VOL. IV.
BATTERY. 

Battery Point, in Geography, lies on the north or starboard shore of the channel of Cork, in Ireland.

Battery, formed of batter, to beat or strike, in the Military Art, denotes an eminence cast up, on which to plant artillery, that it may play to better advantage. It consists of an encausale, parapet, or breast-work, about eight feet high, and eighteen or twenty thick. The platform of a battery is laid with planks, that the wheels of the carriages may not sink; and it is made sloping towards the parapet, that the guns may not recoil much, and that they may be more easily drawn back. See Plate II. Porif. fig. 21. fig. 2, and Plate VII. fig. 38.

In all batteries, the open spaces left to put the muzzles of the great guns out at, are called embrasures; and the spaces between the embrasures, merlons. The guns are generally from twelve to sixteen feet distant from one another, that the parapet may be strong, and the gunners may have room to work.

There are also batteries of mortars, the fame with those of canons, except that they have no embrasures; the flaps being fired over the parapet, commonly at an angle of 45° elevation; and the slope of the breast-work is made inwards, contrary to that of other parapets, having their platforms about six feet square and eight feet aunder.

The battery of a camp is usually surrounded with a trench and pales at the bottom, as also with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or certain places of arms, capable of covering the troops which are appointed for their defence.

All field batteries consist of four parts, viz. the ditch, the parapet, the platform, and the magazine; which see respectively.

The Sieur Remy, in his Memoirs of Artillery, has given a table for the ready finding of all the requisites for the construction of temporary batteries, and for their daily service, the pieces being twenty-four pounders; and although these batteries are calculated only for sieges, and are of the lesser kind, yet from this table may be derived such notions as will greatly help young artilliers on other occasions.

It is also proper to mention the number of fascines and pickets that is usually expected every day from the labour of each man employed in that service.

Of fascines five or six feet long, and five or six inches thick, bound with two with hands each, one man will make 16 or 18 in a day, with two pickets to each.

Of fascines eight or nine feet long by eight or nine inches thick, with two pickets to each, one man usually makes 10 or 12 in a day.

Of fascines 12 feet long by nine inches thick, with three pickets to each, eight or ten are usually expected from the day's work of one man.

The days here understood are such in which the men may work about twelve hours.

In the following table C. stands for hundred.
When batteries are erected at leisure, and are designed to stand for some years, they are built of stone, or brick, or good loamy earth, as the materials may be most easily procured.

To construct the profile of a battery, let its ground line be AB (Plate II. Fort, to fig. 23, No. 2.). BD that of the parapet, the inner slope of which is formed by making DA = 1 foot, and the perpendicular a H = 6 or seven feet; the crown of the parapet HI is formed by making BI a foot or two lower than a H; and the front of the battery IB is found by making IB = ¾ BI when of earth, or = ½ BI when of marram. If DC be made = 2 or 3 feet, we shall have C the fill of the embrasure, the floor of which may be any foot or two below the level line CF. The platform DE is 18 or 20 feet, the tail EF rising about 6 inches above the level line AB; the lower double line represents the sleeper laid lengthwise, and the upper double line shaded with the lines across shews the ends of the planks laid on the sleepers.

A gun on its carriage, with the wheels against the knocker at D, is annexed to the figure, for the purpose of showing the apprehension. For the construction of the embasures, merlons, ramps, &c., see the articles respectively.

**Battery, Open,** is nothing more than a number of cannon, generally field pieces, or such as carry a ball not exceeding nine pounds weight, ranged in a line or row a-breast of one another, on some small natural elevation of the ground, or an artificial bank about a yard or two high. These cannons are ranged at the distance of about 15 or 16 feet from one another; their shot and loading utensils lying by their sides, and the powder lodged in a hole at some distance behind the battery.

**Battery, Covered,** is the case when the cannons and gunners are covered by a bank made of broad-wood, faggots, and earth; about eighteen or twenty feet thick, and seven or eight feet high. The cannon used in such batteries are generally from nine to eighteen pounds; sometimes twenty-four pounds are used in them. See Fascine Battery.

**Battery, sunk or buried,** is that whole platform is sunk or let down into the ground, with trenches cut into the earth against the muzzles of the guns, to serve for embrasures.

This fort, which the French call batterie en terre, and ruimante, is generally used upon the first making of approaches, to beat down the parapet of the place.

**Batteries, Cross,** are two batteries at a considerable distance from each other, which play athwart one another at the same time, and upon the same point, forming right angles; so that they thus combine and produce a greater effect;
effect; because what one bullet shakes, the other beats down.

Battery or Barbet, Barbet, or Open Battery, is a name given to a battery, when the floor of part of it is so raised that the guns placed on it have an advantageous command over some part of the neighbourhood, and when the guns thus raised fire over the crown of the parapet without any embrasure. These barbets may be made either in a curtin, or at the falant angle of a flanker. They should be always 25 or 3 feet lower than the crown of the parapet, and about 8 or 9 yards broad at the top, with a proper slope to the base, of a length suitable to the number of guns to be mounted on them, allowing about five or six yards for each, and at each end have a proper ramp for ascending them.

For the further illustration of their nature and construction, let PQRSTV (Plate III. Fortis, fig. 25.) be a common bank of a line, the parapet of which is RSTV; the inner slope RS being about 6 or 7 feet higher than Q R; then the bank sam R, raised so high that the cannon may fire over the crown of the parapet ST, is the barbet, the height of which sp is about 3 or 4 feet. On the top of the barbet is raised a platform, as in other batteries. Let the figures 26 and 27 represent part of the plan of a line, and one of its flankers, or of a battery constructed in such a form; where Aa is the length of the barbet, or raised battery, suited to the number of guns to be used, which are to be drawn up the ramps placed at the ends; the breadth being about 8 or 9 feet, and the length a about 7 or 8 yards.

Battery, Crown. See Cavalier.

Battery d'Engin, is one which sweeps the whole length of a straight line, &c.

Battery en Échafaud, is that which plays obliquely.

Battery de Revers, or Murdering Battery, is one that plays on the back of any place; and being placed on an eminence, fees into it.

Battery joint, or par caméra, or camérette, is when several guns play on the same time upon one place.

Battery en Rouage, is that used to dismount the enemy's cannon.

Battery à Ricochet, is adapted to the method of ricochet firing, first invented and practised by Vauban, at the siege of Ath in 1692. The guns are loaded with small charges, and are elevated, so as to fire over the parapet; and the shot is hereby made to roll along the opposite rampart. This method of firing with guns has since been applied to mortars and howitzers with success.

Battery, Coffin, is that where the sides of the wall and embrasures only are formed of faèaines, and all the cavities or enclosed spaces filled with earth.

To construct a battery of this kind, mark out with a line the limits of the parapet eighteen or twenty feet thick; and three or four feet before the parapet, mark out with lines or marks the limits of the ditch, ten or twelve feet broad, or even more, if earth is wanted; allowing eight yards in length for one gun, and fix yards more for every other gun. On the outlines of the parapet cut a trench five or six inches wide and deep, and throw a row of faèaines, the ends being jammed one into the other; and let them be flanked down. Lay on them another row, so that the joinings of those may not be directly over the joinings of the lower one, and let all the knots of the hands be turned inward; flake these down; and on them lay in like manner a third and fourth row, &c. until the height be about three feet. The same kind of work being done at the ends, and for the encaissement if wanted, the coffers for the wall will be finished. Then let the men be disposed along the place intended for the ditch, and with proper tools break the ground and throw it into the coffers; where, as the earth is thrown in, other men are to spread it, and ramp it down with rammers; and thus the coffers is to be filled. When the wall is finished, let the embasures be flaked out (see Merlon), and a coffin formed in like manner for each merlon, which is also to be filled with earth, and rammed down. Proceed to complete it in the same manner with Fascine Battery.

Battery, Palatin. See Fascine Battery.

Battery, Gabion. See Gabion.

Battery, in Law, denotes an act that tends to the breach of the peace of the realm, by unlawfully lighting, beating, or offering other violence to another person.

Battery is frequently confounded with affiault, though in law they are different offenses; because, in the trespas for assault and battery, one may be found guilty of the affaault, yet not convicted of the battery; there may therefore be affault without battery; but battery always implies an affault. The least touching of another's person willfully, or in anger, is a battery; so that the law cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it; every man's person being sacred, and no one having a right to meddle with it in any the slightest manner. Upon a similar principle the Corianian law "de injuriis" prohibited "pulution" as well as "verberation;" distinguishing verberation accompanied with pain from pulution without any. However, battery is in some cases justifiable or lawful; as where one who hath authority, a parent or master, gives moderate correction to his child, his scholar, or his apprentice. Thus also on the principle of self-defence, if one strikes me first, or even only afflicts me, I may strike in my own defence, and if seized for it, may plead "for affaault done me," or that it was the plaintiff's own original affaault that occasioned it. So likewise in defence of my goods or possessions, if a man endeavours to deprive me of them, I may justify laying hands upon him to prevent him, and if he perfid in violence, I may proceed to beat him away. 1 Finch. L. 203. Thus too, in the exercice of an office, as that of churchwarden or beadle, a man may by hands upon another to turn him out of church, and prevent his disturbing the congregation. 1 Sid. 301. And if sued for this or the like battery, he may set forth the whole cafe, and plead that he laid hands upon him gently, "moliter manus imposuit," for this purpose. On account of these causes of justification, battery is defined to be the"unlawful" bowling of another; for which the remedy is, as for affaault, by action of trespas "vi et armis," in which the jury will give adequate damages. Atrocius battery is subject to trial by inquisition in pursuance of the order of the court; in which case the battery must be alleged to certainly in the declaration, that it may appear to be the same with the battery inflicted. In the case of a person's beating the servant of another, besides the remedy of an action of battery or imprisonment, which the servant himself may have against the aggrieved, the master, as a recompence for his immediate loss, may maintain an action of trespas "vi et armis," in which he must allege and prove the special damage he has sustained by the beating of his servant, "per quod tertium amitit," and then the jury will make him a proportionable pecuniary satisfaction. A similar practice obtained among the Athenians, with whom no party is entitled to an action against such as beat or ill-treated their servants. A person guilty of battery against a clergyman, is liable to three kinds of prosecution for the same offence; an indictment for the breach of the king's peace, a civil action for damages, and a suit in the ecclesiastical court; toll, "pro correctione et salu animi" by enjoining penance, and then
again for such sum of money as shall be agreed on for taking off the penance enjoined; it being usual in these courts to exchange their spiritual centers for a round compensation in money (2 Rolls Rep. 384); probably, says judge Blackstone, because poverty is generally observed by the moralists the hell medicine "pro salute animae," El. Com. vol. iii. and vol. iv. Batteries is sometimes used in speaking of the fabric of metallic utensils. In this fence, battery-works include pots, saucepans, kettles, and the like vessels, which, though cast at first, are to be afterwards hammered or beaten into form.

Some make battery for the kitchen, batterie de cuisine, comprehend all utensils for the service of the kitchen, whether of iron, brads, copper, or other matters. Others take the term in a narrower fence, and restrain it to utensils of brads or copper. A society for the mineral and battery work of England was incorporated by queen Elizabeth.

Battery, in Electricity, is a combination of coated surfaces of glafs, so connected together, that they may be charged at once, and discharged by a common conductor. Mr. Gralath, a German electrician, was the first who contrived to increase the shock, by charging several phials at the same time. Dr. Franklin, after he had analyzed the Leyden phial, and found that it lost at one surface the electric fire which it received at the other, constructed a battery, consisting of eleven panes of large flat-glês, coated on each side, and connected in such a manner that the whole might be charged together, and with the fame labour as one single pane; and by bringing all the giving sides in contact with one wire, and all the receiving sides with another, he contrived to unite the force of all the plates, and to discharge them at once. A more complete battery is described by Dr. Priestley, of which he says, that after long use he sees no reason for wishing the least alteration in any part of it. This battery (see Plate I. Electricity, fig. 1.) consists of 64 jars, each ten inches long, and 24 inches in diameter, coated within 1/4 inch of the top; and contains in the whole 32 square feet. The wire of each jar has a piece of very small wire twisted about the lower end of it, to touch the inside coating in several places; and it is put through a pretty large piece of cork, within the jar, to prevent any part of it from touching the sides, which would tend to promote a spontaneous discharge. Each wire is turned round, so as to make a hole at the upper end; and through these holes a pretty thick brass rod with brass knobs, one rod serving for one row of the jars. The communication between these rods is made by laying over them all a thick chain. When part only of the battery is used, the chain is laid over as many rods as will furnish the required number of rows of jars. The bottom of the box, in which the jars stand, is covered with a plate of tin, and a bent wire touching the plate passes through the box, and appears on the outside. To this wire any conductor designed to communicate with the outside of the battery is fastened, as the small wire in the figure, and the discharge is made by bringing the brass knob to any of the knobs of the battery. When a very great force is required, the quantity of coated surface may be increased, or two or more batteries may be used. Franklin's Exp. and Obs. ed. 1769, p. 28. Priestley's Hist. &c. of Electricity, ed. 1775, vol. ii. p. 99.

However complete the battery above described appeared to be at the time of its construction, later electricians have discovered many imperfections to which it was subject; of which the principal are those that result from the form and size of the jars, the subsistence of the glês, the height of the coating, and the connections within the battery. In consequence of these imperfections in its structure and constitution, it is prevented from receiving more than about half the charge which it ought to receive in proportion to the quantity of its coated surface. The most perfect batteries of modern construction, since that of Dr. Priestley, have been made in Holland for Teyler's museum at Haarlem, by Mr. Cuthbertson of Poland-street, London, then residing at Amsterdam. Of these batteries there are two, differing in their magnitude and mode of construction, but allowed to be equally perfect. The first was completed in the year 1784, and is composed of 135 jars in nine boxes, each containing 15, which may be used separately or connected. As the nature of the experiment requires. Each box is a separate battery of itself; and the description of one box with a view of the figure, will be sufficient for explaining its construction and use. In Plate I. Electricity, fig. 2. It is exhibited a perspective view of Teyler's first battery, with its parts arranged in proper order for receiving a charge from the electrical machine. Each box, as we have already observed, contains 15 jars; each jar is 11 inches high, and 6 inches in diameter, contracted at the mouth to 4 inches, and coated so as to contain about 140 square inches; and thus the whole battery will contain about 132 square feet of coated surface. Each box is divided into 15 partitions, 5 of which are in the length and 3 in the breadth; the height of the sides of the box being somewhat lower than the coating of the jars, as are also the partitions in which they stand. The lid of the box is made without hinges, for the convenience of removing it from the box, that it may be removed while experiments are performed. It is taken off by lifting it upwards. The outside coatings of the jars are connected by means of crofs wires passing under the bottom of each jar; and those on the inside by means of a brass frame, bearing 15 brass balls, fixed upon the frame above the centre of each jar. All these balls, excepting the four at the corners, have wires screwed to them and hanging downwards into the inside of each jar; but the wires of the four corner jars are screwed to a post, which is cemented to the bottom of each in the inside. Upon these wires the whole frame rests, and is kept in its proper position. The four corner balls have holes, which receive the ends of the wires, and terminate at a proper height from the jars. By this contrivance the inside connecting frame may at any time be easily removed; and as this part of the machine is important, the construction of the whole frame is shewn separated from the battery in fig. 3. It is according to the above construction that Mr. Cuthbertson forms his present batteries, excepting that he has increased the size of the jars, so as to make one battery contain about 175 square feet, and he engages to prove by experiment, that the batteries of his construction are far superior to any others. Teyler's second grand battery was finished by Mr. Cuthbertson in 1789. This is the largest and most complete battery that was ever made. The whole battery, standing in proper order for receiving a charge, is exhibited in fig. 4. It consists of 100 jars of the same shape with that of those already described, only that they are so enlarged in size, that each of them contains 51 square feet of coated surface, instead of 140 inches, and the whole battery contains 5500 square feet of coating; and for convenience, it is put into four separate cases, each containing 25 jars in the form of a square, 5 on each side. The boxes are lined with lead on the inside for forming the outside communication; each jar has a perpendicular fland resting upon its bottom, and supported from falling sideways by three stays on the inside. Upon the top is screwed a three inch brass globe, from which proceeds a brass tube about one inch in diameter,
BATTERY.

Inflations when piles are erected perpendicularly either with two metals or with one metal, in consequence of the oxidation and the loss of moisture from perspiration and evaporation, the electrical action usually ceases after a few days; and in order to renew it, a second conjunction of the piles becomes necessary. Several methods have been proposed for making inflations more permanent in their operation than the pile, and more easily rendered active; but the most ingenious contrivance appears to be that of the trough, discovered by Mr. Crutcher. It consists of a box of baked wood, in which plates of copper and zinc, or of silver and zinc folded together at their edges, are cemented in such a manner as to leave a number of water-tight cells, corresponding to the number of the series: the arrangement becomes active when the cells are filled with the proper saline fluids; and it may at any time be easily freed from oxide by the use of muriatic acid.

In the common apparatus of Volta, that part bounded by the most oxidizable metal, as, for instance, the zinc, is found in a positive state, with regard to electricity, and the other part, as the copper, in a negative state; and when a communication is made between the two ends, by means of a conducting body, a constant circulation of electricity is established.

The electricity of the galvanic battery is capable of being partly transferred into the Leyden phial; and its effects, as has been fully shown by the experiments of Meffrs. Nicholson, Carlile, Woolaston, Van Marum, and Ritter, are similar to those of common electricity, in a low state of intensity. It gives shocks to living animal organs, and excites muscular contractions in bodies for a considerable time after death. It affords the form of fire in passing from one conducting body to another in its highly concentrated state; and it ignites small metallic wires or leaves, and causes them to enter into combustion. It sets fire to charcoal, sulphur, alcohol, and other inflammable bodies; and it rapidly decomposes water and various other fluids.

The intensity of the electricity in Galvanic batteries is greater in proportion as the series composing them are more numerous: but the quantity of it depends upon the quantity of surface they contain. Hence equal numbers of large and small plates arranged in different batteries produce nearly the same effects on the human body which is an imperfect conductor, and which can admit of the passage only of a certain quantity of electricity of a low intensity in a given time; but the large plates are in a determinate ratio, much more powerful in igniting the metals, and in affecting perfect conductors through which a large quantity of electricity, in any state of intensity, easily and instantly passes.

Many important philosophical discoveries, which will be fully described in the article GAlVANISM, have been already made, by means of the galvanic apparatus, in different parts of Europe; and a number of enlightened experimenters have been employed in investigating the principles on which its operation depends. The theory of it is, however, as yet obscure, and the perfect development of it will probably be connected with views more profound than any that have been as yet obtained, with the nature and agencies of electricity, and its relations to chemical changes. See Phil. Trans. for 1800 and 1801. Nicholson's Journal, vol. iv. and v.; and vol. i. of the series. Journals of the Royal Inf. vol. i. Tillich's Phil. Mag. vol. x. xi. and xii. Annalen der Physik. Journal de physique: Annales de Chimie.

BATTEURS d'Artillerie, fronts or horsemen, sent out before, and on the wings of an army, two or three miles, to
make discoveries, of which they are to give an account to the general. See SCOUTS.

BATTLE, CHARLES, in Biography, honorary canon of the church at Rheims, which was his native city, became professor of philosophy at the Royal College of Paris, and distinguished himself by his judgment, learning, and character. He was chosen a member of the Academy of Inscriptions in 1759, and of the French Academy in 1761. His death, which happened at Paris in 1780, is supposed to have been accelerated by the chagrin resulting from the want of succession of the elementary works which he drew up by order of government, for the use of the military school. His chief publications, written in French, are the following: "A Translation of the Works of Horace," 2 vols. 12mo; "The Morals of Epictetus, extracted from his own writings," 12mo. 1758; "A Course of the Belles Lettres," 5 vols. 12mo. 1760; to which are annexed his treatises, before published; "The Fine Arts reduced to a simple Principle," and "On Oratorical Composition;" "History of Primary Causes," 8vo. 1769. "The Four Poetics of Aristotle, Horace, Vida, and Boileau, with Translations and Remarks," 2 vols. 8vo. 1771; "Elements of Literature, extracted from the Course of Belles Lettres," 2 vols. 12mo.; "Elementary Course for the Use of the Military School," 4 vols. 12mo.; and "Translations of Ocelus Lucanus, and Timaeus Lucrensis." Nouv. Dict. Hist.

BATTLE, WILLIAM, born in Devonshire, in 1721, received his education at Eton School, whence he went in 1722, to King's College in Cambridge. On the death of his father, his mother moved to Eton, and afterwards to Cambridge, that she might be near her son, and assist in defraying his expenses. The Craven Scholarship becoming vacant soon after his admission, the Doctor offered himself as a candidate, and had the good fortune to be successful. Of the importance this small stipend, only 25l. per annum, was to him, we may judge, from what he says on the subject, in a letter to a friend. "I shall now," he says, "begin to live agreeably, and have, I hope, got through the worst part of my life." A recollection of the utility of this stipend to him, is probable. Bowyer says, induced him, in the latter part of his life, to found a similar scholarship, at the same university. Pursuing his studies, in 1726, he was made Bachelor, and in 1732, Master of Arts; he was also now one of the Fellows of the College. In 1729 he published a specimen of an edition of Icocrates, in one volume 8vo. He at first proposed studying the law, and his finances not being equal to the expense of taking chambers in one of the inns of court, in London, he communicated his intention to two wealthy cousins in the city, of the name of Coleman; but as they declined affording him, he turned his mind to the study of medicine, and in 1737, he took the degree of Doctor in that faculty. For a short time he practised medicine at Cambridge. Removing thence, he went to reside at Uxbridge, where, acquiring the confidence of some of the principal families in the neighbourhood, he soon came into considerable practice. About the year 1739, he married the daughter of Barnabas Good, one of the masters of Eton, having kept up an intimacy with the lady from the time of his quitting the school. He was also now noticed by his relations, the Colemanas, who were so much gratified by the confidence to which they saw him rising, that the survivor of them left him 30,000l. Continuing a few years longer at Uxbridge, he at length removed to London. In 1745, we find him, Fellow of the College of Physicians. The same year he spoke the Harveian Oration, which was published the following year. About the same time he was elected Fellow of the Royal Society. In 1749, he completed his edition of Icocrates, which was published in two volumes, 8vo. Though this work was not well received by the critics, it was always a great favourite with the Doctor. The year following he experienced a serious mortification. For taking an active part in a dispute between the College of Physicians and Dr. Schomberg, and being one of the most strenuous in opposing his admission as Fellow, he was held up to ridicule in a satirical poem, under the name of the Battand, in which a ludicrous account is given of the dispute, as well as some severe sarcasms on his favourite work. The Battand is supposed to have been the joint production of Mofes Mendez, Paul Whitehead, and Dr. Schomberg. It was published, at the time, in folio, and afterwards, in 1766, in a collection of humorous pieces, in 2 vols. 8vo. Another edition of this collection, much enlarged, was printed in 1792, in 4 vols. 12mo. There being at this time but one public asylum in London, for the reception of insane persons, which had been long found insufficient to contain all the indigent objects labouring under this affliction, a subscription was set on foot by some wealthy and benevolent individuals, to erect another edifice for the purpose, on the plan of Bethlehem Hospital. The scheme was so much approved, and so largely patronised, that in 1751 the managers of the fund were enabled to take, and fit up, a large building on the north side of Moorfields for the purpose, and as Dr. Battle had been very active in promoting the subscription, he was appointed physician to the institution, which was called St. Luke's Hospital. It contained one hundred and ten beds, twenty of which were appropriated to recent cases, such as were suppos'd capable of being relieved, or cured by medical treatment, and thirty for old and incurable cases. By the good conduct of the managers, and the character the charity thence acquired, the committee found themselves enabled, in 1781, to take a piece of ground, in Old Street, and erect a large and magnificent building for the reception of the patients, who were removed into it in 1786. The new building contains beds for 185 recent and incurable patients, and for 120 incurables. The present physician, who was elected into the office, in 1781, is Dr. Samuel F. Simmons. In 1757 Dr. Battle published a treatise on Madness, 4to, in which, having thrown out some censures on the medical practice formerly used in Bethlem Hospital, Dr. John Monro, whose father was implicated in the censures, replied, rebutting his charges, and having humorously taken for the motto to his remarks, "O major tandem parcas infane minori," the Doctor was afterwards called by the wits, Major Battle. In 1762 he published "Aphorismi de cognoscendis et curandis morbis nonnullis, ad principia animalia accomodati," taken principally from his Limieilian lectures. In February 1764 he was examined before a committee of the House of Commons on the state of the private mad-houses in the kingdom, which he shewed them, from instances that had fallen under his notice, to be so ill conducted, as sometimes to be used as prisons for persons whose relatives were interested in getting them out of the way. This gave rise to a series of regulations, made by the legislature, with a view of preventing the continuance of such practices; but they were not completely supressed until the year 1774, when the power of licensing private mad-houses was vested in the college of physicians.

As the Doctor had for several years confined his practice to maniacal cases, he had now leisure to indulge his inclination for building, to which he was much attached. Besides a large house, No. 88, Great Ruffell Street, Bloomsbury, for his town residence, he built an elegant villa at Twickenham, lately the residence of Countess Dowager Powlett. He also
BAT

also erected a more considerable house on the banks of the Thames, at Marlow, in Buckinghamshire, where he passed much of his leisure time, in the latter part of his life. These houses were built under the immediate inspection of the Doctor, and after his own designs. Horrid of a paralytic stroke, at his house in Great Ruffin Street, the 13th of June, 1636, aged seventy-two years. Having bequeathed, his great property, upwards of 90,000l. was divided between his three daughters, of whom the eldest was married to cap-
tain, afterwards admiral Sir George Young, who sold the
house at Marlow, called Court Garden, to Richard Daven-
port, esq. an eminent surgeon of Essex Street, in the Strand, 
London; the second, to Philip Rainleigh, esq. a gentleman 
of Corwall; and the third, to the late Sir John Call, baronet.

Battifolium, or Battifolium, in Antiquity, a
kind of tower or defence, frequently mentioned by Latin 
historians of the middle age. It seems to have been wood, and
have to be erected on sudden and hasty occasions.

BATTLE, in Geography, a small market town of Eng-
land, in a hundred of the same name, in Suffol, is situated six 
 miles from Hatfingon, and 56 south-east from London. It was 
originally called Epton; but the decisive victory at Hatlings, 
gained by William, duke of Normandy, over king Harold, 
induced the former, when he was fixed on the throne, and 
founded the abbey, to change the name of the town to that 
which at present it retains. Battle consists of one principal 
street, indifferently built; and the parish church is a neat 
building, the incumbent of which is daily dean of Battle. 
The inhabitants support also a charity school for forty boys. 
The gunpowder which is manufactured here is esteemed the 
best in Europe, and hence called "Battle powder," though 
the town cannot boast of any other trade. The neigh-
bourhood, however, is so fertile, that an incredible number 
of large cattle are constantly sent up to the London 
marts for sale, especially what are denominated half-fed 
oxen, which produce the largest beef in England. Henry I. 
granted a market to be kept on every "Lord's Day!" but 
Anthony, lord Montague, who, about 1600, built himself 
a beautiful seat here, obtained an act of parliament to change 
the market day to Thursday, as it now continues. Battle 
is reckoned unhealthy, on account of its low dirty situation. 
Its greatest boast is the magnificent abbey built by William 
the Conqueror, on Heathfield, near the town, in 1067, to 
compensate, in some small degree, for the effusion of blood 
the year before; the highest altar of the fabric standing 
on the very spot where the body of the brave but unfortunate 
Harold was found. This abbey was filled with Benedictine 
monks from Normandy, and endowed with such extensive 
privileges, that if a convict were passing to execution, it was 
in the abbé's power instantly to release him, should they 
meet on the road. At the dissolution its revenues were val-
ued at 885l. 14s. 7d. The ruins of the abbey are very 
fantastic; and what remains undestroyed, serves as a house 
for the family of Wedder, and for the purposes of the town, 
the gate-house being used as the hall in which are held fe-
rous and other meetings for this peculiar jurisdiction. From 
Standard and Tullman hills are very extensive prospects. A 
fait related of abbé Hamo, in 1351, is worth recording; a 
body of Frenchmen lording and attacking Rye and Winchel-
sea, Hamo raised whatever force he could collect, repaired 
with Winchelsea, and having fortified it as well as he was able, 
cheeked the progress of the enemy, till the force of the 
country was sufficiently powerful effectually to repel them. 
Battle has three fairs, and two hundred and ninety-four 
houses, inhabited by 2040 persons.

Battle Island. See Bay of St. Louis.

Bat, a river in New South Wales, which runs N.E. 
into Salbakawen river, S.E. from Manchester house.

Battle, or Battel, Wager of, in Law, a species of trial 
of great antiquity, which had its origin in the military spirit 
of our ancestors, blended with superlition, and which con-
stituted in a kind of appeal to Providence, under an apprehen-
sion and hope, however premonstrant and unwarrantable, that 
the most would give the victory to him who had the right. 
Concerning the early history and general course of this 
mode of trial, see Combat. This trial, which had borne the 
immemorial practice of all the northern nations, and which 
had been first reduced to regular and stated form among the 
Burgundians, about the close of the fifth century, and 
passed from them to the Franks and Normans, was introduced 
to England, among other Norman customs, by William the 
Conqueror; but it was only used in three cases, one military, 
one criminal, and the third civil: the first in the court 
martial, or court of chivalry and honour; the second in 
appeals of felony; and the third upon issue joined in a writ 
of right. In these writs of right, the "jus proprietatis" 
could not often be ascertained without difficulty; and this 
mode of determining it was allowed for the sake of such 
claimants as might have the true right, but yet by the death 
of witnesses, or other defect of evidence, be unable to prove 
it to a jury. Although the writ of right itself, and of 
course this mode of trial, be at present much disused, yet it 
is still law and in force, if the parties chuse to abide by it. 

The last trial by battle that was waged in the court 
of common pleas at Westminster, though one afterwards occurs 
in the court of chivalry in 1631, and another in the county 
palatine of Durham in 1638, was in the 13th year of queen 
Elizabeth, A. D. 1571; and was held in Tothill fields 
Westminster, "non sine magna juris consultorium perturbatione," 
says Sir Henry Spelman, who was himself a witness 
of the ceremony. The form of it, described by judge 
Blackstone, is as follows.

When the tenant in a writ of right pleads the general 
issue, viz. that he hath more right to hold, than the demand-
ant hath to recover; and offers to prove it by the body of his 
champion, which tender is accepted by the demandant; 
the tenant in the first place must produce his champion, who 
by throwing down his glove as a gage or pledge, thus wages 
or challenges battle with the champion of the demandant; who, 
by taking up the glove or glove, challenges his part to ac-
cept the challenge. The reason why it was waged by chams-
ions, and not by the parties themselves, in civil actions, is 
because, if any party to the suit dies, the suit must abate 
and be at an end for the present; and therefore no judgment 
could be given for the lands in question, if either of the 
parties were slain in battle; and also that no perfon might claim 
an exemption from this trial, as it was allowed in criminal cases, 
where the battle was waged in person.

A piece of ground is then in due time set out, of sixty feet 
square, enclosed with huts, and on one side a court erected 
for the judges of the court of common pleas, who attend 
there in their feaht robes; and also a bar is prepared for the 
learned sergeants at law. When the court sits, which ought 
to be by fun-rising, proclamation is made for the parties, and 
their champions, who are introduced by two knights, and 
are attired in a coat of armour, with red gauntlets, barefigured 
from the knee downwards, bareheaded, and with bare arms to 
the elbows. The weapons allowed them are only batons, or 
lasses, of an ell long, and a four-cornered leather target; so 
that death very seldom ensued this civil combat. In the court 
military indeed they fought with scorns and lance, according 
to Spelman and Rutherford; as likewise in France only 
well-sought fought with the buckler and baton, gentlemen armed at 

3 all
all points. And upon this and other circumstances, the presi-
dent Montefquieu hath, with great ingenuity, not only de-
pended the impious collusion of private duels upon imagin-
ary points of honour, but hath also traced the heroic madness of
knight-errantry, from the fame original of judicial combats.
Thus to proceed.

When the champions, thus armed with batons, arrive
within the lists, or place of combat, the champion of the te-
man then takes his adversary by the hand, and makes oath
that the tenements in dispute are not the right of the de-
mandant; and the champion of the demandant, then taking
the other by the hand, swears in the same manner that they
are; so that each champion is, or ought to be, thoroughly
perfused of the truth of the cause he fights for. Next an
oath against forcery and enchantment is to be taken by both
the champions, in this or a similar form; "hear this, ye
justices, that I have this day neither eat, drink, nor have
upon me, neither bone, flesh, nor gráfs; nor any enchant-
ment, forcery, or witchcraft, whereby the law of God may
be abashed, or the law of the devil exalted. So help me God
and his saints."  

The battel is thus begun, and the combatants are bound
to fight till the scars appear in the evening: and, if the
champion of the tenant can defend himself till the scars ap-
pear, the tenant shall prevail in his cause: for it is suffi-
fent for him to maintain his ground, and make it a drawn battel,
he being already in possession; but, if victory declares itself
for either party, for him is judgment finally given. This
victory may arise, from the death of either of the champions:
which indeed hath rarely happened; the whole ceremony, to
far the truth, bearing a near resemblance to certain rural
athletic diversions, which are probably derived from this
original. Or victory is obtained, if either champion proves
recreant, that is, yields, and pronounces the horrible word of
crawen: a word of dignity and obloquy, rather than of any
determinate meaning. But a horrible word it indeed is to
the vanquished champion: since as a punishment to him for
forfeiting the land of his principal, by pronouncing that
shameful word, he is condemned, as a recreant, "amittere
liberam legem," that is, to become infamous, and not be
accounted "liber et legalis homo:" being supped by the
event to be proved forsooth, and therefore never to be
put upon a jury, or admitted as witnesses in any cause.

This is the form of a trial by battel; a trial which the
tenant, or defendant, in a writ of right, has it in his election
at this day to demand; and which was the only decision of fuch
writ of right after the conquest, till Henry II., by consent of
parliament, introduced the grand ajfàr, a peculiar species of
trial by jury, in concurrence therewith; giving the tenant
his choice of either the one or the other. Which example,
of discomfiting these judicial combats, was imitated
about a century afterwards in France, by an edict of Louis
the Pious, A. D. 1206, and soon after by the rest of
Europe. The establishment of this alternative, Glanvil,
chief justice to Henry II., and probably his adviser here-
in, considers as a most noble improvement, as in fact it was,
of the law.

The trial by battel may also be demanded at the election
of the appellee, in either an appeal or an approvement, and it
is carried on with equal solemnity as that on a writ of right;
with this difference, that there each party might hire a chas-
man, but here they must fight in their proper persons. And
therefore if the appellant or approver be a woman, a pre-
ate, an infant, or of the age of sixty, or lame, or blind, he or she
may counterplead and refuse the wager of battel; and compel
the appellee to put himself upon the country. Also peers of the
realm, bringing an appeal, shall not be challenged to wage
battel on account of the dignity of their persons; nor the
residents of London, by special charter, because fighting
seems foreign to their education and employment. So like-
wise if the crime be notorious; and if the thief be taken with
the "mainour," or the murderer in the room with a bloody
knife, the appellant may refuse the tender of battel from the
appellee; for it is unreasonable that an innocent man
should stake his life against one who is already half con-
vinced.

The form and manner of waging battel upon appeals are
much the same as upon a writ of right: only the oath of
the two combatants are vastly more striking and solemn.
The appellee, when appealed of felony, pleads not guilty,
and throws down his glove, and declares he will defend
the cause by his body: the appellant takes up the glove, and
replies that he is ready to make good the appeal, body for
body. And thereupon the appellee, taking the book in his
right hand, and in his left the right hand of his antagonist,
swears to this effect. "Hoc audi, homo, quem per manum
tendo, &c." "Hear this, O man whom I hold by the
hand, who called thynself John, by the name of baptin, that
I, who call myself Thomas, by the name of baptin, did not
feloniously murder thy father, William by name, nor am any
way guilty of the said felony. So help me God, and the
saints; and this I will defend against thee by my body, as
this court shall award." To which the appellee replies,
holding the bible and his antagonist's hand, in the same man-
er as the other: "Hear this, O man, whom I hold by the
hand, who called thyself Thomas, by the name of baptin,
that thou art perjured; and therefore perjured, because that
thou feloniously didst murder my father, William by name.
So help me God and the saints; and this I will prove
against thee by my body, as this court shall award." The
battel is then to be fought with the same weapons, viz.
batons, the same solemnity, and the same oath against amu-
lets and forcery, that are used in the civil combat; and if the
appellee be so far vanquished, that he cannot or will not fight
any longer, he shall be adjudged to be hanged immediately;
and then, as well as if he be killed in battel, providence is
designed to have determined in favour of the truth, and his
blood shall be attained. But if he kills the appellants, or
can maintain the fight from sun-rising till the scars appear
in the evening, he shall be acquitted. So also if the appelleant
becomes recreant, and pronounces the horrible word of
crawen, he shall lose his "liberam legem," and become infamous;
and the appellee shall recover his damages, and also be for
ever quit, not only of the appeal, but of all indictions like-
wife for the same offence. Blackf. Com. vol. iii. p. 337,

BATTLE, in the Military Art, signifies an engagement
between two hostile armies, drawn up in regular order, in a
country sufficiently open for them to encounter in front at
the same time; or should some obstacle occur to hinder the
readily entering into action of the whole line, for the greater
part of an army to begin the attack upon the troops opposed
to them, the rest remaining in fight, ready to act as occasion
may require their assistance or co-operation.

Other conflicts, when only certain points of the armies
are engaged, though generally of much longer duration, and
often attended with superior slaughter, are only termed fights,
or, as they are called by the French, combats. (Feuquieres
Memoires, chap. 80.) Under this denomination rank there-
fore, though as obfinate as most others on record; the en-
gagements of Seneffe, of Steinberke, of Oudenarde, and of
latter days, those of Zorndorff and Hochkirchen, equally
celebrated on account of the carnage which attended them,
and the importance of their consequences.
The loss of a battle involves almost always that of the artillery of the vanquished, and frequently of the baggage. As all these losses must be repaired before the beaten army can again look their conquerors in the face, the enemy consequently remains for a length of time master of the country, and at liberty to carry all his projects into execution. These inconveniences are rarely so fiercely felt in case of ill success in a partial combat, however decisive. Greater part of the artillery is generally preserved, and the baggage almost entire; for the opposite armies not closing in front, the civilians which have been engaged alone become the sufferers.

But in a set or pitched battle, the present object of attention, where both parties have time and room sufficient to arrange and extend themselves in regular order, the case is widely different. The least unforeseen advantage afforded to an enemy, or the most trivial circumstance unattended to, may balance the efforts of the most experienced general, may snatch the palm of victory from the hands of numbers and valour, convert a successful pursuit to a disorderly flight, and lead to the irretrievable ruin of an army, possibly even of a state.

The ancients never joined battle without a great deal of preparation and religious ceremony; as making auguries, offering up sacrifices, haranguing to excite the courage of the soldiers, giving the word, or a teffera, &c. The signals of battle were, among the Romans, founding the claccium, or general charge, striking upon their shields with their javelins, and displaying from the prætorium a peculiar flag, called by Plutarch (in Fab. Max. and in Pomp.) a red mantle. Cæsar also mentions this flag in his B. Gallic., lib. ii. c. 20. In the moment of onset, a shout was raised by the whole army, for the double purpose of encouraging their fellows, and striking terror into the enemy. Similar to this was the custom which prevailed among the Greeks, of singing the paean, or hymn of combat, as they moved forward to the charge.

The rigid superstition of the Jews at first prevented them from fighting, or even from defending themselves, on the fast-day; but fatal experience of the inconvenience of the latter precept, induced them, in their wars with the princes of the Syro-Macedonian dynasty, to dispense with its observance. It was, however, in consequence of the sullen they still retained to a violation of that holy day, that Pompey became master of Jerusalem by assault, without any effectual resistance. Dion. Cafl. lib. xxxvii.

The Romans did not carry their regard for religion so far. They had indeed their peculiar days, called "preliares dies," wherein alone it was lawful to join battle; and others wherein it was unfit, called "dies atri," but less scrupulous than the Hebrews, these latter were only observed in respect of attacking. No day was so sacred for them to defend themselves in. (Macrobi. Saturn. lib. i. c. 5.) We observe frequent instances of their engaging by night. It was by right that Scipio defeated near Utica the armies of Africul and Syphax (Lib. xxx. c. 5.); and the decisive battle between Pompey and Mithridates (Plut. in Pomp.) was fought by moonlight.

The Athenians were prohibited, by the ancient laws of their country, from drawing out their forces for battle till after the 7th day of the month; and Lucian, speaking of the Lacedemonians, relates, that by the statutes of Lycurgus, they were not to fight before the full-moon. A similar custom prevailed among the ancient Germans, who reputed it an impious to engage in the war of the moon; and Caesar intimates that his victory over Ariobatus was owing to that prince's having, contrary to the religious maxims of his countrymen, fought during the decrease of the moon. The barbarians were intimidated with the apprehension, and afforded Caesar an easy conquest. To the: own words: "Aice commissa impedibat religione nocte victa." Cafl. de bel. Gal. lib. iv.

An idea of the manner in which warlike operations were carried on, and battles fought, among nations in their primitive barbarous state, has been given under the article Attack. We shall not here repeat what has been already said on that subject.

Authors are fond of quoting the battle of Thymbræ, between Cæcrops and Cyrus (Xenophon. Cyrop. lib. vi. vii.), as the first general engagement ever fought. But as it is only related in the Cyropædia, a work whose historical veracity has been severely called in question, and as its recital is attended with circumstances of the most romantic cast, we shall content ourselves with barely mentioning it, and pass on to instances better authenticated, and less embellished by the marvellous.

At the battle of Marathon (Herod. Eiat. sect. 107. 117.) the Greeks, conducted by Miltiades the Athenian, demonstrated the possibility of compensating by discipline, valour, and military skill, for any inferiority in numbers. A manoeuvre not without its faults, but novel in the art of war as then understood, obtained for them a victory as splendid as extraordinary; and which we may rank as the earliest in profane history, of which any particular account has been transmitted to us.

The battle of Platea, from the numerous forces engaged on either side, behoves the denomination of a pitched battle. (Herod. Calliope, sect. 61. 74.) It was fought upon the true ancient model. Hurry and confusion reigned predominant. Greeks and Persians engaged in two several places, without any attempt at co-operation, or the smallest exertion of military genius on the part of their commanders. In the true language of Homer, here "man was opposed to man, and shield met shield;" and the Greeks seem to have fairly achieved this alluring conquest by excelling their adversaries in the vulgar qualities of bodily strength and brutal courage.

After toiling through the heavy and fagacious period of the Peloponnesian war, where, though convinced at every page of the rapid improvement of the Greeks in tactics, we do not meet with any of those general or important contests, the subject of the present article; and after taking a cursory examination of the misfortunes of Cynax ; we at length arrive at the battle of Leuctra. (Phist. in Popol. Xenophon. Hellen. lib. vi. Diod. Sic. lib. xv.) This brilliant engagement, between numbers comparatively trifling, derives from a scientific reader more attention than that of Platea, as it is indubitably the first occasion on which victory was obtained merely in consequence of an able dispositions. The famous column of Epaminondas, which obliged 24,000 Lacedemonians, the bravest troops in Greece, to yield the honour of the field to 6,000 Thebans, has been repeatedly cited with admiration by the most learned authors, and imitated by the first military geniuses, on various occasions.

The battle of Mantinea, the next instance worthy of particular observation, was won by the same general (Xenophon. Hellen. lib. vii.) on the very same principle. The Lacedemonians, though conducted by their king Agis, one of the ablest leaders of his age, suffered themselves to be again destroyed, by the precise disposition which had already proved so fatal to them at Leuctra. The Spartan glory, by the loss of this battle, sustained a blow it never afterwards recovered. Epaminondas, whose genius had made the bravest followers in all Greece shrink before weaker armies, took 107. 117. inferior
inferior numbers, expired on the field he had immortalized no less by his personal exploits, than his able arrangements before the action. Henceforth pitched battles are more frequently distinguished by matterly strokes of generalship.

The formidable phalanx, then a late invention, no less than his own military talents, secured to Philip of Macedon his important triumph at Chaeronea. (Diod. Sic. lib. xvii. ch. 86.) The three great battles of Alexander against Darius were gained but with little difficulty, owing to the superior tactics of the Greeks. Those of Ipsus and Arbela in particular (Arrian. Alex. iii. lib. xiv. 15. Quint. Curt. lib. iv.) were only slaughter. When we read that in the latter, with the loss of only 1,200 of his own men, the Macedonian destroyed, according to the least exaggerated accounts, 40,000 of the Persians (Arrian says 300,000), it is pretty plain that the resistance was but nominal, and that the conquerors had little more trouble than to do execution on their enemies.

The Grecian history, subsequent to Alexander, is replete with instances of pitched battles; but of which little or no particular account has been left us. We are for the most part in the dark with respect to the order observed in drawing up the rival armies, and the manoeuvres which accelerated or retarded a victory. The abrupt termination of the history of Diodorus Siculus, deprives us of any details respecting the battle of Ipsus, except the brief and unsatisfactory account of Phalæon (in Dem.). The number of the slain alone leaves us sometimes a little room to judge of the importance or the obstinacy of a conflict.

Polybius, however, has left us (lib. ii.) a full and interesting account of the decisive engagement at Sellasia, which, for a time, completely subjected the Grecian states to the power of Macedon. Here again the phalanx determined the fortune of the day, and demonstrated the superiority of its close and impenetrable order, over the more loose and shallow battles of its antagonists.

Among the Romans we shall find still further occasion to remark the rapid improvement of ancient tactics. Guided by Polybius and Livy, we pursue with peculiar interest the account of battles fought for the mastery of the world, perpetually differing in situation, in success, and in consequences. That of Tisso, in particular, between Regulus and Xanthippus, calls strongly upon the attention. We are not dazzled by a long list of numerous forces and barbarous auxiliaries, fatigued by a repetition of defultory attacks and repulses, or bewildered amidst a series of complex manoeuvres. Two armies, nearly equal in numbers, of small strength, but furpremely valor; headed by renowned generals, encounter on a spot of ground easily surveyed by the eye of imagination. We remark their several dispositions. The simple narrative of the historian points out clearly and satisfactorily the faults or advantages of these dispositions, the mistaken rations of the Romans, and the consummate generalship of Xanthippus; and before we enter upon the vicissitudes of the action, we are fully convinced that the errors committed by Regulus must ultimately lead to his total defeat. Polyb. lib. i.

The march of Hannibal into Italy furnishes us with several instances of pitched battles, various in their nature, important in their consequences, and interesting in description. Far from being fatigued with following the brave Carthaginian through a continual scene of slaughter, we consider and admire his conduct, feel for his difficulties, eagerly accompany him in the field of carnage, and take a lively interest in his proceedings. The three famous engagements of the Trebia (Polyb. lib. iii. Liv. lib. xxii. sect. 53—56.) of the lake Trasymene (Polyb. ib. Liv. lib. xxii. sect. 4—7.) and of Cannae (Polyb. ib. Liv. lib. xxii. sect. 44—52.) rising in importance above the other, chiefly arrest our attention. We find that previous to every one of these, the arrangements made by Hannibal were such as almost to ensure success. A series of artful movements was contrivantly employed to draw the Romans into the states prepared for them; and their commanders, deluded by the genius it was necessary to oppose to so formidable an enemy, rushed, as it were, blindfold upon their ruin; though solicited in each of the confents we have just named of every advantage of numbers, resources, and, we may even add, of valor. The talents of a single man reduced those advantages to nothing. The numbers were converted into an hindrance to themselves, their resources were intercepted or rendered useless; and their valor, degenerating into despair, precipitated them madly upon certain destruction.

No action was ever more obstinately fought, or as a pitched battle deserves more consideration, than that of Zama (Liv. lib. xxx. sect. 32—35. Polyb. lib. xivn. lib. xv.), where the fortune of a Scipio finally triumphed over the Carthaginian republic. Without more than barely naming it here, we refer the reader for a more particular account of that celebrated affair, to the article Zama.

From this time, Roman discipline and valor reigned triumphant in every struggle with foreign nations. The armies of Antiochus, Pericles, and Mithridates, were destroyed, for the most part, with scarcely an effort; and the battles they ventured in defence of their dominions are only miserable instances of the inferiority of mere courage, supported by tenfold numbers, to the cool and steady bravery of veteran soldiers, directed and managed by the talents of an experienced general.

But however cheaply the legions of Flamininus, of L. Scipio, of P. Aemilius, and of Lucullus, had earned their laurels, a harder task was imposed on those who, under Cornelius Sylla, and Julius Cesar, turned their arms against their own countrymen. They had to engage with troops equally courageous, expert, and strictly disciplined; with men who, under Marius and the great Pompey, had exterminated the hordes of the savage Cimbri, and had subjugated the eastern world; in a word, with Romans. Three pitched battles, those of Pharsalia, Thapsus, and Munda, signalized this bloody period, and gave ample scope for the exertion of the utmost talents of the matchless Cesar. Yet in the list of these engagements, that consummate general confidelled, that he contended not for victory, but for his life; a satisfactory evidence of the desperation with which it was fought. Plut. in Cæs.

The two battles of Philippi are equally famous. Few have been more decisive in the event, or more distinguished for the uncommon perseverance and obstinacy with which they were contested.

In the age of Tacitus, we find the military science of the Romans brought to perfection. Similar to the train of artillery which modern generals carry into the field, the army of Vitellius at Cremona planted its batteries to play upon the enemy, and with showers of immense stones, swept them away by whole ranks. (Tacit. Hist. lib. iii. sect. 23.) This battle, and the subfstreaming of the adverse camp by the legions of Vepsiusian, give us a perfect insight into the mode of warfare as then practised. Tacit. ibid. sect. 21—33.

In the later ages of the empire we meet with very few instances of conflicts, remarkable either for their long duration or for any celebrated manoeuvres put in execution by rival generals. Nations relapsed fast, even in this destructive science, into their original barbarism. Armies were no longer composed
compiled of troops regularly trained and insured to service, but of cowardly and undisciplined plunderers, to whom victory or defeat was alike the signal for pillage, on whose exertions therefore but small dependence could be placed, and from whose successes little or no benefit could be derived. Numbers soon became, as formerly, the criterion of advantage. War teemed with fantastical combats, productive of trifling consequences. Courage supplied the place of generalship; fury and carnage, of discipline.

Never did a series of pitched battles follow each other in more rapid succession, than during the period subsequent to the fall of the Roman and Persian monarchies. As we accompany them in their progress, the most incredible victories crowded upon and harass our reflections. It is true, that among these engagements, so general, so bloody, and so decisive, we do not find the slightest trace of discipline or generalship. A religious fury, altogether irresistible, compensated with the Arabs the want of both these requisites. Azzadin, Kadija, and Yermouk, are lasting monuments of Mujlem glory; but they do not convey the least information to the military reader, or recompense in interest the attention he may bestow in perusing them.

Alas barren, dry, and interlacing, are the details of most of these battles fought between the time of Charlemagne and the beginning of the seventeenth century. Whether we prune the murderous annals of the Crusades, where all Europe and Asia seem mingled in reciprocal carnage; or the bloodless combats of the Italians in the days of Machiavel, when, after fighting a whole day, armies have separated without the loss of a man on either side (Machiav. Hist. Flor. lib. vii.) we are alike disgusted with the want of circumstantiality to excite our attention.

Crefly, Poitiers, and Agincourt are names venerated with reaso by every Englishman; but setting aside any consideration of the splendid carnage which attended them, and examining them in a military point of view, how little shall we find to extol, how much to censure. In all the three cases, the English armies were brought into the most imminent danger by the Boyish imprudence of their leaders, who ordered them, as it were blindfold, into the heart of an enemy's country, without taking the smallest pains to secure the necessary supplies of provisions, or to ensure a retreat. Not to be behind hand in imprudence, the French generals, although certain of vanquishing their antagonists into a surrender merely by an incomparable delay, had three times successively the infantry to march up and attack the English, strongly and advantageously posted, and on ground too where not a fourth of their own numbers was capable of acting. Unattached by experience, they left the three great battles by exactly the same fault; and in all three (the contested tradition of the artillery used at Crefly alone excepted), we find no reason to commend the military science of our ancients. Indeed, at Poitiers, the Black Prince possessed sagacity sufficient to line the hedges on both sides of a narrow way with archers, for the purpose of annoying the French gens d'armes as they advanced through it to the attack; a stratagem not half so commendable as that of Nevil, earl of Salisbury, at the petty skirmish of Bosworth, in the reign of Henry VI. (Holinshed); an affair as much surprising Poitiers in a tactical consideration, as inferior in the bloody list of the killed, and the consequences that ensued upon it.

