By the river of Oyone, which is the fall in the kingdom. The air is, in general, wholesome. The vulgar, who can neither read nor write, use a small cord tied in knots, to each of which they affix certain ideas, and thus they convey their sentiments to a distance. The manners, do, and religion of the Ardrahans resemble those of the inhabitants of Whydah; and polygamy is equally allowed in both countries. The inhabitants of the sea-coast are employed in fishing, and manufacturing salt; and those of the interior country in husbandry. But they have no ploughs nor instruments of agriculture; the whole labour being performed with the ipade and mattock. Instead of a public burying-place, the inhabitants of Ardrah are interred in a family-vault constructed in their own houses.
As to the government of Ardash, it is monarchical and despotic. The court is numerous and splendid; and the chief-priest is second in dignity, and prime minister in temporal as well as in spirituals. The crown is hereditary; and its revenues arise from heavy capitations on the natives and foreigners, the sale of slaves, duties on foreign trade, taxes upon markets and the necessaries of life, and the confiscation of the estates of governors. Disobedience to the king's commands incurs the punishment of beheading; and the consequence is, that the wives and children of the offender become the slaves of the crown. Inoffensive debtors are sold at the pleasure of the creditor; and the violation of the marriage bed is punished with servitude. The goods proper for importation to Ardash are large white beads, glass crystal ear-rings, gilt hangers, iron bars, failures, knives, copper bells, guns, copper and brass basins, coloured taffeties, striped printed silks, embroidered handkerchiefs, long white horse tails, looking glasses, large umbrellas, brandy, china, Indian silks, gold and silver in dust, with English and Dutch coins. Mod. Us. Hist. vol. xiii. p. 359-374.

ARDRE, a river of France, which joins the Loire at Nantes.

ARDRES, a town of France, in the department of the Straits of Cainis, and chief place of a canton in the district of Cains. On an open plain between Arette and Guines, was the celebrated interview of Henry VIII. of England with Francis I. king of France, in 1510. The two kings and their attendants displayed their magnificence with an emulation and profuse expense, which procured it the name of "the field of the cloth of gold." Feasts of chivalry, parties of gallantry, and such exercizes as were reckoned in that age most free and elegant, rather than serious business, occupied both courts during eighteen days that they continued together. After the wrestling between the French and English was concluded, in which the latter gained the prize, the two kings retired to a tent, and when they had drank together, the king of England feized the king of France by the collar, saying to him, "My brother, I must wrestle with you!" and he endeavoured once or twice to trip up his heels; but the king of France, who was a dexterous wrestler, twisted him round, and threw him on the earth with prodigious violence. The king of England wished to renew the combat, but was prevented. Robertson's Ch. V. ii. p. 110.

ARDROSSAN, the name of a small promontory on the west coast of the county of Ayr, terminating in a ridge of rocks running out into the sea, twelve miles W. N. W. of Ayr.

ARDSALLIS, a village in the county of Clare, Ireland, near which is the abbey of Quin, the whole building of which, including the cloisters, dormitories, halls, &c. as well as the chapel, is still in a state of tolerable repair, except the roof. The buildings are in a good style of Gothic architecture, well contrived and neatly executed.

ARDISCHIR, or Artaxerxes Babegan, in Biography, and Ancient History, a Persian king; and founder of a new dynasty; under the appellation of Saffianides, was defeced, as his enemies say, illegitimately from an offere family; ni. by the fatti ry of his adherents, from a branch of the ancient kings of Persia, reduced to an humble station. If we credit the former, his mother was the wife of a Tanner, whose name was Babec, and his father a common foelder, of the name of Saffian: from the former, Artaxerxes obtained the surname of Bahegan; and from the latter, all his descendants have been called Saffianides. However this be, he was well educated, and served with great reputation in the armies of Artaban, the last king of the Parthians; but being driven into exile and rebellion by royal ingratitude, he fled into Persia proper where it is said his grandfather had been a governor, and took up arms, in order to assist the throne, as lineal heir of the monarchy, and also to relieve Persia from the yoke of the Parthians, under which they had groaned above five centuries, since the death of Darius. The Parthians were defeated in three great battles; and in the heat of their battle King Artaban was slain; so that in consequence of it, the spirit of the nation was for ever broken. Ardshir then affirmed the sovereignty, with the title of "King of Kings," which he had been enjoyed by his predecessor, and his authority was solemnly acknowledged in a great assembly held at Balsch in Khorasan. This great revolution, which established the empire of the Saffianides over Persia, till the invasion of the Arabs and the fatal influence of which was soon experienced by the Romans, happened in the fourth year of Alexander Severus, 226 years after the Christian era.

ARDUTHA, a town of Scotland, in the county of Ayr.

ARDROSA, in Ancient Geography, a city of Dalmatia, which was taken by Tibetius.
areas in country, or the shade of country.

proper perianth three-leaved. Cor. petals three, acuminate, rigid. Stam. filaments nine, the three outer longer than the others. Female flowers, in the same spadix; proper perianth and petals the same as in the male. Per. berry subovate, fibrose, surrounded at the base with the imbricate calyx. Seed ovate.

Eff. Gen. Char. Cor. three-petalled; male nine-flowered; female a drupe with an imbricate calyx in general use.

Species 1. A. catechu, (Herba calceata) ; leaves folded back, opposite, and bittern. A. jasmin. Gaertn. f. l. 10. Pinanga, Rumph. Amb. 1. 46. t. 5. Compa, Rhed. Mal. i. p. 5. t. 5—8. This palm grows to the height of forty or fifty feet; trunk straight, round, about six or eight inches in diameter, and covered with a smooth ash-coloured bark marked with parallel rings. The fronds spring forth in pairs, decumbent, encircling at their base the two of the trunk, and forming an oblong head larger than the trunk itself; they are about six or seven, unarmed, reclining, six feet long, on a stipe four feet in length. From the axils of the fallen fronds issue the sheaths which inclose the flowers and fruits. These sheaths are simple, sharp-pointed, white, coriaceous, thin, flaccid, deciduous, nearly two feet in length, six inches broad, and defended by a wide involucre, formed of the dilated base of the frond involving the spadix and spadix, spadix axillary, branched, reclinata, spadix linear, containing male and female flowers condensedly mixed; flowers white, very small, triangular, smell sweet but faintly morning and evening; the calyx of the male is three-leaved, but that of the female six-leaved, imbricate and unequal. The fruit, according to Gesner, is a borne drupe, or berry, having a thin cuticle and a thick filamentous pulp; shell very thin, brittle, white, with arched red veins; fruit of a rounded conical form. A native of the East Indies. The Indian drug formerly called terra japaena, and now catechu, was very generally considered to be an extract prepared from the seeds of this palm; and hence Linnaeus in his Mat. Med. has referred the catechu to the area here described; but it is well known at present that this drug is manufactured from a species of mimosa. The trivial name of catechu, as tending to mislead, should therefore be abolished here, and confined to the mimosa. The fruit of the area (betel-leaf) is in general use by the Indians, who cut it into slices, and present it with a portion of terra japaena and shell-lime to their guests in all visits, wrapped in the leaf of a small tree called pain. It is chewed like tobacco, and tinges the saliva of a red colour, hence the following lines in Mifs. Nat. Cur.

Quis foliis credat commixta calce tenebri,
Cum fructu loci Indos vefci, unde orae eurent
Purpurum ejiciunt succum, tam dentibus aris
Horrendum arringunt, et dentibus ore minatur?

2. A. oreziformis, (fronds pinnate; leaflets smooth, three-nerved.) Gaertn. f. 1. 23. A. sylvestris. Lour. Cochinch. 568. Pinanga oreziformis, Rumph. Amb. 1. 46. t. 5. f. 1. c. This is a slender palm, growing to the height of ten feet; fronds more than three feet in length, without prickles; stipes triangular, dilated at the base, coriaceous, embracing the stem and fructification; leaflets two feet long, opposite, triplicate, dentate, either pointed, or end bitten; spathe membranous, white, flint; spadix spaded; spadix linear, with the flowers regularly disposed, one female between two males; calyx of the male three-leaved, with subulate unequal leaflets; enolals three-petalled, almost closed; anths twenty-four, linear, without filaments; calyx of the female permanent; its leaflets broad, obtuse; germ oblong-ovate; stylo none; stigma three-leaf; berry ovate, red, scarcely larger than a grain of wheat; pulp or rind thin, fibrous, smooth, adhering to the seed, so that the cell is not inrolled with its proper coat, as in the preceding species; seed ovate, conical, hollowed, at the base within which is a very minute testa; it is solid, horny, and half an inch in length. A native of Cochinchina, Ambon, &c. Its fruit, though much smaller than that of the preceding, is also used in paans. Although this palm has the habit and fruit of the areca, yet the flowers and position of its flowers threw it to be very nearly allied to the Caryota. 3. A. orienae, cabbage-tree; 'leaves quite entire," Jacq. Amer. 278. t. 170. p. 135. Palma aligiafula. Mill. Sloane, Browne. The cabbage-tree is the highest of the American palms. Some authors say that it frequently rises to above 200 feet in height, with a trunk no bigger than a man's thigh, and covered with a coat which is impenetrable to a musket ball. Modern writers, however, describe it from thirty to one hundred feet. It is very different from the East Indian areca. The sheaths of the leaves are very close, and form the green top of the trunk, a foot and a half in length. Below this come out green shining spathes, which fall off when the branching spadix bursts forth. The calyx is one-leaved, cut to the middle into three segments. The fruits are oblong, obtuse, berries of a blue purple colour, and about the size of an olive. Obtaining a stone or nut which is oblong, membranaceous, smooth, brittle, inlaid with a very hard cartilaginous kernel. Within the leaves, at the top of the palm, is found a white heart of eight or nine inches in circumference, which is called cabbage, and which is esteemed a great luxury by the inhabitants, who eat it either raw as fallad, or fried with butter, as well as boiled, and compare its taste to that of artichoke. The seeds of this beautiful tree were first carried to Jamaica by admiral Knowles, when governor of the island, and it has since been cultivated with great care. It is there planted for its beauty, and seldom or never cut down for the cabbage or for any other purpose. The West Indian cabbage-tree was introduced into the king's garden at Kew by Hinton East, esquire, in 1758. There is also a species of palm, called by Solander Areca Sapidus, which grows spontaneously in New Zealand, and abounds in Norfolk island: but the fructification of it is not known. Many of Miller's Dict.

ARECA, in Ancient Geography, a town of Syria, in the Comagone, not far from Antioch, at the foot of mount Taurus.

ARECA, or Karle, in Geography, an island of Africa, on the east coast of the gulf of Peru, between Abufecheir and Bender Rigk, one league south-west of Ormus, about three leagues in circumference. It contains only a single village; but the aqueducts cut in the rocks, which still remain, shew it to have been more populous in proportion to its extent. The Dutch attempted to establish a factory and build a fort here, but they were expelled by the Arabs under the conduct of Mir Mahanna, in the year 1765.

ARED, Arab, or Arab, one of the two principal districts of the province of Neger or Nejasj in Arabia; the other being called Kerje or Kerfje. This district borders on Hejar or Lahja to the east, and contains a district called Harina, anciently celebrated and full known under the same name. Its dependencies are Ajene or Aijana, a town which produced Abud al Wakhfe the new prophet, and Munfaha. Niebuhr mentions other towns of Ared, among which is Jcbria on the confines of Lahja. See Arab.

AREIRA, in Botany. See SCHINUS.

AREKEA, see AREEKO.

ARELATE, ARELATUS, now ARLs, in Ancient Geography, a city of Gaul, situate to the left of the Rhone, at the place where it divides itself into three branches, near
its mouth, and belonging to the Salvii. At this city Car-
far, when he determined to lay siege to Marseille, fitted a
squadron of twelve long vessels; and Strabo speaks of
this place as a commercial emporium. Pompeius Mela
speaks of it as one of the richest cities in Gallia Narbon-
na; and Pumy, Antemolus, and Strabo represent it as a
colony. The colonies conducted thither under the name of
Thebans were detachments of the fifth legion, whence it
was called Colonia Septimiana. When the Roman
province was divided into Narbonna and Vercellian,
Arelate belonged to the latter; and in the time of Co-
stantine, it was extended, by means of a bridge, from
the left to the right side of the Rhone, and the right
extremity celebrated on it the Circensian and Olympic games, in 311.

The emperors Valentinian and Honorius honoured it with
many fabled privileges, whence the poet Ausobius called it
“the Rome of Gaul.” It became at length the seat of a
prætorian prefect, and was in reality the chief city of the
Gauls. Whil st its civil state was improved by its popu-
lation and commerce, and the distinguished patronage of
the Roman emperors, its ecclesiastical power was also aug-
mented by the activity of its bishops. By the council of
Tours, in 387, it was erected into a metropolis; the fe-
asts likewise flourished in this city; and the fertility of its
territory gave it the appellation of “Thomas,” from the
Greek word ἵθα, the bread. The amphitheatre of this
city, though it was never completed, is still one of the
finest monuments of antiquity belonging to the Gauls.

By an infraction it appears, that the flocks of the gladi-
ators were exhibited in this place. See ARENS.

ARELIS, in Botany. See ARELIS.

AREM, or ALAREM, a square mound or dam, which
formed a suspended reservoir above the city Saba, whole
ruins captured an inundation, famous in calmer writers.
Sale’s Prel. Disc.

The word arem is Arabic, and literally signifies
some mound or dam, for the containing of water.

AREMBEBG, in Geography, a town of Germany, in
the circle of the lower Rhine, and capital of a duchy to
which it gives name, situated on the Ahr in the Eifel, six-
teen miles S.S.W. of Bonn, and twenty-six south of Co-
logon. N. lat. 50° 32’. E. long. 6° 74’.

AREMBOBST, in Ancient Geography, a town of India, on
this side of the Ganges, according to Ptolemy.

ARENA, among the Romans, sometimes figured the
name with an amphitheatre; viz. a place where the gladi-
ators had their combat. The word is Latin, and signifies
fand; because the place was always freel of sand or
faw-dust, to prevent the gladiators from flinging, and to con-
ceal from the view of the people the blood f-ll in the com-
bat. Properly speaking, See Neat was only the pit or space in
the middle of those places where the atheists and gladiators
performed. The arena was the same thing with regard to
the gladiators, that the campus, or field, was to soldiers
and armies; viz. the place where they fought. He who
fought in the arena was called arenarius. Nero is said to
have frequed the arena with gold-dust.

ARENA, in Architecture, is the middle or body of a tem-
ple, and comprehends the whole space between the ante
and the extreme wall of the building.

ARENA CIUSEPPE, in Biography. See GIUSEPPE.

ARENA, in Geography, a river of Sicily, which runs into
the sea near the town of Mazer.—Also a town of Italy,
in the kingdom of Naples, and province of Calabria ultra;
sixteen miles east of Nocera.

ARENA, is also a port in the island of Puna, in Guayquil
bay on the western coast of South America, eight leagues
E.M.E. from Santa Clara, where all ships bound into
the bay take pilot.

ARENACEA, in Botany, a species of Phalacus,
in the Bromeli family. The spikes are yellowish: the first
pair sprinkled with black spots above. Distinguishes the Cape
of Good Hope. See GESMEIN.

ARENACM, in Ancient Geography, Procris or Arcis,
the name of a Batavian fort constructed on the Rhine, not far from the place where this river separates to
form the Veland. Tuchman informs us, that Aquileius
afterwards an army in this place to attack the Batavi.

ARENUS, or AREAE, a people of Alba Minor in 148, in the vicinity of Pompeii.—Arenus was also a place
of Scars in Batiaca, on the coast of the Thracian, extending
from the mouth of a fresh river, where was seated Colonia,
the modern city of Thess.

ARENATU, from arena, ground, in Botany, sandwort.

ARE, or AREN, of AREN, five-leaved; leafless oblong, acuminate, spreading,
perennial. Pet. petals five, ovate, entire. Stem. fla-
mum four, subulate, five, alternate interior: authors
roundish. Pet. petales ovate; style from erect reflex; lig-
ament thickish. Per. capsula ovata, covered, one-celled,
three or six-valved. See very many, kidney-shaped. Ovul.
The number of anthers is not constant.

Eff. calyx perianth, spreading; petals five, entire. Calyx}
superior, one celled, many-seeded.

Species 1. A. pholadis, a sandfounder, or thick-wood.

ovate, acute, fleshy; calyx obtuse, nerves, smooth; petals
recurred, smooth, entire; flowers white, appearing in June
and July; capsule roundish, three-valved; seeds large,
black, obvate. Common on the sea-coast. 2. A. tetragro-
ica, square foundowrt; “ leaves ovate, keeled, recurved,
produce four ways; ” petals almost upright and, very numer-
ous, shorter than the flowering stems; flowers marked
with lines, in a head, upon terminating bifid peduncles. A
native of the Pyrenean mountains, flowering in July. Intro-
duced into Kew garden in 1776, by Dr. Ortega. B. pto-
C. 4. 140. A variety with “pointed recurved leaves, and
aggregate flowers.” 3. A. biflora, two-flowered foundowrt:
leaves obvate, obtuse; fruits succulent, peduncles two-
flowered, lateral; its leaves referable those of wild thyme,
roundish, even; two linear bracts at the division of the
peduncle, and also on the other pedicel. A native of the
high Alps of Savoy and Switzerland near the melting snow.
4. A. interflora, side-flowering foundowrt; “ leaves obvate,
obtuse; peduncles lateral, two-flowered. Its stem is short,
small, simple; leaves smooth, on short footstalks; pedun-
cles fingle, long, petiolate; corolla longer than the
caulx. Discovered by Gmelin in Siberia. 5. A. trinervia,
f. 4. 31. Flor. Dan. 429. “ Leaves ovate, acute, petiolate,
nerved,” with the keel of the calyx rough, and obscurely
trinerved, Smith; root fibrous, annual, items about a span
high, slender, creont, branched, round, hairy, and beset
with leaves; leaves three or five-nerved, ciliated; peduncles
one-flowered, long; flowers small, white; leaves of the
caulx lanceolate, acute, keeled, trinerved, rough on the
back, and at the edges membranaceous and ciliated; petals
obvate, scarcely the length of the calyx; capsule ovate,
with an hexifid mouth; seeds small, smooth, black. This,
like the first, is a British species; it grows in woods and
wet flat-ted situations, flowering in May and June. 6. A.
"Leaves ovate, acuteta, acute;" leaves fertile, pointed,
calyx at the base; corolla twice the size of the calyx;
leaves of the calyx oval, pointed, nerved; the flamens
are placed on a circle of nectariferous glands. See Villars'
Dauph. 632. According to Linnaeus, it is a native of
mount Abraham in the Rhenish Alps (Geffius); and Villars
states it to grow on the high mountains of Daurphiiz.
In the Kew catalogue, however, we are told that it is a
native of Iceland, whence it was introduced by Sir Joseph
Banks in 1773. 7. A. balearia, majora short-andow. L'Her-
r.ierit. Fop. Nov. 29. t. 15. "Leaves ovate, railroad, rather
flatly; stem creeping; peduncles one-flowered." A peren-
nial growing in tufts, creeping and taking hold in
its roots; leaves opposite, petioled, acuminate, entire, nerved
with short hairs; petals terminating, solitary, long,
crested, one-flowered; flowers large, white, with two
opposite, sessile, lanceolate bractes. A native of Majorca
and Minorca. S. A. multi"Ficus, many-flowered short-andow;
off*, Hall. havg. n. 6. t. 17. "Leaves ovate, nerved, sessile,
acute; corolla larger than the calyx;" leaves more or less
ciliate; flowers very large. Some botanists consider this
as a variety of the ciliata, and Villars thinks it is a variety of
the fumiculollia. 9. A. fumiculollia, thyme-leaved short-andow.
"Leaves ovate, pubescent, rough; calyx hispitate and common,
only five-nerved;" root fibrous, small, annual; stems many,
about six inches high, spreading, rigid, branched, round,
pubescent, dichotomous at the top; leaves small, ovate,
pointed, entire, oblonger nerved; peduncles erect; flowers small,
white; petals shorter than the calyx; leaves of the calyx
ovate, acute, hispitate, those that are exteriorly nerved,
interior three-nerved; calyx ovate, acute, pubescent,
in the mouth; flowers a yellow brown, tubu-
lar. A common British plant; growing on walls,
and dry barren or sandy situations. It flowers in June or July.
10. A. triflora, three-flowered short-andow; "leaves lance-subulate,
ciliata;" branches mostly three-flowered; petals marked
with lines, obtuse; its items are numerous, about four inches high,
diffused, round, pubescent; leaves like those of juniper;
petals terminating, three-flowered; bracts two, ovate,
ciliata; petals obvolute, twice the length of the calyx, white,
marked with lines; pillil shorter than the flamens. A native
of the south of Europe, on rocks, perennial. 11. A. mont-
tana, mountain short-andow; "leaves linear, lanceolate, rugged,
items barren, very long, procumbent." Its leaves form
a tult about the root, bristle-shaped, spreading, of a
fining green; those on the item are shorter than the internodes,
item-clasping; flower-flèmes half a foot high, hairy, bearing
two or three flowers at the top on long peduncles; calyx
three-keft, with the leaflets separate; petals twice as long
as the calyx, white, marked with lines, ovate, long,
flattened, at the base, pubescent; flowers about one
long. Linnem remarks that the flowers are very large,
and the fruit pendulous. A native of the south of France,
pointed; filipules manubraceous, hiasiating;" seeds compressed,
angular, roughish, Smith. Its root is small, <a href="https://www.nature.com/articles/89" target="_blank">ultral</a>, branched,
annual; items prostrate, divaricate, branched, round, smooth;
leaves linear, very narrow, acute, with a sharp point, gla-
cious or whitish, nearly the length of the internodes; filipules
from under the leaves, opposite, item-clasping, rigid, white,
acute, jagged; panicles terminal, dichotomous; flowers of
a bluish-fic-colour; the division of the calyx lanceolate,
biflute, with dry edges; petals shorter than the calyx; cap-
ful ovate, three-valved; seeds many, brown, angular, rough,
with little tubercles. A British plant growing in sandy
fields, and flowering in July and August. 13. A. marina, sea
media. fp. pl. exclaves synonymus. Alfine fumiculollia close media.
filipules scarious, hiasiating; seeds compressed, marginated,
smooth." Smith. Its root is fibreoid-shaped, annual; items
prostrate, very smooth; filipules similar to those of the rubra;
flowers larger, of a pale flesh or purpureous colour; capulfe
three-valved, longer than the calyx; seeds in having a
dilated membranous white filiated margin. This species and
the rubra are found sometimes to approach as closely as
the pernian of France, Germany, Switzerland, and
"Leaves fewemfemificidric, flufhy, obtuse; petals lanceolate;
peduncles terminal; mostly cinate." Its items are prostrate,
with many slender divided branches, and a pair of leaves
at each joint; these leaves are oblong, narrow, and of a pale
green; petals white, acuminate, sometimes fringed and
smooth; seeds minute, compressed, black, shining, perennial.
A native of Bavaria, Monte Baldo, and Little St. Bernard.
15. A. gypsophila, "leaves linear, foot, at the root bristy;
panicle subpubescent; petals lanceolate;" root perennial;
item erect, j inted, a span high; item leaves large,
and longer than the intermoids; panicle terminating, bristly,
dichotomous; petals three times as long as the calyx.
A native of the Levant. 15. A. fascellis, rock short-andow;
aljnae, Gmel. lib. iv. p. 157. t. 63. f. 2. "Leaves pubes-
cente; items panicled; leaflets of the calyx ovate, obtune;" root
perennial; items exceedingly numerous, forming a very
thick tuft half a foot high, and very full of flowers. A
native of France, Germany, Switzerland, and
Eng. fam. 512. "Leaves flabulate, rather obtune; item panicked;
items obvolute, longer than the calyx, three-nerved;
nerves dilaut, equal, Smith." Root perennial, long, much branched;
items numerous, five or six inches high, round, somewhat
pubescent and viscid, branched at the base, and panicled
above; leaves erecto-patent, pubescent, rather obtune, three-
nerved beneath, and above channelled, conate, and spreading
at the base; bracts ovate, three-nerved, short; peduncles,
etcé, pubescent; leaflets of the calyx acute, hairy,
three-nerved; margins membranous; petals longer than
the calyx, obtune, obtute; anthers flufhy; capsule longer
than the calyx; cylindrical, three-valved; leaves almost kidney-
shaped, rough, compressed. It grows on mountains in
England, Scotland, and Wales, flowering from May till
August. 18. A. hispida, hispid short-andow; "leaves flabulate,
hispid underneath;" this bears much affinity to spury;
items simple, with scattered hairs; leaves opposite, flat,
with a few hairs underneath; panicle flat dichotomous,
then branching, with alternate leaves. A native of
Icon. med. t. 2. 55. "Leaves flabulate, thorny; items eretz,
calyx flared; capules oblong;" root perennial; items nu-
merous, half a foot high, slightly pubescent; leaves spreading,
conate at the base, three-nerved, almost triangular,
mucronate; root leaves very short, blunt, without prickly
points; flowers in terminal panicles, on smooth, fliform,
one-flowered peduncles; bracts acute, three-nerved, with
a scarious waving edge; leaflets of the calyx lanceolate,
mucronate, three-nerved; petals obvolute, lanceolate,
obtuse, white, feebly twice as long as the calyx, flared;
Vol. II.
ARE

ARE

capsule three-valved, obtuse, shining; seeds small, comp. 3.

root, black; native places: in Spain. 28. A. tenuifolia, five-leaved fondwort. J. & G. p. 1.4. 29. A. tenuifolia, five-leaved fondwort. Hatt. With Eng. Bot. B. 19. Viol. Dan. 280. A. fenzelii. Ray Syn. 290. "Leaves subulate, acute; hemi pinnate; capsules erect, three-valved; petals lanceolate, shorter than the calyx; 1' its root is small, annual; leaves erect, commonly smooth, panicled, dichotomous; leaves three-nerved, connate, and dilated at the base; peduncles capillary, erect; flowers small, white; leaflets of the calyx lanceolate, acuminate, three-nerved, membranous at the edges; petals very small, lanceolate, obtuse, half the length of the calyx; flamma very short; capsule cylindrical, three-valved; seeds small, nearly of the shape of those of the A. rubra. It flowers in June, and grows in barren sandy fields, especially in Cambridgehire, Norfolk, Woreceireshire, and Oxfordshire. 21. A. liricifolia, hach-leaved fondwort; " leaves brily; item naked above; calyx rather fraggy; root perennial; items many, half a foot high, bifurged, and rough; peduncles roughish, one-flowered; calyx marked with lines, pubescent; petals ovate, large, marked with lines, twice the length of the calyx; fruit long, cylindrical. A native of France, Swizerland, &c. but not of Britain; the A. lirifel/folia of Withering being according to Dr. Smith, a variety of the A. verina. 23. A. britani, flanged fondwort. Allion pedem. n. 1712, t. 26. f. 4. Villars' Dauph. p. 47. "Leaves linear, erex, pressed to the stem; calyx long, flanged, "bristled." Allioni and Villars differ much in their representations of this species, and we have not the means of deciding which is right. It is a native of Swizerland. 23. A. faijiiculata, chatter-flowering fondwort. Jacq. Antl. 2. t. 185. Stellaria rubra, Scop. Carn. n. 538. t. 17. "Leaves subulate; item eres, stiff; flowers in clusters; petals very short; root annual; item four inches high, pubescent; leaves linear, acuminate, erex, subcyllindrical; flowers in bunches, dichotomous, on very short pedicles; leaflets of the calyx long, subulate, flanged, leaved; petals very small, ovate, white; calyx half the length of the calyx. A native of the south of France, &c. introduced here by Mr. Zier in 1757. 24. A. graniflora, great-flowered fondwort. Allion. pedem. n. 1711 t. 10. f. 1. "Leaves subulate, flat, stiff; radical leaves crowded; items one-flowered." A native of the south of France, Swizerland, &c. Gounn remarks, that Linnaeus and Allioni have made their descriptions from dwic plants. His description of the plant consequently differs much from theirs. See Gounn fihlii. p. 50. 25. A. aulnieri, aulnier's fondwort. Jacq. Antl. 2. t. 70. Allion pedem. n. 1708 t. 64. f. 2. "Stems under shrubby, profusely, thin, herbaceous, and erect; leaves subulate; flowers twin; petals margined;" perennial. Stems dichotomous or trichotomous; leaves linear, subvillose, pointed, connate at the base; items, peduncles, and calyx villose; capsule five-valved, shorter than the calyx; seeds brownish. A native of the mountains of Austria, Swizerland, and Piedmont. 26. A. ineflora, flux-flowered fondwort. Jacq. Antl. 5. t. 445. "Stems erect, branched below, under shrubby; leaves subulate; flowers twin;" perennial. Stems short, disorted; perennial; branches annual, simple, erect; petioles pubescent, terminal, generally two; leaflets of the calyx lanceolate, two-leafed; petals obovate, white. A native of the southern countries of Europe. 27. A. recurva Allion. ped. n. 1713 t. Sp. f. 3. Ger. prov. 425 n. 7. t. 15. f. 1. "Radical leaves heart-shaped, recurved, subulate; item simple, bearing about three flowers;" perennial. Stems three inches high, simple; leaves towards the root aggregate; (in tufts,) bristle-shaped; item leaves falcate, unequal, flatthith above, with the edges rolled back, two-leafed. A native of Provence and Alpine mountains. 28. A. ohlsonia. Allion. ped. 1714 t. 64. 1. "Leaves linear, flat, obtused, calyx vilose;" perennial. Stems procumbent, branched; leaves compound, foot, green, branches usually terminating by two flowers on long peduncles; leaves of the calyx ovate-lanceolate, green; petals entire, scarcely larger than the calyx; fruit conical, five-valved. A native of the high Alps of Swizerland. 29. A. lanceolata. Allion. ped. n. 1715 t. 26. f. 5. "Leaves lanceolate, three-nerved, acute; calyx lanceolate, three-nerved; root perennial, dark coloured, tough, creping; petals filiform, in a tuft, branched, creping, bifid with fine hairs; leaves lanceolate, acute, with three raised nerves; corolla spreading, large; flakes alternately shorter, longer than the petals; anthers small, purple; fruit conical, five-valved. This and many other species of the genus are involved in much confusion, from which they cannot easily be extricated. 30. A. ohlborrhoeidea, Smith inc. incd. t. 16. "Leaves linear, searose at the edge; flowers capitated; bracteae ventricose, longer than the peduncles." Alpine. &c. Tourn. cor. 17. "Root woody, perennial; items a foot high, fixed or even jointed; leaves connate; item clapping, acute, furmated, and rough at the edges; flowers monoeious, in a head or terminal spike; on short filament peduncles, ground with the bract; petals obovate with claws; three times as long as the calyx. Found in Armenia by Tournesort. 31. A. cumbaloides, Smith inc. incd. t. 17. Alpine orient. &c. Tourn. cor. 17. "Leaves linear, searose at the edge; petals dichotomous, pubescent; petals obovate;" root perennial; items a foot high, round, smooth; leaves connate; item clapping, acute; petals spreading, terminating, vilosed; flowers the size and appearance of those of common flux; bracteae acute, searose at the edge, only one fourth of the length of the peduncles; leaflets of the calyx ovate, acute, keeled, vilosed, viliffet, pedunclet; petals white, with subpellucid ileaves; five of the petals longer than the others; capsule one-celled, ventricose, shining, clothed with the calyx; seeds numerous. Found in Armenia by Tournesort.

Propagation and Culture. The greater part of these plants are natives of Europe, and most of them affect mountainous situations. They have neither size nor brilliancy to be generally cultivated in gardens; many of them, however, are neat elegant plants. The perennial sorts may be easily increased by slips, or parting the roots; but both these and the annual sorts may be propagated from seeds. They require no other care than what is necessary for all hardy annuals.

Arenaria, in Ancient Writers, is used for sand-pits, or ground out of which sand is dug. Viturvius.

Arenaria, in Cenecology, a species of Helix of the minute kind, found on the sandy shores of Armenia. This shell is whith, glossy, with extremely thin longitudinal slit; spire revered and hemispherical. Speng. Gmelin. &c.

Arenaria, a species of Sarpula that inhabits India and Africa. The shell is articulated, entire, distinct, and flatthith beneath. Gmelin. It is white or whith, and sometimes marked with pale brown undulated rays; the inside is smooth, outisde cancellated; the slit about one hundred in number, and frequently nodulous. The shell is twisted spirally. Obf. Gmelin doubts whether it may not be a Teredo instead of Sarpula.

Arenaria, in Entomology, a species of Vespa that lives in the sands in America. This insect is black; thorax spotted with yellow; abdomen fasciated on each segment with a fix-dentated yellow band; the first line, and interrupted. Fabricius. Gmelin. &c. Obf. Gmelin has another species of Vespa, under the same specific name, viz. sebes arenaria.
arenaria of Linnaeus: Fe. Snee, which he removes to this genus. It is black, with four yellow bands on the abdomen and two yellow dots on the frill segment. This is found in Denmark and Sweden, and belongs to the section of the Vespa, genus Cheliceris, in Gmelin's arrangement.

arenaria, a species of Formica found in the moveable funds in Barbary. This is a large kind; has a great ovate head, and subglobose pubescent abdomen. The specific character is this, black; thorax unimpressed behind and furnished with two spines; ends of the legs piecious. Fabricius and Gmelin.

arenaria, in Ornithology, the name given by BRILLON to the bird called by Linnaeus and Gmelin, Tringa Interprets; and Turnstone or Sea Dotterel, by English writers.

arenaria, a species of Tringa that inhabits the sandy shores of Europe and the Caffian sea. The neck and legs are black; body grey, beneath white; lores grey. This is calidris giceps minor of Brillon, Gmelin, &c.

arenarii, a species of Antigus, who combated with bals in the arena or amphitheatre. The arenarii were slaves of the lowest rank, so that, though manumitted, they were not capable of being Roman citizens. They were the same with what were otherwise called Deserarinii.

arenarium, in Ecclesiastical Writers, denotes a cemetery or burying-ground. The arenaria were properly a kind of pits, or holes under ground, wherein the ancient Christians not only buried their dead, but held their religious assemblies, in times of persecution. Baron. Annal. and Du-Cange.

arenarius, in Entomology, a species of Curculio resembling C. ligustici, but only about half the size of that insect. The head is hoary; thorax granulated, and with the legs, black; wings-cases conuate, grey, and frilled with punctures. Herblia apud Fuehil: inhabits Berlin.

arenarius, a species of Cimex, very common in the northern parts of Europe. It is black; wings-cases cinereous; wings white. Linnaeus, Fabricius. 0. F. This belongs to the section blugnus in Gmelin's arrangement.

arenarius, in Ornithology, a species of Tetrao, called Black-Latham. The land grinder. The collar, belly, and vent are black; two middle tail feathers rather tawny, the rest fuscated with brown and grey, and white at the tip. Pallis Nov. Comment. Gmelin, &c.

According to Dr. Latham, this bird is bigger than a pheasant; length, more than nineteen inches: bill, blue-grey; tip black; head pale ash-colour; crown and nape clouded yellowish-grey; chin deep yellow, terminated by a triangular black mark about the middle of the neck; the feathers of the throat and neck singularly truncated, and glossy like those of a dove; the upper parts of the neck and body tawny-white: each feather surrounded with a brown border, enclosing an oval yellowish spot; on the lower part of the neck a crescent of black; the breast is white; belly, vent, and thighs, black; wings hoary, with a deep yellow spot on the secondaries; quills brownish, obliquely white at the base; the tail has sixteen feathers; the two middle ones pointed and yellowish, crossed with brown lines; the others brown with grey lines; the tips white; legs slender, feathered to the toes; a black bill, short, naked, and callosely beneath; claws black; behind is a spur, which turns inwards, and is prominent and pointed. The female is rather bigger; of a paler yellowish colour throughout; dotted on the head, neck, and throat, with brown, and fuscated with the same on the back; the markings are less distinct than in the male, but it much resembles it.

This species is found only in the middle of the deserts extending towards the Caspian sea. It is very common about Amidian in summer, and passes the winter in Persia. Their food is the seeds of various kinds of ziziragha, and particularly of the species Aboperaidae, Cicer, and Phylodes. They are seen in pairs in June; and as they drink much water, are obliged to frequent those parts of the desert where it is found. It is said they go to the pools three times in the day, when they are so eager that they do not mind the sportismen, though at other times they are very shy.

They are no where more common than about the sandy mountains at Bardo eludes; fly like pigeons; and have a flickering through not unpleasant cry. The eggs are bigger than those of a pigeon, and white.

arenas, in Geography, are islands that lie 20 leagues north of Cape Condecoreo, or the North-west point of Campeche bay in the gulf of Mexico. Also four islands, situate on the coast of Terra Firna, on the north coast of the Spanish main or South America, before the bay of Bamba, well from St. Martha river and harbour; and sheltering the Lash from winds.

arenata, in Entomology, a species of Phaenalos, in the Geometra family. It is of the middle size, and inhabits Tranquebar. The wings, above, are without spots, beneath, speckled and streaked with brown. Fabricius.

arenation, a term that has been used by some physicians to denote a kind of dry bath, in which the patient only fits with his feet in dry sand.

arendse, in Ancient Geography, a town of Lycia, according to Ptolemy.

arendator, or arenadator, is a term used in Livonia, Ethnia, and some other parts of the Russian empire, for a farmer of the farms, or a person who contracts with the crown for the rents of the farms; and the crown arendator is one who rents an estate belonging to the crown. The term "Arendse" denotes both the estate that is let out, and the farm for which it is let. Arende-corn, is corn paid as rent by admidation.

arendonck, in Geography, a town of Brabant, belonging to the French department of Deux Nethes, and chieft place of a canton in the district of Turnhout, two leagues east of Turnhout. The place contains 2482, and the canton 6662 inhabitants: the territory includes 2374 kilometres and 3 communes.

arendsee, a town of Germany, in the circle of Upper Saxony and old mark of Brandenburg, ten miles west of Schweinfurt.

aren, or arense, in Ancient Geography, a town mentioned by Pausania (Mellen c. 2); and, according to him, founded by Araphaus, the grandson of Perleus, but he does not give its situation. Stephanus of Byzantium mentions two cities of this name, one in Mellenia, and the other in Thrasyllia.

arenium, a place of Italy, upon the Via Flaminia, near the Adriatic gulf.

arenosa, in Geology, a species of Murex, found on the sandy shores of India. The whorls of the spire are decollated with ribs, the first of which is large, and the three outermost ones smooth; beak, acute; aperture, oval; and the lip toothed externally. Gmelin, &c. This is a minute shell, short, acute, and callosely beneath; claws black; behind is a spur, which turns inwards, and is prominent and pointed. The female is rather bigger; of a paler yellowish colour throughout; dotted on the head, neck, and throat, with brown, and fuscated with the same on the back; the markings are less distinct than in the male, but it much resembles it.

arenosa, in Entomology, a species of Sphex, found in Germany. It is black and hairy; second and third segment rufous; wings as long as the body. Fabricius, Gmelin, &c.

arenosa, in Natural History, a species of Madrepora, that inhabits some parts of Africa. It is white; the flars contiguious, flat; rather large and ochraceous. Brander, &c.

arenous, in Entomology, a species of Scarabaeus, in the section Trox of Gmelin. The thorax is somewhat cana-
ARE

enamelled; wing-cases, frilated; body obscure. Fabricius, in his Saxon: and resembles Eurchus fabulosis, but is not more than half its size.

ARENSBERG, in Geography, a town of Germany, in the duchy of Weilphalia, fortified with a castle: the capital of a county incorporated with the electorate of Colouf. It is situated on the River, and divided into the old and new town; 48 miles north-east of Colouf, and 40 S. E. of Munder. N. lat. 57° 25'. E. long. 11° 45'.—Alfa, a town in the circle of Weilphalia, and county of Schauenburg, 5 miles north of Rinteln.

ARENSBURG, a sea-port town and district on the fourth side of the island of Oscei in the Baltic sea, separated from Ambrosk island by a bay, and belonging to the government of Riga or Livonia.

ARENSWALDE, a town of Germany, in the circle of Upper Saxony and new mark of Brandenburg, 44 miles north-east of Berlin, and 50 north-north-east of Kaltrain. N. lat. 51° 10'. E. long. 15° 28'.

ARENTIA, in Ancient Geography, a river of Italy, near the frontiers of Etruria and Liguria. It sprang to the north-east of Luna, and discharged itself into the sea near Carrara.

ARENUMUSA, in Geography, a town of Italy, in the kingdom of Naples, and province of Calabria, 16 miles W. of St. Sebastian.

AREOLA, or AREOLA mammilaris, in Anatomy, the coloured circle which surrounds the nipple. See Breast.

AREOLA, in Conchology, a species of Buccinum, that inhabits the Mediterranean, and India. This shell is sometimes smooth; sometimes frilated; and the firs are larger, or smaller in different specimens: its specific character is thus defined by Linnaeus and Gmelin: shell somewhat frilated, with four bands of square spots; aperture dentated; beak recurved. This is areola of Rumphius, and faburon of Adanson. The length is three inches.

AREOLA, a species of Trachus described by Cennin and Gmelin. It is convex, and frilated transversely; white, with square reddish spots; umbilicus crenulated; the whorls of the spine are separated by a white frack. Its native country is not ascertained.

AREOLA, in Natural History, a species of Madrepora without falk; undulations joined, and in some places doubled, with narrow truncated margin. This is madrepora simplex fuscobrunnata, alla erupito laciniosa lamellis crenulatis, of Pallus, and madrepora (areola) congolomera, anfractibus dilatatis, differentia exsul subequilibiibus, umbilicus duplicatis hinc dilatatus, lamellis denticulatis crenulatis of Solander and Ellis. Pictor calls it corallium album fungoides ovale; and Sloane, fungus lapideus undulatus. It is amarantinus marinus of Valent; morillo of Molin; cariophilioides of Argenville; mycedium cavatum crenulatum of Hill; and crenicles of Knorr. It inhabits India and South America.

AREOLATA, in Conchology, a species of Patella, resembling P. magellanius, but is more depressed, and broader at the base; and by the direction of the flrize which crosses each other, is divided into triangular spaces; the longitudinal finze are about twenty-one in number; the habitat is unknown. Gmelin defines its specific character in these words: shell pyramidal and reddish grey, with very thin circular frize, crofed by others which are longitudinal; vertex violet.

AREOLATA, in Ichthyology, one of the varieties of Perc or sanders, an Arabian fish described by Forke. Ex Arab.-Gmelin thus mentions it, areolata perch, body whitish-cicereus, with yellowish-brown spots. See PERC or SANDER.
The Areopagites were judges for life.—They never sat in judgment but in the open air, and that in the night time; to the intent that their minds might be more present and attentive; and that no object, either of pity or aversion, might make any impression upon them. However, some maintain, that the building in which the areopagites assembled, was not wholly uncovered; and they observe, that among the ruins, large stones have been found, whose joints are in the same angle with the pediment that must have been used for a covering. Mr. Spen, who examined the ant quities of that illustrious city, found some remains of the areopagus still existing in the middle of the temple of Theseus, which was hextroct in the middle of the city, but is now covered by the walls. The foundation of the areopagus is a fortress, with an esplanade of 140 paces round it, which properly made the hall of the areopagus. There is a tribunal cut in the middle of a rock, with seats on each side of it, where the areopagites sat, exposed to the open air. At first they only took cognizance of criminal causes; but in course of time their jurisdiction became of greater extent. This court is recorded as the first that sat upon life and death; and the trial of wilful murder seems to have been the original design of its institution. In later ages, all incendiaries, affiliai, conspirators, defectors of their country, traitors, and mortal causes in general, fell under its cognizance. The opinion which the site entertained of the wisdom, gravity, and faculty of its members, gained for them an unlimited power; insomuch that, according to Solon's regulation of this assembly, the inspection and custody of the laws, the management of the public funds, the guardianship of young men, and the education of youth according to their rank, were committed to them. Their power extended to persons of all ages, and sexes, to punish the idle and profligate, and to reward the industrious and virtuous, according to their own pleasure. For this purpose they were empowered, by entering and examining private houses, to condemn every infames person as dangerous, and every expense not proportioned to the means of the citizen as criminal. Besides they took cognizance of religious matters, blasphemy, contempt of holy mysteries, the erection and consecration of temples and altars, and the introduction of new ceremonies: nevertheless, they interfered in public affairs only in cases of emergency or danger. As this assembly exhibited the greatest firmness in punishing crimes, and the nicest circumstancy in reforming manners; as it never employed chastisement till advice and menace were flighted; it acquired the esteem and confidence of the people, even whilst it exercised the most absolute power. Its meetings were held three times in every month, viz. on the 27th, 28th, and 29th days, but on any urgent business, the senators assembled in the royal portico.

The Court was divided into several committees, each of which took cognizance of separate cases, if the multiplicity of business would not allow time for them to be brought before the whole senate: and this was done by lots, that the cases might not be prejudged. In crimes that concerned religion or the state, the power of this court was limited to preparing the matter for a trial; and it then made its report to the people, without coming to any conclusion. The accused then had it in his power to offer new pleas in his defence; and the people named orators to conduct the prosecution before one of the superior courts.

Trials in the Areopagus were preceded by tremendous ceremonies. The two parties, placed amidst the bleeding members of the victims, took an oath, which they confirmed by dreadful imprecations against themselves and families. They called to witness the Eumenides, who, from a neighbouring temple dedicated to their worship, seemed to listen to the invocation, and prepare to punish the perjurer. They then proceeded to the trial; requiring all pleadings to be conducted in the simplest terms, without circumlocution, apology, or appeal to the passions. After the question had been sufficiently discussed, the judges silently deposited their suffrages in two urns, one of brahs called the urn of life, and the other of wood called the urn of mercy. This mode of giving votes was afterwards abandoned, and they were delivered in public, by calling their calculi or flints upon two tables, one for those that acquitted, and the other for those condemned: when the numbers were equal, an inferior officer added, in favour of the accused, the suffrage of Minerva, so called, because, according to an ancient tradition, this goddess being present in the court of areopagus at the trial of Orestes, gave her calling vote to turn the scale of justice. In some causes the sentence of this court was not final; but an appeal might be made to the courts to which they respectively belonged.

This court is said by some, as by Plutarch and Cicero, to have been instituted by Solon; but others carry it much higher, and ascribe it to have been established by Cecrops, about the year before Christ 1556, or by Cralwus, one of his successors; maintaining also, that Solon only made some new regulations in it, increased its power and privileges, and made it inferior to the ephete, another celebrated court instituted by Draco. In effect, Demosthenes himself, in his oration against Ctesiphon, owns himself at a loss on the point: "The infitutors of this tribunal (says he), whatever they were, whether gods or heroes," &c.

This court preferred its authority uncorrupted and entire till the time of Pericles, who, not having borne the office of archon, could not be admitted into it; and therefore employed all his art and interest to undermine it. This at length he so effectually did, that his contempt of it served to leaven its dignity; and from that time the fame excusses and vices, which were practised in the city gained ground among the areopagites themselves, until by degrees they lost all their former power and eileem.

When the apostle Paul was summoned to appear before the court of areopagus, under a charge of being "a fetter-bore of strange gods," (Ice As6, xviii.) and consequently of having violated the law that fulfilled at Athens, which made it capital to introduce or teach any new gods, his conduct exhibited an admirable union of wisdom and fortitude. In such a case an impositor would have retracted his doctrine to save his life; and an enthusiast would have lost his life, without trying to save it by innocent means. St. Paul did neither the one nor the other: he availed himself of an altar which he had found in the city, inscribed, "To the unknown God," and pleaded that he did not propose to them the worship of any new god, but only explained to them one whom their government had already received; whom therefore ye ignorantly worship, him I declare unto you:" by this he avoided the law, and escaped being condemned by the Areopagus, without departing in the least from the truth of the gospel, or violating the honour of God. "An admirable proof, in my opinion," says Lord Lyttleton, (on the Conversion of St. Paul, in Mice Works, vol. ii. p. 68.) "of the good sense which he acted, and one that shews there was no mixture of fanaticism in his religion." See Altar.

AREOPOLIS, in Ancient Geography, a city of Arabia Petraea, sittuate on the river Arnon, and called also Ar and Rabbath-Moab.

AREOSTYLE. See ARKOSTYLE.

AREOTICS. See ARKOTICS.

AREQUIPA, or ARIQUIA, in Geography, is one of the largest.
ARE

large colonies in Peru, South America; and was founded by Don Francisco Pizarro, in 1539. It stands in the valley of Quito, about twenty leagues from the sea, in a fertile country. Near it is a dreadful volcano. The air is very temperate, and the soil in the country; but it has been four times laid in ruins by earthquakes. It is very populous, and well built, contains a convent and two monasteries, and had a college of Jesuits. It has a bishoprick in Lima, and lies 290 miles south by east from that city. S. lat. 16° 40' W. long. 75° 32'.

ARES, a town in Germany in the county of Tyrol, eleven miles south-west of Tyrol.

ARES, a term framed by Paracelsus, to express a hidden disposer, in the three principles of things, from which each receiving its proper form and fulness, and affirms its own specific nature, not that of any other being. Paracelsus distinguished the are into abstrich, which is natural; and chemical, which is artificial. See Areclus.

ARESCHIL, or Geography, a town of France, in the department of Jura, and chief place of a canton in the district of Arbois, six miles east of Arbois.

ARESKUTAN, is the name of a solitary mountain of Jamtland, in Norway, about four or five Swedish miles from the highest Alps which separate Norway from Sweden; and it is said to be 6,162 English feet above the nearest rivers.

ARESTI, Floriano, in Biography. See Floriano.

ARESTINGA, an island of the Indian ocean, towards Kerman and the town of Dulinda, supposed to be the Liba of Ptolemy.

ARETALOGI, in Antiquity, a sort of philosophers, chiefly of the cynic or stee tribe, who having no school or disciples of their own, haunted the tables of great men, and entertained them in their banquet with disputations on virtue, vice, and other popular topics. Pitiennis Lex. These are sometimes also denominated circuliore philolopiers. Calvin. Lex. Jor.

ARETIUS of Capadocia, in Biography, an early Greek writer, practised medicine at Rome, but at what period is not exactly known. That he lived after the time of Andromachus, physician to the emperor Nero, is evident from his mentioning the Theriaca, a medicine invented by that writer, and that he did not live long after that time. Haller conjectures from the purity of his style. Different writers, who lived a little before the time of Galen, quotes Areatus. Hence we may infer that he flourished some time between the reigns of Vespasian and Adrian. Eight of his books, on the canse, figus, and method of treating acute and chronic diseases, have been preserved, but all of them, as it appears, mutilated and imperfect; Areius having quoted several passages from his works, which are not found in the copies that have come to our hands. The works, however, are in high estimation, as well for the accuracy with which the diseases are described, as for the judicious practice recommended in curing them. Areatus was a bold and decisive practitioner, and made much use of hellebore and other drastic medicines. He is one of the earliest writers who recommends cathartics for raising the bowels in all diseases. The translation of the works into Latin by Junius Paulus Crafinus, was published in 1630 at Venice in 1552, and continued in use, being frequently republished, until 1723, when Dr. Wigan of Oxford made a new version. This was published in folio, with the Greek text in the opposite page, and enriched with a preface, notes, and critical diffutations. A Greek edition by J. B. Goupylus, was printed at Paris in 1754, 8vo.; and reprinted by H. Stephens. A Greek and Latin edition was published by Henchenius, in 1603, fol. It has been since edited by Boerhaave in 1731, with additional notes and observations; and again by Haller in 1771, with further emendations. An English translation of Areatus from the original Greek, was published by Dr. Medall in 1785, 8vo. Catellina Varia libri. Medics. Haller Biblioth. med. pract.

ARETHE, the daughter of Arilitippo of Cyrus, was a female of talents and learning, entertaining her to a place in the catalogue of philosophers. She flourished about 370 years before Christ, professed and taught the doctrine of her father, and professed over the Cyriac school after his death. Lact. b. ii. § 86. Clem. Aet. Strom. i. iv. p. 523. Brucker's Histor. Phil. by Emde, vol. i. p. 118.

ARETTE, in Botany, a species of Papilion (Nymph. Gme.) The wings are entire, brown, with a red line band; on the posterior pair both above and beneath a streak of white dots. Fabricius. Inhabit Andrea.

ARETHAS, in Biography, bishop of Caesarea, was the author of commentary on many collected, according to Mill, from that of his predecessor Andrew, and from the works of Irenaeus, Hipppolytus, Gregory Nasenzer, Cyril of Alexandria, and others. Cave, Mill, Lardner, and others, refer this writer to the middle of the sixth century; but Calimire, Oudin, and Fabricius, are of opinion that he lived in the tenth century. Dr. Lardner observes that he cites most or all the books of the New Testament, and hence infers, that he received all the same books which we acknowledge; he also quotes Solomon's song. Cave. H. L. t. i. p. 520. Lardner's works vol. v. p. 274.

ARETTON, in Ancient Geography, a navigable river of Epirus, which had its source in Athamania, and discharged itself into the Ambrian gulph near Ambria. Ptolemy calls this river Arachthius. Liv. I. xxviii.

ARETHUSA, in Botany, a genus of plants belonging to the natural order Orchid. Lin. g. 1014. Schreb. 1773. Just, 67. Orchid. Nutch. 19. Clei. gynanthera diandria. Gen. Char. Col. spathe leafy, perianth none. Cor. ringent, petal five, oblong, subequal, two places more outward than the others; all converging to the helmet, resembling a bell. One leafed, tubular at the base, within the bottom of the corolla, two-parted; lower lip reflex, broad, wrinkled, the length of the petals, hanging down forwards; upper lip linear, very tender, falcated to the style, lobed at the top. Stem. filaments two, very short, sitting on the top of the pillar; anthers ovate, compressed, covered with the folding of the inner lip of the nectary. Pijg. petal oblong, inferior; style oblong, incurved, clothed with the inner lip of the nectary; stigma funnel-shaped. Per. capsule oblong-ovate, one-crested, three-valved, gaping at the angles. Seeds, numerous, chalzy.

Species: 1. A. bulboia, bulbous rooted arachthia, "root gobo; sacris-thrathit; spathae two leaved." It grows in watery places, as bogs, &c. in Virginia, Carolina, and Canada. Introduced here 1784, by Mr. William Young.

2. A. aphylloides, subula-tongue leaved arachthia. Helleborine var. &c. Phil. Alm. t. 93. f. 2. Cypripedium. Gron. var. t. 313. Hort. Clar. f. 340. root fibrous, leaf of the shield lanceolate, 6 oblong, native of the same places as the preceding species. 3. A. dissectia, lily-leaved helleborine or arachthia. Serapias. Gron. var. i. p. 184. helleborine lili folio, &c. Catelb. var. i. t. 58. "root subpalmate; leaf of the shield and leaflet of the spathae lanceolate; outer petals rising." It grows in the same countries and situations as the first and second species. 4. A. capetia, cape arachthia, fopp. 4251; "bulb round; item two-leaved; simple; one-flowered; leaves two, alternate, falcating, awl-shaped." Found at the cape of Good Hope by Thunberg. 5. A. villofis, villole arachthia, fopp. 495; "bulb round; leaves ovate, eliate, pubescent." This was also
ARE

also discovered at the Cape by Thunberg. 6. A. ciliaris, clusted arethusa; orich burmanniana, fty. ed. 13; "root
fluffy; leaf kidney-shaped, orbiculate; lip ciliate; bulb vil-
dose, double; scape fix or seven inches high; leaf one, sub-
radical, heart-shaped, nerved, Iem clasping; flower one, nodding; germ hairy, the length of the petals; upper
petals rather erect, lanceolate; two lower longer, lanceolate, uniform; horn of the nectary moon-shaped, shorter
than the germ; lip large, subtripartite, clusled, middle division
bifid; namentes feteaceous, longer than the lip itself; column
of the flarnes forming half the length of the petals. Found
at the Cape, by Sparrman; introduced in 1787, by Mr. Maff-
on. 7. A. lophantha, two-feathered arethusa, Smith; in-
sect. t. 23; "cape feathered; Iap the cowled; the two lower
petals elongated, bearded on the upper side;" flem simple,
erec, a foot high; radical leaves linear-lanceolate, equita-
t at the base; Iem-leaves fix or seven, membranaceous, acute,
shathing, alternate; flower terminal, solitary, ered, purple:
germ inferior, obconical, smooth; three outer petals of the
corolla longer, irregular; the upper somewhat vaulted,
acute, naked; the two lower ones pubescent, broad at the
base, bearded on the upper side near the top with club-shaped
hairs, or filiplate glands; the inner petals shorter, opposite,
spotted, somewhat rhomb-shaped, acute, nerted with pur-
iple veins; roots fasciated or in bundles.

Propagation and Culture. The three first are hardy and
will endure the rigour of our climate. The three next must
be kept in the conservatory or case-flour. The last must
be preferred in the back-flour. But none of these plants
have yet been introduced into England, except the first and
third. Containing their places of growth, in bogs and wet-
try places, it will be no easy matter to preserve them long
with us. See Martyn's Miller's Dei.

ARETHUSA, in Entomology, a species of Papilio (Nym-
phaea, Gm.) The wings are dentate, above brown, with
a band spotted red; the anterior with a single ocellus on each
side. Habituates Germany, and is very like the Semcla.

ARETHUSA, in Ancient Geography, a town of Aia, in
Syria, ituate on the river Orontes, south-east of Epiphania,
between this town and Emesa, and distant from Antioch,
according to Antinonius's itinerary, 16,000 paces. It was
a bishop's see — AIfO a town of Macconia, in the district
called Amphaxites. — AItO, a town of Judaea, mentioned
by Josephus, and restored by Pompey to its original inhabi-
tants.

ARETHUSA, a lake of Aia, in the greater Armenia,
south of the mountain Niphates, and not far from the source
of the Tigris, which traverses it. According to Pliny (H. N.
1. vi. c. 27.) it existed nitrous vapours. — AItO a fountain
of Greece, in Boeotia, not far from the city of Thebes. AItO.
AifO a fountain in the island of Euboea. — AIfO, a foun-
tain of Maga, Greece, in Brutium, now the gulf of Squil-
laci, according to Calsidurus. — AItO, a fountain of the
isle of Ithaca, called Cyrys, according to Stephanus Byz.
AIfO, a famous spring in the island of Sicily, near Syra-
ude. For an account of the fable relating to this fountain and
Alpheus, see ALPHEUS. Virgil refers to it in his 10th Eclo-

"Extremum bunc, Arethusa, mihi concede laboren
Sic tibi, cum fluctus tabularibire Scanos,
Doris amara fuisse non interminieat udam.

"Thy sacred succour, Arethusa, bring,
To crown my labour: 'tis the last I sing.
So may thy silver streams beneath the tide,
Unmixed with briny seas, feebly glide.

The water of this fountain, formerly celebrated for its
softness and sweetness, is now brackish, and fit for 90 pur-
poe but washing linen. It is defended from the sea by a
wall, and almost hidden by houset on every side. Rubbish
has choked up its salluary spring; the waves have found
a passage through the rocks, split by repeated earthquakes;
and not a fish is to be seen in it. After an earthquake it
has been left dry; and at other times its waters have been
 tainted by subterraneous effusions. Its fountain-head probably
lies among the neighbouring hills.

ARETHUSA, in Mythology, was one of the Nymphs.
ARETHUSUS, in Entomology, a species of Papilio.

(Dan. Felt, Gen.) The wings are very entire, black,
with blue spots; posterior pair dotted with languiduous
red beneath. Fabricius. Obi. This is papilio arethusa of
Gramer; and papilio arethusa variety supposed by
Genlino to be a variety (6) of this species likewise.

ARETHYREA, ARETHUSA, in Ancient Geography, a
name given by Homer to a small country of Peloponnese,
now Achaia.

ARETIA, in Botany, so called by Haller, in honour of
B. Arethusa, a clergyman of Bern in the fifteenth cen-
tury, the teacher of botany to the famous Gfenner; Haller,
Juf! 96. Chiis. pentandria monogynia. Nat. Order of precious:
yphuchis Juf!. 90. Gen. Char. perianth, one leafed, bell-
shaped, filiguiquesquid, blutfih, and permanent. Cor.
monopetalous, salver-shaped, tube ovate, length of the calyx,
contrasted at the neck; limb five-parted; delisions obovate:
Stem. flaments five, conic, in the middle of the tube very
short; anthers ered, thepfi, within the throat of the cor-
roll. Pfl. gum roundish; fyle filiform, length of the tube;
stigma flat-headed. Per. capitule, one-celled, five-
valved. Sedi five, Jacq.; three and five, Reich.

Eff. Char. Cor. salver-shaped, five-cleft, tube ovate; stigma
flat-headed; cap. one-celled, globular, with about five
seeds.

Species, 1. A. helvetica, imbricatc arelia; diaepia helve-
diapenfia, Villars' Dauph. ii. 472. " leaves imbricate, flower
subfelle; root perennial, with innumerable flments forming
thick twills, covering the rocks where it grows, each branch
terminated by one flower; fruit roundish with angles; seeds
longer, darker, and in number fewer than in primula andandro-
face, and germ containing rudiments of five seeds two or three
of which are abortive. A native of the western Alpes of
Switzerland, and of Dauphine. 2. A. alpina, linear-leaved A.
androface caulefens, &c. Amen. Acad. andr. arelia,
Villars' Dauph. " leaves linear, spreading, flowers pedun-
culated; tufts of leaves, linear, harder, and wider than the
other; fruit often abortive, with sometimes ten or
twelve seeds in dry airy situations. Haller enumerates three
varieties; (a) harder and the leaves almost smooth; fruit
round, compressed, five-valved; (6) more tender, leaves more
villose, not spreading so much, and shorter; flower rote-
coloured with the leaves and calyx covered with a close
white scale; (c) flowers purple; these are found on different
parts of the Swiss Alps; the second on Mount St. Bernard,
Simpton, &c.; the third in the Gripons, and valley of St.
Nicholas. Villars gives three varieties, which he supefcts
to be distinct species: (a) hoary, with the hairs of the
leaves branching, flowers white, often terminating: (b) hir-
toate, hairs of the leaves branching, flowers purplih, ax-
illary, (c) hirtoate, hairs of the leaves simple, flowers white,
with a purple eye; the second forms fine tufts of red
flowers on Mount St. Bernard, 150 toises above the level
of the sea, and carries vegetation to the height of nearly 1700
toises, not much less than two miles. This species occurs
also in Austria; this and the foregoing were introduced in
ARE

1775, by Drs. Pitcairn and Fothergill. 3. A. citithana, 
graff-leaved aretca; viteiliana perennis, &c. Sel. 
epit. t. 10. 
f. 1. sulpum alpinum, &c. colom. cephr. 2. 7. f. 1. 
Kens. 
5. 6. " leaves linear, recurved; flowers submiff;" a small plant, 
always lying on the ground; root perennial, with distinct 
tubs, forming rodes like the fereum; corolla deep yellow, 
with a long tube, with five large glands in the opening; 
fruit round and small, with five kidney-shaped seeds. 
Native of the Pyrenees, the High Alps, between the Valais 
and Italy; and in Dauphiné; introduced here in 1787, by 
M. Cebi.

These are all small perennial alpine creeping plants; 
the little stems are covered with leaves; the flowers are axil-
lary, and almost solitary.

Propagation and Culture. These plants are preferred in 
gardens with difficulty. They require a shady situation: 
and the seeds, if preferred, should be sown as soon as possible. 
They may be also propagated from offsets or slips, and by 
cutting the roots. Martyn's Mill's Diet.

ARETINO, in Ancient-Greek a people of Italy, in 
Etruria. Pliny distinguishes them into three classes, viz., 
Aretoni veteres, Tulentia, and Julicenii; and their territory 
was divided into three different districts.

ARETINO, Francis, in Biography, see Francis Ac-
cotti.

ARETINO, Guido. See Guido.

ARETINO, John, surnamed Tortellini, a grammatarian, 
flourished about the middle of the fifteenth century, and 
was librarian and chamberlain to pope Nicholas V. He 
was the author of grammatical work "De potestate literari-
um," and of a life of Athenaeus; and though not very 
much distinguished by literary attainments, he never dis-
honoured learning by fierce and injurious disputes. 
The tutelage of Laurentius Valla, "De latinia elegantia," was 

ARETINO, Leonard, a learned historian, derived his name 
from Arezzo, where he was born of the family of Bruni, 
in the year 1370. Having acquired under the instruction 
of Emanuel Chrysoloras an accurate acquaintance with the 
Greek language in Italy, he was distinguished as one of the first 
refrainers of Greek literature in Italy. By his reputation 
for talents and learning, aided by the good offices of his 
friend Poggio, he obtained the office of secretary of the 
breviaries, and four succeeding pontificates. When pope John 
XXIII. whom he accompanied to the Council of Constance 
in 1415, was deposed, he returned to Florence, and devoted 
his leisure to the gratification of his taste in the pursuits 
of literature, and in the composition of various works. 
He was afterwards employed in several embassies on the behalf 
of the republic of Florence, of which he was chancellor; 
and by his economy, or rather parsimony, he amassed a 
large fortune. He died at Florence in 1444; his funeral 
was magnificently celebrated at the public expense, and 
whilst his funeral oration was pronounced, the orator, by 
order of the magistrates, crowned the coffin with laurel. 
Aretino was regarded as one of the first men of his age for 
genius and learning, and as one of those who formed the 
epocha of the revival of literature. The Latin inscription 
on his tomb in the church of St. Croce, is this purpose: 
"Since Leonardo palled out of life, history pours, elo-
quence is mute; and it is said, that neither the Grecian nor 
Roman muses could refrain from tears." His works, both 
as original compositions and translations, are very numerous; 
to the former class may be referred "The history of ancient 
Greece," 8vo, Venice, 1543; "An attempt to supply in 
part the defect of the second Decade of Livy," in two books, 
4to, Augsburg, 1537; "An history of the transations 
of his own times in Italy, from 1438 to 1445," 4to, Lyons, 1539; 
"History of Florence," fol. 1744; "The Greek and 
Italian letters," republished by Naude in 1642; and "Epistles, 
translated at Florence, with notes, and the life of the 
author, by Nechr, 8vo. 1754, which work is much valued for 
the historical information which it contains. His Latin 
translations are several of Plutarch's lives, and Ariosto's 
ethics and politics; the latter of these translations was dedicated 
to Duke Humphrey of Gloucester, and the copy presented 
by him to the translator, most elegantly illuminated, is now in 
the Bodleian library at Oxford. His "History of the Goths, 
" published, to his honour as an original work, but dif-
covered to be a translation of the Greek of Procopius; and 
"Three books of the Panec war," published in 8vo. in 
1537, another plagiarism, as the work is for the greatest 
part a translation from Polybius, though the author denies 
is in his preface. Eranus, speaking of Aretino's Latin 
yle, says, "that his works are written neatly and with 
care, and sometimes are even Ciceroan; but his language 
wanting facility, his Latinity is not always a part," Volf. 
ILLUSTRATIONS.
**ARG**

good morals. Arctino died at Venice in 1556, at the age of 66 years. An Italian woman wrote an epitaph for him, the turn of which was, "that he calumniated every one but God, whom he feared only because he did not know him."

**ARETOLOGY, ARETOLOGIA,** that part of moral philosophy which treats of virtue, its nature, and the means of arriving at it.

**AREVA,** in Ancient Geography, now the Adajas, a river of Spain in the country of the Arevas. See Adaja.

**AREVACI,** a people of Spain, who inhabited the interior part of the country to the south-east of the Vicianas, from the source of the river Nereus to the mountains in which was the city of the Sclerei. See to Adaja.

**AREVALILLO,** in Geography, a river of Spain, which runs into the Adajas, a little above Arevalos.

**AREVALOS,** a town of Spain, in Old Castile, on the confines of Leon, between the rivers Adaja and Arevalillo, six leagues S.E. of Medina del Campo.

**AREUS,** in Ancient Geography, a small river on the coast of Africa, in Bithynia.

**AREZZO,** an ancient Areettium, or Aretium, a town of Italy, in the duchy of Tuscany, the seat of a bishop, suffragan of the Archbishop of Florence, but exempt from his jurisdiction. It lies on a declivity in the midst of a fertile plain, producing grain, wine, and oil. In the time of the Romans, it was one of the twelve principal cities of Etruria; but it was over-run and defoliated by Sylla, because in the Social war it was leagued with the enemies of Rome; and he conducted thither the inhabitants who were denominated Aretini Novi. For some time it formed an arch of the Roman wall, on the side of the Duomo, and was incorporated with the territory of the Florentines; and at length was transferred to the dominion of the Medici, with the rest of Tuscany. This city was the native place of Maccenas, Guido Arezzo, Aretin, and Petrarch. It is situated thirty-four miles south-east of Florence, and twenty-five E. N. E. of Sienna. N. lat. 43° 28'. W. long. 11° 50'.

**ARFARA,** one of the smaller of the Shetland islands.

**ARFAS,** in Ancient Geography, a town of Judea, in the half-tribe of Manaffich, on the other side of the Jordan. According to Josephus, it was the boundary of Trachonitis to the east.

**ARFEUILLE,** in Geography, a town of France, in the department of the Allier, and chief place of a canton, in the district of Couffet, four leagues call of Couffet, and four fouth of Donjon.

**ARG,** a river of Germany, in Suabia, falls to Wanger, and discharges itself into the lake, of Constance. It is the Argus of the Latins.

**ARGA,** a river of Spain, rises in the Pyrenees, in the frontiers of lower Navarre, and runs to Pampeluna, and joins the Arragon over against Villa-Blance.

**ARGA,** or Astarta, a small town of Arabia Petraea, in the government of Medina, situated on the Arabian gulf, and west of Medina, to which it is considered a sea-port. Some call it Erpa, and others suppose it to be the same with Djar.

**ARGA,** a branch or rib of the Altay mountains which pass westward to the river Yuta.

**ARGADES,** in Ancient Geography, a river of Afa, in Sitacene, mentioned by Albian, Hill. Anim. i. xvi.—Also, a tributary town of Attica, noticed by Herodotus, and by Plutarch called Iragades.

**ARGADINA,** a small town of Africa in Margaria, according to Ptolemy.

**ARGAIS,** an island of the Mediterranean sea, on the coast of Africa Minor, in Lycia, according to Steph. Byz.

**ARGAL,** or Argol, the hard lees sticking to the sides of wine-vessels; more frequently called Tartar.

**ARGALIS,** a mountain of Africa, being the highest in the Atlas, with its summit always covered with snow, according to Strabo.

**ARGAEUS,** a mountain of Asia, being the highest in the Alps, with its summit always covered with snow, according to Strabo.
of the fallow-deer; of a ferruginous full-colour, intermixed with grey above, and white tinged with grey beneath; the face whitish, and behind each shoulder not unfrequently a dusky spot; the body is large, neck long, legs slender but strong, and the hinder ones longer; the tail is remarkably short, never exceeding three inches in length, and is brown at the tip; the horns in full-grown animals are extremely large, placed at the top of the head, and stand close at their base, rising frill upwards, and then bending down and twisting outwards as in the common ram. The body is covered with hair instead of wool, in which particular confis its chief difference from the general aspect of a sheep; but it is woolly at the rudiments of the hair: the face, and about the tip of the nose especially, becomes whiter in winter; the back more ferruginous, and the hair rather more rough, wavy, and curled. The female is smaller than the male; and her horns are smaller and less curved. The horns of the old males grow to a very size, and have been found of the length of two Ruffin yards, measured along the spurs, and weighing fifteen pounds each.

Like that anomalous creation the goat, the argali entirely prefers the alpine regions in summer, and are found in that season feeding on the scanty herbage that covers the highest mountains; in spring and autumn they are observed in the little valleys between the loftier precipices, and defend to the bottoms as winter approaches. They go in small flocks or parties, produce their young in the middle of March, and have one, or sometimes two at a birth. When first born, they are covered with a soft, grey, curling fleece, which changes to hair towards the end of summer.

"The argali," says Dr. Shaw, "is a very timid animal; and when closely pursued does not run in a directly progressive course, but obliquely from side to side, in the manner of other sheep, ascending the rocky mountains with great agility, and, like the wild goat, going over the narrowest and most dangerous places with perfect safety. The males are laid to fight frequently among themselves, and will sometimes precipitate each other down the rocks in their contest. Their chase is dangerous and difficult, but it is an important object with some of the Aborigines, since the animal furnishes a great number of necessary articles; the skin being used for clothing, and the flesh for food. Dr. Pallas informs us, that the flesh of the lamb is excellent; that of the old animals good, but more particularly when roasted."

In Corsica, the argali is known by the name myro; where it is found there is to be rarely taken alive, but is shot by the hunters, who lie in wait for it among the mountains. When the young are taken, however, which is sometimes the case when the parent is shot, they are observed to be very readily tamed. The Corsican argali, or mouflon of Buffon, is of a darker colour than the Asiatic kind."

The bearded sheep and Siberian goat of Pennant's quadrupeds, Dr. Shaw conjectures to be a variety of the argali; a specimen of it was brought into England from Barbary in 1801, and is described by Cain or Dr. Kay, who named it tragelaphus, on a supposition of its being the same with the tragelaphus of Pliny; and the following account of it is given by Mr. Pennant.

"Sheep with the hair on the lower part of the cheeks, and upper jaws extremely long, forming a divided or double beard, with hairs on the flanks and body short: on the top of the neck longer, and a little erect; the whole under part of the neck and shoulders covered with coarse hairs, not less than fourteen inches long; beneath the hairs, on every part, was a short Gimorne wool, the rudiments of a fleshy clothing; the colour of the beard, neck, back, and sides a pale ferruginous; tail very short; horns close at their base, recurved, twenty-five inches long; eleven in circumference in the thickest place, diverging and bending outwards, their points being nineteen inches distant from each other."

ARGAN, in Botany. See SEIDESMONON.

ARGANA, in Geography, a town of Asia, in the government of Diarbekir, under the dominion of the Turks. It is situated on an eminence, in a principality of the same name, abounds with vineyards, and furnishes exports of good wine. N. lat. 39° 55'. E. long. 39° 15' 43".

ARGANACT, in Geography, a town of France, in the department of the Mofelle, and chief place of a canton in the district of Mez, 3 leagues S. of Thionville, and 14 N. of Metz.

ARGAND'S LAMP. See LAMP.

ARGANTA, in Geography, a town of Spain, in New Catalonia, and diocese of Toledo.

ARGANTE, in Entomology, a species of Papilio. (Dana. Gen. Gmel.) The wings are rounded, and lined beneath, speckled with ferruginous. Fabricius. This insect inhabits Brazil. Off. This must not be confounded with Papilio Argana, of Cranmer, that being Papilio Gombius of Fabricius and Gmelin.

ARGANTAMAGUS, in Ancient Geography, now Argentan, a place of Gaul, between Fries and Ermonnon.

ARGANTONIUS Moses, a mountain of Asia, in Myfia, near the town of Prusa. Strabo says, that in his time the inhabitants of Prusa held a festival, during which they ran upon this mountain, and called Hylas; probably in reference to Hylas, the friend of Hercules, who was carried off from this mountain by the nymphs.

ARGARADUCA, a town of Asia, in Media, Persia.

ARGARI, a place of India, in the peninsula on this side the Ganges, according to Todnay; whence probably was derived the name of the Argaric gulf, on which it situated. This gulf was opposite to the island of Taprobana, and between the promontories of Colis, and Cullacum.

ARGAROSSA, in Geography, a river of Savoy, which runs into the Pyrenees, 3 miles north-west of Montber.

ARGASCH, a town of Raffia, in the government of Simbirsk, 64 miles W. S. W. of Simbirsk. N. lat. 55° 4'. E. long. 57° 45'.

ARGENGE, in Entomology, a species of Papilio, (Nymph. Gen. Gmel.) The wings are indented, white, streaked with black; a singular ocellar spot on the anterior wings, and five on the posterior ones. This inhabits the deferts of Raffia, Eper. Gmelin, &c.

ARGE, in Geography, a town of Asia, in the Arabian Ira, seated on the Tigris, 175 miles north-west of Baffora.

ARGE, a river of Portuguese Prussia, which runs into the Nemen, 4 miles north-west of Wipe.

ARGE, in Mythology, fitter of Hebe and Vulcan, was born of Jupiter and Jutus, when this god disguised himself under the form of a cuckoo, and deceived his wife.

ARGE, or ARGELA, in Antiquity, human figures made of rushes, thrown annually by the Velhia, from the pons Sabinus, into the river Tiber, on the day of the Ides of May.

This ceremony we learn from Fechinus and Varro; the latter of whom, however, says, they were called by the priests, folae, by iaculatim we impose he meant priestesse. He adds, that the number of figures was thirty. Plutarch, in his Roman question, inquires, why they were called arges? There are two reasons elioged; the first, that the barbarous nation who first inhabited these parts call all the Greeks they could meet with into the Tiber; for Argans was a common name for all Grecians; but that Hercules persuaded them to quit so inhuman a practice, and to purge themselves of the crime, by instituting this solemnity.—The second, that Evander, an Arcadian, and a sworn enemy of the Ar-
ARGONOMON, a name given by some of the late Greek writers, to the plant called sarpocolla by the other writers of their times.

ARGENNES, in Geography, a town of France, in the department of the Calvados, and chief place of a canton in the district of Caen, 5 leagues W. of Lisieux, and 25 1/2 E. S. of Caen.

ARGENCHUM, in Ancient Geography, a forest of Gallia Aquitana, near the place where Rochelle is now situated.

ARGENFELS, in Geography, a town and castle of Germany, in the district of the Lower Rhine, 17 miles N.N.W. of Coblentz.

ARGENNOS, in Ancient Geography, the name of one of the three islands called Troglolia, situates in the Ionian sea, on the coast of Asia Minor.

ARGENNUM, a promontory of Asia Minor, in Ionia, near the island of Halonaeus. Strabo and Ptolemy.—Alfo, a promontory on the eastern side of Sicily, now Cape S. Afflito.—Alfo, a promontory on the eastern side of the isle of Lebros.

ARGENOMESCUM, a town of Hispания Tarragonenfis, in the territory of the Cantabri. Ptolemy.

ARGENS, or ARGENTZ, in Geography, a river of France, which discharges itself into the Mediterranean.

ARGENS, John Baptist De Boyer, Marquis de, in Biography, was the son of the solicitor-general to the parliament of Aix in Provence, and born in that city in 1704. He took up arms against the inclination of his father, at the age of fifteen; but on his return from Conflantinople, he was convinced of the error of his course, and determined to return himself at the bar. Being displeased with this profession, he again embarked in the military service, in 1735. D'Alby, on examining him, found him to be very dextrous in the use of arms, and fit for a general, and recommended him to be promoted to the highest rank in that army. He was appointed to be his chamberlain, and continued twenty-five years at Berlin; where he married, and maintained the character of a good husband, friend, and master. At length he returned to his native city, and lived there as a philosopher till the year 1771, when he died suddenly on a visit to his father, the baronet de la Garde, near Toulon.

The marquis d'Argens formed himself upon the model of Bayle, and adopted those free sentiments with regard to religion and morals, which have been more in vogue on the continent from the time of Bayle and Montesquieu. With talents inferior to those of Bayle, he professed an ardent and determined spirit, which led him to make considerable acquisitions in literature and science; so that he understood several languages, had some acquaintance with chemistry and anatomy, and was a tolerable painter. As a writer, his style is diffuse and dilatory; and his works, though they manifest erudition and reflection, are rendered difficult and offensive by the licentiousness of morals, and the perpetual attacks on religion and its establishments, which are their characteristic features. The principal of these are, his "Jewish, Chinesé, and Cabalistische Letters," which, with the "Philosophy of Good"
Good Sense," compose twenty-four volumes in 12mo. published in French under the title of "The Works of the Marquis d'Argens" in 1768; a great number of romances, ill designed and negligently written, including "Memoirs of himself," of no great importance and value: "Translations from Greek into French of Oecclus Lucanii, Timoios Lucrensis, and the Discourse of John on Christinity;" and "Secret Memoirs of the Republic of Letters," printed in Holland in 4 vols. 12mo; and at Paris, in seven. The Jewish and Chinoes letters are now the most known; but his other works have sunk into oblivion. Nouv. Dict. Hist. ARGENSON, in Geography, a small town of France, in the mountains of Duaphiny and diece of Gap, two leagues from Alperse; usually called St. Pierre d'Argenson. ARGENT, a town of France, in the department of the Cher, and chief place of a canton in the district of Sancerce, one league and a half north of Aubigny. The place contains 1,043, and the canton 3,714 inhabitants: the territory includes 2734 kilometres and 4 communes.

ARGENT, in Heraldry, signifies white, or silver, and is so called in the blazoning of the arms of gentlemen, knights, and baronets; but for sovereigns and princes it is termed luna; for dukes, marquises, earls, viscounts, and barons, pearl. By engravings it is represented plain. The word is French, derived from the Latin argentum, silver; this colour being supposed the representation of that metal; whence the Spaniards call this field, campo de plata, plata field.

ARGENTA, in Ancient Geography, a town of the Illyrian region, mentioned by Livy.

ARGENTAC, in Geography, a river of Albania in Europe, which runs into the Adriatic, four miles north of Durazzo.

ARGENTAL, a town of France, in the department of the Corrèze, and chief place of a canton in the district of Talles, four leagues south-east of Talles. The place contains 2,574, and the canton 9,789 inhabitants: the territory includes 135 kilometres and 11 communes. N. lat. 45° 5', E. long. 1° 47'.

ARGENTALIS, in Entomology, a species of Phalaena (Pyralis, Gmel.) found in Germany and Piedmont, about the size of Phalaena paphia. It is cinereous brown, with three waved silverly frisks on the first pair of wings, and two on the second. Fabricius and Gmelin.

ARGENTAN, in Geography, a town of France, and principal place of a district in the department of the Oron, four leagues south of Falaize, and six and a half north of Alençon. The manufactures of this place consist of lace, linen cloth, and light stuffs. It is the Argentum or Argentomagus of the ancients. The place contains 5,618, and the canton 9,409 inhabitants: the territory includes 135 kilometres and 15 communes. N. lat. 48° 44', W. long. 0° 8'.

ARGENTINUM, in Ancient Geography, a town of Italy, in the territory of the Bruttii, noticed by Livy.

ARGENTARIA, a town of Germany, near which the emperor Gratian defeated 30,000 Germans. Prolem calls it Argentavaria and Argentovaria. It was ruined by Attila about the fifth century.

ARGENTARIA Cretica, silver chalk, in Natural History, a name given to an earth, not properly a chalk, but a kind of tripeb. It is a very beautiful earth, of a loose friable texture, and perfectly pure white. It is dug in Prussia, and is much esteemed for cleaning plate. It has also been found in France, and of late in Ireland.

There are many white chalks of various hues, which are dug in Germany, America, Italy, and other countries. That dug in the duchy of Mantua in Italy, is much used by painters, and at Rome vulgarly called gesso.

ARGENTARIUS is frequently used, in Roman Writers, for a money-changer or banker.

The argentarii were mostly people, who made a profit either by the changing or lending of money at interest. They had their tabernae, or offices, in the forum Romanum, built there as early as the reign of L. Tarquinius Priscus. The argentarii and ferrarii were much hated on account of their fraudulent practices and extortion. Du-Cange and Pitieux.

ARGENTARIUS, in Writers of the Middle Age, an officer entrusted with the custody of money.

In this sense argentarius amounts to the same with the Greek ἀργυριαστής, and our cobler. Du-Cange.

ARGENTARIUS Miles, in our Old Writers, an officer of the exchequer, whose business it was to carry up the bag of money from the lower exchequer to the higher, in order to its being examined or told. Spelman.

Argentarii is also applied, in the Civil Law, to those who adorned military arms with silver or gold.

In which sense the word amounts to the same with barnarbaricaris.

ARGENTARIUS MONTIS, in Ancient Geography, Mont ARGENTARO, a mountain of Eturia, in Italy, forming a promontory near the town of Lora.

ARGENTARO is a cape of Tuscany, south of Oristello, and call of the isle of Giglio. N. lat. 41° 55', E. long. 14° 21'.

ARGENTATA, in Entomology, a species of Phalaena, (Pyralis, Gmel.) The wings are yellow at the tips, with two silverly frisks on the anterior pair, and a quadruple black spot on the posterior ones. This is native of China. Gmelin and Fabricius. The anterior wings are silver at the base, with a large triangular brown spot; lower pair silverly, and yellow at the tip; and the four contiguous spots upon them have a brazyl gloss.

ARGENTATA, a species of APIS found in Barbary. It is downy, cinereous; abdomen black; margin of the segments white beneath, with silverly hairs. Gmelin. &c.

ARGENTATA, a species of Musca, about the size of Musca fuscata; it inhabits Saxony. The cutel is slightly bidentated; body black; abdomen covered with silverly down, with yellow lateral spots. This belongs to the genus Stratiomya in the Fabrician system, and must not be confounded with the following insect.

ARGENTATA, a species of Musca, that inhabits Europe. The colour is cinereous; with four black lines on the thorax; abdomen grey, changeable; front silverly on each side. Gmelin. &c.

ARGENTATA, a species of Aranea. The abdomen is white, with the posterior part brown; the margin with five dentications. This is a large insect, and inhabits South America. Gmelin.

ARGENTATA, in Ichthyology, a species of Sciaena, that inhabits the Arabian shore. The scales on the upper parts are blackish, with the margins and apex silverly; on the lower parts pale rufous, with paler margins. Gmelin. There is a large blue curved patch under the eye, which extends towards the mouth; inferior lip longest; lower lateral teeth in a row of larger ones, and behind these a row of smaller ones; posterior gill-covers terminating in an acute angle; fins reddish brown, dorsal one glaucous, with a pale rufous margin; spines of the anal fin becoming gradually longer and larger.

ARGENTATA, in Zoology, a beautiful little creature of the Simia genus, a native of South America; named by Buffon Mico; and by Pennant, the fair Monkey. It is tailed and bearded; white; face red; and tail brown. Gmelin. This creature is not much larger than a squirrel, measuring only
ARG

only about seven or eight inches from the nose to the rudi-
ment of the tail; and the tail itself is twelve inches long.
The whole animal is covered with hairs of a beautiful fine
filvery white; except the face and ears, which are red, and
the tail, which is of a deep brown. It is thus described by
Briss in Cercopithecus ex cineris albus argenteus, facie
auricuclidique rubin splendidissimus, cauda calicani coloris.
Quadr. p. 142. 13; and is Simia argentea of Sclerather.

ARGENTATUS, in Entomology, a species of Curculio,
very frequent on oaks, nettle, wild-trees, &c. in England
and other parts of Europe. Its specific character is

frequently: the whole body silvery green. Gmel. &c. The
colour of the shell itself is black, but being wholly covered
with beautiful minute scales of a fine filvery green colour,
the insect appears entirely of that colour before the scales
are rubbed off. This species is Curculio femoribus ommibus
denticulo notatus, corpore viridi oblongo, of Fik. Succ. 239.
Curculio squamosus viridi auratus, of Geoffroy; Curculio
urtice, of Degueur Inf.; and Curculio argenteus of Do-
nov. Brit. Inf. &c. Off. Gmelin has given another species of
Curculio under the same specific name, viz. Curculio
argentatus, of a silvery green, with the antennae and shanks
of the legs rufous, and the thighs brown and elevate; a na-
tive of Europe. This inattention of Gmelin is the source
of endless confusion; it is no unusual circumstance to find
in his arrangement two or even more very different species
under the same specific name in those genera that are ex-
tensive; sometimes indeed, to avoid confusion, he places
them in different families, but in the present instance, we
find both in the same family: ** Brevisyraxes, f femoribus
dentatis.

Argentatus, in Ichthyology, a species of Sparus that
inhabits the rivers in Japan, and is distinguished by having
a black spot behind the gills. It is covered with silver
scales, and is about five inches in length; and has two no-
trills before the eyes. Gmelin, &c.

Argentatus, a species of Centrogena that in-
habits the rivers in Japan. It is silvery, with a large brown
spot on the nape, and a blackish one on the dorsal fin.
This fish is about three inches and a half in length, and the
tail is forked. Gmelin, &c.

Argentatus, in Ornithology, a species of Larus, called
by Dr. Latham the silvery gull, and it also the silvery
gull of the Arctic zoology. It is white; the head and neck
furnished with cinerous: primary quill feathers black above,
beneath grey, and white at the tips. Gmelin, &c.—This
bird inhabits Norway.

Dr. Latham notices a species of Gull very much like
this in the Leverian Museum. The length is near sixteen
inches; bil a inch and a half long; quills as in the other;
but the two first have the ends tipped with white for near an
inch, instead of a small spot; and if of the prime quills had
the ends black; the bill and legs are pale, but as the bird
had been in spirits some time, nothing certain could be said

ARGENTEA, in Conchology, a species of Venus, of
a somewhat oblong shape, smooth, and silvery, with black
lines united into bands. This shell inhabits the shores
about Cadiz.

ARGENTEA, a species of Patella. This shell is smooth,
thick, and somewhat silvery, with eleven brown rays; mar-
gin silvery; tip pale yellow; bottom like ivory, with a
double white ring. It is a rare shell, about two inches in
length; and the native country unknown. Vide Schloet.
and Gmelin.

ARGENTEA, in Entomology, a species of Cantharis,
found in Africa, and described by Professor Thunberg. The
legs are black, and with the wing-cases are green; the ab-
domen is silky silvery. To this is added, that the head is
black; and legs and yellowish; feet brown.

ARGENTEA, a species of Sphex that inhabits Coromandel.
It is black and glossy; front villous and silvery; wings
white, and brown at the tip. This is a large insect, Fab-
ricius and Gmelin.

ARGENTEA, a species of Aranea that inhabits the de-
serts of Ual, and is deemed a poisonous creature by the
Calmucks. The thorax is depressed, orbiculated, white,
with two black flaps; abdomen ovate, lobed, silvery, with
two pair of dots in the middle, and four rows behind.
Lepech. it. p. 316. This insect spin a perpendicular web;
the legs are long, black, and annulated with yellow. Gmelin.

ARGENTEA, in Ichthyology, a species of Perca that
inhabits America, and is thus very concilely defined by Lin-
neas and Gmelin: nothris tubular; there is a large black
spot on the spinous part of the dorsal fin.

ARGENTEA, a species of Scilena. It is silvery, spotted
above with black; beneath immaculate. Fork. Ind. Arab.
The crown is fcarly; two elevated lines between the nothris;
iris silvery above, brown; teeth numerous, fettaceous, mov-
able, the outer row larger; dorsal fin connected, and
spotted with black; the fin rounded, the other linear;
ventral and anal fin pale rufous, pointed at the ends; tail
somewhat bifid.

ARGENTEA, in Natural History, a species of Sertula-
aria that inhabits the European and American seas; and
is called by Ellis the squirrel's tail; it is also Corallina
comis ad inular caudae vulpingeauris of Mercat.; and Mus-
carinus minor, denticulis alternis bifugis of Morif.
Hift. Pl. &c. According to Linneas, Solander, Gmelin,
&c. its specific character is this: denticles nearly opposite,
and pointed, vertices oval; branches alternate and papillated.

ARGENTEA, Aslem, in Ancient Geography, a town situate
at the northern point of the island of Jabadul. Ptolomy.

ARGENTEAU, in Geography, a deplotted town of the
Netherlands, in the duchy of Limburg, two leagues west of
Dalem.

ARGENTEOLA, or ARGENTIOLUM, in Ancient Geo-
ography, a town of Spain, in Aloria. Ptolomy.

ARGENTELLA, in Entomology, a species of Phala-
ena (Tinea, Gmel.) It is entirely silvery, except the an-
tene, which are annulated with brown. Linn. Fabr. This
is lineae perlola of Wien. Schmetterl. p. 134. The larva is
gregarious, glabrous, brown, and feeds on the nettle. De-
gee, &c.

ARGENTERO, in Geography, a mountain of European
Turkey, between Bulgaria and Macedonia.

ARGENTEUIL, a town of France, in the department of the
Seine and Oise, and chief place of a canton, in the dis-
trict of Verailles, eight miles N.W. of Paris. The place
contains 4,726, and the canton 16,577 inhabitants: the ter-
ritory includes 67,413 kilometres, and 11 communes.—Also,
a town of France, in the department of the Yonne, three
leagues from Tonnerre.

ARGENTEUMO, in Natural History. See Os. Argenteum.

ARGENTEUS, in Coinage. See Denarius.

ARGENTeus, in Entomology, a species of Scarabaeus,
found in England, and the interior of Austria. It is black,
beneath silvery, and shining; margin of the shield and wing-
cases
ARGENTIUS, Codex, in Biblical History, a manuscript of the fourth century, is so called from its silver letters, and is supposed to be a copy of the Gothic version made by Ulphilas, the apostle of the Goths, in the fourth century. It is one of a group of three leaves, which are vellum, parchment, or papyrus, and are stained with a violet colour; and on the ground the leaves, which are all capitals, were afterwards painted in silver; except the initial characters, and a few passages, in gold. Mr. Croke, from a close inspection, was convinced that each letter was painted, and not formed, as some have alleged, by a hot iron upon leaves of gold and silver. Most of the silver letters are green by time; but the golden letters are still in good preservation. This codex is mutilated in several places; but what remains is, for the most part, perfectly legible. It was first discovered in 1597 in the library of the Benedictine abbey of Werden in Westphalia, whence it was brought to Prague, and at the capture of this city in 1648, sent as a valuable present to Christina of Sweden. It afterwards came into the hands of Isaac Vossius, either by theft, or as a present from the queen; and on the death of Vossius, it was purchased by Count Magnus Gabriel de la Gardie for two hundred and fifty pounds, and presented to the university of Upsal, where it now remains. Three editions of it have been given to the public: the first was printed at Dort in 1609, by T. Junius, who borrowed the MS. from Vossius; and accompanied with observations and a glossary, by Thomas Marshall. That printed at Amsterdam in 1672, is the same with this, having only a new title-page, date, and place of impression. The second edition, published at Stockholm, in 1672, by the learned Stierhelm, differs from that of Junius, by having the text in Latin, and not in Gothic characters. Stierhelm, first librarian of the university of Upsal, and afterwards archbishop, collated the MS., rectified mistakes, and made a literal translation into the Latin tongue. These collations and translation, together with various editions, were transmitted to Mr. Edward Lye, of Oxford, who published a third edition in 1750, from the Clarendons press; this is esteemed, by those who have compared it with the original codex, a complete work. Two opinions have divided the learned concerning the original tongue of the codex argenteus; the first opinion, that it is written in the language and character used in the fourth century by the Goths of Moesia, ancestors of the present Swedes, and is a true copy of the version made by Ulphilas, is strongly supported by Junius, Stierhelm, David Wilkins, Stierhelm, and Lye. The second opinion, viz. that it is a translation in the Frankish idiom, is warmly defended by Hung, la Croze, Wetstein, and Michaelis. Mr. Croke inclines to the former opinion, which is confirmed in an ingenious treatise of Lhe; by which it appears that several specimens of the Old Gothic tongue have been lately discovered in Italy, which perfectly resemble both the characters and language of the version in the codex argenteus. However this be, as the Old and Frankish idioms were dialects of the Teutonic or German, this MS. must be considered as the most ancient specimen extant of that language. Those who attribute the version to Ulphilas, refer its date to the fourth century; and those who deem it to be a Frankish translation, allow it to have been copied in the reign of Chloderic, between 564 and 575. Besides, its high antiquity is proved from the fact that, at the end of the Lord's prayer, Matt. vi. 13, which is not found in any of the most ancient versions; and also from the interpretation of many passages in a manner made with several of the Latin translations, which are antecedent to the Vulgate of St. Jerome. Another fragment of this curious MS. containing a few chapters of St. Paul's epistle to the Romans, was found at Wolfenbuettel, and is now preserved in the library of that town. Of this fragment I have published a new and important edition, at Upsal, in 1763. Michaelis's Introduction to the New Testament, by John, vol. n. p. 123—135. Croke's Travels, vol. iv. p. 173—183. ed. 1832.

ARGENTHAL, in Geography, a small town of Germany, in the circle of the Upper Rhine, and district of Simmern, forty miles south of Trier, and four south-east of Simmern.

ARGENTICUS, among Ancient Historians, denotes a kind of silver-haired comet, of uncommon splendour, supposed to be the cause of great changes in the planetary system.

ARGENTIER, John, in Biography, born at Caffelino in Piedmont, in 1514, acquired considerable celebrity, though his talent was rather that of teaching the art than practising, as he was well versed in the theory of medicine, and had read and commented on most of the old writers, but his memory was so defective, that he was rarely able to apply the observations he had made for the benefit of his patients. He taught medicine at Naples, Pisa, and lastly at Turenne, where he died in 1572, aged 58 years. His works were collected and published at Venice, in two vols. in folio, 1592; and have been since twice printed. He prided himself much in having discovered some errors in the works of Galen, whose doctrines he frequently opposed. Haller, Bib. Med. Pract. Essay. Dict. Hall. de la Med.

ARGENTIERA, a volcanic island of the Archipelago, formerly called Cimolias or Cimola, one of the Cyclades, which lies about sixteen miles in circumference, i.e. and derives its name from a mine of silver that was for a long time worked in it with success; but it is now unknown. The soil is extremely dry, and destitute of springs; nor is there any water here but what is collected in cisterns, or brought from Milo, an island at a little distance: the hills, vales, and the whole country are covered with trees, do not offer a single shade to defend from the sun. The Venetians, during their war with the Turks, cut down all the olive-trees, and did irreparable damage to the island: nor do the present inhabitants dare to make fresh plantations, lest they should draw on themselves heavier impositions. Such is the mistaken policy of the Ottoman government; if its subjects manifest any industry, it is immediately taxed, and illused in its birth. Argentiera presents nothing but rocky hills, defitute of verdure, and valleys producing worthless shrubs and thorny thickets. The vales are generally covered with a white and fat clay, called by the ancients Terra Cimolias, or Cimolia Cretia, a kind of Fuller's earth, which the inhabitants employ instead of soap to wash their linen. See Cimolia Terra. Though the soil is barren, the industrious islanders make it produce for them a subsistence.
The women spin cotton, and knit flockings, whenever the labours of the country allow; and the men employ themselves in fishing and navigation. Excellent fish are taken round the island, especially the rouget (the sardine, mulla'de Linnaeus), a fish well known and highly esteemed for its delicate flavour on all the coasts of the Mediterranean. The tribe of Greeks which inhabits this island, is composed of two hundred persons, according to Olivier; two hundred families, as Sonnini reports; or, as others say, about five hundred persons; who have no Turkish officer resident amongst them, but have an annual visit from the captain pacha, who, besides levying an impost of 15 or 1600 piastres, which they find it difficult to pay, exacts presents to a considerable amount, so as to reduce the inhabitants to misery. Cotton is almost the only article that produces for them any money; their cotton flockings supply the Egyptians; and, in former times, supplied their hogs, poultry, and eggs. The dress of the Greek women of Argentiera is peculiar: they swell out their legs by wearing several pairs of flockings, and appear as if they were booted, which they consider an effectual part of dress: their garments do not descend below two inches below the knee, and these are so contrived as to spoil their shape, and render it impossible to form any idea of the beautiful proportions with which they were formed by nature. The neck is concealed under a corset, quilted, and stiffened with whale bone; a piece of velvet, taffin, or cloth trimmed with gold or silver netlace, or let by a fine embroidery, adorns their whole front; and in their gala dress, two wide fleeces are fixed to the corset, and fall on each side to the middle of the thigh. In summer the whole arm is covered only by the sleeve of the shift, the head is enveloped with a handkerchief which passes under the chin. In other respects they are cheerful, lively, and handsome. Savary.

The only inhabited place in the island is seated on the summit of a mountain of rocks, to which the ascent is very difficult. The houses are few, miserably constructed, and filled with flies; but it is surrounded by high walls, and for two gates. Their dwellings, which may be rather called huts or dens than houses, are covered by a roof, consisting only of a fort of wo den hurdle, on which earth is spread and beaten. The superstitious Greeks rely on heaven, more than on the structure of their habitations, for their security. Accordingly, on the eve of the festival of the exaltation of the holy Cross, it is an ancient custom to sweep and nicely clean the flat roofs of the houses; and towards evening, when the bells of the churches begin to ring, the inhabitants show upon them large crosslets, which figures are, in their estimation, the most effectual means of preserving the tops of their houses from being penetrated by the rains. The single street of which this wretched town or village consists, unpaved, is, in the rainy season, a long heap of deep mud; and the water, finding its way into the rooms of the ground floor, which are almost subterraneous, renders their habitations equally unwholesome and inconvenient. The small church or chapel of the Capuchins, serves for the catholics of Argentiera; and a peculiar priory, built in the island of Scio, and educated at Rome, performs divine service in this chapel, and assumes the title of the grand vicar or nominal bishop. The town is of very modern construction, having been erected so lately as the year 1649, by some Greek fugitives from the island of Sipan, who are said to have brought with them an image of the Virgin; and built houses, where this image had slept with them, and preferred them from the attacks of their enemies. Several Greek churches or chapels are built behind the village, all of which have little bells above their portals, which are frequently in motion. About half a league from this town, Olivier found fragments of bricks and potter's ware, which indicated the position of the ancient town; and upon digging in this spot, he discovered some rude figures of baked earth, such as a toad, a sphynx, and a cock, and also a small vase with a handle in the Etrurian style. He also perceived canals in the bank of lava, probably for the purpose of affording a passage to boats, caves for shelter from the rain and sun, and other caverns, which might have been places of habitation or interment at different epochs which history has not recorded.

This island is nothing but a group of volcanic substances, and exhibits every where indications of a great combustion. In several places the rocks are calcined; pozzolana was found here by Olivier, and the hot waters which issue from a rock near the sea, in the north-west part of the island, attest the existence of a subterraneous fire in full activity. The herd of these waters is so fitch, that a person cannot hold his hand in them, and an egg is in an instant boiled hard. The Greeks reckon them efficacious for curing rheumatism, sciatica, and other disorders of that nature, by means of linen cloths steeped in them and applied to the parts affected. Near these waters is the mouth or centre of an ancient volcano, which, for a long time, exhaled infectious vapours, whence the modern Greeks have called it "vromo imino," or flinking lake. This gulf is now a lagoon of the sea, which no longer yields any bad smell. To the north of this lake are several grottoes or caverns cut in the rock, which seem to have served as habitations. Sonnini observed in this place a great number of thuribles of the large species, together with blackbirds, linnets, pettichaps, partridges, woodcocks, &c. In the north-north-east quarter of the island is a district called "Kedros," because it is furnished with the species of tail junipers so denominated by the modern Greeks, being a variety of the "juniperus oicifera" of Linnaeus. They yield to gum in this island; but the Greeks make use of the oil, which they draw from the stem and branches, for the cure of the itch. The environs of "Kedros," or the side of Kedros, furnish a great quantity of wild artichokes; which the inhabitants gather and cat with avidity. The most common shrub on the island is the lentisk, the fruit of which yields on expression an oil, which is fit only for burning, though the poor use it in their food, and it is applied as a topical remedy for rheumatic pains. Saffron also grows on the mountains, and between the rocks of the island, and it is sold in the markets by the weight of eggs. The road-lead of Argentiera, most frequented by the ships which navigate in the Archipelago, is formed by the isle of Muro to the south-west, by that of Argentiera to the north, and by the small islands of San Georgio and of Polvo to the east. Trading vessels anchor between the islands of Argentiera and San Georgio, and are here sheltered from the wind and sea. But this anchorage has not a sufficient depth of water for ships of war and large vessels, which pass more to the north or north-east, in a channel near Polvo. N. lat. 36° 48'. E. long. 24° 40'. Olivier's Travels in the Ottoman Empire, p. 126-133. Sonnini's Travels in Greece and Turkey, p. 281-327.
ARGENTIERA, a town of Italy, belonging to the Venetian frates in the Cadorin, eleven miles N. N. W. of Pieve di Cadore.

ARGENTIERE, 1°, a town of France, in the department of the higher Alps, and chief place of a canton in the district of Briançon, on the Durance, nine miles north of Mont Dauphin.

ARGENTINA, in Botany. See Potentilla.

ARGENTINA, in Geography, a town of Savoy, in the county of Maurienne, near the river Arc, sixteen miles E. S. E. of Chambery.

ARGENTINA, a town of Italy, in the kingdom of Naples, and province of Calabria Citera, at the foot of the Apennines, ten miles S. W. of Bologna.

ARGENTINA, in Entomology, a species of Phalena, (Barnay, Gmel.) that inhabits Germany. The wings are indented, grey, with silvery spots. Fabricius. When this insect is at rest, the wings have three creet tufts on the back. The larva is naked and grey; with the fourth, eleventh, and twelfth segment tuberculated; the pupa is obtuse and brown; feeds on oak.

ARGENTINA, a species of Phalena, (Nodina, Gmel.) found in the southern part of Russia. The wings are grey, with a broad abbreviated silvery stripe. Fabricius and Gmelin.

ARGENTINA, in Ichthyology, a genus in the order Abdominates, containing only four species; viz. Sphyrena, glossodonta, carolina, and machnata. The generic character is thus defined by Gmelin. Teeth in the jaws, and tongue; eight rays in the gill membrane; vent near the tail; and many rays in the ventral fins.

ARGENTINA, in Natural History, a species of Echinorhynchus, so named, because it infests the intestines of the atherine, atherina of Linnaeus. Redi, Gmelin, &c.

ARGENTINE flowers of anitomy. See Antimony, § 6. Oxyds of antimony.

ARGENTINE, of Kirwan. See Sichler spath.

ARGENTINUS, of Kirwan. See Sichler spath.

ARGENTOMAGUS, in Ancient Geography, Argentor, a town of Gaul, belonging to the Bituriges, in the road that led to Mediolanum on the east, and Limontum on the west.

ARGENTON, in Geography, a small and mean, but gay and lively town of France, in the department of the Indre, and chief place of a canton in the district of Chateauroux, five leagues S. S. W. of Chateauroux. It is situated in a beautiful valley, surrounded by vineyards on the Creuse. The place contains 3365: and the canton 10,359 inhabitants: the territory includes 290 kilometres, and 10 communes. N. lat. 46° 35'. E. long. 1° 52'.

ARGENTON le Chateau, a small town of France in the department of the Two Sevres, and chief place of a canton in the district of Thouars; 3 leagues west of Thouars. The place contains 270 and the canton 7937 inhabitants; the territory includes 3425 kilometres, and 19 communes. N. lat. 46° 59'. W. long. 0° 33'.

ARGENTON les Eglises, a town of France in the department of the Two Sevres, four miles north of Thouars.

ARGENTOR, a river of France in the department of Charente, formed by two streams called Argent and Or, and running into the Charente at the village of Porfai.

ARGENTORATENSIS, or Ornithology, a species of Fringilla found in the environs of Strasbourg. It is called by Bruton Linnæus argentoratensis; and by Buffon, Gymel de Strasbourg. This bird is brown; beneath, rufous with brown spots; abdomen and vent whitish. Gmelin.

To this specific character may be added, that it fearlessly exceeds the size of the common linnet; the quills and tail are brown; and the legs reddish. It is familiarly known about Strasbourg by the name of Gymel, and is said to lay sometimes four eggs, but seldom if ever more.

ARGENTORATUM, in Ancient Geography, Strasbourg, a city of Gaul, belonging to the Triboci, or Trebochi, which was a passage from Gaul to Germany, whence its name Strate-bargus, or Strasbourg. It had anciantly a manufacture of offensive and defensive arms of every kind. In the fourth century, Julian gained, under the walls of this city, a famous victory over the Germans, and took their king Chondomarus prisoner. After the establishment of Christianity among the Gauls, it became an episcopal see.

ARGENTRE a Laval, in Geography a town of France, in the department of the Mayenne, and chief place of a canton in the district of Laval, four miles west of Laval. The place contains 1665, and the canton 7570 inhabitants: the territory includes 1821 kilometres, and 9 communes.

ARGENTORATI, a town of France, in the department of the Ille and Vilaine, and chief place of a canton in the district of Vitte, seven miles north-north east of La Guereche. The place contains 2285, and the canton 12,855 inhabitants: the territory includes 2015 kilometres, and 9 communes.

ARGENTUR, in Ancient Geography, a town of Belge Gaul. Ptolemy.

ARGENTUS. See Silver.

ARGENTUS album, mentioned in Domestical book, signifies, according to Spelman, bullion, or silver unwrought. In those ancient days, such metal paid as money from one to another in payment. Samitaur pro quo hoc metallo profite non figurato.

ARGENTUS Del, God's penny, anciently signified earneth-money, or money given to buy a bargain; in some places called erekis, or arks, and by the civilians and canonnets, arme. Et cepit de praedito Henrico tres denarios de argent Del pra manibus.

ARGENTUS fulminans. See Satins of Silver.

ARGENTUS muficus or museum. This is a metallic alloy in the form of silvery flakes, used as a pigment for giving a white metallic lustre to plaster casts, paper, porcelain, &c.

It is prepared in the following manner. Take an ounce and a half of pure tin, and the same quantity of bismuth; melt them together in a clean crucible, and flir the mafs repeatedly with a clean iron rod till the two metals are accurately mixed. Then remove the crucible from the fire; and when its contents are on the point of becoming solid, pour in an ounce and a half of warmed quicksilver; stiring it as before. Previously to using this alloy, it must be ground in a stone or earthenware mortar, with white of egg or spirit varnish, and in this state applied to the intended work: when dried it may be burnished in the usual manner, and has then very much the appearance of silver. Encyclopedia. Method. Arts & Metiers, art. arg. fusicon.

ARGENTUS nitratum, in Pharmacy, otherwise known by the names Nitrated silver, and Lunar caustic.—See Silver, medical preparations of.

ARGENTUS vivus. See Mercury.

ARGENVILLE, in Biography. See Dezallier.

ARGENUS, in Ancient Geography, a port of Carmania. Phiny.

ARGENUS, or ARGUS, in Ancient Geography, a small island situated near the coast of Asia Minor, south-east of the isle of Lesbos and near it. They were rendered famous by the battle gained by the Athenians over the Lacedemonians, in the twenty-sixth year of the Peloponnesian war, or the 46th year before Christ. Of these three islands, the largest had a town called Arginus. CAGENUS, a small isle of Egypt, near Canopus; so called from Argus, king of Macedon, who began his reign in the 67th year before the Christian era.

ARGESTES, is used by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the south and westward.

Ricciulus
ARG

Ricius uses the term to denote the wind which blows at 23° 30' from the west towards the north, coinciding with that which is otherwise called W.n.w. All. Reform. ARGENTIN, in "Ancient Geography," a people of Asia who inhabited the western banks of the river Indus. Pliny. ARGENTINAR, in "Astronomy," a star of the fourth magnitude, in the flexure of the constellation Eridanus.

ARGIAN, in "Geography." See RIGIN.

ARGIA, in "Entomology," a species of Papilio (Dan. Carol. Gmel.) The wings are rounded, entire, and white; tip of the anterior pair black. This is a native of Sierra Leona in Africa; and is figured by Cramer under the name of Calceosa. There is a large brown spot near the apex of the anterior wings beneath; and the inner margin is beft with long, falciculated, erect, white hairs. Fabricius, &c.

ARGI, in "Geography." a town of Arabia Deserta, 360 miles S. S. E. of Ana. This is also the name of one of the three principalities into which Arabia Deserta is divided.

ARGIADENS, in "Entomology," a species of Papilio (Phil. Rural. Gmel.) The wings are entire and blue, with a blackish margin beneath, the colour is a brownish-grey, with a linear mark, and two rows of occluded dots. Fabricius.—This insect inhabits Saxony.

ARGLE, in "Geography," islands of Asia Minor, on the coast of Caria. Pliny. ARGIANs. See ARGIVES, and ARGOS.

ARGIL. See CLAY.

ARGIL. native.—Alumine native, Fr. Reine Thonere, Germ. Argilla pura. Werner. This mineral (called also by some Lac Lune, ") is of a snow white or yellowish white colour. It is found in various sized kidney-shaped masses; is amorphous; and presents a fine-grained earthy fracture; it flies when broken into indeterminate blunt cornered fragments. It is opaque, but when boiled in water acquires a degree of fermenltransparency like gum tragacanth; stains the fingers, feels somewhat meagre; adheres lightly to the tongue, and exhauses, when molifted, an earthly film. It is easily broken, being almost friable. Sp. gr. according to Bergmann = 1.905; according to Gmelin = 1.669.

Native Argil is insufhsible per se even at 166° Wedgeood. It is soluble in mineral acids sometimes with and sometimes without effervescence, on account of a small proportion of carbonated lime with which it is often mixed. By the analyses of Schreber and Frischmann, it is also found to contain a few flight traces of iron and fles. It is said, with little probability however, that this mineral has been procured in Sileia, at Pollinier, and in Lombardy; the most authentic specimens come from Halle in Saxony, being found in the garden belonging to the college there; hence it has been supposed to be an artificial product, and the fibre of it is underfoot to have been for some years past exhausted. It is not made use of. Widenmann, p. 385. Lenz. verfich, &c. vol. i. — Brochant, vol. i. Kirwan, vol. i.

ARGILITUM, the name of a small hill of Rome, between mount Aventine and the Capitol. Num. erected on this hill by the Aventines.

ARGILUS, a mountain of Egypt, near the Nile, so called because Jupiter carried thither the nymph Arges, and had a son by her named Dionysus.

ARGILL, or ARGILL, in "Ornithology," one of the synonymous names of the Linnean Ardea diiha, and gigantic crane of Dr. Latham, being so called by Ives, it. p. 183.

ARGILLACEOUS, in "Agriculture," such ground or soil as contains a large proportion of clayey matter in its composition. See Soil. VOL. II.

ARGILLACEOUS, marl, that sort of marl which contains much clay. As a manure, this kind of marl is the most proper for the sandy and light sorts of soil.

ARGILLACEOUS earths. See ALUMINE.

ARGILLACEOUS schistus. See THONSCHIPE.

ARGILLITE of Kirwan. See THONSCHIPE.

ARGILLITICITE of Kirwan. See MARL.

ARILY in "Geography," a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Beaune, fifteen miles south of Dijon.

ARGILUS, in "Ancient Geography," a town of Thrace in the vicinity of Amphipolis, at the mouth of the river Strymon. Thucydes (I. iv. § 103.) says, that the Argilis were a colony of Andrians, established in the neighbourhood of Amphipolis.

ARGINA, or ARGYNA, an ancient town of Greece in the country of the Ozolian Lucrians. Pliny.

ARGINUS. See ARGUS.

ARGIOUS, in "Entomology," a species of Papilio (Phil. Rural. Gmel.) The wings are tails; above blue, with a black margin beneath; white more richly dotted with black. This insect inhabits Europe. Linnæus, &c.

ARGIPPEI, ARGIPPEANS, in "Ancient Geography," a people of Scythia, whose language was different from that of the Scythians, though they resembled them in their dress. They laboured not on the produce of the chase, but on the fruit of a tree, called "pontaria," of which, when ripe, they made a black and thick liquor, which they drank either clear or mixed with milk. Of the hulks they prepared a kind of cake which they reckoned nutritious. As they lodged both in summer and winter under trees, they formed a covering to shelter them. Such perfons, it is said, were deemed sacred, so that they had no occasion for military weapons in their own defence; and such was their reputation for wisdom, that their neighbours referred disputes to their arbitration, and their abode served as an inviolable asylum.

ARGIRA, a small fountain of Achaia, not far from Charadrus.

ARGIRI, or, as it is called by Arrian, Argali, a town of India, on this side of the Ganges. Ptolomy.

ARGIRO CASTRO, in "Geography," a town of European Turkey, in the province of Livadia, 26 miles north-west of Lepanto.

ARGISCH, a town of Wallachia, on the frontiers of Transylvania, 8 miles north of Helmanitau, and 8 south of Tergowitz.

ARGISH, a town of Asia in Armenia, seated on the lake Van. N. lat. 38° 32'. E. long. 43° 15'.

ARGITHAMNIA, in Botany, (from Argito, white, and 

Eff. Gen. Char. male, Cal. four-leafed, Cor. four-petalled. Female, Cal. five-leafed. Cor. none; styles dichotomous. Caps. trilococceus, with solitary seeds.

Species 1. A. candidum. Swartz. This shrub fihs about five feet high, covered with a whitish bark; leaves at the ends
of the branches which they surround; they are oval, serrate, of a dark green, about one inch and a third in length, and an inch in breadth; flowers axillary on short peduncles; calyx five-lobed; flowers fix, greenish. The leaves when bruised are very odoriferous. A native of Jamaica, on a dry gravelly soil.

ARGITHEA, in Ancient Geography, a town of Greece, the capital of Attamania, according to Livy.

ARGIVES, a people of Greece, who inhabited that part of Peloponnese called Argolis; which see.

ARGIZALA, or ARGISAMA, a town of Asia Minor, in Gliata. Ptolemy.

ARGO, in Antiquity, a ship or vessel celebrated among the poets; being that wherein the Argonauts, of whom Jason was the chief, made their expedition in quest of the golden fleece.

This ship, according to Diodorus Siculus, Apollonius, Tzetzes, Servius, and many other writers, is said to have derived its name from Argus or Argo, the person who, under the direction of Minerva, contrived it; others have thought, that it was called Argo from the Greek word *argos*, care. Some again have attributed its name to that of Argos, the city in which it was built. Cicero cites, in his first Tif Unterstüt, two verses from an ancient Latin poet, who ascribes the appellation of Argo to the Argives or Greeks who sailed in it. Ovid, and many others, call it a sacred ship; and it was thus dedicated, probably, because Minerva was said to have given instructions for building it, or because it was partly constructed of some sacred timber from the grove of Dodona, which was sacred to Jupiter Tomarius, and which sheltered oracles.

Authors generally represent this ship as a long vessel, resembling the modern galleys, and furnished with 30 benches of oars. It could not, however, be of any great bulk, if the ancient tradition be true, which reports, that the Argonauts were able to carry it on their backs from the Danube to the Adriatic sea. However this be, Jason, it is said, happily accomplished his enterprise; and consecrated the ship Argo to Neptune; or, as others say, to Minerva, in the isle of Corinth; where, they add, it did not remain long before it was translated into heaven, and made a constellation. For an account of this enterprise, and of the persons concerned in it, see Argonautic expedition, and Argonauts.

ARGO Navis, or the Ship, in Astronomy, is a constellation of fixed stars in the southern hemisphere, whose stars, in Ptolemy's catalogue, are 457; in Tycho's, 11; in the British catalogue, and Sharp's Appendix, 64.

Argo, in Conchology, a species of Argonauta that is distinguished from others of the same genus by having the flat keel of the shell chiefly toothed along the edges on each side; or, as Linneus expresses it, "carina utrinque subdentata," keel subdenticulate on each side. This is *nautilus teindeli* of Rumphius, *bohemia* of Gmelini and Telfin, *nautilus fidecus* of Klein, *nautilus papraceus* of Argenville, and *nautilus nautilis*, sailor-shell, or sailing-shell, of English collectors.

