The tackle made use of must be carefully attended to, the principal of which is the rod. An angler intending to fish at a distance from home, should be furnished with two rods; if near home, he may fill carry a spare top, or he may be much inconvenienced. When two rods are taken, it is prudent to let one be of the customary form; the other may be a strong cane, in the form of a walking-flick, which may prove useful in case of emergency. It should be so contrived as to fit the hook of the landing-net, and it will moreover be useful in fording rivers, &c. It is necessary to consider the size and nature of the fish in the choice of a rod. The larger kinds require one of considerable strength, with the addition of a reel and running line, passing through rings or eyes placed on the rod from one end to the other. A fishing-rod should be plant, yet firm, with an easy play in the hand, and a regular bend, as though formed of one entire piece. Those which are jointed with ferrules are the best, and for large fish, as salmon, it is proper that within each ferrule there should be a male screw, to fit into a female screw, within the attached joint, by which means the rod is farther secured, and is certain of a regular play. In dry weather it is prudent to dip each joint in the water previously to introducing them to each other, and if any difficulty occurs in undoing them from the swelling of the wood, they should be held over a candle or before the fire. A rod should be kept neither too dry nor too moist; in the one case it becomes brittle; in the other it is rendered rotten. It should be hung up with a weight attached to the end, by which it is kept from warping, and it may be varnished to preserve it from worms. See Fishing-rod.

The angler should farther have a variety of lines of various strengths, and of colours adapted to the waters he sports in, which is a caution of the utmost moment, and not in general sufficiently attended to. Lines should be coiled or wound on a cylinder. When wound, as it usually is, on a bit of split cane, or flat stick, forked at the two ends, or on long line machines, the sharp turns are apt to cut the gut or line. See Fishing-lines.

Hooks of various sizes are necessary, attached and unattached, with floats of cork, of quills, and of porcupine spars. Spare caps, split shaft, shoemaker's wax, bulletts, plummets, are all likewise necessary; nor should the angler forget a cleaning-ring, which is useful in disengaging the hook when entangled among weeds, or fastened to a slump. It is formed of a heavy braze or iron ring, of about two inches in diameter, with several yards of twine attached, and is made use of by pulling it over the large end of the rod, and gently letting down the line to the obstruction; when by pulling the twine, the hook will be either disengaged, or it will be broken off without damage to the reel of the line, by straining it or the rod.

A digger is likewise among the requisites, as fume fish by their eagerness swallow the hook with the bait; in which case, a piece of flat cane or wood, about six inches long, and half an inch wide, forked at the ends, and palmed down the throat, removes the hook, by gently pulling the line. A landing-net will often be found necessary when a large fish is caught; those are the best when made of size to fold up, and the handle may be the walking-flick rod before mentioned. All these, with any other necessary articles, may be taken in a balecket, first wrapped up in an oil skin case, when on the return, the fish, in the balecket will not injure them. For the articles necessary for fly fishing, see Fishing-flies.
It may in this place be remarked, that the prudent fisher will always be clothed in grave colours, or at least in such as are not gaudy. For those who weave much, but which is not a prudent method, a short hunting-jacket is convenient. The experienced fisherman will always likewise provide himself with spirits, in case of falling into the water or other accidents. There are many other small articles also necessary, as twine, pliers, feathers, a penknife; and it will be found useful always to be furnished with some trimmers, to act, if the fish should prove too good as expected.

The baits made use of must particularly attended to by the angler, he should not only procure the bulk of every kind, but he must be careful to appropriate his bait to the fish he means to entrap, and likewise according to the various seasons. He must select such articles to allure most, that nature gives at that particular time in the greatest plenty. For the fish of the fish is adapted to outward circumstances, preferring food at one time that at others it wholly rejects; and this is more particularly the case in fly fishing. An excellent mode of judging what bait is most likely to allure any particular kind of fish is, when one is caught to open it, and examine the fish, and whatsoever is found there will surely be the proper bait for others. It is said, but with what truth we are not aware, that the eyes of other fish are soft and sensitive. Baits made use of in angling are of two kinds, the natural and artificial; the natural are whatever is eaten by the animal in a state of nature, as small fish, frogs, worms of most kinds, insects in great varieties, as beetles, butterflies, all the tribe of Summer flies, moths, wasps, hornets, gnatshoppers, maggots of various kinds, and snails; vegetables are used with success, as wheat, barley, peas, beans, &c.: artificial baits are the forming of whatever imitates the natural food of the animal, as the making and painting small fish, and the imitating flies of various kinds, which latter forms a very considerable and intricate branch of the art. See Fly-fishing. Artificial baits are likewise various compositions in the form of paste: pastes are made with dough, bread, all kinds of flour mixed with honey, fruit, butter, oil, &c. and in mixing these, it is found useful to add a little cotton, tow, or lint, to make the paste more adhesive. The spawn of other fish is frequently used as a bait with success, and it is very commonly potted for this purpose.

Ground-bait is a previous method made use of by anglers to induce fish to frequent particular spots; some are in the habits of throwing this kind of bait into particular places every now and then, by which they are almost certain of finding sport among the fish who refer to this favoured place. Others only do it in the evening, or even an hour before they angle. Ground baits are of grains, barley, moulded bread, ruddings, blood mixed with chopped liver, &c. In running streams a tin box is introduced, bored with holes, with a plummet to sink it, and a line to draw it back at pleasure. The worms, crawling through these holes gradually, are a great inducement to the fish to hover about the spot. All the recipes of fishy oils and other allurements are useless. See Fishing-bait.

The proper season for angling are from the Spring to the Autumn, but much depends on the kind of fish angling for; some may be caught at all times, others, as those of passage, are only to be met with at particular seasons, and others, though always confined to one piece of water, yet are nearly torpid during the Winter, and are found only in the deeps. Weather influences fish much, and when the wind is in some points, few fish will bite. The most unfavourable is the Easter quarter; when the wind is safely no sport is to be expected. A warm lowering day is the most favourable, with flying flowers, and a light ripple on the water. Water slightly disturbed induces good sport; fish then do not easily distinguish the tackle, and are most voracious, having failed while the stream was clear. Hence angling is always good when turbid water is clearing, or in the rive before it becomes too thick. Opening a mill-dam, raising a sluice, or the turning water from a meadow, induceth the angler good sport, as it induces the fish to come to meet the food they expect. In waters affected by the tide, the flood is the best time for angling; but either ebbing or flowing is fit. Whirlpools, edges, the mill-tails, leads of bridges, and under the arches, are places the anglers should not pass over.

All places not disturbed by wind or weather are proper; deep spots, covered with weeds, are much sought after by fish.

Sometimes when you are angling in any spot, and have had good sport, and the fish suddenly leave off biting; it is probable a pike or some fish of prey is at hand, in which case a minnow, placed on your hook after, will probably take him; but the trimmers, before mentioned, are the best preventive. See Fishing.

Angling, Bladder, differs from trimmer angling, in this; instead of a cork, a bladder is made use of, by which means much diversion is occasioned; for as the bladder is drawn under water by the force of the fish; it returns by its own want of specific gravity, which serves to strike him more forcibly and prevents his disgorging the hook.

Angling, Float, is made use of in contradistinction to ground angling, trimmer angling, and fly angling, &c. and consists in the use of a line longer than the rod by two or three feet, with float not to link the float, but to let it go under water on the lightest touch or bite of the fish. In the rivers a cork float is most proper, in standing water a quill is generally used. Perch, chub, carp, tench, barbel, and grayling, are caught in this manner.

Angling, Ground, is practised with a fine rod and line, without a float, and sometimes produces excellent sport. A bullet or plumb of lead is attached to the line, eight or nine inches from the baited hook, by boring a hole and passing the line through it; at the lower end placing a float in the usual manner to prevent the plummet from slipping. This mode proves excellent for large deep-swimming wary fish; and in Winter when they confine themselves wholly to the deeps. A well-found worm is an excellent bait for this method, which is found very successful against the barbel. When one of these fish is observed to take the bait, as he bites strong, he should be instantly struck; the rod used for him likewise should be ringed, and furnished with a winch or reel, and twenty-five or thirty yards of line, which should have gin to the bottom of it. But as a general rule for other fishes, the rod and line should be fine, and when the bait is observed to be taken, the angler should not strike immediately; but slacken his line, to give the fish an opportunity to swallow the hook. Trout are often taken in this manner, as well as chub; for the former, morning and evening prove the best, except in cloudy weather, or muddy water, when you may fish for him the whole day.

Angling, Night, is of two kinds; that wherein the angler attends in person to watch his sport; and that wherein he lies down in different nooks, as trimmers, bladders, &c. and returns in the morning to see his success. By the former method may be taken some of the small and largest fish of most kinds; but among trout it has been found singularly successful; and it is observed, that the largest trout are caught by this means in the still clear deeps. The tackle used in this sport should be strong, and the bait striking; as the large garden-worm, flies, minnow, &c.
Angling. Sea. It is frequent for persons to go out inoats some way from shore, to angle for whiting, cod, etc.
From pier heads, and the mouths of rivers likewise, it is often
successful: first from the former are often taken
codd, cod, whiting, plaice, and small haddock, by means
of a strong rod and line well leade'd, with a cork float,
and a large hook, baited with scoured red worms, shrimps, and
grub. But from the latter, the inside of a small crab, whipt
round the hook with a little white wool; or a bit of any
other fish. If the water is very deep, the bait is permitted
to pass about mid water; if not, towards the bottom.

Angling. Snap. is a method made use of for those
fish that easily part with the bait when taken; or for any
fish, at those times when they are spawning, for being then
sluggish, they will easily disgorge the bait before the hook
has been sunk, but by means of a double spring hook, which
is struck with a forcible jerk the contrary way to that in
which the fish runs, he is secured. The bait hooks made
use of for this purpose are purchased at fishing-tackle shops,
being made with a double spring. The rod should be strong
and the line strong likewise, and not so long as the rod, with
a large cork float. The mode of baiting the snap hook is
thus: make a hook with a sharp penknife in the side of the
bait fish, then put the gimp that is fastened to your hook
into it, and draw it out at the mouth, till the spring hook
comes to the place where the incision was made; when this
is done, put it into the belly of the fish, then have a piece of
lead, about the size of a horse bean, though of an oval form,
with a hole through it from end to end large enough for the
gimp to go through, draw it down to the fish's mouth, then
put it in it, and few it up.

Angling. Trimmer, is an economical mode made use
of either at night, or when you are fishing by other methods,
by setting some trimmers at a distance, waiting the event, and
continuing your angling in another part. It is particularly
successful in meers, canals, large ponds, or any still water.
It requires a round cork, six inches in diameter, with a
groove on which to wind your line, except so much of it
near the line hook, as will allow the bait to hang about mid
water; and so much of the other end as will reach to the
bait or the float; but if you have a float, then need not be
fastened at all. As soon as a fish takes the bait and runs
away with it, the line unwinds itself off the trimmer without
giving any check; but it will be prudent when you come to
the line, to give a light jerk to make your prey more
secure.

Angling. See Fishing.ang.

3. Utin hie esrwillie fet us to daig.
   Our laft super-excellent give us to day.
5. And forges us feyldarnie, we forfegan feyldum
   urum,
   And forwe us debts ours, so we forgiven debts of
   ours.
6. And no inlead uffg in culluny
   And not lead us into temptation;
7. Ah geryng uffg frin lif.
   But free us each from evil. Amen.

In this Specimen we fee that there is not above three or
four words altogether obsolute, and quite unintelligible to an
English reader. The language spoken by our ancestors
above a thousand years ago was capious, expressive, and
musical; abounding very much in vowels, diphthongs, and
poly-syllables, which are esteemed the greatest excellencies of
language. The substance of it resembles modern English,
and most of the words are still in use, though the spellings
and meaning of many of them are changed. The Anglo-Saxon
language was chiefly retained by the English; and it over-
came all the efforts of the Conqueror and his successors to
institute the Norman in its place. It forced its way at
length into the courts of justice, from which it had been
excluded almost 500 years; and in 1352, an act of parliament
was made, that all pleadings in all courts, both of the king
and of inferior lords, should be in the English tongue. The
Anglo-Saxon that was spoken in England about 200 years
after the conquest, was surprisingly pure, and had very little
mixture of Latin, French, or any other language. In the
course of the 14th century, it gradually changed into what
may be called English. This was owing to various causes.
The animosity subsisting between the politeriy of the Nor-
mans and Anglo-Saxons was extinguished, and they were
confoliated, in a great measure, by inter-marriages and
other means, into one people. Many of the Normans, who
were engaged in agriculture, trade, and manufactures, found
it necessary to speak the prevailing language of the multi-
tude. Moreover, Chaucer, Gower, Wickhili, and others,
composed voluminous works, both in prose and verse, in
English; and being men of learning, well acquainted with
French and Latin, and some of them with Greek and Ita-
lian, they borrowed many words and idioms from those lan-
guages, with which they adorned and enriched their own.
Thus the Anglo-Saxon tongue was greatly changed, and the
language of the bett writers approached nearer to mo-
dern English than that of Robert of Gloucester and others
who flourished in the 13th century. Nevertheless, the Eng-
lish of the 13th century was still so different from that of
the 18th and 19th, that a mere English reader cannot al-
ways understand it without a glossary. Besides various dia-
lects and different modes of pronouncing the English pre-
vailed, at the time to which we now refer, in different districts.

Anglist: The editors of the New Testament are extant
in manuscript, and apocryphal accounts is given of several of them
in Le Long's Bibliotheca Sacra; the best edition of which is
that of Marth, published at Halle, in fix vols. 1778—
1792. Some books of the Bible were translated by Bishop
Eadfrid, and the gospel of St. John by Bede; but the
tradition that King Alfred translated the greatest part of
the New Testament is very uncertain. The whole verion
has never been printed, but the four gospels have been pub-
lished by Matthew Parker, William Lille, and Thomas
Marshall, in 1571, 1638, and 1665; and as they are evi-
dently translated from the old Latin, they may be of use in
determining the readings of that version. Marth's Michaelis,
vol. i. p. 159.

ANGLURGE, in Geography, a town of France, in the
department of Marine, and chief place of a canton, in the
district of Sainte, three leagues south-south-west from Sa-
umo.

Anglus, Thomas, in Biography, an English Catho-
lic priest, whole name was White; was a protege
fellow of the Aristotelian philosophy in the seventeenth
century. Being of a lowing disposition, he wandered
through several parts of Europe. After residing for some
time at Paris and at Rome, he was principal of a col-
lege at Lisbon, and sub-principal at Douay. In Eng-
land he adopted the opinions of Sir Kenelm Digby, with
whom he lived, and refilled the efforts made by Des
Cartes to profelyte him to his own systen. He was a
man of a singular character, and combined some degree of
acuteness with considerable obscurity of understanding; but
his writings did not excite the notice and opposition which
he expected. Some of them, however, were cenured by
the congregation of the Index Expurgatoriums at Rome, in
1658; particularly a treatise entitled "Institutiones Peripa-
teticae ad mentem fummi viri clariffimni Philosophi Re-
almi Equites Anglie," printed at Lyons in 1656. He wrote
also "Quello Theologica," with a view of reconciling, in
the principles of Digby's periapteticism, free will with effec-
tual grace; "Institutiones Theologica," and several other
tracts. He is said to have written, at the period of the
commencement of the contells between Charles I. and his
parliament, in favour of the doctrine of passive obdence;
and he surived the restoration of Charles II. Gen.
Dict.

Angoi, or Angoy, in Geography, a province of
Africa, situate upon the Lango coast, lying between Ba-
congo to the north, and Congo to the south; separated
from the former by the river Cabinda, and from the latter by the
Zaire. The inhabitants are extremely indolent, and the
country little cultivated; the coasts abound with fish, and
the foreilfs with apes and other animals; the chief town is
Bomba-Cengoy. The chief port is Cabinda, at the mouth
of a river of the same name, about five leagues north of
Cape Palmierino, on the north side of the mouth of the
Zaire. The bay lies commodiously for trade, wooding and
watering on the sea-shore.

Angoka, Angoka, or Angadoka, islands of, are
islands of Africa in the Mozambique Gulf, and to the south
of Mozambique, situate in 16° 20' south latitude. They
are fertile, but inhabited. The violent currents occasioned
by the river St. Efrin, and which drive vessels to the north-
west against the shores of the continent, terminate near
the northernmost of these islands.

Angol, or Villa nueva de las Infantes, a town of South
America, in the province of Chil, situate on the arm of the
river Biobio, and about 123 miles north north-east of Bal-
diva. This is one of the most agreeable towns in Chil. S.
lat. 37° 36'. W. long. 75° 59'.

Angola, a country of Africa, anciently called
Abonda, or Ambonda, and afterwards Dongo, and by the
Portuguese Angola, may be divided into Angola proper, or
that which was formerly a province of Congo, and the king-
dom of Angola. In the first sense, it is confined between
two rivers of Danda, which parts it from that in the north,
and that of Uanana on the south. In the second sense,
including its additional conquests, it extends along the Eth-
riopie coasts from the mouth of the Danda, situate in S. lat.
8° 10', to that called St. Francis, in 13° 15', according to
some; but according to the most accurate geographers, quite
to Cape Negro, in 16° 27'. According to this last extent,
Angola forms a coast of 480 miles, but its greatest depth
casts...
The whole of Angola proper abounds with mountains, intermixed with a few plains, on the sea side, and between the feet of the mountains. The kingdom of Angola, in its most flourishing state, contained the following 17 provinces: 1. Chifama, under the 11th degree of south latitude, and near the mouth of the Coanza, which produces an excellent salt, and fine hony and wax; Sumbi, in the same climate with the former, admirably adapted for breeding cattle and growing grain, if the inhabitants were not shamefully indolent; Benguela, retaining the title of a kingdom; Rhima, situated between Sumbi on the west, Lubulo on the north, Temba on the east, and Scotta, on the south, and producing great quantities of grain and of fish; Scota, south of the former, and north of Benguela, extremely montaneous, and having a rock that extends 30 miles, the top of which is cultivated and inhabited, and enjoys a most fertile soil, and water, and in the lower parts feeding large herds of cattle: Bembia, extending on one side along the sea, and on the other dividing Angola from the other foreign states in the south, populous, and abounding with cattle; Temba, a flat low province, full of rivers and small streams, and abounding with wild cattle and whole-frond roots; Oacco, situated between the Coanza on the north-east, and Lubulo on the south-west, beautifully variegated with hills and plains, and furnished with springs and streams which render it fertile; Cabeceo, having Coanza on the north-east, and Rhima on the south-west, populous, and well watered with cattle and other provisions, and having also a mine of iron on a mountain called the Iron Mountain; the lord of Oacco was baptized in 1657, and the lord of this province in 1578, and they both induced many of their subjects to become Christians: Lubulo, situated along the southern banks of the Coanza, famed for its noble palm-trees, and yielding in great abundance of wine, and other produce, most of the inhabitants are Christians. The ten provinces above recounted lie on the south side of the Coanza; and within the Coanza is Loanda, an island on the coast of the kingdom of Bengo, chiefly remarkable for the capital of Angola, called San Paulo de Louanda, built upon it by the Portuguese in 1578, large and populous, and well defended: Bengo, commonly known by the name of Zevoa, yielding maize and manioc root, of which the inhabitants, who are all Christians, make their bread; Danda, situated on a river of this name, dividing Angola from Congo; well watered, and fertile in grain and all kinds of fruits, but much infected with crocodiles and serpents; the inhabitants are Christians: Mofche, extending along the northern banks of the Coanza, very fertile in manioc, having mines of several metals, and producing zimba, or their money, of such exquisite beauty, that the Congueʷfe will give a flave for a collar of them, and so much valued as to be worn by persons of the highest rank, particularly the ladies, about their necks, arms, legs, and middle; Ilambba, divided into the higher, between Bengo and Cataca; and the lower, between Dandla, to the north, and Bengo to the south, both fertile and tributary to the Portuguese, and the former having mines of excellent iron: Oari, contiguous to Mofche, well watered, and distinguished by the libato, or ancient royal residence of the kings of Angola; and Embacca, or Membaca, situated on the north side of the river Lucala, wholly subject to the Portuguese.

The principal rivers of Angola are the Danda, Coanza, Rhima, Lutano, or San Francisco, and Congo; the traffic of this country is by sea, of whom the number is very great, partly for sale and partly for domestic use. The traffic is said to have diversified the people of their humanity, as parents fell their children, and husbands their wives, at a very cheap rate. Polygamy is prevalent in this country; and so is also, amongst those people that are not converted to Christianity, the inhuman custom of butchering a great number of human victims at the funeral obsequies of their relations, and piling their carcases in heaps on their tombs.

Before the arrival of the Portuguese, this kingdom was subject to the kings of Congo, and governed by a deputy. One of these deputies, whose name is said to have been Ngola, or Angola, shook off the Congoe янke, and assumed the royal title. In this rebellion the ambition of Ngola was satisfied by the Portuguese, who, discovering this coast in the year 1484, Ngola lived to a very advanced age, and was much respected; but having raised a favourite slave to his throne, and of the two sons of his father, he ordered them to court under a pretence of having them educated as his children and heirs to his crown; but upon the arrival of the eldest, the infant caused him to be murdered. The incensed parent avenged himself by plunging a dagger in her breast; and for this act of retributive justice, the Angolans placed the crown on her head, but the immediate surrender it to her surviving son. He was succeeded by one of his younger sons, Damiu Angola, who, upon ascending the throne, determined to put all his brethren to death. Two of them, however, escaped. Damiu was a monster of perfidy, cruelty, avarice, and Lewdness; but happily for his subjects, his reign was not of long duration. Damiu was succeeded by Ngola Chilvagni, a warlike prince, who extended his conquests along the rivers Danda, Lucalla, Zanda, and Coanza, and literally tinged them with blood. Having carried his victories within eight leagues of Loanda, San Paulo, he caused a tree to be planted, which he fixed as the limit of his ravages, near which the Portuguese afterwards erected a fortress, and they called the tree Isanda, or Ilandura. This ambitious and successful monarch could not forbear fancying himself to be one of the deities of the country, and exacting honours similar to those which were paid to them. It was not long, however, before he was observed to submit to the fate of other mortals. His successor, Nyingha Angola, was a cruel tyrant; but the country was soon delivered from his oppressions; and exchanged those of the father for the more severe and grievous ones of the son, Bandi Angola. The life of this oppressor was threatened by the rebellion of his aggrieved subjects; but the Portuguese defeated the rebels, and thus ensured the favour of the king, who took them into his service, and even into his council. The Portuguese general was the favourite at court, and more especially with the daughter of the sovereign. Her attachment was soon discovered by the father; and with a mind inflamed by resentment, and an apprehension that a connexion of this kind would be the means of depriving him of the crown, he formed a resolution to extirpate all the Portuguese, as a menace essential to his own security. They were, however, appeased by designs by the young princes, and retreated into the kingdom of Congo, without interruption or molestation. The Portuguese general obtained permission of the king of Congo to fall for Lisbon, under a promise of returning with a powerful reinforcement, in order to avenge himself on the perfidious...
An

ning sovereign of Angola. He soon obtained the desired appointment, and returned, at the head of his squadron, up the river Coanaz; he landed his forces about two leagues from Mafinga, a city on the banks of the Coanza, and erected a fortress for their security. The king of Angola prepared for his defence: but in an engagement between his forces and the Portuguese, he suffered a total defeat, and was merely able to escape with his life. His discontented subjects united with the victorious troops of the admiral, and after committing many dreadful ravages, executed their purpose of massacring their sovereign. Bandi Angola was succeeded by his son Nguia Bandi, who began his reign by wreaking his resentment upon all who had opposed his election. The next objects of his hatred and jealousy were the Portuguese; but they, though much inferior in number, obliged him to save his life by flying, first into the island of Chicenda, in the river Coanza, and from thence into one of the neighbouring deserts of Oacoo, where he was permitted to live among the wild beasts, without any other influence than that which the deserts afforded him. Having been guilty of treachery in evading the fulfilment of a contract with the Portuguese governor, and dreading his resentment, he condescended to interest his father Zingha, whose son he had murdered, to undertake an embassy to the governor, and to procure peace with him upon any terms. In order to effect her purpose, he advised her even to embrace the Portuguese religion, if it should prove the means of facilitating her negotiations. Zingha accepted the office, and was received by the viceroy in a very respectful manner. During her stay at Loanda, the governor, seeing the influence which he could gain by the father of one of his slaves, Nguia Bandi delayed executing the flippulated articles, and determined to renew the war against the Portuguese. In executing her purpose, his troops were all cut off, and he was forced to fly into a little island in the Coanza, where he was murdered; and he escaped being murdered by terminating his life with a dose of poison administered to him by order of his father Zingha. Zingha ascended the throne; and, in order to secure her power, she murdered her nephew with her own hand. The object to which her principal attention and anxiety were directed, was the deliverance of the realm from the Portuguese, who were now become numerous, wealthy, and powerful, and who were dreaded by all her subjects. With this view she commenced a war against them, and gained at first some temporary advantages. At length she was abandoned by her allies, and by her own forces, and obliged to abdicate her dominions, and to retire into some of the eastern deserts, where she remained un molested. During her retirement, the Portuguese appointed Ango Oari, a descendant of the royal family, to be king; and before they crowned him obliged him to declare himself a Christian, and to be baptized under the name of John. His reign, however, was of short duration; death made way for his successor, Philip, the second Christian king, who prolonged his reign to the year 1660. Zingha, in the mean while, seeing herself stripped of eleven of her belt provinces, and divested of her authority and tributary in the other five, renounced her religion, and devoted herself to all the idolatrous superstitions and inhuman rites of the Giagas; and she thus acquired such authority and influence, that they were ready, at the first intimation of her will, to follow her through the most hazardous enterprises. By this influence she was able to harass the Portuguese, and to keep them in a state of perpetual terror. At length they sent two deputies to negotiate a peace with her; but their embassy was unsuccessful. Upon renewing the war before the forts of Mafinga, she lost a great number of her men, her two fathers were taken prisoners, and she herself escaped with great difficulty. Zingha had two councils, one for affairs of state and war, the other for religious concerns; the first consisted of four officers; the other of five singolos, or privies of the Giagian religion. Having convened these nine counsclors to deliberate, she propounded to them whether she should, in praise the Christian faith, or continue in the religion of the Giagas. She had recourse to the usual mode of consulting the spirit of her ancestors, and the oracle's answer was such as she had foreseen. The demon declared against his own interest, and exhorted her to be reconciled to the faith from which she had apostatized. While this furious was carried on, she had her troops collected, and in the speech, which she addressed to them, she confessed and bewailed her apostasy, and declared her purpose of conforming to the observance of the Christian precepts and rites. Her address was received with universal approbation, and she considered this as a propitious omen of their speedy conversion. The consequence was her reconciliation with the Portuguese, and singular zeal and activity in promoting the profession of Christianity among her subjects. She prohibited the practices of heathenism which then prevailed, under the severest penalties; and in order to encourage marriage, and thus to restrain the plurality of women, she took a husband, and published an edict against polygamy, which produced effect. She also reformed the tyranny of the lords in her dominions, who did not allow their vassals to marry without their licence, for which they paid a considerable sum. Nothing seemed to be now wanting to complete the progress of Christianity but a new supply of missionaries from Europe; in order to obtain these, she sent a letter to Rome in the year 1658, and received a favourable answer in 1662. The pope's letter was publicly announced in the new church which she had built, on the 15th of July, and she repaired to the place, with the letter fastened about her neck in a rich golden purse. After much solemn ceremony on this occasion, she gave a magnificent treat to the Portuguese resident, and at her court, which was accompanied with the grant of largesses to her chief officers, and with a ratification of a number of slaves; and terminated in her performing, at the head of her ladies of honour, who were arrayed and armed in the Amazonian style, a kind of combat, in which this princeess, though above 50 years of age, behaved with great vigour and activity. While the queen was diligently employed in promoting the conversion of her subjects in her new capital, she was seized with a disorder which proved fatal. Father Antony attended her in her last moments, and received instructions concerning her interment; and she committed the whole conduct of her last obsequies to him; she likewise recommended, with her last breath, the propagation of Christianity, the protection and encouragement of the missionaries, and the enforcement of all the edicts against the impious rites of the Giagas. On the 17th of December, in the 52d year of her age, she closed her life and reign. The deceased queen was buried with great pomp; and, from respect to her memory, her sister Barbara, who succeeded her, was inaugurated a second and a third time, with joyful acclamations. She was a very zealous Christian, but her efforts to promote Christianity were restrained or discouraged by an ill-natured and cruel husband, whose name was

Mona
Mona Zingha, and who had been raised by the late queen from the condition of the son of a slave to the rank of her chief general. The queen’s disorder and infirmities increased, and, after a short reign of about two years and a half, she closed her life A.D. 1666. Mona Zingha succeeded her, and exhibited sufficient evidence of his abhorrence of Christianity, and of his steady attachment to the abominable rites of the Ciaigan sect. To remove all doubt with regard to his sentiments, he caused five young ladies of the first rank to be buried alive in his wife’s grave. By various methods to which he had recourse, he almost exterminated Christianity; but his career was soon stopped by Don John, the prince Charles Barbara’s first husband, from whom she had been divorced on account of his having another wife. Upon his arrival, the usurper fled into an island in the Comor, but he returned again, and having killed Don John, reigned the throne without any further opposition. Don Francisco, however, the son of Don John, headed an army against the usurper, and Mona Zingha having been defeated and slain, Don Francisco became sole master of the empire. The following kings of Angola professed only a shadow of royalty. The root of this description was Ngola Sechio, who revolted, and was taken prisoner. His head was cut off, put in a pickle, and sent from Loanda to Lisbon. After this it does not seem that the Portuguese government have thought it proper or perhaps safe to annul their Angolic subjects with even a mock monarch of their own nation; but they have committed the sole command of the kingdom to the viceroy of Angola, and his council. This kingdom hath long since been erected into a bishopric, suffragan to that of St. Thomas. The manners, language, religion, dress, and ceremonies of the Angolese, are similar to those of the inhabitants of Congo. Mod. Un. Hist. vol. xiii.

**ANGOLENIS** in Ornithology, a species of Falco, found in Angola. It is white, cere bluish, orbits flesh-coloured and naked, primary wing-coverts and base of the tail black. Gmelin. The size of this species is half as large again as the kite. The bill is whitish, long, and but little curved; irides straw colour; head and neck clothed with feathers, black, crest long; head, neck, back, breast, belly, and posterior wing-coverts of a pure white; greater wing-coverts and primaries black; the last tipped with white; end of the tail white; legs dirty white and fealy. Latham, Gen. Syn. This species was first described by Mr. Pennant from specimens in the collection of R. P. Parry, Esq. He observes, that they were very restless and querulous, and more active than is usual with this flagellis race.

**ANGOLENIS**, a species of Merops, of a shining golden-green colour, with a cinereous band through the eyes spotted with black; wings and wedge-shaped tail cinereous beneath; chin yellow, throat chestnut. Gmelin. This is **Aplaster Angolenis** and Le Guipier d’Angola de Briffon, who figured and described it from a drawing sent to him by M. Le Poivre. It is Le petit Guipier vert & bleu a queue étagée de Buffon, and Angola bee-eater of Latham, Gen. Syn. This bird is five inches and a-half in length. The bill is three quarters of an inch in length, and black; the irides red; upper part of the head, neck, body, and wings, are green glossed with gold; on each side of the head an ash-coloured stripe dotted with black, beginning at the base of the bill, and passing through the eyes; breast, belly, sides, and thighs, greenish blue, with a slight golden tinge; under-tail coverts greenish, intermixed with chestnut. The side feathers of the tail margined with cinereous; legs ash-coloured, claws black. Latham, &c.

**ANGOLENIS**, a species of *Toxol* that inhabits Angola. This is the black grosbeak of Edwards, and Angola gros-
under the command of a sultan. The Armenians have seven churches, besides a monastery; and the Greeks, two. 

Angora is famous for the battle between Tamerlane and Bajazet, A. D. 1402, which has immortalized the glory of the former, and the fame of the latter.

ANGOR, a province or kingdom of Abyssinia, formerly rich and fertile, but almost ruined by the Gallars, who are now in possession of it.

ANGOTE, a town of Africa, in the kingdom of Congo, and province of Pango.

ANGOULEME, a city of France, and capital of the department of Charente; before the revolution, the capital of Angoumois, and seat of a bishop, suffragan of Bourdeaux. It is sited on a rock, at the foot of which runs the river Charente. The inhabitants are said to be about 8000, and their manufactures are paper. N. lat. 45° 30', E. long. 8° 45'.

ANGOUMOIS, a district of France, before the revolution a province, bounded on the north by Poitou, on the east by Limousin and Marche, on the south by Perigord, and on the west by Saintonge. It is 15 and 18 French leagues in length, and about 16 in breadth. The principal rivers are the Charente and Touvre; there are many iron mines in this province, and the land produces wheat, rye, barley, oats, saffron, wine, and all kinds of fruits.

ANGOSTRINA, a town of France, in the department of the Eastern Pyrenees, and chief place in the district of Prades, on the frontiers of Spain; four miles north-north-west of Puyara, and eight west of Mont Louis.

ANG. See Guy and Loango.

ANGRA, a sea-port town of Terceira, one of the Azores, the capital of that island and of all the Azores, and the residence of the governor. It is situated in a bay between two mountains on the south side of the island, and it is equally secure against storms and the assault of an enemy. On these hills are two pillars, and a watchman who gives signals of ships approaching the island by means of flags. The town is said to have received its name from Angra, a creek, bay, or lagoon for shipping; this town being the only convenient harbour in all the Azores. It opens from the cast to the south-west, and is not above four cables length in breadth, and, according to Frazier, it has not above two cables of good bottom. In summer, ships may ride here with safety; but when the storms of winter come on, the approach of which is indicated by clouds hanging over the Pico, a high mountain in another of the Azores, and the flitting and chirping of flocks of birds round the city, ships should put off with all expedition to sea. The town is well built and populous, and is an episcopal see, under the jurisdiction of the archbishop of Lisbon. It has five parishes, a cathedral, four monasteries, and as many nunneries, besides an inquisition and a bishop's court, which extends its jurisdiction over all the Azores, Flores, and Corvo. The town is surrounded by a wall and dry ditch, and defended by a strong casle, in which king Alphonso was imprisoned by his brother Peter, in 1668. The houses have a handsome external appearance, but they are indifferently furnished, for which the Portuguese allege, as a plea for their poverty, that warm furniture would be inconvenient in so hot a climate. N. lat. 38° 30', W. long. 27° 12' 15". At Angra are kept the royal magazines for anchors, cables, sails, and all sorts of stores, for the royal navy or for merchantmen in distress. All maritime affairs are under the inspection of an officer called "defambargador," who has subordinate officers and pilots for conducting ships into the harbour, and the proper watering places. The English, French, and Dutch, have each a consul here, though their commerce with the Azores is not very considerable. Mod. Un. Hist. vol. vii. p. 55, &c.

ANGRA DE LOS REYES, a town of South America, in the capitalship of Rio de Janeiro in Brazil, subject to the Portuguese, about 56 miles from Rio de Janeiro. It is situated upon the coast, in a small bay, whence it has its name; being, in English, King's Bay. It has two churches, a monastery, a small guard-house of about 20 soldiers. Its chief produce is fish. S. lat. 2° 58', W. long. 17° 41'.

ANGRA, or Great Bay, lies on the western coast of Africa, to the north of Cape Blanco, in N. lat. 20° 55', and W. long. 17° 10'. This is the most westerly coast of Africa.

Angra River is also on the coast of Africa, in N. lat. 1°, and E. long. 9° 35', having at its mouth the island of Korisco, about five leagues south of Cape St. John, which is its northerly extreme point, as Cape Eufuras, seven leagues from Cape St. John, is the southerly point.

Angra River is also on the same coast, and on the south side of the Cape, and of the river Cabot.

Angra Island lies in the Persian gulf, and has a spacious harbour at Brak; but it is uninhabited.

ANGRA, a river of Abyssinia, formed by several streams in the provinces of Tichken and Sire, and which, by its confluence with the Graugna, forms the Tachazze.

ANGRECOM, in Botany &c. Epipedum.

ANGRIK, in Ancient Geography, a people of Germany, supposed by some to have been the name of the Angiri of the middle age; situate, according to Tacitus (Annal. ii. c. 8.), between the Weser and the Elbe, and extending eastward beyond the Weser as far as the Cherufi, on which side they raised a rampart; with the Tubantes on the Elbe to the north; to the west the Elbe and the confines of the Buriki, and to the north between the Chamas and Apuliani. They are placed by Prolemy between the Cushti and Cati, or Saiwi. Their territory is supposed now to contain a part of the country of Schamburg, half of the bishorip or principality of Minden; and to the south, the greatest part of the bishorip of Olmnburg, the north part of the country of Techlenburg, and a part of the county of Ravenberg. Some trace of the name is observable in a small town of Ravengberg, called Engern.

ANGROGNA, a parish of Piedmont, watered by a river of the same name, and producing excellent fruits, particularly chestnuts. This is a valley surronded by high mountains, to which there is ascent only by two passes. At a village called La Tour, the valley preachers used to officiate, and qualify young men for the ministry, without disturbance, before the reformation.

ANGRUS, a river of Ilyria, which, according to Herodotus, ran towards the north-east, paffed along the plain of the Triballi, and discharged itself into the Brongus, which joined the Iler.

ANGSANA, or Angsaya, in Botany, names by which some authors have described the draca arbor or dragon-tree; one of the trees said to afford the fanguis draconis, or dragon's blood of the fishes.

It is esteemed an altringent, and an excellent remedy in the apthae.

ANGUADA Cape, in Geography, is the most westerly point of Porto Rico Island in the West Indies, and is distant from Cape Sumana, or the nearest land at the north-east of Hispaniola island, 22 leagues.

ANGUEAH, a considerable river of Abyssinia, not far from Killah, in N. lat. 14° 24' 34". Where Mr. Bruce crossed it, it was 50 feet broad and three deep, and the largest river which he had seen in Habelt. It was perfectly clear, and ran rapidly over a bed of pebbles. It was full of small fish,
fish, esteemed excellent. It has its name from a beautiful tree which covers both its banks, and which, by the colour of its bark and richness of its flowers, is a great ornament to it. Bruce's Trav. vol. iii. p. 113.

ANGUEG, in Zoology, a name given in Abyssinia to the water-lizard, or caudiverba of the Italians.

ANGUELLA, in Ichthyology, a name by which some former naturalists distinguished the species of Athetina Hesperus of Linnaeus, a small fish that inhabits the shores of the Mediterranean sea. Pisciculus anguilla Venetus dictus; fortes hexas. Rondeletii, vel athetina eujdion. Wld. Ichth.

ANGUENIS, in Ancient Geography, a place of Africa, situated, according to Hardouin, in Numidia.

ANGUEIR, Francis and Michael, in Biography, sculptors, were born at Ét in Normandy. The elder, Francis, was born in 1634 and having been brought up under Guillaum, a sculptor at Paris, was sent for to England, and there acquired a sufficiency to enable him to visit Italy for improvement. After having spent two years in Italy, he returned to France, and was made keeper of Antiquities by Louis XIII., and had apartments in the Louvre. He was employed in several celebrated works, chiefly of the monumental kind, such as the tomb of James Sourn, at St. John de Lateran; and the monument of the duke de Montmorency, at Moulins. He died at Paris in 1669.

Michael was born in 1612, became an artist at 15, and employed his first savings under Guillaum, at Paris, for visiting Italy, where he entered into the school of the famous Algardi at Rome. After 15 years he returned to France, and assisted his brother in executing the monument of Montmorency. His reputation was great, and he was employed, according to the taste of the times, in many works of decoration. He adorned the apartment of queen Anne of Austria, in the old Louvre, with many allegorical figures; he executed the altar-piece of the church St. Denis de la Chartreuse, and the rich sculpture of the gate of St. Denis. His chief work was a marble crucifix over the high altar of the church of Soissons. He died in 1666. Gen. Biog.

ANGUILARA, in Geography, a town of Italy, belonging to the Venetian States in the Paduan, 12 miles south of Padua.

ANGUILHAS or Cape d', lies to the east of the Cape of Good Hope, on the African coast in the Indian Ocean, in S. lat. 35° 59', and E. long. 26° 36'.

ANGUILA, or Snake Island, so called from its snake-like form, is the first of the smaller Antilles, and the most northerly of all the Caribbean islands possessed by Britain in the West Indies. On the south side it has good anchorage and a gentle current, but on the east side it is inaccessible on account of flats, sands, and small islands. It was discovered and settled by the English in 1650; but the first cultivators were expelled by rapacious invaders, particularly French pirates; and after the revolution, a party of wild frith. New settlers from Barbados and other English Caribbees, knowing the value of the soil, removed to Anguilla, and carried on a lucrative trade, without any government, civil or ecclesiastical. In 1735, a small body of their militia relieved the attack of a considerable number of French, and obliged them to retire with great loss. The inhabitants inhabit mostly by farming, planting India corn, and other kinds of hufusbandry. The climate is healthy, and the people strong and vigorous. The exports, in 1776, amounted, in sugar, rum, and cotton, to near 60. The island is 28 leagues in length, and three in breadth; and is fringed with 25 leagues north-west of Barbuda, and 15 from St. Christopher's. N. lat. 18° 15'. W. long. 63° 57'.

ANGUILA is also a bank island, and east of the great Bahama bank, and north of the island of Cuba. N. lat. 23° 22'. W. long. 78° 47'.

ANGUILLA, in Ichthyology, a species of Silurus. This is the common eel, having the lower jaw longish, and the body, of one colour. Linn. & Gmel. The dorsal fin is to contain 1000 rays, pectoral fin 19, and the anal fin 100. See Eel.

ANGUILLA INDICA, in Natural History, a name given by Willoughby to a species of Trichiurus in the Linnaean arrangement of fishes. See Trichiurus Indicus.

ANGUILLAE, a species of Tenia that inhabits the intestines of cattle. The head is febile, distinct, and thickish, joints obtuse, with irregular protuberances, and two mouths on one side. The body consists of about 600 joints, and is sometimes four feet in length, front of the head truncated, the first eight joints longest. The upper joints of the body are nearly square, and twice as long as they are broad, the lower ones eight times as broad as they are long. Gmelin, Redi, &c. This is a tenia claviceps of Goze.

ANGUILLARIA, in Geography, a town of Italy, in the diocese of the church and province of Patrimonio; situate on a small river near the lake of Bracciano, 12 miles north-west from Rome.

ANGUILLARIA, Giuolanda Dell', in Biography, an eminent Italian poet, was born of a family at Sutri, in 1517. From Rome, where he was engaged with a printer, and whom he left on account of an intrigue with his wife, he went to Venice, and formed an intimate acquaintance with a bookseller, who bought his translation of Osilo's Metamorphoses, which contributed to his reputation. It was first published at Paris, and dedicated to Henry II.; and his taste, in consequence of this work, was probably the cause of the pomp with which his tragedy of Gismon was acted at Vicenza, in 1569, where Palladio was employed in erecting a magnificent temporary theatre for the purpose. He undertook a translation of Virgil's Aeneid, but never finished it. By various other poems, fatalical and burlesque, he obtained a precarious subsistence. He died at Rome in indigent circumstances, and in consequence of his dissolute mode of living. Gen. Biog.

ANGUILLARIA, Lewis, an Italian botanist of the 16th century, travelled over the greater part of Greece, the islands of Cyprus and of Candia, over Switzerland, &c. Returning to Italy, he was made director of the botanical garden at Padua, in which post he continued to the time of his death, in 1550. He left behind him a work on the knowledge of simples, in Italian, which was published by Murinelli, at Venice, in 1499. It was afterwards translated into Latin by C. Bauhin, and printed at Basle in 1593, in 8to. Haller says (Bib. Botan.), Anguillaria was the first Italian who had travelled to acquire a knowledge of plants, in which he attained to such perfection as to be able to correct the works of Dioscorides and of Matthiolus. "Exhausius auctor, qui recte viderat, paulo fuisse docuiciit." This deficiency is supplied by Bauhin, in his edition of his works.

ANGUILLARIA, in Botany. See Ardisia. Anguilaria is made a distinct genus by Gmelin, though his ang. bahamanis and ang. excedeis are the same plant. Linn. Trans. vol. ii. p. 22.

ANGUILLARIS, in Ichthyology, a species of Silurus, that inhabits the Nile, and is described by Hassel and Roelf, Aleppo. The dorsal fin is single, and consists of 70 rays, and it has eight bars. Gmelin. Body above the lateral line marked with black and grey, beneath reddish grey. It has two bars on the upper lip, four on the lower lip, and one at each angle of the mouth. The rays of the gill membrane are nine, dorsal fins 70, and sometime 72, pectoral fins eight, ventral fins seven, anal fin 50, and caudal fin 20.
ANGULIFORM, in Zoology, a species of \textit{viper} found in vegetable fossils of four pale, infusions of blighted wheat, and other grains, \\&c., and known generally by the name of \\
\textit{puff-clad}. It is of equal size throughout, and somewhat rigid. \textit{Gmelin. See Eels microtopia.}

\textbf{ANGUINA, in Botany. See Calla and Tricosanths.}

\textbf{ANGUINA, in Conchology, a species of \textit{serpula} that inhabits the Indian Ocean. The shell is roundish and somewhat spiral, with a longitudinal articulated suture. It varies considerably in form, being either round or angular, straight or waved, smooth or rough, and the articulations of the suture often obsolete. The \textit{serpula muzica} of Born is a variety of this species. \textit{Gmelin.}

\textbf{ANGUINA, in Entomology, a species of \textit{phalana}, of the \textit{bombyx} family, found in North America by Abbot, and described by Dr. Smith. The anterior wings are clauded, bare and transverse streak pale; a whitish spot with a double black pupil near the apex.

\textbf{ANGUINA, in Natural History, a species of \textit{Sertularia}, called the snake coraline by Ellis. It is delitute of
denticles, and the stem is simple, with elevated oblique branches, each of which has a lateral aperture. \textit{Gmelin, Ellis, \\&c. This kind inhabits the Mediterranean Sea; it is white, soft, and flexible, and adheres to other marine substances.}

\textbf{ANGUINA, in Zoology, a species of \textit{lacerata}, having a
torticated tail which is stiff at the extremity, fringed body, and tubulated feet without toes. This is \textit{vermis fletenci-
iformis} or \textit{Africa} of \textit{Scha}, and \textit{chelotes pinnae} of \textit{Laur}. The head is rather depressed and small, ears transverse, body round and torticated, the scales on each side longitudinally curved; tail twice as long as the body, finely pointed at the end; legs six, anterior ones slender, body covered with tubulated scales. \textit{Gmelin. The general description of this creature does not clearly correspond with those of the authors quoted by Linnaeus and \textit{Gmelin. The figure in \textit{Scha} is about 15 inches in length, of which the body is about four inches; the whole is covered with ovate scales, brown above, with dusky longitudinal stripes, yellowish beneath, and ash coloured on the sides. It is common in muddy places about the Cape of Good Hope.}

\textbf{ANGUINEAL hyperbola. See Hyperbola and \textit{curve.}}

\textbf{ANGUINEI vestis, in Poetry, those which may be read
backwards.}

These are otherwise called recurrent verses. Such, e. g. are,

\begin{quote}
\textit{Optimum jus, lex amica, vox diserta}:
\textit{Diserta vox, amica lex, jus optimum.}
\end{quote}

\textbf{ANGUINUM, ovum, among \textit{Ancient Writers}, denotes
an extraordinary sort of an egg, laid to be produced by the
\textit{joint salvea} of a cluster of snakes interwoven and twisted
together; and when it was found, it was used in the air by
the folding of these serpents; and to be caught in a
clean white cloth before it fell to the ground. The person
who caught it was obliged to mount a swift horse, and to
ride away at full speed to escape from the serpents, who
pursued him with great rage until they were stopped by some
river.

The opinions which the Druids, both of Gaul and Britain,
treated of their anguim, or serpent's egg, both as a charm and a medicine, are in a very high degree romantic
and extravagant. The method of ascertaining the genuine-
ness of this was no less extraordinary. It was to be enc-
chased in gold, and thrown into a river; and if it was gen-
une, it would swim against the stream. "I have seen,"
does Pliny (H. N. xxi. c. 3), "that egg; it is about the
bigness of a moderate apple; its shell is a cartilaginous
incrustation, full of little cavities, such as are on the legs of
the polypus; it is the insignia or badge of diffusion of
the Druids." Among other wonderful virtues ascribed to
this egg, it was represented as particularly efficacious for rendering
those who carried it about with them, superior to their
adversaries in all disputes, and for procuring on their
behalf the favour and friendship of great men. We have the
following account of this egg in the part of a Druid, in Mafon's
"Catacenas":

\begin{quote}
\textit{But tell me yet,}
\end{quote}

\begin{quote}
From the grot of charms and spells,
Where our matron filter dwells,
Brennus, has thy holy hand
Safely brought the Druid wand;
And the potent adder-stone,
Gender'd fore the autumnal moon,
When in undulating twine,
The foaming snakes prolife join;
When they hiss, and when they bear
Their wondrous egg aloof in air;
Then, before to earth it fall,
The Druid in his hollow'd pall
Receives the prize,
And infant flies,
Follow'd by the eaven'md brood,
Till he cross the crystal flood?"
\end{quote}

Some have thought that the serpent's egg was a mere
fraud contrived by the Druids to delude the vulgar, who
purchased these marvelous eggs at a high price. Others
have imagined that the story of the anguim was an em-
blematical representation of the doctrine of the Druids con-
cerning the creation of the world. The serpents, they say,
represent the divine wisdom forming the universe, and
the eggs the emblem of the world formed by that wisdom.
It may be added, that the virtue ascribed to the anguim of
giving those who possessed it a superiority over others, and
endowing them with great men, may perhaps be intended to
represent the natural effects of learning and philosophy.

Our modern Drudges, says Mr. Pennant, have an opin-
on of the virtues of the ovum anguim, "glain osirid," as
the Welsh call it, or the "adder-jump," according to the
modern philosophers, similar, though inferior, to that which
the ancients entertained concerning it: they merely apply
it to affit in cutting children's teeth, to cure shin-cough, or
ANG

to cure an ague. These eggs were, in reality, beads of glass, to which the Druids annexed a charm; and they were of a rich blue colour, either plain or flecked.

ANGUINUS, in Entomology, a species of curculio that inhabits Germany. It is cylindrical, grey, and lined with brown. Gmelin. This insect somewhat resembles curculio paraplecturus, the legs and under side of the body are grey, dotted with black, the back much bent, wing cymes marked longitudinally with a double row of minute excavated points.

ANGULUS, in Zoology, the name of a genus of serpents in the Linnæan arrangement, which is distinguished from the rest by having the belly and under part of the tail covered with scales like those on the other parts of the body. Gmelin. The species, according to Gmelin, are: Meur. Frenetus, meleagris, colubrinus, miliaris, fasciatus, maculatus, resecutatarus, cerales, nautus, lumbareis, laticauda, etc., erys, fragilis, ventralis, platurus, lineatus, claricus, annulatus, feutatus, corallinus, sfusus, hepaticus, and tesselllatus; which see respectively.

ANGULIS, in Natural History, the Linnæan name of a creature in the class amphibia, infected in the twelfth edition of the Syntagma Natura, but referred by Gmelin from the genus Anguis to that of Lacerta. The latter author also refers anguis quadrupes of Linnæus to the same genus. See Lacerta Serrata.

ANGUIS Apalis, a species of Turba figured in Martyn’s Unv. Conch. It is irititd transversely, green flirped with black; purely within. Gmelin.

ANGUIS Fufali, see Coluber.

ANGUIMUM Tapis, a name given to a supposed stone in Germany, which is of a cylindric figure, and has a cavity capable of admitting a finger, and of a yellow colour, with a great many variegations. The vulgar call it duscancek, and have an idle opinion of its having its origin in some manner from a serpent-ant. De Boot, who had seen many of them, declares them to be fictitious, and made of glass tinge with two or three colours. There were probably of the same kind, and used for the same purposes, with the Anguinum ovum.

ANGULAR, something that relates to, or hath angles. Angular objects at a distance appear round; the little inequalities disappearing at a much less distance than the bulk of the body.

ANGULAR MOTION, in Mechanics and Aeronomy, is the motion of a body which describes an angle, or which moves circularly round a point. Thus, a pendulum has an angular motion about its centre of motion; and the planets have an angular motion about the sun. Two movable points M and O (Plate I. Mechanics, fig. 7.), one of which describes the arc MN, and the other, in the same time, the arc OP, have an equal, or the same, angular motion; although the real motion of the point O be much greater than that of the point M; viz., as the arc OP is greater than the arc MN. The angular motions of revolving bodies, as of the planets about the sun, are reciprocally proportional to their periodic times; and they are also as their real or absolute motions directly, and as their ratio of motion inversely.

ANGULAR motion is also a kind of motion composed of a right-lined and circular motion, or in which the moveable body slides and revolves at the same time. Such is the motion of the wheel of a coach, or other vehicle. The phenomena, &c. of such motion, see accounted for under the article Rota Arithmetica.

ANGULAR, acute, fission, see Acute.

ANGULAR, capital, see Capital.

ANGULAR column, see Column.

ANGULAR nicker, see Niche.

ANGULAR, Angulatus, in Botany, denotes a stem, &c. having edges or corners, opposed to cylindrical. A stem may have one, two, three, four, or more angles or corners. The white archangel hath four. The flower-de-luce, or flag, has an angular capitule.

ANGULARIS Statula, in Anatomy, a name given by Wlilow, and some others, to the muscle of the shoulder generally called the levator scapulae.

ANGULATA, in Zoology, a small species of Lacerta, first discovered by Rolander in America. The body is brown above, and covered with carinated scales; those on the belly are smooth; under the throat are two large rounded scales; the head is naked, with various, unequal, elevated wrinkles, which appear truncated at the collar, or behind the head; tail very angular, and half as long again as the body: the specific character of this snake is, tail very long and enormous, with carinated and mucronated scales. Gmelin.

ANGULATA, in Entomology, a species of Hesperia, that inhabits Ceylon. The antennae are fimbriated, body yellow; head, dorso line on the thorax, and waved, margin of the wing-cases black. Fabricius and Gmelin.

ANGULATA, a species of Eunelia, that inhabits Egypt. The wing-cases are spinous, the lateral line elevated and ferrated Fabricius. This is the Terminal of Forsk. and tenorio sulphurus of Pall. This insect is black and without wings, and the wing-cases not divided; the thorax is rough, with three rows of spines, and intermediate rows of tuberculated ones, the lateral line deeply ferrated.

ANGULATA, a species of Cantharida, found in the island of Amherst, South Seas. It is of a teataceous colour, thorax angulated and spinous, end of the wing-cases blue, antennae and legs black. Fabricius.

ANGULATA, a species of Phalaena, of the bombyx tribe. The wings are incumbent, angulated, telataceous-brown colour, with numerous black dots, and two obicute bars of ash colour. Fabricius. This must not be confounded with the Bombyx angulata of Gmelin, No. 475; whose description is taken from bombyx, No. 26, of the species formerly of Fabricius, and should have been written angulata, instead of angulata.

ANGULATA is also a species of Phalaena, of the geometra tribe. The wings are angular and tailed; it is varied with large and small grey breaks, and a black dot near the tail. Fabricius and Gmelin. This is a small insect, and inhabits Africa. Gmelin has also another species of Phalaena, of the geometra tribe, under the name of angulata; the wings are angular and pale. It inhabits Europe. Gmel. 1398.

ANGULATA, a species of Anaea. It is ovoate, front and sides acutely angulated; centre of the thorax excavated. This is an European insect, lives in trees, and spins a perpendicular web.

ANGULATA, in Conchology, a species of Tellina that inhabits the Indian ocean. This shell is somewhat ovoate, and marked with transverse recurved lines, anterior part angulated, and no lateral teeth. Gmelin. This is about an inch and a half in length, and two inches in breadth. It differs from Tellina virgata, which it in some respects resembles, in being less oblong, entirely white, the anterior angle scented more outwardly, and the aperture behind oval. Gmelin.

ANGULATA, a species of Anomia. The sides of the base compressed, anterior part plicated, three teeth in the middle. Gmelin. Found in a fossil flate; this shell is smooth, and varies in the number of plaits on the anterior part.

ANCOULATUS, in Zoology, a species of Coluber, of a brownish colour, with dark or blackish, broad, lancedolate, transverse
transverse bands meeting alternately beneath. The Linnæan
specific character is, scales of the belly one hundred and se-
venteen, and those of the tail seventy. The length of this
make is above two feet, head rather small, and covered with
large scales; the scale of the body disposed in about nine-
ten longitudinal rows, and each scale rather strongly cari-
nated; its specific name is taken from the angular appear-
ance of the body. This kind is a native of Afa.

Dr. Shaw having observed, that the number of abdominal
and subabdominal scales vary considerably in different speci-
mens, has assigned this species a new specific character, Fabriceius,
taking the venit, lanceolatus nigricans, Subims alternans con-

Anvulatus, in Entomology, a species of attelanus,
that inhabits Cayenne. It is furrigenous, wing-cases angu-
lated, black in the disk. Fabricius. Anterntee black, furrig-
inous at the base; thorax furrigenous, with a black spot
at the base.

Anvulatus, a species of carabus, of the apterous
kind. It is black and hairy, thorax guttered, wing-cases
burrowed, with two interrupted yellow stripes. Inhabits
Coromandel. Fabricius.

Anvulatus, a species of gmelinus, that inhabits Ger-
many. It is yellowish, abdomen brown, segments of the
joints obtuse and angular. Fabricius.

Anvulatus, a species of cancus, with two points on
each side of the thorax, fore-claws very long. Gmelin.

Anvulosa, in Conchology, a species of tellina,
that inhabits America. This shell is oval, rather flat, and
transversely striated; one end inflated and angulated; first
tooth of the hinge blunt, lateral ones remote. Gmelin and
Chemitz.

Anvulosa is likewise a species of arca, that inhabits
the shores of the African and American ocean. It is ver-
tricose, longitudinally marked with frizie and fine lines,
and has one side angulated; the beaks are contiguous, hinge
arched. Gmelin. Its general colour is brown, with a few
spots.

Anvulosa is also the specific name of a patella,
figured by Liker and Martin. It is rather oval, white,
thin, striated, and varied with spots and dots of red; margin
obtuse. Gmelin. An orange-coloured shell, with elev-
ated white frizie and dots, bottom yellow, central orange ring
and white margin; figured by Martini; is supposed to be a
variety of this species. Its native country is not ascer-
tained.

Anvulosa, in Natural History, a species of mad produced,
that inhabits the American seas. It is short, thick, cellular,
smooth, and white: the specific character is, dichotomous,
fasaltize, with terminal, turtinated, angular flars; the la-
mella or rills dentated. Pallas and Gmelin.

Anvulosus, in Conchology, a species of echinus.
It is hemispherical, with granulated spines, and double series
of warts, the larger ones divided by serrated lines down the
middle; three series of pores upon the arena. The native
country is unknown; it is of a cinerous grey tinged with
violet. Seba, Klein, Gmelin, &c.

Anvulus, in Natural History, a species of trichoda,
described by Müller, Hist. Vert. It is angular, with a
hairy tip. Gmelin. This kind is found in infusions of hay;
it is long and convex, and is divided by an incision into
two parts, of equal breadth, but differing in length, the
fore part shorter than the hind part, the apex furnished with
short waving hair, indistinguishable molecules within, and
no hair on the posterior part.

Anvulida, in Geography. See Angora.

ANGURIA, a genus of the monoezia diandria
(diandria monogynia, Gmelin), and natural order of eucali-
tuces. Its characters are, that it has male and female flowers;
the calyx of the male is monophyllous, ringed, swelling
at the base, divided lanceolate and fringed; the corolla is
pentapetalous, spreading, growing to the border of the calyx;
the flamina have two laminae, opposite, inserted into the
caiy, anther creeping up and down; the calyx and corolla
of the female as in the male; the filaments of the flamina
as in the male, but to anthus; the pistillum has an inferi
oblong, gyno, female, and figures bicolored: the pec- 
angulatus in pennis, oblong, quadrangular, and bilocular; the
seed is very many, oval, compressed, and shining. There
are three species: 1. A. trifida, with three-lobed leaves;
a native of Cathagena in South America, where it flowers
in June. 2. A. pedata, with leaves pedate and serrate; a
personal plant, climbing trees, by means of long tendrils,
to the height of 20 feet; a native of St. Domingo; flowering
in September, and fruit ripening in December. 3. A. tri-
frusta, with leaves ternate and quite entire; a native of St.
Domingo; differing from the former in having the leaves
quite entire and narrower, and several fruits collected to-
gather.

ANGURIA. See CURCUBITA.

ANGUS, in Geography, a district of the county of For-
far in Scotland, formerly an earldom belonging to the
Dounblades, now extinct.

ANGUSTA, in Entomology, a species of mantis, that
inhabits the island of Antigua. It is greenish, tail bifurcated,
antennae as long as the body, and fulvous. Gmelin.

ANGUSTA, a species of tinctuba, found in Europe.
It is black, the body narrow, and covered with greyish
down. Gmelin.

ANGUSTA, in Conchology, a species of patella. The
shell is depressed, white, with elevated frizzles, of which every
fourth is larger than the rest; aperture very narrow, with a
chelate coloured band on the outside, and a green belt
within. Gmelin. This is about three quarters of an inch
in length.

ANGUSTATA, in Entomology, a species of casina,
found in India. It is yellowish, posterior part of the wing-
cases narrow. Gmelin.

ANGUSTATA, a species of pinella, that inhabits the
southern parts of Russia and Egypt. It is glossy, posterior
part of the thorax narrow, wing-cases pointed at the end.
Gmelin. This creature lives in the dry dung of animals,
under stones, &c. and is supposed to be the tenebrio longi-
cornis of Pallas.

ANGUSTATA, in Conchology, a species of lapes,
figured by Donnini. The shell is elongated, funnel-shaped, of six valves,
the aperture narrow, and operculum small. Gmelin. It is
grooved where the valves unite, and is sometimes frizited
with red and white.

ANGUSTATA, a species of cypriia. It is narrow, and
of a brown colour, with reddish spots. Gmelin and
Gutschi.

ANGUSTATUS, in Entomology, a species of cur-
cula, sometines, though rarely found in England. It is
cylindrical and black, wing-cases oblique and punctated.
Fabricius.

ANGUSTATUS, a species of cryptocephalus in Gme-
lin's arrangement, and cistella of Fabricius; the thorax
and wing-cases are of an obscure reddish brown, and black in
the middle. Fab. Inhabits England.

ANGUSTATUS, a species of carabus, that inhabits Ger-
many. The thorax is cylindrical and bine, wing-cases telfa-
ceous, black at the tips. Fabricius.

ANGUSTATUS, a species of cimex, with oblong body,
and filiform antennae; it is black, with an elongated head and thorax. Gmelin and Thumb.

ANGUSTIA, in Ancient Geography, a town of Europe in Dacia, according to Ptolemy.

ANGUSTICLAVIA, or ANGUSTUS CLAVUS, in Antiquity, a tunic, embroidered with little purple flowers, or flowers, worn by the Roman knights, inferior magistrates, and some officers of the army.

The word is compounded of angustus, fisful, and clavus, fish, because those ornaments were smaller in this garment than in the laticlava which was worn by the femaile.

ANGUSTIFOLIUS, in Botany, denotes narrow-leaved.

ANGUSTURA Bark, in the Materia Medica, a species of bark imported here in convex pieces, about an inch and an half or less in breadth, and about six inches long. It is hard and compact, of a yellowish brown colour, and covered with a whitish, uneven epidermis. In powder it has the yellow appearance of rhubarb; its taste is bitterish and aromatic; its colour, when recent, is said to be not ungrateful. An ounce of this bark yields, by means of alcohol, about two drachms of a red wine, bitter extract; and from the same quantity, nearly three drachms and a half of a gummy extract may be obtained by water. This drug, according to some, should be called Aungstula, from St. Augustine, in East Florida; but it is more properly named Aungstula, from a place of this name in South America, whence it was brought by the Spaniards to the island of Trinidad.

The tree which produces it is not acertained. Some suppose it to be Magnolia glauca; but it has been thought, with greater probability, to be the bark of the Brucea antidysenterica, or Brucea ferruginea of L’Heritier and Aiton; for the description of the bark of this tree given by Mr. Bruce agrees very well with the cortex angustula; and this opinion is confirmed by the bark of a living plant of this species growing in the royal garden at Kew.

This bark has been successfully used during the 12 years from 1785, in which it has been known as a medicine in this country, under the characters of a febrifuge, tonic, and allirgent. In intermittent ails it has been found no less effectual than Peruvian bark, and generally more acceptable to the stomach; and in cases of diarrhoea, dyspepsia, febrifuge, and great debility, it has been found to be a useful remedy. The doses in which Dr. Brandi has exhibited this remedy have been, of the powder as much as 20 grains every three hours, but generally less.

The infusion is made with half an ounce of the bruised bark to a pint of boiling water; the decoction of the same strength; the dose, one ounce to an ounce and a half. Of the tincture, prepared with one ounce of bark to 15 of proof spirit, the dose is about one drachm. Woodville’s Med. Bot. vol iv. p. 162. Murray’s Mat. Med. vol vi. p. 172—177. Brandi’s Exp. and Obf. on the Angustura bark, 1791.

ANGUSTUS, in Entomology, a species of Cixiæ, which inhabits China. It is greyish above, beneath yellowish; antennæ and legs tellyaceous brown. Fabrinius.

ANGUSTUS, in Cymatologia, a species of Muræ. This shell is narrow, the first whorl of the spire pleated longitudinally, and ribbed transversely, the rest smooth and round, beak ribbed transversely. Gmelin.

ANHALDIN, anhaladinum, an epithet given to various medicines, formerly kept as secrets in the family of Anhalt. Three of the most celebrated medicines under this denomination are a corrosive, a water, and a spirit.

The corrosive, as described by Burggrave, is compounded of calcined antimony, sublimate mercury, sal ammonica, and calcined tarter, distilled and rectified. The Anhaltin water, or rather spirit, is a farrago of several aromatics, balsamics, and turpentine distilled with spirit of wine. It is nauseous to the palate; but has been applied externally in the, belly, fumigations, vomiting, and gripes. Murray, Mat. Med. vol i. p. 96.

ANHALT, in Geography, a principality of Germany, in the circle of Upper Saxony, terminating to the north-east on the marlhe of Brandenburg, to the east on the elec- torate of Saxony, to the south on the margravate of Mif- fen, to the south west on the county of Mansfield, to the north-west on the duky of Brunswick, and to the north on the principality of Halberstadt and the duky of Magde- burg, and extending about 90 miles from east to west, and in its greatest breadth about 35 miles. The land produces corn and hops, and various kinds of fruits. The rivers, which are the Elbe, the Mulde, the Saale, the Wipper, the Seine, the Bode, the Tutine, the Zitau, the Nuke, and the Kofzka, yield excellent fish. The mines afford lead, copper, silver, iron, coal, sulphur, vitriol, alum, salpetre, and other minerals; and the principal article of trade is beer.

The air is healthy, though cold. In this principality are 19 towns and two boroughs, and the number of inhabitants is about 100,000. Christians were introduced into Anhalt in the ninth century; and the reformation took place in 1527. Until 1596, the whole country professed Lutheranism; but at that time Calvinism was introduced. This principality derives its name from the castle of Anhalt; and the princes of Anhalt are descended from the Aecians. Some of the bell genealogists derive their origin from Berenthobaldus, who made war upon the Thuringians in the sixth century; and in the German history the princes of this family make a conspicuous figure. Joachim Ernart II. was the founder of all the present princes of Anhalt. He died in 1586; and five of his sons shared their father’s territories. To the eldest of the family they all agreed to submit; and with him, to whom belonged Anhalt-Dessau, was vested the supreme government. The other four are Anhalt-Bernburg, Anhalt-Schaumburg, Anhalt-Cotten, and Anhalt-Zerbst. Each of the reigning lines has its regency, exchequer, and consistory. The annual produce of the whole principality of Anhalt is estimated at between 5 and 600,000 rix dollars.

ANHELITUS, formed of the verb ambelo, I breathe with difficulty, signifies a thoroughness and thickness of breath, as in an asthma. See Respiration.

ANHIMA, in Ornithology, a name given by Maregraves, Willughby, Ray, and other old writers, to the Palamedea cornuta of Linnaeus. See Cornuta Palamedea.

ANHINGA, a species of FLOtuS, having a smooth head, and white belly. Gmelin. This is the anhinga of Maregrave, Drilon, Ray, and others; and white belled darter of Latham.

This species is scarcely so big as a mallard in the body, but its length from the tip of the bill to the end of the tail is not less than two feet ten inches; the bill is three inches long, straight, pointed, and jagged at the edges; the colour greyish; yellowish at the base; head small; neck very long and slender; and covered with downy feathers of a rufous greyish colour; upper part of the back and scapulars dusky or blackish, the middle of each feather dabbled with white; lower part of the back, rump, and upper tail coverts black; belly pure silver white; tail of twelve large black feathers, legs and toes yellowish grey.

It inhabits Brazil, and feeds on fish, which it is said to catch with much cunning and dexterity, first drawing up its neck like a serpent, and then darting its bill upon its prey. Like the corvordant, this bird builds the nest upon trees, generally those which grow by the sides of rivers. When at telb
red; it frequently fits with the head drawn in between the shoulders, like the horn. It is for the most part very fat, but the fish has an oily, rank, and disagreeable smell.

Anikaga, or Ornithology, has been described in the laws of William the Conqueror; and their use is, that every one should pay, according to the custom of the country, his part and share, as feet and lat., see Leg. W. I. cap. 64.

AHNOLT, in Geography, a legation of Wellplasia, lies between the bighorn of Minster, the duchy of Cleve, and the county of Zutphen. When the ancient lords of Ahnolt became extinct, towards the close of the 12th or beginning of the 13th century, a female heir of this house transferred it to her co-heiress John of Bronkhorst. The two sons divided the paternal and maternal estates, and thus Count Theodoric obtained the sovereignty of Ahnolt. In 1641, he gave this fiefdom to his daughter, who was married to Leopold Philip Charles, Prince of Salm, whose house, on account of this fiefdom, enjoys both seat and voice in the Wellplasian college of the counts of the empire, and also at the diets of the circle of Wellplasia. The province of Guelders, in the Low Country, new appropriates to itself the fiefdom over this legation. The chief place in it is Ahnolt, a small town and chateau lying in the Old Vifci. N. lat. 51° 54', E. long. 6° 7'.

Ahnolt, an island of Denmark, in North Jutland, situate in the Cattegat, eight miles from the coast of Jutland on the west, ten from Zealand on the south, and seven from Smaland on the east. It is surrounded with sandbanks, and, therefore, dangerous to seamen, but a fire is constantly kept up in a light-house upon it. On each side of it is a channel, as ships may be sailing for Copenhagen on the east or on the west side of Zealand. Professor Bogge observes, that in all the charts and maps of the Cattegat, the position of Ahnolt is very erroneous. The light-house and the whole island are from seven to nine minutes too much westerly; and the distance from the light-house to the Swedish coast, in a direction perpendicular to the meridian of the light-house, is, in all maps hitherto published, nearly four English miles, or one-eighth part of the whole, too great. Experience has taught the navigators that they come too soon down upon Ahnolt; or that, on cruising between Ahnolt and Sweden, they over-run their reckoning, which was ascribed to the currents; whereas, the true reason was the great error in the geographical and hydrographical position of Ahnolt in a narrow and dangerous passage. The light-house is in N. lat. 56° 44' 26", E. long. 11° 39' 51". Phil. Trans. vol. lxxxiv. p. 460.

ANHUIBA, in Botany, a name by which some authors call the sassafras tree, the wood of which is so much used in medicine.

ANHYDROS, a name given by the ancient Greeks, and from them copied by the Romans in the time of Pliny, to express one of those kinds of the strachna, or night-shades, which, when taken internally, cause madness.

ANI, in Entomology, a species of crotophaga, in the Linnean and Gmelinian arrangement, and very briefly described as Ctr. minor pedibus scanforisis (small feet-climbers). This character is, perhaps, insufficient to distinguish it from another species of the same genus described by Gmelin, as Ctr. major pedibus scanforisis, without attending to the characters admitted by other authors; both are of a blackish violet colour, and have the edges of the feathers glistened with green, but in the former the green has a coppery aspect; the bill of this is also shorter in proportion, and rises higher at the top, and its usual length is thirteen inches and an half, which is about four inches and an half less than that of C. ma-

por. Some authors have been disposed to consider them as the two sexes of the same species, or mere varieties; but both sexes of each seem to be well authenticated, and Dr. Latham says he is assured they are distinct species, and never mix together.

This is the Brazilian bird, called by Marcarevic in his History of Brazil, Ani; and Histacqconsinger Ani, by Ray and Willughby. It is not, however, peculiar to this part of South America, being also found in Guinea. It is Moni-

dula tota migrator garrula, mandibula fasiplora arcaetae of Slone, Jamaica; and is likewise described as a Well Indian bird by Brown. Cateley calls it the razor-billed blackbird; Buffon, and des Savi anes, and in the Ph. enl. Petit, Bout-de-Petun. Crotophages by Brinon, and it is supposed the Cacalotot of Ray is the same bird.

Contrary to all other birds, the Crotophaga Ani, says Dr. Latham, "have the singularity of many lying in the same nest, to make which they all unite in concert; and, after laying their eggs, sit on them close to each other, in order to hatch them, each unaniously striving to do the best for the general good; and when the young are hatched, the parents, without reserve, do the best to feed the whole flock. A still greater singularity occurs, which is, that as soon as each female lays her egg, she covers them with leaves, doing the same thing whenever she is obliged to leave the nest for food: this might be necessary in a cold climate; but why it should be wanted in a hot one, I have not clear, especially as it has not been observed in other birds. It generally has two broods in a year, except accidents happen; in which case it has been known to make three nests. The eggs are about the size of those of a pigeon, of a sea-green colour, spotted at the ends."

"Their food is various; worms, insects, fruits, and grain, according to the season. They have the same manners as the greater ani, C. major, and are continually gregarious, from ten to thirty in a flock, whether it be in breeding time or not. They are not difficult to be shot, not being so wild as many other birds; but are known to chatter much on the flight of a man, though they do not fly to a great distance; hence they are not well relished by sportsmen; as, like jays in England, they are the object of taking up during his sport in respect to other game, without making him amends in their own flesh, which is never sought after for food, being rank and unpalatable." Thes Gen. Syn. tom. i. p. 362.

Ani, a name adopted by Dr. Latham in his arrangement, Gen. Syn. for the Linnean genus crotophaga: thus the species C. ani is called the lesser ani, C. major, greater ani, C. ambulatoria, walking ani; and, no doubt, the newly-discovered species described as C. varia, rufo nigroque varia, in Ind. Orn. of the same author, would have been called the variegated ani, had any English name been affixed to it.

Ani, a name given by some early writers on natural history to the uupfa mexicana of Linnaeus, and Mexican pomerots of Latham. Ani mexicana cauda longissima. Seba, &c.

Ani, or Anikaga, in Geography, a town of Greater Armenia, in Asia, in the government of Kers, and under the beglerbeg of Erzerum. Its walls are watered by a river, which descends with rapidity from the mountains of Mingrelia. It was formerly known under the name of Am; and was so considerable and so strong, that the ancient kings of Armenia deposited their treasure in its castle.

Anian Straits, lie between the north-east extremity of Asia, and the north-west point of the continent of America. The west point of this strait is N. lat. 65° 52', and W. long. 160° 20', and the east point, called Cape Prince of Wales, in N. lat. 65° 49', and W. long. 168° 15'; and its breadth is about 14 leagues. See Beering's Straits.

Anian
ANIAN is also a barren, sandy desert, which is excessively hot, and inhospitable, on the east coast of Africa; frequented only by wandering Arabs, who live in camps. It lies upon or near the Eastern Ocean and the Red Sea. See ALEX.

ANIAN-TU or ANIEN, a town of China, in the province of Chuenan.

ANIANA, in Ancient Geography, a town placed by Ptolemy in Mesopotamia.

ANIANE, in Geography, a town of France, in the department of the Herault, and chief place of a canton in the district of Lodève, 25 miles south-north of Montpellier, N. lat. 45° 47', E. long. 3° 29'.

ANIR, a town of Alia in Syria, between Aleppo and Alexandria.

ANIBA, in Botany. See CERODATA.

ANICETUS, Pope, in Biography, a Syrian by birth, succeeded Pope Pius, according to Eusebius, in the year 1577; but, according to other writers, at a somewhat earlier period. In his time, the Gnostic doctrines of Valentine and Marcion prevailed at Rome; but many of the persons who adopted them were reclaimed by Polycarp, who came from Smyrna to Rome, in order to settle the controversy about the celebration of Easter. Anicetus differed with him on this point; and after a conference, each retained his own opinion, whilst both of them manifested mutual forbearance and charity. In token of their amity they communicated together at the eucharist; and Anicetus testified his respect for Polycarp, by yielding to him the honour of performing the service on the occasion. Happy would it have been for the Christian church, if the successors of Anicetus had manifested a similar disposition. Several ordinances and decrees are ascribed to this pope by modern writers, but their authority is doubtful, and therefore they are not worthy of notice.

After having governed the church 11 years, he died, as some have said, a martyr; but of this there is no sufficient evidence. The letters ascribed to him are frivolous. Euseb. Eccl. Hist. lib. iv. c. 11. 14. 22. Dupin. Bower.

ANICH, Peter, a mathematician, mechanic, and alchemist, was born of obscure parentage at Oberperzuff, near Infruck, in 1723; and discovered an early taste for the sciences of astronomy and geometry, which Father Hill, a Jesuit, and professor in the university of Infruck, afforded him an opportunity of cultivating. In a short time he was distinguished by his knowledge both of astronomy and mechanics. He made a very curious pair of globes for the university of Infruck, and constructed many mathematical instruments of his own invention. He also delineated maps with neatness and accuracy. He died much regretted in 1766; and the empress queen testified her respect for his memory, by setting upon his table a pension of 50 florins. Nouv. Dict. Hist.

ANICULA, in Conchology, a name given by Rumphius to a species of conus, called by Linnaeus and later authors, CONUS MONACHUS; which see.

ANICULUS, in Entomology, a species of cancer, having an ovate thorax, ciliated at the sides, and rugid, hairy legs. Fabricius. This creature inhabits the southern ocean, and is the largest of the family PARAFITIS. The rostrum is biform, teeth elongated and acute; the eyes cylindrical and procurred; thorax smooth, tail soft, claws and legs rugged, with hairy tufts.

ANJENGO, in Geography, a small town and factory, with a fort, on the coast of Malabar, belonging to the East India company. The chief trade of this settlement is pepper, and rupees are the current money. N. lat. 8° 39'. E. long. 76° 40'. Vol. II.

ANIERES, a town of France, one league north-west from Paris.

ANIGRUS, in Ancient Geography, a river of Triphylia, in the territory of Elis, to the north of Lepreum. Its course was in Leptis, a mountain of Arcadia; the inhabitants of which thought that it was the same with the Minyas of the ancients, mentioned by Homer. Near this river was a cavern, called the cave of the nymphs Anigrus, or Anigerus, mentioned by Strabo and Paulainus; and it was pretended that any persons who had a complaint of the skin might be cured, if, after having sacrificed to the nymphs, they swam over the Anigrus.

ANIKAN, or INGIERFRAN, a town of Africa, on the Gold Coast, where the English and Portuguese have both a factory and a fort.

ANILL, in Botany. See INDIGOPELL.

ANILLIS, in Entomology, a species of Musca, in the Linnaean system, and Row in that of Fabricius. It is a whitish grey, with transparent whitish wings, and is found in Europe. Gmelin.

ANILLE, in Heraldry, a mill-rind, or, as the French term it, a fer de moline.

ANIM, in Ancient Geography, a town of Palestine, situated in the mountains of the tribe of Juda, according to the book of Joshua.

ANIMA, a soul; whether rational, sensitive, or vegetative.

The world is pure Latin, formed of respirare, to breathe. Anima is sometimes used by physicians to denote the principle of life in the body.

In which sense Willis calls the blood anima brutalis. Anima is also figuratively used by chemists for the volatile principles in bodies, whereby they are capable of being raised by the fire.

In which sense we meet with anima sapidis, the soul of the supr. &c. Phil. Trans. N° 72. p. 2233. Anima is more particularly applied to simple medicines, artfully exalted by distillation and extraction, to a high degree of power.

In which sense we meet with anima alciata, anima Rhodochorini, anima semenis, &c.

Sometimes also it denotes medicines which are particularly salutary to particular parts of the body. Thus we meet with Anima articulorum, which is a denomination sometimes given to hermodactyls, on account of their efficacy in disorders of the joints.

Anima leukos, soul of the liver, a term applied by the chemists to the fæt maris, fæt of iron or steel; on account of its utility in diluting the other parts.

It is more usually preferred under the name of vitriolum maris.

Anima palmonum, used for crucis, or saffron, by reason of its supposed great use in diseases of the lungs.

Anima mundi, qu. d. soul of the world, or of the universe, denotes a certain pure ethereal substance or spirit, diffused, according to many of the ancient philosophers, through the parts of the world, informing, actuating, and uniting the diverse parts thereof into one great, perfect, original, and vital body or animal. See PLASTIC Nature.

Plato treats at large of the soul, in his Timaeus; and even supposes a soul to be the author of the dogma; yet interpreters are much at a loss about its meaning. Aristotle, however, taking it in the common and obvious sense, freed it, without oppressing it.

The modern Platonists explain their master's anima mundi by...
b a certain universal ethereal spirit, which in the heavens exists perfectly pure, retaining its proper nature; but on earth, pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it assumes somewhat of their nature, and becomes of a peculiar kind. So the poet:

"Spiritus intus alti, totiusque infusa per artus.
Mens agitat molem, & magno fe corpore nuceft."

They add, that this anima mundi, which more immediately resides in the celestial regions as its proper seat, moves and governs the heavens in such manner, that the heavens themselves first received their existence from the fecundity of the same spirit: for that this anima, being the primary source of life, every where breathed a spirit like itself, by virtue whereof various kinds of things were formed conformable to the divine ideas.

The notion of an anima mundi is rejected by most of the modern philosophers, though M. du Hamel thinks without any great reason, since the generality of them admit something very much like it. Thus the Peripatetics have recourse to celestial influaxes, in order to account for the origin of forms, and the secret powers of bodies.

The Cartesians have their subtle matter, which answers to most of the uses and intentions of Plato's anima mundi; being suppos'd to flow from the sun, and the other heavenly bodies, and to be diffus'd through all the parts of the world, to be the source or principle of all motion, &c.

Some later philosophers, in the place of these sublimate fire; and others a subtle elastic spirit, or medium, diffus'd through all parts of space.

The principal thing objected to, on the Christian scheme, against Plato's doctrine of the anima mundi, is, that it mingles the Deity too much with the creatures; confounds, in some measure, the workman with his work, making this, as it were, a part of that, and the several portions of the universe so many parts of the godhead. Yet is the same principle affected by Seneca, Epist. 92. \textit{Tutum hoc quo continuatur, \& unum est, \& Deus. \ Et facili ejus funtus, \& membri---}

\textit{Anima gemmara,} a term used by Becher and some others, to express that principle, to which the gems, and other beautiful stones owe their colours.

This anima lapidum is no more than the metallic sulphur to which these stones and gems, naturally coloured, owe their tinges; and, like other metallic sulphurs, it may be raised and evaporated by fire. Becher, Phyf. Subt.

\textit{Anima saturni,} the soul of lead, a preparation of lead, serving to many purposes in the enamel work. The method of making it is this: put litharge, powdered fine, into a glazed earthen vessel, and pour distilled vinegar upon it to the height of four fingers; let it stand till the vinegar is of a white or milky hue; pour off this coloured vinegar and put on fresh, and so do till the vinegar will no longer be coloured by the litharge; then set these liquors together in open glazed earthen vessels, that the white powder may subside, and the vinegar be poured off clear. This white subtilitate is the anima saturni. Sometimes this white matter will not precipitate without the addition of water; and sometimes it is necessary to evaporate the liquors, but by that means it is always prepared. Nerit's Art of Glais, p. 184.

\textit{ANIMACHA, or ANIMACA,} in Geography, a river of India, in Malabar, which rises in Calicut, and discharges itself into the sea, in the vicinity of Cranganor.

\textit{ANIMADVERSION,} formed of animus, the mind, and advertio, I turn to, sometimes signifies correction, and sometimes remarks or observations made on a book, &c. and sometimes a serious consideration and reflection on any subject, by the rules of criticism.

\textit{ANIMAL,} in Natural History, an organized and living body, endowed with the powers of sensation, and of spontaneous loco-motion. The word is derived from anima, soul, and literally denotes something that is Animated. Boerhaave defines an animal to be an organic body, consisting of vessels and juices, and taking in nutrition by a part called the mouth; whence it is conveyed into another called the intestines, into which it has roots implanted, whereby it draws in its nourishment after the manner of plants. The imperfection of this definition is obvious, not merely as it excludes the sentient principle, but because it distinguishes the animal by the instruments or means of its nutrition, which it pollicels in common with vegetables, and which, notwithstanding some variation in their form and structure, are not sufficient to constitute an essential distinction. Dr. Tyson fixes the criterion of an animal in the \textit{"tactus alimentalis"}, \textit{i.e.} a gula, lobum, and intestines, all which make one continued canal; but this definition is liable to the same objection with that of Boerhaave. Some, as Klein and others, have defined animals, from their loco-motion, as being capable of shifting from place to place, whereas plants adhere to the same subject. This property they esteem as the great characteristic by which animals may be distinguished from the other orders of beings. On this principle, however, oysters, muscles, cockles, &c. would be almost excluded from the class of animals, insomuch as they usually adhere, or grow to rocks, &c. and yet it is certain that these creatures are real animals. But loco-motion alone is not sufficient to constitute the generic difference of animals; nor indeed does it sufficiently distinguish an animal from a plant. Many instances are produced, in which plants manifest loco-motive power. This is the case with those denominated fermentive plants, many of which, upon the slightest touch, shrink back, and fold up their leaves; as the final, on the slightest touch, retires into its shell. There are some, on which if a fly perchers, instantly close and crush the insect to death. Plants also change their position and form in different circumstances and seasons; they take advantage of good weather, and guard themselves against bad weather; they open their leaves and flowers in the day, and close them at night; some close before sun-set, and some after; some open to receive rain, and some close to avoid it; some follow the sun, and some turn from it; the leaves of some plants are in constant motion during the day, and at night they sink to a kind of rest or sleep. It has also been observed that a plant has a power of directing its roots for procuring food; and that it has a faculty of recovering its natural position after it has been forced from it. A hop-plant, for instance, in twining round a pole, directs its course from south to west, as the sun does; if it be tied in the opposite direction, it dies; but if it be left loosed in this direction, it will regain its natural course in a single night. A honey-fuckler proceeds in a certain direction till it be too long to sustain itself; it then acquires strength by fluttering into a spiral form; and if it meet with another plant of the same kind, both thece coalesce for mutual support, one twirling to the right and the other to the left. Lord Kames mentions many other instances in which plants manifest a faculty of loco-motion; and, perhaps, in almost as eminent a degree as some animals. Muffles, \textit{e.g.} are fixed to one place as much as plants, nor have they any power of motion, besides that of opening and fluttering their shells; nor do they, even, in this respect, have any imperfection, with regard to the powers of motion, to the sensitive plant and others of a similar kind.
In order, therefore, to form a complete and satisfactory
distinction between animals and vegetables, as well as minerals,
it is necessary to combine with spontaneous locomotion,
which they unquestionably possess in a more perfect
degree than plants, the powers of sensation. These seem to be an
exceptionably distinguishing and characteristic. However,
M. Baffon (Nat. Hist. by Smellie, vol. ii. p. 6.) after allowing
that, although progressive motion constitute a percep-
tible difference between an animal and a vegetable, this
distinction is neither general nor essential; proceeds to
state, that sensation more essentially distinguishes animals
from vegetables. But he adds, that this distinction is neither
sufficiently general nor decided. If sensation, he says, im-
plicated no more than motion consequent upon a stroke or im-
pulse, the sensitive plant enjoys this power; whereas, if
by sensation we mean the faculty of perceiving, and of
comparing ideas, it is uncertain whether brute animals are
endowed with this faculty. If it should be allowed to dogs,
elephants, &c. whose actions seem to proceed from motives
similar to those by which men are actuated, it must be de-
med to many species of animals, particularly to those that
appear not to possess the faculty of progressive motion.
If the sensation of an oyler, e.g. differ in degree only from
that of a dog, why do we not ascribe the same sensation to
vegetables, though in a degree still inferior? In examining
the distinction which arises from the manner of feeding, he
observes, that animals have organs of apprehension, by which
they lay hold of their food; they search for pasture, and have
a choice in their aliment. But it is alleged, that plants
are under the necessity of receiving such nourishment as the
soil affords them, without exercising any choice in the species
of their food, or, in the manner of acquiring it. However,
if we attend to the organization and action of the roots and
leaves, we shall soon be convinced, that these are the external
organs by which vegetables are enabled to extract their food;
that the roots turn aside from a vein of bad earth, or from
any obstacle to which they meet with, in search of a better
soil; and that they split and separate their fibres in different
directions, and even change their form, in order to procure
nourishment to the plant. Irom this investigation he con-
cludes, that there is no absolute and essential distinction be-
tween the animal and vegetable kingdoms; but that Nature
proceeds by imperceptible degrees from the most perfect
to the moft imperfect animal, and from that to the vegetable;
and that the fresh-water polypus may be regarded as the leaf
of animals and the first of plants. After examining the distinc-
tions, this author proceeds to state the refemblances which
take place between animals and vegetables. The power of
reproduction, he says, is common to the two kingdoms, and
is an analog both universal and essential. A second refem-
blance may be derived from the expansion of their parts,
which is likewise a common property, for vegetables grow
as well as animals; and though some difference in the man-
er of expansion may be remarked, it is neither general nor
essential. A third resemblance results from the manner of
their propagation. Some animals are propagated in the
same manner, and by the same means, as vegetables. The
multiplication of the lacerion, or viviparous, which is effected
without copulation, is similar to that of plants by seed; and
the multiplication of the polypus by cuttings, resembies that
of plants by slips. Hence it is inferred, that animals and
vegetables are beings of the same order, and that Nature
distinguishes from the one to the other by imperceptible degrees;
since the properties in which they are confined to another are
universal and essential, while those by which they are distin-
guished are limited and partial. Dr. Watson, bishop of
Llandaff, has examined, with his usual judgment, the distin-
guishing marks between animals and vegetables. See Eff. iii.
in the fifth volume of his Chemical Essays, 12mo. 1787.
He rejects, as insufficient, both figure and spontaneous motion;
and if perception be sublimated in their stead, it will be
found to be a criterion that is in many respects liable to excep-
tions. However, the ingenious and learned prelate produces
many chemical, physical, and metaphysical reasons, which
serve to render the supposition not altogether indefensible,
that vegetables are endowed with the faculty of perception.
Dr. Percival, likewise, in a paper read before the Literary
and Philosophical Society of Manchester, produces several
arguments to evince the perceptive power of vegetables.
From the reasoning adduced by both these ingenious writers,
of which a more particular account will be given in the
sequel of this work (see Plants and Vegetables), those
who daily advert to it, will, we conceive, incline to the op-
inion, that plants are not altogether destitute of perception.
But on a question that has perplexed and divided the most
ingenious and inquisitive naturalists, it is very difficult to
decide. If we extend to the vegetable kingdom that kind of
vitality with which sensation and enjoyment are connected,
there will remain no discernible boundary between this and
the animal kingdom; and that which has been considered as
the distinctive characteristic of animals, and by which they
are separated from vegetables, will be abolished For a dif-
cussion of this question more in detail, see Brute, Instinct,
Physiogy of Plants, and particularly the article Sensa-
tion. Before we clofe this article, we shall add, that the
principle of self-preservation belongs to all animals; and it
has been argued, that this principle is the true characteris-
tic of animal life, and that it is unquestionably a consequence
of sensation. There is no animal, when apprehensivc of dan-
ger, that does not put itself into a posture of defence. A
mucleus, when it is touched, immediately shuts its shell; and
as this action puts it into a state of defence, it is ascribed to
a principle of self-preservation. Those who adopt this rea-
oning, allege, that vegetables do not manifest this prin-
ciple. When the sensitive plant, for instance, contracts from
a touch, it is no more in a state of defence than before;
for whatever would have destroyed it in its contracted state,
will also destroy it in its contracted state. They add, that the
motion of the sensitive plant proceeds only from a certa-
in property called irritability; and which, though pos-
sessed by our bodies in an eminent degree, is a charac-
teristic neither of animal nor vegetable life, but belongs to
us in common with brute-matter. The sensitive plant, after
it has contracted, will suffer itself to be cut in pieces, with-
out making the least effort to escape. This is not the case
with the meander animal. An hedge-hog, when alarmed,
draws its body together, and expands its prickles, thus put-
ing itself in a posture of defence. When thrown into the
water, the same principle of self-preservation prompts it
to expand its body and swim. A snail, when touched,
withdraws itself into its shell; but if a little quick-lime be
sprinkled upon it, so that its shell is no longer a place of
safety, it is thrown into agonies, and endeavours to avail
itself of its loco-motive power, in order to escape the dan-
ger. Mucleus and oysters also, though they have not the
power of progressive motion, constantly use the means which
Nature has given them for self-preservation.
We ourselves possess both the animal and vegetable life,
and ought to know whether there be any connection be-
 tween vegetation and sensation, or not. We are conscious
that we exist, that we hear, see, &c. but of our vegetation
we are absolutely unconscious. We feel a pleasure in gra-
tifying the demands of hunger and thirst; but we are totally
ignorant of the proeess by which our aliment is formed into

chyle,
elites, the elyle mixed with the blood, the ceration of
that fluid, and the separation of all the humours from it. If
we then, who are more perfect than other vegetables, are
utterly infirm of our own vegetable life, why should we
imagine that the less perfect vegetables are feasible of it? We
have within ourselves a demonstration that vegetable life acts
without knowing what it does; and if vegetables are guar-
rant of their most vigorous actions, why should we suppose
that they have any vegetation of their interior ones; such as
contracting from a touch, turning towards the sun, or
advancing to a price? As to that power of irritability which is
observed in some plants, our foliis have it when
deprived both of animal and vegetable life; for a muscle cut
out of a living body will continue to contract, if it be irri-
tated by pricking, after it has neither sensation nor vegeta-
tion. The following moral reason has also been suggested
against believing vegetables to be endowed with vegetation: if
this were the case, they would suffer pain when they were
cut or destroyed, and then would be very unhappy if
they had not the least power to avoid the injuries duly of-
fered them. Accordingly it is maintained, that the good-
ness of the Deity is conspicuous in not giving to vegetables
the same sensations as to animals; and as they have no means
of defence, we may conclude from this circumstance, that
they were granted as food to animals. Encyc. Brit. On
the other hand, those who are of opinion that plants possess
powers of perception, allege that their hypothesis recom-
mands itself by its consonance to those higher analogies of
nature, which lead us to conclude, that the greatest possible
form of happiness exists in the universe. The bottom of the
ocean is overpeopled with plants of the most luxuriant magni-
tude; and immense regions of the earth are overpeopled
with perennial forests. Nor are the Alps, or the Andes, de-
stitute of herbage, though buried in depths of snow: and can
it be imagined that such profusion of life subsists without
the least sensation or enjoyment? Let us rather, with
humble reverence, suppose, that vegetables participate, in
some low degree, of the common allotment of vitality;
and that one great Creator hath appointed good to all
living things, "in number, weight, and measure." Percival,
ubi supra.

For an account of the various systems that have been
adopted in the distribution of animals, see Zoology. See also
Mammalia, Birds, Amphibia, Fishes, Insects, and Worms. For other particulars relating to their num-
ber, analogous structure, sagacity, instinct, &c. see Compa-
rative Anatomy, with the articles referred to under that
head, Brute, Generation, Instinct, Migration, Oviperous, Viviparous, &c. &c.

Animals make the principal figures in Heraldry, both
as bearings and as supporters, &c.

Animal is also used adjectively to denote something
that belongs to, or partakes of, the nature of an animal body.
Thus we say animal food, animal economy, &c.

Morals frequently oppose the animal part, which is the
feable, fleasy part of a man, to the rational part, which is
the understanding.

Animal actions are those peculiar to animals, or which
belong to animals as such:
Such are sensation and muscular motion.

Animal earth. See Earth.

Animal flower, a name indiscriminately applied to a
variety of different creatures in the Vermes tribe, that bear
some resemblance to a flower; and is synonymous with sea
anemone, urtica marina, or sea-nettle, &c. Their, for the
most part, belong to the molusca order in the Linnaean sys-
tem, as the actiniae, and holothurias; yet the name is given
to be tubulariae and hydrea, which belong to an entirely dif-
ferent order, the ephydri of Linnaeus. See Actinia,
Anemone, (sea,) Holothuria, Turulaia, and Hy-
dra.

Animal familiar, among Physicists. See Function.

Animal glue. See Glue.

Animal gods, dii animalis, in Mythology, those into
which human souls are converted by means of certain reli-
gious ceremonies.

Labeo has written expressly on the animal gods.

Animal hunger. See Hunger.

Animal report. The common opinion is, that all the
animal liquors, excepting chyle and milk, are of an acru-
slent nature; but M. Quefay, in his book Sur l'Oeconomie
Animale, affirms, that our gelatious liquors contain a
very acent heat, capable of raising a heat of two hundred
degrees. The proof of which, says he, offers itself daily to
every one: who is it that has not remarked, that broth
made with flesh, well freed from fat, when corrupted, be-
comes as sour as vinegar? The foundation on which M.
Quefay builds his doctrine concerning animal liquors, is
the separation of milk into its oily, cherty, and watery sub-

Animal magnetism. See Magnetism.

Animal manures, in Agriculture, are all such as are
formed from the decomposition of animal substanccs of
any kind, as flesh, blood, hair, wool, bones, fat, &c. Agri-
cultural writers consider them, in general, as more powerful
in their effects, in promoting vegetation, than such as are de-
rivcd from vegetable matters. However, on account of
their being seldom procured in large quantities, they are
mostly made use of in the state of mixture or combination
with other materials, either of the earthy or littery kinds;
in both which cases they may be highly beneficial. In
the former by the action of the ammoniac, which is con-
stantly formed in large quantities, during the decomposition
and decay of animal matters on the mould, and rendering it more
suitable for the support of plants; and, in the latter, by
their well known property of promoting fermentation,
and thus hastening the reduction of the materials into the state of
manure. See Manure.

Animal matter, in Chemistry. The ancient division of
all natural bodies into the three grand classes of mineral, vegeta-
table, and animal, a division founded upon simple observation,
and not upon preconceived theory, may still be retained as
a classification of some practical utility to the chemist,
thought infinitely less so than to the physiologist.

A complete knowledge of the chemistry of animal matter
would comprehend an intimate analysis of all the materials
out of which it is formed, and of their mode of combination;
whereby, from a few simple elements, the great variety of
aliments used by the living animal are produced: it would
also require a minute examination into the processes of
digestion and assimilation of food, step by step, in order to
trace the curious and interlacing conversion of inanimate
matter into an integrant part of the living animal; and
more than all, it would include an investigation into the most
terrible secrecies of nature, in order to determine how far the
known laws of chemical affinity are affected by animal or-
ganization, and by the vital principle. The very imperfect
progress which has been made in this branch of chemical
inquiry shews the great and almost insuperable difficulties
which attend its pursuit; and, notwithstanding the real dis-
covcries made by modern chemists, and the self-complicity
with which they are so often brought forward, little else can
be related on the chemistry of animal matter, than a col-
lection
leision of detached facts and unconnected experiments, from which no plausible theory of the process of animalization has been deduced, and but little assistance has been afforded to the science of physiology, and perhaps still less to the cure of disease.

Before we enumerate the particular parts of animal matter which have afforded the greatest scope to chemical experiment, it may be proper to premise a few remarks on the materials out of which animal matter is formed; on the mode in which they are elaborated within the living body; and on the chemical properties which appear to be common to every part of the animal kingdom.

Two principal functions, poffed, as it were, by every living creature, prepare the materials out of which the animal body is constituted, and from which it draws perpetual supplies; these are, digestion and respiration.

The food taken in by the mouth is the most obvious and abundant source of supply to the body; and this cannot be said to have become an integral part of the animal which receives it, till it has been prepared in the stomach, by the processes of digestion, and till the chyle, or nutritive part which it furnishes, has been further assimilated in the lymphatics, and, at last, added to the mafs of circulating blood.

The vegetable kingdom furnishes, directly or indirectly, the whole of alimentary matter, except the common diluent, water. Hence, chemists have with great propriety directed much of their inquiries relating to this subject, to an examination of the characteristic differences which exist between vegetable and animal matter in general, and some important facts have appeared, which we shall presently relate. The ultimate analysis of vegetables, or that which reduces them to their simplest forms, furnishes us with very few materials. Of these, water is by far the most abundant ingredient; carbovanous matter the next in quantity, and equally constant; and chemical analysis will also show a certain portion of hydrogen and of oxygen unconnected with the composition of water, and a few saline and earthy parts, which, from their constant occurrence, have a claim to be considered as necessary constituents of vegetable matter. In tracing the decomposition of vegetable aliment, however, it should be remembered, that these materials are presented to the animal organs, not merely as so much hydrogen, carbon, and oxygen, but in the intermediate and already very compounded forms of farina, sugar, mucilage, and the like; forms in which their tendency to chemical change is much stronger than when they are reduced to their simplest mode of existence.

With regard to that very large proportion of aliment which is furnished from the animal kingdom itself, forming so much of the food of man, and the whole nutriment of many entire classes of living creatures, this, it is obvious, is still produced indirectly from vegetable matter, and the art of chemistry has not yet been able to detect any very sensible difference between the first, and the subsequent results of assimilation by animal organs. The most accurate chemical analysis could not determine with any certainty, whether a given portion of animal sublubance was a part of a carnivorous or a herbivorous animal; and this single circumstance shews, perhaps, as much as any other, the very imperfect state of our knowledge of the changes produced during digestion in the living organs.

A chemical change equally important with digestion, and still more uniform and constant in its operation, is the action of the external air on the animal fluids through the medium of respiration. The part which immediately receives the action of the air, is the blood while circulating in the extreme branches of the pulmonary arteries and veins in the cells of the lungs. Under the articles Respiration, and Blood, we shall relate at large the facts that have been discovered by the successive labours of some of the most ingenious philosophers which the world has produced, which prove incontrovertibly the analogy between this process and that of combustion, and its connexion with the animal temperature. There can be no doubt that respiration is a chemical process, the operation of which, as it is exerted on the general mass of circulating fluid, is extended through every part of the living body; and perhaps its effects are more peculiarly and exclusively chemical, than most of the other animal functions. Respiration too may properly be considered as the last step in the process of the assimilation of food, since the chyle, when thoroughly elaborated, is thrown into the mafs of blood returning to the heart, whence it directly passes to the lungs (entirely in some classes of animals, and partially in others), and is inducted to the chemical action of the external air, before it refews the round of circulation to suply the different purposes of the body.

As a defective respiration, in the case of original malconformation as well as of diseases, produces a train of disorders which are very strongly and pointedly marked, we may infer that the chemical analysis of the several parts of the body, if we had the means of sufficient accuracy of examination, would readily indicate the deficiency in a powerful a chemical agent as the atmospheric air. Opportunities for such an examination have not, however, been sufficiently frequent, nor is it certain that, in the present state of chemical knowledge, they could be rendered very conclusive.

In confidering the mode whereby alimentary matter is assimilated, or undistinguishingly blended with the solids and fluids of the living animal in which this function is going on, a very interesting inquiry presents itself, namely, to determine how far this process is purely chemical. (that is, conducted by the same laws of simple and complex affinity which operate on inanimate matter), and how far it is affected by the circumstances of the living principle. In favour of the former opinion the following arguments may be urged; first, that the food, whether derived from the vegetable, or the animal kingdom, or from a mixture of both, is a sublubance which strongly tends to spontaneous decomposition, in whatever situation it is placed; and that, ceteris paribus, it is more or less digestible in proportion to its greater or less disposition to chemical change. Likewise, as we have before mentioned, it is already a very compounded mixture, composed of simple elements indeed, but united by very complex affinities; and when in the form of animal flesh, of vegetable farina and the like, it is infinitely more liable to chemical change than if it were reduced to its elementary parts. Secondly, it may be urged, that a part at least of the preparation which the food undergoes in the organs of digestion is obviously a series of chemical processes. By the action of the teeth, of the gizzard, and similar apparatus, the mechanical process of commination is performed; to this succeeds maceration in the saliva, in the gall-bag, liquor, and in other animal secreted juices: the contractile power of the stomach affords constant pressure and agitation to the materials which it contains: a separation of the different parts of the heterogeneous mass under digestion, or a species of filtration, is performed by the biliary and the mesentric glands: during the course of circulation, a most intimate mixture takes place between the fresh supply of nutritive matter from the aliment, and the animal juices already contained in the vessels; and lastly the newly assimilated chyle undergoes a process similar to combustion, whilst in a state of intimate division within the ultimate ramifications of the
pulmonary vessels. To this it may be added, that the temperature of the animal in which these several processes are carrying on, is found by experiments out of the body to be highly favourable to that gradual and complex chemical change which reduces from animal or vegetable matter the greatest variety of important products.

Thirdly, it may be alleged, in answer to the forcible objection which will immediately arise to an explanation of digestion on purely chemical principles, from the impossibility of carrying on the same processes cut of the body, that the chemist cannot imitate animal digestion, because he has not all the materials at command, and especially because he cannot construct, by mechanical means, any apparatus resembling in the most distant degree the curious, beautiful, exquisitely elaborated and complicated organs which nature has furnished for this important process. This limitation has appeared so hopeless, that no such attempt has, to our knowledge, been made; for the valuable and interesting experiments of the late eminent physiologists, Spallanzani and Hunter, on what may be called, a partly artificial digestion, which will be mentioned in a future part of this work, do not come under this point of view.

It is far from our intention, however, to deny that in this, as well as in other functions of the body, the vital principle is to be esteemed as an agent for genera, of the highest importance; and, from the disturbance which certain affections of the nervous system will directly produce on the whole process of digestion, we cannot, perhaps, at any period of life, with entire propriety, from an explanation of its phenomena. The difficulty of investigation into the subject, which at all times is great, is moreover constantly increasing in proportion as the processes of assimilation advance, and at last becomes insurmountable, from the impossibility of gaining access to the interior parts of the animal structure, without producing a total derangement of the functions, and destroying life.

The chemist must, therefore, content himself with examining in detail the properties of animal matter, wherein very sensible differences may be detected, both between different parts and organs, and between the same parts and species, taken at the several periods of life, at different states of activity, and under the various circumstances of health and disease.

Chemists have long directed their attention to discover some characteristic properties common to every species of animal matter, whereby it might be distinguished from the products of the vegetable kingdom. Formerly the method of analysis was principally directed to the process of distillation in a retort, by a heat, at first gentle, and afterwards increased gradually, till every part of the animal matter was volatilized, and only a fixed residue of very difficult combustion, called expul mortuum, remained in the retort. The difference between animal and vegetable matter, when subjected to distillation, is highly important, and is well laid down by the celebrated Neuman, one of the most skilful and accurate chemists of his time. "Animal fabulances," he observes, "are excepted, on being distilled in close vessels, by a strong fire, give over, not a manifest acid liquor as vegetables do, but an urinous or volatile alkaline one, and commonly more or less of a concrete volatile alkaline salt, together with an empyreumatic oil more fetid than the oils of vegetables, and of a different kind of factor.

On calcining the remaining coal in open vessels, and exalting the ashes with water, we sometimes obtain a portion of ether as fixed stone matter, but very rarely a perfect alkaline, like that extracted from the ashes of ve; etables." In the analysis by fire, therefore, the production of ammonia, or volatile alkaline, is the most striking circumstance which characterizes animal matter; and hence the preparation of sal ammoniac, salt of hartshorn, and a variety of the ammoniacal salts, from the distillation of horn, bones, urine, camel's dung, and other animal matter, which forms a very extensive branch of chemical manufactures.

Animal putrefaction, considered as a method of chemical analysis, gives results similar to those of distillation, particularly in the production of the volatile alkaline; and hence it has long been remarked by the manufacturers of this alkali, that the product is much increased by suffering the materials to undergo a certain degree of putrefaction.

Chemists, however, were fully aware that the existence of ammonia, in its alkaline salt, in fresh animal matter, could not with certainty be inferred from its appearance after distillation, but only the presence of the materials out of which the volatile alkali may be separated. So, the author last quoted expressly observes, that the volatile alkaline salts obtained from animals are artificial productions, never found to exist naturally in any animal fibres in its perfect state. They are generally the action of fire, and putrefaction, and not by any known power besides."

The method of analysis, by simple digestion, has another imperfection (besides that of the introduction of an alkali, formed by the process, and not previously contained in the substance examined), which is, that it confounds in a few common products of distillation, a variety of parts, which in their natural state possess very specific and distinguishing qualities. This is particularly the case with those active and acid substances, which produce such powerful effects, either as medicines or poisons. It cannot but be a very imperfect analysis which exhibits no striking difference between the mildest and the most acrimonious substances; between the common articles of food, and those animal products of which the minutest portion introduced into the living body is capable of exciting the most violent commotions.

Modern chemistry has added to the analysis by fire, the use of a more refined and delicate mode of experimenting, the advantage of which we shall presently shew; though it must be confessed that it still throws little, if any, light on those inquiries into the animal body which are the most interesting to the naturalist and physician.

Another important difference between animal and vegetable matter when analysed by fire, is found in the fixed residuum which remains after distillation in close vessels. In vegetable matter this is composed principally of charcoal, in a very pure and easily combustible state, and of a small proportion of vegetable ashes, from which a fixed alkali is procurable. In animal matter, the coal which remains is very difficult of combustion, and leaves, for the most part, a large proportion of Phosphoric salts, generally united with lime. Likewise, if the animal matter be mixed with a fixed alkali before calcination, the Phosphatic acid, a substance peculiarly of animal origin, is found in the residue of combustion.

The great energy with which the nitrous acid acts upon almost every fibrescent immered in it, has long rendered it a very valuable instrument of analysis to the chemist; but as this acid is itself more or less decomposed in by far the greater number of operations in which it is employed, a previous knowledge of the intimate nature of this acid is requisite, in order to enable the chemist to explain the appearances which it produces when in chemical action. This having been obtained by the ingenious researches of several eminent chemists, among whom we may particularly mention the names of Cavendish and Priestley, the use of the nitrous acid has thrown considerable light on the nature of animal.
animal matter. The experiments of M. Berthollet on this subject (Mem. Acad. des Sciences, 1780 and 1785), are so complete and original, as to leave little further to be done by subsequent experimenters, to explain the ultimate composition of the great mass of animal matter.

M. Berthollet began his operations by treating various animal substances with nitrous acid, in the same method in which Bergman had pursued in order to obtain that acid from sugar, which has been termed the 'Saccharine acetic'. He chose silk for his first experiment, on account of the apparent uniformity of its composition. On distilling silk with seven or eight times its weight of nitrous acid, it was soon attacked by the acid, gave out copious red fumes, and presently diffused into a clear bluish liquor. This, on coagulating, yielded a considerable quantity of a yellowish of oxalic acid, exactly similar to that obtained from sugar by a similar treatment. Besides this acid, however, there was found swimming on the surface of the liquor, when cooled, a quantity of oily or greasy matter, which again diffused by heat, and remained in intimate combination with the solution of the oxalic acid. To obtain this greasy matter, M. Berthollet observes, lefs of the nitrous acid should be used than is necessary to give the largest product of oxalic acid.

This excellent chemist then repeated the experiment with a variety of animal matters, in all of which he found similar results, though with a wide difference in the respective proportions of animal grease, and oxalic acid. Of all the substances used, wool was found to give the greatest quantity of oxalic acid. From six gos M. Berthollet obtained somewhat more than half the weight of the crystallized acid, whereas sugar itself only gives about one third of its weight. Skin and hair gave nearly the same results as wool. On the other hand, muscle or flesh, deprived of its natural fat, yielded, with nitrous acid, a very large portion of the abovementioned grease, and a very small quantity of oxalic acid, which could hardly be separated by crystallization from the grease with which the liquor contained. Sixteen ounces of veal, reduced by drying to four ounces, yielded three gos (eight of which make an ounce) of oxalic acid, and a small portion of grease. Thirty-two ounces of whites of eggs, hardened by boiling, and reduced by drying to two ounces, gave two gos and a half of acid, and a moderate quantity of grease.

The author then proceeds to some remarks on the nature of this peculiar greasy matter, which deserves attention.

Vegetable substances, he observes, though containing oil in their composition, when treated with nitrous acid, have their oil so entirely destroyed by its action, that no traces of it can be detected after this operation. Animal matter, on the contrary, always yields more or less of an oily or greasy substance after distillation with nitrous acid, which grease in part adheres strongly to the oxalic acid, and makes it difficult of crystallization, and in part combines with the distilled acid, giving it an unusual yellow colour, and the disagreeable odour of all animal oils. This latter portion may be separated chiefly, but not entirely, by saturating the acid with an alkali, when the animal oil concretes into a stiff grease.

The animal oil differs also from the vegetable, particularly in giving much volatile alkali by distillation, whereas the vegetable yields an empyreumatic acid. It is to be observed, that the oil, both animal and vegetable, which is here spoken of, is not that which in animals is separated in the form of fat, and is secreted in the cells of the adipose membranes; and in vegetables, is deposited in the oil cells of seeds and fruits, or united with mucilage and farina in the emollient plants; but it is an oil which seems to bemost intimately united with every animal and vegetable substance, and never appears in the form of oil or grease, unless when separated by some powerful chemical agent, such as the nitrous acid.

We have mentioned it to be the most striking characteristic of animal matter, to yield a certain quantity of ammoniac by distillation, and we shall now return to this subject, which indeed is directly connected with all that has preceded, and examine into the cause of this product. Under the article AMMONIA, we mentioned how much chemistry was indebted to the successful labours of M. Berthollet for a knowledge of the exact proportion of the constituent parts of this alkali, and particularly of the theory of its production during the decomposition of animal matter.

Ammonia is formed of about three parts of azot, or animal mephitis, as it is sometimes termed, and one of hydrogen. A simple and convincing proof that it is not originally contained in animal matter in the form of an alkali, is, that after animal substances have been distilled in nitrous acid, no nitrated ammonia can be detected by the minutest examination. But the constituent parts of the volatile alkali must be contained in the animal matter, otherwise it would not yield it by simple distillation. Dr. Priestley has observed, that when animal flesh is immersed in nitrous acid, there is an immediate diffiguration of gas which is chiefly phlogificated (azotic) air, but sometimes mixed with nitrous gas, and with fixed air. With the same view, M. Berthollet added an ounce of silk (Mem. Acad. des Sciences, 1785), six ounces of concentrated, pale, nitrous acid, at the temperature of 70°. Nearly 120 ounce measures of gas were diffigured without heat, of which a small part was absorbed by lime water, and was fixed air, and the remainder gave all the appearances of azotic air. The silk being entirely dissolved, a small portion of the greasy matter which we have mentioned above, concreted, and was separated from the solution. Lime-water being added, no precipitation took place, which was a proof that no oxalic acid had yet been formed by the action of the nitrous acid, for, adding afterwards a drop of oxalic acid, an immediate precipitation appeared. The solution being then gently warmed, a violent effervescence took place, nitrous gas was given out in abundance, with the production of much heat, and the solution now contained a considerable quantity of oxalic acid. From this experiment it appears, that there are two distinct periods of the operation of nitrous acid on animal matter; the first, its action without heat; the second, after heat has been applied. The first produces a large portion of nearly pure azotic gas, and it is interesting to determine whence is its origin. as azot is a constituent part of nitrous acid, as well as of animal matter; it is rendered highly probable, however, that the azotic gas produced in the first instance, owes its origin to the animal matter, and not to the nitrous acid, since the latter is capable of acting afterwards with equal energy, as if heat had been applied immediately, and of giving as much nitrous gas. Moreover, M. Fourcroy has observed, that the nitrous acid, after being digested without heat upon animal matter, is able to saturate as much alkali as before the process, which is as convincing a proof of its non-decomposition as we can well have. Therefore, we may consider it as well established, that when nitrous acid and animal matter are digested together, without using artificial heat, the azotic gas which is produced in such abundance arises solely from the animal subslance; that at this period no oxalic acid is formed, but some of the peculiar greasy matter is produced. Afterwards, on heating the mixture, the nitrous acid is itself rapidly decomposed, forming the nitrous gas which escapes, and giving its oxygen to that part of the animal matter which furnishes the basis of the oxalic acid, besides probably occasioning other changes.
ANIMAL MATTER.

changes in which, as the component parts of the nitrous acid are also found in animal matter, the exact operation of the materials furnished by each cannot be dislimphed.

The proof of the existence of azot in animal matter having thus established, we can readily account for the formation of ammonia during distillation per se, or putrefaction, by an union of the animal azot with hydrogen, which may be furnisheil also from the animal fulifcence, perhaps from the decomposing of water, which is abundantly contained in every part of the animal kingdom.

Another proof of the connection between the azot of animal matter, and the production of ammonia, has been furnished by the following ingenions manner by M. Berthollet. For this purpose he made comparative experiments between the inflamable air of noxious gas and the gas furnished by the distillation of fugar, of charcoal, and of oil, and the gas yielded by the distillation of fugar, charcoai, and oil, and is boiled out as frell as possible. Of these four latter substances (for the former may be neglected for our present purpose), the fugar, charcoal, and oil, are vegetable, and give no ammonia by distillation; the latter is animal, and, like all animal matters, produces this alkali. The gas furnished by each was exposed to lime water, and denoted with oxygen in order to absorb every thing but the azot. Now, as the fugar, being of animal origin, contained much more azot than the other substances, it ought to have left a much greater residuum of azotic gas, unless the latter entered into some new combination during the distillation of the fugar, by which its form of azotic gas would be lost. As the residuum was not fufficiently greater than the rest, the azot must have assumed a new form during distillation, and this could have been no other than the volatile alkali which was directly dissolved in the water, through which the distilled gases passed unto the recipient.

Experiments of a later date than those of M. Berthollet, just cited, have shown a differegment of azotic gas, or a production of ammonia from animal matter, by the action of some other of the more powerful acids, and even of the fixed alcalies; but the operation of these is not yet satisfactorily explained, nor does it illustrate in a striking manner the composition of the animal kingdom.

The limits between animal and vegetable matter, laid down by the presence of azot and the production of ammonia, though for the most part sufficiently precise, are, in a few instances, surpaffed.

These are, by those vegetable products, which have been termed vegetal-animal, because they resemble certain corresponding animal matters in the characterislic properties above mentioned.

The gluten of wheat, and some other parts of vegetables, bears a considerable affinity to animal gluten in various properties, and, like it, contains azot, and yields ammonia. The albumen found in the fresh juice of the succulent parts of the tetradynamious plants, is equally similar to the albumen of animals; and the vegetable fungi, when under putrefaction, exhibit to the chemist appearances strongly resembling those of decomposing animal matter.

In the analysis of animal matter, we have principally dwelt on the operation of the nitrous acid, as it has been the means of elucidating this subject in a peculiar manner, and as it furnishes a method of comparison by which the action of other chemical agents may be inferred with considerable accuracy. A few words should, however, be paid on the operation of other reagents in analysis.

The effect of heat on animal matter varies according to the degree which is applied. A gentle warmth simply dissipates the watery part, during which operation the substance generally loses a great part (sometimes by far the greatest) of its weight and bulk.

Animal matter, when thus dried, is long preferred from putrefaction, as moisture is essential to this process of decomposition. So, bodies of animals that have been overwhelmed in the dry hot sands of the African deserts, are first thoroughly desiccated, and then will remain in this medium for many years unmattered. A lower degree of warmth, however, if not sufficient to evaporate the moisture from animal fulifcence, favours putrefaction, and increases the tendencies to decomposition. On the other hand, animal matter, so perishable in itself, is preserved to all appearance absolutely unmattered, whilst exposed to a severe freezing cold. The blood (which when at rest in a moderate temperature, even within the blood-veils, but especially when drawn out, very suddenly coagulates), if suddenly frozen before coagulation, retains for a while its original properties; and when thawed in a gentle warmth, at first becomes liquid, and afterwards coagulates. In like manner, animal flesh employed for food may be preserved, when frozen, for any length of time; and, if thawed gradually, retains all its properties, even to the peculiar flavour which it possesses at first. A degree of heat from about 150° to that of boiling water, begins to produce upon animal matter certain chemical changes independent of the mere evaporation of water: the most important of these is the coagulation of the albumen, which is an abundant and amorphous ingredient in the animal juices. Under the article of albumen we have given the opinions of chemists concerning the cause of the singular property of coagulation bynews, which, however, is but very curiously ascertained. Albumen, when once coagulated, is no longer soluble in boiling water, and hence it may be separated with ease from any watery solution in which it may be contained. A heat considerably greater than that of boiling water cauies animal matter to swell considerably, to twill in every direction as if it still retained some degree of irritability; to soften or melt down, to exhale a copious dense vapour of a festid smell, and, according as the heat is regulated, to yield an empyreumatic oil, an ammoniacal liquor, and often the prussic acid, with a considerable quantity of carbonic and hydrogen gases, arising from the total decomposition of the fulifcence employed.

Water is another re-agent in the analysis of animal matter, which may often be employed with considerable advantage. All the soft parts of animals, when kept immersed in cold water for a considerable time, appear to become thoroughly penetrated with this liquor, have their texture softened, and their bulk enlarged, and yield to its dissolving power all their fat, gelatinous, and albuminous contents. This solution is likewise considerably solfible by the commencement of putrefaction, which soon takes place in moist animal matter at a moderate warmth. The gluten or coagulum of the blood is, however, insoluble in water, when it has once separated by coagulation from the circulating liquor; and hence, by long and repeated effusion of cold water, the coagulum of blood may be freed from the red globules which give it its colour, and from every other extraneous matter, and at last remains in al flat of great purity, in the form of a grey, tenacious, and elastic fulifcence. Muscular flesh may be, in like manner, brought, by mere washing with cold water, into a similar flat of purity. Animal oil or fat, which is naturally mixed with a kind of mucilage, may also be freed from it by melting, and repeated mixture with water, assisted by strong agitation. Heated water is a more active agent in softening the texture of animal matter, and extracting its soluble part; and the assistance of a boiling temperature renders completely soluble every kind of con-
denuded animal membrane, such as skin, cartilage, tendon, and the like. At the same time, however, heat coagulates the albumen, and renders it insufiable in water, so that to obtain the full action of water on animal matter, it should be used first cold, or only moderately warmed, and afterwards heated to ebullition. But there is no part of animal matter which can resist the united action of water and heat, when a temperature above the boiling point is employed, by means of Papin's digester. Gluten, albumen, gelatine, and salts, are then all brought down to complete solution; the oil alone, for the most part, remaining unmixed. Papin's digester, therefore, when judiciously employed, may prove an instrument of some importance in animal analysis; but its use is attended with this inconvenience, that the substances dissolved in water by its powerful affinaceous, cannot be separated from each other by any means with which we are acquainted.

The caufic alkalies are also employed in the analysis of animal matter, particularly as a solvent for gluten and coagulated albumen, after the action of water has been exhausted. The solution of animal matter in alkali, which is the most familiar to us, is that of oil or fat, forming the well-known compound, soap. It would be of advantage to the experimental chemist if the operation of the alkalies were here confined to the oily ingredient, as this is to little soluble in any other menstrum. But the inconvenience of using these powerful re-agents is similar to that of employing Papin's digester, for they act with great energy on all the soft parts of animals indiscriminately, and confound the whole in one saponaceous mass. This, indeed, may be considered in general as the principal obstacle to any satisfactory analysis of animal matter, that all the methods which the chemist can employ, are too general in their operation, and little calculated to mark those shades of difference in the animal composition, which, though perhaps slight when chemically considered, certainly produce very important effects on the functions of the living body.

The chemistry of animal matter appears to us to be still too little known to admit of any scientific arrangement which can give full and comprehensive views of this extensive, interetling, and complicated subject. We shall, therefore, refer the reader to the several articles under their respective heads, which include, either generic distinctions, such as gluten, albumen, gelatine, and the like; or specific solids and fluids, such as bone, blood, milk, skin, &c. The detail of a variety of important experimental inquiries which have been made by several eminent chemists, affords an abundance of interetling matter, which promises a copious harvest of discovery to the follower of this branch of chemical pursuit.

Animal motion is the same with what we call muscular motion. It is divided into two branches: natural or involuntary, and spontaneous.

Animal oil, see Oil.

Animal secretion is the act whereby the diver juices of the body are secreted or separated from the common mass of blood, by means of the glands. See Secretion.

Animal spirits are a fine subtle juice or humour in animal bodies: supposed by many to be the great instrument of muscular motion, sensation, &c.

The ancients distinguished spirits into three kinds, viz. animal, vital, and vegetative: but the moderns have reduced them to one sort, viz. animal; about the nature of which, and the matter whence they are formed, great disputes have arisen among anatomists, though their existence has never been fairly proved.

In the History of the Royal Academy of Sciences at Paris, an. 1759, there is an ingenious memoir on this subject by Mr. Buffon. He undertakes to prove, that the nervous fluids, or animal spirits, circulate; that if they depart from the brain, they return to it by the nerves. In short, he proposes to form the course of this fluid into a system of circulation, less demonstrable, indeed, to the senses than that of the circulation of the blood, but, in other respects, grounded on equally solid reasons.

As it is hard to define what could never yet be brought under the judgment of our senses, all that we shall here offer concerning them, is, that they must needs be extremely subtle bodies, which escape all manner of examination by the senses, though ever so well affected: and pervade the tracts of the nerves, which yet have no discovery of exacty or perforation; nor could they be by any experiment be collected; yet are constantly moving in vast quantities, as they must of necessity be, to perform all those mighty operations which are ascribed to them. However, the antiquity of the opinion claims some reverence.

By the help of these spirits we are furnished with a vast number of precocious solutions of great phenomena; and without them we must have a great chain in the philosophical history of animal bodies; but, after all, the phenomena that would, in this case, be unexplained, are, perhaps, to us inexplicable.

They are supposed to be separated in the brain from the subtilest parts of the blood; and thence carried by the nerves to all the parts of the body, for the performance of all animal and vital functions; and the discovery of the galvanic electricity will probably throw considerable light on this obscure subject. See Nervous Fluid.

Animal substances comprehend all the component parts of animals, of what use or intention they may be.

Animal fossil substances, those found buried in the earth at various depths, and embodied among various strata.

There are principally of four kinds: 1. Sea shells. 2. The teeth, bony palate, and bones of fishes. 3. The bones of land animals. And, 4. complete skins. See Fossil Bones, Fossil Shells, Marine remains, and Fossil Ivory.

Animal substances, fermentative quality of. See Ferment, and Fermentation.

Animal systems, imports the whole classes of beings endowed with animal life.

In which sense animal system amounts to the fame with what chemists and others call the animal kingdom. Animal is also sometimes applied, in a figurative sense, to artificial or moral things.

Hobbes considers government as a huge complex animal, under the denomination of Leviathan.

The reason of the appellation is founded on the analogy between an animal and a political body. The sovereign, or legislative power, answers to the soul; the magistrates, to the limbs or members; rewards and punishments are the nerves; riches, the strength; compound, the faculty of memory; equity, reason; sedition, fecknels; civil war, death.

Animalcule, Animaeculum, a diminutive of animal, and applied, in a general manner, to those creatures whose true figure cannot be discerned without the help of glaccles, and more especially of such as are invisible to the naked eye.

Animalcules are usually divided into two, and, by some, into three distinct families, visible, microscopic, and invisible: the first, though visible, cannot be accurately discri-
cerned without the help of glasses; the few are discoverable only by the microscope; and the last are merely perceived by touch, for they are still unknown. The existence of the latter cannot well be disputed, though it cannot be affirmed, unless we conclude, that the microscope has not yet arrived at its highest degree of perfection. Reason and analogy give some support to the conjectures of naturalists in this respect: animalcules are discerned of various sorts, from those which are visible to the naked eye, to such as appear only like moving points under the microscopic lenses of the greatest powers: and it is not unreasonable to imagine, therefore, that there are others which may fill the field of the microscope, as the fixed stars do that of the telescope with the greatest powers hitherto invented.

ANIMALCULES, vividly: amongst these are included an amazing variety of creatures by no means of an analogous nature. Those numerous creatures which crowd the water in the summer months, changing it sometimes of a deep or pale red colour, green, yellow, &c. are of this description. The larger kinds are chiefly of the infect, or vermin tribes, and of which the mononculus pules is particularly remarkable, being sometimes found in such abundance, as to change the water apparently to a deep red. A similar appearance is likewise occasioned by the cercariae mutabilis, when it varies in colour from green to red; vorticella fusciculata also changes it to green; and rotatoria to yellow. To this section we must also refer many of the acarus and hydraehna genera, and a multitude of other creatures, that will be noticed hereafter.

ANIMALCULES, microscopical. The microscope discovers legions of animalcules in most liquids, as water, vinegar, beer, dew, &c. They are also found in rain and several chalky waters; and in infusions of both animal and vegetable subtances, as the seminal fluids of animals, pepper, oats, wheat and other grain, tea, &c. &c.

Those who have made the most minute researches, and the most accurate inquiries into the natures of the several objects subjected to their views, have found that theustinces, upon which they employed their curiosity, were often quite different from what at first they appeared to be. Thus, for instance, the whole earth has been found replenished with an incalculable store of what we should call of all sorts, that is, an infinite number of animalcules floating in the air we breathe, sporting in the fluids we drink, or adhering to the several objects we see and handle. The conjectures and hypotheses relating to the production, generation, structure, and uses of these animalcules, have been as various as were ever contrived by caprice, or embraced by credulity. Not to bewilder ourselves, however, in these labyrinths, but to confine our attentions to actual discoveries, by the assistance of the microscope we not only perceive that such animalcules exist, but are also enabled, in some degree, to determine their shapes, and the various peculiarities of their motion.

The contemplation of animalcules has made the ideas of infinitely small bodies extremely familiar to us. A mite was anciently thought the limit of littleness; but we are not now surprised to be told of animals twenty-seven millions of times smaller than a mite.

Minute animals are found proportionally much stronger, more active, and vivacious than large ones. The spring of a flea in its leap, how valiantly does it outstrip any thing greater animals are capable of! A mite, how valiantly faster does it run than a race-horse! M. de l'Isle has given the computation of the velocity of a little creature scarce visible by its smallness, which he found to run three inches in half a second: supposing now its feet to be the fifteenth part of a line, it must make five hundred steps in the space of three miles; that is, it would lift its legs five hundred times in a second, or in the ordinary pulsation of an artery. Hill, Acad. 1751, p. 27.

The excessive minuteness of microscopic animalcules conceals them from the human eye. One of the wonders of modern philosophy is, to have invented means for bringing creatures to us so imperceptible, under our cognizance and inspection: an object a thousand times too little to be able to affect our senses, should seem to have been very safe. Yet we have extended our views over animals to whom these would be mountains. In reality, most of our microscopic animalcules are of so small a magnitude, that through a lens, whose focal distance is the tenth part of an inch, they only appear as so many points; that is, their parts cannot be distinguished, so that they appear from the vertex of that lens under an angle not exceeding a minute. If we investigate the magnitude of such an object, it will be found nearly equal to the tenth of an inch long. Supposing, therefore, these animalcules of a cubic figure, that is, of the same length, breadth and thickness, their magnitude would be expressed by the cube of the fraction of the lens, that is, by the number 1/100000000:0000 that is, so many parts of a cubic inch is each animalcule equal to.

Leeuwenhoek calculates, that a thousand millions of animalcules, which are discovered in common water, are not altogether so large as a grain of sand. This author, upon examining the same form of various animals, discovered in many, infinite numbers of animalcules not larger than those above mentioned. In the midst of a single bed of filth, there are more animals than there are upon the whole earth, for a grain of sand is bigger than four millions of them. The white matter that sticks to the teeth also abounds with animalcules of various figures, to which vinegar is fatal; and it is known, that vinegar contains animalcules in the shape of eels. In short, according to this author, there is scarcely anything which corrupts without producing animalcules. Animalcules are said to be the cause of various disorders. The itch is known to be a disorder arising from the irritation of a species of animalcules found in the pubes of that animal: whence the communication of it by contact from one to another is easily conceived, as also the reason of the cure being effected by cutaneous applications. On this foundation some have attributed the small-pox and measles, and infectious diseases; others the epilepsy, &c. to animalcules. Langius goes farther, and pretends to reduce all diseases in general to the same principle; and many other chimerical theories have been formed upon the discoveries made by Leeuwenhoek and other naturalists, on the subject of animalcules.

The discovery of animalcules in the semen of animals was made known to the world about the end of the year 1677, or beginning of 1678, both by Leeuwenhoek and Hartsoeker; but as the observations of the former are more particular, and his experiments more numerous than those of the latter, the merit of the discovery is generally attributed to Leeuwenhoek. According to this naturalist, these animalcules are found in the semen of male animals of every kind, and their appearance is much the same in all; nor do they differ in size, in proportion to that of the animal to which they belong. The Igles of all of them seem to be of an oblong-oval form, with long tapering tendril tails issuing from them; and as by their shape they resemble tadpoles, they have been frequently called by that name; though the tails of them, in proportion to their bodies,
cles, are much longer than the tails of tadpoles are; and it is observed, that the animalcula in the semen of fishes have tails much longer, and more slender, than those in the semen of other animals, infomuch that their extremities are not to be discerned without the bell glasses.

These animalcula appear to be very vigorous and tenacious of life; for they have been observed to move long after the animals, from which they were taken, were dead; and seem to be peculiar to the semen, as nothing that has the least appearance of life has been yet discovered in the blood, sputum, urine, gall, or chyle.

The production of animalcula infusoria is very surprising. In four hours time, an infusion of cantharides has produced animalcula less than even the tails of those in the semen of animals; and it is said, that hot mutton gravy, seeded in a phial with a cork, and afterwards set among hot ashes, to destroy as effectually as possible every living creature that could be supposed to exist in it, has, nevertheless, been found swarming with animalcula, after standing a few days.

In the Philosophical Transactions, vol. lix., is the following curious account of the animalcula produced from an infusion of potatoes, and another of hemp-feed, by the late Mr. Ellis. "On the 25th of May, 1768, Fahrenheit's thermometer 70°, I boiled a potato in the New River water, till it was reduced to a mealy consistence. I put part of it, with an equal proportion of the boiling liquor, into a cylindrical glass vessel that held something less than half a wine pint, and covered it close immediately with a glass cover. At the same time I placed an unboiled potato, and, as near as I could judge, put the same quantity into a glass vessel of the same kind, with the same proportion of New River water not boiled; and covered with a glass cover, and placed both vessels close to each other.

On the 26th of May, twenty-four hours afterwards, I examined a small drop of each by the first magnifier of Wilson's microscope, whose focal distance is reckoned at 1/4 part of an inch; and, to my amazement, they were both full of animalcula, of a linear shape, very distinguishable, moving to and fro with great celerity; so that there appeared to be more particles of animal than vegetable life in each drop.

This experiment I have repeatedly tried, and always found it to succeed in proportion to the heat of the surrounding atmosphere; so that even in winter, if the liquors are kept properly warm, at least in two or three days the experiment will succeed.

What I have observed are infinitely smaller than spermatic animals, and of a very different shape: the truth of which every accurate observer will soon be convinced of, whose curiosity may lead him to compare them; and, I am persuaded, he will find they are on no way akin.

At present, I shall pass over many curious observations which I have made on two years experiments, in order to proceed to the explaining a hint which I received last January from M. de Sauffure, of Geneva, when he was here; which is, that he found one kind of these animalcula infusoria that increase by dividing across into nearly two equal parts.

I have often seen this appearance in various species a year or two ago, as I found upon looking over the minutes I had taken, when I made any new observation; but always supposed the animals, when in this state, to be in coition.

Not hearing, till after M. de Sauffure left this kingdom, from what infusion he had made his observation; his friend, Dr. de la Roché, of Geneva, informed me, the latter end of February last, that it was from hemp-feed.

I immediately procured hemp-feed from different feedsmen in different parts of the town. Some of it I put into New River water, some into distilled water, and some into very hard pump water. The result was, that in proportion to the heat of the weather, or warmth in which they were kept, there was an appearance of millions of minute animalcula in all the infusions; and, some time after, oval ones made their appearance. There were much larger than the first, which still continued: these wriggled and fro in an undulatory motion, turning themselves round very quick all the time they moved forwards. I was very attentive to see these animals divide themselves; and, at last, I perceived a few of the appearance of fig. 3. a, as it is represented by the first magnifier of Wilton's microscope: but I am so well convinced by experience that they would separate, that I did not wait to see the operation; however, as the following sketches, which I have drawn from five other species, will very fully explain this extraordinary phenomenon, there will be no difficulty in conceiving the manner of the first. See fig. 4. 5. 6. 7. 8.

The proportion of the number of these animals, which I have observed to divide in this manner, to the rest, is fearc 1 to 50; so that it appears rather to arise from hurts received by some few animalcula among the many, than to be the natural manner in which these kinds of animals multiply; especially if we consider the infinite quantity of young ones which are visible to us through the transparent skin of their bodies, and even the young ones that are visible in the young ones while in the body of the old ones.

But nothing more plainly shows them to be zoophytes than this circumstance, that when, by accident, the extremity of their bodies has been shrivelled for want of a supply of fresh water, the applying more fresh water has given motion to the part of the animal that was still alive; by which means this harmless figure has continued to live, and to move, and fro all the time it has been suppled with fresh water.

The preceding remarks of Mr. Ellis are particularly satisfactory, as they point out the manner in which animalcula of various other kinds may be produced by infusions of vegetable matter; but it is probable he is mistaken respecting the species generated in the infusion of hemp-feed; and which is called volvex ovalis, or egg-shaped volvex. Perhaps this is volvex globulator, Linn., which is usually spherical, but of an oval form at intervals, and especially at the time the infant brood is separated from the parent; for it seems at that moment to divide, and become two distinct animalcula, as Mr. Ellis mentions. Vide Plate III. of Verms Infusoria, Microscopical Objects. &c. &c.

As the different species will be more fully noticed in their respective places, we shall conclude our remarks with a few observations on the doctrine of equivocal generation, and the different opinions that have arisen respecting the origin and nature of animalcula in particular. Before the invention of microscopes, the doctrine of equivocal generation, both with regard to animals and plants of some kinds, was universally received; but this inference soon convinced every intelligent person, that those plants which formerly were supposed to be produced by equivocal generation, arose from seeds; and the animals, in like manner, from male and female. But as the microscope threw light upon one part of nature, it left another involved in darkness; for the origin of animalcula infusoria, or the spermatic animals already mentioned, remained as yet as much unknown as that of many other kinds was, when the doctrine of equivocal generation reigned in full force.

The discovery of spermatic animalcula was thought to throw some light on the mysterious affair of generation itself; and the minute creatures were imagined to be each of them individuals of the same species with the parent. Here

8 2
the infinite number of these animalcles was an objection, and the difficulty remained as great as before; for, as every one of these animalcles must necessarily be produced from a male and female, to explain their origin by animalcular generation in the same manner, was only explaining generation by itself.

This hypothesis, therefore, having proved unsatisfactory, others have been invented. M. Buffon, particularly, hath invented one, by which he at once annihilates the whole animalcular world; and in this he has been followed by several ingenious philosophers. His hypothesis is diametrically opposite to that of Leeuwenhoek, who described many distinct species of the spermatic animalcles as living bodies, and conceived it necessary that one or more of them should penetrate, or impregnate, the ovum, to effect the purpose of generation.

From a variety of experiments made on the human femen (males), M. Buffon concludes, that what have been called spermatic animalcles, are not creatures really endowed with life, but something proper to compose a living animal; and he distinguishes them by the name of organic particles. The same individual kinds of animals he declares he has found in the fluids separated from the ovaria of females; and for the truth of this appeals to the testimony of Mr. Needham, who was an eye witness of his experiments. He also brings an additional proof of his doctrine from Mr. Needham's observations on the milch of the calmar, a species of cuttle-fish. Here the spermatic animalcles, at least what have only the appearance of life, are vastly larger than in any other creature, so as to be plainly visible to the naked eye. After considering the organization of these particles very fully, he concludes, that they are not animalcles, or endowed with life; and infers, that all the moving bodies that are to be found in the infusions of either animal or vegetable substances, are of a similar nature. To discover whether all the parts of animals, and all the seeds of plants contained moving organic particles, he made an infusion of flesh of different animals, and of the seeds of more than twenty different species of vegetables; and, after remaining some days in close glasses, he found the pleasure of seeing organic moving particles in all of them. In some they appeared sooner, in others later; some preferred their motions for months, and others soon lost it. Some, at first, produced large moving globules, resembling animals, which changed their figure, split, and became gradually smaller. Others produced only small globules, whose motions were extremely rapid; and others produced filaments, which grew longer, seemed to vegetate, and then swelled, and poured forth torrents of moving globules. This observation gave rise to a new system; Baron Munchhausen, perceiving that the last mentioned moving globules, after moving for some time, began to vegetate, concluded they were at first animalcles, and then plants; an hypothesis which Mr. Ellis endeavored to overturn, by ascertaining, that they were no other than the seeds of that genus of fungi called muced, or moul- dines; and that their motion is owing to numbers of minute animalcles attacking them for food.

M. Buffon is not, however, content with denying life only to those beings where the signs of it are most equi- vocal, but includes, in the same rank of organic particles, almost every animal too small to be discovered by the naked eye; and even some of those whose motions are evidently perceptible to the naked eye. He observes, that "almost all microscopic animals are of the same nature with the moving bodies in the seminal fluids, and infusions of animal and vegetable substances. The cells in pate and vinegar, &c. are all of the same nature, and derived from the same origin. There are, perhaps, as many beings that either live or vegetate, produced by a fortuitous allembrage of organic particles, as by a constant and successive generation. Some of them, as those of the calmar, are only a kind of machines, which, though exceedingly simple, are very active. Others, as the spermatic animalcles, seem to imitate the movements of animals. Others resemble vegetables in their manner of growth and extension. There are others, as those of the lighted wheat, which at pleasure can be made alternately to either live or die, and it is difficult to know to what they should be compared. There are still others, and in great numbers, which are at first a kind of animal, then become a species of vegetables, and again return alternately to their vegetable state. The cells in pate have no other origin than the union of the organic particles of the most essential part of the grain. The first cells that appear are certainly not produced by other cells; but though they are not propagated themselves, they fail not to engender other living cells. By cutting them with the point of a lancet, we discover smaller cells lying in great numbers out of their bodies. The body of this animal seems to be only a thread, containing a multitude of smaller animals, which perhaps are other theshes of the same kind, in which the organic matter is assimilated into the form of cells."

The accurate experiments of Baker, Ellis, Muller, Curti, Roffredo, and many others, sufficiently refute the inconclusive reasoning of Buffon; and we cannot do better than conclude, in the words of a late ingenious writer, Mr. Adams, who has treated at some length on the same subject in his Essays on the Microscope.

"Though we can by no means pretend to account for the appearance of most animalcles, yet we cannot help observing, that our ignorance of the cause of any phenomenon is no argument against its existence. Though we are not, for instance, able to account in a satisfactory manner for the origin of the native Americans, yet we suppose M. Buffon himself would reckon it absurd to maintain, that the Spaniards, on their arrival there, found only organic particles moving about in disorder. The cafe is the very name of the cells in pate, to whose animation he objects. They are exceedingly small in comparison with us; but, with the solar microscope, Mr. Baker has made them a more respectable appearance, so as to have a diameter of an inch and a half, and a proportionate length. They swam up and down very briskly; the motion of their intellines was very visible; when the water dried up, they died with apparent agony, and their mouths opened very wide. Now, were we to find a creature of the size of this magnified cell galloping in a place where water had lately been, we should certainly never conclude it to be merely an organic particle, or fortuitous allembrage of them, but a fish. Why then should we conclude otherwise with regard to the cell in its natural state, than that it is a little fish? In reasoning on this subject, we ought ever to remember, that however essential the distinction of bodies into great and small may appear to us, they are not so to the Deity, with whom, as Mr. Baker well expresses himself, 'an atom is a world, and a world but as an atom.'" Were the Deity to exert his power a little, and give a natural philosopher a view of a quantity of pate filled with cells, from each of whose bodies the light was reflected as in the solar microscope, our philosopher, instead of imagining them to be mere organic particles (as the pate would appear a little mountain), would probably look upon the whole as an allembrage of serpents, and be afraid to come near them. Whenever, therefore, we discover beings, to appearance endowed with a principle of self-preservation, or whatever we make the characteristic
ANJ

The udfenr flows from an incision of a tree in Brasil and New Spain, and in the island of Antigua, called courbaril, a species of hymenae; and by Plo, itah, the liquid juice, according to Plo, running down from the tree, sinks into the ground, and is afterwards dug up; so that the larger masses are often full of earth.

The eflern gum amine, which is a finer sort, is distinguished into three kinds: the first is white; the second blackish, in smell like myrrh; the third pale, resinous, and dry.

The small tears are the purest; it has little taste, but an agreeable smell; it easily breaks between the teeth, but if chewed for some time, it softens, and becomes adhesive. Laid on red-hot iron, it melts immediately, catches flame, and burns quickly away, leaving a small quantity of white ashes. It gives but little or nothing to water, but dissolves entirely in rectified spirit; the solution being of a yellow colour, with the odour of the amine, and a warm, pungent, bitterish taste. A small portion of effential oil is obtained by distilling with water a large quantity of amine. This resin has often been confounded with gum copal.

The Brazilians are said to employ amine in fumigations for pains proceeding from cold and rheumatism; they also chew it for the relief of colics and flatulencies; it has been also recommended in catarrhal and paralytical affections; and applied for complaints of this kind, bruises, &c. in liniments and plasters. With us, however, it is rarely, if ever, made use of for any medicinal purpose. The Indians prepare from it an excellent varnish. Lewis and Murray. In our shops we have only the American sorts of this resin.

ANIM., in Heraldry, a term used by the French heralds, when the eyes of any rapacious animal are borne of a different colour. The English blazon it incensed.

ANIMELLÆ, the glands under the ears, &c. called also lanícinos.

ANIMETTA, in Ecclesiastical Writers, denotes the pail or cloth wherewith the cup is covered in the eucharist.

ANIMI deliquium. See Lipothymia and Swooning.

ANIMOTHA, in Ancient Geography, a town of Arabia, according to the notitia imperii.

ANINA, a town of India, on the other side of the Ganges, according to Ptolemy.

ANINACHA, was also, according to Ptolemy, a town of India beyond the Ganges.

ANINATUM, ANIATUM, of ANITATUM, in Geography, a town of Asia under the patriarchate of Constantinople.

ANINGA, in Commerce, a root growing in the Caribbee islands, of use in the refinement of sugar.

The decoction of this root is found a more certain, as well as more innocent means of clarifying sugar, than the sublimate and arsenic used for this purpose, before the discovery of the aniga.

ANIO, or Anien, of Station (lib. i. v. 20.), in Ancient Geography, now Lt. Teverone, a river of Italy, rises in Mount Troia or Trevi, towards the frontier of Abruzzo, pales through the country of the Aequi, then separates the Latins from the Sabines, forms three large lakes in its course, and running through the Tiberine territories, it precipitates itself from a great height, and forms a rapid cataract, whence Horace " Priamus Anio." It falls into the Tiber, about three miles to the north of Rome, not far from Antemnae. The epithet, formed from the name of this river, is Anienus; and this was said to be the name of the god of the river.

ANIOIA, in Geography, a town of Italy, in the kingdom of Naples, 13 miles south-east of Nicotera.

ANJOU, so called from the ancient Anes, or Andegavi, a province of France before the revolution, about seventy miles
niles long and sixty broad; it bounded to the east by Tournai, to the south by Ypres, to the west by Bruges, and to the north by the river Maine. The capital is Bruges; besides which, the chief towns are La Fleche, Chateau-Gontier, Saumur, Briare, Beauce, Poitou, Bearn, Martigues, Villesauval, Beaucaire, &c. It has many rivers, six of which are navigable; namely, the Loire, Vienne, Thouz, Sevre, Mayenne and Sèvre. The climate is temperate, and the face of the country agreeably diversified with hills and valleys. The productions of the soil are wine, chiefly white, grain, peas and beans, flax, hemp, and various kinds of fruit-trees, particularly walnuts and apple-trees. The fine pastures of Anjou furnish rich breeds of cattle; it has also several coal and iron mines, and good quarries of flint, stone, and marble; there are also salt-petre works, and some glass-houses; its commerce principally consists of wine, brandy, grain, cattle, cloths, flax, ironmongery, &c. It formerly consisted of two counties, which, towards the end of the ninth century, were united; and it was annexed to the crown by Philip Augustus, in the year 1252. The departments of Mayenne and Loire, the Sèvre and the Mayenne, now contain a part of this province.

*Anjou Cabbage,* in Botany. See Cabbage.

*ANJOUAN,* or *AMIDAH,* in Geography, a very small island of Africa, in the Ethiopian ocean. It is situated in the Mozambique gulf, between Madagascar and the coast of Zanzibar. The soil is fertile, and it produces excellent fruits.

ANRITTE, in Ancient Geography, a people of the northern part of Marmaria, according to Tolemy.

ANISCALPATOR, in Anatomy, a mufle, otherwise called *latissimus dorsi.*

ANISE-SEED, *anisum, anisum barbatus, anisum vulgare,* in the *Materia Medica,* a medicinal seed, produced by an umbelliferous plant of the same name, which is a species of *Pimpinella,* an annual plant, growing naturally in Egypt, Syria, and other eastern countries; and cultivated for culinary and medicinal uses in France, Spain, Malta, Upper Saxony, and Thuringia. It was cultivated here in the time of Turner, in 1551; but our farmers are seldom warm enough to bring the plant to perfection. The seeds are annually imported from Malta and Spain; and the seeds of Spain, which are smaller than those of France and Germany, are accounted the best.

Anise-seeds are roundish and iriitated, flattened on one side and pointed at one end, of a pale colour inclining to green. They have an aromatic smell, and a pleasant warm taste, accompanied with a degree of sweet-taste. They totally give out their virtue to rectified spirit; the tincture is of a bright lemon colour, and agreeable taste. The spirit distilled from the filtered tincture has a light taint of the seeds, but the greatest part of their virtue is left behind in the extract, which is a pleasant, sweetish, moderately warm, and not very pungent aromatic. Inflated in water, they impart a little smell, but scarcely any taste; and in dilution they give out their whole flavour. With the water rises an effuential oil, to the quantity of an ounce or more from three pounds; this oil is of a yellowish colour, and it coagulates, when the air is not sufficiently cold, into a butyraeous white concretes; its smell is extremely durable and diffusive, but its taint is milder and less pungent than that of any other diffusible vegetable oil.

The seeds likewise yield by expression an oil of great colour, less grateful taint, and strongly impregnated with the flavour of the seeds; sixteen ounces, lightly moistened by being exposed to the fume of boiling water, are said to afford one ounce. This oil is composed of a gros, inipid, inodorous one, fitch as the common expressed oils, and a part of the effuential oil of the seed, on which the flavour depends. The effuential oil is contained in the outer thin skin of the seeds, and the expressed oil in the kernel itself.

*Anise-seeds,* which are ranked among the forty greater hot feeds, have been long employed as a carminative and aromatic; they have also been esteemed useful in pulmonic complaints, and to poxifs, like those of fennel, a power of promoting the ferceration of milk, and on this account given to nurses, in proof of which it is alleged from Geoffrey, that the colour is perceived in the milk. But their chief use is in flatulent colics, in the gripes to which children are subjected, in flatulent pains and obstructions of the breast, in weaknefs of the stomach and indigention, in diarrhœas, and for strengthening the tone of the vifeera and interciles in general; and hence they were called by Van Helmont, "*Solamen intelliatorium.*" The effuential oil, which is the only official preparation of aniseceds now directed by the Pharmacopoeias, is usually grateful to the stomach, and may be taken in the dose of twenty drops. In difficulties of the breast, the oil is preferred; but in flatulencies and colics, the seeds, in substance, are said to be more effectual. It is affected, that the oil is poisonous to pigeons. A spirituous water prepared from a mixture of equal parts of aniseed and anise-sugar, by drawing off a gallon of proof spirit from half a pound of each of the feeds, is commonly kept in the shops, and proves an elegant carminative cordial. They are useful combined with the purgatives that are administrated in flatulencies and gripes. Lewis, Newman, Murray, Bergius.

*Aniseed, barry, anisum fennelum,* is a feed thus called from the affinity it bears in smell to the common anise-feed, and the flat like figure of its capsule feminine. It is the produce of a small tree growing in Tartary, China, and the Philippine islands, which is the *Illicium anisatum* of Linneus.

It was first brought into Europe from the Philippine islands by an English mariner, named Thomas Candy, Candish, or Cavendish, in his return from a voyage round the world in the year 1601. The natives call it *damor* and *zingi;* the Europeans sometimes *fennictum Zierovay,* or Chinesefennel; *botanills, anisum Indicum, anisum perumum, anisum exicum Philippinarum infarum, cardamum Silverfay,* &c. In small and talle this resembles the common anise-feed; but with the aromatic taint is combined a sweetness, and in both respects it is stronger. The capsules or bunks affect the tongue more than the feed, but the flavour of the seeds is accompanied with a greater sweeteness. The seeds afford in dilution with water, the largest quantity of effuential oil; and the capsules yield with spirit, the molt acid, renoous extract. The oil is more limpid, and more fragrant, than that of the common anise-feeds; and the spirituous extract is much warmer and more pungent: for medical purposes, the capsules and seeds are bruised together.

Its virtues are of the same kind with those of the common anise feed, only that it is sweeter, more grateful, penetrating, and aromatic. It is reputed a general cordial and strengthening, and used for this purpose in the eastern countries, and in some parts of Europe; but it has not been received in practice among us, and is rarely found in the shops.

The Chinese use it in the preparation of their tea, and they chew it for sweetening their breath; and after their example, the Dutch also use it in this liquor, pretending it makes it more pleasant.

The wood is also imported into Europe, where it is employed in works of marquetry and mosaic; it is also called *anil.* Lewis, Newman, Murray, Carthener.

ANISIFOLIUM, in Botany. See Lime.*
ANK

ANKSICALM, a name given by some naturalists to the *Sertularia myriophyllum* of Linnaeus; myriophyllum pelagicum of Zanich. Girard, &c.; it is, however, a false notion of C. Bohn, and plicifrons' tail carinale of Ellis. See *Myriophyllum, Sertularia*.

ANKOMARATHUM, in Botany. See SCANDIX.

ANKUM Affricanum. See DURON.

ANKUS, or AWARUS, in Ancient Geography, a river of Norica, which falls into the Danube.

ANKATA, a town of Arabia Petra according to Polyaenus.

ANTIGORIS, a town of Hispania Bética. mentioned by Livy (b.i. xxv. e. 32.), when describing the campaign of Cornelius Scipio, who advanced to this town, and encamped in the fight of the enemy, from whom they were separated by the river.

ANIUS, a river called Roes by Stephan. Dyöz.; and by Livy, Aros; which discharges itself into the Adriatic to the south of Apollonia.

Anius, Lugo Salutatoris, a place of Campania, near Naples.

ANIZA, in Geography, a town of Arabia, 200 miles north-west from Jamana.

ANIZY LE CHATEAU, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Chauny, eight miles north-east of Soissons, and ten south-east of Chauny.

ANKER, Anchor, a liquid measure chiefly used at Amsterdam, &c.

The anker is the fourth part of the awen, and contains two shaks; each shak consists of sixteen manges, the mangle being equal to two Paris pints.

Anker, in Geography, a river of England, which rises about one mile and a half south-east of Hitchley, in Leicestershire, and joins the Tam at Tamworth, in Warwickshire.

ANKEVEEN, a town of the United Netherlands, in the State of Utrecht, one mile and a half south-east from Nærdun.

ANKLE, Joint of the, in Anatomy, is made by the apposition of the articulars, or upper bone of the foot, to the lower part of the tibia and fibula, which, for that purpose, tie together by a strong band of ligaments both before and behind.

The tibia and fibula lead down two processes, called malleoli, which are applied to the sides of the ankle, support it in its situation, and render the joint very secure.

The form of the bones allows them to be moved chiefly forwards and backwards, so that the joint is accounted a ginglymus. When the back part of the ankle is moved forwards, the toes are pointed to the ground, and the foot is said to be extended; in the contrary position, it is said to be bent upon the leg.

When the joint is bent, the form of the anklebone fits exactly and corresponds to the space in which it is received between the tibia and fibula, that no motion can take place; but when it is extended, the narrow back part of the anklebone coming forwards between the malleoli, a space exits between the bones, and a motion of the anklebone from sole to side (such as takes place in directing our steps) is permitted.

In this joint we have the usual apparatus of cartilages to cover the ends of the bone; a capsule to contain the synovia; portions of fat, denominated synovial glands; and strengthening ligaments to bind the bones together (see Joint, Structure of). The capsule of that joint appears in front a little loose, so that it can be pinched up with a pair of forceps, and here also are seen those portions of fat which have been accounted synovial-glands; behind, the capsule is covered by bands of restraining ligaments which conceal it, and strengthen that part of the joint; but the principal strength and restraint to the improper motions of the joint is found, as is common in ginglymoid articulations, at the sides. The internal lateral ligament (ligamentum deltoides malleoli interni of Weithbrecht), which is radiated, extends from the point of the malleolus externus to the articularus and os calcis. The external lateral ligament (ligamentum malleoli externi perpendicularis of Weithbrecht), extends from the point of the malleolus externus to the os calcis. There are also two other bands of ligaments passing from the fibula to the articularus, one in front, and the other behind the last-mentioned ligament. Weithbrecht mentions these under the names of ligamentum malleoli externi, anterius & posterius. These ligaments are in a state of great tension, and prohibit any motion when the joint is bent; but are relaxed, and allow of that motion which is useful in the direction of our steps when it is extended.

ANELE, Rotation of, in Surgery; see Luxation and Dislocation.

ANKUN, in Geography, a town of Germany, in the circle of Upper Saxony and principality of Anhalt; is so near to Zerbit on the west, that it is denominated a suburb to that city, but has a corporation of its own.

ANLERY, a town of France, in the department of the Nivore, and chief place of a canton, in the district of Decane, 15 miles call from Nevers.

ANN, Cape, is the point of the land, in the town of that name, or Gloucester, which forms the north side of Massachusetts's Bay, as Cape Cod does the south side. It was so named in honour of Ann, consort of king James I. N. lat. 42° 45'. W. long. 75° 17'.

ANN, St. is the chief town of the province of Parana, in the eastern division of Paraguay, in South America.

ANN, St., a lake in Upper Canada, to the north of Lake Superior, which feeds its waters north-east into James's Bay, through Albany River. Its north-eastern point lies in N. lat. 50°. W. long. 83°.

ANN, Port, in the state of New York, lies at the head of Batteyanus navigation, on Wood Creek, which falls into South Bay, Lake Champlain, near Skeneborough.

Ann's, St., a port on the south side of Cape Breton, accommodating fishing-reffels, and lying on the north-west side of the entrance into Labrador Lake. N. lat. 47°. W. long. 66°.

Ann's, St., a small town on the river St. John's, in the province of New Brunswick, about 80 miles from St. John's, and almost opposite to Frederic-town. It is at present the seat of government.

Ann's, St., sometimes called Finns, lies at the bottom of a bay, on the north-east part of Bonaventure island, in the Gulf of St. Lawrence. N. lat. 5° 50'. W. long. 65° 20'. This bay, called St. Ann's Bay, is a very considerable bay of the Eastern Ocean, opposite to St. Michael's island. It has a fine and open entrance, a good depth of water, and fine anchorage.

Ann's, St., a bay of Campenelly, in the gulf of Mexico, in N. lat. 18° 10', and W. long. 92° 27', nearly north-west from Cape Conceded.

Ann's, St., a harbour on the north coast of the island of Jamaica, in N. lat. 18° 54', and W. long. 77° 12'; it is a good anchoring-place, and the largest sugar ships may lie with their sides close to the wharf.

Ann's, St. Point, is to the lardboard of the entrance into Milford Haven, on the coast of Wales.
ANN, St. Point, is also in the Strait of Magellan, in that part which leads to the south, and on the west side of it, on the Patagonian shore, four leagues from Cape Fram-ward, the most southerly point of the American continent. Here are good watering, fishing, and sailing.

ANN, St. Port, display, or Killoogly, lies on the east coast of Ireland, between Carlingford and Strangford.

ANN is one of the three principalities into which Arabia Deserta is divided.

Ann is also one of the chief cities of the above principality, and was formerly a famous market town, though it is now not much frequented. It is situated in N. lat. 35° 37', E. long. 42° 10', on the river Euphrates, in a fruitful and pleasant soil, and has two streets which are divided by the river: that on the Mesopotamia side is about two miles long, and thinly peopled by tradesmen; that on the opposite side is about six miles in length, and this part is inhabited by the principal people. Every house has some ground belonging to it, which produces a variety of excellent fruit-trees, as lemons, oranges, citrons, quinces, figs, dates, pomegranates, and olives: some of the flat ground is covered with corn and other grain, which it yields in great abundance. The city is the common rendezvous of all the robbers that infest the country; here they hold their council, and settle their plans of depredation, and from hence they diffuse themselves into all parts of the desert. This is one of the great thoroughfares through which the caravans pass to and from Aleppo, Tripoli, Damascus and Bagdad, and some other parts of the Turkish empire; and it is with difficulty, such is the character of the inhabitants, that the Turks and the janizaries, who are kept here, can levy the tribute imposed by the Turks on all the commodities carried through this city. Mod. Un. Hist. vol. xxxvi. p. 449.

Anna, in Ancient Geography, is a town of Palesine, to the north of Jericho. Josephus calls it Anna; and Berkelius thinks it is the name with Kana.

Anna, a town placed by the periphery of Seculax on the coasts of Lydia; supposed to be Annia, or Anna, which belongs to Ionia or Caria.

ANNABERG, in Geography, a mine town of Germany, in the circle of Erzgebirg and electorate of Saxony, five miles south-west from Wolkenstein. The occupation of its inhabitants consists partly in mining, but chiefly in the lace-trade. The silver-mines of Schreckenberg are not far from the town.

ANNABI, the name of mountains in Independent Tartary, supposed by M. d'Anville to be those of Alat; but they are evidently those of Alak, called by some Mufari, on the north of Little Buxaria.

ANNABON, or Annabon, or Happy Tear, the name given to an island of Africa by the Portuguese, who discovered it on New Year's Day, in 1526. This island lies to the east of St. Matthew, in S. lat. 17° 50', and long. 57° 20', 25 leagues south from St. Thomas island, and from Cape Lopez Gonzak. According to Pyrard, it is five or six French leagues in circuit; but Baudrand makes its compass ten leagues. It has two high mountains, which being almost always covered with clouds, occasion frequent rain. It has a number of fertile valleys, producing Turkey corn, rice, millet, potatoes, yams, bananas, pine-apples, citrons, oranges, lemons, figs, tamarinds, and other delicious fruits. This island also affords oxen, hogs, sheep, goats, and poultry, in great plenty, and abundance of fish; but the only mercantile production is cotton, which is said to be equal to any produced in India; the quantity, however, is small. The governor is a Portuguese; but the majority of the inhabitants are natives, who pay him implicit obedience, and are bidded in their attachment to the Roman Catholic faith.

There are two rocks on the south-east end of the island, which are dangerous to shipping: they are inhabited by a number of birds, to sate, that the fabrics frequently feed and catch them with their hands. Ships, falling for Europe from the Cape of Good Hope, frequently make this island; and the right road for them is on the north-east side, where they may anchor in six or seven fathoms water, and good ground.

The climate is wholesome, and the air clear and serene. Every part of the island is watered by pleasant brooks and fresh-water springs, which, in all high tides, become brackish: the banks are covered with palms, from which the inhabitants obtain their wine by incision; and among other fruits, this island produces a species of black nut of a purgative quality. Most of the dwellings on this island are converted: the inhabitants are mainly clothed: the women have the upper part of the body naked: they carry their children on their backs, and buckle them over the shoulder; the men wear a linen-girdle round the loins, with a small flap before. Mod. Un. Hist. vol. xi. p. 459.

ANNABURG, formerly called Lochea, a town of Germany, in the Electorate of Saxony, and in a prefecture of the same name. This town is situated on an island, and contains a citadel which Anne, consort to the elector Angilinus, caused to be rebuilt in the year 1573; whence the name. N. lat. 51° 42'. E. long. 13° 34'.

Anna Commont, in Biography, was the daughter of the emperor Alexius Comnenus I. by his wife Irene, and so little distinguished by her talents than her rank. She was born at Constatinople in 1063, and devoted herself to the study of literature and philosophy, by which she acquired the reputation of the most learned lady of her age. Upon the death of Constan
tine, the son of Michael Ducas, her intended husand, the married Nicephorus Bryennius, a young nobleman of distinction; on whose behalf she joined with the empress Irene in soliciting her father, in his last illness, to disinherit his son. When this scheme failed, she excited a conspiracy for deposing her brother; and upon her husband's impeding its success, she lamented that nature had miscalculated the fates, as he ought to have been the woman. Her plot was defeated; and Anna was punished by the confiscation of her property, which, however, was restored to her by the emperor; but she lost her whole influence at court. Having lost her mother full, and afterwards her father in 1158 (see Alexius I), and her husband in 1157, she endeavoured to soothe her mind in retirement, by composing a history of her father's reign; a work that was finished in 1148, full extant, and preferred in the collection of Byzantine historians. "This history was written," says Mr. Gibbon (Hist. vol. ix. p. 83, 84), "with an elaborate affection of rhetoric and science, that betrays in every page the vanity of a female author." Nevertheless, it forms a useful contrast to the degrading and partial statements of the Latin historians. Zonaras gives her an excellent character, and informs us, that she engaged vigorously in the pursuit of learning; and had a peculiar attie elegance in her style; and being endowed with a genius suited to elevated contemplations, she improved her natural abilities by intense study, for she was perpetually reading, or conversing with men of learning. Gen. Dict.

ANNACH, in Geography, an island on the west coast of Ireland, about five miles in circumference, between the isle of Achill and the main land of the county of Mayo. N. lat. 53° 58'. W. long. 9° 39'.
ANN

ANNALIS, in some Middle Age Writers, denotes a day held every year in commemoration of the dead. In which sense annals amounts to the fame with what is otherwise called anniversarium. 

ANNALIS is more particularly applied to the masses celebrated, during the space of a year, for the dead.

ANNALES abaxi, in the Civil Laws, denote books wherein the acts and proceeding of a whole year were contained. In which sense annales stand opposed to families, wherein the acts and constitution of six months were contained. See ANNALES.

ANNALIS, in Middle Age Writers, denote yeare, or young cattle of a year old, or under two.

ANNALIS also denote a kind of rent, or annual revenue.

ANNALIS also denote a kind of rent, or annual revenue.

ANNALIS aliquot, in the Civil Laws, denotes an action which may be put in practice any time within the year. In the like case we meet with annale decreatum, or negatum, annalis refiuis, &c.

ANNALIS abaxi, in Roman Antiquity, the nail which the pretor, conful, or dictator, fixed every year in the wall of Jupiter's temple, on the ides of September, to shew the era or number of years from the building of Rome. This custom was afterwards changed, and the years were reckoned by the consuls.

ANNALIS excepitio, a kind of privilege anciently granted the people of Italy, that whoever had made a contract could not be compelled to the performance or payment of what had been
been agreed on within the year. Some extend this privilege so as to render it still more grievous, by computing the year exclusive of all holidays.

ANNALS Lex, a law fixing the age for enjoying the different offices at Rome, which was first made by L. Volusius or L. Julius, a tribune of the commons, A. U. 774; and hence his family had the surname of Annalis. Liv. lib xl. c. 47.

ANNALS, an historical account of the affairs of a state, digested in the order of years. The difference between annals and history is variously assigned by various authors. Some say that history is properly a recital of things which the author has seen, or has been a bystander to. What they build upon is, the etymology of the word; history is the Greek, signifying the knowledge of things present; and, in effect, more properly signifies to see. On the contrary, annals, say they, relate to the transactions of others, and such as the writer never saw.

Of this opinion the great annalist, Tacitus himself, seems to have been; because the first part of his work, which treats of former times, he calls annals; but when he comes down to his own times, he changes his title, and calls it history. According to Sempronius Afflilio, annals are a bare relation of what passes each year; whereas history relates not only to the transactions themselves, but also to the causes, motives, and springs of them. The annalist merely states his facts, but the historian reasons and defends on them.

Of this last opinion Cicero appears to have been, because when speaking of annalists, he says, Chnam diversi laudem patim eff breviolatam, non concursorum verum, sed tantum narraturum. He adds that history, in its original, was the composition of annals. Cicero relates the origin of annals: to preserve the memory of transactions, the pontifex maximus, says he, wrote what passed each year; and exposited it on a table, in his own house, where every one was at liberty to read it. This they called annales maximus; and this custom was kept up till the year of Rome 620. Annales maximi confudii of eighty books. They were most of them destroyed in the burning of the city by the Gauls. After the time of Sylla the pontifices seem to have discontinued the custom of compiling annals; but several private persons composed historical accounts of the Roman affairs, which, from their resemblance to the pontifical accounts in the simplicity of their narration, they likewise entitled annales; as Cato, Pictor, Piso, Hortensius, and Tacitus. The like annals were kept from the earliest ages by the Egyptians, Babylonians, Perrians, Chaldians, &c.

The Annals of Grotius is a book finely written, and contains excellent materials. Grotius is not so particular as Strada, but more profound, and comes much nearer to Tacitus.

ANNAMATIA, in Ancient Geography, a place of Lower Pannonia.

ANNAMETHUS, an island in the Indian ocean, according to Pliny, who makes it depend on Arabia Felix.

ANNAMOOKA, in Geography. See Annamooka.

ANNAN, the capital of Annandale, in Scotland, is a small town, and royal borough, pleasantly suteuate on a river of the same name, which abounds with salmon, and is navigable, within half a mile of the town, for vessels of 250 tons burden. The river at the town is crossed by a bridge of five arches. It was formerly a place of trade, but lying contiguous to the English border, and in the track of their western incursions, it was often pillaged, destroyed, and burned: the last of these destructive inroads was in the reign of Edward VI.; when Lord Wharton, president of the Marches, burned the town, and demolished the church. In this town, there was formerly a castle which was built by the Bruces, after they became lords of Annandale. The export-trade of Annandale consists of grain; and a building for carding and spinning of cotton has lately been erected, and there are some appearances of increase. N. lat. 54° 37'; W. long. 4°.

ANNANDALE, William, in Biography, a Scotch episcopalian, was the son of William Annand, minister of Annan, and born in that town in 1615. His father was obliged to quit Scotland in 1653, on account of his loyalty to the king, and attachment to episcopal government; and he was admitted, in 1651, a scholar in the University of Oxford. Having completed his education, and distinguished himself by his loyalty and zeal for episcopalianism, he removed to Scotland in 1663; and in 1676, he was nominated to the deanery of Edinburgh. He died in 1689, and was interred in the Greyfriars church at Edinburgh. The titles of his works, which he wrote in English, are as follows, &c. "Fides Catholica," or, The Doctrine of the Catholic Church, in Eighteen Great Ordinances, &c. Lond. 1661.-2, 4to. "Panem Quotidianum!" or, Daily Bread, in Defence of Feft Forms of Prayer. Lond. 1662, 4to. "Pater Noster!" or, Our Father, an Explanation of the Lord's Prayer. Lond. 1670, 8vo. "Mysterium Pætatis!" or, The Mystery of Godliness; Lond. 1672, 8vo. "Doxologia." Lond. 1672, 8vo. "Danitalis;" including "Lex Quaedam," or, The Honour of Magnificy; and "Durom Unitas," or, The Agreement of Magnificy and Minificy, &c. Bing. Brit.

ANNANDALE, in Geography, a district or division of Dumfries-shire, in Scotland, the capital of which is Annan. Upon the death of David I in 1153, the lordship of Annandale descended to Thomas Randolph, earl of Murray; and by his sister Agnes, was transferred to the Dunbars, earls of March; after their forfeiture, it passed to the Douglases, who lost it in the same way; and from them it went to Alexander, duke of Albany, who lost it by his rebellion against his brother king James III. From this time, it continued in the hands of the king, and was the great key of the western border. This district is a fertile vale, about 24 miles long and 14 broad; it was formerly, on account of its vicinity to England, subject to depopulation, so that it was left uncultivated; but of late, the culture it has undergone has given it a new aspect. Annandale formerly constituted part of the Roman province of Valeria; and as the wall of Severus terminated here, it abounds with Roman stations and antiquities. Some of the Roman camps are preserved; and the traces of a military road are visible in different parts of the country. Annandale is a marquessate belonging to the Johnstouns, and the chief of that name.

ANNASO, a firming fort of Italy in the duchy of Milan, suteuate on the river Tanaro; twice taken by the French, and restored to the Duke of Savoy in 1706. N. lat. 44° 46'; E. long. 8° 30'.

ANNAREE is a Portuguese factory, lying on the western coast of the penisula of India, 21 leagues nearly S. from Goa.

ANNA PERENNA, in Mythology, the fitter of Dido; of whom fable relates, that the fied with Anaxes to Italy, where she fell a sacrifice to the jealousy of Lavinia, and was drowned by her in the river Numicus, whence she was denominated the Numician nymph. It is certain, that the Carthaginians and Romans paid her divine honours. It is said, that the surname Perenna was derived, "a perpetuam cultum," from the perpetuity of her worship. The feast of this deity was celebrated by the Romans in the ides of March, on the banks of the Tiber; on which occasion the people
people devoted themselves to every kind of amusement and pleasure. Ovid refers to this goddes, in the third book of his Fasti. Some writers maintain, that Anna was the moon, because its revolutions formed "annum," the year.

ANAPOLIS, in Geography, a river of Nova Scotia, rises in the city, and passes into the bay of Fundy, through the basin of its own name; on the south side of which, at the mouth of the river, stands Annapolis Royal. The tide flows up this river thirty miles; and it is navigable for ships of any burden 10 miles; for those of 100 tons, 15 miles; and for boats, within 20 miles of Hotham.

ANAPOLIS, a county on the above river, adjoining to King's County, having five towns, viz., Wilmot, Granville, Annapolis, the chief towns Clare and Mo-nickton, and chiefly inhabited by Canadians, Irish, and New-Englishers.

Annapolis Royal, called by the French Pari Royal, when a colony was settled here by M. de Ponts in 1635, is the chief town of a county of this name, and stands on the south side of the river and bay of Annapolis.

This is reckoned the finest harbour in the world: it is two leagues long, and one broad; and has a small island called Goat Island, almost in the middle of the basin, which is said to be large enough to contain several thousand ships; its depth of water is so near less than four or five fathoms; the bottom is good; and ships may be secured from all winds. The entrance, however, is difficult, so that only one ship can pass in or out at a time, and it must go stern foremost, on account of the strong current and tides; the fogs also are very great here. The gulf through which ships pass into the bay is about three quarters of a mile wide and about one and a half long; and on each side the land is rocky and mountainous. The town is not large, but has some very handsome buildings. It is fortified, and cannot be easily attacked except by bombardment. The fort in its present state is capable of containing about 100 men. Furs are here exchanged by the Indians for European goods. N. lat. 45°. W. long. 63°. 5'.

Annapolis is also the chief town of Ann-Arundel county, and the capital of the state of Maryland. It stands at the mouth of the Severn, 30 miles south of Baltimore, 72 miles north from the federal city, and 132 miles west from Philadelphia. It was formerly called Severn; and in 1604, it was made a port and town. It is situated on a peninsula formed by the river and two small creeks; and affords a beautiful prospect of Chesapeake bay, and the eastern shore beyond it. This town is the wealthiest of its size in the United States. The houses, about 300 in number, are spacious and elegant, indicating great wealth: the flat-house is a noble building, and stands in the center of the city, whence the streets diverge in every direction. N. lat. 38° 50'. W. long. 75°. 8'.

ANN-ARUNDEL, the name of a county in Maryland, which lies between Patapsco and Patuxent rivers, and has Chesapeake bay to the northward. Its chief town is Annapolis. This county contains 22,595 inhabitants, of whom 10,131 are slaves.

ANAT, or Ann, in Scots Law, denotes half a year's stipend, which the law allows to the executors of the ministers of the church of Scotland, over and above what must due to the minister himself, for his incumbency.

Annat, Francis, in Biography, a French Jesuit, confessor to Louis XIV, was born at Rouen, in 1590. Having taught philosophy six years, and theology seven years, in the University of Toulouse, he was invited to Rome to be censor-general of the books published by the society, and theologian-general. On his return to France, he was distinguished by successive offices of honour to which he was appointed, and at length he was made confessor to the king, in which post he continued for 16 years; nor was he allowed to retire from court till within about four months of his death. It is said, though not with much authority, that when Madame de la Valiere was taken into the royal favour, he went to lay down his office. During his long connexion with the court, he never employed his interest in providing for his poor relations. He was chargeable, however, with the crime of persecuting those who professed new opinions, and particularly the Jansenists; and he has been reproachfully denominated "The Flail of Hereford." He died at Paris in 1679. His writings, chiefly on the controversy with the Jansenists, are numerous; and the principal of them were collected in three volumes, and printed at Paris in 1666. Gen. Dict.

ANNATES, Annata, in Ecclesiastical Writers, denote a year's income, due to the pope upon the death of any bishop, abbot, or parish-priest; and to be paid by his successor.

Annates are also called from the Latin annum, year; because their rate is after the value of one year's purchase; and they are the same with what of later days we call primitiae, or first-fruits; with this only difference, that first-fruits with us are paid to the king.

The invention of annates is ascribed, by a late writer, to Anthonin, bishop of Ephesus, who exacted from all bishops consecrated by him, a sum proportionate to the annual revenues of their fiefs. The council of Ephesus, held in 429, condemned this exaction, but not until Anthonin was dead. It was long after that annates got footing in the western church. The time when they were first introduced is very obscure. Clement V. is said to have been the first pope who imposed annates on England for three years, to which Edward I. immediately consented; but the parliament boldly opposed it; the pope's bull was declared abusive, and the king revoked his consent. Polydore Virgil (Inv. et Rer. lib. viii. c. 2.) says, that the council of Vienne, which was held in 1311, under Clement V., made an effort to suppress the annates; a circumstance which shews they subsisted in his time. John XXII. the successor of Clement, published a bull, whereby he referred the first year's fruits of all ecclesiastical benefices that continued vacant for three years, archbishops, bishops, and abbesses, being exempted; but by degrees the first fruits were exacted, without observing whether the benefices were vacant three years or not. Benedict XII. who succeeded John, followed his example; and it was also imitated by succeeding popes; but the authority of their bulls extended no farther than their own lives. In 1399, during the feิตism of the antipopes, Boniface IX. inflicted the first bull for establishing perpetual annates; not merely to be granted as a charitable supply upon extraordinary occasions, but as a matter of right annexed to the dignity of the sovereign; so that he decreed what was local and particular, to be universal and perpetual. Before his time, the annates were not fixed, and the clergy often refused to pay them; but afterwards, the tax was not only imposed at pleasure, but frequently doubled, tripled, and quadrupled. However, it was always a grievance complained of and remonstrated against both by the people and the clergy. There were even many who condemned annates; and the secular princes frequently objected to the payment of them, forbidding any money to be carried out of their dominions on this account. See Leflont's Hist. of the Council of Constance, vol. ii. p. 147. &c. Nic. de Clamanges, A Maffi, Gallechius, Campegius, and Finamundus Cordubensis, have written expressly concerning annates.

Matthew Paris, in his History of England, for the 10th year
year 746. relates, that the archbishop of Canterbury, in virtue of a grant or cession of the pope, received annates of all the benefices that became vacant in England. Before this time, among the laws of King Loth, who began his reign in the year 712, there is an order for the payment of them. But, in after-times, the holy see thought fit to take these away from the bishops and archbishops, and appropriate them to themselves. And from the popes, the parliament under Henry VIII. took them, putting an act in 1532, against levying them, and gave them to the crown. 25 Hen. VIII. cap. 20. Finally, queen Anne reduced them to the church by appropriating them to the augmentation of poor living.

See FirstAI.

ANNATTA, in Geography, the name of a river and bar in the island of Jamaica, nearly north from the town of Kingston, on the north side of the island. N. lat. 18° 32'.

W. long. 76° 46'.

ANNATTON. See AYRATON.

ANNE, in Biography and History, queen of England, was the second daughter of king James II. by his first wife Anne Hyde, and was born in 1665. In 1683, she married prince George, brother to the king of Denmark, by whom she had several children, though none of them lived to maturity. Upon the progress of the king of Orange, and the retreat of the king, prince George, who was under the influence of lord Churchill, afterwards duke of Marlborough, as well as some other persons of distinction, retired to the camp of the advancing prince. When this news reached London, the princess Anne, dreading the king’s displeasure, withdrew herself, in company with the bishop of London and lady Churchill, and fled to Nottingham. The intelligence of her flight was the occasion of great distress to her father; because he foresaw, in this incident, the total expiration of his royal authority; and because he was abandoned by a child, whom he had always regarded with the most tender affection. “God help me,” cried he, in the extremity of his agony, “my own children have forsaken me!” Upon her disappearance, so violent were the prejudices that prevailed, the unhappy father was thought to have put her to death; and if the truth had not been fea-lionly discovered, the populace, and even the king’s guards themselves, might have been engaged, in revenge, to commence a massacre of the priests and Catholics. Upon the settlement of the crown, in 1689, on the prince and princess of Orange, it was enacted by the convention-bill, that the princess of Denmark should succeed after the death of the prince and princess of Orange. Accordingly, she ascended the throne, on the death of king William III. in 1702. The splendour and importance of her reign were owing more to the circumstances of the times, and to the influence of her ministers and favourites, than to any display or exertion of talents on her own part: as she possessed no energy of mind, and her disposition was meek and timid, the surrendered herself to the direction of others, and distinguished herself merely, or principally, by a strong predilection for Tory principles in church and state. “Mildness, timidity, and anxiety,” says Dr. Somerville, “were constitutional ingredients in the temper of this princess; and to their influence chiefly we may ascribe most of the interesting occurrences in her government and private life.” Under the guidance of the counsels of the duchess of Marlborough, to which she had been accustomed to surrender herself in the earlier period of her life and reign, she pursued the projects for reducing the power of Louis XIV. of France, which her predecessor had begun; and after a series of successes, more glorious to her arms than profitable to the nation, the war closed by the peace of Utrecht, in 1713. Much more important to the prosperity of the nation, than all the brilliant successes of Marlborough’s campaigns, was the union of England and Scotland, which took place on the 1st of May 1707. The contention of parties was very violent during almost the whole of the queen’s reign; and more especially towards the close of it, when it was apprehended that the queen and those in whom she confided, wished to secure the succession to her exiled family; and when the evidently favoured the Tories in such measures, as justly alarmed the whigs and the friends of constitutional liberty. Of this kind was the Somersett-Bill, which, after violent debates during its progress through both houses, obtained the royal assent on the 25th of June 1714. But the death of the queen, August 17, in the same year, the very day in which this bill was to take effect, rendered it in a great measure ineffectual. The queen’s death, in the 50th year of her age and 13th of her reign, was occasioned by a drapery, contracted or aggravated by her habits of living. Although Queen Anne had a strong mind, she was not deficient in understanding; and her private character was amiable. She has been charged, however, by some, with the crime of deserting her father in his distress. This charge has been obviated by the peculiar circumstances in which she was placed, and by the state of the nation, when her husband, by his example, countenanced this measure. “The habit (says Dr. Somerville) of a blind deference to the advice of lord and lady Churchill, and a conscientious anxiety for the Protestant religion, exposed to the extremity of danger, lifted the emotions of filial tenderness, in a moment of singular perplexity and agitation, and precipitated her into an action which would have been inexcusable, if it had been the result of cool deliberation, and originated from motives of interest and ambition.” In the management of her fortune this princess was economical, and yet she was not deficient in charity; and she even exceeded it in her bounty to her favourites. In the discharge of religious duties, she was regular and exemplary; and she manifested her zeal for the safety and prosperity of the church in various ways; some of which, indeed, were reckoned as impolitic and unjust; and particularly by augmenting, at her own expense, the livings of the poor clergy. See AUGMENTATION. “She possessed a considerable degree of taste for the fine arts, adorned herself with music and painting, and delivered her public speeches with a melodious propriety, that charmed the ears of her audience. The deceitfulness of grandeur, as a criterion of happiness, was remarkably verified in the life and reign of queen Anne. We beheld a nation rising, under her auspices, to the summit of prosperity. Whilst signal successes crowned her military exertions abroad, agriculture, commerce, manufactures, science, and literature, advanced with rapid steps at home; every event, and every improvement, which contribute to the opulence, the power, and the renown of a nation, distinguished the reign of queen Anne as the most propitious and brilliant recorded in the annals of Britain. But when we follow this princess into retirement, and survey the incidents of her private life, how much are we struck with the distinction between external grandeur and personal felicity! She survived a numerous family of children; the Duke of Gloucester, defined by the act of settlement to succeed her, died to the age of 12, and exhibited early blossoms of every accomplishment that could elevate the hopes of a nation, and delight the heart of a parent. The possession of a crown, held upon the condition of ratifying the degradation and exile of her own family, must have cost her many a pang, which she durst not impart to her most confidential friends. Whilst looked up to as the first potentate in Europe, and loaded with congratulations upon the successes of her arms, she was a slave in her own house; and subjected to daily
daily affronts and mortifications, from the insolence and usurpations of her own servants. Emancipated, at length, from her chains, she only entered upon a new scene of vexation and trial; and all her remaining days were embittered by the jealousies of her people, the turbulence of faction, and the contentions and outrages of a distracted cabinet. By her subjects, whose prejudices coincided with her own, she was honoured with the title of the "Good Queen Anne." Without attaching much merit to the queen herself, as either a patron or promoter of literature, the period of her reign was distinguished as a kind of Anguillian age of English learning, on account of the number of admirable and excellent writers who flourished at this time.

Ann of Austria, queen of France, the daughter of Philip III. king of Spain, by Margaret of Austria, was born in 1601, and married to Louis XIII. in 1615. From this connexion, she did not derive much happiness; for Cardinal Richelieu contrived to persuade the king that she was concerned in conspiracies against his life. Sufpidions were then excited, which rendered it necessary for her to answer interrogatories; and on her confession, to ask pardon of the king, and promise to alter her conduct. When the king died, in 1643, she was declared sole regent during the minority of her son Louis XIV. Her whole confidence was reposed in Cardinal Mazarin; who ruled with such despotism, that discontent arose, which produced a civil war, and obliged her to fly with her son from Paris, and to solicit the affiance of the great Condé. In the conflicts and vicissitudes of her reign, the queen manifested great firmness; at length, the young king affirmed the rights of government, in 1661; and the queen retired, to pass the remainder of her life in pious exercises. In 1666, the death of a cannon, after having endured the pains of it with exemplary patience. In early life, the court of France was much indebted to her for its characteristic politeness and amenity. Nouv. Dict. Hist.

Anne Boyle, queen of Henry VIII. of England, was the daughter of Sir Thomas Boyle, employed by Henry in various embassies, by a daughter of the duke of Norfolk; and born in 1507. At an early age she was taken to Paris, and resided there for a considerable time. Here she acquired a vivacity of manners and conversation, which was further set off by her personal charms. Henry, whose attachments were very variable, was enamoured when he saw her; and as he could not obtain the favour he solicited on any other terms, he hastened to seek a divorce from Catharine of Aragon, and whilst the grant of it was delayed, he married Anne Boyle in November 1532; and publicly declared her queen in the April following. In September she was delivered of a daughter, who was afterwards the famous queen Elizabeth. Anne Boyle had imbibed the principles of the reformers during her residence with the duchess of Alençon; and her influence was for some time of usefully employed in widening the breach between the king and the court of Rome; and in overthrowing the power of that haughty favourite cardinal Wolsey. But her enemies were invidious in their endeavours to supplant her; and the king's new passion for lady Jane Seymour, tended to inflame those jealousies of her conjugal fidelity which the jealousy of her carriage had excited, and in some measure justified. Having been accused of adultery with several officers of the household, and with her own brother, lord Rochfort, she was brought to her trial for high treason, found guilty on very insufficient evidence, and sentenced to be beheaded: the sentence was executed in May 1536. At her death, the confined indigence, but perished in denying any serious guilt. Her letter to the king, written after her condemnation, enhances her character and understanding in our estimation. Many calumnies have been circulated against this queen, by the bigotry of the Catholics, on account of the service she rendered to the cause of the Reformation. It is not possible to ascertain her innocence with regard to the crime charged against her; but as an approved writer of verses, "it seems much less certain that she was criminal, than that her husband was a capricious and bloody tyrant." Burnet's Hist. Reformation, vol. iii. p. 112. Home's Hist. vol. iv. p. 79—149.

Anne, St., of Sleswick Holdyn. This order was instituted in the year 1378, by Charles VI. emperor of Ruffia. The badge of the order is a cross, composed of four large rubies set in gold, the angles between the cross set with diamonds, and on the centre a medallion with the figure of St. Anne. It is worn pendant to a broad crimson velvet ribbon edged with yellow. The star of the order is of silver, with eight equal points or rays; on the centre a red cross on a gold ground, with the following motto written on a red ground, AMANTIUM JUS- TITIAM, PIETATEM, FIDEAM.

Anne's, St. Bay, in Geography. See St Ann's.

Anne's, St. Bay, is a bay on the coast of Labrador, in North America, between Davis's inlet on the north, and Cape Charles, which is the north point of the entrance into the straits of Belleisle, on the south. It is about N, lat. 54°, and W. long. 57°.

Anne's, St. Cape and Island, lie south by east from Sierra Leone river, on the west coast of Africa. The cape is the north-west point of the island, which is a narrow strip of land, near 80 miles in length from west by north to east by south. The inner passage within the channel is called Ferno of St. Anne.

Anne, St. Larfana, or Rota, is one of the Ladrones, or Marianne islands, at the distance of seven leagues from Guam, and is about 45 miles in circumference, situate in N. lat. 14°. This is a pleasant and fertile island, finely diversified with rising grounds, covered with lofty trees, and beautiful plains of a rich black soil, and very well watered. There are two excellent ports, one on the south, and the other on the north-west side of the island.

Anne Charies, Island and Road, lie on the east side of St. Thomas island, under the equator, and 40 leagues west from the mouth of the river Cabon, on the continent of Africa. This island is only a great rock, and the road is under its lee.

Anne's, St. Gulf, is round Cape Blanco, the most westerly point of Africa, which forms a peninsula, as this gulf runs up northerly within the land, which bears away towards the east. It is a large bay, with good sandy sound.

Anne, Cape Queen, lies on the coast of Greenland, in the Northern Ocean, in N. lat. 64° 15', and W. long. 74° 35'.

Anne's, Queen, Forland, lies on the northern main from Hudson's Straits, in N. lat. 64° 8', and W. long. 74° 41'.

Anne's, St. Harbour, is in the island of Martinico, and has good anchorage and a safe port.

Anne's, St. in Ecclesiastical History, is a festival of the Christian church, celebrated by the Latins on the 26th of July; but by the Greeks, on the 5th of December. It is kept in honour of Anne, or Anna, the mother of the Virgin Mary.

Annealing, or as it is popularly called, Nealing. See Nealing.

Annebaud, in Geography, a town of France, in the province of Normandy, situate on the Risle, and enjoying the title of marquisate.

Annecy.
ANN

ANNECY is a city of Savoy, and capital of the Genevois, seated between Chambery and Geneva, on a lake to which it gives name, at the mouth of the river Sier, which passes through it. This lake is about 10 miles long and 3 wide. Annecy is the see of a bishop, whose dioceze includes Faucigny, Chablais, the country of Gex, and part of Burg. It has piazzas in several streets for sheltering the people from rain, several collegiate and parish churches, and convents for men and women. It is 19 miles south of Geneva, and 21 north-north-east of Chambery. N. lat. 45° 56'. W. long. 57° 57'.

ANNEX, Old, is now a village half a league north-east of Annecy. It was formerly a considerable town.

ANNERY is the name of one of the tribes who inhabit the defiles round-Palmyra, which is remarkable for the finest breed of horses in the world; the other tribe the Mowalli, who are much better soldiers, but fewer in number, and little inferior in the excellence of their horses. The Annery posses the country towards the south-west, at the back of Libanus, about Beirut, down the Euphrates; and southward towards the borders of Arabia Petraea and mount Hor. The Mowalli inhabit the plain east of Damascus to the Emphrates, and north to near Aleppo.

ANNESEL, in Ancient Geography, a place of Africa, situate, according to Antonius, in the track of the "Septis Magna," to Alexandria.

ANNESLEY, Arthur, in Biography, earl of Anglesey, and lord privy-seal in the reign of Charles II., was the son of Sir Francis Annesley, bart., Lord Mount-Morris, and Viscount Valentia in Ireland, and born at Dublin in 1614.

ANNIBAL, Domenico, in Biography, was born at Annesley, in Warwickshire, about the year 1624, and educated at Oxford. While he was a student, he was distinguished by his temper and industry. From Calamy, it appears he was ordained after the Presbyterian mode; though Wood says, that he received episcopal ordination.

ANNEXATION, in Geography, one of the smaller Scilly islands, near the south-east coast of England, about half a league from St. Agnes isle.

ANNETUS, in Ancient Geography, or Annestus, in town of Arabia Felix.

ANNEXATION, in a legal sense, the act of joining or uniting some less considerable thing to a greater.

ANNEXED, something joined to, or dependent on another. Thus, we say, such a farm, such an advowson, is annexed to such a fee, such a manor, &c. Charles V., in the year 1486, annexed Provence to the crown of France.

ANNIBAL, Domenico, in Biography, See Domenico.

ANNIENTED, or rather Anniented, formed of the verb annientar, to bring to nothing, or to annihilate, a term sometimes used in law-books, in the sense of frustrated, or nullified.

ANNIHILATION, compounded of ad, to, and nihil, nothing, the act of reducing a sub stance into nothing; or of totally
totally destroying and taking away its existence. Annihilation stands opposed to creation; the one supposes something made out of nothing, the other something reduced to nothing.

All annihilation must be metaphorical, or supernatural; bodies naturally admit of changes and alterations in their form, but not of annihilation.

The ancient philosophers in effect denied all annihilation as well as creation, revolting all the changes in the world into new modifications, without supposing the production of anything new, or destruction of the old.

By daily experience they saw compounds dissolved, and in their dissolution nothing perished, but their union or connection of parts: when in death the body and soul were separated, the man they held was gone, but the spirit remained in its original, the great soul of the world, and the body in its earth from whence it came; there again was re-constituted by nature into new compositions, and entered new states of being which had no relation to the former. According to some, nothing is so difficult as annihilation; it requires the infinite power of the Creator to effect it; some go farther, and feign to put it out of the power of God himself. According to others, nothing is so easy; existence is a state of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all, it is what more, it requires an infinite power to prevent it.

The Talapoins hold it the supreme degree of happiness, to have the soul totally annihilated, and freed from the burden and slavery of transmigrations.

Some Christians maintain, that God will annihilate the souls of the damned, after a certain term of punishment; and this annihilation, they say, is the second death. Tre-nessus, according to M. du Pin, was of this opinion. See Death, Hell, and Punishment.

Annihilation is also used, in Political Arithmetic: thus, when the capital flock of any public fund is reduced, so much as is reduced is said to be annihilated.

ANNI Nubiles, among Late Writers, the legal age at which a maid becomes fit for marriage; which is at twelve years.

ANNIS Communionibus. See Communionibus.

ANNISEDE. See Annis-Seed.

ANNUARIE, is properly the yearly return of any remarkable day; or the day, or mind-day; that is, a memorial day.

The word is from annus and verb, on account of its recurring every year.

Annuaries day, dies anniversarii, among our ancetors; more particularly note those days on which the martyrdoms of the saints were yearly celebrated in the church; as also days whereon, at every year’s end, men were wont to pray for the souls of their deceased friends. Annuaria dies ido repetitur definitis, quoniam nefimus qualifier eorum causa habatur in alia vita. This was the reason given by Alcimus, in his Divine Offices. The first origin of annivarial days is referred by some writers to Pope Anacletus, and by others to Felix I.

Anniversary winds, are those which blow cautiously at certain seasons of the year.

These are otherwise called Etchian winds; such are the trade winds and monsoons.

Anniversary is more particularly used for the annal, or maists, rehearsed daily for the space of a year after a person’s death.

ANNIUS, of Viterbo, or John Nanni, in Biography, a Dominican monk, was born, in 1427, and distinguished as an impudent impostor. Furnished with talents and learning, he employed himself in writing books from his own invention, which he introduced to the world as genuine remaines of several ancient authors, in "Seventeen books of Antiquities." This curious collection contained several treatises of Archiloclus, Xenophontus, Berulphus, Manteho, Megaleses, Philo, Q. F. Pictor, M. Cato, Antonistus Pius, Sopronius, &e. &c. This work was first published at Rome in 1458; a second edition was published by Venetus at Venice; and in 1553, it was published in 8vo. at Antwerp. The editor pretended to have found the books at Muntiis; and the impression was for some time successful. Voilus and Bayle mention the advocates for the genuineness of these writings. On the other hand, the most approved critics examined these pieces, and pronounced them fantastic; and this judgment is now universally received. Annius died at Rome in the year 1552. Gen. Diet.

ANNOBON, in Geography. See Annabon.

ANNO Domini, q. d. in the year of our Lord; the computation of time from the epocha of the incarnation of Jesus Christ. This is generally inserted in the dates of all public writings, with an addition of the years of the king’s reign.

ANNOISANCE, in Law. See Nuisance.

ANNONATION, anlontation, in Rhetoric, the name with what is otherwise called Paronomasia.

ANNONA, Granubanous of Plum. in Botany, a genus of the polyandra polygynia class and order, of the natural order of condinates, and the genus of Juliaen: its characters are, that its calyx is a perianthus three-leaved and small; the calyx is much more numerous, placed on the receptacle: the pistil is a roundish germ, placed on a roundish receptacle; the pistil is nine, ligmas obtuse, covering the whole germ: the pericarpium is a berry, very large; roundish, clothed with a leathery, one-celled (or a comenpa berry, as in Ficus); seat the very many, hard, ovate-oblong, placed in a ring, and netting. Martyn enumerates ten, Wildenes eighteen, and Gemlin nineteen species. 1. A. muricata, rough-fruited currant apple, or four fop, granubanous of Plum. Aratica-pouhe of Marcig. Pif. and Ray, with leaves oval-lanceolate, smooth and acute, fruits muricate, petals ovate, petal the interior ones obtuse, shorter. This is a middle-sized tree, rarely above twelve or fourteen, or at most twenty feet high. It is a native of the West Indies, common in every savannah of Jamaica, and flowering in the spring. The small and taste of the fruit, flowers, and whole plant, resemble very much that of black currants. There is a variety in Jamaica, with inodorous leaves, large flowers of a fulvous colour, and spherical mucronate fruits. It was cultivated here in 1656 by Mr. J. Tradeifant, jun. 2. A. tripelta, A. charnoldi of Miller, broad-leaved currant apple, with leaves ovate, acute, pubetifery, with a few stiff petall and petals lanceolate, coriaceous, and tomentose. This grows to a large tree, with numerous branches, in South America. The fruit is esteemed by the Peruvians as one of their most delicate sorts. It was cultivated in 1739, by Mr. Miller. 3. A. squamola, A. tuberosum of Rumph. ataramma of Rhed and Ray, undulated currant apple, or five fop, with leaves oblong, acute, and smooth, fruits obtusely scaled, petals lanceolate and inner ones minute. This is a small tree about eight feet high, and commonly a shrub; a native both of the Eeal and West Indies; the fruit is sweet, and eaten in these countries; cultivated in 1739, by Miller. 4. A. reticulata, granubanous fructu aureo, &e. of Plum. Anomarum of Rhed and Ray, netted currant apple, with leaves oblong-lanceolate, acute and smooth, fruits ovate and reticulate-arculate, outer petals lanceolate, and inner minute. This
This is a tree growing to the height of twenty-five feet and more, with spreading branches; a native both of the East and West Indies; and the fruit, according to Bartram, is much esteemed by many people; but Swartz says, that it is seldom eaten; cultivated at Hampton court in 1690. 5. A. becola, A. bartramii, A. fimbriata of Ginolin, long-leaved cutiard apple, with leaves elliptic-oblong, acute, and smooth, petals pinnate, equal and acute; a native of China, and cultivated in the East Indies, introduced in 1755, by Hugh, duke of Northumberland, inspected by Lauroire not to be different from the third sort. 6. A. filifolia, granadnanus palmifolius, &c. thinning-leaved cutiard apple, with leaves oblong, rather obtuse and smooth, and fruits morel. This is a small tree, about a foot in height; growing wild in loft marshy places in Jamaica, and bears a few beet-seeded fruit, of no disagreeable flavour; but it is said to be a strong narcotic, and on that account not eaten. It is called alligator apple: its wood is so fine, that it is used for drawers of corks to stop up their jugs and calabashes; and hence it is new universally denominated the cork-wood in Jamaica; introduced here in 1772 by Dr. P. Clarke. 7. A. tribula, triffid-cutiarid apple, with leaves elliptic, acute, and smooth; flowers pendulous and campanulate, calyxes ovate, and petals many and oval. This tree’s trunk is about the size of a man’s leg, and its height about ten or twelve feet. All parts of it have a rank, if not a fettid smell; and few, except negroes, relish the fruit; it usually grows in low shady swamps, and in a very fat soil. It is a native of the Bahama islands, Carolina, Maryland, and Virginia, and the seeds are frequently brought to England, under the name of papaew-tree; introduced here in 1776, by P. Collinson, Eq. 8. A. glabella, smooth cutiard apple, with leaves lanceolate-oblong, and fruits conoid smooth; grows to the height of about sixteen feet, has an eatable fruit, sweet but somewhat inripid; it is the food of the guanas, and many other wild creatures. A native of North America. 9. A. ajBrain. A fiftic cutiard apple, with leaves lanceolate, smooth, thinning, and marked with lines; a middle-sized tree, with spreading branches; a native of the East Indies; cultivated there and in China. 10. A. africana, African cutiard apple, with leaves lanceolate, pubescent; a native of America, though distinguished by the epithet africana.

These fruits are much esteemed by the natives of the countries where they naturally grow; are esteemed very cooling and wholesome, and are frequently given to sick persons.

11. A. exoptica, with elliptic leaves and globose fruits. 12. A. oenopon, with leaves oblong, very entire, tormentofe, and somewhat fettic and smooth fruits. Abl. pl. Guian. 13. A. fruticos, with leaves oblong, very entire, tormentofe, under ruficent, and tuberculated fruits. Abl. pl. Gui. 14. A. punctata, with leaves oblong, smooth and very entire, and punctated fruits. Abl. 15. A. longifolia, with leaves linear-oblong, very entire and smooth, and punctated reticulated fruits. Abl. 16. A. arboris, with leaves oblong, acute, very entire, beneath tuberosous-tomentose tube. 17. A. pyrenae, with leaves oval-oblong, pinnate and many, and punctated reticulated leaves. Abl. 18. A. amara, with leaves cutiared, smooth, petiolar, under yellowish, and tomentose fruits. Abl. 19. A. munita, with oblong leaves, acerated fruits, and external corolla monopetalous. Jacq. Obli. Bot. This is reckoned by Willdenow, a variety of the A. retusa. To more facies, that have been above enumerated Willdenow adds—A. pyrena, A. pinnata of Bartram, with lanceolate acute leaves, and oblong acute petals, the interior longer: a native of Florida: A. obvata, A. grandifolia of Bartram, with leaves obturate and somewhat obtuse, oblong smooth fruit, obturate petals, the exterior the larger: a native of Florida, A. grandiflora, with leaves ovate-oblong and petiolar, of Vahl; with leaves ovate-lanceolate, smooth, and very large flower, of La Marek; and with leaves ovate-oblong, fruit elliptic and somewhat rough, and petals pubescent and oblong, the interior the shorter, of Willdenow: A. angustifolia, with leaves cordate-oblong, acute, double-rowed, and embracing the stem, of La Marek; or with leaves cordate-oblong and embracing, of Willdenow: a native of Madagascar and of the island of Mauritius.

Culture. &c. The seventh fort will thrive in the open air in England, if the flowers be warmed; but the plants must be trained in pots, and sheltered in winter for two or three years, and in the spring they may be turned out of the pots, and planted in the open ground. The other sorts, which are natives of the hot parts of America, or the East Indies, are too tender to live in this country, unless they are preferred in warm flores: the seeds that are brought over must be sown on a good hot-bed, or in pots of light earth, and plunged into a hot-bed of tanamar’s bark in February, which is the best time, that the plants may get strength before the colds of autumn. They should be kept in the hot-box, and with careful management they will make great progresse; but in warm weather, they should have plenty of fresh air. As they advance in their growth, they should be cautiously shifted into larger pots, constantly remain in the tan-bed; and they will thus be vigorous. They are preferred for the sake of the beauty of their leaves, as few of them flower, and none produce fruit in England. The flores in which they are placed should, during the winter season, be kept to the annas heat, as it is marked on the botanical thermometer. The earth should be light and rich, and the tan-bed frequently turned over and refreshed. In summer they should have frequent waterings; but in winter they should be sowed colder, not oftener than once a week in open weather; and in frost, it will be sufficient to water them once in two or three weeks. Martin’s Miller.