In proportion as we approach nearer to modern times, we view the military science making fairer strides towards improvement. The invention of gunpowder effected by degrees an important change in the whole art of war. The arms and order of the battalions underwent a total alteration. The cavalry, formerly the main dependence of an army, much that no peron of family would serve in any other capacity than as a horseman, became a mere appendage to the infantry, who, since the invention of fire-arms, have generally decided the event of battles. The musquet and bayonet are now substituted for the pike and sword; and armies, like fortified places, must be approached in form, and battered down by artillery, while the most complete defeat is rarely attended with worse consequences than the loss of the surrounding territory.

About the year 1630, the entrance of Gustavus Adolphus and his Swedes into the German empire, and the great events which signalized the war of thirty years, render military history more interesting. The celebrated battles of Leipsic and Lutzen, where the first modern use was made of the column, now the chief instrument of the gain of victories, are remarkable epochs. On those days the hard-earned laurels of Tilly and of Wallenstein faded in a moment before the comprehensive genius of Gustavus, who, by his skilful dispositions bought, though with his life, the title of the first general of his age. A succedan of heroes, Waller, Turenne, and Wrangel, adopted and improved upon his maxims. Condé and Turenne profited anew by the example; and a succession of victories obtained under their auspices, rendered the arms of Louis XIV. during 50 years invincible.

On entering upon the history of the war of 1690, we are surprised at the rapid improvements in that part of the military art, the subject of the present article. The engagement of Steinkirk presents a remarkable influence of the recovery of an affair judged entirely desperate. The battle of Landen shows us an army entrenched behind a number of fortified villages, driven from all its defences, and carried as it were by storm. The bayonet, used first by Catrin at the action of Marlagli, added a new and terrible weapon of offence to the infantry, and by degrees entirely superseded the use of the pike. The reader will now observe armies more numerous and more regularly habituated than formerly, plans of attack and defence more ingenious and connected, artillery more formidable and better served, and a degree of method in military operations not before practised.

In the war of succession, or that which took its rise from the separate claims of the houses of Bourbon and Anjou to the Spanish monarchy, the three great battles of Hochheidt, of Ramillies, and of Turin immortalized by the abilities and splendid victories of Eugene and Marlborough, claim particular attention. To enlarge upon each under the present article, would trench too much on the boundaries assigned to us; we therefore refer the scientific reader to the heads Hochheidt, &c. where he will find a succinct account of those engagements, illustrated by the critical remarks of an excellent military judge, M. de Feuquieres.

Of all the battles fought by Charles XII. in his nine years' war with the Ruffian empire about the same period, that of Pultowa alone is remarkable in a tactical point of view. Nares, Duma, Cislow, &c. furnish but splendid and transitory influences of successful redundants in a military madman. The battle, or rather five battles, of Leino on the Soffa, fought by general Lewenhaupt against the whole forces of the Czar, are interesting in so far as they display the astonishing resources of Swedish valour.
From a tranquility of fifty years, hardly interrupted by the short contest for the succession of Poland, Europe was aroused by the war of 1794. With wonder we behold a nation, hardly before reckoned in the number of her powers, a nation of soldiers, flung into energy; and, headed by a monarch who to the most consummate generalship joined the qualifications rarely found in military men, of love for the sciences, and genius for their improvement, perform the most astonishing and romantic exploits. It would be superfluous to follow the Prussian hero through his career of victory and glorious diffrefs, or to enumerate the various means and manoeuvres by which he triumphed at Friedberg, at Prague, at Lissa, at Zorndorf, and at Torgau, over the firms and discipline of Austrian forces, the talents of a Daun, and the enterprise of a Laudohn. Nor have we room to enter into details of his defeats at Kolin, Hochkirchen, and Cunnersdorf; defeats which only throw additional lustre on his transcendent abilities.

It seemed impossible for human genius to surpass the bounds prescribed by the immortal Frederic to modern tactics. His hand had modelled armies into mere machines, liable to be directed with precision at the pleasure of the master. The systems practiced in the Prussian and Austrian schools, seemed to defy alteration or improvement; and the art of drawing up armies in order of battle particularly was reduced to certain rules, adapted to all situations, and which ensured every presumptive means of success.

A revolution, the effects of which have been severely felt in the most remote corners of the globe; a revolution, which has shaken the religious and political opinions of the most powerful nations, arrived to overturn monarchies, to change the face of Europe, and to convert it into one vast theatre of war. The military art did not escape the general influence. When the armies of Prussia and Austria, numerous, valiant, and bred up in the schools of Frederic and Laudohn, poured their united forces upon the French republic, opposed only by raw levies, undisciplined, half armed, and conducted by generals, many of whom knew nothing of service by experience; what resources could we suppose a nation to possess, capable of counterbalancing such disadvantages! But with amazement we view the disciplined invaders, at the end of the first campaign, driven back with shame and defeat. We view the bold officers in Europe in a disgraceful retreat before mere novices in the art of war. We view enthusiasm supply the place of commanders, of numbers, and of discipline.

One general battle had subjugated Belgium to the dis- pofal of France, when the treachery of a general not only occasioned the loss of that country, but endangerd the frontier of the republic itself, then covered only by a disorganized army. Nevertheless, during a long and bloody campaign, the forces of almost the whole of Europe united strove in vain to break through the first line of the bordering fortresses. The scene was soon totally changed. The collected energy of a nation, overbearing all opposition, repelled the attack; retaliated invasion; and by the loss of the most brilliant campaigns recorded in history, achieved such importan, rapid, and extensive conquests as almost exceed credibility.

We must not place to the sole account of enthusiasm these wonderful successes. Enthusiasm alone, though backed by still greater numbers, must ultimately have proved insufficient, when opposed to disciplined troops and skilful generals. The art of war gradually assumed a new face. To the maxims of the German school, others succeded still more prompt, more energetic, and peculiarly adapted to the nation which carried them into execution. To the excellence of their artillery, their skill in the art of managing the bayonet, and the incredible rapidity with which they have executed the different modes of charging in column, as well as to the extraordinary talents of their self-taught generals, the French owe chiefly their successes in the late war. Under some future article we shall hazard some observations on their mode of engaging.

In a war so productive of bloody and general engagements as the last, it would be superfluous to dwell on particular instances. Never in one campaign did so many battles take place as in 1794, when from the beginning of April forwards hardly a day passed without some desperate conflict. In point of conseqences, we must allude the first rank to Jemappes, Tronlembourg, Haueneau, Fleurs, Millemoi, Arcoles, Marconge, and Hohenlinden; but if we only consider the slaughter on both sides, Lodi, Verous, Stockach, Novi, and Zurich stand pre-eminent. A few remarks upon these, with some other affairs of principal consequence, will be found under their proper heads.

When we consider the immense resources required to maintain a large army, and the inconvenience with which the movement of more unwieldy bodies is still attended, we shall find room to commend the least extensive scale on which we carry on our wars, compared to that of more ancient times. Indeed the armies, which we are affured have been brought forth to battle in the earlier ages, almost flag our belief. Sestos is said (Diod. Sic. i.) to have had 600,000 foot, 24,000 horse, and 27,000 armed chariots, on his famous expedition into Upper Asia. The same historian swells the armies of Numa and Semiramis to two and three millions of men. We are told in scripture that Zerah, a barbarous potentate, invaded the kingdom of Judah with a million of his subjects, who were totally exterminated by the Jewish monarch Asa; nor are the accounts of the numbers engaged at mount Zemarain on both sides, and the carnage of the Israelites on that occasion less marvellous. (II. Chron.) Darius, in his Scythian expedition marched at the head of seven hundred thousand of his subjects (Herod. lib. iii.). Xerxes invaded Greece with a fleet of more than 1500 triremes, and a land army of 2,100,000 men. According to Herodotus (lib. vii.), the whole of his sea and land forces numbered above five millions. These numbers, immense as they are, will hardly appear exaggerated, when we reflect on the hosts afterwards brought into the field by the Goths and Huns, and the formidable swarms of Croats in the middle ages. The last Darius, when he engaged Alexander at Issus, mustered in his army fix hundred thousand men; and some historians make his forces at the battle of Arbela amount to a million.

The ease with which these immense hosts were defeated by comparatively trifling numbers of Greeks, gives us the most mean idea of their bravery and military skill. We must except the instance of Platea, where the victory was obliquely disputed, and the carnage consequently dreadful. There are few instances upon record of a battle so completely decisive. Of 300,000 men, of whom the Persian army conf in the commencement of the action, not four thousand escaped the destruction of that fatal day. (Herod. ix.)

The Romans, although they sometimes kept very numerous forces on foot in different parts of their dominions, seldom employed above forty thousand men in the same army. In their war with the Cilapinese Gauls, subsequent to the first Punic, they levied between seven and eight hundred thousand troops; but those all acted in separate corps. One of the largest armies they ever brought into the field, was that defeated, or rather destroyed, at Cannae by Hannibal. It consisted of 75,000 foot and 7,200 horse, of all whom only
only about 5,000 escaped death or captivity. This defeat, terrible as it was, was some years after revenged by the slaughter of 60,000 Carthaginians on the banks of the Matraus. (Polyb. lib. ii. & iii. Livy.)

We shudder at the cruelties which sometimes accompanied the triumphs of Rome over her more barbarous and undisciplined enemies. L. Scipio destroyed 50,000 Syrians at Magnesia. Marius, in his contest with the Teutones, took or exterminated above 300,000 of them. In a second battle, against the Cimbri, he slew 120,000, and captured half that number. In three battles against the generals of Mithridates, Sylla cut in pieces 200,000 men. The bloody defeat he sustained from Lucullus, during the siege of Cyzicus, cost the fame Mithridates three hundred thousand of his forces. On one occasion, Julius Cæsar annihilated an army of 368,000 Helvetii; on another, he extinguished upwards of 430,000 Germans, who had crossed the Rhine in quest of new settlements. (Liv. Plut. in Mar., Sylla, & Lucull. Cf. de Bell. Gall.)

In the civil wars of the Romans themselves, we find instances of the inferior numbers of the troops engaged, of slaughter equally dreadful. In the battle before the Colline gate of Rome, Telemachus, a general of the Marian faction, commanded 59,000 men against Cornelius Sylla; 12,000 of these being taken, were chiefly massacred in cold blood after the action; all the rest perished either on the field or in the flight by the swords of their implacable countrymen. In justice to Cæsar we must observe, that his triumphs over the Pompejan party were in a great measure exempt from these atrocities. (Plut. in Sylla. Eur.)

It is the well-founded remark of a judicious and elegant writer, that our European battles appear only as skirmishes, when compared to those which have desolated the plains of Asia with blood. (Voltaire, Effai sur Pelpist et les Mœurs des Nations.) In the year 218, fatally distinguished as being the epocha of the first invasion of the Moguls and Tartars into the southern provinces of Asia; the destroyer Ghengis-Khan marched to the siege of Otrar at the head of 700,000 combatants. Mohammed, the reigning sultan of Karazam, opposed him with an army 400,000 strong. The weaker party was defeated, and the Tartar conqueror commenced his fangianary career by the destruction of 150,000 of his enemies. This first chastisement only paved the way for others still more terrible. In following the great Khan through the dreadful scenes transferred by De la Croix from the best Eastern authorities, we are shocked at the unheard of ferocities exercised upon such cities as fell incurred his anger by an obstinate resistance. The particulars of such tragedies would but disgust the reader. To select a few of the most remarkable instances:—At the storming of Karazam, Mohammed's capital, 200,000 persons were massacred, and half that number fell as slaves; 60,000 were flung to death with arrows in cold blood on the plains of Nefia; 1,747,000 were butchered in the two cities of Sinhbir and Tum, and their dependencies; 1,600,000 in the district of Herat; and in the last battle fought by Ghengis Khan against the rebels of Targut, 320,000 are reported to have perished. To diminish this subject, the Chinese records inform us, that during the five years of the Mogul empire, the numbers of persons flourished by Ghengis Khan amounted to the dreadful total of eighteen millions and upwards. (Petit de la Croix, Hist. de Ghengis Khan, Par. 1710. Mod. Univ. Hist. vol. iv.)

The subsequent wars of the Moguls abounded with examples of almost equal enormity. In the siege of the capital of the Chinese empire by Oktay Khan, a million of people were slain on both sides. Timur Bek, who carried on his expeditions upon the same plan as Ghengis, could bring 80,000 men at once into the field, with whom he so completely defeated at Ançara 400,000 Turks under Bajazet, that not a fourth part escaped the common destruction. In a word, it is in Asia that war has always been waged on the most gigantic scale.

Let us bloody in their conquests, and more generous in their disputes, the armies, which during the two last centuries have been set on foot by European nations, were comparatively trifling in number. The battle of Malplaquet, where 220,000 men were engaged on both sides, is most remarkable for the number of the combatants; thóse of Hohenlinden and Prague for the destruction of the human species. At Hohenlinden, the French and Bavarian army, which before the action amounted 60,000 men, was reduced to one-third of that number. The battle of Prague cost the king of Prufia, by his own confession, 18,000 of his best troops, while the Austrians lost 24,000 men.

It is with sorrow we are obliged to remark, that the carnage on several occasions, during the last unhappy contest, has been unexampled in the history of modern war. Upon the Rhine, in particular, the losses on both sides, towards the latter end of December 1755, is computed at 80,000 men.

The following concise list of the most remarkable and decisive battles which have taken place (chiefly in Europe) from the earliest ages, may not prove wholly unacceptable.

B. C.

Marathon, between the Greeks and Persians, fought 490
Himera, in Sicily, between the Greeks and Carthaginians, 480
Plataea, Greeks and Persians, 479
Mycale, in Ionion, 479
Eurymydon, 478
In Egypt, between the Athenians and Persians, 460
Of the Athenians, in Sicily, between the Athenians and Syracusans, 413
Cyaxara, in Persia, 400
Corone, between Agesilus and the forces of the Theban alliance, 394
Leuctra, where the Spartans were entirely defeated by Epaminondas and the Thebans, 371
Mantinea, 369
Cheronäa, 367
Of the Granicus, 334
Ilissos, 333
Arbel, or Gangamela, which subverted the Persian empire, 331
Of the Hydaspes, between Alexander and Porus, 327
Ipsa, in Kyphyga, 301
Beneventum, in Italy, between Pyrrhus and the Romans, 274
Agrigentum, in Sicily, between the Romans and Carthaginians, 262
Tunis, in Africa, do. 255
Panormus, in Sicily, do. 251
Of the Maen, in Africa, between Hamilcar Barca and the revolted mercenaries, 239
Tribia, in Italy, between Hannibal and the Romans, 218
Of the lake Tarratinum, do. 217
Cassone, do. one of the most complete defeats mentioned in history, 216
Sena, on the Metaurus, where the army of Alcidas was cut off by Nerius, the Roman confid, 207
In Spain, between Scipio and Alcidas the son of Gisco, 206
Zama, Hannibal totally defeated by Scipio, 203
Magna, between L. Scipio and Antiochus, 190
Pydna, between Perseus and P. Aristides, 168
BATTLE.

Nepheris, decisive of the third Punic war.
Cirta, in Numidia, between Marius and Jugurtha,
Near the Rhone, where the Romans suffered a terrible defeat from the Cimbri and Teutones.
Aquae Sextiae, between Marius and the Teutones,
Vercelli, in which Marius totally exterminated the Cimbri,
Chersonae, between Sylla and the army of Mithridates,
Orchomenus, do.
Before the gates of Rome, between Sylla and the Samnite Telemnius,
Cabrica, between Lucullus and Mithridates,
Tigranocerta, between Lucullus and Tigranes,
Carthage, Crassus defeated by the Parthians,
Pharsalia, between Caesar and Pompey,
Philippi,
Aetium

Bedriacum, between the legions of Otho and Vitellius,
Cremona, between the generals of Vitellius and Vespasian,
Lugdunum, in Gaul, between Severus and Albinus,
Chalons, between Etius and Atilia, in which 300,000 persons fell on both sides,
Aizanad, in Syria,
Kedashe, in Parnis, which subverted the empire of the Saffanides in Perfia,
Yermuk, in Syria, where the Saracen general Khaled totally defeated the Greeks,
Fontenay, in France,
Hatsings,
Alcant in Palatine, between the Croises and the Saracens,
Bouvines,
Ottrar in Tartary,
Of the Indus, between Genghis Khan and Jalala'ddin,
Bannewch, near Paris,
Cressy,
Poitiers,
Angouleme, between Bajazet and Tamerlane,
Agincourt,
Tournay,
Boisworth, between Henry VII. and Richard III.
which finished the war between the houses of York and Lancaster,
Flooden,
Marignano, between Francis I. and the Swifs,
Pavia, between Francis I. and Charles V.
Mohatz in Hungary, which decided the fate of that kingdom
S. Quinvin,
Nespoj, by prince Maurice over Albert,
Prague, by the duke of Bavaria over the Elector Palatine,
Leipzig, by Gustavus Adolphus over count Tilly,
Lutzen, memorable for the death of Gustavus Adolphus,
Nordlingen, where the Protestant league in Germany was totally defeated,
Breitenfeld, near Leipzig,
Edgcorth,
Rochroy,
Nalby,
Jancowitz,
Worceder,
Before Vienna, which was relieved in consequence,

147

Bojne in Ireland,
Fleurus,
Staffa, in which the Savoyards were defeated by
Catinat,
Salankemen, where the Turks were totally defeated by
prince Lewis of Baden,
Aghrim in Ireland,
Steinkirk,
Landen,
Zenta on the Tisibe, memorable for the total defeat of
the Turks by prince Eugene,
Narva,
Chlou,
Hochteut,
Ramilles,
Turin,
Almanza,
Pultowa,
Malphequet,
Denain,
Peterwaradin,
Belgrade,
Parma,
Quatalla,
Molowitz (the first defeat given to the Austrians by
Frederick III.),
Czabo,
Fonctenoy, a memorable battle,
Friedberg in Silezie, where the king of Prufia totally
defeated the Austrians,
Rotto-fredo in Italy,
Culloden,
Kolin (the first defeat sustained by the king of Prufia),
Plafay, which laid the foundation of the future power of
the Britifh nation in Bengal and Hindoostan,
Roffax,
Breilaw,
Liife,
Zorndorff (in this battle the king of Prufia totally
defeated the Russians with terrible slaughter),
Hochkirchen,
Minden,
Cummerdorff (the king of Prufia here sustained a com
plete defeat from the Russians),
Torgau,
Freyberg, decisive of the seven years' war,
Chozzin,
Pozzan,
Jenampe, in which the Austrians were defeated by
Dumouer, and lost in consequence all their posfes-
sions in the Netherlands,
Tirlemont, where Dumouier was defeated by the prince
of Saxe-Cobourg, and the Netherlands subfequently
recovered,
Between Dietz and Louvain, fought by the fame
generals, with fimilar fuccefs,
Hagueenau,
In the neighbourhood of Landau (the Austro-Prufian
army was almoft destroyed by the republican generals
Hoche and Pichegru), from the 22 to the 27 Dec.
Mouconn (Gen. Clairfart was again defeated by Pich
chegru),
Fleuris (the prince of Cobourg was defeated by Jour
dan. This battle ultimately decided the fate of the
Netherlands),

30 March, 1714

Marango, 14 June, 1800
Hohenlinden, 3 Dec. 1800

The chief view of the great commanders of modern times
has been, till of late years, rather to harass, or flave an
enemy, by frequent alarms, by cutting off his supplies of
provisions, carrying off his baggage, seizing his polls, &c.
than to take their fortune and reputation on the event of a
day; a battle generally deciding the fate of a campaign, and
not unfrequently of the war. It is therefore a rule never to
venture a general action without important reasons, or when
absolute necessity leaves no other choice.

Reasons for feigning and engaging the enemy are, a de-
cided superiority in number or quality of forces; discord
among the commanders of the opposite army, when actuated
by different interests; an obvious incapacity on their part,
demonstrated by a neglect of the ordinary precautions in en-
camping, or on a march, the necessity of relieving a con-
durable place befieged by the adversary; an apprehension
of the total ruin and dispersion of an army, unless prevent-
ed by success in a general engagement; an intelligence of
reinforcements coming to the enemy, whose junction
would render him superior, and change the state of affairs; a par-
ticular advantage obtained in some preceding action, which,
however indecisive, has given the enemy a smart check, and
produced an evident superiority; or in fine, the obligation of
putting all to the risk of a battle.

The most proper reasons for avoiding it are; the having
left to hope for from a victory, than to fear from an over-
throw; inferiority, either in number or courage of the
Troops; an expectation of fresh succours, or the junction
of a considerable detachment; the impossibility of bringing
the enemy, too advantageously posted, to an engagement
in fair terms, or of forcing him in his entrenchments; or the
prospect of losing his army by temperament, and de-
ceiving battle. See Action.

But a resolution to engage being once taken, in con-
sequence of one or other of the reasons above recited, the next
object to be considered is the means of carrying it into ex-
ecution with the strongest presumption of success. Those
measures are partly preparatory to the affair; but the most
important and essential chiefly take their rise out of the dif-
terent circumstances of the action itself, and are those which
almost always determine its success.

Preparatory to fighting, a general should carefully observe
the following particulars. He should form the order of bat-
tle according to the strength and quality of the troops of
which his own army is composed, always having an eye
towards counteracting the dispositions in which it is ex-
pected to find the enemy. The general officers should be
assigned their respective posts, and copies of the order of
battle carefully sent to such as have a separate command,
who must be responsible for its observation in every respect.
All the troops must be perfectly armed and equipped; the
proper number of cartridges distributed previously to the
battle; waggons loaded with ammunition, and arms stan-
tioned in the rear of these battalions, which, it is presumed,
will have the hottest fire to fielain; and a fresh reserve pro-
vided at the park of artillery; as well to give out before and
during the action, if wanted, as after it is over, when there
are generally many missing. Time, if possible, should be
allowed to the troops to rest and refresh themselves, before
the engagement. Physicians, surgeons, and medicines must
be provided, and rather more in number than may be deemed
barely sufficient. The army must be totally difcumbered
of the heavy baggage, and the remainder lodged in a
place of safety at some distance. The advantages of sun
and wind, however trivial, are not to be neglected. The
soldiers should likewise be inspired with the desire of
fighting, and a certainty of victory; inflamed with the hope
of plunder and good quarters; and the officers reminded
of glory and of rewards.

Those occasions of conquering which commonly only pre-
fent themselves on the day of battle are, taking advantage
of the ground; strict observance of the disposition already con-
certed, and, should a correction prove necessary, the making
of it without confusion, and with the knowledge of all those
officers, who, from their situations, should become apprised
of it. The artillery is to be planted along the line, accord-
ing to the nature of the country; and every opportunity
narrowly watched of gaining an advantage, either by ex-
tending the wings to turn, if possible, the flanks of the
enemy; or by closing and protecting, to draft sufficient
Troops from them for a grand attack where the enemy may
appear most feeble. Should the march to the enemy be
made by night, or little probability offer of finishing the
contest before dark; the word should be given to the whole
line before they march. If the advance is made in line, due
care should be taken to preserve the equality of the wings,
and the requisite distance between the lines; frequent halts
should be made to give the artillery time to fire and load,
and the ranks to recover their order. Frequent warnings,
above all, should be given the soldiers to receive the
enemy's fire, and almaid from returning it till they have
drawn their adversaries' ammunition from them: for troops
who have parted with their fire will most infallibly give way
on facing an opponent advance, ready to pour in a heavy
volley upon them. If, however, both parties pursue the
same maxim, the only expedient is, to march up close to the
enemy, give in a general discharge upon them, and prevent
its being returned by immediately having recourse to the
bayonet, under cover of the smoke, which seldom fails to
produce an important effect.

If the advancing army, by reason of the distance it has to
march, or the inequality and close nature of the ground, or
defies, it must pass, cannot come at the enemy in front, the
approach must be made in a sufficient number of columns, to
admit the formation in order of battle, out of distance of be-
ing charged when in column. The general officers who conduct their columns should also carefully observe the motions of each other, so that the heads of their divisions may at least preserve a front; and that, when arrived at the ground where the army is to deploy into line, the movement may be executed with dilligence and caution, and at too great a distance to be attacked by the enemy before all the battalions are drawn up in the preconcerted order.

The commander in chief should post himself where he may be felt and most conveniently remark the effect of the first charge, and whence he may with the least difficulty differ his orders, either to sustain the troops who may have broken the enemy, or to replace such as have themselves been thrown into disorder. For both these purposes he should make use of the supernumerary forces stationed between the two lines, or of those of the reserve, as he may judge most advisable. Every other general officer should be at his particular station, either to lead to the charge, or to remedy the disorders which may arise in the brigade entrusted to his command.

If the battle becomes general and bloody, and successes in- cline to neither side, the commander in chief should direct his principal effort against that part of the line where the enemy's resistance is most obstinate; and in this case he should himself hasten to the spot, to animate the troops by his presence, and induce them to charge, under his eye, with greater vigour. If successes are complete throughout the first line, and it entirely overthrows that of the enemy, the principal attention of the general, and of the other officers, should be employed to restrain the soldiers, prevent them from leaving their colours to follow up the flyers, and, committing the pursuit to some detached corps of cavalry and infantry, to march in good order, at a steady pace, to infatiate these detachments, and assail the second line of the enemy. The artillery should always accompany the first line, in the order already distributed, in case the nature of the ground allows of it. The remainder of the army should follow the movement, always observing, without confusion, the distance be- tween the two lines appointed by the order of battle.

Should the first line give way, or be thrown into disorder by the enemy, the battalions are to retire through the intervals left between the two second lines, behind which they are to halt and rally. Great care is here necessary to be taken by the officers, that instead of pausing through the intervals, the routed troops do not directly run in upon the ranks of the second line, and either carry them off in the gen- eral flight, or throw them into such confusion and disorder as it may be impossible to repair before the enemy are upon them.

On the first line's giving way, the second should march up briskly to its relief, and charge furiously upon the enemy without giving him time to repair the disorder into which the action and pursuit milt of course have in some measure thrown him. By executing this with promptitude and determination, it is often easy to retrieve the ground which has been lost, and to defeat and render useless the enemy's first line, already considerably weakened and deranged by the former attacks. It is the sooner effected, as the enemy's fire which does most execution is thrown away; the subsequent discharges, from the great hurry of loading, being of little consequence, in comparison with the first. The great mischief is, that the second line, on seeing the first give way, are usually struck with a panic which magnifies the enemy, and on his nearer approach, either betake themselves to flight, or make but a faint resistance.

If, on the other hand, the victory still remains constant, and the adverse second line is overthrown, the general is chief should use still greater care than formerly to prevent his fol-
order to accommodate the enemy if he form the siege; or keep him in awe, and prevent him from dividing his forces, if his object is only to penetrate into the country, and lay its under contribution.

If the conqueror, on account of his loss in the engagement, finds his industry too much weakened to undertake a heavy siege; should he be disabled from attempting it for want of heavy artillery and ammunition; or should he derive no other profit from his victory than that of discovering his enemy's projects, remaining master of the open country, during the rest of the campaign, or procuring his men quarters upon hostile territory: the vanquished general ought after the full retreat, to occupy a defensible position in the vicinity of some large town, whence he may procure those accommodations his defeat may have deprived him of: such as, records and medicines for the sick, fresh baggage in lieu of the loot, &c. He should encourage his troops, without again facing the conquerors till he has repaired his losses by the arrival of new factions, new arms, fresh ammunition, and artillery, has cured the wounded, and finds himself strong enough to oppose the enemy, and prevent his establishment in advantageous quarters.

Island, Military Discipline.—Memoire de Feuquieres, ch. xx.

Battle was also a term formerly used to denote a body of forces drawn up in order of battle, and amounts to the same with what is otherwise called Battailon.

In this sense, we meet with the length or depth of the Battle; the front, rear, and flanks of the Battle.

Battle, length of the, is the number of soldiers in rank, or the front from the left flank to the right.

Battle, depth of the, is the extent of a file, or number of men from front to rear.

Battle, line of, See Line.

Battle array, the same with order of Battle.

Battle, order of, signifies the disposition of the squadrons and battalions of an army, into one or more lines, according to the nature of the ground, either for the purpose of engaging an enemy, or being reviewed by the general.

The Egyptians, whose priority in civilization and in communicating the arts to the rest of mankind is universally allowed, were naturally, although they ranked many great conquerors among their rivals monarchs, a pacific nation. We have no authorities to enable us to judge of the progress they had made, in the art of war; but from the fanciful account of the battle of Thymbra, given by Xenophon in his Cyropedia, we may fairly presume that they usually fought in large and deep battalions, forming a complete square. On the above occasion he mentions twelve of these unwieldy bodies, each consisting of ten thousand men, and who formed the chief dependence of Cyrus against the army of Cyrus.

A people in particular favour, and protected by heaven, as the ancient Jews, little needed the assistance of human invention when, on any emergency, a new miracle was always ready to relieve them against their enemies. We find, therefore, nothing in the sacred histories that can give us a key of any order of battle observed among them; although the regular division of their numerous forces under David, who distributed them into twelve unities bodies according to their tribes, and each of these into thousands, or regiments, into his bands or companies, into two, and even into four, and even to imagine, that they would not entirely forget matters in the field. The Jewish writers, followed by the author of the "Dissertation sur l'histoire de Palestine," affirm, that they armed them among the heathen, in considerable depth, for troops between twenty and thirty in life. Along the front of these were placed the light armed men, viz. the most expert archers, javelin men, and slingers, who began the onset by a withering shower, and with casting thick showers of darts and stones against the enemy's front, in order to cause terror and confusion, and stop the rushing in of the chariots, which among the Carthagians were extremely numerous, by wounding the horses and drivers. This is the more probable, as it is a method common to most of the Asiatic nations. Avoc. Univ. Hist. vol. iv. p. 94. The order of battle described by Xenophon in Cyropedia to have been used by Cyrus, at the action of Thymbra, though perhaps a visionary one as applied in the text, may serve to give an idea of the method generally used by the ancient Persians in drawing up their armies, with which Xenophon must have been well acquainted. The cavalry, in the direction which it is indispensably necessary for them to observe, were posted on the sides. The heavy armed infantry, carrying, besides the pikes, a sword for close combat, and drawn up twelve deep, formed the first line. The second consisted entirely of light armed, who threw their darts over the heads of the former, and annoyed and disordered the enemy in their approach. The third line, defined to the same purpose as the second, was composed entirely of archers; their bows which were extremely well bent and strong, carrying far beyond the front ranks, so as to excessively incapacitate the enemy. With these were sometimes intermixed slingers, who threw large stones with great effect. For this purpose the Rhodians afterwards substituted leaden balls. The fourth line, consisting of heavy armed, and similar to the first, was intended to support the preceding ones, and prevent them from giving way. It also served as a rear-guard and a corps-de-reserve to repulse the enemy who should penetrate so far. The Persians also made use of movable towers, erected on large carriages, each drawn by sixteen oxen, and containing twenty men, who threw stones and darts. These were placed in line in the rear of all the army, behind the corps-de-reserve, and favoured the rallying of those troops which were pulled and thrown into confusion by the enemy. They placed likewise great reliance in armed chariots, which they drew up sometimes in front of the battle, and sometimes upon the flanks, when in fear of being enveloped.

Such was the extent of the military science of those nations, who under Xerxes threatened Europe and the Weft with subjugation. But we see no occasion on which they knew how to profit by the advantage of the ground to carry the war, when necessary, into a difficult country, to make use of defiles and ambushes, either for the purpose of covering themselves from the attacks of the enemy, or of annoying them on his march; or to protect an unequal campaign by avoiding a decisive action with a superior antagonist, and reducing him to distress for want of forage and ammunition. Neither do we observe that they paid the requisite attention to the supporting of their flanks, by river, morass, or height, when it would have been advantageous by giving them an equal foot to an army much more numerous, and putting them out of danger of being surrounded. Rollin, Hist. Antiqu.; liv. iv. ch. 4.

The Persians made some alterations in this system; but they were far from being judicious. Artaxerxes's Memnon at the battle of Cunaxa, threw all his forces into one line, for the purpose of surrounding or outflanking those of his brother Cyrus; but he preferred the clumsy order of square battle, whose unavoidable form must have been impossible for them to take advantage of a terrain with the necessary promptitude, to retreat with facility, or manoeuvre with any effect. The disposition of Memnon the Rhodian, in opposing the
The passage of the Gracianus by Alexander was less faulty. He formed two lines; the irit of cavalry to affail and disorder the Greeks as they attempted to gain the bank of the river; and the second, at some distance, of infantry, with the intention, no doubt, of supporting the first; but, however judicious this arrangement might have been, he wanted genius or inclination to profit by it, and tamely suffered the Macedonians to reach the shore, defeat the cavalry opposed to them, and form their phalanx unembittered for the attack of his heavy-armed foot, without driving from his position, or calling a single javelin. It is impossible to read, without indignation, the unfoldlike details of the pompous march of Darius, and the extremity, as well as ignorance, conspicuous in the order of battle he made his armv observe at Hiss and Gygargela. His awkward evolutions on the former occasion, disordered his forces before the commencement of the action. In the latter instance he preferred the ruimous arrangement of his infantry by nations, in huge square battalions; he intermixed with them corps of horse no less unwisely; and, not content with having committed faults so inexcusable, he surpassed them both by another. The nature of the ground, not allowing his immense army to extend itself upon a single front, seemed to point out the necessity of a second line, or at least a corps-de-reserve. He indeed drew up, behind his centre, several immense battalions for which he had no room in front; but to clothe the first line, that when these gave way, the reserve, instead of supporting, served only to augment their disorder. Against such an enemy, it is by no means surprising that Alexander should have been, with inferior forces, so completely successful. Xenoph. Anat. lib. i. Arrian. in vit. Alex. lib. i. & iii.

We now turn to the Greeks, who, of all people of antiquity, the Romans excepted, were the best judges of warlike affairs and military conduct; but we cannot easily excuse them for the oversight they almost constantly committed in the drawing up of their whole army on one front, and trusting to a single effort the success of the day. Their infantry consisted of two kinds of soldiers. The heavy armed, who carried large bucklers, lances, and swords, and in whom consisted the principal strength of the army; and the archers and slingers who were generally distributed along the front of the line, and employed their bows, darts, and arrows, to disorder the ranks of the enemy. Having made their discharges, they retired round the flanks into the rear of the heavy armed, whence they continued throwing their darts during the rest of the action. As for the heavy armed, or Hoplites, we shall follow Thucydides in describing their disposition, according to the Lacedemonian system, that nation being then reckoned the most expert among the Greeks in military knowledge. Their battalions consisted of four lesser divisions, each consisting of 125 men, and subdivided into four others, each of 32 men. The effective force of every large corps thus consisted of 512 soldiers, who were usually drawn up in smaller ones of four men in front, and eight in file. We find seven of these regiments engaged at the first battle of Mantinea, during the Peloponnesian War. The depth of the files was, however, often altered, when judged necessary by their commanders. The Lacedemonians never made use of cavalry before the Messenian war, on which occasion they were convinced of the impracticability of carrying on their operations in a flat country without it. Even then they rarely exceeded the number of six hundred, and these were chiefly composed of the inhabitants of a little district in Laconia called Sciritis, a circumstance from which they derived their appellation of Skirmites. They were always drawn up on the left flank of the army, a part they claimed by right. So aversely were the Greeks in general to the use of cavalry, that in the most flourishing periods of the Athenian republic, they never mustered above 1,200 in their army.

The Greek tacticians of the middle ages have hallowed their imaginations in forming fanciful orders of battle, principally for the cavalry. Minute geometers and theoretical folders, they have considered the art of war in a light entirely mechanical; and employing their pencils at random, have given us upon paper such plans and dispositions as only could exist in their own minds, and could only originate in their ignorance of the practical part of the science. It is hence we derive the thumb, the wedge, the oblongal, and angular manner of disposing their forces, manoeuvres perhaps of use in exercising a squadron, but not to be adopted in the field without eminent and inevitable danger. To form a proper estimation of ancient tactics, we should consult the writings of those celebrated characters, who only recount what they have in person seen, and themselves performed. Such are Xenophon, Polybius, Julius Caesar, and Arrian. In reading them we trace the military art among the ancient Greeks and Romans to its highest pitch of perfection. The principal offensive and defensive operations of a campaign in the open country, or of a siege, are developed with order and perspicuity, and the images they present to us are distinctly imprinted on our imagination. Thucyd. lib. iii.—Rollin, Hist. Anc. liv. x. ch. 2.—Potter, Archetol. tom. ii. lib. 3. ch. 9.—Elian. tact. ch. 18.—Guizac. Memoires Milit. in difc. prelim.

Philip and Alexander put the last hand to improving the order of the Greek infantry in the creation and establishment of their formidable phalanx. For a particular account of its formation and evolutions, we must refer the reader to the article PHALANX. For several ages, this was the order of battle which most prevailed among the nations of the then known world. The Carthaginians, the Syrians, the Egyptians, adopted its use. We find the generals of Mithridates employed it against Silla, and the barbarous Helvetii and Germans in their contests with Julius Caesar. But the difficulty of preferring the necessary union and order in so large and numerous a body; and the want of a second line to support it when obliged to give way, were glaring defects in its disposition, and it was therefore eventually forced to give place to the more convenient and scientific arrangement of the Roman legion.

A Roman legion arranged in order of battle, consisted of thirty manipuli, of various strength according to the establishment of the legion. Supposing it of 5000 men, each manipulus of the Haistati and Principes was composed of 140 folders;—those of the Triarii only of 60; the remnant of the troops were Velites, or light armed. Livy, in describing the war with the Latins, gives the following account of the ordnance of the legion. The Haistati, drawn up in separate manipuli, formed the first line. The Principes, chiefly old experienced folders, were placed behind the former, but with intervals between their companies sufficiently wide to receive the Haistati in case they should be obliged to retreat. The Triarii, all veterans, who besides the short sword common to all the legionaries, were armed with long pikes, composed the third line; their intervals being so extended as to enable them to receive both the Principes and Haistati within them without any disorder, and still facing the enemy. If therefore the Haistati found themselves unable to sustain the charge, they retired gently within the Principes, and joining with them, renewed the combat. If thev proved too weak for resistancc, both retired amid the Triarii, where rallying, they formed a new line, and charged with more vigour than ever.
BATTLE.

If again defeated, the battle was lost: the Romans had no further resource. Livy, lib. viii.—Machiavel, art. c. Giver, lib. ii., ch. 1.

Their successive retreats are no where mentioned except in Livy as above related; and prejudiced as we are in favour of the military science of the Romans, we find it difficult to conceive the practicability of their execution. Livy has, in fact, much mistaken the intention of the disposition in quinquennalia of the ancient legion. Its sole design was to enable the army to form with facility in that order of battle which the situation of the enemy, or nature of the ground, might render most applicable. At the moment which preceded the charge, the maniples of the second line, marching briskly up into the intervals of the Hastati, formed a continued front, ten files in depth, and equal to that of the enemy. The Triarius remained as a corps-de-reserve. It was thus, as we shall incontestably prove in our account of those actions, that the Roman infantry were arranged at the Trebia and at Casae. It was thus, with some little variation, that they fought at Zama. Neither was it unusual with them to dispose their maniples according to the principles of the column, as in the battle of Tunis, and that between Scipio and Asdrabul the son of Gisco, in Spain. Where there was but little to fear from the impetu of the enemy, the intervals of the Hastati were filled up by the Velites; the Principes remaining at their posts in a second line; but, opposed to the close and heavy order of the Macedonian phalanx, a directly different disposition was observed. The maniples of each line, preserving their intervals, and acting as separate corps, harassed the enemy by defunctory attacks, obliged them to abandon their united order, in which situation only they were invincible, and penetrating the phalanx in every direction, obtained an easy triumph. Guisicart, Memoires Militaires, ch. iv.

As to the Velites, and in later times the archers and slingers, they were not drawn up in this regular manner; but detached either before the front of the Hastati, or scattered up and down among the void spaces of the first line, or finally, placed in two bodies on the wings. These always began the battle, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired through the intervals into the rear. When they retreated, the Hastati advanced to the charge. The auxiliary forces generally composed the two points of the battle, and covered the whole body of the Roman infantry. As to the cavalry, it was posted on the wings, fighting sometimes on foot as well as on horseback; and here we find some reason to arrange the judgment of the Romans, who never allotted a proportion of more than 300 cavalry to each legion whatever might be the nature of that country which was the theatre of the war. They made no difference between the plains of Lombardy and the mountains of Liguria; and in the Alps maintained the same number of squadrons, as in the fertile valleys of Apulia.

But the order of battle in quinquennalia was in process of time abandoned by the Romans. The tactics of Caesar widely differ from those of Scipio and Flaminius Paulus; and the march and order observed by Metellus in his Numidian war against Jugurtha, transmitted to us by Sallust, are the last traces we find in history of the disposition which proved so fatal to Hannibal, to Philip, and to Perseus. The maniples with interval; the three lines of Hastati, Principes, and Triarii, differing in arms, and in numbers, disappear, and about the age of Marius, the legion assumes a new form. Instead of thirty companies, we then find it divided into ten cohorts, equivalent to our battalion; from these each consisted of from five to six hundred men, drawn up in a single line, with a depth of eight or sometimes nine in file. The legions of Tiberianus, according to Jucundus, were drawn up in deep. This last arrangement continued to be observed without alteration during the flourishing ages of Rome; but as we advance nearer to modern times, we perceive their military force to decline in its perfection, in proportion to the decay of their greatness. Under Leo and Mauritius it is as difficult to recover the tactics, as the empire of the Caesars. The difficulty of ascertaining the period of their successive alterations has deterred those authors who have been most capable from undertaking the office; and finding it easier to suppose that Livy and Plutarch have furnished us with sufficient information on the subject, they have concurred with those writers to mislead and perplex us.

Cæsar.—Joseph. de Bello Jud. Guisicard. prel. d'irc.

For further observations on the discipline and constitution of the Roman infantry, see the article Legio.

For a long succession of barbarous ages, we find nothing to interest us in military tactics. Imitating in a rude degree the order of battle pointed out to them by their ancestors, the western nations from the fifth to the fifteenth century, fought in large bodies, divided into an indefinite number of lines or armies, in every one of which the infantry, interior in strength and importance of service, composed the centre, flanked by the heavy armed cavalry, who always decided the fate of battles. It is in vain to search for military science in these periods, and we shall therefore pass them over with all possible rapidity.

The introduction of artillery and fire-arms necessarily introduced an alteration in this system. The cavalry ceased to be the arbiters of success, and declined rapidly in their importance. The destructive effect of the newly invented engines rendered it impossible to avoid making a material change in the order of the battalions. Their depth was gradually decreased. The method of engaging in wards was abolished, as exposing numbers of troops to be sacrificed without occasion; and two lines with a corps-de-reserve were in time thought quite sufficient for the purpose of action. The front of the army was proportionally extended, and embraced a greater extent of country. The advantages of ground, before judged in comparison trivial, were now eagerly fought after. Generals became from necessity tacticians, and by little and little, continually improving, sometimes slowly, sometimes with rapidity, the military art assumed the face it wears in our times; under the auspices progressively of a Gustavus, a Condé, an Eugene, a Marshal Saxe, and a Frederick the Great, whose many names will never be forgotten by the latest posterity.

Under the articles Columns and Line, to which they of right belong, we shall attempt to illustrate and compare the French and Prussian systems of the order of battle as now practised by both these nations; and accompany them with inferences from among the number which have of late years fallen under our inspection.

BATTLE, in a Naval sense, denotes an engagement between two fleets, squadrons, or even single ships. See Engagement. The ancients had divers forms of sea-battles; as the half-moon, circle, and squares. In all these, not only the ships engaged each other, and by their beams and prows, but sometimes their sterns terminated to death by pieces, or overlapped and took each other, but the holdiers also assaulted the enemy with darts and slings, and, on their nearer approach, with hand and spear, boarding each other by latching bridges between the ships. By way of preparation they took down their sails, lowered their masts, and secured whatever might expose them to the wind, choosing rather to be governed by their own.
Homer never affixes this weapon to any but the barbarians, for the battle-axe was not used in war by the politer nations. Euthathius tells us, it was the favourite weapon of the Amazons. The only instance where Homer has placed it in the hands of a warrior occurs in the thirteenth book of the Iliad, when Pifander fights Menelaus; it is there called Aβoς, and is described with singular minuteness.

The Plataeis, mentioned in the fifteenth book, 1.710, was perhaps not very different:

\[ \text{Aλλος πολεμός ἔργῳ, τοσό ηόσιος εἴσεβος} \]
\[ \text{Oβως ἐν ἀγάλματι, καὶ ἀβως χειρόν.} \]

The battle-axe, an ancient military weapon, which, at different periods, formed a principal part of the offensive armour.

At the siege of the Roman capital, by the Gauls under Brennus, we find one of the most distinguished warriors armed with a battle-axe (Plut. Camillus): and Ammianus Marcellinus, many centuries afterwards, describing a body of Gauls, furnishes them all with battle-axes and swords. From Tacitus, it should seem, the ancient Germans had clubs, but no such weapons as those we are speaking of: and the only instance in his writings where fecuritas occurs as an implement of combat, is where the Othonians are particularly described as striving on the helmets of their antagonists with their axes. (Taciti Hist. II. xii.) In short, it was even then never used but among the Roman auxiliaries.

The introduction of the battle-axe into this country has been frequently attributed to the Danes; but proofs of its earlier use among us are not wanting, and there are instances known where it has been found even among the sepulchres of the ancient Britons. Mr. Rooke, in the Archaeologia of the Antiquary Society (vol. x. p. 113.) has described a fragment of an ancient battle-axe found among some Druidical remains in a barrow at Alpatria in Cumberland, June 1789. And in the same volume (pl. xi.) are two representations of the old Galwegian hill, or battle-axe, found in a mofs near Teesdale, the seat of Marmaduke Maxwell Constable, esq. of Nethdale in Ireland. Others have been found among the barrows on the downs of Wiltshire, and in the north of Scotland.

That it was used in the early Saxon times, we have the authority of several manuscripts of the ninth century; and the French writers have recorded a particular instance of its use in France, so far back as the year 510. Clovis, they say, bribed the ministers and captains of Ragnacharius to deliver up both him and his brother: and when the prisoners were brought before him, he first reproached them for suffering themselves to be chained, and then dispatched them with his battle-axe. See Grot. Turon. I. ii. c. 42.

The battle-axe, however, was more used by the Danes than any other of the Northern nations: and they were, in course, more expert with it. At the battle of Stamford, Oct. 24, 1066, between Harold king of England, and Harold Harfager of Norway, when the Norwegians were obliged to retire, and the English began to pursue them with great eagerness, a total stop was put to their pursuit for several hours by the desperate boldness of a single Norwegian, who defended the pass of Stamford-bridge with his battle-axe; he killed more than forty of the English, and was himself slain only by fratagem. (Hen. Hunt. iv. p. 211.) The battle-axe principally in use among the Anglo-Saxons appears to have been the lopenisses, or double-edged axe; the giparme is supposed to have been the bipennis with a longer handle or halbert; and the pole-axe, with an edge on one side, and a sharp point on the other, probably came in with the Normans.

During the middle period of our history we read but little of this weapon, though the Welsh infantry at the battle of Agincourt, 1415, found it particularly serviceable in dispatching those whom the archers had wounded with their arrows. One of the last instances of its effectual service was at the battle of Tewksbury, during the quarrel of the Roses, when the duke of Somerset clave lord Wenlock's head.

Towards the sixteenth century, it seems to have been gradually disused, though one instance occurs where a pillow placed in its handle befits a with in the warriors of that period to improve its use. (See Arms.) It was perhaps most serviceable when our knights were completely armed, and has since degenerated into the halbert or partisan.

BATTLEMENTS, in the Military Art, indentures, or notches in the top of a wall, parapet, or other building, in form of embrasures, for the fake of looking through them, &c. much affected in the old fortification.

BATTIOCHES, or BATTOGUES. See BATTACKS.

BATTLEY, from βάτος, battus, babbler, and ἄρχε, I speak, in Grammar, a multiplying of words without occasion, or a needless and superfluous repetition of the same words, or things.

BATTONI, or BATONI, POMPEII, in Biography, an eminent Italian painter of the Florentine school, was born at Lucca in 1708. He was the son of a goldsmith, and brought up to that business; but discovering a strong predilection for painting, he was supported in the Roman school by a subscription; and at Rome he employed himself in studying the antique, and copying the works of Raphael, and likewise in forming a style of his own, from a diligent observation of nature. Having distinguished himself both as a designer and a colourist, he was engaged in the execution of many important works, and painted altar-pieces and other pictures for various churches in Rome, Milan, Brescia, Lucca, Parma, Melfina, and other cities; as well as history-pieces for private persons. One of his most admired works, is a holy family, purchased for a large sum by the grand duke of Tullin. Battoni, however, acquired his principal fame as a portrait painter. Besides three popes, he painted several of the Imperial families of Anfraria and Tullia. In recompense for a picture, which commemorated the infant view of the emperor Joseph with his brother at Rome in 1779, he received several magnificent prelates; and he, with all his male issue, was ennobled by the emperor. By the beautiful daughter of the surveyor of the Farneese palace, whom he married in early life, he had several children; and two of his daughters were highly celebrated for their talents and proficiency in music. As to his character, he was simple and modest, sincere, friendly, and charitable; much attached to religion, and very affiduous in the exercise of his profession. He seldom appeared in public, preferring a retired life, partly on account of the defects of his education, and partly by reason of the awkwardness of his figure, which approached
proached to deformity. As a painter, he acquired eminence by the native force of his genius, and he had no rival but Mengs, who surpassed him in knowledge and learning, whilst he was inferior to him in natural talents. Battutin, having completed his 75th year, died 1777. Pilkington. Biog. Dict.

BATTON, or BATTIN. See BAXTON.

BATTIN, a name given by the Ham Lucas to their magazines or pictures abroad; the chief of which are those at Archangel, Novgorod, Bergens, Luton, Venice, and Amsterdam.

BATTOW, in Geography, a village on the west coast of Africa, S. E. from Cape Cavallou, on the west side of a small river opposite to Zee, or Swino, on the east side. About half a league east are two rocks lying under water, and the breakers over them are seen at sea at the distance of a league, and serve to point out the Cape and Road.

N. lat 77. W. long. 30° 30'.

BATTUE, in Measure, Fr. to heat time, in Music. There are various ways of marking the measure and accents in music: by dividing each bar into 2, 3, or 4 equal parts with the motion of the hand, the foot, a baton, or a roll of paper. In common time of 2 minims or 2 crotchets in a bar, called binary measure, the hand is merely moved down and up. In time of 4 crotchets in a bar, the French frequently mark each portion of it, by lifting the hand down to the first crotchet, moving it to the left for the 2d, to the right for the 3d, and lifting it up for the last. In triple time, or ternary measure of 3 minims, 3 crotchets, or 3 quavers, it is usually beaten, 2 down and one up, or the 1d down, the 2d to the left, and the 3d up.

The beating time is of great antiquity. The ancient Greeks had various ways of regulating the accents of song, and steps of the dance. See Rhythm and Greek Music.

The Italians often beat the two first portions of a bar, and left the hand up for the rest, both in common and triple time.

At the Opera, concert-spiritual, and even at private concerts (formerly) there was a perfon at Paris, armed with a truncheon (襄or de mEias) like a general, whom Rouleau, in his Dictionary, ridicules, and says that he had been very aptly called the Buckler, or wood-cutter; though when he wrote his musical articles for the Encyclopédie, the Italians and other nations, fell had a manner to regulate the measure in the numerous hands employed in their churches when there was a grand Pas de deux in celebration of some feast or holy time. But it was at the Church at the Commemoration of Hamel in Wellesley Abbey, that in the most numerous band that ever was assembled in modern times, a Coryphæus was first dispensed with. See Time, Measure, Ars & Thes. Bar, Accent, & Battus.

BATTUS, LAVIN, in Baxton, was born at Ghent, about the year 1549; but his father being obliged to remove to Rochou, on account of the troubles there, he was sent to a master who placed him under the instruction of a musician, and he so well pleased by the master who received him, that in 1559 he was appointed teacher in mathematics. In this office he continued until the year 1565, when the country being once afflicted with wars and the plague, he went first to Padua, and then to Venice, where he was admitted doctor in medicine. Returning to Rochou, he practised medicine with so much success and reputation, that he was appointed professor in that faculty, in which post he died, April 1591. Some small musical tracts, left by him in manuscript, were published in the Magacinel of Henry Sorelli, at Frankfurt, 1611, 8vo. His son, Conrad Battus, following in the steps of his father, returning from his travels, took the degree of doctor in medicine at Bâle, in 1643, but falling down stairs, at his brother's house at Rochou, soon after his return there, he received a wound in his groin, from a knife he had in his pocket, which occasioned his death. He also left some short essays on medical subjects, which were published with his father's, in the Miscellanea.