The animal inhabitant of this shell, as the common character of the argonauta implies, is either a *jefa* or a *dio*; most probably the former; and its appearance and manners of life are so singular and interesting, that they did not escape the notice of some of the earliest writers on natural history with whom the moderns are acquainted. It is a native of the Mediterranean and Indian seas, and is supposed to have taught mankind the use of sails, and the art of navigation in the infant state of society; our admired poet alludes to this opinion in the following well-known lines in the

> "Elyas on Man:"?

5

ARG

"Learn of the little nautilus to sail,
Spread the thin oar, and catch the driving gale."

When this creature intends to sail, it discharges a quantity of water, by which its specific gravity is made less than the sea-water in which it lives, and rising immediately to the surface, erects its arms, and expands a membrane between them, by means of which it is driven before the wind like a vessel under sail; at the same time that two of its arms which hang over the sides of the shell, serve for oars and rudder, as occasion may require. In this manner it is not unfrequently seen by navigators floating upon the surface of the water in calm weather; but the moment a storm rises, or that any thing disturbs them, they lower the sail, draw their arms into the shell, and taking in as much of the water as will sink them, descend directly to the bottom.

Pliny, H. N. xi. 29, &c.

ARGOB, in Ancient Geography, a district of Palestine, belonging to the half tribe of Manasseh, in the country of Bani, one of the most fruitful on the other side of Jordan. In this district there were 63 cities, called Havoth Jair, which had high walls and strong gates.—Also, the capital of this district. (Deut. iii. 14.) 1 Kings, iv. 13.) which, according to Enecius, was 15 miles west from Geraf. This is probably the same with Ragab or Ragaha, mentioned by Jofephus, and in the Misna.—Argob was also a place in Samaritani, near the royal palace, where P. kah, the son of Remalshah, affiliated Pekalish, the son of Menahem, king of Israel. 2 Kings, xv. 25.

ARGODA, or ARGUM, a town in the interior of the Tauric Cheroneus, to the south of Portaera. Ptolemy.

ARGOENUS MONTI, a mountain of Asia, towards N. lat. 38° 20' north of mount Taurus.

ARGOL, in Chemistry, the fame with TARTAR.

ARGOL, See ARGIC.

ARGOLIS, in Geography, a town of France, in the department of Finisterre, and chief place of a canton in the district of Chateaulin, two leagues north west of Chateaulin.

ARGOLI, Andrew, in Biography, an Italian mathematician, was born at Tagliacozzo, in the kingdom of Naples, whence he removed to Venice. Here his merit was acknowledged, and he was appointed professor of mathematics in the university of Padua; and in 1636 distinguished by the title of chevalier. He died in 1657, and left a treatise "De diebus criticis," printed in 1652, 4to.; and "Ephemerides," from 1620 to 1700, 4 vol. in 4to. Nouv. Dict. Hist.

ARGOLIC SEA, in Ancient Geography, a name given by some writers to part, and by others to the whole of the Aegean Sea.

ARGOLIC BAY, now the gulf of Napoli, was formed by a part of the sea that intercepted the peninsula called Argolis on the south-east, and Laconia on the west. In this bay Phily places the following islands: Pityufa, Irene, Epyphere, Tiperans, Aperopas, Colonios, Arilleia, and Calauria.

ARGOLIS, so called from an ancient prince whose name was Argos, one of the first districts of the Peloponnesus, situate on its north-east side, was bounded by Achaea on the north, Arcadia on the west, Laconia and the Argolic gulf on the south, and the Aegean sea on the east. The ancient limits are not clearly ascertained; but it was much enlarged by force of its monarchs, so that it extended from east to west about 70 miles; and from north to south, from 37° 2' to 38° 20' N lat. or about 50 miles. This province is peculiarly interesting to the Grecian antiquarian and historian, because it was the cradle of the Greeks, since it first received the foreign colonies by whom they were civilized. It became the theatre of most of the events recorded in the early annals of Greece. Here flourished Inachus, who gave
ARG

gave his name to the river which waters the territory of Argos: its other rivers were Charadus, Eranus, and Phryxus: there also lived Danaus, Hypermenæa, Lynceus, Alecæon, Perillus, Amphitrion, Pelops, Atreus, Thyestes, Agamemnon, and many other celebrated heroes and heroines. This province contained the cities of Argos, Nemea, Mycenæ, Naupliæ, Tzæzænæ, and Epidauros. The kingdom of Argos was founded, according to Eufebius, 1080 years before the first Olympiad, or 1856 years before Christ, by Inachus, and continued under the name of the Argolic kingdom till the reign of Acræmus, the fourteenth king, who transferred the seat of it to Mycenæ about the year 512 from its foundation; from which time that part of it was called the kingdom of Mycenæ till the division, when the Heraclidæ made themselves masters of this and of the whole peninsula, after it had flooded upwards of 754 years under the government of twenty-one monarchs. The Argolic kingdom, properly so called, retained likewise its own kings after this division, until the Heraclidæ, who divided the peninsula of Peloponnesus into three kingdoms.

That of Argos had not continued above 40 years, before Mælas, their last king, having made an effort to recover the royal prerogative, lost both his kingdom and life. At the period which Homer (Il. ii. v. 559 to 580) celebrates, Argolis appears to have been governed by two dynasties, of which the one reigned at Argos, and the other at Mycenæ; and the respective princes were Diomede and Agamemnon. The king of Mycenæ was at that time the most powerful chiefain not only in Argolis, but in the whole of Greece. The misfortunes of the family of Agamemnon soon led to the humiliation of Mycenæ. Argos became pre-eminent in the district of Argolis, and the Argives, inhabitants of Argos and its dependencies, during the historic ages of Greece, occupy the most prominent part of their faction of the peninsula. In their domestic institutions, the Argives, in common with other Grecian states, were first governed by limited kings, and afterwards their princes having attempted to become absolute, they established a republican form of government. In a maritime situation, and having easy access to the growing refinements of Asia Minor, of Corinth, and of Athens, the Argives successfully cultivated commerce and the arts; and though they did not neglect rural occupations, they were much less exclusively addicted to丈夫 and agriculture than their inland neighbours of Arcadia. The accessibility of their country, and their vicinity to the heroic and aspiring Spartans, exercised their courage in contests of defence, while their own ambition impelled them to offence and aggression.

About a century before the first Persian invasion, the Argives manifested a desire and intention to reduce and command the inferior towns of the province. The influence of the capital provoked the indignation of the country. Mycenæ, Tzæzænæ, Epidauros, and other places of less note, were often conquered, but never thoroughly subdued. Interest taught them to unite, and union enabled them to act at defiance the power of Argos, by which they were branded as rebellious, and which they reproached as tyrannical. Having many contests with the Spartans, with various success, they, about the time of Creusæus, received a decisive defeat (Herodotus, Clio), which depriving them of the valuable territory of Thyrsa, affected their interest much, but operating on the high spirit of Grecian heroism, affected their sensibility more. They had hitherto, like most of the Greeks, adorned their long hair to encrease the gracefulness of manly beauty, and to render their appearance more terrible to their enemies. But in remembrance of this disaster, they shaved their heads, deprived the Argive women of their golden ornaments, and bound themselves by a dreadful imprecation never more to assume their wonted appearance until they had recovered possession of Thyrsa. Although they were not able to recover this territory from the Spartans, now the most potent state of Greece, the Argives continued to be the second power in the Peloponnesus. But having, from jealousy of the Spartans, declined to participate in the defence of Greece against Persia, the Argives fell into the disrepute which never fails to overtake those that from intemperate differences and Jephthah rivalry withold the efforts of patriotism, when required to repel an invading enemy. As defectors of the common cause, the Argives incurred the hatred and contempt of their public-spirited neighbours. Mycenæ, Epidauros and Tzæzænæ, which formed respectively the greatest strength and ornament of the Argive territory, threw off the puke of a capital which for allegiance did not afford protection, and other towns of less importance obeyed the summons to liberty and independence. The insurgents strengthened themselves by foreign alliance, and renounced the authority to which they had so long submitted. By division, intestine war, and the devastation of the province, they paid the price of their baseness or folly, and left to posterity an awful lesson of the impolicy of obstinacy and separation, where common interest demands energy and concert.

If the Argives suffered by insurrection when duty and interest called for activity, they did not rashly fall into the opposite extreme of embroiling themselves in the quarrels of their neighbours, when these were not likely to affect their interest or security. During the first years of the Peloponnesian war, they kept aloof from the contest, and employed themselves in repairing the evils of the late division; but finding the Spartans likely to attain a pre-eminence that must be dangerous if not fatal to neighbouring states, they formed a defensive confederacy, which taking its name from its chief promoters, was called the Argive alliance. Soon after, however, being convinced of the prudent principle of the confederation, they at the instance of Alcibiades the instigator, broke the amenity with the Spartans, and brought upon themselves the punishment of precipitate injustice. The Spartans taking the field, ravaged the country; internal tumult co-operated with foreign hostility in disturbing the unstable Argives, and compelled them to seek again in peace and justice the recovery of those blessings which they had lost by war and rapacity.

When the Spartans, by the complete discomfiture of Athens, became predominant over Greece, remote as well as adjacent, it would have been madness in the conterminous Argives to have questioned their supremacy, or to have provoked the anger of a power which could now overwhelm them in destruction. They therefore acquiesced in a superiority which their opposition could not have destroyed. But when the imperious influence of victorious Sparta excited general resentment, the Argives were among the first to join in a confederacy for reprefling the ambition of Sparta, and asserting the independence of Greece. The policy of Antalcidas procured the establishment of a peace, wherein, by ignomious sacrifices to the ambition of Persia, Sparta was able to retain a great part of her influence over her neighbours. Her exercise of her dominion, however, did not peculiarly affect Argos; and it was reformed for another state finally to humble the Spartan power. But the battle of Leuctra had no sooner relieved the Argives from their dread of the Spartans, than intestine disensions again broke forth.

The great defect of the Grecian republics was the want of
ARG

an efficient control, which should at once mingle liberty and order, and allowing to each chief and individual all the power that was necessary for promoting public and private good, should refrain both tyranny and licentiousness. Hence there were frequent contentions between the aristocratical and democratical parties, not rarely leading to sedition and confusion. The Athenians being the chief patrons of democracy, and the Spartans of aristocracy, the relative power of these parties, and other republics, was strongly affected by the preponderance of Athens, or of Sparta. Macedon being humiliated by Epieminondas, the influence of aristocracy was weakened throughout Greece; and the nobles in many places were slain or driven into exile. At Argos, more than two thousand of the aristocratical party were killed. The Argives now joined the Thebans against the Spartans, and were instrumental in raising Thebes to a pitch of power which might have been dangerous to the independence of Argos, and of all Greece, had not the death of their confederate general dried up the fource from which Theban prosperity and greatness flowed.

The Peloponnesus being now freed from fears of the Macedonians, the Thebans being in a flate of languor after their late and extraordinary efforts, and the Athenians immerced in pleasure and luxurious indulgence, Greece was for several years quiet, and the Argives are rarely mentioned in history. But Sparta having recovered a part of her former power, resumed her pretensions to the direction of the Peloponnesus. The Argives formed with Arcadia and Messenia a league for maintaining their respective independence: with fatal impolicy they called in Philip of Macedon, who overcame the Spartans. But a nominal auxiliary proved a real matter; the Argives now shared the fate of the other Grecian states, and became a dependency of Macedon. See Argos.

ARGONAUTA, in Conchology, the name of one of the Linnæan genera, the character of which is thus defined: animal a sepia olio; shell univalve, spiral, involuted, membranaceous, and containing only one cell. The species of this genus are few. Gymnicharchus five, viz. argo, vitræus, cymbium, coruscus, and arctica; which fcc.

ARGONAUTIC, in Ancient History, denotes something belonging to the Argonauts. The Argonautic expedition is one of the most memorable transactions of antiquity; and references to it are interpersed in most of the writings of the ancients. By the Greek writers, who have traced the complete histories of this event, we are informed that the intention of this armament was to bring back a golden fleece, which was detained by Æetes king of Colchis. It was the fleece of that ram on which Phrixus and Helle fled to avoid the anger of Io. Upon his arrival at Colchis, Phrixus sacrificed it to Mars, in whose temple it was suspended. This fable has been thus explained: Phrixus flying with his sister Helle from the rage of their stepmother Io, the daughter of Cadmus, went on board a ship, whose ensign was a golden ram, and failed to Colchis. Helle was drowned by the way in that sea, from which her name was called the Hellepont, now the Dardanelles. This, it is said, was the ground of the poetical fable, that a ram with a golden fleece swam away with them to Colchis; and that the Argonauts undertook their famous expedition in order to regain that fleece.

After an interval of some years, Pelias, king of Ioleus, commissioned Jason, son of his brother Æson, to go and recover this precious fleece. For this purpose a ship was built at Pagiæ, a city not far from mount Pelion in Thessaly. It was the first that was ever attempted; and the merit of the performance is ascribed to Argus, who was instructed by Minerva, or divine wisdom. This ship, called Argo, was built partly with some sacred timbers from the grave of Dedalus, father to Jupiter (Danaius); and on this account it is said to have been sacred, and to have given verbal responses; which history is beautifully described by Claudian, De Bello Getico, v. 16.

"Argos trabulis jaenat fulcile Minervam: Nunc narratae tantam vincit æraecula securi
Robora; sed, causa Tymniar Johs augus lacuo,
Arboré praexla tabulas animæque iacuæs.
"

As soon as this sacred machine was completed, a full band of heroes, the prime of their age and country, confounded together and engaged in this honourable enterprise. Among these Jason was the chief by whom the others were summoned and collected. Chiron, or, as others say, Musæus, framed for their use a delineation of the heavens, and contrived the first sphere, on which the stars were formed into afterlims for the benefit of the Argonauts, that they might be the better able to conduct themselves in their perilous voyage. The heroes being all assembled, waited for the rising of the Pleiades, at which season they set sail. The general account of their route is, that they coasted Macedonia, and proceeded to Thrace, where Heracles engaged with the Thracians, and is supposed to have also done service in several other places. They visited Lemnos and Cyzicus, and from thence came to the Bosphorus. Here were two rocks called the Cyncecus, and also the Symplegades, which used to clash together with a mighty noise, and intercept whatever was passing. The Argonauts let fly a dove, that they might discover by her fate if there were a possibility of escaping. The dove made its way, with some difficulty; and encouraged by this omen, the heroes pulled forward, and with the assistance of Minerva, escaped. After many adventures, which the poets have described in a manner wonderfully pleasing, they arrived at the Phæis, which was the chief river of Colchis. Immediately addressing Æetes, and informing him concerning the cause of their visit, they demanded a restitution of the fleece. The king was exasperated at their claim, and refused to give up the object in view, but upon such terms as seemed impracticable. Jason, however, accepted of the conditions; and after having engaged in many labours, and, by the help of Medea, footed a street of dragon which guarded the fleece, he at last brought off the prize. This being happily effected, he was received privately by his brother, and at the same time bringing away Medea, the king's daughter. As soon as Æetes was apprised of their flight, he fitted out some ships to pursue them, and arriving at the Thracian Bosphorus, took possession of that pass. The Argonauts, having their retreat prevented, returned by another rout, which writers have differently represented. The author of the Orphic Argonautics makes them pass up the Phasis towards the Mesotis, and from thence, through the heart of Europe, to the Cronian sea, or Baltic; and then to the British seas and the Atlantic; and afterwards, by Gades and the Mediterranean, home. Timagetius says, they proceeded northward to the same seas, by the Æther. Timeus traces their rout to the fountains of the Tanais, through the Pals Masotis; thence, through Scythia and Sarmatia, to the Cronian sea; and from thence, by the Atlantic, home. Hesiod and Antimachus conduct them by the Southern ocean to Libya, and thence over land to the Mediterranean. Heraceus Mela supposes that they went up the Phasis, and turning south over the great continent of Asia, arrived at the Indian ocean, and thence proceeded to the Nile in Egypt, whence they made their progress regularly home. Valerius Flaccus copies Apollonius Rhodius, and pursues their course up the Æther.
Ifer, and by an arm of that river to the Eridanus, and thence to the Rhone, and afterwards to Libya, Crete, and other places. Pindar conducted them by the Indian Ocean. Diodorus Siculus brings them back by the same way as they went out. Upon their arrival in Greece, they offered sacrifices to the gods, and consecrated their ship to Neptune.

Although the object of this expedition has been differently stated, and the account of it has been intermixed with many poetical fables, the reality of it has been generally admitted both by ancient and modern writers. Among the most eminent ancient writers who admitted it as an historical truth, were Herodotus, Diodorus, and Strabo, and with them every Grecian mythologist; and among the fathers, Celsus, Eusebius, and Syncellus. Among the moderns, the principal are, Scaliger and Petavius; and of our country, Archbishop Uther, Cumberland, Dr. Jackson, and Sir Isaac Newton. The learned Bryant (Anc. Mythol. vol. 2. p. 484, &c.) rejects the history of the Argonautic expedition as a Grecian fable. The Grecians, he says, have applied to themselves an ancient history to which they had no relation; and as the real purport of it was totally hid from them, they have, by their colouring and new-molding what they did not understand, run themselves into a thousand absurdities. He alleges the incongruities and contradictions of the different writers, who have given an account of this expedition. They differ as to the number of persons concerned in it; and yet, allowing the highest estimate, they were too few to have achieved what they are said to have performed. After many adventures, and long migrations in different parts, the Argonauts are said to have returned to Iolcus, and to have accomplished all their peregrinations in four, or, as some state it, in two months. “Is it possible,” says Bryant, “for fifty persons, or ten times fifty, to have performed such mighty operations in this term, or indeed at any rate to have performed them? They are said to have built temples, founded cities, and to have passed over vast continents, and through seas unknown; and all this in an open boat, which they dragged over mountains, and often carried for leagues upon their shoulders.” Besides, the æra of the expedition cannot be settled without running into many difficulties from the generality and ages of the persons spoken of. Some make the event ninety years, others seventy-nine, others only forty years before the æra of Troy. Writers have also differed as to the time whither the expedition was directed, the builder of the ship, and various other circumstances minutely recited by this learned writer. According to him, the mythology and also the rite of Greece were borrowed from Egypt; and they were founded upon ancient histories, which had been transmitted in hieroglyphical representations. These by length of time became obscure; and the sign was taken for the reality, and accordingly explained. In the account of Argo, he says, we have undeniably the history of a sacred ship, the first that was ever constructed. This was no other than the ark, called by the Greeks “Argus” and “Arcas,” originally framed by divine wisdom. As the history of the Argo related to an ancient event which the Egyptians commemorated with great reverence, the delineation of it on the sphere was intended as a lasting memorial of a wonderful deliverance; on which account one of the brightest stars in the southern hemisphere is represented upon the rudder of the ship. The star was called by the Egyptians “Canopus,” which was one of the titles of their chief deity, and regarded under this denomination as the particular god of mariners. The star of this deity was put upon the rudder of the Argo to shew, that providence was its guide. According to this writer, all the mistakes in this curious piece of mythology arose from hence, that the Arkites, who came into Greece, settled in many parts, but especially in Argolis and Thessalia, where they introduced their rites and worship; and the several circumstances of the Argonautic history afford wonderful evidence of the Arkites and their rites. The Grecians took the history to themselves; and in conformance of this assumption, wherever they heard that any people under the title of Arcades, or Arkai, settled, they supposed that there Argo had been. Hence they made it to pass not only through the most distant seas, but over hills and mountains, and through the mid of both Europe and Asia. They sent their heroes to Colchis, merely because some of their family had settled there. Jason, says Bryant, who was esteemed the chief in all the Argonautic adventures, was a feigned personage made out of a fancied title of the Arkite god, the same as Arcas, Argus, Inachus, and Prometheus; and the temples said to be built by him were such as were erected to his honour. Many of these were in Armenia, the region of the most ancient Minyae, who were the worshippers of the lunar deity Menes; and particularly in the vicinity of Mount Ida, where the ark really rested, and where the memorials of the deluge were religiously observed.

Among those writers who have allowed the reality of the Argonautic expedition, very different opinions have been entertained concerning its object and design. Diodorus Siculus supposes that the golden fleece denoted the skin of a sheep sacrificed by Phrixus, and guarded with care, from an apprehension that, according to an ancient oracle, the king of Colchis would be killed by the person who succeeded in taking it away. Strabo and Justin supposed that Colchis, a country lying between the Euxine sea and Iberia, and now called Mingrelia, had considerable mines of gold, which gave rise to the fable of the fleece. These mines were apprehended by certain mythologists to have been contiguous to some of those torrents which fall from the neighbourhood of mount Caucasus, and to have brought down with them great quantities of gold dust, which the inhabitants saved by letting fleeces of wool across the narrow passages of those currents. This account was afterwards diversified by the fabulous persons and their manner and embellished with the stories of dragons, brazen bulls, dreadful seas, dangerous passages, and many such perils and innumerable difficulties as commonly attend the too eager search after that pernicious, though so much desired, metal. Pliny and Varro ascribe this voyage to the wish of some Greek merchants to get possession of the fine wool of Colchis. The account which Suicides gives of the golden fleece, namely, that it was a parchment book made of sheep’s skin, and in which was written the whole secret of tranfmuting all metals into gold, scarcely deserves mention.

Sir Isaac Newton, in his Chronology, (apud oper. tom. v. p. 79. ed. Harl.) thinks that the Argonautic expedition was an embassy sent by the Greeks, during the interline divisions of Egypt, in the reign of Amemophis or Memnon, to permeate the nations upon the seas-coats of the Euxine and Mediterranean seas, to take the opportunity of Amemophis’s stay in Ethiopia, for revolting from Egypt, shaking off the yoke and setting up for themselves, as the Libyans, Ethiopians, and Jews had done before; and fetching the golden fleece was only a pretence to cover their true design.

The following judicious and satisfactory account of the Argonautic expedition, and its effects, is given by Dr. Gil- lies, in his “History of Greece.” The northern districts of Thessaly being peculiarly exposed to the dangerous fury of invaders, the petty princes of that province entered into a confe-
confederacy for their mutual defence. They assembled in spring and autumn at Thermopylae, a place afterwards ill-fated, and then governed by Amphictyon, a defendant of Delphi, whose name is immortalized in the Amphictyonic council. The advantages which the confederates derived from this measure were soon perceived by their neighbours. The central states gradually ascended to their alliance; and, about the middle of the fourteenth century before Chrilt, Acricius king of Argos, and other princes of the Peloponnesus, were allowed to share the benefits and security of this useful association.

After this event, the Amphictyons appear to have long confined themselves to the original purpose of their institution. The states, whose measures were directed by this assembly, found sufficient occupation in defending their own territories; and near a century elapsed, before they undertook, by common consent, any distant expedition. But it was not to be expected that their relics activity could be always exhausted in defensive war. The establishment of the Amphictyons brought together the chiefs most distinguished by birth and bravery. Glory and emulation prompted them to arms, and revenge directed those arms against the barbarians. Jafon, Admetus, and other chieftains of Thessaly, having equipped a small fleet in the neighbouring harbour of Eolus, and particularly the ship Argo, of superior size and construction to any before known, were animated with a desire to visit foreign lands; to plant colonies in those parts of them that appeared most delightful and to extend on their inhabitants the benefits which Greece had afforded strangers. The princes of the north having proclaimed this spirited design over the central and southern provinces, the standard of enterprise and glory was speedily surrounded by the flower of the Grecian youth, who eagerly embraced this honourable opportunity to signalize their manly valour. Eolus, Tydeus, Thesius, and, in general, the fathers of those heroic chieftains, who, in the succeeding age, thone with distinguished virtue in the plains of Troy, are numbered among the leaders of the Argonauts. They were accompanied by the chosen warriors, and by the venerable prophets, of their respective tribes; by an Eteoclyus, the admired father of the healing art, and by the divine Orpheus, whose sublime genius was worthy to celebrate the amazing feries of their adventures.

Thus, these adventures, however, have been too much adorned by the energies of poetry, to be the proper subjects of historical composition. The design of the Argonauts is veiled under the allegorical, or at least doubtful, phrase, "of carrying off the golden fleece, which, though easily explained, if we admit the report that the inhabitants of the Euboean banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from Mount Caucasus, is yet described in such various language by ancient writers, that almost every modern who examines the subject, thinks himself entitled to offer, by way of explanation, some new conjecture of his own. But, in opposition to the most approved of these conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to establish extensive plans of commerce, or to search for mines of gold, far less to learn the imaginary art of converting other substances into that precious metal; all such motives supposing a degree of speculation and refinement unknown in that age to the gallant but uninstructed youth of Thessaly. The real object of the expedition may be discovered by its consequences. The Argonauts fought, conquered, and plundered; they settled a colony on the shores of the Euxine; and, carried into Greece a daughter of the king of Colchis, the celebrated Medea, a princess of Egyptian extraction, whose crimes and enchantments are condemned to eternal infamy in the immortal lines of Euripides.

Notwithstanding many romantic fictions that disfigure the story of the Argonauts, their undertaking appears to have been attended with a considerable and a happy effect on the manners and character of the Greeks. From the era of this celebrated expedition, we may discover not only a more daring and more enlarged spirit of enterprise, but a more decisive and rapid progress towards civilization and humanity. The fallen and uncouth chiefs, whose acquaintance with each other mostly arose from acts of mutual hostility, hitherto gave full scope to the fantastic passions which characterize barbarians. Strength and courage were the only qualities which they admired; they fought and plundered at the head of their respective tribes, while the inhabitants of the neighbouring districts were regarded as fit objects only to excite their rage, and gratify their rapacity. But these gloomy warriors, having exerted their joint valor in a remote expedition, learned the necessity of acquiring more amiable virtues, as well as of adopting more liberal notions of the public interest, if they pretended to defend the interests of their equals. Military courage and address might alone procure them the respect of their immediate followers, since the safety of the little community often depended on the warlike abilities of the chieftain; but when several tribes had combined in a common enterprise, there was less dependence on the proves of any single leader. Emulation and interest naturally rendered all these leaders as jealous of each other, as of kings of the public applause; and, in order to acquire this applause, it was necessary to brighten the luster of martial spirit by the more valuable virtues of justice and humanity.

The Argonautic expedition is one of the greatest epochs or periods of history, which has Newton's endeavours to fettle, and from thence to rectify the ancient chronology. This he shews, by several authorities, to have been one generation, or about thirty years, earlier than the taking of Troy, and about forty years later than the death of Solomon. Blair refers this expedition to the year 1263 before Chrilt, or 79 years before the taking of Troy. Playfair places it 44 or 42 years before this event, or in the year 1225 before Chrilt. For an account of the Newtonian system, of the Argonauts in its favour, and the objections that have been urged against it; see Chronology.

ARGONAUTICA, in Literary History, denotes poems on the subject and expedition of the Argonauts. We have the Argonautics of Orpheus, in epic verse, published by H. Stephens; the Argonautica of Valerius Flaccus, in eight books of Latin heroic, in imitation of Apollonius, with respect to which Burman observes, that the imitator has often surpassed the original; the Argonautics of Apollonius Rhodius, an heroic poem, consisting of four books, "opus," as Quinilius calls it, "non contemendum." ARGONAUTS, in Antiquity, a company of fifty-one, according to Valerius Flaccus, or, according to Apollonius Rhodius, forty-four heroes, who embarked along with Jafon in the ship Argo, for Colchis, with a design to obtain a golden fleece.

Hercules, Thessus, Cadmus, Orpheus, &c. were of the number of the Argonauts.

Argonauts of St. Nicholas, was the name of a military order, instituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as some fay, merely for preferring amity among the nobles.

They wore a collar of shells, included in a silver crescent, whence hung a ship, with this device, "Non credo tempori,"
A R G

puri," "I do not trust time." Hence these Argonaut knights came to be called *knights of the shell*. They received the order of St. Basil archbishop of Naples; and held their assemblies in the church of St. Nicholas, their patron.

ARGONNE, in Geography, a country of France, before the revolution, about 20 leagues in length, between the Meuse, the Marne, and the Aine; of which the capital was St. Menehould.

ARGOON. See Argon.

ARGOPHYLLUM, in Botany (Ar<sub>2</sub>g<sub>0</sub> and *<sub>Ph</sub>*<sub>0</sub>l<sub>0</sub>l<sub>0</sub>um, white-leaf; the leaves being of a glossy whitish tinge.). Forster, t. 15, Supp. p. 22. Schreb. 393. Juss. 161. Clas. *Penda<sub>n</sub>tr<sub>a</sub> monogynia*. Nat. Ord. Eric<sub>e</sub>s. Juss. Gen. Char. Col. is small, foliolute, quinquefolia; divisions sharp. Cor. petals five, lanceolate, spreading, three times greater than the calyx; stamens five, angulated, pyramidal, open at the top, consisting of many converging papillae, connate at the base. 

*Stam.* filaments five, subulate, inserted into the receptacle, shorter than the stamens; anthers ovate. *Fil.* germ turbinated, flattened at the bottom to the calyx, flat above; style filiform; stigma globose. *Cap.* capsule hemispherical, flat above, three-celled, opening into three parts. Seeds, numerous, globular, porous.

Species 1. *A. n<sub>it</sub>*<sub>d</sub><sub>um</sub>, perennial, stems, petioles, leaves underneather, panicles, calyxes, shining with a silky down; leaves alternate, petiole, ovate, pointed at both ends, entire; peduncles axillary, solitary, elongated, terminating in a panicle. Found in New Caledonia.

ARGOS, αργος, from αργος, a negativc, and ωρος, work, or b<sub>l</sub>if<sub>n</sub>ē<sub>d</sub>s; as if it were *<wbr/><wbr/>αργω<sub>ν</sub>*. So *αργός* <wbr/>αργων; is fiber not worked; *<wbr/>αργων* <wbr/>ινορρ<sub>π</sub>η<sub>ρ</sub>ας, in Hippocrates, is rude woody, not prepared, but f<sub>u</sub>ch as it is to the floor.

ARGOS, in Ancient Geography, a name given to several cities; and more particularly to the capital of a small kingdom of Greece, denominate ARGOLI. It was also called Argi, and Inachus, from its founder. It is said to have been built by a colony of Argives, who migrated from Egypt under the command of Inachus, and settled in Greece. Inachus was slain the son of the ocean, because his origin was not known, and he had come by sea into Greece. Before his arrival the inhabitants were rude and barbarous. Thence he united and civilized, and instructed in various arts. His son Phoroness invested the laws of government; and, on that account, he has been called the first king in Argos, the first of men, and the father of mortals. The city was seated at some distance from the sea, on the river Inachus, in a spacious, rich, and well-watered plain, from which it is supposed to have derived its name. To this purpose Strabo says *(l. viii. p. 170, &c.)* that Argos is a Macedonian or Thessalian town, signifying a plain or champaign country, and thus it is described by Homer. Hence it has been concluded that they are identical, who have represented this city and its territory as dry and barren, and that they have misunderstood the epithet of "thirty," ascribed to it by the poet; which, it is conceived, should have been translated "delightful," because it was well watered by the Inachus, and by several other rivulets and springs. It was also distinguished by the epithet "hippobotos," from the goodness of its adjacent pastures, in which Neptune is said to have fed his horses, or perhaps from the excellent breed of horses which this territory produced. The epoch of its foundation is referred to the year 1080 before the first Olympiad, or 1856 b. C. before Christ; and it lost its distinction as the capital of the kingdom after the reign of Acrisius, or about the year 1344 before Christ, when the seat of government was transferred to Mycenae. Upon the arrival of the Heraclidae, and the division of the peninsula into three kingdoms, about the year 1104, Argos recovered the rank which it had lost. Strabo speaks of Argos as the principal city of the Peloponnesus, next to Sparta. It was adorned by a number of magnificent edifices and statuary. The most ancient of these edifices was the temple of the Lycian Apollo, erected to this god by Danaus; and in this temple was the statue of Apollo by Attalus the Athenian, that of Biron with a bull upon his back, one of Mercury by Epinus, and others dedicated to Apollo, Jupiter, and Diana. Over against this temple was that of Jupiter Neptunus, with the statue of the deity in bronze by Lygippus; the temple of Phoroneus, whose anniversary was celebrated by the Argives; the temple of Fortune, and another dedicated to the Scyths, &c. &c. Here were also the statues of the heroes who took Thebes, and the cenotaph of the Argians who perished at the siege of Troy. The celebrated citadel, called "Laifax," was seated on an eminence to the north-west of the city. Argos was also much enriched by its trade, and particularly by the fine race of horses that were bred about its territory. Bryant refers the origin of Argos, of the Argives, and also of the Argonauts, to a colony of Arkites, who came from Egypt and diffused themselves widely through various parts of Greece. Anal. Anc. Mythol. vol. ii. p. 526. The medals of this city were gold, silver, and bronze; and their ordinary type was a wolf, which was the symbol of the Argives. There were also imperial Greek medals struck in this city, in honour of Adrian, Antonine, and Septimius Severus. Paulinia, Domna, Geta, Elagabalus, Marcus Aurelius, Piaultilla, Galen, and the younger Valerian. A small village, called *Argos* still subsists on the ruins of the ancient Argus.

ARGOS, a town of the island of Nisyros, one of the Cyclades. Steph. Byz.—Allo, a town of Asia, in Cilicia, called in the time of Steph. Byz. Argopolis, situated near Mount Taurus.—Allo, a town of Asia Minor, in Caria. Steph. Byz.—Allo, a place in the island of Cyprus, famous for the temple of Apollo Erythius, where Venus found the body of Adonis.

ARGOS Amphilochium, a town situated in the Ambrian gulf, two stadia, according to Polybius, and according to Livy twenty-two miles, from the city of Ambria. Thucydides, who represents it as a maritime town, ascribes its origin to Amphilochus, the son of Amphirous, some years after the war of Troy; others say that it was founded by Alcmeon, in honourable remembrance of the friendship that subsisted between him and his brother Amphilochus.

ARGOS Hippium. See ARPI.

ARGOS Orphium, a town of the O牧场ad, a country of Epirus, built by Oicles; where he made his escape, after having killed his mother. Strabo.

ARGOS, or ARGAI, in Geography, a mean town of Turkey, in the Morea on the bay Napolitani and the river Najo or Inachus; N.N.W. from cape Angelo. The Turks took it from the Venetians, under Mahomet II.; twenty miles south of Corinth. N. lat. 37° 36'. E. long. 23° 5'.

ARGOS, a small town of Africa, in the kingdom of Dongola in Abyssinia, on the eastern bank of the Nile, through which the caravans that carry soap and linen pass, and where they pay a duty to the dominion of the place.

ARGOSTOLI, a sea-port of the island of Cephalonia, opposite to Albania, the belt in the island, at the distance of five miles from the fortress.

ARGOUGES, a town of France, in the department of the Channel, four leagues south of Avranche.
ARGOW, ARGAU, or ARGovie, a country of Switzerland, situated on the river Aar, from which it derives its name, and forming the north-eastern part of the canton of Berne. It is divided into Upper and Lower Argow, which are separated from each other by the small town of Arburg. The upper Argow extends to the Thun, and the lower to the confluence of the Aar with the Rhine. By the division of 1798, Argow, the chief town of which is Aran, was made a distinct department or canton; but by the constitution of 1801, Argovie was reunited with Baden and with the upper part of the Frickthal, and thus formed into the fourteenth department or canton, and five persons were appointed to represent it in the diet. Argow is a very fertile country, well watered by rivers which flow into it from the canton of Luzerne, abounds with excellent pastures, and produces alo corn and wine. The industry of the inhabitants in the Lower Argow compensates for the less fertility of the soil. The reformed religion is the general profession of its inhabitants. See Berne.

ARGU, a town of Syria, five miles south-east of Damacus.

ARGUEDAS, a town of Spain, in Navarre, 23 leagues from Tudela.

ARGUIL, a town of France, in the department of the Lower Seine, chief place of a canton, in the district of Neufchatel, six leagues north-east of Rouen. The place contains 349, and the canton 6,638 inhabitants: the territory includes 215 kilometres, and 22 communes.

ARGUENON, a river of France in the late province of Bretagne, which has its source near Jugon, and runs into the sea near St. Malo.

ARGULER, in Geography, a town on the south point of Porto Galiero, towards the north-western corner of the island of Sardinia, in the Mediterranean, nearly east from Cape Caffa.

ARGUIN, an island of Africa, in the Atlantic, situated on the northern part of the coast of Senegambia, and in a gulf of the same name formed by Cape Blanco, about ten leagues from it. N lat. 20° 20'. W. long 19° 22'. To the west of this island are two other long small islands, and in the bay, on the north side, are several shoals from the main. There is also a little island by the point called Terra Gorda, and more southwards another called Monzora. Arguin was probably the island, which was known to the ancients under the name of "Cerne." It became the chief station of the Carthaginians, in the voyage of Hanno, along that coast; and M. De Bougainville contends, that the caltrons found there are monuments of the Carthaginian power and ingenuity. Although Arguin is scarcely two miles in length, it has been for nearly a century, an object of contest to the Portuguese, Dutch, English, and French; but at length the French, in 1725, demolished the fort, and it has not been since rebuilt by any European power.

ARGULUS, in Entomology, one of the genera or divisions of Müller, in his arrangement of Monoccelli. Gmelin adopts it as a subdivision of the genus, with this definition: eves placed beneath: antennae two; legs from four to eight. This subdivision includes the three following species, Charon, Delphinius, and Armatig. It is remarkable that the first kind has four legs, the second eight, and the third six.

ARGUMENT, in Rhetoric, is some reason or series of reasoning, by which we establish the proof, or show the probability of some given proposition. Logicians, somewhat more scientifically, define argument, a medium, from whose connexion with two extremes, the connexion of the two extremes themselves is inferred. To illustrate this definition by an example; let it be inquired, "whether virtue is to be loved?" The agreement between virtue and love might be found by comparing each of them separately with happiness, as a common measure to both. For since the idea of happiness agrees to that of love, and the idea of virtue to that of happiness, it follows that the ideas of virtue and love agree to one another; and therefore it may be affirmed, "that virtue is to be loved." But, on the contrary, because the idea of misery disagrees with the idea of love, but the idea of vice agrees to that of misery, the two ideas of vice and love must concomitantly disagree with one another; and therefore it would be false to affirm, "that vice is to be loved." The third thing logicians call the "medium" or "middle term," because it does as it were connect two extremes, that is, both parts of a proposition. But rhetoricians call it an "argument," because it is applied to what was before proposed as to become the instrument of procuring our assent to it. Ward's Oratory, vol. i. p. 43. See Topics.

Arguments are termed grammatical, logical, physical, metaphysical, moral, mechanical, theological, &c. according to the art, science, or subject, from whence the middle term is borrowed. Thus, if we prove that no man should steal from his neighbour because the scripture forbids it, this is a "theological argument;" if we prove it from the law of the land, it is "political;" but if we prove it from the principles of reason and equity, the argument is "moral." Arguments are either certain and evident, or doubtful and merely probable. "Probable arguments," are those whose conclusions are proved from some probable medium. "Evident and certain arguments," are those which prove their conclusions by clear and uncontroverted principles; these are called demonstrative. In reasoning, Mr. Locke observes, that men ordinarily use four sorts of arguments. The first is to allege the opinion of men, whole parts and learning, eminence, power, or some other cause, have gained a name, and settled their reputation in the common esteem with some kind of authority: this may be called "argumentum ad verecundiam." Secondly, another way is to require the adveresaries to admit what is alleged, as a proof; or to align a better: this he calls "argumentum ad ignorantiam." A third way, is to press a man with consequences, drawn from his own principles or concessions: this is known by the name of "argumentum ad hominem." Fourthly, the using of proofs, drawn from any of the foundations of knowledge or probability: this he calls "argumentum ad judicium;" and observes, that it is the only one of all the four that brings true instruction with it, and advances us in our way to knowledge. For. 1. it argues not another man's opinion to be right, because I, out of respect, or any other consideration but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the same with him, because I know not a better. 3. Nor does it follow, that another man is in the right way, because he has shown me that I am in the wrong: this may disprove me perhaps for the reception of truth, but helps me not to it. That must come from proofs and arguments, and light arisent from the nature of things themselves: not from any shamsmadnec5s, ignorance, or error. See Reason and Reasoning.

Bedeftheke, there are other arguments enumerated by different writers, as the "argumentum ab amore," which is used to engage
A computed theory of the "Y" argument in the context of the planet's argument, it is
advocated by several advocates for Christianity, as a means
of establishing a natural force. The statement has a different on this argument

Sorites, Sylogism, &c.

ARGUS, or Argo, in Geography, a river of Asia,
which rises in a lake of Chinefe Tartary, called "Coloum
Nor," or "Sun" Dalai," situated in N. lat. 49°, E. long.
110° 14', and joins the Amaur or Amoor, in N. lat. 53°.
E. long. 121° 14'. This river separates Ruflia from Chinefe
Tartary, according to the treaty of Nertchinsk in 1728.
It has a peculiar fility, and near its banks are mines of lead
and fliver.

ARGUS, or Argo, is also a mountain of Independent
Tartary, forming the chain with the Kara Tau, though
broken by the interfeclion of a river.

ARGUNA, a town on the coaft of Africa, on the river
Benin or Forntna, thirlean leagues from Benin.

ARGUNKOI, in Geography, a town of Siberia, feated
on the Argun, near the confines of China, one hundred
and thirty miles eft of Nertchinsk. N. lat. 50° 50'. E. long.
120° 14'. This is the farthell fort of the Ruffians towards
the eft, on the Mongoliafiers, and was firft built on
the eft bank of the Argun, in 1682, for the convenience
of levyng the tribute payable by the Tungufians, who
habited there; and it was rebuilt in 1699 on the west
side of that river. A confiderable trade is carried on from
this garrifoned town with the Mongufes. The country round
it is very fertile and the air, though cold, very healthy.
The terriority of Argunfko is often visited with flight
flocks of an earthquake, in the spring or beginning of
winter. The Chinefs erect new pillars every year, on the eft
bank of the Argun, to mark the limits of their frontiers.

ARGURA or ARGISSA, in Ancient Geography, a town
of Greece, in Thelfaly, fituate upon the Penæux, forty fiddia
from Atrax. Strabo.

ARGUS CAMPUS, a plain in the terriority of Mantinea.
Paufanias.

ARGUS, in Fabulous History, is faid to have had an hun-
dred eyes, fome of which were open, whilft the others were
clofed. He was called Panteris, panoptes, becaufe he faw
every thing. On this account Juno intritted him with the
wifdom of Ioo; but Jupiter, having compaffion on Ioo in
felf confinement, commiffioned Mercury to charm Argus to
fleep with his flute, and to feal his eyes with his caduceus,
and then to cut off his head. Juno, in recompence of his
fidelity, took all the eyes of Argus, and deftroyed them and
fixed them to the wings of the peacock; and, as the fable adds,
transformed Argus into this bird. Macedon (Saturn. f. 19.)
gives this fable an aternomical origin: he fays, that Argus
represents the celestial sphere, on which are difperfed a thou-
tand fars; and that Mercury is the fun, that makes them
diffappear by its brillencc.
But when it was known that the
Mercury of the Greeks was the Anubis of the Egyptian
ians, and that Anubis represented the horizon, the applica-
tion of the fable was no lefs obvious, as Mercury caufed
Argus to fleep, and clofed his hundred eyes, as the horizon
evry day veiled the fars of the celestial fphere.

ARGUS, in Conchology, a species of Mur€€€, found in
India. The shell is gibbous, with transverse tuberculated
ribs; brown, obscurely falcated, and white within; aper-
ture ovate. Gmelin, &c. Obs. There are three or more
fuppofed varieties of this species, one of which is believed
to be the shell figured in Martin's Universal Conchology
under the name of Flag-Buccinum; and which is found in
the Friendly and Society iflands.

ARGUS, a species of Cypræa, that inhabits the Indian
and Atlantic ocean. This shell is fearly turbinated, fome-
what cylindrical, and sprinkled with ocalfed marks; four
brown spots beneath. Gmelin. It is called argus by Rup-
mius, argus magus by Argenville, and argus curry by Eu-
ghil collectors. The length is about four inches; it is rather
narrow, and of a grey or yellowish colour above, with three
brown bands; the ocalfed marks are fome times connected;
and it is alfo remarkable that the spots on one fide, beneath
are larger than the other; the lips are ftraw-colour, and the
tooth brown.

ARGUS minor, the name given by Argenville to the shell
called by Linnaeus and Gmelin Cypræa ebravia; which
fhee.

ARGUS, in Entomology, a species of Cureuli, decribed
by Sparrman in the Stockholm Transactions for 1785, as
a native of the Cape of Good Hope. It is downy; head and
anterior margin of the thorax dotted with grey and white;
wing-cafes with elevated frite, and both spotted and dotted
with white and grey. Gmelin.

ARGUS, a species of Cinex (Scurtallus, Gmel.) It is
black, dotted with numerous occil lar fulvous spots. Fabr.
and Gmel. This creature inhabits Surinam, and is about
the fize of Cinex Fabrict; the under-fide is yellow,
varied with black.

ARGUS, a species of Papilio, (Phb. rural. Gmel.) The
wings are deftilute of tails, and blue; beneath, a ferrugin-
ous border on the posterior pair, with blue filvered ocalfed
spots. Gmelin, &c. Obs. This charafter cannot be confi-
dered unexceptionable, since it agrees only with the male
infet; the female is dark brown, and blufh only at the base
of the upper surface. The larva from which it is produced
is green, with a brown line along the back; and the head
and fore-legs black.

ARGUS, a moftingular species of Phalaena, (Bombyx
Att. Gmelin,) in which the posterior wings are furchal
with each a tail, that is more than thrice the length of the
tail of the infet. The specific charafter is as folows:

 Wings fided, pale ferruginous, with numerous occil lar
transfarent spots; and tails very long. This is phalaena brachyura
of Cramer; and found in Sierra Leona. A femewhat ana-
logous species, being furchal with fimilar tails, has been
recently difcovered in the interior of Africa.

ARGUS, in Ichthyology, a species of Pleuronectes,
that inhabits the seas about the Antilles. The body is variegated
and the tail rounded. Bloch and Gmelin. To this conci-
pecal character of the species may be added, that it is white
with yellow spots, which are dotted with brown, and encircled
each with a blue ring; the other parts are also dotted with
brown, and covered with fott fcales; the head is broad; the
eyes are unequal, and rather at a distance; the pupil blue;
the iris white and brown; the lateral line bending in the
middle, above the pectoral fin; the fins spotted with blue;
the membrane yellowish; rays brown; dorsal fin extending
from the nolirls to the tail. It has feventy-nine rays in the
dorsal fin, pecoral ten, ventral eight, anal fifty-nine, and in
the tail seventeen.

ARGUS, a species of Chaetodon, called by Renard
Jean Tayci, and by Valenf Cocatoca Bahintang. It has eeven
fpines in the dorsal fin; the body is entirely dotted with
black; and the tail is entire. Gmelin, &c. The body of
this fih is nearly square; and the fides are spotted and varied
with brown; above it is violet, beneath white; the iris of
the eye is golden; jaws equal; gill-covers large; the mem-
brane looke: the lateral line is arcuated; went nearly in the
middle of the body; fins short and yellow; and four fpines
before the anal fin. This species is found in fresh waters
and swamps, in India; lives on infecls; and the flsh is
fapid.

ARGUS, in Ornithology, a species of Phalisanus, that
habitates
inhabits China and Chinese Tartary; and may be well esteemed one of the most elegant of the feathered race. It was first introduced to the notice of the English naturalist through the medium of the Philosophical Transactions, under the name of Argus or Lanner: it next appeared in the London Magazine for 1766, and Gentleman's Magazine for 1768; and, at length was very completely described by Dr. Latham in his General Synopsis of Birds, published nearly twenty years ago. Still it is rare in cabinets of Natural History; though on the credit of some respectable and faithful writers, it is far from being an uncommon bird in its native country. There is at present a magnificent specimen of it in the Leverian Museum.

From Dr. Latham we learn, that this bird is common in the woods of Sumatra, as well as those of China; and that it is there called Coo-oo. Hitherto every attempt to keep it alive in a state of captivity for a considerable length of time, has proved ineffectual; it has been known to live for about a month after being taken from the woods, but never longer. One circumstance is very remarkable: it has a faint antipathetic disposition, and remains perfectly inactive in the open day; and, on the contrary, when put into a dark place seems easy, and sometimes makes its note or call which corresponds with its name Coo-oo; it is rather plaintive, and not harsh like that of a peacock.

The size is that of the male turkey; the bill, like that of the common pheasant, and of a pale yellow colour; the fore part of the head and beginning of the throat is covered with a granulated skin, of a fine scarlet colour; the irides are orange; round the eye the skin is dusky, and it has a kind of whisker on each side of the lower jaw; the top and hind part of the head and neck, is changeable blue, with a forked crest on the former; the lower part of the neck, back, and wing coverts, dusky, marked irregularly and transversely with reddish brown: the nine outer quills are yellowish-brown, marked with small dusky spots as big as twos on the outer, and smaller spots of white on the inner webs. The eleven remaining quills, dark brown, marked with round and oblong spots on both webs; and on the outer, near the shafts, a row of large eyes has a twelwe to fifteen in number, that is, an inch in diameter, somewhat resembling those on a peacock's train; the throat, breast, back, and upper tail-coverts dull orange, marked with round dusky spots; the tail consists of fourteen feathers, the two middle ones are three feet in length, the next eighteen inches, and thence they gradually shorten to the outer ones which are twelve inches only in length; the colour dusky brown, dotted with white; and the two middle ones have round white spots encircled with black on the outer, and brown irregular ones surrounded with dusky on the inner webs; the lower belly and vent dusky, irregularly mixed with brown; the legs, like those of a turkey, and of a greenish ash colour. Vide Lath. Gen. Syn.

We must not omit observing that the description of this species by Dr. Latham, was partly taken from a drawing sent over with a specimen of the bird; both the head and legs were wanting in this specimen, and were supplied from the painted figure; in this figure the legs have no spurs; but in a drawing, done by Mr. Edwards, they are furnished with a spur like that of a cock.

Its specific character, according to Gmelin, &c, is thus defined; pale yellow, dotted (or spotted) with black; face red; hind part of the head crested, and blue. Buffon calls it L'Argus, ou le Lanner.

Argus, in Zoology, a species of Coluber introduced by Linnaeus, and retained by Gmelin, in the Systema Nature, on the authority of Seba; but as the specific characters assign'd to the serpents by these authors are uniformly taken from the number of scuta, and signa; which, in this instance, they were unable to ascertain, it unavoidably stands without any character by which the species may be distinguished. A general description is indeed added, yet, if either writers are to be depended on, it is not very remarkable for its accuracy: above, smooth brown, and somewhat reticulated; scales palest in the duff; beneath, tesselated: the back of the head likewise is biled and gibbous. Dr. Shaw gives a specific character to this creature, which is taken from the colours, form, and situation of the spots in these words: chinnut-brown, yellow beneath, and banded above by transverse rows of ocellated red spots. Gen. Zonl.

This is a large species, measuring according to Seba above five feet in length, and is of a moderate thickness. The head is large, flatish, and covered with small scales in front; teeth large and strong; and the ocellated red spots on the body are each surrounded by a white iris, which is encircled with red. The tail is moderately slender, tapering to a point, and apparently about a foot in length. It is a native of Arabia, and is supposed from the appearance of the head to be a poisonous species.

ARGUTIAE, in Rhettic, witty and acute sayings, which commonly signify something farther than what their mere words at first sight seem to import. Writers on rhetoric speak of divers species of argutia vix.

Argutiae ab aliquo, when something is said, which seems repugnant either to the nature and property of a thing, or to common custom, the laws, &c. and yet is really consistent therewith; or when something is given as a reason of another, which yet is not the reason of it. For instance, "fi Cainis nihil didicisset, erravit minus:" again, "Aurem hoc fscularum eis, quia plurimum jam auro honos venit."

Argutiae ab alius, those wherein allusion is made to some history, fable, sentence, proverb, or the like; e.g. "multo umbram captant & carrum animatum."

Argutiae a comparatione, when two things are compared together, which yet at first sight appear very different from each other, but so as to make a pretty kind of simile, or allegorium; e.g. "Par eft pauper ill cupris principe omnia habenti."

Argutiae a repugnabatur, when two things meet in a subject, which yet regularly cannot be therein; or when two things are opposed to each other, yet the epithet of the one is attributed to the other; e.g. "Dum tacent clamant."

ARGUZIA, in Botany. See MESSERSCHMIDT. ARGY, in Geography, a town of France, in the department of the Indre, and chief place of a canton, in the district of Chatillon for Indre, three and a half leagues east of Chatillon.

ARGYLE, a township of America, in Washington County and State of New York, on the eft bank of Hudson river, containing 2,341 inhabitants, inclusive of fourteen slaves. In the late census of 1796, there appeared to be 404 electors.—Argyle is also a township of Shetburne County in Nova Scotia, settled by Acadians and Scots.

ARGYLESHIRE, or ARGATHIA, in Scotland, which together with Perthshire and the Wetheren Islands, is said to have constituted the ancient kingdom of the Scots, while the rest of Caledonia was subjected to the Picts and Romans, comprehends Kintyre, Knapdale, Argyle Proper, Cowal, and Lorne. It is bounded on the south by the Irish sea and the Frith of Clyde; on the east, by Perthshire; on the north-east by Lochaber; and on the north-west by several islands. The extent of it from south to north, between the Mull of Kintyre or Cantire, and the point of Ardnamurchan, where it joins the fluire of Inverness, is about 114 miles; and the breadth in some places, including
ARG

including the isles, about 70. This country, like all other parts of the Highlands, affords a very wild and horrid prospect of hills, rocks, and huge mountains, piled upon each other in stupendous and dreadful disorder; bare, black, and barren to the view; or at best covered with thorny heath, which appears black and dismal to the eye, except in the summer, when it is vexted with an agreeable bloom of a purple colour. The coast of Argyle is rocky; yet indented with bays and inlets, that afford good harbours for ship pgs. The country is well watered by rivers, brooks, and lakes, abounding with fish; the vales and flat parts of it are cultivated for corn; the mountains feed an innumerable quantity of black cattle, which run wild among the hills in winter as well as summer; the heath and woods, of which there is a considerable number, afford shelter to deer, roe-bucks and all sorts of game in great plenty: the circumjacent sea, with its rocks, bays, and harbours, pours forth myriads of fish; but the innate wealth of the country is dug from the bowels of the mountains in iron, lead, and other metals and minerals.

Argyle is the seat of a provincial fynod, confining of five presbyteries and 59 parishes; and gives the title of duke and earl to the noble family of Campbell, the most powerful of all the Scottish nobility. The Duke of Argyle is, by hereditary right, great master of the king's household in Scotland, and general of the Western isles; general of Dunstaffnage and Carrick; and, after the jurisdictions were abolished, enjoyed other hereditary offices, which rendered him too powerful for the subject of a limited monarchy. He holds palls many royalties; his vassals, even of the name of Campbell, are so numerous, and his influence extends so far, that he could, on occasion, bring 5000 or 4000 fighting men into the field. Argyleshire is in general peopled by this clan; and affords a great number of castles and seats belonging to gentlemen who hold of the duke, and boast themselves descended from his family.

Argyle Proper is bounded by Knapdale and Cowal on the south; Lochaber on the north; Lennox and the Grampian hills on the east; and Lorne on the west. It lies between Loch Fyne and Loch Linnhe; which last is a fresh water lake about a mile broad, but extending 24 in length, including 12 islets, on two of which are the cairns of Morar and Glenmorris. This lake, which gives the title of viscount to the duke of Argyle, is in the north of the town of Aw, which, after a course of ixx or ixxi miles, is lost in Loch Etif, and this falls into the sea, opposite to the town of Mull; all these abound with excellent trout and salmon.

Argyleshire sends one member to parliament. Its chief towns are Inveraray and Campbeltown.

When the projected canal shall be completed, and some villages and harbours erected, the populous county of Argyll (Mr. Knox affirms) will become one of the most valuable provinces of the British empire. It abounds in black cattle, sheep, and fish, though the latter are less numerous than those on the more northern shores. Walked on both sides by the sea, deeply indented by navigable lakes and bays; having an easy communication with the fishing grounds on the North Highlands; with Glasgow, and the trading towns on the Clyde; with Ireland, Wales, Whithaven, Liverpool, Bristol, and other ports on the west coast of England, we may easily conceive, that the period is not at great distance, when Argyleshire will become a great commercial county. To corroborate this opinion, he observes, than after a vessel gets under fall from this coast, she enters at once into the Atlantic, where the meets with no interruption till the makes the coast of America or the West Indies. The line, therefore, which nature points out for the inhabitants, is that of salt-making, fishing, ship-building, freights, or the carrying trade; flax and flax-makes, by means of the keep upon their fires, and land found upon Gaillisd, which is adapted for the latter.

ARGYNNIS, in Entomology, a species of Curculio, that inhabits the Cape of Good Hope. It is a black, very green; eyes black; back above, with a little longitudinal dot; Spirura, New Act. Sci. 1785. Gmelin.

ARGYRRIS, a species of Spirula (Zygaena, Fabricius). The wings are green-black, with gold spots; posterior pair brown, and gold at the tails. This is a beautiful insect, and inhabits Bohol, Gmelin. The abdomen is black and red at the tails; a few green tips on the anterior vane, and violet spots on the posterior ones.

ARGYRRIS, in Mythology, an appellation of Venus. Argamennon built a temple to this goddess, under this appellation, in honour of a young favourite named Argynus, or Argyrus, who was drowned in the river Cephissus in Boeotia. Propertius mentions it, lib. ii. eleg. vi p. 690.

"Sunt Argamennonis tellantia litora curras,
Quae notat Argyra penna statans aqua.

ARGYPANA, in Ancient Geography, a town of Italy mentioned by Poccius, who says it was ravaged by Hannibal.

ARGYPHEA, a town of the Peloponnesus, named in the hymn of Apollon altered to Homae.

ARGYRA, a country of India, on the other side of the Ganges, mentioned by Mela, Pliny, and Pompey. Also, a town of India, and the metropolis of the island of Labados, on the western side of which it was placed by Ptolemy. This island, called by Steph. Byz. Isal, seems to have been the same with that named Taprobana. It is said to have derived its nameArgyra from apyreis, silver, on account of its fertility, and the gold which it produced. Argyra was also a town of Greece in Achaia. Paulinus informs us, that this, together with several other towns, was depopulated by Augustus, in order to supply Patras with inhabitants. A fountain of the same name was adjacent to its ruins.

ARGYRASPIDES, or ARGYROIASPIDES, in Antiquity, perfidia, and victors in arms.

The argyreasides, according to Quintus Curtius, made the second cors of Alexander's army; the one that was the phalanx.

According to Justin's account, lib. xii. cap. 7, Alexander, having penetrated into India, and extended his empire as far as the ocean, for a monument of his glory, ordered the amours of his soldiers, and the hoardings of his huts to be adorned with silver. And hence he commanded them to be called argyreasides, from the Greek yapar, silver, and aza, anchoer. By this author it should seem, that Alexander's whole army were called argyreasides. After that prince's death, the argyreasides despised all other chiefs of the army, disdaining to obey any other, having borne arms under Alexander.

ARGYREIA, in Botany, a genus of plants so named by L. urceo, from the slivery appearance of the leaves, items nearly related to Argophyllum, which approximates closely to ivy.

ARGYRELLA, in Entomology, a species of Phalæna (Timus, Gmel.). The wings are silver, glossed with brown and fringed. Tins is a large insect, and inhabits Austria.

ARGYREUS, a species of Curculio found in India. The body is green, with spots of silver and gold. Fabricius and Gmelin. The latter author arranges it with those that have the thighs unarmed; but adds in his description that
that they are somewhat armed, those of the first pair of legs having an obsolete spine.

ARGYRINI, in Ancient Geography, a people placed by Steph. Byz. and Lycophron among the Epitrites, or in Epirus; but J. Vellius says they were the inhabitants of Argyrium.

ARGYRIUM, a town of Apulia, in Italy, built by Dionisius. See Arpi.

ARGYRITES, in Antiquity, a denomination given to Greekian games, which formed part of the worship of some divinity. They were so called, because the victor obtained, as a recompence, either some coin or vales of silver, or bucklers of brass, &c. which were of a different kind in different places.

ARGYRITIS, in Natural History, a name given by the ancients to a substance resembling silver.

In this sense, argyritis was used to signify such litharge as was of a white colour, by way of distinguishing it from that which was yellow, which they dignified with the name chrysitis, as we do at present with that of litharge of gold.

The argyrites of late writers seems to have been the same with the lapis magnesia of the ancients, mentioned by Theophrastus, and distinguished from the magnet.

ARGYROCOME, in Botany. See Baccharis, Gnaphalium, and Xeranthemum.

ARGYRODAMAS, in Natural History, a sort of silver-coloured tale, which bears the fire, and neither burns, melts, nor changes its hue. Plut's Hist. Staff.

Hence its denomination among the ancients of argyrodamas, quisli argentum indoluminum.

ARGYRODENDROS, in Botany. See Protea.

ARGYROLIBANUS, in the Materia Medica of the ancient Greeks, a word used to express the white kind of oilthaminum.

ARGYROPHTHALMUS, in Ornithology, a species of Corvus, whose general colour is black; breast blue; eyes silvery; tail white at the tip; and bill and legs black. Gmelin.

The first account that we have of this bird is in Brown's illustration of Natural History; he figures it under the name of the Sriman Dow in the tenth plate of that work, from a specimen then in the collection of M. Tsuchial, Esq. The same was afterwards described by Dr. Latham, as being of the size of a common crow. Bill dusky; head deep green; hind part rich blue; beneath that pale green; under each ear, and on the hind part of the neck, a spot of the same; neck, breast, belly, back, and wing-coverers deep changeable green; prime quills dusky; ends rich blue; tail dusky; legs flesh-coloured. This bird he calls the Sriman Crow; but having lost its tail, one very striking characteristic of the species was unavoidably omitted, viz. the white spot at its extremity. In the year 1759, Jaquin published his "Beytrage zur Geschichte der Vögel," at Vienna, in which this species is more satisfactorily described; and his description was afterwards inserted in the Supplement to Dr. Latham's Ornithology, and the Gmelinian Syllaba Naturae. From hence it appears to be about the size of a jay; the prevailing colour black; and eyes silvery white with a spot of blue above, and another beneath; the breast and outer part of the wing deep blue; tip of the tail white; bill and legs black. It inhabits Carthagena in New Spain, South America; and is called Ofioon de Plata; has a monotonous voice; frequents woods; and being easily tamed, is often kept in houset in that country.

ARGYROPHEIA, in Alchemy, the art of making silver out of other more imperfect metals.

The word is formed of argyro, silver, and poie, I make.

ARGYROPUS, in Ichthyology, a species of Sparus, found in Jamaica and Carolins; and called by Willughby, Zanthurus indica. The tail is lunate; back grooved; iris of the eye silvery. Brown, in his Nat. Hist. of Jamaica, describes it as Sparus inde argentus. dentibus anterioribus comissus. The three first rays of the dorsal fin are very long and attenuated; this fin consists of twelve rays; the second of twenty-six; pectoral fin of seventeen; vertical fin of six; anal fin of nine; and tail of twenty rays. Gmelin, &c.

ARGYROPULUS, John, in Biographia, a Periaptelic philosopher, was born at Constantinople, in the beginning of the fifteenth century, and was one of the first Greeks, who fled from that city, and taught an asylum in Italy, where he came to reside several years before the taking of Constantinople by the Turks in 1453. In 1456, he was taken under the patronage of Cefrio di Medici, who committed to him the education of his son and nephew in the Greek language and philosophy; and who afterwards appointed him professor of the Greek language at Florence. At his request, he undertook to translate into Latin the physics and ethics of Aristotle, but was obliged to leave Florence on account of the plague, he went to Rome, where Cardinal Befarian conferred upon him the professorship of the Greek language. Here he read lectures upon Aristotle, and he had the honour of being the first modern Greek who taught philosophy in that city. His salary, though liberal, was not sufficient to defray the expenses of his luxurious table; and at the age of seventy, in the year 1484, he fell a sacrifice to the unrestrained indulgence of his appetite, as, eating melos to excess, he brought on a fever which was fatal to him. His learning was respectable; but his manners were not amiable; and he manifested a degree of literary jealousy which disfigured his friends, and prevented him from freely communicating his learning to the Italians. He affected to despise Cicero, whom he maintained had been ignorant of philosophy and Greek learning. His translations, which are found in the more ancient Latin editions of Aristotle, and in the Greek and Latin editions of Psili, are valuable. He also wrote a "Commentary on Aristotle's Ethics," Solutions of questions propos'd by him to certain philosophers and physicians in the island of Cyprus; Epitomes and several small pieces extant in MS.; Brucker's Hist. Philos. by Enfield, vol. ii. p. 405. Fabr. Bibl. Grec. l. v. c. 43. § 24. tom. x. p. 445.

ARGYROSTOMA, in Entomology, a species of Musca, found in the environs of Vienna. It is black and hairy; silvery in front, with bands of the same. Schrank, Gmelin, &c. — This insect is shining above; eyes reddish; and the wings transparent.

ARGYROSTOMUS, in Zoology, a species of Turcc, of a whitish colour, radiated with brown; the spire of the spire are fix, and are rather rounded; the first spire considerably larger than the others; the aperture is silvery; and the tip sometimes red. It is a native of India; is called Gs argentum by Argennville, and is thus specifically described by Gmelin. Shell somewhat ovo-rotund, with a very slightly elevated dorsal and strongly shouldered limbus.

ARGYROSTOMUS, a species of Trochus, that inhabits the southern ocean. This shell is ovate, with umbilicated ribs, and frilled transversely; aperture somewhat compressed; spire of the spire swollen; the first slightly carinated at the base. Gmelin. The breadth is about two inches, and the height nearly the same; its colour is black; the first spire terminates in a row of tubercles; and the pillar lip is very green.

ARGYRRHIIUM, or Argyrium, in Ancient Geography.
A R I

ARGYRUNTUM, or Argurutum, in Ancient Geography, a maritime town of Illyria, according to Pliny and Ptolemy; now Navograd in Dalmatia.

ARHAW, in Geography, a river of Africa, in the kingdom of Algiers and province of Tlemcan, which flows into the Storf, a near a noted sanctuary, called Seedy Abid, at a small distance from mount Atlas.

ARHON, a large mountain of Africa, in the kingdom of Fez. It is a branch of mount Atlas, and extends for a considerable distance from east to west. Its inhabitants are partly Moors expelled from Spain, and partly some Arab families. The soil produces abundance of barley, which is the only grain of the country. They have olives and dried raisins; and they rear great numbers of bees. They also manufacture soap, which is an article of commerce. Their habitations, which are rather huts than houses, are scattered over the country. The emperor of Morocco draws from them a considerable tribute; and it is said, that this simple district is able to furnish 100,000 soldiers.

ARIUS. See AARUS.

ARI, a town of Italy, in the kingdom of Naples, and province of Abruzzo Citera, five miles south-east of Civita di Chieti.

ARIA, in Ancient Geography, the name of an island in the Euxine sea, opposite to Pharmacca, called also Chalceritis. Pliny.

ARIA, a mountain of Asia, part of a chain of mountains mentioned by Ammianus Marcellinus.

ARIA, the most considerable lake of Persia, is situated in the western part of the province of Segistan or Seftan, according to the map of major Rennell between 33° 15' and 32° 45', N. lat. and 50° 15', and 61° 20' E. long. In the French maps it is called the lake of Zaré, from a village of that name near its western extremity; and in the map of major Rennell, the sea of Durrah or Zarrah, from a village seated on a river at the distance of twenty miles from the lake, which village is denominated Corra or Curra, whence is probably derived Zarrah. Pinkerton (Mod. Geog. vol. ii. p. 355.) judges, that this appellation might as well be applied by that of the sea of Segistan. According to Otter (Voyage en Turquie et en Perse, tom. i. 217.) cited by this geographer, the length of this lake is thirty leagues, or a day's journey, in breadth; and the water is fresh and full of fish. By his account it only receives the river of Ferah (Tarrac) or Parsa, which runs from the north-east. Aria, and Aretana, are names that have been applied by ancient geographers very variously. Some have applied them to the same country, and others to distinct countries. Prendergast mentions only Aria, without knowing Aras, and the Arians. Pliny (i. vi. c. 25.) mentions Aretana, but takes no notice of Aria; and yet he distinguishes (i. vi. c. 25.) between the Areti and Arian. Parthia, he says, lies on the Aria to the east, and to the south the Arian and Carmania. Hence it has been conjectured, that the Arians were more widely extended than the Aria, and that under this general denomination were included the Gedrosi and the Oranges, Arian (i. iii. c. 25.) has Aria and the Aries, but it is silent with regard to Aretana. Strabo has both names, and extends the limits of Aria, beyond those of Aria: observing, in general, without setting their boundaries, that Aretana commences from India; and he cites a topography, who says that Aria was bounded on the east by Indus, on the south by the Great Sea, on the north by Paropamisus and the mountains as far as the Caspian ports, and on the west by the boundaries which separate Parthia from Media, and Carmania from Parthian and Persia; and, accordingly, Aria is very extensive. Salmantius (Exerc. Phil. p. 553.) distinguishes his Aria from Aria, but does not assign to it any precise limits. The limits of Aria, according to Ptolemy, are parts of Margiana and Bactria, on the east the Paropamisadis, and on the north Drangiana; and Strabo says, that the Aria are adjacent to the Paropamisads on the west. Aria, in major Rennell's map, is a part of the province of Persia, called Koran or Korefan. ARIA, or Artacboina, the chief city of the country called Aria, seated on a river, called by Arian, Areios; by Pliny, Aries; by Ammian, Aria; which had several fortresses in the defect of Margiana, and in the Saraphi mountains, and runs into the Aria Palas, or lake of Aria. In its course it passed by Alexandria, according to Pliny, who calls this city Alexandra Arian or Arianum. Aria or Artacoena is the present Herat, placed in Rennell's map at the confluence of two streams, which form the river that runs into the lake of Durrah. ARIA, Ital. for Air, English (which see). Herr Sulzer, an elegant German writer on the subject of the fine arts, has delivered the construction, and what was thought the perfection of an opera Aria, about the middle of the last century, during du capo times; and not only apologized for it, but extolled and praised it. Aria, by its frequent, and pointed out their utility and beauty in draperies now quite exploded, both in theory and practice. In the remarks of Mr. Framery on the encomiums of H. Sulzer (Encycl. Meth. p. 95.), he allows that his precepts are excellent, but that his definition appears imperfect. He then gives his own notions, which tally more with modern practice. After which he adds, "as to the form of opera Aria indicated by M. Sulzer, it is much varied since he wrote on the subject." The Italians at length, tired of their eternal monotony, melted down the second part of their Aria into the first; or, if definite, when the expression of the words requires it, they do not think themselves obliged to return to it by a du capo. The Aria of comic operas are constantly
ARI

flantly confined to one part or strain, unless some new measure, or similar idea in the words, absolutely requires a different expression. The movement then is changed, and finishes by an Allegro, without returning to the first part.

Aria-Bipar, in Botany. See Milia.
Aria Throphostra. See Crataegus.
Aria-Perih. See Glome.

ARIACA, in Ancient Geography, a maritime country of India, situate, according to the Periplus of the Erythraean sea, to the Arch of Combius Colinus, and thought by M. de Avoile to be the southern part of the country called Latrice.—Ariaca was also a town of Margiana. Pliny.

ARIACAE, a people of Scythia, on the left bank of the Jaxartes, near the Caspian sea. Pliny.

ARIACES, Sadinorum, or Sadanarum, a people of India. Pliny, on this side the Ganges.

ARIACOS, or Aria, a small town of Asia Minor, in Myopia, situate between Placia and Scyelse, near Olympus. Pliny.

ARIADNE, in Antiquity, solemn festivals held at Naxos, in honour of Ariadne.

The Ariadnes are said to have been instituted by Theseus, in atonement for his cruelty in exposing Ariadne big with child on that coast. They were of a mournful cast; one part of the ceremony was for a young woman to lie down, and counterfeit all the agonies of a woman in labour. There was another festival, which was celebrated with various expressions of mirth, in honour of another Ariadne, who was of a gay and sprightly temper. Plut. in Thef. and Potter's Arch.

ARIADNE, in Entomology, a species of Papilio (Nymph. Phal.) described by Linnæus, Fabricius, and Gmelin. The wings are angulated, fulvous, with undulated black breaks, and a white marginal spot on the anterior pair. It inhabits Java—Olf. Cramer has figured this insect under the name of Papilio Merione; and the Papilio Corixa, of the same author, appears to be only a variety of the former species.

ARIADES, in Fabulous History, a daughter of Minos, king of Crete, who being prefposseled in favour of Theseus, committed to destroy the Minotaur, gave him, in token of her love, a clue of thread, which served to conduct him out of the labyrinth, after his defeat of the monster. Theseus, on leaving the island, took with him Ariadne, but abandoned her in the isle of Naxos. Bæcchus found, and married her, and presented her with a crown of gold manufactured by Vulscan, which was afterwards transformed into a constellation. Ariadne had a son by Bæcchus, called Eumemon, who was one of the Argonauts. According to Plutarch, there were two females of the name of Ariadne; one of them was espoused to Bæcchus in the isle of Naxos, and became the mother of Staphylus; the other was abandoned by Theseus in the same isle, where she died. Hence were derived the two kinds of beaks, called Ariaidea. Ariadne's fountain in the isle of Naxos is now only a simple streamlet of water, to which, says Olivier, (Travels in the Ottoman Empire, t. ii. p. 110,) travellers would pay no attention, if they were not thus reminded of the spot where Ariadne abandoned herself to all the despair of a forlorn milkmaid, and from which the perceived the vessel which was transporting her lover from her. At the brink of this fountain, it is said, she came daily to shed tears, Bæcchus found her; and equally compassionating her misfortunes, and enmoured of her beauty, succeeded in confounding her, and in prevailing with her to forget an ungrateful man.

ARIDAE, in Statuary, a beautiful statue of Parian marble, which was for near three hundred years one of the greatest ornaments of the Belvidere; where it was placed by pope Julius II. It is now in the museum at Paris. Ariadne is here represented sleeping upon the rocks of Naxos; where she had been ungraciously left by Theseus. The disorder of the drapery in which she is wrapped, beautifully points out the distraction and anguish of her mind before she fell asleep. On the upper part of her left arm is a bracelet in the form of a little serpent, which the ancients called Ophius, and which, by being taken for the representation of the alpae, has occasioned this statue for a long time to be called Ceopis, by which name it is still known.

ARIALDUNUM, in Ancient Geography, a town of Spain, under the jurisdiction of Cordoba. Pliny.

ARIAN, a name given by a tribe of Tartars, called Bashchkirians, to their favourite drink, which is a mixture of four milk and mead, and which they keep in an oblong bottle, suspended near the chimney of their hut.

ARIANA, in Ancient Geography. See Aria.

Ariana, in Geography, formerly called Abderana, a village in Africa, in the province of Tunis Proper, and about three miles distant from the city of Tunis. It is inhabited by poor gardeners, who supply the city with fruit and herbs. At this place the Carthaginian aqueduct forms a curious object, being seventy-four feet high, and supported by columns four feet square, beautifully cut; and near it are several mastomors or subterraneous mines for corn, strongly arched, and capable of holding a great number of bullocks.

ARIANO, a town of Italy, and a bishop's see, in the kingdom of Naples, and Principe Ultra. According to M. Sabinus (Travels in the Two Sicilies, vol. i. p. 202,) it is an ugly city, built upon the uneven summit of a mountain, with an extensive prospect, but much exposed. He supposes that it is not so ancient as the time of the Romans; and that it owes its rise to the demolition of some neighbouring town, and to the advantage afforded by its situation for discovery and defence. After having several times changed its possessions, it became a part of the demeine of the crown in 1406. It has neither trade nor manufactures, and has declined ever since the desolation occasioned by an earthquake in 1456. The number of inhabitants is estimated about 14,000, and it includes twenty parishes and convents, besides an ill-endowed cathedral. The wine of Ariano is pale, and reekable, both in colour and the sharpness of its taint, red champagne. The soil in its vicinity lies upon a soft argilaceous stone; at a small distance to the east, is a bank of mixed layers of volcanic earth, interperfered with thick strata of oyster shells. The salt and most destructive earthquake experienced in this territory, was that of the year 1732, N. lat. 41° 8'. E. long. 15° 16'.

ARIANS, a denomination given to a class of the ancient inhabitants of the Russian empire, called by the Russians Votyska from the river Votisk, on which they were formerly situated. They call themselves Ari, and their territory Ariam. Their chief town is Chiucof, and the other towns are Sobodskoi, Kaigorod, and Orlof. At first they were subject to the Bulgarians, and afterwards to the Tartars, from whom language they adopted many words into their own.

ARIANS, in Ecclesiastical History, followers of Arius, a presbyter of the church of Alexandria about the year 345; who owned Christ to be God, yet maintained him inferior to the Father even as to his deity, and his efficacy to be different from that of the Father, and that he was neither co-eternal nor co-equal with him; also that the Holy Ghost was not God.

The Arians owned that the Son was the word, but denied that word to have been eternal; alleging, that it had only been created before all other beings. They held, that
that Christ had nothing of man in him but the flesh, with which the words or words was joined, which supplied the rest.

The distinguishing sentiments of Arius may be deduced from his own writings. In his letter to Eunapius of Neo-
media, he says, "We cannot object to their emotions, always Father, always Son, at the same time Father and Son, that the Son always co-exists with the Father; that the Father has no pre-existence before the Son, not to much as in thought, or a moment. But this we think and teach, that the Son is not begotten, nor a part of the uncreated and unpre-existent thing; but, by the will and pleasure of the Father, he existed before time and ages, the only begotten G., unchangeable; and that before he was begotten, or made, or designed, or founded, he was not.—But we are perfected, because we say, that the Son has a beginning, and that God has no begin-
ing. For this we are perfected; and because we say, the Son is out of nothing: which we therefore say, be-
because he is not a part of God, nor made out of any pre-
existent thing." In his letter to Alexander, bishop of Alex-
andria, he says; "We believe, that there are three per-
sons, the Father, the Son, and the Holy Gholl. God, the cause of all things, is alone without beginning. The Son, begotten of the Father before time, made before the ages, and founded, was not before he was begotten. Nor is he eternal, or co-eternal, or begotten at the same time with the Father." The creed, which was prep-
ared by Arius at the council of Jerusalen in 325, was this: "We believe in one God, the Father Almighty; and in the Lord Jesus Christ his Son, begotten of him before all ages; God the word, by whom all things were made, which are in heaven and in earth; who came down and was incarnate, and suffered, and rose again, and ascended to the Father, and shall come again to judge the living and the dead; and in the Holy Gholl; the resurrection of the flesh; the bite of the world to come; and the kingdom of heaven; in one catholic church of God, extending itself from one end of the earth to the other." In short, the Arians seem to have be-
lieved, that Christ was the Word of God, and was in the
beginning with God; but was not the self-existent God, with whom he was in the beginning; but his Son, created by the Father before all ages, one super-angelical and perfect Spirit; and thereby became his only Son, by whom he created all other beings; and that, when he came down from heaven to inhabit the body which was prepared for him in the womb of the blessed Virg.; this super-angelical spirit alone was the soul that informed and enlivened it. From the fol-
lowing abstract of the real opinions of the Arians, as they are given by Dr. Cave in the words of Arius, the reader
may be enabled to compare them with those that have been
deemed orthodox. First, as the Arians believed the divine subsistance of the Father to be unbegotten and without be-
ginning, they concluded that it was different from the sub-
stance of the Son, who was begotten and had a beginning.
But the Athanasiens believed the Father and the Son to be
of the same subsistance; that is, of the same general subs-
stance, as men are of the same subsistance; and the Fi-
endo Athanasiens believe them to be of the same

ARIOUS.

They condemned this from Prov. viii. 26. And because they believed it blasphemous to say, that this generation was out of the invisible subsistence of the Father, and no other subs-
stance than existed, they said, he imbued, not of or from
the Father, but from nothing, and he is not of the Father's subsistance, for he is created and made. But the Athanasiens believed, the Son was literally generated from the Father's subsistance. Firstly, as the Arians believed the Father and the Son be of a different subsistance, they believed them also to be of distinct beings, separately existing, in which they agreed with some of the orthodox fathers, as Origen, Gr.

Gregory Nazianzen, Cyril of Alexandria, Maximus the Martyr, Damasenius, Dionysius of Alexandria, Alexander of Alexan-
dria, &c.; and differed from others who believed him to be of or from the Father's subsistance, as the leaves are from the tree; but not divided from it, as the Athanasiens. Fourthly, they believed that Christ was the only begotten Son of God, because he only was created by the immediate act and power of God him self; and that all other beings, the Holy Gholl not excepted, were created by Christ; in which they agreed with Origen and Eusebius, men of so great character as any in the Christian church. And therefore they called him a creature; but not like other creatures. Tithes, they believed, that the Son was generated or created before all ages; and was a real person, when spoken of, Prov. viii. 23; and that his generation was over, as soon as he existed. Where-
as some of the orthodox believed him to be only an attribute, when there spoken of; and that he was afterwards generated into a Son; and some of them believed him eternally generat-
ing, as light from the sun. Sixthly, they believed the divine
being, who descended from heaven and was born of the vir-
gin Mary, was the only intelligent spirit that animated the
body of Christ; and that this divine being was begotten: but the orthodox believed, that the divine being, that descended from heaven and animated the body of Christ, was incapable of suffering; and that it was only the human nature, or soul of Christ that suffered; i. e. a mere man. Seventhly, as the Arians believed Christ to be the Son of the only true God, and not the true God and Father of that Son, it was very con-
venient with their belief to say, "He is not the true God." But if it be imagined, that by this expression they meant to deny, that Christ was truly God the Son, the expresw words of Eu-
nomius, who calls him, "The only begotten God, the frith-
born of the whole creation, Christ, true God, not unbe-
gotten;" prove the contrary: and Arius himself explains his meaning sufficiently, when he says, "He is not the true (self-existent and unoriginate) God, but receives his divinity by communication; which was also the opinion of Origen, Eusebius, and Laetantius.

It has been commonly affirmed, that Arius denied the eternity and divinity of the Son of God: but the author of "The Apology of Ben Mordecai," p. 93, says, that this assertion never appeared to him to have been made upon good authority; for he never denied the eternity of the Son in any other sense than that in which it is denied by the orthodox, and signifies unoriginate and un-
begotten; that is, self-existent: and that the charge against him of his not believing the divinity of Christ is not founded, appears from this circumstance; that his adversaries accused him of idolatry, because he worshipped the Son of God; supposing him at the same time to be a God created before all ages. Now if he was idolatrous in believing Christ to be a created God, it is impossible he should at the same time be guilty of denying his divinity. Besides, Theodoret says, it was the opinion of Arius and Eunomius, that Christ took a body: but the head or divinity performed the office of a soul: and Athanarius says, Arius taught that Christ had the flesh as a covering to the divinity or godhead. Never
Nevertheless, Athanasius’s enmity to Ariusism is well known. He speaks of it as the worst of all heresies, and says, the devil was the father of it; nor will he by any means allow, that Arians can be rightfully called Christians. However, in declining against Ariusism, as the worst and most hateful of all heresies, he makes this its peculiarity, that the Arians endeavored to carry their point by externals, that is, civil authority, or the power of the magistrates. And on account of the violent methods to which they resorted, he says, that this fact, or hereby, had put on the devil complete.

The rise of the Arian controversy is referred by some to the year 316, by others to 319, by Eusebius to 315, and by Borbonius and others to the year 317. Socrates (Eccl. Hist. i. c. s.) gives this account of its origin. “Alexander,” he says, “discouraging one day too curiously concerning the doctrine of the Trinity in Unity, in the presence of his prebishops and the rest of his clergy, Arius, one of the prebishops, supposing his bishop to advance the doctrine of Sabellius, and disliking that, he went into an opinion directly opposite.” Theodoret also says (Eccl. Hist. i. iv. c. 1.) that Arius took occasion, from things said by Alexander, to raise a disturbance: and Constance likewise, in his letter to Alexander and Arius, first blames the former for putting questions to his prebishops, which he ought not; and then the latter, for inconsiderately uttering notions that ought to have been buried in silence. Accordingly, it seems to have been the chief view of the Arians, as well as of the orthodox, to steer a kind of middle course between Sabellianism and Socinianism. To which purpose, the Arians maintain, against the Sabellians, that the Son of God is a being distinct and different from the Father, and not a mere virtue, or character, or mode of existence; and against the Socinians, as well as the Nectarians and Sabellians, that Christ was not a mere man, but a true God.

After Arius had for some time published the doctrines that are ascribed to him, Alexander was blamed for his indifference, and for his toleration of such novelties. Roufed by reproaches and complaints, he appointed a time for hearing the subjects in dispute fairly debated between Arius and those who opposed him. Arius adhered to the opinions he had advanced; and they who opposed him asserted the Son to be consubstantial and co-eternal with the Father. And though another assembly was appointed for debating the points in agitation, they could by no means come to an agreement. Alexander himself is said to have been at first in some suspense; but at length he declared himself in favour of those who were the antagonists of Arius.

The Arians were first condemned and anathematized by a council at Alexandria, conferring 100 bishoprics, in 320, under Alexander, bishop of that city; who accused Arius of impurity, and caused him and several ecclesiastics, of whom two were bishops, to be expelled from the communion of the church: and afterwards by 318 fathers in the general council of Nice, assembled by Constance in the year 325. In the interval between these councils, Alexander had written a circular letter to all bishops, in which he reprents Arius and his partisans as heretics, apostates, blasphemers, enemies of God, full of impudence and impiety, forerunners of antichrist, imitators of Judas and of men whom it was not lawful to salute, or to bid God speed. Yet Sozomenus (i. c. 15.) acknowledges, that they were learned, and, in all appearance, good men. Eusebius of Nicomedia, and Eusebius the historian, endeavored to pacify Alexander, and to persuade him to compromise the quarrel; and Constance sent a letter, about the year 334, by Houbias of Corduba, addressed to Alexander and Arius, in which he reproved them both for disturbing the church with their insignificant disputes, and exhorted them to mutual forbearance and forbearance. But the dispute was not to be thus terminated; and Socrates represents the parties on both sides as equally contentious and refractory. Accordingly the Nicene council was summoned. At this council Eusebius proposed a creed, in which he avoided the offensive word οὐδεμίας, οὐκοπόται, and anathematized every impious particle, without specifying any; but his advice was not followed, the term was inferred, and the Arian doctrines were anathematized. But notwithstanding these measures, Ariusism was not extirpated; on the contrary, it became the reigning religion, especially in the East, where it obtained much more than in the West. Arius was recalled from banishment by the emperor Constantine, in two or three years after the council of Nice, as some say in 327 or 328, or according to others in 330: and the laws that had been enacted against him were repealed. In the year 335, Athanasius, his zealous opponent, was deposed and banished into Gaul, by the council held at Tyre; and Arius and his followers were reinstated in their privileges, and received into the communion of the church: in little more than a year after this, he fell a victim to the resentment of his enemies, and died a tragical death, occasioned probably by poison, or some other violence. The Arian party found a protector in Constantinus, who succeeded his father in the empire of the East; and the zeal with which he abetted them, produced many animosities and tumults at the time of his death, in the year 337. They underwent various revolutions, perfecting and oppressing, under succeeding emperors, according to the degree of interest they had in the civil power; till, at length, Theodosius the Great exerted every possible effort to suppress and disperse them. He drove them from their churches, enacted laws whose severity exposed them to the greatest calamities, and rendered, throughout his dominions, the decrees of the council of Nice triumphant over all opposition; so that the public profession of the Arian doctrine was confined to the barbarous and unconquered nations, such as the Burgundians, Goths, and Vandals.

The Arians were divided into various sects, of which ancient writers give an account under the names of Semi-arians, Euchelians, Arians, Eunomians, Acacians, Paphyrians, and others. But they have been commonly distributed into three classes, viz. the genuine Arians, Semi-Arians, and Eunomians. The Arian cause suffered as much from the discord and animosity that prevailed among these sects, as from the laboured and zealous efforts of the orthodox party. Ariusism was carried in the fifth century into Africa, under the Vandals; and into Asia, under the Goths. Among those fierce and savage nations, which were overwhelming the Western empire, it found a fixed residence, and a peaceful retreat. As their security animated their courage, they treated the Catholics with the same violence which the latter had employed against them and other heretics; and they persecuted and vexed in various ways such as professed their adherence to the Nicene doctrines. The Vandals, who reigned in Africa, furpassed all the other savage nations in barbarity and injustice towards the Catholics. The kings of this fierce people, particularly Genéric and Hunéric his son, demolished the churches of those Chritians who acknowledged the divinity of Christ, sent their bishops into exile, and mained and tormented in various ways such as were firm and inflexible in the profession of their faith. During these persecutions in Africa, a hopeful miracle is said to have been wrought, by which the Supreme Being is supposed to have testified his displeasure against
Arians.

against the Arians, and his favour to their adversaries. This
miracle confounded in enabling these Catholics, whose tongues
had been cut out by the Arian tyrant, Humifus, to speak di-
finitely, and to proclaim aloud the divine majesty of the Si-
vior of the world. This remarkable tale, says Morin, can
fearfully be believed, since it is supported by the testimony of
the most credible and respectable witnesses; but whether
it is to be attributed to a supernatural and miraculous power
is a matter not to easily decided, and which admits of much
dispute. The reality of this extraordinary fact is attested by
Victor, an African bishop; Zenas of Giza, a platoic phi-
lopher; a perpetual edict of the emperor Julianus; count
Marvellinus in his Chronicle of the times; and pope Gregory
the first, who had refuted at Constantinople as the minister
of the Roman pontiff. Among the moderns who have defend-
ed its miraculous nature, we may mention Abbodice, Berri-
man, Chapman, and Dodwell; and we may refer to Mr.
Middleton's "free inquiry into the miraculous powers," &c.
in his Miscellaneous works, vol. i. p. 149, &c.; and to
Mr. Tott's Defence, p. 89, &c. for arguments against it.
The learned historian, Mr. Gibbon, observes in his usual
manner, (Hist. of the Decline, &c. of the roman empire,
vol. i. p. 295;) that "this supernatural gift of the African
confessors, who spoke without tongues, will command the
attent of those, and of those only, who already believe, that
their language was pure and orthodox; but the blabborn
mind of an infidel is guarded by secret, incalculable fuperici-
and the Arian, or Socinian, who has fiercely rejected the
docline of the Trinity, will not be shaken by the most plu-
flible evidence of an Athenian miracle." Italy, the Gauls,
and Spain, were also deeply infected with Ariafinism; and
towards the commencement of the sixth century, it was tri-
umphant in many parts of Asia, Africa, and Europe.
Many of the Arian bishops favoured the Arians secretly,
while their opinions were openly professed, and their cause
maintained by the Vandals in Africa, the Goths in Italy,
the Spaniards, the Burgundians, the Suevi, and the greatest
part of the Gauls. The Greeks, indeed, who had received
the decrees of the council of Nice, perfected and oppres-
sed the Arians, wherever their influence and authority could
reach; but the Nicerians, in their turn, were not left ligo-
rously treated by their adversaries, particularly in Africa
and Italy, where they felt, in a very severe manner, the weight
of the Arian power, and the bitterness of their resentment.
The triumphs of Arianism were, however, but transitory;
and its prosperous days were entirely eclipsed, when the
Vandals were driven out of Africa, and the Goths out of
Italy, by the arms of Julianus; for the other Arian princes
were easily induced to abandon themselves the doctrine of
that sect; and not only so, but to employ the force of laws
and the authority of councils to prevent its farther progress
among their subjects, and to extirpate it entirely out of their
dominions. Such was the conduct of Sigifund, king of the
Burgundians; Theodern, king of the Suevi, who had
settled in Lusitania; and Recared, king of Spain. How-
ever, it revived again in Italy, under the protection of
the Lombards in the seventh century.

Erasmus seems to have aimed, in some measure, to refor-
m Arianism, at the beginning of the sixteenth century, in his
commentaries on the New Testament: accordingly, he was
reproached by his adversaries with Arian interpretations
and glosses, Arian tenets, &c. To which he made little
answer, save that there was no heresy more thoroughly ex-
tinct than that of the Arians: "Nulla heres magis extinta
quam Arianorum." But the face of things was soon changed:
Servetus, a Spaniard by nation, published, in 1531, a little
satire against the Trinity: which once more excited at-
tention to the sentiments of the Arians in the West-In
indeed, he rather flattered himself a Photinus than an Arian;
only that he made use of the same passages of scripture,
and the same arguments against the divinity of our Saviour,
with the proper Arians.

It is true Servetus had not, properly speaking, any adver-
saries; but he gave occasion, after his death, to the forming
of a new system of Arianism in Greece, which did not a
little puzzle Calvin. From Geneva, the new Arians re-
oved to Poland, where they gained considerable ground;
but at length became Socinians.

The apophasis Arian has been indiscriminately applied,
in more modern times, to all those who consider Joseph
Christ as inferior and subordinate to the Father: and whose
sentiments cannot be supposed to coincide exactly with
those of the ancient Arians. Whilist they all concur in
maintaining the pre-existence of Christ as a super-angelic
spirit, which supplied the place of a son to him upon his
conception and birth, and also his derivation from and sub-
ordination to the Father; some of them ascribe to him a
higher degree, rank, and dignity, than others. Accordingly
they have been sometimes distinguished into High and Low
Arians. The former, approaching in opinion to those that
have been called Semi-Arians, or rather to the ancient
Arians, whilst they believe the Father to be the one supreme
God over all, absolutely eternal, undivered, unchangeable,
and independent; conceive the Son to be the first derived
being from the Father, and under him employed in creating,
and also in preparing and upholding the World, and in ex-
cercising a moral, as well as natural, administration over man-
kind; so that, under this distinguishing character, he is
involved with the office of final judge. Of these high Arians,
some suppose, that Jesus Christ, sustaining relations, and
exercising offices to honorable in themselves and so interest-
ing to mankind, is a proper object of subordinate worship;
whilst others imagine, that worship in the proper and discri-
minating sense of the term, belongs only to the Father, the
self-existent, infinite, and supreme deity. Some Arians of
this class have maintained, that the Son of God, before his
incarnation, had only, or chiefly, the care and government
of the Jewish people allotted to him; whilst other angels
were appointed prefects or princes of other nations and
countries. This was the opinion of Mr. James Petre, an
ingenious and learned commentator: see his "Paraphrase
on Colos. ii. 15," and Heb. vi. 6. Others have also main-
tained, that the conduct of all the dispensations of Prov-
ience, in every period of time, as they related to the
patriarchs, to the Jewish nation, to the prophets, to
Christians, and to the world in general, has been entrusted
to Christ; and that he was distinguished by various appro-
priate titles, as Jehovah, the angel of the covenant, the
angel Jehovah, the angel of the preقاء, and the Logos, &c.
To this purpose they allege, among other arguments, the
declaration of the Apostle (Heb. i. 14.) that it was by
Christ God made the worlds, "after the ages and dispensa-
tions; i.e. by whom God formerly disposed and ordered
those eminent and remarkable periods of time; the Anted-
luvian, the Patriarchal, the Mosaic, and the Prophetic; and
being put under his government, according to the will of the
Father. See Ben Moredean's Apology, letter ii. palfun. It is
also alleged as a further presumption in favour of this hypo-
thesis, that the sacred writings contain a revelation and his-
tory of the administration of Providence with regard to all
the inhabitants and concerns of our world, or of the ter-
restrial globe; and, of course, that the subordinate direction
and superintendence of this part of the government of the
supreme and infinite government of the world, and all other
 worlds,
ARIANISM, the doctrine of Arius, who lived in the beginning of the fourth century. See ARIAN.

ARIAS, or ARIUS, a river of Asia.

ARIAS DE INFANTA, in Biography, a learned Benedictine monk of the sixteenth century, was born at Seville, of a noble but reduced family. Having completed his education at Alcalá, where, besides the study of theology, he made himself master of the Latin and Greek languages, and of all Hebrew, Arabic, Syriac, and Chaldee; he travelled through France, Germany, Italy, the Netherlands, and England, for the purpose of acquiring an acquaintance with the modern languages. Upon his return he took priest’s orders, and then accompanied the bishop of Segovia to the council of Trent, where he obtained great reputation. He afterwards retired to Arevena, a pleasant spot near the mountains of Andalusia, to prosecute his literary labours. From this retreat he was summoned by Philip II. and entrusted with the care of a new edition of the Polyglott Bible, which he much enlarged and improved. The execution of this work contributed so much to his reputation, that he became the object of envy; and he was under the necessity of taking a journey to Rome, to vindicate himself from the censure of those who reproached him with having too closely followed the explanations of the J ewish Rabbins. As soon as he returned to Spain, Philip offered him a bishopric, as a recompense for his labours; but this he declined accepting, and contented himself with a pension of two thousand ducats, and the office of chaplain to the king. He died at Seville in 1568, at the age of seventy-one years. His mode of living was singularly abstemious, as he drank no wine, and seldom tasted animal food. He was indefatigable in his studies; and was regarded as one of the first literary characters in Spain. His writings, which are numerous, bear evident marks of sound sense, as well as profound erudition. Besides his "Discussions on Jewish Antiquities," prefixed to the Polyglott, printed in the "Critici Sacri," and published separatively, in 4to. at Leyden in 1566; he has left in Latin, "Commentaries on several parts of Scripture," published at Antwerp, at different periods, between the years 1583 and 1599; "History of Manchuria," in 1593; "A Treatise on the History of Nature," in 1601; "A Version of the Psalms and Ecclesiastes," in Latin verse, in 4to. 1574, with other poetical pieces; and a translation of Jonathan’s Chaldee paraphrase of Hosea, and the Itinerary of Benjamin of Tudela, Dupin. Novis. Dict. Hist.
Lima; but since that period, the Spaniards have chiefly sent it by land, as the most secure, though most difficult mode of conveyance. It also suffered much by an earthquake in 1005. As they have little or no rain in this place, their houles are built without roofs. The valley of Arica is principally famous for the culture of Guinea pepper, which the Spaniards planted here, of which they raise annually to the value of eighty thousand crowns. This port is still much frequented, not merely on account of the mines, to which it afford an easy access, but for the rock-fall which is dug out of the eastern mountains, and which is shipped for the western coast. S. lat. '18° 27', W. long. 71° 5'.

ARICADA, in Ancient Geography, a town of Asea, in Dingiana. Potency.

ARICARETS, in Geography, a nation of South America, in Guiana, on the banks of a river called Aricari.

ARICATE, a town in the island of Cape Breton.

ARICHI, in Ancient Geography, a people of Afiatic Saramatia, among the Moexa, near the Palus Moeys. Potl.

ARICIA, a town of Italy, in Latium, near the Alban mount, on the Appian way, about twenty miles from Rome. This city existed before the establishment of the Greeks and Latins in Italy; and the inhabitants of it were often distinguished among the encensics of Rome in its naifent state. Cicero speaks of it as a municipal town; and Frontin us, ranking it in the number of colonies, says, that its walls were erected by the orders of Sylla. Near it was the 6th Nesmus Aricinum," or grove of Diana, who hence obtained the epithet of "Aricine." Here she had a temple frequented by her votaries, who travelled to it on foot from Rome, with images covered with crowns, and crowns on their head.

ARICONIUM is placed, in Antoninus's Itinerary, near Ro's, about eleven miles from Caerleon: our other antiquaries place it at Kuchelkirt. It was a town of the Sabines.

ARICOURIS, in Geography, a people of South America, in Guiana, towards the river of the Amawpons. De Lact says, they manifest no signs of religion, but seem to respect the sun and moon, without paying them any worship; and yet they appear to believe the immortality of the soul, as they point to the heavens: as, after death, the abode of those who have lived well. They are timid, frugal, and inclined to revenge. They are addicted to forcery, and confound toothfayers, who, as they think, are inspired by a demon called "Watipa," and thus enabled to foretell future events. Their eyes and hair are black, and they have no covering: but the men envelop themselves all over in a kind of gummy dye, to preserve their bodies from the heat of the sun, and the women paint themselves with it more lightly, and in a variety of figures.

ARIDANA, a town of Arabia, ten miles south of Mecca. ARIDAS, a kind of tapestry, manufactured in the East Indies, from a shining thread obtained from certain herbs; and hence called "Aridas of herbs."

ARIDED, in Astronomy, a fixed star of the second magnitude, in the extremity of the Swa's tail. It is also called Hieroezin, Adigeze, and Aride.

ARIDÉLOSIS, σφαίρωσις, in Rhetoric, is sometimes used for the figure commonly called synony mia.

ARIDSONG, in Geography, a town of Asea, in the country of Thibet, one hundred and fifty-two miles north of Carmandu. N. lat. 30° 40', E. long. 84° 45'.

ARIDULLAM, in Natural History, the name of a fo- file substance, used in the East Indies in intermittent fevers. It is of a greenish yellow colour, and coarse texture, and when burnt, emits fumes smelling like arsine. It is properly of the zarine kind, though somewhat different from all the European kinds.

ARIDURA, in Plutarch, a dryness, or want of juice and moisture of the parts. Hence it is also used by fome for an aridity or conformation; and it is more particularly used to denote a hectic fever. The term is more frequently used by Modern Writers, to denote a particular atrophy, or want of some single member of the body; in which fene, it amounts to the fame with what we otherwise call withering.

ARIENT, in Geography, a small island in the Adriatic, near the coast of Italy, three leagues north of Venice.

ARIZENZO, a town of Italy, in the kingdom of Naples, and country of Lavaera, fourteen miles north-east of Naples. Its situation is low, but delightful, and it is surrounded with vineyards and gardens. It now belongs to Caraffa, duke of Macaloni.

ARIES, or the Ram, in Astronomy, a northern constellation, the first of the twelve signs of the zodiac; from which also a twelfth part of the ecliptic takes its denomination, and into which the sun enters about the twentieth of March. The stars in this constellation, in Ptolemy's catalogue, are 18; in Tycho's, 21; in Hevelius's, 27; in the Britannic catalogue, 66; but they are most of them very small, one only being of the second magnitude, two of the third, and all the rest smaller.

ARIES, in Artillery, denotes a battering-ram, or a military engine with an iron head, much in use among the ancients, to batter and beat down the walls of places besieged.

Of this there were three kinds; the first rude and plain; the others critical and compound.

The first seems to have been no more than a great beam, which the soldiers bore in their arms, and with one end of it, by main force, assailed the walls. This required a great force to work it; yet produced but a small effect.

The second or compound ram is described by Theophrastus (De Extinct. Hierofol. 3.) thus: "The ram is a vast long beam, like the mail of a ship, strengthened at one end with a head of iron, somewhat resembling that of a ram, whence it took its name. This is hung by the middle, with ropes, to another beam which lies across two polls; and hanging thus equally balanced, is by a great number of men violently thrust forward, and recoiled backward, and so shakes the wall with its iron head, nor is there any tower or wall so thick or strong, as to resist the repeated assaults of this forcible machine."

The third only differed from the former, in that it was covered with a χίλιαρι, or screen, to guard the soldiers; whence it was called τρίτη καταρτία.

Mr. Feibien describes a fourth sort of battering-ram, which ran on wheels; and was the most perfect and effectual of the all. Vitruvius affirms, that the battering ram was first invented by the Carthaginians, while they had siege to Cadiz: theirs was the simple kind first mentioned. Psphamenes, a Tyriam, afterwards contrived to suspend it with ropes; and finally, Polydus, the Thebalian, to mount it on wheels, at the siege of Byzantium under Philip of Macedon. Yet Pliny affures us, that the ram was invented at the siege of Troy; and it was this that gave occasion to the fable of a wooden horse. The invention has been ascribed by some to Arctemus, a Greek architect, who flourished 441 years before Christ. Some have supposed, that the walls of Jericho, mentioned in the book of Joshua, were beaten down by this instrument; the ram's horns by which they were overthrown being no other than the horns of the battering ram.

Plutarch tells us, that M. Antony, in the Parthian war, used a ram of 50 feet long; and Vitruvius affures us, that
they were sometimes made 105, and sometimes 120 feet long; to this great length perhaps the force of the engine was in great measure owing.

The ram was managed at once by a whole century of soldiers; so that it played continually and without intermission; being usufully covered with a vinca, to protect it from the attempts of the enemy.

The battering ram is represented in Plate I. Artillery, fig. 1. This ram AB is fastened by a rope at to the cross beam y, at the top of the frame CD. Its head A is fastened to a large beam by three or four bands of iron four feet broad. At the extremity of each of these bands a was a chain b also of iron, fastened by one end to a hook z; and at the other extremity of each of these chains was a cable firmly bound to the ball link. These cables extended through the whole length of the beam to the end of the ram B, where they were bound firmly together with small ropes. To the end of these cables was fastened another, composed of several strong cords plaited together for some length, and then running single. At each of these several men were placed to balance and work the machine. The unsuspended ram differed from this only in the manner of working it: instead of being hung by a chain or cable, it moved on small wheels, on another large beam.

These battering-rams, by their own weight, and by the action of the men who impelled them, excited a force which in some cases exceeded the utmost effect of our battering cannon.

Dr. Defaguiers (Lectures, vol. i. p. 63.) has demonstrated that the momentum of a battering-ram, twenty-eight inches in diameter, one hundred and eighty feet long, with a head of cast iron of one and a half ton, the whole ram weighing with its iron hoops, 141,112 pounds, and moved by the united strength of 1500 men, would only be equal to that of a ball of thirty-six puncheons weight shot point blank from a cannon.

Mr. Atwood, comparing the effect of the battering-ram, having its metal extremity equal to a twenty-four pounder, with a cannon ball of twenty-four pounds weight, observes, that in order to producing the same effect in penetrating a wall or making a breach in it, the weight of the ram must exceed that of the cannon ball in the proportion of the square of 1700, the velocity of the ball, to the square of the velocity with which the battering-ram could be made to impinge against the wall expressed in feet.

Eliminating this at ten feet in a second, the proportion of the weights will be that of about 2589,500 to 100, or 25,900 to 1; and therefore the weight of the battering-ram must be 546 ton. In this case, the battering-ram and the cannon ball, moving with the velocities of 10 and 1700 feet in a second, would have the same effect in penetrating any obstacle; but, as the weight of the ram was probably never so great as the above supposition states it to have been, the force of a cannon ball to make a breach in walls must exceed that of the ancient aries: but the momentum of this, or the impetus by which it communicated a shock to the whole building, was far greater than the utmost force of cannon balls; for if the weight of the battering-ram were no more than 170 times greater than that of a cannon ball, each moving with its respective velocity, the moments or forces of both would be equal; but as the weight of these ancient machines was certainly much greater than 170 times that of our heaviest cannon balls, their momentum or impetus to shatter or overturn walls and demolish buildings, was much superior to that which is exerted by the modern artillery. And since the strength of fortifications will in general be proportioned to the means which are used for their demolition, the military walls of the moderns have been contrived with less attention to their solidity and massy weight than the ancients thought to be a necessary defence against the aries; that fort of cohesive firmness of texture which refits the penetration of bodies being now more necessary than in ancient times. Nevertheless it is manifest, that even now solidity or weight in fortifications is also of material consequence to the effectual construction of a wall or battery.

The ram was frequently used in the fourteenth century. Sir Christopher Wren employed it in demolishing the walls of the old church of St. Paul's previously to his rebuilding it; and found no machine so well adapted to this purpose. See Catapulta.

Aries, in Zoology, the Linnaean and Gmelinian specific appellation of the common sheep, or kind of Ovis, with compressed lunate horns, "cornibus compressis lunatis," Fam. Suce. Syt. Nat. &c.; ovis domestica, of Ray; pecus, aries, ovis, vertex. agnus, of Pin. Aldr. Jonft. &c.; brebis et belier, of Buff.; schlau, weder, hammel, lamb, of Gen. Thierb.; and ram or common sheep, of Penn. Briff. thus defines this species: "aries lamger, cauda rotunda brevi." Dr. Shaw observes, in his Zoology, that the most prominent characters are: that the horns twist spirally outwards; that the tail is round and short; and that the body is covered with wool; but these characters, he remarks, are so greatly varied in different races, that it is hardly possible to fix on an absolute distinctive mark which shall apply to all the varieties.

Pallas, who extensive travels through the Russian empire, and especially Siberia and Great Tartary, enabled him to make many important observations on these useful animals, found what he regarded only one species subdivided into four varieties, distinguished by their tails, the form of their heads, their ears, and fleece; and hence he condemns as unfounded and fanciful the idea of making specific differences of the accidental varieties, which he imagines the education or mode of life, the climate, food, and crossing of the breed have produced in sheep, as in other animals; and in conformity with this opinion, he considers not only these varieties found in Europe, but also those of other quarters of the globe, as only accidental varieties of the same species; an opinion in which he appears confirmed by finding that they produce a prolific race, though the breed be ever so crossed; and which he thinks would not be the case were they different species. Some preceding naturalists evidently entertain very opposite sentiments on this subject; but whether we are to regard the several apparently distinct kinds of the sheep as so many species, or as varieties originating from one parent stock only, it is defensible, more highly requisite, to draw some line of discrimination between the more remarkable, or, if the expression may be allowed, more permanent varieties, by which they may be ascertained. This is confedly a matter of the utmost difficulty. Linnaeus has, we think, devised the best mode in which it can be accomplished without exciting the prejudices of naturalists, or offending with their opinions; and Gmelin has certainly improved upon it. A name and character are assigned to each variety, so far as it is deemed practicable to define them; and by arranging them all as varieties only of the common species Aries, the reader is at liberty to form his conclusions he may think proper. The varieties enumerated by Gmelin amount to ten that are very distinct, and are arranged in the following order.

1. Anglica, a.—Ovis anglica. Amoen. Acad. 4, p. 174. Hornless
ARIES.

Horned sheep of Pennant. In Lincolnshire, and other counties in England, and also in many other parts of Europe, the horned breeds of sheep are raised in great numbers. Independently of this kind being distinct of horns, the tail and fencets hang down as low as the knees; and by these characters it may be distinguished.

2. R. Pal/has. Ovis raffles, Amoen. Acad. 4. 174. This is the variety which Pallais calls ovis brachydon and ovis raffles; it inhabits Raffles, and is called the Raffles s$f$h sheep by the natives. According to Guzlin, this kind is horned, has a short tail, and is covered with short wool. Dr. Pallais acquaints us that it is not only reared throughout all the northern parts of Raffles, but likewise by the Fins and other neighbouring nations; and that some of this kind have been transported into Siberia, where they have supported themselves on some paffure, though in poor condition.

In the southern countries they are, however, in its estimation than the long-tailed and fat-tailed kinds, which are much superior to them in fat, fat, and fatness; but the eves of the former will couple readily with the ram of the fat-tailed variety, and produce an animal arger and more valuable than its mother, with a tail fleeced at the base with fat, and meagre towards the end. This short-tailed kind bears a some resemblance to the flock of Iceland. They are fleeced in fine, tail, and coarseness of the fleece; yet it differs from that breed in the essential particular, the horns, which are much smaller in proportion. The Tlcherkefian sheep, we are told, resembles it also in the form of the head, bright creat ears, and thick, of the fleece; but in texture the fleece is very different, being fine in the Tlcherkefian kind, and in the other as coarse as dog's hair; and the short-tailed kind is uniformly distinguished by the tail being about a quarter of a yard shorter than the other variety.

3. Hispanica, 7. — Ovis hispanica. Amoen. Acad. 4. 174. Spanish sheep. The spires of the horns are extended horizontally, and the wool is remarkably fine and plentiful on the animals of this breed. It is said to be peculiar to Spain.

4. Polyctera, 3. — Ovis polykteria. Amoen. Acad. 4. 174. Ovis fucconi and tricornis. Adr. Brebis a plusieurs cornes, Beher d'Ilande. Brebis d'Ilande. Buff. O. e Gotlandica Pall.; and many horned flock of Pennant. This kind is distinguished by having more than two horns; how far we are authorized to admit it as a definite, rather than an accident, variety, is doubtful. In a supplement to the article sheep in the work of Buffon, the count infers a few observations on the drawings of two Wallachian sheep, a ram and a ewe, which were sent him by Mr. Collinson, one of the members of the Royal Society of London at that time, in the course of which this animal is mentioned; and from thence we should rather conclude the variety is accidental. "The rams, ewes, and widders of Iceland," says that writer, "differ chiefly from ours in having larger and thicker horns. Some of them have three, four, or five horns; but this peculiarity of having more horns than two must not be considered as common to the whole race of Iceland sheep; for in a flock of four or five hundred, hardly three or four widders can be found with four or five horns; and when these occur, they are sent to Copenhagen as rarities. As a further proof of their being scarce, they give a higher price in Iceland for this than for the common kind." Dr. Pallais speaks of an accidental variety of the Kirkupine ram with five horns, and of another with four horns disfigured with great syphiliters. Dr. Shaw describes the many-horned sheep as a distinct variety. He observes that it occurs in the northern parts of Europe more frequently that in other regions, and that it is said to be most common in Iceland.

The horns are either three, four, or five in number; sometimes placed with great regularity, and sometimes differing in proportion and situation. A four horned sheep, with very long hairs hanging from the base, is also found in some parts of Europe; the two largest horns in this kind are straight and nearly upright on the top of the forehead, the smaller pair are set on each side of the head, and turn downwards. Gen. Zool.

6. Guinensis, 7. — Auribus pendulis, pelagricum lanis, pilis occipite prominentis, Linn. ; aries (ovis guineensis), plibus, pilis brevis pelitis, jaha longimana, auticulis longis pendulibus, Briss.; aries guineensibus t. Angol. Briss. ; ovis guineensis f. anglulis Magnus, Raj. ; montes, Assaf.; montes of Guinea, Des Murtiers; Isols derer sebegal, delier des Indus; et breves Indes, Buffon; shep of Sabauro, Shaw, r.; African sheep, Shaw's Zoöl.; Guinea sheep. Lammas, in the twelfth edition of the Syllena Nat., considered this animal as a distinct species, and assigned it the character above mentioned; "t. end pendulums, deuipa lax and hairy; hind part of the head prominent." Gmelin deems it a variety only. In point of figure, this creature is so very remarkable that it cannot easily be confounded with any other variety: "its meagre appearance, length of neck and limbs, pendent ears, and long arched or curved vifage," are strikingly characteristic; and as Dr. Shaw further observes, "it is covered rather with hair than wool, and has a pair of pendent hairy wattles beneath the neck, as in goats; the horns are small, and the tail long and lank." This kind is supposed to be most frequent in Guinea.

7. Laticaudata, 3. — Arabica planifera, Rulphi; Arabiz ovis, Alder.; ovis Tucica, Charletta.; 0vis cauda obf. 1, Lodd.; ovis laticauda. Raj. Genel.; aries (ovis laticauda) langer, cauda latifama, Briss.; montes de Barbarie on a queue, Charl.; montes de Barbarie, monton d'Arabte, Buff.; ovis laticauda, planyeroes. F. Arabien; Acad. p. 175.; ovis laticauda, planyeroes; Berndt, Pall.; ovis laticauda, planyeroes; Rauwolf; arichesches fcafb, Genf. Thier.; die hiefig sahaob, Off. Broad-tailed sheep. This kind is affected to be the largest breed of sheep in the world; and, according to Dr. Pallais and others, is reared throughout all the temperate regions of Asia, from the frontiers of Europe to those of China, in the vast plains of Tartary. All the Nomadic hordes of Asia, the Turensans, Kirgufs, Calkums, and Monguls Tartars rear it; and indeed it constitutes their chief riches, the number which they pollish being enormous. The Persians and it rear it in abundance, as likewise the Hottenots, as Kolben relates in his Travels to the Cape of Good Hope. Olbeck says, in his Journey to China, that the fat-tailed sheep is reared throughout that vast empire, and it occurs in most parts of Syria, Barbary, and Ethiopia. Pallais thinks there is sufficient evidence that it is more universally reared in different countries than any other kind. The flocks of all the Tartar hordes resemble each other in having a large yed with muggle, the upper jaw often projecting beyond the lower one, and by having long hanging ears; by the horns of the adult ram being large, spirul, wrinkled, and bent in a lunar fo m. The tails of these sheep become oftentimes fo large and heavy, as to greatly incommode the animal in walking
ARIES.

walking or grazing; they grow to the weight of fifteen, twenty, or thirty pounds, and even, according to some accounts, they have been known to increase to the weight of fifty pounds each. The sheep are, therefore, very frequently obliged to fall on behind the sheep a small board furnished with wheels on which the tail may rest, and the animal be in some degree relieved of the weight he would otherwise be obliged to bear. This kind is in great estimation, the fatty sub stance of the tail resembling marrow, and the fleece in some countries being of an exquisite fineness.

Mr. Pennant remarks that both the broad and long-tailed varieties of this kind of sheep were known to the ancients, being mentioned by Aristotle and Pliny; the former speaking of the first, and the latter of the second; one says the tail was a cubit broad, and the other a cubit long.

8. Bucharian. 3.—Auriculus magnus pendulis, pulvinari adipoa ammore, Pall. xi. 76.—Bucharian sheep, with large pendulous ears, and small fatty cushions. From Dr. Pallars we learn that this kind of sheep is reared in India, and that called by Bucharian Tartars; and it is also common in Persia and Syria. Pallars and Genchu both regard it as a mixed or hybrid breed, between the long-tailed and fat-tailed varieties; the former believes they never attain the size of either of the parents. The head is like that of the Kinguie sheep; but the muzzle is sharper like that of the Indian sheep of Buffon; the body is rather smaller than that of the Kinguie sheep; the ears large and pendent; and they have a small umbo pygion or fat lump, like that of the Tartar sheep on the Jenuf, especially when begotten by a Kinguie ram; but in general they have a tail, fat and broad at the base, with a long narrow appendage, which resembles the tail of the Tcherekian sheep. The Bucharian Tartars have a very valuable traffic with the furs of the limbs of this variety, which are excellently fine and beautiful. The same variety is likewise raised in great numbers by the Persians; and it is suspected by some writers that this is also the variety known more generally by the name of ovic macrocerus, as an inhabitant of Syria, Palærine, and various countries of Asia.