Annona, in Ancient Writers, denotes victuals, or provision, or corn for a year.

Annona ciliata, the corn with which the granaries of cities were filled every year, for the subsistence of the citizens.

The tax, called the annonæ, or supply of corn for the use of the army and capital, was a grievous and arbitrary exaction, which, in the time of Julian, exceeded; perhaps in a ten-fold proportion, the ability of the farmer, and his distress was aggravated by the partial injustice of weights and measures, and the expense and labour of distant carriage.

Annona militaris, the corn and other provision laid up in the magazines, for the subsistence of an army during the campaign.

In ancient writers we also meet with the phrase 'singula annonæ, bina annonæ, ternæ annonæ: with regard to which Saliusius lays down this rule, that when annonæ occurs in the singular number, it includes not only corn, but flesh, wine, oil, and other necessaries: whereas, when it is used in the plural number, it imports bread alone. Aquinas is not contented with this rule, but instead of it advances another, viz. that annonæ in the singular number includes all kinds of provision; and, in the plural, imports so many rations or portions of bread, flesh, and the like, distributed to so many men.

In this sense, soldiers are sometimes said to have riven to the benefit of five or more annonæ; that is, were entitled to so many rations. The Emperors Arcadius and Honorius took
great pains to reduce this profusion. Hence we read of annonae prefectus, or curator, who superintended the sale of corn; annone fruttor, who managed the military provisions; annonearius, an officer appointed to distribute provisions to the soldiers; and annonearii, denoting monopolists.

ANNONAGE, annomium, a tax on corn. Annus is much the same with francus.

ANNONAY, in Geography, a town of France, in the department of the Ardèche, and chief place of a canton in the district of Mezen, four leagues north-west of Tournon, and 13 north of Privas. N. lat. 45° 15'. E. long. 4° 52'.

ANNOT, or Anot, a town of France, in the department of the lower Alps, and chief place of a canton, in the district of Castellane; two leagues west of Entrevaux, and three north-east of Castellane.

ANNOTATION. formed of ad, and nota, note, a succinct commentary, or remark on a book or writing; in order to clear up some passages, or to draw some conclusion or consequence from it.

ANNOTATION, in the Civil Law, denotes a kind of receipt or grant from the emperor, signed with his own hand. But this annotation differed from a mere script and a pragmatic formula.

It took its name from the note or subscription at the bottom, which was in red letters.

ANNOTTO, in Commerce, a kind of red dye, brought from the West Indies. This is otherwise denominated arnate, anate, attale, and roucou.

It is procured from the pulp of the seed-capsules of a shrub called actoide and urucu; the bixa orellana of Linnaeus, which grows seven or eight feet high, and produces oblong hairy pods, somewhat resembling those of a chestnut. Within each of these are thirty or forty irregularly figured seeds, which are enclosed in a pulp of a bright red colour, and unpleasant smell, somewhat resembling the paint called red lead when mixed up with oil; and it was used as paint by some of the Indians, in the same manner as wood was used by the ancient Britons. The seeds, together with the red tough matter that surrounds them, are softened in a wooden trough with water, until, by a kind of fermentation, which spreads a very nauseous smell, and by diligent stirring and pounding, the kernels are separated from the pulp. This mass is then strained through a sieve, and boiled; upon which a thick reddish liquor, which is the pigment, separates. When skimmed off, it is carefully inpaned in another kettle; and after being completely cool, is moulded in roundish lamps, wrapped round with leaves of trees, and packed for sale. It seems to partake of the nature of vegetable albuminous matter. The method of extracting the pulp, and preparing it for market, is simply by boiling the seeds in clear water, till they are perfectly extracted; after which the seeds are taken out, and the water left undisturbed for the pulp to subside. It is then drained off, and the sediment distributed into shallow vessels, and dried generally in the shade. See Roucou.

The annonto is now only prepared by the Spaniards. The English had formerly a manufacture at St. Angelo, now ruined. This drug is preferred by the dyers to indigo, and sold one-fourth dearer. The double Gloucester cheese is coloured with this dye, not with myrtogold. Some of the Dutch farmers use it to give a rich colour to their butter, and great quantities are sold to be applied to the same purpose in the English dairies. The poor people use it instead of saffron; and it is sometimes mixed as an ingredient in chocolate, during the grinding of the cocoa, in the quantity of about two drams to the pound, in order to give it a reddish colour; but the opinion of its being an earth has brought it into disrepute, and this use of it has been discontinued.

Some have recommended it as a good cordial, and a preferential against retention of urine. It is used by the Spaniards in America as a gentle laxative, as an antidote to the dyentory, and a stimulant. But it is never preferred for medical purposes in Europe.

To water it gives only a pale brownish yellow colour, and is not soluble in that liquid, nor in spirit of wine; but, in order to be fit for dyeing, it requires an alkaline menstruum, to which it gives a bright orange colour; and hence it is useful as an ingredient in varnishes and lacquers, and in dyeing wax of a vermilion colour. Wool and silk, boiled in a solution of it by alkaline salts in water, acquire a deep, but not a durable orange dye; for though it is not changed by alum or acids, it is discharged by lepaps, and destroyed by exposure to the air. It is said to be an antidote to the poisonous juice of manihot, or caiffa. The liquid field under the name of "Scott's varney dye," seems to be nothing but annon to dissolved in alkaline ley.

See more of this artificial preparation, and the manner of making it, in Dr. Lewis's Commercium Phil Techn, p. 234, &c. or Neumann's Works, p. 453, &c. Murray, Med. vol. iii. p. 292. Green's Chem. vol. i. p. 443.

ANNUAL, something which returns every year, or closes at the end of the year. Thus we say, an annual or yearly feast, office, commission, rent, revenue, income.

The annual motion of the earth, see proved under Earth.

Annual is sometimes used for the yearly rent or income of a prebendary, &c.

In which sense annuale amounts to the same with what we otherwise call annum.

Annual is also used, in Ecclesiastical Writers, to denote a yearly office, paid for the soul of a person deceased on the day of his obit, or anniversery.

Annual, in the Scotch Law, denotes any yearly revenue or due paid at certain times, either legal, as Martinmas and Whitsundaze; or conventional, as the parties agree.

In the acts of parliament made by Queen Mary, mention is made of ground-annual, due-annual, and top-annual; the meaning whereof is somewhat uncertain. See Annuel.

Annual argument of longitude. See Argument.

Annual equinox. See Equinox.

Annual equation of the mean motion of the sun and moon, and of the moon's apogee and nodes. See Equation.

Annual leaves, are such leaves of plants as come up afresh in the spring, and perish in winter. These stand opposed to evergreens.

Annual plants, called also simply annuals, in Gardening, commonly signify such plants as are of one year's duration, or which continue for the summer seasons, or a few months only. In general, however, all such plants as arise from seed found in the spring, arrive at maturity in the summer or autumn following, producing flowers and ripe seed; and which afterwards perish in their tops and roots, are considered as annuals. This last effect takes place in most sorts in the autumn and winter following; though some hardy kinds, when late found, will stand over the winter until the ensuing spring, especially those of the eulent sorts; but very few of the flowering kinds remain longer than October or November, unless protected by a greenhouse, garden-frame, or some other covering of a similar nature.

The plants of this tribe are very numerous, as most of U u those
of the herbaceous kinds, confining of uncultivated plants, weeds, &c.; and also a number of cultivated garden and field plants, both of the elegant and flowery ornamental kinds, are of this description. The half hardy are often termed simply annuals. They are likewise very extensive, and both of the hardy and tender kinds, some of which, from the peculiarity of their nature, and others from their producing beautiful flowers, are cultivated as ornaments to the flower garden and pleasure ground, during the summer and autumnal feasts.

The flowering annual plants are distinguished by gardeners into the hardy and tender sorts; the former being such as are capable of being raised from seeds sown on beds, borders, or other places in the natural and open ground, while the latter continually require to be sown, and to have some degree the aid of hot-beds, in order to promote their healthy growth.

The half hardy, or the hardy annuals, are also mostly sown in places where they are designed to remain and flower without being transplanted, as many of them do not succeed under such management; some, however, will answer in either method, and may be occasionally transplanted. But the tender annuals, after being sown and brought to a proper state of growth in hot-beds, are generally to be transplanted about May or June, either into pots or borders in the open ground.

1. Hardy Annuals.—The following are some of the principal of the hardy sort of flowering annuals: adonis, or adonis flower; alkekengi, white flowered, blue, yellow barried, red barried; amaranthus, prince's feather, love lies bleeding, purple; clyfen, white, sweet scented; amethystea, blue; balm, moldavian; belladonna, or summer cypress; calendula, or cape marigold; candy tuft, white flowered, purple, large white, crimson; catchfly, lobes red flowered, white purple, caterpillar; cherv, red topped, white topped; convolvulus, three coloured minor, minor blue and white, minor blue, major blue, great white, great striped blue, great purple, red; cyanus, or bluebottle, blue-flowered, purple, white, red, striped blue and white; cucumber, sporting; devil in a bush, blue flowered, white, nectar leaved; fumitory, yellow; hawthorn, yellow, red; hedgehog, trefild; snail-flapped, prickly, turbinated, globular, orbicular, long crooked twisted; honeywort, greater, less; bolly-hock, chinee variegated, double flowered; jacobea, or ragwort, purple flowered white; indian corn, tall growing, dwarf; kidney beans, scarlet runner, dwarf scarlet, large white runner; ketmia, bladder, larkspur, upright, bright, upright purple, upright white, upright rose colour, wogocket, rose rocket, rose rocket, dwarf wogocket, dwarf rose rocket, dwarf white rocket, dwarf blue rocket, dwarf red rocket, branching, blue branching, white branching, double and single flowered of all the different sorts; lavatona, cretan red flowered, white, purple; lupine, dwarf yellow, large yellow, white, great hairy blue, great hairy rose coloured, narrow leaved blue; lychnis, dwarf; marigold, double orange coloured, double yellow, double lemon coloured, gold coloured, party coloured, yellow ranunculus flowered, childing or profligine, cape marigold; mallow, curled leaved, oriental; mignonette, odoriferous or sweet scented; nasturtium, major or large growing, minor or dwarf; nohame, peruvian dwarf blue; nigella, or devil in a bush; pansy, or heart's cafe, common small variegated, large Dutch variegated, large purple, yellow, purple and yellow, purple yellow and white; peas, sweet scented, purple, white, painted lady, scarlet, tangier; pea, winged; pea, crown, white bloomed crown, painted lady crown, rose coloured; penta, oriental, red flowered, white flowered; poppy, large double purple, double red, white variegated, red and white spotted or carnation, dwarf red, dwarf purple, dwarf variegated, double and single of all the different sorts; queen's balm, fiorious, purple sweet, red flowered, white, striped, hen and chicken flowered, flax flowered; small trefild, flock gillyflower, ten weeks, purple flowered, red, white, scarlet dwarf French, wall-flower leaved red, wall-flower leaved purple, wall-flower leaved white, flock virgin, purple white; snap dragon, annual with white flowers, purple flowers, major or greater with flowers, purple white, yellow, scarlet, red and white, purple and white, red and yellow, white and red, yellow and white, scarlet gold dotted; flowerberry, pink, sun-flower, annual, tall growing dwarf, double flowered of each sort; sweet felts, purple, red, white, yellow; toad flax, three-leaved yellow, three-leaved purple, three leaved blue, variegated, white; branching yellow, tobacco, hardy round leaved, Virginia long leaved, Virginia broad leaved; Virginia or virgin's flax; Venus's looking glass, purple, white; Venus's novel coat, blue flowered; scarabium or eternal flower, red, purple, double flowered.

The authors of the "Universal Gardener," in which the above list is contained, observe, that the general feast for sowing all sorts of hardy annual plants is in the spring, from about the middle or latter end of February to the middle or latter end of April, for the principal blow; and also some in May and the beginning of June, for successive and late flowering, especially those of the quick flowering kinds of short duration, as candy tuft and virgin flax, &c.

The order or method of sowing all these is principally in little patches or clumps, to remain as mentioned above. These patches should be formed from about three or four, to five, six, or eight inches in diameter, at moderate distances, and in some sort of regularity, towards the front, middle, and back parts of the borders or beds; and also in a varied manner in respect to the plants; the smaller growing sorts being constantly sown more or less towards the fronts of the borders, according to their degrees of growth; and the larger kinds more backwards, in the same proportion. Some may likewise be occasionally sown in pots; and in all of which, each sort and respective varieties should be sown in separate patches, &c. from about a quarter of an inch to half an inch or an inch in depth, or but little more, according to the sizes of the different sorts of seeds; observing in this business to generally loosen and break the earth a little, so as to render it fine for each patch, especially if hard, stubborn, or cloddy; then drawing off a little depth of mould, according to circumstancess to one side, so as to feed the seeds many or few together in the patches, proportionately to the sizes of the respective plants, covering them regularly with the earth drawn aside to the depth required; and thus proceed in general, always placing a small short ditch, or some other mark, to each patch as the sowing goes on, in order to distinguish the places.

Some may also be occasionally sown in drills, either in beds separately, or on the borders; the low growing kinds towards the fronts, and the larger sorts towards the back parts; in which order of growing may be had virgin flaxs, candy tuft, larkspur, fucet peas of the different sorts, lupine, tenweek flaxs, &c.

After sowing, if it be dry warm weather, it will be beneficial to give occasional light waterings, both before and after the plants are come up, especially during their more early growth; and when they are come up about an inch or two in height, those in the patches will, in many sorts, require thinning, especially those of a large, tall growth, and bushy.
ANNUALS.

bulky kind, such as sun-flowers, 
precaria, Indian corn, tobacco, helverdes, marigold, &c: fome to one good plant in each patch; others to two or three plants, as hortula, curled and oriental mallow, strawberrv, spinach, Chinese bolly
ock, convolvulus, amaranthus, febricul, sweet Fulton, and similar kinds; and fome also left in small bunches, as candy tufa, lupins, larkspur, sweet peas, cynam, nufurium, convolvulus, 
Yvautes looking-gles, and navel sorts, mignonette, virgin flock, maltbrownian, balsam, and many others of similar growth. Or fome tenweek focks and mignonette may either remain thin in patches, or, where too thick, fome of each fock be transplanted in that order, three, four, or five together; or as required; also in many of the other focks, fome may occasionally be thinned out for transplanting, when required to supply deficiences, &c: always performing the binnets, as much as possible, in fower weather.

It is further remarked by the fame writers, that in the advancing growth of the plants, the principal culture is to keep them clean from weeds; and where any large focks remain too clofe or crowded together, to thin them according to their growth in some regular order; and in the larger tall growing kinds, some will require the support of ficks, as also most of the climbing or trailing focks, particulariy the sweet peas, convolvulus major, and large naturtium, &c: and to the climbers, some upright fmall branching ficks, trimmed up a little regularly, fhould be placed: the convolvulus and scarlet bean being volatile, or twining fickers, will ascend spirally upon any ftrait upright fick, pole, or fke.

If it fhould be required to have any defirable focks of thefe hardy annuals of moderate growth to fower early, they may be forwarded by fowing the fees in pots in February or March, and placing them in a hot-bed, or more successfully in a hot-house, &c: such as scarlet and other sweet peas, virgin flock, candy tufa, mignonette, tenweek focks, dwarf lupins, dwarf larkspur, queen's balsam, and several others, efpecially of limiar moderate growth.

As all the plants of this tribe of annuals generally produce plenty of ripe feed in autumn, care fhould be taken to save proper supplies of the different bell focks, as it ripens in perfeftion, in order to have plenty for fowing the enfuing spring to raise a production of new plants for flovering the following summer. In some focks the scattered, or self
found fees, difminated from the plants on the borders, will often come up naturally early in the spring; fuch as large
spur, prince's feather, percaria, &c: and which, if permitted to ftand, will flower sooner than the fping fown plants; but as many of thefe often ripe irregularly, they fhould be transplanted while young into some regular order; and as they are only chance productions, they fhould not prevent the regular fowing.

2. Tender Annuals.—The principal focks of which are contained in the following list: african marigold, orange co
coured, lemon coloured, deep yellow fibilious or quilled, waved flovered, dwarf, sweet fcented, double flovered of each fock; amaranthus, *greate or true, *bloody, trailing or love lies bleeding; *bolism red, scarlet, purple, fripped, variegated, double; *bim, common greater upright, sweet with broad leaves, fringed leaves, purple leaved, tricolore leaved, red flovered, purple flovered, long frilled, &c:, leaf or bufb balm with hoary leaves, dark purple leaved, variable leaved, &c: calendula, or cape marigold; *cypferum, long podded, short podded, heart podded, bell podded, angular podded, cherry podded, olive podded, red podded, scarlet podded, yellow podded; China-alba, blue flovered, purple, red, white, fripped, variegated, bonnet flovered, quilled flovered, double and fingle of each fock; Chinese bolly
ock, variegated, double; *crysanthemum, yellow, white, cream coloured, sulphur coloured, fibilious or quilled, double and fingle of each fock; convolvulus, major, with deep purple flowers, red, blue, white, deep blue; *cucumber, fiane faped; *egg plant or melangina, white, fruitef, purple fruitef; *french marigold, deep yellow, golden yellow, crimfion coloured velvety, crimfion and yellow striped, variegated crimfion and yellow, sweet fcented dwarf, double and fingle of each fock; *gourd, orange, pear faped, fripped pear faped, lemon, top faped, bottle or calabash buckler faped or squash, carbuncled, warted, long taper, long crooked, horn faped, large barrel faped, large globular, large oval, hemispherical yellow, floce, coloured, fife coloured, fandy coloured, party coloured, white, &c: *globe amaranthus, purple headed, white variegated, silver faped; Indian corn, tall growing dwarf; *india pink, bright red, purple white, red and white variegated, differently variegated, numerous, large imperial, double and fingle of each fock; *love apple, red fruitef, yellow fruitef, cherry faped; *maron of Peru, red flovered, yellow, white, purple, fripped, long tubed flovered; *melon, fiane faped or ferpent cucumber; mignonette, sweet fented; *nolana, trailing blue; *palmia criptis, major or tall growing, minor or leffer, molt broad leaved, leffer leaved, &c: *percaria, oriental, red flovered, white; *sultau flower yellow; *lock gilliflower, ten weeks, red, purple, white, scarlet, dwarf scarlet, dwarf white, wall flovered, white, wall flovered purple, double of each fock; to
bacco, Virginia long leaved, Virginia broad leaved; *tree
amaranthus, *cinna, red flovered, yellow.

In refpect to the culture of the more tender annuals, it is remarkef in the fame work, that they fhould be mostly either fown in a moderate hot-bed in March or April, and the young plants forwarded a little in growth therein, till setted warm weather, in the middle or latter end of May; and then transplanted; or fown in a bed of natural earth or warm border in April, protefed under a garden frame or glaffes, or at leaff defended in cold nights by garden mats; and in either method to be transplanted, in May or beginning of June, into beds, borders, pots, &c. in the flower and pleaure garden, to remain for flovering in summer and autumn. But that, where the convenience of a hot-bed is attainable, it is always adviseable to raise a principal supply by that means for earlier transplanting and flovering, as a portion of the different focks may be fown and raifed in one hot-bed, smaller or larger, according to the quantity required; fuch as a bed for one light, or for two or three light frames; or where considerable supplies are wanted, a larger extent of hot-bed will be necfary in proportion; making the bed or beds in March or the beginning of April, and defending them with a frame and lights, or hand-glaffes; or in want of thefe, protecting them with an awning of mats in cold nights and bad weather, oberving, in general, that only a moderate hot-bed, of about two feet thick in dung, will be fufficient; earthing it at top five or fix inches deep, with fine rich mould; in which fow the feed in small drills crofways, drawn with the finger two or three inches alder, from half an inch to an inch deep, according to the size of the different focks of feeds, which fhould be fown regularly, each fock feparately, and covered in eveny with the earth the fame depth, giving them air occasionally, by raifing one end of the glaffes an inch or two; or if a covering of mats, by taking them off, or turning them up in front in the day time; and according as the plants increafe in growth, admitting a larger portion of fresh air to strengthen and harden them by degrees, giving also occa-

U 2 fionally
fionally gentle waterings. Continue in this manner the care of the young plants until advanced two or three inches in growth, when it will be of advantage to prick out a quantity of the principal sorts into another moderate hot-bed, three, four, or five inches almand; or others into natural beds of light earth under frames and gla\ftes, or to be defended occasionally by mats; but in deficiency of hot-beds, frames, &c. they may, in general, be pricked out in the middle or latter end of May into natural beds in the open ground; all of which should be watered at the time, and afterwards occasionally; and shaded with mats from the sun, if convenient, till the plants have taken fresh root; observing also to give those in the hot-beds and under-glusses left or more air every mild day. When in three, four, or five weeks, in either of these beds, they have acquired a tolerable degree of strength and size, as four, five, or six inches growth, or more, according to the distance of the sorts, they should all be finally transplanted about the middle or latter end of May and beginning of June, into the open ground on the beds, borders, and other compartments, and into pots, to remain for flowering. Taking the opportunity of moist weather, if possible, for the work; and, where convenient, to remove and replant some sorts with a little ball of earth adhering about the roots, as it will be of great advantage in their more early flowering; watering them as soon as planted out, and afterwards as occasion may require, till freely rooted, and they discover signs of a renewal of growth.

It is added, that as any of the above raised plants have remained some time in the seed-bed not pricked out, they may probably have drawn one another up into a weekly growth, care should be taken to plant them out in May, as soon as the weather is fitted and favourably temperate, especially the more tender species that have this mark prefixed to them.

It is also observed, that ten-week flocks and mignonette may be sown in a hot-bed so early as February, or any time in March, in order to raise a few plants to prick out into pots, three or four in each, for the earliest flowering; or some may be sown in March in the natural earth, or a warm border, under gla\ftes or other occasional shelter, for early transplanting in April or May, into pots and flower borders, &c.

In the gourd kinds, when desirous to raise them in hot-beds, they should not be sown before April; for if sown earlier, they are apt to grow too large before the fæon becomes sufficiently warm to admit of planting them out in the open ground; or in the beginning or middle of May some may be sown in the natural ground, both for transplantation, and in patches to remain.

But where hot-beds, frames, gla\ftes, and other similar conveniences are deficient, many of the species and varieties of this class, as has been just observed, may be raised in the open ground, especially if not generally sown till the beginning, or towards the middle or latter end of April, according to the state of the fæon, sowing them in a warm border or other compartment, of light earth, or in pots placed in similar situations; and when the plants are advanced several inches in growth, prick them out into beds, or finally planting them out in May and the beginning of June. In this way they will all flower in tolerable perfection, but not generally so soon by a few weeks, nor all in an equal degree of full growth and perfection, as those which are forwarded in hot-beds, or under the protection of frames, gla\ftes, &c. to a proper size for earlier setting out.

The sorts that will occasionally the most readily succeed without the aid of hot-beds, &c. are the African and French marigold, cynanchum ciliare, fritillary, Indian pink, love-hearts, Nyctaginaceas, Papaver, tobacco, tobacco, Nicotiana, papyracea, and Indian corn; also gourds, if not sown till May; and sometimes palms, &c. and the love apple, in a temperate warm situation. All these may be sown in beds or borders of natural earth, in warm situations, as has been observed, but not in mod of the sorts before the middle of April; the plants being pricked or planted out in May or June into beds, borders, and pots, to remain for flowering.

In sowing the above sorts in the natural ground for want of hot-beds, if the beds or borders in which they are sown be defended under frames or hand-gla\ftes, or sheltered with mats, it will be of much advantage in raising the plants more successfully to a forward growth; and they will more conveniently apply proper strength for transplanting out and flowering.

There are some however of this kind, that cannot be sown in any tolerable perfection without hot-beds to bring them forward at all to a proper growth for transplanting. But in want of hot-beds, some under gla\ftes about the middle or latter end of April or beginning of May; and when the plants are advanced a few inches in growth, in the latter end of May or beginning of June, plant them out into borders, beds, and pots. The method by means of pots, beds, frames, and gla\ftes, is, however, by much the best.

In finally pricking out the plants in May and June, where they are to remain for flowering, showery weather is also of great advantage; and where any particular sorts can be removed and replanted with little balls of earth about their roots, that method should not be omitted. The bufinies may be performed in some with a garden trowel to make proper apertures, as for those with balls of earth full of roots; and others with a dibble, according to their growth. In most sorts, planting them singly, or one plant only in a place, and disposing them in the borders. &c. in a diversified manner, the smaller sorts more or less forward, and the larger sorts towards the middle and back parts, in some proportion to their different degrees of growth, as before directed. Some of the other principal sorts may also be placed in pots as required. But in the ten-week flocks, and other similar plants, it is always advisable to plant some in patches, three or four plants together, about three inches apart, both in the borders and in pots, in order that, as being of small growth, their flowers together may appear more conspicuous, and have a greater chance of producing some double flowered plants. Some mignonette and nolana, as being low plants, may also be planted in the front order. The love apple and gourd being of extreme rambling growth, may be planted against a south wall, paling, trellis, &c. especially the love apple, in order to have their extending branches trained thereto, that they may ripen their fruit more effectually in autumn. Gourds of the small fruited kinds may be planted in a similar manner, or against the railing of arbours, &c. in order to be trained up thereto in their advancing growth; others in capacious spaces, in large borders, &c. to have room to extend along the ground, or to be trained up to strong tall flakes. Moderate watering should be given directly in every case, especially in dry weather, and repeated occasionally till the plants have taken fresh root, and begun to grow.

The after-culture is chiefly to keep the plants clear from over-running weeds, and to give occasional support to those of large or tall growth; and sometimes where any branch out
out very irregularly, or in a rambling manner, in their advanced growth, as often happens in the African and French mangolbs and erythamemon, &c. they should be trimmed to the regular order; and some sorts, as the love apple and the goose kinds, if planted any where in the borders, being of a very rampant growth, be trained up to strong flakes, as before observed, both to prevent their over-running the adjacent plants, and that their fruits may appear more conspicuous, and ripen in greater perfection, especially the one apple. And such plants as have been planted in pots, will now be ready for moving in their respective pots occasionally, when in flower, to adorn particular compartments of the garden or other places, as may be required; and as the earth in the pots driks very fast in hot weather, they will require watering every day or two during the season. All or most of these plants will be flowering in June or July, and continue, in general, till September or October; and the greater part of them are highly ornamental, though there are a few sorts that are of little or no value for their flowers, as the capscium, love apple, egg plant and goose, being chiefly esteemed for the appearance of their fruit; and the palm chilli for its majestic growth and large palmate leaves. All the sorts produce ripe seed in Autumn, and soon after wholly perish: particular attention should therefore be given to collect proper supplies of seed from the best flowering plants of the different sorts: when dry, to be preserved for use in the succeeding spring.

There is, in addition to the above, a still more tender kind of annual plants; and which, according to the writers already mentioned, are superiorly ornamental and curious, some in the beauty of their flowers, others in the singularity of their beautifully coloured leaves, as in the amaranthus tricolor and bicolor; some for the curiosity of their fruit, as in the egg plant andsnake melon, &c.; and the humble and festive plants, from the singularly beautiful festive motion of their leaves; the ice plant, in its icy-lich or crystalline appearance; and the tree amaranthus, both in its large tall growth branching widely around, and its vast pendulous flower-spears often two or three feet long or more.

These are chiefly comprehended in the following list:

3. Tender Annuals.—Amaranthus, tricolor, bicolor, maximus or tree amaranthus, bloody, &c.; balsamum or fum, double fringed, double scarlet, double purple, double bizarre; brassilia; cock’s comb, tall purple headed, dwarf purple, crimson, buff coloured, yellow, branching; convolvulus, scarlet; egg plant; globe amaranthus; humble plant; ice plant, or diamond forms, oval leafed, pinnafied leaved; marcel of Peru; martynia, purple flowered, red, white; melon, snake shaped; frangoarium, double white, double purple, double fringed; festive plant, double flowered annual, common Shirley, humble; samin.

These very tender annuals are all to be raised in hot-beds in the spring, under frames, &c. till May or June; and in order to obtain them in a tolerable degree of perfection, two different hot-beds, at three, four, or five weeks intervals, will be necessary for sowing or raising them in: one the latter end of February, or any time in March, but not later than the beginning of April; the young plants, when about one, two, or three inches in height, being pricked out, some into small pots singly, others in the earth of the same bed if there be room enough, if not, into another hot-bed; and when they have advanced in growth, so as to crowd one another, they should be removed into another hot-bed, under a deeper frame, or the frame raised at bottom occasionally, as the plants rise in height. Some should be put in large pots, and others potted that were not so before, plugging the pots in the earth of the bed; or some may be put in the bed, six or eight inches asunder: water is then to be given in general, and the glasses put on. The whole from their first growth must have an admixture of fresh air every day, by raising the upper end of the glasses two or three inches, supplying them with moderate waterings. In this way they may be forwarded until the latter end of May, or sometime in June, according to their growth or the temperature of the season, as before suggested; but in the mean time, in their advancing stage, inure them gradually by degrees to the weather, particularly by gradually admitting a larger share of air, or by sometimes taking the glasses off entirely in warm days, &c.

The humble and festive plants should, in general, be continued contantly under glasses, in a green house, &c. or in a room window within, in the full sun; as, if fully exposed to the open air, it would deprive them of much of their lively festive motion, in which curious singularity their principal merit consists.

In order to raise some of the more curious sorts of this kind of annuals in the greatest perfection, such as the tall cock's comb, tricolor, bicolor, double fum, frangoarium, globe amaranthus, egg plants, &c. it will be necessary to have two or three different successive hot-beds under frames and glasses, at a month's interval; that is, a small one in March, to sow the seeds, and raise the plants an inch or two high; a second in April, of larger dimensions, in which to prick out the young plants from the seed bed, three, four, five, or six inches asunder; and sometimes a third in May, for a larger frame to receive them when transplanted in pots to remain till June, and they grow to full size; observing that while they are in the second and last hot-beds, the frames be occasionally raised or augmented in depth, according as the plants rise in height.

The first hot-bed for the seed should be made, as already directed, of suitable dimensions, and about two feet and a half deep in dung; the frame and glasses then put on, leaving one end of them open, to let out the rank flem of the dung; and in a few days, or when the first great flem and heat of the bed are gone off, the earth, which must be rich, light and dry, be put on four or five inches thick. The seeds of different sorts may now be sown, each kind separately, in small shallow drills, drawn with the finger, covering them with fine mould, from a quarter to half an inch deep, or with the very small seeds but very thinly. The glasses are then to be put on again, letting one end of them a little open, for the evaporation of the rising flem of the bed, covering them every night with garden mats. The plants mostly appear in a few days, when fresh air must be judiciously and with caution admitted, by propping up the ends of the glasses about an inch or two every mild day; and when the earth becomes dry, a very light sprinkling of water be given in a funny forenoon. The glasses should be mostly kept cloe in the nights; but if a strong flem and heat take place, they may be raised a little at one corner, for air to enter, and the flem to pass away, hanging the end of a mat over the tilted part, and continuing to cover the glasses with mats every night.

The care of the feeding plants is to be continued in the beds for about three weeks, or till they are advanced one, two, or three inches in growth, according to the different sorts; they are then to be pricked out into another newly made hot-bed.

When the plants in the feed hot-bed are advanced one...
two, or three inches, as above, another hot-bed should be put in readiness to receive them, making it for a two or three light frame according to the quantity of plants that are ready for the purpose. When the bed has imparted a proper degree of warmth to the earth, take up the plants with care, and in the same manner as directed above, prick them out into this, four or five inches distant, then give them a very light watering, and occasionally shade them in the middle of sunny days till they have flowered fresh roots, and admit air as before every fine day, by raising the upper ends of the glasses one or two inches; also occasional light waterings two or three times a week, in warm weather, and defend them in the nights with mats, and raise the frames, according as they extend in height, as before advised. After having had four or five weeks growth in this bed, if they have advanced considerably, as to meet and crowd one another much, it will be advisable, as already noticed, to remove them into a third and final hot-bed where it can be conveniently obtained; some being planted in the bed, others previously potted and placed in them, to be covered by glasses as directed above.

The frames, glasses, or other conveniences for these uses should be sufficiently large, especially for the tall plants, and capable of being raised at pleasure, as they advance in growth. The other management being the same as directed above. (See Hort. Anth.)

Before the plants are finally set out, they should always be occasionally exposed, and have the air freely admitted to them in the frames, at proper times, in order to harden them. And about the latter end of June, or beginning of July, when the weather is settled, they may be removed in their pots to the places where they are designed to remain for the summer.

This class of annual plants should always occupy the principal situations both in gardens and pleasure grounds, as in the most public and most frequented compartments in the front courts, &c.

The only culture that is necessary in any of the different sorts, when removed into the full air, is principally to supply them with suitable quantities of water, especially those in pots; and occasionally to such as are in borders, when first planted out, and till fully rooted; and to keep the whole clean from weeds, and supported with dicks, &c. where required.

They all flower from June or July till the end of autumn; and in August and September ripen seed, which should then be gathered from the best and most perfect plants, when the weather is quite dry.

The particular management of the different plants will be found under the genera to which they respectively belong.

**Annual meadow grass,** called in some parts of England Suffolk grass, is a species of grass which makes the finest turf, and teems well adapted to dairy-farms. See Poa Annua.

**Annualia,** yearly oblations anciently made by the relations of deceased persons on the day of their death.

This day they called year-day, &c. and on it mafs was celebrated with great solemnity.

**Annuel, ground,** according to Skene, is when the property of any land, whether built or unbuilt, is let or sold for a yearly rent, to be paid either to the proprietor, or to some chaplain or priet.

**Annuet, fire,** is either when the mail or due is dispofed of as a yearly revenue; or, when the land or tenement is let in a fee-farm heriditary, for a certain yearly sum to be paid under the denomination of feuda firma.

**Annuet, top,** is a due given or assigned out of houses or buildings, where the property remains with the former owner, only with the condition of his paying the said annu.

**Annuet of Norway,** of which mention is made in the acts of parliament of King James the Third, was an annuit payment of an hundred marks sterling, which the kings of Scotland were obliged to pay to the kings of Norway, in satisfaction for some pretentions which the latter had to the Scotch kingdom, by virtue of a conveyance made thereof by Malcolm Canmoin, who usurped the crown after his brother's decease.

This annulet was first established in 1266; in consideration whereof the Norwegians renounced all title to the inheritances of the kings of Scotland. It was paid till the year 1468, when the annuit, with all its arrears, was renounced in the contract of marriage between King James the Third, and Margaret, daughter of Christian the Fifth, king of Norway, Denmark, and Sweden. See Skene de rebus. Sign.

**Annuities Mammalian in Anatomy,** a pair of transverse muscles, at the root of the verte of the back, called also by Mr. Cowper recti internos minoris, because they lie under the recti majorae.

They are called annuities, from annus, to nod towards, because they help to nod the head, or draw it directly downwards and forwards.

Annuities signify any interest of money, rents, or pensions, payable from time to time, at particular periods.

The most general division of annuities is into annuities certain; and annuities the payment of which depends on a contingency; such, in particular, as the continuance of a life.

Annuities have been also divided into annuities in possession and annuities in reversions; the former meaning such as either have commenced, or are to commence immediately; and the latter such as will not commence till some particular future event has happened, or till some given period of time has expired.

Annuities may be farther considered as payable yearly, half-yearly, or quarterly.

The present value of an annuity is that sum which, being improved at compound interest, will be sufficient to pay the annuity.

The present value of an annuity certain, payable yearly, and the first payment of which is to be made at the end of a year, is calculated in the following manner.

Let the annuity be supposed to be 100l. the present value of the first payment of it, or of an hundred pounds to be received a year hence, is that sum in hand, which being put out to interest, will increase to 100l. in a year. In like manner, the present value of the second payment, or of 100l. to be received two years hence, is that sum in hand, which being put out to interest, will increase to 100l. in two years. The like is true of the value of the 3d, 4th, 5th, &c. payments; and the sum of the values of all the payments is the value of the annuity.

Let the interest be supposed to be 4 per cent. The sum which improved at 4 per cent. interest for the year will produce 100l. at the end of the year, is the sum which bears the same proportion to 100l. that 100l. bears to 100l. with 4 added to it, that is, 104l. Say then, as 104l. is to 100l. so is 100l. to a fourth proportional, which will be 96l. 15s. or 96l. 3s., the value of the first payment.

Again, the sum which improved at 4 per cent. for two years,
years, will produce 100l. at the end of two years, is the
sum which being now put out to interest will produce in a
year that sum which in one year more will produce 100l.
that is, it is the sum that will produce in a year 96l. 3s.;
for it has been just shown, that 96l. 3s. will in a year
produce 100l. Say then, as 104s. is to 100l. so is 96l. 3s.
or 95.15, to a fourth proportional, which will be 92.45,
or 91. 9s. The value therefore of the second payment is
92l. 9s.

By proceeding in this method it will be found that the
value of the 3d, 4th, 5th, &c. payments, are £88.89,
£85.48, £82.19, &c. The sum of 10, 20, or 100 of
these values, is £811, £1359, £2450, respectively, or the
present value of an annuity of 100l. payable for 10, 20, or
100 years. The sum of an infinite number of these values
is 2500l, or the value of a perpetual annuity of 100l. at 4
per cent.

In general: suppose r to denote 1l. increased by its in-
terest for a year, or the amount of 1l. in a year. Then
\[ \frac{1}{r} \]
will be the present value of 1l. to be received a year
hence; for r = i as 1 is to \( \frac{1}{r} \). Also \( \frac{1}{r^2} \) will be
the value of 1l. to be received at the end of two years;
for r = i as \( \frac{1}{r^2} \) is to \( \frac{1}{r} \). In like manner, \( \frac{1}{r^3} \),
\( \frac{1}{r^4} \), &c. will be the values of 1l. to be received at
the end of 3, 4, 5, &c. years respectively; and \( \frac{1}{r^n} \) will
be the value of 1l. to be received at the end of n years.
The value, therefore, of an annuity of 1l. for n years is
\[ \frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \frac{1}{r^4} + \cdots + \frac{1}{r^n} \]

conducted to n terms. And the
value of the perpetuity is the series continued in infini-
tum.

In order to find the sum of n terms of this series, put
S equal to it, or \( S = \frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \cdots + \frac{1}{r^n} \).

Then,
\[ S = \frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \frac{1}{r^4} + \cdots + \frac{1}{r^n} \]
\[ S - 1 = \frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \cdots + \frac{1}{r^n} \]
\[ S - 1 = S \times \frac{1}{r} \]

This is the general theorem for finding the sum of any
given number of the first terms of the series \( \frac{1}{r} \times \frac{1}{r^2} \times \frac{1}{r^3} \times \frac{1}{r^4} \times \cdots \times \frac{1}{r^n} \),
that is, for finding, from the rate of intereft
given, the value of an annuity certain, payable yearly for any
number of years. If the annuity is a perpetuity, it is plain
that \( \frac{1}{r^n} \), or the last term vanishing, \( \frac{1}{r} \times \frac{1}{r^2} \times \frac{1}{r^3} \) also van-
ishes; and, consequently, that the expression becomes
\[ S = \frac{1}{r} \] : from whence it results that the value of a
perpetuity is always unity divided by the interest of 1l. for
a year, or 100l. divided by the rate of intereft.

**Example**

Annuties certain differ in value as they are made payable,
yearly, half-yearly, quarterly, or at shorter intervals. Let r,
instead of denoting as before, 1l. increased by its intereft for
a year, denote the intereft only of 1l. for a year, and let n
denote the term or number of years during which the annu-
ity is to be paid. By reasoning as in the former case, the
value of the annuity will be
\[ \frac{1}{1 + r} + \frac{1}{(1 + r)^2} + \frac{1}{(1 + r)^3} + \cdots \]
\[ \frac{1}{1 + r^2} + \frac{1}{(1 + r^2)^2} + \frac{1}{(1 + r^2)^3} + \cdots \]
\[ \frac{1}{1 + r} + \frac{1}{1 + r^2} + \frac{1}{1 + r^3} + \frac{1}{1 + r^4} + \cdots \]
\[ \frac{1}{1 + r^n} + \frac{1}{1 + r^2n} + \frac{1}{1 + r^3n} + \frac{1}{1 + r^4n} + \cdots \]
accordiing as it is payable, either
half-yearly or quarterly. The firt of these series is
\[ \frac{1}{1 + r} \times \frac{1}{1 + r^2} + \frac{1}{1 + r^3} + \cdots \]
\[ \frac{1}{1 + r} + \frac{1}{1 + r^2} + \frac{1}{1 + r^3} + \frac{1}{1 + r^4} + \cdots \]
which series is known to express the number of which \( r^n \) is the hyperbolic logarithm. Let this number be called N, and the value of the annuity
in this case will be \( \frac{1}{r} - \frac{1}{r^N} \). If P be put for \( \frac{1}{r} \)
or the perpetuity, and y, b, g, and m, for the values of the annuity
according as it is payable, yearly, half-yearly, quarterly, or momentarily, the general theorems will then be
\[ y = P - P \times \frac{1}{1 + r} \]
\[ b = P - P \times \frac{1}{2 + r} \]
\[ g = P - P \times \frac{1}{1 + r^2} \]
\[ m = P - P \times \frac{1}{N} \]
Example I.
Let the rate of interest be 4 per cent and the term five years; and consequently \( r = 0.04, n = 5, t = 25 \), then
\[
y = 25 - 25 \times \frac{1}{1.04} = 2.4518
\]
\[
b = 25 - 25 \times \frac{1}{1.02} = 4.4913
\]
\[
q = 25 - 25 \times \frac{1}{1.01} = 4.5129
\]
\[
m = 25 - 25 \times \frac{1}{1.22198} = 4.5415
\]

Example II.
Let the rate of interest be the same, and the term for which the annuity is payable 50 years.
Then,
\[
y = 15.6226
\]
\[
b = 15.7118
\]
\[
q = 15.7094
\]
\[
m = 15.8010
\]

Example III.
Interest being the same, let the term be 50 years.
Then,
\[
y = 21.4822
\]
\[
b = 21.5491
\]
\[
q = 21.5820
\]
\[
m = 21.6160
\]

Example IV.
Interest being the same, let the term be 100 years.
Then,
\[
y = 24.505
\]
\[
b = 24.573
\]
\[
q = 24.5247
\]
\[
m = 24.542
\]

Sums may also be made payable at longer intervals than a year: such are fines required at stated times for the renewal of leases. Supposing these periods to be at the end of every \( n^\text{th} \) year, the series expressing their value will be
\[
\frac{1}{1 + r} + \frac{1}{(1 + r)^2} + \frac{1}{(1 + r)^3} + \ldots + \frac{1}{(1 + r)^n} = \frac{1}{1 + r} - 1,
\]
that is, divide \( r \) by the amount of \( r \) in \( n \) years (see Tab. I.) leant by unity, multiply the quotient by the fine, and the product will be the present value of all such fines for ever, if the first of them be payable at the end of \( n \) years. But if the fine be now due, unity must be added to the above-mentioned quotient, and the sum being multiplied by such fine, the product will be the value in this case.

Example. Supposing an estate of 100l. per annum held by lease, renewable every seven years, at a certain fine of 22l.; what is the value of such estate, computing at five per cent.? Ann. The amount of \( r \) in seven years, by Tab. I. is 1.502857.

Deducting unity from this number, and dividing 1l. by .502857, the remainder, we have 1.59 for the quotient, which, being multiplied by 22l. the given fine, produces 34.50l. for the present value of all such fines, supposing the first of them to be paid at the end of seven years. Now since the sec simple is worth 20 years purchase, or 200l. it follows that the difference between 34.50l. and 31.80l. of the value of this estate, subject to the payment of the fines every seven years. But if the fine be due, it will be worth 22l. less, or 14l. 4s.

The value of the reversion of a perpetual annuity, to be entered upon after a particular term, is "the value of the annuity for the given term subtracted from the perpetuity."

The numbers in this Table are the powers of 1. increased by its interest for a year: that is, they are the powers of the amount of 1. in a year, at the several rates of interest supposing r to be that amount, they are r, r², r³, r⁴, &c.

Use. To find the amount of any sum in any number of years, not exceeding 100. Ans. Opposite to the given number of years, and under the rate of interest, is the amount of 1. in that time, which, multiplied by the given sum, produces the required amount.

**Examples.**

1. What will 10l. amount to in 100 years at 4 per cent. per annum, compound interest? Ans. 50,564,48, multiplied by 10, is 505,448.

2. What will 25l. amount to in 50 years, at 5 per cent. per annum, compound interest? Ans. 11,467,64 multiplied by 250, is 2866,717.

**Table II.**

Shewing the principal that will amount to 1l. in any number of years not exceeding 100; or the present value of 1l. to be received at the end of any number of years not exceeding 100; discounting at any rate of compound interest from 3 to 6 per cent.

### Construction of Table II.

The numbers in this Table are the reciprocals of the corresponding numbers in the last, or the quotients of unity divided, by those numbers; that is, \( \frac{1}{r}, \frac{1}{r^2}, \frac{1}{r^3}, \frac{1}{r^4}, \ldots \).

\[ r = \text{Supposing } r \text{ to denote } 1/10 \text{th with its interest for a year. Ufe. } \]

To find what the present value is of any sum payable in any future time: and also what principal will amount to a given sum in any number of years. Anf. Opposite to the given number of years, and under the rate of interest, is the present value of \( r \) to be received at the end of the given time, or the sum that will amount to \( r \) in that time, which, multiplied by the given sum, produces the required value or principal.

1. What is the present value of 1000\(\ell \) to be received in 10 years hence, reckoning compound interest at 5 per cent.? **Ans.** 615915, multiplied by 1000, is 615.19. 3d. nearly.

2. What principal will amount to 1000\(\ell \) in 10 years, at 5 per cent. per ann. compound interest? **Ans.** 613913, multiplied by 1000, is 613.19. 3d.

3. What sum put out for 25 years at 4 per cent. compound interest will clear a debt of 400\(\ell \)? **Ans.** 331731, multiplied by 4000, is 1330.19. 6d.

Note: The table continues with rows for years 11 to 50, each row providing the amount of an annuity of £1. in any number of years not exceeding 100, when improved at compound interest.
ANNUITIES.
Table IV. continued.
years.


Constitution of Table IV.

The first number of each column in this Table is unity. The second is the first number in this Table added to the first number in the first Table. The third number is the second in this table added to the second in the first table, and so on: that is, the numbers in this Table are $1, 1 + r, 1 + r + r', 1 + r + r' + r", \text{etc.}$ which series, by proceeding in the same manner as in the case of \( \frac{1}{r} + \frac{1}{r'} + \frac{1}{r''}, \text{etc.} \)

expressing the value of an annuity certain, may be found

\[
\frac{r - 1}{r - 1}
\]

Use. To find the amount of an annuity for any number of years not exceeding 100. Multiply the amount in the Table opposite to the given number of years, and under the rate of interest, by the given annuity. The product is the answer.

Examples.

1. What will an annuity of $50 an amount to in 15 years, at \( \frac{3}{4} \) per cent. compound interest? Afs. 19.925.61, multiplied by 50, is 996.256.81.

2. What is the amount of an annuity of $20, in 28 years, at 4 per cent? Afs. 49.9675. multiplied by 20, is 999.35.

3. A person is paid off 1000.00 principal, bearing 4 per cent. interest, and in order to increase his income, resolves, in addition to the interest of 400.00 to take out of his principal 200.00 the first year, and afterwards as much more as will be necessary to make a constant income of 600.00 per annum, in what time will he reduce his principal to nothing? Afs. In the same time that an annuity of 200.00 would increase at 4 per cent. compound interest to 1000.00 that is, in 28 years by the preceding question.

He that would gain farther information on this subject should consult Malcolm's Arithmetic, from page 595 to the end; Simpson's Algebra, sect. 16; Mr. Dodson's Mathematical Repository, p. 298, &c. Jones's Synopsis, ch. 10. Phil. Trans. vol. lxi, p. 109, &c.

For an explanation of the doctrine of annuities on lives, see Assurance, Complement, Expectation, Life Annuities, Mortality, Reversions, Survivories.

Annuity, in Law, is a thing very different from a rent-charge, with which it is often confounded; because a rent-charge is a burden imposed upon, and issuing out of lands; whereas, an annuity is a yearly sum, chargeable only upon the person of the grantor. Therefore, if a man by deed grant to another the sum of 200.00 per annum, without expressing out of what lands it shall issue, no land at all shall be charged with it; but it is a mere personal annuity; which is of so little account in the law, that if granted to an ecclesiastical corporation, it is not within the statutes of mortmain; and yet a man may have a real estate in it, though its security is merely personal.

If the annuitant of an annuity payable half yearly, since the last term of payment, die before the half year is completed, nothing is due for the time he lives. There are now very few, if any grants of annuities, without a covenant for payment, expressed or implied; and therefore, where a distress cannot be made, or is not approved of, the grantee may bring an action of covenant, and recover the arrears in damages, with costs of suit. And that action is now usually brought, real actions, and writs of annuity, being much out of use.

The practice of purchasing annuities for lives, at a certain price or premium, instead of advancing the fame sum on an ordinary loan, arises usually from the inability of the borrower to give the lender a permanent security for the return of the money borrowed, at any one period of time. He therefore stipulates (in effect) to repay annually, during his life, some part of the money borrowed; together with legal interest for so much of the principal as annually remains unpaid, and an additional compensation for the extraordinary hazard of losing that principal entirely by the contingency of the borrower's death; all which considerations, being calculated and blended together, will constitute the just proportion or quantum of the annuity which ought to be granted. If, by the terms of the contract, the latter's principal is boni fide (and not colourfully) put in jeopardy, no inequality of price will make it an amiable bargain; though under some circumstances of imposition, it may be relied against in equity. To throw, however, some check upon improper transactions of this kind, which are usually carried on with great secrecy, the statute 17 Geo. III. c. 26, usually called the "Annuity Act," has directed, that upon the sale of any life-annuity of more than the value of 100.00 per annum (unless on a sufficient pledge of lands in fee-simple, or stock in the public funds), the true consideration, which shall be in money only, shall be set forth and described in the security itself; and a memorial of the date of the security, of the names of the parties, estate que tristes, estate que vices, and witnesses, of the consideration money, shall, within 20 days after its execution, be enrolled in the court of Chancery; if the security shall be null and void; and in case of collusive practices respecting the consideration, the court in which any action is brought, or judgment obtained upon such collusive security, may order the same to be cancelled, and judgment (if any) to be vacated; if the security be set aside for want of complying with the formalities of the act, the consideration, if fair and legal, may be recovered back by the grantee, in action of "assumpsit" against the person actually receiving such consideration money, but not against the surey: and all contracts for the purchase of annuities from infants, shall remain utterly void, and be incapable of confirmation after such infants arrive to the age of maturity. Blackh. Com. vol. ii. p. 40—401, &c.

Annuities, Public. See National Debt and Fund.

ANNULAR, Annularis, something that relates to, or resembles a ring, by the Latins called annulus.

ANNULAR cartilage, or Annularis, in Anatomy, is the second cartilage of the larynx, being round, in shape much resembling a ring, and investing the whole larynx; called also cricoides. See Larynx.

ANNULAR clefts, in Astronomy. See Eclipse.

Annular ligaments, ligamenta annularia, is a name given to those ligaments which confine the tendons of the Carpus and Tarsus.

Add, that the sphincter muscle of the anus is also called annularis, or annular muscle, from its figure.

Annular process, or protruberance, is a prominent part of the medulla oblongata. See Brain.

Annular is also an epithet given to the fourth finger; popularly called the ring finger.

ANNULARIA, in Entomology, a species of phalena, of the geometra section. The wings are cinereous, with a brown streak, a ring in the middle, and two brown bands behind: inhabits Germany. Fabricius, Gmelin, &c.

ANNULARIS, a species of cerambyx, in the section calidium, Gmelin's arrangement. The thorax is spotted with black, wing-cases bidentated and rather greenish, with three black bands, the first annular: inhabits Siam. Fabricius and Gmelin.
Annullaria, is also a species of tenthredo, that inhabits Austria. It is shining black, tips of the antennae white, shanks of the legs ferruginous. Fabricius.

Annullaria, in Entomology, a species of chelodown. The body is flattened, and has a fan-shaped ring on the lateral line. Gmelin. The body is brown, with blue incurvated, and covered with very small scales; the irises of the eyes are silvery; Gill covers of two pieces, the anterior one of which is toothed and spinous; lateral line parallel with the back, anus in the middle of the body; anal fin, round with a streak of blue; dorsal fin, black brown, the others white. This is an ictan batocjang ake, and ican cumpus cambodia, of Valent. Ind. &c.

Annulata, in Entomology, a species of cassida, found in India, and described by Fabricius. It is blue, with two rufous spots on the thorax, and rings of the same colour on the wing-cages. Fab. and Gmelin. Ofj. This is a large species; the thorax is obscure, with a faint rufous spot on each side; wing-cages gibbous, dull blue, with fix rufous annulations; beneath, black, with a rufous dot on both sides each segment of the abdomen.

Annulata, a species of chrysomela, in the section altea. It is brown bronzed; wing-cages striated and crested; base of the antenna rufous; shanks of the anterior legs rufous, with a bronzy-brown annulation. Linneus and Gmelin.

Annulata, a species of nepa, that inhabits the coast of Coromandel. It is with a tail, subrotund, pale brown; shanks of the anterior legs pale, annulated with brown. Fabricius.

Annulata, a species of sphinx, in the Linnean arrangement; zygana, in that of Fabricius. It is black, with six yellow spots on the anterior wings; base of the posterior wings and spot yellow; abdomen annulated with yellow: inhabits New Holland.

Annulata, a species of phalaena, found in Hamburg, and described by Fabricius. The wings are black, with snowy-white spots; shanks of the legs annulated with white.

Annulata, a species of phryganae, that inhabits Europe. It is brown, with long antennae annulated with white; inner and posterior margins of the wings ciliated. Linneus, Gmelin, &c.

Annulata, a name under which two different species of tenthredo are described by Gmelin in the Syntema natural: one is the Linnean species of that name, but the other is adopted, with great impropiety, from the mantissa of Fabricius. To prevent in some measure the confusion which might evidently arise from the same name being assigned to two distinct insects, it is necessary to attend to the characters of the two sections to which they belong. Tenthredo annulata, Linnaeus, is in the section "antennis filiformibus, articulis 7—9" antennae filiform, from seven to nine articulations; and the other in that of "antennis ex-articulatis, extrorsum craflriouis," antennae without articulations, and thickset at the tip. The first species is yellow, with the antenae somewhat elevated and black; tip of the shanks and ends of the feet annulated with black. The second is black, the abdomen yellow, feet of the posterior legs black, annulated with white. Fabricius Mant. Both kinds inhabit Europe.

Annulata, a species of apis, found in Europe. It is small, and smells like musk; the colour is black; front and rings on the legs white. Linneus and Fabricius.

Annulata, a species of tipula. The wings are brown, variegated; thighs annulated with white: inhabits Europe. Linneus, Fabricius, &c.

Annulata, a species of conops that inhabits Europe. The thorax is black; abdomen cylindrical, variegated with yellow and black; base of the wings and legs ferruginous, the latter annulated with brown. Linneus and Gmelin.

Annulata, a species of podura. It is livid, with black rings; and inhabits Europe. Fabricius and Gmelin. This is podura livida lutca, annulus transversis nigris of Geoffroy.

Annulata, in Conchology, a species of ostrea, that inhabits the North Seas; and supposed by some to be a variety of oyster papyracea. The shell is oviform, orbicular, and white, with concentric semi-circles. Gmelin and Mull.

Annulata, a species of voluta. It is white, smooth, with a carinated dorso ring; its habitat is unknown, and there is a variety of it (D), undulated with pale red. Gmelin, Martini, &c.

Annulata, a species of helix. The shell is unbilicated, slightly depressed, and white; wreaths four, the first gibbous and bicarinated. Gmelin.

Annulatorius, in Entomology, a species of ichneumon, found in Great Britain, and described by Fabricius from a specimen in the cabinet of Sir Joseph Banks, Bart. The scutellum is yellowish; thorax spotted, and four first segments of the abdomen margined with yellow; wings transparent. Fabricius and Gmelin.

Annulatum, in Conchology, a species of dentula. It is round and striated obliquely; found in a fossil slate. Gmelin, Guettard, &c.

Annulatus, in Conchology, a species of trochus, found in the sands of the Indian sea. The wreaths are reversed, and ribbed on each side; aperture almost square. Gmelin, Chenm. &c. This is a small species, scarcely exceeding a quarter of an inch in length, and the number of wreaths are usually from twelve to fifteen.

Annulatus, is likewise the specific name of a shell of the turbo genus; its native place is unknown; it is figured by Guettler, and thus very concisely characterized by Gmelin; wreaths with a prominent and margined future: this shell is white, a quarter of an inch in length, aperture suboval.

Annulatus, in Entomology, a species of curculio, that inhabits North America. It is pale, thorax and wing-cages streaked with black. Fabricius and Gmelin. The streaks are disposed transversely, one upon the thorax, and two on the wing-cages.

Annulatus, a species of cerambyx, in the section lucta, having a flatish thorax, gibbous front, wings bluish-black, and blue within; it inhabits America; and is of a reddish grey, and rough, with elevated dots; abdomen annulated, with a few greenish rings; antennae yellow, with black rings.

Annulatus, a species of cimex, described by Fabricius and Gmelin as a native of Virginia. It is greyish, thighs annulated with white. This belongs to the family spinoetus, in the Gmelinian arrangement of cimices, and must not be confounded with another of the same name in the family oblongus, which is an European insect. It is black, posterior part of the thorax and anterior of the wing-cages greyish; legs annulated with brown. Gmelin. There is also another
another species of cinnix in the family rodervius, called annulatus, which likewise inhabits Europe. The tips of the antennae are capillary; body black, with fainqueous spots on the under side. Limnæus. This hal is cinnixiger typtes of Desqueer.

*Annulatus*, a species of ichtyomus, that inhabits Europe. It is black, with rufous legs; thinsk and feet of the polarier pair annulated with white. Gmelin.

*Annulatus*, a species of asilus, that inhabits India. It is cinerous; abdomen black at the end; thighs teldeous, annulated with black. Fabricius and Gmelin.

*Annulatus*, a species of coleus. It is brown; abdomen and legs annulated with white; wings spotted. Fabricius and Gmelin. In the size and shape, it resembles the common gunt (coleus piipiens); the back is half the length of the body. Inhabit Germany and Denmark.

*Annulatus*, in Ornithology, a species of oolus that inhabits America, and is considered as a bird of prey. It is yellow; head and neck black; greater wing-coverts and quil-fathers blackish, edged with pale yellow; a blackish band across the tail. Gmelin, &c.

This is the ring-tailed oriole of Latham; axis ocozintitzcan of Schub; scutum-oriole of Buffon; &c. Aria of M. Labor of Braun; and cornix flavo of Klein. It is about the size of a pigeon; the bill yellow, and a little bent at the point; head and neck black; body yellow; tail yellow; each feather marked transversely with a broad blackish band; and, which, when the tail is expanded, forms a crescent, with the concave part towards the body; legs grey.

*Annulatus*, in Zoology, a species of culkur; described by Linnaeus and Gmelin, as having 190 abdominal scuta or plates on the belly, and 96 subcaudal scales; but it appears from fynonymous authors, that the number of these plates and scales vary exceedingly in different specimens, and that its specific characters should rather be taken from the colour, form and disposition of the spots, which are less liable to variations: in one instance, for example, the abdominal scuta amounted to only 184, and the subcaudal scales to 60; in another to 186—84; and in a third to 186—95. Its general description is, back, cinereous grey, brownish, or brownish-white, with a band, or series of round, alternate, brown spots, that occasionally join or become confluent, especially at some distance down the neck, and are surrounded with pale margins; belly white. Dr. Shaw's specific character is, C. griseus, maculos dusfibius rotundus fulcis palido marginatis. Grey male, with round, brown, dorai spots, with pale margins. Vol. iii. p. 4. 45o.

This creature inhabits America, is from a foot and a half to two or three feet in length; the head is rather large, as are also the scales that cover it; the tail gradually tapering.

*Annulatus*, a species of anguis, of a white colour, with straight brown stripes that meet on the under side; tail tapering, and a double row of imbricated scales beneath. Laf. Gmelin.

*Annulet*, from the Latin annulius, a ring, in Heraldry, granted in coat-armour to those who were in con- fidence, or enfruited with eptical conmions by the king; the annulet, or ring, being the gage of the royal favour and protection. It is also borne as a mark of filtration for the fifth foa. The colour of the annulet must always be expressed.

Annulats were much exhibited as a mark of nobility and jurisdiction; it being the custom of prelates to receive their insignia for baccan and annulat.

*Annulatus*, in Architecture, are small square members, in the Doric capital, placed under the quarter ground. They are also called silius, latles, &c.

*Annulatus* is also used for a narrow flat moulding, common to other parts of a column; viz. the bases, &c. as well as the capital; to called, because it encompasses the column around. In which sense annulet is frequently used for bayonett, or little folding.

*Annulling*, a compound of ad and annulus, noun; q. d. undoing; the abolishing of an act, procedure, sentence, or the like.

*Annulosis*, in Entomology, a species of ichthyomus, found in Europe. It is black; antennae slightly annulated with black; legs rufous; flight short. Linnaeus and Gmelin.

*Annulus*, in Conchology, a species of cypria, very common about Amboyina, and also Alexandreia. It is of an ochreous colour on the outside, and blue within. Its specific character is, frill surrouned on the back with a yellow ring. Linnaeus and Gmelin. This is the thoracicium quadratum of Runphius.

*Annulus*, in Entomology, a species of cassisida, that inhabits Cayenne. It is yellowish, brown in the centre, and annulated in the middle with yellow. Fabricius, Spec. Inf.

*Annulus*, a species of avis, grey and downy, thorax black; and a black clouded band in the middle of the abdomen. Linnaeus and Gmelin. Inhabit Europe.

*Annulus*, or Ring, in Geometry. The area of it may be had by finding the areas of the outer and inner circles, and their difference is the area required. Or, multiply the sum of the diameters by their difference, and the product by 7854.

*Annunciation*, or Anunciation. This order was instituted by Ame VI. earl of Savoy, under the title of the *Collar*, in 1367, in honour of the fifteen divine mysteries of the rota. Favin, on a mistaken ground, calls it *The Order of the Menes of Love*, in regard its founder had received of his lady a bracelet made of the trellies of her hair, plated in love-knots; and that the Founder should signify frapets, entras, rompes tout. It remained, however, as the collar, till Charles II. or Le-bon, duke of Savoy, who bellowed on it the title of the *Annunciation*, from the picture of the Annunciation which he annexed to the picture of the Collar. The founder appointed the number of knihts to be fifteen; among whom was Sir Richard Mufard, an English gentleman, in 1434; their number was increased in 1568; to twenty. Rien caselle, in Burger, was their principal feast. The ancient collar was of gold, three fingers broad; on which were engraved the letters F.E.R.T. and one knot, called the Savoy Knot, at the end of each F.E.R.T., which, with three other knots enenumerate one within the other, made up the circumference pendant at the collar, without any figure. The initials were supposed to be for the words Fortitudo Deus Rhodum Temet, alluding to Anandus le Grand, who so valiantly defended Rhodes against the Turks in 1310. This, however, was long after the house of Savoy took that device; as appears from the coins of Lewis de Savoy, baron de Vaucl, who died in 1301; as also from the monument of Thomas de Savoy, who died in 1239, when several was lying at the feet of his portraiture, a dog, bearing a collor about his neck, with the word Fert; also a silver coin of Peter de Savoy (who erected in England the building of that name in the Strand, temp. Hen. III.) wherein is the word Fert, in Gothic characters. Duke Charles III. farnamed the Good, in 1518, ordered that the badge or mystery of the Annunciation of the Blessed Virgin should be represented within a circle of gold, formed of true-
true-lover's knot, pendant to the collar, which was to be of gold, weighing two hundred gold crowns, and composed of the letters F. E. T. intermixed with true-lover's knots, separated by fifteen rosen of gold, five of them enamelled rubie, five red, and five partly rubie and red, and edged with two thorns gold. The knights wear in common the badge pendant to three small chains of gold round the neck. The reigning king of Sardinia is sovereign of the order.

ANNUNCIATION, compounded of ad and nuncio, I declare, the tidings which the angel Gabriel brought to the Holy Virgin, of the incarnation of Christ.

The Greeks call it κοινήσεα, good tidings, and καταναστασις, signalation.

ANNUNCIATION is also the name of a feast, celebrated annually on the 25th of March, popularly called Lady-day, in commemoration of that wonderful event.

Some authors are of opinion, that the feast was originally solemnized in honour of our Saviour; and that the holding it in the name and honour of the Virgin is of much later standing. This feast seems to be of great antiquity. Among the fermons of St. Augustine, who died in 430, we have two upon the Annunciation. Proculus, who died in 468, and Chrysostom in 407, have, in their works, discourses on this subject. But the Protestant writers reject these authorities, and the writings on which they are founded, as fpiromus. Bingham refers the commencement of this feast to the fourteenth century.

Several of the eastern churches celebrate the Annunciation at a different season from those of the west. The Syrians call it Reza, q. d. search, inquiry; and mark it in the calendar for the first day of December. The Armenians hold it on the fifth of January; thus anticipating the time, to prevent its falling in Lent; but the Greeks make no scruple of celebrating the festival even in Lent. In the west likewise, there has been some variation as to the time of keeping this feast. The tenth council of Toledo, in 639, ordained it to be celebrated eight days before Christmas.

The Jews also give the title Annunciation to part of the ceremony of their passover; viz. that, wherein they explain the origin and occasion of that solemnity. This explanation they call נס בָּנָן, Haggada, q. d. the Annunciation.

ANNUNCiator, in the Greek Church, an officer whose business is to give notice of the feasts and holydays to be observed.

ANNUNTIate, Annuntiada, or Annuntiata, a denomination common to several orders, both religious and military; instituted with a view to the Annunciation. The first religious order of this kind was instituted in 1232, by seven Florentine merchants. These are also called servites, q. d. servants.

The second was a nunnery at Bourges, founded in 1500, by Joan of Valois, queen of France, after her divorce from Lewis XII.

The third also a nunnery, founded by a Genevoise lady in 1604. The fourth was a friary, founded by Cardinal Torrecrema, at Rome, in 1463; which last became so very rich, that it gave fortunes of 60 Roman crowns to above four hundred girls, on the anniversary of the Annunciation.

ANNY, in Geography, a river of France, on the coast of the English channel, north of the river Soame, and south from Boulogne.

ANO, in Zoology, bos bulalus amus, a variety of the buffalo, mentioned by Pennant, Hist. of Quadr. vol. i. Vol. II.

p. 30. This animal is about the size of a middling sheep; it inhabits the mountains of Celebes; is very fierce, lives in small herds, sheltering itself in the caverns of the mountains; is caught with difficulty, and is very impatient of confinement.

ANOBIUM, in Entomology, a genus of coleopterous insects, in the Fabrian system, having four clavate palpi, or feelers; jaws obtuse and dentated; lip entire; and antennae filiform; with the three extreme joints elongated, and rather thicker than the others. Fabrius. This genus includes some insects of the ptinus and dermestes genera, of the Linean system, and byrrhus of Geoffroy; besides some new species not described by either. In the species infectorum, the species of this genus are, pterinax, molle, frumentaria, flavipes, nigriurn, lintumatum, cyanum, & minutum, in all eight species; the arrangement in the last system of that author, Entomologia Systematica, is somewhat different, being testellatum, litteratum, rupipes, cattaneum, pterinax, bolchi, molle, panicum, ablectis, planum, capefle, minutum, mecanis, & nitidum.

Oliver adopts the genus anobium after Fabrius, describing the species testellatum, litteratum, cattaneum, & panicum, as insects of that genus; and Gmelin, in the Systema Naturae, makes the first division of the ptinus of Linnaeus, "palpis clavatis," (clavate feelers), anobiurn of Fab. to distinguish them from the true ptini which have the feelers filiform. Professor Thunberg has also described several species of anobiurn in his Nov. Inf. as rutipes, cervicium, &c, but which Gmelin configns to the dermestes genus in the Linean system.

ANOCYUSTI, an imaginary name of a medicin, concerning which many fruitless conjectures have been made. The word occurs only in Gaza's translation of the account which Theophrastus has left us of the eunymus of those times. The author says, that the goats which eat the leaves and fruit of the eunymus were killed by it, and that they died of a leprosy of the bowels, which he has expressed by the word ἀνοξυς, derived from the verb ἀνόξυσι, which signifies a retention of the fluids.

It is to be observed by the way, that the eunymus of the Greeks could not be the same plant known at this time by that name, since the cattle eat our euonymus or fusiform whenever they can get it, and that without any danger; but the descriptions of those plants in the ancient and modern authors shew also that they were very different.

ANOCYSTORON, in Eecrolofical History, a name used by some writers for a church.

Anocystora properly import Roman halls, divers of which were converted into churches. In which sense anocystora amount to much the same with basilica.

ANOCYSTI, in Natural History, the name of one of the subdivisions of echinus genus, in the arrangement of Klein and other naturalists; consisting of such as have the vent at the top of the shell, and all the tentacula simple, (ano verticali, tentacula undique simplicibus). This is the first of the three principal divisions of the echinus in the Linean system, by Gmelin; the second is britius of Müller, in which the vent is situated at the bottom of the shell, and the mouth dillitius of tentacula; the third is spatangi of Müller, having the vent on the side, and the mouth furnished with pencilled tentacula. Each of these divisions are again subdivided according to the shape of the shell. See Ec Translator.

ANODA, in Botany. See Sida.

In Gmelin's edition of Linnaeus, anoda is a genus of the monadelphia polyandra class and order; the characters of which
which are, that the caless is simple, semiquinquefid, permanent, and very much diluted by the ripe fruit; and the cap-

folae is many-celled, above hemispherical, beneath flat-

plane, with stiff-edged cells. There are three species.

1. A. delitiosa, with triangular leaves, the lower cutened,

the upper oblongely cutened and petiolated, with pedun-

cles axillary, single-flowered, and very long. 2. A. balsate,

sida crisata, with corded, angular leaves; the upper elon-

gated and halated, with very long, axillary, and single-

flowered peduncles. 3. A. triloba, with the inferior leaves
cordated, somewhat angular and cutened; the upper tri-

lobed, with axillary, solitary, very long, and single-flowered

peduncles.

ANOYNE, derived from the privative a, and obsta,
dole, to be in pain, in Phvsic, is understood of such reme-
dies, as calm and allay pain. It is now generally em-
ployed for those medicines which relieve pain by diminu-
ing or destroying sensibility; and in this sense, the general
term is allowable.

Anodynes are of two kinds; the first proper, called also

dosages. The second febulous, or improper, which rather

sharpen than alleviate; acting only by inducing a fluctu-
dousness, or sleep. These are more properly called narco-
sic, hypnotics, or opiates.

The true anodynes are applied externally to the part af-
fected. Such, among the class of simples, are the onion,
lily, root ofmallows, leaves of violets, elder, &c. Cam-
pohor is said to be the best anodyne in nervous cafes, and at
the decline of fevers.

Anodynes should not be given without great caution, nor
on a full stomach, nor in droppies. Hemlock procures ease
and sleep, without caufing that head-ach next morning,
usually complained of after taking opium. If the pulse be
strong, a larger dose is safe; if weak, a less dose must be
given.

We have also certain compound medicines in the shops,
pread with this intention, and called by this name. Such
is the anodyne liniment, commonly called anodyne laflisum,
pread in the following manner: take of opium one ounce,
white Caliie soap four ounces, camphor two ounces, essen-
tial oil of rosemary half an ounce, and rectified spirit of wine
two pounds; digest the opium and soap in the spirit for
three days; then to the strained liquor add the camphor
and oil, diligently shaking the vefsel. It is re-
mended not only for procuring ease in the most racking
extremities of pain, but also for allifying in discharging
the peccant matters that occafioned it. This laflisum is much
the fame with the modern opodelco. A ready way of prepa-
ring an useful, safe, and efficacious anodyne, is as follows: take
half an ounce of opium, dissolve it in a gentle heat in three
ounces of water, stir the solution, and evaporate it to a
dry fhubance; grind this to powder in a glaf's mortar with
twice the quantity of loof-lugar, and you have an excellent
preparation of opium, to be given three or four grains for a

By dissolving the opium thus in water, we get rid, not
only of its grubs and foul parts, but also of its reffinous,
which are found much more pernicious than the cell; and
by dividing its parts afterwards with sugar, the medicine
is rendered more uniform, refidue, and mifeible with ani-
mal fluids.

But however opium is prepared, it still must be acknow-
ledged, that it retains qualities that make it little les than
a poifon in a very large dose; whence it were much to be
willed something could be found that would be more inno-
cent, and yet answer the fame purpofe. And this camphor
and nitre will do on many, though not on all occasions.

An anodyne ointment may be prepared, by mixing ten
drams of olive oil, half an ounce of yellow wax, and one
 dram of crude opium. Opiurn, thus externally applied,
will in some degree produce the fame effect, as when it is
used under the form of anodyne laflisum, in which it teate
produces effects more immediately; but under this form, its
effects are more permanent. The present ointment also fur-
vives an useful drugging for forces attended with twere pain.
For Hoffman's anodyne, see Liquor Minerais Anodynes.

ANOINTED. See Christ, and Messiah.

ANOINTING, in Ecclesiastical History, a religiouf fict
formerly jubilating in fonie parts of England, fo called from
the ceremony they used in anointing all person's before they
admitted them into their church. They founded their opinion
of anointing upon the fifth of James, verfes 14 and 15.
See Plott's Oxfordh. 268.

ANOINTING, a term used by painters. It implies their
method of reftoring the effect of the colours, after the oil
has been drained out of them, by the aborption of the
ground of the picture, or the former coat or layer of col-
ours, whilst they were drying, termed improperly the fink-
ings of the colours. This anointing is performed by means
of varnish, oil, or both together, rubbed in with an hard
hogs hair tool. Besides reftoring the appearance of the
colours, it has another effect; that of disposing the picture
to receive with advantage the future touches of the brush or
pencil. When the anointing is newly laid on, it promotes
leftness and union; and when almoft, but not perfectly dry,
it difposes the picture to receive smurt or crank touches.
Some painters have been more liberal in the quantity of var-
nish, &c. in anointing than may be judicious; too much oil
should not be applied to the more brilliant and lighter parts
of pictures; nor should japanners' gold-fize be introduced in
anointing, unlefs with great caution.

Without an application of this nature, it would be almost
impossible for the painter of delicate works to proceed with
any degree of certainty. The best mixture for this purpo,
se, is an equal quantity of ftrong drying oil and maltich varn
th united. This will retain its clammy nature long enough
for the purpo of the artift, while he covers with paint the
aonted portion.

Thoef who proceed more slowly with the pencil than is
ufual, will do well to ufe a little fat linseed oil with the mix-
ture we have mentioned, which will not so soon grow hard
or dry. Gerrard Lairesfe, whose pictures retain their col-
lours, has recommended this mixture with fat oil, upon re-
touching pictures; and this in a plentiful manner, in order
that the picture may not require varnifhing. On the con-
trary, Mr. Bardwell recommends the anointing as neceffary,
but that almoft the whole should be wiped o££ with an old
filk handkerchief, before the paint is applied to the picture.
The glazing colours should in general be applied with a liberal
ufe of the anointing mixture; and those colours which are ued
in the feubbing of pictures should be employed more
sparingly. See Glazing and Scumbling. Tiffian appears
to have proceeded in this manner with his pictures, and to
have thus produced his most admirable effects.

ANOLE, in Zoology, the name of a species of lizard
common in the West Indies, about houses and plantations.
It is of the size of the common lizard of Europe, but its head
is longer; its skin is of a yellowish colour, and its back va-
riegated with green, blue, and grey lines running from the
neck to the tail. They creep into holea for the night, and
there make a continual and very disagreable noise; in the
day time, they are always in motion.

ANOLYMPIDES, in Antiquity, a name given by the
Eleans to thofe Olympic games which had been celebrated
under
under the direction of the Pisans and Arcadians. The
Eleans claimed the sole right of managing the Olympic
games, in which they sometimes met with competitors.
The hundred and fourth Olympiad was celebrated by order of the
Arcadians, by whom the Eleans were at that time reduced
very low; this, as well as those managed by the inhabitants of
Pisa, they called ανομαλαισεως, unlawful Olympiads, and
left them out of their annals, wherein the names of the vic-
tors, and other occurrences, were registered. Potter, Arch.
Greece.

ANOMALIA, in Conchology, a species of patella, in
the family "integrigem abique vertice mucronato." It is a
coarse, brown, orbicular shell, with the vertex submarginal;
and inhabits the deeps of the Norway seas. Mull. This shell
is minute and rough, with fine elevated dots; sometimes of
a cinereous colour, and blue beneath. The animal con-
fits of two reddish, tough, twittled mafles, which are fringed
the whole length; the fringes are yellow, composed of rigid
hairs, and connected with the rest of the body by a blue ten-
don; the ovaries are ramose, and orange; the eggs globose.
It is uncertain whether this shell belongs to the patella
genus or not. Mull. Gmelin.

ANOMALISTICAL Year, in Astronomy, called also
periodical year, is the space of time in which the earth pas-
ses through her orbit.

The anomalistical, or common year, is somewhat longer
than the tropical year; by reason of the precession of the
equinox. The apses of all the planets have a similar pro-
gressive motion; whence they take a longer time in arriving
at the aphelion, which has advanced a little, than in attain-
ing to the same fixed star. E. G. The tropical revolution of
the sun, with respect to the equinox, is 365° 5' 46.26",; but
the sidereal revolution, or return to the same fixed star, is
365° 6' 10½", and the anomalistical revolution is 365° 6'
15½", because the sun's apogee advances each year 63' 36" with
respect to the equinoxes; and the sun cannot arrive at the
aphelion till he has passed over 63½° more than the revolu-
tion of the year answering to the equinoctes. To find the
anomalistical revolution, use this proportion: As the whole
fcecular motion of a planet, minus the motion of its aphelion,
is to 100 years, or 3155760000 seconds, so is 360° to
the duration of the anomalistical revolution.

ANOMALOUS, irregular, something that deviates
from the ordinary rule and method of other things of the
same kind.

The word is not compounded of the privative α and τοπος,
locus, as is usually imagined; for whence, on such supposi-
tion, should the last syllable α, arise? But it comes from the
Greek ανομος, ounemos, rough, irregular, formed of the pri-
ватive α and μος, plain, even.

ANOMALOUS verbs, in Grammar, are such as are irregu-
lar in their conjugations; deviating from the rules or formu-
las observed by others.

There are anomalous verbs, or irregular inflexions of verbs,
in all languages. In the English, the chief irregularity of
our anomalous verbs lies in the formation of the preter ten-
se, and passive participle; though this only holds of the native
Teutonic or Saxon words, and not of the foreign words, bor-
rowed from the Latin, French, &c.

The principal irregularity arises from the quickness of our
pronunciation, whereby we change the consonant d into t,
cutting off the regular ending ed.

Thus for mixed, we write mixt or mixt'd; for dwelled,
dwell'd, or dwell'd; for intrusted, intrusted, &c. But this prop-
erty is rather of the nature of a contraction than an irregu-
larity; and is complained of by some of our polite writers
as an abuse, to the disadvantage of our language, tending to
disfigure it, and turn a tenth part of our smoothest words
into clusters of consonants; which is the more inexcusable,
because our want of vowels has been the general complaint
of the hell writers.

Another irregularity relates to the preter tense, and pas-
itive participle. Thus give, if it were regular, or formed
according to the rule, would make given, in the preter tense,
and the passive participle; whereas it makes gave in the pre-
ter tense, and given in the passive participle.

ANOMALY, in Grammar, denotes an irregularity in
the accidents of a word, whereby it deviates from the com-
mon rules of paradigms, whereby other words of the like
kind are governed.

ANOMALY, in Astronomy, is an irregularity in the motion
of a planet, whereby it deviates from the aphe lion or apoge,
or the angular distance of a planet from the aphe lion or apo-
ge; that is, the angle formed by the line of the apsides,
and another line drawn through the planet.

Kepler distinguishes three kinds of anomaly; mean, eccen-
tric, and true.

ANOMALY, mean, or simple, in the Ancient Astronomy,
is the distance of a planet's mean place from the apogee, which
Ptolemy calls the angle of mean motion.

In the modern astronomy, it is the time in which a pla-
net, describing an ellipse APQ (Plate I., Astronomy, fig. 9.),
round the sun in the focus, moves from its aphe lion A, to
the mean place or point of its orbit P; or, it is the angular
distance of the planet at a given time from the aphe lion,
-supposing that it had moved uniformly with its mean angular
velocity.

Hence, as the elliptic area ASP, is proportional to the
time in which the planet describes the arc AP; the area
may represent the mean anomaly. Or thus, the area ASN,
found by drawing a line through the planet's place
perpendicular to the line of the apsides AQ', till it cuts the
circle AVQ, and drawing the line SN, may represent the
mean anomaly; for this area is every where proportional
to the former area ASP, as is demonstrated by Dr. Gregory,
Phil. Trans. No. 447. Or, if ST be drawn perpendicular
to the radius NC produced, then the mean anomaly will be
proportional to ST + the circular arc AN, as Keil has
demonstrated in his "Astronomical Lectures," Lect. II.
Hence, if ND be taken equal to ST, the arc AD, or the
angle ACD, will be the mean anomaly for practical pur-
pose, expressed in the degrees of a circle; the number of
the degrees being to 360°, as the elliptic trinacul area ASP,
is to the whole area of the ellipse; and the degrees of mean
anomaly are those contained in the arc AD, or angle ACD.

ANOMALY of the eccentric, or of the centre, in the Modern
Astronomy, is an arc AK, of the eccentric circle (fig. 9.),
included between the aphe lion A, and a right line NI,
drawn through the centre of the planet P, perpendicularly
to the line of the apsides AQ; or, it is the angle AKN at
the centre of the circle. Hence the eccentric anomaly to
the mean anomaly, as AN to AN + ST; or, as AN to
AD; or, as the angle AKN to the angle ACD.

In the Ancient Astronomy, it is an arc of the zodiac, ter-
minal of the line of the apsides, and the line of the mean
motion of the centre. See the methods of finding the an-
omaly of the eccentric, in Phil. Trans. No. 447.

ANOMALY, true, or equalled, is the angle at the fun
ASP, under which a planet's distance AP from the aphe lion
appears; or, it is the angle or area, taken proportional to the
time in which the planet moves from the mean place P, to
its aphe lion A; or, in other words, it is the angle formed by
the

Y y 2
the radius vector, or line SP, drawn from the sun to the planet, with the line of the apsides.

Hence, in the sun's motion, it will be the distance of his true place from the apogee.

The true anomaly being given, the mean one is easily found. But it is much more difficult to find the true anomaly from the mean anomaly given, at least by any direct process. Kepler, who first proposed this problem, and from whom it is called "Kepler's Problem," could not find a direct method of resolving it, and therefore used an indirect one, by the rule of false position; as may be seen in Kepler's Epitome Astron. Copenh. p. 607. See also Wolffius's Elem. Astron. and the treatise of the area ASP in the whole ellipse, or of the mean anomaly to 360°. For the further illustration of this subject, let a body move uniformly in the circle from A to D with the mean angular velocity of the body in the ellipse, whilst the body moves in the ellipse from A to P; then, from what has been above stated, the angle ACD is the mean, and the angle ASP the true anomaly; and the difference of these two angles is called the equation of the planet's centre, or PROSOPHYESIS. Let \( \phi \) = the periodic time in the ellipse or circle (the periodic times being supposed equal), and \( t \) = the time of describing AP or AD; then, as the bodies in the ellipse and circle describe equal areas in equal times, about S and C respectively, we have the area ABD = area of the circle \( \pi r^2 \); and area of the ellipse: area ASP :: \( \phi : t \); also the area of the circle = area ASP :: \( \phi : t \); consequently the area ACD = area ASP = area ACN = area ASP; and hence ACD = ACN; from both which, let the area ACN, which is common, be taken away, and the area DCN = SNC; but DCN = \( \frac{1}{2} DN \times CN \), and SNC = \( \frac{1}{2} ST \times CN \); therefore ST = DN. Now if \( t \) be given, the arc AD will be given; for as the body in the circle moves uniformly, we have \( \phi : t = 360^\circ : AD \). Thus we always find the mean anomaly at any given time, provided that the time be known when the body was in the apsides; hence, by finding ST or ND, we shall know the angle ANC, called the eccentric anomaly, from whence, by one proportion, we shall be able to find the angle ASP the true anomaly. The problem is therefore reduced to this: to find a triangle CST, such that the angle C + the degrees of an arc equal to ST may be equal to the given angle ACD. This may be expeditiously done by trial in the following manner, given by M. de la Caille in his Astronomy. Find what arc of the circumference of the circle ADQE is equal to CA, by faying. 355 : 113 :: 180 : 57° 17' 44" ; 8 the number of degrees of an arc equal in length to the radius CA; hence CA : CS :: 57° 17' 44" : 8; the degrees of an arc equal to CS. Alterm, therefore, the angle SCT, multiply its line into the degrees in CS, and add it to the angle SCT, and if it equal the given angle ACD, the fapposition was right; if not, add or subtract the difference to or from the first fapposition, according as the result is less or greater than ACD, and repeat the operation, and in a very few trials you will obtain the accurate value of the angle SCT. The degrees in ST may be most readily obtained by adding the logarithm of CS to the logarithm of the sine of the angle SCT, and subtracting 10 from the index, and the remainder will be the logarithm of the degrees of ST.

Having found the value of AN, or of the angle ACN, the eccentric anomaly, we may proceed to find the angle ASP, or the true anomaly.

Let \( \alpha \) be the other focus, and put AC = 1; then by

\[
\begin{align*}
\text{Encl. b. ii. prop. 1.} & \quad SP' = Ps' = 48^\circ + 32^\circ \times 11 = 50^\circ + 38^\circ = 2 \times 32^\circ + 32^\circ = 2SC = SC = SP - Ps; \quad \text{or} \quad 2: 2C = SC; \quad SP' = 2 - SP, \quad \text{or} \quad 1: C = SC; \quad SP - 1; \quad \text{hence} \quad SP = 1 + CS = 1 = SC \times CS; \quad \text{hence} \quad CS \times CS = 1 + CS \times SC \times CS = 1 \times CS \times CS \times CS = 1 \times \text{ACN} \times \text{ACN}; \quad \text{hence} \quad \text{AS} = \text{ACN} \times \text{ACN} = \frac{1}{1 + \text{ACN} \times \text{ACN}} = \text{ACN} \times \text{ACN} \times \text{ACN};
\end{align*}
\]

Hence \( \tan \left( \frac{1}{2} \text{ACN} \right) = \frac{1}{\text{ACN}} \times \text{ACN} \times \text{ACN}; \quad \text{and} \quad \sqrt{\text{ACN} \times \text{ACN}} = \text{ACN} \times \text{ACN} \times \text{ACN}; \quad \text{therefore} \quad \sqrt{\text{ACN} \times \text{ACN}} = \text{ACN} \times \text{ACN} \times \text{ACN}.

\[\text{46341749} \quad 90175306 \log. \text{of} \quad 216000 \quad = a \quad 45717055 \quad - \quad 37300 \quad = 25300 \quad 2463288 \quad - \quad 6912 \quad = b \quad 46341749 \quad 90287087 \quad - \quad 200588 \quad = a - b = 38^\circ 4' 48" = c \quad 45692329 \quad - \quad 36557 \quad = 246545 \quad 246388 \quad - \quad 743 \quad = d \quad 46341749 \quad 90297694 \quad - \quad 200931 \quad = c + d = 58^\circ 17' 11" = e \quad 45639413 \quad - \quad 36639 \quad = 246479 \quad 246388 \quad - \quad 82 \quad = f \quad 46341749 \quad 7 \]
ANOMALY.

\[ 4.6341749 \]
\[ 9.0926626 \]
\[ 4.5637175 \]
\[ 36930 \]
\[ 25679 \]
\[ 249388 \]
\[ 9 = \beta \]

Hence, as the difference between the value deduced from the assumption and the true value is now diminished about 9 times every operation, the next difference would be \( \frac{1}{10} \); if, therefore, we add \( \frac{1}{10} \) to \( \beta \), and then subtract \( \frac{1}{10} \), we get \( 55^{15}'57'' \) for the true value of the angle ACN, the eccentric anomaly. Hence we may find the true anomaly AS from the proportion above given, by logarithms, in the following manner:

\[ \log \text{tang. } 29^{9}'5''58'' \left( \frac{1}{2} \text{ACN} \right) = 9.7466246 \]
\[ \frac{1}{2} \log \text{SQ} = \text{CA} - \text{CS} = 10111276 - 211165 = 2.9517531 \]
\[ \frac{1}{2} \log \text{SA} = \text{CA} + \text{CS} = 10111276 + 211165 = 3.0436141 \]
\[ \log \text{tang. } 24^{9}'16''15'' \left( \frac{1}{4} \text{ASP} \right) = 9.6510836 \]

Hence the true anomaly is \( 48^{30}'30'' \). Since the aphelion \( A \) was in \( 81^9 \), \( 5430' \), the mean place of Mercury was \( 10^{20}'27'' \). And hence \( 68^{9}'26'28'' - 48^{29}'32'30'' = 19^{9}'55'' \), the equation of the centre. Also \( \text{SP} = 1 + \text{CS} \times \cos \text{ACN} = 111983 \) the distance of Mercury from the sun, the radius of the circle, or the mean distance of the planet, being unity.

As the bodies at \( D \) and \( P \) are supposed to have departed from \( A \) at the same time, and will coincide again at \( Q \), ADQ and APQ being performed in half the time of a revolution; and as \( D \) is the place of the planet with its least angular velocity, therefore from \( A \) to \( Q \), or in the first fix signs of anomaly, the angle ACD will be greater than ASP, or the mean will be greater than the true anomaly; but from \( Q \) to \( A \), or in the fix signs, as the planet at \( Q \) moves with its greatest angular velocity, the true will be greater than the mean anomaly. Hence the eccentricity, and consequently the angle NCD, is very small, as in the orbits of Venus and the earth, ND considered as very nearly a straight line, will be equal and parallel to \( ST \); in which case SD is parallel to CN, and consequently the angle NCD = DCN. In the triangle DCS, the two sides DC and CS, and the included angle DCN, the supplement of DCA, are known; and hence we can find the angle CDS or DCN. If DCN be not greater than \( 15' \), the conclusion will be accurate to a second. When the angle DCA is not very small, M. Ca1mii, in his "Elements of Astronomy," p. 144, has given the following method of finding it: draw \( Dz \) perpendicular to \( ST \), and \( Tz \) is the sine of the arc DN; consequently \( Sz \) is the difference between the arc DN and its sine, or between the arc of the angle CDS and its sine; compute, therefore, the angle CDS, and from a table showing the difference between the arces of a circle and their sines, to a given radius, take the difference between the arc and its sine; lay \( \text{AD} = Sz \); \( z \) rad.: fine SDC, which subtract from the angle SDC, and you have the angle \( \angle \text{DCN} \), or the alternate angle DCN. The result of the operation is the same before.

\[ \text{E. C. To find the true anomaly of Mercury, the mean being } 60'. \quad \text{Let the mean distance of Mercury be } 1000000, \text{ and the eccentricity } CS = 20878, \text{ according to Caffini; hence, in the triangle DCS, } DC = 1000099, \text{ CS} = 20878, \text{ and the angle DCS} = 120\text{°}; \] therefore \( \angle \text{DCN} = 11905\text{°}, \) and the angle SDC = \( 50\text{°}17'52'' \), corresponding to which, in such a table as that just mentioned, will be the value of \( Sz = 71200; \) hence, 11905 - 71200 rad.: fine of \( Sz = 2'11'' \), which, subtracted from \( 17'52'' \), leaves \( 9'15'44'' \) for the angle DCN, which, subtracted from \( 60\text{°} \), leaves \( 50\text{°}44'16'' \) for the angle NCA. Hence,

\[ \frac{1}{2} \log \text{SQ} = 79112 - 2494185 \]
\[ \frac{1}{2} \log \text{SA} = 120878 + 3541173 \]

Hence the true anomaly is \( 41^{9}58'36'' \); and the equation of the centre is \( 18^1'24'' \).

The first geometrical solution of Kepler's problem, was that of Dr. Wallis, by means of the protracted cycloid; which was also effected in a similar manner, by Sir Isaac Newton, in his "Principia," lib. i. prop. 31. But these methods being unfit for the purpose of the practical astronomer, many approximations have been given by various series; of these, several have been proposed by Sir Isaac Newton in his "Fragmenta Epitola," p. 261, and also in the Scholium to the proposition above-mentioned, which is the bell, as it is adapted not only to the planets, but also to the comets, whose orbits are very eccentric. Dr. Gregory, in his "Aphelion," lib. iii. has also given the solution by a series; as well as M. de la Lande, in his "Analyse Demontrée," p. 71, &c. The method ascribed to some writers to Dr. Seth Ward, professor of astronomy at Oxford, and published in his "Astronomia Geometrica," in 1634, though M. de la Lande observes, that it is given both by Ward and Mercator to Bullialdus, is less accurate than such as have been already given in this article; and yet it may serve, in many cases, as an useful approximation. He assumed (fig. 10.) the angular velocity about the other focus \( v \) to be uniform, which is not strictly true, and therefore made it represent the mean anomaly. Produce \( vP \), and take \( PR = PS \); then in the triangle \( \Delta \text{Sv} = R + vS = \Delta \text{Sv} = \frac{1}{2} \Delta \text{SQ} + \frac{1}{2} \Delta \text{SR} + vS = \frac{1}{2} \Delta \text{SQ} - \frac{1}{2} \Delta \text{SR} = \Delta \text{AP} \); and \( \frac{1}{2} \Delta \text{SQ} - \frac{1}{2} \Delta \text{SR} = \frac{1}{2} \Delta \text{ASP} \). Hence the aphelion distance: the perihelion distance \( = \frac{1}{2} \Delta \text{mean anomaly} = \frac{1}{2} \Delta \text{true anomaly} \). This method is called "the simple elliptic hypothesis," and was used by Dr. Halley in constructing his "Tabula pro exportinge calculo equationum centri Luna." This method is not sufficiently accurate, when the orbit is very eccentric, as in that of the planet Mars, which Bullialdus has shown in his defence of the "Philhologic Aphelion," against Dr. Ward. However, when Newton's correction is made, as in the Scholium above-mentioned, and the problem resolved according to Ward's hypothesis, Sir Isaac affirms, that, even in the orbit of Mars, there will arise even be an error of more than one second.

Although the indirect methods above given, are in general the best for practice, we shall here subjoin the direct method of Dr. Kell, as the most simple, and because it may frequently be applied to advantage. Let the arc ND (fig. 9) = \( \frac{1}{2} \Delta \text{AD} = v \); \( e \) the value of \( AD \); \( f = \) the cofine, \( SC = g \). Then by trigonometry, the line of \( NA = \frac{1}{2} \frac{f^3}{2} + \frac{f^3}{2.3} + \) &c. hence the line of \( AN = e - \)
\[ f^2 - \frac{f^2}{2} + \frac{f^2}{3} = \text{sec}. \text{ Also rad.} = 1 : \text{fin.} \]
\[ AN or \angle \text{SCI} = \angle = \text{a} : \text{ST} \text{ or ND of } y = y^2 - \frac{y^2}{2} + \frac{y^2}{3} + \text{sc} \text{. Hence } y = y + \frac{y^2}{3} + \frac{y^2}{2} - \frac{y^2}{3} = \text{sec}. \text{ Put } y = \text{a}, \frac{y^2}{2} = \text{b}, \frac{y^2}{3} = \text{c} \text{. &c.} \]

The genus Anoma is commonly defined by some authors as a shell inquiline, one valve gibbous towards the beak, the other flat, and perforated near the hinge. The character in the Systema Nature, is the shell inquiline, one valve being flat, and the other gibbous at the base, and one of them usually perforated near the base; the hinge has a linear prominent cicatrix, and a lateral tooth within the margin of the flat valve; and there are two or more rays for the base of the animal. The animal, which had been very imperfectly known, is described by Gmelin, from which it appears to be of a new genus; the body is thin and slender, emargiuated, and calcified or fringed; the hairs affixed to the upper valve; and it has terebration, which are linear and longer than the body. Some conchologists separate the fossil kinds from those which are found in a recent flat. Linnæus, and after him, Gmelin, arrange them together in the following order: craniolaris, pectinata, ephippium, epeps, electrica, squamula, patelliformis, fucinata, aurita, retum, pygopus, pecten, fritalula, truncata, reticularia, piscatella, crista, lacinia, pubescenta, fera, caput perpeta, terebrata, angulata, hylierta, biloba, placenta, sull, spinosa, squamula, muretula, squama, squamula, pandula, undata, capens, destruncata, fangu tongues, vitrea, cranium, doria, pataetes, tridentata, spondylodes, ventricosa, gymnothoe, flexuosa, rugosa, cilindrica, nucleus, avenacea, &c. and others, which are respectively.

ANOMOEANS, ANOMOEIS, in Church History, a sect of Christians who denied any similitude between the essence of the Father and that of the Son. See Trinity.

The word is composed of the privative an-, and omoeis; similar, resembling; q. d. different, dissimilar.

Anomoeans was the name whereby the pure Arians were distinguished in the fourth century, because they not only denied the confusableness of the Word, but also asserted, that he was of a nature different from that of the Father; in contradistinction to the Semi-Arians, who indeed denied the confusableness of the Word, but who owned, at the same time, that he was like the Father. The Semi-Arians condemned the Anomoeans in the council of Seleucia; and the Anomoeans condemned the Semi-Arians in the council of Conantinople and Antioch, erasing the word anomoei, like, out of the forms of Rimini and that of Conantinople.

ANOMORHOMBOIDEA, in Natural History, the name of a genus of spars.

The word is derived from anomoeis, irregular; and rho, like, a rhomboidal figure.

The bodies of this genus are quadrien-and irregular forms of no determinate regular external form, but always breaking into regularly rhomboidal mallees; easily filleted, and composed of plates running both horizontally and perpendicularly through the mallees, but cleaving more readily and evenly in an horizontal than in a perpendicular direction; the plates being ever composed of irregular arrangements or rhomboidal concretions.

Of this genus there are five known species, which have all, in some degree, the double refraction of the island crytal.

ANONA, in Botany. See Achras, Annona, Christophyllatum, Grataea, and Sloanea.

ANONIS, see Glycine, Hedisarum, Ononis, and Sophora.

ANONION, in Antient Geography, a town of the northern part of Italy, belonging to the Euganians, to the west of Venetia.
ANONUS Fons, a fountain of Laconia, according to Pananias, situated near mount Taygeta.

ANONYMA, in Conchology, a species of ostrea. The shell is rather oblong, with narrow, scaly rays; the interstices broad, with perpendicularly lines; and the ears with perpendicular wrinkles. Lift Gmelin. It is variegated with angular breaks and spots.

ANONYMOUS. See Chelone.

ANONYMOUS, formed of the privative a, and nomas, name, something that is nameless, or to which no name is affixed.

The term is chiefly applied to books which do not express their author's name, and to authors whose names are unknown. Decker, advocate of the imperial chamber of Spires, and Placcius of Hamburg, have given treatises of anonymous books. Buc. Cotth. Struvius treat of the learned men who have endeavoured to investigate the authors of anonymous books.

ANONYMOUS, in Anatomy, a name sometimes given to parts newly discovered, or first taken notice of.

ANONYMOUS is also an appellation anciently given to the second cartilage of the throat, by later writers, called criocides, or annuliformis.

ANONYMOUS, in Commerce. Partnerships in trade in France are fyled anonymous, when they are not carried on under any particular name, but wherein each of the partners trades visibly on his own account, and in his own name; after which all the partners give one another an account of their profit or losses in trade. These sorts of partnerships are concealed, and known only to the parties themselves.

ANONYMOUS partnerships in trade, are also in France such wherein perfons of fortune and quality deposit sums of money, in order to share the profits and losses. To this end those who furnished the capital have no trouble in carrying on the trade, nor do their names appear to be any way interred therein.

ANONYMOUS, in Law. The sending anonymous letters, or letters with a fictitious name, demanding money, &c. or threatening, without any demand, to kill any of the king's subjects, or to fire their houses, out-houses, barns, or ricks, is felony by the Black Act, 9 Geo. I. cap. 22. Amended by statute 37 Geo. II. cap. 17. This offence was formerly very high treason by the statute 8 Hen. 5, c. 6.

ANOPEOA, in Ancient Geography, a mountain of Greece, being part of the chain of mountains, called Oeta. A small pass in this mountain formed a communication between Thesaly and the country of the Epicemidian Locrians.

ANOPOLIS, an appellation given to the town of Ardeas in the ile of Crete. Steph. Byz.

ANOPSHEER, in Geography, a town of Hindostan, in the province of Oude, 50 miles east-south-east of Delhi. N. lat. 28° 20'. E. long. 79° 30'.

ANOREXY, Anorexia, in Medicine, loss of appetite, or loathing of food.

The word is compounded of the privitive a, and opteo, appetite, I desire.

Anorexia is seldom an idopathic disease, but a frequent attendant on many.

Curse. — It is present, in some degree, in all scible complaints, and then usually attended by a fever on the upper surface of the tongue, which commonly indicates its intensity; for, as the fever disappears, the appetite returns. It occurs in jaundice; and accompanies a weakness in the organs sublervient to digestion and exflication. Persons addicted to the abuse of spirituous liquors are seldom free from it. The sight of any shocking accident, disaffearing news, depressing passions, or the being present at any surgical opera-

tion, will often abash the appetite of a person, even when longing for his dinner.

A symptom depending, on so many causes, must require considerable diversity in the Treatment. — When it is symptomatic of other diseases, the cure cannot be effected without that of the original complaint. When it arises from the habit of drinking spirits, taking opium, tobacco, or any other poison, the custom must be relinquished, and the digestive organs invigorated by i stomechics. See Dyspepsia.

ANOSMIA, denotes a diminution or abolition of the sense of smell. It is either organic, owing to a disease in the membrane lining the internal parts of the nostrils, and varying according to the nature of the disease; or atomic, without any evident disease of the membrane of the nose. See Smelling.

ANOSSE, Carcaussi, or Androreizaha, in Geography, a province of Madagascar, situated in S. lat. 23° 16'; and extending from the province of Mananaré in 26°. This province is watered by several rivers, that run into the Franchere, Ramevate, or Immour, which rises in the mountain Manghage, and discharges itself into the sea, in S. lat. 25° 18', two small leagues from Port Dauphin. At its mouth is formed a lake, called Amboue, half a league wide, and of sufficient depth for any ship. Crocodiles breed in this river, and in every other in the island. The cape, which is half a league distant from the mouth of the Franchere, is called by the French St. Romain, and by the negroes, Cape Ranevate, or Hehoale. The coast beyond this cape forms a bay, in the middle of which the land runs out in a peninsula, to the north of which lies Port Dauphin, and over against it Port Dauphin; this bay is called by the French Dauphin Bay; and it is convenient for shipping and boats, which may ride here very safely. This province includes several islands and peninsulas along the coast. The country is beautiful, and fertile in pastures for cattle, abounds in fruit-trees, and, if carefully cultivated, would afford every necessity of life. It is surrounded by high mountains, and diversified by numerous hillocks and fruitful plains. The most remarkable towns are Francheville, l'Inland, Cobehmes, Andrapoule, Ambobettanha, Maromambo, Imours, Maroufouants, and Tanangha, besides several villages and hamlets throughout the country. The mountains are covered with wood and fhrubs; but about four leagues distant from Port Dauphin, the adjacent hills are quite defolate of trees. The inhabitants of the province are whites and negroes. The whites form three eftates, or different degrees; and are distinguished by the names of Rohandrians, Anacandrians, and Oudzatsi; the negroes are also subdivided into four classes, viz. Voadziri, Lobahothis, Ontooa, and Onede. These people have neither religion nor temple; they keep up a custom of immolating beasts on particular occasions, in sickens, on planting yams or rice, on the circumcision of children, declarations of war, first entry into new-built houses, and on the funerals of their parents. They offer the first born-beast to the devil and to God, naming the devil first in this manner, "Dianblis Aminan-habare, or lord-devil and God." The country seems to have been originally inhabited by negroes; and the whites took possession of it about 200 years ago; but they were subdued by the French. In 1642, Capt. Rivault obtained leave from Cardinal Richelieu to establish a colony here; and the French, who, after some opposition, settled here, built Fort Dauphin, which is advantageously situated, as it is sheltered from dangerous winds, and its entrance is convenient for all sorts of shipping. The natives, however, after some years of tranquillity and social intercourse, became jealous of the French, and formed a conspiracy to cut off all the French in
one day, which they carried into effect. The Fort Du-
pau, which was erected in 1644, was accidentally de-
bstroyed by fire in 1656, but it was soon after repaired; and its gar-
rision is thus enabled to carry on frequent wars with the na-

ANOTIA, in Botany. See Bixa.

ANOUT, S. in Geography, a bay on the north coast of the island of Jamaica. N. lat. 18° 19'. W. long. 76° 33'.

ANOUPEC, the name of a range of mountains in the Birmam empire, between Ava and Arattan.

ANOUT. See Anholt.

ANPITS, in the Military Art, in some Middle Age Writ-
ers, denotes a break-work, answering to what is otherwise called karhana.

ANREDERA, in Botany, a genus of the pennadria digynia class and order: the characters of which are, that the calyx is bipartite, with the laciniae carinated at the back; and it has one seed covered by a membranaceous, compressed, and two winged calyx. There is one species, viz. andrederia sertata.

ANSA, or Atsa, in Geography, a river which passes by Aquile, in the country of Troili; and runs into the Adriatic, between Grado and Marano.

ANSERES, in Geography, those apparently prominent parts of the planet Saturn's ring, discovered in its opening, and appearing like handles to the body of that planet. The Latin word literally signifies handles, or ears, of diverse utensils.

ANSANI, Giovanni, in Biography. See Giovanni.

ANSARS, or Annariens, in Geography, a people of Syria, employed in cultivation; and called in that country by the plural name Anfari; in Delisle's maps, Enfayrians; and in those of D'Anville, Naffars. The territory which these people occupy, is that chain of mountains which extends from Antakia to the rivulet called Hahrel-kabir, or the great river. The history of their origin, though little known, is instructive. The following account is given in the words of a writer (Allemanni, Biblioth. Orient.), who has drawn his materials from the bel authorities. "In the year of the Greeks, 1222 (A. D. 67) there lived, at the village of Nafar, in the environs of Konfa, an old man, who, from his failings, his continual prayers, and his poverty, passed for a saint: several of the common people declaring themselves his partisans, he selected from among them twelve disciples to propagate his doctrine. But the magistrat of the place, alarmed at his proceedings, fetzed the old man, and confined him in prison. In this reverse of fortune, his situation excited the pity of a girl who was slave to the gaoler, and the determined to give him his liberty. An opportunity soon offered to effect her design. One day, when the gaoler was gone to bed intoxicated, and in a profound sleep, the gently took the keys from under his pillow, and, after opening the door to the old man, returned them to their place, and perceived by her matter: the next day, when the gaoler went to visit his prisoner, he was extremely astonished at finding he had made his escape; and the more so, since he could perceive no marks of violence. He therefore judicially concluded he had been delivered by an angel, and eagerly spread the report, to avoid the reprehension he merited; the old man, on the other hand, ascribed the same thing to his disciples, and preached his doctrines with more earnestness than ever. He had written a book, in which, among other things, he says: 'I, such a one, of the village of Nafar, have seen Christ, who is the word of God, who is Ahmam, son of Mohammad, son of Hanafa, of the race of Ali; who also is Gabriel; and he said to me: Thou art he who readeth with understanding; thou art the man who speaketh truth; thou art the camel which receiveth the faithfulfrom wrath; thou art the beak which carrieth the burden; thou art the Holy Spirit, and John the son of Zachary, go, and preach to men that they make four genuflexions in praying; two before the rising of the sun, and two before his setting, turning their faces towards Jerusalem; and let them fast three times, God Almighty, God most high, God most great; let them observe only the second and third fastival; let them not wash the preface, nor drink beer, but as much wine as they think proper; and, lastly, let them abanion from the flesh of carnivorous animals.' This old man, passing into Syria, propagated his opinions among the lower orders of the country people, numbers of whom believed in him. And, after a few years, he went away, and nobody ever knew what became of him."

Such was the origin of the Anfarians, who are, for the most part, inhabitants of the mountains before mentioned. They are divided into several tribes, or sects; such as the Shamsia, or adherers of the sun; the Keliba, or worshipers of the dog; and the Kadmuia, who pay a particular homage to that part in woman which corresponds to the priapus; and who hold nocturnal assemblies, in which, it is said, after certain discourses, they extinguish the light, and indulge promiscuous lust. Many of the Anfarians believe in the metempsychosis; others reject the immortality of the soul; and, in general, such are the anarchy and ignorance that prevail among them, they adopt any opinions which they think proper, following the fect they like best, and frequently attaching themselves to none.

Their country is divided into three principal districts, farmed by the chiefs called Mokaddamin. Their tribute is paid to the pacha of Tripoli, from whom they annually receive their title. Their mountains are, in general, not so steep as Lebanon, and, consequently, are better adapted to cultivation: but they are also more exposed to the Turks; and hence it happens, that, with greater plenty of corn, tobacco, wines, and olives, they are more thinly inhabited than those of their neighbours the Maronites and the Druzes. Volney's Travels in Egypt and Syria, vol. ii. §. 1. p. 1—8.

ANSARIUM, in the Civil Law, a duty imposed on all provisions carried in vessels with anja. This was otherwise called anjurium, and the collectors of it aubar.

ANSATUM Tulum, according to fome, denotes a dart or javelin, with an antamus fattened to it.

Others rather take the anja of a javelin to be those two eminences about the middle of the cubit, or point, which hinder the weapon from piercing through the whole body. The Tartars are obliged to put their names to their arrows, that the hand which shoots them may be known. When Philip of Macedon was wounded at the siege of a certain town, these words were found on the javelin, "Anja has given this mortal wound to Philip."

ANSATUS, in Conchology, a species of murex. It is brown, transversely striated; spire sharp-pointed; whorls convex, dilated, and knotty at the base; base long. Gmelin. The length of this shell is about five inches and an half, and the flax are large and small alternately.

ANSAUILLERS, in Geography, a town of France, in the department of the Oise, and chief place of a canton, in the district of Breteuil, five miles south-south-east of Breteuil.

ANSCARIUS, in Biography, bishop of Hamburgh and Bremens, was born in 821, in France, at Corin, in the diocese of Amiens. He was recommended by the emperor Louis as apostolic missionary to Harold king of Denmark, who had been lately converted to the Christian faith; and by his preaching he made many profelytes among the Danes. Under the authority of Olave, king of Sweden, he undertook the instruction of his subjects in the Christian religion,
religion, but with less success. By the council held at Aix-la-Chapelle, in 832, an episcopal see was instituted at Hamburgh, and Anfclin was its first bishop. When his eurch was burst by the Normans, in 845, the see of Bremen was added to that of Hamburgh; and Anfclin removed to Bremen, where he refided till his death, in 865. He wrote the life of Willibald, the first bifhop of Bremen; and his own life written by Mabillon, is reprinted by Fabriecius, in his “Memoires pour l'histoire de Hamburgh.”

ANSCOTTE, in our Anci. Lf. Book, the same with Anstele. See Scot.

ANSE, in Geography, a town of France in the department of the Rhone and Loire, and chief place of a canton in the district of Villefranche; four leagues north of Lyons.

ANSEL WILGHT, See Auncel weight.

ANSELM, in Biography, archbishop of Canterbury, was born at Abbeville in Picardy, A.D. 1034, of noble and pious parents, who were at great pains to give him a good education. Having lost his mother Ermengarda when he was about seventeen years of age, he abandoned his studies, and indulged his youthful passions to such a degree, that his father refused to see him, or admit him into his house, on which he left his native country, and travelled into France. After some time, attracted by the fame of Lanfranc, he settled at the abbey of Bec, and prosecuted his studies with such ardour under that great master, that he soon excelled all his fellow students in learning. In the year 1052, he became a monk of the Benedictine order, and in three years after he succeeded Lanfranc, both as prior and teacher of the sciences; in both which stations he acquitted himself so much to the satisfaction of the society, that he was unanimously elected abbot on the first vacancy, A. D. 1078. The abbey of Bec had several estats in England, which obliged Anfcln sometimes to visit this kingdom; and in these visits he gained the friendship of several of the greatest men. He happened to be here in the year 1093, when William II., in a fit of sickness, was prevailed upon to fill the see of Canterbury, which had been kept four years vacant, and nominated him to that high office. After a long and obstinate opposition to his own advancement, in which his sincerity has been suspected, he was forced into the chamber of the sick monarch, who, in a very pathetical manner, asked, "Why endeavoured to ruin him in the next world, which would infallibly follow, in case he died before the archiepiscopie was filled?" The abbot still persisted in his refusal, kneeling, weeping, and entreaty the prince to change his purpose. The pallor of his face was at length forced into his hand, and he suffered himself to be invested with his office; not, however, before he had obtained a promise of the restitution of all the lands, which were in the see in the time of Lanfranc. The temporaries of the archiepiscopie being secured, Anfcln submitted to do homage to the king, and was consecrated on the fourth of December 1093. Soon after his consecration, the king intending to wrest the duchy of Normandy from his brother Robert, and endeavoring to raise what money he could for the purpose, Anfcln offered him a voluntary gift of five hundred pounds, which the king thought too small, and refused to accept. "I entreat your highness," said Anfcln, "to accept the present; it will be more honourable in you to receive a less sum with my consent than to extort a greater by force. If your highness allow me the freedom and privilege of my fixation, my person and fortune shall be at your service; but if I am treated like a slave, I shall be obliged to stand aloof, and keep my fortune to myself." The offer was however, for the present, rejected; and when it was afterwards hinted to Anfcln, that a repetition of it might conccllate the royal favour, he answered, "God forbid that I should suppose my foreigner's favour may be purchased with a small sum of money, like a horse at a fair! Persuade the king not to set a price on his favour, but to treat me, on honourable terms, as his spiritual father, and I am ready to pay him the duty of a faithful. As for the five hundred pounds, which he was pleased to refuse, they were given to the poor." The king, upon being informed of what had passed, was much displeased, and declared he would never acknowledge Anfcln for his ghostly father; he wanted neither his prayers nor his benedictions, and he might go whither he pleased. At another time, when William required from the archiepiscop the quota of men for an expedition against Wales, he sent them out so wretchedly equipped, that it threatened him with a prosecution. Anfcln, on his part, considered the demand as oppressive, treated the king's complaint with silent contempt, and demanded the restitution of all the revenues of his see, and made his appeal to Rome. In opposition to the king's express prohibition, but not without pairing to the court of Rome to attempt his justification, he left England, and the king instantly confiscated the temporalities of the archiepiscopie.

At Rome, Anfcln was received with great respect, as a defender of the rights of the holy see, and a meritorious sufferer in the cause of religion. He accompanied the Pope to his country seat near Capua, and received from him numerous proofs of friendship: but upon their return to Rome the pope's friendship for Anfcln was put to a severe trial. In consequence of a letter sent from Urban II. to William, soon after Anfcln's arrival at Rome, demanding his reinstatement in all the emoluments and privileges of his sees, an ambassador arrived from England to vindicate the conduct of the king. The ambassador was at first received with haughtiness, and was commanded by the pope to return and inform his master, that unless he would hazard the highest censure of the church, he must infantly reinstate Anfcln in the archiepiscopical rights. Notwithstanding this, after some struggle between duty and interest, the pope accepted a large present, and abandoned the cause of his friend. Finding himself deserted by the court of Rome, Anfcln left the city in distress, and went to Lyons, where he remained till the death of William Rufus.

Henry I. who, on his accession to the throne, employed every expedient to support the authority which he had usurped; and being well acquainted with the interest which Anfcln's piety and zeal had obtained in the affections of the people, immediately after his coronation recalled their favour from exile, who landed at Dover, Sept. 23, 1100. A few days after, he was received at Salisbury by the king with every possible mark of respect and affection. But this cordiality was not of long continuance. As soon as Anfcln was commanded to do homage to the king for the temporalities of his see, he returned a flat refusal, and produced the canon of the late council of Rome in vindication of his conduct; declaring, that if the king inflicted upon his pretenions to the homage of the clergy, he could keep no communion with him, but must infantly leave the kingdom. The king, unwilling to resign the right of compelling ecclesiastical vicerecies, and of receiving the homage of his prelates, but at the same time, dreading the departure of the prince, propounded, or rather solicited a truce, till both the parties could find ambassadors to the pope, to know his final determination: to this Anfcln, at the earnest entreaty of the nobility, at last agreed, on what precedent.

During this interval, Anfcln performed many services for the king. In a synod which was summoned at Lambeth, he obtained a decision in favour of the king's intended marriage with Matilda, although the had already worn the veil, without taking the vows. When the kingdom was invaded by
by Robert duke of Normandy, in July 1101, Ansfelm contributed more than any man, by his example, his exhortations, and his authority, to keep the nobility steady in their attachment to King Henry, and thereby preserved him on the throne. In return, the king professed great reverence for the wisdom and fidelity of Ansfelm, and promised to pay a third regard to the dignities and privileges of the church. But when the danger was over, and the messenger from pope Paschal II. returned with a peremptory negative upon Paschal's infatuation, the archbishop and the king and the archbishop was received. Henry resolved not to relinquish the important prerogative of granting church preferences within his own dominions, yet desires to avoid a rupture with the pope and Ansfelm, sent three bishops to Rome, while the archbishop, on his part, dispatched two nuncios to submit the affair to the reconsideration of the pontiff. The pope's letter confirmed his former resolution, declaring, that the church, and all its revenues, belong to the successors of St. Peter; and that emperors and kings had no right to give the investiture of benefices to the clergy, or to exact homage from them. Some of the arguments advanced in defence of this position were either illogical or rude: 'How abominable is it,' said he, 'for a son to desert his father, and a man to create his God? and are not priests your fathers, and your gods?' But this formal declaration was contradicted by the oral testimony of the king's bishops; who asserted, that Paschal had privately expressed to them his acquiescence in their master's claim, but had not given it under his hand, lest other princes should insist upon the same privilege. Ansfelm and his nuncios regarded this story as a designed provocation, prompted by the king; but the test time the princes appeared at court, he required him in a peremptory tone to do him homage according to ancient custom, or leave the kingdom; adding, 'I will suffer no subject to live in my dominions who refuses to do me homage.' The archbishop boldly replied, 'I am prohibited by the canons of the council of Rome to do what you require. I will not leave the kingdom, but stay in my province, and perform my duty; and let me see who dares to do me any injury.' Immediately he left the court, and returned to Canterbury. Soon after, the king granted him permission to make a journey to Rome, in order to learn the pope's final pleasure. He was attended to the sea-coal by crowds of people of all ranks, whom his anctere pietas and zeal for the church had attached to his interest. From Rome the archbishop retired to Lyons, and afterwards to his monastery at Bec in Normandy. The king, still desirous of an accommodation, sent a message to invite Ansfelm into England; and upon receiving information that he was ill at the abbey of Bec, went in person into Normandy to settle every remaining point of difference between them. Ansfelm recovered from his indisposition, and embarked for England, where he was received with singular expressions of a joyful welcome. The queen herself even travelled before him on the road, and gave orders for his accommodation. The popularity of this prelate may be imputed principally to the severity of his manners, and to the zeal with which he opposed abusus, and encouraged superstitious authoritres among the clergy and laity. He rigorously enforced clerical celibacy; and was the first who prescribed this absurd, unnatural, and mischievous practice in England. By one canon of a national synod, held by him during his duces in the monachal, at Weilmunster, in 1103, it was determined that no priest should marry; and those who were already married, were commanded to put away their wives. By another canon, it was decreed that the sons of priests should not be heirs to their father's churches. By a third, marriage is prohibited to those who are within the seventh degree of kinsmen; and the twenty-sixth canon forbade the worship of fonts, which was probably a relic of Druidical superstitious. Ansfelm was ever a violent opposer of all innovations, even in articles of dress and ornament; and preached zealously against the long and curled hair then coming into fashion; and his authority and eloquence had such influence, that the young men universally abandoned that ornament, and appeared in short hair, which was recommended to them by the sermons of the prelate. One of his adherents writing to him about this time, concluded his letter by saying, that religion was raised by his absence; that seductors, abusing long hair, which he himself had regarded as equal crimes, were become very common, and nobody had the courage to reprove them.

In a council held at Whithampton, A. D. 1106, at which the king and principal clergy, with Ansfelm at their head, were present, it was resolved to enforce the canons made six years before, relative to the celibacy of the clergy. Ten others were also added, by which all priests were commanded to put away their wives; instantly not to suffer them to do any act of worship on any of the lands belonging to the church; never to see them except in cases of great necessity, and in the presence of two or three suffragans. Those who put away their wives were ordered to abdicate from marts for forty days, and to perform certain penances; but he who refused to put away their wives were to be excommunicated, and their goods, together with the persons and goods of their wives, were to be forfeited to the bishop of the diocese. These ecclesiastical and wicked decrees afforded sufficient proof, that it was then found no easy task to dispute the natural and virtuous affection that subsisted between the clergy of England and their wives.

One of the last disputes in which Ansfelm was engaged, was with Thomas ejet of York, who, hoping for the death of the prince, delayed to come to Canterbury to receive consecration; but he was at length obliged to submit, make the usual professions of obedience, and render to his superior the accustomed homage. This, in fact, is the only material occurrence mentioned during the three last years of Ansfelm's life. This celebrated prelate died at Canterbury on the 25th of April 1109, in the sixty-third year of his age, and the sixteenth of his priesthood.

The superstitious reverence which was paid to the memory of Ansfelm, and the characteristic credulity of the age, are shown in the account of his miracles recorded by John of Salisbury. He relates, that while he was living, a Flemish nobleman was cured of a leprosy by drinking the water in which Ansfelm had washed his hands in celebrating masses; that he extinguished fires, calmed tempests, and healed diseases, by making the sign of the cross; that two soldiers were cured of an acut by tainting crumbs fallen from the bread which he had been eating; that by prayer to God, he produced a spring of excellent water at the top of a hill for the relief of certain villages; and that a ship in which he sailed, having a large hole in one of her planks, nevertheless took in no water as long as the holy man was on board. The same author adds, that miracles were wrought at Ansfelm's tomb after his death; that one born deaf, dumb, and blind, obtained his hearing, speech, and sight, by paying his devotions at his tomb; that a sailor was cured of the dropsy by winding the saint's girdle about his body; and that the same girdle was successfully applied to the affections of women in child-birth.

Without examining the powers of Ansfelm as a saint, his merit as a man may be fairly estimated, if, with great allowance for the narrow prejudices of a monastic education, and for principles and habits generated by a debasing system of superstition, we give him credit for honest zeal, and manly resolution.
resolution, in support of what he conceived to be the essence of religion. Considering the period in which he lived, An- 
seil was a learned man. He contributed to the introduction of the scholastic method of writing, in which the subtleties of 
logic were applied to theology. Among his metaphysical 
works is a treatise on the existence of God, in the manner 
afterwards refined by Des Cartes.

The largest edition of his works, which are very num-
erous, is that published by Father Gerberon, at Paris, in 
1675. It is divided into three parts. The first contains 
dogmatical tracts, entitled, "Monologia." The second 
contains practical and devotional pieces. The third is com-
and Henry's Hist. of Great Britain.

Anseil's art. See Art.

Anselm of Paris, an Augustinian monk, was born in 
1625, and devoted almost his whole life to genealogical and 
biographical researches. His "Palace of Honour, or His-
torical Genealogies of the Illustrious House of France, and 
of several noble families of Europe," was published in 
French at Paris, in 1647, in two vols. 4to. His "Ge-
netical and Chronological History of the House of France, 
and of the Great Officers of the Crown," was first pub-
lished at Paris, in 4to, in 1695; but the author, dying this year, 
did not complete his design. Fourni enlarged this work, 
and republished it in two volumes folio, in 1714, and it has 
only been continued by the Augustinian fathers, Ange 
and Simplicien; and in 1726, &c., it was published in nine 
volumes folio. Biographers have been much indebted to 

Anselmus, De Fauca, flourished in the thirteenth cen-
tury. Afinruppos he was of the faculty of medicine at 
Montpellier: that he was in repute, in his time, is proved by 
the notice taken of him by Lanfranc, and afterwards by 
Guic de Chauliac, who recommended his practice in certain 
cases; but there are no works now remaining bearing his 
name.

Anser, in Astronomia, a small star, of the fifth or sixth 
magnitude, in the Milky Way, between the Swan and Eagle: 
first brought into order by Hevelius.

Anser Americanus. See Toucan.

Anser, in Natural History, a species of vireo in the 
virgins lubirca. It is elliptical, with a long neck and 
tubercle on the back. Gmelin. This kind is found in 
water where duck-weeds grow: it is between the vireo 
protea and vireo fulvescens, and is chiefly distinguished by 
the protuberance on the back. The body is elliptical, round, 
with no anterior inequality, and full of molecules; the 
hind part is sharp and bright, the forepart produced into a 
beading neck, which is longer than the body; the apex 
even and whole, blue canals passing between the marginal 
edges, and occupying the whole length of the neck: in one of 
these canals a vehement deficernt of water at the 
beginning of the trunk may be perceived. The motion of 
the body is slow, that of the neck is more lively and 
flexuous, and sometimes spiral. See Adams, Microf.

Anser, in Ornithology, a species of anas, or duck, called 
in England the grey-lag, or wild goose, and generally ad-
mittted as the origin of the domestic goose. The character 
of this species is, bill semi-elliptical; body above cinere-
us, beneath pales; neck streaked. Linnæus, Gmelin, &c. 
The length of the bird is usually about two feet nine 
inches, breadth five feet, weight ten pounds. The bill is 
large and elevated, yellow with black colour, with the nail 
white. The head and neck are cinereus, mixed with dirty 
yellow; neck streaked downward; back and primaries dusky; 
the left tipped with black; shafts white; secondaries black, 
edge with white; lesser covers dusky, edged with white;

breast and belly white, clouded with light colour; rump 
and vent white; middle feathers of the tail dusky, tipped 
and edged with white; the outmost almost entirely white; legs 
Syn. &c.

"This species," says Dr. Latham, "inhabits the fens of 
England; and it is believed, does not migrate, as in many 
countries on the continent, as they are not only met with in 
the summer, but also known to breed in Lincolnshire, Cam-
bridgehire, and other places: they have seven or eight 
young, which are often taken, and early become tame. They 
however, unite into flocks during the winter season, as 
numbers are met with together. On the continent they are 
migratory, changing place in large flocks, often five hundred 
or more: in this case the flock is triangular in shape, with one 
point foremost; and as the goose which is first is tired soonest, 
it has been seen to drop behind, and another to take its place. 
In very small flocks, however, they are sometimes seen to 
follow one another in a direct line. Gecfe feed to be general 
inhabitants of the globe: they are met with in Iceland; and 
on the continent, from Lapland to the Cape of Good Hope; 
they are frequent in Africa, Peria, and China, as well as 
distinguished to Japan; and on the American continent from 
Hudson's bay to South Carolina. Our voyagers meet with them 
in the Straits of Magellan, Port Emeont in Falkland Isles, 
and Terra del Fuego; also in New Holland, though not at 
New Zealand, as we find cants. Cook making the inhabitants 
of the antipodes a present of a pair in order to breed." Gen. Syn.

The same author remarks, that the grey-lag goose, in 
a state of domestication, varies in colour from the wild ones, 
though much less so than either the mallard or coot, being 
ever found mere or less varying to grey; though in all cases 
the whitenss of the vent and upper tail coverts is visible, and 
very often those parts are quite white, especially in the 
male. See Goose, domestic.

Anseres, in Ornithology, the third order in the Lin-
nean arrangement of birds. The character, according to 
that author, is, the bill smooth, covered with skin, and 
broadly towards the tip: feet formed for swimming, toes 
palmed, and connected by a membrane; shanks compressed 
and short. The body is fat, and flesh rather rancid. Thse 
live chiefly on the water, and feed on plants, fish, frogs, 
worms, &c. The shell is generally formed on the ground; 
the mother takes little care of the young; and they are 
frequently polygamous.

The birds of this order are divided into two sections, one 
having the beak denticulated, or toothed, and the other 
being deficient of these teeth: the genera of the first section 
are, anas, mergans, phaeton, and plotus; and those of the second 
section, ryhncops, diomedea, apteranpelia, alca, praelaria, pe-
lecanus, larus, itragus, and eolymbus.

Anserifera, in Conexology, a species of lepas. 
The shell is compressed, and has five valves, which are 
fringed, and seared on a pedicle. Gmelin. This kind in-
habits the American and Atlantic sea.

Anserina, in Botany. See Potentilla.

Anseris, in Entomology, a species of pedunculus found 
on both the wild and tame goose; it is fihiform, pale, with 
black dots on the margin. Linnæus, Fabricius, Redi, &c.

Anseris, in Natural History, is also a species of rasciola 
in the Verone infusia. The body is obovate; beneath, 
two rows of opposite papillæ, with approximate pores. 
Prochick, Gmelin, &c. Found in the rump of the common 
goose.

Anseris is also the specific name of a creature in the tania 
genus, that infests the intestines of the domestic goose. It 
is minute and very narrow; the anterior part capillary. Gorce 
and Gmelin.
Ainsi, or Anse, a sea-port town of Norway, in the prefecture of Agderhus, upon the bay of Anifo. See Christianity.

Aenio, or Oenio, a sea-port town of Norway, in the prefecture of Agderhus, upon the bay of Anifo. See Christianity.

Anes, See Anes.

Anesianacies, in Geography, a people of the island of Madagascar, towards the isle of St. Mary.

An Epidemic, or AnSyvaria, in Ancient Geography, the name of a people of Germany, mentioned by Tacitus. According to this historian, they were driven, in the time of Nero, from their own territory by the Chauci, and then took possession of certain lands, previously occupied by the Frisians, which had belonged to the Romans, and used as pittance for their horses and cattle. In this acquisition, they were assisted by Boioicinus, a prince of distinguished reputation, and of whom proved fidelity to the Romans. When the Romans demurred in allowing them to possess these lands, Boioicinus pleaded the merit of 50 years service; and he remonstrated, that the territory was large, and applied to no useful purpose; that an unhappy people, driven from their own habitations, might be accommodated without encroaching on wide tracks, in which the Roman horses and cattle might range; that humanity forbade their suffering men to perish, whilst beaks were amply provided for; that it was incompatible with religion to devote to deferts and solitude parts of the earth which were designed by the gods for the use of men; and that such parts as had no possessor were free and common to all. Then lifting up his eyes to the sun and other celestial luminaries, he asked them, how they could bear to behold a defoliate fell, if they would not, in justice, command the fen to swallow up uppers, who thus engrossed the earth? To this spirited remonstrance, Anius, the Roman commander, indignantly replied, that the weakest must submit to the most powerful; and that as the gods had entrusted the Romans with sovereign judgment, they could not permit any other judges to interfere. At the same time, lands were privately offered to Boioicinus, in recompence of his long attachment to the Romans. This offer the brave general considered as the price of his honour, and as a bribe for betraying his people, and he rejected it with disdain and indignation, alleging, "We may want a place to live in, but a place to die in we cannot want." Upon this the Anibarri invited the neighboring nations into a confederacy against the Romans, but they were averted by the Roman generals and their forces; so that at length the unhappy people, applying in vain for settlements in neighboring territories, were under a necessity of making long and various peregrinations, which terminated in their utter defraction. Tacit. Annal. liv. c. 35. 37. These people have been known under the other denominations of Amfereus, Amfereus, and Amfistari. Some have thought that their name is derived from Ames, the Ems, and Homer, a German word, which signifies to inhabit.

Anisko, or Aniko, called also Makoko, in Geography, a kingdom of Africa, is bounded on the west by the river Umbre, which runs into the Zaire, the kingdom of Wangua and the Ambos, who border on Longao; on the north by some deferts of Nubia; and on the south by the provinces of Congo, called Songo and Sousa. This country has several mines of copper; it produces a great quantity of tanamera wood, both red and grey; and it abounds with thinecrepes, lions, and other wild beasts. The inhabitants have neither fixed lands nor inheritance; they neither sow nor reap, but live like the wandering Arabs, and fulfill by plunder and slaughter. They are said to be the remains of the Giazen, who came originally from Sierra Leone, but being weakened by their marches and battles, they were unable to return, and reduced to the necessity of refiding, principally, in the kingdom of Anisko, and also on the south-east of Angola. In their undertakings and exploits, they are valiant and intrepid, and altogether regardless of life. Their language is barbarous, and difficult to be acquired, even by the inhabitants of Congo. Their food is fand to be human flesh, and human bodies are hung up for sale in their shops. Considering that they have an absolute right to dispose of their slaves at pleasure, their prisoners of war are fattened, killed, and eaten, or sold to butchers. It is also said, that disaffected slaves offer themselves for food to their masters; and that persons of the nearest relation feed upon each other without the least horror. They have no graves for the dead, who are devoured as soon as they have expired. Persons of the principal distinction wear red and black caps of Portuguese velvet, and those of inferior condition, both of sexes, go barefooted, and are naked from the waist upwards. In order to preserve their health, they assist their bodies with a composition of pounded white sandal-wood and palm oil. The king of Aniko, or the great Macoco, is esteemed the most powerful monarch of Africa, and his dominion extends over 13 kingdoms. The zimba, or shell filled for at Longo and Angola, is the current coin of the country, and exchanged by the natives for slaves from Nubia, and also for salt, silk, glass, linen, and other merchandise. The arms of these people are battle-axes, and small but very strong bows, adorned and strengthened with serpents skins, and furnished with strings made of supple and slender flots of trees, like reeds, which never break, and short arrows of hard and light wood. In the use of their bows and arrows, they are so dextrous, that they kill birds flying, and discharge as many as 28 arrows from the bow before the first falls to the ground. Besides their bows and battle-axes, they have also daggers in serpent-skin sheaths, which they carry in ivory belts. With respect to religion, they are idolaters; worshipping the sun as their chief deity, whom they represent under the form of a man, and the moon under that of a woman; and an infinite number of inferior deities, each man having a peculiar idol to whom he offers sacrifices, and whom he constantly invokes in dangerous enterprises. They practise circumcision, but from what motives, whether religious or otherwise, it is not known. These barbarous people are much extolled for their singular fidelity and loyalty, so that they will sacrifice their lives in defence of their princes, or of their friends and allies. Mod. Un. Hist. vol. xxi. p. 264. &c.

Ansel, or Osilo, a sea-port town of Norway, in the prefecture of Aggerhus, upon the bay of Anifo. See Christianity.

Anson, George, Lord, in Biography, an eminent English naval commander, was the third son of William Anson, Esq. of Shuckburgh in St. Fidhshire. He was born in 1697. The navy being Mr. Anson's choice, he went early to sea; and in the year 1716, having sailed regularly though the inferior stations, he was made second lieutenant of his majesty's ship the Hampshire; and in 1724, he was raised to the rank of post-captain, and to the command of the Scarborough man of war. Between this time and 1733, he went, with this ship under his command, three times to South Carolina, where he acquired considerable property, and erected a town bearing his name, the country around which has been ever since called Anson County. Between 1728 and 1739, he made a fourth voyage to the coast of Guinea and to America, in the course of which, by his prudence, he engaged the French to desist from interrupting the English Guinea trade, without coming to actions of hostility.

On the breaking out of the Spanish war in 1739, Mr. Anson was pitchted upon as a proper person to command a fleet destined to attack the Spanish settlements in the Pacific Ocean. He set sail in September 1740, with a squadron of five men of war, a troop, and two victualing ships. The whole business of fitting out this expedition had been managed
naged with extreme negligence and incapacity, which rendered the exertion of all the commander's talents necessary. After a long and tedious voyage, he arrived at Madeira, thence he proceeded to St. Catherin's on the coast of Brazil, and afterwards to St. Julian in Patagonia. In doubling Cape Horn, he experienced prodigious difficulties from storms and tempestuous weather: some of his first were separated from him, of which only a small part ever rejoined him. At length he arrived at the isle of Juan Fernandez, where he refitted, allided with his own hands in landing the sick sailors, and for the benefit of future navigators, fowled the seeds of a variety of garden vegetables and fruits.

Thence he proceeded to the coast of Peru, and took the rich town of Pata; which, on the refusal of the Spaniards to ransom it, he was obliged, according to the practice of war, to reduce to ashes. When the English were about to embark, one of their company was missing, who, however, soon arrived, and acknowledged, that by taking too copious a dose of brandy, he had fallen into a profound sleep, from which he was awakened by the searchlight being fired by the town on fire. Upon opening his eyes, he was amazed to behold on the one hand all the houses in a blaze, and on the other, the Spaniards and Indians near him. The great fear and consternation of the terror instantly brought him back to a state of sobriety, and gave him presence of mind to push through the thickets of the smoke, and thus escape the hands of the enemy. This was the only instance of neglect of duty through the effects of liquor, which might have been obtained in almost every warehouse in the town. On this coast, Commodore Anfon took some valuable prizes, on board of which were several passengers of distinction of both sexes; his treatment of whom was so honourable, and consistent with the most decent decent decorum, that it left the most favourable impressions of himself and his country. He afterwards failed to the coast of Mexico; thence with a view of intercepting the annual Acapulas ship, he took his departure across the Pacific Ocean, with his own vessel the Centurion, and the Gloucester. In this passage the Gloucester became leaky, and was abandoned; and the united crews, reduced by sickness, with difficulty reached Tinon, one of the Ladrones. Here while the commodore and the greater part of his crew were on shore, the Centurion was by a strong gale driven out to sea; and so little prospect was there of her being able to reach the island again, that much labour was spent in fitting up a small vessel found on the island, Anfon himself taking the axe like a common sailor. The only occasion in which marks of emotion broke through the uniform equanimity of his demeanour, was when he received news of the Centurion's coming again in sight. From Tinon he went to Macao; and in returning from Macao, he took a rich Manilla galleon; but at the moment of victory he had a call for the exertion of all his courage and presence of mind, in consequence of a fire which broke out near the Centurion's powder-room, but which his orders, given with all the calmness of one conversant with danger in every shape, soon got under. He failed back to Canton with his prize; and there existed equal dexterity and firmness in transacting affairs with the Chinese, and maintaining the rights of his own country. Returning from thence by the Cape of Good Hope, he arrived at Spithead on the 15th of June 1744, having completed the circumnavigation of the globe, and brought back great riches taken from the enemy, though unforeseen disasters had defeated some of the principal purposes of the enterprise. Thus was the expedition finished, after having by its event strongly evinced this important truth, that though prudence, intrepidity, and perseverance united, are not exempted from the blows of adverse fortune, yet in a long series of transactions, they usually rise superior to its power, and in the end rarely fail of proving successful.

In a few days after his return, Mr. Anfon was made rear-admiral of the blue; and in a short time after a commissioner of the admiralty, and rear-admiral of the white; and in the year 1746, vice-admiral. During the winter of 1746 and 7, he was appointed to the command of the channel fleet; and in the following May he captured, off Cape Finisterre, six men of war bound from France to the West and East Indies, laden with warlike stores and merchandise, and four East-Indiamen.

By this successful enterprise, he defeated the pernicious designs of two hostile expeditions, made a considerable addition to the force and wealth of our own kingdom, and thus converted into a public benefit, the intended means of a public calamity. M. St. George, one of the French captains, in allusion to the names of two ships (L'Invincible and La Gloire), which had been taken, laid, when he presented his sword to the conqueror: "Monseur, vous avez vaincu L'Invincible, et La Gloire vous fait!" For this and other important services, he was with great propriety, in the June following, raised to the English peerage by the title of Lord Anfon, baron of Sobraon in the county of Southampton. And on the occasion, his lordship made choice of a motto very happily adapted to the dangers he had gone through, and the successes he had obtained, Nil desperandum. On the 24th of April 1748, he married the eldeth daughter of Lord Hardwicke, at that time lord high chancellor of Great Britain; this lady died without issue on the 21st of June 1760.

Lord Anfon had frequently the honour of conveying the late king from England to Holland. The first time was in the year 1748; and ever after he constantly attended his majesty on his going abroad, and on his return to this kingdom. In July 1749, his Lordship was made vice-admiral of Great Britain; in 1751, he was preferred to be first commissioner of the Admiralty in the room of Lord Sandwich; and in the years 1752 and 1755, he was one of the lords justices of the kingdom during his majesty's absence. Under him, on the prospect of a war with France, the squadrons were fitted out with great promptitude; and that more successes did not attend them was owing to accidents. He was exposed to some cenure in consequence of the loss of Minorca at the beginning of the war 1755; and in the following year he resigned his post. On a parliamentary inquiry, however, he, and the persons with whom he had acted, were acquitted of all blame respecting Minorca. In the year 1757, he was again placed at the head of the admiralty board, where he continued during the remainder of his life, which included almost all the glorious periods of that war.

The last time he commanded a fleet was in 1758, when he covered the expedition against the coast of France, and kept the enemy's fleet in port. In 1761, he was raised to the principal naval dignity, that of admiral and commander in chief of the fleet, for the purpose of bringing over the present queen of England, whom, after a rough and tedious passage, he landed on the 7th of September. In February 1762, he accompanied the queen's brother to Portsmouth to shew him the arsenal, and the fleet that was then on the point of failing, under Sir George Pocock, for the Havannah. Lord Anfon, in attending the prince, caught a violent cold, under which he languished for three months. At length it settled on his lungs, and was the immediate occasion of his death. Full of honours and reputation, he died at Moor Park, Hertfordshire, on the 6th of June 1762, leaving his whole property to his brother, Thomas Anfon, Esq., of Staffordshire.

Lord Anfon was one of his majesty's most honourable...
privy council, an elder brother of the Trinity House, and a governor of the Charter House. He was remarkably affi-
cient at the Admiralty Board, and very ready in making
naval dispositions of every kind, and in appropriating the
proper strength and proper part of ships to the different services.
Among the various and distinguished merits of this eminent
person, was that of having bred up several excellent officers,
who were afterwards renowned for liberal services achieved
for their country. He may, in general, be said to have been a true
friend and liberal patron to men of real merit and capacity in
this profession. Till later voyages had multiplied the circum-
stances of the globe, to have been round the world with
counselor, Anfr.,' was deemed a great and honourable
Walter's Account of Anson's Voyage.
Ansow, in Geography, an interior county of North Caro-
olina in Fayette district, having Meckinsburgh county to the
north, and Bladen and Craven inland counties on the ouii.
It contains 5,150 inhabitants, including 828 slaves.
Ansow's Isle, the Badio of Bougainville, an island of
the Pacific Ocean, being one of the groups called Solomons' Isls.
S. lat. 5° 15'; E. long. 13° 30'.
ANSCHAP, or Osnabroch, a marquisate or prin-
cipality of Germany, in the circle of Franconia, bounded by
the principality of Bayreuth, and the bishopric of Bamberg
and Wurtzburg. The country is mountainous and vast,
but in general it is fertile, and produces considerable
quantities of corn and tobacco, and along the Mayn good wine.
It has good pastures, and the breed of cattle is excellent.
The chief mines are of iron, those of other kinds
being neglected. It has several medicinal springs.
Anspach, together with Bayreuth, maintains a population of
300,000 on 2,320 square miles. The principal rivers are
the Rattitz, Unter or Rednitz, the Altmull, the Jagel,
the Wormitz, the Tauber, and the Mayn. It has 16 bo-
roughs, and 17 market towns, the principal of which are
Anspach, Schwabach, Kornburg, Cadolzburg, Roth, Gun-
zenhausen, Waffertundingen, Windhach, Freuchtwang,
Kreisheim, Colberg, and Uffenheim. The reigning
marsh of this principality has a fast and a voice in the council
of the princes of the empire, and is also co-constituent prince
of the circle of Franconia.
Anspach, a city of Germany, the capital of the above-
mentioned marquisate, situate on the river Rattitz, about 13
miles south west of Nuremberg. This city was rebuilt and
enlarged in 1710; it has a public library established in
1728, and a good cabinet of medals and curiosities.
N. lat. 49° 41'; E. long. 10° 42'.
ANSPESSADES, or LANSPESSADES, in the French
Hindery, a kind of inferior officers in the foot, below
the corporals, and yet above the common centinels.
The word is formed of the Italian lancia, lance, q. d.
broken lance; which was occasioned, hence, that they
were originally disdained gendarmerie, who, for want of
other subordiation, used a place of some distinction
in the infantry. There are usually four or five in each com-
pany.
ANSTRUTHER, in Geography, a sea port town of
Scotland, and a royal borough, situate in the eastern part
of the county of Fife, towards the German sea. It is divided
into two towns. Lower and Upper (which are royal boroughs)
by a small river: the harbour is capable of receiving only
small vessels, employed principally in the fisheries of the place.
N. lat. 56° 57'; W. long. 1° 10'.
ANSWER, in Lawc. See REJOINER.
ANT, in Entomology, the common English name of the
species of Linnaeus, and synonymous with emmet. That
collective creature terms emmet is also called an ant. See
BiNICA, and Termes.
This is an insect extremely injurious to pasture lands and
lands; in the former, by throwing up hills, and, in the
latter, by feeding on the fruit, &c. The best methods of
keeping them from trees, are those of having the earth
round them constantly dug up; and the application of saw-
dust, coal-dust, or other matters of the same kind, about
their roots. The same purpose may also be effected by
covering the bottom part of the trees with tar; but as this
substance is prejudicial to trees, night-soil may perhaps
answer better, as it is found to destroy them when spread
about, or put into the little holes which they throw up.
A liquor, prepared by boiling rain water with black hops
and sugar, has lately been made use of by M. Tatin, for
destroying these animals, it is said, with considerable
success. Where this liquor is employed, care should, however,
be taken that the ground where they inhabit be perfectly
fumigated with it.
ANT-Bear, or ANT-EATER, in Zool. See Mrm RANGE.
ANT-Egg is a name popularly given to a kind of little
white bulbs found in the banks or motts of ants, ordinarily
supposed to be the ovum of the insect. These are not pro-
perly the eggs of ants, but the young brood in their incipi-
te stage; when they appear like vernicles or little
worms, wrapped up in an film or skin, composed of a fort
of silk, which they spin out of themselves in the manner
of silk-worms and caterpillars. At birth they appear motile,
and after a few days, they manifest some symptoms of
flexion and extension; then they seem yellowish and hairy,
and in the form of small maggots which they assume, they
continue to grow till they are almost as large as ants. After
having passed their metamorphosis, and when they appear
in their proper shape, they exhibit a black speck near the
anus, which Mr. Leeuwenhoek and also Mr. Gould imagine
to be their feces or digested food.
Sir Ed. King noticed several of these vulgarly reputed
eggs, in some of which he found only a maggot in the cir-
cumstances as above described; while in another, the mag-
ogot had begun to put on the shape of an ant about the
head, having two little yellow spots, where the eyes were
to be. And in others, a farther progress was observed, the
included maggot being furnished with every thing to com-
plete the shape of ant, but wholly transparent, the eyes only
excepted, which were as black as bugs. Lastly, in others,
he took out every way perfect and complete ants, which
immediately escaped about the cell.
The true ants' eggs are the white substance which, upon
opening their banks, appears to the eye like the scattterings
of fine white sugar, or salt, but very soft, and tender.
Examined by a microscope, it is found to consist of sev-
eral pure white appearances in distinct membranes, all
figured like the inner part of birds' eggs, and as clear as a
fish's bladder. The same substance is found in the bodies of
the ants themselves. This spawn, when emitted, they lie in
multitudes on, to be fed; till in some time it is turned into
little vernicles, as small as mice, commonly called ant-eggs.
See PorNICA.
ANT-hills are little hillocks of earth, which the ants
throw up for their habitation and the breeding of their
young. These hills are very extravagant to the farmer, depriving
him of as much land as the hills cover, which may, in
many cases, be computed at a tenth part or more of his
great lands; and in some places, where negligence has suf-
ficed them to multiply, almost half of it has been rendered
unprofitable. In order to remove nuisances of this kind in
lands, it has been a custom in some places at the
beginning of winter, and often when the weather was not
very cold, to dig up the ant-hills, three or four inches below
the surface of the ground, and then to cut them in pieces,
and scatter the fragments about. But this practice only
disembowels the ants, instead of destroying them, as they
hide
hide themselves among the roots of the grans for a little time, and then collect together again upon any little eminence, of which there are generally great numbers ready for their purpose; such as the circular ridges round the hollows where the hills flood before. It is therefore a much better method to cut the hills entirely off rather lower than the surface of the land, and to let them lie whole at a little distance with their bottoms upwards; as by this means the rusts, which are known to be very tenacious of their abodes, continue in their habitations, until the rains, by running into their holes of communication, and flagrating in the hollows formed by the removal of the hills, and the frits, which now readily present, destroy them. If a little foot were fown on the places, and washed in with the rains, it would doubtless contribute greatly to the effect intended. The hills, when rendered mellow by the rains, may be broken and dispersed about the land, or removed for the purpose of forming into compost with dung, lime, or other habitanes. By this method of cutting the hill's one other advantage is gained, the land soon becomes even and fit for mowing. In wet seasons, heaps of sandy particles are formed by these insects among the grans, called by labourers fowad-hills, which quickly take off the edge of the fleythe. These, which are very light and compreßmable, may be conveniently removed by frequent heavy rolling in the early spring months. In the rural economy of Norfolk, a practice of cutting and burning the ant-hill: that are formed on grans land is mentioned by Mr. Marshall. The process is, to cut them up with a heart-shaped sharp spade or shovel, in irregular lumps of from ten to fifteen inches diameter, and from two to five or six inches thick. These are to be turned the grans side downwards, until the mould side is thoroughly dry, and then to be set the grans side outwards, until they are dry enough to burn. The fire may be kindled with brash wood, and kept smothering, by laying the fods or lumps on gradually, as the fire breaks out, until ten or fifteen loads of ashes are raised in one heap, which the workers there complete for a shilling or eighteen pence each load of ashes. The places from which the hills have been removed may be fown with grans seeds. Besides the destruction of the ant, this is a ready, though by no means an economical way of raising manure.

But in the sixteenth volume of the Annals of Agriculture, Mr. Young recommends the method of running down the ant-hills, instead of cutting them, as the best practice; and says, that he rode over a large fquare, which he should not have known had ever been infested with these hills, if he had not been afforded that it was once covered with them. No other method had been used but that of repeated rollings with a very heavy roller.

**ANT.** See *Fornica-Loc.*

**ANT, nufh,** the name given by Linser and Ray, to a peculiar species of ant, which is of the number of the perfumed insects. It is found on dry banks, and so much smaller than the common ant, that it needs no other distinction. Those of this species which are without wings are of a yellowish colour, and when bruised or crushed emit a sharp and acid smell, as the common ant does; but those which have wings are coal-black, and these, instead of the four smell of the others, emit a perfume not to be endured for its strength. The smell of all the perfumed insects goes off in keeping; and these little creatures, after they have been dry and dead some time, are found to smell less strongly, but much more agreeably. Phil. Trans. N° 77, or Ab. vol. ii. p. 702.

**ANT, visiving.** At Paramaribo, a Dutch colony in the province of Surinam, there are ants which the Portuguese call visiving-ants; they march in troops; and as soon as they appear, all the coopers and chefs of drawers are laid open, which they clear of rats, mice, and a peculiar sort of insect in that country called cockerlars, and of other noxious animals. If any one chance to molest them, they fall upon him, and tear in pieces his flockings and flocks. Their visits are rare; and they do not sometimes appear for three years. Templeman's Hist. vol. i. p. 36.

**ANTA,** in the Ancienr Architecture, a square column, or pillar, placed at the corners of the walls of temples and other edifices.

Thefe took their name, according to M. Perrault, from the proposition *anta, before,* because placed before the walls and coats of buildings, to secure or strengthen them. The *anta* stood on the wall, with a projection equal to one-eighth of their face, provided there were no ornament that had a greater projection; but it was a rule, that the projection of the *anta* should always equal that of the ornaments.

There are also antas at doors and gates. Pecuus confines their use to this last place.

Vitruvius calls those that have but two faces out of the wall angular *anta*, to distingufh them from others which have three faces digenaged, and which are placed at the ends of the walls of porticos. See AMTICUM.

**ANTA, or HANTE, in Geography,** a small kingdom or province on the gold-coast of Africa, is bounded on the north by the country of Adom, on the north-east by Mampo, by Asim on the west, and on the south and south-east by the ocean. Its extent from east to west is about ten leagues, the country is mountainous, and covered by large trees, among which are situated many fine villages. Anta was formerly powerful and populous, inhabited by a bold and rapacious people, who greatly annoyed the Europeans by their frequent incursions; but by continual wars with Adom and other neighbouring districts, they are now embezzled, and the country is almost depopulated. The land is well watered, the valleys are rich and extensive, and the productions, which are abundant, are rice, the beef, maize, sugar-canes, yams, and potatoes. This country is the most healthy of any along the coast; so that different writers have observed, that the number of deaths here bears no proportion to that in any other of the territories on the coast of Guinea. The principal villages of this country are Bourn-try or Botro, Bayera or Petre Grand, Tokorra, which surphal all the others in extent and beauty, So-conda, Anta, and Sama. See the several articles. The king of *anta* has fixed his residence four miles from the Dutch fort; as he thus enjoys the protection of the Europeans, and is in some measure secured from the apprehensions occasioned by the incursions of the Adomfs. Med. Un. Hist. vol. xii. p. 401, &c.

**ANTA, in Zoology.** See TARRIR.

**ANTAB, in Geography,** a town of Syria, 42 miles south of Aleppo.

**ANTACÆUS, in Hiftryology,** a name first given by the Greek writers Albin and Strabo, to the *tachipis fiscus*, the thugs fish, or *Husco*; and afterwards by Jonon and others, not only to this fish, but to the common sturgeon.

**ANTACHATES, or ad* by some naturalists, for a kind of bituminous stone of the nature of amber, though of different colour, which in burning yields a smell like myrrh.

**ANTACIDS, in the Materia Medica,** is used by some writers to denote medicines proper to correct and acid humours.

**Antacids are chiefly of the alkaline kind.**

Under the class of *antacidus* come, 1. Abihorsents, as chalk, magnesia, corina, calc. pellic, és, coal, lead, haematite, and steel fillings. 2. Obsturants, as oils and fats. 3. Immutants, as luscious farts and scamps.

**ANTACIDS denote medicines suited to correct acrimony, either in the whole system, or in particular parts of it.** See ACROMYNY.
ANTAE, in Ancient Geography, a people placed by Procopius and Jornandes near the mouth of the Danube.

ANTAEOLIS, so called from Antaeus, overcome by Hercules, a town of Egypt in the Thebaid, on the eaid side of the Nile; was the capital of the Nome Antaeopolis, about 32 miles above Panopolis, and about the same distance below Neopolis. The Thebaid, after the age of Constatine, was divided into two provinces; and Antaeopolis became the metropolis of the first Thebaid, and had bishops. This city contained the magnificent temple, which the Egyptians, according to Diodorus Siculus, built in honour of Antaeus. No part of it is now remaining but the portico, supported by large columns, and covered with large domes, one of which may be distinguished, thirty feet long by five wide. The ceiling, painted with gold and azure, has preserved the liveliest of its colours. The Turks have converted it into a stable, where they collect their herds. On the ruins of Antaeopolis is now built a miserable borough called Game el Kebire. Savary's Travels. vol. i. p. 560.

ANTAEUS, in Entomalogy, a species of scarabæus that inhabits America. The thorax has three horns, the middle one the longest, and firepl. head plumed; wing-cases very smooth. Fabriucus, Jablomsky, and Gmelin. The female has no horns.

ANTAEUS, in Fabulous History, a gigantic king of Libya, said to be the son of Neptune and Terra, and of the enormous stature of 64 cubits. In his conflict with Hercules, he was repeatedly overthrown, and laid on the ground half dead; but as often as he touched the earth, he obtained assistance from his mother, and acquired fresh strength. Hercules, therefore, found it necessary to raise him from the ground, and suspending him in the air, squeezed him to death. This Antæus is said to have built the town of Tingis on the straits of Gibraltar, where he was interred. The Greek geographers pretend that this Antæus founded Antæopolis in Upper Egypt; and Diodorus Siculus informs us, that Chesir assigned to him the government of Libya and Ethiopia. But it is not easy to determine how the Egyptians should raise to the rank of their gods the Grecian Antæus. It is probable, however, that the temple in which Antæus was honoured by the ancient inhabitants of Egypt, was ruined; and that in process of time the Greeks, under the reign of the Ptolemies, substituted for the worship assigned to the Egyptian Antæus, that of the giant of the same name, slain by Hercules.

ANTAEUS, in Ancient History, was probably the same with Atlas; and they are represented by ancient writers as two of the first kings of Mauritania. They were both the sons of Neptune, who reigned over Mauritania, Numidia, and a great part of Africa; and they both ruled over a great part of Libya; and they both ruled over a great part of Africa, particularly Tingitania. Hercules defeated and slew Antæus, in the war in which he dispossessed Atlas of Libya. Atlas and Antæus invaded Egypt, and contended with Hercules in the wars with the gods, and were both vanquished by him. Antæus, as well as Atlas, was famed for his knowledge of the celestial sciences; and from this circumstance it may reasonably be inferred, that they were, under different names, the same king of Mauritania. Antæus, in his wars with Hercules, commanded an army of Egyptians and Ethiopians, and behaved with great resolution and fortitude. By means of powerful reinforcements of Libyan troops, he cut off a great number of Hercules's men; but that celebrated commander, having at last intercepted a strong body of Mauritanian or Libyan forces, that were sent to the relief of Antæus, gave him a total overthrow, and put him and the rest part of his troops to the sword. This decisive action put Hercules in possession of Libya and Mauritania, and consequently of all the riches of those kingdoms; and hence arose the fable, that Hercules, finding Antæus, a giant of an enormous size, with whom he was engaged in single combat, had recourse to the artifice mentioned in the preceding article for putting him to death. Hence likewise may be deduced the fable, relating that Hercules took the globe of Atlas upon his own shoulders, overcame the dragon that guarded the orchards of the Hesperides, and made himself master of all the golden fruit. The golden apples so frequently mentioned by the old mythologists, were the treasures that fell into the hands of Hercules upon the defeat of Antæus; the Greeks giving the original word ἄτνος, riches, the signification soiled to their own term ποικλα, apples. After the most diligent and impartial examination of all the different hypotheses of historians and chroniclers, relating to Atlas and Antæus, there is no one that appears so little encumbered with difficulties as that of Sir Isaac Newton. According to this illustrious author, Ammon, the father of Sefac, was the first king of Libya, or that vast tract extending from the borders of Egypt to the Atlantic Ocean; the conquest of which country was effected by Sefac during his father's life. Neptune afterwards excited the Libyans to a rebellion against Sefac, and slew him; and then invaded Egypt, under the command of Atlas and Antæus, the son of Neptune, Sefac's brother and admiral. Not long after, Hercules, the general of Thibus and Ethiopia, for the gods, or great men of Egypt, reduced a second time the whole continent of Libya, having overthrown and slain Antæus near a town in the Thebaid, from that event called Antæa, or Antæopolis. Such is the opinion of Sir Isaac Newton, who endeavours to prove, that the first reduction of Libya by Sefac happened a little above a thousand years before the birth of Christ, as the lat, by Hercules, occurred some few years after. Anc. Hist. Hill. vol. xvi. p. 160.

ANTAGONIST, formed from ἀνταγωνιστής, and ἄνταμν, I contend, among the Ancients, denotes an adversary in battle. In this sense the word is rather used in speaking of sportive combats, or games, than of serious fighting.

ANTAGONIST also denotes one of the parties in literary disputes.

ANTAGONIST muscules, in Anatomy, are those which have opposite functions. Such are the flexor and extensor of any limb, the one of which contracts it, and the other stretches it out; and also the adductors and adductors. Solitary muscles are those without any antagonists; as the heart, &c.

ANTALGIC, from ἀνταλγή, pain, is epithet given by some writers to medicines proper for abating pain. In this sense antalgics amount to the fame with anodynes.

ANTALIS, in Cosmology, the name given by Argenville to the species of dentulus, called entalis by Linnaeus.

ANTALKALINES, in the Materia Medica, signify medicines suited to correct alkaline farts, or alkaline matters in the whole body, or in particular parts. Dr. Cullen observes (Mat. Med. vol. ii. p. 423.), that no alkaline farts, in its separate state, ever exists in the blood-vessels of the living human body. He accordingly expounds the doctrine of Dr. Boerhaave, who treats "De Morbis et Alkalii sponteant," as incorrect and erroneous, and leading to no occasion for the use of antalkalines: and he adds, that the only occurrence requiring them is a very rare one, that of a pure alkali being thrown in by mistake or accident into the stomach; and the means of taking off its irritation by acids is sufficiently obvious. It is farther to be remarked, that as the alkali, in any noxious quantity, cannot have been introduced without hurting the mouth, fauces, and esophagus, it is always necessary, in such cases, along with the acids, to employ the large use of diluents and demulcents.

ANTAMBA,
ANTAMBA, in Zoology, an animal of Madagascar, probably the same with the congo of Congo, is a variety of the leopard, as large as a dog, with a round head; and, according to the relations of the negroes, is like a leopard, and devours both men and cattle. It is found only in the most deforested parts of the island.

ANTANACLASIS, from ant and causulis, repellitur; a figure in Rhetoric; whereby the same word is repeated, but in a different signification—As, "Let the dead bury the dead." "Dum vivimus, vivamus." This figure carries with it a poignancy; and when it appears natural and easy, discovers a ready turn of thought.

ANTANAGOGIC, from ant and argumentum; a figure in Rhetoric, when, not being able to answer the accusation of the adversary, we return the charge, by loading him with the same or other crimes; which is usually called recrimination.

ANTANDRO, in Geography, a town of Asia Minor, in Cyprus, who, according to Strabo, who places it on the north side of the gulf of Adramyttium. Stephanus Byz. says, that the Cimmerians possessed it during a century. According to Strabo, these people, conducted by Lygdamis, made this town their place of arms. Servius says, that Antandros was founded by the inhabitants of Andros, after they were driven from their own island on account of their sedition. Others say, that the Thracians, having made Poleymadas a prisoner, obtained this city as the price of his ransom. Some authors place it at the foot of Mount Ida; and allege, that it gave name to the small chain of mountains extending from Troy to the sea. See Andros.

ANTARES, a people who inhabited Caria. See Boer-havia.

ANTAPHRODISIC, from ant and Apollo, Venus; an epithet given to medicines which diminish the semen, and check or extinguish the incitements to venery. It is doubtful whether there be any medicines of specific power for this purpose; and if there be any which have these effects, it is by answering particular indications, under the titles of which they should only be mentioned, and not under a general term of no defined operation.

ANTAPOCHA, in the Civil Law, denotes one's acknowledgment in writing of money paid, in the way of rent, pension, interest, or the like incumbrance. Such instrument, or antapocha, the debtor gives upon making payment to the creditor, to serve as a proof of the charge or incumbrance for futurity; and exclude any claim of prescription against the payment of it. The antapocha differs from the apogedo, in that this latter is given by the creditors to the debtor, the former vice versa.

ANTARADUS, in Ancient Geography, a town of Syria, commonly called Tortosa, was situated over against the ancient Arados, to the right of the river Euphrates, at a small distance from the sea. In the fourth century, about A. D. 330, it continued to be known by its old name, as appears from the "Itinerarium Hierosolymitanum," which, with its other name Confluentes, given to it by its earlier Confluentes, were diluted some centuries afterwards, in, or perhaps before, the time of the croisades. Shaw's Trav. p. 266.

ANTARCTIC Pole denotes the southern pole, or end of the earth's axis. The word is composed of ant, contra, and spelix, urfa, bear; as being opposite to the artic pole. The stars near the antarctic pole never appear above our horizon.

ANTARCTIC circle, is one of the lesser circles of the sphere, parallel to the equator, at the distance of 23° 50' from the south pole. It takes its name from its being opposite to another circle, parallel likewise to the equator, and at the same distance from the north pole, called the arctic circle.

ANTARCTICA, in Entomology, a species of SpheX, with the lize of the common wasp. It is black, with ferruginous legs and antennae. Gmelin. Inhabits the Cape of Good Hope.

ANTARCTICA, in Ornithology, a species of Procellaria that is found within the antarctic circle. It is brown above, beneath bluish white; tail white, black at the tip; legs lead colour. Gmelin. This is the antarctic petrel of Forster and Cook; petrel antarcticus, ou damier brun, of Buffon; and petrel brun et blanc of Bontinck. It is about the size of a large pigeon, and the length is nineteen inches, of which the bill is one inch and an half, and is brown with a black tip; the second quill feathers are white, with dark brown tips; the quills are dark brown, with the inner webs of some next the body white. These birds have been met with in flights of twenty or more, by navigators, in S. lat. 61°. 30' N.

ANTARCTICA, is a species of Anteodytes; called by Forster the antarctic penguin. The beak is black, legs reddish, and a black line on the throat. Gmelin.

The length of this bird is twenty-five inches; the weight eleven pounds and a half. Bill nearly three inches in length, black, and the under mandible somewhat truncated; iris pale yellow; upper parts of the body black, beneath glossy white. Under the chin is a narrow blackish streak passing backwards towards the hinder part of the head, and somewhat bent about the region of the ears. Wings above blue-black, the lower margin and inside white; tips black. Tail cuneiform; the feathers, or rather bristles which compose it, black, and thirty-two in number. The feet, which are reddish, or rather flesh colour, have the toes black. Latham, Sc.

This species inhabits the South Sea, from 45° to the antarctic circle; and is frequently found on the icy mountains and islands in those regions, according to Forster, Ellis, and other naturalists and navigators.

ANTARCTICUS, in Entomology, a species of Tabanus that inhabits America. It has four brown stripes across the eyes, and the flanks of the legs are white. Fabricius and Gmelin.

ANTAURES, in Astronomy, the Scorpion's Heart; a fixed star of the first magnitude, in the constellation Scorpio.

ANTASTHMATICS, in the Materia Medica, denote medicines that are supposed to cure asthma; or, in general, to relieve difficult breathing.

ANTASTROPHIC, from ant and splex, I turn; in Rhetoric, a species of Anteposition.

ANTAVARE, in Geography, a province of Madagascar, is situated to the north of Bistiane, in 21° 30' of S. lat. and bounded by the province and cape of Manan. It is watered by the river Mananar, whose source is in the mountains of Ambohitrombe, or red mountains, situated about 15 leagues farther north-west; and which runs south-east and east. Antavare is extremely fertile in rice, yams, bananas, sugar-cane, and honey, of which wine is made; and it abounds in cattle and goats, and all sorts of fowls and provisions. The French discovered in this province gold dust by means of the negroes, who offered it for sale.

ANTE, in Geography, a river of France, which runs into the Drire at Calvados, in the department of the Calvados.

ANTE, a town and port of Africa, in Guinea, three leagues from the cape of Three Points.

3 A

ANTEA,
the flood, but he has contented himself with merely setting down the years of the fathers' age, in which the several descendants of Adam, in the line of Seth, were begotten, and the length of their respective lives; and therefore, in this period, nothing more can be done than to ascertain the years of the lives and deaths of those patriarchs, and the distance of time from the creation to the deluge. This, indeed, might easily be done, if there were no varieties in the several copies of the writings of Moses, to which we have now access, which are the Hebrew, the Samaritan, and the Greek version of the Septuagint: but these differ considerably from one another; and hence learned men, as they have preferred one copy or the other, are much divided in their opinions concerning the first ages of the world. In order to enable our readers to judge of the variations of the three copies above mentioned, in this period, we shall subjoin a table extracted from the Ancient Universal History, in which the corresponding numbers of each will appear; and we shall also add those of Josephus, as they have been corrected by Dr. Wells and Mr. Whiston; a correction which became indispensably on account of the corruptions that have been introduced into the present copies of that historian.

A Table of the Years of the Antediluvian Patriarchs.

</table>

To this Table it will be necessary, in order to explain the consequence of these variations, to add separate chronological tables, shewing in what year of his contemporaries the birth and death of each patriarch happened, according to the computation of each of the said three copies.

</table>

To the varieties exhibited in the two last tables, others might be added, by admitting the various readings of some numbers in the Samaritan and Septuagint; for as to the Hebrew copies, there is here a confluent agreement among them.

The manuscript from which the Samaritan Pentateuch was published, agrees exactly with the Samaritan numbers given by Eusebius. But St. Jerome tells us that, in his time, there were some Samaritan copies which make Methuselah 187 years old at the birth of Lamech, and Lamech 182 at the birth of Noah, just as the Hebrew does. Now if these numbers be approved as the true original numbers, the interval from the creation to the flood will be 1556 years; differing from the Hebrew computation but 160 years in the age of Jared at the birth of Enoch; and if this last be allowed to be a mistake of the transcriber, by his dropping a number, and writing 62 instead of 162, as has been suspected, the Samaritan will be perfectly reconciled with the Hebrew, and all difference between them vanish.

Scaliger,
Sealiger, on the authority of an old Samaritan chronicle, having at the end a table of the years of the patriarchs to the time of Moses, would correct two of the Samaritan numbers in Eusebius; viz., instead of 65, the age of Mahalalel when he begat Jared, he thinks it should be 75; and instead of 67, the age of Methuselah when he begat Lamech, he would have it 77. By which alterations he reckons 20 years more to the flood than Eusebius and the manuscript; that is, 1327; but as he acknowledges the table wherein he grounds these corrections, contains some great absurdities, it seems unreasonable to oppose it to the joint authority of Eusebius and the Samaritan manuscript.

As to the Septuagint, in the common editions of that version, the age of Methuselah at the birth of Lamech is 167; and consequently the sum of this period, according to them, is no more than 2242. But in this case Methuselah will outlive the flood 14 years; and we may well wonder, with Eusebius, where he was preferred. To obviate this objection, we are told, that, in some copies, Methuselah is said to have lived but 782 (not 802) years after the birth of Lamech, and no more than 949 in all. But the Alexandrian manuscript entirely takes away the difficulty, by giving the same number in this place with the Hebrew.

Pezron is of opinion, that the age of Lamech at the birth of Noah should be but 182, as it is both in the Hebrew and in Josephus; supposing, with St. Austin, that the present number is the error of the scribes, who first copied the original Septuagint manuscript in Ptolemy's library. So that he computes 2256 years to the flood. And, if this correction be admitted, and one more mentioned also by St. Austin, viz., that Lamech lived 345 years after the birth of Noah, and not 565, as in the present copies, there will then remain no other difference between the Septuagint and the Hebrew than 600 years added to the ages of the six patriarchs when they begat their sons; and Methuselah will, conformably to the Hebrew and Samaritan, die in the year of the flood.

The chronology of the learned archbishop Usher has been followed in the calculations of this period; and they may, with very little trouble, be reduced to that of the Samaritan or Septuagint, by those who prefer the accounts of those copies.

As in the course of this work we shall collect, under separate articles, the leading particulars which sacred history has recorded concerning the principal patriarchs, of the Antediluvian world, it is needless to enlarge in this place. It will be sufficient to observe, that the whole progeny of Adam, of whom we have any mention in scripture, were the descendants of Cain and Seth, and the following genealogical table exhibits their succession.
Sacred history is chiefly confined to the line of Seth, and speaks few particulars concerning that of Cain, so that no connectives can be formed by long he or any of his de-
scendants lived. The whole of what we know is, that
Laemach, the ninth in descent from him, married two wives,
Adah and Zillah, which connection furnishes the first known
instance of polygamy; that by the former he had two sons,
Jabal, who was the first that dwelt in tents and fed cattle, and
Jith, the inventor of metal; and by the other, a son
named Tubal-Cain, who founded the art of forging and
working metals. Zillah likewise brought him a daughter
named Naamah, who is supposed to have invented spinning
and weaving. For other particulars, see Laemach.
The posterity of Cain became in a very great degree degenerate
and wicked; while, on the other hand, the descendants of
Seth were as eminent for their piety and virtue. In
process of time, however, or after seven generations, according
to Josephus, they also became corrupt and profligate; and
every kind of wickedness overspread the earth. At length the
race of man became incorrigible, and all the means which
Providence had taken for awakening and reclaiming them were
ineffectual; so that he pleased God, in just displeasure and
after signal forbearance, to exterminate the whole species,
Noth and his family excepted, by the deluge.
Of the Antediluvian period some accounts have been
transmitted to us by those ancient authors who have
recorded the Pheneic, Babylonian, and Egyptian
antiquities. Sanchoniatho (who is supposed by some to
have been contemporary with Gideon, or with David; wuhil
others deny the existence of such a person, and consider
his history as a fiction of Philo Bibius for discrediting
Josephus’s book against Apion) wrote the Pheneic
antiquities. His history commences with the origin
of the world and of mankind; but as it was written with
a view of apologizing for idolatry, he deduces the his-
tory, not from Adam in the line of Seth, but in the
idolatrous line of Cain, nor does he make the least mention
of the deluge. The first pair of mortals with whom his
history begins, are called by Philo, his translator, Proto-
gonus and Eon. Their issue were designated Genus and
Genea, and they dwelt in Pheneica. From Genus sprung
Phos, Phur, and Phlox, that is, light, fire, and flame.
These found out the method of producing fire by rubbing
pieces of wood against each other, and taught men its use.
Their fons were of enormous height and bulk, and gave to
the mountains of which they took possession their own names of
Cainus and Libanus, Anthbagus and Brathys.
From these again, in the fifth generation, proceeded Memnunus
and Hyphuranus, who were so denominated by their mothers,
who lived in a brutal state of prostitution. Hyphuranus
inhabited Tyre, and there invented the art of making bricks
with reeds and rushes, and the papyrus. He quarrelled with
his brother Ufous, who was the chief inventor of a covering
for his body, made of the skins of wild beasts; and he also
made a raft of boughs, and ventured upon it into the sea.
He likewise confectioned two rude flumes or pillars to fire and
wind, and worshipped them, pouring out to them the blood
of such wild beasts as had been caught in hunting.
Afterwards, however, flumps of wood and pillars were also
confectioned and worshipped as deities. In the next genera-
tion succeeded Agurus and Haneus, the inventors of the arts
of hunting and fishing, from whom the names of huntsmen
and fishermen were derived. These begot two brothers, who
formed the seventh generation, and who discovered iron and
the method of forging it; one of these was called Chryfor,
the name with Hephaestus or Vulcan, and exercised himself
in words and charms, and divinations: he found out the
hook, bait, and fishing line, built light boats, and was the
first man that failed, so that after his death he was wor-
shipped as a god, and called Zeus Michlous, or Jupiter
the engineer; and some say, that his brothers invented the art
of making bricks. From this generation descended two
brothers, one called Techelles, and the other Garios Autancheon,
or the home-born man of the earth. These found out the art of mingling flax
or small twigs, with the clay of which they made bricks and
things. One of their potters, in the ninth generation, was
called Agres, field, and the other Agrot eros or Agrotes,
husbandman, who had a statue most worshipped, and a
temple carried about by one or more yoke of oxen, in Phe-
ncia; and among those of Bybus he is called by way of
eminence, the greatest of the gods. These first made
courtyards about houses, fencens, and caves or cellars.
 Husband-
men and such as use dogs in hunting, derive their origin
from these: and they are also called Aletes, and Titans.
From these succeeded, in the tenth generation, Amyus and
Magus, who taught men to form villages, and to feed
sheep. Of Amyus and Magus were descended Mifor and
Sydes; and the son of Mifor was Tantus or Thoth. The
Protogonus and Enion of the Pheneic genealogy, were,
without doubt, Adam and Eve; and Mifer, the Mzraim
of Mofes. From Protogonus to Mifor, Sanchoniatho reckons
11 generations; and from Adam to Mzraim, Mofes makes
12: so that Sanchoniatho falls short of Mofes only by one
generation, which is owing to his not having recorded the
flood. In this age there was one Elin, importing in Greek
Hyphus, the most high; and his wife was named Beruth,
who dwelt about Bybus; and by him was begotten one
Epicurus, or Autochthon, whom they afterwards called
Uranus, heaven. He gave his name to the element which
is over us, and on account of its excellent beauty, is called
heaven; and he had a father of the same parents, called Ge,
the earth, and by reason of her beauty, the earth was
denominated from her. Hyphus, the father of these, being
slain by wild beasts, was consecrated, and his children
offered sacrifices and libations to him. But Uranus, taking
the kingdom of his father, married his father Ge, and had
by her four sons; Hius, who is called Chitusus or Saturn;
Betylus; Dagon, who is Sitan, or the god of corn; and
Atlas; but by other wives, Uranus had a numerous
issue.
The Babylonian antiquities were collected by Berossus,
who was by birth a Chaldean, and lived in the time of
Alexander the Great. He gives a series of ten kings, who
reigned in Chaldea before the flood, and computes their
regnis by Sari or decades of years; making the whole sum
3200, or more accurately, 1600, years, which is a number
that offers no violence to the Mofe chronology. As these
ten succesions correspond to the ten generations that elapsed
between the creation and the flood, the first king, whose
name was Aloras, has been supposed to be the same with
Adam; and Xifithus, the same with Noah. Aloras
pretended to dominion by divine right, and maintained that God
himself had declared him the pallor of the people; a preroga-
tive that peculiarly belonged to Adam. Aliparas, the second
king, was succeeded by Amenon, or Amalrus, of the city of
Panibilla, probably the Sipharra of Polyteny, and sup-
posed by Sir Isaac Newton to be the Sepharvain of
Scripture. After Amenon and Ambalrus, who were both of
Panibilla, and the successors of Aliparas, arose Daommus,
an inhabitant of the same city, and a thief. The next
vint king, called Eudererebus, was of the same city; the
sexth or ninth was of another city, called Laranchel; and

the last of these, Ohartes or Ardates, was succeeded by his son Xiuthus, in whose time the great deluge happened. See Deluge.

Berosus ascribes the origin of the arts and sciences among the Antediluvians to the following circumstance. There appeared, says he, out of the Red Sea, at a place near the confines of Babylonia, a certain irrational animal, whose name was Oannes. His body resembled that of a fish, and beneath his head another grew; his feet were like those of a man, and proceeded from the fish's tail, and he had a human voice. This animal conversed with men in the day, and communicated the knowledge of letters, arts, and sciences; he taught men to dwell together in cities, to erect temples, to introduce laws, to acquire geometry, and to gather feeds and fruits; and in short, he imparted to mankind whatever was necessary and convenient for a civilized life. When the sun set, this animal, which was off the amphibious kind, retired into the sea, and stayed there during the night. This animal not only delivered his instructions by word of mouth, but wrote concerning the origin of things, and of political economy. Other authors have also mentioned this Oannes, with some trivial difference in their accounts. Hyginus also writes, that Eubabones, a name not very different from Oannes, came out of the sea in Chaldea, and explained astrology. According to Abydæus, a second animal, called Anædotos, and renewing the demi-god Oannes, arose out of the sea in the reign of Amelón; and in the time of Daonus, four such animals arose from the sea, and their names were Euedocus, Eucgamus, Eneubulus, and Antemus; and under Eucdæphus there appeared another animal, like the former, called Odæcon. All these explained more particularly what Oannes had delivered in a more summary and concise manner.

The Egyptians have also a series of kings, who, as they pretend, reigned in Egypt before the flood; and their account begins in the same year with that of Berosus. They had an ancient chronicle, extant among them not many centuries ago, which contained 30 dyadical princes who ruled in that country, by a series of 173 generations, through an immense interval of 36,525 years, during which period Egypt was successively governed by three different races, viz. the Aarises, the Mæthrias, and the Egyptians. Manetho, a writer somewhat later than Berosus, and whose remains furnish the ancient Egyptian history, has not adopted this extravagant number of years, though he has probably been led into errors in chronology by this old chronicle, which nevertheless some have supposed to have constituted a composition of later date than his time. This writer begins his history with 16 dyadical or reigns of princes; of whom the first seven were called gods, and the other nine demi-gods; these, he says, reigned 1685 years.

The knowledge we are able to deduce from the scriptures, the only source of authentic intelligence on this subject, concerning the religion, arts, and sciences, and policy of the Antediluvians, is very limited and imperfect, and depends more upon conjecture than upon certain conclusions from a detail of facts. Their religious rites, we know, consisted of sacrifices, both of the fruits of the earth and of animals; but it is not agreed, whether the blood and flesh of the animals, or only their milk and wool were offered. See Sacrifice. Some have endeavored to prove, that all the patriarchs from Adam had fated places, and both annual and weekly times set apart for divine worship, and also a separate maintenance for the priests; but these particulars, though they may be true, cannot be proved from the scripture. See Sabbath. The arts and sciences, as we may naturally suppose, made but slow progress during the period to which we now refer. It appears that the art of working metals was discovered by the last generation of the line of Cain, and nulce, which they might have been supposed to practice for their pleasures, was not brought to any perfection (if indeed it was actually invented) before the same generation. Some have supposed, that the science of astronomy was cultivated by the Antediluvians; but this opinion is probably owing to a misapprehension of Josephus: but if it was known, the progress they made in it, or indeed in any other science, was inconsiderable. It has been even doubted, whether or not letters were known before the flood. See Letters and Writing. As to their politics and civil constitutions, we can only say, that the patriarchal form of government was probably the first that was adopted; but this was set aside, when tyranny and oppression began to take place; and this change occurred much sooner, as we have reason to believe, among the race of Cain than that of Seth. Their communities were few, and consisted of much larger numbers of people than those which were formed after the flood; and it has been questioned, whether after the union of the two great families of Seth and Cain, there was any abolition of civil societies, or diversity of regular governments at all. It is more likely, that all mankind formed one great nation, living in a kind of anarchy, divided into several disorderly associations, which was almost the natural consequence of their having but one common language, and must have greatly contributed to the general corruption, that could not otherwise have so universally overspread the Antediluvian world. For this reason chiefly, as soon as the posterity of Noah were sufficiently increased, a plurality of tongues was miraculously introduced, in order to divide them into distinct societies, that they might not be so easily debauched for the future. See Confusion of Tongues, and Dispersion.

The Antediluvian world was, probably, flocked with a much greater number of inhabitants in proportion to the extent in which we may suppose it to be habitable than the earth, in its present state, is perhaps capable of containing or supplying. This increase of population seems naturally to follow from the great length of their lives, exceeding the present standard of life in the proportion of at least ten to one; the Antediluvians must, accordingly, in any long space of time, double themselves, at least, in about the 10th part of the time in which mankind do now double their number; for they began to procreate as early, and left off as late, in proportion, as men do now; and the several children of the same father seem to have succeeded as quickly one after another as they usually do at this day; and as many generations, which are but successive with us, were contemporaneous before the flood, the number of people living on the earth at once, would be sufficiently increased to answer any defect which might arise from other circumstances not considered. So that, if we make a computation on these principles, we shall find, that there was a considerable number of people in the world at the death of Abel, though their father Adam was not then 130 years old, and that the number of mankind before the deluge would easily amount to above 100,000 millions, even according to the Samaritan chronology; that is, to 20 times as many as our present earth holds, in all probability, now upon it, or can well be supposed capable of maintaining in its present constitution. It is now generally owned, as the result of good observations, that mankind double themselves in about 300 or 350 years; or, allowance being made for all excepted cases, such as wars, famines, &c. in about 400 years. So that allowing the period for doubling mankind from the creation.
creation to the deluge to be ten times shorter by reason of their much longer lives; if we have a series of 40 numbers, beginning at two, for so many God created at first, and doubling themselves in 40, or for convenience, in 41 years, at a mean, or one age with another, till the deluge, we shall, in some degree, obtain the sum total of mankind at the deluge, and also in the several ages before that time; though this period of doubling must still have been much shorter in the earliest, and longer in the latest times of the interval; which computation Mr. Whiston, who has furnished these observations has given in the following table.

This table is calculated at the long interval of 50 years, that it may appear that even under the number of mankind, there would be so many millions born into the world before the deluge came, that they would be obliged to spread themselves over the face of the earth, though but one half of the sum total of 429,490 millions had been alive at the time of the deluge; but as the interval here allowed may appear to be too long for the time of doubling, the second is calculated at the interval of 40 years, which comes nearer to the truth of the cause, though even this may exceed the time of doubling.

Mr. Cockburn, in his Treatise on the Deluge, has made several objections to the principles upon which the above table is calculated, for which we must refer to the author's own account. This author has computed two tables, exhibiting the increase of mankind in the Antediluvian world; the first on the supposition of their doubling themselves in 50 years, and the other in 40 years, and both beginning at the year 500, when there could not be fewer than 120 married or marriageable persons descended from Adam and Eve.
The author, allowing for all obstructions and deficiencies in the course of nature, and for all casualties and accidents, reduces the former number to one-half, viz. to 27,457,795,694,400, that is, 27 billions, or millions of millions, four hundred and eighty-six thousand, seven hundred and ninety millions, six hundred and ninety-four thousand, and four hundred. This he supposes to be the whole number of those who were born into the world before the deluge, or during an interval which he rates at 2256 years. He then allows for those who died before the deluge, and on this account reduces the above number again to one-half, and rates the whole number of mankind alive upon the earth at the time of the deluge to have been no more than 13,743,893,147,200, that is, 13 billions, or millions of millions, seven hundred and forty-three thousand eight hundred and ninety-five millions, three hundred and forty-seven thousand and two hundred; a number far exceeding that of the present inhabitants of the whole earth. The first of the above tables is brought down no lower than to the year 2050, and the second to the year 2022, though there remain by the first 256, and by the second 236 years to the flood; the reason of which is, that in the last 200 years of the world, mankind would not increase in any measurable way to what they had done in the preceding years, though regularly the increase should have been much greater; because violence was then great in the earth, and thousands, yea millions, might have been cut off by untimely deaths; for which cause the duration of the world was determined 120 years before the flood came.

For the longevity of the Antediluvians, and the probable causes of it, see Longevity.

It has been a question much debated, whether or not flesh was permitted to be eaten before the deluge. By the permission given expressly to Noah for that purpose, after the flood, and God's allowing vegetables only for food to man, as well as beast, at the creation, one would imagine it was not lawful before; yet others have supposed, that it was included in the general grant of dominion given by God to Adam over the animal creation; and the distinction of beasts into clean and unclean, which was well known before the flood, is alleged as a strong argument on this side, and which it is not easy to answer. On the other hand it is urged, that if flesh were eaten before the flood, it does not appear that there was any occasion to renew this grant after it, which grant, specifying distinctly animal food, contradistinguished from vegetable, respected not Adam only, but all his posterity. It is farther urged, that the distinction between clean and unclean, respected animals offered in sacrifice in the Antediluvian world; as appears from this circumstance, that upon the grant of animal food to him and his descendants, which was posterior in time to the sacrifice, there is not the least mention of any distinction between clean and unclean with respect to food, but the contrary. The distinction of clean and unclean with regard to food, was introduced by the law of Moses, and differed from that of sacrifices; as there were several creatures clean for food which were not to be offered in sacrifice. Others contend, that if it be alleged that this distinction was used propertly, it is a mere subterfuge; and to supposing it made solely to distinguish what was lawful or unlawful to be sacrificed, and not what might or might not be eaten, is little better; it being the custom to offer to God such fruits and animals as were fit for food and sufficiency, and not such as were of no use or benefit to mankind in this respect. Shuckford's Connexion, &c. vol. i. book i. p. 1—57. Anc. Un. Hist. vol. i. p. 21—72.

ANTEJURAMENTUM, from ante, before, and jura-mentum, oaths, or Præjuramentum, by our ancestors also called jura mentum callumae, in Law, an oath by which both the accuser and the accused were anciently obliged to make before any trial or perjury. The accuser was to swear that he would prosecute the criminal; and the accuser was to make oath on the very day that he was to undergo the ordeal, &c. that he was innocent of the fact of which he was charged. If the accuser failed, the criminal was discharged; if the accused, he was under the obligation to be guilty, and was not to be admitted to purge himself by the ordeal.

ANTEJUSTINIANEAN, an appellation sometimes given to the ancient Roman law, as it stood before the time of the emperor Julian.

Tribonian has been often condemned for suppressing the writings of the Antejustinian lawyers. Schulting, a celebrated professor at Leyden, has a dissertation on the equity of this censure. Fabricius gives a catalogue of the ancient Antejustinian lawyers. Schulting has published a collection of the Antejustinian writers.

ANTELMII, in Ancient Geography, a town of Asia, in Armenia.

ANTELIUS, or ANTHELII, in Ancient Writers, denotes an idol placed over the doors of houses, supposing to have the guardianship, or protection of them.

The word is originally antelvion, q. d. against the sun, as being expos'd to it.

ANTELMII, Joseph, in Biography, a French writer of ecclesiastical history, was a canon of Frejus, in Provence, in the 17th century. He published, in 1680, a Latin "Discertation, Historical, Chronological, and Critical, on the church of Frejus." He also wrote a critical inquiry concerning the author of the creed, commonly called Athanasius's, with other tracts, amusing with curious research. He died, a victim to immediate flux, at the age of 49, in the year 1697. Now, Dict. Hist.

ANTELOPE, Antilope, in Zoology, a genus of the Manulidae Pecora, in the Linnean family by Gmelin; the characters of which are, that it has concave horns, turned upwards and round, annulated, i. e. surrounded with prominent rings, or spiral and permanent. The lower jaw has eight broad fore-teeth; the upper jaw none; and there are no teeth in either. To these characters Mr. Pennant adds, that the inside of the ears is marked longways with three feathered lines of hair, and that the limbs are of a light and elegant form. The antelope forms an intermediate genus between the deer and the goat; though arranged with the latter by Linnaeus, in his former editions, and by several other naturalists: but Gmelin, in imitation of Pennant, Erxleben,
and Dallais, has referred them to a distinct genus. In the form of their bodies they agree with deer, and in the texture of their horns, which have a curve in them, they resemble the goats; they have all gall-bladders, distinct lacrimal, and many, or little, under the eyes; a plate of the skin divided into several cells in the groins; brushes of hair on the knees, and beautiful black eyes. In general their flesh is excellent, as they feed on the tender shoots of trees, though some have a rank herbage or musky flavour, which probably results from the qualities of the plants on which they feed. None of the numerous species of this genus are found in America; they are mostly confined to Asia and Africa, inhabiting the hottest regions of the Old World, or the temperate zones near the Tropics. None of them, except the chamois and farga, are found in Europe. They chiefly inhabit hilly countries, though some in the plains; and some species form herds of two or three thousand, while others keep in small troops of five or fix. These animals are elegantly formed, active,riefles, timid, shy, and sufficiently fast, running with rapid bounds, and springing or leaping with surprising elocution; they frequently stop for a moment in the midst of their course to gaze at their pursuers, and then resume their flight. The faults of these animals is a favourite diversion among the colonists; and the accounts that are given of it supply ample proofs of the swiftness of the antelopes of the tribe. The greyhound, the sleetest of dogs, is usually outrun by them; and the sportsman is obliged to have recourse to the aid of the falcon, which is trained to the work, for feigning on the animal, and impeding its motion, that the dogs may thus have an opportunity of overtaking it. In India, and Peria, a fort of leopard is made use of in the chase; and this animal takes its prey not by swiftness of foot, but by its astounding springs, which are similar to those of the antelope; and yet the leopard should fail in its first attempt, the game escapes. The swiftness of this animal has been proverbial in the country which it inhabited from the earliest times: the speed of Ahabib (2 Sam. ii. 18.) is beautifully compared to that of tzebi, which Shaw, in his Travels, translates antelope, and not roe, as it is in our text; and the Gadites were said to be as swift as the roes upon the mountains. We may add, that the disciple restored to life at Joppa was supposed to have been called Tabitha, i.e. Dorcas, or the Antelope, from the beauty of her eyes; and it is still a comparison in the east; so that aine el cazel or "You have eyes of an antelope," is used as the greatest compliment that can be paid to a fine woman. Authors enumerate 20 species. 1. Antelope lycellus, blue antelope, with recurved, roundish, and annulated horns, and of a bluish colour. This is the blue-bock of Kolben, duch-chamois of Journal Histoire, and blue antelope of Pennant. It inhabits the country to the north of the Cape of Good Hope; is larger than the fallow deer or buck; its colour, when alive, is a fine blue; of a velvety appearance, but when dead changes to a bluish grey, with a mixture of white; beneath each eye is a large white mark, and the belly is white. This species, according to Pennant, from the form of the horns, which are sharp-pointed, taper, and arcuated, bending backwards, and marked with 20 prominent rings; and also from the length of the hair, seems to connect the goat and antelope kinds. 2. A. Lervius, lervee, with wrinkled horns, bent backwards, dainty in the middle, and approaching each other at the base and points, having a remarkable tuft of hair on the nape of the neck, and of a reddish colour. This is the antelope kob of Erxleben; the kob or little brown cow of Buffon; the fish-tall or lervice of Shaw's Travels; and the Gambian antelope of Pennant. It inhabits Africa, chiefly about the rivers Gambi and Senegal; it is about the size of the fallow-deer, and is remarkable for the tuft of hair on the nape of the neck, and for having long brushes of hair on the knees of the forelegs. The horns are surrounded with eight or nine rings. 3. A. Rupicapra, chamois; see Chamois. 4. A. Duana; see Nanguiw. 5. A. Reindeer; see Nagor. 6. A. Tragacannah; see Biegel and Tragacambus. 7. A. Piola; see Nylghau. 8. A. Saiga; see Saiga. 9. A. Gutturosa; see Tysian. 12. A. Sigutyrus, Perian antelope, with horns bent in form of a lyre; the upper parts of the body of a brownish ash colour, the under parts pure white, and a yellowish white stripe along each side. It inhabits Peru between the Caspian and Euxine seas. In size and habit it resembles the roe, lives in large flocks, and builbully chiefly on the centemata panion; the horns are above 13 inches long, and smooth at the points; the throat has at the forepart a protuberance, and the knees are furnished with brushes. The female brings forth in May. The flesh is reckoned very good. 11. A. Paphs; D. of Cassias; cercisopra of Houttyn, Linn. ed. Blye; and suggeleed, not without hesitation, by Gmelin to be the koba of Buffon, and mountain antelope of Ruffel's Allepo; klipfspringer or spring-look of Sparmann; white-faced antelope of Pennant, with the horns bent like a lyre; the general colour a hoary-red, and a blood-red or bright bay neck, a deep red band along the fides, white butts, and a white face. This species is about five feet four inches long, and three feet high at the shoulders; inhabits the countries to the north of the Cape of Good Hope, runs swiftly, bounding from rock to rock, is caught with difficulty, and its flesh is much esteemed. The horns bend outwards in the middle, and approach at the points; those of the males have each fix or seven rings on the lower part, and those of the females have no rings. 12. A. Satanis, jumper antelope, with slender horns, twice contorted, and annulated half way, the general colour a pale brown, the chest, belly, hindmost of the limbs, buttocks, and half way up the back are white, and a broad crescent coloured band along the fides. This animal, if it be different from the preceding species, with which it agrees in the form of the horns and disposition of the dark-coloured bands, inhabits the Cape of Good Hope. It is rather less than a roebuck; and migrates annually from the interior parts of the country, in small herds; continues near the Cape for two or three months, and then retreats towards the north in herds of many thousands. Herds of many hundred thousand periodically migrate, in seven or eight years, from the north, probably compelled to leave their haunts in the Terra de Natal by the excessive drought of that region, and spreading over the whole country of Cafraria, which they desolate, without leaving a blade of grass. In their migrations, they are attended by lions, hyenas, and other wild beasts, to which they afford a prey. The Hotenotis call them the lions' flocks of sheep. Their flesh is excellent; and with other antelopes, they furnish the venison of the Cape. From their prodigious bounds, they are denominated spring-bocks; and when alarmed, they have the power of expanding the white space about the tail into a circular form, which assumes its linear shape when the animal is tranquil. Pennant. Maffnon in Phil. Trans. vol. lxxvi. p. 310. 13. A. Dorcas; see Dorcas. 14. A. Kervella; see Kervel. 15. A. Coronna; see Corine. 16. A. Dubalis, the Cervine Antelope of Pennant; which see. 17. A. Kafa; see Kafa. 18. A. Guu; see Guu. 19. A. Oryx; see Pasan. 20. A. Oeotragus, African antelope, with very frighted, tapering, and sharp-pointed horns, slightly wrinkled at the bases. It inhabits Africa; has a reddish head, the upper parts of the body greenish-yellow, and the under parts of a whitish ash-colour; the tail is very short.
short. 21. A. Gazella, capra bezoardica; or bezoar goat of Syr. Nat. ed. 2.; Hircus bezoardicus of Briffon, &c.; animal bezoardicum of Ray; animal ignotum of Gencer; gazella of Belon and Prosper Alpinus; algael of Pennant and Buffon, with very long, wrinkled, flender, upright, tapering, and sharp pointed horns, which are slightly bent forwards at the ends. It inhabits India, Persia, Egypt, and Ethiopia; runs swiftly up hill, but slowly on plain ground; is gregarious, and is easily tamed; the general colour of the fur is red, with a white breast and belly: the real oriental bezoar, of a greenish and bluish colour, and when recent, of a very powerful aromatic odour, is frequently found in the fourth stomach of this species, chiefly in that of males and full grown animals, and more rarely in the stomachs of females or younger individuals. 22. A. Leucoryx; see Leucoryx. 23. A. Orcus, Indian or elk antelope; see Coudou. 24. A. Scripta, or harnessed antelope; see Guib. 25. A. Grimmia, or Guinean antelope; see Grimm. 26. A. Pygmea, or royal antelope; see Guib. 27. A. Sylvestica, wood antelope, wood goat, or boch-bock of Sparrman; with horns smooth, somewhat spirally twisted, annulated at the bases, and marked with several longitudinal ribs, the ends being taper and sharp pointed. It inhabits chiefly the woods near the Cape of Good Hope, and lives in pairs. It is about three feet high, the upper parts of the body are brown, the forehead white, two white spots on each cheek, a large white spot under the throat, and another at the bottom of the neck; the breast and hinder part of the belly are white, and there are several white spots on the thighs and flanks; the tail is very short, and a short mane runs along the neck and ridge of the back; the whole fur is longish and coarse. The female has no horns. 28. A. Strepeceros, or striped antelope; see Coudou. 29. A. Cervicapra, Indian, common, or brown antelope; see Lidsee.

Professor Pallas, in his travels through different provinces of Russia and northern Asia, has described the method of hunting the antelope, which is the principal amusement of the Tungus, who inhabit the heaths of Daouria beyond the lake Baikal. They choose for this purpose the level and open tracks, situated near a mountain, a river, or a forest. In autumn, at which season their horaces are most vigorous, they form companies of 150 to 200 hunters, all on horseback, attended by led horses. Each has a trained dog; and they are armed with bows and arrows. This chase commonly lasts several days. When arrived at the rendezvous, they send before three or four sharp sighted huntsmen to get a view of the game from the heights or mountains; who, flop to wait for their companions as soon as they perceive the antelopes. When the troop comes in sight, the scouts make signals to them, or by some evolutions of their horaces signify the place in which the antelopes feed, and the course that must be taken in order to come up with them. The troop then breaks into several divisions, and the hunters separate to the distance of 60 or 80 fathoms from each other, in order to form a great ring. Those on the wings advance towards the paturage of the herd, and endeavour to conceal themselves behind the heights till the animals are surrounded: the ring then closes. When the antelopes, at the approach of the hunters, attempt to escape, the men rush on them, chafe them from one party to another, terrifying them with their shouts and the whistling of their arrows, which, for that purpose, are furnished with a button of bone, perforated beneath the head. In this manner they kill all that they can reach. This chase is more successful when the scene of it lies near a river or a mountainous forest, as the antelopes or beast goats never take to the water, though long and furiously harassed, but rather strive to escape by sudden and valiant runs through the troops of their pursuers. They are almost equally ill of fists. They are no sooner hunted into a wood, than they are bewitched among the trees as not to be able to make a hundred paces, but run their heads against every tree, and soon fall breathless. Pallas, Travels, tom. i. p. 402. tom. ii. p. 204.

ANTELUCAN, from ante and lux, light, in Ecclesiastical Writers, is applied to things done in the night, or before day. We find frequent mention of the antelucan assemblies, catus antelucanic, of the ancient Christians in times of persecution for religious worship.

ANTELUDIA, from ante, and ludus, game, in Antiquity, a day of show or parade preceding the circuses, wherein the preparations made for those solemnities were exposed in great form and pomp.

ANTEMETICA, in the Materia Medica, denote medicines suited to cure a preternatural vomiting.

ANTENNA, in Ancient Geography, a town of Italy to the north or north-east of Rome. Although it was built in the territory of the Sabines, it was founded by a colony from Alba, and comprised in the division called Ancient Latium. According to Varro, its name, derived from ante annum, denoted its position, which Cluver and M. d'Anville assign at the confines of the Anio and Tiber. Its inhabitants were called Antennates; and in the fourth year of Rome, they contended with the Romans, and were totally vanquished by them, and their city was destroyed. They afterwards became citizens of Rome.

ANTENURAL, from ante, and natus, born, in Middle Age Writers, denotes a kind of outer wall environing the other walls and works of a place, and preventing the too near access of the enemy to them.

This is also called by Ildoro, promurale, as being pro munitione muris, the defence of the wall.

In some writers we find it denominated antepedoralis muris, in other ambits.

ANTENURAL is also used to denote any work with the rampart or wall of the place.

In this scene, antenural amounts to the same with what we otherwise call Outwork.

ANTENATUS, from ante, and natus, born, is used, in Ecclesiastical Writers, for the vehicle or entrance of the presbyterium, or Eema.

ANTENATUS, from ante, and natus, born, is used in some Law Writers, for the first-born, or eldest son, answering to what we call aijue.

Antenatus, is also sometimes used for a son, the issue of a former marriage. In which scene antenatus amounts to the same with privignum.

ANTENATI, in the modern English History, is chiefly understood of the subjects of Scotland, born before king James the First's accession to the English crown, and alive after it. In relation to these, those who were born after the accession were denominated POSTNATI. The antenati were considered as aliens in England, whereas the postnati claimed the privilege of natural subjects.

ANTENCLEMA, in Oraflory, is where is the whole defence of the person accused turns on criminating the accuser. Such is the defence of Orelles, or the oration for Milo, Oecidus fals fed latro. Exspectus red raptor. See RECRIMINATION.

ANTENICENE, in Ecclesiastical Writers, denotes a thing or person prior to the first council of Nice.

We say the antenicene faith, antenicene creeds, antenicene fathers.

ANTENNÆ, in Entomology, are those delicate moveable horns with which the anterior part of the heads of insects are invariably furnished. These are peculiar to this order of beings, and are easily distinguished from the tenta-
cule of vernes, in being crenulaceous; and from the palpi or antennae, by their situation being nearer the mouth, though much shorter in number, as natural; for early imagined, for they are not mentioned as such until the antenna (Fundamenta Entomologiae). The palpi are usually four in number, as Lepidoptera; but in most lepidoptera insects, when accurately measured, only amount to two; and the same may be observed of the libellula, phalangie, and several others; while, on the contrary, in the cancer, sepsularis, allacis, gomphus, and some other genera, the number of them is six. Fabricius. The antenna in all insects, or at least with the exception of a few of the aperturals kinds that have four, and some six, rarely exceed two. Both the antenna and palpi are of the utmost consequence in the systematic arrangement of insects, as will be noticed hereafter.

For the want of a more appropriate term in the English language for the antenna of insects, they are sometimes called the horns, and sometimes the feelers; the latter of which is by no means applicable, since it confounds them with the palpi, which are the true feelers. Of the purposes for which nature has designed the antenna we are ignorant; some have conjectured, that they are the organs of smell or hearing; and others have supposed they are appropriated to a feeling more delicate than our own, and feasible to the least motion or disturbance in the ambient fluid in which they move. In form and size they vary extremely in different insects, and even generally in the two sexes of the same species, as is fully exemplified in the phalaen genus.

Andrew John Blash, a pupil of Linnaeus's and author of the paper in the seventh volume of Linnaeus's Amoenitates Academicae, called Fundamenta Entomologiae, characterizes the different structure of the antenna of insects in the following manner.

Sectae, fascias, are those which gradually taper towards the point, and resemble a bristle.

Filiformes, filiform, such as are of uniform thickness throughout, like a thread.

Moniliformes, moniliform, are filiform like the preceding, but consisting of a series of round knobs, like a necklace of beads.

Clavate, clavate, club-shaped, or increasing gradually from the base to the extremity.

Capitata, capitata, club-shaped like the former, but the last articulation larger than the rest, and forming a kind of capital or head.

Fissilae are capitata, but have the capitulum divided horizontally into three or four laminse or plates, as in the scarabae.

Perfoliatae are likewise capitata, but have the capitulum divided horizontally, and connected by a kind of thread that passes through their centre.

Pectinatae, so called from their resemblance to a comb, though they more properly resemble a feather, having usually lateral appendages on both sides, as in phalaenus, &c.

Aristatae, such a have a lateral hair, which is either naked or furnished with a hair, as in some mufcic, &c.

The terms breviores, longiores, and mediores, are occasionally employed in speaking of the length of the antenna, and of course imply whether they are shorter, longer, or of the same length as the body. See Entomology.

ANTENNATOR, a species of ichneumon that inhabits Cayenne. It is pale yellow, crown, back of the thorax, tail, and tip of the wings black. Fabricius and Gmelin.

the metallic salts, the calees of metals, and some of the vegetable poisons, together with a suitable regimen, are principally relied on. See Epilepsy.

ANTEPOSITION, from ante, and pons, 1 place, a grammatical figure, whereby a word which, by the ordinary rules of syntax, ought to follow another, comes before it. As when, in Latin, the adjective is put before the substantive, the verb before the nominative case, &c.

Anteposition stands opposed to postposition. One case or species of this figure is called by a particular name, antepograph.