BATTUS, CHARLES, a Flemish writer of some eminence, who flourished about the end of the 16th century, published in 1566, a translation of the works of Guillemin, into his own language, folio, Dordrecht, and in 1615, the works of Ambrose Para, folio, Amsterdam, with numerous plates engraved on wood; also a manual for surgeons, with a treatise on wounds of the head, from Hippocrates, 2dmo. Haller. Bib. Chirurg. Elov. Dict. II. il.

BATTUS, in Ecclesiastical History, an order of pensioners at Avignon, and in Provence, whose piety carries them to exercise severe discipline upon themselves, both in public and private.

BATTUSZANI, in Geography, a town of European Turkey, in the province of Moldavia, 44 miles N.W. of Jaffy.

BATTUTA, It. a bar in Music, or those portions of a musical composition, where the time is beaten, or marked, with the hand or foot. The Crucefa dictionary defines battuta, quella misura di tempo che da il maestro della musices, in battuta al cantori. Varchi, who died in 1566, and who is quoted in the Crucefa as authority for the use of this term, says: quota noia, e falsidao n appronturo coloro agli occhi, e agli orecchi, i quale che non ballano a tempo, o non cantano a battuta. What pain and uncertain fainlations do those give us, who neither dance nor sing in time?

Amendae parliamo in rime, cansoni, e altre spedie di dire con mufica di pide, e di tempo sillabati. Both pronounced in rhyme, longs, and other species of poetry, in measured feet, and poetical numbers. This passage is cited from a MS. of 1400.

It is not easy to imagine how music, in many parts, could be composed in score, with bars or vertical lines drawn through them all, whence the term score was derived; nor what kind of bars could contain the quantity of a maxima, equal to eight semibreves, unless we suppose that semibreves were sung or played as quick as quavers are now. See Time, Accent, Ars & Measure.

The most ancient kind of time-table that has occurred in the course of our researches, consisted of only four several kinds of musical characters.

The Maxima

equal to

2 Longs

4 Breves

8 Semibreves

Among Italian music, as we frequently find the words battuta, which import actio in musica, after resecutive, or "a d battut". Accordingly, a in the Italian musical language, when it precedes a half note, has the power of an.

BATTUPTUDAN, Thes. lapidet. Pal. in Natural Hist. of true, one of the synonyms of Madrutora Labyrinthica. Gracal.

BATTER, Batus, Author, in Batum, in Ancient Geography, a town of Dalmatia, now Budia, which is.

BATTUS, in Geography, a kingdom of Africa, in the empire of Monomorpo, extending from the mountains of
the Moon to the river Magnico, whose prince is a vassal of the emperor. It is famous for its gold mines.

BATUDA, a method of mining mentioned in some Middle Age Writers, wherein the gold is driven by beating the water with poles, till flocking into one place, they are the fonder caught.

BATUCEAS, Los, in Geography, a people of Spain, in the kingdom of Leon, and diocese of Coria, inhaling a valley called the valley of the Batuecas, encompassed by mountains that are almost inaccessible, between Salamanca to the north, Coria to the south, the river Tormes to the east, and the rock of France to the west. These people are supposed to be the remains of the ancient Goths, who took refuge in this valley among high mountains in their escape from the Moors. Others say, that their ancestors were ancient Spaniards or Iberians, who retired bither at the time of the invasion of the Goths. They are distinguished by their barbarism and rudeness to such a degree, that the Spaniards proverbially denominate an uncivilized person, one who comes from the valley of Batuecas.

BATURIN, a town of the Ukraine, on the river Desna, belonging to the Russians, and situate in the district of Nefchin, which forms a part of Lower Russia. It was destroyed by the Russians in 1728; but the castle has been twice rebuilt, and the town in some degree repaired.

BATUS, in Entomology, a species of Cerambix, found in India and South America. The thorax is wrinkled and pitted; wing-cases hidentated; antennae long, with hooked prickles. *Linn.* This is Capricornus Niger. *Muf. Petrop.*

BATUZABER, in Geography, the capital of the kingdom of Yohor, in the southern extremity of the peninsula of Malacca, situated about 6 leagues from the sea, on the river Yohor or Jor, in a marshy situation, so that its small wooden houses are raised upon poles about 8 feet from the ground.

BATZ, or BATZEN, in Commerce, a copper coin mixed with some silver, and current at different rates, according to the quality of alloy, in many parts of Germany and Switzerland.

B. A. V. See Character.

BAVANY, or BOWANY, in Geography, a river of Hindoo-fooian, which runs into the Caevry, 7 miles north of Erroad in Coimboore. N. lat. 11° 25' E. long. 77° 50'.

BAVARIA, Circle or, called Bayern by the Germans, one of the circles of Germany, derives its name from the duchy of Bavaria, which is the most considerable part of it, and is bounded on the east by Austria and Bohemia, on the south by Carinthia and Tyrol, on the west by Swabia and Francois, and on the north by the Upper Palatinate, which, if considered as belonging to it, verges towards Upper Saxony. The dominions of the elector of Bavaria and the Palatinate, for those electorates are united, are computed to contain 16,176 square miles, and 1,334,000 inhabitants. Heeck estimates Bavaria at 1,139,600, and the Palatinate at 305,400. See PALATINATE. Bulching distributes the 20 fates of the circle of Bavaria into ecclesiastic and laic. To the former he refers the archbishopric of Salzburg, the bishoprics of Freisingen, Ratibon and Palffuen, together with the priory of Berchtholfadren, and the abbeys of St. Emeran, Lower and Upper Minster, all which three lie in the city of Ratibon. The latter are composed of the elector of Bavaria, the duchies of Neuburg and Sulzbach, the landgraviate of Leuchtenberg, the princely county of Sternstein, together with the counties of Haag and Ottenburg, and also the lordships of Ehrenfels, Sulzbach, and Pyrbaum, Hohenwaldeck, Brieteneck, and the imperial city of Ratibon. Of this circle, the elector of Bavaria, and the archbishop of Salzburg, are joint summoning princes. The diets, though usually held at Ratibon, are sometimes summoned to Waffenburg, Landshut, and Muldorff. When the military force of the empire, in time of peace, was settled in 1691, at 40,000 men, the number required to be furnished by this circle was 800 cavalry, and 1494 infantry; and towards the 300,000 florins granted in 1707, it paid 18,252 florins, 9 kruutzers. The elector of Bavaria is the military commander of the forces of the circle.

Bavaria is part of the Rhetian Vindelician and Noricum of the ancients, and is supposed to have derived its name from the Boii, a warlike people that migrated from Gallia Celtica, crossed the Rhine, and first settled in Bohemia. About the time of the empire Augusti, they were expelled the country by the Marcomanni, and removed into Noricum; and their settlement was called "Bojoi" or "Bayerland:" in Latin, "Bohuria," or "Bacaria," whence, in process of time, was formed Bavaria. In the 5th century, when the empire of the Franks was divided among the four sons of Clovis, Bavaria became subject to the dominion of the Austraian kings, and was governed by dukes. In the 6th century, princes of the Frankish family allumed the title of kings of Bavaria, while Liutpold in 889, was the first duke; and his progeny extend to the present day, though interrupted in 946, when, Berthold dying without children, the emperor Otto gave Bavaria to his brother Henry of Saxony. In 1071, Wilf, son of Azo of Ebe, became duke of Bavaria, which, in 1135, passed to the house of Austria; but in 1134, it reverted to the house of Wilh, in the person of Henry the Lion. In 1180, it finally returned to the first family, by the succession of Otho of Wittlebach, a descendant of Arulaup, second duke of Bavaria, A.D. 997. After the family had been unjuilly deprived for more than two centuries, the Palatinate and Bavaria have recently been inhabited by a branch of the family of Deux Ponts, the son of the elector being now nominal duke of Deux Ponts.

BAVARY, Duchy or Electorate of, comprehends the greater part of the circle, and is divided into Upper and Lower Bavaria, and the Upper Palatinate. The length from north to south is somewhat interrupted, but may be about 150 British miles, and the breadth about 120. The duchy is bounded on the north by Bohemia and the Upper Palatinate; on the east by Austria, and the bishoprics of Salzburg and Palffuen; on the west by the duchy of Neuberg, the marquisate of Burgau, and the bishopric of Augsburg; and on the south by the county of Tyrol, and the bishopric of Brixen. Upper Bavaria is, for the most part, mountainous, cold, and barren, producing little corn and lefis wine; but it is covered with forests, intermixed with large and small lakes, and abounds in cow, wild fowl, game, haths, medicinal springs, and salt works. It is also enriched with mines of silver and copper, lead and iron. It has also many quarries of marble. Lower Bavaria, being much more level, is more fertile, and produces plenty of grain, palmage, and fruit. The mountains of Upper Bavaria may be considered as branches of the Alps. The chief rivers of this duchy are the Donabe, the Iter, the Inn, the Lech, the Na, the Atmuh, and the Regen. Its large inland lakes are 16, and its smaller ones 100. Render, in his "Tour through Germany." (Vol. ii. p. 290.) reckons 33 cities, besides Munich the capital, 80 market towns, 8,000 villages and hamlets, 39,449 taxable farms, 12,000 solitary houses, 6,000 uninhabited farm-houses, 180,000 hearths, 3,050 churches, 5,48 chapels, 906 parishes, 12 collegiate foundations, and 142 convents. Upper Bavaria is divided into two governments or regencies; that of Munich, and that of Burghtaun. The principal towns of the former are Munich, Pfaffenhauten, Abenberg, Ingolstadt, Donawert, Friedberg, Landshut, Weilheim, Töz, Waffenburg, Traunstein, and Reichenhall. Those of the latter, are Burghaun, Goting, Tirolburg, Brunn.
Bavaria.

Lower Bavaria is also divided into two governments; that of Landshut, comprehending, besides other towns, Landshut, Erding, Dingelberg, Teilsbach, Hals, Rottenburg, Molburg, and Olbernhofen; and that of Straubing, the chief places of which are Straubing, Pogen, Cham, Kelheim, Stadt-am-Hof, and Deckenhofen. The rates of the duty of coal in both places, which a common council sits at Munich whenever it may be necessary, but before the accession of the house of Deux Ponts, the administration had become the most baleful of any in Germany; and on this account the political importance of Bavaria lies, in some measure, declined; and in the dangerous conflict that has subsisted, and may still subsist, between France and Austria, it may be difficult for this power to preserve a shade of independence.

The celebrated religious division of Bavaria is the Roman Catholic; and no other is even tolerated; and thus the spirit of industry is very materially checked and restrained. The clergy, both secular and regular, are very rich; and the peasants are wretched in the extreme, their chief subsistence arising from the herd of swine that are fed on acorns and crabs in the woods and forests. The regular military force is estimated at 12,000. The principal manufactures of the country are those of coarse woollen cloth, flax and woollen stuffs, velvet, tapestry, flockings, clocks, and watches. The principal exports are wheat, cattle, wool, salt, and iron. Besides the mines of silver and copper near Donau-Ries and Kottwall, in the basin of Weichach, and of lead at Reichenbach, the chief mineral riches of Bavaria consist in the salt springs at Traunstein, which descend mountains of saline earth, like those at Haltern, in the archbishopric of Salzburg, and occupy many people in productive industry. There are other springs at Reichenbach. These latter springs are 20 in number; but salt is only made from 4 of them; for which purpose part of the water proceeding from them is conveyed by pipes to the cauldrons at Traunstein, which are about 3 leagues distant. The salt annually made from these springs amounts to 250,000 quintals.

The title of the elector is “By the grace of God, duke of Upper and Lower Bavaria, as also of the Upper Palatinate; Palatine of the Rhine, arch-landgrave of the holy Roman empire, and elector and landgrave of Leuchtenberg.” He has 5 hereditary offices, viz. a master of the household, a baron, marchal, cup-bearer, and houseman. The Bavarian order of St. George was revived in 1798, by the elector Albert. The knights of the order are styled “defenders of the immaculate conception of the blessed Virgin Mary,” and are required to produce unblemished proofs of the nobility of their ancestry for 8 generations in both lines. The elector is a grand master; and his ensign is a crown, enamelled blue, with a St. George in the middle; on the reverse of which is the name of the ruler of the order in a cypher surmounted with a crown, and below it the angle the letters I. V. P. E. with lightly “julius exult palma fiorb,” i.e., the righteous shall flourish like a palm-tree. The crown is worn pendant to a broad blue-blue ribbon, with a black and white border. The elector has the fifth seat in the electoral college, and general votes at the diets, both of the empire and the circle, in the colleges of the princes and counts. His ordinary revenue, including the tolls on all the vessels which pass up and down the Danube, and other navigable rivers, with all that arises from the monopoly of cornc, flax, hemp, tobacco, and wines, together with his own domain, is appraised, by some, to amount to 700,000l. per annum. Buchensch and Baron Reissbach estimate it at 800,000l.

The Bavarians are little distinguished in literature; but there are a vigorous race, adapted to the fatigues of war. They have, however, an university at Ingolstadt, and an Academy of Sciences at Munich. Baron Reissbach’s “History” gives a very complete account of their costume, and general disposition and character. The character of a Bavarian, he says, is a very round head, a little hump, a large belly, and a pale complexion; so that many of them appear like caricatures of men. They have large fat bellies, fine clubbed feet, narrow shoulders, a thick round head, and short necks; and they are hearty and awkward in their carriage. But the women are, in general, extremely beautiful, well shaped, of clear transparent complexion and much more lively and graceful in their gestures than the men. The chief ornament of the men is a long broad waistcoat, strangely embroidered, from which their breeches hang low and loose. The women disguise themselves with flaps in the shape of a funnel, covering the breast and shoulders, and hiding the whole neck. He says, that no one can describe the ridiculous mixture of debauchery and devotion, which is exhibited every day; and he adds, that the propensity to feasting, indolence, and beggary, which prevails in Bavaria, is compensated and sanctioned by the example of the pupils. Indolence, he says, is the prevailing character of the Bavarians; and Bavaria well deserves the character given of it by an officer of Gaffney, of being the greatest brothel in the world. With their indolence, temperance, and devotion, they unite, according to his account, a certain ferocity of temper, which often occasions quarrels, mutual abuse, and feuds of blood. The Bavarian peasant, says this writer, is gruff, fat, dirty, lazy, drunken, and undisciplined; but he is brave, economical, patriotic, and such a slave to his word, that when it has once been given, it is never violated. Considerable benefit, however, has been derived from the landable plans for destroying mendacity and encouraging industry, proposed and carried into effect at Munich by Count Rumford. See Munich.

By the plan of indemnities, agreed upon between the First Consul of France and the emperor of Russia, in pursuance of the 7th article of the treaty of Laneuve, it was agreed to propose that the indemnities to the archduke, grand duke, should be for Tuscany, and its dependencies, the archbishopric of Salzburg, the provostship of Brandsort, the bishopric of Trent, that of Brixen, and part of that of Passau, situate beyond the Rhine and the Inn, on the side of Austria, except the seaboard of Passau, with a radius of 500 toises, and the albes, chapters, and convents, situate in the abovementioned diocese. These principalities were to be taken out of the circle of Bavaria, and incorporated in the circle of Austria; and their ecclesiastical jurisdictions, both metropolitan and diocesan, were to be also separated by the limits of the two circles; Mulhildorf to be united to Bavaria, and its equivalence in revenue taken from those of Freisingen. To the elector Palatine of Bavaria those were to be added, for the dukedom of Deux-Ponts, the duchy of Juliers, the palatinate of the Rhine, the marquisate of Reig-op-Zoom, the regency of Raunstein, and others situate in Belgium and Alsace; the bishopric of Passau, with the reservation of the part of the archduke; of Waltzhausen with the reservations hereafter mentioned; of Bamberg, of Augliedt, of Freisingen, and of Augsburg; the provostship of Kempton; the imperial
BAU

perial cities of Rothenbourgh, Weissenbourgh, Windheim, Schweinsfort, Groshheim, Schnedelf, Allsteuben, Kempton, Kauflcuren, Memmings, Dinkelshul, Nordingen, Uhn, Boffingen, Buchorn, Wangen, Leutkirch, Ravenbourgh, and Allschhausen: the abbeys of St. Ulric, Iftece, Wengu, Soedlingen, Elchingen, Urrburg, Rothenbourgh, Weitenhausen, Ottobercn, Kaisemhof. By the treaty of Preburg, 26 Dec. 1805, the electorate (now the new kingdom) of Bavaria acquired the margravate of Burgau and various other territories.

BAVARIA, Palatinate of. See Upper Palatinate.

BAVAY, Paul Ignatius De, in Biography, born at Brusells in 1704, applied himself early, and exclusively, to the study of chemistry, in which his father had waffed a considerable patrimony. At length, in 1755, he went to Lovain, where, at the end of two years, he was admitted Doctor in Medicine. He now returned to Brusells, and acquired so much reputation by his success in his practice, that, in 1746, when the French were in possession of the city, he was made physician to the military hospital there. In 1749, the French having evacuated Brusells, he was appointed Demontrator in Anatomy, but being opposed by the principal physicians, and his practice condemned, probably on account of his professing to cure some diseases by a nostrum of his invention, he went to Dendermond, where he continued for some time. Returning again to Brusells, he died there, Feb. 20, 1768. His works are, "Petit Recueil d'Observations en medecine fur les vertus de la confection tonique, refutive et diurétique," Bruxelles, 1753, 12mo. "Méthode courte, saine, peu coûteuse, utile aux médecins, et abfolument nécessaire au public indigent pour le guérison des pleureurs malditos." Bruxelles, 1759, 12mo. The principal ingredients in his medicine, are said to be quilles and Florentin oreis. Elyot. Dict. Hill.

BAVAY, in Geography, a town of France, in the department of the North, and chief place of a canton in the district of Avesnes. The place contains 14.55 and the canton 6260 inhabitants: the territory includes 1455 kilometres and 20 communes. N. lat. 59° 25'. E. long. 2° 45'.

BAUBEE, a term used in Scotland for a halfpenny. Johnson.

BAUBIGNY, in Geography, a town of France, 14 league from Paris.

BAUBIS, in Zoology, a French name of a race of running dogs, called chins Normans, or dogs of Normandy. BAUBULA, in Geography, a river of Spain, in the province of Arago, which runs into the Xalon, about a league below Catalantid. BAUCDIAS, in Ancient Geography, an island of Greece in the Saronic gulf. Pliny.

BAUCONICA, a town of the Vangiones, in Gallia Belgica, 9 miles from Mogontiacum, and 14 from Botribotinum: supposed to be Oppenheim, which it is.

BAUD, in Geography, a town of France, in the department of Morbihan, and chief place of a canton in the district of Pontivy, 18 leagues south of Pontivy. The place contains 6115 and the canton 13,607 inhabitants; the territory includes 2432 kilometres and 47 communes.

BAUDANVILLE, a town of France, in the department of the Meurte, and chief place of a canton in the district of Blamont, 53 leagues south of Blamont.

BAUDEKIN. See Baudachin.

BAUDELOT, Charles-Cesar, in Biography, was born at Paris in 1648, and studied first at Beauvais, and then at Paris. He was, against his inclination, bred to the law, and pleaded as counsellor of the parliament of Paris for some time with success. But he afterwards devoted himself to the study of antiquities. Having had an opportunity, in a journey to Dijon, to visit the libraries and cabinets of the place, he began to make a collection of books and medals; and he was thus led to write a book "On the utility of Travelling," 2 vols. 12mo, 1686; the subject of which was inscriptions, medals, statues, bas reliefs, and other relics of antiquity. It passed through several editions in French, and was translated into English. This work introduced him into an acquaintance with the most celebrated antiquaries of Europe, and was the means of his admission into the academy of Ricovresti at Padua. In 1705, he was made a member of the academy of Belles Lettres; and he had the charge of the valuable cabinet of the duchess of Orleans. He was the author of several dissertations on subjects of Medallie history and antiquities: and he is said to have composed the first travels of Paul Lucas. He died in 1722, with the character of a mild, modest, and benevolent man. Novv. Dict. Hill.

BAUERON, Brice, born at Charolles, about the middle of the sixteenth century, distinguished himself by his knowledge in pharmacy, to which he applied with such success, that a Pharmacopoeia, published by him in 1588, became the standard book for many years in France. It was founded on the Pharm. Lyonnaise, and of Du Boys, with the observations of Catalanius on distilled waters. Philemon Holland translated it into Latin, and published it in London, in folio, 1639, and at the Hague in 1642. It has since been many times reprinted, both in French and Latin. He also published "Praxis de Fabrius, et de symptomatibus in morbis internis," 4to, 1622, Paris. In the preface to this book he says, he is now 80 years of age. He died three years after, 1625. His son, Gratian Baueron, who was brought up to the same profession as his father, died in 1615, aged 35 years. Halle. Bib. Med. Pract. Elyot. Dict. Hill.

BAU DIER, Michael, historiographer of France under Louis XIII. was born of a noble family in Languedoc. He was the author of many works containing valuable information, collected with greater industry than tallow genius. The principal are, A General History of the Seraglio and Court of the grand Signor," 8vo. Paris, 1653; "A General History of the religion of the Turks, with the life of their prophet Mahomet, and the four first Caliphs," etc. 8vo. 1636; "A History of the Administration of Card. d'Ambe, minister of State under Louis XII.," Paris, 1643, 4to; "History of Marshal de Thoiras," Paris, 1643, fol., and 1666. 2 vols. 12mo. He left in MS. a history of Margaret of Anjou, wife of Henry VI. of England, which is said to have been translated and published as an original work in England. Baudier was attached to the polite arts, and made a collection of medals and curiosities, such as his fortune would allow. The time of his death is not known. Novv. Dict. hill.

BAUDIUS, Dominie, a learned philologius, was born in 1561, at Lille, in Flanders, and retired with his parents, who were of the reformed religion, from the persecution of the duke of Alva, to Aix-la-Chapelle. After having studied at Leyden, Geneva, Ghent, and other places, he settled at Leyden, where he applied with affivity to the study of jurisprudence, and was made doctor of laws in 1587. He visited England, and then travelled into France, where he obtained several distinguished patronages, and resided for 10 years. In 1602, he was nominated professor of eloquence at Leyden, and he also delivered lectures in history and jurisprudence. In 1611, the States made him joint historiographer with Meurinius, and as such he wrote in published
hished Latin, a "History of the Truth." He also acquired great reputation, both as a poet and prose-writer in that language. Towards the close of his life, he incurred the displeasure of prince Maurice, by his harangues in favour of peace; and he offended many persons by his political and religious sentiments, as well as by his moral conduct, which was not such as to secure respect. His poems include an irritable temper, and abound with critical abuse and defamation; and particularly against the enemies of Scaliger. Moreover, he was boastful, vain, importunate, and selfish; and his licentious outbursts, both with regard to wine and women, involved him in much disgrace. He died at Leyden in 1542. His poems, which manifest gravity and solemnity of diction and elevation of sentiments, were first collected and printed in 1587; and a more complete collection was printed at Leyden in 1627, and reprinted at Amsterdam and other places. The "Letters" of Baudius, published after his death, are more esteemed for their style, than his poems. He also published "Haranques," and some other pieces, all in Latin. Gen. Dict.

BAUDOBRIUM, or BAUDOBRIA, in Ancient Geography, a place of Gallia Belgica, upon the banks of the Rhine, south of Confluentes. The machines of war, called Balli, were under the conduct of a prefect residing in this place; and the head-quarters of the general were at Auguntiacum, or Mayence. Baudobrica was also another place of Belgica Prima, north of Anglia Treverorum, now Boppard.

BAUDOUIN, Francis, in Latin Balduinus, in Biography, an eminent civilian and man of letters, was born at Arras in 1522, studied at Louvain, and in his youth resided at the court of Charles V. At Geneva he became intimate with Calvin, and embraced the reformed religion. In France he conformed to the religion of the country, and taught the law at Bourges from 1528 to 1545. In Germany he delivered lectures at Strasburg, Heidelberg, and other places, avowing himself a Protestant; but by joining Cassander in a project for bringing about a coalition of religions, he excited the lasting dislike of Calvin and Beza, and others of the reformed party. He enjoyed the favour of cardinal Lorraine, the inveterate enemy of the Calvinists, and is supposed to have induced Augustus, the weak king of Navarre, to abandon them. By that prince he was patronized, and appointed his legat at the council of Trent. Upon the death of Antonio in 1562, he was invited to join his father, and finally settled at Paris, where he resided, acquired by several learned works which he had published, rendered his character popular among persons of the first distinction. The duke of Anjou after rewards Henry III. wished to engage his pen in the embellishment of the Church of St. Bartholomew; but to this prince he delivered his sentiments as an honest man, and was so much esteemed by him that he appointed him one of his counsellors. While he was preparing to follow Henry to Poland, he was seized and imprisoned, which terminated his life at the college of Arnaud in Paris in 1573. He was distinguished by critical knowledge, admirable memory, and persuasive eloquence. Notwithstanding the just reproach which he incurred by his veracity in religion, so that he was appropriately denominated a "Hermaphrodite," it appears to have been a man of moderate and tolerating principles; and whilst he condemned the severities exercised against the protestants in the Low Countries, he also confided the unfavourable zeal of Calvin in the perfecution of heretics. His Latin style was pure and elegant, and he left several works on the civil law, and also historical, theological and controversial works, which have been much esteemed. Gen. Dict. Nouv. Dict. Hist.

BAUDRAND, Michael Antony, a celebrated geographer, was born at Paris in 1633. When he had

finished his studies, he accompanied cardinal Antonio Barberini as his secretary to Rome; and upon his return to France, he was employed in revising Ferrarius's Geographical Dictionary, which he enlarged by half, and published at Paris in 1671, fol. By his travels in Germany, and his visit to England, he was furnished with a variety of observations that were useful to him in the compilation of his geography. Upon his return to France in 1677, he composed his Geographical Dictionary in Latin, entitled "Geographia ordines literarum dictionum," Paris 1682, 2 vols. fol. After a journey to Rome in 1691, he applied himself at Paris to the completion of his French Geographical Dictionary, which he was prevented from publishing by his death the year 1702. This work was published at Paris in 1705, in folio, but it is said to be a corruption rather than a translation of the Latin Dictionary, printed in 1682. Gen. Dict.

BAUER, in Ichthyology, the name of the angler or Eel.
of France, Germany, Italy and Switzerland. In this jour-
ney he collected a prodigious number of plants, which formed
the basis of his principal work, the "Historia Plantarum,"
which he even then had in contemplation, as appears by his
correspondence with Gesner, carried on long after his return,
but which was not published until several years after his
death. Having accomplished the principal object of his
travels, he first settled at Basel, where in 1566 he was
elected professor in rhetoric. Some time after he removed
to Yverdun, and at length, on the invitation of the duke of
Wurttemberg, to whom he was made principal physician, he
went to Montbéliard, where he continued to reside the re-
maining forty years of his life. Though botany engaged
the greater part of his time and attention, yet he was not un-
mindful of other parts of natural history, as appears by his
account of the medicinal properties of the principal mineral
wars of Europe, particularly of the waters at Boll, in the
principality of Wurttemberg, written at the command of the
duke, to which he has added descriptions of the complaints
in which mineral waters are miscible; and his "Historia plantarum aliquot nupramorum, circa annum 1565. apud Monopolithicam, medullarum damno, pub-
lie graphicum fuus," published at Montbéliard, 1591, 8vo.
He died in 1613, aged 72 years. His correspondence with
Gesner, principally on botanical subjects, with his book "De
plantis a divina fucrificiis non lenebutinis," was published
by his brother Gaspard, at Basel, 8vo, 1591, parum libel-
num, Haller says, et quod specimen fectorum operis. In 1593,
he published at Montbéliard also, in 8vo, "De plantis ab-
fintiis non lenebutinis." The prodromus of his great work
was published at Yverdun, in one volume 4to, in 1619, under
the names of J. Bauhin and Henry Cherler, his brother-in-
law, who had contributed to its perfection. In this speci-
imen, Haller says, you see the rudiments of a natural clas-
sification of plants. The "Historia plantarum nova, et absolu-
titulam, cum anetorum confenfio et diffiner, circa can," upon
which the author had bestowed above forty years' labour,
was at length published at Yverdun in 1650 and 1651, in
three volumes in folio, under the care of Dr. Chudér. Not-
withstanding the numerous errors in this book, many of
which Haller says should be imputed to the editor, who
was but indifferently qualified for the task he had under-
taken, it is a noble and valuable work, and defervingly
places the author in the first rank among the improvers of botany.

BAUHIN, JOHN GASPARDS, born at Basel in 1560, twenty years
later than his brother John, having the advantage of his
brother's experience to guide him in his inquiries, made
proportionately early advances in knowledge. After passing
through the necessary preliminary studies, under Fabricius
ab Aquapendente. Sev. Pinæus, and other celebrated anat-
omists at Padua, Montpellier, and Paris, and having col-
llected in his travels a large number of plants, many of them
unnoticed by his brother, he returned to Basel in 1580, and
was admitted doctor in medicine. In 1582, he was made
Greek professor, and in 1558, professor of anatomy and bot-
any, of which he is called in his epitaph the Phænix. He
was afterwards made professor of the practice of medicine,
archiætor, or principal physician to the city of Basel, dean
of the faculty of medicine, and rector of the university, which
distinguished honours he continued to hold to the time of his
death, which happened in 1624.

Indications in his attention to the duties of his several
offices, he discharges them with such regularity as to secure
him the affection of his pupils, who materially assisted him
in collecting plants, necessary in completing his botanical
works, to which also his correspondents in different parts of
Europe largely contributed.

Notwithstanding the number and variety of his offices,
many of his time must have been employed in composing and
preparing for the press his numerous publications on anat-
omy and botany; and though great additions and improve-
ments have been made in our knowledge in these sciences
since his time, many of our author's works are still consulted,
and held in estimation. A few of the titles to his principal
works follow: for the refri, see the Bib. Anat. and Bot. of
Haller. "Flora, Rousseti i. de partu cæfaro, e Gallico in
Latinum tradid." 4to. 1585, Basel. Two years after he re-
published this work with an appendix, containing additional
causes of women who are said to have undergone the operation
and recovered; to which is also added a description of the
valve of the corset, of which he claimed the discovery. "The-
atum Anatomicum, infinitis locis auctum, Francol." 1621,
4to, including several smaller works on anatomy, published
by him before at various times. "Viva imaginea corporis huami aevi formis expresse, ex theatro anatomico
Cap. Bauhini demusculata." 1620. The figures are
principally from Vesalius and Eugabius; some are proper
to the author. In this work also are contained other disco-
very in anatomy made by the author. "De hermaphro-
torum monoturumque partium natura," Oppeheim, 1618,
8vo. In 1598, he published "Matthioli opera, quæ extant
omnia," fol. Franc. in which there are many plants Haller,
says, not before described. "Finus theatris botanici, seu
index in Theophrasti Dioscoridis, Plini, et botaniculturorum
qui a feculo scripferant operis," &c. Basle. 1623, 4to, a
work extremely useful to perfons consulting the older bot-
aical writers. "Catalogus plantarum cire Bafileam nasce-
tium," Bafil 1622, 8vo; the largest catalogue extant,
Haller says, of plants growing in a single district.

BAUHIN, JOHN GASPARDS, born of the former, born March 12th 1560, after being well instructed in the Latin
and Greek languages, and initiated in the knowledge of bo-
tany, anatomy, and other branches of medicine under his
father, went to Paris in 1624, where he continued two years,
attending the schools of the most celebrated masters there.
He afterwards visited England, Leyden, Padua, and various
other places; the fame of his ancestors procuring him an easy
introduction, wherever he went, to the most distinguished
perfons. Returning to Bafil 1628, he was made doctor
in medicine, and two years after professor in anatomy and bot-
any, which office he held for thirty years. In 1669, he
was made professor in the practice of medicine, and
was several times appointed dean of the faculty, and rector
of the university. He died July 14, 1685.

Notwithstanding the numerous honors conferred upon
him, he does not appear to have contributed much to the
improvement of the science he professed, having only left
three dissertations of little note or value, "De pelle, de
morborum differentiis et causis, et de Epilepsia."
legume. El. Char. C. f. five-leaved, deciduous. Pet. expanding, elongating, with claws, the upper one more distant, all inserted into the calyx. Legume. Species, 1. B. fimbriata, climbing mountain ebony. Tettn. Ing. Rumph. Amb. 5, t. 1. Clematis indica. Ray Suppl. 328. n. 13 & 14. Naga-mu-villa, Rheed. Mal. S. 57. t. 32, 31. "Stem circumflexus." Raising with many slender flutes, which put out tendrils and form themselves to the nearest rising tree; leaves alternate, heart-shaped, or long foot flutes, six inches long, three and a half broad in the middle, deeply cut into two-pointed lobes, each having a prominent longitudinal vein: flowers at first white, turning to a yellowish or violet: fruit slender and flat, containing six to eight flat boxy seeds, black with a silvery border. A native of both Indias, not producing flowers in England. The seeds were sent to Mr. Miller from Campeachy, probably before the year 1752.—2. B. acuminata, prickly, rounded mountain E. * Item prickly.* An erect vigorous shrub, about a man's height; trunk and branches prickly, leaves roundish, with two to roundish blunt lobes; eleven to one-third of their depth, smooth with nine nerves; petiole thicker and callous at both ends, from the base of which proceeds on each side a sharp short prickle, distilling when young, nectariferous; flowers large, white, and having an unpleasant scent; rising, in Jamaica, to the height of sixteen or eighteen feet, and plentiful there and in the other fuchsia islands; the flowers are succeeded by pods, about three inches long, containing two or three fueling seeds; the pods are glutinous, and their, as well as the brided leaves, have a strong balsamic scent. Called in America the Indian fave-tree, from its strong odour, which somewhat resembles the common fave. It is frequent about Carthagena in woods; cultivated by Mr. Miller in 1752.— 3. B. divaricata, dwarf mountain E. * Leaves smooth, leaves divaricata, acute, two-nerved; petals lanceolate.* A low shrub, seldom rising more than five or six feet high, dividing into several branches; corolla, white, and flowers in a simple upright raceme; having an agreeable scent, appearing during the greater part of summer, and exhibiting one of the chief beauties of the hot-house: the pods are taper, about four inches long, and contain four or five dark-coloured seeds. A native of the north side of Jamaica, where it grows plentifully; cultivated by R. J. Lord Petre, before 1742; flowering from June to September.—4. B. angustata, "leaves ovate, leaves parallel," differing from the others in its more oblong leaves, entire at the base, divided in the middle into two straight parallel lobes, and having nine nerves. The calyx is long, divided, and of a grey colour; the petals are subulate, flowers elegantly shorter; leaves very long, penultimate, its to the height of twenty feet, with a number of leaves, divided into two final branches, terminated by loose bunches of white flowers, which are succeeded by very long, narrow, compressed fruits, in which hiding the true seeds. A native of America; the seeds were received by Mr. Miller from Campeachy.—5. B. variegata, variegated mountain E. Arbor S. Thiere, Zool. H. d. 26. n. 15. Chavona-Mandar: 1 Rhed. Mal. 1. 57. t. 32. "Calyces one-leaved, lurking; petals oblong, oval; leaves of the lower ovate." In the with a three leaves, upwards of twenty feet high, divide into many short branches, flowers large, in large panicles, at the extremities of the branches, of a purplish red, marked with white, and the bottom yellow; pods about six inches long, and an inch thick, containing three or four compound seeds. Growing naturally both Indias, and introduced here by Mr. Bentick in 1762.—6. B. protostel'a, purple mountain E. Chavonna-Mandar: 2. Rhed. Mal. 1. 50. t. 33. "Leaves subsulcate, two-parted, and hirt, tenui-to mentato beneath." A tall tree, differing from the foregoing in having larger leaves, more deeply divided and more contracted on the sides; the calyx is yellowish green, and red; the corolla of a very red purple, and one petal out of the five forked with white on the claw within and without; all lanceolate and distinct; leaves larger than those of any other part, being one and half or two spans long, and an inch broad. A native of the East Indies, where it flowers thougthout the year. Introduced here in 1752.—7. B. fimbriata, growing mountain E. Mandar Mandapam, Phil. Arch. 23. t. 44. f. 6. Callistemon, Rheed. Mal. 1. 63. t. 33. "Leaves cordate, leaves semi-orbiculate, tenuifomes." This grows to the height of two fathoms, with a trunk nearly six inches in diameter, and divides 170 many branches; leaves smaller than those of the foregoing, round, cloven half way, seven-nerved and blunt, with round lobes; having a strong scent if rubbed during the night, when the leaves are clapped together; the calyx of the flowers green and bell-shaped, the corolla yellowish white; one of the petals having a dusty red purple spot at the claw; lamellae yellowish white; flowers without fince. A native of the East Indies. Cultivated, by Ray, by Compton bishop of London, in 1687.—8. B. acuminata, sharp-leaved mountain E. Velutina-Mandar, Rheed. Mal. 611. t. 34. "Leaves ovate, leaves acuminate semi-ovate." This rises to a man's height, with a trunk as thick as his arm; leaves more deeply cut, longer, contracted into a cup or point towards the end, nine-nerved, leaves divaricata, flowers bell-shaped, pure white, without scent; petals rounded and blunt; lamellae white; leaves smaller than in the others, being four or five inches long, an inch broad, smooth, with a round broad back. A native of the East Indies.—9. B. marginata, "item prickly, leaves cordate with round lobes, tenuifomes beneath." Folid rising more than ten feet high, dividing into many branches, armed with short crooked spines; leaves alternate, heart-shaped, with two roundish lobes; flowers two or three together at the extremity of the branches, large, of a dirty white colour, and succeeded by flat pods, each containing two or three seeds—10. B. revoluta, "item prickly, leaves subcoricate, two-parted, rounded, flowers scated," rising twenty feet high, with a strong upright stem, sending out branches towards the top, armed with spines in pairs, strong and crooked; leaves like the former; flowers large and white, succeeded by long flat pods, narrow, and each including five or six seeds. This and the preceding are natives of Cathagona in New Spain.—11. B. maria, long-cared mountain E. "Leaves subtranslucent from the base, leaves lanceolate, porrected, three-nerved; petals lanceolate." Cultivated by Mr. Miller, in 1756, and flowering in September.—12. B. perrotata, smooth broad leaved mountain E. "Leaves cordate, leaves porrected, acute, three-nerved, petal lanceolate." A tree rising about fifteen feet high, with several straight trunks, thick as a man's leg, covered with a whitish bark, dividing into many branches and twigs; leaves three inches long and two broad, yellowish-green, smooth, with seven or more ribs, and four transverse; the peduncle an inch long; the flowers at the ends of the twigs, on peduncles, if an inch long; petals long, red-white variegate; corolla red; stamina white, and yellow; leaves five or six in the same brown. Growing on the hill in Jamaica. The wood is very hard, I painted with black, whence the name of clavata. Cultivated by Mr. Miller, in 1739, and flowering in July.—13. B. rufii-fata, white-leaved mountain E. "Leaves cordate, pilosellate beneath, leaves ovate, obtusif, calyces not expanded upward and elongated." A native of the East Indies, introduced by Dr. P. Ruffill in 1777; flowering in May and June. There are many other species both from the East and West Indies, not yet sufficiently examined. The whole genus needs further investigation.

E. Propagation.
BAU

Propagation.—All these plants, being natives of hot countries, will not thrive in England out of the bark-floe. They are propagated by seeds procured from their native countries, which should be brought over in their pods. These must be laid in pots filled with light fresh earth, and plunged into a moderate hot bed of Tanner's bark; and if the seeds be good, they will come up in five weeks, and in a month after they should be carefully shaken out of the seed pot, without injuring their roots, and each of them planted in a separate small pot filled with light loamy earth, and plunged again into the hot-bed, finding them till they have taken fresh root, and then admitting fresh air to them every day in warm weather. In autumn they must be placed in the bark-floe, and treated like other tender exotics, giving them but little water in winter. As these plants frequently flower in winter, they deserve a place in the floe. Martyr's Miller's Dict.

BAUVINs, in War, faggots made of birch, heath, or other 'ort of brush-wood, that is both quickly fired and tough, 2 or 3 feet long, with the brush-ends all laid one way, and the other ends tied with two bands. They are dipped and sprinkled with sulphur, like reeds, excepting only that the brush-ends only are dipped, and should be closed together before they are sprinkled, to keep them more close, in order to give a stronger fire, and to keep the branches from breaking off in shifting and handling them. See Fascines.

BAULA, in Ancient Geography, a district of Italy in Campania, between Baiae and the Lucrine lake, formed according to Tacitus, by the sea; and the fact of many country houses.

BAULAS, in Geography, a town of Syria, 50 miles east of Damascus.

BAULEM's Kill, a western water of Hudson's river, 83 miles below Albany.

BAULOT, or BEAULIUS, JAMES, in Biography, of mean and obscure parentage, was born in the province of Burgundy, in 1651. Becoming acquainted with Pauloni, an Italian itinerant lithomith, he travelled with him, as an assistant, for some years; but having at length, from observation, acquired the art of cutting for the frowns and of curing rupitces, he separated from him, and soon became celebrated for his skill in both those arts. Though illiterate, and totally unacquainted with anatomy, yet he is said to have considerably improved on the method of operating used by his master; and even to have approached very near the mode now followed by the most celebrated furgeons. Following the steps of Pauloni, he visited in turn all the principal cities on the continent. In 1665, he went to Paris, where he at first operated with success, but failing in some cases, he went to Geneva, Aix-la-Chapelle, and Amsterdam; in each of which places he was much respected to; for having both improved his instruments, and his mode of using them, he was now generally successful. He next went to Strasbourg, where he cut successfully a great number of patients, then to Venice, Padua and Rome, every where acquiring additional fame and reputation. He was of a singular disposition, and wore a sort of monkish habit, whence he became generally known by the title of Friar James. He at length settled in a village near Belfancr, where he died, 1720, being sixty-nine years of age. In gratitude for the numerous cures he had performed at Amsterdam, the magistracy of that city caused his portrait to be engraved, and a medal to be struck, bearing for impress his bust. Haller Bib. Chirurg Gen. Biog. Dict.

BAULTE, in Geography, a river of Pruflia, which runs into the Frith Hafl, a little below Frauenburg.

BAUM, in Botany. See MELISSA.

BAUM, Balsard. See MELITIS.

BAUM, Molucca. See MOLUCCAL.
In 55 places deep and 60 wide, and covered with a kind of vaulted roof, from which water continually drops. In this grotto is a small brook, that is said to be frozen in summer and not in winter. When the peasants observe a mill rising from this cavern, they predict rain on the following day.

Baur, in Oryibouz, the name of the bernacle goose; And Helenica, in Frijh, H.H. Birds.

BauHGANGS, Alexander Gottlieb, in Biography, an eminent philosophical writer, was born at Berlin in 1744, and educated at Halle. He here distinguished himself by his private Lectures in philosophy; and after having officiated for some time as extraordinary professor he was invited in 1752 to be professor of philosophy at Frankfurt on the Oder. His constitution, being naturally feeble, was much impaired before the year 1751, by close application to study, and his infirmities were aggravated by the toils of a great part of his property, during the bombardment of the fortress of Cahirin, which he had fled for shelter. In 1750, his health being in some degree restored, he returned his labours with new ardour; but in 1762 he was carried off by a stroke of the apoplexy; having established the character of an acute and found philosopher, who united to an extenfive acquaintance with the sciences, a distinguished accuracy of judgment, and an agreeable cheerfulnes of temper. His principal works are "M Iphophica," Halle, 1759, 4 to., 8 vo., published in Germany by Meyer, with many alterations, and reprinted by Prof. Eleuther. "Ethica Philosophica," Halle, 1749, 1751, 8 vo.; "Lectura," Frankfurt in Oder, 1750, 1755, 8 vo., and "Bibliotheca Philophoica Prapriac," Frankfort on the Oder, 1760, in 8 vo. B. Bing.

BauHGARTEN, Nicolaus Jacob, brother of the above, was born in 1706 at Weinhalt on the Oder, and having studied at Halle became of the society. He died in 1757; he was a man of great learning, and many of his writings have been published into German.

Baukur, in Geography, a town of Germany, in the archbishopric of Mainz, in the duchy of Pfalz.

Bauucar, a town of Bessarabia, is the circle of Chernigow, 3 miles from Burscha.

Baumholsker, a town of Germany, in the circle of Upper Rhine, and Duchy of Deux Ponts, 12 miles west of Laufersweil, and 25 north of Dusseldorf. Since the French revolution, it is the chief place of a canton in the department of Sarre, and district of Berthelf. The place contains 695 and the canton 6111 inhabitants; the territory comprehends 33 communes.

Baumwald, a forest of Prussia, on the borders of Lithuania, about 10 leagues long and 7 wide.

Bauach, a town of Germany, in the circle of Franconia, and bishopric of Bamberg, near the river Main; 7 miles north of Bamberg. This is also the name of a canton of Swabia, so called from the river Bamach, which runs into the Main.

Bauosa, in Ichthyology, a name given by the Italians to a species of Ray, called by modern naturalists "Raja Oxyrincus," which is.

Bauota, Patavina, in ancient Geography, a town of Italy, in Cappadocia.

Baur, Bawr, or Bouwer, John William, in Biography, an eminent painter of landscape and architecture, was born at Straubing in 1610. After having been the disciple of de Bredell, he went to Rome for improvement; but though he possessed great genius and fertile imagination, and resided for a considerable time in and about Naples and Rome, where he devoted himself entirely to architecture and landscapes, he retained the German taste in all his figures, and neglected the study of nature or the antique; so that he never arrived at a grandeur of design. However his pencil was light, his composition good, and his general expression beautiful, though his figures were somewhat heavy. His paintings in water-colours on vellum are held in the highest estimation. For the duke of Bracciano, at whose court he resided for several years, he finished some charming perspective views of gardens, with statues and fountains, and a number of elegant buildings, with many figures, coaches, cattle, and hortusmen; and he generally distinguished people of different nations by their appropriate dresses. This artist also engraved a great number of plates from his own designs. His engravings from the Metamorphoses of Ovid are generally preferred to the rest. They are slightly etched, and touched with the graver. The figures are small, and incorrectly drawn. The background is dark and heavy, and the trees are defective of that lightness and freedom, which would render the effect agreeable. His pieces of architecture are well executed, and the perspective finely preferred. In his style of engraving he feems, in some degree, to have imitated Callot, and the nearer he approaches it, the better are his productions. The Metamorphoses contain 150 middle-sized plates. Baur died at Vienna in 1640. Fick, Proctor, and Strutt.

Baurac, an ancient name for nitre, but in some places used in a reftraint sense, as not signifying every thing that was called by that name, but only one of two different salts that were confusedly called nitre.

The Arabs give the name baurach to tincar or tincal, which when refined is called borax, but when it is rough, in little crystalline masses like the small crystals of soda, mixed with earth or other impurities, it is always distinguished by the name of tincal. Neumann, p. 227. See Natrium.

Baurinkel, in Geography, a town of Germany, in the circle of Wettphalia, and county of Liigen, 6 miles N.E. of Liigen.

Bausch, Leonard, in Biography, a physician of Schweinfurt, in Franconia, acquired considerable reputation by his commentaries on the works of Hippocrates, published 1594, folio, at Madrid. His son, John Lawrence Bausch, born at Schweinfurt, September 30th 1665, after the usual school education at home, visited the principal seminaries in Germany, France, and Italy, and was made doctor in medicine at Altdorf in 1700. He had the merit of forming a society of physicians, in 1652, who met at stated periods, and communicated such observations in philosophy and medicine as occurred in their practice, and seemed deserving of being preserved. This, in time, gave birth to the Academia Naturae Curiosorum, of which he was the first president, and in 1671 they began to publish their memoirs, under the title of "Milestone Curiosi Medicino-Physica, Academia Naturae Curiosorum," 4to. The society still continue their meetings, and have published near seventy volumes of the Mecifiany. Haller Bib. Med. Prat. Eloy, Dict. Hall.

Bauschouwitz, in Geography, a town of Silesia, in the principality of Neisse, 8 miles E. N. E. of Neisse.

Bausk, or Bautko, a town of Courland seated on the river Mula, on the frontiers of Poland. It was taken by the Swedes, under Guifavar Adolphus, in 1625, and by the Russians under Czar Peter, 1705, after a bloody battle between the Russians and Swedes. N. lat. 56° 30'. E. long. 24° 44'.

Bausset, a town of France, and chief place of a canton in the department of the Var, and district of Toulon. The place contains 2980 and the canton 12,285 inhabitants, the territory includes 270 kilometres, and 5 communes.

Bautsch, a town in Moravia, in the circle of Praha, 18 miles N. of Praha.

Bautzen, or Buderschin, the capital of Upper Lusatia.
fatia, in Germany, situated in the circle of Bawden, on the river Spree, subject to the elector of Saxony, and fortified by a citadel, called the Castle of Ortenburg, standing on a high rock, and separated from the town by a ditch and ramps. This citadel was founded before the town, which had its rise in the 9th century. This town had formerly a considerable manufacture of linen, hats, stockings, and gloves, and also of glazed leather, cloth, flufian, &c. It has frequently suffered much from fire. It was taken by the Prussians in 1757; and after their retreat, taken possession of by the citizens. The Lutherans and Catholics are allowed the free exercise of their religion. N. lat. 51° 10'. E. long. 14° 42'.

BAUX, Les, or BAUX, in Latin Balium, a town of France, in the department of the Rhone, and chief place of a canton in the district of Tarascon, leant on a hill, having a strong castle, formerly an independent barony, and afterwards a marquise. N. lat. 45° 42'. E. long. 5° 0'.

BAUX Island, a name given by captain Marchand to a small island of the Pacific ocean; being one of the group called Herne's Islands, near the Marquesas, and denominated by Hergriff, Sir Henry Martyn, of Island, which he first.

BAUZEL, St., a town of France, in the department of Aveyron and district of Milka. The place contains 823 and the canton 5870 inhabitants; the territory includes 2434 square miles and 12 communes.

BAWD, a person who keeps a place of prostitution, or makes a trade of debauching women, and procuring or conducting criminal intrigues. Some think the word is derived from the old French bours, bold or impudent; though Verdegan has a conjecture which would carry it higher, viz. from boute, Anciently written bolt, in which feorte, bawd, originally imported no more than bath-holder, as if bagnios had anciently been the chief scenes of such prostitution. The Romans had their male as well as female bawds; the former denominated lenones and proagogi, among us pardoners; the latter, lune.

By a law of Conflantine, bawds were to be punished by pouring melted lead down their throats.

BAWDER, in Geography, a river of England, which runs into the Twees, about 3 miles N. N. W. of Barnard castle, in the county of Durham.

BAWD-MONEY, in Botany. See AETHUSA MELAN M. BAWDSEY HAVEN, in Geography, a small bay or anchoring place near the south point of the coast of Suffolk, formed by the ocean, and the mouth of the small river Deben, about a league to the east of Languard fort.

BAWDY-HOUSE, a house of ill-fame, to which lewd persons of both sexes resort for the purpose of licentious and criminal indulgence. House of this kind, under the denomination of brothels and hews, are licenced in some countries; and in England they were privileged by patent, regulated by statute, and tolerated as a necessary drain for corruption, from the reign of Henry II. to the half year of Henry VIII., when they were suppressed by found of trumpets; and their suppression was perhaps attended with greater solemnity than that of the convents. Their suppression, however, failed to extirpate lewdness; and Latimer (Sermons, p. 45), whose sermons are replete with a harsious eloquence, inveighs bitterly at its sublquent prevalence. In 1650, the repeated act of keeping a brothel, and also of committing fornication, was upon a second conviction, made felony without benefit of clergy. But at the restoration, when hypocrisy devoured into the extreme of licentiousness, it was not thought proper to renew a law of such unfashionable rigour. The keeping of a bawdy-house is cognizable by the temporal law, as a common nuisance, not only because it endangers the public peace by drawing togethether dissolute and debauched persons, and promoting quarrels, but because it tends to corrupt the manners of the people by an open profusion of lewdness. (3 Inst. 292. 2.) Those who keep bawdy-houses are punished with fine and imprisonment, and also such infamous punishment, as pillory, &c. as the court shall inflict; and a lodger, who keeps only a single room for the use of bawdry, is indictable for keeping a bawdy-house. (1 Salk. 582.) Persons resorting to a bawdy-house are punishable; and they may be bound to their good behaviour. But if a person he indicted for keeping or frequenting a bawdy-house, it may be expressly alleged to be such a house, and that the party knew it, and not by sufficiency only. (Poph. 268.) A man may be indicted for keeping bad women in his own house. (1 Hawk. P. C. c. 61. § 2.) A confable, upon information that a man and woman are gone to a lewd house, or about to commit fornication or adultery, may, if he finds them together, carry them before a justice of peace without any warrant, and the justice may bind them over to the feisions. (Dalt. 294.) Constables may enter bawdy-houses, call others to their assistance, and arrest the offenders for a breach of the peace. In London, they may carry them to prison, and by the common of the city, whores and bawds may be carted. (3 Inst. 266.) By that

25 Geo. II. c. 56, made perpetual by Stat. 28 Geo. II. c. 19. if two inhabitants, paying leot and lot, shall give notice to a constable of any person keeping a bawdy-house, the constable shall go with them before a justice of peace, and shall, upon the oath of such inhabitants, that they believe the contents of such notice to be true, and their entering into a recognizance of 201. each, to give material evidence of the offence, enter into a recognizance of 30l. to prosecute with effect such person for such offence at the next seions. The constable shall be paid his reasonable expenses by the overers of the poor, avertainable by two justices; and upon conviction of the offender, the overers shall pay the two inhabitants 201. each. A constable, neglecting his duty, forfeits 201. Any person appearing as master or mistress, or as having the care or management of any bawdy-house, shall be deemed the keeper of it, and liable to be punished as such. A wife may be indicted and set in the pillory with her husband, for keeping a brothel; for this is an offence respecting the domestic economy and government of the house, in which the wife has a principal share; and it is such an offence as the law presumes to be generally conducted by the intrigues of the female sex. (1 Hawk. P. C. 2, 3.)