9. Longicauda, l.—Cauda longissima, Gmel. : alterum genus, Raj.; ovis arabica, Jonst.; aries (ovis longicauda) laniger cauda longissima, Briff.; ovis ovischura Tschirchelica, Pall.; Schassir, O. ear., ein ander arabisch schaaf, Gern. Thierb. Long tailed-sheep. The long-tailed, or, as the natives of Russia and Tartary call it, the Tcherkian sheep, is described as a hardy animal, with a noble air, in its native country and the south of Russia, resembling in its habits, horns, fleece, and length of tail, the Spaniel, but more particularly the English sheep. Its head is well-proportioned, and of an elegant form; ears large, horns large, even, rounded in the angles, tapering to a point, and bending forwards towards the back. The rams are seldom without horns, and the ewes have them often bent in a lunar form. The wool, though coarse, is without admixture of hair, which is perhaps but an accidental discoloration, and promises to be much microlated by crossing the breed, and rearing the animal with more care and skill. It is even known to become much finer without the assistance of art, merely from the influence of a temperate climate; it is also a more robust animal. The tail of the ram is covered with fine long wool like the Indian sheep described by Buffon, which trails on the ground so as to efface the prints made by the animal's feet on the sand, and it contains often twenty joints or vertebrae. In passing from the state of nature to that of servitude, it seems to have lost its native ferocity, together with the coarseness of its fleece. Dr. Pallars says, it is a

ARIES.

mild gentle animal, and is less degenerate in form from the argali, which he deems the parent species, than the Matoz, pygæa; but which on the other hand has retained much more of its native wildness than the Tcherkian breed; perhaps because it is allowed to range with little restraint on the wide extended plains of Great Tartary. The Tcherkian breed is reared in all the European regions of the Russian empire, situated on this side the river Ob, in the nearer Poland, and by the pastoral people of Mount Caucasus, and is commonly of a white colour. The same variety, we find in Raffé's Natural History of Asia; it is reared under the name of Badam sheep by the Arabs, and in the western parts of Mauritania. In the latter a trifling difference is observable, in the length and thickness of the tail. Long-tailed sheep are likewise reared in Morocco, and which it is supposéd belong to this variety, because they possess the distinguishing character, a long tail, although in other respects they are different. These have the same look; the head is covered entirely with hair; the ears are small, and pendulous; and the wool remarkably long. The inhabitants of Ukraine and of the countries near to the extensive traffic with the fells of the Tcherkian variety.

10. Capra. 7.—Ovis auriculis magnis pendulis, cauda magna ex adipise vix prominente.—Cape sheep of Pennant. An awkwardly formed animal with large pendulous ears, covered entirely with coarse hair instead of wool. The tail, Dr. Shaw observes, is sometimes so enveloped in fat as to be scarcely visible, the parts on each side swelling out into a pair of naked hemispheres, of such a size as sometimes to weigh nearly forty pounds. The legs are rather long; the village somewhat arched; and the horns of the male like those of the common sheep.

In the General Zoology, by Dr. Shaw, the Ovis Strepice-ros, or Cretan sheep, which Linnaeus and Gmelin deem a distinct species, is considered also as a variety of Aries. The principal varieties of the sheep, according to Dr. Shaw, are the following: Cretan sheep (ovis Strepsiceps, Linn.); many horned sheep (ovis polycerata, Linn.); African sheep (ovis guineensis, Linn.); broad-tailed sheep (ovis latiacauda, Linn.); fat-rumpled sheep (ovis Stntopolga, Linn.); of the Caucasus and Hindistan (ovis Hispanica, Linn.); and hornless sheep (ovis Anglica, Linn.).

Thus far have naturalists endeavoured to trace and define from the parent species, the more remarkable varieties into which those useful animals, appear to be divided; and if we have digressed too far from the conclusens of the Gmelinian order, by attending more fully than that writer to the collateral observations of Linnaeus, of Pallars, and other distinguished naturalists, who have entered minutely into the same inquiry; on a subject of so much importance, it is at least excusable. In the present instance, it is incumbent only to ascertain the principal varieties, so far as the characters assigned to them may justify: to dwell on the intermediate varieties into which these varieties have again degenerated is needless; by education or culture, the effects of climate, food, and crossing breeds, these are now extended beyond the ability of the naturalists to ascertain with accuracy; and it would be well but tend to obscure the subject, were we to enlarge upon them. To the agriculturist, or the practical farmer of this country in particular, the history of the first variety, and perhaps one or two more, is obviously useful; but to treat on these would alone extend this inquiry to undue lengths. Nor does it with strict propriety fall under the article Aries; it is a subject that deserves the fullest investigation, and elucidation the most ample; and will be duly attended to in its proper article, sheep, or ovis. See Sheep, and Ovis.
ARI

ARIKILL, in Geography, a small creek which runs northerly into Mohawk river, two miles and a half west from Schenectady river in New York.

ARIES, in Zoology, a name given to the Gmelinian Camillus Aracosmus, or Peru camel, in Neumann's Natural History. This species is called the sheep of Peru, muttons, or muttons de Perou, by Feuille, Ficquier, and other writers.

ARIES, in Entomology, a species of Lepidura, in the Fauna Svecica, and Systema Naturae Linneus, Historiae des Insectorum of Geoffroy, and British Insects of Doovan. Degeer arranges it with the Cerambix, under the specific name of quadrinotatus; Scopoli calls it Ste- nocrorus arieti; Fabricius makes it a CALLIDUS; and Gmelin a Cerambyx in his family of that name, (palpis clavatis, CALLIDIA).

This is a very common insect in England; and probably throughout the other parts of Europe is not less frequent. It is found in gardens, and is easily distinguished from other species of the same genus. The thorax is black; wing-cases black, with four yellow transverse bands; the second of which is arched and curved upwards; and the legs are ferruginous. Fabr. Gmel. &c.

ARIETIS, a species of Vespa, that inhabits South America. The colour is in general black; petiole of the abdomen, and the legs rufous. Fabricius.

ARIETTA, in Music, the diminutive of Aria. The French have a very confused notion of the meaning of this term, and call by the name of ariette the capital song of a musical drama, and which the Italians term aria d'al- l'ita, generally composed to display the powers of a principal performer, in point of execution. Arett, every where but in France, has been always understood to imply a little short air, a cavatina. "Now we begin to emerge from barbarism (says M. Guignéme) why do we continue to speak like barbarians?"

ARIETUM Levatio, in Antiquity, a kind of sportive exercize, probably the same with that which in later times is called, "running at the quintain."

ARIETUM, in Ancient Geography, a town of India, suppos'd by major Rennel to be Ijab, in the modern Cabul, in the route of Tamerlane, near the southern mountains. Alexander found it burnt and abandoned, according to Arrian.

ARIGENUS, the capital of the Videcafii, situate in the northern part of Gallia Lyonnesis. Ptolemey.

ARIGNA, in Geography, a place situated amidst valuable coal and iron mines in the county of Lettrim, Ireland, at which great iron works have been lately established. As soon as the completion of the royal canal opens a communication between Dublin and the Shannon, it is to afford an easy conveyance of the articles to market, great advantages are expected. Dr. Beaumont.

ARIGNANO, a town in the province of Italy, in the duchy of Tuscany, on the river Arno, between Florence and Arezzo.

ARIGNAY, a town of France in the department of Upper Garonne, and chief place of a canton in the district of St. Gaudens, 5 leagues W. of Rieux; and 3 N.N.E. of St. Gaudens.

ARIH, or ARIANS, in Ancient Geography, a denomination by which several people of Asia were distinguished. Thus, the Arian or Aryan, were the inhabitants of Aria, in the vicinity of the Sogdians, according to Herodotus: he also says that Aria or Aryan was an appellation commonly given to the Medes. Arii were a people placed by Ptolemey in Arabia Felix. ARIH, or Arians, were also a people of Germany, occupying the first rank, according to Tacticus, among those who were denominated Lygoian. They were more valiant, and also more fierce, than most of the other Germans; and with their ferocity they blended a considerable degree of cunning. They wore black bucklers, painted their bodies, and made their attacks in the night.

ARILLUS, in Botany, the feed-cost of the permanent hulk that invests the feed. Some have objected to this term, as improper; but Dr. Smith (Linn. Trans. vol. v. p. 205.) is of opinion, that it expresses the true nature of the tunic, to which it is applied, much better than the hypothetical one of meclram, the erroneous one of capsule, or even the analogous denomination of corolla.

ARIM, in Geography, a town of Afa, in India, suppos'd by the calern geographers to be at an equal distance from the columns of Hercules on the west, and those of Alexander to the east, and therefore used by them in reckoning the longitudes.

ARINA, a town of Japan, in a country of the same name. N. lat. 31° 45'. E. long. 129° 24'. The Strait of Arina lies between the small island of Nangayuma, and that of Xince.

ARITI, in Ancient Geography, a mountain of Cilicia, or of Lydia.

ARIMANIAM, or AHRIMAN, in the Persian Theology, denotes the devil or the principle of evil, which, as some fay, co-existent from eternity with Omrufd or Orominds, the principle of good; each of them possessing the powers of creation, but each disposed, by his unchangeable nature, to exercise them with different directions. Others say, that Omrufd first sublustrated alone, but being dissatisfied with a solitary existence, and having no power to oppose him, Ahriman was produced. Perhaps these divinities were originally, like Mitra, merely human beings; the one, a good prince, who had distinguished himself by rendering important services, civil or military, to his countrymen, the other, a tyrant, who had been the cause of grievous public calamities. Ahriman was not called by the Persians a god, but an evil daemon; and they always wrote his name with the letters inverted. This rude and vulgar superstition, which had no other object than individual men, was afterwards corrected by philosophy, and changed into the worship of two spiritual beings, one the author of good, the other of evil. The system which supposes two such principles in nature, seems to have been held by the Persian Magi, before the time of Zoroaster; but it does not appear, how far they suppos'd them dependent upon the supreme divinity. Zoroaster, however, certainly taught the doctrine of their inferiority to the first parent of all things. According to this system the principle of good, it is said, is eternally absorbed in light, and the principle of evil eternally buried in darkness. The wife benevolence of Omrufd formed man capable of virtue, and amply provided for him the means of happiness. By his vigilant providence, the motion of the planets, the order of the seasons, and the temperate mixture of the elements, are preserved. But the malice of Ahriman has long since pierced Omrufd's egg, or in other words, violated the harmony of his works. Since that fatal irruption, the good and evil are blended; the rankest poisons spring up amidst the best salutary plants; deluges, earthquakes, and conflagrations attack the conflict of nature; and the mind, as well as the dispositions of man, is perpetually agitated with vice and misfortune. Ahriman's power, however, is subject to limitation and restraint: Omrufd will ultimately triumph over the furious malice of his rival; and at that decisive period, Ahriman and his followers, disfavored...
ARI

disarmed and subdued, will sink into their native darkness; and virtue will maintain the eternal peace and harmony of the universe. The modern Persians extol the Ormuidi into the highest eminence in the scale of mankind, whilst they degrade Ariman into an infernal region of infernal spirits. Their defile of pleasuring the Mahometans, says Mr. Gibbon (Decl. and Fall of the Rom. Emp. vol. i. p. 322, Svo.), may have contributed to refine their theological system.

ARIMANNI, in Antiquity, the denomination of a class of perfons employed in agriculture in the middle ages, who were free men. Among the writers of the middle ages, they were called alio conditionales, originarii, tributati, &c. They seem to have been perfons who sold their small alodial property of their own, and, besides that, cultivated some farms belonging to their more wealthy neighbours, for which they paid a fixed rent, and bound themselves likewise to perform several small services, such as ploughing a certain quantity of their landlord’s ground, afflicting him in harvest and vintage work, &c. It does not appear whether these Arimanni were removable at pleasure, or held their farms by lease for a certain number of years. The former, says Dr. Robertson (Hist. Ch. V. vol. i. p. 276, Svo.), if we may judge from the genius and maxims of the age, seems to be most probable. These perfons, however, were considered as free men in the most honourable sense of the word. They enjoyed all the privileges of that condition, and were even called to serve in war; an honour to which no slave was admitted. Nevertheless, their condition was greatly superior to that of slaves, such was the spirit of tyranny which prevailed among the great proprietors of land, and so various their opportunities of oppressing those who were settled on their estates, and of rendering their condition intolerable, that many free men, in despair, renounced their liberty, and voluntarily surrendered themselves as slaves to their powerful masters, who might thus become more immediately interested to afford them protection, together with the means of subsisting themselves and their families.

ARIMANON, in Ancient Geography, a city of refuge beyond Jordan; probably the famous Ramoth in Gilead. Jos. xvi. 38.

ARIMANON, in Ornithology, the name given by Buffon to that species of Peitacas, since called by Gmelin taitianus, and Otahitian blue parrot by Dr. Latham. See Taftianus.

ARIMANTIS, in Ancient Geography, a town of Africa, in the Pentapolis. Ptolemy.

ARIMARA, a town of Afia, in Syria, situate on the Euphrates. Ptolemy.

ARIMASPI, a people who inhabited the northern part of European Scythia, called Scythia Arimaspae, which lay eastward joining to Scythia in Asia. They were so called, it is said, from the Scythian Arima, one, and Spae, eye; not because they had but one eye, as some of the ancients absurdly believed, but rather, as Bochart conjectures, because they were such excellent archers, at which exercitium it is necessary to shut one eye; that the nick-name of one-eyed was given to them on that account. According to Diodorus, who places them in Asia, to the south of the Oius, they were called Evergetes, because, in an expedition of Cyrus, when his army was so distracted with famine, that the soldiers were reduced to the necessity of eating their comrades, this people supplied them with 3000 carriages of provisions. Steph. Byz. ascribes the appellation to the kind treatment which they afforded to the Argonauts, when they travelled through their country.

ARIMATHEA, or Ramathia, a city of Paleolne, Vol. II.

placed by Jerome between Lydda and Joppa; but M. D’Anville places it a little to the south-east of Lydda and Diodorus. Modern travellers speak of a city called Ramathia, between Joppa and Jerusalem. The name Ramathia, whence Arimathea is derived, signifies height; but this place, which lay west of Jerusalem, was very different from Ramathathaim, Samuel’s country (1 Sam. i. 1), which was north in the mountains of Ephraim, and was probably the same as Ramah, near Bethel, four leagues distant from Jerusalem. Arimathea was the city of Joseph, the honourable counsellor, mentioned Luke, xxii. 50. The ancient Arimathea, says Volney (Travels in Egypt and Syria, vol. ii. p. 333.), is now Rama, which is one-third of a league to the southward of Lydda, or the present Loudi, and is in as ruinous a state as Loudi itself. Within its boundaries nothing was found but rubbish; and yet the aga of Gaza reudes here in a feudal, the floors and walls of which are tumbling down. He maintains about 1000 holmen, and as many Barchy soldiers, who are lodged in an old Christian church, the nave of which is used as a stable, and in an ancient kan, which is disused with them by the scorpions. The adjacent country is planted with lofty olive trees, disposed in quincunxes, which are decaying. Amidst these plantations are every where found dry wells, mouldering cisterns, and large vaulted referraries, which prove that, in ancient times, this town must have been upwards of a league and a half in circumference: at present it fearely contains 200 families. The manufacture of the place is soap, which is sent into Egypt, and the spinning of cotton, which is chiefly purchased by two French houses established there. The aga built here, in 1784, a windmill, completed after the plan and under the direction of a Venetian carpenter; and this is the only windmill observed by Volney in Syria or Egypt, though it is said to have been originally invented in those countries. The only remarkable antiquity at Rama is the minaret of a ruined mosque, on the road to Yafa, which appears, by an Arabic inscription, to have been built by Saif-el-din, sultan of Egypt. In the adjacent plain between Rama and Gaza, there is a number of villages, consisting of huts built of dried mud, which, like their inhabitants, exhibit every appearance of poverty and wretchedness. The only fuel is dung kneaded into cakes, and dried in the sun. The environs of these villages are fown, at the proper season, with grain and water melons; and the reed is a defect, abandoned to the Bedouin Arabs, who feed their flocks in it.

ARIMINUM, RIMINI, a town of Italy, in Umbria, on the coast of the Adriate, at the mouth of a river of the same name, and south east of a small river called Rubicon. Strabo (1. v.) ascribes its foundation to the Umbri, who inhabited the country before the Senones. The Romans, when they became masters of it, sent a colony thither A. U. 485, and a new colony was sent thither by Augustus. This is the first town of which Caesar took possession, after passing the Rubicon. It is now in a state of great decay; but there are some monuments of antiquity that claim the attention of the curious traveller. In the market-place there is a kind of stone pedestal, with an inscription, declaring, that on it Caesar had fixed and harangued his army; but the authenticity of this is not ascertained to the satisfaction of antiquarians. The harbour is now choked with sand; and the brick tower, which formerly served for a faro or light-house, is surrounded with gardens; but they fill to the coast the spot where St. Anthony is said to have fixed where he preached to the fishes. N. lat. 44° 8’. E. long. 13° 46’. Keyler, vol. i. p. 223. Majorca. Travels, vol. i. p. 276. In the collection of Dr. Hunter there was a medal of bronze, which Dr. Coome ascribed to this city.
ARINE, GIAH, a town of Africa, in Mauritania Ce-
farenticus.

ARINGA, in Ichthyology, a name given by Paulus Jo-
vius and others to the hering, Gomphus harangus of Linnæus.

ARINGAN, in Geography, a town of the province of
Tranoxana, belonging to Sannacand.

ARINTHO, a town of Frigia, in the department of
Jura, and chief place of a canton in the district of Lams-
Sautn, 23 leagues south of Orgelet. The place contains
15,191, and the canton 16,023 inhabitants: the territory in-
cudes 220 kilometers, and 47 commune.

ARNUS, in Entomology, a species of Papilio (Pb. orb.)
that inhabits Evrope. The wings are without tails; above
brown, dark blue, with black spots; beneath grey, with
ocellated dots. Fabricius, Donov. &c. The male has a
single black spot on the anterior wings, and a row of mar-
ginal spots on the posterior ones; the female has about six
black spots on the disk of the anterior pair.

ARJONA, in Geography, a small town of Spain, in An-
dalusia, on the river Prio, between Juen and Andujar.

ARISO, in Myth., an adjective used adverbially, im-
plies, according to Rouffeau, a kind of melody bordering
on the majestic style of a capital air.

ARIOSTI, ATTILIO, in Biography, a native of Bo-
logna, was designed for the priesthood, but devoted him-
self to the profession of music, and became an eminent mu-
ical composer and performer. He exercised this profession
at Bologna and Venice, and also in Germany, where in
1700 he composed a Ballet, and an Opera called "Attis," for
the electoral princes of Brandenburg, to whom he was
appointed "Maestro di capella." Having continued for
some years in Italy and Germany, and distinguished himself
by his composition of operas and other pieces, and also by
his performances on the violoncello, and viol d'amore, an
instrument either invented or much improved by himself;
he came to England in 1716, and played on his new instru-
ment, the first of the kind heard in this country. When
the Royal Academy of Music was established in 1720, he
was employed to compose several operas: and he formed
one of the celebrated musical triumvirates of the time with
Handel and Bononcini: but both Attilio and Bononcini
were obliged to give way to the superior genius of Handel.
The former, without much invention, is said to have been
a perfect harmonist, and to have treasured up much good
music in his head. By way of relieving his necessities,
he published a book of canatas by subscription, and left Eng-
land; after which his history is not known. Burney's Hist.

ARISTO, LUDOVICO, a celebrated Italian poet, was
born in 1474, at the castle of Reggio in Lombardy, and
defended of a family allied to the dukes of Ferrara. At
an early age he manifested his poetical genius by a drama
on the subject of Pyramus and Thisbe, which was acted by
his brothers and sisters; and though his father for some
time endeavoured to prevail with him to study the law,
which he seemed to have reluctantly professed for some
years without making any great progress, he was at length
allowed to indulge his own inclination. At his father's death,
when he was 24 years of age, he found himself in embar-
sassed circumstances, and was almost induced to abandon
his favourite studies. But being invited to the court of
Alphonso duke of Ferrara, he became the particular fa-
ourite of the duke's brother, the cardinal Hippolito of
Este, and maintained his attachment to him, with some
occasional interruption, as long as he lived. Having re-
covered and much improved his early knowledge of the
Latin language, Cardinal Bembo wished him to employ it
in his compositions rather than the Italian; but Ariosto de-
nied it, alleging, "that he preferred being the first of Italian
writers, to being the second or third among the Latin ones;"
and also adding, "that his genius was most inclined to the
former." After the death of Hippolito, he was patron-
ized by his brother Alphonso, who was much delighted
with his conversation, and enabled by his bounty to build a
small
ARI

small house at Ferrara, where he employed himself in those studies and compositions which made his name immortal. This retirement, in which he lived with the plainness and simplicity of a philosopher, and where he enjoyed ease and liberty, he preferred to any other situation which he might have obtained under the offered favour of Pope Leo X. and several distinguished princes and cardinals. When he was asked why he had not built his house in a more magnificent manner, and more suitable to the noble descriptions which he had given of sumptuous palaces, beautiful porticoes, and pleasant fountains, in his Orlando Furioso, he replied, "that words were combined together with less expense than flowers." Upon his door he inscribed the following verse:

"Parsa, sed apta milii, sed nulli obnoria, sed non Sordida, parta mea sed tamen are domus."

Thus translated by Sir John Harrington in his "Life of Ariosto," p. 420:

"This house is small, but fit for me, but hurtful unto none, But yet not fluttish, as you see, yet paid for with mine owne."

Ariosto was so attached to a plain and frugal mode of life, that he says of himself in one of his poems, "that he was a fit person to have lived in the world when acorns were the food of mankind." But, though he was fond of retirement, he enjoyed the friendship of the most eminent men of learning of his time, who highly esteemed him, and whom he mentions with great respect in the last canto of his "Orlando Furioso." However, he was chiefly attached by obligation and friendship to the house of Este; and the adulation he bestowed upon it in several parts of his works would have subjected him to the charge of insincerity and servility, if it had not been sanctioned by the general practice of his age and nation. For the glory of his country he was ardently solicitous; and he often laments the injury and disgrace which Italy suffered under the dominion of foreigners. In his general behaviour he was affable and condescending; and, on particular occasions, he manifested a becoming degree of spirit and resolution, even when he thought himself ill-treated by princes of the highest rank. His charity and integrity are said to have been exemplary: to his mother he was singularly dutiful and affectionate; and heaved her the greatest respect in her old age. The writers of his life record several instances of his attachment to the fair sex; and it is said, that he was privately married to his mistress Aleflandra, by whom he had two illegitimate sons; but that he did not acknowledge her as his wife, for fear of losing some ecclesiastical benefices which were incompatible with a married state. His constitution was delicate and infirm; and, notwithstanding his temperance and general abstinence, his health was often interrupted. He bore his last sickness with uncommon resolution and serenity; affirming, "that he was willing to die on many accounts, and particularly because he found that the greatest divines were of opinion that we shall know one another in the other world," and he observed to those who were with him, "that many of his friends were departed, whom he defied to visit, and that he thought every moment tedious till he gained that happiness." He died at Ferrara, on the 6th of July 1534, according to Sanovino; and on the 8th of July 1533, according to Sir John Harrington; at the age of 59 years; and he was interred with singular tokens of respect in the church of the Benedictine monks, who, contrary to their custom, attended his funeral. An epitaph, written by himself, was inscribed upon his tomb. His death was regretted by all who knew him, and particularly by the men of letters, who honoured his memory in Latin and Italian poems. Sir John Harrington quotes his account of him in these words: "his learning, his good behaviour, his honesty, made him both beloved of all good men in his life, and bewailed of all honest men in his death; so as methinks, reading over his life, I could find in my heart to wish (faving for some very few things),"

"Sic mihi contingat vivere, sique mori."

The works of Ariosto, who, as Dryden says, with all his faults, must be acknowledged a great poet, are fates, comedies, sonnets, fables, small pieces of poetry, and his great heroic poem, called "Orlando Furioso," on the composition of which he bestowed his principal attention, and which manifests the distinguishing excellence of his poetical powers. The author began this poem when he was about 30 years of age; and whilst he was engaged in the composition of it, he rofe sometimes at one or two o'clock in the morning, both at home and abroad, and continued to write as long as he found himself properly disposed. The poem itself was singularly popular at its first publication, even among the lowest classes; and inspired a very extraordinary degree of enthusiasm. Such were the reputation and authority which Ariosto acquired by it, that he commanded respect among the most licentious and abandoned. To this purpose it is related, that when he was governor of a province in the Apennines, which was overrun with smugglers and banditti, his influence was sufficient to prevent for some time the tranquillity of the district over which he presided. Once, however, as he wandered in a fit of reverie to some distance from the fortresses which he inhabited, he was surprized by a party of free-booters, to one of whom he was known as the author of "Orlando:" as soon as this information was communicated to the rest, they fell at his feet, conducted him to the castle; and, at parting, told him that they respected him as governor on account of his character as poet. To such a degree was Ariosto himself charmed with his own verse, and so much did he inculc المسيrcrino i his manner of reading, that he was always disquieted if he heard his own writings repeated with an ill grace and accent. Accordingly, it is said, that, when he accidentally heard a potter singing a stanza of his "Orlando," in an incorrect and ungraceful manner, he was so incensed, that he struck him on the head, and in his rage, threw the stanza into his lap, and broke several of the pots which were exposed to sale; when the potter expostulated with him for this unprovoked injury, Ariosto replied, "I indeed have broken half a dozen of your pots, which are not worth so many half-pence; and you have spoiled a stanza of mine, which is worth a considerable sum of gold." A similar tale has been told by Piatarch of Philoxenus, and applied also to Caiusden. The "Orlando Furioso," after ten years labour, was published at Ferrara in forty cantos, in 1516; and the author gave it complete, in forty-six cantos, in 1533. This poem has been very differently appreciated by different writers, from the time of its first publication to the present day. Whilst some have unduly extolled it, others have degraded it below its just rank. A French writer prefers it to the Odyssey of Homer, and Sir John Harrington compares it with the Aeneid of Virgil; and in answer to the objection, that Ariosto wants art, and recedes from the example of Homer and the precepts of Aristotle, he observes, that what was proper in Homer at the time when he wrote, would now appear otherwise from the different circumstances of the age, and that with regard to the rules of Aristotle, he followed them very skilfully. Some have preferred Ariosto to Tasso; whilst others have regarded the latter as much superior to the former, and have adopted the common saying, that "Ariosto's tomb
ton b was in Tifs." The "Orlando Furioso," says a biographer of approved judgment and taste (see Aiken's Gen. Dig.), "is a tissue of adventures in love and sense, lightly, and often not at all, connected by reference to the principal hero, and formed upon the fictitious manners of chivalry, with all its accompaniments of enchantments, transformations, and supernatural events of every kind, and not without a mixture of moral allegory: it has its tragic and comic faults, its serious and burlesque; and the traditions from the one to the other are often immediate: thus, as a whole, nothing can be more wild, incongruous, and absurd; and it might be thought profligating the dignity of epic poetry to belittle the name on his performance, or put it in parallel with any of the great works of that class. Yet the inexhaustible invention, the boundless variety, the wonderful facility, and the profusion of real poetical beauties of the most different kind, have ever rendered it a most attractive piece; and as far as the ends of poetry are to excite admiration or pleasure, it certainly has attained them. Many even of the most cultivated critics are inclined to prefer its wild charities to the more regular and finished beauties of Tasso; and perhaps, in general opinion, it still stands as the full specimen of Italian heroic poetry. It is not free from the hankering faults of its age, and has some singular freaks of ridicule upon topics thought facetious. But by much the greater part can offer the delicacy of taste only, and not that of morals." Editions of this work have been numerous, and in various countries; and translations, and imitations, of part or the whole, in different languages, have been very frequent. Mr. Hoole's translation in English verse is much esteemed. Gen. Dict. Nouv. Dict. Hillor.

ARIPO, in Geography, a fort in Asia, on the western side of the island of Ceylon, at the mouth of the river Cemenda.

ARIS, a town of Polis Prussia, 74 miles south-southwest of Konigsberg.

ARIS, in Ancient Geography, a river of Greece, in Melfina, on the banks of which was built the city Thuria. Pantheon.

ARISABUM, a town of India, on the other side of the Ganges. Ptolemy. Some have thought that this is the modern Asa.

ARISARUM, in Botany. See Ambrosinia and Arum.

ARISBA, in Ancient Geography, a town of Asia Minor, in the Troade, founded, says Steph. Byz., by the Mitylenians, but according to Photius, by the Miletians. It was a little four-road of Abydos; the Trojans took it before the ruin of their city, and preferred it as an ally. Alexander's army, after passing the Hellespont, encamped near this city, when he went to visit the ruins of Troy. This city fruck imperial Greek medals in honour of Trajan.—Alfo, a town of the island of Lesbos, ruined by an ancient earthquake, according to Pliny.—Alfo, a town of Greece in Bocota.

ARISBUS, a river of Thrace which ran into the Hebrus. Strabo.

ARISCH. Abu, in Geography, a principality of Arabia, is properly a part of Tebaha, and stretching along the Arabian gulf northward from Loheja, for the space of two degrees; like the rest of Tebaha, it is every where dry and barren, except in parts that are watered by the rivers from the mountainous regions of Yemen. The remarkable places in this principality are the capital, known by the same name, which is encompassed with walls, and is the seat of the sheikh, twenty leagues north of Loheja, in N. lat. 16° 45', and E. long. 43° 15'; and the sea-port town of Gezan, a day's journey from Abu Arisib.

ARISE, licence quo, in Law. See Licence.

ARISH, El, in Geography, a town of Egypt, near a gulf of the Mediterranean to which it gives name, in the road from Cutch to Goza, 41 miles south-south of Cairo, and 115 miles northwest of Suza. The town is situated three leagues from the sea, in a sandy country; and it is the last place where water, which can be drunk, is to be found, until you arrive at Sultana.

ARISI, a Persian long measure, containing 3197 English feet. Arith. Tab. 32.

The Persian arish, according to Mr. Graces, is a long measure equal to 365,314 English inches.

ARISI, rice, an Indian word, which does not properly signify the plant which produces the rice, but the seed itself when cleaned from its husk, and rendered fit for use. The Indians call it anit in that state; but in the husk, and upon the plant, they call it nello.

ARISTA, in Astronomy. See Spica Virginis.

ARISTA, in Botany, a long needle-like beard, that grows out from the hulk of corn, or grass; called also the arista.

ARISTA, in Ichthyology. See Aterina.

ARISTENETES, in Biography, a Greek pagan writer of the fourth century, was the friend of Libanius the rhetorician, and mentioned with respect by Ammianus Marcellinus. He perished in an earthquake that happened at Nicomedia in the year 355; and left two books of amatory epistles, written with tercets, elegance, and tenderness, and containing quotations from Plato, Lucian, Philodorus, and others. An edition of these epistles, with notes, was published by Mercer, at Paris, in 1595, 8vo. and reprinted in 1600 and 1610. Fabr. Bib. Græc. l. ii. § 10. t. i. p. 432.

ARISTEUM, in Ancient Geography, a town of Thrace, built on the summit of mount Hæmus, mentioned by Pliny, and Diódorus Siculus.

ARISTEUS, in Mythology, the son of Apollo and the nymph Cyrene. He is said to have communicated to mankind the art of curdling milk, of managing bees and forming hives, and of cultivating olives. At Thebes, he married Autonoë the daughter of Cadmus, by whom he had a son, the unfortunate Adon, and a daughter named Macria. After the death of his son, he removed to the island of Cea, where he restrained the progress of a destructive plague, and erected an altar to Jupiter, and offered sacrifices both to him and to Caeaca, or the dog-star; by whose favour, the Egyptian winds were caused to blow, and to mitigate the heat that had been so fatal; and from this time, it is said, these winds have been regular every year for forty days. From Cea, he palced over to Sardinia, which he embellished, cultivated, and peopled; and thence he proceeded to Sicily, and imparted his secrets to the inhabitants of that island. One of his principalstations was Arcadia, whither, according to Pindar, he removed from the island of Cea; and in Arcadia he taught the inhabitants the method of stockling their hives with bees; and hence Virgil (Georg. l. iv. v. 283), gives him the name of Arcadian. He afterwards went to Thrace, where Bacchus admitted him to the mysteries of the Orgies, and imparted to him a variety of important and useful discoveries. This fabled benefactor of mankind lived for some time near mount Hæmus, and then disappeared. His numerous services were recomposed both by Greeks and Barbarians, with divine honours; and the gods are said to have placed him among the stars, so that he became the Aquarius of the zodiac. He was sometimes called Agreus or Nomius. Huetius has curiously discussed the resemblance of the fable of Aristeus, to the true history of Moés. Gen. Dict.

Aristeus,
ARISTARCHUS, in Biography, was also an eminent Geometer, of Crotonia, who lived before Euclid. 330 B.C. Pappus (Mathem. Collect. in propm. lib. vii.) speaks of him as writer on cones, respected by Euclid. This Aristarchus was a disciple of Pythagoras, and succeeded him in the care of his school after his death, and continued to teach his doctrine for thirty-nine years. Fabr. Bib. Graec. v. i. p. 456.

ARISTANDER, a famous foot-flyer, was a native of Telmessus, a city of Asia, whose inhabitants were said to be naturally endowed with the gift of divination. He was first employed in the court of Philip of Macedon, and on this monarch dreamed that the queen's womb was closed with a seal, on which was engraved the figure of a lion, and he interpreted it as signifying, that the son of whom the queen was pregnant would have the heart of a lion. He accompanied Alexander in his Persian expedition, and in order to answer the purposes of policy or superstition, he performed several mysterious rites before the famous battle of Arbela. On this, and also on several other occasions, he predicted victory, and perhaps contributed to obtain it; for it is said, that by the success of his art, he gained a very considerable degree of influence not only over the credibility of Alexander's soldiers, but over the mind of Alexander himself. Q. Curtius, i. iv. c. 2, 6, 13, 15. i. v. c. 4, l. vii. c. 7. l. ix. c. 4. Plut. in Alex. Oper. t. i. p. 684. Arrian. l. i. c. 8. Gen. Dict.

ARISTARCHUS, a celebrated Greek astronomer and philosopher, was born at Samos, and flourished about the middle of the third century before Christ. There has been a considerable difference of opinion about the precise time of Aristarchus; according to Eratosthenes, he died at the age of eighty-one, in the first year of the 125th Olympiad, or 280 years before Christ. Playfair, with Plutarch, who makes him contemporary with Apollonius, the successor of Zenodorus, refers him to the 190th Olympiad, or 264 years before Christ. But the time in which he flourished may be more satisfactorily ascertained by the testimony of Ptolemy, who informs us, that he made an observation of the full tides in the fiftieth year of the first period of Calippus; and supposing with Blair, this period to commence in the year of Darius's death, or the 330th before Christ, the fiftieth year must have been the 280th before Christ. Aristarchus is well known to have maintained the modern opinion with regard to the motion of the earth round the sun, and its revolution about its own center or axle. To this purpose Archimedes says in his " Areareus," (apud Opera, p. 449. ed. Rival.) that "Aristarchus the Samian laid down a certain hypothesis, from which it follows, that the world is much larger than what we have hitherto; for he supposes that the fixed stars and the sun are immovable, and that the earth is carried round the sun in the circumference of a circle." The editor remarks, that in this passage Archimedes seems to intimate that Aristarchus was the first author of this opinion. Sextus Empiricus also (Adv. Mathem. p. 410.)`t, in speaking of the hypothesis of the earth's motion, plainly infinuates that Aristarchus had been the first discoverer of it. Plutarch (Quaest. Plat. apud oper. t. ii. p. 1006.) observes, that this opinion was taught hypothetically by Aristarchus, and dogmatically by Seleucus. There is also a passage of Plutarch (De facie in orbe lune. Opera, t. ii. p. 935.), which, with the correction proposed by Gaffendiis, and adopted by Menage, Fabricius, and Bayle, affords another decisive testimony to prove, that the opinion of the motion of the earth was held by Aristarchus. "Being not an accuser against us, as Cleanthes thought the Greeks ought to have done against Aristarchus the Samian, as a disturber of the foundation of the world, because he endeavored to explain the celestial appearances on the supposition that the heavens stand still, and that the earth is carried in an oblique orbit, and at the same time revolves about its own axis." Aristarchus also taught, that the annual orbit of the earth is but merely as a point, compared with the distance of the fixed stars. His method of determining the distance of the sun from the earth, was by means of the dichotomy of the moon (see Dichotomy); and in this way he concluded, that it contained at least eighteen or twenty times that of the moon from the earth. He also found by methods, the detail of which would be too tedious, that the diameter of the moon bears a greater proportion to that of the earth than that of 43 to 108, but less than that of 19 to 60, so that the diameter of the moon, according to his statement, should be somewhat less than a third part of that of the earth. He also estimated the apparent diameter of the sun at the 720th part of the zodiac. Besides his astronomical discoveries, Aristarchus invented a peculiar kind of fun dial, mentioned by Vitruvius, i. ix. c. 9. The only work of this ancient astronomer now extant is a treatise "On the magnitudes and distances of the sun and moon;" first published by Vallaus, at Venice, fol. in 1498; afterwards by Wallis, with his own notes, and Commandine's version, at Oxford, in 1682, 8vo.; and again in Wallis's works, vol. iii. A fragment of this work is introduced by Pappus in his "Coll. Mathem. i. vi. prop. 43. p. 135. Another work "On the mundane sylphem," has been ascribed to Aristarchus, but its generally understood to be a spurious work, written by Roberval. Gen. Dict. Mountula. Hist. Mathem. tom. i. p. 218. Fabr. Bib. Graec. l. iii. c. 5. § 14. t. 2. p. 89.

Aristarchus, a Greek grammarian, was a native of Samothrace, refided chiefly at Alexandria under Ptolemy Philomotor, who intruded him with the education of his son, and died in the fiftieth year of the 125th Olympiad, or the 156th year before Christ. To Aristarchus the ancient commentators upon Homer attribute the division of the Iliad and Odyssey into books, according to the order and number of the Greek letters. He was a rigid critic, and excelled his talents in this way upon Homer, Pindar, Aratus, and other poets. Erafmus (Adag.) says, that it was his practice, in revising Homer, to mark those verses which he thought unworthy of him with an obelisk, and to condemn them as spurious, and to distinguish those which he thought particularly excellent with an asterisk. Cicero alludes to this practice in two familiar epistles, viz. Ad. Fam. lib. iii. ep. 11. lib. ix. ep. 10. Oper. t. vii. p. 95. p. 250. ed. Olivet. Cicero in his oration against Piso, (Oper. t. vi. p. 213.) uses the name of Aristarchus proverbially for a severe critic, when he tells Piso, that he is not an Aristarchus to affix a mark to a bad verse, but a Phalaris to assault the perfon of the poet. Thus also when he requests his friend Atticus to examine his orations with strictness, he calls him his Aristarchus. (Ep. ad Att. l. i. ep. 14. t. viii. p. 61.) Horace also suggests the fame idea in his Ars Poetica, v. 445. &c.

"Vir bonus et prudentus verus reprehendit inercias,
Culpabit duros, incompitos allinet strum
Transverco calamo signum: ambitiofa recidet
Ornamenta; parum claris lucem dare coget:
Arguet ambiguus dictum? multa notatibus:
Fiet Aristarchus: nec dicet, cur ego amicum
Offendam in inspis?

"A friendly critic, when dull lines move flow
Or harshly rude, will his relentment show;
Will mark the blotted pages, and efface
What is not polished to its highest grace;
Will prune th' ambitious ornaments away,
And teach you th' obscure to pour the day:

Will
A R I

Will mark the doubtful phrase with hand fierce,
Like Arilarchus, rig'rous and sincere:
Nor say, For trifles why should I displease
The man I love?"

Arilarchus was of a contentious temper, and had frequent disputes, at Pergamus, with Crates the grammarian. In the decline of life he was droppical, and fought a remedy by slandering himself to death, which happened in the ille of Cyprus. His school of grammarians and critics sullibated at Alexandria for several ages after his time, and produced no less than forty grammarians. Suidas says, that he wrote three books of commentaries; and therefore the apology which he is said to have made for not writing, was not very proper: "I cannot write what I would, and I will not write what I can." Suidas, Gen. Diæ. The name of Arilarchus has given title to several books.

A R I

Aristarchus, a disciple and companion of the apostle Paul, accompanied him to Ephesus, and here his life was in danger, and followed him in his subsequent travels. He was originally a Jew of Thessalonica. Acts xix. Col. iv. 10. Philom. 24.

Eff. Gen. Char. Pet. fix; style declinate; stigma funnel-form, gaping; capii. inferior, with many seeds.

Murea africana, Murr. Syll. Veg. This is a small shrubby rooted plant, rising to fix or six inches in height; leaves grass-shaped, two or three inches long, bent forwards, forming a tuft at the root; flowers blue, with a white eye. A native of the Cape of Good Hope, whence it was introduced into the Kew garden by Mr. Maffon, in 1774.

ARISTEAS, in Biography, a pagan officer under Ptolemy Philadelpbus, king of Egypt, about two hundred and fifty years before Christ. To this person is ascribed a Greek work, still extant, entitled "An History of the interpreters of scripture," or of that Greek translation of the Hebrew scripture which we call the Septuagint. The account which Aristeas gives is briefly as follows. Whilst Demetrius Phalererus, a noble Athenian, was employed by order of Ptolemy Philadelpbus, in collecting books from all nations for the royal library at Alexandria, he was instructed to procure a copy of the sacred books of the Jews, and to engage proper persons from Jerusalem to translate them into Greek. As the king wished for information what was proper to be previously done towards facilitating the accomplishment of his object, Aristeas, (the pretended author of the history of the seventy-two interpreters.) Sofobus of Tarentum, and Andreas, three noblemen of the king's court, favourably inclined towards the Jews, recommended the release of the Jewish captives who were detained in Egypt, and whose whole number amounted to 198,000, before any message was dispatched to Jerusalem. Accordingly, a degree was issued for their release; and twenty drachmas each were paid out of the treasury for this purpose, so that the whole sum devoted to their redemption was not less than 664 talents. When this was done, Demetrius proposed that a letter should be written to Eleazar, the high-priest at Jerusalem, requesting him to send from thence a true copy of the Hebrew original of the sacred books, and with it fix persons out of each of the twelve tribes of Israel, to translate it into the Greek language. The bearers of this message were Aristeas and Andreas, who carried them, as royal prelates, several gifts for the temple, in money for sacrifices and other uses of the sanctuary, 100 talents; in utensils of silver, seventy talents; and in those of gold, fifty talents; and of precious stones, as ornaments to the utensils, five times the value of the gold. Upon their arrival at Jerusalem, they were received by the high-priest, and by the Jews, with great respect, and their request was immediately granted. Having received from the high-priest, true copy of the law of Moses, written in golden letters, and fix elders out of every tribe, i.e. seventy-two in all, they returned to Alexandria. The seventy-two elders being introduced to the king, they were tried by seventy-two questions, proposed to them, to each one in their order; and as their answers were satisfactory, the king gave to each of them three talents, and sent them into the island of Pharos adjoining to Alexandria, in order to perform the work assigned them. In the course of seventy-two days they completed their business, and as they agreed in the version of each period by common conference together, Demetrius wrote it down; and when the whole had been read and approved in the king's presence, each of the translators received another present of three rich garments, two talents in gold, and a cup of gold of the weight of a talent; and they were all sent home into their own country. Such is the account of Aristeas, which he ascribes in form of a letter to his brother Philocrates.

A Latin version of this history by Pameraus was prefixed to the Latin edition of the Bible, printed at Rome in 1473. It was a fo printed in Greek at Basle, in 1543, and as an appendix to the edition of Josphus, at Cologne, in 1701, with notes by Fabricius; and another edition was published at Oxford, in 1624, 8vo. It is universally allowed even by those who dispute the genuineness of this history, that it is ancient; because it agrees with the accounts of the Septuagint, given by Josphus and Eusebius, which appear to have been borrowed from Aristeas; and some modern writers have concurred with these and other ancient writers in admitting the truth of the narrative. But those who have taken great pains in examining this subject, have produced a conviction that now pretty generally obtains, that the tradition relating to the appointment of seventy-two interpreters by Ptolemy Philadelpbus, for the purpose of translating the Hebrew scriptures into Greek, is entitled to no credit; and that the story was invented by the Jews of Alexandria, in order to give importance and authority to the translation, which they had been under a necessity of making, after Greek had become their common language.

The work ascribed to Aristeas, a pagan officer in the court of Ptolemy, was probably written by some Hellenist Jew at Alexandria, not less than 200 years after the reign of Ptolemy Philadelpbus; in proof of which it is alleged, that Alexander Polyhiltor, who wrote about that time, mentions a history of the Jews by Aristeas. Hody (Bibl. Text. Orig. Oxon. 1705. fol.) Van Dale (Differt. supr. Aril. de Sept. syst. Amst. 1704. 4to.) F. Simon (Crit. Hift. Vet. Telt. l. i. e. 2.), Dupin (Proleg. ad Bibl. l. i. e. 6, § 2, 3.), and Pridaux (Conn. p. ii. b. i. vol. iii. p. 49.) Archibishop Usher (Syrantiga de Septuag. Interpret. ver.) Morinus (Exerc. Biblicum), Walton (Prolegomena to the Polyglot Bible, c. 9.), Voilus (de I. X. Interpret.), and many others, concur in rejecting the history of Aristeas as a fiction; and they have urged a variety of
of objections, that seem to be unavoidable, against its authenticity. Although there was in the reign of Ptolemy Philadelphus a Greek translation, the narrative of Aristotle was written at a time when the Jews were much given to religious romances; and whilst the author pretends to be a heathen Greek, he everywhere speaks as a Jew. He makes Ptolemy advance an incredible sum for redeeming captives and obtaining this version; a sum which Prideaux estimates at nearly two millions sterling, which may be reckoned above twenty times as much as the whole library was worth. Besides, the questions proposed to the seventy-two interpreters, and their extemporaneous answers, carry much the air of a fiction. The representation of seventy-two elders being sent from Jerusalem to Alexandria, and fix being chosen out of every tribe, has the appearance of a Jewish fiction, as it concerns the Jewish fanatics, and the twelve tribes, of which a heathen Greek must probably have been ignorant. Besides, this is said to have been transacted by Demetrius Phileres, who was banished or poisoned, or dead, at the time when this version was made. Nor is it probable that six elders of every tribe in Palestine could have been found so well skilled in both languages as to make an exact version from the Hebrew into the Greek. Moreover, why should seventy-two be sent, when seven would have been sufficient for the work, and such a number might have been more easily obtained. Gen. Dict. Fabr. Bibl. Græc. lib. iii. c. 12. § 2. t. ii. p. 317.

ARISTELLA, in Botany. See STIPA.

ARISTERA, in Ancient Geography, an island south-east of the peninsula of Argolis.

ARISTERIA, a town of Syria, in the Cyrrhotic territory. Ptolemy.

ARISTIDA, in Botany, an exotic grass (from arista, an awn or beard). Lin. g. 94. Schreb. 125. Clas. triandra digynia. Nat. Order, Gramineæ. Gen. Char. Cyl. glume one-flowered, bivalve; valves linear-fimbriate, membranaceous, unequal. Cor. glume bivalve, thicker than the calyx; outer valve linear, converging longitudinally, hispitate at the base, terminated by achenes awnese, pubescent or pubescent, or lanceolate, sharp, very short, wrapped within the outer valve; nectary, two-leaved; leaves, lanceolate, obtuse. Stam. filaments capillary; anthers oblong. Pity. germ turbinata; styles capillary; stigmas villose. Per. none; glume converging, involving, gaping. Seed, one, siliiform, the length of the corolla, naked.

Species. 1. A. adscenens. Browne, jam. 135, t. 1. "Panicle branching, spike scattered, corollas one-valved;" culms in tufts, one or two feet high, decumbent, jointed, simple; branches of the panicle defied close, subdivided, upright; florets on short pedicels, narrow, brown; awn three-parted at the base; anthers dark purple. This species, according to Linnaeus, has the habit of the festuca ovina. It is a native of the isle of Acrenion, and of Jamaica, where it is called the bearded grass. 2. A. americana. Swartz. Obs. 41. t. 2. f. 2. Browne, jam. 135; f. 2. "Panicle simple, corollas two-valved, one with dorsal, the other with terminating awns;" culm half a foot high, jointed, subdivided; leaves linear, stiff, even; panicle with simple alternate spreading branches; florets more pointed one way, approximately; rac His compacted, somewhat close. Dr. Browne calls this the smaller bearded grass, a native of Jamaica. 3. A. plumosa, "panicked, the middle awn longest and woolly, culms villose." The woolly horns give this species the appearance of festuca ovina, but the panicle is more compound, all the parts smaller, and the culm villose; the awn is also naked towards the base, where it has two bristles or little awns, which are opposite, short, spreading. We are informed by Linnaeus, that this species was found in America, by Schreber. 4. A. annulata, "panicked, corollas two-valved, middle awn longer, smooth;" culms four feet high; leaves rolled inwards, narrow, even, flattened; panicle oblong, brown; outer valve of the corolla awned at the tip; awn length of the flower, naked, and at its base, a minute awn faintly visible. Found in the East Indies, by Koenig. 5. A. gigantea, "panicle elongated, loose, one-valved; calyces one-flowered;" awns of the corolla feathery, straight;" culm lofty, branched, smooth; panicles about eight inches long, terminal; calyx very smooth, unequal, bluish; corolla smooth, with equal short awns, almost naked. Found on the island of Teneriffe, by Maffon. 6. A. hybrida. Pkbl. Alm. 191. f. 3. "Panicle divaricated, very spreading; flowers simple, smooth, awns straight, divaricated;" culm excreting, foliolous, smooth, very tough, leathy, short; leaves convoluted; panicle terminating, large; peduncles and pedicels binate; rays angular; flowers filiform, oblong; calyx one-flowered; valves unequal; corolla longer than the calyx, convoluted, terminated by three equal straight spreading awns. Observed in Malabar by Koenig.

ARISTIDES, surnamed the Just, in Biography, the son of Lytmachus, an illustrious Athenian, was distinguished for his moral and religious character, and peculiarly eminent for justice, magnanimous self-denial, and virtuous patriotism, disdaining his own private interest or power, where these might interfere with the welfare of his country. From his early youth he manifested a firm and steady temper, and a disdain of mean and base opinions. In the course of his diligent application to study, he became directed his attention to the subjects of philosophy. He acceded to the laws of Lycurgus, he preferred an oligarchy to the unbounded democracy that prevailed at Athens, to which his early and persevering antagonism to Themistocles was ardently attached. Hence arose that competition between them, which displayed itself on various occasions, in the progres of their advancement to public offices. Aristas engaged in the service of his country from the purest principles of patriotism; and his character was held in such general estimation, that when the following verses of Theocly, describing Amphious, were once recited in the theatre,

"To be, and not to seem, is this man's maxim:
His mind repose on its conscious worth,
And wants no other praise,"

the attention of the whole audience was directed to Aristas, as the person to whom this description might with the utmost propriety be applied. Aristas and Themistocles were so much the champions of opposite parties in the Athenian state, that their mutual competition led them to counteract one another even in measures that were just and useful. Aristas, however, could not pursue this line of conduct without self-reproach; and having, on a particular occasion, refilled a proposal of Themistocles, which he thought right in itself and conducive to the public good, he exclaimed, as he came out of the assembly in which the measure had been debated, "The affairs of the Athenians will never prosper, till they throw both of us into the barytron," that is, the dungeon for condemned criminals. In the office of public treasurer, he convicted Themistocles and others with whom he was connected, of peculation; and thus he excited a party against himself, which acceded him of having misapplied the public money; and he was cleared only by the interposition of the court of Areopagus. When he was again involved with the fame public trust, he allowed the persons who were concerned..."
cerned with him to act fraudulently without control, but at the same time keep a secret account against them. His conduct was universally applauded, and it was the general wish that he might be continued in office. However, when they were proceeding to elect him, he gave them a severe rebuke, and told them, "that while he had served them faithfully, he was the object of their displeasure and calamity; but when he had violated his trust, he was applauded, as an excellent citizen." He then exposed the frauds, and all parties were ashamed of their conduct.

The first public display of his generous and patriotic character was when Darius sent the Persian host to invade Attica. The republicanism of the Athenian democracy extending to military institutions, their army was commanded by ten generals, each of whom had the supreme direction for one day in their respective turn. Arilides, one of the ten, perceived that a vitiad of command must interrupt unity of design, and prevent a regular system and steady plan of military operations. The ability of the generals he well knew to be Miltiades; and he was aware that it was expedient for the country, in time of pressing emergency, to be guided by its greatest ability. The day approaching when it belonged to him to assume the command, he generously yielded his authority to the approved valour and experience of Miltiades. The other generals followed this magnanimous example, sacrificing the dictates of private ambition to the interest and glory of their country; and the commander in chief thus enjoyed an opportunity of exerting, uncontrolled, the utmost vigour of his genius.

After the defeat of the Persians in the famous battle of Marathon, in the year before Christ 490, Arilides was entrusted with the care of the spoils, which he faithfully brought to the public account, without reserving anything to himself. The following year he was archon or chief magistrate, and he continued to watch the welfare and interests of his country. Formed in such schools of moral and political knowledge as then flourished at Athens, he had learned to prefer glory to pleasure, the interest of his country to his own personal renown, and the dictates of justice and humanity even to the interests of his country. His ambition was rather to deserve, than to acquire, the admiration of his fellow-citizens; and while he enjoyed the inward satisfaction of conscious rectitude, he was little anxious about the external rewards of splendid actions. Eager to promote beneficence, he did not court popularity, but his conduct, without seeking the favour of the multitude, commanded their esteem and respect. His opinion gave law to the courts of justice, or rather such was the effect of his equity and discernment, that he alone became sovereign empire in Athens. In all important differences he was chosen arbitrator; and the ordinary judges were deprived of the dignity and advantages formerly resulting from their office. The Athenian magistrates were extremely displeased with an authority which had in a great degree superceded their jurisdiction. But the most formidable foe of Arilides was Themistocles—pre-eminent in genius that excelled itself in every department of public conduct, and excelling in arms, in policy, in eloquence, he secured a certain path to popularity. The affability of his manners, the magnificence of his entertainments, and profusion of his gifts, confirmed among the populace the impression of his talents and qualifications. Themistocles beheld with jealousy the influence acquired by the stern integrity of Arilides, and being himself so much better calculated for winning the affections of the multitude, succeeded in rendering the upright patriotism obnoxious to the people. Arilides truiling to the innocence and integrity of his own heart, disdained to employ any unworthy means, either for gaining the favour, or for averting the resentment, of the multitude. The contest, therefore, ended in his banishment for ten years, by the oracles, by which the majority of the Athenian assembly might expel any citizen, however odious or meritorious had been his past conduct, who, by his present power and greatness, seemed capable of disturbing the equality of republican government. Among those who voted against him on this occasion, one person was a rustic citizen, who, unable to write his name on the ball by which his concurrence in the sentence was signified, accidentally met with Arilides, and requested him to inscribe his name. The patriot asked him, "Did Arilides ever injure you?" the voter replied, "I do not so much as know him, but I am distinguished with everywhere hearing him called "the just." Arilides took the ball, wrote his own name upon it, and returned it to the voter. Upon his leaving Athens, he hired his hands towards heaven, and prayed that the Athenians might never be compelled to remember Arilides.

While Arilides was in exile, Xerxes had brought to a conclusion his immense preparations for the invasion of Greece. But when the Persian armament endangered his country, he facilitated all remonstrance to patriotism, joined his countrymen, who lamented his absence and wished his return, and at Salamis performed important services. Some time after the victory at Salamis, in the year before Christ 480, to which his concurrence with Themistocles greatly contributed, this commander informed the Athenians that he had conceived a project of great advantage to the state, but which he could not safely communicate to the public. The people directed him to disclose it to Arilides. The object of this scheme was the destruction of the whole confederate fleet of Greece, their own ships excepted, which would render Athens sole mistress of the sea. Arilides reported his opinion, that the project of Themistocles was eminently advantageous, but that nothing could be more unjust; and this determined them against acquiescing in it.

Mardonius having attempted to induce the Athenians to submission, Arilides, now chief annual magistrate, inspired and invagitated his gallant countrymen to perforce in rebellion, and in the following summer commanded the Athenian troops in the battle of Platea, which entirely discomfited the armament of Xerxes. When Athens was rebuilt, Arilides was active in promoting a popular decree, which gave to all the citizens a share in the government, and enjoined that the archons should be chosen out of the whole body. The virtues of Arilides were now celebrated throughout Greece; and the finances of the confederates were committed to his management. This important office he executed with such skill and fidelity, as very greatly improved the public resources. The plausibility of his disposition was eminently displayed in his conduct towards his invariable antagonist, Themistocles; for when he had incurred the displeasure of the ruling party, Arilides declined concurrence in the capital prosecution of him; and when Themistocles was banished, he was so far from triumphing on occasion of his fall, that he ever afterwards spoke of him with a greater degree of respect. After having contributed so momentously to the good of Athens and of Greece, Arilides died of old age, about 467 years before Christ, either at Postum, or at Athens, universally regretted by the affectionate admiration of his country. He, who had long managed the common treasury of Greece, left not a sufficient sum to defray the expense of his funeral. His son Lysimachus received a preface of three hundred pounds from the
he expresses his superior value for learning and eloquence above all things, he says; "nor can he be so stupid as to despise glory if it comes to his share, and so far as it may play, first in the court, and a life of virtue suited to his discourse; for he did not desire to obtain it by other means." "A character of such eminence," says Lardner, "must have been an ornament to the popular religion and its rights; and the charms of eloquence in his hymns to the gods, and in his other orations, cannot but have had powerful attractions."

Among the works of Aristides, are found an epistle "On the Causes of the Incendia of the Nile," in which he sets aside the common explanations of this phenomenon, and affirms it wholly to the immediate power and providence of God; and an excellent treatise "On popular and simple: Diction," exemplified from Demosthenes and Xenophon; which latter piece was published by Aldus, among the Greek rhetoricians, at Venice, in 1508. The oration of Aristides, in praise of Athens, intituled "Panathenaeus," written in imitation of Isocrates, is annexed to H. Stephen's edition of Isocrates, published in 1593. The entire works of this orator were published in Greek, at Florence, in 1517, folio; or in Greek and Latin, in three vols. 12mo., by P. Stephens, in 1626, at Upland by Normen, in 1577; and by J. B., in two volumes 4to., at Oxford, in 1722. Philosoph. de vit. Sophist. Sidusis. Lardner's Works, vol. viii. p. 81—85. Fabr. Bib. Graec. l. iv. c. 50. § 4. t. iv. p. 375. &c.

Aristides, a painter of Thebes, was contemporary with Apelles, about the year 334 before Christ, and distinguished for force and felicity of expression. He is said to have been the first who painted mind, and expressed the affections and passions. One of his subjects was the representation of the destruction of a town, and described by Pliny. Among other scenes of horror, a child was painted clinging to the breast of its wounded mother, who feared that after she was dead the child should suck blood instead of milk. This piece was carried by Alexander to Pella in Macedonia. The Bacchus and Ariadne of this master was part of the plunder of Corinth; and after it had been bought by Attalus, king of Pergamus, at a very high price, it was restored to Mummius for the temple of Ceres at Rome. For another piece Attalus is said to have given one hundred talents. Aristides's old man with a lyre teaching a boy to play, was fixed in the Caryatids. His Sick Man was much admired. Pliny, H. Nat. l. xxxv.

Aristides, an eloquent Athenian philosopher, and a convert to Christiannity, flourished about the year 126; and retaining the habit of his former profession, prefixed to the emperor Adrian an apology for the Christians, which was extant in Jerom's time, and which he represents as a monument with the learned of his ingenuity. This apology was imitated by Justin in the book which he prefixed to Antoninus Pius, his son, and the Roman senate. It is to be regretted that no fragment of this eminent Christian apologist's composition now remains. Euseb. H. E. i. iv. c. 3. Hieron. ad. Magn. ep. 84. Lardner's Works, vol. ii. p. 290.

Aristides Quintilianus, author of the most ample and, in many instances, satisfactory treatise among the seven Greek writers on music published by Melibonius. He flourished after Cicero, and before Ptolemy; which is all the information that can be obtained concerning the period of his existence. With many wild and fanciful notions about musical effects, his doctrines often breathe taste and feeling, but the taste and feeling of an enthusiast. His moral disquisitions of melopoeia are as curious and fanciful as those which the Arabs assign to the stringers of their lute.
ARISTIPPOS, founder of the Cyrenaic sect, was a native of Cyrene in Africa, and flourished about the 97th year of the Olympiad, or the 352d year before Christ. During his attendance at the Olympic games, he heard of the fame of Socrates, and immediately went to Athens, that he might become his disciple. After his introduction to the school of this great master of wisdom, he was for some time esteemed, on account of his genius and improvement, one of its chief orators; but his fondness for effeminate and luxurious indulgence gave great offence to Socrates and his friends. Of this propensity on the part of Aristippus, and his master's desire to correct it, we have a beautiful illustration in a dialogue preserved by Xenophon, Mem. i. ii. Involved in expenses which his patrimony could not defray, he set up a school of Rhetoric, and he is remarked to have been the first disciple of the Socratic school who took money for teaching. With a view, probably, of diverting or of silencing the reproofs of Socrates, he sent him a present of 20 minae, or about 64l.; but Socrates refused the present, alleging that his demon forbade him to receive it. At length the freedom of his manners alienated him from Socrates, and obliged him to leave Athens.

Devoted to a life of pleasure, Aristippus visited the island of Ægina, and there met with the celebrated Lais, whom he accompanied to Corinth. In this voyage, he was terrified by a storm, and one of the crew observing that he was somewhat disconcerted, alluded him, "Why are you philosophers afraid, when we illiterate fellows fear nothing?"

"Because," replied Aristippus, "we have more to lose."

In his way from Corinth to Alia, he was shipwrecked on the island of Rhodes; and accidentally perceiving a geometrical anagram on the sand, he exclaimed to his companions, "Take courage, I see the footsteps of men." When they arrived at the principal town in the island, he procured by his address accommodation for himself and his fellow-travellers, thus confirming one of his own aphorisms, "If you ask what advantage a man of learning hath above one that is illiterate, find them together among strangers, and you will see." After some interval, Aristippus repaired to the court of Dionyfius, tyrant of Sicily. When he first came to Syracuse, he was assailed by Dionyfius, "Why did you visit my court?" To which he replied, "To give what I have, and to receive what I have not." By the veracity of his disposition, and suppleness of the fable which he had adopted, as well as by the politeness of his manners, he accommodated himself to every situation, verifying the maxim of the poet, "Omnis Aristippus decus color, et flatus, et res." "Yet Aristippus every drees became," in all offices, in every state the fame."

Hor. ep. i. 17. 23.

Whilst he ridiculed the singularities which were affected by other philosophers, particularly the flattery of Plato, and the rigid abstinence of Diogenes, he complied with the requisition of Dionyfius, which enjoined all the guests at a public festival to appear in purple robes; whilst Plato refused, he adorned himself with a rich and splendid drees, and conversed and danced with the cafe and grace of a courtier. By these flexible and captivating manners, he conciliated the regard of the Sicilian tyrant, and gained a command of the royal favours. Thus distinguished, he became the object of envy to his brethren; and this circumstance will account for many of those tales that have been circulated to the disadvantage of this philosopher both by ancient and modern writers. However it is impossible wholly to exculpate him from the charge of libertinism. The reason of Aristippus's leaving Syracuse is not known, nor is it certain whither he removed. Æchines, who remained in Sicily till after the exile of Aristippus, on his return to Athens, immersed Aristippus teaching in the city, probably about the year 356 before Christ; and it is pretty certain that he and the rest of the philosophers left Syracuse before the expulsion of the tyrant. But whether he ever returned to his own country, and also when and how he died, are circumstances concerning which we have no certain information.

Aristippus was, without doubt, the man of pleasure in practice, as well as the preceptor of pleasure by profession. And yet, though he deviated from the strictness of Socratic morals both in his principles and his conduct, he must be allowed the credit of elegant manners, a spirit after knowledge, ready wit, and an ingenuous temper. The manner in which he became re-united to his friend Æchines, who had offended him, affords an amiable illustration of the latter quality. In the midst of a dispute which was becoming violent, "Let us give over," said he, "and be friends, before we make ourselves the talk of servants; we have quarrelled, it is true, but I, as your senior, have a right to claim the precedence in the reconciliation." Æchines acquiesced, and acknowledged his superior merit. The following repartee, selected from a great number attributed to Aristippus, deserve to be recorded. Polyxenus, a friend of Aristippus,
ARISTIPPUS, happened to call upon him when preparations were making for a sumptuous entertainment, and began a tedious discourse against luxury: Aristippus, tired of the harangue, invited Polycrates and a few friends to stay with him, and, after he accepted the invitation, "I perceive then," says Aristippus, "it is not the luxury of my table that offends you, but the expense." When he was asked, "what he had gained by philosophy?" he replied, "a capacity of converting, without embarrasment, with all classes of men."

A wealthy citizen complaining that Aristippus, in requiring 500 drachmas for the instruction of his son, had demanded as much as would purchase a slave: "purchase then one with the money," said the philosopher, "and you will be master of two." To one who boasted of his skill and activity in swimming, he said, "Are you not ashamed to value yourself on that which every dolphin can do better?"

The following maxims are not unworthy of the Socratic school: "Philosophers," said Aristippus, "excel other men in this, that if no laws existed, they would live honestly." "It is better to be poor than illustrious; for the poor man only wants money, the illustrious want the distinguishing characters of human nature." "The houses of the wealthy are frequented by philosophers, for the same reason that induces physicians to frequent those of the sick."

"The truly learned are not those who read much, but they who read what is useful." "Young people should be taught those things which will be useful to them when they become men." For the distinguishing sentiments of the Cyrenaic sect, founded by Aristippus, see CYRANEIS. Diogenes Laertius, lib. ii. § 65—80. Brucke's Hist. Philos. by Enfield, vol. i. p. 182—190. Travels of Anacharsis, vol. iii.

ARISTO of Chios, a Greek philosopher of the Stoic sect, was the son of Miltiades, and the intimate associate of Perioteus; and as both attended the lectures of Zeno at the same time, he must have flourished about 360 years before Chr. He was called, on account of his persuasive powers of eloquence, the Sirens'. His incoherent and eloquent style displeased his master, from whom he removed to the school of Polemon; and afterwards he made unsuccessful attempts to establish a school of his own. He opposed the doctrine of uncertainty maintained by the Academic philosophers, and particularly by Arcaelus; and made several innovations on the Stoic philosophy. He excluded from the course of his studies both physics and logic; the former as incomprehensible, and the latter as unuseful to the purposes of human life. He taught, with the Stoics, that virtue alone is the supreme good; but also, that in other things there is no difference which can render one more desirable than another. This doctrine of indifference he applied to moral actions, representing all actions as alike; so that to a wise man it was the same thing whether he performed the part of an Agammenon or a Thersites, provided he did it well. Seneca charges him with rejecting and condemning the preceptive part of philosophy in its relation to the particular duties of life. Whilst he discouraged all speculations in opinions, he maintained that the divine nature is incomprehensible, and he doubted whether the gods have perception or animal life, thus in effect denying the existence of deity. "Philosophers," says Arrius, "injure, instead of benefiting their disciples, if what is well meant be ill interpreted; and thus it is that the pupils of Aristippus became disaffected and thence of Zeno morose."

He should have added, says Bayle, that every teacher should avoid ambiguous maxims, and prevent false glooishes being put upon them; nor should we infer, that the doctrines of these philosophers had a tendency, even if rightly understood, to produce hurtful effects. While he inveighed against Arcaelus, he himself became addicted to pleasure in his old age. His death is said to have been occasioned by his bald head being scorched with the heat of the sun. Cie. de Fin. l. iv. c. 27. Nat. Deor. l. i. c. 14. Seneca's Ep. 89. 93. Diogenes Laertius. Gen. Dict. Brucker by Enf. vol. ii. p. 352.

ARISTO of Cence, a Pythagorean philosopher, filled the Aristotelian chair about 230 years before Chr. being the fourth in succession from the celebrated founder of that school, and died about the year before Chr. 185. He is represented by Cicero (de Fin. l. v. c. 5.) as a neat and elegant orator, but deficient with regard to the dignity and authority of a philosopher. Athenaeus (l. x. p. 419. and l. xii. p. 456.) cites a work ascribed to him, and intituled "Amarytory Similes."

ARISTO, Titus, a Roman lawyer, very much distinguished by his talents and character, lived in the time of Trajan, about the year 110. The younger Pliny, in his Epistles, (l. i. ep. 22. l. viii. ep. 14.) highly extols both his learning and his character; but if it be true that in an illusory, which he is said to have borne with great patience, he summoned his friends, and intreated them to ake his physician, what was likely to be the issue of his disorder? so that if they pronounced it incurable, he might put an end to his own life; we must admit the high panegyric of Pliny with considerate abatement. Aulus Gelius (l. xi. c. 11.) speaks of him as the author of many books. Gen. Dict.

ARISTOBULUS, in Biography, an Alexandrian Jew, was preceptor of Ptolemy Euergetes, eldest son of Ptolemy Philometor, king of Egypt, and flourished about 145 years before Chr. He was an admirer of the Greek philosophy, and united the study of the Aristotelian system with that of the Mosaic law. Eusébius represents him as a favourite of Ptolemy, and cites from his "Commentaries on the books of Moses," inferred to that prince, several verses of Orpheus, in which mention is made of Moses and Abraham. These verses are also found in the works of Justin Martyr; but so much altered as to afford reason for supposing their authenticity. In the Commentary the author also affirms, that part of the law had been translated into Greek in the time of Alexander; and that the whole was translated, under the care of Demetrius Phalarus, in the reign of Ptolemy Philadephus. But the commentary was not written till 120 years after the reign of that king; and as Demetrius Phalarus was in exile during the reign of Ptolemy Philadephus, he could not have superintended the Septuagint translation. It is therefore probable, that Aristasbuls either invented the story of the Septuagint interpreters, or borrowed it from Aristaes, in order to support the credit of this translation with his brethren in Palestine. See ARISTEAS. Aristasbuls seems to have been devious of ascribing the Grecian philosophy to a Hebrew origin, as we learn from Clement of Alexandria (Strom. lib. i.) and of establishing an opinion that Pythagoras, Plato, and other Greek philosophers, were acquainted with the Jewish law. It is not unlikely that he forged the above-mentioned verses of Orpheus, and also the tales respecting the Greek versions of the Hebrew scriptures. Upon the whole, Aristasbuls may be ranked with those who have been culpable of profaning pious frauds. Eufh. Prep. Ev. l. xii. c. 13. l. viii. c. 8. Brucker by Enf. vol. ii. p. 167.

ARISTOCRACY, in Politics, a form of government, where the supreme power is lodged in the hands of the optimates, i.e. of a council or Senate composed of the principal persons
perform of a state, either in respect of nobility, capacity, or probity. The word is derived from *aρος*, *ὁπία*, and *σεία*, *impero*, *I govern*.

In an aristocracy, the legislative and executive authority is vested in a select assembly, the members of which either fill up by election the vacancies in their own body, or succeed to their places in it by inheritance, property, tenure of certain lands, or in respect of some personal right or qualification. The separate advantage of an aristocracy consists in the wisdom which may be expected from experience and education; for a permanent council naturally polishes experience; and the members who succeed to their places in it by inheritance, will probably be trained and educated with a view to the station which they were defined by their birth to occupy. In an aristocracy, however, there is less honesty than in a republic, and less strength than in a monarchy. Its mischiefs are secretions in the ruling orders of the state, which, from the want of a common superior, are liable to proceed to the most desperate extremities; and oppression of the lower orders by the privileges of the higher, and by laws partial to the separate interests of the law makers. It would be a very happy thing, says Montefio- quien, if by some indirect method or other, the people could be emancipated from their state of annihilation; and, consequently, the bad aristocracy is that in which the part of the people who have no share in the legislation is so small and inconsiderable, that the governing party may have no interest in oppressing them. Thus when Antipater made a law at Athens, that any person who was not worth 2000 drachmas should be excluded from the right of suffrage, he formed by this means the best possible aristocracy; because the sum was so small, that few of any rank or consideration in the city were excluded. The more an aristocracy borders on democracy, the nearer it approaches to perfection; and it is the more imperfect in proportion as it draws towards monarchy. In an aristocracy, the laws should tend, as much as possible, to infuse a spirit of moderation, which would supply the place of the spirit of equality in a popular state; and as meddily and simplicity of manners constitute the strength of an aristocratic nobility, the nobles should not be involved in personal and particular specifications, distinct from those of their body. There are two principal sources of disorder, which should be avoided; there are execrable inequality between the governors and the governed, and the fame inequality between the different members of the body that governs.

Aristocracies, says archdeacon Paley, are of two kinds; first, where the power of the nobility belongs to them in their collective capacity alone; that is, where although the government resides in an assembly of the order, yet the members of that assembly separately and individually possess no authority or privilege beyond the rest of the community; such is the case in the constitution of Venice. Secondly, where the nobles are severally invested with great personal power and immunities, and where the power of the senate is little more than the aggregated power of the individuals who compose it; such was the case in the constitution of Poland. Of these two forms of government, the first is more tolerable than the last; for although many, or even all the members of a senate should be so profligate as to abuse the authority of their stations in the prosecution of private designs, yet, whilst all were not under a temptation to the same injustice, not having the same end to gain, it would be still difficult to obtain the consent of a majority to any specific act of oppression, which the iniquity of an individual might prompt him to propose: or if the will were the same, the power is more confined; one tyrant, whether the tyranny reside in a single person, or a senate, cannot exercise oppression in so many places at the same time, as may be carried on by the dominion of a numerous nobility over their respective realms and dependents. Of all species of dominion, this is the most odious; the freedom and satisfaction of private life are more restrained and harassed by it, than by the most vexatious laws, or even by the laws of a tyrant, who will of an arbitrary monarch, from whole knowledge, and from whose injustice, the greatest part of his subjects are removed by their distaste, or concealed by their obscurity. An aristocracy of this kind has been productive, in several instances, of disastrous revolutions; and the people have concurred with the reigning prince in exchanging their condition for the miseries of despotism. This was the case in Denmark about the middle of the seventeenth century, and more lately in Sweden. In England, also, the people beheld the depredation of the barons, under the house of Tudor, with satisfaction, although they saw the crown acquiring thereby a power which no limitations, provided at that time by the constitution, were likely to confine. From such events this leon may be drawn; that a mixed government, which admits a patrician order into the constitution, ought to circumscribe the personal privileges of the nobility, especially claims of hereditary jurisdiction and local authority, with a jealousy equal to the solicitude with which it provides for its own preservation." Mont. Sp. of Laws, vol. i. p. 18. 72—77. Paley's Prize of Philos. vol. ii. p. 150—182. See **OLIGARCHY.**

ARISTOGITON, in Biography, an Athenian who, with Harmodius, attempted to restore the liberty of their country by the overthrow of the two tyrants Hippias and Hipparchus.

Harmodius and Aristogiton, connected not only as citizens of Athens, but as friends, resolved to revenge an affront offered to the daughter of the former by Hipparchus, who had obliged her to retire from a public procuration, at which she was entitled to have aslilt, carrying a basket of flowers. Nothing less would satisfy the remonstrance of these two men, than the deposition of the tyrants. Having concerted the proper measures for their enterprise, they secretly imparted their plan to a small number of the citizens, fixed the day of execution to be the feast of Panathenaus, when all the citizens wore arms. They accordingly attacked and slew Hipparchus, in the year 514 before Christ, but were themselves instantly apprehended, and Harmodius was put to death. Aristogiton was put to the torture, in order to force him to declare his accomplices. The most intimate friends of Hiprais were named, and immediately put to death. When Aristogiton was asked by the tyrant, if there were any more? "There now remains," said he with a smile, "only yourself worthy of death." Leana, the mistress of Harmodius, is said to have behaved with similar intrepidity; for fearing left the pains of torture might extort from her a confession, she bit off her tongue, and spit it out. Though these champions of liberty perished themselves, yet the spirit which they excited continued to operate until it effected the emancipation of the Athenians, and drove Hiprais into exile three years after this event, or about the year 516 before Christ. Having reinstated freedom, the Athenians erected in the forum statues, made by Praxiteles, to the memory of Harmodius and Aristogiton, who had begun this revolution, and set them up to public view, that the fight of them might inspire the citizens with a more violent hatred of tyranny. They sung hymns to their praise at the Panathenaus, decreed that no flaves should bear their names, and very extensive privileges were granted in perpetuity to their descendants.
However, neither the characters nor the motives of these conspirators, whatever benefit might result from their conspiracy, seem to have deferred such testimonies of respect. Thucyd. i. vi. c. 56. Plat. in Hipp. t. ii. p. 220. Philostr. in Vit. Apollon. i. vii. c. 4. p. 265. Aulus Gelius, l. ix. c. 2. Travels of Anacharsis, vol. i. p. 171.  

Species 1. A. bicolata, two-lobed birthwort. A. longa scandens, foliis ferri equin effigie. Plum. Ray. "Leaves two-lobed, stems twining;" stem filiform, subdivided, leaves cordate; lobes oblong, armed, entire; petals crooked smooth; peduncles one-flowered, longer than the leaves; corolla ligulate; tube globose, many-keeled, curved, hexagonal, bluish, funnel-shaped, at the throat marked with longitudinal brown lines; limb elongated, flatulate. Nat. of Dominica and Hispaniola, covering trees and shrubs, and flowering from November till January. 2. A. triplata, three-lobed birthwort. Jacq. obf. 8. t. 3. Browne, 329. 3. Schartz. obs. 341. "Leaves three-lobed, stem twining; flowers very large, bagged at the base, tongue linear, very long." This is a climbing plant like the former; the stem is aromatic, and the flowers large and ventricose. It is a native of the West Indies, and South America; introduced here about the year 1775; and flowers in June and July. 3. A. pentandra, five-flamed birthwort. Jacq. Amer. 223. t. 147. piét. 115. t. 224. "Leaves cordate, hallate-subtrilobate, stem twining, bracteate cordate, embracing." The flowers of this are smaller, and have only five filaments. It is a native of America. 4. A. petala, peltate cordate. Jacq. Amer. piét. 114. 222. "Leaves kindsey-shaped, subpetalate, stem twining;" stem filiform, frusted; leaves small, armed, entire, smooth, standing on footstalks which embrace the stem; corolla spotted, brown; tube globose at the base, limbed, reflex, an inch long, the limb doted with green; throat funnel-shaped, pubescent at bottom; border having a lip an inch in length, tongue-shaped, retruse at the tip, slightly emarginate, set with convex, acute, dark purple dots, green below the tip to the throat. A native of St. Domingo and South America, where it flowers in February and March. 5. A. maxima, greatest birthwort. Jacq. Amer. 223. t. 146. piét. 114. 223. "Leaves oblong, acuminate, stem twining, peduncles many-flowered." This has strong climbing items by which it mounts up to the top of the tallest trees; leaves four inches long, two broad, oval, obtuse, thick; flowers curved in loose clusters at the ends of the shoots; fruit like a purse, very large. It was sent to England by Mr. R. Miller, from New Spain, and since found by professor Jacquin, to whose elegant figure of it we have above referred. 6. A. bilabiata, two-lipped birthwort. Schwartz. obs. 342. Plum. fpec. 5 ie. 32. f. 1. "Leaves cordate-tongue-shaped, obtuse, stem twining, corolla two-lipped;" stems filiform; branches alternate, loofe, three or four leaved; leaves entire, filiform, smooth, petals shorter than the peduncles; corolla middle- 

fized, brown purple, frilated; tube globose at the base; border elongated, oblong, blunt, reflex; funnel of the tube, spilt, so as to make the corolla bilabiata. A native of South America. 7. A. eretta, upright birthwort. "Leaves lanceolate, felifel, subbifurcate; items erect, peduncles solitary, one-flowered, flowers very long; stalk three feet high, leaves long, narrow, hairy, with very short footstalks; flowers solitary, axillary, four inches long, of a dark purple colour; seeds flat, heart-shaped. Discovered at Vera Cruz by Dr. Houfton, who sent the seeds to Europe about the year 1733, where it was cultivated by Mr. Miller. 8. A. arborens, tree birthwort. Pacific. 50. t. 78. f. 1. "Leaves cordate-lanceolate; items erect, shrubby," about two feet high; branches strong enough to support themselves; flowers solitary, axillary. A native of North America. 9. A. couda, tall birthwort, Jacq. Amer. 233. t. 145. piét. 114. t. 221. "Leaves cordate, obtuse, emarginate at the tip, lobes incumbent, lip tailed;" the lobes of the leaves lap over each other at the base; the lip of the corolla ends in a bristle-shaped tail. A native of America. 10. A. odoratissima, sweet-scented birthwort. Browne, 329. 1. Sloane, v. t. 102. t. 104. f. 1. "Leaves cordate; item twining, shrubby; peduncles solitary; lip of the corolla very large;" root long geniculated; stem climbing, five or eight feet high; branches numerous; leaves cordate or triangular, four inches long, longitudinally ribbed; corolla yellowish. The whole plant has a strong grateful smell. A native of Jamaica, where it is called conca. Native of the United States, cultivated by Miller in 1752. 11. A. sphyrtosa, broad-leaved birthwort. L. Heritier, filip. nov. p. 13. f. 7. "Leaves cordate, petiolated, flowers solitary; border trinity, equal, bracteate ovate; item twining, shrubby." This is a tall twining shrub with few branches, of a camphorsaceous smell, leaves spreading, remote, roundish, foliate-cordate, veined; peduncles lateral, one-flowered; bracteate decurrent, embracing the peduncle; corolla of a purplish brown, an inch and a half long; tube shaped like a syphon, with a trident flat border. A native of North America, and introduced here by Mr. Bartram about the year 1763. It flowers in June. 12. A. angucida, snake killing birthwort. Jacq. Amer. 232. t. 144. piét. 114. t. 220. Morris hill. 3. f. 12. t. 17. f. 7. "Leaves cordate, acuminate; item twining, shrubby; peduncles solitary; flippus cordate;" root thick; items slender, long, jointed, purple; cordillas purple, straight, truncate as it were with a lanceolate lip. If the juice of the root mixed with the saliva be put into the mouth of a serpent, it may be handled with safety; but will recover in two hours. A native of Mexico and the West Indies. 13. A. davurra, Moorish birthwort. Mor. hill. f. 3. f. 12. t. 17. f. 11. "Leaves hallate, quite entire; item weak, simple; flowers solitary, recurved." It has several filiform items producing seven or eight leaves on each side of the upper part of the item, these are ash-coloured, opposite, rethming those of ofunella regalis. The flowers are larger than those of common birthwort, brown, and appear among the lower leaves. Discovered by Rausel in olive grounds about Aleppo. 14. A. Indica. Indian birthwort. Gartn. Prat. i. 45. Carul. vegen. Rheed. Mal. 8. 48. t. 25. "Leaves cordate, rather acute; item twining; peduncles many-flowered;" items shrubby, frusted, slender; leaves entire, smooth, frequently retruse or emarginate; peduncles axillary, with alternate acute bracts, within which stands a single flower on its proper pedicel; corolla a dulky purple. A native of the East Indies and Cochinchina. 15. A. boecia, Spanish birthwort. Mor. t. 17. f. 6. "Leaves cordate, rather acute; item twining; peduncles about three, longer than the petals;" these are slender, frusted, spreading over hedges and bushes; leaves acuminate, on long pedicels;
flowers crooked, oblong, very dark purple; stigmas ovate-oblong, and mucronate. Found by Chittis in Andania. An evergreen, and odorous plant, flowering in January and February, cultivated by Gerard in 1597. This was formerly called climbing birthwort. 16. A. junciperina, evergreen birthwort, *fj flor hæbæ čertica*. Bauh. pin. Mor. Nat. Hist. 12. t. 17. f. 16. "Leaves cordate-oblong, acuminate, waved; stem weak, flowers solitary;" the leaves are many, trailing, more than a foot long, flattened, angular, leafless, narrow, evergreen, on long peduncles; flowers axillary, crooked, attached to the leaves, of a dark purple externally, internally yellow. A native of the island of Crete, flowering in May and June. Cultivated in the Chelsea garden in 1739. 17. A. serpen tinus, Virginia birthwort or snake-root. Woodv. Med. Bot. 274. t. 156. Nat. Med. "Leaves cordate-oblong, flat; stem weak, flexuose, round; flowers solitary;" root a congeries of small fibre, yellowish; stem jointed, thin, from six inches to a foot in height; leaves lanceolate, cordate, nerves; flowers blue or purplish, on long footstalks, proceeding from the lower joints of the stem; tube compressed at the throat, ventricose and round at the base, spreading at the border. It flowers in May, and perfects its seeds in August. A native of Virginia and Carolina. Cultivated by Tradecant at Lambeth, in 1632. 18. A. pyrifolia. Lin. esp. 1704. "Leaves cordate-crenulate, retted underneath, petiolate; flowers solitary;" the leaves are angular, branching, fleshy, riling to a foot in height, and feebly strong enough to support themselves; bracte heart-shaped at the base of the peduncle; flowers small, lip incurved, tubes and beginning of the petal yellow, broader and blood-coloured. A native of the south of France, Spain, and Switzerland. Cultivated by Gerard in 1597. 19. A. rotunda, round-rooted birthwort; "leaves cordate, subfuscile, obtuse; stem weak, flowers solitary;" the roots are roundish, about the size of a small turnip; they send out three or four weak trailing branches, to the extent of two feet; leaves rounded at the end; flowers stand singly, close to the petioles, they are of a purplish black colour, and curved inwards at the lip. A native of the south of Europe, flowering from June till the end of August. 20. A. longa, long-rooted birthwort. Woodv. Med. Bot. p. 294. f. 127. "Leaves cordate, petiolate, obtuse; stem weak; flowers solitary, fruit ovate;" the root is very long, somewhat fulliform; stem weak, angulate; branches trailing; peduncles at the axil of the leaves; flowers of a pale purple colour, angulate; tube gradually widening to the mouth, which is ovate and terminating in a pointed apex. A native of the south of Europe. It flowers at the same time as the *A. rotunda*, which it very much resembles. They were both cultivated by Gerard in 1596. 21. A. lyfuta, rounder birthwort. Tournef. inüu. t. 127. "Leaves cordate, rather obtuse, flagglar; flowers solitary, pendulous, recurved, lubrumeate." This species has some resemblance to the preceding, but the leaves are hairy, and not so deeply cut at the end, the flowers are also much larger; stem fribated, hairy, leaves obtuse, danger-pointed; corolla incurved, and recurved, without an elongated lip. Tournefort says the root is nearly two feet in length, and two inches in thickness; stems two feet high, knotted, at each knot arises a single leaf three inches long; flowers axillary, of the shape of an S, and of a pale green, mixed with a purple colour. It is a native of the island of Scio or Chios. 22. A. elamtitus, common birthwort. Hudf. 394. With. 1935. Woodv. Med. Bot. supp. f. 238. Eng. Bot. 398. "Leaves cordate, stem erect, flowers axillary, crowded;" the leaves are two feet high, simple fringed, smooth, a little zigzag; leaves alternate, on footstalks without stipules, heart-shaped, entire, smooth, broad, veined, nervet; flowers five or fix in a cluster, axillary, of a pale yellow, appearing from July till September, consisting of one petal, globe to the base, with fix stigmas, the funnell-shaped, and terminating in a tongue-like figure; style simple, with fix stigma. Smith. Found in England about the ruins of monasteries, abbeys, &c. The following five are new species. 23. A. annuus. Mill. Dict. n. 9. "Leaves cordate, on very long footstalks; stems climbing; flowers terminal, on very long peduncles." This climbs to a very considerable height; leaves broad, longitudinally veined; flowers in terminal clusters. They are native of Crete, and of long peduncles. It grows about Tolu in New Spain, from whence Mr. R. Millar first the seeds to England. 24. A. confertif. Mill. Dict. n. 11. "Leaves cordate, petiolate; stem climbing; flowers in axillary clusters." This climbs to the height of three or four feet; leaves short, somewhat like those of *A. rotunda*; flowers dark purple. It was discovered by Mr. R. Millar at Campusque. 25. A. bradula, Retz. obsb. 5. 29. n. 80. "Leaves cordate, obtuse; stem weak; flowers solitary; bracteae, petiolate, stem flexuose, fringed; flowers peduncled, shorter than the leaf, with a long curved lip. Found by Koenig about Madras. 26. A. obfufata, Swartz. prod. 126. Plum. ic. 27. t. 53. "Leaves cordate, rounded at the tip, three-veined, nerved, and tomentose beneath; stem twining; peduncles solitary." A native of the Caribbean islands. 27. A. grandiflora, Swartz. prod. 126. Brown. jam. 272. n. 2. "Leaves broad, cordate; stem twining, tuberoseaceous; peduncles solitary, tip of the corolla very large, with a long tail." Flowers large, five or six inches round the margin; throat clasped long and narrow; a figure of the flowerable time; lip terminating at the lower extremity in a long slender appendix. A native of Jamaica (about St. Ann's). Medicinal Properties. The *A. rotunda*, *longa*, and *elamtitus*, formerly were admitted into the materia medica of the British pharmacopoeias; and the leaf is still retained by the Edinburgh college. The virtues which the ancients ascribed to their roots were very considerable, and they were consequently employed in various diseases, particularly those thought to proceed from obstructions more especially of the uterine volumen; and we are informed by Dr. Cullen, that in some cases of this description, he found the *aristolochia* an useful remedy. Though many species of this genus have been recommended for their medicinal powers, it is only that of *serpen tinus* which has continued to maintain its character as a medicine of importance. The root of *serpen tinus*, as well as that of some of its congeners before mentioned, was first recommended as a medicine of extraordinary power in counteracting the poisonous effects of the bites of serpents, since that time it has been principally employed in fevers, especially those of the malignant kind; a practice founded on a supposition that the mottled matter of these fevers was to be lubricated by the same means as that of the poison of serpents: hence the *serpen tinus* has been deemed the most powerful of these medicines termed alexipharmics. But since this theory has been exploded, its good effects are now ascribed to its tonic and antifebrile properties. It is certainly a powerful stimulant and diaphoretic, and has been found very useful in fevers, where these effects have been required, as appears from the writings of Huxham, Hillary, Fringle, &c. See Woodville's Med. Bot. p. 193. Propagation and Culture. Those species that are natives of hot climates, as 1, 7, 9, 10, 12, 14, 27, require a stove to preserve them. The seeds, by which they are to be propagated, should be brought over in their pods, and immediately on their arrival here, should be sown in small pots filled with light
light earth, and should this happen in autumn or winter, the pots should be plunged into the tan of the bark flour, and under the shade of large plants. After remaining till March, they should be plunged into a hot-bed under frames, where the plants ought to appear in May. But if the seeds arrive in spring or summer, they must be sown in small pots, and plunged into a moderate hot-bed, offering to the shade of leafy plants, and kept there continually during the heat of the day; but the seeds found at this season of the year seldom grow the same year, and in the spring following treated as before directed. When they are strong enough, they should be transplanted into separate small pots, and treated as other tender plants of the same countries. 8. The tree is kept in open ground, but requires shelter in winter. It is hardy and may be propagated by seeds, suckers, or by parting the roots. 13, 15, 16, 18, are propagated by parting the roots; they should be sown from seeds sown in March. 17, 19, 20, 21, are propagated by seeds, in pots placed under a frame to defend them against frost, but the glases to be taken off when the weather is mild; and they would be greatly improved by removing them to a gentle hot-bed in March. As the season advances, they should be gradually urged to bear the open air; when the pots are taken out of the bed, they may be exposed to the morning sun, but screened during the heat of the day. They are to be refreshed with water moderately during dry weather only. In winter, the pots must be sheltered as before; and, in March, before the roots begin to show, they should be transplanted into separate small pots, and placed under the frame till spring, when they may be removed into the open air, and treated in the same manner as in the former year. The next spring they may be turned out of the pots, and planted in a warm border, where they will only require to be kept clean from weeds, and the roots defended from the frost, by covering the border, in autumn, with old tanner's bark. By this management the plants will become much healthier and stronger than if kept in pots, and when they are three years old, will flower, and produce plenty of seeds. The 22d species spreads so rapidly by its creeping roots, that it will be found troublesome, unless planted where it cannot injure other plants. All the species are perennial, and their fruits generally require support. See Martyn's Mill Diet.

ARISTOMENES, in Biography, a famous general of the Meffinians, distinguished by his love of liberty and his valour, and also by the vicissitudes of his fortune, was the son of Niconides, and a descendant of the royal family of Meffene. The oppression of the Spartans roused his indignation, and he took up arms, in connection with the Argives and Arcadians, for the rescue of his country; and thus commenced the second Messenian war, in the year before Christ 684, which terminated in the year 608 before the same era. The first battle was fought in a village of Meffene, and the victory was long doubtful; but Arilomenes by his valor determined the fate of the day; and the army unanimously hailed him as king. This honour, however, he declined, and chose to retain that of general. His next object was to intimidate the Spartans by a single act of courage; and with this view he repaired to Lacedemon, and having secretly entered the temple of Minerva, he affixed to the wall a buckler, with this inscription, "Arilomenes has consecrated this to the goddess, from the spoils of the Lacedemonians." In a second engagement the Lacedemonians were again defeated, and one of their towns was taken and pillagd; but in this action Arilomenes received a wound in the thigh, which however did not prevent his marching to invade Sparta, whence he was under a peculiarity of retreat.

In the third year of the war, the Messenians were betrayed by the treachery of Arilomenes, king of Areola, and followed a defeat, attended with the loss of the greatest part of their army. Thus weakened and divested, the resolution of Arilomenes was invincible; and with a small band of select men, he contrived to harass the Spartans, and to penetrate into Laconia. At length the valiant general was taken prisoner, and confined in a deep cavern amidst the other wounded and dying prisoners. In this nofme recess he continued three days; when perceiving at a small distance from him a fox preying upon a dead body, he seized its leg and permitted it to conduct him to a small hole through which he could discern the light. Having enlarged the aperture with his haws and nails, he obtained a passage through which he made his escape, undeceived, to his countrymen at their post on mount Ira. He then renewed his ravages among the enemy, and compelled them to a truce; but he was perilsly feized by some Cretan soldiers in the service of Sparta, and carried away captive. Thefe Cretans, who were feen in number, fopped at the hose of a widow with one daughter; and whilst they were intoxicated with wine, the woman cut the thongs by which he was bound, and set him at liberty. Thus released, he flew all his guards, and accompanied by the mother and daughter, halled to Ira, where the latter was married to his son. Ira was treacherously surrendered to the Spartans; but Arilomenes forming a small band of his followers into a column, marched directly to the enemy's line, which opening to the right and left, as he advanced, afforded him an unobstructed passage. He then joined the Arcadians, by whom he was kindly received, and proposed to them a bolder exploit than any which he had yet achieved. " I have still left," he said, "five hundred brave soldiers who will follow me where I place; if you affit me, whilst the Spartans are occupied in the pillage of Ira, I will march immediately to Lacedemon and surpise it." The proposal was received with great applause; but, before it could be executed, the Arcadian king contrived to delay it till he had forewarned the Spartans of their danger. His treachery was discovered, and the enraged people flung him to death. Thus disappointed, he left the Cretians, under the conduct of his son, to the island of Sicily, where they founded the city of Messina, about the year 608 before Christ, according to Paulainus; and he remained in Greece, watching a favourable opportunity for accomplishing the designs against the Spartans which he was still meditating. Such was his reputation, that when a perfon of the first rank at Rhodos consulted the oracle at Delos whom he should marry, he was directed to espouse the daughter of the most worthy of the Greeks, meaning Arilomenes. On a visit to this son-in-law, Arilomenes died, and a magnificent tomb was erected for him at Rhodos. The independence of his country, however, expired with him. Paulainus, l. iv. c. 21, 22, 23. Anc. Un. Hist. vol. v. p. 413—423. Travels of Anarcharhis, vol. iv. p. 38—53.

ARISTONIUS, in Ancient Geography, a town of Achaia, near the borders of Sicily, north of Palene, and at the bottom of a small gulf.

ARISTONIUS, a city of Egypt in the road from Coptos to Berenice, 25 miles from Diodopolis.
The eagle is necessarily attached to Jupiter in order to distinguish the god, but with respect to the other attributes, we may fairly infer that they were introduced in order to point out the union of justice and money in the divine nature. The thunder, an emblem of his power to execute judgment, is placed in his hand, but the bloodstains of spring are as a crown upon his head, to show that it is his delight and his glory rather to bless mankind. The face of this divine being turned towards fun-ride, seems to strengthen this idea, and might be intended to exhibit the care and government of the Divine Being in the conduct of his providence.

ARISTOPHANES, a celebrated comic poet, flourished about the middle of the fifth century before Christ, and was contemporary with Sophocles, Socrates, Euripides, and several others of the greatest men in Greece. The place of his birth is not known; but it is generally supposed that he was not a native of Athens, though he was much esteemed in this city, where he seems to have resided and been admitted to the honour of a denizen. Having been accosted by Cleon of alluming the title of a citizen without possessing a legal right to it, in his defence he parodied two verses which Homer has put into the mouth of Telamonus, of which this is the sense: "I am, as my mother tells me, the son of Philip; for my part I know little of this matter, for what child has his own father?" This stroke of pleasantry is said, having impressed his judges to confirm him in his privileges as a citizen, he breathed more bawdy against Cleon, and composed a piece against him aboundimg with the bitterest sarcasms. As he advanced in life he employed those talents for poetry which distinguished his early age, in that species of dramatic writing, called "The Old Comedy," which flourished during the Peloponnesian war, and a little before it, and which introduced on the stage real personages by name, in order to make them the objects of invective or ridicule. Having reduced this kind of comedy from its rude and unconnected state into a better and more useful form, he made it the vehicle of very unallowable and licentious severity and abuse. This was particularly the case in his first comedies; but he is said to have become more moderate in his later performances, and to approach in his manner to what was called "Middle Comedy," in which real personages were not introduced, but the characters were in some measure dignified by fictitious names; see Comedy. His first efforts were directed to the reformation of abuses in the state; and he laboured, without discrimination, the usurpation and misconduct of the great, and the follies and vices of the people in general. While he exposed the finiter deligns of the magistrates and generals of the Athenians by his wit and satire upon the theatre, he at the same time took care to defend the commonwealth against its foreign enemies; infomuch that Lyceum and other cities which were jealous of the grandeur of Athens, frequently experienced that Aristophanes alone was worth an army to that city, and that it was impossible to succeed while they followed the advice of this poet, who had made the stage a kind of school for the art of war, and all other virtues which can render a city formidable to its enemies. We are told that the freedom with which he reprehended the errors and faults of the philosophers, poets, generals, and ministers of state, and those of the masts of citizens, was so well received by the Athenians, that they cast handfuls of flowers upon his head, and carried him in triumph through the city with the greatest respect and loud acclamations. As a recompense for the zeal which he manifested on behalf of the commonwealth, they pofled a public decree, that he should be honoured with a crown of the sacred olive in his lifetime, which was the highest token of respect that could be paid to any citizen. Two excellent actors, Callistratus and Philodamus, performed in the comedies of Aristophanes. When the first appeared, it was understood that the comedy was directed only against the vices of individuals; and when the second acted, that it attacked the leaders of the administration. But the licentious attacks of Aristophanes, though often applauded by the multitude, were disapproved and condemned by the mod. intelligent part of the public. Accordingly, by one decree, the acting of comedy was prohibited; by a second, it was forbidden to mention any person by name; and by a third, to attack the magistrates. But these decrees were soon forgotten or repealed; nor would the multitude consent to relinquish a species of entertainment in which all the abusive and obscene expressions of their language afforded, were lavished on the objects of their jealousy or resentment. Towards the end of the Peloponnesian war, the licentiousness of the poets was restrained, and Aristophanes himself submitted to this reformation in his latter pieces. But no reformation which he might effect in the state, much less any gratification which he might afford to the licentious humour of individuals, can alone for or excuse his maligant attack on the reputation and life of Socrates. His comedy of "The Clouds," was written with a view to expose to ridicule this admirable philosopher. To this purpose he represents him suspended in a baloon, resembling his thoughts to the subtle and light air to which he refers, and invoking the gods, the tutelary deities of the sophists, who over him he imagines that he hears in the midst of the fogs and darkness by which he is surrounded. To inflame the more against him the prejudices of the people, he accuses him of teaching the youth of Athens to contemn the gods, and to deceive men. This piece, which was received at its first and second recital with applauses, though it did not obtain the crown, is thought to have contributed towards preparing the Athenians for that unjust decree, which bereaved that age of its brightest ornament. Aristophanes, notwithstanding the malignity of his satire, the occasional obliquity of his humour, and the licentiousness of his morals, was universally admired among the ancients on account of the Attic elegance of his style, and the peculiar poignancy of his wit. The purity and elegance of his diction was so much admired even by Plato, the disciple of Socrates, that in an epigram he represents the graces searching for a desirable mansion, and at length fixing it in the mind of Aristophanes; and St. Chrysostom, the most eloquent of the Greek fathers of the church, is said to have laid him always under his pillow when he went to bed. Nevertheless, many of the ancients felt and enured the faults of Aristophanes. The character which Plutarch (in Compar. AristoPh. & Menand., Oper. t. ii. p. 853 and 854.) gives of him, is as follows: "he outrages nature, and addresses himself more to the populace than to a genteel audience; his style is constantly mixed and unequal, elevated to bombast, familiar even to vulgarity, and buffonish even to childines. In him the father is not to be distinguished from the son, the citizen from the peasant, the warrior from the tradesman, or a god from a human servant. His impudence can only be endured by few of his own; his wit is bitter, sharp, and cutting; his plesantry consists chiefly in a play upon words, grots equivocations, and far-fetched and licentious allusions. In him, sublety of expression becomes malignant, and simplicity appears stupid; we are more inclined to hiss than to laugh at his buffoonery, and his gravity is effrontery; in short, he writes not to please rational and worthy people, but to gratify envy, spite, and debauchery." Upon the whole, we may observe, that such wit as his would not be admired in any modern
modern composition. Frischlin has written an express vindication of Aristophanes, in answer to the objections of Plutarch. Cicero likewise, in his first book "De legibus," tells him the most witty poet of the "Old Comedy," and highly commends him for endeavouring to expel the new deities out of the city, and to prevent the admission of scandalous forms of religion. Bruinoy thinks that Plutarch's remarks are too severe; and Mr. Cumberland has defended the author of the "Clouds," with true classical zeal, somewhat, perhaps, at the expense of Socrates and Euripides.

Athenæus (Deipn. l. x. c. 9.) informs us, that he wrote his comedies when he was drunk, as Alcæus likewise did his poems. Julius Caesar Scaliger compares Horace to this poet; but Prichard is of opinion, that Plautus has a greater affinity to him in his manner of writing, and has actually imitated him in many parts of his plays. By others, his writings have been represented as containing within them the germ of true comedy, and the models of the ball comic style; and they maintain that the author well understood that species of raillery, which, in his age, was pleasing to the Athenians, and which must please in every age.

Aristophanes is said to have invented a peculiar kind of verse, which was called by his name, and is mentioned by Cicero in his "Brutus." Suidas tells us, that he likewise invented the "triterameter" and "octameter" verse. Eleven of the fifty-four comedies said to have been written by this poet, still remain, and these belong entirely to the first era, known by the name of "the Old Comedy." Of this kind of drama Eupolis, Cratinus, and Aristophanes, were the three most celebrated authors. Of "the Middle Comedy," he gave a specimen in his "Cocулus," that is now lost, in which he did not introduce real personages, as in his "Equites," "Clouds," and "Frogs," but fictitious ones. Madame Dacier observes, that there are but two of them, "Plutus," and the "Clouds," which, with a regard to decency, will admit of a translation into the modern languages. The design of the latter has been already mentioned. The former, written after the magistrates had given orders that no perfom should be exposed by name on the stage, was intended to reproach the Athenians with their avarice, which had been the occasion of their committing many errors in concerns of the greatest importance. This is the most esteemed of any of the comedies now extant. Euripides, to whom this poet had a particular aversion, is fatigued in several of his plays, particularly in his "Frogs," his "Acharnenses," and his "Themisorphonizal." The best editions of Aristophanes are those of Kuller, Berger, and Brunck. Gen. Dict. Travels of Anacharsis, vol. iv. p. 48. 53, &c. Nouv. Dict. Hiler.

ARIPOPHANEUM, in Ancient Physic, a name given to a kind of emollient plaster, prepared of pitch, wax, opopanax, opoponax, and vinegar.

ARISTOPHILL, in Ancient Geography, a people of Asia, in the Paropamisus, Ptolemy.

ARISTOTELIA, in Antiquity, annual feasts, celebrated by the citizens of Stagira, in honour of Aristotle, who was born there; in gratitude for his having procured from Alexander, the re-building and re-peopling of that city, which had been demolished by king Philip. It is said, that after his death at Chalices, in the island of Euboea, he fetched away his bones, built an altar upon his tomb, called the place by his name, and held their assemblies there afterwards. Mandeville, in his fabulous account of his voyages, says, that this was still in being in his time; that is, in the fourteenth century. Ammon. in Vit. Aristot. Stanley's Hist. of Philos. p. iv. c. 8.

ARISTOTELIA (from Aristotele), in Botany, a small shrub, a native of Chili. Schreb. n. 810. L'Héritier Hrbp. Vol. II.

nov. 31. t. 16. Jul. 473. Clas. dodecandra monogynia. Gen. Char. Cal. perirnith one-leaved, five-parted; divitions lanceolate, concave, acute, upright. Cor. petals five, wedge-shaped, concave, erect, lying over each other at the sides, scarcely longer than the calyx. Stam. filaments fifteen, very short; anthers linear, shorter than the germ. Pfl. gurn inferior, roundish, rather three-cornered; style filiform, longer than the corolla; figmas three, recurved. Per. berry subglobular, obtusely three-cornered, three-celled. Seed two, or solitary in each cell, angular.

Species, 1. A. macupi, shining-leaved Aristotelia; root woody; stem brachiate, round, grey, tubercled; branches spreading, leaf with wart-like glands; leaves opposite, oblong-ovate, acuminate, serrate; the younger leaves of a shining bright green, somewhat viscid, on foot-alkals; stipules in pairs, minute, like glands; peduncles racemose, axillary, nodding; flowers pedicelled, drooping, globose, hermaphroditous; calyx villose; style often triphid; berry the size of a pea, of a dark purple, becoming black. This small shrub is a native of Chili, whence it was first sent to Europe by Dombey, and known by the name of macupi. The inhabitants of Chili make a wine of the berries, which they give in malignant fevers. It is hardly enough to bear the open air in general. But in severe winters it ought to have the protection of a green-house. It flowers in April and May, and was introduced here about 1773, by Meiff. Kennedy and Lec. Lourieo has given the name of Aristolotha to a genus of the clafs gymandra, found in China.

ARISTOTELIAN, something that relates to the philosopher Aristotle. Thus we have an Aristotelian dogma, the Aristotelian school, &c. See ARISTOTELE.

ARISTOTELIAN philosophy, the philosophy taught by Aristotle, and maintained by his followers.

The Aristotelian is otherwise called the Peripatetic philosophy; the rite, progres, vicissitudes, and fate of which, see under ARISTOTELE, and PERIPATEETES.

ARISTOTELIANS, a sect of philosophers, otherwise called Peripatetics.

ARISTOTELICA rota. See ROTA.

ARISTOTLE, in Biography, was born at Stagira, on the coast of Thrace, in the beginning of the ninety-ninth olympiad, eighty-five years after the birth of Socrates, and 384 before the birth of Christ. Stagira, as well as the neighbouring Greek cities, enjoyed the precarious dignity of independent government: it was the ally of Athens in the Peloponnesian war, and, like other nominal allies, experienced the flero dominion of that tyrannical republic. The city of Stagira indeed owes its celebrity wholly to Aristotle and his family; and, if its name is still familiar to modern ears, this proceeds merely from having communicated to our philosopher the appellation of Stagite. His father, Nicomachus, who was the physician and friend of Amyntas, king of Macedon, derived his descent through a long line of medical ancillaries from Eleucipas the companion of the Argonauts, whose skill in the healing art had raised him to a seat among the gods. Nicomachus improved a branch of knowledge which was the inheritance of his family, by writing six books on natural philosophy and medicine. The mother of Aristotle was Phœdia. He left his parents in early youth, but inherited from them a large fortune. He was left to the guardianship of Proxenus, a citizen of Atarne in Mythis, who received the young Stagite into his family, and skilfully directed his education. At the age of seventeen, Aristotle was attracted by the love
Aristotle.

love of learning to Athens, and particularly by the desire of hearing Plato in the academy, the bad School of Greece as well as morals then existing in the Lyceum, and where the most ambitious student might find competitors fit for exciting his emulation and sharpening his diligence. Plato early observed of him, that he required the rim rather than the spur. His industry in penning and copying manuscripts was unexampled, and almost incredible; he was named, by way of excellence, the studens or reader. Plato often called him the "soul of his school;" and, when Aristotle happened to be absent from his prelections, often complained, "Intellect is not here," and that he spoke to a deaf audience. As the student advanced in years, his acuteness was as extraordinary in canvassing opinions, as his industry had been unrivalled in collecting facts: his capacious mind embraced the whole circle of science; and, notwithstanding his pertinacity in rejecting every principle or tenet which he could not on reflection approve, his very singular merit failed not to recommend him to the discerning admiration of Plato, with whom he continued to reside twenty years, even to his master’s death; alike careless of the honours of a court, to which the rank and conditions of his family had often led him the road in Macedonia; and indifferent to the glory of a name, which his great abilities might have attained by establishing a separate school, and founding a new sect in philosophy. While Aristotle thus attended to the improvement of his mind, he did not neglect whatever might adorn his person. His figure was not advantageous; he was of a short stature, his eyes were remarkably small, his nose was high, his limbs were dis proporcionably slender, and he tiptoed or flamed in his speech. For his ungracious perfunctory Aristotle is said to have been anxious to compensate by the finery and elegance of his drees: his mantle was splendid; he wore rings of great value; and he shaved both his head and his face, while the other scholars of Plato kept their long hair and beards. This fondness for drees, however, neither altered his character, nor interrupted his ardent passion for knowledge. When he was about six and thirty years of age, he left his master Plato. Of that fage he always spoke with a degree of respect approaching to veneration. Soon after Plato’s decease, Aristotle wrote verses in his praise, and erected altars to his honour. Thus it is inscribed by Aristotle on the monument of his master, is preferred in a Latin version of an ancient life of Aristotle, written in Greek, and ascribed by some to Ammonius, and by others to Philo- ponus, and it is as follows:

"Gratia Aristoleos fruct hoc altare Platonii,
Quem turbae injuxit vel celebravit nefas."

"To Plato’s sacred name this tomb is reared,
A name by Aristole long revered!"

Far hence, ye vulgar herd! nor dare to stain
With impious praise this ever-hallow’d fane!"

These extraordinary tokens of respect on the part of Aristotle, afford a presumption amounting almost to certainty, that there is no truth in the relation of which Aristothenes is said to have been the original author, and which has been transmitted by Aelian, Diogenes Laertius, and others, that Aristotle gave great offence to Plato by the effeminate elegance of his drees, and by his pertness and loquacity; and that in refutation of the preference manifested by his master in favour of the Lyceum and Speuceus, he hit out into the school perplexed Plato at the age of eighty, when his faculties were failing, with subtle questions, drove him from his academy, and took possession of the chair, till it was reclaimed for Plato by his disciple Xenocrates. In the Latin translation of the life of Aristotle above mentioned, this

columny is charged on Aristothenes, who, as Simias observes, entertained a personal enmity against Aristotle, for preferring Thrasippus to him in the faculty of logic. For the situation that Aristotle instituted a new school before Plato’s death, we have, therefore, no sufficient authority. It has been also related by Aelian, (Var. Hist. l. v. c. 19.) whose testimony, indeed, does not deserve implicit credit, and also by Athenæus (Diopnoiph. I. viii. p. 574.) that Aristotle, in his youth, was so much addicted to pleasure as to spend his patrimony; that he afterwards entered into the army; and abandoning a military life, professed medicine, and practiced pharmacy; till at length he was led by accident to turn his attention to philosophy. But the age at which he was admitted into the academy, and under circumstances, very much vouched the credibility of this account. The conceptions which Aristotle had formed, at the time of his master’s death, with some of the most illustrious, as well as the most extraordinary, persons of his own or any age, might naturally inspire him with the design of leaving Athens, after he had lost the philosopher and friend whose fame had first drawn him thither, and whose influence had so long retained him in that celebrated city. Aristotle might have been to him the ascent to the succession in his deceased master’s chair at the academy; and upon the election of Speutippus, disappointment and disgust might have furnished additional motives to his leaving Athens. Whatever might have been the cause in this respect, Aristotle, while a boy at Atarina, had contracted an intimacy with Hermias, who, originally in a state of servitude, had been enabled by the bounty of a patron to procure the study of philosophy; and having become a fellow-student with Aristotle at Athens, soon united with him in the bands of affectionate esteem, which finally cemented into firm and unalterable friendship. Aristotle through life pursued the calm and secure paths of science, but Hermias ventured to climb the dangerous heights of ambition. His enterprising spirit, seconded by good fortune, raised him to the sovereignty of Attac and Attarina, Greek cities of Mytia. Thither, at the invitation of his royal friend, Aristotle repaired. At Atarina he found the wish of Plato realized; and in his friend Hermias, philosophy feated on a throne. In that happy situation near three years enjoyed the inexpressible happiness of seeing his enlightened political maxims and sentiments in the virtuous reign of his fellow-student and sovereign. But Hermias being afterwards deposed, Aristotle was obliged to fly. When Hermias was put to death by Artaxerses, king of Persia, Aristotle erected a statue of his friend in the temple of Delphos, and wrote in praise of him an epitaph, and a hymn to virtue; of which we have an elegant translation, with ingenious remarks, in bishop Hurd’s Notes on Horace’s Art of Poetry, v. 219. Aristotle, on this occasion, escaped to Mytlen on the isle of Lesbos, in company with Pythias, the kinswoman and adopted daughter of the king of Attac and Atarina, but now miserably fallen from the lofty expectations in which her youth had been educated. But this sad reverse of fortune only endeared her the more to Aristotle, who married the fair companion of his flight in his thirty-seventh year; which is precisely that age pointed out by himself as the fitted, on the male side, for entering into wedlock. Pythias died shortly afterwards, leaving an infant daughter, whom Aristotle named after a wise and truly beloved friend, who repaid his affection with the most amiable sensibility. Aristotle was now distinguished throughout Greece, and Philip of Macedon, acquainted with his fame, and apprized of his merits, early designed to request his acceptance of the tuition of his son Alexander, and at length prevailed on him to undertake the charge,
charge, in the fourth year of the 10th Olympiad, or the 3418 before Christ, when Alexander was fourteen years of age. See Alexander.

In the education of Alexander, the Stagirite spent near eight years, or five (Julian Hist. B. xii. c. 16.), during which period, in an office of much delicacy, he enjoyed the rare advantage of giving the highest satisfaction to his employers, while he excited the warmest gratitude in his pupil. But the ambition of Alexander had early taken root, and the peculiarities of his character had displayed themselves in a very public and very important transaction, which happened long before the Stagirite arrived at the court of Pella. This was his intercourse with the Persian ambassadors, which has been mentioned under the article Alexander. In training such a youth, says Dr. Gillies, the Stagirite had a rich field to cultivate; but he could only hope to give a new direction to passions, which it was too late to moderate or control. In his treatise on politics, he has carefully delineated the plan of education best adapted to persons of the highest rank in society; and, in performing the task assigned to him by Philip, this plan was to be skillfully modified, by adjusting it to the peculiar circumstances and extraordinary character of his pupil. Alexander's bosoms could not be conquered, but it might be made to combat on the side of virtue; if he was angry, it was proved to him that anger was the effect of want, and the mark of inferiority. His love for military glory, which, while it is the idol of the multitude, will always be the passion of the great, could neither be restrained nor moderated; but, to rival this tyrant of his breath, still more exalted affections were inspired, which rendered Alexander as much superior to conquerors, as conquerors themselves, superior to the lowell of the vulgar. Agreeably to a maxim inscribed in that book of Aristotle's politics which relates to education, the two years immediately following puberty constitute that important period of life, which is peculiarly adapted for improving and strengthening the bodily frame, and for acquiring that corporeal vigour which is one main spring of mental energy. During this interesting period of youth, with the proper management of which the future happiness of the whole life is so intimately connected, Aristotle observes that the intellectual powers ought indeed to be kept in play, but not too strenuously exercised, since powerful exertions of the mind and body cannot be made at once, nor the habits of making them be simultaneously acquired. In conformity with this principle, Alexander was encouraged to proceed with alacrity in his exercises, till he acquired in them unrivalled proficiency; after which, the whole bent of his mind was directed to the most profound principles of science. Aristotle having directed the studies of his pupil to such subjects as expanded and invigorated the understanding, proceeded to those which regulate private and public conduct. He carefully instructed his pupil in ethics and politics. He wrote to him, long afterwards, a treatise on government; and exhorted him to adjust the measure of his authority to the various characters of his subjects, agreeably to a doctrine which he frequently maintains in his political works, that different nations require different modes of government, respectively adapted to their various turns of mind, and different habits of thinking.

The influence which Aristotle acquired with his royal pupil he employed to beneficent purposes. One distinguished instance is his conduct to his native country. See Alexander, Aristotelia, and Stagira.

After the most intimate communication during the space of eight or nine years, the pupil and the preceptor separated for ever, to pursue, in a career of almost equal length, the most opposite paths to the same immortal renown; the one by arms, the other by philosophy; the one by gratifying the most immoderate füll of power, the other by teaching to despise this and all similar gratifications. During his earlier triumphs, terminated in the course of ten years by his premature death, Alexander gave many illustrious proofs of gratitude to the virtuous director of his youth. Although the tutor declined accompanying his pupil in this expedition, their mutual regard was maintained by a friendly correspondence; and the conqueror furnished the philosopher with materials for his Natural History, by sending him, at a great expense, from different countries, a large collection of animals. See Plin. H. N. i. viii. c. 16. Athen. I. ix. However, in a subsequent period, Alexander's resentment against Callisthenes was transferred to Aristotle, and a mutual alienation took place between the philosopher and the prince.

Having taken leave of the Macedonian capital, Aristotle returned to his beloved Athens, where he spent thirteen years, almost the whole remainder of his life, instructing his disciples, and improving the various branches of his philosophy. Finding the academic chair occupied by Xenocrates, the successor of Speusippus, he obtained permission to apply to the purposes of public instruction a large building in the suburbs of the city, called the Lyceum, which had been used for military exercise. Accordingly, about the second year of the 11th Olympiad, or the 337th year before Christ, he opened his school, and founded a new sect of philosophers, denominated, from the circumstance of his walking when he delivered his lectures, Peripatetics. Here he delivered his acratic, acronomic, or coterie and exotic philosophy; the former, consisting of physics and logic, and delivered to a select audience; the latter, composed of rhetoric, ethics, and politics, and delivered to the public at large. See Akroates. The talents and virtues of Aristotle exposed him to envy and calumny, and the found wisdom of his philosophy excited the hatred of the many pretenders that naturally abounded in such a refevor of literature as Athens. He regarded with equal contempt, vain pretenders to real science; or real professors of sciences which he deemed unproductive of any beneficial purpose.