ANTEPREDICAMENTS, Antepredicamenta, in Logic, certain previous matters, requisite to a more easy and clear apprehension of the doctrine of predicaments of categories.

Such are definitions of common terms; as equivocals, univocals, &c. See Definition, Division, &c.

They are thus called, because treated by Aristotle, before the predicaments; that the thread of the discourse might not afterwards be interrupted.

ANTEQUERA, in Geography, a well built town of Spain in the kingdom of Grenada, divided into two parts, the higher and the lower. The former is situated upon a hill much above the rest, has a fortifieated castle, and is occupied by the nobility; and the latter is in a fertile plain, watered by a number of streams. It has a collegiate church, four parishes, fourteen convents of monks, and eight of nuns, and about 15,000 inhabitants. The mountain on which part of the town is situated, yields a quantity of salt; and at a small distance is a fountain of water, which is said to cure the gout. In the neighbourhood are also excellent quarries of stone for building. It is 26 miles north-north-west from Malaga, and 54 miles from Grenada. N. lat. 35° 6'. W. long. 4° 10'.

Antequera is also a town of New Spain in America, in the province of Guaxaquia, 50 leagues south-east from Guaxaquia.

ANTERIDES, in the Ancient Architecture, denote buttresses erected to support a wall.

These are sometimes called antes, sometimes crifmas, and by the Greeks giugmata.

Anterides answer to what the modern builders call counterforts and arch buttresses; the Italians barbicans, and ipersoni or spurs.

ANTERIOR, or Anteriour, formed of the preposition ante, before; something before another, chiefly in respect to place. In which sense the term amounts to the same with prior, and stands opposed to posterior.

Anterior Romanus. See the article Ramus.

ANTIERNACHA, Andernach, in Ancient Geography, a town of Gaul, belonging to the Rupeni, and situate at the confluence of the Moselle and Rhine. See Andernach.

ANTEROS, in Mythology, the son of Venus and Mars, one of the two Cupids who were the chief of the number. They are placed at the foot of the Venus of Medici. This is represented with a heavy fallen look, agreeably to the poetical description of him, as the caufe of love's ceasing. The other was called Eros. Ovid. Rem. Amor. V. ver. 549 to 577.

Anterotes, a name given by some of the ancient writers on gems to a species of the amethyst. Some have imagined they meant by it a sort of opal; but Pliny expressly contradicts this, making the anterotes the fifth kind of amethyst in value. Plinius Hist. Nat. lib. xxxviii. ch. 40.

Antes, in Architecture. See Anta.

ANTESIGNANI in the Roman armies, a kind of soldiers posted before the eagles, and other ensigns of the legions, whence their appellation.

The antesignani stand contrading ejected from the column of the standards, who were ranged in the same line with the ensigns; and from the postesignani, who were placed behind them. Cesar and Livy mention the antesignani as the first line, or first body, of heavy armed troops. The velites, who used to skirmish before the army, were also called antesignani.

Antesignani was a denomination given to those inferior officers, called campi doctores, who instructed the troops in their exercises.

ANTESIGNANUS, Petrus, in Biography, an industrious grammarian, was born at Rabalsteins in Languedoc, and flourished in the sixteenth century. He published a Greek grammar, which passed through several editions, and a treatise on universal grammar; but his most esteemed publications were his editions of Terence's comedies, in which he took pains to facilitate the learning of the Latin language. The epistle to this work was dated at Lyons in 1556. His industry also appears in his "Thematicus Verbum" and "Praxis Præceptorum Linguæ Graecæ," annexed to several Greek grammars.

"Let others," says he, "afford the reputation of learning; I honestly and truly own, that I have to the utmost of my power devoted my labours to the useful purpose of forming and filling the minds of boys." Gen. Dict.

Antesimista, a name given by the angurs to those thunderbolts, or birds, which proceeded from the south and passed to the east, and which were thought to afford unfavourable presages. Virgil calls by this name a crow, Eclog. ix. 15, according to Servius:

"Ante omnia cava mons illius ab illico cornix."

Antestari, in Roman Antiquity, denoted to bear witness against any one who refused to make his appearance in the Roman courts of judicature, on the day appointed, and according to the tenor of his bail. The plaintiff finding the defendant after this breach of his engagement, was allowed to carry him into court by force, having first asked any of the perjurors present to bear witness. The person asked to bear witness in this case expressed his consent by turning his right ear, which was instantly taken hold of by the plaintiff, and this was to answer the purpose of a signature. The ear was turned upon this occasion, says Pliny, as being the seat of memory; and therefore the ceremony was a sort of admonition to the party to remember his engagement.

Antestature, in Fortification, a small retrenchment, made of palisadoes, or facks of earth set up in haft, to dispute with the enemy the remainder of a piece of ground part whereof had been already gained.

Antevera, or Anteverta, and Postvera, or Postverta, in Mythology, deities worshipped among the Romans: the first, called after, or Porina, was supposed to know past events, and was invoked to repair injuries that had already occurred; and the second, being acquainted with futurity, was supplicated to prevent evils that might happen.

Antevirgilian Husbandry. See Antivirgilian.

Anthallium, among the Ancients, a root growing in dry places, and about the bignets of the fruit of the medlar; it was dug up for food, and esteemed very pleasant and wholesome.

Anthana,
ANTHANA, or ANTHEMA, in Ancient Geography, was a city of Peloponnesus, and one of the 100 towns of Laconia, according to Stephanus Byz. It is said to have derived its name from Anthe, the son of Neptune, who was killed by Cleomenes, the brother of Leonidas.

ANTHEDON, a town of Bœotia, placed by Paulini, and after him by M. d'Anville, a little to the north of Mount Meffapus, and owing its name to its elevated situation. In the middle of this city was a temple of the Cabiri, and near it the sacred wood of Ceres, and the temple of Proserpine, with her statue in white marble; it had also a temple and statue of Bacchus. The poet Anthes, who composed hymns, was, according to Plinius, a native of this city. Imperial Greek medals were struck here in honour of Carsella.

ANTHODON, of Agrippia, a town of Palaecine, in the country of the Philistines, upon the borders of the sea, to the south-west of Gaza. Herod gave it the second name in honour of Agrippa, his friend, and the favourite of Augustus.

ANTHELA, a town of Messenia, which Homer mentions, and which had been promised to Achilles by Agamemnon. In Stрабo's time it bore the name of Theoria.

ANTHELE, a town or borough of Greece, near the ruins of Thermopylae. According to Herodotus (ib. vii. 176), it was near the river Phaexis, and watered by the Aepus.

ANTHELION, from oint and oint, in Physic, signifies a mock or spurious sun; and denotes a meteor, not very common, of a luminous appearance, somewhat resembling the sun, seen through clouds, bigger, sometimes four or five times, than the solar disk. In its most refulgent state, it is as yellow as the sun: but the lucid tract surrounding it is of a paler yellow or whitish cast, interspersed sometimes with a few reddish or fulvous spots. The most received opinion relative to the formation of this kind of meteor attributes the phenomenon to a multitude of minute icy or snowy particles suspended in the air, and either refracting or reflecting the solar rays in such a manner, as to multiply the image of the sun. But the theory of anthelia, for want of a proper number of observations, seems not yet to be brought to such a degree of satisfaction, as by every lover of physiognomy could be defined. The infinances of them are but rare. See Phil. Trans. vol. lli. Part. i. N° 15. An. 1761. See Halo and Parhelion.

ANTHELIX, in Anatomy, the inner circle of the auricle: thus called from its opposition to the outer circuit, called the helix.

ANTHELMA, Indian pink.

ANTHELMINTICS, in the Materia Medica, medicines good to destroy worms.

The word is compounded of oint and matter, again, and worm, a worm.

There are two principal kinds of worms which infect the human stomach and bowels: the flat or tape worm; and worms of various sizes, which are round, somewhat like earth-worms. The former is called Tænia, the latter Ascaris, lubricous, &c. See Memoirs of Med. Soc. Lond. vol. v.

The presence of worms in the prime viscera generally arises from weak digestion; and therefore the cure of Dyætes and will generally destroy the worms. In particular kinds of worms, however, require particular anthelmintics, which will be found under those heads. See Ascarides, &c.

Two or three grains of calomel, with one of falt of steel, taken in threeg, for two or three mornings, and then a brisk purge of rubarb and jalap, ten or fifteen grains of each, is the best general vermifuge.

ANTHEM, from oint, and oint, a hymn. In our church service, any psalm or portion of scripture, set to florid counterpoint, different from chanting in our cathedrals, and from metrical psalmody in our parish churches, is called an anthem, whether for one, two, three, or more voices. Anthems, in our choral service, are distinguished by the epithets solo, verse, or full anthems. Solo anthems have frequently symphonies or ritornels for particular stops on the organ. In verse-anthems, there are solo parts for voices of different registers or compasses, and different stiles of the choir. A full anthem is in choral chorus, except at the leading off a fugue, or new point of imitation. Anthems for a single voice, in the Romish church, are called motets. At the latter end of the 17th century and beginning of the 18th century, the motets of Baffani, the maker of Corelli, were in great favour in England, as well as Italy. In ecclesiastical history, anthems are styled Antiphons, from oint, contra, and oint, vos, fons. Antiphonal singing implies singing from side to side, alternately, as the psalms are chanted in our cathedrals. St. Ignatius, a disciple of the apostles, according to Socrates the ecclesiastical historian, was the author of this kind of singing in the Greek church, and St. Ambrose introduced it into the Roman.

There is in the Brit. Mus. an admirable collection of solo, verse, and full anthems, and services, compiled by Dr. Tudway, of Cambridge, for the Earl of Oxford, in six huge vols. fol. (N° 747). Dr. Green began to collect our best cathedral music from the time of the reformation, to the middle of the last century; but he dying before any great progress was made in the work, it was carried on with great judgment and spirit by his worthy scholar and successor, Dr. Boyce, and engraved and published, in a correct and splendid manner, in three vols. large fol. 1762, 1768, and 1773. This useful publication has been resumed and carried on since the decease of Dr. Boyce, by Drs. Arnold and Dupuis.

The solo anthems of Purcell, Drs. Crofts, and Green, are elegantly printed, and in choral use in our cathedrals. It is hoped that the solemn and dignified style of the fathers of our church music, Tallis, Bird, and Gibbon, will long be regarded as a model for our services and full anthems, as that of Palestrina continues to be, for the best composers, a capella, in Italy.

Anthems were first introduced into the reformed service of the English church in the beginning of the reign of queen Elizabeth.

ANTHEMIS, in Botany, supposed from oint, flores, having an abundance of flowers, a genus of plants of the chamomile kind. Lin. G. 970. Juffieu 185. Linnaean clas and order, fynבע תורא פוג לנג יפוגל פוג פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל פוגל Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погл Погł

Nineteen species of this genus are described, of which five are natives of Britain. 1. A. colta, which bears a very large flower, and the petae or chaff between the florets is rigid and prickly; it is a native of Spain, growing in ploughed fields; annual. 2. A. alitrima, grows three feet in height; leaves pinnatifid, compound, with pointed teeth; it grows wild in
ANT

in the south of Europe; annual. 3. A. maritima, with stems prostrate, branches smooth; leaves pinnate, fleshy, cut into small teeth; calyx and peduncles pubescent; a native of the south of France, and also of Britain. 4. A. tomentosa, with stems a foot high, one flowered, leaves tomentose; the two outer divisions of the corolla longer than the others; a native of the north of Europe. 5. A. missa, with leaves simple, jagged, toothed; a native of France and Italy; annual. 6. A. alpina, with leaves tooth-pinnated, entire, linear; stem villose, one-flowered; florets of the radius lilac, three-toothed, See Jacq. Fl. Aufi. vol. t. 39: a native of Italy; perennial. 7. A. chia, with leaves pinnatifid, jagged, peduncles naked, fulvous; a native of the Levant. S. A. nobilis, with root stalk, stems trailing, hairy; leaves bipinnated, pinnules two or three-cleft, pointed; hairy; flowers solitary; calyx hairy, with broad, thinning, membranaceous edges; florets of the circumference somewhat elliptical, entire, or with two or three teeth, those of the centre yellow: this is the common chamomile; it grows wild in many parts of England, and flowers in July and August. See Woodv. Med. Bot. t. 108. 9. A. arvensis, with stem erect, much branched; leaves pinnatifid, hairy; peduncles tomentose, terminal, one-flowered; disk yellow; florets of the radius white, three-toothed; receptacle conical: it is a common annual weed among corn, and therefore called corn-chamomile; it flowers in June and July. See Eng. Bot. 602. 10. A. austriaca, with stems upright, branched, scarcely a foot high; leaves bipinnate: flowers solitary, disk yellow, radius white; seeds naked: a native of Austria. 11. A. cotula, with stems much branched, smooth; leaves pinnatifid, smooth, of a light green colour; disk of the flower convex, yellow: radial florets white: this, from its ungrateful smell, is called flinking chamomile, or May-weed; it is very common, and flowers in June and July, annual. Curt. Fl. Lond. fac. t. 61. 12. A. pyrethrum, with stem simple, trailing, scarcely a foot high, one-flowered; leaves pinnatifid, segments linear, pointed: florets at the centre yellow, those of the circumference white, and purple on the under side: it is perennial, and flowers in June and July; it is called Spanish chamomile, or petilium of Spain. 13. A. valentina, with stem branched, leaves pubescent, tripinnate, binate-flapped; calyx villosa: a native of Spain. Miller, fig. 73. 14. A. repanda, with leaves simple, alternate, obtuse; flowers terminal, globose: a native of Spain and Portugal. 15. A. trinervia, with stem erect, simple; leaves smooth, coloured; peduncles terminal, one-flowered: a native of South America. 16. A. americana, with leaves triternate, peduncles terminal, longer than the branch: a native of America. 17. A. truncifolia, with stem erect, angular, about a foot and a half high; leaves bipinnatifid, smooth, laciniate pointed; flowers of a bright golden colour; ox-eye chamomile: it is a native of Sweden and Germany, and also of Britain, flowering in July and August. See Flor. Dan. t. 741. 18. A. arabica, with stem upright, proliferous, round, purplish; leaves finely and doubly pinnatifid; one flower terminates the stem; it is large, and of a beautiful golden colour. See Smith, spicil. 20. This handsome annual plant is a native of Arabia. 19. A. odorata, with leaves pinnatifid at the tip, calyx membranaceous: a native of the Cape of Good Hope, where it was discovered by Mr. Mafioa in 1774.

Medicinal Properties. The common chamomile, species 8, and the petilium of Spain, species 12, are both articles of the materia medica, in the London and Edinburgh pharmacopoeias. Both the leaves and flowers of the former have a strong, though not ungrateful smell, and a very bitter nauseous taste; but the latter are preferred, being bitterer, and considerably more aromatic. The flowers readily give out their virtues to water, and also to rectified spirit. They possess the aromatic and tonic qualities usually ascribed to simple bitters, having very little astringency, but a strong, aromatic, penetrating odour, from which they are also judged to be carminative, emmenagogue, anti-rheumatic, and anodyne. They have been successfully employed for the cure of intermittensts, as well as of fevers of the irregular nervous kind, accompanied with visceral obstructions, for which we have the authority of Sir John Pringle. That chamomile flowers have been effectually substituted for Peruvian bark, we have the testimony of several respectable physicians, among whom we may notice Dr. Cullen, who recommends them to be given, combined with an astringent, to prevent their tendency to produce diarrhoea. A watry infusion of these flowers is frequently used for the purpose of exciting vomiting, or for promoting the operation of emetics. Externally they are directed in the decoction pro fomento; they are also ordered in the decoction pro comune. Murray, ap. Med. vol. i. p. 105. Woodv. Med. Bot. vol. ii. p. 105.

From the aromatic and stimulating qualities of the root of the petilium of Spain, there can be no doubt that it might be found an efficacious remedy, and equally valuable as an internal medicine in the many others of this class now constantly prescribed. Its use, however, has been long confined to that of a mallefactor, for on being chewed or long retained in the mouth, it excites a glowing heat, stimulates the excretories of the saliva, and thereby produces a discharge which has been found to relieve tooth-aches and rheumatic affections of the face; in this way too, it is recommended in lepargic complaints, and paralysis of the tongue. Woodv. Med. Bot. vol. ii. p. 287.

ANTHEMIS, or ANTHEMUS. in Ancient Geography, one of the names of the isle of Samos, according to Hity.

ANTHEMIIUS, in Biography, and History, emperor of the west, was a native of Constantinople, and descended from an ancient, illustrious, and wealthy family. His name was derived from his grandfather by the mother's side, Anthemius, prefect of the eph, and the excellent prime minister of Theodosius the younger. Having married Mariana, the only daughter of the emperor Marcian, he was fuscifire advanced to the chief dignities, and had some claim to the empire itself. He was cousin to A. D. 435, and afterwards patrician and general, in which office he gained a victory over the Huns on the banks of the Danube. Being nominated by the emperor Leo I. to terminate the interregnum in the west, Anthemius left Constantinople with a splendid retinue, and entered Rome with universal acclamations, where he was inaugurated A. D. 467. Soon after this event, he married his daughter to Ricimer, the powerful commander of the barbarians. His government was too fecile to prevent Gaul from the invasions of the Visigoths, who defeated a body of British troops sent for by Anthemius to protect his subjects, unused to military operations. In the discord that arose between the emperor and Ricimer, the latter fixed his residence at Milan, and succeeded an independent sovereignty over that part of Italy; and marching with an army of Burgundians and Suevi, brought with him Olybrius, whom he defined for the empire. Anthemius, faithfully supported by the senate and citizens of Rome, refuted a siege of three months; but at length Ricimer took the capital by storm, and discovering Anthemius in his place of concealment, caused him to be mafacred. Anc. Un. Hist. vol. xiv. p. 429—431. Gibbons's Hist. vol. vi. 193, 194, 217, 218.
particularly the church of St. Sophia in Constantinople, who on this occasion formed the division, and directed the operations of 10,000 workmen, whose pay and in pieces of five sestertii was never delayed beyond the evening. An- thennius was also a sculptor, a mathematician, and an experimental philosopher. He is said to have been well imitated an earthquake, as to frighten out of his house one Zenos, a rhetorician, who had offended him. At another time the friends of Zenos, as they sat at table, were dazzled by the intolerable light which flashed in their eyes from the reflecting mirrors of Anthennius. Traces describes the artifice of those burning glasss, which he had read in a mathematical treat- isle of Anthennius, entitled, “Πηλο τοιαύτων Μακρύων.” Of Wonderful Machines: which treatise has been published, translated, and illustrated by M. Dupuy, a scholar and a mathematician. Mem de l'Acad. des Inscriptions, tom. xix. p. 376-451. Gibbon's Hist. vol. vii. p. 111.

ANTHEMUSIA, in Ancient Geography, a town of Asia, in Micopatania, mentioned by Phylus, Strabo, and Tacitus; situate to the south-east of Samosatis, and usually called from Zenogna, and separated by a chain of mountains from Edessa to the north-east. An imperial Greek medal of this city was struck in honour of Caracalla.

ANTHENA, a town of the Argolidce, in Cynuria.

ANTHERA, in Botany, a term used by some authors for the yellow or ruddy globules in the middle of certain flowers, as of lilies, fawon, &c.

Some confine the anther to the yellowish globules in the middle of rosettes. These are held mere alltient than the rest of the plant.

Others apply the name anther to those little tufts or knobs which grow on the tops of the flamina of all other flowers; more usually called filaments.

The anther or apex of the flamen, in the Linnaean system, is a principal part of the male organ of generation in plants, and contains within it a fine powder, called pollens, or farina sexuada, designed for the impregnation of the germen, and which, when come to maturity, it discharges.

ANTHERICUM, said to be derived from Αῖθος, i.e. flower of the hedges. Lin. G. Pl. n. 422. Gertn. 16. Phalangium, Julifin, 52. Clafs, bexandra mo- nagra, natural order of coranaric and of aphodolii of Julifin. Its generic characters are as follows: Calyx none; corolla, petals six, oblong, obtuse, spreading; flami- na, filaments subulate, erect; anther, small, incumbent, four- forked; pistillum, germen obscurely triangular; filum simple, of the length of the flamina; stigma obtuse, tri- angular; carpe ovate, smooth, three-forked, three- celled, three valved; seeds numerous, angular. There are more than thirty species of this genus, many of which are very difficult to ascertain. The only species which is a native of Britain is the A. ferratum, the A. officinalis and calycanthus, being by Dr. Smith now referred to other genera. 1. A. floribundum, with leaves flat, smooth, linear-lanceolate, acute; scape simple, raceme many-flowered, cylindrical, compact; petals spreading; flamina smooth; a native of the Cape of Good Hope, from whence it was sent by Mr. F. Maffon, and introduced into the Royal Garden at Kew, in 1773; it flowers in March and April. 2. A. ferratum, with root perennial, corolling of ob- long curved bulbs; stem or scape erect, smooth, round, commonly one-flowered; radical leaves exceeding in height that of the stem, falcifer, infolded, narrow from the base, those of the stem alternate, short; petals elliptical, equal, nerved, white on the outside, externally reddish; flamina smooth; it grows on high mountains among rocks in several parts of Europe; in Britain it has only been found in Wales, &c. Flor. Annl. 5. t. 28. It flowers in June. 3. A. caprinum, with leaves flat, scape simple, flowers corybolus, filaments woody: a native of the Levant. 4. A. planifolium, with leaves flat, scape and filaments woody; it is a native of Portugal, flowering in April. 5. A. revolutum, curled flowered anthericum, with leaves flat, scape branched, corolla revoluted: it is a native of the Cape of Good Hope; and was first cultivated here by Mr. Miller, in 1731. 6. A. naticum, branching anthericum, with leaves linear, subulate, flat; scape branched, peduncles solitary, corolla flat, pubescent bright; it is a native of Sweden, Switzerland, Affria, the south of France, &c. and was first cultivated in England by Gerard, about the year 1597. 7. A. elatum, tall anthericum, with leaves flat, scape branched; flowers scattered, white: it is a native of the Cape of Good Hope, flowering in August and September. S. A. triflorum, three-flowered anthericum, with leaves channelled, sword-shaped, scape, simple, bracteate remote, three-flowered: it is a native of the Cape of Good Hope, and introduced into the King's Garden at Kew, in 1752, by George Winch, Eqg. 9. A. cauliculatum, channelled anthericum, with leaves rather flabby, hairy, sword-shaped-tri- quetrous, channelled; scape simple: this is also a native of the Cape: it flowers in April. 10. A. luteocordes, triped flowered anthericum, with leaves linear, channelled, smooth, with a cartilageous edge; scape simple: a native of the Cape, flowering in August; it was discovered by Mr. F. Maffon, in 1758. 11. A. thiligo, grais leaved anthericum, with leaves flat; scape perfectly simple; corolla flat; pistillum bending down. Jae. Hort. t. 83. Fl. Dan. t. 616: it is a native of Germany, France, and Denmark; cultivated here, in 1597, by Gerard. 12. A. luteifolium, Saray anthericum, with leaves flat; scape perfectly simple; corolla bell-shaped, white; flamina bending down; the French call this species St. Bruno's lily; it grows wild on the mountains of Swifterland and Savoy. 13. A. falcatum, without leaves; scape four inches high, filiform, spiral, bearing three or four flowers: a native of the Cape. 14. A. ferrugineum, shrubby anthericum, with leaves flabby, columnar; stem shrubby: a native of the Cape; first cultivated in Chelsea garden, in 1752. 15. A. luteocordes, aloe-leaved anthericum, with leaves flabby, subulate, flattish; a native of the Cape; cultivated by Dr. Sherard, in 1732. 16. A. nephrolepis, glaucous-leaved anthericum, with leaves flabby, subulate, semi-columnar, upright, filif; flowers yellow: a native of the Cape; cultivated by Mr. Miller, in 1759. 17. A. assimilis, annual anthericum, with leaves flabby, subulate, columnar: scape subreatened; flowers yellow: a native of the Cape; cultivated by Mr. Miller, in 1748. 18. A. bifolium, hairy-leaved anthericum, with leaves flabby, compressed, rough; flowers white: a native of the Cape, and sent to the King's Garden at Kew, by Mr. F. Maffon, in 1774. The preceding five species have all leaved flowers, but those that follow are sword-shaped. 19. A. cal- ycanthum, see Tojielda. 20. A. officinalis. See NARTHE- CIUM. 21. A. japonicum, with leaves sword-shaped, convolute, smooth; scape branched, angular; flowers racemose, nodding: a native of Japan, China, and Java. 22. A. filiformis, thread-leaved anthericum, with leaves filiform, rather cylindrical, rough; filaments smooth; it is perennial, flowering in April: a native of the Cape, and introduced here by Mr. F. Maffon, in 1774. 23. A. strictifolium. 24. A. mucronatum. 25. A. latifolium. 26. A. candidissimum. 27. A. tricorpus. 28. A. elatum. 29. A. falcatum. 30. A. cortus, 31. A. flavo- bucum. 32. A. ferrugineum. The above ten species are all Cape plants, and mentioned in the Supplementum Plantarum, but unknown in this country. They were all but the last discovered by Thunberg. 33. A. cirratum, with leaves lanceolate, flattish; scape panicked: a native of New Zealand. 34. A.
ANT

*Propagand Culture.* All the species except the sixteenth are perennial, and arc usually propagated by offsets taken during the summer or autumn. Those plants which do not throw out suckers freely, may be propagated by seeds, sown in the spring or autumn, in a warm situation, on a bed of light sandy earth. When the leaves decay, the roots should be broken up and transplanted. If the winter prove severe, they should be defended from the cold by covering the bed with straw, or what is better, old tan, from a hot bed. Thus treated, they will be strong enough to flower in one year, and in autumn may be taken up, and planted in the borders of the flower-garden, where they will live several years, if the roots be well defended from the frost. Some of the species, as the 7th, must be houfed in winter, or placed under a hot-bed frame, which is to be preferred to a common green house. See Martyn's Miller's Diet.

*ANTHERINUS,* in Entomology, a species of *cryptocephalus,* in Gmelin's arrangement. It is black, with two ferruginous bands. This is tenebrio pedicularis of the tenth edition of the Linnean Syllagma Naturalis, and mele antherinus of the twelfth edition of the same work, and the Fauna Suecia. Fabricius places it in his genus lagria, in the Species Infectorum: this insect is very small, lives on flowers, and runs fast.

*ANTHESPORIA,* in Antiquity, a feast celebrated in Sicily, in honour of Proserpine. The word is derived from *anthos,* flower, and *phiw,* I carry, in relation to Pluto's having forced away that goddes when he was gathering flowers in the fields. Yet Felix does not ascribe the feast to Proserpine; but says it was thus called, because ears of corn were carried on this day to the temples. Anthesporia seems to be the same thing with the *floriferium* of the Latin, and answers to the *harvest-home* among us.

Anthesporia were also celebrated in the temple at Argos, in honour of Juno Antheias; according to Faunus, in the Corinthiac.

*ANTHESTHERIA,* was a feast celebrated by the Athenians in honour of Bacchus.

The most natural derivation of the word is from *anthos,* flower, and *phiw,* I carry, to offer garlands of flowers to Bacchus.

Some are of opinion it took its name from the month Anthesteria, in which it was celebrated. Others pretend, that this was not the name of any particular feast, but that all the feasts of Bacchus were called anthesteria.

The anthesteria lasted three days, the eleventh, twelfth, and thirteenth of the month; each of which days had a name suited to the proper office of the day, and during which the masters served their slaves at table. The first day of the feast was called *synophyse,* i.e. opening the vessels, because on this day they tapped the vessels, and tasted the wine. The second day they called *xopoi, congii,* the name of a measure, containing the weight of a cut ten pounds; on this day they drank the wine prepared the day before. The third day they called *xopoi, kettles:* on this day they boiled all sorts of pulse in kettles; which, however, they were not allowed to taste, as being all to be offered to Mercury.

*ANTHESTERION,* in Ancient Chronology, the sixth month of the Athenian year. It contained twenty-nine days, and answered to the latter part of our November and beginning of December. Nepos, a commentator on the *Tale of Ovid,* says, that it answered to the end of February and beginning of March. The Macedonians called it *Defon or Deson.* In this month the Athenians and other people of Greece celebrated feasts in honour of the dead.

It had its name from the festival Anthestheria kept in it.

ANTHIAS, in Ichthyology, a species of *labrus,* very concisely described by Gmelin, after Arcted; as being entirely reddish, "totus rubescens." This is Anthia of Rondel, and according to Catesby, found in Carolina; it is also said to inhabit the south of Europe, and to have the gill covers serrated. Some have supposed this fish to be a perch.

ANTHISTIRIA (Anthistira, floralis, an Athenian festival observed in honour of Bacchus), in Botany, an exotic plant, of a graps-like appearance, belonging to the class *polygama monoeica,* and natural order, *gramina.* The essential generic character is, that the calyx is cleft at the base into four equal divisions or valves. *Anthistira ciliata* is the only species of the genus hitherto discovered.

ANTHUS, FLOWERS, in Mythology, a surname given to Bacchus, at Athens, and also Patras in Achaia; because the statues of this god were covered with a robe charged with flowers.

ANTHOCEROS, a small cryptogamous plant, of the order *alga.* Lin. Gen. 1201. In the *male* flower the calyx is fiddle, cylindrical, entire; anther very long, subulate, two-valved; in the female, the calyx is cut into four divisions, and contains three seeds. 1. A *punatus,* with the fronds undivided, indented, dotted: a native of Britain, growing on heaths and moist shady places. 2. A *larvus,* with smooth, undivided, indented fronds. 3. A *multifidus,* with bipinnate linear fronds. See Hedwig's Figures and Flor. Dan. 396.

ANTHOINE, NICOLAS, in Biography, was born at Brien in Lorain, of Roman Catholic parents, and educated in the college at Luxembourg, and also under the Jesuits at Triers and Cologne. Conceiving a dislike to the church of Rome, he embraced the Protestant religion; and such was his zeal in his new profession, that he endeavoured to profeyle his relations. In pursuing his theological studies, he became a convert to Judaism, and solicited the Jews in several cities to admit him among them as a proselyte, but his application was ineffectual. Returning to Geneva, he made an external profession of Christianity, but privately performed his devotions as a Jew. He was at length admitted into the minitry of the reformed church; and appointed by the ynod of Burgundy, to be minister of the church of Divonne in the country of Gex. Here he was instructed, and became infan; but upon the recovery of his understanding, he was committed to prison. After some time, he was brought to his trial; upon which he avowed himself a Jew, and befought God that he might die in the Jewish religion. The result was his condemnation by the council, who, in 1632, sentenced him to be shanged and burnt; and he was executed on the day of his condemnation. His sentence expressed, that "laying aside all fear of God, he was guilty of apostacy and high treason, having opposed the Holy Trinity, denied our Lord and Saviour Jesus Christ, blasphemed against his holy name, renounced his baptism to embrace Judaism and circumcision, and perjured himself, which are great and horrid crimes, &c." Anthoine left several pieces written with his own hand, such as several prayers, that are said to be composd in a strain of great devotion, though he introduces them no mention of Jesus Christ; a small paper, containing eleven philosophical objections against the *Treaty*; a condiction of his faith in twelve articles, which are as follow: viz. that there is only one God, without distinction of persons; that there is
no other way of salvation, without fulfilling the law of Moses— that is, a fulfilling of the law of talitha, and also the direction of clean and unclean meats:— that sacrifices will be reformed, and the temple and city of Jerusalem rebuilt:— that the true Messiah is to come, and that he will be a glorious, holy, and just king, and return the kingdom of Israel:— that there is no imputation of Adam’s sin:— that there is no predestination, by which God has decreed to save some persons and to damn others, but that man shall be rewarded and punished according to their actions:— that no person can make satisfaction for us, but that we sin there is room for repentance:— and that the New Testament is not agreeable to the Old, Gen. Dict.

ANTHOLOGY, a church-book in use among the Greeks. It was called ṿολογιον, q. d. floridum, or a collection of flowers. The anthology is a sort of breviary or masb-book, containing the daily offices addressed to our Saviour, the Virgin, and the principal saints; with other common offices of prophecies, apostles, martyrs, pontiffs, and confessors, according to the Greek rite. See Breviary, Mass, and Office.

ANTHOLOGY, Anthologia, a dictionarie or treatise of flowers, or of beautiful passages from any authors. Thus called from antó, a flower, and λεξικός, a dictionarie; though others choose rather to derive it from antó, a flower, and λέξις, a gathering; and use it to signify a collection of flowers.

Anthology is frequently used for a collection of epigrams of divers Greek poets.

ANTHOLYZA (Ἀνθόλυζα, a flower, and λύζα, madnify), in Botany, Lin. Gen. 38, class triandra monogynia; natural order euface; and irid of Jullian.

Generic Character. Calyx, ephaphe two-valved, alternate, imbricated, permanent; corolla, petal one, gradually dilated, from the tube into a comprized ringent throat; upper lip straight, flender, very long, furnished with two short dividers at the base; under lip shorter, trident; stigma, anthers long, flender, under the upper lip; anther acute; pellitum, germ ellipsoidal; style filiform; stigma trident, capping, reflex; per. capule roundish, threecornered, threecelled, threevalved; seeds many, triangular.

Eff. generic Character. Cor. tubular, irregular, recurved; sep. inferior.

Species. 1. A. ringens, narrow-leaved antholyza, with lips of the corolla divericated, throat comprized; it grows two feet high, producing red flowers cut into five unequal segments, and appearing in June; cultivated by Mr. Miller in 1759. 2. A. platycarpa, plaited-leaved antholyza, with leaves plaited; lip branching bifidate; corolla, ringent, shorter than the stigma; a native of the Cape, and discovered by Thunberg and Maarston. 3. A. eunoria, scarlet-flowered antholyza, with corolla somewhat butterfly-shaped, the two outer lobes of the five-parted lip broader and ascending, Miller, fig. 113, and Bot. Magazine, 343. A native of the Cape and Persia; cultivated by Miller in 1756. 4. A. athtica, broad-leaved antholyza, with corolla incurvate; the two alternate lobes of the five-parted lip spreading, large, lanceolate; its flowers are scarlet, and appear in May and June; cultivated by Mr. Miller in 1759. This and the preceding species very much resemble the gialonius. 5. A. meriana, redflowered antholyza; with corolla funnel-shaped; leaves linear, sword-shaped; the flowers have long tubes, of a copper colour on the outside, but of a deeper red within; appearing in April or May. Bot. Magazine, 418. Cultivated by Miller in 1756. See fig. 276, Miller. 6 A. meriana, dwarf antholyza, with corolla funnel-shaped, leaves linear; the flowers are of a paler red, larger than those of the preceding species. Spec. Bot. Mag. 421. The seeds were brought from the Cape in 1754. Both this and the meriana differ much from all the other species of antholyza, and ought perhaps to constitute another genus. 7. A. heder, with radical leaves siliforn at the base, broad, bluish, arrowed at the top; tube simple, leafy, spike, a foot and a half high; flowers oblong, a little bent, purple above, cut into five unequal lanceolate parts. This, as well as the other six species, are natives of the Cape of Good Hope.

Propagation and Culture. As these are very ornamental plants, much attention has been given to their cultivation. They do not always ripen their seeds in this country, and are therefore frequently propagated by offsets, which their bulbous roots lend forth in great abundance. Miller says, "the roots should be taken from them, for if they are kept out of the ground till the following spring, they will often miscarry, or at least remain a year in the ground before they grow. If the seeds are taken in pots of light earth, and plunged into an old bed of tan, which has lost its heat, and shaded in the middle of the day in hot weather, the seeds will come up the following winter; therefore they must be kept covered with glasses to screen them from cold, otherwise the young plants will be destroyed. These may remain in the pots two years, if the plants are not too close, by which time they will have strength enough to be planted each into a separate small pot filled with light earth. The time for transplanting these roots is in July or August, when their leaves are decayed. In summer, the pots may be placed in the open air, but in winter they must be removed and placed under a hot-bed frame, for they are not very tender; but where any damp air is, it is very apt to occasion a mouldeus upon their leaves. The roots shoot up in autumn, and the flowers begin to appear in May; the seeds ripen in August, and soon after their leaves fall. The shoots may then be taken up, and kept six weeks or two months out of the ground, so that they may be easily transplanted from one country to another at that time." See Martyn's Miller's Dictionary.

ANTHON. in Geography. See VIETTIE D’ANTHON. ANTHONY, Francis, in Biography, the son of — Anthony, goldsmith, who held a lucrative place in the Jewel Officer under queen Elizabeth, was born in London in the year 1550. After passing through the usual steps, he was sent to Cambridge, where he graduated in the year 1574. Having applied himself diligently to the study of medicine, particularly of chemistry, and invented a panacea, which he called Aurum Potabile, he returned to London, and commenced practitioner of physic, but without obtaining a licence from the College. He was therefore summoned before them, and interdicted practising, Goodall says, for incapacity; and on his promising refraction, was committed by them to the Compter-prison. He was, however, soon after released, on his submitting to the college, and paying them a fine of five pounds. Two years after, Dr. Taylor and two other members of the college, accused him of occasioning the death of funery persons, to whom he had given his medicine. Against this charge he defended himself, in 1610, by a work entitled, "Medicina Chymica et vari Potabilis Auri affortior," by no means (Aitkin says) devoid of learning and art, although in the present state of chemistry and medicine, it would be thought deliptious of solidity." This was answered by Dr. Matthew Gwynne, in a tract called "Aurum non Aurum, five adversaria in affortorem Chymie, sed vera Medicina defertorem Fran. Anthonium." It is curious to find this
this writer calling upon the king to prohibit the sale of the medicine, left the banihers of the physician, surgeon, and apothecary should be ruined. This at least showed it possesed considerable efficacy. This produced from the inventor, in 4016, an apology in defence of his medicine, written in English, in which, besides some popular arguments in favour of the idea of an universal medicine, there is a large collection of attested cures. He had now acquired such a degree of popularity, and so many powerful protectors, that the College did not think prudent, it would seem, to prosecute him farther. He is said to have been liberal to the poor, and to have lived hospitably in his house in Bartholomew-cloke, where he died, aged 74, on May 26th, 1632. There is a monument erected to him and his son John, who succeeded him in the sale of his medicine, in the church of Bartholomew-the Great, in London. Charles, his second son, removed to the town of Bedford, where he practised physic with considerable reputation and success.

Anthony, or Antony, St. the first initiatore of the monastic life, was born at Cana, a village of Egypt, in the lower parts of the Thebais, in the year 251 (324, Cave). Some have said, that though born of wealthy parents, he was wholly illiterate; whilst others affirm, that he could read and write in the Coptic, which was his native tongue. At the age of 18, he was left in possession of a large estate, which, under the impulse of a fanatical spirit, he sold, distributing the produce of it among the poor, and devoting himself to religion in a state of solitude and poverty. After a long and painful journey among the tombs, and in a ruined tower, he boldly advanced into the desert, three days' journey to the eastward of the Nile, discovered a lonely spot, which possest the advantages of shade and water, and fixed his last residence on Mount Colzim, near the Red Sea; where an ancient monastery still preserves the name and memory of the saint. Before his settlement at Colzim, and during the perfection of Maximin, in the year 311, he left his solitary retreat, and visited Alexandria, for the purpose of administering consolation to those who were suffering in the Christian cause. During the latter part of his life, in the year 355, he took another journey to this city, at the request of Athanasius and other Catholic prelates, to affirm the faith against the Arians; where he is said to have supported his name with discretion and dignity. Declining to accept an invitation from the emperor Constantine to visit Constantinople, he returned to his cell, and there lived to the advanced age of 105 years. The venerable patriarch beheld the numerous progeny, which had been formed by his example and labours to that kind of monastic seclusion and mortification, which superstition may deem meritorious, but which an enlightened and benevolent philosophy must pronounce absurd and mischievous. The public colonies of monks multiplied with rapid increase on the sands of Libya, upon the rocks of the Thebais, and in the cities of the Nile. To the south of Alexandria, the mountain and adjacent desert of Nitria were peopled by 5000 anchorites; and the traveller may still investigate the ruins of 50 monasteries, which were planted in that barren soil by the disciples of Anthony. But 'what honour can be due to the memory of the fanatic who laid the foundation of an institution, which has alienated millions of human beings from the first duties and the finest enjoyments of society?' Anthony left his cloak to Athanasius, and his hair-cloth to two brethren who were with him at his death. Seven letters, written originally in Egyptian, and translated into Latin, abounding more with pithy than eloquent, with some other pieces, ascribed to this proto-monk, may be found in the 'Bibliotheca Patrum.' Cave's Hist. Lit. vol. i. p. 320. Gibbon's Hist. vol. vi. p. 241, &c.

See Morn.

Anthony, St. of Hainault. The order of St. Anthony in Hainault, was instituted by Albert, duke of Bavaria and count of Hainault, Holland, and Zealand, in 1382, on designing an expedition against the Turks and Moors. The clofn of the order was a collar of gold made like an hermit's girdle; at the centre thereof hung a crutch, and a small bell of gold.

Anthony, St. of Ethiopia. The order of St. Anthony in Ethiopia. After the death of St. Anthony the hermit, who died in 357, many of his disciples remaining near Ethiopia, followed his example and manner of life; and their successors lived in great austerity in the desert, and were called Anchorites till the year 372; when John, emperor of Ethiopia, erected them into a religious order of knighthood, under the title and protection of St. Anthony, patron of his empire. Being thus instituted, they received St. Basil's rule, and lived in monasteries; their habit was black, with a blue Cross Tau. Philip VII. four to the Founder, enlarged their lands and privileges, and added a borodure of gold to the badge of the black cross. In Italy, France, and Spain, there was formerly a fort of monks that had the title of Knights of St. Anthony, which observed the rule of St. Aquilung, and they wore a plain cross like that in Ethiopia; but the principal of these wore a double St. Anthony's cross of blue fatin, the one above the other. Their chief seat was at Vienne in Dauphiné, of which place the General of the Order bore the title of abbot; the monastery being erected, in 1297, in honour of St. Anthony, whole body was translated thither from Conflantinople. The badge of this order was a Cross of azure azure, the base point thereof couped, and the whole edged with gold. The friars of this order came into England in the reign of king Henry III. and had one house at London, and another at Hereford.

It is said that, in some places, these monks assume to themselves a power of giving, as well as removing the ignis facer, or Erysipelas; a power which is usefully employed for keeping the poor people in subjection, and extorting alms.

St. Anthony's Fire. See Erysipelas.

Anthony, St. Island of St. Anthony's, in Geography, the most northerly of all the Cape Verde islands, lying in N. lat. 18°, and divided from St. Vincent by a clear and navigable channel, about two leagues broad. The island stretches from north-east to south-west, and abounds with high mountains, whose tops are constantly covered with snow, and generally hid in the clouds. On the north side is a good road for shipping, and a supply of fresh spring water. The inhabitants are chiefly Negroes, amounting in number to about 5000 under the protection of the Portuguese. The island produces a variety of fruits, oranges, lemons, palms, melons, bananas, pomegranates, and the Iegar-cane. The potatoes and melons are particularly excellent, and much sought after by mariners.

Anthony Cave's Island, an island in the Pacific Ocean. S. lat. 3° 10'. E. long. 152° 50'.

Anthony's Falls, St. lie in the river Mississipi, about ten miles north-west of the mouth of St. Pierre river, which joins the Missipipi from the west, and are situated in N. lat. 44° 50'. They were so named by father Louis Hennipin, who travelled into those parts about the year 1680, and was the first European ever seen there by the natives. The whole river, 1250 yards wide, falls perpendicularly above 30 feet, and forms a very agreeable estuary. The rapids below, in the space of about 500 yards, render the descent apparently greater, when viewed at a distance. In the middle of the falls is a small island, about 40 feet square, in which...
grow a few hemlock and spruce trees. These falls are in
peculiarly situated, that they may be approached without
any intervening hill or precipice; and the scene around
them is uncommonly beautiful. At a little distance below the falls
is a small island, about ½ acre, on which grow a great num-
er of oak trees, all the branches of which are loaded, at the
proper season, with the nests of eagles, where they are secure
from the attack both of man and beast.

Anthony's Kill, a western water of Hudson's river; the
mouth of which is seven miles above that of Mohawk river,
with which it likewise communicates at the end of Long
Lake.

Anthony's Nose, a point of land in the highlands, on
Hudson's river, in the state of New York; from which to
Fort Montgomery on the opposite side, a large Boom and
chain was extended in the late war, at an expense of
70,000. dollars. It was partly destroyed by general Clinton
in 1777. This is also the name of a point of a mountain
on the north bank of Mohawk River, about 30 miles above
Scheneectady. The flag road runs about this point.

ANTHOFIHYLLUM, in Natural History, a species of
Madrepore, found in the Mediterranean. The stalk is
simple and ovate; flar terminal, hemispherical, and concave,
with radiated lamellae, which are thick at the bottom.
Gmelin, Esper, &c.

ANTHOFIHYLLUM, is also a name given by Rumplius to
madrepora ramea of Linnaeus. Vide Anthophyllum fascicul
Rumpf. amb. vi. p. 245.

ANTHORA, in the Materia Medica, a medicinal plant,
of the aconite kind, having yellow flowers, resembling helm-
ets; growing chiefly on the mountains in Switzerland
and Savoy. See ACONITUM.

This is otherwise called anthora, as being reputed an an-
tidote against the thora; sometimes aconitum falsiflorum;
in English, the helmet-flower.

The root, anthora radix, has been chiefly in use. It holds
a place in the catalogues of the Materia Medica, but is not
kept at this time in the shops. It is of a dusky brown without
and whithit within, of a warm bitter taste, and is reputed
a caradice and alexipharmic, much of the same qualities with
contrahernia root; on which account some also denominate
it the German contrahernia, though it now only obtains
a few official compositions.

ANTHORISMNUS, in Rhetorica, denotes a counter de-
definition or description of a thing.

Thus, if a plaintiff urge, that to take any thing away
from another, without his knowledge or consent, is a theft;
this is called esse, or definition. If the defendant reply, that
to take a thing away from another, without his knowledge or
consent, provided it was done with deffign to return it to
him again, is not theft; this is an esse non esse.

ANTHOS, in its original Greek, signifies flower; but
by way of excellency is appropriated to refemine, so as to
express only that plant.

ANTHOSPERMUM (A. scler., and Agra, flower-seed), in
Botany, Linn. Gen. 164. Class, polvagmi, dioecia; natu-
ral order, feliatae; and rubriceae. Jull.

Generic Character. Male. Calyx, perianth one-leaved, co-
ical, quadrifid beyond the middle; divinations ovate-oblong;
revolute, obtuse, corolla none; flamina, filaments four, cap-
illary, erect, the length of the calyx, inserted into the re-
ceptacle; anther two, oblong, four-cornered, erect.

Female. Calyx and corolla as in the male; pistillum, ger-
men inferior, ovate, four-cornered; styli, two, recurved;
 stigmae ample.

Efflo, Generic Character. Calyx four-parted; corolla none;
flamina four; pistillum two; germ, inferior; male and fe-
male in the same, or a distinct plant.

Species. 1. A. rhizophor. amber-tree; it bears male
and hermaphroditic flowers on distinct plants; a beautiful
ever-green shrub, with branch-pollished leaves, which emit
a very fragrant odour on being rubbed between the fingers.
2. A. racemosa, with root peduncled, woody, much branched;
leaves ciliated, narrow, lanceolate; flowers axillary, f. sile.
3. A. berbecum, with leaves fi, pollishd; stem herbaceous.
This has the appearance of a glIMUM. All these species are
natives of the Cape of Good Hope.

Propagation and Culture. All these plants may be easily
propagated by cuttings during the summer months; they
will take root in a border of light earth, provided they are
watered and shaded as the kasim may require; or if these
cuttings are planted in pots, and placed in a moderate hot-
bed, they will take root sooner. Afterwards they should
be taken up, and planted in pots filled with light sandy
earth, and exposed to the open air till October, when they
ought to be removed into the conservatory. See Miller's
Dict. by Motyn.

ANTHOXANTHUM. See RUMEX marinia.

ANTHOXANTHUM (Adox, and lacinia, yellow flower),
Lin. Gen. 42. Class, indigera digita; natural order, gra-
mina, or grasses.

Generic Character. Calyx, glume one-flowered, two-
valved; valves ovate, acuminate, concave, the inner one
larger; corolla, glume one-flowered, two-valved, of the
length of the greater valve in the calyx, each valv e
emitting an awn from the lower part of the back, one of them
jointed; nelly two-leaved, very fleshy, cylindrical; leaflets
subovate, embracing; flamina, filaments two, capillary, very
long; anther oblong, forked at both ends; pistillum, germ-
men oblong; styli two, filiform; stigma fimbria; pericar-
pium, glume of the corolla grows to the seed; feed one,
pointed at both ends.

Efflo, generic Character. Glume two-valved, one-flowered;
glume of the corolla two-valved, acuminate; feed one.

Species. 1. A. odoratum, sweet vernal grasa, with spise ob-
long-ovate; flowers longer than the awn, on short peduncles.

This is an early grass, and grows about a foot high; it may
be easily distinguished from all the other grasses which are
natives of this country, by having only two flamina; its
fragrance is also very remarkable, giving that pungent smell
discovered in new-mown hay. See Eng. Botany, 647. 2. A.
indicum, with spise linear; flowers f. sile, shorter than the
awn; culm, or stem, a foot high, jointed; leaves broad, short,
spice very narrow; a native of the East Indies. 3. A. crin-
atum, with culm high, smooth; panicule long, spike-shaped;
with awns long, spreading, loote: a native of New Zealand.

ANTHOXANTHUM acutatum. See CRYPTIS.

ANTHOXANTHUMpaniculatum. See FESTUCA Spatacea.

ANTIRACIUS, in Natural History, a word used for a
gem by the ancients, but in several different senses; all
which seem evidently to refer to the cat's eye, or afteria kind.

Many of the ancients also have called the HEMATITES, or
blood-stone, by this name, because of its being of the
colour of a burning coal.

ANTIRACOLOITE (of Kirwan), in Mineralogy. See COAL.

ANTHRACOSIS, in Surgery, is a disease affecting the
eye or its appendages, which more commonly bears the
appellation of Anthrax. Carlo, or Carbuncle. This disorder
may, however, be stated in any other external part of the
body; and there is no good reason why its name should be
altered, when it affects the eye. See CARBUNCLE.

ANTHRAX,
ANTHRAX, in the Natural History of the Ancients, was a word used by the most early writers for the subfuscation we now call pit coal, and lithoanthrax. Theophrastus plainly tells us, that the subfuscation strictly and properly called anthrax (for they also knew a gem by the same name, used in a metaphorical sense) was an earthy fosile subfuscation, which was broken in pieces to be used, and kindled well, and burnt almost like wood-coals, and was used by the smiths. See Coal.

ANTHRAX Morio, in Entomology, a name given by Scopoli to the musca morio of Linnaeus. Vide Scop. ent. Carn. 971.

ANTHRAX, in Surgery, a circumfered tumour seated in the common integuments, and ready becoming gangrenous. For a more particular description of this complaint, see Carbuncle, which is synonymous. The distinction which some persons have made between anthrax and carb is not founded in nature.

ANTHRHENUS, in Entomology, a genus of coleopterous insects in Gmelin's arrangement of the Systema Naturae, comprehending seven species, viz. pinnipinnella, feroxphilus, mufcorum verbacis, vagus, glaber, and fucius. The character of this genus is, antennae cuvate; club solid; palpi unequal, filiform; maxilla membraneous, linear, and two-cleft; lip entire.

ANTHRIBUS, a name given by Geoffroy to the Cryptoccephalus Cruceus of Gmelin.

ANTHRISCUS, in Botany. See Chelanthemum and Scandix.

ANTHROMETRICA macchina. See Anthropometrica.

ANTHROPODÆMON, in Ancient Writers, a demon concealed under the figure or appearance of man.

ANTHROPOGLOTTUS, in Natural History, something that has a tongue or speech resembling that of a man. The parrot kind are denominated anthropogolltus, on account of their broad, thick and muscular tongues, by which they are enabled to speak, and to roll their meat from side to side under the edges of their bills.

ANTHROPOGRAPHIA, a description of man; more particularly of the structure of his body, and the parts thereof.

ANTHROPOLÆÆ, in Ecdesiological History, a title given to the Nettarians, on account of their believing Christ to be a mere man, yet paying him the honour of a God.

ANTHROPLATRIA, the paying divine worship or honours to a man. Anthropolatry is suppressed by some to have been the most ancient species of idolatry.

ANTHROPOLITES, in Natural History, a term denoting petrifications of the human body; as those of quadrupeds are called zooliths. See Petrification.

ANTHROPOLOGY, compounded of anthropos, man, and logos, discourse, a discourse or treatise upon man, or human nature; considered as in a found or healthy state.

Anthropology includes the consideration both of the human body and soul, with the laws and effects of their union; as sensation, motion, &c.

It is particularly used, in Theology, for a way of speaking of God after the manner of man; by attributing human parts and passions to him; as eyes, hands, ears, anger, joy, &c. We have frequent instances of anthropology in holy scripture; by which we are only to understand the effect, or the thing which God does, as if he had hands, &c.

ANTHROPOMANCY, compounded of anthropos, man, and mania, divination, a method of divination, performed by inspecting the visera of a person deceased; the emperor Helios halus practised this method of divination. The fame is related by Cedrenus and Theodoret of Julian II.

ANTHROPOLOGY, compounded of anthropos, man, and logos, discourse, a figure, expression, or discourse, whereby some passion is attributed to God, which properly belongs only to man.

Anthropopathy is frequently used promiscuously with anthropology; yet, in strictness, they ought to be distinguished as the genus from the species. Anthropology may be understood of any thing human attributed to God; but anthropo-
anthropophagy, only of human affections, passions, feudations, &c.

ANTHROPOPHAGI, compounded of the Greek ἄνθρωπος, man, and ψυχος, to eat, people who feed on human flesh.

The Cyclops, the Lebykgous, and Scylla, are all represented in Homer as anthropophagi, or man-eaters; and the female phantoms, Circe and the Syrens, full bewitched with a show of pleasure, and then destroyed. This, like the other parts of Homer’s poetry, had a foundation in the manners of the times preceding his own. It was till in many places the age spoken of by Orpheus:

“When men devour’d each other like the beasts,
Gorging on human flesh.”

Some remains of the usage subsisted much longer, even among the most civilized nations, in the practice of offering human sacrifices.

Hillery gives us divers instances of persons driven by excess of hunger to eat their own relations. Others commence anthropophagi out of revenge and hatred; there are many instances of soldiers, who in the heat of battle have been carried to such excesses of rage, as to tear their enemies with their teeth.

The violence of love has sometimes produced the same effect as the excess of hatred. The Lapithas, the gods of their friends and nearest relations to preserve them from storms and putrefaction, thinking they do not only hereby afford them an honourable grave, but even a new life; a kind of revivification in themselves. Artemis did something like this, when she swallowed the ashes of her dead husband, Mausolus. Among the Bithynian Scythians, when a man’s father died, his neighbours brought him several beasts, which they killed, minced, and mixed up with the flesh of the deceased, and made a feast.

Among the Maflagett, when a person grew old, they killed him and ate his flesh; but if the party died of sickness, they buried him, eviscerating him unhappy.

Idolatry and superstition have occasioned the eating more men, than both love and hatred put together. There are few nations but have offered human victims to their deities; and it was an established custom to eat part of the sacrifices they offered.

This practice has prevailed more or less in different parts of the globe, in more modern times. The Caribees used to make as much of their children, in order to fatten and eat them. Garcilasso de la Vega mentions a people in Peru, who were accustomed to fatten and eat the children produced by their female captives, whom they kept as concubines for that purpose; and when the mothers had done breeding, they themselves were killed and eaten. The virtues whereby the Tououpinambos believed they merited Paradise, were revenge, and eating abundance of their enemies. Herrera speaks of great markets in China, that were furnished wholly with human flesh for the better fort of people.

The Jogos, and the subjects of the great Macoco, are said to be anthropophagi. This prince is very powerful, having several kings for his valets; his court is so numerous, that there are two hundred men butchered every day to supply the table; part of this number are criminals, the rest flaves furnished in the nature of tribute. See Ansik.

It appears pretty certain from Dr. Hawkeforworth’s Account of the voyages to the South Seas, that the inhabitants of the island of New Zealand, a country unfurnished with the necessaries of life, eat the bodies of the enemies. It appears also to be very probable, that both the wars and anthropophagia of these savages take their rise, and owe their continuance, to irresistible necessity, and the dreadful alternative of destroying each other by violence, or of perishing by hunger. See vol. iii. p. 447, and sec. and vol. ii. p. 589, &c.

Mr. Mathen, in his account of Sumatra, informs us, that the Battas, a people of that island, are anthropophagi. They do not eat human flesh to satisfy hunger, because other food is wanting, or as a glutinous delicacy, but as a mode of frowning their detestation of crimes by an ignominious punishment, and as an indication of revenge and insult to their enemies. The objects of this favage repulse are the prisoners taken in war, and offenders convicted and condemned for capital crimes. When sentence is pronounced, the unhappy object is tied to a stake; and when mortally wounded by lances thrown at him by the assembled multitude, they rush upon him as in a rage, cut pieces from the body with their knives, dip them in a dish, previously prepared, of salt and lemon-juice, slightly broil them over a fire, and then swallow the morsels with a kind of favave enthusiasm. In some cases, they tear the flesh from the carcass with their mouths.

Some say that they do not eat the bodies of their enemies plain in battle; but though the practice be not general, instances of it occasionally occur.

M. Petit has a learned dissertaion on the nature and manners of the anthropophagi. Among other things, he disputes whether or not the anthropophagi act contrary to nature? The philosophers, Diogenes, Chryfippus, and Zeno, followed by the whole body of Stoics, held it a very reasonable thing for men to eat each other.

According to Sextus Empiricus, the first laws were those made to prevent men from eating each other, as had been done till that time. The Greek writers represent anthropophagy as universal before Orpheus. To shew farther, that anthropophagy is not contrary to nature, a modern author urges, that cats, dogs, rabbits, and other animals feed on each other. Piny, after Arifolfe, affirms, that swans eat each other; and the bees also eat their nymphes, which are their young. The Dutch, in Nova Zemfia, have bears devour each other; and the like has been observed of the fift kind: the tibrobe, according to Ovil, are caught with a hook baited with their own flesh. Leondarla Florenciunt, having fed a hog with hog’s flesh, and a dog with dog’s flesh, found a repugnancy in nature to such food; the former lost all its brillures; the latter its hair; and the whole body broke out in blotches.

It may be said, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent; but whatever the practice of eating human flesh may be in itself, it certainly is, relatively, and in its consequences, most purgative. It manifestly tends to eradicate a principle, which is the chief security of human life, and more frequently restrains the hand of the murderer, than the fear of duty, or the dread of punishment. If even this horrid practice originates from hunger, till it must be perpetual from revenge. Death must lose much of its horror among those who are accustomed to eat the dead; and where there is little horror at the sight of death, there must be less repugnancy to murder.

See some farther observations on this subject, equally just and ingenious, by Dr. Havedkeworth, &c.

Some carry their respect to dead bodies to a great length. M. Petit does not think it lawful for anatomists to dissect human bodies in order to learn their structure, except those of condemned criminals, and such as are denied the rites of burial. The Arabs went farther; notwithstanding all their curiosity, and desire to be acquainted with the human structure, they could never be induced to make one dissection; but were contented to borrow all their knowledge of this kind from the Greek physicians.
ANT

Some maintain it impossible, whatever precaution is used, to prevent the ingress of the parts of dead bodies with our food and drink. Add, that if we do not feed on our own species, we feed on plants and animals which derive a great part of their nutriment from us. Whence the impossibility of the resurrection of the same body has been inferred.

ANTHROPHAGIA, the act or habit of eating human flesh.

This is pretended by some to be the effect of a disease, which leads people affected with it to eat every thing alike.

Some choose only to consider it as a species of VICE.

The annals of Milan furnish an extraordinary instance of anthropophagy. A Milanese woman, named Elisabeth, from a depraved appetite, like what women with child, and those whole men are obstructed, frequently experienced, had an insatiable inclination to human flesh, of which she made provision by enticing children into her house, where she killed and salted them; a discovery of which having been made, she was broken on the wheel and burnt in 1519.

ANTHROPOSCOPIA, the art of judging or discovering a man's character, disposition, passions, and inclinations, from the lineaments of his body.

In which sense anthroposophia seems to be somewhat more extenstive than PHYSIONOMY, or NEPTOSCOPY.

Oppo has published an "Anthropophagia, sive judicium hominis de hominebus lineamentis ex variis."

ANTHROPOPHAGIA, the science of the nature of man, and his structure and composition, both internal and external.

In this sense, anthroposophia amounts to much the same with the medical physiology or anatomy.

ANTHOPOTHEIA, in Ancient Writers, denotes the offering of human victuals.

The anthropophagy was a frequent practice among the ancients. Some have imagined that the sacrifice of Abraham was the first instance. Many reasonings and disquisitions have been founded on this supposition; by which the severity of Abraham's trial is thought by some to have been somewhat exaggerated. Human sacrifices were in use among the Gentiles before that time; practised by kings as well as by private persons; nay by entire nations, as the Egyptians, Phenicians, Canaanites, &c.

ANTHUMON, in the Materia Medica of the Ancients, a name given to the epithyrmn, or dodger, growing upon thisium.

ANTHUS, in Ornithology, a name by which Aldrovand and some other authors have called that species of the Genatnta Loxia, called the chelirius or green finch.

ANTHILLA, in Ancient Geography, a town of Egypt, situated, according to Herodotus, in a plain, nearly well of the Canopic branch, and north-well of Naucratis.

ANTHILLUS. See Arearia, Aspalathus, Camphorosa, Cressa, Ebenus, Polycarpus, Polycenium, Salsola, and Teucrium.

ANTHILLIS Valentina. See Frankenia.

Generic Character. Calyx, perianth one-leaved, ovate-oblong, swelling, villose; the mouth five-toothed, unequal, permanent; corolla papilionaceous; banner longer than the wings, the fides reflex, claw the length of the calyx; wings oblong, shorter than the banner; keel compressed, of the length of the wings; filaments, filaments concre, rising; anther simple; pachylium, germen oblong; style simple; stigma obtuse; perianthium, legume roundish, concealed within the calyx, very small, bivalve; seeds one or two.

Species. 1. A. tetraphylla, four-leaved anthyllis or kidney-vetch; with leaves pinnate, with four lobes; flowers lateral: an annual, the spontaneous growth of Spain and Italy; it flowers in the open border in July. Curt. Bot. Mag. 108. 2. A. vulgaris, kidney-vetch, lady's-finger, with leaves pinnate, unequal; head double; root woody, perennial; stems decumbent, hairy; leaves lyrate-pinnate; flowers yellow. There is a variety with red flowers: a common native of Britain, flowering in July and August.

This plant is recommended as an excellent palliative for sheep. Figured in Eng. Bot. 104. and Flor. Dan. 983. 3. A. montana, mountain kidney-vetch, with leaves pinnate, equal; head terminal; flowers oblique; stems four to six inches high; flowers pale, streaked with a deep purple; they appear early, and the seeds ripen in July: a native of the south of Europe. 4. A. cornelina, with leaves pinnate, unequal; head solitary; stem seven or eight inches high; flowers of a pale yellow colour, appearing in May and June: it is a native of Spain, annual. 5. A. totoledes, with leaves three-parted; calyces primatric, facicled, of the length of the legumes, half a foot high; leaves alternate, diurnal; flowers about nine, of a deep sulphur colour: a native of Spain, annual. 6. A. Gerardii, with leaves pinnate, unequal; peduncles lateral, longer than the leaf; heads leafless: grows wild on the ten coast of Provence. 7. A. quinqueflora, with leaves ternate, linear; head five-flowered; it bears yellow flowers: a native of the Cape of Good Hope. 8. A. melleharta, sub-herbaceous; with leaves ternate, stipulate, sword-shaped; flowers in a head, yellow: a native of the Cape. 9. A. limifolia, with leaves ternate, feathery, eniform; flowers in a head: stiles eight feet high. 10. A. barna jovis, with leaves pinnate, equal, tomentose; flowers in a head Miller. t. 41. f. 2. A shrub ten or twelve feet high, bearing yellow flowers, which appear in June: a native of France, Spain, Portugal, &c. 11. A. tetraphylla, with leaves pinnate; floral leaves ternate; a small shrub, bearing minute flowers in pairs: a native of Spain and Portugal. 12. A. quinqueflora, with leaves digitate-pinnate; calyces flabby, vescous; head of five or six flowers, which are yellow: discovered at the Cape of Good Hope by Sparrman. 13. A. pectioides, downy-leaved anthyllis, with leaves ternate, unequal; calyx woolly, linear; a low shrub with yellow flowers, appearing three or four together on the sides of the branches: a native of Spain and the South of France; cultivated by Miller in 1759. 14. A. hermanum, lavender-leaved anthyllis, with leaves ternate, sub-peduncled; calyces naked; a shrub five or six feet high; flowers yellow, in small clusters at the side of the branches: a native of the most southern parts of Europe. 15. A. erinacea, prickly anthyllis, a spinose shrub, with fimple leaves; it somewhat resembles gorse or whin: a native of Spain and Portugal; cultivated by Miller in 1759. 16. A. teregranthoides, with leaves pinnate, equal, tomentose; pectioles spinose; flowers in racemes. It has a thorny item about a span high, and bears purple flowers: a native of Mount Lebanon. 17. A. indica, with leaves pinnate, equal, smooth, racemes oblong, sub-terminating; a large shrub, with white flowers: it is a native of the mountains of Cochinchina.

Propagation and Culture. Most of the herbaceous species may be propagated by seeds, sown either in the autumn or spring in a bed of light earth, and transplanted at a proper age in the place where they are to remain. The thorny species are commonly propagated either by seeds or cuttings; if by seeds, they should be sown in the autumn in pots filled with light earth; and placed under a frame in winter, to protect...
ANT

protect them from frost. The following spring the plants will rise; and when they are strong enough to be removed, they should be each planted in a small pot filled with light earth, and placed in the shade till they have taken new root; after which, they may be put along with other hardy exotic plants, in a sheltered situation, till October, when they must be removed into shelter. See Miller's Gardener's Dict. by Martin.

ANTHYLLOIDES. See Salisola.

ANTHYPNOICA, in the Materia Medica, medicines suited to dispel sleep.

ANTHYPOMICRONIA, in Ancient Writers, an oath taken by a prophet or accuser, declaring that the absence of the party accused is not for any just cause, and therefore demanding that judgment may no longer be delayed on that account.

ANTHYPOPHORA, in Rhetoric, a figure whereby we covertly obviate a reductio or objection.

In this sense anthypophora stands opposed to hypophora, e. gr. if the hypophora be, grammar is very difficult to obtain; the anthypophora may be, grammar is indeed a little difficult to obtain, but then its use is infinite.

ANTI, Anti, is a preposition used in composition with several words in Greek, Latin, English, &c. in different senses. In English, it sometimes signifies before; as in antichamber, a place before the chamber. In which case it has the same meaning with the Latin ante, before.

Sometimes, again, it signifies contrary, or opposite; and is then derived from anti, contra, against. In this latter sense, the word makes part of the name of various medicines, to denote some peculiar or specific virtue in them against certain diseases: such, e. gr. are antivenereals, anticothletics, antinephritics, &c.

The preposition is frequently, however, omitted on these occasions, without any alteration of the sense; as in nephritics, arithmetics, algebraics, &c.

ANTI, in Matters of Literature, is a title given to divers pieces written by way of answer to others, whose names are usually annexed to the anti.

See the Anti of M. Baillot; and the Anti-Baillet of M. Menage; there are also Anti-Menagiana, &c. Caesar the Dictator wrote two books by way of answer to what had been objected to him by Cato, which he called Anti-Catores; those are mentioned by Juvenal, Cicero, &c. Vives assures us, he had seen Caesar's Anti-Catoses in an ancient library.

ANTIDES, a term used by some writers for the glanules and kernels, more commonly called torsiles and almonds of the cast.

ANTIDIAPHORISTS, compound of anti, contra,aggiungi, and ἀναθῆκη, in different, opposite to the adiapheres, a name given in the fourteenth century to the rigid Lutherans, who disavowed the episcopal jurisdiction, and many of the church-ceremonies retained by the moderate Lutherans.

ANTIANA, Sericus, in Ancient Geography, a town of Pannonia, placed by M. D'Anville north of Lusatburgium.

ANTIBACCHI, an island of the Red Sea.

ANTIBACCHUS, in the Ancient Poetry, a foot, consisting of three syllables; the two first of which are long, and the third short.

Such are the words candida, sūlitēs, ἐλεός.

It is so called, as being contrary to the bacchius, the first syllable whereof is short, and the two last long. Among the ancients, this foot is also denominated Pulumbacchus, and

ANTICADMIA, a species of mineral cadmia, sometimes also called pseudo-cadmia.

It takes the denomination anticadmia, not as being opposite in quality to the cadmia, but because it is used as a sublimate for it.

ANTICACHECTICA, in the Materia Medica, medicines adapted to the cure of cachexy.

ANTICARDIUM, in Anatomy, &c. that hollow part under the breast, just against the heart, commonly called the pit of the florbach; called also scrobiculus cordis.

The word is compounded of anti, contra, against, and καρδια, heart.

ANTICASIS, in Ancient Geography, a mountain opposite to Mount Calus, at no great distance from Antioch.

ANTICATARRHAL, an epithet given to medicines prescribed for catarrha.

ANTICATEGORIA, in Oratory, denotes a reccrimination or mutual accusation; where the two parties charge each other with the same crime.

Apolloindorus considers the anticategorai as two several caifes or actions.

ANTICAUSOTICS, among Physicians, denote medicines against burning fevers. In this sense, Juncker has given the description of antiausotic syrup.

ANTICHAMBER; see Antechamber.

Generic Character. Calyx, perianthium four-leaved, very much expanded; leaflets lanceolate, acuminate, deciduous; corolla, petals four, obovate, obtuse, the length of the calyx; filaments fertile, erect, shorter than the corolla; anthers roundish; pistillum, green superior, ovate; style cylindrical; stigma obtuse; pericarpium, capsule subulate four
four celled, four-valved; seeds very many, truncated, in four rows.

**Essential generic character.** Cylis four-leaved; petals four; calyx superior, four-celled, four-valved; seeds very numerous. There is only one species of this genus, viz. A. depressus, which is a small procumbent annual, not exceeding three or four inches long, with alternate branches, bearing yellow flowers: it is a native of Arabia.

**ANTICHRESIS,** in the *Civil Law* a covenant or convention, whereby a person borrowing money of another engages or makes over his lands or goods to the creditor, with the use and occupation thereof, for the interest of the money lent. This covenant was allowed by the Romans, among whom usury was prohibited; it was afterwards called mort-gage, to distinguish it from a simple engagement, where the fruits of the ground were not alienated, which was called *vigna.*

**ANTICHIST** (noted in the old.) is a species of *Antichrist,* in general sense, denotes an adversary of Christ, or one who denies that the Messiah is come. In this sense, Jews, infidels, &c. may be said to be *Antichrist.*

The epithet, in the general sense of it, is applicable to any power or person acting in direct opposition to Christ or his doctrine. Its particular meaning is to be collected from those passages of Scripture in which it occurs. Accordingly it may either signify one who assumes the place and office of Christ, or one who maintains a direct enmity and opposition to him. See bishop Hurst's intro. to the study of the Prophecies, vol ii. p. 10.

**Antichrist** is more particularly used for a tyrant who is to reign on earth toward the end of the world, to make the ultimate proof of the elect, and to give a final influence of the divine vengeance, before the last judgment.

The Bible and the fathers all speak of Antichrist as a single man; though they also assure us, that he is to have divers precurors, or fore-runners. Yet many Protestant writers apply to the Roman church, and the pope, who is at the head of it, the several marks and signatures of Antichrist enumerated in the Apocalypse; which would rather imply Antichrist to be a corrupt society, or a long series of perfecuting pontiffs, than a single person: or, rather, a certain power and government, that may be held for many generations, by a number of individuals succeeding one another. The Antichrist mentioned by the apostle John, i Ep. ii. 18, and more particularly described in the book of Revelation, seems evidently to be the same with the Man of sin, &c. characterized by St. Paul in his second Epistle to the Thessalonians, chap. ii. And the whole description literally applies to the excesses of papal power. Had the right of private judgment, says an excellent writer, been always adopted and maintained, Antichrist could never have been; and when that sacred right comes to be universally ascertained, and men follow the voice of their own reason and conscience, Antichrist can be no more.

A late writer (see Kett's History, the Interpreter of Prophecy, vol ii.) after collecting the principal prophecies relating to Antichrist, infers from them, that a power, sometimes represented as the little horn, the man of sin, the Antichrist, the beast, the harlot, the far falling from heaven, the false prophet, the dragon, or as the operation of false teachers, was to be expected to arise in the Christian world to pervert and oppress, and delude the disciples of Christ, corrupt the doctrine of the primitive church, enact new laws, and establish its dominion over the minds of mankind. He then proceeds to shew, from the application of prophecy to history, and to the remarkable train of events that are now (1790) passing in the world, how exactly prophecy, Mahometanism, and infidelity correspond with the character given in Scripture of the power of Antichrist, which was to prevail a certain time for the especial trial and punishment of the corrupted church of Christ. Upon this subject, the different opinions of the Protant and papists, concerning the power of Antichrist, derived from partial views of the subject, are not wholly incompatible with each other.

With respect to the commonly received opinion, that the church of Rome is Antichrist, Mede and Newton, Daubuz and Clarke, Lowman and Hurst, Jurin, Vitringa, and many other members of the protestant churches, who have written upon the subject, concur in maintaining, that the prophecies of Daniel, St. Paul, and St. John, point directly to this church. This was likewise the opinion of the reformers; and it was the prevalent opinion of Christians, in the earliest ages, that Antichrist would appear soon after the fall of the Roman empire. Gregory the Great, in the sixth century, applied the prophecies concerning the beast in the Revelation, the man of sin, and the apostasy from the faith mentioned by St. Paul, to him who should presume to claim the title of universal priest, or universal bishop in the Christian church; and yet his immediate successor, Boniface III. received from the tyrant Phocas the precise title which Gregory had thus confounded. At the synod of Rheims, held in the tenth century, Arnulfus, bishop of Orleans, appealed to the whole council, whether the bishop of Rome was not the Antichrist of the apostles, "sitting in the temple of God;" and perfectly corresponding with the description of him given by St. Paul. In the eleventh century, all the characters of Antichrist seemed to be so united in the person of pope Hildebrand, who took the name of Gregory VII. that Johannes Aventinus, a Roman historian, speaks of it as a subject in which the generality of fair, candid, and ingenious writers agreed, that at that time began the reign of Antichrist. And the Abbe geneves and Waldenses, who may be called the protestants of the twelfth and thirteenth centuries, expressly asserted in their declarations of faith, that the church of Rome was the whore of Babylon. The papists imagine they view in the prophetic picture of Antichrist, the imperial Rome, elated by her victories, exulting in her fertility and her spoils, polluted by idolatry, perfecuting the people of God, and finally falling like the first Babylon; whilst another and holy city, represented by their own communion, filled with the popish votaries of the Christian faith, rises out of its ruins, and the victory of the crofs is completed over the temples of paganism. This scheme has had its able advocates, at the head of whom may be placed Bishop bishop of Meaux, Groton, and Hammond. Some writers have maintained, that Calagula was Antichrist; and others have affirmed the same of Nero. But in order to establish the refutation, they violate the order of time, disregar the opinions of the primitive Christians, and overlook the appropriate descriptions of the apostles.

It is observed by an ingenious writer, that the term "Antichrist" is used by the apostle John, and by no other facetious writer. He first mentioned it in a period which he called "the last hour;" and this, says he, can admit of no tolerable interpretation, except that of the latter period of the Jewish state, just before the destruction of Jerusalem, when the Roman army was actually in Judea. The apostle refers to some prophecy of Antichrist, who should appear before the dissolution of the Jewish state; "Ye have heard," from the gospels of Matthew, Mark, and Luke, "that Jesus, sitting with
with his disciples, of whom I was one; on the mount of Olives, foretold the destruction of Jerusalem, and said, ‘When ye shall see Jerusalem compassed with armies, then shall the generation of Antichrist appear. Antichrist shall arise, to seduce, if it were possible, even the elect.’ Matt. xxiv. Mark, xiii. Luke, xxi. ‘Ye have heard that Antichrist shall come. Even now there are many Antichrists; whereby we know, that it is the last time.’ It was natural to all, who knew the Antichrists were, and by what mark they who had not the gift of discerning spirits, as the apostles had, might know them? To this reasonable inquiry, the apostle answers by saying, ‘Every spirit that confesseth not that Jesus Christ is come in the flesh, is not of God: and this is that spirit of Antichrist, whereof ye have heard that it should come, and even now is already it in the world.’ The name of the apostle seems to be explained by himself in the second epistle, where he again describes an Antichrist. It was a teacher of a doctrine: it was a doctrine concerning Christ; but it was not the doctrine of Christ, which he himself taught. The doctrine of Christ had in it both the Father and the Son: but the doctrine of Antichrist, by not including both, had not God; that is, had not a right notion of the kingdom of God, either as it had been among the Jews, or as it was to be; after the coming of Jesus Christ in the flesh, among both Jews and Gentiles; one delusion of truth, virtue, and social love throughout the world. If he be inquired further, whence came these Antichrists? The apostle says, they were none of us, apostles; they went out from us. This must mean, that Antichristian teachers either withdrew from the apostles, or from the doctrine which they taught. It is too evident, that they did not withdraw from their persons; they followed them; they mixed in their churches; they taught there another gospel; they drew the attention of the people from virtue, and fixed it on ceremonies and secular glory. John calls Antichrist a deceiver; and by deceit this party prevailed. John foretold the whole, and pointed out the place where this iniquity would fix its seat, and for ages try to conceal its ignorance and barbarity under such splendid enigmas of secular glory, as never fail to dazzle, to intoxicate, and to enervate mankind. When Rome boasts of her antiquity, she boasts of a true fact. There is a fine expression of Paul to the Galatians, which teaches readers to consider such Antichrists as abortives, exhibiting a form of unformed Christianity. Robinson’s Hist. of Baptism. p. 625.

After the point had been maturely debated at the council of Gap, held in 1603, a resolution was thus arrived: to infuse an article in the confession of faith, whereby the pope is formally declared to be Antichrist. Pope Clement VIII. was flung to the life with this decision; and even king Henry IV. of France was not a little mortified, to be thus declared, as he said, an imp of Antichrist.

F. Malvenda, a Spaniard, has published a large and learned work, De Antichristo, in thirteen books. In the first he relates all the opinions of the fathers with regard to Antichrist. In the second, he speaks of the time when he shall appear; and shews, that all the fathers, who supposed Antichrist to be near at hand, judged the world also was near its period. In the third, he discourses of his origin and nation; and shews, that he is to be a Jew, of the tribe of Dan; that he founds on the authority of the fathers, on that passage in Genesis xlix. Dan shall be a serpent by the way, &c. on that of Jeremy vii. 16. where it is said, The armist of Dan shall devour the earth; and on the Apocalypse, chap. xii. where St. John, enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books, he treats of the signs of Antichrist. In the sixth, of his reign and wars. In the seventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his persecutions; and, in the roll, of the coming of Enoch and Elias, the conversion of the Jews, the reign of Jesus Christ, and the death of Antichrist, after he had reigned three years and a half.

Hippolytus, and others, held that the devil himself was the true Antichrist; that he was to be incarnate, and make his appearance in human shape before the consummation of things.

How endles are conjectures! Some of the Jews, we are told, actually took Cromwell for Christ, while some others have laboured to prove him Antichrist himself. Paphius affures us he saw a folio Book in the Bodleian library, written on purpose to demonstrate this latter position.

ANTICHRISTIANISM, a state or quality in persons or principles, which denominate them Antichristian or opposite to the kingdom of Christ, and the genius and spirit of religion.

ANTICHRISTS properly denote the followers or worshipers of Antichrist.

ANTICHRISTIANS are more particularly underlaid of those who set up, or believe in a false Christ, or Messiah.

ANTICHTHONES, in Geography, are those people who inhabit countries diametrically opposite to each other.

The word is compound of anti, contra, and αἰών, terra, earth. They are sometimes also called, by Latin writers, antigonia.

In which sense, antichthones amount to much the same with what we more usually call antipodes.

Antichthones is also used, in Ancient Writers, to denote the inhabitants of contrary hemispheres.

In which sense antichthones differs from antocyli, and antipodes.

The ancients considered the earth as divided by the equator into two hemispheres, the northern and southern; and all those who inhabited one of those hemispheres, were reputed antichthones to those of the other.

ANTICYMOLIS, or Anticymeolus, in Ancient Geography, a small island of the Euxine sea, situated opposite and near to the town of Cimolis or Cinolis, on the northern coast of Paphlagonia, to the east of the mouth of the river Egineia.

ANTICIPATION, from ante, before, and capio, I take, the
the act of preventing, or being before-hand with a person or thing; or of doing a thing before the time.

Anticipating a payment, denotes the discharging it before it falls due.

Anticipation is also used, in a logical sense, for a presumption, prejudice, or preconceived opinion.

This is also denominated preconception, presumption, or instinct.

Anticipation, in a medicinal sense, is applied to diseases, wherein some of the symptoms which regularly belong to some future period, appear in the beginning; or the word may be understood of those diseases, which having their accesse and remissions at flaterd hours, gain in point of time, and finish their period sooner than ordinary.

In this sense, anticipation, or anticipated diseases, by the Greeks called προφανές, and opposite to ἀνεπιστέα, which come after the time.

Anticipation, in the Epicurean Philosophy, denotes the first idea, or definition of a thing, without which we can neither name, think, doubt, or even inquire, concerning it.

This is otherwise denominated premonition.

Anticipation, in this sense, makes the second of Epicurus's criterions of truth.

Anticipation is also used by Shaftesbury, in speaking of painting, to denote the expression of some future action, resolution, or the like.

Anticipation. This word, and suspension, in speaking of discords, were first used as technical terms, in Music, we believe, by Ramus; and as they are English words as well as French, they may be usefully adopted.

A sound is said to be anticipated, when a composer wishes a note to be heard before its time, in plain counterpoint. The same passage will explain both these terms. Anticipation in the treble, requires suspension in the base, and vice versa.

There are several kinds of anticipation in music: first, in passing-notes, of which no notice is taken in the base; but this must be done diatonically, not by distant intervals or leaps. Secondly, when the chord is struck on a reff, before the base. Thirdly, in serious and fundamental discords that are to be regularly prepared and resolved, the anticipation in the treble is striking the second before it becomes a third, by the descent of the base. And anticipation in the base, or inferior parts, is when the base rises before the treble falls; as from the eighth to the seventh, or tenth, (octave of the third,) to the ninth. The following are examples, in notation, of the several kinds of anticipation, in treble and base. See Suspension.

See Passing-Notes.
ANTICIPATION, in Rhetoric, a figure otherwise called \textit{prolepsis}. 

ANTICK, in Sculpture and Paintings, denotes a fantastically composed group of figures of different natures, sexes, ages, as men, beasts, birds, flowers, fishes, and even things merely imaginary, which have no existence in the nature of things.

Antick amounts to much the same thing with what the Italians call euripheis, and the French genreoire.

ANTICLIMAX, from \textit{an}, and \textit{clima}, declination, in \textit{Rhetoric}, is a figure, whereby the progress of a dissertation descends from great to little, and this is sometimes reached particularly by such a reversal between the first and second sentences, that the latter may contribute to make the omission appear still more diminutive. Horace affords a striking example.

"Parturient montes, nascetur ridiculus mus."

ANTICERMONIUM, from \textit{ax}, and \textit{nu}, thing, the feminine, in \textit{Anatomy}, denotes the thin, or the prominent part of the \textit{tibia}.

This is otherwise called \textit{aceba}, by the Latins \textit{prima tibia}, or \textit{anterior tibia}, and lands opposed to the \textit{fura}, or calf of the leg, sometimes called \textit{acetosa}.

ANTICOLICA, in the \textit{Materia Medica}, medicines used to cure the colic.

ANTICOLIS, in \textit{Ancient Geography}, a people of interior Lybia, according to Ptolemy.

ANTICONDYLII, a people placed by Stephanus Byz., in Beotta, supposed to be originally Phrygians.

ANTICOSTI, in \textit{Geography}, a barren uninhabited island, in the mouth of the river St. Lawrence. This island has no harbour, but is covered with wood, and excellent cod is found on the shores. N. lat. 45° 10', to 45° 52' W. long. 61° 32', to 63° 4'.

ANTICRAGUS, in \textit{Ancient Geography}, a mountain of Lybia.

ANTICTERIC \textit{Spirits}, in \textit{Pharmacy}, is obtained by distilling one ounce and a half of spirit of turpentine with half a pound of rectified spirit of wine, with a gentle heat; and then separating the oil that flows above in the receiver from the -fromated spirit, which is to be preferred for use. Some have imagined, that this combination of oil of turpentine with ardent spirit will furnish a solvent for biliary calculi. Hence the origin of the name; but though this effect may be produced by a copious application to the calculi in a glass vessel, yet it is not to be expected when the spirit reaches them in the course of the circulation.

ANTICUM, in \textit{Architecture}, a porch before a door; also that part of a temple which is called the outer temple, and lies between the body of the temple and the portico. It is sometimes called \textit{ante}.

ANTICUS, \textit{ferratus minor}. See \textit{Serratus}.

ANTICUS, \textit{pernax}. See \textit{Pernax}.

ANTICUS, \textit{tilaxis}. See \textit{Tilaxis}.

ANTICYRA, now \textit{Aspro Spitta}, in \textit{Ancient Geography}, a city in Phocis, in a small island which joins a peninsula in the gulf of Corinth. Pausanias supposes, that this was the city called by Homer \textit{Cypris}. This place was famous for its hell-bore, and was restored to its perfections for the benefit of this medicine, which was prepared by an excellent recipe; and hence the adage, "\textit{navigat Anticyram}," Hor. Pliny relates, that the philosopher Carneades, and Livius Drusus, tribune of the people, availed themselves of this remedy. Pausanias distinguishes two kinds of hell-bore, and says that it grew among the rocks which encompassed the city. This place was adorned with many statues of gods. Above the port was a temple consecrated to Neptune; and this city had gym-

ATICIAN, in \textit{Sculpture} and \textit{Paintings}, denotes a fantastically composed group of figures of different natures, sexes, ages, as men, beasts, birds, flowers, fishes, and even things merely imaginary, which have no existence in the nature of things.

Above the port was a temple consecrated to Neptune; and this city had gym-
ANTIDOTICUS, in the *Materia Medica*, medicines suited to cure giddiness.

ANTIDORON, in *Scriptural Writings*, a name given by the Greeks to the consecrated bread, out of which the middle part, marked with a cross, wherein the consecration refires, being taken away by the priest, the remainder is distributed, after mass, to the poor.

On the sides of the antidoron are impressed the words, *Jesu Christus vineit*. The word is formed from *doron*, *doros*, a gift, as being given away *laoco muneros*, or in charity.

Some suppose the antidoron to be distributed in lieu of the sacrament, to such as were prevented from attending in person at the celebration; and thence derive the origin of the word, the eucharist being denominated *doron*, gift, by way of eminence.

ANTIDOSIS, from *ant*, and *dosis*, *I give*, in *Antiquity*, denotes an exchange of elates, practiced by the Greeks on certain occasions with peculiar ceremonies, and first instituted by Solon.

When a person was nominated to an office, the expense of which he was not able to support, he had recourse to the antidosis, that is, he was to leck some other citizen of better substance than himself, who was free from this and other offices; in which case the former was excused. In case the person thus substituted denied himself to be the richest, they were to exchange elates, after this manner: the doors of their houses were clofe flut up and sealed, that nothing might be conveyed away; then both took an oath to make a faithful discovery of all their effects, except what lay in the silver mines, which by the law was excused from all imposits; accordingly, within three days, a full discovery and exchange of elates were made. Potter, Archael. lib. i. cap. 46.

ANTIDOTARY is used by some writers for what we more usually call a dispensatory.

We have *antidotarios* extant of several authors, as those of Nicobrus, Meus, Myrephus, Rhodius, &c.

ANTIDOTE, a remedy taken either to prevent or cure some contagious, malignant, or other dangerous disease.

The word is borrowed from *ant*, again, and *idos*, *I give*, as being something given against poison, either by way of cure or preventive.

Antidote, is also used to signify a medicine taken to prevent the ill effects of some other; for instance, poison.

In which sense the word has the same signification with alchymic, alexiterial, and counterpoison.

The Indian physic confuits much in the use of antides, viz. the root *mannog*, and the bitter *stone*; both held love-reign against the bite of the *cobras de capello*, and other venomous creatures.

Antidote is also used, in a more general sense, for any compound medicine.

In which sense, Peter Damian speaks of a person who in his whole life never took an antidote.

Antidote is also used in a less proper sense, for any remedy against any disease, chiefly if it be inveterate, and arise from some ulcer or abscess.

Antidote is also used for a perpetual form of medicines, otherwise called opiates, or more properly confuctions.

Antidote is also mystically applied to the philosopher's stone.

ANTIENT. See Ancient.

ANTIDYSENTERICA, in the *Materia Medica*, medicines suited to cure dyentery.
ANT

ANTIGONAD, in Geography, a town of Hydra, two miles and a half northwest of Pedion.

ANTIGONCA, or Antigonia, a town of European Turkey, on the north of Jaco.

ANTIGONE, daughter of Cleophas and Jocalla, is celebrated by the ancient tragedians as a model of filial and fraternal virtue. She accompanied her father in the voluntary exile to which he was condemned, and conducted him in his wanderings after he had lost his sight; and when her brother Polyneus was killed in the fatal war of Thebes, the vessels to counteract the inhuman order of Creon, and to pay funeral honours to his expiomed corpse. The tyrant commanded her, for this offence, to be flaved to death in prison; but she eluded his barbarous sentence, by flinging herself to death; andHyemon, the son of Creon, who was her lover, killed himself upon her head's body. Gen. Bion.

ANTIGONE, in Fabulous History, the daughter of Idomoneus, celebrated for being more beautiful than Juno; and was transformed by the godhead into a fawn.

ANTIGONIA, in Ornithology, a species of Ardea. The head is naked, collar papillosus, and red; body cinceres; primary quills feathers black. Lannan. Gen. &c. This is the Indian crane of Latham, and genus orientalis indica of Bohn and Klein. According to Pennant and Latham, it inhabits the Mongolian deserts; from whence it migrates into that part of the Russian dominions which lies beyond Lake Baikal, keeping chiefly within the plains below the rivers Onon and Arlun, which is the western extremity of the Gobcan plain.

This bird is larger than the common crane, being in height five feet; the bill is of a greenish yellow, daffy at the tip; irides bright reddish hazel; crown of the head bare and white; on each side of the head, about the ears, is a bare white spot; the rest of the head, and a small part of the neck, covered with a fine red skin, and also distilate of feathers; the plumage of the bird is ash-colour, lightest about the neck; the quills are black; tail and secondaries ash-colour; those nearest the body are pointed at the ends, longer than the quills, and hang over them; the legs and base space above the knee are red; the claws white; the middle and outer toe connected by a membrane as far as the first joint. Latham. Gen. Syn. v. p. 38.

There is a variety of this species found also in the East Indies, &c grus torquata, and grus a collar of Buffon, which is four feet three inches and half in length; bill long and black; the head and neck, for above half its length, are almost naked, being covered with a reddish-white down; round the middle of the neck is a collar of red; the lower part of the neck, and rest of the body, bluish ash-colour; on the rump is a tuft of flowing feathers, which hang over the ends of the wings and tail, as in the common crane; the tail is black, legs daffy.

ANTIGONEA, in Ancient Geography, a city of Macedonia in Mygdonia, founded, according to Stephanus Byz., by Antigonus, the son of Gonatas. This was also the name of a city of Epirus, placed by Steph. Byz. in Chonae, and by M. d'Avville southeal of Apollonia, and near Celydun. Another, in Arcadia, was founded on the ruins of the ancient Mantinea, and this name had superseded the other by the adulation of the Greeks, who gave it the name of King Antigonus.

ANTIGONIA, a city of Troas, probably the same with that which was called Alexandria. This name was also given, according to Strabo, to Nicæa, a city of Bithynia. Antigonia was also a city of Syria, upon the Orontes. Diodorus Siculus informs us, that it was built by Antigonus, and that it was 170 stadia in circuit, and that it was designed for the residence of the governors of Egypt and of Syria; but when Seleucus was built, he destroyed Antigonia, and removed the inhabitants to this city. There was also a city of the same name in Asia Minor, in the vicinity of Busiris, or rather a fortress, about 50 stadia from the sea. Antigonia was also an island of the Thracian Bosphorus, now called Jafa del principe. This was also the name of a city of Macedonia in the Chalcidian territory, in the Thermaic gulf, now the Gulf of Thasianica. It is called Antigaea.

ANTIGONIA, in Geography, an island of the Portuguese, in the Brazilian gulf, near that of St. Thomas, called by them Iba da princi.

ANTIGONUS, in Ancient Geography, a country of Greece, in Attica.

ANTIGONUS, in Ancient History and Biography, one of Alexander's chief generals, was the son of Philip, a Macedonian nobleman. Upon the division of the Macedonian empire, after the death of Alexander, Pamphylia, Lycia, and Phrygia Major were assigned to him; but Perdicca, who allumed regal power, and who desired the talents and high spirit of Antigonus, determined to take him off; and with this view formed and encouraged various accusations against him. Antigonus, whilst he appeared to submit to Perdicca, and prepare for his trial, retired with his son Demetrius into Greece, in order to avoid the danger that threatened him, and put himself under the protection of Antipater and Craterus. After the death of Perdicca, when the provinces were again divided by Antipater, Lycaonia was added to those which Antigonus had originally possessed; and he was appointed to the command of the troops that were destined to act against Eumenes, who was now reputed a public enemy. Eumenes was at first totally routed, through the treachery of Apollonides, general of his horse; and compelled to retire into the castle of Nora, which was situated on an inaccessible rock, and very strongly fortifid. The place was invested by Antigonus, but he soon found that it was impossible to reduce it by force; and he therefore contented himself with erecting a strong wall about it, and leaving a sufficient number of troops to guard it, and marched against Alcetas and Attalus, who had raised a considerable force for the succour of Eumenes. Having taken the one and reduced the other to the alternative of surrendering or defying himself, which latter mode of escape he preferred; their troops were disperfed, and Antigonus had leisure to concert those plans of ambition which he determined to accomplish. Upon receiving the news of the death of Antipater, he resolved to seize Asia. In order to facilitate the execution of his projects, he removed all the governors of provinces who were not in his interest, and endeavoured to secure friends in whose constancy and valour he might confide. With this view, he solicited the concurrence of Eumenes; but this faithful commander having contrived to make his escape from the castle of Nora, assembled an army, and was appointed the royal general in Asia. After several advantages which he gained over the army of Antigonus, he was at length delivered by treachery to his enemy, and put to death. Having thus removed the principal obstacle to his progress, he soon vanquished lesser difficulties; and making himself master of the immense treasures of Sula, he marched forward to Babylon, of which Seleucus was governor. Seleucus eloped, and entered
entered into a league with Ptolemy, Lysimachus, and Caffander, in order to reduce the power of Antigonus, and secure themselves in their possessions; but in the mean while Antigonus feized the provinces of Syria and Phœnicia. In consequence of a diversion given by Caffander to his arms, Ptolemy recovered Syria, and defeated Demetrius, his son, who had been sent to oppose him. Antigonus, however, who was then in Phrygia, hearing of this defeater, hastened his march over mount Taurus to join his son, and recovered all the provinces which he had lost. Emboldened by this success, he formed a design of subduing the Nabath Arabs, who inhabited the defects bordering on Judea. To this service his general Athenæus was appointed; but after having surprised Petra, and possessed himself of its treasures, he was followed by the Arabs; and his whole army, indulging themselves in their imagined security, was cut off, with the exception only of 50 horse, who made their escape. Upon this Antigonus sent his son Demetrius against the Arabs, but he could only succed so far as to bring them to a kind of composition, with which he was obliged to be satisfied, and to return. He was afterwards sent against Seleucus, who had recovered the province of Babylon, but which he was now obliged again to abandon; and the refult of this expedition was, that the confederates made a treaty with Antigonus, and surrendered to him the possession of the whole of Asia, upon condition that the Greek cities should remain free. The treaty was soon broken; and Ptolemy made a defeat in Lesser Asia, and some of the islands of the Archipelago, which was at first successful; but he was defeated in a sea-fight by Demetrius, who took the island of Cyprus, and also a great number of prisoners. Such was the effect of these successes on the mind of Antigonus that he assumed the title of king, and conferred the same on his son; and from this period (ante Chr. 306) properly commences his reign in Asia, and also the reign of Ptolemy in Egypt, and those of the other captains of Alexander in their respective territories. Antigonus now formed the design of driving Ptolemy out of his Egyptian dominions, and for this purpose he prepared a powerful army and fleet, putting himself at the head of the former, and committing the command of the latter to his son Demetrius. This expedition, however, proved unsuccessful, and the design was abandoned. The reduction of Rhodes was the next object to which the attention of Antigonus was directed; but the enterprise was difficult of execution; and Demetrius having made a favourable treaty with the inhabitants, obeyed the summons which he received to aedit the Athenians against Caffander. This was followed by a new confederacy on the part of Caffander, Seleucus, and Lysimachus, against Antigonus and his son; and in order to resist it, they combined their forces, and marched with a powerful army to Phrygia. Here they met Seleucus and Lysimachus with a force nearly equal; and there ensued the decisive battle of Iphus, of the event of which Antigonus seems to have some pretention; for in the prospect of it he appeared thoughtful and melancholy, and was frequently seen at intervals and, contrary to his usual manner, was slow in his resolutions, consulted much with Demetrius, and as he was reviewing his troops, recommended him to the officers as his successor. His usual confidence, therefore, seems to have forsaken him. On the morning of the battle, as he was rising from a fall with some difficulty, he exclaimed, "Immortal gods! grant me victory, if it be your will; but if not, let me fall in battle, and not survive my fading glory." Whilst the battle was advancing, the king was defeated by a number of traitors, who went over to the enemy; and at length he was overpowered by a shower of arrows, and thus terminated his life in the 84th year of his age, ante Chr. 301.

The character of Antigonus was that of a soldier of fortune, brave, active, sagacious, of inflatible ambition and avarice, and too heedless of the means by which these passions were gratified. He had also other better qualities; and towards the close of his life he became more mild and tolerant, and endeavored by good will to retain the subjects whom he had acquired by force. In all private concerns he was justly just; and to his brother, who wished him to hear in his cabinet a cause in which he was a party, he replied, "No, my dear brother; I will hear it in the open court of justice, because I mean to do justice." Concerning the weight and duties of his office, he frequently uttered philosophical sentiments; and when addressed by Hermodotus, a Greek poet, and one of his flatterers, with the title of a god, and the offspring of the sun, he remarked, that his chamberlain well knew the contrary. At another time, when he was complimented upon his recovery from sickness, he said, "This disease was sent to apprise me, that being a mortal, I should not grasp at anything above a mortal." As an apology for his extortion, to which he was urged by his exigence, and when he was reminded that Alexander asked differently, "True," said he; "Alexander reaped Asia, and I only glean it." With regard to his domestic conduct, and the harmony with which he lived with his wife and family, Antigonus was peculiarly distinguished; and such was his affectionate confidence in his son Demetrius, that, though he was a youth of splendid talents and considerable ambition, he admitted him as an associate both in his title and government; and Demetrius approved himself not only the dutiful son, but the loyal subject and attached friend. Anc. Un. Hist. vol. vii. p. 443-479. vol. viii. p. 1-7.

Antigonus Gonatas, so called from the place of his birth, was the son of Demetrius Pohorocetes, and grandson of the preceeding Antigonus, and distinguished by his prudence and mildness more than by his valor. His hereditary claims to the dominions of Demetrius, which comprehended several cities of Greece and the kingdom of Macedon, involved him in various contels, in which he alternately succeeded and was defeated. After the death of Soithenes, the evacuation of Macedon by the Gauls, he offered his claim, which he had before done without effect against Ptolemy Ceraunus; but on this occasion he was opposed by Antiochus Soter; the event of the contest was favorable, and he was restored to his possessions. He afterwards established himself by defeating the Gauls, who made an irruption into his kingdom; but was himself expelled by Pyrrhus, king of Epirus. He afterwards recovered a great part of Macedon; and followed Pyrrhus to the neighborhood of Argos. But the inhabitants wished neither of the contending princes to enter their city. Pyrrhus acquiesced, and at the same time challenged Antigonus to determine the contest by single combat. To this challenge Antigonus replied; "That in making war, he used not only arms, but time; and that if Pyrrhus was weary of life, there were many ways to death, which lay directly before him." Pyrrhus, in a contest that ensued, was slain: and when the son of Antigonus brought the head of the vanquished prince to his father in triumph, Antigonus thrust his son from him with disdain; "Barbarous wretch!" says he, "do thou think, that he whose grandfather was thus slain, and whose father died a captive, should rejoice at such a sight?" Then covering the head with his robe, he bedewed it with his tears, and ordered the body to be sought, and burned with all the funeral
ral honours due to a king. When Helenus, the son of Pyrrhus, was brought to him by the same son, who had treated his captive kindly; "Weil my son," said Antigonus, "this is better than you did before; however, you have done less than your duty ill, because you have suffered a perfom of his quality to approach me in that thread-bare coat, which is not a disgrace to him, but to our victory." Having entertained Helenus with respect, and kindled him for the loss of his father, he set him at liberty. He also extended his favour to the principal officers in the army of Pyrrhus, and incorporated the troops bay commanded in his own. In the closing years of his life and reign he governed his subjects in Macedon, recovered to him from the Gauls by his son Demetrius, in peace; and enlarged his authority, and consolidated the attachment of the people both to himself and to his descendants. On occasion of the siege of Thbes, in the earlier period of his life, he remonstrated with his father on account of the loss of so many lives for an object so incon siderable. Nevertheless, he was eminently distinguished by filial affection and respect to his father; for when he was made plaintiff by Scelusus, he offered himself as hostage to procure his liberty; and not succeeding, wore deep mourning, and declined participating in any futilities, while his father remained in prison; and on the news of his death, he prepared a fleet, with which he failed to meet his ashes, which he received with the utmost sensibility and respect. One of the least honourable transactions of his life, was his gaining possession of the citadel of Corinth by means of a stratagem, the success of which threw him into a phrenzy of joy; and of the power which he acquired by this event, he made use in augmenting his dominions in Greece, and supporting the petty tyrants against the free states. The Achaeans, under their illustrious chief Aratus, vigorously opposed him, and at length recovered Corinth; but Antigonus, indisposed to war, pursued his course of artful and peaceable policy. After a reign of 34 years, and having attained the age of above 80 years, he died, ante Chr. 343, and was succeeded by his son Demetrius II. Anc. Un. Hist. vol. viii. p. 53—62.

Antigonus Doros, q. d. will give, so called because he was more ready to promise than to perform, succeeded his brother Demetrius II., whose widow he married, in the throne of Macedon; and was distinguished by his great talents in maintaining peace at home, and profecting war abroad; by his reputation for justice; by clemency towards his enemies; and by a pliable and kind heart towards his friends. The Achaeans invited him into Greece, to aid them in counteracting the power of Cleomenes, king of Sparta, who was himself assisted by the Eleans. The citadel of Corinth was put into his hands; and Aratus, who was now become a friend to the Macedonians, was distinguished by his respectful attention. Whilst the greater part of his army was absent, he declined an engagement with Cleomenes; but as soon as his forces arrived, he totally defeated him at Selinus; and by this victory, became master of the hitherto unconquered city of Sparta, which, however, he treated with great lenity, and left free. He then made a precipitate march back into Macedonia, in order to retake the Illyrians, who had, during his absence, invaded that kingdom. In his return, he refoled the little republic of Tegea; and arriving at Argos, during the celebration of the Nemean games, he received many testimonies of respect from the Greek states. The deliverance of his country cost him his life; for in a battle with the Illyrians, though victory was decisive and complete in favour of the Macedonians, the king fell a sacrifice, not to the sword of the enemy, but to the exertion he used in training his voice during the engagement, and to a spattering of blood that was the consequence of this exertion. This boon terminated in his death, ante Chr. 221. Having died, as he had lived, in the service of his country, he appointed for his successor Philip, his brother's son, to whom he had acted the part of a kind and faithful guardian. Anc. Un. Hist. vol. viii. p. 63—66.

Antigonus, king of the Jews, the son of Aristobulus II., was established on the throne of Judah by the assistance of the Parthians. Soon after his accession, he caust the ears of his uncle Hyrcan, the high priest, to be cut off, that he might be incapacitated for the office; but Herod, who had betrothed, and afterward married, Mariamne, the grand-daughter of Hyrcan, invaded Jerusalem, and after a siege of six months, took it by storm. With this event, which happened ante Chr. 37, ended the reign of the Antigonids, which had continued 129 years, from Judas Maccabaeus to Antigonus, the last male of that race who bore the royal title. Simon, governor of Syria, who commanded the Roman forces, and who had officiated Herod on this occasion, having presented a crown of gold to the temple, left a shameful death to the latter, of whose death he performed a faithful account in the third year of his reign. Anc. Un. Hist. vol. iii. p. 159.

Antigonus Carystius, a philosopher and historian, flourished under the Ptolemies Lagus and Philadelphus, about 300 years before Christ. He wrote several lives of philosophers, an heroic poem, entitled, "Antipater," mentioned by Athenaeus, and other works; but none are extant, except one epigram, Καρυστίου Αντιγονος, a collection of wonderful stories concerning animals and other natural bodies, compiled from various authors. This work was first published by Xivander, with a Latin version, at Basle, in 1563, Svo.; and reprinted at Leyden, by Meursius, in 1619, 4to. Fabric. Bib. Graec. lib. iii. c. 27, § 8. tom. ii. 672.

Antigonus Sochæus, a Jew, was born at Socho, on the borders of Judæa, flourished in the time of Eleazar the high priest, about 300 years before Christ, and was a disciple of Simeon the Jul. Offended at the innovations, which were introduced by the patrons of the traditionary institutions, and particularly at the pretenions which were made to meritorious works of supererogation, by which men hoped to establish a title to extraordinary temporal rewards, he strenuously maintained and taught, that men ought to serve God, not like slaves for hire, but from a pure and disinterested principle of virtue. This refined doctrine, opposed by Antigonus merely to the expectation of a temporal recompense for works of religion and charity, was misinterpreted by his followers, and extended to the rewards of a future life; and particularly by Simeon and Baithus, two of his disciples, who taught that no future recompense was to be expected, and consequently that there would be no resurrection of the dead. This doctrine they taught to their followers; and hence arose, about 200 years before Christ, the sect of the Baithofæi, or Suducees. Brucker, Hist. Philos. by Enfild, vol. ii. p. 172.

Antigraphæ, from αυτοί, and γραφα, I write, in Antiquity, denotes a law suit about kindness, whereby a person claimed relation to such or such a family.

The antigraphæ appears to have been the fame with παναγιγραφά.
accounts, to prevent mistakes, and keep them from being falsified. Potter Arch. lib. I. c. 14.

Antigraphus is also used, in Middle Age Writers, for a secretary or chancellor. He is thus called, according to the old glossarists, on account of his writing answers to the letters sent to his master. The antigraphus is sometimes also called arctigraphus; and his dignity antigraphus, or arctigraphus. Du-Cange.

Antigraphus is also used in Isidorus for one of the notes of sentences, which is placed with a dot to denote a diversity of sense in translations.

Antigraphus is also applied, in Ecological Writers, to an abridgment of the papal letters. In which sense the word is used by pope Gregory the Great in his Register.

Of late days, the office of antigraphus confits in making minutes of bulls from the petitions agreed to by his holiness, and renewing the bulls after engrossing.

Antigua, called also Antigo, in Geography, one of the Antilles or Caribbe isles, belonging to Britain, and lying about 20 leagues east from St. Christopher's, and 10 north-east from Montserrat; and being about 50 miles in circumference, is reckoned the largest of all our Leeward islands. It contains 59,838 acres of land, of which about 34,000 are appropriated to the growth of sugar, and parfure annexed; its other principal staples are cotton-wool and tobacco; and in favourable years it furnishes great quantities of provisions. Antigua was one of the Caribbe isles discovered by Colon, in his second voyage, and is said to have been planted by the English in 1632. The first regular grant of it was made by Charles II. about 1663, to William lord Willoughby of Parham. The French were masters of this island for a few years, but in 1668 it was restored to the English by the treaty of Breda. It owes its chief prosperity to the attention of colonel Christopher Codrington, who, in 1746, removed from Barbadoes to Antigua; and having been appointed captain-general and governor of all the Leeward isles, made this the seat of his government. He applied his knowledge in sugar-planting with such good effect and success, that others, animated by his example, and affixed by his advice and encouragement, ventured in the same line of cultivation. The climate of Antigua is hotter than that of Barbadoes, and so subject to hurricanes, that if it were not for the convenience of its situation and harbours, it would probably be uncultivated and desert. Its soil is of two different kinds; the one, a black mould on a subfratum of clay, which is naturally rich, and in favourable seasons, when unchecked by the droughts to which the island is subject, very productive. The other is a stiff clay on a subfratum of marl; less fertile than the former, and abounding with a kind of gravis which is not capable of being eradicated, so that many estates once profitable, are now covered with it, and so impoverished, as to become either pasture land or utterly abandoned. Exclusively of such defeated land, and such part of the island that is altogether unimproved, the whole of it may be said to be under cultivation. It is not easy to ascertain an average return of the crops; because they vary to such a degree, that the quantity of sugar exported from this isle in some years is five times greater than in others. In 1775, were shipped 3,582 hogheads, and 579 tiers; and in 1782 the crop was 13,102 hogheads, and 5,653 tiers. Mr. B. Edwards is of opinion, that the isle has progressively decreased both in produce and in white population. It appears from the returns to government in 1774, that the white inhabitants of all ages and sexes were 2,430, and the enslaved negroes 37,803; and 17,000 hogheads of sugar of 16 cwt. are reckoned a good saving crop; which is about a hoghead of sugar per acre for each acre that is cut.

Antigua is divided into six parishes and 14 districts, and contains six towns and villages: viz. St. John's, the capital, Parham, Falmouth, Willoughby Bay, Old Road, and James Fort, of which the two first are legal ports of entry. No island in that part of the world can boast of so many excellent harbours; the principal of which are English harbour and St. John's, both well fortified; and at the former, the British government has established a royal navy-yard and arsenal, and conveniences for caring ships of war. The governor of the Leeward Islands is generally stationary at Antigua; in hearing and determining causes from the other islands, he presides alone in cases arising in Antigua, he is assisted by his council; and by an act of assembly of this island, confirmed by the crown, the president, and a certain number of the council may determine chancy causes, during the absence of the governor-general. The other courts of this island are a court of king's bench, a court of common pleas, and a court of exchequer. The legislature of Antigua is composed of the commander in chief, a council of 12 members, and an assembly of 25. This legislature presented the first example of the mitigation of the criminal law, respecting negro slaves, by giving the accused party the benefit of a trial by jury; and allowing, in the case of capital conviction, four days between the time of sentence and execution. The military establishment generally consists of two regiments of infantry, and two of foot militia, besides the force raised in the island. The Moravians have been active in their endeavours to enlighten the minds of the negroes, and to lead them into the knowledge of religious truth; and the number of converted negro slaves under the care of the brethren, at the end of the year 1787, was 5465. St. John's lies in N. lat. 17° 40'. 30'. W. long. 62° 46'. Edwards's West Indies, vol. i. p. 437-455.

Antigugler is a crooked tube of metal, so bent as easily to be introduced into the necks of bottles, and used in decanting liquors, without disturbing them. For this purpose the bottle should be a little inclined, and about half a spoonful of the liquor poured out, so as to admit an equal quantity of air; let one end of the bent tube be stopped with the finger, whilst the other is thrust into the body of the liquor near the bubble of air already admitted. When the finger is taken off, the bottle will have vert, and the liquor will run out steadily and undisputed. See Siphon.

Antithecics, in the Materia Medica, remedies against hectic disorders.

Antitecticum Poteri, in Pharmacy, a celebrated chemical preparation, made of equal quantities of tin and chalybeated regulus of antimony, by melting them in a large crucible, and putting to them, by little and little, three times the quantity of nitre; the detonation being over, the whole is to be washed with warm water till no saltiness remains.

This was formerly esteemed a very penetrating medicine, making way into the minutest pittings, and searching even the nervous cells; whence its use in hectic disorders, from which it derives its name. It was accordingly recommended in hæmorrhages of the head, giddiness, and dizziness of light, from whence proceed apoplexies, and epilepsies; and in all affections and foulness of the viscer of the lower belly; and also in the jaundice, dropsies, and all kinds of cachexies. Quincke adds, that there is fearlessly a preparation in the chemical pharmacy of greater efficacy in most obstinate chronic distempers. But Neumann observes, that it has no claim to one
ANTHOCYTIC, nor indeed to any salutary operation; and it is now generally disregarded. See Neumann's Chem. Works, p. 82., and 178.

It is also called _antitoxinum digesitricum jovius_. There are divers methods of preparing it, given by Wedelius, Etnmuller, &c. A learned author speaks of it as fatal to consumptive persons. Junker says of it, that in hectic fever, it is rather injurious than salutary. Gmelin's _Apparatus Medic._ vol. i. p. 275.

ANTILEGOMENA, in _Scripture Criticism_, an expression denoting doubtful, but acknowledged by most to be genuine, one of the three classes into which Eusebius has distributed the books of the New Testament; the other two are homologomena, i.e. of undoubted authority, and noth or spurious. To this class he refers the epistles ascribed to James and Jude, the second of Peter, with the second and third of John, whether they were written by the evangelist, or by another person of the same name. He is of opinion that these books may be received as genuine productions of the Apostolic age, even if they were not written by the evangelists. Euseb. Eccl. Hist. lib. iii. c. 2.

ANTILEXIS, from αντιλέγομαι, _contra duct in_, _Antiquity_, denotes a new trial granted in the Athenian judicatures, where judgment had before passed against a party for non-appearance.

ANTILIBANUS, in _Ancient Geography_, a chain of mountains in Caelo-Syria, which ran parallel to the other chain denominated Libanus, and both extended from south to north. Antilibanus was the east, and commenced nearly to the north of Upper Galilee, from which it was separated by mount Hermon, and reached almost to Heliopolis, where it terminated; and thus a distinction is established between Libanus and Antilibanus, though the scriptures call them both by the same common name, Lebanon. The long valley that was situated between these two chains of mountains was called Caelo-Syria. These mountains are now inhabited by those semi-christians called Druzes. The Jordan has its source in these mountains.

ANTILLARUM. in _Conchology_, a species of _nerita_, very frequent on the shores of the Antilles islands. The shell is tubo-globose and black; within white, grooved, and frilled; vertex obtuse; and both pillar and outer lip rugose and denticulated. Gmelin.

ANTILARUM, in _Ornithology_, a species of _falco_, described in L'Histoire des Antilles, tom. ii. p. 252, under the name of Mansenny, by Buffon; and likewise called le faucon des Antilles by Buffon, Orn. i. p. 701. This is the falco Antilleanus of Gmelin, who says it is brown, crown black, and belly white; and Mansenny of Latham, who characterizes it specifically as having the body totally brown. This bird has the shape and plumage of a eagle, but is smaller, being not much bigger than a falcon, and has legs and claws double the size in proportion to those of the falcon tribe. It is found in the Antilles or Caribbean islands, and feeds on small birds, snakes, lizards, &c.

ANTILLES, in _Geography_, a denomination differently applied by various geographers. The term is applied by Hoffman (_Lexicon._) to the Windward or Caribbean islands only; and he says, "dicuntur Antille Americae quasi ante fictus Americae, nempe ante majores insulas finis Mexicanit.

Rochfort and Du Tertre explain the word nearly in the same manner; whilst M. D'Aville applies the name to those islands only which are _anti-infima_, or more immediately _opposed to_, or situated against the continent. Thus he terms Cuba, Hispaniola, Jamaica, and Porto-Rico, the _Great Antilles_; and the small islands of Aruba, Curacao, Bonaire, and Margarita, and some others near the coast of Caraccas on the southern peninsula, _the left_; altogether excluding the Caribbean islands. The Spanish historians plainly prove, that the word _Antilla_ was applied to Hispaniola and Cuba, before the discovery either of the Windward islands, or any part of the American continent. This appears from a passage in the first book of the first decade of Peter Martyr, bearing date from the court of Spain, Nov. 1493, eight months only after Columbus's return from his first expedition: "Ophirum insulam fepe reprehendit refert, feces mirificorum tractu diligenter considerato, Antilia infima sunt ille et adjacentes alia; hanc Hispaniolam appellavit, &c." The cluster of islands, denominated the Antilles, is usually divided into Great and Small. They lie from 21 to 24 degrees of N. lat. and are by many geographers distinguished into Windward and Leeward islands; and they lie in the form of a bow, stretching from the coast of Florida north to that of Brazil south. The Greater Antilles have usually been made to comprehend Cuba, Hispaniola, Jamaica, and Porto-Rico; and the Lesser to include Aruba, Curacao, Bonaire, Margarita, and some others near the coast of Terra Firma. See each under its proper head. See also _Caribbees._

If we examine, says M. Buffon, the position of the Antilles, beginning with the island of Trinidad, which is the southernmost, it is impossible to doubt but that Trinidad, Tobago, the Grenades, St. Vincent, Martinico, Marigalante, Antigua, Barbadoes, and all the adjacent islands, once formed a chain of mountains, which extended from south to north, like Newfoundland, and the country of the Equinoctia. The direction also of the Antilles from east to west, if we begin with Barbadoes, and psfs on to St. Bartholomew, Porto-Rico, St. Domingo, and Cuba, is nearly the same with the coasts of Cape Briton, Arcadia, and New England. All these islands lie so contiguous, that they may be regarded as a continued belt of land, and as the most elevated parts of a country now occupied by the sea. These islands, therefore, he considers as relics of ancient continents, that seemed to unite the old continent with America. Buffon's _Works_, by Smellie, vol. i. p. 316., vol. xix. p. 182.

ANTILLON, in _Geography_, a town of Spain, in Navarre, five leagues from Balbastro.

ANTILOCHUS, in _Entomology_, a species of _papilio_ that inhabits North America. The wings are tailed, and yellow both above and beneath, with black bands and margin; tail white, and as long as the wings. Linnaeus, Fabricius, &c. This is papilio caudatus maximus (Euris umbriake nigris of Petiver mart. p. 50., n. 505.

ANTILOGARITHM, the complement of the logarithm of a finite, tangent, or secant; and it is found by beginning at the left hand, and substracting each figure from 9, and the last figure from 10.

ANTILOGY, _antologia_, q.d. contrary saying, a contradiction between two expressions or passages in an author.

Tinius has published a large index of the seeming _antologies_ in the Bible, i.e. texts which apparently contradict each other, but which are all explained and reconciled by him, in his comments on the Bible. Dom. Magri, a Maltese of the Oratory in Italy, has attempted the like; but he has done little more than rehearse what occurs of that kind in the principal commentators.

ANTIOMICA, in _Materia Medica_, medicines which preserve against the plague.

ANTIOPF, in _Entomology_, a species of _lucanus_ that inhabits Africa, and is described in the Stockh. Tran. 1787. The jaws are exerted, and bimarginated on the interior side; upper margin two-toothed, lower margin five-toothed. Swedense, Gmelin: found in Sierra Leone; it is brown, and rather smooth.
ANTILYSSUS in Medicine, is composed of equal parts of the lichen aureus turritis, & piper niger. It is reckoned useful in preventing the rashes canina. Phil. Trans. N° 448.

ANTIMACHUS, in Biography, a name applied to three Greek poets, of whom the most celebrated was the son of Hipparchus, a native either of Claros or of the neighbouring Colophon, who flourished in the 93d Olympiad, about 465 years before Christ. He was reckoned one of the first and most famous Greek poets; and he is ranked by Quinellian next to Homer, at a great distance, in heroic poetry. His great work was a "Theaid," or an epic poem on the war of the Thebes. It is said that it consisted, before the seven chief were brought to the siege, of 24 books; and at a public recital of his piece, all his auditors, except one, deserted him; but this one was Plato; and Antimachus declared, that he would read on, as Plato alone was equal to the whole audience. When his fame was almost forgotten, the emperor Adrian endeavored to revive it, and to give him the priority to Homer; but a Roman emperor could not do this. Antimachus wrote a poem to Lyde, supposing to be either his wife or his mistress, the celebrity of which may be inferred from the mention of it by Ovid:

"Nee tantum Clario Lyde dilecta poetae."

"More lov’d than Lyde by the Clarian bard."

Nothing of this writer has reached modern times. Voëlius, Gen. Biog.

ANTIMACHUS, in Entomology, a species of papilio that inhabits Africa. The wings are indented, long, and black; interior pair spotted with rufous; disk of the posterior pair rufous, radiated, and marked with black spots. Fabricius, &c.

ANTIMACO, Mark Antony, in Biography, a learned Italian, was born at Mantua about the year 1473. He spent five years at Greece in the study of the Greek language; and on his return opened a school at Mantua for the study of this language and of polite literature, which became famous. He purified the same employment at Ferrara, where he died in 1552. Antimaco translated several pieces from the Greek, which were printed at Basle in 1540, together with an imitation in praise of Grecian literature. He also wrote Latin poems. Thes. of Gib. Gen. Biog.

ANTIMENIUS, a kind of consecrated table-cloth, occasionally used in the Greek church, in places where there is no proper altar.

F. Goar observes, that in regard the Greeks had but few consecrated churches, and that consecrated altars are not things easy to be removed; that church has, for many ages, made use of certain consecrated flours, or linens, called antimenia, to serve the purposes thereof.

ANTIMENIUS, in the Greek Church, answers to the altar portable, or portable altar, in the Latin church. They are both only of late invention, though Habertus would have them as old as St. Basil. But Durant and Bona do not pretend to find them in any author before the time of Gregory and Charlemagne.

Antimenia is also applied to other tables, used in offices of religion, besides those wherein the eucharist is administered: such, e. g. are those wherein the host is exposed, &c. The origin of the antimenia is described by Macrobius: when the bishop had consecrated a church, the cloth which had been spread on the ground, and over the communion-table, was torn in pieces, and distributed among the priests, who carried each a fragment away, to serve to cover their tables in their churches and chapels. Not that it was necessary that such cloths should be laid on all tables, but only on those which either were not consecrated, or at least whose consecration was doubted of.

Antimenius, an ancient officer in the Greek church, whose business it was to introduce and place the communicants at the eucharist.

Some have imagined that he had the care of the antimenia. But this rather belonged to the office of great fiscophyla. He is otherwise called chief of the antimenia.

ANTIMENIA, from ant, and men漂亮的, a part, in Grammar, a figure whereby one part of speech is used for another: e. g. "velle fuisse simulquis effluere; for voluntas fut simulquis effluere; also populus late rex for populus late regnans.

Antimenia, in a more restrained sense, is a figure whereby the noun is repeated instead of the pronoun.

The antimenia is frequent in the Hebrew, and is sometimes retained in our version of the Old Testament; accordingly, e. g. "Hear my voice ye wives of Lamech, for my wives, Gen. ch. iv. ver. 23.

ANTIMETAPOLE, in Rhetoric, a figure which sets two things in opposition to each other.

The word is compounded of ant, against, and meta, from μετά, I shift, or transfer; i.e. a shifting, or setting two things over against each other.

This figure is twice exemplified in an apologium of Musonius; which, on account of its excellence, is called auream monitionem, the golden maxim or precept:

"Αν τι πράξας καλόν μετά ποιόν, ή μεν πόσον δικαιότερον, τό Μεν καλό μέλλειν.
Αν τι πράξας αιτχριβίν μετά ποιόν, τό μεν πόσον δικαιότερον, τό δε αιτχριβίν μέλλειν.

In English thus:

"Allowing the performance of an honourable action to be attended with labour; the labour is soon over, but the honour immortal; whereas, should even pleasure wait on the commissiion of what is dishonourable, the pleasure is soon gone, and the dishonour eternal."

ANTIMETHYTHESIS, from ant, and μετά, I transfer, in Rhetoric, is the inversion of the parts or members of an antithesis. Such is that of Cicero, in Verrem, lib. iv. cap. 52. "Compare this peace with that war; the arrival of this governor with the victory of that general; his profligate troops with the invincible army of the other; the luxury of the former with the temperance of the latter; you will say, that Syracuse was founded by him who took it; and taken by him, who held it when founded."

ANTIMIL, in Geography, a small desert island of the Archipelago, a few miles north-west of Milo, and like it appearing volcanic.

ANTIMUS, in Antiquity, a table placed before the Roman tribunal or judgment-seat.

What relation this has to the antimefia in the Greek church
church, does not appear. Some writers confound them together as the same thing.

ANTIMONARCHICAL, from ἀντι and μονARCH, μον, alone, and σικτον, dominion, something that oppresses or hinders against monarchy or kingly government. Antimonarchial is frequently used in the sense of republican.

ANTIMONARCHIST, a person who maintains antimonarchical principles.

Buchanan, Milton, Hutton, Langue, Ludlow, Sidney, and others, are celebrated antimonarchs.

ANTIMONARCHOMACILLI, from ἀντι, and mon, and μακ illi, antimonarchomachi, is used by some political writers to denote maintainers of monarchical or absolute power clothed by divine right in the persons of princes. In which sense, antimonarchomachi land opposed to monarchomachi.

King James the First, Salmasius, Peter du Moulin, bishop Bramhall, Albericus Gentilis, Ziegler, William and George Barclay, etc. have distinguished themselves in the clasps of monarchicalchills. Acker has treated profusely of the monarchomachills and antimonarchomachills.

ANTIMONIALS, in Medicine, denote preparations of antimony, or remedies whereof antimony is the basis or principal ingredient.

Antimonials are chiefly of an emetic tendency; though they may be so qualified as to become either cathartic or diaphoretic, or even only alterative. See WARD'S Pill.

An antimonial cup, made either of glafs of antimony, or of antimony prepared of falt-petre, though a substance indiffusible by the stomach, will give a forc'athartic or emetic quality to any liquor poured into it, without any diminution of its own weight.

ANTIMONIATED, something tinged with the qualities, or resembling the appearances of antimony.

Dr. Woodward speaks of a kind of irritat'd, or antimonyated lead ore.

Antimony is a brittle metal, of a brilliant white colour; fusible at a moderate red heat; and at a higher temperature, with access of air, it exhales a white inodorous vapour. It is soluble in nitric acid, and precipitable from its solution of a white colour by distilled water, and of a deep brick-red by sulphur of ammonia (volatile liver of sulphur.)

4. Ores of Antimony.

The antimonial ores have not as yet been analyz'd with sufficient accuracy to clear up all doubts as to the nature of their contents; an arrangement of them must, therefore, as yet principally depend on their external characters. We shall follow the example of Weidenmann, Emmel'ing, &c. in dividing them into several species, though probably the whole may be reduced to the native, the sulphurated, and the oxidated.

Has a light thin-white colour, with an occasional shade of yellow. Occurs massive, diffe'ediated, or kidney-shaped. Is internally of a brilliant metallic luster. Its fracture is either strat'd or curved foliated. The fragments are usually large or small grain'd; seldom concho'idal. It is soft, approaching to half hard, and of considerable specific gravity.

It melts with ease on charcoal before the blowpipe, exhaling a white ar~ecutous flame, and readily amalgamates with mercury.

By the analysis of Mengez the younger, it appears to be a native alloy of antimony and arsenic, in the proportion of about 96 of the former to 4 of the latter.

Native antimony is a mineral of very rare occurrence; it was first found in 1748, by Schwab, in the silver mines of Sahl'a in Sweden, with a gangue of calecarous spar; and has since been detected by Sage imbedded in quartz in the mines of Allemont in Dauphiné.

Of this ore there are three varieties, the compact, foliated, and stratified.

The colour of this is lead grey, passing into red, and is tinged blue or purple on exposure to the air. It occurs massive or diffe'ediated. Is of a metallic lustre, shining or little thinning. Its fracture is fine-grain'd uneven. It flies, when broken, into irregular plane-cornered fragments. Is soft, gives a bright metallic streak, and is of considerable specific gravity.

It melts with great ease before the blowpipe, and burns with a blue flame, exhaling a copious white sulphurous vapour.

It is the scarcest of the sulphurated antimonial ores, and is found principally in quartz and phlogopite iron ore at Braundorf in Saxony, Goldkronach in Bavaria, Avetovre in France, and Majuska in Hungary.

This differs from the former variety in the following particulars. Colour, light lead-grey. Fracture fine grain'd foliated, fpl. gr. 4. 36. Occurs in quartz at Braundorf, and at Nagyug in Hungary.

Its colour is light lead-grey, passing into a blackish grey, azure blue, golden yellow, and other splendid indefinite tints. It occurs diffe'ediated, or in elastic marmellite and flaky chelitic mica; or crystal-lized. The primitive form of its crystals has not yet been ascertained. Haüy has shewn that they are mostly cleft and nearly divisible in one direction only, parallel to their axes; other natural joints are, however, discernible by the varying reflection of light from these surfaces when held before a candle. The only crystal-line form that has hitherto been determined, is a compressed hexagonal prism, terminated by obtuse tetrahedral pyramids with trapezoidal surfaces (antimonium sul'dure secundum of Haüy). See crystallographical plates, fig. 266. Incidence of on s 134° 3; of on l 160° 30; of on t 140°. Born also mentions specimens from Hungary and Norway of truncated tetrahedral prisms. The surface of the crystals is generally marked longitudinally, with delicate fibres, and pollesies much luster. The internal luster both of the amorphous and crystal-lized kinds is metallic and bright, or little thinning. Its fracture is friable either broad or narrow, radiating, diverging, or implicate. When broken, it flies into irregular prismatic, or large granular fragments. Is soft and brittle. Specific gravity from 4.13 to 4.54. Its component parts, according to Bergman, are,
ANTIMONY.

The Hungarian antimony also contains a small variable proportion of gold.

This is the commonest of all the antimonial ores: it is procured at Freymuth and Telobunya in Hungary, at Dra-\(\text{v}i\)za in the Banat, Braunford in Saxony, the Black Forest in Swabia, Pereta in Tucyfan, Lublia in Auvergne, and Cornwall in England; also in Spain, Mexico, and Siberia. The splendid iridescent specimens come principally from Hungary.

Subphurated antimony is sometimes confounded with oxyd of manganese; it may, however, be clearly distinguished by the great ease with which it is fusible in the flame of a common candle: it differs also from native antimony in exhaling, when heated, a sulphurous, and not an arsénilous odour; in being of a darker colour, and leaving a dark grey trace when rubbed on paper.

It is found, for the most part, in primitive mountains, in micaceous schistus, and clay porphyry, mixed with pyrites and oxyds of iron: the gangue is sulphurated barytes in Hungary, but elsewhere, for the most part, quartz; also, though rarely, bladedony flour and calcareous spar.

The colour of plumeo antimony is fleck-grey, passing into greyish black, lead, or smoky grey: by exposure to the air, it tarnishes to an iridescent blue or yellow. It occurs in slender minute capsular crystals involving the surface of quartz and other minerals with a delicate brittle down or wool: the crystals are sometimes feebly visible to the naked eye, and so impregnated with each other, as to appear like an amorphous crust. According to Delide, the form of the crystals is that of a compressed hexahedral prism, terminated by dichoiid summits with pentagonal faces; the longitudinal fibre, however, are generally so strongly marked as to obscure the sides of the prism. Its lustre is semi-metallic, more or less glistening. The fracture is coarsely fibrous, and the fragments are indeterminate. It is brittle: fp. grav. 3.57. Before the blowpipe it emits a smoke that departs a white and yellow powder on the charcoal, and the residuum then melts into a black flag. No accurate analysis has yet been made of it; but, according to Bergman, it consists of antimony, iron, arsenic, sulphur, and sometimes silver.

This substance is ranked by many mineralogists among the silver ores; but improperly, as the proportion of silver is casual and variable, and never exceeds \(\frac{1}{4}\) or 4 per cent.

It is met with in the Saxon mines, especially that of Himmelfurth near Freyberg; also at Stollberg in the Hartz, and Schenmitz in Hungary.

The colour of red antimony is a deep crimson approaching to blood red, sometimes, though seldom, clouded with irid-fenton blue. It occurs generally in minute short hair, or needle-form crystals, radiating or implicated: sometimes also it is found massive or dillematious. Its lustre is vitreous, little shining. Its fracture is fine, and irregularly diverging fibrous. It is opaque, brittle but somewhat elastic: fp. grav. 4 to 4.7.

Before the blowpipe it melts easily and evaporates, exhaling a slight sulphurous odour.

The only mineral with which it is liable to be confounded is the red filky oxyd of copper: this last, however, is of a brighter colour, and diffuses with effervescence in nitrous acid, giving it a green tinge; the red antimony, on the contrary, is not diffused, but becomes covered with a whitish crust. No accurate analysis has yet been made of this ore; from its colour it was formerly supposed to contain arsenic and sulphurated antimony: according to Ege, however, it is a native mineral kermes. This much is certain, that it is met with in the crevices, and involving the surface of the common sulphurated antimony, and appears to be this in an advanced state of natural decomposition: the amorphous or massive variety is frequently fledded with small crystals of native sulphur, in the form of rhomboidal octahedrons.

It is met with at Braunford in Saxony, Malazka and Cremzitz in Hungary, and Allemont in Dauphine.

The colour of white antimony passes from snow-white through greyish and yellownish white into ash grey. It is seldom found massive, often radiating like zoelites, but generally crystallized in small and long quadrilateral prisms or rectangular tables, which are accumulated together in bundles or cells. The surface of the crystals is plain, or longitudinally striated, and bright shining or specular. Internally this mineral is much shining, or shining with a vitreous lustre passing into pearly. Fracture flat. It flies when broken into irregular, not particularly sharp-cornered fragments. It is translucent, soft, brittle, and heavy.

In whole crystals it decrystallizes before the blowpipe; but when powdered, it melts quietly and without difficulty, giving out a white smoke, and by degrees totally evaporates. Between two coal it is reducible to the metallic state.

From the analysis of Klaphroth, it seems to consist of antimony and muriatic acid; but the accicular variety from Dauphine afforded Vaquelain, 80 oxyd of antimony, 3 oxyd of iron and oxyd of antimony, 8 flex, 3 100.

This beautiful, but uncommonly rare fossil, was first discovered in 1781, by Mongez the younger, at Allmont in Dauphine, mixed with native antimony: afterwards, in 1787, by Rörsler at Pratram on the surface of galena: it occurs also at Malazka in Hungary, with the red and sulphurated antimony.

The colour of this is orange or wax yellow, or yellownish white, passing into black when tannished. It occurs in long striated needleform crystals, or quadrilateral tables. It is shining, and when black has a metallic lustre. Is soft, flexible, and heavy.

Before the blowpipe it neither flames nor smokes, but melts easily into a brittle flag, containing a small tin-white lead
head of metal. It is not been analyzed. This mineral
was first discovered by Count Radomawsky, in a vein of ful-
phated antimony at Firegaj in Saxoy, and has since
been found at Malazka in Hungary.
Sp. VII. Antimonial ochre. *Sphatifikser, Germ. Ant-
minum ochreum, Werner.*
its colour is dark or lemon yellow, and yellowish grey.
Occurs plentifully determined or intermixed. Is solid; of a
fine earthy fracture; soft, brittle, and heavy.
Before the blowpipe it becomes white, volatilizes, but
does not melt. It diffuses strongly with borax, and is
partially reduced. It has not yet been analyzed, but is sup-
posed by Karden to be an oxyl of antimony.
It is found at Binsbergh near Freiberg, and in Hun-
gary, mixed with fulphated and red antimony.
Delhie, *Crystallographie,* vol. iii. Kirwan's *Mineralogy,*
vol. iii.
All the antimonial ores are easily reducible before the
blowpipe on charcoal; and by a continuance of the heat,
they exhale a dense smock of a white or yellowish colour,
with little or no arsentic colour, and deposit yellowish
flowers, or white needleform crysals on the surface of the
charcoal: these appearances are, however, liable to con-
iderable modification on account of the variable proportion
or lead, arsenic, sulphur, &c. that are usually mixed with
the antimony. A more certain, therefore, though not so
expeditious a method of ascertaining the presence of this
metal, is to reduce 200 grains of the ore to fine powder,
and digest it in a moderately diluted nitric acid, in
which the nitric is not more than one-third of the mu-
ritic part. The clear liquor, after flow digestion for an
hour, is to be decanted and reduced by evaporation to
about half its bulk, and then poured into a large quantity
of distilled water: a copious white precipitate immediately
takes place of antimonial oxide, which when edulcorated
and mixed with an equal weight of crude tartar, is to be
put into a small lined crucible fitted with a cover, and by a
moderate red heat the oxide will be reduced into a metallic
button.

The analysis of antimonial ores presents no particular
difficulties, except such as are common to all minerals in which
arsenic enters. The following are the substances which have
been found mixed with antimony, viz. iron, silver, lead,
copper, arsenic, and sulphur, to which must be added, iron,
and alumina, as composing the flinty gangue, which cannot
always be entirely separated previous to analysis.

(a) Let 500 grains of the ore be reduced in an agate
mortar to an impression powder, and afterwards mixed in a
flask with 1000 grs. of pure nitric acid of sp. gr. 1.25, and
1000 grs. of distilled water; digest the mixture at a tem-
peratures of 50° less than boiling, for half an hour, then pour
off the clear liquor, and add nitric acid equal to half the
quantity first used: digest this for a few minutes, and add
by degrees, during the remainder of the digestion, half as
much distilled water as acid; then pour off the clear liquor,
and wash the residue with distilled water.

(b) Add together the two nitric solutions and the
waithings, and drop in a satured solution of muriated soda
as long as any precipitate takes place, and allow it to stand
for a few hours; pour off the liquor, and boil the precipi-
tate in a little distilled water; filter and edulcorate. Add
the waithings to the liquor.

(c) The precipitate (b), consisting of muriated silver,
and probably a little arsenic, being dried in a heat just inferior
to its fusion, is to be weighed, and reduced in a small crucible
by twice its weight of pearl ash: 75 parts of silver denote
100 of muriated silver, and if the produce of metal is less
than that obtained by calculation, the deficiency may be let
down as arsenic.

(d) The nitrous solution (e), containing a great excess
of acid, is to be reduced to only a slight excess by the addi-
tion of potash or soda; and is then to be treated with
muriated barites for sulphuric acid: the sulphate of ba-
rites thus produced, contains the sulphur of the ore oxy-
generated by the nitrous acid. This being separated, add a
satured solution of muriated soda, as long as any precipi-
tation takes place. This is sulphated lead.

(e) The residue of solution (d), being evaporated to
dryness, is to be mixed with soap, and heated in a sub-
liming flask, the arsenic will thus be obtained in a metallic
state.

(f) Upon the insoluble residue (a) digest two or three
ounces of nitric-muriatic acid, composed of nitric acid 1,
muriatic acid 5; water 3. By this the antimony, iron, and
sulphur will be dissolved, together with a little alumina and
sulphate. Separate this from the undissolved residue, and pour
the liquor into three or four times its quantity of distilled
water, and the oxyl of antimony will be precipitated. Se-
parate this by filtration, wash, and add the waithings to the
other liquor: 130 parts of oxide of antimony well dried
denote 100 of metal.

(g) Evaporate the fluid (f) to a small bulk, and super-
flurit a little with caustic ammonia, the iron and earths will be
precipitated, and the copper will be held in solution, giving
it a blue colour. Separate the precipitate by a filter; and
add sulphuric acid to the ammoniacal liquor till it becomes
acidulous, then precipitate the copper by a bar of clean
iron.

(h) The precipitate (e) being digested with a little caustic
potash, the flux and alumina will dissolve, leaving the
oxyl of iron behind.

(i) The undissolved residue of (f) being dried and
weighed, is to be ignited to drive off the sulphur, the
quantity of which is denoted by the loss of weight after
ignition. What remains is earth and a few atoms of met-
als, oxide, which being fused with black flux, will reduce
the oxide, and render the earths soluble in water.

(j) The sulphate lead (d) is to be reduced by fusion with
tartar, and the oxide of antimony also by the same method:
being then weighed separately, as much pure lead is to be
added as will make the lead twice the weight of the anti-
mony. The metals being melted together are to be divided
into two equal parts, and subjected to copellation; if any
silver remains, its amount is to be added to that of (c).
Bergmann's *Erfig. Klaproth's Analytical Essays.* Kirwan's
*Mineralogy,* vol. ii.

§ 3. Reduction of Antimonial Ores.

The grey or sulphurated antimony is the only one of this
metal that is found in sufficient abundance for the purpo-
ses of manufacture, and the treatment that it undergoes
is extremely simple. The larger pieces of the earthy or stony
matter of the gangue being first picked out, the remainder is
coarsely bruised, and subjected to a low red heat in close
vessels: the sulphurated metal then melts on account of its
very easy fusibility, leaving the impurities behind. This
proces is usually performed in a crucible, whose bottom,
perforated with a number of small holes, is inserted into an-
other
other crucible. (See Chemisty, Plate iv.) A B, Fig. 15, or connected with the lower crucible by means of a pipe, Fig. 16. In each apparatus the ore is put into the upper crucible, which serves the purpose of a filter, by detaining the flaky impurities, while the melted metal flows into the lower receptacle. Fig. 17, 18, 19, 20, 21, 22, are plans and sections of the furnaces generally made use of. This method, however, of extracting the ore is far from being the most economical possible, on account of the length of time necessary to charge a multitude of crucibles, the expense of replacing those that are broken, and the extra quantity of fuel required when the ore is not in immediate contact with the flame. On this account some of the founders in Hungary and France have altogether discarded the crucibles, and melt the antimony in masses by a reverberatory furnace, taking care to keep the surface of the metal covered with charcoal to prevent oxidation. Fig. 23 and 24 are a plan and section of such a furnace. The rough ore being placed in the bed A, and covered with charcoal, is gradually brought to a state of fusion; and the slug at B being then withdrawn, the melted metal flows into the receptacle C. Fig. 25, 26, represent another kind of furnace for the same purpose made use of at Ramée in La Vendée. The sulphurated antimony thus obtained is remelted, and cast into loaves or cakes, forming the common crude antimony of the shops.

§ 4. Regulus of Antimony.

The sulphurated ore of the preceding section having been long known by the name antimony, the term regulus of antimony was employed to designate the pure metal: in the reformed nomenclature, on the other hand, the former of these substances is called sulphuret of antimony, and the latter simply antimony. This ambiguity is of consequence to be aware of, and we shall endeavour to avoid it as much as possible by using the term regulus of antimony wherever by so doing the sense may be made clearer.

The substance from which the regulus is prepared, whether in the large way for the purposes of commerce, or in the laboratory, is universally the native sulphuret. This consists of antimony and sulphur in the proportion, according to Bergman, of 74 of the former to 26 of the latter. Numerous methods have been proposed by different chemists for the separation of the metal, all of which may be conveniently arranged under the three following general heads. 1. Reduction by roasting. 2. Reduction by incipient fusion. 3. Reduction by dry parting or precipitation.

1. Reduction by roasting.

The native sulphuret of antimony being previously separated by fusion from all earthy impurities, as described in § 3, is to be pulverized and spread thinly on the floor of a reverberatory furnace or muffle, to be freed from its sulphur by roasting. At the commencement of the process the fire must be managed with particular care, and the temperature ought scarcely to be greater than what is necessary for the fusion of tin, otherwise the antimony will clog, and even melt, so as to require being removed from the fire, and again pulverized: as soon as the fumes of sulphur become visible to the eye, in the form of a light lambent blue flame, it is a proof that the heat is sufficient; and the ore should now be continually stirred with a tobacco-pipe, or any other earthen rod. In a short time the antimony will begin to oxide, and assume a greyish earthy appearance; the fire may then be raised a little, to halt the evaporation of the sulphur; and thus the operator may go on gradually increasing the heat as the ore will bear it; and continually flaring it, so as to expose fresh surfaces to the air. When the ore is moderately red-hot, and ceases to give out a fulminating vapour (which will not be till after some hours), the roasting is finished. By this means an all grey oxyd is obtained; till, however, not entirely free from sulphur, weighing from 30 to 36 per cent. less than the original sulphuret.

In order to obtain the regulus from this grey oxyd, the common way is to mix it with half its weight of crude tartar, and expose it in a covered crucible to a full red-heat; the tartar will thus be decomposed, its carbonaceous part serving to deoxygenate the antimonial oxyd; and its alkaline base combining with the sulphur still contained in the ore, forms sulphuret of potash, by which a portion of antimony is held in solution, while the rest of the regulus, by its superior specific gravity, settles into a mass at the bottom of the crucible. The quantity of regulus obtained by this means in the large way is, from 60 to 70 per cent. on the oxyd; but the produce depends essentially on the accuracy with which the roasting has been performed: if much sulphur still remains in the oxyd, a large proportion of the metal will be diffused in the sulphurated alkaline copper. Kunkel's method appears to be more economical, and better in every respect: he mixes the roasted oxyd with an equal weight of sulphur and a little powdered charcoal, puts the mixture into a crucible to melt, and as soon as the regulus begins to flow itself, injects by degrees some powdered nitre, in the proportion of an ounce to a pound of antimony: the matter in thin fusion being poured out, a pure regulus is obtained in much greater quantity than by the common way. Most of the sulphurated ores, as those of lead and copper, are reduced to the metallic state after roasting by a simple carbonaceous addition, by which means the product of metal is greater than if an alkaline flux was made use of, and the whole expense of the flux is saved. Induced, therefore, by these motives and analogies, a series of experiments was undertaken by Haffenratz, Vauquelin, and Buillon la Grange, to obtain the regulus of antimony by cheaper means than the use of tartar or nitre. For this purpose different parcels of the roasted grey oxyd were mixed with charcoal powder, with tallow and with pitch, and exposed in covered crucibles to a reducing heat; being then withdrawn, and the contents of each examined, nothing was found in the crucibles but a little carbonaceous matter, and a few minute globules of antimony, the red being evaporated. Some grey oxyd was then mixed with 1. equal parts of lime, alumine, and glass; 2. equal parts of sulphur of barytes, chalk, and clay; 3. with common salt; 4. with sulphur or soda; and the materials being strongly heated, they were all found converted into yellow glasse, but not a particle of regulus could be perceived. The above four mixtures, with some charcoal rubbed up into them, were next treated as before: vitreous scoriæ were obtained, but no greater quantity of regulus than when charcoal alone was made use of. Lastly, some of the same grey oxyd being fluxed with half its weight of tartar, yielded a perfect button of pure antimony. Hence it appears, that potash, and probably alkalies in general, exert some specific action on antimonial oxyd, which induces it to become much more fixed while converting into regulus, than when more carbonaceous matter is employed.

II. Reduction by incipient fusion.

This, although the most expensive and inaccurate method of procuring the regulus of antimony, is generally preferred in the laboratory to every other on account of its expedition. For this purpose the antimonial sulphuret is reduced to a fine powder,
powder, and mixed with nitre and tartar; a crucible being then made red hot, succeffive fcools of the mixture are gradually projected into it till the velf is nearly filled; being then covered, and a full red heat applied for half an hour, the contents are either poured out into a greased iron cone, or suffered to cool in the crucible: a pure regulus is thus obtained, covered with a mafl of fulphuret of antimony. In this process the acid of the nitre is decomposed, and is employed in acidifying the fulphur and partly oxidizing the antimony, while the carbonaceous matter of the tartar serves to de-oxidize the metal, and in some degree also to decompose the fulphuric acid; hence the fcorie confit of the potash of the nitre and tartar, partly united with fulphuric acid, forming fulphat of potash, and partly with fulphur, forming fulphuret of potash, which lafl also holds in solution a con- siderable proportion of the antimony.

If the quantities of nitre and tartar are large compared with that of the crude antimony, nearly the whole of the metal will be taken up by the fcorie. According to Lemery, sixteen ounces of sulphurated antimony, mixed with the fame weight of nitre and allof tartar, yielded no more than five ounces and a half of regulus. Whereas sixteen ounces of crude antimony, twelve ounces of tartar, and fix ounces of nitre, afforded fix ounces and one dram of regulus. The usual proportions are four parts of crude antimony, with three parts of tartar, and one and a half of nitre. Some advice to detonate the nitre and tartar together, before the antimony is added, but this is decidedly a bad way, as the ufe of the nitre is not to alkalinize the tartar, but to oxygenate the fulphur. A greater proportion of regulus than usual would probably be obtained by mixing the antimony and nitre alone, and not adding the tartar till after the detonation had taken place.

III. Reduction by precipitation.

This is efected by fusing the antimonial fulphuret with any other metal whose affinity for fulphur is greater than that of antimony, in which cafe the fulphur combines with the added metal, while the regulus of antimony collects in a button at the bottom of the crucible. The metals capable of thus decomposing the fulphurated antimony are iron, copper, lead, filver, and tin, whence originated five varieties of antimonial regulus, known among the alchemists by the names of marten, venereal, faturine, lunar, and jovial. As equal parts of these metals require different quantities of fulphur for their faturation, a greater or less proportion of them is necessary for a given weight of crude antimony: thus two parts of this fablilance are decompofed by one part of iron, by two parts of copper, or by four parts of lead.

In order to prepare the martial regulus (for all the others are now became obfolute), a number of formulæ are given by Lemery, Beaufé, and other practical writers, the relative merits of which can only be duly appreciated by a comparison of the quantity and purity of the regulus with the expense of time, of fuel, and of nitre, required in its preparation. The following are thofe which seem belt worth notice:

1. Take eight ounces of horseshoe nails, and heat them nearly to whitnefs in a crucible, then add, by degrees, fifteen ounces of coarfeely pulverized antimonial fulphuret; cover the crucible and keep up the fire; in a few minutes the mixture will be in perfect fution, at which time, add little by little, three ounces of nitre, a flight detonation will take place, and the whole will be brought to a rate of perfect fution; then pour it into an iron cone, heated and greafed, and strike the fides of it gently as the mafla becomes solid to favour the precipitation of the regulus. When cold it will be found to confift of a button of antimony, weighing about ten ounces, covered with an alkaline ferrugineous fcorie, from which it is readily separated by a blow with a hammer. This regulus, however, is far from pure, containing both iron and a little fulphur; it is therefore to be remelted, and mixed while in fution with two ounces of crude antimony and three ounces of nitre; after all detonation has ceased, pour it into an iron cone as before, and separate the regulus from the fcorie. Remelt the regulus and project upon it by degrees three ounces of nitre. Separate this regulus from the fcorie, and melt it again once more with three ounces of nitre; heat it strongly and rapidly, and pour the whole into a cone; there will be obtained about eight ounces of a beautiful flattered regulus, covered with yellow white fcorie. In this process the whole of the materials employed are eighteen ounces of crude antimony, eight ounces of nails, and twelve ounces of nitre; four separate fusions are required, and the product is eight ounces of regulus.

2. Pulverize and mix together 16 ounces of crude antimony, 12 ounces of tartar, 10 ounces of nitre, and eight ounces of iron filings; project it by degrees into a red hot crucible, a strong detonation will take place, and the mafla will enter into fution; keep it at a full heat for a few minutes, and then pour the whole into an iron cone; when cold, there will be found beneath the fcorie a pure flattered martial regulus, weighing about fix ounces.

3. Heat in a crucible till they are white hot, five ounces of horseshoe nails, and then add 16 ounces of crude antimony, coarfeely pounded; the two will prefently melt down together, and as soon as the mafla is in very liquid fution, project it at several times one ounce of pulverized nitre; during each projection there will be a detonation, and when the falt has ceafed, increase the heat for a few minutes, and then take out the crucible and allow it to cool gradually; there will be found at the bottom of the velf a perfectly pure martial regulus.

In the reduction of antimonial fulphuret by iron, the fuccifes of the experiment depends much upon the tempera- ture; a high heat briskly applied, and of fhort con tinuance, so as to bring the whole into very liquid fution, is far pref- erable to an inferior heat of longer continuance: since the regulus separates more completely from the fcorie, and the proportion of metal, lost by evaporation, is not nearly fo confiderable.

The antimony obtained by roasting or fcorification, by proper care, may be rendered absolutely pure; but the martial regulus, though purified fo as to exhibit the flattered appearance on its surface, which is ufually reckoned characterife of purity, is, in fact, an alloy of antimony and iron; hence it is harder and more difficultly amalgamable than the former; and when reduced to fine powder, fo, according to Lemery, attracted by the magnet.

§ 5. External Characters and Physical Properties of Reguline Antimony.

This metal, when perfectly pure, is of a dusky white colour, between that of tin and iron; it appears to be ab- solutely deftitute of ductility, and may easily be reduced in a mortar to a fine powder; it is moderately hard, and may be cut without much difficulty by a common knife. Its fusibility is not quite fo great as that of zinc, since it requires to be made red hot before it flows. Its specific gravity, according to Bergman, is 6.86; but by the later ex- periments of Brillon, amounts to 6.702. Its fracture is usually broad foliated, but sometimes the facets are fo minute as to give it almost a granular appearance; in general the flower it is cooled, the broader will be the plates of which it
ANTIMONY.

is composed, but this rule is not without its exceptions. Antimony is one of the most easily crystallizable of all metals, and this tendency is shown in a striking manner by the appearance of a radiated flar, or of pincontinued leaves, like those of fern, with which the convex surface of a mass of antimony that has been allowed to cool slowly is generally covered. It was this circumstance that induced the alchemists to pay so much attention to antimony; by their heated imaginations every thing singular was considered as a type or mysterious hint, and thus confounding farce with profane, they denominated this appearance, which in truth is only the result of a confined crystallization, the eastern flar that was to conduct the fages (themselves) to the cradle of their king, i.e. to the method of making gold, the king of metals. These rays or branches are merely superficial as Lemery demonstrated, by making transverse sections of various masses of tangled regulus. If a crucible, furnished with a plug at the bottom is filled with melted antimony, and the fluid part allowed to run out by withdrawing the plug as soon as a crust is formed on the surface of the metal, there will be found under the crust various crystalline groups, consisting of cubes, of lengthened rectangular parallelepipeds, or ramifications, made up of small octahedrons implanted in each other, and frequently aggregated into a trihedral pyramid, with furrowed faces. The primitive crystalline form of antimony has hitherto eluded the sagacity of Hanx: it is divisible at the same time parallel to the faces of a regular octahedron, and of a rhombohedral dodecahedron.

§ 6. Oxides of Antimony.

The action of air and moisture at the usual temperature upon reguine antimony is scarcely perceptible, as it remains a long time without even tarnishing, and the oxidation is never more than merely superficial. By a low red heat, however, and the contact of air, this metal is gradually converted into a greyish white oxied, volatile at a higher heat, and capable of being more completely oxygenated. When antimony is brought quickly to a bright red heat, and then exposed to the air, it is rapidly converted into a white oxied, which being volatile, exhales in the form of a dense smock from the surface of the melted metal, and condenses in the upper and cooler part of the crucible into beautiful, needle-like crystals of a snowy or silverly white, which have obtained the name of argenteous flowers of antimony, or snow of reguine antimony. As this crystallized oxied is not easily obtained in a common crucible, we shall mention the method of preparing it as given by Beaune. Place a wide cylindrical earthenware tube closed at one end in a wind furnace, in that it shall remain in a flasking direction, with the open end protruding a little way through a hole or door in the side of the furnace; and to prevent the ascent of the tube from being too much cooled, an earthenware flopper must be prepared to fit loosely into the open mouth of the tube.—The apparat being properly put together, light the fire, and when the bottom of the tube is red hot, introduce the antimony in small pieces, and close the mouth of the tube with the flopper. The metal being melted, will begin in a short time to smock, and the crystalline oxied will be deposited in the upper part of the tube, from which it may be scraped from time to time with a clean iron spoon. The first portions are generally yellowish on account of a small quantity of sulphur contained in the metal; this, however, is soon burnt off, and the succeeding flowers are of a pure brilliant argenteous white colour. Although antimony is not combustible at so low a temperature as zinc, yet, at a white heat, with access of air, it burns with a white flame, throwing out copious vapours of white oxied. Another pretty experiment on the inflammation of antimony, was disco- 

VOL. II.
tion. In its eager absorption of oxygen, a great analogy subsists between antimony and tin; for not only the nitric acid, but even the water that is mixed with it, are decomposed by the antimony; the azot of the former, and the hydrogen of the latter of these fluids, combine together during their nacent state, and produce ammonia, which with the undecomposed acid, forms nitrate of ammonia, the crystals of which fall, thus unexpectedly occurring, have sometimes been mistaken for nitrat of antimony. If the white oxyd, resulting from this chemical action, is mingled, before it has been washed, with lime or caustic alkali, ammoniacal gas will be diffused. The greatest part of the antimonial oxyd remains unconsumed at the bottom of the vessel; a very small quantity, however, is taken up by the supernatant acid; but even this little is precipitated by water, by evaporation, and by mere standing for a few days. The white nitrous oxyd is fully saturated with oxygen, of which it contains, according to Thénard, about 30 per cent. It is considered as one of the most refractory and irreducible of the metallic oxids, which it certainly is when treated with the common fluids; but when rubbed with a little regulus of antimony, and heated in a close vessel, it becomes in succussion yellow, orange, brown, and then black; containing only about two per cent. of oxygen, as is related of the argentum flowers in the former action.

4. Muratic acid, when affixed by heat, is capable of dissolving a small proportion of antimony; part of this, however, is again deposited in the form of a white oxyd as the liquor cools; by evaporation it may be brought to crystallize in small acicular deliquent needles. The oxyd of antimony is more easily soluble in muriatic acid than the metal itself, and also in greater proportion; it crystallizes, according to Monnet, in brilliant plates, like the boracic acid, and is decomposable by water.

5. The oxygenated muriatic acid, when in the form of gas, exerts a very striking action on reguline antimony; if this metal, previously reduced to a fine powder, is thrown by small quantities at a time into a vessel filled with the acid gas, each parcel will be found to take fire, and burn with a white flame, throwing out, at the same time, a number of bright sparks, and thus forming a molten beautiful shower of fire. The antimony is converted into a white muriated oxyd. The liquid oxymuriat acid changes the metal into a powdery oxyd, but holds a very small quantity, of it in solution; no doubt on account of the great proportion of water, which even the most concentrated liquid oxymuriatic acid necessarily contains. If a solution of either the muriat or oxyniat of antimony be gently evaporated nearly to dryness, and afterwards exposed in a retort to a low sand heat, a thick oleaginous liquid will come over, that by cooling concretes into a soft mass, called, from its consistence, by the ancient chemists, butter of antimony: the above, however, is not the actual method of preparing this salt in the laboratories; it is more expeditiously made by taking advantage of the superior affinity which antimony has over mercury: for this purpose some reguline antimony is well mixed in a mortar with twice or two and a half times its weight of oxymuriated mercury (corrosive sublimate); during trituration, much heat is extricated, the evidence of chemical action between the two substanacies; the mixture being put into a wide necked retort, with a suitable receiver adapted, is exposed in a sand bath to a gentle heat. During the first half hour, a small quantity of a clear liquid passes into the receiver, which is afterwards followed by a thick liquor that concretes by cooling in the receiver, and often in the neck of the retort into a white mass; this is the butter of antimony. A moderate fire is kept up till nothing more comes over, at which time the receiver is unlidded, and emptied of its contents; there remains in the retort fluid mercury with some muriated oxyd of antimony. By continuing the distillation at a greater heat, the mercury is volatilized, and collected in a liquid state in the receiver. It is to be remarked, however, that there are two objections to this process; the one, that if the mercural salt is in too great proportion, a little of it will rise with the butter of antimony, and be diffused in it; the other objection is, that if too little oxymuriat is used, the produce will be much diminished, as a considerable proportion of the antimony will be merely in the state of muriated oxyd. The bell way, therefore, of preparing this salt, is to mix the unwashed sulphat of antimony ($\text{I. }\frac{7}{12}$) with common salt and black manganece, and distill the whole to dryness.

The London Pharmacopoeia orders the sublimed muriat to be made thus. Mix together one part of crowns of antimony with two parts of decrepitated salt; put the mafs into a glass retort, and add one part of sulphurac acid; then distil, and what comes over is buter of antimony.

Butter of antimony, though solid at the usual temperature of the atmosphere, liquefies at a very gentle heat, and by slow cooling crystallizes in large parallelepipeds. It is intensely caustic, destroying the organization both of animal and vegetable substances; by exposure to the air and light it becomes coloured, and deliquesces into a thick oleaginous fluid. When dropped into distilled water, it is for the most part decomposed, and a copious white precipitate is thrown down, which is little else than a perfect oxyd of antimony. This, after being washed and dried, forms the poswer of algaroth, or mercurius vitae. The clear liquid separated from the precipitate still holds a little antimonial oxyd in solution, as is obvious from a further precipitation taking place on the addition of an alkali.

Scheele has given the following method of preparing powder of algaroth, in an essay of his on this very subject. To two parts of sulphurated antimony add three of nitre, and detonate the mixture in a hot crucible; pulverize the mafs, and fill in one part of this to three of water, with one of sulphuric acid, and one of common salt. Let the whole digest together for twelve hours in a sand bath, and strain it through a cloth; separate the clear liquor, and add to the residue more salt and diluted sulphuric acid, which digest and filter as before. Mix the two liquors together, and pour them into a large quantity of boiling water; a white precipitate immediately takes place, and this, when washed and dried, is the powder of algaroth.

If to any quantity of sublimed muriat of antimony an equal weight of nitric acid is added, the liquor becomes highly coloured, copious orange-coloured fumes are difgaged, and a considerable degree of heat is excited; after a while, a white magma of oxyd is deposited. If before the latter effect takes place, the liquor is evaporated to dryness, a pure white oxyd remains behind; and this being three times more subftracted with fresh nitric acid, and afterwards heated moderately red in a crucible, affumes the appearance of a pulverulent mafs, white at the surface, and rose-coloured beneath; this being ground in a mortar, so that the white and coloured parts may be thoroughly mixed, is known in the shops and old pharmacopoeias by the name of becar mineral; and, in fact, is nothing more than a perfect oxyd of antimony, holding, perhaps, a very small portion of the acid.

6. Nitro-muriatic acid is the best solvent of reguline antimony; if the acid is made moderately warm, and the metal put in by small pieces at a time, taking care not to add
ANTIMONY.

add a second till the first is completely dissolved, it may be thus charged with a considerable proportion of antimony, only a small part of which is deposited by cooling. This, however, like all the preceding antimonial solutions, is almost wholly decomposed by the addition of distilled water.

A piece of iron or zinc also causes a precipitation of a black oxyd (§ 6.), almost in the metallic state, which, according to Theurs, when dried at a low temperature, acquires the properties of a pyrophorus, inflaming spontaneously by contact with the air.

1. The fluoric, boracic, and carbonic acids, have no action on reguline antimony; they are capable, however, of combining with its oxyds, forming salts, the particular properties of which have not been examined.

2. The action of all the metallic acids on antimony, except the arsenic acid, is wholly unknown: and for this see Arseniát of Antimony.

3. The vegetable acids produce no other effect on metallic antimony, except blackening its surface; they dissolve, however, its oxyds without much difficulty, forming salts, a few only of which have been properly examined: these shall proceed to particularize.

4. The antimonated tartar, or emotic tartar, is the most important of the combinations of antimony with the vegetable acids. It was first prepared by Adrian Mynheer, in 1651; and from that time to the present, has attracted the notice of chemists and physicians. Bergman, in his admirable essay on Emetic Tartar, was the first who gave any thing like a confident account of the rationale, and the various chemical affinities concerned in its preparation; and the subject has of late been finally elucidated by the able and fragrant experiments of Theurs.

5. The tartaric acid, the acidulous tartarite of potash (or cream of tartar), and the tartarite of potash (soluble tartar, or tartarized tartar), are each capable of dissolving and combining with oxyd of antimony; an inquiry, therefore, into the chemical properties of emotic tartar, necessarily includes the consideration of the above different ingredients, and thus renders it a very complicated affair.

6. Pure tartaric acid and boiling water, digested on any of the oxyds of antimony, except that which is satured with oxygen, as the diaphoretic antimony, may be made to take up one-third or one-fourth part of its own weight; and the solution, when concentrated by evaporation, and allowed to cool gradually, usually deposits a few crystalline grains, but is for the most part converted into a brownish gelatinous mass, which, at a red heat, is charred, and the antimony contained in it is partly extirpated in the form of a white smoke, and partly reduced to metallic grains.

7. A solution of tartaric of potash, at a boiling temperature, takes up at least as much oxyd of antimony as tartaric acid is capable of dissolving; the liquor becomes slightly alkaline, and upon evaporation, yields a number of crystalline grains.

8. A solution of tartaraceous acid, or cream of tartar, being boiled with any of the simple oxyds, or sulphurated oxyds of antimony, dissolves a considerable quantity; and by evaporation and cooling, deposits elongated octahedral crystals of emotic tartar.

9. The taste of this triple salt is slightly harsh and metallic; it reddens vegetable blues; it effloresces in the air, loses its transparency, becomes of a dead white, and is then pulpulent; it requires for its solution about 30 times its weight of boiling water, and expires in a cloud at the common temperature. Sulphuric acid precipitates from it a sulphated oxyd of antimony, leaving the cream of tartar pure; the alkalies, both pure, and carbonated, decompose it in part only; a loose white oxyd being precipitated by the first, and by the second, a carbonated oxyd, which, in a short time, crystallizes in the form of divergent rays. If either tartaraceous acid, or tartarite of potash, is added to the solution of emotic tartar previously to pouring in the alkali, there will be no precipitate; for the tartarite of potash produced by the alkaline addition, or already existing in the fluid, immediately dissolves the antimonial oxyd; and for the same reason, a simple solution of emotic tartar cannot be wholly decomposed by any quantity of alkali; and hence probably have arisen the great seeming differences in the proportion of its constituent parts, as the salt has been analyzed by means of a pure alkali, a carbonated alkali, or other re-agents. According to Theurs, the cryllals of emotic tartar, from whatever antimonial oxyd they are prepared, and whatever has been the proportion of ingredients employed, contain in a given weight precisely the same quantity of antimony, of tartaraceous acid, of potash, and water; and even the degree of oxydation of the metal is also invariable. His method of analyzing this salt, is first to ascertain its water of cryllallization, by drying in a heat just not sufficient to decompose it; secondly, to diffloge the emotic tartar, and precipitate the antimony by sulphurated hydrogen; thirdly, to ascertain the tartaraceous acid from dropping in acetate of lead; fourthly, to determine the quantity of potash by igniting the residue, and extraling the alkali by dilute nitric acid. By a very careful analysis, conducted in the above manner, he found 100 parts of emotic tartar to contain 38 oxyd of antimony, 34 tartaraceous acid, 10 potash, and 3 water, besides 4.6 parts. But the tartaraceous acid, which supplies both the acid and alkali to the emotic tartar, contains 57 tartaraceous acid, 33 potash, and about 10 water and lofs; or 70 tartarite of potash, and 20 tartaraceous acid in excess. Hence it follows, that there is a greater excess of tartarite of potash in cream of tartar over the acid, than exits in the emotic tartar; and this excess of tartarite of potash is found in the mother water, in which the cryllals of the emotic are decomposed; when, therefore, the whole is evaporated to dryness, as it is often the case in the preparation of emotic tartar, there is a portion of antimonated tartarite of potash superadded, which, no doubt, modifies its effect, and produces variations, which are unjustly charged to the emotic tartar. Another objection to evaporating the whole mass to dryness without separating the cryllals, is, that the tartarite of lime which exits in a variable proportion in all cream of tartar, according to Vaquelin, is also mingled with the antimonial salt, and weakens its operation. To make, therefore, emotic tartar uniformly of the same strength, select an antimonial oxyd somewhat below the maximum of oxydation, and digest it in a hot saturated solution of cream of tartar, taking care that the oxyd shall be rather more than enough to sature the salt (if the grey oxyd from the sulphur of antimony is made use of, or even the common glasses of antimony, as these are not already sufficiently oxydated, there will be a decomposition of water, and a small quantity of kermes will be formed); when the liquor refuses to take up any more antimony, filter and evaporate till a pellicle begins to be formed; allow the solution to cool, and select all the octahedral and tetrahedral cryllals that are deposited; wash them in cold water, and again diffloge in hot water, and cryllallize. For the particular formula of the different pharmacistias, see § 12.

11. The only remaining antimonial salts of any consequence, are the oxalat and acetite of antimony; and we are as yet acquainted with very few particulars even concerning these. The oxalat of antimony is readily formed, and concretes into small crystalline grains; these are soluble in wine, giving it an emotic quality; and this preparation has been
A N T I M O N Y.

been used by some medical men instead of the common antimonial wine. The acetate of antimony being known before the discovery of emetic tartar, was recommended for the same use to which the former is now applied, by Angelo Sala. Neither the oxalate, nor the acetate, however, of this metal appear to be possessed of any superiority over the emetic tartar, and are now, we believe, wholly disused.

Muriaut of soda is said to be in part, at least, decomposable by antimony at a red heat; but the experiments on this subject are contradictory, and require to be performed afresh with care and exactness.

Sulphat of potash (and probably all the alkaline sulphates), is decomposed without any difficulty. This was first shown by Monnet: he fused together in a crucible two parts of sulphated potash, and one of antimony; the metal disappeared, and he obtained a yellow, semi-vitrified mass, intensely caustic, of antimoniated sulphuret of potash; which, when washed with warm water, depolished, by cooling, a hydro sulphuret of antimony. The metal, therefore, in this case, became oxidized at the expense of the sulphuric acid; and the sulphuret of potash resulting from this combination with the metallic oxide, rendering it partly soluble in hot water.

Oxymuriat of potash has a very powerful action on antimony, as it has indeed upon all the easily combustible metals: if equal parts of this salt, and antimony previously reduced to a fine powder, are mixed together, and triturated briskly on an anvil, or any suitable hard body, a remarkably loud and vehement detonation takes place: if the mixture, instead of being triturated, is poured into sulphuric acid, or rather if the acid is poured upon the powder, a hissing noise is produced, red sparks are emitted, and the metal is converted into an oxyd.

Nitre and antimony, in equal parts, or two parts of the former to one of the latter, being thrown into a red-hot crucible, detonate with a vivid flame, the acid of the nitre is decomposed, and the metal is completely oxidized. The white mass remaining in the crucible being pulverized and digested in hot water, is separated into two parts, one soluble, and the other insoluble: the latter of these was formerly considered as a pure oxyd of antimony, but Thuemars has shown, that it contains about one-fifth of potash, intimately united with the oxyd, which appears to act the part of an acid: it was formerly known by the name of reguline diaphoretic antimony, but appears, in fact, to be a kind of antimoniate of potash, rendered insoluble by an excess of oxyd; the soluble part differs from the other merely in the proportion of its ingredients, being an antimoniated potash, crystallizable and decomposable, with precipitation of its oxyd, by any of the metallic acids. As, however, this is generally prepared from the sulphuret of antimony, we shall refer the reader for further particulars to the next section.

1. Sulphuret of antimony may be prepared artificially, by pulverizing a pound of reguline antimony, and mixing with it eighteen ounces of flowers of sulphur; this being put into a crucible, and brought to a low red heat, melts into an uniform mass, of the weight of about two pounds, which, when cold, exhibits a frizzed appearance, exactly similar to the native grey sulphuret (§ 3.), and is possessed of all the same physical and chemical properties; hence, for cheapness fake, all the preparations from the antimonial sulphuret are made with the native ore, just separated by fusion from the flory and earthy matters that it is mixed with, which is known in commerce by the name of crud antimony, or antimony of the flours.

2. If the sulphuret of antimony is exposed to a red heat, with access of air, most of the sulphur is volatilized, and a small but variable proportion of the metal is carried up at the same time: this operation being performed in a melting-pot, surmounted by a series of shells, the vapour as it rises, is condensed in the form of a light pulverulent substance, called flowers of antimony. The flowers, at the beginning of the process, are of a greyish yellow colour, and confit of sulphur, with antimony, either in the metallic state, or at least very little oxidated; the next portions are orange-coloured, and those which rise towards the end of the operation, are almost yellow, and confit of little else than pure sulphur. What remains behind at the bottom of the melting-pot is a greyish ash-coloured oxyd, still holding a little sulphur: among the old chemists it was known by the name of grey calc of antimony; by the moderns it is called the grey sulphurated oxyd of antimony. It is most commonly prepared by flow roasting of the crude antimony in a flat dish or reverberatory furnace, and the sulphur and metal that are volatilized with it are allowed to escape. See § 4.

3. The grey sulphurated oxyd, when urged by a sufficient degree of heat, forms a transparent glafs, possefling, according to circumstances, every shade of colour from light yellow to the deepsehest hyacinthine red; this is the glafs of antimony, or, according to the modern nomenclature, the vitreous sulphurated oxyd of antimony. In order to prepare this, any quantity of the grey oxyd is put into a crucible, and kept at a full red or low white heat till it enters into perfect fusion; soon after this has taken place, the end of a clean tobacco pipe should be dipped in it; and if the matter that adheres to the pipe is transparent, and may be drawn into a thread like common glass, it has been treated sufficiently: the crucible is then to be removed from the fire, and its contents are to be poured on a compact flat stone or plate of copper. When the glafs has become solid, it should be removed into a covered vessel, as it cracks and flies while cooling.

It sometimes happens in making the glafs of antimony, that the grey oxyd begins to melt as soon as it is red hot, and continues limpid like water, without acquiring the property of drawing into threads like glafs: at other times, on the contrary, the long continuance of a white heat will do no more than bring it to a pally confluence. In the former case, the glafs is of an uncommonly deep colour; in the latter of a very light colour. This inequality arises from a difference in the grey oxyd; if it has been too little roasted, it flows with the first impression of the heat, but when more completely oxidated and desulphurated, it proves very refractory: this last, however, may be remedied by throwing in a little crude antimony in powder, which will immediately determine its fusion and vitrification; and in this case there are always found at the bottom of the crucible a few grains of very pure regulus of antimony.

If the previous desulphuration has been very slight, the oxidation also will have proceeded but a little way; and the glafs produced, though possessed of a vitreous fracture, is imperfectly opaque, and of a dark liver colour, hence it has obtained the name of liver of antimony: the same name, however, has been given to a preparation of crud antimony and nitre, which will be mentioned presently.

4. The action of acids upon the sulphuret of antimony is upon the whole so similar to their action on the regulus, as described, § 7, that it will only be necessary to point out the circumstances in which they differ. In general, the metallic part of the sulphuret is more easily dissolved and retained.
tained by acids than the mere regulus is, and the fulphur of the compound is not at all or very little acted upon. The sulphuric and nitric acids are decomposed with considerable energy, on pulverized fulphur of antimony; sulphurous acid in one cafe, and nitrous gas in the other, being copiously difengaged, the metal is oxidized, and remains intimately mixed, though no longer combined with the fulphur, very little of it being actually diffus'd by these acids. The mutric acid, even when cold, will decompose a large quantity of fulphur, during which process there is a considerable extraction of sulphurated hydrogen; if the mixture is heated, the whole of the metal enters into solution, leaving the fulphur at the bottom unaltered; a small portion, however, both of the fulphur and metallic oxide is diffus'd in the hydrogen, and escapes in a gaseous form; for Bengman observed, by performing this experiment in a vessel with a long narrow neck, that the sulphurated hydrogen, in its passage through, deposited a little kermes, or hydrofulphurated oxides of antimony. The belt menirrurn, however, for crude antimony, is a nitro-muricate acid, composed of one part nitric, and three parts mutric acid; the metallic oxide is entirely taken up, part of the fulphur is carried off by the hydrogen gas, another part is acidified and mixes with the other acids, and the remainder, about 25 per cent., is left at the bottom of the vessel in form of a white powder. In § 7, we have given an account of the original method of preparing the butter of antimony by sublimation of the regulus with corrosive mercurial mift: the same antimonial falt may be obtained by using the sulphuret of antimony, but instead of obtaining the mercury in a metallic flate, it is combined with the fulphur of the antimony into a violet-coloured mass, which, at a full red heat sublimes, and is deposited in the upper and cooler part of the vessel, in needle-form crystals of cinnabar, hence called cinnabar of antimony.

5. The fixed alkalies are capable by the dry way of combining with sulphurated antimony, forming several important preparations. If 15 ounces of pulverized crude antimony, 12 ounces of decrepitated sea salt, and 3 ounces of tartar, were mixed together, and fused in an earthen crucible, there will be found, on breaking the vessel when cool, that it contains two sublimes; the upper is of a lighter colour than the other, and consists of the salt with a little fulphur; the inferior sublimate is very heavy, opaque, of a black colour, and on being broken, exhibits a shining vitreous fracture; it has obtained the name of medicinal regulus, though improperly, being a simple alkali sulphuret of antimony, in which the metal is probably uncombined with oxygen, and nearly saturated with fulphur. A similar preparation to this is the ruby of antimony, or magnesia opalina, differing, however, in containing less fulphur, and in the metal being perhaps more oxidized. It is prepared by mixing equal parts of muriated soda (sea salt), nitre, and crude antimony, and fusing the whole in a crucible; there is a large quantity of fioriz in this as in the former process, and underneath them is a compact vitreous mass transparent in thin slices, and, if well made, of a deep, somewhat smoky-red colour, and brilliant metallic lustre. Neither of these preparations is deliquescing, or soluble in water, on account of the small proportion of alkaline falt that they contain. By increasing, however, the dose of alkali, the mass becomes soluble; thus, if to one part of sulphurated antimony we add two parts of pure dry pearl ash, we obtain by fusing a compact reddish-brown mass of alkaline fulphuret of antimony, and a little of the metal in its pure reguline flake is found at the bottom of the crucible. If the whole of the antimony is required to be diffus'd in the sulphurated alkali, as is the case in the preparation of kermes, it is requisite to add to the above ingredients about one-twentieth of their weight of sulphur. Hence it appears, that the sulphur of the crude antimony is divided between the metal and the antimony, in the compound ratio of their weights and their respective affinities for sulphur, in consequence of which some of the antimony is entirely desulphurated, and remains in an uncombined state, while the remainder being only partially desulphurated, unites into one mass with the sulphurated alkali. If this alkaline sulphuret of antimony, coarsely powdered, is boiled in pure water, nearly the whole is held in solution as long as the liquor continues hot, so that it may be filtered hastily through a filter; but in proportion as the liquor cools, a copious precipitation takes place of a bulky, flocculent sublimation, whose colour is a deep brick-red approaching to that of the kermes mift, whence it has been called kermes mineral: after the deposition of kermes has ceased, the liquor being separated from it by a filter, is of a wine-yellow colour; and upon the addition of any acid, a still further precipitation is brought about, of an orange yellow powder, which is called the golden sulphur of antimony. Kermes may also be prepared in the humid way, as was first shewn by Lemery in the year 1707. Since that period a multitude of processes have been published by the French chemists for the preparation of this sublimate; none of them, however, appear to be essential improvements of Lemery's original method; and as this has received the high favour of the observant and accurate Beau'mé, we shall select it for the use of our readers. Put into a clean iron pan five or six parts of pure liquid fixed alkali, with fifteen or twenty parts of water; let it over the fire to heat, and as soon as it has begun to boil, stir in some well levigated sulphuret of antimony, equal in weight to one-sixteenth of the alkali; stir the mixture well, and when it has boiled for a minute or two, throw the whole on a filter, so that the clear liquor may pass through while hot; a large quantity of kermes will be deposited while it cools, which, after being separated from the alkaline solution, is to be washed first in cold, and then in hot water, till the water is washed off quite limp; the powder being then dried in the flase by a gentle heat, and levigated and passed through a fine sieve, is to be kept in a well-closed pint for use. The alkaline liquor, when it has ceased to deposit kermes, may be made to yield the golden sulphur, by saturating it with dilute sulphuric acid. In this process by the humid way, as in the other by the dry way, a partition of the sulphur takes place between the alkali and the metal, by which a portion of this last is left undissolved in the form of a grey powder; and this, by simple fusion in a crucible, is reduced to a mass of regulus. According to the French chemists, both the kermes and golden sulphur are hydrofulphurated oxides of sulphuret of antimony; and Thetars, in his experiments on the antimonial oxides, has given the following as the result of his analyses of these two sublimes, viz. Kermes mineral contains,

The
The theory concerning their formation is, that the alkaline antimonial sulphuret coming into contact with water, decomposes it; that the oxygen of the water combines with the sulphur of the metal, while its hydrogen dissolves some of the sulphur with which it is in contact, and unites to the sulphurated metallic oxyd in different proportions, according to the different degrees of oxidation of these oxyds; that when the antimony is the lead oxidated, it unites with the greatest quantity of sulphurated hydrogen, and becomes insoluble in alkali, forming the kermes; and, on the other hand, when more oxidized, it unites with its sulphurated hydrogen, and remains dissolved in the alkali till precipitated by an acid, forming the golden sulphuret. Kermes may also be made by pulsing sulphurated hydrogen through a solution of muriat of antimony; and this among others is added as a proof of the kermes containing the metal in an oxidated state. Notwithstanding, however, the excellent experiments of Berthollet and Benhars on this subject, many very strong objections may, in our opinion, be urged against their theory; to enter into them at full length would be inconsistent with the plan of this work, but we shall reserve the subject when treating of the Metallic Hydrosulpheurts.

6. The nature of the preparations resulting from the mutual action of nitre and sulphurated antimony, depends very much on the proportion which the nitre bears to the other ingredient. The nitric acid is consumed in acidifying the sulphur and oxidating the antimony; and the alkaline base of the nitre unites with the sulphur, if any remains, with the sulphuric acid forming sulphate of potash, and with the metallic oxyd. When the nitre considerably exceeds the antimonial sulphuret, as in the preparation of diaphoretic antimony, the sulphuret is entirely oxygenated, and partly escapes in the form of sulphuric acid gas, while the remainder, with part of the alkali, forms sulphate and fulphate of potash; the metal also is completely oxygenated at the expense of the nitre; and the oxyd, hence resulting, combines with the potash in two proportions; that portion which is united to a large quantity of alkali is rendered soluble, and the other remains insoluble. Hence when the result of the above process is dissolved with hot water, we find dissolved in the liquor, and may obtain, in a crystalline form, sulphate and fulphate of potash, some undecomposed nitre, and antimonite of potash; the undissolved residue, or diaphoretic antimony, consists of the perfect oxyd of antimony combined with about a fifth of potash.

When the nitre and crude antimony are in equal proportions, only part of the sulphuret is oxidized, and the metal is at a low state of oxidation; by the action of warm water the mass is divided into two soluble portions; the first, called crucus metalletum, seems, like the glases of antimony, to be merely a sulphurated oxyd; the latter consists of kermes, of golden sulphur, and sulphate of potash. For further particulars see § 12.

§ 10. Phosphuret of Antimony.

Pelletier, in his Essays on Phosphorus, has given the three following processes for combining antimony with that highly inflammable substance. 1. To one ounce of regular antimony add an equal weight of glases of phosphorus, and one dram of charcoal; pulverize the whole well together, and fuse the mixture in a covered crucible; the result is a white metallic mass of phosphorated antimony, very brittle, with a lamellar fracture, and nearly cubical fragments. When a little piece of it is put upon lighted charcoal, and exposed to the action of the blowpipe, it emits, at the moment of fusion, a faint green flame, and then volatilizes like pure antimony, in the form of white flowers.

2. Equal parts of regular and glases of phosphorus furnish by fusion a metallic mass, whose fracture displays minute facets, and in every other respect is similar to No. 1. § 3. A phosphuret of antimony, with the same properties as theformer, may also be prepared by projecting on the melted regular small pieces of phosphorus. In this case, however, the crucible must be removed from the fire immediately after the last portions are thrown in, otherwise by a continuance of the heat it would be volatilized.

The phosphures of antimony are not applied to any use, and the above are all the facts which we are possessed of concerning them.

§ 11. Alloys of Antimony.

1. Antimony with gold. See Gold.
2. Antimony with platinum. See Platinum.
3. Antimony with silver.

According to Lamy, one ounce of regular antimony and three drams of cupelled silver, being fused together in a strong heat, yields an alloy of the same weight as the original materials, and similar to common regulars of antimony, but more compact, and not so brittle. Gellert (Chymie Metallurg.) relates, that 181 grains of silver being fused with 257 grains of regular antimony, the alloy was found to have lost during the process 11.5 grains; the remainder was very brittle, and in colour similar to regulars of antimony; its specific gravity was 8.44. But the fp. gr. of the silver being = 0.1, and that of the antimony being = 6.7, the fp. gr. of the alloy, supposing the whole lost of weight to have been antimony, ought to be = 7.56. Therefore the fp. gr. of this alloy is greater than the mean of its constituent parts. It is made no use of.

4. Antimony with copper.

These two metals mixed together in nearly equal proportions, form a hard brittle alloy, of a violet colour internally, which is not very liable to be affected by exposure to the air. Gellert, having mixed together 314 grains of copper, fp. gr. = 8.7, with 142 grains of regular antimony, fp. gr. = 6.7, obtained an alloy whose fp. gr. was = 7.02. During the fusing there was a loss of 4.5 grains; and putting the whole of this to the account of the antimony, the fp. gr. of the alloy ought, by calculation, to have been = 7.49. The fp. gr. therefore of this alloy is greater than the mean of its constituent parts. It is made no use of.

5. Antimony with iron.

The general properties of antimony with a very small proportion of iron, or martial regular, may be found above in § 4. Gellert having mixed by fusion 115½ grains of iron, fp. gr. = 8.0 with 173 grains of regular antimony, obtained an alloy of 63 grains less by weight than the materials. It was brittle, of an ash colour, and contained specks like rust of iron. Its fp. gr. was = 6.92. Now supposing the loss of weight to be placed to the account of the iron, the density of the alloy ought to be = 7.05; its fp. gr. therefore is less than the mean of its ingredients. This alloy was wholly unaffected by a powerful magnet, except one or two particles which appeared to be iron. It is not made any use of.

6. Antimony with mercury. See Mercury.

7. Antimony with tin.

These two metals being mixed together in nearly equal proportions, form a moderately hard, very brilliant, and brittle alloy, capable of receiving an exquisite polish, and not easily tarnished; it has therefore been occasionally manufactured into spectacles for telescopes. Gellert mixed together by fusion 231.5 grains of tin, fp. gr. = 7.36, with 231.5 grains of antimony; 77 grains were lost in the process, and the alloy was = 6.94 fp. gr. Supposing the whole loss to be...
be attributed to the tin, the density of the compound ought to be \(= 7.0\); its sp. gr. is therefore less than the mean of its ingredients.

8. Antimony with lead.

This is the most important of all the alloys of antimony, it being the material of which the common types for printing are made. In proportion as the lead exceeds the other ingredient, will be the ductility of the mass; and the lead may be hardened, and its fusibility unimpaired by so small a proportion of antimony as not to injure its ductility.

Gmelin found that equal parts of the two metals produced a porous brittle alloy; one part antimony, and two parts lead; afforded a more compact metal, but still brittle; one part antimony and three lead, gave a homogeneous metal ductile under the hammer, and much harder than lead: one part of antimony gave to eight of lead an increase of fusibility, hardness and colour, without materially injuring its malleability.

According to Gellert, 386 parts of lead, sp. gr. 11.7, being fused with 333 grains of antimony, experienced a loss of 101 grains. The alloy was brittle, and presented a granular somewhat shining fracture; its sp. gr. was \(= 9.17\); and even if the whole loss of weight is attributed to the antimony, the density by calculation ought to be \(= 9.12\).

The mass is therefore of a greater sp. gr. than the mean of its ingredients.

Equal parts of the two metals being fused together, formed a homogeneous brittle mass of a light ash colour; the loss of weight was about one-sixth of the whole; as however both these metals are very volatile, it is impossible to say with any certainty what proportion of the loss is to be attributed to each; the sp. gr. of the mass was rather less than that of the antimony, which is the lighter of the two.

It is not used.

10. Antimony with bismuth.

According to Gellert, equal parts of the two metals being fused together, lost \(\frac{1}{3}\) of their weight, and produced an alloy of a lighter colour than bismuth, and very brittle, displaying in its fracture a cubical structure like that metal; its sp. gr. of the mass was \(= 8.96\); whereas, supposing the \(\frac{3}{4}\) of loss to have been sustained by the bismuth, the density of the two, its density by calculation ought to have been only \(= 7.94\). Not used.

Concerning the combination of the other metals with antimony nothing is as yet known, except merely that cobalt unites easily with antimony, and manganese with great difficulty, and very imperfectly.

§ 12. The medicinal Virtues, and pharmaceutical Preparations of Antimony.

This metal affords several of the most valuable articles of the pharmacopoeia; and as it has for so many years engaged the attention of chemists and alchemists (of whom a large number have ever been zealous to add to the resources of the healing art), we possess an almost infinite variety of antimonial preparations, all of them valuable as medicines, all enjoying many virtues in common, but a few out of the number recommending themselves peculiarly to the medical practitioner from the uniformity of their composition, or from a greater tendency to one mode of operation rather than another, whereby particular indications in the cure of diseases may be fulfilled.

The first and most unquestionable operation of antimony on the human body is that of an emetic. This operation appears to be always in direct proportion to the activity of the antimonial in every other respect; and it exists in the highest degree in those preparations that are almost too virulent to be given internally with safety in common doses. Antimonials excite to vomit very speedily, and their action is continued on the stomach for a considerable time; hence they are of a peculiar service, either where any acid or poisonous matter has been taken which requires to be speedily and effectually removed; or in such cases as incipient fever, where, along with the clearing of the first passages, the physician wishes to prolong the mechanical action of vomiting, so as to induce a relaxation on the skin, and complete perspiration.

The operation of antimony is also extended to the intestinal canal, and hence it proves considerably purgative; and this effect takes place, either when the dose has been greater than necessary, merely to produce vomiting; or when the stomach has escaped the action of this powerful mineral. In order to secure the purgative, and prevent the emetic operation of antimony, it is advisable to unite it with some of the usual aperient medicines, whose operation it will thus assist in a considerable degree.

Antimony appears to promote almost all the evacuations, and to quicken and stimulate the action of the absorbent vessels. It is therefore eminently diaphoretic (or promoting perspiration); expectorant, and often diuretic. It frequently happens that a single one of the antimonial preparations may be made to produce each of these effects by varying the dose, increasing it to render it a vigorous emetic or cathartic; and diminishing it when the gentle and more gradual operation of a diaphoretic or expectorant is to be secured.

A long continued course of antimonials, in the mildest form, wherein the direct operation of this metal is scarcely at any one time to be detected, has been found of effient service, both in various obliterative cutaneous complaints, and to produce that change of constitution and supposed resolution of internal obstruction, which entitle a medicine to the (somewhat ambiguous) character of alterative and desinfectant.

We shall now proceed to take notice of those preparations of antimony which are actually in use, or which have acquired a certain reputation in medicine.

Antimonatum preparatum (Pharm. Lond. & Edin.). This is nothing but the crude antimony or native black sulphuret prepared for medicinal use simply by trituration to an impalpable powder, elixiduation with water, and subsequent drying.

In this native mineral the proportion of the sulphur to the metallic part is so large, as to render it almost entirely inert, at least with regard to any sensible operation. It is sometimes, however, though rarely, employed in cutaneous complaints; and formerly it was used in the preparation of decoctions of safflower, guaiacum, and the other sudorific woods; a quantity of the mineral being tied up in a loose cloth, and suspended in the vesel in which the decoction was preparing; but as scarcely the minutest portion of the antimony could be dissolved by this process, it has properly been omitted.

The crude antimony still, however, is retained in veterinary practice; and it may be given to many animals in doses of several ounces without any apparent operation.

It is likewise the material from which all the other antimonial medicines are prepared, directly or indirectly.

Antimonium vitreale (Pharm. Lond.), vitrum antimonii (Pharm. Edin.), Glass of antimony.

To prepare this, the crude antimony is roasted on a tile or other shallow vessel, with a very slow fire, and frequent stirring, till all the sulphur is expelled which can be separated in this method. What remains is a grey powder, which is to be melted in a crucible and an intense fire into a yellowish vitreous mass, to be poured out on a warm copper or iron plate, and when cold reduced to a very fine powder,
powder. This preparation is an oxyd of antimony not at its highest point of oxidation, and still retaining a small portion of sulphur, which it is impossible to separate by mere heat. When well prepared, it is pretty uniform in its nature, and is a very valuable medicine, operating even in small doses as a strong emetic and cathartic. It is scarcely ever employed internally, but is the basis of the emetic tartar, and the antimonial wine, in the London Pharmacopoeia.

Triturum antimonii ceratuum (Pharm. Edin.)

Take one ounce of glasses of antimony in fine powder, add it to one dram of yellow wax melted in an iron vessel, heat them gently together for a quarter of an hour, with constant stirring; pour out the mass when cold, and reduce it to powder.

The glaft of antimony here incorporates with the wax, and changes its colour from lemon yellow to brown in the process. The wax appears to lessen in a very great degree the activity of the antimony, so that this medicine may be given with safety, and has been much recommended in dysenterics and other bowel complaints. It is rejected from the London pharmacopoeia; but retained in those of Edinburgh, Amsterdam, and some others.

A great variety of preparations have been made from the crude antimony by the intermedium of nitre. The operation of this salt on the metallic sulphuret when dephlagrated together, is first to confine the sulphur, and afterwards, if the quantity be sufficient, to oxidize the metal to the highest point. It is remarkable, that the perfect oxyd of antimony, entirely dewelled of sulphur, and fully fusurated with oxygen, appears almost as inert as the crude sulphuret of antimony itself, whilst in the intermediate states of defulphuration, and oxidation, many very active medicines are found.

Of these the two following alone are now retained, the first with a smaller proportion of nitre, the latter fully saturated.

Crocus antimonii (Pharm. Lond. & Edin.). Crocus of antimony, also called crocus metallorum, fafran des metaux, and hear or liver of antimony, by foreign writers.

To prepare this, take one pound of crude antimony, one pound of nitre, and one ounce of common salt, mix them accurately, and project them, a spoonful at a time, in a large crucible heated red hot; when the whole is dephlagrated, increase the fire so as to melt the mass, and pur it out. When cold, it will be found to consist of two parts, the upper a whitish faline facetia, to be separated from the lower, which is the crocus of antimony. This is to be rubbed to a fine powder, and repeatedly washed with warm water, till it comes off from the powder quite infusid.

The crocus of antimony is a very violent emetic and purgative, and is seldom employed internally except in farriery. When washed it appears to have the greatest resemblance to the glasses of antimony above deferrited, and it is referred for similar purposes, that is, as a basis for the tartar emetic and some other of the antimonial preparations.

When prepared in the large way, it would appear that it is not necessary to heat the vessel in which the mixture is fired, the heat excited by the dephlagration being sufficient to fuse the whole to the requisite degree. The whitish facetia here produced consists of sulphate of potash (formed by the potash of the nitre and the sulphuric acid, generated by the dephlagration of the sulphur), of the sea-salt, and probably of a portion of uncombined alkali, with some particles of the metallic sulphuret that may have escaped the action of the nitre.

{Antimonium calcinatum (Pharm. Lond.), antimonium

Sulfum cum nitro (Pharm. Edin.), eale antimonii, or diaphoretic antimony.

This is prepared, according to the London college, by projecting gradually in a hot crucible a mixture of one part of crude antimony with three parts of nitre, raising the heat after dephlagration, and continuing it for half an hour, and when cold, pulverizing and edulcorating it.

The Edinburgh college directs one part of the grey powder left after roasting crude antimony for the glasses of antimony, to be dephlagrated with only an equal weight of nitre, to be heated for an hour, and afterwards reduced to powder and washed till infusid.

These two preparations are, however, essentially the same, and consist of the oxyd of antimony left after the sulphur has been entirely dissipated by the nitre, itself having been oxidized to a high degree by the same dephlagration.

As the intention of using so much nitre in the first method is to confine the whole of the sulphur as well as to oxidize the metal, it is obvious that a much larger quantity of this neutral salt will be sufficient where so much of the sulphur has been driven off by roasting, as is the case in the second method. Formerly a distinction was made between the pulverized oxyd taken before, or after washing; in the first instance being termed antimonium diaphoreticum nitratum; and in the second, antimonium diaphoreticum lactum: the former, as it contained an alkaline salt, was deliquescent to a certain degree, and required to be preferred in a close vessel. It is now, however, diluted, the powdered alone being retained.

The diaphoretic antimony, owing probably to its high state of oxidation, is mild in its effects, and may be taken in large doses, without producing sickness or purging. It is naturally white and in a pulverulent state, the antimonial oxyd not being truly vitrified in the process, as it is in the preparation of the crocus of antimony, but only involved in the alkali of the nitre, from which it is separated by washing.

The several washings of this substance contain a mixture of sulphate of potash, with part of the nitre undecomposed, and the naked alkali, all holding in solution a certain quantity of antimonial oxyd.

If this compound liquor is decomposed by an acid, the metallic oxyd precipitates in the form of a white powder, which has been called the ceruse of antimony, or materia perlata; but if the liquor is merely evaporated to dryness, part of the salts crystallize together with metallic oxyd, and form the nitrum filiate, or antimoniated nitre of Stahl. Theselatter preparations are now in disuse.

Some other antimonial medicines have been prepared with different proportions of antimony and nitre, forming oxyds, all of which act in a similar manner upon the human body, but with different degrees of energy. It should be noted that the middle point with regard to the proportions of antimony and nitre, that is, equal parts of each, furnishes the most active antimonial oxyd, which is the crocus; and the medicinal power seems to diminish in proportion as either of these ingredients is used in excess. Thus the completely oxydized metal, the diaphoretic antimony, is posseted of but little activity; and on the other hand, the crocus antimonii medicinalis, formed by dephlagrating eight parts of antimony with one of nitre, and consequently but partially dephlagrated, is equally mild in its operation.

The crocus antimonii nitidus, the proportions of which are two parts of antimony to one of nitre, is another medicine now in disuse, which appears to be more active than the last mentioned, but milder than the common crocus.

The
The *emeticum mite antimonii* of Boerhaave is made by employing one part of antimony to two of nitre, and is a mild and safe medicine.

Another antimonial oxdy, formerly employed in medicine, is prepared by dephlegmatizing the *regulus* of antimony with twice or thrice its weight of nitre, and this has also been termed by some the *creaffa antimonii*.

The nitre here, having no sulphur to engage it, acts entirely on the metal, and reduces it to the state of a perfect oxdy, which, when washed, resembles in every respect the washed diaphoretic antimony made with the black sulphuret and three times its weight of nitre. The *regulus*, however, does not require more than its own weight of nitre for this preparation; all the rest is superfluous.

**Regulus antimonii medicinalis**, vel *ferifigum Crani*, an antimonial remedy much recommended by many of the German physicians, and introduced in the former pharmacopoeias of Edinburgh, Brandenburg, Strasburg, and others of celebrity, but now discontinued.

This, which is improperly termed a *regulus*, is prepared by fusing together five parts of crude antimony with four of common salt and one of salt of tartar. On cooling, two subflavines are found in the crucible, an upper fcoria, containing the sea-falt, the alkalies, and part of the sulphur, and the lower, a reddish mafs composed of the greater part of the metal, deprived of a portion of its sulphur by means of the alkalies, and thus rendered more active as a medicine than the crude antimony. It is this lower reddish mafs which is the *medicinal regulus*. The ufe of the common falt fcarms to be merely to affift the fusion.

**Regulus antimonii**. The methods of preparing the true regulus of antimony have been already mentioned. This metal ufed formerly to be caft in the form of a cup, and, owing to its flight degree of fusability in various metals, a powerful emetic liquor was prepared fimpfly by filling the cup with wine, and fuffering it to fland for fome hours. At the fame time the cup had lost fo little of its weight that it would continue to give the fame properties to fresh portions of wine for years, or almost centuries, without being corroded through.

In like manner the regulus caft into the form of pills would produce the emetic or purgative operation to any number of persons in fuccedence, and hence they were called *perpetual pills*.

These preparations are now, however, difcontinued.

**Vinum antimonii**. (*Pharm. Lond.*). Instead of the regulus, the glafs of antimony is now employed as the basis of this medicated wine. One ounce of this, in fine powder, is to be digefled for twelve days with frequent agitation, in a pint and a half of white Libfon wine.

This is a very valuable antimonial, principally employed in dofs of from ten to fifty drops as a diaphoretic. The quantity of the metal taken up by the wine is extremely small, but is liable to vary in proportion to the acidity of this mefltrum, which is one inconvenience attending its ufe.

**Vinum antimonii tartarifati**. (*Pharm. Lond. and Edin.*) In the former diffenatory it is directed to be made by dif- solving forty grains of cement tar in two ounces of boiling water, and afterwards adding eight ounces of white Libfon wine.

In the latter, twenty-four grains of cement tar are fimply difolved in a pint of the wine.

The nature and preparation of the celebrated *kermes mineralis*, or *palvis carthusianus*, have been already explained; this is at preffent laid afide, and in its place the London and Edinburgh pharmacopoeias have adopted the precipitate, formed from a liquid folution of sulphuret of antimony in caufic alkali, by the addition of an acid, instead of by mere cooling, as is the caufe with the kermes: this is the

**Sulphur antimonii precipitatum vel auratum**, the golden sulphur of antimony.

To prepare it, boil for three hours two pounds of crude antimony with four pounds of the aqua kali puri (or caufic bye), diiled with three pounds of diffilled water; strain it while hot through a linen cloth, and immediately add gradually dilute virtuof acid, sufficient to precipitate the sulphurated antimony, which is of a fine golden colour. Wash it well with warm water, and dry in a gentle heat.

The golden sulphur is of a lighter colour than the kermes, the latter being generally of a brown or brick red. Both of them confift principally of sulphur, but holding in solution a certain quantity of the metal which renders them emetic or purgative when taken in dofs of feveral grains. The golden sulphur is never ufed with a view of acting violently or by any fensible operation, but it is employed (often combined with mercury) as a gentle alternative, with a view of keeping up a constant perforable state of the skin, and determining a gentle increase to the feveral emunctories. Hence its ufe in various obflinate cutaneous complaints, and other chemical disorders.

The only folutions of antimony in acids employed in medicine are the *muriated antimony*, more commonly known by the name of *butter of antimony*, and the *antimoniated tartar* of *potash*, or the tartar emetic. The chemical nature of each of these interfecling preparations has been already described.

The muriated antimony is much too acid and violent to be employed for internal purpofes. It is ufed externally as a caufic, efpically in farricine. The *powder of algarob*, or the antimonial oxdy, precipitated from this falt by water alone, or by an alkaline folution, is ufed by feveral chemifls as the basis of the emetic tarar.

**Antimonium tartarifatum vel tartrarum emeticus**. (*Pharm. Lond. and Edin.*) To prepare this moft valuable medicine according to the London Pharmacopoeia: take one pound and a half of crocus of antimony in fine powder, two pounds of cream of tartar, and two gallons of water, boil them together in a glafs veffel for a quarter of an hour, strain the liquor through paper, and fet it by to cool: the cryftals that form are the emetic tarar.

The Edinburgh college directs: fiift, to add some of the muriated antimony to hot water, holding falt of tartar in folution, to collect the white precipitate thus formed, and edulcorate it thoroughly: next to add nine drams of this precipitate, and two ounces and a half of cream of tartar, in fine powder, to five pints of water, and to boil the whole till the tartar is difolved; afterwards to evaporate the liquor in a glafs veffel, till a pellicle appears on its surface, and to fet it by to cryftallize.

The emetic tarar is by much the moft valuable of all the antimonial preparations; its composition renders it sufficiently fusible in fimple mefftrum, and as it is almost entirely infipid, and as the requisite dose is in all cafses comparatively fmall, it may be given with great cafc to children, or wherever there would be a difficulty of getting down bulky medicines. In dofs of from one to about three grains it proves emetic, and often purges even after the ftomach has been emptied: in smaller quantities, or mixed with various other medicines, and efpically with thofe that correct its emetic property, it fulfills the other intentions with which antimonials are given; and with proper precautions it is always safe, manageable, and highly to be depended on.

vol. ii.
When prepared in the same way, it is generally very uniform in its nature, but it is liable to some variation, when different antimonial oxides are used; an inconvenience it would be of great importance to prevent.

The last of the antimonial medicines that we shall mention, is the pulvis antimonialis (Pharm. Land.), or the antimonialis calcaris phosphaturae. (Pharm. Edin.)

To prepare it. Take equal parts of crude antimony and bartholomew's leavings, mix them together, and throw them into a wide iron pan, heated fairly red, and stir them constantly till they acquire an ash-colour; then take them out, reduce them to powder, fill a coated crucible with it, and let it cool on the top another crucible, inverted, and with a small hole at the bottom, to serve as a cover; then raise the fire gradually to a full white heat, and keep it in this state for two hours; when cold, take out the contents, reduce them to a moist sublimate powder, and it is the pulvis antimonialis.

This preparation is intended as a substitute for the James's Powder, one of the most celebrated empiric medicines in this or any other country, the value of which has long been established by the most unequivocal testimony. We shall refer the reader to this article for an account of the ingenious analyses made by Dr. Pearsall of this powder, and published in the Philosophical Transactions, whereby it is proved to be a mixture of an oxal of antimony with the earth of bones, and calcareous phospurate; and hence the pulvis antimonialis has been employed as a substitute.

This preparation is given in doses of one to five or six grains, or even more, and is employed peculiarly in removing general fever, by means of perpiration. It is never intentionally given in such large doses as to prove emetic; but it is generally supposed, that the genuine James's Powder may be taken in larger doses than the antimonial powder, without exciting sickness.