BAWLING, among Hunters, is spoken of the dogs, when they are too noisy before they find the feent good.

BAWN, or BAN, derived from the Teutonic bawen, to construct and secure with branches of trees, in Antiquity, an area inclosed with thick ditches of earth square or circular, impaled with wooden stakes or branches of trees, and surmounted with a deep trench. This was called in Irish daingean, a word of Celtic origin. Numerous remains of such fortresses are found not only in various parts of Ireland, but also in Britain, Germany, Sweden, and almost every country of Europe. The Irish gave great trouble to the English for many centuries by fortifying paries between the bogs and mountains in this manner, so that it was a tedious work to cut through them, and make the roads passable. This was called ploughing a path, from the Franco-Gallic word ploufer, which, like brawn, signifies to entwine: and it consisted in securing the top of the culm with fleeks interlaced with branches. Before the English invasion, each family of the Irish was supplied by Mr. Ledwich, to have lived in a mud cabin surmounted by a bawn. The English introduced castles, in which they were inhabited by the natives. In course of time, brawn came to signify an inclosure with a wall, instead
of plated flakes; and we find queen Elizabeth and James I. requiring those to whom grants were made, to construct cairds with bases, or courts round them, for the protection of their families and tenants. When the grant was not very considerable, a bawn with a house within it was sufficient. Of the latter kind was Hamton Court, in the county of Arundel, which is mentioned in Dean Swift's novels, and which now gives name to a village in that county. This was built of lime and stone, eighty feet square, with two round towers, for gunners, and two stories high, vaulted, the wall itself being thirteen feet high. Within the bawn was a house of lime and stone, thirty-six feet long and twenty feet broad. Further particulars may be found in Ludowick's Antiquities of Ireland, p. 168—176.

BAWROR. In Geography, a town of Red Russia, in the palatinate of Lemberg, 64 miles east of Lemberg.

BAWT, a town of Peria, in the province of Ilak-Agami, 80 miles north of Itchan.

BAWTRY, a market-town in the west riding of Yorkshire, and on the confines of Nottinghamshire. In England, is situated on the high road to Scotland, and confines principally of one broad street, well furnished with inns. It is 80 miles from Doncaster, and 132 miles from London. The river Idle confused a considerable trade from Derbyshire, of food and grime-dolies, as well as lead and iron ware from Markfield, which are conveyed hence to Hull and other parts of the country. The market is held on Wednesday and Saturday; and the town has also three annual fairs. Its houses are 154, inhabited by 798 persons. Nor. lat. 56° 42'.

BAXA Terra, or Baxer Bay, lies on the west coast of Africa, 4 leagues south of the river Otro, which is in Nor. lat. 26° 29'. It is large, and has in several places good anchorage, especially on its northern side.

BAXAS. Bama, lies on the coast of Brazil, in South America, and lies E. and E. by S. from the land-bank of Tamarindo, or Turtle harbour. It has good anchorage, harbours, and good water; and it is well provisioned by a band of vessels from the north wind, and by the land from all other winds.

Baxa, Dra. Porta, denoting a cape of Great Britain, is a low point, 12 leagues from the Inner, and 18 from the Torbay.

BAXTARO, Cape, is situated in the Indian Ocean, in Nor. lat. 18° 41'. E. long. 135° 8'.

BAXOIAS. Antic. or Usk, are two villages of rocks, on the south coast of the island of Ceylon, called the Great or Little Baffes. The former is in Nor. lat. 6° 16'. E. long. 81° 52'; and the latter in Nor. lat. 6° 25'. E. long. 85° 2'.

BAXOES A. Abolos. See Abolos.

Baxos de Llano. See Aboles.

Baxos de la Candeleria, a fine or reef of rocks, in the Pacific ocean, so called by Malaiva in 1567, and lying, by M. Hurter's calculation, near 13°. 64', and E. long. from Paris 157° 7'.

Baxos, Cape, or Las Cabo, is the end point of the entrance into the river Sado, on the coast of Algarve. It lies west of both Cape Tenafos and Panaos island, 2 leagues distant from the latter. On the end of this cape are several dangerous rocks, one of which has no water, and should therefore be carefully avoided by the trading ships that navigate in these parts.

Baxos, Cape, is also on the coast of Africa, southward of the river Colon, 2 leagues from the Quatre Montes, or hill called the Cape is old together.

BAXTER, Richard, in Biography, an eminent divine among the non-conformists of England, was born at Rowton, a small village in the county of Salop, in 1615. His father was a small holder of exemplary character, who, though belonging to the Established Church, was charged with puritanism on accout of his religious demeanour. Under his instruction and example, Baxter manifested early indications of that contemplative and pious disposition for which he was afterwards distinguished. In his youth he enjoyed few advantages for education; the schools from which he attended being more of little learning and boorish morals. But under the tuition of Mr. Wickstead, chaplain to the council at Ludlow, he had access to an excellent library, of which he availed himself on a year and a half very much to his improvement. At this time his views were directed to the profession of a minister. However, in 1633, Mr. Wickstead prevailed upon him to relinquish this object, and to seek his fortune at court. Accordingly he was recommended to sir Hen. Herbert, master of the revels; but disdaining with the mode of living which this situation presented to him, he soon retired into the country, and resumed his purpose of prosecuting his studies for the ministry. Being appointed master of the free school at Dudley, his health declined; and under the impregnation produced by the immediate prospect of dissolution, and by the perusal of several practical treatises, he acquired that deep and setted sense of religion which formed the ruling and permanent principle of his future life. Being more than ever determined to engage in the ministerial office and having at this time no scruples against conformity to the Church of England, he was ordained in 1638; though he afterwards condemned his precipitancy in complying with the laws of subscription without due examination; and he frequently preached at Dudley and in the neighbourhood villages, much to the satisfaction of those who heard him. He objected, however, to some of the ceremonies of the church, and he soon began to entertain doubts concerning the lawfulness of conformity. What led him and several others to study the cafe of episcopacy, and to think unfavourably of the establishment, was the imposition of the "et extra" oath, which expressed an universal approbation of the doctrine and discipline of the church of England, and a determination never to attempt any alteration in its government. Mr. Baxter demurred against taking this oath; and though he would have submitted to the ecclesiastical jurisdiction that was actually established, he could not conscientiously declare his approbation of it, and his determination to support it to the extent which this oath required. In 1645, he was invited by the principal inhabitants of Kidderminster to reside with them as a preacher; and this place became the scene of his ministerial services for about fifteen years. Such, indeed, was the success which attended them, that he was eminently useful in reforming the morals of the district, and in promoting in the town and its neighbourhood a spirit of religion. About two years after his settlement at Kidderminster, the civil war commenced; and on this occasion he took part with the parliament, and recommended the prostitution prescribed by it, to the people. He was thus reduced to the necessity of leaving this town, and of repeatedly changing his residence, till at length infested at Coventry, where he preached regularly once a week both to the soldiers of the garrison and to the people of the town. After the battle of Naseby, he became chaplain to the regiment of colonel Whalley, and attended it at several sieges, though he was never present in any engagement; so that the story of his having killed a man in cold blood, and robbed him of a medal, was an unfounded and scandalous fabrication. During these times of confusion, Mr. Baxter was a zealous friend to religious government both in church and state; and it is said that he took
BAXTER.

took great pains to reproach the sectaries. The accidental circumstance of a profuse bleeding at the nose, which reduced him to a state of great languor, was the occasion of his being separated from the army in 1647, and of preventing that service to his country, which might have been expected from a person of his principles and moderation. However, he relented to the utmost of his power, the manners of those who afterwards usurped the government of the kingdom; he opposed taking the covenant, preached against it, and engrossed, still clinging to the false principles and fictions against the sectaries who came into the kingdom with Charles II.; and therefore the charge alleged against him, of his having been a trumper of rebellion, is altogether without foundation. When Cromwell assumed the supreme power, he boldly and openly declared, that he disliked his usurpation; and in a private conference expressly told him, that in his opinion the ancient monarchy was a blessing. To that form of government, Baxter always avowed his attachment; and in a sermon preached before the parliament on the 30th of April 1666, the day preceding on which they voted the king's return, he maintained, that loyalty to their prince was a thing essential to all true protestants of whatever persuasion. About the same time he preached a thanksgiving sermon at St. Paul's, on occasion of the success of general Monk; and this circumstance refutes the charge of his having diffused his excellency from pursuing in, or bringing about that change.

After the restoration, Baxter was made one of the king's chaplains, and was always treated by him with peculiar respect. To his majesty he spoke with the same freedom which he had used with the protector Cromwell. He strongly represented the great importance of tolerating those pious men who entertained doubts concerning the ceremonies and discipline of the church; and he observed, that the late usurpers had so well understood their own interest, that they had found the way of doing good to be the most effectual means to promote it; and therefore he besought the king that he would never suffer himself to be tempted to undo the good which Cromwell or any other had done, because they were usurpers that did it; and on the contrary, that he would rather outgo them in doing good. At the Savoy conference he was one of the commissioners, and was employed in compiling the reformed liturgy. Having declined the preferment of the bishopric of Hereford, which was offered him, he wished to retire to his friends at Kidderminster, and to officiate among them in the humble station of a curate, but was not permitted. Disappointed with regard to the object of his wishes, he preached for some time occasionally in London; but the act against conventicles obliged him to retire first to Acton, and then to Totteridge. During the persecution of the non-conformists, he preached, as opportunity offered, and the state of the times allowed, either more openly or more privately; and he was sometimes a sufferer for his zeal, and sometimes unmolested. After the indulgence of 1672, he chiefly resided in London, and exercised his ministry, either occasionally or flattered, but not without interruption and molestation. To the sufferings attendant on his preceptor were added the infirmities of a feeble constitution, and frequent bodily disorders, together with the loss of the greater part of his fortune, in consequence of the starving up of the exchequer in 1671, and by the penalties inflicted upon him for the exercice of his ministry; but he bore all these evils with singular fortitude and patience. In 1684, he was treated with peculiar severity. Although he was so ill as not to be able to stand, a warrant was granted against him, in order to his being bound to his good behaviour; and the confidables who were entrapped with his execution, watched him so incessantly, that they prevented him passing from his study to his bed-chamber; and by thus depriving him both of food and sleep, at length effected their purpose, though they were not empowered to break open doors, and took him away to the Seilion-house, where he was bound in the penalty of 400l. to keep the peace; and he was brought up twice afterwards, though he kept his bed during the greatest part of the time. In 1685, he was committed to prison by the request from lord chief-judge Jeffries, for his paraphrase on the New Testament, which was charged with being hostile to episcopacy, and brought to trial for sedition. In the course of this trial, he was treated with all the brutal infolence and tyranny, to the exercise of which that ruffian of the law, Jeffries, was accustomed; reviled by his judge in the grossest terms, and prevented from obtaining the full defence of his counsel; and at last found guilty on the most frivolous grounds, and sentenced to pay 500 marks, to lie in prison till he paid it, and to be bound to his good behaviour for seven years. From this heavy penalty, however, after a confinement of several months, he was released, in 1686, by king James, and allowed to remain in London, notwithstanding the provisions of the Oxford act. From this time he lived in a retired manner, neither interfering in the concerns of his party, nor taking any part in those addresses which some of his brethren presented to James II. on his indulgence. He perished, however, in the performance of his ministerial duties, till increasing weakness confined him to his chamber. The close of his life corresponded to the uniform tenor of it; the approaches of dissolution were regarded by him with pious resignation; and he died, with the tranquillity and hope appropriate to his exemplary character, on the 8th of December 1691. Urged by extreme pain to wish for a release, he checked himself by saying, "It is not fit for me to preferable; when thou wilt, when thou wilt, and how thou wilt." To one who asked him in his sickness how he did, he replied, "Almost well." In 1692, Mr. Baxter married the daughter of Francis Charlton, Esq., a distinguished magistrati of the county of Salop; a woman of great piety, who entered thoroughly into his views concerning religion, and cordially approved all the sacrifices which he made from a conscientious regard to duty. She accompanied him in prison, and submitted, without repining, to all the hardships consequent upon the persecution which he suffered. She died 10 years before him. "Richard Baxter was a man whose whole soul was engaged in his profession. Ardent piety towards God, zeal for the best interests of his fellow-creatures, were the active springs of his conduct; and few men have ever devoted more time and labour to those objects. He passed a life of much contention and obloquy; but at this cool distance, no candid enquirer can mistake his true character. His early studies in divinity were not, perhaps, the best adapted to form a theologian. They confined chiefly to the schoolmen and metaphysicians of a dark age, and gave him a turn to subtleties of distinction, which made him fland apart in some theoretical points from all his contemporaries. Yet, in practical religion, the devotional warmth of his temper allied him to the pious of all denominations, and inspired him with an enlargement of mind, which let him above the differences resulting from petty controversies. He was a most voluminous writer, and his works are sufficient to make a library of themselves. Above 145 distinct treatises of his composition have been reckoned up; of which 4 were folio, 73 quarto, and 49 octavo, besides several others of a smaller size. They comprise bodies of theology, practical and theoretical, besides a vast number of tracts on particular topics." His practical works have been collected together in.
BAXTER

in 4 vols. in folio. His income, it is said, which was not great, was increased by the profit which he made of his writings, for which he sometimes received 60 or 80 l. a year of the booksellers. But this money he seems to have employed for charitable purposes. Of his numerous works some of the principal were his "Methodus Theologicorum," printed in Latin in 1654, folio; his English body of practical divinity, published in 1673, folio, under the title of "The Christian Directory," &c.; "Cædes Salvatorum, or the Reformed Pastor," 1678, much esteemed by many divines; "Universal Concord," 12mo. 1678, giving an account of the terms upon which all Christian churches may hold communion; "Reasons for the Christian Religion," 1672; "Catholic Theology," fol. 1675, intended to reconcile the differences between the Arminians and the Calvinists; "A Treatise of Episcopacy," 4to. 1681; "A Treatise of Universal Redemption," 1680. The most popular of his practical pieces were his "Saints' Everlasting Rest," and his "Call to the Unconverted," of which latter 20,000 were sold in one year, and it was translated into all the European languages, and into the Indian tongue. To these which we have enumerated, we may add his "Reformed Liturgy," his "Poor Man's Family Book," his "Dying Thoughts," and his "Paraphrase on the New Testament." The first book he published was his "Aphorisms of Justification" and the "Covenants," printed in 1649; and the last in his lifetime, "The Certainty of the world of Spirits," printed in 1691; so that he was an author 42 years. One of his works is "A Narrative of his own Life and Times," in which, though a chapbook, says Mr. Granger, "composed in the manner of a diary, contains a great variety of memorable things, and is itself, as far as it goes, a history of non-controversy." Mr. Baxter was a distinguished, able, not only as a practical, but also as a controversial writer; and under this latter character, he particularly opposed the Antinomians. Few persons have suffered more unanswerable abuse than Mr. Baxter; and few have been more highly respected both by his contemporaries and posterity. Among his friends and admirers we may reckon some of the most distinguished characters of the age in which he lived, of whom many were members of the establishment, such as chief justice Hale, Sir John Maynard, Dr. Barrow, bishop Wilkins, bishop Park, and bishop Burnet. The great chief justice Hale honoured him with an intimate friendship, gave a high encomium of his piety and learning to all the judges, and when he was in prison, on the Oxford act, let him a legacy in his will, and several large books, in his own hand-writing, on the matter of their conversations. Dr. Barrow has testified concerning his works, "that his practical writings were never mended, his controversial seldom confuted." Bishop Wilkins affirms, "that he has cultivated every subject which he has handled," and he used to say of him, "that he never lived in the primitive times, he had been one of the fathers of the church. Bishop Burnet's testimony is somewhat qualified. "Baxter," he says, "was a man of great piety, and if he had not meddled in too many things, would have been esteemed one of the learned men of the age. He was a very moving, and pathetic way of writing, and was his whole life long a man of great zeal, and much tempation; but was most unskilfully fecular and metaphysically in every thing." Baxter was one of the last divines, whose name, distinguished a particular demonstration or description of persons. See BAXTERIAN. Bayley's Life of Baxter. Biog. Brit. Chron. Biog.

BAXTER, William, an eminent philologist and antiquarian, was the nephew and heir of Richard Baxter, and was born of parents in mean circumstances at Leighton, an obscure village of Shropshire, in 1632. He traced his pedigree, like a true Cambro-Briton, through a long line of ancestors from John Baxter, who, in the reign of Henry VI., settled at Shrewsbury; and he knows, that the name Baxter signifies originally a baker, in Latin "Excellere," and that it was given to that family, because they were bakers to the ancient princes of Wales, in which post, according to the custom of the ancient Celts and Greeks, the nobble persons were employed.

In his infancy and youth, his education was so much neglected, that when he was sent to Harrow School at Middlesex at the age of 18, he knew not one letter, nor understood one word of any language but Welsh. Yet such were his talents and application, that he soon became distinguished by his extensive knowledge. In 1657, he published a Latin grammar, entitled "De Analoge, seu articulo Latinae linguae commentariis," &c. 12mo. Thus qualified for the profession of a schoolmaster, to which he devoted himself, he employed the greatest part of his life in this occupation. For some years he kept a boarding school at Tottenham High-cross in Middlesex; and he was afterwards elected master of the preacher's school in London. Having acquired great celebrity as a scholar, and in the prosecution of antiquarian researches, and distinguished, perhaps, more by his learning than his judgment, he died in 1733. In 1695 he published a new and corrected edition of "Ameron," with notes, which was reprinted with considerable additions and improvements in 1710. His abode of Tanaquil Fibe, a former editor of Ameron, was amply restored upon himself by J. C. Wilkins de Paro, in his 4to. edition of the same post, published at Utrecht in 1733, in which held his comments in great contempt. His edition of "Homo," printed in 1701, and reprinted with improvements in 1722, has obtained a more lasting reputation. Dr. Harwood pronounces this the best edition ever published, and the learned Gefner has testified his approbation of it, by making it the ground-work of his excellent edition Bentley, famed for the facility of his criticism, in speaking of it, calls Baxter "Vir reconditissimus." In 1717 Baxter published his dictionary of British antiquities, under the title of "Glossarium Antiquitatum Britannicarum, five syllabus etymologicus antiquitatum veterum Britannic et atque Germaniae, temporibus Romanorum," 8vo. By his skill in the British or Welsh tongue, and by means of etymology, he professed to correct Camden, and to add about 250 names of ancient places and rivers omitted in his Britannia; of this work, a second edition was published, after the author's decease, in 1733. His glossary of Roman antiquities, proceeding no farther than the letter A, was published in 1726 by Mr. Mofes Williams, under the title of "Reliquiae Baxterianae," &c. and republished in 1751, with the title "Glossarium Antiquitatum Romanorum," Lond. 8vo. Baxter also wrote four letters on subjects of antiquity, inserted in the first volume of the "Archaeologia." He left behind him notes on Periplus and Juvenal, and was the translator of many of Plutarch's lives "done into English" by his faithful hands. Biog. Brit.

BAXTER, Andrew, an ingenious metaphysician and philosopher, was the son of a watchman at Abirnken, and born there in 1686 or 1687. He was educated in King's college in that city, and afterwards undertook the care of private pupils, some of whom were pupils of John and Baxter. About the year 1735, he published in 4to. his celebrated work, entitled, "An Enquiry into the Nature of Human Souls; wherein the Immateriality of the Good
BAX

Soul is evinced, from the principles of Reason and Philosophy." This work, which was reprinted in 2 vols. 8vo. in 1737 and in 1745, was much applauded by several persons of eminence, and particularly by Bishop Warburton, who, in his "Divine Lyegation," speaks of it as containing "the justest and precitious notions of God and the Soul," and "as one of the most munificent of the kind, that the present times, greatly advanced in true philosophy, have produced." Of the author's sentiments, see some account under the articles Dream, Soul, and Vis Inertia. In 1741 Mr. Baxter went abroad with one of his pupils, and settled for some time at Utrecht, where he became acquainted with several of the literary persons, and whence he made several excursions into Flanders, France, and Germany. Upon his return to Scotland in 1747, he died till his death at Whittingham, in the shire of East Lothian. His work entitled "Matho, Five Coelestheria Pucrilis," was drawn up for the use of his pupils, and first printed in Latin, and afterwards greatly enlarged, and published in English, in 2 vols. 8vo. The second edition of this work was published in 1745, and the third in 2 vols. 12mo. in 1755. The design of this work was to deduce the principles of natural religion from the phenomena of the material world. A mistake in the astronomical theory, which the author did not live to rectify, as he had intended, had disguised some readers; and therefore, in the third edition, the conference that was chiefly affected by that error, was suppressed, and the vacancy supplied by another. In 1750 the author published "an Appendix to the first part of his Enquiry into the Nature of the Soul," vindicating it from some objections, which was dedicated to Mr. Wilkes, with whom he formed an intimate acquaintance abroad. In this year Mr. Baxter, having endured great sufferings from the gout, and a complication of disorders, with exemplary patience, closed his life about the sixty-third year of his age. He left behind him several unfinished MSS. on philosophical subjects, and one in a complete state, concerning the controversy between the English and foreign philosophers on the subject of the force of bodies moving in free spaces, which however was never published.

Mr. Baxter's learning and talents are sufficiently displayed in his writings. His application was such, that he sometimes sat up whole nights reading and writing; and yet his disposition was cheerful and sociable. In conversation he was modest and unassuming; and in the discharge of the social and relative duties of life, his conduct was exemplary. His mind was policed with the most reverential sentiments of the Deity, and the general tenor of his life was conformable to the rules of virtue. He was economical without parsimony. Such was his disinterestedness, that he declined considerable offers of preferment, which he might have obtained if he had taken orders in the church of England. His knowledge of the modern languages was extensive; so that he could write and speak in French, German, Dutch, Italian, and Spanish. Before his wife, whom he married in 1724, and who survived him ten years, he had one son and three daughters. 

BAY

Mr. Baxter, nonconformist minister; of whom we have already given an account. His theological system has been called Baxterianism; and those who embrace his sentiments in divinity, are called Baxterians. The Baxterians have endeavoured to strike into a middle path between Calvinism and Arminianism; and to unite both these schemes. They profess to believe in the doctrines of election, effectual calling, and other tenets of Calvinism; and consequently, suppose, that a certain number, determined upon in the divine counsels, will infallibly be favored. This they think necessary to secure the ends of Christ's interposition. But then, on the other hand, they reject the doctrine of reprobation, and admit that our blessed Lord, in a certain sense, died for all; and that such a portion of grace is allotted to every man, as renders it his own fault, if he doth not attain to eternal happiness. If he improves the common grace given to all mankind, this will be followed by that special grace which will terminate in his final acceptance and salvation. Whether the Baxterians are of opinion, that any besides the elect, will actually make such a right use of common grace as to obtain the same, and, at length, come to heaven; we cannot assuredly say; there may possibly be a difference of opinion upon the subject, as they approach nearer to Calvinism or Arminianism. Mr. Baxter appears, likewise, to have modelled the doctrine of justification, and the perseverance of the saints, in a manner which was not agreeable to the rigid Calvinists. Some foreign divines in the 17th century struck nearly into the same path as, and particularly, in France, M. le Blanc, Mr. Cameron, and the celebrated Mons. Amvrault. For a considerable time the non-conformist clergy in England were divided into scarcely any but two doctrinal parties, the Calvinists and the Baxterians. Of late the Baxterians have been less numerous. However, they are still a considerable body, and several persons are fond of the name as a creditable one, who probably go farther than Mr. Baxter did. The name, however, like other theological distinctions, will probably, in a course of time, sink into disuse, till it is either wholly forgotten, or preferred merely in the records of history.

BAY, in Botany. See Laurus.

BAY, Loblolly. See Gorgonia.

BAY, Rose. See Nerium.

BAY, Dwarf Rose, and Mountain Rose. See Rhodendron.

BAY, Sweet Flowering. See Magnolia.

BAY Plum. See Prunus.

BAY, in Building, denotes any kind of opening in walls; as a door, window, or even chimney.

BAY windows are the same with what we otherwise call bow windows.

BAY, in Geography, denotes a little gulf, or an arm of the sea, stretching up into the land; being larger in the middle than, at its entrance, which is called the mouth of the bay. The largest and most remarkable bays are those of Biscay, Bengal, Hudson's, Panama, &c.

BAY, All Saints. See All Saints.

BAY, of Antigua. See Antongil.

BAY, Buffin's. See Battin.

BAY, of Conace. See Cancale.

BAY, Chequit. See Chequitain.

BAY, of Chesapeake. See Chesapeake.

BAY, of Chesaapeake. See Chesapeake.

BAY, of Firth lies on the east coast of New South Wales, or New Holland, in the Pacific ocean, to the north of St. Patrick's Head. The north point of the bay is called Edystone, and the south point St. Helen's. A small rocky island is near the middle of its entrance, on each side of which is an open passage.

BAY, of Fresh Water, lies south of Agression bay in the north part of the gulf of Mexico. N. lat. 30°. W. long. 93°.

BAY of Funday. See Funday.

BAY, of Good Fortune, lies on the north coast of Chaleur bay, which is a large bay of the gulf of St. Lawrence, and on the north east coast of Nova Scotia in North America.

BAY, Hudson's. See Hudson's.

BAY of Lintot, a bay on the south east coast of New Hol-
BAY

land, between cape Palmarion and cape Townshend.  
S. lat. 21° 53', to 22° 30'.  
W. long. 209° 36', to 210° 43'.

Bay of *Islands* lies on the coast of Nova Scotia, on the continent of North America, about 6 leagues south-west from cape St. Mary.

Bay of *Islands* is also a bay on the northern island of New Zealand, in the south Pacific ocean, lying on the north-east coast between cape Brett and cape Pocevke. This bay is large and deep, and has many small islands in it. The boat entrance into the bay is on the west side; within it are several other bays.

Bay of *Islands* is also on the south-east coast of Magellan, towards the western entrance, W. by N. from Upright bay, and E. by S. from the bay of Hoppominent. A cluster of small islands lies in the entrance, and in the east part of the bay: but the boat entrance is between the westernmost of the two islands off the point of Cape Upright, and a small island farther west, where a ship may have fair passage, and anchor in 20 fathoms in soft mud, near the west coast of the cape, in S. lat. 53° 5'.  
W. long. 75° 32'.

Bay of *Isla* is an extensive bay of the gulf of St. Lawrence, on the west coast of Newfoundland, about 8 or 9 leagues to the S. W. from the Belle bay, and 14 or 15 leagues to N. E. from Port aux Prince. The centre of the bay lies in about N. lat. 49° 5'.  
W. long. 58° 15'.

Bay of *Iloilo* is also a bay situated towards the west end of the north coast of South Georgia island, in the south Atlantic ocean.

Bay of *St. Louis*, lies on the Labrador coast, and has cape St. Louis on the north, and cape Charles on the south. It has many small islands; the largest of which is Battle island, in the mouth of the bay. The middle of the bay is in N. lat. 52° 23', W. long. 55° 23'.

Bay de Rochefort, lies on the west side of Lake Champlain, and the flat of New York, 17 miles above Crown-point.

Bay of *Rocks* is a spacious bay of the Arabian sea, which forms a part of the Indian ocean, and lies on the south-east coast of Arabia, with good anchorage for ships.

Bay of *Seven Islands* lies W. N. W. from Moishe river, and about 18 leagues to N. E. from Trinity point, on the north shore of the gulf of S. Lawrence.

Bay of *Shoals*.  
See BAYAS Babet.

Bay of *St. Spirit*, is a large bay of the Indian ocean, on the south-east coast of Africa, on the north of the island and E. of the Malabar. It is sufficiently spacious to receive a fleet of 40 ships, and is called from the river of St. Spirit, or Manne, which enters this bay.

Bay, or *Inlet*, is that part of the bar of where the mouth is.

Bay, or *Harbour*, signifies a port, or port and head, made up of a large basin, to which is a large sea of water; between the shores of a large or branches of an island, by the current of which exten'sed through it or branches, called the *tongue*.

Bay o'er, or *Wade*.  
The wind blows from the land toward the sea, and back again, so that you cannot or cannot see the land. It is also said, among the seamen, that all way, if well placed, is called the *spout*.

Bay, or *Island* colour among horses. It is a strong and perhaps prevalent character in the colour to be associated with a black man, and not with the black or any other colour that apprehends it as a mark. The bay is also most frequently tied with black, and feet up to the knee and back; but, how much it varies in the same animal of the colour, in respect to its esteemed is almost inconstant. There are several kinds of bays, as light bay, dark bay, brown bay, golden bay, dappled bay, &c.

Bay *à mirrur*, the same as *Dapple Bay*.

Bay, among *Sportifien*, is applied to flags, boars, foxes, &c. and also to dogs when they turn head against another. Thus when a flag has been too long pursued, that he is almost exhausted, he turns round, and the hounds defends himself with his antlers, and keeps the hounds at bay, till the sportifien come up, draw off the dogs, and give his name. When a flag takes *tail*, that is, takes to the water, he will defend himself, and keep the hounds for a long time at bay, provided that he fathoms the lake or river so well as to keep the hounds swimming, without going out of his own depth, but if he is obliged to swim at the time, he is up or quite tired, and being surrounded by the dogs, he is inevitably drowned. In fox hunting, when the fox is supposed to have entered the earth, the place of his retreat is soon discovered by the terriers, "laying well at him," provided he has not turned in the earth; but if he has, the terrier and the fox are face to face, and are both baying, or keeping each other at bay; and the contest terminates with driving out the fox.

Bay *fale*, see SALT.

Bay yards, is a denomination sometimes used prominently with *woollen yarn* 10 and 11 W. III. c. 10. 5 G. II. c. 21.  
See YARN, &c.

BAYA, in Geography.  
See BAY, and BAYA.

BAYA, low, marshy land on the Gold coast of Africa, without any towns or people near the shore; 4 leagues W. S. W. from the river Volta, and 8 leagues E. and N. E. from Ningo ground.

BAYA, in Ornithology, Indian gooseberry, or *Laxia indica*, is rather larger than a sparrow, with yellow brown plumage, a yellowish head and feet, a light-coloured breast, and a conic beak, very thick in proportion to his body. This bird is very common in Hindoostan; and is described as furiously feitulous, faithful, and docile; never voluntarily deserting the place where its young are hatched, not even from the society of mankind, and easily taught to perch on the hand of his master. In a state of nature the baya builds his nest on the highest tree which he can find; generally on the palm tree or fig tree, preferring that which overhangs a well or rivulet, forming it of grass in the shape of a large bottle, suspending it on the branches so as to be firm and yet to rock with the wind, and placing it with its entrance downwards, to secure it from birds of prey. This bird is taught with care to fetch a piece of paper, or any small thing which its master wants. If a ring be dropped into a deep well, and a signal given to the bird, he will fly down with astonishing celerity, and bring it up to his master with apparent volition; and it is sufficiently affected, that if a house or any other place be thrown to him once or twice, he will carry a note thereto immediately, without ever returning a proper signal. They are also trained by the youthful librarians of libraries to pluck off the pieces of gold called tics, placed by way of ornament between the eyes of, or under the frills, which they bring in triumph to their masters. The baya's natural food is grasshoppers and other insects; but it is equally well, when tame, on pulse macerated in water. The female lays many beautiful eggs, resembling large seeds, white, when boiled, transparent, and of the flavour of them is equably delicate.  
*Atlasses and Geographies*, vol. 3. p. 109.

BAYAgARES, in Geography, a town on the island of St. Domingo.

BAYANO, called also St. Salvador, a town in the eastern part of the island of Cuba, having the town of Almo to the west, and St. Barbara to the south. It lies on the east side of F. 2.
of Estero river, about 20 miles from the sea; and it gives name to a channel, that runs between the numerous small islands and rocks, called "Jardin de la Reyna, or Queen's gardens," on the north-west, and the islands and rocks that line the coast on the south-west side of it, from the bold point called Cabo de Cruz.

BAYARD, or BAIZE, in some Old Writers, is an appellative for a horse. Hence the phraces, blind bayard, bayard's wanding, bayard's green, &c.

BAYDORF, in Geography, a small town of the Crimez or Tartar tribes, in the delightful valley, called by the natives the "Tauric Arcadia," the "Crimin Tempe," &c. which is watered by two gentle murmuring streams. It is of an oval form, about 20 miles long, and surrounded by high mountains, covered with beautiful woods, intermixed with odorous flowering shrubs. It contains a number of Tartar villages, romantically situated and inhabited by the families of shepherds and husbandmen.

BAYEN, Cape. See BAJADORE.

BAYEUX, Peter, in Biography, a French chemist, was born at Calais in 1725. In 1749, he served under Charas in pharmacy. He gave analyses of the mineral waters of France; and he wrote memoirs on marbles, serpentinite flons, porphyries, granites, jaspers, feldspars, and iron spar. He doubted the existence of the phlegiston of Stahl; and by operating on mercurial precipitates, he found that what are called metallic oxides owe their state, when obtained by calcining metals, to the absorption of one of the constituent ingredients of atmospheric air. This chemist also discovered the fulminating property of metals, when mixed with a very little sulphur; and he showed that tin was not necessarily contaminated by arsenic; that what is used by potters contains copper and antimony, by which it is rendered hard; zinc, by which it is whitened; bismuth, by which it is rendered more durable; and lead, in order to diminish the price. Bayen died at the age of 72 years. Mem. de l'Institut National, &c. vol. i.

BAYER, Gottlieb Siegfr. a celebrated philologist, was born at Konigberg, in Prussia, in 1694, and studied, chiefly, the languages, in his native city, and afterwards at Danzig, Berlin, and Leipzig; at which latter place he took the degree of master of arts in 1717. On his return to Konigberg in the following year, he was appointed librarian of the public library. In 1726 he removed to Peterburg, became professor of the Greek and Roman antiquities in the Academy of Sciences, and acquired an extensive knowledge of the Chinese and other Asiatic languages. In 1738 he was chosen member of the Academy of Sciences at Berlin; and in 1739 he was invited to professor of eloquence at Halle; which he was not allowed to accept, but continued in Ruffia with a considerable increase of salary. He died at Peterburg in 1738. His numerous dissertations on different subjects are inserted in Lichtenhain's "Select. Hiflor. Liter." the "Acta Eruditorum," and the "Comment. Acad. Petropol." &c. His "Museum Sinicum," published in 1732, in 2 vo. 8vo. is a work of great learning and ingenuity. Gen. Biog.

BAYER, John, a German astronomer, flourished at the close of the 16th and commencement of the 17th centuries; but the time and place of his birth are not ascertained. Some have supposed that he was the grandfather of the subject of the preceding article, and that he was born at Augsburg. It was at Augsburg, however, that he published, in 1603, his excellent and useful work, entitled "Uranometria." This is a large celestial atlas, consisting of folio charts of all the constellations, with a nomenclature, collected from all the tables of astronomy, ancient and modern, improved by his own useful invention of denoting the stars in each constellation by Greek letters, in alphabetical order according to the magnitude of each. The stars are thus as easily distinguished as if each of them had an appropriate name; and the utility of this mode of classification has been so much approved, that it has been retained, since Bayer's time, in all the atlases, catalogues, and celestial globes through the scientific world. This valuable work was gradually improved and augmented by the author himself. In the year 1637 Julius Schiller, a civilian, projected by the suggestion of Bayer, and published his Uranographia, under the title of "Celum Superioris Chronogrammar," in which he rejected the heathen names, characters, and figures of the constellations, and inserted in their stead others taken from the scriptures. Accordingly he placed the twelve apostles in the zodiac; and he deduced the southern constellations from the Old Testament, and the northern ones from the New Testament. This innovation, however, tended to embarrass astronomers, and was never adopted. The ancient names were therefore restored in the later editions of the Uranometria of 1645 and 1661. Montucla, Hist. des Math. tom. ii. p. 333. See Catalogue.

BAYERSDORF, in Geography, a town of Germany, in the circle of Frankonia, and principality of Bayreuth, seated on the Rednitz, with a tribunal of justice and a large synagogue; 4 miles north of Erlang.

BAYETTE, in Ichthyology, a French name of the species of Silurus observed by Soninini in the Nile, and figured pl. 27 of his "Voyage en Egypte." It is the same kind which Forciam calls Silurus bajad. It grows to a large size, but its flesh is not much esteemed.

BAYEUX, in Geography, a town of France, and principal place of a district, in the department of Calvados. Before the revolution it was the capital of Belfin, in the province of Normandy, the seat of a bishop, whose diocese included 61 parishes. The cathedral is much admired. The principal commerce is leather. It is seated on the river Aure, about 4 miles from the sea. The place contains 9970, and the canton 15261 inhabitants, in a territory of 86 kilometres, including 19 communes. N. lat. 49° 16' 30". W. long. 0° 42' 51".

The celebrated tapestry of Bayeux, which still exists, and is publicly exhibited at stated periods in the cathedral of the city, is a very curious monument of the state of the art of embroidery at the time of the Norman conquest. It is a web of linen, nearly two feet in breadth, and 342 in length, embroidered with the history of that memorable expedition, from the embassies of Harold to the Norman court in 1055, till his death in the following year. The scenes of this busy period are successively exhibited, and contrast of many hundred figures of men, horses, beasts, birds, trees, hedges, cistals, and churches, with inscriptions over them explanatory of their meaning and history. This work is understood to have been performed under the direction of Matilda, consort to William I, and was not improbably executed by the hands of English women, whose superiority in performances of this kind was then universally acknowledged. The entire contents of this tapestry are represented in a series of engravings, which may be seen in Montfaucon, tom. 1 & 2; and Ducarel, Anglo-Norman Antiquities, App. No. 1.

BAYE, or BAFE, Lazzare De, in Biography, was the son of a gentleman of Anjou, and having studied under Budreus and others, he pursued the profession of the law at Paris; and afterwards travelled into Italy, and learned Greek under Mufurus, a Candiat, at Rome. Upon his return he devoted himself to literature, and retired to his own estate at Arjou. In 1531 he was sent by Francis I as ambassador to Venice;
In 1539 he was deputed on public business to Germany; and after his return was made master of requests, and had also the abbacies of Grenetiere and Charroux. The precise time of his birth and death is unknown. A writer seems to have been the first who introduced the Greek tragedy among his countrymen, by his translations of the "Electra," of Sophocles, and the "Helena," of Euripides, into French verse. He was also the author of two learned treatises, "De re vetera," and "De re Nova," Paris, 1576, 4to; and he translated some Lives of Plutarch.

Bayle, John Anthony. See BAYLE.

BAYLE. Baja or Bala, in Geography, a town of Africa, in the kingdom of Tunis, not far from the frontiers of the Algiers, is supposed to be the ancient "Vaca" of Sachels, the "Oppidum Vageniens" of Pliny, and the "Bala" of Plutarch; and it is at this day, as it was formerly, a place of great trade, being the chief mart of the whole kingdom, particularly for corn, which is supplied in such abundance by the plains of Budaera, along the banks of the Mejerda, that the Tunisians lay proverbially concerning it, that if there was another such town for plenty of corn, it would become as common and cheap as land. It has also every summer a public fair, to which the most desert Arabian tribes resort with their flocks, their manufactures, and their families. However, the inhabitants, subject to the oppressive exactions of government, and the frequentursions of the Arabs, who are numerous and powerful in its vicinity, are extremely poor, and a great part of their ground remains uncultivated. It is fed on the declivity of a hill in the road to Constantia, about 15 leagues from the northern coast, and 35 W.S.W. from Tunis; and has the convenient of being well watered. On the summit of the hill is a castle of no great strength. The walls, which are railed over the materials of the old Roman Vaca, are still entire, and have some ancient inscriptions. N. Litt. 36. 42. L. 91. 27. Shaw's Travels, p. 92.

BAYLE, Pierre, in Biography, an eminent critic and philopher, was the son of a protestant minister at Carla, in the county of Pau in France, where he was born in 1632. Whilst he pursued his studies, first under his father, and afterwards in the protestant academy at Pluye, whither he was sent in 1654, his application was so acute and uninteresting that he injured his health. His reading was very extensive; but his favourite authors were Plutarch and Murez. From Pluye, he removed in 1660, to the University of Toulouse, with the hope of obtaining superior advantages for improvement, and of making more rapid progress. Here he attended the philosophical lectures that were read in the college of the Jesuits; and his disputations with a good pastor, who lodged in the same house with him, forced him to increase the study which he had already begun to entertain against the prejudices of religion, and induced him to take to himself a new Catholic. This change of opinion, which seemed to be the result of interest, and of conviction, although produced by arguments which no learned examination would discover to be inadequate, manifested an honesty of mind. However it is proved and admitted to his credit, that he withdrew from him the necessary means of subsistence. In their delicate circumstances, he was generally relieved by the bishop of Rieux, who much unseasonably have been gratified by the accession of such a convert. Upon further inquiry Bayle found, that he had been too precipitate in abandoning his religion; and he therefore determined to leave Toulouse after having continued there about eighteen months, and to renounce the errors into which he had been betrayed. Having made his abjuration in the presence of his eldest brother and some other noblemen, he immediately set out for Geneva, in order to prosecute his studies. Here he soon found reason for relinquishing the philosophy of Aris- totle, to which he had been originally attached, and to adopt that of Descartes. His reputation introduced him to an acquaintance with several persons of eminence at Geneva, and particularly with Mr. James Balfage; between whom and Bayle an intimate friendship subsisted as long as they both lived. At this time Bayle required the means of support by private tuition; but dissatisfied with this mode of life, which did not suit the independence of his spirit, nor correspond to his desire of further improvement, he wished to exchange it for some station better adapted to his genius and views. After a few years employed in this way an opportunity occurred for gratifying his wishes. In the spring of 1675 he removed to Paris, and undertook the tuition of Messrs. de Beringhen, brothers to a counsellor in the parliament of Paris. From this city, however, to which his wishes had been directed, he soon removed, at the desire of his friend Mr. Balfage, in order to offer himself as a candidate for the vacant professorship of philosophy in the protestant university of Sedan. His views were encouraged by Mr. Jurieu, the professor of divinity, who favored Bayle, partly because he was anxious to exclude another candidate. Bayle evinced a decided superiority to the other competitors in a public disputation, and having secured his election, began his lectures, Nov. 11, 1675. By the affability with which he discharged the duties of his public office, and by the amiable temper which he manifested in private life, he gained great reputation, and many friends at Sedan; and he devoted his hours of leisure to compositions of the critical kind, which habituated him to that accuracy and depth of reasoning, that afterwards constituted his distinguishing excellence. The first week, which he committed to the press, was his Observations on the comet that made its appearance in December 1664; the first edition of which was printed at Rotterdam in 1662, without a name, and under the assumed character of a Roman Catholic, under the title of "Liste a M. L. A. D. C. docteur de Serbonne," &c. and Colonne was the pretended place of publication. In this treatise, afterwards called "Pentes fac la Comete," as many delicate questions are discussed, relative to supposed miracles wronged, and prejudice given among the heathens, to the comparison of the miracles of atheism with those of idolatry, and to other points which afforded a range to the author's spirit of free inquiry. In 1681 the university of Sedan was suppressed by an arbitrary edict of Lewis XIV; and Mr. Bayle, deprived of his professorship, was reduced to the necessity of seeking some new employment. At this time, the magistrates of Rotterdam established a "Schola Histo- rica," and Bayle was appointed professor of philosophy and history; and at his recommendation Jurieu was engaged as professor of divinity. In December 1685, Bayle entered on his new office. In the next year he published a criticism on Maimbourg's "History of Calvinism," in the form of letters, under the title of "Critique Générale de l'histoire du Calvinisme de M. Maimbourg." This work written in a lively manner, and with a vein of satire, was read with pleasure by persons of the Reformed religion, and it was particularly agreeable to the prince of Condé, who was no friend to Maimbourg. Although it was publicly condemned at Paris, it became popular in Holland, and a new edition of it, with amendments, was speedily published. Jurieu had also published a refutation of Maimbourg; but being much less popular than Bayle's, the author began to regard his brother professor with a considerable degree of jealousy.
had, In 1684 Mr. Bayle was induced, by the freedom of the press in Holland, to print several controversial works, that were sent him from France; and particularly "A collection of some curious pieces relative to the philosophy of Descartes," with a preface, giving an account of these pieces, and containing some reflections on the inquisitorial power exercised in France over books on scientific topics. In this year he began his monthly literary journal, entitled "Novelles de la Republique des Lettres," which was written in a manner that ferved not only to support, but to increase the reputation which he had already gained. About this time he declined an offer of the professorship of philosophy at Franeker, though it was proposed very much to augment the salary which he received at Rotterdam. His "Novelles Lettres de l'Auteur de la Critique generale de l'Histoire du Calvinisme de M. Mainmbourgh," which was a continuation or second part of his former work, and printed in 1685, excited much less attention than the first. Having given an opinion in favour of M. Malebranche in his account of Arnauld's book written against him, he was engaged in a dispute with the latter; and in 1686 he had a correspondence with Christi'an, queen of Sweden, concerning a letter of her majesty's, which he had mentioned in his journal, and which condemned the persecution suffered by the protestants in France. This letter, he had said, was "the remander of the Protestant religion in her." This expression had given some flight offence to the queen, and Bayle addressed to her a letter of apology, in an ample reply the queen declared her satisfaction with his excuses; and adds, "I will lay a penance upon you which is, that for the future you vend me all the curious books, in French, Latin, or Italian, upon all kinds of sciences and all sorts of subjects, provided they be worth reading." Her majesty made no exception of romances or fables, and particularly requested books of chemistry, and the author's journal. Bayle was much affected by the revocation of the edict of Nantes, and the cruelties exercised against the protestants in France for the purpose of inducing them to abjure their religion. Upon this conduct he made some jult and pointed reflections in his journal; and in 1686, he published a pamphlet, entitled, "Ce que c'est que la France toute Catholique sous le regne de Louis le grand," or, a character of France, become entirely catholic under Louis the great. It was published without his name; and contained very severe cenfures on the treatment which the protestants received, as well as on the iniquity and folly of all attempts to procure conversion by force. This was from followed by his famous work, intituled, "Commentarie Philosophique," &c.; or, a Philosophical Commentary on the words: "Compel them to come in." This work was an elaborate defense of toleration, which formed the first part of it; and in the second the author answers all the objections against it. It was followed in the next year by a third part, containing a confutation of St. Auguinik's apology for persecution. The free sentiments expressed in this work gave offence to Jurieu; and though he was ignorant of the author, who had taken pains to conceal his name, he wrote a treatise against it. Bayle's health was so much impaired by the application devoted to the composition of his commentary, and probably also by the vexation occasioned by his controversy relating to queen Christi'an, that he found it necessary to discontinue his literary journal, in the conduct of which he had obtained numerous testimonies of approbation, not only from private persons, but from several societies of learned men, and particularly from the French Academy and the Royal Society of England. His situation also at Rotterdam became unpleasant to him, on account of
Bayle.

Argumentation he had spent his life in acquiring." The text is concise; but the notes, which contain much valuable information, are spun out to a tiresome and interminable length. This dictionary, generally so well received, and containing a variety of unexceptionable matter, displayed the freedom of several kinds, both as to sentiment and dictum, which were not likely to escape censure. Jurieu, the avowed and inimical antagonist of Bayle, attacked it from the press, and endeavoured to procure its condemnation from the ecclesiastical assemblies. The consistory of the Walloon church of Rotterdam contented itself with the detailed objections against particular articles, for which indeed no satisfactory apology could be offered; but satisfied with Mr. Bayle's promise of amendment in a second edition, they proceeded no further. In 1702, Mr. Bayle published a second edition, with many additions. In the following year he wrote a volume entitled, "Réponse aux Questions d'un Provincial," containing an entertaining and instructive variety of historical, critical, and literary observations, to which he added a second and third volume in 1703, and a fourth in 1706. In 1703, he published "A Vindication of his Thoughts on Comets," which involved him in new disputes, particularly with the ingenuous and learned Le Clerc. With his fame, his adversaries multiplied; and attempts were made to prejudice lord Sunderland, the English minister of state, against him, and to prevent the publication of the United States, as a man who was not only an enemy to religion, but chargeable with treason against the government. The form, however, was diverted by the influence of lord Shaftebury. He was offered at this time a liberal provision and hospitable refuge by several persons of distinction in England; but he declined all these generous proposals. The decline of his health made him averse from changing his situation; and towards the close of the year 1706, he was reduced by a pulmonary disorder, which was hereditary, to a very weak state. The approaches of death were regarded by him with philosophical firmness, nor did he interrupt his literary labours to the last period of his life. In the morning of December 28, 1706, when his landlady entered his chamber, he asked her in a faint voice if his fire was kindled, and immediately expired; having attained the age of somewhat more than 59 years.

By his panegyrics, Mr. Bayle's talents, learning, and powers of reasoning have been usually extolled; by his adversaries they have been as little unjustly degraded. M. le Clerc, who belongs to the latter class, and whose judgment is evidently biased by prejudice, has not allowed him the merit to which he is unquestionably entitled. He represents him as so ignorant of geometry, that, according to his own confession, he could never understand the demonstration of Euclid's first problem, and as having written in the latter period of his life, against the evidence of mathematical demonstration. As a reasoner, he says, he had no settled principles, and he argued only with a diligence to puzzle the unlearned reader. His arguments, he adds, contain much more truth and empty words than sound reasoning. He was unacquainted with the books written in England upon experimental philosophy, and understood only a little of the philosophy of Drs. Cartes and Berkeley. He had perused only a few translations of English books upon metaphysical subjects. His knowledge of divinity was derived from his catechism, from sermons, or from a few French books. In ecclesiastical antiquity, and that of Greece and Rome, he was indifferently filled; and the latter were to him hidden treasures; and his knowledge of modern history was partial and imperfect. He had collected with great labour a thousand literary trifles and inconsiderable circumstances; and though he wrote in a very agreeable manner, it was only when he was not in a passion. Saurin says of him, that he was one of those extraordinary men, whose opposite qualities leave room to doubt whether we ought to look upon him as the beast or the work of men. On the one hand, he was a great philosopher, knowing how to distinguish truth from falsehood, and perceiving at one view all the consequences of a principle and their connection; and on the other hand, a great sophist, confounding truth with falsehood, and deducing false inferences from his assumed principles. On the one hand, a man of learning and knowledge, who had read all that can be read, and remembered all that can be remembered; and on the other, ignorant, or feigning ignorance, with regard to the most common subjects, proposing difficulties which have been a thousand times solved, and urging objections which a schoolboy could not make without blushing. On the one hand, attacking the most eminent men, opening a large field for their labours, and giving them a great deal of trouble to vanquish him; and on the other, using the worst authors, to whom he was belov'd of his professees, and disengrafting his works by such names (meaning probably Brantome and Rabelais) as a learned mouth never pronounced.

On the one hand, free at last in appearance, from all the passions which are inconsistent with the spirit of Christianity, grave in his discourse, temperate in his dict, moderate in his manner of living; and on the other, employing all the force of his genius to overthrow the foundations of moral virtue, and attacking as much as his power, chieftly, modesty, and all the Christian virtues. On the one hand, appealing to the throne of the most severe orthodox, going to the purest springs, and borrowing his arguments from the least suspected writers; and on the other, following the paths of heresies, proposing again the objections of the ancient heretarchs, lending them new arms, and collecting together in one age all the errors of past ages. The eloquent preacher closes this detail with the following benevolent wish: "May that man, who had been endowed with so many talents, be acquitted before God of the ill use he made of them! May that Jesus, whom he often attacked, have exalted his fins!"