"He fought," (says his modern biographer and interpreter), "only for truth, and was careless of the obstacles which stood in his way to attaining it, whether they were found in the errors of philosophers, or in the prejudices of the vulgar. Such a man, in such a city as Athens, where, since the days of Socrates, the learned taught publicly, and converted freely with all descriptions of persons, could not fail to have many rivals and many enemies. Sophists and ficionists, footstrollers and satirists, and that sort of wcoe, satirical historians, heaped obloquy on a character, the ornament of his own age, and desired to be the instructor of poltcrity." In pretended piety, the enemies of Aristotle found the means of accusing a sage, who was incomparable wisdom corrodéd their envy. After having taught thirteen years in the Lyceum with the highest reputation, he was charged with irreligion before the Areopagus by the mower, Eumenides, abettéd by Demophilus, a person of weight in the republic, and both of them inflaméd to this cruel prosecution by our philosopher's declared enemies. The heads of the accusation were, "that Aristotle had humoured the virtues both of his wife Pythis and of his friend Hermias, with such ceremonies and honours as the piety of Athens justly revered for the majesty of the gods." Though these accusations were extremely frivolous, yet Aristotle was condemned, but escaped punishment by leaving the country. After making a rhetorical defence of himself, and accompanying it with a proverbial line:

"O Xvs"
The works of Aristotle are referred to three heads, God, Nature, and Man. Whatever reasons relate to theology, though scattered in different treatises, may be referred to his metaphysics; a name unknown, indeed, to Aristotle, but given to his theological works by his editors, and importing, that the fourteen books which bear it, should immediately follow his numerous treatises on the subjects of physics or natural philosophy; that we may not reft satisfied with the knowledge of bare effects, but proceed to the principles of the causes, and the primary cause of all. In connection with his "metaphysics," we may mention his treatise "of the universe and its causes," and "a refutation of Xenocrates, Zeno, and Gorgias." Aristotle's doctrines concerning Being considered abstracdy, concerning deity, and concerning the soul, are comprehended under the term "metaphysics," because they "go beyond" sensible bodies to objects that are perceived only by the understanding, and this branch of science is called by him "the first philosophy." The doctrine of Being, or ontology, is nothing more than the definition and arrangement of general terms; and from a series of definitions Aristotle deduces such corollaries as necessarily follow from them. The first principle or axiom, as he states it, of this doctrine is, that it is impossible that the same thing should be, and should not be, in the same subject, at the same time, and in the same respect. To this universal principle, which is itself incapable of demonstration, because it is a primary truth, all demonstration may be reduced. Being exits either by itself, or by accident; on the other hand, all properties and accidents depend; but of the latter no certain knowledge can be obtained. Being may be either in power, or act; and power is either active or passive. The former is the principle of motion or change, and the latter contains in the subject upon which active power is exercised. Power remains when it is not exerted in action; and action takes place when a thing is otherwise than when it was in power. Again, Being is either notional, as it is conceived in the mind, or real, as it exists in nature. To unity, which is one of the properties of Being considered with respect to numbers, are nearly related, identity, equality, and similarity. Being also admits of genus and species. The doctrine of Aristotle concerning the First Mover, is more important. From the circular motion...
in an organized body, possesses life potentially, but does not move itself. It is not a rare body, composed of elements; for it differs from those in having perception. It has three faculties, the nutritive, the sensitive, and the rational. The first is that by which life is produced and maintained. The second is that by which we perceive and feel, without perceiving itself or its organs, but some external object by the intervention of its organs, which are adapted to produce the sensations of sight, hearing, smell, taste, and touch. The external senses, by means of sensible objects or forms, are immaterial, perceive objects as wax receives the impression of a seal, without receiving any part of its substance; but the difference of these objects is perceived by the common or internal sense. Perception differs from intellect; the former being common to all animals, the latter belonging to a few. Fancy is the perception produced by the immediate action of the senses. Memory is derived from fancy, and has its seat in the same power of the soul; being the effect of some image impressed upon the soul by means of the senses. Remembrance is that mental facility, by which we search for anything which we wish to recollect, through a series of things nearly related to it, till at last we call to mind what we had forgotten. The intellect is that part of the soul by which it understands; and it is passive and active; the former being the seat of the species or forms of things, and the latter the efficient cause of all knowledge. The principle of local motion is the desire or avarice which arises from the practical exercise of the understanding; and it produces either rational veneration or seditive appetite. The production of animal life arises from the union of the nutritive soul with animal heat. Life is the continuance of this union, death its dissolution.

As to the Soul or first principle of animal life, and of all perception, intelligence, or action, Aristotle was at a loss in explaining its specific nature. He could only define the mind to be that principle by which we live, perceive, and understand. When he attempted to form an abstract conception of this principle, he was perplexed; and he was so unacquainted with the nature of this substance, or so undeceived in his opinion, or perhaps so anxious to conceal it, that he recurred to the use of a term, which merely expressed the confused idea which he had formed to himself from observing its operations, and called ὑποθέσεα, or perfect energy, designating some unknown source of seditive and rational life in certain organized bodies. It does not certainly appear from the writings of Aristotle, whether he thought the soul of man mortal or immortal; but the former appears most probable, from his notion of the nature and origin of the human soul, which he conceived to be an intellectual power, externally transmitted into the human body from an eternal intelligence, the common source of rationality to human beings. We have no evidence that he supposed the union of this principle with any individual to continue after death.

Aristotle's histories of the heavens and of the earth; of animals, plants, and minerals; and even of man, considered merely as a material and sentient being, may, comfortably with modern language, be arranged under the head of Nature; though, in Aristotle's own acceptance, that term has a more limited sense; and is confined to terrestrial objects, and those existing between this earth and the lunar sphere.

The physical writings of Aristotle are the following: "Of Physics, or the Doctrine of Nature," explaining the principles and properties of natural bodies: "Of Heaven;"* treating of the universe, the celestial spheres, and simple bodies or elements: "Of Generation and Corruption;"* "Of Meteorology;"* "Of the History of Animals;"*
Aristotle.

"Of the parts of Animals and their Causes;" "Of the Production of Animals;" "Of the Pigs of Animals;" "Of the Soul, or Vital Principles;" "Of the Senses;" "Of Memory;" "Of Sleep;" "Of Dreaming;" "Of Animal Motion;" "Of the Length of Life;" "Of Youth and Old Age;" "Of Respiration;" "Of Plants;" "Of Breath;" "Of Marvellous Facts;" "Of Physiogomy;" "Of Sounds;" "Of Colors;" and "Problems."

In Aristotle's style of thought, the principles of nature are neither the "similar parts" of Aracandre, nor the "atoms" of Leucippus and Democritus, nor the "sensible elements" of Plato, nor the "party" of Pythagoreans, nor the "ideas" of Plato, but they were the right following, viz., "form, privation, and matter;" the two former being contrary to each other, and the latter the common subject of both. Matter, according to Aristotle, is a primary substance without quantity or quality, form or figure, or any of the properties of body. This incorporeal matter, through its real connected by the Pythagoreans, Aristotle professed, and in his own invention of the form of the heavens, the first who had discovered the true principles of bodies. Form is the peculiar nature or essence of any thing, or that which makes it to be what it is. Privation is the absence of form, so that matter and form are the constituent principles of things, and privation is accidentally associated with them. In order to unite matter and form, Aristotle for this purpose conceived in his mind a vague notion, which he has very obscurely and unsatisfactorily explained, of some internal cause of motion and arrangement, to which he applied the term "nature." Causes are distinguished by this philosopher into four kinds: material, of which things are made; formal, by which a thing is that which it is, and nothing else; efficient, by the agency of which anything is produced; and final, or the end for which it is produced. Substances he divides into eternal, as the heavens which revolve round the earth with a circular motion peculiar to the celestial spheres; and perishable, as animal or terrestrial bodies. The heavenly sphere has neither gravity, nor gravity, is liable to no change, and is eternal. Its natural motion is circular, but there are other spheres which move in a contrary direction to this, in order to produce the vicissitudes of terrestrial things. The motion of the first sphere, or the "primum mobile," is equal and uniform: this and the first mover being eternal and immutable. The stars are of the same nature with the spheres that support them, but more dense, and send a light and heat to the air, and then to the inferior world, by means of friction; and they are moved in consequence of the motion of the spheres, in which they are placed. The earth is spherical, and immovably fixed in the center of the motion of all the spheres. The first sphere revolves with the greatest velocity from west to east, and the inferior spheres in a contrary direction. The velocities of the spheres of the seven planets are inversely as their distances from the first sphere. The world, according to this philosopher, is finite and eternal; and there is only one world. Bodies, according to his system, are either simple elements produced by the union of the first matter and form, or compound bodies produced from the combination of elementary bodies. The elements are four, namely, fire, air, water, and earth. The two principles of motion are gravity and levity; by the former, bodies descend towards the center of the world, and by the latter, they rise towards the heavens. The element of earth has simple gravity; that of fire, simple levity; and air and water partake of both. Compound bodies suffer a perpetual succession of diffusion and production; and this change is effected by the action of the circular motion of the heavens, by means of which the sun and stars, which are the immediate agents in production and diffusion, approach towards or recede from the earth. An action and a passion that are reciprocal arise from the mutual contact of different bodies. In animal bodies there are certain primary qualities, some active and others passive, which constitute their specific difference. Of this kind are heat and cold, moisture and dryness, heaviness and lightness, hardness and softness, roughness and smoothness, and the like. From the union of the two off the latter qualities, the elements are formed, as fire, heat and dryness; air, from heat and moisture; water, from cold and moisture; and earth, from the union of air and dryness. All the elements may be transmuted; and all mixed bodies are formed by the combination of all of them. From the general principle of production and diffusion, and from the mutual action and passion of the simple qualities, Aristotle endeavours to assign the causes of natural appearances, and to explain the nature of mixed bodies, both perfect and imperfect. In his speculative philosophy, Aristotle displays an extensive practical knowledge of nature. His writings in natural history are a continued chain of physical and anatomical facts, which appear to have been the result of accurate observation. He collected by diligence, and by the assistance of others, and particularly of Alexander his pupil, a great number of natural bodies which he accurately examined; and he appears to have himself collected, or to have been present at the dissection of, many animals, especially of fishes.

Upon the philosophy of man, as our author calls it, that is, of man considered as a social and rational being, endowed with sentiment, affection, and intellect, Aristotle's writings are as clear and copious as they are solid and satisfactory. His treatises on logic, ethics, and politics, as well as his books on rhetoric and poetry, may all be referred to this one head, and viewed as connected parts of one great system of knowledge. In the most important, "ethics," contained in ten books to Nicomachus, seven to Eudemos, two intitled "the greater morals," and a small part comprehending definitions of "virtues and vices," he considered, in the first place, their object, to wit, happiness; and afterwards the faculties of the mind, their exertions and determinations which tend to produce happiness. The excellencies of our species, he observes, all refer either to the understanding or the will, the first producing reason essentially in itself, the second is capable of being combined and affiliated with this divine principle. From the two powers of the understanding and the will, are respectively derived two classes of virtues, the intellectual and the moral. Sagacity, penetration, intelligence, wisdom, are virtues of the understanding; gentleness, temperance, fortitude, justice, are virtues of the heart. The former class consists in the proper disposition and habit of the intellectual part of the soul; the latter in the proper disposition and habit of the desires and affections, which being formed subordinate to reason, and capable of conforming to its dictates, then only perform their duty, when, like obedient subjects, they cheerfully observe the commands of their sovereign. The intellectual virtues depend chiefly on education and exercise; the moral proceed entirely from habit, from which they derive their name. It is by practising justice, that we become just; by practising temperance, that we become temperate; by practising courage, that we become courageous. Hence the wondrous power of legislation and early instruction, by which the Cretans, the Spartans, and some other nations were horribly distinguished among the rest of mankind. Virtue is a practical art, and like all practical arts, can be preferred by practice only. It is neither
her natural, nor contrary to nature. We are born capable of attaining it, but the invaluable attainment must be made and perfected by habit. The virtues depend on the propriety of the affections from which they arise; and live in a mean between the extremes of too much and too little. Thus, to fear everything is cowardice; to fear nothing is rashness; courage requires that we should fear only such objects as are truly formidable, and only in that degree in which they ought to be feared. In the same manner, he who is too much affected by objects of pleasure, and feizes every opportunity to enjoy them, is called inconstancy; he who is too little affected by such objects, and refuses every opportunity to enjoy them, may be called insensible. Temperance teaches us to pursue only such pleasures as we ought, at proper times, in proper places, and on proper occasions. According to the same view of things, generosity lies in the middle between avarice and prodigality; modesty, between pride and diffidence; mildness, between irefulness and softness; magnificence, between ostentation and parsimony; popularity, between forbidding disdain and officious adulation; in a word, every virtue consists in a mean equally remote from two vicious extremes. Considered as the quality of an action, virtue consists in the propriety of that affection from which the action proceeds, when the affection is neither too strong, nor too weak, but has precisely that degree of strength which right reason teaches us to approve. As the quality of an action, virtue consists therefore in mediocrity; but as the quality of a person, it consists in the habit of this mediocrity, since in judging persons and characters, we regard not particular acts and feelings, but such acts and feelings as are frequent and habitual. There are many, and those the most important virtues, the exercise of which is not in the first instance attended with pleasure. To support labour, to endure pain, to encounter difficulties and dangers, which wisdom and fortitude on many occasions require, are not obviously recommended by any natural desire; nor is the practice of such duties immediately agreeable. It is full less agreeable, at first, to curb and restrain our natural appetites for pleasure, which is the proper office of temperance; nor can that vigilant circumspection, and ever-watchful attention to the most remote concealed dangerous actions, which is essential to the virtue of prudence, be acquired without trouble and care, without many painful efforts and difficult struggles. Yet it is the nature of all those virtues, as well as of the hardest lessons of justice, patriotism, and friendship, to become through habit agreeable; and the only sure test that we have acquired them is, that they are practiced with pleasure. The moral virtues cannot, according to Aristotle, subsist without some mixture of the intellectual; but the latter may subsist alone and independent; and according to both Aristotle and Plato, the purest and most permanent felicity of which man is susceptible, results from the exercise of his rational powers upon subjects of abstract speculation. The labours of the statesman or general, the exertions of the legislator or patriot, all refer to some end or purport, the attainment of which may be prevented by fortune, or frustrated by the weakness or wickedness of man. The practice of justice, generosity, temperance, and fortitude requires many conditions, and supposes a variety of situations, which it is not always in our power to command. The just or generous man must have objects to whom he may distribute his justice or generosity; he must possess the means by which to exercise those virtues which all participate of frail mortality; since, though directed by prudence, they are impelled by passion, and result from the exigencies of our present corporal state. But the energies of contemplative wisdom are pure and simple, like the intellectual source from which they spring. Not subjection to remote purpores or contingent ends, they are immediately agreeable on their own account, and on every side round and complete in themselves. Such are the principal doctrines to be found in Aristotle's "Ethics."

Histories of "Politics," comprehending eight books, in the very full paragaphs, in a few plain words, states the only legitimate purpore of political establishments. Every political society forms, it is plain, a sort of community or partnership instituted for the benefit of the partners. Utility is the end and aim of every such institution; and the greatest and most extensive utility is the aim of that great association comprehending all the rest, and known by the name of the community.

Having stated and explained the grand purposes of society, he considers the best systems of means for attaining those purposes, and traces the distinction of ranks which arises from the inequalities of individual talents, virtues, and fortune. Political institutions are best fitted for promoting human happiness, when they are most suitable to the opinions and sentiments of the people, and the circumstances of the times and country. No one political system will equally suit all situations, and scarcely any two. Government being an arrangement, the best government must be the best arrangement, and the best arrangement is that in which the materials to be arranged are the best fitted both to receive and to preserve. The materials of the statesman or legislator are the number and character of his people, and the extent and quality of his country. The excellence of a commonwealth, however, is not to be estimated by its population as such or extent, but by its fitness for performing its proper functions; the same energies and habits constitute the happiness both of individuals and of nations. Men make governments, not governments them; nor by any fyltem of political arrangements can a happy commonwealth be constituted from fools or cowards, profligates or knaves. The bricks must be first prepared, before the edifice can be reared. The human character is a compound of good and evil; the former arises from the balance of the affections, under the control and guidance of reason, the latter results from passion operating without restraint. That government is the best, which most powerfully stimulates the energies of the people to beneficent purposes, and represses them from base pursuits. That must be a system of freedom in the first place tempered by order, and moderation in the second. Mixed governments, widely formed and balanced, best correspond to the state of mankind. Democracy, though apparently most agreeable to the rights of man, is not the best adapted to his wants; the general will unrestrained is apt to run into excess, and precipitate in deliberation, to be tardy in execution. While simple democracy is inexpedient for the people themselves, simple aristocracy and simple monarchy are equally inexpedient; and being the subjection of the many to a few or to one, are moreover unjust. For these reasons Aristotle recommends a constitution that combines and balances the three orders in a most generally likely to promote the good of society. To his treatise on politics, Aristotle has added two books on "Oeconomics," in which he has treated in a similar way, on the management of domestic concerns.

In "Logic" or the art of reasoning, in which Aristotle has the merit of being an inventor, his writings are, "The Categories," or ten general heads of arrangement; "of Interpretation," explaining the philosophical principles of Grammar; "Analytics," including the whole doctrine of syllogisms and demonstration; "Topics," or common-places of arguments; and "Sophistic Refutation."
tions," teaching the art of replying to an opponent. These pieces collected in one volume, are called the " Organon of Aristotle." The arrangement of the ten Categories (which see) was borrowed from the Pythagorean school, and is laid to have been first invented by Archytas of Tarentum, and communicated to Aristotle by Plato, who conveyed this Pythagorean in Italy. The art of syllogistical reasoning (see Syllogism), was perhaps altogether the invention of Aristotle; and, whatever may be thought of its utility, it must be allowed to have been a wonderful effort and display of ingenuity. On the invention and application of syllogisms, Aristotle treats with a degree of minuteness and facility, which produces obscurity. His logical diffutations would have been clearer, as well as more concise, if he had carefully distinguished between words and ideas, and confined his attention chiefly to the latter. The reader will find a distinct account of the logic of Aristotle, by Dr. Reid, in the second volume of lord Kaimes's Sketches of the History of Man. Edinb. 4to. 1774, p. 165. See also the articles Demonstration, Dialectics, Logic, Proposition, Syllogism, &c. in this work.

The "Rhetorik" of Aristotle is comprised in three books, in which the principles of eloquence are investigated, and the whole art of oratory taught with so much depth of investigation, and accuracy of arrangement, that the work has been the basis of all that has been since delivered upon the subject by Cicero, Quintilian, and later writers. See Oratory. Another treatise, addressed to Alexander, is added, in which are distinctly considered the various species of discourse belonging to the several heads of deliberative, demonstrative, and judicial pleading.

On the subject of "Poetry," the "Poetic" of Aristotle affords a correct analysis of the constituent parts of the drama and the epic; and contains general principles and particular observations, which could only have been written by a master in criticism.

The position "Mathematics," which Aristotle has left, are, an obscure, and probably imperfect treatise on "Imcomputable Lines," and a book of "Quiddles in Mechanics."

Although among the works of Aristotle, nothing written expressly on Music has come down to us, if we except his tract ποτ εκποτισία, and the nineteenth section of his Problems; yet we find from these, and from his works in general, that he had thought much and deeply on the subject. Indeed among the titles of two hundred and fifty of his lost books, which have been collected by Fabricius, a work on Music appears, Ηθικ Μουσική, written expressly on the subject. We shall therefore do the art and science of Music the honour to rank this great, this full of men, among its benefactors.

For a further account of the reception, progress, and decline of the Aristotelian philosophy in the middle and in later ages; see PERIPATETICS. See also Logic, Metaphysics, Philosophy, Physics, &c.

Having given a curious account of the life and writings of Aristotle, to which his distinguished talents, his rank as an author, his personal merit, and his reputation, and influence in the various departments and faculties of literature for many ages, gave him a just claim, and without which a work of this nature must have been essentially imperfect; it may not be improper to collect a few particulars that may serve to aid us in appreciating his literary character as well as the importance and utility of his writings. Whilst we disregard the fictions of calumny and panegyric, we shall not unduly extol his talents and virtues, nor degrade them below their just standard. On the one hand, no credit can be attached to the abuse of Timeus the Tauromenite, who represents him as a pretender to learning, a vile parasite, and an habitual gluton and drunkard; nor to the calums that were raised against his reputation, in consequence of the honour he paid to the memory of his friend Hippas, and that of his wife Pythias; and, on the other hand, there is no foundation for attributing his extraordinary wisdom to divine revelation; nor are we sufficiently authorized to say with the Jews, that he gained his philosophy in Judaea, and borrowed his moral doctrine from Solomon; much less that he was of the seed of Israel and the tribe of Benjamin; or with the Chaldaeans, that he was a special messenger, supernaturally ordained to prepare the way for divine revelation, and that we are indebted to the aid of his philosophy for the extent and accuracy of our acquaintance with the sublime mysteries of religion. Although we cannot believe that just before his death, he delivered to his friends concerning "the contempt of death, and the immortality of the soul;" that in his last moments he dictated a book in order to throw, that wise men need not lament their exit from this tenement of clay, of which book, an Hebrew version of the Arabic translation from the Lippus of original was rendered into Latin, about the year 1500, by Maund, son of the emperor Frederic I.; yet we cannot allow that either his doctrine or his life warranted his being considered as an advocate for immortality or impiety, much less that he was the most infamous of human beings. No one was his virtues of that exalted kind which commend admiration, nor his faults to criminal as not to admit of some apology. He may, perhaps, be justly cenured for having taught his pupil Alexander principles of morals and policy, which were accommodated to the manners of a court, and which might be easily rendered subservient to his ambitious views. And it cannot be doubted, that his philosophical doctrines concerning nature were not favourable to the public forms of religion. Few will now be found such extravagant admirers of Aristotle as to join us, and entailing him as the fletcher of nature," and as having dipped his pen in intellect; and yet all must admit, that he possessed a profound and penetrating genius, and a wonderful talent for calling ideas, defining terms, and analyzing the faculties and operations of the human mind. He had also, without doubt, an extensive acquaintance with natural objects, and he was a diligent observer of physical and moral phenomena. If he had bestowed that attention on the discrimination and arrangement of natural bodies which he devoted to words, he might have been a Linnaeus; or if he had, according to the modern mode of philosophizing, deduced general principles from facts and experiments, he might have been a Bacon, a Boyle, or a Newton. Instead of doing this, his ambition to stand distinguished among philosophers as the founder of a new sect induced him to try his strength in abstruse disquisitions, and to indulge a too daring spirit of contradiction and innovation. His object was to erect his own edifice upon the ruin of every other structure. As lord Bacon has wisely remarked (De Anm. Scient. I, ii, c. 4,), "while a few assumptions he thought he could not reign secure, unless all his brethren were slain. Innovating rather in words than in reality, and determining to oppose his new philosophy to ancient tenets, of which many were founded on truth and experience, he sometimes misrepresents the opinions of former philosophers; sometimes selects those which were most trifling, or most easily refuted; and sometimes has recourse to uncertain principles and vague terms, in hopes that obscurity might be mistaken for novelty. Having acquired the habits and manners of a high life at the court of Amynes to which his father introduced him, and having occasion, as preceptor to Alexander, to accommodate his
ARI

his philosophy to the ambition of the young prince with whole education he was enticed, he deferred the fanciful republic of Plato, and finding the morals of Socrates too confined for his purpose, framed a system of ethics for himself, which would allow full scope for the aspiring views of Alexander and his friends. Even the Syllogistic art, which was peculiarly his own, is very materially defective, tends to misled by multiplying hypothetical propositions, or by teaching the practice or detection of sophistry, and affords little or no assistance in the investigation and discovery of truth. The conclusion in every syllogism is, in fact, contained in the premises; if the premises have not been previously proved by other means than syllogistic reasoning, the conclusion is not established; if they have, the syllogism is unnecessary; so that, as Dr. Reid observes in his account of Aristotle's logic (ubi supra), other kind of reasoning, independently of observation and experiment, only carries a man round, like a horse in a mill, without any real progress. Upon the whole, it has been observed by competent and candid judges, that the philosophy of Aristotle is rather the philosophy of words than of things, and that the study of his writings tends more to perplex the understanding with subtle distinctions than to enlighten it with real knowledge. The reception that was paid to him in the Arabian, Jewish, and Christian schools, was rather the means of obliterating than of aiding and promoting the progress of useful science. It was not, as an excellent biographer remarks, till mankind were emancipated from their vassalage to Aristotle, that the human mind assured its native freedom and dignity, and that genuine science began to enlighten the world. The principal writings of Aristotle have been often separately printed, and of his entire works, the chief editions are: 6 vols. fol. ap. Ald. Venet. 1498. 8 vols. 12mo. Ald. 1552. 10 vols. 4to. Sylburgii, Franc. 1587. Gr. and Lat. fol. Caeraboni, Lugd. 1550. 1646. fol. Genet. 1625. 8vo. Lugd. 1597. 2 vols. fol. Du Val, Paris, 1629. 1634. Vid. Dib. Larer. t. i. p. 268. Dion. Halicarn. t. ii. p. 193. Suida, Fabr. Bibl. Græc. i. iii. c. 6. t. ii. p. 107, &c. Brucker's Hist. Phil. by Enf. vol. i. p. 355—288. Gen. Dict. ARISTOTUS, in Idiologia, a name given by Aldus and some other old writers to the fish which we call the fluke; Clupea Alfa. Linn.

ARISTOXENUS, in Biography, is the most ancient Greek writer on the subject of music that has come down to us. He was the son of a musician, whom some call Mnasias, others Spinathus. He had his first education at Mantinea, a city of Arcadia, under his father, and Lampus of Erythrae. He next studied under Xenophilius, the Pythagorean, and lastly under Aristothele, in company with Theophrastus. Suidas, from whom these particulars are transcribed, adds, that Aristoxenus, enraged at Aristotle having bestowed his school on Theophrastus, sought him ever after. But Aristoxenus the Peripatetic, in Enchiridions, excusses Aristoxenus in this particular, and affirms us that he always spoke with great respect of his master Aristotle.

From the preceding account it appears that Aristoxenus lived under Alexander the Great, and his first successors.

His Harmonics in three books, all that are come down to us, together with Ptolemy's Harmonics, were first published by Gavagesius, but not very correctly, at Venice, 1562, in 4to., with a Latin version. John Murinus next translated the three books of Aristoxenus into Latin, from the MS. of Joseph Scaliger, but, according to Melbonius, very negligently. With these he printed at Leyden, 1616, 4to., Nicomachus and Alpyius, two other Greek writers on music. After this Melbonius collected these musical writings together, to which he added Euclid, Bacchius senior, Aristides Quintilianus; and published the whole with a Latin version and notes, from the elegant press of Elzevir, Amst. 1652. The learned editor dedicates these ancient musical treatises to Christiana, queen of Sweden.

Aristoxenus is said by Suidas to have written four hundred and fifty-two different works, among which those on music were the most esteemed; yet his writings upon other subjects are very frequently quoted by ancient authors, notwithstanding Cicero, and some others, say that he was a bad philosopher, and had nothing in his head but music. The titles of several of the lost works of Aristoxenus, quoted by Athenæus and others, have been collected by Meursius in his notes upon this author; by Tondus and Mengel; all which Fabriicus has digested in alphabetical order. We shall here only mention such as concern music, which are upon subjects so interesting to inquirers into the merits of ancient music, that their loss is truly to be lamented. 1. "Of Perf. smokers on the Flute, and concerning Flutes and other musical instruments." 2. "Of the Manner of boring or piercing Flutes." 3. "Of Music in general." In this work, which was different from his Harmony, he treated not only of the rhythmical, metrical, organical, poetical, and hypercritical parts of music, but of the history of music and musicians. 4. "Of the Tragic Dance." With respect to the treatises of Aristoxenus that are come down to us, they are cited by Euclid, Cicero, Vitruvius, Plutarch, Diogenes Laertius, Athenæus, Arif. Quintilianus, Ptolemy, and Boethius. And as a musical writer, he is so much celebrated by the ancients, and so frequently mentioned by the modern, that his treatises which are extant, seem to deserve a particular attention. They are given by all his editors as divisions of one and the same work; but the two first books are evidently independent fragments. The second book is not a second, but another half part. It is surpising that Melbonius should regard it as a continuation, and wonder in his notes, that Porphyrus should quote the second book as the first. The second book is plainly the opening of another work, as appears by its beginning with an explanation of the subject, and a sketch of the order in which the author proposed to treat it, all which is done in the first book. It is likewise full of repetitions. There appears, however, through the cloud of bad readings, and all kinds of corruptions in the text, to be an accuracy, and an Aristotelian precision in these old books, which are not to be found in later writers, who seem to have all the negligence and inaccuracy of compilers.

As Pythagoras and Aristoxenus were heads of the two most numerous and celebrated musical sects in antiquity, we shall endeavour to make such of our readers as are curious in these matters, acquainted with their different tenets.

The Pythagoreans, by their rigid adherence to calculation, and the accurate divisions of the monochord, may be said to have trilled more to the judgment of the eye, concerning the perfection of consonance, than to that of the ear. Intervals, according to them, were consonant or dissonant, in proportion as the rates of the vibrations were simple or complex. Thus the octave was more perfect than the 4th, because the ratio of 1 to 2 is more simple, and more easily perceived, than that of 2 to 3, and the 5th, for the same reason, was more perfect than the 4th. It was upon this principle that they allowed of no deviation from the strict ratios of sounds. They left nothing to the uncertain judgment of the ear, which they thought so more able to determine a perfect consonance without a monocord,
menochord, than the eye to form a perfect circle without compasses.

Aribolexenus, on the contrary, referred everything to the ear. He thought the senses sufficiently accurate for musical, though not for mathematical purposes; and that it was absurd to aim at an artificial accuracy in gratifying the ear, beyond its own power of distinction. The philosophy of the Pythagoreans, their velocities, vibrations, and proportions, he rejected with contempt, as being foreign to the subject; substituting abstract causes in the room of experience, and making music lead the object of sense than of intellect.

According to these principles, his doctrine maintained, that concords were to be taken by the judgment of the ear only, and other intervals of which the ear was not able to determine the perfection, by the difference, or sum of concords. Thus the tone was the difference between the 4ths and 5ths: the ditone was taken by alternate 4ths and 5ths: as Ea, aD, DG, GC. Had he dropped here, nothing could reasonably have been alleged against him. But, taking the tone as a well-known interval, of which the ear, from the comparison of 4th and 5th, could judge with sufficient exactness, he made it the measure of all other intervals: of the greater by addition, and of the less by division. Thus the 4th contained, according to him, two tones and a half; the 5th, 3 and ½; the octave, consequently, 5 tones and 2 semi-tones, or 6 tones. And, further, the tone he divided into 2, 3, and 4 equal parts. By this process, as it is justly objected to him by Ptolemy, he acted inconsistently with his own principles, pretending to trust solely to the ear, and to exclude reason and calculation, at the same time that he was making a parade of both, in a way either totally useless and nugatory, or more complicated and difficult than that which he had rejected. If the ear is unable to determine the exact ratio of a concord, still less is it able accurately to bisept a tone; and that a tone cannot be numerically divided into two, or more equal parts, has long been demonstrated. It can only be done by geometrical and linear methods, more operose than the calculations of Pythagoras, and which, if accomplished, would give only false, incomprehensible, and tempered intervals. Aristolessenus seems to have been led into this inconstancy by his desire of distinguishing himself from the mere practical musicians of his time, whose inaccuracy and want of science he frequently speaks with great contempt.

The Pythagoreans, on the other side, were not without their errors. The principles were right, but they carried them too far, and forgot that they could not otherwise be known to be right, than as they were confirmed by the pleasure of the ear. How, for instance, did they know that the ratio from 2 to 3 was that of a perfect fifth but by the ear, which, upon repeated trial, found that interval most harmonious when produced by strings in that proportion? But it was the peculiar character of the Pythagorean philosophy, to erect abstract numbers and proportions into physical causes. Not content with purifying their principle of the simplicity of ratios, as far as experience warranted, and the ear approved, they set it up as an a priori principle, and rejected intervals which the ear pronounced to be concords, merely because they did not fall within the proportions which they chose to admit. The compound interval, for instance, of the 8th and 4th, though undoubtedly concord, they would not admit as such, because its ratio, 3: 8, is neither multiple nor submultiple, the only proportions they admitted as consonant, on account of their simplicity.

They are, indeed, charged both by Ptolemy and Aristolessenus, with sometimes assigning such ratios to intervals as the ear did not approve; but no blame is given. It would be injustice, however, to quit these famous musical theologians, without acknowledging that their physical doctrines concerning the production of sound, and the causes of gravity and acuteness, have been confirmed by modern philosophy, and their metaphysical speculations concerning the causes of consonance, adopted by modern writers of no inconsiderable reputation. Gen. Hist. Mul.

ARITHMANTY. See Arithmomancy.

ARITHMETIC, formed from αριθμός, number, the art of numbering; or, that part of mathematics, which considers the powers and properties of numbers, and teaches how to compute or calculate truly, and with expedition and ease. By some authors it is also defined to be the science of discrete quantity. It consists chiefly in the four great rules or operations of addition, subtraction, multiplication, and division: to which may also be added involution and evolution.

Besides these, for the purpose of facilitating and expediting computations, mercantile, astronomical, &c. several other useful rules have been contrived; as, the rules of proportion, progression, allocation, false position, fellowship, interest, barter, rebate, equation of payments, reduction, rare, and tetr, &c. But there are only applications of the first four rules. See these rules under their several heads, Addition, &c.

Concerning the origin and invention of arithmetic, we have very little information; history fixes neither the author nor the time. Some knowledge, however, of numbers must have existed in the earliest ages of mankind. This knowledge should be attributed to them, whenever they opened their eyes, by their own fingers, and by their glance, and by the variety of objects that surrounded them. At first, indeed, their powers of numeration would be of very limited extent; and before the art of writing was invented, it must have depended on memory, or on such artificial helps, as might most easily be obtained. To their ten fingers they would, without doubt, have recourse in the first instance; and hence they would be naturally led to distribute numbers into periods, each of which consisted of ten units. This practice was common among all nations, the ancient Chinese, and an obscure people mentioned by Aristotle, excepted. But though some kind of computation must have commenced at a very early period, the introduction of arithmetic as a science, and the improvements it underwent, must, in a great degree, have depended upon the introduction and establishment of commerce: and as commerce was gradually extended and improved, and other sciences were discovered and cultivated, arithmetic would be improved likewise. It is therefore probable, that if it was not of Tyrian invention, it must have been much indebted to the Phoenicians or Tyrians. Proclus, indeed, in his Commentary on the first book of Euclid, says, that the Phoenicians, by reason of their traffic and commerce, were the first inventors of arithmetic; and Strabo also informs us, that in his time it was attributed to the Phoenicians. Others, however, have traced the origin of this art to Egypt; and it has been a general opinion, sanctioned by the authorities of Socrates and Plato, that Thet or Thot was the inventor of numbers; that from hence the Greeks adopted the idea of aferbing to their Mercury, corresponding to the Egyptian Thot or Hermes, the superintendence of commerce and arithmetic. With the Egyptians we ought also to associate the Chaldeans, whose astronomical disquisitions and disco-
A R I T H M E T I C.

verses, in which they took the lead, required a considerable acquaintance with arithmetic.

From Ahas, in Egypt, as Josephus says, by means of Brahman. Here it was greatly cultivated and improved; information that a large part of the Egyptian philosophy and theology seems to have turned altogether upon numbers. Hence those wonders related by them about unity, trinity, the numbers seven, ten, four, &c. Effect, Kircher (in his Oedip. Egypt. tom. ii. p. 2) shows, that the Egyptians explained every thing by numbers; Pythagoras himself affirming, that the nature of numbers pervades the universe, and that the knowledge of numbers is the knowledge of the Deity. From Egypt arithmetic was transmitted to the Greeks by Pythagoras and his followers; and among them it was the subject of particular attention, as we perceive in the writings of Euclid, Archimedes, and others; with the improvements derived from them, it passed to the Romans, and from them it came to us.

The ancient arithmetic was very different from that of the moderns in various respects, and particularly in the method of notation. M. Goguet (Origin of laws, arts, &c. vol. i. p. 118) conjectures, that the ancient Greeks first used pebbles in their calculations; and in proof of this he adduces the word βραδος, (derived from βρίς, a little stone or pebble,) which signifies to calculate: and he also supposes that the word calculation is derived from the term calculus, little stones, used by the Romans in their first arithmetical computations. To this purpose it has been also alleged, that the Indians are at this time very expert in computing by means of their fingers, without the use of pen and ink; and that the natives of Peru, by the different arrangements of their grains of maize, surpafs the European, aided by all his rules, with regard both to accuracy and dispatch. The Hebrews and Greeks, however, at a very early period, and after them also the Romans, had recourse to the letters of their alphabet for the representation of numbers. The Greeks in particular had two different methods: the first resembled that of the Romans, which is sufficiently known, as it is still used for distinguishing the chapters and sections of books, dates, &c. See Characters. They afterwards had a better method, in which the first nine letters of the alphabet represented the first numbers from 1 to 9, and the next nine letters represented any number of tens, from 10 to 90, that is, 10, 20, &c. to 90. Any number of hundreds they expressed by other letters, supplying what they wanted by some other marks or characters: and in this order they proceeded, using the same letters again, with different marks to express thousands, tens of thousands, hundreds of thousands, &c.; thus approaching very near to the more perfect duodecuple scale of progression used by the Arabs, who acknowledge, as some have said, that they received it from the Indians. Archimedes also in his "Arenarius," used a particular scale and notation of his own. In the second century of the Christian Era, Ptolemy is supposed to have invented the sexagesimal numeration and notation, and this method is still used by astronomers and others for the subdivision of the degrees of circles. These several modes of notation above recited, were so operose and inconvenient, that they so limited the extent, and restrained the progress, of arithmetic, that it was applicable with great difficulty and embarrassment to the other sciences, which required its assistance. The Greeks (if we except Euclid, who, in his Elements furnished many plain and useful properties of numbers, and Archimedes in his Arenarius) contributed little to the advancement of this science towards perfection; its practical operations derived little benefit from their theory, abstract properties, and tedious divisions and divisions of numbers; and the imperfection of the art sufficiently appears from a treatise of Nichomachus, supposed to be written in the third century of Rome, and published at Paris in 1548; from the two first books of the Mathematical Collections of Pappus, of which only a small fragment remains; and also from that of Boethius, written at Rome in the fifth century after Christ, and still extant. From Boethius we learn, that some Pythagoreans had invented and employed, in their calculations, nine particular characters, which others used the ordinary signs, namely, the letters of the alphabet. These characters he calls after; and they are said, more correctly to resemble the ancient Arabic characters, which circumstance suggests a presumption of their authenticity. Indeed, the MSS. of Boethius, in which these characters, resembling those of the Arabic arithmetic, are found, not being more ancient than three or four centuries, confirm the opinion that they are the works of a copyist. Upon the whole, this treatise of Boethius does not warrant our rejecting the commonly received system with regard to the origin of our arithmetic; but if we suppose that the Arabs derived their knowledge of it from the Indians, it is more probable that it was one of the inventions which Pythagoras spread among the Indians, than that those persons should have obtained it from the Greeks. See Figures.

A compendium of the ancient arithmetic, written in Greek, by Plolius, in the ninth century, was published in Latia by Xylander, in the year 1556; a similar treatise was written soon after in Greek, by Jordanus Williusius; and a more ample work of the same kind was written by Jordanus in the year 1200, and published with a commentary, by Faber Stapuleus, in 1490. The same author also wrote upon the new art of computation by the Arabic figures, and called this book "Algorismus demonstratus." This book in MS. is still extant, according to Dr. Wallis, in the Saviour library at Oxford, but has never yet been printed. A treatise on arithmetic was also written by Johannes de Sacro Bofco, who died about the year 1256. The introduction of the Arabian or Indian notation into Europe, about the tenth century, made a material alteration in the state of arithmetic; and this, indeed, was one of the greatest improvements which this science had received since the first discovery of it. This method of notation, now universally used, was probably derived originally from the Indians by the Arabs, and not, as some have supposed, from the Greeks; and it was brought from the Arabs into Spain, by the Moors or Saracens, in the tenth century. Gerbert, who was afterwards pope, under the name of Silvester II, and who died in the year 1003, brought this notation from the Moors of Spain into France, long before the time of his death, or, if some think, about the year 960; and it was known among us in Britain, as Dr. Wallis has shown, in the beginning of the eleventh century, if not somewhat sooner. See Figures. As literature and science advanced in Europe, the knowledge of numbers was also extended, and the writers in this art were very much multiplied. The next considerable improvement in this branch of science, after the introduction of the numeral figures of the Arabs or Indians, was that of decimal parts, for which we are indebted to Regiomontanus; who about the year 1464, in his book of "Triangulorum Canonum," set aside the sexagesimal subdivisions, and divided the radius into 60,000 parts; but afterwards he altogether waved the ancient division into 60, and divided the radius into 10,000,000 parts; so that if the radius be denoted by 1, the lines will be expressed by so many places of decimal fractions as the cyphers following 1. This seems to have been the first introduction of
ARITHMETIC.

Arithmetic, binary, or dyadic. See Binary Arithmetic.

Arithmetic, common or vulgar, is that which relates to integers and vulgar fractions.

Arithmetic, decimal, or denary, is that which is performed by a series of ten characters or figures, in a ten-fold progression, as from 1 to 10, from 10 to 100, &c. including both integers and decimal fractions in the common scale of numbers. See Decimal.

The characters now used are the ten Arabic or Indian figures, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9; for the history of which see Figures, and Arithmetic, figura.

Arithmetic, dyadic, or dyadic, which proceeds from 1 to 12, or by a continual subdivision according to 12, and is much used by most artificers in calculating the value of their works; as bricklayers, carpenters, painters, tylers, &c.

Arithmetic, fractional, or of fractions, is that which treats of fractions both vulgar and decimal. See Fraction.

Arithmetic, harmonical, is that part of the doctrine of numbers, which relates to the composition, reduction, &c. of musical intervals.

Arithmetic of infinites, is a method of summing up a series of quantities, consisting of an infinite number of terms, or of finding their ratios. This method was first invented by Dr. Wallis, as appears from his treatise on the subject in the "Opera Mathematica," vol. i. p. 265, &c., where he shews its use in geometry, in finding the areas of superficies, and the contents of solids, and their proportions. This is also called the method of "Indivisibles," because magnitudes are here supposed to be resolved into their indivisible parts, or at least as far as there is any occasion to consider them as indivisible. See Indivisibles. But the method of Fluxions, which is an universal arithmetic of infinites, performs all this much more easily, and many other things, which the former will not reach.

Arithmetic, instrumental, is that in which the common rules are performed by means of instruments contrived for safe and dispatch; such are several sorts of scales, and sliding-rules; Napier's bones or rods, described under their proper article; the arithmetical machine of Pafcal and others; Sir Samuel Morland's instrument, the description whereof was published by himself, in 1672: that of Mr. Leibnitz, described in the Mifcellan. Berolin.; that of Polenus, published in the Venetian Miscellany, 1679: and that of Dr. Saundersen, described in the introduction to his algebra. Such is also the Algebror, or Stwan-pan of the Chinefe.

Arithmetic, integral, or of integers, is that which relates to integers, or whole numbers.

Arithmetic, literal, or algebraic, is that which is performed by letters, that represent any numbers indefinitely. See Algebra.

Arithmetic, logarithmic, is that which concerns logarithms, and is performed by tables of Logarithms; which see.

Arithmetic, logistical. See Logistical.

Arithmetic, mechanical, is that which is performed by means of a lever or balance. See Balance.

Arithmetic, numerous, or numeral, is that which gives the calculus of numbers, or indefinite quantities; and is performed by the common numeral or Arabic characters.

Arithmetic, palpable, is that which is performed by the sense of feeling, and practiced by blind persons. Dr. Saundersen, Lucasian professor of mathematics in the university of Cambridge, had contrived, for his own use, a commodious notation for any large numbers, which he could express...
express on his abacus, or calculating table, and with which he could very readily perform any arithmetical operations. His calculating table was a smooth thin board, somewhat larger than a foot square, raised upon a small frame, so as to be hollow; and this board was divided by a great number of equidistant parallel lines, and by others as many at right angles to the former. The edges of the table were distinguishable by notches, at the distance of about half an inch from one another, and to each notch belonged five of the aforementioned parallels; so that every square inch was divided into an hundred little squares. At every point of intersection the board was perforated by small holes, capable of receiving a pin; for it was by the help of pins, stuck up to the head through these holes, that he expressed his numbers. Of these pins he used two sorts, some larger, and others smaller; or, at least their heads were different, so that they might be easily distinguished by the touch. A large quantity of these pins, with the points cut off, was kept in two boxes, which were always near him when he calculated. In order to understand his mode of calculation, it is necessary to premise, that to every numerical figure a little square was appr opriated on the table, consisting of four of the little squares above described, and allowing a small interval between one figure and another; and this numerical figure was different according to the different magnitude or situation of the one or two pins which always composed it; for which purpose the ingenious professor had settled in his mind and strictly observed the following analogy or notation. A great pin in the centre of the square, its appropriate and invariable place, was a cypher, or 0, by which name we shall call it. Its chief office was to preserve order and distance among the figures and lines. This cypher was always present, except in the case of an unit, for expressing which, the great pin in the center was changed into a little one. When 2 was to be expressed, the cypher was restored to its place, and the little pin was put just over it. To express 3, the cypher remained in its place, and the little pin was advanced into the upper angle, on the right hand. To express 4, the little pin defended, and immediately followed the cypher. The expression 5, the little pin defended to the lower angle, on the right hand. For 6, the little pin retreated, till it was just under the cypher. For 7, this pin retreated into the lower angle, on the left hand. For 8, it ascended, till it was just before the cypher. For 9, the little pin ascended into the upper angle, on the left hand. In this manner all the digits were expressed by an easy and uniform notation, which might readily enough be apprehended and distinguished by the feeling. These digits or figures are represented in Plate I. Algebra, fig. 1. Dr. Saunderfon was able, by this contrivance, to mark, or write down, as we may say, any proposed number upon his table, and by lightly running his fingers over it, he could at any time easily read it, and know what it signified. The great pins or cyphers which were always placed at the center of the little squares, and most frequently at equal distances from one another, were a sure guide to direct him in keeping the line, in ascertaining the limits of every figure, and in preventing any ambiguity that might otherwise occur. As three of the erect parallels were sufficient for a single figure, so three or the transverse parallels would suffice for a line of figures, and the next three for another line, and so on, without any danger of interfering. Thus we may conceive, without much difficulty, how he might have any number of lines of figures upon his table at the same time, in a defending order, or how he might deduce one number from another, or how he might make any computation required. It is said that he could place and displace his pins with incredible quickness and facility, to the surprise and amusement of spectators. He could even break off in the middle of a calculation, resume it when he pleased, and instantly know the state of it, by only drawing his fingers gently over the table. The table might also be previously prepared by himself or some other person, by filling every third hole of every third parallel line with large pins or cyphers; and then, when he intended to calculate, he would only need to complete every figure by adding a small pin in its proper place, except when he wished to express an unit, in which case he must have changed the large pin into a small one. He had contrived and preferred for his own use certain arithmetical tables, which seemed to have some relation to the tables of natural sines, tangents, and secants. These were four pieces of solid wood, in the form of rectangular parallelopipeds, each about 11 inches long, 3\(\frac{1}{2}\) broad, and somewhat above half an inch thick. The two opposite faces of every one were divided into little squares after the manner of the abacus above described; but they were perfectly fixed in all the necessary points, where the pins were stuck fast to the board. Each face exhibited nine small arithmetical tables, of ten numbers each; and every number, generally speaking, consisted of five or six figures. One of these tables is represented in Plate I. Algebra, fig. 2.

Besides this arithmetical use of his table, for which it was primarily and chiefly designed, he could describe upon it very neat and perfect geometrical figures, consisting of right lines, intersecting one another in a variety of ways. This he did by two methods; either by pins set in rows, which exhibited the appearance of pricked lines, or by pins placed only at the intersections. Then by winding a piece of fine thread or silk about their heads, he could very well exhibit any continued straight lines at pleasure, or any figure of such lines. Whether he had palpable letters also, somewhat like printing types, to distinguish the several angular points, and to afford in demonstrating the properties of these figures, does not now appear. It is not very difficult to conceive, how the same table might possibly be applied to the representation of all kinds of algebraical equations, and to the several reductions of such equations, especially by the use of the mentioned types, or some familiar contrivance. Dr. Saunderfon also might have had types, in the form of pins, for the common algebraic signs, and to serve the purpose of various operations; and thus his table would have had a near resemblance to a printer's form, which he might have read by the touch, if he had thought proper to use it. It is said that he could spell very well, that he knew the shapes of the letters, both small and capital, and would sometimes amuse himself, when opportunity offered, by reading the inscriptions upon tombstones with his fingers; and he is known to have often regretted, that he did not apply himself to learn to write in his younger years, which he thought he could easily have accomplished. Saunderfon's Alg. vol. 1. Intro.

The description of an apparatus for the improvement of this numerical board of Dr. Saunderfon, was prefixed to the Society of Arts, &c. in 1786, by a blind person of the name of Thomas Grenville. The board is perforated with holes, in exact lines, horizontally and perpendicularly. The horizontal lines denote units, tens, hundreds, thousands, &c. reckoning from right to left, as usual; and the perpendicular lines allow the figures to be placed below each other, as is usual in every account. These holes are fitted with pegs, on the heads of which are painted the figures (or numbers) they respectively represent; which figures are distinguished by the blind person by means of certain pins placed in the heads of these pegs. Between the rows of holes for these
thee pegs are rows of smaller holes, adapted to receive the
borders of flush wires, which perform the part of lines,
placed either horizontally or perpendicularly, as is necessary
for any arithmetical operation. The box is formed into
proper divisions for holding the pegs and wires: and it is,
without doubt, a very useful apparatus for blind persons,
who, with a little attention, may perform by means of it
every arithmetical operation which they could perform if
they had the use of sight.

Arithmetic, political, is the application of arithmetic to
political subjects, such as the strength and revenues of king-
goods, the number of inhabitants, births, burials, &c. See
Political Arithmetic. To this head may be also referred
the doctrine of Chances, Gaming, &c.

Arithmetic of Ratio. See Ratio.

Arithmetic, Sexagesimal, or sexagenary, is that which
proceeds by sixties: or the doctrine of sexagesimal fractions;
supposed to have been invented by Polonius, in the second
century. In this notation the integral numbers from 1 to
59 were expressed in the common way; then sixty was
called a sexagesima prima, and marked 1V; twice sixty, or 125,
1V2; and so on to 59 times 60, or 3540, which is LIX.
Sixty times sixty, or 3600, was called a sexagesima secunda,
and marked with two ciphers, 1; twice 3600, 1V2; and ten
times 3600, X3V, &c. And in this way the notation was
continued. But if a number like 63 was joined with any
of the sexagesimal integers, their proper expression was
annexed without the prefix; eg. 4. gr. 60 and 23 is IVXXV,
the sum of twice 65, ten times 3600, and 15; X1IVV, &c. So
nearly did the inventor of this method approach to the
Arabic notation: instead of sexagesimal progression, he had only to substitute decimals to make the
figures of numbers from 1 to 9 simple characters, and to
introduce a character which signifies nothing by itself serving
only to fill up places. The sexagesima integralia were thus
laid aside, after the introduction of the Arabic notation;
but the sexagesimal fractions continued till the invention of
decimals; and are still used in the subdivisions of circular
areas and angles.

Sam. Reysier has invented a kind of sexagenal rod, in
imitation of Napier's bones, by means whereof the sexa-
genary arithmetic is easily performed.

Arithmetic, specious, is that which gives the calculi of
quantities; using letters of the alphabet instead of figures,
to denote the quantities; and coincides with what we usually
call algebra, or literal arithmetic.

Dr. Wallis has joined the numeral with the literal calculi;
and by means of it demonstrated the rules for fractions,
proportions, extraction of roots, &c. a compendium of which
is given by Dr. Wells, under the title of Elementa Arith-
metica, in 1698.

Arithmetic, tabular, is that in which the operations of
multiplication, division, &c. are performed by tables cal-
culated for that purpose; such as those of Herwart ab
Hohenburg, called "the universal table of prolatephereses,"
published in 1610; and Hutton's tables of powers and pro-
ducts, published by order of the commissioners of longitude,
in 1781.

Arithmetic, tertitale, is that in which only the figures
1, 2, 3, and 0, are used. We have a treatise of this arith-
metic, by Erhard Weigel; but both this and binary arith-
metic, are little better than curiosities, especially with regard
to practice; inasmuch as the numbers may be much more
compendiously expressed by decimal arithmetic, or the com-
mon decuple scale, than by either of them.

Arithmetic, vulgar, is that conversant about integers and
vulgar fractions.

Arithmetic, universal, the name given by Sir Isaac
Newton to the science of algebra. See Algebra.

Arithmetical, denotes something relating to, or
performed after the manner of, arithmetic.

Arithmetical complement of a logarithm, is what the
logarithm wants of 10000000. Thus the arithmetical
complement of 71679543 is 1, 99543, and it is found by
subtracting each figure but the half from 10, and that from 10.
It is often used in trigonometrical calculations, when
radius or 10000000 is the first term, to save the labour of
subtraction. It is distinguished by placing a point before,
and another after the index; thus, 2, 8992496.

Arithmetical division of the octave, in Muses, is that which

<table>

</tbody>
</table>

The first of these divisions consists of fifths and fourths;
the second of fourths and fifths.

These divisions still exist in Canons, or plain chant;
though they have been long abandoned in musical music. It
is necessary, however, to know them, as they still serve to
regulate the answer to figures. See Division in Muses,
Figure, and Mode.

Arithmetical instruments, or machines. See Instrumental
Arithmetic.

Arithmetical medium or mean. See Medium.

Arithmetical progression. See Progression.

Arithmetical proportion. See Proportion.

Arithmetical ratio. See Ratio.

Arithmetical scales, a name given by M. Buffon, in
the Mem. d'Acad. of 1741, to different progressions of
numbers adapted to arithmetical computations. Besides
the common decuple scale, consisting of ten numbers, others
have been devised, such as the binary, tetradecal, &c. con-
sisting of a different number of characters. M. Buffon lays
down a concise and simple method, which serves to fly at
once how to write down any given number in any scale
whatever; and he also makes several observations on the
different scales that have been proposed. It is evident that
any scale of numbers, containing fewer or more than ten,
would have both its advantages and inconveniences. In a
scale of fewer and lower numbers, a given number would
require more places of figures for denoting or expressing it;
but multiplication and division would be more easily
performed, as it is more easy to use the smaller numbers 2, 3, 4;
and the larger ones 7, 8, 9; but in a scale ascending be-
yond 10, or containing 10 or 10 characters, any given
number might be expressed by fewer of them, and yet the
arithmetical calculations would be more difficult, on account
of the larger numbers 11, 12, 13, &c. Hence it may be
concluded, upon the whole, that the decuple scale is a con-
venient medium between the two extremes, as the numbers
which it comprehends, are neither too small nor too large.
The duodecimal scale, comprehending 12 characters, would
express all numbers in a more compendious manner than

the
the decimal scale; and yet no single character would represent a number too large for ordinary computations. Accordingly the multiplicative table is now made to extend to 12 numbers instead of 10, and the mode of multiplying and dividing by 11 and 12, is as easily acquired as that by 8, 9, or 10. Besides, the number 12 has this advantage; that it admits of more submultiples than 10, and therefore there would be fewer expressions of interminable fractions in this scale than in the decimal one; and hence it has been suggested that the duodecimal scale would be preferable to any other.

Arithmetical Triangle. See Triangle.

Arithmomania, compounded of arithmetic, number, and mania, distinction, a kind of divination, or method of foretelling future events by means of numbers. Didrio distinguishes two sorts of it; one used by the Greeks, who from the number and value of the letters contained in the names, e.g. of two combatants, inferred, that the person whose name consisted of those that were most numerous and of greatest value, would be victorious; and thus they concluded, it is said, that Hector should have been vanquished by Achilles; the other was that of the Chaldeans, who divided their alphabet into three decades, and changing into numeral letters the letters of the names of those who confuted them, they referred each name to some planet, and in this manner formed their prefaces. The Platouilians and Pythagoreans were addicted to the Arithmomania. The gematria, which makes the first species of the Jewish Cabbala, is a foot of Arithmomania. See Ge-matria, and Cabbala.

Arizium, in Ancient Geography, a town of Spain, in Lusitania, situate upon the Tagus, north-east of Ohigo.

Aritzar, in Geography, a town of European Turkey, in the province of Bulgaria, ten miles south of Viddin.

Arivates, in Ancient Geography, a people placed by Pliny in Pannonia.

Arius, in Biography, founder of the sect called Arians, in the beginning of the fourth century, was, according to Epiphanius, a native of Libya; but, according to Photius, of Alexandria. In early life he was probably of the school of Lucian, bishop of Antioch, who favoured the opinions of Paul of Samosata; for Arius, in a letter to Eusebius of Nicomedia, calls him a Collucianist; whence Cave and others have inferred that they were fellow disciples of Lucian. He was appointed deacon by Peter, bishop of Alexandria, and afterwards excommunicated, because he disapproved of the bishop's treatment of Melitian and his adherents. After the martyrdom of Peter, he was re-admitted by Achilles; the next bishop, to the office of deacon, and also ordained presbyter. At this time he was much approved by Alexander, the successor of Achilles, and he was not only presbyter, but excommunicated in one of the churches of Alexandria. About the year 315, the contile commenced between Arius and Alexander, of which as to its rise, progress, and consequences, an account is given under the article Arians. In the year 322, he was excommunicated from the church, and expelled the city by a council convened by Alexander, upon which he withdrew into Palestine, where he formed a strong party of persons who favoured him and his cause. Whith he complained in a letter to Eusebius of Nicomedia, of the persecution he suffered for the sake of the truth, he derived encouragement from the number and rank of those who were attached to his opinions and interests; among whom were several presbyters and bishops. The breach between him and Alexander was thus gradually widened, and parties were formed, who became inveterate and invincible in their opposition to each other. This mutual altercation proceeded to such an extreme, that it furnished a subject of satirical exhibition in the public theatres. The emperor Constantine, in this flag of the dispute, interposed with the best intention to produce mutual reconciliation. But his efforts, as a mediator, were altogether ineffectual; and he himself was at length induced, by the interference of Antin and begotten ecclesiastics, probably against his judgment and不得已, to take an authoritative and active part, with a view of terminating a controversy which had filled the milder methods of pernicious and retributive. For this purpose, he imprudently convened the council of Nice, in order to decide whether the Logos, or only begotten Son, was of the same substance with the Father; and thus, instead of terminating, he perpetuated the divisions of the church, and divided the whole Christian world into "Homousians" and "Homoeans." This council having decided that Christ is consubstantial with the Father, the doctrine of Arius was of course condemned, and the presbyter himself, who was then at Nice, ensuing its determination, was banished by Constantine into a remote province of Illyricum. By an edict of the same emperor, he and his adherents were disqualified with the opprobrious name of Porphyrians, his books were ordered to be burnt, and those who concealed any of them were to be put to death. In a little while, the emperor, who seems to have naturally poissied a candid and benevolent mind, relented, and his conduct towards Arius underwent a total change. Eusebius of Nicomedia, it is said, by means of a presbyter who enjoyed the confidence of Constantine, the emperor, who gained over that lady to the favor of the former, recommended to the emperor this presbyter, by whom he was persuaded to believe, that the faith and conduct of Arius had been misrepresented by his enemies. Upon this Constantine recalled him from banishment; and having received a satisfactory confession of faith, in which he professed his belief, that "the Son was begotten of the Father before all ages," but without any acknowledgment of consubstantiality, recommended to the bishops assembled in council at Jerusalem, A. D. 355, to re-admit him into the communion of the church. The bishops, who are supposed to have been convened Arians, readily complied, and recommended Arius to a cordial reception among other churches. Attempts were made for restoring him to the church of Alexandria, but they were ineffectual, on account of the refusals of Athanasius, who had succeeded Alexander in that see. A day was appointed, by the express command of the emperor, for his reception into the church; at Constantinople's order, on that very day, A. D. 339. It is said, Arius walking in the city, and retiring to obey a sudden call of nature, he discharged his entrails and died on the spot. The glory of his death is related both by the historian Socrates (i. i. c. 25. ii. 38. Ep. ad Serap.) and Athanasius, but with circumstances which very much invalidate its credibility. The learned editor of Mosheim admits the testimonies of Socrates, Sozomen, Athanasius, and others, with respect to the manner of his death, as unexceptionable. The causes of it, however, have involved much matter of dispute. The ancient writers, who considered this event as a judgment of heaven, maliciously procured by the prayers of some, to punish the impiety of Arius, will find little credit in our times, among such as have studied with attention and impartiality the history of Arius. "After having considered this matter with the utmost care," says the writer above mentioned, "it appears to be extremely probable, that this unhappy man was a victim to the resentment of his enemies, and was destroyed by poison, or some such violent method." He adds; "a blind and fanatical zeal for certain items of faith has, in all ages, produced such horrible acts of cruelty and injustice."
The talents and learning of Aratus have been generally admitted; but his delight in allegory and character have been more widely represented by writers of different parties. To this purport we shall take an extract from the account given of him by the echo and impartial Hesiod and on the other hand, "Aratus was very tall, grave and serious, yet affable and courteous. With good natural parts, and no mean facility of figure, peculiar learning of all sorts, he was particularly distinguished by his skill in logic, or the art of disputing. He had at least the outward appearance of piety. In short, he is represented as a man exceedingly well qualified to form a party, and carry on any enterprise he should undertake. So far as I recollect, his conduct was unblemished, excepting what relates to his zeal for maintaining his disputed errors, and that he is charged with detraction of his real enemies upon some occasions, in those difficult circumstances to which he was reduced by the prevailing power of his adversaries."

"I may add here," continues the same author, "that he was much the most spiritual and a full assurance of the truth of his opinions; particularly in his letter to Eschines of Nicomedea, where he базes orthodox, and he tells that truly, that he and his friends were unjustly perjured by Alcimus, as the truth's sake, which conveys all things; that all the bishops of the East in general had been anathematized by Alexander, except Ptolemaeus, Helianus, and Macrius, whom he calls ignorant heretics. As for himself, he was not able to entice their impious doctrine; nor would he ever receive it, though he were to suffer a thousand deaths from those heretics."

One of his biographers says (Gez., B. 58), that "for aught that appears upon the face of his glory, it may be confidently affirmed, that his morals were untainted, and his piety sincere. The incidents of his life afford a strong presumption, that he possessed a genuine love of truth, and adhered to what he judged to be its cause with firm integrity. Had his party prevailed during his life, there can be no doubt, that after his death his name would also have been recorded among the saints; having had the misfortune to be registered by the church which called itself orthodox, among heretics, he can only be found by porcellus in the humblest lot of honest men."

The works of Aratus do not appear to have been voluminous; though, it is probable, that he wrote many letters. We have still extant his epistle to Eschines of Nicomedea, (Ap. Epig. H. 69;) and another to Alexander, bishop of Alexandria (Theod. l. i. c. 57, 8.) He also wrote several little poems, fitted for the use of common people, with a view of promoting his peculiar opinions. A book called "Thalia," but whether it was written in prose or verse, or partly in the one form and partly in the other, is not certain, is mentioned by Socrates (H. E. l. i. c. 9.) and Sosamen (H. E. l. i. c. 21.) and confirmed as wanton and dilatory. It was condemned, as they say, by the council of Nice. Athenaeus (De Sent. Dom. u. v. p. 247.) quotes its several times, and is supposed to have read it; he speaks of its effeminacy and boibonery. It must be owned, however, that this is the testimony of enemies, and that other writers probably took their character of it from Athenaeus. Thelusmenus also mentions, that Aratus also published some works against the heathens in defence of the Christian religion. Soc. Hist. l. i. Sosamen l. i. Cave. Hist. Lit. vol. l. p. 172. Lardner's Works, vol. iv. p. 106-110. Mulheim's Ecl. Hist. vol. i. p. 412-418 Gen. Dist. Gibbon's Hist. vol. iv. p. 228-234.

ARJUANX, in Geography, a town of France, in the department of Landes, and chief place of a canton in the district of Mont-de-Marsan, eleven miles north of Tarbes. The place contains 359, and the canton 725 inhabitants; the territory includes 402. kilometers and 15 c. minutes.

ARIZA, a town of Spain, in Aragon, seated on the Xalon, eight leagues above Calatayud.

ARK, or Arcus in Geometry, Astronomy, &c. See ARCM.

ARK, Arcus, in the Scripture Language, denotes a kind of floating vessel built by Noah, for the preservation of several species of animals from the deluge.

The Hebrew word, by which the ark is expressed, is הַמְנָאִית (hamannayit), or הַמְנַאָה (hamanah), the constructive form of הַמְנָא (hamane), which is evidently the Greek δίκα (dikai), and to the LXX renders the word in θυσίαν, τός, where only it occurs. There they render it xòma. Josephus θερινον, and the Vulgate version, signifying an ark, collar, or chief. Although the ark of Noah answered, in some respects, the purpose of a ship, it is not so certain that it was of the same form; for it was inconclusively argued by Michaelis and some others, that if its form had not been like that of a ship, it could not have resisted the force of the waves; because it was not intended to be conducted, like a ship, from one place to another, but merely to float on the surface of the water." Gen. vii. 17. It appears to have had neither helm, nor sail, nor oars; but was merely a bulky capacious vessel, light enough to be raised aloft with all its contents, by the gradual rise of the deluge. Its shape therefore, was of little importance; more especially as it seems to have been the purpose of providence, in this whole transaction, to signify to those who were saved, as well as to their latest posterity, that their preservation was not in any degree effected by human means. The ark in which Moses was exposed, was a vessel of the same nature, and bears the same name; and some have thought that both were of the same materials. With respect to the etymology of the Hebrew word, the most rational seems to be that of Codius, who derives it from the Arabic word 2717, kollet, from which is formed 2717, or 2717, denoting a place in which things are collected. Forth (De D. l. i. c. 31, Antiquorum,) defines it from two Egyptian words, thot, a ship, and haj, a palm-branch tree; and such ships are still to be seen not only in Egypt, but in India and other countries; particularly in some isles of the Pacific ocean.

The ark has afforded to the critics and naturalists several points of curious inquiry relating to its form, capacity, materials, time of building, place of resting after the flood, &c.

Noah is computed to have been one hundred years in building the ark, viz. from the year of the world 1552, to the flood, which happened in the year 1550; at least this is the common opinion of the fathers, oriental authors, and other learned persons; and to this purpose they allege, that Noah is said to be five hundred years old before any mention is made of the ark. Origen, lib. iv. contra Cels. St. Aulinn, de Civit. Deli. lib. xv. c. 27. and contra Fustum, lib. xi. c. 18. and in his Quod. 5 and 23. On Gen. Rupert, lib. iv. in Gen. xx. affect as much; and are followed by Solan, Turnel, Spondus, Plessier, &c.

Yet Berosus affirms, that Noah only began to build the ark seventy-eight years after the flood. On the other hand, will have it to have been an hundred and twenty years in building. Tschuana fifty-two, and the Mahometans only two years. See the texts, Gen. vi. &c.

Several interpreters of the sacred writings infer from the words of St Peter (1 Ep. iii. 20., "thealogos suffering of God waited in the days of Noah, while the ark was preparing," that Noah was employed in building the ark during the whole time of forebearsance, which was 120 years: but others think the time much shorter, because Noah's three sons, the chief of whom was born in his 50th year, are not only mentioned before the directions given for the ark, but they and their wives are ordered, in those directions to be taken into the ark; a circumstance which
ARK.

which seems to imply that they were then married. Some, in order to evade this difficulty, have said that when Noah is declared (Gen. vi. 32.) to have begotten Shem, Ham, and Japheth, at the age of 500 years, it should be translated, "he had begotten," instead of "he begat." F. Fournier, in his Hydrography, adopts the opinion of the fathers; noting that the hands employed in it were only Noah and his three sons. To this purpose he alleges the instance of Archias of Corinth, who, with the help of three hundred workmen, built Hiero's great ship in one year. Add, that Noah's eldest son was not born till about the time when the ark was begun, and the younger after: so that it was a long time before they could do their father any service. Upon the whole it may be observed that there is no such connection or exact order of time in the whole narration as to establish any of these conjectures. But it is certain, that so large a building, and the previous preparations, could not have been the work of a few years.

The wood whereof the ark was built, is called in scripture "gopher wood," and in the LXX. οἶνος γαβριαίς, "gopher wood," and in the Vulgate, "pinus pinifera," "gopher wood." Onkelos and Jonathan render gopher by דִּבָּר, "eker, cedar." St. Jerome, in the Vulgate, by ligia levigata, plane wood; and elsewhere, ligia bituminata, q.d. pitched wood, which is adopted by Delgado, a learned London Jew. Kimchi translates it "wood most proper to float." Vatable, "light wood," which swins in the water without corrupting; Junius Tremellius, and Buxtorf, a kind of "cedar," by the Greeks called κητβαξι; Avenarius and Munster, "pine." Fuller and Bochart, "cypræs," and the "ebyon-tree;" others, "fir;" Caftalio, "turpentine," &c. Pelletier prefers the opinion of those who hold the ark made of cedar: his reasons are, the incorruptibility of that wood; the great plenty thereof in Asia, whence Herodotus and Theophrastus relate, that the kings of Egypt and Syria built whole fleets of it in lieu of deal; and the common tradition throughout the East imports, that the ark is preferred entire to this day on mount Arafa. The Mahometans explain it by the word "Sag," or the Indian plane-tree. To these various conjectures may be added that of Dr. Geddes (Crit. Rem. vol. i. p. 67.), who apprehends, that the Syriac translator has given the true meaning in the word נְבָר, rendered in the polyglot by the Latin word vinum, signifying in general a twig, rod, or wicker of any kind. In Arabic the same word signifies a cheffet, coffer, or basket made of twigs, particularly of palm-tree leaves. And, indeed, all the first vessels of capacity, whether coffer, ark, or ship, seem to have been composed of the same materials. The ship or ark of Noah, says this writer, was a large coffer formed of twigs, like balfet work, and covered over with bitumen, both within and without, to keep out the water. Whether those twigs were of such, or palm-tree, or hazel, or poplar, or birch, or juniper, or any other kind of vinnamonous wood, he does not presume absolutely to determine; but he thinks it must have been the oifer, which, as we learn from Columella, was considered as the principal of the wicker kind. It is certain, that boats, balfets, and ships, were originally made of such twigs, and particularly of oifer; and even those, which were externally covered with skins, had other ribs at the base of that wood, on account of its pliability. See Herodotus (Clio); or Niebuhr's Arabia, vol. ii. p. 175.

The figure of the ark was that of an oblong square, or parallelepiped, with a flat bottom, and it was gradually contracted at the top, in the form of a floping roof; and this roof rofe in the middle a whole cubit higher than its extremities. This slope was sufficient, when covered with bitumen, to let the water pass easily off the deck. This vessel was, without doubt, so contrived as to admit air and light, though the particular conformation of the air-vents or windows be not mentioned. Bryant (Anal. Anc. Myth. vol. ii. p. 195.) supposes, that it was so closed up and fastened, that the persons within it were confined to darkness; having no light but what they received from lamps and torches. They could not therefore have been witnesses to the general calamity of mankind; nor see the mighty eruption of the waters, nor the turbulence of the seas. Some, with this writer, have supposed that they had one window above a cubit in diameter; but others have thought that the term יִיבָר refers to the floping roof, and that the windows are not particularly mentioned.

The ark, whatever were the materials of which it consisted, was pitched over, or coated with bitumen, such as some have supposed to be used in building the tower of Babel; and it has been observed, that the bitumen judaicum, or aphthalus, was the most proper of all substances for this purpose. At first, it was foil, vitious, and plaible, and might be thrust into every chasm and crevice with the greatest ease; but it would soon acquire a tenacity and hardness superior to those of our pitch. A coat of it spread over both the inside and outside of an ark, even of wicker work, would render it perfectly water-proof and impregnable: and the longer it was kept in the water, the harder and stronger it would grow. The Arabs still use it in covering their vessels; and mixed with a tenth part of common pitch, it is called "philaphalus," and has been employed to the same purpose in our days by M. de la Sabloniere at L'Orient. Beroysus says, that the people of Armenia, where it was supposed that the ark refled, scraped off the aphthalus, and used it as a charm; and Abüdenus informs us, that small pieces of the wood were carried about by way of amulet.

As to the place where the ark was built, there have been different opinions; some have supposed that it was built in Palestine, and that Noah planted the cedars, of which it is said to be made, on the plains of Sodom; others imagine that it was built on mount Caucasus, on the confines of India; and others refer it to China, where Noah was supposed to have lived before the flood; but it was probably constructed not far from mount Ararat, where it rested, as it was not of a form which would allow of its being driven to a great distance. It is therefore most reasonable to imagine, that it was built in Chaldæa, in the territories of Babylon, where, it is said, there was so great a quantity of cypress in the groves and gardens in the time of Alexander, that he constructed a whole fleet of it for want of other timber; and this conjecture is confirmed by the Chaldæan tradition which makes Xifithrus, the Noah of Beroysus, fail from that country.

The dimensions of the ark, as delivered by Moses, are three hundred cubits in length, fifty in breadth, and thirty in height; which, compared with the great number of things it was to contain, seem to many to have been too scanty: and hence an argument has been drawn against the authority of the relation. Apelles, one of Marcion's disciples, objected to it, and Celsus ridiculed it, calling it "sublumination, the absurd ark." To solve this difficulty, many, both of the ancient fathers and later critics, have been very much perplexed. Origen, St. Augustine, and others maintain, that by the cubit here spoken of, we are to understand the Egyptian geometrical cubit, equal, according to them, to six vulgar cubits, or nine feet. But the truth is, it does not appear there ever was any such measure as a geometrical cubit either among Egyptians or Jews.—Others, as Sir W. Raleigh, account for it by assuming the stature of mankin'
mankind in the first ages to have been much greater than in our days; and consequently the cubit, which is taken for a part of the human body, proportionally larger. But this does not avail, since the same reason will infer an equal augmentation of the size of other animals. Others suppose the facred cubit to have been here spoken of, which was a hand's breadth longer than the civil one; but this only affords a small supply; besides, the facred cubit does not appear to have been ever used, except in facred edifices, as the temple and tabernacle.

This difficulty is much better solved by Butero and Kircher, who, supposing the common cubit a foot and a half, prove geometrically that the ark was abundantly sufficient for all the animals supposed to be lodged therein. The capacity of the ark will be doubled, if we admit with Cumberland, &c. that the Jewish cubit was 21.88 inches. According to this measure, it must have been 54.72 English feet long, 91.12 broad, and 54.72 high; and its solid contents 2,730,811,9008 feet. Smeulius computs the ark to have been about half an acre in area. Cuneus and others have also calculated the capacity of the ark.—Dr. Arbuthnot computes it to have been 81,062 tons. Father Lamy says, that it was an hundred and ten feet longer than the church of St. Mary at Paris, and sixty-four feet narrower; to which his English translator adds, that it must have been longer than St. Paul's church in London, from west to ealt, broader than that church is high in the infide, and about sixty-four feet in height, of our measure.

The things contained in the ark were, beside eight persons of Noah's family, one pair of every species of unclean animals, and even pair of every species of clean animals, with provisions for them all, during the whole year.—The former appears, at first view almost infinite; but if we come to a calculation, the number of species of animals will be found much smaller than is generally imagined; out of which, in this case, are to be exempted fuch animals as can live in the water; and bishop Wilkins imagines, that only seventy-two of the quadruped kind needed a place in the ark. Mr. Kirwan (Irish Trans. vol. vi. p. 291.) with a view of solving the objection arifing from the difficulty of collecting or finding all the various species of animals now known, some of which can only exit in the hottest, and others only in the coldest climates, apprehends that no others were collected in the ark besides those that were most 'necifary for the use of man, and those only of the granivorous or granivorous classes. At this early period, ravenous animals were not only unnecessary, but would have been even deftructive to those which had just obtained existence, and probably not in great numbers: they only became necifary, when the granivorous had multiplied to such a degree that their carcaces would have fupplied fufficient food to the human inhabitants of the ark. Hence it appears, they should have been of posterior creation: and thus he also accounts for the existence of those that are peculiar to America and the torrid and frigid zones. Such is the singular hypothesis of this ingenious naturalist.

The ark appears to have been divided into three fories; and it is agreed on, as most probable, that the lowest flory was defigned for the beasts, the middle for the food, and the upper for the birds, with Noah and his family; each flory being subdivided into different apartments, flats, &c. Though Josephus, Philo, and other commentators add a kind of fourth flory under all the rest; being, as it were, the hold of the vefcl, to contain the ballast, and receive the felony and feces of fo many animals.

Drexelius makes three hundred apartments; father Fournier, three hundred and thirty-three; the anonymous authur of the Questions on Genesis, four hundred; Butero, Temporarius, Arien Montanus, Wilkins, Lamy, and others, suppose as many partitions as there were different fpecies of animals. —Pelletier only makes seventy-two, viz. thirty-four for the birds, and as many for the beafts: his reafon is, that if we suppose a greater number, as three hundred and thirty-three, or four hundred, each of the eight persons in the ark must have had thirty-four, forty-one, or fifty flats to attend and cleanse daily, which he thinks impossible. But there is not much in this; to diminish the number of flats, without a diminution of the animals, is vain; it being perhaps more difficult to take care of three hundred animals in seventy-two flats, than in three hundred. Butero computes, that all the animals contained in the ark could not be equal to five hundred horses; he even reduces the whole to fifty-four pairs of oxen. Father Lamy enlarges it to sixty-four pairs, or an hundred and twenty-eight oxen; so that supposing one ox equal to two horse, if the ark had room for two hundred and fifty-four horses, there must have been room for all the animals. And the fame authors demonstrate, that one floor of it would suffice for five hundred horses, allowing nine square feet to a horse.

As to the food on the second flory, it is obferved by Butero, from Columella, that thirty or forty pounds of hay ordinarily fuffices an ox for a day: and that a solid cubit of hay, as usually prefixed down in our hay-racks, weighs about forty pounds; fo that a square cubit of hay is more than enough for one ox one day. Now it appears that the second flory contained 150,000 solid cubits; which, divided between two hundred and fix oxen, will afford each more hay by two-thirds than he can eat in a year.

Bishop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies, and their food, to twenty-seven wolves; and all the reft to two hundred and eighty beeves. For the former he allows the fufficiency of 1875 fheep, and for the latter 109,500 cubits of hay: all which will be easily contained in the two firft flories, and much room to spare. As to the third flor, no body doubts its being fufficient for the fowls, with Noah and his fons and daughter.

Upon the whole, the learned bishop remarks, that of the two, it appears more difficult to affign a number and bulk of necifary things to answer the capacity of the ark, than to find fufficient room for the feveral fpecies of animals already known to have been there. —This he attributes to the imperfection of our lifts of animals, especially those of the unknown parts of the earth; adding, that the most expert mathematician at this day could not affign the proportions of a vehicle better accommodated to the purpose than is here done; and hence finally concludes, that the capacity of the ark, which had been made an objection against fcripture, ought to be efcounted a confirmation of its divine authority; fince, in those rude ages, men being lefs verfed in arts and philofophy, were more obnoxious to vulgar prejudices than now; fo that had it been a human invention, it would have been controvirted according to those wild apprehenfions which arise from a confused and general view of things, as much too big, as it has been represented too little. If we suppose that many animals would probably become torpid during the cold of the deluge, or consume little food whilst they were confined in a flate of darknefs, the means of fufficiency laid up in store for them would be thus diminished. Besides, it would be sufficient to preferve the eggs of thofe animals that are oviparous; and many of them would be lodged in the earth with the feeds of plants, kernels of fruits, &c.; and thus the labour attending such as were preferved in the ark would be leffened; and room would be obtained for difposing a variety
A R K.

variety of instruments and utensils which would be wasted immediately or soon after the deluge had subsided. So that, all circumstances considered, the capacity of the ark might be found fully adequate to all the purposes of its construction, and for preserving an ample supply of every thing that would be necessary for raising a new flock of animals and vegetables, after the deluge had subsided.

Those who have objected to the Mosiac history of the deluge, ought candidly to consider the several particulars that have been above stated; and they ought also to recollect, that the several varieties and species of both plants and brute animals, which differ from each other by small degrees, seem to be multiplied every day by the vicissitudes of climates, culture, food, mixture, &c. On the supposition of an universal deluge, which is confirmed by the general history of the world, and by a variety of existing facts and monuments, such a structure as the ark, for the preservation and multiplication of various animals, seems to have been absolutely necessary; for as we can trace up the first imperfect rudiments of the art of shipping amongst the Greeks, there could be no shipping before the flood; and, consequently, no animals could have been saved. Nay, it is highly improbable that even men and domestic animals could have been saved, not to mention wild beasts, serpents, &c. through we should suppose, that the antediluvians had shipping, unless we suppose also, that they had a divine intimation and direction about it, such as Moses relates; but this would be to give up the cause of infidelity.

Hartley's Obi. on Man, p. 372. Dr. Bryant (Anal. Anc. Myth, vol. ii. p. 213, &c.) has collected a variety of ancient historical relations, which shew that fome records concerning the ark had been preserved among most nations of the world, and the general fystem of Gentile mythology. Abydenus, with whom all the earlier writers concur, informs us that the place of descent from the ark was Armenia; and that its remains had been preserved for a long time. Plutarch (De Solert. Anim. Oper. vol. ii. p. 508,) mentions the Noachic dove, and its being sent out of the ark. Lucian (De Dea Syria, vol. ii. p. 882,) speaks of Deucalion's going forth from the ark, and raising an altar to God. The priests of Ammonia had a cultus, at particular seasons, of carrying in procession a boat, in which was an oracular shrine, held in great veneration: and this cultus of carrying the deity in an ark or boat, was in use also among the Egyptians. Bishop Pococke has preserved three specimens of ancient sculpture, in which this ceremony is displayed. They were very ancient, and found by him in Upper Egypt. Vid. Diod. Sicul. l. xvii. p. 528. Pococke's Works, vol. i. p. 252. The ship of his referred to the Ark, and its name "Baris," was that of the mountain corresponding to Ararat in Armenia. Bryant finds refer to the ark in the temples of the serpent-worship, called "Dracoth," and also in that of Selusiris, founded after the model of the ark, in commemoration of which it was built, and consecrated to Obris at Theba; and he conjectures, that the city, said to be one of the most ancient in Egypt, as well as the province, was denominated from it. Theba being the appellation of the ark. In other countries, as well as in Egypt, an ark, or ship, was introduced in their mysteries, and often carried about in the feasons of their festivities. He finds also in the story of the Argonauts several particulars, that are thought to refer to the ark of Noah. As many cities, not in Egypt only and Boeotia, but in Cilicia, Ionia, Athens, Pheonicia, Carthage, Syria, and Italy, were called Theba; so likewise the city Apanema was denominated Ciboton, from ἡ κύρος, in memory of the ark, and of the history connected with it. The ark, according to the traditions of the Gentile world, was prophetic; and was regarded as a kind of temple, or refeence of the deity. It comprehended all mankind, within the circle of eight persons, who were thought to be so highly favoured of heaven, that they at first were reputed to be deities. Hence in the ancient mythology of Egypt, there were precisely eight gods (Diod. Sic. i. i. p. 12.), and the ark was esteemed an emblem of the system of the heavens. The constellation Aquarius, in particular, and the great effusion of that element, as it is depicted in the sphere, undoubtedly related to this history. The principal terms by which the ancients distinguished the ark, were Theba, Baris, Argus, Aien, Aren, Arni, Laris, Bouta, Bocotus, and Cibotus; and out of these they formed different periphanies. As the sky in the ark was an intermediate state between a loft world and a world renewed, this was alluded to in the hieroglyphical representations of the Gentile writers. See Janus, Prometheus, and Saturn. As the ark was represented under the figure of a ship, basted αὐτον ἀγγειον, i.e. whose extremities were alike, which formed a kind of crecent, the new moon, appearing in this shape, was made a type of the ark. Hence, in the mythology of the ark, and the Jônah or dove, there is continually some reference to the moon; and hence the moon was esteemed by the Egyptians the mother of all beings, for the moon and the ark were synonymous terms.

ARK.

Ark of the Covenant, or of the Testimony, in Scripture, denotes a kind of chest made of shittim wood, overlaid with gold and without with pure gold, 2 ¹/₂ cubits long, 1 ½ broad, and 1 ½ deep, in which, by God's command, Exod. xxv. 16. were kept the two tables of stone, on which God had engraven the ten commandments, given to Moses on the mount, and held in high veneration among the Hebrews. It contained likewise the golden pot that had manna, and Aaron's rod, and the tables of the covenant. Hebr. ix. 4.

The ark was reposed in the holiest part of the tabernacle. — It was taken by the Philistines, and detained twenty, some say forty years, at Kirjath-Jearim; but the people being afflicted with epidemic disease, on account of it, returned it with divers presents. It was afterwards placed in the temple. See Plate 1. Miscellany.

The lid or covering of the ark was called the propitiatory, or mercy seat; over which were two figures placed, called Cherubim, with expanded wings of a peculiar form. This covering was made of pure gold, of equal length and breadth with the ark, and kept flady by a crown or coronet of gold, which also served as an ornament. The covering was called הָעֵפָן, a word which may be derived from covering or from exspiring, as in the language of scripture, when sins are forgiven, they are said to be covered. The septuagint have joined both forms together in their translation, εἰρήκον ἑκάστου. Over this covering, and between the wings of the cherubim, was the place, where the Schecinah reeled, both in the tabernacle and temple, in a visible cloud; hence it is called the holy of holies, and they high priest appeared before this mercy-seat once a year, on the great day of expiation; and the Jews, wherever they worshipped, turned their faces towards the place where the ark flour'd. In the second temple there was also an ark, made of the same shape and dimensions with the first, and put in the same place, but without any of its contents and peculiar honours. It was used as a representative of the former, on the day of expiation, and a repository of the original copy of the holy scriptures, collected by Ezra and the men of the great lyagogue, after the captivity. And in imitation of this, the Jews to this day have a kind of ark in their synagogues, wherein their
ARK

sacred books are reposed: this they call arem. Leo of Modena gives a description of it, in his account of the customs and ceremonies of those of his nation: "The Jews (they say), in the corners of their synagogues, have an ark, or armarv, called arem; in memory of the ark of the covenant. In this are preferred the five books of Moses, written on vellum, with ink made on purpose." &c. Some have supposed that the figure of this ark is still remaining on the triumphal arch of Titus at Rome; though Villalidos and others, with greater reason, are of opinion that it is the table of Alhambra. Prideaux's Conn. vol. ii. p. 297. Lowman's Traits, p. 132. Tertullian calls this ark, Armamentum Judaicum; whence the phrase, to be in the armarv of the synagogue, q. d. in the number of canonical writings.

A chest or coffier, very nearly resembling the Jewish ark, and called the "house of the God," was found in Hussein, one of the islands of the southern sea. Mr. (Sir Joseph) Banks could obtain no other information concerning it than what the name imports. Hawkewthorn's Account, &c. vol. ii. p. 252.

Ark is used for a large chest, in which corn and fruit are deposited.

ARK, or ARKs, in Conchology, the trivial English name of all such shells as belong to the Linnaean genus Arca, and corresponding with the French name Arche. See ARCA.

ARK island, in Geography, one of the two small islands, which lie between the islands of Guernsey and Sark; the other is called Arm.

ARKA. See ARCA.

ARKADEL, Gial com or Jacques, in Biography, was a disciple of Juiquin, and seems to have spent the chief part of his life in Italy, as the first editions of his principal works were printed at Venice, between the years 1539 and 1575.

The number of his motets that was published then, in different collections of the times, is very considerable; but his madrigals were received with such avidity, that five books of them were published at Venice, between the years 1539 and 1541, in one of which is the celebrated madrigal, Il bianco e dolce signor contadino nuoro, highly favoured all over Europe; and his reputation for this species of composition was so great in Italy, that, according to Adami, who enumerates him among theingers and composers of the pontifical chapel, his name was sometimes prefixed to the productions of others, in order to forward their sale.

Why Du Verdier and others have called Arkadel a Frenchman, Dr. Burney do not know: his master, at least, was a Netherlander, and his name has a very Flemish appearance. He was at Venice in the elder Doni's time, and composed chiefly to Latin and Italian words. Whatever country gave him birth, he was an excellent composer; and, for the time in which he lived, his melodies are uncommonly natural, smooth, and graceful.

ARKADINSKAIO, in Geography, a town of Russian Tartary, in the country of the Collacks, on the river Medveditz, 240 miles north-east of Azep, and 124 south-west of Stratov. N. lat. 50° 10'. E. long. 43° 4'.

ARKANSAS, a north-west branch of Missipii river, which falls in by two mouths, and forms an island, whose north-western point lies in N. lat. 33° 55'. W. long. 91°. Its length is thirty-five, and breadth ten miles.

ARKEEKO, a town of Abysinia, seated on a large bay of the Arabian gulf, and confining of about 400 houses, of which some few are built of clay, and the rest of coarse grass-like reeds. There is water enough for large ships close to Arkéeko, but as the bay is open to the north-east, it is uneasy riding in blowing weather. The bottom is composed of loft sand. In standing in upon Arkéeko from the sea, through the canal between Shekh Scide and the main land, it is necessary to range the coast about a third nearer the main than the island. The point, or Shekh Scide, stretches far out, and has shallow water upon it. The cape that forms the south west side of the large bay is called "Ras Gedem," being the rocky base of a high mountain of that name, seen at a considerable distance from sea, and distinguished by its form, which is that of a hog's back. In the bay between Arkéeko and Maféesh are two islands, Toudlout and Shekh Scide; the first on the west, the other on the south, both uninhabited and delitute of water. Shekh Scide has a marble, or fain't's tomb, on the west end. It is not half a mile in length, when not overflowed; but has two large points of sand which run far out to the sea and well. Its well point runs so near to Toudlout, as, at low water, scarcely to leave a channel for the breadth of a boat to pass. N. lat. 15° 33'. E. long. 59° 30'. Bruce's Trav. vol. iii. p. 56.

ARKEL, a district of the united provinces, in the low countries, belonging particularly to that of Holland; comprehending the town and city of Afpeira, of Heuchel, and some villages; and otherwise called the country of Gorkum.

ARKI, a town of European Turkey, situate in Bosnia, at the mouth of the river Bofna.

ARKITES, in Ancient Geography, the descendants of Canna, who inhabited the town of Ark or Arca.

ARKITES, were also a people so denominated, according to Bryant in his "Analysis of Ancient Mythology," from Noah's ark, and the descendants of this venerable patriarch, who sent out various colonies that established themselves in different countries of the globe. They were distinguished by their peculiar rites, and they gave names to the different countries and towns in which they settled, which had a reference to the ark, and their ancestors who were preferred by it from the destruction of the deluge. Thos of whom they came into Greece, settled in many parts, but especially in Argolis and Thessaly, where they introduced their rites and worship. In the former of these regions, they were commemorated under a notion of the arrival of Daunas, or Danaus, supposed to have been a person who fled from his brother Agamemnon; and was in a sacred ship given by Minerva; which, like the Aro, is said to have been the first ship that was constructed, and he was assisted in the building of it by the same deity, divine wisdom. Danaus, upon his arrival, built a temple, called Argus, to Jônah, or Jono, of which he made his daughters priestesses. The people of the place had an obscure tradition of a deluge from which some few escaped, the principal of whom was Deucalion, who took refuge in the Acropolis, or temple. The Arkites who settled in Thessaly carried with them the same memorials, concerning Deucalion and his deliverance, which they appropriated to their own country. These Arkites, and their rites, extended very widely, from Chaldea and Babylonia, where they originated; and passed from Egypt and Syria, to Phrygia and Pontus, Thrace and the cities of Greece; and they were likewise carried into Hetruria, and into the regions of the Celn, and traces of them are to be observed as high up as the Suevi. Bryant thinks, that the Arkite rites prevailed in many parts of Britain, especially in the isle of Mona, which was afterwards the chief seat of the Saroniodes or Druids; and he conceives, that this island had its name Mona, or Menai, Men-ai, the island of the god Lunnus, from its rites. The same worship was probably further introduced, as he imagines, into some of the Scottish isles, and particularly into that called Columb-kil or Columba. To the claps of Arkite priests Bryant refers the Cabiri, or Curetes, Corybantes,
A R K

bantes, Telephines, and Idai Dafylyi, who belonged to the same order, under different denominations. See ARGOLIS, ARGONAUTS, and ARK.

ARKK-T-KAN, in Geography, a town of Alfaci Turkey, in the province of Caramania, eighteen miles east of Alikhehr.

ARKLOW, a small neat town of the county of Wicklow, in Ireland; situate near the mouth of the little river Owen, or Ovo; and having a haven for small craft. The copper mine company have had thoughts of making the river navigable to Rathdrum; but the port is so bad, and the coast so sandy, that the vessels must remain about a mile off, and put out to sea on the flight appearance of bad weather. There was a desperate battle fought here, on the 9th of June 1793, between the insurgents, twenty thousand strong, and the king's troops and yeomanry under general Needham. The town was set fire to by the rebels, and great part of it destroyed; but they were finally repulsed with considerable loss. Distance from Dublin thirty-six miles. N. lat. 52° 48'. W. long. 6° 51'.—In 1795, a discovery was made of native gold in a brook that descends from the north-east side of a mountain about 600 yards above the level of the sea called Kinsbally, and situate about seven English miles to the west of Arklow. This discovery was made public, and the researches for gold began early in the month of September, and continued till the 18th of October, during which period of about six weeks, the quantity of gold that is supposed to have been collected amounted to 500 ounces. The gold was of a bright yellow colour, perfectly malleable; and it was found in pieces of various weights, forms, and sizes, from the most minute particle to 237.7 dwts.; one piece of 2 oz. and another of 22 oz. were also found. Two specimens of this gold were assayed by his majesty's assay-master in the tower of London; one of which appeared to contain, in 24 carats, 11% of fine gold, 12% of fine silver, and 3% of alloy, which seemed to be copper tinged with a little iron. The works were taken possession of by order of government; and the operations of the peatmen, who in great numbers had been indolent in their researches, were discontinued. Phil. Trans. vol. lxxxvi. p. 34—45.

ARKLOW bank, denotes sand-banks in the Irish sea, about ten miles long, and scarcely one broad, five miles from the coast of Ireland, having the town of Arklow nearly opposite to the middle part of them.

ARKWRIGHT, Sir Richard, in Biography, an eminent manufacturer, advanced himself, by his mechanical inventions for carding and spinning cotton, from the humble station of a country barber to an immense fortune and an honorary title. For performing these operations of carding and spinning by means of machinery, it was required either that the usual manner of the carder should be effaced with square cards, or that cylinders, covered with a kind of metallic brush-work, should be made to revolve in contact with each other, either to card or to strip, according as the respective velocities, directions, and inclinations of their wires might be adjusted. With regard to spinning, it would be indispensably necessary, not only that the raw material should be very nicely prepared, but also that it should be regularly drawn out by certain parts representing the fingers and thumbs of the spinner. The contrivance for this purpose consisted of a certain number of pairs of cylinders, each pair revolving in contact with each other. Suppose then that a loose thread or slightly twisted carding of cotton were made to pass between one pair of cylinders, properly adapted with a facing for holding it, and that it proceeded from thence to another pair, whole surfaces revolved with a much greater velocity; it is evident, that this quicker revolution would draw out the cotton, and render it thinner and longer when it came to be delivered at the other side. This is the operation which the spinner performs with his finger and thumb; and if the cotton be delivered to a spinning apparatus, it will be converted into thread.

Sir R. Arkwright contrived to make these rotatory carding and spinning engines to move by horse, by water, and by steam; and thus, by the saving of labour, and with the advantage of a patent monopoly, he was rendered one of the most opulent of our manufacturers.

After he had quitted his original busines; in the year 1757, he came to Warrington, where he projected a mechanical contrivance for a kind of perpetual motion. A clock-maker of this town, whose name was John Kay, accused him from it, and suggested that much money might be gained by an engine for spinning cotton, which Kay promised to describe. Arkwright at first objected, but afterwards asked Kay, if this engine might be made at a small expense? Kay had been employed in making a cotton spinning engine; and in the trial for setting aside Arkwright's patent, it was proved that he had invented such an engine, but he had not brought it to perfection. Kay and Arkwright applied to Peter Atherton, Esq. of Liverpool, for assistance in the construction of such an engine, who, discouraged by the mean appearance of the latter, declined undertaking it; though he from after agreed to lend Kay a smith and watch-look maker to prepare the heavier part of the engine, whilst Kay himself undertook to make the clock-maker's part of it, and to instruct the workmen. In this way Arkwright's first engine, for which he afterwards took out a patent, was made. Mr. Arkwright soon after connected himself in partnership with Mr. Smalley of Preston in Lancashire; but their property failing, they went to Nottingham, and there, by the assistance of wealthy individuals, erected a considerable cotton mill turned by horses. A person of the name of Hayes had also employed himself in making cylindrical carding engines. Upon the whole, without minutely detailing further particulars, it appears that the cotton spinning was no new attempt when Mr. Arkwright embarked in it; but many difficulties occurred in bringing it to perfection. In the hands of Mr. Arkwright, the carding and spinning of cotton became a great national manufacture. According to his statement, it appears that the advancement of it during a period of five years, cost him and those that were concerned with him 12,000l. before they derived from it any profit; and it must be allowed, that he alone seems to have had sufficient perseverance, activity, and skill to perfect a scheme, in the prosecution of which many others had failed, and to render it valuable to himself and the public. The merits of Sir R. Arkwright may be summed up with observing, that the object in which he was engaged is of the highest public value; that though his family were enriched, the benefits which have accrued to the nation, have been incalculably greater; and that upon the whole, he is entitled to the respect and admiration of the world." He was knighted by his present majesty on the 24th of December 1786, on occasion of presenting an address from the high sheriff and hundreds of Wirksworth; and died at his works at Crumford in Derbyshire, August 3d, 1792. Gen. Biog. ARL, Gross, in Geography, a town of Germany, in the circle of Bavaria, and biphopric of Salzburg, 10 miles S.W. of Radstadt, and 35 S.S.E. of Salzburg.—Alno, a river of Germany, which runs into the Salza, about 6 miles S.W. of St. John, in the biphopric of Salzburg.

A R L, Klein, a river of Germany, which runs into the Salza, near the town of St. John.

ARLAND, a town of France, in the department of Puy de Dome; and chief place of a canton in the district of Ambert—
hert, 3 leagues south of Amherst. The place contains 7,140,000, and the canton 10,974 inhabitants; the territory includes 167,500,000, and 84 communes.

ARLANZA, a river of Spain, which runs into the Pinarre, between Valvina and Valladolid.

ARLANZO, a town of Spain, in Old Castile, 3 leagues from Lerma.

ARLANZON, a river of Spain, which joins the Arlanza, near Palencia.

ARLAUD, James Anthony, in Biography, a famous painter, was born at Geneva in 1608. His principal attention was devoted to portrait painting, and he excelled in it to such a degree, that the regent duke of Orleans, who favoured him with his patronage at Paris, paid of him, that while other miniature painters produced only images, he had found the means to paint portraits. In 1721 he visited England, and being recommended to the princes of Wales, afterwards queen Caroline, he was much favoured by the court. After leaving England, he made a tour through the provinces of France, and afterwards to Switzerland. Besides portraits, Arland produced some historical pieces, and other works. His Leods, which are copied from a bas-relief of Michael Angelo, which, at a small distance appeared like the original marble, he destroyed, because he thought it too licentious. After a residence of about 40 years at Paris, he returned with a handsome fortune and a good collection of pictures to his native place; where he died in 1745, at the age of 75 years. His valuable collection of paintings, drawings, models, and rare books, he left to the public library of Geneva. Moriri.

ARLAY, in Geography, a town of France, in the department of Jura, and chief place of a canton in the district of Lons-le-Saunier, five miles north of Lons-le-Saunier.

ARLBERG, a mountain of Germany, in the Tyrol, being a part of the Alps, between Bregenz and the lake of Constance.

ARLE, a river of Denmark, which runs into the North sea, four miles south of Bredleede.

ARLEN, a town of Germany, in the county of Tyrol, situate on a mountain, 8 miles N.W. of Landeck.

ARLÉQUIN, or HARLEQUIN, in Natural History, a trivial English name occasionally applied to some birds, insects, shells, and other objects of natural history, that are remarkable for a variety of colours; thus the Tricholus multicolor of Gmelin is called by Dr. Latham the harlequin humming-bird, and the name may be introduced by various other instances of the like nature. — The French naturalists adopt the term arlequin also; for example, arlequin de Ceylanum, the common name of the prionus longimanus, Prion longimanum (Ceranys longimanus of Linnaeus); arlequin doré, the name given by Geofoffy to their Chrysonela cérélle (Chrysonela ceriella of Linnaeus); and arlequin velus, a name given likewise by Geofoffy to their Cétonce velus (Cétonia hirta of Fabricius).

ARLES, in Geography, a town of France, in the department of the East Pyrenees, and chief place of a canton in the district of Ceret, 18 miles S.W. of Perpignan. The place contains 1,126, and the canton 47,766 inhabitants; the territory includes 1,074,750,000, and 14 communes. N. lat. 42° 27'. E. long. 2° 32'.

ARLES, a city of France, and principal place of a district in the department of the mouths of the Rhone, and chief place of a canton, in the district of Tarascon, was, before the revolution, the seat of an archbishop. It is situated in the midst of a fertile country, which produces corn, wine, manna, oil, and fruit of various kinds. This city has several monuments of antiquity, which are worthy of notice. The amphitheatre is of an oval form, and was begun by Julius Cæsar, but never finished. It is in circumference about 1,164 feet, and the front is 102 feet in height. The arena, or middle, is 426 feet long, and 312 broad; the porticos or piazzas are three stories high, built with very large stones, and each of them consists of 60 arches, which in part still remain. The obelisk is of granite, 58 feet high, and 7 feet in diameter at the base, the pedastal is adorned with four lions in marble, and at the top is a blue ball, on which are flower-de-luces of gold, and terminated by a fin. It was dug up near the walls of the city in 1677, erected in the following year, and dedicated to Louis XIV. Here are the ruins of two temples; the remains of a triumphal arch; two large columns of Grecian marble; the wreck of a capital built here by the Romans; the burying place of the Pagans and Christians, set up on the top of a hill, consisting of two parts; one called "Campus Elymus," or "Efiharm," and the other "Moulhires," that of the Pagans being distinguished by two letters, D. M. "Diei munus," and that of the Christians by a cross. Various pieces of gold, silver, and bronze have been found here: and also urns, lamps, and cups, without number. It was at Arles that the statue of Diana was dug up, which was removed to the gallery of Varriæles. On a column erected in honour of Constance the Great, who made this city the seat of empire, repaired its walls, and built a palace in it, is an inscription, which imports that he was the reforer of Arleata or Arles. Thirteen councils were held in this city, between the years 353 and 1661. At Arles there is an academy of belles lettres founded in 1609; the academy of sciences was discontinued after the life of Louis XIV., by whom it was founded. The marshy land that lies in the vicinity of Arles renders it unwholesome. The place contains 9,000, and the canton 23,020 inhabitants; the territory includes 1,047,950,000, and 15 communes. N. lat. 43° 4'. E. long. 4° 25'.

ARLESHEIM, a small but pleasant town of Switserland, about 4 miles from Basle. Within a quarter of a mile from this town is a beautiful hermitage, designed for the employment of the poor in a season of great scarcity, and furnishing agreeable walks for the inhabitants of the town. The walks are carried along the sides of rocks, which are richly wooded, and through a semicircular plain, bounded by fertile hills, and watered by a small lake; several natural caverns add to the romantic singularity of the scenery; while many transparent streams, brought from a considerable distance, fall in small cascades, or bubble from the ground like clear springs.

ARLESUX, a town of France, in the department of the North, and chief place of a canton in the district of Douay, 8 miles N.W. of Cambray. The place contains 1,460, and the canton 9,038 inhabitants; the territory includes 165,950,000, and 15 communes. N. lat. 50° 17'. E. long. 3° 10'.

ARLINGTON, a township in Bennington county, Vermont, 12 miles north from Bennington, containing 561 inhabitants.

ASLINGTON Bay, lies on the east coast of Ireland, within the entrance of Carlingford bay.

ARLINGTON'S Island, is situated not far from the south shore of Magheallan's Strait.

ARLON, a town of the Netherlands, in the comté of Chast, annexed to the county of Luxembourg; and by the new arrangement, in the department of the Forets, and chief place of a canton in the district of Luxembourg. It is a town on a hill near the source of the river Semoir, 17 miles east of Luxembourg, and 14 south of Buitague. The place contains 3,140, and the canton 14,680 inhabitants; the territory includes 310,050,000, and 13 communes. N. lat. 49° 53'. E. long. 5° 27'.

ARLOTTO, in PIOVANO, or the Deux, in Biography,
ARM

was born of a family named "Mainardi," at Mugello, near Florence, in 1395, and at the age of 28 years adorned the clerical professed. His peculiar talent of contributing to the amelioration of society by his humanious extravagances and repineries in conversation, he obtained ecclesiastical preference, of which the height was the rural deanery of St. Crezi, in the diocess of Fiesole. Lofs celebrated as a poet as a bush, he rambled over Italy and other countries, diverting those with whom he associated by his pleasantries and singularities; and thus recommended himself even to Lorenzo and Giuliano della Medici. After his death, which happened in 1483, at the age of 87, a collection of his jests, witaffins, and adventures, was printed under the title of "Facieeli Fabule e Matti del Piovo Arbotto, Prete Fiorentino," which has been frequently reprinted. Nouv. Dict. Hilior.

ARLY, in Geography, a river of Savoy, which runs into the Iera, near Conflans.

ARLYNO, in Ornithology, a name by which the Linnean Asticylla omamata is known in some parts of England. This is the bird, called by Ray, Willughby, and other old writers, the cowl-finch, or white-tail, and is the wheat-eat of modern English ornithologists.

ARM, bastard, in Anatomy. Strictly speaking, signifies the whole of that part of the upper extremity which intervenes between the shoulder and the elbow.

ARM, Amputation of, in Surgery. See Amputation.

ARMatis. See Axilla.

ARM, or presentation, in Midwifery, is when the arm or hand of the fetus presents to the orifice of the uterus, instead of the head. In natural labors, that is, when the head of the fetus is the presenting part, and frequently when the breech presents, they may be easily perceived through the parietes of the uterus and vagina, at whatever period of gestation labour comes on, even before the os uteri begins to be dilated; but when the arm, or any other part, presents, the body of the fetus being thrust down with more difficulty, it frequently happens, we are not able to distinguish the presenting parts until the os uteri is considerably dilated; and sometimes they are not to be discovered until the membranes are ruptured, and the waters are flowing away. Whenever, therefore, on examining per vaginam during a pain, no part of the fetus can be distinctly felt, we shall be generally right in concluding that the labour will be prernatural, that is, that the arm, shoulder, or some other part than the head or breech of the fetus, will present to the orifice, unless the descent of the fetus be prevented by the unnatural projection of the brim of the os, or the pelvis be in some other way contracted and dilated. In these cases, by the general consent of practitioners, the child must be turned and extracted by the feet. For the manner of performing this operation, see PREMATURAL LABOURS.

Arm of a horse, is that part of his fore leg which is intercepted between his shoulder and knee. See Horse.

ARM, in the Manager, is applied to a horse, when he endeavours to defend himself against the bit, to prevent obeying or being checked thereby.

A horse is said to arm himself, when he presses down his head, and bends his neck, so as to roll the branches of the bridle upon his briscket; in order to withstand the effort of the bit, and guard his bars and his mouth.

A horse is said to arm himself with the lips, when he covers the bars with his lips, and deadens the pressure of the bit. This frequently happens in thick-lipped horses. The remedy is by using a bit-mouth, forged with a cannon or serratemouth, broader near the bars than at the place of its pressure or reft upon the bars.

For arming against the bit, the remedy is, to have a wooden hallow covered with velvet or other matter, put on his chaul, which will so press it between the jaw bones, as to prevent his bringing his head so near his breast.

ARM, in Geography, is used for a branch of a sea or river. Italy and Sicily are only parted by an arm of the sea. St. George's arm, in the Mediterranean, is the Thracian Bosphorus.

ARM Island. See Ark.

ARM, among Gardeners, is sometimes used in respect of cucumbers and melons, in the same sense a branch of other plants.

ARM is also figuratively used for power. Theicular arm is the lay or temporal authority of a secular judge; to which recourse is had for the execution of the sentences passed by ecclesiastical judges. The church feds no blood; even the judges of inquisition, after they have found the person guilty, surrender him to the secular arm. The council of Trent, held in 1541, decrees, that recourse he had to the secular arm to repress those who refuse obedience to the church; for secular arm, they hare here exterior power.

ARM, in the Military Art, Heraldry, &c. See ARMS, and ARMOR.

ARM, in Sea Language, a ship is said to be armed, when fitted out, and provided, in all respects for war.

Armed ship more peculiarly denotes a vessel that is occasionally taken into the service of government in time of war, and employed to guard some particular coast, or attend on a fleet. All ships of this sort are commanded by an officer of the navy, and are upon the same establishment with the king's ships.

Also a cross-bar shot is said to be armed, when some rope-yarn, or the like, roller round about one end of the iron bar which runs through the shot, both that the shot may be better bammed down into the gun, and left the sharp end of the bar should catch into any honey-combs within the cylinder of the piece.

ARM, Yard. See Yard.

ARM, in respect of the Magnet.—A loadstone is said to be armed, when it is capped, cased, or set in iron or steel, in order to make it take up the greater weight, and also to distinguish its poles. See ARMED MAGNET.

ARMA, in Geography, a small province of South America, with a town and a river of the same name. The soil is so fertile, that it produces maize twice in the year.

ARMA dore, to give arms, in some ancient charters, signifies to dub or make a knight.

ARMAR deporner, to lay down arms, was a punishment anciently enjoined when a man had committed an offence. Leg. Hen. I.

ARMA mutare, q. d. to change arms, was a ceremony used to confirm a league or friendship.

ARMAR molata, were sharp weapons: Ficata calls them arma emolita.

ARMAR reversata, inverted arms, was a punishment when a man was convicted of treason or felony.

ARMADA, a Spanish term, signifying a fleet of men of war. The armada which attempted to invade England in the time of queen Elizabeth A.D. 1588, is famous in history; it was partly scattered by the wind, and partly subdued by the English fleet. On which occasion a medal was struck with this motto, A[ff]lavit Deus, et dissipatur.

The situation of Philip II. at the time when he projected this invasion, was such as furnished a variety of motives, not only to induce his undertaking it, but to flatter him with the hope of success. Whilist secretly meditating his design in the preceding year, and actually commencing his preparations, Drake destroyed a whole fleet of transport saw Cadiz, laden with ammunition and naval stores; he also ravaged his western coast, insulted Lisbon, and took a rich carrack,
carrack, laden with treasure and papers of great importance. By this townd expedition, the means of which had been furnished by the London merchants, the naval preparations of Spain were disconcerted, the proposed expedition against England was retarded twelve months, and the queen had leisure to make more secure measures against that formidable invasion. Cavendish had also, in the same year, committed great depredations on the Spaniards in the South-Sea; having taken nineteen vessels, some of which were richly laden; and after returning by the Cape of Good Hope, he had entered the river Thames in his way to London with a kind of triumph. His mariners and soldiers were clad in silk, and his sails were of damask, his top-sail cloth of gold, and his prizes were esteemed the richest that had ever been brought into England. Philip, provoked by these hostilities on the part of Elizabeth, had harboured for a considerable time a secret and violent desire of revenge. His ambition also, and the hopes of extending his empire, were much encouraged by the present prosperous state of his affairs; by the conquest of Portugal, the acquisition of the East-Indian commerce and settlements, and the yearly importation of vast treasure from America. Besides, his highest glory was connected with that perpetual object of his policy, which was the support of orthodoxy and the extermination of heresy; and as the power and credit of Elizabeth were the chief bulwark of the protestants, he hoped, by fubiaging that prince, to acquire the immortal renown of re-uniting the whole Christian world in the Catholic communion. Above all, his indignation against his revolted subjects in the Netherlands, inflamed him to attack the English, by whom they were encouraged and supported. The period which he had chosen for this purpose was peculiarly favourable to his design; as a truce had been lately concluded with the Turks; the empire also was in the hands of a friend and near ally; and France, the perpetual rival of Spain, was so distracted with internal commotions, that she was incapable of directing her attention to her foreign interests. Thus circumstanced, Philip was determined, by one bold effort, to acquire that ascendant in Europe, to which the present greatness and prosperity of the Spaniards seemed so fully to entitle them; and he therefore proceeded immediately to the execution of his ambitious project. His preparations had been for some time conducted with studied secrecy and reserve; but when his resolution was formed, every part of his extensive empire was put in motion with the utmost dispatch. And all his ministers, generals, and admirals were employed in forwarding the design. The marquis of Santa Croce, a sea officer of great reputation and experience, was designated to conduct the naval equipments, and to command the fleet. Accordingly the plans were laid and measures were taken in all the ports of Sicily, Naples, Spain, and Portugal, for fitting out such a fleet and embarkation as had never before had its equal in Europe. The military preparations in Flanders were no less formidable. Troops were collected from all quarters for reinforcing the duke of Parma; and an army of 34,000 men was assembled in the Netherlands, which was kept in readiness to be transported into England in boats and flat-bottomed vessels, previously prepared and conveniently flationed for this purpose. To the most renowned nobility and princes of Italy and Spain, who were ambitious of sharing in the honour of this great enterprise, might be added some hundreds of desperate English renegades under the conduct of Stanley, who had been already proscribed for filling a Dutch fortress to Spain. The Spaniards, ostentations of their power, and elated with vain hopes, had already denominated their navy the "Invincible Armada." As soon as the news of this proposed invasion reached the court of London, the queen made preparations for resistance; nor was she dismayed by that power, by which all Europe apprehended the might of necessity be overwhelmed. Her forces, however, seemed very unequal to such a formidable enemy. All the sailors in England amounted at that time to about 14,000 men, and the royal navy consisted only of 28 ships, many of which were of small size. The dexterity and courage of the seamen far surpassed those of the Spanish mariners, and compensated for the inferior size and force of their vessels. The alarm roused the exertions of the English people; and they concurred with singular alacrity in defending their liberty and religion against those imminent perils with which they were menaced. The city of London supplied thirty ships and 10,000 men; other ports followed this example; the nobility and gentry, among whom were several Roman Catholics, and even all uns, hired, armed, and manned 43 ships at their own charge; and all the loans of money which the queen demanded, were cheerfully granted. The command of the navy was entrusted and anxious spectators of this contest, a man of courage and capacity, and under him, as admiral, served Drake, Hawkins, and Frobisher, the most renowned names in Europe. The principal fleet was stationed at Plymouth; and a smaller squadron of 40 vessels, commanded by lord Seymour, second son of the protector Somerset, lay off Dunkirk in order to intercept the duke of Parma. An army of 20,000 men was dispersed in different bodies along the coast; and a body of 20,000 foot and 1000 horse, under the command of the earl of Leicester, was stationed at Tilbury, in order to defend the capital. The principal army consisting of 34,000 foot and 2000 horse, commanded by lord Haldon, guarded the queen's person, and had orders to march whitherover the enemy should appear. James, the Scots king, retained his engagements, with a fleet which was of great importance to England and the Protestant cause, and kept himself prepared to march with the force of his whole kingdom to the assistance of Elizabeth; and the queen obtained some secondary aid from Denmark and the Hanse-towns. In a word, all the protestants throughout Europe were interested and anxious spectators of this momentous contest. In order the more to excite the martial spirit of the nation, the queen appeared on horseback in the camp at Tilbury; and riding through the lines, discovered a cheerful and animated countenance, exhorting her soldiers to remember their duty to their country and their religion, and professing her intention, though a woman, to lead them herself into the field against the enemy, and rather perish in battle than survive the ruin and slavery of her people. The loyalty and enthusiasm of the soldiers were elevated into a kind of phe nousy, and they were prepared for any exertion which the cause in which they were engaged might require. In the beginning of May, the armada was ready; but when it was preparing to sail, the admiral, the marquis of Santa Croce, and the vice-admiral, the duke of Paliano, both died; and the duke of Medina Sidonia, a nobleman altogether unacquainted with naval affairs, and unexperienced in action, was appointed admiral. On the 29th of May, the Spanish fleet left from Lisbon; but the next day it was intercepted by a hostile fleet, and some of the smallest ships were sunk, whilst the others took shelter in the Groane. As soon as the armada was refit, it sailed again towards the English coast. The fleet consisted of 150 vessels, of which about 100 were galleons of larger size than any before used in Europe; and it carried on board 19,295 soldiers, 8456 mariners, 2088 galley-flavises, and 2650 great pieces of brass ordnance. It was victualled for six months, and attended by 30 smaller vessels. Superstition too added her fanatical but powerful aid: bulls, denoue-
ing hell-fire to Elizabeth and her abettors, accompanied the squadron; and a confederate banner from Rome waved over the heads of these new crusaders. On the 10th of July, the armada arrived in the channel, disposing itself in the form of a crescent, and stretching to the distance of seven miles from the extremity of one division to that of the other. The English admiral had just time to get out of port, when he saw it in full sail, as Bentivoglio, an Italian writer, in a kind of poetical language, describes its progress, and yet advancing with a low motion, as if the ocean groaned with supporting, and the winds were tired with impelling, to enormous a weight. As the armada proceeded up the channel, Elizabeth, with the English fleet consisting of 140 ships, gave orders to avoid a close fight, but to skirmish with the larger ships of the Spanish fleet, which it continued to do for six days. The armada, having reached Caiaus, call anchor before that place; and waited for the arrival of the prince of Parma, who delayed leaving the Frenli ports until he was assured that the Spaniards were masters at sea. While the Spanish fleet lay confounded in this position, the English admiral, by a successful stratagem, dispatched eight of his smaller ships filled with combustibles, one after another, into the midst of the enemy; and thus alarmed them to such a degree, that they immediately cut their cables, and betook themselves to flight with the greatest disorder and precipitation. The English fell upon them the next morning, took about 12 of their larger ships, and damaged several others. The Spanish admiral having destroyed only one small vessel of the English, and perceiving that his own fleet had greatly suffered, and was in danger of being totally destroyed, prepared to return to quarters; but as the wind opposed his passage through the channel, and the English vessels harasscd his retreat, he determined to sail northwards, and make the tour of the island, to reach the Spanish harbours by the ocean. The English fleet for some time pursued him; and if their ammunition had not failed them, the whole armada must have been compelled to surrender at discretion; and indeed the duke of Medina was prevented from doing so merely by the advice of his confessor. The event, however, proved almost equally fatal to the Spaniards. A violent tempest affrighted the armada after it had passed the Orkneys; and the mariners, unable to govern their unwieldy ships, yielded to the fury of the storm, and allowed their ships to drive either to the western isles of Scotland, or to the coast of Ireland, where they were miserably wrecked. At length, after the experience of insufferable humiliation and distress, the flattered fleet, confiding of less than half its number, returned to Spain; and the seamen and soldiers, very much reduced by famine and disease, and the various hardships with which they had encountered, filled the country with accounts of the desperate valour of the English, and of the tempestuous violence of the ocean that surrounds them. Philip, as soon as he heard of the disastrous event, to mortifying to his pride and ambition, with an afflicted philosophy fell on his knees, and rended his hair, for that gracious dispensation of Providence, expiated his joy that the calamity was not greater. The Spanish priests, who had frequently foretold the infallible success of this holy crusade, perplexed in accounting for the victory which had been gained over the Catholic monarch by uncommunicated heretics and an execrable inulper, at last discovered, that all the calamities of the Spaniards had proceeded from their allowing the infidel Moors to live among them. The first English newspaper, entitled the "English Mercury," was printed during the time of the Spanish armada; the first number, dated the 23d of July 1588, is still preserved in the British Museum. Hume's *Hift. vol. v. p. 310—345.* Watson's *Hift. Philip II.* vol. iii. p. 122. *Andrews' Hist. Great Britain,* vol. i. p. 145.