We may add, that Mr. Chenevix, (in the Philosophical Transactions for 1801) has given the following ingenious method of preparing this medicine in the moist way, which removes every cause of variation which may take place whenever the oxal of a metal so volatile as antimony is in certain flutes, is subjected to intense and long-continued heat. The following is the simple process: "Dissolve together, or separately, in the least possible portion of muriatic acid, equal parts of the white oxal of antimony, formerly called algaroth powder (made by dropping the butter of antimony into water), and of phosphore of lime; pour this solution gradually into distilled water, previously alkalized by a sufficient quantity of caustic ammonia: a white and abundant precipitate will take place, which, when washed and dried, is the proposed substitute for James's Powder."

In this process, the antimony and the phosphore of lime are precipitated from their solution in muriatic acid at the same instant, the former by means both of the ammonia and the water in which it is dissolved, and the latter merely by this alkali. Hence, the inventor gives the useful caution to pour the mixed muriatic solutions into the alkaline liquor, and not to add the latter to the former; in order that the precipitation of the antimony and the phosphore of lime may be concomitant, and therefore in uniform proportion from first to last. The muriatic acid simply dissolves phosphore of lime, and does not decompose it, and therefore it is separated unchanged from its solution by the ammonia. If it be wished to prepare this powder with a stronger dose of antimony, it is only requisite to increase the proportion of muriated antimony to the muriated calcareous phosphore, before the precipitation is made.

We shall only add to this short review of the various antimonial preparations used in pharmacy, that several other preparations, slightly varying from those which we have mentioned, have been at times recommended by several eminent men, and have had a certain vogue; but it does not appear that any thing further can be expected from any other change in the preparation of antimonial medicines; and those which we already possess, form some of the most valuable articles of the Materia Medica.

§ 15: Uses of Antimony.

The uses of antimony are not very numerous; it is of high value in medicine, and is employed, in combination with other metals, in the manufacture of printers' types, and specula for telescopes. Its oxides are used in colouring glafs; the sulphuret is employed in feurifying copper and other metals which are found mixed with gold; hence it was called by the alchemists balthum regis, or balthum folis.

The native antimony, at first, was of service only in the composition of paint. Scripture describes it to us as a sort of paint, with which the women blacken their eye-brows. Jezabel underlining that Jehe was to enter Sarepta, painted her eyes with antimony, or, according to the Hebrew, "put her eyes in antimony."

At this day the women of Syria, Arabia, and Babylonia, anoint and blacken themselves with the eyes; and both men and women put black upon their eyes in the desert, to preserve them from the heat of the sun, and the piercing of its rays. M. Daruix tells us, that the Arabian women border their eyes with a black colour made of tylis, which the Arabsians call redel. They draw a line of this kind of blacking without the corner of their eyes, to make them appear larger. Inf. in his enumeration of the several ornamentations belonging to the daughters of Sion, has not forgot the needles which they made use of in painting their eyes and eye-lids, nor has this practice escaped the lapse of Juno.

"Ile fupercrium madida fulgine tintum
Obliqua producit acn, pinguque trementes
Attollens oculos."

Ezechiel, describing the irregularities of the Jewish nation, under the idea of a debauched woman, lays, that she bathed and perfumed herself, and that she anointed her eyes with antimony. Job shews sufficiently how much antimony was in esteem, by calling one of his daughters a vessel of antimony, or a box to put paint in, corum fibil. Tertullian and St. Cyprian have declaimed very warmly against this custom of painting the eyes and eye-brows.

ANTINE, in Biography, a Benedictine monk, was born at Gonoreux, in the diocese of Liege, in 1618, and published several useful works of an historical kind. In 1730, he published the five first volumes of a new edition of "Du Cange's Glossary," with valuable corrections and editions. He also bestowed much pains upon "Bouquet's collection of French Historians," and on "The Art of verifying Dates," published in 4to. in 1750, and reprinted, with enlargements, in 1770. Nov. Dict. Hist.

ANTINOE, or ANTINOopolis, now called Ennea, by the Arabs, in Ancient Geography, a city of Upper Egypt, on the east side of the Nile, was built near the ruins of Abydos, where the Egyptians worshipped the god Befa, and revered his oracles; and became the capital of a nome or province. The oracle of Befa was famous in the time of Aemilianus Marcellinus, who says that all the neighbouring people went to consult him, and assembled at a certain period to celebrate festivals in his honour. Hence the Arabs call Antinoe the city of the Magi. This city was built in consecuence of a flamboyant passion, which ill disguised the appearance of gratitude affected by Adrian, its founder.
This prince, renowned for his political and military talents, was, at the same time, contemptible on account of his passion for Antinous. The perfection of whose form is proved by one of the finest statues bequeathed to us by antiquity. Adrian, equally superstitious and depraved in his manners, while he was in Egypt with his court and army, consulted the oracle of Befa, which declared, that he was threatened with great danger, unless a perfon that was dear to him, and by whom he was beloved, was immolated for his preservation. Antinous offered himself for the victim, and the emperor had the cruelty to accept the sacrifice.

The beautiful and generous Antinous precipitated himself from the summit of a rock into the Nile, and Adrian thought to efface his ingratitude and infamy by building, in honour of his favourite, whom he likewise regarded as his deliverer, a city which, under the name of Antinoe or Antinopolis, has perpetuated at once his barbarous cruelty, and his criminal passion. This city he embellished with all the most valuable productions of art. The statues of Antinous were here considered as sacred images; and the emperor not only erected temples in honour of him, but instituted games and sacrifices, and regulated the worship that was to be paid to his memory. Savary tells, that this city was half a league in circumference, and that two principal streets, 45 feet wide, intersecting each other at right angles, traversed its whole extent. The others were narrower, but equally straight. The two largelst terminated by four gates, some of which still subsist; the handomest has three vaulted entries; that of the middle is 40 feet high by 22 in width, and 20 thick; the other two are smaller. Each of the façades of this edifice is ornamented with four pilasters in bas relief, the Corinthian capitals of which, with the leaf of the Acanthus, have a considerable projection. This beautiful gate was surrounded by eight Corinthian columns, of the same height with itself. One only has escaped the ravages of time, and of men; the rest are either mutilated or destroyed; but the pedestals remain entire. Besides this edifice, one discovers in different quarters of the town, heaps of rubbish, which announce temples or palaces destroyed. If we may judge from the distances of the pedestals along the streets, they were bordered by a colonnade, which formed a portico on each side, and allowed the inhabitants to walk sheltered from the sun. Besides these embellishments, one of the squares was ornamented with four large pillars of the Corinthian order, three of which have perished, their bases only remain. The fourth is preferred, and is about 50 feet high. The shaft is composed of several stones. On the first is carved an ornament of oak leaves. On the pedistal is a Greek inscription, half effaced, which dedicates it to the emperor Alexander Severus.

The velleites of the city, says Sonnini, excite regret for its destruction. The extent of ground, strewed with the most beautiful remains of antiquity, threw him into admiration and astonishment. In the time of Vansleb and of Paul Lucas, there were exiling piles of architecture altogether entire, which he could not find. What appeared to him most remarkable was a triumphal arch, or magnificent gate, decorated with fluted pillars; its front was 50 yards in length; and he has given a drawing of it. On the other side of the mountain which terminates, towards the east, the site of the ancient Antinopolis, are to be distinguished many apertures in the rock, which led to grottoes, that were burial-places or catacombs. The mosque of the village which is near the city, the appearance and population of which form so striking a contrast with the superb edifices and elegance of the ancient city built by Adrian, contains a tomb, and the relics of a saint, from whom this place has obtained the name of Scheik Abadi; and this saint, though regarded by the Mahometans as a zealous defender of the Koran, was, at the same time, claimed by the Christians as one of their bishops, who enjoyed the painful honour of martyrdom at Antiné. Towards the end of the fourth century, this city is said to have been peopled by Christians. Palladius assures us, that it had 12 convents of virgins, and several others inhabited by monks. It is now occupied by the worst people and most determined banditti and robbers in Egypt. Savary's Letters, vol. i. p. 552. Sonnini's Travels in Upper and Lower Egypt, p. 517.

**ANTINOEIA, in Antiquity, annual sacrifices, and quinquennial games, in memory of Antinous the Bithynian.**

They were instituted at the command of Adrian the Roman emperor, at Mantinea in Arcadia, where Antinous was honoured with a temple and divine worship. They were also celebrated at Argos.

**ANTINOMIANS, in Church History, denote those who maintain the law of no use or obligation under the gospel dispensation, or who hold doctrines that clearly subvert the necessity of good works and a virtuous life.**

The Antinomians took their origin from John Agricola, about the year 1528, who taught that the law is no wife necessary under the gospel; that good works do not promote our salvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the gospel.

This sect sprang up in England, during the protectorate of Oliver Cromwell; and extended their system of libertinism much farther than Agricola, the disciple of Luther. Some of their teachers expressly maintained, that the elect cannot fall from grace, nor forfeit the divine favour; the wicked actions they commit are not really sinful, nor are to be considered as infinities of their violation of the divine law; and that consequently they have no occasion either to confess their sins, or to break them off by repentance. According to them, it is one of the essential and distinctive characters of the elect, that they cannot do any thing which is either displeasing to God, or prohibited by the law.

Luther, Rutherford, Schlabbechburgh, Sedgwick, Gataker, Witsius, Bull, Williams, &c. have written refutations; Crip, Richardson, Saltmarsh, &c. defences of the Antinomians; Wigandus, a comparison between ancient and modern Antinomians.

The doctrine of Agricola was in itself obscur, and perhaps represented worse than it really was, by Luther, who wrote with acrimony against him, and first styled him and his followers Antinomians. Agricola stood on his own defence, and complained, that opinions were imputed to him, which he did not hold. Nicolas Anfodir fell under the same odious name and imputation, and seems to have been treated more unfairly than even Agricola himself. It is rather hard to charge upon a man all the opinions that may be inferred from things that have halfly dropped from him, when he himself disfaves such inferences.

**ANTINOMY, ANTINOMIA, derived from anti, contra, and νομος, νομι, a contradiction between two laws, or between two articles of the same law.**

Antinomy, sometimes also signifies an opposition to all law. Whene a sect of enthusiasts, who are for carrying gospel liberty above all moral regards, and who neglect the motives of virtue as insufficient to salvation, are called Antinomians; and sometimes Anomians.

**ANTINOUS, in Astronomy, a part of the constellation Aquila, or the eagle.**

**ANTINOUS, in Mythological History, a Bithynian youth,**
youth, the favourite of Adrian, and the object of his unnatural and detestable passion. Some have said, that he fell accidentally into the Nile, as he was sitting on that river with the emperor, and was drowned. Dio Cassius affirms us, that he was assassinated in the manner already related under Antioch. The emperor, whatever was the occasion of his death, bewailed him, says Spartian, with all the tenderness and weakness of a woman lamenting the death of her husband. To lothe in some measure his grief, he defied the Greeks to rank him among the gods, which they accordingly professed; so that in a short time all the Eastern provinces were filled with statues, temples, and chapels, consecrated to this new divinity. It was even pretended, that he uttered oracles; but his answers were commonly thought to have been composed by Adrian. The Astrologers, having discovered, or pretended to discover a new star, gave out that it was Antinous. Adrian caused the body of his beloved satyr to be buried with the utmost magnificence, built a city on the spot, and converted his tomb into a temple, where he was laid to work miracles; which we find exposed and ridiculed by the Pagans themselves.

Antinous, in Sculpture, a very famous Roman antique statue; originally in the collection of cardinal Alexander Albani: it is at present in the gallery of antiques, in the museum at Paris.

This statue is in marble; it is a standing figure of a young man, entirely naked; the head looks downwards, with a melancholy air; this is in every respect a highly finished and beautiful performance.

There are nearly as many statues of Antinous as of the Venus de Medici; and they are very similar to each other: the hair is always disposed in the same manner, covering the forehead nearly as low as the eyebrows; and they all resemble one another in conveying a melancholy idea to the mind.

Mr. Richardson supposes that the vast number of these statues may be attributed to the nobility of Rome, who probably might make court to the emperor Adrian, by having statues of his favourite Antinous.

Among the different statues referred to, was one of late in the yard of the palace of the grand duke at Florence. There were two in the Villa Matelli; another in the garden of the Belvidere, found in Adrian's baths by Leo. X. Another fine statue of Parian marble, formerly broken to pieces, but well put together, stood in the Villa of Caffafo, on Monte Caelio. The pieces of this statue had been made use of by the Goths to build a wall with, at the demolishing of which, they were found and put together. All the statues of this Villa had been treated in the same manner.

There is also a number of very fine busts of Antinous; among which, was one twice the size of life in the palace of the Caffeo, at Rome; another in the palace Giuliniani; besides many others.

Antioch, or Anzio, Capr., in Geography, a promontory of Italy, in the ecclesiastical state, between port Olbia and the gulf of Gaeta. It has a fortified tower, and a convenient port. It takes its name from the ancient Antium in its vicinity.

Antioch, in Ancient Geography, a city of Syria, was built in memory of his father Antiochus, by Seleucus Nicator, on the river Orontes, about 20 miles from the place where that river empties itself into the Mediterranean; being equally distant from Constanopolis and Alexandria in Egypt, or about 700 miles from each. It soon became, and continued to be for many ages, the metropolis of the east, for the Syrian kings, and afterwards the Roman governors, who presided over the affairs of the eastern provinces, chose it for their place of residence; and in the Christian times, it was the see of the chief patriarch of Asia. It ought also to be particularly mentioned, that the disciples of Christ were first called Christians at Antioch, and this Chrysolotn signifies as the distinguishing appellation of this city above all others; and he has celebrated this honour in a distinct homily on Acts XI. Here also the gospel was preached to Greeks who were incorporated into the Christian church. Here also Barnabas and Saul were sent out by the church, under the direction of the Holy Ghost, to travel through Pagus cities, to give light to the Gentiles, and to publish Jesus for salvation to the ends of the earth. We cannot forbear observing, that the Gospel acquires credibility from its being first taught in the most populous, enlightened, and free cities, never flinching or compromising the public eye, but challenging full examination; and that in those cities it obtained numerous converts by conviction, without the aid of force or fraud. Antioch was particularly honoured by the Jews, on account of the Its civilization, which Seleucus Nicator had given to that city, together with the Greeks and Macedonians; and which, according to Josephus (Ant. lib. xii. c. 13.), they retained in his time. This metropolis of Syria was afterwards known by the name of Tetrapolis, being divided, as it were, into four cities, each of them having its proper wall, besides a common one, which enclosed them all. The first of these cities or quarters was built by Seleucus Nicator; the second by those who repaired thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callinicus; and the fourth by Antiochus Epiphanes. At the distance of about four or five miles was a place called Daphne, and reckoned a suburb of Antioch. Here Seleucus planted a grove, and in the midst of it erected a temple, which he consecrated to Apollo and Diana. To this place the inhabitants of Antioch repaired for their pleasures and diversions; and thus it became at last so infamous, that "to live after the manner of Daphne," was used proverbially to express the most voluptuous and dissolute mode of living. Daphne was formerly of such note, that the metropolis was distinguished by it, and denominated Antioch near Daphne.

Antioch, though it continued for 1600 years, as Pliny calls it, the queen of the East, was frequently in danger of being overwhelmed by earthquakes to which its situation exposed it, or of being ruined by its enemies. About 144 years before Christ, the disorders and tumults occasioned by the licentious and tyrannical conduct of Demetrius, the sovereign of Syria, terminated in a general revolt of the inhabitants of Antioch; and Demetrius was under a necessity of seeking assistance from Jonathan, one of the Macedonians, for the purpose of chastising the mutineers. Having obtained 3000 men, he resolved to disarm them, and issued orders for this purpose. This measure inflamed their resentment, and produced an insurrection; in that 125,000 men invested the palace in order to kill the king. The Jews flew to dissuage him, dispersed the multitude with fire and sword, burnt a great part of the city, and killed or destroyed very nearly 100,000 of the inhabitants. Upon the destruction of the Syrian empire by the Romans, Antioch submitted, and remained for a long time under their dominion. About the year 115, in the reign of the emperor Trajan, Antioch was almost utterly ruined by one of the most dreadful earthquakes which history records. Trajan himself escaped with difficulty, and not altogether unshorn, through a window of the room in which he had retired; and he afterwards contributed largely towards restoring its ancient splendour. In the year 155, it suffered very much by a fire, the damage of which was repaired by Antoninus Pius. Upon the revolt of Avidius Cassius, the Roman
general, about the year 176, the inhabitants of Antioch took part with him, and thus incurred the resentment of Marcus Aurelius, who inflicted a severe decree, forbidding all shows and public divertions, and even the exercise of all municipal offices; but upon their repentance he pardoned their offences, restored their privileges, and visited their city before he left the province. In the year 194, they were again deprived of their privileges by the emperor Severus, for joining Niger, and subjected, as a mere village, to the authority of Laodicea; but by the intreaties of his son Caracalla, then an infant, he mitigated their punishment.

Upon the decline of the Roman power, Antioch became an object of contention between the Romans and the nations of the East; and accordingly, when Sapor, king of Persia, overran Syria and other provinces, the city of Antioch was surprised whilst the idle multitude was fondly gazing on the amusements of the theatre; its splendid buildings, private and public, were either pillaged or destroyed; and the numerous inhabitants were put to the sword, or led away into captivity. This fact of Antioch is alluded to by the decisive testimony of Ammianus Marcellinus, to the reign of Gallienus; though other historians refer to it that of Valerian, some years before. Upon the division of the Roman empire by Constantine, in 337, it was inhabited with a very gibeous famine, and relieved by the liberality of the emperor, who sent thither 39,000 bales of corn. In 347, Constantine II. caused a harbour to be erected at Seleucia for the convenience of Antioch, which was executed at a very great expense. It suffered from famine in the reign of Julian, and also in that of Theodosius the Great, at which latter period the distress of famine was aggravated by a plague. On occasion of a tax imposed in 387, by Theodosius, the people were much enraged; and the cruelty of the governor, in restraining and punishing their faction, induced many of them to abandon their dwellings, and to retire with their wives and families to the neighbouring mountains. Some of them, however, returned; and to these St. Chrysoflem preached some of those admired homilies now in our possession; and these homilies are said to have had a great effect in reforming the licentious and diabolical.

Theodosius, when he heard of this tumult, commanded the city to be destroyed, and the inhabitants to be put indiscriminately to the sword; but the order was revoked; and he contented himself with inflicting a punishment similar to that of Severus at a former period. Numbers, however, were condemned; and St. Chrysoflem interposed to obtain for them a reprieve. At last a general pardon was obtained, and the city was restored to its former privileges. Antioch suffered from earthquakes in the years 458 and 526; but when Chosroes, king of Persia, invaded Syria in 540, the city, disdaining the offers of an easy capitulation, was taken by storm, the inhabitants slaughtered with unrelenting fury, and the city itself delivered to the flames; those who escaped were carried into Persia, and sold as slaves. Having again recovered, in a great degree, its former splendour, it was visited with an earthquake, A. D. 587, by which 30,000 persons lost their lives, and the city was almost wholly destroyed. In 611, it was seized by Chosroes II.; but "the aged metropolis, so often overturned by earthquakes and pillaged by the enemy, could supply but a small and languid stream of treasure and blood." In 638, Antioch was reduced by the Saracens, and razomed with 300,000 pieces of gold: but "the throne of the successors of Alexander, the seat of the Roman government in the east, which had been decorated by Caesar with the titles of free, and holy, and inviolate, was degraded, under the yoke of the caliph, to the secondary rank of a provincial town." It was re-

covered by the Greeks under Nicephorus Phocas and John Zimicces, in the 10th century, and again restored as a permanent and useful accession to the Roman empire. But the civil divisions in the empire afforded to the Turks an opportunity of feising upon Antioch, as well as the whole kingdom of Syria; and from them it was taken by the crusaders, A. D. 1098. In 1263, it was taken by Bifar, sultan of Egypt, and then its glory terminated.

Antioch, called by the Arabs Antakia, anciently so renowned, is now no more than a ruinous town, the houofs of which built with mud and straw, and confining of narrow and miry streets, exhibit every appearance of poverty and wretchedness. It is situated on the southerm bank of the Orontes, at the extremity of an old decayed bridge, and is covered to the south by a mountain, upon the slope of which is a wall built by the crusaders. The distance between the present town and this mountain may be about 420 yards; and the intervening space is occupied by gardens and heaps of rubbish.

Antioch, however, seems to be better calculated than Aleppo, which is become the metropolis of these eastern parts, to be the emporium of the Europeans. By clearing the mouth of the Orontes, which is six leagues lower down, boats might be towed up that river, though they could not fail up, as Pococke has asserted, its current being too rapid. The natives, who never knew the name Orontes, call it, on account of the fruitful of its stream, El-Agh, that is, the rebel. Its breadth at Antioch is about 40 paces. Seven leagues above the town it passes by a lake abounding in fish, and especially in eels. Many of these are fished every year; but the quantity is not sufficient for the numerous falls of the Greek christians. We no longer hear at Antioch either of the grove of Daphne, or of the voluptuous scenes of which it was the theatre.

The walls of each quarter of Antioch, as well as those which surrounded the whole, are still remaining; but as the houses are destroyed, the four quarters appear like so many inclosed fields.

There were many other ancient cities which bore the name Antiochia. Stephano, de Urbibus, and Hultatinus, in Dionyl, p. 170, enumerate 14; and others, particularly Ap- ianus in Syriacus, mention 16 cities distinguished by this appellation. Of those we may mention, Antioch of Pidía, as it was usually denominate, though it was situated in Phrygia, near Pidía, or in the northern part of Pidía; this was a Roman colony, and called also Cafara. It is mentioned by Strabo and Ptolemey; and also by St. Luke, Acta xxii. 14. Another was of Caria, situate on the Mender river, at the confluence of this with the Confinos, north- west of Aphrodisius. According to Stephan. Byz. it was also called Phythopolis, and Nylia or Nyla; which, according to Strabo, was near Trales. This was built by Antio- chius, the father of Seleucus, and was a bishop's see. An- other was of Cilicia, in that part called Trachæa, on the borders of the sea, at the foot of Mount Cragus. Ste- ph. Byz. is mistaken in placing this city near the Pyramus, which
which watered Cilicia Canpeftris. There was also another town of this name in Cilicia, situate on the Sarus, and an-
cently called Adam; but Antiochus Epiphanes gave it his
name, about 171 years before Christ. It was famous under
the emperor Titus Antoninus, and distinguished by hono-
rary titles. The Itineraries place it 57 Roman miles from
Tarus, and 18 miles from Mopsucaea. Another Antiochis
was situated in Mesopotamia, at the foot of mount Mafius,
according to Strabo, and the name of Nithis. A city of
this name is placed by Steph. Byz. between Cæcophyra
and Arabia; and Berkelius says, it was the same as with
Gadaara. Another Antiochis was situated in the province of
Syria, called Comagine, at the foot of mount Taurus, to the
west of Samoata, and at a distance from the Euphrates, where
Pliny places it. Antiochis was also the name of Edcilla.
Pliny places a city of this name in Sittacena, which Har-
doun supposes to be that which Polyenius calls Apollonia.
Another Antiochis was in Margiana, called Alexandria,
after the name of its original founder, but re-established
by Antiochus, son of Seleucus, who gave it its own name.
Antiochis was also, according to Polybius, an island in
the entrance of the Thracian Bosporus. Stephanus Byz. says,
that there was also a city of this name in Scythia.

ANTIOCHAS, in Entomology, a species of papilio that
inhabits South America. The wings are black, with two
white bands on the anterior pair. Fabricius, Gmelin, &c. Papi-
lio clytias of Cramer is considered as a variety β of this species.

ANTOIOCHE, in Geography, a channel in the Atlantic.
Atlantic coast, near the northern part of the island Oleron,
and on the southern of the island of Rhé. ANTOIOCHETTA,
a town of Aziatic Turkey, on the coast of Caramania, and
nearly due north from the western end of the island of Cyprus. It is a bishop's see. N. lat.
36° S. E. long. 22° 15'.

ANTIOCHIA, a town of South America, in the king-
dom of Popayan.

ANTIOCHIAN, feb; or academy, a name given to the
fifth academy, or branch of academies.
It took the denomination from its being founded by An-
tiochus, a philosopher contemporary with Cicero.
The Antiochian academy succeeded the Philonian. As
in points of doctrine, the philosophers of this sect appear to
have refuted those of the ancient academy, except that in
the article of the criterion of truth, Antiochus was truly a
Stoic, and only nominally an Academic. After his time,
the professors of the academic philosophy were divided by
the tumults of war, and the school itself was transferred to
Rome. See ANTIOCHUS.

ANTIOCHIAN epocha, in Chronology, a method of com-
puting time from the proclamation of liberty granted the
city of Antioch, about the time of the battle of Pharalba.

ANTIOCHIS, in Ancient Geography, a tribe of Greece,
in Attica.

ANTIOCHUS Soter, in Ancient History and Biography,
was the son of Seleucus Nicator, by Apama, the daughter
of Artabazus the Persian; and took possession of the
empire of Asia, on his father's death, and held it for 19
years. He is chiefly recorded in history on account of his
passion for Stratonicus, his mother-in-law. Fearing to dislo-
cate his attachment, he fell into a lingering disease, which
dangerous his life. But the affection of his father induced
him to employ the celebrated physician, Erasistratus, to di-
cover the cause of his disorder, and to administer necessary
relief. The physician soon perceived, by the changes of his
culture and countenance whenever Stratonicus entered the room,
the occasion of his complaint; and he pretended to the father,
that Antiochus was in love with his wife, and at the fame
time expressed his concern, that his malady admitted of no
cure. Seleucus remonstrated, and strongly urged the phy-
ician to preserve the life of his son by yielding to his wishes.
"Would you do so (said Erasistratus) provided Strato-
nicus were the object of his affection!'—"Molt willingly," replied
the king.—"The cure then (rejoined Erasistratus) is in
your own power:" and when he discoursed to him the secret.
Seleucus fulfilled his promise, and rejoined the beautiful
Stratonice to his son, together with a considerable part of his
dominions; and cauèd them to be crowned king and
queen of Upper Asia. Upon the death of his father, he
succeeded to the whole empire, and reigned at Antioch.
Having surrendered his pretensions to Macedon in favour
of Antigonus Gonatus, on his marrying Phila, the daughter
of Stratonice by Seleucus; and after this defeated the
Gauls, who had settled in Lower Asia, when he obtained
from these provinces the title of Soter, or Saviour. He
himself was afterwards defeated by Eumenes king of Per-
gamus; and after this defeat returned to Antioch, where he
put one of his sons to death, for raising disturbances in his
absence; and at the same time proclaimed the other, called
Antiochus, king of Syria. He died on the 1st of the month
before Christ, 261. Anc. 

ANTIOCHUS THEOS, or God; so called by the flattery of the
Milicians, for delivering them from Timarchus; was the
son of the preceding Antiochus by Stratonice, and suc-
ceeded his father in the sole possession of all his dominions.
In the third year of his reign, a bloody war broke out be-
 tween him and Ptolemy Philadelphus, king of Egypt, on occa-
sion of an insult offered to Apamea, father of Antiochus, and
widow of Magas king of Cyrene and Libya. During this
war, the Parthians revolted, and putting themselves under the
conduct of Arsaces, drove out the Macedonians; and thus laid
the foundation of the Parthian empire, which at length
became formidable not only to all the Princes of the East,
but even to the Romans. The Bactrians also, under Theo-
dotes, and the other nations in those parts, shook off the
Macedonian yoke, and elected princes of their own; and
thus Antiochus lost all the provinces of his empire lying
beyond the Euphrates. In these circumstances of defection
and disaffection, Antiochus concluded a treaty of peace with
Ptolemy, on the condition of divorcing his former wife
Laodice, who was his own sister by the father, and marrying
Berene, the daughter of Ptolemy, and setting the crown
upon the male issue of that marriage. The nuptials were
solemnized with extraordinary magnificence at Seleucia.
Within two years after this marriage Ptolemy died, and
Antiochus repudiated Berene, and restored Laodice, who
embraced this favourable opportunity of securing the suc-
cession to her son. With this view, the caufed Antiochus to
be poisoned, and employed Artemon, who much resemb-
l in his voice and features, to be placed in his bed, the
body of his deceased husband being secretely conveyed away.
To complete this stratagem, Artemon strongly recommended
his son Laodice and her children to the lords that visited
him. Accordingly, in the name of Antiochus, hipped to
be ill alive, orders were issued that all his subjects should
obey his beloved son Seleucus Callinicus, and acknowledge
him for their lawful sovereign. The crown being thus
secured, the death of the king was publicly declared, and
Callinicus, without opposition, ascended the throne.
Antiochus died in the year before Christ 246, after a reign
of 15 years. Laodice finished her infamous career by the murder
of Berene and her son. Anc. 

ANTIOCHUS the Great, so called in account of his illu-
trious actions, was the son of Seleucus Callinicus, and suc-
ceeded his brother Seleucus Cerranus, in the year before
Christ
Antiochus.

Chrift 225. After the troubles with which his reign commenced, and which were terminated peaceably by his activity, his attention was engaged by the revolt of his uncle Achaeus, who usurped the sovereignty of Aia Minor; and by a confederacy of Ptolemy Philopator, king of Egypt, for the recovery of Cœle Syria. He first resolved on a war with Ptolemy, which, after several advantages gained by him, terminated by a defeat in the decisive battle of Raphia, in the year before Chrift 217, which obliged him to abandon all his conquests, and to withdraw, with the remains of his shattered army, to Antioch. The result was a negotiation for peace, which Antiochus obtained, on the condition of surrendering to Ptolemy the whole of Cœle Syria and Palestine. His next object was Achaean, whom he obliged to quit the field, and to flit himself up in the castle of Sardis; but he was at length delivered up by treachery to Antiochus, who, whilst he compassionated the misfortunes of a man to whom he was indebted for his crown, ordered him to be beheaded, and thus put an end to the war of Achaean. Antiochus was now at liberty to pursue his plans for the reduction of those provinces in the east, which had shaken off the Syrian yoke. Accordingly he recovered Media and Parthia, and reduced Siringis, the capital of Hyrcania. Arfaces, however, was a formidable enemy; and he therefore made overtures to him for putting an end to the war; the consequence of which was, that it was agreed by treaty, that Arfaces should hold Parthia and Hyrcania, on condition of his assisting Antiochus to recover the other provinces which had revolted. He also, in a similar manner, concluded a peace with Euthydemos king of Bactria. After this pacification, he crossed Mount Caucasus, and entered India, where he renewed his alliance with Sophagarean, king of that country; and having marched through Arachosia, Drangiana, and Carmania, he returned by Persia, Babylonia, and Mecopotamia, to Antioch, after a successful expedition of seven years, and with the surname of Great, which he had acquired, and which he might have retained, with the reputation annexed to it, till his death, if he had not unfortunately engaged in a war with the Romans.

Soon after the return of Antiochus, Ptolemy Philopator died, and was succeeded by his son Ptolemy Eiphanes, a child of five years. The youth of the sovereign of Egypt prefented to the ambitious views of Antiochus objects which were too alluring to be refi- d. Antiochus, however, was a favourable opportunity, not only for recovering his lost provinces, but for seeking further aggrandisement. Accordingly he entered into a treaty with Philip king of Macedonia, in virtue of which they were to deprive the infant king of his dominions, and to divide them: Philip was to have Caria, Lybia, Cyrene, and Egypt; and Antiochus all the rest. Antiochus, having fetted these preliminaries, marched into Cœle Syria and Palefince, and soon subdued them. But it so happened, that at this time Scipio had concluded the second Punic war; and the fame of the Romans was every where spread. The guardians of the young king, incited by the celebrity of the Roman name, sent an embassy to Rome, imploring the protection of that republic, and offering the guardianship of their king, and the regency of the kingdom during his minority. The Romans acceded to the proposal, and immediately signified their compliance to Antiochus and Philip, requiring them to desist from invading the dominions of their pupil, and threatening war upon them for his protection. Arilomenes, an old experienced officer, was appointed the young king's minister, and he deputed Scopas to levy troops in Etolia, for the service of his master. These troops marched, during the absence of Antiochus, into Palestine and Cœle Syria, in order to recover those provinces; but after some success, Antiochus returned, defeated Scopas, with the loss of the greatest part of his army, and obliged him to surrender Sidon, into which he had retired, with the whole garrison. Antiochus was cordially received by the Jews; and on his approach to Jerusalem, treated with the utmost respect and hospitality. In return, Antiochus granted them many privileges and favours. Antiochus proceeded from Palestine to Aia Minor; and as he failed with a formidable fleet along the coast of Cilicia, Pamphylia, Lycia, and Caria, many of the maritime cities of those provinces voluntarily submitted to him. He then failed to Ephesus, made himself master of it, and took up his winter-quarters there. In the mean time Smyrna, Lamphactus, and other Greek cities of Aia, which at that time enjoyed their liberty, concurred in imploring the protection of the Romans, who were at last prevailed upon to exert themselves in restraining the progress of Antiochus. But during this embassage, Antiochus crossed the Hellepont, and landed all Thracian Chersonesus. The much which those cities solicited was delayed, and much time was lost in ineffectual negotiation; till at length, in the year before Chrift 195, Hannibal fought the protection of Antiochus, and engaged him to make war on the Romans. Antiochus strongly urged himself by new alliances; having married his daughter Cleopatra to Ptolemy king of Egypt; and Antiochus, his second daughter, to Ariarathes king of Cappadocia. After fruitless embarkations between him and the Romans, he formed the fatal resolution of commencing a war with them. Hostilities were mutual, and successes for some time was doubtful; but the fleet of Antiochus having been defeated by that of the Romans, and his troops having been withdrawn from the Hellepont, the two Scipios, Cornelius and Africanus, found a free passage into Aia. The king was alarmed, and made propostals of accommodation to the Romans, which, although very advantageous to them, were rejected. He also restored, without condition, the son of Africanus; and the grateful father acknowledged his obligations, by deeming him not to hazard a battle before his return to the army. But a decisive engagement took place at Magnesia, in Lower Aia; Antiochus was completely vanquished, in the year before Chrift 190: and compelled by the circumstances to which he was reduced, to sue for peace. The terms were his giving up all his pretensions on Europe, limiting his Asiatic dominions to the country beyond Mount Taurus, and paying the expenses of the war. The surrender of Hannibal was also stipulated, but he had made his escape. The Syrian monarch did not long survive this humiliation: the manner of his death is not satisfactorily ascertained. Jerom, on the authority of Strabo, says, that having plundered the temple of Jupiter Belus, in the province of Elemais, he was slain in an insurrection of the people. Aurelius Victor relates, that he gave himself up to every kind of diffolute pleasure; and that he was killed at an entertainment by one of his guests, whom he had insulted. He died, however, in the year before Chrift 187, in the 27th year of his reign, and 52d of his age; and he is highly commended by most of the ancient historians for his humanity, clemency, and liberality. Till the 50th year of his age, his prudence in counsel, and courage in action, were such as to command successes, and entitle him to the appellation of "Great," but after that age, he was less wise and valiant, and less prosperous. His conduct in the war with the Romans, the contempt with which he received the wife counsel of Hannibal, and the ignominious peace which he was forced to accept, obscured all the glory of his former expeditions. The prophecies of Daniel, from the 17th verse of the 11th chapter to the 19th, inclusive,
Antiochus, in the year before Christ 176. It was one article of the humiliating treaty of Magna Graecia, that this prince should be sent to Rome as a hostage; and there he was detained for 13 years, till he was exchanged for his brother's son Demetrius. In his way home, his brother Seleucus was poison'd by Heliodorus, who usurped the crown. But aided by Eumenes, king of Pergamus, and Attalus that king's brother, he drove out the usurper, and ascended the throne. His conduct was foolish and extravagant to an extreme degree; and besides the frantic follies with which he was chargeable, he was addicted to drunkenness, squandered away large sums of money in riotous excesses; and in his mad frolics, scattered handfuls of money among the populace, crying out, "Let him take it to whom fortune gives it." This odd and extravagant conduct, of which many singular influences are recited, made his subjects regard him as a madman; whence, instead of "Epiphanes, or the Illustrious," the title which he allclaimed on being settled on the throne, they used to style him "Epiphanes" that is, "the Madman." Soon after his accession, a demand was made by the administration of Egypt for the restoration of Cæsarea and Palestine; and this demand occasion'd a war between the two courts. Antiochus determined to anticipate the preparations made in Egypt, by a commencement of hostilities, and by an actual invasion of the country; and, at the same time, he sent a splendid embassy to Rome to justify his conduct, and to conciliate the favour of the senate. In his first expedition, he routed the Egyptians, and wintered at Tyre. In a second campaign, in the year before Christ 175, he reduced the whole country, except Alexandria, and gained as much by his clemency as by his arms. On this occasion, Ptolemy Philometer fell into the hands of the conqueror; and the Alexandrians, considering him as lost to them, placed upon the throne his younger brother Ptolemy Euergetes, called also Phylcon; and made attempts to recover their country from the Syrians. Antiochus was thus induc'd to make a third expedition into Egypt, and advanced directly to Alexandria, with the design of besieging it. In this danger, Ptolemy Euergetes, and his sister Cleopatra, sent an ambassador to Rome to supplicate assistance. The senate determined to give them relief, and accordingly sent an embassy into Egypt for the purpose of terminating the war: and the instructions of their ambassadours were, to order the contending princes to suspend all hostilities, and to put an end to the war, on pain of forfeiting the friendship and alliance of the Romans. Antiochus, in the mean time, had made a pacification with Philometer, and engaged to restore him to the possession of his dominions, Pelusium excepted. He then returned to Antioch; but during his absence, the two royal brothers agreed, under the influence of Cleopatra's mediation, to reign jointly, and to renounce their dependence on Antiochus. This produced a fourth expedition into Egypt; and the Syrian king was halfly marching towards Alexandria, after having reduced the greatest part of the country, when he was met by the three Roman deputies. The decree of the senate was announced to him, and he defined some time for deliberation. Popilius, one of the deputies, drew a circle with a rod, which he held in his hand, round the king, and informed him that he expected a peremptory answer before he left that ring. Antiochus hesitated for a few minutes, and then declared his readiness to comply with the requisition of the republic. The three deputies gave him their hands, and Popilius renewed his former familiarity with him. Antiochus was probably not a little exasperated, though he was obliged to submit; for on his return from Egypt, he visited Jerusalem, and with extreme cruelty compelled the Jews to violate the principles of their religion and worship at the heathen altars which he had caused to be erected. In a former expedition, he had taken Jerusalem by storm, plundered and defiled the temple, and abolished the Jewish rituals. These violence, which are related in the books of the Maccabees, occasion'd the revolt of Mattathias and his sons; which for a long time filled that country with bloodshed, and defied the whole power of Syria.

With a view of further ingratiating himself with the Romans, he celebrated their festivities of the kingdom of Macedon under Perseus, bycausing games to be exhibited at Daphnæ near Antioch, with a pomp and magnificence which even in that luxurious part of the world had never before been witnessed. The king's conduct was so extravagant and absurd on this occasion, that Tiberius Gracchus, the Roman envoy at his court, informed the senate, that they need be under no apprehensions from any design which he could form. Nevertheless, on a revolt of Armenia and Persia, he left part of his army under Lyfias to reduce Judea, and marched with the rest against Artaxias, the Armenian king, whom he defeated and took prisoner. From Armenia he marched into Persia, and flew to Elam, of the immense wealth of which he had received information, with a design to plunder both the city and the temple. Here he was repulsed with the greatest ignominy; and mortified at the disgrace he suffered, he withdrew to Ecbatan in Media. But news arriving of the defeat of Nicander and Timotheus, two of his generals in Judæa, he hastened towards Babylon; and was met in his piquage by two messengers, who gave him an account of the defeat of Lyfias, and that the Jews had retaken the temple, thrown down the images and altars which he had erected, and restored their former worship. These tidings exasperated him beyond measure; and he determined to march in person against the Jews, and threatened to extirpate the whole nation. He had fiercely uttered these words, when he was feiz'd with an excreting pain in his bowels, which no remedy could cure or alleviate. He resolved, however, to proceed; till at length he was obliged to halt at a town called Takba, on the confines of Persia and Babylon; in the year before Christ 165, where he expired, after languishing for some time in the most dreadful agony both of mind and body, in the 36th year of his reign, and 39th of his life. The 11th chapter of Daniel, from the 20th verse to the end, wholly relates to this Antiochus. Anc. Un. Hist. vol. viii. p. 105, 213.

Antiochus Eupator, was the son of the preceding, and placed on the throne at the age of 9 years, on the death of his father, by Lyfias; though the deceased monarch had appointed Philip, his prime minister, for his guardian. Philip retired into Egypt; and Lyfias profecuted the war with the Jews which Epiphanes had begun; but the large army which he conducted thither was defeated by Judas Maccabæus.

From another expedition into Judea, and the siege of Jerusalem, he was recalled by the intelligence, that Philip had taken possession of Antioch, and riz'd on the government. Lyfias made peace with the Jews; and having marched against Philip, defeated him, and put him to death. In the mean time the Roman senate had assumed the tutelage of the young king, and sent a commission of guardianship into Syria, with orders to burn all the decked ships, and dispose the war-elephants. Octavius, who was appointed chief of this commission, and who executed his orders with great in-
olanoe, was killed in a popular tumult at Laodicea; and buried with great pomp by Lyfias, who dreaded the indignation of the senate, and sent ambassadors to Rome for his own excommunication. At this time Demetrius, the son of Seleucus Philopator, who had the best right to the crown, but who was kept at Rome as a hostage, contrived to make his escape; and arriving in Syria, was received everywhere by the people as their lawful sovereign. Lyfias and the ineffectual Emperor were delivered by their own soldiers to Demetrius, who ordered them both to be put to death, in the year before Chrifl 162, after the young prince had reigned between two and three years. The author of the first book of the Maccabees says, they were taken prisoners by the soldiers of Demetrius, and by them put to death, without any orders from Demetrius. Anc. Un. Hist. vol. vii. p. 212.

Antiochus Sidetes, or the Hunter, was the second son of Demetrius Soter, and succeeded to the throne, vacated by his brother Demetrius Nicator, after the expulsion of Tryphon the usurper, by the interest of Cleopatra, the wife of Demetrius, whom he married, and the alliance of Simon, high priest of the Jews, in the year before Chrifl 138. After his accession, he reduced all those cities of Syria which had rendered themselves independent during the interregnum. He then made war with the Jews, besieged Jerusalem, and compelled Hyrcan, who had succeeded his father Simon, to purchase a peace, on the condition of paying tribute. He then entered Parthia, with a motley multitude of cooks, fitters, women, and other minillers of luxury, much more numerous than his soldiers, defeated Phraates, and regained the provinces which he had separated from the Syrian empire. But his troops being dispersed into distant winter-quarters, the oppressed people, joined by the Parthians, confpired to attack them all in one day; and Antiochus, and every man under his command, were destroyed. Others say that he could not survive the disgrace of being vanquished in battle, and that he put an end to his own life. This happened in the ninth year of his reign, before Chrifl 130. Although Antiochus was addicted to intemperance and ammendment, he is represented as a prince poffefling many good qualities, a lover of justice, and inclined to clemency. Phraates, on viewing his dead body, is said to have exclaimed, "Your wine, Antiochus, and your too great confidence, have brought you to this untimely end. You thought you could have swallowed the kingdom of Arfaces in your cups." Anc. Un. Hist. vol. viii. p. 242—245.

Antiochus Grypus, or book-eater, was the son of Demetrius Nicator by Cleopatra; and on the death of his brother Seleucus, whom his mother, jealous of her power, caused to be murdered, was recalled by her from Athens, where he had been sent for his education, and proclaimed king of Syria, in the year before Chrifl 123, to the exclusion of Alexander Zabin, who had usurped the throne, and whom Grypus afterwards put to death. Cleopatra had advanced Grypus to the throne, with a view of removing the authority to herself, and of allowing him the mere title of king. But when he began to manifest an inclination to govern independently of his mother, she determined to transfer the crown to a younger son, and to dispach this by poison. For this purpose she prepared a bowl, and presented it to the young king on a day when he returned hot and weary from the chase. But as he was forewarned of his purpose, she defied her to take the first draught; and on her refusal, he summoned the lords of his court, communicated to them the information he had received, and then said, that the only mode by which she could expiate her

self, was to drink what she had prepared for him. She drank, and presently expired. After her death, Antiochus enjoyed the sovereignty of Syria for eight years without disturbance; but there arose a rival, viz. Antiochus the Cyzicene, the son of Cleopatra by Antiochus Sidetes. The confedence of this rivalship was a civil war, which terminated in the division of the kingdom. Having thus settled their difference, they both devoted themselves to voluptuousness and debauchery, and totally neglected both their private and public concerns. This negligence on their part gave John Hyrcan an opportunity of making conquests upon Syria; and the subsequent disagreement of the two brothers afforded occasion for several cities to assert their independence. At length Grypus was assassinated by one of his own subjects, in the 43d year of his age, in the year before Chrifl 97, after having reigned, according to Josephus, 29, and according to Porphyry, 26 years. Cyzicus, some years after, was defeated and slain by his nephew Seleucus. Anc. Un. Hist. vol. viii. p. 245—253.

Antiochus, a monk of Saba in Palestine, of a very superfluous complexion, lived towards the beginning of the seventh century; and wrote a summary of the religious doctrines, intitled "The Pandect of the Holy Scriptures," in 120 homilies. In the preface, he mentions the capture of Jerusalem by Chofroes, king of Persia; and relates the cruelties inflicted on the monks of Palestine; and in an anec-}

domesticated a new insect, described by professor Gerbi, in a small work published at Florence in 1794; so called from its property of allaying the tooth-ach. It is a kind of curculio, and found on a species of thistle, carduus spinosissimus, which is perhaps a variety of the...
the enamel. Its flowers, when analysed, gave the acid of falts, the muartic acid, oxalate of lime, extractive matter, and a very little resin. The insect eats not only the parenchyma, but also the vessels and fibres of the leaves. It is of a longish figure, covered below with short yellow hair, and above with golden, yellow velvety spots. Its corect is variegated with specks, and the covering of its wings with specks and stripes. It has a short proboscis, and somewhat resembles the curculio villiis of Geoffroy. Its larva represents a sort of ichneumon. If 12 or 15 of these insects, in the state of larva, or when come to perfection, be bruised and rubbed slowly between the forefinger and thumb, until they have lost their moisture; and if the painful tooth, where it is hollow, be touched with that finger, the pain ceases, sometimes instantaneously. A piece of flannel leather will answer the same purpose with the finger. If the gums are inflamed, the remedy is of no avail. Other insects possess this property of curing the tooth-ach: such as the carabus ferrugineus of Fabricius; the coccinella septempunctata, or lady-bird; the chrysoloma populi, and the chrysoloma fanguinolenta. This property seems to belong to several kinds of the coleoptera.

ANTIOPE, a species of pappilio that inhabits Europe. The wings are angulated, black, with a whitish border. Linn. Faun. Suec. Fabricius, &c. This is pappilio maxima nigra, also utirique limbo illo ab humilis Ray, &c.; and is known by the English name of Camberwell beauty butterfly. The dark colour of the wings inclines to a rich purple-brown, the external border to yellowish; and it has an intermediate black stripe, with a row of brindled spots, and two very yellowish spots on the anterior margin of the first wings. It is produced from a black spiny larva, that is marked on the back with a row of ferruginous spots, and feeds on the willow. It is remarkable, that the insects of this species found in England have the external border of a paler colour than those found in other parts of Europe, though in other respects they are perfectly similar. Donovan's British Insects, vol. iii. p. 47.

ANTIOPE, in Fabulous History, the wife of Lycurgus king of Thebes, who, being deflowered by Jupiter in the form of a fayre, brought forth Amphin and Zethus. Another Antiope was queen of the Amazons; and, with the assistance of the Scythians, invaded the Athenians, but was vanquished by Theseus.

ANTIOPIA, in Ancient Geography, an ancient town of Palæstina, in the tribe of Naphath, towards the frontier of Aser, between Tyr and Bethpharaoh. It was once a principal city of the Canaanites, but is now reduced to a miserable village.

ANTIPACHSU, in Geography, a small island on the coast of Epirus, over against the gulf of Arta, between Corfu and Cephalonia.

ANTIPÆDO-BAPTISTS, derived from ant, against, παρεξ, παρά, εχθρός, εχθρίς, and βάπτιστης, baptism, whence βαπτιστής, is a distinguished denomination given to those who object to the baptism of infants; because, they say, infants are incapable of being instructed, and of making that profession of faith which entitles them to this ordinance, and an admission into church communion. See ANABAPTISTS and BAPTISTS.

ANTIPAGMENTS, Antipagmena. See Antepagmena.

ANTIPAPINIANUS, antipapinianus, a title given by the Greek lawyers to the fourth part of the Digest, including four books, beginning with the title De paginiarum. This is otherwise called antipapianus. The antipapianus was thus denominated, not as being intended in opposition to Papinian, but because it was to serve in the schools in the civil law in lieu of the books of that lawyer, pursuant to an edict of the emperor Julian; so that the antipapapianus was so far from being a refutation of Papinian, that it was only a substitute for his writings, which were not so proper for the use of the younger sort of students.

ANTIPARALLELI, in Geometry, are those lines which make equal angles with two other lines, but in opposite directions. Thus, if AB and AC (Plate 11. Geometry, fig. 27.) be any two lines, and FC and FE be two others intersecting them in such a manner, that the angle B is equal to the angle E, and the angle C equal to the angle D, then BC and DE are antiparallels, with respect to AB and AC; and these latter are antiparallels with regard to the two former. It is a property of these lines, that each pair cuts the other into proportional segments, if they be taken alternately, viz. AB : AC :: AE : AD :: DB : EC, and FE : FC :: FB : FD :: DE : BC. M. Leibnitz, however, calls those lines antiparallels, which cut two parallels so, that the outward angle being added to the inward one, the sum may be equal to a right angle.

ANTIPARALYSIS, in the Materia Medica, medicines fitted to cure the palsy.

ANTIPARASTASIS, from αντι and παράστασις; of παράστασις, I exhibit, in Rhetoric, a reply to an opponent, by allowing part of his argument, and denying the rest, e. g. "you may print whatever you please, provided the public suffer no prejudice from it; but you must not, if it does."

ANTIPAROS, in Geography, an island in the Archipelago, opposite to Paros, and separated from it by a strait about seven miles wide. This is the ancient Olaros, which was established by a colony of Sidonians. It is narrow and long, extending in a direction from north-east to south-east; and, according to Tournafort, about 15 miles in circumference; its soil is tolerably fertile, and produces for its own supply wheat, barley, wine, sasfinum, and some legumes; but the most considerable production, and that which enables the inhabitants to pay their impost, is cotton. What renders Antiparos particularly famous is the grove, which penetrates into its bosom to a very great depth; and which, according to the relations of the Greeks, communicates beneath the waters with some neighbouring islands. Magni, an Italian traveller, who first discovered this subterraneous grove, has given an account of it; Tournafort has also described it with great exactness; and M. de Choiseul-Gouffier has given some very beautiful drawings of it in his "Voyage Pittoresque de la Grèce."

We first find a ruthless cave, about 30 feet wide, divided by some natural pillars; between which the ground slopes gently, and then more precipitately to the bottom of the cavern. At last the defcent is by a ladder to the grove itself, which is about 300 fathoms below the surface of the earth; and it appears to be about 25 fathoms high, and 50 wide. It is full of large and beautiful stalactites, hanging from the roof, and covering the floor. Olivier (Travels, p. 121.) queries, whether it ought to be considered as a quarry, from which marble has been extracted for a length of time, or as in impenetrable cavern, such as naturally exist in most calcareous mountains.

ANTIPAS-Herod. See Herod.

ANTIPASCHA, in Ecclesiastical Writers, denotes the first Sunday after Easter; otherwise called Dominica in allis.

ANTIPATER, in History and Biography, was a native of Iduma; and, having acquired wealth and influence in the Jewish state, joined the Pharisees against Aristobulus the high
high priest, in favour of his brother and competitor Hyrcan. He also engaged Aretas, the Arabian king, to invade Judaea, where he was strengthened by Hyrcan's party; and totally defeated Artilobulus, who was forced to fly into Jerusalein, and await the event of a close siege. In these circumstances Artilobulus applied to the Romans for succour; and Scærus, the Roman general, was induced by a considerable bribe to desert Artilobulus, and thus to induce him to lead his army out of Judaea. He was afterwards overtaken by Artilobulus, and defeated with great slaughter.

When Pompey arrived in Syria, in the year before Christ 62, the two brothers, Artilobulus and Hyrcan, appeared before him, and urged their respective pleas: but the decision was deferred, and Artilobulus departed in disgust.

When Pompey entered Judaea, he summoned Artilobulus, who had raised a considerable army, to appear and to answer for his conduct; but being dissatisfied with the terms of conciliation that were proposed to him, he fled with haste to Jerusalem, and was soon followed by Pompey, who laid siege to the city, and, after an obstinate resistance, took it. On this occasion, 12,000 of the besieged were slaughtered by the Romans, besides many more who died by their own hands. During this horrid scene, the priests never intermitted the divine service in the temple; and at last suffered themselves to be butchered before the altar, with as much meekness and constancy as the victims they were then offering.

Hyrcan was restored to the pontifical dignity, with the specious title of prince, though from thenceforth tributary to Rome; but he was wholly directed of his regal power, and forbade to resume either the diadem or royal style, or to extend his territory beyond the old borders of Judæa. Artilobulus and his two sons, Alexander and Antigonus, together with his two daughters, were taken by Pompey to Rome, as captives to adorn his triumph. The insolence of Hyrcan led him to commit the management of his affairs to Antipater, who artfully contrived to ingratiate himself with the Romans, and to promote the aggrandizement of his own family. With these views he gave successive alliance to Scærus, Gabinius, and Cassius, the Roman generals who commanded in those countries. He also facilitated the capture of Pelusium by the forces which he afforded to Julius Caesar, and he was one of the foremost in sealing it, when this city was taken by assault. Mithridates, in a letter to Caesar, acknowledged that his successes were owing to the co-operation and valour of Antipater; and in recompense of his favours. Caesar gave his son-in-law a province in the army, and made him procurator or lieutenant of Judæa, and citizen of Rome. Antipater, having accompanied Caesar to Tyre, where he embarked for Sicily, returned to Jerusalem, and exerted himself in restoring the Jewish government to its ancient model, and repairing the walls and fortifications. He also made his eldest son Phasael governor of the metropolis, and appointed his second son, Herod, governor of Galilee. This growing power, however, excited the envy and jealousy of the principal Jews; and at length Malchus, who had been of the same party with Antipater, and who had concurred with him in the support of Hyrcan's interest, resolved to take him off by treachery. Antipater, being apprized of his design, retired beyond Jordan, and put himself in a posture of defence; but Malchus contrived by various stratagems to remove his suspicion, and to effect a reconciliation with him; and Antipater, by his interest with Marcus, governor of Syria, prevented his being put to death. The jealousy and envy of Malchus were inflamed, but not extinguished; and he embraced the first convenient opportunity that offered of bribing the butler of the high priest to poison him with a glass of wine, whilst with an armed force he feized upon the government of Jerusalem. This event happened in the year before Christ 45. Antipater, the Macedonian, was a person of noble birth, and distinguished by his natural talents and excellent education. He was the friend and disciple of Aristotle, learned, and a lover of learning; magnificient in his actions, but plain in his drees and behaviour, never varying his habits during the whole time of his government, but appearing like a private person when he gave laws to kings. Philip of Macedon selected him as his minister, and confided in him as his friend. "I have kept fondly," said he, "for Antipater was waking." And Alexander, referring to his plain garb, replied to those who observed to him, that all his great officers, except Antipater, were purple; "True; but Antipater is all purple within." During the absence of Alexander, on occasion of his expedition into Asia, the government of Macedon was given to Antipater; and he was supported even against the interference of Olympias, Alexander's mother. He also maintained the tranquillity of all Greece; and marching with a considerable force against Agis III.'s king of Sparta, who had united several of the Greek fleets against the Macedonians, he defeated the Spartan king, and by a single action terminated the war.

After the death of Alexander, when the empire was divided by a general council summoned by Perdiccas, the government of the European provinces was assigned to Antipater, as general of the army in that continent. In consequence of an edict of Alexander, which directed all the cities of Greece to recall their exiles, Antipater was soon engaged in a war, in which the Athenians were particularly active, and in which they were at first unsuccessful; so that they compelled him, after a defeat, to retire to Larisa, a strong city, near the field in which their armies had been engaged. But Antipater, receiving assistance from Asia, was rescued from confinement, and the siege being raised, he was joined by Craterus, and thus enabled to defeat the confederate Greeks. Athens, on his approach, was compelled to submit at discretion; and he abolished the popular government there, and established that of Solon, leaving a Macedonian governor in the place. He also litigated the revolt of the Grecian fleets on a similar plan of equity and moderation; and so much to general satisfaction, that he was honoured as the father and protector of Greece. Upon his return to Macedon, he directed his arms, in conjunction with his son-in-law Craterus, who had married his daughter Phillip, against the Eotians, the only perfons that had refused to be comprehended in the peace, and effected their purpose. They afterwards entered into a league with Ptolemy, and passed over into Asia, in order to control the power of Perdiccas, who had assumed the sovereignty. But Perdiccas being soon after slain in Egypt, Antipater was sent for to the army in Syria, and declared the sole protector of kings, and invested with sovereign power. Antipater next proceeded to make a new division of the provinces and then returned to Macedon, his own province, with the kings, leaving the army satisfied with his proceedings. Soon after his return to Macedon, he was attacked by a dangerous disease; which, at his advanced age, left him little hope of life. In his last moments he behaved with the same firmness and the same regard to his reputation which he had manifested in all the actions of his life. His great offices of protector and governor of Macedon he bequeathed to Polyperchon, the eldest of Alexander's captains then present; and his eldest son, Cæcander, he merely appointed to be a chieftain or colonel of a thousand men.

Antipater, bishop of Bithynia, an Arabian church, and flourished towards the end of the 5th century. He wrote a refutation of Eusebius's Apology for Origen, fragments of which are preferred in the acts of the second council of Nica. Fabr. Bib. Græc. l. v. c. 34. § 7. t. 9. p. 274.

Antipater. Lelius Coelius, a Roman historian, who lived in the time of the Gracchi, was the author of a history of the second Punic war, of which Brutus wrote an abridgment. He is often mentioned by Cicero. The emperor Adrian preferred Antipater to Sallust, probably for the same reason that he preferred Ennius to Virgil, because he was an admirer of the ancient Roman language. Fragments of this historian were published by Riccoboni in 1766, and reprinted with fragments of other historians, by Antony Angullia, at Antwerp, in 1790. Vol. de Hist. Lat. l. i. c. 8.

Antipater of Sidon, or of Tarfus, a Stoic philosopher, and also a poet commended by Cicero and Seneca, flourished about the 17th Olympiad, or 80 years before Christ. He was the disciple and succeessor of Diogenes the Babylo- nian; and his chief opponent was Carneades.

Antipater, an ancient physician of the sect of the methodists, died, as Galen relates, of a tubercle in his lungs. The tubercle occasioning an intermission of his pulse, which continued several months, Galen, from this circumstance, predicted that his death would be sudden, which accordingly happened.

Antipathes, among the Ancient Naturalists, was used to express any stone or gem, which, according to their superstitious ideas of the virtues of gems at that time, was supposed to have a power of refilling the force of enchantments. Phinies mentions a very valuable gem, called by the ancients antipathes for this very reason; and the black coral had the same name on the same account.

Antipathes, in Natural History, the name of a genus in the Zoophyta order of Vermes, the character of which, according to the Linnean system, is animal growing in the form of a plant; item within horny, with small spines; base expanded; the outside covered with gelatinous flesh, and numerous polypliherous warts. The species of the genus are spiralis, ulyx, subpinnata, myriophyla, clope- curoides, cupreus, orichalca, dichotoma, elathara, fa- belium, penneaca, ericoides, and funiculacea; which fece re- spectively.

Antipathy, compounded of ant, contra, against, and σπασειν, passion, in Physiology, a natural enmity or averse- tion of one body to another. In which sense the word stands opposed to sympathy. Such an aversion is commonly said to be between the falamander and the tortoise, the vine and the elm, the toad and the weasel, the sheep and the wolf, the olive and the oak, &c. Phil. Trans. N° 339.

In a more restricted and proper sense, antipathy denotes that natural aversion and detestation which an animated and sensitive being feels with regard to some object that is presented to it, either in reality or in imagination; and the cause of which is mysterious and inexplicable. Such are some of the antipathies mentioned in the last paragraph; and such also is the aversion to which some persons are conscious under the apprehension or at the sight of particular objects, as cats, mice, spiders, serpents, &c., &c. and which produces, whatever be the cause of it, sensible and apparent effects. Many influences of antipathies that have been recorded are, perhaps, no better than fables; and a severe examination would reduce them to the large class of vulgar errors. There are also fictitious aversions, which have no other source besides affection, and a pretended delicacy of nerves, which is more frequently feigned than real. Of these other antipathies, the existence of which is capable of being ascertained, and which produce sensible and undisputed effect, it is not difficult to assign a cause without recurring, with the Peripatetics, to any occult qualities inherent in bodies. In the credulous period of infancy, with what pains and industry are the minds of children impressed with the sense of the noxious qualities of particular animals, such as serpents and other reptiles; and how easily do they associate the ideas they are thus led to entertain of some objects, with others that resemble them in their visible form or general properties? When an aversion thus imbued in early life, or in consequence of some trivial act or injury, concurs with a feeble frame and irritable state of the nervous system, it will serve to account, with sufficient satisfaction, for the antipathies of advanced age, without recurring to any occult qualities and latent principles, which are mere names for unknown and unascertained causes of particular effects. The antipathy which some personas have to eels, may be traced to the resemblance which these fishes bear to serpents, and to the dread of these reptiles that has been betimes implanted and cherished. There are other an- tipathies with regard to food or liquor of any particular kind, which have proceeded from a defective and faulty conduct of indulgent and ill-judging parents in early life, or from some natural unfruitfulness of the table or digestive fac-ulty of children. "To what then are those antipathies of which we have heard so much reducible? Either to leg- endary tales, or to aversions against objects which we believe dangerous; or to a childish terror of imaginary perils; or to a diphiloph, of which the cause is disguised; or to a nudi- culous affection of delicacy; or to an infirmity of the sto- mach; in a word, to a real or pretended reluctance for things which are either unwholesome, or supposed to be tainted with qualities hurtful to us. Too much care cannot be taken in preventing or regulating the antipathies of children; in familiarising them with objects of every kind; in discovering to them, without emotion, such as are dangerous; in teaching them the means of defence and security, or the methods of escaping their noxious influence; and when the rational powers are matured by age, in reflecting on the nature of those objects which we fear, in ascertaining what has been told concerning their qualities, or in vigorously operating upon our own dispositions to overcome those vain repugnances which we may feel." Some think that the term antipathy can only be applied to any certain purpose, when used with the restriction of modern philosophers; among whom it signifies no more than a vis contrarig, or repelling power.

Antipathy is sometimes also used in a moral sense, to de- note a contet between the mind and the body, or between reaon and inclination.

Antipathy, in Painting, relates wholly to the colouring- part of that art, and which may be more properly ex- pressed by contrariety, degradation, &c. Blue and crimson are by mixing changed into purple, as blue and yellow are into green, or red and yellow into an orange colour; these mix- tures may be said to be kind to, or to harmonize with each other. If red and green, yellow and purple, or blue and orange colours, be united by admixture, they not only de-
ANT

The term antipathy is commonly used to describe a feeling of dislike or aversion towards someone or something. It is derived from the Greek words ἀντί (anti) meaning 'against' and πάθος (pathos) meaning 'feeling' or 'emotion'. Antipathy can be felt in various contexts, such as personal relationships, cultural differences, or even towards ideas and beliefs.

In the context of the ancient world, the concept of antipathy would have been understood within the framework of classical philosophy and ethics. The ancient Greeks and Romans had a rich vocabulary to describe different forms of attraction and repulsion, which were often influenced by factors such as symbols, colors, and the balance of forces in nature.

For example, the ancient Greeks saw colors as having a symbolic value. Red was associated with love and passion, while white was associated with purity and truth. However, extreme reactions to these colors could lead to feelings of antipathy or antipathy.

The concept of antipathy would have also been applied to the natural world. Ancient philosophers believed that nature was governed by a balance of forces, and that when this balance was disrupted, it could lead to antipathy or antipathy.

In summary, antipathy is a complex concept that has been studied and debated throughout history. Its roots can be found in the philosophical and cultural traditions of ancient Greece and Rome, and it continues to be a relevant topic in modern times.

This is a brief introduction to the concept of antipathy. For a more detailed exploration of this topic, one could consult ancient Greek and Roman texts, as well as modern studies on emotion and philosophy.
ANTIPHON, in Biography, an Athenian orator, was born at Rhamnus in Attica, and hence called the Rhamnusian. He was instructed by his father Sophilus in rhetoric, and was deemed not inferior in eloquence to Themistocles, Aristides, Pausanias, or Gorgias, his immediate predecessors; and he was preceptor in this art to Thucydides, who mentions him as an eminent orator. Quinianus (Instit. i. iii. c. 1.) informs us, that he was the first who wrote precepts on oratory; and Ammianus Marcellinus (xix. xxx. c. 4.) says, that he first introduced the practice of pleading for money. Plutarch, as well as Thucydides, represents him as an energetic and persuasive orator, of fertile invention, and ingenuous in adapting himself to the prejudices and interests of his auditors. Philostatus (de Soph. I. i.) describes him as poising peculiar powers for soothing the minds of his hearers, and alleviating grief. Plato, however (in his Memorabilia) treats his talents with contempt, and makes Socrates employ him in opposition to Alcibiades; but Socrates, it should be remembered, had been infected by the sophists, and particularly by Antiphon. His talents, as it is observed to his dishonour, were employed in establishing the tyranny of the four hundred in Athens; and, as Plutarch says, he was, for this offence, condemned and executed as a traitor, and his body thrown out of the walls of the city, in the first year of the 92d Olympiad, or 412 years before Christ. Others have given a different account of the manner of his death. Sixty orations under his name were formerly extant, but there now remain only 16; of which the subjects are criminal, for murder or manslaughter, or defensive in similar causes. Fabricius and other critics think that they are genuine, though their authenticity has been questioned by others. They have been edited, with the orations of Scechnes, Lytias, &c. by Aldus at Rome, in folio, in 1513; by H. Stephens, in 1577; and in Svo. by Minutius, at Hanau, in 1619. Plutarch. de Vita x. x. 6, auctor, apud Spal. tab. ii. p. 832. Fabr. Bibl. Græc. l. ii. c. 62. § 2. l. i. p. 882.

ANTIPHONALLY, from ant., contra, and σως, voice, in respect of church music, imports as much as alternately, or anthem-wife.

The Greeks have a method of singing antiphonally, antiphonos, called by them ἀντιφωνοσ, wherein two persons singing together, and then are silent, and so on.

ANTIPHONY, antiphonarium, a service book which contained all the invitatories, responsories, collect, and whatever else was said or sung in the choir, except the lessons. This is otherwise called responsum, from the responses therein contained. The author of the Roman antiphonary was Pope Gregory the Great.

This is a book containing, in Gregorian notes, the anthems and hymns of the Romish church. The Abbé Fayet, in correction of Rouillé, says that the book only which contains the anthems is styled the Antiphonarium. When the psalms and hymns are understood to be included, it is called vesperalis; when it contains the chants of the mass, it is termed gradual. The procedural book contains the benediction, chant, and processional chants. The funeral chants occupy the ritual.

We also find mention of nocturnal and diurnal antiphonaries, for the use of the daily and nightly offices; summer and winter antiphonaries: also antiphonaries for country churches, &c. By the provincial constitutions of archbishop Wincelicia, made at Merton, A. D. 1305, it is required that one of these should be found in every church within the province of Canterbury.

The use of these, and many other popish books, was forbidden by the 3d and 4th of Edward VI. c. 10.

ANTIPHONY, antiphona, the answer made by one choir to another, when the psalm or anthem is sung alternately between two.

ANTIPHONY, sometimes denotes a species of psalmody, wherein the congregation, being divided into two parts, repeats the psalms, verse for verse, alternately. In this sense, antiphony stands contradistinguished from symphony, where the whole congregation sings together.

Antiphony differs from responsum, because in the latter the verse is only spoken by one person, whereas in the former, the verses are sung by the two choirs alternately. The original of antiphonal singing in the western churches is referred to the time of St. Ambrose, about the year 374. That father is said to have first introduced it into the church of Milan, in imitation of the custom of the eastern church, where it appears to be of greater antiquity, though as to the time of its institution, authors are not agreed. It was most probably introduced at Antioch.

St. Ignatius, who, according to Socrates (E. H. i. vi. c. 8.), had conversed with the 2600, is generally supposed to have been the first who introduced the primitive christians in the east the method of singing psalms and hymns alternately, or in dialogue: dividing the fingers into two hands or choirs, placed on different sides of the church. Socrates, and several of the fathers, pretended, that it was revealed to St. Ignatius by a vision, in which he had seen choirs of angels praising the Holy Trinity in this manner by singing a ternary hymn. The custom from prevailled in every place where christianity was established. But Theodosius (E. H.) li. c. 24 informs us, that this manner of singing was first practised at Antioch. Suidas, under the word συμφωνία, says, that the choirs of churches were, in the time of Constan
tius, the son of Constantine the Great (who reigned from 337 to 361) and of Flavian, bishop of Antioch, divided into two parts, who sung the Psalms of David alternately; a practice, he adds, that began at Antioch, and was thence dispersed into all parts of the christian world. Indeed, it seems, that many of the primitive christians had not any more sublime conceptions of the celestial employment, or the joys of the blest, than that they were eternally singing. The ancient hymn, "Te Deum laudamus," still retained in the church, appears to have furnished the poet Dante with a model of the 25th canto of his "Paradiso," where, under three different hierarchies, confounding each of three choirs or choruses, the heavenly host of cherubim and seraphim are singing perpetual hallelujahs. Milton has also alligned them the fame employment:

"________ Their golden harps they take;
Harps even tuned, that glittering by their side
Like quivers hung, and with preeminent sweet
Of charming symphony they introduce
Their sacred song, and waken raptures high;
No voice exempt, no voice but well could join
Melodious part, such concord is in heaven."

ANTIPHONY is also used to denote the words given out at the beginning of the psalm, to which both the choirs are to accommodate their singing.
ANTPHONY, in a more modern sense, denotes a kind of composition made of several verses extracted out of different psalms, adapted to express the mystery solemnized on the occasion.

ANTIPHONY ad intravmis, that ancienly sung in the interlude of the mas.

ANTIPHONY invitatoria, that repeated at the psalm Venite exultemus.

ANTIPHONAE majores, those seven used to be sung in the time of Advent, at the Magnificant, and during the seven days before Christmas.

ANTIPHONAE processionales, those sung at processions.

ANTIPHONAE regulatae, those rehearsed at institutions.

ANTIPHRAESIS, derived from ἄντι and ἀφράσια, of ἀφανής, I speak, in Rhetoric, a sort of figurative expression, which has a contrary meaning to what it carries in appearance. Or, a kind of irony, wherein we say one thing, and mean the contrary.

Sanctius defines antiphraes to be a form of irony, whereby we say a thing, by denying what we ought rather to affirm it to be: as when we say, "he did not displease me!" or, "he is no fool!" meaning, "I was pleased with it; or he is a man of sense." On this principle the antiphraes ought to be ranked among the figures of sentences, and not among those of words.

It is a common error, to make antiphraes confound in single words; as when we say, that the Parch are thus called by antiphraes, because they spare nobody, "Parch, qui nemini parcunt." St. Jeron, in his epistle to Riparius against Vigilantius, says, he ought rather to be called "Dormitantius per antiphraes," than Vigilantius, because he opposed the christians holding wakes at the tombs of the martyrs.

Sanctius holds it improper to call these antiphraes; because "phraes is not applicable to a single word, but signifies eruditionem, aut locundi modum.

ANTIPHTHISICA, in the Materia Medica, medicines adapted to reful and cure phthisis or consumption.

ANTIPHISUS, in Entomology, a species of papilio that greatly resembles P. Polydorus, but is still a distinct insect. The wings are tailed, black on both surfaces, with seven lunated red spots on the posterior pair. Fabricius, and Donovan's Insects of India.

ANTIPINO, in Geography, a town of Russia, in the province of Saratov on the Volga, 100 miles south of Saratov.

ANTIPLEURITICA, in the Materia Medica, medicines suited to cure pleurisy.

ANTIPODAGRICA, medicines suited to cure the foot.

ANTIPODES, from ἄντι, antith. and πόδι, podis, a foot, in Geography, a relative term, denoting such inhabitants of the earth as live diametrically opposite to one another.

The Antipodes are those who live in parallels of latitude equally distant from the equator, the one toward the north, the other to the south; and under the same meridian, though 180°, or just half of that meridian, distant from one another.

The Antipodes have nearly the same degree of heat and cold; and the same length of night and day; but contrary times: it being midnight with one, when it is noon with the other; and the longest day when it is the shortest with the other.

Again, as the horizon of any place is 90° distant from its zenith, the Antipodes have the same horizon. And hence, when the sun rises to one he sets to the other.

Plato is said to have first-illustrated the notion of Antipodes and likewise to have given them the name; as he conceived the earth to be of a spherical figure, it was easy for him to infer, that there must be Antipodes.

Many, and particularly Laetanius and Angulatus, ridiculed the notion. These fathers are strangely perplexed to think how men should stand pendulous in the air, with their feet uppermost, as they thought they must do in the other hemisphere.

This perplexity was owing to their not considering, that the lowell point, with regard to the inhabitants of our earth, is the centre; and that the terms up and down are relative and merely signify farther from or nearer to the centre, to which all heavy bodies gravitate. If we traversed the globe, we should, in every part of it, have to fly over our heads, and our feet towards the centre; and we should every where call it up over our heads, and down under our feet; although the same right line which is down to us, if continued through and beyond the opposite side of the earth, would be up to the inhabitants on the opposite side.

Our Antipodes may as well imagine, that we stand with our heads hanging downwards, as we conceive that this is their pendulous position; but if we changed places, we should find that we stood equally upright and firm where we were. Nay, the fact is that we, who are now on what we are ready to call the uppermost side of the earth, and so wonder how another, in the situation of our Antipodes, can stand securely on the undermost side, with his head hanging downwards, shall be carried by the revolution of the earth, in the space of 12 hours, to the situation where our antipodes now are, although we shall be as far from them as before; and when we arrive there, we shall find no difference as to our manner of standing: but we shall then see the opposite half of the heavens, and imagine that they have moved half round the earth.

If we may believe Aventine, Boniface, archbishop of Montz and legat. of pope Zachary, the eighth century, declared a bishop of that time, called Virgilius, heretic, for maintaining that there was such a thing as Antipodes.

But this piece of history is controverted by the authors of the Mem. de Trevoux: as having been made use of, it seems, by some persons, to shew that the church has been mistaken in its decisions.

As to the sentiments of the primitive Christians with regard to the Antipodes, some, rather than admit the conclusions of the philosophers, absolutely denied the whole, even the demonstrations of the geometers relating to the sphericity of the earth; which is Laetanius's way. Inlift. lib. iii. cap. 24. Others only called in question the conjectures of the philosophers; which is St. Augurine's method. De Civ. Dc Civ. Dei, lib. xvi. cap. 9. After putting the question, whether there ever were nations of the cyclopes, or giants, or of people whose feet stood outward, &c. he comes to the point of Antipodes, and asks, "whether the lower part of our earth be inhabited by Antipodes?" He made no doubt of the earth's being round, nor of there being a part diametrically opposite to ours, but only disputes its being really inhabited. And the considerations he suggests for that purpose are just enough, as that they who affected Antipodes had no history for it; that the lower part of the earth may be covered with water; and that to place Antipodes there, of a different origin from us (as must be the opinion of the ancients, since they thought it impossible to go from our world to theirs), is to contradict scripture, which teaches, that the whole race descended from one man. Such are the sentiments of that father. It may be added, that the Christian fathers were not the only persons who disputed the truth of the Antipodes. Epicurus and Lucretius had
had done it before them; at the end of his first book, v. 1663, &c. Secundo Librach, E. De Facie in Oboe Luce; and Pope, who writes the opinion, lib. iii. cap. ii.

ANTIPOLIS, in Ancient Geography, now ANTIBES, a city of Gaul, near the river Varus, in Narbonese Secunda, situated on the Mediterranean; built and colonized, according to Strabo, by the Micans, from whose authority it was withdrawn by a edict of the Roman Senate, in the time of Augustus. Others say, that it was taken by them from the Ligurians of Gallo, called Deciani. It was once very considerable, and had a port, a theatre, and many public monuments. See ANTIS.

ANTIPOLITE, a false or pretended pope; or one that is, or is pretended to be, irregularly elected in opposition to another.

Cardis gives the history of no less than twenty-four schisms in the Roman church, caused by antipopes; some took their rise from a diversity of doctrine or belief, which led different parties to elect each their several pope; but the greater part from dubious controverted rights of election, the fruits of chicane and ambition.

ANTIPORTICO is used for one a vestibule, or porch, at the entrance of an edifice.

ANTIPRAXIA, from ant and πράξα, I perform, in the Ancient Physic, denotes a contrariety of functions, temperaments, &c. in different parts of the body; invented to account for that contrariety of symptoms which frequently concur in hypochromia cæsæ, when, e. gr. the liver is charged with being immoderately hot, and the stomach excessively cold.

The moderns, particularly Ettmuller, refute the notion of an antipraxis, on this principle, that the blood circulating duly through the whole body, warms all the parts, as well the stomach as liver proportionally. To which some advocates for the ancient sytem objects, that this is confounding the preternatural state with the natural.

ANTIPREDICAMENTS, in Logic; see Antepredicament.

ANTIPROBABILISM, the doctrine or fystem of those who hold it unlawful to follow the least probable opinion in opposition to the more probable one.

There have been vigorous advocates for antiprobabilism; for even among its greatest enemies, the Jesuits, P. Gilbert has a treatise in favour of antiprobabilism, viz. "Antiprobabilismus, seu tractatus theologicoeedem totius probabilismi flaterram continent," &c. Par. 1701, &c.

ANTIPROBOL, in Rhetoric, a figure whereby the defendant admits or admits the charge brought against him by the prosecutor.

E. gr. supposing the prosecutor's argument to be, "Titus has killed Caisus;" the defendant's antipsebe may be, "I have killed him, but undesignedly." See Antipropemptic. In Pater, a poem wherein a peron going a journey addresses himself to his friends. Such is that of Ovid, lib. i. Trist.

"Cum sibi illius tribuiffe ac sitis image," &c.

It is opposed to P ropemptic.

ANTIPROTASIS, in Rhetoric, a solution of the pro-tasis.

ANTIPSYRA, in Geography, a small island in the Grecian Archipelago, two miles from the island of Ipsira.

ANTIPSYRA, from ant and σύρα, fish, in Pharmacy, remedies prop. against the itch.

ANTIPSYRITIS, a figure in Grammar, whereby one case is put for another.

The word comes from ant, pro, and σύρα, fish.
ANT

Foundations of this kind have often been wished for, and sometimes also attempted, in England.

Sir H. Spelman speaks of a society of Antiquaries in his time, to whom his treatise of the terms, written in the year 1714, was communicated, he himself being one of the number.

The society was founded in 1732, by archbishop Parker, Camden, Sir Robert Cotton, Stowe, and others. Application was made, in 1589, to queen Elizabeth for a charter, and a house wherein they might hold their meetings, erect a library, and the like. But by the death of that prince, their application proved abortive. Her successor, king James I, was far from favouring their design.

In the year 1717, this society was revived again, since which time no interruptions having happened, it is at present in a very flourishing condition; consisting of many learned and ingenious men, of the nobility, gentry, clergy, &c. whose business, as members, is to discover the antiquities of their own, as well as those of other nations.

This society was incorporated by the king's charter, in the year 1751, by the name of the President, Council, and Fellows of the Society of Antiquaries of London; their council consists of twenty-one persons, ten of whom are annually elected: the election of members is by ballot, a certificate signed by three or more fellows being previously exhibited for fix ordinary successive meetings, except in the case of peers, members of the privy council, and judges, who may be proposed by a single member, and balloted for the same day; and the choice is determined by a majority of two-thirds. Every member pays an admission-fee of five guineas, and two guineas a year, or an additional sum of twenty-one guineas. They have weekly meetings on Thursday, from seven o'clock in the evening till nine. This society began to publish its discoveries, &c. in 1770, under the title of "Antiquarian.

A similar association was founded in Edinburgh, in 1783, and received the royal charter in 1793. See Society.

Antiquary is also used, by Ancient Writers, for the keeper of the antiquarium, or cabinet of antiquities.

This officer is otherwise called archæus, or antiquary, of a king, a prince, a flate, or the like.

Henry VIII. gave John Leland the title of his antiquary, a title which, says the author of his life, no body ever enjoyed besides himself. But the restriction, we suppose, was only intended to be understood in respect of the kings of England. M. Schott, we find, had the title of antiquary to the king of Prussia; P. Pedruzzi, that of antiquary to the duke of Parma; M. Gallant, held some time in Turkey, under the title of antiquary of the king of France. The university of Oxford have still their antiquary, under the denomination of cypher archivorum. The kings of Sweden have been at great expences in order to illustrate the antiquity of their country, having established an academy of antiquaries with this single view.

The office of the ancient Irish antiquaries was to preserve the genealogies of the kings of Ireland, to correct the regal tables of succession, and deliver down the pedigree of every collateral branch of the royal family.

P. Lübce and Petavius have published pieces expressly concerning the apparatus of antiquaries.

ANTICATA, in Conchology, a species of arca, that inhabits the Mediterranean, Indian, and American seas. The shell is obliquely heart-shaped, with many unarrow grooves Linnaeus, Gmelin, &c. This kind is rather large, white, and covered with a hairy epidermis; a compressed prominent angle in the anterior sipe.

ANTIQUE, a species of chama, found in the Atlantic.
that over his finished picture he spread a transparent liquid like ink, of which the effect was to give brilliancy, and at the same time to lower the too great glare of the colour: 'Quod absoluta opera igne illuminata in suis, ut si id ipsum percurritis claritatis colorum excensis.'—Et tu vatia magno né colorum claritas oculorum aciorem offendidur. This palliative, though it may possibly perplex the critics, is a true and artful like description of the effect of glazing or feigning, such as was practised by Titian and the rest of the Venetian painters: this custom, or mode of operation, implies at least a taint of what the excellence of colouring confisits, which does not proceed from fine colours, but true colours; from breaking down those fine colours which would appear too raw, to a deep-toned brightness. Perhaps the manner in which Correggio practised the art of glazing was still more like that of Apelles, which was only perceptible to those who looked close to the picture, ad manum intuiti demum apparet; whereas in Titian, and still more in Baffano and others his imitators, it was apparent on the first glance: artists, who may not approve of glazing, must allow, that this practice is not that of ignorance. Another circumstance which tends to prejudice me in favour of their colouring, is the account we have of some of their principal painters using but four colours only. I am convinced the fewer, the cleaner the will be the effect of those colours, and that four are sufficient to make every combination required; two colours mixed together will not preserve the brightness of either of them single, nor will three be as bright at two: of this observation, simple as it is, an artist, who wishes to colour bright, will know the value. In regard to their power of giving peculiar expression, no correct judgment can be formed; but we cannot well suppose that men, who were capable of giving that general grandeur of character which so eminently distinguishes their works in sculpture, were incapable of expressing peculiar passions. As to the enthusiastic commendations bestowed upon them by contemporaries, I consider them as of no weight. The well words are always employed to praise the bell works: admiration often proceeds from ignorance of higher excellence. What they appear to have most failed in is composition: both in regard to the grouping of their figures, and the art of disposing of the light and shadow in masses. It is apparent this, which makes so considerable a part of modern art, was to them totally unknown.

"If the great painters had possessed this excellence, some portion of it would have infallibly been diffused, and have been discoverable in the works of the inferior ranks of artists, such as those whose works have come down to us, and which may be considered as on the same rank with the paintings that ornament our public gardens. Supposing our modern pictures of this rank only were preferred for the inspection of connoisseurs two hundred years hence, the general principles of composition would be still discoverable in these pictures; however feebly executed, there would be seen an attempt to an union of the figure with its ground, some idea of disposing both the figures and the lights in groups. Now, as nothing of this appears in what we have of ancient painting, we may conclude that this part of the art was totally neglected, or more probably unknown."

"They might, however, have produced finge figures, which approached perfection both in drawing and colouring; they might excel in fobo (in the language of musicians), though they were probably incapable of composing a full piece for a concert of different instruments."—Reynolds's Notes upon Trench, note 27, verse 250.

Antique, in Sculpture, a statue, busto, basso-relievo, or other work, the production of ages prior to the fall of the Roman empire; a term chiefly applied by sculptors to the works of the ancient Greeks and Romans.

The statues of the ancients were very numerous, chiefly arising from their custom of defacing and erecting statues in honour of almost all the heroes and celebrated characters among them. But the Romans seem to have surpassed the Greeks in the number of their Gods. "There was no place in Rome," Livy observes, "which was not full of gods and fachifices;" and for this reason, Quintilla says, "our country is so full of deities, who honour it with their presence, that it is more easy to find a god than a man."

Antique sculpture is universally supposed to be far superior to the productions of modern times: it is certain, that the best antiques greatly surpass modern sculpture in general; but it is equally true, that the bell modern works exceed by far the majority of the ancient. And here it may not be improper to remark, that the different casts in plaster, and specimens in marble which are brought to England from abroad, are carefully selected from the casts of productions; and therefore an Englishman is not usefully aware of the deficiencies that are attached to the bulk of the works which remain abroad.

One considerable advantage which antiques possess above modern productions is, that they are in general works of much longer time. It was in many instances among the ancients considered sufficient for one sculptor to have executed four or five statues in the course of his life; hence we find, that the most celebrated marbles of antiquity are finished to a degree that will bear the closest inspection, and will appear equally complete in all the different lights in which they may chance to be placed. Another advantage of the antique above the modern is, that they are the works of artists, who were continually in the habit of viewing nature half or quite naked, owing to the scanty clothing of the lower orders of people in the climates of Greece and Italy: the artists were able to study these fine examples of nature while in action, as running, wrestling, boxing, and playing at the several athletic games and exercises of those times; and especially in the gymnasia or public places, where the youths performed their various feats quite naked. Here all the different motions and beautiful play of the muscles, together with an amazing variety of postures and attitudes, were exhibited to the attentive observer; and with a dignity, truth, grace, and expression, that can never be imitated by those meritorious models, that felt their ignoble nakedness to the artists in our modern academies. The clothing of those days, being light and scanty, did not confine and disfigure the body, as unfortunately is the case in modern times. They had also, it report be true, peculiar advantages in the statues of some of their goddesses; as it has been asserted, that even the modest women of those days considered themselves honoured by being allowed to sit as models for a goddes: and that in consequence of this, noblemen of the first distinction would bring their daughters to the artist for that purpose; report has also gone so far as to state, that not less than four hundred young women of the first rank and greatest beauty flocked to the sculptor who executed the Venus de Medicis.

In many inances, the ancients seem to have bestowed as much labour on the subordinate parts of their statues as on the principal; hence we very often find the fingers, toes, nails, ears, and hair as highly finished as the face or body; whereas, modern sculptors in general are apt to bellow their labour upon the more important parts, to the neglect of the inferior. But in many other inances the ancients neglected, to a very inexecusable degree, what they conceived to be of subordinate consideration: the following remark in one of the lectures of Sir Joshua Reynolds, is a sufficient evidence of
of this fact. "The ancient sculptor," says he, "neglected to animate the features, even with the general expression of the passions. Of this, the group of the boxers is a remarkable instance; they are engaged in the most animated action with the greatest ferocity of countenance—this frequent deficiency in ancient sculpture could proceed from nothing but a habit of inattention to what was considered as comparatively immaterial."

But it is nevertheless proper to remark here, that the ancients in their busts, where the face became the principal object of attention, excelled to a great degree; and undoubtedly surpassed modern sculptors far: their treatment of the human countenance, displayed in the beauty and dignity of some of their heads and busts, is beyond description; they were acquainted to the smallest nicety with the effect of every expression, and were perfect masters of the art of bringing each into full effect.

Simplicity is a great characteristic of antique sculpture in general: this principle is attached not only to the attitudes of their figures, but to the disposition of the drapery, the hair, and every other attribute: fearse an infall of the entré or extravagant is to be found among the finer antiques. But this principle, however beautiful, was often carried too far: and in many instances rendered their works stiff and unintelligible, which may certainly be considered the chief defect of antique sculpture. The ancients, in order to preserve dignity and majesty in the statues of their gods, heroes, emperors, philosophers, and other great characters, often placed the head and body of the statue in an upright position, which in very many instances bordered upon stiffness; and by purposely avoiding every trifling turn or angle in the drapery that might tend to destroy its simplicity, they were sometimes drawn into the opposite error: we therefore find in many instances, though each may be beautiful in itself, that their drapery is composed of a continued repetition of long and straight lines.

There is a subordinate mistake attached to many of the bell as well as to the inferior antique statues; where, in order to strengthen them, the stump of a tree, or a piece of rock is introduced, as incorporated with the flesh of the limb againhil which it is placed; whereas, it is evident that some drapery or other disguise should be thrown over the support, to conceal an effect to awkward and unnatural.

There was also a great degree of falsity taken among the ancients, manifested in their custom of introducing metallic eyes, and working the heads, hands, and feet of some of their statues in marble of a different colour from the other parts of the figure; but this mistake does not belong to their principal and most celebrated works.

For some account of the chief antique statues, see the following articles:

Ceres. Laocoön. Torso.
Cupid. Mars.
Difcobolus. Marlia.

See also Sculpture and Statue.

ANTICUENSIS, or ANTIGUENSIS, in Entomology, a species of Aphis that inhabits the islands of Antigua. It is hairy and black; thorax and anterior part of the abdomen yellow. Fabricius and Gmelin.

ANTICUENSIS, rather ANTIGUENSIS, is also a species of Mutilla that inhabits Antigua, and is described by Fabricius and Gmelin. It is red, abdomen black at tip, and streaked with white.

ANTQUITY, ANTIQUITY, is used to denote the times or ages past long ago.

Thus we say, the heroes of antiquity, the marks or foot-steps of antiquity, monuments of antiquity, &c.

ANTIQUITY is also used to denote the works or remains of ancient times. See Monument, Remains, Ruins, &c.

Thus we say, a fine curios piece of antiquity; Italy, France, and England, abound in antiquities.

ANTIQUITY is also used to denote the great age of a thing, or its duration from times of old.

In this sense we say, the antiquity of a kingdom, a custom, or the like; most nations lay claim to an antiquity much greater than they can truly warrant. The present age may be said to be the antiquity of the world; which was but new in what are commonly called the ancient times, according to the received chronology.

There are great disputations concerning the antiquity, or age of the world.

Ariftingale carried it even to eternity; Parmenides, Pythagoras, and the Chaldeans, were of the same opinion: but the generality of philosophers, as well as divines and historians, have always held an origin of it; though where to fix that origin is the difficulty. The different systens of the chronology of the Greeks, the Egyptians, the Jews, the Hebrew Text, and the Septuagint version of Scaliger, of Dr Isaac Newton, &c. to say nothing of the Chinese annals, leave the point infinitely embarrased.

Dom. Pezon thinks he has merited well of the public by adding 2000 years to the age of the world, which had been taken from it by Scaliger and others; but this did not hinder P. Martinay from entering a prosecution against him in the archbishop's court of Paris for hereby. His crime was following the Hebraen rather than the Hebrew chronology, in which however he was preceded by the generality of the fathers and primitive writers of the church; among whom it appears to have been a common practice, to make 5000 years between the creation and the incarnation. In reality, the Jews are charged with having corrupted their chronology; by which the moderns have been misled.

Some have proposed to trace out the antiquity of the earth, by an observation of the thickness of the Ice; others by observing the elevation of the bottom of the Sea, or the growth of its frusta. One mark or proof of antiquity has been started by Rudbeck, which he pretends to have carried to a demonstration; it is taken from the thickness of a certain black crust, called in the Swedish tongue, mat-iordan, or cast-iron, which covers the surface of the earth, being formed of a mixture of rotten gravel and other herbs, with dust and a kind of mud, which the melted snow leaves behind it. According to this antiquity, there are at least 5000 years requisite to form an inch thick of this crust, which in many places of Sweden is found to be upwards of seven inches thick, where horns have been dug up full of bones and ashes. From whence it follows, according to this author, that it is upwards of 3500 years since burning the dead was practised in Scandinavia.

Recupero, the historiographer of Ætna, suggests an argument in favour of the antiquity of the earth from the several frusta of lava that have issued at different times from this mountain. A stream of lava, which Diodorus Siculus relates to have burst out in the time of the second Punic war,
ANT

is covered at this day only with a very scanty foil; and in digging pits and wells, several strata of lava have been discovered with earth to a considerable thickness over the surface of each stratum; in one instance, seven distinct faces of this kind were pierced; and allowing 2000 years for the interval between two eruptions, the lava that composed the first or lowest stratum, must have flowed from the mountain above 14,000 years ago. Brydon's Tour, &c. vol. i. p. 131.

But this argument is very fallacious, because we learn from Sir William Hamilton's remarks on the island of Naples, that since the first eruption of Vesuvius, which destroyed the ancient town of Herculanenum in the year 79, there have been six eruptions of lava, forming as many different strata, with veins of good foil between them. Phil. Trans. vol. lx. No. 1. See Addenda.

There is scarce a nation under heaven but lays claim to a greater degree of antiquity than the rest of its neighbours; the Scythians, the Phrygians, the Chaldeans, Egyptians, Greeks, Chinese, &c. pretend each to have the honour of being first inhabitants of the earth; several of these nations, left they should be outstripped in their pretensions by any of the rest, have traced up their origin to ages long before the received account of the creation. Hence the appellations aborigines, indigenes, terrigenes, autelulneres, &c. The Athenians were not allowed to pretend to be autarchiotes; and what is most remarkable, Socrates himself gives them this ridiculous appellation, which, as some others of the philosophers have wisely observed, only put them on a level with ants and grashoppers. Mem. Acad. Infer. tom. vii. p. 429.

The Chaldeans pretend to astronomical observations of 47,000, or 47,000 years; they mention the precise king who reigned over them at the time of the deluge, whose name was Xilithus, and attribute to him several things which we ascribe to Noah.

The Chaldaic antiquities of Herofus are lost, except a few fragments which have been collected by Jof. Scaliger, and since more fully by Fabricius. Ammius of Viterbo, a Dominican monk, towards the close of the fifteenth century, would not suffer us to want such a treasure, but officiously went to work, and forged a Herofus out of his own brain, which he published at Rome in 1448. The monk went farther; and from the same mint soon after produced Manetho's supplement to Herofus, from the time of Aegyptus king of Egypt, to the origin of the Roman state. The milhiedis, Manetho lived before Herofus; this anachronism alone had sufficed to betray the cheat.

St. Augustine baushe at the folly of the Egyptians, who pretend to observations of the stars above 100,000 years old: in effect, no people appear to have been warmer in the contetl for antiquity than those of Egypt. They pretend two periods of time; one shorter, during which the throne of Egypt had been filled by men; the other almost indefinite, wherein gods and demi-gods had worn the crown. From Isis and Osiris to Alexander they reckoned a space of 27,000 years, the time before that, while the gods reigned, made 43,954 years more; the whole duration from the beginning of their monarchy amounting to 65,954. De Civ. Dixi, lib. xviii. c. 45.

The computation of their dynasties, as given by Manetho, a writer of their own (of whom we have extracts in Synel- lus, taken from Julius Africanus and Eusobius), extends to 55,50 years before Alexander's time; and the Egyptian chronicle, cited by the same Synellus, goes farther, reckoning 36,525 years. Diogenes Laertius makes no less than 48,993 years from the reign of Vulcan. Yet the Scythians, the Phrygians, the Ethiopians, and some others, still insist on their priority to the Egyptians; and in the judgment of many seem to have carried their point. Julius, after Trogus, gives the precedence to the Scythians; and affirms, that they were always allowed to have been before the Egyptians.

It is no wonder that their catalogues should be ridiculously incredible, when the Egyptians made their first kings reign 1200 years a piece; and the Assyrians 4000.

But the Chineses, the most ancient monarchy in the universe, have cultivated the sciences from the earliest ages, and published at least those 4000 years with the same laws, manners, and usages.

Some indeed have called in question the truth and authenticity of the Chineses annals; yet we find them confirmed, at least as high as 662 years before Chrilt, by the annals of Japan. At worst, the Chineses antiquities stand on as good a footing as those of either Greece or Rome. Their annals, both for order and chronology, are not inferior to any of those ancient for much admired among us; but far surpass them in point of antiquity, and have a better title to be credited, as having written by public authority, which can be said of few Greek or Roman pieces, except perhaps the Capitoline Marbles, which are not properly a history.

We have no inconceivable confirmation of the truth of the Chinese account, from an ancient observation of a grand conjunction of the planets under Chuen-Hio, emperor of China, related by Mattius. That prince lived 2513 years before Chrilt. M. Kerschius has defended the observation against Callinius, and thrown a conjunction must really have happened at the time mentioned by the Chinese annals.

But the authenticity of this observation, and the whole of the Chinese chronology, has been attacked by an ingenious author, Mr. Coltar.

Dionysius Halicarnassius has traced the Roman antiquities, Josephus the Jewish antiquities, Berosus the Chaldaic antiquities, Sanchoniathon the Phcenician antiquities, Manetho and Mariham the Egyptian antiquities.

The Phcenician antiquities of Sanchoniathon are preferred in part by Eusebius. We have an English translation of Sanchoniathon, with notes, by bishop Cumberland, and a continuation from the canon of Eratosthenes. Lond. 1720, 8vo.

Dionysius gave his book the title of Roman Antiquities, on account of the curious inquiries he had made concerning the origin of the Romans, by tracing them back to the remotest ages. For fidelity as well as instruction he is generally preferred to Livy; his accounts are more ample, and his facts defended with more particularity; he gives a full idea of the Roman ceremonies, the worship of their gods, sacrifices, manners, customs, discipline, policy, arts, laws, &c.

To the clasfs of supposititious antiquities belong the Hetrurian antiquities, pretended to have been found by Scornaelli near Volaterra; and published in 1656, by Curtius Ignir- ramus, who is generally supposed to have been the forger of them. A great number of fictitious names of ancient authors are cited in this book to give the better face to the cheat; but the style betrayed it. Allutius and Ern- Flus early detected the imposture. Fabr. Bibl. Lat. lib. iv. cap. 15.

The British antiquities, before Caesar's invasion, are utterly dubious, not to say fabulous. Old chronicles speak of Samo- thes, the son of Japhet, as the founder of the British monarchy; Albion, a descendant of Cham, invaded it three hundred years after; and about 6000 years after this, Brutus, grandson
grandson of Aeneas, came and took posseffion of the island in
the year of the world 2880, giving it the name which it still
retained when Cesar made his attempt. This is Geoffrey of
Monmouth's fytem of the antiquities of the British nation,
which the generality of our historians admit, for want of a
better. It has been defended by A. Thomson of Queen's
College, in the preface to his English translation of that
writer.

It must not be forgot that the Irish also pretend to be the
most ancient of all nations; they trace their origin without
interruption up to Japhet. But the Scots still dispute their
priority with them, holding themselves to be an elder branch
of the Scythinns, the first of men.

The antiquity of religion has been often urged as a proof of
the truth of it. Jews, Gentiles, Chriftians, Protestants,
Papists, have all in their turns made use of the argument
from antiquity. It is indeed of the artificial kind; and
comes rather under the denomination of a presumption than
a proof: on the whole, it seems to have served the caufe of
error as much, if not more, than that of truth.

Antiquity is more peculiarly used to denote the cere-
monies, customs, and ufages, which obtained in ancient
times, either with regard to perfons, places, or things.

Antiquities, in this fente, are usually divided into fecred,
political, military, literary, and domestic; sometimes only
into civil and ecclefiafal.

Antiquities, fecred, thofe relating to the religious
worship, discipline, and belief of ancient times and people.
These may be subdivided into Heathen, Chriftian, and Ma-
hometan, &c.

Reland has a treatife expressly on the fecred antiquities of
the Jews: Struvius on thofe of the Romans; Lickemacher
on thofe of the Greek; and Stillingsfleet on thofe of the
British churches.

Fabricius has given two plans of a thesaurus or body of
antiquities; the one of Hebrew antiquities, after the manner
of Graevius and Gronovius: the other of ecclefiafal anti-
quities, divided into twelve books. He gives the names and
titles of 150 authors to be included in the first, and 101 au-
thors for the second.

Antiquities, Chriftian, thofe which relate to the an-
cient flate of the Chriftian church.

These are the fame with what we otherwise call ecclefia-
fical antiquities.

The Magdgborg centuries are looked upon by perfons as
a librarv of Chriftian antiquities.

Mr. Bingham has published a learned fytem of Chriftian
antiquities.

As a principal branch of Chriftian antiquities, we may
reckon,

Antiquities, Biblical, the notices of ancient laws, ce-
monies, events, &c. occurring in the Scriptures.

These make a branch of ecclefiafal antiquities, and bear
a near relation to the Jewish, &c. antiquities.

Some pretend to deduce moit of the heathen antiquities from
the Bible; others, as Spencer, &c. take the contrary
course, and deduce the antiquities of the Bible from those of
heathenifm.

To interpret Scripture, it is absolutely necessary regard be
had to the heathen antiquities alluded to in them, and thofe
not only fuch as are directly aimed at or approved, but also
fuch as are purposely opposed.

Dr. Cave has published a treatife of apoftolical anti-
of the Apoftles, Evangelifts, &c. Lond. 1674, fol. 1684,
and 1686.
of Europe, and is admitted as a British herb. There are three supposed varieties of it figured by Seba, Martin, and Loddiges, and the nuculus eurynus of Pennant has been confounded as an accidental growth of the same species; but the last is certainly distinct. Vide Don. Brit. shed. p. 110.

The thistle is from four to six inches in length, of a yellowish colour, finely cancellated with transverse thrie and longitudinal plait; it has two or more angular ridges along the whorls, which are tuberculated.

ANTI-RATIONALISTS, a name sometimes given to divines, who in matters of religion are for humble reason, and making it bend to faith, alleging that the absurdity of a thing is no reason for rejecting it.

In this sense, the rigid Calvinists and adherents to the fy-thod of Dort have been denominated anti-rationalists, on account of the doctrine of absolute predetermination, &c. The Roman Catholics are also entitled to the same appellation, on account of the doctrine of transubstantiation. M. Bayle took shelter in the system of the anti-rationalists, the better to combat the Christian doctrines of the origin of evil, providence, &c. But this, like other offensive appellations, has been very indifferently applied; it has been uncandidly used as a term of reproach; and reason, the first endowment conferred on mankind by their Creator, though unduly depreciated by some, has been extravagantly extolled by others, who have been enabled to extend and improve the exercise of it, especially in the province of religion, by the extraordinary communications of a divine revelation.

ANTI-RHODUS, in Ancient Geography, a small island situated within the port of Alexandria, in Egypt, whither Antony retired in despair, after the battle of Actium. After the example of Timon the misanthrope, he withdrew into intercourse with mankind, and called this recluse habitation Timotheum.

ANTIRRHEA, in Botany. See Cunninghania.

ANTIRRHEIUM, from ari and rham, I speak, in Literary History, denotes a refutation of some book, author, or opinion. In this sense we also meet with the word antirrhis.

ANTIRRHENUM, in Botany, ari, equalis, and fi, una. Quod fructu fit unui narium himile; hence it has been called calves-smout; chas didymaia angijoflora. Linn. Gen. 735. Garrn. 53. Juff. 120. Snap-dragon, or toad flax; natural order, perifomae.

Generic Character. Calyx perianth five parted, permanent; divisions oblong, the two lower more gaping than the others; corolla monopetalous, ringent; tube oblong, gibbous; limb bilabiata; upper lip bind, reflex on the sides; lower limb trifid, obtuse; palate convex, usually closed by a prominence between the lips, arising from the under lip; nectary at the base of the corolla produced downwards, prominent; filaments four, two of which are shorter; anther converging; phyllium, germin roundish; style simple, of the length, and in the situation of the filaments; stigma obtuse; pericarpium, capule roundish, two-celled; seeds numerous.

Essential gen. Character. Calyx five-leaved, corolla with the base produced downwards and eccentric; stamens two-celled.

Fifty-two species of this plant are described, only eight of which, according to Dr. Smith, are the spontaneous growth of this country.

Species. 1. A leaves angular. 1. A. symbolorum, ivy-leaved toad-flax; leaves heart-shaped, five-lobed, alternate; flaxks proeminent; the root is perennial, from which fleshy long, decumbent, spreading flaxks, bearing violet-coloured small flowers, with a yellow palate: it is a native of Britain, growing on crevices of rocks and old walls; hence this plant is well adapted for the ornament of rock work; it flowers from June till October. Figured in Curt. Flor. Lond. fasc. ii. 47. Eng. Bot. 521.

2. A. polyanthum, hairy-leaved toad-flax, leaves hairy, flat, very hairy, alternate; flaxks proeminent; the edge of the leaves divided into one or ten obtuse cumulate lobes; a native of the Mediterranean region. J. Bot. 431. 3. A. ombrosa, hairy, pointed toad-flax, or flaxk, leaves oblong alternate; flaxks proeminent; calyx and leaves hairy; corolla upper lip purple underneath: a British annual, growing in fields, and flowering from July till October. Curt. Flor. Lond. fac. i. 46. Eng. Bot. 692. 4. A. floribundum, round-leaved toad-flax, or flaxk, leaves ovate alternate; flaxks proeminent; this plant is hairy; the upper lip of the corolla is yellow, the under purple: it is an annual British plant, growing among corn, and flowering from July till September. Curt. Flor. Lond. fac. iii. 37. Eng. Bot. 665. 5. A. caesalpinium, tendrilled toad-flax, leaves oblong alternate; flaxks spreading; petioles tendril-like; flaxks filiform, very branching; pudesces axillary, one-flowered; corolla bluish, with a white palate fpitted with purple; annual: a native of Egypt; introduced in 1775, by Dr. Joseph. Nich. de Jacquin. Jac. Hort. t. 82. 6. A. corymbosum, Egyptian toad-flax, leaves oblong alternate; flaxk erect, and much branched; this very much resembles the third species; it is an annual plant, a native of Egypt.

**Leaves opposite. 7. A. triphyllum, three-leaved toad-flax, leaves ternate, ovate; an annual plant, rising with an upright branching flaxk, more than a foot high; leaves oval, in threes, sometimes in pairs, flowers yellow, with fawon-coloured lips: a native of Sicily; a variety of this has a purple standard and spur; this species has been cultivated here since 1940. 8. A. trinerviflorum, leaves in fours, lanceolate; flaxk erect, branching; flowers pedunculed; it grows more than five feet high, bearing large purple flowers: a native of Portugal and America.

9. A. purpureum, purple toad-flax, leaves quaternate, linear; flaxk erect, flower-bearing, spiket; a perennial plant, rising two feet high; it is a native of Italy; and cultivated in the Oxford garden, in 1648. Curtis Magaz. 99. 10. A. vespertine, leaves linear-lanceolate; the lower ones ternate; flaxk erect, spikes; it resembles the A. linearis, or common toad-flax, except that the upper lip is white, and the flowers racemose; a native of the south of Europe, and introduced, in 1775, by Mont. Thomin. Jac. l.c. rar. 10. 11. A. repens, leaves linear, glaucescent, villiferous, or scattered; flaxk panicle; calyx smooth, of the length of the spur; corolla of an ash-coloured white; under lip streaked with purple: a perennial British plant, flowering from July till September. 12. A. monspellicum: this, according to Dr. Smith, is the same plant as the repens. 13. A. fruticosum, branching toad-flax, leaves falcate, channelled, fleshy, the lower ternate; flaxk panicled; corolla very smooth; flaxk about a foot high, smooth, erect, stiff; flowers racemose, yellow, with a tinge of red at the palate; a native of Spain, and introduced in 1775, by Mr. Richard. Curt. Bot. Mag. 200. 14. A. bipinnatum, dotted toad-flax, leaves linear, smooth, the lower quaternate; flaxk erect, panicled; flowers spikes-headed; an annual from four to eighteen inches high, bearing yellowish flowers, spotted with brown on the lower lip: a native of France and Spain; introduced by M. Thomin in 1777. 15. A. triste, dark-flowered toad-flax, leaves linear, scattered, the lower opposite; nectary falcate; flowers subfusce; flaxk eight inches long, decumbent; flowers of a dark purple. Curtis Magaz. 74: a native of Spain; introduced in 1777, from Gibraltar, by Sir Charles Wager.

16. A.
16. *A. fujinum*, procumbent toad-flax, leaves sub-quaternion, linear; leaf-diffused; flowers racemose; spur straight: a native of France and Spain; cultivated by Miller, in 1728. 17. *A. arvensis*, yellow corn toad-flax, leaves sub-linear, lower quaternate; calyx hairy, viscid; flowers spike; stem erect, a spain high; the colour of its flowers varies blue and yellow; according to Hudson, it is a native of Britain. 18. *A. pellestrinum*, violet-coloured toad-flax, stem-leaves linear, alternate; root leaves lanceolate, ternate; flowers corymbed; an annual, eight inches high, with purple flowers; a native of France and Italy. 19. *A. faxattile*, rock toad-flax; leaves lanceolate-linear, scattered villose; the inferior quaternate; stem decumbent; flowers spike; a perennial, with yellow flowers, having two orange spots on the palate; a native of Spain. 20. *A. virgineum*, chammy snap-dragon, root leaves quaternate, lanceolate; stem-leaves linear, alternate; calyx villous; about eight inches high; a native of Spain; introduced by M. Thouin, in 1785. 21. *A. multiflorum*, many-flaked toad-flax; leaves linear, piliferous; flowers headed; an annual plant, about a foot high; with several flowers, bearing either deep yellow, or sulphur-coloured flowers; a native of the south of Europe; and cultivated by Miller, in 1727. 22. *A. glocum*, leaves quaternate, fabulata, piliferous; stem erect; flowers spike; a small annual, with yellow flowers; spur pale, or striped with blue; a native of the south of Europe. 23. *A. apiaceum*, alpine toad-flax, leaves quaternate, linear-lanceolate, sea-green; stem diffuse; flowers racemose, four bract; perennial; it has a stem about five inches high; flowers of a violet-purple colour, and of a deep yellow in the middle. Curtis Mag. 207. A native of the Alps. 24. *A. bicurum*, horned toad-flax, leaves opposite, ovate-oblong, serrate; stem erect; flowers spike; capsules two-horned; it grows a foot and a half high, bearing blue flowers, with a yellow mouth; a native of the Cape; and introduced by Mr. F. Maillon, in 1774. annual. 25. *A. villifolium*, leaves all opposite, ovate, villose; stem simple; flowers opposite, lateral; a perennial with yellow flowers; introduced by Sir Francis Drake, in 1785; a native of Spain. 26. *A. origineum*, leaves mossy opposite, oblong; flowers alternate; an annual, polymorphous plant, varying with lanceolate leaves. It grows wild on the Pyrenees; it was introduced by Lee and Kennedy, Hemmerith, 27. *A. pinatllum*, leaves opposite, pinnated; stem erect; flowers racemose; found at the Cape, by Thumberg. ***Leaves alternate. 28. *A. minus*, leaf toad-flax; leaves mossy alternate, lanceolate, obtuse; stem very much branched, spreading; calyx longer than the spur; stem erect, branched, villose, villose; flowers small, violet coloured, with the under-lip white, and palate yellow, growing on assyria peduncles; it is a British perennial plant; found in corn fields and sandy pastures. Curtis. Lond. 541. 29. A. dalmaticum, leaves alternate, heart-shaped; stem clapping; stem woody, three feet high; flowers large, yellow, axillary; a native of Crete. 30. *A. hirtum*, leaves lanceolate, hairy; flowers spike; the upper leaf of the calyx large; an annual, rising with a single flax a foot and a half high; flowers of a pale yellow colour, with dark stripes, and deep yellow lips. Miller received the seeds of this species from Madrid. Jac. ic. rar. t. 117. 31. *A. gynelyctosum*, broun-leaved toad-flax, leaves lanceolate acuminate; panicle flender, flexuose; stem erect, much branched, three feet in height; flowers of a bright yellow colour, in loose spikes, and resemble those of the Linaria (32); perennial or biennial: a native of Siberia, Austria, Switzerland, &c.; cultivated by Dr. Sherard, in 1732. Jacq. Flor. Auct. t. i. f. 242. 32. *A. juncum*, rush-like toad-flax, leaves linear, alternate; stem panicled, flender; flowers racemose; upper-lip of the flowers white, with blue stripes; lower a pale yellow; found in Spain; introduced by M. Thouin, in 1728. 33. *A. linearium*, common yellow toad-flax, leaves lanceolate-linear, crowded; stem erect, spike; calyx smooth, shorter than the spur; it is a common well-known plant, which, from the colour of its flowers, is vulgarly called butter and eggs. Woodly. Med. Bot. suppl. 221. Eng. Bot. 638. 34. *A. isnifolium*, leaves lanceolate, three-nerved; flowers racemose; peduncles distinct; shorter than the bracteae; flowers yellow; spur the length of the flower; it grows wild on the sea-coasts of Italy; perennial. 35. *A. chalcedonicum*, white-flowered toad-flax, leaves linear-lanceolate, alternate; flowers in racemes; calyx longer than the corolla; stem erect; an annual plant, growing two feet high; the flowers are small, white, with long spurs, produced singly, almost extending over the whole branches; a native of Italy; and cultivated in the Oxford garden, in 1680. 36. *A. reflexum*, leaves ovate, smooth; peduncles axillary, fruit-bearing, elongate, recurved; stem procumbent; this annual plant rises with infirm procumbent stems, seven inches high, bearing white flowers, with a yellow mouth, placed on solid peduncles; it grows near Meffina; and was discovered in Barbary by Branden. 37. *A. pedunculatum*, leaves linear remote; flowers panicled; peduncles longer than the leaf, fluff, upright; leaves seven inches high, bearing branching; flowers yellow, streaked with blue; a native of Spain. 38. *A. lappopodium*, leaves crass, foet, recurved at the tip; spikes ovate, villose; flowers herbaceous, nearly a foot high; leaves lanceolate-linear, flowers small, yellow with two orange spots within the palate; a native of Siberia. ***No leaves. 39. *A. aphylum*, a capillary midne; this is a very singular plant, resembling a kind of moss (*pinchanum*); no part of it produces any leaves: found near the Cape by Thumberg. *****Corollas gaping, or tail-lefs. 40. *A. majus*, great toad-flax, or snap-dragon; flowers without tails, in spikes; calyces obtuse, villose; stem from one to two feet high; leaves lanceolate or ovate; flowers violet, lower lip white, mouth yellow, spur very short pointed; a British annual, growing in sandy ground, and flowering from June till August. Eng. Bot. 120. 41. *A. orontium*, lefter toad-flax, corolla without a tail; flowers sub-pripled; calyces digitate, longer than the corolla; stem erect, a foot high; leaves lanceolate; corolla a pale purple; lips rose-coloured; palate yellow; spur very short, obtuse; this much resembles the preceding species; it is a British annual, affecting a sandy and calcareous soil, and flowering from July till August. Curtis, Lond iv. 45. 42. *A. papilionaceum*, corolla tail-lefs; flowers axillary; calyx papilionaceous; leaves flagellate; leaves ovate, entire, alternate; calyx five-leaved; upper lip of the corolla bend, lower trident: a native of Perlia. 43. *A. aferina*, heart-leaved toad-flax, corollas without tails; leaves opposite, heart-shaped, crenate; stems procumbent; a low, trailing annual; flowers of a dingy purple colour above; below greenish; a native of Italy and the south of France; cultivated in 1669, by Jacob Bobart. 44. *A. molle*, woolly-leaved toad-flax; corollas without tails; leaves opposite, ovate, tomentose; stems procumbent; flowers white villose; upper lip streaked with red; a native of Spain; cultivated by Miller, in 1748. 45. *A. unilibiatum*, corollas without tails, furnished with two calluses; leaves alternate, pinnate; stem panicled; found near the Cape, by Thumberg. *****Corollas gaping. 46. *A. bellisulphurum*, daily-leaved toad-flax, root leaves tongue-shaped, toothed, marked with lines; stem-leaves partite, entire; flowers very small, in a long spike, which frequently contains one hundred flowers; it is a biennial or triennial, with branched stem, two feet high: a native of the south of Europe; and cultivated in England, in 1629. 47. *A. Ca. wadeni*,
ANT

Canada toad-flax, leaves linear, alternate; lower lip of the corollas spreading out, flat; an annual, with a filiform item, about a foot high; flowers racemose, alternate; a native of Virginia. 48. A. microanthum, small-flowered toad-flax, item herbaceous, erect; lower leaves quartenary, upper alternate; flowers very small; spur short, interior; an annual, with very small blue flowers, having a white palate; they are axillary, dilant, solitary, terminating the item; a native of Spain, near Madrid. 49. A. reticulatum, leaves linear, channelled, laciniate; those on the radical florets generally in five; flowers-flawks shorter than the bract; flowers thrice as long as the calyx; spur conical, acute, a little curved, the twice length of the peduncle, yellow, thread; upper lip erect; segments acute, divergent, thread; before expansion purple, changing to a blood-red, and afterwards violet-coloured; it is perennial, with herbaceous branched erect items, having its radical flowers proflate, and producing only one flower on each peduncle placed alternately; discovered at Algiers, whence it was sent to the royal garden at Paris, by professor Desfontaines. Its seeds were transmitted to Dr. Smith by Mr. Thouin; and from these seeds several plants were produced, in Chelsea garden, by the care of Mr. Fairbairn. Smith. loc. c.r. fac. t. 1. 2. 10. A. pignum, dwarf toad-flax, leaves fagitate; peduncles capillosese; items wand-like, proflate; leaves an inch long upon long foot flanks, calyx extremely small; flowers yellow, little, each upon peduncle, axillary, peduncles. 51. A. eryngium, lower leaves in fours, linear; flowers in racemes; the upper leaflet of the calyx twice as long as the others; it is annual, having several wand-like items nearly upright, and linear-lanceolate glaucous leaves; flowers in a terminal raceme, which contains about 30 or 40; these are yellow, and commonly their lower and upper lips are bluish; spur of the length of the flower, recurved and variegated above, with violet-coloured streaks; this species varies into what Linnaeus has termed pellaria, from one to five or six points of yellow flowers on the same plant; it is a native of Spain. 52. A. hexandrum, leaves opposite, cordate-ovate, ferrate; peduncles axillary, one-flowered. Flav. Auct. n. 235. A native of the island of Otaheite in the South Seas. The five last species are to be considered as new, none of them being noticed by Murray in the fourteenth edition of the "Sydenham Vegetabilium," published in 1784.

Propagation and Culture. The various species of snap-dragon are raised from seeds, which may be sown in April or May, or in Autumn: all the varieties of the 49th species, sown late in spring, may in July be planted out in borders, where they will flower the following spring; or they may be sown early in the spring, for flowering in the autumn of the same year; but in this case the plants are not so likely to withstand the winter; and if the autumn prove bad, they will not perfect their flowers. Any of the perennial snap-dragons may be propagated by parting the roots, or by cuttings, which, during the summer months, will readily take root. They are all pretty ornaments in a garden, and requiring very little culture, are rendered more acceptable. The antirrhins are hardy plants, and will in general refight the cold of our winters; but the tenderer species, or those that are natives of warm climates, should be planted in pots, and removed into shelter, or placed under a hot-bed frame during frosty weather. The soil and situation in which the different species grow in a wild state, should always be considered, and their culture adapted accordingly; a dry gravelly or sandy soil well suits the 49th species and several others, especially those that are natives of Britain; and should these be planted in a rich moist soil, they become very luxuriant in a short time, but are very liable to rot in autumn or winter. Many of these plants are permitted to scatter their seeds, and thus suffered to propagate themselves, the young plants only requiring thinning where they come up too close, and removing any weeds with which they may be encumbered. See Miller's Dictionary, by Martyn.

The A. linaria, or common toad-flax, is the only plant of this genus to which any medicinal virtues have been ascribed: its leaves, which have a bitterish and somewhat saline taste, are reported to be diuretic and cathartic; they have been recommended in dropsies and other disorders requiring copious evacuations. This plant has also been used as a relievant in jaundice and other visceral obstructions; but it has chiefly been valued as an external application in hemorrhoidal affections, employed in the various forms of ointment, fomentation, and cataplasm. An augmentum de linaire is to be found in the Wirttemberg, Brandenburg and Danish pharmacopoeias. Linnaeus (Flor. forn.) says, this plant is used as a poison for flies. See Murray, vol. ii. p. 153. Woodville, Med. Bot. vol. iv. p. 25.

ANTIRRHINUM, in Ancient Geography, a promontory and small town of Lucania, at the entrance of the Cornish Gulf, opposite to Rhium, whence its name.

ANT-SABBATARIANS, a modern religious sect, who oppose the observance of the Christian Sabbath.

The great principle of the ant-sabbatarians is that the Jewish Sabbath was only of ceremonial and not moral obligation; and consequently is abolished by the coming of Christ. See SA. 5th.

ANTISAGOGE, in Rhetoric, a figure differing little from that called concession. The following passage from Cicero is an instance of it: "Difficilis ratio bellii gerendi; ut plena fidei, plena pictatis; et sic dicis, magnus labor, multa percussa propinquitur; at gloria ex his immortalibus celt conscriptura."

ANTI-SEPTIC, something opposed to the reanonings and syphilis of Pyrrophiids, or septicums.

ANTIQU, compounded of ari, against, and σκοτος, a shadow, in Geography, denotes people who dwell in the opposite hemispheres of the earth, and whose shadows at noon fall in contrary directions. Thus the people of the north are antefic to those of the south. The one project their shadows at mid-day towards the arctic pole; and the others towards theantarctic pole. The antefics are very often confounded with the Antecis, though the former term is more general than the latter. The antefic fland contadigit avulso from pericis, &c.

ANTIQU, is sometimes also used, among Astrologers, for two points of the heavens, equally distant from the tropics. Thus the signs Leo and Taurus are called antefics to each other. ANTIQUCOCUTICAE, in the Materia Medica, medicines proper for the cure of the fevers.

ANTISEPTIC, from arii, and πατρις, patriis, of πατρις, to putrify, an appellation given to such substances as resist putrefaction.

We have a curious experiments in relation to antiseptic substances by Sir John Pringle, who has ascertained their several virtues. Thus, in order to settle the antiseptic virtue of salts, he compared it with that of common sea-salt; which being one of the weakest, he supposes equal to unity, and expresses the proportional strength of the rest by higher numbers, as in the following table.

<table>
<thead>
<tr>
<th>Salt</th>
<th>Mixture</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sea salt</td>
<td>-1</td>
</tr>
<tr>
<td>Salt Gemma</td>
<td>+1</td>
</tr>

<tr>
<td>Salt dulcetius</td>
<td>+2</td>
</tr>
<tr>
<td>Crude Sal Ammoniacs</td>
<td>+3</td>
</tr>
</tbody>
</table>
In this table the proportions are marked in internal numbers; only to some there is added the sign +, to show, that these salts are posseffed of a stronger antifeptic virtue than the number in the table expresses, by some fractions; whereas in the third half, where the same sign imports, that the salt may be stronger by some units.

Some refining and other substances even exceed the antifeptic virtues of the natural salts; thus myrrh, alfa-fericida, terra Japonica, and aloes, are at least twelve times more antifeptic than fcn.falt. Two grains of camphor are equivalent to fifty grains of that salt. An infusion of a few grains of Virginia snake-root, in powder, exceeds twelve times its weight of fen-falt. Chamomile flowers have nearly the same extraordinary quality. The Jefuits bark has it also. Besides these, pepper, ginger, faffron, comfrey-root, are twelve times more antifeptic than fen-falt. Dried fage, rhubarb, the root of the wild valerian, mint, angelica, ground ivy, fenn, green-tea, red roses, wormwood, mullard, and horde-radiata, were likewise found more antifeptic than the fandard.

To the clas of antifeptics medicines may likewise be added fermented liquors, acids, spirits, and even those plants called anti-acids, and erroneously supposed beneficenions to putrefaction, particularly horde-radiata. Now vegetables possessing this virtue are the more valuable, in that being usually free of acrimony, they may be taken in much greater quantities than either spirits, acids, refining, or even the neutral salts.

Antifeptics are prescribed in all putrid, malignant, and pestilential cases. It is to be remarked, however, that different kinds of them are to be given in different difeases, and even in different stages of the same disease. Thus, the bark is a specific in a gangrene, when the vessels are relaxed, and the blood resolved or disposed to putrefaction; but will fail, if the vessels are too full, or the blood too thick. It must be confefled, however, that inferences drawn from the effects of antifeptics on dead putrefactive matter, may mislead us considerably in their application to the living human body. The putrefactive tendency of the fluids, suppoed to be prevalent in fcarry and contagious fevers, cannot be obviated by the most powerful antifeptics alone, but will oftentimes yield to substances scarcely antifeptic in the lowest degree. On the contrary, ganrergue, though generally treated with astringents and antifeptics conjoined, has often been arrested by animal food and volatile alkali.

From the great antifeptic virtue of alnun, the bark, and other astringents, it should feem, that affraction had no small share in the cure of disorders termed putrid; and, indeed, the very nature of putrefaction consists in a separation or diffusion of the parts. But as antifeptics are improper to be administered in many cases, comfrey-root, alka-root, camphor, &c. may supply their place; which, though highly antifeptic, have very little, or any, of an antifeptic quality. Pringle’s Obs. on the Difeafes of the Army. See Dr. Macleod’s Essay on the respective Powers, &c. of Antifeptics.

Antifeptic substances, in Agriculture, are such substances as have a tendency to reft the putrefaction and decay of animal and vegetable matters, when united with them, either beneath the foil or upon its surface, and in the dung or compost heap. Aluminous and vitreous substances are most of this kind; and likewise the astringent principle of different vegetable matters.

ANTISIGMA, among the Ancient Grammarians, signifies one of the notes of fentences affied to thofe verbs whose order was to be changed.

ANTIPASMODICS, in the Materia Medica, are medicines proper for the cure of spasms and convulsions. Heat, especially alternating with cold; arder, wine, spirits, opium, balm of Peru, and the effential oils of many vegetables, are the principal articles of this clas of medicines. Opium excels, for its immediate effects. Peruvian balm, in many instances, produces more lasting benefit than opium, and sometimes succeeds where opium fails. As antipasmodics, the effential oils differ in this from opium, that they act more on a particular part than on the fylflem in general, and have no fooporic effect. Where the ftrictures are produced by inanition, and a defect of vital heat, spasms are removed by thofe medicinal means that restore the vital fire, fuch as warmth, appropriate food and drink, pure airs, cordials, aromatics, and the cheerful piifions.

The other antipasmodics will be found under the particular difeafes, to which they have been applied with the greatest success. See Hysteria, TETANUS, Confuitions, &c.

ANTISPASTUS, a poetical foot, confifing of four syllables, whereof the first is short, the second and third long, and the fourth short.

ANTISPODIUM. See Spodium.

ANTISSA, in Ancient Geography, was, according to Strabo, in ancient times, an island, and thus called, because it was opposite to Lefbos, then known by the name of Ída; but having offended the Romans, it was depopulated by Labro, and the inhabitants were transplanted to Methyma.

ANTI-STANCARIANS, in Church History, a fecl of German protestants that oppofed the doctrine of Stancarius, who allerted that justification was the fole effect of Christ’s human nature, exclusive of his divinity.

ANTISTASIS, in Oratory, a defence of an action, from the confideration, that if it had been omitted, worfe would have ensued. This is called by Latin writers comparisonem argumentum: such e. g. would be the general’s defence, who had made an inglorious capitulation, that without it the whole army muft have perifhed.

ANTISTASIS, in Antiquity, denotes the gibbous part of the liver in the Grecian victms.

ANTISTES, from ante, before, and ßo, I fand, in Eccle- tiical Writers, a title usually given to bishops, though sometimes also to priets or prebendaries. Among the ancient Romans, antistes was an appellation given to the chief or first orders of the priets in the provinces.

In which fente, antistes stands diftinguished from pater and magiftri.—In the more usual fente, notwithstanding, antistes denotes the fame with fccoder.

There were also females of this quality under the title of antistes.

ANTISTHENES, in Biography, an Athenian philofopher, and the founder of the Cynic fecl, was born about the 9th olympiad, or the year before Christ 420. His firft attention was directed to military exploits, and he acquired fame by his valour in the battle of Tanagra. But changing his obiect, he studied the art of rhetoric under Gorgias, and then prosecuted the attainment of more subftantial wisdom under Socrates; and fuch was the ardour of his mind, that though he lived at the Præsum, which was distant 40 fadua from the city, he was a daily attendant on the inftructions of this admired oracoper. The virtuous manners of Socrates, and the noble independence of his spirit, attracted his notice and efteem; and he determined to make the character of his teacher the obiect of his imitation. Whilft he was a disciple of Socrates, he discovered his pro- pensity towards severity of manners by the meannets of his dress, and frequently appeared in a thread-bare and ragged cloak. His matter perceiving that he took pains to expofe,
rather than to conceal his tardy death, said to him:  
"Why so incontinent? through your rage, I lose your  
variety." (Epheb. lib. iv. c. 6.) After the death of  
Socrates, Antithenes, by a treasonable plot, induced the  
defenceless pupil of his predecessor, Melitus, and Antistias.  
When some young men came from Pontus to Athens for  
the purpose of attending upon Socrates, they were  
introduced to Antistias by Antithenes, who assured them,  
that he far exceeded Socrates in wisdom. By this conciliating  
recommendation the Athenians against those who  
had disgraced their city by the haughtiness of so excellent  
a man, was inflamed; and the consequence was the speedy  
exile of Antistias, and the death of Melitus. In the school  
established by Antithenes, and called Cynofigurum, or the  
temple of the white dog, he sedulously inculcated, both  
by precept and example, a rigorous discipline. In order to  
accommodate his manners to his doctrine, he wore a coarse  
robe, suffered his beard to grow, and carried a wallet and  
fluff, like a wandering beggar. His diet also was of the  
most simple kind, and he refrained from every kind of  
eminence indulgence. In his discourse, he cenfured the  
manners of the age with a degree of harshness, which  
procured him the surname of "The Dog." He also expressed  
the utmost contempt for pleasure, as the greatest evil, and  
declared, that he would rather he mad, than addicted to a  
voluptuous manner of living. Towards the close of his  
life, the gloomy cast of his mind, and the moroseness of his  
temper, so increased, as to render him troublesome to his  
friends, and an object of ridicule to his enemies. In his last  
illness he was fretful and impatient; tired of life, and yet  
loath to die. When Diogenes, at that time, asked him,  
whether he needed a friend, Antithenes replied, "where  
is the friend that can free me from my pain?" Diogenes  
presented him with a dagger, saying, "Let this free you!"  
but Antithenes answered, "I wish to be freed from pain,  
not from life." He paid little respect to the gods and to  
the religion of his country; nevertheless, he seems to have  
taught himself just notions concerning the Supreme Being.  
In his book, which treats on physics, says Cicero (De Nat.  
Deor. lib. i. c. 13.), he observes, that "The Gods of  
the people are many, but the God of nature is one." For  
the doctrine inculcated by Antithenes, see Cynics. The  
following maxims and aphorisms are ascribed to him:  
"As ruff composes iron, so doth envy compose the heart  
of man."  
"That fate is hateful to rain, in which no difference  
is made between good and bad men."  
"The harmony of  
brethren is a stronger defence than a wall of brass."  
"A  
wife man converts with the wicked, as a physician with the  
sick; not to catch the disease, but to cure it."  
"A  
philosopher gains at least one thing from his manner of life,  
a power of converting with himself."  
"The most necessary  
part of learning is to unlearn our errors."  
"The man  
who is afraid of another, whatever he may think of himself,  
is a slave."  
Antithenes being told that a bad man had been  
praising him, said, "What foolish thing have I been doing?"  
He wrote many books, of which Diogenes Laertius has  
given a long list; but none are extant, except two declama-  
tions, under the names of Ajax and Ulysses, which are  
published in the collection of ancient orators by Aldus, in 1513;  
by H. Stephens, in 1575; and by Canter, with a Latin  
version, as an appendix to his edition of Ariostes, printed  
c. 23. §. 32. tom. i. p. 830. Brucker's Hist. Phil. by Enf.  
vol. i. p. 296.  

ANTISTITIUS, is a term used in ancient chronicles  
for an abbey or monastery.  

ANTISTIAS, in Biography, a physician whole name  
is only known from his having been called on to examine  
the wounds of Julius Caesar, after he had been affrighted in  
the Capitol, forty-three years before the commencement of the  
Crusades.  

ANTISTEION, from αντι, and στειοκατα, letter, a  
grammatical figure, which by one letter is used instead of  
another; as ἀλι for  ἱλι. This is otherwise called  
antisthenon, by  
some writers.  

ANTISTROPHON, a kind of dance in use among the  
ancients; wherein they leaped sometimes to the right and  
sometimes to the left, till doubling their turn, or  
conversions.  

The motion towards the left, they called  
αντιφορα; from  
ἀν-αντι-φορα; and ἐναντιον, of ἐναντιον, a turn.  

It was customary among the Greeks, on some occasions,  
to dance round the altars, whilst they sung the sacred  
hymns, which consisted of three flanxes, or parts; the first of  
which, called  
φορα, was sung in turning from call to call; the  
other, named  
αντιφορα, in returning from well to east.  
Then they leaped before the altar, and sung the epode, which  
was the last part of the song. Hence,  

ANTISTROPHON is also used in Lyric Poetry, in speaking  
of the ode, which is usually divided into the  
φορα,  
αντιφορα, and  
εποδα.  

The αντιφορα is a kind of echo, or replication to the  
φορα; and the  
εποδα is a launching out from them both.  

ANTISTROPHON is also a figure in Grammar, whereby two  
terms or things, mutually dependent one on another, are  
reciprocally converted. As if one should say, "the  
master of the servant, and the servant of the master."  

ANTISTROPHON, in Rhetoric, the name with which is more  
commonly called  
epistrophon.  

ANTISYLLOGISM, in Logic, a syllogism, which  
infers a contrary conclusion to that of another  
syllogism.  

ANTITACTIC, or ANTITACTIC, in Antiquity, a kind  
of Gnomics, which owned that God, the Creator of the  
universe, was good and just; but suffered, also, that one  
of his creatures had created evil, and had engaged us to  
follow it, in order to let us in opposition to God the creator;  
and that it becomes our duty to oppose this author of evil,  
in order to avenge God of his enemy.  

Hence the name; which is derived from  
αντιτάξω,  
I oppose,  

ANTITARIUS, in Geography, a chain of mountains  
in Cappadocia, falling from the south-west to the north-east,  
and extending from Mount Taurus to the Euphrates. The  
habitants of the country now call it Rhioam-Taurus.  

ANTITHEMEN, in Anatomy, from αντι, against, and  
θεματις, the palm of the hand, is the name given by Riolanus  
to the muscle, commonly named in English adductor indicus  
natus, to which refer. Winflow also calls by this name, the  
adductor pallicis pedis, which see.  

ANTITHESIS, from αντιθέσω, I oppose, in Rhetoric, a  
setting two things together by way of opposition to each  
other, that the different qualities of each may appear the  
more strongly.  

Such is that of Cicero, in the second Catilinarian: "On  
the one side stands modesty, on the other impudence; on the  
one fidelity, on the other deceit; here piety, there sacrilege;  
here continency, there lust," &c. —Such also is that of  
Augustus to some froward young men; "Audite juvenes  
fenem, quern juvenem fenem audirete." —Such again is that  
of Seneca; "Cur autem loquuntur, ingentes pulvere."  
And that of Virgil;  

"Flectere si nequeo superos, Acheronta movebo."  
St. Augustine, Seneca, Salvian, and many other ancient  
writers.
writers, seem greatly to affect antitheses; but among the moderns they are generally deferred. Definace represents them as the favourites of young writers.

**Antithesis** is sometimes used for controversy.

In this sense we meet with **antithetic** method, antithetic discourse, &c.

**Antithesis** is also a figure in Grammar, used to the fame purpose with **antithetich**.

**Antithetarius**, a term occurring in the title of a chapter in the laws of Caunus, but not in the chapter itself.

The meaning of the word is, a man who endeavours to discharge himself of the fault of which he is accused, by recriminating, i.e. by charging the accuser with the same fault.

**Antitheton**, in *Rhetoric*, a figure wherein contraries are set in opposition to each other.

Some distinguished between the **antithesis** and **antitheton**. Volusius thinks that in the antitheton nouns and verbs are opposed; but in the antithesis, epithets only. Others comprehended the antithesis under antitheton.

**Antithora.** See *Antithora*.

**Antitragicus**, in *Anatomy*, is a muscle belonging to the pinna of the external ear. It arises from the cartilage below the antitragus, and terminates in its ridge, extending as far forwards as the antihelix.

**Antitragus** is a ridge or eminence in the cartilaginous pinna of the external ear. See the article *Ear*, external.

**Antitragus** in *Anatomy*. See *Cypsis*.

**Antitrinitarians**, those who deny the Trinity, and teach, that there are not three persons in the Godhead.

Thus the Samosatians, who do not believe the distinction of persons in God; the Arians, who deny the divinity of the Word; and the Macedonians, who deny that of the Holy Spirit; are all properly Antitrinitarians. Among the moderns, Antitrinitarians are particularly underfoot of Socinians, called also Unitarians.

The *Bibliotheca Antitrinitaria**, or *Antitrinitarian Library*, is a posthumous work of Christopher Sandius, an eminent Antitrinitarian; wherein he gives a lift, digested in order of time, of all the Socinian or modern Antitrinitarian authors, with a brief account of their lives, and a catalogue of their works. See *Unitarian*.

**Antitype**, a Greek word, properly signifying a type or figure correspondent to some other type.

The word antitype occurs twice in the New Testament; viz. in the Epistle to the Hebrews, ix. 24. and in St. Peter, i. Ep. iii. 21. where its genuine import has been much controverted. — The former says, that "Christ is not entered into the holy places made with hands, which are antitypes, the figures or antitypes of the true—now to appear in the presence of God for us." — Now *antitype*, as is elsewhere observed, signifies the pattern by which another thing is made; and as Moses was obliged to make the tabernacle, and all things in it according to the pattern showed him in the mount; the tabernacle so formed was the antitype of what was shewn to Moses: anything, therefore, formed according to a model, or pattern, is an antitype. Sykes's *Paraphrase* in loc. p. 157.

In the latter passage, the *Apocalypse*, speaking of Noah's flood, and the deliverance only of eight persons in the ark from it, says, "*Ν ο ι α ρ ν β δο ε τι *π ν σ ε β α τημιν," bat- tifim, being an antitype to that, now faves us: not putting away the midst of the flood, but the answer of a good confidence towards God." &c. The meaning is, that righteousnes, or the answer of a good confidence towards God, now faves us by means of the resurrection of Christ, as formerly righteousness faved those eight persons by means of the ark, during the flood. The word antitype, therefore, here signifies a general similitude of circumstances; and the particle α, "whereunto," refers, not to the immediate antecedent, ἥτοι, "water," but to all that precedes.

Some read, as it is in the Alexandrian and several other approved MSS. instead of ἥτοι, "*ε κα ο νες," &c. "that which is the antitype doth now save us also, that is, baptism." The term "antitype" seems here to signify no more than some similitude, or resemblance, in the two things compared. But it may be asked, what are the two things compared? and in what does the resemblance consist? Is the water of baptism compared to the waters of the flood, or baptism itself, compared to Noah's ark? or the being faved by baptism, to being faved in the ark? A judicious commentator is of opinion, that the last comparison was designed by St. Peter; and that the salvation by the ark, in this particular, resembled our salvation by christian baptism. For as those righteous persons, Noah and his family, were faved in the ark, from perilling by the deluge; so christian baptism, if accompanied with righteousness, or a good confidence, will, through the resurrection of Christ, save christrians from perilling with a wicked world. Beaufon on the *Epistles*, in *loc. cit.* vol. ii. p. 269.

**Antitype**, among the *Antient Greek Fathers*, and in the *Greek literatur*, is also applied to the symbols of bread and wine in the *Sacrament*.

Hence it hath been argued, by many protestants, that the Greeks do not really believe the doctrine of transubstantiation; because they call the bread and wine *antitype*, *antitypon*, q. d. figures, similitudes, and this even after the *consecration*.

**Antivari**, in *Geography*, a town of European Tur- key, in Dalmatia, situate on the gulf of Venice, opposite to Dari, and formerly the see of a Greek archbishop. But the Turks took it from the Venetians in 1573, and it still remains in their possession. It is about eight miles north-west of Dulcigno, and thirty south-east of Ragusa. N. lat. 42° 34'. E. long. 19° 30'.

**Antiveduto**, in *Biography*, an eminent painter of portrait and history, was born near Rome in 1552; and under the care of Giovanni Dominico Perugino, exhibited surprizing proofs of genius, and became a portrait painter of the highest reputation. In the hairs of the head, natural tint of the carnations, ana striking resemblance of the features, he had no superior. He was principally employed by the Medicin family. He had likewise a considerable talent for historical painting. He died in 1626. Pitkington.

**Antiventria**, in *Geography*, a name given by the Spaniards to one of their divisions of *Terra Firma* in South America. It comprehends the government of St. Martha, the new kingdom of Grenada, and some others to the south of Caracasa, as far as the river of the Amazons.

**Antivirgilian Husbandry**, a title by which the drill or horse-hoeing husbandry, as improved by Mr. Tull, is sometimes distinguished by writers on agriculture.

**Antium**, in *Ancient Geography*, now *Cape d'Anzo*, a town of Italy south of Rome, situate on a rock near the sea, but without a harbour, as there was one in the neighbouring hamlet, called *Ceno*. It belonged to the Volsci before it became the possession of the Romans, and was for a long time a very strong place. Dionysius Halicarnasseus, after Demaroras, says, that it was founded by a son of Circe; others ascribe its origin to Aecanius. However that be, the Romans, under the conduct of Numicius, took pos- session of it, A. U. 263; and within two years, sent a colony thither. The colonists and inhabitants were called *Anticata*. Livy (l. v. c. 14.), and Florus (l. i. c. 17.), informs us, that the Romans acquired their first reputation in naval affairs against
the Antiates; whose ships they partly conveyed into the
arsenal of Rome, and partly burnt, and with their books,
or toils, they adorned the pulpit erected in the forum,
hence called of. Horace refers to a famous temple of
Fortune in this place, 1. 1. od 35.

"O Diva, gratum quae regis Antium," &c.

Caligula and Nero were born in this city; and Suetonius
says, that the former proposed to retire thither after he
had massacred the principal persons of Rome, and the latter
alligned it as a place of retreat for the veteran soldiers.
Tacitus informs us, that Nero was at Antium, when news
was brought to him of the conflagration of Rome, which
Suetonius charges upon himself. In Christian times, Antium
became the seat of a bishop; but it is now extinct.

ANTIXENI, a people of Idas, who, according to
Pliny, lived on the other side of the Indus.

ANTLER, among Hunters, the fall of the pears that
grow about the bur of a deer's horn. There are also
autlers, brow-autlers, &c.

ANTLESTORF, in Geography, a town of Germany,
in the archduchy of Austria, six miles east of Eutzeistorf.

ANTLIA, an ancient machine, supposed to be the fame
with our pump.

Hence the phrase, in antium conducmari, according to the
critics, denotes a kind of punishment, whereby criminals
were condemned to drain ponds, ditches, or the like.

ANTOECI, in Geography, those inhabitants of the earth
who live under the fame meridian, and at the fame distance
from the equator; the one toward the north, and the other
toward the south.

The word is formed of AN, contra, and ECI, inhabit.

The Australi are contradistinguished from the Persici, and
are frequently confounded with the Amfici.

Hence the Antoei have the fame longitude, and equal lati-
attudes, only of a different denomination; and, of course,
they have precisely the fame hour of the day and night, but
opposite seasons: when it is 12 o'clock in the longest summer’s
day with one, it is 12 o'clock of the shortest winter’s
day with the other; and hence the night of the one is equal to
the day of the other.

ANTIOING, a town of the Netherlands, in the circle
of Hainault, near the Scheldt, 14 league S. of Tournay.
It is the chief place of a canton in the district of Tournay, and
department of Jemappe. The place contains 14577, and
the canton 14849, inhabitants; the territory comprehends 125
kilometres and 90 communes.

ANTOMOSIA, from AN, contra, and MOSIA, I suffer, in Ancient
Writers, an oath taken by both the parties in a criminal ac-
cusation; whereby the accuser charges the other with the
fact, and the accused in his turn denies the fame.

In which sense, antomosia amounts to the fame with
domosia, though some distinguish between the two, restraining
antomosia to the oath of the person accused, whereby he
engages to make no other than a fair defence; and domosia
to the protector’s oath, whereby he swears that his ac-
cusation is justly founded.

Others will have antomosia properly denote a law-suit
about things to which there are no witnesses, and which
can only be decided by the oaths of the parties. Others again
will have it to be, where the accused party alleging fiek-
ness for his non-appearance, the protector takes an oath
that the fickness is only feigned, upon which the judges
proceed to sentence.

ANTONA, in Ancient Geography, a name given by Ta-
citus (Vit. Agricol.) to a Britifh river, concerning which
antiquarians are not agreed. Some writers, as Camden,
Carte, &c. appropriate the name to the Nan of North-
tain a small portion of an alkaline salt, a larger portion of sea-fall, and a yet larger of a calcareous earth, and with this a very considerable quantity of a subtile and penetrating mineral spirit.

It is a very temperate water, not too strongly operating either by flood or urine; and hence it is a very proper drink for persons in chronic and in many acute cases, either alone, or mixed with wine, to supply the place of malt liquor, which is proper but in very few illnesses. A long use of it alone may also prove of considerable service in hypochondriac cases.

ANTONIANO, SILVIO, in Biography, a cardinal and learned man of the 16th century, was born at Rome in the year 1549; and, at the early age of 10 years, distinguished himself by extemporaneous productions in verse. Having given various proofs of his singular talents in this way, he was taken under the protection of the duke of Ferrara, who provided him with excellent masters to instruct him, affixed him a pension, and established a professorship of belles lettres, with which he was honoured at the age of 17 years; and on this occasion he pronounced some orations, which were afterwards published. When cardinal de Medicis succeeded to the popedom, under the name of Pius IV., he went for Antoniano to Rome, and made him Latin master and secretary to his nephew, cardinal Borromeo. He was also appointed professor of polite literature in the college at Rome; and discharged this office with such reputation, that he had for his auditors not only a prodigious number of people, but even 25 cardinals. He was afterwards chosen rector of the same college. At the death of Pius IV., he was chosen secretary of the sacred college by Pius V.; and occupied this post for 25 years. Clement VIII. made him secretary of the briefs, afterwards his chamberlain, and finally a cardinal. He fell a sacrifice to intense study, in his 65th year. Antoniano is said to have written with such ease and correctness, that he never made a blot or erasure; and his manners were so irreproachable, that he is said never to have transgressed the bounds of the strictest chastity. He left a variety of works both in prose and verse; of which the principal are, "De Chirilliana Puerorum Educatione," "Dissertatio de Officiorum Solidis in Morbe Chirilli," "De Succedentia Apostolica," "De Stylo Ecclesiastico seu de conferenda Ecclesiastic Historia," "De Primatu Sancti Petri," "Lucubrations in Rhetoricam Artillobolii, et in Orationes Ciceronis." It is also said that he had a share in the catechism of the Council of Trent. Gen. Dict.

ANTONIDES, J. VANDER GOES, an eminent Dutch poet, was born of anabbazial parents, at Goes in Zealand, in the year 1647. After a tolerable education, he was apprenticed to an apothecary; but the fame of Vondel and some other poets of his country, led him to cultivate his natural talent in this way. He began with translations from the best Latin writers, and then launched into original composition. His tragedy upon the conquest of China by the Tartars, entitled "Trazii," was followed by "Belona in Chains," which was highly applauded by the best judges. But his capital work was entitled "Y Stroom," or the River Y, which forms the port of Amsterdam. This recommended him to M. De Bufero, deputy in the college of admiralty, who procured for him the place of secretary in that department. Soon after he had been thus raised from his obscure situation, he married a clergyman's daughter, who had a taste for poetry; but abandoning the Muses, and devoting himself to the duties of his office, he soon died of a consumption in the flower of his age, in 1684. He had proposed, and begun a life of St. Paul, but left only a few fragments of it.

His works were published, in 1610, at Amsterdam, in 1714, under the inspection of Mr. Hoogstrate, one of the masters of the Latin school. Gen. Dict.

ANTONIENBERG, in Geography, one of the highest points of the Swiss Alps, in the Valais.

ANTONINE COLUMN, in Architecture and Sculpture. See Column.

ANTONINUS PIUS, or Titus Aurelius Fulvius Valentine Antoninus, a Roman Emperor, was born at Lararium or Lavarium, in the vicinity of Rome, A. D. 86; and descended from virtuous and honourable ancestors at Nimis in Gaul. Both his grandfathers, and his father, were confuls. After the death of his father, his education was completed in the house of his maternal grandfather, Arrius Antoninus. At an early age he concluded the affiection of all his relations, so that when they died, he was distinguished by their bequests, and became rich; and as he advanced to maturity, he combined, in a very eminent degree, all the virtues of the heart with a gentle and majestic countenance, a cultivated understanding, a commanding eloquence, and an exemplary conduct. In his sentiments and actions he was guided by moderation; and he was perfectly free from affectation and vain glory. Having attained the confidence A. D. 116, he was afterwards one of the four consuls appointed by Adrian to govern Italy, and became proconsul of Asia; where, by the mildness of his authority, and the ability of his manners, he engaged the affection and attachment of persons of all ranks and parties. On his return to Rome, he was admitted into the council of Adrian; nor did the emperor pursue any measure of consequence without his advice. He married Anna Faultina, the daughter of Annius Verus; and though he was not very happy in his choice, he behaved with singular respect to the father, comforting him in his old age, and supporting him with his arm when he came into the senate; and it is said, he obtained the surname of Pius. By this marriage he had two sons, who died young; and two daughters, one of whom, named Faultina, was married to Marcus Aurelius, afterwards emperor. Upon the death of Aelius Verus, Adrian determined upon the adoption of Antoninus; and having overcome his reluctance to undertake so great a charge as that of the Roman empire, he declared his nomination in the presence of a council of the principal senators, on the 25th day of February, A. D. 138, and immediately made him his colleague in the proconsular and tribunitian authorities. He also caused him to adopt the son of Verus, an infant of seven years of age; and Marcus Annius, afterwards Aurelius, who was about 17 years old. Upon the death of Adrian, July 10, A. D. 138, or, as some say, A. D. 159, Antoninus succeeded to the throne, amidst the congratulations of the senate, and to the universal satisfaction of the Roman people. His accession was marked by the usual titles and honours conferred upon the Roman emperors; to which the senate added that of Pius, either from the circumstance already mentioned, or on account of the respect with which he treated the memory of his predecessor. Although the pacific reign of Antoninus affords little variety of incident, it is nevertheless to be regretted, that we derive our direct information of this reign from a confused and obscure historian, Capitolinus; the records of Dio Cassius having been lost. From the testimony of this historian, however, it appears, that, after his accession to the empire, he pursued the fame course of conduct which he had so well whilst he was a private person; fixing the attachment of his friends, and conciliating his enemies; confiding the senate on every transaction of importance, and frequently giving an account to the people of all his actions.
and negotiations. Such was his general conduct, that M. Aurelius was convinced, by his example, that a prince might lead a private life even in a court. He reduced most of the imposts and tributes, and enjoined his collectors to exact them without severity; observing, that he rather chose to be poor, than that his coffers should be filled at the expense of an oppressed people. Soon after his accession, he distributed the greatest part of his private estate among the indigent citizens; and when the empress Faustina required at his liberality, he told her, that a prince ought to have no private interest, no private property, and nothing in view but the public welfare. He was solicitous in the choice of the governors of provinces; and, it is said, that he never promised an undeserving person to any employment or honour. The penalties of uncleanness were abolished, and he alleged, that he could not bear to see the state impoverished by those who did it no service, but lived idle upon the labours of others. But though he was sparing of the public money, no one ever charged him with avarice, as he was exhibiting daily evidence of an unbounded generosity. He never would accept legacies from so many as had children; and he ordered the estates of criminals condemned for extortion to be restored to their heirs, after having rendered satisfaction to those whom they had pillaged. He also extirpated the whole tribe of informers; and upon any misfortune that happened to any city or province, he was ready to lessen their tribute or taxes. Antoninus everywhere where it yielded men of learning, encouraged the education of youth, and spent considerable sums in providing for the children of indigent parents. Although he was not addicted to building, he raised several lofty edifices in Rome and its vicinity. He caused a post to be made at Caieta or Cela; repaired that of Terracina; finished Adrian's magnificent mausoleum; built a stately palace at Lorium in Aetolia, about ten miles from Rome, where he had been educated; and he contributed large sums towards repairing several ancient buildings in Greece, Ionia, Syria, and Africa. It is probable that Nimes was indebted to him for those magnificent decorations that still distinguish it, the amphitheatre and aqueduct. Having declared at the commencement of his reign, that he would not spoil the blood of any senator, he religiously observed his engagement; so that when one was convicted of parricide, he contented himself with banishing him, after he had confessed his crime. When Attalus Tatianus and Eucratides were accused of conspiring against his life, and after the latter had destroyed himself, and the former was banished, he took the son of the survivor under his care, and brought him up as if he had been his own child; nor would he suffer any inquiry to be made after their accomplices, alleging to the senate, who urged him to it, "I do not care the world should know by how many perfons I am hated." In the exercise of jurisprudence, he inflicted three decrees which manifest a laudable spirit of equity. The first was, that no one should be again prosecuted on a charge of which he had been once acquitted; - the second, that the children of a person become a Roman citizen, who were not so themselves, should not, as in former times, forfeit their inheritance to the treasury; - and the third, that a woman prosecuted for adultery by her husband, should have a right to remitention. He also allowed refractions in favour of the Chriftians, to prevent them from popular rage and legal injustice. One of thefe, addressed to the people of Afa Minor, is preferred by Eusebus (E. H. I. iv.), and it bears testimony to their character. So pacific was his disposition, that he never engaged in any war which he could avoid; and was often heard to say, "that he had rather save one citizen than destroy a thousand enemies."

Some commotions, however, arose in various parts of the empire; but they were suppressed, without much difficulty, by his lieutenants. In Britain, the incursions of the Brigantes were suppressed; and the boundaries of the Roman province were extended, by building a new wall to the north of that of Adrian, from the mouth of the Elbe to the north of the Tweed.

Antoninus, by his temper and conduct, gained the affection of not only his own people, but by whom he was revered as their father and protector, but of those who were the avowed enemies of Rome. Such was the influence of his character, that a letter addressed by him to the king of Parthia, induced him to decline a meditated invasion of Armenia, and to disband his troops. The kings of Hyrcania, Boeotia, and India, sent embassadors to him, court- ing his friendship and alliance. Parthamene, king of Iberia, paid him a visit in person at Rome; and the Lazi, the Armenians, the Quachi, and several other nations, readily received such persons as he was pleased to appoint for their rulers, though they were not then subject to the empire. Antoninus is by some historians compared, and by others even preferred, to Numa, on account of the tranquility which Rome enjoyed during the greatest part of his reign; and his extraordinary care of all things belonging to the worship of the gods, and to religion.

Some per sons have thought that he extended his indulgence to the empress Faustina, whose life was dissolute, to an improper and culpable extreme. After the died, she was honoured with divine worship, priests, temples, and statues of gold and silver; games were also instituted in her honour; and her solitude was carried on by his express order, amongst those of the other gods, at the Circenian sports.

Soon after his advancement to the throne, Marcus Aurelius was distinguished by his favour; for he married him to his daughter Faustina, and declared him Caesar; nor had any reason to regret the honours he conferred upon him, and the confidence he reposed in him. In this state of domestic and public tranquility, Antoninus attained his 74th year; and being feigned with a fever at one of his country seats at Lorium, he closed his life, in the month of March, A. D. 161. He forewarned the event, and munified the principal officers of state to attend him; and in their presence confirmed his choice of Marcus Aurelius as his successor, and caused the imperial insignia to be carried to him. In the state of derangement, occasioned by his fever, his thoughts were evidently directed to the republic; and he deprecated the anger of the gods whom he supposed hostile to it. In a lucid interval, he gave as a watchword to the praetorian tribunes, "Equanimities;" and then placidly expired, after a reign of 22 years seven months and 26 days. His funeral was conducted with pomp and magnificence; his remains were deposited in the tomb of Adrian; he was ranked by the senate among the gods; a temple was built to his honour; and priests, sacrifice, and annual sports were instituted. His death, though at an advanced age, was the subject of universal lamentation; and so highly honoured was his memory, that succeeding emperors chose to bear the name of Antoninus, as the most popular appellation they could assume. Marcus Aurelius and the senate conferred upon his memory a memorable pillar, which served as one of the principal ornaments of Rome, under the name of the Antonine Column. Anc. Un. Hist. vol. xiii. p. 294—299. Crevier's Hist. of the Emperors, vol. viii. p. 198—232. Lardner's Works, vol. vii. p. 583—587.

Antonius, Marcus Annius Aurelius, one of the most illustrious of the Roman emperors, was born in the year of
of Rome, 874, A. D. 121, during the second consulship of his grandfather, L. Annius Verus; and descended from an honourable family of Sucebiius or Uebius, of Betica, supposed to be related to that of Adrian. He was distinguished by the patronage and favour of Adrian in his early years; and at the age of six years he advanced him to the rank of knighthood, at eight admitted him into the college of Salii, and at length adopted him into the imperial family, so that his succession to the empire was secure. The Emperor used to call him M. Annius Veritissimus, on account of his great sincerity. When he was adopted, he took the names of M. Enus Aurelius Verus. Aurelius being an appellation peculiar to the family of Antoninus, and Ælius belonging to that of Adrian, into which Antoninus had been adopted. Upon his accession to the empire he assumed the name of Antoninus; and he is usually distinguished from his predecessor by the prenomen of Marcus, or surname of philosophus, which was given him by the unanimous consent of historians, and not by any decree of the senate. The care of his education in his infancy was devolved on his paternal grandfather, Annius Verus; and in his mature years, he was brought up in the palace, and instructed under the direction of Adrian, in all the arts that pertain both to the body and mind; eloquence and poetry, however, engaged little of his attention, for his thoughts and time were devoted to philosophy; and more especially to that kind of philosophy that tended to regulate the temper and conduct. His principal masters were Herodes Atticus, and Cornelius Fronto, Greek orators; and above all, Junius Rufinus, who joined to an infallible birth a hereditary taste for the stolid philosophy. Such was his proficiency under these instructors, that at the age of 12 years he assumed the philosophical gown. To his intense study he added the austerity of the profusion to which he was devoted; and by unvaried application and strict regimen he prejudiced his health. With the gravity of a philosopher, however, he blended no part of the severity; his address was agreeable and engaging to all with whom he had any intercourse; he was virtuous without pride, modest without timidity, and grave without melancholy. To his masters he was respectful and grateful; he honoured them living and dead; and kept their images of gold, with those of his household gods, in his domestic chapel; and offered up chaplets of flowers and victu; at his tombs. At 15 years of age, he put on the main gown, and soon afterwards was appointed prefect of the city. About this time he manifested his Antecedent meekness, by surrendering to his only sister, Anna Cornelia, all his father's effects. His adoption into the Aurelian family, by Antoninus Pius, took place in his 17th year, but such was the superiority of his mind to all distinctions of this nature, that the honour produced no change in his disposition and mode of life, nor in the course of his studies. After his adoption, he was appointed quaestor; and immediately upon Adrian's death, Antoninus married him to his daughter Faustina, advanced him to the dignity of Caesar, and conferred upon him, in quick succession, a variety of civic honours. He was appointed chief of one of the centuries of Roman knights, had a household attached to him, was twice consul, and received the tribuniate and provincial authorities. Such was the emperor's confidence in him, that he was called to all his public councils, and he gave away no office without his advice and approbation; and such was Aurelius's attachment to the emperor, that, during almost 23 years, he never flpt apart from him more than two nights either in town or country. Of the disinterestedness of Aurelius, we have a singular instance on his first accession to the throne. L. Aurelius Commodus, the son of that Verus whom Adrian had adopted, had been joined with Marcus Aurelius in the adoption of Antoninus, and equally intended for the succession. But Antoninus, on account of the errors and vices of his youth, had excluded him from any share in the sovereignty, and appointed Aurelius heir to the empire; and, upon the death of Antoninus, the senate confirmed his purpose. Aurelius, however, procured Commodus to be declared his colleague, promissed him his daughter Lucilla in marriage, and ordained that he should take his own original name of Verus, by which name he was afterwards known. In the first year of Aurelius's reign, Faustina was delivered of male twins, one of whom died under age, and the other was Commodus, who succeeded his father in the empire, disgraced his elevation, and became notorious for every kind of profligacy. About the same time, the public tranquillity was disturbed in Germany, Great Britain, and Parthia; but the most important events were, the invasion of Armenia by Valerian, king of the latter country, and the irruption into Syria. Verus proceeded to the east, rather making a tour of pleasure than conducting a military expedition, and took upon him the supreme command. After four years the war terminated in a treaty, which restored the king of Armenia to the throne; and though Verus was an object of contempt, on account of his luxurious dispositions, to foreign nations, and had little personal share in the honour of bringing the war to a termination, he was dignified with the title of "Imperator" by the army, and other pompous apppellations. During the course of this war, he married Lucilla; and, on his return to Rome, both emperors were united in the triumph, and a cordial harmony subsisted between them. The character of these two emperors was, however, essentially different. Verus was debauched and extravagant; and if we except cruelty, in the exercise of which he was restrained, he exhibited all the follies and vices of the world of his predecessors. Aurelius, on the other hand, was a philosopher on the throne; and exhibited a pattern of every private and public virtue. He distinguished himself more than any former emperor had done, by his respect and deference to the senate, and by his attention to the happiness of the people. He would not touch the money in the treasury, without the express permission of the senate: "Every thing," said he, "belongs to the senate and people: we have nothing which we do not hold of you, the very palace we inhabit is your property." When he was under a necessity of patiently enduring those vices habits which he could not reform by gentle means, he used to say, "We cannot make men as we wish them to be; we must take them as they are, and do the best with them that lies in our power." So determined was Aurelius in fulfilling exactions, that he checked the rapacity of his soldiers at a moment of victory, by telling them, "All that is given you beyond your due must come from the blood of your parents and relations." In a time of public distress, he preferred selling the furniture of his palace, and the rich wardrobe of his wife, to increasing the burden of the provinces. Although he did not wholly abolish, he restrained the expense of public buildings: and he softened the cruelty of the combats of the gladiators, by substituting less hurtful arms in the room of those that were destructive. Lenity was the chief foible of his character; and yet he ever manifested a strict regard to justice. He expedited the decision of legal processes, increased the number of days on which the courts were to sit for the dispatch of business, and followed the example of his predecessor in his improvement of jurisprudence. The right of succession of children to their mothers was made by him a part.
a part of the Roman law, and he appointed a particular prior for the guardianship of minors.

The close of the life and reign of this tranquil prince was disturbed by the hostilities of the Marcomanni and other German tribes; and when a peace had been concluded with the Parthians, their hostilities, which had become formidable, demanded attention. In the year 116, the two emperors having levied an army, left Rome together, and wintered at Aquileia. Antoninus had prepared for the conflict that was expected, by a variety of religious ceremonies, which he thought might tend to render the deities propitious, while they manifested their own attachment to the forms of religion which superstition had devised and sanctioned. Till the death of Venus, in the year 169, nothing decisive seems to have occurred. Worthless as his character was, Antoninus professed upon him divine honours: and in his memoirs, he speaks of him with undue respect, and in a manner that is not very compatible with the report which he calls upon him in his address to the Senate. In the following year, the emperor, who was now sole protector of power, returned to Panormia, and vigorously opposed the Marcomanni, who had advanced as far as Aquileia. During a conflict which detained Antoninus in these parts for five years, he had many opportunities for the exercise of fortitude and patience, and for the practice of those virtues which he had cultivated in his youth. The most celebrated event which occurred in this period, was a victory obtained by the emperor in person over the Quadi, the consequence of a sudden storm of rain, hail, and lightning, which disconcerted the barbarians, and was regarded as miraculous. Antoninus and the Romans ascribed it to an intercession of Jupiter and Mercury, but the Christians attributed it to the effectual prayers of a legion of Christians who served in the army, hence called the "thundering legion." See a more particular account under that article. Panormia was at length delivered from the incursions of the barbarians; to whom territories were assigned on the confines of the empire. The subjugation of the Marcomanni was delayed by the revolt of Avilius Caffius, who assumed the purple in Syria; and who obtained support in consequence of a rumour of the emperor's death, which he contrived to circulate. This rebellion was soon quelled by the officers of Caffius, who conspired against him, and killed both himself and his son. Such was the magnanimity of the emperor on this occasion, that, having obtained the papers of Caffius, he committed them to the flames without reading them. After the suppression of this insurrection, Antoninus made a progress through the east, and was accompanied by Faustina, who died in this journey, after a short illness. In her lamentations he rivalled the infamous Meplieda; and yet, such was the fideliousness of her husband, that he paid her divine honours after her death. This conduct on the part of the emperor, either betrays great want of penetration, or offers an inexcusable insult to decorum and good morals. Whilst the emperor visited Syria, Egypt, and Greece, in the year 176, he was initiated at Athens, in the Eleusinian mysteries, and he conferred various privileges on this feast of philosophy. On his return to Rome, after an absence of eight years, he obtained a triumph on account of his conquest of the Marcomanni, and profusely distributed largesses among the people. After two years, he marched again towards the Danube, where the war with the Marcomanni was renewed; and in this expedition he was accompanied by his son. Before his departure, it is said that, in compliance with the request of the people, who wished him to instruct them in the secrets of philosophy, he gave public lectures for three days; and the report of addiction adds, that he delivered similar lectures in some of the capitals of the provinces. In this new war, Antoninus was successful, and was for the 10th time honoured with the title of "Emperor." After an absence of two years, he fell ill at Vindobona, now Vienna, in Austria, apparently of a mortal disease which prevailed in the army, and died on the 7th day, March 17th, A. D. 161, U. C. 953, at the age of 59 years, and after a reign of somewhat more than 17 years. His death was universally lamented; he was deified by the acclamation of the Senate and people; his image was kept in the private houses of the Romans among their deities, and he who had not one was deemed innocuous; this worship of him continued above 100 years; and Diocletian gloried in honours as one of the principal deities.

Marcus Aurelius, notwithstanding all the good qualities by which he was distinguished, and the mildness and clemency which perhaps on some occasions he carried to a blameable extent, perverted the Christians. He was undoubtedly prejudiced against them, and in his own book, (xi. 3.), confesses very unreasonably what he ought to have approved (as the excellent Dr. Justin remarks, Dilicorius concerning the Truth of the Christian Religion, p. 57.)—their readiness and resolution to die for their religion. The ground of this enmity is particularly examined by Dr. Lardner: and he ascribes it partly to the Christians refusing to join in the common worship of the Heathen deities, and to the freedom of their thoughts upon the philosophers; partly to their upholding even the fancies in patience under all kinds of sufferings; and partly to the emperor's bigotry, both in religion and philosophy, which often militated against the judgment, and induces persons of the bed disposition to act contrary to the laws of equity on some occasions...
ANT

ANTONIO, Nicholas, was born at Seville in Spain, in 1617; and having studied law in the university of Salamanca, became agent-general for the king of Spain, at Rome. He is known as the author of a celebrated work in Spanish literature, intitled “A Catalogue of Spanish Authors,” to the compilation of which he devoted several years in the royal monastery of Benedictines at Salamanca; and for the completion of which, as well as the gratification of his taste for letters, he purchased 30,000 volumes. The work was completed in four volumes folio, and printed at Rome in 1666. It is copious, correct, and methodical; and is now scarce. He also wrote in Latin a treatise “On Exile,” which was published at Antwerp in 1639. Antonio died in the year 1684. Gen. Dig.

ANTONIO, Port, in Geography, a bay or harbour on the north-coast of the island of Jamaica, two leagues west-north-west from north-east point.

ANTONIO Island. See St. Anthony’s Island.

ANTONIO, St. Cape, lies in a small deep bay, about two leagues north-west from Cape St. Martin’s, on the coast of Valencia, in the Mediterranean, belonging to Spain.

ANTONIO, St. Port, lies in the island of Lemnos, in the Archipelago, between two hills, appearing at sea like two islands; 12 leagues north-west from Mitylene, or Lebos.

ANTONIO Flana, is a short due west of Cape Negro, on the coast of Africa, 80 or 90 leagues from the shore, which is very dangerous, and should be carefully avoided.

ANTONIO, St. Cape, is the extreme western point of the island of Cuba, in the West Indies. N. lat. 21° 45’. W. long. 84° 10’.

ANTONIO, St. Port, lies on the coast of Brazil, within the north point of the river Pará. S. lat. 21° 25; called Point Lucena, and the rendezvous of the Brazil ships for Europe.

ANTONIO De Suchitpec, St., a town in Mexico, or New Spain, on the coast of the Pacific Ocean. N. lat. 15°. W. long. 93° 6’.

ANTONIO, St., the capital of the province of Apachiera, in New Mexico.

ANTONIO, a town in the province of Navarre, in North America, on a river which runs south-west into the gulf of California.

ANTONIO De Cabo, St., a town of Brazil, in South America, near Cape St. Augustine, subject to the Portuguese, where they manufacture a considerable quantity of sugar. S. lat. 8° 34’. W. long. 35° 22’.

ANTONIO, St. a town of New Mexico, on the west side of Rio Bravo river, below St. Gregory. It is also the name of a town on the river Honda, which falls into the gulf of Mexico, north-east of Rio de Brava.

ANTONIOITO, GIO GIO, in Musical Biography. See GIO GIO.

ANTONIUS, MARCUS, the Orator, in Biography, was the greatest ornament of the Antonian family. Having obtained the quinquennial of the province of Asia, he had proceeded to Brundisium, when he was informed that he was accused of incest; and that the cause lay before Caecilius the praetor, who was a very severe judge. Declining to avail himself of the privilege belonging to those who were absent in the service of the commonwealth, against whom no accusation could be preferred, he hastened back to Rome, and submitted to a trial, in which he was honourably acquitted. Whilist he was praetor, Sicily fell to his lot; and he cleared the seas of the pirates which infested those coasts. He was conful in the year of Rome 653, before Christ 101, and was very active in suppressing the tumults excited by the tribune Sextus Titus. His conduct, whilst he was governor of Cilicia, obtained for him the honour of a triumph. In order to improve his talents for eloquence, he put himself under the instruction of the principal teachers of rhetoric, both at Athens and Rome. On his return to Rome, he performed the office of censor, and gained a cause against Dononius, who had on revenge preferred an accusation of bribery against him. He was highly admired and esteemed on account of both his talents and conduct; but unfortunately fell a sacrifice in the tumults occasioned at Rome by the factions of Marinus and Cinna. The soldiers who were dispatched to draw from his retirement, and to kill him, were to be overpowered by his address that they were unable to execute their commission; and the commanding officer, observing that they hesitated, and enraged that his orders were not complied with, became himself the assassin. His head was afterwards exposed before the rostra, which he had adorned with his triumphal spoils. This happened in the year of Rome 667, before Christ 87. Marcus Antonius was one of the greatest orators of Rome; and in the judgment of Cicero, it was owing to him and to Caflus, that Italy was the rival of Greece in the art of eloquence. He makes him one of the principal interlocutors in his “Dialogue on Oratory,” and in his “Treatise on famous Orators,” describes at length his character as a speaker. His distinguishing qualities were force, cere-mnus, acuteness, variety, readiness, and copiousness, and he excelled as much in action as in language. His memory was singularly retentive; and though he began to speak without any seeming preparation, he was always to much matter of his subject, that the judges seemed not sufficiently prepared to answer him. In his defence of Marcus Aquilus and others, he moved the judges, by the tears he shed, and by exhibiting the fears on the breast of his client, to such a degree, that he gained his cause. Although a trait of his oratory had got abroad surreptitiously, he never suffered any of his pleadings to be published; alleging that whenever it would have been better that any thing had not been said, it might not be proved against him. Cicero, de Oratore, lib. ii. c. 47. &c. Apud Oper. tom. i. p. 254, ed. Olivet.—De Claris Oratoribus, c. 30, 31, &c. Oper. tom. i. p. 416, &c. Pro Cluentio, c. 50. Oper. tom. v. p. 58, Valer. Max. lib. vii. c. 3. Gen. Diet.

ANTONIUS, MUSA, physician to the emperor Augustus. Having had the good fortune to restore the emperor to health, from a tedious and dangerous complaint, which his other physicians had attempted in vain, he was loaded with riches, and was allowed the liberty of wearing a gold ring; a privilege only granted to personages of the first rank. This privilege was afterwards granted to other physicians at Rome, in compliment to Antonius. —The medicines he used in the cure of Augustus are said to have been principally cooling herbs, to which he added the use of the cold bath, at that time but little known. He was skilful, Haller says, in the knowledge of medicine, and many of his compositions continued to be used to a very late period.

ANTUNE, in Geography, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Perigueux, on the Ille; five miles east of Perigueux.

ANTONOMASIA, compounded of art, for, and eosa, name, a figure in Rhetoric, whereby a noun appellative is used instead of a proper name, or vice versa. Thus we say, the Philosopher, instead of Aristotle; the Orator, for Cicero; the Apostle, for St. Paul; the Prophet,
for Meca, &c.—Thus also we call a voluptuous person, a Sattanapalus, &c. And thus the French say, Henry the Great, meaning Henry IV. of France.

ANTONOW, in Geography, a town of Poland, in the palatinate of Muilk, 16 miles south-south-east of Mozyr.

ANTONY, a town of France, two leagues S. of Paris.

Antony, Mark. Marcus Antonius, the tribunus, in Biography and History, was grandson of the celebrated orator of that name, and son of Antonius, sonnamed Cre- tusus. His mother's name was Julia, of the Cæsarian family, a lady of distinguished merit. He was born in the year before Christ 86, and educated under his mother's direction. But, following the example of his father, he launched out at an early age into the excess of riot and debauchery. His conniving person, lively wit, and inveterate address, recommended him to Cæsar, who encouraged and supported his licentiousness, and involved himself on his account in a debt of 50,000 pounds. On this occasion Cæsar was requested to appease the anger of Cæsar's father; and having prevailed with him to pay his son's debts, he advised him to copius on his for the surrender of all intercourse with Antony. This laid the foundation of an early enmity in Antony to Cæsar, which was increased by his forming intimate connection with the enemies of Rome. He afterwards attached himself to the profligate Clodius; but conceiving a dislike of him, and dreading the termination of the measures he was pursuing, he went to Greece with a view of improving himself in eloquence and the military art. Here he was invited to serve under the proconsul Gabinius, and obtained the command of the cavalry in his expedition into Syria, where he signalized himself by his valour in a complete victory over the Jews, and in his attempts to restore Ptolemy to the throne of Egypt. When Pelusium was taken, Ptolemy ordered the inhabitants to be put to death; but Antony interposed, and by his influence saved their lives. He afterwards performed several glorious actions, by which he gained the reputation of a great general. Upon the breaking out of the civil war, he joined Cæsar's party, and was created augur and tribune of the people; but becoming obnoxious to the senator's, he was driven out of Rome, and sought an asylum in the camp of Cæsar; in Gaul. Having complained, that the tribunes of the people were not permitted to speak freely, and that those who appeared in favour of equitable measures were in danger of losing their lives, Cæsar marched immediately into Italy; and on this account Antony was as considered as the promoter of the civil war among the Romans. When Cæsar had made himself master of Rome, he appointed to Antony the government of Italy and the supreme command of the army, which attachment he engaged, whilst he incurred the charge of oppressing the people. Such was the reputation he acquired by the effectual alliance which he gave to Cæsar, that he was appointed to the command of the left wing in the battle of Pharsalia, whilst Cæsar himself led the right. When Cæsar, after the victory over Pompey, was made dictator, Antony was appointed general of the horde, which office he retained for a whole year, though the usual period of it was only six months. In the exercise of this office he was tyrannical and intolerant; and his general conduct was so dissolute and licentious, that Cæsar treated him with coldness, and did not admit him to be his colleague in the consulship at this time; as he died two years after, in the year before Christ 44, when he himself was consul the fifth time. His restoration to favour was the remission of the most profligate adulation and servility, and his conduct in office was so base as to accelerate the fall of his patron. At the festival of the Lupercalia, he thrice tempted Cæsar with the offer of a regal diadem, which was so often refused by Cæsar, to the great satisfaction of the multitude. This attempt at royalty was soon attended by the conspiracy which deprived Cæsar of his life. Antony escaped by the interposition of Brutus; and afterwards contrived, by his art and eloquence, to procure a confirmation of Cæsar's acts, and to oblige the conspirators to fly from Rome. The government of Antony, after Cæsar's death, was for some time absolute; and he seemed to aspire to the sovereign power which Cæsar had proscribed. His contemptuous treatment of Octavius, the heir of Cæsar, however, threw him into the arms of the Senate, and defeated his own ambitious projects. Having failed in his various attempts for regaining him, Antony levied forces and retired to Ciliceine Gaul, of which he had been appointed governor, and laid siege to Mutina, now Modena, which was occupied by Decimus Brutus. For this conduct he was declared a public enemy; and the two confuls, Hortius and Pansa, accompanied by Octavius, were sent against him. In the battle which ensued, the two confuls lost their lives, but Antony was defeated, and the whole republican army was at the disposal of Octavius. Antony was compelled to leave Italy, and to march his troops over the Alps, which he conducted with a fortitude that did him honour. Having arrived in Gaul, he attached the soldiers of Lepidus to his interest; and they induced Lepidus to join him. Strengthened also by the troops of Plancus and Pollio, he returned to Italy with a large army. At Bologna, Antony and Lepidus had an interview with Octavius, who abandoned the Senate; and here they agreed on the partition of the Roman empire. They also concurred in that detestable proscription, of which the first sanguinary measure was the death of Cæro, against whom Antony had conceived an inveterate hatred on account of the condemnation of Lentulus the second husband of his mother, and the Philippi which he had pronounced against himself. The usurpers proceeded to Rome, and filled the city with rapine and murder; and Antony enjoyed the base satisfaction of fixing the head and right hand of the illustrious Roman orator upon the rostra, which had so often witnessed the triumphs of his eloquence.

After having completed the destruction of their enemies in Rome, Antony and Octavius marched into Macedonias, against Brutus and Cassius; the latter of whom, after a defeat at Philippi, put an end to his own life; and, in a second battle, Brutus fell in the same manner. It is recorded, as an instance of generosity on the part of Antony, that when Lucullus, who was mistaken by the Thracians for Brutus, surrendered himself in order to give his friend an opportunity of escaping, Antony commended his fidelity, and embraced him as a friend; and also, on viewing the dead body of Brutus, his sensibility was affected, he threw over it his own rich mantle, and ordered it an honourable funeral. At Athens in Greece, whither Antony next proceeded, he endeavoured to ingratiate himself with that city, by expressions of regard, and he frequented its public schools and gymastia. In Asia, he indulged his taste for splendid and voluptuous pleasures; and, though he frowned some lenity to the friends of Brutus who fell into his hands, he plundered several cities, and bestowed the wealth he thus collected on his parasites and buffoons. In Cilicia he summoned the famous Cleopatra, queen of Egypt, to give an account of her conduct, which had given offence to the triumvir. The interview was singularly splendid; and the queen advanced with confidence, not doubting that, as in her youth she had enslaved Cæsar and Pompey, she would be able, by her charms and the art which experience had taught her, to captivate the heart of Antony. The intercourse terminated as he expected. The triumvir was completely subdued, took the queen with him to Alexandria, and
and indulged in dissipation and luxury, which made him regardless of every important concern. In the mean while, Fulvia, the widow of Clodius, whom Antony had married before the death of Cæsar, quarrelled with Octavius, and assembling some legions at Benevente, commenced hostilities. Before Antony could reach Italy, the war had terminated in favour of Octavius; and the death of Fulvia, who is thought to have concerted this war for the purpose of detaching Antony from Cleopatra, made way for completing a reconciliation with Octavius, by the marriage of Antony with his sister Octavia, to whom the brother was affectionately attached, and who was a lady of an excellent and amiable character. On this occasion, Antony and Octavius, the two principal of the triumvirs, agreed on a new partition of the Roman empire; and by virtue of this partition, Codropolis, a town of Illyricum, being fixed as the boundary of their dominions, the whole that lay west of this place was allotted to Octavius, and the whole that was situated to the east belonged to Antony; so that the former had Dalmatia, the two Gauls, Spain, and Sardinia, and the latter all the eastern provinces as far as the Euphrates. Africa was allotted to Lepidus. It was also agreed that Antony should make war upon the Parthians; and Octavius reduce Pompey, if he refused to submit to reasonable conditions. Antony, after this business was amicably settled, spent the winter at Athens with Octavia, and dispatched his lieutenant Ventidius into Asia, to check the incursions of the Parthians. The successes of Ventidius routed the jealousy of Antony, and he determined to leave Athens and march into the east. When he arrived, he dismissed his lieutenant, who was besieging Samothrace, and went to Rome to demand of the Senate and people the honours of a triumph. Antony, having offended his soldiers by dismissing Ventidius, and raising the fuge without much honour, returned to Octavia at Athens, and soon afterwards failed to Italy, at the request and for the affiance of Octavius, in order to overpower by their united councils and forces their rival, Pompey. Antony came as far as Brundusium; and not finding Octavius there at the time appointed, he returned to Athens. However, when Octavius was reduced by Pompey to great danger, Antony assembled a large fleet, and sailed for Italy. But his two ambitious triumvirs, jealous of each other, disapproved; and Octavia, by a conference with her brother, in the presence of Maceenas and Agrippa, and by earnest entreaties, prevailed with him to meet Antony, and to compromise the differences that subsisted between them. In this office of prudence and affection he succeeded; and after an accommodation, Antony departed once more for Syria. Octavia accompanied him to Coreiya, but from thence returned to Italy. Upon Antony's arrival in Syria, he invited Cleopatra, and bestowed upon her all Phœnicia, Cilicia, Cyprus, and a great part of Arabia and Judea. His profusion offended the Roman people, and they encased his conduct on account of his scandalous connection with Cleopatra. After these extravagant grants, he marched with a large army against the Parthians, which only served to render his retreat the more ignominious. The Romans justly attributed the misfortunes of this fatal expedition to his passion for Cleopatra, and they were also particularly incensed by his conduct towards Artabazus, king of Armenia, whom he slew in a treacherous manner, and led in triumph to Alexandria. Having been induced by the crafty queen to order Octavia not to pursue her journey into Syria, but to return to Rome; he accompanied Cleopatra to Alexandria, and passed the winter with her in every kind of pomp, luxury, and voluptuousness. Octavius availed himself of the general resentment against Antony, and preferred to the senate and people several articles of accusation against him. A war between these two triumvirs became inevitable: but Antony, instead of making necessary preparations, appointed the ides of March for the place of general rendezvous; and summoned thither players and musicians, and all the minstrels of riotous luxury. From Syria he afterwards failed to Athens, where he pursued the same course of luxury and dissipation; and in order to justify his renunciation against Octavius, he solemnly divorced Octavia, and ordered her to be expelled from his house at Rome. Many of his friends abandoned him. War was declared against the Egyptian queen; and Antony was deprived of his confideate and government; and the reason assigned for it was, that he suffered himself to be ruled by a woman. Each party collected its forces; and the Ambazian gulf, between the islands of Coreya and Caphalaonia, became the scene of contest. The famous battle of Actium ensued: and this was fought at sea, against the advice of Antony's best officers, and chiefly through the perusal of Cleopatra, who was proud of her naval force. In the midst of the action, Cleopatra, with her 50 galleys, took to flight, and Antony followed her in a small vessel, and thus overwhelmed his character in perpetual ignominy. After an obdurate refiiance on the part of the soldiers, though abandoned by Antony, and at length by their principal officers, they surrendered to Octavius, and were incorporated in his legions. Antony, thus defeated and disgraced, vented his resentment against Cleopatra; but they were soon reconciled; and he pursu'd his course to Libya, where he had stationed a considerable body of troops: but on his arrival, he found that they had defected to Octavius. Disaffected with disappointment and vexation, he returned to Egypt, and lived for some time in gloomy solitude; but Cleopatra by her arts drew him to her palace, and he refused his former voluptuous life. Hither he was pursued by Octavius: and though on his approach to Alexandria, Antony made a successful sally against the invader; yet, defeated by the Egyptian fleet, by his own army, and betrayed, as he suspected, even by Cleopatra, he sunk down in despair. His first frantic effort was directed against the queen, who had been the cause of all his misfortunes; but the fled from her palace and escaped: he then defied one of his own servants to dispatch him; but the faithful Eros stabbed himself, and fell down at the feet of his master. Antony, emboldened by this act of heroism, fell on his own sword: but as the wound did not immediately prove mortal, he fought Cleopatra in her place of retirement and safety; and being drawn up to the tower in which she lodged, by ropes, he expired in her arms, in the 56th year of his age, and in the year before Christ 30. He was magnificently interred by Cleopatra; but at Rome his remains were desecrated, and his memory was declared infamous.

Antony left seven children by his three wives; two sons by Fulvia; two daughters by Octavia, who by their alliances gave three emperors to Rome; and two sons and a daughter by Cleopatra, whom he had lawfully married after his divorce from Octavia. Of these children Octavia took the most laudable care; and at length the daughter of Cleopatra was married to Juba king of Mauritania.

Antony was neither a great nor a good man: he wanted that vigour of understanding which entitled him to a place in the first class; and his love of pleasure, his want of principle, as well as his menacings and cruelty, exclude him from the second denomination. He has had, however, his partisans and admirers; and, it must be allowed, possessed a generosity of disposition which raised him above his rival, the cold and crafty Octavius. Plutarch in Anton. apud. oper. tom. i. p. 915—957, ed. Franc. Auc. Un. Hist. vol. xi. and vol. xii. Gen. Diet. 3 L 2
ANT

ANTONY, St. the hermit. See Anthony.

ANTONY of Lattavia, or Antonia Nobissiis, a Spanish writer, was born at Lebiva in Andalucia, in 1444, and contributed to the revival of literature in Spain. He first studied at Salamanca; and acquired farther knowledge in the University of Bologna. Besides classics and polee literature, he was acquainted with the mathematics, law, medicine, and theology, and might have been justly clasped among the most learned men of his age. After his return to Spain, he taught grammar at Salamanca for 23 years; and at Alcala, under the patronage of Cardinal Ximenes, he till his death. Here he employed himself in publishing a polygot edition of the Bible. As historigrapher to the king, he published, in 1509, two decades of the history of Ferdinand and Isabella, which are to be found in the work intitled "Hispania Illustrata." His dictionary of the Latin, Greek, and Hebrew languages, was printed at Grenada in 1545. He also wrote notes upon several Latin classics, and upon Aristotle's Rhetoric; a Treatise on Weights and Measures; a cosmography; a law dictionary; a medical dictionary: Commentaries on the Scriptures, &c. He died in 1522. Cave, Hist. Lit. Appendix, vol. ii. p. 209.

ANTONY of Mistina. See Antonello.

ANTONY of Padua, a monk of the order of St. Francis, was born at Lisbon, in 1195. A desire of obtaining the crown of martyrdom induced him to fall for Africa; but being driven on the coast of Italy, he devoted himself in that country to the study of theology, and became an eminent preacher. The fraternity of Flagellants is said to have owed its origin to his sermons. Pope Gregory XI. used to call him "the Ark of the Covenant, and the Depositary of sacred Learning." He was successively a teacher at Montpellier, Toulouse, and Padua; where he died, in 1231, at the age of 36 years. His works, confilting of sermons, commentaries, and a moral concordance to the bible, were published at the Hague, in 1641. Nou. Diet. Hiflor.

ANTONY of Pratoerobio, in Tufcany, was educated at Florence, and distinguished himself in the 15th century, by his attempt to form a new code of feudal law. The emperor Sigismund created him count and counsellor of the empire, and charged him with the execution of this undertaking. The result was a treatise, entitled "A Course of Feudal Law," and published in the year 1428. Although the emperor, under the influence of the lawyers, who envied the reputation of Antony, refused his imperial approbation of this new code, it was afterwards granted by Frederic III. Antony also wrote a "Commentaries on the Decree of Gratian," and a "General Repertory" or Lexicon of Jurisprudence. He died at Bologna about the year 1451. Gen. Biog.

ANTOSIANDRIANS, in Ecclesiastical History, a sect of rigid Lutherans, who oppose the doctrine of Olander, relating to justification. They are otherwise denominated Clandre-monfortes.

The Antosiandrians deny that man is made just, with that justice wherewith God himself is just; that is, they affirm, that he is not made effentially, but only imputationally, just; or, that he is not really made just, but only pronounced so.

ANTTRAIGUE, in Geography, a town of France, in the department of the Ardèche, and chief place of a canton, in the district of Privas, ten miles west of Privas. The place contains 1531 and the canton 7401 inhabitants: the territory includes 1874 kilometres and 8 communes.

ANTRAIN, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Fougeres, seven leagues north-north-east of Rennes, and four south-east of Dij. The place contains 1375 and the canton 14,353 inhabitants: the territory includes 222 kilometres and 10 communes.

ANTRIM, a county of Ireland, in the province of Ulster, lying at the north-eastern extremity of the island, and being one of the most respectable in point of culture and population. It is washed on its northern and eastern sides by the north channel, which divides Ireland from Scotland. On the west, Lough Neagh and the river Bann form a natural boundary, except for about five or six miles near the sea. On the south-east, it has a large estuary, called Carrickfergus Bay, or the Lough of Belfast; and on the south lies the county of Down, from which it is partly separated by the river Lagan. Its greatest length from north to south is 44 miles (56 English), and its greatest breadth 21 miles (30 English), containing 387,092 acres (927,050 English), and being about 605 (or 972 English) square miles. The number of houses, according to an official return made to the House of Commons, in 1791, is 30,314, from which we may estimate the population at about 170,000. The number of parishes is 74, of which 42 only have churches, all of them, except one, in the diocese of Down and Connor. This county returns five members to the Imperial parliament; namely, two knights of the shire, and one each for the towns of Carrickfergus, Belfast, and Lisburn. The face of the country, essentially in the northern and eastern parts of it, is very mountainous, and there are several extensive bogs, some of which have been improved, and others are very improvable. There is also a tract of very rough and hillcd on the west of Belfast; of which Mr. Arthur Young observes, that to their farms they confit of exceedingly good loam, and such as might be improved into good meadow. Of the mountains, Devis near Belfast, Slenslth in the middle, and Knocklaid in the northern part of the county, are the most considerable. The richer and more fertile parts of it are well cultivated, producing fine crops, especially the southern extremity, which is in a high state of beauty and improvement. The linen business extends throughout the whole county, in a manner which seems peculiarly favourable to the morals and happiness of the people. The farms are generally very small, and chiefly in the hands of weavers, who make the web at their own houses, and on their own account, and then carry it to the nearest market-town, where it is purchased by the bleacher. They grow their own flax, and generally have a patch of oats, some potatoes, and a cow, which supply them with their usual diet. The rivers of this county are generally small, but very numerous: the principal ones are, the Lower Bann, a broad and rapid stream, by which all the waters of Lough Neagh are discharged into the sea; and the Lagan, which passes by Lisburn, and a little below Belfast flows into Belfast Lough. The northern coast of this county is remarkable for its basaltic pillars, an account of which will be found in the article relating to the Giants' Causeway, where they are most conspicuous. The stupendous promontories of Bencore and Fairhead (the Robegium of Ptolemy), in particular, are in a great measure composed of these pillars. The eait-rn coast has many little bays, on which are villages inhabited by fisher-men. At the south east is a little town called Hill; it was once a bishopric. It has an important representation in the most maps as an island, though connected with the main land by an isthmus of more than a mile broad. The inhabitants of this county had an early period a considerable intercourse with the adjoining parts of Scotland; and some Scotch families settled in it, previously to the encouragement given by James I. The counties of Antrim, of the family of M'Donnell, descended from one of these, has in her possession, according to Mr. Young, 172,000 acres in this
this county, which are let on very long leases for £600 per annum, and relet for £4,000.

At present the greater part of the inhabitants are of Scotch extraction, and most of them continue attached to the Presbyterian form of worship. The places, elections, &c. for the county are held at Carrickfergus, but the quarter sessions is Antrim. Dr. Basset's Memoir; Mr. Young's Travels in Ireland; Dr. Hamilton's Letters respecting the Coast of Antrim.

Antrim, a town in the county of the same name in Ireland, pleasantly situate on a small stream, called the Sixmile-Water, which a little below the town empties itself into the north-eastern extremity of Lough Neagh. This was a populous, thriving place, but was injured some years ago by the desire of the proprietor to increase his influence in the election of members of parliament. It still partakes the benefits of the linen manufacture; and the fine-yard-wides are chiefly bleached and finished in the neighbourhood of this town, Lisburn, and Belfast. Amongst the different minstrels of this town were Mr. Abernethy and Dr. D'Udall, so well known by their writings, both of whom afterwards removed to Dublin; and from that prebendarry took its name, which still bore the name of the pope's patron saint, as will be seen when the church is visited. The town is a great mart of Italy, and is noted for the beauty of its streets.

Antrim, or Antrim, a township of Hillsborough county, New Jersey, in America, having 548 inhabitants, incorporated in 1777, 75 miles well from Portmouth, and as many north-west from Boston.

Antrodoco, a small town of Italy, in the kingdom of Naples, situate in Abruzzo, on the small river Velino, between Aquila and Rieti.

Antron, in Ancient Geography, a town of Greece, in that part of Thessaly, called Phthiotis, situate at the entrance of the Pelaic gulf. It was famous for furnishing apes of a large size. This town existed in the time of the Romans; and in the war against Perseus, the confidant Licinius, in the year before Christ 171, obtained it by treachery.

Antros, a small island of France, on the mouth of the Garonne, where was erected the tower of Cordova, which served as a light-house to vessels that entered this river, in passing to Bordeaux.

Antrum Genuen, in Anatomy, a large cavity in the bone of the upper jaw, which communicates with the nostrils. It was thus called by Caffierius, but by Dr. Highmore antrum maxillare superiorum. It is also frequently called antrum Highmoraniun. For a further account of this cavity, see the description of the superior maxillary-bone.

Antrum Pylorico, a term which has been employed to express the concavity in the great curvature of the stomach, as it approaches the pylorus.

Antrum Maxillare, in Surgery. The cavity of the cheek bone is liable to inflammation and abscesses. The bone itself may become cavernous, and be followed with very alarming consequences. Infections will sometimes be generated within this sinus, and produce the most excruciating pain for years together.

We have already had occasion to notice the treatment of abscesses in the maxillary sinus, to which we therefore leave our readers. See Abscess, Inflammation, Caries, and Diseases of the Teeth.

Antrim, in Geography, a mountain of Switzerland, in the Valais, which is a part of the Alps, that may be passed from the Valais into the Milanese.

Antuly, in Geography, a town of France, in the department of the Maine and Loire, and chief place of a canton in the district of Autun, five miles south-east of Autun.

Antwerp, or Antwerp, in French Antoerz and in Spanish Antwerp, the capital of a marquisate in Brabant, called the Marquisate of Antwerp, and also the Marquisate of the Holy Roman Empire; situate in a large plan on the eastern side of the Scheld, which is sufficiently deep and wide for admitting vessels of great burthen to the quay; and vessels may be brought by means of canals cut through the town to unload at the doors of the warehouses. It ranks the third city in Brabant; it is large and well built, and contains 22 squares, and more than 200 streets, which are straight and broad; and one of them, called the Merc, is so wide, that six carriages may pass abreast. At the head of this street a crucifix of brass 33 feet high. The cathedral church is a beautiful and elegant building; but in the course of the late war it was robbed of its richest ornaments, or the pictures of Rubens, which are now placed in the Louvre gallery at Paris. The Stadthouer and the Exchange are also magnificent structures. The latter built in 1561, is the first building of that kind in Europe, and on the model of this were built the exchanges of London and Amsterdam. Its pillars are of blue marble, and carved, but every one of them in a different style. Antwerp, towards the end of the 15th century, when the commerce of Bruges declined, and the English fixed their staple in it, became one of the most celebrated trading towns that ever existed. There were two circumstances in particular, that contributed to the great increase of its commerce and riches; one was the grant of free fairs for commerce, two of which lasted six weeks, and latter merchants resorted from all parts of Christendom, with their merchandise, custom free; and at these fairs great concerns were managed, not only in merchandise, but in bills of exchange with all parts of Europe; the other was, Portugal's bringing over in immense quantities, the rich produce of India, first to Lisbon, and thence to Antwerp, as to a kind of half-way port between the northern and southern parts of Europe. This drew the German and other merchants to settle at Antwerp; and after the archduke Maximilian had, about the year 1499, brought Bruges into subjection, the merchants of that city removed to Antwerp. In 1543, it was enlarged for the third and last time, and encompassed with new walls, built of fine hewn stone, and beautifully adorned. At this time it contained, according to the computation of Guiccardin, 150,000 inhabitants. When the emperor Charles V. wished to introduce the inferior tribunal of the inquisition into this city, about the year 1550, he was awed by the information, that the English merchants would leave the city and country; and this remonstrance proved effectual; for upon inquiry the emperor found, that the English merchant adventurers maintained or employed at least about 10,000 persons in Antwerp alone, besides 30,000 more in other parts of the Netherlands. At this time this city, and Hamburgh, possessed the principal commerce of the northern and middle parts of Europe; but after the Union of the seven United Provinces, in 1579, the commerce of Antwerp began to decline; and this misfortune was accelerated by the perfecution of the duke d'Alva, and the rack of the town by the duke of Parma, in
ANVAT, in Ancient Geography, a town in the island of Taphrodon, according to Ptolemy.

ANUBINGARA, a town also in the same island.

ANUBIS, in Mythology, a deity worshipped among the Egyptians, the Greeks, and the Romans. Ovid mentions this deity, when he says to Isis, (Amor. lib. ii. cleg. 13.)—

"Per tua ultra precor, per Anubidis ora verenda."

The head of this deity was that of a dog, and in Egypt especially he was regarded as the faithful companion of Osiris and Isis, and received divine honours. Temples and priests were consecrated to him; and his image was borne in all religious ceremonies. His temples were denominated Anu-bida. This kind of worship seems to have commenced in Egypt, by consecrating an animal to Anubis, as was the custom with regard to other deities. Soon afterwards they substitutted the figure of a dog for that of Anubis himself, and then annexed the head of this animal to a human body, as an emblem of the new deity. Thus he is represented in the ruins of the ancient temples of Egypt, as well as on bronzes and marbles in the collections of antiques. Diodorus Siculus (lib. i.) says also, that the god called Anubis is represented with the head of a dog. Virgil, Ovid, Lucretius, first of the ancient writers, represent him thus. They had a temple of him, and performed sacrifices and other religious ceremonies in his honour. The priestesses of Anubis were called Aneidiae. Virgil (Aen. lib. vii. v. 462) pronounces him "Barker Anubis." Cypopolis, the present Minieh, situated in the lower Thebais, was built in honour of Anubis. The priests celebrated his festivals with great pomp, and consecrated the dog to him, as a living representation of him. This city of dogs, says Strabo, (lib. xvii. p. 1116) is the capital of the Cypopolitan prefecture. These animals are fed there with sacred aliments, and religion has decreed them a worship. The medals of this city bear upon them the figure of a man with a dog's head. But though Cypopolis was the centre of the worship of Anubis, the whole of Egypt adopted it; and to this purpose Juvenal says, Sat. xx. v. 8.—

"Oppid a tota canem venerantur."

From the universality of the worship of this deity proceeded the respect which the Egyptians manifested for dogs. This strange worship, however, was not confined to the banks of the Nile. The Greeks adopted it not only in the time when the Ptolemies blended the worship of their country with that of their new subjects, but in the more remote periods of the Greek history. When Rome had adopted the ceremonies of Egypt, the emperor Commodus, in celebrating the festival of Arsac, sacrificed a dog, and carried the god Anubis. His statue was of marble or gilt, and presented as the attributes which accompanied it. Even the name of Anubis, derived according to Jablonski (Pantheon Egypt.) from ab, gold, and annub, gift, signifies gilded.

But what was the significance of this emblematical deity? What is the natural meaning concealed under it? Plutarch, in his Treatise of Isis and Osiris (Opere. tom. ii. p. 358), explains this. "The circle which touches and separates the two hemispheres, receiving the name of horizon, is called Anubis. He is represented under the form of a dog, because that animal watches and night." St. Clement of Alexandria, well informed concerning the mystic theology of the Egyptians, favours this explanation. The two dogs, says he, (Strom. v. tom. ii. p. 671), the two Anubis are the symbols of two hemispheres, which enquire into the terrestrial globe. He adds in another place; others pretend, that
that these animals, the faithful guardians of men, indicate the tropics, which guard the fun on the north and the south, like porters. According to the former of these interpretations, the prieëls, regarding Anubis as the horizon, gilded his stature, to denote that this circle, receiving the first rays of the sun, appears sparkling with brightness on his rising; and that at his setting he reflects his last rays upon the earth. In their sacred fables they said, that Anubis was the illegitimate son of Osiris. In fact, he only gives to the earth a borrowed light, and never can be esteemed like Horns, as the father of the day, or as the legitimate offspring of Osiris. We may add, that the visible horizon turning with the fun, is his inseparable companion. According to the latter explication, which makes Anubis to represent the tropics, he is also the faithful guardian of Isis and Osiris. In reality, the course of the fun and of the moon is contained between the circles in which the solstices occur, without deviating from them. These limits assigned by the author of nature, might therefore, in hieroglyphic language, be represented by a divinity with the head of a dog, who seemed to oppose himself on the side of the sun. The other opinion, however, seems to be more natural, and more analogous to the ideas of the prieëls. Upon the whole it is not unreasonable to imagine, that Anubis was, at first, only a symbolical image, invented by astronomers, to convey a sufficiently expressive of their discoveries; that afterwards the people, accustomed to see it in their temples, which were the depositories of science, adored it as a deity; and that the prieëls favored their ignorance by connecting it with their religion. The worship of Anubis introduced that of the dog, which became his emblem. Almost all the gods of the Gentiles have originated in this manner. Before the invention of writing, men made use of hieroglyphics or imitative figures to convey their ideas; those hieroglyphics remained in their sanctuaries, and the prieëls alone preferred the knowledge of them. In the end, these allegorical signs no longer represented the real meaning of things to vulgar understandings, but the external forms and figures only, which became the objects of superstition. Savary's Letters, vol. ii. p. 488—495.

Siris or Osiris (says Bruce, Travels into Abyssinia, vol. i. p. 413.) was not the fun, but Syrius or the dog-star, represented under the figure of a dog, because of the warning he gave to Atbara, where the first observations were made at his heliacal rising, or his disengaging himself from the rays of the sun, so as to be visible to the naked eye. He was the "Ladatvor Anubis;" and his first appearance was figuratively compared to the barking of a dog by the warning it gave to prepare for the approaching inundation of the Nile. This, he thinks, was the first hieroglyphic; and Isis, Osiris, and Tut, were subsequent inventions relating to it. In this opinion he is confirmed by confiding, that in the city of Axum, once a large city, there is not any other hieroglyphic besides that of the dog-star.

At Rome they had many statues of Anubis, the principal of which are two in the Villa Albani, and one in the Barbarini palace. Anubis is frequently represented in pictures, &c. with a dog's head, holding in one hand a branch of palm, and in the other a caduceum, or Mercury's wand. Anubus, in Entomology, a species of sphinx that inhabits Surinam, and is figured by Cramer. The anterior wings are sub-ferocious, posterior wings black with a row of whirly spots. Fabricius. A black spot in the middle, and a large brown spot with a few streaks near the margin of the posterior wings.

Anuchtia, in Ancient Geography, a town of Asia, in Sufiana, according to Ptolemy.

Anvers, D' Henry, earl of Danby, in Biography, is here introduced, as being founder of the botanic garden at Oxford. In the year 1022, he purchased five acres of land in the vicinities of Oxford, which he took care to flock with numerous foreign as well as indigenous plants; and having erected hot-houses and other necessary buildings, gave it to the university in 1651. He also endowed it with an annual rental, for the support of a gardener and proper assistants; and of a botanical professor, to teach the science to the students of the university. Dr. Sherard augmented the estate of the garden, by a donation of 500l., to enable the curators to enlarge the conservatory, and present them with a large number of exotic plants, and a handsome collection of books on the subject of botany.

Anversa, in Geography, a town of Italy in Naples, five miles well of Solomiao.

Anui Bolsche, a river of Siberia, which runs into the Kolima, eight leagues call of Niznie Noviimskoi.

Anui Schos, a river of Siberia, which runs into the Kolima, nine leagues call of Niznie Noviimskoi.

Anvil, a smith's utensil, serving to place the work on, to be hammer'd or forged.

The face, or uppermost surface of the anvil must be very flat and smooth, without flaws; and so hard, that a file will not touch it. At one end there is sometimes a pike, bickern, or beak-iron, for the rounding of hollow work. The whole is usually mounted on a firm wooden block.

Forged anvils are better than those of cast work; and the hollow have the upper part made of steel. Locksmiths have a smaller kind of anvil, called the flake, which is moveable, and placed ordinarily on their work bench. Its use is for setting small cold work straight, or to cut or punch on with the cold chisel or cold punch.