Voltaire, speaking of his Critical Dictionary, says, "It is the first work of the kind in which a man may learn to think." He confesses, however, those articles which contain only a detail of minute facts, as unworthy either of Bayle, an intelligent reader, or polemic. "In placing him," adds this author, "among the writers who do honour to the age of Louis XIV, although a refugee in Holland, I only conform to the decree of the parliament of Toulouse; which, when it declared his will valid in France, notwithstanding the rigour of the laws, expressly said, that such a man could not be considered as a foreigner. "Without controversy, or a patron, or prejudice," says Gibbon in his "Miscellaneous Works," "Bayle claimed the liberty, and fulfilled by the labours of his pen." The inequality of his voluminous works is explained and excused by his alternately writing for himself, for the book sellers, and for polemic; and if a severe critic would reduce him to a single folio, that relic, like the books of the Sibyl, would become still more valuable. The ancient paradox of Plutarch, continues this writer, that atheism is less pernicious than superstition, acquires a tenfold vigour when it is adorned with the colours of his wit, and pointed with the acuteness of his logic. His "Critical Dictionary" is a varied, poetical of facts and opinions, and he balances the false religions in his sceptical scale, till the opposite quantities, adopting the language of algebra, annihilate each other. The wonderful power which he so boldly exercised of assembling doubts and objections, had tempted him jealously to assume the title of the "Historian's Zephyr, the cloud-compelling Jove; and in a conversation with the
Bay

Bayle, in *Fortification*, the space outside the ditch of our ancient fortresses, commonly surrounded by strong palisades, and sometimes by a low embattled wall.

Bayley, Lewis, in *Biography*, an English bishop in the reign of James II., was born at Carmarthen, in South Wales, and educated at Oxford. Being an eminent preacher, he was appointed one of the king's chaplains, and promoted to the see of Bangor in 1616. In 1621 he was committed to the Fleet, probably on account of his concern in Prince Henry's match with the Infanta of Spain. He died in 1632, and was buried in the church of Bangor. This prelate was the author of a famous piece called "The Practice of Piety," which has been so popular that the edition of 1754 was the 59th. It was translated into Welsh and into French in 1753; and a complaint was alleged against it, that the common people regarded its authority as equal to that of the Bible. *Bib. Brit.*

Bayna, in *Geography*, a town of Hungary, in the Bodok district, the inhabitants of which are principally farmers and husbandsmen.

BAYNES, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Bayeux, 31 leagues W.S.W. of Bayeux.

Baynet, a town and bay on the south side of the island of St. Domingo, 4½ leagues from Petit Guave, on the north side of the island, and about 8 leagues west of Jackmel. N. lat. 18° 17'.

Bayon, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Luneville, seated on the Meurthe. The place contains 793 and the canton 7677 inhabitants, on a territory of 195 square miles, containing 25 communes. N. lat. 48° 30'. E. long. 14° 42'.

Bayona, a sea-port town of Spain in Gallicia, situated in a small gulf, near the mouth of the Minho, with a convenient harbour. The coast near it abounds with excellent fish; and the land, watered by many springs, is fertile. N. lat. 42° 15'. W. long. 9° 30'.

Bayona Bay and Islands, lie on the south part of the great bay of Vigo, and to the east of Cape Fisticho, on the west coast of Spain, in the Atlantic Ocean. The bay forms the harbour of the town of Bayona. The two islands are situated a little to the west of north from the town. They were anciently called "Inhuke Deorum," or the isles of the Gods. A large rock, with many small ones about it, lies at the foot east of Bayona islands.

Bayonet, in the *Military Art*, signifies a short broad dagger, used by all modern armies, since the sword has been laid aside, as a necessary appendage to the infantry. The origin of the term is not correctly known, but is most probably derived from having been first manufactured at the city of Bayon, or originally invented by an engineer of that place.

Bayonets were formerly made with a round handle, adapted to the bore of a firelock, so as to be fixed there after the folder had discharged his piece. They are now constructed with iron handles and rings which go over the muzzle of the firelock, and are secured fast; thus enabling the folder to fire and load with his bayonet fixed, and ready to ac, if necessary, against horse. This is particularly service to dragoons and fusiliers, after they have expended all their powder and ball.

The use of the bayonet fastened on the muzzle of the firelock was a great improvement, first introduced by the French, and to which, according to the chevalier de Polard, (Comm. fur. Poliv. vol. I. p. 135. edit Paris, 1772), they owed a great measure of their victories obtained in the war of 1689. To its neglect in the next war, the same writer attributes most of the losses they sustained. It is to marshal Catlin, the French are indebted for the great superiority they
The population of the place is said to amount to 13,199 persons. N. lat. 43° 29' 21". W. long. 1° 30' 6".

BAYS, in Commerce, a kind of coarse, open, woolen stuff, having a long knap; sometimes frizzed on one side, and sometimes not frizzed, according to the uses for which it is intended.

This stuff is without waist, being wrought on a loom with two tredles like flannel. It is chiefly manufactured about Colchester, and Backing in Essex; and in Flanders, about Lille and Tournay, &c.

This manufacture was first brought into England, together with that of fays, serges, &c. by the Flemings, who fled hither from the persecution of the duke of Alva, about the fifth year of the reign of queen Elizabeth, and had afterwards peculiar privileges granted them by the 12 Car. II., in 1660. The exportation of bays was formerly much more considerable than it is now, as the French manufacturers have learned to imitate them, and have set up manufactures of their own at Nimes, Montpellier, &c. However, a considerable quantity of bays is still exported to Spain, Portugal, and Italy. Their chief use is for the religious, and for linings in the army; the looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the cafe-makers to line their cafes.

The breadth of bays is commonly a yard and half, yard and three quarters, or two yards; by forty-two, or forty-eight, in length: those of a yard and three quarters are most proper for the Spanish trade.

Bays, in Geography, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne, 3½ leagues E.S.E. of Mayenne. The place contains 2,100, and the canton 14,470 inhabitants; in an extent of 1291 kilometres and 9 communes.

BAYONNE, or BAZAR, in Commerce, fine open cotton, which comes from Jerusalem, whence it is called Jerusalem cotton.

Bazars, in Geography, a town of Germany, in the duchy of Carniola, 7 miles S.S.W. of Feldsch, Baza, or Baza, a town of Spain, in the province of Granada, between Guadix and Huecar, supposed to be the ancient Bactus. N. lat. 37° 31'. W. long. 2° 31'.

BAZADOIS, a district of the province of Guyenne, before the revolution, situated between Agenois, Condominois, and Guyenne. The soil is sandy and unproductive. The capital is Bazas.

The word bazars means of Arabic, or rather of Persian and Turkish origin, where it denotes fales, or exchange of goods. Some of the eastern bazars are open, like the market-places in Europe, and serve for the same uses, more particularly for the sale of the more bulky and less valuable commodities. Others are covered with lofty ceilings, and are sometimes pierced to give light; and it is in these the jewellers, goldsmiths, and other dealers in the richer wares, have their shops. The bazar or market of Ilfoun is one of the finest places in all Perif, and even surpasses all the exchanges in Europe; yet, notwithstanding its magnificence, it is exceeded by the bazar of Tauris, which is the largest that is known, having several times held thirty thousand and more ranged in order of battle.

At Constantinople there are the old and the new bazar, which are large, square buildings, covered with domes, and embellished with arches and pilasters; the former chiefly for arms, harness, and the like; the latter for goldsmiths, jewellers, furriers, and all sorts of manufacturers. For an account of the bazars of Alkppo, see ALKPP.

BAZAR, or BAZAAR, a town of Hindostan, 20 miles N.E. of...
BAZ

of Attock, seated near the Indus, Nibak or Sinde river. N. lat. 33° 45'. E. long. 71° 18'.

BAZARUTO, or Bosaca island, lie off the south-east coast of Africa, in the Indian ocean, opposite to Asoeca bay. S. lat. 21° 55'. E. long. 32° 30'.

BAZAAS, a city of France, and principal place of a district, in the department of the Gironde, before the revolution the capital of Bazadois, and see of a bishop. It is seated on a rock. The place contains 4,215, and the canton 9,862 inhabitants, in 13 communes and a territorial extent of 210 kilometers. N. lat. 44° 26'. W. long. o° 30'.

BAZEELE, 59., a town of France, in the department of the Lot and Garonne, in the district of Marmande, 3 leagues N. W. of Marmande.

BAZENDGES, in Natural History, the name of a substance used by the Turks, and other eastern nations, in their scarlet dyeing: they mix it for this purpose with cochineal and tartar, the proportions being two ounces of the bazzengdes to one ounce of cochineal.

The bazzengdes seem to be no other than the horns of the terepine tree in the eastern parts of the world; and it is not only in Syria that they are found, but China also affords them. Many things of this kind were sent over to M. Geoffroy at Paris from China, as the substances used in the scarlet dyeing of that country, and they proved wholly the same with the Syrian and Turkish bazengdes, and with the common terepine horns. The lentilk or mastic tree is also frequently found producing many horns, of a like kind with these, and of the same origin, all being owing to the puccenta, which make their way into the leaves, and breed their young there. Reaumur's Hist. of Insects, vol. vi. p. 57.

BAZIELE, in Geography, a town of France, in the department of the upper Garonne, and chief place of a canton, in the district of Villefranche, 4 leagues S.E. of Toulouse.

BAZIN, NICOLAS, in Biography, a French physician and corresponding Member of the academy of Sciences at Paris, graduated at Strasburg, where he afterwards resided, and acquired considerable reputation as a practitioner in medicine, though his attention was principally turned to the study of natural history, which he enriched with the following valuable productions. "Observations fur les plantes, et fur leur analogie avec les infestes," Strasburg, 1741, 8vo. He believed that plants required, and that the juices abdorbed by them for their nourishment were digested, or concocted in the root, prior to their distribution. "Histoire des Abeilles," 2 vols. 12mo. Paris, 1744. "Lettre au fujet des animaux, appelles polyopes," 1745, 12mo. He died in March 1754. Hall. Bib. Pot. Eloy. Dict. Hist.

BAZIRA, in Ancient Geography, now BIZIRE, a district of a territory adjoining to the country of the Assaceni, or Assacen, corresponding to the present Sewad or Sowhad, between the rivers Bzore and Perjekoreh in Hindoostan. When Alexander had taken Mallaga, the capital of the Assacen, by assult, he humoured Bazira, the capital of the next adjacent territory, and the modern district of Bzire presents itself in a position that answers most unequivalently to that of Bazira; and the similarity of their names is no less striking. See Bzore.

BAZIRGON, a town of Peria, is the province of Laidian, 57 miles east of Las.

BAZIUM, a promontory of Egypt, on the western coast of the Red Sea. Ptolemy.

BAZOCHE, or BAOCHE, in Laos, formerly a royal kind of jurisdiction exercised among the clerks of the palais, or courts of justice at Paris. It was administered in the name and by the authority of the king of Bazoches, roi de la Bazoches, by virtue of an ancient grant of the kings of France; the elder among the clerks were the officers; and he who presided was the chancellor. This court only took cognizance of causes among the clerks, or between clerks and artificers for goods bought, or work done. The freedom they exercised with regard to private characters in their Inquisition and remonstrances, occasioned several arrests to restrain their power, and prohibit their holding pleas without leave.

A collection of statutes, ordonnances, regulations, monumens, and prerogatives of the kingdom of Bazoches, was published at Paris in 1654, 8vo.

BAZOCHE, LA, in Geography, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Nogent le Rotrou, 5 miles S.E. of Author.

BAZOCHEs, LE-GERVAND, a town of France, chief place of a canton, in the department of the Loiret; the place contains 1,026, and the canton 4,289 inhabitants, in 46 communes, and a territory including 305 kilometers.

BAZOCHEs fur-Hotiers, a town of France, in the department of the Ome, and chief place of a canton, in the district of Mortagne, 9 miles N.W. of Argentan. The place contains 1,349 and the canton 7,254 inhabitants, in 44 communes, and on a territory of 122 kilometers.— Alto, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Soissons, 4 leagues E. of Soiffons.

BAZOGE, LA, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of le Mans, six miles N. of le Mans.

BAZOUGERs, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval, 24 leagues S.E. of Laval.

BAZOGUES LA PERROUSE, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Dol, 3 leagues S.E. of Dol.

EDELLUM, BODLIO, an aromatic gum, brought from the Levant, of some use, both as a medicine and a perfume.

The word is supposed to have been formed of the Hebrew בגדל, bazzoldahl, which the English translators render by the appellation bizzellum. It is also written bizzellum, bedellio, petellum, petallium, megalium, and telium.

There is much uncertainty concerning both the plant and the place of its production, which is supposed to be in Africa. We find mention of the name both among the ancient naturalists, and in Scripture; but it is doubtful whether any of these be the same with the modern kind. As for the Scripture bizzellum, we know very little of it. Mofes describes manna as of the colour of bizzellum; and Josephus explains the passage, by saying it is the gum of a tree resembling the olive tree; and that the manna wherewith the Jews were fed in the desert resembled this drug.—But Scaliger and others yet abide this explication, and own they do not know what the bizzellum mentioned in Scripture is.

The bizzellum of the moderns is a gum-refin in irregular brittle masses, of a deep brown when broken, interlacered with more transparent parts; and mixed with small twigs and other accidental impurities. Its external appearance a good deal resembles myrrh. The smell of this gum-refin is somewhat fragrant, and its taste somewhat bitter and pungent. It grows soft and tenacious when chewed. It burns with ease, giving a fragrant smoke and a crackling noise. It is partly fisible in alcohol, and partly in water, or completely (the impurities excepted) in diluted spirit. By Neumans's experiments only about one-sixth is pure resin. The watery solution is tea-green, the spirtuous red. Diluted with water it impregnates the liquid with its flavour, but it does not yield any feasible quantity of effluent oil, when only a moderate quantity is used.

*Edellium*
BEA

Bullaun was formerly employed in a stimulating remedy, chiefly for external application, and is still retained in some of the warm plasters of the Paris dispensatories. It is entirely diffused here, and seldom to be seen in the shops. It resembles myrrh in its properties, but less in degree, and is very degreelly neglected. Murray, Lewis, “La Grande Enciclopaedia de Pharm.”

BEACH, in Geography, a branch of Salt river, which rises in Nelson county, Kentucky, in America. On this river is famed a clay, which it is thought might be manufactured into good porcelain.

BEACH-HEAD, a bold promontory which projects into the English channel on the Sarket coast, between Hastings and Shoreham. This commanding headland consists of alternate strata of chalk and clay; though the latter is only seen in thin layers or veins. “It is embellished,” says Camden, “the highest cliff of all the fourth coast of England,” and “on its fourth side is a large semicircular indentation.” It is divided into seven cliffs, and called by Frenchmen. The coast round this head is very dangerous in foggy weathers, particularly when the wind is in from S.S.E. or S.W. From this promontory to Arundel, the country along the coast rises into high hills, which are known by the name of South-downs, and celebrated for their sheep walks. Beach-head is memorable for the defeat of the English and Dutch fleets near it by a superior force of the French, June 30th, 1692. N. lat. 3° 44' 30". E. long. 5° 19' 46". See EASTBOURNE.

BEACH-HEAD, lies also on the eastern coast of South America, in Patagonia, about S.S.W. from Port Julian, and N.N.E. from Cape Faire Weather. S. lat. 50° 21'. W. long. 6° 42'.

BEACON, a signal for the better securing of the kingdom against foreign invasion.

Different methods have been taken in different countries, both anciently and of later ages, to convey the notice of any impending danger to distant places with the greatest expedition. But no kind of signals has more generally prevailed than that of fires in the night. That was practised among the Jews we learn from the sacred writers. Hence the prophet Hiah, in allusion to that custom, threatens them that they should be left as “a Beacon upon the top of a mountain, and as an ensign on a hill.” (chap. xxx. 17.) And in the like manner Jeremiah alarmeth them by laying, “Set up a fire of sign in Beth-lacharon, for I will appear thereunto out of the north, and great destruction!” (chap. vi. 1.) And as to other countries, Aretch de Mundo, informs us, that such signals were to be depended on towards all the territories of the land of Israel, that in the space of twenty-four hours he could receive advice at Saba and Edomata, his two capital cities, of any conveyance or disturbance that might happen in the most distant parts of his dominions. But to the Scots, as Theyle relates, “the use of torches for fires, is by a different management, to give notice of the approach of an enemy or the arrival of a friend in their territories. For as the school of delay, in the former case, of the English were from time to time, and in the latter they were kept handy,” (b. ii. c. 16.) Among the Greeks, they were called Phosphoroi, and their use is particularly described in the Agamemnon of Aischylus. The like custom of using torches and fires appears also among the Romans, as appears from Cicero, where, speaking of the miraculous doct of Virro, who governed of Sicily, he says, “Non solo longe invenisse, sed primum ad oculos fecisse ignem e specula fabulosa; sed haec ex ipsius piscatorum nomine, et calamitatum accipitrum et periculorum insigni auxilio; (lib. v. in Verrem, § 91.) Wherefore sigg’s of this fort are called by Pliny “ignes nauticorum” Nat. Hist. lib. xi, § 73.) which he distinguishes from the Pharos, or light-houses, that were placed upon the coasts for the direction of ships; the latter of which were constant, but the former only occasional.

Established signals were repeated, says Charnock, in his “Moral Architecture,” by means of beacons or light-houses erected in proper positions, from mountain to mountain, through a chain of stations, which were laid to have commanded an extent of more than three miles; so that even the inhabitants of Constantinople were capable of being informed, within the short space of a few hours, of motions that might be attempted by their Saracen enemies in Darius.

In our own country, the name of beacon is derived from the Anglo-Saxon lecman, to shew by flag or beacon. It was generally placed upon a high ground, and sometimes on a tumulus. From lord Coke we learn (Fourth B. R. c. xxx. p. 184.) that before the reign of Edward the third, beacons were but flashes of wood left up on high places, and at the coming of the crown, the signal was deferred; but in his reign pitch boxes were set up instead of these. In time of danger a watch was kept at them, and horsemen called hobbles were stationed by most of them to give notice of an enemy’s approach.

Beacons are also marks and signs erected on the coasts, for the guidance and preservation of mariners at sea by night as well as by day. The erection of beacons, light-houses, and sea-marks, both for alarming the country in case of the approach of an enemy, and for the direction and safety of ships, is a branch of the royal prerogative. For this purpose the king hath the exclusive power, by commission under his great seal, to cause them to be erected in fit and convenient places, as well as upon the lands of the subject as upon the demesnes of the crown; which power is usually veiled by letters patent in the office of lord high admiral.

Nevertheless it must be understood that the power of erecting beacons was occasionally given to individuals, and limited by grants from the crown, whence, or for some achievements performed in times of danger, the beacon is worn as a mark in the arms of several families, as Belknap, Butler, Mountford, Soley, and Shelly of Mitchel Grove, one or two of whom obtained especial grants which empowered them to erect and maintain beacons at their own expense.

The care of these, when erected by the crown, was committed to one or more of the adjacent hundred; and the money due or payable for their maintenance, called torrangingum, was levied by the Sheriff of the county upon each hundred. (Archaeologia, vol. i. part 1. Hutchins, Hist. of Dorset, vol. i. p. lix. Camul. Brit. Edit. 1609. p. 195.)

By Statute 8 Eliz. c. 13, the corporation of the “Trinity House” are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall defray them, or shall take down any he may, they, or other known beacon, he shall forfeit £ 1, or in case of inability to pay it, he shall forfeit the same.

BEACONAGE, money paid towards the maintenance of a beacon. A fact for a lease of a beacon standing on a rock in the sea may be brought in the court of admiralty, the admirals having an original jurisdiction over beacons. 1 Salk. 186.

BEACON HILL, in Geography. See HARWICH.

BEACONSFIELD, a small market town of Buckinghamshire, in England, at the distance of 34 miles N.W. from London. The town is built on a high ground, whence the inhabitants have a clear view of a beacon formerly occupying the spot. The habitation no
which it stands is chiefly gravel, and the houses are built with flints or brick, there being no stone quarries in this part of the county. Beaconfield has little claim to popular attention, there being no particular historical events or antiquities attached to it. Here are a small weekly market on Wednesdays, and two annual fairs. Seated on the great public road between London and Oxford, it derives some advantages from travel; but it has been particularly noted in the literary annals of this country, by the continuous residences of Edmund Waller the poet, and Edmund Burke the politician, both of whom resided estates near Beaconfield, and the memories of both are commemorated by inscriptions at the parish church. See Waller and Burke.

About three miles east of Beaconfield is Bushford, a seat of the duke of Portland. This ducal residence was formerly in the possession of the Bushford family, but reverting to the crown, was given by king William III. to William Bentinck, who had long been the constant attendant and faithful servant of that monarch, and who was created by him earl of Portland in 1689. From him it descended to the present nobleman, who has made considerable additions and improvements to the house and grounds. The former is a large irregular brick building, seated on a high knoll, in the centre of a fine park which abounds with venerable trees, and is diversified with that variety of surface, which constitutes the foundation of the picturesque. This park contains about 800 acres, and in the eastern part of it is a large circular entrenchment enclosing an area of twenty acres. See Beauties of England and Wales, vol. i. 1801.

**Bead**, Baguette, Fr. in Architecture, a little round moulding, the diminutive, or rather the vulgar name of a triglaf. This moulding is generally found in the cornices of antique buildings, where it is uniformly carved with ornaments, sometimes in the shape of a string of beads, sometimes a twisted ribbon or a rope. See Plate XXI. of Architecture. Plain beads are very much used in modern joiners' and plasterers' work, as the mouldings of doors, shutters, skirtings, impolts, and cornices.

Bead, in AFFAYING, the small lump or mass of pure metal separated from the Jesse, and seen distinct and pure in the middle of the coppers while in the fire.

Thus, in separating fire from its ore by means of lead, the silver remains in form of a bead, when the lead, that had before affiled in the operation, is reduced to Jesse. In this process, the bead of silver must be taken out of the coppers as soon as it is seen pure and flat, and growing cold, it should be conglutinated to the coppers or lathage. This bead, when rightly made, is always porous underneath. Cranner.

Beads are more particularly used among us for a fort of glass necklace, made in imitation of the colour and figure of pearl.

Beads are also used in speaking of those glass globules vended to the savages on the coast of Africa, thus denominated, because they are stringed together for the convenience of traffic.

The common black glass of which beads are made for necklaces, &c., is coloured with manganene only; one part of manganene is sufficient to give a black colour to near twenty of glass. Lewis's Comm. Phil. p. 422. See Artificial Pearls.

Beads, in a religious sense. See Chaplet.

Bead-Roll, among the Romish priests, a list or catalogue of such persons, for the red of whose souls they are obliged to rehearse a certain number of prayers, &c., which are told by means of their beads.

Bead-Makers, called by the French paternostriers, are those employed in the making, stringing, and selling of beads. At Paris there are three companies of paternostriers, or bead-makers; one who make them of glass or crystal; another in wood and horn; and a third in amber, coral, jet, &c. Bead Proof, or Double Proof, terms used by our distillers, to express that fort of proof of the standard strength of spirituous liquors, which consists in their havings, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rectified spirits and phegum.

This is a fallacious rule as to the degree of strength in the liquor; because any thing that will increase the tenacity of the spirit, will give it this proof though it be under the due strength. Our malt distillers spoil the greater part of their goods, by leaving too much of the flinking oil of the malt in their spirit, in order to give it this proof, when somewhat under the standard strength. But this is a great deceit on the purchasers of malt spirits, as they have them by this means not only weaker than they ought to be, but flinking with an oil, which they are not easily cleared of afterwards.

On the other hand, the dealers in brandy, who usually have the art of suffusing it to a great nicety, are in the right when they buy it by the strongest bead proof, as the grand mark of the bell; for being a proof of the brandy containing a large quantity of its oil, it is, at the same time, a token of its high flavour, and of its being capable of bearing a very large addition of the common spirits of our own produce, without betraying their flavour or losing its own.

We value the French brandy for the quantity of this essential oil of the grape which it contains, and with good reason; as it is with us principally used for drinking as an agreeably flavoured cordial: but the French themselves, when they want it for any curious purposes, are as careful in the rectification of it, and take as much pains to clear it from this oil, as we do to free our malt spirit from that nauseous and fatal oil, which it originally contains.

No judgment can be formed of brandies by the bead proof as to their mixed or adulterated, or their pure flate, farther than that they are likely to be most pure when they have the greatest proportion of this oil, in regard to mixtures of other spirits. There are many occasions where we want spirit, merely as spirit, and where any oil, whether sweet or flinking, must be equally improper. Shaw's Eff. on Distillery.

**Bead Tree**, in Botany. See Melia.

**Beadle**, or Bedell, Bedelius, signifiques a messenger or appraitor of a court, who cites men to appear and answer in the court to what is alleged against them.

Beadle is also used for an officer in universities, whose place it is to walk before the masters at all public proceedings, &c., with a mace. The office of church and parish beadles is well known.

Spelman, Volins, and Sommer, derive beadle from the Saxon beadl, a publicicer; in which sense bishops, in some ancient Saxon manuscripts, are called beadles of God, Dei beadell. The translator of the Saxon New Testament renders exalter by beadle; and the word is used in the same sense in the laws of Scotland.

Beadle of the Forth is an officer, that warns all the courts of the forefathers, and executes process, makes all proclamations, &c. 4 Inft. 315.

**BEAGLE**, in Zoology. See Canis Familiaris, and Dog.

Beagles are of divers kinds as the southern beagle, something less and shorter, but thicker than the deep-mouthed hound; the fleet northern, or cat beagle, small and of a finer shape than the southern, and a harder runner. From the two,
two, by crossing the Arian, is bred a third sort held preferable to either.

To these may be added a still smaller sort of beagles fierce and like dogs, which make a pretty diversion in hunting the otter, or even small hares in dry weather; but otherwise unserviceable, by reason of their size. Beagles, both rough and smooth, have their admirers among sportmen; their tongues are musical, and they go farther than the southern hounds; they run so close to the ground, as to enjoy the scent better than taller dogs, especially when the atmosphere is low. In an inclosed country they are said to do best as they are good at trailing or default, and for hedge-rows; but they require a clever huntsman, for out of eighty couple in the field, during a winter's sport, scarcely forty couple are to be depended upon. Of the two sorts, the wire-haired, as having good shoulders and being well fletched, are preferred. Smooth-haired beagles are commonly deep hung, thick-lipped, with large nostrils, but often too fat and had quivered, as to be shouder-broke, and clipped the first season they hunt; among them are frequently seen crooked legs, like the Batturns, and after two hours running many of them are disabled. Their form and three sufficiently denote them not designed for hard exercise. Daniel's Rural Sports, vol. i. p. 373.

BEAK, Raftreum, in Ornithology, the bill of a bird; from the form and structure of which, Linnaeus divides this whole family or general class of animals into six orders. See Bird and Ornithology.

BEAK, in Architecture, a little fillet left on the edge of a timber, which forms a canal, and makes a kind of pendant chin, answering to what Vitruvius calls the canemum.

BEAK, or Beak-Head of a Ship, is that part without the ship behind the forecastle, which is fastened to the stem, and is supported by the main knee: this is usually carved and painted, and, besides its use, makes the becoming part, or grace of a ship.

The beak was anciently made of wood, but fortified with brafs, and faftened to the prow, serving to annoy the enemies' vessels. Its invention is attributed to Pisius, an Italian. The first beaks were made long and high; but afterwards a Corinthian, named Arius, contrived to make them short and strong, and placed it low as to pierce the enemies' vessels under water. By the help of these, great havoc was made by the Saracens in the Athenian fleet. Petr. Arched. lib. iii. c. 17.

BEAK was also used for one of the ancient battle, or forms of ranging an army for battle, particularly used by the Macedonians.

BEAK is also applied to the slender crooked prominences of divers bodies, bearing some analogy or resemblance to the beaks of birds.

In this sense, we meet with beaks of shoes, rita caelestis, for long pointed toes, in use of old. Du-Cange.

Among Farriers a beak denotes a little horfe-shoe, turned up, and faftened in upon the forepart of the hoof.

It is used to keep the shoes faft, and not liable to be struck off by the horse, when by reason of any itch, or being much disturbed by the flies in hot weather, he dampens his feet violently on the ground.

BEAKED, Cequé, in Heraldry, is used when the beak or bill of a fowl is of a different tincture from the body.

In this cafe, they say leaked and membred of such a tincture.

BEAKING, in Cock-Fighting, expresses the fighting of these birds with their bills, or holding with the bill, and striking with the beaks.

BEALE, in Geography, a river of Ireland, which runs into the Shannon near Athlone, in the county of Limerick.

BEALE, Mary, in Biography, a female portrait painter in the reign of King Charles II., was the daughter of Mr. Craddock, minister of Walton upon Thames, and was born in Suffolk in 1672. Although she was not instructed in the rudiments of painting by her Peter Lely, as some have supposed, she diligently copied the works of that great master, as well as those of Vandyke. She painted oils, water-colours and crayons; and by copying some pictures of Italian masters, improved her taste and pencil, and acquired much of their air and style, which appear in her portraits. She was little inferior to any of her contemporaries with respect to colouring, strength, force, or life; and she worked with a great body of colours. Her performances were held in high estimation by Sir Peter Lely. Amiable in her conduct, and insidious in her profession, she was very much encouraged and employed, both by the clergy and by several persons of rank, whose portraits she painted. It appears, that in one year she received for pictures 450l., and that she and her husband devoted about two hundred in the pound of their income to charitable purposes. The MSS. of Mr. Oldys, Mrs. Beale is celebrated for her poetry as well as her painting. She died Dec. 28, 1697; and left two fons, Charles and Bartholomew, both of whom exercised the art of painting; but the latter relinquished painting, and studied physic under Dr. Sydenham, and practised at Coventry, where he and his father died. Walpole's Anecdotcs of Painting, vol. iii.

BEALNABRUCH, in Geography, the name of a river in the county of Galway, province of Connaught, Ireland, which rives in Joyces country near the Killeres, north of the mountain of Bannoclea or the twelve pins, and flows through a mountainous country into Lough Corrib, near the base of the stupendous Ben Levegh. The valley through which it runs is pretty well peopled. A great error is committed in Roque's and all the old maps, in representing this river as flowing into Roundstone bay, and affording a second outlet to Lough Corrib, instead of carrying it into a large supply of water. Dr. Beaumont's Map and Memoirs.

BEALS, URG, a small town of America, in Nelson county, Kentucky, on the eait bank of Rolling fork, containing twenty houses, and also a tobacco warehouse; 15 miles W.S. W. from Bardstown, and 590 from Philadelphia. N. lat 37 42. W. long 85 50.

BEALT, See Built.

BEAM, in Architecture, is any piece of timber of a rectangular section of equal depth and thickness throughout its length, applied in an horizontal position in various situations in a building, for the purpose of resisting some strain either in a longitudinal or transverse direction, such as to prevent the rafters of roofs from pulling out adjacent walls upon which they rest, or to sustain a superincumbent part of a wall instead of an arch. This word, however, is not much used technically, and only in combination with other words, which denote its position or use. When a beam is placed at the bottom of a pair of rafters it is called a "fice-beam," but when placed in a higher situation it is called a "collar-beam." When a beam is placed over piers of masonry or wooden posts to support a superincumbent wall, it is called a "breast-fummer," or "summer-beam." When a beam is placed across a floor to support the ends of joists and shorten their bearings, it is called a "girdle," or "girdling-beam." See Carpenter.

Some of the best authors have considered the force or strength of beams, and brought their reliance to a precise calculation; particularly M. Varignon and M. Parent. See Strength of Timber.

BEAM of a Plough, in Agriculture, a name given by our farmers...
fanners to the great timber of the plough, in which all the other parts of the plough-tail are fixed.

This is usually made of ash, and is straight, and eight feet long in the common plough: but in the four-centined plough, it is ten feet long, and its upper part arched. The head of this beam lies on the pillow of the plough, and is raised higher, or sunk lower, as that pillow is elevated or depressed by being flapped along the crow-flares. Near the middle, it has an iron collar, which receives the tow-chain from the box, and the bride-chain from the flake or gallows of the plough is fixed in it a little below the collar. Some inches below this, there is a hole, which lets through the collar; and below that there are two other small ones, through which the heads of the retches pass. These are the iron which supports the joint, and with it the flares. Further backward still is a larger perforation, through which the body of the joint passes and behind that, very near the extremity, is another hole through which the piece called the hinder-joint passes. See Plough.

Beams of a ship, are the large, main, cross timbers, studding from side to side, which hold the sides of a ship from falling together, and which also support the deck and orlop of the ship.

The main beam is that next the main mast: and from it they are reckoned by first, second, and third beam. The great beam of all is called the midship-beam.

There are usually twenty-four beams on the lower deck of a ship of 74 guns, and on the other decks additional ones in proportion, as the ship lengths above.

Bean, on the, in Sea Language, denotes any distance from the beam on a line with the beams, or at right angles with the keel. Any object that lies east or west, when the ship steers northward, is said to be on the larboard or starboard beam.

Bean, before the, signifies an arch of the horizon comprehended between the line of the beam, and that point of the compass which the item denotes. See ABBEY.

Bean, on the Weather, signifies on the weather side of the ship.

Bean, Camber. See CAMBER-BEAM.

Bean of an Anchor. See Anchor.

Bean of a balance, is that piece of iron or wood, somewhat bigger towards the middle than at the ends, where there are holes through which run the ropes or liftings which hold the fede: the beam is divided into two equal parts, by a needle placed over it perpendicularly: and the centre of motion must be placed a little above the centre of gravity, that the beam may rest exactly in an horizontal position.

See BALANCE.

Bean, or Roller, among Weavers, is a long and thick wooden cylinder placed lengthways on the back part of the loom of those who work with the shuttle. The threads of the warp, of linen or woollen cloth, lerges, on other woollen fluffs, are rolled upon the beam, and imroled as the work goes on. That cylinder on which the fluff is rolled as it is woven is also called the beam or roller, and is placed on the fore part of the loom.

Bean, in Heraldry, is used to express the main horn of a hart or buck.

Bean, among Hunters, denotes the main item of a deer's head; or that part which bears the antlers, royals, and tops; the little flakes which of are called circles.

Bean is also used for a fiery meteor in the flaps of a pillar; and for a ray of the sun.

Bean compasses. See Compasses.

Beam feathers, in Falconry, the longest feathers of a hawk's wing.

Beam filling, in Building, the filling up the vacant space between the rising plate and roof, with stones, or bricks, laid between the rafters on the rising plate, and plastered on with loam; this is frequent where the gurrets are not peraet, or plastered.

Bean tree. See CRATAGES Aria.

BEAMINSTER. See BEMINSTER.

BEAN, in Botany. See Vicia Fabia.

Bean, faba. The medicinal and dietetic qualities of beans are said to be nutritive, but flatulent: the pods yield a water held good against the gripes in children. Some have used the bean as a feecedicine in coffee; which in principle is much preferable, and which is contained in half the quantity of oil. Mr. Boyle has several experiments of beans treated potwatomically to throw the great plenty of air they afford, on which their flatulence depends. This air, which beans contain in a fixed state, is extracted during their digestion in the flomach, in greater quantity than can be again absorbed, and upon that account these, and other leguminous, have been at all times noted for occasioning flatulence, and sometimes colic pains. The expansion of beans in growing, Mr. Boyle also found so considerable that it would raise a plug dugged with above a hundred pounds weight. Boyle's Works abr. tom. i. p. 285. tom. ii. p. 615, &c.

Beans with proper management make one of the finest of all baits for fish. The method of preparing them for this purpose is this: take a new ceharn pot glazed on the inside, boil some beans in it, suppo a quarter of a peck: they must be boiled in river water, and should be previously steeped in some warm water for six or seven hours. When they are about half boiled, put in three or four ounces of honey, and two or three grains of salt: let them boil a little on, then take them off the fire, and use them in this manner: seek out a clean place, where there are no weeds, that the fish may see and take the beans at the bottom of the water. Throw in some beans at five or six in the morning, and in the evening for some days. This will draw them together, and they may be taken in a casting net in great numbers.

The ancients made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified abolution, and a black one condemnation. Beans had a mysterious use in the limenath and parentalia; where the master of the family, after washing, was to throw a fort of black beans over his head, full repeating the words, "I redeem myself and family by these beans." Ovid gives a lively description of the whole ceremony in his Fasti, lib. v. ver. 435. Abstinence from beans is said to have been enjoined by Pythagoras, for which prohibition various reasons have been assigned. Some have supposed that it was intended to refrain his disciples from meddling in trials and verdicts which were decided by throwing beans into an urn. Others founding their opinion on the double sense of the word abstinens, which signified both a bean and the common telficle, explain it by abstin- ing from venery. Clemens Alexandrinus grounds the abstinence from beans on their tendency to render women barren; which property is confirmed by Theophrastus, who extends the same effect even to plants. Cicer suggests another reason; viz., that beans are very injurious to mental tranquility. Hence Amphiaras is said to have forborne the use of beans, before Pythagoras, that he might be better prepared for divining by dreams. The Egyptian priests held it a crime to look at beans, judging the very fight unclean. The flamens dialitus was not permitted even to mention the name. Lucian introduces the same philosopher in hell, saying, that to eat beans, and to eat our father's head, were equal crimes. After all, both the gennicenec of the precept, and the reality of any such abstinence among the ancien
cient Pythagoreans have been disputed. Some attribute the precept to Empedocles, a disciple of Pythagoras. Aristo-
leon, an ancient writer cited by A. Gellius, (l. iv. c. 11.) introduces Pythagoras saying, that he eat more frequently of beans than of any other pulse, on account of their gentle soothing the belly. Accordingly he is said to have permitted the use of them, because he believed them to be wholesome, but his disciples have forbidden them, because they thought them, as Hippocrates also did, productive of flatulence, and otherwise prejudicial to health. Thus, a pro-
hibition, which was at first a civil regulation, or salutary advice, assumed the authority of a sacred law.

**BEAN.**

*See Menyanthes.*

**Beans,** *See Zygophyllum.*

**Beans,** in *Navigation,* a small fishing vessel or pilot boat, used by the Portuguese, which rides with one mast, similar to the *Futan,* which fee.

**Beans,** in *Antiquity,* called by the Romans *lomentum,* was of some repute among the ancient ladies as a com-
menetic, wherewith to smooth the skin, and take away wrinkles.

**Beans,** in *Natural History,* the name given by authors to a very beautiful fly, of a very beautiful purple colour, frequently found on bean-flowers. It is produced from the worm or maggot called by authors *rada.*

**Beans,** in *Agriculture,* a sort of pulse, of which there are several kinds; but those best adapted to field culture are the small forts, such as the common *borst-beans,* and the *field-
beans.* The large forts, or garden-beans, as the *Windor,* *Long-pan,* and *Marsey,* have also been occasionally employed in the field, with success, in some of the southern districts.

Beans constantly prefer a strong moist soil, and on such, where proper culture is given, they mostly afford an abun-
dant produce. Tick-beans are foppoped by some farmers to be more productive than horse beans; but the latter grow taller in the field, and produce a more flagonate flate of the air, or moisture the land more, consequently are the most suitable for the stronger forts of soil.

The author of the *Agricultural Survey of Middlesex* ob-
erves, that beans are a crop which thrive well in almost any soil that is rather strong, such as medium-loams, sandy-loams, clayey-loam, and chalky-loams; on clay, marl, chalk, and fuch like cold subsoils. And the author of the *Synopsis of Husbandry* remarks that the proper time for planting beans is towards the latter end of January, or early in the following month; though this &ndash; may be continued to ad-

vantage till the middle or latter end of March, if the weather had prevented their being got in at an earlier season; but in general it is best to embrace the first opportunity of fowing them after Candlesmas, as they often uncertainly if the feaon be procrastinated beyond that time, especially if a dry summer should succeed. In purchasing beans for feed, care should be taken to choose such as are hard and bright, with-
out being wrinkled in their appearance.

Mr. Dandieon, in his view of the present state of hu-
bandry, observes, that the ordinary mode of preparing land for a crop of beans, is to give one ploughing only, which is generally performed in the spring, immediately before the seed is fown.

Beans are for the most part sown broad-cast, either on the
flubble, before ploughing, or on the new turned-up furrow. Sometimes beans are sown or planted in the bottom of every black or third furrow, and afterwards hoed and hand-hoed. In a few districts they are sown with a drill-machine, and at such distances in the rows as to have sufficient space, either for hand-hoeing, when that only is intended, or for horse and hound-hoeing, when it is purposed that both these operations should be performed. It will at once appear obvious, he thinks, that either of these last-mentioned methods is preferable to sowing the seeds broad-cast, as a better opportunity is not only afforded of clearing the ground properly, but a more abundant return, and a produce of superior quality

The spring feed time in general commences with the sow-
ings of beans. In the southern districts, they are sown in ordinary seams so early as the middle or towards the end of February; and in the northern parts of Scotland so late as the beginning of April. The month of March may, however, as has been observed, be considered as the general bean feed season.

The first of the above writers thinks, that on land which is inclined to mould the preparation for this crop should be as follows: Early in autumn lay on the manure, and imme-
diately plough the land into ridgelots of two feet six inches wide; in which flate let it lie until the seaon for planting, when the seed may be dibbaced in, one row of beans into the middle of each ridglet, at the distance of about three inches from bean to bean. They should be immediately covered; which may be done by children, with a garden rake or hoe, or, should the surface of the land be dry and crumbly, a horse and a broad harrow would do as well. In most places, he ob-

erves, it is advisable to set a boy with a rattle to frighten away the rooks until the beans have attained some growth. The distance between the rows will not prevent the crop from completely covering the ground, especially if the land was manured for them, as they will branch out sideways, three or four flout items from each root. They should be early planted, in order to their getting sufficient root-hold of the land, and procuring thade against the hot weather set in. It is also some security against the black dolphin, which is the greatest enemy the bean is ever attacked by. They require a soil that can seldom be worked without damage during the winter and spring; consequently it ought to be manured and gathered into one bout ridges in the autumn. The shape of these ridges keeps the land more dry through the winter than any other, and prevents excessive rains from washing away the manure, which had been previously folded by the plough into the centre of such ridges; in which flate it should lie, as has been already observed, until the seaon for fowing; when the land thus prepared will be so dry as to admit of dibbacing every fair day; which secures to the farmer the advantage of choosing his seanon. He dandies, he says, about ten acres in September 1793, and ploughed the land into ridges of two feet and a half wide, burying the dung in the middle of them. The land lay dry through the winter, and he dibbled one row of beans into the middle of each ridge during the first week of February 1794. Mr. my neighbours, says he, on a similar soil, who ploughed into flat ridges of about fifteen feet wide, could not get their feed in till March. The ensuing summer was uncommonly dry; my beans being of unusually wide apart, admitted the plough and hoe to work as freely between the rows; as a flimboon would allow. The plants tierked or branched till they completely covered the intervals, and the field appeared as completely cropped as though it had been sown broad-cast. When my neighbours' plants, says he, were beginning to pod, mine were half set. The whole were alike attacked by the black-fly, which reduced their crops to a bullock or two per acre, while I had twenty.

Mr. Young, however, remarks in the *Survey of Suffolk,* that it is there uncommon to give more than one earth for beans, and generally improper, as they have a whole firm fur-
row, and never thrive better than on a layer.

There are many different methods, Mr. Bannister says, of raising crops of beans. In some counties they sow this pulse by broad-cast, which is by no means an eligible way, since much
much of the feed will be left above ground, and a great part of that which is covered by the harrow will not be covered to a proper depth; and many other objections might, he thinks, be urged against this method of fowling beans at random, of which it is not one of the least, that such irregular fawn crops are in great danger of being injured by weeds, which cannot easily be extirpated when the beans are sown at random as when they are planted regularly in drills.

In some districts, as Middlesex, Surrey, &c. the method is, to plant this pulse in rows stricken out by a line, by which a great saving is made in the article of seed, a circumstance which is thought to compensate for the extraordinary charge of this mode of husbandry; and thus far it may be fairly acknowledged, that the method of planting beans by the dibble is greatly to be preferred to that of sowing the feed at random. The economy of this agricultural process he thus explains: the rows are marked out one foot apart; the rows are stretched across the lands, which are formed about six feet over, so that when one row is planted, the ficks to which the line is fastened are moved by a regular measurement to the distance required, and the same method pursued till the field is completed. The usual price for this work is 9d. per peck, and the allowance two bushels per acre. Great confidence must necessarily be reposed in the people who transact the business of planting beans by the dibble, who, if inclined to fraud, have it in their power to deceive their employers by throwing great part of the feed into the hedge, from which their daily profits are considerably enhanced, their own labour spared, and every discovery effectually precluded, till the appearance of the crop, when the frequent chafms in the rows will give sufficient indications of the fraud; and by this time perhaps the villainous authors of the mischief may have escaped all possibility of detection, by having conveyed themselves from the scene of their iniquity. Such is the method of planting beans by the dibble; but the neatest and most expeditious way of sowing this pulse, especially the field bean, is, he observes, that pursued by the Kentish farmers. The usual course in that county, is to plough up the oat or barley grattens, which are designed for beans, soon after the wheat is sown, in which condition the fallows are to lie till towards Candlemas, or later, as the state of the weather, or the farmer’s occasion may require, and then to strike out the furrows.

About eleven furrows to a row’s breadth is the usual width of setting out the rows, though some prefer a wider space, whilst others strike them still narrower; and this difference in the width of the rows is the cause why the farmers vary so effectually in respect to the quantity of seed to be sown on the same given space of ground; for, whilst some will content themselves with an allowance of two bushels per acre, others will throw a sack of beans upon the same compass of land. When the furrows are struck at the distance mentioned before, two bushels and a half of middle-sized tick-beans are sufficient to feed an acre, and on good land (for if the ground be not either rich in itself, or rendered fertile by art, it is of little consequence to attempt the cultivation of this crop,) a person, in his opinion, finds a much fairer chance for a crop when the beans are thinly planted, than when a more liberal quantity of seed is allowed; for, when beans stand so thick in the rows, they never pod so kindly as when the ilaks are less crowded; and although the crop of haulm may be more abundant, the increase will not be adequate to the large bulk of straw.

In Suffolk, according to Mr. Young, beans have been dibbled by some a row on every flag; by others, on every other flag. He has found it more advantageous to plant in clutters four or five beans in every hole; and eight or nine inches from hole to hole, which admits of much better hoeing than when more thickly set. Dibbling, says he, is the best and most effective method of cultivating beans. In the Synopsis of Husbandry it is further observed, that in Kent some people make use of a drill plough at bean feed time; but as thispulse, especially the larger ticks, are very unequal in size, they cannot be let out of the hopper with sufficient regularity; for by this inequality in size, many yards of ground in the length of a furrow will be left vacant from the casual obstruction of a large bean, and when this is removed, numbers of a smaller size crowd to the chafm, and shoot out of the hopper for a considerable space, till another large bean intervenes to obstruct the passage, and thus the crop makes a very unflighty appearance in the rows, and at the time of harvest is very unequal; the injury in large fields being not inconsiderable: for, in those parts of the furrows, where no beans had been sown, an increase cannot be expected; and those which are huddled together by a quart or more in a spot, will, from the thickness of their growth, in course come to little. Some farmers are so nice as to pick and pull their feed before it goes into the hopper, in order to render the beans more even, and prevent the injury above mentioned: but this is a very tedious practice, and after all, he believes, very seldom answers the expense. The best method of sowing this crop, according to this writer, is from an instrument called a box, which is held by a man who follows the tilting plough, and who, by shaking the box filled with beans, drops them with regularity in the furrow, keeping even pace with it; so that by two men, and two or three horses to the ploughing plough, a man to box, and a boy and two horses to harrow down the ground after the plough, three acres may be finished off in a day, and the whole conducted with regularity.

The writer of the Agricultural Survey of Middlesex thinks that beans should be manured for, and kept perfectly clean while growing, by ploughing, horse or hand-hoeing, and hand-weeding; and that where they are so managed, they are an excellent preparation for either wheat or oats. They have a tap root, and hence they are more likely to succeed after crops that have fibrous roots; though he never heard that they would not grow after any crop. They are generally sown after wheat, barley, or oats; and ought, as has been already observed, to be planted on ridges, especially on wet and thin-burnt soils.

In the Synopsis of Husbandry it is recommended as a good method to roll and harrow beans in the latter end of March. By the roll, says this writer, the clods are broken so as to afford fresh nourishment to the roots; and the furrows following this operation pulverize and loosen the surface, which had been flattened and baked down by the rains in the preceding month, by which the beans are considerably assisted in the future progress of their growth. Soon after this the crop should be edge-hoed, and afterwards barked; which method of barking is a piece of husbandry peculiar to the county of Kent, and in every respect claims the preference to that of hoeing the whole space between the rows; not only because the barking is performed at an inferior expense, but it is likewise more efficacious, as well for extirpating the weeds that may have sprung up between the rows, as in furthering the advance of the beans in growth, by loosening the soil, and conveying fresh earth to the flanks. This operation of barking may be continued at the interval of three weeks or a month, from the beginning of May till the crop becomes in bloom. When it is proposed to earth up the beans, this may be effected with great facility by fixing a small block of wood on the break of the brake; the manner of doing which is familiar to every Kentish ploughman; and according to the diameter of this block, the earth may be throwa
thrown to different heights on the bean stalks, as they advance in growth.

In dry fanners when early winds prevail, beans are very apt to be driven with the dolphin fly, an insect which in a very short space of time will destroy the produce of a whole field. In this case it has been found very beneficial to take off the tops with a scythe, as the dolphin generally effects its first lodging in the upper part of the stalk. Where this gulf is sown broadcast, there remains no other way of clearing the field, than by cutting up the weeds with a hook, or by turning in a flock of sheep in May, when the ground is very foul, as this animal will devour the weeds, and leave the beans untouched. From this very partial method of weeding, it may fairly be concluded, that in a few acres, and on light lands, the gatron will be abundantly stocked with weeds at harvest, and the ground be totally unfit for sowing with wheat; and indeed, the practice of sowing beans where no attempt is made in those countries where this method of sowing beans at random prevails; and here, therefore, the beans and pea grains generally come in course the next year for a fallow. This is a practice that cannot be recommended.

It is remarked in the Survey of Middlesex, that beans are seldom ripe enough to cut till the latter end of August, and the proper time is when the Eo is turning black, about ten days before they would begin to open at the ends. Though in some parts of the field the kids may not be to black as in others, this should not prevent their being cut; for they will ripen and harden after that is done, by letting the sheaves upright, and leaving them in the field for a week or ten days. If they are cut long before they are ripe, they will shrunken and shrivel; and if too ripe, they will feed considerably; though there is much less danger in reaping them too early, than in letting them fland too long. Tho'se that are over-ripe should be cut with the dew on them, and carried to the barn in the same state; the green parts of the crop being cut in the middle of the day. When the intention is to sow wheat or rye after beans, they ought to be set up so as to occupy as little space as possible, that the vacant ground may be immediately prepared for the next crop. The writer of the Synopsis of Husbandry affords, that after a growing fummer, and on land which is in good heart, there will be many green pods when the crop is upon the whole fit for the hock; for the stalks having run to a great length, and being very replete with moisture, the upper part of the beans, pods, and stalks, will appear to be in a growing state long after the pods on the lower part of the stalk are fully ripened. To wait the ripening of these upper pods would be very ill-judged, as by this delay the great part of the crop would be lost, from the shedding of these which were already come to maturity. The best method, therefore, is to cut the beans when the major part have ripened, and by allowing the flocks to remain in the field, the upper part of the stalks will be sufficiently shaded, to prevent any ill effects from their humidity, when laid in the barn or soak; nor will the beans from those maripted pods be of any injury to the fample. As harrowed time, the same author informs us, that in Kent thole beans which were sown broadcast are mown with a scythe, and chased loose into the barn; a practice which is fraught with many inconveniences; but that in Middlesex, when the beans are planted in rows with a dibble, as before mentioned, the intervals are carefully cleansed during their growth by means of a hoe; and to this purpose the farmers are under the necessity of employing a number of hands; the Kentish method of cleaning the intervals by the horse not having yet been introduced into that county; since the whole ground between the rows must be flat-hoed. At harvest, the falks are cut with a hook, brand into sheaves, and fill up four together; and as a substiute for flings, it is usual to sow the headlands with peas, the haulm of which answers the purpose of bands to tie up the sheaves.