**ARMADILLO.** In *Entomology,* one of the species of the Oniscus genus, described by Linnaeus in his *Fauna Suec.* It is oval, eminently brown, with a tail obtuse and entire. This kind inhabits Europe; licks under stones; and is called by Ray *aflalus bivittus.*

**ARMADILLO.** In *Zoology,* the name given by English writers to those quadrupeds which in the Linnaean system constitute the genus *Dasypus;* it is derived from the Spanish word *armadillo,* and is synonymous with the French *talon.* See *Dasypus.*

**ARMAGAR.** In *Ancient Geography,* a town of India, on this side of the Ganges. *Ptolemy.*

**ARMAGEDDON.** See *Megiddo.*

**ARMAGH, or ARMAGH,** in *Geography,* the name of one of the counties of the province of Ulster in Ireland. It has rough Naghan on the North; the county of Down on the east; Louth on the south; Tyrone on the north-west; and Monaghan on the west. Its length from north to south is nearly thirty-two English miles, and its breadth almost twenty; and the superficial content 181,450 acres, or 283 square miles (386,786 acres, and 454 square miles English). The number of houses, according to the last official return, is 12,000; in which, according to Mr. Bulke's statement, we cannot reckon fewer than 190,000 inhabitants; which is a population of nearly 450 persons to every square mile; a greater proportion than is found in any other county except Dublin. The number of parishes in this county are twenty, and what happens only in Ulster, the number of churches is greater, being twenty-six. Besides the two county members, the city of Armagh sends a member to the Imperial parliament. There is in this county a very little flat ground; but the gentle hills which diversify the face of it, are covered with a very rich soil, except in the district called the Feus which is full of mountains, and in the south-eastern angle which is occupied by the lofty Slieghgullen; but great part even of this rough ground is cultivated, and thickly inhabited. Throughout this county, the farms are small, seldom exceeding from forty to sixty acres, more commonly from five to twenty acres; and the tillage in general is bad, which has been observed to be the case wherever the linen manufacture spreads, because tillage is there only a secondary object. To the industry of the people, and the flourishing state of this manufactures which is carried on in all its branches, the extraordinary population of the county is to be attributed, and indeed there is no part of Ireland which affords such pleasing spec;tales to a philanthropic observer. Yet, strange to tell, this apparently happy spot, where industry seems to confer every blessing, has been the scene of most of the disturbances which have taken place in the north; and both the Oak-boys and Defenders had their origin in it. There is no river of confluence in Armagh, but
but the Blackwater which separates it from Tyrone, on its north-western boundary is navigable for some miles into Lough Neagh; and the river Bann, and the Newry canal, afford a water-carriage from the lough to the bay of Carlingford on the eastern side. There are some considerable bogs from which the inhabitants are supplied with abundance of good turf, which is much used for firing. Some good marble is also found in this county. Armagh was one of the countries forfeited to the crown after the reduction of the cast of Tyrone, in the latter end of queen Elizabeth's reign, and was colonized under James the First; and the northern part is still called Oneill-land from the family name of that noted chieftain. The affrays are held at the city of Armagh. Beaumont, Young, &c.

Armagh, a city, and the capital of a county to which it gives name, in the province of Ulter, Ireland. It is said to have been founded by St. Patrick in the fifth century (though the very existence of such a person has been questioned), on an eminence from which it acquired its name, which implies a great high place or field. On the establishment of Chriftianity in this country, Armagh became a considerable city, and a celebrated university, which was not only reftored to by the natives, but also by the Angle-Saxon youths from Britain. In the seventh century it was nearly destroyed by fire; and on the arrival of the Danes, was frequently plundered, and the greater part of its records taken away and destroyed. In 1152, cardinal Paparo being sent to Ireland as legate, constituted Armagh the metropolitian see of Ireland; and it was provided for solemn ordinance, that no one should be allowed to profess or teach theology, who had not been educated at its university. This University however has been long extint. The town was frequently plundered by the English before the reduction of that part of the island, and it was entirely destroyed by O'Neill in the reign of queen Elizabeth. It was soon after rebuilt and garnished, and has latterly become a pretty town of good fize, and well inhabited, through the attention and munificence of prince Robinson, lord Roekey. He built there a handsome archiepiscopal palace, and a noble house for the school, which is one of the royal foundations, and extremely well endowed. To these is added a public library for the promotion of science. He also erected a complete observatory; with a liberal establishment for the support of an astronomer, and secured the permanency of his endowments by several acts of parliament. The province of Armagh contains ten dioceses; the archbishop having under him, the bishops of Dromore, Down and Connor, Derry, Raphoe, Clogher, Kilmore, Ardagh, and Meath. The archbishoprick extends into five counties, viz. Armagh, Tyrone, Londonderry, Louth, and Meath, and is reputed to be worth 8000l. per annum. Armagh has one of the best linen markets in Ulter, and there are many bleach-greens in its neighbourhood on the banks of the Calen, a small stream which paffes near the foot of the rising ground on which it is built. Its distance from Dublin is sixty-two miles, N. by W. N. lat. 54° 20' 30". W. long. 6° 32'. Collec't. de Reb. Hiber. N° 11. Beaumont. Leiland.

ARMAGLIA, a town of Arabia, fifty-eight miles south of Cathem.

ARMAGNA, a province of France, in the district of Gafeoyne, and government of Guenoe; before the late division, about thirty six leagues long and twenty-five broad; is bounded on the north by Aragon and Condomais, on the east by Languedoc and the country of Comminges, on the west by Marfon and Bearn, and on the south by the Pyrenees, which separate it from Arragon, and Bigorre. The capital is Auch. It is divided into Upper and Lower Armagnac; the former lies among the Pyrenean mountains, and comprehends four valles; and the latter is more extensive and fruitful, and contains proper Armagnac, and several counties and cardinals. The soil is generally fertile, and produces corn, wine, fruits, and pasture; and the commerce is considerable in wine, brandy, wool, flax, &c. The Armagnacs, who were the adherents of the young duke of Orleans, and so called from the count of Armagnac, father to this prince, formed one of the two parties into which the whole kingdom of France was divided, about the year 1415. The city of Paris, distracted between them and the Burgundians, but inclining to the latter, was at this time a perpetual scene of blood and violence; the king and royal family were often detained captives in the hands of the populace; their faithful subjects were butchered or imprisoned before their faces; and it was dangerous for any man, amid the enraged factions, to be distinguished by a flitht adherence to the principles of probity and honour. The fraternity of butchers declared for the duke of Burgundy, and committed the most violent outrages against the opposite party; whilst the Armagnacs made intertil with the fraternity of carpenters; the populace ranged themselves on one side or the other; and the fate of the capital depended on the prevalence of either party. At length the Burgundians prevailed; butchered many of the faction of Armagnac, and threw the count and several persons of note into prison, who were afterwards murdered by the populace.

ARMAMAR, a small town of Portugal, in the province of Baira and district of Lamago, containing two parishes and about 1500 inhabitants.

ARMAMAXI, compofed of the Latin arma, and the Greek ἀρμαξις, painfulyn, carriage, in Antiquity, a kind of Scythian chariots, or carriages, compofed of two wheels, variously adorned with crowns, shields, barrel-plates, and other trophes, carried in procession after the images of the gods and great men. These were sometimes called amami, or amasa. Pitr. Lex. Ant.

ARMAMENT, a large body of forces, raised and provided with the furniture of war, either for land or sea service.

ARMAMENTA, in Roman Antiquity, comprifed the rigging and toggling of a ship, its Bills, fire-yards, oars, ropes, &c. Hence arna denotes the funs (Virg. Æn. v. 55) and the rudder (vi. 353).

ARMANCE, in Geography, a river of France, which runs into the Armançon, near St. Florentin, in the department of the Yonne.

ARMANCON, or ARMANSON, a river of France, which ripes near Semur-en-Auxois, and runs into the Yonne, near Noyon.

ARMANT, a village of Egypt, feated on the Nile, in the route from Thebes to Eiffe; suppofted by Savary to be the ancient Hermutis.

ARMARCALES, in Ancient Geography, a name given by Abydenus to the artificial channel that connected the two branches of the Euphrates, more properly denominated by Annianus Naarmachca; which fee.

ARMARIIUM unguntum, among Hermetrical Philosophers, a sympathy ointment, or pofition-falve, whereby wounds are faid to have been cured at a distance, by only drefling the weapon.

ARMATA, in Entomology, an European species of Aris, described in the Syntema Naturen from Muf. Leck. It is brown; the head and thorax grey; jaws armed with a tooth at the bafe; bottom of the feet yellow. This insect belongs to the genus Melittta in Kirby's Apum Anglique, in which it is thus defcribed under the fpacific name armata: "Bigna,
ARM

"nigra, cinerascen&-villoa; maxillis longitudine capitis, bafi dente armatis."

ARMATA, 3 species of LEPTURA found in some parts of Europe. The thorax is black and spinous; antennae and legs ferruginous; wing-cases yellow, with two dots, a heart-shaped spot, and three bands of black. Herbll. Gmel. &c.—This insect bears some resemblance to leptura ottomana; the head, feet, posterior thighs and flanks, are black.

ARMATUM, in Ancient Physic, a derivate kind of collyrium, of great value in removing affections of the eye lids. Its chief ingredients were ex ulnun, gum ammoniac, and the roots of the tree thu. This preparation is described by Galen, Aetius. Paulus, and Scribonius.

ARMATORIUS, in Entomology, an insect described in the Florican manifec. It is small, and inhabits Germany; colour black, cutell white; thorax immaculate, posterior part bidenticate; abdomen and legs ferruginous.

ARMATURA, ARMATUM, in a general sense, is the same with what we otherwise call ARMOUR.

ARMATURA is more particularly used in the Ancient Military Art, for a kind of exercize, performed with missile weapons, as darts, spears, arrows, and the like.

In this sense, armatura stands contrasted from palaria; the latter being the exercize of the heavy-armed, the former of the light-armed.

The armatura was practised with great diligence among the Romans; they had their campisclores, on purpose to instruct the tyrones, or young soldiers, in it. Under it were included the throwing of the spear or javelin, shooting with bows and arrows, &c.

ARMATURA is also an appellation given to the soldiers who were light-armed.

Aquinus seems, without reason, to restrain armatura to the tyrones, or young soldiers, under discipline or tutorage in the exercize above mentioned.

ARMATURA is also a denomination given to the soldiers in the emperor's retinue. Dr. Canp.

Of these we find two schools mentioned in the notitia imperii, called the armatura juniores, and armatura seniorus. Their commander was entitled tribunus armatorum.

ARMATUS, in Entomology, a species of CICEREX that inhabits New Holland. The thorax is acutely spined; scutell black with two dots, and apex tesselaceus; antennae and legs red. Fabricius. Gmelin.

ARMATORIUM, in Ancient Geography, a town of Asia, in the greater Armenia. Ptolemy.

ARMAXA, or ARMACA, a town of Asia, in Cappadocia. Anton. Irit.

ARMÊ, in Ichthology, a specific name given by the French naturalists to a fish of the SICILUS genus, found in Asia; and according to Block, in Surinam; this is the Linnean SICILUS majoris. See MILLARIS.

ARMED, in Law. See Arms.

ARM D, in Sea-Language. See Arm.

ARMED in flute. See FLUTE.

ARMED, in Heraldry, is used in respect of beasts and birds of prey, when their teeth, horns, feet, beak, talons, or tusks, are of a different colour from the rest. He bears a cock, or a falcon, armed or, &c.

ARMED at all points, terms applied to a person who is completely covered with armour, except his face.

ARMEDON, or ARMENDON, in Ancient Geography, a name given by Pliny to a small island in the vicinity of Crete, opposite to the promontory of Samothrace; probably one of those nautamels rocks which now encompass Candia.

ARMENA, in Botany, a name given by Pliny to a kind of wild asparagus; but the ancient Greeks have used the same word to express the young shoots of the common asparagus, at the time when they are eaten; and not only thefe, but the young sprouts of the cabbage, and of all other eulent plants.

ARMENIA, in Ancient and Modern Geography, a country of Asia, derives its name, according to the Greeks, from Armonus, one of the Argonauts, who settled in this country.

Bochart (Phileg. i. c. 3.) supposes Armenia to be a contradiction of NEMEN, denoting the mountain of Min, the name of a province of this country, mentioned by the prophet Jeremiah (ch. ii. 27.) and placed by him between Ararat and Aschishen; and probably referred to by Amos (ch. iv. 3.) under the name of NMM, or mountain of the moon. To this purpose Mr. Bryant (Anal. Anc. Mythol. vol. iii. p. 2.) distinguishes between this country and Armenia, the land of Aram, which was separated from it by mount Taurus, supposed it to be denominated from Arm or Hanmen, the mountain where the ark rested.

Armenia was anciently divided into Major and Minor, or the Greater and Lesser.

Armenia Major, or Armenia properly so called, was, according to Strabo, bounded on the south by mount Taurus, separating it from Melopotamia; on the east by the two rivers; on the north by Iberia and Albania, or that part of Carthasis by which both are surrounded; and on the west by Armenia Minor, or the mountains Paryades, by some Pontic nations, and by the Euphrates. Ptolemy divides the whole of Armenia into three districts: the first, comprehending that part which lies between the Cyrus and the Araxes; the second, those provinces which extend well to the bordering of the Euphrates; and the third, all the country lying between the springs of the Tigris, and that part of the Euphrates which separates commagene from Armenia Major. The most considerable cities of ancient Armenia were Artaxata, Sebista, Armenian, Tigranocerta, Artaga, Carpathoecerta, Colon, and Chorda. Strabo enumerates five rivers of principal note; viz. the Lycus and Phasis, falling into the Pontus; the Cyrus and Araxes, discharging themselves into the Caspian Sea; and the Tigris and Euphrates, which disembody themselves into the Persian Gulf. The most considerable mountains were the Molchick, separating the western parts of Armenia from Colheis; the Paryades, extending from the former to the borders of Armenia Minor and Pontus; Matus, bounding the province of Sophene to the south; Asiantirus does to the north; Nipotes, Atus, and the Cordyian mountains. As to the origin of the ancient Armenians, Herodotus, and after him Stephanus, derive them from the Phrygians, on account of several Phrygian words that had been blended with the ancient language of the Armenians. Strabo supposes, that they were originally Syrians, or that the Syrians and Armenians were two tribes of the same nation; and in this opinion Bochart acquiesces, as he discovered a great similarity between these two nations, in their manners and language. However, in process of time, many foreigners settled among them; namely, Phrygians, Greek, and Persians.

Armenia was advanced at a very early period to the honour of a kingdom. After the death of Barzanes, the successor of its first king Scythia, it was divided into several petty kingdoms, as we learn from Pliny (H. N. i. c. 9.). The Armenians were afterwards subdued by the Medes, to whom they were made tributaries by Alyages, but continued to be under the government of kings of their own country. During its submission to the emperor of Persia,
Armenia was reduced to the form of a province, and its rulers were prefects appointed by the Persian kings. Armenia, as a part of the Persian empire, was subdivided by the Macedonians under Alexander the Great; and remained in subjection to the Macedonians till the time of Antiochus the Great. During the minority of Antiochus, Artaxas and Zadrages, two governors of Armenia, united their forces, fixed on the country they governed, and having added to it some neighboring provinces, erected two kingdoms, viz. that of Armenia Major, which Artaxas received for himself, and that of Armenia Minor, which was allotted to Zadrages. Antiochus made several attempts to recover the provinces, which these governors had appropriated to themselves, but his efforts were unsuccessful; and by an alliance with the Romans, they secured to themselves and their posterity the continued possession of them. After the death of Artaxas, the Armenian history is interrupted by a chasm of about 70 years; it is only known, that the Armenians had engaged in a war with the Parthians, which terminated to their disadvantage. Tigranes, however, the king's son, who had been delivered as a hostage to the Parthians, was restored to his kingdom after his father's death, about the year before Christ 95; and entered into an alliance with Mithridates Eupator, against the Romans. Having married Cleopatra, the daughter of Mithridates, Tigranes invaded Cappadocia, and took possession of it, but surrendered it to Ariarathes, the son of Mithridates. Soon after his expedition into Cappadocia, he seems to have made peace with the Romans, and abandoned the cause of Mithridates; and having been chosen king of Syria, indulged his ambition by invading Armenia Minor, and reducing the whole kingdom. After several successful expeditions, by which Tigranes enlarged the boundaries of his dominion, he was defeated with great slaughter by Lucullus the Roman general, in the vicinity of Tigranocerta, who at length took the town, and got possession of the immense treasures which it contained. The consequence of this second defeat was the total dismemberment of the united armies of Tigranes and Mithridates, and the flight of the former to the most remote part of his dominions. During a cessation of hostilities, occasioned by the mutiny of the Roman soldiers against Lucullus, and a disagreement between him and Pompey, by whom he was superseded in the command, Mithridates and Tigranes rallied their forces, overran Cappadocia, and recovered all Armenia, with a great part of Pontus; but Tigranes's son, taking up arms against his father, joined the Romans, and conducted Pompey into Armenia. Tigranes, dispossessed by his son's revolt, met Pompey on his march towards Artaxata, and surrendered himself into his hands. Pompey, after having heard the appeal of the father for justice against his son, restored the kingdom of Armenia to Tigranes, together with the greatest part of Mesopotamia; imposing upon him at the same time a fine of 60,000 talents for making war against Rome without cause. Tigranes, being put in possession of his kingdom, voluntarily yielded to the Romans Cappadocia, Cilicia, Syria, and that part of Phoenicia which he possessed, and referred for himself only his paternal kingdom. His successor Artusdèes, called by Josephus, Arabazes, by Orofas, Artabanes, and by others, Artaxèdes, was put to death by order of Marc Antony; and the kingdom of Armenia was conferred by Antony on Alexander, his son by Cleopatra. Artaxas, the eldest son of Artusdæus, who was proclaimed king by the Armenians, was obliged by the Romans to abandon his kingdom, and fly into Parthia; but he was soon put to death. Tiberius, whom Augustus had deputed to settle the affairs of the state, bestowed the kingdom of Armenia, after the death of Artusdæus, on his younger brother, Tigranes; who was in a little while, by Tiberius's own orders, put to death. The kingdom was afterwards given by Augustus to Artusdæus, supposed to have been the son of Artusdæus; but the Armenians, tired with the Roman yoke, expelled him, and called in Phraates, king of Parthia, pretending submission to the Parthians rather than to the Romans. Upon the approach of the Roman army, Phraates withdrew his arms, and Artusdæus was made king. After a successful conquest of several kings, occasionally under the control of the Parthians, but generally holding the crown as viciss of the Roman empire, being either appointed or confirmed by the emperors; the ancient kingdom of Armenia was reduced by Trajan to the form of a province; and the Tigris was made the eastern boundary of the empire, which Augustus had thought it to extend no farther than the banks of the Euphrates; but it soon recovered its liberty, and was again governed by its own kings, in the reign of Constance the Great, and his successor, to whom the kings of Armenia were feudatories. In the Perisan war, A. D. 76—77, the tributary kingdoms of Armenia and Iberia, the sovereignty and advance of which had been sedulously retained by the Romans, were expelled, without protection, to the arms of the Persian monarch. Armenia was reduced to the state of a Perisan province by Sapor, and the administration was shared between a distinguished satrap and a favorite eunuch. In the reign of Julian II. it was inhabited by the Saracens, A. D. 687, who held it till the irruption of the Turks; and when they took possession of it, about 775 or 882, they gave it the name of Turcomania. The Turks, by invading Persia, and other eastern countries, gave the Armenians an opportunity of throwing off the Turkish yoke, and of chafing kings for themselves, by whom they were governed till the country was again subdued by Occicán or Heccata, the son of Cinigs, and first Cham of the Tartars. The conquest of the Tartars, however, was not so complete as tofully to extirpate from Armenia the race of its own kings; as we read of some of them who reigned afterwards, and particularly in our own chronicles, of Leo, king of Armenia, who, in the reign of Richard II., came into England to solicit aid against the Turks, by whom he had been driven from his kingdom. In the year 1752, Ufain Cahfanes, king of Armenia, succeeding to the crown of Persia, made Armenia a province of that empire; and in this state it continued till the year 1532, when it was subdued by Sisam II. and made a province of the Turkish empire; from time it has ever continued subject to the Turks, except the eastern part of it, which belongs to the Persians. Armenia Minor, was bounded on the east by the Euphrates, which separated it from Armenia Major; on the south by Mount Taurus, parting it from Cilicia; on the west and north by a long chain of mountains, called in different places Mors Scardicus, Aramans, and Antitaurus, which divided it from Cappadocia. This is a very mountainous country, but some of the mountains are intermixed with pleasant and fruitful vales, abounding with oil and wine, not inferior to the best in Greece. This country was a part of Cappadocia, till the reign of Antiochus the Great, when the distinction between Armenia the Greater and the Lesser was introduced; as we have already mentioned. In the time of the Romans it was divided into four provinces; viz. Laviana, Mariana, Araman, and Meltene, each of which had its cities, mentioned by Ptolomy; but those of chief note were Meltene, Nymphopolis, Garamus, Araratia, Daidph, Zaram, and Ladana. The manners, customs, and religion of the inhabitants of Armenia Minor, were
were similar to those of Armenia Major. Its first king was Zalathades, who, forming an alliance with the Romans, was maintained on the throne which he had usurped. Nero bestowed this kingdom on Ardisobulus, great-grandson of Herod the Great; upon whose death it fell to Tyranus, his near relation; and as he died without issue, Armenia Minor was made by Vespasian a province of the Roman empire, and thus continued till the division of the empire, when it was subjected to the emperors of the East. On the decline of their power, it was subdued, first by the Persians, and afterwards by the Turks, who called it "Genice," and have held it ever since. Anc. Jn. Hist. vol. viii. p. 363—410. Gibbon's Hist. i. 435. ii. 159, Sc. iii. 137. iv. 157, &c. v. 438. See Armenians.

Armenia is still divided into Lesser and Greater. Armenia the Lesser is one of the two districts of Atalucia; Cappadocia being the other. It has Greater Armenia on the east, Syria on the south, the Exone on the west, and Cappadocia on the north. It is also called Western or Lower Armenia, and is subject to Turkey.

Armenia the Greater, or Turcomania, is bounded on the south by Mesopotamia, and the provinces of Diarbikr, Kurdiylan, and Aderbijan; on the north by Georgia; on the east by Persia, and particularly the province of Shirvan; and on the west by Cappadocia and the Lesser Armenia, from which it is parted by the river Euphrates. It belongs partly to the Turks and partly to the Persians. The chief towns in that part which belongs to the Turks, are Erzerum, the capital of Armenia, Kars, Barazid, Mulh, Argilj, Van, &c. In that part of Armenia to which the dominion of Persia extends, are Erivan, the capital, Ganjas, near the Kur, Nacivan, Adabad, Aftabad, Marced, Cors, &c. Armenia is one of the most healthy and fertile provinces in Asia; it aboundes with mountains and valleys, lakes and rivers, so that the climate is temperate, and the soil rich; and some have conceived from its fertility, as well as its central situation on the globe, that it was the seat of Paradise, or the garden of Eden. Besides all sorts of grain, it produces tobacco, cotton, flax, melon, and grapes, and formerly olives. See Arm. It has also mines of salt, sufficient to supply all Persia. The extreme cold of this country has been long noticed; and to this purpose Sir John Chardin informs us, that he found ice in the rivulets in the mornings of the month of July. The inhabitants are sober and industrious; and they are described as a sensible and polite people. By their frugality and enterprize, they are singularly qualified for commercial transactions. Since the conquest of their country by Shah Abbas, king of Persia, they have been dispersed through various parts of Asia and Europe, and have devoted themselves, as merchants and brokers, to trade, in the conduct of which they excel: hence they are become, in a great measure, masters of the whole trade of the Levant, and are much concerned in that of other places. It is common to meet with Armenians at Leghorn and Venice, and even in England and Holland; whilst they are also known, by their commercial dealings, in Persia, Turkey, and Tartary, and indeed all over the East. Shah Abbas the Great, it is said, with a view of securing the conquest of Armenia, removed into Persia the first Armenians who ever settled there; and on this occasion about 30,000 families were transported into the province of Ghilan only, whence we have brought the first Persian folk. He also caused all the inhabitants of Zulfa, a large city of Armenia, to settle at Isphahan, whence the new Zulfa of Persia took its name. This Zulfa is since become the centre of the commerce of the Armenians; and to this place Shah Abbas these people are said to owe their genius and disposition for trade, little of which appeared before their transmigration into Persia. As Abbas the Great had no other object in view but that of enriching his country, and was sensible that this must be effected by trade, he directed his views to Silk as the most precious commodity, and to the Armenians as the most proper people to be employed in disposing of it. Accordingly, the Armenians, who were at first mere handworkers, were converted by him into merchants; and these merchants are become some of the most able and most celebrated traders in the world. Such has been their extensive and established reputation in this respect, that the cardinal de Richelieu, we are told, had a design to make a settlement of them in France, for promoting the commerce of that country; and the chancellor Seguier granted them a printing-house at Marseille. See Armenians.

Armenia, in Botany. See Prunus. ARMENIAN Bible. See Bible, and Armenian Persian, infra.

Armenian Rule. See Bole.

Armenian Language and Sciences. The Armenians, according to the account given of them by Moses Chorenesis, were, in their original state, rude and savage, without letters, knowledge, and culture, in a great degree ignorant of the history of their ancestors; and indebted for the scanty information respecting them to the books of their neighbours. They had no written characters, and those of their neighbours were not fit for expressing the sounds of their language. At length, however, the art of writing was introduced among them. For a considerable time their transactions were recorded in the Avarian language; in process of time they employed that of the Greeks; and afterwards they made use of that of the Persians. In the time of Moses Chorenesis, the names of their towns, and some other particulars, were expressed in one of these three languages. It was after the introduction of Christianity, that Miecrof, either towards the close of the fourth or the commencement of the fifth century, invented letters that accurately expressed the sounds of the Armenian language, and which are in use among them at this day. This invention, according to the tradition of the country, was revealed to Miecrof in a dream, after the author had in vain attempted to make the discovery himself, and after he had taken many fruitless journeys to procure assistance from the learned. Sir William Jones (Aiat. Ref. vol. iii. p. 12.) is of opinion, that the basis of the Armenian language was ancient Persian, of the time Indian lect with the Zend, and that it has been gradually changed since the time when Armenia ceased to be a province of Iran. However, the letters in which it now appears are allowed to be comparatively modern; and if they be not derived from the Pahlavi, they are probably, as this ingenious writer imagines, an invention of some learned Armenians in the middle of the fifth century. According to Strabo, the language of the ancient Armenians was similar to that of the Syrians; at least it is very probable, from Polycrates (l. iv.), that they used the Syrian characters. The modern Armenians pretend, that, besides their vulgar language, they have a learned one, which has no affinity with the other oriental languages, and which is very expressive, and enriched with all the terms of religion, and of arts and sciences. Moses Chorenesis informs us, that Arztefchich II. took great pains to civilize the Armenians, and to reduce them from that state of barbarity in which they lived; and he says, that agriculture was little and rarely attended to in this country. They could neither build bridges nor construct boats; they had no method of dividing time, and were scarcely able to distinguish...
that the succession of the months. If, indeed, we credit the tables recorded by Berosus, we find that Noah left among the Armenians books of religious ceremonies; that he taught them astronomy, and the divination of years and months; that on this account he was honoured amongst them, under the titles of Osibuma and Arfa, i.e. the "heaven" and "sun:" that they dedicated many cities to him, under the name of Jupiter Sagus, aluming him the soul of the heavenly bodies. The Armenians also tell us, that Noah taught them husbandry, and the planting of vines; that he was their first king; and that, when he quitted Armenia, he left his mother, wife, and several of his descendants, to people the country. However, in later times, the Armenians made considerable progress in the useful arts and sciences; and particularly in the science of commerce. See Armenia.

Armenian Religion. Strabo informs us, that the ancient Armenians worshipped the same deities with those of the Medes and Persians; but this must be understood with some latitude, and as applicable to different epochs of their empire. The chief deity of the Armenians, according to Strabo, seems to have been the goddess Tanais, or Anaitis, whom we know, from other authorities, to be the Nahed or Venus of the Persians; and it is for many reasons highly probable, that one and the same religion prevailed through the whole empire of Cyrus. See Anaitis. For an account of the Armenians after the introduction of Christianity, see Armenians.

Armenian Stone, lapis Armenus, a mineral cuprous stone, or earth of a blue colour, sometimes spotted with green, black, and yellow. It is a very scarce foil, anciently brought only from Armenia, but is now found very pure, though in small quantities, in the mines of Goltseara in Saxony.

The Armenian stone, in its harder state, bears a near resemblance to the lapiz-lazuli, from which it seems only to differ in degree of maturity; they are distinguished by this, that the lapis armenus is fother, and instead of sparks of gold, is often speckled with green.

Boehaive ranks it among semi-metals; and supposes it composed of a metal and earth. Woodward says, it owes its colour to an admixture of copper.

Mr. Kirwan says, that it consists of calcareous earth or gypsum, penetrated with the blue calc of copper: hence it sometimes effervesces with acids, sometimes not; but never gives fire with steel; it loses its colour when heated. Elem. of Mineral. p. 262.

Its chief use is in Mosaic work, though it has some place also in physic. It is a very valuable sublimate in painting, being a bright and florid blue. It was in fo high esteem as a paint, among the ancients, that counterfeits were continually attempted to serve in its place.

Both this and the lapis lazuli are ores of copper.

Armenian Version, in Biblical History, an ancient translation of the scriptures, for which the church of Armenia, according to the unanimous testimony of the Armenian writers, is indebted to Miecrofob, who is said to have finished it in the year 410. This is attested by Moses Chorenena, a disciple of Miecrofob; who adds, that he began with the Proverbs of Solomon. Moses lived in the fifth century, and alludes in the third version of the bible. The internal characters, and the readings of the Armenian version, have convinced the critics in that language, and especially LaCroze, a man of the most profound erudition, that the antiquity ascribed to the Armenian version does not exceed the truth. The learned, however, are divided in opinion, whether it was taken from the Greek original, or from the Syriac version. The Armenians pretend that it was taken from the Syriac; and Moses Chor. (l. iii. c. liv. p. 300) explicitly confirms this opinion. To which it has been added, that the Armenian version contains readings, which are found in no MS. or version, except the Syriac. But another relation from the same writer, (l. iii. c. xii. p. 313.) is adduced on the other side of the question; and this is decisive: for it gives a full and credible account of the care bestowed by the Armenians on their version of the bible, and that they translated it twice from the Syriac, and a third time from the Greek. Hence may be assigned the reason, why the readings of the Armenian version are so frequently different from the Syriac. Another argument, which has been thought decisive in favour of the opinion, that the present Armenian version was not taken from the Syriac, is, that the former contains those books of the New Testament, which were never admitted into the latter. The Armenian version would be an inconvertible treasure, if it had defended to the present age unaltered by time and superlition. But the churches of the Isser Armenia, or Cilicia, submitted in the thirteenth century to the authority of the pope; and Haitho, or Hethem, who reigned from 1224 to 1270, became shortly before his death a Franciscan friar. This prince was not only attached to the church of Rome, but likewise acquainted with the Latin language; and, publishing a new edition of the Armenian bible, he altered, or rather corrupted it, from the Vulgate. He translated, for instance, all the prefaces of Jerom; and as the words of St. John v. 7. were not in the old Armenian MSS., he inferred them probably from the Latin; for thirty-seven years after his death this passage was quoted at a council held at Cis, in Armenia, and is found in other Armenian records. Michaelis, Nat. T. by Marth, vol. ii. p. 98, &c. See Armenian Bibles.

ARMEIANS, in Ecclesiastical History, a division among the eastern Christians, thus called from Armenia, the country anciently inhabited by them.

Some have supposed, that Christianity was established in Armenia by the apostle St. Bartholomew; but this is certain, that in the beginning of the fourth century the Armenian Christians were in a flourishing state. In this century Tiridates the king established an hierarchy; and in the beginning of the sixth, under the patriarch Nerfes, the Armenian church succeeded from other establishments, became independent, and embraced the theory of the Jacobites, some few articles of discipline excepted. The schism of the Armenians is placed eighty-four years after the council of Chalcedon, A. D. 555. It was consummated at the end of seventeen years; and it is from the year of Christ 552, that the era of the Armenians is dated. In the fifth century, Armenia was divided into fifteen provinces, and subdivided into one hundred and ninety-one dioeceses.

The Armenian church, in the sixteenth century, was governed by three patriarchs, the chief of whom reigned in a monastery at Eschminzin, three leagues from Erivan, the diocese of this patriarch comprehends Greater Armenia; and he preaches over forty-two archbishops; he is elected by bishops, and his election is confirmed by the king of Peria. The revenues of this spiritual ruler are such as would enable him to live in the most splendid and magnificent manner; and yet there is no mark of pomp or opulence in his external appearance, or in his domestic economy. His table is frugal, and his habit plain; nor is he distinguished from the monks, with whom he lives, by any other circumstance besides his superior power and authority. A second patriarch, subject to the first, and called the "Catholic," resides at Cis in Cilicia, and has twelve archbishops under him, who govern
ARM

govern the churches established in Cappadocia, Cilicia, Cyprus, and Syria. A third patriarch lives in the island of Aghtamar, in the midst of the great lake of Vanafputumac; he has no more than eight or nine bishops under his jurisdiction, and is regarded by the other Armenians as the enemy of their church. Besides these prelates, who are patriarchs in the true sense of the term, the Armenians have other spiritual leaders who are honoured with the title of patriarchs, though it be unattended with the authority and prerogatives of the patriarchal dignity. Thus, the archbishop of the Armenians, who lives at Constantinople, and whose authority is respected by the churches established in those provinces that form the connection between Europe and Asia, enjoys the title of patriarch. The same denomination is given to the Armenian bishop who resides at Jerusalem; and to the prelate of the same nation, who has his episcopal seat at Camnise in Poland, and governs the Armenian churches that are established in Russia, Poland, and the adjacent countries. They assume the title of patriarchs, on account of some peculiar privileges conferred on them by the great patriarch of Echnaizin; for by an authority derived from this supreme head of the Armenian church, they are allowed to consecrate bishops, and to make every third year, and distribute among their congregations, the holy chrism or ointment, which, according to a custom among the eastern christians, is the exclusive privilege of the patriarchs. After the death of Abas the Great, the Armenian exiles, who, under his protection, had enjoyed the favours of liberty and abundance, were involved in various kinds of calamity. The floruit of perfec- tion shook their confidence; and many of them apostatized to the Mahometan religion. So that it was apprehended that that branch of the Armenian church, which had been planted in Persia, and especially in Isphahan, would gradually perish. On the other hand, the flate of religion in that church derived considerable advantages from the settlement of Armenians in different parts of Europe, for the purposes of commerce. These merchants, who had fixed their residence during the sixteenth century, at London, Amsterdan, Marseilles, and Venice, were not unmindful of their brethren in their native country; but supplied them with Armenian translations of the holy scriptures, and of other theological books, from the European presses, which prevented the illiterate and superstitious people, who lived under the Persian and Turkish governments, from sinking into the most confusmate and deplorable ignorance.

The Armenians, though they agree with the other Monophysites in the main doctrine of that sect, relating to the unity of the divine and human nature in Christ, differ from them, nevertheless, in many points of faith, discipline, and worship; and hence it comes to pass, that they hold no communion with that branch of the Monophysites, who are Jacobites, in the more limited sense of that term. As to the eucharist, they agree with the Greeks, except in this that they mix no water with their wine, and use unleavened bread after the manner of the Latins. Infants of two or three months old are admitted to the communion; and the consecrated bread, soaked in the consecrated wine, is distributed with peculiar ceremonies. When the priest takes the chalice and patrin, he is followed by his deacons and sub-deacons, with flambeaux and plates of copper furnished with bells; thus accosted, with a censer before him, he goes in procession round the fanctua : he then places them on the altar, pronounces the words of consecration, and turns himself to the people, who fall down, kiss the earth, and beat their breasts; then, after taking the bread himself, he distributes it to the people. In the baptism of children, they practise trine immersion; and then the priest binds a small cord of silk and cotton round the neck of the child, anoints his forehead, laves, arm, ribs, hands, and feet, and makes on each part the sign of the cross. The child, after baptism, is carried home by the godfather with the sound of drums and trumpets. The women do not go to church for forty days after delivery; and they observe many Jewish customs. The Armenians celebrate an annual festival, called Cachacouran, which, half Armenian and half Persian, signifies the baptism of the cross. It is generally supposed that this is a religious ceremony, like the theophany of the Greeks, and the epiphany of the Roman catholics. It is celebrated on the sixth of January, and the terms signify "marriage;" but it is not agreed, whether it commemorates the birth of Christ in his mani- festation in the flesh; or his appearance to the wife men when he was manifested to the Gentiles; or his manifestation to the Jews by the voice from heaven at his baptism. Perhaps it is merely a civil institute, resembling the Roman lustrum. The Persians mark this Armenian festival in their almanacks; their Mahometan kings attend it; and some say, it is an imitation of the Abhirkhan of the Guebres, or Gausa, i.e. the festival of lustral water, in use among the ancient Per- lians.

The Armenians abstain very rigorously from eating of blood, and meats strangled, and are much addicted to falling; infomuch that from their discoure, one would conclude that almost their whole religion consists in falling; and the higher the rank of their clergy, so much the greater must be their abstinence. Their monks, every Wednesday and Friday, eat neither fish, nor eggs, nor oil, nor any thing made of milk; and during Lent, they live upon nothing but roots; they are allowed wine only on the Saturday in the holy week, and meat on Easter Sunday. Besides the great Lent, they have four or five others of eight days each, preparatory for the four great festivals of the Nativity, the Ascension, the Annunciation, and of St. George, during which they are not allowed so much as to speak of eggs, flesh, oil, or butter.

Their monastic order is in great repute among them, since one of their patriarchs introduced that of St. Basil; but part of them, which have united with the church of Rome, have changed their ancient rule for that of the Dominicans.

ARMENIAIRE, in Zoology, a term occasionally given by some French writers to the Medusa tribe of Verme Mullusca. See Medus.

ARM, one of the synonymous names of Bos Americanus of Gmelin, an animal which Dr. Shaw considers a variety only of Bos Taurus. "The American Bifon," says that author, "seems to differ in no respect from the European, except in being more faggy, and in having a more protuberant bunch of fleshy filibabe over the floulders: the fore-parts of the body are extremely thick and strong; the hinder parts comparatively weak. The colour of the American Bifon is reddish brown, and the hair in winter is of a wooley nature, falling down over the eyes, head, and whole fore-part of the animal. In summer it often becomes almoat naked, but particularly on the hind part of the body. It grows, according to Lawton, to a vast size, and has been found to weigh sixteen hundred, and even two thousand four hundred pounds; and the strongest man cannot lift one of the flceans from the ground." Gen. Zool. Gmelin, who expresses some doubt whether it be distinct from Bos Taurus, assigns it the fame character as Liunezus.
ARM

Linnaeus had previously given to the variety of that species, namely, cornibus diversicatis, juba longissima, dorso gibboso, only making it a second variety. (Cornibus diversi- catis, name longis, back gibbosus, var. B) This is Boris (Bifon Americanus) cornibus sulcatos reflexis, dorso gibbosus, capitis postera longissima obtusa. Brum. (Bifon Ameri- canus) of Buff. Buffon, Linn. Carol. Buffon, Catheley. Ameri- canus (b) or (c), Dobbs. Didd. American bull, Ram. See Taurus.

ARMENOUNT, or ARAMENZA, in Geography, a village of Spain, in the country of Alava, once a city, and c. of an archbishop, one mile from Victoria.

ARMENTIERES, a town of France, in the department of the North, and chief place of a canton in the dis- trict of Lille, seated on the Lys. It was taken and de- manded by the French in 1817. The place contains 759,800, and the canton 14,974 inhabitants; the territory includes 535,800 acres. N lat. 52° 40', E. long. 3° 5'.

ARMENTORO, a town of Italy, in the kingdom of Naples, and province of Bari, 20 miles S. S. E. of Potenza.

ARMERIA, in Botany. See DIANTHUS.

ARMERIUUS. See DIANTHUS, and SILENE.

ARMET, in Geography, a town on the island of Nonfia- laout, one of the Molucca islands.

ARMIDA, in Entomology, the name of a species of PHALANA, in the Bombyx family, that inhabits Cayenne. The wings are yellow, speckled, and spotted with violet, and a streak behind of the same colour. Fabricius. Gmelin. &c. Off. This is a large insect; the antennae are yellow; the thorax yellow with a violet coloured spot on the back; abdomen yellow with a violet-coloured spot on the frill seg- ments; wings beneath yellow, with a violet spot in the middle. Off. This must not be confounded with the moth figured by Cramer, t. 197, fig. A., under the specific name of Armida, being Phalana Bryterna of Fabricius and Gmelin.

ARMIERES, in Geography, a small town of Hainault, on the Sambre.

ARMIGER, armour-bearer, in Modern Writers, denotes a title of dignity, rendered in English by Esquire.

ARMIGER, in Entomology, a species of CEMEX found in Africa. It is grey; thorax acutely spinous; two dots on the scutel, the antennae and legs pale. Gmelin and Fabricius. Off. This is Coreus armiger of the latter author, and was first described by him in his Species Insectorum.

ARMIGER, a name given by Fabricius to a species of Cancer that inhabits the Southern ocean. The thorax is somewhat smooth, with eight teeth on each side, and five lobes in front; the arms are toothed on each side. Fab. Mant. Inf.

ARMIGER, a name of Monoculus, in the sixth sec- tion of the Gcinuchian fylden, or those furnished with an uintavle shell: eyes two, and placed beneath; two antennae, and from four to eight legs. In this section (Arigera) are only three species, and the present is distinguished from the two others by having six legs. Slab. microcos. Gmel. &c.

ARMILAUSSA, in Antiquity, a short military coat, reaching down only to the knee. Aquin. and Prisci. Lex. Ant.

It was thus called, as being divided both before and behind, and only close about the shoulders, in armas tantum clavia, quos armiludina, f. Had. Orig. I. xix. c. 22.

The word is sometimes also written, armilauda, armulau- sa, armicafa, and armilaeafa.

ARMILAUSSA is also applied, in Ecclesiastical Writers, to the scapular of monks and canons; thus called on account of its hanging from the arms or shoulders. Schmud. Lex. Cereif. p. 73.

The name is vulgarly called patience. ARMILLARIA, in Zoology, one of the VERMES infusoria, belonging to the genus LEUCOPHORA, and both figured and described by Müller in his Zool. Dan. It is invisible to the naked eye, round, and annular; it is rather thickened above, and bent into the form of a ring.

ARMILLA, or ARMILARIA, in Anatomy, named by some Anatomists to the annular ligament.

ARMILLARIA, in Zoology, a creature of the VERMES Mallofer kind, in the genus NAKES. It is subdepressed; palpable above; corn lenticular. This species inhabits the North seas, where it bares itself felt deep in the fudges. The shape is oblong; length an inch and a quarter; on each side of the head are three lenticular fudges; in the body are a hundred and twenty joints, each of which is furnished with a small peduncle on both sides; and the tail terminates in two long filaments or threads. Mull. O. Fabr. Gmel. &c.

ARMILLARY, ARMILARIES, formed of armilla, a bracelet or ring, in Astronomy, an epithet given to an artificial sphere composed of a number of metallic circles, re- presenting the several circles of the mundane sphere put to- gether in their natural order.

Armillary spheres serve to affix the imagination in con- ceiving the arrangements and the motions of the heavenly bodies.

Such is that represented (Plate II. Astron. fig. 14. — Where P and Q represent the poles of the world, A. D. the equator, E. the ecliptic and zodiac, P A G D the meri- dian, or the follicular circle, T the earth, T G the tropic of cancer, H P the tropic of capricorn, M N the arctic circle, O V the antarctic, N and O the poles of the ecliptic, and R S the horizon.

The armillary sphere constructed by Dr. Long, in Pembroke-hall, Cambridge, is eighteen feet in diameter; and more than thirty persons may conveniently sit in it. The lower part of the sphere invisible in England is cut off; the whole apparatus is so contrived, that, when in order, it may be turned round with as little labour as it takes to wind up a jack.

ARMILLARY trigonometer, an instrument first contrived by Mr. Mungo Murray, and improved by Mr. Ferguson, con- taining of five femicircles; viz. meridian, vertical circle, horizon, hour circle, and equator; so adapted to each other by joints and hinges, and so graduated and divided, as to serve for expeditiously resolving many problems in astronomy, dialling, and spherical trigonometry. For the drawing, de- scription, and method of using it, see Ferguson's Tracts, p. 80, &c.

ARMILLATI MILITEIS, those who wore bracelets on their left arms, belted on them by their generals or emperors. But the term is more frequently applied to soft and effeminate soldiers, who wore bracelets on their arms, not as the rewards of their prowess, but marks of their foppish. Aquin. Lex.

ARMILLATUM, in Conchology, a species of Buce- num, figured and described by Lamarck and others. The shell is oblong; the aperture large and toothless; the whorls crowned with a single row of tubercles. Its native place is unknown.

ARMILLATUS, in Entomology, a species of CURCULIO that inhabits the Cape of Good Hope. The thorax is somewhat spinous on the fides; a grey belt near the tip of the thighs; shanks dentated. Sparrn. nov. ad. Stock. There is a variety of this insect entirely of a brownish grey colour, and
and another in which the wing-cases are clouded with grey, and an oblong spot placed obliquely on each side.

Armillatus, a species of Crambus, of a large size, that is found in India. On each side of the thorax are four spines; wing-cases furrugious, with a black margin; a single tooth on the posterior thighs. Gronov. Fabr. See.

Armillustrium, in Antiquity, a feaft held among the Romans; wherein they sacrificed, armed at all points, and with the sound of trumpets.

Some define armillstrium to have been a feast, wherein a general review was made of all the forces, in the Campus Martius. But this does not come up to the point; for Varro does not derive the word from the Latin arma and lustrare, to make a review; but from the custom of holding this feast in the place where the reviews were used to be made, or rather from their going round the place armed with bucklers.

The sacrifice was intended for the expiation of the armies, and the prosperity of the arms of the people of Rome; and was celebrated on the fourteenth of the calends of November. This feast may be considered as a kind of benediction of arms. It was first observed among the Athenians.

Arminiales, in Geography, a small town of Asia Minor, in Albania, at the foot of Mount Taurus; supposed to have been the ancient Cybius.

Armings, in a ship, are the same with scarp cloths, being red cloths hung about the outsides of the ship's upper works fore and aft; and before the cubboard-heads.

There are some also hung round the tops, and called top-armings. See Top.

Arminia, in Ancient Geography, a river of Italy, in Etruria, flowed from north to south between Saturnia and Volinii, and discharged itself into the sea near Forum Aurelii.

Arminianism, the doctrine of Arminius and of his followers. See Arminians.

Arminians, in Ecclesiastical History, the followers of Arminius, who, though educated at Geneva, and having imbibed the doctrines concerning predestination and grace, maintained by Calvin, Beza, Zanchius, &c. began to express his doubts concerning them in the year 1601; and upon further inquiry, adopted sentiments more nearly resembling those of the Lutherans, than of the Calvinists. After his appointment to the theological chair at Leyden, he thought it his duty to avow and vindicate the principles which he had embraced; and the freedom with which he published and defended them, exposed him to the reftament of those who adhered to the theological system of Geneva, which then prevailed in Holland; but his principal opponent was Gomar, his colleague. The controversy which was thus begun, became more general after the death of Arminius in the year 1609, and threatened to involve the United Provinces in civil discord. The Arminian tenets gained ground under the mild and favourable treatment of the magistrates of Holland, and were adopted by several persons of merit ued distinction. The Calvinists, or Gomarists as they were now called, appealed to a national synod; accordingly the synod of Dort was convened by order of the States General, in 1618; and was composed of ecclesiastical deputies from the United Provinces, as well as from the reformed churches of England, Scotland, Hesse, Bremen, Switzerland, and the Palatinate. The principal advocate in favour of the Arminians was Episcopius, who at that time was professor of divinity at Leyden. It was first proposed to debate the principal subjects in dispute, and that the Arminians should be allowed to state and vindicate the grounds on which their opinions were founded; but some difference arising as to the proper mode of conducting the debate, the Arminians were excluded from the assembly; their case was tried in their absence; and they were pronounced guilty of pedilential errors, and condemned as corruptors of the true reigion. In consequence of this decision, they were treated with great severity; they were deprived of all their posts and employments; their ministers were silenced, and their congregations were suppressed. However, after the death of prince Maurice, who had been a violent partisan in favour of the Gomarists, in the year 1625, the Arminian exiles were restored to their former reputation and tranquillity; and under the toleration of the state, they erected churches and founded a college at Amsterdam, appointing Episcopius to be the first theological professor. The Arminian synod has very much prevailed in England since the time of archbishop Laud, and its variations in other countries are very numerous.

The distinguishing tenets of the Arminians may be comprised in the following five articles; relating to predestination, universal redemption, the corruption of man, conversion, and perseverance. With respect to the first, they maintained, "That God, from all eternity, determined to bestow upon all men salvation on the condition that they should continue in his faith in Christ Jesus; and to inflict everlasting punishment on those who should continue in their unbelief, and refuse unto themselves divine favours; so that election was conditional, and predestination in like manner the result of foreseen infidelity, and persevering wickedness."

On the second, the Arminians taught, "That Jesus Christ, by his sufferings and death, made an atonement for the sins of all mankind in general, and of every individual in particular; that, however, none but those who believe in him can be partakers of his divine benefit."

On the third article, they held, "That true faith cannot proceed from the exercise of our natural faculties and powers, nor from the force and operation of free-will, since man, in consequence of his natural corruption, is incapable either of thinking or doing any good thing; and that therefore it is necessary, in order to his conversion and salvation, that he be regenerated and renewed by the operation of the Holy Ghost, which is the gift of God through Jesus Christ."

Fourthly, "That this divine grace, or energy of the Holy Ghost, begins and perfects every thing that can be called good in man, and consequently all good works are to be attributed to God alone; that nevertheless this grace is offered to all, and does not force men to act against their inclination, but may be resisted, and rendered ineffectual by the perverse will of the impatient sinner."

Some modern Arminians interpret this and the last article with a greater latitude.

Fifthly, "That God gives to the truly faithful, who are regenerated by his grace, the means of preferring themselves in this state; and though the first Arminians made some doubt with respect to the closing part of this article, their followers uniformly maintain, "that the regenerate may lose true justifying faith, forfeit their state of grace, and die in their sins."

The modern synod of Arminianism likewise, founded on a comprehensive plan projected by Arminius himself, as appears from a passage in his last will, extends the limits of the Christian church, and relaxes the bonds of fraternal communion in such a manner, that Christians of all sects and denominations, whatever their sentiments and opinions may be,
be, papists excepted, may be formed into one religious body, and live together in brotherly love and concord. But, in order to avoid the reproach of being altogether unconnected by any common principles, Episcopius drew up a confession of faith, expressed for the most part in words and phrases of Holy Scripture, which the Arminians have generally adopted, though not enjoined upon them by any authoritative obligation.

The Arminians are also called Remonstrants, from a humble petition intituled their Remonstrance, which, in the year 1618, they adduced to the states of Holland. Their principal writers are, Arminius, Episcopius, Vossius, Grotius, Calixtus, Lejten, Lejten, and Witsen, who mention many others of more modern date. Brandau's History of the Reformation in the Netherlands; and Molvin's Eccles. Hist. by Dr. Machaon, vol. iv.

The progress of Arminianism has been somewhat retarded, and its prevalence restrained, more especially in Germany, and several parts of Switzerland, in consequence of the ascendant which the Leibnizian and Wolffian philosophy both gained in those countries, particularly among the clergy and the men of learning. Leibniz and Wolff, by attacking that liberty of indifference which is supposed to imply the power of acting, not only without, but against motives, struck at the very foundation of the Arminian system. Besides, by considering the multiplicity of worlds that compose the universe as one system or whole, the greatest possible perfection is the ultimate end of creating good and evil, and the sovereign purpose of governing them, they removed from the doctrine of predetermination the arbitrary procedures and narrow views with which the Calvinists have been charged with loading it, and gave it a new, a more sublime, and a more philosophical aspect. As the Leibnizians laid down this great end as the supreme object of God's universal dominion, and the scope to which all his dispensations are directed, so they concluded, that if this end was proposed, it must be accomplished. Hence the doctrine of necessity, to fulfill the purposes of a predetermination founded in wisdom and goodness: a necessity physical and mechanical in the motions of natural and inanimate things, but a necessity moral and spiritual in the voluntary determinations of intelligent beings, in consequence of propitious motives which produce their effects with certainty, though these effects be contingent, and by no means the offspring of an absolute and immutable fatality. These principles are evidently applicable to the main doctrines of Calvinism; by them predetermination is confirmed, though modified with respect to its reason and end; by them irreclaimable grace, irresistible in a moral sense, is maintained upon the hypothesis of propitious motives and a moral necessity. The perseverance of the saints is also explicable upon the same system, by a series of moral causes producing a series of moral effects. The learned Canisius has written a book for the express purpose of showing the eminent use that may be made of the Leibnizian and Wolffian philosophy, in throwing light upon the chief articles of our faith, "Philosophiae Lib. et Wolf. usus in theologica per praecipua fides capita." Trarion and Leips. ed. 1749. The scheme of necessity, and of partial evil tending to universal good, has been fostered in some parts of Great Britain, and has converted some zealous Arminians into moderate and philosophical Calvinists. But "the zealous Calvinists (says Dr. Macleane) have for the most part held firm to their theology, and blended no philosophical principles with their system; and it is certain that the most eminent philosophers have been found, generally speaking, among the Arminians. If both Calvinists and Arminians claim a king, it is certain that the latter alone can boast of a Newton, a Locke, a Clarke, and a Boyle.

ARMINIUS, or Harmanssen, James, in Biography, founder of the sect called Arminianism, was born at Oude-Water in Holland, in 1560; and he lost his father in his infancy. He was first instructed by a Catholic priest, who was secretly a friend to the reformed religion, and by his liberality encouraged as a student at Utrecht. Upon the death of this patron, he obtained assistance from Rodolphus Scheius, his countryman, and in 1575 accompanied him to Marburg. During his abode in this place, he received information that his native town was polluted by the Spaniards, and he fled thither, determined to return to the sword. At Leyden, he afterwards prosecuted his studies with reputation; and at length the magistrates of Amsterdam provided him with the means of finishing his education at Geneva. The lectures of Theodore Beza on the epistle to the Romans, are supposed to have first suggested to Arminius those speculations, which led him to form a new sect. As he adopted and privately taught the philosophical system of Peter Ramus, he was obliged to withdraw from Geneva; and he then removed to Basle, where he gained great credit by his lectures; after a short interval he returned to Geneva, and enjoyed in tranquillity the society of the learned. Devoid of farther improvement, he visited Padua, in order to attend the philosophical lectures of the celebrated Zabarella; and after having travelled in Italy for five or six months, he returned, in 1588, to Amsterdam, where he found his patrons much prejudiced against him. "It was reported and believed, that Arminius had killed the Pope's toe, whom he had only seen in a crowd; this he had contracted an intimacy with Jesuits, whom he had never heard of; that he had introduced himself to Bellarmin, whom he had never seen; and that he had abjured the reformed religion, for which he was prepared to die." These prejudices, however, as they were occasioned by groundless rumours and calumny, gradually subsided; and the talents and zeal of Arminius, as a fireproof advocate for the reformed religion, and an eloquent preacher, raised him to distinguished notice; accordingly he was engaged to refute a work which had been written against Beza's doctrine of predetermination. In the course of his examination, he became a profligate to the opinions which he had undertaken to refute; and renouncing the Calvinistic doctrine concerning the decrees of God and divine grace, he maintained, that the merits of Christ extended to all mankind, and that the grace of God, which is necessary to salvation, is attainable by all. This change in the sentiments of Arminius took place in the year 1591; and his undigested and honest avowal of it excited hoistilities, which would have been injurious to Arminius, if the magistrates of Amsterdam had not interposed and suppressed the contest. After having officiated as a minister in the church of Amsterdam for fifteen years, Arminius, notwithstanding the heretical opinions which he had adopted, was elected, in 1603, to the professorship of divinity in the university at Leyden, and admitted to the degree of doctor in divinity. In his lectures, and also in his writings, the professor tremulously asserted and defended his opinions, and made many converts both among the clergy and the laity. His adversaries, however, were very numerous; and of these the most violent was his colleague, Francis Gomar. Unable to contend with the various modes of attack by which his enemies percuted him, he funk under a complication of diffeal, and departed this life in the year 1660. Arminius was eminently distinguished by his piety and integrity,
The glasses for this musical instrument are blown as nearly as possible in the form of hemispheres, having each an open neck or socket in the middle. The thickest of the glasess near the brim is about one tenth of an inch, increasing towards the neck, which in the largest glasses is about an inch deep, and an inch and a half wide within; but these dimensions lessen as the size of the glasses diminishes, only observing that the neck of the smallest should not be shorter than half an inch. The diameter of the largest glasses is nine inches, and that of the smallest three inches: between these there are twenty-three different sizes, differing from each other a quarter of an inch in diameter. For making a single instrument, there should be at least six glasses blown of each size, and out of these thirty-seven glasses (which are sufficient for three octaves with all the femtum) may be found, that will either yield the note required, or one a little sharper, and fitting so well into each other, as to taper regularly from the largest to the smallest. The glasses being chosen, and the note for which each glass is intended being marked upon it with a diamond, they are to be tuned by diminishing the thickness of those that are too sharp, which is done by grinding them round from the neck towards the brim, comparing, by means of a well-tuned harpsichord, the tone drawn from the glass by your finger with the note you want, as found by the corresponding fingering of the harpsichord. The largest glases in the instrument is G, a little below the reach of a common voice, and the highest G, including three complete octaves: and they are distinguished by painting the apparent parts of the glasses within, every semi-tone white, and the other notes of the octave with the seven prismatic colours: so that glasses of the same colour (the white excepted) are always octaves to each other.

When the glasses are tuned, they are to be fixed on a round spindle of hard iron, an inch in diameter at the thickest end, and tapering to a quarter of an inch at the smallest. For this purpose, the neck of each glass is fitted with a cork, projecting a little without the neck; these corks are perforated with holes of different diameters, according to the dimension of the spindle in that part of it where they are to be fixed. The glasses are all placed within one another, the largest on the biggest end of the spindle with the neck outwards; the next in size is put into the other, leaving about an inch of its brim above the brim of the first; and the others are put on in the same order. From these exposed parts of each glass, the tone is drawn, by laying a finger upon one of them, as the spindle and glasses turn round. The spindle thus prepared, is fixed horizontally in the middle of a box, and made to turn on braze gudgeons at each end. A square Shank comes from its thickest end through the box, on which a wheel is fixed by a screw: this will serve, like a fly, to make the motion equable, when the spindle is turned by the foot like a spinning-wheel. The wheel is eighteen inches in diameter, and conceals near its circumference about twenty-five pounds of lead, and may be made of mahogany. An ivory pin is fixed in the face of the wheel, about four inches from the axis; over which is put the loop of the string, that comes up from the moveable flap to give it motion. The box is about three feet long, eleven inches wide at the biggest end, and five inches at the smallest end; it is made with a lid, which opens at the middle of its height, and turns up by back hinges. The instrument, thus completed, stands on a neat frame with four legs. This instrument is played upon by fitting before it, as before the keys of a harpsichord, turning the spindle with the foot, and wetting the glasses now and then with a sponge.
a sponge and clean water. The fingers should be first soaked in water; and rubbed occasionally with fine chalk, to make them catch the glaze, and bring out the tone more readily. Different parts may be played together by using both hands; and the tones are best drawn out when the glazes turn from the ends of the fingers, not when they turn to them.

The advantages of this instrument, says Dr. Franklin, are, that its tones are incomparably sweet beyond those of any other; and that they may be swelled and softened at pleasure by stronger or weaker prelurries of the finger; and continued to any length: and when it is once well tuned, it never again wants tuning. Franklin's Letters, &c. on Philosophical Subjects, p. 478.

Mr. Peckrich, the first performer on the new instrument, was, by a fatal accident was burned in his bed at his lodgings in Swiftin's Alley near the Royal Exchange, in 1759, by the hose in which he lodged taking fire in the night, and being destroyed, before any assistance could arrive.

Mr. Selman, a German harpsichord-maker, played publicly afterwards with considerable success in several parts of London and Westminster. But the first and only performer on the Armonica, contrived and so accurately described by Dr. Franklin, in a letter to Padre Beccaria of Turin, was the eldest Miss Davies, sister to Miss Cecilia Davies, the celebrated opera singer, but best known in Italy by the title of P. Inglisha.

The talents of our two countrywomen, the Misses Davies, who resided a considerable time at Vienna, in the same house as the celebrated HaFe and Paufina (see Prent State of Music in Germany, Art. Vienna, vol. i), have been described by the admirable lyric poet, Metaftafo; the eldest for her performance on the Armonica, at that time a new instrument, and the youngest, for her vocal abilities. The Emprefs-queen had been so pleased by their several talents, that in the year 1759, on the marriage of the infant duke of Parma with the arch-duchess Maria Amelie, she deigned Metaftafo to write a cantata, which was set by HaFe, in order to display their several talents. This cantata has been published in late editions of the poet's works, under the title of l'Armonica, the name of the new instrument on which the eldest Miss Davies accompanied her sister, in the performance of the cantata.

A letter written by the poet to the princes of Bel- momont at Naples, recommending the performers to her protection, will serve as a comment to the cantata just mentioned.

The bearers of this most reverential address, are two English young persons, travelling under the conduct of their worthy parents, in order to give testimonies at Naples of their several abilities in music; their names are Miss Mary, and Miss Cecilia Davies: the first performs with admirable skill on an invention of new invention called the Armonica. It is composed of glazes of different sizes, revolving, by means of a pedal, on a spindle. These glazes, forming a regular scale of tones and faint-tones, being delicately touched with wet fingers during their revolution, produce the most uncommonly sweet and celestial tones imaginable; particularly in pathetic strains, for which the instrument is eminently calculated. The other singer, who is poftidal of a very pleasing and flexible voice, sings extremely well, with much art and natural expression; and when accompanied by her sister on the Armonica, she has the power of animating her voice with the instrument, and of imitating its tones so exactly, that it is sometimes impossible to distinguish one from the other. They have been here universally admired and applauded: and my most envious patrons, who has designed to hear them frequently, has honoured them with munificent testimonies of imperial approbation.

Miss Cecilia Davies performed in the theatre of San Carlo at Naples, at the part of Bradomonte, in Metalafaö's new opera of Ruggiero.

In the first fol. edit. of the French Encyclopédie, t. xxviii, printed in 1765, under the article VERRES, MUSIQUE des, Musical glazes, it is said: "they have contrived within these few years to produce a new species of harmony from glazes, which is extremely pleasing to the ear.

"It is pretended that an Englishman of the name of Puckridge is the inventor. However this method has been much known in Germany. The instrument used on this occasion is a oblong square box, in which are arranged and fixed many round glazes of different diameters. In these there is water of different quantities. By rubbing the edge of the glazes with a wet finger very gently, the sweetest, most melodious, and flattened tones are produced, and with these the most agreeable airs are performed.

"The Periards, in very high antiquity, have produced musical sounds by a simlar contrivance; by drinking from porcelain cups, tuned by water, with little flacks, a regular scale is produced." No authority is given for these affirmations. Metalafaö, who had resided near fifty years in Germany, calls the Armonica, "an instrument of new invention." The producing musical tones from drinking-glazes has been long known to the natives of Great Britain and Ireland; but the forming different toned glazes into an instrument, and tuning them by water, we have not the least doubt was the invention of a native of Ireland, of the name of Poekrich; as the placing a series of glazes on a cylinder, or spindle, turned with a pedal, was the invention of Dr. Franklin, who tuned his glazes by grinding, not by water. A drawing of Miss Davies's instrument will be found in one of the plates of musical instruments. Her performance on this musical instrument pleased the great masters on the Continent, that Padre Martini, Haff, Galuppi, Jomelli, Mozart, &c. presented her with original compositions, purposely produced for the Armonica, upon which she often playi, extempore, till more exquisite brains than these great composers, at an early period of its invention, thought this instrument capable of expressing.

ARMOR, or ARMOUR, in a general sense, is a term that may be applied to any defensive habit, used to protect the person of the wearer from the attack of an enemy; or abridgedly, to any part of such habit. Armour, in the aggregate sense of the word, is frequently called barefied by the English writers of the fifteenth and sixteenth centuries, as well as in our ancient statutes.

The materials anciently used for the making of armour were exceedingly multiform; depending in some instances upon the produce of the country in which it was fabricated, but more generally upon the judgment or experience of the inhabitants. Among the more civilized nations, brass, iron, and other metals were preferred; and in the time of Affict magnaissance, even gold was not spared; on the other hand, the Libyans, according to Herodotus (in Polybius), who affiled Xerxes when he invaded Greece, were clothed in tunics of leather, to supply the place of body armour; and the same author (in Clio) affures us, that the military dress of the ancient Perians was composed of leather, and girt about the body with a leathern girdle; and speaking of the Affict Indians (in Polybius), he tells us, that some of them used a species of armour made with wood; others again plaited rushes upon each other like mats, and worked them into the form of a thorax, or breast plate; he also mentions (in Melponene) a people who inhabited the maritime parts
ARMOR.

parts to the well-ward of the Garamantes, who, "when they make war," (says he) "wear the skins of ottrches instead of armour."

The shield, the helmet, and the breast-plate, may claim precedence of every other part of the ancient defensive armour; the first, from the obvious use of such an instrument and the extensiveness of its service; and the other two, from the protection they afforded to the sources of life and function. We must refer to the fac'd writings for the earliest memorias of the ancient military habit; little more, indeed, than the names of the different parts of this habit occur; but with the asseilance of more modern authority, we may be enabled to form some idea of the nature and usefulness of those parts, when applied to the protection of the wearer.

The defensive armour of the Israelites consisted of a shield, a helmet, a military veil, a thorax or breast-plate, and belts of metal, or plated with metal, to gird upon the body, beneath the breast-plate. It does not appear that they wore greaves or military boots for the defence of their legs; though the greaves are mentioned as a part of the armour belonging to Goliath, the giant of Gath (1 Samuel, chap. xvii. ver. 6): they were also worn by other Asiatic nations; and at the siege of Troy, by the Grecians in general. Homer frequently distinguishes his countrymen by the epithet of well-greaved or well-booted Grecians. The greaves attributed by the author of the book of Samuel to Goliath, are called (יָשָׂם), literally, the shins, or hining plates, and were made of brass, resembling probably those upon the legs of the little figure marked A. Plate I. of Armour, which reach from the top of the knee, to the instep, but do not cover the feet; so those of the giant are expressly said to have been placed above his feet. The figure B. upon the same plate, of which we have two views, exhibits the greaves of a thicker constancy, and from the manner in which they are fastened upon the back part of the legs, they appear to have been made with the skins of animals, having the fur upon them. See Greaves.

In the book of Exodus (chap. xxviii. ver. 32. and chap. xxxix. ver. 23.), Moses mentions a garment, which our translators considered as a military one, and accordingly have rendered it an habergeon; that is, a short tunic of mail, fitted close to the neck, without sleeves, and defending something lower than the breast. The sacred penman, speaking of "the robe of the Ephod," says, "there shall be a hole in the top, in the midst thereof, and it shall have a binding of woven work round about the hole of it, as it were the hole of יָשָׂם an habergeon, that it he not rent." But the deduction of the original word, from a root which signifies to make hot, justifies the lexicographers in conceiving it to have been a thick or quilted garment fitted close to the body; and probably it was the same as the vest which Saul put upon David, previously to his arming him with the thorax and girdle (1 Samuel, chap. xvii. ver. 38, 39). This vest, indeed, is distinguished by another name (תַּק), but the objection is of little moment, for a redundancy of names applied to single objects, is common enough to be met with in the Hebrew, and other Asiatic languages. Saul's tunic was evidently placed under the body armour, to prevent the plates of metal from pressing too closely on the skin, and hurting it; and answered precisely the purpose of the doublet, or pointpoint, worn beneath the coat of mail in more modern times (see Doublet); and perhaps, like that, was made without sleeves. Upon the fig. B. Plate I. we find a similar kind of military garment which is worn without the breast-plate, and has only one sleeve occupied by the left arm; this tunic appears to have been fabricated with some rigid material, perhaps of thick leather, and might have answered the double purpose of the pointpoint and the pectoral: the right sleeve, which is full of folds, is evidently made of more pliant stuff than the body garment, and probably belonged to an inner tunic; it was_sublimated for the leather sleeve, because it was less rigid, and did not equally impede the motions requisite for the sword-arm. This curious ancient figure is preserved in the British Museum; it is of Greek workmanship, and was found in the ruins of Herculaneum.

The thorax or breast-plate, called in the Hebrew יָשָׂם or יָשָׁם, derived from a word significative of strength; and usually rendered by our translators, coat of mail; formed another part of the Jewish military habit; it is first mentioned as such, 1 Samuel, chap. xvii. ver. 38 and the same word is used for the body armour of Goliath the Philistine (ibid. ver. 5.), joined with an adjective, expressive of its having been covered with plates of brass in the form of scales. This ordi. totally omitted in our translation, but it is a very important one; and the passage may be rendered, "a thorax or breast-plate of scales of brass." Herodotus (in Polyhistor) informs us, that the Median and Persian folders belonging to the army of Xerxes, had each of them a tunic covered with plates of iron like the scales of a fish, and adorned with sleeves of various colours; but over the tunic, it appears from the historian, they wore an Egyptian pectoral. This kind of scale armour consisted of small plates of metal fastened upon a garment fitted to the body and limbs of the wearer, and contrived to hang over each other like a fish's scales, but in such a manner, as not to prevent the flexibility of the garment, nor obstruct the exertions of the soldier's agility. The form and nature of this equipment are admirably represented by the Sarmanian horsemens, upon the Trojan column; a deft, somewhat similar, was partially adopted in the western parts of Europe by the heroes of the middle ages; but it was soon superseded by the chain, or ring mail, which became universal.

It is highly probable, that the thorax of the Philistines was much longer in proportion to his size than that of Saul, and might cover the greater part, if not the whole of the front of his body; at least one may so judge from its great weight, equal, it is said, to 65 pounds Troy weight; for had the breast-plate of Saul been longer or larger than the ancient pectorals usually were, and proportionate to his size, it would have been an absurdity in him to have attempted to put it upon David, who was a dwarf, and at least a full head and shoulders beneath his stature. Yet we are told, he did put it upon David, and girded his sword upon the tunic beneath it. When David rejected the deft, it is not said he did it because it was too large or too long, or that he appeared ridiculous in it, but because he had not essayed, tried, or been used to such an equipment; for which reason, instead of being useful, it was in incumbrance to him, and obstructed the free use of his arms. See Breast-plate.

If we turn to the little figure A. Plate I. we may meet with something resembing the body armour of Saul, and may easily conceive how it might be applied to a perfon of smaller stature, without the least inconseuency; first, we observe the short flirts of the tunic (above mentioned) with which David was first invested; secondly, the thorax or breast-plate, here apparently one solid plate of metal, worked into the form of a man's breast, and fastened upon the tunic beneath the thorax, are two belts plated with metal, from one of which the sword was usually suspended. If we look to the fac'd text, we shall find that Saul girded David with his own sword upon the tunic; and as he had been previously invested with the thorax, it reasonably follows that...
that the sword was girded "upon" a portion of the tunic which hung belw the thorax, accordingly to the representation of the belts upon the bronze. There is only one girdle mentioned in this passage of the Scripture; and perhaps one was sufficient for David, though Saul, a much taller man, might require two or more. The little figure here engraved perfectly explains the manner in which Abah king of Israel received his death's wound; we are told (1 Kings, chap. xxviii. ver. 31.), that he was smitten by an arrow, "between the joinings of the belts, and between the breadth-plates," that is, in the opening where the lower part of the breadth plate was joined with the uppermost belt or girdle. See Fig. 11.

Xenophon (Cyrop. lib. vi. v., describing the military dress of Abdabates king of Sifica, mentions προσπέρας as part of the Ancient Grecian cuirass, with breadth-plates of metal for the protection of the shoulders (see the fig. are marked C. C. Plate I. of Armour); and also καστελλάρια for the thighs; and τάφθα, or plated strips, attached to the thorax, for the protection of the lower parts of the body. In process of time the thorax was gradually enlarged, and from its appendages originated a complete suit of body armour, such as was introduced by the Grecians, and occasionally used by the Romans. In the middle ages, this custom of cufmg of men in brass or iron was revived, and carried in more modern times to a greater extent than it had been before. A front and a back view of a close-armed man according to the ancient Grecian fashion, is given. Plate I. marked C.C.; the succeeding alterations will appear hereafter, under the article. "Coat of Mail." We may here add, that the λορδς or mail, a species of armour so famous in the ages of chivalry, is by none of modern invention. The thorax of the Phænian giant appear to have been somewhat of this kind, consisting of small plates of metal quilted over each other like the scales of a fish; and if we turn to Plate I. and examine the body of the figure marked D. we shall find strong indication of a chain-mail or net-work of wire rivetted together. If it should be thought, from the smoothness of the bronze upon the left side, that the armour was only made to cover the right, it will be necessary to observe, that this figure in its original plate was supported by another figure, whose right arm, broken away near the elbow, appears beneath its left shoulder, and the part of the arm which is lost covered that portion of the body where we remark the deficiency of the mail; in the present cafe, the left hand of the supporting figure is also seen upon the right hip.

The Egyptian armour of defence for the person consisted of a brazen helmet, and a thorax or coat of linen so plaited and folded as to reflect the point of the enemy's weapon; the whole seems to be formed of rolls of linen or cotton fattened together like the flaxings worn at present by the Tyrolese, or like the hay-bands which a countryman twirls round his legs to serve instead of boots. Fig. 1 and 2. Plate II. were copied from the tombs of the kings of Thebes. Denon's Egypt. Herodotus.

In the earliest defensive armour for the person, the Greeks seem to have used the skins of animals. Horses wore the lion's skin, which, in very ancient sculpture and painting, is tied round his neck by the paws, and again fattened round his loins with a ligature, in such a manner as to form a kind of coat. Jupiter wore the ægis, or goat-skin, for both breadth-plate and shield, to which afterwards was added a cover of metal scales for better defence, and it was further decorated with the Medusa's head to terrify the beholder; the κωκλον, or dog's skin, was the ancient hat and helmet.

The ægis, or dog's skin, is the name generally given to the helmet by the Greeks. Homer frequently uses it, but it is particularly given to that worn by Ulysses in the night expedition. Τρίφθαλοι, τριπχαλοι, is the triple-crested helmet; the crests were principally made of horse-hair. Fig. 4. Plate II. is of the first description. Κυριος, κυριος, a word derived from kyrion, the head, is properly applied to No. 3, and 15. Plate III., and the helmet of 7 and 8. Plate II. because this species of helmet being drawn over the face, at the same time that the form of the head was preferred, the features of the wearer appeared through the front of the helmet.

The Greeks made the thorax, or armour for the body, of brass, linen, or leather. Homer calls his heroes, bra Lars.

The plate-armour for the body consisted of four principal divisions, the breadth-plate, the back-plate, the shoulder-plates and the δίσπερα, or the belt.

The breadth and back plates were formed to resemble the naked body (see Fig. 8. Plate II., and Fig. 14. and Plate III.); these two pieces were fastened together by hasps on each side.

The shoulder-plates were tied to the pans of the breadth, in some instances, which projected like hinges, to allow room for the knot; see Fig. 8. Plate II.

The δίσπερα, or some, comprehended the belt and hanging straps which formed the lowest part of the thorax; see Fig. 3, 7, and 8. Plate II.

Fig. 6 and 7, are coats of mail; in Fig. 6, the shoulder-plates are fastened by rings to a small circle or umbilicus, close to the girdle. Fig. 3. Plate II. has the appearance of linen armour or a coat of mail.

_written was the large round shield, see Fig. 9. Plate III.
The peltis was a small shield, see Fig. 10. Plate III.

were several other shields, but those of the large round, and large oval forms, seem to have been more commonly used.

Fig. 12. Plate III. is one of the Roman heavy-armed soldiers called principes; his armour consists of plates of iron or brass. Fig. 20. Plate III. is one of the Roman velites, or light-armed soldiers, his covering consists of a leather jacket, breeches or femoralia, and sandals. Fig. 15. Face plate, is a Roman general (the emperor Trajan), whose dress is sufficiently explained in the account of Grecian plate armour; the only peculiarity in this figure worthy of observation is, that he wears the military chlamys or cloak.

Fig. 11 and 19. Plate III. are two brazen swords in the British Museum, the latter is sheathed in the same metal; these with the helmets 12 and 16, and the breadth and back plates 14 and 18, were found in the field of Canne, and are believed to have belonged to the Carthaginians.

Fig. 5. Plate II. is a figure in an elegant suit of armour, copied from an antique plate in the collection of Mr. Tafft; but whether it is Etruscan or Roman would be difficult to determine, as it bears but little resemblance to any other ancient work of art that is known.

Although the foregoing observations will throw considerable light on the subject of Greek and Roman armour in general, yet it must be acknowledged that their species is almost infinite; and that all the antique statues, pictures, and gems of armed warriors, of which many hundreds exist, exhibit those differences and peculiarities which must naturally be expected from the variety of times, countries, geniuses of men, and the gradual progress of improvement. In the representations of armour for the body made of leather, we see the imitation of that covered with hair, and made with plaited thongs; in the linen mail, we see thofe doubly and triply plaited, and others worked in oilet holes; in the mail of brass and iron, we see different kinds of scales and chain-works, with
with the various combinations of rings; these differences may be observed in the structure of the armour itself, besides the great variety of animals, foliage, and devices, with which the different specimens are decorated. Concerning the magnificent thorax of Menecus described by Homer in the beginning of the eleventh book of the Iliad, it is said to have had ten stripes of black feel, twelve of gold, and twenty of tin, besides three dragons on each side, which rise up to the neck of the thorax; all this could be only decoration, the general form resembling some one of those represented in Plate II.

Homer and Hecataeus's descriptions of the shields of Achilles and Hercules broke the reader with astonishment, and bewildered his imagination; but we may form a simple and satisfactory conception of both, by remembering they were large circles, decorated with basreliefs of figures, the subjects of which followed in succession until the last reached the front. In an enumeration of the magnificent examples of ancient armour, the trophies of Augustus, formerly called those of Marius, in the capitol, excite our astonishment by the extreme richness and beauty of the helmets, coats of mail, cuirasses, &c., which compose them; and the knowledge of these noble works has been widely communicated by Piranesi's admirable engravings. In concluding this subject, it is to be remarked, that the excavations of Pompei have furnished a great quantity of curious and interesting information on the subject of ancient armour, totally unknown to the moderns before there are in the king of Naples's museum of Parthian, ancient Roman helmets made of brass, with caps to cover the face and guard the eyes; armour for the upper and lower arms, shoulders, elbows, and thighs, of a kind not to be seen in any of the antique statues or bas-reliefs. Some of these pieces are adorned with figures, groups, and other ornaments; but as no drawings are permitted to be made from them, except by those permitted for the publication of the Hellenic antiquities, by the Neapolitan government, we must wait for the next volume of that work to satisfy our curiosity.

In Plate I. the figures C, C, and D, will be sufficiently explained by what has been said concerning the different articles in Plates II. and III. there being nothing particular in these figures except the swan or goose's head which forms the crest of fig. C. The fig. A. and B. wear helmets with visors; the helmet of fig. A. has a high cone and two horns; the shield, which was originally a long square, is broken.

Vegetius observes (De re militari, l. i. c. 10), that the Roman infantry was invariably covered with defensive armour, from the foundation of the city to the reign of the emperor Gratian. The relaxation of discipline, and the dilution of exercise, rendered the soldiers less able and less willing to support the fatigues of the service; they complained of the weight of the armour, which they seldom wore; and they succeeded in obtaining permission for laying aside both their cuirasses and their helmets. The heavy weapons of their ancestors, the short sword and the formidable pilum, which had subdued the world, insensibly dropped from their feeble hands. As the use of the shield was inconsistent with that of the bow, they reluctantly marched into the field. The cavalry of the Goths, the Huns, and the Alani, had felt the benefit and adopted the use of defensive armour; and as they excelled in the management of missile weapons, they easily overwhelmed the naked and trembling legions, whose heads and breasts were exposed without defence, to the arrows of the barbarians. The loss of arms, the destruction of cities, and the dishonour of the Roman name, insectually solicited the succours of Gratian to restore the helmets and cuirasses of the infantry. The encrusted soldiers abandoned their own and the public defence, and their pulchritudinous indolence may be considered as the immediate cause of the downfall of the Roman empire. Gibbon, vol. iii. p. 67, 68.

Thus far we have chiefly considered the defensive Armour of the ancients; and shall now present our readers with a correct sketch of its history as it relates to Britain.

The early Britons, though by no means unequipped with the artifices of war, seem to have had no defensive armour; merely endeavouring to make their appearance dreadful, by tracing wild and horrid images upon the skin; and though they afterwards adopted many of the Roman customs, arts, and habits, they do not seem to have availed themselves of armour, perhaps thinking the freedom of exertion oppressed by such an incumbrance; and it must likewise be remembered, that it was the constant policy of the Romans to deprive all these nations whom they subdued of the use of arms, and to accustom them to a soft, effeminate way of life, that they might have neither ability nor inclination to make off their yoke (See Tac. vit. Agr.). And the Britons perhaps had little inclination to adopt the Roman method of defence, since it could be no honour to wear the military habit of their conquerors. The Saxons, whose chief delight was war, and though among the earliest of the Britons, who arrived in Britain, we hear of nothing like what is now called armour, yet there seems some ground for thinking that it was not entirely unknown to them, since the first species of military habit they afterwards made use of, was the scale armour, similar to that which Xenophon describes among the Sarmatians, from whose neighbourhood it is now believed the ancestors of the Saxons had their origin. In manuscripts of the tenth century, the Saxons soldiers appear habituated in a kind of mail, or scale armour, similar to that worn by the ancient Normans (Strutt's Manners and Customs of the English, vol. i. p. 29), already described. And another kind of mail in use appears to have been composed of strong wires, closely interwoven with each other, like fine wicker, with which the soldiers were cloathed from head to foot (see Pl. IV. fig. 1, 2); others, however, appear to have been cloathed with it in part only, its inflexibility seeming to require that it should be confined to the body, ending at the bottom of the loincloth, and a little below the shoulders (Ibid. vol. i. p. 30). The helmets usually worn with this latter species seem to have been of skins. A manuscript in the Cotton library (Clc. e. 5) universally allowed to be as old as the reign of Canute, represents the Danes soldiers in complete suits of armour (see Pl. IV. fig. 3, 4), from the bends and folds of which they are supposed to have been made of leather, with a diamond crossing of strong wires, interwoven with each other, and made with strong joints in proper places. This armour covers the whole body, legs, and arms, half the left hand being left uncovered, for the betterpurchase in holding either the sword, the spear, or the shield. Their heads are covered with helmets, much superior to those we have mentioned of the Saxons, and still better fashioned to sustain the shock of a violent blow. A projection also crosses the face, to prevent the peron armed from receiving any hurt from the crofs (stroke of an enemy's sword, not unlike what is sometimes seen in the ancient Greek and Roman helmets); and, with a little variation, in the modern helmets of the Mamelukes.

The defensive armour of the Normans was chiefly the coat of fence called Mail, especially for the better foot; others had body armour of iron or leather. The mail was made of small iron links, with joints at a convenient distance; and so contrived as to move upon each other with the greatest facility
facility (see Pl. IV. fig. 5.). With this defensive armour both the horsemen and better foot of foot were covered, the face and left hand excepted. When the mail itself did not compose the guard for the head, they wore helmets, either of iron or brass; the leaders and standard-bearers had generally beavers, composed of thin plates of iron, fastened on the mail before the face; and a few, apparently of a higher rank, wore helmets clumsily composed of the mail.

Mail armour maintained its ground from the Norman invasion to the fifteenth century. Henry IV. is the last of our kings who appears in it on his great seal (Gough's Sep. Mon. I. cxxii.). Many influences, however, of helmets adorned with park, and mail, occurred about the middle of the fourteenth century (Hibd. cxxiv.); at which time Mr. Grose affirms, that plated armour was completely introduced both here and in France. The transition from mail to plate armour is shown (Pl. IV. fig. 6.), from the monument of Thomas Beauchamp, earl of Warwick, 1370. When plated armour came into fashion, it was composed of different pieces for the back, breast, shoulders, arms, hands, thighs, legs, and feet, under the several names of curiies, consisting of a back and breast-piece, foulbroads, frollasts, gourd-braies or avanti-braies, (corruptly, in English, crombraces); garnets, cufHants, with garnetiere; greaves, and iron shoes. Such was the suit of armour in the tower, said to have been made for Henry the VIII., when eighteen years of age (Pl. V. f. i.). Plate armour continued in use for the half a century, when the introduction of firearms, with the improvement of artillery, and a more active mode of warfare, superseded the incumbrance of heavy armours. Of all this furniture of war, scarce any thing is now retained, except the curiies; the gorget or neck-piece, worn by officers, being at present only a badge of honour, and of no defence. The minute changes of our ancient armour may perhaps be traced, by the inquisitive reader, upon sepulchral monuments.

The different articles of which the ancient armour was composed will be found under their respective heads.

**Armad, or Armours, Horse.** The horse belonging to the cavalry, in the army of Cyrus, according to Xenophon (Cyrop. l. vii.), were armed with headpiece-plates, breast-plates, and side-pieces, and the side-pieces served as thigh-pieces to the horsemans. The Sarmatian war-horses were covered with small plates, in imitation of the scales of a fish, after the manner of their riders. And Plutarch informs us, that when the Parthians opposed the younger Cæcilius, they were not only clothed with defensive armour themselves, but that their horses were covered in the same manner. (Φηύτες καταπλακήνων χαλίπην και σιγόντα φάσαλις,) polished to the highest perfection (Plut. Vit. v. iii. p. 280. ed. 1723.). The investing of horses with defensive armour was common enough in the middle ages, and was perhaps introduced into England by the Normans (See Hoveden Annal. p. 446.). It continued to the close of the sixteenth century, when the horse-armour appears to have consisted of a chanfron, or kind of mask, which inclosed the face and ears, with sometimes a spike slanting from the center of the forehead; a criniere, to guard the mane; a poleyn, or breast-plate; and a croipiere, or buttock-piece, that usually descended to the hoofs. (See Pl. V. fig. 2.) After this time the barde, or horse armour, appears to have been neglected; except that in the thirteenth and fourteenth years of Charles the second, the horses of the militia were ordered to be provided with a pectoral and crupper (Grose's Mili. Antiq. ii. 355.). To prevent their hoofs from being fatigued under all their own incumbrances, and the enormous weight of their riders, and to prefer their vigour for the charge, the men at arms in ancient times had commonly hackneys for riding on a march, and did not mount their war horses till they were certain of coming to action; a circumstanc which sometimes occasioned them to be surprized and defeated, before they could mount the chargers and form.

**Armod, or Armours, for the Tilt Yard.** The incident in which the tournaments of ancient times were held, will account for our making the armour of the tilt-yard a separate article. In the middle ages, the common armour seems to have been used, only sumptuously covered with drapery, both as to man and horse, and occasionally charged with the armorial bearings of the combatants. The hilde and furniture were often times of goldsmiths' work, and the emblems richly embroidered. Toward the reign of Henry the Eighth, the drapery was in a great measure thrown aside; and the tails of the combatants was usually displayed in the elegance and lightness of their tilting armour. Under Elizabeth, it seems to have been extravagantly ornamented, and, in many cases, materially to have differed from the military habit of defence. Mr. Pennant, in the history of London, has engraved the portrait of Robert Dudley, earl of Leicester, clad for the tilt-yard; from which it appears very plainly, that the tilt and bow were chiefly confined. (See Pl. V. fig. 3.) Mr. Strutt too, in his Manners and Customs of the English, has engraved a portrait of Prince Henry, child of James the First, in a coat of half-titting-habit, worn when the pike was executed for foot (Pl. IV. fig. 4.). The gallantry of going to the battle naked, without any defensive armour, prevailed so far, that the French, during the reign of Louis XIV. were obliged to be continually issuing ordinances to restrain it; in consequence of which, the general officers, and those of the cavalry, were obliged to refuse their curiis, which yet has been but ill observed.

And now we conclude the article of armour; but not without informing our readers, that the first part of it was furnished by a hand of which death has now deprived us. The person we allude to was Mr. Joseph Strutt, of whose ability as an antiquary the world has been long convinced.

**Armour, Cuff, or embrocure of any person or family, with its several charges, and other furniture; as mantling, crest, supporters, motto, &c.** Thus we say, a gentleman of coat-armour, meaning one who bears arms. See Arms.  

**Armoric, or Armorial, in Botany.** See Cochlearia.  

**Armoric, in Entomology.** A species of Crenosoma, described in the Linnaean Fauna Suecica, by Fabricius, Herbit, Gwelin, and other Dutch and English authors. It is very glossy; blue-black above; beneath black. Degener names it crenosoma plantagoins, from its being found chiefly on the plantain. Cochlearia armoricana ranunculo aquatili, flammula.  

**Armorial, something that relates to arms, or heraldry.** In this sense we say an armorial figure, armorial bearing, armorial ensign, the armorial lily of France, armorial lion or leopard of England, &c.  

**Armorial is also a title given to several books, which contain the arms of a number of persons of quality.** In this sense we meet with the French armorial, the Spanish armorial, &c.  

**Armoric, or Armoric, something that belongs to the province of Britagne, or Brittany, in France. See Armoric.**  

**Armoric, absolutely used, denotes the language in use among the inhabitants of Britany.** The French usually call this language Bas-breton; compounded, says M. Menage, of ar, upon, and mor, sea.  

The Armoric is a dialect of the Welsh, and filter of the Cornish language.
The inhabitants of Brittany, of Cornwall, and of Wales, formerly understood each other's speech; though considerable diversities have crept in between these languages, since their separation from each other.

The inhabitants of Brittany, Mr. Lluid observes, by their intercourse with the French, have much altered their ancient orthography; besides that there are several words in the Armoric which have no affinity with the Welsh; and that both the Armoric and Cornish retain several ancient words and phrases which are lost in the Welsh. Julian Manoir, a Jefuit, has published an Armoric grammar and vocabulary, in French, which has been translated into English by Mr. Williams, and published with notes by Mr. Lluid. In Archæol. It. 3. and 4. p. 180, &c. Before him, Yvon Quilleré published an Armoric vocabulary at Paris, 1521.

Toland has given a catalogue of several Armoric words, which prove to be Irish; also a vocabulary Armoric and Irish.

ARMORICA, in Ancient Geography, the name given by the Romans, after the conquest of Gaul, to that portion of its maritime countries that is situated in the north-west corner between the rivers Seine, the Loire, and the Atlantic. The name Armorica was anciently given to the whole northern and western coast of Gaul, from the Pyrenées to the Rhine; under which name it was known in Caesar's time. Cæf. De Bell. Gall. lib. vii. c. 14. During the first three centuries of the Christian era, this remote corner was with little interruption in tranquil subjection to the refilible dominion of Rome. But its submission was the exaction of force, not the acquiescence of content. The Armoricanians were impatient of slavery, and when the northern hordes shook the tottering fabric of the western empire, they were eager to revolt. They expelled the Roman magistrates who acted under the authority of the usurper Constantine; and a free government was established among a people who had so long been subject to the arbitrary will of a master. The independence of Armorica was confirmed by Honorius himself; but after the northern conquerors of Gaul had successively fallen, the maritime provinces were restored to the empire. Employed on this portion of his glory, Gibbon (Hist. vol. v. p. 325.) in a few lines marks the character of a people “reflects under con- traint, but unfit for liberty.” Yet their obedience was imperfect and precarious; the vain, confoantal, rebellious disposition of the people, was incompatible either with freedom or turitude; and Armorica, though it could not long maintain the form of a republic, was agitated by frequent and destructive revolts. In the end of the fifth century, when Clovis established his Franks in Gaul, Armorica, after a long and obstinate opposition, at length capitulated on honourable terms, by which the people were admitted to be a part of the newly-formed kingdom of France. The Britons, when finally subdued by the Saxons, and expelled from their native land, sought and found refuge in Armorica, and coalescing with the natives, became a powerful though vaffal state. This territory, says Warton (Hist. Eng. Poet. vol. i. diff. 1.), was, as it were, newly peopled in the fourth century, by a colony or army of the Welsh, who migrated thither under the conduct of Maximus, a Roman general in Britain, and Canus, lord of Meiriadoc or Owain. Milton more than once alludes to this Welsh colony:

"Et tandem Armoricae Britonum sub leges colons," Manuf. And, in the “Paradise Lost,” (b. i. 579.) he mentions in Vol. II.

Differimnately the knights of Wales and Armorica, as the customary retinue of king Arthur:

"—What renown'd In fable or romance, of Uther's son Begin with British and Armoric knights.”

This migration of the Welsh into Armorica, which had thrown off its dependence on the Romans during the dis- fractions of the empire, seems to have occasioned a close connection between the two countries for many centuries. From this connection of Wales with Armorica, the scene of ancient romances, we are able to deduce the reason why Wales was so constantly made the theatre of the old British chivalry, and also why so many of the favourite fictions which occur in the early French romances, should also literally be found in the tales and chronicles of the elder Welsh bards. It was owing to the perpetual communication kept up between the Welsh and the people of Armorica, who abounded in these fictions, and who naturally took occasion to interweave them into the history of their friends and allies.

Armorica, or Brittany, was not annexed to the crown of France till the close of the fifteenth century, and the inhabitants retained various privileges and immunities, which continued in force until the revolutionary establishment of departments put an end to all local or provincial privileges, and amalgamated all former diversities into one mass.

From the settlement of the refuge Britons, Armorica received the name of Lesser Britain or Brittany; and was governed by dukes. See BRITAIN, and Gaul.

ARMORIST, a person skilled in the knowledge of arms.

ARMORUM CONCUSIO, in Antiquity, the clashing of arms, practiced by the Romans before an engagement, designed for striking a panic into their enemies. It always followed the Classicum, and barratus.

ARMORY, or Armoury, a flour-house of arms, or a place where military habiliments are kept to be ready for use. There are armories in the Tower, and in all arsenals, citadels, castles, &c. Imbezzling or destroying the king's armour or warlike stores, is declared to be felony without benefit of clergy, by Stat. 31 Eliz. c. 4. 22 Car. II. c. 5. 12 Geo. III. c. 24.

Armory, is also used for a branch of Heraldry, being the knowledge of coat-armors, as to their blazons and various intendments.

ARMOSATA, or AROMOSATA, in Ancient Geography, a very considerable city of Armenia, and next in importance to Artaxata; situated between the Stygis and the Ephemares. It took its name from the river Aramissus of Pryn, or Aramactus of Tacitus, on which it was built. It was by turns taken and sacked by the Huns, Arabs, and other neighbour- ing nations.

ARMOSAT, in Geography, a small island in the sea of Gacogny, on the coast of Santonge.

ARMOSA, a promontory of Asia, in Carmania, near a place called Armastia, at the entrance of the Persian Gulf.

ARMOT, in Geography, a small island in the sea of Gacogny, on the coast of Santonge.

ARMOURER, a maker of arms, or armour. The profession of an armourer, which was formerly an office of great importance in this kingdom, is now totally extinct.

Therefore the Roman armours were disposed in certain places in the empire, it being forbid, either to sell, to buy, or make arms elsewhere. They were exempt from all offices and taxes, and received a salary from the public.

When once they had taken that employment on themselves, neither they nor their children were allowed to quit it. To prevent this, they had a kind of note, or stigma, impressed on the arm, whereby they might be known.
known. If any of them fled, or deserted their war, the
Irish were allowed to answer for him; on account of which,
the effects of such as died without a legal tenet went to the
coffin.

There were fifteen armament opt or repositories of arms in
the Eastern empire, placed near the frontiers; and mention
in the Western. Titus L. S. Ant.

Armament of a fobb, a source whose office is to take care
that the arms be in a condition fit for service.

ARM, Arm. A general word, include all kinds of
weapans, whether for offence or defence. Nic. de
Derive the word from the Latin phrase, quod hujus armas,
because: they cover the shoulders or bulls; but Varro derives
arms, de armis, from quod accessit. It is supposed, that
the first artificial arms were of wood, and were employed
only against bulls; and that Belus, the son of Nimrod, was
the first that waged war; whence, according to some, came
the appellation bellum. Dioscorus Siculus takes Belus to be
the same with Mars, who first trained soldiers up to Battle.

Lucretius is minute on this subject:

"Arma antiqua manu, ingens dentique fure
Et lanceis, & steme lacerum fragmam, rami.
Et laminae: atque ignes polluant sunt cognitum primum.
Poderam ferri, vis et antiqua repertus,
Et prior axis erat quam ferri cognitum usus."

The most ancient and universal arms of offence seem to
have been bows and arrows; to which succeeded the fagg.
See Gec. 22. 23. 27. 3. Job. xii. 10. Hebd. expressly
tells us, that in the early ages, the arms and instruments of
the primitive heroes were covered entirely of bratf.
The arms of the early Greeks were heavy, and principally
defensive, consisting of an helmet, a breast-plate, and greaves,
all of brass: with a shield, commonly of bull’s hide, but
often strengthened with the metal just mentioned; the shield
being a superadded protection for every part. The Locrans,
however, under Oilean Ajax, were all light-armed; bows
were their principal weapons, and they never engaged in

The infantry which composed the Roman legions were
of three kinds, the hastati, the principes, and the triarii.
Their arms, both offensive and defensive, were in a great
measure the same. They wore an head-piece of bratf or
iron, coming down to the shoulders, but leaving the face
uncovered; a coat of mail, generally made of leather, cou-
vered with small plates of iron, in the form of leaves, or iron
rings twisted within each other; greaves for the legs, or
shin-guards only on the right leg; an oblong shield, with an
iron buss; a sword; and two long javelins. Adams Rom.
Antig. 357. There was also a fourth kind of troops, called
milites, from their swiftness and agility; they were first insti-
tuted in the second Punic war. They were aligned no
regular post, but fought in scattered parties, whenever occa-
sion might require, usually before the lines. They were
equipped with bows, slings, and javelins, a small round shield,
a sword, and a helmet of the skin of some wild animal. (Hist.
358.) What contributed most to render the Romans masters
of the world was, that having successively ware against all
nations, they constantly renounced their own methods, arms,
&c, whenever they met with better. Thus Romulus, during
his war with the Sabines, a bold and warlike nation, adopted
their broad-buckler in lieu of the small Argian buckler,
which he had used till that time.

The arms in use among the ancient Britons were light,
and unfit to withstand the Romans in a close encounter; though in light skirmishes, prudently made, the Britons
generally gained considerable advantage (Strutt, Maners
and Customs, vol. i. p. 3f.). Their young men were not only
trained to the use of arms in early youth, but continued in
the exercise of them to the very close of age; and were
always ready to appear, when called by their leaders into
actual service. Their very directions and moral maxims, were
of a martial and a manly cast; and were javelins they used in
hunting, was a principal weapon in the field of war. They
had neither helmets, broad plates, nor defensive armours,
but a light shield. Cicero tells us, they had a dart or javelin,
which they threw from their war chariots to annoy the
enemy; with a short spear for the infantry, that had a ball
at the other end filled with brass that they shuck with
great violence before the battle, in hope to intimidate the
enemy; and again when they engaged the cavalry: to the
upper end of it a thong was fixed, that when used as a
middle weapon, it might be recovered, and again used in
the close encounter. They had also long and broad swords,
without points, designed only for cutting, which were flung
by a chain over the left shoulder; and occasionally a short
disk fixed in their girdles. The feythes that were sometimes
falled to their chariot-wheels, may perhaps be ranked
among their offensive arms.

The ancestors of the Saxons, in their native woods,
were told, transacted no business, public or private,
without being completely armed (Pac. De Mith. Germ.
§ xii.); and the custom of wearing swords on all occasions
prevailed in every country where the Germans took
possession.

The early Saxons, previous to their arrival in Britain,
beside the buckler and the dagger, used a sword bent in
the manner of a yeath; but their descendants from changed
it for one that was long, straight, and broad, double-edged,
and pointed.

The Saxon infantry were not all furnished with the same
defensive weapons; some being provided with spears, others
with axes, and not a few with clubs, bulke swords, which
were common to them all. Their shields were generally of
the middle size, for the most part oval, always convex, and
having a sharp spike protruding from the center; with which,
while they defended themselves, they annoyed their enemies.
They fought with their swords and shields, much like the
gladiators of the Romans; and in the earliest times had
nothing like defensive armours, which they seem to have
adopted about the eighth or ninth century. Some alteration
in our national arms probably took place on the
arrival of the Danes. Their swords were both longer and
larger than the Saxon swords; the blade had a right differ-
cence; and they appear to have brought the battle-axe into
more general use. Verdugan enumerates the crofs-bow as a
Saxon weapon, but had no good authority for the aflertion;
as it neither appears in any ancient history or delineation,
that the Saxons ever were acquainted with it. And though
they used the common bow when following the chase, they
never brought it to the field of action. Their cavalry were
armed with greater uniformity than they who fought on
foot; carrying in their right hands long spears, and at their
left sides a sword. They were also better provided with
defensive armour.

The Saxon and the Dafih troops were chiefly infantry;
and though not entirely for the introduction, we are cer-
tainly indebted to the Normans for the more general use of
cavalry. In regard to defensive arms among the Norm-
ans, both horse and foot folders were differently clad;
three to support the for battle, and some the lighter skirm-
ishes (Strutt, Man. and Customs, vol. i. p. 56.). The
offensive arms the cavalry used were long spears or lances,
swords like thiefs of the Saxons, and short darts or daggers.

Vol. I.
The invention of gunpowder, which had already been used by the Chinese in the thirteenth century, was brought to Europe by the Turks and the Arabs in the sixteenth century. In 1544, the French army was equipped with firearms, which were used in the battle of Parnawa and later in the battle of Guineau. These firearms included arquebuses, muskets, and crossbows. The use of firearms revolutionized warfare and led to the decline of the traditional infantry. The introduction of gunpowder also led to the development of new weapons, such as the cannon and the howitzer. The use of these new weapons had a significant impact on the outcome of battles and the strategies employed by armies.

This text does not provide any information about the number of people who used firearms. However, it is clear that the use of firearms was widespread in Europe, and their effectiveness is widely acknowledged.

The improvements in warfare and the development of new weapons had a significant impact on society and the economy. The use of firearms led to the rise of a new class of soldiers, the musketeers, who were well paid and highly skilled. The use of firearms also led to the development of new industries, such as the manufacture of gunpowder and firearms.

The use of firearms was also a significant factor in the history of England. The English army was one of the first to use firearms extensively, and this gave them a significant advantage over their opponents. The use of firearms also led to the development of new tactics, such as the use of fortifications and the use of artillery.

ARMS.

the duke of Parma, who studied and conducted war as a science to which mathematical, geographical, and even historical aid was indispensable. The infantry of Philip the second and third spread terror over Europe.

In the middle ages, and even so late as the sixteenth century, the chief national weapon of the Scots was the spear, seventeen feet in length. It was undoubtedly formidable, when projected by a deadly and complete battalion. But the Scottish troops were deficient in point of discipline. In pitched battles, they might have equal bravery, but seldom succeeded against the disciplined archers.

By the ancient laws of England every man was obliged to bear arms, except the judges and clergy. Under Henry VIII, it was expressly enjoined on all persons to be regularly instructed, even from their tender years, in the exercise of the arms then in use; viz. the long bow and arrows, and to be provided with a certain number of them. 33 Hen. 8.

Arms, Arma, in Lat. are extended to any thing which a man takes in his hand in a war, to use it or strike another.—So Crompton—Armarum appellatio non utilique facta, & gladiis, & gladiis & lapis. See VI. & arts.

By the common law, it is an offence for persons to go or ride armed with dangerous weapons: but gentlemen may wear common armour, according to their quality, &c. &c. 1 Int. This is also declared by flat. 1 W. and M. fl. 1. c. 2. The king may prohibit force of arms, and punish offenders according to law; and herein every subject is bound to be aiding, flat. 7 Edw. I. None shall come with force and arms before the king's justices, nor ride armed in array of the people, on pain to forfeit their armour, and to suffer imprisonment, &c. 2 Ed. III. c. 5.

The importation of arms and ammunition is prohibited, by 1 Jac. II. c. 8. and by 1 W. and M. fl. 2. c. 2. Protestant subjects may have arms for their defence. So likewise, arms, &c. shipped after prohibition, are forfeited by 29 Geo. II. c. 16. sect. 2.

It is one branch of the royal prerogative vested in his majesty by statutes Car. II. c. 4. and 29 Geo. II. c. 16. to prohibit the exportation of arms and ammunition out of the kingdom, under severe penalties.

Arms of offence and use are amongst us at present are, the sword, pistol, musket, bayonet, pike, &c. the arms of the Highlanders are, the broad-sword, target, poniard, and whiny or dirk, &c.

There are several acts of parliament for disarming the Highlanders: see 1 Geo. I. c. 54. 11 Geo. I. c. 26. 19 Geo. III. c. 39. 21 Geo. III. c. 34. 26 Geo. II. c. 22 and 29.

Arms of Defence. See Armor and Arms.

Arms, Fire, are those charged with powder and ball; such are cannon, mortars, and other ordnance; muskets, carbines, pistols, and even bombs, granadoes, canon, &c. Fire-arms discharged by hand were first called hand-cannons, hand-culverines, and hand-guns; they afterwards acquired the appellations of hawk-buts, arquebuses, muskets, and culverines; and, lastly, their present name of fire-locks.

In the history of the Royal Academy for the year 1767, we have an account of some experiments made with fire-arms differently loaded, by M. Calini. Among other things, he observes, that by loading the piece with a ball which is somewhat less than the calibre, and only having a little gunpowder below the ball, and a good deal above it, it will yield a vehement noise, but have no sensible effect or impulse on the ball. This he takes to have been all the secret of those people who pretended to fell the art of rendering one's self invulnerable, or shot-proof.

Arms, Bills of, or Bill-lets, denote a kind of tents in the shape of a cone, where the company's arms are lodged in the field. They are generally painted with the colour of the facing of the regiment, and the king's arms in front.

Arms, Pali of, was a kind of combat in use among the ancient cavaliers. See PASS.

Arms, Stand of, signifies a musket, a bayonet, a sword, &c. &c. &c. and cartridge-box.

Arms of Parade, or Courty, were those used in the ancient jilt, and tournament; which were commonly unfixed lance, swords without edge or point, wooden swords and even canes.

Arms, 16, a beat of the drum, is a signal to summon the soldiers to their alarm-polls on some sudden occasion.

Arms denote the natural weapons, or parts of defence of beasts, as claws, teeth, tusks, of elephants, beaks of birds, &c. &c. and also the defensive weapons of plants, as thorns, prickles, &c. Arms are also used figuratively for the profession of a folkt. Thus we say, he was bred to arms.—See Preference, Law, Place, Suspension of Arms.

Arms, or Armorial Ensigns, in Heraldry, are marks or badges of dignity and honour usually composed of certain figures and colours, given or authorized by sovereigns, and borne on banners, shields, &c. &c. &c. for the distinction of persons, families, and states.

Concerning the origin and use of arms, or armorial ensigns, many authors, who have thought that comparative antiquity must necessarily decide on the merit of their favourite science, have traced it far beyond the scope of chronology, to the Egyptians, and "the land of darkness." Diodorus Siculus is cited as an authority, asserting, that armorial distinctions were first adopted by Antius and Macedo, sons of Olins, under the emblems of a wolf and a dog. To the Greeks they are likewise attributed, and if the poetical delineations of the "shields" of heroes described by Homer, Achilles, and Virgil, be not inapplicable to the devices of the middle centuries, with apparent propriety; these, however, were not anlogues, being the personal furniture of the chief, only embellished according to the fancy of the artist, and allusive to some exploit past or predicted, but neither hereditary nor gentilitial. Some deduce the introduction of arms from the ancient mythology, and consider the hieroglyphics and emblems of Greece and Rome impressed on the reverses of their medals, as the indubitable prototypes of modern armories. It has likewise been supposed, that arms were attributed to individuals, and confirmed to them by the Romans; and it is further urged, that in their code of laws under Augustus, and in that select by Justinian, the "jus imaginum," unequivocally referred to those rights, this distinction of families, or the right of having the images and statues of their ancestors, an honour which was allowed to those Romans only whose ancestors had borne some office in the state, as censor, praetor, consul, &c. He who had the privilege of using the images or statues of his ancestors, was termed "nobilis," he to whom it was permitted to have his own statue or image only, was called "novus," and the person who was not allowed to have the image or statue either of his ancestors or of himself, paid under the appellation of "ignobilis," as do the common people amongst us who have no right to armorial ensigns. These images or statues were made either of wood, brass, marble, or wax, painted the better to represent the persons intended, and were dressed out according to the quality of the persons they represented, being adorned with the robes of the offices they had borne, and the marks of their magistracy. These images were usually placed by the Romans in cabinets, which
which flood in the court before the entrance into their homes; and on solemn days were usually exposed to view, not only that the people might be reminded of the nobility and honours of the family to whom they belonged, but also to excite the piousness of the populace to imitate the virtues of their ancestors. When any of the family died, the statues and images were not only thus exposed, but in the tombs were placed on beds, and carried before the corpse, as emblems of the nobility of the dead. Thus, at the funeral of Marcellus, Augustus ordered five hundred beds of images to be carried before the corpse; and no less than six thousand are reported to have attended that of Sylla the dictator. The right of keeping and exhibiting the images and statues being hereditary, and allowed proofs and evidences of nobility and ancient descent, they partook to such an extent of the nature of coat-armour, as in some measure to countenance a probability that the latter were contrived and introduced in lieu of the former. The jus nobilitatis of the moderns, say the advocates for this figuration, is nothing else but the jus imaginum amongst the Romans; for as they placed the images and statues before the porches and gates of their houses, so our nobility and gentry used to have their banners, helmets, and other armorious placed in some conspicuous parts of their dwellings, and their armorial ensigns, either cut in stone, or painted on ceilings, over their gates, not only as monuments of their nobility and ancient descent, but with intent thereby to encourage the beholders to imitate the virtues and bravery of their ancestors. The analogy between this and the subsequent use of armorial ensigns, extends only to the single circumstance of hereditary appropriation. Acquired as they were by actual services to the state, so they were preferred to the descendants of illustrious characters by the function of the laws, and thus became a certain species of right and property, which at once endeared them to the populace, and rendered them objects of honourable ambition. Besides, the pride of the Romans was remarkable, and on every occasion carried to the highest pitch; inomuch that, in case any particular hereditary tokens or marks designed for distinguishing one family from another, and established by public authority, had been used by them, they never would have suffered such pleasing testimonies of family honour and aggravendance to have sunk into oblivion; but, on the contrary, would have endeavoured to perpetuate the memory of them, by representing some of the honourable badges in the paintings and sculpture of their villas, funereal monuments, triumphant arches, columns, temples, or other edifices: whereas no such have ever been hitherto discovered: consequently the difference between the jus imaginum of the Romans, and the bearing of coat-armours of later times, is wide and essential. Armorial ensigns are military, but the jus imaginum appears to have been a civil institution, established to do honour to such particular families only. Much honour must be attributed to those ensigns which were first adopted by the principes bands of German soldiers; for their chiefs having the power of investing them, considered them not solely with regard to gentilitial distinction, but as personal appendages; and this in the very early centuries. When the Saxons, after their invasion of this kingdom, ratified the partitions of the whole territory, and established the heptarchy, to each principality its peculiar badge was assigned, and borne upon the banners; and it appears, that whenever any of the provincial kings became monarchs of the island, they retained the gentilitial bearing, as personal, not adopting any new device. This, however, applies only to a period prior to 959, when Edgar, surnamed the Peaceable, added to the "Croix Flore" four martlets; in 1042, five were used by Edward the Confessor, which remains the general armorial bearing of the Saxon nation.

Whether armorial ensigns were used by the Merovingian kings whose race became extinct in the person of Childeric the Third in 754, or not till the close of the ninth and commencement of the tenth centuries, who first determined? The fairest conjecture seems to be, that the tournaments held with such magnificence towards the end of the tenth century, under the auspices of Hugh Capet, were introductory of the more general usage and assumption of arms. No past-factory account is preserved whether, after the personal use of arms, they were first painted or embroidered on rich stuffs in the form of pennons, or emmellled on shields. The more probable conjecture inclines to the former mode. The victorious William, who had been educated in the courts of Robert and Philip the First, successors of Hugh Capet, had imbibed an early taste for the martial exercises of which France was then the most magnificent and frequented theatre. After his successful enterprise, and establishment on the throne of England, together with his desire of immortalising his followers, he encouraged, but under great restrictions, the individual bearing of arms. About the year 1189, it was usual to have a small field fastened to a belt, upon which arms were painted; and it is in proof of this custom obtaining in England prior to Richard the First, upon whose great feast the shield is charged with three lions païant, or, as some term them, leopards. The more general use of arms, and that which affords the best information concerning them, was the custom of engraving them on seals for the purpose of ratifying deeds and charters. This mode is said to be introduced by Edward the Confessor from Normandy, where he was educated, and to have been confirmed by him to the royal use. In the year 1095, being the commencement of the crosfades, a period the most intermixing in the history of heraldry now opens, when all Christendom united in one common and infatuated cause; when even rival princes engaged in the same enterprise, not merely because sanctioned by the church, but rather as being highly delightful to the romantic and warlike genius of that age. The great council of Clermont had determined in that year to recover the holy city from the Saracens, by enlisting the church under the consecrated banner from which they were to derive supernatural assistance. In the following year this immense army began their expedition; and, as a flattering badge, every private soldier wove a crofs of red stuff sewed to his surcoat, from which circumstance these achievements were called "crosfades." The hereditary use of arms, says Camden, was not established till the reign of Henry III. The last arms of Cheltenham, the Quineys, Earl of Winchelsea; and the Laces, Earl of Lincoln; varied still the father from the son. The Veres and Berkley altered their paternal coats, "when they had taken up the crofs," the phrase of that day for engaging in the holy wars.

The application of arms to the coin of this realm is of great antiquity; the scutum being paid with ducats, a silver coin upon which a shield was impressed (see Cork). The first inscriptions of sculpture of arms upon the effigies placed on sepulchral monuments remain in the Temple Church, London, of the date 1144. The nobility and principal gentry not only continued their armorial ensigns on their shields, but in order to be better known and distinguished, had them depicted on the Breast and backs of the tombs and sarcophagi which they wore over their armour, as also on the caparisons of their horses. This fashion of surcoats spread over their coats of mail, and hanging down
to their heels, appears by the figure of Gildas, earl of Richmond, who died in 1189, and is reproduced on that
coat of arms in the pavement by William Venables, earl of Pembroke, in Westminster abbey, who died in 1176, has the finest to charged with aromatic dyes.
The emblem of embalming arms upon coffins of state
prevailed from the fourteenth century: they were likewise introduced into coffins and private houses, as well as churches,
painted in compartments upon the walls, or flamed in gilds, and inserted in the windows of the chief rooms, and
painted in the choicest style on velvet rolls. Armorial
bearings upon plate were in use as early as the beginning
of the sixteenth century, as appears by an inventory of
the crown jewels taken in 1544. In the reign of Richard
II. the armorial device was no longer confined to the
gorgeous array of warriors completely armed, but embroidered
and embroidered on the common habits of those who
attended the tumulus court. Upon the mantle, the fur
coat, and the julk-at-corps or bodice, the charge and cog-
nernance of the wearer were profuselylettured, and done
replendent in silver and beaten gold. The wardrobe of a
noblesman became no small part of his wealth, the arming of
which was in the end, the same as the goldsmith's craft. Even
the ladies were as well versed in mantling their hereditary
achievements, as in the service of oratory: the tumulus
vails and mantles, which they were employed in embroidery,
were made in the form of ecclesiastics joined together,
and were of velvet, fanning, and taberne, according to the
rank of the person, and were worn as the court drest till
the commencement of the sixteenth century; since which
they have been used only as the state drest of the officers
of arms; from this custom we have the modern phrase
"coat arms, or coats of arms."

The ecclesiocran was now no longer singly charged with the
hereditary bearing, but admitted those of the wife
by diminution or impalement, and of heirs general by quarter-
ing. The first that bore arms quarterly in England appears
to be John Hasting, second earl of Pembroke, in 1258.
Crests and cognizances were multiplied, and a mode of de-
corating the armories introduced, that of placing the shield
of arms between two animals as supporters. Arms were first
borne on a shield by king Richard I., on the escutcheons for
harbour by Edward I., and the custom of broadening them
on the julk-at-corps, or bodice, by Richard II.