Anvil Island, in Geography, an island of the Pacific Ocean, on the north-west coast of America, so called from the shape of the mountain that composes it, and lying in N. lat. 40° 30'. W. long. 237° 3'.

Anville, Jean Baptiste Bourguignon d', in Biography, geographer to the king of France, and adjutageographer to the Academy of Sciences, was born at Paris, July the 11th, 1697. D'Anville possest a peculiar talent and disposition for geographical researches; and the principal part of his time was devoted to this kind of employment. Accordingly he collected, from the paraphernal of ancient and modern authors of various descriptions, such as geographers, historians, travellers, and even poets, materials for his main purpose, which was, the construction of charts, and the accurate adjustment of the situation of different places. At the age of 22, he began to publish some of those charts which have given celebrity to his name. To every chart of importance he annexed an account of the authorities upon which he depended, and of the means by which he obtained necessary information; and this he did not with selfish views, or for the purposes of ostentation, but from a conscientiousness of the difficulty and extent of his inquiries, and in order to enable others to form a competent judgment for themselves. The successes of his investigations, and the reputation he acquired, were owing partly to the natural vigour of his mind, and perhaps principally to his indefatigable study; for he is said to have devoted, for 50 years of his life, 15 hours of every day to study. To this recluse mode of life it was probably owing, that though he was cheerful, modest, and unassuming, his decisions on the peculiar objects of his study were more positive and dogmatical than they would have been if he had accustomed himself more to the society and conversation of literary men. In the year 1773, the Academy of Sciences appointed him adju-
When the surgeon wishes to promote the formation of an artificial anus, he must first carefully examine which is the superior portion of the intelleine: and this he may, in general, know, by observing through which the excrements are discharged. However, as this is not always a certain mark of distinction, he may let the patient swallow a few spoonfuls of oil, after which he might distinguish the superior portion of the intelleine with certainty, by observing from whence the oily discharge proceeds. Through this end of the intelleine he then pales a thread, which he falls with adhesive plaster to the external skin, in order that it may not be drawn back into the cavity of the abdomen. This operation, however, is not often necessary, as both ends of the intelleine generally adhere within and behind the abdominal ring. The lower portion of the intelleine must then be cleared by glyclers and purgative injections; and it may be suffered to lie in the wound, in order to avoid the inconveniences which might arise from returning it into the abdominal cavity. At the end of the cure, a plug of sponge should be introduced into the upper orifice, to prevent its contracting, and occadiong an impediment to the discharge of the faces.

With respect to the formation of an artificial anus, however, the most rational practice is to leave the whole to nature. The surgeon, in general, has done all that he can when he has opened the gangrenous hernia, separated the gangrenous portion, and evacuated the excrements from the intelleines; after which nature either re-unites the intelleine, or does not re-unite it, in which case an artificial anus is formed, with regard to which the surgeon has nothing to do besides what has already been mentioned. If the surgeon wishes from the very first to form an artificial anus, he should immediately introduce pledgets into the superiour extremity of the intelleine, whereby the reunion of the two ends will be prevented.

His next business must be to endeavour to obviate the inconveniences arising from the involuntary discharge of the excrements through an unusual passage, and to keep the parts clean. For receiving the matter discharged, he may choose a receptacle of horn or strong leather to the body by means of a strap, in such a manner that its orifice falls upon the artificial anus. Dr. Richter (Abhandlung von der Bruchen. neue Aufg. Gottingen, 1785, page 458.) proposes, for the same purpose, an elastic rupture-bandage, having a piece of sponge fastened under its head, which covers and closes the artificial anus in such a manner as to prevent both the access of the air and the discharge of the faces; and to supply the place of a sphincter, without either irritating or rubbing the orifice. Whenever the patient wishes to discharge either faces or wind, he must take it off.

M. LOELEF (Archiv. der praktischen Arzneykunst, &c.)
ANU

&c. Leipzig. 1785. b. i. p. 115.), however, has found the use of this bandage to be attended with some inconveniences, which, he thinks, may be avoided by one of a different construction. In the pelotte of the bandage he directed a hole to be made, an inch in diameter, and a varnished leathern receptacle to be adapted to its outer margin.

As the sphincter is wanting, a prolapsus of the intestine may more easily be produced through an artificial anus than through the natural one. Such a prolapsed intestine may sometimes be easily reduced with the hand; sometimes it is reduced spontaneously, merely by the patient lying down upon his back. When this is not the case, the patient should constantly lie on his back, every exertion of the body should be carefully avoided, and gentle pressure permanently applied, by which means the protrusion will generally be effected in a longer or shorter space of time: force ought never to be applied, as by too hastily and forcible reduction of the intestine the lice afflication might easily be excited. A prolapsus of the lower portion of the intestine is in general far more difficult to be reduced than that of the upper portion; and frequently it cannot be reduced at all, the intestine being contracted, or even entirely closed, behind the prolapsed part. Such hernia ought never to be suffered to attain too large a size, as in that case it may become impossible to reduce them; they may particularly also prevent the discharge of the excrements, and occasion the death of the patient. By using an elastic bandage, the head of which is provided on its inner side with a sponge, which covers and gently compresses the artificial anus, both the production of such a prolapsus, and its recurrence after having been reduced, may be prevented. Mr. Lange (Schmuckers vermittelte chirurgische Schriften, &c. b. ii. p. 298.) has shown that such a hernia may actually become strangulated. He mentions an instance in which the intestine hung down a foot in length, and was so turgid with blood, that it was impossible to reduce it. He was, therefore, obliged to enlarge the artificial anus and abdominal ring by an incision, after which the reduction was easily performed.

It is always a dubious undertaking to attempt to close up an artificial anus of a pretty long standing, and render the discharge of the excrements by the natural passage. However, when still some part of the excrements is discharged by the natural anus, when clocks can be thrown in by that passage, especially when the artificial anus is of no long standing, and we can be assured that the lower portion of the intestine is still open, we may make the attempt to close the artificial anus. That even where the artificial anus is already of long standing, the cure is still possible, has been proved by a case related by Mr. Deuffalt. The disease had already continued for the space of four years, the intestine was protruded out of the body, in the form of a cylinder, nine inches in length; and its membranes were so much thickened and hardened, that it appeared more than tenuity to attempt the reduction of so considerable a mias.

The patient had discharged nothing from the rectum since he had received his wound; every two or three months, however, he had a flux, by which he voided a whitish hard sell of substance. Mr. Deuffalt applied a simple bandage over the whole tumor from the top to the bottom, in such a manner that the turns of the bandage applied close over each other, leaving only a small opening at the point, for the purpose of discharging the feculent matter, which consisted of half-digested aliment. When by this means the intestine had been restored to its natural size, on the fourth day, he directed it to be raised up into a perpendicular direction; and having introduced his finger into the orifice of the intestine, whilst he pressed the intestine itself with his other hand, in order to prevent the protrusion of the parts, he extricated the intestine, so that it now contracted into itself, and consequently the hernia was reduced. The orifice of the intestine, through which the excrements were voided, was closed by means of a plug three inches long, and made of a piece of linen rolled up, which was introduced into the orifice, and secured by means of the common inguinal bandage. His intention with this plug was, that it should be withdrawn twice a day, in order to afford a passage to the faces; but soon after the reduction of the intestine, flatus were several times discharged through the anus; and soon afterwards fluids; which, in the course of the following days, acquired more confidence, so that on the eighth day the plug was no longer used, but the external orifice merely covered and secured with pluggs of lint, compresses, and the elevation of an elastic bandage: by this means the discharge of the excrements through the preternatural orifice was prevented, and its natural passage by the rectum permanently re-established.

But, in general, the attempt to close up an artificial anus is not unattended with difficulty and danger; and it ought never to be risked, unless when the vicinity of the orifice to the stomach gives rise to inanition, or a consumption, or some other material inconvenience. But even in these circumstances, Prof. Richter thinks we ought to use gentler means of alleviating the symptoms, and with a view to the cure. He recommends to keep the orifice of the artificial anus constantly closed, by means of the bandage above mentioned, whereby the chylous fluids will be detained longer in the alimentary canal, and a greater absorption of the nutritive parts take place; to let the patient take only easily digestible, very nourishing, and fluid aliments; and to avoid whatever might tend to accelerate the passage of the aliments through the intestinal canal. By these means he thinks that the above mentioned inconveniences may generally be remedied.

ANUS, in Botany, denotes the posterior opening of a monopetalous flower.

ANUS, in Conchology, a species of Murex in the order of Telescopium Verum, having a velvety shell with membranaceous dilated lips, gibbous reticulate-tuberculate aperture, sinuous and erect as the end. It is the auris hirta of Rumph. Mus. t. 24; found in the Mediterranean, and the ocean contiguous to the southern part of Asia; the shell is about three inches long, for the most part brown, with white bands, and an almost triangular aperture. Gmelin.

ANWEILLER, in Geography, a town situate in the duchy of Deux Ponts, ceded to France by the treaty of Wellphalia; eight miles west of Landau. It is the chief place of a canton in the district of Deux Ponts, and department of Mont-Tonnerre: the place contains 1,841, and the canton 12,690, inhabitants; the territory includes 24 communes.

ANXA, in Ancient Geography, the name given by the Romans to Callipolis.

ANXANUM, Lanciano, or Anciano, a considerable town of Italy, which was the capital of the people called Frentani. It was situate in Latium, near the mouth of the Sagrus.

ANXI, in Geography, a town of Italy, in the kingdom of Naples, and province of Basilicata, eight miles south-east of Potenza.

ANXUR, in Ancient Geography, a town of the Volsci, called by the Greeks and Latins Taracina, situate at the lower extremity of a small gulf to the east of the Circene promontory. In allusion to its situation on a mountain,
AOR

Martial calls it "superbus Aurox." Jupiter αυρως, or the beardless Jupiter, was worshipped in this town; and at the distance of three miles from it there was a grove and waters consecrated to the goddess Feronia, mentioned by Horace, lib. i. fast. 3.

ANYM, a town of Palatine, placed by Joshua in the tribe of Judah; and supported by Calmet to be the same with Anam or Anem.

ANZABAS, a river of Aes, which, according to Ammianus Marcellinus, was not far from the Tigris.

ANZA, in Geography, a river of Italy, which runs into the Tola near Urgugna, in the principality of Piedmont.

ANZAR, a town of Tusquellia, in the vicinity of the northern part of China, where Tamaraeus died.

ANZERMA, a town and province of Popayan in South America, situate on the river Coca, and having mines of gold. N. lat. 4° 58'.

ANZIKO. See ANZIKO.

ANZITA, in Ancient Geography, a town of Aes, situate on a small river, near the city of the Ephorates.

ANZQUI, in Geography, a town of Japan, in the island of Honshu, upon the eastern side of the gulf of Mazzu.

ANZQUIAMY, a town of the kingdom of Mine: the territory to which was the paradise of Nubumanga, who went from the sovereignty of Mine to that of Japan.

AOAYS, a town of Spain, in Navarre, on the river Yrare, seven leagues from Pampluna.

AOBRIGA, or Aobrica, in Ancient Geography, a town of Spain, called also Aobricia and Abobriga.

AOCHARA, a town of Africa, in the kingdom of Algiers, between Tenez and Serelles.

AOE, or AONIUS, in Ancient Geography, a people of Bceotia, who joined with the Hyantes succeeded the Eetecens. At the arrival of Cadmus, according to Pausanius (in Bceot. c. 5.), the Hyantes took up arms to oppose him; but the Aonians submitted, and were afterwards incorporated with the Phocians. The Aonians derived their name from Aonia.

AONIA, an ancient name given to Bceotia.

AONIDES, in Mythology, the appellation of the Miles, derived from the mountains of Bceotia, where they were particularly honoured, called the Aonian mountains.

AONIS, in Entomology, a species of Papilio (Nymp. Gem.) found in India. The wings are angulated, grey, anterior pair clouded with yellow: a large and small eye-shaped spot above. Cranmer, Gmelin, &c.

AORASIA, formed of α, priv. and αυρας. I see, denotes invisibility, and was applied by the ancients to the gods; for they apprehended that, in their intercourse with men, they never shewed themselves face to face, but were distinguished, as they retired, by their backs. Thus Neptune, as Homer represents him (Od. ii.), assumed the form of Calchas in conversing with the two Ajaxes, and was known merely as he withdrew by his majestick gait and step. Venus also, according to Virgil, appeared to Aneas under the form of an huntef; but the discovered herself in her retreat by her radiant head, flowing robe, and dignified movement.

AORISTIA, in the Sceptic Philosophy, denotes that state of the mind, in which we neither affect nor deny any thing positively, but only speak of things as seeming or appearing to us in such a manner.

The aorist is one of the great points or terms of scepticism, to which the philosophers of that denomination had continual recourse by way of explication or subterfuge. Their adversaries, the dogmatists, charged them with dogmatizing, and affecting the principles and positions of their sect to be true and certain.

AORISTUS, compounded of α, privative, and ἄοριστος, to limit, in the Greek Grammar, an indefinite and indeterminate kind of tense, which sometimes expresses the present, sometimes the future, but most frequently the past time.

The Greeks have two aorists; the Latins have none.

Dr. Beattie, in his "Theory of Language," (Part ii. ch. 22), giving an account of the Greek tenses, omits the second aorist as well as the second future; because he considers them as unnecessary. Some grammarians, he says, are of opinion, that the first aorist signifies time past in general, and the second, indefinite time past; and that the second future denotes a nearer, and the second a more remote futurity. But this he apprehends to be mere conjecture, unsupported by proofs, and he inclines rather to the sentiments of those who teach, that the second future and second aorist have no meaning different from the first future and first aorist; and that they are the present and imperfect of some obsolete theme of the verb; and, when the other theme came into use, were retained for the sake of variety, or, by accident, with a pretcrite and future significatiori. In this opinion Lord Monboddo concurs; and he has endeavoured to strengthen it by the testimony of some ancient grammarians. Dr. Browne, in his "Brief Structure of certain Observations of Lord Monboddo respecting the Greek Tenses" (See Transactions of the Royal Irish Academy for 1789), or vol. iii. part ii. p. 11, &c., has controverted this opinion. Aorists, or indefinites, he observes, are sometimes called, because they are used for many tenses indifferently, past, presents, and futures; sometimes, because they do not mark any precise point of time when an action happened, but only express that it did happen; sometimes, because the verb, when used in these tenses, do not express whether the action signified be perfected or imperfect. In this last sense he uses the term aorist; and by definite, he means the tense in which the verb expresses the perfection of the action. Having thus defined the meaning which he annexes to the term aorist, he allows that both the aorists are often used, without discrimination, as mere past imperfects; but he maintains, that the first aorist has much more frequently a definite meaning than the second; whereas the second appears in nine instances out of ten to be used indefinitely. Grammarians have observed, that the first aorist is often introduced to denote the past perfect time, than their preterperfect tense itself; and hence he argues, that its proper meaning is of a definite nature, and that it is not properly an aorist. Such, he argues, seems to have been of this opinion, when he calls the second only by the name of aorist. He then proceeds to show, that such a definite, as he conceives the first aorist to be, was wanting in the Greek language, and is not supplied by the preterperfect; which implies, that the action has been done, and still continues to be done. In the Greek language there must be some other tense for expressing the time of the performance of an action which was perfected at a time past, and has ceased to continue. Dr. Clarke has assigned to this office the tense usually called the preterperfect; but in Dr. Browne's opinion, without sufficiently it authority, as that tense expresses something more. He has recours, therefore, for this purpose, to the first aorist, the original intention of which was to express the real preterperfect time of philosophical grammar. In the Latin and English languages we have no diversity of tenses, or of single words, to express whether a past action has been done lately, or a long time since. It is only from the tone of the speaker, from the circumstances of the event, or from the context, that we can find out the difference. To supply the defect which these languages labour under, in their à la voix, in not distinguishing, by different
different sounds or words, the difference between what was 
later perfected, and that which was perfected some time 
ago; and in the _p옼_ , in not making this distinction 
except by the help of auxiliary verbs; the Greeks, according 
to Dr. Browne, invented their first aorist; and intended 
by it to indicate the latter, as the pretender indicated the 
former. When Archimedes rushes out of the bath, after 
having made his celebrated discovery, he exclaims ἵππαξ, 
because he had just at that moment found out and solved 
the difficulty. But when Nelfor (Homer II. i. v. 260, 261.) 
speaks of ancient days and ancient heroes with whom he 
had been conversant, he speaks in the aorist, ἔρμην ἔμε 
θεος ἅπατο ἀποκαλάκα. When Demosthenes supposes the 
question πότε ἤρατα; it follows, that if it had been so, 
and any person had suddenly announced it, he would have 
replied ἄρα. But when Chrysis (II. i. v. 40) alludes to 
actions formerly and frequently performed by him, he uses 
the aorist, "if I have ever crowned your altars or burnt 
victims," ἢπατα οἴκους καὶ ἀποκρατήσσας ἦσαν. 

Moreover, the probability that the Greek language had 
a distinct tense to denote what had lately, or what had 
long since happened, is augmented by the consideration that 
they had a tense to express what was soon to come. As 
they had a "passo-poll future," they might also have had a 
"paolo ante preterit." 

If an action be spoken of which has been often done, 
the Greeks generally use the first aorist. Thus, in the 
beginning of the "Cyropedia," where Xenophon reflects 
how many democracies have been reduced, and how many 
oligarchies subverted, he often speaks of how he 
expresses the first aorist: thus also he expresses, in 
the beginning of the "Memorabilia," his frequent surprise 
at the errors respecting Socrates; "I have often 
heard," in the first aorist. This is also the case in the 
example of Nelfor above mentioned; and in similes, where 
a comparison is made with something frequently occurring, 
the first aorist is generally used. In such cases, no particular 
time at which the action happened is specified, but an action 
which has often passed is mentioned, without determining 
any precise time. The second aorist, on the other hand, 
which generally refers to a particular time, is seldom if ever 
used to denote a frequentative; although lord Monboddo 
has alligned this usage to this as well as to the first aorist.

To close this article, we may observe, that definite tenses 
are thoe which limit both the times of the peron and of 
the action; whereas those tenses which leave the nature of 
the action wholly undecided, and take no notice whether it 
be finished or unfinished, are indefinite, or aorists; e. g. "I 
write," is the aorist of the present tense, "I wrote," is the 
aorist of the past tense; and "I shall write," is the aorist of the 
future tense.

AORNS, in _Ancient Geography_, a town of Bactria, 
situate to the south of Bactra.

AORNS was also a place of Epirus, according to Phiny; 
belonging to the Threpetisa, according to Pausanias; whence 
the name was given to the high mountain of 
that was fatal to birds which flew over it; and where, it is said, they invoked the dead to predict 
future events. In this place were a temple and grove confe- 
crated to the Muses.

AORNS. Rock of, a name given to a high mountain of 
India, situata in the modern district of Bijore, and 
driving its name from a, priv. and apo. bird, expressing its 
great elevation, which was suffopd to be above the flight of 
a bird. The circuit of it, according to Arrian, 200 
flada or about 18 or 20 miles; its height about 11 for 
longs; and the access to it was only by one narrow path, 
cut out of the rock. On the summit was a great extent of 
ambles and pasture land, with springs of water; so that a 
garrison of 1000 men might subist, without any extravagant 
supply. It may be supposed to be somewhat similar to 
Gwaler, or Rotas Gur, in Bahar. Some have laid, that 
the Indus passed by Aorns; but this, says Mr. Pennell 
(Memor. &c. p. 174.), could not be the case; because the 
district of Sowdad Proper lies between the Indus and Bi- 
lore, according to the Aysen Achebe. The siege and cap- 
ture of this fort were among the most celebrated exploits of 
Alexander in his Indian expedition. Hercules had to 
have attempted it in vain: but Arrian informs us, that this 
was a groundless report; and that it was a fable, probably 
invented by some of Alexander's flatterers to magnify his 
enterprise. Whilst he was preparing for the siege, an old 
man and his two sons, who had long lived in a cavern of 
the mountain, offered to shew him a private way of ascend- 
ing it; and a deputation of light-armed troops, under the 
command of Ptolemy, was sent to accompany them. As 
soon as they were safely lodged, they caused a lighted torch 
to be erected on a pole in their camp, as a signal to Alex- 
ander. Alexander, attempting the ordinary passage with a 
body of troops, was repulsed with great slaughter. But 
Ptolemy attacking the Indians in the rear, whilst Alexander 
renewed the assault, a second repulse took place. Upon this 
Alexander, perceiving that the strength of the Indians de- 
pended on the narrowness and declivity of the passage, gave 
ordeal to fell a quantity of trees, and to fill the cavities 
between the plain on which the Indians were encamped, and 
the highest of his own advanced posts. The measures were 
at first derided by the Indians; but as soon as they began to 
feel the effects of the missile weapons of the Macedonians, 
they proposed terms of surrender. Alexander, suspecting 
that they really wanted to gain time, and to make their 
escape, took the advantage of their defeat; and having 
gained possession of the deserted rock, he then made a 
signal for the forces to fall upon the flying Indians. The 
 fugitives, hearing their loud shout, were so terrified, that 
many of them fell from the rocks and precipices, and were 
dashed to pieces, and the rest were cut off in the roads. 

AORSI, a people who, according to Strabo, inhabited 
the banks of the Tanais. They afterwards extended them- 
selves along the northern parts bordering on the Caspian sea, 
and carried on a commerce in gold and other articles of 
merchandise between India and Babylon.

AORTA, formed of αορτάς, which signifies a _lag. chis_, 
&c., in _Anatomy_, the great artery proceeding from the 
left ventricle of the heart; from which all the other arteries 
either mediately or immediately proceed, and by which 
the whole mass of blood is conveyed to all parts of the 
body.

The structure, divisions, courses and branches of this 
vein, are explained under the article _Artery._

AORTA, _diseases of the_, in _Surgery_. The most common 
local disorders of this vein are, _anguria_, _ossification_, 
or a thickening and opacity of the seminal valves of the 
aorta, interrupting their proper action, and sometimes pro- 
ducing fatal consequences. This artery is likewise subje 
to _inflammation and ulceration_, like other parts of the body; but in all the complaints the art of healing affords 
only palliative means of relief. See _Polyphus_ of the heart 
and blood vessels.

AOUIS, in _Ancient Geography_, a river of the isle of 
Cyprus.

Aou is also a name given to the river Aas near Apol- 
lonia,
ioia, which rose in the south-east, and discharged itself towards the west into the Ionian sea.

AOUSTA, or Aoust, in Geography, formerly Augusta pretoria, a city of Piedmont, situated at the foot of the Alps, on the river Doria, is so called probably from its ancient name, which was given it by Augustus, who sent thither a colony of 5,000 of the Pretorian legion. It is the see of a bishop, has several Roman antiquities, such as a triumphal arch, an amphitheatre, &c., and was the birth-place of Anselm, archbishop of Canterbury. It is distant 25 miles north-west from Ivrea, and 50 north-north-west from Turin; N. lat. 45° 32' E. long. 7° 33'.

AOUST, a district of Piedmont, with the title of a duchy, is a valley about 30 miles long, and fertile in pasturage and fruit; extending from the pals of St. Martin's, near the frontiers of Yvree, to St. Bernard. Its capital is Aouilla, and most of the inhabitants are Goites.

AOUST, a town of France, in the Department of the Drôme, and chief place of a canton in the district of Crest, situate on the Drôme: 15 miles south-east from Valence, and two south-east from Crest.

AOUST, the name of the paper mulberry-tree at Otaheite, in the South Sea, from which a cloth is manufactured that is worn by the principal inhabitants. The bark of the trees is stripped off, and deposited to soak in running water; when it is sufficiently softened, the fibres of the inner coat are carefully separated from the rest of the bark; they are then placed in lengths of about 11 or 12 yards, one by the side of another, till they are about a foot broad; and two or three layers are laid one upon the other. This is done in the evening; and by the next morning the water is drained off, and the several fibres adhere together in one piece. It is afterwards beaten on a smooth piece of wood, with instruments, marked lengthways with fine grooves of different degrees of fineness; and by means of this operation becomes as thin as muslin; and after bleaching it in the air in order to whiten it, it is fit for use. If the cloth breaks in the beating, it is easily repaired by pasting on a patch with a gluten that is prepared from the root of the pes, which is done so nicely that it cannot be discovered. This cloth is cool and soft, but as liable to be rent as paper. The colours with which it is dyed are principally red and yellow. The red is a beautiful scarlet, and produced by mixing the juices of two vegetables, viz. the fruit of the fig called maité, and the leaves of the cordia febathina or etou.

The yellow is made of the bark of the root of the marinda citrifolia called nono, by scraping and infusing it in water. The inhabitants of the island also dye yellow with the fruit of the tamanu. Hawkesworth's Voyages, &c. vol. ii. p. 210, &c.

AOUTOS, in Geography, a town of European Turkey, in the province of Romania, 44 miles west-north-west from Burgas.

AOYCA, a town of Spain, in Navarre, four leagues from St. Elievan, and five from Pampeluna.

APACHES, a people of North America, in New Mexico, who occupy an extensive country under the apppellations of Apaches de Parillo, to the south; Apaches de Xilla and de Navaio, to the north; and Apaches Vaguecos, to the east. They are brave, and resolute, fond of liberty, and the inveterate enemies of tyranny and oppression. Ever since their revolt from the catholic king towards the close of the 17th century, they have been the allies, but not the subjects of the Spaniards.

APACHIERA, an audience and province of New Mexico, whose capital is St. Fe, in N. lat. 36° 30', W. long. 104°.

APACTIS, (Apactus, abdulatus, from Apactus), in Botany, Thunberg, Jap. 11. Schreib. gen. 883. Jaff. 432. Clas. duodecim monogynum. Generic Character: calyx none; corolla four-petalled; petals round in fructa, concave, unequal, two opposite broader; filaments from 16 to 20; style hisp. superior; style one. Essential character: cor. four-petalled; cal. none. Apactis japonica, the only species of this genus, is a tree growing erect, with numerous branches, which are alternate, round, februous, dotted, erect. Leaves alternate, petiolate, ovate, acute, lerrate, entire at the base, nerv'd, smooth, paler underneath, an inch long. Petioles half round; furrowed a quarter of an inch in length. Flowers in racemes, at the ends of the branches; Racemes usually ovate, as they advance becoming more oblong. Peduncae villose-februous.

APADUSIA, from a, and apolda, inscription, denotes ignorance or unskillfulness in what relates to learning and the sciences. Hence also perfons un instructed and illiterate are called apedute. The term apedute was particularly used among the French in the time of Huet; when the men of wit at Paris were divided into two factions, one called by way of reproach apedutes, and the other crufihs.

The apedute are represented by Huet as perfons who finding themselves either incapable or unwilling to undergo a severe course of study, in order to become truly learned, conspire to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity.

The apedute, in effect, were the men of pleasure; the crufhi, the men of study.

APAGMA, a term used by some writers, in Surgery, for the thrusting of a bone or other part out of its proper place. But it is more properly used for a fracture of a bone at or near the part whereby it is articulated with another.

APAGGE, from agge and aff, draw, or bear, in the Athenian Law, the carrying of a criminal, taken in the fact, to the magistrate. If the accuser was not able to bring him to the magistrate, it was usual to take the magistrate along with him to the house where the criminal lay concealed, or defended himself.

APAGGE, in Logic. See Abduction.

APAGGE, in Mathematics, is something used to denote a progress or passage from one proposition to another; when the first, having been once demonstrated, is afterwards employed in the proving of others.

APAGOGICAL demonstration, is such as does not prove the thing directly, but shews the impossibility and absurdity which arises from denying it.

Hence it is also called, reducio ad impossibile, or ad absurdum.

APALACHES, or St. Mark's River, in Geography, rises in the country of the Seminole Indians, in East Florida, in N. lat. 31° 30', and runs south-west, through the Apalachy country, into the bay of Apalachy, situate N. lat. 30° W. long. 83° 50', in the gulf of Mexico, about 15 miles below St. Mark's. After a course of about 155 miles, it falls into the bay, near the mouth of Apalachicola river.

APALACHIAN Mountains, sometimes called the Allegany Mountains, pass through the territory of the United States, from the south-west to the north-east. According to the best maps, they commence on the north of Georgia, where they give rise to many rivers that run south to the gulf of Mexico,
Mexico, and to the Tenasses, and others that have their course to the north. The Apalachian chain, from which proceed several collateral ridges, as the Iron, or Bald mountains, the White Oak mountains, and others, extends from thence through the western territory of Virginia, together with its collateral ridges, the breadth of the whole being often 70 miles, and advancing through Pennsylvania, passes Hudson’s river, and afterwards rises to a greater elevation, and seems to terminate in the country of New Brunswick. Accordingly, this chain may extend about 900 geographical miles, which is a length univalled by any European mountains, except the Norwegian Alps. The collateral ridges are singularly distinct; and a naturalist would at once pronounce that the central or highest must be granite, the next schistose, and the exterior belts calcareous. The granite forms commonly to confine of white felspar, bluish or rather pellucid quartz, and black mica. The schistose band presents copper ore; and in Canada, lead and silver are said to have been discovered. The limestone contains, as usual, many petrifactions, particularly the common ammon, a small scallop shell; and several forts of corals. The height of the chief summits, which appear to be in the province of New Hampshire, has not been accurately ascertained, but does not probably exceed 3000 feet above the sea; and they are often clothed with forests. Mr. Weld conjectures, that the Peaks of Otter, the highest of the Blue Mountains, are little more than 2000 feet high, and at any rate their height is much inferior to that of Snowdon. Morfe’s Amer. Geog. p. 392. Pinkerton’s Mod. Geog. vol. ii. p. 575.

APALACHICOLA, a river of America, between East and West Florida, rises in the Apalachian mountains, in the Cherokee country, within 10 miles of Tugaboo, the upper branch of Savannah river, and from its source to the mouth of Flint river, in a course of 350 miles, bears the name of Chata-Uche, or Chatuhoochee river. Flint river falls into it from the north-east, below the lower Creek towns, in N. lat. 31°. From thence it runs near 80 miles, and falls into the bay of Apalache, or Apalacheolina, in the gulf of Mexico, at Cape Blanche. From its source to N. lat. 35° its course is south-west, and thence to its mouth nearly south.

APALACHICOLA is also the name of the mother town, or capital of the Creek or Muscoyliu confederacy, called Apalachicola by Bertram; who describes it as a prefect place, no captives being put to death or blood shed there; and when a general peace is proposed, deputies from all the towns in the confederacy meet here to deliberate. Whereas the great Coweta town, 12 miles higher up the Chata-Uche river, is called the “Bloody Town,” where the Miccos chiefs and warriors assemble, when a general war is proposed; and here captives and slave maidens are put to death. Apalachicola is situated one mile and a half above the ancient town of that name, which lay on a peninsula, formed by the doubling of the river, but deserted on account of inundations. The town is about three days journey from Tallahassee, a town on the Tallapoosa river, a branch of the Mobile river.

APALACHY COUNTRY extends across Flint and Apalachees rivers in East Florida, having the Seminole country on the north-east. Apalache, or Apalachy, is also a name applied by some writers to a town and harbour in Florida, 90 miles east of Pensacola, and at the same distance west from Del Spiritu Santo river. The tribes of the Apalachian Indians lie around it.

APALATOA, in Botany. See CYCAS.

APALHAO, in Geography, a town of Portugal in Alentejo, containing about 1200 inhabitants.

APALORIA, an island that lies on the eastern coast of the peninsula of India, in S. lat. 9° 8’. E. long. 79° 40’.

APALUS, in Entomology, a genus of the coleoptera infects, with biliform antennae, equal and biliform palp, maxilla horny and undidentate, and lip membranaceous, truncated and entire. There is one species, the op. bimaculatus, pyrophora bisculata of Dugger; found early in the spring in the sandy parts of Sweden.

APAM, in Geography, a village of Africia, in the kingdom of Acron, on the Gold Coast, inhabited by fishermen, and fortified by the Dutch in 1697. See Acron.

APAMA, in Botany, a genus of the polyalthia polyanthrida clas and order: the characters of which are, that the calyx is trid, no corolla, and the filaments distributed in three ranks. Guervie mentions one species, viz. A. aubri, the alpum of Rheed, Malab. vi. p. 51. This is a tree in the East Indies, with ash-green bark and white wood. It is an evergreen, and bears fruit twice a year. With its juice and oil are formed an ointment which cures the itch, and deters old ulcers. La Mark. Encyc. t. i. p. 91.

APAMATUCK, in Geography, a river of North America, in Virginia, runs into the Powhatan.

APAMÆA, or APAMIA, in Ancient Geography, a town of Syria, situated in a marshy country, at the confluence of the Orontes and Marflas, which form a kind of lake, that has no communication with the land but by a small isthmus. It is about 60 miles almost south of Antioch, and about 90 from Aleppo, in N. lat. 35° C, E. long. 37° 18’. Its former name was Pharnacea, and the Macedonians called it Pella; and as it was almost wholly surrounded by water, it was denominated Cheroneus. According to Strabo, it was founded by Seleucus Nicator; and derived its name from his wife Apamea, the daughter of Artabazus the Persian. It had its own kings till the arrival of Pompey in Syria; and afterwards the whole country became a Roman province. It was there, says Strabo, that the Seleucidæ had established the school and nursery of their cavalry. The soil of the vicinity, abounding in pasturage, fed no less than 30,000 mares, 300 stallions, and 500 elephants. It is now called Famia; and its marshes scarcely afford supply for a few buffaloes and sheep. To the veteran soldiers of Alexander, who here repose after their victories, have succeeded wretched paupers, who live in perpetual dread of the oppressions of the Turks, and the inroads of the Arabs. Some have transformed this city to have been the present Hamah, Volney’s Travels, vol. ii. p. 298.

APAMEA is also a town of Asia Minor, in Bithynia. It was originally called Myrela, but destroyed by Philip, king of Macedon, the son of Demetrius, and the father of Perseus; and given to his ally Prusias the Bithynian, who rebuilt it, and called it after his wife’s name, Apama. Such is the account of Strabo. But Steph. Byz. says, that it was founded by Myrelus, a general of the Colophonians; and that Nicanedes Epiphaneus, son of king Prusias, called it Apamea in honour of his mother. Others say, that it derived its name from Myrela, an Amazon. The Romans fixed a colony there called Colonia Apamæa.

APAMEA Cibotar, so called, according to Sarmusius, from καβότας, an ark or coffer, because it was the last common treasury of those who traded from Italy and Greece to Asia Minor, was the metropolis of Phrygia, till Constan- tine’s division of the empire. It was situated at the confluence of the Marfylas and Maenander. It was built, according to Strabo, by Antiochus Soter, and so called from his mother Apameia, the wife of Seleucus Nicator. He also removed...
removed the inhabitants of the ancient Celeny, the situation of
which is confirmed by some writers with that of Apama,
and this city. It is now called Apamia Koria Hisar, or
the black castle of Opium, which drug is collected in its

Apama was also a city on the confines of Media and
Parthia, not far from Ragaz, and surnamed Raphane,
probably as it should have been, Ragane.

Apama, Mefene, is a town of Asia, in Mesopotamia,
situated to the south-call upon the Tigris, in a district which
lay between the eam and the river, whence the epithet Mefene,
because it was in the midst of that small territory
now called Dikedel.

Apama, Keoma, a town situate at the confluence of
the Tigris and Euphrates, to the south of the preceding.

Apama, Cebene, a town of Asia, on the left bank of
the Euphrates, opposite to Zengma; both founded by Se-
leucus, and connected by a bridge.

APAMIS, a name anciently given, according to Steph.
Byz. to Lampacus.

Apamis is now the name of the Ancient Apamea, on
the Meander, called Mindra, a town of Asiat India
Turkey, and the city of a Greek bishop; 100 miles west of Elki-
hisar.

APAMMARIS, a town of Asia in Syria, on the banks
of the Euphrates, south-call of Hierapolis.

APAN, in Cn tochology, a name given by Adamson to the
name shell as Linnaeus has since called PINNA RUDIS; which
see.

APANAGE, APENAGE, APPANAGE, APANAGE, or
APENAGE, in the French Law, the fortune of a king's
younger son; or a settled portion of land, &c. assigned for
the subsistence of the cadets or younger sons of a sovereign
prince. Need and Menage derive the word from paenite,
bread, which frequently includes all other sorts of provi-
sion necessary for subsistence. Some will have the apangages,
at the first institution, to have been only pensions, or an-
ual payments, of a certain sum of money.

During the first and second races of kings, the right of
prinogeniture and apangages were unknown; but the do-
 mains were divided pretty equally among all the chil-
dren.

Great inconveniences arising hence, it was at length found
proper to put off the younger-born with counties, dukish,
or other districts, on condition of their paying homage and
fealty for the same; and of their reverting, in defect of
heirs male, to the crown.

This has happened, accordingly, to the first and second
branch of the dukes of Burgundy. The duchy of Orleans
was the apangage of the second son of France. The apa-
ngage was unalienable; collateral branches did not inherit
it. The eldest son alone was heir to the whole apangage:
but bound to allow the younger an honourable mainte-
ance.

1. France, apangages were of two kinds, royal and ca-
family; the first only granted to male the king's brothers,
exclusive of the females. There are not so properly aliena-
tions of the king's demesnes, as demembroting of them.
Cafmanny apangages were those granted to women, the king's
sisters. Jouvin. Miveras has published a body of all the
writers on apangage and pragage, in one volume in folio.

APANORMIA, in Geography, a town in the island of
Santaon, in the Archipelago; it has a spacious port, in the
form of a half-moon, but the sea is so deep as to afford no
anchorage.

APANTA, or APANTE, a province of Terra Firma, in
South America, between the lake Parima and the river of
the Amazonas; to the west of the province of Carepa.

APANTHROPY, in Medicine, a term sometimes used
to denote a love of solitude, or an aversion from the com-
pany of mankind; and is reckoned by some a symptom, and
by others a species or degree of melancholy; and it is a
bad indication in melanchymatic cases.

APAN FARE, in Entomology, a species of cancer that
inhabits Chili. The thoris is ovate, sides denticulated,
tail triangular. Molin. and Gmelin.—Obv. legs hairy, tail
rather long.

APARA, in Zoology, a species of armadillo or dasyp-
pus. See Dasyphus.

APARGLA, in Botany. See Hydypnois.

APARIA, in Geography, a province of South America,
in Peru, near the river of the Amazons, where it receives
the Curavaya.

APARINE, in Botany. See Asperugo, Galium,
Sherardia, Valantia, and Utricularia.

APARINES, See Ammania.

APARITI S, in the Ancient Poetry, an appel-
lusion given to a verse, which comprehended an entire line
or sentence in itself.

This is sometimes also written apartemus, i.e. suspend-
ed, as not needing any following verse.

APARTMENT, a portion of a large house, wherein
a person may lodge separately; having all the conveniences
required to make a complete habitation.

The word comes from apartimentum, of the verb partiri,
to divide; or, as some imagine, a parte mansio, making
part of a dwelling.

A complete apartment must consist of a hall, a chamber,
an antechamber, a closet, and a cabinet or wardrobe.

APATE, in Botany. See Lectuca.

APATE, in Entomology, a genus of coleopterous insects
in the Fabrician sytem (Ent. Syn.); the character of which
is, feclors bilorum; jaws, one tooth in each; lip membrana-
ceous and truncated; and the antennse perforated. This
genuse includes some of the Linncean dermestes, as capucius
and domestieus; bolrichus of Geoffroy and Oliver, as
cornufus & bicamellatus; and ligniperda of Pallis, as
terebra & cornuta.

Gmelin makes a subdivision of the Linncean dermestes,
in his edition of the Sytema naturae, according to the num-
ber of teeth in the jaws, maxilla bifida, and maxilla uni-
dentata; the latter he calls apate, and it includes several of
the species described by Fabricius in his genus of the
same name.

APATHY, formed of the privative, α, and ἀπαθεῖν, ap-
ath, denotes an insensibility; or a privation of all passion,
all emotion, or perturbation of mind.

The Stoics affected an entire apathy; their wisdom was
to enjoy a perfect calmness or tranquility of mind, inca-
pable of being ruffled, and above the reach of any fene
either of pleasure or pain.

Whil's Epicurus taught his followers to seek happiness
in a kind of indolent ease or freedom from labour and pain;
Zeno imagined his wife man, not only free from all fene of
pleasure,
pleasure, but void of all passions and emotions, and capable of being happy in the midst of torture. That he might avoid the torpid indolence of the Epicureans, he had recourse to a moral institution, which bore indeed the lofty front of wisdom, but which was elevated far above the condition and powers of human nature.

In the first ages of the church, the christians adopted the term apathy to express a contempt of all earthly concerns; a state of mortification, such as the gospel precribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking, hereby, to draw the philosophers to Christendom, who aspired after such a sublime pitch of virtue.

Quietism is only apathy disguised under the appearance of devotion.

APATI, in Geography, a small town of Hungary in the county of Jarmat, situated on the river Carasna or Tisza, east of the latter Varadin, and north-west of Sams. Its territory is fertile in grain and purlarge.

APATITE. Phosphpnite of Kirwan. Calcarea apatites of Werner.

This mineral is divided by the German mineralogists into two varieties, the crysallized, and earthy.

The usual colours of this substance are greenish-white, mountain green, olive green, violet blue, rose-red, and close brown; more rarely pearl grey, greenish grey, sky blue, Prussian blue, or flesh red. In some crystals several of the colours are combined, other fpecimens are indetermiante.

It is generally found crysallized, but occasionally dehivated; the forms of its crystals are the following:

1. A short regular hexagonal prism (Ch.roph. périododeaede of Haury), Crystallography (Pl. xxx. fig. 92), but this is of rare occurrence.

2. The fame prism truncated on its pendicular edges (Ch.roph. minéral of Haury), Crystallography (fig. 91). Incidence of $r$ on $M = 150^\circ$. The sides $r$ are often striated longitudinally.

3. The same prism bevelled on its lateral edges (Ch.roph. minéral of Haury), Crystallography (fig. 92). Incidence of $r$ on $M = 112^\circ 12'$ $38''$, and on $P = 157^\circ 47'$ $32''$.

4. The same prism exhibiting a combination of the truncatures and bevelling of the two preceding varieties (Ch.roph. emarginée of Haury), Crystallography (fig. 93).

5. The same prism bevelled on the edges as No. 3, and having a quadrangular facet on each of the solid angles of the original prism (Ch.roph. minéral of Haury), Crystallography (fig. 94). Incidence of $r$ on $P = 125^\circ 15'$ $53''$. Crystallography (fig. 94).

These crystals, &c. are commonly small, or very small, being rarely of a middling size; they are almost always grouped one upon the other in an irregular manner, being seldom found single. The surfaces are usually smooth, except the lateral faces of the prisms which are sometimes furrowed with long longitudinal lines. Their external figure is shining, and often brilliant. Internally they are shining, with a vitreous luster.

The cross fracture (or parallel to the base of the prism) is straight lamellar; in the opposite direction it is uneven fine-granular, sometimes imperfectly conchoidal.

Its fragments are indeterminate, with somewhat sharp edges.

It is usually semitransparent, pulsing, however, on one hand to transparent, and on the other to translucent.

Its hardness is a little inferior to that of flour spar; it is brittle, easily broken; fp. grav. = 3.218.

When thrown on hot coals, the apatite gives a greenish phosphoric light. It is infuscible, without addition, by the flame of the blowpipe, only losing its colour. It dissolves almost totally in nitric acid. It has been erroneously supposed to become electric by mere heat, not acquiring this property without friction.

According to the analysis of Klaproth, its constituent parts are 55 lime and 45 phosphoric acid, with a little man-ganese.

It is met with in the tin-mines of Ehrenfriedshofd and Schneeberg in Saxony, and at Kutenberg and Schlaenwald in Bohemia, accompanied by flour spar, quartz, brown spar, wolfram, molybdena, lithomarga, flettite, and cupreous and arfenzal prytces.

This mineral was formerly considered as a fect of some authors, as a flour spar by others; it was also not unfrequently ranked among the beryls and aquamarines; hence its old German names of aquamarinus, chrysolithius, bafaltamethyft, &c. The analysis of Klaproth however, in 1788, established its chemical nature; and Werner made a particular species of it, to which he appropriated the name apatite from the Greek apateia, to deceive, on account of its resemblance to substances from which it is essentially different. See Sparcegielstein.

Its colour is yellowish or greyish white. It occurs massive or earthy, amorphous.

Its fracture is earthy, passing into the fine grained uneven. The fragments are indeterminate, blunt-edged, sometimes wedge-shaped.

It is opaque; half hard, sometimes friable; brittle; easily broken; meagre and harsh to the touch; fp. grav. = 2.824.

On exposure to the blowpipe it yields a phosphoric light and fufes into a white glass; it is also phosphoric when pulverized and thrown on hot coals; it dissolves in nitric acid, and gives out white vapours when treated with the sulphuric acid.

Its constituent parts, according to the analysis of Bertrand, Pellletier, and Donadie, are,

This mineral is found in beds mixed with quartz, in great abundance in Spain, near Truxillo, in the province of Estremadura. It is used by the inhabitants of the country for building fhone, who appear to have been long accustomed with its phosphoriccement property. It is to Prooff however that the public is indebted for the first scientific account of it. (See his Letter to Darcefs, Journal de Physique for April 1788.)

Wiedemann's Handbuch der Mineralogie, p. 528. Emmering,

APATURIA, in Antiquity, a solemn feast celebrated by the Athenians in honour of Bacchus.

"The word is usually derived from πατόν, feast."

It is said to have been instituted in memory of a fraudulent victory obtained by Melanthus, king of Athens, over Xanthus, king of Butora, in a single combat, which they agreed upon, to put an end to a debate between them relating to the borders of their countries. — Hence Budeus calls it "seulum deceptas, the feast of deceit."

Other authors give a different etymology of this feast; they tell us, that the young Athenians were not admitted into the tribes on the third day of the Apaturia, till their fathers had full grown, that they were their own children, and that till that time, they were supposed in some mixture to be without fathers, πατός: whence the feast, they say, took its name.

Xenophon, on the other hand, informs us, that the relations and friends met on this occasion, and joined with the fathers of the young people who were to be received into the tribes; and that from this assembly the feast took its name; that in πατός, the α, far from being a privative, being here a conjunctive, signifies the same thing with από, together.

This feast lasted four days: the first day, those of the same tribe made merry together; and this they called έπατός; the second day, which they called πατός, they sacrificed to Jupiter and Minerva; the third day, which they called πατός, such of their young men and maidens as were of age were admitted into their tribes: the fourth day they called πατός.

APATURIAN, a denomination given by Strabo to a temple consecrated to Venus. It was built at Corocondoma, a peninsula between the Euxine sea and the Ialysus Meotis. The surname dextraful, from πατός, was given to Venus, because this deity used artifice in the war of the gods against the giants.

APAPULIA, in Antiquity, the third day of a marriage solemnity.

It was thus called, because the bride, returning to her father's house, had πατός την παιδιά, lodge apart from the bridegroom. Some will have the apapulia to have been the second day of the marriage, viz. that wherein the chief ceremony was performed; thus called by way of contradiction from the first day, which was called ναπαλία. On the day called παπαλία (whenever that was), the bride presented her bridegroom with a garment called παπαλιάκα.

APAUMEE, in Herodotus. The French heralds use this term to express a hand open and extended, so that the full palm appears, as is seen by the hand of Ullier, borne by the baronets of England.

APAVORTEN, in Geography, a pleasant and fertile country of Asia, in Mawarahrana, to the eait of the Caspian sea. In this country, the faces, the rehers of the Parthian empire, built Dara or Daraum.

APE, in Zoology, one of the four sections into which the numerous race comprehended under the genus Simia, is divided; including thus as are definite of a tail. The other three are baboon, mandrill, and sigajus; to which some have added a fifth, called sigajus. For the Linnaeugeneric characteristics and distribution of the genus Simia, see SIMIA.

It is the distinguishing character of the ape, that they have no tails. Besides, their vifage is flat; the teeth, hands, fingers, feet, toes, and nails, resemble those of man; and they walk naturally erect. This division includes the many apes, properly so called, of the ancient, which are not found in America. Dr. Gmelin, in his edition of the Systema Naturae, refers to this division the following species, viz.

1. S. Troglodytes, or Chimpanze, which Dr. Shaw considers as a smaller variety of the Jocko, in its life thaggry or more naked State. 2. S. Salvinii, or Oran-otan, with the varieties, or two distinct species of this animal, as Dr. Shaw designates them, the Punco and the Jocker. 3. S. Lar, long armed ape of Pennant, and grand Gibbon of Buffon, with the varieties of the lesser gibbon and silvery gibbon. 4. S. Symphecus, or Pygmy. 5. S. Innum, Barbary ape, or Magot of Buffon. See the several articles.

APE, Sea, in Ichthyology, the long tailed shark, a species of Squaleus.

APE, Sea, in Zoology, is also a name given to a very singular animal seen by Mr. Steller on the coast of America, and which is thus described. It was five feet long, with a head like a dog's, erect and sharp ears, large eyes, a sort of beard on both lips, round body, thick neck near the head and tapering to the tail, which was bifurcated, the upper lobe the longest: its body was covered with thick hair, grey on the back, and red on the belly. Mr. Steller could discover neither feet nor paws. It was full of frollic, and played a thousand tricks, sometimes swimming on one side, sometimes on the other side of the ship, and looking out with seeming affrontment. It would come near the ship that it might be touched with a pole; but if any person stirred, it would immediately retire. It often raised one third of its body above the water, and float erect for a considerable time; then suddenly darter under the ship, and appeared in the same attitude on the other side; and it would repeat this 30 times together. It would frequently bring up a sea-plant, not unlike the hette-gourd, which it would throw about and catch again in its mouth, playing with it numberless fantastic tricks. Nat. Hist. of Quadrupeds, &c. vol. i. p. 575.

APECHEMA, Apocheuma, in Surgery, the same with Contrafissure.

APEDIA, in Zoology, fimia apedia, little baboon, with short tail, thumbs of the hands close to the fingers, oblong nails on the fingers, and rounded nails on the thumb, and hairy buttocks. This is said by Linnaeus to be of the fize of a squirrel; but in a description given in the Acconitates Academice, it is said to be as large as a cat. Its general colour is yellowish, the hairs being tipped with black; face brown, with a few scattered hairs; head roundish; ears roundish and naked; tail scarce an inch long. No bare spaces on each side. A native of India, and said to be a lively species. Gmelin queries whether this animal be not a variety of the simia fesures.

APEE, in Geography, an island, one of the new Hebes, about 20 leagues in circumference, situate in the South Pacific ocean. S. lat. 16° 45'. E. long. 168° 31'.

A-PEEK. See Anchor.

APE-EBIA, in Botany. See Aulettia.

APELCHE, or Apselscheluel, in Geography, a town of the United Netherlands, in the country of Friesland, 12 leagues south of Lewarden.

APELLA, in Conchology, a species of Tellina, figured by Chemnitz. It is oval, pellucid, colours changeable, with a white rib in each valve that extends from the hinge to the exterior margin. Gmelin. A variety (a) tellina paprica a alba spengleri is described by Schrot; this papreyaceous white kind, is found with the other in Nicobar.
APPE, among Physicins, a name given to those who prepare physicians of the tincture that is to be used in the preparation of medicines. It is the word that is used in the Latin language to denote a physician. The term is not usually applied to a physician who is a specialist in a particular branch of medicine.

APELLES, in Biography, the most famous painter of Antiquity, was born in the island of Cos, and flourished in the time of Alexander the Great, in the fourth century. Having been instructed in his art by Parmniphus of Amphipolis, he distinguished himself by his affability; and from this circumstance arose the proverb: "No day without a line." It was with this, in the exercise of his art, to approve himself even to the vulgar; accordingly when a shoemaker pointed out a defect in a shoe which he had painted, he corrected it; but when the same artist was proceeding to criticize the leg of his picture, he came forth from his hiding place, and reproved him in those words, which are become proverbial, "ne futor ultra crepidam." Such was his idea of excellence, that he used to write under his pictures, in the imperfect tense, "Apeles xerex, faciebat, and not πεπανθή, faciet." Nevertheless he censured Protagoras for not knowing when "to take his hand from his work," an expression which is become proverbial. The characteristic excellence of Apelles in all his performances was "grace," and in this he claimed the pre-eminence. His colouring was chaste and simple; and, according to Pliny, he used only four colours. The varnish with which he covered his pictures was of a peculiar kind, and served to soften and harmonize his tints. It is recorded of him, that when he saw a Helen painted by one of his pupils with a profusion of gold and jewels, he said jococely to him; "not knowing how to make her handsome, you have made her rich." Apelles was a great favourite of Alexander, and was admitted into very intimate familiarity with him. Alexander would not allow any other painter to take his portrait; and it is related of Pliny, that when he had painted one of the most beautiful and beloved of his conceptions, Campaephe, naked, Alexander finding that Apelles had fallen in love with her, generously surrendered her to him. Apelles was permitted to use freedoms with Alexander, the reality of which has been disputed on account of their singularity. When Alexander was one day in his study, talking very ignorantly of his art, it is said that Apelles requested him to be silent, lest the boys who ground his colours should laugh at him. Apelles painted many pictures of Alexander, but the most famous was one, in the character of a thundering Jove, in the temple at Ephesus. The hand which held the thunderbolt seemed to come out of the canvas, and excite horror in those who beheld it. But the most celebrated of all the pictures of Apelles was his "Venus Anadomene," or rising from the sea, and prefenting her wet locks with her hands. The lower part of it was injured by time; but no one ventured to repair it. Another unfinished Venus, of which the head and neck only were executed, was very much admired. Several of his other works were the ornaments of the temples and other edifices in which they were placed. Of the volumes which he wrote on art, and inquired of one of his scholars, nothing is extant. Apelles was fond of society, pleasant in conversation, addicted to pleasure, and devoted to the fair sex. It is said that the beautiful Lais was initiated by him into her profession. The time and place of his death are not known.

APELLES was the name also of one of the first of the Sarcophagi, who flourished about the year 100. Tertullian and some others charge him with criminality in his connexion with Philomene, a fanatical virgin who pretended to prophetic illuminations; but Rhodon, in Eufebius, bears testimony to his character, as a person venerable for his age and obscure mode of life. Beaufort and Lardner investigate him from this appearance. Apelles, however, separated from his master, and adopted different sentiments. Whilfe he taught that there is one God, perfectly good, he maintained that this holy and good God, who is over all, created an inferior deity, who was a fiery being, and who made heaven and earth, and all things in the world. He also believed that souls have faxes, or at least that bodies derived their faxes from the souls that animated them. Concerning Christ, he taught that he assumed flesh, not from the Virgin Mary, but that he formed for himself a body out of the four elements; and believing the reality of his crucifixion and resurrection, it was his opinion, that when Christ ascended, he surrendered his body to the elements from which he took it, and returned to heaven. These peculiarities of Apelles are ascribed to his conferences with Philomene. As he rejected Moses and the ancient prophets, he maintained that Jesus was the only person who ever came from God. He also denied the resurrection of the body. In other matters he generally agreed with Marcion, and concurred with him in condemning marriage. As to his opinion concerning the scriptures of the Old Testament, it appears by his writings, as they are cited by Eusebius, Origen and others, that if he did not absolutely reject the Old Testament, he charged upon it contradictions and contradictions, and he laboured to evince the difficulties that occur in it, if not totally to overthrow its authority. His sentiments concerning the New Testament were probably not different from those of Marcion; as he denied the miraculous conception of Christ, it is likely that he rejected at least the beginning of the gospels of St. Matthew and St. Luke. It appears, upon the whole, that he treated the scriptures as Marcion did, by receiving part, and rejecting what did not suit his purpose. And to this purpose Epiphanius accuses him with acting, in this respect, like a judge, and not like an interpreter of scripture. None of Apelles's writings are preserved, and therefore we must depend altogether upon the report of others with regard to his sentiments. Lardner's Works, vol. ix. p. 437—448. Cave's Hist. Lit. tom. i. p. 85.

APELLES in Entomology, a species of Scarabaeus, found at the Cape of Good Hope. The head is furnished with a very short horn; and the wing-cases are cinnereous, with elevated black dots. Fabricius, and Gmelin. This is a small insect: the legs are yellow and spotted with black.
APE

**APE**

**APE** is a species of *Hesperia viridissima* in the Fabianaceae family. (Ent. Syst.) The wings are dentated, falcate, bordered brown. Under side of the posterior pair marked with rufous slaty-margined bands. Habits New Holland. Obs. In the Limmicaceae family, this is one of the *Papilio Pec. ruralis*.

**APELLE** in *Biography*, a piratical, was a native of Teos, and lived about 90 years before Christ. He was extremely rich and ambitious: but his peculiar propensity led him to expend his wealth in the purchase of books. This propensity he indulged to such a degree, that his collection consisted of all the most scarce and valuable books that could be purchased or procured by any means, however illicit and dishonorable. Among other literary treasures, he at length obtained possession of the libraries of Aristophanes and Theophrastus. These libraries had passed, by bequest, into the hands of Nikias of Scepsis, and from him they descended to his heirs. When they were informed that the king of Persia, to whose jurisdiction Scepsis was subject, eagerly sought after books, they hired their collection in a cave, where they lay for more than 100 years, and suffered great damage. Apollon released this treasure, and purchased it at a great price. Upon removing his library to Athens, he called the writings of Aristophanes and Theophrastus to be copied; but the claims occasioned by the depletion of time were supplied by the transcribers, so that though the copies were made from the originals, they were of course in many respects erroneous and faulty. After Apollon's death, Syla seized on all his books, and took them with him to Rome to enrich his own library, and hence erroneous transcripts were communicated to the world. Apollon himself was more pleased with having the possession of valuable books than with the perusal and study of them; so that Strabo justly calls him a lover of books rather than a lover of wisdom; *παθετικόν μελέτην καὶ φιλοσοφίαν*. Strabo Geog. lib. xiii. tom. ii p. 920, &c.

**APELITAE**, in the Primitive Church, denote those who taught in the second century, that Christ left his body dissolved in the air, and ascended into heaven without it. See *APELLES*.

**APENE, axon, chariot, in Antiquity**, a kind of chariot wherein the images of the gods were carried in procession on certain days, attended with a solemn pomp, songs, hymns, dancing, &c.

The *apex*, or sacred chariot of the Greeks, is called *tenfis*.

It was very rich, made sometimes of ivory, or of silver itself, and variously decorated.

**APENNANA.** See *APANAE*.

**APENNINES, in Geography**, a chain of mountains or hills of Italy, extending from the Alps to the southern extremity of the kingdom of Naples. At first they are a branch of the Alps, which separates the plains of Piedmont from the sea; so that they commence near Ormea, in the high ridge which now forms the boundary of the French department of the Maritime Alps, and stretch without interruption along both sides of the gulf of Genoa, at no great distance from the sea, giving source to many rivers that flow to the sea. In the south of the former territory of Modena, after giving rise to the Panaro, and Reno, they proceed almost due east to the centre of Italy, where they afford fountains to the Arno and the Tiber, and thence pass south-east to the extremities of Italy, generally approaching nearer to the Adriatic than to the Mediterranean. These mountains confine, to the south of Bologna, of stratified grey hard limestone, with a few petrofactions. Yet in the Genoaese territory and Tuscany, appear not only the beautiful marble of Carrara, but rich serpentine, here called Gabbro, with fletlente and serbido. Granite, consisting of white felsipar and green mica, is also found here. Among the animals of the Apennines we may reckon the marmot and the ibex. Pinkerton's *Geog.* vol. i. p. 631. The Apennines derive their name from Alpen, a Celtic word, signifying a high mountain.

**APENNIS, in Ancient Laos**, a deed or instrument made in favour of a person, who has left the title-deeds to his house or land by fire. Du-Change.

In such cases, an assembly of the people of the neighbourhood being called, and an exact inquiry made before the judge, another instrument was framed to confirm and secure the unhappy person's right.

**APENAIDE, in Geography**, a sea port town of Denmark, in the duchy of Slewick, situated at the bottom of a bay in the Baltic sea, surrounded with hills, which form a harbour, both deep and secure. The inhabitants are much employed in fishing, and it is besides a place of considerable trade. N. lat. 54° 52'. E. long. 10° 7'.

**APEPSY, in Medicine**, denotes drowsiness, or a want of digestion.

The word is formed from the privative particle *a*, and *peps, I concert*.

**Appia** may be defined a defect in the stomach, which prevents the aliment taken in from affording a proper chyle for supplying the blood and nourishing the body. Abbe-mignonfels and excess are alike causes of indigestion. The method of treatment in the *appia* is the same as in the *anorexia*. The *columbo* root is particularly useful, when the stomach is languid, and digestion difficult, &c. It may be given in infusions with any grateful aromatic, or in Madeira wine, now and then interpolating gentle doses of rhubarb in tincture. A mixture of mulard-feed with the *columbo* root is of great utility in cafes of this nature, where acidity and flatulence prevail much in the *prima vis*. See Percival's Essays, &c.

**APER, Marcus, in Biography**, a Roman orator in the first century, was a native of Gaul, who distinguished himself by his genius and eloquence, and occupied several important posts in the empire. He was probably the author of the dialogue "On the Corruption of Eloquence," sometimes ascribed to Tacitus or Quinctilian, and placed at the end of their works. He died at Rome about the year 85. Gen. Brog.

**APER, in Zoology**, a name given to several species of the *Sus*; as the variety *ferus* of the *sus ferus*, the *sus tajosus*, the *sus arbiopus*, and the *sus babirius*. See those articles, and *BOAR*, and *HOG*.

**APER, in Ichthyology**, a species of *Zeus* that inhabits the seas about Rome and Genoa. The tail is even, and the body reddish. Linn. and Gmel. Some describe it as having the tail even, body entirely red or reddish, and the back reflected.

**APERAE, in Ancient Geography**, a town of Libya, which became an episcopal see.

**APERANTES, a people who inhabited Aperantia**, which was a district of Thessaly, situate towards the south-west, and abounding with mountains, in which was the source of the river Achelous.

**APERAE, in Zoology**, a species of *Cavia* or *Cavy*, having no tail, and the upper parts of the body being of a reddish ash-colour. This is the *cuniculus brasilienis*, having
A P E

no tail, &c. of Drissen and Ray; the aperas of the Brasilians, so called by Mecenrane, &c.; the enunciates indicus
form of Aldrovand. This animal inhabits Brazil, in the
caves of the rocks, from which it is driven out and taken
by little dogs; the colour of the upper part of the body
resembles that of the hare; its belly is white; the upper
lip divided; the ears short and rounded like those of a rat.
It moves like the hare, the fore legs being shorter than the
hind; it has four toes with short small claws on the fore feet,
which are black and naked, and only three on the hind, of
which the middle is the longest; its length is about 12
inches; its flesh is like that of the rabbit, but reckoned of
a superior flavour; and its manner of living is also very familiar.
There is a variety, which is the rock cavy of Perent, of
a black colour, mottled with tawny on the back, belly and
white throat. It is exactly similar in every respect, except
in colour, to the former. The animal called cori by Oviedo,
Charlevaux, &c. is thought by Buffon to be the same with
the apera. There are many varieties of the cori with respect
to colour; and they are found in various parts of the West
Indies, and on the continent of America.

APE R I E N S O tis, in Anatomy, a name given by some
writers to a muscle of the mouth, called by Albinus héventer
maxilla inferioris, and by others DIGESTIVUS.

APE R I E N T S , or Digestive, medicine, from aperio, I
open, are such as are said to open obstructed passages: and
particularly to restore suppressed excretions or evacuations;
and the term is most commonly applied to those that are
adapted to open the vesicles of the uterus, and thereby to
evade the retained, or to restore the suppressed, menstrual
flux. The term, however, as variously employed, both with
respect to different cases and to different modes of operation,
is, without specifying the particular case and operations,
The term apertures in its present use is synonymous with
laxatives or purgatives, which see.

APE R I S TAT I O N , from a, without, and περιέσεσα, un-
favourable circumstance, in the Ancient Physic, denotes an
ulcer of a mild or benign kind, and not attended with any
severe symptom.

APE R IO P L A, in Ancient Geography, a small island of
the Aegean sea, opposite to the promontory of Duponthmos
in the Argolid. It was so called by Pliny.

APE R I O N S , in Architecture, are the openings in a
building, as doors, windows, staircases, chimneys, outlets
and inlets for light, smoke, &c.

The apertures should be as few as may be; it being a
rule, that all openings are weaknesses; and they should
not approach too near the angles of the walls.

APE R TO, Ital. in Musée, open, opposed to Chiusa, close.

APE R T O R , auri, in Anatomy, a name given by Spal-
clius and others to the muscle called the aperas pollebrum,
and levator pollebrum superiores by others.

APE R T U R E , the opening of any thing; or hole, cleft,
or vacant place, in some otherwise solid or continuous sub-
ject. It comes from aperire, to open.

In Geometry, aperture is used for the space left between
two lines, which mutually incline towards each other to
form an angle.

In Optics, aperture is the hole next the object-glass of a
telecope or microscope, through which the light and
image of the object come into the tube, and are whence carried
to the eye.

APE R T U R E S is also understood of that part of the object-
glass itself which covers the former, and which is left per-
vious to the rays. See TELESCOPE.

A great deal depends on having a full aperture. To find
it experimentally, apply several lines of black fumetted
paper, each bigger than the other, upon the face of the
grafs, from the breadth of a straw to such as have only a
small hole in the grafs; and with each of these separately
view several distinct objects, as the moon, stars, &c.; that
through which they appear the most distinctly is to be choos.

M. Auzout affirms, that he found that the apertures of
telescopcs ought to be nearly in the subduplicate ratio of
their lengths; but Huygens, who first found that the use
of apertures conducted very much to one perfection of tele-
scope, affirms us he found by experience, that the aper-
ture of an object-glass, e. gr. of 30 feet, is to be determined
by this proportion; as 30 to 3, that is, as 10 to 1, so is the
square root of the distance of the focus of any glafs multi-
plied by 30 to its proper aperture; and the focal distances
of the eye-glafs are to be proportional to the apertures.
A table of apertures for telescopcs of various lengths, &c.
see under the article TELESCOPE.

The greater or less aperture of an object-glass, it is to be
noted, does not increase or diminish the visible area of the
object; all that is effected by this is the admittance of
more or fewer rays, and, consequently, the more bright or
obscure appearance of the object; but the largeness of the
aperture or focal distance causes the irregularity of its re-
frations. See ABBERRATION.

Hence in viewing Venus through a telescope, a much less
aperture is to be used than for the Moon, Jupiter, or Sa-
turn, because her light is so vivid and glaring. This
circumstance does a little invalidate and disturb M. Auzout's
proportion, as is shown by Dr. Hook. Phil. Tran. N° 4.

APE R T U R A tabularum, in Ancient Law Books, signifies
the breaking open a last will and testament.

APE R T U R A fesci does denote the loss of a feudal tenure,
by default of illece to him to whom the feud of see was first
granted.

APE S A S , or APE S A N T S , in Ancient Geography, a
mountain of Peloponnese, in the territory of Nemea.

APE T A L O U S , or APETALOUS plants, are such as are
without, or have an imperfect or flameous flower. They
are so called because they are defluvite of those tender fugu-
cious coloured leaves, called petals; but consist only of a
calyx or cusp, and of stigma, or capillaments, or stigmas.
Phil. Tran. N° 56.

The word comes from the privative particle a, and
πετάλον, folium, a leaf.

The apezatous kind is subvided by Ray, 1. Into such
whose fruits are not contiguous to their flowers; as in hops,
hemp, nettles, spinach, mercury, palmu Chrifti, the Ameri-
can physic-nut, &c. 2. Such as have a triquetrous or
triangular feed, as the does, forrels, armsarts, knot-grafs,
snake-weeds. 3. Those which have round, comprefeed,
and otherwise figured feeds, as the pond-weeds, oracles,
salt purification, the brites, the amaranth, the beets, some
kalics, &c.

APE T N A, in Ancient Geography, a town of Bactia,
near Corduba.

APE T O U S , or APETUBES, in Geography, a people of
South America, in Brazil, occupying the parts in the vicin-
ity of the government of Puerto Saguro.

APE U T I C , from απετυχω, I deprecate, in the Ancient

Poetry.
APHASCITES, a people of Libya, who had no fixed habitation.

APHARANTITES, a people who were transferred together with the Apharses into Samaria, by Ehabadon, king of the Syrians, and who opposed the Jews in rebuilding their temple. Ezra, iv. 9.

APHAS, called by D'Anville Avas, a river of Epirus, which ran from north to south in the eastern part of the country, and discharged itself into the Ambracian gulf, at some distance to the east of the Achaiaus.

APHARIA, from A, and phi, I speak, in the Septuagint, signifies a fable of doubt, wherein a person not knowing what to determine on, it is bel felt for him to be silent. In this sense aphis means opposed to phygi, under which are included both affirmation and negation.

APHÉA, in Mythology, a goddess worshipped by the Egyptians and Cretans. Pindar wrote an ode in honour of her, and she had a temple in the island of Creta. The Cretans confounded her with Diana.

APHÉMARIA, one of the three triarchies added to Judæa by the kings of Syria.

APHÉRESIS, from a, and phi, I take away, in Grammar, a figure whereby something is taken away from the beginning of a word.

Thus zonis, by aphasis, is written conia; contemnere, semnere; unditum, mitture, &c.

A like retraction at the end of a word is called aphasis.

APHÉRESIS, in Medicine, denotes a necessary taking away or removing of something that is noxious.

In Surgery, it signifies an operation whereby something superfluous is taken away.

APHANES or Aphanes, not apparent from its diminutive, in Botany, parley-piert. Linn. Gen. 166. Schreb. 223. Juff. 317, Clais, Tetrandria digynia, or Monandria monogyz; natural order, fentosia; sapience of Jehovah.

Generic Character. Calyx, perianth one-leaved, tubular, permanent, mouth one, eight-petalled; corolla none; filaments, filaments four, or one, erect, tubate, very small, placed at the mouth of the achenes, or reflexed, as in one twin; pistilum, germ ovate; style bifurcated; anthers in the form of filaments, cylindrical, none; style ovate, acuminate, compressed, contained in the bottom of the calyx. This plant is by Dr. Smith removed to the genus alecbnella. Flor. Brit. vol. i. 190. 1. A. arvensis, parley-piert. HUD. Aug. 72. WRETH. 147. Flor. Dan. 975. A small annual plant, with spreading branched leafy stems; leaves alternate, petiolate, palmatifide, crenate and indented, hairy; calyx eight-toothed, alternately very minute; seeds one or two; it is a common British plant, growing in fallow fields. In most of the old Herbals, it is called parsley break-fox, from its supposed lithriptitic qualities.

APHAR, in Ancient Geography, the metropolis of Arabia Felix, situated near a bay on the sea-flower, and not far north from the Promontorium Aromatum. Aphar according to some authors, was the capital of the Hauranites, where the king kept his court. In the Noticia Imperii, Aphar is a river. This place, now called Al-Fara, is situated in the region between Meeza and Medina.

APHARA, or APHERA, a town of Palestine, in the tribe of Benjamin.

APHAKANTES, a people of Libya, who had no fixed habitation.

APHARANTITES, a people who were transferred together with the Apharses into Samaria, by Ehabadon, king of the Syrians, and who opposed the Jews in rebuilding their temple. Ezra, iv. 9.

APHAS, called by D'Anville Avas, a river of Epirus, which ran from north to south in the eastern part of the country, and discharged itself into the Ambracian gulf, at some distance to the east of the Achaiaus.

APHARIA, from A, and phi, I speak, in the Septuagint, signifies a fable of doubt, wherein a person not knowing what to determine on, it is bel felt for him to be silent. In this sense aphis means opposed to phygi, under which are included both affirmation and negation.

APHÉA, in Mythology, a goddess worshipped by the Egyptians and Cretans. Pindar wrote an ode in honour of her, and she had a temple in the island of Creta. The Cretans confounded her with Diana.

APHÉMARIA, one of the three triarchies added to Judæa by the kings of Syria.

APHÉRESIS, from a, and phi, I take away, in Grammar, a figure whereby something is taken away from the beginning of a word.

Thus zonis, by aphasis, is written conia; contemnere, semnere; unditum, mitture, &c.

A like retraction at the end of a word is called aphasis.

APHÉRESIS, in Medicine, denotes a necessary taking away or removing of something that is noxious.

In Surgery, it signifies an operation whereby something superfluous is taken away.

APHANES or Aphanes, not apparent from its diminutive, in Botany, parley-piert. Linn. Gen. 166. Schreb. 223. Juff. 317, Clais, Tetrandria digynia, or Monandria monogyz; natural order, fentosia; sapience of Jehovah.

Generic Character. Calyx, perianth one-leaved, tubular, permanent, mouth one, eight-petalled; corolla none; filaments, filaments four, or one, erect, tubate, very small, placed at the mouth of the achenes, or reflexed, as in one twin; pistilum, germ ovate; style bifurcated; anthers in the form of filaments, cylindrical, none; style ovate, acuminate, compressed, contained in the bottom of the calyx. This plant is by Dr. Smith removed to the genus alecbnella. Flor. Brit. vol. i. 190. 1. A. arvensis, parley-piert. HUD. Aug. 72. WRETH. 147. Flor. Dan. 975. A small annual plant, with spreading branched leafy stems; leaves alternate, petiolate, palmatifide, crenate and indented, hairy; calyx eight-toothed, alternately very minute; seeds one or two; it is a common British plant, growing in fallow fields. In most of the old Herbals, it is called parsley break-fox, from its supposed lithriptitic qualities.
APHELION

Apelia, from απελείον, simple, in Rhetoric, is used to denote simplicity of diction.

APHELION, from απελεύο, from, and ελεύο, run, in Astronomy, that point of the earth's or any planet's orbit, in which it is at the greatest distance from the sun.

Thus, a planet being in A (Plate I. Astron. fig. 9.) its utmost distance from the sun 8, at the extremity of the greater or transversal axis of the elliptic orbit, is said to be in its apsine. In the system of the sun's moving round the earth, the point in which it appears when the planet is in its apsine, is called apsine. The apsine stands opposed to the perihelion.

The times of the apsines of the primary planets may be known by their diameters appearing the smallest, and by their moving with the least velocity in a given time. Methods for calculating them, with the results of the computations, have been given by many astronomers; such as Riccioli, Almag. Nov. lib. vii. § 2 and 3; Wolthus, Elem. Astron. § 675; Dr. Halley, Phil. Trans. N° 138; Sir Isaac Newton, Princip. lib. iii. prop. 14; Dr. Gregory, Astron. lib. iii. prop. 14; Keili's Introd. to Astron. lect. xxi-xxiv.

De la Lande, Mem. de l'Acad. 1755, 1757, and 1766; and Astron. lib. xxii.; and also in the writings of M. Euler, M. D'Alembert, M. Clairaut, &c. upon Attraction. See also Vincent's Astron. vol. i. p. 170, &c., and the article Planet in this Dictionary. The places of the apsines are stated by different authors as in the following tables.

For the Year 1702, according to Kepler and De la Hire.

N. B. The place of the apsine of Herschel, or Georgium Sidus, in 1782, was 11°. 16°. 19°. 0°'; and in 1793, 11°. 29°. 42°'.

Kepler makes the earth's apsine to have coincided with the equinoctial point θ, on July 24, in the year 3993 before the Christian era, which, according to some authors, is about the time of the creation. At the same time, he makes the apsine of Saturn to be θ 24°. 58'. 0"; of Jupiter θ 23°. 34'. 18"; of Mars θ 15°. 0'; of Venus θ 0°. 0'. 0"; of Mercury θ 0°. 0'. 0"; and the apsine of the Moon θ 0°. 0'. 0".

None of the apsines of the planets are at rest; for their mutual actions upon one another keep those points of their orbits in a continual motion; and this is greater or less in the different planets. The course of this motion is in consequence, or according to the order of the signs; and Sir Isaac Newton shews, that it is in the sexagesimal ratio of the respective distances of the planes from the sun, or as the square root of the cube of the distances. This motion, arising from their mutual attraction, is ascertained by comparing the places settled by the ancient and modern observations; or by comparing the length of an anomalistic with that of a tropical or sidereal revolution.

To find the motion of the Earth's Apesine. Hipparchus, 140 years before Chrill, determined its place to be 2°. 5½'; and by the observations of Wallisius, in 1496, it was found to be 3°. 3°. 57°. 57°; whence the motion of the apsine is 1°. 24" in a year, with respect to the equinoctial points. M. de la Caille determined the place of the apsine for the beginning of the year 1749, to be 3°. 8°. 39'; which compared with the observation of Wallisius, gives 1°. 0" for the yearly motion. In the year 1788, Tycho determined the place of the apsine to be 3°. 5°. 30'; and Kepler, in the same year, determined its place to be 3°. 5°. 32'. These compared with the observation of Caffini, in the year 1738, who determined its place to be then in 3°. 8°. 19'. 8°", give about 1°. 7" for the annual motion. M. de la Caille determined the length of the anomalistic year to be 26°. 35° longer than the tropical year, which makes the motion of the apsine to be 1°. 3°. 15" in a year. Kepler made it 1°. 2"; Ricciolis 1°. 2°. 4µ. 4"", in a year. Mayer in his Tables makes it 1°. 6°. Dr. Halley makes it 1°. 1"; and Cassini about 1°. 1°. 25°.

M. de la Lande, in his Tables, makes it 1°. 2° as computed by M. de Lambre, from Dr. Malkeley's observations in 1785; and this determination is most to be depended upon, as made by so eminent an astronomer, from observations which
which are acknowledged to be the least that have been ever made. These motions are in respect to the equinox. If we assume it to be 1°. 20', and the precession of the equinoxes to be 50', we shall have the real motion of the apogee 11° in a year.

To determine the Motion of the Apheleon of Saturn. The place of the apheleon, in 1694, was 3° 28'. 5°; but from three oppositions observed in the years 1717, 1713, and 1736, the place for the year 1720 was 7° 24'. 11'. 20', which makes the annual motion 1°. 20'. Tycho found the place of the apheleon on December 19, 1593, to be 8° 23'. 40'. 51', which compared with the observation in 1731, gives 1'. 18', for the annual motion. The same observation of Tycho compared with the place of the perihelion on December 14, 1708, in 8° 28'. 25'. 10', gives 1°. 23'. 35' for the annual motion. If the same observation of Tycho be compared with the place of the apheleon in April 1694, in 8° 28'. 5°, it gives 1°. 53' for the annual motion. Caflini conjured from all this, that the motion of the apheleon was quicker now than formerly. He also found the perihelion, in 1593, not so far forward by a degree as it ought, when compared with the place of the apheleon in 1591, at the annual movement of 1°. 23'; from whence he suspected that the orbit had a librating motion, and that there ought to be an equation employed between the two points. The irregularities of Saturn, however, are so great, that we need not wonder at these differences. Kepler makes it 1°. 16'; Caflini supposes it to be 1°. 18'; and Dr. Halley 1°. 20'. M. de la Grange, from calculating the disturbing force of each planet upon the other, has determined the annual motion of the apheleon to be 1°. 6'. 3'. M. de la Place makes it 1°. 6'. 07' which M. de la Lande has employed in his Tables.

To determine the Motion of Jupiter's Apheleon. According to the observations of Ptolemy, the apheleon was in 14° 38' in the year 136; but in 1720 it was in 8° 40'. 47'; this gives 57°. 11' for the annual motion. In the year 1596, the place of the apheleon, calculated from the observations of Tycho, was found to be in 8° 64'. 50'. 43'; this compared with the observation in 1720, gives 1'. 30' for the annual motion. If we compare the places in 136, and 1596, they give 34' for the annual motion. This induced Caflini to think, that the motion of the apheleon is accelerated; or that it was subject to some irregularities; he states the motion at 57°. 24'; Kepler makes it 47°; Dr. Halley makes it 72°; M. Jeaurat computed the place of the apheleon in 1590 to be 8° 74'. 49'. 16'; and in 1762 in 8° 16'. 30'. 41'; from which he found the annual motion to be 58°. 4'; Euler, from the theory of attraction, found it to be 55°; M. de la Grange, 57'. 12'. M. Wargentin says, that an annual motion of 60' does agree with observations. M. de la Lande has employed 56°. 73' in his last Tables, according to the theoretical determination of M. de la Place.

To determine the Motion of the Apheleon of Mars. From three oppositions determined by Ptolemy, the place of the apheleon in 135 was found to be 3° 20'. 24'; and by the observations made at Greenwich in 1631, 1660, and in 1700, the place was found to be in 5°. 0'. 31'. 34' in 1666; hence the annual motion of the apheleon is 1°. 11'. 47'. 20''.

Kepler makes it 1°. 78'; Dr. Halley makes it 1°. 12'. From comparing the place, in 1748, in 5° 1°. 26'. 10'; the place in 1502 in 4° 28'. 49'. 50'; the motion is 1°. The mean of these determinations is 1°. 17'. 5'. M. de la Lande supposes it to be 1°. 27'.

To determine the Motion of the Apheleon of Venus. Caflini has found, from computing the place of the apheleon from the ancient observations, 11/16 of 15', from which uncertainty it is more difficult to determine its annual motion. However, the place, computed from the observations in 136, 138, and 139 (and which he thinks are the most to be depended in), was found, in 158, to be in 7° 21'. 29'; this differed compared with the observations in 1715, 1717, and 1718, when it was found to be in 7° 6'. 56' in 1716, the annual motion is found to be 1°. 42'. 50'. From comparing the place in 1596 in 7° 15'. 54' with the place in 1710 in 7° 6'. 56', the motion is 2°. 28'. Horrox fixed the place of the apheleon in 1720 in 7° 50'; this compared with the place in 1716, gives 1°. 20' for the motion. By comparing the place of the apheleon in the first Tables of M. de la Lande with the place in Kepler's Tables, the annual motion comes out 2°. 41'. 54'; Caflini makes it 1°. 20'; and Dr. Halley 56'. 5'. Kepler makes it 1°. 18'. Amidst so much uncertainty, M. de la Lande thinks it better to depend upon the theory which, according to M. de la Grange, makes it 48', and which M. de la Lande employs in his Tables. On account of the small eccentricity, this uncertainty of the place of the apheleon is not of so much consequence, as an error of 1° in the place of the apheleon will never produce an error of 1° in the heliocentric longitude.

To determine the Motion of the Apheleon of Mercury. From the observations of the pallsages of Mercury over the sun in 1661, 1692, and 167, Caflini determined the place of the apheleon on November 9, 1693, to be in 8° 16'. 28'. 29'; and upon supposition that the motion of the apheleon was 1°. 20' in a year, he found that it represented the pallsages very well in 1631, 1672, 1723, and 1736. But as these pallsages were nearly at the same point of the orbit, it does not sufficiently establish 1°. 20' to be the true motion, as it might answer to the same points nearly, but not to other parts of the orbit. We ought not therefore to be surprized, says M. de la Lande, that a motion of 54' 15' by Dr. Halley answers equally well to the same observations. Kepler makes it 1°. 45'.

M. de la Lande found, by the greatest equation, that on May 6, 1753, the place of the apheleon was 8° 13'. 55'. From comparing this place with the place computed from eight observations of Ptolemy (rejecting four others, two of which did not appear to be reconcilable with each other, and four were too near the apheleon), he found the motion to be 1°. 10' in a year, which he constructed from his first Tables upon observing, however, that the same time, that this motion does not agree perfectly with the observations in this century. He has since found that a motion of 56'. 25' will agree with observation; and this he has affirmed in his last Tables. M. de la Grange makes it 57' by theory. The motions of the apheleon here determined are their motions in longitude; if therefore we subtract 59' 25' (the annual precession of the equinoxes) from each, we shall get their real motions.
Motion of the Aphelia in One Hundred Years.

According to the calculations of M. de la Grange, the aphelion of the Georgian planet is progressive 5° 17 in a year, from the action of Jupiter and Saturn; consequently its motion in longitude is 50° 25 + 5° 17 = 55° 42. He has also calculated the effect of each planet in disturbing the aphelion of the rest. The following table contains the annual effect.

Annual Motion of the Aphelia.

M. de la Grange here supposes, as before, the density of Venus to be 1,31; but M. de la Lande makes it only 0,95; for this density, therefore, the second horizontal line must be diminished in the ratio of 1,31 to 0,95. See Vince’s Astronomy, vol. 1 c. 14.

APHELLAN, the name of a bright star in the constellation Gemini, marked α.

APHERNOUSLI, in Botany, a species of pine growing wild on the Alps. The timber is large, and the planks made of it are of a finer grain, and more beautifully variegated than deal; and may therefore be applied to many uses. It grows in bleak and barren ground, and most refemblies that which is called in England the Weymouth pine.

APHES DOMIN, in Scripture Geography, a place of Palestine in the tribe of Judah between Socho and Azæcha, where the Philistines were encamped whilst Goliath insulted the Israelites.

APHESIS, from αφεσις, I remit, in the Athenian Laws, was applied to the case of a person deeply indebted, who desired the people to remit part of the debt, on account of his disability to make payment.

Voetius has a dissertation express on the words apheis and parēis, and their difference.

APHETERIA, in the Ancient Military Art, a kind of engines used in the besieging of towns.

Suidas does not mention their particular form or structure. Aquinostok them to have been of the projectile kind.

APHIIODIDES, in Entomology, a species of acarius, of a red colour; the first pair of legs very long, and formed for running; two horns on the posterior part of the abdomen. Linn. Faun. Succ. Fab. This is la tique range des pierres a pattes antérieures fort longues of Geoffroy, and is found among flounces and rotten wood.

APHIDUM, a species of ichtumon that is produced from several of the European kinds of aphides. It is black, with yellow feet, and antenae about the length of the body. Geoff. Inf. L’ichtumon des pucerons.

APHILANTHROPY, from αφιλ, friend, and θηρος, man, among Physicians, denotes the flat or disorderly,
APHIS. 

wherein a person has an unnatural desire for mirth and society, and indulges solitude and melancholy.

APHIOCEN, a composition made principally of the buds of hemp before they flower. It is much in use among the Arabs, and has the intoxicating quality of opium.

APHION. Kara Hissar, in Geographia, a town of Asiatic Turkey in Nautalia, situated on the Mindeia, and defended by an elevated castle; 50 miles south from Kautia. N. lat. 58° 35'. E. long. 35° 13'. See APASHE.

APHIS, in Entomology, a very interesting and extensive genus of the Hemiptera order, in the Linnaean system. It is a tribe of creatures that has, in a particular degree, engaged the attention of naturalists for various reasons: their generation is equivocal, and their instinctive economy differs in some respects, from that of most other animals, as will appear hereafter.

Linnaeus defines the generic character of the aphis thus: 

beak infected, heated of five articulations, with a single bristle; antennae faveate, and longer than the thorax; either four erect wings, or none; feet formed for walking; posterior part of the abdomen usually furnished with two little horns. Geoffroy says, the aphides have two beaks, one of which is secreted in the breast, the other in the head; this last extends to, and is laid upon the base of the pectoral one; and serves, as that writer imagines, to convey to the head a part of that nourishment which the insect takes, or sucks in, by means of the pectoral beak.

The species enumerated by Linnaeus and Gmelin are:
longirostris ribis, arundinis, ulmi, papaveris, paeoniae, pruni, fambuci, solidaginoides, carapi, rumicis, acetosae, ligustici, lychnidis, capreae, paui, rofes, cortenis, picirodi, paeopodi, dauci, urticae, myrsinae, corni, tilii, juniperi, braulicet, craceae. lacuceae, fonchii, cirtii, cardui, achileae, tanaeceti, aburthii, millefolii, evonymi, avenae, fraxini, jacinthi, betulii, alni, roboris, fagi, quercus, pini, pineti, falcis, vitis, populi, trincula, viburni, mali, burlaria, apusines, urticae, aceris, triplicis, pilacheae, polype, polyanthis, faginae, plantaginis, archangelicae, leucanthemi, fabiofem, lacer, gelifcet, coriili, juglandis, balamites, gallarum, farinae, xylofæ, and mayeri. The whole of these, and, no doubt, many others, are found in different parts of Europe. They infest an endless variety of plants; and it is believed each species is particularly attached to one kind of vegetable only; hence each fort has been hitherto universally named after the individual species, or genus of plants, on which it feeds; or if that could not be ascertained, that on which it had been found; for some species are rather uncommon and little known, though others are infinitely too numerous. The aphides are sufficiently known by the indiscernible term of plant lice; they abound with a sweet and grateful moisture, and are therefore eagerly devoured by ants, the larva of coccinelle, and many other creatures, or they would become, very probably, more destructive to the whole vegetable creation than any other race of insects known.

If Bonnet was not the first naturalist (as is generally acknowledged) who discovered the mysterious course of generation in the aphides, or, as he calls them, pucerons, his experiments, together with those of his countryman Trembley, tended at least to confirm in a most satisfactory manner the almost incredible circumstances respecting it: that an aphis or puceron, brought up in the most perfect solitude from the moment of its birth, in a few days will be found in the midst of a numerous family; and that if the experiment be again repeated on one of the individuals of this family, a second generation will multiply like its parent; and the like experiment may be many times repeated with the same effect.

"M. Bonnet," says an ingenious writer, "had repeated some experiments of this kind, as far as the sixth generation, which all uniformly presented the observer with fruitful virgin, when he was engaged in a series of new and tedious experiments, from a philosophy imparted by M. Trembley, in a letter to him, who thus expresses himself: "I have formed the design of rearing several generations of solitary pucerons, in order to see if they would all equally bring forth young. In cases so remote from usual circumstances, it is allowed to try all sorts of means; and I argued with myself, who knows that one copulation might serve for several generations?" This "who knows" persuad M. Bonnet that he had not sufficiently pursued his investigations. He therefore now reared to the tenth generation his solitary aphis, having the patience to keep an exact account of the days and hours of the birth of each generation. He then discovered both males and females among them, whose amours were not in the least equivocal; the males are produced only in the tenth generation, and are but few in number; that these soon arriving at their full growth, copulate with the females, and that the virtue of this copulation serves for ten successive generations; that all these generations, except the first, from fecundated eggs are produced viviparous, and all the individuals are females, except those of the last generation, among whom some males appear to lay the foundation of a fresh series." Adams Muroc.

The history of aphides has also been very copiously treated upon by Dr. Richardson, in a paper printed in the 41st vol. of the Philosophical Transactions; nor must we omit another upon the same subject by the late ingenious Mr. Curtis, that appeared in the sixth volume of the Transactions of the Linnaean Society.

The tenor of Dr. Richardson's remarks is briefly this: the great variety of species which occur in the insects now under consideration, may make an inquiry into their particular natures seem not a little perplexing; but by reducing them under their proper genus the difficulty is considerably diminished. We may reasonably suppose all the insects, comprehended under any distinct genus, to partake of one general nature; and by diligently examining any particular species, may thence gain some insight into the nature of all the rest. With this view, Dr. Richardson chose out of the various forts of aphisides the largest of those found on the rose tree; not only as its size makes it more conspicuous, but there are few of so long duration. This fort appears early in the spring, and continues late in autumn, while several are limited to a much shorter term, in conformity to the different trees and plants whence they draw their nourishment.

If, at the beginning of February, the weather happens to be so warm as to make the buds of the rose tree swell and appear green, small aphides are frequently to be found on them, though not larger than the young ones in summer when first produced. It will be found, that those aphides which appear only in spring, proceed from small black oval eggs which were deposited on the last year's shoot; though when it happens that the insects make too early an appearance, the greater part suffer from the sharp weather that usually succeeds, by which means the rose trees are some years in a manner freed from them. The same kind of animal is then at one time of the year viviparous, and at another oviparous.

These aphides which withstand the severity of the weather,
ther, seldom come to, their full growth before the month of April, at which time they usually begin to breed, after twice calling off their exuvia, or outward covering. It appears that they are all females, which produce each of them a numerons progeny, and that without having intercourse with any male insect; they are viviparous, and, what is equally singular, they all come into the world backwards. When they first come from the parent, they are enveloped in a thin membrane, having in this situation the appearance of an oval egg; these egg-like appearances adhere by one extremity to the moth, while the young ones contained in them extend to the other, and by that means gradually draw the ruptured membrane over the head and body to the hind feet. During this operation, and for some time after, the fore part of the head adheres, by means of something that is glutinous, to the vent of the parent. Being thus suspended in the air, it soon frees itself from the membrane in which it was confined; and after its limbs are a little strengthened, is set down on some tender shoots, and left to provide for itself.

In the spring months there appear on the rose trees but two generations of aphides, including those which proceed immediately from the last year's eggs; the warmth of the summer adds so much to their fertility, that no less than five generations succeed one another in the interval. One is produced in May, which calls off its covering, while the months of June and July each supply two more, which call off their coverings three or four times, according to the different warmth of the season. This frequent change of their outward coat is the more extraordinary, because it is repeated more often when the infects come the soonest to their growth, which sometimes happens in ten days, where they have had plenty of warmth and nourishment.

Early in the month of June, some of the third generation, which were produced about the middle of May, after calling off their last covering, discover four erect wings, much longer than their bodies; and the fame is observable in all the succeeding generations which are produced during the summer months, but still without any diversity of sex: for some time before the aphides come to their full growth, it is easy to distinguish which will have wings, by a remarkable fulness of the breast, which in the others is hardly to be distinguished from the body. When the last covering is rejected, the wings which were before folded up in a very narrow compass, are gradually extended in a surpising manner, till their dimensions are at last very considerable.

The increase of these infects in the summer time is so very great, that by wounding and exhausting the tender shoots they would frequently suppress all vegetation, had they not many enemies to restrain them. Notwithstanding these infects have a numerous tribe of enemies, they are not without their friends, if those may be considered as such, who are officious in their attendance for the good things they expect to reap thereby. The ant and bee are of this kind, collecting the honey in which the aphides abound; but with this difference, that the ants are confant visitors; the bee only when flowers are scarce; the ants will suck in the honey, while the aphides are in the act of discharging it; the bees only collect it from the leaves on which it has fallen.

In the autumn three more generations of aphides are produced, two of which generally make their appearance in the month of August, and the third before the middle of September. The two first differ in no respect from those which are found in summer; but the third differs greatly from all the rest. Though all the aphides which have hitherto appeared were female, in this tenth generation several male infects are found, but not by any means so numerous as the females.

The females have, at first, the same appearance as those of the former generations, but in a few days, their colour changes from a green to a yellow, which is gradually converted into an orange before they come to their full growth: they differ also, in another respect, from those which occur in summer, for all these yellow females are without wings. The male infects are, however, still more remarkable, their outward appearance readily distinguishing them from this and all other generations. When first produced they are not of a green colour like the rest, but of a reddish brown, and have afterwards a dark line along the back; they come to their full growth in about three weeks, and then cast off their last covering, the whole insect being after this of a bright yellow colour, the wings only excepted: but after this change they become of a deeper yellow and in a few hours of a dark brown, if we except the body, which is something lighter coloured, and has a reddish cast. The males no sooner come to maturity than they copulate with the females, who, in a day or two after their intercourse with the males, lay their eggs, generally near the buds. Where there are a number crowded together they of course interfere with each other, in which case they will frequently deposit their eggs on other parts of the branches.

It is highly probable that the aphides derive considerable advantages by living in society; the reiterated punctures of a great number of them may attract a larger quantity of nutritious juices to that part of the tree or plant where they have taken up their abode. Vide Adams Microf. Phil. Trans. &c.

The observations of Mr. Curtis on the aphides are chiefly intended to show that they are the principal cause of blights in plants, and the sole cause of the honey-dew. He therefore calls them the aphides, or blighters; and after observing, that in point of number, the individuals of the several species compone the superior to those of any other genus in the country, speaks thus, in general terms, of the whole tribe:

"These infects live entirely on vegetables. The least tree is no less liable to their attacks than the most humble plant. They prefer the young shoots on account of their tenderness; and on this principle often infest little trees into the very heart of the plant, and do irreparable mischief before they are discovered. But for the most part, they best The foliage, and are always found on the under side of the leaf, which they prefer, not on account of its being the most tender, but as it affords them protection from the weather, and various injuries to which they would otherwise be exposed. Sometimes the root is the object of their choice, which, from the nature of these infects, one would not, a priori, expect; yet I have seen them root the roots of the trees, and the entire root, in the course of the worst storms, and the most exposed, and little value; but these influences are rare. They rarely also attach themselves to the bark of trees, like the aphides, being one of our largest species, and hence possessing superior strength, is enabled to penetrate a substance harder than the leaves themselves."'
the sole cause of the failure of the crops of hops. In 1794, a season almost unparalleled for drought, the hop was perfectly free from them, while peas and beans, especially the former, suffered very much from their depredations. Beans, in 1798, were almost wholly cut off by them; indeed they suffer more or less every year by a black species of aphis, particularly the latter crops. To potatoes, and even corn, they prove in some years highly detrimental, and not less so to melons. To plants in flowers, green houses, and frames, where, from the warmth and shelter afforded them, a preternatural multiplication takes place, they prove extremely injurious; and many rare and valuable plants also in the open ground of our botanical gardens fall victims to these general depredators. "Seeing, therefore," says that writer, "that our necessaries, as well as luxuries of life, are so materially affected by the insects of this genus, an attempt to avert some curious and important facts relative to their history, and to make them more generally known, will not, we trust, be unacceptable. Such inquiries may possibly lead to the means of obviating the injuries they occasion; and if they fail in this, they may tend at least to correct the erroneous notions entertained of blights, not by the vulgar and illiterate merely, but even by persons of education, who may be frequently heard to maintain, that the insects are brought by the east winds; that they attack none but sickly plants; with other notions, all as fallacious in fact as unphilosophical in principle."

In the course of this long but ingenious paper, Mr. Curtis proves, in a satisfactory manner, the truth of his preliminary remarks; and, by a series of experiments, which are necissarily beyond our limits to detail, has discovered some peculiarities in their economy deserving notice; we shall conclude with a brief survey of those most interesting, and refer the more inquisitive reader to the paper at length, in the Transactions of the Society for 1802.

Loculæ and caterpillars are furnished with strong jaws, by means of which they crop and wholly devour the foliage of plants. The aphis destroys them in a different way. Instead of jaws and teeth, it is provided with a hollow-pointed proboscis, which, when the animal is not feeding, folds under the breast. With this instrument it pierces the plant, and imbibles its juices to support itself; but these juices being essential to the life of the plant, it follows, that when they are drawn off, the plant, exhausted, flags and perishes, being, in fact, literally bled to death by these leech-like animalculæ. Yet so tenacious of life are plants in a healthy state, that, in general, they only fall victims to the continued attacks of these insects when in immense numbers. But it most commonly happens, that if they do not wholly destroy a plant, they deface it; and a small number of aphides are sufficient to produce this effect.

Aphides are described by the best authors as being generally oviparous and viviparous at different periods of the same year. Mr. Curtis found, from the 24th of September to the 6th of December following, during which time Fahrenheit's thermometer had been as low as 29, that the aphis fulcis was constantly viviparous; though, from the inclemency of the weather, very few of these insects, at the period last mentioned, remained on the trees; and those few were soon after entirely cut off by the unusual cold that took place, the thermometer falling to four degrees below 0. Other aphides are oviparous or viviparous, according to the temperature of the air to which they are exposed. In very cold weather they are oviparous, for this obvious reason, that the eggs are capable of huffing cold more powerfully than the young. On the 22d of November, in the same year, he found a considerable number of eggs, which had been deposited in some auricula plants by a green aphis, which infests plants very commonly, while the same species on a geranium within doors produced young. In mild winters, in the month of January, the same species of aphis has been observed in great numbers on various species of primula without doors, and all the females viviparous. Thence, and some preceding facts, prove, that all aphides are not oviparous and viviparous at the same season, but that some may be wholly viviparous; that all such as are both oviparous and viviparous do not lay eggs toward the middle of autumn, nor at all during the winter, unless a certain degree of cold takes place.

In the quality of the excrement voided by these insects, there is something wonderfully extraordinary. Were a person accidentally to take up a book, in which it is gravely affected, that in some countries there were certain animals which voided liquid sugar, he would lay it down, regarding it as a fabulous tale, calculated to impose on the credulity of the ignorant; and yet such is literally the truth. Mr. Curtis collected some on a piece of writing paper from a brood of the aphis fulcis, and found it to be as sweet as sugar; and observes, that were it not for the wasps, ants, flies, and other insects that devour it as quickly as it is produced, it might, no doubt, be collected in considerable quantities; and by the procists used with other saccharine juices, might be converted into the choicest sugar or sugar-candy. The sweetness of this excrementitious fuliture, the glossy appearance it gave the leaves it fell upon, and the swarms of insects this matter attracts, led him to imagine the honey-dew of plants was no other than this secretion, which further observation has since fully confirmed; and not, as its name implies, a sweet fuliture falling from the atmosphere. On this opinion it is further remarked, that it neither falls from the atmosphere, nor is it of the plant itself, as is easily demonstrated. If it fell from the atmosphere, it would cover every thing it fell upon indiscriminately, whereas we never find it but on certain living plants and trees. We find it also on plants in flowers and green-houses covered with glasses. If it exuded from the plant, it would appear on all the leaves generally and uniformly; whereas its appearance is extremely irregular, not alike on any two leaves of the same tree or plant, some having none of it, and others being covered with it but partially. As far as the writer's observation extended, there never exists any honey-dew but where there are aphides; though such often pafs unnoticed, being laid on the under-side of the leaf; and wherever honey-dew is observable upon a leaf, aphides will be found on the under-side of the leaf or leaves immediately above it, and under no other circumstance whatever. If by accident any thing should intervene between the aphides and the leaf next beneath them, there will be no honey-dew on that leaf: and thus he conceives it is incontrovertibly proved that aphides are the true and only source of honey-dew.

Though no mode of destroying aphides will perhaps ever be devised on a large scale, in the open air, by artificial means, it can be accomplished most effectually when they infest plants in flowers, green houses, and frames, or any situation in which they can be enclosed for a certain time in clouds of smoke. Powders or liquids, however fatal to aphides, must ever be ineffectual, from the trouble and difficulty of applying them, so that they may come in contact with the insects. The smoke of common vegetables, however powerful, is found inadequate to their destruction, and the only one yet employed with success is that of tobacco.
A H

bacca. They may for hours, or even a whole day, be
immersed in water, and when taken out some will be liv-
ing, and many of the rest will revive afterwards; they re-
main affixed to the plant in water as before, and their bod-
ies assume a luminous appearance from the minute bubbles
of air which issue from them. One experiment is men-
tioned, in which a green-house plant, with the pot it grew
in, was immersed in the evening into a tub of water, and
in the morning they appeared alive and well. When they are
taken from the plant on which they feed, and are kept
under water, they do not survive long; their struggling
in that case perhaps exhausts them sooner. It appears there-
fore, upon the whole, that they are extremely tenacious
of life, and that wet is not so hurtful to them as might na-
turally be imagined.

Some curious remarks on the opinions that prevail re-
specting blights conclude the paper. Blights, he observes,
originate from a variety of causes, the chief of which are un-
favourable weather, and insects. Some imagine that the in-
sects which are the cause of them are brought from a dis-
tance by easterly winds; and others, that they attach them-
selves to none but sickly plants; neither of which, so far as
the writer has observed, are founded in fact; and he is in-
duced to believe the aphides are by far the most general cause
of the disfigurements distinguished by the name of blights.

APLASTUM, from a and phæus, frangibile, in the An-
cient Navigation, a wooden instrument, shaped like a plume
of feathers, fastened on the groove of a swan's neck used
by the ancient Greeks in the heads of their ships.

The aphantum had much the same office and effect in a
ship that the crest had on a helmet. It seems also to have
had this further use, viz. by the waving of a party-coloured
ribbon fastened to it, to indicate from what quarter the
wind blew. The aphantum was the proper ornament of the
head, as the acrotolium of the flern. The Greek aphant-
um answered to, and was probably the origin of the Latin
aplatische.

APHEL, in Ancient Geography, a town of Asia, in
Chaldæa, situate near the Tigris, where it borders on the
Persian gulf.

APHNEUM, a town of Phrygia, near Cyzicum. Steph.
Byz.

APHNEUS is also a town of Lydia.

APHONIA, in Medicine, the state of a person who is
deprived of voice.

The word is compounded of the privative α, and φωναί
voice, q. d. a loss of speech or voice.

This is rarely an idiopathic affection, and may arise from
a variety of causes; such as cutting the recurrent nerves
which go to the larynx or glottis, where the voice is formed:
or making an aperture into the trachea below the glottis, or
any other mechanical injury to the parts.

Any fit may deprive the patient of the use of the organs
of speech, as epistaxis, apoplexy, paralysis, or hysteria, may be-
cause a come of aphonia.

When a person is suddenly seized with a loss of voice, and
no cause appears, it generally indicates the approach of one
or other of these attacks.

As all voluntary motion depends on the nerves and muf-
cles of the respective organs, so whatever injures those of
the tongue, or any of the other organs subservient to the
formation of the voice, may induce aphonia.

Some other causes have been mentioned by medical writ-
ers, which are only accidentally so; such as the receding of
cutaneous eruptions, inflammation of the tongue and faucets,
episodic affections, worms, fear or joy, a crumb of bread, or
any other extraneous substance sticking in the rima glottidis.

The prognosis will vary with the cause; the most obilinate
cases are those which depend on a paralysis of the state of
the nerves. As hylieria, worms, or extraneous matters, are com-
monly soon removed; so a disease depending on them may be
deemed easily curable.

The general indications of cure are, to restore freedom to
the nervous influence when impended, and integrity to the
organs themselves when wounded or otherwise disabled. The
first indication is answered by the treatment of Paraly.
sis; the second by the practice of surgery. Particular indica-
tions are taken from the cure of those particular disfigurements on which the
aphonia depends, viz. Hystaria, Epilepsia, Worms, Seama, &c. &c., which see.

APHORISM, a maxim, general rule, or principle of a
science; or a brief sentence, comprehending a great deal of
matter in a few words.

The word is derived from ἀφορίζω, ἅ separate, q. d. a choice
or select sentence.

The term is chiefly used in Medicine and Law. We say,
the aphorisms of Hippocrates, of Sanchezus, of Boerhaave,
&c.; aphorisms of the civil law, &c.

APHORISM is used, in Ecclesiastical Writers, for the lefser
excommunication, by which the delinquent is cut off from
the benefit of the sacrament and the prayers of the faithful;
but allowed to bear a part in the rest of the service.

APHORISM is also used for a kind of figure in Rhetoric,
whereby something that has been said is limited and cor-
rected. This is otherwise called diōrismus.

APHORISTIC, something relating to, or partaking of
the nature of aphorismus.

The aphoristic method bands contradistinguishing from
the systematic, or methodical, as also from the diësodius, or di-
fusive way.

The aphoristic method had great advantages, as containing
much matter in a small compass; sentiments are here almost
as numerous as expressions; and doctrines may be counted
by phrases. Every thing is close and pertinent, allowing no
room for useless discussions, or for languishing connections
and transitions; there is hardly a word to be lost.

APHORMION, in Ancient Geography, a place of Bœot-
ia, dependent upon Thetia, which, according to Steph.
Byz. was the birth-place of Typhus, who superintended the
construction of the ship Argo.

APHOSIATIN, in Geography, a part of Romelia in
European Turkey, near the Black Sea, and not far from
Clanfantine to the north.

APPHADENA, a town of Asia in Mesopotamia,
near the Euphrates.

APHRACI, from α, and φωνας, inclosed, in the An-
cient Military Art, denote open vessels, without decks or
hatches, furnished only at head and stern with cross planks,
whereon the men float to fight.

The apfront, or open vessels, wind contraeoistinguishing from
catophracis, or covered ones.

APHRODISIA, in Antiquity, festivals in honour of the
goddess Adonis, or Venus. There were several of these
between allies observed with lascivious ceremonies in divers cities of
Greece; the most remarkable was that at Cyprus, first
instituted by Cinnyrus, out of whose family certain priests
of Venus were elected, and for that reason named Kowghus. At
this solemnity several mysterious rites were practised: all
who were initiated to them offered a piece of money to Venus
as an alms, and received as a token of the goddess's favour,
a measure of salt, and a φαλαλος; the former, because salt is a
concretion of sea-water, to which Venus was thought to
owe her birth; the latter, because the was the goddess of
wantonness.
Aphrodite. In *Entomology*, a species of *Papilio* in the section *Nymph.* The wings are dentated, tubulous, with black spots; the underside of the posterior pair is brown, with 24 silver-coloured spots. Fabricius and Gmelin. This is a native of South America.

Aphrodite, in *Natural History*, a name given to some authors to the small species of *anamys* or. See *Gemma Veneris*.

Aphrodite, in *Ancient Geography*, the name of an island in the Arabian gulf, near Egypt, according to Ptolemy. M. d'Anville supposes that it was the island called Susiane-al-Belri.

**Aphroditoides**, in *Natural History*, a species of *Nereis* found in the Greenland seas. The body is deep-striated, without furrows; and the peduncles furnished with a cirrus and papilla. Gmelin & Fabr. The head is white, eyes and jaws black, tentaculiform, two cirri in front, body pellicul; anterior part ochraceous yellow, the rest reddish, with two ferruginous lines along the abdomen. Sometimes, though rarely, it is green, with the ferruginous lines on the abdomen, and transverse reddish lines upon the back.

**Aphroditoides**, a species of *Terebella*, inhabits the Indian ocean; it is about a foot and an half in length, and consists of about 148 segments; the peduncles are fleecy, furnished with a cirrus, and two cirri at the head. The specific character is, body round, and gradually tapering towards the posterior extremity; beneath rather depressed, with an oblong furrow; the first eight segments dentate of branchiacthe, thence the three next simple, and the rest becoming gradually larger, and pinnated on each side. Gmelin, &c. This is *Nereis* aphroditoides of Pall. nov. act. Petrop. &c.

**Aphroditopolis**, in *Ancient Geography*, the name given by Pliny and Ptolemy, to two, and, after them, by M. d'Anville, to three towns in Egypt; and each of the two former the capital of a particular name. *Aphroditopolis*, in the Heptanomia, upon the right of the Nile, at some distance south from Memphis, is the capital of the 36th nome; and M. d'Anville supposes it to have been succeeded by Ascalon; but Father Siccard imagines that it is *Bersabel*, a small place at a little distance to the south-west.

**Aphroditopolis** is also a town of Upper Egypt, and the capital of the 42d nome. This town lay to the left of the Nile, a little north of Ptolemais; and it seems to have been that which Pliny calls *Oppidum Veneta*. M. d'Anville supposes that *Ascalon* now occupies its situation.

**Aphroditopolis** belonged also to the name of Hermonithites; and was situated on the left of the Nile, at a small distance north from Latopolis. M. d'Anville assigns it to the place where Asfan, or Asfoum, now stands.

**Aphroditopolites**, a name of Egypt, the metropolis of which is called by Ptolemy *Crocodilorum civitas*. **Aphrogala**, from αργος, *white*, and γαλας, *milk*, in the *Ancient Physic*, denotes a kind of white cream, or milk, agitated till it be converted wholly into froth.
APHTHAE.

The aphthae are directed by Galen, as proper against hot disorders of the stomach.

APHROTURM, in the Ancient Physic, denotes the spume or froth of him; and seems to amount to the same with aphthurem.

APHRODITE. See Nitrum.

APHROSELENOSS, according to Ancient Naturalists, a derivative to the sappho, or the bottom of the throat.

APHTHAE, in Surgery, from σφόνζ, incision, the trench.

By this term are denoted clear, white, pale, livid, painful spots, which appear in the mouth, fancies, and neighbouring parts, of various sizes and shapes; and which generally raise themselves into real ulcerations, filled with a clear or turbid yellow or bluish fluid. They attack every part of the cavity of the mouth, the cheeks, pharynx, oesophagus, stomach, and intestines; sometimes also they are found in the nostrils. Generally they appear at first in small white points, which are always preceded by a very sensible degree of heat in the mouth and breath of the patient, which gradually increases in size; and sometimes in the space of a few minutes, or more slowly, spread themselves farther, become elevated, and form ulcerations, which are either round or flattish, and with either single, or in groups. In some cases they soon burst open, or separate themselves at their base; and the contained fluid is either quickly discharged, or is absorbed; and they collage, or wither away, as it were, and the detached cuticle forms wrinkled white spots, which frequently occupy a larger extent of surface. Sometimes they remain longer elevated, the contained fluid grows thick, and they fall off in flakes of a darker yellow colour. Sometimes aphthae are not of a white colour; for when the morbid matter has long continued its ravages in the syalem before affluence is procured, or if the aphthae have not been discovered early enough, they are found sometimes ah-coloured, sometimes lead-coloured, blue, and black, according as either the vitiated humours, or the bottom of the sore, appears through the skin.

After a shorter or longer space of time, they generally detach themselves and fall off, upon which a moilure is seen to cover the ulcerated parts. When this becomes greatly accumulated, a saltation is commonly produced. If the parts do not soon become covered with a new skin, they begin to bleed, and to occasion acute pain. This separation sometimes takes place within a few hours, generally within twelve; sometimes also the floughs remain for several days, and do not fall off at the same time, but one after the other, in different parts.

Frequently they disappear, but as frequently return again, according as there is a larger or smaller quantity of morbid matter which deposits itself in the mouth, and irritates it. Sometimes the internal surface of the mouth becomes covered with a perfectly white crust, produced by the coalescence of the separate aphthae, whence a variety of inconveniences are produced; for the symptoms of the disease are exacerbated, and at length putrefaction and gangrene supervene, which takes place the sooner if there be a fever at the same time present. In this state the patient can take no nourishment, as he cannot swallow even liquids without intolerable pain and anxiety; and should it be possible to get any thing down, it does not contribute to the nourishment of the body, so that the strength of the body vanes away, and death may at length terminate the sufferings of the patient.

Frequently the aphthae appear as a primary or idiopathic disease; but more commonly they are symptomatic, or concomitants of other diseases. Some have also affected, that they may be critical, which however is doubtful; or, if they ever are so, it is only with adults. In the idiopathic aphthae, the following symptoms are observed; they appear in children from a week to a fortnight old, sometimes also later. The infant becomes uneasy, sometimes sleeps much, sometimes little; he cries a great deal: his voice grows feeble, shrill, and hoarse; his respiration is very quick and difficult; his pulse uncommonly quick and small, with symptoms of fermenting in his mouth, tongue, and the other neighbouring parts, are dry and very hot; this heat extends itself over the whole body without perforation, and the patient becomes languid, feeble, and spiritless. The infant is very eager for the breath, where the mother feels an intolerable heat; but he is unable to suck, on account of the pain excited by the pressure of the nipple, and the exertion of the mufcles requisite in the action of sucking; in consequence of which many infants die for want of nourishment, even before the thrush breaks out.

When aphthae appear as symptoms or concomitants of other diseases, the febrile symptoms become exacerbated; and they are very apt to appear when the patient has been afflicted with a diarrhœa at the very commencement of the febrile attack. The patient is moreover troubled with continual nausea, a loathing of food and drink, and sometimes also with vomiting. He feels a sense of anxiety and weight at the pit of the stomach and in the thorax, especially if copious and frequent evacuations have preceded. He feels a lefion as if some hard substance stuck in his throat, especially when he swallows any liquid. If evacuations have been administered, and have produced a discharge of much mucus, bile, and other impurities, and the above mentioned symptoms continue, aphthæ certainly make their appearance. Finally, they are frequently prognosticated by a dulness and stupiditiy of the senses and understanding, during which the patient is much inclined to sleep, but his sleep is attended with a great deal of dreaming.

It is necessary that the physician or surgeon should be well acquainted with these symptoms, from which the appearance of aphthæ may be prognosticated; for whether they be idiopathic or symptomatic, they are always an unfavourable occurrence, and seldom unattended with danger.

When aphthæ actually make their appearance, they are attended besides with the following symptoms; shortly before they break out, or when they do break out, a lefion of heat and intolerable burning is felt in the mouth. The patient feels as if the whole cavity of his mouth were excoriated or ulcerated; and the slightest touch excites the most acute pain in it. If, at the same time the voice becomes hoarse, with a hollow tone, the fever and uneasiness increase, hiccup supervenes, the tongue becomes very red, with a sense of pain deep in the throat, or about the upper orifice of the stomach, we may conclude with certainty that aphthæ have already been formed in the stomach and oesophagus, which will gradually spread themselves higher up, till they appear also in the fauces. These excite indigulations and vomiting, especially with infants. The evacuations by ileus are very copious; and infants void, together with the other excretions, lamps of undigested milk. With this copious and preternatural alvine evacuation, fever is often combined during several days. As soon as the aphthæ have spread themselves over the whole internal surface of the mouth, they render malnutrition, inflammation, and deglutition extremely difficult to the infant, who therefore continually cries; and when he yawns, he is always affected with violent griping in the belly, which is attended with a rumbling noise. When the aphthæ have completely broke out, they are accompanied also with a variety of symptoms of different kinds, of which we are to form our judgment, partly according to the colour of the aphthæ,
A P H I T H E.

aphthe, partly according to the symptoms and course of the disease, of which they are symptoms or concomitants.

The morbid matter by which the aphthe are produced, is to be sought almost solely in the prime vix, where it is formed, particularly with new-born infants, when the first indifferently necessary purgation has been neglected, and also when in any other manner, either by the improper diet of the infant, or also by that of the mother or nurse, occasion has been given to the production of impurities in the prime vix. It is prejudicial to suffer the infant to sleep on the breast, as he then keeps some of the milk in his mouth, where it easily becomes spoiled.

This disease may also be produced by the infant receiving unwholesome milk. With many infants, therefore, we may prevent the production of aphthes, by frequently cleaning their mouths, soon after birth, in order that none of the mucus may remain in them; by evacuating the contents of their intestines by proper purgatives; and by keeping them, in general, clean, and giving them wholesome nourishment.

In the cure of the aphthe, our first object must be to examine whether they be idiopathic or symptomatic, as each species requires a distinct mode of treatment. The most important general indication of cure, is to endeavour to correct and remove the viscid, acid, and offensive humours. For this purpose we may administer elder-flower tea, demulcent pills, with a little lemonjuice, emulsion of almonds, sweet milk, a dilute decoct of oats or barley, whey, &c. When the infant is affected with the aphthe in his mouth, the mother or nurse should take these remedies; and, at the same time, it will be very beneficial to purge the hands and feet of the infant frequently into warm water, or to apply either liquid or vapour-baths with elder-flowers, and other emollient herbs, wheat, bran, soap, &c. Emollient glisters, composed with the above mentioned substances, are particularly to be recommended, as the requisite remedies may thus be introduced into the body, without doing any violence to the mouth, fauces, and throat of the infant; besides that, this manner of administering remedies is the best adapted for infants, who generally neither can nor will swallow them.

The use of much animal food, and whatever can increase the alkaline tendency of the fluids, must particularly be avoided in the diet of the patient, as the quality of the morbid matter would thereby be increased. On the other hand, fresh air, a clean and warm chamber, frequent cleaning of the body, bodily motion, both with children and adults, the application of acidulous vapours, and other substances that heat or neutralize the alkalies, also fixed air, are to be recommended. The diet of the patient ought in general to be liquid and light, but, at the same time, nourishing, consisting of bread-pouls, barley-broth, fago, &c. Panada, made with bread, honey, and wine, boiled in water, is also a good article of food; but with respect to the wine, we ought to be very cautious, in order that we may not increase the irritation in fevers of an inflammatory nature, and when there is already too much irritation in the sytem. We may administer it more plentifully in diseases of debility and malignant fevers; and the same applies to all aromatic and other stimulant substances.

Our most important object here is to diminish the violence of the fever and the febrile heat. If the fever be an intermittent, cinchona, rad. bened., and other bitter and slightly astringent remedies are proper. In nervous, malignant, or putrid fevers, cinchona, contrayerva, arnicas, camphor, and acidulous substances are indicated. But most frequently the fever is either of the inflammatory kind, or at least it is attended with a considerable degree of febrile heat. In this case we may use warm drinks, a decoction of flor. extract with spicis vitriol, oxyamel simplex, with tamarinds, cream of tartar, or other acidulous substances. Flux, birth, and rub. iod. diluted with water, emulsion of poppy seeds with nitre or sal. aceticell. officin. or also the following composition: R. Aq. flor. sanctun, tisal 3 $j. nitr. depur. $j. fyr. rub. idz., or aceticell. citr. $j. M. D. S. A table-spoonful to be taken every two hours. Many of these remedies may be administered in the form of glysters; inunctions with four whey are also particularly to be recommended.

Finally, we must moderate the heat by means of external applications, of which the most approved are the following. R. borac. venet. gr. xxx. solv. in aq. rub. idz. 3 $j. adde fyr. rub. id. M. D. S. A sponge, a piece of linen, or a brush of lint to be dipped into it, and the mouth cleaned with it. We may also give a tea-spoonful of it every two or three hours internally, with great advantage. We may likewise administer from time to time aq. aceticof, with syrup or honey. Allo: R. spir. vitriol. $j. fyr. violaar. 3 $j. aq. commun. 3 $v. M. D. S. A table-spoonful to be taken every hour by adults, and a tea-spoonful by infants, also to be used for washing the mouth. We may also administer, particularly to young children, an ounce of house-leaf juice (femperovium), with an equal quantity of honey. Or, according to Mr. Starke, R. borac. venet. 3 $j. fyr. moror. 3 $j. fyr. papav. alb. 3 $s. M. D. S. The mouth to be cleaned with a brush dipped in it.

Besides what has been already said, the following directions are particularly to be attended to: as soon as the idiopathic aphthe appear, it will be very useful to administer a purgative, either of rhubarb or mann, with some neutral salt, or magnesia and rhubarb, with infants; but with adults, tamarinds and some neutral salt, or the infusion of fennel. When there are bilious or other impurities in the intestines, an emetic with tart. emet. is administered in a dose proportionate to the age of the patient; or with children, pulf. aurat. antm. or laxative glysters. If the patient already complains of great pain in the throat and oesophagus, or even in the belly, these remedies are altogether inadmissible. In the symptomatic aphthe it depends upon the nature of the primary disease whether it shall be proper to administer any evacuant. Emollient and gently laxative glysters, however, will never do any harm. With these remedies the liquid ones brisk mentioned are to be combined.

When the aphthe have actually made their appearance, the above mentioned draughts and remedies are to be administered; with children, frequent injections should be used, and the mouth washed with emollient decoctions, or with figs and honey of roses, or some other acidulous syrups, applied by means of a brush. But when it is observed that they extend lower down than the fauces, or even already form crusts and excite pain, they must be moistened, softened, and gently irritated. We may then apply to the aphthe a decoction of carrots, or the expressed juice of boiled carrots, with honey of roses, by means of a brush; or we may let the patient swallow a tea-spoonful of this remedy in cafes of internal aphthe. Equally beneficial is also a decoction of the brassica rapa sweetened with sugar, or its expressed juice slightly boiled and sweetened with honey, and its efficacy will be increased if we rub down the peel together with the pulp; we may also use the juice expressed from it after having been roasted, mixed with honey of roses. With these remedies we should frequently wash out the mouth of the patient, or let him use them as gargles; and where there are internal aphthe some of them must be swallowed down.
APHTHEAE.

We may also boil the brassica rapa in veal broth, and let the patient eat it; and he may either drink the broth, or it may be administered in injections. Sem. lin. boiled in water, and mixed with honey of roes, or any other acidulous syrup, as also the compositions with borax, are very serviceable in these cases.

As external remedies we may use those that have just been mentioned with great advantage, as also the following: macerate fage in warm wine, add some honey, and let the patient’s mouth be washed with it; this mixture may be applied to the mouths of infants, even though they Should bleed; after which the mouth is to be washed again, by means of a bruhl, with syrup of mulberries, honey of roes, syrup of quinces, or the juice of four cherries, diluted with an infusion of sage, and two or three drops of the spirit of vitriol; or we may use white vitriol dissolved in barley-water, with the addition of honey of roes; a decoction of roe-leaves with honey has also produced very good effects. The following remedy has likewise been recommended: R. mel. commun. 3j; borac. venet. 3j; alum. ult. 3fs. aq. rofar. 3fs. M. D. S. * To be applied to a bruhl, and the mouth cleaned with it. Finally, when the crults will not separate, we may use the following composition: R. fsp. cochlear. syr. face. etr. pref. 3j; M. For washing the mouth we may use also the decoction of Peruvian bark.

When the apthae at first appear discoloured and gangrenous, or become so in the course of time, we should use the following composition: R. terr. catech. 3jij. coq. in aq. calc. lbi. ad rem. 3viiij. colat. add. facch. saturn. 3fs. mel. rofar. 3j; M. D. S. A table-spoonful to be taken every hour, held for some time in the mouth, and swallowed down slowly. Cinchona administered internally, in injections, and mixed with honey of roes, is likewise recommended. The same mode of treatment is to be pursued with the symptomat apthae.

When the apthae slough off, and the parts become raw, fore, bloody, and painful, the following mucilaginous and gently astringent remedies are useful: mucilag. cydon. with aq. salv. or H. aq. rofar. 3j; vitell. ovum. N° ii. fyr. papav. alb. 3j; crem. tart. 3fs. M. Allo borax with syrup of poppies, emulsion of poppy seeds, and even opium triturated with mucilage of quinces, and diluted with water, may be used with advantage. But if the parts appear discoloured, or the pain in general has abated, we may administer the remedies mentioned just before, as they are of a more astringent nature, and tend to check inflammation and gangrene; allo whey with vinegar, the juice of lemons and oranges, or oxymel; a decoction of hb. agrimon. & mel. rofar. is recommended, to which acetof. may be added; allo Peruvian bark.

When the apthae have sloughed off, both in the mouth and other parts, which we may know to be the case when any of them are voided by food; when a sufficient quantity of strengthening remedies has been employed, which may be known by the abatement of the fever, and the absence of morbid matter in the humours; purgatives, and particularly those of a mucilaginous and tonic nature, are necessary; such as tamarinds, manna, rhubarb, or glycyrrhiza made with these substances, in order that any impurities that may still remain in the stomach and intestines may completely be evacuated.

Sometimes, however, the apthae, particularly the symptonum, produce other peculiar symptoms; as in children, when they alleviate the other symptoms of the disea as soon as they make their appearance, in which case we must endeavour to promote the eruption by means of the above-mentioned decoction of brassica rapa, and other similar rem- 
edies. When the fever becomes of a malignant and putrid nature, cinchona, ferentinaria, contrayerva, muflard with some fp. salis and mel. rofar. also butter-milk, are the proper medicines. When they are of a febrile or venereal nature, these morbid poisons must be counteracted by the appropriate remedies.

When the bowels are obstipated, we must loosen them by means of emollient glyders with chamomile flowers, decoction of ows, soap, or oil of almonds. Frequently a violent and exhausting diarrhea comes on, which is to be checked by mucilaginous medicines, such as corn. cerv. gum arabic dissolved in barley water, with the addition of a quantity of saffron; the same end may also be obtained by means of opium, laud. hq. or tinct. opii and fyr. paffav. which the mother or nurse may also take; and some time after having taken it give the infant breast. Mucilaginous glyders with teriacus and soap are sometimes very effectual.

When a troublesome and pernicious salivation comes on, it must first be treated with mucilaginous and gently astringent remedies, such as mucilag. cydon. aq. salv. &c. and afterwards with stronger, such as a decoction of rad. tormentill. herb. agrimon. or granate with honey of roes.

The hiccup, with which patients are sometimes attacked, frequently ceases spontaneously; however, nourishing mucilaginous remedies, combined with a little opium, will contribute much to remove it.

With a view to relieve the patient’s strength, mild, light, and mucilaginous substances must be given him, in order that the stomach and bowels may again become used to food; e. g. barley-water, fago, faic, jelly, and even fengeal. When the stomach has become somewhat accustomed to the reception of these substances, the patient may gradually return to his former diet.

With adults, apthae occur in various kinds of fever, but particularly in those annual fevers which commence with diarrhoea or dysentery, when the impurities of the bowels have not only not been evacuated, but have been detained by the medicines that have been used. Such apthae have sometimes been observed to be epidemic; and they frequently appear in hectic fevers. The prognosis depends upon the nature of the disease which accompanies the apthae, and the strength of the patient. It is an unfavourable circumstance when, after the apthae have made their appearance, the fever returns, the pulse grows small and weak, and the appetite is not restored.

This species of apthae is to be treated like the reit; but when they are accompanied with a putrid fever, we must be very cautious with regard to the use of evacuating remedies; antifeptic and other appropriate remedies should rather be administered, and those combined with the former. When the apthae have seattered, acrid and too stimulant medicines and food, as also cold air and drink, should be avoided; let the former should excite inflammation and suppuration in the stomach and bowels, and the latter a new swelling of the mouth, and the most dangerous species of angina.

APHTHARTODCETAE, in Ecclesiastical History, a sect, sworn enemies to the council of Chalcedon.

The name is derived from aφθαρτος, incorruptible, and δεός, I imagine; and was given them, because they imagined the body of Jesus Christ was incorruptible and impenetrable, and not capable of death. They arose among the Eutychians, and made their first appearance in 525.

APTHONIUS, in Biography, a rhetorician of the third century, wrote a work entitled “Progymnasmata Rhetorica,” or Rhetorical Exercises; first published in Greek by Aldus, at Venice, in 1508; afterwards with Her-
A PHYLLANTHES, in Botany, (άφιλλος; δαντίς), a flower without leaves. Linn. gen. 406. Schreb. 576. Jull. 44. Clus. catharum monegnia; nat. order of tritox, abed, sumti, Juff.; Gen. character, cal. gyno, mesofall, fanceolate, several, imbricate; cor. petals fixi, ovate, spreading; claw flanged, erect, converging into a tube; flask, flaments tunicous, shorter than the corolla, inserted into the throat, anthers oblong; pil. germ superior, three-cornered, turbinate; filly tube, of the length of the flaments; figma three, oblong; per. capsule, turbinate, triangular, trilocular; seeds ovate. Species 1, aphyllantas montpellizens; root creeping; cens naked, simple, furnished on the base with sheaths like the root; glume two-valved, two-flowered. It grows wild near Montpellier, in barren and rocky places. This plant differs solely from the root in having a corolla.

APHYLLON. See OZOBANCHE.

APHYLLUS, formed of α, priv. and ουλός, a leaf, denotes leaflets.

APHYTELA, a plant having neither root, stem, nor leaves (from α, priv. and φυτία). Linn. gen. Schreb. 1104. Ame. Acad. 8. 312. Spach, pl. 48. Hydroca, Thunb. Art. Holm. 1775. 69. Clus. monadophyllo trimestrié. Generic character. cal. perianth monophyllous, feminiad, funncl-shaped, large, flabby, erect, permanent; corolla, united parts of three petals, growing to the divisions of the calyx; flask, flaments connate at bottom; short; anthers, connex; coudate, pistil, germ inferior; flppy, thick, short; figma, triangular, channelled; per. a berry, one-seeded; seeds, numerous, netting. There is one species, viz. Aphytis hydróca, a vegetable without leaves, stem, or root; parasitical, terrellid, consisting of a single fructification, which is four inches over, cecile, concave, succulent; calyx large, with an erect trifid border, white within, fumitoment. The ripe fruit, which is not unpleasant to the smell, is eaten, both raw and roasted, by the Hottentots. Discovered by Thunberg at the Cape of Good Hope.

APHYTELLA, or Aphytis, in Ancient Geography, a town of Thrace in the Pallene, a peninsula south-west of the Thracian gulf. Phutarch relates, that when Lyfander laid siege to this town, Jupiter Ammon appeared to him, and ordered him to abandon it.

APIAN, Peter, in Biography an eminent astronomer and mathematician, called in German Benedicte, was born at Lothlinch in Minisia, and became professor of mathematics at Ingolstadt, in 1524. He wrote several valuable mathematical and astronomical treatises, and enriched astronomy with many inventions and observations. His first work was a treatise on "Cosmography, or Geographical Instruction," which was published in 1530, and several times re-published, particularly by Gemma Frisius. In 1531, he conducted, at Nuremberg, a curious instrument, called from its figure, "Fulmum populim," which showed the hour of the day by the sun's rays, in all parts of the earth, and even the unequal hours of the Jews. In 1534, he published his "Inscriptions astronomic," and in 1542, his "Instrumentum soleum," with 120 problems. In the same year his principal work, intitled "Altronomicon Castrorum," was published at Ingolstadt; and it contains many interesting observations, with the descriptions and divisions of instruments, calculations of eclipses, and the construction of them in plan. In the second part of this work, or the "Meteoroaegnium Planum," he describes the construction and use of an accurate astronomical quadrant, and he has annexed to it observations of five different comets, viz. those of 1531, 1532, 1533, 1538, and 1539, and here he has first shown that the tails of comets are always projected in a direction opposite to the sun. The elements of the comet of 1532 were nearly the same with those of one observed 128 years after, viz. in 1651, by Hevelius and others: hence Dr. Halley inferred that they were the same comet, and it was expected in the beginning of the year 1758. But astronomers, either through an error of Apian, or from some other cause, were disappointed. Apian was also the author of many other works, among which may be numbered the "Epiphanes" from 1534 to 1570; "On Shadows;" "Arithmetical Ceniglogues;" "The Rule of Dofs;" or Algebra demonstrated; "On Grating;" "Almanacs;" "On Conjunctions;" "Books of Eclipse;" "The Works of Polemen, in Greek;" "the Works of Azoph;" an ancient astrologer; "The Works of Gere;" "The Perspectice of Vocelli;" "Of Critical Days, and of the Rainbow;" "A New Altronomical and Geometrical Radius, with various uses of lines and chords;" "Universal Altronomical of Nambume;" "Maps of the World, and of particular Countries," &c. &c. Apian was treated with great respect by the Emperor Charles V., who published several of his works at his own expense, conferred on him the honour of nobility, and presented him with 5000 crowns of gold. Apian, after a life devoted to study and the improvement of science, died at Ingolstadt in 1552. His son Philip, who succeeded him, was also an eminent astronomer, and taught mathematics both at Ingolstadt and Tubingen. He was born in 1531, and died in 1589. He has left a treatise on "Solar dials," and other writings. Tycho has preferred his letter to the Landgrave of Hesse, in which he gives an opinion on the new star that appeared in Cassiopeia, in 1572. Voll. de Scient. Montaia Hist. Mathem. tom. i. p. 625. Hutton's Math. Dict. Nov. Dict. Hitter.

APIARIA, in Entomology, a species of Musca. (Linn.)

The anterior part of the thorax is yellow; abdomen black at the apex: tips of the wings ferruginous. Gmelin. This kind inhabits Italy, and somewhat resembles Musca myladea. The antennae are feathered, front of the head, posterior part of the thorax and abdomen, except the apex, black. Wings obscure. Obf. This is SYRPHUS APIARIUS OF Fabricius. Spec. Inf.

APIARIUS, a species of Atellus; bluish, upper wings red, and three black bands; Gmellin. This is the clerus, with red wings, and three bluish bands of Fabricius; the clerus nigro-violaceus hirutus, &c. of Geoff. Clerus ceruleo-violaceus of Degener; and dermelle apiarius of Schrank. Found in Europe, America, and Siberia.

APIARY,
APIARY, from *apis*, a bee; a garden or place where bees are kept. The ancient as well as modern writers on bees agree in recommending a southern aspect as the most proper for this purpose; as a general rule bee-hives should be placed in situations that are little exposed to the wind, and enjoy as much of the influence of the sun as possible: as wind always retards the bees in their works, while the sun's beams invite it to them. Thus, though it be well known, that bees will thrive well in high and windy situations, a low one is obviously always to be preferred. In the vicinity of the apiary, there should constantly be abundance of flowers, from which the bees may collect their wax and honey. Mr. Donner, a late writer on the management of bees, observes, that they were a choice allowed him where to place his bees; it should be in an airy situation, a hollow glen by the side of a rivulet, surrounded with abundance of turnips in blossom in the spring, meadow and clover in summer, and heath in the latter end of autumn and harvest; with a variety of other garden and wild flowers in their seasons. It is not, however, to be understood from this, that bees will not thrive unless they are placed in such an advantageous situation, as the cornfields, he says, he found for bees have thriven amazingly well in places where they were not within reach of any of the above-mentioned flowers: but although they will do well in most situations, fly far for their food, yet they will thrive far better when situated among or near good pasture, and surrounded with plenty of food, and Mr. Keys properly remarks that the limes should be clear from the droppings of trees and the annoyance of dunghills, long grass and weeds, as by these means insects are bred which are not only destructive to the bees, but which greatly retard them in the preparation of honey. See Bili, and Bee-house.

APIASTIUM, in Botany, the name of two different species of plants with different authors; *Dodonaea* being by it the common baum; and *Apuleius* the black broyony.

APIASTER, in Ornithology, a species of *mecops* found in Europe and Asia. The back is ferruginous; abdomen and tail azure green, the two middle tail feathers long; chin yellow. Linn. Gmel.

This is *mecops galileaenus* of Haflequint, *epida cana* molici of Kramer, guipier of Buffon, Scharghegham of Forcell, and common bee-eater of English writers. Its length is about ten inches, of which the bill is an inch and three-quarters. The pervading colours are green and blue, blending into each other; it has a few white feathers at the base of the upper mandible, and on the forehead a space of blue green, behind this another of green, and then succeeds the chiefnt colour, tinged with green, and becoming paler on the back. From the bill to the back of the head is a black stripe that surrounds the eyes. Under parts of the body blue-green, palet on the belly. Lefter wing-coverts dull green, middle one rufous, and the greater ones an intermediate colour between both green and rufous. The legs are of a reddish brown, and the claws blackish.

It takes the name of bee-eater because those insects are its usual food; but it pursues and devours other kinds, as gnats, flies, and cicadas, on the wing, like the swallow; and at times will eat various kinds of seeds. Ray supposes, from its similarity to the king's-fisher, it may possibly feed on fish. Willoughby tells us on the testimony of Belon, "that its singular elegance invites the boys in the island of Candia, which it inhabits, to hunt for it with cieade, as they do for those greater swallow called swifts, after this manner; bending a pin like a hook, and tying it by the head to the end of a thread, they thrill it through a cieade, (as boys bait a hook with a fly), holding the other end of the thread in their hands; the cieade, so fastened, flies neverthelss in the air, which the mecos spying flies after it with all her force; and catching it swallows pin and all, wherewith the is caught." Will. Orn.

APIASTRA, or American king-flyer. See Alcedo hestorbycha.

APIASTRUM, in Botany, a name given by the ancients to two different plants of such contrary form and qualities, that it is unlucky they should have given occasion of confounding them together, as mistakes about them might be of fatal consequence. The one of these plants was the poenous *water-tresfoot*; which they called spinarium, because of its having leaves that somewhat resembled filagge. The other spinarium is the common garden baum, so called by these writers, from their having observed that the bees were very fond of it.

APICALIS, in Entomology, a species of *phalena*, in form and size resembling *phalena* purpuralis. It is a native of South America, and its specific character is, according to Fabricius, wings deep yellow, with a brown streak, apex oblique purple, with a yellow spot and two white dots on the wings. In the Linnean arrangement, this insect belongs to the palaet feection of the *phalena* genus; Fabricius places it with the geometry.

APICE, in Geography, a town of Italy, in the kingdom of Naples, and Principe Citra; seven miles east-south-east of Benevento.

APICES, SUMMITS, in Botany, the same with ANTHouses.

APICILLIA, in Ancient Geography, a town of Italy, at some distance east of Concordia, in Carca.

APICUS, in Biography, a name rendered infamous by the gluttony and epicureism of three persons at Rome, to whom it belonged. The most notorious of these lived under Titus; and he is recorded as the inventor of several new sauces and delicacies, and as having kept, as it were, a school of gluttony at Rome. Senece and Martial inform us, that he equipped away in the gratifications of the table an hundred million of sesterces, which, computed by Mr. Raper's rule for Imperial money (see Sesterce), amounts to about 8,750,001 l. sterling; and when he found, that, after payment of his debts, he should have but a tenth part of this sum, he poisoned himself for fear of starving. Pliny describes him, in reference to some of the dishes of his invention, as "neptum omnium altissimum gurges," i.e. the deep well or whirlpool of all spendthrifts. Athenæus (Deipnos, lib. iv. p. 168) mentions another Apicus of similar celebrity, who lived about the year of Rome 660, and was the cause of the banishment of Rutulus. The third Apicus lived under Trajan; and having a secret for preserving oysters, he sent some perfectly fresh to the emperor as far as Parthia. A work "De Re culinaria," is extant under the name of Caelius or Caelius Apicus, which is supposed to have been written at a later period. Cretier's Rom. Emp. vol. ii. p. 227 Gen. Diet.

APICUM, in Antiquity, a kind of thread or fillet which the flamen wore, in the heat of summer, in lieu of the apex.

Peius speaks of the apicum as a cover for the apex; but the pallece seems to be corrupt.

APIDANUS, in Entomology, a species of *papilio* found in Surinam. The wings are tailed, blue; the lower ones, beneath brown, variegated with blue; a double golden-coloured spot in the anal angle. Fabricius and Gmelin. Obi. In the Fabianic system it belongs to the hesperia genus; in that of Linnaeus and Gmelin, it stands in the papilio genus. (Section Pleb. rural.) The wings are edged with black and have a ferruginous spot at the base on the under side.

Vol. II.
APIDANUS, Apis, in Geography, a river of European Turkey, which runs into the Pansus, near Larissa.

APICUS, in Entomology, a species of musca, found in Germany. It is hairy and black; thorax at the base, and legs red; the abdomen yellow; tail whitish. Crotch. Blanders. Paper-horn, gibbons, found in decayed trees. Old. Thi belongs to the section that has the hair of the abdomen black. There is likewise another insect in the same section that is called by some; it inhabits Germany; is downy; thorax black with white dots and lines; abdomen yellow with black spots.

APICUS, is also a species of sphinx, in the Linnean style, and so on in that of Linnaeus. The wings are two spots, albinus yellow with black spots; thorax black, with two yellow spots on each side. Lin. Fab. It lies in the leaf-meat in the nicks of willow trees. This is sphinx heptapla of Scopoli; sphinx erabroniiformis, W. Schnidt; and sphinx epithontum, hornet sphinx, Donov. But. Br. Tom. XX.

APILAS, in Ancient Geography, a river of Macedonia, in Thessalia.

APINA, a town of Italy, in Daunia.

APION, in Biography, a learned grammarian and historian, was born at Oasis in Egypt, about the beginning of the Christian era, and probably derived his name from Apis, the Egyptian deity. The character of Apion, whatever might be his talents or learning, was that of a pedant, who took pains in investigating and ascertaining matters of trifling importance. Accordingly he took infinite pains, and had even recourse to magic, in order to discover the country and family of Homer. He valued himself on having discovered that the two first letters of the Iliad, considered numerically, amounted to 48, and he fancied that the poet had used these letters designedly to express the number of books. Hence he also concludes that the opening of the first poem was thus written. His arrogance and ostentation are justly reprehended by Pliny, when he says (Pref. in Nat. Hist.): "A certain grammarian, named Apion, whom Tiberius called the symbol of the world, but who might more properly be styled the drum of public fame, boasted that he conferred immortality on those to whom he dedicated any of his writings; an arrogant boast which time has refuted; for all the works of Apion are lost; and his name only lives in the writings of others."

Having been admitted to the citizenship of Alexandria, whence he obtained the appellation of Alexandrinus, he was sent to Caligula as chief of the embassy which carried complaints to the emperor against the Jews; and, on the other hand, Philo and several other deputes were committed to justify their conduct. Apion executed his charge with much partiality and rigour, and instead of confining himself to the subject in dispute, preferred charges against the Jews of a foreign nature, which merely tended to exasperate the emperor; accumulating them of refuting to consecrate images to him, and to swear by his name. He also wrote an work with the express purpose of justifying his charges, which Josephus refuted in a direct reply "against Apion," which he also designed as an apology for his Jewish antiquities. He wrote, moreover, a learned treatise: "On the Antiquities of Egypt," in five books, one of which is cited by Tatian. In this work he allotted to largely on the pyramids of Egypt, that Pliny (Nat. Hist. lib. xxxvi. c. 12.) mentions him as a principal authority on this subject. He also wrote: "On the luxury of Apicius;" "On the Roman Tongue;" "On the knowledge of metals;" and on "Universal History." Gen. Dict. Nouv. Dict. Hist.

APIS, in Botany, see Glycine and Euphorbia.
"The industry of these little animals (says an ingenious writer), which is as profitable, as curious in itself, will always continue to excite the admiration of the wiser part of mankind." Swammerdam, Remane, Hagtrom, D'Aubenton, Geoffroy, and others, have written their history with great accuracy. Swammerdam, above all, deserves to be read with the greatest attention. To these may be added the names of several later naturalists, who have bestowed uncommon attention upon their economy and manner of life, as will be more fully noticed in the article APIS, a term by which these creatures are better known to the English reader than that of api.

In this general term it must notwithstanding be observed many creatures are included, which, in the opinion of naturalists, do not belong to the same family, or even genus. This is obvious on the slightest inspection of a few of the species so named; but whether, on the other hand, the characters laid down, by most of those naturalists, for ascertaining the different families and genera, are not rather more capricious than just, deserves consideration. It is certain that no two writers have yet agreed upon the same characters by which they are to be divided into sections, and each seems to have had his own system for their arrangement.

Linnæus, to whom a comparatively small number of species was known, contented himself with dividing them into two families, one including those with smooth bodies, or with only a few hairs upon them, APIS propria dicit, and the other bowlnertiaris hirsutifera, with bodies very hairy. These subdivisions have been since found too vague and inapplicable for a number of later discovered species, and even for those Linnæus had described; for, as Scopoli observes, the mode they make in their flight, and the hair on their bodies, increase so gradually, as to render it uncertain where the first family should terminate, or the second commence: and therefore he divides them in a different manner, into two sections, according to the form of the antennæ, which in some were straight, and in others bent, and forming an angle from the base, antennæ rectæ, and antennæ flexuæ; but he then perceived the insufficiency of his own system, as it would unavoidably exclude some species with which he was well acquainted, and for that reason he afterwards divided them into three distinct genera, viz. eucrea, apiis, and nomada.

Geoffroy, after Scopoli, gives this character of his apiis; L'Abeille, antennes brossées, dont le premier membre est très-long. Ailes inférieures plus courtes. Bouche armée de machoires, avec une trompe membraneuse couchee en defous. Aiguillon simple et en pointe. Ventre attaché au procorit par un pédicule court. Trois petits yeux biffes. Corps velu. And these are divided into two families. Familie 1. Abeilles proprement dites. Corpore villoso. Familie 2: Abeilles—bournons. Corpore hirsutifero. These characters differ only in one exception from the vespa genus of the same author, in which, instead of the body being hairy or downy, it is glabrous.

Dytter divides the apes into two genera, apis and nomada: the first he defines, antennæ rectæ atque articulo primo longiori; os dentibus et rotro flexui fractio; et utrinque pictus rostrum; abdomen thoraci patulo brevi adhesum; aculeus punctarius in abdomen recessus; occuli recticulati ovales integri. And the second, antennæ clavatae vel flexuæ articulis duodecim; os dentibus et rotro procoriato vaginae car- tilagineae circulari; et utrinque; abdomen petiolatum; aculeus punctarius in abdomen recessus; occuli recticulati ovales uniti.

The Fabrician divisions of the apes are these: HEMEEX, HYLAEUS, ANDREAE, APIS, EUCERA, AND NOMADA. The character of his genus APIS is, os linguæ, inflexa, quinquifida; palpi bivittati; antennæ dilatatorum. End. Syll. (Toung inflected, five-ckist: feelers very short; antennæ dilatatorum.)

Gmelin, we think, should rather he commenced than confirmed for the cautious manner in which he has adapted the improvements of the latter writer, to that of his great master, Linnæus; for had he ventured to divide the genera, and destroy the distinctions Linnæus had laid down, instead of endeavoring to reduce the newly discovered species to his arrangement, he would have incurred more blame than he has for avoiding it. Some may perhaps think he has been cautious to a fault, and not made those alterations that are absolutely requisite; the arrangement unquestionably demands some amendment.

Roemer, in his "Genera infectorum Linnæi et Fabricii iconibus illustrata," gives another definition of apis, to which it is objected, he introduces more characters than are needful; some of them belonging only to certain families, are consequently not general distinctions. APIS as maxilius dentatis, atque proboscidibus inflexis, vaginis dubius vivalibus lingua incommunibus. Capite triangulaire, fronte plana, flexuæ. Antenne longae pedata, primo articulo recto, genere longiore, Occp plane, in omni secta. Acelus punctatorius, reconditus, retraitatis, ferretus, feminis et neutra. Tarji quique articulis, primo longitudine tibio, comperto, cilia, transversa fulcato. P. 28.

M. Latreille, about six years since, published a work at Paris, intitled, "Despecs des caractères généraux des insectes, divisé dans un ordre naturel," in which the characters are taken from the antennæ, labium placer, mandibulae, labia, maxilla, tubus, et palpi. The APIS, which, like Fabricius, this writer places between nomada and eucrea, is thus briefly described; APIS, langue de trois pieces. (Organes de la nutrition plus petits dans les males.)

The latest treatise on APIS is that of the Rev. Wm. Kirby, entitled "Monographia Apum Angliae," a book we shall advert to more fully hereafter. It is an attempt to divide into their natural genera and families such species of the Linnæan genus APIS as have been discovered in England; but the introductory and collateral remarks take a wider range. By way of illustration, these include many observations on the class hymenoptera, to which they belong; and a comparative view of the exotic species analogous to those he describes. Mr. Kirby first reviews the several characters of the genera into which different authors have divided apes, and after pointing out imperfections in each, proceeds to offer an arrangement altogether different from either.

After laying these characters of the two genera MELITTA, and APIS, Mr. Kirby proceeds to mention the distinctions which divide them into families; in which his aim, as he observes, has not been so much to fix upon artificial characters,
be no difficulty; and perhaps there can exist but one objection to his mode of arrangement, and that arises from the difficulty in some instances of perceiving them. All his descriptions were taken, as he himself says, from insects viewed under a lens; an advantage no doubt to him in defining these characters with fidelity, but which at once implies that they are minute, and the lamentable errors he points out by that means in the observations of his predecessors on those parts, prove sufficiently they are ambiguous also. Every naturalist will blame Fabricius for having taken his characters too frequently from the mouth, _Insectorum Cetraria_, and other minute and complicated parts; because, except in recent specimens, it is difficult, nay often impossible to ascertain his distinctions of genera and families, without injuring or destroying the very parts he describes, and frequently not then. Mr. Kirby has, we may believe, endeavoured to avoid this error as far as the subject would permit; and we must only regret that in such able hands, some characters less complicated and minute than those sometimes adopted by him, could not have been found for the arrangement of this curious tribe of creatures.

**Apis**, in Geography, a town of Egypt, on the banks of the lake Maricaus, not far south from March. It is mentioned by Herodotus; and Pliny says, it is 62 miles from Parastomus. South of this town, and at some distance from the sea, was a mountain of the same name.

**Apis** was also, according to the Scholiast of Apollonius, a small island near that of Crete.

**Apis**, in Mythology, a symbolical deity, worshipped by the Egyptians in the whole country, and particularly at Memphis. It was an ox, having certain exterior marks, in which animal the soul of the great Osiris was supposed to subsist. This animal was preferred to others, as being the symbol of agriculture, which Osiris had found out, and to the improvement of which he was zealously devoted. He was so famous, that all who visited Egypt had the curiosity to see him, and to render him respect and homage. Alexander conducted his army to Memphis, and according to Arrian, sacrificed to all the gods, and more especially to **Apis**. Pliny says, that when Germanicus was in the camp, he consulted **Apis**; and the same curiosity which induced Augustus to visit Memphis, induced Titus, Adrian, and Septimius Severus, to follow his example. **Apis** was an object of worship, not merely on account of his divinity, but because he was consecrated in a peculiar manner to the sun and moon; that is, to Osiris and Isis. Suidas and Ammianus Marcellinus mention his consecration to the moon, and Porphyry expressly says, that this animal bore the characteristic signs of that celestial luminaries. The marks or characters, by which this sacred bull was distinguished from others of the same species, were, his black colour, a white square mark upon his forehead, the figure of an eagle on his back, a lump under his tongue resembling a beetle, and a white spot in the form of a crescent on his right side. These marks were obviously the contrivance of the priests, who secretly brought up the calf that was intended for the **Apis**. This sacred animal was not produced by the ordinary laws of generation. The Egyptians averted his birth to celestial fire; and, as Plutarch informs us, the priests pretended that the moon diffused a generative influence; and that, as soon as the calf to whom it was imparted took the bull, the conceived an **Apis**. When a calf was produced in these circumstances, and with the appropriate marks, the priests announced to the people the birth of **Apis**. According to, says Zelius (de Anim. lib. xi.), they built a temple to the new god, facing the east, in pursuance of the order of Mercury; and nourished
nourished the young calf with milk for four months. At the close of this period, and at the time of the new moon, the priests repaired to his habitation, and saluted him with the name of Apis. He was then placed in a vessel magnificently decorated, covered with rich tapestry and replete with gold, and conducted to Nilopolis, a city of the Nile, with hymns and perfumes. Here they kept him for 49 days, and suffered only women to visit and examine him. After the inauguration of the god in this city, he was conveyed to Memphis with the same retinue of priests, followed by a great number of boats sumptuously adorned. From this time he became sacred to all the world. He was superbly lodged, and the place where he lay was mythically called “the bed.” The edifice in which he was kept, and which is particularly described by Strabo (lib. xvii.), was situated near the temple of Vulcan; in a court of which he was occasionally presented to gratify the curiosity of strangers; and he might be seen at all times through a window; but it was the office of the priests to produce him to public view. Once a year, say Pliny, Solinus and Ammianus, they presented a heifer to him, which they killed on the same day. This bull, to which supernatural knowledge was ascribed, is said by the priests to have predicted future events by certain signs and motions, which they interpreted according to their own fancy. They say (lib. viii.), that he had two temples called “beds,” which served as an asylum to the people. When they came to consult him, if he entered into one of those, the omen was favourable; but if he passed into the other, unpropitious. He also gave answers to individuals, by taking food from their hands; and Ammianus says, that he refused that which was offered him by Germans; and that this unfortunate victim of the jealousy of Tiberius was soon after poisoned. The worship that was offered to this deity was very solemn. The people assembled to offer sacrifices to him, and oxen were selected for the victims on this occasion. In every part of Egypt feasts were consecrated in honour of him, and particularly in honour of his birth: they were called “Theophania,” the apprehension of God, and lasted seven days. “What festivals!” (says Albinus) “what sacrifices take place in Egypt at the commencement of the inundation! At this time all the people celebrate the birth of Apis. It would be tedious to describe the dances, the rejoicings, the shows, the banquets, to which the Egyptians abandon themselves on this occasion, and impossible to express the intoxication of joy which breaks forth in all the towns of the kingdom.”

During the seven days in which the priests of Memphis celebrate the birth of Apis” (says Ammianus), “the crocodiles forget their natural ferocity, become gentle, and do no injury.” This sacred bull, however honoured, had a fixed term assigned to his life; at the termination of 25 years, the priests drowned him in the Nile; and as Pliny says, in the fountain of the priests. This number was the product of five and itself; and gave the number of the letters of the Egyptian alphabet, as well as the age of Apis: and this number marked a period of the sun and moon, to which luminaries the bull was consecrated. Hence it has been inferred, that Apis was the tutelary divinity of the cultivated form given to the solar year, which was to consist invariably of 365 days, and of the cycle of 25 years, discovered at the same time. “Nor can it be doubted,” says Savary (Letters, vol. ii. p. 472.), “that he had a marked relation to the dwelling of the Nile, for it is testified by a great number of historians. The new moon which followed the summer solstice was the aera of this phenomenon.” The crescent on the right side of Apis indicated, according to Albinus, the commencement of the inundation. “If Apis,” continues Savary, “possessed the characteristic signs which proved his divine origin, he promised fertility and abundance of the fruits of the earth. It seems demonstrable, therefore, that this sacred bull, the guardian of the solar year of 365 days, was also regarded as the genius who presided over the overflowing of the river. The priests, by fixing the course of his life to 25 years, and by making the initiation of a new Apis conform with the renewal of the period now mentioned, had probably perceived, as the result of long meteorological observations, that this revolution always brought about abundant feasts. Nothing was better calculated to procure a favourable reception of this emblematical divinity from the people, since his birth was a prelude to that of a happy inundation, and of all the treasures of teeming nature.” The name Apis in the Coptic language signifies number, and seems to have referred to the number of cubits which marked the increase of the Nile, that was most advantageous for the fertility of Egypt.

When Apis died, he was embalmed and privately deposited in the subterraneous cavern destined for this purpose. If he died a natural death before the expiration of 25 years, the priests publicly proclaimed his death, and solemnly conveyed his body to the temple of Serapis at Memphis. Strangers were forbidden to approach the temple, and the priests entered it only when Apis was interred. It was then, says Plutarch, that they opened the gates called Λείχε and Κούτυ (of oblivion and lamentation), which are said to have made a harsh and piercing sound. On occasion of the death of Apis, Egypt conferred upon the priests of Apis, the right of mourning, and lamentation of those who bewailed it, and the whole country put on mourning. To this purpose Plutarch says, (Eleg. i. 8.)

“Te canit atque pulte facies miratur Olibrin,
Barbara, Memphiten plangere docta bove.”

Lucian also represents this circumstance in his usual pleasanter manner. “When Apis dies, is there any one so enamoured of his long hair as not immediately to cut it off, or to display on his bald head the symptoms of his sorrow?” This distress and mourning continued till the people had obtained another Apis. Darius Hyllapis, being at Memphis on an occasion of this kind, and observing the conformation of the town, offered 400 talents of gold to any one who discovered a new Apis. Polybius, Strat. vii. Jablonki, in his “Pantheon Egyptianum,” and M. Huet, bishop of Avranche, and some others, have endeavoured to prove, though not with much success, that Apis was a symbolical image of the patriarch Joseph, and appointed for the commemoration of him. But the hypothesis, that Apis and his worship were symbolical of the Nile, and the circumstances attending it, seems to be more probable. The particulars that have already recited afford a strong presumption to this purpose. The kind of animal that was selected favours this opinion; for rivers were anciently represented by bulls or oxen. Plutarch says expressly (De Iside & Osiride, Oper. tom. i. p. 66.) that the ox was in Egypt the symbol of the earth. All the mythic phenomena that attended the birth, growth, character, death, and worship of Apis, bore an obvious reference to the agriculture of Egypt, and the fertility occasioned by the inundation of the Nile.

Dr. Bryant apprehends that the name of Apis was an Egyptian term for a father, that it referred to the patriarch Noah, and that the cressent, which was usually marked on the side of the animal, was a representation of the ark. Anc. Mythol. vol. ii. p. 420.

Jablonki (ubi supra) fixes the aera of the consecration of the
the field Apis at the year 1141 before the winter sun of
Grioth; and, by the fire and water, it could be
memorized, under the reign of Theodos, together
with that of Sardus at Alexandria; and his age, a period of
1,500 years for its whole duration.

Aphis is represented on the Greek medals in the form of
a bull, with a face of the lion, the waterer of the
Net, depicted by Marquis to be a symbol of the nation.
On the medals of Adrian and Antoninus Pius, drunk in
Egypt, and on a marble presented in the cabinet of Otho-
bianus, he is dedicated with the emblem on his face.

Aphis in Eudoxus Hyfrus, the son of Phoebus, second
king of Argos, who filled in Egypt, according to the
fables of the Greeks, and made himself so famous, that after
his death he was ranked among the gods, under the name of
Serapis.

APITANI, in Ancient Geography, a people of Arabia
Pelas, according to Pliny.

APITIUS, in Ancient Geography, a people of Arabia
Pelas, according to Pliny.

APITIUM. (p. planks from Alpes, because these
insects are found of it,) in Botany, a genus of plants, including
Joff. 213.

Chis. pennatula, small, natural color of uncut
bells, a general character, cut, general leaflet of fewer
rays than those of the partial; general involucrum small, of one
or more leaflets; partial similar; proper petiole obsolete; cor.
general uniform; filaments almost all frut; petals roundish;
imper, equal; stalk, filaments simple; anthers roundish; pistil.
germ inferior; fieves excel. fiesmus obtuse; fer, none; fruit
ovate, frutate, splitting in two; seeds two, ovate. frutate on
one side, plane on the other. Edit. gen. char. fruit ovate,
frutate; locul. one-leaved; petals equal.—Species 1. A.
pe-o-traphum, common parley, fies leaflets linear; involucrum
minute; the leaflets are round, smooth, frutate. At the
origin of the universal name there is usually one leaflet,
and an involucrum of five or eight short foliages, almost as
large as hairs, at the partial involucrum. Flowers pale yellow,
regular; petals small, long, narrow, acuminate, filiform. It is
a common plant, and generally cultivated for culinary pur-
potes. Linnaeus found it growing wild in Sardinia. The
varieties of parley are a. A. folium, common garden par-ley.
A. A. tippuchum, large root parley. 2. A. glareum, or bud-
lage, or wild celery, fies leaves wedge shaped. This is
also a broad-leafed plant, frutate with a smooth, shining, deeply
furrowed fies; leaves alternate, radical, punctate, terrate
pear, triad, and frutate, shining, smooth, on one axillary
with about fifteen marcal rays; fowers for 4, white; seeds
minute. Il grows in warm, muddy places, in which it is
acid and fresh. Smith's Faw. B. 325. Miller states the
varieties of this plant as follow: 1. A. dulce, upright
celey; 2. A. raphanum, or Swiss parley; 3. A. leucophyllum.
Portuguese parley.

In regard to the medicinal properties of parley, Doctor
Woodville, in his M. Med. Genus, remarks that both the
roots and seeds are directed to be employed by the London
College; the former of which have a fies, a table, ac-
companied with a slight degree of warmth, or strains
resembling that of a: taste, but that the latter are warmer in
taste, and more aromatic than any other part of the plant,
and so must have a considerable degree of bitterness.
In dilutions, three pounds were found to yield above an ounce
of effective oil, a great part of which sunk in the fluid.
They gave out little of the qualities by infusion in water
menstrua, but readily impart all their virtue to rectified
sirups. The roots by dilution in water were aperient, but a very
mild, while a portion of effused oil, not more than an ounce
of the decoction, has the same effect as many unial.

The roots are used to be aromatic and diuretic, and
have been employed in apocryph, to relieve rheumatic
pain, and swellings of limbs. In this way they have
been prescribed by Dr. Calley, without producing any
dangerous side effects, so, by this, he thinks, may for some
hundreds be attributed to the loss of their active matter, which
they formerly possessed.

The bristled leaves have been successfully made use of as
a digestive; to servitio various kinds of tumours. We are
informed that in France, the leaves were used to cure
pains, however, as the above water, that these leaves have been
employed to prove that in some instances it causes epilepsy, or
not at all; it is given to the sick, or to the sick, who are
subject to the disease. It has been found a able to produce inflammation in the
eyes.

Aphis Menziesii. See Pseud.

Aphis petrium and montanium, See Athamanta.

Aphis, Pirusium. See Citrihum.

Aphis in Garden, comprehends parley, celery, and
in:! misleading, which are several species cultivated in the
kitchen-garden. Act. A. petrii um or common parley,
which has two varieties, the common plain-leaved, and
the curled-leaved; the A. leucophyllum, broad-leaved, or large-rooted
parley; the A. dulce, sweet, or common upright celery
of which the following varieties are cultivated: the common
upright, with the hairs of the leaves hollow or solidly
the common upright, with the hair of the leaves solid,
generally known by the names of hollow and solid celery,
the giant upright, the giant upright, with a large body
of thick hollow leaf-lances, the A. raphanum, or turpin-
seeding celery or celeriac, and the A. glareum, or
broad-leaved, or involucrum; all of which are herbaceous plants, of
hardy growth, and of the biennial tribe, or for years duration,
producing only leaves the first year, but retaining perfection for
the plant on all other domestic Uses. The second spring
they, however, shoot up flats, flower, and perfect their
seed; and in autumn perish both in root and brunch, so that
they can continue useful only one year, and therefore of little
supply must be raised annually from seed. Some of the species may
however, be deemed annual, as it grows very easily, they
run to seed the same year, especially in the celery kind.

Of the A. petrii um, or common parley, both the var-
eties are in use; but it is remarked by the authors of
the Universal Gardener, that the plane-leaved flat is most
commonly cultivated, though many prefer the curled
kind, because its leaves are more easily distinguished from
the almond, or to its parley, a sort of hemlock, and a pu-

Wild garlic is a plant, which, while young, has great resemblance to the common plane-leaved parley. Besides, the
curled parley, from its having lacerate and thicker leaves, and
being curiously infested and curled, so as to tew full and
double, makes a better appearance in its growth, and is
more
more esteemed by cooks for the purpose of garnishing dishes, &c. It may, however, be necessary to remark, that this fort, as being only a variety, is liable to degenerate to the common plane fort, unless particular care be taken to save the seed always from the perfect, full curled plants. Both the varieties are propagated by sowing grains annually in spring, where the plants are to remain; but the plants, as has been seen, are biennials, rising from seed sown in March, April, and May.

The proper season for sowing the different varieties, is any time from the beginning of February until the beginning of May; but they will grow at almost any time of the year; however, in order to have the plants come into use by the time the old plants begin to run, it is necessary to sow half about the time just mentioned. The best method for which is in dills, as it will be thus not only more conveniently kept clean and more easily gathered, but have a nearer appearance. Where only a sufficiency is required for the supply of a family, it may be sown in single drills along the edges of the borders, or the quarters of the kitchen-garden, the plants thus serving the double purpose of utility and edging; but for the supply of markets, gardeners generally sow it in large plots, either in broad drills, raking it in, or in shallow drills, at eight or nine inches distance from each other, trimming the earth evenly over it, near half an inch deep, and then lightly raking the surface, to give it a degree of smoothness. Seed of this kind is extremely slow in vegetating, sometimes not appearing in lea before a month or five weeks from the period of its being sown.

The chief culture the plants require while growing, is to be kept clean from weeds; and when they grow fuller than wanted, which is often the case in private gardens, to be cut down close. This should be constantly practiced in autumn, as about Michaelmas, or in sufficient time for the plants to recover before the winter sets in.

In order to have the seed, some rows of the one year old plants must be permitted to stand, and shoot up their stalks, which is done in May and June following, the seed being ripened in July and August.

A. latifolia, or broad-leaved parsley. The propagation of this species is also by seed sown annually in February, March, or April, where the plants are to remain. For this purpose, a spot of rich earth, in an open exposure, is to be preferred; the seed being broadcast, and raked in, the plants generally appearing in about a month after being sown, and in May or June they require to be thinned and cleared from weeds, which may be performed either by hand or hoe, but the latter is more eligible, as it will fill and loosen the surface of the earth, which may be beneficial to the plants, cutting them out to about six inches distance from each other.

In the latter part of July, the roots will mostly have attained a fixe proper size, and may be drawn occasionally; but they seldom increase their full growth, till about Michaelmas. This is sometimes called Edible parsley, probably from its being more cultivated in that place.

It is easily cultivated and esteemed for its large roots, which are white and carrot-shaped, being long, taper, and of downward growth, often attaining the size and appearance of small muddling parsnips; they boil exceedingly tender and digestible, are very wholesome, and may be used in soup or broths, or to eat like carrots and parsnips, or as sauce to hot meat.

A. dulce, or the common celery. The method of propagation in all the varieties of this fort, is by forcing the seed in the spring, and when the plants have attained six or eight inches in height, transplanting them into trenches in the manner described below, in order to be earthed up on each side as they advance in growth, and have their stalks blanched or whitened, so as to render them crisp and tender.

As plants of this kind continue useful only one year, a fresh supply must be raised annually, as has been already observed.

The proper periods of sowing, if a regular succession of plants be required for eight or nine months in the year, are at two or three different times from the beginning of March till the middle of May. As, for example, if it is intended to have celery for use as early as possible in the summer, as in July, some seed must be sown the first week in March on a warm border; or to bring the plants more forward, in a sheltered hot bed; or if it be necessary to have it still more early, the middle of February; but as the plants of these very early sowings are apt to pipe or run for seed the same year, before they attain their perfection, a few only need be raised. But for the principal crops, to come in for autumn and winter, as in August or September, and continue in perfection till Christmas or spring, the seed may be sown about the middle of or towards the latter end of March, or in the first or second week in April, in a bed of natural earth in an open exposure; and a little more of the latter end of the last named month, or in the first or second week in May, to furnish a still later crop to come in the beginning of November, and continue good until the March or April following; and to have a late crop principally for the spring, it will be necessary that a small portion be sown at the latter end of May, and by putting out some of the plants in shallow trenches about Michaelmas, and in October and November, they may be fit for use in March and April, and continue without running till the middle or latter end of the May following.

As it has been observed, that the early crop may either be sown upon a warm border of natural earth, or upon a flag or hot-bed, it may be observed, that by the latter practice, the plants may be so forwarded, as to be fit to transplant into trenches sooner by three weeks or a month, than those raised in the natural ground; a small bed of about eighteen or twenty inches deep of dung will be sufficient, which may be sheltered either with a small frame, or occasionally with mats supported on arches made with sticks; upon this five or six inches of rich light earth should be laid, the seed being then sown on the surface, and covered near a quarter of an inch deep; when the plants appear, the full art must be freely admitted in warm days, but sheltered with a glass or mats in the nights until they acquire some strength, frequent light waterings being occasionally given; when the plants of either of the sowings are two inches high, some of the stoutest should be pricked out into a bed of rich earth, in a sheltered situation, three inches apart, or to bring them still more forward, upon a tender hot bed, and occasionally sheltered with mats, giving them water, and occasionally shade, till they have firm roots; and if rain do not fall, refreshing them frequently with water as may be necessary.

As those that were thus pricked out will, in May or the beginning of June, be generally five or six inches high, some of the strongest of them should be transplanted into trenches in order to their being blanched. In regard to forcing the main and later crops at four times as have been recommended, make choice of a spot of rich light earth, in an open situation, and let it be neatly dug and divided into one or more beds; but one bed is generally sufficient for private use, which should be three feet and a half wide, the trench being made level and firm. The lead may then either be sown on the surface, and raked in lightly, or the surface first raked smooth, the lead the town, earth being sifted over it near a quarter of an inch thick; or the bed being first raked smooth as above, the earth may be sifted with the back
back of a rake from off the surface a quarter of an inch deep to the seed, then be covered by the rake turned the right way. the earth drawn upon the bed again with a kind of or, so that it may spread and cover it equally.

When the plants of these sowings are come up, they should be frequently watered in dry weather, especially when they are young. And when about three or four inches high, the feed-bed should be thinned by picking out a pair of the stronger into an open rich spot, properly dug and divided into beds three feet and a half wide, taking an opportunity, if possible, of mild weather, and in rows six inches asunder, and three or four inches distant in each row, water being given, and if dry weather succeeds, occasionally repeated till they strike fresh root; in this bed, they are to remain a month or five or six weeks, to acquire due strength previous to their being transplanted into trenches, in order for blanching. The same feed-bed will frequently afford three, four, or more different sowings, to prick out in this way, by oberving to thin out the largest plants regularly each time, before they draw each other weak by close blanking; and by thus picking them in beds till the ground intended for the trenches is at liberty, they will be advancing in their growth, and be considerabily better prepared for setting out, than such as have remained all the time in the feed-bed.

The next business is that of transplanting them into the trenches for the purpose of blanching; the season for which is occasionally from the middle of May till the latter end of October, or even middle of November, according to the forwardness of the plants, the time they are required for use, and the period it is intended they shall continue. When the plants are from about five to ten or twelve inches high, as has been observed, they are of a proper size for transplanting into the trenches.

It is necessary always to make at least three different transplantations, allowing the distance of three or four weeks between each time of planting; but when the plants are required for use as early in summer as possible, and to be continued in spring as late as the middle or latter end of May, it is eligible to plant five, or even six different crops, allowing the distance of time abovementioned between the planting of each separate crop; observing that the crops intended principally for spring use be of the latest born plants and not planted in the trenches until September, October, and beginning of November.

In making the trenches, choose a dry rich spot of ground, in an open quarter, and with a line and spade mark and chop out the trenches crossways of the piece of ground, each trench twelve inches, or about one spade breath wide, and allow a space of three feet between trench and trench, that there may be sufficient scope to have a due portion of mould to earth up the plants to a proper height; the trenches being marked in this manner, proceed to dig them out in order to form the furrow for the reception of the plants, which should be done lengthways to the depth of a moderate spade, or about six or eight inches for the early crops; but the later ones do not require so much, without taking out any slopings, laying the spits of earth alternately to the right and left in the spaces between, levelling it neatly, and beating up the edges firm and straight; then let the bottom be properly dug and levelled, or if the ground be poor, first spread therein two or three inches depth of rotten dung, and dig it in four or five inches deep.

The trenches being thus prepared, a quantity of the beet plants must be drawn, the ends of their roots, and the tops of the fraggling leaves trimmed off; then a row planted exactly along the middle of each trench, placing the plants four or five inches distant, a good watering being immediately given out of a pot with the rule on, and which, if flowers do not fall, should be repeated every other evening at least, till the plants have taken fresh root.

Only a few of the very early plants, as those sown in February, or early in March, should be planted out at a time, as they are apt to pipe almoh as soon as they are blanched, or sometimes before it is fully effect.

When it happens that the plants intended to be planted in autumn, for the late crops, have, by the allotted compartment of ground for their reception not being vacant, been put, and the seed-bed almost prepared, it may be proper to retard their running up tall, in order to obtain them of robust growth against October and November, for planting them in shallow trenches; to effect this, it will be advisable, in August or the beginning of September, either to cut them down low to shoot out again, or transplant them into rows nine inches distant.

Another method of planting and making the trenches, but which is less in use, is with a line and spade to cut or mark out a bed, or rather trench, six feet wide, crossways the ground; then to begin at one end, and proceed to dig out a cavity the above width and length, one spade deep, laying the spits of earth to the right and left, in a ridge along each side of the cavity or trench, beating it up in front that it may not slip down; and when the trench is dug, to level and level the bottom; and where dung is necessary, to add it, digging it into the bottom four or five inches deep. When more than one of such trenches are to be made, a clear space of six feet must be allowed between trench and trench, to contain the earth dug out, and to have a sufficiency to bring up to the plants afterwards.

The trenches being thus prepared, the plants are to be trimmed as before directed, and then planted, observing that they are here to be planted in rows crossways the trench, about a foot asunder, and in other respects as in the other method.

The plants of this sort, in order to whiten or blanch the stalks, and render them crisp, tender, and of a grateful flavour, require to be earthed up as they rise in height on each side, for which purpose the earth that was dug out of the trenches is to be employed; and when that is expended, that in the spaces between them must be dug out, broken, and applied repeatedly as the plants advance in growth, in this way blanching them from ten or twelve to fifteen or eighteen inches or more in height.

The proper time to begin this work, is when the plants are about ten or twelve inches high, which should be repeated every fortnight or three weeks, as may be necessary, during their principal growth. In performing the work, regard must be had to break the earth, where lumpy, moderately small with the spade; or the first and second earthing may be performed with a large hoe, but afterwards in the principal earthing a spade is to be preferred, and care taken to trim the earth up lightly to the plants, so as to break the flaks of the leaves, or force the mould into their hearts. The first time, they may be earthed three, four, or five inches, according to the size and height of the plants, observing the same rule at each time, till they are by degrees earthed to twelve inches, but fifteen or twenty are better. By this means, if the soil be rich, those of the main crop that have been planted out in the end of June or in July, sometimes make such progress, that by September or October they may be blanched eighteen inches, or near two feet in length. These earthings are to be continued to the later crops.
crps occasionally, until Christmas, or as long as the plants continue to grow in height during the winter, at which seas, as about November and December, it is proper to earth them up, and to secure their tops from hard frost sitting in, which often destroys such plants as are out of the ground, and which, if of considerable duration, would occasion the decay of most of the other parts that are within the earth.

But in the late crops, planted in October or November for spring use, each plant as are of small or low growth, will probably require but little or no earthing till February or March, at which time they should be earthed up moderately, according to their growth, to have them for use in April and May, when the general crops are finished.

In earthing up the plants that are planted in the latter of the above methods, it will be necessary to trim the earth in well between the rows, taking it equally from the different sides; in doing which, it is of advantage, where the plants have attained a large growth, to be furnished with a couple of thin boards, fix feet long; which are to be used at the time of earthing, to open the spaces between the rows of plants, to keep the banks and leaves up close just till the earth is put in, placing them close to the plants, and then trimming in the earth between them; and when one space is thus earthed, drawing out the boards, and placing them in the next.

The different earthings should always, if possible, be performed when the plants are dry, as where this circumstance is not attended to, they are apt to become spotted and canker.

Some of the first earthed-up plants, where they have been planted in the trenches in May, or the beginning of June, will generally be fit to take up in July; for when such early plants are blanched five or six inches in length, it is time to begin to take them up, as they rarely continue long before they begin to pipe and become useless.

But the plants of the main crop will seldom be blanched any considerable length, till the middle or latter end of August, and beginning of September, and will not have acquired their full perfection until October, as observed above. However, where there is much demand for the plants, you may begin to take some up, when they are blanched six or seven inches, as, if properly followed with earthing, they will be daily increasing in length in the blanched part.

In winter, at the approach of very severe frost, it may sometimes be of advantage to cover some of the rows of the main crop with dry long litter to save the plants, and prevent the ground being frozen hard, that the plants may be readily dug up when wanted. And when a hard frost is expected, a quantity of the plants may be taken up for use, and laid in some dry earth in a shed, or other sheltered place.

**A. rapifera**, or the turnip-rooted celeriac. This is likewise propagated by seeds, sown in an open rich spot in March or April, as directed for the common sort; and when the plants are an inch or two high, they are to be thinned to three inches; and at four, five, or six inches in height, transplanted into shallow trenches; previously to which the ground must be dug all over one spade deep, and drills three inches deep and eighteen inches wide, made with a hoe, in which the plants are to be set six inches distant.

When they are advanced nine or ten inches in growth, observe the progress of the roots, and if they have acquired a tolerable size, draw earth up to each side of the row of plants, three or four inches high, which, being well watered, will be sufficient to improve the roots. They are generally fit to take up for use in a fortnight or three weeks afterwards.

**APR**

A. *gervicolus*, or smallage. This is a plant of the weedy kind, and but seldom cultivated in the garden. If wanted, it may, however, be easily raised in the spring.

**APVIRUS**, in Ornithology, a species of the falco genus. The head is black; feet half marked and yellow; head grey; tail banded with crimson colour, and white at the tip. Linn.

This is a very variable bird in respect of its colour, and scarcely any two authors agree in describing it. The length of one specimen is twenty-three inches; weight thirty-eight ounces. The bill and cere black; irides golden yellow; head n-coloured; neck, back, angular, and wings covert deep brown; the chin nearly white streaked with narrow brown lines; some part of the neck rufous, breast and belly barred with transverse regular bars of rufous brown and white; each feather being white with two bars across it. Tail brown, with two double bars, one in the middle and the other near the end. Legs short, yellow, claws black. Lath. Gen. Syn.

One described in the British Zoology about the same size had the chin white, breast and belly of the same colour, marked with dusky spots, pointing downwards; and the tail long, of a dull brown colour, marked with three broad dusky bars, between each of which were two or three of the same colour, but narrower. Another, supposed to be the female, being shot on the moor, is noticed in the supplement of the folio Zoology of Pennant; it was entirely of a deep brown, but had much the same marks on the wings and tail as the male; and the head was tinged with ash colour. Linnaeus says, the tail has only one circular band across; the side tail feathers are banded with white, and spotted with brown, according to Briflon; and Albin's bird had no bars on the tail.

The honey-buzzard inhabits various parts of the continent of Europe, but is no where common except in the open parts of Ruffia and Siberia; is seen as far north as Sondor in Norway; in England is scarcely ever met with.

It feeds on larvae of bees and wasps, and on frogs and lizards; the eggs are of a deep red brown, with ferruginous blotches. This is the subgeneric *APVIRUS* of Ray, la bonte de Briflon and Buffon, le gisant on borde de Billon, and honey-buzzard of Albin. Pennant, Brit. Zool. and Donovan, Brit. Birds, 5, 50.

**APLANTATIC**, formed of of *s. prin. and etiax, ota*, in Optics, a term applied by Dr. Blair, professor of practical astronomy in the university of Edinburgh, to that kind of refraction discovered by himself, which entirely corrects the aberration of the rays of light, and the colour depending upon it, in contradistinction to the word aplanatic, which has been appropriated to that refraction, in which there is only a partial correction of colour. After a variety of researches and experiments, detailed at large in a paper read before the Royal Society at Edinburgh, in 1791, and published in the third volume of their Transactions, he discovered a mixture of solutions of ammoniacal and mercurial salts, and also some other substances, which produced dispersions proportional to that of glasses, with respect to the different colours; and he proceeded to construct a compound lens, consisting of a semi-convex one of crown glasses, with its flat side towards the object, and a meniscus of the same materials, with its convex side in the same direction, and its flatter concave next to the eye; and the interval between these lenses he filled with a solution of antimony in a certain proportion of muratic acid. The lens, thus artificially adopted, did not manifest the slightest vestige of an extraneous colour. His discovery is undoubtedly valuable and important, and may lead to a very useful improvement in the construction of telescopes.

Dr. Blair obtained a patent for his invention of a method of
improving the refracting telescopes, and other optical instruments, in 1791. See Abbreviation and Telescope.

APLHEBOL, in Geography, a town of Germany, in the circle of Weilphalia and county of Mark, three miles south from Dortmund.

APLOGA, a district of the kingdom of Wikkad, on the Slave coast in Africa, where is held a regular market for slaves, cows, sheep, goats, birds, apes, cloth, cotton, callicose, silk, fluits, china, mercury, gold in dust and ingots, &c.

A-PLOMB is a very expressive French term in music and dancing, for exactness and precision in time, or measure. To say that a vocal or instrumental performer has an exact \(\text{\textit{d'aplomb}}\) is pronouncing him or her to be a good timist. So a dancer who \(\text{\textit{dances on his feet precisely at the beginning of a bar, or the end of a period or movement, is said to have a good \text{\textit{d'aplomb}}—the highest praise that can be given him. A leader on the violin, who in } \text{\textit{tempo rubato}} \text{ (borrows time which he never pays), drags a note beyond its due length, and arrives not at the beginning of a bar at the same instant as the rest of the band, has no \text{\textit{d'aplomb}}. It seems as if the old refinement of \text{\textit{tempo rubato}}, and the new one of \text{\textit{retractando}}, could only be validly practiced in folos, or solo passages, as great confusion must arise in an orchestra by the recantando and accelerations of an individual performer, if the rest are not appraised of the leader's intention.}

A-PLUDE (the name of the chaff, &c. that dies off from grain), in Botany, a plant of the genus kind, Lin. gen. 1147. Schreib. 1751. Gerin. t. 1 5. Jeff. 32. Chaff, pellima monoxe; natural order of Gramina.

Generic Character. Calyx, involucr-common univalve; valve ovate, concave, terminated by a very short point or leaflet, two-flowered; the inferior flower fertile, short at the base, ovate, truncate, hollow down into the two opposite foot-flats, which are glamous, flat, vertical; on one of these is placed the superior flower, on the other a very short rudiment of a flower; inferior flower hermaphrodite, almost wholly concealed between the foot-flats; calyx involucr-proper univalve; valve-linedolate, compressed, rigid, double-toothed at the tip, smooth, embracing the flower with its margins beneath, opposite to the common involucr; glume one-flowered, two-valved; valves membranaceous; transparent, shorter than the involucr; the exterior navel, gibbous on the back, keeled, contracted towards the tip, acuminate; the interior ventricose lanceolate that sharp, flattened; corolla globose bivalve, membranaceous, very thin; transparent; valve-exterior navicular, compressed, smooth, greenish, gibbous on the back, biform, acute, awned above the tip, concealed within the exterior valve of the calyx; the interior lanceolate, flat, acute, dilated to each other at each margin, the exterior rather longer; nectary very small, twolayered, truncate-rounded, greenish; filaments three, capillary; anther linear, biform on each end; stigmas, green oblong, small; stigmas two, papilliform, erect, ligneous oblong, vilose, protruding on each side of the flower; perigynium none; corolla cherishes the seed, which is ovate-oblong, compressed and smooth; flower-superior small; calyx, glume two-flowered, two-valved; valves lanceolate, broadish, flat, sharp, nervously, nearly equal: one fleshy female, the other male or neuter; corolla of the male a bivalve glume; valves membranaceous, greenish; the exterior ventricose, cornered, pointed: the interior lanceolate, narrower, shorter, obtuse; of the male, glume bivalve; valves lanceolate, membranaceous, greenish, the exterior rather ventricose, sharp; the interior narrower, shorter; nectary in both as in the inferior flower, and into the stamens of the male, and pubescence of the female flowers. It has been observed, that sometimes each flower of the superior flower is male.

Essential generic character. Calyx, glume common, twice; female flower bivalve, male peduncled; male, calyx none; corolla bivalve; \(\text{\textit{femina thre-}}\); female calyx none; corolla bivalve; filey one; food one, covered.

Species. 1. A. nucalis, leaves lanceolate, all the flowers awl-like; culms very long, weak, smooth, awned at the joints; leaves long, flat, narrowed at the base into a petiole; palisade small, lateral; a native of India. 2. A. ariflata, leaves lanceolate, male flowers awl-like, except one at the end, which is awned and fertile; culms a foot long, inflected; leaves rough, petiolate; racemes axillary; flowers in threes: a native of India. 3. A. argentea, mountain-reed-grass, leaves ovate, flowers similar to those of the ariflata; culms from one to two feet in height, bifoliate, pointed; leaves subphaloe, acute, nerves, rectulicate, smooth; panicle spreading, few-flowered; a native of Jamaica, where it was found by Brown. See his Jam. 341. t. 4. f. 3. 4. A. digitata, spikes dioctot; flowers all pointing in the same direction; a native East-Indian grass, described by Thunberg.

APLUSTRE, or ASPHALT, in the Ancient Naval Architecture, a carved tablet, somewhat after the manner of a shield, fixed by way of decoration to the extremity of a ship's head. This ornament was in the stern, and sometimes on the prow, and from it was erected a flag or pole, with a ribbon or banner on the top. It belonged to the Greek asphalites.

The asphalites, or bucks of ships, were sometimes also called aphisites.

But what think that the asphalite answered to what we call the flag, or ensign.

APYNOEA, from \(\text{\textit{ap}}\) and \(\text{\textit{nous}}\), to breathe, in Medicines, denotes a want of breath, or loss of respiration.

In this sense, the word was used among the ancients, not as importing a total privation of breath, which would be another name for death; but to denote the respiration very small and slow, or as to seem quite gone, as is the case in suffocation of the meara, apoplexies, lycocenes, lethargies, &c.

APOBATEN, in Antiquity, the name given to those athletes, who were also denominated \(\text{\textit{parabat}}\). 4. APOBATAN, in Ancient Geography, the metropolis of Macedonia, more properly and more generally called Edessa.

APOBATITION, from \(\text{\textit{ap}}\) and \(\text{\textit{baton}}\), to depart, among the \(\text{\textit{A}n}o\)ts, a farewell speech or poem, made by a person on his departure out of his country, or some other place where he had been kindly received and entertained.

Such is that of \(\text{\textit{A}n}o\)ts to Herodius and Andromache, \(\text{\textit{An}}\); ii. iii. The oblation slain is opposed to the epibatides.

APOBATIVO, in Ancient Geography, a place of Peloponnese, on the coast of the Argus, west of the gulf, near Corinth and Larus; where, according to tradition, Danaus and his sons landed on the shore of Argos; whence the name.

APOBATIRHA, a place in the Thracian Chersonesus, where the troops of Xerxes landed in their passage from Asia to Europe.

APOBATUS, in Antiquity, a kind of little bridges, or rails, joining the land to ships, or one ship to another.

APOPHEI, in Botany, a name given by the natives of Guinea to a species of corn-marygold, called by Petiver \(\text{\textit{citrisinonanum apophi}}\) Guinea corn longis amygdi, from its having long and narrow leaves, and no stalk to support the flower. The people of the place use this in the small-pox, and other eruptive fevers, boiled in water, and the liquor drank warm. Phil. Trans. N. 232.

APOPOMIOI, from \(\text{\textit{ap}}\) and \(\text{\textit{mioi}}\), below, and \(\text{\textit{aspos}}\), altar, in Antiquity, sacrifices offered on the bare earth, without altars.

APOCALYPTA, formed of \(\text{\textit{apokalypys}}\), I reveal; \(\text{\textit{katapsimia}}\), the name of the last book in the canon of Scripture.
The first question that occurs in our examination of this book relates to its authenticity. This is a subject on which many ancient and modern writers have differed; and it will be sufficient to give a brief view of the evidence which testimony affords concerning it. It has been alleged, that there are evident allusions to this book in the Shepherd of Hermas, a piece that was written towards the close of the first century; and that it was received by Papias, who flourished about the year 150. Justin Martyr, about the year 140, was well acquainted with this book, and received it as the genuine writing of the apostle John. Among the works of Melito, bishop of Sardis, one of the seven churches of Asia, about the year 177, Eusebius mentions one, intitled, "The Revelation of St. John;" and it is probable, that he ascribed this book to the apocryphal name, and esteemed it of canonical authority. It appears to have been referred to by the Martyrs at Lyons, A.D. 177. Irenaeus, bishop of Lyons, about 178, who in his youth was acquainted with Polycarp, often quotes this book as "The Revelation of John the Disciple of the Lord;" and he says concerning it, that it was written not long ago, but almost in our age, at the end of the reign of Domitian. From the writings of Athenagoras, the Testament of the Twelve Patriarchs, and the Clementine recognition, Dr. Lardner has produced single allusions to the Apocalypse, which prove, that the authors of these books were acquainted with it, though they do not warrant the conclusion, that they considered it as the genuine work of St. John the apostle. But it was undoubtedly received, and often cited by Theophilus, bishop of Antioch, about A.D. 181; Clement of Alexandria, who flourished about 194; and Tertullian about the year 200. Eusebius informs us, that Apollonius, who wrote against the Montanists about the year 211, quoted the Revelation. It was received by Hippolytus about the year 220, who wrote a commentary upon it; and about 230, by Origen, who has often cited it, and who seems to have had no doubts about its genuineness. Dionysius, a disciple of Origen, and bishop of Alexandria, about the year 247, or somewhat later, wrote a book against the Millenarians, in which he allows the Revelation to have been written by John, a holy and divinely inspired man, who was, as he supposes, not John the apostle, but an elder who also lived at Ephesus. About the year 240, and before, it was received by Nepos, an Egyptian bishop, and by many others in that country, and held in great reputation. After the age of Dionysius, the number of ecclesiastical writers who quote the Apocalypse, as a divine work, begins to increase. According to Lardner, it was received and frequently quoted by Cyprian, bishop of Carthage, about 248; and by the church of Rome in his time, by Novatus, A.D. 254; and his followers; by Commodian, A.D. 270; by Victorinus, who wrote a commentary upon it; and by Methodius, A.D. 290; probably by the Manichaens, though this is disputed by Beaufobre; by Arnobius, and Laetantius, A.D. 306; by the Donatists, and by the Arians, in the fourth century. In the time of Eusebius, about the year 315, it was not received by all, and therefore he reckons it among contradicted books, observing that it was rejected by some, but by others referred to the class of books universally received. He seems to have hesitated about it; for he neither pronounced it to a forgery, nor ascribed it to St. John the apostle. He says, however, that the Revelation was seen by John the elder, if not by John the apostle. Dr. Lardner observes, that the critical argument of Dionysius of Alexandria had great weight with him, and with others of that time. The Revelation was received by Athanasius, bishop of Alexandria, A.D. 325; by Epiphanius, bishop of Cyprus, A.D. 378; by Gregory Nazianzen, A.D. 370, as some have inferred from his citing it, but others have disputed his acknowledgment of it; by Jerome, A.D. 392, who admitted it after a more cautious examination than was instituted by some of his predecessors, and who appealed in support of its authenticity to ancient testimonies; by Rufinus, A.D. 397; and by Augustine, A.D. 405. The authority of this father was so great, not only in the African church, but in the Latin church in general, that his reception of the Apocalypse contributed very much to its almost universal admission both in Africa and in the west of Europe. During his time, in the year 397, was held the third council of Carthage; and this was the first council in which this book was pronounced canonical. Innocent I. declared pope in 402, declared likewise, that this book, from which his successors were to be proved the Antichrist, was canonical. It is in the catalogue of Dionysius the Areopagite, and in Greek manuscripts, such as the Codex Reucliini, Alexandrinus, and Seidelianus. It was received by Sulpicius Severus about 401, and declared to be a genuine and divine work, in the fourth council of Toledo, A.D. 633, for this curious reason, because it had been pronounced such by several councils and several popes, and the decrees of this council annuls all doubts of its authenticity in the Latin church. Andrew bishop of Cæsarea in Cappadocia, at the end of the fifth century, and Arius bishop of the same place in the fifth century, wrote commentaries upon it. In the Syrian church, which comprehended not only all the Chriftians who resided in Syria, Affyria, and Mesopotamia, but likewise all those who were dispersed in Arabia, Persia, Tartary, and China, as well as in the Greek and Latin churches, the book of Revelation was acknowledged as a divine work. To this purpose Ephrem the Syrian, about A.D. 370, not only quoted it, but received it as a divine book; for he says concerning it, "John saw in revelation a great and wonderful book which God had written, and which was sealed with seven seals." In the seventh century, a new and very literal translation was made of the Apocalypse, and taken into the Philoxenian version, which was chiefly used by the Monophysites, so that they did not reject it. In the latter end of the same century, and the beginning of the next, lived Jacob the Monophysite, bishop of Edessa, who has quoted the Apocalypse in his commentary on Gen. xlix. 17. That the Syrians of the Nestorian party likewise received this book in the eighth century, appears from an ancient monument which was dug up at Sanchuan, in the Chinefe province of Xeni, in the year 165. On this monument, which appears to have been erected A.D. 751, at which period, as well as during some centuries later, there was a very numerous colony of Nestorian Syrians, in China, mention is made of the New Testament as containing 27 books, so that the Apocalypse must have been included; but it is needless to pursue the evidence to a wider extent, or to a later period. Having cited a great number of very respectable authorities in favour of the genuineness of the Apocalypse, it may not be improper, for affailing the judgment of the reader, to present some of the testimonies that have been urged against it. The most ancient evidence on this side of the question, is that of Ignatius, A.D. 107, who wrote epistles to the churches of Ephesus, Smyrna, and Philadelphia; three of these that are mentioned in the book of Revelation; and who reminds the Ephesians of the praises bellowed upon them by St. Paul, and yet takes no notice of the praises which, according to Rev. ii. 1—7, 8—11, iii. 7—12, their bishops had received from Christ himself. Hence it has been in-
ferred, either that the Apocalypse was unknown to Ignatius, or if known, not believed by him to be genuine; and it was a genuine work of St. John the apostle, it could not have remained unknown to him. The old Syriac translator, who lived in the first century, did not translate the Apocalypse; and hence it is probable, that he either knew nothing of it, or did not believe it to be genuine. The testimony of Papias in its favour is dubious; for it is urged, that as he was the friend of the faith of the Millennium, he would naturally have recorded the 20th chapter of this book, if he had been acquainted with it, in support of his opinion. In the second century it was acknowledged and cited by many eminent persons; nevertheless in this century there existed a sect, called the Alogi, who were acquainted with the Apocalypse, and yet denied it to be genuine. One of their principal and most plausible objections against the authority of this book is founded on the circumstance recorded in ch. ii. 23-25, in which the fourth epistle is directed to be addressed to the aged of the church at Thyatira; whereas, they affirm, that there existed no church at Thyatira. This objection of the Alogi Epiphanius has delivered in the following words, "καί Μη αναλέγοις την επιστολήν τον Θυάτιρα, ἀλλ' ανέλεγον τις την επιστολήν τον Θυάτιρα." But these words are ambiguous, for they may denote either that there was no Christian community at Thyatira in the time of St. John, or there was no such community there when the Alogi made their objections. In the latter sense the argument is of no importance; for though there might be no Christian society at Thyatira in the middle of the second century, there might have been one in the reign of Claudius, to which period Epiphanius refers the Apocalypse. But the fact was not true, as there existed a community of Alogi, who certainly considered themselves as Christians, and another sect who were opposed to the Alogi, and who were called Phyrgians. It is, therefore, not necessary to recur with Epiphanius to the prophetic spirit of St. John, who foresaw there would be a church at Thyatira in course of time. Besides the Alogi, there were other adversaries of the Apocalypse, who lived partly at the same time with them, and partly in the beginning of the third century; and who rejected the Apocalypse, not so much as the Alogi did, from their antipathy to the term apocalyptic, but principally from their dislike of the doctrine of the Millennium. Among these we may reckon the Roman presbyter Caius, who lived about the year 210. Some, however, have supposed that Caius refers to a different Apocalypse from ours. Dionysius of Alexandria, though he did not reject it as a forgery, did not ascribe to it the work of St. John the apostle, and probably did not believe it to be a divine work; but his reason for not ascribing it to St. John are not historical but critical; and, therefore, their importance depends not on the antiquity of the writer who affixed them, but merely on their own internal strength. It is well observed by Michaelis, who himself hesitates in allowing the genuineness of this book, but who has fairly stated the evidence on both sides, that if it were not written by St. John, we have reason to wonder, that neither Dionysius nor his predecessors, neither the Alogi nor Caius, should have alleged against a work, supposed to have been first uttered into the world about the year 120, any arguments like the following: "It is not preserved in the archives of the seven churches; the oldest persons in these cities have no knowledge of its having been sent thither; no one ever heard during the life of John; it was introduced in such and such a year, but was contradicted as soon as it appeared." Arguments like these would have at once determined the question in dispute; but since we meet with no such arguments in the writings of the ancient adversaries of the Apocalypse, its very adversaries have given it an advantage, which, if not decisive, merits peculiar consideration. Eusebius, who was in possession of almost all the information that was to be collected before his time, had not been able to discover anything decisive in respect to the Apocalypse, and consequently remained in doubt. He, therefore, neither pronounced it a forgery, nor ascribed it to St. John the apostle. Michaelis gives his examination of the evidence prior to the time of Eusebius, with the following remarks: "How is it possible that this book, if really written by St. John the apostle, should have either been wholly unknown, or considered as a work of doubtful authority in the very earliest ages of Christianity? The other apocalyptic epistles are addressed only to single communities or churches; but the Apocalypse, according to its own contents, was expressly ordered by Christ himself, in a command to St. John the apostle, to be sent to seven churches; and not only were these seven churches in that part of Asia Minor where Christianity was in the most flourishing situation, but one of them was at Ephesus, where St. John spent the latter part of his life, and consequently where every work of St. John must have been accurately well known. If St. John then had actually sent the Apocalypse to these seven churches, and that too not as a private epistle, but as a revelation made to him by Jesus Christ, one should suppose that its authenticity could not have been doubted, especially at a time when there were the best means of obtaining information. We cannot say that the book was kept secret, or was concealed in the archives, lest the prophecies against Rome should have been concealed on the Christians; for secrecy is contrary to the tenor of the book; and the author of it enjoins (ch. i. 2) that it should be both read and heard. "Under these circumstances," adds the author, "the authenticity of the Apocalypse appears to me very doubtful; and I cannot avoid entertaining a suspicion, that it is a spurious production, introduced probably into the world after the death of St. John." Since the time of Eusebius, and some centuries later, the doubts that had prevailed concerning the authenticity of the Apocalypse considerably abated, especially among the members of the Latin church, who at last received it almost unanimously. Among the Greek writers, however, there were several who rejected it. It was not received by all in the time of Epiphanius; it was omitted in the catalogue of the council of Laodicea, held A.D. 363; but professor Spittler, says Michaelis, has clearly shown, that the whole of the sixteenth canon, which contains this catalogue, is a forgery; and if this be true, no evidence can be deduced from it in future against the Apocalypse. It was not acknowledged by Cyril, who was bishop of Jerusalem from the year 350 to the year 386; nor was it admitted into the catalogue of canonical books by Gregory Nazianzen; and by Gregory of Nyssa it was placed among the Apocryphal writings. In fact, says Michaelis, it was almost universally considered as spurious by the members of the Greek church at the end of the fourth century: and Dr. Lardner acknowledges, not only that the two celebrated Greek commentators, Chrysostom in the fourth, and Theophylact in the eleventh century, have not quoted it in a single instance; but that Nicephorus, patriarch of Constantinople, about the year 806, expressly rejected it; and on his testimony, it was placed among the Apocryphal books.

Although the Apocalypse made no part of the old Syriac version, which is the vulgate of the Syrian church in general, it was translated in an early age into that language. Nevertheless, it was not received by Severian, bishop of Gabala in Syria, A.D. 401; nor by Theodoret, bishop of Cyrus, in Syria, A.D. 423; nor by Ambrose, who was priest of all the Monophysites of the east in the thirteenth century.
century, and was by far the most learned of all the Syrian writers; and it was entirely omitted in the catalogue of sacred books formed by Ebeddus, metropolitan of Armenia, who died in the year 1318. It does not appear to have been received, or at least to have been publicly read at Alexandria in the fifth century, but it was received in general by the Egyptian Christians.

In modern times this opinion of learned men has been very generally and decisively in favour of the authenticity of the Apocalypse; yet there have been some who have entertained doubts about it, and others who have denied it. Among the latter we may mention Luther, who, in the preface to his edition of 1524, positively rejected it; but in the later editions, he has expressed himself in terms less decisive, and left it to others, who, he says, were better qualified than himself to determine whether it merited a place in the sacred canon or not. Michaelis, also, after an elaborate examination of the authenticity of this book, concludes with leaving the decision of this important question to every man's private judgment.

The arguments for or against its divinity, deduced from the completion or non-completion of the prophecies contained in it, have been particularly considered by Michaelis (ubi infra), and to this learned writer the reader is referred.

Sir Isaac Newton closes his brief account of the ancient testimonies in favour of the genuineness of the Apocalypse with this observation: "I do not, indeed, find any other book of the New Testament so strongly attested, or commented upon so early as this."

As to the author of this book, there has been a considerable difference of opinion among both ancient and modern writers. Some have ascribed it to John, a presbyter of Ephesus. Of this number seems to have been Eusebius, who, after having drawn from the writings of Papus, that beside St. John the apostle, there lived at Ephesus a presbyter of the same name: he adds, "This latter John was probably the person who saw the Revelation, unless it be inferred on that, it was the former." Others attributed the Apocalypse to Cerinthus, who is supposed to have lived in the time of St. John; and to this class we may refer the Alogi, and, probably, the Roman presbyter Caius, and other persons in Egypt, of whom Eusebius has given an account. Eccl. Hist. b. vii. c. 25. Against this opinion it has been justly alleged, that if the inspiration be not false, Cerinthus could not have been the author, unless he also was called John; besides, the Revelation contradicts many of Cerinthus's sentiments, and therefore could not be his work. According to Irenæus, Cerinthus denied that God made the world; whereas, the writer of the Revelation often teaches the contrary. See Rev. c. iv. 11. He also maintained, that Christ did not suffer, but Jesus only. But the author of the Revelation calls Jesus Christ, not Jesus alone, the first begotten of the dead; and adds, that the same Jesus Christ washed us from our sins in his own blood (Rev. 1. 5.); and, v. 7. he says of Jesus Christ, that he was pierced. It is, therefore, improbable to the highest degree, that Cerinthus should have written the Revelation under the name of John; for if he had meditated such a fraud, in favour of his Millennium, he would have so contrived it, as not to hurt his other equally favourite opinions. It has been also said, that the Revelation does not establish Cerinthus's notions of the Millennium, but directly contradicts and overthroweth them; for the author of the Apocalypse describes his Jerusalem as inhabited by numbers of pure and holy persons (Rev. xxii. 27. xxii. 24. 15.); whilst Cerinthus's Jerusalem was to be the residence of the earthly and sensual. His citizens were to serve their passions and their pleasures; whilst the men of John's Jerusalem were to serve God and the Lamb (Rev. xxii. 3.). His millenarian state was not the life of saints, as the Apocalypse represents it, but the life of libertines.