The Kentish mode of husbandry is greatly to be preferred, he thinks, to that of the Middlesex farmers, as is evident from the recommendation of the comparative disadvantages which attend a crop raised and managed according to the latter method, with the superior benefits of the former. At feed-time the planting by a dibber is infinitely more tedious and expensive than that of dropping the seed into the furrow after the whirling plough; and in the course of husbandry required to cleanse the intervals, the several flat-hoehes cause a far heavier charge than that which attends the breaking and edge-hoehing; and after all, the ground is not so well prepared for a wheat seed at Michaelmas, a method of husbandry generally pursued by the Middlesex farmers. One reason may be assigned, he says, why the Kentish husbandry has not yet been adopted by the Middlesex farmers; and this is from the nature of the land in that county, which in many parts is a deep heavy clay, so that these adhesive foils the sowing-plough is generally used, and the ground divided into portions, or (as they are termed) bands, to guard against the contingency of a wet season. But here, says he, this foil might be worked with a turn-roller-fout plough, and by proper drain be secured from the ill effects of a moist time; and the field being thus laid on a level, the rows might easily be struck out, and the subfrequent brakings he executed to advantage during the fummer, as usual with the Kentish farmers. It is added, that in those parts of Kent where the ground is very flat and husbandry is pursued, the farmers are particularly attentive to the several operations of hoeing and breaking the ground during the growth of the beans; for, as the land in that county is of a nature to require no prelile to the intervention of a summer fallow, they spare no pains in the cultivation of their bean and pea grounds, in order to render it as clean and well pulverized as possible by means of the hoe and break, so that this latter instrument is scarcely ever out of the field, from the beginning of May till the time when the beans are advanced to that height, as to obstruct the working of it; by which the ground becomes so intimately divided, that every particle of foil in the interspace is exposed to the beneficial influence of the sun and air, and at harvest scarcely a weed is perceptible throughout the crop. In order to destroy what few weeds may remain in the rows, and to give that part of the ground its due share of pulverization, and to cleanse it from the bean haulm, a plough is let to work from after barley to spuddle the graten; and for this purpose a plate of iron is fixed across the share at about four or five inches from the point, and the same axle-tree and wheels are made use of that were before employed for breaking out the furrows; and with this plough and two horses three acres of ground may be spuddled in a day, by setting the share point in the interval, so that the iron or fiin may embrace a row on each side; and when the whole field is thus spuddled, the harrows and rollers are to succeed, by which the haulm and weeds, will be completely extracted at a trifling charge, and the ground be laid in readiness for ploughing the seed furrows, at which time these beans or peas which may have been fired will have vegetated, and are destroyed by the plough; so that the farmer may, from this mode of husbandry, be not less confident of growing a clean sample of wheat, than if his ground had been summer followed.

On thin, chalky, or gravelly grounds, notwithstanding what has just been urged of the good effects of spudding, he added, there are times when it is absolutely necessary to lay off a crop of peas or beans, and to allow them to ripen, as the standing crop effectually prevents the succession of weeds; and in such cases the farmer may consider the mode of husbandry with advantage, which has been heretofore alluded to, as a part of the whole agricultural system of Kent.
BEAN.

observes that it would perhaps be more prudent to omit that work, lest it might contribute towards loosening the soil beyond a due medium; for on these soils the chief aim should be to close them as much as possible, that at wheat feeding time the surface may be perfectly tight; and therefore to roll and harrow the bean and pea ground on such soils, in order to rid the field of the haulm, &c., and when it has lain some time, to plough the seed furrows, are the whole proceeds necessary to prepare it for the succeeding crop of wheat: and this he thinks, the necessity of sowing with this grain or with peas that part of the farm which is most free from weeds, and in the heart belt; not only that these pulses, both of them (especially beans) require to be sown on good land, and on such as has been improved by art, but likewise that the grattens may be so perfectly clean, as not to require the operation of spuddling. In Kent, they cut their beans with a hook, and bind them into sheaves with rope-yarns. These sheaves are set up in shocks of various forms, either five on each side, in the manner of wheat shocks, or in a circular form, four sheaves to the shock. The expense of cutting, binding, and setting up is from 4s. to 6s. or 7s. per acre, according to the degree of goodness in the crop. Some farmers, in such years when the hops have failed, cut up the bind, and referve it as a substitute for rope-yarns to tie up their bean sheaves. But though this practice may at first sight bear the appearance of frugality, it will be found essentially to be the most expensive; as the cutting the hop-vines at that season will be apt to cause them to breed, to the infinite prejudice of the shocks; and thus the future crops may be hazarded by a premature removal of the binding those years when, from the failure of the hops, it should seem to be of no further use. Mr. Marshall, however, recommends the pulling beans in preference to cutting; for, he says, the benefit the soil receives will more than pay for the extra labour in clearing. Another advantage arising from their being pulled, is the stubbornness of the roots keeping the mow open, and admitting a circulation of air. And he says in another place, that by experience he found pulling up by hand far preferable to cutting with sickles; as they may be pulled up not only much fuller, but much cleaner from weeds and graffs than when cut, besides leaving the land in a state of the most perfect. The wale is also less, so much so as to lose scarcely a bean; and the bean stalks are immediately ready to bind and set up; and by the roots lifting them from the ground, the air acquires a free circulation. The work is also easier to the labourer, who finds more upright, and the power required is much less, especially in dry weather. By striking the roots of each handful against the foot, the mould is almost wholly disengaged from the fibres. The soil in the drills, instead of being bound by the roots, and encumbered by the stubble, is left as loose as a garden, and the surface free from obstructions: and if thoroughly hoed, is as fit as a fallow to be sowed with wheat on one ploughing.

Beans are very where an uncertain crop, conseqently the average produce difficult to estimate. In Kent, Mr. Young thinks, they probably exceed four quarters; but in Suffolk he should not estimate them at more than three: yet five or six are not uncommon. According to Mr. Donaldson, a crop of beans, taking the ifland at large, may be supposed to vary from sixteen to forty bushels; but that a good average crop cannot be reckoned to exceed twenty. And in Middlesex, Mr. Middleton tells us, that bean crops vary from ten to eighty bushels per acre. They are rendered a very precarious crop by the ravages of myriads of small black insects of the same species. The lady-birds are suppos'd either to generate or feed on them, as they are observed to be much among them. Mr. Foot says, the average produce is from three and a half to four quarters per acre.

It is ascertained by the author of the Synopsis of Husbandry, that bean straw, if well harvelled, forms a very hearty and nutritious diet for cattle in the winter-time; and that both oxen and horses, when not worked, will thrive on it. Sheep are also very fond of browsing on the pods; and the earing are very nutritious manger meat for horses. But in Middlesex the straw is generally employed in bedding the farmers' horses and other cattle, and in littering the farm yards, where it is picked over by young flock; though sometimes a load is sold for 20s. or 25s. delivered in. When the bean-straw and the roasting-chaff are made use of as a fodder for cattle, they should always be newly threshed, as in that state they are much more nutritious than when they have been kept some time of length.

Crops of this kind are for the most part applied to the purpoze of feeding horfes, hogs, and other domestic animals. In the county of Middlesex all are given to horfes, except what are preferred for feed, and such as are pedled at a good price, and sent to the London markets. When pigs are fed with beans, it is observed that the meat becomes so hard as to make very ordinary pork, but good bacon. It is also supposed that the meal-mengd in many horse-beans among wheat, to be manufactured into bread. And Dr. Darwin remarks in his Phytologia, that a skife or bushel of oats weighs perhaps forty pounds, and a skife or bushel of peas and beans sixty pounds; and that as the skim of peas and beans is much less in quantity than that of oats, he suppos'd there may be at least fifteen pounds of flour more in a skife of peas and beans than in a skife of oats. There is also reason to believe, he says, that the flour of beans is more nutritious than that of oats, as appears in the fattening of hogs; whence, according to the respective prices of these two articles, he supposes that peas and beans generally supply a cheaper provender for horses than oats, as well as for other domestic animals. But as the flour of peas and beans is more oily, he believes, than that of oats, it may in general be somewhat more difficult of digestion; hence, when a horse has taken a stomach full of peas and beans alone, he will be less active for an hour or two, as his strength will be more employed in the digestion of them, than when he has taken a stomach full of oats. Hence it may be found advisable to mix the bran of wheat with the peas and beans, a food of less nutrition but of easier digestion; or to let the horfes eat before or after them the coarse tuffocks of four graps, which remain in moisr pastures in the winter; or halfly, to mix finely cut straw with them.

BEAN, in Gardening. See Vicia.

BEAN-Goofe. See Anas.

BEAN, Ignatius's. See Ignatius's Bean.

BEAN, Kidney, or French, in Botany. See Phaseolus.

BEAN, Kidney, Tree. See Glycine.

BEAN, Malacea, the anguicordium orientale, is a fruit of a shining black colour, of the shape of a heart flattened, with a very thick pedicle occupying almost the whole bals. For the characters of the plant that produces it, see Avicennia Tonon-ofa; and for its qualities, see Anacardium.

BEAN, Molucca, a name given by Sir Robert Sibbald in his Prodromus, and by Mr. Wallace in his description of the Orkney islands to a sort of fruit frequently cast on shore in the north-west islands of Scotland, especially on the coasts most exposed to the waves of the great ocean. They are called by some Orkney beans, and are not the produce of that island, or indeed of any other part of Europe, but of America. Sir Hans Sloane procured four species of them
...where appeared eveu From bear fuppofed, See dainty piece de- its Kamt- which has yellowifii be It nobody Among the alfo said icnturcr eafterly fuppofe, there rally currents eafy and t'f vrrith. forth with. This is defcribed by many authors, and among the ref by sir Hans Sloane, in his catalogue of Jamaica plants; and is found in many other of the hotter parts, both of the East and Well Indies. A third kind of fruit found on these shores, is that called by the people of Jamaica the ash-coloured nickar nut; it has this name from its colour, and from its being perfectly round, of the shape of a nickar, or marble, such as boys play with. This is also common in the East and Well Indies. A fourth kind is also a Jamaica fruit, with the history of which we are not yet well acquainted; nobody has seen it growing, but the fruit itself is preferred in many of the collections of the curious, and has been figured and defcribed by Clofius and others under the name of a round exotick fruit rigid with four rising nerves. These are the principal kinds of fruits thus toffed on shore with us; but how the produfs of Jamaica, or other parts of America, should be brought to the shores of Scotland and Ireland, feems difficult to determine on any certain foundation. It is easy to conceive, that when they grow by the fides of rivers, they may fall off from the trees into them, and be thence conveyed into the fen. It is likewise easy to fee, that when they are thus floating on the furface of the fen, they may be carried about by the winds and currents to a coniderable distance; but their motion this way muft naturally be stopped by the main continent of America, and they muft be forced through the gulf of Florida, or the canal of Bahama, going thence confantly eafit, and into the North American fen. This is easily conceived by a familiar fact which happens every day; which is, that a kind of fen kind, called furgofta, which grows very plentifully on the rocks about Jamaica, is washed off from thence, and carried by the winds and currents, which for the moft part go impetuously the fame way, toward the eal of Florida, and thence into the North American ocean, and is there found floating on the furface. Thus far it is easy to trace our fruits from their native fen; but how after this they should beforwarded to us is unaccountable, unless we fuppofe, that as fhips, when they go fouth eafterly wind, and when they come north eafterly, and generally had a westerly wind, for at high parts in three of the year, if their fruits being brought north by the current from the gulf of Florida, are put into the way of these westerly winds, and by them conveyed to the coasts of Scotland and Ireland. Philofop. Tranf. N. 222, p. 320. 

By the fame mean, that these fruits come to Scotland, it is reafonable to believe that the fame winds and currents brought from America those feveral things towards the Acores and Porto Santo, which are recorded by Ferdinand Columbus in the life of his father; which gave this bold ad- venturer the firft notion that there was fuch a place as Ame-
The inhabitants of Kamthakha hold in high estimation the fat of the bear, as a very favourable and wholesome nourishment; and when melted and thus rendered, fluid, it supplies the use of oil.

Bear’s Skin, makes a fur in great esteem, and on which depends a considerable article of commerce, being used in horsewhips, on coach-boxes, &c. In some countries, cloaths are made of it, more especially bags wherein to keep the feet warm in severe colds. Of the skins of bears’ cubs are made gloves, mitts, and the like. It is used in Russia for beds, coverlets, caps, gloves, and collars for their hounds. Those who travel the ice for the capture of marine animals make their shoe-soles of bear’s skin, which prevents the danger of slipping. A light black bear skin is one of the most comfortable and costly articles of the winter wardrobe of a man of fashion at Peterburgh or Moscow; and even the small white hand of a belle is flit into the large bear muff, which covers the half of her elegant shape. The exportation of bear-skins forms a very considerable article of Russian commerce, independently of those that are used for home consumption.

Bear Garden, a place where bears and other beasts are exposed as a public spectacle to be baited. See Baiting.

Bear, hunting and killing of the. The bear is in a variety of respects a useful animal in Russia and northern countries, that the inhabitants have devised several ingenious methods of taking and destroying them. The most usual way of killing this animal is with fire arms, and spears or darts. The Laplanders knock them down with clubs, as they can easily overtake them in running with their snow-shoes; but they are generally shot from a distance, and then dispatched with spears. In some parts of Siberia, the hunters erect a scaffold of several bales laid on one another, which falling down, crushes the bear, on his slipping upon the trap placed under it. Another method is to dig pits, in which is fixed a smooth, solid, and very sharp-pointed pole, which rests a foot above the bottom. The pit is carefully covered with sods, and across the track of the bear is stretched a thin rope with an elastic bug-bear. As soon as the bear touches the rope, the wooden bug-bear flutters loose; and the terrified animal, endeavouring to save himself by flight, falls with violence into the pit, and is killed by the pointed pole. If he escape this snare, at a small distance, perhaps, several caltrops (see CALTROP) and other instruments of annoyance await him, amongst which a similar terrific log is erected, and where the perfecuted bear, the more he strives to get free, fixes himself more firmly to the spot at which the bug-bear lies in ambush for him. The Keriaks find out a crooked tree, which is grown up in the form of a gibbet, and at the bent summit of it they attach a noose, with a bait suspended to it. The hungry bear, thus allured, eagerly climbs up the tree, and on his moving the branch, the noose draws to, gATHER, and the animal remains suspended to the tree. But the method adopted by the inhabitants of the mountainous parts of Siberia to make this ferocious animal kill himself is more singular and ingenious. They fasten a very heavy block to a rope, terminating at the other end with a loop. This is laid near a deep precipice on the path which the bear usually takes. On having his neck in the noose, and finding that he cannot proceed on account of the clag, he takes it up in a rage, and to free himself from it, throws it down the precipice, which of course kills him after it, and he is commonly killed by the fall. Should this accidentally not be the case, he draws the block again up the acclivity, and renew his efforts, till with increasing fury he either sinks to the ground, or kills himself by a decisive plunge.

The white or polar bear (Ursus Maritimus) lives on the coast of the Frozen ocean, and in some of the eastern and northern isles, where the chance of him is a collateral occupation of the mariners who visit these coasts for the capture of the morse. Black bears are so numerous in Kamthakha, that they are seen roaming about: the plains in troops, and must long since have been exterminated, if they were not here more tame and gentle than in any other part of the world. In spring, they descend from the mountains where they have wintered, to the mouths of the rivers for catching fish, which swarm in all the streams of that peninsula. If the fish are plentiful, they eat only the heads; and when they find nets laid in any place, they dexterously drag them out of the water, and empty them of the fish. Towards autumn, when the fish go up the rivers, they advance with them gradually to the mountains. When a Kamthhadale despairs a bear, he endeavours toconciliate his friendship at a distance, accompanying his gestures by courteous words. Indeed they are so familiar, that the women and girls, when they are gathering roots and herbs, or turf for fuel, are never disturbed in their employment, even in the midst of a whole drove of bears; and if one of these animals comes up to one of them, it is merely to take something out of their hands. They have never been known to attack a man, except when they are roused from their sleep, and they seldom turn upon the mariners whether they be hit or not. Notwithstanding this gentleness of the bear, its utility renders it a valuable object of prey. When the hunter and the bear meet, the contet is generally bloody, but it generally terminates to the advantage of the artful huntsman. Armed with spears and clubs, the Kamthhadale goes in quest of the peaceful bear in his calm retreat; who, thinking only of his defence, takes the faggots brought by his pursuer, and makes them the entrance into his den. The mouth of the cavern being closed, the hunter bores a hole through the top, and then with the greatest security spears his defencel with. Tooke's View of Russia, vol. ii. p. 443, &c.

Dr. Barton, in his " Fragments of the Natural History of Pennsylvania," informs us, that the bears migrate in great numbers, every autumn across the Missilippi, proceeding south, perhaps to the mountains of New Mexico, in search of a milder climate. In the spring they return again by the same route. This migration of the bears is particularly observed at Manchar, on the Missilippi.

Bear leading, to shew tricks, is an ancient practice, which we find prohibited in the canons of the church. Du Cange.

Bear wards urfarii, were a kind of servants in great families among the Romans, who had the care of breeding and feeding those animals. Pfitz. Lex. Ant. tom. ii.
BEA

p. 1110. Our nobility had formerly officers of this kind. The annual salury of one of these belonging to the fifth earl of Northumberland was twenty shillings. Northumb. Household Book.

Bear-Tribe, in Geography, one of the tribes into which the American Indians of the Six Nations are distributed. See Six-Nations.

Bear, Order of the, was a military order in Swizerland, erected by the emperor Frederic II. in 1213, by way of acknowledgment for the service the Swiss had done him, and in favour of the abbey of St. Gal. To the collar of the order, which was a gold chain interlaced with a chaplet of oak-leaves, hung a medal of gold, on which was represented a bear ruled on an eminence of earth; or a bear fable on a ground vert.

Bear-bird. See Convolvulus.

Bear's breech. See Acanthus.

Bear's ear. See Primula Auricula.

Bear's eyes. See Verbascum.

Bear's foot. See Helichrysum.

Bear's-head. A term, synonymous with make hisfe, or chipbate. See BEARING.

Bear's Bay, in Geography, or Little Port, lies at the east end of Anticosti island, at the mouth of the river St. Lawrence, in North America.

Bear's Bur, or White Bear Bay, is a very deep bay on the south coast of the island of Newfoundland, towards its west end.

Bear's Cape, the south-east point of St. John's island, near Nova Scotia, in North America. N. lat. 45° 53'. W. long. 62° 40'.

Bear Cove, lies on the east side of the south-eastern corner of the island of Newfoundland, at the head of which is the settlement of Port au Port. It is a good shipping-place for boats. Rencourt's rocks are situated between Bear Cove and Fresh-water bay on the south, 32 miles northerly from cape Race.

Bear Creek, a water of Tennessee river. See Occo-cappo.

Bear's Great Creek, a small creek on the eastern side of Ohio river, north of the town of Louisville, in Kentucky, and near it. A canal is proposed to be cut from this creek to the rapids of the Ohio, which would render the navigation of the river safe and easy. The country on the side of this creek, between Salt river and Kentucky river, is rich and beautiful.

Bear Island, an island near the entrance of Bantry bay, in the county of Cork, Ireland. It is about six miles long, and is very curiously, mountainous, and rugged, but is of great use in defending the passage of the bar by the tory of the south-west ends, so that vessels within the land may ride secure. N. lat. 51° 35'. W. long. 89° 45'. The whole bay was formerly called of Bearhaven; but this name is now confined to that part between the island and the peninsula of Bear, on which is the small town of Castletown, South-Cork. Bearfort. See BANTYRE.

Bear, and Bantyre, the name of a barony in the western part of the county of Cork, Ireland, which is very mountainous, and with the adjoining parts of Carbery and Mulherry, is a most excellent and improved part of the county.

Bear's North, a small island in St. John's bay, Holland's bay. N. lat. 54° 46'. W. long. 90°. - Another small island in the same bay, called South Bear. N. lat. 54° 35'. W. long. 89°.

Bear, or Cherry Island, lies on the coast of Grez island, N. lat. 74° 28'. E. long. 17° 54'.

Bear Lake, Great, is situated in the north-west part of North America, near the Arctic circle, in N. lat. 65°; and W. long. 121°; and a river flows from it in a W. N. W. course, called Great Bear river, which runs into Mackenzie's river.

Bear Lake, Black, lies in New South Wales, North-west from Cumberland house, N. lat. 53° 30'. W. long. 107° 30'.

Bear Lake, White, lies due west from another small lake called Bear lake, both in N. lat. 48° 15'; and the former in W. long. 98° 30'. These lakes are said to give rise to the river Mulippen.

Beats, White, Point of, the east point of St. Peter's river, on the coast of Labrador, in North America, to called from the great number of bears that were seen there. N. lat. 51° 55'. W. long. 55° 50'.

Bear's Port, one of the ports on the coast of Nova Scotia, in North America, between port and cape de l'Heure to the north-east, and cape Sable, the south-west point of Nova Scotia.

Bear River, a river of the north-west part of North America, which runs into the Unigah, or Peace river, in N. lat. 56° 12'. W. long. 119° 28'.

Great Bear River. See Bear Lake.

Bear Roads, N. w., are situated about south by west from the extreme west point of the island of Jamaica. N. lat. 16° 20'. W. long. 82° 55'.

Bear Sound, or Barfand, lies on the west coast of West Greenland. N. lat. 62° 20'. W. long. 49°.

Bear Town, a town of America, in Caroline county, Maryland, about 7 miles north of Greenburg, and about 15 south-east from Cheltenham.

Bear, to, denotes to bring forth young, or to produce fruit. BEERALSTON, in Geography. See BEERALSTON.

BEARD, John, in Biography, an energetic English figure, and an excellent actor, was brought up in the king's chapel. He knew as much of music as necessary to sing a single part at sight; and with a voice that was more powerful than sweet, he became the most useful and favourite figure of his time, on the stage. As a developer of his father's estate, he became manager of that play-house, and discontinued all public singing, which he thought he had been long encroaching rendered necessary. His first marriage was with a lady of quality, a sister of the late Earl of Walgrave, to whom he was a very indulgent and tender husband; and he proved himself to be a man of honour and principle in every transaction of his life. There were so much intelligence and humour in his acting and singing comic parts on the stage, and Scots and Irish ballads in private, as well compensated for deficiencies of voice. He was closely united by friendship to Dr. Boyce, in the performance of whose music he manifested a zeal and even a partiality which were not discoverable for that of any other composer. He died in 1791.

BEARD, in Geography, a town of France, in the departement of Nievre, and chief place of a canton in the district of Decize, on the Loire; 10 miles S. E. of Nevers.

BEARD, in Physiography, the hair growing on the chin, and adjacent part of the face; chiefly of adults and males.

Varnish have been and still are the ceremonies and uniforms of different nations with regard to the beard; Kingdom affirms it, that a considerable branch of the religion of the Tartars conflicts in the management of their beards; and that they waged
waged a long and bloody war with the Perizans, and declared
them infidels, though, in other respects, of the same faith
with themselves, merely because they would not cut their
whiskers after the mode or rite of the Tartars. The
Spazans, from the age of 20 years, suffered their hair and beards
to grow: the hair being deemed an ornament, which became
the freeman and warrior. A Spartan being once asked why
he wore so long a beard, replied, “Since it is grown white
it incessantly reminds me not to dihonor my old age.”
Nevertheles, as they were accustomed to obedience, even in
things the most indifferent, the ephori, when they entered
on office, proclaimed, by sound of trumpet, a decree, com-
manding the people to shave their upper lips, and to submit
to the laws. The Egyptian priests shaved the head, chin,
and whole body. Accordingly, most of the Egyptian figures
are without beard. However, Herodotus informs us, that
in time of calamity, they suffered their beard and hair to
grow. The Affyrians had long beards; and Chryfoltom
observes, that the kings of Peria had their beards woven
or matted together with gold thread; and some of the first
kings of France had, in the same manner, their beards matted
and knotted with gold. The Africans wore long beards, as
may be seen on the medals of Juba. The Greeks, it tradition
may be credited, wore long beards from their heroic times.
Cedrenus informs us, that at Constantinople, in the time of
Zeuxippus, there was a statue of Homer with a long beard.

Atheneeus, from Chryfippus, observes, that the Greeks
always wore their beards till the time of Alexander; and
that the first who cut it at Athens ever after bore the addi-
tion of riperis, florere, on medals. Plutarch adds, that Alex-
ander commanded the Macedonians to be shaven, lest the
length of their beards should give a handle to their enemies:
however this be, we find Philip, his father, as well as Amy-
tas and Archeclus, his predecessors, represented on medals
without beards. The Greeks continued to shave the beard
till the time of Jullianus, under whose empire long beards
were again into fashion, and so continued till Constantinople
was taken by the Turks. The Greek philosophers difting-
uzzled themselves from the vulgar by their long beards.
Aaccording to Laertius (i. vi.) Antithenes was the first of
the philosophers who suffered his beard to grow. This custom,
however, among the philosophers, was not invariable, for the
scholast of Ariftophanes (Nub. 120.) pretends, that the an-
cient philosophers shaved their beards. The Roman phil-
osophers affected to preserve the same distinctive characters of
the mantle and long beard.

Thus Horace describes them:

- - - - -

Solutes iaffit lapientem paucere barbarum.

Sermon. i. ii. sat. iii. v. 34.

Aulus Gellius and Lucian express themselves in a similar
manner. Perius seems to have been so convinced of the beard's
being the symbol of wildom that he thought he could not
bellow a greater enormity on Socrates than calling him
“Magistrum barbatum.” The Sicilians, and the Etrurians,
adopted the customs of the Greeks. The latter exhibited
all their deities with a beard, except Vulcan, but on the me-
dals of the former their kings appear without a beard.

The Romans for a long time wore beards and long hair.
Cicero, in his oration for Celsus, (c. 14.) mentions the
“barba horrida, quam in italicis antiquis & imaginibus vi-
dominus.” Livy (v. 51.) speaking of the senators, who re-
mained in Rome, after the entrance of the Gauls, says that
they wore a very long beard: “barbae, ut tum omnibus
promissa erat.” Scipio Africanus appeared with a long beard
in his interview with Massinissa.

Hence Ovid calls the an-
cient Romans “intonsi;” thus,

Juvenal alfo (Sat. xvi.) describes them in the same manner.

“Et credam dignum barba, dignumque capillis

Majorum.”

Pliny observes, that the Romans did not begin to shave
till the year of Rome 454, when P. Tienius brought over
a number of barbers from Sicily; he adds, that Scipio Af-
ricanus was the first who introduced the mode of having
every day. The philosophers, however, retained the beard;
and the military men wore it short and frizzled, as we see it
upon the triumphal arches, and other monuments. In time of
grief and affliction they suffered their beard and hair to grow,
as was the case with M. Livius in his retirement from Rome,
and with Augustus after the defeat of Varus. The Greeks,
on the contrary, in time of grief, cut their hair and shaved
their beards; (Seneca Benef. v. 6.) which was also the custom
among some barbarian nations. Accordingly, the custom of
letting the beard grow is a token of mourning in some coun-
tries, and of mourning in others. The first fourteen Roman
emperors shaved, till the time of the emperor Adrian, who re-
tained the mode of wearing the beard. Plutarch tells us he
did it to hide the scars in his face.

Antoninus Pius and Marcus Aurelius wore a beard un-
der the character of philosophers. The succceffors of Juffian
refumed the habit of wearing beards, and the latter Greek
emperors had them of an extraordinary length. The ancient
Britons in the time of Cesar shaved the rest of the body,
extep the head and upper lip: “Capillus ac barbam radere
preter caput, et labrum superius.” Bell. Gall. i. v. c. 14.

Diodorus Siculus and Tacitus inform us, that the ancient
Germans shaved the beard, except that on the upper lips;
and, among the Catti, a nation of Germany, a young man
was not allowed to shave or cut his hair till he had flain an
enemy. Tac. de Mem. Germ. 31. Among the Jews it was
reckoned ignominious to shave a perfons beard. 2 Sam. x. 4.

Strabo relates, that the Indian philosophers, the Gym-
osophists, took great pains to attract the veneration of
the people by the length of their beards. The Goth
and Franks wore only a mustache, called by Plutarch
“barbae,” and by the Latins “crilla.” While the Gauls
were under their sovereignty, none but the nobles and Chris-
ian priests were allowed to wear long beards. When the
Franks made themselves masters of Gaul, they assumed
the same authority as the Romans; the bondmen were expressly
ordered to shave their chins; and this law continued in force
till the entire abolition of servitude in France. In the time
of the first race of kings, a long beard was a sign of nobility
and freedom; and the kings were emulous to have the largest
beards. Egnid, secretary to Charlemagne, speaking of the
law kings of the first race, says, they came to the as-
semblies in the field of Mars, in a carriage drawn by oxen, and
fat on the throne with their hair diwelled, and a very
long beard.

It is not easy to fix with precision the time when the
beard was first shaven among the young Romans. It was
sometimes when the toga virilis was assumed, according to
Suetonius (Calig. 10.) Macrobius (Somn. Scip. i. 6.)
says, it was about the age of 21. Augustus did not have
before the age of 25. Hence young men with a long down, or
“lausura,” upon the chin, were called “juvenes barbatiu,”
or “beni barbati.” The first growth of the beard was
conferred to some god, finally to the Lares. Nero con-
secrated his in a golden box, set with pearls, to Jupiter
Capitolinus. The day on which the young men, among the
Greeks and Romans first shaved the beard, was a festival;
visits of ceremony were paid them; and they received preseuts
from their friends. To this purpose, Juvenal says, Sat. iii. 186.

”Ille
“Ille metit barbarum, crimen hic depositi amati: 
“Pleas domus libris genitibilibus!”

Slaves, among the Romans, wore their beards and long hair; when manumitted they shaved the head in the temple of Ter- rona, and put on a cap, or "pileus," as a badge of liberty. Those who escaped fromshipwreck, shaved their heads; and persons accused of a capital crime, cut their hair and shaved, and went to the capital to return thanks to Jupiter.

Persons of quality had their children shaved the first time by one of the same, or greater, who by this means became peculiar, or adoptive fathers of the children. As the child grew, a person became godfather of the child by his own will, which is the custom; thus it is a practice, that one of the grandfathers of the twenty-fifth A.D. was, that Alaric should touch the beard of Clevis to become his god- father.

As to ecclesiastics, the discipline has been very different on the subject of beards; sometimes they have been encharged to wear them from a notion of too much effeminacy in shaving, and that a long beard was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as seeming pride to lock beneath a venerable beard. The Greek and Roman churches have long disputed together about their beards; since the time of their separation, the Romans have been to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions "de radendis barbis." The Greeks, on the contrary, espouse very zealously the cause of long beards, and are extremely fond of them in the Roman churches.

By the statutes of some monasteries, it appears, that the laymen were to let their beards grow, and the priests among them to shave; and that the beards of all that were received into the monasteries were blest with a great deal of ceremony; and there are still extant the prayers used in the solemnity of consecrating the beard to God, when an ecclesiastic was chosen.

Le Comte observes, that the Chinese affect long beards excessively; that nature has balked them, and only give them very little hair. One, which, however, they cultivate with great care; the Europeans are strangely eluded by them on this account.

The Russians wore their beards till within these few years, when the czar Peter enjoined them all to shave; but, notwithstanding his injunction, he was obliged to keep on foot a number of officers to cut off continually the beard of such as would not otherwise part with it. For enforcing his regulation, which was violently opposed, he laid a tax on long beards, and many submitted to it rather than part with their beard, which was unmercifully held to be an ornament to the person.

Superstitious Russians even thought it to be an external characteristic of the orthodox faith; and those who were too poor, or too partial to pay the tax for retaining the beard, religiously preserved the beard that was shorn off, and laid it deposited in the coffins with them on their decease, that they might present it to St. Nicholas, on his refusing to admit them, as barbarous idolaters, into the kingdom of heaven. As a proof of the high estimation in which the beard was held in Russia formerly, it is a law in the Novgorodian code, that whoever plucks hair from another's beard shall be mulcted four times as much as for cutting off a finger.

In the eighteenth century, King Charles the Third, of France, was so much moved for his captive electors than for his long white beard, which he suffered to hang down on the outside of his collar, to encourage the troops in battle, and to rally them when defeated. Upon the death of the great Henry IV. of France, who was succeeded by a beardless youth, the beard was proscribed. Louis XIII. ascended the throne of his glorious ancestor without a beard; and his courtiers immediately reduced their beards to whiskers, and a small tuft of hair under the lower lip. The duke of Sully, however, though he encountered ridicule, would never adopt the effeminate custom. Whiskers continued in fashion in the commencement of the reign of Louis XIV. who, as well as his courtiers, were proud of wearing them; so that they were the ornament of Turenne, Condé, Colbert, Corneille, Molière, &c.

In Spain, Philip V. ascended the throne with a shaved chin; and the warriors imitated the prince, and their example was followed by the people. The change, however, produced lamentations and innumerable. Hence arose the Spanish proverb, denoting, "Since we have lost our beards, we have lost our souls." The Portuguese, whose national character is much the same, have imitated them in this respect. Accordingly we read, that in the reign of Catherine queen of Portugal, when the heave John de Castro had taken the Castle of Din, in India, he was under the necessity of borrowing from the inhabitants of Goa a thousand pitholes for the maintenance of his fleet; and that as a security for the loan, he left them one of his whiskers, telling them "All the gold in the world cannot equal the value of this national ornament of my person;" and deposit it in your hands as a security for the money. The inhabitants of Goa, it is said, generally returned both the money and his whisks.

We have already observed, that the ancient Britons, in the time of Cæfar, shaved the body, except the head and the upper lip; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length. The Anglo-Saxons, on their arrival in Britain, and for a considerable time after, allowed their beards to grow, as well as their near neighbours the Longobards, to whom in every respect they bore a near resemblance. After the introduction of Christianity, their clergy were obliged to shave their beards, in obedience to the laws, and in imitation of all the western churches. This distinction between the clergy and the laity subsisted for some time; and a writer of the seventh century complains, that the nuns of the clergy were so corrupted that they could not be distinguished from the laity by their actions, but only by their want of beards. By degrees the English laity began to imitate the clergy so far as to shave all their beards except their upper lips, on each of which they left a lock of hair; by which they were distinguished from the French and Normans, who shaved their whole beards. The Normans had as great an aversion to beards as they had a fondness for long hair. Among them, to allow the beard to grow, was an indication of the deepest distress and misery. They not only shaved their beards themselves, but when they had authority, they obliged others to imitate their example. It is mentioned by some of our ancient historians, as one of the most wanton acts of tyranny in William the Conqueror, that he compelled the English, who had been accustomed to allow the hair of their upper lips to grow, to shave their whole beards. This was so disagreeable to some of that people, that they chose rather to abandon their country than retain their whiskers. In the fourteenth century long beards were in fashion, and continued to the sixteenth century; so that in the reign of Mary I., the beards of bishop Gardiner and cardinal Pole, appear in their portraits to be of a most uncommon size. The lawyers, however, had a regulation imposed upon this important feature. Towards the close of the sixteenth century, the beard was much defended, and gradually dwindled into mutton-chop or whiskers; and in process of time the practice of having the whole face become universal.
Among the Turks, it is more infamous for any one to have his beard cut off, than among us to be publicly whipt, or branded with a hot iron. They who serve in the seraglio have their beards shaven as a token of servitude; and when they are let at liberty, they permit it to grow. With them and the Persians the beard is a mark of authority and liberty; and the want of moustachios and beards discriminates slaves and women. Hence, it is said, arises the unfavourable idea which they form on the first sight of an European. There are many in that country who would prefer death to this kind of punishment. The Arabs make the preservation of the beard a capital article of religion, because Mahomet never cut his. The Moors of Africa hold by their beards while they swear, in order to give validity to their oath, which after this formality they rarely violate.

The Turkish wives kiss their husbands' beards, and children their fathers', as often as they come to salute them. The men kiss one another's beards reciprocally on both sides, when they visit one another in the streets, or come off from a journey. The Jews wear a beard on the chin, but not on the upper lip or cheeks. Moles forbid them to cut off entirely the angle or extremity of their beard; that is, to imitate the Egyptian fashion, who left only a small tuft at the extremity of the chin; whence the Jews to this day suffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well as on their lower lips, their beards form a pretty long bunch. In time of mourning the Jews neglected to trim their beards, that is, to cut off what was superfluous on the upper lips and cheeks. In time of great affliction they also plucked off the hair of their beards.

It has been advanced by several historians and travellers, that the Indians of America differed from other males of the human species in the want of one very characteristic mark of the face, viz. that of a beard. From this general observation, the Eskiımions have been excepted; and hence it has been suppos'd, that they had an origin different from that of the other natives of America. Mr. Caulfield, after ten years residence at Niagara, in the midst of the Six Nations, with frequent opportunities of seeing other nations of Indians, affirms, that they do not differ from the rest of men in this particular more than one European differs from another; and as this imperfection has been attributed to the Indians of North America, equally with those of the rest of the continent, he inclines to think, that the affliction is void of foundation in one region as it is in the other. All the Indians of North America, says this writer, except a very small number, who, from living among white people, have adopted their custom, pluck out the hairs of the beard; and as they addict themselves to this practice from its first appearance, it may be suppos'd, that to a superstitious observer, their faces will seem smooth and beardless. As farther proofs that they have beards, he alleges that all of them have an instrument which they use for plucking out the hairs; that when they neglect this for some time, hairs sprout up, and are seen upon the chin and face; that many Indians allow tufts of hair to grow upon their chins or upper lip; and that several of the Mohocks, Delawares, and others, who live among white people, sometimes have with razors, and sometimes pluck their beards out. Accordingly, colonel Butler affirms, that the men of the Six-Nation Indians have all beards naturally, which is also the case with respect to all other nations of North America, which he has had an opportunity of seeing; but that it is the general practice of the Indians to pluck out the beard by the roots from its earliest appearance; and hence their faces appear smooth. The same fact is confirmed by Captain Brent. Phil. Trans. vol. Ixxvi. p. 229. &c.

**BEARD.**

**BEARD, anointing the,** with unguents, is an ancient practice both among the Jews and Romans, and still continues in use among the Turks; where one of the principal ceremonies observed in serious visits, is to throw sweet-scented water on the beard of the visitant, and to perfume it afterwards with aloes wood, which sticks to this moisture, and gives it an agreeable smell, &c.

In Middle age Writers we meet with adlentare barbam, used for frotting and combing it to render it soft and flexible.

The Turks, when they comb their beards, hold a handkerchief on their knees, and gather very carefully the hairs that fall, and when they have got together a certain quantity, they fold them up in a paper, and carry them to the place where they bury the dead.

**BEARDS, plucking the,** was practiced to Cynics by way of contempt. The Stoics, as well as Cynics, affected to be insensitive to injury, and their patience was tried by this practice. Socrates was not exempt from this species of insult and persecution, as we are informed by Diogenes Laertius.

Horace says to a person of this description:

---Vellunt tibi barbam

Laskivi pueri."

_Sermon, Sat. 3. 133._

And _Periplus_ Sat. 1. 133._

"Si Cynico barbam petulans Nonaria vellat."

The fame fatyris represents Jupiter as offering his beard to be plucked by Dionysius the tyrant:

"Ideo alio Rolidam præbuit tibie vellere barbam

Jupiter."

Some authors also speak of _mortgaging the beard, barbam hypothecare._ Du Cange.

**BEARD, touching the,** was an action anciently used by suppliants, and by those who made vows. An instance of this is found in Homer (I. K. 454.) and Pliny (ii. 45.) says, that the ancient Greeks had a custom of touching the chin of a person, whose compassion they wished to excite; the chin being sublimated for the beard. Instances of a similar kind occur in the _Oreôles_ and _Hecubæ_ of Euripides. To touch any one's beard, or cut off a small part of it, was among the ancient French, the most sacred pledge of protection and confidence. For a long time all letters, infusing from the sovereign, had, for greater satisfaction, three hairs of his beard in the seal. A charter of 1211, still extant, concludes with the following words: "Quod ut ratum et stabile perverit in pollueram, prestantis scripto figuli mei romanori appoil com tabius pilis barba mee." Du Cange.

**BEARD, false, barba falsis,** was an artificial one. _Ina_ general court of Catalonia, led in 1351, it is expressly enjoined, "Ne quis barbam falsam feci fictam audacter vel fabricare." Du Cange.

Hottomans have given an elegant dialogue de barba, first printed by Plantin in 1566.

**BEARD, or under-beards,** called also chæra, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

**BEARD, old-man's, in Botany.** See _Clematis._

**BEARD of a Comet,** denotes the rays which the comet emits towards that part of the heavens to which its proper motion seems to direct it. Thus, the beard of the comet is distinguished from the tail, which is understood of the rays emitted towards that part from which its motion seems to carry it. It is called beard from some fancied resemblance it bears to the beard of a man; or because it is projected before the comet.

**BEARD, in Conchology,** the byssus of the _pinna, the mycelia, &c._ an affemblage of threads or hairs of a down texture that hangs from the body of the animal, and by means of which it
it falls itself to bones, or any other heavy substance; the hairs of the beard terminating in a spungy substance, that adheres very tenaciously to the smoothest surfaces. The thread of this kind of byflus is sometimes woven as an object of curiosity into gloves, lockings, &c. and in point of durability at least, cannot be inferior to any other material that could be employed for that purpose. Some notice is taken of this among ancient writers, who speak of it as a kind of silk. See Silk.

BEARED, beared, duty, denotes a person or thing with a beard, or some resemblance thereof.

In Middle Age Writers, this is sometimes expressed by mulut, q. v. burads in multy fen genus.

The faces on ancient Greek and Roman medals are generally bearded. Some are denominated bearded, as having long beards, etc. the Parthian kings. Others have only a nose about the chin, as the Seleucida family. Adrian was the first of the Roman emperors who nourished his beard: hence all imperial medals before him are bearded: after him, bearded.

The medals of gods, and heroes, in vigorous youth, represent them beardless, except Jupiter, and a few others.

The Roman paid their worship to a bearded Venus, Perseus, and Metis, supposed to have been of both sexes: a statue of whom was also found in the isle of Cyprus. The reason of representing the goddess of beauty with a beard is variously given at by the learned.

Bearded women have all observed to want the menstrual discharge; and several instances are given by Hippocrates, and other physicians, of women, especially widows, in whom, the menses being stopped, beards appeared.

Erebus Nicerembergius mentions a woman, who had a beard reaching to her navel. Bartholin speaks of a bearded woman at Cupinian, who partly, in virtue thereof, paifed for an hermit-hedge.

Bearded, bearded, bearded, in Ecclesiastical Writers, are those otherwise called barstes barstes, in the order of Grammon and the Cistercians. They took this denomination because they were allowed to wear their beards contrary to the rule of the professed monks.

Bearded, bearded, in the, among Floridos, a hawk which is hairy on the edges, as that of the roe, &c.

BEARING, in Geography, denotes diminishing any piece of timber from a given line on its surface, to make the thickness less on the edge.

BEARING, in Manufacture, See Wool.

BEARDSTOWN, in Geography. See Bairdstown.

BEARER, in Architecture, any subsidiary or intermediate support in aid of the principal supports, as the small joints or brackets which bear a gutter or the covering board of a cove, the pieces and blockings under the joints of a ground floor, or the joints, &c. which bear any thing independent of or unconnected with the building, as the bearers of a column, of a vat, or of a platform.

BEARERS, bearers, in Middle Age Writers, are sometimes used for a child's pillows, because they hold the infant in their arms, and pretend to the privileges in the ceremony of baptism. See Child.

The bearers are more particularly used for those who carry the dead to their graves.

In a sense somewhat different from this, we also say bearers, &c.

The ancients had peculiar orders or officers of bearers, called, by the Greeks, bearers, by the Romans, bearded. The vespillones, or hojiuli, were a lower sort of bearers, appointed for persons of inferior rank.

Bearers, in Horticulture, denote the fruit branches, or such as bear fruit.

The bearers, or bearing branches of an apple-tree, and the like, are found to be rougher, and fuller of acerities in their bark, than the other branches.

Bearers, in Heraldry, see Supports.

Bearers, in Law, denote such as bear down and oppose others, and are said to be the same with maintainers. By Stat. 4 Edw. III. c. 11. justices shall enquire of, hear, and determine maintainers, bearers, and conspirators, &c.

BEAR-HAVEN, in Geography a commodious harbour formed by the island of Bear, near the mouth of Bantry bay in the county of Cork, Ireland, into which ships of war and merchantmen often put for shelter: but the adjoining village of Callidtown affords them few resources, and no accommodation. See Fort's Memoir.

BEARING, in Geography and Navigation, the situation of one place from another, with regard to the points of the compass, or the arc of the horizon, that lies between the meridian of a place and a line passing from that place to another; or the angle which a line drawn through the two places makes with the meridians of each.

In other words, the bearing of an object in navigation, is the azimuth on which it is seen; and the bearing of one place from another is reckoned by the name of the azimuth passing through those two places. In every figure relating to any case of plain sailing, the bearing of the line not proceeding from the centre of the circle, or horizon, is found by drawing a line parallel to it from the centre and towards the same point.

To find the bearing of any two places, e. g. cape Clear, and the island of St. Michael's, one of the Azores, by the plain chart; lay a ruler by the two places, take the nearest distance between the centre of the compass, and the edge of the ruler; and in this position, slide one point of the compasses along the ruler, and the other point will point along the point of the compasses, deciding the bearing, which in this case is S.W., that is, St. Michael's lies to the S.W. of Cape Clear, or Cape Clear to the N. E. of St. Michael's. See Sailing.

To find the bearing of any two given places on the globe, lay the graduated edge of the quadrant of altitude over both places, the beginning, or 0, being on one of them, and observe, while the quadrant lies in this position, what azimuth of the nearest fly, or compass, runs mostly parallel to the edge of the quadrant, and that azimuth shows the bearing sought, nearly.

The bearings of places on the ground are usually determined from the magnetic needle; in the managing of the principal part of the surveying; since the bearing and distance of a second point from the first being found, the place of that second is determined; or the bearings of a third point from two others, whose distance from each other is known, being found, the place of the third is determined instrumentally we mean; for to calculate trigonometrically, there must be more data. Mr. Collins gives the solution of a problem in the Philosophical Transactions, where the distances of three objects on the same plane being given, and the bearings from a fourth place in the same plane observed,
firmed, the distances from the place of observation to the respective objects are required. See Surveying.

BEARING, in the Sea Language. When a ship sails towards the shore, she is said to bear in with the land.—When a ship that was to windward, comes under another ship's stern, and so gives her the wind, she is said to bear under her lee.—If a ship falls into a harbour with the wind large, or before the wind, she is said to bear in with the harbour, &c.

In causing they say, bear up, the helm, that is, let the ship go more large before the wind—bear up round, that is, let the ship go between her two sheets, directly before the wind—bear a head, i.e. make haste.

They also say a ship bears when, having two flinders a quarter, she will sink too deep into the water with an over light freight, and therefore can carry but a small quantity of goods.

Bear fail well, to, is said of a ship when she is a stiff-guided ship, and will not touch down on a side, with a great deal of fail.

When a ship is said to bear out her ordnance, it is meant, that her ordnance lies to high, and the will go so upright, that in reasonable fighting weather, she will be able to keep out her lower tier, and not be forced to that in her ports.

A ship is said to bear another, when it is able, in a great gale of wind, to carry out more fails, viz. a top-fail, more, or the like.

Bearing off is also used by Seamen generally in business belonging to the shipping, for thrust off.

Thus, in hoisting any thing into the ship, if it hath hold by any part of the ship or ordnance, or the like, they say, bear it off from the ship's side. So if they would have the breech or mouth of a piece of ordnance, or the like, put from one, they say, bear off or bear about the breech.

Bearing up, or bearing away, is improperly used to denote the act of changing the course of a ship, in order to make her fail before the wind, after she had failed some time with a side wind or close-hauled.

Bearing also expresses the situation of any distant object, estimated from some part of the ship, according to her position. In this sense, the object must be either a head, a foremast, or the beam, before the beam, abaft the beam, on the lee or weather bow, and on the lee or weather quarters.

Bearing of a piece of timber, in Carpentery, denotes the space either between the two fixed extremes thereof, when it has no other support; which is called bearing at length; or between one extreme, and a poll, brick wall, or the like, trimmed up between the ends to shorten its bearing.

Joists are not to bear above ten feet length; nor single rafters more than nine feet. 19 Car. II. c. 3.

Bearing of an arch or vault, denotes the effort which the stones make to burst open the piers, or peddrosis.

This amount to the fame with what the French call poufles.

Bearings, in Heraldry, a term used to express a coat of arms, or the figures of armorials, by which the nobility and gentility are distinguished from the vulgar, and another. See Arms.

Bearing of an organ pipe, denotes an error or variation from the half found it ought to yield. See Temperature.

Bearing pains, in Midwifery. The pains in labour or childbirth are said to be bearing pains when they force the child downward.

Bearing down of the womb, vagina or anus. When the uterus descends from the upper part of the pelvis, and press upon or passes through the os externum, it is called a bearing down (producetia) of the womb. In this case the uterus is included in a duplicature of the vagina, to the upper part of which it is attached. Women who are troubled with the whites (florid albus) or who have borne children, particularly if the perineum was injured, or torn, at the time of the birth of any of them, are most subject to this complaint. It manifests itself at first by a sense of dragging or bearing down of the part; some time after, there is a difficulty in making water, the uterus lying on, and covering the meatus urinarius. In this stage of the complaint, on passing a finger into the vagina, it meets the os uteri, immediately on getting through the os externum. If not now remedied, the uterus continues descending, until it frees the os externum, and hangs down between the thighs; and if still neglected, the part protruded goes on increasing, from the size of a nut to that of a large pear, and in some cases the uterus, covered with the vagina, has been found hanging down beyond the middle of the thighs, and to the size of the body of a Florence flask. When a fold of the vagina only descends, and passes through the os externum, it is called a bearing down (producetia) of the vagina. A similar indisposition affects the rectum, a fold of the gut being forced through the sphincter ani, whenever the forces are voided. This complaint is particularly incident to weak children, though adults are not unfrequently affected with it. As in all these cases there is a relaxed tone of the fibres, the cure is to be effected by the exhibition of such things as strengthen and increase the tone and elasticity of them, by the Peruvian bark and chalybeats, the use of the cold bath, exercise, air, and other applications to the parts, as decoctions of oak bark, pomegranate hulls, balmaline flowers, red rose leaves, &c. to which a portion of red port wine is to be added, and the medicine so prepared is to be injected into the vagina or rectum, and compressed in a keel, in applied to the parts externally, taking care in the mean while that the body be kept moderately open. When the womb is the part bearing down, in addition to these remedies, after returning the womb to its proper situation, a pellitory is to be introduced into the vagina and worn there to prevent its defending again. See Pessary; see also Producetia Uteri, Vaginae, et Ani.

Bearing claus, among cock fighters, denote the foremost toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

Bearing of a flag, is used in respect of the flag of his head, or the croches which he bears on his horns.

If you ask what a flag bears, you are only to reckon the croches, and never to express an odd number; as, if you have four croches on his near horn, and five on his far, you must say he bears ten; a false right on his near horn; if but four on the near horn, and six on the far horn, you must say he bears twelve; a double false right on the near horn.

BEARN STONE, Ice Phosphorus.

Beards, in Geography, was a province of France, before the revolution, at the foot of the Pyrenees, about 16 leagues long and 12 broad; bounded on the east by Bigorne, on the north by Armagnac, Turfan, and Chalosse, on the west by Daus, a part of Soule, and lower Navarre, and on the south by the Pyrenees. The plain country is very fertile, producing flax and Indian corn, and the mountains are covered with fir-trees, and within them are mines of copper, lead, and iron, and the lesser hills are planted with vines, which yield good wine. The Spaniards are supplied hence with horses and cattle, and also with linen, of which there is in this province a considerable manufactury. The principal rivers which bear the name of Gaves, are the Gave de Bearnais, and the Gave d'Oleron. Bearn forms now the department of the Lower Pyrenees; and its capital is Pau.

BEAST, in Zoology, an appellation given to all four-footed
footed animals, fit for food, labour, or sport. See Brute, and Zoology.

Authors make this difference between "beasts of the forest" and "of chase," that the first are "silversonic, the latter "campileon," i.e. beasts of the wood, make their abode all the day time in the great forests and secret places of the woods, and in the night feed on trees and plants feeding on trees, whilst their denomination "silversonic" q. d. beasts of the wood.

"Beasts of the chase" reside all the day time in the fields, and on the mountains afar off, to prevent surprise; but on night's approach, they feed, as the reet, in meadows, &c. whilst their denomination "campifero," q. d. beasts of the field.

In our Statute books, "beasts of chase" are five: the buck, deer, fox, martin, and raccoon. "Beasts of the forest," called beasts of venery, are the buck, hind, bear, and wolf; and "beasts and fowls of the chase" are the hare, coyote, peafant, and partridge. See Game.

No other, according to Maxwell, are accounted beasts or fowls of warren, than hares, coyotes, peafants, and partridges. Lord Coke is of another opinion, distinguishing beasts of the warren, from fowls of the warren. Under the former he includes hares, coyotes, and rats; the latter he divides into "flagecon, campileon, and aquatic." To the first belong the peafant, wood-eeek, &c. to the second the partridge, quail, rad, &c. to the third the mallard, hen, &c. Coke on Littleton, p. 233.

"Beasts of burden" is understood of all quadrupeds employed in carrying goods on their backs. To this class belong elephants, dromedaries, camels, horses, mules, asses, and the sheep of Mexico and Pern.

"Beast," in Games of Chance, a game at cards, played thus: the backs cards are the king, queen, &c. of which are formed three heaps, designated the king, the play, and the trotelet. Three, four, or five may play; and to every one: are dealt five cards. Before the play every one throws to three heaps. He that was most tricks takes up the heap called the queen; he that has the king takes up the heap, so called; and he that has three of any sort, at three fours, three fives, three sixes, &c. takes up the trotelet heap.

"Beast at order," is where the player or person that undertakes the game, loses it to the other, and is, for the penalty of which a forfeit is equal to the stake played for.

"BEASTAN," in Geography, a town of Peru, in the province of Segeilana, 80 miles N.W. of Lima.