Originally, none but the nobility had a right of bearing
arms; but king Charles V. by his charter in 1372, permitted the Parliams "to bear arms," from whose example the more eminent citizens of other places
did the like. The use of arms became more chiefly
connected with the study of genealogy: and when the
mode of including in the same ecclesiocran the armorial bear-
ing of every heir female, with whom an intermarriage had
been made, was universally followed, they were more
necessary to each other. By the fully quartered ecclesiocran,
a comprehensive scheme of connexions presented at one view,
and a general idea communicated of the comparative claims
of each family in the scale of hereditary dignity. To
determine the right of introducing the arms of others into
the ecclesiocran, and to distribute them when altered in their
proper gradation, opened a new field of professional ability,
which required the most diligent application to the laws
and confirmed practice of arms. No heraldic, or elemen-
tary treatise, by which the science could have been taught,
was made public till the avenue to universal information was
laid open by the typographic art. It was confined to the
heralds, or painter-keepers whom they employed, who
confidered it as the mystery of their trade, and therefore
not to be divulged. Henry V. seems to have held a just
opinion of the necessity of ascertaining those who were
legally appointed to armorial distinctions, and of prohibiting
an undue annexation of them: in 1415, the 7th of his
reign, he issued an edict directed to the sheriff of each
county, to summon all persons bearing arms to prove and
establish their right to them. Many claims, examined in
consequence of this inquiry, were referred to heralds, as
commissioners; but the first regular chapter held by them in
a collegiate capacity was at the see of Rouen, on the
5th Jan. 1420. King Richard III. by his letters patent,
dated 2d March 1483, the first of his reign, directs the
incorporation of heralds, and established the "College of
Arms" on its present foundation, investing them with full
powers of summoning those that assumed the arms of others
to appear in the earl marshals court, and of granting elec-
theosis to new families. This privilege multiplied the
figures of arms, and varied the differences. Forms of
every description in the infancy of the graphic art, with-
out any exact resemblance, it may judge from the spec-
ine piece as remaining, were universally introduced. The
arms were exhibited in the representation of the different
parts of it, and to Charles II. the introduction of gryphons,
mermaids, wyverns, and harpies. Every invention of art, whether military or mechanic, has been at one time or other a badge of hereditary

Arms at present follow the nature of titles, which bring
the several marks for distinguishing families and kindred,
as names are of persons and individuals; they also shew who
were the founders of towns, cities, churches, ancient ab-
ways, and colleges, by having their arms affixed to them;
and it is well known, during a war, that a ship taken car-
rying the armorial emblems of an enemy, is declared a prize,
though belonging to a power at amity. Arms are also
variously distinguished by the heralds under the following
heads.

Arms of Dominion, are those which belong to sovereign
princes and commonwealths in right of their sovereignty.
In regard to such ensigns, it may be observed, that if the
person ascending the throne by legal succession be a so-
vereign, he marshals his arms with those of the dominion to
which he succeeds. If he who ascends the throne by legal
succession, be of the quality of a nobleman, he then uses all
his own arms, and only those of the dominion to which
he succeeds. Those who ascends a throne by election, carry
their arms on an ecclesiocran placed on the center of the
arms of the dominion to which they are elected. William,
prince of Orange, placed those of Nassau over those of
England and Scotland, as an elective king.

Arms of Patronage, are part of the arms of these lords of
whom the persons bearing them held in fee, either added to
the paternal arms of the person assuming such addition,
or borne as feudal arms in order to show the dependence of
the parties bearing them: thus, as the earls of Chelten-
ham bore baron, many gentlemen of the county bore baron
also. The late earls of Warwick bore chequy or & blue, or chevron
ermine, and therefore many gentlemen of Warwickshire bore
chequy.

Arms, Feudal, are those annexed to dignified fees, as
dukedoms, marquises, earldoms, &c. and which arms the
possessor of these fees carry in order to show their dignities;
the creation was denoted by the bearing the ensigns of their
dominions. In England there have been but few instances
of feudal bearings, but there are many in Spain and in Scott-
lanc.
ARMS of Conquest, are armaments granted by the sovereignty of part of his arms; thus the royal armament in the arms of the duke of Rutland, were granted by Henry the Eighth.

ARMS of Community, are those of boroughs, cities, universitites, and other bodies corporate. (See Impalement.)

ARMS, Civil, or as the French call them, "armes par-antes." (or generic arms, alluding to names, a tribute for the vet, three berasings for Herring, &c. These, though some ancient precedents exist, are not common till the commencement of the seventeenth century, when they prevailed under the auspices of James I.

ARMS Paternal and Hereditary, are such as belong to a particular family, and which no other has a right to assume.

ARMS of Succession, are those taken by inheriting certain fiefs or manors, either by will, entail, or donation; as we find that Hubertus de Burgo, earl of Kent, who bore for his arms "gules seven lozenges vaiz," granted the manor of Elmore in the county of Gloucester, in 1745, to Anselm De Guise, at the yearly rent of a clove-jilliflower in acknowledgment of the gift, with the concession of his coat-armour: whereupon the said Anselmus de Guise bore the coat with a carnage, or charged with a mullet pierced fesse, and which arms have been continued by the family, and are now borne by the baronet of that name.

ARMS of Alliances, are such as when an heir or marries, her issue quarter her arms to show their maternal descent. By this means the memory of many ancient and noble families, extinct in the male line, is preserved and conveyed to posterity; which is the principal reason of marshalling several coats in one field.

ARMS of Adoption, are those which you take from another family quartered with your own. The last of a family may by will adopt a stranger to take his surname, arms, and estate, thereby to continue to the world his name and family after his decease; permission for which is obtained by petition to his majesty for his royal licence and authority to comply with the request of the tellator, and the sign manual is then recorded in the college of arms.

A test of the antiquity of a coat of arms is in general its simplicity; a single ordinary, or two at most, constituting the most noble.

ARMS, in Falconry, denote the legs of a hawk, from the thigh to the foot. See HAWKING.

ARMS, King of. See King of arms.

ARMS, Herald at. See HERALD.

ARMS, Pursuivant at. See PURSUIVANT.

ARMS, in Geography, a town of Germany, in the circle of Wefphalia, and county of Verden, seven miles call-south east of Verden.

ARMSTRONG, John, in Biography, was born in the year 1759, at Carlston in Roxburghshire, where his father was minister, under whom he received the rudiments of his education. Being intended for the practice of medicine, he was sent to Edinburgh, and in 1732, took the degree of Doctor, and published for his thesis on that occasion, a dissertation "De tabe purulenta." He soon after came to London, where his wit procured him the notice of some of the most eminent men of the time; particularly he became acquainted with John Wilkes, who was then rising to celebrity. In 1735, he published "An Essay for abridging the Study of Physick, with a Dialogue," written with much humour, "between Hygeia, Mercury, and Plato, relating to the practice of physick, as it is managed by a certain illiberal infancy," which gained him credit as a wit, but was probably one of the causes of his having but little notice as a physician. To repair the injury this might have done him, in 1737, he published "A Synopsis of the History and Cure of the Venereal Disease." This was however soon followed by the "Economy of Love," on sex ingeniously, and licentiously, and calculated entirely to effect any favourable impressions of his flocks for the medical profession which his former work might have excited. Its luxuriancies were considerably pruned by the author in an edition printed in 1748. But the work for which he is indebted for his fame as a poet, is his beautiful "Essay on the Art of preserving Health," which appeared in 1734. It is written in black verse, and is first reprinted one of the finest specimens of didactic poetry in our language. Indeed he seems to have exhausted his stock of genius in the composition of this chef d'oeuvre: his poems on "Benedict Cock," in 1717, "Tale's," in 1733, and "Day," an epistle to John Wilkes, &c. the latter of his effusions in this line, scarcely rising above mediocrity. His ability to Mr. Wilkes was written in Germany, in the year 1744, while he was physician to the British army there; a poem for which he was indebted to some of the friends his wit had procured him. In this poem he unfortunately hazarded a reflection on Churchill, which drew from that irritable bard a severe retort in his "Journey." Before this time, viz. the year 1738, he had published a volume in prose, of "Sketches and Essays," under the name of Launcelot Temple, &c. which was very well received. His friend Wilkes contributed some of the essays in this collection. In the year 1763, he returned to London, and found his practice in medicine somewhat increased, through the connections he had formed in the army; but that his calls that way were not very numerous, appears by his being able, in the year 1771, to make a tour through France and Italy, in company with the celebrated artist M. Tefuti. In his journey he met his friend Dr. Smollett, to whom he was much attached. On his return, he published an account of his ramble, under the name he had before assumed of Launcelot Temple, &c. His last work, a 4to. pamphlet, intituled, "Medical Essays," appeared in 1773. In this he complains of the little attention that had been paid to him, while so many other physicians of inferior abilities had risen to fame and fortune, forgetting that the levity of his own conduct, and not the fickleness or want of deference of the public, occasioned the neglect. A large portion of his time was spent at Slaughter's coffee-house in St. Martin's lane, where he usually took his meals, and where messages to him were ordinarily directed to be addressed. He died September 1779, and left about 3000l. a larger sum than his friends supposed he could have amassed out of his very moderate income.

ARMSTRONG, William, in Biography, was founded in the "Art of preserving Health." Of his style and manner we have the following character by a very competent judge, in an essay prefixed to an ornamented edition of the poem, printed in 1795. "It is distinguished by its simplicity, by a free use of words which owe their strength to their plainness, by the rejection of ambitious ornaments, and a neat approach to common phraseology. His sentences are short and easy; his sense clear and obvious. The full extent of his conceptions is taken in at the first glance; and there are no lofty mysteries to be unravelling by a repeated perusal. What keeps his language from being prosaic, is the vigour of his sentiments. He thinks boldly, feels..."
feals Arantia, and therefore expresses himself poetically. Where the subject hints, his style hints with it, but he has for the most part excluded topics antipathetic either of vital detection, or of the ordinary sentiment. He had from nature a musical ear, whose lines are tacitly ever harsh, though apparently without much truth to render them smooth. On the whole, it may not be too much to affirm, that in black verse can be found more free from flatness and affectation, more enterprising without harshness, and more dignified without formality.

He left his fortune by his will to his three nieces, daughters of his brother Dr. George Armstrong; who, after having practised pharmacy successfully for several years at Hamptead, at length obtained a diploma constituting him Doctor in Medicine, and came to London, and was made physician to a dispensary for the benefit of infant poor, opened at a house taken for him by the suffrers in Soho square. To aid the design, he published a small treatise on the diseases of children, in which he was supposed to have been aided by his brother John. The work was well received, and contained some observations on the subject that were new and ingenious. The dispensary, however, did not succeed; and the Doctor died some years after in obscurity.

ARMUA, in Ancient Geography, the modern Schelmen, a river of Africa mentioned by Pliny, emptied itself into the Mediterranean between Aphroditaum and Hippo Regius, south-east of the former, and north-west of the latter.

ARMUS, in Entomology, a species of Cuculio, found in France. It is black; the scutel whitish; wing-cases with denticulated frize on each side.

ARMUYDEN, or ARMUDEMID, in Geography, a strong sea-port town of Zealand, in the Low Countries, situated on the eastern side of the isle of Walcheren. It was anciently a large place, and divided into the Old and New Town. The convenience of the port, the depth of water, and its nearness to the sea, drew to it much commerce, especially in fish. But it has often been damaged by the sea, and the harbour is now choked up with land, so that the sea is made navigable by means of a canal to Middleburg, from which Armuyden is distant about a league to the east.

N. lat. 51° 31'. E. long. 3° 42'.

ARMUZA, ARMOUZ, or ARMUZIA, in Ancient Geography, a city of Alia, in Caria, near the promontory Armouz, to which it gave name, as well as to the island of Ormus. Pliny, and Ptolemey.

ARMY, a large body of soldiers, consisting of horse and foot, under the command of a general, with several ranks of subordinate officers under him.

An army consists of brigades, regiments, battalions, and squadrons, and is usually divided into three corps; which are ranged in three lines. The first line is called the front-line, and part of it forms the van-guard; the second, the main body; and the third, the rear-guard, or body of reserve. The middle of each line is generally pollied by the foot; the cavalry forms the wings on the right and left of each line; and sometimes they also place squadrons of horse in the intervals between the battalions.

The British army, when it takes the field, is divided into brigades, and these brigades into battalions, squadrons, companies, and troops, both in the infantry and cavalry respectively. The French have lately made a different distribution. Their infantry is divided into half-brigades, each half-brigade consisting of three battalions, and each battalion of nine companies. A company of artillery is attached to each half-brigade, for the management of its field-pieces. The half-brigade are either of the line, or light infantry; each battalion of those in the line having company of grenadiers, and each battalion of light infantry one of carabineers. For the arrangement of the army in order of battle, see ORDER OF BATTLE.

The number of soldiers is necessarily much smaller, and bears a less proportion to the whole number of the people, in a civilized than in a rude state of society. Among the civilized nations of modern Europe, it has been stated, as the result of long experience, that a prince with a million of subjects cannot keep an army of above ten thousand men, without running his head. It was otherwise in the ancient republics; the proportion of soldiers to the rest of the people, which is now about one to a hundred, might then be as about one to eight; and in some of the little Athenian states of ancient Greece, a fourth or fifth part of the whole body of the people considered themselves as soldiers, and would sometimes take the field. The reason seems owing to that equal portion of lands, which the ancient founders of communewas made among their subjects; so that every man had a considerable property to defend, and had means to defend it. While among us, the lands and riches of a nation being shared among a few, the rest have no way of subsisting, but by trades, arts, and the like; and have neither any free property to defend, nor means to enable them to go to war in defence of it, without starving their families. A large part of our people are either artisans or servants, and so only minister to the luxury and efficiency of the great. While the equality of lands subsisted, Rome, though only a little state, being refused the succours which the Latins were obliged to furnish after the taking of the city in the conoast of Camillus, presently raised ten legions within their own walls; which was more. Livy affirms us, than they were able to do in his time, through matters of the greatest part of the world. A full proof, adds the historian, that we are not grown stronger; and that what swells our city is only luxury, and the means and effects of it. Vide Liv. dec. 1. lib. vii.; and Confid. fur des Cauf. de la Grand. des Rom. chap. iii. p. 24.

In the republics of ancient Greece and Rome, during the whole period of their existence, and under the feudal governments for a considerable time after their first establishments, the profession of a soldier was not so separate and distinct, as to confine the whole or even the principal occupation of a particular clafs of citizens. In process of time, however, that industry which produces, and that wealth which follows, the improvements of agriculture and manufactures, provoked the invasion of neighbours, and rendered it necessary for a state, likely and liable to be attacked, to adopt some regular measures for the public defence, more especially as the people, by their natural habits, were incapable of defending themselves. In these circumstances, there seem to be but two methods to which the state can have recourse for its own securitv: one of these is the introduction of a military force under the denomination of a Militia; and the other, the establishment of a standing army. The soldiers of this latter description are solely or principally occupied in the practice of military exercises; and the maintenance or pay which the state affords them is the principal and ordinary fund of their subsistence. In a standing army, the character of a soldier predominates over every other; and the mode of their discipline, as well as the conformity of their exercise, renders the soldiers of this clafs superior to a militia, in whatever manner it may be either disciplined or exercised. This superiority of a well-regularized standing army is attested by the history of all ages. One of the first standing armies of which we have any distinct account, in any well-authenticated history, is that of Philip
of Macedon. His frequent wars with the Thracians, Illyrians, Thessalians, and some of the Greek cities in the neighbourhood of Macedon, gradually formed his troops, which were probably at first militia, to the exact discipline of a flanding army, which, as he was feldom, or never for any long time, at places, he was careful not to disband.

With this army be vanquished, after repeated and violent conflicts, the galling and well-exercised militias of the principal republics of ancient Greece; and afterwards, with very little struggle, the effeminate and ill-exercised militia of the great Perian empire. The fall of the Greek republics, and of the Perian empire, was the first great revolution in the affairs of mankind, which history has circumstantially recorded; and it was the effect of the irrefrangible superiority which a flanding army has over every fort of militia. The fall of Carthage, succeeded by the elevation of Rome, is the second, which may be ascribed to the same cause. From the end of the first to the beginning of the second Carthaginian war, the armies of Carthage were continually in the field, and employed under three great generals, who succeeded one another in the command. These were Hamilcar, his fon-in-law Afdrubal, and his fon Hannibal. The army led by Hannibal from Spain into Italy, must necessarily have been gradually formed to the exact discipline of a flanding army. The Roman armies on the other hand, which Hannibal encountered at Trafymes, and Cannae, were militia opposed to a flanding army; and this circumstance, perhaps, contributed more than any other to determine the fate of those battles. The flanding army which Hannibal left behind him in Spain, had the like superiority over the militia which the Romans sent to oppose it, and in a few years, under the command of his brother Afdrubal, expelled them almost entirely from that country. The Roman militia, being continually in the field, became in the progress of the war, a well-disciplined and well-exercised flanding army; and the superiority of Hannibal was gradually diminished. Afdrubal judged it necessary to lead almost the whole of the flanding army which he commanded in Spain, to the assistance of his brother in Italy, but being surprized and attacked by another flanding army, in every respect equal or superior to his own, he was entirely defeated. When Afdrubal had left Spain, the great Scipio was opposed merely by a militia, inferior to his own; and having conquered and subdued that militia, his own militia necessarily became, in the course of the war, a well-disciplined and well-exercised flanding army. That flanding army, which he transported to Africa, where it was opposed only by a militia; and in order to defend Carthage, it became necessary to recall the flanding army of Hannibal. The dilated and frequently defeated African militia joined it; and at the battle of Zama, composed the greater part of the troops of Hannibal. The event of that day determined the fate of the two rival republics. From the end of the second Carthaginian war, till the fall of the Roman republic, the armies of Rome were in every respect flanding armies: and to these the militias of all the civilized nations of the ancient world, of Greece, of Syria, and of Egypt, made but a feeble resistance. The militias of the barbarous nations defended themselves much better. The Scythian or Tartar militia, and also the Parthian and German militias, were formidable enemies to the Roman armies, and gained considerable advantages over them. In general, however, and when the Roman armies were well commanded, they appear to have been very much superior.

Many different causes contributed to relax the discipline of the Roman armies. One of these causes was its extreme severity. Besides, under the Roman emperors, the flanding armies of Rome, those especially which guarded the German and Pannonian frontiers, became dangerous to their masters, by setting up their own generals against them. To remedy this evil, and to render them less formidable, Dacilian, as some fay, or, according to others, Constantine, first withdrew them from the front, and diffused them in small bodies through the different provincial towns, where some of them became trademen, artificers, and manufacturers; and thus the civil acquired a predominance over the military character, and the flanding armies of Rome gradually degenerated into a corrupt, neglected, and undisciplined militia, incapable of resisting the attack of the German and Scythian militias, which soon afterwards invaded the Western empire. The fall of this empire, which is the third great revolution in the affairs of mankind, dilltilly recorded in ancient history, was brought about by the irrefrangible superiority which the militia of a barbarous nation has over that of a civilized nation. But the victories which have been gained by militias have generally been, not over flanding armies, but over other militias, in exercise and discipline inferior to themselves. Such were the victories which the Greek militia gained over that of the Perian empire; and such were also those which in later times the Swifs militia gained over that of the Austrian and Burgundian. As the art of industry advanced, the military character of the chief towns gradually decayed, and the tradesman body of the people had less time to devote to military exercises. Hence, the discipline and the exercise of the feudal militia gradually declined and fell to ruin, and flanding armies were at length introduced in order to supply its place. When once the expedient of a flanding army was adopted by one civilized nation, it became necessary that all its neighbours should follow the example. They found that their safety depended upon their doing so, and that their own militia was altogether incapable of resisting the attack of such an army. The soldiers of a flanding army, though they may have never seen an enemy, have nevertheless frequently appeared to poffefs all the courage of veteran troops, and the very moment in which they have taken the field have been fit to face the hardest and most experienced veterans. A well-regulated flanding army, as it is superior to every militia, and as it can both be maintained by an opulent and civilized nation, can alone defend such a nation against the invasion of a poor and barbarous neighbour. Moreover, as a civilized country can only be defended by means of a well-regulated flanding army, it is only natural that the people of a civilized country can be more strongly and tolerably civilized.

The first flanding army that appeared in Europe, after the fall of the Roman legion, was that established in France by Charles VII. A.D. 1445. Such an establishment, however, was so repugnant to the genius of feudal policy, and so incompatible with the privileges and pretensions of the nobility, that during several centuries no monarch was either so bold, or so powerful, as to venture on any step towards introducing it. Charles VII. under pretence of keeping always on foot a force sufficient to defend the kingdom against any sudden invasion of the English, when he disbanded his other troops, retained under arms a body of 9,000 cavalry, and of 16,000 infantry. He also appropriated funds for the regular payment of these; he stationed them in different places of the kingdom, according to his own pleasure; and appointed the officers who commanded and disciplined them. By this measure he occasioned an important revolution in the affairs and policy of Europe. By depriving the nobles of that direction of the military force of the state, which had hitherto given to the feudal aristocracy, in that part where its power seemed to be most complete. The institution of flanding armies hath since become general; and this can only be attributed to the superiority and success which are ever attended upon such armies.
ARMY.

every where observed to attend it. The truth is, the close
ness, regularity, and quickness of their movements; the
unreserved, infatuated, and almost mechanical obedience
to orders; the sense of personal honour, and the familiarity
with danger, which belong to a disciplined, veteran, and
embodied foldier, give such firmness and intrepidity to their
approach, as well as such weight and execution to their
attack, as are not to be withstood by loose ranks of occa-
sonal and newly-levied troops, who are liable by their inex-
perience to disorder and confusion, and in whom fear is
consequently augmented by novelty and surprize. From the
acknowledged superiority of flanding armies, it follows, not
only that it is unsafe for a nation to disband its regular
troops, whilst neighbouring kingdoms retain theirs, but
also that regular troops provide for the public service at the
least possible expense. A flanding army adds more than
any other force that can be provided to the common strength,
and takes less from that which composes the wealth of a
nation, or its flock of productive industry. Besides, when the
flate relies for its defence upon a militia, formed from
the mass of the people, such as husbandmen, and artificers,
and manufacturers, it is necessary that arms be put into the
hands of the people at large. Such a militia, inferior indeed
in discipline and force to a flanding army, must be supplied
by rotation, allotment, or some mode of succession, which
replaces fresh draughts from the country; and of course a
much greater number will be instructed in the use of arms,
and will have been occasionally embodied together, than are
actually employed, or than are supposed to be wanted at
the same time. The effect of this diffusion of the military
character upon the civil condition of the country, becomes
a subject of inquiry, peculiarly delicate and important. "To
me," says the ingenious archdeacon Paley, "it appears
doubtful, whether any government can be so secure, where
the people are acquainted with the use of arms, and
accustomed to resort to them. Every faction will find itself
at the head of an army. Every difficult will excite commo-
tion; and every commotion become a civil war. Nothing
perhaps can govern a nation of armed citizens, but that
which governs an army—defopotism." "I do not mean,"
continues this writer, "that a regular government would
become defopot by training up its subjects to the knowledge
and exercise of arms, but that it would ere long be forced
to give way to defopot in some other shape; and that the
country would be liable to what is even worse than a fettled
and constitutional defopot, to perpetual rebellions, and
to perpetual revolutions; to short and violent usurpations; to
the sucessive tyranny of governors, rendered cruel and
jealous by the danger and instability of their situation."

The strength and efficacy of a flanding army depend, in
mixed governments, on its being submitted to the manage-
ment and direction of the prince. A popular council, how-
ever well qualified for the purposes of legislation, is alto-
gerher unfit for the conduct of war; in which success usually
depends upon vigour and enterprise, upon secrecy, dispatch,
and unanimity, upon a quick perception of opportunities,
and the power of seizing every opportunity immediately.
The obedience of an army should also be as prompt and
active as possible; and it ought, therefore, to be an obedience
of will and emulation. Upon this consideration is founded
the expediency of leaving to the prince not only the govern-
ment and direction of the army, but the appointment and
promotion of its officers; because a design is then alone
likely to be executed with zeal and fidelity, when the person
who orders the service, employs the instruments, and rewards
the service. There is, however, a danger to the liberty of a
state, that is inseparable from flanding armies, which ought
not to be concealed nor dissembled, and which has been
thought by some to counterbalance its acknowledged advan-
tages. These properties of their constitution, the foldier
being separated in a great degree from the rest of the com-
munity, their being closely linked among themselves by
habits of society and subordination, and the dependency of
the whole chain upon the will and favour of the prince,
however essential they may be to the purposes for which
armies are kept up, give them an aspect in no wise favour-
able to public liberty. The flanding army of Cæsar de-
stroyed the Roman republic. The flanding army of Crom-
well turned the long parliament out of doors. This danger,
however, is diminished by maintaining, upon all occasions,
as much alliance of interel, and as much intercourse of senti-
ment, between the military part of the nation and the other
orders of the people, as are consistent with the union and dif-
cipline of an army. For which purpose, the officers of the
army should be selected from the principal families of the
country, and be encouraged to establish in it families of
their own, as well as be admitted to seats in the senate, to heredi-
tarial distinctions, and to all the civil honours and privileges
that are compatible with this profession; that by such circum-
stances of connection and situation they may have a share
in the general rights of the people, and their inclination
may be engaged on the side of public liberty, so as thus to
afford a reasonable security that they cannot be brought,
by any promises of personal aggrandizement, to affill in the
execution of measures which might enlave their posterity,
their kindred, and their country. To prevent the executive
power from being able to oppress, says baron Montefquieu,
it is requisite that the armies with which it is entrusted should
consist of the people, and have the same spirit with the
people; as was the case at Rome, till Marius new-modelled
the legions, by infilling the rabble of Italy, and laid the
foundation of all the military tyranny that ensued. Nothing
then, according to these principles, says judge Blackstone,
ought to be more guarded against in a free state, than
making the military power, when such a one is necessary
to be kept on foot, a body too distinct from the people.
Like ours, it should be wholly composed of natural subjects;
ought only to be infilled for a short and limited time;
the soldiers also should live intermixed with the people;
no separate camp, no barracks, no inland fortresses should
be allowed. And perhaps it might be still better, if, by dif-
milling a flated number, and imitating others at every renewal
of their term, a circulation could be kept up between the
army and the people, and the citizen and the foldier be more
intimately connected together.

Since the general introduction and prevalence of flanding
armies in Europe, it has also for many years past been annu-
ally judged necessary by our legislature, for the safety of the
kingdom, the defence of the possessions of the crown of
Great Britain, and the preservation of the balance of power
in Europe, to maintain even in the time of peace a flanding
body of troops, under the command of the crown; who are
however ido fato disbanded at the expiration of every year,
unless continued by parliament. See Mutiny Bill.

It is probable, says Andrews (Hift. of Great Britain, vol. i.),
that the first flanding military force in Britain was that
garrison in Dover Castle, which, by refiling the arms of the
Dauphin of France, invited by the barons to their fucour in
their content with king John, faced the kingdom of
England from a foreign dynasty. Camden quotes from an ancient historian, "Sir Hubert de Burgo,
when made contable of the castle, considering that it was
not for the safety of the fortress to have new guards every
month, procured, by the affection of the king, and of all
that held of the castle, that every tenant for one month's
guard should find his ten shillings, out of which certain
persons
ARMY.

persons elected and sworn, both of horse and foot, should receive pay for guarding the castle.”

If we advert to the ancient history of this country, we shall find, that by the Saxon laws, every freeman of an age capable of bearing arms, and not incapacitated by any bodily infirmity, was obliged, in case of a foreign invasion, internal insurrection, or other emergency, to join the army: that being one of the three services comprehended under the title of the trinoda necessitas; and all such as were qualified to bear arms in one family, were led to the field by the head of that family. Every landholder was obliged to keep arms and weapons, according to his rank and possessions, which he was prohibited from selling, lending, or alienating, or even alienating from his heirs. For their instruction in the use of arms, they had flat times for performing military exercise, and once in the year there was a general review of arms throughout each county. The greater part of the Anglo-Saxon forces consisted of infantry; which seems to have been of two sorts, the heavy and light-armed; and the cavalry was chiefly composed of the thanes, such men of property as kept horses. The Anglo-Saxon mode of drawing up their armies for battle, was in one large dense body surrounding their standard, and placing their foot, with their heavy battle-axes, in the front. The military establishment of the nation underwent a considerable change, when the feudal system was introduced about the year 1066. By this system, all the lands of the realm were considered as divided into certain portions, each producing an annual revenue, denominated a Knight’s Fee: and every tenant in capite, or person who held from the king land amounting to a knight’s fee, was bound to hold himself in readiness, with horse and arms, to serve the king in his wars, either at home or abroad, at his own expense, for a flat time, generally forty days in a year. When this service was accomplished, they were at liberty to return home; but if they remained with the army, they were paid by the king. Persons of this description, unable to serve, were by proclamation directed to find unexceptionable substitutes. Soon after the conquest, the constitutional military force of England consisted of such feudal troops, and of the Posse Comitatus, including every freeman above the age of fifteen and under the age of sixty, who were only liable to be called out in case of internal commotions or actual invasions. That this body of men might be ready to take the field, a law, called the affile of arms, was enacted by Henry II., A.D. 1181, in the 27th year of his reign; which law was further corroborated and enforced by the 13th of Edw. I., called the statute of Winchester, 33 Hen. VIII., c. 5, 2 & 3 Edw. VI. In the reigns of Richard II., Hen. VII., and Henry VIII., four military bodies, still existing, were instituted, viz. the SERJENTS AT ARMS, the GENTLE MEN PAVINGMEN, the YEOMEN OF THE GUARD, and the ARTILLERY COMPANY.

During the troubles under Charles I., the royal army consisted chiefly of regiments raised by the nobility and gentry who adhered to the royal cause, from among their tenants and dependants. After the restoration of Charles II., when feudal tenures were abolished by act of parliament, a national militia was established; which was declared, by an act of parliament, to be under the immediate orders of the king. See MIlITIA. Besides these constitutional forces, there were in the English armies and garrisons, at all times from the conquest downward, stipendiary troops, both national and foreigners; the first hired by our kings, with the money paid by persons commuting for their feudal services, and employed in castle guards, foreign garrisons, and protecting the marches or borders of the kingdom, adjoining to Wales and Scotland; and the latter, paid out of the privy purse, or living upon free quarters. They were known by the various names of rupartii, routers, and ruyters, from a German word signifying a horsemanship or knight; they were also denominated Brabançons, Provençales, Cotercili, and Flemings, and were in reality a set of freebooters of all nations, ready to be engaged for hire. These were chiefly called in by our kings in their disputes with the great barons. Since the time of King Edward III., when it became customary for our kings to engage with their subjects, and other persons by indenture, to furnish soldiers at certain wages, most of our armies consisted of stipendiary troops: such was the army raised and commanded by the bishop of Norwich, A.D. 1382, the 6th of Richard II., and that of Henry IV. Of these stipendiary forces were, the garrisons and castle guards excepted, kept up only in time of war; and though mercenary, were not freebooting armies. Their subsistence was drawn from the grants made by parliament, in which their specific numbers were sometimes stipulated. The first footing forces employed by our kings were their immediate body-guards, such as the serjeants at arms, the yeomen of the guard, and the gentlemen pensioners; and yet these were calculated rather for the splendour of a court than the operations of the field. Under the troubles of Charles I., a number of troops were levied by both parties, without any regard to law or custom. Two regiments of guards raised by Charles II. in 1660, one of horse and one of foot, formed the two first corps of our present army; and these were afterwards considerably increased. In 1661, the first regiment, or Royal Scots, were brought back from France, jubilantly filled from its antiquity, “Pontius Pilate’s guards”; and there was also, about the same time, an English corps of cavalry in the French service. The revolution caused the military part of the constitution to be new modelled, and the bill to be voted from year to year, by the act filled the MUTiny Bill.

The methods of raising the stipendiary, or mercenary troops, were either by commissions, resembling our present recruiting orders, authorizing persons to enlist volunteers; or by indenture, which was a practice that began about the latter end of the reign of King Edward III., and in that of Henry V. became general. By these indentures, different persons engaged to provide a certain number of able men, properly armed, to serve the king for a flat time, at a stipulated pay and bounty, then styled wages and regards: and in these agreements it was usual for the king to advance part of the pay before-hand, afterwards called “Impept Money,” and also to give security for the regular payment of the remainder. For this purpose, King Henry V. pledged all his jewels, which were not redeemed till after his death. Criminals were also sometimes pardoned on condition of serving in the royal army abroad, and finding security to answer any prosecution if called upon at their return. Several of our sovereigns also, under the authority of the royal prerogative, obliged districts, cities, towns, and even individuals, to send men and horses, or to pay contributions for that purpose.

The present mode of recruiting our armies is by engaging volunteers, who are enlisted to serve for an indefinite time, that is, till they shall be discharged, or for a certain time, with an annexed clause, “or during the war.” See Inlisting. Precluding for soldiers was practised much in its present form in the time of Queen Elizabeth; and it has been several times occasionally authorized by acts of parliament. This, however, in itself, is but a bad expedient, and in general timidly, partially, and improperly executed.

The army, as it now stands, may date its origin from the restitution; though some of the establishments, formed by Charles II., were taken from corps raised during the civil
civil wars; such as the first regiment of foot, and the Coldstream regiment of guards, which last came with general Monk from Scotland. The royal regiment of horse guards, commonly called the Oxford Blues, is among the first in this establishment. The two troops of horse-guards, embodied by Charles about the same time, and of which the privates were all gentlemen, have been for some years abolished; and in their room have been substituted two fine regiments of cavalry, subject to military discipline like the rest of the army, and called the first and second regiments of Life Guards.

The regular army established by Charles II. consisted at first of little more than 5,000 men, including carriions abroad. In 1684, the standing army amounted to 8,000 men; that on the 11th establishment having been at the same time augmented to 7,000. During the two succeeding reigns the army was much increased, as the nation was engaged in continental wars. Under Gen. I., in 1717, the forces voted by parliament amounted to 16,000 men. The standing army was much augmented during the following reign, on account of foreign wars and internal disturbances. Every successive war has augmented the establishment of the army in proportion to our acquisition of foreign territory. At the conclusion of the American contest, the forces were reduced to about 40,000 men for Great Britain and Ireland: and the peace establishment, in 1802, consisted of 126,899 men, including 17,000 cavalry, six regiments of colour in the West Indies, amounting to 4,138 men, and the foreign corps of Swits, &c. estimated at 5,530. For the different kinds of troops, see CAVALRY, FENCIBLES, FOOT, GRENADIERS, GUARDS, INFANTRY, INVALIDS, and MARINES, &c. For the arrangement of an army in an engagement, see ORDER OF BATTLE.

An army sometimes acquires different appellations from the services in which it is employed. Thus, a covering army is that which covers a place, by lying encamped or in cantonments for the protection of the different places which lead to a principal object of defence. An army is said to blackade a place, when, being well provided with heavy ordnance and other warlike means, it is employed to invest a town for the direct or immediate purpose of reducing it by assault or famine. An army of observation, is so called, because by its advanced positions and defultory movements it is constantly employed in watching the enemy. Such a body of troops is employed by besiegers to prevent relief being brought into a place, or the siege being raised by the enemy. An army of reserve may not improperly be called a general depot for effective service. In cases of emergency, the whole, or detached parts of an army of reserve are generally employed to recover a lost day, or to secure a victory. It is also sometimes used for the double purpose of secretly increasing the number of active forces, and affording the aid necessary to prevent exigency, and of deceiving the enemy with respect to its real strength. A flying army is a strong body of horse and foot, usually commanded by a lieutenant general, which is always in motion, both to cover its own garrisons, and to keep the enemy in continual alarm. Smith's Wealth of Nations, vol. iii. ch. 1. part 1. Robertson's Charles V. vol. i. p. 112. Paley's Princ. of Mor. & Pol. Philosophy, vol. ii. p. 425. Mostefq. Sp. of Laws, vol. i. p. 229. Blacket. Com. vol. i. p. 417. De Lomme's Cont. of Eng. p. 429, &c. Grose's Milit. Ant. vol. i.

Army, Naval, is a number of ships of war, equipped and manned with sailors and marines, under the command of an admiral, with other inferior officers under him.

Army, Royal, is an army marching with heavy cannon; capable of besieging a strong, well-fortified city.

For the diseases incident to armies, see DISEASE, CAMP, GARRISON, HOSPITAL, SOLDIER, &c.

ARNA, in Ancient Geography, a town of Italy, in the eastern part of Umbria, opposite to Perugia and near the Tiber, mentioned by Silius Italicus, l. viii. v. 438; now known under the name of "La Civitella d'Arne."" ARNA, or Arne, a small territory of Greece, in Thessaly, so called from its metropolis, Panay, and being a district of Thessaly. Strabo says, that Homer gives the name of Arne, or Arne, to Arpilim in Boeotia, assigning to it the epithet πορναιοτεκνη, on account of its abundance of grapes. It is said to have derived its name from Arne, the daughter of Cleitus, by whom son Boreas it was built.—Arna was also a town of Asia Minor, in Lycia, called by some authors Xanthus.—Also, a town of Spain, on the right of Beticus, between Hipaspis to the south-west, and Corduba to the north-east.—Also, a town of the island of Andros, in the Archipelago.

ARNAB, in Zoology, the name of the hare (Lepus) among the Arabs.

ARNABA, in Entomology, a species of Papilio (Nymph, gem.), found in Surinam. The wings are slightly indented and brown; posterior pair bluntish, with five ocellated spots beneath. Fabricius. Oj/. This author suspects that the insect figured by Cramer, under the specific name Leon, may belong to this species.

ARNAK, in Ichthyology, one of the Arabian fishes of the Raja genus, described by Forskal in his Faun. Arab. p. 9. n. 13. The body is roundish and silvery; tail without fins, and armed with two spines. Forsk. Gmelin. The teeth are granulate.

ARNALDIA, in Physea, a flow malignant kind of disease, frequent formerly in England; the most distinguishing symptom whereof was a falling of the hair.

Authors are much at a loss for the nature and kind of this disease, which appears to have been peculiar to our country. From the description given of it in an ancient chronicle, Mollerus concludes it to have been a species of the venerable disease, as that distemper appeared in three days in this country.

ARNAU, in Geography, a town of Bohemia, in the circle of Koniggratz, on the Libe.

ARNAUD DE VILLA NOVA, so called from Villeneuve, the place of his birth, in Biography, a philosopher and physician of extraordinary talents, born about the middle of the thirteenth century, studied at Paris and Montpellier, and further improved himself by visiting the different schools in Italy. He then travelled to Spain, where he acquired a knowledge of medicine, and of their language, from the Arabian physicians. He here acquired so much reputation, that a seat was formed in the country, called from him "A nolditer." He is said to have had such faith in a trilogy, as to predict from the aspect of the stars the termination of the world, which he propounded would happen by the year 1576. He was a great elymist, and wrote several treatises on the subject. While in Spain, he became acquainted with Raymond Lully, who call'd him his master. At Paris, he had given his opinion so freely on theological matters, particularly of the monks, and of the mafs, that the faculty of theology there condemned fifteen of his positions, one of which was, "that the works of mercy and of medicine were more acceptable to God than the sacrifice of the altar," To avoid the consequences of their censures, and finding the Inquisition were proceeding against Apono, for taking similar liberties with religion, he retired to the court of Frederic of Aragon, who had formerly been his friend, and there wrote his treatise concerning the government of health, and his commentaries on the Schola Salernitana. He is supposed to have died about the year 1312. In 1313, pope Clement
ARN

wrote a circular letter, adjuring every one under their apolitical obedience, to discover and tend to him a treatise on the practice of physic written by Arnauld which he had promised to give his holiness, but was prevented, he sup- posed, by his death. Friend's Hist. of Phys. vol. ii. p. 257. His works, which were numerous, were collected and printed at Lyons in folio, 1570: and again at Balle, 1582, with notes by Nicolas Telerus. Eloy has given a catalogue of the treatises in his Dict. Hist. among them we find, "Expositionis vineanum quæ sunt in sommis, ad usitatum medicinae." "Remedia contra maleficia." "De conferenda juventute, et retardanda senectute;" and others "ejusdem faminis;" but many of them are on more familiar and useful subjects. He complains in several parts of his works, of the interference of the clergy in the practice of physic, to the great detriment of the professors of the art, as well as of the art itself. The evil however continued to increase, notwithstanding the attempts of the popes to check it, until after the revival of letters.

ARNAULD, in Geography, a fortified island on the west ern coast of the hither peninsula of India, commanding the entrance of the Angilafiyah or Mandavee river, between Bombay and Surat.

ARNAULD, ANTONY, in Biography, an eminent lawyer, was born at Paris in 1550. As an advocate to the parliament of Paris, he was distinguished for his eloquence and probity, and confuted by persons of distinction on the most important affairs. His pleadings against the Jefuits in favour of the university of Paris, in 1594, which are famous, were published in Svo. at Paris in 1594, and in 12mo. in 1717. He also published another work against the Jefuits, in 1602, and "Advice to Louis XIII." in Svo. in 1615. He died in 1619, and several of his sons acquired great celebrity. Nouv. Dict. Hist.

ARNAULD, D'ANDILLY, the eldest son of the preceding, was born at Paris in 1588. In several polls of distinction which he occupied at court, he employed his influence in support of justice and virtue; and such was his character, that Bæzzez said of him; "he was neither ashamed of the Christian graces, nor vain of the moral virtues." At the age of fifty-five, he retired to Port Royal, and devoted himself to religious studies. He died at the age of eighty-five, having retained the full vigour both of his body and mind. Besides other works, his "Translation of Josephus," and "Ditat ad Amsterdam," his "Apologetic memoir for the house of Port Royal," was written in 1554; "Memoirs of his life by himself," were printed in two volumes 12mo.; and "A Poem on the life of Chirill," was printed in 1688,12mo. Nouv. Dict. Hist.

ARNAUD, HENRY, brother of the preceding, abbot of St. NichoIs, and afterwards bishop of Angers, was born at Paris in 1597. For his services to the family of the Barba rini, in 1645, on occasion of their disputes with pope Innocent X., they struck a medal in honour of him, and erected his statue in their palace at Rome. From the time of his appointment to the see of Angers, in 1649, to his death in 1653, he left his diocese only once, which was for the purpose of reconciling the duke of Tremouille to his son. He is said to have appeased the queen mother when she was about to punish the inhabitants of Angers for their revolt in 1652, by laying to her at the communion, "Receive your God, who, when he was dying on the cross, pardoned his enemies." It is reported concerning him, that the dearth at his favourite to have offended him. His whole time was devoted to study, religious exercises, and the affairs of his diocese; and being exhorted by a friend to allow himself one day for relaxation, he replied, "I shall willingly do it, if you can find a day in which I am not a bishop." Although he attained the advanced age of 92, his death was considered as premature, and he was lamented as the father of the poor, the comforter of the afflicted, and the bell of bishops. His "Observations" at the court of Rome, and in other courts of Italy, containing many curious remarks, were published at Paris, in 1748. Nouv. Dict. Hist.

ARNAULD, ANTHONY, an eminent Jansenist, was the twentieth child of the advocate of the same name, and born at Paris in 1612. Having first studied the languages and philosophy in the college of Calvi, and afterwards theology in the college of Sorbonne, he was, in the year 1643, admitted a member of the Sorbonne. In the dispute between the Jansenists and Jansenists, concerning frequent communion, Arnauld took an active part; and in 1643 published his famous book on "The Practice of communicating frequently." The frequent celebration of the Lord's Supper was strenuously recommended by the Jansenists as the most certain and infallible method of appeasing the deity, and obtaining plenary remission; but the Jansenists, and also many other learned and pious doctors of the Roman church, condemned this mode of thinking, whilst they rejected the inordinate and inefficient operation, called the "opus operaturn," attributed to the sacraments; and maintained that the act of receiving the sacrament of the Lord's Supper can be profitable only to those whose minds are prepared by faith, repentance, and the love of God, for that solemn service. Arnauld's treatise on that subject gave great offence to the Jansenists; and their enmity against him was increased by the books written by him in defence of the Jansenists, on the subject of grace. In 1656, he was excluded from the faculty of divinity of Sorbonne, against the judgment of seventy-two doctors of this faculty; and from this time he withdrew into solitude, where he remained twelve years, and employed himself in writing curious treatises in various branches of science. When the perfection of the Jansenists was upheld by pope Clement IX. in 1669, Arnauld returned to Paris, and was respectfully received both by the pope's nuncio, and by Louis XIV. At their requell he defended the Catholic faith against the Calvinists; but his enemies succeeded in bringing him into dispute with the king, and he thought it prudent to retire. Accordingly he left the kingdom in 1670, and took up his residence in the Netherlands, where he essentially served the cause of the Jansenists, and gained over by his eloquence and sagacity the Roman congregations in Holland to their party. In this retreat he also wrote "An Apology for the Clergy of France, and the Catholics of England," in reply to the "Politics of the Clergy of France," written by Jurius, a Protestant minister, and published at the Hague; and this reply produced from the pen of Jurius, a piece of keen satire, entitled "L'Epirit de M. Arnauld." His "Reflections philosophical and theological," were produced by Malbranche's treatise "On Nature and Grace;" and in a work, "On true and false Ideas," he attacked the philosophical doctrine advanced by this author in his "Search after Truth." His "Practical Morality of the Jansenists," was levelled against this fraternity; and he also attacked father Simon on the inspiration of the scriptures, and wrote in defence of the propriety of translating the scriptures into the vulgar tongue. Notwithstanding all the zeal of Arnauld in vindication of the Catholic faith, his orthodoxy was suspected, and in 1690, a canonical warrant was issued against him, under the contemptuous and illiberal description of "One Arnauld," by the superiors of the several monastic fraternities at Liège. Arnauld, however, persevered in his attachment to the church, notwithstanding the charges of heresy with which he was reproached; and in his last moments he received the sacrament from the hands of his prêtre,
prifft, though he had only two days before celebrated mass. He retained his faculties to the advanced age of 82 years, and died at Bruffels, on the 8th of August, 1694. His heart was carried, at his particular request, to Port Royal, and there it was honorably deposited. Arnauld posseffed a vigorous and active mind; his memory was tenacious, his literature various and extensive: he excelled as a logician; and in theology and ecclesiastical history he was deeply read; and he was well acquainted with polite literature. His genius was original and inventive; and he is said to have taught in philosophy, opinions similar to those of Des Cartes, before his writings appeared, and to have maintained the doctrines of Janfenuis several years previous to the publication of that prelate's book on grace. Although Arnauld suffered perfeerion with the Janfenuis whilst he lived, it has been a problem of no easy solution ever since his death, whether he was an heretic. His writings are chiefly controversial, and bear evident marks of a strong intellect and lively fancy. In polite literature and philosophy, he published "A general and rational Grammar," illustrating the universal principles of language, reprinted with notes by M. Duclos in 1756; "Elements of Geometry;" "The art of Thinking;" "Reflections on the Eloquence of Preachers;" "Objections to the Meditations of Des Cartes;" and "A treatise on true and false Ideas." On the subject of grace, his principal works are "Reflections philosophical and theological," and translations of several pieces of Auguftine. In the controversy against the Protestants, he wrote "The perpetuity of Faith;" "The overthrow of Christian Morality by the Calvinists;" "The impolicy of Calvinistic Morality;" "An apology for the Catholics;" "The Calvinists convicted of impious tenets in Morals;" and "The Prince of Orange, a new Abilom, a new Herod, a new Cromwell," which was extensively circulated through various courts of Europe by Louis XIV. Against the Jefuits, his most famous work is "The practical morality of the Jefuits," in eight volumes, to which several learned Janfenuis are supposed to have contributed; it was republished at Amsterdam in 1742. His writings upon the holy scriptures are "Difficulties proposed to M. Steyart;" "Defence of the New Testament of Moses;" "The translation of the Mifal into the vulgar tongue, authorized by Scripture and the Fathers;" and an "Hiloply and Harmony of the Evangelists." After his death M. Quefnel published, in nine volumes, his "Letters" and several "Poetical Pieces," among which is the "Differtation on the method of Mathematicians," vindicating his mode of writing, and justifying, in certain disputes, the use of terms commonly thought harh.

Arnauld, George, son of an eminent surgeon at Paris, applied himself, during the latter part of his life, almost exclusively to the cure of ruptures, in which he acquired considerable knowledge. On account of some accident occurring while he practiced midwifery, occasioned, as it was suspected, by mismanagement, he was removed from Paris to London, where he continued to reside the remainder of his life. In 1748, he published "Difertation on Hemias, or Ruptures, in two parts," in Svo. In these he gives directions for enabling persons afflicted with ruptures, to avert the danger usually consequent to that accident. He supposes that one eighth part of our species suffer from this complaint, which, though perhaps an exaggerated account, shews its frequency, and how necessary it is to direct the attention of surgeons towards making improvements in its treatment. He gives the signs by which the different kinds of ruptures may be distinguished, and clear and definite directions for managing them. He relates cases of cures effected by him after a gangrene had taken place, by cutting out the mottled part of the integument. In 1753, he published "Plain and easy Inructions on the Diseases of the Bladder and Urethra," in 12mo. in which he highly commends the use of bongies. In his "Memoires de Chirurgie," published in 1768, in 2 vols. 4to. he gives the whole of Dr. Hunter's treatise on the "Hernia congenita," with additional observations, from inspection of a case that fell under his notice; also further observations on ruptures, and observations on aneurisms. We have, by the same writer, "Remarks on the compostion, use, and effects of the extract of lead of Gualard, and of his vegato-mineral water," 1770, 12mo. Bibloth. Chirurg. Halter.

Arnaud, Belligrad, in Geography, a town of European Turkey, in the province of Albania, 40 miles north-east of Valona.

Arnauds, in Military Language, denote Turkish light cavalry, whose only weapon is a very crooked sable. Some such are in the Russian service.

Arnaud, Le Duc, in Geography, a town of France, and principal place of a district, in the department of the Coté d'Or, and chief place of a canton in the district of Beaune, 25 miles south-west of Dijon, and 24 south of Semur en Auxois. The place contains 2543, and the canton 11,550 inhabitants: the territory includes 2675 kilometers and 20 communes. N. lat. 47° 7'. E. long. 4° 26'.

Arndal, a small town of Norway, in the diocese of Christiania, and district of Nidadal, seated on a rock in the middle of the river Nid, and remarkable for a good wharf or landing-place. The houses stand mohly on the declivity of the rock, and the others are built on piles in the water. The inhabitants pass from house to house by means of bridges of boats. The town is commodiously situated for trade; and many ships are employed in the transportation of timber. The church stands near the summit of the rock, and there is an ascent to it from the houses by steps hewn in the rock. In the neighbourhood of this place are many iron mines.

Arndorf, a town of Germany, in the circle of Bavaria, and principality of Saltzbach, four miles east of Kemnatt.

Arndt, John, in Biography, an eminent Protestant divine, born at Ballinlacht, in the principality of Deffau in Germany, in 1555. In consequence of a vow which he made when he was sick, whilst he was persecuting the study of medicine, he devoted himself to divinity; and was successively minister of Quedlinburg, and at Brunswick. His fame, as a preacher, excited jealousy among his brethren; and being charged with errors, he escaped persecution by retiring to Lieben; and in 1611, the duke of Luenburg gave him the church of Zell, and appointed him superintendent of all the churches in his duchy. The charge against him was occasioned by a book which he published at Jena, in 1605 and 1608, intituled "True Christianitv," asserting that many of the irregularities fulfilling among Protestants were owing to a mistaken notion of the efficacy of a speculative faith unproductive of good works: he laid great stress on the contrary doctrine; and intermixed some mythical ideas and expressions, borrowed from the writings of Bernard, Thomas a Kempis, and other ascetics. He thus gave offence to several of his brethren, and particularly to Osiander, a divine of Tubingen, who attacked him in a treatise, intituled "Judicium Theologicum." By Osiander, and others, it was alleged against him, that his style was infected with the jargon of Paracelitus, Weigelus, and other mythical
Anno, Joshua, a German divine, was born at giltrow in 1626, and became professor of logic at rooldock, and preacher, and also ecclesiastical counsellor to the duke of mecklenburg. He died in 1657, and left several works, particularly "miscellanæ sacra," 8vo.; "clavis antiquitatum judaïcarum," 4to.; and "tractatus de superflunione." His life, written by his son, was printed at giltrow in 1697. Nov. Dic. Hiflor.

Arne, Thomas Augustinæ, was the son of Arne, the celebrated upholsterer of king-linnet, Covent-garden, at whom house the Indian kings lodged in the reign of queen Anne, as mentioned in the spectator, No. 56. Arne had a daughter by a second marriage, also named Anne, to his father, who intended him for the law. But we have been assured by several of his schoolfellows, that his love for music operated upon him too powerfully for his own peace, or that of his companions; for, with a miserable cracked common flute, he used to torment them night and day, when not obliged to attend the school. And he told us himself, that when he left eton, such was his passion for music, that he used to avail himself of the privilege of a servant, by borrowing a livery, and going into the upper gallery of the opera, which was then appropriated to domestics. At home he had contrived to recite a psalm in his room, upon which, after muffling the flings with a handkerchief, he used to prattic in the night while the rest of the family were asleep; for had his father discovered how he spent his time, he would, probably, have thrown the instrument out of the window, if not the player. This young votary of apollo was at length obliged to serve a three years' clerkship to the law, without ever intending to make it his profession; but even during this servitude, he dedicated every night to that fair art of his, having, for the study of music. Besides practising on the psalm and studying composition by himself, he contrived, during his clerkship, to acquire some instruction on the violin, of fielding, upon which instrument he had made so considerable a progress, that soon after he had quitted his legal master, his father accidentally calling at a gentleman's house in the neighbourhood upon business, found him engaged with company; but finding in his name, he was invited up stairs, where there was a large company and a concert, in which, to his great astonishment, he caught his son in the very act of playing the first fiddle! Finding him more admired for his musical talents than knowledge in the law, he was soon prevailed upon to forgive his unruly passion, and to let him try to turn it to some account. No sooner was the young musician able to practice aloud in his father's house, than he bewitched the whole family. On discovering that his father was not only fond of music, but had a very sweet toned and touching voice, he gave her such instruction as soon enabled her to sing for lany in his opera of alma. And finding her so well received, his performances, he soon prepared a new character for her, by setting Addison's opera of rofamond, in which he employed his younger brother likewise in the character of the page. This musical draw was first performed March 7, 1733, at Lincoln's-inn fields, where Mrs. Barber performed the part of the king; Leveridge, Sir Trudy; Page, Maber Arne, who had never appeared in public; Meller, Mr. Corfe; Queen, Mrs. Jones; Gridleine, Mrs. Chambers; and the part of rofamond by Mrs Arne. The opera was performed ten nights together, and with great applause; the last time, for the benefit of Mr. Arne, jun., the composer. Having succeeded so well in a serious opera, our young musician tried his powers at a burletta, and fixed upon fielding's tomb thumb for that purpose, which, under the title of the tragedy of tragedios, having met with great success in 1731, he now got it transformed into the opera of operam, and setting it to music after the Italian manner, had it performed May 31st, at the new theatre in the Haymarket; the part of tomb thumb by Maber Arne, his brother. Princeps alemia and the duke of Cumberland honoured the second representation with their presence; the prince of wales, the sixth; the youngest princesse, the eighth; and afterwards it had a considerable run.

In 1736, Maber Arne, his father, now Mrs. Clibber, who had captivated every hearer of sensibility by her satiety of voice and power of expression as a singer, first appeared as a tragic actress, in the part of Zara, at Drury-lane, where her brother was engaged as composer; and it was not difficult to fancy which of the two received the greatest applause; the actress for her truly interlacing person, and pathetic voice and manner, or the musician for his nature and pleasing brains, particularly the March, which was encored every night, and remained in great favour throughout the kingdom during many years.

In 1738, Arne established his reputation as a lyric and dramatic composer, by the admirable manner in which he fet Milton's Comus. In this masque he introduced a light, airy, original, and pleasing melody, wholly different from that of purell or Handel, whom all English composers had hitherto either pillaged or imitated. Indeed, the melody of Arne at this time, and of his vauxhall songs afterwards, forms an area in English music; it was so easy, natural, and agreeable to the whole kingdom, that it had an effect upon our national taste; and till a more modern Italian style was introduced in the palliccio English opera of mehra. Bickerstaff and cunningham, it was the standard of all perfection at our theatres and public gardens.

In 1742, Mr. and Mrs. Arne went to Ireland, where they remained till 1744; in the autumn of which year he was again engaged as composer, at Drury-lane; and on the death of Gordon, the first violin, who was ficed for his nature, he accepted of the station in the orchestra of that theatre of leader of the hand. His hand was enfeebled by rheumatism, but his skilful passed that of any performer on the violin who had preceded him.

Mr. Arne and Mr. Boyce were frequently concurrents at the theatres, and in each other's way, particularly at Drury-lane. Arne was aspiring, and always regarded Handel as a tyrant and usurper, against whom he frequently rebelled; but with little effect, except upon his own purse, for he was always a lofer whom he had oratories performed in lent on the fame night as Handel. But in his songs for the theatres and public gardens, he was ever triumphant over all competitors. At vauxhall, particularly, where his ballads, dialogues, duets, and trios, were performed during many years with great applause, and were afterwards circulated all over the kingdom. In the summer of 1745, when vocal music was first added to instrumental, by Mr. Tyers, the proprietor of vauxhall, Arne's little dialogue of coln and phaebes, written by the late Mr. Moore, author of fables for the female sex, was constantly enquired every night for more than three months successively.

In 1759, this ingenious and popular composer had the degree of doctor in music conferred upon him at Oxford. And
And in 1766, quitted his former style of melody, in which he had so well set Comus, and furnished Vauxhall and the whole kingdom with such songs as had improved and polished our national taste; and when he let the bald translation of Metalliño's opera of Artaxerxes, he crowded the airs, particularly in the part of Mandane for Miss Brent, with all the Italian divotions and difficulties which had ever been heard at the opera. This drama, by the novelty of the music to English ears, with the talents of Tenducci, Peretti, and the doctor's scholar Miss Brent, had very great success; and still continues to be represented whenever fingers can be found who are possessed of sufficient abilities for its performance. But in setting Artaxerxes, though the melody is less original than that of Comus, Arne had the merit of still adapting many of thehill passages of Italy, which all Europe admired, to our own language, and of incorporating them with his own property, and with what was still in favour of former English composers.

The general melody of our countrymen, if analysed, would perhaps appear to be neither Italian nor English, but an agreeable mixture of Italian, English, and Scots. Many of his ballads, indeed, were prefolved imitations of the Scots style; but in his other songs he frequently dropped into it, perhaps without design.

Arne never was a close imitator of Handel; and was almost the only English composer of the last century, who did not build his fame on imitations of his works, and who was not proud to hear his admirers lay of his compositions—'in all Handel.' On which account Arne was never thought by the veterans of their great model to be a found contrapuntist. However, he had an inward and secret reverence for his abilities, and for those of Geminiani, as well as for the science of Pepusch; but except when he attempted oratorios, there was not the merit requisite for him, a popular composer who had different performers and different hearers to write for. In the science of harmony, though he was chiefly self-taught, yet being a man of genius, quick parts, and great penetration in his art, he betrayed no ignorance or want of study in his scores.

The oratorios he produced were so unfortunate, that he was always a lover whenever they were performed. And yet it would be unjust to say that they did not merit a better fate; for though the choruses were much inferior in force to those of Handel, yet the airs were frequently admirable. But besides the great reputation of Handel, with whom he had to contend, Arne never was able to have his music so well performed; as his competitor had always a more numerous and select band, a better organ, which he played himself, and better fingers.

None of this ingenious and pleasing composer's capital productions had full and unequivocal success but Comus and Artaxerxes, at the distance of twenty-four years from each other. Rofamond, his first musical drama, had a few songs in it that were long in favour, and the Judgment of Paris many; but except when his filler, Miss Arne, afterwards Mrs. Cibber, sang in them, he never gained any thing by either. Thomas and Sally, indeed, as a farce, with very little musical merit, was often acted; and previous to that, Eliza was a little while in favour; but the number of his unfortunate pieces for the stage was prodigious! yet none of them were condemned or neglected for want of merit in the music, but words, of which the doctor was too frequently guilty of being the author. Upon the whole, though this composer, who died March 5th, 1778, had formed a new style of his own, there did not appear that fertility of ideas, original grandeur of thought, or those resources upon all occasions, which are discoverable in the works of his predecessor Purcell, both for the church and stage; yet, in secular music, he must be allowed to have surpassed him in ease, grace, and variety; which is no considerable praise, when it is remembered, that from the death of Purcell to that of Arne, a period of more than fourteen years, no candidate for musical fame among our countrymen had appeared, who was equally admired by the nation at large.

Of near a hundred and fifty musical pieces that were brought on the stage at the two theatres, from the time of his composing Rofamond, to his decease, a period of little more than forty years, thirty of them, at least, were by Arne. Arne, Michael, the natural son of Dr. Arne, was brought at an early age on the stage by his aunt Mrs. Cibber, who took great pains in qualifying him for the part of the page in the Orphan, and his father also tried to make him a singer; but he was naturally idle, and not very quick. However, he acquired a powerful hand on the harpichord, and played with neatness and precision some of Scarlatti's most difficult fffs. It is recorded with reluctance as a beacon, that his moral character was less deserving of praise than his professional. Always in debt, and often in prison, he fung his first wife to death and starved the second, leaving her in absolute beggary.

Arne, in Ancient Geography, a town of Afia, in Melopotamia. —Allo, a town of the territory of the Ermakini, in the vicinity of Thrace.—Allo, a fountain of Peloponnesus, in Arcadia.

Arne, in Geography, a river of Switzerland, descends from the lofty Alps in the vicinity of Mont Blanc, and forms a junction with the Rhone about a quarter of a league from Geneva; and the two rivers run together for more than half a league before their waters are blended: the stream is broad, and on one side is the brown and muddy Arne, while on the other are distinctly seen the clear, blue, and untainted waters of the Rhone. This river, or rather torrent, is subject to sudden and considerable swellings; and its waters have flowed back on the bed of the river, and in their recessed course turned the mills that are constructed on its banks. The waters of the Arne, when it has deposited the silt with which it is charged, is of the purest quality. Saufure, Voy. des Alps, tom. i. § 13, &c.

ARNEWBURG, a small town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, seated on the Elbe. The principal subsistence of its inhabitants is derived from navigation and traffic in corn, and also in agriculture. From the town of Arnewburg are denominated a circle and provincial riding. It is 50 miles west of Berlin. N. lat. 52° 45'. E. long. 11° 50'.

ARNEWO, a sea-port town of Peru, with a good harbour, in the Pacific ocean, 23 miles north of Lima. S. lat. 11° 38'. W. long. 76° 54'.

ARNE, a town of Hindostan, in the Carnatic, 14 miles S. of Arcot, and 52 N. W. of Pondicherry.

Arne, in Zoology, a quadruped of the Bos or Ox tribe, a native of India, and which appears to have been first described by Mr. Kerr, in his work on the Animal Kingdom. To Gmelin it was very probably unknown. In the General Zoology by Dr. Shaw it is specifically described in these terms: Bos Arne. B. cornubica eritica lunaria super planifolia rugosa.—Ox with upright branched horns, flat and wrinkled on their upper surface. The latter writer observes that this Indian species is known chiefly by its vaft horns, which are sometimes seen in museums; and from Indian paintings, in which it is occasionally represented.

In the work of Mr. Kerr, it is said to have been met with by a British officer, in the woods above Bengal; and to have been fourteen feet high, measuring from the hoofs to the top of the horns. It partakes of the form of the horfe, the bull, and the deer; and is represented as a bold and daring animal. The figure of this species in the work of Mr.
Mr. Kerr, is copied from an Indian painting, and the same figure is again introduced into Dr. Shaw's Zoology. The animal is of a black colour, quite smooth, and without either protuberance or mane.

ARNEMUDEN. See Armyneden.

ARNEN, or Arnem, in Geography, a town of Swifterland, in the Valais, thirty-five miles call of Sion.

ARNESIO, a town of Italy, in the kingdom of Naples, and country of Bari, seven miles W. S. W. of Andria.

ARNES-SYSSEL, a district of Iceland, in which is situated the episcopal see of Skalholt.

ARNELV, a town of France, in the department of Sarre; and chief place of a canton, in the district of Sarrebruck. The place contains 502, and the canton 8514 inhabitants; the territory includes 31 communes.

ARNFELS, a town of Germany, in the duchy of Stria, ten miles south-east of Landburg.

ARNIGHTZES, a town of Walachia, forty-two miles S. S. E. of Hermanstadt.

ARNHUSEN, a town of Germany, in the circle of Upper Saxon and duchy of Pomerania, twenty-four miles call of New Sestin.

ARNHEIM, or Arnem, Arnolds-villa or Arenacum, a large, strong, and populous town of the United Netherlands, the capital of Arnheim or the Veluwe quarter of Guelderland, lies on the north side of the Rhine, at the foot of the Veluwe hills, near the place where the Vecht and the Rhine separate their streams. The streets are regular, the houses well built, the walls are delightfully planted with elm and lime trees, and the town is the usual winter residence of many families, who spend the summer on their estates in the Veluwe, where they enjoy a much more fabulous air than that of the maritime provinces of Holland. The church of St. Walburg is a fine edifice; and that of Eembus has an excellent chime of bells. Arnheim is fortified with a rampart of earth, faced with brick, and walked on one side by the Rhine, and on the other by a deep fosse, dug by Drusus Nero. This city was founded before the time of Tacitus, who mentions it under the name of Arenacum; and it was fortified and invested with the privileges of a city by Otbo III. duke of Gueldern, A. D. 1233. It is thirty miles east of Utrecht, and forty-five south-east of Amsterdam.

ARNBERG, a mountain of Swifterland, in the district of Erzgebirge.

ARNICA. In Botany. Lin. p. 958. Schreb. 1296

Juli. 182. Gardin. t. 177. Claes, fynegasta polygonum fjerum. Nat. Ord. Composita diffusia. Caryophyllaceae. Jull. Gen. Char. Calyx, common, shorter than the ray of the corolla; leaves lanceolate, the length of the calyx, erect. Cor. compound, radiate; corollas hermaphrodite in the disk, very numerous; females in the ray about twenty; proper of the hermaphrodite, tubular, erect, five-cleft, equal, female lanceolate, very long, three-toothed, spreading. Stam. to the hermaphrodite, filaments very short; anther cylindrical; to the females, filaments subulate, erect; anthers none.

Pet. germen oblong; style simple, the length of the filaments; stigma bident. Ped. none; calyx unchanging. Seeds, solitary, oblong; down simple, in the hermaphrodite pubescent, long.

Rec. naked. Olf. Corollas of the disk often trifid, with the outer division twice as broad as the others.

Eff. Gen. Char. Rec. naked; down simple; corollas of the ray have five filaments, without anthers.

Species. 1. A. mantana, mountain arnica. Gardin. fr. 2. 481. Flor. Dan. t. 63. Woody, Med. Bot. t. 180. "Leaves ovate, entire, stem-leaves twin, opposite;" the root is woody; stem above a foot high, and not more than half this height in alpine situations, simple, obscurely angular; flowers two inches in diameter, of a deep yellow, and placed on upright terminal peduncles; calyx cylindrical, composed of rough hairy scales; ligulate florets about fourteen, three-toothed, fringed, as long as the calyx, hairy at the base; seeds oblong, blackish, hairy, crowned with a straw-coloured down. A native of most parts of the continent of Europe, and of Siberia, flowering in July; cultivated by Miller in 1759. 2. A. piloselloides, mouse-car arnica; "leaves perfectly entire, elliptic, villose; face one-flowered, woolly; calyx equaling the ray;" the stem and leaves covered with down; stem two or three inches long, and about half this breadth, hairy, especially on the back, pointed; scape twice as long as the leaves, very woolly towards the top; flower large; calyx tomentose, of the length of the ray; florets of the ray very narrow, of a dark red or purple colour, and male. A native of the Cape of Good Hope. 3. A. foersteides, alternate-leaved arnica. Jacq. Flor. Aufl. t. 4. 1740. "Leaves alternate, toothed." The roots are contorted, and thus supposed to have some resemblance to a scorpion; items several, from six inches to a foot in height, terminated by a deep yellow flower, of two inches diameter; root-leaves roundish or oval, deeply serrate, on long foot-thanks; stem-leaves few, nearly fertile, villose, flat, flaggy. The whole plant has a disagreeable smell. A native of Swifterland, Savoy, Dauphine, &c. Cultivated by Miller in 1759. 4. A. donitrimum, Jacq. Flor. Aufl. t. 92. A cushion alpin. ped. A. liraeae. Villars Dauph. 210. "leaves alternate, subfractured, oblong, rough." The leaves are hairy; stem from four to eight inches high, and never bears more than one flower. A native of the high Alps of the Grisons, Dauphine, Piedmont, and Andria. 5. A. maritima, tea arnica. After, helenium maritimum, &c. Gmel. lb. ii. p. 173. "leaves lanceolate, the lower ones serrate; stem leathery, many florecled." A native of Kamtschatka and North America. 6. A. crenata, farron-flowered arnica; "leaves ovate; repand totoletted, tomentose underneath;" scape one-flowered, with a few linear bracte; root-leaves oval, often heart-shaped, rigid, petioled; florets of the ray furnished with flavens. A native of the Cape of Good Hope. 7. A. ciliata, ciliate-leaved arnica; "leaves stem-clasping, oval, toothed, ciliate, smooth; stem simple, one-flowered." The stem is erect, a foot high, angular, hispid, with white bristles; leaves alternate, lower attenuated at the base, obovate, gaff-toothed, ciliate; upper roundish, finely toothed, smaller ciliate; flower terminating, red, the size of a small pear. A native of Japan. 8. A. japonica, japonica arnica. Thunb. p. 319. "Leaves gaff-palmated, totoletted; flowers terminal, sub-binate;" the stem is hollow, round, flattened, erect, more than a foot high; leaves petioled, alternate, smooth, lobes gaff-pinnatifid, toothed; petioles of the lower leaves long, of the branches broad; stem-clasping, flattened, short; flowers peduncled, red, few. A native of Japan. 9. A. palmata, palmate-leaved arnica. Thunb. i. c. "Leaves gaff-palmated, toothed; flowers panicked;" the stem is two feet high, flattened, erect, smooth; leaves alternate, p. toothed; lobes of the lower leaves unequal, toothed, the upper undivided, serrate; flowers terminating, small, yellow. A native of Japan. 10. A. german, "Leaves pinnatifid;" lobes rounded; the lobes of the leaves are imbricated backwards, and, when young, tomentose underneath; the scape is surrounded with very slender leaves, and supports one large flower, with a dark purple disk, and a yellow ray, purple underneath. A native of the Cape of Good Hope. 11. A. coronophipha, "Leaves pinnate;" dilatation linear. This very much resembles the german, and is also native to the Cape. 12. A. grunia. Forli. Aufl. t. 299. Shrub; leaves lanceolate, callous-crinate, tomentose beneath; peduncles one-flowered, ciliate, filamentary, terminating, ciliate. A native of New Zealand.

Medicinal Properties. The only species supposed to posses...
these in any considerable degree is the arnica montana, the virtues of which have been most extravagantly extolled in Germany. It was first recommended as peculiarly efficacious in bruises, and hence obtained the appellation of pa-
aucta lapiforum; and to this solvent power its utility in various diseases has been ascribed, particularly in pulmonary complaints, suppurative menorrhagia, hepatic obstructions, &c. Of its use in paralytic and other affections of a similar nature, many testimonies are adduced: nor have its good effects been less praised in rheumatism and dropsy; but it is the extraordinary febrifuge and antifeptic powers of the arnica which have been peculiarly celebrated by Dr. Collin of Vienna. With the flowers of this plant made into an elixir with honey, he informs us, that he cured more than one thousand patients labouring under the different species of intermittent fevers, in the Pauzen hospital, from December 1771 to July 1774, and with the watery extract of the flowers he cured thirty quidians, forty-six tertiars, and forty-eight quartans. In putrid fe-
vers the Doctor employed an infusion of the flowers, with which many hundreds of patients were snatched from the very jaws of death. There are some cases, however, in which the Doctor recommends the roots in preference to the flowers, believing the former to possess more cordial, tonic, and antifeptic qualities; he therefore prefers it where putridity and debility are more prevalent than fever. It was also found very efficacious in a malignant dysentery, in which he adduces many hundred instances of its successful employment, confirmed by the practice of Dr. Dietl. In thirteen cases of gangrene, this medicine proved its antifeptic virtue in a still more evident manner. The Doctor gave nine drams of the powder of the flowers of arnica, mixed with a sufficient quantity of honey, in the course of forty-eight hours. Of the infusion in the proportion of one ounce to two quarts of water every two hours. When he employed the root, it was in double this proportion. At first this plant is apt to occasion vom-
ing or uneasiness at the stomach, so that it is necessary to begin with small doses. See Wod. Med. Bot. vol. i.

Propagation and Culture. 1, 2, 3, 4, 5, the European species are hardy, and require a moist situation. They may be propagated by parting the roots in autumn when the stalks begin to decay, or by the seeds sown in autumn soon after they are ripe, for those sown in the spring often fail; but if the seeds are permitted to sear, the plants will often come up of themselves, and require no other care than keeping them clean from weeds. The other species must be kept in pots under a frame, or in a dry house. They may be increased by seeds, cuttings, or parting the roots, and must be treated as other plants from the Cape of Good Hope. See Martyn's Miller's Dict.

Arnica. See Doronicum.

Arnicae, in Enotomology, a species of Staphylinus from the Africa, and described by Scopoli. It is black, the thorax and antennae ferruginous; legs tectaceus.

Inhabits Europe.

Arnica is also a species of Musca that inhabits Europe, and is said to be found chiefly on the disc of radiate flowers, and especially on that of Arnica montana. It is described by Linnaeus in his Fauna Suecia; and by Scopoli. The wings are hooked, grey, and spotted with black.

Arnias, in Geography, a small island of Denmark, in the duchy of Sleivick, in the gulf of Schelby.

Arniseus, Heniusus, in Biography, a celebrated philosopher and physician, born at Haberstadt in Lower Saxony, taught medicine at Helmaîdt the beginning of the seventeenth century, where he acquired such reputation that he was invited to Denmark, and made physician and coun-
sellor (archiater) to the king. In 1619, he published "Ob-

fervatimnes aliquot Anatomiae," in 4to. In describing a woman who died the sixth day after being delivered of her first child, he says, the osa pubis separated from each other, and the osa ilia from the sacrum, and hence ac-
counts for the greater difficulty with which women part with their first, than with their subsequent children: "quia articulatio tum primum folivit." Later observations have however shown us, that this separation of the bones of the pelvis is of very rare occurrence, and when it does happen to any considerable degree, occasions incurable lameness.

The following year he published, "De partus humani legitimis terminis." This he fixes at the end of the ninth, or the beginning of the tenth month, though he admits a certain latitude, that is, that the fetus may be perfect and fit for exclusion some weeks earlier, so it may some-
times be determined in the uterus beyond that period.

He wrote also several political works, which are still esteemed. His book "De auctoritate principum in populum femper inviolabili," was printed in 1614; and his "Reflexiones politico," in 1746. To this work he in-
tended making additions, which were never completed.

He was industrious in his endeavours to acquire information, and for this purpose travelled over France and England. Haller. Bib. Chr. Gen. Dict.

Arnissa, in Ancient Geography, a town of Greece, in Macedonia.

Arno, anciently Arnaus, a river of Italy. rises in the Apennine mountains, in the duchy of Tuscany; falls by Florence, divides Pisa into two parts, and enters the Medi-
iterranean, in the gulf of Genoa, twelve miles north of Leghorn, and four below Pisa, to which it is navigable for small vessels. It receives in its course the Sieva, the Peda, and the Elsa.

Arno is also a river of Abyssinia, which falls below Embrun, into the lake Tzana.

Arnobius of Africa, in Biography, a Christian divine, flourished about the beginning of the fourth century, and taught rhetoric, in the reign of Dioclesian, at Sicca in Africa, with great reputation. At this time, he was a blind and zealous idoler; but he afterwards became a convert to Christianity, and a distinguished advocate in its defence.

The manner of his conversion is thus related by Jerom in his chronicle, at the twentieth year of Conftantire, or the year of Christ 326. "Arnobius, a rhetorician, is famous in Africa; who, while he taught the youth rhetoric at Sicca, and was yet a heathen, was admonished in his dreams to embrace Christianity. But when he applied to the bishop of the place for baptism, he rejected him, because he had been wont to oppose the Christian doctrine. Whereupon he composed an excellent work against his old religion, and this at length, as by hostages of his piety, he obtained the seal of the covenant."

Dr. Lardner questions the genu-

![Image](arnica.png)
of observing the multitude with which the Christians endur'd their sufferings.

Arnobius's work "Adversus Gentes," or "Against the Gentiles," was probably written some time after the commencement of Diocletian's persecution, about the year 305 or 306; for he speaks in it of the afflictions endured by the Christians, as if they were actually suffering at the time of his writing. This work, which consists of seven books, is a valuable defence of Christianit.y. It shews that he was acquainted with the Jewish scriptures, and with the books of the New Testament; though he did not think fit to quote them expressly in writing against the Gentiles. It evinces the learning and piety of the author; and though it contains a mixture of pagan errors with Christian doctrines, and though some passages are obscure, and the style, which is strong and nervous, is harsh and unpolished, it may be read with pleasure and advantage. It is much to the honour of this rhetorician, who possessed a very considerable share of the learning of Greece and Rome, that he embraced the Christian religion in a state of persecution, and that he employed his talents in its defence. His summary of the Christian religion is as follows: "We Christians are men who worship the great Lord of the universe, according to the direction of Jesus Christ. If you examine it, you will find nothing else in this religion: this is the sum of the whole affair: this is the lefe and design of all our religious offices: to this supreme Lord we bow down: him we worship with united prayers: to him we present holy, and innocent, and honourable requests, fit to be heard by him." The arguments, by which he proves the truth and divine original of Christianity, are deduced from its excellence; from the amiable and perfect character of its author; from the miracles of our Lord himself and those of his disciples; from the great effect of the Christian religion in softening the tempers and amending the manners of its votaries, and fouling the seeds and principles of benevolence, peace, and friendship among mankind, and in refining them from idolatry and a false worship; from the extensive progress and influence of the Christian doctrine, insomuch that there were then Christians, in all countries, as Syria, Persia, Scythia, Africa, Spain, Gaul, &c.; from its having been embraced under the greatest difficulties and discouragements by men of all ranks, as by orators, grammarians, rhetoricians, lawyers, physicians, philosophers, and the greatest wits, as well as by men of low condition and inferior attainments; from the absurdity of supposing that so many people should on a sudden, without any good reason, change their former opinions and customs, and forsake the religion of their ancestors, and thus expose themselves to singular danger and severe sufferings; and from the character and situation of the first writers of Christianit.y, who had no inclination to induce them to fallacy, and who, by withholding their testimony, might have avoided many sufferings, and lived quietly and comfortably among their neighbours: so that they must have been fully persuaded of the truth of the things which they related. By such solid and convincing arguments did this Christian rhetorician and apologist vindicate the truth of our holy religion more than 1500 years ago. He has likewise examined and well refuted some of the principal objections against Christianity. To the Christian religion he bears this honourable testimony: "It treats to its own evidence, and stands firm upon its own foundations, whether any man embrace it, or not." Of the time and manner of Arnobius's death we have no account. Among his disciples we may reckon the learned Laëntius. His treatise "Adversus Gentes," was first printed at Rome, in fol. in 1542; at Basile, in 1546 and 1560; at Paris, in 1580; at Antwerp, with Canter's notes, in 1582, 8vo.; at Coligny, in 1604: at Leyden, with various notes, in 1651, 4to; and at the end of Cyprian's works, at Paris, in 1666. Lightfoot's Works, vol. iv. p. 1-22. Cave Hui. Lit. i. p. 161. Fabr. Bibl. lat. i. iv. c. 3. t. ii. p. 280.

Arnobius the Younger, or of Gaul, a Christian divine, lived about the year 461, and published brief Commentaries upon the 150 Psalms. He took part with the Pelagians in the disputes on predetermination, against the followers of Augustine. His work was dedicated to Leontius, bishop of Arles, and Rufinus, bishop of Narbonne, and printed at Basile, in 1522; by Eразиmus, at Cologne, in 1532, and by Laurentius de Barre, at Paris, in 1601: and in the Bibl. Patrum of Paris and Leyden. Fabr. Bibl. lat. i. p. 292.

Arnoldi, in Antonine, the same with Richardson. The word is compounded of alpha, a lamb, which was their usual reward, and ab. fort, 'a grudging spirit.'

Arnold of Brescia, in Biographie, an Italian monk, was a native of Brescia, but in his youth travelled to France, where he became a disciple of Abelard, and probably imbued some of his notions concerning the Trinity and the Sacraments, that were repugnant to the orthodox creed. On his return to Italy, he assumed the monastic habit, and taught some doctrines that were deemed heretical. His hereby, however, was chiefly of a political kind. Having perceived the disorders and ananoties, the calamities and disorders, that sprung from the overgrown opulence of the pontiffs and bishops, he was persuaded that the interest of the church and the happiness of nations in general required, that the clergy should be divested of all their worldly possessions, and of all their temporal rights and prerogatives. He, therefore, maintained publicly, that the treasurers and revenues of popes, bishops, and monasteries, ought to be solemnly renounced and transferred to the supreme rulers of each state; and that nothing was to be left to the ministers of the gopel but a spiritual authority, and a sufficiency drawn from tithes, and from the voluntary oblations and contributions of the people. This doctrine was eagerly embraced by the laity; and it was recommended by the extensive erudition, irreproachable character, singular authority, and vehement zeal of the proposer. Arnold was honoured as a patriot, and the inhabitants of the diocece of Brescia revolted against their bishop. The church was alarmed, and the reforming monk and his doctrine were condemned in the council of Lateran, A. D. 1179, by Innocent II. Arnold fled from perfection to Swifferland, and found an asylum at Zurich, where his doctrine was at first received with applause; but at length he was obliged to leave Switzerland, and after the death of Innocent II. in 1151, he returned to Italy, and set up the standard of ecclesiastical reform, and of civil freedom at Rome. His bold harangues on the inalienable rights of men and Christians, roused the populace, and produced tumults and seditions, which terminated in the emancipation of the inferior clergy from the despotic yoke of the cardinals, and in a change of the civil government of the city. Arnold, in fact, possessed the chief power in Rome during ten years, while the Popes "either trembled in the Vatican, or wandered as exiles in the adjacent cities." On the accession of Adrian IV., Arnold and his followers were driven from Rome, and found protection at Orscoli in Tuscany. After the coronation of Frederic Barbarossa, pope Adrian preferred complaints to the emperor against Arnold; and he was feized by cardinal Gerard, brought to Rome, and condemned by the prefect of the city to suffer death. Accordingly, in 1155, he was burnt alive; or, as Molheim says, crucified, and afterwards burnt; and his ashes were thrown into the Tiber, left the people should wonder at the sacred relics. Arnold was undoubtedly of an impetuous and turbulent spirit, and his proceedings were impudent and violent: but one of his biographers
ARN

biographers has not utruly observed, "that he lived in an age which provoked reform," "With his blight," says Gibbon, "his left was dispelled," though "his memory still lived in the minds of the Romans." But Motheim says, that "this violent reformer, in whose character and manners there were several things worthy of esteem, drew after him a great number of disciples, who derived from him the denomination of Arnoldists; and, in succeeding times, discovered the spirit and intrepidity of their leader, as often as any favourable opportunities of reforming the church were offered to their zeal." Motheim's Ecc. Hist. vol. iii. p. 119. Gibbon's Hist. vol. xii. p. 291, &c.

ARNOLD, NICHOLAS, was born at Lutin in Poland, in 1618; and after having studied in several universities, and visited England in 1644, was chosen professor of divinity at Franeker in Friesland, in 1652; which post he occupied till his death in 1635. He is the author of several tracts against the Socinians; particularly, "A Refutation of the Catechism of the Socinians," "A Commentary on the Epistle to the Hebrews," and "Last Testimony of Mr. Grotius," printed at Leiden in 1648, &c. and explaining passages added by the Socinians in favour of their system. Gen. Dict. Arnulf, a German divine, and celebrated ecclesiastical historian, was born at Ansbach, in the mountains of Miflin in Saxony, in 1606, and studied in the university of Wittenberg, where he acquired reputation by his personal conduct and literary improvement. In 1697, he was appointed professor of history at Gifffen, but disapproving of the forms of admission required in the German universities, he resigned his office, and in 1608 retired to Quedlinburg. In 1700, he removed to Altdorf, where he became the king's chaplain to the duchess dowager of Eisenach. Being obliged to leave this city, in 1705, he was invited to Brandenburg by the king of Prussia, and preferred to the office of chaplain of the church of Werben; and in 1707, his Prussian majesty appointed him pastor and inspector of the churches of Perleburg, and afterwards historiographer to that court. Here he died in 1714. He was considered as the patriarch of the Scotch German mystics, called "Pietists." Besides many other works, he wrote in German, "A History of the Church, and of Heretics," "Historia Ecclesiastica et Heretica," printed at Leipzig in 1700, &c. which incurred the reproach of being his a defender of heretics; and in Latin, "The History of Mystical Theology." Theriged Lutherans have treated him with peculiar veneration; and Motheim represents his history, "as the production of a violent spirit, and dictated by a vehement antipathy against the doctrines and institutions of the Lutheran church." He acknowledges, however, that "he became at last a lover of truth, and a pattern of moderation." Gen. Dict. Motheim's Ecc. Hist. vol. v. p. 325.

ARNOLD OF HILDEDEHEIM, an historian of the thirteenth century, bom under the emperors Philip and Otho IV. His "Continuation of the Chronicle of the Slavonians by Helmoldus," is chiefly valuable in its relation to Schonavia. It was published at Lubeck in 1659; and by Mebonius in the "Opuscula Historica," printed at Helmstadt in 1609. Dupin.

ARNOLDS, SANY, Muf. D. and celebrated musical composer, received his musical education at the Chapel Royal, St. James's, partly under Mr. Gates, and partly under his successor, Dr. Nares. He manifested early indications of those talents by the cultivation and exercise of which he acquired celebrity in the science to which he was devoted; and his application, as well as subsequent attainments, fully justified the expectations which were formed concerning him both by his parents and preceptors. It is hardly necessary to mention that little lively air, "If tis joy to wound a lover,"

which first excited popular attention, as it was soon succeeded by various compositions of a superior kind, which evinced the genius and taste, and established the professional reputation, of Mr. Arnold. About the year 1760, Mr. Beard, one of the managers of Covent Garden theatre, duly apprized of his extraordinary merit, introduced him to the notice of the public, as composer to that house; and in the year 1776, he was engaged by Mr. George Colman, to conduct the musical department at the theatre in the Haymarket. The chief musical pieces that were produced for many years at this theatre, were composed by Mr. Arnold. Having in early life enjoyed the benefit of Handel's direction and superintendence, and having derived from this sublime composer, a taste for sacred music, he diverted his attention from those lighter pieces in which he had gained reputation, to the composition of oratorios; and his performances of this kind served to augment the fame which he had already acquired. In the year 1767, he made choice of the "Cure of Saul," written by the late Rev. Dr. Brown, for the subject of his first effort in a higher style of musical composition. Such was his success, that this production is generally allowed to be the best of its kind since the time of Handel. It was generously presented by the author to the society instituted for decayed musicians and their families; and to that society it proved a very valuable acquisition. The approbation of the public encouraged Dr. Arnold to proceed; and the "Cure of Saul" was soon followed by the oratorios of "Abimelech, the "Reformation," and the "Prodigal Son," which were performed during several successives Leuits at the theatre-royal in the Haymarket, and Covent-garden theatre, under his own management and direction. About the time of his composing the "Reformation," he published in score, four sets of Vauxhall songs, most of which are singularly sweet in their melodies, and display in their accompaniments a thorough acquaintance with the characters and powers of the various instruments. Of all his oratorios, says an anonymous writer, the "Prodigal Son" reflects the greatest honour on his talents and judgment. So high, indeed, was the fame of this sacred drama, that in 1773 a trial was performed with his permission, at the installation of the late lord North, as chancellor of the university of Oxford. In consequence of his ready compliance with the request made to him for this purpose, he was offered an honorary degree in the theatre, but he preferred obtaining it in the academical mode; and, agreeably to the statutes of the university, he received it in the school-room; where he performed, as an exercise, "Hughes's poem on the power of Music." On this occasion it is customary for the musical professor of the university to examine the exercise of the candidate; but Dr. Hayes, then professor of Oxford, returned Mr. Arnold's score unopened, saying to him, "Sir, it is quite unnecessary to scrutinize the exercise of the author of the Prodigal Son." In 1771, Mr. Arnold married a lady of good family and fortune; and about the same year he purchased "Marybone gardens," which were then a much frequented scene of gaiety and fashion. Here he provided for the entertainment of the public, several excellent burlettas, which were very favourably received. On the death of the late Dr. Nares, in 1782, Dr. Arnold was appointed his successor as organist and composer to his majesty's chapel at St. James's; and at the grand performances of the commemoration of Handel, in Westminster abbey, the first of which took place in 1784, he was one of the subdirectors, and presented with a medal, which his majesty permitted the subdirectors always to wear, as a testimonoy of his approbation of their conduct on that occasion. In 1786, Dr. Arnold projected the plan of publishing
ARN

Anon, in Geography, a river of France, which runs into the Cher, near Vitton.

ARNSTIE, a town of Germany, in Thuringia, and county of Mansfeld, between Mansfeld and Quedlinburg.

ARNSTORF, a town of Germany, in the archduchy of Austria, 6 miles west of Mautern.

ARNSTSEE, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, on the side of a deep lake formed by an earthquake in the year 811.

ARNULPH, or ERNULPH, in Biography, bishop of Rochester in the reign of Henry I., was born at Beauvais in France, about the year 1040. Having studied at the abbey of Bec, under Lanfranc, archbishop of Canterbury, he came over to England at his solicitation; and passed through the gradations of prior of the monastery of Canterbury, and of abbot of Peterborough, to the see of Rochester. He held this see nine years, and died in 1124, at the age of 84 years. His mind was tinctured in a very considerable degree with the superstition of the age in which he lived. His works are a history of the church of Rochester, known by the title of "Textus Rohanius;" "An epistle on incestuous marriages;" and "An epistle containing answers to divers questions of Lambert, abbot of Minster, especially concerning the body and blood of our Lord." Biog. Brit.

The river Ar, twenty-nine miles S. S. E. of Paderborn, and thirty-eight W. S. W. of Gottingen. N. lat. 51° 15', E. long. 8° 36'.

AROSA, in Modern Chemical Language, is applied to a certain subtle attenuated principle, in which the smell of all odorous bodies is supposed peculiarly to reside.

The term aroma has superseded that of spiritus rectior, used by the elder chemists down to the time of the modern alterations in chemical nomenclature; but the latter appellation has had a more extended sense; of which, as a part of chemical history, it may be proper to lay a few words.

The ancient chemists, who united in a rare degree the opposite qualities of ardent imagination and patient inquiry, supposed that in every animal or vegetable there is a certain aura, or spirit peculiar to that single body, and so subtle as to be perceived by the fenes of smell and taste, or by particular effects upon the nervous system of the animal body. This aura then exhibits the proper character of that body, and from its great penetrability, exquisite subtlety, and extraordinary volatility, it was termed the spiritus rectior, or precluding spirit.

If we consider the appropriate and often intense odour professed by the fragrant or the fœtid vegetables, by bulk and other animal juices; the nutus odor whereby living animals distinguish each other, whereby the bound leisures its game or recognizes its master; the narcotic aura of opium; and the sickening and often deleterious efflavia of several of the most formidable poisonous vegetables found in tropical regions; and lastly, the suificial matter of contagion which is scarcely evident to any sense; and only known by its terible effects; when all these circumstances are taken in view, we cannot consider it as a very wild conjecture to suppute something peculiar in the nature and essence of odour independent of all other natural bodies.

The ancient chemists, however, have not limited themselves to general conjectures, but have attempted to analyse the properties of this odorous principle, to give it "a local habitation and a name," and in doing so they have been carried beyond the sober bounds of rational inquiry, and have advanced opinions which have long been confounded to merited oblivion.

We shall not attempt the unprofitable task of unravelling the mysteries of Paracelsus and other chemists of the same standard, in order to pursue this inquiry; but shall avail ourselves of the learning and admirable judgment of the excellent Boerhaave, to select just so much of these opinions as is necessary to throw the idea of a spiritus rectior, which is very general in its nature, has come to be confounded almost excluively to the aroma of vegetables. This spirit, as Boerhaave observed, was supposed "to be lodged by the Creator in a tenacious durable matter, not easily to be diffused either by air, water, or fire, and called oil, by whose lenter it is as if it were incinerated and prevented from flying off and deftecting the body for whose direction it was appointed." This oil, however, is more volatile than the common oil, and contains the spiritus rectior in a very sparing quantity.

The idea and name of essence and quintessence have a similar origin. The ancient chemists conceived that the four elementary substances of fire, air, earth, and water, contributed to the composition of bodies, and to this was added a fifth essence (quinta essentia) extremely small in quantity, but rich in efficacy, which by its own particular virtue imparted odour, colour, taste, and inherent characteristic qualities.

Having formed this theory, an apposite illustration was requisite,
The requisite, and none appeared so much to the purpose as the
products obtained by the distillation of some of the aromatic
vegetables. The following example which Boerhaave gives
is very clear and intelligible: supposo cinnamon, "which is
an aromatic of a most fragrant smell and pleasant taste; on
distilling a pound of this with boiling water, there will arise
a milky odorous savoury liquor, to the bottom of which settles
a little reddish fragrant oil, strong of the virtue of the
cinnamon, and such the liquor was. After separating
the liquors, let the remaining bark be distilled with a
second water, upon this will arise a limpid watery juice
of an acid taste, a faint smell, and affording none of the
marks of cinnamon, &c." The inference which the
author would draw from this is obvious; the spiritus rectior, or
distinguishing characteristic of the cinnamon, refines in
the water and oil, the products of the first distillation; and
the remaining substance of the bark consists only of the common
vegetable principles, is inert in its nature, moridous, iniprid,
and incapable of producing those effects upon the nervous
system of living animals which it exhibited before distillation.
Again, if the distilled water separated from the oil be ex-
pelled to the air, the whole place will smell of cinnamon,
and the water will after a while become iniprid, and lose all
its aromatic virtue, yet without suffering a greater loss of
weight than common water would have done under similar
circumstances; and also if the fragrant oil be exposed to the
air, it will gradually lose its odour, but will remain nearly
of the original weight: and from these facts it is inferred,
that the spiritus rectior is extremely small in quantity, when
separated from those substances with which it is naturally
combined.

The example of the aromatic vegetables corresponding so
well in these important particulars with the theory of a pecu-
cular aroma or efflent spirit, we ought not to be surprized to
find the opinion of Paracelsus and the older chemists,
divelled of its mysticism and extravagance, supported by
such respectable authorities as Boerhaave, Macquer, Beau-
me, and many other excellent chemists; and the prococes
for obtaining the spiritus rectior have long formed a regular
part of the practice of chemistry.

As the extraction of the aroma of vegetables makes an
interesting branch of vegetable chemistry, we shall give the
process and the remarks of the celebrated Beaufme, whose
long experience as a pharmaceutical chemist entitles him to
the highest attention.

"To prepare the spiritus rectior of thyme, take any
quantity of this plant fresh gathered and flowering, put it
in an alcumbne, and moisten it with a very small quantity of
water (which addition however is not requisite where a suc-
culent plant is employed). Distill with a water bath in a
very gentle heat, not equal to that of boiling water, and
a perfectly clear odorous water will arise. When about
half an ounce of this liquor to the proportion of a pound
of the plant has distilled over, stop the operation, and this
liquor is the spiritus rectior of thyme. If however the pro-
cesses be continued till the plants be perfectly dry, a larger
quantity of liquor comes over, and this is called officinal
water of thyme."

In like manner may be prepared the spiritus rectior of
all other aromatic or acid plants. This preparation is not
used however in medicine, probably from being too expen-
sive, and from not differing very materially in properties
from the distilled essenttial water, which is yielded in much
larger quantities, and prepared by the addition of more
water to the plants before distillation.

If the liquid spiritus rectior be kept even in well closed
bottles, it becomes mouldy and vificid in a year or two, but
the same effect takes place much more rapidly when exposed
to the air.

The quantity of aroma furnished by the several odorous
plants differs greatly: those that have a high and penetra-
ting scent, but yield little effental oil in distillation, such as
the tuberose, jasmine, joquille, &c. are fail to give the
greatest proportion of spiritus rectior, but in so volatile a
state that it cannot be procured in union with water in the
usual way. The intermeirc of alcohol or fixed oil, is re-
quired in this case.

If the aroma be considered as a separate principle, there
may be no plea for denying its production when the pun-
gent acid vegetables are submitted to distillation. Thus,
mustard-feed, distilled with the precautions above mentioned,
yields an intensely pungent aqueous liquid, in which the
lucid qualities of mustard are certainly very much con-
denmed, and it would be called by the olden chemists the spi-
ritus rectior of mustard.

We shall treat more fully of these prococes under the
article Distilled Waters of Pharmacy, Distilled Spirits,
and Od. Essential.

Even the inodore plants, such as lettuce or borage, when
distilled with care by a very gentle heat, may be made
to yield a liquor in which an odour peculiar to each plant
may be selected, and this may be termed the aroma of
these vegetables.

By the processes of coloration, or re-distilling the first li-
quor over fresh materials, the aroma appears to be con-
denmed in a much smaller bulk of watery menstruum, and
at the same time the liquor becomes superfaturated with the
aromatic effental oil of the plant. This is shown in a
striking manner in the preparation of that exquisite orien-
tal perfume, the Attar of Roses. That most speedy fatal
of all known poisons, the Laurel Water, is another ex-
ample of the same; the aroma of the laurel has a sudden
and violent operation on the nervous system of living an-
imals; now if laurel leaves are distilled in a gentle heat with
a small quantity of water, the first product is a clear li-
quor holding all the aroma in solution, smelling powerfully
of the plant, and possessed of a potention quality, whilst
the remaining leaves are insipid and inert; but if the same
liquor be again distilled with fresh leaves, it receives all the
aroma of this second quantity, becomes proportionately
stronger, and acts with more energy on the living body;
and thus by repeating the proceses, so much of the aroma
is condensed into a small bulk of water, that the peculiar
qualities of laurel may be exhibited in the most striking
manner, unnumbered with the comon vegetable materials
of which the leaf itself is composed.

The extraction of the aroma of plants is the basis of the
art of perfumery, an art in which there is much room for
the exercice of skill and ingenuity, and to the perfumers at least
it is one of the mott able branches of technical che-
mony. We have mentioned that the aroma of some ex-
quately scented flowers, such as the tuberose, jasmine, or
honey-tackle, though much potent to the sense, is of so ex-
tremely volatile a nature that it cannot be prepared by
common distillation with water; and if it does reside in an
effental oil, the quantity of that oil is so minute as not to
be extracted in the usual proceses. The perfumers have
therefore adopted a very ingenious method of fixing the
aroma in expressed oils without the affinity of any but the
gentlest heat. The oil which is used is ether oil of
ben or the purest olive oil, both of which are entirely scen-
tless. The prococes is the following: the flowers whose
aroma is to be extracted, the jasmine flowers for exmple,
are thickly spread upon flakes of wool, previousy soaked in
in the fixed oil, then are inclosed in tin boxes, and suffered to remain till the flowers begin to decay and lose their texture and colour. They are then removed, fresh flowers are added, and the maceration repeated till the fixed oil becomes entirely impregnated with the balsamic scent. The wool is then pressed, and the fragrant oil separated from the flowers is put in closely-flapped bottles, and sold under the name of Balsam of Ambergris, or whatever other flower was employed. Care is taken during the operation to pick the flowers carefully. These effluves therefore consist of a fixed oil saturated with the aroma of the plant, and if these effluves are digested in pure alcohol, the oil remains insoluble in this liquid, but yields to it the aroma; and thus the scent alone is transferred to the spirit. By this method a spirituous water is prepared for the toilette, scented with these delicate and exquisite perfumes.

The chemical nature of aroma may be considered as still unknown to us: that is to say, we are still ignorant whether the powerful scent of a plant resides in some substance fitted to do the scents of nature as to have eluded our research, or whether it is only an inherent quality in some known part of the plant (and if this is the case, probably it is the essential oil), which by being volatilized in the air is able to reach our olfactory organs.

Several writers have brought the influence of the inflammable gas, which, in fulvous evolutions, is often found to hover round the fraxinella when in full blow, as an example of aroma in the purest form in which it is ever procured. This would certainly be an interfering subject for chemical examination, if we could gather ourselves that the means which chemistry affords were at all equal to the task; but what chemist could yet flatter himself with the hopes of discovering the nature and composition of the fixed air, of finding the means of separating the odorous principle of the fyringa that tickles with its fragrance, from the breeze that conveys it to his fences; or of distinguishing by chemical tests the inconceivably minute portion of the aroma of musk, that loads with its oppressive scent an extensive chamber, from the dreadfully active effluvia which spreads disafe and pellucide?

The most powerful argument in favour of the peculiar nature of aroma distinct from that of essential oil, seems to be the circumstance which we have just mentioned, namely, that the quantity of aroma emitted by several of the most fragrant plants, which is indicated by the extent of atmospheres saturated as it were with perfume, is not in the least degree commensurate with the quantity of essential oil which any proce of art can extract from them. We shall forbear, however, to enter further into this inquiry; but as we may surely infer from the examples of effluvia, of galvanism, and of contagion, that the organs of sensation in the living animal are more delicate analysers than the telts and re-agents of the chemists, they certainly ought to be considered as at least equally conclusive.

A very few words will be sufficient on the subject of the different species of aroma which have been supposed to be detected by various chemists. So many of the parts and products of living vegetables are in a certain degree volatile in an atmosphere of moderate warmth, that the aroma which is equally volatile may readily combine with all or any of them. The gas of the fraxinella has been already mentioned as one example of gaseous aroma; the pungent vapor of the crucifolium plants has been found by later experiment to contain fulminating hydrogen, which probably affords the volatilization of the aroma, and furnishes another example of the gaseous. The watery aromas and the essential or oily aromas are almost indistinguishably intermixed in the products of the distillation of plants, in the old methods of obtaining the spiritus rectus, which have been already described. All the pure essential oils also contain aroma as a heterogeneous ingredient, though the intensity of this principle varies not only in different oils, but in the same species at different seasons; and, as we have mentioned, is almost entirely lost by long exposure to the air; but whether this change takes place by an actual loss of the aromatic principle, or by some internal chemical change, has not yet been ascertained. Lastly, various odorous plants yield an aromatic liquor which is slightly acid; the nature of this acid is not sufficiently known, but it has been supposed to be similar to the balsam. Some further notice will be taken of this subject under the articles belonging to vegetable matter, and that of Vegetable Analysis.

Aroma is by some particularly applied to denote myth. Aroma Germanicum, is a denomination given by Plutarch to clematris. Some writers give the title aroma Germanicum to juniper berries, on account of the great clemm that are in many of that, for their spiny, warm qualities; in which respect they are by many preferred to gin- her itself. Aroma philothorum is used by some for edon. Others take the appellation of aroma philothorum to Para- celus's amphi.

AROMATA, in Ancient Geography, a mountain of Afa Minor, in Lydia. Strabo.

AROMATA, Gardefan, a promontory and town of Ethiopia. It was, according to Ptolemey, the most easterly point of Africa. Here terminates the kingdom of Adel and the Barbarian of the Peribus; and here the coast of Ajam or Azaria commences.

AROMATIC, Aromaticus, is underfoot of a drug, plant, or the like, which yields a brisk fragrant smell, and a warm spicy tate.

The word is formed of ozym, which is compounded of oyi, very, and oym or oym, smell.

Aromatic Plants, in Gardening, are such as possess a fragrant aromatic flavour, combined with a strong odoriferous smell in many of the kinds. Many of these plants are proper to the kitchen-garden, being employed as favour sweet herbs for various culinary purposes; and some of them are likewise employed for medicinal and domestic uses. The principal sorts necessary to be cultivated in the garden, as aromatics, are the following, being species of several different genera. They conff, according to the authors of the General Dictionary of Gardening, of under-thrubby and herbaceous perennial's of many years duration, and of annuals and biennials of only one or two years continuance, which of course require to be raised every year or two from seed.

These are of the first kind: rhumus, or thyme; s gardia, or fage; satureja, or winter savour; origanum, or pot marja- nam; origanum, or winter sweet marjoram; hyssopus, or hyssop; rueta, or rue; rosmarinus, or rosemery; lavandula, or lavender. The above have abiding tops, and continue furnished with leaves, in most ales, all the year round. But the following are herbaceous, and renew their flakks, and some of the other parts, every spring and summer: mentha, or mint; melissa, or penny-royal; melissa, or baume; anethum, or fennel; tarchnium, or tansy; artemisia, or tarragon; anethum, or cham- molou; mentha, or peppermint; kelytrium, or kalytr.

These are of the second kind: eryngium, or sweet mar- joram; satureja, or summer savour; fandilia, or chervil; anethum, or dill; calendula, or marigold; oculum, or basil; apium, or parley; biennial, carum, or caraway; pungnella, or anise; angelica, angelica, biennial-perennial.

Among the perennial kinds, the principal culinary or pot-herb
pet-herb aromatics are thyme, fage, winter savory, marjoram, mint, penny-royal, tansy, tarragon, and fennel.

The others are not used as kitchen or culinary aromatics, but mostly for domestie occasions, as hyssop, balm, chamomile flowers, lovage, rue, and rofemary. And for simple medicinal purposes in a family; the peppermint for distilling; also the lovage and penny-royal occasionally for the same purpose; and the lavender for its flowers, both to distill for lavender water, and to lay among clothes to give them a sweet and agreeable scent; some forms of fage, common mint, and balm, are also distinguished by way of tea; and young green mint and tarragon often in salads. But among the annual and biennial aromatics, the sweet marjoram, summer savory, chervil, diit, marigold, bafli, parsley, and coriander, are the principal sorts to cultivate for culinary ufe, &c. The caraway and anife are cultivated in fome inftances for seeds, both to use in the kitchen, and for distilling; also sometimes the coriander feed, but more generally the two former; and the angelica, principally for the young tender shoots of its falks which are used in confectionery, to candy as a vegetable sweetmeat, and the feeds for medicine; fome of these annual aromatics are also in fome cafes used to give flavour to falls, as chervil, coriander, bafli, &c.: the young leaves being used in fmall quantities to mix with fome principal failed herbs. See the defcription of each under its respective genue.

All of them, except the bafli, are mostly of hardy growth, fo as to thrive in any common foil and fitation. The perennial sorts continue severall fairs in the fame plant, among which fome are durable, both in root and top, and remain green for ufe all the year, as thyme, fage, winter savory, marjoram, hyfop, rue, rofemary, &c.; the others are perennial only in root, and annual in falks, as the minis, penny-royal, tansy, tarragon, fennel, chamomile, &c. and furnish their respective produce for ufe only in the spring, summer, and autumn.

All the perennial aromatics are eafily raised, either by flips, off-fets, putting the roots, or by feed, and may be planted in fpring, summer, or autumn, in beds or borders at from fix to ten or twelve inicks affunder; but the annual and biennial kinds, continuing in the former only one fearon, and in the latter only til the second year, muft be raised every year or two, from feed in the fpring, in any compartment or common earth in the open ground, except the bafli, which being tender, muft be raised in hot-beds, in order to be transplunted in May or June; molt of the others generally remain where fown in the natural ground, but may be occasionally transplunted, the sweet marjoram and summer-savory in June, &c. and likewise the angelica, as being of large growth, in fummer. As fome of these only afford their full parts at particular fasons, as point, balm, penny-royal, tarragon, fweet marjoram, &c. they fhould be cut and preferved at fuch times for winter ufe, as about July and August. But for the marjoril, chamomile flowers, and thofe of lavender, as well as fage, tops, marjoram, hyfop, and fuch like, which often fland the winter, autumn may be better, as they will then be ready in cafe of a fevere winter. Parfley generally furnishes proper supplies of green leaves all the year; bafli and dilly only in fummer; chervil and coriander, principally in fummer and autumn, of the spring and fummer fowings; or if fome of each be also sown in August, they will continue green all winter, but the coriander will require a little protection in that fefon; and the caraway, anife, and angelica continue only in fummer and autumn.

In regard to the general culture of these plants, the perennial sorts being planted in beds or borders, continue there, Vol. II. as has been observed, several years, and only require to be kept clean from weeds in the fummer and autumn, and to be cut down and the decayed flalks removed at the latter fason; and in fpring to give the beds, &c. a neat deftriming by clearing off all weeds and litter, and then lodenning the ground a little between the plants; and in fome cafes running kinds, as mint, &c. to spread some earth thinly over the general furface; and when any particular sorts appear in a ftringy manner, to make a fresh plantation in the proper feron; as to the annual sorts, they only require to be kept clear from weeds during their growth and continuance, and that fresh supplies be raised every year from feed.

Aromatic Confection. See Confection Aromatic.

Aromatic Powder. See Pulvis Aromaticus.

Aromatic Spirit. See Aromatical Preparations.

Aromatic Tincture. See Tinctura Aromatica.

Aromaticus Calamus. See Calamus.

Aromatics, in Pharmacy. The Materia Medica contains a number of vegetable substances which possess a fragrant penetrating smell, a strong pungent taste, and a considerable stimulating power on the fytlem in general. These are called aromatics, and their characteriftic properties appear to depend chiefly, if not entirely, on an effential oil, which, when extracted from the vegetable, exhibits all its aromatic power in a very concentrated form. The aromatic property is found in combination with a variety of other vegetable principles, many of which modifies its effects on the constitution. The fimple operation of the aromatic principle appears to be diminifhed in a considerable degree; but the effet of feveral of the effential oils differs entirely from that produced by common stimulants, that we cannot include these substances under a fingle claffe without very great limitation.

As the claffe of aromatics is distinguished entirely by certain properties of smell and fitle, in each of these circumstances it approaches by infensible gradations upon the limits of other claffes.

The aromatic or fragrant smell of nutmeg, peppermint, or rofemary, would be denied by none; but the strongly odorous or gravolent fcent of wormwood or rue would be classed by many organs with the fettled; the odorous principle, however, in each of these fubstances appears to refile in the effential oil. In tafe, likewise, the aromatic, when powerful, proceeds to the acrid, and all the effential aromatic oils, when uncombined, produce very acid, and sometimes even caufetive or corrosive effects on the tongue, fo as to defroy the furface of the part which they touch, even by a very fhort application. The vegetables, or parts of vegetables, that contain the aromatic principle, are chiefly the following.

1. The Spices, thofe exquisite productions of the tropical region, which, besides being highly useful in medicine, form the moft grateful condiments for the table. The power of habit in acquefiting the constitution to excefsive quantities of the hotfeft Stimulants, and to fubstances that produce powerful local effects, is in few inftances more flringing than in the manner in which these valuable vegetable productions are employed by the inhabitants of the countries to which they are indigenous. In many of the spice-bearing plants various parts of the fame vegetable are richly impregnated with the aromatic principle, as in the inftance of the mace and nutmeg, productions of the fame plant, or the leaves and bark of the cinnamon.

2. The aromatic barks and woods, such as the canella, orange peel, cists, and many trees of the fir tribe. In many of thofe the aromatic is combined with the astringent and the bitter principles, and this union is often of singular service.
service in the formidable bowel complaints so common in tropical climates.

3. The fragrant herbaceous plants, such as the lavender, mint, thyme, &c. Among this very extensive class of aromatic vegetables are included all the fragrant pot-herbs employed for culinary purposes in climates not blessed with the spices that require a burning fun. From this class also are procured several of the perfumes and other agreeable scents for the toilette.

4. The resinous aromatic, such as the Mucca balsam, myrrh, capra balsam, frankincense, Cinn turpentine, and many others. The strong smelling resins and balsams, when submitted to distillation, yield a very large quantity of essential oil in which their characteristic properties of small and taste reside, whilst the residue is hard, brittle, almost without odour, and impalpable. The gravorulent and sedentary gums have the same character.

The aromatics are used very largely in pharmacy in a great number of forms and combinations, both on account of their proper stimulating cordial properties, and as powerful auxiliaries in a variety of infirmities. Their strong and agreeable smell and taste render them peculiarly proper for concealing and correcting those of the more nauseous and unpalatable medicines. As the essential oil to which the aromatics appear to owe their properties is soluble largely in spirit of wine, and partially in water, they are very conveniently employed under the forms of Distilled Spirits and Distilled Waters.

AROMATIC, in Ornithology, the Gmelinian name of the species of Columba, or pigeon, called by Buffon, Columba viridis Amboinensis; le pigeon verd d'Amboine, by Buffon; and aromatic pigeon, by Latham; from the latter of which Gmelin adopts the name aromatica. It is, as the synonyms imply, a native of the island of Amboyna; and is about ten inches and a half in length, or the size of the common turtle. The general colour is olive-green; back bay or cheetuff; on the wing a double bar of black, edged with pale yellow; quill feathers black, with yellowish margins. Gmel. &c. The bill of this bird is greenish; the upper part of the head is grey, darkish behind; the sides, throat, neck, breast, belly, rump, upper tail coverts, and tail, olive-green, but inclining to yellow on the neck and breast; the under parts of the tail black at the base, and dirty white at the end; the under tail coverts dirty yellowish white; wing coverts, like the back, cheetuff; and the legs and claws either grey or red; for Dr. Latham describes them of a grey colour, and in Les Planches duves of Buffon, they are painted red.

AROMATZ, in Geography, a town of France, in the department of Jura, and chief place of a canton in the district of Orgelet, fourteen miles south of Orgelet.

ARON, Peter, in Biography, a voluminous writer of music in the sixteenth century, was a native of Florence, of the order of Jerusalem, and a canon of Rimini. He appears to have studied music as a profession under the patronage of Leo X., in whose pontificate he was admitted into the papal chapel at Rome. His most considerable work, in which there is little that is new, was intitled, "Totentanz della Musica," and first printed at Venice in 1533, and with additions in 1539. This is divided into two books: the first containing a penurious treatise, an account of its inventors, definitions of terms, &c.; the second, an impartial account of the genera of the ancient, a decalogue or ten precepts concerning counterpoint, an explanation of proper terms, and directions for dividing the monochord, upon the principles of Guido Arctino. Burney's Hist. of Mus. vol. iii.

ARON, in Geography, a town of Peræa, in the province of Iraq, two leagues from Cashan.

ARONA, a small town of Italy, in the Milanese, belonging to Piedmont; seated on the side of a hill, near the well known lake of Maggiore, the environs of which are exceedingly fertile, and supplies wines that are much valued. Above it rises a ruined castle: two promontories project into the lake at this spot; the eastern is crowned with the castle of Anglona, and gives name to this valuable province, which, in 1397, was erected into a county by the emperor Wenceslas, and has since been transferred to the king of Sardinia. In doubling the promontory of Arona, the lake again subverts, and forms a bay.

ARONABAD, a town of Deccan, in the province of Iraq, twenty leagues south of Hiphah.

ARONCHES, a town of Portugal, in the province of Alentejo, walked and defended by a castle, and containing about 620 inhabitants; 65 miles tall of Lisbon. N. lat. 38° 56'. W. long. 6° 14'.

ARONDE, a river of France, which runs into the Oise, opposite to Compaigne.

ARONDELA, in Fortification. See Doved-tail, and Queue d'Arondre.

ARONDELLE, and Harondelle, in Ornithology, the French synonymous names of the Sterna tribe; terms of fast-fallowers of English writers. See Sterna. The term Arondelle is also applied in a general manner to the species of Trigla described by Linneus under the name of volitans. This is one of the flying-fishes of our naturalists; and in the classification of Natural History by Laëetpe, forms a new genus, which he called Doliophytere. See Trigla Volitans.

ARONIA, in Botany. See Orontium.

ARO Orbis. See GALENGAL.

AROOL, in Geography, a town of the Russian empire, in the Ukraine, on the river Ossa, eighty leagues north of Moscow. N. lat. 51° 43'. E. long. 58° 13'.

AROSSI, a territory of Abyssinia, being the southermost division of Mahala, on the west side of the Nile, inhabited by the Abyssinians, a kindred of the Agow. It is bounded on the north by the river Kelti, and on the south by the Alfar; the Arossi running through the middle of that district. This little territory is described by Bruce (vol. iii. p. 550), as by far the most pleasant which he had seen in Abyssinia; and perhaps, he says, is equal to any thing which the east can produce. The whole is finely shaded with the acacias, or Egyptian thorn, that yields the Gum Arabic, which feldom rises above fifteen or sixteen feet high, and then spreads wide at the top, so that the branches of different trees touch each other, and under a vertical fun afford a cool, delicious shade. Below these trees the ground is chiefly covered with lupines; and wild oats grow up spontaneously to a prodigious height and size, and have, when ripe, the appearance of canes. The inhabitants make no use of the grain, though the face of the meal, when made into cakes, is very good. The soil of this country is a fine black mould, like that of our gardens. Arossi is finely watered with small streams.

AKOPI, a term used by Paracelsus, to denote a medicine; made of the uppers of the thorns, and divided into the human body, in which limestone, arophi amounts to the same with lithontriptis. Van Helmont affirms us, that he was posseted of the arophi; and from his account, it seems to have been a preparation of croffon and rye-bread, digested with spirit of wine, in a horrito-dum heat, and at length distilled. Vide Croflein. In Ephem. Acad. N. C. dec. 1. an. 4. obf. 109.
ARPAS, or Parades, is also a name given to a kind of chemical flowers, elegantly prepared by sublimation, from equal quantities of lapis hematitius and ful amoenus; said to be of great efficacy in quanrant agues, the phlebotomus, and hypochondriacal diseases. This is also called aroma phosphorina.

ARPIS is also used to denote Mandragora.

AROSAY, in Geography, a town of the East Indies, on the coast of the island of Madura, near Java. S. lat. 9° 30'. E. long. 114° 30'.

AROSLA, Western. See Wisteros.

AROSLA, Egean, or Osra Aros, the ancient name of Upsala.

AROSIS, a river of Persia, which bounded Persis on the west, and separated that province from Susiana.

AROUANS, one of the islands which are near the mouth of the river of the Amazons in South America.

AROU-HARISL, in Zoology, according to Tielenot, the name of the Rhinoceros in the East Indies.