The more general received opinion concerning the author of the Apocalypse is, that it was written by St. John the apostle and evangelist, who was the writer of the Gospel and the Epistles. To this purpose it has been argued, that in ch. i. v. 1. John titles himself the Servant of Christ, in a sense not common to all believers, but peculiar to those who are especially employed by him; and, in v. 2, the writer is supposed to refer to the written gospel of St. John, and to say, that he had already borne testimony concerning the word of God and of Jesus Christ. On this particular, Dr. Lordner lays no great stress; and he thinks, that if St. John had intended to manifest himself in this introduction, he would have more plainly characterised himself in several parts of this book than he has done. But the evidence of antiquity, in favour of its having been written by St. John the apostle, is of much greater moment; besides, it has been alleged in proof of its genuineness, and of St. John's being the author of it, that there are many infinities of conformity, both of sentiment and expression, between this and the uncontroverted writings of St. John. For such coincidences, learned men have referred to Rev. xix. 3. John, i. 1.; Rev. v. 12. John, i. 7. 19. 35. 36; Rev. iii. 7. xii. 11. John, i. 14. xiv. 6.; 1. John, v. 20. Rev. ii. 17. John, vi. 32.; Rev. i. 7. John, xxxii. 37. Rev. iii. 20. John, xiv. 23. Rev. i. 5. 1. John, i. 7.; Rev. iii. 21. John, xvi. 23. 1. John, ix. 13. 14. iv. 5. These coincidences tend to invalidate the objection of Dionysius of Alexandria, who says, that there is no affinity or resemblance between them. This learned writer has also observed, that the Gospel and first Epistle of John are written correctly, and not only according to the propriety of the Greek tongue, but with elegance of phrase, argument, and composition; quite free from barbarism and solecism, and even idiom of language; but the writer of the Revelation discovers no accurate skill in the Greek tongue; on the contrary, he has barbarisms and some solecisms. The Apocalypse, it is observed, abounds with harsh constructions, in which a nominative is placed where another case ought to have been used. Bengelius, in his "Apparatus Criticus," has alleged instances from ch. i. 5. ii. 203. iii. 12.; viii. 93; ix. 14.; xvi. 12.; xviii. 11. 123.; xxi. 10. 123.; xiv. 5.; xvii. 4.; others might be added. Although constructions of this kind were probably not unusual among the Greek Jews, yet we find no such examples in the gospel and epistles of St. John. Some of these unusual constructions, it has been pleaded, are not found in all manuscripts, and only in a very few printed editions; but they occur too frequently in the Apocalypse to be imputed wholly to transcribers: and they existed in this book long before our most ancient manuscripts were written, as in the third century, when they were noticed by Dionysius. Besides, the Apocalypse abounds with Hebrisms much more than the other writings of St. John; and this coincidence has induced some commentators to suppose, that it was originally written in Hebrew, and that our Greek text is only a translation; but this is wholly unsupported by historical evidence. Moreover, though the figurative language of the Apocalypse, when compared with the simple style of St. John's Gospel, cannot be fairly alleged as an argument, that the two books were written by different authors; for the same author, when animated by a spirit of prophecy, will write in a different manner from that in which he had written as an historian; yet there is a certain character, it has been said, in the language of the Apocalypse, which is hardly to be reconciled with the manner that is visible in St. John's Gospel. In the latter, there is a soft and gentle character.
APOCALYPSE.

rater, so peculiar to itself, as to exhibit no trace of imitation; whereas, in the former, we find the author an imitator of the ancient prophets, from whom he borrows his images, and renders them more beautiful than they were in the originals. And the imagery, which is taken from the theology of the rabbins, acquires in the Apocalypse a taste and eloquence, of which the rabbinical writings themselves are wholly deficient. The beauties of St. John's gospel are of a different kind; for while the author of the Apocalypse hurries us away to enchanted ground, and refembles a torrent which carries every thing before it, St. John the evangelist is plainspeaking and gentle-necess, and is like a clear rivulet, which flows without rapidity and violence. Is it possible, therefore, subjoins Michaelis, that St. John the apostle, and the author of the Apocalypse, called St. John the divine, were one and the same person? It is, indeed, an undeniable fact, that the style of the Apocalypse is very different from that of St. John's gospel. Mr. Blackwell denies this; but it is allowed by Joachim Camerarius, Beza, Mill, &c. "This, I suppose," says the impartial and candid Lardner, "to be the more general opinion of learned men, that there is a considerable difference of sentiments and words, and manner, in the Revelation, and the acknowledged pieces of the apostle John; whatever this difference is owing to, whether it be that these writings are not all the compositions of one and the same author, or that it is entirely owing to the diversity of subject and design, or to some other cause. I shall, however, mention another thing to be considered: if there were any reason to think, that there was some considerable distance of time between the composing of any of these books, that might be one good way of accounting for differences of style; for it is not unlikely, that one and the same person, writing upon different arguments, and at a great distance of time, especially if he be one who does not frequently exercise his fancy, or write in the intermediate space, should have a very different manner in his several performances."

Dionysius has further remarked, that St. John the apostle has not mentioned his own name in his gospel, or in any of his epistles; but, when he has occasion to speak of himself, he makes use of a circumlocution. On the other hand, St. John the divine mentions his own name, not only in places where it was requisite, as in the address to the seven churches (ch. i. 4.), but likewise in places where the simple pronoun "I," or the expression, "he who wrote this," would have been full as proper the term "I, John." The one appears to have an execeptive mould, and to avoid even the shadow of egotism; the other avoids it so little, that he is lavius in the use of his name. And what renders this difference the more remarkable is, that the circumlocution by which St. John the apostle denotes himself, viz. "the disciple whom Jesus loved," is not once used by St. John the divine. This objection admits of various replies. Although St. John has not expressly named himself in his gospel, he has so described himself (John xxi. 24. and other places), that it is impossible not to know him; the other apostles have forborne to mention their names as well as John; nor is there any name prefixed to the epistle to the Hebrews; and the character of the prophet being different from that of an evangelist, required the introduction of his name in conformity to the ancient prophets, who had inherited their names at the beginning, and in other parts of their prophecies. Dr. Lardner does not allow this last observation to be fully satisfactory, as the apostle has not specified the time of his prophecies and visions, and other particulars, which was done by the ancient prophets, and by Daniel in particular. As for the want of any description annexed to the name of John, we may infer from this circumstance, that he was the principal person of that name then living, that is, John the evangelist; and as this was the case, his name needed no additions. Besides, he is actually described (ch. i. 9.) under characters which were appropriate to John the apostle. Upon the whole we may observe, that he calls himself John; that he is described as one who bore record of the word of God; that he had been in the isle of Patmos for the testimony of Jesus; and we have no account of any John who had been an exile in this island about that time, except John the apostle; and, moreover, he writes to the seven churches of Asia, where the apostle and evangelist is supposed to have prevailed; and it is not likely that the spirit of God should admonish and reprove these churches by John the elder, allowing there was such a person, whilst John the apostle was living, and prevailed in those parts. Upon the whole, there seems to be sufficient reason for concluding, that St. John the apostle was the author of the Apocalypse.

Another subject of inquiry, concerning which the learned have differed, is the time in which this book was written. On this point fix different opinions have been advanced. 1. It has been asserted, that the Apocalypse was written in the reign of the emperor Claudius. Epiphanius is the only evidence in favour of this opinion, and he lived 300 years later than St. John. Although Grotius recommends this opinion by having adopted it, and supposes that the visions of the book were seen at several times, and afterwards joined together in one book, two very material objections have been urged against it: the first is, that there was no persecution of the Christians in the reign of Claudius, and therefore the banishment of St. John to the isle of Patmos cannot be referred to this period. This emperor did indeed issue an edict for banishing the Jews from Rome, but it did not affect the Jews in the provinces, much less the Christians; and the governors had no authority to banish Jews or Christians out of their governments, without an order from the emperor; and moreover, St. John was not in Ephesus during the reign of Claudius. The second objection to this date is founded on the circumstance, that the seven churches in Asia, to which the Apocalypse is addressed, did not exist at so early a period as the reign of Claudius; for this fact cannot be reconciled with the history given in the Acts of the Apostles, of the first planting of Christianity in Asia Minor. 2. It has been maintained that St. John was banished to Patmos, and wrote the Apocalypse there, in the reign of the emperor Nero, before the destruction of Jerusalem. This opinion has one evidence in its favour, but it is anomalous, and without date; and that is, the subcription to the Syracusan version of the Apocalypse; but thus feebly supported, it has been sanctioned by the adoption and arguments of Sir Isaac Newton. Dr. Lardner has examined the arguments of Newton, and does not allow them much weight. 3. According to another opinion, the Apocalypse was written before the time of Domitian, and before the Jewish war, but it does not determine whether it was in the reign of Claudius or in that of Nero. 4. The most probable, and the generally received opinion is, that St. John was banished into Patmos in the reign of Domitian, and by virtue of hisedicts for persecuting the Christians, in the latter part of his reign, and that he had the Revelations contained in the Apocalypse on that occasion; but the book itself could not have been published till after St. John's release and return to Ephesus. All antiquity, says Mr. Lampe, is agreed that St. John's banishment was by order of Domitian. Irenæus, Origen, Eusebius, and various other ancients, refer the banishment of St. John to the latter part of the reign of Domitian; and they concur in saying, that he there faw the Revelation. As Domitian died A.D. 96, and his persecution did not commence till near the end of his reign, the Revelation

...
A P O C A L Y P S E.

Revelation seems to be stiply dated in the year 95 or 96, in the last of which years Mill, Baffle, and Le Clerc place it. Mr. Lowman supposes, that he had his visions in the isle of Patmos, in the year 95; Dr. Lardner refers the visions recorded in this book, and the publication of them, to the years of Christ 95 and 96, or 97. There are two other opinions, which shall be merely mentioned, because they are not supported by any sufficient authority, that refer the fulfillment of St. John to Patmos, the one to the reign of Trajan, and the other to that of Adrian. Mr. Wetstein (N. T. t. i. p. 746.) favors the opinion of those who have agreed that the Revelation was written before the Jewish war; and in this case, he says, it is likely that the events of that time should be foretold in it. But upon this supposition, Dr. Lardner is of opinion, that it was not necessary the destruction of Jerusalem, and the calamities attending it, should be foretold in this book; because our blessed Lord’s plan predictions, and symbolical prefigurations of these events, had been recorded by no less than three historians and evangelists before the war in Judea broke out. “If we consider the Apocalypse as a divine work,” says Michaelis, “I think we must confine our choice to those dates which precede the commencement of the Jewish war; for thus only shall we be enabled to show that its first prophecies were fulfilled in a short time. And I grant, that if it is referred to the reign of Claudius, the explanation of it is still easier than when it is referred to the reign of Nero; for the curiosity predicted (ch. vi. 6) is derogative of that which took place in the time of Claudius. If it be considered as a mere human invention, it may be either ascribed to Cerinthus, or attributed to some unknown writer, who lived between the time of Papias and that of Justin Martyr; in the latter case, it might have been written in the reign of Hadrian. But if it be really a forgery, if it contain prophecies of the Jewish war, made after the events themselves had taken place, we have reason to wonder, that the author did not more circumstantially, and that he appears so little acquainted with the events of that war.”

The book of the Revelation, notwithstanding the pains which have been taken by men of ability and learning to explain it, seems yet to the generality of Christians very obscure; and many look upon it as a sealed book still, never to be explained to any certainty or satisfaction. A great critic, Scaliger, said, that Calvin was wise because he did not write upon the Revelation. And another (Dr. Whitby), who has written with great reputation on the other books of the New Testament, confesses he did not do it for want of wisdom; because, says he, “I have neither sufficient reading nor judgment to discern the intentness of the prophecies contained in that book.” Michaelis has arranged the explications of the Apocalypse, considered as a divine work, under the following classes. To the first class may be referred all those commentaries which are fashionably among Protestants, and according to which, the Apocalypse contains prophecies against the pope and the church of Rome; and in the commentaries belonging to this class, the prophecies in the Apocalypse are considered as fulfilled literally. To this class of commentators we may refer Medle, Sir Isaac Newton, Lownes, bishop Newton, Hurd, &c. &c. and many other Protestant writers. To the second class belong those commentaries, which confine the prophecies of the Apocalypse to the three first centuries, at least such as relate to persecution and punishment: for the happy Millennium may, according to these commentaries, be made to commence with the conversion of the Conquintante the Great. Commentators of the third class find in the Apocalypse nothing but the destruction of Jerusalem, and the flight of the Chaldeans from that city to Pella before the commencement of the siege. The book of Revelation, according to the interpretation of the best commentators, comprehends a much longer period than has been assigned to it by those who suppose that the expressions “which must shortly come to pass,” and “the time is at hand,” and the like, point out a very short period: so that the whole prophecy should be accomplished in a few years after the vision. These explications will, indeed, show that the accomplishment of the things foretold in this prophecy was soon to begin, but determines nothing concerning the time of their termination, the duration of which is much longer, and reaches from the time of the vision to the day of judgment. The book itself seems also to shew farther very plainly the order of the several prophecies, according to their several periods, as well as the whole duration, from the time of the origin to the fulfilling of the whole mystery of God’s providence towards the church. The Revelation begins, according to Mr. Lowman, by opening the sealed book, which describes the future state of the church in seven successive periods.

The first period shows the state of the church under the Heathen Roman emperors, from about the year 95 to about the year 333; and comprehends the opening of seven seals. The first seal represents a white horse and rider, having power to take peace from the earth, denoting the first memorable judgment on the persecutors of Christianity, in the destruction of the Jews under Trajan and Hadrian, from 100 to 138. The second seal represents a black horse and its rider, having power to take war. The third seal represents a yellow horse and its rider, having power to take famine; the fourth seal represents a pale horse and its rider, having power to take death, signifying a great mortality and pestilence, in the reigns of Maximin and Valerian, from 235 to 270. The fifth seal represents the souls of the martyrs under the altar, describing the severe persecution in the reign of Diocletian, with an encouragement to constancy. The sixth seal represents earthquakes, &c. signifying great commotions in the empire, from Maximin to Constanine the Great, who put a period to the persecution of Heathen Rome. The interval between the first and second periods represents an angel sealing 144,000 with the seal of the living God; signifying great numbers forsaking the idolatrous worship of the Heathen Roman empire, and embracing the profession of Christianity.

The second period reveals the state of the church and providence in the times following the reign of Constanine, during the invasion of the empire by the northern nations and the rise and progress of the Mahometan imposture, till the flat put to it in the western empire; extending from the year 337 to 775, and denoted by seven trumpets. The first trumpet represents hail and fire mingled with blood, signifying great storms of war falling upon the empire, and the blood that was shed in the realms of the Conquintante family and their successors, till things were settled under Theodosius, from 379 to 379. The second trumpet represents a mountain burning with fire, call into the sea, whereby it became blood; denoting the invasion of Italy by the northern nations, and taking the city of Rome by Alaric, from 399 to 412. The third trumpet represents a burning star falling upon the rivers, which became bitter; signifying the ravages in Italy, putting an end to the Roman empire, and founding a kingdom of Goths in Italy itself, from 412 to 493. The fourth represents a third part of the sun and
and mean darker, signifying the wars in Italy between
Julianus's generals and the Goths, whereby the exarchate
of Ravenna was erected, and the remaining power and
authority of Rome quite disappeared, from 355 to 568. The
fifth represents the bottomless pit opened, and hell is com-
ing out of it, signifying the rise of the Mahometan reli-
gion and empire, and the great progress of both till a flop
was put to them by a contest for the seesion, from 568 to
576. The sixth trumpet represents four angels loosed,
which were bound in the Ephphates, signifying the reunion
of the divided Saracen powers in the invasion of Europe
by them, and threatening the conquest of it, till defeated
by Charles Martel, from 632 to 720.
The third period reveals the state of the church and pro-
deence, in the times of the last head of Romish government,
represented by the beast, for 1260 years to its final overthrow,
from about the year 750 to about the year 1060. The sealed
book opened by the lamb, and given to St. John to eat,
depicts a further revelation of what was to follow, in order of
time, in the end of the world. There are three general descrip-
tions of this period in the sixth, ninth, and twelfth chapters.
The first signifies the corrupt state of the church, and the confu-
sion of some faithful witnesses to the truth, though under severe
persecutions, during the whole of this period. The second
represents a woman forced to fly into the wilderness for
safety, and protected there 1262 days, signifying the per-
secution and preservation of the church during the same
period. The third description represents a monstrous wild
beast rising out of the sea, with seven heads, ten horns,
as many crowns and titles of blasphemy, who was to continue
42 months, signifying that new Roman power, which should use its authority to promote idolatrous worship,
and to persecute all who would not submit to it, and should be
supported by another power like to its own form and constitu-
tion during the same period. In the sixth chapter, the
chorus of the heavenly church celebrates in an hymn the
happiness of those who remain faithful and constant; and a
minister or angel is represented as coming down from hea-
von, to declare the certain and severe punishment of the en-
mies of truth and pure religion in this period. In the seventh
chapter, seven angels are represented as receiving seven cups
full of the wrath of God; signifying that the enemies of truth
and pure religion in this period shall be severely pun-
ished in the course of it, and be utterly destroyed in the
end. The seven angels pour out their vials or cups: the first
vial poured on the earth, and on the worshippers of the beast,
denotes great commotions through the whole empire, under
the family of Charles the Great, by which that family be-
comes extinct, and the empire and crown of France are
transferred to other families, from 830 to 988. The second
vial poured on the sea, signifies the great bloodshed of the
holy war, to recover Jerusalem from the Saracens, from
1040 to 1160. The third vial poured on the rivers and fountains,
signifies the bloody civil war between the Guelfs and Gibellines,
the papal and imperial factions, when the pope were driven out of
Italy into France, from 1200 to 1377. The fourth vial poured on the sun, denotes the long
wars in Italy, Germany, France and Spain, occasioned by
a long schism in the papacy; the Turks taking Constantin-
pole, and putting an end to the eastern empire; and planetary
dicalese occasioned by intertemperate heat, from 1378 to
1530. The fifth vial poured on the earth or throne of the
death, signifies the desolation, and the total abolition of it
by the principal states of Europe, in opposition to the papal
authority, from 1560 to 1650. The sixth vial poured on the
river Euphrates, makes way for the kings of the East; this, in
the order of the prophecies, from hence to be yet future; but may
probably mean some invasion of the pope's dominion from its
colquall boundary on the Adriatic, from 1670 to 1850. The
seventh vial poured on the air, the seat of Satan's empire;
describes the utter ruin of this perfecting, idolatrous, go-
vernment, or mythical Babylon, at the end of this period,
from 1853 to 2016.
The fourth period is described in the eighth chapter; an
angel being sent from heaven to shut up Satan in the bottom-
less pit, as in a secure prison, for 1000 years, during which
time there will be a very happy state of the church in purity,
peace, and prosperity.
The fifth period terminates the 1000 years of the church's
prosperity, when Satan will be loosed again for a little time,
and a new attempt will be made to revive the corruptions at
the church, and a spirit of persecution, which shall end in the
final destruction of Satan's power, and of all the enemies of
peace and true religion.
The sixth period comprehends the general resurrection and
final judgment, and the everlasting destruction of the wicked.
The seventh period concludes the whole prophecy, with the
vision of new heavens and a new earth, representing in
strong images, the extent, fecundity, riches, and grandeur
of the heavenly Jerusalem; signifying the consummation of
the heavenly state; and the sure reward of all who shall be
found faithful and constant in the true religion of Jesus
Christ. Such is a specimen of the interpretation of the
prophecies of the Apocalypse, given by Mr. Lowman, a judi-
cious and approved writer on this subject; but the meaning
serves to particular parts and prophecies of this book by
different commentators, is very various. On this article the
reader may consult Newton's Observations on the Apoc-
alyse. Mr. Horby, in his Apocryphal, p. 438—491. Mede's Works. Lowman's Paraphrase and Notes
on the Revelation of St. John, prefixed and Lardner's
Works. Michaela's Introduction to the New Testament, by
There have been several other works published under the
title of Apocalypses. Sozomen mentions a book used in
the churches of Palestine, called the Apocalypse, or Revelation
of St. Peter. He also mentions an Apocalypse of St. Paul,
which the Coprus retain to this day. Eusebius also speaks
of both these Apocalypses. St. Epiphanius mentions an
Apocalypse of Adam; Niphonius, an Apocalypse of Eileus;
Gratian and Cedrenus, an Apocalypse of Memes, another of
St. Thomas, and another of St. Stephen; St. Jeron, an
Apocalypse of Elias.
Porphyry, in his life of Plotin, makes mention of the Apo-
calypses or Revelations of Zoroaster, Zoi'trias, Nicotius,
Alcogenes, etc.
APOCARITES, from άποκαριω, I cut off, in Ecclesiastical
History, denote those who affected that the human soul is
part of, or derived from the substance of God.
The Apocarites are ranked as a branch of the Mani-
archs.
APOCARPSAM, in Natural History, a name given by
the ancient Greeks to a poisonous drug, called also some-
times simply carpafum; it was the exudation of a tree grow-
ing in the country of the Alyphes, and was so nice the
fifth myth, that it was often mixed with it, and many lives
were lost by admixturing it as myrrh. The wood of the tree
which produced it was also poisonous, though in a less degree,
and was called by the same writers apocarpsam, as the wood
of the balm of Gilead tree is apopalsamum.
APOCATASTASIS, from apokatasthen, I restore, de-
notes the entire restitution, or reintegration of thing.
In
In this sense, we read of the apocatastasis of the world, or of all things.

**Apocatastasis.** Among **Afternoons**, denotes the period of a planet, or the time wherein it returns to the same point of the zodiac from which it set out.

**Apocatastasis** is also used in Medicine, to denote the subduing or ridding of a thing.

In this sense, we read of the apocatastasis of urine, the apocatastasis of tumours, and other diseases.

**Apothephrasis.** In general this sense, denotes the name with catharsis, or exhausion.

In this sense, we read of apocatastasis of bile, a symptom mentioned by Thucydides in the plague of Athens.

Quintus defines apocatastasis, a purging upwards and downwards, without sufficient authority. Hence also apocatastasis, a denomination sometimes given to what we otherwise call simply cathartics.

**Apothecarys.** In Medicine, the fourth order of the fourth class, or beatores, in the arrangement of species, by Dr. Callen; comprehending those which have a flux of blood or some other humour, more abundant than usual, without pyrexia, or an increased impulsion of fluids. This order includes the following genera, viz. profulfo, or a flux of blood; ephidrosis, or a proternatural evacuation of sweat; epiphora, or a flux of the lachrymal humour; ptyalismus, or a flux of saliva; ancreus, or an involuntary flux of urine without pain; and gonorrhoea. See the several articles.

**Apotheosis.** From από and θέος, I have, in *Civil Law*, denotes an acquisition or receipt given by the creditor to his debtor for money paid: in which sense the word stands contradistinguished from *antapochia*, which is given by the debtor to the creditor. Reurnier and Zieglerius have dissertations de apothesi.

**Apotheculumis.** From από and ηθελεῖα, I extract the juice, in *Pharmacy*, denotes an infusated vegetable juice; answering to what is called in the flaps a *θελέ*. APOCOPÉ. Compronounced of the proposition από, and the verb από. I cut, a figure in *Grammar*, wherein part of the end of a word is cut off; as in *die* for *dies*; fraud for *fraudem*; nil for *nilium*, etc. for *apocope*. A like retenclion at the beginning of a word is called *apophasis*.

*When the apocope is marked with a superior comma* (called an *apophaisis*), the word is said to be *apophaezed*; as *theo* for *theo*.

*Apoptosis.* From από and οτινος, I am sick, in *Surgery*, is synonymous with *Enteropathy*.

**Apothecarius.** From από and *σεκερ*, a sacchar, in *Antiquity*, an officer appointed to carry or deliver the messages, orders, and answers, of a prince or emperor. Hence he is usually called *reponens*, q. d. *answerer*.

The apothecarius afterwards became the emperor's chancellor, and kept the seal. In the barbarous Latin we sometimes meet with *secressa*, secretary, for apothecarius. Zomarus defines apothecarius, secretary for foreign affairs; being the same with what Vopiscus, in the life of Aurelian, calls *natarius*.

The title of apothecarius became at length appropriated as it were to the pope's deputy, or agent, who resided at Constantinople to receive the pope's orders, and the emperor's answer.

St. Gregory was apothecarius of pope Pelagius, at the time when he composed his morals on Job. The apothecarius did the office of the modern *nuncio*. Sometimes, however, he held the rank and quality of the pope's *legate*.

The institution of apothecarius seems to have been in the time of Constantine, or not long after, when the emperors being become Christians, foreign churches had more occasion to promote their faiths, at court than formerly; at least we find the office of *nuncio* by the law in the time of Justinian.

In one of the novels, it is recorded, that as no bishop was to be long absent from his church without special command from the emperor, if any one had occasion to negotiate any ecclesiastical cause at court, he should prefer his petition, either by the apothecarius of his church appointed for such purpose, or by the emperor, or some of his clergy sent expressly. In imitation of the apothecarius of churches, almost every monastery had their apothecarius likewise, whose business was not to reside in the royal city, as the former did, but to act as protectors for their monastery, or any member of it, when they had occasion to enter any appearance at law before the bishop under whose jurisdiction they were.

This appears from another of Justinian's novels, which requires the aforesaid in such cases to answer by their apothecarius or responsibles. Du Cange sets Bingham, Orig. Eccles. lib. iii. cap. 13. sect. 6.

The heresy of the Monothelites, and afterwards that of the Iconoclasts, broke off the custom of having a papal apothecarius at Constantinople.

**Apothecaries.** Literally denotes an *answerer*. Under this denomination were anciently included, not only the receipts of the emperors to the petitions of parties, but all kinds of decrees and mandates.

We have several books extant under the title of Apocrifus, and some in opposition to these under the title of Antapocrifus.

**Apothecaries.** Derived from *από* and *πολύς*, much, in *Medicine*, remedies ended with a repelling and altringent power, whereby they prevent the too great influx of humour to a part diseased. See *Repellents*.

**Apotheosis.** Something dubious; or that comes from an uncertain author, on which much credit cannot be reposed. We say, an *apotheosis* book, a jeu de mot, by *Ecclesiastical* or *Scientific* meaning such as are of inspected authority.

Vossius observes, that, with regard to the sacred books, none are to be accounted apocryphal, except such as have been admitted neither into the synagogues, nor the church, so as to be added to the canon, and read in public.

For this reason also the books of Sibyls were anciently called apocryphal, as being committed to the truth of the *decrews* alone; and for the like reason the annals of the Egyptians and Tyrians were called by the same name.

In the original meaning of the word, all the writings deposited in the temple were called apocryphal: because they were kept secret from the people.

When the Jews published their sacred books, they only gave the appellation of *canonical* and *divine* to such as they thus made public; and such as were still retained in their archives they called apocryphal, for no other reason but because they were not public; so that they might be really sacred and divine, though not promulgated as such.

Thus in respect of the Bible, all works were called apocryphal, which were not inscribed in the Jewish canon of Scripture; and it is in this sense that St. Epiphanius is to be understood, when he says, that the apocryphal books are not put in the ark among the other inscribed writings. By the ark he is supposed to have meant not the ark of the covenant, but the common archives; for, according to Josephus, there was no ark in the second temple. Nevertheless, the sacred writings were locked in the temple; and the apocryphal books were without doubt deposited in a distinct archive from that in which the canonical books were kept.

To this purpose Tertullian, speaking of the book of Enoch, says, that some did not own it, "quia nec in Judaeis armis moritorum. 
A P O C R Y P H A L.

morism admittitur;" and St. Austin (De Civ. Dei, l. 15.) says, that the canonical books of the Old Testament were preferred in the Jewish temple by the carefulness of the priests, who consecrated one another. Hence it is probable that the holy books were lodged in the temple in one archive, and the apocryphal in another place.

The word is derived from apocryphon, to hide; because the origin of such books was unknown, or because they contain fables mysteries not fit to be known.

The notion expressed by the word Apocryphal is taken, as we have just seen, from the Jews, and though the word itself is of Greek original, it cannot be explained by a Greek etymology, according to which it would convey a much higher idea, and signify writings preferred in the sacred records of the temple. It is merely a translation of the Rabbinical word ταυτος, which signifies "laid aside," so as not to be read in the synagogue; e.g., if a copy of the bible had two mistakes in one and the same page, it was allowable to correct them; but if there were three mistakes, the book must be laid aside (ταυτα τυπωμες), and they used the same expression for books, which were not supposed to be of divine authority. However the terms ταυτος and apocryphon, though similar in their original meaning, are very different in their use and application. The word ταυτος was applied to books divinely inspired, but we apply the term apocryphon, apocryphal, to those, whose divine inspiration is denied. It is true that the ancient Jews made a distinction, which varied at various periods, between books that were to be read, and books that were not to be read in the synagogue, which latter the Rabins called ταυτος, but those were included in the sacred canon, whereas we apply the term apocryphon to those that are excluded from it; and this term, as applied by modern writers to such books as have relation to the New Testament, signifies in general "spurious or supposititious," and in this sense differs in a still higher degree from ταυτος as applied to the books of the Old Testament. Fabricius in his "Codex apocryphus N. T." includes such writings as are supposed to be "a forgery," whereas those of a similar description, which have relation to the Old Testament, are contained in his "Codex Pseudepigraphus." This term is applied by Jerome to books which by their title or otherwise make some claim to be a part of sacred scripture, but are defective of a right to be so esteemed; and generally, or oftentimes, they are spurious. It is necessary, however, to distinguish between the terms apocryphal and spurious: a spurious work is that which is ascribed to an author who did not compose it; and apocryphal, whether written by the author to whom it is ascribed or not, is used in such the same sense with uncanonicals. Michaelis uses the term apocryphal for authentic, as distinguished from inspired; and merely in opposition to canonical; and he cautions against considering it as a term of contempt, or as deprecating a book to which it is applied. The exclusion, he says, of books called on this account apocryphal, from the canon, by no means derogates from their real worth; and although there are many under this title, which are manifestly spurious, there are others again which are highly deserving our esteem. Apocryphal books, according to the definition of St. Augustine (Contr. Faust. l. xi. c. 2. and De Civ. Dei, l. 15. c. 23. n. 4.), are not such as are of authority (or received by the church,) and are kept secret; but they are books whose original is obscure, and which are distinguished of proper testimonials; their authors being unknown, or their character either heretical or supposititious. The term apocryphal, which is variously used, is sometimes applied to those books that are not in the canon, (see Canon:) and of these there are two classes, viz. that of useful books, which may be read for the edification of the faithful, though doubtful and opposed; and that of the spurious pieces which are heretical and full of errors. Origen calls all the books which are out of the canon, apocryphal. Encheclus seems to use it for those wicked books that were composed by heretics, and which have given rise from those which are cited by ecclesiastical writers. Gregory Nazianzen, Athenæus, Epiphanius in the 5th Her. &c. Ruffus, and most of the modern Greeks, give the name apocryphal to such books only, as are apparently spurious and wicked; and usually denote those which are good and useful, ecclesiastical, though they were not received by all the churches as canonical. On the other hand, Cyril, Epiphanius in his Treatise of weights and measures, Jerome, the African Fathers, mult of the Latins, and Antiochus among the Greeks, attribute the term apocryphal in general to all the books which are not in the canon. St. Augustine distinguishes two sorts of canonical books; those which are received by all the churches, and those which are only received by some. Sixtus of Siena likewise distinguishes them into two classes: the proto-canonical, which have been always received and were never questioned; and the deuter-canonical, which were formerly doubted, but have been since admitted into the canon. All the rest, according to this author, are apocryphal, though this term had been sometimes applied only to heretical books. Mr. Jones lays down the following criteria or tells, by which we may determine whether any books are apocryphal or spurious, or not. That book is apocryphal, in which are found any contradictions,—which either contains any histories, or proposes any doctrines contrary to those which are certainly known to be true:—which contains things ludicrous or trifling, fabulous or silly relations:—which mentions facts that were later than the time in which the author, whose name it bears, lived:—the style of which is different from, or contrary to, the style of the author whose name it bears, in his known and undoubted writings:—the idiom and dialect of which are different from the known idiom or dialect of the author whose name it bears, or the country where he lived:—which manifests a disposition in its author, different from the known temper of the author whose name it bears:—and which for the most part is transferred or stolen out of another.

As the number of books in the Jewish canon was equal to the number of Hebrew letters, it amounted to 22; and that this number might not be exceeded, the book of Ruth was joined to that of Judges, and the Lamentations to the prophecy of Jeremiah. The books, therefore, that were not contained in this number, were excluded from the canon, and deemed apocryphal. The ancient catalogues of the canonical books of the Old Testament, which are to be met with in Christian writers, whether Greeks or Latins, are conformable to the canon of the Jews, and contain no other books: such are those of Melito bishop of Sardis, of Origen, of the council of Laodicea, of Jerome, &c. &c. The first catalogue in which the books of Wisdom, Ecclesiasticus, Tobit, Judith, and the two Maccabees were admitted as canonical, and as having the same authority, is that of the 2d council of Carthage, A. D. 397, which confirms the decree of the council of Hippo, A. D. 393, in which these books were received into the canon. St. Augustine, according to the authority of the African church, reckons all these books as canonical. Pope Innocent I. on behalf of the church of Rome, places the fame books in the canon of the Old Testament, as did also pope Gelasius in the council held A. D. 494: and moreover, the decree of pope Eugenius, and the canon of the council of Trent, agree with the canon of the council of Carthage, and with the decree of
of pope Innocent, and rank the above mentioned books among those of the Old Testament. See Ecclesiasticus, Judith, &c.

Among the books which have been wholly thrown out of the canon of holy scripture, we may mention a part of the book of Daniel, which the Jews rejected, containing the prayer of Azarias, and the song of the three children in the fiery furnace, which begin at the 24th verse of the 3d chapter, and end at the 59th: the history of Susanna, related in the 13th chapter; and of Bel and the Dragon, in the 14th and 15th. These subjects are not in the Hebrew or Vulgate text, nor in the Greek version of the Syriac, but are taken out of the Greek version of Theodotion, which was then used by the church, in Daniel's prophecy, as St. Jerom has observed. Africanus, Eusebius, and Apollinaris, have rejected these narrations, not only as being of dubious pseudepigraphal nature, but the whole number amounts to seven. The apocryphal books enumerated in the 6th article of the church of England, are the 3d and 4th of Esdras, the book of Tobias, that of Judith, the rest of the book of Esther, that of Wisdom, that of Jubes the son of Sirach, Baruch the prophet, the Song of the three children, the story of Susanna, of Bel and the Dragon, the prayer of Manasseh, and the first and second books of Maccabees. These books, by the same article, the church doth read and hear for the instruction of men, but do not apply them to establish a doctrine. Accordingly in the table prefixed to the Common Prayer, and appointing the lections, they are directed to be read in the months of September, October, and November. It appears, however, that in the Common Prayer of Edward VI. there was for Nov. 22d and 23d, no Bel and Dragon, no history of Susanna; but the order proceeded from Baruch to Jeremiah. The apocryphal books are prohibited in the other reformed churches. The Puritans, in the reign of queen Elizabeth, disliked and objected to the reading of these books in the church.

The spurious and apocryphal books, composed in the early days of Christianiety, published under the names of our Saviour, his apostles, their companions, &c. &c. and mentioned by the writers of the first four centuries, under the titles of gospels, epistles, acts, revelations, &c. &c. are numerous. Most of them have been long lost, and some few are still extant, to which class belong our Saviour's letter to Abgarus; his letter, which fell down from heaven at Jerusalem, directed to a priest named Leopas, in the city Eris; the constitutions of the apostles; the creed of the apostles; the apocryphal epistles of Barnabas, Clemens, Ignatius, and Polycarp; the shepherd of Hermas; the gospel of the infancy of our Saviour; the gospel of the birth of Mary; the prot-evangelium of St. James; the gospel of Nicodemus; the martyrdom of Thecla; or acts of Paul; Abdis's history of the twelve apostles, or the acts of Pilate; St. Paul's epistle to the Laodicceans, and St. Paul's five letters to Simeon, &c.; the others, that are not extant, are enumerated by Mr. Jones, adb infra. These books were not much used by the primitive Christians. There are no quotations of them in the apocryphal fathers, i.e. Barnabas, Clement of Rome, Hermas, Ignatius, and Polycarp, whose writings reach from about the year of our Lord 70, to the year 125. Some of them are mentioned, but not cited, by Irenæus and Tertullian. Several of them are mentioned and quoted by Clement of Alexandria and Origen, but not as having authority, and sometimes with expressions of disapprobation. Eusebius mentions some of them, and says, that they were of little or no value, and that they were never received by the founder of the Christian part of Christians. Athanasius, without naming any of them, paffes a severe cenure upon them in general, and from copies of them with diff like and cence. We may observe further, that these books, so far from militating against the evangelical history, confirm it; for they are written in the names of such, as our authentic scriptures say, were apostles, and companions of apostles; and they all suppose the dignity of our Lord's person, and a power of working miracles, together with a high degree of authority, to be conveyed by him to his apostles. It ought also to be considered, that few, if any, of these books were composed before the beginning of the second century. As they were not composed before that time, they might well refer to the commonly received books of the New Testament, as most of them certainly do; and therefore, instead of invalidating the credit of our books, they really bear testimony to them. All these books are not properly spurious, that is, ascribed to authors who did not compose them; but as they were not composed by apostles, nor at first ascribed to them, they may be fitly called apocryphal; for they have in their titles the names of apostles, and they make a splendid pretence of delivering a true history of their doctrine, discourses, miracles, and travels, though that history is not true and authentic, and was not written by any apostle or apostolical man. Moreover, we may account for the publication of these apocryphal or pseudepigraphal books, as they were unquestionably owing to the fame of Christ and his apostles, and the great succcess of their ministry. And in this respect the case of the apostles of Christ is not singular; many men of distinguished characters have had discourses made for them which they themselves knew nothing of, and actions imputed to them which they never performed; and eminent writers have often had works ascribed to them, of which they were not the authors. Christians of former ages exercised a laudable caution and circumspection with regard to books of doubtful authority. For a good while, the epistle to the Hebrews, some of the Catholic epistles, and the revelation, were doubted of by many; when other books of the New Testament were universally acknowledged. Upon the whole, the books, now and for a long time called apocryphal, afford no valid argument against either the genuineness or the authority of the books of the New Testament, generally received as written by apostles and evangelists; but they sanction the truth of their genuine writings, and the reputation of their character; they confirm the general account given us in the canonical scriptures, and thus indirectly establish the truth and divine original of the gospel.

The writing of books under spurious names, and obtaining them for the works of inspired authors, though once reputed laudable, and consecrated under the name of pious fraud,
APO

Wolius has given the literary history of the apocryphal books, their various editions, translations, commentaries, &c. See also Jones’s Canon, vol. i. and vol. ii. Dupin’s complete history of the Canon, &c. ch. i. Lardner’s works, in various pieces. Michaelis’s Intro. in vol. 1. p. 170. p. 376.

APOCYNUM, (αποκολομη), because it is supposed to kill dogs, in Botany, Dog’s-bane. Lin. gen. 325. Schreb. 426. Juli. 146. Clara petandria digollta; nat. order, composita; species. Jaff. Gen. Char. cail. perianth, one-leaved, five-parted, acute, short, permanent; cor. monopetalous, bell-shaped, feminiquinquefoliata; divisions revolute; nectary, five glandular oval corpusculae surrounding the germen; flum. filaments very short; androces oblong, erect, acute, converging, buli at the base; pist. gerns two, ovate; styli, short; filigria roundish, buli at the tip, mucro, glued to the androces; per. follicles two, long, acuminate, one-valved, one-celled; seeds very small, numerous, crowned with a long down: receptacle subulate, very long, rough, free.

Effren. gen. char. cor. bell shaped; nectaries five, alternate with the flaments.

Species. 1. A. struthiospermum, tutsian-leaved dog’s-bane; flum straightished, herbaceous, leaves ovate, smooth on both sides; cymes terminating; its items are erect about three feet high; leaves opposite; flowers white, with purplish nectaries. If flies alight on this plant they are frequently entangled by the glutinous matter and destroyed. Hence this plant has been called Herbe du puce. It is a native of Virginia and Canada, flowering from July till September: a perennial, cultivated by Miller, in 1731.

2. A. cannabim, hemp dog’s-bane; flum straightished, herbaceous; leaves oblong; cymes lateral, longer than the leaf; items about two feet high; leaves in pairs, smooth, and like the former abounding with a milky juice; flowers small, of an herbaceous white colour, and not having an handsome appearance. The plant is only cultivated for the sake of variety. It flowers about the same time, and is a native of the same countries as the former species. The Indians of North America use this species for the same purpose as we do hemp. It was cultivated by the duchess of Beaufort, in 1699. 3. A. hypericifolium, St. John’s-wort-leaved dog’s-bane; flum straightished, herbaceous; leaves oblong-cordate, smooth; cymes shorter than the leaf. Martin’s Miller’s Dict. A. fiebericum, Lin. filyl. Jacq. hort. 3. 37. 1. 66 an annual, a foot and a half high, with opposite, sharpish, fimbriate leaves, and small inodorous flowers. A native of North America, cultivated in 1756, by Miller.

4. A. speculum, spear-leaved dog’s-bane; flum straightished, herbaceous; leaves ovate-lanceolate; a perennial, about two feet high; leaves opposite, smooth; flowers in small umbels, purple or white, appearing in July and August. It grows in the islands of the Adriatic. Cultivated here in 1699. 5. A. distans, dog’s-bane; flum straightished, herbaceous; leaves oblong-cordate, smooth; cymes shorter than the leaf. Mar-
wife the roots are apt to rot in winter. The fourth fort
will also live in the open air, provided it be planted in a
warm situation and dry soil. The spring, before the flims
fhoot out, is the best time to remove it. The other species
are tender, and must be constantly kept in a hot-house,
plunged in the tan-bed. They may be propagated by cut-
ingst, during the summer months; but should be laid to dry
in the flove three or four days before they are planted.
When the seeds are obtained from their native places, they
should be sown in pots filled with light sandy earth, and
plunged into a tann-pit; in a month or five weeks they will
appear, and should then be watered sparingly. As they
advance, they will require larger pots; and the second
year the plants will generally flower, and some of them
make a fine appearance. Martyn Miller's Dict.

APODAGYN. Sec Asclepias, Cepheugia, Cyann-
chum, and Echites.

APODA, in Ornithology, a species of Paradise, called
the greater bird of paradise. The face feathers are longer
than the body; the two middle tail feathers long and feta-
ceous. Gmelin. This is called Mammastia, by Griffon and
Marangraze; Paradice Avis, by Seba, &c.; Oiseau de Par-
radis, by Buffon; bird of Paradise, by Willughby; and
Greater Bird of Paradise, by Albin and Edwards.

This bird appears from the plumage to be as large as a
pigeon, but the body scarcely extends in size that of thethurn.
The length is twelve inches, the bill greenish yellow, and
an inch and an half in length; its eyes are small; head and
neck covered with short thick feathers, of which those on
the head and hind part of the neck are of a pale gold colour.
The base of the bill is surrounded with black; front of the
neck green; lower part of the neck, back, wings, and tail
are chestnut, deepseall on the breast, where it assumes a tint
of purple. From under the wings spring a great quantity of
feathers, which are loosely webbed, and appear like the her-
ring-bone; some of these are eighteen inches in length, and
different colours; but the prevailing tint is yellowsih
white. The legs are stout and of a brown colour.

The female is said to be like the male, except that the
webs of the two wire-like feathers in the tail are shorted.
They inhabit the Molucca islands, and those surrounding
New Guinea, and particularly that of Aroo. It is sup-
pofed they breed in New Guinea, from whence they emi-
grate in the wetter or dry monsoon, and return when the
easterly or wet monsoon commences. They are seen at
these times in flights of thirty or forty, with a leader at their
head, which is constantly seen flying higher than the rest.
During their flights, it is observed they take the advantage
of going against the wind, and have a cry like the starlings;
but should the wind shift, they are in great distress, and
croak like ravens, for their long capular feathers then be-
come rumpled, their flight is impeded, and they fall to the
ground, from which they cannot rise until they gain an
eminence, or into the water, from which they cannot extric-
te themselves. The natives, who make a trade of their
skins with the Dutch, watch this opportunity, and take
them in large numbers: the value of each to the people of
Aroo is a five-nail; but at Banda they fetch half a rix-
dollar apiece, and perhaps of late more, since it is the plume
of this species which has become a fashionable ornament to
the head-dres of the ladies in England. The food of these
birds is not certain; some say they feed on berries; others,
on butterflies; and others again, on small birds; the latter
of which is probable, as they are very courageous, and are
furnished with claws and beak of strength sufficient for that
purpose. They were formerly brought to Europe without
legs, and many were perfumed they never had any; but

the truth is, the legs being useless for the purpose of orna-
ment, the only motive for which they are taken, are torn
off on the foot, and thrown aside. They were worn in the
East Indies by people of distinction; the grandees of Peria
and Surat use them as sigarettes, and even adorn their horses
with them.

In Forrest's Voyage to New Guinea, &c. a smaller
bird of this kind is described as a native of Papua; Gmelin makes
it a variety only (3) of this species.

APODACRYTXA, from apo and cryt, a tear, in
Pharmacy, medicines proper to excite tears. Some also use
the term apodacryt, for remedies proper to suppress tears.

APODECTE, from apo d?gyn, a receiving, in Antholo-
ogy, a denomination given to ten general receivers, appointed
by the Athenians, to receive the public penalties, taxes, debts,
and the like.

The apodCTA had also a power to decide controversies
arising in relation to money and taxes, all but those of the
most difficult nature and highest concern, which were referr-
ed to the courts of judicature.

APODECTETI, in the Athenian government, officers
appointed to see that the measures of corn were jut.

The apodetetI were nearly related to the aeropami.

APODEMCA, from apo and emka, the doctrine or
science of travelling, whether for knowledge or devotion'sake.

Jo. Moraker has published an apodemica. Ranzovius, a
methodus apodemica.

APODES, in a general sense, from apo and des, denotes
things without feet. Zoologists apply the name to a fabu-
loss fort of birds said to be found in some of the islands of
the New World, which being entirely without feet, support
themselves on the branches of trees by their crooked bills.
The Germans and Dutch have also their apodes, a fort
of birds somewhat like swallows, whose legs and feet are so
very small, that they seem rather formed for creeping than
running.

APODES, is one of the four orders of fishes in the Lin-
nean distribution of animals. Their character is that they
have no bely fins.

APODICAL argument, or syllogism, signifies a
clear convincing proof, or demonstration of a thing. The
word is formed of apo d?gyn, I demonstrate.

APODICAL method, is used by some writers, to denote
the philosophical or sceptical method of teaching or writing.

APODIXIS, from apo d?gyn, I exclude, in Rhetoric, a
figure whereby we either pass over a thing lightly, or refer
it to some other time or place.

This is also called by Latin writers, rejeclio, e.g. Quid
ego senatum defendam, justices? Equidem debes, &c.
Again, "Quid ego senatum hoc loco defendam, justices? De
tud rectius, tum quum, &c.

APODISXIS, in Logisc, the rejection of such things as
do not necessarily belong to the question to be considered.

APODIPNE, or Apodepine, fongs which the Greeks
fing after supper: either to thank the Gods, or congratula-
te themselves for their good fare.

APODIXIS, from apo d?gyn, in Rhetoric, denotes an
evident proof, or demonstration of a point.

We have several books extant under the names of apo-
dixes; and some by way of answer to thefe, under that of
antapodixes.

APODIXIS, in Middle-Age Writers, denotes a receipt
for money paid. In which sense it amounts to the fame with
apodix.

APODIXIS is also sometimes used for a specimen or proof
of a thing.

APODOSIS, from apo d?gyn, I apply, in Rhetoric, makes
the third part of a complete exordium, being properly the
application, or reflection of the precept.

The apodyterium is the same with what is elsewhere called
apodyterium, and stands opposed to a bath, or a public bath.
All branches of baths are necessary for a Subsistent; so
that without thus, it can in no way be understood.

Aponosis is also used in the king of India, for that part
which makes the objection of the titles.

Aponosis is also used, in a literal sense, for the con-
sequent to a prothesis, or antecedent to a periphrasis.
Aponosis is also used for a return to something antec-
dent, or that went before.

This is otherwise called antecedent.

APODYTERIUM, a room or a bath, in Antiquity, a shifting
room, or apartment at the entrance of baths, or in the bath-
room, wherein persons dressed and undressed, either for baths, or for the gymnastic exercises.

This was otherwise denominated apothemum, gymnasion,
and apathetum.

Some will have the apodyterium to have been the same
with the consernum; but Vossius shows they were two
different places.

APOGEE, formed of apo, from, and gee, earth, in Astro-
nomy, that point in the orbit of the sun, or a planet, which
is farthest distant from the earth.

The apoge is a point in the heavens at the extreme of
the line of the apsides; in which the sun, or a planet, is at
the greatest distance that it can be, from the earth, in its
whole revolution, and the opposite point to this is called the
perige.

The ancient astronomers, regarding the earth as the
centre of the system, chiefly considered the apogee and peri-
gee: the moderns, making the sun the centre, change the
apogee and perige for aphelion and perihelion.

The apoge of the sun is, therefore, the same with the
aphelion of the earth, and the perige of the sun the same
with the perige of the earth. The manner of determin-
ing the place of the apogee of a planet is exactly the
same with that for determining the place of the aphelion for
the sun and superior planets. See aphelion and planets.

The place of the apoge of the sun, at the beginning of
the year 1759, was, according to the tables of La Caille, 3° 8'
58.2'.

The quantity of the motion of the apogee may be found
by comparing two observations thereof made at a great
distance of time; converting the difference into minutes,
and dividing it by the number of years elapsed between the
two observations: the quotient gives the annual motion of the
apogee. Thus, from an observation made by Hipparchus
in the year before Christ 142, whereby the sun's apoge was
found 5° 32' of II; and another made by Ricci-
uoli, in the year of Christ 1645, wherein it was found
7° 26' of 59; the annual motion of the apogee is found
to be 1° 2'. See aphelion.

Its peculiar motion, with respect to the equinoxes, is,
according to the tables of La Caille, 1° 49' 10'. The
cause of this motion is the attraction of the planets, par-
ricularly of Venus and Jupiter, as M. Euler has shown in his
work: "On the inequalities of the earth," which obtained
the prize of the Academy of Sciences, in 1756.

The apoge of the moon, in 1750, was in 5° 21' 2' 32",
and its annual motion is about 1° 10' 39' 50"; and the re-
olution of the apogee, according to the tables of Mayer,
in relation to the fixed stars, is performed in 8 years, 311
days, or 3231 days, 0° 54' 57.5'.

Besides the progressive motion of the apogee of the
moon, astronomers have also considered the orbit of the moon
as subject to an equilibration of its apogee, joined to a
variation in its eccentricity. Horrox was the first author
of this ingenious hypothesis, which Newton adopted in his
"Principia," and upon which are founded Halley's tables
of the moon, and those of Flamsteed, which were published
by M. le Monnier, in his "Astronomische Institutionen;"
M. Euler was the first who substituted to this hypothesis an
equation more convenient, and called correction, the quantity
of which is 1° 26' 34". In order to explain the hypo-
thetical of Horrox agreeably to the principles of attraction,
it ought to be considered that the motion of the apogee of
the moon depends upon the diminution of the central force
of the moon towards the earth; so that the motion ought
to be the greatest when the line of the fictitious centre
with the line of the apogee, or when the place of the sun
corresponds to the apogee or perigee of the moon. When
in the quadratures, the motion of the apogee is the slow-
est, because the total diminution of the central force is then
the least; when the sun is at 50° from the apogee, the true
motion of the apogee is equal to the mean motion; but its
true place differs then the most from the mean place, and
the equation is the greatest, because it results from all the
degrees of velocity which the apogee has acquired to this
point. This equation, in the tables of Halley, amounts to
10° 18'. There is also an inequality in the place of the
apogee, which proceeds from the distances of the sun with
respect to the earth, and which is 3° 14.2' additive, when
the sun is at 3° from the apogee.

See Moon.

APOGRAPHI, a copy or transcript of some book or
writing. The word is formed of apo, ab, from, and graph, write.
In this sense apograph means opposite to autogra-
ph, as a copy to an original.

AFQGRAPHE, in the Ancient Law, was, when a
person being fined for money fipped for to the public,
pleaded that the charge was unjust, and withal produced
all the money he was poffessed of, and declared by what
means it came to his hands.

Suidas adds, that it is sometimes taken for an action
against such as neither paid the fines laid upon them before
the ninth pyrtanae following their sentence, nor were able
to give sufficient security to the city. Potter, Arch. Graec.
lib. i. cap. 23.

APOGRAHS, in the Roman Law, denotes a catalogue
or inventory of goods.

APOKERA, in Geography. See Cape Duxur.

APOKOPA, in Ancient Geography, a name given to the
Cape Baxos of the Portugeu, situate upon the coast of
Zinguebar.

APOLDA, in Geography, a town of Germany, in the
circle of Upper Saxony, and principality of Weimar, eight
miles N. W. from Weimar, and 40 S. W. from Leipzick.
N. lat. 50° 56'. E. long. 11° 22'.

APOLEPSIS, from apolepsin, I leave, in the Athenian
Law, an action of divorce; brought when a woman had
sued her husband.

APOLEPSIS, from apolepsin, I retain, in the Ancient
Phyle, denotes a retention of the blood or spirits, or an extir-
ation of the native heat of the veins.

APOLEPSIS is also a denomination of a species of apo-
plexy, wherein the speech, sense, motion, &c. suddenly
fails.
This seems to coincide with what is otherwise called a
Catalepsy.
APOLLINES, from πόλις, city, in Antiquity, those
condemned for life to the public works, or exiled into some
island, and thus divested of the privileges of Roman ci-
tizens.
APOLLINARIANS, Apollinarists, called also by
Epiphanius, Diocletian, in Ecclesiastical History, ancient her-
etics, who denied the proper humanity of Christ, and main-
tained that the body which he assumed was endowed with a
sensitive, and not a rational soul, but that the Divine
Nature supplied the place of the intellectual principle in
man.
This sect derived its name from Apollinaris, bishop of
Laodicea in the fourth century.
The Apollinarians have been charged with other opinions,
such as the Millenarian and Sabellian, the pre-existence of
the body of Christ, and the passion of his Deity; but eccle-
siastical writers are not agreed with respect to these
and other particulars. Their doctrine was first condemned by
a council of Alexandria, in the year 362, and afterwards in
a more formal manner by a council at Rome in 375: and
by another council in 378, which deposed Apollinaris from
his bishopric. Notwithstanding these censures, his doc-
tine spread through most of the churches of the East; and
his followers were subdivided into various sects. The ten-
ent against Apollinaris and his followers was confirmed by
a council held at Alexandria in 378, by an oecumencical
council, assembled at Constantinople in 381, as well as by
the council of Antioch in 379. In 388, the emperor The-
dofus enacted a law, forbidding them to hold assemblies,
and to have any ecclesiastics or bishops, or to dwell in cities.
The rigorous execution of this law, in concurrence with the
defects of different councils, reduced them to a very small
number, and their doctrine had no long duration. Dupin,

The doctrine of Apollinaris, viz. that the Logos, a
divine person, which descended from heaven, supplied the
place of a soul in Christ, is learnt or heard of in letters,
(Morellet's Letters, p. 53,) is plain and intelligible; and
answers much better than any other to the facts, which
assert that Christ took on him the destiny of Abraham—
was made in the likeness of man—God was manifest in the
flesh—he was in the flesh, in the likeness of sinful flesh—in
him dwelt the fulness of the Godhead; The Word was
made flesh—was incarnate. * * * All these texts of scripture,
" says Dr. Sykes (External Peace of the Church, p. 29, 30.),
" are, upon the Apollinarian scheme, natural, plain, and
easy; it teaches a most proper unity of person; and as making
the God-man, Jesus Christ, to be strictly one intelligent
agent. * * * It makes the very same person suffer and die,
that came down from heaven; which is the fundamental article
of the Christian religion. Mr. Whitton also says (see Ac-
count of the Convocation's proceeding against him, p. 87.),
"the scripture and earliest antiquity never affirm that Christ
took a human rational soul; they never say he took a whole
human nature; never say, he was in that sense a true and
perfect man; but that he was made flesh, had a body pre-
pared for him; was the Word, or a God incarnate; was
made in the likeness of man; was found in fashion as a
man, while he was the Word. Nay, Ignatius directly
affirms, that it was the Word, and not a human soul, which
inhabited in that body; and almost all the ancients agree in
the same doctrine; even Athanasius himself, before the
council of Nice. " Notwithstanding the pains that were.
taken to discourage this opinion, it appeared again in differ-
ent forms, in the Christian church, in the doctrine of the
Monarchies, who held, that Christ had only one will, which,
without doubt, is sufficient for one person.
APOLLINARIAN games. Apollinares lud. in Antiquity,
games at Rome, instituted A. D. 541, celebrated yearly in
honour of Apollo, on the fifth day of July, under the
direction of the pretor, in the Circus Maximus.
The occasion was a kind of oracle delivered by the pro-
phet Marcus, after the fatal battle at Cannae; declaring
that, to expel the enemy, and curb the people of an infec-
tious disease which then prevailed, sacred games were to
be annually performed in honour of Apollo. And that the
pretor was to have the direction of them; and the decennvriti
were to offer sacrifices after the Grecian rite.
The senate ordered that this oracle should be observed,
because another of the same Marcus, wherein he had fore-
told the overthrow at Cannae, had been verified; for this
reason they gave the pretor twelve thousand only out of the
public cash to defray the solemnity. There were sacrified
as ox to Apollo, as also two white goats and a cow to
Latona; all with their horns gilt. Apollo had also a col-
lection made for him, besides what the people, who were
spectators, gave voluntarily. The first pretor by whom
they were held was P. Cornelius Sulp. For some time they
were moveable and indetinute, but at length were fixed, un-
der the pretorship of P. Licinius Varus, to the fifth of July,
and made perpetual. Livy, xxxvii. e. 25. tom. iv. p. 75.
Ed. Drakenb.
The men who were spectators at these games, wore
garlands on their heads; the women performed their de-
votions in the temples at the same time; and at last they
caroused together in the vehicle of their house, the doors
flanding open.
The tradition reports, that at the first celebration hereof,
the people were suddenly invaded by the enemy, and
obliged to take to their arms; upon which occasion a
cloud of darts and arrows falling upon their enemies, the
Romans soon returned victors to their sport.
The Apollinarian games were only scenical; and at first
only observed with singing, piping, and other sorts of mu-
 sic; but afterwards there were also introduced all kinds of
mountebank tricks, dances, and the like, yet so that they
still remained scenical, no chariot races, wrestling,
or the like laborious exercises of the body, being ever prac-
ticed at them. Dansa, and others, confounded the ludi
Apollinares with the Actioi or Actian games.
APOLLINARES lud. was also a general name given to all
scenical games.
These were also called lud. liberale, and feenici.
They differed from the ludi theatralis, in that the former were celebrated with all sorts of plays, farces,
poems, recitations, &c. the latter only by dancing and
music.
This kind of Apollinarians had their share in almost all
the solemn games.
APOLLINARIS, CLAVDIIUS SULPITIUS, in Biography,
celebrated grammanian, was born at Carthage, and flour-
ished in the second century under the Antonines. He was
succeeded in his profession by his scholar Helvius Pertinax,
who afterwards became emperor; to him are ascribed the
verges prefixed to the comedies of Terence, and the follow-
ing epigram written upon the orders which Virgil gave
to burn his Æneid:
" Infelix alio ecceit prope Pergamon ignes,
E. p. e. l. a. Troja cremata rogo."
AULILIUS, or APOLLINARIUS, the elder, was a native of Alexandria, and flourished about the middle of the fourth century, as according to Cave, A.D. 362. He was distinguished, both as a grammatician and a divine. After having been a teacher of grammar at Berystus in Phoenicia, he became prebendary at Laodicea in Syria. Under the reign of Julian, when the Christians were forbidden the use of the Greek and Roman classics in their schools, he composed a grammar in a Christian form, and wrote many books in imitation of the ancients. He translated the books of Moses into Greek heroic verse, and wrote in the same manner the whole history of the Hebrews to the time of Saul, which he divided, like Homer’s Iliad, into twenty-four parts, to which he prefixed, in regular series, the letters of the alphabet. The remaining historical books of the Old Testament he exhibited partly in hexameters, and partly in a dramatic or lyric form, imitating the tragedies of Euripides, the comedies of Menander, and the odes of Pindar. Sozomen (Eccl. Hist. i. vi. c. 15) speaks highly of his talents and performances, and leads us to lament, in proportion to our confidence in his judgment, "works equal in number and merit to the ancient Greek models." See More. Cave, Hist. Lit. vol. i. p. 237.

APOLLINARIUS, of Apollinarius, the younger, the son of the former, was the disciple of Epiphanius thelothiphil, and taught grammar at Laodicea, of which city he was at length ordained bishop. At the time, viz. A.D. 362, when Julian issued the decree mentioned in the preceding article; he concurred with his father in rendering service to the Christians; and he is said to have put the gospels and the apologetic doctrine into dialogues after the manner of Plato. He also wrote commentaries on the book of Psalms, the Ecclesiastes, the prophecy of Isaiah, that of Daniel, (rejecting the stories of Sutana, and Bel and the Dragon, as not extant in Hebrew,) and that of Hosea, and likewise on several books of the New Testament. His apology for the Christian religion against Porphyry, in thirty books, is mentioned with commendation by Jerome and others. Some learned men have been of opinion, that he published a new Greek translation of the books of the Old Testament, compiled from the Greek versions that had been made before; but this does not seem to have been a fact, though Fabricius enumerates this as one of his works. Sozomen (Eccl. Hist. i. vi. c. 18, p. 623.) mentions a valuable work of this author, addressed to the emperor himself and the Greeks philosophers, intituled, "Of the truth;" in which he shewed, by reason alone, without alleging the divine scriptures, that they did not think rightly of the deity. It is said, that Julian writing to some Christian bishops concerning this book, made this remark; "I have read, underfoot and condemned:" to which he received this answer, "You have read, but you did not understand; if you had understood, you would not have condemned." Besides all these, Apollinarius wrote divers books against those called heretics; and he employed his poetical talents in composing short stanzas and hymns fit for festivals and for all feasts, on a variety of subjects; some of which were vied in their religious assemblies, and others were sung by the men at their works and entertainments, and by the women at their spindles. For an account of the doctrine of Apollinarius, and of the fact of which he is said to have been the founder, see Apollinarism.

The character of Apollinarius has been very differently appreciated by modern writers. Lord Chancellor King, the reputed author of "The Apolline Creeds," &c. calls him the great Apollinarius, the ornament and splendor of the church of that age, the most signalized champion for the faith, and an illustrious example of piety and virtue; by all esteemed the greatest man of his age both for learning and piety; a most accurate and nervous defender of the faith against all its enemies, whether heathens or heretics. Dupin says, he was beloved and esteemed by St. Athanasius, St. Baffi, St. Epiphanius, and all the great men of his age, for learning and knowledge. St. Jerome says, that he had often seen him at Antioch, that he honoured him, and that he learned many things of him. Philologorus, the Arian historiographer, says, that he and Baffi, and Gregory Nazianzen, defended the divinity of Christ better than any either before or after them; in comparison of whom, the great Athanasius was esteemed to be but a child; and the most considerate and esteemed of these three was this Apollinarius; and that these three were wanting in nothing necessary for understanding and reading the scriptures; and especially this Apollinarius, who understood the Hebrew language. He wrote against the Arians and other heretics, &c. in many volumes, overthrew heresies, and confuted errors opposite to the faith; and in thirty large and noble books, most convincingly baffled...
And the calumnies of Torpby: and his moral character was as conspicuous as either Gregory's or Balil's. His writings surpassed in beauty and strength every thing that had been written by Eusebius, or any of the ancients. Nevertheless he was excommunicated by George Bishop of Lardis, for taking the part of Athanasius against him. To these testimonies in favour of Apollinaris, we shall subjoin a very different kind of judgment formed concerning him by M. Tillemont. "He maintained to the end his integrity, and died in his heresy: so that we cannot admit the hope of any other lot for him, but the condemnation of hell." Dupin having mentioned Apollinaris's paraphrase of the psalms, adds, "All the other works of this author are lost, except some fragments. His error in all probability occasioned this loss: the catholicks had such a dread of the books of heretics, that they have not preserved so much as those which had no relation to their heresy, and which might have been useful to the church." If that be so (says the candid and impartial Dr. Lardner), we must acknowledge that the catholicks were to blame; it is like rooting up tares and good corn altogether. And we may hence receive this instruction, to be upon our guard that we admit not too great an avercion for men on account of difference of sentiment in things of a speculative nature: lest by violence in opposing error, we should obstruct the progress of knowledge, and the cause of truth which we are desirous to serve." Apollinaris died, according to Jeron, in the reign of Theodosius, and probably not long after the beginning of it, in 352, or soon after; for Epiphanius, in 370 or 377, calls him a venerable old man. Lardner's works, vol. iv. p. 350—397. Mohiën's Eccl. Hist. vol. i. p. 243, &c. Cave, Hist. Lit. vol. i. p. 250, &c.

APOLLINIS urb, or APOLLINIS PARVA, according to Ptolemy, or APOLLONIS according to the Itinerary of Antonine, or APOLLONOS according to Hierocles, in Ancient Geography, the capital of the fifty-second nome of the same name in the southern part of Upper Egypt, about twenty-five leagues nearly north of the great cataracts. M. d'Anville, Savary, and Denon, agree in assigning to it the situation of the present village of Edfon or Elph, governed by an Arabian sheik.

The site of this ancient city is singularly advantageous, as it commands the river and the whole valley of Egypt; and its magnificent temple, seated on a rising ground, towers over the rest like a large citadel which keeps the adjacent country in awe; and, indeed, it is known to the natives merely by the name of "the fortresses." The extent, majesty, magnificence, and high preëminence of this edifice, says M. Denon, surpassed every thing he had before seen in Egypt, or elsewhere. The building itself is a long suite of pyramidal gates, of courts decorated with galleries, of porticos, and of covered avenues, constructed, not with common stones, but entire rocks. The excellent preservation of this ancient edifice forms a wonderful contrast with the grey ruins of modern habitations built within its vast inclosure; a part of the population of this village being contained in huts built in the courts, and around the fragments of the temple. This temple is the most beautiful in Egypt, and, next to those of Thebes, the largest. As it was built at a period when the arts and sciences had acquired all their splendour, the workmanship of every part is equally beautiful, the hieroglyphics are admirably executed, the figures more varied, and the architecture of a higher order than in the Theban edifices, the building of which must be referred to an earlier age. At the foot of this greater temple, and on a much lower level, is a smaller one, at present almost buried; but in a hollow surrounded with rubble, there may be seen a little portico of two columns, and as many pilasters, a pristyle, and the façade of the temple enclosed within a palisaded gallery. A single column with its capital rising from the ruins to the height of forty feet above the portico, and the angle of a wall forty feet beyond, shews that there formerly existed a court in front of the temple. The gate, it is observed, are not exactly in the middle of the sides. It seems to have been dedicated to the evil genius: for the figure of Typhon is seen in relief on the four sides of the plinth which surrounds each of the capitals; the whole friezes and all the paintings within appear deforative of his detesting herself against the attacks of this monster. M. Denon has illustrated his description of these temples by appropriate drawings. See Denon's Travels into Upper and Lower Egypt, &c. vol. ii. p. 107. 297.

APOLLINIS urb, or APOLLONIS PARVA or Minor, another city of Egypt, called also Vicus Apollinis in the Itinerary. According to Ptolemy, it belonged to the forty-eighth nome of Coptos; and was situated between Coptos to the north, and Thebes to the south-west, on the right of the Nile. M. d'Anville refers this to the present situation of Kous. Denon found in the middle of the square the summit of a large and well-proportioned gate, sunk into the ground to the cornice. This single fragment, which must have belonged to a great edifice, and which appears larger than all the rest of the city, proves, says this traveller, that Kous was built on the site of Apollonopolis Parva. The other parts of the edifice are, without doubt, buried under the mountain of rubbish that is occupied by the present town. The inscription, engraved on the lintel of the gate, was posterior to the monument, and affords a curious instance of ingenious flattery in a preface of Upper Egypt, at the time of the Ptolemies; who, on account of some repairs twenty or thirty centuries after the building of the temple, ventured to dedicate it to his matters, to inscribe the gate with their names, and thus to transmit them to posterity. Denon's Travels, vol. ii. p. 236. 297.

APOLLINIS Farnum, or Temple of Apollo, a town of Lydia, according to the periples of Scylax, which became a bishop's see. This is also the name of a place of Africa propria, according to Ptolemy, situate probably north-east of Tabraca.

APOLLINIS insula, an island of Africa, according to Steph. Byz.

APOLLINIS lucas, a grove consecrated to Apollo in that part of Cilicaine Gaul called Tranapandana, among the Lubici, to the north-west of Vercellae.

APOLLINIS oppidum, a small town of Ethiopia, in the country of the Megabores, according to Pliny.

APOLLINIS Phisii portus, a port of Greece, attributed by Pliny to the Oxolocrians.

APOLLINIS promontorium, Ras Zebed, was situate to the east of Utica, and to the north of Carthage. Another promontory of the same name is placed by M. d'Anville after Ptolemy, in Mauritania Caesarianis, north-west of Cearea.

APOLLINIS regio, a name given to the country of Ethiop. Opus.

APOLLINIS templum, or Temple of Apollo, was situate in Thrace, and called Zenithium. Another of this name was situate in Lydia, upon the gulf of Myra. Another was in Thessaly, upon the Pelopisic gulf, near Pagaiz.

APOLLINIS urb, or city of Apollo, was a name given to Delos, called allo Aretne, in the isle of Delos.

APOLLO, in Entomology, a species of Papilio, in the section
A P O L L O.

A section Parnassus. The wings are white spotted with black: on the upper side of the posterior wings are four eye-shaped spots, and on the under-side six. It inhabits Europe and Sicily: and is the Papilio ursa of Pallas. Genitive.

Apollo, in Mythology, a pagan deity worshipped by the Greeks and Romans. Cicero (De Nat. Deor. l. i. n. 123. oper. t. i. n. 105, ed. Oviet.) distinguishes four deities of this name; the first and most ancient was the son of Vulcan, and the guardian of Athens; the second was the son of a Corybant, and born in Crete; the third was the son of Jupiter and Latona, who was born in the island of Delos at the same time with his sister Diana, and who was according to Ptochis, the most ancient of the three, and, in many respects, the most celebrated; the fourth was born in Arcadia, and called by the Areopag, Nomus, or the legislator, because he enacted laws for them. Of these four, the three last were Greeks, and the first an Egyptian, who, according to Herodotus, was the son of Osiris and Isis, and called Orus or Horus. Paulyanus agrees with Herodotus, and ranks Apollo among the Egyptian divinities. Diodorus Siculus also, after saying that Isis had invented the practice of medicine, adds, that she taught this art to her son Horus, named Apollo, who was the last of the gods that reigned in Egypt. Indeed, all the Greek fables and mythologies may be easily traced to Egypt. To this purpose, it is observed, that if the Apollo of the Greeks was said to be the son of Jupiter, it was because Horus, the Apollo of the Egyptians, had, for his father Osiris, whom the Greeks confused with Jupiter. If the Greek Apollo was reckoned the god of eloquence, music, medicine, and poetry, the reason was, that Osiris, the symbol of the sun among the Egyptians, as well as his son Horus, had there taught those liberal arts. If the Greek Apollo was the god and conductor of the muses, it was because Osiris carried with him, in his expedition to India, singing women and musicians. The parallel might be pursued, and sufficient evidence is thus obtained, that the true Apollo was that of Egypt. Cicero says (De Nat. Deor. l. ii. c. 27. oper. t. ii. p. 578.), that Apollo is a Greek name, and that he represents the sun; and that the sun is so called, because this luminary is alone so great compared with the other stars, or because this alone appears when it is riven, all the others being obscured. Accordingly the etymology may be deduced from a priv. and τοιχία many; as the Latins derive sol from Iouis, alone. Voifius thinks (De Idol. vol. l. i. ii. c. 17. p. 391.), that the Apollo of Greece and Rome was the same as the Abellon of the east; and Abellon was, in the etymological system of Bryan (Mythol. vol i. p. 17), a combination of the terms Ab-El-Eon, denoting "Pater summis Solis", or "Pater Deus Solis." The sun was also worshipped, adds this writer, under the title of Abaddon; which, as we are informed by the Evangelist, was the name as Apollo, or as he terms him (Rev. c. ix. v. 11), Μεσαμνοvl. Apollo has been peculiarly distinguished by the poets, in preference to the other deities; and many extraordinary discoveries and performances have been ascribed to him. He has been esteemed the inventor of all the fine arts, such as poetry, music, and eloquence, and regarded as the protector of the poets, musicians and orators. No one has performed like him on the lyre; and he has been thought to personify an intimate acquaintance with all the secret powers of medicine. The muses were under his protection, and he presided on Mount Parnassus at all their concerts. None of the gods was endowed to the same degree with himself, with the knowledge of futility; and therefore he was the god of divination; and had a greater number of oracles than any other deity. Of these the Delphian claimed the first rank on account of its antiquity, truth; and the perspicuity of its answers, as well as the magnificence of its Structure, the variety and value of its Anamnetes or oracles, and the multitudes that resorted thither. There were others at Ceira, Delos, among the Milesians, at Asae, at Chaos, at Larissa, at Beotia; at Cyno, at Cyrene, and Phoebus, at Oreus in Eubea, at Corycia in Tusc, at Hybla, at Thebes in Macedo; &c. He had also temples through all Greece and Italy; and he was honored and worshipped as the representative of the sun, among the Gauls and Britons. It has indeed been doubted whether Apollo was a red personage, or merely a symbolical deity representing the sun. Voifius (ubi supra) adopts the latter opinion, and maintains that there was never any other Apollo besides the sun; thus he was styled the sun of Jupiter, because that god was reckoned by the ancients, the maker of the world. His mother was called Latona, signifying "hidden," because all things were enveloped in the obscurity of Chaos, before the creation of the sun. He is represented as a beardless youth, because the sun never grows old and decrees; and his bow and arrows denote his piercing beams. Besides, according to this writer, all the ceremonies that were performed to his honour bore an obvious relation to the great source of light which he represented. It is in vain then, he concludes, to seek for any other divinity than the sun, which was adored under the name of Apollo. There is reason, however, to imagine, that there might have existed some illustrious personage named Apollo, who after his apotheosis was made the emblem or symbol of the sun; as we know to have been the case with respect to the Egyptian deities, Horus and Osiris.

To the distinguishing qualities above enumerated and ascribed to Apollo, the poets have joined beauty, graces, eternal youth, and the art of charming the ear by the sweetness of his eloquence, and the melodious sounds of his lyre, and of thus captivating both gods and men. Accordingly he is principally distinguished in ancient statues by the beauty of his face; and the gracefulness of his figure; and hence Virgil (Enn. iii. v. 115) calls him "the beautiful;" and Tibullus (l. ii. c. 3; v. 11), "the well-shaped god." We need not wonder then at the amours and love-conquests that have been attributed to him. His musical contests, and some of his other feats, will be related in their proper places, in the course of this work. See Marsyas, Midas, Pan, Python, and Thamyris.

Apollo is usually represented as a beautiful, beardless youth, with long hair (hence called "intinos and erinthus;"

Ovid. Tril. iii. 680), holding a bow and arrows in his right hand, and in his left hand a lyre or harp. He is crowned with laurel, which was sacred to him, and from this circumstance his favourite poets were the same crown. In the character of the sun, his head is surmounted with rays. He is often represented on the coins of the Syrian princes. The animals consecrated to him were the wolf and hawk, as symbols of his piercing eyes; the crow and raven, from their suppled faculty of predicting the future; the cock, from his announcing the dawn of morning and rising of the sun; the griffon, on account of his tuneful powers, recorded and celebrated by Anacreon (od. 43); and the swan, partly from his prediction of futurity, and partly from his extraordinary vocal powers. The various appellations which were appropriated to Apollo, were derived either from some of his chief attributes, or from the places where he was worshipped. It would be endless to enumerate them all; we shall therefore content ourselves with some of the principal, and refer for their more particular explanation to the articles under which they occur. He was called Aslan, in reference
A P O L L O.

to Actium: Actebruris; in his hymn, attributed to Homer; and "Intanum," by Propertius, Ovid, &c. on account of his long hair; Alexius, from his power of healing; Aristeus and Argyrosetus, from his bow and arrows made of silver: Ctenus, from ctenes, on account of his fine hair, under which appellation he was worshiped at Seleucia; Cepheus, on a golden pillar of Aurelian: Cepheus, from Cepheus, where he had an oracle; Centaurus, from a mountain of this name in Delos: Delphi, from Delphes; Delphi, from Delphi; Didymus: Erotes, or long计算器, in allusion to his arrows and the rays of the sun; Laton and Latona, from his mother Laton; Medicius, from his being the inventor of medicine; Nausicaa, from Anguila's having ascribed his victory at Actium to him; Nausicaa, or Nominus, either from his superintending herds and peltry, or from the fertility which the earth derives from the influence of the sun: Pan, formed of ψαυταν, because he wounded with his arrows; Panthen, from Patara in Lycaea, where he had a temple and oracles; Phobus, from Phoibe the mother of Latona, or from his splendor; Python, from his victory over the serpent Python: Smintha, from σμῆνα, a name given by the Croets, who, having neglected his worship, were punished by the devastations of these, and rescued by his interposition: Socratis, from his predicating over lots: Thaetis, from θηην, a gate, because he predicted at the gates, among the Greek; who adorned them with his statues: Thymiaterus (Virgil Æneis. iii. §.v.), from Thyma, where he had a grove and temple, &c.

Apollo Belvidere, in Sculpture, a very celebrated antique statue, esteemed by many of artists the most excellent and sublime of all the antique productions. It was found towards the end of the fifteenth century, at Capo d'Arco, upon the sea coast, about two leagues from Rome, in the ruins of ancient Antium. It was purchased by pope Julius II. when only cardinal, and placed in his palace near the church of Santi Apolloni; but soon after, being made pope, he removed it to the Belvedere of the Vatican; from whence it takes its name, and where it was for three hundred years the admiration of the world; until Rome was taken and plundered by the French, who have transported this divine statue to the museum at Paris.

The marble out of which this statue was worked, is of so peculiar a kind, as to occasion much doubt about the quarry it was taken from. The sculptors of Rome are all of opinion that the marble is Grecian; with the exception of one or two, who call it marble of Luni or Carrara. However positive these opinions may be, it is quite most probably from a quarry totally unknown at this day.

Some accounts have stated, that this statue was the work of Agathias the Epeban; but the French artists, who were sent to Rome at the time of the incursion of the French into Italy, to explore the different works of art and their history, state that the author is certainly unknown.

This statue is a standing figure, almost naked, and more than seven feet in height; it has a freedom, grace, and majesty in the whole attitude, and especially in the turn of the head, that surpasses any other antique known. The god is here represented with his quiver hanging behind his right shoulder, and his pallium over his left arm, which is extended, and has in the hand the remains of a bow, out of which he is supposed to have just discharged an arrow at the serpent Python. On this account the statue is called Apollo Pythius. The mind of the god is here so nobly exhibited, that without saying too much, he evidently appears watching the event of his aim; but with such confidence and majesty, as proceed from a certainty of success in the attempt; forming a sublime contrast to the tremulous anxiety of Diocletian, who, in another statue, is represented as having just thrown the discus. On the stump of a tree, introduced in order to strengthen the figure, is executed a serpent, the symbol of physic, of which Apollo was god. To describe this figure in few words; it is a complete composition of sublimity, elegance, activity, and youthful beauty. The right fore-arm and the left hand, which were wanting, have been restored by Giovanni Angelo da Montorfio, pupil of Michael Angelo.

In the eighth year of the French Republic, Bonaparte, accompanied by the third consul Lebrun, was present at the inauguration of this statue; and on the occasion, a bronze tablet was presented, in the name of the artists, by Citizen Vien, and placed on the pedestal of the statue, on which was engraved the following inscription:

La statue d'Apollo, qui s'élève sur ce piedestal trouvé à Actium sur la fin du XV° siècle, placée au Vatican par Jules II. au commencement du XVI°, conquise par l'armée de la République par l'armée d'Italie, sous les ordres du général Bonaparte, a été fixée ici le 21 Germinal a l'année VIII., premier an de son consulat.

On the opposite side of the pedestal is engraved:

Bonaparte, 1er Consul.

Cameracéris, 1er Consul.

Lebrun, 1er Consul.

Lucien Bonaparte, Ministre de l'intérieur.

Beside the above, there are many other statues of Apollo; some of which possess great merit. In the Villa Medicis were the following.

One smaller than life, grouped with a figure of the God Pan, who is teaching him to play the syrinx. (One, the same as this, was in possession of the Earl of Belborough at Roehampton.)

Another Apollo, leaning on the stump of a tree; his right arm rests upon his head. A very elegant and beautiful figure. The left arm and the feet are modern. This is called the Apollo de Medicis.

Another, leaning on the stump of a tree; with his leg crooked. This was originally playing on a lyre; though the lyre is now wanting. Over the tree hangs the pallium of Apollo, and at the bottom is a swan. The air of the head, and the sweep of the body of this figure, are very elegant.

Two others, of the same design; except that their heads are more elevated. These are not quite equal in merit to the first.

Another, also leaning on the stump of a tree, with his lyre; very fine.

In the palace Farnefe, was an Apollo of black marble, leaning on his lyre, with his right hand over his head.

Another in the palace Giulietti, where he holds the skin of Marlyas; very fine.

A group of Apollo and Marlyas was in the palace Chigii, in which Apollo has one hand on the shoulder of Marlyas, with a knife in the other. They regard each other, in this group, with an expression that is surpassingly well told. The air of Apollo's head is divine.

There are some small beautiful statues of Apollo at Wilton house: several at Paris, and very many in different parts of Europe, besides a great many celebrated busts and baso-relevos.

Apollo was also the name of a kind of pantomime dance, which exhibited some actions of this god:

APOLLODORUS, in Biography, a grammarian of Athens, was the son of Areopides, and a disciple of Aristarchus the grammarian, and of the two fioic philosophers Panaitius and Diogenes the Babylonian. He flourished about

A P O

the 15th Olympiad, or 143 years before Christ, under Pha-
kleus Philemon. None of his works are extant; the three
books of his "Bibliotheca," which contain the whole
history of the Greek divines and heroes, from Lucan,
who is believed to have founded the kingdom of the
Argivians in the time of Abraham, to the time of Thucydides,
the son of Athens. This history was written in the reign of
Antiochus I. the Great, king of Persia, who died in the 50th
year of the 14th Olympiad, or 143 years before Christ.
Sicinnus pronounces this to be a very elegant and cir-
mous performance, from which we may derive some acquaintance with ancient history,
as the fables are founded on historical truth, and as the
persons whom it records actually existed, though their actions
are exaggerated or digested. He adds, that we may extract
from Apollodorus a more certain and better founded chronology,
than from the napologies of Hesiod, and Vossius is of
opinion, that by separating the fabulous stories from real
events, we may learn from his writings a true history.
The first edition of this work was published by Spalinitus
at Rome, in 1533, 8vo.; but the best edition is that of Gar
among the five ancient Greek writers of fabulous history,
to which he has annexed notes, and a genealogical table,

A P O L L O D O R U S, a famous Athenian painter, flourished
about the year before Christ 448. He is said to have ple-
ished the resources, in which his predecessor Polygnotus
failed, and to have diversified the tone of his colours, and to have
produced a happy mixture of light and shade. Heliodorus
says, that he was so fnitable of his superiority in the exercise
of his art, that he wore a sort of regal tiara, as the prince of his
profession. Zeuxis improved upon his discovery, and Apol-
lordorus, in a poem written on the occasion, records and
eulogizes that of his rival. "I had discovered," says he, "for
the distribution of shades, secrets unknown till our days;
they have been wrested from me; the art is in the hands of
Zeuxis." Pliny, Hist. Nat. i. xxxv. c. 9. Anacharsis's
Travels, vol. i. p. 448.:

A P O L L O D O R U S, a famous archist, was born at Dam-
cius, and flourished under Trajan and Adrian. In the year
of Christ 104, he built the stone bridge over the Danube,
which was one of the most considerable works of Trajan;
and he also constructed the edifices round the Forum Traja-
nianum in Rome, among which were a triumphal arch, and
the sculptured column of Trajan, now existing. His off-
ensive reply to Adrian, who seems to have envied his tal-
ents and fame, was reiterated with a severity which must be
unequivocally condemned. Whilk Apollodorus was conver-
ning with Trajan on some plans of architecture, Adrian inter-
fered, and gave an opinion, which the artist treated with
tempt: "Go," says he, "and paint gourds." (an amuse-
ment which Adrian was fond of.) "for you are very ignorant of the
subject on which we are conversing." When Adrian be-
came emperor, the afront was remembered, and it prevent-
ed Apollodorus from being employed: nor was the opinion,
which Apollodorus gave with respect to the plans of a
sumptuous temple of Venus, which the emperor was build-
ing, at all conciliatory. Adrian, meanly jealous, and inex-
curably revengeful, banished the architect; and having
cauced him to be accused of various crimes, put him to

A P O L L O D O R U S, born at Lemnos, was physician to
Pto-
lemey Soter, to whom he is said by Pliny to have dedicat-
ed a book on the qualities and uses of wine. There were
two other physicians of that name, both mentioned by Pliny;
one of them is supposed to have invented an antedote against
the bite of a viper, described by Galen. Haller, Bibl.
Med. Pract.

A P O L L O D O R I A, in Antiquity, was sacred to Apollo at
Lygara. It is said, that Apollo, after the defeat of Py-
tion, having returned to Elegaia with his sister Diaca, was
driven thence by the inhabitants, and obliged to seek a
retreat in the island of Crete. In a little while, a plague made
great ravages in this place, and upon consulting the oracle,
information was received, that seven young women, and as
many young men, should be sent to Apollo and Diaca to
requite their return to Elegaia. As soon as these duties
were performed, the plague ceased; and in commemoration
of this event, they annually depicted the same number of young
women to the sea, as were, in search of Apollo and Diaca.

A P O L L O D O R I A, in Geography, a female Chaldean Martyr
of Alexandria, was an advanced age at the beginning of the
Decian persecution, in 248, and yet fell a victim to her
profession. Her persecutors struck her upon the cheeks, and
beat out all her teeth; then lighting a fire without the city,
they threatened to burn her alive; unless the would join
with them in pronouncing certain profane words; but the leg-
hog shut his mouth, and was beheaded, threw himself into the
fire, and was consumed to ashes. Euseb. Eccl. Hist. lib. vii.

A P O L L O D O R I A, in Ancient Geography, the name of sev-
eral ancient cities; viz. a town of Abydia, situate, according
to Steph. Byz., between Caphlon and Suse. M. d'Avrille
places it upon the river Digs, to the north-east of Ar
tium. — A town of Patalytine, between Capara and Joppa,
called Apollonias by M. d'Avrille, and placed to the north-
west of Antipatris. It was recollected by Galienus, pre-
fessor of Syria, after having suffered much in wars of this
province. — A town which some authors place in Phoibis,
but which M. d'Avrille places in Caria, near the Xander,
at some distance to the west of Attocia Macedon. — A
town of Myla, according to Steph. Byz. — A town of Alia
Minor, in Ithymia, on the north bank of a lake of the same
name, and near the Rhynthus, now Aboukhina; this was
once a city of great note, and maintained its life till the
reign of the emperor Alexius Comnenus, when it was
taken and pillaged by the Turks. Apollo is referred to
the recovery of several medals of this city. There are
many Imperial Greek medals that have been found in this
city, in honour of M. Aurelius Venus, Septimius Severus,
Caracalla, Gordian, Plautilla, and GETA. — A town of Pon-
tus, according to Pliny. — A town of the small island of
Pyphys, one of the Cyclades. A town of Thrace, now
Sizoboli, situate on the south side of a small gulf of the
Euxine sea: this town was ruined by Lucullus, when he was
power of Macedonia. — A town of Macedonia in
Calcidicis, situate upon the Chabrian to the north of Chal-
cis. Another town in Macedonia, in Mygadon, south-east
of the Thessalonica, and south-west of Amphipolis. A
town dependent on Macedonia, when it extended to the west
as far as the Adriatic sea. It was situate at a small distance
to the north of the Aon, and was an episcopal seat. — A town
of the Phocide, on mount Parnassus, and formerly called Era-
nus, and CPSiiPiaS. — A town in an island near Acarn-
nania. — A town of Sicily, near the promontory of Paedum,
where was a temple of Apollo. The medals of bronze
found in this city, had the legend "Tauromenitanit."
A town of Crete, near Gnoetis, according to Steph. Byz.
— Another town of Crete, formerly called Eleutheria. It was,
says Steph. Byz. the country of Linus, and of Diogenes
the physician. — An island in the vicinity of Lycia, Steph.
Byz. — A town of Libya. — A town of the Cyreneis, to-
dwards the north west, and near the sea. Under the lower
empire it took the name of Sozusa, and its modern name is
Marzu-Sofa. — A town of Ilyria, on the Ionian sea, near
Epidamnus,
Epidamus, and not far from the port of Oricum, according to Herodotus.

APPOLLO, Cape, in Geography, a promontory on the
Ivory coast of Africa, in N. lat. 4° 56', and in the midway
between Rio Suero da Costa, and Cape Threepoints, from
which it is distant W. by N. 15 leagues. It is remarkable
for its height, and the lofty trees with which it is covered.
The surf at the Cape is so violent that no boats can land
there; and though it has a fort, it is of little or no
importance.

APOLLONIAN Hyperbolæ and Parabolœ, in Mathematics.
See Hyperbolæ, Parabolœ, and Conic Sections.

APOLLONIATIS, in Ancient Geography, a country of
Assyria, so called from its metropolis Apollonia, lay call of
Adiabene, and is placed by Ptolemy between the rivers
Gorgus and Sula.

APOLLONIUS PERGÆUS, in Biography, an eminent
mathematician of Perga in Phrygia, flourished under the
reign of Ptolemy Physcon, about 240 years before Christ.
He studied under the disciples of Euclid at Alexandria,
and there laid the foundation of that celebrity which entitled
him to the distinguished appellation of the “Great Geo-
metrion.” Of the various mathematical works which he
is said to have composed, the only one now extant is his
Tentacle of the Conic Sections; and even this has been
transmitted to us in an imperfect state. It appears that
the author’s dedicatory epistle to Eudemon, have originally
confined of eight books, but of these seven only remain.
Heraclides, in a life of Archimedes, charges Apollonius
with having appropriated to himself the discoveries and writ-
ings of that eminent mathematician; but Eutocius repels
the charge, and vindicates him from any dishonest plagiarism.
Whilst it might naturally be imagined that he would avail
himself of the works of his predecessors, it nevertheless suf-
iciently appears, that he has made several valuable improve-
ments on Euclid and Archimedes. Eutocius informs us,
that before the time of Apollonius, it was usual for mathe-
maticians to deduce the properties of the conic sections
from three different sorts of cones; those of the parabola
from a right-angled cone; those of the ellipse from an
acute cone; and those of the hyperbola from an obtuse cone;
because they admitted only one mode of cutting the cone,
which was by a plane perpendicular to the side: but
Apollonius, by varying the position or inclination of the
cutting plane, derived all these sections from any angle cone.
This valuable improvement, now universally adopted, had
been for a considerable time ascribed by Eutocius, Pappus,
and others, to Apollonius. Guido Ubaldus, however, in
his Commentary on the 2d book of Archimedes’s “Equi-
ponderantes,” published at Pisa, in 1588, has shown,
that he was acquainted with this method of obtaining the several
sections of the cone. Archimedes is said to have appropri-
ated the name of parabola to one of these sections; and the
properties of the ellipse and hyperbola are said to have been
introduced by Apollonius, in imitation, probably, of the
former. However this be, it is universally allowed, that
the conic sections of Apollonius rank among the most
valuable remains of antiquity. The first four books
have been preferred in the original Greek; and the 5th, 6th,
and 7th, have been transmitted to us in an Arabic tran-
slation. The translation of Apollonius’s conics was begun
under the caliph Almamun in the year 830; and Thabit
Ben Corah took pains to revise and augment it with that of
the three last books, in the course of the same century.
Abaliphat made a new translation, under the caliph Abû-
Culghian, in 924; and this version fortunately fell into the
hands of Borelli, in the manner recited in the sequel of this
article. This celebrated work of Apollonius, in its imper-
fect state of four books, was first known among the western
Christians towards the middle of the 15th century, when
Regiomontanus projected an edition of it, which he was
prevented from completing by his death. In 1517, a Latin
translation was made by Memmius, a noble Venetian, and
published after his death by his son. This seems to have
been the first edition, and its being the first was the only
merit that belonged to it. A better translation of the first
four books by Commandinus, with the Commentary of
Eutocius, and the Lemmas of Pappus, was published at
Bologna, in 1566; they were also printed in 1574, by H.
Stephens, at Paris, in 1525; in folio, at Antwerp, in 1575;
and in 1610, at London, by Dr. Barrow, in 1675. The
fol of the other three books of Apollonius was much
regretted by the Europeans; and attempts were made to re-
cover them. Maurolycus, a Sicilian geometer of the 15th
century, sketched out the theory of the 6th and 7th
books, and it was published by Borelli, as a Supplement to
Apollonius, in 1654. Father Richard, the Jesuit, pro-
vided a work of the same nature, but it never appeared:
however, his prolix Commentary on the first four books was
printed at Antwerp, in 1657, in folio. Whilst Viviani was col-
gnating materials for the restoration of the lost books, Golius
returned from the east with a great number of Arabian MSS.
among which were the seven first books of Apollonius’s
Conics. This discovery was speedily announced; and in
1644, it was noticed by Mercurinus. Golius delayed the
publication of the tract of that was expected; and in 1658,
Borelli, visiting Florence, found in the library of the Medi
cis, an Arabian MS., the Italian title of which announced the
seven books of Apollonius. Ferdinand II, duke of Tuscany,
generously entrusted him with this MS. which he carried to
Rome; and with the assistance of Abraham Eccellennus,
an oriental linguist, it was translated into Latin, and pub-
lished with notes, and a preface, maintaining that these
books are not supposititious, in 1661. The 8th book was still
wanting; and Golius affirmed, that it was not contained in the
Greek copies from which the other books were translated
by the Arabs. However, the learned Mercurinus, who pub-
lished Apollonius’s Conics, in his “Synopsis of the Mathem
tics,” found an Arabian work of Abu Neden, written about
the year 1020, in which the 8th book is mentioned; and
it is asserted that all the books were extant in Arabic. A splendid edition of all the eight books has been published at Oxford, in folio, by Dr. Halley, in 1710;
together with the Lemmas of Pappus, and the Commenta-
ries of Eutocius; the first four books in Greek and Latin;
the rest in Latin only; and the last restored by the editor.
An 8vo. edition was also published at Oxford by Dr.
Halley.

This excellent work was begun by Dr. Gregory, whose
desire prevented his proceeding farther than the 44th page;
and completed by Dr. Halley, with the assistance derived
from an Arabic version in the Bodleian library, made by
Thebit Ben Corah; and another Arabic MS. in the same
library, made by Abdolechel Schiraziti, a Persian, about
602 years ago, and brought out of the East by Chirisanus
Rarius, and principally the MS. of Golius, purchased of
his heirs by Dr. Marth, archbishop of Armagh, and com-
unicated to him for the public benefit. This MS. con-
tains the first seven books of Apollonius’s Conics; was tran-
slated by Thebit Ben Corah; and after several amendments,
completed, in 1503, at Maraga, a city on the confines of
Media and Assyria.

With respect to the conic sections, we shall merely ob-
serve, that their properties are derived in the most scientific
and
and satisfactory manner from the cone; and this has been done by several moderns, and among others, with peculiar advantage, by Dr. Hamilton. Others have, in a manner more operative, deduced their properties from descriptions of the several curves on a plane; and a late very ingenious at-

tempt, which, in the construction and demonstration, is almost wholly original, has been made to deduce all the properties of the three cone sections, from the 17th proposition of Sir Isaac Newton's Universal Arithmetic, in Mr. Walker's Treatise "on the Cone Sections," the first book of which was published in London, in 1794.

The other writings of Apollonius, mentioned by Pappus, are the following: "The Section of a Ratio, or Proportional Sections?" "The Section of a Space?" "Determine Section?" "The Tangencies?" "The Incidences;" "The Plane Loci;" each of these comprehended in two books. Pappus delivers many Lemmas relating to them; and attempts have been made for reducing them by modern mathematicians. Montucla, Hist. des Math. tom. i. p. 243—255. Voss de Scient. Math. Fabric. Bibl. Graec. lib. in. c. 51, tom. ii. p. 556. Gen. Dict. Halley's Preface.

Apollonius, surnamed Dyscolus, or the leam, on account of the poverty of his condition, a celebrated grammarian of Alexandria, lived in the reign of Adrian, and Antoninus Pius. Such was his indifference, that having no money to buy paper, he was obliged to write on oyster shells. Priscian prefers Apollonius and his son Herodian to all preceding grammarians, and professes to follow Apollonius as his guide. His treatise "on Syntax," written in Greek, is highly commended by Priscian. A correct edition of this work, with a Latin translation and notes, was published in 1840 at Frankfort, by Syburbis, in 1590. Another treatise ascribed to this writer, entitled, "Degesice, or Wonderful Hillories," was published, with other pieces, by Antonius Liberalis, Phlegon and Antigonus, and the works of M. Antoninus, in 8vo. at Basili, in 1568; and a better edition in 4to. at Leyden, in 1620, by Muenius. Suidas. Fabr. Bibl. Graec. lib. v. c. 7.

Apollonius Rhodius, so called from his long residence at Rhodes, was a native of Alexandria, and flourished in the 3d century before Christ, under Ptolemy Euergetes. Callimachus was his preceptor, by whom he was feverely satirized for his ingratitude; and he succeeded Eratothenes in the care of the Alexandrian library. Of his works, the most distinguished is a poem, in four books, on the Argonautic expedition. The author, mortified by the cenures passed upon it at its first publication, removed to Rhodes, and opened a school of rhetoric; but having afterwards corrected and improved it, the Rhodians applauded it, and conferred on him the freedom of the city. This poem has been differently appreciated both by ancient and modern critics. Quintilian and Longinus give it only the praise of mediocrity, and represent it as having no claim to real genius, and as displying the rhetorician rather than the poet. By others it has been commended as exhibiting beauties of a sentimental and descriptive kind; and Virgil has borne testimony to its value, by copying several incidents from the relation of the loves of Medea and Jason, into his beautiful story of Dido and Æneas Rapi. in his "Reflections upon Poetry." (Part ii. Rel. 15.) declares, that his style has no manner of elevation or sublimity, and that the structure of the fable is very injudicious; that the catalogue of the Argonauts is defective of variety; and that the poem becomes extremely languid from the first book: besides, Apollonius has egregiously erred in making this expedition to continue but four months.

The best editions of the "Argonautics," are Apoll. Rhod.
in his sacrifices and oblations in the temple, that he might obtain the restoration of an eye that had been lost by punishment. In his enduring infidelity, Apollonius dismissed as unworthy of admission into the temple, and also instructed the people who were afflicted, that when they entered into the temples of the idols, jut, and all knowing gods, they should pray for obtaining what it is fit for them to receive; and that the wicked, however lavish they might be in the disposal of their wealth, would be rejected; because they made their offerings not to honour the deity, but to purchase exemption from deserved punishment. Upon the death of his father, he attended his funeral at Tyana, and having given the great part of his wealth to his brother, and admonished him to reform his vicious conduct, he returned to Εγυς, where he erected a temple, and established a school of philosophy. In order to qualify himself for the office of preceptor in the Pythagorean philosophy, he determined to pass through the noviciates of five years’ silence, which the Pythagorean system required; and during this period he chiefly resided in Pamphylia and Cilicia, conveying instruction and admonition by his looks and gestures. At Afpenda he is said to have quelled a tumult occasioned by famine, and to have relieved the distressed people, by writing on a tablet the following reproof to the covetous engrossers of the grain: “The earth, the common mother of all, is just; but ye, being unjust, would make her a bountiful mother to you alone: defie from your iniquitous proceedings, or ye shall no longer be suffered to live.” The terrified corn-merchants opened the granaries, the people were supplied, and the tumult was suppressed. When his term of silence was expired, he visited Antiphon, Ephesus, and other cities, and associated chiefly with the priests. At funerary ceremonies he performed certain religious rites, which he dispensed only to those who had passed through the discipline of silence, the rest of the day was spent in the instruction of his disciples, and in communicating counsel and reproof to the people. His style was neither too florid nor too refined, but truly Attic. Avoiding verbose declamation, and ironical raillery, he delivered his doctrine with conciseness, and with the authority of a legislator. Being asked why he did not pursue his inquiries, instead of dogmatically afflicting his tenets, he replied: “I fought for truth when I was young; it is now my duty to teach what I have found; a wise man ought to speak as a law-giver, and make the doctrines which he embraces, incongruent to the people.” Apollonius now resided in Athens, and having proposed his design to some of his disciples, they declined accompanying him. He therefore entered upon his expedition attended only by two servants. At Nymus, however, he engaged Damis as his associate; and to him he confided, that he was acquainted with all languages, though he had never learned them; and that he even understood the language of beasts and birds; the Assyrian youth believed him, honored him as a god, and accompanied him in his journey. At Babylon, Apollonius converted with the magi; and in an interview with the king, whom he visited in his illness, he discoursed so excellently concerning the soul, that the sick monarch acknowledged to his attendants, that this Greek had taught him not only to deprive a kingdom, but even death itself. At the expiration of the term which he had fixed in his prediction, he took his leave of Babylon; and furnished with camels and provisions for his journey over Caucasus, he pursued his route to Taxilla, the residence of Phraotis the Indian king. With Phraotis he had many philosophical conferences; and being dismissed with presents, he was recommended to Jarchas, the chief of the Indian philosophers or gynecomorphs residing between the Hyphasis and the Ganges. After a residence of four months with the Indian sages, Apollonius returned to Babylon; and from thence passed into Ionia, where he visited Ephesus and several other places, every where reproving the people for their misdeeds, and enforcing the Pythagorean doctrine and discipline. In his visit to Pergamus and the ancient fest of Troy, he paied a night by himself near the tomb of Achillies; and he afterwards informed his companions, that by the power of an incantation which he had learned in India, he raised that hero from his tomb, and held a conversation with him. In the island of Lesbos he conversed with the priests of Lesbos, and from thence proceeded to Athens. He arrived there at the time when they were performing their sacred mysteries, and presented himself for initiation, but was refused because he was an enchanter; at a future period, however, he was admitted. After passing through some other Grecian cities, where he pretended to perform miracles and to predict future events, he purposed his course through the island of Crete to Rome. Jut before his arrival, Nero had indulged an edict, that all those who practised magic should be banished from the city. His friends were alarmed on his account, and though twenty-six out of the thirty-four persons who were his flated associates, deserted him, he persevered in his purpose, and under the protection of the sacred habit obtained admission into the city, and also leave from the confidant Teleclus to visit the temples and converse with the priests. From Rome, Apollonius travelled to Spain; and after the death of Nero, he returned to Italy in his way to Greece, whence he proceeded to Egypt, where Vepodian was trying every expedient to establish his power. This prince engaged the philosopher in his favour; and he in return adapted his measures to the views of the new emperor, and used all his influence among the people in support of Vepodian’s authority. When he was in Egypt, he visited Ethiopia; and on his return he was favourably received by Titus the successor of Vepodian, to whom he wrote the following laconic epistle, on his refusing a crown of victory upon his taking Jerusalem: “Apollonius to Titus emperor of the Romans. Endeth your opinion, since you refuse to be applauded for bloodshed and victory in war, I send you the crown of moderation; you know for what kind of merit crowns are due.” Upon the accession of Domitian, he was concerned in exciting a sedition in Egypt against that tyrant, and in favour of Nerva. An order was issued for seizing him and bringing him to Rome; but as soon as he heard of the order, he repaired thither of his own accord; and was brought to trial before the prætor Elan, who acquitted him. Apollonius now passed over into Greece, and visited the temple of Jupiter at Olympia, the cave of Trophonius in Arcadia, and other celebrated seats of religion; and wherever he went the number of his followers increased. At length he settled at Ephesus, and there established a Pythagorean school, and had many disciples. Of his fate, after he settled at Ephesus, nothing certain is related. The time, the place, and the manner of his death, are unknown. It is probable that he lived to an extreme old age, and died in the reign of Nerva. After his death, Damis became his first memorist. His memoirs were communicated by a friend, to the empress Julia, the wife of Seuerus, and by her to Philolatus, with a request that he would transcribe and embellish the narrative. Philolatus undertook the task, and so loaded his account of the life of this extraordinary man with marvellous tales, that it is very difficult to ascertain the credit due to his narrative. He relates, for example, that while the mother of Apollonius was pregnant, the Egyptian divinity, Proteus, appeared
peared to her, and told her that the child she should bring forth was a god; that his birth was attended with a celestial light; that in the Athenian temple at Aigae he predicted future events; that at the tomb of Achilles, he had a conference with the ghost of that hero; and that whilst he was publicly disputing at Ephesus, he suddenly paused, as if struck with a panic, and then cried out, "Slay the tyrant!" At the very instant when Domitian was cut off at Rome, if to these tales we add the accounts which Philostratus gives of the efficacy of the mere presence of Apollonius, without the attendance of a single word, in quelling popular tumults; of the chains of Prometheus which he threw upon Mount Caucasus; of speaking trees, of pigeons, phonixes, tayys, and dragons, which he met with in his southern tour; and of other things equally wonderful; it will be impossible to hesitate in ascribing the marvellous parts at least of Philostratus's narrative to his ingenuity, or his credulity. Nevertheless, the narrative of Philostratus, with all its inconveniences, was, about a century after its appearance, referred to in preference to other accounts of Apollonius then extant, by Hierocles, who first endeavoured to form a comparison between Christ and this philosopher; and Eusebius, in refuting this attack upon Christianity, admits, in general, the accounts of Philostratus, and shews that, according to his account, Apollonius does not deserve to be compared with Christ.

Dr. Lardner indeed has fully shewn that Philostratus did not write the life of Apollonius with any reference to the life of Christ; and that his design was to exhibit this philosopher as a counterpart to Pythagoras. The narrative of Philostratus may be admitted, in concurrence with other collateral evidence, as a sufficient testimony to the existence of such a man as Apollonius, and to his having been an eminent philosopher of the Pythagorean sect, who travelled through almost every part of the civilized world, exhibiting an example of illicit and rigid morality, teaching lessons of moral wisdom, and doctrines of speculative philosophy, and attracting popular attention and reverence by pretending to supernatural powers. After all, very different opinions have been entertained concerning his character. Some have even supposéd that the whole series of extraordinary events related concerning him has been the mere invention of Philostratus and others, for the purpose of obliterating the progres of Christianity, and providing a temporary support for the falling edifice of paganism; and it must be acknowledged that several writers on the mode of regarding the Apollonius have availed themselves of his history to call a shade over the character of Christ, and to perplex and weaken the evidence afforded by his miracles, of his divine origin and mission. Some, allowing that such a person as Apollonius existed, of which there is no sufficient reason to doubt, have apprehended that he was intimately acquainted with nature, and deeply skilled in magical arts; and that he applied his knowledge and skill to the purposes of imposture, that he might thus delude a credulous multitude, and induce them to believe that he was something more than human; whilst others imagine, that he accomplished his fraudulent designs by means of a real intercourse with evil spirits. Perhaps the truth of the case is, that Apollonius was one of those impostors who professed to practise magical arts and perform other wonders for the sake of acquiring fame, influence, and profit among the vulgar. In this light he was regarded by his contemporaries: Lucian, who lived in the time of Trajan, and Apuleius, who flourished under Antoninus Pius, rank him among the most celebrated magicians.

How successfully Apollonius practised the arts of imposture, sufficiently appears from these events which followed. The dominion over the minds of men which he found means to establish during his life, remained and increased after his death, so that he long continued to be ranked among the divinities. The inhabitants of Tyana dedicated a temple to his name. The Ephesians consecrated a statue to him, in commemoration of his having delivered them from the plague. The emperor Adrian collected his writings, and preferred them in his library. Caracalla dedicated a temple to him, as to a divinity among men. Alexander Severus kept, in his domestic temple, the image of Apollonius with those of Abraham, Orpheus, and Christ. Aurelian showed the Tyraean particular favour, from respect to his memory. Ephesius cites Hierocles, as ascribing to Apollonius a divine and hidden wisdom, by which, and not by magical art, he had performed great wonders; and it is added, that in his time there were persons who pretended to perform magical incantations by invoking the name of Apollonius. Ammianus Marcellinus (I. xxi. c. 14.), ranks this philosopher among those eminent men who have been attested by the supernatural aid of a daemon or genius, as Socrates and Plato; and Eunapius, who was indeed a credulous and fantastical Platonist, speaks of him as something between a god and man, and adds, that Philostratus ought to have intituled his history, "The Defect of a God upon Earth." The common people ranked him in the number of deified men, and made use of his name in incantations; and even among the philosophers of the Eclectic sect, he was regarded as a being of a superior order, who partook of a middle nature between gods and men.

Of the writings ascribed to Apollonius, none remain except his "Apology to Domitian," and his "Epistles." The first, in its substance, is genuine, but strongly marked with the sophistical manner of Philostratus: the latter abound with philosophical ideas and sentiments, and are written in a laconic style, which affords a premonition in favour of their authenticity. From these epistles it appears, that Apollonius blended with the Pythagorean system concerning the nature and origin of things, according to which God and nature are primary, independent principles, the notion of the Heraclitean school, viz. that the primary essence of all things is one, endowed with certain properties by which it assumes various forms; and that all the varieties of nature are modifications of the universal essence which is the first cause of all things, or God. Hence Apollonius taught, that all things arise in nature according to one necessary and immutable law; and that a wise man, being acquainted with the order of nature, can predict future events. Thus Apollonius connected fuperition with impiety, and made both subservient to imposture. The epistles of Apollonius were edited by Commelin, in Svo. in 1603; and by Stephens, in 1577. Philostrat. Vit. Apoll. Brucker's Hist. Philos. by Enfield, vol. ii. p. 42—45. Gen. Dict. Lardner's works, vol. viii. p. 296—292.

APOLLOS, a native Jew of Alexandria, and a Christian convert, was celebrated in the time of the apostles for his eloquence and his knowledge of the scriptures; Acts, xvii. 24. In the year 54, he went to Ephesus; and, during the absence of the apostle Paul, preached the gospel in the synagogue, and demonstrated from the scriptures that Jesus was the Christ. Having been more fully instructed by Aquila and Priscilla, he went to Corinth, and preached with such acceptance and success, that he made many converts; and such was his popularity, that they considered him as their leader, in opposition to Peter and Paul; 1 Cor. iii. 7. But this division did not alienate the affections of Paul and Apollos from each other. St. Jerom says, Apollos was so satisfied with the division which had happened on his account
Apo

at Corinth, that he retired into Crete with Zenos, a doctor of the law; but when the disturbance was appeased by the letter of St. Paul to the Corinthians, Apollos returned to this city, and became bishop there.

APOLLYON, in Scripture History, a Greek appellation corresponding to the Hebrew ABADDON, which see; see also APOLLO.

APOLGETIC, APOLGETICAL, something said or written by way of excuse or apology for any action or person.

The Apolgetic, or Apology of Tertullian, is a work of much force and spirit. He there vindicates the Christians from all that had been objected to them; particularly from the abominable crimes said to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this last accusation was, their refusing to take the accustomed oaths, and swear by the tutelary gods of the empire. Tertullian addresses his Apolgetic, written at Carthage about the year 203, to the magistrates of Rome, the emperor Severus being then absent, or rather to the governors of provinces, or perhaps to the proconsul of Africa; and the chief magistrates residing at Carthage. His Apolgetic addressed to Scipula, proconsul of Africa, on account of his severe treatment of the Christians, is supported by Care (Hist. Lit. t. p. 93.), to have been written in the year 197.

APOLLOGOS, in Ancient Geography, Oboleb, a town of Asia, upon the bank of the Paphitis.

APOLLOGE, APOLLOGEUS, a moral fable, or a feigned relation intended to inform and amuse the manners. Scaliger derives the name απολογε, inasmuch as the apologue means something more than what at first sight it expresses. Such are the fables of Aesop; whence, moral fables are usually denominated Aesopic Fables.

F. de Colonia makes it essential to the apologue, that it contain what passes among brutes; and distinguishes it from the parable by this, that the latter, though feigned, consists of possible circumstances, which the former does not, hence heals cannot speak. There is this farther difference between them, that the latter is a fumultum drawn from natural, moral, or any other branches of knowledge; the former only from moral topics. See PARABLE.

Apollogue, according to some, differs from fable, as the former is used in speeches and harangues, to persuade; the latter in tragedies, comedies, and other pieces of poetry, to instruct, and correct the manners. See FABLE. Apologue also differs from ανερ, as the latter is only calculated for the use of men, and carries a graver and weightier admonition; whereas apollogues are proposed to children. We find many things in authors concerning the origin of apollogues, the distinguishing characters of apollogues, the use and advantage of the way of teaching by apollogues. See Story, Dict. Crit. in voc. & Shaftel. Charact. tom. iii.

APOLLOGY, formed of απολογο, to refute, defend; a discourse or writing in vindication of a person or performance.

The principal ancient apologies in favour of the Christians are those of Quadratus, written about the year 126, and addressed to the emperor Adrian, which is said by Jerome and Eusebius to have had a good effect on the emperor; of Aristides, written at the same time with the former, and prefixed to the same emperor; of Justin Martyr, one of which was written in the year 150, and addressed to Antoninus Pius, Marcus Antoninus, Lucius Verus, and the senate and people of Rome, which is extant entire, and the other in 152, prefixed to Marcus Antoninus; the beginning of which is wanting; one of Melito, in 177, prefixed to the same emperor; one of Athenagoras, written between the years of Christ 177, and 183, and prefixed to M. Antoninus and Commodus; one of Pollio, addressed to M. Antoninus about the year 176 or 177; one of Miltiades, about the year 180, addressed to the princes of this world; three books in defence of the Christian religion, by Theophilus, written a little before his death, in the beginning of the reign of Commodus, A. D. 181, and addressed to Autolycus, a learned heathen; that of Pollio, prefixed to the Roman senate, A. D. 186 or 187; the apology of Tertullian, and the dialogue of Municius Felix, called Olivarus, written in the beginning of the third century.

We have two excellent treatises by the learned and ingenious Dr. Watson, bishop of Landaff, under the title of Apologue: one, an "Apology for Christianity," in a series of letters addressed to the well-known historian, Mr. Gibbon, and printed in 1776; and another, "An Apology for the Bible," in a series of letters addressed to Thomas Paine, author of "The Age of Reason," and printed in 1795. The name of the author will sufficiently recommend these tracts in defence of our common faith.

APOLYSIS, from απολύω, I release, in a general sense, the solution or refolution of any thing. Thus we read of the apolysis of a disease, the apolysis of a bandage, or the like.

APOLYSIS, in a more particular sense, denotes the exclusion of any thing. Thus we read of the apolysis of the fetus, the fecondaries, and the like.

APOMEILL, in Medicine, a kind of decoction prepared of honey, or a honeycomb, mixed with vinegar, and boiled a short time, till the qualities of both be united, and the acrimony of the vinegar allyed.

The apomeil is represented as a kind of medium between mufle and oxymel. It was anciently of great use among the Greeks, as a detergent, promoter of flood, urine, &c.

APOMYOS DEUS, from από, and μυς, fly, in the Heathen Mythology, a name under which Jupiter was worshipped at Elis; and Hercules, as well as Jupiter, at the Olympic games. These deities were supplicated under this name, to destroy or drive away the vast number of flies which always attended at the great sacrifices; and in those which accompanied the Olympic games, the first was always to the Apomyos or Myiagrus Deus, that he might drive the flies away from the field. The usual sacrifice was the bull.

APONEUROSIS, compounded of από, from, and υερος, a nerve, in Anatomy, signifies an expanded tendon. See the description of the Aponeurosis of the mufculus obliquus extremitatis alernini.

APONEUROTICUS MUSCULUS, a name given by Spurinca, and some others, to a mufle of the thigh, called by Cowper and Winslow, the mufculus latus tendinis, and mufculus fasciae lateralis. Winslow has called it, with more propriety, the mufculus vagnis feminis.

APONIA, from από, and νοαμ, labour, among Physicins, a state of indolence, or the absence of pain. In which sense, the word amounts to the fame with anodynia. Hence also aponia is used by fome for medicines which do not excite pain.

APONIANA, in Ancient Geography, a name given by Hirtius (De bell. Afr. c. 2.), to an illand near Sicily, opposite Lilybaeum, and suppos'd by Cluverius to be the fame with Capula.

APON, Peter de, in Biography, a celebrated philofopher and phyfician, born at a village of that name near Padua, about the year 1570, went early to Constantinople to acquire a knowledge of the Greek language, and from thence to Paris, where he was instrued in mathematics and in medicine. He appears also to have visited England
and Scotland. In 1502, he was invited to Padua, to fill the Professor's chair. He afterward went to Bologna, and to great was his reputation for his skill in medicine, that he is said to have received fifty crowns for every visit he made out of the city. On being sent for to Pope Honorius the fourth, he is said to have received four hundred ducats a day while he remained at Rome. As he pretended to a knowledge of astrology and heresy, and hence to possess the power of the ducats for which he was consulted, he was accused of being a magician, and cited before the tribunal of the inquisition. On this charge, however, he was at that time acquitted, as appears by the information placed over one of the gates of the palace at the foot of his statue erected there in the year 1420:

"Petrus Aponus Patarcianus,
Philosophus medicinae qua scientissimus.
Ob iaque Conciliatoris cognomen adeptus.
Atheologus vero adae peritus.
Ut in magisque fupcipium incertis.
Falsoque ec harxie pullultas, absuluto fuit."

But being again accused of the same crime, he died before the process was finished, aged 66 years. Not appearing, therefore, to answer the charges against him, he was condemned, and his body ordered to be taken up and committed to the flames. The officers not being able to find the body, his friends having removed and privately interred it, they burned him in effigy. Frederic, Duke of Urbino, honoured him with a statue, which he placed among those of other illustrious persons in his castle.

While at Paris, he wrote, "Conciliator differentiarum philosophorum, et praecepte medicorum," which was so much esteemed as to acquire for him the title of "Conciliiator." This book, which has passed through several editions, was first printed at Mantua, in 1472, in folio; in the first year was printed his book "De Venenis, comque remedii"] also in folio, in 1474, "La Finitione del Pietre de Apono? , at Padua in 2mo. in 1505, "Textus Medicamentarum," Lugduni, 8vo. For the titles of various other works, and their different editions, see Elsy's Diction.

A P O

A P O

APONOGETON, in Botany, Lin. Supp. 32. Schreb. gen. 83:1. Thumb. nov. gen. 72. Jaff. 19. Clas. "Aconitria etragynia." Nat. order. inundata: noadis, Jaff. Gen. char. cal. none, except a spathaceous scale surrounding the flower, simple, sessile, oval, obtuse, entire, erect, smooth, coloured; cor. none; filo. filaments eleven to nineteen, in the upper flowers fewer, inserted between the spathe and the capsule, subulate, smooth, white, many times shorter than the spathe; pist. germ ufually four; styles none; stigmas subulate, bent inwards; per. capsules four, seldom three or five, oval, subulate, acute, gibbous on the outside, flat on the inside, smooth, one-celled; seeds three in each capsule, attached to its base, sessile, obovate, very blunt, smooth, sub-compressed.

Eff. gen. char. cal. an acumen; cor. none; cox. three-seeded.

Species 2. A. mononachyon, single-spired aponogeton: spire simple; leaves cordate-ovate; root bulbous; leaves very long, petioled, radical, entire, floating, spike hexagonal; bracteae instead of a co-olla, two below each floret; flowers fixed, longer than the bracteae. Observed by Koenig to be common in the fields in the East Indies that are flooded. For 2. A. ephichymus, broad-leaved aponogeton: spire bifid; leaves linear oblong, floating, bracteae entire; flowers many-flowered. Thumb. nov. gen. 44: root bulbous; spire imbricated; flowers white, fragrant, alternate, erect, with an ovate bract; piliils three or four; filaments vary from six to twelve; flowers almost all the year. Thumb. found it in brooks at the Cape of Good Hope, whence it was introduced here by Mr. F. Aiton in 1788. 3. A. angustifolium, narrow-leaved aponogeton: spire bifid; leaves linear lanceolate; bracteae two-parted; flowers fixed, villous. The flowers of this species are in the Supp. Plant. fail to vary from six to twelve, whereby it has been confounded with the preceding plant. A native of the Cape of Good Hope, introduced by Mr. F. Aiton, in 1788. It flowers during the greater part of the year.

Propagation and culture: the plants are inhabitants of the green house or excape floor, and may be increased by offsets from the bulbs. See Miller's Dict. by Martyn.

APOPHYSIS, in Anant Geography, an hamlet near Patavium or Padua, and celebrated by Martial as the birth place of Livy, and on account of its balsam, now Abano.

APOPHITYPLICA. From apophysis, I disjunct, in the Ancien Poety, a hyrrn addressed to a stranger on his departure from a place to his own country.

The ancients had certain holy days, wherein they took leave of the gods with apophytic songs, as supposing them each returning to his own country.

APOPHYSIS. From apophysis, I declare, and I deny, in the Civil Laws, an acquittal or remission of the prince.

Among Logicians, the word is also used for a negation or denial.

APOPHISIS was also used for the account given of effluvia, at the exchange of them, for avoiding public employments. When any man would exclude himself from any troublesome and chargeable task, by calling it another richer than himself, the perfon produced had power to challenge him to make an exchange of effluvia, and thereby compel him to undergo the office he had before refused.

APOPHISIS. In Retorik, a figure whereby we really say or advise a thing, under a feigned flow of passing over or diffusing it.

Quintilian makes the apophysis a species of irony. Scleriger holds it the fame with what is otherwise called sccupation.

APORHEMATIZANTIA, (ex apophysis, pita, purgato), Masticatoria, Salivantia—Stalagmites. This term is applied to those remedies, by which a discharge of saliva is produced, or the evacuation of the saliva promoted. They are, properly speaking, evacuant, stimulating remedies, which, when they are chewed, or made to operate upon the internal parts of the mouth or throat, partly contribute to render the viscous fluid thinner, and partly produce a more copious flow of the saliva and other fluids, and their evacuation from the glanses situate within the cavity of the mouth, about the palate, pharynx, larynx, uvula, and tonsils. To these classes of remedies belong all those solid substantices, which can be moved backwards and forwards in the mouth, without injury; as in consequence of the preurface which they give to the salivary glands, and in the disposition of the discharge from those passages is increased; on this account such substantices are chosen for this purpose as poiffets at the same time a degree of acrimony. As a security against the infection of contagious diseases, it has therefore always been recommended to chew cubic, caranum, cinnamon bark, juniper berries, wax, marjoram, fange, anglicca root, and to spit out the saliva thus evited. More stimulating remedies of this kind are, tobacco-smoke, the leaves of tobacco, mustard seed, horse-radish, ginger, pepper, pimipinella, &c.

To the true stalagmites belong those powerfully revolentes, medicines, which dissolve the mucous and acid lymph to that
that degree, as to enable it to be separated and discharged
by the smallest reflexes of the glands;—to these belongs
Mercury.—However the use of dialogues cannot be rec-
commended without distinction, as they are detrimental to
debilitated constitutions, and those that are much inclined
to vomiting. They are prejudicial to ulcers, within the
cavity of the mouth, and are frequently fatal to emaciated and
pathical constitutions.

**APOPHORETA**, from αποφορεῖν, I carry away, in An-
tiquity, presents made to the gods at a feast or other enter-
ttainments, which they carry away with them.

**APOPHULADIES**, from αποφοραίον, unfortunate, derived
again from αποφορεῖν, I speak, in Phylus, denote a sort of
unhappy days, wherein neither one exist, or an ill one, is to
be expected.

**APOPHTHEGM**, from αποφθορίη, I speak, a short, sententious,
and instructive saying or maxim, delivered by a person of distingushed character.

Such is that of Cyrus: "He is unworthy to be a ma-
gistrate, who is not better than his subjects." Or this:
"He that will not take care of his own business, will be forced
to take care of that of others." Or that of Aesop: Mau-
mon, when reduced by hunger to loot of his baggage:
"How much pleasure have I hitherto lived a stranger to!"
Or that of Cato, "Homines nihil agendo diffici mulæ
agere." Or, finally, that of Anaxagoras, "fella lente." The
apopthegm of Plutarch are well known.

**APOPHYSGE**, in Architecture, that part of a column
where it begins to spring out of its base, and shoot upwards.
The word in its original Greek signifies flight; whence the
French also call it espace, congé, &c.; and we, sometimes, the
spring of the column.

The apophyses, in its original, was no more than the
ring or ferrule heretofore fallent at the extremities of wooden
pillars, to keep them from splitting; which afterwards was
imitated in stone-work.

It is properly a large concave or arched member, serving
either to connect two flat members together, or to join a flat
member to another not flat.

In this sense we may distinguish two apophyses, the up-
per and lower.

**APOPOMEI, upper**, is that part, or sweep, whereby a
large flat member of the upper part of an order is connected
to the lower.

This is also called by the French le congé d'embaut; and
by the Italians, il cavò di frora.

**APOPOMEI, lower, apophysis inferior**, is a concave mem-
er, which connects two flat parts in the lower half of an
order.

This the French call le congé d'emba; and the Italians,
le cavallo di fuofo. Sometimes also, il cavo di fuofo.

**APOPYSIS**, in Anatomy, a protuberance of a bone;
or a part eminent, and jutting out beyond the rest.
The word literally denotes a production outwards; formed from
αποφυτεῖν, to arise from. It is the fame with what
we otherwise call process, eminence, probol, projection,
protuberance, cephalis, head, and the like. Apophyses differ
from ephipheis, as these latter are only appendages adhering
to or connected to a bone; whereas the former are produc-
tions or continuations of the bone itself, growing out from
it like branches from the trunk of a tree. For an account
of the kinds of process or apophyses, which are found in the
skeloton, seeSkeleton.

**APOPHEIS, or Procillus mammillaris, a name given to
the olifatory nerves, when they lie on the cribiform lamalla
of the ethmoid bone.**

**APOPHEIS mammillaris, or mufoids, is a process in the
petrous part of the temporal bone.**

**APOPHEIS eruvia, denotes a large process of the
malleus of the ear, formed to give attachment to
muscles.**

**APOPHEIS is also applied by Hippocrates to certain
delicate excrences found in mules, and female fetuses of seven
months, as appearing rather pecuflag, and origins of
members, than distinct members, such as he says may be found
in male fetuses.**

**APOPHEIS, in Botany, excrences from the receptacle
of the musk.**

**APOPLANESIS, from ἀποπλανεῖν, I deceive, in Or-
tory, a kind of fallacious defence, and flattering over, dark-
ening, and concealing things, in order to blind the judges, or
the audience.**

**APOPLANESIS, in a more particular sense, denotes a sort
of confutation, wherein the speaker promises to answer what
the adversary objects in another place, but which being too
difficult to answer, is afterwards forgot and left to pass un-
answered.**

**APOPLETIC, relating to an apoplexy. Thus we
say, an apoplectic fit, an apoplectic water, &c.**

**APOPLETIC vein, a name sometimes given to the jugu-
laris.**

**APOPLETICA, apoplectic medicine, a name used by
some for what we more properly call antapoplecticis.**

**APOPLETICAL balms is a name given by some writers,
to a sort of sweet scented balms, prepared of distilled oils,
and used by way of perfume.**

**APOPLEXY, Apoplexia, in Medicine, a sudden priva-
tion of all the senses, and all the sensible motions of the
body, excepting the heart and lungs, attended with
an great depravation or suspension of the principal faculties
of the mind.**

The word comes from ἀποκλέω, to strike, or oftenis; this
disorder striking suddenly, and, as it were, like a flash of
lightning.

Hippocrates distinguishes two kinds of apoplecticis, the
one, strong, the other weak; only differing in the greater or
lesser difficulty of respiration and the circulation: in the
former the pulse and breath seem almost entirely stopped;
in the latter there are considerable remains of them.

The more modern authors distinguish apoplecticis from their
causes (affecting the brain, or nervous system in general), into
funicous, ferous, nervous, phusmodic, symptomatic, &c.
Diseases discover the funicous only; unless hydroceph-
us may be considered as producing cases of ferous apo-
plesy. The speedy recovery of the patient, in a considerable
number of instances, together with some other considerations,
have induced medical writers to admit the other species.
Whenever apoplexy is followed by paralysis, it appears from
diseases, that it always is of the funicous kind. For
Dr. Cullen's other species, see Hydrocephalus, Cata-
lepzia, Apophysia, &c.

The fit of apoplexy is usually preceded by a violent pain
in the head, a dimness and loss of sight or memory; some-
times by an universal indolence. It is attended with a flut-
tor and difficulty of breathing; sometimes with a fever,
with a fuming at the mouth; frequently with a sweat,
haemorrhoids, or diarrhoea.

With respect to the prostrate cause, a multitude of the
most accurate observations have made it appear, that this
disorder arises from any cause that is capable of preventing
either totally, or in part, the influx of the nervous fluid, sup-
posed to be secreted in the cerebrum, to the organs of senl

3 T 2
and voluntary motion; and the reflux of the same fluid from
the above mentioned organs to the common cavity in the
brain; whilst the precepts, and perhaps the returns of the
fluid, supplied by the cerebellum to and from the heart
and organs of respiration, is preferred in a degree sufficient
in some measure their functions.

All the remote, predisposing, or occasionally exciting
causes, as observed and delivered by authors, may for the
greater perpetuity be reduced to clausis; in the full of
which may be reckoned,

1. The natural make of the body. Thus, when the head
is naturally large, the neck short, and as it sometimes hap-
pens, confiding of six vertebrae, whereas there ought to
be seven; this structure disposes to apoplexy; as it fa-
vours the congestion of blood in the head. Thus also, if
the body is corpulent, the capillary arteries will in general
be subject to constrictions, or the circulation in them will
be more languid in proportion to that in the larger trunks;
and face and neck in particular are observed to be turgid, florid, or bloated.

2. To the second clas belong all those causes which in-
duce such a change in the blood, lymph, and nervous fluid,
as to render them incapable of circulating freely through
their respective vessels in the brain; till lately, this clas of
causes was considered as more generally applicable to
pathology than any other. At present, the existence of such
causes is more generally doubted than believed. So great, in-
deed, is the instability of Medical Theories at this time,
that many physicians of great respectability have seriouly
recommended our return to propriety Empiricism. As this,
however, is not likely to take place from, we shall mention
the causes which have been aligned by eminent Pathologists,
and leave their adoption or rejection to the judgment of
the public.

Among these are—polypous or granulous concre-
tions in the carotid or vertebral arteries, whether formed
originally about the heart, or within the cranium; there are
discovered by a palpitation of the heart, an unequal pulse,
a vertigo, and temporary loss of sight often recurring, and
which are increased by motion or heat: an inflammatory
fizmen of the blood, which may be known by an acute con-
tinual fever, an inflammatory pain in the head, eyes, &c.
—a thick, glutinous, and sluggish disposition of the whole
mass of blood: whence old people, those who are much
subject to catarrhs, whose constitutions are cold and moist,
and who are pale and lethargic, are very subject to
apoplexies. It is not difficult to preface an apoplexy from
this cause, as it is generally preceded by an universal bilfe-
nes and dulness of the feehes, unusual swoons of speech,
tremors, fetors, insulii (night mares), frequent discharges
of vile phlegm by vomit, vertigoes, shortness of breath on the
leat motion, with a compreession of the cartilages of the
nose.

3. To the third clas belongs whatever comprises the ar-
teries themselves, or the nervous brain and of the brain, so as
to prevent a free circulation of the fluids through them.
People who are plethoric and bloated are much subject to
this species of apoplexy; especially if extraordinary motion
or heat increase the velocity of the circulation. To such,
therefore, high feeding, spirituous liquors, acid medicines,
intense and long-continued thought, are pernicious. All
humors evacuated or effused within the cranium properly
belong to this clas; as also a too great velocity of the blood
in the vessels of the head, determined thither by some imped-
iment to the circulation in the inferior parts, which may arise
from an infinite number of causes. Hither also may be referred
all compressions, from whatever cause, of the veins without
the head, which convey the reflect blood from the contents
of the cranium toward the heart; as also effusions of blood,
pus, phlyct or lymph, which press externally on the durum
and pia mater.

To the fourth clas belong all those causes, which by
any means to dissolve the texture or tear down the coats
of the arteries, veins, or lymphatic, belonging to the internal
parts of the cranium; as to cause an extravasation of
their respective fluids, which then press upon and injure the
medullary origin of the nerves of the cranium.

Some sorts of poisons, which are suddenly deleterious,
may be ranked in the fifth clas; but these may either be
reduced to the second, third, or fourth, or may be more pro-
perly laid to act on the nervous fluid or the blood, than the
brain. Among these are the fumes of mineral sulphures,
of charcoal, or that gas which exhalas from vegetable juices
during fermentation.

The anatomical inspection of bodies which have died
of apoplexies, and the historical observation of such circum-
stances as occur in the treatment of these cases, furnish us
with a knowledge of their causes; and a due reflection upon
these naturally leads us to a distribution of them into the
preceding clas, which are well adapted to the investigation
of the first methods of cure. The part affected in a perfect,
vignt, or what Hippocrates calls a strong apoplexy, appears
to be the entire encephalum commune, or what has been
called the whole brain; but in a parapoplexy, those parts
only of the common encephalum which are more compressed
than the rest: whilst the cerebellum, and its dependencies,
remain in the beginning of the disorder unaffected. Boc-
hae.

As to the prevention and cure of apoplexy, no invariable
rules can be laid down; for as the predisposing and exciting
causes, together with the parts principally affected, are va-
rious, the method of relief must also vary; and must be at-
tempted before the predisposition grows inveterate, other-
wise successes will be very precarious.

In general, however, to prevent an apoplexy, wine, hard
labour, excess in eating, and sleeping after dinner, are to be
avoided: exercise is to be kept up, anxiety and chag-
in to be restrained. To cure an apoplexy, the indications
must be taken from the appearance and age of the patient;
but more particularly from the remote and proximate causes.
The peril being placed and supported as nearly in the fit-
ting posture as possible; and a free access of fresh air secure-
d; we must, during the fit, in the singular kind, em-
ploy copious evacuations of blood, sarum, and faeces.

The jugulars or temporal arteries should be opened as
soon as a proper operator can be procured. In default of
one, the vein of the arm or leg should be tried; or, cupping,
or leeches applied to the occiput and back of the neck, to
as to take away nearly a pint of blood. The head should
be shaved, and as soon as a leuaphasia has inflamed the skin,
an active blister must be applied to the whole occiput and
back of the neck. Sinapisms also should be applied to the legs.

When these steps have been taken, the patient should be
laid on his side, with the head raised; and a stimulat-
ing esynty with aloes and spiritus turpentine injected as soon
as possible: if no urine is evacuated with the return of the
clyster, the catheter should be introduced.

As soon as swallowing becomes practicable, ten or fifteen
grains of calomel should be got down, and repeated if ne-
necessary. If these means, duly employed, produce no relief
in twenty-four or thirty-six hours; the patient's recovery
will be very doubtful, if not impossible.

In the seconl kind, that is, where the patient has not
signs of fulness of blood, but on the contrary a poverty or
defect
defect of that fluid, blisters and evacuations of the bowels constitute the principal means of relief: bleeding, even with leeches, should be admitted with caution.

In the nervous or symptomatic species, the treatment will vary with the cause. When noxious gasses have been inhaled, or poison swallowed, the offending cause should be removed, and its place supplied by exhilarating air, or medicated food. Dr. Flemmng recommends treading for the cure of apoplexies. Med. Man. vol. ii. p. 223, &c.

Termination. The disease sometimes degenerates into a paralysis; and sometimes only half the body is affected, in which case it is called simply a hemiplegia. Apoplexy differs from carus, lethargy, and coma, as in those three ditempers the fluor is not to profound, nor is the sensation quite delirious.

It differs from introps, in that there is little or no sensible pulse in this last; whereas in an apoplexy, the pulse is often full, and perceptible almost till death. It differs from ejaculation, because no motion is abolished in that. as in this; and it differs from the palsy, inasmuch as the palsy is not attended with any flor, nor does it deprive the patient of sense and perception.

Apoplexy is also reckoned among the diseases of hawks; being a ditemper which fixes their heads, occasioned by too much gase and blood, or their having blood too long exposed to the best of the sun, or having taken too long flights in the heat of the day. Harpes are also staff to be subject to apoplexies, occasioned by want of exercise, or too plentiful feeding.

The ditemper swells itself by a giddiness, reeling, trembling, and sometimes falling suddenly down without sense or motion. The cure is by taking a large quantity of blood from the neck, and applying volatile spirits to the nostrils.

APOLISTAE, from απόσις and αὐτός, arms, in Ancient Laws, a fort of officers in the county, appointed to disarm all private persons, or those not entitled to have arms; for the prevention of mischief and violence.

APOPOMPÆ, in Antiquity, certain days in which sacrifices were offered to the gods called pompæi. Whose thefts deters, were, is doubtful.

APOPSICHA, from αἴσθησις, I expir, is sometimes understood of effluvia emitted from the sun, moon, and other heavenly bodies; to which their influence on funbly things was ascribed by astrologers.

APOQUEMENY Greek, in Geography, a creek of America, which falls into Delaware-bay from Middle-town, in Newchester-county in Delaware, a mile and a half beyond Reedy island.

APORIA, from ἀποτίμω, I doubt, in Rhetoric, denotes a state of doubt or wavering, wherein the orator appears undetermined whether to say any thing or not: e. g. "Eloquar, an fleam? Shall I speak out, or hold my tongue?"

The uncertainties arising from such a disorder of thought, and the hesitation produced by it, are naturally very moving. Of this kind is that of Cicero for Chaucius (c. i.): "I know not which way to turn myself. Shall I deny the scoundrel thrown upon him of bribing the judges? Can I say the people were not told of it? that it was not talked of in the court? mentioned in the Senate? Can I remove an opinion so deeply and long rooted in the minds of men? It is not in my power. You, judges, must support his innocence, and release him from this calamity." Orators sometimes begin their discourse with this figure; and as it expresses a diffidence of mind, and has an air of modesty, it tends very much to conciliate the affections of the hearers.

Livy gives us a very elegant example of this, in a speech of Scipio Africanus to his soldiers, when he called them together after a feation: "I never thought I should have been at a loss in what manner to address my army.—I am in doubt what or how to speak to you, not knowing what name to give you. Shall I call you citizens, who have re¬ volved from your country? Soldiers, who have disowned the authority of your general, and violated your military oath? Enemies? I perceive the men, the aspect, and habit of citizens; but discern the actions, words, deliges, and disputations of enemies." Livy, book xvii. c. 27. tome iv. p. 228. ed. Drakenb.

APORON, or APORIME, a problem difficult to resolve, though it be not certain that the resolution is impossible.

The word is derived from ἀπότιμω, which signifies something very difficult and impracticable; being formed from the privative α and ἀπότιμω, paphitis.

Such we conceive the quadrature of the circle; the du¬ plicate of the cube; the trisection of an angle, &c.

When a question was proposed to any of the Greek philoso¬ phers, especially of the sect of academists; if he could not give a solution, his answer was, ἀπότιμω, q. d. "I cannot conceive it; I am not able to explain it."

This word is also used by some law-writers for an inexp¬ licable speech or discourse.

APORROEAE, APORROEAE, in Philosophy, sulphur¬ ous effluvia, or exhalations, emitted from the earth and subterraneous bodies.

The word is formed from ἀπότιμω, defus, to from from.

APORROEAE, in Physics, is sometimes particularly used for morbid or contagious effusim, or exhalations from unwhole¬ some bodies. The word is also used to denote a shedding or falling of the hair. See APORROEAE.

APOSIOPESIS, from ἀποσιτεῖσθαι, I am silent, in Rheto¬ ric, otherwise called reticency, and suppression; a figure, by which a person really speaks of a thing, at the same time that he makes a show as if he would say nothing of it. See PRETERITION.

It is commonly used to denote the same with ELIPSIS. Jul. Scaliger distinguishes them. The latter, according to him, being only the suppression of a word; as "me, me: adsum qui feci?" the former, the omitting to relate some part of the action; as,

"Dixerat, atque illam media inter talia ferro Collapsam adspicient."
Apostasia, from ἀποστασία, I depart, &c. in Physic, usually signifies the same with abscense.

In which sense the word is used by Hippocrates and others, promiscuously with ἀποστασία, ἀποφασίς, ἀποφασίζω, &c.

Apostasis, in a more particular sense, denotes a departure or removal of the morbid matter, in the crisis or solution of a disease.

Apostasis is also used by Hippocrates for a fracture of a bone, wherein some part is entirely separated or broken off.

Apostasy, a deserting or abandoning of the true religion.

The word is borrowed from the Latin apostates, or ἀποστασία, to despise, or seduce, any thing. Hence apostates legis anciently hingisri to transgress the laws. Qui legis apóstatis terrae rubris suscitavit. I. L. Edw. Concell. The Latin apostates, as before, comes from ἀποστασία, from, and Ἀπόστασις, I stand.

Among the Romans, apostasy also signifies the forfaking of a religious order, whereas a man had made profession, without a lawful dispensation.

The ancient disdained three kinds of apostasy: the first, ἀναστρεπτόμενος, is committed by a priest, or religious, who abandons his profession, and returns to his lay state; the second, ἀναστρεπτόμενος Dei, by a peron of any condition, who abandons the commands of God, though he retains his faith; the third, ἀναστρεπτόμενος, by him who not only abandons his works, but also the faith.

There is this difference betwixt an apostate and a heretic; that the latter only abandons a part of the faith, whereas the former renounces the whole.

The primitive Christian church distinguished several kinds of apostasy. The first was that of those who relapsed from Christianity into Judaism: the second, that of those who blended Judaism and Christianity together; the third, that of those who so far complied with the Jews as to communicate with them in many of their unlawful practices, without making a formal profession of their religion: and the fourth, was that of those who, after having been Christians, voluntarily relapsed into Paganism. The perversion of a Christian to Judaism, Paganism, or another false religion, was punished by the emperors Constantius and Julian with confiscation of goods: to which the emperors Theodosius and Valentinian added capital punishment, in case of the apostate, preventing others to the same iniquity: a punishment, says Blackstone, too severe for any temporal laws to inflict upon any spiritual offences, and yet the zeal of our ancestors induced it into this country: for we find by history, that in his time apostates were to be burnt to death. It is also said to have been anciently punishable, in England, by burning, and being driven to bear a horn. Thus Rota, lib. i. c. 37. § 8. "Apostates & heretics, &c. &c." Aul. § 14. "Si inde convincatur, &c. &c." Where Du Cange interprets, "discrimini, ut tibi &c. &c.

This punishment has long ago become obsolete, and the offence of apostasy was for a long time the object only of the ecclesiastical courts, which corrected the offender "profane animas." Nevertheless, it was enacted by statute 9 and 10 Will. III c. 3. 32, that if any person engaged in, or making itself a profession of the Christian religion shall, by writing, publishing, teaching, or advising speaking, deny the Christian religion to be true, or the holy scriptures to be of divine authority, he shall, upon the first offence, be rendered incapable to hold any office or place of trust; and, for the second, he is rendered incapable of bringing any action, being guardian, executor, legatee, or purchaser of lands, and shall suffer three years imprisonment, without bail. To give room, however, for repentance, if, within four months after the first conviction, the delinquent will, in open court, publicly renounce his error, he is discharged for that once from all disabilities. Such, however, is the spirit of toleration which has prevailed in this country, that penal statutes in the province of religion, though they fall exit, have long lain dormant, and find few advocates in modern times.

APOSTATA capiendo, a writ which anciently lay against one, who having entered and professed some order of religion, broke out again, and wandered through the country, contrary to the rules of the order.

APOSTATE, in a general sense, signifies a defeter from the true religion.

In which sense apostate amounts to much the same as lapsed, perverted, &c.

APOSTERIGMA, from ἀποστήμιον and στίχος, I support, in the Ancient Physic, denotes a rest or support for a diseased part, without binding.

Such are pillows, cushions, and the like.

The word seems also to have been used by Hippocrates for a lopperage, or obstruction of some vascular part.

A POSTERIORI. Demonstration à posteriori. See Demonstration.

APOSTHUME, or Apostem, Apostemia, in Surgery, a preternatural tumor; called also abscess, and inflammation.

The word comes from εἰς ἀποστήμιον, abscedo, I depart from one place and fix in another, alluding to the manner wherein the tumor is usually formed of a translated humour.

Aposthume is particularly used for a diseased or heath, which occasions swellings in the head, arising from a redundancy of humour, and a preternatural heat of that part.

The aposthume discovers itself by a swelling of the eyes, a malaise ensuing from the ears, and their wings extremely thick.

APOSTIL, apostilla, in Matters of Literature, a marginal addition, or note to a book, pasillage, or the like.

APOSTLE, apostolos, one of the twelve disciples of Jesus Christ, commissioned by him to preach his gospel, and propagate it to all the parts of the earth. The word originally signifies a person delegated or sent; from ἀποστέλλειν, mitti; in which sense it occurs in Herodotus, and other profane authors. Hence, in the New Testament, the term is applied
APOSTLE.

applied to divers sorts of delegates; and to the twelve di-
ciples by way of eminence. They were limited to the num-
ber twelve, in allusion to the twelve tribes of Israel. (See
Mat. xix. 28 Luke. xxii. 30 Rev. xxi. 12, 14; and com-
pare Exod. xxiv. 4 Deut. i. 23 and John iv. 2, 3;) ac-
cordingly care was taken, on the death of Judas, to choose
another, to make up the number, Acts i. 21, 22, 26. This
seems to have been a token of respect to the Jews, pre-
vious to the offer of the Gospel to them; whereas, when
they had generally rejected it, two more, Paul and Barnabas,
were added, without any regard to the number of twelve.
Of the first election and commission of the twelve apol-
les, we have an account, Luke vi. 13 Acts. x. 1, &c. Hav-
ing chosen and constituted twelve persons, under the name
of Apostles, our blessed Lord determined that for some time
they should be continually with him, not only to attend upon
his public ministry, but to enjoy the benefit of his private con-
versation, that he might furnish them the better for the great
work in which they were to be employed; and that, at
length, after suitable preparation, he might, with greater
advantage, send them abroad to preach his Gospel, and
thus make way for his own visits to some more distant parts,
where he had not yet been. And to enable them more ef-
effectually to do it, he endowed them with the power of
working miracles, of curing diseases, and calling out di-
mon; well knowing that such endowments would command a re-
gard, notwithstanding the meanness of their origin and ap-
pearance. About the commencement of the third year of his
ministry, according to the common account of its du-
ration, he sent them out two by two, or in pairs, that they
might be agreeable companions and assistants to each other
in their work; and he commanded them to reft their
preaching and services to the people of Israel, and to avoid
going to the Gentiles or to the Samaritans; to declare the
approach of the kingdom of heaven, and the establishment
of the Gospel dispensation; to exercise the miraculous
powers with which they had been endowed gratuitously,
and to depend for their subsistence on the providence of
God, and on the donations of those to whom they ministered.
Their names were: Simon-Peter; Andrew, his broth-
er; James the greater, the son of Zebedee; and John his
brother, who was the beloved disciple; Philip of Beth-
saida; Bartholomew; Thomas, called Didymus, as he had
a twin-brother; Matthew or Levi, who had been a pub-
ic; James, the son of Alpheus, called James the less;
Lebbeus, surnamed Thaddaeus, and who was also called
Judas or Jude, the brother of James; Simon, the Cana-
aneus, so called, as some have thought, because he was a na-
tive of Cana, or Dr. Hammond thinks, from the He-
brew נֶפֶל, signifying the same with Zelotes, or the
Zealot, a name given to him on account of his having be-
fore professed a distinguishing zeal for the law; and Judas
Iscariot, or a man of Cariot (Josh. xv. 25), who after-
wounds betrayed him, and then hid violent hands on himself.
Of these four, viz. Simon, Andrew, James the greater,
and John, were fishermen; two, viz. Matthew, and James,
the son of Alpheus, were publicans; and the other six were
probably fishermen, though their occupation is not distinctly
specified.

After the resurrection of our Saviour, and not long be-
fore his ascension, the place of Judas the traitor was sup-
plied by Matthias, supphed by some to have been Na-
thaniel of Galilee, to whom our Lord had given the distin-
guishing character of an "Israelite indeed, in whom there
was no guile:" and the twelve apostles, whose number was
now completed, received a new commission, of a more ex-
tensive nature than the first, to preach the Gospel to all
nations, and to be witnesses of Christ, not only in Jeru-
lalem, in all Judea, and in Samaria, but unto the utter-
mmost parts of the earth; and they were qualified for the execution
of their office by a plenteous effusion of miraculous powers
and spiritual gifts, and partly by the gifts of tongues. In
consequence of this commission, they preached first to the
Jews, then to the Samaritans, and afterwards to the idola-
rous Gentiles. Their signal success at Jerusalem, where
they opened their commission, alarmed the Jewish Sanhedrin,
before which Peter and John were summoned, and from which
they received a strict charge never more to teach, publicly
or privately, in the name of Jesus of Nazareth. The noble
reply, and subsequent conduct of the apostles, are well
known. This court of the Jews was so awed and incensed,
as to plot the death of the twelve apostles, as the only ef-
effectual measure for preventing the further spread of Chris-
tianity. Gamaliel interposed by his prudent and moderate
conduct; and his speech had so good an effect upon the
Sanhedrin, that instead of putting the apostles to death,
they scourged them, removed their charge and threats,
and then dismissed them. The apostles, however, were not di-
couraged nor restrained; they counted it an honour to suffer
such indignities, in token of their affection to their master,
and zeal in his cause; and they persisted in preaching daily
in the courts of the temple, and in other places, that Jesus
of Nazareth was the promised and long-looked for Messiah.
Their doctrine spread, and the number of converts in Jeru-
salem still increased. During the violent persecution that
raged at Jerusalem, soon after the martyrdom of St. Stephen,
several of the leading men among the Churitians were dis-
missed; some of them travelled through the regions of
Judea and Samaria, and others to Damascus, Phœnicians,
the island of Cyprus, and various parts of Syria; but the
twelve apostles remained, with undaunted firmness, at Jeru-
salem, avowing their attachment to the perfected interest
of Christ, and confuting how they might best provide for
the unforeseen emergencies of the church, and its infant and
oppressed rate.

When the apostles, during their abode at Jerusalem,
heard that many of the Samaritans had embraced the Gos-
pel, Peter and John were deputed to confer upon them the
gift of the Holy Spirit; for to the apostles belonged the
jurisdiction of conferring upon others spiritual gifts and
miraculous powers. In their return to Jerusalem, from the
city of Samaria, they preached the Gospel in many Sam-
aran villages. The manner of its being sent to Ethiopia,
by the conversion of the enunuch who was chief treasurer
to Candace, queen of the country, is related in Acts. viii. 26.
&c. After the Christian religion had been planted in Jeru-
salem, Judea, and Samaria, and sent into Ethiopia, one of
the uttermost parts of the earth (Acts. i. 8;) and after it
had been preached about eight years to the Jews only; God,
in his wise and provident providence, disposed things for
the preaching of it among the Gentiles. With this
view, about the year 41, the next transition was to the de-
vot Gentiles within the borders of Palæstine. As they had
called off idolatry on the one hand, and on the other hand
had not submitted to the ceremonial part of the Jewish law,
they were better disposed and prepared for receiving the
Gospel. Caesarea was the scene in which the apostle Peter
was to open his commission for this purpose; and Cornelius,
one of the devout Gentiles, and a man distinguished by his
piety and charity, was a proper person to be selected as
the first proselyte to Christianity. After Peter had laid
the foundation of a Christian church among the devout Gentiles,
other Christians imitated his example, and a great number of persons of this description embraced the Christian faith, more especially at Antioch, where the Jews, whom their enemies had hitherto called Gileanians, Nazarenes, and by other names of reproach, and who, among themselves, had been called disciples, believers, the church, the saints, and brethren, were denominated, possibly not without a divine admonition, Christians.

When Christianity had been preached, for about eight years, among the Jews only, and for about three years more among the Jews and devout Gentiles, the next graduation of its progress was to the idolatrous Gentiles, in the year of Christ 44, and the 4th year of the emperor Claudius. Barnabas and Saul were elected for this purpose, and constituted in an extraordinary manner apostles of the Gentiles, or uncircumcised. Barnabas was probably an elder of the first rank; he had seen Christ in the flesh, had been an eyewitness of his being alive again after his crucifixion, and had received the Holy Spirit on the day of Pentecost, as being one of the 120. Saul also, since his conversion, had preached as a superior prophet, about seven years to the Jews only, and about two years more to the Jews and devout Gentiles. They had both been in Gentile countries: and therefore may he supposed to have had more respect and affection for the Gentiles, than most of the Jews who were natives of Judea. Saul had been converted, and had hitherto preached chiefly on Gentile ground; and he had joined with Barnabas in teaching devout Gentiles for a whole year, at Antioch in Syria; by all which previous steps they were regularly conducted to the last gradation, or the conversion of the idolatrous Gentiles. But it was necessary, in order to the being an apostle, to have seen our Lord Jesus Christ alive after his crucifixion, for the apostles were in a peculiar manner the witnesses of his resurrection. Some have supposed that Saul saw the person of Jesus, when he was converted, near the city of Damascus; but others, who conceive, from attention to the history of this event, that this could not have been the case, as he was instantly struck blind, are of opinion that the seerom, when his apostolic qualification and commission were completed, was that mentioned by himself (Acts, xxii. 17.), when he returned to Jerusalem the second time after his conversion; when he saw the Lord Jesus Christ in person, and received the command to go quickly out of Jerusalem, and was informed that he should be sent unto the Gentiles. See also, Acts, xxvi. 16—20., where he gives an account of the object of his commission. He also received a variety of gifts and powers, which, superadded to his own genius and learning, as well as fortitude and patience, eminently qualified him for the office of an apostle, and for that particular exercise of it which was assigned to him. St. Paul is frequently called the Apostle, by way of eminence; and the Apostle of the Gentiles, because his ministry was chiefly employed for the conversion of the Gentiles, as that of St. Peter was for Jews, who is therefore styled the Apostle of the Circumcision.

The apostles having continued at Jerusalem twelve years after the ascension of Christ, as tradition reports according to his command, determined to disperse themselves in different parts of the world. But what were the particular provinces assigned to each does not certainly appear from any authentic history. Socrates (Hist. Eccl. lib. i. c. 19.) says, that Thomas took Parthia for his lot; Matthew, Ethiopia; and Bartholomew, India. Eusebius (Hist. Eccl. lib. iii. ad init.) gives the following account: "Thomas, as we learn by tradition, had Parthia for his lot; Andrew, Scythia; John, Asia; who having lived there a long time, died at Ephesus. Peter, as it seems, preached to the dispersed Jews in Pontus and Galatia. Bithynia, Cappadocia, and Asia; at length, coming to Rome, he was executed with his head downwaid, as he had desired. What need I to speak of Paul, who fully preached the Gospel of Christ, from Jerusalem to Illyricum, and at last died a martyr at Rome, in the time of Nero?" From this passage we may conclude, that at the beginning of the 4th century there were not any certain and well attested accounts of the places out of Judæa, in which any of the apostles of Christ preached; for if there had, Eusebius must have been acquainted with them.

The stories that are told concerning their arrival and exploits among the Greeks, the Egyptians, the Samaritans, the Greeks, and Romans, are too advanced in their nature, and of too recent a date, to be received by an impartial inquirer after truth. These fables were for the most part forged after the time of Claudine, as we have said. It is beyond all question that no epistles or other doctrinal writings of any person who was of a rank below that of an apostle, were received by Christians as a part of their rule of faith. With respect to the writings of Mark and Luke, they are reckoned historical, not doctrinal or dogmatical; and Augustines says, that Mark and Luke wrote at a time when their writings might be approved not only by the church, but by apostles still living. The credit of men, not apostles, though they were companions of apostles, was admitted no farther than as historians, or reporters of what they had seen, or of what they had heard from apostles, or eye-witnesses, and ministers of the word.

The several apostles are usually represented with their respective badges and attributes: St. Peter with the keys; St. Paul with a sword; St. Andrew, with a cross or faldor; St. James minor, with a fuller's pole; St. John, with a cup, and a winged serpent flying from it; St. Bartholomew, with a knife; St. Philip, with a long staff, whose upper end is formed into a crook; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-axe; St. James major, with a pilgrim's staff, and a gourd bottle; St. Simon, with a corn; and St. Jude, with a club.

This appellation of Apostles was also given to the ordinary travelling ministers of the church. Thus St. Paul, in the epistle to the Romans, xvi. 7. says, "Salute Andronicus and Junia, my kindred and fellow-prisoners, who are of note among the apostles." In this inferior sense the appellation is applied by Clement of Alexandria, to Barnabas; and it is alleged that he was not an apostle in the highest sense of the word, fo as the twelve and Paul were apostles. Tertullian calls all the seven disciples, apostles; and Clement calls Barnabas apostolical only in another place, and says, that he was one of the seventy, and fellow-labourer of Paul. Thefe, says Dr. Lardner, are the highest characters which he really intends to give to Barnabas, and what he means when he styles him apostle; therefore he need not be apposed
APOSTOLIC was a title given to those sent by the churches to carry their arms to the poor of other churches. This usage is similar to the synagogues, who called those whom they sent on this mission, by the same name; and the function of office itself is known as apostolic. Thus St. Paul, writing to the Philippians, tells them, that Epaphroditus, their apostle, had ministered to his wants, ch. ii. 25. It is applied in like manner to those persons who first planted the Christian faith in any place.

Thus Dionysius of Corinth is called the apostle of France; Xaver, the apostle of the Indies, &c. In the East Indies the Jesuit missionaries are also called apostles.

In some ages of the church, the pope was peculiarly denominated the apostle.

Apostle, is also used among the Jews, for a kind of officers recently sent into the federal parts and provinces in their jurisdiction, by way of visitor, or commissary; to see that the laws were duly observed, and to receive the monies collected for the reparation of the temple, and the tribute payable to the Romans.

The Theodotian code, lib. xiv. De Judeis, calls those apostoli, qui ad exiendum eorum augebat inopia, aisiarchia eis tempore diriguntur. Julian the Apostate remitted the Jews the aposto, σειράς; that is, as he himself explains it, the tribute they had been accustomed to fend him.

These apostles were a degree below the officers of the synagogues called patriarchi, and received their commissions from them. Some authors observe, that St. Paul had borne this office; and that it is this he alludes to in the beginning of the Epistle to the Galatians: as if he had said, Paul, no longer an apostle of the synagogue, nor sent thereby to maintain the law of Moses, but now an apostle and envoy of Jesus Christ, &c. St. Jerom, though he does not believe that St. Paul had been an apostle of this kind, yet imagines that he alludes to it in the passage just cited.

Apostle, in the Greek Liturgy, is particularly used for a book containing the Epistles of St. Paul, printed in the order wherein they are to be read in churches, through the course of the year. Another book of the like kind containing the Gospels, is called Συναγωγας, Gospel.

The apostle, of late days, has also contained the other canonical Epistles, the Acts of the Apostles, and the Revelations. Hence it is also called Acts of the Apostles, Πραξεων των Αποστολων, that being the first book in it.

Apostle is also thought by many to have been the original name for bishops, before the denomination bishop was appropriated to their order. Thus Theodoret says expressly, the same persons were anciently called promiscuously both bishops and presbyters, whilst those who are now called bishops were called apostles.

In the arsenal of Bremen, there are twelve pieces of cannon, called the Twelve Apostles, or a supposition that the whole world must be convinced, and acquiesce in the preaching of such apostles.

Apostles' Creed. See Creed.

Apostles, in Ecclesiastical History. See Apostolic.

APOSTOLIC, or APOSTOLICUM, in Geography, a cape on the east coast of Siberia, at the west end of the Amuriokul gulf in the North Pacific Ocean. N. lat. 63°. E. long. 179° 14'.

APOSTOLICUM, or APOSTOLIC, in Ecclesiastical Writers, denotes a church dedicated to, and called by the name of an apostle.

Vol. II.

Apostolic events, see History.

Apostolic letters, see Letters.

Apostolic traditions, see Tradition.

Apostolic Fathers is an appellation usually given to the writers of the first century, who employed the pen in the cause of Christianity, and who had conversed with the apostles, or their disciples. To this class are referred, Cle-

Sozomen speaks of the apostolium of St. Peter at Rome, and the apostolium of St. Peter and St. Paul a Quercus near Chalcedon.

In this sense apostolium falls distinguished from prophete, martyrion, &c.

APOSTOLIC, Apostolicare, apostolizing, in some Middle Age Writers, denotes the being preferred to the dignity of pope.

APOSTOLATE, in a general sense, is used for mission. In this sense, Olearius has a discourse concerning the apostolate of Christ. L. p. 1681, 4to.

Apostolate more properly denotes the dignity or office of an apostle of Christ; but it is also used in ancient writers for the office of a bishop.

In this sense, we meet with several letters, petitions, requests, &c. directed to bishops under the title of your apostolate, or apostolatus ejusque.

Thus the title apostolus had been appropriated to the pope, to that of apostolatum became at length restrained to the sole dignity of the popedom.

Every bishop's see was anciently dignified with the title of fides apostolica, an apostolic see, which is now the peculiar denomination of the see of Rome.

APOSTOLIC, in Latin, denotes those letters missive which are demanded in cases of appeal.

APOSTOLIC, Apostolical is anything which relates to the apostles, or descends from them.

Thus we see, the apostolical age, apostolical doctrine, apostolical character, confessions, traditions, &c.

APOSTOLIC, in the Primitive Church, was an appellation given to all such churches as were founded by the apostles; and even to the bishops of those churches, as being the reputed successors of the apostles. These were confined to four, viz. Rome, Alexandria, Antioch, and Jerusalem.

In after-times, other churches assumed the same quality, on account, principally, of the conformity of their doctrine with that of the churches which were apostolical by foundation, and because all bishops held themselves successors of the apostles, or acted in their dioceses with the authority of apostles.

The first time the term apostolical is attributed to bishops, as such, is in the letter of Clovis to the council of Orleans, held in 511; though that king does not there expressly denominate them apostolical, but apostolica sedes dignissimo, highly worthy of the apostolical see. In 521, Guntram calls the bishops, met at the council of Mason, apostolical pontiffs, apostolici pontifices.

In progress of time, the bishop of Rome growing in power above the rest; and the three patriarchates of Alexandria, Antioch, and Jerusalem, falling into the hands of the Saracens, the title apostolical was restrained to the pope, and his church alone. Though some of the popes, and St. Gregory the great, not contented to hold the title by this tenure, began at length to insist that it belonged to them by another and peculiar right, as being the successors of St. Peter. The council of Rheims, in 1049, declared that the pope was the sole apostolical primate of the universal church.

And hence a great number of apostolical; apostolical see, apostolical munici, apostolical note, apostolical brief, apostolical chamber, apostolical vicar, &c.

Apostolic clerks, see Jesuatis.

Apostolical canons, and constitutions; see Canons, and Constitutions.

Apostolical traditions, see Tradition.

Apostolical Fathers is an appellation usually given to the writers of the first century, who employed the pen in the cause of Christianity, and who had conversed with the apostles, or their disciples. To this class are referred, Cle-
APOSTOLICI, APOSTOLI, or APOSTLES, in Ecclesiastical History, was a name assigned by three different sects, on account of their pretending to imitate the manner and practice of the apostles. The first APOSTOLI, otherwise called Apostolical, is the term given to the Oriental, or Coptic, Church, in the third century. They made profession of abstaining from marriage, and the use of wine, fish, money, &c. See Apostolici.

Gerhard Sagarelli was the founder of the second sect; he obliged his followers to go about from place to place as the apostles did, to wander about clothed in white, with long beards, dishevelled hair, and bare heads, accompanied with women, whom they called their spiritual sisters. They likewise renounced all kinds of property and possessions, inveighed against the growing corruption of the church of Rome, predicted its overthrow, and the establishment of a purer church on its ruins. With this practice, they made little or no alteration in the doctrinal part of the public religion; but they principally aimed to introduce among Christians, the simplicity of the primitive times, and more especially the manner of life that was observed by the apostles. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards succeeded by Dulcinus, a native of Novara, who added to the character of an apostle the office of a prophet and general, and carried on a bloody and dreadful war for the space of more than two years against Raynerius, bishop of Vercelli; he was at length defeated, and put to death in a barbarous manner, in the year 1307, together with Margaret, whom he had chosen for his spiritual sister, according to the custom of the sect. Nevertheless this sect flurished in France, Germany, and in other countries, till the beginning of the fifteenth century, when it was totally extinguished under the pontificate of Boniface IX.

The other branch of APOSTOLI were of the twelfth century. These also condemned marriage, preferring celibacy, and calling themselves the chaste brethren and sisters; though each was allowed a spiritual sister, with whom he lived in domestic relations; and on this account they have been charged with concubinage; they held it unlawful to take an oath; they set aside the use of baptism; and in many things imitated the Manichees. Bernard wrote against this sect of Apostolici.

APOSTOLICUM is a peculiar name given to a kind of long or hymn, anciently used in churches.

The Apoliticalum is mentioned by Greg. Thaumaturgus as used in his time. Vossius understands it as spoken of the apostles' creed. Suicer thinks this impossible, because this creed was then unknown in the churches of the East.
APOTELESMA, the science of apotefis, or the art of foretelling future events, from the aspects and configuration of the heavenly bodies.

In this sense the word amounts to the same with what we otherwise call judicial astrology.

APOTHECARY, a person who professes the practice of pharmacy, or that part of physic, which consists in the preparation and composition of medicines:

The word is derived from απόθεος, apotheos, the place where he makes up and expotes his medicines to sale. The apothecaries in England are obliged to make up their medicines according to the formulas prescribed in the College Dispensatory.

Their shops are subject to the visitation of the censors of the College, who are empowered to destroy such medicines as they think not good.

The company of apothecaries was incorporated by charter from James I. procured at the solicitation of Dr. May-erne and Dr. Atkinis; till that time they only made a part of the grocers' company; plums, sugar, spice, Venice-trace, mithridate, &c. were sold in the same shop, and by the same perfon. The reason of separating them was, that medicines might be better prepared, and in opposition to divers persons who imposed unwholesome remedies on the people. Obscr. on Cafe of Will. Role, feét. 2.

In the year 1712, the 10th of queen Anne, an act passed for reviving and continuing several acts therein mentioned, one whereof was for exempting the apothecaries from serving the offices of constable and scavengers, and other parish and ward offices, and from serving upon juries; which act was made perpetual in the ninth year of George I.

They have a hall in Black-Friars, where there are two fine laboratories, out of which all the surgeons' chests are supplied with medicines for the royal British navy.

To his majesty belong two apothecaries; the salary to the first, 320 l. to the second, 275. To the houehold belong also two. The charitable dispensation of medicines by the Chirne is well deferving notice. They have a flone, which is ten cubits high, erected in the public squares of their cities; and on this flone are engraven the names of all forts of medicines, with the price of each; and when the poor fland in need of any relief from physic, they go to the treafury, where they receive the price each medicine is rated at.

APOTHECARY, apothecaries, in Writers of the Middle Ages, denotes a shop-keeper, or warehouse-keeper.

Apothecarius is also used to denote a florce-keeper, or officer appointed to have the direction of a magazine, granary, &c.

In which sense apothecarius is sometimes rendered by berce-arii and rationarii.

APOTHEOSIS, derived from απόθεωσις, apotheosis, God, in Antiquity, a heathen ceremony, whereby their emperors and great men were placed among the gods.

After the apotheosis, which they also called delification and consecration, temples, altars, and images were erected to the new deity; sacrifices, &c. were offered, and colleges of priests instituted. Dico. 47. 56. 59. Suct. Aug. 5. Tib. 46. Patrec. 1. Ovid. Pount. 4.

Images were erected to them, with the attributes of divinity (Lucan 7. Dio. 53. Capitolin. Antonin.).

The Perians, according to Herodotus (I. i. c. 131. 1. viii. c. 143.), never conceived that their gods were deified men; and Jablonski, in the prolegomena to his

Panthon
"Pantheon Egytorum," maintains that it was a fundamental principle in the mythology of the Egyptians, not to defile any mortal. The Greeks, it is said, were the first who admitted this practice; and the heroes of the first ages were of this description. Under the Caesars, the Romans imitated the Greeks; at first they contented themselves with defacing Romulus, their founder; but having lost their liberty under Julius Cæsar, they allowed Augustus, his successor, to acknowledge him as a god, to build temples in his honour, and to offer sacrifices to him. Augustus, at the age of twenty-eight years, was declared the tutelary god of all the cities of the empire. The example was followed by succeeding emperors; so that they elevated to the rank of gods, not only the most stupid, such as Claudius, but the most wicked and abandoned; and the appellation "Divus" was assumed among their ordinary titles.

It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees, that virtuous persons, after their death, were raised into the order of gods. And hence the ancients defined all the inventors of things useful to mankind; and those who had done any important service to the commonwealth. Tiberius proposed to the Roman senate the apotheosis of Jesus Christ, as is related by Eusebius. Tertullian, and Chrysostom. Juvenal, railing at the frequent apotheoses, introduces poor Atlas complaining that he was ready to sink under the burden of so many new gods as were every day added to the heavens. Seneca ridicules the apotheosis of Claudius with admirable humour. Herodian, lib. iv, in speaking of the apotheosis of Servius, gives us a very curious description of the ceremonies used in the apotheosis of the Roman emperors. After the body of the deceased emperor (said he) had been burnt, with the usual solemnities, they placed an image of wax, perfectly like him, but of a sickly aspect, on a large bed of ivory, covered with cloth of gold, in the vestibule of the palace. The greatest part of the day, the Senate met ranged on the left side of the bed, drest in robes of mourning; the ladies of the first rank sitting on the right side, in plain white robes, without any ornaments. This lasted for seven days succeedingly, during which the physicians came from time to time to visit the sick, always making their report that he grew worse, till at length they published that he was dead.

This done, the young senators and Roman knights took the bed of state upon their shoulders, carrying it through the Via Sacra, the Old Forum, where the magistrates were used to dwell themselves of their offices. There they set it down between two kinds of amphitheatres, in the one whereof were the young men, and in the other the maidens, of the first families of Rome, singing hymns set to solemn airs, in praise of the deceased. The hymns ended, the bed was carried out of the city into the Campus Martius, in the middle of which place was erected a kind of square pavilion, the inside whereof was full of combustible matters, and the outside hung with cloth of gold, and adorned with figures of ivory, and various paintings.

Over this edifice were several others, like the first in form and decoration, but less; always diminishing and growing slenderer towards the top. On the second of these was placed the bed of state; and a great quantity of aromatic perfumes, and odoriferous fruits and herbs were thrown all round; after which the knights made a procession or cavalcade in solemn measure around the pile; several chariots also run round it, those who conducted them being clad in purple robes, and bearing the images of the greatest Roman emperors and generals.

This ceremony ended, the new emperor came to the cataphalx, or pile, with a torch in his hand; and, at the same time, fire was set to it on all sides; the splices and other combustibles kindling at once.

While this was doing, they let fly from the top of the building an eagle, which, mounting into the air with a freebrand, carried the soul of the dead emperor along with it into heaven. Augustus believed; and thenceforward he was ranked among the gods. It is for this reason, that the medals, wherein apotheoses are represented, have usually an altar with fire upon it, or else an eagle taking its flight into the air, and sometimes two eagles.

There are several curious and celebrated monuments of antiquity under the denomination of apotheoses: the first and principal is the apotheosis of Homer, said to have been the work of Archelaus of Priena, a famous ancient sculptor, and discovered, in 1668, in the Apian way near Albano, in a place formerly called Ad Bevillias, but now Pratale, belonging to the prince of Colonna, where the emperor Claudius had a house of pleasure. This is now one of the principal ornaments of the palace of those princes at Rome. To decipher the figures upon this monument, has been the labour of several celebrated antiquarians, such as Kircher, Cuper, Spanheim, Heinsius, Gronovius, Wetstein, Schott, and Winkelman. The apotheosis of Homer has also been represented on a silver vase, in the form of a mortar, and found at Herculaneum. The apotheosis of Romulus was published at Florence, in 1719, and by Montfaucon, in the third volume of the Supplement to his Antiquities. This work was executed at the time when the arts declined, and was intended to be presented in the Quirinal fields, or in some other games celebrated by horse races in honour of Quirinus, and called Quirini Circenses. The apotheosis of Julius Cæsar is exhibited on a gem in the museum of Brandenburg. Cæsar is mounted on a cedal globe, and holding in his hand an helm and a large crown of laurel. The apotheosis of Augustus is represented on a beautiful agate, which the emperor Baldwin II., when in 1244, he fought success of the Christian princes, and particularly of St. Louis, is said to have sold to the pious monarch, who deposited it in the museum of the holy chapel at Paris. See Agate. The apotheosis of Germanicus is the subject of a precious gem; that of Claudius is a basse-relieu; that of Titus is exhibited in the arch of Titus at Rome; and that of the younger Faustian, represented in basse-relieu in the Capitol, is mentioned by Montfaucon in the fifth volume of his Supplement.

Apothepalia, from ἀπόθεωσις, to set above, in Physis, properly denotes a complete or finished cure.

Apothepalia is also used, in the Gymnastic Art, for the last part of all regular exercise, viz. friction or union with oil, before as well as after bathing.

The design of this was partly to cleanse the skin from any fifth or dui it might have contracted during the exercise, and partly to remove weariness.

Apotheparium, from ἀπόθεωσις and ἱερός, holy, in Ancient Writers, a sharp kind of sauce, like that prepared of mustard, oil, and vinegar, or of vinegar alone.

Apothome, in Mathematics, the difference of two incomparable quantities: such is the difference between √2 and 1; and luch is the excess of the diagonal of a square above its side.

The word is derived from ἀπόθεωσις, to set off.

Euclid (lib. x.) makes six forts of apotomes.

Apothome prima, is when the greater number is a rational number, and the difference of the squares of both numbers is a square number, e.g. 3 = √5.

Apothome secunda, is where the lesser number is a rational number, and the square root of the difference of the squares of both numbers has a ratio expressible in numbers to the greater
greater number; such is \( \sqrt{18 - 4} \), since the difference of the squares 18 and 16 is 2, and \( \sqrt{2} \) is to \( \sqrt{18} \) as 1 to 3, because \( \sqrt{18} = 3 \sqrt{2} \).

**Apotome tertia** is when both the numbers which are subtracted from each other are irrational numbers, and the square root of the difference of their squares has a ratio to numbers to the greater. This holds in \( \sqrt{24 - 18} \), for the difference of their squares 24 and 18 is 6, and \( \sqrt{6} \) is to \( \sqrt{24} \) as 1 to 2, for \( \sqrt{24} = 2 \sqrt{6} \).

**Apotome quartia** is when the greater number is a rational number, and the square root of the difference of the squares of both numbers has no ratio to it in numbers: such is \( \sqrt{4} - \sqrt{2} \), for the difference of the squares 6 and 4 is 2, and \( \sqrt{2} \) has to \( \sqrt{6} \) no ratio in numbers.

**Apotome quintia** is when the lesser number is a rational number, and the square root of the difference of the squares of both numbers has no ratio to numbers to the greater number: such is \( \sqrt{6} - \sqrt{2} \), for the difference of the squares 6 and 4 is 2, and \( \sqrt{2} \) has to \( \sqrt{6} \) no ratio in numbers.

**Apotome sexta** is when both numbers are irrational, and the square root of the difference of their squares has no ratio in numbers to the greater: such is the case in \( \sqrt{6} - \sqrt{2} \), for the difference of the squares 6 and 4 is 2, and the root thereof has to \( \sqrt{6} \) no ratio in numbers. Peter Ramus cenures Euclid’s doctrine of *apotomes*, and even all the rest delivered in the tenth book concerning irrational lines.

**Apotome, in Muffe, is the difference of the tone major and limma, expressed by \( \frac{1}{2} \).**

The Greeks thought that the greater tone could not be divided into two equal parts; for, reason they called the first part \( \alpha \), and the other \( \lambda \): in this imitating Pythagoras and Plato.

The *apotome* is by some authors, as Boethius, called *bimiotomion major*: and the *limma*, *bimiotomion minor*. He also calls the difference of these two *comma*. The interval of two sounds expressed by \( \frac{1}{2} \), was called by the ancients *apotome major*; and that expressed by \( \frac{1}{2} \), *apotome minor*.

**Apotopote Bay, or Round bay, in Geography, lies on the S. W. coast of Otaheite, in the Pacific Ocean.**

**Apotropæa, from ἀπωτρόπαια, I avert, in the Ancient Poetry, verfs composed for averting the wrath of divinities: and the deities invoked for averting any threatened misfortune were called *apotropæans*: they were also called *Alessi, from ἀλλαξει, I drive away; and *Aventurni, from avventuro, which denotes the fame.***

**Apozemy, derived from ἀπωτρόπαια, fervefcio, I make hot, in Medicine, a form of remedy, otherwise called a decoction; which see.**

**APP, in Ancient Geography, a town of Arabia Felix, according to Ptolomy.**

**APPACK, or APPACH, in Geography, a town of Africa, in the country of Ardah, on the slave coast.**

**APPANCE, or APPENACE. See APPANCE.**

**APPARATOR. See APPARATOR.**

**APPARATUS, from apparo, I appear, properly signifies a formal preparation for some public and solemn action. We say, the apparatus of a feast, coronation, &c. The prince made his entry with great apparatus and magnificence.**

**Apparatus is also ufed for the utensils and appendages belonging to some more considerable machine; as the furniture or apparatus of an air-pump, microscope, &c.**

The term *apparatus* is used in Chemistry, either generally, to express the whole of the instruments and vessels in which or by whose means any processes is performed, or in a more limited sense, it is applied to those complicated instruments, for the most part of modern invention, in which a number of separate parts are combined into one whole. Thus a retort, according to the former application of the term, is an article of chemical apparatus; a receiver is another article; and these two when combined form the retort and receiver, one of the simplest species of *distillary apparatus*, according to the latter method of applying the term. Thus also the complicated arrangement of vessels invented by Woulfe, is called Woulfe’s apparatus, that executed by Nooth is called Nooth’s apparatus. It might seem at first sight that this was the proper place to introduce all that we shall have to say concerning chemical apparatus, but by doing the article would be extended to an unseemly length; we have therefore adopted the method of defining every general article under its proper name; of which the articles *Alembic and Alumel,* already printed, are examples; and the apparatus for particular experiments is described where the experiments themselves are mentioned; thus under the article *Alcohol* will be found a description of the apparatus invented by Lavoisier for the combustion of that fluid. Certain kinds of apparatus have also a necessary connection with each other, either in similarity of form, or of the uses to which they are applied; there will be found therefore in the course of the work certain general articles, such as *Distillary apparatus*, *Pneumatic apparatus*, &c. where these topics will be discussed.

**Apparatus, in Surgery, consists of such outward applications as are usually termed Dressings, together with such instrumental means as are requisite for the performance of any surgical operation; e.g. bandages, lint, pledgets, tents, compresses, ointments, and various machines. Previous to the performance of any chirurgical operation, a surgeon should always consider what sort of apparatus will be necessary; and he should never, for the sake of parade or ostentation, bring together any instruments which may as well be dispensed with: Modern surgery has very widely laid aside a number of uncouth, clumsy, and terrible instruments employed by our ancestors, especially the tools named cauterizing-irons (see *Cautery*), and the immense levers, &c. for reducing dislocations or fractures. Whatever is indispensably necessary in operations, should be prepared before the time fixed for their performance; and it ought to be an invariable rule among surgeons, to prevent the patient from seeing his formidable apparatus, lest he be thereby intimidated and discouraged at the very moment he most stands in need of resolution: for inalties are not wanting of patients actually dying from the effects of terror, without having undergone the intended operation.**

The term *apparatus* is sometimes used to distinguish the operation of *Lithotomy or Cystotomy*; thus we say, the greater apparatus, the lesser apparatus, &c. See *Stone, cutting for the.*

**Apparatus is also used as a title of several books composed in form of catalogues, bibliothecas, dictionaires, &c. for the ease and convenience of study.**

The apparatus to Ciceron, is a kind of concordance or collection of Cicernian phrases, &c. The apparatus facer of Poffevin, is a collection of all kinds of ecclesialical authors, printed in 1611, in three volumes.—Glossaries, comments, &c. are also frequently called *apparatures.*

**Apparent, from apparo, I appear, that which is visible to the eye, or evident to the understanding.**

**Apparent, in Mathematics and Astronomy, is ufed to signify things as they appear to us in contradistinction from real or true; and in this respect the apparent flate of things is often very different from their real state; as in the case of distance, magnitude, &c.**
APP

APPARENT Altitude, Conjunction, Diameter, Distance, Figure, Horizon, Magnitude, Motion, Place, Time, &c. See the several tabulations.

APPARENT, Heat, in Lat. See Heat.

APPARENT Island, in Geography, lies in Dulcey bay, on the coast of New Zealand, and is placed by captain Cook on an arm, which captain Vancouver found to be divided into two branches, leaving that island a peninsula joined to the main land by a very high though narrow ridge of mountains; the perpendicular height and very extraordinary shape of the rocky part fronting the arm, render it a most singular and majestic promontory. As the entrance of these arms was called by Cook "Nobody knows what;" Vancouver, having particularly examined them, called them "Somebody knows what." Voyage round the World, vol. i. p. 63.

APPARITION, in Astronomy, denotes a star's or other luminary's becoming visible, which before was hid.

In which sense the word stands opposed to occultation. Thus the helical rising is rather an apparition than a proper rising.

APPARITION, circle of perpetual. See Circle of perpetual apparition.

APPARITION, in a general sense, is the appearance or semblance of a thing.

APPARITION is also used to denote a spectre, or preternatural appearance of some spirit, or the like.

We read of apparitions of angels, genii, demons, fairies, witches, departed souls, &c. apparitions of God, of Christ, the Virgin, saints, prophets, and of the devil himself.

Among the most zealous advocates of the reality of apparitions and witchcraft, we may reckon Dr. Henry More, Baxter, and Glanvil. The latter, in particular, has attempted, in a treatise entitled, "Saduceismus triumphatus," to prove the doctrine of apparitions, by arguments deduced from the nature of the soul, the testimony of scripture, and the evidence of fact; and he expressly asserts (Part II. p. 2.) that those who deny and deride the existence of apparitions and witchcraft, are prepared for the denial of spirits, a life to come, and all the other principles of religion. It is a strong presumption against the reality of apparitions, however anciently and generally the belief of them has prevailed, that they have been connected with some causes and circumstances of terror, either real or apprehended; and these have previously dispossessed the imagination for being imposed upon and deluded. The darkness of the night, the gloom that has overspread particular situations, the horror produced by the record of some diabolical occurrence, such as murder or the like, and a state of mind naturally depressed and melancholy, and of course easily alarmed, have contributed to give rise to many of those stories, that have been credulously received and as obstinately vindicated and sedulously disseminated by the vulgar. The ancients also entertained some notions concerning the state of the soul on its escape from the body, which favoured this opinion; and they were disposed to seek the spirits of their deceased ancestors near the habitations in which their bodies were deposited. Hence they would be easily led into deception; and when they fancied that they actually saw their departed friends, they distinguished the phantoms which were merely the creations of their own fancy, by the name of "shades." It ought also to be considered, that the relation and belief of apparitions have prevailed chiefly in times of ignorance, and amongst those who had the fewest opportunities for inquiry and instruction. In fact, as the night has been the season to which the appearance of ghosts has been referred, the belief of their reality has gradually subsided in proportion to the degree in which knowledge has been diffused. It ought also to be considered, that apparitions are machines that on particular occasions have been of good service to generals, to ministers of state, to priests, and others; to lay nothing of the very injudicious and culpable use that has been made of them by those with whom the care of children, at a period when their imagination is easily impressed, has been entrusted. Upon the whole, it must be allowed, that many of the apparitions that are recorded by writers, or reported by tradition, are mere delusions; others are fictitious contrived merely to amuse or to answer some purpose; and others have originated in dreams or deliriums. There are instances of shadows when we are not in the being asleep. On this principle, Hobbes (Treatise of human nature, part i. c. 2. Works, p. 102.) has endeavoured to account for the spectre that is said to have appeared to Brutus. "We read," says he, "of Marcus Brutus (one that had his life given him by Julius Caesar, and was also his favourite, and not withstanding murdered him), how at Philippi, the night before he gave battle to Augustus Caesar, he saw a fearful apparition, which is commonly related by historians as a vision; but considering the circumstances, one may easily judge to have been a short dream. For sitting in his tent pensive and troubled with the horror of his rash act, it was not hard for him, flumbering in the cold, to dream of that which most alarmed him; which fear, as by degrees it made him awake, so also it must needs make the apparition by degrees to vanish; and having no assurance that he slept, he could have no cause to think it a dream, or any thing but a vision." The well-known story told by Clarendon, of the apparition of the duke of Buckingham's father, has been solved in a similar manner. There was no man in the kingdom so much the subject of conversation as the duke; and his character was so corrupt that he was very likely to be misled by the enthusiasm of the times: Sir George Villiers is said to have appeared to him at midnight; and hence it appears probable that the man was asleep; and as he was terrified by the dream, it must have made a strong impression, and was likely to be repeated.

Mr. Andrew Baxter, in his "Essay on the phenomenon of dreaming," recurs to the principle "that our dreams are prompted by separate immaterial beings," in order to account for apparitions. If the power of such beings be unrestrained, this author maintains, that it will equally possess the fancy with delusive fancies, without waiting for the occasion of sleep to introduce them, and obtrude them forcibly upon the organ, amidst the action of external objects. For it requires but a greater degree of the same power to make delusive impressions upon the faculty, while real external objects are making true impressions upon it, than it would require to make the same impressions, while no other impression from external objects is made upon it at the same time. "If our imaginations," says Dr. Tillotson in one of his sermons, "were let loose upon us, we should be always under the most dreadful terrors, and frightened to distraction with the appearance of our own fancy; and an over-ruling power restrains these effects;" i.e. as Mr. Baxter conceives, by restraining the power of invisible beings, which would otherwise incessantly delude the soul with such unpleasing visions. Upon this hypothesis, he thinks there is nothing inconsistent in the relations of apparitions which we meet with in history, whether the facts be true or false; for these spirits may, upon some important occasions, be licenced to affect the faculty, according to the exigency of the case, that the whole scene of vision, which is then thought to have an existence from without, may be the effect of impressions made on the brain only. Thus, for instance, that apparition mentioned before which was presented to Brutus before he came
APP

over from Afia, and again the night before the battle of Philippi, the noise as of one entering into his tent which he heard, and the words spoken, “I am, O Brutus, thy evil genius, but thou shalt see me again near Philippi,” might all be only inward representations upon the fenfory, and any other person present might neither have heard nor seen any thing. This, in our author’s opinion, affords a better account of the appearance than that of Hobbes, who makes cold dreams and visions of fear, without either reaft or experience to support his affeotions. He makes Brutus to be sleeping, but Plutarch tells us, that he had slept the former part of the night immediately after eating, and had risen to digeft something in his own mind; fo that, according to Hobbes’s scheme, it was a waking vision, and it occurred without any previous distemper either external or internal. The cafe of Dion, related by Plutarch, is alleged to the fame purpofe; for he was fitting in the porch of his own house in a thoughtful and meditating attitude, when the fpirits appeared to him; and this happened while the affaffins were contriving his death, a little before he was crueltiy murdered. No men in antiquity could be lefs liable to the fimulation of weaknefs and credulity than Brutus and Dion; and therefore, according to Mr. Baxter, the terror they experienced must have proceeded from the power of some superior being. Upon the whole he thinks that although Δινογειως, or a fear of spirites, hath been much abused by vain or weak people, and carried to an extreme, perhaps by designing and crafty men, the molt rigorous philosophy will not juftify its being entirely rejected. It is true, he adds, no evil can happen to us in God’s world but by our own fault; but that subordinate beings are never permitted, or commissioned to be the ministers of his will, is a hard point to be proved; and that direct atheifm is better than this delufion is horrid. See Effay on the phenomenon of dreaming, in the “Inquiry into the nature of the human foul,” vol. ii. p. 111, &c.

The abbe de St. Pierre has a ditercure expressly on the physical method of solving or accounting for apparitions; he makes them the effect of feventh dreams, disturbed imaginations. &c.

APPARITOR, or APPARATOR, a beadle in an university, who carries the mace before the masters, and the faculties.

APPARATOR is also used in some ancient English laws, for a judge or justice.

APPARATOR comitatus. There was formerly an officer called by this name, for which the sheriffs of Buckinghamshire had a considerable yearly allowance; and in the reign of queen Elizabeth there was an order of court for making that allowance. But the custom and reafon of it are now altered.

APPARITORS also denote meffengers who served the procefs of the spiritual court. Their duty is to cite the offenders to appear, to arrest them, and to execute the sentence or decree of the judges. See flat. 21 Hen. viii. c. 5.

Among the Romans, apparitors were the fame with ferjeants or tiffiffs among us; or rather apparitor was a general term, and comprifed under it all the minions and attendants of the judges and magiftrates, appointed to receive and execute their orders. And hence, they fay, the name was derived, viz. from apporare, to be present, to be in waiting. Under the name appartiories were comprehended the scriba, acceft, interpretes, prociones, viatores, iudices, iudicatores, and even the canntifices or hangmen.

They were usually chosen out of the freedmen of the magiftrates, and their condition was held in so much contempt, that, as a mark of ignominy, the fenate appointed a city that had revolted from them to furnish them with apparitors.

There were also a kind of apparitors of cohorts, called cohortates or ofifionates, as being attached to a cohort, and doomed to that condition. The apparitors of the praetors, praetorani, were those who attended the praetors, or governors of provinces; and who, on their masters’ birth-day, were always changed, and preferred to better lots. Add, that the pontifices had also their apparitors, as appears from an infcription of an ancient marble in the Via Appia:

APPARATORI
PONTIFICVM
PARMVLRARIO.

APPAMUEE, in Heraldry. See APPAMEE.

APPEAL, derived from the French verb appeler, of the fame signification, in Law, signifies the removal of a cause from an inferior court or judge to a superior; or the having recourse to a superior judge to rectify what is amifs in a sentence passed by an inferior.

Appeals to Rome were first introduced into England in the reign of king Stephen; and though they were not strictly regarded in the succeeding reigns, they continued till the time of king Henry the eighth, when they were finally abolished by the 24 Hen. 8. c. 12. and 25 Hen. 8. c. 19. 21.: by which appealing to Rome from any of the king’s courts, fuing to Rome for any hecnece or difpenfation, and obeying any procefs from thence, are made liable to the pains of premunire.

Appeals lie from the archdeacon or his official to the court of arches, and from the arches to the archbishop, and from the bishop or his commiffary to the archbishop; and when the caufe concerns the king, appeal may be brought in fifteen days from any of the faid courts to the prelates in convocation, 24 Hen. 8. c. 12.: and by the 25th Hen. 8. c. 29. for lack of justice in the archbishop’s courts, the party may appeal to the king in chancery, where commiffaries are nominated, and by reason of this appointment they are called delegates; and after the decision of this court, a commiffion of review may be granted by the king as supreme head, to review the definitive sentence given in appeal in the court of delegates.

Appeals lie from all the ordinary courts of justice, and also from the court of equity in chancery, to the houfe of lords, who judge ex deriure ruft; i.e. no appeal lies from them.

But appeals from a court of equity, and writs of error from a court of law, differ in these two particulars: 1. The former may be brought upon any interlocutory matter; the latter upon nothing but a definitive judgment. 2. On writs of error the houfe of lords pronounces the judgment; on appeals it gives direction to the court below to rectify its own decree.

There are appeals from ecclefialitical justice to fecular.

The first initiation of this is that of Paulus Samoletanus, who being condemned and deposed by the second council of Antioch, refused to surrender the episcopal houfe to Donnus, who had been elected his fucceflor, and appealed to the emperor.

APEAL is also used, in Common Law, in the fame fence with accufation among the Civilians. And when thus spoken of as a criminal prosecution, it is derived from the French verb active appeller, to call upon, damnmum, or challenge one, and denotes an accufation by a private subject against another, for some heinous crime; demanding punishment on account of the particular injury suffered, rather than for the offence against the public. This method of prosecution is fill in force, but very little in use. This private procels, for the punishment of public crimes, had probably
probably its original in those times, when a private pecuniary satisfaction, called a _wergild_, was commonly paid to the party injured, or his relations, to expiate enormous offences. This was a custom derived to us, in common with other northern nations, from our ancestors the ancient Germans: and we find in our Saxon laws, particularly those of King Athelstan, the several wergilds for homicide, established in progressive order, from the death of the corset or penant, up to that of the king himself. And in the laws of King Henry I. we have an account of the other offences that were redeemable by wergild, as well as of those that were not so redeemable. As therefore, during the continuance of this custom, a process was certainly given for recovering the wergild by the party to whom it was due; it seems that, when these offences by degrees grew no longer redeemable, the private process was still continued, in order to infuse the infliction of punishment upon the offender; though the party injured was allowed no pecuniary remuneration for the offence. It was also anciently permitted, that any subject might appeal another subject of high-treason, either in the courts of common law, or in parliament; or for treasons committed beyond the seas, in the court of the high-constable and marshal. The cognizance of appeals in the latter still continues in force; and so late as 1631, there was a trial by battle awarded in the court of chivalry, in such an appeal of treason; but that in the first was virtually abolished by the statutes _5 Edw. 3. c. 9._ and _25 Edw. 3. c. 4._; and in the second expressly by statute _1 Hen. 4. c. 14._

So that the only appeals now in force, for things done within the realm, are those of felony and mayhem. Mr. Kyd, the ingenious editor of Comyn's _Digil_, observes, "that the appeal of treason does not appear to have been taken away by the Stat. _1 Hen. 4. c. 14._ or any other. But as no influence occurs of any such appeal, before any court of common law, either since that statute was made, or for many years before, the law relating to such appeals feems to be wholly obsolete at this day."

_Criminal appeals_ are either capital or not capital. Of the latter sort, _appeals de pace_, _de plagia_, _de imprisionamento_, and _of mayhem_, are now become obsolete; having been long since converted into actions of trespass. _Capital appeals_ are either of treason or felony. The latter may be subdivided into _appeals of death_, or of murder, _appeals of larceny_, _robbing_, _appeals of rape_, and _appeals of arson_, which last are now entirely obsolete. _An appeal of felony_ may be brought for crimes committed either against the parties themselves, or their relations. The crimes against the parties themselves are _larceny_, _rape_, and _arson_. And for these, as well as for mayhem, the persons robbed, ravished, mained, or whose houses are burnt, may initiate this private process. The only crime against one's relations, says judge Blackstone, for which an appeal can be brought, is that of killing him; either by murder or manslaughter; but Mr. Tomlin, in his edition of Jacob's _Law Dictionary_, observes, that this seems to be an unguarded alteration of the learned commentator, as an appeal is given to the husband, next of kin, &c. by _stat._ in _cafe of rape._

_All appeals of death_ are _indictive_ actions which the law gives to the wife for the death of her husband, or to the heir male for the death of his ancestor; which hereditum was confined, by an ordinance of king Henry I. to the four first degrees of blood. It is given to the wife on account of the loss of her husband; therefore if the marries again, before or pending her appeal, it is lost and gone: or if she marries after judgment, she shall not demand execution. The heir must also be heir male, and such a one as was the next heir by the course of the common law at the time of the killing of the ancestor. But this rule has three exceptions:

1. If the person killed leaves an innocent wife, the only, and not the heir, shall have the appeal.
2. If there be no wife, and the heir be accused of the murder, the person, who next to him would have been heir male, shall bring the appeal.
3. If the wife kills her husband, the heir may appeal her of the death. And by the statute of Gloucester, _6 Edw. 1._ c. 9. all appeals of death must be filed within a year and a day after the completion of the felony by the death of the party, which seems to be only declaratory of the old common law. The court must set forth the fact, and the length and the depth of the wound, the year, day, hour, place where done, and what weapons, and that the party died in a year and a day; and by the above statute, principal and accessory before and after are to be joined in appeal; and this is to be observed, though the accessory is guilty in another county. _3 Hen. 7. c. 1._ The case of other appeals than of murder, as of robbery, rape, &c. are not within this latt statute, and therefore _auteriors aequius_, upon an indictment within the year, stands at common law, a good bar to an appeal of robbery, or any offence besides murder or manslaughter; and yet the judges at this day never forbear to proceed upon an indictment of robbery, rape, or other offence, though within the year, because appeals of robbery especially are very rare, and of little use, since the statute of _21 Hen. 8. c. 11._ gives restitution to the prosecutor as effectually as upon an appeal.

The several appeals above enumerated may be brought previous to any indictment; and if the appellic be acquitted thereon, he cannot be afterwards indicted for the same offence. But if the appellant does not prosecute his appeal, the appellee may be indicted. If a man be acquitted on an indictment for murder, or found guilty and pardoned by the king, fiill he ought not (in finickiers) to go at large, but be imprisoned, or let to bail till the year and day be past, by virtue of the statute _3 Hen. 7. c. 1._ in order to be forthcoming to answer any appeal for the same felony, not having as yet been punished for it; though if he has been found guilty of manslaughter, on an indictment, and hath the benefit of clergy, and suffered the judgment of the law, he cannot afterwards be appealed for, it is a maxim in law, "_that nemo his _punitur per edem dolbros._"

If the appellee be acquitted, the appellee (by virtue of the statute of _Wilmouth 2. 13 Edw. 1. c. 12._), shall suffer one year's imprisonment, and pay a fine to the king, besides restitution of damages to the party for the imprisonment and irkamy which he has sustained; and if the appellee be incapable of making restitution, his abettors shall do it for him, and also be liable to imprisonment. This provision proved a great discouragement to appeals, so that henceforward they ceased to be in common use. If the appellee be found guilty, he shall suffer the same judgment as if he had been convicted by indictment; but with this remarkable difference, that, on an indictment, the king may pardon and remit the execution; but on an appeal, which is at the suit of a private subjéct, to make an atonement for the private wrong, the king can no more pardon it, than he can remit the damages recovered on an action of battery. And the ancient usage was, so late as Henry the fourth's time, that all the relations of the slain should drag the appellee to the place of execution. However, the punishment of the offender may be revoked and discharged by the concurrence of all parties interested; and as the king of his pardon may frustrate an indictment, so the appellant by his release may discharge an appeal. A peer in appeal of murder, shall not be tried by his peers, but by a common jury; though he shall upon an indictment for murder. Where appeal of death is brought, the defendant cannot
APP

cannot justify se defendendo ; but must plead not guilty, and the jury are to find the special matter.

An appeal is prosecuted two ways, either by writ, or by bill.

Appeal by writ is, when a writ is purchased out of chancery, by one for another, to the intent that he may appeal a third person of some felony committed by him, finding pledges that he shall do it.

Appeal by bill, is where a man of himself gives up his accu-

sation in writing, offering to undergo the burden of ap-

pealing the person therein named. The appeal of death may be brought by bill before the justices in the King's Bench; before justices of gaol-delivery, and commissioners of oyer and terminer, &c. or before the sheriff and coroner in the county-court; but the sheriff and coroner have only power to take and enter the appeal and count, for it must be re-

moved by certorari into B. R.

In appeal by original, principals and accessories are gene-

rally charged alike without distinction, till the plaintiff

counts; but it is otherwise in appeals by bill. There is but one appeal against the principal and accessory: if the prin-

cipal is acquitted, it shall acquit the accessory: and both shall have damages against the appellant on a false appeal, or the accessory may bring a writ of conspiracy. If the defendant in appeal is acquit or acquit, or the plaintiff nonquit after appearances, which is peremptory, no other appeal lies. If an indictment and an appeal be depending at the same time, against the same person, the appeal shall be tried first, if the appellant be ready; otherwise the king would destroy the suit of the party.

Appeal of Mayhem is the accusation of one that hath

maimed another; but this being generally no felony, it is in a manner merely an action of trespass, and nothing is re-

covered by it but damages. Bacon calls this appellum de

plagis & maibennio, and has a whole chapter upon it. In this appeal, the defendant pleads that the plaintiff had brought an action of trespass against him for the fame wounding, and had recovered, and damages given, &c.; and this was a good plea in bar of the appeal, because in both actions damages only are to be recovered. In king John's time, there is recorded an appeal against a Jew, qui fecit ementuladi quodam nepoten suam.

Appeal of rape lies where a rape is committed on the body of a woman. A femme covert without her husband may bring appeal of rape; and statute 6 R. 2. c. 6. gives power where a woman is ravished, and afterwards consents to it, for a husband, or a father, or next of kin, there being no husband, to bring this appeal: also the criminal in such case may be attainted at the suit of the king. If a woman be ravished by her next of kin, and consents to him, and has neither husband nor father, the next of kin to him shall have the appeal; for he has disabled himself by the rape, whereby he becomes a felon. If there be no husband nor

father, the appeal is given to the heir, whether male or female. The statute of Wellm. 1. c. 13. which reduced the crime of rape to a trespass, enacts that appeal of rape shall be brought within forty days; but by statute Wellm. 2. c. 34. which makes this offence felony, no time is limited for the prosecution, so that it may be brought in any reasonable time. It is to be commenced in the county where the rape was committed. It is held, that though formerly the defendant might have his clergy, it is taken away by the statute 18 Eliz. c. 17. See further on this subject, 2 Hawk. P. C. c. 23. §. 58—73.

Appeal of robbery or larceny is a remedy given by the common law, whereby a person robbed of his goods may obtain restitution of them. If a man robbed makes freth pursuict after, and apprehend and prosecute the felon, he may bring appeal of robbery at any time afterwards. By statute

21 Hen. 8. c. 11. restitution of stolen goods may be had

on indictments after attainer, as on appeals; and appeals of robbery, as well as of mayhem and rape, are now much out of use. By the express provision of statute 4 & 5 W. & M. c. 3. an accomplice committing two others guilty of robbery, shall have the king's pardon; and this shall be a good bar to an appeal of robbery. Blackist. Com. vol. iv.

Jacob's Law Dictionary by Tomlin. tit. Appeal.

Appearance, the exterior surface of a thing; or that which first strikes the sense, or the imagination.

The Academicians maintain, that the sensible qualities of bodies are only appearances; and the like doctrine is held by some later philosophers.

Our errors arise chiefly from a too hasty and precipitate

affront of the will, which acquiesces too easily in the appearance of truth.

Appearance, in Law, is the defendant's engaging to

answer a cause or action entered against him in some
court of judicature; and it is done by filing common or special bail, when he is served with copy of, or arrested on any process out of the courts at Welfington, and there can be no appearance in the court of B. R. or king's bench, but by special or common bail. There are four ways for defendants to appear to actions; viz. in person, or by attorney, by perons of full age; and by guardians or next friend, by infants. It is now the common course for the plaintiff or defendant, in all kinds of actions where there may be an attorney, to appear by attorney, and put in his warrant without any writ from the king for that purpose, as was formerly the case by common law. And, therefore, generally, in all actions real, personal, and mixt, the demand-

ant or plaintiff, tenant or defendant, may appear by attorney. But in all cases where the party stands in contempt, the court will not admit him to appear by attorney, but oblige him to appear in person. In all cases where process issues forth to take the party's body, if a common appearance only, and not special bail is required, there every such party may appear in court in his proper person, and file common bail. In a capital criminal case, the party must always appear in person, and cannot plead by attorney; also in criminal offences, where an act of parliament requires that the party should appear in person, and likewise in appeal or on attachment. On an indictment, information or action for any crime whatsoever under the degree of capital, the defendant may, by the favour of the court, appear by attorney; and this he may do as well before plea pleaded, as in the proceeding after, till conviction. Attorneys sub-

scribing warrants to appear, are liable to attachment, upon non-appearance; and where an attorney promises to appear for his client, the court will compel him to appear and put in common bail in such time as is usual by the course of the court; and that although the attorney say he hath no war-

rant for appearance; nor shall requiring a warrant of attorney to delay proceedings excuse the attorney for his not appearing, who may be compelled by the court. The defendant's attorney is to file his warrant the same term he appears, and the plaintiff the term he declares, under penalties by Stat.

4 & 5 Ann. c. 16. An attorney is not compellable to ap-

pear for any one, unless he take his fees or back the war-

rant; after which the court will compel him to appear.

In actions by original, appearances must be entered with the falsier of the county; and if by bill, they shall be entered with the prothonotary; and by statute 5 Geo. 2. c. 27. where defendant is served with a copy of the process, appearances and common bail are to be entered and filed by him within eight days after the return of the process; and if defen-

dant
APPEND

fendant does not appear, plaintiff may, on affidavit of the service of process, enter a common appearance for defendant, and proceed upon it: statute 12 Geo. 1. c. 29. And by statute 23 Geo. 3. c. 33. § 22, a common appearance may be filed by plaintiff, without entering or filing a record, a memorandum or minute for defendant. Jacob's Law Dict. by Tomlin.

**Appendance Day of Term.** SeeTerm.

**Appendance, in Perspective,** is the representation or projection of a figure, body, or like object, upon the perspective plane.

The appearance of an objective right line is always a right line. See Perspective. The appearance of an opaque body and a luminous being given, to find the appearance of the shadow, see Shadow.

**Appendance of a star or planet.** See Apparition.

**Appendance, in Astronomy,** &c. are more usually called phenomena and phaen.

In Optics, we use the term direct appearance for the view or sight of any object by direct rays, without either refraction or reflection.

**Appearances, to issue,** is to discharge one's duty seemingly, or acquit one's self of the formalities and externals thereof; so as to save the character, and avoid giving scandal or offense.

**Appearances, in Physiology.** See Phasmata.

**Appeasing Remedies, in Medicine,** are those which allay the pain in a disease, and give the patient some respite; and at the same time contribute to the cure. These are not the same as what we otherwise call Parkeorics, Anatomy, &c.

**Appelldorn, in Geography,** a town of the united Netherlands, in the duchy of Gueldres, 43 leagues N. W. of Zutphen.

**Appellant, in Law,** denotes a person who brings an Appeal.

**Appellants, in Ecclesiastical History,** is a denomination distinguishing those among the French clergy who refused to subscribe the constitution or bull Unigenitus, issued by Clement XI. in 1713, and appealed from it, either to the pope better informed, or a general council.

**Appellation signifies the name by which any thing is known or distinguished. See Name.**

**Appellative, formed of appellee, to name a thing, in Grammar,** denotes a common name which stands for a whole rank of beings, whether general or special, in contradistinction to proper names, which belong only to individuals, e. g. fish, man, horfe, tree, &c. are appellatives; and so are trout, elk, lobster; for the, all agree to many individuals, and form to many species: but Peter, Gabriel, Bucephalus, are proper names. See Name.

**Appellee, in Common Law,** signifies the person against whom an appeal is brought. See Appeal, and Approval.

In the civil law, appellement, appellementus, properly belongs only to the judge before whom an appeal is brought.

**Appenage.** See Apnance.

**Appendant, from appendo, I hang, in Law,** understood of such things as by preference have belonged, appertained, and been joined, to some other principal thing.