"Beasts, rather, for mortar.

"BEAT," in Fencing, denotes a blow or stroke given with the sword. There are two kinds of beats, the first performed with the blade of a man's sword, and the other with the shaft of his adversary's, which in the schools is commonly called baton, from the French baton, and is chiefly used in a pursuit, to make an open upon the adversary. The second and best kind of beat is performed with the forte of a man's sword upon the blade of his adversary's, with a spring, as in a beating, but with a jerk, or dry beat; and it therefore must properly for the parades without or within the sword, because of the return of a man's sword, which is from his adversary, whereby he procures to himself the better and safer opportunity of manceuvring.

"BEAT," in Geography, a town of France, in the department of the upper Garonne, and chief place of a canton, in the district of St. Gaudens, on the Garonne. All the houses are built of marble, the height of building supplying no other materials. It is built between two mountains, close to the town on each side. The place contains 1596 and the canton 957 inhabitants; the territory includes 2470 kilometres and 25 communes. N. lat. 42° 50'. W. long. 1° 6'.

"Beat," St., mountains of, are mountains of Switzerland in the canton of Berne, near the lake Thun; the rocks of which are calcareous and rugged, and containing in a few places broken petrifications. Some of these rocks are perpendicular, and even impending, and are marked at different elevations with fowls, occasioned by the waters of the lake, which in former periods was probably several hundred feet above its present level.

"Beat," in Horology. See Beats.

"Beat," in the Moulin. A horse is said to beat the dust, when, at each stroke or motion, he does not take in ground or way enough with his fore-legs. He is more particularly said to beat the dust at terra a terra, when he does not take in ground enough with his shoulders, making his strokes or motions too short, as if he made them all in one place. He beats the dust at curves, when he does them too precipitantly and too low. He beats upon a walk, when he walks too short, and thus rides but little ground, whether it be in straight lines, rounds, or passing.

"Beat upon the hand," see Clack.

"Beat of the Drum," in the Military Art, is differently performed, according to the purpooe designed by it. Notice is hereby given of any sudden change; soldiers are summoned to repair to their arms and quarters; and the various movements before and after, and during the engagement, are denoted by different beats of the drum.

The chief beats or beats on the drum are, the general, the affit, the chasse, the march, the revelle, the retreat, &c. See Drum.

"Beat," in Minstrel. A graze marked thus: or thus .

Its effect is just the contrary of a short shak in rapid movements, where it can neither be prepared nor turn.

cd. It confits merely of three notes:

Beat. Efect.

transient shakes:

Explain.
BEATIA, in Ancient Geography, a town of Spain, in Beata, south-east of Cadiz, and near it.

BEATIFICO. See Vision.

BEATIFICATION, in Electricity, a term used by professor Dzu to denote an electrical experiment, by which he inclosed the head of a person strongly electrified, and standing on a large cake of pitch, with a luminous glory, resembling that with which painters ornament the heads of saints. The secret of this experiment, which occasioned many fruitless and expensive trials to the first electricians in Europe, consisted in the use of a suit of armour decked with red, in various figures; and the glory was produced by rays issuing from the edges of the helmet.

Beatification, in the Roman Church, the act by which the pope declares a person happy after death.

Beatification differs from canonization; in the former, the pope does not act as a judge in determining the state of the beatified, but only grants a privilege to certain persons to honour him by a particular religious worship, without incurring the penalty of superstitious worshippers; but in canonization, the pope speaks as a judge, and determines "ex cathedra" upon the state of the canonized.

Beatification was introduced when it was thought proper to delay the canonization of saints, for the greater assurance of the truth and manifestation of the rigorous steps taken in the procedure.

The ceremony of beatification is a previous one to that of canonization; and cannot be performed till 50 years after the death of the person thus honoured. On this occasion, certificates or attestations of the character and miracles of the person for whom this honour is intended, are produced and examined by the congregation of rite. An advocate, called by the people the devil's advocate, is employed to controvert the claims of the candidate; and it is the business of an advocate, engaged on the other side, to obviate and refute the cavils of the adversary. As soon as the saint's claim is confirmed, he is admitted into all the privileges of beatification by the pope's decree. His relics, if any such are found, become henceforth entitled to the veneration of all good Christians; his images are crowned with rays, and a particular office is set apart for him; and the day of his beatification is distinguished by the grant of indulgences and remission of sins.

It is remarkable, that particular orders of monks affume to themselves the power of beatification. Thus Octavia Medicatoria was beatified with extraordinary ceremonies by the Dominicans, for a legacy of 7000 dollars to the order.

BEATING, among Sportsmen, denotes the noise which hares make in Rutting-time.

The word is said to beat, the hart to bell, &c.

Beating, Pulsation, in Medicine, is applied to the regular agitation or palpitation of the heart and pulse. See Pulssation.

Beating of the Heart. See Pulsation.

Beating Flax, or Hemp, is an operation in the dressing of these matters, contrived to render them more soft and pliable.

When hemp has been swengled a second time, and the bundles laid by, they take the strikes, and dividing them into dozens and half dozens, make them up into large thick rolls, which being broached on long strokes, are let in the chimney corner to dry; after which they lay them in a round trough made for the purpose, and there with beetles, beat them well, till they handle, both without and within, as plain as possible, without any hardsets or roughness to be felt; that done, they take them from the trough, open and divide the strikes as before, and if any be found not sufficiently beaten, they roll them up, and beat them over as before.

Beating hemp is a punishment inflicted on loose and disorderly persons.

Beating, in Book-Binding, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or stitching. On the beating of it properly, the elegance and excellence of the binding, and the easy opening of the book principally depend.

Beating, in the Paper Works, signifies the beating of paper on a floor with a heavy hammer with a large smooth head and short handle, in order to render it more smooth and uniform, and fit for writing.

Beating the Wind, was a practice in use in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other was to beat the wind, or to make so many drouishes with his weapon; by which he was intitled to all the advantages of a conqueror. Du-Cange.

Beating the Hands or Feet, by way of praise or approbation. See Applause.

Beating Time, in Music. See Battre la Mesure.

Beating, in Navigation, the operation of making a progress to sea against the wind, in a zigzag line or traverse, by steering alternately close-hauled on the larboard and flarboard tacks. See Tacking.

Beating, Drumming, or Stripping, make one of the moft ancient as well as universal species of punishment. Among the Romans it obtained, under the denomination of verberes, flagigores, flagellares, &c. In the East it still prevails under the name of bofanoada.

Some dillinguish between pulfation and verberation, as if the latter imported a beating with pain, the former without; but this distinction is not always observed.

Beating, in the English Laws. See Battery.

Beating in the Flanks, a distemper to which black cattle are subject, and is an indication of a great inflammation in the bowels.

Beating, in Husbandry. See Burning of Land.

BEATITUDE, imports the supreme good, or the highest degree of happiness human nature is susceptible of.

In which sense, it amounts to the same with what we otherwise called blissfulness and sovereign felicity; by the Greeks called χαρά, and by the Latins sumnum bonum, beatitudine, and beatissimus.

Beatitude, among Divines, denotes the beatific vision, or the fruition of God in a future life to all eternity.

Beatitude is also used in speaking of the theses contained in Christ's sermon on the mount, whereby he pronounced blessed the poor in spirit, those that mourn, the meek, &c.

Beatitude was also a title annually given to all bishops; but of later days restrained to the pope.

It appears to have been sometimes also given to laymen.

BEATON, BEaton, or Bethune, David, in Biography, primate of Scotland, and cardinal of Rome, was descended from a family originally of France, and the nephew of archbishop James Beaton, his predecessor in the privity. He was born in 1494; and having passed through the ordinary discipline of the schools, and of the university of St. Andrew's, he was sent to France by his uncle, for the completion of his education. In the university of Paris he applied with diligence to the study of the civil and canon laws, and also of divinity, in order to qualify himself for the service of the church. At the proper age, he entered into holy orders; but, notwithstanding his clerical character, he was
was employed in several affairs of importance by John duke of Albany, regent of Scotland, and appointed presulent at the court of France in 1519. In 1523 his uncle, being promoted to the archbishopric of St. Andrews, resigned the rich abbacy of Arbroath in his favour, and having obtained from the pope a dispensation for holding it two years without taking the habit, he returned to Scotland in 1525, and took his seat in parliament as abbot. Having ingratiated himself with the young king, whom he had served in France during his minority, he was promoted in 1528 to the high office of lord privy-seal. In this capacity he obtained the king's confidence; and in 1533 he was entrusted with an important commission which required his return to France, where he was amply instrumental in maintaining the attach- ment of James to the French interest, and where he was employed in negotiating several important concerns between the two courts, and in demanding for his master, Magdalen, the king's daughter, in marriage. During his stay at the French court, he gained the esteem of King Francis I. to such a degree, that he granted him several singular favours; inviding him, in 1537, with all the privileges of a native of France, and conferring upon him, in the same year, the valuable bishopric of Mirepoix. King James having espoused the princess Magdalene at Paris in 1535, the abbot of Arbroath accompanied them to Scotland; and after her death, in the same year, he was deputed to negociate a second marriage for the king with Mary, daughter of the duke of Guife, whom he conducted to Scotland in 1538, where their nuptials were celebrated at St. Andrew's. In this year he was advanced by pope Paul III., who wished to attach the clergy of Scotland and England to the see of Rome, to the dignity of cardinal. Upon the death of his uncle soon after, he succeeded to the primacy, and exercised the cardinal powers with which he was invested in evincing his attachment to the religion and interests of Rome, in conducting a very severe inquisition into heretical doctrines, and in causing prosecutions to be instituted against several persons, of whom some were men of family and distinction. It is said, that he had prefigured to the king a roll of 560 of the chief nobility and barons, as suspected of heresy, and if the king's death had not prevented the execution of his designing purposes, these, and perhaps many more, must have fallen sacrifice to his perfidious power, which his policy did not dissemble to conceal. At the elevation of the cardinal, James undertook the invasion of England, and at Solway Moss the royal army was totally defeated in 1542; but this unexpected disaster proved fatal to the king, and he died soon afterwards. The cardinal was the only person of authority who was present with him in his last moments; and he is accused of having forged a will, in which the king appointed him together with three other noblemen to be regents of the kingdom, and disfranchised the minority of young Mary. This fact is considered as unequivocal by the sincerity of modern, as well as the more early historians. But the English interest prevailed, and the earl of Aran was declared to be regent. Upon the Cardinal Beaton was apprehended and confined; but in a little while, he contrived by his political ability a influence not only to be liberated, but to be appointed high-chancellor of the kingdom. The commission of legate "a latere," which he found afterwards obtained from the court of Rome, empowered him to proceed in his favourite design of extirpating heretics. In the execution of this design, he caused several persons to be condemned and executed; and among the rest, Mr. George Wilhart, the most famous presbitant preacher in Scotland, who was born at St. Andrew's in 1546; the cardinal himself, as it has been alleged on the authority of Buchanan, being feated at a window as a spectator of the tragedy. This execution produced great discontent and murmurs amongst the adherents of the protestant religion; and as the forms of law had not been duly regarded, they meditated a revengs. The cardinal, himself, however, apprehended no danger; and so prevalent was his interest at this time, that the earl of Crawford was gratified by marrying his elised first cousin to the cardinal's natural daughter; for notwithstanding his profession and high rank in the church, Beaton, without dispute, kept a concubine, by whom he had several children. In less than three months after the death of Beaton, the event which this good man denounced, and as some have said, without sufficient reason, predicted, happened, to the cardinal. A conspiracy was formed against his life by some persons whom he had disdained; and they, accompanied by a small number of attendants, surprised the castle of St. Andrew's, in which the cardinal lodged, rushed into his chamber, and dispatched him with their swords. One of the conspirators, James McEvilly, expressly invited his revenge to the cardinal's perfecution of Wilhart. This event happened in the latter end of May 1546, and proved fatal to the ancient religion, and to the French interest in Scotland.

Beaton's character is sufficiently marked in the history of his life. Possessed of talents, which qualified him for the high rank to which his ambition aspired, and which he occupied both in the church and the state, he espoused and forwarded the interests of Rome, as the most effectual method of securing his advancement. Dr. Robertson, indeed, ascribes his support of the Romish superintendence, and his enmity to the reformers, merely to political motives; but there is reason to imagine, more especially when we consider the period in which he lived, that a real bigotry in favour of popery might blend itself with the principles and views of ambition and policy. It is certain, however, that his ambition was unbounded, that he was haughty and violent in his temper, that his inconstancy was carried to the highest pitch, and that his character, upon the whole, was extremely detestable. His violence, as a perfector, must ever cause his memory to be held in abhorrence, by those who have any feelings of humanity, or any regard for religious liberty. He appears to have had but little learning, being prevented from acquiring it by hisearly and continued application to public business; and his morals were unbecoming his station. Biog. Brit. Robertson's Hill of Scotland, vol. i. p. 95; &c.

BEATUS, in Ancient Geography, a name given to one of the Oases (See OASIS) of Africa, called an island, because it was surrounded with sand, like an island in the sea, and denominated "incola Beatum," because, according to Strabo, it abounded with water, wine, and other necessaries of life, though encompassed by salt sand deserts. Some have supposed that this Oasus was a district of the "Oasis monstini," about seven days journey west of Thebes. Others suppose that it was situated in the "Regio Ammoniaca," and that it was the site of the temple of Ammon, which was amply supplied with fountains and vegetation, and afforded a very pleasant habitation. Ulpius says, that it was a place of banishment for real or pretend criminals, whence, as it was surrounded by sand, there was no probability of escape.

BEATS, in Horology, are the audible breaks which attend the fall wheel in a clock or watch movement made against its pallet, to maintain the vibration of a pendulum, or oscillation of a balance. The interval between two consecutive beats, in a clock or watch with an ordinary escape, is equal to one vibration or oscillation, but is not exactly contemporary with it, because the latter is counted as commencing at one of the extremities of its arc, whereas, as the former begin at such other degree of its, as the nature
nature of the escapement determines, a vibration here implies either one direct or one retrograde passage through the whole arc of a pendulum, and an oscillation one direct or one retrograde motion of a balance through its whole arc. Hence, in a common clock or watch, the words beat, vibration, and oscillation, are synonymous terms, when applied as the measure of the smallest subdivision of time; there being a stroke of the last wheel at some part of every vibration or oscillation; but in those astronomical and marine time-pieces which have detached escapements, there is but one beat in two vibrations or oscillations, the alternate stroke of the piece which unlocks the detent being usually silent; in these machines, therefore, the beats are fewer by one half than in ordinary ones, notwithstanding the movements, or mechanism of wheels and pins, may be the same in both, and the vibrations or oscillations similar. In any horological machine, the number of vibrations or oscillations which it makes in an hour, is the value of its train, which may be thus determined, viz.: divide double the product of all the wheels, by the exact product of all the pinions, and the quotient will be the train universally; the great wheel and its pinion, however, being used only to regulate the period of going after winding up, and to communicate motion, are left out of the calculation. The reason why the product of all the wheels is required to be doubled, is, that one tooth of the last wheel does not completely clese its pallet in less than two successive vibrations or oscillations in any escapement. The beats of a pocket watch are a very convenient measure of small portions of time, and might be applied to many useful purposes with advantage, particularly if they were each an exact fraction, such as $\frac{1}{2}$ or $\frac{4}{3}$ of the second, which they might as easily be as otherwise. (Vid. Nicholl's Journal, vol. iii. p. 45—and 189, and vol. v. p. 46, 480. Series.) In the best time-pieces or chronometers for determining the longitude, this circumstance is attended to, and the trains are usually either 14,400 or 18,000, namely, either four or five oscillations; i.e. either two, or two and a half beats per second, by reason of their escapements being detached. If the same attention were paid to the trains of common pocket watches, the frequency of their beats would fit them for nice observations in some of the departments of philosophy, and give them, in this respect, a preference even over more accurate instruments with less frequent beats; but at present, the only attention that is paid by the makers to the value of the train of a common watch is, that, for a small balance, it may be a quick one, and for a large balance a slow one; or, in other words, that the momentum of the balance shall not be too much controlled by the maintaining power, which necessary provision might be equally attended to, if the beat were made an exact fractional portion of a second. In any watch the whole train or vibrations in an hour divided by 3600, the seconds in an hour, will give the vibrations per second of that watch. See CLOCK-MOVEMENT, DEAD-BEAT, ESCAPEMENT, &c.

Beats, in Music, are certain pulsations of two continued sounds, as in an organ, which are out of tune, occasioned by warring vibrations that prevent coincidence in any two concords. This phenomenon, which was first discovered by M. Sauveur, has not only been defcribed by Dr. Smith in his "Harmonics" but made the foundation of a system of temperament. "In tuning musical instruments, (says he, Sect. IV. Prop. X.) especially organs, it is a known thing, that while a consonance is imperfect, it is not smooth and uniform as when perfect, but interrupted with very sensible undulations or beats; which, while the two sounds continue at the same pitch, succeed one another in equal times, and in longer and longer times, while either of the sounds approaches gradually to a perfect consonance with the other; still at last the undulations vanish, and have a smooth, uniform, consonance." These beats, the same author observes, are of use in tuning an organ to any desired degree of exactness.

The work of Dr. Smith, though excellent, is far too profound for the perfect most in want of it: the organ and harmonichord tuners are seldom mathematicians; and to comprehend the doctrines laid down in this book, would require as much science as Newton's "Principia".

The beats of two diftant organ pipes, resemble the beating of the pule to the touch; and, like the human pulse in a fever, the more diftant are the sounds, the quicker they beat, and the slower as they become better in tune; till at length they are lost in the coincident vibrations of the two sounds. See VIBRATION, TEMPERAMENTS, and TUNING.

BEATTIE, James, L. L. D., in Biography, a celebrated moral philofopher and poet, was born Nov. 5, 1735, in the county of Kincardine, in North-Britain. His father was in a station of life no higher than that of a little farmer, a chief of men subject to much hardship and indigence in Scotland. He was, however, poftiffed with that laudable spirit which he frequently in that country raifes native genius from obscurity; and he beflowed upon his fon a literary education, first in the parochial school of his neighbourhood, and then in the college of New Aberdeen. The youth was attached to his professor through the studies of the latter, by the liberality of a brother, (his father having died when he was 7 years of age,) and by one of those small exhibitions which have been annexed to it for the encouragement of learning; and it is supposled that he supported himself in the intervals of the fetions by teaching at a country school. For some considerable portion of his early life, it is known that he acted as a schoolmaster, in Kincardinehshire. At length he removed to Aberdeen, and engaged as assistant to the master of the principal grammar-school, whole daughter he married.

The talent which first made him known to the world was that of poetry, which he had cultivated from his youth. In 1761, he published a volume of "Original Poems and Translations," which in 1765 was followed by "The Judgment of Paris." These performances were characterized by richness and elegance of language and melody of verfification; but rather denoted a refined taste in poetry, than a powerful and inventive genius. They probably brought the author into notice at the place of his residence, but seem to have excited little attention among readers in general.

One of the fruits of his rising reputation was to obtain for him the patronage of the earl of Erroll, whose dwelling in the neighbourhood of Aberdeen. Of other benefits, the influence of this nobleman acquired for Mr. Beattie the honourable situation of professor of moral philosophy and logic in the marfhal college of Aberdeen. In this capacity he next appeared before the public as the author of a philosophical work, entitled "An Essay on the Nature and Immutability of Truth, in Oppofition to Sophiftiy and Scepticism," 8vo. 1760. The progress made about this time by Mr. Hume's principles, especially among his countrymen, could not fail of exciting alarm among the friends of revealed religion. How long Beattie had ranked among these, does not clearly appear. An admired poem of his, "The Hermit," in its first form strongly expresses that doubt of a future existence which could not be banifhed from heathen philofophy; and in a poem hereafter to be mentioned, he warmly congratulates himself on having escaped "from Pyrrho's maze and Epicurus' fly." There is a vein of acromony and exasperation in all his allusions to the sceptical philofophy, which renders not improbable the report of a personal offence received by him from Hume; though there is
no reason to doubt that when he wrote his book, he was very finely impressed with the danger of the tenets he opposed, and that he ever after remained zealously attached to the cause of revolution. The author in this work is regarded as a philosophical disciple of Dr. Reid, admitting an instinctive principle of the perception of truth, and founding it upon that faculty of common sense, which acts in a familiar manner upon all, or a great majority, of mankind. As he wrote with more eloquence and a more popular manner than Dr. Reid, his performance was much read, and gained him a number of very respectable friends and admirers. It is allowed, that he has successfully detected many of the sophisms of Hume, and has brought together many ingenious and useful thoughts on this subject; but the foundation of his philosophy has been, especially by Dr. Priestley, been treated as shallow and superficial; and he has been accused for the arrogance which he has displayed towards those of opposite opinions, and for the readiness with which he has imputed to them consequences subversive of morality. Indeed, many parts of his book favour more of the ranticerian than the philosopher. These defects, however, did not render his's acceptable an attempt to a Layman to serve the cause of religion; and among the friends, Bateste acquired on the occasion, were lords Mansfield and Lyttelton, bishops Hard and Porteus, Dr. Johnson, and Mrs. Montague. The influence of Lord Mansfield obtained for him a period of 200l. from his majesty's privy-seal.

In the year 1771, his fame as a poet was extended throughout the kingdom by the publication of the first part of "The Minstrel." The subject of this piece, is the signed birth and education of a poet. The term minstrel is not very happily applied to the character described; nor are the scenes "Gothic days" in which he is placed to be recognized in real history; but there is great beauty in the delineation of the active poetical disposition assigned to him, and in the invention of circumstances by which it is nourished. The flamma that is of Sprat, which is managed with singular dexterity, and made to produce a melody of verification scarcely exceeded in the range of English poetry. The second part of this poem, which appeared in 1774, contains the natural education of the young bard, and enlightens his mind with the lessons of history, philosophy, and science. There are many fine stanzas in this part, which, however, deviates from the original conception; and the work is left a fragment, probably because it was found to involve unavoidable incongruities. To "Minstrel," whatever he derives, is probably the performance on which Beattie's future fame will chiefly depend; and it may be said, it is a proper instance of a place and its most approved poetry in the language.

Mr. Beattie visited London in 1771, and was received with great civility by his acquaintances. The degree of L.L.D. was conferred on him by the college at Aberdeen in 1773, and he returned to London in 1773. In company with two friends and the poet, he moved in London. A new edition of part of "The Egdon Truth," was published in 1779, by a private subscription. In 1780, he moved to Edinburgh, and to Edinburgh people, and to this volume was added, "The Egdon Truth," to which was added a "Lamentation Moral and Cruel." In 1781, published a quarto volume containing "Debates, Moral and Cruel." There are detached essays on various subjects, which formed a part of a course of lectures read by the author in his professional capacity. Many useful and curious topics are discussed in them, without any pretensions to extraordinary facility and acuteness, but in a mode calculated to improve the heart as well as the understanding. The work is not free from somewhat of the warm and dogmatical manner which characterizes the Essay on Truth; and though not unworthy of the writer's fame, it appears to have made little addition to it. The applique given by the bishop of London to a sketch of manuscript lectures to young persons on the evidence of Christianity, induced Dr. Beattie to draw up and publish, in 1785, a work entitled "Evidences of the Christian Religion, Briefly and Plainly Stated," 2 vols. 8vo. This was deemed a plain, elegant, and popular view of the subject well calculated for its intended purpose. In 1790 he published a summary of his lectures under the title of "Elements of Moral Science." The first volume contains a very accurate examination and arrangement of the perceptive faculties and active powers of man. He has also given a cursory view of what is called Natural Theology. The second volume, published in 1793, comprehends much miscellaneous information in ethics, economics, politics, and logic, including rhetoric, towards the latter part of his life. It was the last publication of the author, whose time was much occupied with the duties of his station, and with social and domestic concerns; of which one, if the desired to his heart was the education of his eldest son, James Hay Beattie, a youth of very extraordinary endowments and uncommon moral excellence. He was so successfully taught by his father, as to be made his assistant in the professorial chair at the age of nineteen; and he became the most intimate friend and beloved companion of his revered parent, when he fell into a decline, which carried him off in 1790, at the age of 22. Dr. Beattie had just time enough, to be the editor of a small volume of the youth's compositions, in verse and prose, to which he prefixed a memoir on his life and character, highly interesting and unaffectedly pathetic. This generous life was followed in 1796 by that of his younger son, Montague Beattie, in his eighteenth year. Their father was unable, with all his resources, to bear up under the accumulated sorrow. The latter years of his life were a blank of existence, which terminated at Aberdeen, on August 15, 1803, in the 66th year of his age. Dr. Beattie was amiable and exemplary in every department of private life, and published the duties of his public station in both a manner, as to confer honour and credit upon the university of which he was a professor. He was a fellow of the Royal Society of Edinburgh.
greatly to revive ancient literature, and Scrioppius bears 
very honourable testimony to his talents as a critic. To-
wards the close of his life he was afflicted with a diabetes,
and obtaining no relief from the baths of Baden in Switzer-
land, he died at Strasbourg in 1547. He was no less dis-
tinguished by his integrity and modesty, and his mild and 
conciliating temper, than by his great learning. He pro-
tected great regard for Luther, and detested the tyranny 
which the clergy exercised at that period; but he never 
openly declared in favour either of Luther or of any other 
reformer. Although he was no less displeased than Eraf-
mus with the errors that had blended themselves with re-
ligion, he was an enemy to schism, and wished, by prudent 
reformation, to preserve the unity of the Christian church. 
Of his works, written in Latin, which were numerous, we 
shall only mention his "Observations on Pliny's Natural Hi-
story," his "Notes on Livy," his "Preface and Anno-
tations to Tacitus," his "Epitile prefixed to Erasmus's ed-
tion of the Works of Origens," his "Preface to the Works 
of Erasmus, and his "Origines Gothicë," to which we may 
add his best work, entitled "De rebus Germaniae libri tres," 
printed at Ulm in 1603, with the annotations of James 

BEAU, Charles Le, was born at Paris in 1701, and 
became professor of rhetoric in the college des Graffins, 
then professor in the college-royal, secretary to the duke of 
Orleans, and perpetual secretary and penionary of the 
academy of inscriptions. Like Rollin, he united the charms 
of eloquence with profound erudition, and was no less, than 
this eminent professor, beloved by his pupils. His most 
considerable work was his "History of the Lower Empire," 
in French, 22 vols. 12mo., which is written in a correct and 
elegant style. He also wrote several learned dissertations 
in the "Memoirs of the Academy of Belles Lettres," and 
"Histoire et Archéologie," on the academicians. His 
private character was amiable, and he was much esteemed 
for his worth and geniality. He died at Paris in 1778. 
His younger brother, John Lewis Le Beau, was professor 
of rhetoric in the college des Graffins, and member of 
the academy. He published a discourse on the condition of 
fortune most suitable to a man of letters; and an edition of 
"Homer, Greek and Latin," 2 vols. 1746, and of 
"Cicero's Orations," 3 vols. 1750; both with notes. 
Nouv. Dict. Hill.

BEAUV, in Geography, a spacious and commodious 
harbour on the S. E. part of the Falkland islands, capable 
of accommodating a large fleet of ships in perfect safety. 
It is almost surrounded by the land, has good anchorage, and 
is sufficient depth of water.

BEAUBASSIN BAY. See Chignecto.

BEAUBASSIN Bay, is also a bay on the south coast of 
the fleet of Magdalen, at the S. E. angle of the fleet, where 
it extends to the W. It is nearly opposite to Wallis's har-
bour on the north coast, is a spacious bay, and has an open 
entrance.

BEAUCARIE, a town of France, and chief place of 
a canton in the district of Nimes and the department of 
the Gard, on the right bank of the Rhone, opposite to Tarragon, 
with which it has a communication by a bridge of boats. 
This town carries on a considerable commerce in wool, silk, 
flax, flax, spices, drugs, leather, cotton, &c.; and it has an an-
imal fair which lasts for six days. The part of the Rhone 
is well constructed. The principal building is the collegiate 
curch. The place contains 7943 and the canton 16,853 
habitation. The territory includes 162 kilometres and 4 com-
unies. N. lat. 43° 18'. E. long. 4° 30'.

BEAUCARI DE PECULION, Francis, in Biography, a 
poetical scholar of the sixteenth century, was descended from 
an ancient family of the Bourbonoys, and born in 1514.

In consequence of his literary reputation, he was appointed 
preceptor to cardinal Lorrain, the second son of the first 
duke of Guise, and attended him to Rome. On his return, 
he was promoted to the bishopric of Metz, and at-
tended his pension to the council of Trent, where he dislin-
"guished himself by his eloquence. He was of uiligious 
jury, in the council. He was a man of singular service in 
reforming the fathers of the church on the perplexity occa-
sioned by different opinions concerning marriage; for he de-
volved a decree, framed in terms so 
ambiguous as to be accommodated to the variety of op-
"nions that were held, and by the different faiths in which it might be interpreted to satisfy all parties. However, 

gave offence to the votaries of the papal power by main-
taining the independence of the episcopal order, and his op-
inion on this point was disfavored by the cardinal of Lorrain.

In 1568 he resigned his bishopric to Lewis, cardinal of 
Lorrain, and retired to his castle of La Chrette in the Bour-
bournois. Here he employed himself in composing a "His-
tory of his own Times," which was written in Latin, and 
complished the events from the year 1462 to 1567. This 
work was discontinued about three years before his death, 
which happened in 1591. It remained in MS. for several 
years, the author having declined the publication of it for 
fear of giving offence; but being found in his library by 
Philip Dute, he printed it at Lyons in 1625, in folio. It 
is deemed a well-written, and upon the whole, a faithful 
history; though too favourable to the house of Guise, and 
very hostile to the Huguenot party. Beaure, some time 
after he had taken possession of his fee, engaged in a con-
troversy with the Calvinists upon the future state of child-

BEAUCHE, or Beausse, in Geography, the name given 
before the revolution to a country of France, part of Orleanoys, 
now the department of Eure and Loir, which was so fertile 
in every part, as to be called the granary of France. Its 
capital was Chartres.

BEAUCHENES ISLAND, a small island to the S. of 
the Falkland islands, in S. lat. 53°, and W. long. about 
52° 35'.

BEAUCHASTEL, a town of France, in the de-
partment of the Ardeche, 34 leagues S.S.W. of Valence.

BEAUCHIEF ABBEY, was situated in a pleasant 
valley, on the north side of Derbyshire, in England, with-
in a short distance of the town of Sheffield. This celebrated 
religious house was founded by Robert Fitz-Ranulpht, lord 
of Alfreton, between the years 1172 and 1176, for regular 
canons of the premonstratensian order. Since the disolution 
of monasteries, 26th of Henry VIII. this abbey has con-
tinued to crumble by the decay of time, and only a part of 
the chapel remains to mark the character of this once 
proud pile. See Peg's History of Beauchief Abbey, 4to.

BEAUDUN, a town of France, in the department of the 
Var, and chief place of a canton, in the district of Bar-
jols; 12 miles N. E. from Barjols.

BEAVER, in Zoology, the English name of Castor 
Fiber, Linnæus, which fee. Pennant calls Sorex Mos-
chatus of Pallis, the Long nofed beaver.

BEAVER, Bever, and in Latin Fiber, Castor & Castorius, 
John, in Biography, a benedictine monk; in Wolfinster 
Abbey, flourished about the beginning of the 14th century. 
He is represented as a person of ingenuity and industry, and 
a great master of the history and antiquities of England, 
for the study of which he particularly devoted himself. 
He wrote, "Chronicle of the Britih and English Affairs," 
from the coming in of Brute to his own time, which remains in 
MS. in the Cottonian library; and also a book "De Rebus 
Canobi
from the bodies of the fowlers, who have worn it for some time; this, though better than the dry, is yet only used for hats.

Its chief use is in the composition of hats, furs, &c. Besides this, in 1669, an attempt was made to employ it in other merchandises; accordingly, a manufactury was settled in the Palais de S. Antoine near Paris, where they made cloths, mantles, stockings, &c. of caffer, with a mixture of wool. The manufacture flourished for a while, but soon decayed, it being found by experience that the fells left their dye when wet, and that when dry again they were harsh and flinty, &c.

After the hair is cut off the skin is used in hats, the pelt or skin itself is used in various covers, &c. for the covering of mails and trunks, in flippers, &c.

Beaver is chiefly imported by the Hudson's-bay company, from the northern parts of America, where the animal abounds. Beaver skins are also procured in considerable abundance on the western coast of North America. See FUR.

Beaver's Tower, in Geography, lies between Margaret's creek, an upper N. W. branch of Muskingum river, and the north branch of that river; at the head of which north branch there is only a mile's portage to Cayahoga river. Beaver's town is distant about 85 miles N. W. from Pittsburg.

BEAUFET. See BUFFET.

BEAUFORT, HENRY, in Biography, cardinal and bishop of Winchester, was the natural son, legitimised by parliament, of John of Gaunt, by Catherine Swineford, who afterwards became his third wife. Having been educated at Oxford and Aix la Chapelle, he was advanced, at an early period of his Life, to high stations both in the church and the state. In 1397 he became bishop of Lincoln, in 1399 chancellor of the university of Oxford, and dean of Wells, in 1404 lord high chancellor of England, and in 1405 bishop of Winchester. During the reigns of his brother, Henry IV., and of his nephew, Henry V., he does not seem to have possessed much political importance; but he lived in great splendour, and acquired immense wealth, so that he was able to lend Henry V. 20,000l. to aid his expedition into France, and thus to divert him from the design of attacking the revenues of the church. Upon the death of Henry V. he was appointed one of the guardians of his son Henry VI. during his minority; and in 1425 he was again made lord chancellor of England. In 1425, the difference that subsisted between him and the protector, Humphrey duke of Gloucester, not to fouch a height, that Beaumont thought it necessary to appeal to his nephew, the duke of Bedford, then regent of France, and to request his presence for bringing about an accommodation. Upon the arrival of the report an affability of the nobility was expressed at St. Albans; but then interposition proving fruitless, the decision of the court was referred to the parliament held at Lancaster in 1426. The duke of Gloucester produced six articles of accusation against the bishop, of which he was acquitted; and the disputants being enjoined to cultivate mutual friendship, departed with outward appearances of perfect unity. The regent, however, in order to gratify his brother, the protector, took away the great seal from the bishop. In 1428 the duchy of Bedford returned to France, and was accompanied by Beaumont to Calais, where he was invested with the dignity of cardinal, with the title of St. Eulalia, conferred upon him by pope Martin V. He was also honoured by the same pope with the character of legate; but on his return to England, he was forbidden the exercise of it by royal proclamation. As he was likewise appointed the pope's legate in Germany, and general of the crusade against the Hultars, or heretics of Bohemia, he obtained from parliament the grant of a sum of money, and a body of forces, for the more effectual execution.

VOL. IV.
cution of his office. Having embarked with his troops for France, he was obliged, for some time, with reluctance on his own part, to employ them under the duke of Bedford; and he then proceeded with them to Bohemia, where he remained for some months, till he was recalled by the pope. In 1430 he accompanied King Henry into France; under the title of the king's "principal councilor," and performed the ceremony of crowning the young monarch in the church of Notre Dame, at Paris. The honors, however, which he received during his absence, were, in his estimation, an inadequate compensation for the mortification resulting from the duke of Gloucester's successful attempts for humbling his pride, and restraining his power. He not only procured an order of council, prohibiting any of the king's subjects accompanying the cardinal, if he should leave the king without his permission; but he attempted to deprive him of his bishopric, as insufficient with the dignity of a cardinal. On his return, and for his more effectual security against these hostile attempts, he obtained, by the interference of the house of commons, letters of pardon for all offenses committed by him contrary to the statute of "provisors," and other acts of "premunition." This pardon was renewed five years after, viz. in 1437, for all crimes whatsoever. Notwithstanding these precautions, the duke of Gloucester, in 1442, drew up fourteen articles of impeachment against him, and presented them with his own hands to the king, who referred the matter to his council. The examination of these articles was attended with such delay, that the protector dropped the prosecution, and the cardinal escaped. The cause of the protector's invertere enmity against the cardinal is said to have been the part which he had taken in mitigating certain pernicious to accuse and perforce his duchies for treason, witchcraft, and other notorious crimes.

Cardinal Beaufort died in 1447, about a month after the duke of Gloucester, in whose murder, it is supposed, he was concerned. The remorse and horror occasioned by the reflection on this event, in the near approaches of his own death, were "more," says Hume, "than could naturally be expected from a man hardened, during the course of a long life, in falsehood and politics," and they are exhibited in very impressible characters in the representation of his last scene by Shakespeare, in the last scene of the third act of the "Second Part of King Henry VI."

"If thou l'eft death, I'll give thee England's treasure, enough to purchase such another island, so thou wilt let me live, and feel no pain."

Again, "Bring me unto my trial when you will. Dry'd he not in his bed? where shou'd he die? Can I make men live, whether they will or no? Oh! torture me no more; I will confess— Alive again? Then, shew me where he is; I'll give a thousand pounis to look upon him—He hath no eyes, the thumb hath blinded them: Comb down his hair; look! look! it flanks upright, like lime-twigs set to catch my wrinkled soul. Give me some drink, and bid th' apothecary bring the strong poison that I bought of him."

The cardinal was buried at Winchester. He died rich, and left large sums for pious and charitable purposes, in various parts of the kingdom; and he ordered 10,000 masses to be said for his soul. "Haughty and turbulent, and fond of pomp and power, he is allowed to have been a faithful and able servant of the crown." Mr. Hume describes him as a prodigy of great capacity and experience, but of an intriguing and dangerous character. Hume's Hist. vol. iii. p. 135-173. Biog. Brit.

Beaufort, Margaret, distinguished by her munificent encouragement of literature, was the daughter of John Beaufort, duke of Somerset and grandson of John of Gaunt; she was born at Oldfield, in Bedfordshire, in 1441. Her first husband was Edmund earl of Richmond, by whom she had one son, Henry VII. king of England. Her second husband was Sir Henry Stafford, second son of Henry duke of Buckingham. She had three sons, Thomas lord Stanley, afterwards earl of Derby, by neither of whom she had any issue. Waving all pretensions to the crown in favour of her son, she devoted her life to exercises of piety and charity, and derived her chief pleasure from relieving the indigent and distressed. She kept constantly in her house twelve poor people, whom the lodged, fed, and clothed. She extended her patronage to the students of both universities, and to men of learning throughout England. In 1502 the instituted two perpetual public lectures in divinity, one at Oxford, and the other at Cambridge, which still subsist under the name of Margaret professorships. At Cambridge she established a perpetual public preacher, whose duty it should be to preach, at least, six sermons every year, at certain churches in the dioceses of London, Ely, and Lincoln; and she also founded a perpetual chantry at Winchcombe minster, in Dorset, for teaching grammar. But her noblest institutions were the colleges of Christ and St. John in Cambridge, the former founded in 1505, for one master, twelve fellows, and fourty scholars. She was a founder of the Abbot's Hospital. She founded a new grammar school in her own city, which still subsists; and the multitude of her charitable bequests may be seen by any traveler, who will take the trouble to examine the registers of the free schools and hospitals in her patronage. She died in 1509, and was interred in the chapel of her son Henry VII. in Westminster Abbey. She is the reputed author of the translation of two devotional pieces from the French, and also of rules and orders for the prudence and attire of noble ladies at funerals. Biog. Brit.

Beaufort, in Geography, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the district of Bauge. The place contains 5900 and the canton 15,125 inhabitants; the territory comprehends 200 kilometres and 7 communes. The castle of Beaufort gives the title of duke to the noble family of Somerset, literally descended from John of Gaunt, duke of Lancaster, and the house of Lancaster obtained this castle from Blanche of Artois, queen of Navarre, wife to Edmund Crouchback, second son of king Henry III., and first earl of Lancaster. N. lat. 47° 26'. W. long. 0° 3'.

Beaufort, a town of France in the department of the Drome, 2 leagues N. E. of Crest.

Beaufort, a town of Italy in Savoy, on the river Oron, 30 miles E. N. E. of Chambery. By the late French arrangement, this is the chief place of a canton in the department of Mont Blanc, and district of Montiers. The place contains 3070 and the canton 7357 inhabitants: the territory includes 1821 kilometres and 4 communes. N. lat. 45° 46'. E. long. 6° 48'.

Beaufort, a district of the lower country of South Carolina, lying on the sea-coast, between Combahee and Savannah rivers. It is 69 miles long and 37 broad; and divided into four parishes, containing 18,753 inhabitants, of whom only
only 4,196 acres. The northern part of this district is a large forest of trees; but the land is fit for farming. It sends twelve representatives to the legislature of the state. The amount of taxes is $2,114,914.10, 11th, rating.

BEAULON is the chief town of the above-mentioned district. It is situated on the mouth of the Dore, at the head of Roque, at the mouth of the Orne. It is a pleasant though small town, and has a fine harbour, but it has not a large population. There is a considerable wharf. Its population is about 7,000 S. W. from Caen, and about 27 from Calais. N. lat. 51° 47'. W. long. 77° 20'.

BEAULON is a part of the North of France, and the capital of the district of Villedieu, in the district of Val-d'Aulne, in the department of the Eure-et-Loir, in the province of Normandy.

BEAULON, or Beauron, a town of France, and the capital of the district of Villedieu, in the department of the Eure-et-Loir. It is situated on the right bank of the Orne, and is about 22 miles from the mouth of that river, and 45 miles from S. W. from Orleans. The town contains 4,852 inhabitants on a territory of 1,700 square miles, including 71 communes. N. lat. 49° 46'.

BEAULON, a small fertile village in the New Forest, Hampshire, is a part of the manor of the abbot of Beaulieu, which was granted in 1324 to King John, by his uncle, for the support of the abbot's household. The town has a fine church, dedicated to St. Peter, which is said to have been founded by the abbot of Beaulieu, and is now a parish church.

BEAULON, a pleasant village in the New Forest, Hampshire, is a part of the manor of the abbot of Beaulieu, which was granted in 1324 to King John, by his uncle, for the support of the abbot's household. The town has a fine church, dedicated to St. Peter, which is said to have been founded by the abbot of Beaulieu, and is now a parish church.

BEAULON, a town of France, in the department of the Loire, and the capital of a canton, in the district of Sables d'Olonne, in the department of Vendée, and the capital of a canton in the district of Redon. The town contains 1,285 inhabitants. — Also, a town of France, in the department of the Loire, and the capital of a canton, in the district of Sables d'Olonne, in the department of Vendée, and the capital of a canton in the district of Redon. The town contains 1,285 inhabitants.

BEAULON, a town of France, in the department of the Loire, and the capital of a canton, in the district of Sables d'Olonne, in the department of Vendée, and the capital of a canton in the district of Redon. The town contains 1,285 inhabitants.
BEAUMARCHÉ, a town of France, in the department of the Gers, lies about 20 miles from Auch. Lat. 43° 55. W. long. 60° 1'.

BEAUMARIS, or Beaumaris, the principal and central town of the island of Anglesea, North Wales, is situated on the eastern bank of the river Menai; which forms a fine spacious bay opposite the town. The castle, intimately connected with the early history and foundation of this town, owes its origin to Edward I. who, having erected two magnificent fortresses at Caernarvon and Conway, deemed it necessary to raise another at this place, for the purpose of enforcing obedience and subjection among the conquered Britons of Anglesea. The foundation of this structure was laid in 1295, in a place called Donor Maris, which afterwards assumed the compound French terms beaufort, fair, and merisies, merlins.

The favourable situation of the castle enabled the engineers to make such a fosse or ditch round it, as might be constantly filled with water from the bay, and a canal was also cut between the river and castle, that small vessels might carry their freightages immediately to the walls of the latter. This fortress being complete, the royal founder appointed Sir William Pickmore, a gentleman, the first governor, who was also nominated captain of the town. The same person (one instance excepted) was always appointed to these two offices; and his annual stipend was forty pounds as capite, and twelve pounds three shillings and fourpence as captain. The castle and town were guarded by 24 folders, at four-pence a day each. Other persons had proportionable pay; yet from every man's salary a certain sum was deducted monthly towards the payment of infant preachers and teachers, and for letters and intelligence. The castle becoming very burdensome to the people, occasioned many contentions between the inhabitants of the town and those of the fortresses. Battles sometimes ensued. One of them called the black fray, happened on a market-day, in the time of Henry VI., and it produced great slaughter. The history of these fortresses presents a continued series of oppression and irritation; and it seemed a grand policy of the English governors to exclude the Welsh from those strong holds, and their dependant towns, which they had wrested from the subjugated Cambrians. By a rental of the borough property of Beaumaris, taken even as late as 1608, there appear only seven Welsh names, and one burgage in the tenure of a Welshman. The castle was given by Henry IV. to Percy, earl of Northumberland, for life; and Richard III. granted the confiscated and captiveship of the castle and town to Sir Richard Huddleton, knight. From the time of Sir Rowland Villerville, alias Brytong, the reputed base son of Henry VII., and capite of the castle, the garrison was withdrawn till 1642, when Thomas Chevile, then capite, replenished it with men and ammunition. It was then held for Charles I. whose throne was in danger. The gentlemen of this town and island being warm partisans for the monarchy, determined to oppose the parliamentary forces which had assembled at Conway, and had deputed five commissioners to manage their business. The islanders refusing to surrender on summation, were invaded by about 1500 men, horse and foot, whose superior discipline and courage soon routed and conquered the royalty. On the 22d of October 1648, the town and castle surrendered to General Myton; colonels Bulkeley and Whiteley were made prisoners; and the inhabitants agreed to pay to their conquerors 5000l. within fourteen days. The castle is now the property of the crown. It stands in the grounds of lord Bulkeley, attached to the east end of the town, and covers a considerable space of ground. Though partly in ruins, yet its outer walls, several towers, and many parts remain, to characterise its dimensions and architecture. It is surrounded by a fosse, with a entrance to the east between two embattled round and square towers. Within the fosse is the principal body of the castle, which is nearly of a square form, having a round tower at each angle, and another in the centre of each face. The area is an irregular octagon, about 57 yards from north to south, and 60 from east to west. In the middle of the north side is the hall, twenty yards long and twelve wide. What was formerly the porter's lodge is now used as the bridewell.

A gallery of communication extended round the buildings of the inner court; and in different recesses of this were square holes, which seemed to have opened into dungeons beneath. The two eastern towers served also as dungeons, the descent to which was dark and narrow. On the eastern side of the castle was a small chapel, some of which remains.

The town of Beaumaris is not very ancient; nor do we find any particular records of it previous to the erection of the castle, fo much as it assumed some consequence, and Edward I. surrounded it with a wall, made it a corporation, and endowed it with certain privileges. In the 27th of Henry VIII. Anglesea, with eleven other counties of Wales were impropriated and furnished to send members to parliament, but no return was made from this county till the 33d of Henry VIII. when Newborough, now a poor decayed village, sent one member. Since the 2d of Edward VI. Beaumaris has been regularly represented by one member, and the right of voting was vested, in 1729, in a mayor, two bailiffs, and twenty-one capital burgesses. Though this town has not an extensive trade, yet it has a custom house for the usual reception of goods, a large town-hall with assembly-room, a free school, almshouses, and a handsome church or chapel with a lofty square tower. The free school and almshouses were founded by David Hughes; the flir in 1603, and the latter in 1614. Here are a weekly market on Saturday, and a fair annual. It is situated 59 miles W. by N. from Chester, and 25 N.W. of London. Lat. 53° 14'. W. long. 4° 15'.

The Bay of Beaumaris forms a fine expanse of water before the town, and ships can ride safe at anchor in six or seven fathom water, even when the tide is out. From this to the opposite shore at Aber is a distance of about four miles, yet the channel at low water does not occupy above one mile. The remainder is a uniform bed of sand, called Traeth-Telaran, or the Lavan sands. These, the Welsh supposèd, were anciently quite free from water, and formed a habitable part of Carmarvonshire; which Mr. Pennant admits, and endeavours to prove, by showing that the sea has made great encroachments at Abergeley, and that several bodies and roots of oak trees have been found in a tract of hard loam at a considerable distance from the present shores.

About one mile from Beaumaris stand some shattered remains of Llangaff, which Camden called "a famous religious house in times past," and belonged "to the friars minor, unto whom the kings of England shewed themselves very bountiful patrons, as well in regard to the friars' hospitals, as also because (that I may speak out of the public records of the kingdom) were buried a daughter of king John, a son of a king of the Danes, the bodies also of the lord Clifford, and other knights and squires, who in the time of the noble and renowned kings of England were slain in the wars against the Welsh." This monastery, erected by Llewelyn ap Gorwerth, was consecrated in 1240, by Howel, bishop of Bangor; and in a few years afterwards burnt in the intestine of Madoc. At the dissolution, Henry VIII. took the convent and its possessions to one of his courtiers. The family of Whyte (now extinct) afterwards became possessed of it, and built a respectable house, which has since been enlarged, modernized, and the grounds much improved. It
is now one of the seats of Sir Robert Williams, Bart. Near
this place a severe battle was fought, in 819, between the
Welsh and the Saxons under their leader Egbert, who had
invaded the island, and given it then, for the first time, the
name of Anglesea. The Saxons at first proved victorious,
but were strongly opposed by Brian Frith, the Welsh
prince, who after some severe battles expelled the invaders
from this island.

Two miles north of Friars are the remains of the priory
of Penmon, consisting of little more than the ruinous refec-
tory and part of the church. This priory for Benedic-
tine monks was endowed, if not founded, by Prince Ievelyn ap
Jerewarth before 1221.

Near Penmon is a well surrounded with a wall and three
fountains, having two doors or entrances. This was a fons,
baptismal, or holy well. About a quarter of a mile distant
is an ancient cromlech, six feet high, the shaft of which is curi-
ously ornamented with sculptured chequered work. At the
distance of about one mile from the shore is Ynis Seiriol,
or Seiriol's island, now called Pielholm. This was once
appendant to the monastery of Penmon; and the remains of
a square tower still mark its religious appropriation. This
island is sometimes called Puffin island, from its being much
frequented by birds of that name. From the beginning of
April to the beginning of August, immense numbers of these
and other sea-birds resort to this spot. To the west of Piel-
holm are three smaller islands, called Ynis Llygod, or the
Monfe islands.

In the channel which washes these islands, the large oysters
called the Penn are taken by the dredge, and great quan-
tities are picked, packed in fagan cases, and sent to different
ports of the kingdom.

Baron Hill, the seat of Lord Bulkeley, is finely sited on
an eminence, overlooking the town, castle, &e. The
original mansion of this family in Wales was Court maor,
in Creek-street, Beaumaris. The present mansion was built
by Sir Richard Bulkeley, for Prince Henry, son of James I.
The house has since been enlarged and greatly improved by its
present proprietors, under the direction of Mr. W. Wyat.
The grounds of this domain are irregularly fine; a beautiful,
and the various prospects of sea, mountain, and fayern
fields, are highly grand and interesting.

About five miles south-west of Beaumaris is Plas Newydd,
an elegant modern mansion, built in a casetettled stye, be-
coming to the east of Ubridge. The house is large, com-
modious, and handsome, and the ancient woods around it
give it a venerable character. Close behind the house are
two Cronleths, the largest of which has been long de-
rated by the name of Cronlech of Mona. See Cron-
lech. The same interesting term called "Bemasr's Bay," with
notes: "A Tour round North Wales," by the Rev. W.
Bagley; and "Mr. Pennant's Tours in North Wales."

BEAUMASS. See Mass

BEAUMASSE. See Beaumaise

BEAUMASSE, LAURENT ANGLIELLE DE LA, in Bi-
ography, a modern French writer, was born in 1727, at
Versailles, in the diocese of Allais. Having been invited
to Denmark to undertake a professorship of French Belles
Letters, he opened his course by a "Discours," printed in
1751. But the climate being too severe for his constitution,
he quitted Denmark with a pension and the title of coun-
delor. In his return by way of Berlin, he wished to form an
acquaintance with Voltaire, of whose writings he was a pal-
fete admirer; but their irritable dispositions produced a
quarrel, which admitted of no reconciliation, and which pro-
duced personalities equally displeasurably to both. On his ar-
ival at Paris, in 1753, his publication, entitled "Mes Pen-
fers," caused him to be confined in the Bastille; and soon
after his liberation he was committed to the same prison on
account of his "Memoirs of Maintenon." After his second
liberation, he retired into the country; but in 1772, he was
called back to Paris to occupy the pill of king's librarian,
from which death removed him in consequence of a disorder
of his breast, in November 1773. The principal of his
works are: "A Defense of the Spirit of Laws;" "Mes Pen-
fers," a satirical work; and "Memoirs of Madame, Maintenon," 6
vols. 12mo, soon followed by 9 vols. of her "Letters;"
"Letters to M. de Voltaire," 1761, 12mo, upon the pernicious
of which Voltaire acknowledged, "the raffle has a great
deal of wit;" "Thoughts of Seneca," Latin and French;
He left some MSS. He is said to have been of an open
and frank temper, but hasty, captious, and addicted to

BEAUMETZ-LES-LOGES, a town of France, in the
department of the Eure, and chief place of a canton, in the
district of Bernay; 2 leagues S. E. of Bernay. The
town contains 448 and the canton 9350 inhabitants, on a territory
of 1950 square kilometres containing 24 communes

BEAUMES, a town of France, chief place of a can-
ton in the department of Vaucluse and district of Orange.
The town contains 1573 and the canton 5452 inhabitants;
the territory includes 1224 square kilometres and 9 communes.