AROUKORTEKEN, in Geography, a country of Tartary, near the great wall of China.

AROURA, a Grecian measure, of fifty feet.

AROURS, was more frequently used for a square measure, the half of the plethron. The Egyptian aroura was the square of a hundred cubits. Archuth. tab. 9.

AROW, ISLANDS OF, in Geography, a cluster of small islands in the Indian ocean, situate north-east of Timorland, and nearly south of the coast of New Guinea. South lat. from 5° to 7°. E. long. 137°.

AROW, a river of South America, flowing from the lake Cultipe in the province of Paria, and discharging itself into a river of this name.

ARPAD, ARADUS, or Rovanhalde, in Ancient Geography, an island situate on the coast of Syria. See ARADUS and ROWHADUS.

ARASAGUS, or rather HARASAGUS, formed from άρας, τόπος, I. staed, in some ancient inscriptions, signifies a person who died in the cradle, at least in early youth. The Romans made no funeral for their arasag. — They neither burnt their bodies, nor made tombs, monuments, or epitaphs for them, which occasioned juvenal to say,

"——Terra clauditur infans,
Et minor igne rogi."

In afterwards it became the custom to burn such as had lived to the age of forty days, and had cut any teeth; though these also called άρας, τόπος, q. d. τόπος, ravished. The usage seems to have been borrowed from the Greeks; among whom, Eutathius affirms it, was the custom never to bury their children either by night or full day, but at the first appearance of the morning; and that they did not call their departure by the name of death, but by a foster appellation, γιορίς, γιορίς, importing that they were ravished by Aurora, or taken away to her embraces.

ARPAIA, in Geography, a town or village of Italy, in the kingdom of Naples; and Principato Ultra, six miles well-south-well of Benevento; supposed to be the ancient Caudium.

ARPAION, or ARPASJOU, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Corbeil; 10 miles south of Paris. The place contains 2,093, and the canton 13,366 inhabitants; the territory includes 147½ square kilometres and 19 communes.

ARPA-SOU, a river of Peria, between Erivan and Tabriz.

ARPEGGIO, ARPEGGIATA, in Magg., is playing the sounds of a chord in a rapid manner upwards and downwards; after each other, instead of striking them together. In doing this on keyed instruments, the fingers of each hand must be kept on to preserve each sound, till its turn comes for the key to be struck again. The word arpeggio is derived from Arpa, the harp; upon which instrument the sounds of a chord are usually struck in succession, by beginning at the lowest. There are as many kinds of arpeggio as sounds in a chord, or changes in their succession. The violin family having but four strings, and the viol family fix, can only arpeggio four or six sounds; and from the convexity of the bridges of these instruments, there is no other way of playing chords with a bow, but in arpeggio.

The abbé Peyton says very truly, that the harmonies arising from a single string or four, when first discovered, gave birth to arpeggio; or perhaps long before that, it was suggested by the lection of the cænon, or division of the mono-chord. The musical reader will find the examples of several kinds of arpeggio in the Mentor Plates.

APENBURG, in Geography, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, nine miles south of Saltzwedel.

ARPENT. See ACRE.

ARPHAXAD, in Scripture History, the third son of Shem, and father of Salah, was born in the second year after the flood, A. M. 1658, and died A. M. 2906, aged 438 years. Gen. xi. 12, &c. He was distinguished above the rest of his brethren, by having the patriarchal line continued through him. Arphaxad is placed by some in Arrapachitis, a province of Syria, towards the north part of the country; but others fix him, with his family, in Chaldea, where we find his descendants till the time of Abraham. Some, who confess as one and the same person Arphaxad and Cainan, who is inserted between him and Salah in the Septuagint version, suppose him to be the founder of the monarchy of China. Some Mahometan authors make Arphaxad both a prophet and an apostle, and judge the chief sovereignty over the nations of the world in his descendants.

ARPI, in Ancient Geography, a town of Italy, in Apulia between Luceria and Sp同志. It was anciently called Argos Hypium, and afterwards Argyrippa, the capital of a kingdom founded by Diodemus after the siege of Troy; in the time of Livy it was large and populous, and furnished Hannibal with 3000 armed men. It is now in ruins, about fourteen miles west of Manfredonia, in the province of Catanata, and kingdom of Naples.

ARPII. A people placed by Ptolemy in Lower Myacia. They inhabited the coast at the northern mouth of the Æger, at the entrance of the Bosphorus. Their capital was called Arpis.

ARPINAS, JOSEPH CESAR D', in Biography, commonly called Jofepin, a famous painter, was born at the castle of Arpinas in Naples, in 1560. After receiving some instruction from his father, who was an artist, he was sent, at the age of thirteen, to Rome, where he waited upon the painters in the Vatican, and at intervals sketched figures on the pilasters, which adorned the other artists. Under the patronage of Gregory XIII, he enjoyed the means of further improvement, by being employed first in the ornaments of the Vatican, and afterwards in history painting; and his bold and free manner was much admired. At Naples he painted the cupolas of the Chartreux; and returning to Rome in 1560, he began to paint the great hall of the capitol in fresco. Clement VII, distingushed him by his protection, and made him a knight of the order of Christ; and in a journey to France with cardinal Aldobrandini, in 1600, he was created knight of the order of St. Michael, by Henry IV. Arpinas, notwithstanding the honours that were conferred upon him, was of a discontented and querulous temper; and fell out both with Caravaggio his rival, and with Anibal.

Carachio.
Caraccho. He declined a duel with the former, because he was not a knight; and willing to measure swords with the latter, Caraccho preferred his pincel, and said to him, "With this I d. he you." He died at Rome, at the advanced age of eighty years. Notwithstanding the fire and elevation which distinguished some of his compositions, his colouring was cold, and his attitudes stiff and forced, to that his name now fearfully exists, in the list of great artist. Although his school was much frequented, he seems to have left no eminent disciples. His best performances are the pieces of Roman history in the capitol; and one of his capital works is his "Battle between the Romans and the Sabines." Arr Open also engraved in aqua fortis. Nouv. Dict. Hist.

ARPINO, in Geography, a town of Italy, in the kingdom of Naples, and county of Lavora, ten miles north of Casano. This was the ancient Arpinum, situate to the left of the river Liris, and south of Sora, and famous for being the birth-place of C. Marius and Cicero, two citizens, who, as Pompey said in a public speech, each in his turn preferred Rome from ruin. It was a city of the Samnites, which, upon its submission to Rome, acquired the freedom of the city, and was infected into the Cornelian tribe. The territory of Arpinum was rude and mountainous, and Cicero (Ad Attic. n. 11. ) applies to it Homer's description of Ithaca, Od. iv. 27:

"The rough indeed, yet breeds a generous race."

Cicero's family seat was about three miles from the town, in a situation extremely pleasant, and well adapted to the nature of the climate. It was surrounded with groves and shady walks, leading from the house to a river, called Edeumnes, which was divided into two equal streams, by a little island, covered with trees, and a particular contrivance both for skirling and exercise, whether Cicero used to retire, when he had any particular work on his hands. "The clearness and rapidity of the stream, murmuring through a rocky channel; the shade and verdure of its banks, planted with tall poplars; the remarkable coldness of the water; and above all, its falling by a cascade into the nobler river Liris, a little below the island," give us the idea of a most beautiful scene, as Cicero himself has described it. The house, Cicero says, was small and humble in his grandfather's time, according to the ancient frugality, like the Sabine farm of old Curius; but his father beautified and enlarged it into a spacious and handsome habitation. It is now possessed by a convent of monks, and called "the villa of St. Dominic." The villa of Mari, was about twelve miles dilant from Arpinum; and on the spot now stands the only convent of the aulter order of La Trappe in Italy. Its present name is "Casa Mari."

ARPI. See ARPI.

ARPONIUM, in Ancient Geography, a town of Italy, in Magna Graecia, which, as Diodorus Siculus informs us, was pillaged by the Etrurians, during the war of the Ixian. ARQUA or Arracan, in Geography, a village of Italy, in the Pisan territory, about three miles from Batagia, famous for having been the read-nace and burial-place of Petarch. N. lat. 45° 43'. E. long. 11° 43'. There are two other places of this name; one in the March of Ancona, on the frontiers of Abruzzo, and another in the duchy of Milan, situate on the Scriva.

ARQUE, a town of France, in the department of the Aisne of Calais, and chief place of a canton in the district of St. Omer, half a league south-east of St. Omer.

ARQUEBUSADE W ATER. See AQUA Vulneraria.

ARQUEBUSS. See HARQUEBUSS.

ARQUEMON, in Geography, a river of France, which passes by Jugon, in the department of the north coasts, and runs into the English channel about 13 miles north of that town.

ARQUES, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Dieppe, one league south-east of Dieppe. It is built on a river of the same name, which runs into the English channel near Dieppe.

ARQUES is also a town of France, in the department of the Aude, and chief place of a canton, in the district of Limoux, three leagues south-east of Limoux. The place contains 488 and the canton 3743 inhabitants: the territory includes 277 kilometres and 36 communes.

ARRA, in Ancient Geography, now called Maura, a town of Asia, in Syria, which was formerly large and well-peopled, but is now reduced to a small place under the government of Aleppo; the territory of which is very fertile in grain and good fruit.

ARRA-BIDA, in Geography, a height mountain of Portugal, in Alentejo, on the frontiers of Algarve, forming part of the Soria or mountain of Caledram, and seeming to be a branch or continuation of the Spanish chain to the north of Madrid, called by some the mountains of Idabads, which enters Portugal near the town of Guarda, and pursues its former course to the south-west. It is chiefly calcareous, and affords beautiful marble.

ARRACAN, Arrakan, or Arrakan, a maritime country of the north points in the Gulf of Bengal, from the Chindee isles, borders on the south-east province of British India, and is separated from the Indian empire by a range of lofty mountains called Anoupee, and bounded on the north by the Murr, or the country of the Muggaioos, the Castle of major Rennell, on the south by the flat lands of Pegu, and on the west by the bay of Bengal. This country is called by the Bengal Hindoos, who have fettled it, Roffaan, whence, probably, Rennell has derived the name Rohan, which he has given to it. The Mahometans fettled in Arrakan call it Roving; and by the Persians it is denominated Rakan. The proper natives of the country, who use a dialect of the Birmah language, call their country Yee-Kein; and by the people of Pegu, the inhabitants are named Takain. From Isbambah, N. lat. 24° 20'. E. long. 91° 55'. the coasts of Arrakan and Pegu take a south-west coast line to Cape Negrais, the extreme point of Pegu to the south-west, in N. lat. 16° 6' and E. long. 94° 27'. Pennant (Outlines of the Globe, vol. iii. ) says, that the kingdom of Arrakan stretches along the coast to an extent of 200 miles; others make it length above 500 miles, and its breadth from 20 to 200 miles. Its topography, however, is still obscure. According to Symes (Embassy to Ava, vol. i. p. 243, &c. ), Arrakan, or Yee-Kein, stretches south-west coast from the river Naff, the boundary that divides it from the territories of the Indian company, as far as Cape Negrais, where the ancient Pegu empire commenced. "The range of lofty mountains called Anoupecoromion, or the great western hilly country, nearly encircles it. From the quarter of Baffin and Negrais, Arrakan can only be invaded by water, through the many rivers that interfice the country adjacent to the sea. From the side of Chittagong, entrance into Arrakan must be effected by a march along the sea-beach, which is interrupted by several channels, that chiefly oveer their waters to the action of the tide. Arrakan thus displays a great space of coast, very disproportionate to the internal extent. "Cheduba and Ramree, called by the Birmans Magou Kion and Yamgee Kion, are extensive and highly cultivated islands, which, with Arrakan and Sandoway, form four distinct provinces, and comprehend the whole of the Arrakan empire. The ancient government
government of Arracan has never been so completely conquered as to acknowledge vassalage to a foreign prince. It experienced, however, in the two last centuries, the usual convulsions to which all states, and those of the eastern world in particular, are liable. The Moguls on the west, and the Peguans on the east, had, at different periods, carried their arms into the heart of the country. The Portuguese, sometimes as allies, and at other times as open enemies, gained an establishment in Arracan, which decayed only with the general ruin of their interests in Aia. Arracan, however, though often exhausted, was never wholly consumed; it always rose from its own ashes, a free and independent nation.

In 1783, Mind-ragee, who held the throne of the Birman empire, feized the country, and annexed it to the conquests of his father Alomprâ, consisting of Pegu, and the coast of Siam, as far as the port of Merghî, in N. lat. 12° 20'. In this conquest, the booty most highly valued was an image of Gandma, the Boddhe of the Hindoos, made of burnished brass. There were also five images of Raknus, the demon of the Hindoos, of the same metal, and of gigantic stature; these were accounted valuable, as they were supposed to be the guardians to the sanctuary of the idol. All the spoils taken at Arracan were of brass, among which was a large gun, thirty feet long, two and a half in diameter at the muzzle, and the calibre ten inches; it was mounted on a low truck carriage, supported by fix wheels, and had several shot of hewn stone fitted to the calibre. The surrender of Che-dubs, Ramee, and the Broken Isles, followed the conquest of Arracan. Many of the Mughals, or ancient inhabitants of Arracan, so called from being subjects of the Great Mogul, preferred flight to servitude; and took refuge in the Dumbuck hills, on the borders of the province of Chittagong, and in the deep forests and jungles that skirt the frontier, where they formed themselves into independent tribes of robbers, that have since created infinite vexation to the Birmans, and to this day commit merceufes depredations on the persons and property of their conquerors. Many settled in the districts of Duca and Chittagong, under the protection of the British flag; whilst others accepted the oath of allegiance, and bowed their necks to slavery, rather than abandon their country and their household gods, to whom the sectaries of Budhoo are much attached. Arracan, with its dependencies, was afterwards constituted a province of the Birman empire; and a Maywoon, or viceroy, appointed to govern it. The reduction of Arracan was completed in the short space of a few months. The country is fertile, abounding with well-watered meadows and pellure lands; the soil luxuriant; the mountains are green through the year, though in winter, that is from August to October, the weather is for the most part wet and tempestuous; and the contiguous islands uncommonly fruitful. The population is estimated at between two and three millions. It produces great quantities of rice, coconuts, bananas, oranges, and many other kinds of excellent fruit. The rice is produced in such abundance, that it might be improved by proper policy into a lucrative branch of commerce. The trade of Arracan has never been so very considerable; it is confined to falt, bees' wax, elephants' teeth, and rice. Articles of foreign importation are introduced into other parts of the Birman empire by way of Arracan, and carried over the mountains on the heads of coolies, or labourers; such as European broadcloth, hard-ware, coarse Bengal muslins, Coflembugaik handkerchiefs, china ware, and glass; coconuts are also brought from the Nicobar islands, and bar a very high price; and merchants carry down silver lace, precious stones, and some other articles, to no great amount. Pol-

fees of Arracan and the adjacent islands was a very desirable acquisition to the Birmans, as it afforded protection to their boats, which, navigating in the north-west monsoon through the channel and along the coast, make an annual voyage from Bussien, Rangoon, and Martaban, to Chittagong and Calcutta, where they dispose of the produce of their countries, and in return bring back cloth and commodities of India. Elephants and buffaloes are very numerous, and are used instead of horses. The forests are infested with tigers. The natives of Arracan do not differ from those of China and Siam, except in their colour, which is somewhat blacker. They are fond of large flat foreheads, and, in order to obtain them, they apply a plate of lead to the foreheads of their children immediately after their birth. They have large open nostrils, small sparkling eyes, and ears so long that they rest upon their shoulders. They eat without difficulty mice, rats, serpents, and pottered fish. Their women are tolerably fair, and their ears equally long with those of the men.

*See Birman Empire.*

**Arracan.** Arracan, the capital of the above country, is seated most singularly in a valley, surrounded with vall and craggy mountains; and these are afforded by art, so as to be made the most sublimal fortifications. The entrances are cut through the solid rock, as are also the gates of the city. The precipitous face of the mountains serves for walls; besides which, it has a citadel and other artificial defences. The city is said to be fifteen miles in circumference, and to contain 160,000 inhabitants. The royal palace is very magnificent, and highly adorned and enriched with works of masy gold. Pennant.

**Arracan** is also the name of a river, which divides the above country by several canals, and discharges itself into the bay of Bengal, about fifty miles below the capital. Its banks are bounded by woods and plantations, that are animated, says Pennant, by the gambols of the monkey tribe, or the gay flights of numbers of peacocks. Dr. Buchanan says (Symes's Embassy to Ava, vol. ii. p. 413), that the Arracan river is not so considerable as has been supposed, but takes its rise in hills at no great distance to the north. He adds, that the river coming from Tibet, which is supposed to be that of Arracan, is in fact the Keendum, or great western branch of the Ava river. Pennant (Outlines of the Globe, vol. iii.) says, that this river is the Tocofanee of Potemny, and that it is faintly traced beyond the capital. A few miles below Tellakee, at the western foot, says Symes (Emb. to Ava, vol. i. p. 244.), the river, till then a streamlet that rives in the hills, becomes navigable from the influx of the sea; in two tides a boat reaches the foot of Arracan. From the foot to the sea, the river expands into a noble sheet of water, well adapted for trade and the reception of shipping.

**Arrachee,** in Heraldry, is underlord of representations of plants forcibly torn up by the roots, with their roots hanging at them.

In this figure, arrachee amounts to the same with what is otherwise called erubens, or erupel. *Nib. Her.*

**Arracife,** Cape of, in Geography, is situated on the coast of the Cufres in Africa, about sixty leagues from the Cape of Good Hope.

**Arracife,** a port-town of Brazil, in the captainship of Pernambuco, esteemed the strongest in Brazil. The port consists of a suburb, in which are some large houses, and repositories for stores; and it is built upon a narrow passage, with a castle to defend the entrance. Nevertheless, James Lancaster, with seven English vessels, made himself master of the town and castle in 1597, and obtained immense plunder.
ARRAGON, derived either by corruption from Tarraconensis, the name of the Roman province of which it formed a part, or from the little stream called Arragon, which falls from the Pyrenees into the Ebro, is a province of Spain, bounded on the north by the Pyrenean mountains, on the west by Navarre and the two Cathies, on the south by Valencia, and on the east by part of Valenza and Catalonia. Its extent from north to south is about 210 miles, and in breadth about 120. The country is, in general, mountainous, dry and sandy, badly cultivated, and thinly peopled; but it is intersected with delightful fertile valleys, which are well watered, and produce corn, wine, oil, flax, fruits of different sorts, and some flax. Aragon breeds a great number of sheep and cattle; its rivers abound with fish, and its forests with game. The mountains are said to have formerly yielded gold, silver, and other metals; but they now afford, probably on account of the indolence of the inhabitants, little besides iron. The principal rivers, besides the Ebro, which traverse the province from north-west to south-east, are the Cinca, anciently Cinga, the Gallego, the Huéca, Alcalat, Daroca, and Alcaniz. The principal inhabitants of this country, in ancient times, were the Celtiberians, and they have been always deemed active, hardy, enterprising, courageous, and fond of liberty, but proud and pugitive, and bigotted in their religion. Marcellus, after a short war, taxed them at 600 talents of gold. When they fell under the dominion of the Goths, they frequently revolted, and made valiant and repeated struggles for the preservation of their liberty. On the irritation of the Moors, these people retired into their inaccessable rocky mountains for the enjoyment of their freedom and independence; and there they erected, for their own security, a form of government, to which they submitted by common consent. Aragon was first erected into a kingdom by Don Sancho the Great, king of Navarre, who died in the year 1055, in favour of his son, Don Ramiro. He was succeeded by his son, Don Sancho Ramirez, who added to his own dominions part of Navarre, and obtained several advantages against the Moors of Saragossa and Huéca; but was at length mortally wounded at the siege of the latter of these places, in 1094. The kingdom devolved on his son, Don Pedro, who, after defeating the Moors in the plain of Alcaraz, took possession of Huéca, A.D. 1096. He was succeeded in the year 1104 by his brother, Don Alfonso, who, by the display of his martial virtues, obtained the surname of "the Warrior." Having reduced Tudela, and obtained a signal victory over the Moors, he laid siege to Saragossa, and compelled it to capitulate, after a long and obstinute defence, A.D. 1118. He dispossessed the Moors of several other strong places, and defeated them in several battles; but in his attempt to reduce Fraga, the capital of a Moorish government, he provoked an engagement, in which he was overpowered with great slaughter; and this defeat affected him so much that within eight days he died of grief. After his death the monarchies of Aragon and Navarre were separated; and Don Ramiro, brother to the late king, ascended the throne of the former kingdom. But in 1117, after a short reign, he abdicated the government in favour of Don Raymond, count of Barcelona, to whom he married his daughter Petronila. Don Raymond dying in Pedrigni, in 1122, was succeeded by his eldest son, Don Alfonso, who enjoyed the sovereignty of Catalonia, in conjunction with the realm of Aragon. Alfonso having, in 1166, confirmed the liberties of the clergy and nobility in an assembly of the states at Saragossa, soon after, viz. in 1169, collected a powerful army, commenced a war with the Moors, and drove them out of all the places which they held in that territory, which is now called Aragon. Alfonso closed a reign, rendered illustrious by many military exploits, at Perpignan, in 1166; and the crown of Aragon devolved on the son of his son, Don Pedro II.; who, in 1193, paid a visit to the pope at Rome, acknowledged himself a vassal to the holy see, and continued to pay an annual tribute of 250 double palfenes. His premature death, in an action with the papal troops before Muret, A.D. 1213, was followed by great confusion and tumult, both in Aragon and Catalonia; but at length his son, Don Jaime, was proclaimed and acknowledged as his successor. This prince, being threatened by the pope with excommunication for his vices, affirmed the oath, and actually embarked at Barcelona for the Holy Land, A.D. 1268; but he was driven back by a tempest, and returned to his own dominions. After a defeat by the rebellious Moors of Valencia, he fell sick, resigned the crown, took the habit of a Cistercian monk, and penitently bewailing the ill example he had given to his family and subjects, expired in 1276; upon which the crown devolved to his son, Don Pedro III. Pedro, having subdued the Moors of Valencia, and composed the tumults of Catalonia, engaged in an expedition against the Isle of Sicily, which he conducted with great spirit and success, and in consequence of which he was, with universal applause, proclaimed king of Sicily. The pope, Martin IV., who took part with his successor, Charles, excommunicated Don Pedro, and proceeded to give away his kingdom, as a fief of the holy see, to Charles de Valois, son of king Philip the Hardy, and to publish a croisade against the defaced king of Aragon. In 1284, the king of France took the croisade, and assembled a very large army in order to seize and secure the possession. During this contest, Don Pedro died, in 1285, and left the crown of Aragon to his son Don Alfonso, and that of Sicily to his second son, Don Jaime. Alfonso, having entered into a treaty for the marriage of princes Eleanor, daughter of Edward I. of England, was suddenly taken ill during the magnificent preparations that were made for this purpose at Barcelona, and died in 1291. His brother, Don Jaime II., succeeded him; and after having conciliated the affection of his subjects by many popular acts, he died much regretted, A.D. 1326. His son and successor, Alfonso IV., pursued the conduct of his father, and cloistered his life and reign, in the year 1356, much beloved and lamented; and on account of the gentleness of his administration, he was termed "The Kind." His son, Don Pedro IV., commenced his reign with all the avoiments of royalty; but protracted it to a very advanced period, and died in the year 1385, with the character of having been in many respects the wisest, and in many more the worst king that ever sat upon the throne; and of having been better obeyed, and much less beloved, than any of his predecessors. He was succeeded by his son, Don Juan, whose death, in 1395, occasioned great confusion in the
the kingdom of Aragon. After the death of his successor, Don Martin, duke of Montsalvan, there occurred an interregnum, occasioned by disputes about the succession of the crown. The titles of several claimants were examined by nine judges appointed for this purpose; and at length the majority determined in favour of Don Ferdinand of Callicue, who was the son of Donna Leonora, the eldest sister of the two late kings; and the reti also acquiesced. Accordingly, he was proclaimed king, A.D. 1142, and in 1143 solemnly crowned at Saragossa. At his death, in 1146, he was succeeded by his son, Don Alfonso V., who, in 1153, became sole and absolute master of the kingdom of Naples; and was afterwards esteemed the great arbiter of peace and war through all Italy. He died in 1168, as the greatest prince that ever sat upon the throne of Aragon (See Alfonsino V.). Don Juan II. succeeded to his hereditary dominions; and after a reign of 21 years, Aragon, with its dependent dominions, was united to the crown of Castile, A.D. 1479, under his son Don Ferdinand, who confirmed the laws and privileges of the kingdom of Aragon, in Saragossa, Barcelona, and Valencia.

ARAGONITE. In Mineralogy, Aragonite, Kirwan. Aragonit, Werner. The colour of this mineral is either greyish, or greenish white, or pale mountain green; in the center it is often of a violet blue, or brownish red. It occurs only crystallized; and its varieties may be referred to the following forms.

1. A perfect equidiagonal, six-sided prism (Aragonite primaticius of Kirwan). The crystalline prism is usually surrounded by a double rhombohedron. The faces of the double rhombohedron are equal, and correspond with the two sides of a diamond, and terminate the prism (Aragonite Cancille of Hauy). The crystalline prism is generally hexagonal, and sometimes concave. The mineral is vitreous, and varies from little shining to very brilliant.

2. A six-sided prism, two opposite faces of which are the largest, and correspond with the two sides of a diamond, and terminate the prism (Aragonite Cancille of Hauy). The crystals are small, or of moderate size, often grouped in crossettes; their faces are very rare and smooth, being generally hexagonal, or sometimes concave. The mineral is vitreous, and varies from little shining to very brilliant.

3. A rounded mass, deeply striated (Aragonite cylinder of Hauy). The crystals are small, or of moderate size, often grouped in crossettes; their faces are very rare and smooth, being generally hexagonal, or sometimes concave. The mineral is vitreous, and varies from little shining to very brilliant.

The fracture is lamellar, but often indeterminate as to piling into the imperfect conchoidal. The bluish of the crystals is always present in a distinct, minute, wedge-shaped concretion, which gives the fibrous appearance which this mineral is characteristic.

It is almost semi-transparent, and possesses a double refraction resembling calcareous spar; it is considerablv hard, brittle, and easily broken: fp. gr. 2.94.

4. Aragonite is extremely fusible with evaporations in nitrous or mineral acids. Before the blowpipe, it melts and cracks, and at length is calcined like calcareous spar; when pulverized and sprinkled on a hot coal, it gives out a reddish phosphorescent light.

This mineral was named by the celebrated Werner, because it was first discovered in Spain, on the borders of Aragon and Valencia, where it is imbedded in lamellar and fibrous gypsum; it has since been found in the Pyrenees, and at Leogam in the country of Salzburg, in a shattory argillaceous rock, or in quartz, accompanied by calcareous spar and pyrites.

The crystals belonging to the first variety, present occasionally a singular kind of composition, being found to contain internally a second prism, the axis of which crofles of the former nearly at right angles, and is engaged in its very fusion in such a manner as to produce no alteration in its external figure. This arrangement appears in the fracture of the crystal, at the crofles of the frize; or in a kind of mosaic, representing four triangles united round a common point, upon making a vertical section of the whole prism; of these triangles, two opposite ones are nearly colofured, and the other two are violet.

The repeated analyses of Klipoth, Vauquelin, and Thenard, have discovered nothing in the aragonite but lime and carbonate of lime, in the same proportions as calcareous spar; yet the crystalline structure of these two substances is wholly different. The primitive form of calcareous spar is a rhombohedron; the aragonite is divisible only in two directions; the inclination of the joints in the latter is about 116°, but in the former only 104° 28'; a circumstance worthy of special attention, as it is the only instance known in which the geometrical and chemical analyses of crystallized bodies are at variance. Mineralogie de Brochant, v. i. p. 576. Hauy Traite, &c. v. iv. p. 237.

ARRAT, in Geography, a town of Japan, in the province of Tootomi or Tsun-i.

ARRAIALTO pediicum, the ranging or arraying of foot-soldiers.

ARRAIGN, or Araign, in Law, signifies to fet a thing in order, or its place.

It is derived from the French arraisonner, i.e. "ad rationem ponere, to call a man to answer in form of law," which comes from the barbarous Latin adrationem, i.e. platicum.

In which sense, to arraign a criminal, is ponere eum ad rationem. Thus he is to be arraigned a witness of novel fact, and fix it for trial before the justices of the court. To arraign the affize, is to cause the defendant to be called to make the plaint, and to set the cause in such order as the tenant may be forced to answer to it. A prisoner is also said to be arraigned, when he is indicted, and called to the bar of the court, to answer the matter charged upon him in the indictment.

But no man is properly arraigned, except at the suit of the king, upon an indictment found against him, or other record, wherewith he is to be charged: and this arraignment requires, that the prisoner appears to be tried, and holds up his hand at the bar, for the certainty of the person, and makes a sufficient plea to the indictment. i. Hali. 262, 263. The prisoner is to hold up his hand only in treason and felony; but this is only a ceremony: if he own that he is the person, it is sufficient without it.

It was laid down in the ancient books, that the prisoner, though under an indictment of the highest nature, must be brought to the bar without irons, or any manner of shackles or bands; unless there be an evident danger of an escape, and then he may be secured with irons. But in Lay's cafe, A.D. 1725, a difference was taken between the time of arraignment, and the time of trial; and accordingly, the prisoner stood at the bar in chains during the time of arraignment. Prisoners are now generally tried in their irons, because taking them off is usually attended with great pain and trouble. When the prisoner is at the bar, and confesses that he is the person named, the indictment is to be read to him distinctly in the English tongue, that he may fully understand his charge. After which it is to be demanded of him, whether he be guilty of the crime, of which he stands indicted, or not guilty. By the old common law, the accolyti could not be arraigned, till the principal was attainted, unless he chose it, and waived the benefit of the law; in which case, principal and accolyti might, and may still, be arraigned, and plead, and also be tried together. But if the principal had never been indicted at all, had stood mute, had challenged above 35 jurors peremptorily, had claimed the benefit of clergy, had obtained a pardon, or had
 ARR

had died before attainer, the accourty, in any of these cases, could not be arraigned; for "non culditas," whether any felony was committed or not till the principal was attainted; and it might so happen, that the accourty should be convicted one day, and the principal acquitted the next, which would be absurd. The law full continues, that the accourty shall not be tried, so long as the principal remains to be tried hereafter. But by flat 1 Ann c. 9, if the principal be once convicted, and before attainer, i.e., before he receives judgment of death or outlawry, he is delivered by pardon, the benefit of clergy, or otherwise, or if the principal stands mute, or challenges punctuously above the legal number of jurors, to as never to be convicted at all; in any of these cases, in which no further trial can be had of the principal, the accourty may be proceeded against as if the principal had been attainted; for there is no danger of future contradiction. And upon the trial of the accourty, as well after as before the conviction of the principal, it seems to be the better opinion, and founded on the true spirit of justice (Pooler, 357), that the accourty is at liberty, if he chooses it, to controvert the guilt of the apprised principal, and to prove him innocent of the charge, as well in point of fact, as in point of law.

When a criminal is arraigned, he either stands mute, or confess the fact; which circumstances may be called "incidents" to the arraignment; or else he pleads to the indictment. For the law, as it formerly existed, and now subsists with regard to standing mute, see Mute. Upon the prisoner's simple and plain confession of the indictment, the court hath nothing to do but to award judgment; but it is usually very backward in receiving and recording such confession, out of tenderness to the life of the subject; and will generally advise the prisoner to retract it, and plead to the indictment. For another species of confession, see Approval. For the plea of the prisoner, or defensive matter alleged by him on his arraignment, if he does not confess, or stand mute, see Plea. For the solemnity of the arraignment, and trial of a prisoner, see Dall. c. 135, p. 575.

An attainer of high treason has been revered for the omission of an arraignment. In an action of slander, for calling one thief, the defendant justifies that the plaintiff bible goods, and if he be taken therein; if it be found for the defendant, in D. R. and for felony in the same county where the court sits, or before the justices of assize, &c. he shall be forthwith arraigned upon this verdict of 12 men as on an indictment.

A R R A N, a province of Peris, situated between Georgia, Aiderbeizan, and Shirwan, and surrounded by mountains. A R A N, or Arr-an, i.e., the island of mountains, one of the Scottish islands, situated in the Firth of Clyde, between the main land of Aritherie and the coast of Kintyre, and forming part of the county of Bute. This island is about twenty-three miles long and nine broad, and contains about 7000 inhabitants, who chiefly occupy the parts near the coasts; the interior mountainous part being for the greatest part uninhabited. The chief place is the village of Ranza; and the parishes are two, viz. Kilbride and Kilmore. The principal mountains are Goatfall, Goatfield, Goolbhein, or the mountain of the widows, nearly 3000 feet high, composed of immense piles of morraine, cloathed with heaths and mosses, and inhabited by eagles and ptarmigans; Bon-bharrin, or the sharp-pointed; Ceum-na-Caillich, or the flap of the Carline or old hag; and Griann-Athlo, inferior to none in ruggedness. The lakes are loch Jorfa, where salmon come to spawn; loch Tana; loch Na-Jura, on the top of a high hill; loch Machairi and loch Knoecharai, abounding with large eels. The chief rivers are Abhan-mhor, Moine-mhor, Sfordroni mchare, and Jorfa, of which the two last are remarkable for abundance of salmon. From the mineralogy of this island, published by Mr. Jamfson in 1798. Sea, it appears to be a mountainous region; the southern parts, however, present low and cultivated grounds: the base is chiefly sand-stone and granite, the former traversed by veins of basalt. Near Lamish, and also near to Brodick wood, there is an extensive vein of pitchstone, of a greenish colour, and the black also occurs. There is also granite, composed of quartz, felspar, and hornblende; maccareous felinites likewise abound; but there is little coal. The bays of this island are those of Lamish, Brodik, and Ranua, where ships of any burden may safely ride in all weathers; and it is surrounded with fisheries of various denominations. The climate is severe; nevertheless in summer the air is debourious, and many invalids resort hither on that account, and for the purpose of drinking the whey of goats' milk. The men are strong, tall, and well made; they speak the Erse language; but have laid aside the ancient habit. Their diet consists chiefly of potatoes and meal, with an occasional addition, in winter, of the dried flesh of sheep or goats. Their farms are leased for nineteen years; and each farm is commonly possessed by a number of small tenants, who are jointly and severally bound for payment of the rent. The arable land is portioned out by lot, and to each portion or ridge the occupier annexes his mark: and this species of farm is called "run-rig," i.e., ridge. All the tenants join in ploughing. The pasture and moor-land annexed to each farm are common to all the occupiers. All the farms are open, and inclosures are unknown. The produce of the island is chiefly oats and barley; its live Rock blink-cows and other cattle, horses, sheep, and goats. Flags have been lately introduced. The herring-fishery is beneficial. The exports are black cattle, horses, and bar ley, herring mts., and thread formed of the fish that is low here. The women manufacture the wool for the clothing of their families, desks and fish the flax, let the potatoes, make butter, some of which is exported, and cheese for their own table. The inhabitants are sober, religious, and industrious: in summer they prepare peat for fuel; before and after harvest, they are employed in the herring fishery; during winter the men make herring nets, and the women spin their linen and woollen yarn. In spring they till their grounds; and in autumn they collect and burn fern for making kelp. Among the quadrupeds of this island, such as otters, wild cats, three mice, rabbits, and hares, flags, which were formerly numerous, are now reduced to few; and among the several species of birds, such as eagles, hooded crows, wild pigeons, black game, grous, ptarmigans, flares, daws, green plovers and curlews, are parturges, which now inhabit the island, and prove the advancement of agriculture. The government of the island is the same with that of the county of Bute; and besides, justice is administered at the baron's daily court, who may fine as high as 20s. decide in matters of property not exceeding 40s. imprisonment for a month, and put delinquents in the stocks for three hours, but only in the day time. From the immense carins, monumental stones, and many relics of Druidism, this island must have been very considerable in ancient times. Little is known concerning this island, till the time of Magnus, the Barefooted, the Norwegian victor, who probably included Arran
Arran in his conquests of Kintyre. Ache, one of his successors, laid claim to it 1267, together with Ruth and the Cumrays, and having furnished the first, was defeated in a bloody engagement at the village of Largs, facing the island of Ruth, and obliged, after the loss of 15,000 men to give up his conquests. Arran was the property of the clan. Robert Bruce, with several of his followers, found an asylum here in their distress. About the year 1343, this island seems to have formed part of the estate of Robert Stewart, afterwards Robert II. In 1356, it was ravaged by Donald, Earl of Ross, and lord of the isles. It was still the property of James II, and was given by his successor James III, as a portion to his sister, who married Thomas Lord Boyd, created Earl of Arran. On the disfigure of that family, the countess was divorced; and both the lady and island were bequeathed on Sir James Hamilton, in whose family, with the exception of a few farms, it now continues. Perth's Journey through Scotland, vol. ii. 172, 184.

Arran, or Arran, the name of two clusters of islands near the west coast of Ireland, the largest of each of which is called Arranmore, i.e. the great Arran. The north isles of Arran are near Donegal, in W. long. 5° 25', N. lat. 55°, and in one of them a town called Ruthland has been built for a later use. The most important isles are on the coast of Galway, between W. long. 6° 26', and 6° 45'. N. lat. between 53° 1', and 53° 36'. They are three in number, and shelter the entrance of Galway bay. They are very fruitful, and produce a small kind of oats without any husk. They are also remarkable for the finest caves in the county. Mr. Young mentions that they are not for 2000. per ann. In Arranmore several Irish saints were buried, and it is still held in veneration by the neighbouring peafantry. In this island also, on a high cliff over the sea, is Dun Aengus, a circle of monolithic stones without cement, capable of containing 200 cows. This is supposed to have been one of the Mandæa or melofores of monastic buildings, common in the seventh and eighth centuries. Dr. Beaufort's Memoir. Young's Collected. Ledwiche's Antiquities of Ireland.

ARRANGE, or RANGEMENT, the disposition of the parts of a whole, in a certain order. The modern philosophy shews us, that the diversity of colours of bodies depends entirely on the situation and arrangement of the parts, which reflect the light differently; the diversity of taste and smell on the different parts; which render them differently sensible; and the general diversity of bodies on the different arrangement of their parts. The happy arrangement of words makes one of the greatest beauties of discourse.

ARRANGEMENTS, Philosophical, a title given by the ingenious J. Harris, Esq. to an excellent commentary on the Categories of Aristotle: it is just as happy a simplification of Logic, as his Hermes is of Grammar. Both these valuable books, so well calculated to convey sensible and precise notions of logic and grammar, might be very usefully and copiously exhibited in the forms of a logical and grammatical treatise, after the manner of genealogical tables.

ARRAPACHITIS, in Ancient Geography, the most northern province of Affyrnia, according to the distribution of Pliny. It was watered by the Gyndas. The towns are unknown.

ARRAS, in Geography, a city of France, and capital of the department of the Braix of Calais, situate on the Scarp; before the revolution, the metropolis of the province of Artois. It was taken by the French king Louis X 11.; and annexed to France, in 1649, by the peace of the Pyrenees. Being seated on a mountain, it is surrounded by quaries, which supply stone for building. It is divided by a strong wall, a large fossé, and the brook Chinchiron, into two parts, called the town and the city, each of which is well fortified. It has four gates, and a strong citadel with five bastions. The great square, in which is kept the principal market, is full of fine buildings, surrounded with piazzas. The lesser market contains the town-houfe, the tower of which is covered with a crown, with a brazen lion on the top serving for a vane; in the middle of this market is the chapel of the Holy Candle, reported to have been brought by the Virgin Mary above 500 years ago for the use of the diseased inhabitants, and kept in a silver shrine. The cathedral church of Notre Dame is a large Gothic building, with a high tower, in which is a fine clock, embellished with small figures in bronze, representing the passion of Jesus Christ. In this church is a silver shrine, enriched with pearls and diamonds, and containing a part of wood called maux, which, report says, fell from heaven 1400 years ago in time of drought, and which was carried in procession when rain was wanted. The greatest ornament of Aras is the church of St. Vedalf, with a fine cupola, a pulpitt of brass in the firm of a tree, supported by two bears of the same sort. The chimes play a great variety of tunes. There are eleven parish churches. The tapestry, called Aras hangings, derives its denomination from this city. The place contains 19,564, and the canton 29,013 inhabitants: the territory comprehends 70 kilometres and 13 communes. N. lat. 5° 17'. E. long. 5° 50'.

ARRAYS, a river of France, which runs into the Garonne, about two miles north-west of Avillard, in the department of the Lot and Garonne.

ARRAY, in Law, the ranking or ordering a jury or inquill of men impannelled on any cause. The word may be derived either from the obsolete French, array, order; or from arrange, a line, stroke, &c.; hence, to array a pannel, ann. 3 Hen. V. is to set forth the men impannelled one by another. By the statute, every array in assize ought to be made four days before. For challenges to the array, see Challenge.

ARRAY, in Military Language. See Battle.

ARRAYAL, de FORATE, in Geography, a town in Brazil, situate on the west side of Para river, below the junction of its two great branches.

ARRAYERS, for ARRAYS, ARRAYERS, a Militar. Language, is used in some ancient statutes, for certain provincial officers, whose duty it was, not only to inspect the soldiers, and see that they were able-bodied and fit for service, but also that they were properly armed, accoutred, and otherwise appointed according to the station and nature of their service. They were likewise to arrange both the cavalry and the infantry into their proper bodies, equivalent to the present divisions of troops, squadrons, companies, and battalions. In some reims, commissioners were appointed for this purpose; and the form of the commission of array was settled in parliament in the 5 Henry IV.

About the reign of the king Henry VII. or his children, lieutenants began to be introduced, as standing representatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the statute 4 & 5 Ptn. & M. c. 3, though they had not then been long in use; for Camden speaks of them in the time of queen Elizabeth, as extraordinary magistrates continued only in times of difficulty and danger. But the introduction of these commissions of lieutenancy, which contained, in substance, the same powers as the old commissions of array, caused the latter to fall into disuse. In this state things continued, till the repeal of the statutes of armour in the reign of king James I. Stat. 1 Jac. I. c. 21. Jac. I. 5. G. c. 28.
ARR

c. 28. After this period, viz. in 1642, king Charles I. oppo-
pied his commissaries of array to the ordinance of parliament,
concerning the militia, and thus brought on the question of
the question which became at length the immediate cause
of the fatal rupture between the king and his parliament.

ARRAYOLOS, in Geography, a small town of Portuga-
lar, in Alentejo; situate upon the declivity of a mountain,
and containing about 2,000 inhabitants, a large monastery
belonging to the canons of St. John the Evangelist, and a
monastery of Franciscans. It lies north of Evora, south-
west of Montemour, and 6 leagues from Évora, in which
distance a single village is not seen. The soil is sometimes
granite in masses, and sometimes sandy granite. In the
vicinity are tracts overgrown with broom; but within a
league of Arrayolos the lands are cultivated.

ARREAR, ARREARAGE, ARREARAGE, or AR-
REARIUM, the remainder, or a sum of money
remaining in the hands of an accountholder. The word is
derived from the French arrêrages, which is formed from
arrêre, behind.

Arrears is also used more generally for a remainder of
rents or monies unpaid at the due time; whether they be
rents of a Manor, or any thing referred: called also, in
some writers, arrearagem firmarum.

Arrears, in Military Language, denote the difference
between the full pay and subsistence of each officer, directed
to be paid once a year by the agent. These arrears were
abolished in 1797. See PAY.

ARREAU, in Geography, a town of France, in the
department of the Higher Pyrenees, and chief place of a
canton in the district of Bigeres, 13 miles south-east of
Bigeres, and 131 furlongs south-west of Tarbes. The place
contains 980 and the canton 5779 inhabitants; the territory
includes 175,000 square miles and 159 communes.

ARRENS, a town of France, in the department of the
Higher, Pyrenees and chief place of a canton in the district
of Argelèse, on the Garonne, 8 miles south-west of Argelèse.

ARRENTATION, in the Forei Law, the licent
ning an owner of lands in the forest, to incline them with a low
hedge, and small ditch, in consideration of a yearly rent.
Saving the arrentations, denotes a power reserved to give
such licences for yearly rent.

ARREST, in Common Law, the apprehending or re-
aining of one's person, in execution of the command of
tome court of record, or officer of justice.
The word arrest is French, and is used in that language
for a decree or determination of a cause debated and to
and fro: in which sense it seems derived from arriér, placitum,
the pleasure of the court.

Hence when a person is legally flapped, apprehended,
and restrained of his liberty, for debt, &c., he is said to
be arrested, or put under an arrest; which is the beginning
of imprisonment.

Arrests are either in civil or in criminal cases.

i. An arrest in a civil cause, is defined to be the ap-
prehending or restraining of one's person by process in execu-
tion of the command of some court or officer of justice.
Wood's Jfr. 575. This arrest must be corporal seizing
or touching the defendant's body; after which the bailiff may
justify breaking open the house in which he is, to take him;
otherwise he has no such power, but must watch his opportunity
to arrest him. For every man's house is considered by
the law as his castle of defence and asylum, in which he should
suffer no violation. This principle is carried so far in the
civil law, that for the most part, not so much as a common
citation or summons, much less an arrest, can be executed
upon a man within his own walls. But doors may be
broken up in pursuance of one arrested; otherwise, action of
trespass, &c., lies for breaking open a house to make arrest
in a civil action. But if it appears a bailiff found an outer
door, &c., open, he may open the inner door to make an
arrest. Comb. 327. The court of King's Bench has
determined, in the case of Lee vs. Gen. Guelph, that the
chamber door of a lodger is not to be considered as his
outer door; but that the direct door being open, the officer
had a right to force open the chamber door, if the defendant
was in the room and refusing to open it. Comb. 1. Peers
of the realm, perseverers by birth, peers of Scotland, a percev-
by marriage, not afterwards having intermarried with a com-
moner, members or parliament, and corporations, are pri-
ileged from arrests, and of course from outlawries. And
gainst them the process to enforce an appearance must be
by summons, and ditrefes sine die, instead of a capias. Also
clerks, attorneys, and all other persons attending courts of
justice (for attorneys, being officers of the court, are always
supposed to be there attending), are not liable to be arrest-
ed by the ordinary processes of the court, but must be sued by
bill (usually called a bill of privilege), as being personally
present in court. Clergymen, performing divine service, and
not merely staying in the church with a fraudulent design,
are for the time privileged from arrests, by (5 Edw. III.
c. 5, and 1 Ric. II. c. 161; as likewise members of con-
vention actually attending thecon, by (5 Hen. VI. c. 1; 
and also ambassadours, or the domestic servants of an am-
badour, "really and bona fide in that capacity." Suitors,
withesses, and other persons, necessarily attending any courts
of record upon business, are not to be arrested during their
actual attendance, which includes their necessary coming and
returning. A bankrupt coming to surrender, or within 42
days after his surrender (5 Geo. II. c. 28, 5, Comb. 156);
withesses properly summoned before commissioners of bank-
rupt, or other commissiiners under the great seal (1 Atk.
54); but not creditors coming to prove their debts
(4 Term Rep. 377); heirs, executors, or administrators
(R. M. 1654), except on personal contracts by themselves
(1 T. Rep. 716); or in cases of deflagrat (1 Salk. 58),
are exempted from arrests. By (5 Ric. II. c. 10, no
isman aboard his majesty's ships can be arrested for any
debt, unless the fame be sworn to amount to at least
loll; but by the annual muster acts, a soldier may be arrested
for a debt which extends to half that value, but not to a less
amount. In an action against husband and wife, the hus-
band alone is liable to be arrested, and shall not be
charged till he have put in bail for himself and his wife
(1 Vent. 49. 1 Mod. 8); and ifhe is arrested, the shall
be discharged on common bail (1 Term Rep. 496. 1 Salk.
115). No arrest can be made in the king's presence, nor
within the verge of his royal palace, extending by (5
26 Hen. VII. c. 12, from Caring-troofs to Westminster
Hall, or within 200 feet from the gate of any of the
palaces and houses of the king, or any other house where
the royal person shall abide, nor in any place where the king's
jueces are actually sitting. The king hath moreover a
special prerogative (which indeed is very seldom executed)
that he may, by his writ of preceptio, privilige a defend-
ant from all personal, and many real, suits for one year at
a time, and no longer; in respect of his being engaged in
his service out of the realm. And the king also, by the
common law, might take his creditor into his protection,
so that no one might sue or arrest him till the king's debt
were paid (F. N. B. 28. Co. Litt. 131); but by (5
25 Edw. III. ft. 5. c. 19, notwithstanding such pretence,
another creditor may proceed to judgment against him,
with a stay of execution, till the king's debt be paid;
unles
unless such creditor will undertake for the king's debt, and then he shall have execution for both. An arrest in the night, as well as the day, is lawful. 9 Rep. 66. And lately, by that, 29 Car. II. c. 7, no arrest can be made, nor process served, upon a Sunday, except for treason, felony, or breach of the peace. But a person may be retaken on a Sunday, when arrested the day before, Mod. Ca1. 231; or, when he goes at large out of the rules of the King's Bench or Fleet prison, &c. 5 Ann. c. 9. By 12 Geo. I. c. 29, and 5 Geo. II. c. 27, both made perpetual by 21 Geo. II. c. 3, no person can be arrested, or held to bail, on a writ sued out of the superior courts, unless the cause of action be 10l. or upwards. And by 19 Geo. III. c. 70, no person can be arrested or held to bail upon process out of any inferior court, for less than 10l., but proceedings are to be had in inferior courts according to the directions of 12 Geo. I. c. 29, extended by 15 Geo. III. to debts under 10l. It is now settled, both in R. B. and C. P. that a person may be arrested in an action on a judgment for 10l. for damages and costs, though the original debt alone were under 10l. 4 Term Rep. 570. on the authority of 2 Blackf. Rep. 1274.

When a peron is apprehended for debt, &c. he is laid to be arrested; and writs express arrest by two several words, &ciones and attachatia, to take and catch hold of a man; for an officer must actually lay hold of a peron, besides saying that he arrrests him, or it will be no lawful arrest, 1 Liff. Abr. 96. If a bailiff be kept off from making an arrest, he shall have an action of assault; and where the person arrested, refists or assaults the bailiff, he may justify beating of him. If a bailiff touch a man, which is an arrest, and he makes his escape, it is a forcous, and attachment may be had against him. If a bailiff lays hold of one by the hand held out at a window, this is such a taking of him as will justify his breaking open of the house to carry him away.

2. An arrest in a criminal cause is the apprehending or restraining one's peron, in order to be forthcoming to answer an alleged or suspected crime. To this arrest all persons whatsoever, who are, without dangerous or equal, liable, and doors may be broken to arrest the offender; but no man is to be arrested, unless charged with such a crime as will at least justify holding him to bail, when taken. There is this difference between civil and criminal cases; that none shall be arrested for debt, trespass, &c. or other cause of action, but by virtue of a precept or commandment out of some court; but for treason, felony, or breach of the peace, any man may arrest without warrant or precept. Terms de Ley, 54. But the king cannot command any one by word of mouth to be arrested; for he must do it by writ, or order of his courts, according to law; nor may the king arrest any man for fullpicion of treason or felony, as his subjects may be, cause, if he doth wrong, the party cannot have an action against him. 2 Inst. 130. In general, an arrest may be made four ways; viz. by WARRANT: by officers without warrant, as by a JUSTICE of the peace, the SHERIFF, the CORONER, the constable, and Watchmen; by a private peron also without warrant; and by an FLIUE and ARRY. Amongst by private persons, also, it is considered that any peron who is present when any felony is committed, is bound by the law to arrest the felon, on pain of fine and imprisonment, if he escapes through the negligence of the by-standers. 2 Haw. P. C. 74. And they may justify breaking open doors upon following such felon; and if they kill him, provided he cannot be otherwise taken, it is justifiable; though, if they are killed in endeavouring to make such arrest, it is murder. 2 Hal. P. C. 77. Upon probable fullpicion also a private person may arrest the felon, or other person so suspected. 30 Geo. II. c. 24. But he cannot justify breaking open doors to do it; and if either party kill the other in the attempt, it is merely man slaughter, 2 Hal. P. C. 82, 83. Every private peron is bound to afford an officer, requiring him to apprehend a felon. In order to encourage the apprehending of certain felons, rewards and immunities are belowed on such as bring them to justice, by several acts of parliament. By 4 & 5 W. & M. c. 8. perons who apprehend a highwayman, and prosecute him to conviction, shall have a reward of fifty pounds from the public, to be paid them, or if they be killed, to their executors, by the sheriff of the county; to which is added by 8 Geo. II. c. 16. ten pounds, to be paid by the hundred indemnified by such taking. By 6 & 7 W. III. c. 17, and 15 Geo. II. c. 18. persons apprehending and convicting any offenders against those statutes respecting the coigne, shall, if the offence be treason or felony, receive a reward of 45l. or 10l. if the offence amount only to counterfeiting the copper coin. By 10 & 11 W. III. c. 33, any person apprehending and prosecuting to conviction a felon guilty of burglary, house-breaking, horse-stealing, or private larceny to the value of 5l. from any shop, warehouse, coach-house, or stable, shall be excused from all parish officers. By 5 Ann. c. 31. any peron so apprehending and prosecuting a burglar, or felonious house-breaker, or, if killed in the attempt, his executors shall be entitled to a reward of 40l. By 6 Geo. I. c. 25. persons apprehending and prosecuting to conviction any one taking reward for helping others to stolen goods, shall be entitled to 40l. By 14 Geo. II. c. 16. explained by 15 Geo. II. c. 34. any peron apprehending and prosecuting to conviction such as steal, or kill with intent to steal, any sheep or other cattle specified in the latter of the said acts, shall, for every such conviction, receive a reward of 10l. Lately, by 16 Geo. II. c. 15. and 8 Geo. III. c. 15. persons discovering, apprehending, and convicting felons and others, being found at large during the term for which they are ordered to be transported, shall receive a reward of 20l. Blackf. Com. vol. iii. p. 288. vol. iv. 289. Jacob's Law Dict. by Tomlin, art. Arrest.

The method of procuring a man's apperance before a court of justice, is different from that above recited, in most of the countries of Europe, where the forms introduced in the Roman civil law, in the reigns of the latter emperors, have been substituted. The usual practice is to have the peron sued, summoned to appear before the court by a public officer belonging to it, a week before the time. If no regard is paid to such summons twice repeated, the plaintiff, or his attorney, is allowed to make before the court a formal reading of his demand, which is then granted him, and he may proceed to execution.

In Rome, the method of seizing the peron of a man, against whom a demand of any kind was preferred, previously to any judgment being passed against him, was adopted and continued to be followed after the institution of the prator's court, to whom the civil branch of the power of the consuls was afterwards delegated; and it laded till the times of the latter emperors, in whose reigns the Roman civil law underwent those alterations which gave it the form it now has in those codes or collections that are in our possession. In Rome, however, instead of employing a proper officer, and furnishing him with a writ or order for seizing a man's peron, every one became a kind of public officer in his own cause, for ascertaining the prator's prerogative; and without any oftensive legal licence, or badge of public authority, had a right to seize by force the person of his opponent, wherever he met him. The practice was, that of
the "actor," or plaintiff, first summoned the "reum," or person sued, with a loud voice to follow him before the court of the prorator. If the defendant refused to obey this summons, the plaintiff, by means of the words "lust antellani," required the by-laws to witness the fact, in token of which he touched the ears of each of them; and he then proceeded to force the person of his opponent by throwing his arms around his neck "obsto colo," and thus endeavouring to drag him before the prorator. If the person sued was, by age or infirmity, unable to follow the plaintiff, the latter was directed by the Twelve Tables to supply him with a horse. This method of proceeding was afterwards, though very lately and very slowly, mitigated. In the first place, it became unlawful to seize a man in his own house, as it was the abode of his domestic gods. Women of good family, or "matronae," were protected from being dragged by force before the tribunal of the prorator. The method of forcibly placing a sick or aged person upon a horse was abolished during the latter times of the republic. Emancipated sons, and slaves who had obtained their freedom, were afterwards restrained from summoning their parents or relatives without the express leave of the prorator, under the penalty of fifty pieces of gold. However, so late as the time of Pliny, the old mode of summoning or carrying by force before a judge continued in general to subsist; though in the time of Ulpian, the necessity of obtaining the express leave of the prorator was extended to all cases and persons; and in the reign of Constantine, the method was introduced of having legal summonses served only by means of a public officer appointed for that purpose. After that time other changes in the former law took place, from which the mode of proceeding now used on the continent of Europe has been borrowed. De Lomme's Constitution of England, ch. 10.

**Arrêt of Judgment,** to move or plead in, is to shew just cause why judgment should be stayed, notwithstanding verdict given. Judgment may be arrested for good cause in criminal cases, as well as civil, if the indictment be insufficient. 3 Inst. 210. Motions in arrest of judgment may be made at any time before judgment signed. Doug. 747, Str. 845. Arrest of judgment arises from intrinsic causes appearing upon the face of the record. Of this kind are, first, where the declaration varies totally from the original writ; also, secondly, where the verdict materially differs from the pleadings and issue thereon; or, thirdly, if the case laid in the declaration is not sufficient, in point of law, to found an action upon. If judgment is not by some of these means arrested within the first four days of the next term after the trial, it is then to be entered on the roll or record. See Judgment.

In criminal cases, whenever the defendant appears in person, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment in arrest or stay of judgment, as for want of sufficient certainty in setting forth either the person, the time, the place, or the offence. And if the objections be valid, the whole proceedings shall be set aside; but the party may be indicted again. A pardon may be pleaded in arrest of judgment; and it has the same advantage when pleaded here, as when pleaded upon arraignment; viz. the faying the attainer, and of course the corruption of blood, which nothing can restore but parliament, when a pardon is not pleaded till after sentence. Praying the benefit of clergy may also be ranked among the motions in arrest of judgment. If all these remedies fail, the court must proceed to pronounce the judgment. See Judgment.

**Arrêt of Inquest,** or to plead in arrest of taking the inquest, is to shew cause why an inquest should not be taken. See Inquest.

**Arrêt, in Military Language,** is the exercise of that part of military jurisdiction, by which an officer is noticed for misconduct, or put into a situation to prepare for his trial by a general court-martial.

**Arrêt, or Arrêt,** is sometimes used among French writers, in the sense of the Latin word "retrocessum," to signify a small piece of steel, which was formerly used in the construction of fire-arms, to prevent the piece from going off.

**ARRÉSTANDIS honoris ne diffugiatum,** a writ which lay for the whole cattle, or goods taken by another, who during the controversy makes or is likely to make away with them, and will hardly be able to give satisfaction for them afterwards. Reg. Orig. 126.

**ARRÉSTANDO ipsius, qui pecuniam recepit ad professandum in obsequium reipr.** Sc. is a writ which lay for the apprehension of him that hath taken pecuniary to serve in the king's wars, and hides himself when he should go. Reg. Orig. 24.

**ARRÊTMENT,** in Scots Law, signifies the securing of a criminal till trial, or till he find caution to stand trial, in what are called bailable crimes. In civil cases, it denotes either the detaining of strangers or natives "in meditatio fugas," till they find caution "judicio fili;" or the attaching of the effects of a stranger in order to found jurisdiction. But, in the most general acceptance of the word, it signifies that diligence by which a creditor detains the goods and effects of his debtor in the hands of third parties, till the debt due to him be paid or secured. Arrestment may be laid on by the authority either of the supreme court, or of an inferior judge. In the first case, it proceeds either upon special letters of arrestment, or on a warrant contained in letters of horning, and it must be executed by a messenger. The warrants granted by inferior judges are called precedes of arrestment, and they are executed by the proper officer of the court. All debts, in which one is personally bound, though they should be hierarchically secured, are grounds upon which the creditor may arrest the moveable estate belonging to his debtor.

Moveable debts are the proper subject of arrestment; under which are comprehended conditional debts, and even depending claims. But there are certain moveable debts which are not arrettable; such as debts due by bil, future debts, and alimentary debts, including salaries of public offices. If, in contempt of the arrestment, the arrestee shall make payment of the sum, or deliver the goods arrested, to the common debtor, he is not only liable criminally for breach of arrestment, but he must pay the debt again to the arrestee. Arrestment is only an inchoated or begun diligence; for perfecting it, there must be an action brought by the arrestee against the arrestee, to make the debt, or subject arrested. Forthcoming. In all competitions of arrestments, regard is had to the dates, not of the grounds of debt, but of the diligence proceeding upon them. In the competition of arrestments with allegations, an affirmation by the common debtor, intimated before arrestment, is preferable to the arrestment; if the affirmation is granted before arrestment, but not intimated till after it, the arrestee is preferred. See Pounding.

**ARRÊTO ficta super hostis mercatorum alienigenarum,** Sc. is a writ which lay for a defencc against the goods of aliens found within this kingdom; in recompence of goods taken from him in a foreign country, after he hath been denied
denied restitution there. This answers to what among the ancient civilized was called charitote, now barbarously re-

dened. ARRETET-NE, in Zoology, a common term among the French for the Remora, or sucking-fish; alluding no doubt to the fabulous relations of the ancient poets, who feigned that this fish, which is scarcely more than a foot or two in length, was capable of arresting the progres of a ship to fall by fastening itself to the bottom of it. See ECHENES remora.

ARRETIIUM Vetus, now Arezzo, in Ancient Geography, a town of Italy, in Etruria. It was feated on a hill not far from Umbria, and was celebrated for its manufacture of earthen vessels, its wine, a fountain whence were flued oracles, &c. See Arezzo.

ARRETIIUM Julia, a town of Etruria, upon the Arno, north of the former.

ARRETIIUM Fidenis, another town of Etruria, south of Arretium vetus.

ARRETED, Arrectatus, orifi. ad rectum vocatus, is formed like in one of the ancient law-books imputed, or laid to.—As, no folly may be arrested to one under age. It is applied also to a person who is convended before a judge, and charged with a crime.

ARRHADON, a river of Aila, in Armenia, had its source in mount Caucasus, and ran into the Cucus. Strabo.

ARRHABONARI, derived from ἀρβανις, arba, corn- nel, in Ecclesiastical History, a feclt, in the sixteenth century, who held that the eucharist is neither the real flesh and blood of Christ, nor yet the sign of them, but only the pledge or carnell thereof.

ARRHADA, in Ancient Geography, a town of Arabia Deferta. Ptolomy.

ARRHE, or Argentum Drii. See EARNEST, &c.

ARRAPA, in Ancient Geography, a town of Aila, in Allfria. Ptolomy.

ARRAPHON, denotes a skill without futures, found to be the cure of incurable CEPHALAGIA.

ARRHENA, in Ancient Geography, a town of Aila, in Armenia Major. Pliny says, that the rivers Tigris and Aratius ran near one another through this country.

ARRHENOGONON, in Botany, a name given by fome to the paxistia, or pellicy of the wall.

ARRHEPHORIA, in Antiquity, a feft, among the Athenians, inultuted in honour of Minerva, and Herse, daughter of Cercus. The word is comp. made of ἀρρήφω, mystery, and τόιας, I carry; on account of certain mysterious things which were carried in procession at this solemnity.

Boys, or, as some fey, girls, between seven and twelve years of age, were the miniatures that affiluted at this fest, and were denominated αρρηφάς.

This feast was also called Hersephoria, from Herse the daughter of Cercus, on whose account it is said to have been first established.

ARRIA, in Biography, a Roman lady distingjuished by her fortitude and conjugal affection, was the wife of Cæ-

sion Petaus, a man of comtul dignity, who died in the 43d year of the C玳an era. Pliny, the younger has preferred (Epist. i. iii. ep. 16.) several anecdotes, fome of which are worth recording. Her husband and her son, who was a very amiable and promising youth, were both fazed at the fame time with a very dangerous disorder. The son died, but the mother concealed the dilrefling event from the fick father: and whenever he appeared in his presence, assumed a cheerful countenance, and answered his inquiries respecting the deceased with so much composure and serenity, that she even prevented the suspicion of his death. When her husband was apprehended, in confquence of having joined Scribonianus in a rebellion against the emperor Clau-

dus, and was conveyed by fome to Rome, Arria wished to accompany him in the fame veft; hut being refused, she hired a fiting boat, and followed him. Having arrived at Rome, she determined to die with Petus; and to the remonftrance of her fon-in-law Thraex, who asked her, "Would you wish that your daughter should accompany me, if I were to die?" she replied, "Yes, provided she had lived fo long and fo happily with you as I have lived with Petus." To those who watched her, and who endeavoured to divert the execution of her purpose, she faid, "You may make my death more painful, but cannot prevent it:" and dashing her head against a wall, fell fencile on the ground. Upon her recovery, she calmly faid, "I told you that I would find a difficult road to death, if you hindered me from obtaining an easy one." When her husband was ordered to defray himself, Arria perceiving his hefitation, plunged a dagger in her breast, and then prefented it covered with blood to her husband, exclaiming, in words cele-

brated by the ancient, who did not entertain that horror of fell-murder which Christians have derived from better principles, "Petus, it is not painful." Martial’s epigram on this subject is well known; but it is remarkeful, that he has given an ingenious turn to the fpecch, which injures its noble simplicity:

"Cafla fuo gladium cum traderet Arria Patro, 
Quam de scriboniis traducerat ipsa suis; 
Si qua fides, vulnus, quod fecis, non dolor, inquit; 
Sed quod tu facies, hoc mihi, Patre, dolor.

"When Arria pulled the dagger from her side, 
Thus to her comfort spoke the illustrious bride: 
The wound I gave myself I do not grieve; 
I die by that which Petus must receive."

Arria, the daughter, who was married to Petus Thraex, propofed to imitate this example of her mother, when her husband was condemned to death under Nero; but the changed her reflation upon his requiffit, who defired her to live in order to take care of their daughter. Tacit. Annal. i. xvi. c. 34. Gen. Diæt.

ARRIACA, in Ancient Geography, a town of Spain, between Complutum to the south-west, and Seguntia to the north-east, on the fame river with the fift of these towns.

ARRIAGA, RODERIO DE, in Biography, a learned Spanish Jesuit, was born at Lucena in 1592, and gained great applause by teaching philosophy at Valladolid, and divinity at Salamanca. Having voluntarily undertaken the office of teaching thefe sciences in Bohemia, he re-

moved to Prague in 1624, whence he was deputed three to Rome by the province of Bohemia, to affil at the general congregations of the order of Jesuits; and after acquiring distinguished reputation in the several offices to which he was appointed, he died at Prague in 1667. Such was the vigour of his mind, that he broke through the trammels of the schools in the investigation of philosophical and theological subjects; but delitute of the right clue to guide his inquiries, he indulged the wildest fcotettes in explaining the phenomena of nature, and wanderet into the regions of general scepticism, so that he was more successful in demolishing the opinions of others than in establishing any of his own. His works are: "A Course of Philosophy," in one volume folio, printed at Antwerp in 1632, and several times re-printed; and "A Course of Divinity," in eight volumes folio, printed between the years 1643 and 1655, by Balthasar Moret, at Antwerp.
ARR

He was prevented from finishing a ninth volume by his death. Gen. Diet.

ARRIAGLI, in the *Roller Media*, a name given by some authors, particularly by Sarmanna and Aviceina, to a fine kind of cannibar.

ARRIÀN, in Biography, a Greek historian, was born at Nicomedia in Bithynia, where he was priest of Procolepis, and flourished in the second century under the emperors Adrian and the Antonines. After his residence at Rome, he became a disciple of Epictetus, and by his talents and learning he recommended himself to the patronage of Adrian. Having been admitted to the honour of a Roman citizen, he was appointed prefect of Cappadocia, and in this situation he distinguished himself by his prudence and valour in the war against the Alani and Magyars. He was afterwards advanced to the dignities of senator and confus. Like Xenophon, he united the literary with the military character, and devoted a great part of his life to the pursuits of learning and philosophy. Of the numerous historical writings of Arrian, if we except some fragments preserved by Phoutius and Tzetzes, two only remain. The first is, “The Expedition of Alexander the Great, in seven books;” a work in high estimation, not only on account of the accuracy and fidelity that distinguishes the detail of facts, but for the simplicity and sweetness of the style in which they are recited. As his knowledge of political and military science was more extensive than that of Q. Curtius, he possessed a founder judgment, and was less inclined to the marvellous than that historian. His facts were collected from the best authorities, particularly from the memoirs left by Procmi Lagus and Aritobulus, who had served under Alexander in his expedition, and who did not publish their accounts till after the death of Alexander, and with no other motive besides that of discovering the truth. His style was formed upon the model of that of Xenophon, and combined simplicity and ease with strength and elegance, so that he was not unjustly denominated the second Xenophon. “This work,” says Dr. Robertson, (Hist. Diq. concerning India, p. 24,) though composed long after Greece had lost its liberty, and in an age when genius and taste were on the decline, is not unworthy the purest times of Attic literature.” Arrian’s “Account of the Affairs of India,” in which the history of Alexander is pursued, has been considered by many as an eighth book of the former work; though it has been objected that this book is written in the Ionic, but the former in the Attic dialect, and that its facts are chiefly taken from Megasthenes, to whom Strabo allows little credit. Dr. Robertson (ubi supra, p. 344.) lays, that the Indian history of Arrian is one of the most curious treatises transmitted to us from antiquity. The first part of it consists of extracts from an account given by Nearchus of the climate and soil of India, and the manners of the natives; and the second contains that officer’s journal of his voyage from the mouth of the Indus to the bottom of the Persian gulf. For the elucidation of this curious monument of ancient navigation, see “The Voyage of Nearchus from the Indus to the Euphrates,” by Dr. Vincent, 4to., 1797. We may add, that notwithstanding some particulars, to which objections have been made, and which have been examined by Dr. Robertson and others, the account of Nearchus’s voyage, detailed, probably only in part by Arrian, the promontories, the creeks, the rivers, the cities, and the mountains, which came successively in his view, are so clearly described, and the distances of such as were most worthy of notice are so distinctly marked, that M. d’Anville, by comparing these with the actual position of the country, according to the best accounts of it, ancient as well as modern, has been able to point out most of the places which Nearchus men-

ARR

tions, with a degree of certainty, which does as much honour to the veracity of the Greek navigator, as to the industry, learning, and penetration of the French geographer. Mem. de Later. tom. xxx. p. 132, &c. See also the learned and elaborate work of Dr. Vincent, above cited. Arrian’s “Expedition of Alexander” was first printed in Greek, at Venice, in 1808, in 1535; at Basle, in 1539, 8vo.; at Geneva, by H. Stephens, in 1755, fol.; in Greek and Latin, by Blanchard, 8vo. with notes, at Amsterdam, in 1658; by Gronovius, at Leyden, in 1704, fol.; and at Amsterdam, in 8vo., with the notes of Raphaelius and others, in 1757. The book, “De Indicis” has usually been published with the “Exped. Alex.” The “Periplus Ponti Euxini,” in a letter from Arrian to Adrian, contains a description of a voyage along the coasts of the Euxine Sea, is still extant, and was probably written while Arrian was prefect of Cappadocia. The “Periplus Maris Erythraei” has been ascribed by some to Arrian, but Salmuani is of opinion that it was written in the time of Pliny the natural historian, or a little before his time; and that it could not have been composed by Arrian, and addressed to Adrian, because mention is made of several princes who lived in Pliny’s time. M. Tillemont apprehends, that it was composed by that Arrian to whom Pliny the younger wrote several letters, whom he represents as a man of great abilities and eloquence, and who was considered as an imitator of Demochernes. But this Arrian, having retired from public employments about the time of Nerva, or the beginning of Trajan’s reign, could not have been the same with the disciple of Epictetus. The “Periplus Ponti Euxini,” and “Periplus Maris Erythraei” were published together at Basle, in fol.; at Leyden, in 1577; and among the Ancient Geographers, in 4to. by Gronovius, at Leyden, in 1697; and at Oxford, in 1693, 8vo. The “Tactica” of Arrian was written in the 20th year of Adrian. It treats of the order and arrangement of an army, and also the order which Arrian gave for the march of the Roman army against the Alani. His book “On Hunting” was published in Blanchard’s edition of the works of Arrian; and of his invaluable moral treatise, intitled “Enchiridion,” containing the discourses of Epictetus, we have an excellent edition by Upton, printed at London in two volumes 4to., in 1739.

ARRIANA, in Ancient Geography, a town of Panonina Prima, in the district of Norica Ripenula.

ARRIÀ, in Geography, a village of Africa, two leagues north of Tunis, in which are seen some ruins of ancient Carthage, particularly a long range of the arches of the celebrated aqueduct, all of them entire, seventy feet high, supported by columns sixteen feet square. The channel, that conveyed the water, lies upon these arches, and is high and broad enough for a person of an ordinary size to walk in. It is vaulted, and plastered in the inside with a strong cement, which by the stream running through it, is discoloured to the height of about 3 feet. Shaw’s Trav. p. 42.

ARRIB, in Commerces, equal to 100 crores, each crore being 160 lacks, and each lack 12,500l.: so that an arrib is equal to about 25,000,000 l.

ARRIBANTRUM, in Ancient Geography, a town of Dardania, a country of Upper Mysia. Procliyn.

ARRIEGE, in Geography, a river of France, which rises in the Pyrenees, passes by Foix, Pamiers, Savarden, St. Gabelle, &c. and joins the Garonne about two miles from Touloune. Gold has been found in several parts of this river near Pamiers.

Arriège gives name to one of the departments of France, formed of the territory called Conzernes, and the Pays de Foix. It is bounded on the north by the departments of Upper
ARR

Upper Garonne, and of Aude; on the coast, by the departments of Aude, and the Eastern Pyrénées; on the south, by the department of the Eastern Pyrenees, and the Pyrénées; and on the west, by the department of Upper Garonne. Its superficial is about 1,037,532 square acres, or 529,542 hectares; its population consists of about 104,936 individuals; and it is divided into three communal districts. Its chief town is Tarbes.

ARRIÈRES, a mountain of France, in the department of the Cantal, remarkable for the resort of birds of prey, such as eagles, falcons, kites, &c. one league from Falaize.

ARRIERE, Fr. denotes the rear.

ARRIÈRE-BAN, or Arrière-ban, in the French Calquons, is a general proclamation, whereby the king summons to the war all that hold of him: both his vassals, i.e. the nobles, and the vassals of his vassals.

M. Caffeneve takes the word to be composed of arriere, and ban; the ban, according to him, denotes the convening of the nobles or vassals, who hold feoff immediately of the king; and arriere, those who only hold of the king immediately.

ARRIÈRE, or arrièr, is a fee dependant on some other superior one.

Arrièr-fees commenced at the time when the counts and dukes, rendering their governments hereditary in their families, distributed to their officers certain parts of the royal domains which they found in their provinces; and even permitted those officers to gratify the holders under them with parts of the same.

ARRIÈRE-GUÉL. See Rear-guard.

ARRIÈRE-Vaill, or tenant, the vassal or tenant of another vassal or tenant.

ARRIGNO, in Geography, a town of the island of Corsica, eight miles east of Calvi.

ARRIGONI, CARLO, in Biography, an eminent Italian Lutenist, who arrived in England about the time of the establishment of the Royal Academy, or opera, in 1721, where he accompanied on the lute out of the composer's book or score, during the whole time of Handel's regency. In 1721, he accompanied Farinelli: he had many scholars in singing in the great families of this country, and had the reputation of a good composer. He left England in 1738, and removed to Vienna, where he composed the oratorio of Elither, which augmented his reputation as a good musician.

ARRION, in Geography, a town of Perpignan, in the province of Ardeil-belzian, thirty leagues south-east of Tauris.

ARRIÖN, or Carrion, a river of Spain, which runs into the Pyrénées, near its union with the Duero.

ARRIO, a river of England, which runs into the Lug, near Lemington, in Herefordshire.

ARROBAS, or Arrobas, in Commerce. See Arobes.

ARROE, in Geography, an island of Denmark, in the Baltic mountains, but interfaced with valleys, and containing three parishes: it lies south of the island of Funen, and west of that of Langeland. N. lat. 54° 55'. E. long. 10° 10'.

ARROGAS, is also a small island of Denmark, in the Little Belt, west of Funen, and almost contiguous to the east coast of the duchy of Sleswick. It gives name to a Sound on that coast. N. lat. 55° 16'. E. long. 9° 40'.

ARROEKJOBING, a town of Denmark, in the island of Arroe, in the Baltic.

ARROGATION, See Adoption.

ARROJA, or St. Servan, in Geography, a town of Spain, in the province of Elbremadura, three miles south of Merida.

ARROS, village of Scotland, in the isle of Mull.

ARRON, or Aron, a river of France, which runs into the Loire near Dazé.

ARRONCHES. See Aoronches.

ARRONCHIE, in Heraldry, Cross-arrondie, or rounded, is that whose arms are composed of sections of a circle, not opposite to each other, so as to make the arm bulge out thicker in one part than another; but both the sections of each arm lie in the same way, so that the arm is every where of an equal thickness; and all of them terminating at the edges of the escutcheon, like the plain cross.

ARROON, or Arron, a geographical island of that part of Asia called Aufralasia, lying to the south-west of New Guinea; in s. lat. 6°, and E. long. 135°. Although Penman calls these among the fiphey islands, they produce, according to his account, fago, and not fipe. During the dry, or westem monsoons, the mannequart, or birds of Paradife, which breed in New Guinea, and reside there whilst the wet monsoon lasts, retire to Arroon; migrating in flocks of 30 or 40, under the conduct of a leader, called by the inhabitants of Arroon, the king: he is said to be black, to have red spots, and to fly far above the flock, which never desert him, but settle where he settles. During their flight they cry like starlings; but when surprized with a strong gale, they croak like ravens, and attend to the superior regions of the air. They slight on the highest trees, and seem to feed on berries, or on nutmegs and butterflies; and they are either shot with blunt arrows, or caught with birdline, or nooses. The bowls and breast-bone being extracted, they are dried with smoke and pulphor, fold for nalls or bits of iron, and exported to Asia, Africa, and America. The Arroon idylls appear, in Arroon thefth's chart, divided into five by intervening illarts. The chief produce is fago; and the people make expeditions to the main land, where they seize captives, and sell them at Banda. Since 1623, the Arroon idylls have been considered as belonging to the Dutch East India Company, and subervience to those of Banda.

ARROS, a river of France, which runs into the Adour near Aire, in the department of Landes.

ARROSOR, in Conchology, a name signified by modern French naturalists, after Brugière and Lamarck, to a new genus of shells, formed exclusively of the Linnean Serpula penis, and another analogous species figured in the twenty-ninth plate of Tawan's Conchology. The former is the Pcellus marinus of Argenville; Chinese water-pot of the English; and L'Arrosee d'herve of the French; the latter is also called by them L'Arrosee de la Nouvelle Zeland. See Serpula penis.

ARROTONIO, L', in Sculpture, a statue in the gallery of the great duke at Florence, representing an old man reeling upon one knee, and whetting a kind of bread knife upon a stone, with his head erect, and, as it were, bilinging with great attention, but very cautious of being observed. The head and the hair of this piece of sculpture are particularly admired. It is generally thought to have been a peafant, who, being in the field, happened to over hear some of Catiline's accomplices, and discovered them: but the history of that conspiracy, as also of that headed by Brutus's sons, makes no mention of their being detected by a country labourer. Keyhler's Trav., vol. ii. p. 21. Leonard Agotlin, cited by Gronovius, supposes that this statue represents a Scebian charged by Apollo with the destruction of Mar- syas, and that it made part of a group, exhibiting the punishment of this audacious rival of Apollo.

ARROU, in Geography, a town of France in the department of the Eure and Loir, and chief place of a canton in the district of Chartres, 4 leagues S.S.W. of Chartres.

ARROUKHAGE. See Arukhage.

ARROUX, in Geography, a river of France, which rises near Arneay-le-Duc, and runs into the Loire, between Digoin, and Motte St. Jean, in the department of the Saone and Loir.

ARROW,
ARROW, in Archary, in the Saxo nympe, or nympe, a native weapon of offence, flunder, pointed, and barbed, made to be cast or shot from a bow. See Archary.

Matthew derives it from the Latin arcum, because the ancients so frequently made the shafts of their arrows from reeds. Skinner refers us to the Anglo-Saxon sceap, p饌sow, and Jones to the French pereche, because the arrows depended on the enemy like a shower.

The chief of the nations that composed the army of Xerxes had both their bows and arrows made of reeds; the bows, however, of the Lyceans were of round wood; the arrows of the Ethiopians were pointed with iron; those of the Egyptians with a sharp bone that they sometimes used to cut their heads with; and the arrows of the Lyceans were unfeathered. (Herodotus, Polymniau.) The Grecians headed their arrows with brass, as well as the Scythians; and from a particular passage in the Olds, they are supposed, that the heads of the Grecian arrows were followed on as they were wanted.

The ancient Germans generally prefixed pointed flakes to their weapons; and Broder, in his notes on Tacitus, observes, that many such have been discovered in the German provinces. Nor is it an uncommon thing to find arrowheads of flint in the ancient coins of flint in our own country. (See Gough, Sep. Mon. vol. i. p. 18.)

Among the Romans, although the tree called Corvus was very frequently made use of for the arrow-faith, yet the most common material was the reed, which grew in Italy, not with great strength, but in great abundance, particularly in the Pompeine marshes.

The use of the arrow among our early ancestors has been already spoken of (see Archary); the particular material, indeed, of which either the head or shaft was made, has not come down to us; but we can speak of the arrows of the middle ages with a greater degree of certainty.

Roger Asham thought (Toxophil. ed. 1571, f. 166.) that for the pluming of an arrow, the feathers from the wing of a grey goose were preferable to any other; which strongly reminds us of part of a stanza in the well-known ballad of Chevcy Chase, where an English archer aimed his arrow at Sir Hugh Montgomery:

"The grey goose weiging that was thereon, In his heartes blood was wette."

The more ancient ballad, however, reads, faneke feathers. In the "gelle of Robyn Hode," among Mr. Garrick's old plays, in the Muckle, the arrows of the outlaw and his companions are particularly described:

"With them they had an hundred bowes, The stringes were well ydght; An hundred shefe of arrows good, With hecche burnifli'd full breyth; And every arrow an ell longe, With peakele well ydght, And nocked they were with white silk, It was a feemly flght."

And Chaucer, in his description of the swyers yeoman, says:

"And he was clad in cote and hode of grene, A shefe of peakele arrowes breught and thicke, Under his belt he bare full thirthily, Well coude he dreffe his tackle yemanly: His arrowes droupt not with fethers lowe, And in his hande he bare a mighty bowe."

Prof. to Cant. Tales.

In the wardrobe accoutrements of the 28th Edw. I. (p. 350.) is a charge of verdigrise to flain the feathers of the arrows green. Nor are we to suppose that peacock arrows are only to be found in poetry; a wardrobe accoutrement of the 4th Edw. II. furnishes this entry; "Pro duodecin fleechis commenis de Arrew, emptis pro rege de 12 den." And Corvele Mulkham mentions that when he wrote, 1631, the penteck feather was sometimes used at the short butt; yet seldom or ever, he complains, did it keep the shaft either right or level. (Art of Archery, p. 94.)

"As chayn says, in the composition of an arrow there are three essential parts; the fluke or wadd, the feathers, and the head. The fluke was not always made of the same species of wood, but varied according to the different modes of shooting prescribed. He commands found off for military arrows, and prefers it to ash, which in his day, as well as at the time of Charles I., was generally used for the arrows of the army; but for palmyre he thought none were better than those made of oak, hard-beam, or birch. Occasionally, it should seem the arrow, toward the head, was pierced with brasil, holly, or other heavy wood, to make it fly the faster. (Mulkham's Art of Archery, p. 86.)

The arrows at Chievit Chace were drawn to the ear, contrary to the usage of the ancients, as appears not only from many of their relics, but the traditionary circumstance of the Amazonsparting with their belts as an indemnity to their using the bow. Some of our ancient ballads extend the length of the arrow to an ell; but the cloth-yard appears to have had the preference, and is mentioned not only in the old ballad of Chevy Chace, but by most of our historians, as the particular length of the arrow used by the English archers at the battle of Agincourt, 1415; and by Carew, (Survey of Cornwall, p. 73.) 1622, as in use among the Cornwall bowmen. (See Strutt's Sports and Pastimes, p. 50.)

Archers generally speak of an arrow weighing so many fluidrams; but they consider an arrow of an ounce's weight to be the belt for flight or hitting a mark at a considerable distance. As to the feathers, those of a goose are preferred; it is also wished that the bird should be two or three years old, and that the feather may drop of itself. Two out of the three feathers are commonly white, being plucked from the gander, but the third is generally brown or grey, being taken from the goose, and from this difference in point of colour informs the archer when the arrow is properly placed. (Arch. and vol. vii. p. 65.)

Mr. Grofe, in his Military Histo, (vol. ii. p. 160,) quotes a curious particular respecting arrow heads from Swinden's History of Great Yarmouth; where the sheriff of Norfolk, in the 42d of Edw. III, being ordered to provide a number of garbs of arrows headed with steel for the king's use, is directed for the heading of these to seize all the flocks of anchors (omnes alas ancorum) necessary for the purpose. Arrows were usually reckoned by the garb or h of. For immediate use they were carried in the girdle.

ARROW, for the graft bow. See Bolt.

ARROW. Fire. When the Parthians, under Xerxes, encamped on the hill opposite the city of Athens, they commenced their attack by flouting against the barricade of wood, which the oracle had declared invincible, arrows wrapped in tow, and fir-d. (Herodotus, Uraniu.) This, as far as we remember, is the earliest instance of fire arrows on record. Among the Romans they were seldom used. But the warriors of the middle ages frequently fixed phials of quicklime, or other combustible matter, to their arrow heads, and shot them from the bow; (See Matt. Paris, p. 1600, 1601) and in sea-fights they were found particularly serviceable. Even so low as the time of Edward VI. arrows with wild-fire, and arrows with fire-works, are mentioned among the arrows at Newhaven and Berwick. (Grofe, Milit. Hist. vol. ii. p. 276.)

ARROWS, Whiffing. The use of whiffing arrows, as laid in this country, cannot be carried to very high antiquity. It seems probable that they were first used on military occasions,
finns, and especially as signals during the quarrel of the roes. Hall (An. 7 Hen. VIII. fol. 56.) mentions a company of archers who met King Henry VIII. at Shooter's-hill, on a May-day morning, where they discharged their bows in his presence, and the arrows made a loud whistling in their flight, "by craft of the head." The slangers of the noise, we are told, surprised the king: but this is no proof that the use of the weapon was a novelty. In this case the arrow-head was usually made with horn, rounded at the end and pierced with f-velar holes. See Arch. vol. ii. p. 58.

For the practice of divining by arrows, see Belomancy.

Arrow, in Astronomy, Trigonometry &c. See Sagitta.

Arrow, in Fortification, is a work placed at the slanting angles of the glacis, and consists of two parapets, each forty toises long. The work has a communication with the covert-way, of about twenty-four or thirty feet broad, called capponier; and a ditch before it, of five or six toises.

Arrow, in Geography, the name of a rough, or lake, in the county of Sliö, in Ireland, which is about eight miles long, full of romantic and woody islands, and of a very irregular form; and also of a river proceeding from the lake, and running northward to Ballydore, where it rushes at once into the sea, breaking over rocks in the most romantic manner, from edge to edge, in many falls for the space of 200 yards, before it comes to the principal one, which is twelve or fourteen feet perpendicular. Beaufort. Young.

Arrow, in Surveying, is used for small straight rods, of which there are ten, about a foot or half a yard long, studded with iron ferris. Their use is to lie across the ground, at the end of every chain, in measuring lines.

ARRAUΣ, or Arracks, in Geography, a name given to the ancient natives of Hispaniola, Cuba, Jamaica, and Porto-Rico, as well as of Trinidad, who were a mild and comparatively cultivated people, and who seem to have had one common origin, as they speak the same language, follow the same institutions, and practise similar superstitions. Columbus treats of them as such; and the testimony of many contemporary historians confirms his opinion. The Charaibles, or Caribbees, regarded them as the descendants of a colony of Guiana, a race of Indians to whose noble qualities the most honourable testimony is borne by every traveller who has visited them, and recorded his observations. Mr. Bryan Edwards thinks it extremely probable, that all the various nations of this part of the New World, excepting only the Charaibles, emigrated anciently from the great hive of the Mexican empire. But at what period such emigrations were made; whether the Charaibles were previously pollefed of the widely extended coast that bounds the Atlantic, or, in posterior ages, accidentally found their way thither by sea from the continent, are points concerning which, as it is impossible to determine, it is in vain to inquire. Mr. Edwards has given a particular detail of their person and corporeal endowments, their intellectual faculties and dispositions, their political institutions, and their religious rites. See his History of the West Indians, vol. i. p. 60. &c. Arrow, Eff. See Eff-arrows.

ARRAWSIKE, in Geography, an island in the district of Maine, in America, separated from Parker's island by a small strait. It is within the limits of George-town; and contains nearly one-third of its inhabitants, and has a church. It comprehends about 20,000 acres of land.

Arrow, Magical, a sort of weapon very common among the barbarous inhabitants of Lapland, and many other of the northern climates; and supported to pollefs very strange virtues.

Arrow, Wildfire. See Wildfire, Vol. II.
ARS

faicida," however, was not extinguished in Artahanus, but continued to reign in Armenia, till the time of the emperor Juffianus, holding that kingdom of the Persians monarchs, to whom the "faicidae" of Armenia were tributaries. Anc. Un. Hist. vol vii. p. 129. Vol. ix. p. 240.

ARSACIDES, Land of, in Geography, high land, covered with wood, Situate near the mouth of the Angelus, in that part of Asia called Anablania, forms a part of the islands of Gower, Cartaret, and Simplon, seen by Captain Carteret in 1767, observed by M. de Bougainville in 1768, and seen by M. Surville in 1766, who called it the Archipelago of the Arsicades. This land forms some part, at least, of the Solomon islands, which were first recognized by the English; though the discovery of them is claimed by M. de la Tour, and other French writers, in favour of French navigators. These islands were visited in 1788, by Mr. Shortland, and called by him New Georgia. See Solomon Islands.

ARSÉ, in Ancient Geography, a people of Arabia Felix, according to Ptolemy.

ARSÉALITÉ, a people of India, placed by Pline beyond the Indus.

ARSAG, in Geography, a town of Italy, in the Milaneze, four leagues north of Milan.

ARSAMAS, a town of Russia, in the community of Novgorod. It is the capital of the district of Arjas, Situated on the river Teth, falling into the Oca, and on the road from Moscow to Archangels, 120 leagues southward from the former, and 200 north-west from the latter.

ARSAMATTHAS, in Ancient Geography, a river of Armenia, over which the Parthians compelled the Romans to build for them a bridge. Lipius has, without sufficient reason, corrected the text of Tacitus, and called it Arfànias.

ARSAMOSATA, Simsat. See Armosata.

ARSE, a town of Palentine, in which Afa, king of Israel, was buried, according to Josephus, Ant. i. v. c. 6. ARSANIAS, ARSEN, a river of Asia, which had its source in the mountains east of the Euphrates, and passing through a small lake, traversed the south-west between the mountains, passed by Arsamofata, and discharged itself into the Euphrates to the south-west of that city. Pliny, Dion, Plutarch, and Tacitus, mention this river; and the latter says, that it ran between Tigranocerta and Artaata.

ARSARATHA, a town of Asia, in Armenia Major. Ptolemy.

ARSCHIN, in Commerce, a long measure used in China, to measure fluids; of the same length with the Dutch ell, which is two feet eleven lines.

ARSCHOT, in Geography. See Arschot.

ARSE-veris, in Antiquity, a term, or formula, inscribed on doors, to prevent fire. It is said to be of Tuscan origin, where the word arse signifies arsenic, and veris, fire. Plut. Lex. Ant.

ARSEMINI, in Geography, a town of the island of Sardinia, seven miles south-west of Cagliari.

ARSENE, in Ancient Geography, a river of the western part of Arcadia, which ran from the north-east to the south-west, and discharged itself into the river Ladin.

ARSENA, a name given by Strabo to the lake Arethusa in Armenia Major.

ARSENALE, a royal or public magazine, or place appointed for the making and keeping of arms, necessary either for defence or assault. The Romans had arsenals in all the frontiers of their empire.

The arsenal of Venice is the place where the galleys are built and laid up. This is a fortification of between two and three miles in compass; on the ramparts are many little watch-towers, where escutcheons are fastened. Like the arsenal at Toulon, it is both a dock-yard, and a repository for naval and military stores. Here the Venetians build their ships, call their cannon, make their cables, fix their anchors, &c. — The arsenal of Paris is that where the cannon or great guns are cast. It has this inscription over the gate: "Arsenal, Henry IV., to the manufacturers of cannon, "Tous Cuirassiers, De Choultre, Sireux." There are arsenals or gun-rooms appropriated to naval furniture and equipments. — At Marseilles is the arsenal for the galleys; and at Toulon, Rochefort, and Breil, are those for the men of war.

ARSENARIA, in Ancient Geography, a Roman colony of Africa, in Mauritania Cæsariensis. This town was an episcopal see. It corresponds to the modern Arséw.

ARSENIAIT. See Arsenic, § 10.

Arsenic is a brittle acid-soluble metal, of a bluish white colour, easily tarnishing by exposure to the air: it does not melt, but volatilizes by a gentle heat; exhaling copious white fumes, with a peculiar allusive or garlic smell; it is soluble in nitric-nitric acid, and is precipitable in the form of a light orange-coloured powder by sulphuret of ammonia, or of a green colour by ammoniated copper.

§ 1. Ores of Arsenic.

Besides the ores of arsenic properly so called, this metal is found in combination with silver, copper, iron, lead, cobalt, antimony, and lime, all of which will be treated of in their proper places; at present we shall confine ourselves to those fruffles which, by the common content of mineralogists, are arranged as ores of arsenic.

Its colour when newly broken is a very light lead-grey, often passing into tin white; but the surface, by a short exposure to the air, becomes yellow, then blackish grey, and finally almost black.

It is found generally in mafs, more rarely disseminated; in kidney-shaped or clustered mafs, or in plates, or carious, branched, bearing impressions, &c. Externally it is rough or granular, with little or no luster, internally it is little shining, with a metallic lustre.

Its fracture is sometimes fine-grained, uneven, or curved lamellar; more rarely radiated or bundled. It flies when broken into indeterminate blunt-edged fragments, sometimes in the form of plates. It is also frequently composed of different concretions, either tellaceous, concentric, or kidney-shaped.

It acquires a polish by friction, and emits an aniseaceous odour; is half-hard and brittle. It rings when struck by a hard body.

Sp. gr. according to Brillon 5.724...5.763; according to Kirwan 5.67.

Before the blow-pipe native arsenic fuses without difficulty, giving out a copious, white, allusive flame; by an increase of heat it takes fire, burns with a bluish flame, and is wholly dissipated. It deposits on the charcoal, or any cold substance that is presented to it, a white powder, which is oxide of arsenic.

Native arsenic is not, however, in a state of absolute purity; it always contains a small and variable proportion of iron; besides occasionally a little gold or silver.
ARSENIC.

This mineral is found at Weilrich and Joachimsthal, in Bohemia; at Freyberg, Annaberg, Schn eебerg, Marienberg, and Johanneburg, in Saxony; at Andreasberg, in the Harz; at Geilberg and Seit lipach in Carnuthia; at Nagyag in Transylvania; and St. Marie-aux-Mines in France. It occurs only in the veins of primitive mountains: the substances that accompany it are red silver, realgar, galena, native silver, specular cobalt, kupfernickel, spathose iron, fahlerer, pyrites, quartz, heavy spar, calcareous and fleshy spars.

Of this there are two varieties.

Its colour where recently fractured is silvery white, but in general its surface is yellowish, greyish, or bluish, sometimes iridescent. It occurs in mafic, disseminated, involuting, or crystalized. The primitive form of its crystals is a rhomboidal prism, the angles of whose base are 105° 20', and 76° 40': the other varieties that have been ascertained are, the rhomboidal prism with dihedral summits (for arsen., dimin. of Haury), and the same prism with tetrahedral summits (E. sr. quadrilateral of Haury). The lateral faces are sometimes cylindrical, either concave or convex. The faces composing the sides of the prisms are always smooth and shining; those of the summits are crooked by attrition. Internally the marcasite is shining, with a metallic lustre. Its fracture is uneven, coarser, or finely granular; presenting occasionally columnar or granular distinct concretions. When broken it flies into indeterminate sharp-edged fragments. It is hard, generally giving fire with steel, and diffusing an alliaceous odour; it is brittle, but difficult to break.

Sp. gr. according to Gallert 5.75; according to Haury 5.52.

When exposed to the flame of the blow-pipe on charcoal, this mineral gives out a copious arsenical fume, and melts into a globule of brittle iron. Its analysis has not yet been made with any accuracy, and probably the amorphous kind at least, on account of the variable proportion of its ingredients, is incapable of affording an exact result. The con- fluent parts of pure mispickel appear to be only arsenic and iron, both of them in the metallic state; but it is often intimately mixed with iron pyrites, and hence affords an uncertain quantity of sulphur: two specimens analyzed by Vaqueruel, yielded respectively 35.8 and 4. per cent. of arsenic, which seems to show that mispickel and pyrites, though, when pure and crystalized, sufficiently distinct from each other, are so intimately blended by nature, as to pass by insensible gradations from the one to the other extreme of the series. In several of these compounds, however, minute inspection has discovered small separate cubes of pyrites; and the intermediate varieties are rather to be considered as simple mixtures than chemical compounds.

The two substances with which marcasite is liable to be confounded, are arsenical cobalt and pyrites. It differs from the first in being harder, in having a yellowish white tint, while the colour of the other is reddish white, and in the form of its crystals: it is distinguishable from the latter by giving out when struck an arsenical, instead of a merely fulphurous odour, by the lighter yellow of its colour, and by its crystalline forms.

Marcasite is found in Bohemia, in Saxony, in Silesia, in Cornwall, and various other places, either in veins, or disseminated through primitive mountains. The substances by which it is accompanied, are generally tin-stone and galena; more rarely black blende, spathose iron, copper pyrites, quartz, fluor, and calcareous spars. At Reichenbach in Silesia, it is found in serpentine rock.

Marcasite appears to be made little or no use of: the more brilliant specimens are occasionally cut and polished, and made into buttons, and other small articles; this is particularly the case with some found near Dublin, and called Irish diamonds.

Var. 2. Argentiferous marcasite. Weißerz, Werner.

Its colour is similar to that of the preceding variety, but when exposed to the air it tarnishes to a deeper yellow. It is rarely found in mafic, being generally disseminated or crystallized in minute acicular four-sided prisms. Externally it is shining, internally little shining, with a metallic lustre. Its fracture is fine-grained, uneven, with granular distinct concretions.

Its other external and chemical characters correspond with those of the preceding variety, from which it differs only in a variable proportion of silver, from 1 to 10 per cent., and for which it is often worked.

It is found at Freyberg and Braundorf in Saxony; and is usually accompanied with common marcasite, red silver, galena, copper pyrites, &c.

For the affinities of this mineral with arsenical silver, see Silver. Orts of.

This species is divided into two varieties, the red and yellow.

Its colour is a bright Aurora red, passing on one hand to scarlet-red, and on the other to yellow-orange. It is rarely found in mafic, more frequently disseminated or involuting, and very frequently crystalized. The primitive form of its crystals is a long octahedron, with faceted triangular faces exactly the same as sulphur. The two pyramids of the octahedron are sometimes intercepted by a quadrilateral prism (see Crystallographical Plates, fig. 94.), forming the variety A. f. r. emouillé of Haury; other varieties are derived from bevelling and truncating the angles of the intervening prism; and a further variety (fig. 95.) A. f. r. furcomposé of Haury, is produced by the truncation of all the fold angles of the terminating pyramids. The crystals are for the most part small, and not easy to determine. Their surface and interior are shining or much-shining, with a vitreous lustre. The fracture is uneven granular, passing into minute conchoidal: the fragments are indeterminate, blunt-edged. It is commonly translucent, occasionally semi-transparent or opaque. The colour of its streak is orange-yellow. It is very tender, somewhat brittle, and easily broken by the nail.

Sp. gr. according to Brugman 3.22. Brisson 3.33. It is idio-electric, acquiring the reflexion electricity by friction.

Before the blow-pipe it melts easily, burns with a blue flame, and a fulphurous arsensical odour, and is for the most part volatilized. Nitrous acid in a short time deprives it of its colour. It has never been accurately analyzed, but contains principally of arsenic and sulphur.

Realgar occurs native in the vicinity of Etna and other volcanos, and also in the primitive mountains of Germany, Hungary, and Switzerland. The substances that are found most frequently to accompany it are native arsctic, red silver, and galena.

The substances that it resembles are red silver and chro- mated lead; it may, however, be distinguished from the first by the following properties: the powder of the fiver ore is red, that of the realgar orange-yellow; the fp. gr. of the silver...
silver ore is the greatest, in the proportion of about 5 to 3; besides which, it does not become elective by friction, nor does it flame or volatilize by the blowpipe. Chromated lead is more than twice as heavy as realgar, and exhibits the same differences with regard to electricity and habitus before the blowpipe as red silver.

Native realgar is made of no use; for the purposes to which the artificial is applied, see § 11. of this article.

Its usual color is a beautiful lemon-yellow, passing on one side into sulphur-yellow, gold-yellow, or honey-yellow, and on the other into aurora red. It is found disseminated, and in masses. It is internally shining, or very shining, with a bright wax-like lustre, sometimes passing into the metallic. Its fracture is straight or curved foliated. In masses it rarely is more than translucent at the edges, but in thin plates it is semi-transparent. Its streak is of the same color as the mineral itself, only a little lighter. It is very tender, soft to the touch; when in plates it is flexible though not elastic. Sp. gr. 3.45: It is idio-electric, and in its chemical characters, corresponds with the preceding variety. It confounds of sulphur and arsenic, but the proportions are not ascertained with accuracy.

Orpiment is found in the Banat in Natolia and Serbia, at Nagyag in Transylvania, Pelfobanya in Hungary, &c.

It appears to be a mineral of late formation, being always found in strataform mountains. It is, for the most part, accompanied by clay, quartz, &c. &c. sometimes by realgar.

The crytaline forms that are usually attributed to this mineral are, upon the whole, referred to the preceding variety.

Its color is snow-white or yellowish, reddish, or greenish-white; it is found also of a clear smoke grey. Its common form is that of a superficial earthy friable crust on the surface of other minerals; more rarely it occurs in an indurated state, either flake-like, chaffed, or crytalized. The crytals are always extremely minute, sometimes capillary, bundled, interlaced, or diverging, sometimes in octahedrons, sometimes in quadriangular tables. When crytalized it appears to be translucent, but in the earthy state it is always opaque. It is very tender. often friable, brittle; has a very sharp disagreeable taste. Sp. gr. 3.7.

Before the blowpipe it gives out a white smoke, and the usual arsenical odour; the grey coloured, as being little oxydated, burns with a blue flame: after a time, but not so quickly as native arsenic, it is almost wholly volatilized. It is soluble in fifteen times its weight of boiling water: and appears to be an oxyd of arsenic nearly pure with a variable proportion of oxygen. The only Substance with which it is liable to be confounded, is the Pharmacolite, or native arsenic of lime: this latter however is insoluble in water, and leaves a considerable residue when exposed to the blowpipe.

The native oxyd of arsenic is a mineral of very rare occurrence; it is found at Joachimsthal in Bohemia, in Saxony, Hesse, Transylvania, and Hungary, in the vicinity of native arsenic, and in certain cobalt mines.

§ 2. Assay and Analysis of Arsenical Ore.

Arsenic is a metal in itself of so little value, and sonoxious to other metals by its obdurate adherence to them, rendering them brittle, and degrading their colour, that in all works in the great, and even in almost all chemical analyses, every method has been resorted to in order to drive off the arsenic, and its proportion to the whole mass has only been vaguely estimated by the loss of weight experienced during the process. The methods employed by Bergman, and the term of his contain parare, for ascertaining the quantity of arsenic in any of its ores are extremely imperfect; even the accurate Klaproni confounds the imperfections of his mode, and till the publication of Mr. Cheniev’s Analysis of the Arseniates of Copper and Iron, chemistry had attained no certainty in the resolution of this important problem. We shall only mention the advantages and defects of the methods recommended by Bergman, Kirwan, Klaproth, &c. and then proceed to the more accurate ones of Cheniev.

The decomposition either of the native arsenic or marcasite, Bergman proposes to treat the pulverized ore with four times its weight of nitro-muriatic acid, formed of one part nitrous and one a half or two parts muriatic acid. By this menftruum the silver will be converted into muriated silver, and will, together with the oxide, remain undissoved, and the arsenic and iron will continue in solution. The filtered liquor is to be evaporated to one-fourth of its bulk, and poured into water; the arsenic will thus be precipitated, and the iron may then be thrown down from the filtered liquor by ammonia, &c. Another way of proceeding is to boil the ore with dilute nitrous acid, in order to take up the silver, copper, &c., while the arsenic will remain behind in form of a powder, and may afterwards be taken up by nitro-muriatic acid, and precipitated from its solution by water.

For these methods, however, it may be objected, that the precipitation of arsenic from its solution in nitro-muriatic acid by water, is denied by some chemists; and even if the fact of precipitation be allowed, still it is certain that some of the arsenic will remain in solution. 2dly, Antimony, which is often mingled with arsenic ore, will also be thrown down by this process. 3dly, The Ammonia added to the remaining liquor, besides precipitating the iron, &c. will, by destroying the excess of the nitro-muriatic acid, allow the arsenic acid to combine with the oxyd of iron, and thus induce an error in the proportion of this last metal. 4thly, It appears from the uniform experience of Klaproni, and other eminent chemists, that arsenic is abundantly soluble in nitrous acid, and that the silver precipitated from such a solution, even by muriat of soda, contains a little arsenic; and whichever of the alkalies was afterwards used for throwing down the copper, &c. the necessary neutralization of the nitrous acid would afford an opportunity for the arsenic acid to combine with the oxyd of copper.

The native oxyd of arsenic is proposed by Kirwan to be dissolved in boiling water, and of course its proportion is to be ascertained by the loss of weight fulfilled by the quantity of ore thus treated. But (besides other objections) the dark-coloured varieties of this ore are probably not sufficiently removed from the metallic state, to be thus soluble. In order to decompose reale for arsenic, Bergman directs long-continued ebullition with muriatic acid, adding, if necessary, a little nitrous, till the insoluble residue becomes grey. The insoluble powder is the sulphur, and the arsenic solution is to be decomposed as before mentioned by water. In this process, however, the sulphur will still retain some arsenic; and a little of the sulphur will be oxygenated, and converted into sulphuric acid. Mr. Kirwan recommends
ARSENIC.

The analyses in the dry way of the arseneous ores are still less satisfactory than those in the humid way above recited. If sublimation in close vesseis has had recourse to, a very intense and long-continued heat will be insufficient to volatilize the whole of the arsene; the sulphur will also rise at the same time and produce orpinment. Roasting in a muffle, provided the ore is mixed with powdered charcoal, is more effectual; but in this case, not only the arsene, but the sulphur and antimony, if there happens to be any in the ore, will fly off, and the relative proportions of these must be estimated by mere guesses.

Klaproth's method of treating the unfulphurated ores of arsene may be deduced from his analysis of the arsenical silver ore, which consists of iron, arsene, silver, and antimony. He first digests the ore with moderately strong nitric acid, which takes up the arsene and the greatest part of the iron and silver: the addition of muriat of soda throws down the silver in the state of muriat combined with a few atoms of arsene; and afterwards, the arsene of iron is thrown down by potash; this precipitate being dried and weighed, is afterwards roasted with charcoal several times, till it ceases to give out arseneical fumes, and is tractable by the magnet: from the loss of weight sustained by the iron, the quantity of arsene is then estimated. This however, as Mr. Klaproth himself observes, is a very imperfect method. Another way practised by him in the analysis of the arsenical cobalt is, to digest the ore in nitric acid, which oxidises the arsene and takes up the greater part of it, leaving the residual arsene soluble in water. The nitrous solution is then evaporated as long as it continues to deposit oxys of arsene, and the oxys of cobalt afterwards separated by potash from the nitrous acid, is presumed to be pure, because it affords a sympathetic ink with mutric acid. From this humid analysis the cobalt ore is flated by Klaproth to contain 54.5 cobalt, 45 oxys of arsene and 4 sulphur: a specimen, however, of the same ore treated in the dry way, afforded only 44 cobalt; there was therefore required to make up the 100, 4 sulphur, and 55.5 regaline arsene. Hence it is evident, that little dependence is to be placed on the estimation of the quantity of arsene from the oxys precipitated by evaporation of the nitrous solution.

A more certain mode of ascertaining the proportion of arsene is furnished by Mr. Chenexiv. Let the ore, previously reduced to extremely fine powder, be digested in nitric acid sufficient to acidify and take up the whole of the arsene; pour off the clear liquor, and boil on the residue some distilled water; filter, and add the water to the nitrous solution; then neutralize the excess of acid by potash, taking care, however, not to have an excess of alkali, and add nitrat of lead as long as any precipitate takes place: wash the precipitate in cold water, dry and weigh it. As the arseneous ores often contain sulphur, it is possible that the arsene of lead thus procured, may be mixed with a little fluphat of lead: to decide this, digest the powder in some warm dilute muriatic or nitric acid, and the arsene of lead will be dissolved, leaving the fluphat behind. 100 parts arseneate of lead contain, of arsene acid 33, oxys of lead 63, water 4, and the 33 parts arsene acid, denote 22 of the metal.

§ 3. Reduction of Arsenical Ores, and Preparation of Crude Arsenic, and White Arsenic.

Arsenic is a substance of such small value and such little demand, that none of the proper ores of this metal are wrought in the great; the whole of the arsene of commerce being prepared in Saxony, by roasting the cobalt ores in the manufacture of zafir. These consist principally of arsene, cobalt, iron, and a little sulphur: the first and last ingredients of which are got rid of by roasting: this process, instead of being performed in the open air, is done in an oven, the flue of which runs horizontally to a considerable distance before it bends upwards. By this contrivance the arsene and sulphur, when liberated, are for the most part deposited in the horizontal flue in the form of a greyish meal, streaked with yellow (such portions as are nearest the fire being often melted into a feftamentary crystalline mass). In this state it is called crude arsene, or flowers of arsene; the yellow flecks proceed from the sulphur uniting with the arsene into orpinment; and besides this, it is also fulfilled with other impurities.

The white arsene of commerce is prepared from the crude, by mixing this last with potash, or as some advise, with lime, and re-subliming. By this the sulphur and other impurities unite with the alkali, and the white oxys is driven over into a heated receiver, where it melts into a heavy colourless transparent glass: by expoufure for a short time to the air, this glass becomes opaque, and resembles in its fracture the finest white china; and it is in this state that the white arsene of commerce is found in our shops and laboratories.

§ 4. Preparation of Reguline Arsenic.

The old method of procuring the regulus of this metal confuted in mixing white arsene with half its weight of black flux, one fourth part of borax, and the same proportion of filings of iron or copper, and fufing the whole as quick as possible in a crucible. When the whole is grown cold, there will be found, on breaking the crucible, a mass of impure metallic arsene, of a bluish white colour and considerable hardness and solidity. Probably this regulus was originally made from the crude arsene, in which case the addition of iron or copper was for the purpose of separating the sulphur according to the process mentioned for metallic arsene.

Klaproth found, however, that the arsene must contain a variable proportion of iron or copper when prepared according to this method, by which its external and chemical characters will be in some degree modified. Another way of obtaining the regulus is recommended by Brandt, to which there can be no objection, upon the supposition that he used crude arsene. He directs that white arsene should be milled with fop, and sublimed: in this operation the oil of the soap serves to de-arsenate the arsene, and the alkali to keep down any portion of sulphur that may have been combined with the arsene.

The white arsene of commerce being an almost entirely pure oxide of arsene, the reduction of it into the metallic state is very easily effected. The most eligible way is to mix the white arsene with any of the vegetable or animal expressed oils, till it becomes of the consistency of very soft glazier's putty; it is then to be made up into round or oblong pieces, and dropped into a Florence flask, so as not to adhere to the sides. The flask with its contents is to be put into a sand-bath, or over a gentle charcoal fire, and must be heated very gradually as long as any thick vapours proceeding from the decomposition of the oil are given out. When these cease, the heat may be increased till the bottom of the flask becomes obscurely red; shortly after the flasks may be withdrawn from the fire, and when cold, upon carefully breaking it, there will be found in the neck and upper part of the veffel, a crust of brilliant triangular crystals of oxide of arsene, semi-transparent, and
of a yellowish grey colour, below these there will be a thick amorphous crust of regulus, and some impurities will remain at the bottom. Let these products, except the impurities, be separated from the fragments of glass, and pulverized together with half their weight of charcoal; then re-sublime the whole asbefore, and the inside of the flask will be found lined with a crust and crys tallites of pure and shining regulus of arsenic. It is necessary that these sublimations should be performed under a chimney, for the vapours that arise are intolerably fatal, and extremely noxious to the operator, bringing on in a very short time headache, fickleness, and other unpleasant symptoms. Instead of a flask, an earthen retort may be made use of.

The fresh surface of arsenic is of a bright metallic lustre, and a colour between that of tin and lead; it very soon however tarnishes by exposure to the air, becoming first yellowish, then slightly iridescent, and finally black, in which state it is also wholly delusive of lustre. Its fracture is compact, granular; in hardness it is said to be superior to copper, but it is so brittle as to be reducible to power in a common mortar without any difficulty, being neither malleable nor ductile. It crystallizes in octahedral or tetrahedral pyramids. Sp. gr. = 8.3, according to Bergman, but according to Morveau = 5.76. It is not fusible to the small white lead, yet the fingers after handling it acquire a slight metallic odour; it is sublimed to the tallow by a peculiar acid flavour; and when heated to volatilization, diffuses a characteristic fetid alligaceous odour.

I. Effects of Heat.

Arsenic, when pure, is incapable of being melted; in clove vessels, at a heat inferior to that required for the fusion of tin, it begins to be volatilized, and is deposited in the upper and cooler parts unchanged in form or properties.

II. Effects of Atmospheric Air.

Atmospheric air at the usual temperature is slowly decomposed by this metal, the oxygenous part uniting with the arsenic, and converting it into a black oxyd, as mentioned § 5. At a heat of about 350° Fahr. the absorption of oxygen is much more rapid, and vapours of white oxyd begin to be visible, diffusing the well-known arsenical smell. At a higher temperature combustion takes place: thus if a vessel or crucible be made red hot, and a few pieces of arsenic be thrown in, a dense white vapour is immediately produced, accompanied by a light blue flame, and in a short time the whole is volatilized. This experiment must not be made in an iron ladle, for the affinity between the two metals at this temperature is so great, that artificial milfpicklet would be formed, and this being very fusible, the ladle would in all probability be found after the process to have a hole in its bottom.

III. Effects of Water.

Although arsenic is so easily oxydable, yet it does not appear capable of decomposing water; at least it may be immered in it for any length of time without exhibiting any signs of solution or oxydation; and a covering of this fluid or of alcohol is the best preservative of arsenic against the tarnishing effect of the air.

IV. Arsenic with Hydrogen.

This combination was first discovered by Scheele. If liquid arsenic acid be digested with zinc, an effervescence will take place; and the air thus disengaged, has a strong arsenical smell, inflames by the contact of a candle, and deposits on the inside of the vessel a brown film, which is metallic arsenic. The same gas may also be produced by granulated zinc in a hot solution of white arsenic in water with the addition of a little muriatic acid.

V. Arsenic with Phosphorus.

The union of these two substances was first observed by Marignaffi whose experiments have since been repeated and confirmed by Pelletier. Phosphuret of arsenic may be made in four ways: first, by subliming equal parts of phosphorus and white oxyd of arsenic, in which case, part of the phosphorus will be condensed at the expense of the metallic oxyd, while the remainder will combine with the metallic base; secondly, by subliming equal parts of reguline arsenic and phosphorus; thirdly and fourthly, in the bound way, by digesting equal parts of arsenic or oxyd of arsenic, with the same weight of phosphorus in a flask, containing a sufficient quantity of water. Phosphurated arsenic is volatilizable in a moderate heat, and is combustible on hot coals, exuding the mixed odour of its ingredients.

VI. Arsenic with Sulphur.

Both arsenic, and the white oxyd, are capable of uniting with sulphur, by means of fusion or sublimation, into a beautiful red or yellow mass, according to the relative proportion of the ingredients. The yellow is called orpine, or yellow sulphuret of arsenic, the red, realgar, or red sulphuret. The sulphur in the realgar is to the arsenic as 1 to 4 nearly, but in the orpine as 8 to 9 or 10. Both preparations are fusible, and may be sublimed, but the realgar is more easily melted, and with care may be obtained quite transparent, and of a bright red colour; hence it has been called arsenical ruby, rubine d'arsenique. The fp. grav. of orpine, according to Bergman, is = 5.15; but of realgar, only = 3.25.

These two substances have not been very accurately analyzed, and it is the opinion of several modern chemists, that the differences between them does not depend so much on the proportions of the sulphur and arsenic, as on the presence of oxygen in the one, and its absence from the other. Hence they call realgar, sulphuret of arsenic, and orpine, sulphurated oxyd of arsenic. This appears, however, to be a mistake, for the following reasons; when regulars of arsenic and sulphur are mixed together, the combination takes place without the extrication of any gas, but when the oxyd of arsenic is sublminated for the regulars, at the moment of combination a portion of the sulphur is converted into sulphureous acid gas, probably on account of a decomposition of the metallic oxyd. Further, it appears from the experiments of Bucquet, that by continued fusion orpinet is made of a much redder colour than before, by the volatilization of part of its arsenic; and as an additional confirmation, it may be mentioned that realgar, being sublimed either with metallic or oxydized arsenic, is converted into orpine.

It is not very easy to make realgar by the direct combination of its elements when they are in a state of purity, on account of the ease with which they are volatilized before they have experienced the proper degree of heat. In Saxony, where orpinet and realgar are made in large quantities, the method is to fill an oven like that described in § 3, with milfpicklet and iron pyrites, proportioning the quantities of each according as realgar or orpinet is intended to be produced. Now the sulphur and arsenic contained in these minerals being in natural combination with iron, require for their sublimation a degree of heat far greater than they could sustain without volatilization, if they were pure.

Sulphurated arsenic is wholly insoluble in water or alcohol. The nitrous and nitro-muriatic acids, especially when warm, take up the arsenie from the sulphur. The former of these, however,
however, except it is so concentrated as to act on the sulphur also, only takes up a portion of the arsenic from realgar, converting it into orpinment. Nitro-muriatic acid completely decomposes both the red and yellow sulphuret, hepatic gas being given out at the same time, a circumstance worthy of notice, as affording additional strength to the opinion mentioned above, concerning the flate of the metal in these compounds. Sulphuret of arsenic is also decomposed by distillation with two or three times its weight of corrosive muriatic of mercury, the acid and oxygen of the mercurial salt uniting with the arsenic into corrosive muriatic of arsenic, § 7, and the metallic base with the sulphur of the orpinment, forming cinnabar.