Thus an hospital may be appendant to a monastery; a common of fishing, to a freethed; a feast in a church, to a house; or the like. As appendants are ever by preference, they are thus distinguished from appurtenances, which may be created in some cestas in this day. See Apportion.

**Appendant, Adowfon.** See Advowson.

**Appendant, Common.** See Common.

**Appendicula, or Appendix veriformis, in Anatomy,** an appendage to the intestines, or spout colic. See the description of the Intestines.

**Appendiculae AFteriarum, voices of afterlee, a name given by the writers on Natural History to certain small branches which are placed in a circular order at different distances upon the column of the afterlee.**

**Appendiculatus, Appendice, in Anatomy,** a term mostly used to express an additional small leaf.

**Appendix, or Appendix, in Anatomy,** is a part in some measure distinct yet connected to another. Thus, the Fallopian trumpets, ovaries, &c. are called the Appendices Uteri.

**Appendix is more particularly used in the same sense with Epithysis.**

**Appendix, or Appendix, a thing necessary to, or dependant on another.**

The term is chiefly used in matters of literature, for an additional discourse, placed at the end of any piece, or writing, to explain or prosecute something there left deficient, or to draw conclusions from it. In which sense the word coincides with Supplement.

**APPENDULA, from ad, and pendu, I hang to, or Appendix melancholy, such as are outwardly applied, by hanging about the neck.**

Such are divers amulets, necklaces, phylacteries, &c.

**APPENZELL, in Geography,** a town of Swifferland, and principal place of a canton to which it gives name. N. lat. 47°. 17'. E. long. 9°. 20'. It is supposed to have derived its name from the Latin, "Abbats cella," and to have been originally only a religious house belonging to the abbey of St. Gal.

**APPENZELL, the thirteenth canton of Switzerland, surrounded by the Rhinthal and the lands belonging to the abbey of St. Gal, is about ten leagues from call to well, and from fix to seven broad. The whole country is hilly and mountainous. It is divided into twelve communities; of which are Protectors, and nine Roman Catholics. The country formerly belonged to the abbey of St. Gal; but the inhabitants, wearied with exactions and oppressions, affrated their liberty against the troops of the abbot and the Austrian sent to sucur them, and sealed it with their blood. In the year 1513, it was admitted into the Helvetic league, and constituted the thirteenth canton. The population is estimated at 51,000, 13,300 being catholics, and 38,000 protestants; which is a large number in a country of not more than sixty square leagues, and composed for the most part of glaciers, inaccessible rocks and precipices. It yields, however, good pasturage; and, in some parts of it, the manufacturers have of late been much encouraged. This canton is popularly divided into Innerodden, or the interior part; and Auffrooden, which comprehends the tracks fituate near the borders. In the former part, pasturage is the principal employment; and whatever respects the feeding the cattle, the management of dairies, and the making of cheese, is carried to a high degree of perfection among these mountaineers. The rich and poor are cow-keepers; but the poor, having little or no graps land, employ agents through the canton to inform them where hay may be obtained; and the fenn, or cow-keeper, bargains for it, and drives his cattle, when they return from grass, to the places where the hay is to be had. The person who sells his hay, furnishes the fenn not only with flabbling for his beasts, but boards and lodges him and his whole family. In return, the fenn, besides paying the stipulated price for the hay, allows to his hoist as much milk, whey, and ziegge (a kind of lean cheese), as may be used in the house, and leaves him also the manure of his cows. In the middle of April, whea
when nature revives, the fenn again issues forth with his herd to the meadows and fertile Alps, which he rents for the summer; so that the life of these people is a constant migration, and they enjoy with health, content, and cheerfulness. The original breed of cattle in this canton is of a black and brown coat; but the fenns, preferring a motley herd, compose it of black, brown, and some bay cows: to produce which set a black cow with a white belly and a stripe of the same colour along the back is required. The animals are curried, dressed, and tended with the utmost care; and thus they have an appearance of sleekness, cleanliness, and health, superior perhaps to that of any other cattle in the world. The mountaineers, it is said, lives with his cows in a constant exchange of reciprocal acts of gratitude; the latter affording him almost whatever he wants; and the fenn, in return, providing for and cherishing them, sometimes more than his own children. The fine cattle, which are the pride of the cow-keeper who inhabits the Alps, are adorned with large bells suspended from broad thongs; and every fenn has a harmonious set of at least two or three bells. The whole peal, including the thongs, will sometimes be worth between 150 and 150 guilders; while the whole apparel of the fenn himself, when belted, does not amount to the price of 20 guilders. These ornaments, however, are only worn on particular occasions; as in the spring, when the cows are driven up the Alps, or removed from one pasture to another; or when, in winter, they travel to the different farms, where the owner has contracted for the hay. The fenn, arrayed in his belt garb, leads the procancellation, singing the rance des vaches, consisting of simple tones mosty formed within the throat, and without articulate sounds or words; three or four fine goats follow, then comes the hand-som cow with the great bells, and then two others with smaller bells; these are succeeded by the rest of the cattle; and in the rear is the bull, with a one-legged milking-floor hanging on his horns; and the procession is closed by a fledge which are the implements of the dairy. The cows themselves, as well as the keeper, seem to be pleased with their ornaments; and if the leading cow is deprived of her honours, she manifests her grief by lowing incessantly, abstaining from food, and becoming lean; and she pursues her rival, who has obtained the badge of superiority, with vengeance, butting, wounding, and perfecuring her in the most furious manner. The cows, when dispersed on the Alps, are brought together by the voice of the fenn, who allures them to him by singing the rance des vaches. Of the urine of the cattle, the farmers of Appenzell make salt-petre by a very simple process. Under their stables, which are built on sloping ground, so that one side of the edifice rests on the hill and the other is elevated by means of two strong piles which support it two or three feet above ground, are pits filled with sandy soil. The animal water continually oozes through the planks of the floor; and, having drenched the soil contained in the pit for two or three years, the pit is emptied, and the salt-petre is collected and refined in the usual manner.

Among the various modes of industry in Innerooden, that of feeding flails is one of the most singular. In the garden grounds along the river Sitter, such numbers of flails are kept during the summer season, that the sound caused by the motion of their denticulated jaws, while they are eating, is distinctly heard at several paces from the spot. Young flails are collected in the adjacent parts, placed in these gardens, and supplied (till, on the approach of winter, they inclose themselves), with leaves of lettuce, celeriac, cabbage, and other vegetables, by which they grow and fatten to a surprising degree. Some time before Lent, the owners pack up the closed flails in casks, and carry them for sale to the convents of Suabia, Bavaria, and Austria, and even as far as Vienna, where they are purchased as delicacies. By this traffic some have acquired a handsome fortune.

The food of the inhabitants is exceedingly simple, consisting chiefly of milk, cheese, whey, oatmeal, and potatoes. Bread is not in common use, except among the rich. Their dress is equally plain; and as there is less disparity of fortunes among them than in almost every other part of Europe, a great uniformity prevails in diet, dress, and manners; and this constitutes the main support of their civil and political equality. Some travelers, who have observed crowds of beggars in this canton, have been led to draw erroneous inferences concerning the prosperity of the people; but the fact is, that hosts of beggars, attracted by the charitable disposition of the Appenzellers, flock thither from Suabia, and other neighboring provinces of Germany. The mountaineers of Appenzell are undisturbed and content, free from the oppression of arbitrary power and the exactions of taxes, and solely occupied with their cows and the Alps on which they graze. The government of this republic confines itself to merely granting protection, and providing for the security of persons as well as of property. The people have no desire of knowledge; and are so ignorant, that the majority of the inhabitants of Innerooden cannot read and write; and of course they have no schools, or such as are in the most deplorable state. This ignorance is necessarily attended with gross and wretched superstitution. Parents, whose children are taken ill, feel no medical aid, but have matles read for the purpose of obtaining from heaven their speedy dissolution. On the loss of a child they are inconsolable, under an apprehension that for want of baptism it is gone to hell; but, on the contrary, the parents are joyful, and their friends say to them by way of congratulation, “now you have an angel in heaven.” The punishment inflicted on incontinence is not very severe; the transgressing parties only paying a fine of five guilders each, provided that both be unmarried; but if any female commits the same fault three times, she is sentenced to be publicly whipped. Yet popular opinion requires, that he who violates a virgin shall make her his lawful wife; and if they are not joined in marriage, both of them, especially the ravisher, are branded with indelible shame. The girl, in such a case, is prohibited from wearing the badge of virginity, which is a metal pin stuck into the braided hair, and is obliged to cover her head with a black or brown hood. The male offender is virtually divested of those privileges which belong in common to all citizens; an humiliation than which there is none more grievous in democratic states; for the man so disgraced is civilly dead in his own country, having lost what is most dear to him, the advantages of a freeman. The preceding remarks pertain chiefly to Innerooden, the inhabitants of which are Roman Catholics; but in Auflerooeden, and the outer parts of the canton of Appenzell, the reformed religion has been established since the middle of the sixteenth century. From that period, the manufacture of linen, muffin, and cotton cloth has constituted the chief branch of industry among the reformed Appenzellers. The manufacturers of Appenzell have now attained to such a degree of skill, as to be able to spin out of half an ounce of flux, a thread measuring from 9 to 10,000 feet in length; whence their cambrics are in great demand on the continent. The Appenzellers, apprized of the improvements of the manufactories in Ireland and Scotland, and desiring to lose their trade, have lately begun to introduce machines for spinning and carding wool, to prevent the poorer class from being driven to despair in their attempts to procure any subsistence.
wool, invented by an inhabitant of Reichtobel. Pastures, in this district, has of course decreased; the large pasture grounds being divided into small meadows, each sufficient only for two or three cows. The people of Appenzell are industrious and persevering, in common with other Swiss; but their distinguishing feature is quickness of apprehension. They accordingly manifest particular ingenuity in inventing, imitating, and improving machines, as well as other branches of mechanics, without any assistance from instruction or books. Besides some exceedingly skilful weavers, several among them have acquired reputation by the manufacture of watches, clocks, and fire-engines. The wooden bridges of Ulrick Grubenmann, a native of the village of Teufen, are very generally known on the continent. This ingenious mechanic, it is said, offered to build an arched wooden bridge across the river of Derry in Ireland, which is 60 feet wide; but his plan was rejected.

See Schilderung des Gebingfolkr des Schweiz**, &c. or A Description of the Tribes which inhabit the mountainous parts of Switzerland. By John Gottfried, M. D. vol. i. containing the canton of Appenzell; Svo, Leipzig, 1783.

APPERCEPTION, or APPERCEPTION, is used by Leibnitz and his followers, as an attribute of the mind, considered as confound of, or reflecting on its own perceptions; in which sense the word amounts to the same usage as that Des Cartes and others call consciousness.

APPERWACK, or APPERWACK RIVER, in Geography, lies about E. S. E. from the island and city of Cayenne, on the coast of Guiana, in South America. An island extends across the entrance, which is surrounded by a sand bank, and off the river is a cluster of rocks called the Contables.

APPETITE; **APPETITUS, APPETENCY, formed of ad, to, and pate. I crave, in Physiology, a desire of enjoying something that is apprehended to be necessary or conducive to happiness. When this inclination towards any object considered as good, is guided by reason, and results from reflection on the real value of the object, it is called rational; but when it proceeds from the mere impulse of the senses, without any distinct apprehension of the value of the object, it is denominated sensitive.

Appetite is restrained, by Hutcheson, to fuch of our desires as have a previous painful and unpleasent situation, antecedently to any opinion of good in the object; nay so as that the object is often chiefly esteemed good only for its allaying this pain or uneasiness, or if it give also a positive pleasure, yet the unpleasent sensation is previous to, and independent of this opinion of good in it. By another ingenious writer (see Lem. Crit. vol. i. p. 44.), appetites are represented as passions directed to general objects, in contradistinction to passions directed to particular objects, which retain their proper name. Thus we say an appetite for fame, for glory, for conquest, for riches; but we say the passion of love, of gratitude, of envy, &c. Appetite may be also distinguished from passion, since the latter has no existence till a proper object be presented: whereas the former exists first, and then is directed to an object.

Some have erroneously ascribed the appetites solely to the corporal sytem or animal part of man; but this mode of representing them must appear to be a mistake on a closer examination; since, though the generality of moral writers may be inclined to regard the grosser appetites as having their seat in the body, and thence term them sensual and carnal, they never reproach the more refined species of corporal enjoyments with these degrading epithets: nor do they accuse a man of being fraudulently disposed, if he loves music, or receives delight from the contemplation of the beauties of nature. Dr. Reid (Essays on the active Powers of Man, Eff. iii. p. 122, &c.) limits the term appetite to a particular class of desires, which belong to the animal principles of action, and which are distinguished by the following properties. Every appetite is accompanied with an uneasy sensation proper to it, which is strong or weak in proportion to the desire we have of the object. Moreover, appetites are not constant, but periodical, being fated by their objects for a time, and returning after certain periods. He adds, those that are chiefly observable in man, as well as in most other animals, are hunger, thirst, and lust. The ends for which our natural appetites are given, are too evident to escape the observation of any man of the least reflection: two of those above enumerated are intended for the preservation of the individual, and the third for the continuance of the species. To act merely from appetite is neither good nor ill in a moral view: it is neither an object of praise nor of blame; and the person who yields to its impulse, when there is no reason to the contrary, acts agreeably to his nature. Appetites, considered in themselves, are neither social principles nor selfish. They cannot be called social, since they imply no good for the good of others; nor can they justly be called selfish, though they be commonly referred to that class. To this purpose, Dr. Reid observes, that appetite draws us to a certain object, without regard to its being good for us, or ill; nay, in some cases, self-love is facilitated to appetite. But it may be replied, that the impulse of appetite supposes the previous apprehension of good; though this apprehension, and the appetite that results from it, may be misguided and perverted. Besides the appetites which nature hath given to us for useful and necessary purposes, we may create appetites which nature never gave. As it is therefore belike to preserve our appetites in that tone and degree of strength which nature gives them, so we ought to beware of acquiring appetites which nature never gave; these are always useless, and often very hurtful. It should also be considered, that although there be neither virtue nor vice in acting from natural appetite, yet there may be much of either in the management of our appetites; and the power of self-government is necessary for their restraint and regulation.

Appetite, in Medicine, is more particularly used to denote a natural periodical call or desire to eat and drink, occasioned by a certain uneasiness and painful sensation, and with a view of repairing what had been wasted by the several exertions of the body. A loss or prostration of appetite is called Anorexia. The defect of appetite is of two kinds, and is usually divided, by medical writers, under two names, the anorexia and nausea.

The anorexia is a too great abstinence from food, which sometimes has its origin from depravation of the stomach, sometimes from other causes more remote.

The nausea is defined to be a plenary abstinence from foods, being a complaint of the same nature and origin with the anorexia, but differing in degree.

The figs are very obvious to be a distaste to food, which is common to both; but there is this difference, that in an anorexia the patients usually eat something, though without appetite, and are troubled always with a pain and uneasiness of the stomach after it; but in the nausea there is a greater dilution of food of all kinds, and frequent vomiting. Men of idle lives, and such as drink too freely of strong liquors, are subject to idiopathic defects of appetite, from actual injuries in the stomach; others labouring under the different diffeases before mentioned, are as often subject to the symptomatic. People of a languid habit, when afflicted with a loss of appetite, always find great relief in acids of the milder kind; and those of a leucophlegmatic
leucocephalogen habit are often cured by taking small doses of elixir propinquia every day before dinner. Some perons are very fond of external applications to the nostem in those cafes, but there are rarely to be found of any great service. The bell of them is a phaler of tinctura balsami, with oil of mallic.

A preponderous appiency of things not proper for food is called pica; and an inmoderate appetite is called bulimia, or syneus comina. Some, however, distinguish between the syneus, and tanine apples; making it the distinguishing character of the latter, that it is attended with a hentary or other coelal flux.

**Appetite exciue. See orexis.**

Dr. Cullen, in his arrangement of diseaes, makes two different classes of aetiosa and deficient appetites under the order of dierecius: to the former he refers kulmi, poly-
dipheria, pica, syneusiothys, nymphomania or furor uterinus, and anse峛us; to the latter, anorexia, adipsia, and anaphrodisia.

APPIA, or APPIA, in Ancient Geography, a town of Achaia, in Phrygia.

APPIADES, in Mythology, five divinities so called be-

cause their temples were at Rome near the fountains of Appius, viz. Venus, Pallas, Vesta, Concord, and Peace.

APPIAN, in Biography, a Greek historian, was a native of Alexandria, and lived under the regns of Trajan, Adrian, and Antonianus Pius, in the former part of the second cen-
tury. In the time of Trajan, he settled at Rome, and gained a reputation as an advocate that he was chosen one of the procurators of the emperor, and had the government of a province assigned to him. In the preface to his history, he informs us, that he wrote about the 50th year of Rome, and therefore this preface must have been written about the year of Christ 147.; or 148. His Roman History was compiled in 24 books, and compiled, not in the chronological order of Dionysius Haliearnassenis and of Polybius; nor in the biographical method of Plutarch, nor in a continued series like that of Livy, but in the order of the countries in which the events that are related by him happened, as Italy, Gaul, Sicily, Spain, Africa, Greece, Syria, Parthia, Egypt, and Arabia. He is charged with many errors by Bodin, Sidonius, and Scaliger; though the former allows, that he is the only historian, who gives a just and clear account of the Roman provinces, cities, and armies, and a lively description of the Roman empire. La Mothe le Vayer thinks that the principal ground of complaint against him, is his undue partiality to the Romans, so that he represents the right as well as the advantage to be always on their side, to the prejudice of all other nations, and even of his own country. He is also charged with having borrowed many passages from Polybius, Plutarch, and other authors, without acknowledgment; inomuch that Scaliger reproachfully calls him " alienorum laborum fucum," a drone who robs the industrious bees of their labour. Pholius, however, is of opinion, that he wrote with the utmost regard to truth, and that he has flown a more accurate and extensive acquaintance with military affairs than any of the historians; while we read him, he says, we cannot but imagine that we see the battles which he describes. But his chief talent, according to this author, is displayed in his orations, in which he moves the passions as he thinks proper, either in animating the resolution of the soldiers, or reproving the impetuousity of those who were too precipitate. His iyle is plain and simple, without any thing turgid or superfluous. In his preface he has given a general description of the Roman empire. Of the nine first books of his "History," some fragments remain, which are preferred in Ursinus's " Excerpta de legationibus," published in Greek, at Antwerp, with notes, in 1592, 4to.; and some of them are extant in the "Excerptae Perieoscianae," published by Valerius, with a Latin version and notes, at Paris, in 1634, 4to.; of the fourth book on the war with the Gauls, only an epitome remains; the fifth and seventh books, on the affairs of Spain, and the war with Hannibal, were first published, in 1599, by H. Stephens, at Paris, in 1557; the eighth, on the affairs of Libya; the eleventh and twelfth, on those of Syria and Parthia; five books on the Civil Wars; and fragments of the twenty-third, on the af-
tairs of Illyria; are extant. A Latin version of several parts of Appian, by Petrus Candidius, was printed at Rome, in 1472, and at Venice, in 1477 and 1493, in folio. An edition of Appian was published, in Greek, by Charles Stephens, with various readings, at Paris, in 1557; in folio; another, in Greek and Latin, was published by Henry Ste-

APPIAN AQUEDUCT, was fo called from Appius Claudius, who was censor of Rome in the 442d year of that city. This aqueduct began seven miles from Rome, and after having run a great way under ground, discharged part of its waters through the gates Capenna and Trigemina, and conveyed the rest quite to the Campus Martius; and thus the whole city was plentifully supplied. It was dug under ground, and laid very deep, says Frontinus (De Aqueduc-
tibus;), either because the arts of levelling was not then brought to perfection, or because the Roman territory was too much exposed to the incursion of its enemies, who might have destroyed the lately arches, and intercepted the water. This water was for many ages called "Aqua Appia." The principal fountain under this denomination, was placed in the forum of Cesar, below the temple of Venus Appiaede; and by a verse of Ovid it appears to have formed a jet of water:

"Appius expressit aera pulsat aquas."

APPIAN WAY, a great Roman highway, constructed by Appius Claudius, censor of Rome, in the 442d year of that city. It commenced at the gate Capenna, now called St. Sebastian's, and passing over the mountain called St. Angeli, crosses the plain of Valdruma, the Papus Pomponia, and ends at Capua, which was the limit of the Roman empire.

The Appian way, called by Statius (Sylv. i. 12.), "the road of queens," extended about 140 miles, and was wide enough for two chariots to go abreast without inconve-
nience. The stones which Appius employed in this work, were brought from a great distance, and were as hard as flints. They were previously squared and smoothed by skilful workmen, and then joined together without any cement; so that they appeared for several miles like a single stone. In the beginning of Augustus's reign, this road reached to Brunduimum, that is, 238 miles farther; but it is not certain, who was the manager of this additional work. It is generally ascribed to Cesar. Dr. Burnet, in his Let-
ters, says, that in many places, it is full as entire as when it was first made. On each side of it was a deep ditch for receiveing off and conveying away the water.

Catus Graceus placed the small columns called termii, which marked the miles.

The new Appian way was constructed by Caracalla, from his baths to the gate Capenna, where it joined the other.

APPIANI, GIUSEPPE, in Biography, an exquisite Italian singer, with a contralto voice, born at Milan, and al-
ways mentioned with rapture by some of our friends who heard him at Rome when he was very young; they like-
Of the awkward applauses of the uninstructed rustics, who did not understand the art of applauding, and who disturbed the general harmony by their discordant sounds, Tacitus speaks: (Annal. xvi. 5.), "cum manibus neficiis faticentibus, turbantibus ignoramus."

**APPLE-TREE.** Malus, in Botany, a general name applied to a cultivated orchard-tree, which produces the fruit known by the name of apple. In the fifteen of Limæns, it is conflated as a species of the genus *rinus*, of which there are three: the *wild-apple* or *crab*, which has a very four fruit; the *Virginian wild crab*, which produces a sweet-scented flower; and the *dwarf-apple*, frequently known by the name of *Paradise-apple*. See *Pyrus Malus*.

Trees of this sort are produced in an artificial manner, by means of ingrafting the feions or shoots of such apple-trees as are valuable for their fruit, on stocks that have been raised from the seeds of crabs. Thus a feion of an apple-tree, inserted into a crab-block, occupies the crab-tree from that time to produce *apples* of nearly the same kind and quality with those from which the feion was taken. Mr. Ray, indeed, thinks, that the fruit of these trees always follows the nature of the feions.

In the nurseries, three sorts of blocks are commonly used to graft apples upon: first, *free blocks*, which are raised indifferently from the kernels of all sorts of apples, and which by some are also termed *crab-blocks*, as all those trees which are produced from the seeds before they are grafted, are termed *crabs*, without any distinction. Such blocks should, however, be preferred, as are raised from the kernels of crabs, where they can be procured. Several old writers are of this opinion. Aulenus, who wrote more than an hundred years ago, lays the block which he accounts best for *apple-grafts* is the *crab*, which is better from *sweeter apples* than to graft on, because it usually free from canker, and will become a large tree, and, he conceives, last longer than blocks of *sweeter apples*, and makes fruits more strong and hardy to endure frosts. It is well known, however, that by frequent grafting some sorts of apples upon free blocks, the fruits have been rendered larger, but less firm, and of shorter duration.

The second sort of block is the *Dutch creeper*; these blocks are designed to flint the growth of trees, and keep them within compas for dwarfs or epaphers. The third sort is the *Paradise apple*, which is a very low shrub, consequently only proper for trees which are kept in pots by way of curiosity, as they do not continue long. See *INGRAFTING OF FRUIT TREES*.

Trees of the apple kind are found in general to thrive well when planted on strong deep loamy soils, or such clayey ones as, by having a portion of gravel in their composition, are rendered not retentive of moisure. Mr. Knight, in his treatise on the Culture of the Apple and Pear, remarks, that a preference has been given to soils of opposite kinds, by planters of different ages. Those of the last century uniformly contended, he says, in favour of a light sandy loam, and on that their finest cyder fruits were grown; but at present a soil of a diagnostically opposite quality, a strong red clay, is generally preferred. Much of the soil which is called clay, in the district where he resides, is, however, he observes, properly argillaceous marle; and some of it contains a large portion of calcareous earth, and effervescences strongly with acids. He has found this soil to form the subtilisum of some orchards much celebrated for producing fruit of the first quality. It appears, he thinks, to have the effect of mitigating the barkerbats of rough unripe fruits; and as the trees grow with great luxuriance in it, it is perhaps, of all soils, the best calculated to answer the wishes of the planter; but that the strongest and most highly flavoured

miscellaneous, and endure the To be the of which the celebrated Salimbene. His style was naturally pathetic and touching, and his suaveo, consequently extremely admired.

**APPANO, in Geography, a town of Italy in the duchy of Milan, 22 miles N. N. W. from Milan.**

**APPIARIA, in Ancient Geography, a town of Europe, in Lower Asia, on the right bank of the Danube, there called Iiler. It was situated between Durastorius on the call, and Nicopolis ad Ithrum on the west.**

**APPIDEMISCHKAN, in Geography, a town of Prufia, nine miles south-east from Cambinana.**

**APPII Forum, in Ancient Geography, Burgo Lango, a small town of Italy, in Latium, in the country of the Volsci. It was situated upon the Appian way, between Suseia Pometia to the north-west, and Terracina at some distance to the south-east. It is mentioned in the Acts, ch. xxvii. 15, and by Horace in his account of his journey to Brundusium:***

"inde forum Appii Differtium natus, canopibus atque malignis,"

"To Appii thence we flier, a place Stulf'd with rank boatmen, and with vintners bafe."

**FRANCIS.**

On the ruins of this ancient little town is situated an abbey called Fossia Nova.

**APPLANA, in Entomology, a small species of Phalaena, of the Tortrix family, that inhabits Kiel and other parts ofEurope. The wings are depressed, brown, with three white dots in the centre. Gm. Obf. This is the Fabrician character in the species Insectorum, where it is arranged in the section Pyralis t. 2. 288.; and it is also Phalaenæ pentadactyle of Clerk. Icon.**

**APPLAUSE, properly signifies an approbation of something, witnessed by clapping of hands; and in this respect it differs from acclamation, which was articulate, and performed with the voice. The word comes from the verb plaudere, to clap the hands.**

The ancient way of applauding by clapping of hands is scarcely retained any where but in theatres. Among the Romans there were three different species of applause denominated from the different noises made in them, viz. tomus, imbrices, and tefte; the first a confused din, made either by the hands or the mouth; the second and third by beating on a sort of foundling vessels placed in the theatres for this purpose.

Persons were instructed to give applause with skill; and there were even masters who professed to teach the art. The proficients in this way let themselves out for hire to the vain-glorious among the poets, actors, &c. and were properly disposed to support a land applaudee. These they called *ludenii.*

At the end of the play, a loud peal of applause was expected, and even asked of the audience, either by the chorus or the person who spoke last. The formula was, *spectatoris plaudite, or valet & plaudite.*

The *plavers*, or applauders, were divided into *clori,* and disposed in theatres opposite to each other, like the choristers in cathedrals; so that there was a kind of concert of applaudees.

Seneca (Nat. Quafl. ii. 28.) has described the different modes of applauding with the hands: "Averfæ inter fe manum collit, non plaudunt, fed palma cum palmâ collatit, plauum facit, Et plurimum intereft utramque concitatum, et plane et extensa." The people stood up to applaud in the theatres; thus Propertius (iii. 16.);

"Stantiaque in plauum tota theatra juvent."
A

flavoured liquor, which has hitherto been obtained from the apple, is produced by a foil which differs from any of those that have been mentioned—the shallow loam on a lime-lined bank, such as is met with in the forest of Dean.

It is added, that in regard to situation, the apple-tree succeeds best in those which are neither high nor remarkably low. In the former, its blossoms are frequently liable to be injured by cold winds, and in the latter by spring-fruit, particularly when the trees are planted in the lowest part of a confined valley. A south or south-west aspect is generally preferred, on account of the turbulence of the wind, and the coldness of north winds; but orchards succeed well in all and where the violence of the west wind is broken by an intervening rise of ground, a south-west aspect will, he thinks, be found equal to any. Apple-trees are generally the most productive of fruit when they are situated near the fold-yard, and the ground, in consequence, much trod and manured by the cattle in the winter season. The soil in which old apple-trees have grown, is, however, esteemed very unfavourable to young ones.

When from contiguity to the house, an orchard is planted in this kind of ground, the pear and apple should be made to succeed each other, as has been judiciously recommended by the author of the Rural Economy of Gloucestershire. The land intended to be planted with apple-trees should be well prepared the year before, by thoroughly digging or ploughing; and if dung, in the form of compost with mould, be laid on, it will be of great utility. In chafing the trees, such as are but of two years growth from the graft, are, in general, to be preferred, and they should have strong straight stems. When the trees are planted, they should also be felled, to prevent their being shaken by the wind. For the manner of planting apple-trees, &c. see Orchard.

In directing the choice of fruit-trees, for particular situations, great attention should be paid to select such as are proper for the peculiar views of the planter, and sufficiently early to ripen well in them. The apple-tree being naturally very full of branches, frequently requires the operation of pruning; and when properly executed, great advantages will be found to arise from it. Mr. Knight thinks, in this business, the pruner should confine himself almost entirely to the extremities of the bearing branch, which are always too full of wood, and leave the internal part of the trees nearly as he finds it. Large branches should rarely or never be amputated.

In the garden culture of the apple, where the trees are retained as dwarfs or espaliers, the more vigorously growing kinds are often rendered unproductive by the excessive, though necessary, use of the pruning knife. The above writer has always succeeded, he says, in making trees of this kind fruitful, by digging them up, and replacing them with some fresh earth in the same situation. The too great luxuriance of growth is, he thinks, thus checked, and a disposition to bear in consequence brought on. See Pruning of Fruit-trees.

Apple-trees sometimes begin bearing at the age of two or three years; but when they are six or seven, they are for the most part found to produce the most abundantly.

The blossoms of apple-trees are liable to be injured or destroyed by various causes; as severe cold, a hazy state of the atmosphere, frosts, and insects of various kinds. And Mr. Knight has remarked, that they also fail frequently from want of impregnation, when the weather is unusually hot and dry, or when cold winds prevail, as he has often observed the farina to wither and die on the anthera in such seasons. In these cases, those trees have been found to escape the heat, that were moderately full of wood, and consequently capable of affording the blossoms the most protection.

Apple, a well-known orchard fruit, cultivated for the purposes of the table as well as for the liquor which is prepared from its juice. The varieties of this valuable fruit are extremely numerous. Mr. Forysth, in his treatise on the Culture and Management of Fruit-trees, mentions eight different sorts, as having been introduced from France; among which the French rennet, the rennet grise, and the white apple, are most esteemed in this country, and about thirty-six sorts of our own growth, which may be considered as valuable. But the varieties of this fruit will be treated of more fully under the article Pyrus Malus.

In respect to the method of preserving apples for use during the winter season, it has been recommended to let them remain upon the trees until perfectly ripe, and then to gather them by the hand in dry weather, laying them in heaps for a few weeks, in order that they may undergo a slight degree of sweating. They should then be carefully looked over, and all such as are in any way soft or decayed, be removed, the sound fruit being wiped dry, and packed in any kind of large jars that have been previously made clean and dry; the mouths or openings being closely secured, in order to exclude the air as much as possible from them. In this way apples are said to keep found a great length of time, the skin or pulp remaining perfectly firm and plump, which is not the case when they are constantly exposed to the action of the open air. But they may be kept perfectly well without this trouble, by being closely packed in large hamper, baskets, or bins, and placed in close dry situations.

The sort of apples that are in general held in most esteem for the table are the following, which stand in the order of their ripening: the white jucating, the margaret apple, the summer pearmain, the summer greening, the embroidered apple, the golden rennet, the summer white calville, the summer red calville, the flaker pippin, the aromatic pippin, the la rennette grise, the la haute bonté, the royal ruffing, the wheeler's ruffet, the sharp's ruffet, the pomme apple, the golden pippin, the noaprel, and l'api or pomme d'api.

But for kitchen use; the codling, the summer marrigold, the summer red pearmain, the Holland pippin, the Kentish pippin, the compund, the Loam's pearmain, the French rennet, the French pippin, the royal ruffet, the monstrous rennet, the winter pearmain, the pomme violeta, the Spencer's pippin, the france pippin, and the eaken pippin.

And for the purposes of cider; the flate apple, the bagnio crab, the golden pippin, the old red'srake, and the woodcock, were the favourite old cider fruits; but most of them are now, according to Mr. Marshall, on the decline. The madd and the coccage are, however, still in high estimation, especially the latter. Mr. Crocker, in his treatise on the Art of Making Cyder, observes, that in the districts of Hereford and Worceter, the following are considered as the best liquor fruits; the Bredin apple, Captain Nurse's kernel, Elton's yellow, Normandy apple, and the yellow or forse flyre. And that in the county of Somerset; the fersey, the white sour, the marrig, wallis apple, barn's-door crab, red'srake, Du-ann, Jack Every, coccage, Charl's prims, Buckland, Pit crab, Slater's pearmain, Slater's No. 19, Slater's No. 20, Slater's No. 21, Caffe pippin, faw-pit, and the pomme anis, are supposed most valuable. But that in Devonshire, the most esteemed fruits are; the Scroton red'srake, the fawet broady, the lemon bitter fawet, jeofy, Orcheton pippin, wine-apple, marred gold spic-apple, Ludbrook red'srake, green Cornish, the butter-box, red Cornish, broad nosed pippin, eac'
The bell and molt proper sorts of apples to be cultivated in a small garden are, according to Mr. Forth, the jenning, golden pippin, nonpareil, Ribstone pippin, nonpareil, Queen's apple, jysbaie, golden rennet, aromatic pippin, grey hailstone, scarlet pearmain, lemon pippin, pomme gre, and the French crab, with rufflings and roads for the purpose of baking.

It has been ingeniously suggested by Mr. Knight, in his treatise on the Apple and Pear, that the juice of these fruits might be used with great advantage in long voyages. He has frequently, he says, reduced it by boiling, to the confidence of a weak jelly; and that in this state it has remained several years without the slightest apparent change, though it has been intentionally exposed to much variation of temperature. A large quantity of the infusigated juice would, he further observes, occupy but a very small space; and the addition of a few pounds of it to a hoghead of water would probably, at any time, form a liquor a good deal similar to cyder or perry: it might also, he thinks, be used to supply the place of vinegar and orange, and might be obtained at a much lower price.

It has been observed by Dr. Grew, in his Anatomy of Vegetables, that the apple is formed of four distinct parts, consisting of the cuticle or pill, the parenchyma, the branchery, and the core; that the pill or skin is only a dilatation of the outermost skin or rind of the bark of the branch on which it grew; and that the parenchyma or pulp, though tender and delicious to the palate, is only a dilatation of the alburnum, or inner part of the bark of the same part. This is evident, he thinks, not only from the visible continuation of the bark, from the one through the pedicle or stalk to the other; but also from the structure common to both. And that the branchery, or vellums, are only ramifications of the woody part of the branch divided through all the parts of the parenchyma, the greater branches being made to communicate with each other by the medium of the smaller ones; and that the core proceeds originally, he supposes, from the pith of the branch, the sap of which finding room enough in the parenchyma, to diffuse itself, quits the pith, which, in consequence, hardens into core.

Apple is also a name given to divers fruits, bearing some resemblance in figure, rotundity, and the like, to the orchard apple.

Apple, Adam's. See Citrus, and Pomen Adami.

Apple, Alligator. See Annona.

Apple, bitter, a name sometimes given to the fruit of the Colocynthis. See Cucumis.

Apple, blad. See Cactus.

Apple, cudifid. See Annona.

Apple, dwarf. See Dwarfr-trees.

Apple-flies, in Natural History, the name given by authors to a small green fly found sometimes within an apple, and hatched of a worm or maggot, very frequently found infesting that fruit.

Apple, bee. See Solanum.

Apple, man. See Solanum.

Apple, male ballyum. See Monordica.

Apple, marsh, so called by Dr. Grew on account of its figure, as being round, except on one side, where it falls in, and has a flank like a young apple. Mus. Reg. Soc. P. ii. 3, cap. 2.

Among the ancient ornaments of churches we read of golden apples, pomae aurea; by which it should seem, we are to understand the globular parts of candlesticks. Du-Cange.
APP

and motion is determined by successive application of any thing to different parts of space.

Application is sometimes also used, both in Arithmetic and Geometry, for the operation of division, or for that which corresponds to it in Geometry. Thus \( \frac{a}{b} \) applied to, or divided by \( \frac{c}{d} \), i.e. \( \frac{a}{b} \cdot \frac{c}{d} \), gives \( \frac{ac}{bd} \). And a rectangle \( ab \) applied to a line \( e \), gives the fourth proportional \( ab \), or another line, 

\[ \frac{a}{b} = \frac{ac}{de} \]

Application, in Geometry, denotes the act of placing one figure upon another in order to determine their equality or inequality. In this way Euclid, and other geometers, have demonstrated some of the primary and fundamental propositions in elementary Geometry. Thus it is proved, that two triangles, having two sides of the one equal respectively to two sides of the other, and the two included angles equal, are equal in all respects; and two triangles having one side and the adjacent angles of the one respectively equal to one side, and the adjacent angles of the other, are also in the same mode of application shown to be equal. Thus also it is demonstrated, that a diameter divides the circle into two equal parts, and that the diagonal divides a square or parallelogram into two equal parts. The term is also used to signify the adaptation of one quantity to another, in order to their being compared; the areas of which are the same, but their figures different. Thus Euclid shows how, on a right line given, to apply a parallelogram that shall be equal to a right-lined figure given. See also I. vi. pr. 28. &c.

Application of one science to another signifies the use that is made of the principles of the one for augmenting and perfecting the other. As there is a connection between all the arts and sciences, one of them may be made subservient to the illumination and improvement of the other: and to this purpose algebra has been applied to geometry, and geometry to algebra, and both to mechanics, astronomy, geography, navigation, &c.

Application of Algebra, or Analysis, to Geometry. After the discovery of algebra and analysis, it was natural to apply these sciences to geometry, since lines, surfaces and solids, which are the objects of geometry, are commensurable, and capable of being compared with one another, and consequent upon their relations and proportions exhibited. The application of algebra to geometry is of two kinds: that which regards the plane or common geometry, and that which respects the higher geometry, or the nature of curve lines. The first of these is concerned in the algebraical solution of geometrical problems, and the investigations of theorems in geometrical figures, by means of algebraical investigations or demonstrations. Influences of this kind of application occur in the works of the most early writers in algebra, as Diophantus, Lucas de Burgo, Cardan, Tartalea, &c. and may be found in those of authors of modern date even to our own times. Some of the best precedents and exercises relating to this kind of application may be seen in Sir Isaac Newton's "Universal Arithmetic," and in Mr. Thomas Simpson's "Algebra" and "Select Exercises." This method of resolving geometrical problems is, in many cases, more direct and easy, than that of the geometrical analysis; but the latter method by synthesis, or construction and demonstration, is the most elegant. The algebraical solution succeeds best in such problems as respect the sides and other lines in geometrical figures; and those geometrical problems in which angles are concerned are best resolved by the geometrical analysis. See other remarks on this method of solution in Newton's treatise above mentioned. The solution of problems in this way depends upon a previous acquaintance with the method of expressing geometrical magnitudes, as well as their mutual positions and relations, by algebraical notation; e.g. a line, whether known or unknown, is represented by a single letter; a rectangle may be denoted by the product of the two letters expressing its sides; and a rectangular parallelepiped by the product of three letters, two of which represent its rectangular base, and the third its height. The opposite position of straight lines may be expressed by the signs + and −; and segments of lines may be denoted by letters with these signs prefixed, as circumstances require. In order to express the positions of geometrical figures, which it will be more difficult to do, because they are infinitely various, it will be necessary to have recourse to proportions or equations, which express certain relations that depend upon their positions: and the positions of figures may again be deduced from the equations that express the relations of their parts. Thus, an angle may be expressed by the ratio of its line to the radius; a right angle in a triangle, by making the sum of the squares of the two sides equal to the square of the hypotenuse; the position of points may be ascertained by perpendiculars let fall from them on lines given in position; the position of lines by the angles which they make with given lines, or by perpendiculars drawn to them from given points; the similarity of triangles by an equation deduced from the proportionality of their sides, &c. But it is not possible to give general rules for all the particular cases that occur. As the geometrical proposition must first be expressed in the algebraic manner, the result, when the operation is completed, must be expressed geometrically. All theorems, in which the proportions of magnitudes only are employed, and all those that express the relations of the segments of a straight line, of their squares, rectangles, cubes, and parallelepipeds, are easily demonstrated in the algebraical method. From the first proposition of the second book of Euclid, the nine following may be derived with ease in this manner; and they may be considered as appropriate examples of this most obvious application of algebra to geometry. Moreover, the algebraical demonstrations of the 12th and 13th propositions of the second book require only the 47th of the first book; and the 35th and 36th of the third book require only the third of the third book and 47th of the first.

In the solution of problems, the following general observations will be of use. When any geometrical problem is proposed for algebraic resolution, you are, in the first place, to describe a figure that shall represent the parts or conditions of the problem, and regard that figure as the true one; then, having considered the nature of the problem, you are to prepare the figure for a solution, if it be necessary, by producing and drawing such lines, as appear most conducive to that purpose. When this has been done, let the unknown line or lines that seem to be the most easily found, and any of the known ones that are requisite, be denoted by proper symbols; then proceed to the operation, by observing the relation which the several parts have to each other. As no general rule can be given for the drawing of lines and selecting the most proper quantities to subsist for them, so as always to bring out the most simple conclusions, because different problems require different methods of solution; it will be best, in order to gain experience in this matter, to attempt the solution of the same problem by several ways, and then to apply those which succeed best to other cases of the same kind, when they afterwards occur. The following general directions will be of use.

1. In preparing the figure, by drawing lines, let them be either parallel or perpendicular to other lines in the figure,
APP

and this, multiplied by \(x\), gives \(ax - ax' = ee = \text{the area of the rectangle; whence we have} \ \frac{a^2}{\sqrt{b^2 - 4a}} = \frac{x}{\sqrt{b^2 - 4a}} \),

Then, \(BP\) will be from \(BC\), and by its nature being from the base of the figure, the perpendicular is easily found by common arithmetic; whereas if the perpendicular were first sought, both the segments would be found quantities, and the final equation a quadratic one.

3. Where in any problem, there are two lines or quantities alike related to other parts of the figure or problem, the best way is to make use of neither of them, but to substitute for their sum, their rectangle, or the sum of their alternate quotients, or for some line or lines in the figure, to which they have both the same relation.

4. If the area, or the perimeter of a figure be given, or such parts of it as have but a remote relation to the parts required, it will sometimes be of use to assume another figure similar to the proposed one, of which one side is unity, or some other known quantity; from whence the other parts of this figure, by the known proportions of the homologous sides, or parts, may be found, and an equation may be formed.

Prob. I. "The base \(a\), and the sum of the hypothenuse and perpendicular \(b\), of a right-angled triangle \(ABC\) (Plate II. Geometry, fig. 28.) being given, to find the perpendicular.

Let the perpendicular \(BC\) be denoted by \(x\); then the hypothenuse will be expressed by \(a - x\); but (by Eqv. 47. t.) \(AB' + BC = AC\); i.e., \(b + x = a - 2ax + x^2\); whence \(x = a - b + b\) is the perpendicular required.

Prob. II. "The diagonal, and the perimeter of a rectangular triangle \(ABC\) (fig. 29.) being given, to find the sides." Put the diagonal \(BD = a\), half the perimeter, \(DA + AB = b\), and \(AB = x\); then will \(AD = b - x\); and therefore, \(AB + AD\) being \(BD\), we have \(x + 2b = 2bx + x^2 = a\); which solved gives \(x = \sqrt{2a^2 - b^2 + b}\).

Prob. III. "The area of a right-angled triangle \(ABC\) (fig. 30.), and the sides of a rectangle \(EBDF\) inferred therein, being given, to find the sides of the triangle." Put \(DF = a\), \(DE = b\), \(BC = x\), and the given area \(ABC = d\); then, by similar triangles, we shall have \(x - b\) (CP): \(a\) (DF) :: \(x\) (BC): \(AB = ax\). Consequenty \(ax = \frac{x}{\cdot x} = \frac{d}{a}\);

and therefore \(x^2 = 2dx - 2bd\), or \(x^2 = 2dx = -2bd\); which, solved, gives \(x = \sqrt{d^2 + 2bd - 2b^2}\); whence \(AB = \sqrt{\frac{a}{a} \cdot a - \frac{a}{a}}\).

AC will likewise be known.

Prob. IV. "Having the area of a rectangle \(DEFG\) (fig. 31.) inferred in a given triangle \(ABC\), to determine the sides of the rectangle." Let \(CI\) be perpendicular to \(AB\), cutting \(DG\) in \(H\); and let \(CI = a\), \(AB = b\), \(DG = x\), and the given area \(= e\); then it will be, as \(b: x:: a: ax = CH\); which, taken from \(CI\), leaves \(a - ax = IH\); and this, multiplied by \(x\), gives \(ax - ax' = ee = \text{the area of the triangle; whence we have} \ \frac{a}{\sqrt{b^2 - 4a}} = \frac{x}{\sqrt{b^2 - 4a}} \),

Hence it appears that \(c\), or its equal \(\sqrt{a + b} + c\), cannot be less than \(4\ a\), and therefore \(b\) not less than \(8\ a\). for the condition \(\frac{a}{4} cc - ac\) under the radical sign, would be negative, and its square root impossible; and all squares, whether their roots be positive or negative, are positive; so that there cannot arise any such quantities as negative squares, unless the conditions of the problem under consideration are inconsistent and impossible. See Simpson's Algebra, sect. 18, parlam.

The second branch of the application of algebra to geometry, or that which respects the higher geometry, or the nature and properties of curve lines, was introduced by Des Cartes. In this department the nature of the curve is expressed or denoted by an algebraic equation, which is thus formed. A line is conceived to be drawn, as the diameter or some other principal line of the curve, and upon this line, at any indefinite points, are erected perpendiculants, which are called ordinates, and the parts of the first line cut off by them are called abscesses. Calling the abscesses \(x\), and its corresponding ordinate \(y\), the known nature of the curve, or the mutual relations of the curve lines in it, will afford an equation involving in it \(x\) and \(y\), and other given quantities. And as \(x\) and \(y\) are common to every point in the primary line, the equation, derived in this manner, will belong to every position or value of the abscesses and ordinates, and may be properly considered as expressing the nature of the curve in all points of it; and is usually called the equation of the curve.
Hence every particular curve will appear to have an appropriate equation, differing from that of every other; either as to the number of the terms, the powers of the unknown quantities \(x\) and \(y\), or the signs of the coefficients of the terms of the equation. Thus the circle, the ellipse, the parabola, the hyperbola, and other curves, have their peculiar and distinguishing equations. The geometry of curve lines has been much extended and improved by means of these algebraic equations; for thus, all the properties of such equations, and their roots are transferred to the curve lines whose abscissae and ordinates have similar properties, and consequently the known properties of curves are transferred to the equations that represent them. See CURVES.

**APPLICATION of Geometry to Algebra.** The higher geometry, or that of curve lines, is usefully applied to the purpose of investigating the nature and roots of equations; and also the values of those roots by the construction of such lines. Besides, common geometry is also applicable to algebra in some cases with advantage. A familiar instance will be sufficient to evince the truth of this observation. If it were required to square the binomial \(a + b\); a square (Plate II. Geometry, fig. 34.) may be formed, whose side is equal to \(a + b\), and then drawing two lines parallel to the sides from the points of division, it will immediately appear that the square of the compound quantity \(a + b\) is equal to the squares of both the parts, together with two rectangles under the two parts, i.e., \(a + b = (a + b)^2\), which is also deduced from a geometrical construction. Hence it also appears, that if \(a = b\), the square on the whole line will be equal to four times the square upon the half of that line. In this manner the Arabians, and the early European writers on algebra, deduced and demonstrated the common rule for resolving compound quadratic equations. And by a similar method, Tartalea and Cardan derived and demonstrated all the rules for the resolution of cubic equations, using cubes and parallelepipeds instead of squares and rectangles.

**APPLICATION of Algebra and Geometry to Mechanics.** This is founded on the same principles as the application of algebra to geometry. It principally consists in representing by equations the curves described by bodies in motion, and in determining the equation between the spaces which the bodies describe, when actuated by any forces; and the times employed in describing those spaces, &c. The article ACCELERATION exhibits an instance of this kind of application; as the altitudes of triangles represent the times, the bases, the velocities, and the areas, the spaces described by bodies in accelerated motion. In short, as velocities, times, forces, spaces, &c., may be represented by lines and geometrical figures; and as these are capable of algebraic notations and operations, it is evident how the principles and properties of both algebra and geometry may be applied to mechanics, and added to all the other branches of the mixed mathematics.

**APPLICATION of Mechanics to Geometry,** consists chiefly in the use that is sometimes made of the centre of gravity of figures for determining the contents of solids described by those figures. See CENTROBARY Method.

**APPLICATION of Geometry and Astronomy to Geography,** principally consists in the following articles; viz. in determining by geometrical and astronomical operations, the figure of the terrestrial globe; in finding the positions of places by their observed latitude and longitude; and in determining, by geometrical operations, the positions of places that are not very remote from one another. Astronomy and geography are also of great use in navigation.

**APPLICATION of Geometry and Algebra to Physics, or Natural Philosophy.** For this application we are indebted to Sir Isaac Newton, whose philosophy may therefore be called the geometrical or mathematical philosophy; and upon this application are founded all the phystico-mathematical sciences. Hence a single observation or experiment will often produce a whole science. Having ascertained by experience, that the rays of light, by reflection, make the angle of incidence equal to that of reflection, we hence deduce the whole science of Catoptrics, which thus becomes purely geometrical, since it is reduced to the comparison of angles and lines given in position. The same is also the case in many other sciences.

**APPLICATION of one thing to another,** is employed generally in subjects of art or science, to denote the use that is made of the former for understanding or perfecting the latter; thus the application of the cycloid to pendulums signifies the use that is made of the cycloid for improving the doctrine and use of pendulums. See CYCLOID and PENDULUM.

**APPLICATION is also used, in subjects of literature, &c., for the adjusting, accommodating, or making a thing quadrate to another. Thus we say, the application of a fable, &c.**

**APPLICATION, in Theology, is particularly used, by some divines, for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchased by his holy life and death. Accordingly it is by this application of the merits of Christ, that we are to be justified and entitled to grace and glory. The sacraments are the ordinary means, or instruments, whereby this application is effected.**

**APPLY, among Mathematicians, sometimes signifies to transfer a line given into a circle most commonly, or into any other figure; so that its ends may be in the perimeter of the figure.**

**APPLY denotes also as much as divide, especially among Latin writers; who as they say duce AB in CB, draw AB into CB, when they would have AB multiplied by CB; or rather when they would have a right-angled parallelogram made of those lines; so they say, apply CB ad AB, apply AB to CB, when they would have CB divided by AB; which is thus expressed as \(\frac{CB}{AB}\).** Or, if it is used when the area of a figure, and one dimension are given, and the other is to be found: as the area \(ab\) applied to the line \(c\), is \(\frac{ab}{c}\).

**APPOGGIATURA,** in Music, is a small additional note of embellishment added to a melody, which is not supposed to occupy any portion of the time, a bar appearing complete without it, but the time which is given to this little note, is taken out of the great note which it precedes. As to the length of these diminutive notes, the best rule that can be given for them is, that in common time they should be half the length of the great note, for which only the other half remains; and in triple time they rob the subsequent note of two-thirds of its length. So that the appoggiatura to a minim is a minim, to a minim a crotchet, to a crotchet a quaver, &c.
It has been well observed by M. Framery, in the Encyclopædic Methodique, that the appoggiatura gives a tender expression to the melody, that would injure marches and movements of spirit, which require energy and strong accents.

Fragment of recitative, from Sacchini's opera of Crefo.

```
Eccomi a piedi tuoi; supplice io chiedo pietà da te, ma non rispondi?
```

```
al-trove perché volgi il sembiante? Ah ti; costanza non hai di rimar-mi in quello
```

This piece of recitative should be sung as if it were written in the following manner:

```
Eccomi à piedi tuoi; supplice io chiedo pietà da te, ma non rispondi?
```

```
al-trove perché volgi il sembiante? Ah ti; costanza non hai di rimar-mi in quello
```

M. Framery says, that the appoggiatura is the only embellishment in recitative. But Pacchierotti and Marchetti (perhaps since his article was written) have introduced graces in recitative, particularly before a close, which all the Italian fingers and their imitators, who can execute them, have followed. See Recitative.

The term appoggiatura is derived from appoggiare, to lean on. And as these little notes generally occur on the accented parts of a bar, more force is given to them by good performers, than to the principal note which they precede. In pathetic strains, the soul of the melody may be said to reside in the appoggiaturas.

APPOINTEE, a name formerly given to a foot soldier in the French army, &c. who for his long service and bravery receives pay above private sentinels.

Till the year 1670, they had also captains and lieutenants under the appellation of appointees, who, without refunding in the regiment, received their pay. See Ansessades.

APPOINTEE, in Heraldry, is when two or more things are placed touching each other at the points or ends.

APPOINTMENT, a pension or salary given by great lords and princes to persons of worth and parts, in order to retain them in their service. This term was chiefly used among the French in the time of their monarchy.

Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treasurers; whereas appointments are annual gratifications granted by brevet for a time uncertain, and are paid out of the privy purse.

APPOINTMENT, in Law, is used in contradistinction to a bequest. Thus, by construction of the statute 43 Eliz. c. 4, it is held, that a devise to a corporation for a charitable use is valid, as operating in the nature of an appointment rather than of a bequest. It is also held, that the statute of Elizabeth, which favours appointments to charities, superseded and repealed all former statutes, and supplies all defects of assurances; and therefore, not only a devise to a corporation, but a devise by a copyhold tenant without surrendering to the use of his will, and a devise (nay even a settlement) by tenant in tail without either fine or recovery, if made
made to a charitable use, are good by way of appointment. Blackl. Com. b. ii. vol. ii. p. 376.

APPOMATOX, in Geography, is the name of a southern branch of James river in Virginia.

APPORTIONMENT, Apportionamentum, in Law, a dividing of a rent into two or more parts, or portions, according as the land whence it issues is divided among two, or more proprietors.

Thus if a man, having a rent-service issuing out of land, purchase a part of the land; the rent shall be apportioned, according to the value of the land.—So if a man let lands for years, reserving rent, and a stranger afterward recover part of the land; the rent shall be apportioned.

But a rent-charge cannot be apportioned, nor things that are entire; as if one hold land by service, to pay to his lord yearly at such a feall a horse, &c.; there, if the lord purchase a part of the land, this service is totally extinct; because such things cannot be divided without hurt to the whole. But if part of the land, out of which a rent-charge issues, descends to the grantee of the rent, this shall be apportioned.

On partition of lands out of which a rent is issuing, the rent shall be apportioned. The statute 12 Geo. ii. c. 19. § 15. has in certain cases altered the law as to apportioning of rents in point of time; it being thereby enacted, "that if any tenant for life shall happen to die before, or on the day on which any rent was reserved or made payable, upon any demise or lease of any lands, tenements, or hereditaments, which determined on the death of any such tenant for life, the executors or administrators of such tenant for life, shall and may, in an action on the cap, recover of and from such under-tenant or under-tenants of such lands, &c. if such tenant for life die on the day on which the same was made payable, the whole; or if before such day, then a proportion of such rent, according to the time such tenant for life lived, of the last year, or quarter of a year, or other time in which the said rent was owing due as aforesaid, making all just allowances, or a proportionate part thereof respectively." Before this statute, the rent, by the death of a tenant for life, was lost; but the legislature having thus interposed in favour of tenants for life, the provisions of the statute have, by an equitable construction, been extended to tenants in tail. However, the dividends of money directed to be laid out in lands, and in the mean time to be invested in government securities, and the interest and dividends to be applied as the rents and profits would in case it were laid out in land, were held not to be apportionable, though tenant for life died in the middle of the half year. But where the money is laid out in mortgage, till a purchase could be made, the interest is apportionable. This distinction, however, may be referred to interest on a mortgage, being in fact due from day to day, and so not properly an apportionment; whereas the dividends accruing from the public funds are made payable on certain days, and therefore not apportionable. Upon this principle the Master of the Rolls decreed an apportionment of maintenance-money, it being for the daily subsistence of the infant; and the principle extending to a separate maintenance for a femce covert, such apportionment has, in such cases, been allowed at law.

A man purchases part of the land where he hath common appurtenant; the common shall be appurteoned: of common appurtenant it is otherwise; and if by the act of the party, the common is extinct. Common appurtenant and appurtenant may be apportioned on alienation of part of the land to which it is appurtenant or appurtenant. Danv. Abr. 505. 507. Co. Litt. 144. 148. 149. Amb. Rep. 502. 2 P. Wms. 176. 501. 8 Rep. 79. Wood's Intit. 199.

APPOSAL of scriti, is the charging of them with money received on their account in the exchequer, 22 and 23 Car. II. c. 22.

APROSER signifies an examiner. In the court of exchequer, there is an officer called the foreign aproser.

In the office of confirmation, in the first liturgy of Edw. VI. the rubric directs the bishop, or such as he shall appoint, to appose a child; and a bishop's examining chaplain was anciently called his aproser.

APPPOSITION, from ad, to, and pono, I put, the act of putting or applying one thing to another.

APPPOSITION is used in Physics, in speaking of bodies which derive their growth from the adjunction or union of neighboring bodies.

APPOTION, in Grammar, denotes the putting two or more substantives together in the same case, and without any copulative conjunction between them.

Thus, Flanders, blustering theatre, horrible scene of war; love, enemy of human quiet; peace, parent of riches, source of faction, &c.

APPRaiser, from ad, to, and pretium, value, one who rates, or sets a value upon goods, &c. He must be a skilful and honest person. It is not a business of itself, but is practiced by brokers of homchold furniture, to which fet of men the word is chiefly applied. Yet upholsterers and other brokers are employed, or even any person or persons who are supposed to be skilled in the commodities to be appraised or valued. They are employed in cafes of death, executions brought in upon goods, or of flock to be turned over from one person to another, or divided between copartners; and are called sworn appraisers, from their taking an oath to do justice between party and party. If they value the goods too high, they shall be obliged to take them at the price appraised, statute 1 Edw. I.

They sometimes appraise on behalf of both sides, each party agreeing to have the same appraiser or appraisers; sometimes in opposition, each party chusing one or more of a side; and sometimes by commiffion or deputation of trustees, mailers in chancery, &c.

APPReciation, in Musick, is the judging accurately of things within the power of our senses and perception. Our organ of hearing is unable to judge of sounds beyond a certain degree of gravity and acuteness. The octave below double C, the lowest note of the additional keys in the bafe of piano-fortes, is extremely difficult to tune; and the additional high notes seem more the production of wood than wire. However, the great mathematician, Euler, gives the extent of eight octaves to human perception; from the highest appreciable found to the lowest; but, says Roufleau, these extremes of the scale not being very agreeable, we seldom, in practice, exceed five octaves, which the common compass of keycl-instruments furnishes. There is likewise a degree of force or loudness, which we cannot appreciate. The sound of a great bell, for instance, gives no distinct and certain tone, but a confusion of harmonies, which we cannot distinguish in the bellrey, from the fundamental. We must diminish the force by distance, ere we are sure what the real sound is. It is the same with a wind instrument overblown, and a voice that is forced beyond its natural power; so that those who try to sing loud, with a feeble voice, are always out of tune. With respect to noise, we cannot reduce it to any fixed-tone; and it is that which constitutes the difference between found and noife. See Bruit.

The abbé Feyer, taking up the subject, says, "Euler probably determined the compass of appreciable sounds, from
from the following circumstances: The largest pipe in a 27
feet organ, is an octave below the bariton, or double-bass
flop, and two octaves below double C in the top of a
organ. Now from the lowest C to the highest, on a
pan-flute or harp kind, there is an interval of four
octaves; and if we add two octaves to the bottom, and
two to the top, for the low and high fluts of an organ, we
shall have the eight octaves in question. In order to com-
plete the demonstration, we must have found by ex-er-
iment, that a pipe less than two inches will not speak: for
the most acute C in the 17th has only that length; but
though birds, and the ferruccio or bird-pipe, do produce
more acute sounds, as we are unable to find their union,
we know not what they are.

APPREHENSION, in Logic, denotes the simple at-
tention of the mind to an object presented either to our
sense, or our imagination, without passing a judgment,
or making any inference.

The term literally denotes the action of the hand, where-
by it takes hold of, and grasps any thing: being formed of
ad, and, prehend, I take.

It is by that operation of the understanding, which is
called simple apprehension, that we acquire those notions or
ideas, which are the materials of all our knowledge. Ac-
cording to Dr. Reid, it is synonymous with conception;
and like other simple operations of the mind, it cannot be
logically defined. For his account of this operation of the
mind, see CONCEPTION.

APPREHENSION is likewise used to express an inadequate
and imperfect idea; and thus it is applied to our knowledge
of God, in contradistinction to comprehension.

APPREHENSION, in Law, signifies the feizing a criminal,
in order to bring him to justice. See AREST.

APPRENDRE, in our Ancient Law-Books, a fee or
profit to be taken or received. Statute 2 & 3 Edw. VI.
c. 8.

APPRENTICE, from apprendre, to learn. One who is
bound by covenant to serve a tradesman or artificer a certain
time, usually seven years, upon condition of the master's in-
structing him in his art or mystery.

Apprentices may likewise be bound to husbandmen, or
even to gentle men of fortune and clergymen; who, as
well as tradesmen, are compellable to take the children of
the poor under a penalty of 10s. (Stat. 8 & 9 Will. III.
c. 30. § 5.); and the church-wardens and overseers, with
the consent of two justices, may bind them till the age of twenty-
one years. Stat. 43 Eliz. c. 2. 18 Geo. III. c. 47. And
by statute 5 Eliz. c. 4. § 15, the justices may compel cer-
tain persons under age to be bound as apprentices, and on
refusal may commit them.

Apprentices may be discharged on reasonable cause, either
at their own request or that of their masters, at the quarter
fissions, or by one justice, with appeal to the seisons
(5 Eliz. c. 4.), who may, by the equity of the statute, if
they think it reasonable, direct restitution of a rateable share
of the money given with the apprentice; and parson-appren-
tices may be discharged in the same manner, by two jus-
tices, 20 Geo. II. c. 19. But if any, whose premium has
been less than ten pounds, run away from their masters,
they are compellable to serve out the time of absence, or
give satisfaction for it, at any period within seven years after
expiration of the original contract, 6 Geo. III. c. 26. Ap-
prentices gain a remission in that parish where they last
served forty days, 11 & 12 Car. II. c. 12. And by the
5th of Elizabeth, c. 4. they have an exclusive right to ex-
ercise the trade in which they have been instructed, in any
part of England. However, the resolutions of the courts
have in general rather confined than extended the restrictions
of this statute.

No trades are held to be within the statute, but such as
were in being at the making of it. For, trading in a coun-
try village, apprenticeships are not requisite; and following
the trade seven years, without any actual prosecution (either
as a master or a servant), is sufficient without an actual ap-
prenticeship. See Blackste. Com. vol. i. p. 426, &c.

By the common laws, infants, or persons under the age
of 21 years, cannot bind themselves apprentices, in such a
manner as to enable their masters to an action of covenant,
or any other action against them for departing from their service,
or any breach of their indentures; which makes it nec-

cesseiy, according to the usual practice, to gain their
friends to be bound for the faithful discharge of their
offices, according to the terms agreed on. If an apprentice
misbehaves himself, the master may correct him in his ser-
vice, or complain to a justice of peace, to have him punished
according to the statute 5 Eliz. c. 4. If any one enters
an apprentice from his master's service, or harbours him
after notice, the master may maintain a special action on the
cause against the person so doing. By the custom of London,
an infant unmarried, and above the age of fourteen, may
bind himself apprentice to a freeman of London, by inden-
ture with proper covenants, which covenants, by the said
custom, shall be as binding as if he were of full age. By
the 5th Eliz. c. 4. § 25, an apprentice must be bound by
deed indented; and this must be complied with for all
purposes except for obtaining a settlement. Indentures
must also be enrolled in all towns corporate, 5 Eliz. c. 5.
and 5 Geo. II. c. 46; and in London, by the custom, in
the Chamberlain's office there. In London, if the inhabi-
tants be not enrolled before the Chamberlain within a year,
upon a petition to the Mayor and Aldermen, &c. a firte
facias shall issue to the master, to shew cause why not en-
rolled; and if it was through the master's default, the
apprentice may sue out his indentures and be discharged:
otherwise, if through the fault of the apprentice, as if he
would not come to present himself before the Chamberlain,
&c. if it cannot be enrolled unless the apprentice be in court
and acknowledge it. Indentures are likewise to be stamped,
and are chargeable with several duties by act of parliament.

With regard to the assigning of apprentices, it hath
been held that an apprentice is not assignable. He can-
not be bound nor discharged without deed. But though
an apprentice is not assignable, yet such assignment amounts
to a contract between the two masters, that the child
should serve the latter. By the custom of the city of
London, an apprentice may be turned over from one
master to another; and if the master refuse to make him
free at the end of the term, the Chamberlain may
make him free; but, in other corporations, there must be a
mandamus to the mayor, &c. to make him free in such
case. It seems agreed, that if a man be bound to in-
struct an apprentice in a trade for seven years, and the
master dies, the condition is dispensed with, being a thing
personal; but if he be further bound to find him meat,
drink, clothing, and other necessaries; here the death of
the master doth not dispense with the condition, but his
executors shall be bound to perform it as far as they
have affots. But if a person is bound apprentice by a judge
of the peace, and the master dies before the expiration of
the term, the justices have no power to oblige his executors,
by their order, to receive such apprentice and maintain him.
It is said, however, that the executor or administrator may
bind him to another master for the remaining part of his
life. In this case of the master's dying, it is said that by
the
the custom of London, the executor must put the apprentice to another master of the same trade. By the custom of the city of London, a freeman may turn away his apprentice for gaming; though, if a master turn away an apprentice on account of negligence, &c. equity may decree him to refund part of the money given with him. Jacob's Law Dict., by Tomlin, Art. Apprentice.

In France, the sons of tradesmen, living in their fathers' houses till seventeen years of age, were reputed to have served an apprenticeship. In that country the times of serving are different in the different professions, from three years to eight. After serving out an apprenticeship, the person becomes what they call an aspirant, or candidate for mastership, and is to be examined by proper officers as to his skill and proficiency, and also to exhibit a chef d'œuvre or master-piece in the art he has been bred to, before he be suffered to set up for himself. And the custom of France, in regard to apprentices, is not unworthy the imitation of other nations.

Anciently, benchers in the inns of court were called apprentices of the laws, in Latin apprænticium juris nobilibus; as appears by Mr. Selden's note on Fortescue; and so the learned Plowden styles himself. See BENCHER.

Sir Henry Finch, in his Nomenclatura, writes himself, apprentici de legi; sir Edward Coke, in his Infl. says appræntici legiæ, in pleading, are calleth bonus confiliarii. & in lege præst.; and in another place, apprentices, and other councillors of law.

APPRENTICESHIP denotes the servitude of an apprentice, or the duration of his indenture. The ingenious Dr. Smith, in his well-known and admirable work on "The Nature and Causes of the Wealth of Nations," has introduced several important and useful observations on this subject. The competition in several employments is restrained to a smaller number, than would otherwise be dispofed to enter into them, partly by the limitation of the number of apprentices, which attends the exclusive privilege of incorporated trades, and partly by the long term of apprenticeship, which increases the expense of education. Seven years seem formerly to have been, all over Europe, the usual term established for the duration of apprenticeships in the greater number of incorporated trades. Such incorporations were anciently called universities, which is the proper Latin name for any incorporation whatever. The university of smiths, the university of tailors, &c. are expressions commonly occurring in the old charters of ancient towns. When those particular incorporations, which are now peculiarly called universities, were first established, the term of years during which it was necessary to study, in order to obtain the degree of Master of Arts, appears evidently to have been copied from the term of apprenticeship in common trades, of which the incorporations were much more ancient. As to have wrought seven years under a master properly qualified, was necessary to entitle any person to become a master, and to have himself apprentices, in a common trade; so to have studied seven years under a master properly qualified, was necessary to entitle him to become a master, teacher, or doctor (words anciently synonymous) in the liberal arts, and to have scholars or apprentices (words like-wise originally synonymous) to study under him. By the 8th of Elizabeth, commonly called the statute of apprenticeship, it was enacted, that no person should for the future exercise any trade, craft, or mystery, at that time exercised in England, unless he had previously served it as an apprenticeship of seven years at least; and thus, what before had been the bye-law of many particular corporations, became in England the general and public law of all trades carried on in market towns. To country villages the term of seven years' apprenticeship doth not extend; but the limitation of this statute to trades exercised before it was passed has given occasion to several dilutions, which, considered as rules of police, appear as foolish as can well he imagined. A coach-maker, for instance, has no right to make, or employ journeymen for making, coach wheels; but he may buy them of a master wheelwright, this latter trade having been exercised in England before the 5th of Elizabeth. But a wheelwright, though he has never served an apprenticeship to a coach-maker, may, by himself or journeymen, make coaches, because this trade, being of a later origin, is not within the statute. Thus also the manufactures of Manchester, Birmingham, and Wolverhampton are, many of them, upon this account, not within the statute, not having been exercised in England before the 5th Elizabeth. The regulations of apprenticeship in Ireland are upon a different footing, and somewhat less liberal than in England. Prohibitions similar to those of the statute 5 Eliz. obtain in all corporate towns, by authority of bye-laws of the several corporations; but these prohibitions extend only to natives of Ireland; for by a regulation made by the lord lieutenant and privy council, having in this instance, by 17 & 18 Car. 11. the force of a law, all foreigners and aliens, as well persons of other religious persuasions as pro- tellants, who are merchants, traders, artisans, &c. shall, upon coming to reside in any city, walled town, or corporation, and paying twenty shillings by way of fine to the chief magistrate and common council, or other persons authorized to admit freemen, be admitted to the freedom of that city, &c. and to the freedom of guilds of their respective trade, with the full enjoyment of all privileges of buying, selling, working, &c.; and any magistrate, refusing to admit foreigners so applying, shall be disfranchised. In Scotland, there is no general law which regulates universally the duration of apprenticeships. The term is different in different corporations; where it is long, a part of it may generally be redeemed by paying a small fine. In most towns too, a very small fine is sufficient to purchase the freedom of any corporation. The weavers of linen and hempen cloth, the principal manufacturers of the country, as well as all other artisans subservient to them, wheel-makers, reel-makers, &c. may exercise their trades in any town corporate without paying any fine. In all towns corporate all persons are free to fell butchers' meat upon any lawful day of the week. Three years are, in Scotland, a common term of apprenticeship, in some very nice trades; and, in general, there is no country in Europe in which corporation laws are so little oppreive. In France, the duration of apprenticeships is different in different towns and in different trades. In Paris, five years are the term required in a great number; and before any person can be qualified to exercise the trade, as a tailor, he must, in many of them, serve five years more as a journeyman. During this latter time, he is called the companion of his master, and the term itself is called his companionship. The institution of long apprenticeships, says Dr. Smith, can give no security that inconsiderate workmanship shall not. Frequently be exposed to sale: nor has it any tendency to form young people to industry. Apprenticeship is altogether unnecessary, it being altogether unnecessary, the arts, which are much superior to common trades, such as those of making clocks and watches, contain no such mystery as to require a long course of instruction. In the common mechanic trades, the
the lessons of a few days might certainly be sufficient. The dexterity of hand, indeed, even in common trades, cannot be acquired without much practice and experience. But a young man would practice with much more diligence and attention, if, from the beginning, he wrougth as a journeyman, being paid in proportion to the little work which he could execute, and paying, in his turn, for the materials which he might sometimes spoil through awkwardness and inexperience. His education would generally in this way be more effectual, and always less tedious and expensive.

The matter, indeed, would be a loser; he would lose all the wages of the apprentice, which he now faves for seven years together. In the end, perhaps, the apprentice himself would be a loser in the trade for greatly he would have more competitors; and his wages, when he came to be a complete workman, would be much less than at present. The fame increase of competition would reduce the profits of the masters, as well as the wages of the workmen: the trades, the crafts, the mysteries would all be losers; but the public would be a gainer, the work of all artificers coming in this way much cheaper to market. Smith's Nature and Causes of the Wealth of Nations, vol. 1. p. 183–191. Irth Traft, vol. iv. pt. ii. part 59, &c.

APPRISING, in Scots Law, the name of the action by which a creditor formerly carried off the estate of his debtor for payment. It was thus called, because the sheriff, when no purchaser of the heritable rights could be found, apprised, or taxed the value of the lands by an inquest, so as to make over to the creditor lands to the value of the debt. By the act 1672, apprisions were superceded, and adjudications were substituted in their place. See Adjudication.

APPROACH, curve of equal, accessus equalis, was first proposed by M. Leibnitz, and has given the analysts some trouble. The curve is of such a nature, that a body depending in it by the sole power of gravity approaches the horizon equally in equal times.—This curve has been found by Bernouilli, Varignon, Maupertuis, and others, to be the second cubical parabola so placed as that its point of regression or vertex is uppermost, and the descending body must commence its motion in it with a certain determinate velocity. M. Varignon rendered the question general, by investigating the curve which a body might describe in vacuo, so as to approach towards a given point through equal spaces in equal times, according to any law of gravity. Maupertuis also resolved the same problem, in the case of a body depending in a medium, the refiitance of which is proportioned to the square of the velocity. Vide Hitt. Acad. R. Sciences, an. 1699. p. 82. Idem, an. 1750. p. 129. Mem. p. 333.

APPROACH, in Gardening, is used in speaking of the method of incirching or inoculating, which is called grafting by approach.

Some physicians also speak of a method of curing dis- eases by touching or approach. See Approximation.

APPROACHES, in Fortification, the several works made by the besiegers for advancing or getting nearer to a fortress, or place besieged. Such are trenches, mines, faps, lodg- ments, batteries, galleries, epaulements, &c.

APPROACHES, or Lines of Approach, are particularly used for trenches dug in the ground, and the earth thrown up on the side next the place besieged; under shelter or de- fence whereof the besiegers may approach, without loss, to the parapet of the covered way, and plant guns, &c., wherewith to cannonade the place.

The lines of approach are to be connected by PARALLELS, or lines of communication.

The besieged frequently make counter-approaches, to interrupt and defeat the enemies' approaches.

The ancients made their approaches towards the place besieged much after the same manner as the moderns. M. de Polard shews, that they had their trenches, their faps, parallels, &c., which, though usually held of modern invention, appear to have been practised long before by the Greeks, Romans, Asians, &c. Vide Polyb. t. ii, p. 161.

APPROACHES, Method of, in Mathematics, a name given by Dr. Wallis, in his Algebra, to a method of resolving certain problems relating to square numbers, &c., by first assigning certain limits to the quantities required, and then approaching nearer and nearer till a coincidence is obtained. In this fentic, the double rule of false position may be considered as a method of approaches. See APPROXIMATION.

APPROACH, in Fowling, expresses the devices made use of to get within shot of fhy birds. There are many contrivances practised for this purpose: a very common one is by means of circular pieces of wood or loops surronded with boughs, not unlike a chimney-sweeper's or milkmaid's gar- land, within which the fowler conceals himself with his gun, and fleas on the birds, who are completely deceived, imagi- ning the machine a tree, and its approach effected by their own motion towards it: it is therefore necessary that the fowler's approach should be very slow, and his motions very uniform; for any ruffle or fhlake would alarm the birds, and put them to flight. This mode is successfully practised on water-fowls when they are feeding on marshy grounds or banking on the sides of the waters. But when these birds confine themselves principally to the middle of wide rivers, or in moors and lakes, this lefly covering must be placed in a boat; or a tall screen made of straw is sometimes set upright in it, behind which the sportsman remains concealed, and either gently paddles himself near the birds, or permits the boat to drift towards them.

In moonlight nights when water-fowls come on shore to feed, they are approached by the fowler, concealing himself behind a horse, who is made to move gently towards the birds, and this practice has given rise to an artificial figure called a flanking-horse, behind which the sports- man endeavours to gain on the fowls; but this is a less cer- tain method, as they are fearful even of horses, cows, and sheep, as well as of man.

In deep snows, birds are approached by concealing every part of the person in a white dree; and even the gun must be clothed likewise. By this means hares, partridges, and moor-game are killed in abundance: but this device is not held fair in sporting language, because these are lefs wary animals, and, moreover, because there are regular meth- ods in constant practice to entrap them. When buffards were plentiful on Salisbury plain, it was usual to hunt and approach them in a kind of covered cart with loopholes through which the fowler could see and take aim at them; but cultivation and increased population have nearly destroyed these birds in England.

APPROBATION, a state or disposition of the mind wherein we put a value upon, or become pleased with, some perion or thing. Morals are divided on the prin- ciple of approbation, or the motive which determines us to approve and disapprove. The Epicureans still have it to be only self-interest; according to them, that which deter- mines any agent to approve his own action, is its apparent tendency to his private happiness; and even the approbation of another's action flows from no other cause but an opinion of its tendency to the happiness of the approver, either immediately or remotely. Tho se, who incline to this system,
reason thus: having experienced, in some instances, a particular conduct to be beneficial to ourselves, or observed that it would be so, a sentiment of approbation rises up in our minds, which sentiment afterwards accompanies the idea, or the mention of the same conduct, although the private advantage which first excited it no longer exist. Others resolve approbation into a moral sense, or a principle of benevolence, by which we are determined to approve every kind of affection, either in ourselves or others, and all publicly useful actions, which we imagine to flow from such affection, without any view to our own private happiness.

Dr. Adam Smith thinks it needless to introduce any new power of perception, in order to account for the principle of approbation; and apprehends that sympathy is sufficient to account for all the effects ascribed to this peculiar faculty. This system places virtue in utility; and accounts for the pleasure with which the spectator surveys the utility of any quality from sympathy with the happiness of those who are affected by it. This sympathy, he observes, is different from that by which we enter into the motives of the agent, and from that by which we go along with the gratitude of the persons who are benefited by his actions; and he says, it is the same principle with that by which we approve of a well-contrived machine.

Dr. Smith does not reject entirely from his system that principle of utility, the perception of which in any action or character constitutes, according to Mr. Hume, the sentiment of moral approbation. That no qualities of the mind are approved of as virtuous, but such as are useful or agreeable, either to the person himself or to others, he admits to be a proposition that holds universally; and he also admits, that the sentiment of approbation with which we regard virtue, is enlivened by that sympathy of this utility, or, as he explains the fact, by our sympathy with the happiness of those to whom the utility extends. Nevertheless he infers, that it is not the view of this utility which is either the first or principal source of moral approbation. To sum up the whole of his doctrine in a few words: when we approve of any character or action, the sentiments which we feel are derived from four different sources. First, we sympathize with the motives of the agent; secondly, we enter into the gratitude of those who receive the benefit of his actions; thirdly, we observe that his conduct has been agreeable to the general rules by which these two sympathies generally act; and, lastly, when we consider such actions as making a part of a system of behavior which tends to promote the happiness of the individual or of society, they appear to derive a beauty from this utility, not unlike that which we ascribe to a well-contrived machine. These different sentiments, he thinks, exhaust completely, in every instance that can be supposed, the compounded sentiment of moral approbation. "After deducting," says he, "in any one particular case, all that must be acknowledged to proceed from one or other of these four principles, I should be glad to know what remains; and I shall freely allow this surplus to be ascribed to a moral sense, or to any other peculiar faculty, provided any body will ascertain precisely what this surplus is."

When we approve of good actions, and disapprove of bad, this approbation and disapprobation, when we analyse it, says Dr. Reid, "Essays on the active Powers of Man," (ch. vii. p. 244) appears to include not only a moral judgment of the action, but some affection, favourable or unfavourable, towards the agent, and some feeling in ourselves. Dr. Ferguson, in "Principles of Moral and Political Science," agrees in the main with Lord Shaftesbury, Dr. Hutcheson, Dr. Reid, and Buffier, in regarding moral approbation as a specific sentiment, incapable of resolution into any other sentiment or principle.

According to Dr. Clarke and others, reason or the understanding, the same faculty by which we distinguish between truth and falsehood, enables us to distinguish between what is fit and unfit, amiable and odious, both in actions and affections; and they argue, that such are the natures of certain actions, that when perceived as they are by a reasonable being, there must result in him certain emotions and affections. An excellent writer adds, that in contemplating the actions and affections of moral agents, we have both a perception of the understanding and a feeling of the heart; and the latter, or the effects in us accompanying our moral perceptions, are deducible from two springs. They partly depend on the positive constitution of our natures; but the most steady and universal ground of them is the essential congruity between the object and the faculty. Hutchesons Inquiry, &c. trac'd iv. sect. vi. and Eff. on Pass. p. 207, Smith's Theory of Mor. Sent. Parts iv. and vi. Cudworth's Immort. Mor. b. i. Price's Review, &c. ch. ii. Paley's Philosophy, vol. i. p. 14.

APPROBATION, in Civil Law. It is a maxim among civilians, approbate &c. et non impubl. He is judged to approve who does not disapprove.

By the civil law, a mere approbation of a crime after comminution does not make a person guilty; but an approbation attended with fact is equivalent to a command.

APPROBATION is more particularly used in speaking of recommendations of books given by persons qualified or authorized to judge of them.

These appointed to grant licences and imprinture, frequently express their approbation of books.

Books were formerly submitted to a licensor in England, see 15th Car. II. c. 31, which act is long since expired; and being incompatible with the noble principles of the revolution, has never since, and we hope never will be revived.

APPROPRIARE ad bonorn, in Law, signifies to bring a man within the extent and liberty of such an honour.

APPROPRIARE communum, signifies to discommon, i.e. to separate and inclute any parcel of land, which before was open common.

APPROPRIATE, Appropriated, in Philosophy, is underfoot of something which is indeed common to several; yet, in some respects, is peculiarly attributed to one.

APPROPRIATION, in Law, denotes the annexing of an ecclesiastical benefice to the proper and perpetual use of some religious house, bishopric, college, or spiritual person, to enjoy for ever; in the same way as impropriation is the annexing of a benefice to the use of a lay person or corporation; which which is an appropriation in the hands of religious persons being usually called an impropriation in the hands of the laity. It is computed, that there are in England 3845 impropriations.

This contrivance seems to have sprung from the interefled policy of the monastic orders, who begged and bought, for mafles and obits, and sometimes even for money, all the adworons within their reach, and then appropriated the benefices to their own corporation. But, in order to complete such appropriation effectually, the king's licence and the bishop's convent must first be obtained; because both the king and the bishop might some time or other have an intereft, by laple, in the presentation to the benefice, which can never happen if it be appropriated to the use of a corporation, which never dies. The content of the patron is also necessarily implied, because the approbation can be originally made to none but to such spiritual corporation as
is also the patron of the church; the whole being, indeed, nothing else but an allowance for the patrons to retain the
titules and glebe in their own hands, without preferring
any clerk, they themselves undertaking to provide for
the service of the church. When the appropriation is thus
made, the appropriators and their successors are perpetual
parsons of the church, and must live and die, in all
matters concerning the rights of the church, by the name
of parsons. This appropriation may be severed, and
the church become disappropriate, two ways: as first, if the
patron or appropriator present a clerk who is inducted and
indicted to the parsonage; for the incumbent so instituted
and indicted is, to all intents and purposes, complete parson;
and the appropriation, being once severed, can never be
re-united again, unless by a repetition of the same solemn
nities. And when the clerk so presented is distinct from the
vicar, the rectorly then vested in him becomes what is called a
fine-cure; because he hath no cure of souls, having under
him a vicar to whom that cure is committed. Also, if the
appropriation which has the appropriation is dissolved,
the parsonage becomes disappropriate at common law; because
the perpetuity of patron is gone, which is necessary to sup-
port the appropriation. In this manner may appropriations be made at this day;
and thus were most, if not all, of the appropriations at
present existing originally made; being annexed to bishoprics,
prebends, religious houses, may even to muniments, and
certain military orders, all of which were spiritual corpora-
tions. At the dissolution of the monasteries by statutes 27
Henry VIII. c. 28. and 31 Henry VIII. c. 13. the appro-
priations of the several parsonages, which belonged to those
religious houses, amounting to more than one-third of all
the parishes in England, would have been, by the rules of
the common law, disappropriated; if a clause in those sta-
tutes had not intervened, by which they were given to
the king in as ample a manner as they were before held
by the abbots, &c. The alien priories had, in former
reigns, been dissolved and given to the crown. From these
two sources have sprung all the lay appropriations or secular
parsonages in the kingdom; they having been afterwards
granted out from time to time by the crown. Blacklione's
Com. vol. i. p. 384. &c.

APPROUAS, or Approuar, in Geography, a river of South America, in the country of Guiana, which
discharges itself into the sea; N. lat. 4° 20'. W. long. 52°
46'.

APPROUAS, or Approuar, a town of South America, in
Guiana, situate at the mouth of the river of the same
name.

APPROVEMENT, Approvamentum, or appro-
viamentum, is sometimes used in Ancient Law Writers, for
an improvement, or rise of the value and worth of a thing.
Thus to approve, approbar, is to make the best benefit of a
thing; by increasing the rent, &c. Cun omnibus approva-
mentis, at alia pertinentis juris. &c.

Hence, in some ancient statutes, bailiffs of lords in their
franchises are called their approvers. A bailiff is not to
think it below him to approve, approbar, his master's goods;
but of his barony to make malt, of his wool to make cloth,
&c.

APPROVEMENT is more particularly used where a man
hath common in the lord's waite, and the lord incolpeth
part of the waite for himself, leaving sufficient common,
with egrets and regrets, for the commoner. Reg. Jud.
3, 9. This inclosure, when justifiable, is called in law
approvement, an ancient expression signifying the same as
improvement. Accordingly, it is provided by the statute of
Merston, 20 Hens. III. c. 4. that the lord may approves, or include, and convert to the use of husbandry, which is a
melioration or improvement, any waste grounds, woods, or
pallares, in which his tenants have common appendent to
their cottages, provided he leaves sufficient common to his
tenants, according to the proportion of their land.

APPROVER, in our Lactus, one who, being indicted for treason or felony, and arraigned for the same, doth
confess the fact before plea pleaded, and appeals or accedes
other his accomplices of the same crime, in order to obtain
his pardon; and this confession is called approvement.
He is called an approver, or prover, predictor, because he
must prove what he hath alleged in his appeal. This
proof was anciently either by battle, or by the country,
at the choice of the appellee; and the form of this acculation
may be found in Clomp. Jul. 250. See also Bracton, lib.
iii. Staunfl. Pl. Cor. 52.

If the appellee were vanquished, or found guilty, he must
suffer the judgment of the law, and the approver have his
pardon ex delibo injusticia. On the other hand, if the
appellee were conqueror, or acquitted by the jury, the approver
must receive judgment to be hanged, upon his own confes-
sion of the indictment; for the condition of his pardon has
failed, viz. the conviction of some other person, and there-
fore his conviction remains absolute. It is purely in
the discretion of the court to permit the approver thus to appeal,
or not; and, in fact, this course of admitting approachoms
has been long disused. But we have, in cases of burglary
and robbery on the highway, what seems to amount to the
sain by statute; it being ordained, that where persons
charged with such crimes out of prifon, discover two others
concerned in the crime, they shall have a pardon, &c. Stat.

APPROVERS of the king, are those who have the letting of
the king's demesnes in small mansors, &c. Stat. 51 Hen. III. b. 5.

In the statute of the 11th of Ed. III. c. 8. sheriffs are
called the king's approvers.

APPROVER is particularly used, in Ancient Law Writers,
for a bailiff or land-steward, appointed to have the care of a
manor, franchise, or the like, and improve and make the
moll of it for the benefit of his master.

In this sense, the word is also written approver.

APPROXIMATION, from ad, and proximus, near
to, in Arithmetic and Algebra, a continual approach fill
nearer and nearer to a root or quantity sought, without a
possibility of ever arriving at it exactly.

Methods of continual approximation for the square roots
and cube roots of numbers have been employed by Algebraists
and Arithmeticians, from Luers de Burgo, and perhaps a
much earlier period, to the present time. For the roots
of higher powers, and of all simple equations, and also for
the roots of all compound equations whatever, we have
approximations by Wallis, Raphson, Halley, and
later writers, especially Newton, De Lagny, &c. all of them
forming serieses infinitely converging, or approaching fill
to the quantity required, according to the nature of the
series.

It is evident, that if a number proposed be not a true
square, it is in vain to hope for a jaff quadratic root there-
of, explicable by rational numbers, whether integers or
fractions; whence, in such cases, we must content ourselves
with approximations, somewhat near the truth, without pre-
tending to accuracy: and so for the cubic root, of what is
not a perfect cube, and the like for superior powers.

This the ancients were aware of, and accordingly they
had their methods of approximation; which, though fearfully
applied by them beyond the quadratice, or perhaps the cubic
roots,
root, are yet equally applicable, by due adjustments, to the superior powers also, as is shown by Dr. Wallis, in the Phil. Transact. Ns. 215, or Pr. Tr. Ab. vol. I. p. 93.

The rule of double position furnishes an easy and general method of approximation. See Position.

For the roots of pure powers, many rules are given by writers on this subject; but the following, discovered by Dr. Hatton, and published in the first volume of his "Mathematical Tracts," is peculiarly recommended by its convenience for practice.

Let $N$ be any number, the root $r$ of which is to be extracted, and let $n$ be the nearest root first found by trial:

$r+1.N + r-1.n$ = $r-1.N + r+1.n \times n$ will be equall to the required root of $N$ very nearly; or expressing this theorem in a proportion, we shall have the following ratio: $r + 1.N + r-1.n : n = r-1.N + r+1.n \times n$,

$r+1.N + r-1.n : n$ : the required root, very nearly.

In order to find a root still nearer, substitute the last value of the root sought for $n$, and repeat the operation, as often as may be thought necessary. This theorem includes all the rational formulae of Halley and De Lagrange. E.G. Let it be required to double the cube, or to find the cube root of the number 2. In this case $r=3$, $r+1=4$, and $r-1=2$; and the general theorem will be $4N+2n2 = 2N2n$, or $2Nn = N2n$, or $N = 2n2$.

$x = 2n2$, or the cube root of $N$; or the proportion will be $N + 2n2$ = $2N + n2$ = $n$: the root sought nearly. Hence $N$ being 2, the nearest root $n$ is 1, and its cube root also is 1: consequently $N + 2n2 = 2 + 2 = 4$, and $2N + n2 = 4 + 1 = 5$; therefore $4 : 5 = 1 : 1.25$ is the result of the first approximation. Again, taking $n = \frac{1}{2}$, and consequently $n^3 = \frac{125}{64}$, we shall have $N + 2n2 = 2 + \frac{25}{64}$ = $\frac{378}{64}$, and $2N + n2 = 4 + \frac{125}{64}$ = $\frac{381}{64}$; and therefore the proportion will be $\frac{378}{64} : \frac{381}{64}$, or $i.e. = \frac{378}{381} = 0.9816$ or $125:127$.

$\therefore : \frac{5}{5} = \frac{555}{555} = 1.2500$, &c. the cube root of 2, true in all the figures: and by again taking $\frac{635}{635}$ for a new value of $n$, and repeating the process, many more figures may be found; and the result more nearly obtained.

Another method of approximating to the square root or cube root of any number, that is not a perfect square or cube, is as follows: First of all suppose two facticeive square or cube numbers, one greater and the other less than the given number, and whose square or cube roots differ from one another by unity. Then for the square root, it is evident that the given square number may be represented by $m^2 + n$; $m$ being greater or less than the given number, and $n$ being the part which is to be added in the former case and subtracted in the second, in order to obtain the said number.

Thus, $\sqrt{m^2 + n} = \frac{m + \sqrt{m^2 + n}}{2}$ = $\frac{m^2 + n}{2m}$ = $\frac{m^2 - n^2}{2m}$ = $\sqrt{m^2 - n^2}$, &c. will be the square root required. This series will always converge, because quantities are supposed to be integral numbers, and $n$ not to exceed unity: e.g. let the non-quadratic number $m$ be 150, and the nearest square numbers being 144 and 169, and their square roots 12 and 13, and 150 being nearer to 144 than to 169, $m^2 = 144$ and $n = 6$; and the formula $m^2 + n$ will be 144 + 6; consequently $\sqrt{144 + 6} = 12 + \frac{6}{24}$.

$\therefore \frac{36}{8} \times 1728 + \frac{216}{1624832}$ &c. Of this converging series it will be sufficient to take the three first terms for the required square root of 150: i.e. 12 + 1 + $\frac{1}{4}$ = 12 + $\frac{95}{384}$ = 12.247395 for the approximated root. The process is the same for the cube root, biquadratic root, &c.: e.g. let a number, which is an imperfect cube, be represented by $m^3 + n$, $m$ being the next greater, or next less cube to the number given, and $n$ the part to be added or subtracted, so as to give the proposed number. Then $\sqrt[3]{m^3 + n} = m + \frac{n}{2m} = \frac{n^2}{2m} = \frac{n^3}{2m^2} = \frac{n^4}{2m^3} = \frac{n^5}{2m^4} = \frac{n^6}{2m^5} = \frac{n^7}{2m^6} = \frac{n^8}{2m^7} = \frac{n^9}{2m^8} = \frac{n^{10}}{2m^9}$ &c. will be the cube root sought. The reader conversant with subjects of this nature, will easily supply an example.

To extract the roots of equations by Approximation. Stevinus and Vieta propo'd methods for obtaining the roots of equations by approximation; and their methods were improved and pursu'd by Oughtred and others. However they required a different process for every degree of equation, and of course were very tedious as well as imperfect. Sir Isaac Newton introduced general methods for investigating and expressing radical quantities by means of approximating, infinite series, and also the roots of all sorts of compound equations whatever, which methods are easy and expedient. For the approximation of roots he pursu'd the following method: he first found by trial the value of the root, either greater or less, but nearly equal to it; then assuming another letter to denote the unknown difference between this and the true value, he substituted in the equation, instead of the unknown root or letter of the equation, the sum or difference of the approximate root and the said assumed letter; and thus he obtained a new equation, having only the assumed small difference for its root or unknown letter, and then found by a certain method which he purposed, from this equation, a near value of this small assumed quantity. He then assumed another letter for the small difference between this last value and the true one, and substituted the sum or difference of these into the last equation, whence arose a third equation, involving the second assumed quantity, whole near value he found as before. Proceeding thus as far as he thought proper, he connect'd together by their proper signs all the near values that had been found, and thus formed a series approaching still nearer and nearer to the true value of the root of the first or proposed equation. The approximate values of the several small assumed differences may be found in different ways. Newton's method was as follows: as the quantity sought is small, its higher powers decrease more and more, and therefore no great error will result from neglecting them; accordingly Newton neglected all the terms having in them the second and higher powers, leaving only the first power and the absolute known term; from which simple equation he always found the value of the assumed unknown letter nearly, in a very simple and easy manner. Halley's method of doing the same thing, was to neglect all the terms above the second power, and then to find the root of the remaining quadratic equation; which would give a nearer value of the assumed letter than Newton's method, but by a more troublesome and less expeditious processes. Raphson has proposed another method, little different from that of Newton, thus: having found a near value of the first assumed small quantity or difference, he corrected this by the first approximation to the root of the proposed equation; and then, assuming another letter for the next, or smaller difference, he introduced it into the original equation in the same manner as before;
and thus he proceeded from one correction to another, employing always the first proposed equation to find them, instead of the successive near equations used by Newton.

E. C. Let it be required to find the root of the equation $x - \frac{3x}{3} = 31$ or $x - \frac{3x}{3} - 31 = 0$; here the root $x$ is evidently equal to $8$ nearly; and therefore for $x$ take $8 + \alpha$, and substitute $8 + \alpha$ for $x$ in the given equation, and the terms will be as follows:

$$x^3 = 64 + 16\alpha + \alpha^2,$$
$$x^2 = 64 + 16\alpha,$$
$$x = 8 + \alpha,$$
$$\alpha = 0.1.$$  

the sum is $7 + 11\alpha + \alpha^2 = 0$. Then, rejecting $\alpha$, we have $x = 7 + 11\alpha$, and $x = 7.03$, &c. Consequence, or $0$ nearly.

Next assume $z = 0.5$, then

$$0.5^2 = 0.25,$$
$$0.5^3 = 0.125,$$
$$0.5^4 = 0.0625,$$
$$0.6 = 0.6,$$
$$0.7 = 0.7.$$  

the sum $-0.4 + 12.2y + y^2 = 0$, and rejecting $y$, $12.2y = 0.04$, and $y = \frac{0.04}{12.2} = 0.003278$ nearly. Assume $y = 0.003278 - z$, then

$$y^2 = 0.00001075284 - 0.00556 \alpha + \alpha^2,$$
$$2.2y = 0.000909010 - 12.2 \alpha,$$
$$-0.4 = -0.4.$$  

the sum $0.00001345284 - 0.20556 \alpha + \alpha^2 = 0$, and $\alpha = \frac{-0.00001345284}{12.20556} = \frac{0.0000124133}{12.20556}$. Hence, collecting all the assumed differences, with their appropriate signs, we shall have $x = 8 + y + z = 1.6 + 0.3278 + 0.003278 = 8.6032787867$; the required root of the equation proposed, according to the method of Newton.

Raphson’s process is as follows: assume $x = 8 + z$; then

$$x^3 = 64 + 16\alpha + \alpha^2,$$
$$x^2 = 64 + 16\alpha,$$
$$x = 8 + \alpha,$$
$$\alpha = 0.1.$$  

the sum $7 + 11\alpha + \alpha^2 = 0$; hence $x = 7.03$, &c. Consequence, or $0$ nearly.

Assume $x = 8.6 + y$; then $x^3 = 73.90 + 17.2y + y^2$,

$$-5x = -43 - 5y,$$
$$-31 = -31.$$  

the sum $-0.04 + 12.2y + y^2 = 0$; hence $y = \frac{0.04}{12.2} = 0.003278$ nearly; and $x = 8.6 + y = 8.603278$ nearly. Assume $x = 8.603278 - z$; then

$$x^3 = 74.10639245284 - 17.20556 \alpha + \alpha^2,$$
$$5x = -43.0163900 + 5 \alpha,$$
$$-31 = -31.$$  

the sum $0.00001345284 - 0.20556 \alpha + \alpha^2 = 0$, and $\alpha = \frac{-0.00001345284}{12.20556} = \frac{0.0000124133}{12.20556}$ as before.

For the cubic equation e. g. $y^3 - 2y - 5 = 0$, Newton proceeds thus:

$y$ is nearly $2$; assume therefore $y = 2 + \beta$; then,

$$y^3 = 8 + 12\beta + 6\beta^2 + \beta^3,$$
$$-2y = -4 - 2\beta,$$
$$-5 = -5.$$  

the sum $1 + 10\beta + 6\beta^2 + \beta^3 = 0$; hence $\beta = 1.8$. Consequence, or $0$ nearly.

Assume $\beta = 1.8$, then

$$\beta^3 = 0.001 + 0.037 + 0.39 + 0.83,$$
$$\beta^3 = 0.006 + 0.129 + 0.62,$$
$$\beta^3 = 1 + 0.9,$$
$$\beta = 1.8.$$  

the sum $0.001 + 11.237 + 0.37 + \beta^3 = 0$; hence $q = -0.0034$ nearly.

Assume $q = -0.0034 + r$; then

$$q = -0.0000157464 + 0.00000078458, \&c.$$
$$q = -0.00001803786, \&c.$$
$$+11.237 = -0.066042 + 11.237 \beta,$$
$$+0.001 = +0.001.$$  

the sum will be $0.000054155330 + 0.000014248$; hence $r = 0$. Consequence, or $0$. Consequently,

$$y = 2 + \beta + q + r,$$
$$2 + 0.1 = -0.0034 + -0.000048517,$$
$$2.0034551483, \beta 

In the same manner Newton proceeds for the root of the equations of literal equations, that is, equations having literal coefficients; thus, the root of this equation,

$$y + asy + ay^2 = -x^3 = 0,$$  

is

$$y = \sqrt[3]{\frac{x^3}{4} + \frac{13x^3}{54}} + \frac{13x^3}{54}, \&c.$$  

Vid. De Analysi per &c. Cap. vi. §. 1 and 2, apud Oper. Newton. t. p. 270, &c. Geometria Analytica, cap. ii. &c. Ed. Hor. Raphson. Analyseum Universalis. Phil. Trans. &c. M. Newton. t. p. 349, &c. Ed. Hor. Raphson. Analyseum Universalis. Phil. Trans. &c. M. Clairaut, in his “Algebra”; and by Dr. Hutton, in vol. i. of his “Tracts.” Belides, the methods of infinite series by Wallis, Newton, Gregory, Mercator, Machin, &c. may be considered as approximations in quadratures, and other branches of the mathematics, many inferences of which may be seen in Wallis’s Algebra, the Philosophical Transactions, and other works on the subject. To this head may be referred the methods of exhaustions of the ancient, by which Archimedes and others have approximated to the quadrature and rectification of the circle, &c. which was performed by continually bisecting the sides of polygons, both inscribed in a circle, and circumscribed about it, which means the sums of the sides of the familiar polygons approach continually nearer and nearer to each other, and the circumference of the circle is nearly a mean between the two sums. See Equation.

Approximation, in Medicine, denotes a magnetic kind of cure or method of transplanting a disease into some other subject, whether animate or vegetable, by bringing it in immediate contact with the patient.

Approximation, in Surgery, Appropinquatio, Enzyma, Enzyma Ossum Cranii. Fr. Approximation des os du crane; Germ. Die Ueberwindung fehlbeg. des Hirnschadelns. This term is applied to those wounds of the head, in which the skull being fractured, one or more of the splinters are forced under the found part of the bone, so as to occasion a compression of the dura mater. In the delivery of a child, this occurrence with the bones of the cranium, one lapping over the other, is a natural circumstantial. APPUI, in the Manege, q. d. rest or stay upon the hand, is the reciprocal effort between the horse’s mouth and the bridle-hand; or the sense of the action of the bridge on the hand of the horsemann. A jult appui of the hand, is the nice bearing up or stay of the bridge; so that the horse, being saddled by the sensibility and tenderness of his mouth, dair not rest too much upon
APP

upon the bit-mouth, nor check or beat upon the land to withstand it.

A dull appui, is when a horse has a good mouth, but his tongue is so thick that the bit cannot work, or bear upon the bars; the tongue not being so flexible as the bars; though the like effect is sometimes owing to the thickness of his lips. A horse is said to have no appui, when he dreads the bit-mouth, is too apprehensive of the hand, and cannot bear the bit. He is said to have too much appui, when he resists, or throws himself too much, or too hardly, upon the bit. Horses designed for the army ought to have a full appui upon the hand. See HAND.

APPULSE, from ad, and pule, I call on, in a general sense, a thing's being brought to, or in contact with another.

Articulation is either by appulse, i.e. when one of the moveable organs touches and holds on some of those which are immovable; or without appulse, only by inclination of the moveable organ to the immovable.

APPULSE of cattle, appulsus pecoris, in the Civil Law, the right of driving them to water.

APPULSE, in Astroonomy, the approach of any planet to a conjunction with the sun, or a star; so that they may be seen within the range of the telescope; or, as some authors have defined it, the actual contact of two luminaries.

The appulse of the planets to the fixed stars have always been of great use to astronomers, in order to fix the places of the former. The ancients wanting an easy method of comparing the planets with the eclipses, which is not visible, had recourse to any other way of fixing their situations, but by observing their track among the fixed stars, and remarking their appulse to some of these visible points. Hill. Acad. Scien. an. 1710, p. 417.

Dr. Halley has published a method of determining the places of the planets, by observing their near appulse to the fixed stars. Phil. Tranf. No 369. See also Phil. Tranf. No 76, p. 361, and Mem. Acad. Scien. for 1708, where Flamsteed and de la Hire have given observations of the moon's appulse to the Pleiades.

For discovering the longitude at sea, observations of the appulse of the moon to the fixed stars afford an excellent method. See LONGITUDE.

Of all the celestial observations hitherto made, none are capable of so perfect an exactness, as the near appulse of the moon and planets to the fixed stars; for though the places of the stars have not as yet attained their ultimate precision, yet such observations are ever good, the places of the planets being thereby ascertained in proportion to the correctness of any catalogues that may be made hereafter. But the ordinary number of stars, with which the planets may be thus compared, being small, the opportunities of observing are consequently rare; whence appears the great use of a full catalogue of all the telescopical stars within the zodiac, viz. that thereby opportunities of observing appulse may be more frequent. Since the royal observatory at Greenwich was put under Dr. Halley's care, he endeavoured to put himself in a condition to supply the many and great vacancies to be met with in the present zodiac; and for the service of astronomy, published a map or planisphere of the starry zodiac, wherein are accurately laid down all the stars to which the moon's appulse has ever been observed in any part of the world. Phil. Tranf. Abr. vol. vi. p. 170.

His successors in that department, and particularly the present astronomer royal, Dr. Maskelyne, have contributed, in a very high degree, to the facility and use of such observations. See NAUTICAL ALMANAC, and LONGITUDE.

APURTENANCES, or APPURTENANCES, in Common Law, signify things belonging to some other as their principal.

The word is formed of ad, to, and pertinent, belonging. Appurtenancies may either be things corporeal, and which belong to a chief tenant, and common of pasturage, trees, &c.; or incorporeal, as liberties and services of tenancy.

See APPENDANT, and COMMON.

APREMONT, in Geography, a town of France, in the department of the Higher Alps, and chief place of a canton, in the district of Sables d'Olonne, long. of S. of Sables d'Olonne, and 4 N.E. of Challans.

APRES, a fictitious or heraldic animal, drawn as a bull with a short tail, like that of a bear; it is borne as the sinister supporter to the arms of the company of Muco voy merchants.

APRES-LES-VEYNE, in Geography, a town of France, in the department of the Higher Alps, and chief place of a canton in the district of Gap. The place contains 857, and the canton 5300 inhabitants: the territory includes 245 kilometers and 9 communes.

APREY, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Langres, 8 miles S. W. of Langres.

APRI, in Natural History, a species of Thaenia that infests the liver of the boar. Gaese Eingewe.—Gmelin.

APRI, is also the specific name of another kind of vermian that inhabits the intestines of the boar; it is of the Trichocephalus genus, and is thus described. Tail furnished on each side with ciliated scales. Gaese Eingewe. This is of the same size as T. hominis, which infests the human body.

APRI, a third kind of vermis, also belonging to the Ascaris genus. It is found in the lungs of the boar; is viviparous, brittle, tapering to a point at each end; slender as a fine thread, and an inch in length.

APRICARIUS, in Ornithology, a species of Charadrius, about the size of the golden plover, that inhabits the northern parts of Europe; as Sweden, Denmark, Iceland, and Greenland; and feeds on worms, and the buds of the black-berryed heath in the latter. The flesh is delicious. The specific character is, the chin and abdomen black; body brown, dotted with white and yellow; legs cinereous. Linn. To which may be added, the length of the bill is one inch, its colour brown; the eyes large, irides brown; the feathers black; forehead, between the eyes, white, a line of which is continued over each eye, down the sides of the neck, and unites on the breast in the form of a transverse bar. The vent is spotted with white; secondaries, quills, and tail, barred with black and brown; legs black.—The male is distinguished by having a black patch on the temples.

This is Pluvialis aurica floriuse Hudsons of Britain; pluvier doré à gorge noire of Buffon; spotted plover of Edwards; and alwargrim plover, Arch Zool. & Lath. Gen. Syn.

APRICOT, in Botany. See PRUNUS.

APRICOT, in Gardening, a general name applied to a fruit-tree of the plum kind. This tree, we are told by different writers on gardening, came originally from Armenia, whence it takes the name of Armeniaca. It was introduced into this country, according to Mr. Forstyth, in 1562. The same writer also remarks, that though the apricot will not take upon the cherry-bloek, it will succeed upon all sorts of plums, except the Bruxells. The following selection of apricots is recommended as the most suitable for a small garden. The Malfastia, the Roman, the Orange, the Breda, and the Moor Park. The most proper time for planting trees of this kind, the above author observes, is in autumn, as soon as the leaf begins to fall; such trees being chosen for this purpose as have the strongest and cleanest stems, and if such as have been headed down, and are of two,
two or three years growth, they will bear and fill the wall of much sooner than those which have not been so treated. He thinks they should only have one item; or if they have two, one of them should be cut off; for by planting those with two items, the middle of the tree is apt to be left naked, and of course one-third of the wall remains uncovered by the branches. The writer, however, feels fully aware, that it is the practice of many to make choice of trees with the smallest items; but these, he thinks, always produce weaker fruits than such as he has recommended. The Breda is supposed the best and the richest flavoured for a standard, although the Brouvils is frequently preferred; but Mr. Forby would by no means recommend planting more than three trees of each sort in a garden, as standards; as it is not one year in ten, he says, that a tolerable crop is produced from them. He thinks the Breda, the Brouvils, and the Moor Parks, should always be planted on an east or west aspect. A few trees for an early supply may be planted on a south aspect, according to the size of the garden, and the demand there may be for the supply of the family; but a west aspect is far preferable for the general crop. Those who wish for a late supply, may also have some trees planted on an east aspect.

In planting the trees, it is recommended, where the borders are near, that they should be made two feet and a half or three feet deep of good, light fresh loam; and that in old borders, where the earth has been injured by the roots of the former trees, it will be necessary to take out the old mould at least three feet deep and four feet wide, filling up the hole with fresh loam, taking care to plant the trees about eight inches higher than the level of the old border, to allow for the sinking of the earth, and that they may not afterwards be too deep in the ground. But the propagation, culture, and management of apricot trees, will be more fully treated of under the article Prunus.

The produce of the apricot tree is highly valuable as a summer fruit, for different purposes; while green and young, for tarts, pies, &c.; when ripe, it is a fine table fruit, provided it be gathered before it become soft and mealy; and when preserved in sugar, is an excellent sweetmeat.

APRILS, in Biography and Ancient History, succeeded his father Flaminus or Planitius, as king of Egypt, in the year before Christ 594, and is supposed to have been the Pharaoh-Hophra of Jeremiah, ch. xxxvii. 5; and Ezekiel, xvii. 15. Herodotus (l. i. c. 161.) and Diodorus (l. i. p. 62.) give him the character of a martial prince; and speak of successful wars which he carried on against the Tyrians, Sidonians, and Cypriots. Having taken Sarbon by storm, and made himself master of the isle of Cyprus, he returned with immense spoil into Egypt. In the first year of his reign, he entered into a league with Zedekiah king of Judah, against the king of Babylon; and about two years after, attempted to relieve Jerusalem, which was strongly beleaguered by Nebuchadnezzar; but as the Babylonians approached, he and his Egyptian army fled, and left the Jews to the merciless rage of their enemies. Towards the latter end of his reign, the Libyans applied to him for succour against the Cyrenians, a Greek colony of Africa, by whom they were invaded; but the powerful army which he sent to their relief, being defeated with great slaughter, a discomfit, which terminated in a civil war, took place among his own subjects. Amasis, who was employed to quell the tumult, betrayed Aprils, and was proclaimed king. In a battle near Memphis, Aprils was vanquished and made prisoner, and after some time was strangled; having reigned, according to Herodotus, 25 years, but 22 according to Diodorus. Anc. Un. Hist. v. i. p. 312.

APRIGLIANO, in Geography, a town of Italy, in the kingdom of Naples, and province of Calabria Citera, 7 miles S. E. of Cosenza.

APRIL, the fourth month of the year, according to the ancient computation; but the second, reckoning from the vernal equinox.

The word is derived from Aprilis, of apiris, I open; because the earth, in this month, begins to open her bosom for the production of vegetables; or, as others say, from Apiris, the Greek appellation of Venus.

In this month the sun travels through parts of the signs Aries and Taurus.

APRILE GIUSEPPE, in Biography. See TENDUCHE, and CANTARE.

APRILINA, in Entomology, a species of Phalaena, in the Nectis family, described by Linnaeus, and Fabricius. Both authors, it must indeed be remarked, have made great confusion between this and another species of the same family; viz. Runica: and Entomologists have been under considerable doubts respecting the identity of these. These are natives of Great Britain, and as such fully noticed by Mr. Donovan, in his "Natural History of British Insects;" from which it appears that the Linnaean species named Aprilina, is the same as Fabricius calls Runica; and, on the contrary, the Runica of Linnaeus is the Aprilina of Fabricius: to reconcile the difficulties arising from this confusion, the two insects are thus defined.

Phalaena Aprilina: thorax crested; wings distended, green; a black mark and transverse band; and a single row of black triangular dots near the apex. Vol. x. p. 57.

Phalaena Runica: thorax crested; first wings greenish, with black marks; and a row of triangular dots behind. Vol. x. p. 75.

And it is further observed, that the two black semicircles on the thorax, and double row of triangular spots at the ends of the posterior wings, are mentioned as peculiarities of the species Runica, by some writers; the latter is, however, liable to considerable variations, the spots being in general crowded in a confused series, and forming an irregularly interrupted line. It may be easily distinguished from the Phalaena Aprilina, by its superior size; the colours are less vivid, and it is distinble of the broad transverse bar, which is conspicuous on the upper wings of Phalaena Aprilina. Vide Don. Brit. Inf.

APRILIS, or Prisus Lacus, in Ancient Geography, Lago de Caglioles, a lake of Italy, belonging to Eturia, to the west of Nulien.

APRIO, in Geography, a town of European Turkey, in the province of Romania, the see of a Greek archbishop; situated on the Lirviss, between Trajanopolis and Rhodolus. It was anciently called Theodosiopolis, from its being a favourite residence of Theodosius the great; and afterwards April or Aprilis.

APRIO, or Aprilis, in Naval Architecture, is a piece of curved timber fixed behind the lower part of the stern, immediately above the foremost end of the keel.

APRON, in Gunny, a piece of lead which casts or covers the vent or touch-hole of a cannon.

APROS, in Ancient Geography, a river of Gaul, in the country of the Oxybians; supposed by M. D'Anville to be the present Loup.

APROSIO, Angelico, in Biography, a learned Augustine monk, was born at Ventimiglia in Genoa, in 1507. In Genoa he taught philosophy for five years, and he afterwards settled at Venice, where he lectured on polite literature.
nature. Of the library of the Augustines, founded by him in his native place, he published a catalogue, under the title of "Bibliotheca Aproliana," printed at Bologna, in 1673,
12mo.; which contains an account of his own life, and
various authors. He wrote many fabulical or humorous
pieces under fictitious names. He died about the year 1682.

APRUSA, in Ancient Geography, a river of Italy, placed
by Piny in Umbria, and supposed by Hardouin to be the
present Avis.

APRUTUM, APRIGLIANO, a town of Italy, in Bruto-
tium, fourth book of Callistus; and supposed by Hardouin to be the
Aefulnum of Ptolemy.

APRUTUM, a town of Italy, now Teramo.

APSAIUS, a town placed by Ptolemy in Macedonia.

APSYNES, in Biography, a sophist and rhetorician of
Athens, was born at Gadara of Phoenicia, and flourished
about the year 236. Philonorus was his friend, and
celebrates his accuracy as a writer, in the left book of his
sophists. His remains are to be found in Manutius's Col-
lection of Rhetoricians, published at Venice in 1603. fol.

APSYNTII, in Ancient Geography, people who inhabited
the southern part of Thrace, towards the coasts, east of
the river Melas, and west of the Hebrus. They took their
name from the river Apisintus, which traversed their country.

APSIUS, or APSIS, signifies the bared or arched roof of
a house, room, or even, &c. as also the ring or compass of a
wheel.

APSIUS, in Ecclesiastical Writers, denotes an inner part in
the ancient churches, wherein the clergy fat, and where
the altar was placed. It is supposed to have been thus
called, because covered with an arch or vault of its own, by the
Greeks called αψις, and by the Latins apsis. I suppose, with
less probability, it is called as being the most lu-
minous part; from αψις, to give light.

Apsi, in this sense, amounts to the same with what is
otherside called choir, concha, camera, and prothesis; and
stands opposite to the nave or body of the church.

APSIUS is more particularly used for the bishop's seat, or
throne, in ancient churches. This was more peculiarly
called apsis gradata, because raised on steps above the
ordinary stalls. It was also denominated exedra, and in later
times tribunal.

APSIUS is also used for the reliquary, or cafe, wherein the
relics of saints were anciently kept. It took the name apsi
from its being round, or arched at the top; or perhaps from
the place where it was kept. The apsis was commonly placed
on the altar; it was usually of wood, sometimes also of gold
and silver, with sculptures, &c.

APSIUS, in Astronomy, is applied to either of the two points
in the orbits of planets, wherein they are at the greatest,
and the least distance from the sun, or earth. The apsis at the
greatest distance is called the major or oppress apsis; that
at the least distance, the lesser, apsis minima, or infrantis. The two
apses are also called aequis. The higher apsis is more par-
cularly denominated the aphasis, or apgesis; the lower, the
perihelion or perilune. The diameter which joins these two
points is called the line of the apsis, and this passage through
the centre of the orbit of the planet, and the centre of the
earth or sun. In the modern astronomy, this line makes the
longer or transverse axis of the elliptical orbit of the planet.
Such is the line AQ (Plate I. Astron. fig. 9.) drawn from
the apsion A to the perihelion Q. The eccentricity is
reckoned in the line of the apsis; being the distance be-
 tween the centre of the orbit of the planet C, and the centre
of the sun or earth, S, according as the Copernican or the
Iteolemaic system is followed.

These definitions suppose that the lines of the greatest
and least distances form one and the same right line; but
this is not always precisely the case; as sometimes make
an angle with each other, which is greater or less than
80 degrees; and the difference from 180° measures the motion
of the line of the apsis. When this angle is less than 180°,
the motion of the apsis is said to be contrary to the order
of the signs, and when it exceeds 180°, the motion is ac-
cording to the order of the signs. Astronomers have pro-
posed various methods for estimating the motion of the
apsis, several of which are recited and explained in the
"Astronomy" of Keil and that of Monnier. Newton, in
his "Principia," has given an excellent method for deter-
mining the motion of the apsis of a planet, occasioned by
the attraction of another, on the supposition that the plan-
etary orbit is little different from a circle. He shows, that,
if the sun be immovable, and all the planets gravitate
towards him, in the inverse ratio of the squares of their
distances, the motion of the apsis will be nothing; or the
lines above mentioned will make an angle with each other
of 180°, or form one straight line. But, on account of the
mutual gravitation of the planets towards one another, their
gravitation towards the sun is not precisely in that ratio,
and consequently their apsis are not always exactly in a right
line with the sun; and Newton has given a very elegant
method of determining the motion of the apsis, on the
supposition that we know the force which is thus added to
the gravitation of the planet towards the sun, and that this
additional force is always directed towards the sun, which
is not precisely the case. For the motion of the apsis,
see APHELION, APOGES, and PLAINET.

Kepler discovered, from observation, that the velocities
of the planets in their apsis, are inversely as their distances
from the sun; hence it follows, that they deferibe, in
these points, equal areas about the sun in equal times.
And although he could not prove, from observation, that
the same was true in every point of the orbit, yet he had no
doubt that this was the case. He therefore applied this
principle to find the equation of the orbit, and, finding
that his calculations agreed with observations, he concluded it
was true in general, "that the planets describe about the sun
equal areas in equal times." This discovery was, perhaps,
the foundation of the "Principia," as it probably might
favour to Sir Isaac Newton the idea that the proposition
was true in general, which he afterwards proved it to be.

APSORRUS, or APSARUS, in Ancient Geography, a river
in the district of Colchis, which fell into the Euxine sea, to
the call of Athens.

APSorrus was also the name of a town in Asia, on the
coast of the Euxine sea.

APSUS, now Creusa, a river of Europe, in Macedonia,
which rises in Mount Tomaritis, and runs into the Adriatic
sea, at some distance to the south of Dyrachium. This river
watered a valley, which the ancients compared to that of
Tempel. The Roman and Macedonian armies encamped on
the banks of this river, in the war against Philip.

APSYCHIA, from α, privative, and ψυχη, soul, in
Medicina, a frowning or fainting away, called also gynychia
and apsiychia.

APSYCTOS, from α, and ψυχη, I cool, a word used by
the ancients, as the name of a stone found in Arcadia,
and of the colour of iron, the quality of which they say was,
that when once heated red-hot, it would never grow cold again.

We have some stones indeed in England, that when once
heated, will retain a warmth for a long time, but all the other
accounts seem groundless; our warming-stone, used in Corn-
wall and Yorkshire to lay at the feet of people's beds, will
retain warmth eight or ten hours; and there is a sort of red
stone.
APT in Geography, a town of France, and principal place of a district in the department of Vienne; the fee of a bishop, fullrann of Aix, before the revolution; the cathedral is said to be the oldest in France, and a council was held here in 1352. It is situated on the river Calavon, 9 leagues E. of Avignon, and 7 N. of Aix. N. lat. 43° 52'. E. long. 5° 56'.

APT JULIA, in Ancient Geography, called also Civitas Apteum, a town of Gallia Narbonensis; now Apte.

APTENODYTES, in Ornithology, a genus of the order Austeridae. The bill is straight, rather compressed, and sharp along the edges; the upper mandible is obliquely falcated lengthwise; feet palmated, thacked; wings fan-shaped, and without quill feathers.—Gmelin, &c. This is the genus Pinguin of Dr. Latham's Synopsis; its character of it is more copious, and is as follows: bill strong, straight, more or less bending towards the point, covered with the fides; nostrils rounded, placed in furrows; tongue covered with strong spines, pointing backwards; wings small, more like fins, covered with longer feathers than the rest of the body, undeveloped in flight; body clothed with thick short feathers, having broad shafts, and placed as compactly as scales; legs short and thick, placed near the vent; toes four, all placed forwards, the interior loofe, the rest webbed; tail very fift, consisting of broad shafts scarcely webbed.

"This genus of birds," adds Dr. Latham, "seems to hold the same place in the southern parts of the world as the auk do in the northern, and are by no means to be confounded with the one or the other, however authors may differ in opinion in respect to this matter. The penguin is seen only in the temperate and frigid zones, on that side of the equator which it frequents; and the bird is observed of the auk in opposite latitudes; and neither of the genera has yet been observed within the tropics. The auk has true wings and quills, though small; the penguin, more fins only, instead of wings. This bill has four toes on each foot; but the former only three. The penguin, while swimming, sinks quite above the breast, the head and neck appearing only out of the water; rowing itself along with its finny wings, as with ours; while the auk, in common with most other birds, swims on the surface. Several other circumstances, peculiar to each, might be mentioned, if these were insufficient to characterize this genus.

"The bodies of the penguin tribe are commonly so well and closely covered with feathers, that no wet can penetrate; and as they are in general excessively fat, these circumstances unite to secure them from cold. They have often been found above seven hundred leagues from land; and frequently on the mountains of ice, on which they seem to feed without difficulty, as the foles of their feet are very rough, and suited to the purpose." Gen. Syn. vol. iii. p. 2.

The birds called by Buffon and some others penguin or penguin, belong to the Alca genus of Gmelin.—The last author describes the following species of the Aptenodytes genus: cluflonae, patagonica, pape, anarctica, magdalenica, demersa, cataracte, turquadra, minor, chionocephala, and chilensis.

APTERA, from α and ωγγως, wing, in Entomology, the seventh and last order of insects in the Linnean system. The definition of the order is simply this: aptera, wingless; and the genera are divided into the three following sections:

- Legs six: head distinct from the thorax: comprehending the leptura, podura, termes, aphelurus, and julius, genera.

- Legs from eight to fourteen, inclusive: head and thorax united: comprehending the acarus, hydrachna, arana, phalangium, scorpio, monocusus, and oniscus, genera.

- Legs numerous: head distinct from the thorax: comprehending the two last genera, scolopendra, and julius.

It must, however, be observed, that this arrangement, though preferable to that of Fabricius in some respects, is not entirely free from objection; for there are abundant instances of apterous insects that can only be referred to the other classes, unless we separate the two sexes of many individual species, as we shall have occasion to notice in the articles Formica, Mutilla, and others hereafter. Bruniche, in his system of entomology, has arranged every insect wanting wings, under his apterous order, without regarding those in which one sex has wings, and the other is destitute of them. Thus, for example, the apterous aphid, the female cousc, the neuters of ants, and the apterous mutilla, are separate from their own species, and arranged amongst insects that have no affinity with them; and, to complete the disorder and confusion, the pupa of the gryll, creatures in a state yet imperfect, is included with the apterous order also.

No insect can be referred to the apterous order in the Linnean system, unless both sexes, when arrived at their last state of being, are destitute of wings: although the term apterus is used in a general manner, by entomologists, to signify any insect without wings, when complete, whether it be the females of those winged males that belong to the other orders, or not; and even for coleopterous and hemipterous insects that have a hard, leathery covering or elytra, and have no wings under them. It is often used, by Linneus himself, in this manner, as the following examples fully prove.

Apter a, a species of Blatta; it is apterous, brown, and punctured; posterior margins of the abdominal segments, and legs livid; wings (wing-cases) ferruginous; thanks spinous. Linn. and Gmel.

Apter a, a species of Cicada; apterous and black; wing-cases abbreviated; thanks and antennae pale. Linn. & Gmel.

Apter a, in Ancient Geography, a town of Lyicia.

Apter a, or Apteria, was also a town of the isle of Crete, situated in the western part to the north-west of Cypasia, and having for its port Cillus or Cissura. Near this town, according to Stephan. Byz., the Sirens challenged the Muses to a musical contest, but having been vanquished, they plucked off their wings, and leaped into the sea, whence Faber reports its name; but Eusebius, in his Chronicon, says, that it was so called from one Aptera, king of Crete, the supposed founder of it. Here was also a temple or chapel dedicated to Venus Urania. This town is now called Ater i a or Palaea Co."
Apeterus, is likewise the name of a species of Hister, of a fulvous colour, and without wings. It is a native of Italy, and described by Scopoli (ent. cory.). Gmelin.

Apeterus, is a species also given to one of the curculiones, Curculio Apeterus, thorax spinosus, impregnated with a cruciform mark; wing-cases dotted with ferruginous brown. Fab. Obt. The Dick is short, legs unarmed, hairy black, and punctured on the belly. It is the Curculio Cruciatus of Degeer, is of a large size, and inhabits the Cape of Good Hope.

Apeterus is, lastly, a species of Cimex found in Europe. It is variegated with red and black; elytra red with two black spots; no wings. Fab. and Gmel.

Ap-Thanes, an ancient term for the higher nobility in Scotland. See Thane.

Aptitude, from aptus, fit, the natural disposition any thing hath to serve for such or such a purpose. Thus oil hath an aptitude to burn, and water to extinguish fire.

Aptitude, or Aptness, is often used in speaking of the habits of the mind, for a promptitude or disposition to learn things with ease and expedition.

In which sense aptness amounts to the same with what the Greeks call aptes, and the Latins bene indoles, and we sometimes doctibly.

Chariton divides aptness into three parts, viz. acuteness, sagacity, and memory.

Aptote, derived from priv. and απτειν, cujus, in Grammar, a noun indeclinable, or which is without any variation or case. Such are the words fats, nasis, &c.

Apuleius, Lucius, in Biography, a Platonic philosopher, was born of a respectable family at Madura in Africa, and lived in the 2d century, under the Antonines. He prosecuted his studies at Carthage, Athens, and Rome; at which latter place he acquired the knowledge of the Latin tongue without a master: and of these studies he gives the following curious account. "Our first cup of knowledge, which we receive from the hand of the teacher of letters, removes entire ignorance; the second furnishes us with the learning of the grammerian; the third arms us with the eloquence of the rhetorician; and as much as this is drunk by most persons: but at Athens I drank other cups from the delectful fountain of poetry, from the clear stream of geometry, from the sweet waters of muse, from the rough current of dialectics, and from the necerous but inexhaustable deep of universal philosophy." In the early period of life he spent his patrimony, which was considerable, in acts of liberality to his instructors and to the indigent, and in his travels, which he undertook for the acquisition of knowledge, and chiefly for obtaining information concerning the religious opinions and ceremonies of different countries. With this view he obtained admission into their several mysteries; being initiated, in Greece, into several solemn rites; and devoting himself, at Carthage, to the worship of Aesculapius, their tutchary divinity, and performing the honourable office of Antiltes, chief conductor of the ceremonies, in the college of his priests. Upon his return to Rome, his patrimony was so completely exhausted, that he was said to have pawned his clothes in order to defray the expense of the inaugural ceremonies of his introduction into the fraternity of Osiris. In order to gain a subistence, he assumed the profession of a pleader, from the exercise of which he derived considerable profit; but with a view of more speedily repairing his fortune, he married Pudentilla, a rich widow of Oea, whose principal attraction was her wealth. This connection involved him in a lawsuit with the brother of her former husband, who charged him with employing magical incantations to gain her affection: but he found no difficulty in proving to the satisfaction of his judges, that the only witchcraft by which he accomplished his purpose were the attractions of his person. The apology which he delivered on this occasion is still extant, and is much admired. In consequence of this unfounded accusation, and without any other evidence, Apuleius was ranked among the professors of magic; and after his death miracles were ascribed to him, which were placed in competition with those of Jesus Christ. Accordingly, Laërtius, in the beginning of the 4th century, expressly states his opinion that the author whom he confutes, had emitted Apuleius, of whom so many wonderful things were reported; and Augustine, in the fifth century, was requested by Marcellinus to exert his utmost efforts in refuting those who falsely affected that Christ did nothing more than was done by other men, and who produced their Apolitians, Apuleus, and other matters of the magic art, whose miracles they maintained to have been greater than his. Apuleius feems, indeed, to have been no mean proficient in those arts of imposition, which he had learned from priests of different countries; but the idle report above-mentioned was the only ground of the opinion circulated after his decease, that he professed or exercised miraculous powers. This opinion, probably, originated in an absurd misapprehension of his fable of the "Golden Aes," for true history. The work is a fictitious romance, in which a Milawian fable, on the metamorphosis of Lucius into an aë, intended by Lucius of Patras, and abridged from him by Lucian, is enlarged and embellished. Although there be no sufficient evidence that Apuleius pretended to work miracles, and for inftituting any comparison between him and Jesus Christ, yet it is not improbable that in some passages of the fable of the golden aë, he intended to ridicule the Christians; and bishop Warburton was per- haps, right in his conjecture, founded on a passage in Apuleius's Apology, that Lemius, the brother of Pudentilla's first husband, who professed him for magic, was a Christian. But there seems to be no sufficient ground for the supposition of this learned writer (see Div. Leg. b. iv. § 4.), that the design of the fable of the golden aë was "to recommend the Pagan religion as the only cure for all vice in general." The author himself calls it a Milawian tale, and a Greek fable; and the ancients always so understood it. Mosheim and Lardner have examined the hypothesis of Dr. Warburton, and urged against it objections that are unanswerable. The true character of this work seems to be that which Barthius and Bayle have given it, viz. "that it is a perpetual satire on magical delusions, the tricks of priests, and the crimes of adulterers, thieves and robbers, committed with impunity." This work was published with large notes by Beraldis, at Venice, in 1504, 2o.; reprinted at Paris, in 1510, folio; and in 1536, 8vo. The beautiful Epitome to it, intituled, "The Loves of Cupid and Pufhe," has been repeatedly translated into various languages. The Apology, or "Oratio de Magia," was published separately by Catusbon, in 1594, 4to.; and by Leyden, in 1608, 8vo.; and by Priceus with notes, &c. at Paris, in 1657, 8vo. In philosophy, Apuleius wrote a treatise, "De habitudine Titanum et naturae Polum Philosophi," in 2 books: the first on the speculative doctrines of Plato; the second on his morals; and the third on his logic. He also wrote a Latin translation of Aristotle's treatise, "De Mundo," an oration "De Deo Socrates," d'feulling the question concerning his demon; and a work intituled, "Florida," which, though rather rhetorical than philosophical, serves in many particulars to illustrate the history of philosophy. Another botanical work, intituled, "De Herbis, five de nominibus ac virtutibus Herbarum," has been ascribed to Apuleius; but
but Johnson, the translator of Gerard, supposed it to be a translation of a Greek writer of the 8th century. Fabricius, however, thinks that this is an improbable conjecture. The first edition of the works of Apuleius was printed at Rome under the care of Cardinal B. fariion, in 1469, folio; they have since passed through various other editions, as those of H. Stephens, in 1585, 8vo.; of Elmeunorilu, at Frankfort, in 1621, 8vo.; of Schwarz, at Leyden, in 1624, 12mo.; "Variation" edition, at Gouda in Holland, in 1656, 8vo.; and another, "In Usum Delphini," vol. 4to. at Paris, in 1688. Apuleius by his writings ought to be claffed among the wis rather than the philosophers of his age. His writings, the view of Plato's doctrines excepted, are too folid and ftropic, and in many parts too boofe and wanton, to comport with the gravity of philosophy. Fabr. Bib. Latin. lib. iii. c. 2. tom. ii. p. 17. Gen. Dict. London's Works, vol. vii. p. 459-463. Brucker's Hist. Philo. by Enfield, vol. ii. p. 53.

APULIA, now Puglia, in Ancient Geography, denoted that large district of Magna Graecia in Italy, which extended along the Adriatic sea from the river Fronto or Fronto to the north-west, as far as the cape Japygium to the south-east, and comprehending Daunia, Peucettia, and Messapia. Its boundaries were, on the north and east, the Adriatic sea; on the south, Sinus Tarentinus, or the gulf of Tarentum, and part of Lucania; and on the west, Samnium. The principal mountains were, Garganus to the north, and Vultur to the south: its chief rivers were, Fronto, Aufidus, Celurus, and Bradanus; and its principal cities were, Tarnum, Apulum, Spito, Arpi, Luceria, Aequum, Venenum, Acheronia, Canumutin, Butantum, and Barium; and Mepapa, eastwards, Brandumus, and Hydruntum; and in the gulf, Tarantum and Callipolis. M. Fretet supposes that the Apulians were a party of the Liburni, of Illyrian origin, who penetrated into Italy about the 6th century before Christ, and established themselves between the Alps and the river Atheus, whence they proceeded to that part which the Romans called Apulia and Japygia.

APULIBAMA, in Geography, a jurisdiction of South America, confiding of millions belonging to the Franciscans, subject to the bishop of Cufo, 63 leagues from that city, in the empire of Peru, and comprehending seven towns of converted Indians.

APULUS, in Entomology, a species of Sphinx that inhabits Syria. The wings are indented; anterior pair fulvous, with two golden-colored spots; posterior wings white, antennae feathered. Fabricius and Gmelin.

APURIMA, or APURACAE, in Geography, a very rapid river of South America, rising near the town of Arequipa in Peru, on the west of the Great Lake Tiahca, S. lat. 16° 33' and running into the Ucayali. The Apurima, in the map of La Cruz, appears to be the original and proper river of the Amazon, and forms the remotest branch of the Ucayali, which must be regarded as the ancient or genuine Maranon.

APURWACA, or APURCA, a river of South America, in Guiana, which is one of the most considerable rivers in the country.

APUS, in Astronomia, a constellation of the southern hemisphere, placed near the pole, between the Triangle and the Chameleon, supposed to represent the bird of paradise.

The apus is supposed to be one of those birds called opodes, as having no feet.

The stars contained in this constellation, according to Sharp's catalogue, annexed to the British, are eleven; in Bayer's charts, twelve; but more numerous in La Caille's catalogue. The principal star is of the 5th magnitude; and in 1750, its right ascension was 213° 32' 45", and its southern declination 77° 57' 6".

The synonymous terms for this creature are numerous. It is the binocerus cauda bifera of Geoffroy; binocerus (palustris) ocults superis, telta po
de

sharp's river

fulvous, in

the Good Hope, and Carolina in North America. Swifts are almost constantly on the wing; they fly higher and with more rapidity than the swallows, and never associate with them. They fly about, and if by accident they should fall upon the ground, raise themselves up again with great difficulty. They are said to avoid heat as well as cold, and therefore remain in their holes in the daytime, and fly chiefly in the morning and evening in search of prey; their nests are built in elevated places, such as lofty steeples and high towers; the nest is composed of a variety of materials, as dry grass, moss, hemp, shreds of flax, linen, gauze, feathers, and other light substances. They lay five white eggs, which are rather of a longish form; the young are hatched about the latter end of May, begin to fly about the middle of June, and shortly after the nests are abandoned. Swifts begin to assemble, previously to their departure, early in July; their numbers daily increase, and large bodies of them appear together, they soar higher in the air, with fluttering cries, and continue at times to assemble together in greater numbers till the beginning or middle of August, when they leave the island of Britain altogether.

APUTASY, in Botany, a name given by the people of Guinea to a tree, a dejection of which is in great use among them for wafting the mouth to cure the fever in the gums, and preserve the teeth. Phil. Trans. N° 257.

APYCN, in the Ancient Music, was used for such chords or sounds of the scale as could never enter the psalms. They were fixed, or stabiles.

APYCNON, from a, and πυκνος, non sphe'minos, rarun. in the Ancient Music, was applied to those two conjunct intervals of a tetrachord, which taken together were greater than the third.

This happened only in the two diatonic genera.

APYREXOS, in Botany, properly signifies without kernels.
**AQU**

**APRYXOY**, formed of the privative *a*, and *εψε*, *εγνε*, *εκε*, in *Medicine*, the intermission of a fever, or ague.

**APYR0IL**, in *Antiquity*, a denomination given to *altars* whereon sacrifice was offered without fire.

In which sense, the word *flamis* contradistinguished from *empyrion*.

**APYROMETALLOM**, in *Metallurgy*, a name by which some authors have called gold, from its refining the force of fire.

**APYROUS**, in *Chemistry*, is a word applied to denote that property in some bodies, by which they refit the molt violent *fie*, without any sensible alteration.

**AQUA**, in *Natural History*, *Physics*, *Chemistry*, *Medicine*, *Water*, *Scic., which see.

The word is Latin, and supposed to be compounded of *α* and *qua*, *q. d.*, from which; alluding to the opinion that water is the basis, or matter of all bodies.

**Aqua forte**. The workers in metals, &c. distilling two kinds of *aqua forte*, the double and single, or prima and secunda; the former of these is common nitrous acid, the latter is nitrous acid distilled with an equal bulk of water.

**Aqua marina, Aqua marina**, in *Mineralogy*. See *Beryl*.

**Aqua regia, or Aqua regalis**. This is a combination in various proportions of nitric and muriatic acids. It was formerly known by the name *aqua regia*, from its being at that time the only acid capable of dissolving gold. In the new nomenclature it has attained the appellation of Nitromuriatic acid.

**Aqua succinea**. This is nothing else but *aqua forte*, distilled with much pure water. It is employed in several arts, to clean the surface of metals and of certain bones, and for various other purposes.

**Aqua sulphae, sulphur water**, formerly called *gas sulphur* by Van Helmont, is at present known by the name, of liquid Sulphureous acid.

**Aqua vitae, water of life, eau de vie of the French*, *usquebaugh of the Irish*, *usbyliae of the Scotch*, is a name familiarly applied to native distilled spirits. Hence grape wine being the material from which the common spirits are moly procured on the continent, the French *eau de vie*, the Italian *acqua vitae*, the German *brandwein*, are strictly synonymous, and correspond to the English word brandy. But fermented barley, rye, &c.; being the material made use of in Scotland, Ireland, Holland and England, the terms *usquebaugh*, *whisky*, and *Hollands*, are more properly synonymous with the English *Malt spirit*.

**Aqua, in Pharmacy**, is a term prefixed to a variety of liquid preparations, in which water is the principal liquid vehicle. Thos. are of two kinds, one the *distilled waters*, consisting of water impregnated with the medicinal virtue of various vegetables, through the medium of distillation; and the other kind is simply a solution of various saline substances, in known proportions of water, to ensure a greater accuracy in prescription.

We shall briefly notice the several aqueous preparations which are either actually in use, or have acquired a certain celebrity.

**Aqua distillata, Pharm. Lond.** *Aqua distillata*, Ph. Edin. Simple distilled water. To prepare this, any quantity of spirit *g* water is to be distilled in clean *vials*. The first portions are to be rejected, and the process continued, till about two thirds are distilled off, which are to be kept for use in clean glasses.

No other water but distilled is allowed by the college to be used in the aqueous preparations. It is particularly requisite in some of the saline solutions, as, for instance, in

distilled waters, but milky with pure or river water.

**Aqua distillata, P. Lond.** *Aqua distillata*, P. Edin. The distilled waters of Pharmacy.

The general rule for preparing these waters is to put the plants, or parts of plants employed, into a tinned copper still, to cover them with water, and to distil it off with a gentle heat, as long as the liquor retains sufficient flavour of the plant. The process must be stopped before all the water is evaporated, otherwise the plant would be burned, and would give a disagreeable burnt taste to the liquor. See the articles *Distillation*, *Springs distilled*, and *Oils essential*.

The number of plants submitted to distillation by former pharmaceutical chemists, is almost endless; and in the older pharmacopoeias, we find numerous compound waters made of ingredients, many of which are either inert in themselves, or whose virtue is not capable of uniting with water through the medium of distillation. Of this kind are the daily, buglofs, water-cress, &c. which have been prescribed for distillation; but in the present pharmacopoeias, all these useless materials are omitted, and those only are retained that will give some sensible flavour or smell to water distilled of them.

The following are retained at present. *Aqua anbii* (distilled water of dill)—*cinamomo* (or true cinnamon)—*faunefol* (or fennel)—*menthe piperiti* (of peppermint)—*mentha fariea* (of peppermint)—*pimento* (of allspice)—*pulvfr* (of pennyroyal)—*ro"* (of roe leaves)—*cortis limonum* (of lemon peel)—*cortis aurantium* bialpalmum, (of Seville orange peel)—*caffia lignes* (or cafea cinnamon).

About a pound of the dry barks and seeds, and a pound and a half of the fresh plants, are sufficient for a gallon of the distilled waters; but three or four pints of water more must be employed to prevent burning, and to allow of that quantity to be distilled off.

It should be remembered that the term *distilled water* is now strictly confined to those preparations in which no other liquid than water is employed to extract the virtue of the plant; but formerly it was extended to those that were prepared with a mixture of ardent spirit and water, or even with pure spirit. Thus the *aqua lavendula* (lavender water) is a spirituous water, prepared by distilling a mixture of spirits of wine and water from the lavender.

A few of the most celebrated distilled waters or spirituous waters, may be mentioned.

*Aqua asperlitera, plaque water*, is prepared by distilling the roots of matherwort (*imperatoria*), the seeds of angelica and elder flowers, in French brandy.

*Aqua Regia Hungaria, Hungary Water*. The genuine Hungarian water is a pure spirit distilled from the roemany, and strongly sected with the rich perfume of this aromatic plant. The French is reckoned the best.

*Aqua odorifera, honey water, eau de miel*. This is a compound aromatic spirit, prepared by distilling spirit of wine with honey, coriander seeds, wildoese, cloves, nutmegs, lemon-peel, floxar, benzoin, to which are added spirituous roe-water, and orange-flower water.

*Aqua Vulnaria, Arqueolysate Water*, is a spirit prepared from a great variety of aromatic plants, such as thyme, origanum, balm, lavender, roemany, &c.

The reader will find the recipes for the above-mentioned waters, and a great number of others (many of which are now obsolete) in *Beauvais Elements de Pharmacie*.

The medicinal virtues of the distilled aromatic waters and spirits have, perhaps, been much over-rated, and numerous distinctions between them with regard to their effects, have been made, without much foundation.

All of them are cordial and stimulating, and as such have

4 A 2 con-
considerable efficacy in sudden fittings, sickness, and languor; but the difference of effect between the impure aromatic and the limpid waters is so great, that much of the virtue of the latter is attributed to the aromatic spirit. They are largely used in medicine; and from their agreeable flavor and fragrance, they will conceal the nauseous taint and smell of many of the most unpleasant drugs. The consumption of the fragrant aromatic spirits is perhaps still greater, as perfumes for the toilet; and the flavoured spirits, more than all, as elixirs and cordials.

The other kinds of waters in pharmacy are simple solutions of various salts, as we have already mentioned. The following are retained in the London and Edinburgh pharmacopoeias.

*Aqua aluminia composita* (formerly *Aqua aluminia Batanea*), is a solution of half an ounce of alum, and half an ounce of vitriolated zinc, in two pints of water.

*Aqua cupri ammoniaci* (formerly *Aqua saprophirina, or aqua caelestis*), is prepared by mixing one dram of nitrate of copper with a pint of lime water, and suffering them to stand in a copper vessel till the solution has acquired that beautiful blue colour by which it is distinguished. The same effect takes place in glass vessels, if some thin pieces of copper are added. This preparation is a very weak solution of copper in the caustic ammonia, which is separated from the sal ammoniac by means of the lime water. It is used as a gentle gallic in surgery, and it also forms a conspicuous ornament to the druggist’s shop. See Copper.

*Aqua lithargyri acetae composita*, is a mixture of two drams of the aqua lithargyri (or Gouldard’s extract), with two pints of distilled water, and two drams of proof spirit of wine.

*Aqua zinchi vitriolata cum camphora*, is a solution of half an ounce of vitriolated zinc, in two pints of distilled water, to which half an ounce of camphorated spirit is added, and the whole filtered, to separate most of the camphor which is precipitated by the mixture. Enough of the camphor remains to give its strong smell to the solution.

*Aqua ammonica* and *Aqua ammonica pura*. See *Ammoniacal preparations*.

*Aqua ammonica acetate*. See *Acetate of Ammonia*.

*Aqua kali preparati* (formerly *lithium tartari*), is a saturated solution of carbonate of potash in water, made by the spontaneous deliquecence of this alkaline salt, when kept for some time in a molasses vessel. *Aqua kali puri* (formerly *lithium fasanarium*), is a solution of potash made caustic by means of lime. See Potash.

*Aqua caesi, lime water*. See Lime.

*Aqua phageanum*. A preparation often used in surgery, is a solution of half a dram of corrosive sublimate of mercury, in one pint of lime water. The lime water here decomposes the mercurial salt, and makes a turbid brick-colored liquor, of great efficacy as an epharmac in foul wounds or obliterating ulcers.

*Aquæ Minerals*. See *Waters Mineral*.

*Aqua*, or *Aqua*, in *Geography*, a province of Africa in Cyrenaica, on the Gold Coast, bounded on the south by Pentin, on the north-east by Dinikira, and on the west by the river of Chama, or St. John.

*Aqua* from the lake of that name, about 14 miles from Rome, near the Claudian way, was a stream of water brought to the city, and entering it at the porta Esquilina, now the gate of St. Laurence. It was not fit to drink, and served merely to water gardens, and to supply the Nannachite.

*Aqua crebra* in *Ancient Geography*, a river which passed by the villa of Cicero at Tusculum, supposed by Cluver and M. D'Auville to be that which is now called Maranna: but the able Chappy is of opinion that those were different rivers.

*Aqua Julii*, a river about 12 miles from Rome, in the Via Latina, brought by Agrippa to Rome during his residence, A. U. C. 721. Its source was called *Cepoi Julii*, and it is now known by the name of *Capo d'Aqua*. It enters the city near the Esquilina gate, and had its name, according to Frontinus, from one Julianus, who discovered the spring that finances it.

*Aqua Miliaris*, a stream of water which was conveyed through a considerable distance underground, near the Tiber. This was also called *Aqua flavia*, and is said to have been first brought to Rome by the praetor Q. Marcius, from a spring near the Valerian way, upwards of 50 miles distant from the city, which it enters near the Esquilina gate. This was, and still is, reckoned the best water for drinking in Rome.

*Aqua Paulina*. See *Aquaeduct*.

*Aqua Tepula*, a river formed by the union of several streams, which had its source about ten miles from Rome, in the Via Latina, and was conveyed thither by Agrippa; now known by the name of *Depuri*, near Praefate.

*Aqua Virginis*, a stream of water; so called from a country girl’s frowning the spring to some soldiers who were ready to perish with thirst; which enters Rome at the gate Pinciana, and was brought thither by Agrippa, A. U. C. 735. At present it issues from the fountain in the Piazza di Spagna, which represents a slip, and from that of Trevi, so called from the Trivium, where three streets meet.

*Aqua Viva*, a place in Etruria, north of Rome.

*Aqua*, a small place in Brutium, near the sea; north-east of Scylla.

*Aqua*, baths of mineral waters in Mauritania Caesariana; mentioned by Ptolemy, and placed by Antonini in his itinerary, 25 Roman miles from Casaraca. The city was once a Roman colony and episcopal see.

*Aqua Caldas*, a small ancient town situated in Hispания Tarragonensis.

*Aqua*, a small place of Italy, in Pecenum, south-west of Aculum.

*Aqua Alba*, a town of Africa in Bizzacium; also a town of Africa, in Mauritania Setifensis, which had been an episcopal see.

*Aqua Angitae*, a small place of Italy, in Brutium, upon the western coast.

*Aqua Apollinaris*, a place of Italy, in Etruria, between Tarquinii on the north-west, and Care on the south-east.

*Aqua Augulis*, or Tarbellae, a city of Gaul, in Comagiana, and capital of the Tarbelli. It is now *Aque*, or *Dax*. See *Aces*.

*Aqua Billicus*, Vasserblitch, a town of Gaul, belonging to the Sunici; and placed by Martin south-east of Orolunnum, and west of Angulfia Treverorum.

*Aqua Bilbliana*, Bilbliana Aemilia, a famous place of Hispania Tarragonensis, between Bibernis, and Anacum to the west.

*Aqua Bormaetae*, Bourbon-l’Archambault, a place of Gaul, belonging to the Bituriges Cubi, in Aquitania prima, between Tumcunicum to the north-west, and Sitilia, belonging to the Boii, to the east.

*Aqua Borrominis*, Bourbonnes les Bains, a place of Gaul, belonging to the Sequani, between Andometurum, or Lingones, to the west, and Dittatium to the east.

*Aqua Calienes*, a place of Gaul, belonging to the Aveni, east southwards.

*Aqua Galles*, Bagni di Ballicano, baths of Italy, three miles from Pulsone.—Allo, a town of Africa, in Numidia Propria.
Propria, wholly destroyed:—also, *Aguae-Petrae*, a place of Gaul:—also, Bath in Somerethini:—also, *Calida Cilinarum*, a town of Hispamia Tarragonensis, north of Barcino, belonging to the Laetaniti:—also, *Calida* or *Tibiltamine*, in Africa, about ten leagues south-west of Hippo Regius, now called Hamam, or the baths, lying to the east of the Hamam-Mekkouteen, on the north side of the river Sciboufe, in the district of the Bookalwan, of the province of Constantina:—also, *Calida Colonia*, now the Hamam or the baths of Mereega, in the African province of Trencha, eight miles east-north-east of Mahana, between the river Sheliff and the sea; the largest and most frequented of these (says Shaw, *Travels*, &c. p. 50), is a basin of 12 feet square, and four deep; and the water, which bubbles up with a degree of heat force tolerable, after it has filled this cistern, pales on to a much smaller one, which is made use of by the Jews, who are not permitted to bathe in company, or in the same place, with the Mahometans; retorted to by a great concourse of people in the spring, the season of these waters, which are accounted very efficacious for curing the jaundice, rheumatic pains, and some of the most inveterate diseases: near this bath are the ruins of an old Roman town, and tombs and coffins of donatus; the rose of an unusual size:—*Calida, Pilica*, a place of Gaul, south of Vorogum, and north-east of Angulfometum, or Avernii.

*Aqua Cordana*, a place of Etruria, north-west of Core.

*Aqua Cilinorum*, a place of Spain, south-east of the river Iria Flavia.

*Aqua Convenarum*, Cophina according to M. D'Anville, south-east of Turba and north-west of Logunum, or Convena. Some authors have assigned its situation to that of the present Bagneres; but this does not correspond to the measures given in the Itineraries.—*Convenarum*, or *Onciforum*; coming a town of Gallia Narbonensis.

*Aqua Cumana*, baths near Cumas in Italy.

*Aqua Caetilia*, Pozzo Rutigena, a lake of Italy, in the country of the Sabines. Pliny, Seneca, and Varro report, that in this lake there was a moving island, and the latter says, that it was the centre of Italy, Vespianus used these waters every summer, and died in this place. By some they are called *Aqua Sabina*; and by Strabo, *Aqua Caetilia*.

*Aqua Dura, Alcalá del Río*, a place of Spain, in Bética.

*Aqua Flavia, Chieres*, a town of Hispamia exterior, belonging to the Callai, and situate to the north-east, in the interior part of the country. Trajan built a bridge on the river now called Tamaga, the ruins of which indicate its former grandeur.

*Aqua Helvetiae, Badon*, a town of Gaul, belonging to the northern Helvetii, between Vindomila to the well and Vitodurum to the east.

*Aqua Latiniatis, Sarum*, a town in the island of Sardinia.

*Aqua Leo*, a town of Spain, at the mouth of the Minius.

*Aqua Meron*, supposed to be the lake called by Josephus Samsononitis, in Upper Gallice, into which the river Jordan falls before it arrives at the sea of Genareth. Here Jabin, king of Hazor, encamped, when he was defeated by Joshua. See Josh. ch. xi. 5.

*Aqua Neapolitana*, a town of the island of Sardinia.

*Aqua Nera*, or *Nera*, *Nera*, a place of Gaul, belonging to the Bituriges Cubi, and situate between Mediolanum to the north-east, and Castalia to the south-east.

*Aqua Nigerii*, or *Nilucii*, *Roman-Lains*, a place of Gaul, belonging to the Axel, south-east of Durtum, and west of Tuchonum.

---

*Aqua Nuphis*. See *Aqueus Sibari*.

*Aqua Origenis*, a place of Spain in the country of the Callai, upon the Minius, north-east of Tyde.

*Aqua Pannonica*, baths of Aquitania, now called Baden.

*Aqua Paustris*, a place of Italy, in Etruria.

*Aqua Patavina*, baths in the territory of Venice, near Padua, called *Fontes Aquae* by Livy and Martial, now *Bagni d'Asso*.

*Aqua Pisanæ*, a small place of Etruria, north-east of Pisa.

*Aqua Populonae*, a small place of Etruria, between Sabro to the south-east, and Manlius to the north-west.

*Aqua Querquernae*, a place of Spain, belonging to the Callai, between *Aqua Origenis* and Nomentana.

*Aqua Quintanae*, a place of Spain, in the country of the Callai, south-east of Lucus Augusti.

*Aqua Regia*, a town of Africa, situate some miles south of Turzo; the ruins of which still remain.

*Aqua Regia*, baths of Epirus, near Aerocerasium.

*Aqua Sabina*, a famous place in Italy, three miles from Rome. It was the see of a bishop, suffragan to the archbishop of Carthage.

*Aqua Segresta, Ferrabres*, a place belonging to the Senones, between Genabum to the north-west and Agidium to the north-east;—also *Segresta, Affluat*, a place of Gaul belonging to the Segoured;—placed by M. D'Anville near Liger, and south of Forum Seguninorum.

*Aqua Sextilia, Aix*, a town in Gaul, in Narbonenensis Secunda, to the north of Mailla. See Aix.

*Aqua Sicula*, probably Sib比例 a place of Gaul, situated, according to M. D'Anville, south-east of Tolofa, and near it, north-east of Vernol.

*Aqua Statiuor*, or *Statilorum*, a town in Italy in Liguria, now *Aquae*, in Montferat.

*Aqua Tamarina*, a place of Africa in Bizaecium, now called El-Hammah of Gabs, i.e. the baths of Gabs, or Tatapae. These baths are sheltered from the weather by low thatched hovels; and their basins are about the size of those at Mereega. See *Aqua Caetilia*. One of these baths is called the bath of the lepers, and below it the water flages and forms a pool; the same, perhaps, with the lake of lepers, mentioned by Leo.

*Aqua Tauri*, hot baths of Etruria in Italy, three miles from the sea, said to be discovered by a bull, whence their name; now *Aquapendente* in Orvieto.

*Aqua Veconia*, a place of Spain, south-east of Gerunda.

*Aqua Volaterrana*, a place of Italy in Etruria, south of Volaterrana, and on the other side of Cecina.

*Aqua et ignis interdicto*. See *Interdiction*.

*Aqua balsam*, an ancient name for the clerk officiating under the chief minifier, whose business was to assist him in carrying the holy water. The office corresponding to it at present is that of the parish clerk.

*Aqua balsam*, in the *Civil Law*, a right of drawing water, and carrying it through another's ground.

*Aqua favor*, is used by some to denote the *Hydrophobia*. Phil. Traut. N° 147.

*AQUEDUCT*, *AQUEDUCTUS*, q. d. *aquae, a conduit of water*, in Architecture and Hydraulics, is a construction of stone or timber, built on an uneven ground, to preserve the level of water, and convey it by a canal, from one place to another. Some of these aqueducts are visible, and others subterraneous. Those of the former sort are constructed at a great height across valleys and marshes, and supported by piers and ranges of arches. The latter are formed by piercing the mountains, and conducting them below the surface of the earth. They are built of stone, brick,
brick, &c, and covered above with vaulted roofs or flat stones, serving to shelter the water from the sun and rain. Of these aqueducts, some are single, and others triple; that is, supported on two or three ranges of arches. Of the latter kind are the pont-du-gard in Languedoc, supposed to have been built by the Romans to carry water to the city of Nimes; that of Conflantinople; and that which, according to Procopius, was constructed by Csesar king of Petra, near Petra in Moabitis, and which had three conduits in the same direction, each elevated above the other. Some of these aqueducts were paved, and others conveyed the water through a natural channel of clay; and it was frequently conducted by pipes of lead into reservoirs of the same metal, or into troughs of hewn stone.

Aqueducts of every kind were reckoned among the wonders of ancient Rome; their great number, and the immense expense of bringing water, 30, 40, or 60, and even 100 miles, either upon continued arches, or by means of other works, when it was necessary to penetrate mountains and rocks, may well astonish us. If, says Pline (Hist. Nat. i. 36. c. 15.), we consider the incredible quantity of water brought to Rome for the uses of the public, for fountains, baths, fish-ponds, private-houses, garden, and country-lects; if we repent to ourselves the arches constructed with at great expense, and carried out through a long distance, mountains levelled, rocks cut through, and valleys filled up, it must be acknowledged that there is nothing in the whole world more wonderful. For 440 years the Romans contented themselves with the waters of the Tiber, and of the wells and fountains in the city and its neighbourhood. But when the number of houses and inhabitants was considerably augmented, they were obliged to bring water from remote places by means of aqueducts. Appius commenced this scheme of improvement. See Appian aqueduct. About 37 years after him, M. Curiius Dentatus, who was censor with Papius Curfor, brought water from the neighbourhood of the city of Tibur; and applied towards defraying the expense, part of the sums taken in the spoils of Pyrrhus. After them Lucius Papius, Caius Servilius Cepion, Lucius Longinus Caius, Quintus Marius (who brought water to Rome from a spring at the distance of sixty-one miles), Marcus Agrippa, Augustus, and others, signalised themselves by their noble aqueducts. Even Tiberius, Claudius, Caligula, and Caracalla, though in other respects not of the best character, took care of the city in this useful affair. There are still to be seen in the country about Rome wonderful remains of the ancient aqueducts, some elevated above the ground by arches continued and raised one above the other, and others subterraneous passing through rocks; such is that seen at Vicovaro beyond Tivoli, in which a canal pieces a rock to the extent of more than a mile, and about five feet deep and four broad. With what attention these immense works were constructed, will appear by inspection of the 128th plate in the 4th volume of Montfaucon's Antiquities. At certain distances vents were provided, so that the water which was accidentally obstructed in its passage, might be discharged, till its ordinary passage was cleared; and in the canal of the aqueduct itself there were cavitizes into which the water was precipitated, and where it remained till its mud was deposited, and ponds in which it might purify itself. In the construction of these aqueducts, there was a confideable variety; that cailed the Aqua Marcia had an arch of sixteen feet in diameter; it was constructed of three kinds of stone, and was formed with two canals one above the other: the most elevated was supplied by the waters of the Tiberone, Anio novus, and the lowest by the Claudian water. The entire edifice was 70 Roman feet high. The arch of the aqueduct which brought to Rome the Claudian water was constructed of beautiful hewn stone. This is represented by Pline (Hist. Nat. i. 36. c. 15.), as the most beautiful of all that had been built for the use of Rome. It conveyed the water through a vaulted canal, through the distance of 39 miles, and was so high that it fulfilled all the hills of the city. According to him, and the computation of Budaeus, the charge of this work amounted to 14,850,000 crowns.

This aqueduct was begun by Caligula, and finished by Claudius, who brought its waters from two springs called Cornelius and Curtius. Vespasian, Titus, Marcus Aurelius, and Antoninus Pius, repaired and extended it; it is now called Aqua Felice. The aqueduct that conveyed the Aqua Neroniana to Rome, was built of brick; this, as well as the former, was 62 Roman feet high. The aqueduct that brought the Aqua Marcia into the city was repaired by Agrippa, who laid pipes from it to several parts of the city. The Aqua Marcia, Aqua Julia, and Aqua Tepula (i.e. Aqua), entered Rome in one and the same aqueduct divided into three ranges or foyers; in the uppermost of which flowed the Aqua Tepula, in the second the Aqua Julia, and in the lowest the Aqua Marcia. This accounts for the extraordinary height of this aqueduct, which far surpassed that of any other in Rome. From the ruins of this fabric, which still subsist, and are called "Il castello del Aqua Marcia," it appears to have been a very superb structure. The aqueducts were under the care and direction, first of the cenfors and ædiles, and afterwards, of particular magistrates called "curatores aquarum," instituted by Agrippa, to whom the aqueducts of Rome were objects of particular attention. Metellus was one of these curatores in the reign of Augustus, and Frontinus held the same office in that of Nerva. Augustus caused all of them to be repaired. Procopius reckons only fourteen aqueducts in ancient Rome; but Victor has enlarged the number to twenty. Frontinus, a man of confiderable dignity, and who had the direction of the aqueducts under the emperor Nerva, mentions nine that emptied themselves through 13,594 pipes, of an inch diameter. Vigenece has observed, that in the space of twenty-four hours, Rome received from these aqueducts no less than five hundred thousand hogsheads of water. The three chief aqueducts now in being are those of the Aqua Virginea, Aqua Felice, and the Aqua Paulina. The last was repaired by Pope Paul IV. The second was constructed by Pope Sixtus V, and is called from the name which he assumed before he was exalted to the papal throne. It proceeds from Fabbrina at the distance of twenty-two miles, and discharges itself at the Fontana di Terminii, which was also built at his expense, and consists of three arches, supported by four Corinthian pillars, and the water gushes out through three large apertures. Over the middle arch flanks a beautiful statue of Mofes striking the rock with his rod; over another arch is a buffelo-relievo of Aaron leading the people to the miraculous springs in the wilderness; and the third exhibits Gideon trying his fowlers by their drinking water. Round it are four lions, two of marble, and the other two of oriental granite, said to be brought thither from a temple of Serapis. All the four lions eject water; and on the front is an inscription, importing that this aqueduct was begun in the first and completed in the third year of the pontificate of Sixtus V. 1588. The third was repaired by Pope Paul V in the year 1612. This divides itself into two principal channels, one of which supplies Mount Janiculums, and the other the Vatican and its neighbourhood. It is conveyed through the distance of thirty miles, from the district of Bracciano, and three of its five streams are not inferior to small rivers, and sufficient to turn a mill.
After recounting the ancient and modern aqueducts of Rome, we might mention those constructed by the Romans in other countries: one of the principal of these is the aqueduct of Metz, of which a great number of the arcades still remain. These arcades crossed the Moselle, which is broad and deep; and the copious waters of Gorze furnished water sufficient for the representation of a sea-fight. The water was collected in a reservoir, whence it was conducted by a subterraneous canal formed of hewn stone, and so lofty that a man might walk in it erect; and it then traversed the Moselle, at the distance of two leagues from Metz. This aqueduct was so accurately worked and newly cemented, that it remained in a great degree restored the shores of the most fertile regions. From the arcades that crossed the river, other aqueducts conveyed the water to the baths of Metz, and also to the place where the mattress was exhibited. Of the aqueduct of Segovia, there still remain 150 arcades, consisting of stones of an enormous size, and joined without mortar. These arcades are 102 feet high, and are disposed in two ranges, one above the other. The aqueduct traverses the city, and passes under a considerable number of houses. The famous aqueducts of Constantinople, about six miles from the village of Belgrado, were built by Valentian the first, Celsinus being prefect, and afterwards repaired by Soliman the magnificient, who exempted twelve adjacent Greek villages from the customary tribute of the empire, in consideration of their keeping these aqueducts in repair. Of these the most remarkable are three large and lofty fabrics, built over so many valleys betwixt the adjoining hills, of which the longest has many but few arches, and may possibly (says Chirnloth, Travels, &c. p. 43.) be the entire work of Soliman. The other two have an appearance of a more ancient and regular architecture, consisting of two rows of arches one over the other; and those of the second were enclosed by pillars cut through the middle, so as to render the fabric both passable like a bridge, and useful for the conveyance of water. The more considerable of these two consists of only four large arches, each twenty yards long, and somewhat above twenty high, supported by octagonal pillars of about fifty-six yards in circumference towards the summit. For an inquiry into the nature and construction of the aqueducts of the Romans, see Governor Pownall’s Notices and Descriptions of Antiquities of the Provincia Romana, of Gaul, 1788. The aqueduct built by Lewis XIV. near Maintenon, for carrying the river Bure to Verfaillies, is perhaps the greatest now in the world. It is 7000 fathoms long, and its elevation 2560 fathoms; containing 242 arcades. Vide Phil Trans. Vol. xxvii. 1794. p. 594.

Aqueductus Fallipus, a name improperly given by Fellipus to the bony canal through which the firm portion of the auditory nerve pusses out of the cranium. Aqueductus Sylliss, the iter a tertio ad quartum ventriculum, or canalis medius. See Brain.

Aquamanilis, from aqua, water, and manus, hand, is particularly used, in Ecclesiastical Writers, for a kind of bason or lavar, anciently placed in the vehicles of churches, serving to wash the hands in. Aquamanilis flood contradistinguished from urceolas, as the former was placed under the hands, the latter above them, from whence the water tricked down by a cock. The priest also, after celebrating mass, washed his fingers in an aquamanilis.

In the inventories of church plate, we frequently find mention of aquamanilis, aquamanilla, aquamanilla, of silver gilt, wrought, &c. Du-Cange.

Aquaffo, in Geography, a town of Africa on the Gold-coast, where is held a slave market, to the west of Cape-coast-castle.

Aquafort, a settlement on the east side of the south-eastern extremity of Newfoundland island. N. lat. 47° 10'.

Aque, a water-course.

Aquallus, in Anatomy, a name given by some to the region of the body wherein the trunk terminates, and the thighs commence, and in which also the privities are placed.

The aquallus is the same with what others call pube, others the hypogastrium, pene, inus venter, &c.

Aquilus, in Geography, a town of Africa, in the country of Soko, on the Gold-coast.

Aquambae, a kingdom of Africa on the Gold-coast, bounded on the east by the river Volta, and on the west by Agonna. That part of Aquambae which lies on the coast is called Acre, and might formerly have been an independent state; but it is now dependent and tributary. Aquambae is one of the most extensive and powerful monarchies on the coast of Guinea; its maritime dominions extending twenty miles along the coast, and ten times as far into the inland parts. The territory towards the coast is said to be divided into a number of petty royalties, but all of them subject to the king of Aquambae, who exercises an unlimited and indiscriminate authority over them as his meanest subjects; whence it has become a proverb, that in Aquambae there are only two ranks of men, the royal family and the slaves. The natives of this country are haughty, turbulent, and warlike; and their power is formidable to all the neighboring kingdoms, except Acre. All the tributary nations are previously infested by the incursions of the Aquambaes. It has been thought that the king and his nobility are richer in gold and slaves, and possesses greater treasures than all the kingdoms on the coast of Guinea, at least on the Gold-coast; and the extensive commerce of the maritime part of Acre would be much enlarged, if it were not obstructed by perpetual quarrels between the natives of Aquambae and Acre. The sovereign of the former claims an annual tribute from the latter, the refusal of which excites frequent dillemmas; but the former, feble of the superiority of the latter, diverts the form by creating discord in the councils of Acre, and thus he artfully contrives to preserve the tranquility and trade of his realm. The chief busines of the people is trade, agriculture, and war; and war in this country promotes trade and husbandry, by increasing the number of slaves and prisoners, who are obliged to labour for the Aquambaes, while they are maintained by them. Of course, they are by interest and inclination much addicted to warlike and warlike pursuits. Though the soil is fertile, yet before the expiration of the year, they are in the necessity of seeking supplies from other countries. The Aquambaes, disdaining the employments of fishing and making of salt, leave them to the maritime negroes, who are very numerous, and carry on a great trade with the European shipping. The number of slaves sold here is at least equal to what is disposed of on the whole coast besides, except Anamabo. In time of war, every man fit to bear arms enters the field; and a certain number is detached to cultivate the ground and fell the prisoners, while the rest are engaged in opposing the enemy. Among the fishermen on the coast there are few warriors; for as they live under the protection of the Europeans, and are defended on the north by their more warlike countrymen, they are seldom attacked, or compelled to change the hook and net for the sword and buckler.
buckles. The countries of Lalande, Ninga, and Suko, all of which have ports on the sea coast, are merely divisions of the great kingdom of Aquamboc.

AQUA-NEGRA. See AQUA-NEGRA.

AQUANITE, a river of Cabala, tapped by Sain-\-bottle (Travels in the Two Sicilies, vol. ii. p. 173), both on account of its name and position, to be the Helis, anciently the limit between Schorr and Crton. On its bank the Cretans gained the victory which made them masters of the Schorr principality.

AQUAPENDENT. See AQUAPENDENT. AQUAPEUCC. See AQUAPEUCC. AQUARIA. See AQUARIA.

AQUARIANS, in Ecclesiastical History, a sect, toward the close of the second century, who, instead of wine, used nothing but water in the sacrament. It is said the occasion of the abuse was owing to the perfecution which prevailed in those times: for the Cithrons, being then obliged to celebrate the sacrament in the night, found it necessary to make use of water, lest the smell of the wine should betray them to the heathens. But they afterwards went farther, and actually forbade the use of wine in the eucharist, even when it might be used with safety.

Epiphanius tells us, the Aquarians were the followers of Tatian; and were so called from the word aqua, water, because they abstained wholly from wine, and did not use it even in the eucharist.

AQUARIUS, in Astronomy, the eleventh sign in the zodiac, reckoning from Aries; from which also the eleventh part of the ecliptic takes its name.

The sun moves through Aquarius in part of the months of January and February: it is marked thus, .

The poets feign that Aquarius was Gaetamede, whom Jupiter raffiled under the shape of an eagle, and carried away into heaven, to serve as a cup-bearer in the room of Hebe and Vulcan; whence the name. Others hold, that the sign was thus called, because, when it appears in the horizon, the weather usually proves rainy.

The stars in the constellation Aquarius, in Ptolemy's catalogue, are 45: in Tycho's, 41; in Hevelius's, 47; in Flamsted's Britannic Catalogue, 108.

Eff. gen. char. Cal. bell-shaped; corolla, wheel-shaped, with linear divisions; berry, many, seeded.

Species. 1. Aquaria aculeata. This is a perennial spinous plant, with alternate, ovate, obtuse, petiolate leaves. Jacquin observes that it rifes with a thorny branched stem, to the height of four feet, producing white flowers, and yellow flowering fruit, about the size of a pea. It has the appearance of a solanum, and Swartz thinks that it ought to be considered as one of that genus, with four flaments. A native of the West-Indies, and of South America. Jacq. ed. 2. Am. d. 15.

AQUA-SPARTA, in Geography. See AQUA-SPARTA.

AQUATANTIO, or Aqua d'Acio; a small river of Italy, which runs into the Tiber about a mile from Rome.

AQUATIA, in Middle Age Writers, a right of fishing three days in the year. Du Cange.

In ancient deeds we find divers grants of this privilege of aquaria, or aquatara; sometimes also called aquaria.

In some writings aquaest seems also to have figured a fer, or other service, paid for the privilege of fishing.

AQUATIC, something which lives, breeds, or grows on or about the water. Thus we have aquatic plants, and aquatic animals. Those which grow peculiarly on the banks of rivers, or in marshes, &c. are also called aquatics.

The ancient Romans had also their aquatic or aquatico geomet, da aquantes, called by Catullus, du litorales; concerning whom we have an inscription in Reichenius, Nepve et Fhiss AQUATILIBVS.

To this class belonged the Tritons, the minstrels of Neptune.

AQUATICA, in Agriculture, a term applied to such manure as is formed in consequence of the distillation or decay of various aquatic vegetables, and deposited at the bottoms of ponds, ditches and other similar places. It has been observed by Mr. Marshall, in the Rural Economy of the Middle Counties, that he dressed two lands with the aquatic manure (raised two or three years before out of a fish-pool, and afterwards turned up into a heap of diggins), the rest of the piece being manured with yard dung, the quantity of each about eight loads an acre, the two lands dressed with the aquatic manure were obviously the better crop of turnips; the plants were, he says, not more numerous but larger and cleaner-flumm, and what was remarkable, while the crop of the piece in general was full of eelcot and chick-weed, which rose after the hoeing, the two lands where this sort of manure was applied, were in a manner entirely free from these weeds.

AQUATINTA, in the History of the Acts, a method of producing engravings very much resembling drawings in Indian ink.

The principle of this process consists in corroding the copper with aquafortis, in such a manner, that an impression from it has the appearance of a tint laid on the paper. This is effected by covering the copper with a powder or some substance which takes a granulated form, so as to prevent the aquafortis from acting where the particles adhere, and by this means cause it to corrode the copper partially and in the interfaces only. When these particles are extremely minute, and near to each other, the impression from the plate appears to the naked eye exactly like a wash of Indian ink. But when they are larger, the granulation is more distinct: and as this may be varied at pleasure, it is capable of being adapted with great facility to a variety of purposes and subjects.

This powder or granulation is called the aquatinta grain, and there are two general modes of producing it.

We shall first describe what is called the powder grain, because it was the first that was used. Having etched the outline on a copper plate prepared in the usual way by the coppersmith, (for which fee the article Etching) some subfusant must be finely powdered and fitted which will melt with heat, and when cold adhere to the plate, and refill the action of aquafortis. The fusibants which have been used for this purpose, either separately or mixed, are, alpahum, Burgundy pitch, rosin, gum copal, and gum mastic; and in a greater or less degree all the resins and gum resins will answer the purpose. Common resin has been most generally used, and answers tolerably well; though gum copal makes a grain that refills the aquafortis better. The subfusant intended to be used for the grain must now be distributed over the plate, as equally as possible; and different methods of performing this essential part of the operation have been used by
by different engravers, and at different times. The most usual way is to tie up some of the powder in a piece of muffin, and to shake it against a piece of stick held at a considerable height above the plate. By this, the powder that falls gently, and settles equally over the plate. Every one must have observed how uniformly hair powder settles upon the furniture after the operations of the hairdresser; this may afford a hint towards the best mode of performing this part of the process. The powder must fall upon it from a considerable height, and there must be a sufficiently large cloud of dust formed. The plate being covered equally over with the dust or powder, the operator is next to proceed to fix it upon the plate, by heating it gently, so as to melt the particles. This may be effected by holding under the plate lighten pieces of brown paper rolled up, and moving them about till every part of the powder is melted. This will be known by its change of colour, which will turn brownish. It must now be suffered to cool, when it may be examined with a magnifier; and if the grains or particles appear to be uniformly distributed, it is ready for the next part of the process.

The design or drawing to be engraved must now be examined, and such parts of it as are perfectly white, are to be remarked. Those corresponding parts of the plate must be covered, or flopped out, as it is called, with turpentine, or what is better, maltese varnish, diluted with turpentine to a proper consistence to work freely with the pencil, and mixed with lamp-black to give it colour; for, if transparent, the touches of the pencil would not be so distinctly seen. The margin of the plate must also be covered with varnish. When the flopping out is sufficiently dry, a border of wax must be raised round the plate in the same manner as in etching, and the aquafortis, properly diluted with water, poured on. This is called biting in; and it is that part of the process which is most uncertain, and which requires the greatest degree of care. It is well to mix a part of the aquafortis, has lain for some time in the plate, when printed, would produce the lightest tint in the drawing, it is poured off, and the plate washed with water, and dried. When it is quite dry, the lightest tints are flopped out, and the aquafortis poured on as before; and this is repeated as often as there are tints to be produced in the plate.

Although many plates are etched entirely by this method of flopping out and biting in alternately, yet it may be easily conceived that in general it would be very difficult to flop round and leave out all the finishing touches, as also the leaves of trees, and many other objects, which it would be impossible to execute with the necessary degree of freedom in this manner.

To overcome this difficulty, another very ingenious process has been invented, by which the touches are laid on the plate with the same ease and expedition as they are in a drawing in Indian ink. Fine washed whiting is mixed with a little treacle or sugar, and diluted with water in the pencil so as to work freely, and this is laid on the plate covered with the aquaforting, in the same manner and on the same parts as ink on the drawing. When this is dry, the whole plate is varnished over with a weak and thin varnish of turpentine, asphaltum, or mastic, and then suffered to dry, when the aquafortis poured on. The varnish will immediately break up in the parts where the treacle mixture was laid, and expose all those places to the action of the acid, while the rest of the plate remains secure. The effect of this will be, that all the touches, or places where the treacle was used, will be bit in deeper than the rest, and will have all the precision of touches in Indian ink.

After the plate is completely bit in, the bordering wax is taken off by heating the plate a little with a lighted piece of paper; and it is then cleared from the ground and varnished by oil of turpentine, and wiped clean with a rag and a little fine whiting, and then it is ready for the printer.

The principal disadvantages of this method of aquatinting are, that it is extremely difficult to produce the required degree of coarseness or smoothness in the grain, and that plates so engraved do not print many impressions without wearing out. It is therefore now very seldom used, though it is occasionally of service.

We next proceed to describe the second method of producing the aquatint ground, which is generally adopted. Some refines substance is dissolved in spirits of wine, as for instance common resin. Burgundy pitch, or malle, and this solution is poured all over the plate, which is then held in a resting direction till all the impurities fluid drains off, and it is then laid down to dry, which it does in a few minutes. If the plate be then examined with a magnifier, it will be found that the spirit in evaporating has left the resin in a granulated state, or rather that the latter has cracked in every possible direction, still adhering firmly to the copper. A grain is thus produced with the greatest ease, which is extremely regular and beautiful, and much superior for most purposes to that produced by the other method. After the grain is formed, every part of the process is conducted in the same manner as above described.

Having thus given a general idea of the art, we shall mention some particulars necessary to be attended to, in order to ensure success in the operation. The spirits of wine must be rectified, and of the best quality; what is sold in the shops contains camphor, which would entirely spoil the grain.

Resin, Burgundy pitch, and gum maltic, when dissolved in spirits of wine, produce grains of a different appearance and figure, and are sometimes used separately, and sometimes mixed in different proportions, according to the taste of the artist, some using one substance and some another.

In order to produce a coarser or fine grain, it is necessary to use a greater or smaller quantity of resin; and to ascertain the proper proportions, several spare pieces of copper must be provided, on which the liquid may be poured, and the grain examined before it is applied to the plate to be engraved.

After the solution is made, it must stand still and undisturbed for a day or two, till all the impurities of the resin have settled to the bottom, and the fluid is perfectly lucid. No other method of freeing it from these impurities has been found to answer. Straining it through linen or muslin fills it with hairs, which are ruinous to the grain.

The room in which the liquid is poured on the plate must be perfectly still, and free from dust, which, whatever it falls on the plate while wet, causes the grain to form a white spot, which it is impossible to remove without laying the grain afresh.

The plate must be previously cleaned with the greatest possible care, with a rag and whiting, as the smallest hair or particle of grease produces a break or blemish in the grain.

All these attentions are absolutely necessary to produce a tolerably regular grain; and after every thing that can be done by the most experienced artists, still there is much uncertainty in the process. They are sometimes obliged to lay on the grain several times before they procure one sufficiently regular. The grain proportions of materials do not always produce the same effect, as it depends in some degree upon their qualities, and it is even materially affected by the weather. These difficulties are not to be surmounted but by a great deal of experience; and those who are daily in the habit of practising the art are frequently liable to the most unaccountable accidents. Indeed it is much to
be lamented, that so elegant and useful a process should be so delicate and uncertain.

It being necessary to hold the plate in a flinting direction in order to drain off the superficial fluid, there will naturally be a greater body of the liquid at the bottom than at the top of the plate. On this account, a grain laid in this way is always coarser at that side of the plate that was held lowermost. The most usual way is, to keep the coarsest side for the foreground, being generally the part that has the deepest shadows. In large landscapes, sometimes various parts are laid with different grains, according to the nature of the subject.

The finer the grain is, the more nearly does the impression resemble Indian ink, and the litter it is for imitating drawings. But very fine grains have several disadvantages. For they are apt to come off before the aquafortis has lain long enough to produce the defined depth; and as the plate is not corroded so deep, it forms wears out in printing. Whereas coarser grains are firmer, the acid goes deeper, and the plate will throw off a great many more impressions. The reason of all this is evident, when it is considered, that in the fine grains the particles are small and near to each other, and consequently the aquafortis, which acts laterally as well as downwards, soon undermines the particles, and causes them to come off. If left too long on the plate, the acid would eat away the grain entirely.

On these accounts, therefore, the moderately coarse grains are more sought after, and answer better the purpose of the publisher, than the fine grains which were formerly in use. Although there are considerable difficulties in laying properly the aquafortis grain, yet the corroding of the copper, or biting in, so as to produce exactly the tint required, is still more precarious and uncertain. All engravers allow, that no positive rules can be laid down, by which the success of the process can be foreseen: nothing but a great deal of experience and attentive observation can enable the artist to do it with any degree of certainty.

There are some hints, however, which may be of considerable importance to the person who wishes to attain the practice of this art.

It is evident, that the longer the acid remains on the copper, the deeper it bites, and consequently the darker will be the shade in the impression. It may be of some use, therefore, to have several bits of copper laid with aquafortis ground of the same kind that is to be used in the plate, and to let the aquafortis remain for different lengths of time on each; and then to examine the tints produced in one, two, three, four, five, or more minutes, or longer. Observations of this kind frequently repeated, and with different degrees of strength of the acid, will at length settle the judgment in guessing at the tint which is produced in the plate. A magnifier is also useful to examine the grain and to observe the depth to which it is bit. It must be observed, that no proof of the plate can be obtained till the whole process is finished.

If any part appears to have been bit too dark, it must be burnished down with a steel burnisher; and this requires great delicacy and good management not to make the shade thready; and the beauty and durability of the grain are always somewhat injured by it, so that it should be avoided as much as possible. Those parts which are not dark enough must have a fresh grain laid over them, and be flapped round with varnish and subjected again to the aquafortis. This is called retouching, and requires peculiar care and attention. The plate must be very well cleaned out with turpentine before the grain is laid on, which should be pretty coarse, otherwise it will not lie upon the heights only, as is necessary in order to produce the same grain. If the new grain is different from the former, it will not be so clear nor so firm, but rotten.

We have now given a general account of the process of engraving in aquafortis; and we believe that no material circumstance has been omitted, that can be communicated without seeing the operation. But after all, it must be confided, that no printed directions whatever can enable a person to practice it. Its success depends upon so many niceties and attention to circumstances apparently trivial, that the person who attempts it must not be surprised if he does not succeed at first. It is a species of engraving simple and expedient, if everything goes well; but it is very precarious, and the errors which are made are rectified with great difficulty.

It seems to be adapted chiefly for imitations of sketches, waffled drawings, and flight subjects; but does not appear to be at all calculated to produce prints from finished pictures; as it is not susceptible of that accuracy in the balance of tints necessary for this purpose. Nor does it appear to be suited for book plates, as it does not throw off a sufficient number of impressions. It is therefore not to be put into competition with the other modes of engraving. If confined to those subjects for which it is calculated, it must be allowed to be extremely useful, as it is expeditious, and may be attained with much less difficulty than any other mode of engraving. But even this circumstance is a source of mischief, as it occasions the production of a multitude of prints that have no other effect than that of vitiating the public taste.

Engraving in aquafortis was invented by Le Prince, a French artist, who kept his process for a long time secret; and it is said he sold his prints at first as drawings. But he appears to have been acquainted only with the powder grain, and the common method of stopping out. The prints which he produced are still some of the finest specifc in the art. Mr. Paul Sandby was the first who practised it in this country, and it was by him communicated to Mr. Jukes. It is now practised very generally all over Europe, but no where more successfully than in this kingdom.

AQUATULCO. See AQUATULCO.

AQUAVIVA. CLAUDIUS in Biography, the son of Andrew Aquaviva, duke of Atri in Naples, was born in 1542, and at the age of 25 admitted amongst the Jesuits. In 1581, he was advanced to the office of general of the fraternity, and in the exercise of it was distinguished by his prudence and mildness. He drew up an order under the title of "Ratio Studiorum," printed at Rome in 1588, 8vo.; which much offended the Jesuits, and was suppressed by the inquisition; but it was reprinted in a mutilated state, in 1591. This celebrated has left "Letters" in French and Latin, "Meditations on the 44th and 45th Psalms," and also a treatise entitled "Industria ad curandos animae morbos," printed in 1626, 12mo. Nouv. Dict. Hist.

AQUAVIVA, in Geography. See AQUAVIVA.

AQUEDOCHTON, the outlet of lake Winnipesaukee in New Hampshire, North America, N. lat. 43° 40'; whole waters pass through several smaller ones in a south-west course, and empty into Merrimack river between the towns of Sandwich and Canterbury.

AQUELAOR, one of the Lacadives islands; N. lat. 10° 45'; E. long. 73° 25'.

AQUENSIS COLONIA, in Ancient Geography, the town of Aix.

AQUENSIS, the name of an episcopal see of Africa, in Mauritania Caftrarsis: also, an episcopal see in Bithynia.
AQUENSIUS VICUS, or Aque Grubus, is the ancient name of the present Bagneres.

AQUEOUS, Aqueous, something that partakes of the nature of water, or abounds therewith.

AQUEOUS bath. See Bath.

AQUEOUS humour, in Anatomy, is the front humour of the eye, which occupies the space between the cornea and the crystalline lens, and across which the iris may be considered as floating. See Eye.

AQUETTA, a name for a kind of liquid poison made much use of by the Roman women, under the pontificate of Alexander VII. This poison was prepared, and sold in dropper-ports, by Tophania, or Turpinosa, an infamous woman, who refided first at Palermo, and afterwards at Naples. From her they obtained the name of aqua Tophania, aqua della Toffina, and also acquetta di Napoli. It is said, that she distributed her preparation to wives who wished to have other husbands, and that it was secretly administered in many cases, which rendered the removal of obnoxious persons desirable; and that five or six drops were sufficient for destroying a man, and that the dose might be so proportioned as to operate in a certain time. This woman was imprisoned at Naples, and was living there in 1750, when Keyser visited the city. This traveller says, that since it has been discovered that lemon-juice is an antidote to it, the composition is funk to difference. He adds, that Dr. Branchiatti wrote a book expressly on the remedies and antidotes against these flygian drops, which continued to be privately made and vended at the period above mentioned. (Keyser's Travels, vol. iii. p. 37.)

Tophania (Says Labat in his Travels through Italy, vol. iv. p. 33.) distributed her poison in small glass phials, with this inscription, Manna of St. Nicholas of Bari, under a pretence that it was a miraculous oil which dropped from the tomb of that Saint at Bari in the kingdom of Naples, and that it was effective for the cure of many diseases. Upon being put to the rack, this woman acknowledged her wickedness, and immeasured several ecclesiastics by whom she was protected. She was afterwards strangled. This art of administering secret poison was much practiced in France and Italy about the close of the 17th and commencement of the 18th century. It was communicated by Godin de Sainte Croix, a dissipat-ed young man of respectable family in France, to the Marchioness de Brinvillier, with whom he had intrigues. St. Croix was suffocated in his laboratory, whilst he was preparing his poison; and the Marchioness, whose whole life had been singularly infamous, and who confessed her horrid crimes, was executed at Paris, July 16th, 1676, and afterwards beheaded and burned. Garelli, physician to the emperor Charles VI, who was king of the two Sicilies when Toffania was arrested, in a letter to the celebrated Hoffmann, in 1718 or 1719, says, that the slow poison administered by this wretch to the destruction of 600 persons, was nothing else than crystallized arsenic, dissolved in a large quantity of water by decoction, with the addition, for some purpose unknown to him, of the herb callistatus. Hoffmann. Med. Ration. Syilem. t. ii. p. 2. c. 2. § 17. p. 185. Hala 179. 220. It has been concluded also from the effects produced by the poisons of Toffania and Brinvillier, that they were arfenic mixtures; though some have maintained, that they were composed of opium and cantharides. This mixture is represented as a liquor, no less limpid than rock-water, and altogether inoffident. Its effects were slow and almost imperceptible, and a few drops of it were administered in tea, chocolate, or other dietetic liquid.

AQUI, or Aquita, in Geography, a town and province of Japan, in the southern part of the island of Nippon, near the frasts of Suganar.

AQUIABENSIS, in Ancient Geography, an episcopal see of Africa, in Bizacium.

AQUIDNECK, the ancient name of Rhode Island.

AQUIFOLIUM. See Ilex.

AQUIGUI, or Aquigni, in Geography, a town of France in the department of the Eure, one league from Louviers.

AQUILA, in Astronomy, a constellation of the northern hemisphere; usually joined with Antinous.

The stars in the constellation, Aquila and Antinous, in Ptolemy's catalogue, are 15 in Tycho's, 19 in Hevelius's, 42 in the British catalogue, 71; but in Aquila alone, Tycho reckons 12 stars, and Hevelius 23; the principal star being Lucida Aquila, between the first and second magnitudes. Aquila, in Chemistry, has several significations, according to the interpreters joined with it.

AQUILA alba is a name given to a combination of corrosive sublimate with fresh mercury, called mercurius dulcis.

AQUILA, in Ancient Geography, a river of Scythia, near mount Caucasus.

AQUILA, anciently Aasia or Avella, in Geography, a city of Italy, and the capital of Abruzzo ultra, situated on a hill near the river Pescara; is the see of a bishop, and was once fortified, but now quite dismantled. In 1703, it suffered much from an earthquake, which damaged a great part of the town, and destroyed 24,000 persons, and dangerously wounded 1500; on this occasion, 800 were swallowed up, together with the church, to which they had fled for refuge. The territory of Aquila formerly furnished Italy, almost exclusively, with saffron; but since that plant has been so much cultivated in Lombardy, it has declined in Abruzzo. Aquila is 50 miles N. of Rome, and 93 N. of Naples. N. lat. 43° 15'. E. long. 14° 22'.

AQUILA, in Biography, a native of Sinope, a city of Pontus, flourished at the beginning of the second century, under Adrian, and was employed by him as superintendent of the public buildings, and particularly of the new city called Julia, which the emperor was erecting on the site of the ancient Jerusalem, destroyed by Titus. Here he became a profelyte to Christianity, and was baptized; but his attachment to astrology offended the Christians, and they excluded him from their communion. Disgraced by this treatment, he renounced Christianity, joined the Jews, and became a disciple of the rabbi Akibah. At their request, being previously instructed in the Hebrew language, he undertook, about the year 128 or 129, a new Greek version of the Hebrew scriptures. In this translation, which was very acceptable to the dispersed Jews, and which was read in their synagogues, he proposed to adhere more literally and accurately to the Hebrew text than the Septuagint; but he has been charged, both by ancient and modern writers, with perverting the original text, in order to render his version less favourable to the Christians. On the other hand, it has been alleged in favour of its accuracy and fidelity, that it was not only adopted by the Jews in their synagogues, but mentioned with approbation by many Christian writers, and frequently cited by the Christian fathers, instead of the Hebrew text, which few of them were capable of reading. This version was corrected and improved by Aquila, in a second edition; the public use of which was prohibited, as some have thought, in Justinian's Novella 146, under the title of Adivnrmus; but others have supposed, with greater probability, that this prohibition refers to a distinct work, framed by Aquila, from the instructions of his master Akibah; and containing the traditional institutions of the Jews. Of Aquila's version, some few fragments only are extant. See HEXAPL.

AQUA
Aquileia and Priscilla were natives of Padua, converted to the Christian faith by the apostle Paul. They lived at Corinth, being obliged to quit Rome and remove thither by the edict of Claudius, which banished all Jews from that city; and here Paul lodged with them. When the apostle left this city, Aquila and Priscilla accompanied him to Ephesus. A.D. 56, where they exposed their own lives to danger for preserving him. When the apostle wrote his epistle to the Romans, A.D. 58, they were at Rome, as he distinguishes them in this epistle by his salutations. We find them again at Ephesus, when St. Paul wrote his second epistle to Timothy, A.D. 61; but what became of them afterwards is not known. These early converts were tent-makers; and as they had, probably, a considerable number of servants in their house, who were instructed by them in the Christian faith, they had, by means of these, "a church in their house," wherever they settled.

Aquila, Francesco Farina, an engraver of some eminence, who flourished from 1651 to 1722, was born at Palermo, but chiefly refided at Rome. His engravings are numerous, and many of them celebrated. His style of engraving, in general, is rather neater than that of Pietro, but much inferior in drawing and expression. Strutt.

Aquila, Pietro, an eminent engraver, was born at Palermo, and flourished about the year 1662, and refided at Rome. As a designer and painter, he floured high in the estimation of the curious; but he is more generally, and perhaps more deservedly known, as an engraver. He drew admirably, and etched in a bold free manner, infining his lights and harmonizing his shadows with small dots. His general faults are want of effect from scattering his lights, and what by the artist is called "manner" in his drawing. In all his works he manifests much scientific knowledge. Strutt.

Aquilae Arbor, in Botany, a name given by some authors, to the tree whose wood is the agallochum, or lignum aloes of the ships.

Aquilano, Serapino, in Biography, so called from Aquila in Abruzzo, the place of his nativity, was born in the year 1466; and obtained great reputation as an "improvisator," or extemporaneous maker of verses, which he recited with enthusiasm, and accompanied with the strains of his lute. He was patronized by many Italian princes; and his written poems also gained considerable applause. A collection of his sonnets, elegies, epitaphs, &c. was printed at Rome in 1503, 8vo. The sonnets have obtained the highest reputation, and have preferred them even to those of Petrarch; but the works of Serafino have now sunk into oblivion. He died at Rome in 1500. Now. Dict. Hist.

Aquilanus, Sebastianus, supposed to have taken his name from Aquila, the place of his birth, was professor of medicine at Padua, in the latter part of the fifteenth century. He is one of the early writers on the venerable disease, his account of which "De Morbo Gallico," dedicated to Lewis de Gonzaga, bishop of Mantua, was published, 1489. It now stands first in Lupinus's collection of writings on the subject. He was acquainted with the use of mercury in the cure of the disease, and cautions us against employing it in weak and debilitated habits. His work passed through several editions. He also wrote "Quelio de febre flaginiana," first printed at Basi, in 1537. Alltuc de morbo Gallico, p. 575, and Haller's Bib. Med. Pract.

El. gen. char. Cal. five-cl. Cor. none; nct. pitcher-shaped, half five-cl.; calis oblong; capsule inferior, woody, two-celled, two-valved. Seeds, solitary.

Species. 1. Aquilaria ovata; leaves alternate, ovate, mucronate. This is a large tree covered with greyish bark. Its leaves are entire, smooth, veined, about eight inches long, and fland on short hairy toothed. The flowers terminate the branches, on many-flowered peduncles. A native of the mountains of Malacca and Cochyn-China. The wood of the tree has been long used as a perfum; and was formerly an article of the materia medica, under the name of agallochum, lignum aloes, or aloes wood. This wood in its natural state is white and inodorous. That which pollishes the peculiar aracna for which it is valued, is supposed to be the consequence of a differend process in the tree, resulting the eleganous particles to flagrate and combine into a resin, in the inner parts of the trunk and branches; by which the natural appearance of the wood is altered, so as to become of a darker colour, and of a fragrant smell. At length the tree dies, and when splitten, the resinous part is taken out. The perfumes which this wood affords, are highly esteemed by the oriental nations; and from the bark of the tree is made the common paper which the Cochyn-Chinese use for writing; in the same manner the Japanese make use of the bark of a species of mulberry (manna papryfera). This perfume is said to be useful in vertigo and palsy; given in the form of powder, it is recommended to restrain vomitings and alvine fluxes. To us, however, it seems to contain little else than that camphorous matter common to many other vegetable substances. From its bitter taste, it has the name of aloe, although no otherwise allied to it.

Aquilaria, in Ancient Geography, Loudhursh, a town of Africa, east-north-call of Nini, or Secdy Doude, and south-west of the promontory of My curt. In this place, says Ca far (De Bcl, Civil. l. n. 21), Crito disembarked his troops, which were afterwards cut in pieces by Sabnna. Many frag- ments of antiquities are still extant in this place. Shaw's Trav. p. 88. Aquelegia, in Botany, also called Aquilina (from Aquila, an eagle; the necearies being fancied to resemble an eagle's claws), the plant named cumbolium, from a suppos'd resemblance the same parts of the flower bear to the head of a pigeon (columba), Lin. gen. 284. Schreb. 934. Juss. 234. Gartn. t. 118. Cala, polyandra pentagonia. Nat. order, mult-ij'chias, ranunculaceas. Juss. Gen. char. Cal. none. Cor. petals five, lanceolate-ovate, flat, spreading, equal; neccaries five, equal, alternate with the petals, horned, gradually broader upwards, with an oblique mouth, attached to the receptacle; each produced below into a long attenuated tube, with an obtuse top. Stam. filaments thirty or forty, fabulous, the outer ones shorter; anthers oblong, erect, the height of the neccaries. Fah. germs five, ovate-oblong, ending in fab-
AQUILEA, in Ancient Geography, Aquileia, an ancient and a large city of Italy, situate on the sea coast at the entrance of the Sinus Tergestinus, or Gulf of Trieste, was built, according to Strabo (1. v.), by the Romans, in order to detain the barbarians; and a Roman colony was conducted thither between the first and second Macedonian wars. It was washed, says Pliny (H. N. i.iii. c. 8.), by the two rivers Natifo and Turrus. It was augmented, according to Livy (l. xiii. c. 17.), by 1500 families, by a decree of the senate; and afterwards, as Herodian (l. v. c. 14) informs us, became a celebrated emporium. Julian ascribes its name to the augury of an eagle (aquila) at the time of building it: Voilus deduces it from the abundance of its waters, as if it were "Aquilegia;" but the appellation was more probably derived from aquila, the eagle, which was the standard of the Romans, who had long encamped in this place. Strabo (ubi supra) says, that the harbour, at the mouth of the Natifo, was at the distance of 60 miles from the city, so that ships of burden were towed up the river. This city was of such importance, that it was one of the first places which the partisans of Vespasian took possession of. A.D. 69.

In the year 166, the emperors Marcus Aurelius and Verus wintered there, previously to their taking the field against the Marcomanni; who, having defeated Vindex, the praetorian praefect, in 170, entered Italy, and approached Aquileia. In 228, it was beleaguered by the troops of Maximin, who demolished its suburbs and beautiful vineyards, and employed the timber of the buildings, in the engines and towers with which the city was on every side assaulted. It was defended, however, by the invincible constancy of the citizens, and the army of Maximin was repulsed in repeated attacks; his machines were destroyed by showers of artificial fire; and the generous enthusiasm of the Aquileans was exalted into a confidence of success by the opinion that Bellenus, their tutelar deity, combated in person in the preservation of his devoted worshippers. The Celtic deity, supposed to be Apollo, received, under that name, the thanks of the senate; and a temple was likewise erected to Venus the balm, in honour of the women of Aquileia, who had parted with their hair to make ropes for the military engines. In 432, Attila invaded Italy, and besieged Aquileia with an innumerable host of barbarians. On this occasion, the walls of the city were assaulted by a formidable train of battering rams, moveable turrets, and engines that threw stones, darts, and fire; and the monarch of the Huns employed the formidable impale of hope, fear, emulation, and interest, to subvert this only barrier which delayed his conquest of Italy. Aquileia was, at that period, one of the richest, the most populous, and the strongest of the maritime cities of the Adriatic coast. After an ineffectual siege of three months, Attila was compelled, by the want of provisions, and the clamours of his army, to relinquish the enterprise, and to issue orders for this purpose; but as he rode round the walls, penive, angry, and disappointed, he observed a flark preparing to leave her nest in one of the towers, and to fly with her infant family towards the country. He feized, with the ready penetration of a flatein, this trifling incident which chance had offered to superflution, and exclaimed, in a loud and cheerful tone, that such a domestic bird, so constantly attached to human society, would never have abandoned her ancient feasts, unless those towers had been devoted.

AQU,
devoted to impending ruin and solitude. The favourable
omen inspired an assurance of victory; the siege was re-
newed and prosecuted with fresh vigour; a large breach was
made in the part of the wall from whence thekes took
had taken its flight; the Hessus mounted to the assault with ir-
resistible fury; and the succeeding generations could fearlessly
discern the ruins of Aquileia. "Gibbon's Hist. vol. vi.
p. 122—123.
This place, formerly so rich and flourishing, is now known
only by its ruins; and is reduced into a mean village, whence
the patriarch of Aquileia derives his title: but as the
territory of Aquileia belonged to the house of Auplia,
this house, and also the Venetians, pretended to nominate
the patriarch. However, in 1751, the pope supplanted this
patriarchate, and erected Udine, where the patriarch had
used to reside, into an archbishopric for the Venetians,
and Gorizia, or Goriz, a town of Carniola, into an archbishop-
ric for the house of Auplia. Aquileia is distant 18 miles
S. W. from Goriz, and 20 S. from Friuli. N. lat. 45° 55';
E. long. 13° 30'.

AQUILEIA, Aquilependente, a small town of Italy, in Etru-
ria, S. E. of Florentia. The name of Aquileia has been also
sometimes applied to Forum Julli (Cividale del Friuli),
the more recent capital of the Venetian province.

AQUILICIANUM, or AQUILICUM, in Antiquity, a
fercifie celebrated among the Romans, in time of exccssive
droughts, to obtain rain of the gods.

Dante calls this aquilicina. The pilgrims who officiated at
it were denominated aquilicites, quia aqum elicicabant, because
they brought down water: but where he finds this new or-
der of priests, he does not tell us.

AQUILICER, from aquila, eagle, and fero, I bear, among
the Romans, an ensign-bearer, who carried the standard on
which the eagle was represented.

AQUILINE, something belonging to an eagle. Hence,
aquiline nœs denotes an hooked nose, or such as is like the
beak of an eagle; called also a hawk's nose.

AQUILA, is used by Vitruvius for the north-east wind;
or that which blows at 45° from the north towards the east
point of the horizon.
The poets gave the name aquilo to a stormy wind dreaded
by the mariners.

AQUALONDA, in Geography, a large lake of Africa,
in Ethiopia, at the foot of the mountains of the Ina, on the
confines of Congo and Angola.

AQUILONIA, in Ancient Geography, a town of Italy,
in Apulia, &ituate in the road from Beneventum to Venalis.
It belonged to the Samnites. This is also the name of
another town in Apulia, in the road from Beneventum to
Canfinum, between Aquus Tellerus to the south-west, and
Aeae to the north-east.

AQUILUS, among the Ancients, a dark or dusky col-
our, approaching to black.

Hence some of the heathen gods were called div aquili,
q. d. nigri.

AQUIMINARIS, in Antiquity, a kind of luftral
vessel wherein the Romans carried their holy water for ex-
piation, and other religious offices.

AQUINAS, Thomas, in Biography, a famous scho-
lastic divine, a descendent of the illustrious family of Aquino
in the Terra di Lavora, in Italy, was born at Aquino in
the year 1224. He was sent, at five years of age, for edu-
cation to Mount Caffino, and from thence he was removed to the
university of Naples. Here he acquired that strong pre-
dilection in favour of a retired and studious life, which in-
duced him to enter himself, without the knowledge of his
parents, among the Dominicans, in the order of the preach-
ing friars. His mother was peculiarly solicitous to divert
his design, and wished to obtain an interview with him for
this purpose; but the monks were as anxious to retain him;
and in order to prevent the effect of his mother's persuasion,
removed him from one place to another, that she might have
no opportunity of seeing him. At length, whilst they
were conducting him to Paris, her other sons seized him
and conveyed him to her castle, where he was confined for
two years. Notwithstanding all his mother's importunities,
his purpose was fixed; and for the accomplishment of it, he
left himself from a window by night: and aided by his
Dominican brethren, he escaped to Naples. In the year
1244, he was conducted by the master of the Teutonic
order to Paris; and after some delay there, he removed
to Cologne, and became a disciple of the famous Albert.
Under this eminent preceptor, he was prolific in his applica-
tion, and made great attainments. His lecture, however,
and apparent dexterity, induced his fellow-students to call
him by the contemptuous appellation of the "dumb ox;" but
Albert, more penetrating than they, said, "this ox, if
he begin to bellow, will fill the whole world with his roar-
ing. Accompanying Albert to Paris in 1246, he remain-
ed, as a student in that university till 1248. At length
Aquinas, having made himself master of the dialectics, phi-
losophy, and theology of the age, became, at 24, an eminent
teacher at Paris; and in 1255, obtained the degree of
doctor in divinity. Such was his distinguished reputation,
that he was honoured by the peculiar attention of princes
and of popes. On one occasion, as he was dining with
Lonis IX. of France, called St. Louis, his thoughts were
bustily employed on the objections of the New Manichæans
against the orthodox faith, and striking the table with his
hand, after musing a long time in silence, he suddeuly ex-
claimed, "this is a decisive answer to the Manichæans." Upv'n a visit to Rome, whilst he was in the closet of pope
Innocent IV., an officer brought in a bag of money, pro-
cured by the sale of abolitions and indulgences: "You
fee, young man," said the pope, "the age of the church
is past, in which the fraud, silver and gold have I none." Aquinas, replied, "True, holy father; but the age is
also past, in which the could lay to a paralytic, rise up
and walk." In 1265, he returned to Italy, and was appointed
rector of his order in the Roman province; and he con-
tinued to distinguih himself as a public preceptor in scholastic
theology in several of the chief universities of that country.
He was offered the archbishopric of Naples by pope Clement
IV., but declined accepting a charge so weighty; and when
the university of Paris, at a general chapter of the order
held at Florence in 1272, demanded his return, he was de-
tained by Charles, king of the Sicilies, and appointed pro-
feßor of theology at Naples, with a monthly allowance
of an ounce of gold as his pension. Being summoned to a
general council held at Lyons in 1274, in order to preënt
a book which he had written by order of pope Urban IV.,
for refuting the errors of the Greek church, he was seized,
in his way through Campania, with a violent disorder;
and died in the monastery of Fonta Nova, in the diocese of
Terragina, in the year 1274. After his decease, the whole
western world began to load him with honours. The Do-
minican fraternity removed his body to Touloupe; pope
John XXII. canonized him; Pius V. gave him the title of
"The fifth doctor of the church;" by others he was de-
nominated "the angel of the schools," "the eagle of
divines," and "the universal and angelic doctor;" and the
the vulgar believed that many miracles were wrought at his tomb; and it was said that the soul of Aquinas had passed into Thomas Aquinas. His writings were held in the highest estimation; and his name was assumed, in the next century, by a feéduco, who, under the appellation of Thomists, long occupied the field of controversy with the Scotists, followers of Duns Scotus, in various metaphysical and theological questions.

Notwithstanding all the extravagant praises and honours which were lavishly bestowed on Thomas Aquinas, it is certain, that his learning was almost wholly confined to philosophy, and that he was too little conversant with elegant and liberal studies as not to be even able to read the Greek language. For all his knowledge of the Peripatetic philosophy, which he so liberally blended with theology, he was indebted to the defective translations of Aritotle, which were supplied by the Arians; but he obtained from some unknown person a more accurate version of his philosophical writings. Adopting the general ideas of the age, that theology is but defended by the weapons of logic and metaphysics, he mixed the subtleties of Aristotle with the language of Scripture and of the Christian fathers; and, after the manner of the Arians, framed abstruse questions with out end upon various topics of speculative theology. Upon the whole, his talents and industry, which under better direction might have been usefully employed, were misapplied to subtleties, which tending neither to enlighten the understanding nor to improve the heart, must be pronounced altogether useless. His writings are numerous: but the most celebrated are his "Summa Theologiae," or summary of theology, which was received with great applause, and used as a textbook of high authority in the instruction of youth; of this the second folio, treating of morals, may be read with advantage; and his "Commentaries upon the works of Aristotle." A collection of his works was published, in seven folio volumes, at Venice, in 1492; at Nuremberg, in 1496; at Rome, in 1524; at Venice, in 1544; and at Antwerp, in 1612. The "Summa Theologica," has sepulchrally passed through several editions, as at Cologne, in 1604; Antwerp, in 1644; Paris, 1638. But as neither the matter nor the style of the angelic doctor is much suited to modern taste, his writings have sunk into neglect and oblivion.

AQUINO, Philip, a learned Jew, was converted to the Christian faith, and baptized at Aquino his native place, whence he derived his name. The clergy of France allowed him a pension. Such was his knowledge of the Hebrew language, that he was entrusted with the charge of printing and correcting the Hebrew and Chaldee texts of his polyglot bible. He was the author of several works; but the principal was his "Dictionarium Hebraeo Chaldæo-Thalmudico-Rabbinicum," printed in folio, at Paris, in 1629. His son, Lewis Aquino, was also very learned in the oriental languages, and has left several rabbinical works. His grandson, Antonio Aquino, was first physician to Louis XIV. Nouv. Dict. Hiflor.

AQUINO. Aquinum, in Geography, a town of Italy, in the kingdom of Naples and territory of Lavora; thirteen miles S. S. E. from Sorà. It was the birth-place of Juvenal and of Thomas Aquinas. It was formerly a large municipal town, and a Roman colony; but the emperor Constantine ruined it; and it is now reduced to about thirteen houces. There are some remains of a theatre and amphitheatre, which indicate its former grandeur. N. lat. 41° 32'. E. long. 14° 30'.

AQUIQUIL, in Zoology, the name of a particular species of monkey, called by the people of Bafiel, the king monkey, as being much larger than all the other monkeys. It is the Simia Bearculus of Linnaeus.

AQUITANI, in Ancient History, a people of Gaul, situated between the Garonne and the Pyrenees. Cesar distinguishes the Aquitani from the Celti or Gauls; and in reality, they were a different nation, and derived their origin from Spain. They were distributed in various districts; but that which preferred the name, was situated at the foot of the Pyrenees, where are now found Bearn and the diocese of Auch. The Aquitani were rich, as they possessed many mines, and an extensive commerce both by sea and land; hence they became corrupt and effeminate; and in this state the Romans found them; and though they made many efforts for refitting the attacks of these conquerors, they were not at last compelled to submit in common with the other Gauls.

AQUITANIA, Gallia Aquitana, or Provincia Aquitanica, in Ancient Geography, a considerable province of Transalpine Gaul, Gallia Comata, or Gaul properly so called. Some have supposed that it derives its name from the abundance of waters which the Romans found in this country. Aquitania, in the time of Julius Cesar, was bounded by the Pyrenees and the Garumna or Garonne: Aquinths extended it to the Liger or Loire. From his time it comprehended two provinces, known afterwards by the names of Aquitania Prima and Secunda; to which, in the time of Honorius, was added a third province, which had formerly been designated Novempopulana: Aquitania Prima was bounded on the north by the Aureliani; on the east, by the Senones, Eduli, and Segusiavi, the Helviti, and the Volcii Arecomici; on the south by the Volci Arecomici, the Umbraciini, and the Tolosati; and on the west, by the Nitiobriges, the Petrecioni, and the Pictones. It extended about 84 leagues from north to south, and in its greatest breadth about forty. Its chief city was Avaricum, afterwards Burdigala, and now Bordeaux. Aquitania Secundis, literally towards the sea, had on the north the river Liger; on the east, the Bituriges, Lyonnoves, and Cadurci; on the south, the Vefalcs, and Cecofates; and on the west, the ocean. It comprehended the Medulli on the left of the Garumna, towards its mouth. Its length was sixty-three leagues, and its greatest breadth forty. Its metropolis was Burdigala, now Bordeaux. Aquitania Tertia, or Novempopulana, was bounded on the north by the Bituriges Vivisci; on the east by the Nitiobriges and Volcae Tectosages; on the south, by the Pyrenees; and on the west, by the sea. It was about forty leagues long and as many broad. The first two provinces, viz. Aquitania Prima and Secunda, were conquered by Caesar; the third by his lieutenants. When the emperor Honorius was under a necessity of succouring the Vinitges that part of Gallia Narbonensis, which was afterwards called Septimania, they soon took possession of the three provinces of Aquitania, and retained them till the time of Clovis, A.D. 486. Aquitania, after having undergone many revolutions, was ceded into a kingdom in 778, by Charlemagne, and afterwards reduced into a dukedom by Charles the Bald. Aquitaine, or Aquitania, in later times, has been included between the Loire, the ocean, and the Pyrenees, and comprehended Guienne and Gascogne.
ARA

AQUIZEBA, in Geography, a river of Spain, which runs into the Ocean, below Toletta, in Guipuzcoa.

AQUIA, in Geography, a port on the south side of the island of Candia. N. lat. 35° 3', E. long. 24° 59'.

AQUILA, the name of a disorder of the eyes, called also hippitis.

AR, See AAR.

Ar, called also Arraica, Ariel of Moab, and Rabbath-Moab, in Scripture Geography, the capital of the Moabites, on one side of the river Arnon, opposite to Arbar on the other, in Arabia Petrea. St. Jerome says, that this city was destroyed by an earthquake, when he was young.

Ara thuriens, the altar of intense, in A姊omancy, a southern constellation, not visible in our hemisphere, confuting, according to Ptolemy, of seven stars; and according to Sharp's Catalogue, annexed to that of Mr. Flamsteed, of nine stars.

ARA, Cape, in Geography, anciently Neptuni promontorium, is the most southern cape of Arabia Felix, forming with the coast of Ajan, in Africa, the is rafts of Babelmandel.

ARA AMORIS, in Ancient Geography, a cape of Ethiopia, upon the Arabian gulf, according to Ptolemy.

ARA Cæsaris, Arsago, a place of Italy in Insulbera, ten miles north of Melodium.

ARA FLAVIA, a colony of Germany, noticed on a medal of Domitian.

ARA Jovis Montani, a place near the island of the Thracian Chersonesus, between Potidos and Leucate-Aétê.

ARA Jovis Panopei, a place in the Treade, between the Sigurian and Rhetaian promontories.

ARA Lugdunensis, an altar consecrated to Augustus by sixty cities of Gaul, in the year of Rome 742, upon the point of land formed by the confluence of the Rhone and Saone; called by the writers of the middle age Attamum, now the point of Annay. Dion Cassius informs us, that in his time, two centuries after Augustus, the altar, and the honours rendered to this emperor, subsisted. Juvenal mentions it in his first satire, v. 44.

ARA Palladis, an island of the Arabian gulf, mentioned by Ptolemy.

ARA TUTIL, an ancient city on the eastern side of the island of Corica, according to Ptolemy.

ARA Ubius, Gotsberg, a place of Gaul, in Germania Secunda, now occupied either by Cologne or Bonn. In this place the Roman Legion, called prima legio, was encamped.

ARA PARUS, the little altar, a denomination in the Ancient Surgery, given to an elegant kind of bandage, said to have been invented by Solfratus.

ARA, in Geography, a river of Spain, which joins the Cinca at Ainfa in Arragon.

ARA, in Ichthyology, a name by which the Linnaean species of Scoumer, Trachurus, has been called by Kempt. jap. i. pl. ii. fig. 5. Vide Donov. Brit. Fishes.

ARA, in Ornithology, a generic name given by Briffon, Buffon, and others, to some birds which belong, in the Linnaean arrangement, to the genus Psittacus; thus, for example, Psittacus Macus of Linneaus and Gmelin is called ARA Eosafenbyi by Briffon, ARA premier by Fermin, and ARA rouge by Buffon; in like manner Allo, Psittacus Aracanga Linn. is ARA Jamaicensis of Briffon, and Petit ARA rouge of Buffon; Psittacus ater, Linn. ARA noir of Buffon; Psittacus celer, ARA Jamaicensis cynocereus of Briffon, &c.

ARA, is also a synonym of Cuculus tabulis of Gmelin, a bird that inhabits the Society Islands, and is called by the natives Ara wieroa. Vide Cook's Voyages.

ARA, or ARABIAN horse. See Horse.

ARA, in Scripture Geography, a town of Palatine, belonging to the tribe of Judah. Josh. xv. 72.

ARA, in Geography, a town of Asia, in Arabia Deserts, in the country of Najed or Nedifiche; one of the most ancient of this country, and perhaps of Asia.

ARA, a town of Perim, in Segellan, between the city of this name and Candalar. Some have thought that this is the ancient town of Arinape, the capital of Drangia.—Also a river of Peru, which serves as a nominal boundary towards Hindostan.

ARA, in Ancient Geography, a city of Ethiopia, assigned, according to Prais, on the bank of the Nile.

ARABAH, in Scripture Geography, a town of Palestine, belonging to the tribe of Benjamin. Josh. xviii. 18.

ARABAN, in Geography, a small town of Asia, on the river Kahur, in Diariski, in the Turkish government of Ora or Raca.

ARABANT, from ara, I plough, in Lavo, ad curiam deminis, was a term applied to those who held by the tenure of ploughing and tilling the lord's lands within the manor.

ARABAT, in Geography, a small maritime town of Europe, in the eastern part of Carm Tartary, on the borders of the sea of Azof, south of Bacha-fersa, and sixty miles south-east of Porecop. In 1771, it was assaulted and taken by the Russians, under the conduct of prince Tichiboff. Most of the besieged were put to the sword, and the rem made prisoners of war.

ARABAZARI, a town of Asiatic Turkey, in the province of Caramania, sixteen miles north-east of Alameh.

ARABEIA, or ARBELA, in Ancient Geography, a town of Sicily, mentioned by Silius Italicus, l. xiv. v. 271.

"Sidonius Araba ferox, et cellus Tetas".

Those critics who would substitute Arbeia for Arbeia, introduce the epithet ferox, denoting ferile, instead of ferox. Vide Sil. Ital. ed. Drakenborch. in loc.

ARAB-HISAR, in Geography, a town of Asiatic Turkey, in the province of Notulia, twenty-eight miles north-west of Mogha.

ARADESQUE, or MORESQUES, denotes a style of painting or of sculpture, so called from the Arabs and Moors, who employed ornaments of this kind for want of human and animal representations, which their religion prohibited their using. These ornaments are still in practice; but executed only in painting, and not in sculpture. Such are seen at the chateau of Meudon, that of Sceaux, to the Menagerie, and at Trianon, painted by Audran; and, in short, at the seats of various noblemen, &c. at home and abroad. Berin, Gillet, and Vateau, likewise excelled in this species of decoration, which has furnished models for tapestry at the Gobelins and La Savonnerie, as hangings in the royal private apartments, to which this sort of ornament is adapted, and no where else. Accordingly the best architects have only made use of them in retiring rooms, or at most in small apartments, treating with contempt the bad taste of these artists, who are profuse of these chimerical and imaginary ornaments in apartments that demand gravity, instead of preferring the real and beautiful productions of nature.

Arabes is used by Stephen Roux, esq. in his book on architecture, to denote that style of building which is vulgarly called...
called Modern Gothic, which he also terms Saracenic and Moris'; the introduction of which he ascribes to the Moors, or, which he says is the same thing, the Arabs or Saracens, who have expressed it, and in their architecture, the same tale as in their poetry, which are both fullyy dedicated, crowded with superfluous ornaments, and often very unnatural. This manner of building, he says, was introduced into Europe through Spain. The crusades gave the Christians an idea of Saracenic architecture, which they afterwards imitated. Sir C. Wren elevates the Zephyr as Anglo-Saxon, the lighter as Arabesque.

ARABIA, gulf of Giri, in Geography, called also Cyfa or Zygis, a small gulf on the coast of Barbary, between the coasts of Barca and those of Egypt.

ARABIA, in Ancient and Modern Geography, a considerable country of Asia, which, taken in its largest extent, lies between N. lat. 15° 30' and 31° 30', and E. long. 34° 14' and 50° 14', and forms one of the largest peninsulas in the world. It is bounded on the eait by the Euphrates, the Persian gulf, and the bay of Oman, on the west by Palestine, part of Syria, the illusmus of Suez, and the Red Sea, on the south by the frontier of Babemandel, and the Indian ocean, and on the north by part of Syria, Diarbekir, Iraq, and Khuzefan. Its northern limits, however, are left strongly marked than the others; for in both ancient and modern times, they ascend to an angle about 100 miles to the east of Palmyra, which is not included in Arabia. In these parts, the proximity of the Euphrates to the Mediterranean forms a peninsula. Its length, estimated from the cape of Babelmandel to the extreme angle on the Euphrates, may be rated at about 1800 British miles, and its mean breadth at about 820; or from the port of Jeddah to the cape of Razal-Gad, not less than 1000. Its limits, however, have been either enlarged or contracted by various geographers, according to the times in which they wrote; some having comprised under the name of Arabia, such of the neighbouring countries as might perhaps be subject to some particular tribes, and others detaching from it certain districts submitted to a foreign dominion. Accordingly the limits of the Proper Arabia reached no farther than the illusmus, extending from Allah at the north point of the Arabian gulf to the extremity of the Persian gulf, and the borders of the territory of Cufa; which tract of land was nearly comprehended by the Greeks under the appellation of Arabia Felix; and here the Arabs have been settled almost ever since the flood. The eastern geographers assign Arabia Petrea partly to Egypt, and partly to Syria; and they call Arabia Deferta, the defects of Syria: but as the Arabs have for many ages reduced these two provinces, the Turks and Persians now include them in Arabia. The ancients also assigned different limits to this large peninsula. Piny extended it as far as the border of Comagene, the northern part of Syria, on account of the many Arabian colonies established there by Tigranes; and Xenophon included in it the greater part of Mesopotamia: but, according to Ptolemey, the city of Phara, between the Elamite and Isopolitian gulf, or rather a line passing a little westward of this city, near the district of Isopoli, was its boundary on the side of Egypt. On the west, it was terminated by Palestine, part of Syria, the confines of Egypt, and the Arabian gulf; on the north, by the Euphrates, from the city of Thaphaeus, near the borders of the Palmyrene, to the district of Idicara in Babylon; on the east, by the Chaldæan mountains and the Persian gulf; and on the south, by the Erythrian sea. The same situation and extent are assigned to it by Diodorus and Strabo. Whatever be deemed its extent, it may justly be considered as a peninsula, because in the northern region it is confounded between the Euphrates and the Mediterranean.

The revolutions of time have produced no change in its primitive denomination; since even in the ages bordering upon the deluge it was known by the name of Aravah; which some derive from the Hebrew ערה, Arab, or eres, signifying the sea, a mixture, or merchandise, or traffic; others from Jarab, the son of Joktan, and grandson of Eber; and others again from Arabah or Araba, a district of Tehama, inhabited by Ishmael. By the Syrians and many of the orientals, it was called Arabìtan; and, in our sacred books, it is sometimes denominated the land of Cuf. Moses himself styles the western Arabia, Arabah, which affords a strong presumption, that its original name was derived from its situation: and when the Ishmaelites, who possessed it, gradually reduced the adjacent parts, they carried with them the appellation Arabah, and applied it to the whole peninsula. The first part of the peninsula of the Arabs was divided into Kedem and Arabah, as we learn from scripture. Kedem comprehended the Arabia Felix and Arabia Deserta of Ptolemy. Arabah corresponded to that country which was called, from Petra its metropolis, Arabia Petrea by Ptolemy; Arabia Citerior, from its situation with respect to Italy, by Pliny; and Arabia Vetus, by Stephanus and Procopius. Moses, with a geographical accuracy that defies the severity of criticism, determines the boundaries of this kingdom, when he tells us, that on the south, it reached to the sea of Saph, or the Red Sea; on the west, to Paran and Tophel; on the north, to Laban, Hattefor, and Di Zahab, that is, to the borders of Syria; and on the east, to Kadesh-Barnea, about eleven days' journey from Mount Horæ. As Arabah imports the sea, to Kedem does the saif; and these significations correspond to the respective situation of these countries. The first inhabitants of Arabah, or the western Arabia, were the Calluhim, descended from Mizraim, the Caphtorim, and the Horites, who occupied Mount Seir, before they were expelled from thence by Esau and his posterity. Afterwards Ishmael and his descendants settled here; and left of all, the Edomite or Libanans. Kedem, or the eastern Arabia, was first peopled by the sons of Joktan, who are reposed the aboriginal Arabians; though, in process of time, the Ishmaelites spread themselves over this country. Some of the Cuthites also gained early possession of part of it; and the children of Abraham by Keturah contributed, as sacred historians inform us, to augment the number of its inhabitants.

Ptolemy seems to have been the first who divided this peninsula into Arabia Petrea, Arabia Deferta, and Arabia Felix; and since his time this division has generally prevailed.

Arabia Petrea, or the Scaly, was contiguous, on the eait, to Syria and Arabia Deferta; on the south, to Egypt and the illusmus of Suez; on the north, to Palestine, the lake Alphalities, and Ceosyria; and on the south to Arabia Felix. This tract did not admit of much cultivation, the greatest part of it being covered with dry lands and rocks (whence its name), interspersed with some fruitful spots. Its metropolis was Petra; the other most considerable places noticed in scripture as belonging to this district were Paran, Dumah, and Pitom. The principal people that inhabited it were the Ishmaelites, the Nabiheims, the Cadi or Kadaren, and the Haageri or Ayarim. Of these the Ishmaelites were the most powerful, if they did not comprehend the whole of it. The most remarkable places in this region were the town of Kolsyium or Kolzom, the wilderness of Shur, that of Sina, that of Sinai, the mounts Caius and Sinai.
ARABIA.

Simon, Yezinghaher, the progenitors of Paran, Adra, Elufi, Abda, and Mecca. See the several articles.

Arabia Deserta was bounded on the north by the Euphrates, separating it from Mesopotamia; on the west, by Syria, Judaea, and Arabia Petraea; on the east, by Chadzara and Babylon; or a ridge of mountains dividing it from those countries; and on the south, by Arabia Felix, from which it was disjoined by several ranges of hills. The Cantabahoon, according to Ptolemy, inhabited that part of this province bordering upon the Euphrates, and the Batahuni occupied that which lay on the confines of Syria. The Agbeni and Rhabenii were placed more northward towards the frontiers of Arabia Felix, and near the Persian gulf, the Orchideth. Near the Cantabahoon, on the land of Babylon, dwelt the Aithia, supposed by Bathycol to have inhabited that tract in which was the country of Jab; and above the Rhabenii were the Mafa. In the interior part were the Agreys; and in the mountainous region, near Chadzara, were situated the Marteni. The towns of this district, enumerated by Ptolemy, if such they might be called, were places of no great importance.

Arabia Felix was limited on the north by the provinces already mentioned; on the south, by the Erythrean sea; on the east, by part of that sea, together with the Arabian and Persian gulfs; and corresponded to that tract which the oriental geographers regarded as the proper peninsula of the Arabs. Strabo says (l. xvii.) that, in his time, it was divided into five kingdoms, corresponding to the division of the proper Arabia into five provinces by the earlier writers. The principal nations noticed by the ancients in this province were the Sabaei, Gueerzi, Minzai, Atrakene, Maranisse, Catabani, Aafscre, Homereiss, Sapphorites, Omanites, Saracens, Nabathei, Thamydeni, and Binuzemene. The most remarkable places were Nyfa, Arga, Aidea, Pudini, Mula, Odaxis, Arabie emporium or aden, Mofha or Mafkat, and Atamass portus or Cadhemaa.

The belt eastern writers have divided this peninsula into five provinces or kingdoms, namely Yaman, Hejaz, Tehama, Naid, and Yamunam. The province of Yaman or Yemen, so called either from its situation to the right hand or south of the temple of Mecca, or from the verdure of its soil, extends along the Indian ocean from the fronds of Bahelminkel to Cape Razal-Chad or Rafalat. It is bounded by part of the Red Sea on the west and south, and on the north by the town of Nairwan, the Magera of Ptolemy; Hal or Haljo on the sea Al Kolzom; and Oman or Sohar; and it is subdivided into several lesser provinces as Hadramaut, Shihir, Oman, Nairwan, and Mahra, of which Shihir alone produces the frankincense. This country has been famous, from a very remote period, for its fertility and riches, and the happiness of its climate. The principal cities known to the ancients were Mocha, Aden, Sanza the capital of the province, and now reckoned the chief city of Arabia, Saba or Mareb, Shihid, Dhafar, and Oman or Sohar. This province, known under the appellation of Arabia Felix, called by the Greeks μῆλα ἄδηπος, and formerly extolled for the verdure of its trees, the purity of its air, the flavour of its fruits, and the fertility and abundance of its productions, manifests at present few traces of its ancient opulence; insomuch that it is difficult to conceive how it has acquired the name of happy; being a country where the greater part of the land remains without culture; and, excepted by burning heats, it is delight of inhabitants, excepting in places remote from the sea, where the mountains afford a refuge by their shade. It may therefore be presumed, that the articles of luxury which it produces, and which polished nations have converted into wants, have given rise to the belief, that where ever superfluities are found, there the necessities of life must be enjoyed in abundance; just as the vulgar imagine, that the most fortunate countries are those which produce gold, pearls, and diamonds. This province, far left tilter than Egypt or Syria, which lie at no great distance, seems only to have slipped the title of happy, from a comparison with the barren and indigent tracts that surround it.

Hejaz, so called because it includes Najf from Tehama, is limited on the south by Yemen and Tehama; on the west, by the sea Al Kolzom; on the north, by the deserts of Syria; and on the east, by the province of Najf. The chief towns are Mecca, Medina, Taif, Ailah, Yanbo, Madian, and Hejaz. The soil in this province is more barren than that of Yemen, and it is so parched as to afford neither water, nor fruit, nor genial habit; and yet supernatural cruelty produces plenty, insomuch that a province, doomed by nature to scarcity and want, becomes the wealthiest and most flourishing of Arabia. It was known, in the earliest ages, under the name of the Madianites, or Arabia Petraea. It once its opulence and celebrity to the towns of Mecca and Medina, the former having shared the honour of giving birth to Mahomet; and the other boasting of having granted him as an asylum, when, at the commencement of his ministry, he was obliged to retire from the face of his persecutors. Many honourable pretensions add lustre to this province. It was here, according to report, that Abraham laid the foundations of the most ancient temple in the world; it was here that Ishmael, on being forced to quit the paternal roof, came to seek a second country; it was here that Moses, when a fugitive from Egypt, withdrew from the vengeance of those who wanted to punish him for having killed the Egyptian; here he married the daughter of Jethro, a prophet highly revered, who, as the Arabsians relate, gave edifying lessons to the leader of the Hebrews; in short, it is here that we behold the two mountains of Horeb and Sinai, where Jehovah gave laws to his people, amidst awful thunder and lightning. It is from these illustrious claims that a province, which offers to the fight only lands and rocks from whence flow bitter waters, establishes its pre-eminence, and finds resources ever new in a glorious and profitable tradition. The province of Tehama, so denominated from the vehement heat of its sandy soil, and Gaur, from its low situation, is bounded on the west by the Red Sea, and on the other side by Hejaz and Yemen, extending almost from Mecca to Aden. The Arabian geographers have sometimes confounded this province with Yemen and Hejaz. Abulfeda mentions several towns in Tehama, which must have been undoubtedly of great antiquity, but unknown both to the Greeks and Romans. As the ground of this district is the lowest in Arabia, it abounds with springs, which are an invaluable treasure to a dry and parched region.

The province of Najf or Nebad, signifying a ruling country, lies between those of Yaman, Yemen, and Hejaz, and is bounded on the east by Irak. This elevated country presents to the view only rocks and deserts, from whence men and animals are totally excluded, on account of the scarcity of water, except in some few more favoured districts, where the shade of the mountains affords a defence against the scorching heat of the sun.

Yamama, called also Arad, from its oblique situation in respect of Yemen, is surrounded by the provinces of Najf, Tehama, Bahrman, Oman, Shihir, Hadramaut, and Saba. The chief city is Yamama, which gives name to the province; and it was anciently called Jaw or Gjauva; it is particularly famous for having been the residence of Mahomet's competitor, the false prophet Mofallama.

The inland parts of Arabia, occupied by the extensive province
province or desert called Neged, were, till of late years, almost utterly unknown. The relations of travellers were confined to the coasts of that vast country, to which, without doubt, their perambulations were limited. Michæli, the celebrated professor of Gottingen, proposed to the late king of Denmark, to send five able persons to explore the territory and productions of Arabia. Of these five Danes, four dying in the journey, M. Niebuhr, who had been appointed to the geographical department, took upon him to execute the object of the expedition alone. From the relation which he published in 1772, we shall make some extracts. Of all the maps of Arabia that have hitherto been published, this learned traveller gives the preference to that of M. D'Anville, published in 1711, under the title of "Première Partie de la Carte de l'Afrique, la Turquie, l'Arabie, l'Inde, & la Tartarie." He collected a great number of inscriptions and medals in Cufic characters, to which he annexes the explanations given by Mr. Reifschneider, professor at Leipſie. Among these antiquities, he presents one of bronze, on which appears the figure of the crofis, with the name of a caliph and a Turkish legend. Our astonishment at this curious mixture will cease, on learning that the medal was struck in a country that was, at the same time, governed by the Greek emperors and the caliphs of Bagdad.

Arabia is divided by the inhabitants themselves into eight provinces, entirely independent on one another, viz. Yemen, on the south, towards the Red Sea; Hadraimit, Hadramaut, on the shores of the Indian Ocean, Oman, on the south of the entrance of the Persian Gulf, Hadisjar, or Hijaz, the Hijer of M. D'Anville, or Lahfa, Nedjed, or Neged, and Hedjas, or Hejaz. The territory of the Bedouins, or of the Arabs in the desert of Syria, may be reckoned a seventh province; and to this again may be added the Arabian establishments on the southern coast of Persia. See the several articles.

All of the governments of Arabia, which is divided among numerous Imams and Sheiks, that of Yemen is the most uniform and belt regulated, and an idea of the rest may be formed from that of Yemen, described by Niebuhr. The title of Imam, denoting Viceroy, that is of Mahomet, is ecclesiastical; in Arabia it is considered as synonymous with Caliph, and Emir or Mumenin, or prince of the faithful. Its antiquity is not explained, but the history of the Imams of Yemen is very modern; and though they sometimes celebrate divine service, the fally of Emir, which they themselves assume on their coins, seems more proper and precise. They give the government up to Sheiks, a term signifying old men, and rarely blended with the ecclesiastical character.

The throne of Yemen is hereditary; and the Imam, or Emir, an independent power, acknowledging no superior in spiritual or temporal affairs. He possizfs the prerogative of peace and war; but cannot be called despotic, as he cannot deprive even a few of a pagan of life; but the emir must be tried before the supreme tribunal of Sana, confining of several Cadis, while he is only prexident. When an Emir shews a despotic disposition, he is merely dethroned. The first in rank are the Pakis, a title so lax as seemingly only to imply gentleness. The governors of districts are called Dolas; or, if superior in birth, Walis. The Dola corresponds in some degree with the Turkish Pasha. The chief magis ter of a small town without a garrison is called Sheik; as a superior governor is sometimes called Emir, and in little villages, Hakim. The Bakhate, or comptroller, is an officer who depends on the prince, and inspects the conduct of the Dola, and the management of the revenues. In each district there is also a Cadi, who, like those in Turkey, are judges of ecclesiastical and civil affairs; and perhaps depend on the chief Cadi at Sana, as those of Turkey do on the Mufil: but in Arabia the prince himself is the high priest. His army, in peace, was computed at 4000 infantry, and 1000 cavalry; the soldiers being, as usual in the east, without uniforms. There is no navy, and the vessels in general are very ruderly constructed, those of Yemen having sails made of matting. Yemen adopted the koran in the 7th year of the Hegira. This fine province has at several times excited the ambition of Egypt, and been subjected to the Ottoman sultan. It successively became a prey to Saladin, Guri, and Solymian; but the love of liberty always triumphed in the mountains over the Ottoman arms.

In 1630, Khaffem, one of the independent Sheiks, forced the Turkish Pashas to quit the country; and Ismael, his son, established this happy revolution, and took on himself the office of Imam. The general aspect of Arabia, says a modern geographer (Mr. Pinkerton), presents a central desert of great extent, with a few fertile "cafes," or islands, as in Africa; while the flourishing provinces are those situated on the shores of the sea, which supplies rain sufficient to maintain the vegetation. In Yemen there are mountains of considerable height, but chiefly barren and upland; while the temperature and plants are striking contrast with those of the Gulf; yet the want of rivers, lakes, and perennial streams, must diffuse ideas of fertility through the Arabian landscape. In the delta of rivers strictly belonging to Arabia, the Euphrates and Tigris, which pass through Irak-Arabi, have been claimed by some geographers; and the Euphrates may be justly considered as an Arabian river. But in Arabia Proper, what are called rivers are mere torrents, which descend from the mountains during the rains, and for a short period afterwards. Such is the Alfan of Neged. The most important river is probably that which arises near Sana, and joins the Indian sea below Harjiah. The little river of Krim flows from Mahah into the same sea, and is followed by two or three brooks in Oman, or Oman. One or two small lakes occur in situations incircled with hills, which prevent the escape of the water.

The chief range of mountains seems to proceed in the direction of the Red sea; towards the north not more than 30 miles distant, and sometimes in the fourth about 150; a fertile vale which bears its desert and fertility to Yemen. The hills of Oman seem a continuation of those on the other side of the Persian gulf; and the islands in the mouth of that gulf may be regarded as summits of that range. In the country of Sega, commonly ascribed to Hadramaut, there is a range of hills remarkable for the product of frankincense. The direction of the other ranges cannot be accurately ascertained in the imperfect geography of the country. In Arabia Petraea is the celebrated mountain of Sinai, with its two sublime summits of red granite.

The agriculture of Arabia is employed in the production of wheat, maize, "dura," or a kind of millet, barley, beans, lentils, and rape, with the sugar cane, tobacco, and cotton. Rice seems unknown in Yemen, and oats throughout Arabia: the horses being fed with barley, and the asses with beans.

They also cultivate "sars," a plant which dyes yellow, and is exported in great quantities from Mocha to Oman; and "fua," used in dyeing red; likewise indigo. The wheat, in the environs of Makkah, yields little more than ten for one; and in the bull cultivated districts of Yemen, go to one; but the dura sometimes much exceeds this ratio, yielding in the highlands 140, and in the Tehama, or plain, from 200 to 400. By their mode of fowing, and watering this grain, the inhabitants of Tehama reap three
three successive crops from the same field in the same year. The plough is simple, and the pick is used instead of the spade. The principal exertion of the Nabob's industry is to water the lands from the rivulets and wells, or by conducting the rains. Barley is reaped in November; but the fikon depends on the situation. At Maklat, wheat and barley are sown in December, and reaped in March; but durra is sown in August, and reaped in the end of November. The Arabsians pull up their ripe corn by the roots; but the green corn and grapes, as forage for the cattle, are cut with the sickle. In thrashing their corn, they lay the sheaves down in a certain order, and then lead over them two oxen dragging a large flail.

The greater part of Arabia, being composed of dry barren deserts of sand, either wholly destitute of water, or furnishing scanty springs of that which is brackish, presents few objects to botanical investigation. The vegetable in such districts, exposed to the violent sun, and freshened merely by nightly dew, belong for the most part to the genera of aloes, melobrenchymen, euphorbia, lappelia, and fufola. On the western side of the Arabian desert, numerous rivulets, descending into the Red Sea, diffuse verdure; and on the mountains from which they run, vegetation is more abundant. Either many Indian and Persian plants, distinguished for their beauty or use, have been transported in former ages, and are now found in a truly indigenous state: such is the case probably with the tamarind, the cotton tree (inferior to the Indians), the pomegranate, the banyan tree or Indian fig, the sugar cane, and many species of melons and gourds. Arabia Felix may peculiarly boast of two valuable trees, namely, the coffee (coffeae Arabicae), found both cultivated and wild; and the amyris opolpehennum, which yields the balm of Mecca. Of the palms, Arabia possesses the date, the cocoa nut, and the great fan palm. It has also the sycomore fig, the plantain, the almond, apricot, and peach, the papaw, the bead tree, the mimola nilotica, and fenitilla, and the orange. Among its thorns and herbaceous plants may be enumerated the rictum, the liquorice, and the fenian, used in medicine; and the balsam, globe amaranth, the white lily, and the greater panarium, distinguished for their beauty and fragrance.

The mineralogy of Arabia is not very important. It has no native gold, nor any silver, besides that which is mingled in the lead mines of Oman. In the northern district of Yemen, called Saade, there are some mines of iron, which is brittle. Its precious stones have been imported from Hindostan: its agates, called Mocha stones, are brought from Surat, and the balt cornelians from the gulf of Cambay. Yemen, however, produces onyxes: a kind of Saroney is found near Damas. Rock salt appears near Loheia; and in Ajemen, Niebuhr has observed pentagonal pillars of salt, with bluish alabaster, flint, and various spar; but it does not appear that any of the gems are produced in Arabia. The pearls and spires, of which Arabia formerly boasted, were probably the products of the Indies and the coasts of Africa, whither the Egyptians went to fetch them, in order to diffuse them among the nations of the west; and as it was their interest to conceal the source of their wealth, they chose rather to have it thought that they traded to Arabia, where it was impossible to penetrate far, without imminent danger of death in the sands of the deserts.

The principal riches of Arabia consist in flocks and herds, and especially those species of animals that require only succulent herbs for their nourishment. The cow here yields but little milk; and the flesh of the ox, which like her delights in fat pastures, is insipid and nauseous. The wool and mutton of the sheep are coarse. In the mountains of Arabia Petraea is found the rock-goat. It is probable that Arabia, notwithstanding the fertility of its soil, was formerly inhabited and peopled for the same reason that commodity formed a prime object of commerce with the neighbouring countries; nevertheless it is a well-known fact, that in all the tropical regions there is a greater consumption of fruits and vegetables than of flesh. Of all the animals of Arabia, the horse claims the pre-eminence. According to Zimmerman (Zool. Grec. 1777, p. 149), this animal is found wild in the extensive deserts on the north of Hadramout: this might have been the case in ancient times, unless it should be thought more probable that the wild horse of Tartary has passed through Persia, and has been only perfected in Arabia. The horses here are distributed into two classes, viz., the Kudjebeli, or common kind, whose genealogy has not been preserved, and the Kuchinian, or noble horses, whose whole breed has been ascertained for 2000 years, proceeding, as their fables assert, from the tails of Solomon. They are reared by the Bedouins in the northern deserts between Baffora, Merdian, and the frontiers of Syria; and though they are neither large nor beautiful, their race and hereditary qualities being the only objects of estimation, the preservation of their breed is carefully and authentically watched; and the offspring of a Kuchinian stallion with an ignoble race is reputed Kudjebel. These will bear the greatest fatigues, and pass whole days without food, living according to the Arabian metaphor, on air. They are said to run on a foe with impetuousness; and it is asserted that some of them, when wounded in battle, will withdraw to a spot where their mallet may be secure; and if he fail, they will neigh for assistance. Accordingly their value is derived from their singular agility, an extreme docility, and an uncommon attachment to their masters. The Arabian fleeds are sometimes bought at excessive rates by the English at Mocha. The duke of Newcastle asserts, that the ordinary price of an Arabian horse is 1000, 2000, or even 3000l; and that the Arabs are as careful in preferring the genealogy of their horses, as princes in recording that of their families: the groom's are very exact in registering the names of the fires and dams of these animals, and none of them are of very ancient date in this species of pedigree. It is affirmed that Arabian colts are brought up with camel's milk. In this country there is also a superior breed of asses, in form and qualities approaching to the mule, and sold at high prices. Arabia, or Africa, seems to be also the native country of the camel. Niebuhr observed camels of different kinds, and he seems to have decided the question concerning the domestication by saying that this animal in Arabia and Egypt has always one hunch only, and can otherwise be scarcely distinguished from the camel, but in being more light and speedy. The bufalo seems to be unknown in this country; and the camel in general have a hunch on the shoulder. Arabia is infested with almost all kinds of furious beasts, that prefer burning sands and arid mountains to humid regions: they fix their abode in the caves of the mountains, in the cellars of the rocks, or in dens which they dig for themselves. The other animals are the jackal, or chael; the hyena, towards the Persian gulf and the desert mountains of Arabia Petraea; numerous monkeys in the woods of Yemen; the jebba, or rat of Pharaoh, in Neged; and there are also antelopes, and wild oxen, with wolves, foxes, and wild boars, and the large panther, called in Arabia, "nemer," and a small panther, called the "faith." The tiger seems utterly unknown, and the lion only appears beyond.
yond the Euphrates. But if ferocious animals of various kinds exercise with impunity their ravages in the deserts, the mountains teem with other animals, which produce great advantages to commerce; such as the civet-cat, the bezeror goat, the mule-rat, and various others, which are divested by nurture of their savage disposition, and admired by habit to domestic discipline.

Among the birds may be named the pheasant, common in the forests of Yemen, and the grey partridge in the plains, besides all sorts of common poultry. On the coasts of the Persian Gulf, and of the Red Sea, there are species that live on fish are numerous, and in an island of this sea are found cases in the deserts are ostriches; and the birds of prey in Arabia are eagles, falcons, vultures, and sparrow-hawks. A bird of the thrush kind, called by Mr. Forfkal, "turdes fleucus," is very serviceable in destroying locusts, and is thought to come annually from Khorasan. It is designated "Sa-marmog," or, "Samarmog." Arabia abounds with land-tortoises, which are eaten by the Cenfern Christians in Lent; several forts of lizards, and all of serpents; and of the latter, the only fort that is formidable is that called "Extan," which is small and slender, and spotted with black and white; its bite is so poisonous, that it occasions instant death. The Red sea is florid with a great variety of fishes. Mr. Forfkal is said to have observed more than 80 new species; some of which he could not rank among any of the known genera. The locusts are very numerous; and that species which infests Arabia is called by Mr. Forfkal, "Gryllus gregarius," which he thinks to be different from the "Gryllus migratus" of Linneus. All the Arabians, whether living in their native country or in Persia, Syria, and Africa, are accustomed to eat locusts, and they ascribe a peculiar delicacy to the red fort, which they esteem fatter and more succulent than any of the others. The swarms of these insects darken the air, and at a distance appear like clouds of smoke. In flying, their noise is tremendous, and resembles that of a water-fall. When such a swarm falls upon a field, it is soon confounded and defoiled of its verdure. A small insect, named "Arda," (the "Termeis fatale" of Linneus), is another scourge of Arabia, as well as of hot countries in general. These live and work together like ants, and are very destructive to trees. The inhabitants of the country, for preferring their gardens from the depradations of these mischiefous insects, surround their trees with sheep's dung, the smell of which the arda cannot endure. A species of "escopendria" torments the Arabsians, and afflicts those on whom it fixes with burning pains. Among the "Tenebriones," there is one species which the women of Arabia and Turkey dig out of the frost of the garden; and they swell three of them fried in butter every morning and evening, in order to acquire that plumpness which is deemed in the East a beauty.

The Red Sea is full of marine insects; and Mr. Forfkal, from a number of observations, inferred, that an immense number of these animals contribute to produce the reflection perceived at night in sea-water. The shells of the Arabian gulf are numerous, and some of them belong to rare species. The most beautiful is a "pinna," with superb colours. The Arabian gulf abounds with immense banks of coral; so that most of the houses in the Tehama are built of coral cok. These rocks, rising sometimes ten fathoms above the surface of the sea, are folt under the water; and as they are easily wrought, they are preferred to all other stones for the purposes of building.

In the whole peninsula of Arabia the year has only two distinct seasons, the dry and the rainy. The latter commences in the province of Yemen, about the middle of June, and terminates in September; but the sky is rarely covered with clouds for 24 hours at a time. At Makkah, and in the eastern mountains, it fails from the middle of November to the middle of February; and in Oman and Hadramaut, from the middle of February to the middle of April. These regular rains are very beneficial, as they render the valleys lying among the mountains fertile and delightful. In the plains of Yemen rain is sometimes uncommon for a whole year; and in the dry season, a cloud is rarely to be seen. The heat is no less subject to variation, than the wet season. At Saba, in the mountains, it has never exceeded 85° from the 18th to the 28th of July; whereas in Tehama, which is lower than Yemen, it has stood at 95° from the 6th to the 20th of August. It sometimes, though rarely, freezes at Sana, while at Lobra the thermometer is at 86°. Hence the inhabitants of Yemen live as if they belonged to different climates; and even at a small distance are found fruits and animals which might indicate remote countries. The wind from the sea is generally moif, that from the interior deserts dry; and in the northern deserts are chiefly perceived the disastrous effects of the burning wind called Sam, Samam, or Samiel. The Arabs discern its approach by an uncommon reduction in the air; and to defend themselves from the imminent danger, they throw themselves flat on the earth. The people of the isle of Chantilli and of the Marelin, have nothing to dread from this deadly wind; sleeping in the open air from the 18th of May to October, without feeling any inconvenience.

Although the Arabians are ingenious and diligent, their manufactures are of little consequence. Even in Yemen, the works in gold and silver, and the coin itself, are produced by Jewish manufacturers. In the whole country of Arabia there are neither wind-mills nor water-mills. The mulkets that are made in the country, are like the Arabians were formerly deemed, are mere matchlocks of mean fabric. At Musca there is one glafs-houfe; and in Yemen there are some linen manufacturies, chiefly coarse. Among the chief vegetable products of Arabia, Nibnuhr reckons aloes, myrrh, frankincence of an inferior kind, and coffee; and also cocoa trees, pomegranates, dates, apricots, peaches, almonds, filberts, pears, figs, and tamarinds. But the best frankincence, with pikennards, cinnamon, caflon, cardamums, and pepper, are imported from Hindostan. The orange trees are brought from Portugal, and the lemon from Italy; the mangoes and cocoa, with several others, are imported from Hindostan.

The commerce of Arabia was formerly very considerable; as its ports facilitated a communication between the eastern and western world. But since the Portuguese opened a passage to India by the Cape of Good Hope, its intercourse with Hindostan has very much declined. The chief articles exported from them are coffee, aloes, and myrrh (of which the latter is brought from Abyssinia), olban (or an inferior kind of frankincence), fenna, ivory, and gold from Abyssinia. The European imports are iron, steel, cannon, lead, tin, cochineal, mirrors, knives, sabres, cut glafs, and false pearls. Nibnuhr regards aloes and frankincence (the latter chiefly from Hadramaut) as the only native articles of commerce, before coffee came into use. The principal trading ports are Jidda or Gdida, the harbour of Mecca, Lobra, and Beit el Fakih, carrying on a confiderable trade in coffee; Gezan, trading in fenna and coffee; Hodeida, Mocha, Aden, Makkah, Sur or Seer, Fahat and Datar, on the Arabian ocean; Bahrin and El Katif, in the gulf of bassora; Bassora, &c. See the articles.

Besides the maritime commerce, a considerable traffic is carried on by land by means of the caravans of Aleppo and
Suez, which bring lusher velvets, fattrns, armories, and all sorts of rich stuffs; fasson, mercury, vermilion, &c.; and take in return, partly the natural products of the country, partly manufactures, and partly the foreign mechanizd that have been brought from the Indies, from Aeppus, and from Europe. Neithr observes, that the trade on the coast of the Red Sea cannot be advantages to any nation that has not settlements in India. The Arabian, he lays, make no use of the productions of Europe. It will be, therefore, necessary to supply them with India goods, and to take coffee in return, which can be brought cheaper from ships which take it in merely to avoid returning empty. There is, however, a great quantity of corn sold in Arabia, which the English produce chiefly from the Downs. This ingenious traveller adorns strangers against the beauty of the Mahometan books; and he recommends the applying rather to the Banians, among whom are many very considerable merchants, who are very hospitable men. In his description of the extensive country of Neged, he informs us, that the Arabs, who inhabit it, are not more inhuman to strangers than the rest of their nation, nor less hospitable; but as this country contains many little independent states, each governed by a sheikh, it may be easily conceived that travellers here find little security. Each prince endeavors to get from them all he can; and as they are commonly at war with each other, strangers are despised by the first, that their neighbours may not be the richer. Hence opulent foreign merchants cannot hazard their caravans in these regions; and those that come from Oman and Labba to Mecca, are generally composed of beggars, or people who wish to pass for such; and the caravan which every year leaves Bagdad for Mecca, accompanied with many rich Persians, is, in proportion to its number, charged with familiar expenses and extortions with those of Turkey, Egypt, and Magreb, which pass by Hejaz. Yet there is reason to believe, that the town of Neged carry on a considerable trade among themselves, and with the neighbouring places in Hejaz, Yemen, and Labba; and by these means it may be possible for an European traveller to inspect this internal part of Arabia.

The population of Arabia consists chiefly of Mahometans, intermixed with some Jews and Christians. Banians also from India are settled in great numbers in their commercial cities. For their manners and customs, language, and literature, and other particulars, see the following articles, and those already referred to in the general account of the country.

Of the various Arabian colonies settled in the maritime parts of the gulf of Persia, the most considerable is the city of Aboushan, 28° 57' from the equator. That of Gombron, founded by Shah Abbas, has been lying, ever since the troubles consequent on the death of Shah Nadir, the opulence and splendor which it derived from the extent of its commerce. Besides several isles of little consequence in the Arabian gulf, there are Socotra in the Arabian sea; and the Isle of Imam, or Ara, in the Persian gulf, in which there is a fortified town; and on this and the group of adjacent small isles, there are 50 or 60 mean villages.

ARABS, bistory. Character, enforts, Sc. of the. According to the oriental writers, the Arabs are distinguished into two classes, viz. the old loth Arabians, and the present. The former were very numerous, and divided into several tribes, which are now all destroyed, or else destroyed and swallowed up among the other tribes; nor are any certain memoirs or records extant concerning them. The most famous tribes among these ancient Arabians were Abi, Thamud, Tafin, J blade, the former Jorham, and Andak. The present Arabs, according to their own historians, are sprung from two flocks, Kahtan or Juktan, the son of Eber, and Adan, descended in a direct line from Ishmael, the son of Abraham and Hagbar. The poverty of the former they call Al Arab, Al Arabi, i.e. the pensive or pure Arabs; and those of the latter, Al Arab al Masireb, i.e. naturalized or inquisitive Arabs. Besides these tribes of Arabia, mentioned by their own authors, who were not descended from the race of Shem, others of them were the poverty of Ham, by his son Cuth, who inhabited the banks of the Eufrates, and of the Persian gulf, whether they came from Chiraz, or Susiana, the original settlement of their father. To these three flocks traditional report ascribes the origin of the Arabian. Some time after the condition of languages at Babel, or according to the computation admitted in Europe about 3500 years ago, Yarah, the elder of Juktan's sons, it is said, succeeded his father in the kingdom of Yemen, giving name, as the Arab writers maintain, to their country and language; and Jorham, the younger, founded the kingdom of Hejaz, where his polity preserved the throne till the time of Ishmael. The kingdom of Yemen, or at least the better part of it, particularly the provinces of Saba and Hadramaut, was governed by princes of the tribe of Hamyar, the son of Saba, and the great granulated of Kahtan; though at length the kingdom was transplanted to the descendents of Cahlan his brother, who still retained the title of king of Hamyar. The princes of the Hamyaries, called Homerites by the later Greek and Latin authors, had the general title of "Tooba," signifying successor, as the Egyptian kings had that of Pharaoh, the Roman emperors that of Caesar, and the succerors of Mahomet that of Caliph. This kingdom failed, according to Abubedia, 2030 years; or, as other Arab writers say, above 5000; the length of the reign of each prince being very uncertain. The first great calamity that befell the tribes settled in Yemen was the inundation of Aram, which is said to have happened soon after the time of Alexander the Great, and to have been occasioned by the irruption of a mound, or dam, erected near the city of Saba, afterwards called Mereb, and serving as a reservoir for receiving the water which came down from the mountains for the supply of the city, and for watering their lands. On this occasion, eight tribes were forced to abandon their dwellings; and some of them, in their migration, gave rise to the two kingdoms of Ghaffan and Hirah; both of them out of the proper limits of Arabia. The founders of the former, in Syria Damascena, maintained their kingdom, according to Abubedea, 616 years. Five of these princes were named Hareth, written by the Greeks Aretas; and it was the governor of one of these who ordered the gates of Damascus to be watched, for the purpose of apprehending the apostle Paul. This tribe was Christian; but their last king, on occasion of the successes of the Arabs in Syria, professed Mohammedism under the Caliph Omam; however, on receiving some disfavour, he returned to his former faith, and retired to Constantinople. The other kingdom of Hira, founded in Chaldea, or Iraq, continued, with some small interruption by the Persians, till the caliphate of Abubeker, and its duration was near 623 years. The princes were under the protection of the kings of Persia, acting as their lieutenants over the Arabs of Iraq, as the kings of Ghaffan were for the Roman emperors, over those of Syria.

Jorham, the son of Kahtan, who founded the kingdom of Hejaz, and his posterity, maintained possession of it till the time of Ishmael, who, marrying the daughter of Modad, one
one of the princes of the country, had 12 sons; to one of whom, called Kidar, the crown was resigned by his uncle, the Jorhamites; but others say, that the defenders of Ithana expelled that tribe, who, retiring to Johinah, were, after various fortune, all destroyed by an insurrection. Of the successive kings of Hamyar, Hira, Ghassan, and Jorham, Dr. Pococke, in his "Specimen Arab," has given catalogues, that are said to be tolerably exact.

After the expulsion of the Jorhamites, the government of Hejzy seems not to have remained for many centuries in the hands of one prince, but to have been divided among the heads of tribes, almost in the same manner as the Arabs of the desert are governed at this day. At Mecca, an aristocracy prevailed, where the chief management of affairs, till the time of Mohammed, lay in the tribe of Koreish; more especially after they had obtained the custody of the Caaba from the tribe of Khazaah, one of those tribes that had migrated from Al-Aram.

Besides the kingdoms already enumerated, there were some other tribes, which in latter times had princes of their own, and formed states of inferior note; such, in particular, was the tribe of Knda, which had several kings.

Having given a brief abstract of the history of the ancient Arabs before Mahomet, it may not be improper to subjoin a concise account of the principal transactions in which those people were concerned with the Egyptians, Persians, Greeks, and Romans, extracted from the most approved writers of the two last nations. According to Dioecitus Siculus (lib. i.), Sesostris, the Sefac of Jophesus and Sir Isaac Newton, subdued Arabia. But it is evident, that the Arabs were never completely subjugated, nor for any long time rendered any homage to the kings of Egypt, because Sefac himself, as the same author informs us, was obliged to draw a line from Helopolis to Pelusium, in order to secure Egypt. But Hecataeus, the first Arab historian, gives an account of the great conquests of the Arabians, more Scenicus Arabs, contiguous to Palestine and Syria, milit., therefore, have been independent on that prince. Nor can it be inferred from Dioecitus, that he ever harried Arabica Felix, though he had a fleet of 400 sail upon the Red Sea; but only coaled it, or at most seized upon some of its maritime provinces in his voyage to India; and by the testimony of this historian, who has extolled the conquests of Sesostris, it sufficiently appears, that the whole peninsula of the Arabs never was, at least for any considerable time, in a state of servitude to the Egyptians. It appears on the contrary, that they gave kings to Egypt, who were known under the name of Shepherds. From Dioecitus (l. ii.) we also learn, that neither the Assyrians, Medes, nor Persians, could ever gain any considerable settlement among them. The Persian monarchs were respected by them as their friends, and received from them, as Herodotus informs us (l. iii. c. 97.), an annual present of frankincense; and yet they never made them tributary, and gave law to them; nor is Arabia found in any enumeration of their provinces: so far indeed were the Persians from being their masters, that Cambyses, in his expedition against Egypt, was obliged to ask permission to pass through their territories. The Spartans, inured to conquer, made a defect on their coasts, and repented of their temerity.

When Alexander the Great had subdued the Persian empire, the Arabians, however exorbitant and generally dreaded his power was, in consequence of the extent and fame of his victories, had but little apprehension of him, that they alone, of all the neighbouring nations, sent no ambassadors to him. The preparations which he made shew, that he regarded this conquest as worthy of his utmost exertions, but death put a stop to his enterprise, so that it is impossible to decide what would have been the event; but perhaps this people might have convinced him that he was not absolutely invincible. The successors of Alexander, who attempted to prosecute his design, were as often defeated. For an account of the unsuccessful enterprise of Athenacus, the general of Antigonus, the Antigonid.

The reply of the Arabs to Demetrius, who undertook a second expedition against them, demonstrates their manly resolution, and their indifference to the fame that is acquired by arms. "King Demetrius!" said they, "what are thy pretensions? what wouldst thou have of us? what motive brings thee to disturb the silence of our deserts, where nature, a cruel stepmother to us, grants children no other than the painful means of subsistence? our parcelled and fan- dy deserts have no charm for us except the liberty they allow us to enjoy, and which thou art come to ravish from us. It is the love of independence, that renders such hardships as are unknown to the other inhabitants of the earth, supportable to us. Our rocks are too hard to be broken by thy speccepe; if thou wouldst subject us to thy yoke, begin by subjugating our sentiments; alter our manner of life; but first convince us of subsistence in a country that has nothing but sand, and rocks, and metals. Be advised, and let those people live in peace against whom thou hast no cause of complaint, and who desire to have no quarrel with thee. Accept the presents we here bring thee; and may they induce thee to believe that the Nabathans are thy friends."

The Romans made incursions into Arabia, but never subdued it. Some few tribes, vanquished by Lucullus, did homage to the majesty of the Roman people. Pompey, as Plutarch informs us, obliged Areias, an Arab prince, whose dominions bordered upon Syria and Melopotamia, to receive a Roman garrison; and the same general likewise subdued the Arabs who dwelt about mount Ammon, by his lieutenants. After which the king of the Arabs, residing in Petra, addressed a letter of submission to him; but it does not appear that Pompey ever gained possession of that fortresses. Crassus, ambitious of making the conquest of this country, entered a district of it with a numerous army, which perished in the defects from thirst and misery. Albus Gal- lus, in the reign of the emperor Augustus, in some measure repaired the disgrace of this disaster. He, of all the Roman generals, seems to have penetrated farthest into the immense and frightful deserts. At first he met with some brilliant successes; but the deadly heats consumed the flower of his troops, and he was obliged to retire with the remains of his army, whose fruitless victories were celebrated by the flatterers of Augustus. Caius, his grandson, convinced of the impossibility of subjugating a people, who only regarded life inamuch as they could live free, invaded their towns with fire and sword; and having forced them to surrender, he thence made excursions upon the territories of the empire; but after all his exertions, contented himself with the glory of having deprived them of the means of offence. From that time to the reign of Trajan, we read no conquest between the two nations. This emperor laid siege to the capital of the Hagaranes; and after repeated efforts, submitted to the disgrace of raising it. Notwithstanding the flatteries of Tra- jan, by the historians and orators of his time, and the medals struck by him, he did not subdue the Arabs; the province of Arabia, which he is said to have added to the Roman empire, scarcely reaching farther than Arabia Petraea, or the very skirts of the country. About eighty years after this period, the emperor Severus, being greatly incensed against the Arabs bordering on Syria, laid siege to Atrac their capital, with a formidable army; but he was obliged to raise it, and to retire into his own dominions. The Sa- racens,
racers, the most celebrated people among the Arabs, ravaged Mesopotamia in the time of the emperor Constantius, and joined the Persians against Julian. This prince, and one of his predeccessors, had paid a subsidy to the Saracens who served in their armies; but Julian, who considered them as his subjects and not as his allies, thought the treaty degrading to the majesty of the empire, and refused to pay a tribute under the qualifying term of a subsidy. Of this infraction the barbarians complained; but the prince, who knew how to fight as well as to govern, haughtily answered: "My implement is iron: I know nothing of gold." This expression they repeated, defected to the Perian, and ever after continued faithful to him. Sometime afterwards these warring races of people marched to the relief of Conscientiopolis, of which city they became the deliverers. It was under the reign of Theodosius that they began to make war in their own behalf; and after having been the play of the tottering empire, they became its terror. The Arabs, hitherto divided in tribes, now united their forces, and rallied forth to make conquests. It appears that the feet of that barbarous valour they now displayed had been concealed in their breasts, and that their hard and laborious life had prepared them for becoming intrepid soldiers. Their defeats were a rampart that secured them from foreign incursions; it was impossible to penetrate them without the danger of perishing for want of water, as the wells for the supply of it were known only to the inhabitants, who never disclosed the secret. Their towns were little elie than magazines, in which they stowed up the fruits of their predatory attacks, confuting of little more than a collection of huts, which they abandoned on the approach of an enemy; their citadels were the work of nature, steep rocks from whence they defied the most numerous hosts, who, like them, had nothing to fear, except the dearth of water and famine. Being ignorant in the art of fortification, they were but little vexed in the attack of strong holds; thus their offensive wars were nothing more than trancitory incursions: the forts which their enemies erected on the frontiers were sufficient to restrain their depredations. They were wont to thank heaven for giving them swords instead of ramparts. Their education was martial; they trained their children to the use of the bow and the sword, and in breaking their horses. An excellent sword was a family token, which a father bequeathed to his children, to remind them of the bravery of their ancestors. Prodigal of their own blood, it cannot be imagined that they were sparing of that of others. They fought only by daylight, because courage is routed by having witnesses of its efforts, and they thought that darkness was favourable to cowardice. It is therefore by no means surprising, that a people born with such noble propensities should have achieved such prodigies of valour, when once they had yielded to the ambition of conquests. The Arabs then, naturally warlike, only waited for circumstances to render them conquerors; for a long time, however, pacific and obscure, they took up arms merely from greediness of spoil, and never with a view of extending their borders, holding mankind in too great contempt for wishing to have them for subjects. They marched to battle without order or discipline; but accustomed to contend with ferocious animals, they carried courage to the excess of ferocity. Some, however, more savage than the rest, folo their blood and their services to such kings as were able to buy them; and it was not so much from a sentiment of honour, as from the hope of spoil, that they abandoned the tranquility of their solitudes. The Romans and the Persians, as we have seen, had in their armies a body of Saracens, who frequently decided the fortune of war. Though satisfied with their independence, they were scrupulous of attacking the liberty of their neighbours; and their greatest glory was their never having surrendered to foreign dominion. To this, however, they have undoubtedly a distinguishing claim; those who at different times attempted to subjuge them, having merely succeeded against a few tribes, settled in the cities on the Arabian gulf, or in the vicinity of Syria; and even here their power was extremely transient. After the time of Mahomet, Arabia was for about three centuries under the Caliphs his successors; but neither he, nor the Caliphs, could ever entirely subdue their own nation. Many chiefs in the interior parts of the country still maintained their independence, without respecting the Caliph in any other light than as the head of their religion; and the authority of the Caliphs was merely spiritual, except in their dominions over a part of the coast, where they were acknowledged as sovereigns. In the year 342 of the Hegira, a great part of the country was possessed by the Karmatians, to whom the Caliphs were obliged to pay tribute, that the pilgrimage to Mecca might be regularly performed. After the ruin of the power of the Caliphs, the Turks, Arabia shook off the yoke to which it had been partly subject, and was governed, as it formerly had been, by a number of chiefs more or less powerful, defended from different indigenous families. No neighbouring power ever attempted to subdue this country, till the Portuguese penetrated into India, and made their appearance in the Red Sea. Then, in the beginning of the 16th century, Sultan "El-Gury," fitted out a fleet to expel these invaders; and their fleet feized almost all the sea-ports of Arabia. But when the dynasty of the Mamelukes was terminated by the Turks, these cities fell again into the hands of their natural sovereigns. In the continuance of the war between the Turks and the Portuguese, Solomon Pacha, with a powerful fleet, feized all the towns upon the Arabian gulf. His successes pushed their conquests still farther, and subdued great part of Yemen, penetrating into the highlands; so that Arabia became almost entirely a province of the Sultan of Conscientiopolis, and was governed by Pachas, like the other provinces of the Ottoman empire. These events happened, under a lieutenant of Soliman I., A.D. 1538, and under Selim II., A.D. 1568. In the interior parts, however, there were still independent princes and Sheiks, who had never been subdued; but continued to harass the Turks, and to drive them towards the coasts. After various reiterated efforts, a prince of the family now reigning at Sanaa, at length succeeded, about the middle of the 17th century, and obliged the Turkish nation to evacuate all the places upon the Arabian coast, which they had occupied for more than a century. The Turks now profess nothing in this country, says Niebuhr, but a precious authority in the city of Jidda; and it is therefore absurd to reckon Arabia among the Ottoman provinces, since it is properly to be considered as independent of all foreign powers. From the view above presented of the independence of Arabia, the contemptuous reflection of a popular historian (see Gibbon's Hist. vol. ix. p. 299, sect. not justly warranted: who, after observing that "the perpetual independence of the Arabs has been the theme of praise among strangers and natives," adds, "the arts of controversy transform this singular event into a prophetic and miraculous, in favour of the policy of Islam. Some exceptions, that can neither be disbelieved nor denied, render this method of reasoning as indirect as it is superfluous." This reflection was aimed at the authors of the Ancient Universal History, who had observed (vol. xvi. p. 299.), that the manner of life, disposition, power, and government of
of the Sceantine Arabs, now known under the name of Bedouins, as well as their never having been thoroughly subjugated by any foreign power, from the age of Ithmael to the present time, illustrate the truth of a scriptural prediction, 

Gen. xvi. 12. The learned historian himself allows, that, though the kingdom of Yemen has been successively subdued by the Abyssinians, the Persians, the Sultans of Egypt, under a brother of the great Saladin, A. D. 1173, who founded a dynasty of Curds or Ayoubites, and the Turks: though the holy city of Mecca and Medina have repeatedly bowed under a Scythian tyrant; and though the Roman province of Arabia embraced the peculiar wilderness, in which Ithmael and his sons must have pitched their tents in the face of their brethren; yet these exceptions are temporary or local, and the body of the nation has escaped the yoke of the most powerful monarchies. This writer, however, has admirable隐患ed the causes of the freedom and independence of the Arabs, and also the effects thus produced on their disposition and character.

Arabia, like other nations of the east, was partitioned into different tribes, each of which had its chief, its customs, and its sacred rites peculiar to itself; although every family formed a species of domestic government absolutely independent, though distant from one another, without any relations of interest or friendship, they retained certain features which clearly indicated, that they were so many branches sprung from the same stock; all had the same love of independence, and, free in their native defects, they pitied the nations that were subjected to masters. This love of liberty which is the passion of noble and generous minds, was, in them a national fanaticism which, causing them to despise the rest of mankind, prevented their participation in the disorders and crimes which have poisons the source of public morals. The long memory of their independence was the firmest pledge of its perpetuity; and succeeding generations were animated to prove their descent, and to maintain their inheritance. Their domestic feuds were inflected on the approach of a common enemy; and when they advanced to battle, the hope of victory was in the front; in the rear, the assurance of a retreat. The arms and defects of the Bedouins are not only the safeguards of their own freedom, but the barriers also of Arabia Felix; whole inhabitants, remote from war, are enraptured by the luxury of the soil and climate. In every tribe among the Arabs, superstition, or gratification, or fortune, has exalted a particular family above the heads of their equals. The dignities of sheik, and emir, invariably descend in this chosen race; but the order of succession is loofe and precarious; and the most worthy, or aged, of the noble kinfmen, are preferred to the simple though important office of composing disputes by their advice, and guiding valour by their example. The momentary juncture of several tribes produces an army, their more lasting union constitutes a nation: and the tribes and families are held together by a mutual and voluntary compact. In the simple state of the Arabs, the nation is free, because each of her sons disclaims a base submission to the will of a master. His breath is fortified with the austere virtues of courage, patience, and forbearance: the love of independence prompts him to exercise the habits of self-command; and the fear of dishonour guards him from the meaner apprehensions of pain, of danger, and of death. The vigour of their frame is preferred by the laborious enterprises of an active life, that enables them to toil and fatigue. The frugality to which they are conduite by the sterility of their climate, seems to be a virtue in them; and they are thus preferred from the imbecility and idleness that are the result of intemperance either in eating or drinking, and enabled to prolong their life to old age. Their virtues and their vices partake of the influence of their fiturinated climate. That complexional gravity, which renders them insensible to whatever affects the rest of mankind, that scornful indifference and insolent pride with which they regard others, and that torpid insensibility which they manifest, are contracted and nourished in their state of solitude. The gravity and firmness of the mind are indicated in the outward demeanour of an Arab; his speech is slow, weighty, and concise; he is seldom provoked to laughter; his only gesture is that of stroking his beard, the venerable symbol of manhood; and the sense of his own importance teaches him to accept his equals without levity, and his superiors without awe. A more serious charge than any thing already mentioned is brought against the Arabs, and from which it is difficult to justify them: this is the unbridled cruelty prompting them to shed human blood without repentance and without remorse. Their own historians have transmitted to us the fact of Pisistratus, as tellingly as that ferocious people proposed not to make conquests over the world, as to destroy it. "In the study of nations of men," says Mr. Gibbon, "we may observe the caudles that render them hostile or friendly to each other, that tend to narrow or enlarge, to mollify or exasperate the human character. The separation of the Arabs from the rest of mankind has accustomed them to confound the ideas of stranger and enemy; and the poverty of the land has introduced a maxim of jurisprudence, which they believe and practice, to the present hour. They pretend, that in the division of the earth, the rich and fertile climates were assigned to the other branches of the human family; and that the povertv of the outwash Ithmael might recover, by fraud or force, the portion of inheritance of which he had been unjustly deprived. Thus, the feizure of a caravan is not a robbery that can excite in them any remorse. They look upon it as the recollection of their courage, as well as a restitution of property; and hence their errors concerning the right of war have precipitated them into a deluge of crimes.

According to the remark of Pisistratus, the Arabian tribes are equally addicted to theft and merchandise. If a Bedouin discovers from afar a solitary traveller, he rides furiously against him, crying with a loud voice, 'Undres thyself, thy aunt (my wife) is without a garment.' A ready submission entitles him to mercy, resistance will provoke the aggressor, and his own blood must expiate the blood which he precipitated to shed in legitimate defence. A single robber, or a few associates, are branded with their genuine name; but the exploits of a numerous band assume the charactcrs of lawful and honourable war. The temper of a people, thus armed against mankind, was doubly inflamed by the domestic licence of rape, murder, and revenge. Each Arab might, with impunity and renown, point his javelin against the life of his countryman; as in each community, the juridiction of the magistrate was weak and impotent. Holiness was embittered with the rancour of civil faction, and the recital, in prose or verse, of an obloque feud, was sufficient to rekindle the same passion among the descendants of the hostile tribes. In every life, every man, at least every family, was the judge and avenger of its own cause. The nice sensibility of honour, which weighs the infant rather than the injury, sheds its deadly venom in the quarrels of the Arabs; the honour of their women, and of their beards, is most easily wounded; an indecent action, or a contemptuous word, can be expiated only by the blood of the offender; and fuch is their patient inveracity, that they expect whole months and years the opportunity for revenge.

Vol. II.
ARABIA.

A fine or compensation for murder is familiar to the barbarians of every age; but in Arabia, the kinship of the dead are at liberty to accept the atonement, or to exercise with their own hands the law of retaliation. The refined idea of the Arab refuses even the head of the murderer, substitutes an innocent to the guilty person, and transfers the penalty to the bail and most considerable of the race by whom they have been injured. If he falls by their hands, they are exonerated, in their turn, to the danger of reprisals; the individuals of either family lead a life of noise and disruption; and fifty years may sometimes elapse, before the account of vengeance is finally settled. The modern theory and practice, in the revenge of murder, are described by Niebuhr; and the haftier features of antiquity may be traced in the Koran, c. 2. p. 29, c. 17. p. 270, with Sale's observations. The attachment of the Arabs to their customs and opinions, their included life lowering them from mankind, and their contempt of death, which they contemplate with a cold inaptness, were so many causes adapted to render them barbarous. He who depletes life is inaccessible to pity; and no enemy is more formidable than he who is ready to die. Nevertheless, this fanguinary spirit, ignorant of pity or forgiveness, has been moderated by the maxim of honour, which requires, in every private encounter, some decent equality of age and strength, of numbers and weapons. An annual festival of two, perhaps of four months, was observed by the Arabs before the time of Mahomet, during which their swords were religiously sheathed, both in foreign and domestic hostility. But the spirit of rapine and revenge was further attenepred by the milder influence of trade and literature. The solitary peninsula is encompassed by the most civilized nations of the ancient world; the merchant is the friend of mankind; and the annual caravans imported the first fbeets of knowledge and politeness into the cities, and even the camps of the defect. The Arabs have always blenched a very considerable degree of benevolence, hospitality, and politeness, with their ferocity. The same hospitality, which was practised by Abraham, and celebrated by Homer, is still renewed in the camps of the Arabs; and examples of this kind, among them, exceed any thing that can be produced from other nations. The contrary view was held among them in such contempt, that one of their poets upbraids the inhabitants of a certain district in terms of bitter reproach, alleging, that none of their men had the heart to give, nor their women to deny. After the time of Mahomet, they were no less liberal than their ancestors had been. Sale (Pref. Koran, p. 214) mentions the following singular instance. Three men were disputing in the court of the Caaba, who was the most liberal of all the Arabs. One gave the preference to Abdallah, another to Kais, and a third to Arabah. It was proposed, however, for the deputation of the dispute, that each should go to his friend, and ask his assistance. Abdallah's friend fancied him with his foot in the stirrup, mounting his camel, and just setting out on a journey, and thus accosted him; "Son of the uncle of the apostle of God, I am a traveller, and in distress." Upon which Abdallah hastily dismounted, and provided the pilgrim with his camel, its ram, a camel, some veils of silk, and a purse of 4000 pieces of gold. The servant of Kais informed the second suppliant that his master was asleep, but that he had rather relieve his necessity, than awake his master; accordingly, he gave him a purse of 7000 pieces of gold, assuring him that it was all the money they had in the house; and directed him to go to those who had the charge of the camels, with an order for a camel and a slave. When Kais awoke, and was informed of what his servant had done, he gave him his freedom, and asked him why he did not call him; for, says he, "I would have given him more." The third person went to Arabah, who, being dun-dighted, was leaning on two staves, and just coming out of his house in order to attend the hour of prayer. As soon as his case was made known, Arabah clapped his hands, lamented his misfortune, as he had no money, but directed him to take his two slaves. When these were refused, Arabah protested, that if they were not taken, they should be enmischelled; and, leaving the flaver, groped along by the wall. Arabah was pronounced the most generous of the three. The character of Hitam is the most perfect model of Arabian virtue. He is represented, by D'Herbelot (Bibl. Orient, p. 426), as brave and liberal, an eloquent poet, and a successful robber; forty camels were posted at his hospitable feasts; and at the prayer of a supplicant enemy, he reduced both the captures and the spoil. In the desert, and on the roads, the Arabs will carry off the spoils of the traveller, and in a moment afterwards embrace, without inquiry or hesitation, the stranger who dares confide in their honour, and enter their tent. His treatment is kind and respectful; he shares the wealth or the poverty of his host; and, after necessary repose, he is dismissed on his way with thanks, with blessings, and perhaps with gifts. In every inhabited district, fires are lighted up at night, which are called the fires of hospitality, to invite the travellers that mifs their way, or are in want of rest from the fatigues of their journey; and after well regaining them, they are fet forward on their route with the sound of instruments and with presents. Their humanity is also manifest in the modes and degrees of punishment which they inflict on persons convicted of crimes. The Arabs extend their generosity and kindness even to the animals that grow old in their service; granting them the privilege of grazing in the richest pastures, except from every species of labour; and they feed them provender even to the summits of their mountains. In polite and manly, the Arabs vie with the Persians. The common mode of salutation is the "Salâm alaihum," or, peace be with you; in pronouncing which words, they raise the right hand to the heart; but this form is seldom addressed to Christians. On meeting, in their wide deserts, the relations are multiplied; and the hand of a superior is kissed in token of respect, a ceremony which sometimes passes among equals; and hence probably was derived, by means of their Moabish victors, the Spanish expression of kissing the hands. Nor were these the only good qualities of the Arabs; they are commended by the ancients for the adoration and respect that subsist between parents and children, and other kindred; and for the fidelity with which they fulfil their engagements. He who violates the sanctity of an oath, is doomed to grow old in ignorance; and it is with their blood that they fign their alliances, in order to impress upon them a more sacred character. The rights of friendship are deemed inviolable; and when two friends contract reciprocal obligations, they cannot decline them without being treated as prodigals. The primitive form of government, among the Arabs, was of the patriarchal kind; and the same form, according to Niebuhr, has ever subsisted, without alteration, a circumstance which proves the antiquity of this people. Among the Bedouins, or pastoral Arabs, the defendants of the ancient Scipio, it is preserved in all its purity. Of these, some who live in tents, have many sheiks, each of whom governs his own family with a power almost absolute. All the sheiks, however, who belong to the same tribe, acknowledge a common sheik, whose autocracy is limited by
by custom. The dignity of grand sheik is hereditary in a certain family; but the inferior sheiks, upon the death of a grand sheik, choose a successor out of his family, without regard to age, or lineage; succession, or any other consideration, except superiority of abilities. This right of election obliges the grand sheik to treat those of the inferior order rather as associates than subjects, flattering with them his sovereign authority. The spirit of liberty, which animates this warlike nation, renders them incapable of servitude. But this spirit is less prevalent among those who live in towns, or who are employed in husbandry. In the fertile districts of this country, there have been always monarchies, formed either by conquest, or religious prejudices. Such are the present dominions of the sherrifs of Mecca, of the imams of Sina and Makkat, and of some princes in the province of Hadramut. However, as these countries are intermixed by large ranges of mountains, the mountains are occupied by independent sheiks. But, although so many independent sheiks have their domains intermingled through the territories of these several sovereigns, yet nothing of the feudal government appears here. The sheiks possess no fiefs; they have only a sort of property in the persons of the people of their several tribes. Even those who seem to be tributary subjects to the princes within whose dominions they dwell, are not actually so, but they retain their independence, and the tribute they pay is merely that which makes the food of which they are the sort of farmers. Such are the sheiks settled in Syria, Egypt, and over the whole of mount Atlas. This multiplicity of petty sovereigns, occasions several inconveniences to the people in general. Wars cannot but frequently arise among states, whose territories are so intermingled together, and whose sovereigns have such a variety of jarring interests to manage. But, happily, these quarrels are fearfully ever productive of any fatal consequences. An army of a thousand Arabs will betake themselves to flight, and think themselves routed, if they lose seven or eight of their number; and their contrels are terminated as easily as they are excited. It is somewhat surprising, that the Arabs, in a country so rich and fertile, should be so uncomfortably lodged, indifferently fed, ill clothed, and destitute of almost all the conveniences of life. But the cauves are sufficient to account for the effects. As to the wandering Arabs, their poverty is voluntary. They prefer liberty to wealth, pastoral simplicity to a life of contrast and toil, which might be procured for them in a greater variety of vocations. Those who live in cities, or who are employed in the cultivation of the land, are kept in poverty by the exorbitancy of the taxes to which they are subject. The whole subsistence of the people is confined in the support of their numerous princes and priests. The general cause of the impoverishment of Arabia is, without doubt, its having ceased to be the channel of trade with India, since the discovery of the passage by the Cape of Good Hope. Yet, if the lands were better cultivated, this country might, without the aid of foreign trade, afford sufficient resources to supply all its inhabitants with abundance of the necessaries and common conveniences of life.

The houffes of the Arabs are built of stone, and have terraced roofs; but those occupied by the lower people are small huts, formed, for such as inhabit the banks of the Euphrates, of branches of the date-tree, having a round roof, covered with rush mats. The poor spread their floors with straw mats, and the rich with fine carpets. No person ever enters a room, without having first put off his shoes. The men occupy the fore part of the house, and the women the back part. If there are no separate apartments for the different sexes, the Arabs, when they introduce a stranger, enter before him, and cry out, "Tarik," retire; upon which the women instantly disappear. The great have often in their halls balconies with jets d'eau to cool the air. The Arabs practice several modes of sitting; but that to which they recur, for the greatest ease, is folding their legs under their body; but in the presence of superiors, an Arab sits with his two knees touching each other, and with the weight of the body resting upon the heels. The chief amusements of the Arabs are fought at coffee houses, in markets, and publick meetings, which they are fond of frequenting; and in order to give the dolls of domestic life, they recur much to the use of tobacco; and persons of opulence and fashion carry with them a box of odoriferous wood, a piece of which they put into the pipe of a person to whom they wish to show respect; this communicates a fragrant smell and an agreeable taste. Instead of opinion, which the Arabs do not use, they constantly chew "kaad," or the buds of a certain tree, which are brought in small boxes from the hills of Yemen. The lower people addicted to intoxication, smoke, for this purpose, the dried leaves of a sort of hemp, which raises their spirits, and throws them into a state in which delightful visions dance before their imagination. At their meals, they squat themselves upon the ground when they sit; and as they have neither knives nor forks, they use their fingers with great dexterity, and eat all dishes with the hand. The food of the most eminent sheiks is of pilau, or boiled rice. The Arabs repeat always a short prayer before they sit down to a meal; "In the name of the most merciful God!" and every one when he has done retires, pronouncing, "God be praised." As they drink little when they eat, after fasting they drink cold water and a cup of coffee, which they use without either milk or sugar. In Yemen, however, of which the coffee-plant is a native, the use of coffee is rare. The favourite drink of this province is prepared from the husks of coffee-beans slightly washed and pounded; it tastes like tea, and is deemed refreshing. Intoxicating liquors of various kinds are privately used in different parts of Arabia; and they are obtained from the Christians and Jews. The Arabs, in general, are sober, frugal, and abstemious. Their usual articles of food are rice, pulse, milk, butter, and whipped cream. They seldom eat animal food. Of this, mutton is the most common; and the Arabs in the desert use it freely. The common people in Arabia have little other food besides bad bread, made of "dura," by kneading it with camel's milk, oil, butter, or grease. Their grain is bruised with flones, as they have no mills; and in the defect they take their cakes on a plate or gridiron, or on live coals, or on camel's dung, under which they cover it till it is penetrated by the heat. In the towns, they have ovens like ours, and their bread is of barley meal, in form resembling our pancakes.

There is a great variety in the national dress of the Arabs. Their head-dresses consist of fifteen caps laid over one another; some of which are of linen, and the rest of thick cloth or cotton. The uppermost is one richly embroidered with gold, and some sentence of the Koran; and over all they wrap a large piece of muslin, ornamented at the ends, and flowing loose upon the shoulders, with silk or golden fringes. The Arabs of the common class wear only two caps, with the face carelessly bound on the head. Some have drawers and a shirt; but the greater number have only a piece of linen about their loins, a large girdle, and a piece of cloth upon their shoulders; in other respects they are naked, having neither shoes nor stockings. In the highlands, where the weather is colder, the people wear...
sheep skins; and in the night, as a security against insects, they sleep in facks. Perfumes of middle rank wear sandals instead of shoes. The ordinary dress of the Arabs is very simple; but they have also a sort of great coat without sleeves, called "abba," which is still more simple. In several parts of Arabia, the men wear no drawers; but these, with a large shirt, are the whole dress used by the women. In several provinces, they wear different sorts of veils. All wear rings on their fingers, arms, nose, and ears. They display their nails red, and their hands and feet of a brownish yellow, with the juice of the alhena; and they paint the circle of the eyes, and even the eyelashes, black, with a preparation of lead ore. The women of Yemen also make black punctures in the face, to improve their beauty. Every body, without exception, wears the beard of its natural length; but the Arabs keep their mustachios very short. The fets are forbidden the use of the turban, using instead of it a small bonnet; nor are they permitted to dress in any colour but blue. The dress of the Bavians settled in Arabia, consists of a red turban of a particular form, a piece of white linen upon the shoulders, another about their loins, and flippers.

The Arabs are attached to certain customs, which they inherit from their progenitors, and which they observe in common with other oriental nations with which they have no immediate connexion; and this circumstance seems to prove that they have been led to them by the nature of their climate. As cleanliness is indispensably necessary to health, the founders of several sects have enjoined particular purifications and frequent ablutions as a religious duty; and the Arabs are scrupulous in the observance of the precepts that enforce them. They not only wash, bathe, and pare their nails very often, but cut away all hairs from the body. The painful rite of circumcision, which they adopted from Ishmael, has been retained under the persuasion that it checked the ravages of particular diseases; and hence the practice of circumcising girls is general in the same countries where boys are circumcised. The distinction of meats into allowed and prohibited was a lesson deduced from experience, teaching that such animals as have an influence on the physical constitution, had in like manner a secret influence on the moral; and therefore a direct police was authorized to interdict the flesh of the hog, and other unclean animals, that might at once be prejudicial to the health and to morals. With similar views, Mahomet, and some other founders of sects, have affixed ideas of spiritual impurity to the act of touching a dead body.

Polygamy, which was authorized by the example of the patriarchs, has been perpetuated in Arabia; but the Arabs seldom avail themselves of the privilege of marrying four lawful wives, and entertaining at the same time any number of unlawful ones. None but rich voluntaries marry so many, and their conduct is blamed by all sober men. An Arabian, in moderate circumstances, seldom marries more than one wife; and as the husband is by law obliged to treat his wives suitably to their condition, and to dispense his favours among them with perfect equality, the privilege of polygamy is thought rather troublesome than convenient. Besides, divorce may be obtained without much difficulty: though the Arabsians never exercise the right of repudiating a wife, unless urged by the strongest reasons, because this is considered as dishonourable, and entails disgrace on the woman and her relations. Wives are entitled to demand a divorce, when they think themselves ill used by their husbands. The Arabian women enjoy a great portion of liberty, and often, of power, in their families. Their dowries, and the annual income which they afford, remain at their disposal during marriage; and, in the case of divorce, the whole of their own property is referred to them. Some travellers have absurdly said, that the Mahometan wives are all slaves, and so entirely the property of their husbands, that they are even inherited by their heirs. This representation confounds slaves that have been purchased with women of free estate, who despise of themselves in the East as they do in Europe; and the erroneous opinions seem to have arisen from the equally mistaken notion, that fathers in Arabia sell their daughters to the highest bidder. The case is so much other-wise, that every man, in tolerably easy circumstances, instead of selling his daughter, strives to give her a dowry, which may continue her own property. The marriage is made out by the Cadi, and signed in his presence; and it incurs to the wife not only her dowry, but also a separate maintenance in case of a divorce. Many ridiculous stories have been related of the tests of virginity which an Arab expects when he marries a young woman; but most of these stories greatly exaggerate the truth. The Bedouins and the highlanders of Yemen, a rude and shabby savage race, do indeed regard the want of these tokens as a mark of dishonour, and send a woman back to her relations, when her chastity cannot be thus evinced; but the more civilized inhabitants of the towns seldom or never concern themselves about such trifles. Many superstitious observances respecting marriage still prevail in Arabia. The Arabs believe in the virtue of enchantments, and in the art of tying and untying the knots of fate. The miserable victim of this art addresses some physician, or some old woman; for the old women are always skilled in forcery. The Christians of the East have still a more certain remedy against the effects of witchcraft. They lay mallets for the afflicted person, and the honour of his cure is always ascribed to the influence of these mallets. In Arabia there are no eunuchs; and the Arabians abhor the cruel operation which is requisite to render a man a fit guardian of the chastity of a harem.

The characters of nations are very much formed and modified by climate, government, and education. To the first of these the Arabs owe their vivacity and their disposition to indulgence: the second increases their thrift, and gives them a spirit of duplicity; and the third is the one principal cause of that formal gravity which influences the faculties of their minds, as well as their carriage and exterior aspect. The mode of education among the Arabs is very different from that of the Europeans. The former strive to attain the age of maturity, as much as the latter endeavour to retard it. The Arabs, says Niebuhr, are never children; but many Europeans continue children all their lives. As soon as boys in Arabia leave the Haram, about the age of five or six years, they are accustomed to think and speak with gravity, and to pass whole days in the company of either fathers or preceptors. As music and dancing are esteemed indecent among the Arabs, women are also excluded from all amusements, and the use of strong drinks is forbidden. The young Arabs thus become penive and serious even in infancy. Nevertheless they have in reality a great degree of vivacity, which varies in the different provinces. This vivacity makes them fond of company and of large amusements, notwithstanding their seeming sternness. Several travellers accuse the Arabs of being cheats, thieves, and hypocrites. An arbitrary government, which impoverishes its subjects by extortion, can, indeed, have no favourable influence upon the probity of the nation, yet Niebuhr avers, from his own experience, that such accusations have been exaggerated beyond the facts. The irritable and vindictive spirit of the Arabs has been already noticed.

The Arals, proud of their remote origin, have always made
made their genealogies a subject of serious study; and as their ancestors could neither read nor write, they were unable to transmit to them the records of their descent; and for the same reason, it is impossible to convict them of error. For about thirty-six centuries, however, the sultans have been deposited in the public archives. This custom, which is religiously observed, is said to have been introduced by Arab, one of the ancestors of Miah of Sebait, a people to be remembered, that has not contravened any foreign alliance, and which, in its Solitary leisure, is always occupied about the interests of its vanity, may rarely have preserved the remembrance of its ancestors, and the feries of its generations. All those petty princes, who govern in Arabia, are very proud of their birth, and this pride may be ascribed to the independence and sovereignty power which their families have enjoyed from time immemorial. The nobility, who are free, or dependent only on the chiefs of their tribes, are infected with the same vanity. What adds to the high concoct which the Bedouins have of their nobility is its being communicable, and not to be transferred by any foreign prince, nor even by the caliphs. The descendants of Mahomet are those who hold the first rank among the great families in Arabia. These descendants have received different titles; in Arabia, they are called Sheikhs or Sejids; in the Mahometan countries situate northward, Sheikhs or Emirs; and in the Arabian colonies in the east, simply Sejids. Of all the titles in use among the Arabian nobility, the most ancient is that of Sevian or Sejiz. Other families that are anxious to preserve their genealogies, are those that are descended from the tribe of Koreish, and who have held, by hereditary right, certain employments since the days of Mahomet and his succours. The Arabs seem still to be vain of those long names which are so disgusting in their history; but their length of names and titles is occasioned by the difficulty of distinguishing individuals among a nation that knows not the use of family names.

Although in Arabia there are neither numerous academies nor men of profound learning, yet the Arabian youth are not entirely neglected. In the cities, many of the lowest rank are taught both to read and write; and the same qualifications are also common among the sheikhs of the desert, and in Egypt. Persons of distinction retain preceptors in their families to instruct their children and young slaves. In almost every mosque is a school, having a foundation for the support of teachers, and the entertainment and instruction of poor scholars. In great towns, there are likewise other schools, to which people of middle rank send their children to receive religious instruction, and to learn reading, writing, and arithmetic. There are no girls taught in these schools, but they are privately taught by women. Besides these schools, there are more considerable seminaries of learning in some of the great towns of Arabia. There are colleges in which the sciences of astronomy, astrology, philosophy, and medicine are taught; but the Arabs, for want of books and good masters, make little progress, and their attainments are very partial and imperfect. In the dominions of the Imam, there have been for a long time two famous academies; one at Zebis for Somnites, and the other at Damir for the Zedites. The chief employment of men of letters among the Arabsians is the interpretation of the Koran, and the study of the ancient history of the Mahometans. Some seeds of the sciences seem to have sprung up in Arabia before they were known to other nations. They were the first who studied the laws of the heavenly bodies. A roaming people, in a region lying beneath a fereau and cloudsless sky, folly employed in tending their flocks, either in the open plains, or on the tops of mountains, must, at an early period, have acquired some knowledge of the planets and the stars; and it appears a predilection of their having been among the first astronomers, that the names which denote the different constellations, are taken from the different species of animals known in those parts, and many of the stars are called by their names. Their knowledge, however, was neither very accurate nor very extensive. It was derived from long observation and experience, and not from any regular study or astronomical principles and rules. The Arabsians, as well as the Indians, chiefly refrained themselves to the observation of the fixed stars, and in this they differed from other nations, whose observations were almost confined to the planets; and they foretold their effects from their influences, not from their nature; and hence, it hath been said, arose the difference between the idolatry of the Greeks and Chaldeans, who chiefly worshipped the planets; and that of the Indians, who worshipped the fixed stars. The fixed stars in which they most usually observed the weather, were those they called "Anwa," or houses of the moon, which were twenty-eight in number, and divided the zodiac into so many parts, through each of which the moon passes every night; and from their rising and setting, the Arabs, by long experience, observed the changes that happened in the air; and at length they were led to assign a divine power to them, saying that their rain was from such and such a star, which expression Mahomet condemned and prohibited. The old Arabsians, therefore, seem to have made no farther progress in astronomy, which science they afterwards cultivated with so much success and applause, than to observe the influence of the stars on the weather, and to give them names; so that they became astrologers and magicians, rather than astronomers. The infancy of science is generally infected with an inclination to the marvellous; accordingly, in Arabia, pretended sages arose who boasted of understanding the language of birds; and others, profaning the name and office of prophet, retired into caverns and deserts, where, after long fasting and painful meditations to gain the favour of the deity, they were gratified with visions, which they solemnly related to the multitude, who could not discern the impostor concealed under the figure of a pale and haggard being, often covered with wounds and ulcers which they fondly and foolishly imagined to be the marks of sanctity. It was likewise in that part of Arabia, which borders on Egypt, that the swarms of adventurers startled up, who, wandering on the globe, without a native home, under the appellation of gypsies and fortune tellers, procure a wretched livelihood by their tricks from the stupid vulgar. It was with arrows, divinity rods, philters, amulets, and charms, that these vagabond impostors, by pronouncing certain mysterious words, practised their magical operations, and imposed on the credulity of mankind in an age of ignorance: such was the Arabian expression for the period that preceded the time of Mahomet. The Arabians, even in a later period, delibrate of books and instruments, have made little progress in astronomy. Although it is known to all men of sense in Arabia, that eclipses are owing to the intercession of one heavenly body by the interposition of another, yet the multitude still maintain the absurd opinion, that a huge fish pursues the planet which is eclipsed; and women and children ascend the roofs of their houses, and make a hideous noise with brazen kettles and basons, in order to chase away the fish. The Arabians, indeed, at this time, seem to study astronomy solely with a view to their successes in the cultivation of astrology, which is a science highly esteemed, and very lucrative, in the east. The occult sciences, as they are called, are in high estimation.
ation among the Arabsians. One of these is denominated "Im Allah," or the science of the name of God, which is the most sublime of all: for God, they say, is the lock, and Mahomet the key; and consequent there is but Mussulmans even acquire it. It enables its possessor to discover what is passing in the most distant countries, to make himself familiar with men, and to oblige them to obey his pleasure; to dispose of the winds and seasons as he chooses; and to cure the bites of serpents, and many other diseases and infirmities. To this science, the absurdity of which is evident from the mere mention of it, belongs also the art of discovering hidden treasure; and in this the Magrebs, or Arabsians of Barbary, are known to excel. The art of procuring sublimed vitrulions is also known to the Arabsians. The second of the occult sciences, called "Simia," teaches juggling tricks, and this is practised even by some orders of the dwarfs to prove the truth of their religion and the faculty of the founder of their order. The science of "Karra" teaches a person to compose billets which excite him that wears them from the power of enchantment, and from all sorts of accidents. These billets are inclosed in small purses of skin, and worn on the head, arm, or breast; and bound for particular purposes upon the necks of horses or asses. The science of "Ramle" is the art of fortune-telling; and that of forcery is called "Sihrr, which is applied to many infamous purposes. Alchemy is still in vogue among the Arabsians.

The grave and serious sciences that depend on calculations and reasoning could not make any great progress among a people governed by an imagination always hearted, and almost incapable of direction and restraint. These sciences, banished from the climate bordering on the tropic, have been replaced by the agreeable arts that delight in the irregularities and disorders which affront the mind, and captivate the heart. In Arabia we find the cradle of poetry and eloquence, which had scarcely appeared before they arrived at a sudden maturity. The Arabs are all poets and orators: for an account of the poetry of the Arabs, see Arabian Poetry. Among the ancient Arabs, eloquence was an accomplishment for which they valued themselves. Their orations were of two sorts, metrical and profaic: the one being compared to clouds floating, the other to loofe ones. They attempted to excel in both; and whoever was able, in an assembly, to persuade the people to a great enterprise, or to diffuse them from a dangerous one, or gave them any other judicious advice, was honoured with the title of "Khatib," or orator, which is now given to the Mahometan preachers. They pursued a method very different from that of the Greek and Roman orators; their fentences being like loose gems, without connection; so that this sort of composition struck the audience chiefly by the fulness of the periods, the elegance of the expression, and the acuteness of the proverbial sayings; and so confident were they of their pre-eminence in this way, that they would not allow any nation to understand the art of speaking in public, except themselves and the Persians; and the Persians were reckoned, in that respect, says Pococke (Spec. 161), much inferior to the Arabsians. In Arabia, eloquence is not now much cultivated. Occasions for the exercise of it very rarely occur. The Arabsians, however, tell us that they have great orators in their mosques. The only theatres for the exercise of profane eloquence are the coffee-houses, which are commonly large halls, having their floors spread with straw mats, and illuminated at night by a multitude of lamps. The guests are served with pipes and a cup of coffee. They are also amused by readers and orators, who are commonly "Mullabs," or poor scholars, and who either read or repeat passages from some favourite authors, or recite tales and fables of their own invention. When the orator has ended, he obtains a voluntary contribution from his hearers.

It was Arabia that gave birth to the Apologue, a method of instruction, which, in all ages, has been in use among the oriental nations, who love to conceal under a mysterious veil the most trivial subjects, in order to give them an air of dignity. The Arabs especially have displayed their subtlety in the solution of enigmas. They boast of having produced a Lokman, surnamed "Al Ham," i.e. the wise or the sage, whose fables bear too great a resemblance to those of Aesop, to admit a doubt concerning the identity of their performer. Some, however, have thought it more likely that the compiler of these fables had been those of Aesop, and chose to invent some of them in his own collection. This celebrated fabulist has served as a model to all those who have come after him; and the Arabsians have thus, guided by their own genius alone, drawn from its native funds those riches which others have reciprocally borrowed of their neighbours. For the Arabic characters, chronology, language, music, philosophy, physics, poetry, and religion; see the following articles.

The mechanical arts could not well be brought to any considerable degree of perfection among a people who knew but few wants. As their productions are less splendid than useful, it is rather in towns than in the bosom of defects that they grew up, because necessity is the parent of industry. The Arabs, entirely occupied in warring against man and beast, excelled only in the manufacture of scymetars, bows and arrows, and darts; nor, as it has been already observed, have they made any great progress in modern times. Their cotton stuffs were never greatly esteemed; and few of their other manufactures are the produce of the skill and labour of native Arabsians. Sale's Koran Pref. Anc. Univ. Hist. vol. vii. p. 242—327. Arabic References, vol. ii. p. 11, &c. Niebuhr's Travels through Arabia, &c. paffim. Pinkerton's Mod. Geog. vol. ii. p. 406—430.

ARABIC, or ARABIAN, something that relates to Arabia, or the Arabs.

ARABIC Characters or Figures, are the numerical characters commonly made use of in mathematical computations; and they are also contradistinguished from the Roman. Concerning the origin of these figures, see Figures.

ARABIC Chronology. The Arabs divided their year formerly, as is now the case, into twelve months, to which they gave names; but an ancestor of Mahomet gave them new names deduced from certain events happening in every month; and the old ones were, by the authority of Mahomet, totally abolished in every part of Arabia. The year was also anciently divided into six feasons, viz. 1. The feason of herbs and flowers; 2. Summer; 3. The hot feason; 4. The feason of fruits; 5. Autumn; 6. Winter. The ancient Arab year was lunisolar; but the custom of intercalary months, in order to make the course of the moon agree with that of the sun, was abolished by Mahomet; and the learned now reckon by months corresponding to the course of the solar year, and confiding of the same number of days with ours. See Year. The Arabs, like the Egyptians, Indians, Greeks, and Romans, anciently computed their time by weeks, or periods of seven days, as we learn from a very ancient poet, who died many ages before the publication of the Koran. The Arab day consists of twenty-four hours, and falls from sun-fetting to sun-rising; so that their hours are of uncertain duration, and vary with the length of the natural day, or the time during which the sun is above the horizon. The different parts of the day, as they have no peculiar idea of the duration of their hours, are distinguished by vague and uncertain denominations.
Afterwards the vehicle diffolves folid white. The heat of simple yellow, important, and becomes does it water voluminous pale almond, from but powder, has thick larger in walnut, the from j.

The settlement at Senegal is another great mart for this commodity; and the gum, which bears the name of this place, is generally in larger masses, and of a yellowish or amber colour, but it does not feemibly differ from the Egyptian gum in any of its properties.

This mucilage exudes spontaneously in a liquid flate from the trunk and boughs of the tree, andhardens by contact with the air and the heat of the sun. It begins to flow about December, immediately after the rainy feaion, near the flow-er time of the tree. Afterwards as the weather becomes hotter, incisions are made through the bark, to affift the transudation of the juice.

The best gum arabic is brought over in oblong or roundi6 humps seldom bigger than a walnut, nearly transparent, white, or of a pale yellow, wrinkled, and of a flaming fracture. It is so brittle as easily to be reduced to a fine powder. It is also perfectly infipid and inodorous, diffolving in the mouth into a channy liquid.

As the gum arabic is the most perfect specimen of a gum mucilage, all the properties which we shall now mention to belong to it, may be considered as descriptive of this whole class of chemical subllances.

The habitudes of this gum with water affords one of its most striking characters. When added to water, either cold or hot, and not less than twice its weight, it diffuses slowly, and converts the whole into a very flimsy viscid li-Quor. Heat does not coagulate this solutian; a gentle evaporation will expel the water and leave the gum as solid and as before, equally soluble in water, and unaltered in any of its properties.

Thus in respect to its diSsolution, it differs in a striking manner from most other vegetable subllances.

It is entirely insoluble in ardent spirit and in oils; alcohol indeed coagulates the watery solution, by uniting with the water, and thus precipitating the gum.

Gum mucilage is but little inflammable, when put into the fire it swells and grows puffy, and soon is reduced into a voluminous coal. Distilled per fe in a retort, it first yields a limpid water, then an acid (which was at one time sup-posed to be peculiar, and was termed the Pyro-mucous), and afterwards a thick empyreumatic oil, and a little volatile alkali, like all the diSSolutions of vegetable matter.

The pure gum mucilages, when dry and solid, will remain unchanged for any length of time: the watery solution is likewise the least alterable of all the vegetable liquids; but by long keeping it becomes four and grows mokly on its surfaces, if it is prevented from drying up by the evaporation of its water.

When nitric acid is distilled off gum arabic, or any other of the gum mucilages, a peculiar acid is formed, which appears as a white powder of difficult solution, and has been termed the Mucous acid. It is the same with the Sacchro- lactic acid of Scheele.

The specific gravity of the solid mucilages, according to Fourcroy, is from 1.3 to 1.48.

The gum which exudes in considerable abundance in our own climates from the apricot, plum and cherry trees, bears the strongest resemblance to the gum arabic in all its properties; only it is generally of a yellow colour, not so brittle, and forms a mucilage of somewhat inferiority.

Gum arabic is employed for a number of valuable purpo- ses both in the arts and in medicine. It may be used either to suspend in water a number of subllances which could not otherwise be kept equally diffused in this liquid, or as a means of gluing together a variety of articles of light work; and as a clean colourlefs cement perfectly easy of application, and which may be prepared in a few minutes, it is peculiarly valuable. Gum Senegal is used in very large quantities by the calico printers, to mix the colours and the mordants in block printing; gum arabic forms the basis of crayons, and the cakes of water colours, and of sev-era1 liquid colours, of which common writing ink is a familiar example.

All the gum mucilages are considerably nutritious; in the countries where the gum arabic and senegal grow native, it forms an important article of food, either by itself, or mixed with milk, rice, &c. Hasdrubal relates an instance of the travelling of a large caravan, who had consumed all their provisions in the middle of their journey, preferring themselves from famine by the gum arabic—which they were bringing as merchandise.

In medicine, this gum is employed, either by itself, or as a vehicle for other subllances. Taken internally, it has been suppos ed to be incraftful and obtunding; qualities, however, which probably have little foundation in fact and real observation. As it is simply mucilaginous, it will cer-tainly in some degree protect the parts with which it comes in contact from the effect of any acid and stimulating subllances; and thus it is of use in quieting the tickling cough which arises from any acrimony in the faxes, and in some faxes it is of material service in diarrhoea and dysentery. It is given either in powder, or diffused in water, almond milk, &c; and one ounce of the gum is sufficient to give a considerable thickness to a pint of liquid, without making it too flimy to drink with pleasure.

In pharmacy, gum arabic polishes the valuable property of rendering miscible with water the balsams, refined or spirit and similar subllances, which may be very conveniently modiously taken in a liquid form. One part of gum arabic previously moistened with water (or an equivalent quantity of the mucilage), will thus render four parts of balsam or oil soluble in any watery liquor, and will form an uniform emulsion. Even mercury may be thus sulfcnded in water, by being previously rubbed for a considerable time with gum arabic, which preparation is called, from the inventor, Plank's solution. The corrosive acids, when taken internally, are belt diffused with a solution of this gum.

The pharmaceutical preparations, in which gum arabic enters as a principal ingredient, are the Mucilago gummi Arabici, a simple solution of one part in the gum in two parts of boiling water; the Mulinof Abritica Ph. Edin, which is gum arabic diffused in almond milk; the Treubii Arabi, with gum arabic, and fch ond fugar; and the Pulvis tragantii compositus Ph. Lond., a powder made of tragantia, gum arabic, fhar, and fugar. Murray Ap- par. Med. Fourcroy, &c.

Arabic language is derived from the same fwork with the Hebrew, Syriac, and Chaldean tongues. Its near affinity to the Hebrew is almost universally acknowledged, and owe have eum maintained, that it was not only a literar dialect of this
ARABIC LANGUAGE.

this language, but in its original and unsoiled state, pure Hebrew. Of course it must unquestionably be one of the most ancient languages in the world. The Arabs, by whom it was spoken, having inhabited the country now possessed by their descendants almost from the deluge, without intermixing with other nations, or being subjugated by any foreign power, their language must have been formed soon after, if not at the consummation of Babel. The Arabian writers ascribe it to Joktan, the son of Eber, and its name to Yarab, the son of Joktan or Kahtan, supposed to be the fame that is mentioned, Gen. x. 26. This opinion is adopted by many learned moderns. See Hunt, Orat de Antiqu. et Eleg. Ling. Arab. p. 1. Pococke Spec. Hist. Arab. p. 29. Bachart in Georg. Sacr. c. ii. e. 15. Golinus, in Lex. Arab. Schultens, in Orig. Hebr. The two principal dialects of this language were, that spoken by the Hasmites and other genuine Arabs, and that of the Korish in which Mahomet wrote the Koran. The Hasmite dialect is supposed to have approached nearer to the purity of the Syrac, and consequently to have been more remote from the true genius of the Arabic than that of any other tribe. The dialect of the Korish, usually termed the pure and ancient Arabic, and in the Koran the perfidious and clear Arabic, is referred to Ishmael as its author, who, according to the oriental writers, first spoke it; and, as Dr. Pococke apprehends, after he had contrived a matrimonial alliance with the family of Jorham, formed it of their language and the original Hebrew. This latter dialect of the Korish was conceived to consist chiefly of the Hebrew; but its politeness and elegance should rather be ascribed to their having the custody of the Cæsa and dwelling in Mecca, the centre of Arabia; for by their situation, they had less intercourse with foreigners, who might have corrupted the language, and were more frequented by the Arabs of the whole circumjacent country, who returned to Mecca on a religious account, and for the accommodation of their differences; from their discourse and veris the Korish took the words and phrases which they judged to be most pure and elegant, and thus the beauties of the whole tongue were transplanted into this dialect. Other circumstances also contributed to the improvement of this dialect. Of the pilgrims who returned to Mecca, many were of the first rank, and possessed all the science of their country and age. In the great feasts which were held during their stay in this city, a variety of amusements occupied their attention, and literary compositions, which called forth an emulation to excel, formed some of their principal entertainments on these occasions. Hence the dialect of the Korish, the noblest and the most learned of all the western Arabs, became the purest, the richest, and the most polite of all the Arabian idioms; and about the beginning of the seventh century, it was the grand language of Arabia; the other dialects being either gradually disused, or incorporated with it. By this union, and by commercial intercourse with Alexandria, the seat of learning, and with other places where they might obtain an acquaintance with Grecian literature, the Arabic language acquired a facility and also an elegance, in a great degree peculiar to itself.

The Arabs are so extravagant in the commendations of their language, that they not only represtent it as peculiarly harmonious and expressive, but they also say, that it is so copious and comprehensive, that no uninspired person can be a perfect master of it in its whole extent. To this purpose it has been alleged, that this language has 550 names for a lion, 200 for a serpent, more than 80 for honey, and above ten for a sword. Nevertheless, the Arabs believe that the greatest part of their language has been lost; and this opinion is not very improbable, when we consider how lately the art of writing was introduced into Arabia. To this purpose Dr. Robertson (ubi infra) has observed, that the genius of the Arabic language resembles that of the Hebrew; as all its primary or radical words are composed of different combinations of consonants by trilites, so that the various combinations and equivalents of three letters form more than 10,000 roots, without including those which may arise from the concord of guttural letters. To this quality of the language he partly ascribes that flexibility or permanence which this language possesses in common with the Hebrew, by reason of which it has retained its purity and integrity for so many thousand years, without those changes and fluctuations to which other tongues have been subjected. Sir William Jones also observes (Afric. Refer. vol. ii. p. 6.), that the Arabic roots are universally triliteral, the composition of the twenty-eight Arabic letters would give 12,300 elements of the language; and this circumstance demonstrates its surprising extent; for although great numbers of its roots are confessedly lost, and some perhaps were never in use, yet we suppose 10,000 of them, without reckoning quadriliterals, to exist, and each of them to admit only five variations, one with another, in forming derivative nouns, even then a perfect Arabic dictionary ought to contain 50,000 words, each of which may receive a multitude of changes by the rules of grammar. To this circumstance it is probably owing, that the Arabic, and also all its other dialects, abhor the compositions of words, and invariably express any complex ideas by circumlocution; and this genius of its language has been one source of its copiousness and extent. And yet, notwithstanding the variety of its words, in which it is far superior to the Greek and Latin, and indeed to most other languages ancient and modern, it is equally distinguished by its perplexity and precision. This excellence of the ancient Arabic, this union of brevity and variety, by which it is able to express with clearness and energy what could not be described in other tongues without hideous circumlocutions, is particularly mentioned and illustrated, among other distinguishing qualities of this language, by the learned Pococke in his "Orations on the Arabic language."

Dr. Robertson has cited an apposite passage to this effect, which is here subjoined for the satisfaction of the curious and learned reader. "Necque in nullâ certe laudis parte, mira ilia (inguit dçthnàmivm Pocockiis), quâ non folum verborum in significando penipœleavit, sed in protolone elegantiæ et duxesìnius cavuit, fedulis; quâque non folum accuratâ inter literas et significatione proportione, fœnus vel intentionem vel remissione, prout res polluaverit, literarum appositione, substutione, vel juxta ornam omnium ratione, proficiscunt; sed et nequitianelius auribus, ne quid horribilum aut usu pepote repersiciit, effecerunt. Hoc in genere eft, quod nulpa in verbo ab eo, genuine apud Arabis originis, concurrent, non intercedente vocalis alicujus motione, consoalien, cum vel tres vel plures, alia in linguis frequenti collaudata. Immo necque, licuit adiunct, quæ apertitati remedió sunt, vocales, qualibet tamen temere committunt consoalien; sed si ríam natura polluat, ut concurret debeat illa, quæ licet invicem fine apertitati alicujus inducitione consecui, et inter se conciti non pollat, illi vel òstas vel literarum mutatuonem, eius abhijendo, subiecto, emolendo, alifice quibus polluit modi, remedia quaerunt; adeo ab omnibus, quod vel absumum ve duium eft, abhorrent. Quod si nobis facus videatur, et apertiter, nonante Arabibus prolata, illud auribus, nolisis vel ufo, non linguis imputandi; nec mollius illis nolisis, quam corum nolisis confecundum. Quin et gutturalium, quae nobis..."
nobis maxima sideratis causa videtur, abstentiam, ut magnum in linguis Graecae defectum, argumentu Arabum.

The learned Dr. Hunt, late professor of the Hebrew and Arabic languages at Oxford (in his Orat. de Ling. Arab. p. 17.), expresses his opinion of the excellencies of this language much to the same purpose: "Nil Quibus mihi ereditoe (inquit), auribus magis parcitum, quam in Arabiis; nulla lingua a xxxxxx omnii alienorum, quam Arabica. Quaenam enim nonnullae ejus literae minus fortasse iuicere, immo durum ctiam sonantur, ita tamen Arabes eas temperamentum, ut afferam cum lenibus, duras cum molibus, graves cum acute, miscendo, voces inde non minus audita auderint, quam pronunciati facies consercent, totique fenones mirum sonum tam dulcedinis quam variatatem.

Quod quidem orationes modulanda Rudens in Corano adeo manifestum cit, ut primi Islamii oppionantes cum librum magicae ideo arte scriptum dixerint. Nec auribus tamot gratios cft Arabifmus, sed et amni constitantur expressiones aptas, nonus suis fortissimae tempfer accommodans, et felici verborum juncture ipsum rerum naturam depingens. It is needful to multiply testimonies of a similar kind, extracted from the writings of Bochart, Erpenius, Golinus, Schultens, &c.

Some have maintained that the Arabic tongue defended from the deluge to the time of Mahomet in its original purity; but that it should remain altogether unaltered for a period of more than 3000 years, is not very probable. Whatever care might have been taken of it, however tenacious the Arabs were of their ancient customs and institutions, and however favourable their situation might have been for preferring the language unmixed, it is not likely, nor indeed can we conceive it to be possible, that it should have escaped a variety of changes in that long period; or that it should not have acquired in its progress downwards from the mere lapse of time, from necessity or voluntary interchange with different and neighbouring nations, and from a variety of other causes, diminutions or additions, or intermixtures, which render the words, idioms, and phrasology of the Koran very different from the Hebrew, Syriac, or Chaldaic, to either of which the ancient Arabic must have been nearly allied. But these changes affected merely or principally the dialects of the language, while the substance or marrow of it, as Schultens calls it, remained untouched; and comprehended the letters, vowels, and pronunciation.

Dr. Robertson, professor of oriental languages in the university of Edinburgh, in an elaborate dissertation, "De Origine, Antiquitate, Conversatione, Indole, et Utilitate Linguae Arabicae," prefixed to his "Chloris Pentactchii," is an able and zealous advocate for the unpolluted purity of the ancient Arabic; infomuch that it did not degenerate from its original purity in the same manner as the Spanish, Italian, and French dialects have degenerated from the Latin stock. This opinion is sanctioned by the authority of the learned Schultens, in his Orig. Heb. vol. ii. p. 26, 211. Orat. Ling. Arab. p. 28, and by several others, who have been well acquainted with the structure of the Arabic language, and with the history of the ancient Arabs. Without deviating into the unfounded extreme of Hitchenon, who ascribes a comparatively modern origin to this language, and traces it no higher than the age of Mahomet, we may allow that such changes as have been already mentioned might have been introduced into it, without disputing its antiquity, or upon the whole its uncorrupted state for many ages previous to the time of Mahomet. This celebrated impostor indeed makes his boast, that the language of the Koran was the same, with respect to its purity and perfection, with that which was anciently used by Abraham and Ishmael. Dr. Robertson (ubi supra) maintains, that the Arabic language

Vol. II.
were different from the Hymaritic; and though far from being either convenient or beautiful, they were long used by the Arabs. They were denominatet Cufic from Cufa, a city of Irak; and in this character the Koran was first written. These letters are also used occasionally, at this day, by the Arabs for the titles of books and public inscriptions. The more elegant and expeditious character that is now used, was first formed from the Cufic by Abulali Ebn Moklah, vizar to the caliph of Bagdad, about 520 years after Mahomet, and perfected by Ali Ebn Bawah, who died in the year of the Hegira 419, A. D. 1022. Herbelot, Sale, and Dr. Hunt inform us, that the person, who completed and reduced it to the form in which it now exists in some of the most beautiful copies of the Koran, was Yakut Al Mofalaem, the last of the caliphs of the family of Abbas, a little after the year of the Hegira 640, A. D. 1242; for which reason he obtained the appellation of "Al Khattat," or the scribe.

Concerning the chaos of the invention of the Arabic vowel points, there has been a difference of opinion among the learned. Hottinger (Tract. Philolog. p. 400. 410. Tiguri, 1659) maintains and addsuces testimonies from the Arabian writers to prove, that vowels were in use from the most ancient times. But they are not now the same as they were formerly. A single point, in the most ancient copies of the Koran, denoted different vowels, according to its position above, below, or within the letter. Schultens (Clav. Dinelch. p. 322. &c.), speaking of the improvement of the Arabian alphabet in the 10th century by Ebn Moklah, says, that its form, at this time, underwent a change; and that its former clumsy embarrascd character was made to give way to the polished, easy, and expeditious type. Regarding this expedition above, the author of the invention left very few vowel characters; and as the Hebrew mode of writing admits five long ones and five short ones, in different shapes, he taught how to express all the vowels, both long and short, agreeably to the genius of the language, by three, or rather by two, small points, without any danger of mistake; an abbreviation truly admirable, and worthy of being recorded! For by placing a small line above 

\[ \vspace{1cm} \], he expressed the sounds of a and e, and by placing the same below, \[ \vspace{1cm} \], he meant to express i only. To the other short ones 

\[ \vspace{1cm} \] and \[ \vspace{1cm} \], he assigned a small vowel, or so above, as \[ \vspace{1cm} \].

For representing the long ones, he used the "matres lectionis," or quiescent letters, \[ \vspace{1cm} \], \[ \vspace{1cm} \]. So that 

\[ \vspace{1cm} \] expressed a and e long, that is lamda and hlam; and 

\[ \vspace{1cm} \] placed after kafam became teer and chibk long, and 

\[ \vspace{1cm} \] added to dama became shurek. From this statement we may infer that, before the tenth century, the Arabs had no vowel points; and consequently that they read without vowels, or contented themselves with the "matres lectionis" above mentioned. Dr. Gregory Sharp, in his "Dissertation upon the Origin, Contraction, &c. of Languages," p. 87, expresses his opinion, that the Arabs were the original authors of the vowel points; and that they invested three called fatba (a) and (e), damma (o) and (u), and lafer (i). But these, he conceives, were not in use till several years after Mahomet; for the first copies of the Koran were without them. The rabbins, he adds, stole them from the Arabs. Capellus, Walton, Simon, and others are of opinion, that all the vowels were expressed by the three letters \[ \vspace{1cm} \], \[ \vspace{1cm} \], \[ \vspace{1cm} \], called "matres lectionis." But it has been alleged, that these three letters have, in the Koran and in other punctuated copies, various vowel points annexed to them: whence it is inferred, that they are con-
and we find mention by Abulpharagius, Pococke, D'Herbaut, and Hottinger, of learned men, and books without number.

The revival of learning in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silvester II. and afterwards among the Europeans in general, may be ascribed to the instructions and writings of the Arabian doctors and philosophers, and to the schools which they founded in several parts of Spain and Italy. And in the twelfth century, the inquisitive of different countries frequented the schools of the Saracens in Spain, and diffamated the knowledge which they obtained there, after their return. At this time, many of the learned products of the Arabians were translated into Latin, which facilitated the general progress of science.

Arabic or Arabian logic, was that of Aristotle, as explained by Avicenna and Averroes. As the Arabs applied themselves to this branch of science, they became proficient in the knowledge of words rather than things. Whence they have been sometimes denominated, "masters of the wisdom of words;" and sometimes the talking feet.

Arabic music, Arabicum marmor, a name given by the ancient Greeks to a species of marble brought from Egypt and Arabia, and remarkable for its beautiful whiteness.

Arabian music. In the Encyclopedic Methodique, we have a long article on this subject, chiefly taken from the Essay on Music, by M. la Borde. It, in a careful perusal of this article, we have been able to discover any essential qualities in this music that would improve our scale, intervals, melody, harmony, measures, or the tone of our voices or instruments, we should foolishly have studied and adopted them. But notwithstanding that the ancient Greeks praised and admired our music, by their own and the Persian poets, and the parade with which the Arabian scale and musical terms have been exhibited, we do not find ourselves much enlightened by the perusal. Indeed we are inclined to imagine that music in Europe has been cultivated with so much more success than that of any other quarter of the globe; our instruments, our harmony, and our melody, are arrived at such a superior state of perfection, that to abandon or neglect them for any refinements or properties which the music of Asia, Africa, or America could furnish, would indeed be letting our corn-fields lie fallow, and feeding on acorns; or throwing aside the poetry of Milton, Dryden, and Pope, to read and imitate only Chaucer, Gower, and Lidgate.

As national tunes, the airs of the Arabsians, Turks, and Perians, would amuse curious inquirers after exotics; but as to their theory, practice, and taste, faith in their excellence is wanting to make us imagine them worth the time and labour necessary to their acquisition. If, therefore, the article Arabic music has not been further extended, and should disappoint our readers by its brevity, the concessions made by M. Ginguè, who has compiled and digested the article in the new Encyclopedic, will a little abate their curiosity, and apologize for our want of time and zeal to investigate this music.

After giving us the scale and technica of the Arabian music in the language of the country, but expressed in letters of the French alphabet, M. G. says; "The Arabs, like other oriental people, never pass from one found to another, however distant, either in rising or falling, without running through all the intermediate intervals. These continual slides of the voice, which to us are insupportable, constitute, according to them, the charm of their music, and grace of their melody." Now the difficulty and effects of such sliding or mewing passages will be easily conceived by our readers, from what follows in the article of M. G. "From C to D they reckon four intervals; from D to E the same, and from E to F two." So that it is all done in quarter tones, or the enharmonic genus and scale. And where shall we find voices or instruments to furnish these intervals? "They have no knowledge of harmony (continues M. G.), and in their concerts, all the parts are performed in unisons and octaves, and all on slurred instruments; of which they sometimes sweep the whole number, to produce more or less effect, or at least more noise, which necessarily occasions a discordance, to which, from their ignorance of harmonic chords, their ears are insensible." Their instruments are chiefly those of percussion, or stringed, with the fingers or nails; they have, indeed, a flute, called Naïs, with vintages. It is the sound of this flute that the dervises dance. Two or three musicians are placed in a gallery that surrounds the mosque. The Naïs is flattened in the midst of the dervise; he gives the signal, the Naïs begins to found, and the dervises turn round with extreme rapidity. The Naïs gives another signal, the flutes then cease to found, and the dervises stop, and throw themselves into a particular attitude.

They have an instrument which resembles a lute, to which they affix more marvellous effects than the Greeks did to the lyre of Apollo. "They tell you, with the utmost gravity, that each of the strings of this instrument, four in number, has particular virtues: the first, for instance, acts as a specific against bile and phlegon; the second is a sovereign cure for the most invertebrate melancholy and vapours; the third gives health and vigour to young people of both sexes; and, lastly, the fourth string affords relief to the infant if he be heard, to a languid temper and distemper."

But the power of these strings depends much on the manner in which they are pinched or thumbed; which, like the power of the bow on the violin, is attained by long and laborious practice. "They have a particular pincicato, or pinch, for every action and passion; courage, liberality, and noble sentiments, by one mode of thumbling; love and pleasure by a second; the dance is inspired by a third; sleep and tranquillity by a fourth."

"At the distance which separates us from Arabia, and the difference in our ideas and sentiments (concludes M. G.), we can form no just conception of these fanciful effects, from which we might doubtlesse abate much of the marvellous. What they ascribe to each instrument, string, and stroke of the fingers, and delicate shades of perfection, only convinces us, that they are a people endowed with a sensibility very different from ours."

Arabic or Arabian oratory, according to Renaudot, confided in a luxuriant of quaint, high-flown words, epithets, and descriptions. That the ancient Arabs were eloquent in a high degree, and that they possessed wonderful powers of speaking, without preparation, in flowing and forcible periods, is evident from their whole history. Their eloquence was an harmonious and cadenced prose, adapted to their ears, and accommodated to the genius of their language, and to the cast of their character, but can never serve as a model for foreigners. Their orators, like their poets, were honoured and rewarded; and their orations were much the offspring of the imagination, without concatenation in the arguments, but confoling of different sentences following one another without connection, and remarkable for abrupt antitheses, and for sudden and unexpected transitions, rather dazzling than enlightening. See History of the Arabs.

Arabian or Arabian philosophy claims, according to some writers, and more particularly Ludwig, a very remote antiquity. On this subject the Greek writers are silent; but this, it is alleged, is a proof of their pride, and not of the barbarism of the Arabs. The Saracens themselves have confessed,
confessed, that before the rise of Mahometanism, their country was in a low state of civilization; and to this effect we have the testimony of Abulpharagius. Nevertheless, the advocates of the wisdom of the ancient Arabians have alleged, that from them, according to the relation of Porphyry, Pythagoras acquired a great part of his knowledge; that Moses fled out of Egypt into this country, and carried with him the wisdom of the Egyptians; that the queen of the calf, who visited Solomon, was of Saba, a region in Arabia; and that the wise men, who paid their homage to Jesus, were from this country. Besides, their origin leaves no doubt concerning the culture of their minds; for as they were descended from Abraham, it is pretended that they must have derived from their common father, not only a philosophic spirit, but a considerable portion of science. To all which is added the acknowledgment of Abulpharagius, that even before Mahomet, to which, in that country, is owing the revival of letters, they thoroughly understood their language, that they knew its value, and the several properties of it; and that they were good poets, excellent orators, and able astronomers. It is very possible, that the Arabians might have polished their language, that they might have held in examination, and the interpretation of dreams; that they were successful in the composition and solution of enigmas; that they had even some knowledge of the courses of the planets; and yet have no jut title to the character of philosophers: since all these arts, if they can modify the appellation, tend rather to nourish and foment superstitition, than to attenuate truth, and purge the soul from the tyranny of the passions. As to Pythagoras, nothing is more uncertain than his journey to the calf; and if it were more unquestionable, we can only infer from this circumstance, that he learned from the Arabians the art of divination, with which they, in common with other oriental nations, were well acquainted. If Moses went into Arabia, and settled there on marrying one of the daughters of Jethro, it could not be with the design of diffusing among the Arabians, or of gratifying their idle curiosity with philosophic systems. Providence permitted this retreat of Moses, for conveying thither the knowledge of the true God, and his religion. With respect to the remaining arguments, if they be allowed their utmost force, it will give the Arabians a very small share of the credit among the nations of the world, derived from the ancient philosophy of the eal: But it has been further said, that there was in Arabia, at a very remote period, a sect of philosophers called Zabians or Sabians. But the existence of this sect is doubtful. No mention is made of it by Greek or Roman writers. We owe all our information concerning them to the Arabians, from whom Maimonides, the Jew, borrowed his account. The probable truth concerning them is, that they were a mixed body of Gentiles and Jews, who, to give the fânction of antiquity to their institutions, pretended to derive them from Sabi, the son of Seth. Their system of opinions was an heterogeneous mass, which must have been the produce of a period much later than that to which we now refer. See Sabians. The Arabians, besides what has been already said of their science, in this article, and that of the History of the Arabians, it is, like the neighbouring Chaldeans and Persians, to have had their wise men, by whom their knowledge, such as they had, was taught, and their religious ceremonies and superstitions were practised. Pliny (H. N. Ixxx. c. 1.) mentions the Arabian magic, and speaks of Hippocrates, an Arabian, as belonging to their order. It can scarcely be supposed, that the Arabians were unacquainted with moral wisdom. The fables of Lokman, mentioned in a preceding article, translated from Arabic into Latin by Erpenius, afford no inelegant specimen of the moral doctrines of the Arabians; better adapted, however, to popular instruction than to the improvement of philosophy, which the Arabians do not appear to have cultivated, till the period when their government fell into the family of the Abbasides. Breyer's Hill. Phil. by Enfield, vol. i. p. 76. See the article Arabian learning. Sir William Jones (Aristatic Researches, vol. ii. p. 9.) says, that he finds no trace among them, till their emigration, of any philosophy but ethics: and even their system of morals, generous and enlarged as it seems to have been in the minds of a few illustrious chieftains, was, on the whole, miserably depraved for a century at least before Mahomet; the distinguishing virtue which they boasted of cultivating and practising, was a contempt of riches, and even of death.

Arabic, or Arabian, poetry, and physicians, succeeded the Grecian, and handed down the art to us, having made considerable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them most of our species and aromatics, as nutmegs, cloves, wace, and other matters of the produce of India. We may add, that most of the gentler purgatives were unknown to the Greeks, and first introduced by the Arabs; as manna, fenna, rhubarb, tamarinds, coffee, &c. They likewise brought sugar into use in physic, in which, before, only honey was used. They also found the art of preparing waters and oils, of divers simples, by distillation and sublimation.

The first notice of the small-pox, and the measles, is likewise owing to them. Lastly, the restoration of physic in Europe took its rise from their writings.

M. Le Clerc has given a sketch, and Dr. Friend an ample history of the Arabian physic. We have also a notitia of all the Arabian physicians by Fabricius.

Those who now practise the art of medicine in Arabia, know little more than the technical terms as they find them in the writings of Avicenna, and the ufe of simples. All the physicians in Yemen, Niebuhr says, acted at the same time as chemists, apothecaries, surgeons, and horse-doctors; and yet, by the practice of all these arts together, they could hardly earn a livelihood. A disease very common in Yemen, and ascribed to the ufe of putrid waters, is occasioned by the Guinea-worm; but it is not dangerous if the perfon that is attacked can extract the worm without breaking it. The leprosy seems to have been always an endemic disease in Arabia; and there is one species which authors differ widely in the character of Arabian. Three different variations of it are known; the first is the lepreux, of which two, named 'bokah,' and 'baras,' are rather disgusting than dangerous; but the third, called 'juddem,' is very malignant, and apparently infectious. The last prince of Arabia is said to have sent to the isle of Bahrein, with a body of the leprous, with or without complaints. At Bahrein, all lepers are shut up in a house by themselves; and in Bagdad there is a quarter surrounded with walls, and full of barracks, to which lepers are carried by force, if they retire not thereto voluntarily; but government does not provide with due care for the maintenance of these lepers. Incubation for the small-pox has been in use from time immemorial among the Bedouins: mothers perform this operation on their children, by opening the skin of the arm with the prickle of a thorn.

Arabic or Arabian poetry, may be divided into two ages. The ancient, according to Vitellus, was no other than rhyming stanzas, whether proper or improper; the rules of the verses loose and irregular, confined to no feet; number of syllables, or any thing else, so that they rhymed at the end; oftentimes all the verses in the poem ended with the same rhime. It is in such verse that the Alcoran is said to be written.

Poetry
Poetry was in fo great esteem among the ancient Arabs, that it was a great accomplishment, and a proof of ingenious extraction, to be able to express one's self in verse, with ease and elegance, on any extraordinary occurrence; and even in their common discourse, they made frequent applications of celebrated passages of their famous poets. In their poems they preferred the distinction of defects, the rights of tribes, the memory of great actions, and the propriety of their language; for which reasons an excellent poet reflected an honour on his tribe. So that as soon as any one began to be admired for performances of this kind in a tribe, the other tribes sent publicly to congratulate them on the occasion; and made entertainments at which the women assisted, drafted in their nuptial ornaments, singing to the sound of timbrels, the happiness of their tribe, who had now one to protect their honour, to preserve their genealogies, and the purity of their language, and to transmit their actions to posterity; for this was wholly performed by their poems, to which they were solely obliged for their knowledge and instruction, moral and economical, and to which they recurred, as to an oracle, in all doubts and differences. It is no wonder then, that a public congratulation was made on this account; an honour so distinguishing, that it was conferred only on one of these three occasions; namely, on the birth of a boy, the rite of a poet, and the fall of a foal of generous breed. To keep up an emulation among their poets, the tribes had once a year, a general assembly at Ocahd, a place famous on this account, and where they kept a weekly mart or fair, held on our Sunday. This annual meeting lasted a whole month, during which time they employed themselves, not only in trading, but in repeating their poetical compositions, contending and vying with each other for the prize; whence the place, it is said, took its name. The poets that were judged to excel, were bid up in their king's treasuries, as were the seven celebrated poems thence called "Al Moulikhat," or "Moulekkat," rather than from their being hung up in the Caaba, which honour they also had by public order, being written on Egyptian silk, and in letters of gold; for which reason they had also the name of "Al Modhalabat" or the golden verses. These poems, which have appeared in our own language, exhibit an exact picture of the virtues and vices of the Arabians, their wisdom and their folly; and shew what may be constantly expected from men of open hearts and tumultuous passions, with no law to control, and little religion to restrain them. The fair and assembly at Ocahd was suppressed by Mahomet; in whose time, and for four hundred years, poets seemed to have been in some degree neglected by the Arabs, who were then employed in their conquests. When these were completed, and peace was established, this study was revived; and almost all kinds of literature were encouraged and greatly improved by them. This interruption, however, occasioned the loss of most of their ancient pieces of poetry, which were then chiefly preserved by memory; the use of writing being rare among them, in their time of ignorance. Though the Arabs were so early acquainted with poetry, they did not at first write poems of a full length, but only expressed themselves in verse occasionally. Albert Schultens has preserved, in his Ancient Memorials of Arabia, two little poems, in an elegiac strain, which are laid to have been found about the middle of the seventh century, in some fragments of ruined edifices in Hadramaut, near Aden, and which are supposed to be of an indefinite, but very remote age. Sir W. Jones conjectures, that these were modern compositions on the inutility of human greats, and the confusions of religion; illustrated by the example of the Hamyaric princes; and to the same class of literary impurities belongs, as he suspects, the first poem quoted by Schultens, and ascribed by him to an Arab in the age of Solomon.

The modern Arabian poetry takes its date from the caliphate of Al Rafehid, who lived towards the close of the eighth century. Their poetry then became an art, and rules of profody were digested by Al Khalil Ahmed al Farahidhi, who lived in the reign of this caliph. The Arabians still cultivate poetry, and sometimes reward those who excel in it, though they have at present among them no great poets. The books are among the Bedouins of Desert. To this period it is mentioned by Nichubar, that a flock of that country was imprisoned at Sana, and that observing a bird upon the roof of a house, he recollected the opinion of those pious mujlimans, who think it a meritorious action to deliver a bird from a cage. He thought that he himself had seen a good right to liberty as any bird, and expressed this idea in a poem which he got by heart, and which becoming generally known, at length reached the monarch's ears, who was so pleased with it, that he fet the sheik at liberty, although he had been guilty of various acts of robbery. The exploits of their flocks are now frequently celebrated in the Arabian fons.

Arabic, or Arabian Religion was, in the state of ignorance, as they called the period before Mahomet, entirely Sabian; but the Sabian faith is not clearly and satisfactorily ascertained. See Sabians.

It is generally allowed, that they admitted the existence of one supreme God, the Creator and Lord of the universe, whom they designated "Allah Tealha," the most high God; and the religion of the noble and learned Arabs, as well as of the poets, was pure theism. We have Arabic verses of unsuspected antiquity, which contain pious and elevated sentiments with respect to the goodness, justice, and omnipotence of "Allah," or God. If an inscription, said to have been found on marble in Yemen, be authentic, the ancient inhabitants of that country preferred the religion of Eber, and professed a belief in miracles and a future state. It is certain, however, that the people of Yemen very soon degenerated, and fell into the error of adoring the sun and the firmament; for even the third in descent from Joktan, who was consequently as old as Nahor, took the surname of "Abdunas," or servants of the sun; and his family, we are assured, rendered particular honours to that luminary. Other tribesworshipped the planets and fixed stars; and by degrees a stupid idolatry prevailed among the lower orders of the people. The deity of the Arabs, or Sabians, chiefly confided in the worship of the fixed stars and planets, and the angels or intelligences which, as they supposed, resided in them, and governed the world under them. Those they honoured as inferior deities, and as mediators with God, imploded their intercession. To the worship of the heavenly bodies the Arabs were easily led, by observing the regularity of their motions, whence they thought them to be animated; and also that the changes of the weather happened at the rising or setting of some of them for a considerable period; and hence they offered to them a divine power, and conceived themselves indebted to them for their rains, which were highly beneficial to their parched country. This kind of worship was prescribed by Moses, and is frequently alluded to in the book of Job, particularly ch. xxxi. 26—28. Accordingly they had seven celeberated temples dedicated to the seven planets; and this planetary worship has been supposed by some Persons to have been the first species of idolatry. To this purpose Paulanens insinuates (Lacoeu. Oper. lib. iii.), that the worship of the planets was earlier than the first arrival of the Pelagis in Greece; and that before this time they had statues erected to their honour. Besides these stars, which were the general objects of worship throughout Arabia, there were some that were more peculiarly revered in particular provin-
Of the angels or intelligences which they worshipped, the Koran mentions three, namely, Allat, Al-Uzza, and Manah; these were called Goddeses, and the daughters of God; and thus appellation they bestowed not only on angels, but on their images, which they believed to be animated by the angels. All religious addresses, they conceived, were made as effectually before the one as before the other; and to this practice some have traced the origin of image-worship. Allat, or Allah, was the idol of the tribe of Thakif, who dwelt at Ta'ef, and had a temple consecrated to her in a place called Nubkhah. Al-Uzza was the idol of the tribes of Kurnash and Kenanah, and part of the tribe of Salam, as some say; but according to others, it was a tree called the Asaca, worshipped by the tribe of Ghatfan, and first consecrated by Dhulem, who built a chapel over it. Manah was the object of worship of the tribes of Hulaidh and Khazazah, possibly the Causanite of Potome, who dwelt between Mecca and Medina; and as some say, of the tribes of Awa, Knazra, and Thakif also. Dr. Pococke supposes, that the Manah of the Arabs was the Munt of the prophets. This idol was a large tree, described by Saadi in the ninth year of the Hegira, as a year fatal to the idols of Arabia; and its name is supposed to be derived from "Manah," to flow, from the effusion of the blood of the victims sacrificed to the deity and intelligence represented by it; others say it was the name of a convulsion. Besides these, the Arabian writers describe live antichristian idols, who are said to have been men of great piety and reputation, whose statues the Arabs at first revered with a civil honour only, which in process of time was heightened into religious worship. The Arabs had also a great number of other idols; and each country, and even each family, had its appropriate deity. There were, it is said, no less than 560 idols, equal to the number of days in their year, and in about the Caaba of Mecca.

Some of the pagan Arabs believed neither a creation pall, nor resurrection to come; but attributed the origin of things to nature, and their dissolution to age. Others allowed both. Some adopted the opinion of a metempsychosis, or transmigration of souls. The Arabs in general were strongly propounded in favour of auguries and fate; they perceived any beast or bird of ill omen, they were very close within their tents; and the months, holy occasions of buffets, or curiosity would, if possible, have determined them to set out on a journey under such unfavourable auspices. The priesthood among them gave no pre-eminence over the rest of the people; every family had its altar, its idol, and its sacrifice, who was not excused from bearing arms in defence of the common cause, nor from the other obligations imposed on their fellow-citizens. They were selected from among the aged; and it seems probable that the priesthood was a temporary dignity conferred on every minister employed in acts of religious worship; and when the service ended, these episcopal priests returned into the clafs of ordinary citizens; but whilst they were in office, it was expected that they should exhibit examples of moderation and sobriety. The Sabian priests referred to themselves no part of the sacrificed victim, which was the case with the pagan priests, but reduced it to ashes; abhorring the pre- sumption and sacrilege of setting down to the tables of the gods, and touching the viands that were offered to them. The ancient Arabs never imagined that tears and mourning could be grateful to the deity; and therefore they celebrated their religious festivals with dances and concerts, and the public jubilations was considered as the testimony of their gratitude towards a God who favoured his bounty upon them. It is true, however, that every tribe had its particular customs, and stamped its own character, jovial or gloomy, on its ceremonies of devotion. The Magian religion was introduced among some tribes of Arabia a long time before Mahomet, in consequence of the vicinity of the Persians, and their intercourse with the Arabs; and hence this impostor borrowed many of his institutions from it. Javaun also is said to have been introduced among the idolatrous Hanyrites by Abu Carb Afaal, who was the foreigner of Yemen about 700 years before Mahomet; and the Jews, who fled into Arabia in great numbers after the defection of their country by the Romans, made profelytes of several tribes, and particularly those of Kenanah, Al Harith Eda Caaba, and Kendah; and in time they became very powerful, and obtained possession of several towns and fortresses. At length Yufik, king of Yemen, raised a dreadful persecution against them, and put them to death by various tortures, one of which was throwing them into a glowing pit of fire, from which circumstance the Arabs gave him the opprobrious title of the "Lord of the pit." and Caleb, or Eleban, king of Ethiopia, to revenge the massacre of the Christians at Najran, put an end to Judaism and the kingdom of the Hanyrites in Yemen, this same time. The event happened in the reign of the emperor Justin. Chriftianity had likewise made a great progress in Arabia before the time of Mahomet. Whether St. Paul preached in any part of Arabia, properly so called, it is not easy to determine; but that the Christian religion was planted at a very early period in this country is an unquestionable fact. When the eastern church, soon after the beginning of the third century, was much harassed by discord and persecutions, great numbers of them sought shelter in Arabia; and as these were for the most part of the Jacobite communion, this fact generally prevailed among the Arabs. The principal tribes that embraced Chriftianity were Hamyar, Ghal- fan, Rabia, Taghliah, Bahara, Tomuh, part of the tribe of Tay and Koda, the inhabitants of Najran, and the Arabs of Hira. See Jacobites.

Such as we have above recited were the principal religions which obtained among the ancient Arabs; but as freedom of thought, says Bâle, was the natural consequence of the political liberty and independence of the Arabs, some of them fell into other opinions. The Korâh, in particular, were infected with Zendicism, an error supposed to have a near affinity with that of the Sadûdees among the Jews, and perhaps not much different from modern Deism; for several of that tribe, before the time of Mahomet, worshipped one God, and were free from idolatry; though they embraced none of the other religions of the country.

Since the establishment of Mahometanism in Arabia, there are several sects of this profecion in the country; such as the Sonnites, Scites, Zaidites, &c. of which an account will be given in the course of this work. In Arabia there are at this time many Jews, who are dispersed through different cities, having their synagogues, and enjoying a considerable degree of freedom. As they are fond of living together, they commonly form a village near every principal town. In the neighbourhood of Kheibar, there are some Jewish tribes, who are not barely tolerated, but possess the sovereign authority. Although the Chriftians were once numerous in Arabia, Niebuhr says, that he knows no Christian church remaining at present in that country. In the province of Lôh, they are called Saheans, or Chriftians of St. John; but the Chriftianity of this sect is a kind of confused medley of the opinions and ceremonies of several different religions. In the commercial cities there are many Banians from India: at Mocha, however, they undergo many mortifications; but at Mafcat, among the tolerant sect of the Beysi, they are permitted to observe the laws and cultivate the worship of their own religion, without disturbance. A considerable degree of religious toleration
is exercised among the Arabs. Their contempt, however, of those who differ from them is more chiefly manifested towards the Banians than the Jews, and least of all to the Christians; who, in return, express the least aversion for the Muslims. This progress towards general toleration among the Arabs is preferred from the rage of making profiteers. They seek neither to enter nor constrain any person, except sometimes their young slaves, whom they compel to embrace Mahometanism; but when a profiteer voluntarily enters himself, they are, by the laws of their religion, obliged to receive him, and to provide for his maintenance.

ARABIC Vesions. See Arabic Blesses.

ARABIC Year. See Arabic Chronology, and Year.

ARABICA, in Conchology, a species of CYPRAEA that is found in India. This shell is highly turbinated; characterized with irregular letter-like marks; and has a simple longitudinal streak down the back of it. Lin. Gen. Scl. Cyperea Arabica, or Arabic cowry, is about three inches in length; its ground colour is whitish or buff, and is covered with characters of a chefant or dark brown, that somewhat resemble Arabic letters upon the back; the edges are thick and spotted with purple. When the outer coat is worn off, the back of the shell is pale, with dark transverse bars. The inside of the mouth is violet; lips reddish-grey; cirrulations chiefest. It is called by Rumphius, Porcellana literata f. Arabica.

ARABICI, a feath that sprang up in Arabia, about the year 207, whose distinguishing trait was, that it was a more sweet with the former, and also rose again with it.

Eusebii, lib. 6. c. 38, relates that a council was called to stop the progress of this rising sect; and that Origen affixed at it; and convinced them so thoroughly of their error, that they abjured it.

ARABICUS effus. See Costus.

Clus. tetradynamia filiguetta. Nat. Ordes, filiguetta. Crucifers, Juss. Gen. char. Cal. perianthi, four-leaved, deciduous: leaves from parallel-converging; two opposite larger, ovate-oblong, acute, a little prominent at the base, gibbous, concave; the other two linear, erect. Cor. four-petalled cruciform, each ending in claws of the length of the calyx, Nectaries, four; each from a little scale within the bottom of the calyx leaflet, affixed to the receptacle, relic. permanent. Stam. Filaments fusiform, upright, two the length of the calyx, four twice as long; anthers cordate, erect. Pet. Germ. columnar, the length of the filaments. Style, none. Stigma obtuse, entire. Per. filique, comfressed, very long, linear membranaceous, with swelplings at the ends; valves almost the length of the partition. Seeds, many, roundish, compressed. Eff. gen. char. Nectaries glans four, one within each leaflet of the calyx, like a reflex scale. Species 1. A. Alpina, alpine wall-crefs; leaves clasping the stem, toothed; root perennial, creeping, from which proceed many leaves collected into heads, spreading circularly: they are whitish, oblong, and indented at the edges. From the centre of these arise the flowering stems, which grow nearly a foot high, with alternate leaves closely clasping the stem. The flowers are white, in bunches towards the top. Flor. Dan. t. 62. A native of the Alps and other mountains of Europe, on rocks, in caverns, and in woods. It was cultivated in the botanical garden at Oxford, in 1658, and is now common in gardens. 2. A. lucida, flowering wall-crefs, leaves embracing the stem, shining. Stem four inches high, simple, smooth, leaves opposite, those at the bottom ovate, obtuse; those on the stem alternate, cordate, clasping the stem. Petals red, white, linear, in corollas, which become racemose. A native of Hungary, perennial. 3. A. grandiflora, great flowered wall-crefs, stem naked; root-leaves many, two inches long, lanceolate, cut beyond the middle like pinnate leaves, with acuminate divisions. Corona terminating with alternate flowers, on very short peduncles. A native of Siberia, perennial. There is one variety of this species with entire leaves, and another with white flowers. 4. A. thibetana, common wall-crefs, leaves petiolate, lanceolate, perfectly entire. Curt. Lond. 2. 29. Eng. Bot. Root-leaves sometimes toothed near the base, filaments five, and toothed, hairy: stem upright, somewhat branched, round, crooked, hairy; the little branches alternate and drooping; petals white, entire, obtuse, twice the length of the calyx; stile half an inch long, containing several yeljow seeds. A common annual, growing in sandy grounds, and on old walls. 5. A. bellidifolia, daily-leaved wall-crefs, leaves subdenteat: those of the root obtuse, of the stem lanceolate. Jacq. Flor. Aug. 2. 1280. Root perennial, producing tufts of leaves, and several items, which are undivided, round, smooth, bending, lengthened out gradually at top, into a long raceme; flowers corymbed, inodorous, white, conflVerting of obtuse petals; filaments parallel to the stem, linear, compressed, opening at both ends. A native of the foot of the Alps in Switzerland and Austria: Introduced into the Royal garden of Kew, by John earl of Bute, in 1773. A smaller variety of this species is described and figured by Jacques; see c. 28, p. 115. 6. A. lutea, root-leaved wall-crefs, leaves smooth; those at the root lyrate, on the stem linear; root annual; the flower-flaws nearly a foot high, terminated by white flowers. Linnæus observes, that this differs in no respect from the fourth species, except that the root-leaves are lyrate and smooth, and the flowers larger. A native of North America. 7. A. hispidis, rough wall-crefs: this, according to Professor Martin, is the A. frieta of Hudson and Withering; leaves wedge-shaped, sublyrate, hispid; stem-leaves half embracing the stem, lanceolate; filaments hispid, anepical; root annual; items many, six inches high; root-leaves very many, toothed and gauze-toothed, rough, hairy; stem leaves three or four, toothed, hispid; flowers white, in racemes, on short peduncles; flowers an inch and a half long, quadrangular at the base, triated. It grows wild in most parts of Europe; and was found on St. Vincent's rocks near Bridiot, by Mr. Hudson, who describes it as a new species. 8. A. Halleri, Haller's wall-crefs, stem-leaves sublyrate, those on the branches lanceolate, gauze, hispid, five inches long, toothed on the edges, obtuse, repand, a tooth or two at the base; stem-leaves petiolate, oblong, finetoothed; petals white, with green claws. This plant sends off runners from the root and base of the stem. A native of Germany, Carniola, and Piedmont. 9. A. canadenfis, Canadian wall-crefs; stem-leaves lanceolate, toothed, smooth; flowers pendulous. A native of North America, two feet high, with broad, lanceolate, irregular, ferrate leaves; flowers in lateral racemes. 10. A. pendulosis, pendulous wall-crefs; leaves filmento-claspings; filaments anepical, linear, calyces sub-pilose; stem nearly a foot high, rough with scattered hair; leaves rough, partly embracing the stem, ferrate; peduncles long, filiform, loose; flowers white; filaments smooth, nothing. A native of Siberia. Cultivated by Miller, in 1759. 11. A. terricr, tower wall-crefs, Eng. Bot. Leaves filmento-claspings; filaments bending down, flat, linear; calyces frabridgade; root woody, biennial; stem usually simple; from one inch to two feet in height, upright, down, round; leaves hairy on both sides; root-leaves petiolate, oblong, thick, hispid, waved, and toothed; stem-leaves similar, filmento-claspings, toothed, regularly decreasing as they approach the top; flowers upright, white or yellowish, on short peduncles; filaments very
very long, linear, compressed, curved; seeds round, compressed: common on old walls, rocks, &c. 12. A. juncea, drill excrt, leaves linear, lanceolate, toothed; flowers the length of the stem; stem about six inches high, round, simple, have crowded, upright, hair at the base, deeply toothed, and as well as the whole plant covered with soft hairs; nodules of flowers terminal, nodding; petals white, lustrous, filiform, filaments in short, minute, flat, compressed, annual. Althorn and Villars differ considerably in their descriptions of this plant. A native of the south of Europe, on rocks. 1. A. fruticosa, root leaves roundish, rough, toothed; stem leaves, hairy. This, in many respects, agrees with the 9th species. Its stem is found in the United States from four to six inches high; simple, furnished with one or two opposite lanceolate leaves; flower large, white; calices white; stigmas broad, bowed at the end, upright, parallel to the stem. A native of the south of Europe. 14. A. lepida, all of the leaves entire; stem flexuose; densiform, bending, entangling one with another; leaves small, filiform, befit with forked hairs; petal small, white; stamens very thin, a little compressed. A native of Denmark. 15. A. erecta, stem straight, leaves longish lamellated, sessile; stigmas from erect spreading. This resembles the 14th species, except that its stems are constantly straight. It is annual or biennial, and found on walls or rocks about Granoble.

**Propagation and Culture.** All the above are hardy plants, and will thrive in any situation. They may be easily propagated by seeds, which they produce in great plenty. The first species is most common in our gardens, and by multiplying itself by its creeping roots, few persons are at the trouble of tending its seeds. It flowers early, and having many strong stems from one root, it makes a pretty variety in cold situations, where many finer plants will not thrive.

**ARABIS.** See Cardamine.

**ARABIS, or ARABIA, in Ancient Geography, a river of Persea, in the province of Gedrosia, which took its rise on a ridge of mountains that ran across the province, and after a short course, discharged itself into the Indian ocean. The mouth of the Arabis is placed by Mr. Rennell in E. long. 69° 34', and N. lat. 25° 26', about 44° Well from the western mouth of the Indus. Arrian mentions an island at the mouth of the river; and there is still a small town, called Sommene, at the entrance, and labouring under the same difficulty for water, which is noticed by Arrian; who says, that they were obliged to go up the country above two miles to find a well. From the Indus to the river Arabis, the Greeks, in the voyage of Nearchus, found the coast inhabited by an Indian tribe, whom they have named Arabes; and contiguous to them were the Orites, whose territory extended from the Arabis to Malana, or Cape Maran, which terminates a ridge of mountains sloping off from a chain which bounds this country on the north, from the Arabian capitol, now Hara, is placed by Mr. D'Anville on the Teneris; the country appear to have been fully peopled; and the Orites are described as dressed and armed like the Indian tribes; but their customs, manners, and language, says Dr. Vincent, "On the Voyage of Nearchus," mark them as a different race. The modern inhabitants confess chiefly of a predatory people, denominated "the Bellahs."

**ARABISM, ARABISIUS, an idiom, or manner of speaking peculiar to the Arabs, or the Arabic language. R. Martin maintains that it sometimes expresses an oath in the Hebrew as well as the Arabic.

**ARABISSUS, in Ancient Geography, a town of Asia, situate on a plain to the south of the river Medas.

**ARABIST, a person curious of, and skilled in the learning and language of the Arabian; such were Erasmus and Guilielmus. The system of the 13th century are called Arab. by Severinus. Freid, Hist. Phys. tom. ii. p. 301.

**ARABISTAN, in Geography, a name given by the Turks and Persians to modern Arabia.

**ARABIK, a town of Asia, in the province of Carmania, 105 miles south-east of Yruncup.

**ARABLE FARM, in Agriculture, that part of farm which is either wholly or in a great part under the plough.

**ARABLE Land, that kind of land which is proper for being ploughed or cultivated by means of the plough, with the view of producing grain or other crops. The dry and frangible sorts of soil are most adapted to this purpose. See Land.

**ARABS, in Entomology, a species of Tenebrion that inhabits the cast. It is black; thorax serrated; antennae and legs telocnemous brown. Fabricius, Gmelin.

**ARABS, a species of Ciemex found in South America. The thorax is spinous; body ovate, hvid; end of the abdomen bidentated. Linn. Feb. Gmel. This is called by Shane, Ciemex sylvestris vastus viridis triangularis.

**ARABS, in Ornithology, a species of Otis that inhabits Arabia Felix; and which Dr. Latham concludes must be the flying olear of Le Maure and Adamson; though Buffon supposes that bird to be the Limensis Otis area. Its specific character is very concise, 'ears with erect crest,' Gmelin. Brisson calls it L'Outarde d'Arabie; and Buffon, Le Lebon, ou L'Outarde buffle d'Arabie; and it is likewise the Arabesque Buffle of Edwards and Latham.

The size is that of the great buffle, but the bill, neck, and legs are longer in proportion. The bill is pale horn colour; the black of the head black and crested; forehead white, a black mark on each side of the head, piling into the crest behind; the rest of the head, neck, and upper parts of the body, rufous, mixed with black, and somewhat resembling the markings on the plumage of the woodcock; the throat, and fore-part of the neck, ash-colour crossed with brown lines; breast and belly white; quills black; secondaries black and white in spots, those near the body rufous, with dusky marks across; tail white except the middle feathers, which are blackish rufous; all of them are mottled and marked with a black band across; the legs are pale brown.

**ARABSCHAH, in Biography, a Mahometan writer of the fifteenth century, was a native of Damascene, where he died in the year 1450. He is the author of a history of Tamerlane, intitled, "The wonderful effects of the divine decrees in the affairs of Tamerlane," and of a theological treatise "On the unity of God." D'Herbelot Bibl. Orient.

**ARABUM LEPA. See Leprost.

**ARABUM sandaracha. See Sandaracha.

**ARAC, or ARAC, a spiritous liquor, imported from the East Indies; chiefly used by way of dram, in punch. The nature and composition of this celebrated liquor have been much controverted.—The name arac, Mr. Lockyer affirms us, is an Indian word for strong waters of all kinds; as they call our spirits and brandy, English arac. But what we understand by the name arac, is really no other than a spirit procured by distillation from a vegetable juice called toddy, which flows by incision out of the cocoa nut tree, and some other trees, like the birch-juice procured among us.

The toddy, Mr. Lockyer adds, is a plentiful drink of itself, when new, but purges those not used to it; and when stale, is heady; and finally makes good vinegar. The English at Madras used it as leaven to raise their bread with.

Others are of opinion, that the arac, or arcac, is a vinoous spirit.
spirit obtained by distillation, in the East Indies, from rice or sugar fermented with the juice of cocoa nuts.

The Goa arcade is made from the toddy, the Batavia arcade from rice and sugar. There is likewise a kind of shrub from which arcade is made.

Goa and Batavia are the chief places for arcade. At Goa there are divers kinds—ingle, double, and treble distilled. The double distilled, which is that commonly sent abroad, is but a weak spirit in comparison with Batavia arcade; yet, on account of its peculiar and agreeable flavour, it is preferred to all the other arcades of India. This is attributed to the earthen vessels which they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

The Parier arcade, made at Madras, and the Cumber and Quilon arcade, at other places, being fiery hot spirits, are little valued by the Europeans, and therefore rarely imported: though highly prized among the natives. In the belf Goa arcade, the spirits of the cocoa juice do not make above a fifth or eighth part: the manner of making the Goa arcade is this: The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himself with a parcel of earthen pots, with bells, and a number of earthen bird-bottles: he makes four a number of these to his girdle, and any way else that he commodiously can about him. Thus equipped, he climbs up the trunk of a cocoa-tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the small knots or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off other buttons, and falls on his pots, till the whole number is used: this is done in the evening, and defacing from the tree, he leaves them till the next morning; when he takes off the bottles, which are molefully filled, and empties the juice into the proper receptacle. This is repeated every night, till a sufficient quantity is procured, and the whole being then put together, is left to ferment, which it soon does.

When the fermentation is over, and the liquor or wath is become a little tart, it is put into a still, and a fire being made, the still is suffered to work as long as that which comes over has any considerable taste of spirit.

The liquor thus procured is the low wine of arcade, and this, to a liquor, that it will soon corrupt and spoil, if not distilled again, to separate some of its phlegm; they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof spirit, in which state we find it. The arcade we meet with, notwithstanding its being of a proof left, according to the manner of judging by the crown of bubbles, holds but a fifth, and sometimes but an eighth part of alcohol, or pure spirit: whereas our other spirits, when they flew that proof, are generally esteemed to hold one half pure spirit. Shaw's Essays on Distilling.

There is a paper of observations on arcade, in the Melanges d'Histoire Nat., tom. v. p. 302. By fermenting, distilling, and rectifying the juice of the American maple, which has much the same taste as that of the cocoa, the author says he made arcade not in the least inferior to any that comes from the East Indies; and he thinks the juice of the sycamore and of the birch trees would equally answer the end.

Besides the common forts of Goa and Batavia arcade, there are two others less generally known; these are the bitter arcade, and the black arcade.

By that 11 Geo. I. c. 30, arcade on board a ship within the limits of any port of Great Britain, may be searched for and seized, together with the package; or if found unshipped or unshipped before entry, may be seized by the officers of excise, in like manner as by the officers of the customs. 33 Geo. II. c. 9, 9 Geo. III. c. 6.

Upon an excise officer's suspicion of the concealment of arcade, and oath made of the grounds of such suspicion, before the commissioners or a justice of the peace; they may empower him to enter into such suspected places, and seize the liquor, with the calves, &c. If the officers are obstructed, the penalty is 100l.

Arc is not to be sold but in warehouses, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the calves, &c. If permits are not returned, which are granted for the removal of arc, or if the goods are not sent away within the time limited, the penalty is triple the value. If the permits are not returned, and the decrease is not found to be sufficient, the like quantity is forfeited. Permits are not to be taken out but by direction in writing to the proprietor of the flock, or his known servant, upon forfeit of 50l., or three months' imprisonment.

By statute 9 Geo. II. c. 35. if arcade is offered to sale without a permit, or hawk, pedlar, &c. with a permit, the person to whom it is offered, may seize and carry it to the next warehouse belonging to the customs or excise, and bring the person offering the same before any justice of the peace, to be committed to prison, and procured for the penalties incurred by such offence. The person seizing such goods may prosecute in his own name; and on recovery is entitled to one-third part of the goods produce of the sale; and the commissioners are, if desired, upon a certificate from the justice of the offender's being committed to prison, to advance to the feizor 1£ s. per gallon for the arcade so seized.

Arc (except for the use of feamen, two gallons each) found in any ship or vessel arrived from foreign parts, at anchor, or hoisting within the limits of any port, or within two leagues of the shore, and not proceeding on her voyage (unless in case of unavoidable necessity and distress of weather, notice whereof must be given to the collector or chief officer of the port, upon the ship's arrival), is forfeited; with the boxes, calves, or other packaging, or the value thereof. 5 G. III. c. 43. 19 G. III. c. 69. 21 G. III. c. 89. 11 G. III. c. 35. 24 G. III. c. 47. Also, is also the name of a spirituous liquor made by the tasters of Tungisia, of mar's milk, allowed to become four, and afterwards distilled twice or thrice between two earthen pots closely stopped, whence the liquor runs through a small wooden pipe. It is said to be more intoxicating than brandy.

ARACAPU, in Botany. See Drosiera.

ARACAEI, ARACANS, or ARKITES, in Ancient Geography, a people supposed to be defended from Arak the son of Cannan, who inhabited a district in the vicinity of Sidon, which afterwards fell to the lot of the tribe of Abier, where Josephus places a town called Arce or Arca. From hence they removed farther north to a town of the same name between Aradus and Tripolis. The Arce mentioned by Josephus, and belonging to the tribe of Abier, was otherwise called Antipas. The Jewish historian says, that Baalnah, mentioned, 1 Kings. iv. 16, as superintendent of the tribe of Abier, was governor of the country round about the city of Arce, which lies upon the sea. In the latter times of the Jewish commonwealth, this city was a part of Agrippas's kingdom.

ARACAN, in Geography. See ARRACAN.

ARACANGA, in Ornithology, a species of Psittacus, or parrot, in the Linnean system; the Arracana of Mac-grave, the Arracanga Macaw of Willughby, Ara Jamac- craft of Brisson, Petit Ara Rouge of Buffon, Jamaica Macaw of Albinus and Brown, red and yellow Macaw of Bancroft and Latham. It is of a pale scarlet colour, with 4 F

naked
Arenaria

naked wrinkled cheeks; the scapular feathers are yellow, and tip with green; the wing quills are blue above, and red beneath. Mr. Latham suspects, that this may be a younger bird of the species called Arenaria, which is somewhat bigger. It inhabits Guiana, Brazil, and Jamaica.

ARACARI, a species of Ramphastos. It is green; abdominal band, vent, and rump red; belly yellow. Gmel. &c. Ramphastos with a black beak, the upper mandible white on the sides, and three-toed at the base. Linnaeus. Sw. Nat. Mascarene calls this bird Aracari; Brisson, Tucana Brachyopa Viridis; and Buffon, Grigi, and Tucan Verdu del Brazil.

The length of this bird is sixteen inches, of which the bill measures four inches and a quarter; it is hooked at the tip; the upper mandible white, marked above with a black stripe the whole length; the lower mandible is wholly black, and deeply serrated at the edges. The head, throat, and neck black; on each side of the head is a small chief spot just above the ears; the upper part of the back, scapulars, and wing-coverts are dull green; lower part of the back, rump, and upper tail-coverts, bright red. Breast, belly, and sides bristline, with a bright red band across the belly. Tail wedge-shaped; legs blackish green; claws black. Inhabits South America.

ARACCA, in Ancient Geography, a town of A sia, in Sufiana, on the eastern branch of the Tigris, according to Ptolemy. This is probably the city of Chaldæa, built by Nimrod the grandson of Cush, and mentioned under the name of Erach, Gen. x. 10. Ammius calls it Areca; hence originates the name of Arechian plains, described by Tibullus (l. iv. p. 405. ed. varior.):

"Ardet Arectes aut unda per hospita campus."

And this city might probably have led the Arabsians to call the large province of A sia, Iraq or Irak, the capital of which was formerly Babylon, and now Bagdad.

ARACENA, in Geography, a town of Spain, in the province of Andalufa, situated near the Sierra Morena, in the country of Seville, with a castle on an eminence; 10 leagues N. N. W. from Seville.

ARAC-CELERAN, a small district of Chufflan, a province of Perù.

ARACH, or Erach, a name now given to the ancient Partia.

ARACH, in Botany. See Atriplex.

ARACHIDNA, and Arachnidoides. See Arachis, Glycine, and Lathyris.

ARACHIS (from ἄραχνα, damnum, vel nocca), in Botany, earth-nut. Lin. gen. 576. Schreb. 1177. Linn. t. 144. Juss. 351. Arachis, Plum. 37. Arachidnoides, Niff. act. gall. 1723. t. 10. Clf. diadhelica decandrea. Nat. Order, Papilionaceae or leguminosae. Gen. Char. Cal, perianth two-parted, gaping; upper lip ovate, emarginate; the intermediate division the largest, emarginate; under lip lancolate, concave, acute; longer than the upper. Cor. papilionaceous, reflexed; banner roundish, flat-delicate, very large, emarginate, longer than the calyx; wings free, subovate, shorter than the banner; keel subulate, incurred, the length of the calyx, very slightly bident at the base. Stam. filaments ten, all united at bottom, subulate; anthers alternately roundish and oblong. Pfyl. germ oblong; style reflexed, the length of the germ; stigma simple. Per. a legume, ovate-oblong, columnar, valves crisps, gibbous, one-celled. Sepals two, oblong, obtuse, gibbous, truncate. Olf. Most of the flowers have a pilifer without a germ.

Species, 1. A. hypogea, common earth or ground nut.
which is 

debis, it therefore forms a subdivision of the genus in the Linnean system, and is thus defined; circular mouth central; vent square, and placed on the surface: 

Arachniodes Kleinini.

Arachniodes is also a species of Maderpora found fossil. The stars are very small, crowded, and flattened; rays somewhat undulated, short, and equal. Gmel. &c.

ARACHNOIDEUS, in Botany, denotes cobwebbed.

ARACHOSIA, in Ancient Geography, a province of Persia, situated between Drangia, on the north, and by Paropamisus, on the east by the river Indus, and on the south by Gedea. It was anciently inhabited by the Ari

maphri. Ptolemy enumerates thirteen cities in this province; the principal of which were Arachosia, Alexandria, and Arbacia. The ancient Arachosia is traced by major Ren
dell in the present ARACHNE. Captain Wilford says (see Asiatic Researches, vol. vi. p. 517.) that Rob. Coel, according to the Bollachi pronunciation, denoting the mountains of Coel. or Rou-Coo as softened by the Pattans, is the Ara

chosia of the Greeks; and that it includes the districts of Gazni and Candahar. Arachosia is now called Cawer or Cawaran; but even this appellation is becoming obsolete. By a strange mistake, says this ingenious writer, the country of Arachosia, and the river which flows through it, have been placed by the learned D'Anville to the south of Candahar. He adds, that if this famous geographer had recognized Gazni in the Shakeni-Couze of Tavernier, this mistake would not have happened. Mr. Wilford having conversed often with natives of Candahar, of Kála-at-Núr-Khán, and Coughor, as well as other intermediate places, obtained sufficient local knowledge of that country to rectify this error.

ARACHOTUS, an ancient people of India, supposled by Bryant (Anal. of Anc. Mythol. v. 111. p. 199.) to be the same with the Catha"ans, and fo denominated from their city Ar-Chota, the same as Cothopolis, or city of Cutha. The Arachotians were styled Arachnites from their particular habit which was of linen; and were a branch of the Amo

rians, who, wherever they settled, were famous for this manu

facture.

ARACHOTUS, a town of Asia in Arachosia, built on a lake of the same name by the famous Semiramis, who is said to have given it the name of Cophes. This city, says captain Wilford, (ubi supra), was probably Cog-vara or Chijhar, Coggvar, and Chijhar, the Kodzor and Kozdor of Perian authors; and literally the habitation of Cog, and by implication, the capital city of Cog. The river Arachosia, called also Chooass and Cophes, is now called Abul-Tarnic, or the river Tarnic. It rises in the hills north-east of Gazni, and after having watered the whole valley of Arachosia, loses itself in a marsh about four miles to the south of Candahar, which marsh was the Arachosian marsh of the ancient geographers. The present river Arachotus is formed by a small stream, which rises a little above Mucur in this marsh, and hence it is often called the water of Mucur.

ARACHOTUS, a town of Zola, according to Ptolemy Arachthus, a river of Epirus, which ran into the gulf of Ambracia.

ARACHUS, in Botany. See ERYUM.

ARACIA, in Ancient Geography, an island of the Persian gulf, situated on the Persian fide, and placed by Nearchus between the isle of Caucæsopes and the mountain Ochos. ARACIANA, a town of Partha, mentioned by Ptolemy, ARACILLUM, an ancient town of Spain, taken and destroyed by Augustus.

ARACINTHUS, in Entomology, a species of Papilio (Hef. Urb. Linn.). The wings are rounded, entire, and brown; polierrier pair beneath grey, with white eye-shaped spots. Fabr. Sp. Inf. This butterfly inhabits France, Germany, and Siberia; it is Papilio morpheus of Pallis, and Papilio hypergus of Eger.

ARACLEAN, in Geography, a sea-port town of European Turkey, in Romiuni, on the north-west coast of the ten of Marmora, called by the Turks Ercelti, 15 leagues west of Constantinople.

ARACNEUS, in Ancient Geography, a mountain of the Arcadia, part of a chain which separated the peninsulas of Morea on the south-call. It lay to the north-west of Epidaurus.

ARACOUIA, or ARAGHOTA, in Geography, a borough of Greece in Laceda, near the Gulf of Lepanto; supposed to be the ancient Ambelis.

ARACUITES, a people of South America in Brazil, in the vicinity of the prefecture of Pernambuco.

ARACUS, in Botany. See ORDUS.

ARACUS Aromaticus, in the Materia Medica, a name given by some authors to the Vanilla used in making chocolate.

ARACYNTHUS, in Ancient Geography, a mountain of Greece in Boeotia, whence, according to Steph. Byz. Mireva was denominated Aracynthus. Strabo places this mountain in Zola, and Pliny in Carmania.

ARAD, ARADUS, a town in an island of the same name on the coast of Phocis, over against Antarados. Strabo says that this town was built by the exiles of Sidon: and Josephus informs us, that it had at first its own kings, in common with the other cities of Phocis; but, in progress of time, it was subdued by the Tyrians. After the Persians took possession of Phocis, the kings of Aradus were tributary to Persia. After the fall of Strato, the son of Gerostratos, obtained of Alexander the Great, for himself and his father, the established possession of this kingdom. It afterwards, as a part of Phocis little privilege: but they were deprived of it by Antiochus Epiphanes, who, on his return from Egypt, took their city, and ravaged the whole province. When Pompey made a conquest of Syria and Phocis, the Ara

dians became subject to the dominion of the Romans. The city of Arad, though it had no harbour in the island, became powerful at sea by means of a port which it had on the continent at the mouth of the river Eleutherus. Its inhabitants detested piracy, and separated from the Cilicians, who were addicted to it. Strabo, i. xvi. The island Aradus, the Arard of the Scriptures, and the feast of the A-sardite or Aradite (see Gen. xi. 15.), is at present called Rou Waddi; and this island, and also El-Hammah, the ancient Hamath, the feast of the Hamathite, lying over against it (Exk. xlvii. 26.), ten leagues to the eastward, are the most northern settlements of the sons of Caanan. The prospect of Rou-waddi from the continent is very magnificent, and furnishes at a distance a continued train of fine buildings and impregnable fortifications. But this is altogether owing to the height of its situation, and the rocks that abound in it. Its whole strength and beauty, though it was called Rou

wadde, or Arpad, probably from the Hebrew ר"ש, firmus fuit, consists of a weak fortification wall, defended by a few small cannon. Formerly, however, it was surrounded by a strong wall, constructed with stones of an immense size adapted to each other without cramps and mortar, so as to withstand the violence of the sea, and the battering engines of an enemy. In the time of its prosperity, art and nature had conpired to render it a place of such strength and im-

portance,

ARADUS.

See Arad.
ARADus,aii iHand of the Red Sea, mentioned by Steph.
Byz. Alio, the name of an ifland in the Perfian gulf, mentioned by Euftathius, and alfo by Strabo.
ARiE. Athenasus mentions three iflands of this name
on the coaft of Ionia. There arc feveral places under this
denomination, derived from the altars that were erefted in
them, on various occafions and for different purpofes.
Ar.e Phileenorum. See Phil.^ni.
ARiEGEN-US, a town of ancient Gaul, fiippofed by
M. D'Anville to have been Bayeaux ; formed of BajocafTos,
wtiofe capital was this city.
formed of ccfatoi, thin, and psTpov,
rinj/ure, an iiiflrument wherewith to mcafure the denlity or
gravity of fluids.
The invention of the areometer has been commonly
afcribed to Hypalia, the daughter of Tneo, about the md
of the fourth century
hut: this account, fays Salverte
(Annales de Chemie, xxvii. 13.), is not accurate, if the
poem, " de pondtiibus et menfuris," annexed to the works
of Prifcian, and written by Rhcmnius Fanrius Palxmon, be
tiu'y afcribed to him.
Rhemnius has given a perfpicuovs
and exadl drfcription of aracomctry ; and he lived under
Tiberius, Caligula, and Claudius Casfar, t^ree centuries before Hypatia ; and he attribtites the invention to Archimedes.
However, if it be confidered that valuable inventions are forgotten and difcovered again durin<^ the lapfe of
a (horter period than three centuries, Hypatia may be
allowed the honour of a fecoad invention.

ARAFAT,


ARA

ARAFAH, in Geography, a mountain of Arabia, near Mecca, so called, as some say, because Adam there met and knew his wife, after a separation of 200 years; or, according to others, because, after he had instructed Abraham in all the sacred ceremonies, coming to Arafa'h, there asked him if he knew the ceremonies which had been shown him; to which Abraham replying in the affirmative, the mountain thence had its name, and was called "the mountain of knowledge." To this mountain the Mahometan pilgrims proceed in a tumultuous manner on the ninth day of the month Dhulhajja, after morning prayer; and here they continue performing their devotions till after sun set. When their devotion is finisht on this mountain, they depart to Mozdalifah, an oratory between Arafa'h and Mina, and there spend the night in prayer and reading the Koran.

ARAGON. See ARAON.

ARAGUAY, a town of Arabia, 100 miles E. S. E. of Saba.

ARAGUA, a town of South America, in the country of Tera Firma, and province of Camana.

ARAGUAY, 1747, in Ethnology, a name given by Markgrave to a species of Malva, once called by Linnaeus Squa- lus Pratis, which see.

ARAGUS, in Ancient Geography, a river of Asiatle Iberia, which, according to Statho, joins the Cyrus; but Ptolemy calls it Alazon, and says that it descends from Mount Caucausus, separates Iberia from Albania, and discharges itself into the Cyrus.

ARAHUM, or HAPAUM, in Ancient Writers, denotes a place consecrated or set apart for holy purposes. Du.

cange.

Hence the phrase, in ababo jurare, or conjure, to make oath in the church; because by the Riparian laws, all oaths were to be taken in the church on the relics of the saints.

ARAIL, Francino, in Biography. See FRANCINO.

ARAINIIE, in Fortification, sometimes denotes a branch, return, or gallery of a mine.

ARAIIE, the name of a small plough used in Provence and Languedoc, in France.

ARAL, in Geography, the name of a lake or sea of Great Britain. In Scotland Tartary, about 100 miles to the east of the Caspian Sea. It is about 200 miles long, and about 50 broad; and receives the river annterior called xias-

arteas, and more recently the Sir or Sihon, and the Oxus of antiquity, now called the Gihon. It is very probable that the Caspian Sea and the Aral formerly constituted one lake, though they are now separated by an elevated place, occasioned, perhaps, by the sand rolled down by the Gihon, the Sirr, and other rivers which now flow into the sea of Aral.

The waters of this lake are saline, like those of the Caspian, and the fish found in both are of the same species. N. lat. 42° 45' to 46° 40'. E. long. 57° 4' to 61° 14'.

Species. 1. A. spinosa; thorny aralia, or angelica-tree; angelica arborescens, &c. Comm. hort. t. 47. christopho-

riana, &c. Pluk. phytt. t. 20. Sp. char. arboreescnt. Stem and leaves prickly. This rises with a woody stem to the height of eight or ten feet, dividing into several branches, with branching leaves, composed of many divaricating wings. The ribs of the leaves, as also the branches and stem, are armed with strong hooked spines, rendering the place where the plants grow in plenty, very difficult to pass through.

The flowers are produced in large loose umbels, at the extremities of the branches, and are of an hermaphrodite character.

The berry is three-cornered and three-celled. A native of Virginia, whence it was sent to England in 1668, and cultivated by bishop Compton at Fulham. 2. A. penophylla; five-leaved aralia; arboreous, prickly; leaves pinnate. The branches of this tree are prickly, round, flexuose, ash-coloured; prickles axillary, solitary, horizontal; leaves petiolated, from one bud, to three, four, or more; leaflets ovate-acute, serrate at top, smooth; flowers in umbels, which are peduncled; flowers longer than the corolla. A native of Japan. 3. A. chinensis; Chinese aralia; frutes species, aquo-

uosus mas. Rumph. amb. 4. t. 8. Nalgu, Rheed. mal. 928. fruticos, petiolate prickly; leaflets unarمعed; villose; stem fimbriate, closely befed with prickles; leaves confined to the top of the plant, on three-parted prickly villose pedicels; partial leaves pinnate; leaflets ovate-ferrale, villose, large; panicle branching, with numerous umbelules. It was found in China by Olbeck, also in Cochin-China by Lourierio. It is a native of Malabar, and of Amboina; but Rumphius speaks of it as a large tree growing in the woods; whereas Lourierio describes it in Cochin-China as procumbent or scendant. See his Fl. Cochin. 157. 4. A. japonica; Japanes aralia; Kempt. ilc. Sel. 18.; fruticos, leaves lobate; stem unarmed, upright, six feet high; leaves towards the top close, alternate, petiolated, seven lobed, young leaves five lobed; bractes many, involving the whole panicle of flowers, which are terminal in compound panicles, with alternate umbelled peduncles; umbels fimbriate; no involucle. A native of Japan. 5. A. racemosa; bery-

bearing aralia; stem leafy, hermaphrodite, smooth. This grows three or four feet high, dividing into many irregular branches; leaves ramose, alternate; peduncles axillary, terminal, round umbels of small four-leaved flowers, of a whitish colour, succeeded by round channeled berries. A native of Canada, where the berries are eaten, and the leaves and roots used as fallalds and pot-herbs, by the Indians and French. 6. A. nudifolius; naked-rachis aralia; stem naked; leaves in pairs, ternate; stem so very short, as to scarcely delvery the name: leaves decomposed; leaflets pinnate, with five ferrate pinnae; scape long, supporting about three umbelules, in shape and colour like those of the preceding species. This, and also the fifth fort, were cultivated by Miller in 1731. It is a native of Canada and Virginia. See Pluk. als. 98. t. 238. f. 5. The roots of this plant have been sold for those of farfaparilla, and are still used for the same by some of the inhabitants of Canada, though very different from the true farfaparilla. 7. A. cordifolia; heart-leav-

ed aralia; hermaphrodite; stem angular, unarmed; leaves fimbriate, heart-shaped; stem fuscute, white, yellow, branching but little; leaves alternate; petiolated, ovate-acute, toothed, rough on both edges; pale and ribbed beneath; umbelules; flowers axillary, umbelled; peduncles trichotomous. A native of Japan. 8. A. 00phylla; digitate-

leafed aralia; stem arborescent, unarmed; leaves digitate, with eight leaflets; panicle umbelled. A tree, ten feet high; leaves on long footstalks; leaflets oblong, obtuse, entire, smooth, unequal, dilated in a ring; flowers yellow, sprinkled with red, in a vall terminating panicle, ending in umbels; no involucle; calyx truncate; petals oblong spreading.
spreading. It is a native of Cochin-China, where it is also cultivated, and used as a medicine in droppers. Near Canton there is a species or variety of aralia with two filaments, and a ten centimetre.  

$A$ pflumila; pflumilate-leaved aralia; stem slender, prickly; leaves a-fiovehead; umbel single, lateral; stems slender; leaves large, scattered, on long fouldits; flower white, without an involucre; petals and peduncles unarmed; prickles on the stem, fouded, bowell back. A native of China. The bark of this is also used in droppers, and in cutaneous disorders. Positively known of the above species, may, on more accurate examination, be found to belong more properly to the genus Herberi, which item nearly all ad to the vrat.

Propagation and Culture. The frist is propagated by seeds, which are easily procured from North America, and which should be sown in pots filled with light earth, and placed in a shady situation till autumn, when the pots should either be plunged into an old bed of soil, or planted in a warm border, sheltered by a hedge or wall; and if the winter prove severe, it will be proper to cover the pots with straw or peat-haulm, to prevent the fruit from penetrating deep into the ground. In March the pots should be plunged into a temperate hot-bed, which will bring up the plants early, so that they will have more time to get through the following winter. The pots should be constantly kept clean from weeds, and when the plants come up, they ought to be frequently refreshed with water; in May they should be inured to the open air; and when they are removed out of the bed they ought to have a shady situation. In mild weather, these plants should be always exposed to the open air; but great care must be taken to guard them against frosts; therefore the frames under which they ought again to be placed in October, are to be constantly opened when the weather is not severe. In the spring, before the plants begin to push, they should be carefully shaken out of the pots and separated; part of them should be planted singly in small pots, and the other may be planted in a bed of light earth, in a warm situation. If these which are planted in small pots, be placed in a moderate hot-bed, it will greatly forward their growth; but they must be early inured to bear the open air, otherwise they will draw up weak. In the following summer, they must have a shady situation, and next winter sheltered again; the spring following they may be shaken out of the pots, and planted where they are designed to remain. Those plants which were planted in the beds will require protection from the frost the first winter; but if the surface of the ground be covered with old tawny bark, it will prevent the frost from penetrating to the roots; and in hard frosts some straw, peat-haulm, or any light covering, will secure the stems from being injured; and after they have remained in the beds two years, they will be strong enough to be transplanted in the places where they are intended to grow. This plant may be also propagated by its roots. The fifth and sixth species are hardly enough to be propagated with very little trouble. Their seeds should be sown in autumn. See Miller's Dict. by Martyn.

Aralia arborea & capitata. See Hedera.

Aralia in Ancient Law Writers, denotes arable, or ploughing lands.

This is otherwise denominated aratoria, araturia.

In Domesticy for Essex, we meet with deem cures prurit, deo runcid. quatuor aralia—Where aralia seems to denote land fit for ploughing and tillage, by way of contradiinction to runcida, which was over-run with brissors and thorns. Du-Cange.

ARALIASTRUM, in Botany. See Panax.

ARALUCUS, in Ancient Geography, a place of Gallia

Narbonensis, north—north—east of U. rum Juli. Venus hid in this place a temple, which was destroyed in the year 447.

ARAM, a name given in literature to Syria, from Aram the fifth son of Shem, by whose descendants, called Arameans, Syria was peopled.

ARAM, a town of Judah, in the Staffle of Manesich, on the other side of Jordan.

ARAM, in Geography, a town of Arabia, 58 miles N. E. of Chamor.

ARAM Bde-Rohol, that part of Syria which lies N. of Palmyre, and was the territory of the city of Rohob, belonging to the tribe of Abar. See Damauscus, or Syria Damausea, a principal and most powerful part of Syria, of which Damascus is the capital.

ARAM-Machesa, a district of Syria at the foot of mount Hermon, on the border of the half tribe of Manesich, on the other side of Jordan, called the coast of Maacsa.

ARAMrodara, or Syria of the rivers, or Marchopotamia, situate between the Emporium and Tigris, whence the name.

ARAM-Ziba, a country of Syria, near the Emperthres, conquered by David, and afterwards the site of Panamra; bounded in the E. by the Emperthres, and on the W. by the land of Canaan and Syria Damascena.

ARAMACA, in Littymology, a name given by some naturalists to the species of Paeonectes, called by Linneus manius. Vide Ruficz, theat. anim. Maregrafe.

ARAMAGARA, in Ancient Geography, a town of India, on this side of the Ganges, according to Ptolomy.

ARAMASCEVA, in Geography, a town of Siberia, 30 leagues S. of Tobolk.

ARAMATHA, in Ancient Geography, a metropolitan city of the Armenians, according to Josephus.

ARAMAVA, the name of a town of Arabia Felix, according to Ptolomy.

ARAMBY, the name of the five factories established by Hamon, the Carthagman admiral, on the western coast of Africa, between the river Lixus and the promontory of Soleic.

ARAMEL, ARAMEANS, a name given by the Jewish lawgiver Moses, to the inhabitants of Syria and Mesopotamia. See Zera. Phiny places a people of this appellation among the Scythians.

ARAMITUS, in Geography, a town of France, in the department of the Lower Pyrenees, and chief place of a canton in the district of Oleron, on the Vert, seven miles S. W. of Oleron. The place contains 1,050 and the canton 5,883 inhabitants: the territory includes 203,426,000, and 6 communes.

ARAMO, a town and fortrefs of South America, in the kingdom of Chili, near the Pacific Ocean.

ARAMONT, a town of France, in the department of the Gard, and chief place of a canton in the district of Nimes, on the west side of the Rhone; 8 miles below Avignon. The place contains 2,200 and the canton 10,577 inhabitants: the territory comprehends 122,900, and 15 communes.

ARAMPO, or MAN-ETES, in zoology, a name given by the negroes on the gold coast of Africa, to a long slender animal, in shape resembling a weasel, with a long tail, and large breadth at its extremity, of a pale brown colour, and long thin hair. It is so called because it digs up graves, and is easier for human flesh. See Ateipe.

ARAMROY, in Geography, one of the principal ports of the district inhabited by a piratical tribe named Sanganians, and situated on the south coast of the gulf of Cutch, between the mouth of the river Indus and Sindo, and the river Puddar.

ARAN, a town of Perfia, in the province of Irak, 35 leagues north of Isphahan.

ARANAS,
ARANAS, a town of Sweden, in the province of Welf Gutland. Aifo, a river of Spain, which runs into the Agra, one league below Pampeluna.

ARANCE, a town of France, in the department of the Ain, and chief place of a canton in the district of St. Rambert; 8 miles E. of Ambronay.

ARANDA, a town of Spain, in Aragon, 19 miles N. W. of Calatayud.

ARANDA de Duero, a small town of Spain, in Old Castile, on the Duero; 30 leagues north of Madrid, and 11 south of Burgos.

ARANDON, a town of France, in the department of the Ille-et-Vilaine, and chief place of a canton in the district of la Tour du Pin; 16 miles S. of St. Sorian.

ARANA, in Ancient Geography, a town of the Lefet Armenia, according to Ptolomy.

ARANEA, in Entomology, a genus of apertous insects, well known by the common English name, Spider. The mouth is furnished with short horny jaws; lip round at the apex; feelers two, incurved, pointed, very acute at the tip, clubbed, with the genitalia in the male; no antennæ; eyes eight, or rarely five; feet eight; anus furnished with papillose, or on the forminating, Gmelin Linn. &c.

Schéffer adds to the Linnæan character, that the feet are made for running; the head united to the thorax and the abdomen, which is of an oval form, and joined to the thorax by a short petiole or stalk. He divides them into different families, according to the various situations of the eyes, in which he followed Frisch, Geoffroy, and others. The eyes of spiders are immovable, and their structure is different from those of most other insects; confining each of only one lens, which deprives them of the faculty of multiplying objects, as their immobility does that of seeing them if placed otherwise than exactly before either of them. Geoffroy observed before, that all spiders have eight eyes, and that the eye at each extremity of the line, in the species which Linnæus believed to have only five, is double.

Fabrics and Gmelin have attended, in the subdivisions of the genus, very carefully to the situation of the eyes, which differ greatly in different species: in some, for example, they form a quadrangle on the back of the head, two looking in front, two behind, and two on each side; the disposition of them in the species Globulae ia altogether different; five of them form a semicircle in front, and three lie parallel to each other behind; in argenta, the order is precisely reversed; three parallel eyes are in front, and the semicircle of five are behind them; in extensa, they form two parallel lines across, of four eyes each; again, in pulchra, two are in front, and fix in a transverse streak; three of which incline to one side, and three to the other; in Goezi, they form two somewhat oblique longitudinal streaks, having four eyes each; in anachus, four are contiguous in the centre, and form a quadrangle, and the four others are disposed in the same order, one at each angle; in conica, according to Gmelin, are two more than usual; three being placed in front, three behind, and two on each side; and in ibivious, all the eyes are disposed in one line, which bends a little in the middle.

The species are numerous; Gmelin describes the following: fusata, diadema, marmorea, reticulata, cucurbita, cayenus, ophioupunctata, bipunctata, armindacca, angulata, riparia, labyrinthic, quadrabella, redemita, corollata, montana, fanguinaevia, nigra, notata, rufoes, nocturna, sexpunctata, cornifex, flavifrons, binaculata, quadri punctata, militari, tricolor, rupitri, aquatica, palustris, triguttata, scorpiformis, vidicera, formica, hexacantha, tetracantha, aculata, spinosa, spinipes, fusata, opilionoides, Olbeckii, Wilkii, speciosa. horrida, latro, doméstica, trilintata, dor- fata, imperforata, tricuspis, globosa, argentata, funigata, clavipes, fuscata, extensa, lobata, longissima, cancriformis, nudulana, hirta, fignata, mactas, nigrita, cor- nuta, simbrinata, orisalis, tanaruta, cinerea, pupleus, fulvaca, fuscus, plicata, goeci, avicularia, truncata, conica, albigans, myops, longipes, fcrabo, fuscata, leopodorum, luca, bicornis, capilis, argentea, holofcrisca, spinimobilis, crenatata, hirtipes, venatoria, eccletia, tribullis, alba. Which see respectively.

Spiders have usually five teats or nipples at the extremity of the abdomen, whof apertures they can enlarge or contract at pleasure. It is through these apertures that they spin a glues substance, with which their bellies are filled. They fix the end of their threads by applying these nipples to that substance, and the threads lengthen as the animal recedes from it. They can flop the string of the threads by contracting the nipples, and recand by means of the claws on their feet. Much in the same manner as men wear up a rope. When the common house-spiders begin her web, she generally chooses a place where there is a cavity, such as the corner of a room, that she may have a free passage on each side, to make her escape in case of danger. Then she fixes one end of her thread to the wall, and pales on to the other side, dragging the thread along with her, or rather the thread follows her as she proceeds, till she arrives at the other side, and there fixes the other end of it. Thus she pales and repales, till she has made as many parallel threads as she thinks necessary for the purpose. After this, she begins again, and croaches the web by other parallel threads. These are the toils or fames which she prepares for entangling flies, and other small insects. But besides this large web, she generally weaves a small cell for herself, where she lies concealed, watching for her prey. Before this cell and the large web she has a bridge of threads, which, by connecting with the threads of the large one, both give her early intelligence when any thing touches the web, and enables her to pass quickly in order to lay hold of it. There are many other methods of weaving, peculiar to different species of spiders, and some that deserve particular notice. Aranea venatoria forms a large cylindrical web under or on, with a lid connected by a kind of hinges, which she can open or shut at pleasure; she watches for her prey at the entrance of her den, which is level with the surface of the ground, and at the least approach of danger retreats into it and shuts the lid, by which means she is completely secure; this is a native of the hotter parts of South America. An European species, labyrinthic, spins an horizontal web on the ground, with a cylindrical cavity below the surface, in which she watches her prey: marmorea spins on the ground nearly in the same manner: some live in trees, and spin long perpendicular webs, as angulata: latens, horrida, and others, spin little webs on the underside of the leaves of plants; and one kind, calycina, will secrete itself in the calyx of a flower, and after the corolla has fallen off, and fallen on flies and other insects that may come to attract its juices.

The darting of long threads, by means of which some species also can convey themselves to a vast distance, is remarkable; and some have adopted, on that account, that spiders have the power of flight; though unquestionably no one will believe that a spider can have wings, as it could no longer be an apterous insect. Dr. Lister says, that attending closely to a spider weaving a net, he observed it suddenly to drift in the mid-work; and turning its tail to the wind, it darted out a thread with the violence and stream with which we see water spout out of a jet; this thread taken up by the wind.
wind was immediately carried to some fathom's length, fill filling out of the belly of the animal. Some time after, the spider leaped into the air, and the thread amounted her up swiftly. Upon this discovery, he made the same observation on near thirty different sorts of spiders, and found the air filled with young and old, hanging on their threads, and double-lefs feizing gnats and other insects in their path; there being often manifold signs of daughter, legs and wings of flies, &c. on the threads, as well as in their webs below.

Dr. Lillie made the like discovery about the same time.

Dr. Lillie thinks there is a fair hint of the darning of spiders, in Aristotle, Hist. An. lib. ix. cap. 30.; and in Pliny, lib. x. cap. 74. But with regard to their failure the ancients are silent, and he thinks it was first seen by him. He also observes of those failing spiders, that they will often dart, not a single thread only, but a whole sheet at once, confiding of many filaments, yet all of one length, all divided each from the other, and distinct, until some chance either snapt them off, or entangle them: but for the most part it may be observed, that the longer they become the more they spread, and appear like the numerous rays of a blazing star. As for that which carries them away in the air so swiftly, it is partly their sudden leap, partly the length and number of the threads projected, and partly the porosity and management of their feet. Dr. Lillie offered some forts to use their legs, very like wings or oars; these being sometimes clofe joined, at others opened, and again bent and extended as necessity required. To fly they cannot be precisely said, because they are carried into the air by external motive; but they can, when the wind will suffer them, flie their course, and perhaps mount or descend at pleasure; and in rowing themselves along the air, it is observable that they ever take their flight backwards. It is feasibly credible to what height they will mount; which yet is precisely true, and may be easily observed by any one that shall fix his eye some time on any part of the heavens, the white webs at a vast distance very distinctly appearing from the azure sky; but this is in autumn only, and in very fair and calm weather. Such are briefly the remarks of Dr. Lillie, to which may be added part of his letter to Mr. Ray on the same subject: "Last October, &c. I took notice that the air was very full of webs; I forthwith mounted to the top of the highest flceple on the Minster (in York), and could there discern them exceeding high above me." He further observes, that they not only thus shoot their threads upward, and mount with them in a line almost perpendicularly; they also project them in a line parallel to the horizon, as may be seen by their threads running from one wall to another in a house, or from one tree to another in a field, and even from wall to wall across gardens of considerable extent.

The matter of which the spider's web is formed, as before observed, is a vivid juice produced in the body of the creature, and emitted from the tracts at the extremity of the abdomen. The apertures in these are numerous, and according to Reaumur, there are enough even in the compass of a pin's head to yield an amazing number of distinct threads. The holes are perceived by their effects: to take a garden spider ready to lay its eggs, and apply the finger on a part of the paper, and as you withdraw the finger a vast number of distinct threads will appear. Reaumur has often counted seventy or eighty with a microscope; but has observed that there were infinitely more than he could tell. In effect, if he should say that each tip of a papilla furnished a thousand, he is assured he would say much too little. The part is divided into an infinity of little prominences, like the eyes of a butterfly. Each prominence, no doubt, makes its several threads; or rather between its several protruberences, there are holes that give vent to threads; the use of the protruberences, in all probability, being to keep the threads adhurder, at their first exit before they are yet hardened by the air. In some spiders these protruberences are not so sensible; but in lieu thereof there are tufts of hairs which may serve the same purpose, viz. to keep the threads at a proper distance from each other. By this it will, there may threads come out at a thousand distinct places in every papilla; consequently the spider having five papille, has holes for above five thousand threads.

Such is the tenacity of the threads in the larger fort of spiders, but if we examine the young produced by those, we shall find that they do sooner quit their egg than they begin to spin. Indeed their threads can scarcely be perceived, but the webs may: they are frequently as thick and clothe as those of the house-spiders; and no wonder, there being four or five hundred little spiders concurring to the same work. How minute must the apertures in the papille of these spiders be! The whole spider is perhaps less than a papilla of the parent which produced it. But there are even some kinds of spiders so small at their birth, that they are not visible without a microscope. There are usually found an infinity of these in a cluster; they only appear like a number of red points; and yet there are webs found under them, though well nigh imperceptible. What must be the tenacity of those web-spiders? Leeuwenhoek has computed that one hundred of the single threads of a full grown spider are not equal to the diameter of the hair of his beard; and consequently, if the threads and hair be both round, ten thousand such threads are not bigger than such a hair. He calculates further, that when young spiders first begin to spin, four hundred of them are not larger than one which is of a full growth; allowing which, four millions of a young spider's thread are not so thick as the single hair of a man's beard.

Some experiments have been made to manufacture the threads of spiders into a kind of silk; and it is said that a short-legged species of garden-spiders yields a silk fearfully inferior to that of the silk-worm. The webs of some foreign species might even be employed with still greater propriety for this purpose, than those which inhabit Europe. A later writer, Sir G. Staunton, in " the Embassy to China," alludes to this when speaking of the Java forests. " In some open spots (says that author) were found webs of spiders, woven with threads of so strong a texture, as not easily to be divided without a cutting instrument; they seemed to render feasible the idea of him who, in the southern provinces of Europe, proposed a manufactury of spiders' threads, which was so ridiculous to the eyes of those who have only viewed the limy webs such insects spin in England."
or two left in each cell; and to this inclination of devouring their own species in common with any other insect they can overcome, Rannier ascribes the fecundity of spiders, considering the vast number of eggs they lay.

But this is not all; he affirms, and it is well known since, that the spider's bag is inferior to that of the silk-worm, both in strength and ifyre, and produces less of the material proper to be manufactured. The thread of the spider's web, he says, can only bear a weight of two grains without breaking; and that of the bag bears thirty-fix. The latter therefore, in all probability, is eighteen times thicker than the former; yet it is weaker than that of the silk-worm, which bears a weight of two drams and an half.

So that five threads of the spider's bag must be put together to equal one thread of the silk-worm's bag. Now it is impossible these should be applied so justly over one another as not to leave little vacant spaces between them, whence the light will not be reflected; and of consequence, a thread thus compounded must fall short of the lisle of a solid thread. Add to this, that the spider's thread cannot be wound off as that of the silk-worm may, but must of necessity be carded; by which means being torn in pieces, its evenness, which contributes to its lisle, is destroyed. In effect, this want of lisle was taken notice of by M. de la Hire, when the flockings were presented to the Academy. Again, spiders furnish much less silk than the worms: the largest bags of these latter weigh four grains, the smaller three grains; so that 23,648 worms produce a pound of silk. The spiders' bags do not weigh above one grain; and when cleared of their dust and fift, lice two-thirds of that weight. The work of twelve spiders, therefore, only equals that of one silk-worm; and a pound of silk will require at least 27,648 spiders. But as the bags are wholly the work of the females, who spin them to deposit their eggs in, there must be kept 55,296 spiders to yield a pound of silk: yet this will only hold good of the best spiders; those large ones ordinarily found in gardens, &c. scarcely yielding a twelfth part of the silk of the others.

Two hundred and eighty, it seems, of these would not yield more than one silk-worm; 663,552 of them would scarcely yield a pound.

The act of generation among spiders varies in different species. As these insects prey upon each other, except during the time of their amours, they dare not come within reach of one another but with the utmost caution. They may be sometimes seen stretching out their legs, shaking the web, and tampering with each other by a light touch with the extremity of their feet; then, in a fright, dropping hitherto down their thread, and returning in a few moments to make a fresh trial by feeling. When once both parties are well allured of the sex they have to deal with, the approaches of their feet in order to feel are more frequent, confidence takes place, and amorous dalliance ensues.

"We cannot," says Lyenont, "but admire how careful they are not to give themselves up blindly to a passion, or venture on an imprudent lep, that might become fatal to them." A caveat this to the human kind. Lifer and Lyonnet, two accurate observers, say, that the extremity of those arms or claws, which the spider nies to grasp his prey with, suddenly opens, as it were by a spring, and lets out a white body, the sexual organs in the male; those of the female are beneath the abdomen; a fact which later naturalists have ascertained.

Thesequulating animals, in every stage of their existence, preying with the most savage ferocity upon all insects they can overcome, and also upon one another, as already observed. They cast their silks once in a year, and this they perform by suspending themselves in some corner, and creeping out of it. In respect of colour, they vary greatly in individuals of the same species. The fphex and ichneumon are their mortal enemies.

The weapon wherewith the spiders seize and kill their prey is a pair of sharp crooked claws, or forceps, placed in the tergum of the head. They can open or extend these pincers as occasion may require; when undisturbed, they suffer these to lie one upon another. Lecouwenhoek says, that each of these claws has a small aperture, or slit, through which he supposes a poisonous juice is injected into the wound it makes. Dr. Mead, in his Essay on Poisons, differs from this opinion altogether, having never been able, on repeated examinations, to discover any such opening, not even in the claws of the largest spiders; which being above fifty times larger than any of the European spiders, would have more easily afforded a view of the opening, if nature had allotted any to this part of the animal. Besides, repeated observations also convinced him that nothing dropped out of the claws of the living spider when he bit any thing, because they were always perfectly dry; but that a fluid profusely was at the same time thrust out of the mouth, which unfilled a liquor into the wound. And the same writer observes, that the quantity of liquor emitted by the common spiders when they kill their prey is visibly very great, and these wounded instruments (the claws) at minute, that they could contain but a very inconsiderable portion thereof, if it were to be discharged through them. In justice to this remark of Dr. Mead, it may be added, that though there is an apparent groove or indentation visible on these fangs, in some very gigantic species, they do not appear to be perforated; and in general they are smooth without even this apparent indent. The form of the fang may be compared in some respects to those of a poisonous snake: the latter, beside the aperture at the base, has a linear opening near the tip; and through this, and perhaps the other also, it discharges a mortally poisonous fluid into the wound it inflicts, in the same manner as the spider is supposed to do: now, in some great spiders, these fangs are nearly, if not quite, as large as those of a rattle-scare of a moderate size; and yet, in such an aperture, if it does really exist, is not only invisible to the naked eye, at the same time that they are sufficiently obvious in the fang of the snake, but appears even dubious under the most powerful glass with which the claw can be examined. Thus, before said, a kind of groove or indented in the claws of some species; but whether they answer the above purpose, or are even perforated, is a point on which the naturalist must decide with caution.

The silks that have been fed, and are found in the webs, being dry and transparent, have also the claws attached to them; and these may be more easily examined than in the living spider.

Araecia, in Mineralogy, a silver ore found only in the mines of Potosi, or in the finge mine there of Catamito. It owes its name to some resemblance it bears to a cobweb, being composed of threads of pure silver, which to the sight appear like a silver lace when burned to separate the silk from it. It is the richel of all kinds of silver ore.

Araeaea Tonicia. See Arachnoides.

Araeiformis, in Entomology, a species of Cerambyx. The thorax is spinous and tuberculated; wing-cases porous; antennae long, with a fingle tooth on the fifth joint. Fabr. Spec. Inf. Of. Gmelin misquotes the Fabrianian character, "articulo quinto unidentato," for "articulo quinto barbaro," p. 1819. "This insect inhabits South America."

Araeiformis, in Natural History, a species of Echium. It is orichal, grey, with blaining greyish-purple.
spines, which are thicker in the middle. This is Echinomorpha mutipila f. Minosiflora Americana of Seba; and Spina-cekoff, Pflie. Zee-egl. Inhabits the American tans. Gemelin.

ARANEOIDES, in Entomology, a species of CINEX, in the section "oblongus." It is yellow, with very long legs, and inhabits Germany. Schaff. Gemelin.

ARANEOUS, a species of CANEX, found in the European seas. The thorax is ovate, tuberculated, and hairy; front bin; claws ovated Linn. Fabr. Gemelin.

ARANGAS, in Ancient Geography, a mountain placed by Ptolemy in the interior Syria.

ARANGHERA, in Geography, one of the Bifflages islands in the Atlantic, at the mouth of the river Grandi, near the coast of Africa.

ARANIMEGIES, a small but beautiful town of Hungary, in the country of Zatmar, situate in the middle of a plain between the rivers Samos and Tur; three leagues north-eaft of Zatmar.

ARANISO, a river of Transylvania, which rises near Clujemburg, and joins the Marich.

ARANJUEZ, a village and royal palace of Spain, in New Calbros, situate on the Tagus, six leagues north-eaft of Toledo, and ten fouth of Madrid.

ARANJUEZ, a town of South America, in Mexico, in the province of Costa Rica.

ARANNOS, a town of Spain, in Navare, three leagues from St. Efevan.

ARANTA, a sea-port town of South America, in Peru, and jurisdiction of Arequipa, with a deep harbour and narrow entrance; ten leagues south-well of Arequipa.

ARANTIA, in Ancient Geography, a country of Pelopon- aeus, according to Pausanias; and also a town of the fame country, situate on a bill, called "Arantius Collis."

ARANTITUS, JULIUS CESAR, in Biography, a cele-bated anatomist and phyfician, born at Bologna, about the year 1530; studied under his uncle Bartholomew Maggius, and under Vesalius; and took his degree of Doctor in Medicine, and was afterwards made professor of medi-cine, anatomy, and surgery, in the fame university; in which situation he continued to the time of his death, in 1589. He was indefatigable in his researches into the structure of the human body, which he took every oppor-tunity of difsecting and examining. In his first work, "De humano favo," published at Rome, in 1574, he corrected many mistakes of former anatomists, in their description of the uterus, which they had generally taken from brutes. He properly describes the velum of the uterus as derived from the perranetics and hypogastrics. He described the fornemen ovale, and ductus anteriores in the fawus; and denies the existence of urachus, or of allantoid membrane, in the human subject. This book has been frequently re-published. In 1579, he published "In Hippocratem de vulneribus capitatis brevis commenrarius;" and in 1581, "De tumoris praeter naturam hiber," 4to; in which he describes a pair of forer was he had contrived to extract polyipi from the nostrils. He showed there was no cagage from the right to the left ventricle of the heart, but that the blood was carried from the heart, through the lungs, by the pulmonary artery; thus making one step towards the discovery of the circulation of the blood, which was after-wards completed by Harvey. Halier Biblroph. Anat. et Bib. Chirurg.

ARANYVAN, in Geography, a fortrees of Transylvania, in the county of Weilmberg, on the north side of the Marich, five miles north of Millenbach.

ARAPABA, in Botany. See Spigelia.

ARAPHA, in Ancient Geography, an island which belonged to Caria. Steph. Byz.

ARAPUS, the name of a river of Carmania, according to Ptolemy.

ARAYAS, in Geography, a town of Spain, in Arragon, four leagues north-north-west of Jaca.

ARAVUL, a town of Spain, in Navare, five leagues west of Pampluna; supposed to be the ancient Arcuillum, or Arocotes.

ARAR, in Ancient Geography, the Salinc, a river of Celtic Gaul, which, according to Cesar, separated the territory of the Sequani from that of the Aoins; and the course of which is to flow, that its motion cannot be perceived; whence Pliny calls it "the sluggish river," and Silius Italicus describes it (ib. xv. v. 544. p. 773. ed. Drakob.) to the fame purpose:

"Quorum ferpit Arar per rura pigrissimum undas."