In the dry way, the fixed alkalis decompose orpinment into alkaline sulphuret and arsenic, which latter sublimes; but if the alkali is in excess, the arsenic is in part detached as well as the sulphur. A solution of caustic potash in water being boiled with orpinment, diffuses it completely, but by the addition of an acid a yellow precipitate is thrown down, which probably is a hydro sulphuret of arsenic. Quicklime and orpinment also unite by boiling in water, forming an arsenio-sulphuret of lime, which is sometimes employed as a Wine-test.

VII. Arsenic with Oils.

Any of the expressed oils being triturated with arsenic, gradually diffuses it, and thus acquire a dark colour and confidence like faly.

VIII. Alloys of Arsenic.

Arsenic unites with almost all the metals, debasing the red and yellow ones, and destroying in a great measure the luster of all the red, except tin. It renders those which are malleable and ductile, brittle, and for the most part increases their fusibility and hardness. For other particulars, see the several metals.

§ 7. Salts of Arsenic.

1. Reguline arsenic is acted upon by sulphuric acid when concentrated and affilied by heat: if the operation be performed in a retort with a pneumatic apparatus, there will be produced a considerable quantity of sulphurous acid gas, and sulphur will sublume into the neck of the vessel. What remains behind is a white mass similar to oxyd of arsenic, but combined with a little acid. By the addition of a fresh portion of sulphuric acid, the sulphated oxyd is taken up; as the liquor cools, however, a precipitation of crystalline grains happens, and these are sulphat of arsenic. This salt is much less soluble in water than white arsenic; when exposed to the flame of a blow-pipe, it fuses and begins to emit an arsenical smoke, but requires a much longer time for its volatilization than the simple oxyd. By repeated cohabitation with sulphuric acid, the arsenic approaches more and more to the nature of arsenic acid, but always contains in some degree sulphated.

2. Nitric acid when hot is readily decomposed upon reguline arsenic, being itself changed into nitrous gas, and the metal becoming oxydated. An addition of dilute nitrous acid at a boiling temperature effects a complete solution of the residual oxyd, and the liquor by evaporation and cooling may be brought to deposit crystals of nitrat of arsenic. This salt being abstracted with fresh nitrous acid, and then heated red hot, is wholly converted into arsenic acid. Nitrat of arsenic is sparingly soluble in water, and with the blow-pipe exhibits nearly the same appearances as the preceding salt.

3. Oxymuriatic acid when pure, fresh made, and in the form of gas, exercises a very powerful action on the regulus of arsenic, and exhibits a very striking and beautiful appearance. For this purpose, let a common fry or eight ounce phial be filled in the usual way with oxymuriatic acid gas procured from falt, manganae, and sulphuric acid, in order to have the acid as dry as possible (for the further securing of which, the gas produced about the middle of the process is the belt); lop the mouth of the phial with a cork, and place it on a table in an upright position; then reduce some reguline arsenic to a fine powder, and cautiously opening the mouth of the phial, thake in from the end of a knife, or in any other convenient way, a little of the powder. As soon as it comes in contact with the gas, a white vapour will first appear, and will be immediately followed by ignition of the metal, which in its passage to the bottom of the vessel will appear like a stream of fire: this phenomenon may be repeated with successive portions of powder till the acid is almost wholly decomposed. At the bottom will be found a white acidulous oxyd of arsenic. Liquid oxymuriatic acid also is capable of dissolving reguline arsenic; but during this process, the metal being oxygarnated at the expense of the acid, the result is muriat of arsenic.

Arsenic acid has a remarkable action on its own regulus, though the two appear to be incapable of combining into a proper salt. If the regulus is digested with the acid, its surface becomes shortly covered with a white powder, which is oxyd of arsenic. If the acid is kept in a flat of fusion in a retort, and small pieces of the regulus are dropped in from time to time, an inflammation and lubimation of white arsenic will be manifest at each addition. Hence it appears that the oxygen of the arsenic acid quits this to combine with the regulus, till an equilibrium is produced by the one and the other brought to a common flat of oxydation.

There are all the acids which are known to act upon reguline arsenic; many others however are capable of combining with this metal, when previously brought to the flat of white oxyd. The facts hence resulting we shall proceed to mention.

1. Muriatic acid when boiling will take up one third of its weight of oxyd of arsenic; a saline precipitate is produced by cooling, and if this is managed gradually, there are formed spicular crystals of muriat of arsenic. This salt sublimes wholly if exposed in clove vessels to a moderate heat. Before the blow-pipe on charcoal it is decomposed in part, and flies off, giving out at the same time the distinguishing odour of the metal. It is soluble, though sparingly, in warm water, and the solution is decomposable by an alkali, the oxyd of arsenic being thrown down.

Very dry and concentrated muriatic acid, or oxymuriatic acid, are capable of uniting with a much larger proportion of oxyd of arsenic than the liquid muriatic acid. This combination is called butter of arsenic, and is thus prepared: take one part of white arsenic, one and a half of red calcined sulphat of iron, and three parts of common salt; mix them accurately in a mortar, and sift in a glass retort from a sand bath. When the heat has been gradually raised so as to make the bottom of the retort nearly red, and nothing more comes over, the process is finished, and there will be found in the receiver two distinct liquors of different consistence. The lower one is of a clear iron brown colour, and is called butter of arsenic; the supernatant liquor is thinner, of a lighter yellowish colour, and is called oil of arsenic.

Butter of arsenic is a heavy thick liquor, excessively corrosive and poisonous; on exposure to the air it exhales a dense white suffocating vapour, deliquates, becomes turbid, and finally is spontaneously decomposed. When, instead of this gradual absorption of moisture, it is directly mingled with water, an immediate turbidness and precipi-
A S E N I C.

Fluoric acid, when digested on white oxvd of arsenic, dissolves a small proportion; and by evaporation and cooling, a granular crystalline salt is obtained, {

4. Boracic acid combines with white arsenic by means of water, but not in the dry way, according to Reuss. Equal parts of the oxvd and acid digested together in a little water are entirely diffused, and afforded by evaporation \textit{brous} of arsenic in powder or picipal crystals.

5. Phosphoric acid and oxvd of arsenic combine together without difficulty in the moist way, and afford crystals of \textit{phosphat} of arsenic. This salt is very sparingly soluble in water, and is decomposable by heat, the oxvd being volatilized.

6. Liquid tartaraceous acid unites by digestion with oxvd of arsenic into a crystallizable salt, \textit{tartrate} of arsenic; the properties of which are as yet in a great measure unknown.

7. Oxalic acid dissolves very calmly a considerable quantity of white arsenic, and the liquor affords by evaporation and cooling precipitate crystals of oxalot of arsenic, these melt in a very gentle heat, the water of crystallization with part of the acid is evaporated, and the residue affords a very beautiful tafine vegetation. Oxalot of arsenic is soluble both in water and alcohol, changes the colour of litmus tincture to red, and sublimes at a moderate heat; but at a higher temperature the acid is first destroyed and flies off, leaving behind the metallic oxvd.

8. Acetic acid, by long digestion and boiling with white arsenic, dissolves a small proportion, and deposits by cooling and evaporation small crystalline grains of \textit{acetat} of arsenic, which are very sparingly soluble in water.

9. Benzoic acid, according to Trommborf, dissolves white arsenic with considerable ease, and forms with it \textit{benzoyl of arsenic}. This salt appears in the form of long slender radiating crystals, posseted of a four and pungent tafle, which effloresce in the air, are very soluble in boiling water, and are again for the most part deposited by cooling.

10. Gallat of arsenic is not known, nor does the tincture of galls, according to the chemists of Dijon, produce any alteration in a solution of white arsenic.

11. Pruffiat of potash, when pure, throws down an abundant white precipitate from the solution of arsenic in muriatic acid. This is soluble in a large quantity of water, and by sublimation in the dry way affords a semi-transparent macl; it is probably a \textit{pruffat} of arsenic, but has been as yet scarcely at all examined.

The order of affinity of the various acids for oxvd of arsenic is not ascertained with much certainty. Bergman arranges them in the following order: muriatic, oxalic, sulphuric, nitric, tartaraceous, phosphoric, fluoric, arsenic, acetic, and prufic acids.

\textit{Oxvd of Arsenic, or Arseniac Acid.}

Oxvd of arsenic is prepared in the large way according to the method already mentioned in \textsection 3. When pure, it is of an opaque white colour; or if recently fused, is perfectly transparent and colourless. It crystallizes artificially (\textsection 4.) in three-fided pyramids, the vertical angle of which is generally deeply truncated; the crystals are transparent, of a dilute wine yellow colour, and not liable to effloresce or become opaque by exposure to the air, probably owing to their containing rather a smaller proportion of oxygen than the white arsenic of the fops. The fp. grav. of the fused oxvd is about \(=5\). It flows exces upon the tongue a sweetish acid taste. It is the most volatile of any of the metallic oxvds, rising at \(=83^\circ\) Fahr.

Pure water at the temperature of \(60^\circ\) Fahr, will dissolve about \(\frac{3}{5}\) of its weight of this oxvd, but when boiling it takes up \(\frac{7}{5}\) the greater part of which it retains even when cold; by evaporation, however, minute three-fided pyramidal
ARSenic.

Pyramidal crystals are deposited: the solution is clear and colourless. Alcohol also, when boiling, will diffuse about \( \frac{1}{\sqrt{\gamma}} \) or \( \frac{1}{\gamma^2} \) of its weight.

From many of its properties white arsenic seems to hold a kind of middle place between an acid and metallic oxid: thus, it reddens litmus tincture, but turns syrup of violets green, and its aqueous solution is incapable of causing an effervescence in the carbonated alkalies and earths. In the new chemical nomenclature it is denominated the arsenious acid (\( \text{acide arsenieux} \), \( \text{Fr.} \)); and the salts that are formed by its combination with the alkalies, earths, and metals, are called arsenites. These seem to hold nearly the same relation to arsenic acid and the arseniats, as sulphurous acid and the sulphites do to sulphuric acid and the sulphates.

The white oxid of arsenic is easily deoxidized by carbonaceous matter, by hydrogen, phosphorus, and sulphur, as already mentioned \( \S \) 4. and 6. and is reduced to the state of reguline arsenic: its habits with acids are described \( \S \) 7.

If to a solution of caustic potash in water there be added some finely powdered oxid of arsenic, the whole combines together by a boiling heat into a thick, viscous, scarcely fluid matter, of a brown colour, and nauseous smell, which as it cools becomes solid and brittle. This was named by Macquer \textit{liver of arsenic}, and in the modern system has obtained the name of \textit{arsenite of potash}. By long exposure to the air it becomes deliquescing; it is readily soluble in water, but has not been made to crystallize. The addition of any of the acids to the solution causes an immediate decomposition with a copious precipitation of oxid. Caustic soda produces the same general effects on white arsenic as potash; except that the arsenite of soda is crystallizable. Either of these salts, on being subjected to a full red heat, is decomposed; the greater part of the arsenic being volatilized in the form of a dense white smoke, while the remainder in the state of arsenic acid remains united with an excess of alkali. In the dry way, the white oxid of arsenic melts together with the fixed alkalies, forming a mass not easily decomposable by heat. According to Bergman, potash is capable of thus fixing twice its weight of the oxid, and soda three times its weight of the same.

When ammoniacal gas is passed for two or three times over heated white arsenic, the two substances contract at length to intimate an union as to bear even fusion without separating from each other. In the moist way also, a combination takes place by the help of a gentle heat, which differs essentially from the common liver of arsenic in that the acids occasion no precipitation. These are singular facts, and the nature of the arsenite of ammonia is well worthy of more notice from chemists than it has yet obtained.

Quicklime and barytes combine by fusion with oxid of arsenic into a vitreous mass, which however becomes milky and opaque by the continued action of the air. In the moist way, lime and white arsenic being boiled together form a soluble arsenite of lime, from which a precipitate is thrown down on the addition of an acid. Neither magnesia, alumine, nor fluxes, appear capable of uniting with white arsenic by fusion, but all or any of them combine into an easily fusible mass with the arsenites of potash, soda, lime, or barytes.

But few of the neutral salts have been examined with respect to their action on arsenious acid. The nitrates of potash and soda are decomposed by heat converting the arsenious into the arsenic acid, and therefore this combination is treated of in \( \S \) 10. (\textit{Arseniate}). The effect of white arsenic on acetic of potash, as recorded by Cadet and the other chemists of the academy of Dijon, is however too remarkable to be omitted. A mixture of these two substances being subjected to distillation, there first passed over a limpid liquor, with a slight arsentic smell; this changed the colour of syrup of violets red, caused an effervescence in a solution of carbonated alkali, and rendered the liquor turbid. The next product was of a reddish brown colour, and filled the receiver with a dense vapour of a must pelliferous smell, different however from that of arsenic: towards the end of the process, some reguine arsenic sublimed into the neck of the retort. The red liquor, after being from dried for three weeks in a reported phial, was still smoking, and exhaled the same detectable fumes as before; it produced no alteration in syrup of violets, and occasioned only a very feeble effervescence with carbonated alkali, depositing a little flaccid sediment: it occasioned a white precipitate in a solution of corrosive sublimate: being poured into a filter, in order to separate a yellowish thick portion that had separated from the ret, I nearly had a few drops passed through, than a dense suffocating vapour began to rise accompanied by an ebullition at the edges of the vesel and immediately followed by a beautiful rose-coloured flame which lasted several seconds.

A hot solution of arsénious acid dissolves some of the metals, particularly copper, iron, and zinc; the differences, however, between these and the metallic arseniats have not been ascertained with much accuracy.

\( \S \) 9. \textit{Arsenic Acid}.

The properities of the white oxid of arsenic that have been mentioned in the preceding sections, especially its ready solubility in water, its crystallizability, its taste, its habits with alkalies and metals, had long induced a suspicion of its saline nature. This suspicion was at length confirmed by Macquer\'s valuable discovery of the arsénical neutral salt (see \( \S \) 10. \textit{arseniat of potash}); but chemists still continued ignorant of the precise difference between this and the liver of arsenic (arsenite of potash). The illustrious Scheele first cleared up this difficulty, and pointed out a method of procuring the arsenic acid in a state of purity, and uncombined with any other substaniges. Bergman\'s valuable effay on the same subject confirmed and extended the discoveries of his friend and countryman, and more recent experiments have brought new accusations to the interesting facts already collected. Arsenic, as well as some others of the metallic bodies, is not only a combustible and oxidizable, but also an acidifiable base. It combines with oxygen, in at least three different proportions. By the spontaneous action of air and moisture, at the usual temperature, it is converted into the black oxid, an additional portion of oxygen is absorbed by the affinity of a higher heat, forming the white oxid; and by means, that we shall now proceed to mention, this latter sub stance may be saturated with oxygen, forming a perfect acid; the \textit{arsenic acid}, or Arsenic (\textit{acide arsenieux}, or \textit{arsenic acid, a dirine arsenieux, arsenilfueur}).

The method recommended by Scheele for the preparation of arsenic acid is the following.—Take two parts of finely powdered white oxid of arsenic, and put it into a capacious tubulated retort, adapted to a quilled receiver, and fixed properly in a found-bath; then pour in seven parts, by weight, of thong and pure muriatic acid, and close the tubulation of the retort; as soon as the acid begins to boil, the arsenic will be rapidly dissolved; and when the whole is taken up, lower the heat, and add three and a half parts of concentrated nitric acid; the mixture will immediately begin to foam, and there will be a copious extraction of nitrous gas.

The distillation is, at the same time, to be proceeding gradually, as long as any nitrous gas is produced; and when this ceases, one part more of the white oxid of arsenic may be
be added. As soon as this is dissolved, pour into the retort one and a half part of nitric acid, and a fresh effervescence will take place. The whole is now to be distilled to dryness, and towards the end of the process the heat must be increased till the bottom of the retort, with its contents, is red hot. After the retort is grown cold, it must be broken open, and there will be found within it a saline mass, which is the dry arsenic acid. In order to preserve it in its solid state, it must be put into a dry, well-stoppered phial. The proportion of acid thus procured is nearly equal to the quantity of white oxide employed. The use of the muriatic acid in this process, seems to be merely that of a solvent of the arsenic oxide, which is thus presented to the action of the nitric acid in a state of extreme division. The nitric acid is decomposed into nitrous gas and oxygen, the former of which flies away, while the latter is expended in acidifying the oxide; by the subsequent red heat, the undecomposed residue of the nitric acid, and the muriatic, are driven off in vapour, and the arsenic acid alone remains behind.

It generally, however, corrodes the retort, in a greater or less degree; whence the solid acid, when boiled with water, leaves a small insoluble residue of siles.

Bergman's method is to make a hot saturated solution of white arsenic in muriatic acid, and to add double the weight of nitric acid. The effervescence, however, thus occasioned, is so great, that a considerable portion of the arsenic is driven off in the form of fumes of arsenic, but the consequent produce of acid is much diminished, the quantity of this being estimated by Bergman at no more than 50 per cent. of the white oxide employed. Weigleb, by repeatedly retorting the liquor collected in the receiver into the retort with fresh nitric acid, obtained 12½ of arsenic acid for every 100 of oxide.

Another method of preparing this acid, also discovered by Scheele, is by oxymuriatic acid. Take one part finely pulverized black oxide of manganese, and mix it with three parts of strong muriatic acid, in a tubulated retort, large enough to allow ample room for the effervescence of the mafs: the retort is to be connected, in the usual way, with a Woulfe's apparatus, containing the white oxide of arsenic and a little water. By a gentle heat, the muriatic acid becomes oxygenated at the expense of the manganese, and passes into the bottles in the form of oxymuriatic acid; here it is decomposed, and the muriatic acid unites with part of the arsenic, while the oxygen combines with another portion. This compound liquor being then gently distilled to dryness, and towards the end of the process the bottom of the retort being made red hot, a complete separation will take place; in the receiver there will be found distilled muriat, or butter of arsenic, and the saline masses remaining in the retort is arsenic acid.

A simpler way of procuring the acid, is to heat together the white oxide of arsenic, with diluted nitric acid, in a retort, and when the solution is complete, to add some strong nitric acid, and proceed to distillation: much nitrous gas will be given out, and some orange-coloured acid will come over into the receiver; return this upon the mafs in the retort before it becomes dry, together with a fresh portion of strong nitric acid, and thus repeat the coagulation till the distillation of nitrous gas has almost ceased; then distil to dryness, and make the bottom of the retort red hot; all the remaining oxide of arsenic and nitric acid will be driven off, and nothing will be left behind but pure arsenic acid.

Besides the above proceedings, Pelletier has described another method of procuring the acid of arsenic. He mixes the white oxide with nitrat of ammonia, and subjects the mass to distillation in a luted retort. It is necessary to begin with a very gentle degree of heat, for the decomposition of the amnaniacal salt is otherwise so rapid, that a large portion of the oxide of arsenic is carried over into the receiver. But by proper management, the operation goes on more slowly and quietly; there passes over some nitrous acid, and by a slight increase of the heat, amnaniacal gas is also produced; towards the end of the process, a little white oxide usually sublimes, and a solid vitreous mafs of arsenic acid remains at the bottom of the retort, which, when heated red hot, becomes perfectly pure.

Arsenic acid is a solid vitreous mass, of a milky white colour: its sp. gr. according to Bergman, is 3.395. It suffes at a temperature a little below red heat, and becomes a transparent colourless fluid; but by cooling, it again becomes milky. When raised to a full red heat, it begins to boil, and gives out a portion of its oxygen; being slowly converted into white oxide of arsenic, which sublimes in proportion as it forms. If this experiment is performed in a covered crucible, after a time, almost the whole of the arsenic acid will be disiliated, and the residue will be found closely adherent to the sides of the vessel, having distilled a portion of its earth, and being thus converted into a permanent glazing. Arsenic acid is wholly insoluble in alcohol; but has a strong affinity with water, as is demonstrated by its exposure to a moist air: it dissolves completely in three to four times its weight of water, and has not been obtained in a crystalline form, either by refrigeration or evaporation. It has a four, caustic, metallic taste, and reddens litmus tincture, though it produces no change on syrup of violets. Charcoal powder, digested with the aqueous solution, exerts no chemical action whatever on it, but if the mixture is distilled to dryness in a close retort, as soon as the bottom begins to grow red hot, the whole mafs takes fire with violence, and the acid is deoxygenated, a beautiful sublime of regular arsenic being found in the neck of the retort. Sugar, and oil of turpentine, or any of the expressed oils, are charred even by digestion with a saturated solution of the acid. Six parts of the acid digested with one of sulphur fuffer no change, but when the mixture is distilled to dryness in a close retort, as soon as the water is driven off, and the sulphur begins to melt, a sudden combination takes place, accompanied by a copious extraction of sulphurous acid gas, and the whole contents of the retort rise almost instantaneously, and attach themselves to the upper part in the form of beautiful every; it combines with various alkaline earths, and metallic bases, forming a genus of compound salts, known in chemistry by the name of ARSENIATS.

None of the acids appear to have any action on the arsenic, though it is soluble in some of them, it may be separated again unchanged. It uniteis with the boracic and phosphoric acids by fusion, but neither suffers nor occasions any decomposition.

The order of its affinities, according to Pearson, are, in the moist way, lime, barityt, sforntia, magnesia, potash, soda, ammonia, alumine, metallic oxts, water.—In the dry way, lime, barityt, sforntia, magnesia, potash, soda, metallic oxys, ammonia, alumine.

1. Arseniat of Potash.

If a solution of arsenic acid is dropped into caustic potash, till the mixture excites to change syrup of violets green, and turns tincture of litmus red; thus fiewing an excess of acid; there will be obtained by evaporation a cryallizable salt, arseniats of potash. But if on the other hand pohtash be added to arsenic acid till the mixture turns syrup of violets green, but produces no change on tincture of litmus,
ARSENIC.

Arsenic, an uncrystallized salt is the result, which being evaporated to dryness, again deliquesces on being exposed to the air. These varieties of aroeniat potash are, however, rarely made by the direct union of their competent parts, but from the white oxyd of arsenic and nitre. The phenomena attending this process we shall therefore first explain, before we enter upon an enumeration of the properties of the salt.

Let any quantity of nitre be melted in a crucible, the bottom of which is heated red, and small portions of white oxyd of arsenic be projected at intervals, taking care not to add a second portion till the effervescence and disengagement of the nitrous gas occasioned by the former has ceased. By degrees the matter in the crucible, provided the heat is not augmented, will grow thick; and being then examined by solution and crystallization, will be found to yield litmus, and confit of arseniat of potash in a crystallizable state, and some undecomposed nitre. If, however, the mass in the crucible is kept for a few minutes at a little higher heat, it will enter into perfect fusion, and give out some nitrous gas; after a short time it will again grow thick, and being then dissolved in water, will turn fyrup of violets green, and refuse to crystallize, forming what Macler and the old chemists call nitre fixed by arsenic.

If a mixture of equal parts of nitre and white arsenic be put into a crucible (or still better, into a Florence flask), and the flask be heated gradually in a fused bath, till its bottom is obtrusely red, there will happen a very copious disengagement of orange-coloured vapours; when these cease, the vessel is to be withdrawn from the fire, and will be found to contain a white faine mafs, which, by solution in hot distilled water, and evaporation, will yield arseniat of potash, formerly collected after the invention of Macler's natural arsenic. When, on the contrary, two parts of nitre and one of white arsenic are subjected to the above treatment, the result is an uncrystallizable deliquecent mafs, the alkaline arseniat of potash. This may be converted into the crystallizable or acidulous arsenate, either by the addition of arsenic acid, in which case the whole will be arseniat of potash, or by sulphuric acid, which neutralizing the alkali, the liquor will yield by crystallization arseniat and sulphat of potash. In opposition to these facts, which are mentioned by Bergman, Scheele, Macler, and most modern chemists, Peltier has recorded an experiment, which, though he draws no conclusions from it, seems incapable of being reconciled with the theory of an alkaline and acidulous arseniat of potash. He mixed, according to the process of Lefèvre, two ounces of white arsenic with four of nitre, and put the whole into a large crucible, the mouth of which was then closed with a smaller inverted crucible pierced with a small hole to give vent to the vitrious vapour. It was subjected first to a very gentle heat for three hours, and then exposed to a red heat for eight hours longer. The matter thus prepared was a compact faine white mafs, easily separating from the crucible, and weighing one gross less than four ounces. Being dissolved in distilled water and filtered, there was separated a gelatinous mafs, confuting no doubt of some of the potash combined with the earth of the crucible. The clear liquor that passed the filter afforded by evaporation crystals of arseniat of potash, and the mother water contained almost wholly of caustic potash, which united quietly with sulphuric acid, and formed sulphat of potash. Here therefore we have an example of the crystallized arseniat formed in the midst of caustic potash, a circumstance wholly unaccountable if an exces of acid is necessary for this purpose.

Arsenat of potash crystallizes in rectangular quadrilateral prisms, terminated by four-angled pyramids. In close vessels it fumes at a low red heat, but shows no figures of decomposition; when made to boil violently in an open vessel it gives out oxygen, and acquires alkaline properties. It neither effervesces nor deliquesces in the air. It is soluble in about five parts of boiling water, and deposits crystals by cooling. It is decomposable by lime and barytes, either in solution or by fussion, the acid quitting the alkali to unite with the earths. The sulphuric, nitric, and muriatic acids, abstract from it the alkaline base, setting the arsenic acid at liberty, and forming sulphat, nitrat, or muriat of potash. It decomposes and precipitates almost all metallic oxyds from their combinations, forming insoluble metallic arsenits. In the dry way, it is decomposed by charcoal, and the product is a mixture of nitrate of copper and arsenic. Demyon, and Caro, then in the presence of iron, aluminium, and copper, lead to the three arsenites of potash, muriat, and nitrat. Sulphur, iron, and zinc, also decompose this salt, the requisite arsenic combining with one part of them, while the other is oxygenated.

2. Arsénat of Soda.

According to Scheele, if soda is satured with arsenic acid, crystals of arseniat of soda are obtained, similar in figure to those of the preceding salt; however, the solution of them has no effect on litmus, but turns syrup of violets green. Some arsenic acid superadd to, takes away the crystallizability of the mafs, which, when evaporated to dryness, deliquesces in the air. Pelletier, by decomposing nitrat of soda by oxyd of arsenic, in the manner already recited for preparing arseniat of potash, obtained a permanent salt in truncated hexahedral prisms. The other properties of arseniat of soda are unknown; probably, however, they are analogous to those of the preceding article.

3. Arsénat of Ammonia.

Liquef ammonia, satured with arsenic acid, affords by evaporation a salt similar in form to the comboidal crystals of nitrat of soda. It turns fyrup of violets green, but produces no change on litmus; by a gentle heat it becomes opaque, and part of the ammonia flying off, it exhibits an excels of acid. In this flate it forms long acicular acid crystals, which deliquesce in the air. When distilled, it first gives out some ammoniacal gas, then fumes, and again becomes solid after it has parted with some oxyd of arsenic which sublimes. By a further increase of temperature it again becomes fluid, and is now found to be wholly changed into arsenic acid. Muriat of Ammonia is decomposed by distillation with three parts of arsenic acid. There first rises muriatic acid, then amonnacal gas, afterwards oxyd of arsenic, and arsenic acid remains behind; hence it is obvious that part of the arsenic acid is deoxygenated at the expense of a portion of the ammonia.

If arsenic acid is dropped into lime water, a white precipitate is thrown down, which is soluble in a fresh portion of acid; the solution being now evaporated, small crystals are obtained of arseniat of lime. Another way of procuring this salt is by digesting chalk in arsenic acid. As effervescence ensues, and afterwards by cooling, copious crystals are deposited. Arsenat of lime is sparingly soluble in water, and the solution is decomposed by sulphuric acid, sulphat of lime being precipitated. The affinity of arsenic acid for lime, is also inferior in the moist way to nitric, muriatic, or even acetic acid. Yet nitrat, muriat, and acetate of lime are decomposable by means of double affinity, by the uncrystallizable arseniat of potash, and the arseniats of soda and ammonia, arsenat of lime being in all these cases precipitated. This salt, if heated strongly in a close crucible, enters into fusion, forming a white enamel-like mafs, but without undergoing any decomposition; by mixing with charcoal and subsequent heating, the greater part
part of the acid is oxygenated, and reguline arsenic is sublimed. Arsenic acid in the dry way has so powerful an affinity for lime, as to be capable of unifying with this earth to the exclusion of sulphuric, fluoric, and nitric acids.

5. Arsenif of Magnesia

Acid of arsenic, when digested upon magnesia to saturation, forms a coagulum; this being dissolved in a fresh quantity of arsenic acid, and evaporated, yields a jelly which by further privation of its moisture is converted into an uncrystallizable viscous mass. The sulphat, nitrat, muriat, and acetate of magnesia, are not decomposable by arsenic acid, but readily so by the alkaline arsienates; the precipitate thus produced is insoluble in water, but readily so by acids. When heated in a close vessel with charcoal, it exhibits the same phenomena as arsenif of lime.

6. Arsenif of Barytes

This salt may be obtained in an earthy form, according to Scheele, by digesting the acid upon barytes; at first the barytes dissolves readily, but when the acid is saturated, a spontaneous precipitation of arsenif of barytes takes place. Fourcroy informs us, that it may be procured in a crystalline form by mixing a warm concentrated solution of acetate of barytes and arsienate of potash; a deposition takes place, and bright pinnate needles of arsenif of barytes are deposited. In the moister way this salt forms undecomposable except by sulphuric acid and the easily soluble sulphates. In a full red heat, however, even sulphat of barytes is decomposed by arsenic acid, the sulphuric acid being volatilized.

7. Arsenif of Alumine.

Moist earth of alum is readily soluble in arsenic acid, and by evaporation it yields a gummy uncrystallizable mass. The alkaline arsienates will occasion a precipitate in sulphuric, nitric, and muriatic acids, previously saturated with earth of alum, and this precipitate is soluble in acids, though not so in water. It must however be remembered, that the earth precipitated from alum by an alkali is not pure Alumine, and therefore that the preparation here described is not arsienate of alumine. Scheele indeed expressly mentions, that the solution mixed with charcoal, and evaporated to dryness, and then ignited in a close vessel, yields a sublimate of orpiment, together with reguline arsenic and sulphuric acid, and that the residue, when dissolved in sulphuric acid, deposits after a time some crysalis of alum. The arsenic acid, even by a long digestion with white clay, does not take up any portion of it. One part of clay and four parts of acid combine by fuson into a viscous mass; and this, by being again heated with charcoal, affords a beautiful sublimed reguline of arsenic.

The combinations of orpiment, and the other earths with the arsenic acid, have not as yet been examined. The metallic arsienates will be found under the several metals.

§ 11. Historical Notice concerning Arsenic.

The native sulphuric of arsenic, was the only one of the arsenical ores known to the ancients. Arifotle speaks of the Σαουρσιος; and his pupil Theophrastus, in his treatise on minerals, mentions the Αργηνιος, corrupted afterwards by Dioscorides and others into Ασθιον. Pliny also, in his Natural History, describes the arsenicum, auripigmentum, and sandaracha. The Syrian orpiment, probably from its colour, was supposed to contain gold, and an ineffectual attempt by order of the emperor Claudius to extract this metal from it, is recorded by the Roman naturalist just mentioned. The sandaracha of Pliny is realgar, being reprefented by him as friable, of a ruddy colour, and analogous to litharge. Its arsenicum is expressly laid to be of the same substance as sandaracha, and is thus described.

... The colour of the bell is superior even to gold; the inferior sorts are paler, or else approach to the hue of sandaracha. It is of a fealy texture. The two last do not appear to have been considered of the fame nature as auripigmentum: and the only use to which they were applied, was that of a calcine in medicine, and a pigment. The first mention of white arsenic is in the works of Avicenna, who lived in the 11th century. Paracelsus affirms, that arsenic sublimed with egg-thills becomes like silver; and in 1673, Lumery published the method of obtaining the regulus by sublimation from a mixture of white arsenic, fixed alkali, and soap. Albertus Magnus and Beccher considered arsenic (by which they meant the white oxys) as of a saline nature. Kinkel was also of the fame opinion; and Macquer, by his discovery of the arsenic and arsenif of potash, demonstrated that in these combinations it held the place of an acid. Finally, Scheele proved, that the bafe of arsenic (according to the Stahlian theory then in vogue) was not only similar to, but was actually an acid, by discovering the method of obtaining it in an uncombined state.

Arsenic being found in the ones of many metals, often serving as a mineralizer to them, and adhering with great obliquity to them even when brought into the state of regulus, was long considered, like mercury, as an essential component part of metallic substances, nor was his opinion abandoned till the celebrated essay of Munnet in reply to a prize question proposed by the Royal Berlin Academy, in 1773, on the nature and peculiar agencie of arsenic in the formation of metals. In this treatise he shews arsenic to be a peculiar metal, essentially differing from all others, and instead of being a necessary component part of them, is often totally absent, and when present is so far from perfecting them, that it always deteriorates and obscures their characteristic properties.

§ 12. Uses of Arsenic.

In the regulus state, it is used to whiten Copper, and enters as an ingredient in several kinds of Speculum Metal. Oxys of arsenic is employed as a poison for rats and other vermin, and a flux in Glass-making. Orpiment and realgar are of extensive use in Dying and Calico-printing, and as a pigment. For the deletious properties of arsenic, and its medical uses, see the next article.

Pinii Hill. Nat. Bergman's Essays. Scheele's Essays. Pelletier, Memores de Chimie, vol. i. Encycloped. Method. art. Arsenique. Fourcroy, Syll, des Connoiss. Chem. vol. v. Macquer's Chemisches worterbuch, art. Arfenik. Gren's Syllenatiches handbuch der Chemie, vol. iii. Arsenic in Pharmacy, and its Operation upon the Human Body.—Arsenic is perhaps of all natural substances, that which exerts the most virulent and dreadfully active operation upon the living animal, when taken into the stomoch or any other part of the stomach. We are, unfortunately, too familiar with its effects as a poison; its cheapness and abundance rendering it easily accessible to malevolence, or obnoxious to carelesstifs, and the history of almost every year adds to the number of sufferers from this formidable mineral.

Nevertheless, as every poison, when judiciously managed, may be converted into a powerful medicine, several very skilful practitioners have attempted, and not without advantage, to add this substance to the materia medica, and hence the effects of arsenic become important to the physiologist in a double point of view, both that he may relieve and counteract them, when they operate as a poison; and manage them with judgment and caution, when they are intended to cure disease.
ARSENIC.

We may begin by observing, that all the preparations of arsenic appear, as far as experience goes, to operate in a similar manner, though some with much more activity than others, in proportion to their quantity; and likewise it is fully ascertained, that sulphur moderates the operation of this metal in a very striking manner, as indeed it does that of all the other metallic medicines. This comparative mildness of the sulphur may be the reason why the native opium and garlic have been employed medicinally for ages by some of the oriental nations, particularly, among other caes, as an antidote to the bite of the cobra, and other venomous serpents; and we may remark, that the native arsenical sulphures (as observed by Holmann, and confirmed by subsequent experiments) are much milder and safer in their operations, than any of the artificial combinations of these two minerals.

When the active arsenical salts (the white arsenic for example) have been taken into the stomach in the quantity of a few grains or upwards, the most dreadful confusions are observed to succeed: these are, first, a most horrible and almost indescribable anxiety at the pit of the stomach, to which succeeds a very acute burning pain in this organ, generally attended with violent retching and vomiting, whereby, indeed, the life of the sufferer is sometimes preferred, owing to the rejection of the arsenic; this is often followed with fever purging, and the pain proceeds with increased virulence, to the bowels, and almost the whole of the alimentary canal; to this succeeds, in a shorter or longer time, convulsive tremors of the limbs, cold sweats, and a very sudden and characteristic swelling of the emphysematous kind, which pulls up the face, the neck, and at last every other part of the body. If no relief be obtained from these dreadful symptoms, they quickly proceed to the destruction of life; the unhappy sufferer becomes insensible to surrounding objects, lying on his belly, with every muscle distorted by the violence of the pain, his hands clenched, his eyes bloodshot and goggled, his jaws now immovably fixed, and unable to swallow either solids or liquids, his limbs convulsed with severe cramps, his face and neck so much swollen that the features can hardly be recognized, till at last death terminates his agony. On inspecting the body after death, the stomach is always found highly inflamed, partly gangrenous, and often actually corroded by phosphated spots. The same inflammation and partial mortification also extend in mottled caes to parts of the small intestines. The body is laid to putrefy with remarkable rapidity.

Even when persons have recovered from poisonings by arsenic, they feel its effects long after in griping pains, tremors of the limbs, partial paralysis, loss of appetite, and often a lingering hectic fever, which remains for a considerable time, and without great attention to health, are apt materially to injure the constitution. An exposure to the fumes of arsenic occasions similar accidents, particularly griping, bloody urine, and contraction of the body, and sometimes a general eruption like the nettle-rash; and hence in all chemical operations with this dangerous metal, the operator should be particularly cautious of avoiding its noxious fumes.

Arsenic, when applied to any wounded or ulcerated surface of the body, is equally liable to produce the above-men- tioned symptoms in a greater or lefs degree; but as the first that appear are generally pains in the stomach and bowels, and swelling of the face, sufficient warning is hereby given to withdraw the cause of them.

A variety of remedies against the poison of arsenic has been proposed, all of which are intended to fulfill the two indications, to remove the noxious ingredient, and to protect the alimentary canal from its baseul operation. The first object is to get rid of the poison by moli copious vomiting and purging; and for this purpose all the substances known to produce these effects, may be employed with the greatest freedom. It has been thought that the rougher mineral emetic and purgative medicines should be avoided, and certainly the milder vegetable substances appear the most eligible; but it is of such infinite consequence to apply an immediate remedy, that the preference due to one over another medicine can hardly ever be equivalent to the mischief incurred by allowing this most corrosive and deleterious of all poisons to remain a moment longer in the stomach than can be avoided. Hence the first emetic medicine at hand is always the bell, nor should the mechanical means of exciting vomiting, as by thrusting a feather down the throat, and the like, be neglected. In the intervals of vomiting, the stomach should be deluged with any mild muclaginous liquid that is at hand; milk, gruel, linseed tea, broth, oil of any kind, or even warm water, in the largest possible quantity, should be taken, and where the arsenic itself excites violent vomiting, as is often the cafe, no other remedy than these muclaginous or oily liquids is required. These should be affiously perferred in till the burning pain and other symptoms produced by the arsenic are removed, and only the forenses consequent to such a violent exercise of the alimentary canal remains; after which a cautious and judicious use of opiates will prove of material benefit: but the rate of health will require much attention for a considerable time, before the constitution can entirely recover the effects of so rude a shock. When the poison has remained too long in the stomach that the sufferer lies insensible, racked with pain and unable to swallow, recovery seems to be hopeless; in such cases, the most probable method of exciting vomiting is to lay some tartar emetic upon the tongue, part of which may perhaps be carried by the saliva into the stomach, and relieve it from the noxious mineral.

Some ingenious men have endeavoured to discover an antidote to arsenic, in the proper meaning of the term; that is, a substance which may prove a peculiar corrective to its baneful effects, by uniting with it when in the stomach, and destroying its acrimony. The well-known effect of sulphur to mitigate the operation of all metallic bodies, readily suggested this as the desired remedy, and the liquid alkaline sulphuret was proposed by Navier, an eminent physician of Chalons in France. Fourcroy has suggested the liquid hydrogen sulphides (or solutions of sulphurated hydrogen in water, in which the sulphurated mineral waters are familiar examples) as an improvement on Navier's remedy. Experience, however, has not confirmed the utility of either of these preparations. It is true, that if the poison and the antidote were previously mixed, and in a state of solution, the former would be disarmed of its terrible powers; but to tru to the chance of a mere chemical operation in an organ so irritable as the stomach, so dreadfully susceptible of active inflammation, and actually suffering under a violent injury, which is halting the destruction of the whole system, is to carry the idea of a laboratory much beyond the bounds of sober prudence and found practice.

It has been urged, however, that after the immediate danger from arsenic has been removed by the liberal use of emetics and emollient liquids, much advantage may be derived from the use of the liquid sulphures. But at this period we have not (in all probability) any of the arsenic to remove, but only the inflammation, the effects of arsenic, and on what ground can sulphurated hydrogen be supposed to be of use in inflammation of the stomach and bowels? The medical chemist is for the time called upon the magistrate to ascertain the presence or absence of arsenic in the stomach of persons who have died from some of the violent
A R S E N I C.

It is a matter of common observation, that no vegetable or mineral poison, however virulent, excels, which in diminished quantity and by prudent precautions may not be converted into a valuable remedy. This observation will apply even to arsenic, and we have the most respectable testimony to its value in the cure or relief of some complaints which entitles it to considerable notice. The medical use of the fulphures of arsenic may be traced back to very early times, and the Greeks and Romans appear to have used it with considerable freedom. Dioscorides observes that the arsenic (arsenicos) is found in the same minerals which produce the haemath. The text for medicinal purposes, he adds, is, of a golden colour, unmixed with any other substance, which easily separates into feaks, and comes from Myia on the Helenesport. An inferior sort comes from Pontus and Capadocia. It is prepared by roasting on hot coals, with constant stirring till it takes fire, and alters in colour, when it is to be cooled and carefully pulverized. The haemath is prepared in the same manner as the arsenic or orpiment, and poisons the same virtues. When taken internally, they have a violent corrosive and afflactive operation, exciting a burning on the skin, and causing the hair to fall off. These arsenical powders were used principally as external applications, mixed with pitch, oil, or fat, against a variety of cutaneous complaints, itch, phthisiafia, and other deformations of the skin, and also to ulcers of the nostrils and mouth, and condylomata.

Much attention has been bestowed in modern times to the power said to be possessed by arsenic of relieving or curing cancers, when employed both as a topical application, and taken into the stomach. The progress of this disorder is so dreadful, and the remedies usually employed have proved so inadequate to stop its ravages, that any medicine, however severe, may be employed without censure, which affords a chance of permanent relief. We have still to regret that the flattering hopes of a cure, and the real benefit often produced by this metal, have not been confirmed by frequent experiment; but the virtues of this remedy, however, are too important to be neglected. Several medical practitioners and empirics have gained much credit for supposed cures of cancers by remedies which appear to have been arsenical; and Mr. Juffamond, in his valuable Surgical Treatises (London, 1780), gives the recipe of an arsenical cation, called "the earl of Arundel's receipt to cure a cancer," and found in the Harleian MSS, which appears to have been divulged by a woman in the lower order of people, in the year 1658, whose father had long employed it for the cure of cancers.

Mr. Juffamond, in his ingenious work above quoted, gives the history of many cases of cancer in different stages, in which the following arsenical preparations were topically applied:

1. The earl of Arundel's receipt above mentioned, composed of one ounce of yellow arsenic, and half an ounce of boul arsenic; or cote of one ounce of the yellow arsenic, half an ounce of the red precipitate, and half an ounce of boul arsenic.

2. A sulphur of arsenic, formed in the following way: Take four pounds of sulphur, and one pound of white arsenic, mix and put them into a glass retort, on a fend heat, and lute to the retort a long neck and receiver: raise the fire gradually till the mixture be fused: reject the sublimed portion, and refine the fixed matter beneath, which must be deeply leviaged.

3. A mixed sulphur of arsenic and antimony, formed by melting together in a crucible, with a very moderate heat, the native black sulphur of antimony (or the common antimony...
of the tumour. This is to remain till the escharotic separates spontaneously. The ranunculus, which is an acid plant, is not here an useless addition, as it afflicts in separating the cuticle, and till this is done the arsenic is scarcely able to act.

5. The arsenum citrinum (gelber arsénik) employed at Vienna, is one of the strongest of these preparations, being composed of ten parts of arsenic sublimed with one of sulphur. When used, the scrapings of it are laid on the cancerous ulcer till it is confluent. The pain which it occasions is most severe.

Mr. Frobure's arsénical remedy (Reméde éprouvé pour guérir radicalement le Cancer occlu, ou ulceré, Paris, 1775), which excited much attention at the time, is the following:

6. Take one pint of water; one ounce of extract of rhubarb; three ounces of Goulard's extract; one drachm of liquid laudanum; and ten grains of arsenic; mix them into a liquid, with which the cancer is to be smeared every morning and evening.

Lastly, of the external applications, we may mention the following, which is simple, and probably as efficacious in ulcerated cancer as any of the preceding.

7. Take a solution of white arsenic in water, in the proportion of one grain to two pints, mix it with crumb of bread into a poultice, and apply it to the open sore.

Frobure appears to be the first who ventured to recommend the internal use of arsenic in the cure of cancer; a practice which has rarely been openly followed, though probably this mineral forms the basis of many of the empirical remedies for this disease. Frobure's internal arsénical medicine is the following:

8. Take of white arsenic, two grains; of syrup of chicory with rhubarb, half an ounce; of water, one pint. Of this one tablespoonful is given every morning and evening, in an ounce of milk, with half a drachm of syrup of poppies. The dose is to be gradually increased as the patient can bear it.

Mr. Juilamond also was able to give internally as much as five grains of the arsénical sulphuret (N° 2.) daily, without injuring the patient.

The inference which the reader will be disposed to draw from all that we have given, concerning the efficacy of arsenic in cancerous complaints, will not probably be very encouraging to its use. The actual pain attending its application is always very acute, though perhaps not more so than the disease itself; but the quantity of the remedy here requisite, either for external or internal use, is so considerable, as to incur great danger of poisoning the constitution irremedially, and inducing calamities almost equal to those which it is designed to counteract.

With more satisfaction we can conclude our account of this mineral, with a history of its employment in another oblique and often dangerous disorder, in which it promises what certain advantage, unattended with any considerable risk where managed with great prudence and discretion. This is, in obliterative and lingering agues, such as have resisted ordinary remedies, and are proceeding gradually to undermine the constitution by their periodical and repeated paroxysms.

We owe the introduction, or at least the publicity of this remedy to Dr. Fowler's highly valuable memoirs on experimental cases, undertaken in the Stafford infirmary, in 1784, and published in the following year. The circumstance that directed his attention to this remedy, was the very great sale and successful operation of certain patent aqve drops, which were (probably with reason) supposed to be a preparation of arsenic.

Dr.
Dr. Fowler’s arsical solution is thus prepared.
9. Take white arsenic in fine powder, and pure salt of tartar, of each sixty-four grains, put them into a Florence flask, or other glass vessel, along with half a pint of distilled water; heat them slowly to boiling, till the ingredients are dissolved; when cold, add half an ounce of compound spirit of lavender, and distilled water sufficient to make up the whole quantity one pint, or rather fifteen ounces and a half troy-weight.

Of this solution, one ounce, apothecaries measure, contains four grains of arsenic, or one dram, half a grain; and Dr. F. calculates each dram to be equivalent to eighty drops.

In preparing this liquid, the operator should be aware that the salt of tartar of the shops, even the purest, seldom makes a perfectly clear solution with water, but leaves a small earthy sediment, which no continuation of the boiling will dissolve. Instead of this alkali, twice the weight of pure nitre has been employed, which promotes the solubility of the arsenic, and is perhaps somewhat preferable to the salt of tartar. These salts are not necessary to the immediate solution of arsenic, but they prevent this metallic oxide from separating again from the water by long keeping.

The proportion of arsenic to water, in the solution, may be varied from the sum above given; but as white arsenic requires eighty times its weight of cold water to remain dissolved, not less than this quantity should be employed, and the nitre or alkali should never be omitted, as it is of the utmost importance for the practitioner to know precisely the dose of arsenic which he prescribes.

Dr. F. found that for the cure of intermitents it was of importance to give the arsenic in divided doses as fast as the patients could bear it, without experiencing inconvenience from its poisonous effects. Strong adults could generally bear about ten drops of the solution (equivalent to one-sixteenth of a grain of arsenic) for a dose, which he repeated twice, or, if convenient, thrice a day. By flow increare, some were able to bear as much as twenty drops for a dose, and this course was continued for five days, when, if the fits of the intermittent were suspended, the drops were interrupted for two or three days, and then resumed for three days longer to prevent a relapse.

Infants could bear about two drops twice a day, and young or delicate persons took the solution in intermediate doses from two to ten or twelve drops.

The operation of this powerful remedy was truly surprizing in checking almoast immediately, and finally removing the paroxysms of the most obstinate intermitents, some of which had relapsed back and other remedies for a considerabe time. In a few, however, it failed entirely; and in others the poisonous effects of the arsenic came on so speedily that it could not be continued, and the cure was completed by bark and other tonics.

Every practitioner will be aware of the great caution necessary in the exhibition of a remedy, which, though safe in prudent hands, might induce the most dangerous accidents if exposed to careless use or ignorance. In most of the successful cases, the medical removed the diseasewithout producing any of the inconveniences attending its use in larger doses; but when the arsenic began to show its poisonous effects, the symptoms were, nausea, often accompanied with a flight gripping and purging, swellings of the soft integuments of the body, particularly the face, sometimes ureasheats at the flomach, and a flight eruption like the nettle-rais; and, in a very few instances, head-ach, sweat, and flight tremors. By attending to these ferior and very characteristic warnings, and by the assiunce of gentle appe-
ARSICARITA, an episcopal see of Africa, in Numidia.

ARSICUA, a town of Germany. Ptolemy.

ARSIKARITUS, a promontory of the western coast of Africa, in Lybia Interior, now Cape Verdo, or Cape Bajaerivo.

ARSNIA, ARSCHI, a town of Asia, in Armenia, W. N. W. of Amida, and near it.

ARTSINNAKTANUS, an episcopal see of Africa, in Mauritania Caesariensis.

ARSIKOE is a name given to several places not only in Egypt, but also in other countries; and according to Bryant (Anc. Myth. vol. i. p. 209.), it was synonymous with Arsinoe, Arschließen, and Arsina. Arsis, says this writer, is a compound of Areus, Sol's son; and most places to denominate will be found famed for some fountain. To this purpose he observes, that Arsinoe in Syria had its name from the streams which issued out of the rising ground on which it stands; Arsine and Arsiana in Babylonia had fountains of bitumen; Arsine in Armenia was a nitrous lake; near Arsinoe upon the Red Sea were streams of bitter waters; and Arsinoe near Epheus had waters equally bitter. The first Arsinoe we shall mention was a town of Egypt, situated on the whole side of the Arabian gulf near its extremity, and not far from the situation of the modern Such. Ptolemy and Strabo mention this city; and the latter says, that it was called by some Cleopatra. It is said, that it was called Arsinoe from a queen of that name in the time of the Ptolemies; and that Cleopatra embellished it with new buildings, whence it was called after her name. In order to bring the trade from India, which began to revive at Tyre its ancient flation, to center in Alexandria, Ptolemy Philadelpbus undertook to form a canal, an hundred cubits in breadth, and thirty in depth, between Arsinoe and the Pelusiac branch of the Nile; and Mr. Rossell states the distance between Pelusium (Timah), and Arsinoe (Suez), at fifty-six British miles; and by means of this canal he proposed to convey the productions of India to that capital wholly by water. But the work was never finished. A second Arsinoe was a town of Egypt, the chief place of a neme which bore its name, on the west side of the Nile, above Memphis, south of Acanthus and north of Ptolemais. It was also called the City of Crocodiles, because the inhabitants worshipped that animal, and bred some of the species in the neighbouring lakes. This city must have stood at some distance from the river, since Ptolemy calls it a Mediterranean metropolis. It retained its name Arsinoe in the time of Adrian. Imperial Greek medals were struck in this city in honour both of Trajan and Adrian. It is now called Pajoum. The province, of which it was the capital, contained the Labyrinth and its twelve palaces, the lake Morris, and the pyramids described by Herodotus, but not existing in the time of Augustus, as they are not mentioned by Strabo; and it is extolled by Strabo (l. xvi.) for its beauty, fertility, and the variety of its productions. It abounded with wine, corn, vegetables, and seeds of every kind. A third Arsinoe was a port of the Red Sea, to the left of the entrance into it and near the promontory Dirce or Dirc, according to Strabo and Ptolemy. This was sometimes called Berenice. A fourth is placed by Strabo on the Red Sea, considerably more to the north than Philoterus. Its warm, saline, bitter waters flowed from a high rock and ran into the sea near this town. A fifth was a town of Africa, in the Cyrenaica, between Leptis and Ptolemais; the fame that was formerly called Teuchiara. A sixth was a town of Caelofoya, according to Steph. Byz. A seventh, a town of Asia, in Syria, situated on a hill near a valley which was near Damascus. An eighth, a maritime town of Asia, in

Clodia, to the call of the river Ormagedus, in the district called Cetis; it had a port and road for ships. A ninth, a town of Greece, in Aetolus, at the passage of the Achelous, near Canopus; to called from the wife and master of Ptolemy II., and mentioned by Cicero. A tenth Arsinoe, according to Strabo, one of the names given to the city of Ephesus. An eleventh Arsinoe is a maritime town of the island of Cyprus, situated to the west between old and new Paplos: it called from a queen of Egypt, Cyprus having been long subject to the Ptolemies. It had a port, a temple, and a grove. A twelfth Arsinoe was also a small town of Cyprus, on the northern coast, at the bottom of a small gulf closed to the north-west by the promontory Acantha. 13. There was another town of this name on the eastern coast of the same island, to the south-east, and near Salamis. 14. Arsinoe was also the name of an inland town of Cyprus.

ARSINOE in Entomology, a species of Papilio (Nymph. Gem.) found in the island of Ambys, the wings of which are yellow, indented, fulvous, spotted with black; and the posterior ones marked both above and beneath with two osculated spots. It is figured by Seba and Cramer.

ARSIS, and THESIS, in Proseody, are names given to the two proportional parts into which every foot or rhythm is divided.

Arbis and thesis are used as musical terms when the subject of a fugue or point is inverted or reversed; i.e. when one part rises and the other falls. These two words are Greek: Aris comes from aris, tos, I raise or elevate; thesis, deposition, reminisa, a depression or lowering. These terms were applied by the ancients to the motion of the hand in beating time.

ARSISSACA, in Ancient Geography, a town of Asia, situate in the interior part of Media. Ptolemy.

ARSISSA, a lake of Asia, in Armenia, about a degree from east to west, called the lake of Van or Arciab; between 37° 42' and 38° 30' N. lat.

ARSISSIT, a country of Asia, near mount Coronos in Hircania. Ptolemy.

ARSK, a town of Ruffia, in the government of Cahan, forty miles N. E. of Cahan. N. lat. 56° 20'. E. long. 49° 34'.—Also, the name of one of the thirteen districts of Cahan, situate on the river Cahanaka.

ARSKOG, a large forest in the northern part of Sweden, in the province of Medelpad.

ARSLAN, a fortified place of Asia, in Pereia, near Cahan, in the province of Erach.

ARSMART, in Botany. See Polygonum.

ARSOFFA, a fortified town of Asia, in that part of Arabia which is called the Defert of Syria; supposed by some to be the name of the pool in the Palmyrene territory, mentioned by Ptolemy: it is ninety miles south-east of Aleppo.

ARSON, ab ardendo, in the Law of England, a felony at common law, in maliciously and wilfully burning the house, or out-houses, of another, by night or by day. See Hawkins's Pleas of the Crown, book i. chap. 59.

5 K
The owners, though not contiguous to the dwelling-house, nor under the same roof, that were parcel thereof, such as barns and stables, may be the subject of arson: and this by the common law, which also accounted it felony to burn a single barn in the field, if filled with hay or corn, though not part of the dwelling-house. The burning of a stack of corn was anciently likewise treated arson. The offence of arson, strictly so called, may be committed by wilfully setting fire to one's own house, provided one's neighbour's house is thereby also burnt; but if no mischief is done but to one's own, it does not amount to felony, though the fire was kindled with intent to burn another's. For by the common law, no intention to commit a felony amounts to the fame crime; though it does, in some cases, by particular statutes. However, such wilful firing one's own house in a town, is a high misdemeanour, and punishable by fine, imprisonment, pillory, and perpetual forfeitures for the good behaviour. And if a landlord or receiver fires fire to his own house, of which another is in possession under a lease from him, and from thence whole estate he hath, it shall be accounted arson; for, during the lease, the house is the property of the tenant. A bare intent or attempt to burn a house, by actually setting fire to it, unless it absolutely burns, does not fall within the description of "incendit et combuisset," which were words necessary, in the days of law-latin, to all indictments of this kind. But the burning and confounding of any part is sufficient; though the fire be afterwards extinguished. Also, it must be a malicious burning; otherwise it is only a trespass; and therefore no negligence or malice amounts to it. But by 6 Ann. c. 31; any servant, negligently setting fire to a house or out-house, shall forfeit £8. or be sent to the house of correction for eighteen months; in the same manner as the Roman law directed: "eos, qui neglexerint ignes apud fe habuerint, fuluhas vel flagellis cessi." The punishment of arson was death by our ancient Saxon laws. And in the reign of Edw. I., this sentence was executed by a kind of "lex rashionis," for the incendiaries were burnt to death; as they were also by the Gothic confessions. The statute 8 Hen. VI. c. 6, made the wilful burning of dwellings under some special circumstances the crime mentioned, amount to the crime of high treason. But it was again reduced to felony, by the general acts of Edw. VI., and queen Mary; and now the punishment of all capital felonies is uniform, namely, by hanging. The offence of arson was denied the benefit of clergy by 31 Hen. VIII. c. 1, but that statute was repealed by 1 Edw. VI. c. 13, and arson was afterwards held to be out of clergy, with respect to the principal offender, only by inference and deduction from the statute 4 & 5 P. & M. c. 4, which expressly denied it to the accessory before the fact: though even it expressly denied to the principal in all cases within the statute 9 Geo. I. c. 22. Blackl. Com. vol. iv. p. 226. &c.

Arson Appeal of. See Appeal.

Arstad, in Geography. See Arad and Rowandie.

Arse, a sea-port town of Pandion, in the Mediterranean, six miles north-east from Joppa. It is in ruins: but in its vicinity there is a small island called Airsas.

Arsuba, in Ancient Cyprian, a term used for the melting of gold and silver, either to refine them, or to examine their value. See man.

The method of doing this is explained at large in the Book of the Esquecher, ascribed to Gervaice, in the chapter De Officio Militis Argentarii, being in those days of great use, on account of the various places and different manners in which the king's money was paid.

Art. Artura is also used for the loss or diminution of the metal in the trial. In this sense a pound was said tot audere aliaris, to lose so many pennyweights.

Artura is also used for the dust and sweepings of fitters, and others who work in silver, melted down. Dunciage.

Arbura is also used, in some writers, for the diffuse called crysiter, or ignis focer.

Arthusita, in Ancient Geography, an episcopal see of Africa, in Bizacum.

Art, is defined to be a habit of the mind prescribing rules for the due production of certain effects; or the introducing the changes of bodies from some fore-knowledge and design in a person endowed with a principle or faculty of acting.

The word art is derived from zps, utility, profit; and is found in that sense in Aichlyus.

According to lord Bacon, it is a proper disposition of the things of nature by human thought and experience, so as to make them answer the designs and uses of mankind. Nature, according to that philosopher, is sometimes free, and at her own disposal; and then the manufactures hereafter in a regular order as we see in the heavens, plants, animals, &c. Sometimes she is irregular and disorderly, either through some uncommon accident, or depravation in matter, when the resistance of some impediment prevents her from her course; as in the production of monsters. At other times she is subdued and fashioned by human industry, and made to serve the several purposes of mankind. This last is what we call art.—In which sense, art flounders opposed to nature. Hence the knowledge of nature may be divided into the history of generation, or pregeneration, and of arts.

The first confiders nature at liberty; the second, her errors; and the third, her restraints.

The ingenious Mr. Harris, after purifying several regular gradations in his inquiries concerning this subject, proceeds from it an answer to four different questions. If it be asked, "What art is?" We have to answer, "It is an habitual power in man, of becoming the cause of some effect, according to a system of various and well-approved precepts." If it be asked, "On what subject art operates?" We can answer, "On a contingent, which is within the reach of the human powers to influence." If it be asked, "For what reaon, for the fake of what, art operates?" We may reply, "For the sake of some effect good, relative to human life, and attainable by man, but superior to his natural and un instructed faculties." Lastly, if it be asked, "Where it is the operations of art end?" we may say, "Either in some energy, or in some work." Harris's Three Treatises, dialogue i.

Art is also used for science or knowledge, reduced into practice.

Several of the schoolmen hold logic and ethics to be arts; insomuch as they do not terminate in mere theory; but tend to practice.

In this sense some branches of the mathematics also are arts; others, matters of doctrine or science. Statics is wholly scientifical, as it comprehends the mere contemplation of motion: mechanics, on the contrary, is an art, as it reduces the doctrine of flats into practice.

Art is more commonly used to denote a certain system or collection of rules, precepts, and inventions or experiments, which being duly observed, make the things a man undertakes succeed, and render them advantageous and agreeable. In this sense, art is opposed to science, which is a collection of speculative principles and conclusions.

The nature and origin of art, and its distinction from science,
Art, according to the foregoing definition, may be divided into visible and effective.—Such as leave no external effect after their operation, as dancing, singing, &c., are called visible or practical arts: those which do leave an effect behind them, as painting, &c., are called effective arts.

Further, with respect to their scope and object, they may be divided into human, as medicine and divinity, as theology.

Arts, human, again may be subdivided into civil, as law, politics, &c.; military, as fortification, &c.; metaphysical, as logic, pure mathematics, &c.; philosophical, as grammar, criticism, &c.; mercantile, to which belong the mechanical arts and manufactures. See each in its place.

Arts are more properly divided into liberal and mechanical.

Arts, liberal, or polite, are those that are noble and ingenious, or which are worthy of being cultivated without any immediate regard to the pure arising from them. They are such as depend more on the labour of the mind than on that of the hand; or that confine more in speculation than operation, and have a greater regard to amendment and curiosity than necessity. Such are poetry, music, painting, grammar, rhetoric, the military art, architecture, and navigation. The liberal arts used formerly to be summed up in the following Latin verse:

"Lingua, Fratrum, Ratio, Numerus, Tonus, Angulus, Altra."

In the eighth century, the whole circle of sciences was composed of the seven liberal arts, as they were called: viz. grammar, rhetoric, logic, arithmetic, music, geometry, and astronomy: the three former of which were distinguished by the title of trivium, and the four latter by that of quadrivium.

Arts, mechanical, are those wherein the hand and body are more concerned than the mind: and which are chiefly cultivated for the sake of the profit attending them. Of which kind are most of those which furnish us with the necessities of life, and are popularly known by the name of trades and manufactures. —Such are weaving, spinning, brewing, masonry, clock-making, carpentry, joinery, foundery, printing, &c. These arts, which indeed are innumerable, were formerly comprehended under this title:

"Res, Numerus, Arma, Faber, Vulnora, Lano, Rates."

The mechanical arts take their denomination from operam, machine, as being all practiced by means of some machine or instrument. With the liberal arts it is otherwise; there being several of them which may be learnt and practiced without any instrument at all; as logic, eloquence, medicine properly so called, &c.

The arts which relate to the fight and hearing, Lord Bacon observes, are reputed liberal, beyond those which regard the other senses, and are chiefly employed in matters of luxury; these are usually called the fine arts; such are poetry, painting, sculpture, music, gardening, and architecture.

As all arts have this common property, according to the definition above cited from Mr. Harris's dialogue, that they respect human life, it is evident that some contribute to its necessities, as medicine and agriculture; and others to its "elegance," as music, painting, and poetry. The former seem to have been prior in time to the latter. Men must naturally have consulted how to live and to support themselves before they began to deliberate how to render life agreeable. Indeed this is confirmed by fact, as no nation has been known to barbarous and ignorant, as not in some degree to have cultivated the rudiments of these necessary arts; and hence plausibly they may appear to be more excellent and worthy, as having claim to a preference derived from their seniority. The arts, however, of elegance are not debarred of pretensions, if it be true, that nature formed us for something more than mere existence. Nay further, if well-being be clearly preferable to mere being, and this, without the other, be contemplated, they may have reason perhaps to aspire even to a superiority. Harris, ubi supra, p. 54.

As the history of the origin and progress of the particular arts is receiv'd under their respective denominations in the course of this work, it is unnecessary to charge in this place. It may be observed, however, in general, that most of the arts that are necessary to the subsistence, or conducive to the convenience and comfort of mankind, have had a very early origin. Some of them may be considered as almost coeval with the human race; and others have sprung up at different periods and in various nations, so remote, that the history of their rise and of their progress for many ages is involved in an obscurity which precludes any satisfactory investigation. The want of food, raiment, and habitations, would naturally suggest a variety of inventions; and when the first and scanty demands of necessity were satisfied, mankind would proceed by further discoveries to improve the ordinary means of supply, and to lengthen and embellish the condition which providence had afforded them. But for a long time their real exigencies would be few, and their views and wishes very limited; and of course their progress in improvement would be proportionably slow and tedious. In a more advanced state of society, their necessities and desires would be multiplied, and they would devise new methods of supplying and gratifying them; so that the arts they had already invented would be improved, and new ones would be discovered. At last, as a change of circumstances occurred, or some accident suggested the hint or afforded opportunity, they would proceed from the invention of the necessary and mechanical arts to those that contributed to elegance and ornament, as well as superior accommodation. As to the inventions and discoveries of the early ages, nothing certain is known. Those arts that may be referred to the clas's of such as are most necessary and useful, were the predictions of periods when men had little acquaintance with letters, and when they polished no certain mode of transmitting an account of them to succeeding generations. The records of tradition are obscure, doubtful, or fabulous; and other modes of conveyance are subject to corruptions and mutilations in the lapse of many ages. To this purpose, it may be alleged, that many passages in the works of Pliny, who appears to have been industrious in collecting whatever he thought to be useful or curious, and to have been as defiers of communicating knowledge as he was diligent in acquiring it, have suffered in this way to such a degree, that some of them have not been satisfactorily illustrated even by the best commentators. However, it is universally allowed, that the arts laid their rise in the East; and that they were conveyed from thence to the Greeks, and from them to the Romans. The Romans, indeed, seem to have been chiefly indebted to the Greeks, by whom they were excelled in point of invention. The Romans acknowledged this superiority, for they sent their youth to Greece in order to finish their education; and from this circumstance we may infer, that they considered that country as the seat of the arts and sciences, and as a school where genius would be excited by the most finished models, and the taste corrected and formed. Pliny and other writers have, nevertheless, given hints which had escaped
ART

us to conclude, that the Romans possessed a more extensive acquaintance with the arts than the moderns are perhaps willing to allow, and that some inventions, regarded as new, may be only old ones revived and again applied to practice. When Rome, abandoned to luxury and vice, became an easy prey to the horde of barbarians who overpowered the empire, her arts flared in the general wreck, and were either entirely lost, or for a considerable time forgotten. The deplorable state of ignorance in which Europe was afterwards plunged during several centuries, retarded their revival; and it was not till a late period, when favoured and protected by a few men of superior genius, that they began again to be cultivated. It cannot, however, be denied, that several important discoveries, altogether unknown to the ancients, which must have had considerable influence on the general state of society, were made in ages that can hardly be exempted from the appellation of barbarous. Of this kind were the inventions of paper, painting in oil, the mariner's compass, gunpowder, printing, and engraving on copper; see the several articles. After the invention of the compass and printing, two grand forces were opened for the improvement of science. As navigation was extended, the new objects discovered to awaken the curiosity and excite the attention of the learned; and the ready means of diffusing knowledge afforded by the press enabled the ingenious to make them publicly known. Ignorance and superfluous, the formidable enemies of philosophy in every age, began to lose some of that power which they had usurped, and different flates, forgetting their former blind policy, adopted improvements, which their prejudices had before condemned.

In countries, however, where civil and ecclesiastical tyranny prevailed, the progress of the useful and elegant arts was slow, and struggled with many difficulties. Particular events, indeed, have occurred in all ages and nations which have roused the exertions of genius, and furnished occasion for making important and useful discoveries. The history of Greece and Rome, and, even of modern Europe, will afford many obvious facts that seem to confirm and illustrate this observation, and they will be found in detail under the respective titles in this work.

It has been well noted by philosophers, that, during the rise and growth of flates, the military arts chiefly flourished; when arrived at their height, the liberal arts; and when in a declining state, the mechanical arts. There are also divers particular arts; the art of memory, the art of decyphering, the art of swimming, the art of diving, &c.

Democritus maintained, that men learnt all their arts from brutes: that the spider taught them weaving; the swallow, building; the nightingale, music; and several kinds of medicine.

ART, term of. See Term.

ARTS; bachelor of. See Bachelor.

ARTS, major of. See Master, Degree, Faculty.

Art is also applied to divers imaginary, and even superfluous doctrines and inventions. Such are Lully's art, or the transcendental art. This is an art by means of which a man may dispit all days on any topic in matter, without understanding the least tittle of the thing in dispute; thus called from its inventor Raymond Lully. It conduct chiefly in disproving the several sorts of beings into divers scales or cliques, to be run down in a defying progres from. Thus, whatever was proposed as the subject of discourse, they would say, first, it is a being, and consequently, one true, good, perfect; then, it is either created, or uncreated. Again, every created being is either body or spirit, &c.

ART, art notoria, is a pretended manner of acquiring sciences by intuition, without any other application than a little falling, and performing a few ceremonies. It was solemnly condemned by the Sorbonne in 1320.

ART, St Anjelii's is a superfintitious manner of curing wounds, by barely touching the lincw herein which those wounds had been covered. Delrio, in his Disquisitiones Magicae, observes, that some Italian soldiers, who practised this art, attributed the invention thereof to St. Anjelii; but this affrays us also, that it was really invented by Anselm of Parma, a celebrated magician.

ART, St. Paul's, is a branch of the art notoria, so called as being supposed to have been taught by St. Paul, after his being taken up into the third heaven.

ART and Part, is a phrase used in the north of England, and in Scotland. When any one is charged with a crime, they lay he is art and part in committing the fame; that is, he was concerned both in the contrivance and in the execution of it.

The facts inferring art and part need not to be particularly laid in the libel or indictment, for these general words, as terms of flated signification, are sufficient. Yet these facts may be let forth, and it is proper so to do, if the prosecutor chooses to confide in the court rather than in the jury. Vide Mackenz. Crim. Law.

One may be art and part, 1. By giving counsel to perpetrate, without dililiction, whether the crime would have been committed without such counsel or not: this being what can never be perfectly known. But it is to be observed, that in the more atrocious crimes, he that gives counsel is equally punished as he that commits them; but in the less atrocious, less severly. And sometimes reasons of mitigation are taken from the age, the manner of advising, &c.

2. By aid and assistance, and that either previous, or concomitant, or subsequent, to the commission of the crime.

3. By a clear and explicit mandate to commit the crime, or to do somewhat unlawful in itself, which with great probability might produce it, executed by the hand of the mandatory, and not that of another.

ART hermetical. See HerMETICAL.

ART, hyssopic. See HisySOPIC.

Art, military, comprehends the order and arrangement with which public or private forces are formed and conducted, as an army, when it is to fight, to march, or to be encamped, usually denominated tactics; and also the construction and application of warlike machines.

ARTA, in Geography, a town of Switzerland, in the canton of Schwitz, on the south border of the lake of Zug.

ARTA, a river of European Turkey, which runs into the gulf of Arta, near a town of the same name.

ARTA, or Larta, a town of European Turkey, with a Greek archbishop's see, in the province of Albania, on the river Ardisias, near a gulf to which it gives name. The cathedral is said to have as many windows and doors as there are days in the year; it is supported by above two thousand marble pillars, and was built by Michael Ducas Connenos, emperor of Constantinople. The inhabitants, who are partly Mohometsans, and mostly Chirilians, are reckoned to be about seven or eight thousand, and carry on a considerable trade in tobacco and skins. The gulf is on the east side of the Adriatic. N. lat. 39° 29'. E. long. 21° 20'.

ARTABA, an ancient measure of capacity used by the Persians, Medes, and Egyptians.

The
The Persian artaba is represented by Herodotus as bigger than the Attic medimnus, by three Attic cheires; from which it appears that it was equal to 62 Roman modii, consequently that it contained 1662 pounds of wine or water; or 1263 pounds of wheat.

The Egyptian artaba contained five Roman modii, and fell short of the Attic medimnus by one modius; consequently held 1331 pounds of water or wine, 109 pounds of wheat, or 60 of flour.

The Babylonians allowed their god Belus twelve artabas of fine flour for his daily suffusion; which will amount to 60 Roman modii, and consequently 720 pounds of flour.

The Median artaba was of the same content with the Attic medimnus, and consequently equal to six Roman modii, held 160 pounds of water or wine, and 120 of wheat. Be- verin de Pond. & Menf. part ii. p. 125.

ARTABANUS, in Ancient History, the common name of several kings of Parthia. The first died in the first year of his reign, in consequence of a wound received in a battle with a tribe of Scythians, about the year before Christ 150. The second was of the race of Arfas, and was king of Media, when he was called to the throne of Parthia, about the year of Chrifl 167; and died much lamented by his subjects, about A.D. 43. The third lived in the reign of Vepshianus or Titus, and espoused the case of a counterfeit Nero; he died whilst he was meditating the invasion of Armenia. With the death of Artabanus IV. in the year 226, the Parthian empire terminated. See ARTACINE.

ARTABRI, in Ancient Geography, a people of Europe, in Spain; deriving their name from Artabrum, a promontory near which they dwelt, and corresponding to cape Finif- terre.

ARTACABANE, a town of Asia, in Aria. According to Pliny, it was larger and more ancient than Alexandria in the same country.

ARTACÉON, a small island of the Propontis, in the vicinity of Cyzicum. Pliny.

ARTACAANA, a town of Asia, situate in the northern part of Aria, on the confines of Parthia, according to Strabo. Q. Curtius makes it the capital of ARIA.

ARTACE, the name of a colony established by the Miletians in Phrygia, in the year before Christ 694. Venus had a temple in this place, whence her name Artacia.-Also, a fortress of Aria, in Bithynia, situate on the Euxine sea.—A mountain of the peninsula of Cyzicum.—A small island of the Propontis, over against the mountain of this name.—A port of Asia, on the coast of the Propontis, near to, and west of Cyzicum.—A town of Asia, in Armenia.

ARTACENA, a country of Asia, in Assyria.

ARTACH, a town of Asia, according to Curoslotae.

ARTACII, a people placed by Dion towards Thrace, and said to have been conquered by Craesus.

ARTACINA, a town of the island of Crete. Ptolemy.

ARTEA, a country of Persia, according to Pausanias.

ARTAGERA, a town of Asia, in Armenia, near which C. Cæsar was dangerously wounded by one Audus, according to Vellicus Paterculus.

ARTAGICARITA, a town of Greater Armenia, placed by Ptolemy between Arfamofara and Tigranocerta.

ARTAGICERTA, Ardis, a town of Asia, in Armenia, on the western branch of the Tigris, north-east of Armida.

ARTAGIRA, a town of Interior Libya.

ARTAKI, in Geography, a town of Asiatic Turkey, in the province of Natain, on the fourth coast of the sea of Marma, 76 miles south-west of Coutilantinople. N. lat. 40° 15'. E. long. 27° 39'.

ARTAKUI, a town of European Turkey, in the province of Romania, 48 miles north-west of Gallipoli.

ARTAMIS, in Ancient Geography, a town of the Cyrene- nian territory in the Pentapolis.—Alfo, a town of Asia, in Bactriana.

ARTAMOVA, in Geography, a town of Siberia, 120 miles south-south-east of Tobolik.

ARTAN, a town of Asiatic Turkey, in the province of Natain, 24 miles south of Akferai.

ARTANA, or ORTANA, a town of Spain, in Navarre, five leagues from Pampluna.

ARTANES, or ARTANUS, a river of Aria, in Bithynia. ARTANICA, in Botany. See CYCLAMEN.

ARTANISSA, in Ancient Geography, a town of Asia, in Iberia. Ptolemy.

ARTAS, a town of Asia, in Syria, situate at the foot, and to the east of one of the branches of mount Amanus.

ARTAS BAT, in Geography, lies in the island of Majorca, in the Mediterranean, S.W. from Cape la Padré, the western extremity of the island. The town lies between two rivers, which fall into the bay from the west and north-west. Al- cuini Bay is to the north-west from the Cape la Padré.

ARTASIA, in Ancient Geography, a town of Asia, in Syria, in the neighbourhood of Antioch.

ARTATUS, a river of Illyria, mentioned by Livy.

ARTAVIVA, in Geography, a town of Asia, in Min- grelia, 110 miles north-east of Trebizon.

ARTAXATA, in Ancient Geography, the metropolis of Armenia, and the residence of the Armenian kings. This city was built upon a plain, which Hannibal recommended to king Artaxes as a proper site for the capital of Armenia. It was situated upon an elbow of the river Araxes, which forms a kind of peninsula, and surrounded the town, except on the side of the isleannus ; and the isleannus was secured by a rampart and a broad ditch. Lucullus, after having de- feated the Armenians under their king Tigranes, would not venture to lay siege to Artaxata, which he considered as impregnable. The gates of the city were thrown open to Corbulon, the Roman general; but the city itself was burnt and razed. It was afterwards called Neronia, in compliment to Nero, who ordered Tredites to rebuild it. The ruins of this city are shown at a place called Artaxata.

ARTAXERXES, in Biography, the name of three kings of Persia. The first furnamed Longinamus and Mavus- zan, from the extraordinary length of his arms and hands, so that, on his standing upright, they could reach his knees; he succeeded his father Xerxes, who was murdered by Arta- banus, the captain of his guards. The traitor charged the death of Xerxes upon Darius, his eldest son, and induced the young prince to get rid of him in the same manner. Darius was therefore, by the counsel and advice of Artabanus, immediately assassinated, and Artaxerxes was placed upon the throne, in the year before Christ 404, notwithstanding the prior claim of his second brother Hyllaspe, who was then in Bactriana. Artabanus, having thus far succeeded, proceeded to the accomplishment of the design which he had formed of securing the crown to himself. But Artaxerxes being informed by Megabyzus of his conspiracy, prevented the execution of it by the death of the traitor. Thus esta- blished in the throne, notwithstanding the treachery of Arta- banus, and the hostile attacks of his brother Hyllaspe, he pursued a much more prudent course than that of his father, and defied from impracticable attempts to subdue the valiant Greeks, who were fighting for their liberty. At length a war between the Greeks and Persians, which had been pro- tracted for fifty-one years, was terminated, happily for both nations,
nations, and very honourably to the former. Artaxerxes proceeded, very much to the satisfaction of his subjects, to cultivate the arts of peace, and to redress the evils which had resulted from the frantic ambition of his father. Although he was an absolute prince, he distinguished himself during a long reign by his mildness and humanity. At his court Themistocles, the illustrious Athenian, who had been an avowed enemy to the Persian government, found an asylum; and here he was treated with great distinction and hospitality. Thucydides (I. i. p. 91.) refers the retreat of Themistocles to the commencement of this reign; but other authors, as Strabo, Plutarch, and Diodorus, fix this incident under Xerxes in the preceding reign. In this latter opinion Dr. Prideaux concurs. Artaxerxes was very averse to the Jews, and his latter suppised by Prid- eaux and many others to have been the Ahasuerus of Scripture, who married Esther, and by whose permission Darius restored the Jewish worship and civil government at Jerusalem. Archbishop Usher supposes that it was Darius Nothus, the son of Hyllapae, who espoused this illustrious Jewess. See Darius, and Esther. The seventy weeks of Daniel are reckoned to commence in the reign of Artaxerxes, See Prophecy. Artaxerxes died within eight months after the beginning of the forty-first year of his reign, and was succeeded by Xerxes, his only legitimate son. Prud. Comm. vol. i. p. 360. &c. and vol. ii. p. 372, 579.

Artaxerxes II., called Mimon on account of the strength of his memory, was the eldest son of Darius Nothus by his queen Parysatis, and bore the name of Artashes before his accession to the throne, in the year before Christ 454. It is related (see Athenæus, l. 12.) that when he was attending his father, who was on his death-bed, he defined instruction for the succesful conduct of government, and then appointed him to succeed him, with this memorable advice: "Thus," he expected the felicity and favours which he had enjoyed, "it must be by doing in all things that which was just both towards God and man." Artaxerxes had a younger brother named Cyrus, the favourite of his mother, and whom she wished to elevate to the throne upon the following claim: the birth of Artaxerxes had happened before the accession of his father to the throne; but that Cyrus was born the son of a king; a distinction which, however frivolous it may be deemed in modern times, had engaged Darius Hyllapae to prefer Xerxes, the younger of his sons, to his elder brother Artaxerxes. Cyrus formed a conspiracy against the life of his brother, for which he was sentenced to death, but pardoned by the intercession of his mother; he afterwards attempted, with the assistance of a Greecian force, to dethrone his brother; but, though victorious, he was killed in battle. His friends on this occasion were all destroyed; but the Greek army kept entire, and in spite of all the force and artifice with which they had to reconcile the scattered remnant of his family by a retreat, which is one of the most brilliant events in history, and is recorded by Xenophon, who was a principal actor in it. Artaxerxes x is much cenured for the weakness betrayed by him in delivering up to the vengeance of Parysatis all who had been instrumental in the death of Cyrus, though he himself boated of having inflicted the mortal wound; and for furloughing this female monster to murder them with attendant circumstances of the most exquisit terror. She soon after poisoned the queen Statira, by which she excited the indignation of her son so much, that he confined her to Babylon, and vowed never to enter the city as long as she remained there. At length, however, she was recalled to court, and main- tained considerable influence as long as she lived. The

Arta-
ART

point six leagues nearly east from the river Copalita, on the
south-west coast of Mexico, in the north Pacific Ocean:
appearing at a distance like a small island.

ARTEAGA, Steffano, in Biography. See Steffano.

ARTEDEI. Peter, born in the province of Ingmanland
in Sweden, in the year 1705, received the first
part of his education at the College of Halleland, where
he was removed to Upsal. He was intended for the
church, but his disposition leading him to the study of Na-
tural History, in which he was a student in Linnaeus, he prefer-
red practicing medicine, and applied himself to chemistry, but
his principal attention was turned to Ichthyology, in which
he made considerable progress. In 1732, he came to Eng-
land in pursuit of his favourite study, at the same time that
his friend Linnaeus set off to examine the natural pro-
ductions of Lapland. On paring, they mutually assigned
to each other such manufactures as they should be in pos-
fession of treating on natural history, in case either of them
should die in their travels. This event however did not
then take place, as they met together at Leyden in the
year 1735. It was here that Linnaeus engaged his friend
in the superintend the printing of the third volume of Seba's
Thecannus, which treated of fishes. Returning one evening
from Seba's house to his lodgings, while prosecuting this
business, he fell into the canal, and was drowned, being
only 30 years of age. Linnaeus, who got possession of his
manuscripts, published his 'Bibliotheca Ichthyologica,' and
his "Phylogenia Ichthologica" in 1738, with the life of the author prefixed. He had before published his
"Classification of Umbelliferous Plants from the Calyx." 

GEN. BIOG.

ARTÉDIA, in Botany (from P. Artedi, a student
of medicine in Sweden), an umbelliferous plant, formerly called
Partial, small, similar. Involucr um uniflor., about ten-leaved;
leaflet ovate-oblong, three-brilled at the end, nearly
the length of the umbel; Partial, two or three-leaved, verging
outwards; leaflet linear, pinnate, longer than the umbelule.
Cor. uniflor. diliform, radiate; florets of the disk abortive.
Pet. of the disk, male; petals five, corolla longer than the
stamens, hermaphroditic, with similar petals, but the outer-
most largest. Stamina five, calyptrate in all the florets;
spathers simple, rounded. Fil. of the ray, germ small, in-
fessor; styles reflex; stigma simple. Per. ovate; fruit rounded,
compressed, leaf-like, seated on the edge, bipartite. Seeds
two, oblong, rounded, spreading, scales about the edge.

fruit, rough with scales.

Species, t. A. fumawut, flasks, about two feet high,
founding for a few late branches, with linear multifid
leaves, resembling those of dill; flowers white, in a large
terminal umbel; fruit-bearing umbel converging; involucre
many-leaved, having the leaflets margined at the base; petals:
as in the tordium; annual, flowering in July. Found on
Mount Libanus by Rauwolf, and by Tournafort in Notalia.
Introduced by Mr. Thouin in 1788.

Propagation and Culture. The seeds should be sown in
autumn in a warm border, where the plants are to remain,
for they do not bear transplanting. To secure their feeding,
they should be raised in a hot-bed, and kept in a green-
house.

ARTECIA paniculata. See DAUCUS.

ARTEL, in Commerce, a name given to a commer-
cial association, consisting of a certain number of labourers, who
voluntarily become responsible, as a body, for the honesty
of each individual. The separate earnings of each man are
put into the common stock; a monthly allowance is made
for his support; and at the end of the year the surplus
is equally divided. The number varies in different associations,
from 50 to 100; and it is considered to be of benefit to belong
to one of these societies, that 350, and even 1000 roubles
are paid for admission. These societies are not bound by any
law of the empire, or even written agreement; nor does the
merchant restrain them under any legal obligation; yet there
has been no instance of their objecting to any just claim, or
of protecting an individual whose conduct had brought a
demand on the society. Hence arises the denomination of
Artelshiefs, who are persons employed by the Russian mer-
chants of St. Petersburg to collect payment on bills, to re-
ceive and pay money, and also to superintend the loading and
unloading of the different cargoes. These Russians are
mostly natives of Archangel and the adjacent governments,
of the lowest class; they are frequently slaves, generally of
the crown; and yet the merchant has no reason to distrust
their fidelity, partly from the nature of their affiliation,
and partly from the natural reluctance of the Russian to
bear the confidence that is reposed in him.

ARTEMIDIS, in Ancient Geography, a town of A sia,
in Leffer Armenia, called by Ptolemy, Artemidia, or Ar-
tempis.

ARTEMIDORUS, in Biography, a remarkable vision-
ary, who spent his whole life in attempting to solve the
mysteries concealed, as he apprehended, in dreams. For
this purpose he not only collected all that had been written
on the subject, but travelled over Greece, Asia, and Italy,
to learn such stories relating to them as were current in those
countries. He was born at Ephesus, in the time of Antoninus
Pius, as we learn from a passage in his work, called "Oni-
ocrítica," the interpretation of dreams, which, though mis-
based in this strange fancy, still keeps its rank, on account
of the information it contains relative to ancient rites and
customs. "Rum i speciebus," Gerard Vosius says, " nihil
coepit vanus: fidetis tamen eum lectio eicit om tam multa,
qua admittere de ritibus antiquis et fidei humanis," e
In this work he assumed the surname of "Daldanian," from
Dalsius, a seafarers of Lydia, the birth-place of his mother.
The Onior-critica was first edited in Greek, by Aldus, in
Svo., in 1518. Coronarius published a Latin translation at
Bafle, in 1577; which was reprinted with the Greek text
in 4to., at Paris, in 1604, by Rigaltius. Lucian Philopa-
§ 5. 8. 6. iii. p. 402.

ARTEMIDORUS, a geographer of Ephesus, is frequently
commended by Strabo, Pliny, and Steph. Byz., and flou-
rished about the 160th Olympiad, or the 104th year before
Christ. His description of the earth is often cited by the
ancestors. Some fragments of this geographer are collected
in the first volume of Hudson's Leffer Greek Geographers.

ARTEMIS, in Entomology, a species of Papilio (Nymph.
Phal. Gmel.) that inhabits Germany and some other parts
of Europe. The wings are indented, falciform varied with
black: a row of black spots both above and beneath on the
posterior pair. Fabr, ccc.

ARTEMISIA, in Antiquity, yearly festivals observed in
diver cities in Greece; particularly Delphi, in honour of
Diana, named Artemis.

In the artemis, a milklet was sacrificed to this goddess, as
being thought to bear some resemblance to her, because
it is said to hunt and kill the shehare. Athen. lib. viii. The
Syracusans also celebrated the artemisia for three days,
with great joy and festivity.

ARTEMISIA

*Shrubby, erect.*

Species. 1. A. vermiculata; leaves acerate, crossed, very small; panicle racemose, on the floor of the cell. A stiff upright, common, alvine, pinnate, on the upper surface tomentose, beneath naked, and rather convex; pinnate, imbricate, confining of racemes, formed of felied, ovate, imbricate spicules; flowers tomentose. A native of the Cape of Good Hope. 2. A. capillaris, Thunb. Jap. 1809. "Leaves simple, capillaceous." The item is stilted, redflut, a foot high; branchlets scattered, subflabellate, from upright spreading, like the item; leaves many, smooth, half an inch long; flowers in close racemes, on the extreme twigs. A native of Japan, where it flowers in October. 3. A. judaica, abanathinum halepense, &c. Pink. Alm. t. 73. f. 2. "Leaves obovate, obtuse, lobed, small; flowers panicled, pedicled." The item suffruticose, subpuedificant, ashes-coloured, a foot and a half high; leaves three or five-lobed, subtomentose, ash-coloured, middle leaf the broadest; flowers roundish, rather depressed, the size of crimson feathers. A native of China, Judea, Arabia, &c. 4. A. Athabepica; "leaves palmate, linear, very minute; flowers racemose, peduncled." A shrubby plant, one foot high, white; leaves the size of those of heath, in clusters, subtomentose; divisions linear, very narrow; flowers nodding, the size of those of wormwood; receptacle naked. A native of the Cape of Good Hope, and of Spain. 5. A. caudata; "leaves palmate, linear, minute; panicles racemose, flowers filiform." An upright, tomentose, white shrub; leaves crowded; flowers imbricate, small, in spikes, which fit close to the branches. Found by Ltere in Peru. 6. A. abramerum, fothernwood. Woodv. Med. Bot. t. 119. A firm erect, common fothernwood. A Dwarf fothernwood.

"Leaves stelose, very branching." A well-known under shrub, common in gardens, rising three or four feet in height; leaves alternate, petioled, multitudinous; leaves linear, very narrow, pale green, tomentose-labiate, 6ids divided towards the top, where they become thin, and even linear next the flowers, which are in upright spikes at the extremities of the branches; they are numerous, nodding, yellow, but rarely open in England. A native of the Southern parts of Europe and of Asia. 7. A. arboreum, common narrow-leaved tree-woodworm. "Leaves thin, whitish, silky, cinereous; leaves linear; flowers globose; flower-bearing branches simple." The stalk is woody, fix or seven feet high; leaves resembling those of common wormwood, but much whiter, and more finely divided; flowers globular, in spikes, terminating the branches. This is some confederated as a variety of the common wormwood. A native of Italy. 8. A. argentea, broad-leaved tree-woodworm. "Leaves bipinnatifid, silky, white; leaves lanceolate-linear; flowers globose; flower-bearing branches wand-like." The whole plant is of a silvery colour; receptacle villose. A native of Madeira, where it was discovered by Maffon, and introduced here in 1777. 9. A. arganiae; "leaves linear, bipinnate, hairy; flowers racemose, scarcely a foot high; upper leaves simple, linear; racemes small, axillary. 10. A. defferschmidtii; "leaves linear, multitudinous; racemes erect, slender, loose." The item is upright suffruticose; the whole plant tomentose. 11. A. Tartarica; "lower leaves bipinnate; pinnae equal; upper leaves pinnate, linear; racemes erect, loose, many-flowered." This, like the preceding species, is a tomentose under-shrub. They were both found in Tartary by Mefferich. See Stechin. p. 19. n. 9 & 10. 12. A. nitroa, Gmel. Sib. 2. t. 50. f. 1. "Lower leaves finely multitudinous; upper entire, obtuse; corollines erect, hoary, oblong, spicate, filiform, felliform." A native of Siberia. 13. A. lebriana, Gmel. Sib. 2. t. 50. f. 2. 3. "Lower leaves finely multitudinous; upper entire, obtuse; corollines erect, hoary, oblong, spicate, filiform." A native of Siberia. 15. A. paviiflora, Gmel. Sib. 2. t. 52. f. 1. 2. "Branches virgate, tomentose; corollines one-ranked; spikes subfiliform." Calyx three or four flowered. A native of the banks of the Volga; and a rarity by Gmelin between the rivers Jenifa and Iris. 14. A. ten. Ille. Alfi. ser. Hisp. Tournef. infil. 45. "Leaves short, very finely multitudinous; corollines slender, loose, leafy; peduncles one or two-flowered." Stem woolly. A native of Spain. 15. A. paviiflora, Gmel. Sib. 2. t. 52. f. 1. 2. "Branches virgate, tomentose; corollines one-ranked; spikes subfiliform." Calyx three or four flowered. A native of the banks of the Volga. 16. A. italica, Pluk. phyt. t. 121. f. 2. "Leaves tomentose, loofely pinnate; pinnae long, linear; root-leaves dotted; spikes dense; flowers erect." A native of Italy. 17. A. hispanica; "leaves loosely pinnate; pinnae long, linear; spikes very dense; calyces oblong;" not tomentose. A native of Spain. 18. A. Gmelini, Gmel. Sib. 2. t. 56. f. 1.
**Artemisia.**

1. "Leaves doubly pinnate, obtuse, linear; coriaceous green, roundish, nodding." The leaves are sub-velvety underneath. Found by Gmelin near the rivers Lena and Angara. 19. A. lobata, Allion, ped. n. 607. A. camphorata. Villar's Dauph. 242. "Leaves petiolate, palmate, multifid, linear; upper ones simple, angular." This is a smaller plant than common fothernwood, and has a strong coriaceous smell. The leaves are leathery, and those about the flowers broader, longer, and not so much cut. The coriaceous are larger, and thinner, and the flowers of a fine yellow. A native of Piedmont, Dauphiné, &c.

**Proctorum before flowering.**

20. A. fontanica. Tartarian fothernwood or worm-wood, Med. Bot. t. 123. "Stem-leaves bipinnate, multifid; branches undivided; spikes one-ranked, reflex; flowers with five florets." Stem panicked, rather hoary; lower leaves pinnate, multifid, linear; branches wool-like; spikes alternate, recurved; flowers round, nodding, solitary; leaves on the branches undivided, nearly linear. A native of Tartary, and cultivated by Miller in 1768. It flowers from September till November. 21. A. campdress, field fothernwood, Hudw. 257. With. 729. Eng. Bot. t. 378. Smith. 803. Abrotanum campdress. Ray Syn. 190. Ger. Em. 1165. "Leaves multifid, linear; stems procumbent, wool-like; root fusiform." Stems prostrate, ultimately erect, about two feet in length, virent, paniculate, angular, smooth, reddish, leafy; leaves irregularly bipinnatifid, rather reflex, somewhat hairy underneath; radical leaves depressed, and with longer foot-flanks; those on the stem alternate, minute, compound; flowers in racemes, drooping, small, of a brownish green; scales of the calyx carnose, and rough at the margin; florets of the disk about fifteen, yellow, with a purple apex; those of the ray only two or three, very small, subulate, closed, entire; receptacle naked, convex. It has been found in several places in Norfolk and Suffolk. This plant differs from common fothernwood, as its odour is so weak as to be scarcely discoverable. 22. A. palustris, marsh fothernwood, Gmel. Sib. t. 555. "Leaves linear, pinnate, entire; flowers glomerate, subsefife." The leaves referable those of a buckhorn plantain, with five or seven segments; flowers yellow, receptacle naked. A native of Siberia. 23. A. erythraea, dill-leaved fothernwood. "Leaves compound, divaricate, linear, febbly, smooth; stem rising, paucised." It has the habit of the A. camphorata; stems from half a foot to a foot in height; leaves pinnatifid and trifid. Found by Loefling on the sandy shores of Holland. Cultivated by Miller in 1768. 24. A. vallescasa, downy fothernwood; "leaves pinnate, many-paired, filiform, tomentose; flowers sessile, erect, subco- lumnar, having few florets." An erect shrub, a foot high; leaves hoary, bipinnate; pinnae pinnate, and also tribolate; flowering branches tomentose, alternate; flowers tomentose, with linear bracts; scales of the calyx concave, outer tomentose, inner membranaceous. No female florets. A native of Spain, Piedmont, and the Valais, flowering in August. Introduced by Dr. Pitcairn and Fothergill. 25. A. maritima, sea fothernwood, Hudw. 358. With. 709. Woolly. t. 122. Smith. 804. "Leaves many-paired, tomentose, racemes drooping, receptacle naked; flowers threefold." Root woody, perennial; stems erect or decumbent, leafy, furrowed; lower leaves pinnate; pinnae tripartite; upper various, divided, at the top simple, all entire at the margin, and white on both sides; racemes drooping; flowers ovate, nodding. There are three varieties of this species. A British plant growing on the sea-coast, and flowering in August. 26. A. glaucescens, silky fothernwood, Jacq. Alp. t. 35. "Leaves palmate, multifid, silky; stems ascending; flowers glomerate, level-topped." Leaves small, three-parted, linear, segments trifid, subsefife, silky white, tomentose, very short on long foot-flanks; those below fleathering the items which are a span high, simple, subto- mentose, leafy; flowers glabrous, yellow, terminal, on very short peduncles; receptacle hairy. Villar describes it as three or four inches high, with about four terminal flowers, including from forty to fifty florets. A native of the south of Europe, flowering in August; cultivated by Miller in 1748. 27. A. rupestris, creeping fothernwood, Flor. Dan. t. 801. "Leaves pinnate; stems ascending; flowers glabrous, nodding; receptacle pappose."" It grows near a foot, hoary, hirtufate; leaves on long foot-flanks, narrow, having two or three pairs of pinnae, with an odd one; pinnae three or five-paired; flowers axillary, on long peduncles, nodding; receptacle hairy. A native of Alpine situations, cultivated by Miller in 1748; flowers in August. 28. A. fruticosa, spiked fothernwood. Jacq. Alp. t. 34. "Root-leaves biternate; stem ascending; flowers erect." Linnaeus made this a variety of the rupestris, but Haller says, though it has the same habit, the leaves in this case are much broader and each pinnax trifid, and the nerves is very broad; on the stem the leaves are sessile, semipinnate, with four pairs, the last largest, shortly trifid; pinnae not branching, scarcely a span high; peduncles one-flowered; leaflets of the calyx ovate, dark coloured, and hence called Genipi noir. A native of the Alps of Swizer- land, Austria, Piedmont, and Dauphiné.

**Ercti herbaceous, with compound leaves.**

29. A. arctica, dill-leaved fothernwood, Gmel. Sib. t. 54. "Leaves multifid, very slenderly divided; coriaceous roundish, nodding, one-ranked, filthy, spiked;" the item is herbaceous; florets reddish; calyces large, green, and streaked with white. A native of Siberia. 30. A. pontica, Roman fothernwood. Jacq. Alp. t. 99. "Leaves many-paired, tomentose beneath; flowers roundish, nodding; receptacle naked." Stems in their natural state short, of two feet high, but when cultivated in gardens, four; upright, reddish, smooth, hoary, branched. Stem-leaves bipinnate tomentose, with sharp linear segments, uppermost entire, simpie, those at the bottom of the branches and top of the item are simple pinnate; flowers in racemes, nodding, hoary; disk yellow; florets 24, those in the circumference about six, female, apetalous, and of a greenish yellow; the others hermaphrodite; seeds naked; receptacle conical, naked. A native of Germany, Piedmont, &c. flowering in September. Cultivated here in 1843. 31. A. aphylla, Auriachian fothernwood. Jacq. Alp. t. 100. "Leaves many-paired, tomentose, hoary; flowers oblong, nodding, receptacles naked." Stems from six inches to a foot and a half in height; branches numerous, sending forth simple short twigs, which are one-flowered on the shorter items, but on the greater many-flowered; leaves on the twigs are first entire, then trifid, and -fo on, increasing the divisions till they become subtrilobulate-pinnate; hermaphrodite florets about eight, females from four to seven, apetalous. It differs from the maritima in the leaves, being less tomentose and hoary, roundish, and not oblong. A native of Austria. 32. A. anomalis, dill-leaved fothernwood, Gmel. Sib. n. 108. "Leaves three-fold pinnate, smooth on both sides; flowers fagiforme, nodding; receptacle smooth, conical." An annual, with a creft, smooth, streaked stem, rising to eight feet in height, though seldom higher than two in our climate; flowers yellow on axillary racemes; peduncles long, with lanceolate entire bractes; all the florets hermaphrodite. A native of Siberia and China; cultivated by Miller in 1759. It flowers in August. 33. A. tanacetifolia, tanfy-leaved
leaved wormwood, Allson. Ped. n. 668 t. 70, f. 2. Gmel. Sib. 2. t. 58. "Leaves bipinnate, underneath tomentose, shining; pinnae transverse; racemes simple." Stems numerous, simple, from five inches to a foot high; root-leaves sheathing, petioled, ovate-pointed, all-coloured, having from five to eight pinnae; pinnales three-toothed; pinnales of the stem-leaves simple; upper oval, lanceolate; spikes terminal, compound, with racemes rising from all the axis; in the terminal spike there is a diplole to each peduncle, which is one-flowered; flowers nodding, in pairs, all towards the same side; receptacle naked; perennial. A native of Dauphiné, Piedmont, and Siberia. In this it is sometimes entirely tomentose. 34. A. absonbium, common wormwood. Huds. 359. With 710. Woodv. Med. Bot. t. 123. "Leaves multitid, of a filky white; flowers hemispherical, pendulous; receptacle hairy." Root woody, branched; stems rather erect, branched, angular, pinnate at the top, lower-leaves, bipinnatifid; upper, pinnatifid, or digitate; divisions elliptic-oblong, obtuse, entire; racemes erect; flowers nodding, yellow; florets of the disk numerous, of the ray very few; receptacle very hairy. It grows wild among rubbith, rocks, and on road fides. 35. A. vulgaris, mugwort. Huds. 359. With 710. Med. Bot. t. 121. "Leaves pinnatifid, flat, gashed, tomentose underneath; racemes simple; flowers ovate; receptacle naked." Root woody; stems four feet high, erect, branched, pinnate, furrowed, smooth, leafy, purplish. Leaves alternate, petiolar, pinnatifid, gashed above and smooth, of a dark green, underneath tomentose, very white; racemes somewhat erect, simple, leafy; flowers feifie, erect, ovate, woolly; receptacle naked; florets of the ray five. It affects similar situations as the preceding species, and like it flowers in August. 36. A. pectinata. "Leaves pinnate, pectinate, smooth, feifie; flowers axillary, solitary, feifie, having four florets? a fragrant annual having a stem about eight inches high. It is easily to be distinguished by its feifie pinnate leaves; pinnae feifie, parallel, pinnatifid; flowers solitary, from the axis along the stems. Found by Pallis in the dry lands of Dauria.

37. A. integrilolia, entire-leaved mugwort, Gmel. Sib. 2. t. 48. f. 1. "Leaves lanceolate, tomentose underneath, entire or with one or two teeth; female florets five." Stem simple, about two feet high; leaves narrow, cut into acute segments at their edges, somewhat like those of buck's horn plantain; flowers axillary, in small loose spikes, large, of a pale yellow. A native of Siberia. 38. A. japonica, Japanese wormwood, Thunb. Jap. 110. "Leaves on the branches smooth, lanceolate-entire, on the stem oblong, trifid; flowers racemed, nodding." An underthub with an erect angular, feared, wand-like, smooth, feim, branched at the top, and above two feet high; leaves on the stem alternate; feifie, attenuated, and entire towards the base, but towards the top cut, ferrate, spreading; those on the twigs similar, but very small; flowers pointing in the same direction, on capillary reflex peduncles. It differs from the cerculescens in having smooth leaves. A native of Japan. 39. A. cerculevens, bluish mugwort, Huds. 359. With 711. Smith, 806. Gmel. Sib. 2. 131. t. 64. f. 1. Abf. maritimum lavandulae folio. Bath, pin. Ray Hist. &c. "Leaves hoary; on the stem lanceolate, entire; lower leaves multiid; flowers cilindrical; receptacle naked." Root perennial fibrous; stems nearly erect, round, channelled and pubescent, leafy panelied; leaves alternate, petiolar, hoary on both fides; racemes erect, simple; flowers ovate-cylindrical, small; florets of the ray three. A native of the southern parts of Europe, on the sea-coast; and found in Lincolnshire. Cultivated by Tradescant, jun. in 1658. 40. A. dracunculus, Tarragon. Scop. Carn. 0. 1032. Gmel. Sib. 2. t. 59 & 60. f. 1. Drake herb, Ger. Emac. 249. Park. Rau Hill. "Leaves lanceolate, smooth, quite entire." Stem divil, smooth, branched, from one to two feet high; leaves petiolate, green on both fides; flowers yellow, in a kind of spike all directed the same way; hermaphrodite florets twelve, female six; receptacle flat, glutinous, naked. A native of Siberia and Tartary. Cultivated in 1596, by Gerard; flowers appear in August. Tarragon is frequently used in salads, especially by the French, to correct the coldness of other herbs. The leaves make an excellent pickle, they have a fragrant smell, and aromatic taste. 41. A. chinenis, Chinese Mugwort. Gmel. Sib. 2. 61. f. 1. 2. Lour. 402. "Leaves simple, tomentose, obtuse, lancolate; below wedge-shaped, three-lobed." Stem herbaceous, simple, cottony, branched, between two and three feet high; lower leaves obtuse, three-lobed; upper lanceolate-linear, entire, tomentose on both fides, feifie crowded, scattered; flowers small, on terminating erect racemes. A native of China and Siberia. In China the moxa is prepared from this species. See Med. Prop. 42. A. madrophaenum. Madras Wormwood. Jacq. Hort. 2. t. 58. called by him Tanacetum Egypt. "Leaves simple, lyrate linnate; items procumbent; flowers pedunculate, solitary, globose, opposite to the leaves; an annual, growing close to the ground; branches alternate, streaked, pubescent; leaves folf, widening outwards; peduncles one-flowered, naked, streaked, villo; flowers large, yellow, with a convex disk. A native of the East Indies. Introduced in 1782, by M. Thouin. 43. A. minima, leaf wormwood. Burm. Ind. i. t. 58. f. 5. centipeda orbicularis. Lour. 403. "Leaves wedge-shaped, repand; them procumbent; flowers axillary feifie." This is a very minute annual; leaves smooth; flowers very small, axillary, solitary, with six or seven foles. A native of China, where it was found by Lagerstrom, and also of Japan; introduced here by M. Thouin in 1783. 44. A. littoralis, Retz, Obf. 5—28. n. 77. "Procumbent, frigole; leaves pinnatifid, ferrate-toothed; calyces naked, pedicelled." This resembles the forty-second species, but the whole plant except the calyces is covered with a downy or cottony subfiance. Gathered by Koening in the East Indies, on the coast.

Medical Properties. Many of the species of artemisia posse simple feifie and medicinal qualities; but those species which now have a place in the Materia Medica, are southerwood, common wormwood, mugwort, sea wormwood, and Tartarian southerwood or wormwood. The first has been esteemed as a flomachic, carminative, and deobstruent, and used more especially for removing obstructions in the uterine system. But it is now rarely preferred unless as an ingredient in fomentations. Common wormwood is intensely bitter, and is the most powerful medicinal of the whole genus. Its qualities are flated by Bergius to be antifeptic, antacid, anthelmintic, refolvent, tonic, and inflamachic. Though it is now chiefly employed in the two last mentioned characters, yet we are told of its good effects in a great variety of disorders, as intermittent fevers, hypochon- droiac alfections, vesicular obstructions, gout, gravel, feanny, drophy, worms, &c. With some it is said to have a narcotic power, and to occasion head-ache. It may be given in powder, but it is more commonly preferred in infusion. The Edinburgh college directs a tincture of the flowers. Externally wormwood is used in difcunt and antifeptic fomentations. Mugwort was by the ancients thought to be very efficacious in promoting the uterine evacuation, and relieving hysterical complaints, but it is now so little valued that

5

it
it has been expounded from the Materia Medica by the London college. A subsance called moxa is prepared in Japan, from the dried tops and leaves of mugwort, by being and rubbing them between the hands till only the fine lanuginous fibres remain, which are then combed and formed into little cones. These used as cauteries, are greatly celebrated in eastern countries for preventing and curing many disorders; but chronic rheumatism, gouty and some other painful local affections, seem to be the chief complaints for which the moxa can be rationally employed. Sea wormwood, by being left powerfully bitter, must be confidered in a proportionate degree a less efficacious medicine than the common; but as it is left disagreeable to the stomach, it is more generally preferred; and a confcrve of the tops of this plant is directed in the London and American practice. Worm-feed is a solid matter from the power of these seeds in destroying worms, for which their character has been long established. The dofe is from one to two drams for an adult, twice a day. See Woodv. Med. Bot.

Propagation and Culture. Most of the plants of this numerous genus are hardy perennials, and may be increased without much difficulty by seeds, parting the roots, slips, or cuttings. The first species and a few others that are natives of very warm climates, and of course rather tender, must be placed in a green-house with myrtles, and other hardy exotics, which require a large space of free air. In mild weather, when they should be frequently watered. They love a light fresh soil, and may be propagated by slips, or cuttings. In general they will succeed in a shady border, defended from the froid. See Martyn's Miller's Dict.

ARTEMISIUM, in Ancient Geography, a promontory of Euboea, on the northern side of the island, above the town of Hilaria, and opposite to the ancient Olympos, and the Pegasean gulf. It had a temple consecrated to Diana; and it was famous for the first victory gained by the Greeks over the fleet of Xerxes. This naval engagement happened on the same day with the glorious action at Thermopylae. The Grecian fleet, confisting of 271 sail, was stationed in the harbour; but that of the Persians, which was much more numerous, had anchored in the road that extends between the city of Callanassa, and the promontory of Sepsias on the coast of Thebly. The first line of their fleet was sheltered by the coast of Thebly; but the ships of the other seven lines rode at anchor, with their prows turned towards the sea. On the morning of the second day after their arrival on the coast, and after their arrangement was made, there arose a dreadful storm, which raged for three days, and which destroyed 400 of their galleys, besides a great number of store-ships and transports. However, 300 ships of war, together with many vessels of burden, failed into the Pegasean bay, and anchored in the road of Apielet, which, at the distance of a few miles, lies directly opposite to the harbour of Artemisium. The Grecians, who had posted centurions on the heights of Euboea to the effects of the storm and the motions of the enemy, upon receiving information of the dilater that had befallen the Persian fleet, poured out a joyous liberality, and sacrified with devout gratitude to "Neptune the Deliverer." The Persians, notwithstanding their loss, were still confident of victory; and detached 300 of their best-flying vessels round the island of Euboea, for the purpose of encumbering the Grecian fleet, and of preventing any of them from cleaving through the narrow Euripus. After fun-fet the Grecian fleet approached in a line, and were met by the Persians. At the first signal, the Greeks were formed into a circle; and at the second, began the engagement. Surrounded as they were by the enemy, and crowded into a narrow space, they soon took 30 of their ships, and sunk many more. When night came on, with a violent storm of rain and thunder, the Greeks retired into the harbour of Artemisium, and the enemy were driven to the coast of Thesly. The greatest part of the Persians fortunately escaped immediate destruction, and gained the Pegasean bay; but the ships that had been ordered to sail round the island, were overtaken by the storm at a considerable distance from the shore; and, unable to direct their course, they were under a necessity of contending with the storm during the greatest part of the night, and they were all wrecked amidst the shoals and rocks of an unknown coast. With the dawn of morning the Persians perceived the extent of their misfortunes; but the Greeks were usefully reinforced with a fleet of fifty-three Athenian ships. Thus aided and encouraged, they seized the advantage of the ebbing dusk of the evening, to renew their attack; and, at the appointed time, availing themselves of their skill in fighting, and the knowledge of the coast, they fled towards the road of Aphete; and having cut off the Glician squadron from the rear, totally destroyed it; and at night returned to Artemisium. The Persians, enraged by the disasters and disappoointment they had experienced, and dreading the resentment of their sovereign, determined to make one other vigorous effort. As the Greeks had availed themselves of the night, they determined to choose the time of action. Accordingly, on the third day at noon, they sailed forth in the form of a crecent, which they conceived to be of sufficient extent to enclose the Grecian line. The Greeks, emboldened by successes, were too confident to decline another offer of battle, though their admirals, and particularly Themistocles, would probably have preferred delaying it to a more favourable opportunity. The deficiency of skill and courage on the part of the barbarians was supplied by the impetuosity and violence of indignation. The battle was protracted, and remained for a longer time doubtful than any former occasion; many Grecian vessels were destroyed, five were taken by the Egyptians, who, on the side of the Persians, distinguished themselves as much as the Athenians did on that of the Greeks. The persevering valour of the latter at length prevailed; the enemy retired, and acknowledged their superiority, by leaving them in possession of the dead and the wrecks. However, the victory was dearly purchased; as their vessels, and especially those of the Athenians, were much scattered; and their great inferiority in the number and size of their ships, made them more sensitively feel every diminution of strength. The engagement at Artemisium, though it was not absolutely decisive, contributed greatly to encourage the Athenians, who were now convinced, that the enemies, notwithstanding their immense number, were not invincible. Gillies's Hist. of Greece. See Athens.

ARTEMISIUM, a town of Caria, situate in the eastern part of the gulf of Glancus. — Also, a place in the island of Delos, Herodotus. — Also in the place of the Peloponnesus, Polybius. — A city of Italy, in Magna Graecia, belonging to the Oecistrians; now called Arani; in the island of Greece, between that of Euboea and the promontory of Sunny Arrian. — A mountain of Peloponnesus, in Arcadia, near the river Ladon. Pausanias mentions a mountain of this name, to which he refers the source of the river Inachus, and where was a temple of Diana. — Also a place of Sicily, where was the camp of Sextus Pompeius, Dion & Appian. — A port of Greece, built by Julianus, at the mouth of the river Rechius or Reus. — A town on the eastern side of Spain, called also Dianium, and now Denia, on the sea-coast of Valencia. Artemisium, in Ancient Chronology, the name of a Grecian month, the seventh of the year among the Macedonians.
ART

mans, in Asia, at Ephesus, Pergamus, &c. among the Syro-macedonians, Tyrians, Sydolians, and Lyceians. Among the Lacedemonians and Corcyreans it was the second mouth of the year, and corresponded nearly to our February. 

ARTEMITA, in Ancient Geography, a small isle of the Ionian sea, opposite to the mouth of the river Acheius. — Alfo, a large town of Asia, in Mesopotamia, according to Pline, but placed by Strabo in Babylonia, 500 fadca call of Selencia, on the banks of the lake Artifis. — A town of Asia, in the Greater Armenia. — A town of Asia, in Arabia Deserta. Ptolemy.

ARTEMUS, a mountain of Peloponnesus. Pline.

ARTEMON, or ARTEMAS, in Biography, the leader of an ancient sect among the Christians, and supposed by Tillemon to have arisen about the year 200. Enphilus (E. H. l. c. 37, 28), early in the fourth century, speaks of him as the propagator of a heresy, which Paul of Samosata endeavoured to revive in his time. Artemas and his associates, according to Theodoret, concurred with other Christians in acknowledging the supreme deity, and owning him to be the creator of the universe. But they maintained, that Christ was a mere man, born of a virgin, and superior in virtue to the prophets. This, he said, was the doctrine of the apostles; and they alleged, that all the ancients, as well as the apostles themselves, received and taught the same things which they now held; and that the truth of the gospel had been preferred till the time of Victor, the thirteenth bishop of Rome; but by his successor, Zephyrinus, the truth had been corrupted. They are accused, however, in a work cited by Enphilus, with corrupting the scriptures, and transferring them with variations, which they called emendations, but which their enemies denounced corruptions. They are said to have proceeded so far as to have rejected the law and the prophets. It was also charged upon Artemon and his followers, that they neglected the holy scriptures, studied geometry, and admired Aristotle, and Theophrastus, and Galen. From this account it appears, that whatever might be their error, they were men of inquiry and learning; and Dr. Lardner conjectures, they might join with the study of the scriptures that of mathematics and philosophy. He also imagines, that the alterations or corruptions, which were the fubjects of complaint, related merely to some Greek copies of the old testament, probably the seventy; and though he does not wholly exclude these men, he thinks this consideration may serve to lessen the injury of their conduct. Lardner's Works, vol. ii. p. 359, and vol. ix. p. 465, &c. The followers of Artemon were called Artemonites.

ARTEMUS, in Geography, a cape of Spain, in Valencia, called also the "Cape of St. Martin" and the "Emperor's point."

ARTENA, in Ancient Geography, a town of Italy, in Etruria, in the territory of the Cetzer, mentioned by Livy, as destroyed by the kings of Rome. — Alfo, a town of Italy, in Latium, in the country of the Volsci; which was taken, says Livy, about the year of Rome 351, and totally razed.

ARTENAY, in Geography, a town of France, in the department of the Loiret, and chief place of a canton in the district of Neuvile, 11 miles north of Orleans.

ARTENNA, or AVIS DIOMEDEA, in Ornithology, a name given by Ray, Willughby, and other old writers, to the bird called by Linnaeus Procellaria Puffinus; which sec.

ARTERN, in Geography, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld, 29 miles N. N. E. of Erfurt. N. lat. 51° 17'. E. long. 11° 8'.

ARTERIA ASPERA, in Anatomy, the tube by which the air passes into and out of the lungs in respiration. It is also called the trachea, and windpipe. See Lungs.

ARTERIA Vena, a name given by the ancients to what we call the pulmonary vein, or that vessel whereby the blood is conveyed from the lungs to the left ventricle of the heart. See Def. Med. p. 54.

ARTERIACS, ARTERIAC, medicines proper for disorders of the trachea, and the voice. This term, says Dr. Cullen (Mat. Med. vol. i. p. 172.), conveys no precise meaning, and is therefore improper.

Arteriacs are reduced by Galen into three kinds: 1. Such as are void of all acrimonious, serving to mollify the aperities of the part; to which kind belong: gum tragacanth, after fumus, amygdal, or parch, milk, &c. 2. Those of an acrimonious quality, whereby they stimulate even the found parts; such are honey, turpethines, bitter almonds, iris root, &c. 3. Those of an intermediate kind, soft and mild, yet deterrent; such are butter, and divers preparations made of almonds, milk, honey, &c.

ARTERIOSA Vena, or arterial vein, a denomination given to the pulmonary artery, or that vessel whereby the blood is conveyed from the right ventricle of the heart to the lungs.

ARTERIOSUS Cava is the continuation of the trunk of the pulmonary artery of the foetus into the aorta. See FOLUS, Peculiarities in the Structure of.

ARTERIOTOMY is a surgical operation, so denominated from arteria, an artery, and teneo, I cut. It therefore signifies, the artificial section, or opening of an artery, for the purpose of evacuating blood. The advantages and disadvantages of this operation, as well as the manner of performing it, are considered under the head of BLEEDING: where the subject of PHLEBOTOMY is likewise discussed at some length.