BEAUMETZ-LES-LOGES, a town of France, in the
department of the Straits of Calais, and chief place of
a canton in this district of Artois; 2 leagues S. W. of
Arras. The place contains 318 and the canton 10,683 inhabitants;
the territory includes 1873 square kilometres and 29 communes.

BEAUMONT, ELIE DE, in Biography, was born at
Charenton, in Normandy, in 1752, and admitted an advocate
in 1753, in which profession he did not succeed for want of
voice. Upon his retirement from the bar, he became a writer,
and addressed a variety of eloquent pieces to the magistrates
ded to the public. His memoir in behalf of the unfortunate
Cobé family produced a permanent effect. This was succeeded
by many others, no less interesting and pathetic. Beaumont's
imagery was lively, but like other persons of the same
quality, he was liable to dejection. He was lord of Caen, in
Normandy, where he organized an interesting festival, called
"Fête des bon gens," or the good people's feast. He died
at Paris, in 1788.

The wife of the preceding, MADAME ELIE DE BEA-
umont, was born at Caen in 1732, and is known with reputa-
tion by her "Letters of the Marquis de Robles," 12mo,
a work which exhibits a faithful picture of the manners
and characters of the courtiers of the day, and of their fash-
ions and dependants. In society she was beloved and re-
pected by reason of the amiable qualities of her disposition,
the polite ease of her manners, the soundness of her understanding,
and the extent of her knowledge. She died at Paris in

BEAUMONT, FRANCIS, an eminent dramatic poet,
was the son of Francis Beaumont, one of the judges of the
common pleas, and born at Grace-Dieu, in Leicestershire, an ancient
seat of the family, in 1585 or 1586. He was educated at
Cambridge, and afterwards admitted a student in the Inner
Temple, where his devotion to the Muses diverted his at-
tention from the study of the law. Beaumont and Fletcher
were unfortunately connected, and wrote so much in concert,
that it is difficult at this distance of time to assign to each
his appropriate part in the numerous compositions, tragic and
comic, which have been published under their common
name. Tradition report, and probably with truth, that
Beaumont was peculiarly disfigured by judgment, which
was commonly employed in correcting and reestablishing
the superfluities of Fletcher's wit. It appears, however, from
an examination of Beaumont's dialect productions, and particularly his little 'Masque of the Inner Temple and Gray's Inn, and also a poem entitled the "Hermaphrodite," that he was by no means d. of poetic imagination and invention, and that his verisimilitude is elegant and harmonious. Beaumont was esteemed a judge of the plays, that Ben Jonson, who expressed his affectionate regard for him in a copy of verses, submitted all his writings to his censure, and is thought to have waived himself of his judgment in correcting, if not in copyrighting, all his plots. He died before he had attained the age of 50 years, in March, 1615; and left a daughter, who was in possession of several poems of her father's writings, but they were all lost at sea in his voyage from Ireland, where he had lived for some time in the duke of Ormond's family. Besides the plays in which he was jointly concerned with Mr. Fletcher (for an account of which see Fletcher), he wrote the dramatic piece above mentioned, entitled, "A Masque, &c." "A Poetical Epistle" to Ben Jonson, "Verdes to his Friend Milter John Fletcher upon his Faithful Shepherds," and other poems, printed together in 1653, 8vo. The elder brother of the publisher, Mr. John Beaumont, was distinguished by his poetical talents, and was the author of several pieces which had considerable merit. A volume of his miscellaneous poems was published by his son in 1629, Gen. Dict. Biog. Brit.

BEAUMONT, in Geography, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Pont l'Evêque, 6 leagues E. N. E. of Caen.

—Allo, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Is-sur-Tille, 16 miles N. E. of Dijon.—Allo, a town of France, in the department of the Channel, and chief place of a canton, in the district of Valognes, 8 miles west of Cherbourg. The place contains 558 and the canton 9,493 inhabitants, on a territory of 1634 kilometres, including 20 communes.

—Allo, a town of France, in the department of Puy-de-Dôme, and chief place of a canton, in the district of Clermont-Terradon, 2 miles south of Clermont.—Allo, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Pontoise, on the Oise, 33 miles north of Paris.—Allo, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Bergerac, 3 leagues west of Belvès. The place contains 1505 and the canton 7,124 inhabitants on a territory of 170 kilometres and 14 communes.—Allo, a town of France, in the department of the Haute-Marne, and chief place of a canton, in the district of Voves, 5 leagues N. E. of Le Mans. The place contains 2,402 and the canton 14,720 inhabitants: the territory includes 175 kilometres and 15 communes.

BEAUMONT en Argonne, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Sedan, 5 leagues S. E. of Sedan.

BEAUMONT-ET-CHANCEUX, a town of France, in the department of the Meuse, and chief place of a canton, in the district of Marcinelle, 4 leagues N. E. of Nevers.

BEAUMONT-le-Vieux, in the department of the Seine and Marne, and chief place of a canton, in the district of Nemours, 4 leagues S. W. of Nemours.

BEAUMONT de Lomagne, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of Castel-Sarrazin, 5 leagues N. W. of Grenade. The place contains 6700 and the canton 11,177 inhabitants: the territory includes 200 kilometres and 20 communes.

BEAUMONT-le-Roger, a town of France, in the department of the Eure, and chief place of a canton, in the district of Bernay, 8 leagues E. of Bernay. The place contains 1406 and the canton 13,685 inhabitants: the territory includes 2271 kilometres and 26 communes. N. lat. 49° 54'.

BEAUMONT SUR Y, a town of France, in the department of the Marne, and chief place of a canton, in the district of Reims, seated on the Vesle, 8 miles S. E. of Reims.

—Allo, a town of France, in the department of Jemeppe, and chief place of a canton, in the district of Charleville. The place contains 1376 and the canton 7438 inhabitants: on a territory of 1774 kilometres, including 10 communes.

BEAUNE, a town of France, in the department of the Mayenne and Loire, and chief place of a canton, in the district of Baugé, 3 leagues south-west of Angers, and 3 miles west of Baugé.

—Allo, a town of France, and principal place of a district, in the department of the Côtes d'Or, 7 leagues south of Dijon. The place contains 8313 and the canton 23,900 inhabitants: on a territory of 300 kilometres. The northern canton includes 13 and the southern 16 communes. N. lat. 47° 16'. E. long. 5° 57'.—Allo, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Pithiviers. The place contains 2657 and the canton 14,855 inhabitants: the territory includes 250 kilometres and 24 communes.

BEAUPLEADER, or BEAULIEU in Lozé, a shipwrecks on the statute of Marlbridge, 52 Hen. III. c. 11, whereby it is provided, that no fine shall be taken of any man in any court for fair-pleading, i.e. for not pleading aptly and to the purpose. But Beauplader is as well in respect of various pleadings, as of the fair-pleading, by way of amendment. 2 Inst. 122.

BEAUPRE', in Geography, an island in the Pacific Ocean, so called after the name of Beaupré, engineer-geographer to the expedition fitted out for search of La Perouse, lying west of the new Hebrides, in S. lat. 20° 14'. E. long. 161° 27'. It is very low, and about 1500 toises long.

BEAUPREAU, a town of France, in the department of the Mayenne and Loire, and chief place of a district, 3 leagues S. of St. Florent. The place contains 1640 and the canton 11,150 inhabitants: the territory includes 260 kilometres and 11 communes.

BEAUESNE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Dourlens, 2 leagues S. E. of Doullens.

BEAURAING, a town of France, in the department of the Sambre and Meuse, and chief place of a district in the district of Dinant: the place contains 452 and the canton 607 inhabitants: the territory includes 2574 kilometres and 33 communes.

BEAUREGARD, a town of France, in the department of the Dordogne, 4 leagues south of Perigueux.—Allo, a town of France, in the department of Puy-de-Dôme, 3 leagues south of Clermont-Ferrand.—Allo, a town of France, in the department of Lot, 5 leagues S. E. of Cahors.

BEAUREPAIRE, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Louhans, 24 leagues east of Louhans. The place contains 817 and the canton 8,409 inhabitants: on a territory of 1224 kilometres, including 7 communes.—Allo, a town of France, in the department of the Hère, and chief place of a canton, in the district of Viene, 3 leagues S. E. of Vienne. The place contains 1800 and the canton 9,550 inhabitants: on a territory of 195 kilometres including 14 communes.

BEAURIEUX, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Laon, 35 leagues N. W. of Reims.

BEAUSÔRE, ISAAC DE, in Biography, a learned French Calvinist minister, was born at Nort, in Switzerland,
BEA

in 1653, and descended from a family of Provence, originally named Boffa, and changed into Beaufobre on their return to Switzerland, from the wars of St. Bartholomew's. Having completed his education at the protestant college of Saumur, he declined the profession of the law, in which he was tempted to engage by flattering prospects, and determined to devote himself to the Christian ministry. Accordingly he was ordained at the age of 22 years, and formed a church in Paris for 3 or 4 years; but when his place of worship was shut up, his zeal prompted him to break the bishop's seal, which was affixed to the door; and on this account being condemned to an "ordre honorable," he left his country, and took refuge in Holland.

Under the patronage of the princes of Orange, he was appointed chaplain to her daughter, the princess of Anhalt Dussau; and in 1668, settled at Berlin, where he had leisure to prosecute his studies. In 1659, he published the first result of his theological acquisitions, under the title of "A defence of the Reform.," which was very favourably received by his party. In 1674, he obtained a very advantageous settlement among the French refugees at Berlin, which was the place of his residence for the remainder of his life. He held several offices of distinction among his brethren, and discharged the duties connected with them in a manner honourable to himself, and satisfactory to them. At the same time he was absorbed in his application to his studies, and thus acquired that extensive knowledge, for which he was so eminent. The first work which he undertook, and which occupied many years of his life, was "A History of the Reformation." This work, which he left in manuscript for the press, was published at Berlin in 2 vols. large 8vo. in 1734, 1755; under the title of "Histoire de la Réformation, ou Origine et Progrès du Lutherainisme dans l'Empire, &c." i.e. A History of the Reformation, or an Account of the Origin and Progress of Lutheranism in the Empire, and in the States, where the Confession of Augsburg was received, from the year 1517 to 1730. Although the origin and progress of Lutheranism be the principal objects of this work, in the delineation of which the author has revealed himself of the materials contained in the excellent history of Socinian, it contains also details and illustrations of several political and ecclesiastical transactions, that are not to be found in Socinian, or in any other written books. It also contains a very curious and ample narrative relative to the progress of the reformation in France and Switzerland, and the character, learning, and writings of those who fostered it and maintained or opposed the doctrine and ordinances of the reformers. Beaufobre was also employed with the celebrated Fleury by the court of Berlin in the French edition of the New Testament. This work, of 12 vols. 8vo. published in 1718, in 2 vols. 4to, with ample prefaces and notes, was well received. Beaufobre was one of the principal members of the academies, and was "Anonym" and confided interval to the "Belgique," a journal of literature, of which he was the director as long as he lived. In 1739, he published "A dissertation sur l'Anne de Beaufobre," i.e. A Dissertation on the Life of Beaufobre; and in 1740, "Un traité de la Religion," i.e. A Treatise on Religion, published in 3 vols. 8vo. and 1750, "Histoire de Munich," published in 2 vols. 8vo. and died in 1739, aged 64 years, in Leusa, 1739. To the death of this learned and zealous friend of the cause of truth, we shall add the following tribute: The celebrated historian Gibbon pays of it (Hist. Decl. &c. vol. viii. p. 260, note): "This is a treasure of ancient philosophy and theology. The learned historian spins with incomparable art the system of opinion, and transforms himself into the hero of his own mind, as the man he guides against calumny, does not allow sufficient scope for superstition and fanaticism." The candid and impartial Lardner (Works, vol. iii. p. 539), after acknowledging his obligations to Beaufobre, from whom however he occasionally differs, says of this work, that "it contains not only a biographical history of the Manichees, but likewise several entertaining and useful digressions concerning the opinions of the heathen philosophers, and the most early Christian sects," and he closes with expressing a wish, "that some learned man might have sufficient leisure and encouragement to give us a handlyme edition of it in English." "As for me," says Beaufobre himself (Hist. Man. &c. p. 732), "what heaven has preserved from the spirit of the church, who knew no greater good than freedom of thought, nor any more delightful employment than the search of truth, never greater pleasure than that of finding and speaking it, I have found ecclesiastical history with as little prejudice as possible."

In the composition of his sermons, Beaufobre employed much time and care, and they contained much original matter, moral and theological, and a fund of the most striking oratory. His talents for preaching, and his powers for conversation, continued unparalleled to his seventy-sixth year. He was eminently a polished scholar, and adorned a person, naturally agreeable and prepossessing, with all the acquired graces of good company. The qualities of his heart were not less distinguished than the faculties of his mind-radiating. He was kind, generous, cheerful, and disinterested, always ready to perform acts of friendship, and desiring every degree of malvolence and slander. He enjoyed life without interruption from the weakkens of advanced age to his eightieth year, and died on June 5th, 1738. Beaufobre was twice married, and left children by both wives, of whom Charls Lewis was pastor of a church in Berlin, and made him felt known by some learned works; and Leopold was colonel of a regiment in the Russian service. Four volumes of posthumous sermons were printed at Leusa, in 1755. Mem. for la Vie, &c. de Beaufobre, prefixed to the second volume of his Hist. du Manichéen.

BAUSET, Ed., in Geography. See BAUSET.

BEAUTY, in a general and popular sense, denotes that quality, or the whole and union of qualities in the objects of our perception, whether they be material, intellectual, or moral, which we contemplate with emotions of complacency and pleasure; and it is referred by many writers to a principle or faculty, called by some an "internal sense," and by others a "reason." (See these articles.) In a more strict and philosophic use, beauty may denote that sentiment of delight which is excited in the mind by objects of perception, that we are led to admire, or to take pleasure in.

The word Beauty, according to Dr. Hutcheson, (Essay concerning Beauty, &c. p. 7.) means the idea of a set of objects, and that kind of beauty, which consists of power in receiving this idea, which he denominates an internal sense. This sense is common to all other beauty as a general sense, and in every other species of beauty. But it is not made hard and abstracted, as it is in the object, which is the idea of itself considered, without relation to any mind which receives it; for beauty, he says, his other names of relatable ideas, properly denotes the perception of some
Beauty.

some mind; and, therefore, by absolute beauty he means only that beauty which we perceive in objects without comparison to any thing external, of which the object is supposed to be an imitation or picture; such as that beauty perceived from the works of nature, artificial forms, figures, and theorems. Whereas comparative or relative beauty is that which we perceive in objects, commonly considered as imitations or refinements of something else. The general source of our ideas of beauty, according to this writer, is uniformity and variety; and what we call beautiful in objects seems to be in a compound ratio of uniformity and variety, so that where the uniformity of bodies is equal, the beauty is as the variety, and vice versa. This position he illustrates by a number of examples deduced from different figures, from the works of nature, from the inward structure and outward form of animals, and the proportion of their parts to each other, from the harmony of found, from theorems or universal truths, and from the works of art. Relative beauty is founded, as he conceives, on a conformity; or a kind of unity between the original and the copy; and for obtaining this sort of beauty it is not necessary that there should be any beauty in the original; for an exact imitation may still be beautiful, though the original is altogether destitute of beauty. A sense of beauty from uniformity and variety is, in his opinion, universally prevalent among mankind; and for the truth of the fact, he appeals to experience. The same ingenious writer deduces all our ideas of virtue from an implanted sense, called "Moral sense;" (which he; and he describes moral good and evil by the effects accompanying the perception of them.

Dr. Price, in his inquiry into the origin of our ideas of beauty and deformity of actions, (see "Review of the principal Questions in Morals," ch. i. and ii.) distinguishes between our perception of right and wrong, and our perception of beauty and deformity, in considering the actions of moral agents. He observes that, in contemplating such actions, we have both a perception of the understanding and a feeling of the heart; and that the latter, or the effects in us accompanying our moral perceptions, depend on two causes; partly on the positive constitution of our nature, but principally on the essential congruity or incongruity between moral ideas and our intellectual faculties. "Pia facta sunt natura-virtus," Seneca. "Etiam a nillo landcert, natura eet laudabile." Tully. He apprehends, that the above-mentioned author was led to derive all our ideas of virtue from an implanted sense, in consequence of not duly considering the difference between the "homeliwm," and "pathemrm," the "deum," and "aynay," of actions; or of not carefully distinguishing between the different sense of the mind and the sensations attending it in our moral perceptions. With him the "ratio" of an action is the fame with its gratefulness to the observer; and wrong, the contrary. But what, says this writer, can be more evident, than that right and pleasure, courage and pain, are as different as a cause and its effect; what is understood and what is felt; absolute truth, and its agreeableness to the mind. Mr. Bulley indeed (see his "Tracts on the Foundation of Moral Goodness, p. 61," it is of opinion, that all beauty, whether natural or moral, is a species of absolute truth; as refuming from, or consisting in, the necessary relations and congruities of ideas. As to moral beauty, says Dr. Price, one would think, that the author just cited must mean, though his meaning is not very intelligible, that it denotes a real quality of certain actions. But the word beauty seems always to refer to the reception of pleasure; and therefore the beauty of an action, or character, must signify its being such as pleases us, or having an aptness to please when perceived. Nor can it be just to conceive more in the action itself, or to affirm more of it, than this aptness, or that objective goodness or rectitude on which it depends. Beauty and loveliness are synonymous; but an object self-lovely can only mean an object, by its nature, fitted to engage love. It may be added, that the epithets beautiful and amiable are, in common language, confined to actions and characters that please us highly, from the peculiar degree of moral worth and beauty apprehended in them. All various actions must be pleasing to an intelligent observer; but they do not all please to the degree necessary to entitle them to these epithets, as they are generally applied. These observations are applicable, as Dr. Price thinks, with a little variation, to natural beauty; the general sense of which, according to Dr. Hutchcsoir, is uniformity and variety. If we ask, why this pleases? The proper answer is, that by its nature it is adapted to please. There seems, as Dr. P. observes, no more occasion in this case to have recourse to an implanted sense than in the former. Regular objects contribute towards producing the complacency of our minds, and the preference we give them, because they are more evenly viewed and comprehended by the mind; because order and symmetry give objects their liability and strength, and sufficiency to any valuable purpose; and because regularity and uniformity evidence art and design. Bruces are incapable of the pleasures of beauty, because they proceed from a comparison of objects, and a disconcertment of analogy, design, and proportion, to which their faculties do not reach.

To Dr. Hutchinson's theory of beauty, which ascribes it to uniformity and variety, it has been objected, that, though it accounts in a satisfactory manner for the beauty of many figures, yet when we endeavour to apply this principle to beautiful objects of some other kind, as to colour or motion, it will be found inoperative. And even in external figured objects, it is not just, that their beauty is in proportion to their mixture of variety, with uniformity, as many are highly beautiful and please us much, which have no variety at all, and others which possess variety to a degree of intricacy. With respect to the opinion, that natural beauty is a real quality of objects, it may be observed, that it seems impossible for any one to conceive the objects themselves to please more than a particular order of parts, and certain powers, or an affinity to our perceptive faculties, hence arising: and if we call this beauty, then it is an absolute inherent quality of certain objects, and equally existing, whether our mind discerns it or not. However, order and regularity are, more properly, the causes of beauty than beauty itself.

Beauty, says another ingenious writer, (see Reid's Essay on the Intellectual Powers of man, ch. iv.) is found in things fo various and so very different in nature, that it is difficult to say, wherein it consists, or what can be common to all the objects in which it is found. Of the objects of sense we find beauty in colour, in found, in form, in motion. There are beauties of speech, and beauties of thought; beauties in the arts, and in the sciences; beauties in actions, in affections, and in characters. In things so different, and so unlike, is there any quality, the fame in all, which we may call by the name of beauty? Why then should things so different be called by the same name? They please, and are denominated beautiful, not in virtue of any one quality common to them all, but by means of several different principles in human nature. The agreeable emotion, excited by them, and called beauty, is produced by different causes. However, though there be nothing common in the things themselves, yet the kind of beauty, which seems to be as various as the objects to which it is ascriued, must have some common relation to us, or to something else, which leads us to give them the same name. All the objects we call beautiful, agree in two things, which seem to concur in our sense.
BEAUTY.

First, when they are perceived, or even imagined, they produce a certain agreeable emotion or feeling in the mind; and secondly, this agreeable emotion is accompanied with an opinion or belief of their having some perfection or excellence belonging to them. Whether the pleasure we feel in contemplating beautiful objects may have any necessary connection with the belief of their excellence, or whether that pleasure be connected with that belief, is surely by the good pleasure of our Maker, Dr. Reid does not determine. Beautiful objects excite an emotion of a flattering and elevating kind, that sweetens the temper, allays angry passions, and promotes every benevolent affection, and disposes to other agreeable emotions, such as those of love, hope, and joy. "There is nothing," says Mr. Addison, "that makes us go more directly to the soul than beauty, which immediately diffuses a secret satisfaction and compliance through the imagination, and gives a feeling to any thing that is great and uncommon. The very first discovery of it striketh the mind with an inward joy, and spreads a cheerful and delightful through all its faculties." This agreeable emotion, produced by beautiful objects, is accompanied with an opinion or judgment of some perfection or excellence of those objects, adopted by its nature for producing that emotion; and this, according to Dr. Reid, is a second ingredient in our sense of beauty. To affect, says this writer, that there is in reality no beauty in those objects, in which all men perceive beauty, is to attribute to man fallacious senses; and thus to think disrespectfully of the Author of our being; who has diffused over all the works of nature a profusion of beauties, which are real, and not fanciful, and thousands of which our faculties are too dull to perceive. This author distinguishes our determinations with regard to the beauty of objects into two kinds, viz. infinutive and rational. In the former case, objects strike us at once, and appear beautiful at first sight, without any reflection, and without our being able to say why we call them beautiful, or being able to specify any perfection which justifies our judgment. Whereas our rational judgment of beauty is grounded on some agreeable quality of the object, which we distinctly conceived, and may be specified. Beauty itself may be distinguished into original, and derived. It is natural and agreeable to the brain of human sentiments and of human language, says Dr. Reid, that in many cases the beauty which originally and properly exists in the things signified, should be transferred to the sign; that which is in the cause to the effect; that which is in the end to the means; that which is in the agent to the instrument.

E. G. The beauty of good lodging is in the original in the art, all its excelence in which it consists; it is derived from the quality of the art, which it signifies; and though there may be good lodging without it, the excellent qualities of mind in beauty, it is still derived from what it naturally expresses. Beautiful lodging is a sign of beauty; the agreeable qualities are the original; and it is the beauty of the original that is reflected on the sign or the instrument.

In the use of the term beauty, some have extended it so as to include every thing that pleases a good taste; and others have restricted it to the objects of light, when they are either seen, or remembered, or imagined. But the latter idea is much too limited, as there are beauties of various kinds, that are not objects of light, such as those of music, or words, character, affectation, and a scene; and personal may impress on the mind the ideas of beauty, who are deprived of the faculty of light. It may be observed, that as the proper object of admiration is grandeur, beauty is the proper object of love and esteem: and the occasion of beauty with real perception was a capital lesson of the Socrates School. It is often ascribed to Socrates in the dialogues of Plato and of Xenophon. We may, therefore, fully ascribe beauty to those qualities that are the natural objects of love and kind affection: of this kind are those moral virtues, which are such a manner constitute a lovely character; such as innocence, gentleness, constancy, humanity, natural affection, public spirit, and the whole train of the soft and gentle virtues: qualities which are amiable from their very nature, and on account of their intrinsic worth. There are also many intellectual talents, which excite our love and esteem of those who possesses them, such as knowledge, good sense, wit, humour, cheerfulness, good taste, excellence in any of the fine arts, eloquence in dramatic action, and also excellence in every art of peace or war that is useful to society. There is like with talents or accomplishments, which we refer to the body, that have an original beauty and comprehensives, such as health, strength, and agility, the usual attendants of youth, skill in bodily exercise, and skill in the mechanical arts. Dr. Reid is of opinion, that beauty originally dwells in the moral and intellectual perfections of mind, and in its active powers, and that from this, as from this, all the beauty which we perceive in the visible world is derived. This was the opinion of the ancient philosophers above named; and it has been adopted by lord Shaftsbury and Dr. Akenhead among the moderns.

"Mind, mind alone! be witness, earth and heaven,
The living fountains in itself contains
Of beauties and sublimes. Here, hand in hand,
Sit paramount the graces. Here, enthron'd,
Celestial Venus, with divinest airs,
Invites the soul to never-failing joy."

AENSIDE.

But neither mind, nor any one of its qualities or powers, is an immediate object of perception to man. These are perceived through the medium of material objects, on which their signatures are impressed. The signs of these qualities are immediately perceived by the senses, and by them reflected to the understanding: and we are apt to attribute to the sign the beauty which is properly and originally in the thing signified. Thus, the Invisible Creator hath ramped on his works signatures of his divine wisdom, power, and benignity, which are visible to all men. The works of men in science, in the arts of table, and in the mechanical arts, bear the signatures of those qualities of mind, which were employed in their production. Their external behaviour or conduct in life expresses the good or bad qualities of their minds. In every species of animals we perceive by visible signs their infinites, appetites, affections, or capacity; and even in the inanimate objects there are many things analogous to the qualities of mind; so that there is hardly any thing belonging to mind, which may not be represented by images taken from the objects of sense; and, on the other hand, every object of sense is beautiful, by borrowing attention from attributes of the mind. Thus, the beauties of mind, though invisible in themselves, are perceived in the objects of sense, on which thus beauty is impressed. Thus also, in those qualities of sensible objects to which we ascribe beauty, we derive in them some relation to mind, and the greatest in those that are most beautiful. The qualities of inanimate matter, in which we perceive beauty, are found, colour, form, and motion: the first being an object of sight; and the other three of light. These several qualities are particularly illustrated by Dr. Reid, with a view of evincing the beauty that respectively belongs to them. Every beauty in the vegetable creation, of which we form any rational judgment, expresses some perfection in the object, or some of the contrivance in the author. In the animal kingdom we perceive superior beauties, resulting from life, sense, activity, various instincts and affections, and in many cases, great facility; which are attributes of mind, and polish an original beauty. In their manner of life we observe, that they push their powers, outward form, and inward structure, exactly adapted to it;
and the more perfectly any individual is fitted for its end and manner of life, the greater is its beauty. But of all the objects of sense, the most striking and attractive beauty is perceived in the human species, and particularly in the fair sex.

In the following well-known passage of Milton, this great poet derives the beauty of the first pair in paradise from those expressions of moral and intellectual qualities, which appeared in their outward form and demeanour.

"Two of far nobler shape, erect and tall, Godlike erect! with native honour clad, In naked majesty, seem'd lords of all, And worthy seem'd, for in their looks divine, The image of their glorious Maker, home Truth, wisdom, patience severe, and pure: Severe, but in true filial freedom plac'd, Whence true authority in man; though both Not equal, as their sex not equal seem'd; For contemplation he, and valour form'd, For softness the, and sweet attractive grace."

The author of "Crito," or "A Dialogue on Beauty," and his reference to the human species, and particularly to the female sex, ascribed to the author of "Polymetis," and republished by Dodgley, in his collection of "Fugitive Pieces," reduces this species of beauty to the four heads of colour, form, expression, and grace: the two former of which may be called the body, and the latter, the soul of beauty. As for the beauty of colour, if we allow for associations and predispositions arising from difference of climate and peculiarity of constitution, that have great influence on the internal sense, as well as on those senses that are external, and consequent on the judgment, it seems to depend, according to the common estimate of mankind, on that quality, as it expresses perfect health and liveliness, and in the fair sex, softness and delicacy; nor can anything be called deformity but what indicates disease and decline. The beauty of colour, therefore, is derived from the perfection which it expresses. "Venus et pulchritudo corporis fecerni non potest valutinum," Cicero. The most beautiful form or proportion of parts, according to this author, is that which indicates delicacy and softness in the fair sex; and in the male, either strength or agility; so that the beauty of form lies altogether in expression. With regard to expression, he observes, that this has greater power than either colour or form; and that it is only the expression of the tender and kind passions that gives beauty; that all the cruel and unkind ones add to deformity; and that, on their account, good nature may very properly be said to be the best feature, even in the finest face. Modesty, sensibility, and sweetness, blended together, so as either to enliven or correct each other, give almost as much attraction as the passions are capable of adding to a very pretty face. It is owing to this force of pleasingness, which attends all the kinder passions, says this author, that lovers not only feel, but really are, more beautiful to each other than to the rest of the world; and in their mutual presence and intercourse there is, as a French writer has well expressed it, a fond upon their countenances, which does not appear when they are absent from one another, or even in company that lays a restraint upon their features. The last and noblest part of beauty is grace, which this author thinks to be incapable of an accurate definition (see Grace). All the ingredients of beauty, enumerated and described by this ingenious author, terminate in expression: they express either some perfection of the body, as a part of the man, and an infringement of the mind, or some amiable quality or attribute of the mind itself.

Dr. Blair (Lectures, vol. i. p. 161 &c.), in his enumeration of the separate principles of beauty, in each of those classes of objects, which most remarkably exhibit it, begins with colour, as affording the simplest instance of beauty. With respect to this he observes, that neither variety, nor uniformity, nor any other principle which he knows, can be assigned as the foundation of beauty; and that it can be referred to no other cause but the structure of the eye, which determines us to receive certain modifications of the rays of light with more pleasure than others. As this organ varies in different persons, they have their different respective favourite colours. In some faces, he thinks it probable, that affection of ideas has influence on the pleasure which we receive from colour. Green, for instance, may appear more beautiful, by being connected in our ideas with rural prospects and scenes; white, with innocence; blue, with the serenity of the sky. Independently of such affections, those colours, chosen for beauty, are, generally, delicate, rather than glaring. Figure opens to us forms of beauty more complex and diversified. Under this head, regularity is first noticed as a source of beauty. Thus a circle, a square, a triangle, or a hexagon, pleases the eye, by their regularity, as beautiful figures. But regularity is not the sole, or the chief foundation of beauty, in figures. On the contrary, a certain variety of regularities is found to be a much more powerful principle of beauty. Regularity, according to this author, expresses beauty chiefly, if not solely, on account of its suggesting the idea of fitness, propriety, and use, which have always a greater connection with orderly and proportioned forms, than with those which appear not constructed according to any certain rule. Nature, the most graceful artist, hath, in all her ornamental works, pursued variety with an apparent neglect of regularity. Mr. Hogarth, in his "Analysis of Beauty," published about the year 1753, enumerates, as elements of beauty, fitness, variety, uniformity, simplicity, intricacy, and quantity; and he observes, that figures bounded by curve lines are, in general, more beautiful than those bounded by straight lines and angles. The beauty of figure principally depends, in his opinion, upon two lines which he has selected. One of them is the "waving line," somewhat in the form of the letter S: and this he calls the "line of beauty," which is found in shells, flowers, and such other ornamental works of nature, and is also common in the figures designed by painters and sculptors for the purpose of decoration. The other line, which he calls the "line of grace," is the former waving curve, twisted round some solid body, and exhibited in twisted pillars and twisted horns, and in the curling worm of a common jack. Variety plainly appears, in the instances which he mentions, to be the material principle of beauty, that he defines the art of drawing pleasing forms to be the art of varying well; and, according to him, the curve line, which is so much the favourite of painters, derives its chief advantage from its perpetual bending and variation from the stiff regularity of the straight line. Motion, says Dr. Blair, furnishes another source of beauty, distinct from figure; being of itself pleasing, so that bodies in motion are, "ceteris paribus," preferred to those at rest. But the quality of beautiful belongs to gentle motion, such as that of a bird gliding through the air, and that of a smooth running stream. In general, motion in a straight line is least beautiful than that in an undulating direction; and motion upwards is also commonly more agreeable than motion downwards. The only pleasing motion of flame and smoke is an object irregularly pleasing, and exhibits an instance of Mr. Hogarth's waving line of beauty. This artiff observes, that, as all the common and necessary motions for the business of life are performed in straight or plain lines, all the graceful and ornamental movements are made in waving lines. Dr. Beattie, in his "Dissertation Moral and Critical," has introduced, in his digression on beauty, some ingenious remarks on this subject. After observing that custom has a perpetual influence in determining
determining our notions of beauty, he proceeds to prove, that
tales allusions founded on habit, many, or perhaps most of
table pleasing emotions are derived, which accompany the
perception of what in things visible is called beauty. With
regard to the beauty or awkwardness of motion, he observes,
that the one will be found to please, and the other to dis-
please, claims an account of certain disagreeable ideas suggest-
ved by the former, and of certain disagreeable ones associated
with the latter. Motions, that imply ease, with such an
arrangement and proportion of parts in the moving object, as
may give reason to expect its continuance without injury,
are generally pleasing, at least in animals, especially when
they betoken a sort of perfection suited to the nature of the
animal. But motions, that betray inhumanity, unkindness,
impertinence, or the appearance of danger, cannot be called
beautiful, because they convey unpleasant ideas. These ob-
servations are illustrated by a variety of apposite instances. Ci-
cero (De Off. b. III. § 36.) blames every motion that alters the
contour, quickens the breath, or betrays any discompo-
sure. Routund observe, that in running, a woman is defi-
citute of that grace which attends her on other occasions.
Perhaps, says Beattie, the jutting out of her elbows, the
natural effect of her endeavouring with lifted hands to face
the most delicate part of the human frame, may give to her
motion the appearance of timidity and constraint. Or, per-
haps, she may fall in this exercise, merely because, according
to us masters, she can be no much accustomed to it. See
Dancing.

It is not easy to convey, in so few words, so many charm-
ing ideas of beauty, in its several varieties of colour, shape,
attitude, and motion, as Gray has combined in the follow-
ing image:

"Slow melting streams their queen's approach declare;
Where'er she turns the graces homage pay:
With arms sublime that float upon the air,
In gliding flight the wins her easy way:
O'er her warm cheek, and rising bosom more
The bloom of young desire, and purple light of love."

But to return from this digression. Dr. Blair observes, that
though colour, figure, and motion be separate principles of
beauty; yet many beautiful objects they all meet, and render
the beauty both greater, and more complex. Thus, in flowers,
trees, and animals, we are entertained at once with the delicacy
of the colour, with the gracefulness of figure, and sometimes
also with the motion of the object. Perhaps, the most com-
plete assemblage of beautiful objects is presented by a rich
natural landscape, composed of a sufficient variety of objects;
fields in verdure, scattered trees and flowers, running water,
animals grazing; to which may be added some productions
of art, which but such a scene, as a bridge with arches over
a river, smoke rising from cottages in the middle of trees, and
the distant view of a fine building, seen by the rising sun.

The beauty of the human countenance is more complex
than any that has yet been considered. It includes the
beauty of colour, arising from the delicate shades of the com-
plexion; and the beauty of figure, arising from the lines
which form the different features of the face. But its chief
beauty depends upon a mysterious expression which it con-
veys of the qualities of the mind; of good sense, or good
humour; of shyness, candour, benevolence, flexibleness,
or other amiable dispositions.

Another distinct species of beauty arises from design or
art, or from the perception of means being adapted to an
end; or the parts of any thing being well fitted to answer
the design of the whole. This is altogether different from the
perception of beauty produced by colour, figure, variety,
or any of the causes already mentioned. This kind of beauty
in arts and design, has an extensive influence over many
of our ideas. It is the foundation of the beauty which we
discover in the proportion of doors, windows, arches, pillars,
and all the orders of architecture. We shall here observe,
that Mr. Pernaut distinguishes two kinds of beauty in archi-
tecture. The one he calls "positive," and "commentary,"
such as the richness of the materials; grandeur of the struc-
ture, neatness of the workmanship, symmetry, &c.; the other
he calls "arbitrary," which depends on the will, and which
would admit of having their proportions changed without
defority. These only pleae by the connection or associa-
tion of their ideas with others of a different kind, which
please of themselves: they owe their beauty to that pro-
position of the mind, by which a thing, whose value we do
know, infames an esteem for others which we do not know.
Thus, he observes, there are many things in architecture,
which reason and good sense would judge deformed, which,
however, custom has not only made tolerable, but even
beautiful, by their being always joined with other beauties
that are positive. Being at first pleased with viewing them
in company, and merely on that account, we at length become
pleased with them alone; and thus we frequently become
fond of faults, and fall in love with deformity. Our tenue
of fineness and design holds to a high rank among our percep-
tions as to regulate, in a great degree, our other ideas of
beauty. In an epic poem, a history, an oration, or any
work of genius, we always require, as in other works, a fit-
ness, or adjustment of means, to the end which the author
is supposed to have in view.

Beauty, as it is applied to writing or discourse, denotes
tall that pleases, either in style or sentiment, from whatever
principle that pleasure flows; and a beautiful poem or ora-
tion means, in common language, no other than a good one,
or one well composed. Beauty, besides this indefinite fene
of it, is also used to signify a certain grace and amenity in
the turn either of style or sentiment, for which some authors
have been peculiarly distinguished. In this sense it denotes
a manner neither remarkably sublime, nor vehemently
passionate, nor uncommonly sparkling; but such as excites
in the reader an emotion of the gentle placid kind, similar
to what is excited by the contemplation of beautiful objects
in nature, which diffusse over the imagination an agreeable
and pleasing serenity. Addison was eminently a writer of this
character; and it belongs also to Fucelon, the author of the
Adventures of Telemachus. Virgil, among the ancients, is
distinguished, in his general manner, by beauty and grace,
rather than sublimity. Among orators, Cicero has more of
the beautiful than Democritus; whose genius led him wholly
towards sublimity and strength.

The ingenious Mr. Burke, in his "Philosophical Inquiry
into the Origin of our Ideas of the Sublime and Beautiful,"
excludes from the number of real causses of beauty, the pro-
portion of parts, sizes, or that idea of utility which consists
in a part, being well adapted to answer its end, and alto
perfection; and he observes (p. 210.) that beauty is, for
the greater part, some quality in bodies, acting mechanically
upon the human mind by the intervention of the senses. The
quality of beauty, as they are merely sensible qualities
which he enumerates, are the following: they should be
comparatively small, in both, various in the direction of their
constituent parts; their parts should not be unequal, but
mixed, as it were, into each other; they should be of a deli-
cate frame, without any remarkable appearance of strength;
the colours should be clear and bright, but not very strong
and glaring; and any glaring colour that is introduced should
could be divested with others. The few properties
upon which, according to this author, beauty depends; prop-
erties that operate by nature, and are liable to be al-
tended by caprice, or confused by a diversity of tales, than
those. The philosophy also, says Mr. Burke, have
considerable share in beauty, especially in that of our own
species.
The magnanimous The consequence few certain fimplicity jullly order nearer and influence, which stood), common and AUifon wlvich beauty," kind parts sculpturere. Socrates declares, that good and evil qualities of the soul may be represented in the figures of man by painting. Plato, in his dialogues, reasons to the fame purpoze, and declares, that the good and beautiful are one.

Aristotle (De Mor. l. iv. c. 7. t. iii. p. 49. De Pot. c. 7. t. ii. p. 658.) observes, that beauty is order in grandeur. Order furnishes symmetry, fitness, and harmony; and in grandeur are comprized simplicity, unity, and majesty. However, in his catalogue of virtues and their families, as well as of the opposite vices and their families, Aristotle concurs with Plato in acknowledging the relation between beauty and good- nefs, evil and deformity. Indeed, it has been one of the great objects of philosophy, through all the ancient schools, to trace and demonstrate not only the likenefs but the identity of beauty and goodnefs. Among the Platonists and the Pythagoreans, malignity was abandoned, goodnefs or the jull, and intellect or wisdom cultivated, because by this means, man is elevated to a nearer approach to the divinity. Fortitude and temperance were the virtues of the floecs and early epicureans, because the one radies man above common fears and wants, and the other gives him better health and enjoyment of his faculties. These conclusions are convincing, and their illuftrations may be drawn in great abundance from

B E A U T Y.

The manners give a certain determination to the countenance, which being observed to correspond pretty regularly with them, is capable of joining the effects of certain agreeable qualities of the mind to those of the body. So that to form a finished human beauty, and to give it its full influence, the face must be expressive of such gentle and amiable qualities as correspond with the folluces, smoothness, and delicacy of the outward form. For Mr. Burke's mode of illustrating and confirming his theory of beauty, the reader is referred to his work above cited.

Dr. Sayers, in his "Disquisitions, metaphysical and literary," 1792, has given a new analysis of beauty, conducted on the principles which were applied by Dr. Priestley in his "Lectures on Oratory and Criticism," and by Mr. Allison in his "Effays on Taste," to the explanation of the intellectual pleasures, namely, the doctrines of the Hartleyan school. His argument, summed up in a few words, is as follows: that individual of a class of objects is justly to be esteemed more beautiful than the rest, with the whole of which, or with its component parts (when properly understood), the greater number of the excellencies of its class are universally associated. The same may be affected of any species of objects, when compared with any other species of its kind; and that object may be justly esteemed a "standard of beauty," with the whole appearance, or with the component parts of which (when properly understood), all the excellencies of its kind are "universally" associated.

Beauty, in the Arts of Design. Whatever of beauty or perfection becomes an object of contemplation to our minds, whether it be purely mental or perceived through the medium of our senses, must be derived from the beautiful and perfect itself, and may be traced back towards its Divine source. However diversified, it proceeds from this source, and directs us where to seek the principles and perfection of all science and art, of all things metaphysical, physical, and moral, which by their mutual connection and harmony declare their common relation and origin; therefore what is called beauty in the arts of painting and sculpture must be sought for in its principles, metaphysical, physical, and moral. In this research we should do well to take those philosophers for our guides, who were the oracles of Greece, in the times when painting and sculpture attained their highest excellence. In the dialogue between Socrates and the sculptor Clito (Xenophon's Memorabilia,) Socrates concludes that "that statuary must represent the actions of the soul by form." And in the former part of the same dialogue Parrhasios and Socrates agree, that the good and evil qualities of the soul may be represented in the figures of man by painting. Plato, in his dialogues, reasons to the fame purpoze, and declares, that the good and beautiful are one.
BEAUTY.

design, we shall produce illustrations from the antique sculpture and painting. — The ancients adorned the hill clads of beauty to the superior deities, the legends to heroes, and the third to faws. Other divinities and genii seem to have partaken more or less of these clays. Mere portraits cannot be enumerated in either, because they are but faithful representations of ordinary nature. Of the superior gods, the Saturnian family possess the rank of beauty in the and the beautiful. In the base head of Jupiter lately in the pope's museum, now with the original gilding at Paris, the hair yields from the forehead, and descends in abundant locks on each side of his face and neck to the shoulders; his forehead is muscular, expressive of greatstrength; his nose and cheeks are correspondent; his eyes and mouth express benevolence; his wife and famous brow, his pliant countenance, and full beard, inspire reverence and awe. This is the might of the superior gods. His right arm modestly raised with his thunderbolt, or leaning on his sceptre, presents the habitual act of governing the universe. Winkelman has judiciously remarked, that the Greek sculptors preferred the family resemblance in the Satyria race, with as much exactness as if they had been real portraits; they bore Jupiter's brothers strongly partake of the same character, excepting that Neptune's countenance is more fierce and his hair more dishevelled. Pluto's hair hanging over his forehead gives a gloomy cast to his countenance, which is increased by his more open and startling eyes. Winkelman has observed, that something of the lion may be traced in the nose, forehead, and hair of Jupiter, which adds might and magnanimity to the benevolence, wisdom, and awful majesty of his character. In the youthful beauty of Apollo, Bacchus, and Mercury, the same benevolence and wisdom are expressed, modified by their peculiar characteristics and offices. Apollo is light and strong in his make; Bacchus is more soft and luxurious, and Mercury more athletic. The peculiarity of Hercules is magnanimity and unconquerable strength. The heroes have a more limble character throughout, approaching nearer to common nature. The fauns may be placed in the lowest class of beauty expressed in the human figure. Although their persons are youthful, and rather handsome, their proportions are shorter than those of the clays above-mentioned; and sometimes their muscles are turgid and tendinous, accommodated to their sylvan habits and activity; their rounded faces have a portion of rude gross nature; but their parted eyes-brows, eyes placed diagonally to the nose, small hollowed nose, and grinning mouths, express some mixture of savage, ferocious, and ridiculous dispositions. The most engaging and captivating species of beauty exists in the female sex; and was represented in perfection by the Greeks in their superior clays of statues. The large eye and full under lip of Juno, give an air of haughtiness to her countenance; her limbs are round and her figure is majestic. Minerva's figure partakes of Juno's majesty; but her face is not so full, and has an expression of abridged wisdom. Venus is represented as a symbol of female charms; her form is diaphanous, perfect, and exact in the highest degree; her mouth is graceful, and her countenance expressive of love and favours.

The soft and beautiful hands of antiquity are oval in the front view; in profile, the low forehead and nose forms nearly one straight line; the lips are rather full and the chin rounded. Juno has the largest eye of the goddesses, according to Homer's epithet of "O-eye'd," the nose is round like a column; the mouth is high and extended; in the male subject the abdomen is flat; and, as Winkelman remarks, "Such is the appearance of a sleep and gorged digestion; the arms, delicate from full shoulders, are taped downwardly to the waist with a very gentle flattened hollow towards the inner elbow, to distinguish the bend of the arm; the back of the hand is one mass; the fingers rather long and tapered, with knuckles indicated in a manner almost imperceptible; the lower limb tapers more sensibly than the arm, because the thigh is larger in its commencement; the knee-pan in youthful statues is nearly oval; and the inner side of the tibia, or principal bone of the leg, is perceptibly marked by a curve of about 30 degrees; the great toe is large, and divided by a considerable space from the lesser toes, which are straight, and not bent over each other like such as have been Edition in fuses.

In the female form, the limbs are more round and delicate; the knuckles of the hand and foot are expressed by flight dimples; the fingers are more tapered; and their outline determined by a long curve, a little reversed towards the end. The principal difference of relative proportions is, that the female figure should be about one face shorter than the male; each having eight heads in height. The female figure is also narrower in the shoulders and hips, and somewhat broader from the os pubis to the extremities of the nates. The Greeks represented the godesses with virgin bosoms. Winkelman, in his "Monumenti Idbiti," has treated largely on the beauty of the antique statues. Prosector Camper, in his "Principles of Design," has also given excellent observations and rules on the beauty and proportions of the human head and figure, absolute as well as comparative. For his account of beauty, as exhibited in ancient sculpture and engravings, see his treatise, entitled "Verhandeling over het natuurlyk verbijlder wezenstrieken," &c. or, on the natural difference of features in persons of various countries and ages, published by his son, at Utrecht, 1792, 4to. In his dissertation on the beauty of forms, subjoined to his "Lectures," published by his son at the same place and in the same year, entitled "Roden Vooeringen," &c. it is his object to prove, that no particular form can, abstrusely considered, constitute beauty; that the real basis of beauty confides in the means being adapted to the end; and that, exclusively of this, our ideas are influenced by customs, national prejudices, implicit confidence in the taste and opinions of others, &c.

Proportion is an essential quality of beauty in the human form; and the coincidences are afforded in its relation to perfect geometrical figures, and the harmony of sounds and numbers. A man, standing upright, can stretch out his arms to a length equal to his height; consequently his figure may be included in a square; by stretching the arms not so much, and the legs a little, the figure may be contained in a circle, whose centre is the top of the os pubis. The ancients divided the height of the human figure into eight heads, and the face into three parts; five of these parts are the breadth of the hands; three parts, or noes, measure the upper part of the thigh; two, the calf of the leg, and one, the ankle. A well proportioned figure measures their equal parts from the top of the shoulder to the tip of the index next the rectus abdominis; from the top to the bottom of the knee-pan; and from the latter to the bottom of the ankle.

The term grace, as a quality of beauty, however it may have puzzled the moderns in its definition and application, was clearly understood by the ancients. The graces or graces of the Romans were the charity of the Greeks. VAPs, is grace, beauty, fairness, endearing, agreeable, eligible; and the graces, gentle &c. are connectives which denote beauty and connivance. The graces are three beautiful fifters, whose influence is their only grace, embracing each other in the gentle manner. The Greek Christians have preferred the ancient signification of this word in its application to all those endearing duties which presage happiness to, and follow it on others; nor is it surprising, that these characteristics are given to women, because all the milder and endearing virtues are full more amiable.
B E A

amiable in the female sex. If by grace, the succession and
variation of undulating lines be intended, it is seen most per-
fently in an elegant female figure moving slowly. It is remark-
able, that man, of all creatures, presents the most perfect view
of his figure in front. Quadrupeds, birds, and fishes, are best
seen in profile, and we look on the backs of reptiles and in-
sects. It is necessary, to the most advantageous appearance
of man, that we should contemplate the affections of his
heart, and operations of his reason continually beaming in his
countenance; the waving lines of his body, moving on
the centre of gravity, and varied curves and angles formed
by his limbs, perfect the whole of his figure, with an union
of faculties mental and bodily, which reminds us that "God
created Man in his own Image."

The various heads touched upon in the latter part of this
article, will be treated of in the several articles of Painting
and Sculpture.

We cannot forbear subjoining the reflection with which Mr.
Thomson, (a late writer on the subject of beauty) cloths his
detail of the various beauties of the female form. "If we
should see a person employ himself with a sledge hammer to
dash the enchanting form of the Venus de Medici to pieces,
break her lovely limbs, and deface her beautiful features, we
should not hesitate a moment to pronounce him a savage
barbarian, without taste, feeling, or sentiment, though his
frenzy was employed only on a faceless piece of stone; what
then must we think of the diabolical savage, who exercises
the world of all creatures (because the most laiting and affec-
ting both to body and mind,) on the most beautiful and
amiable of all creatures on this side heaven?—made ex-
pressly for his happiness, solace, and delight, by first cor-
rupting and betraying her, and then basely abandoning her
to perish with want, pain, wretchedness, and misery."
The sentiments of mankind, with regard to female beauty,
have been very various in different ages and nations; and it
is not possible to establish a standard which shall compre-
prehend all, without discrimination; among the ancients, a
small forehead and joined eye-brows were charming features
in a female countenance; and, in Paria, large joined eye-
brows are highly esteemed. In some Indian countries,
black teeth and white hair are necessary ingredients in the
character of a beauty; and in the Marian Islands, it is a
capital object with ladies to blacken their teeth with herbs,
and to bleach their hair with certain liquors. Beauty, in
China and Japan, is composed of a large countenance,
small, and half-concealed eyes, a broad nose, minute feet,
and a prominent belly. Some Indians of America and
Asia, compells the heads of their children between two
wooden planks, with a view to enlarge and beautify the
face; others compells them laterally, others depres the
commonly, and others make the head as round as possible.
Every nation has ideas of beauty peculiar to itself; and
almost every individual has its own notions and taste con-
cerning this quality. The empire of beauty, however,
amidst these discordant ideas, with respect to the qualities
in which it consists, has been very generally acknowledged,
and particularly in all civilized countries; and when it is
united with other accomplishments that tend to render
females amiable, it contributes in no small degree to give
tem importance and influence, to polish the manners of
society, and to contribute to its order and happiness.

BEAUVIS, BELLVOCAM, and CESARONABUS, in
Geography, a city of France, and capital of the
canton of the Ofte, seated on the Therin; and, before the revolu-
tion, the capital of the Beauphais, and the see of a bishop.
The architecture of the cathedral has been much admired,
besides which it has several collegiate and paroch churches.
The manufacture of the city is a beautiful tapestry, which
has supplied a considerable branch of trade. It has also
produced great quantities of serge and woollen cloth. This
city was unsuccessfully besieged by the English in 1443
and by the duke of Burgundy in 1472, at the head of
80,000 men. On the latter occasion, the women displayed
singular courage under the conduct of Jane de Hatchett,
whose portrait is preferred in the town house; and in com-
memoration of their brave defence, the women form the first
rank of a procession, observed annually on the 10th of July.
This place contains in its N. E. and S. E. districts 13,000,
and in its two cantons 10,350 inhabitants, on a territory of
224 kilometres. Its N. E. canton includes 7 and its S. E.
canton has 4 communes. N. lat. 49° 26'. E. long. 2° 13'.

BEAUVAIS, a small fertile district of France, bor-
dered on the north by Picardy, on the west by Vexin-Nor-
mand, on the south by Vexin-François, and on the east by
Senlis; now forming a part of the department of Oise. See
BEAUV.

BEAUVAIS, a town of France, in the department of the
Somme, and chief place of a canton, in the district of
Douains, one league S. of Douains.

BEAUVÉR, a little town of France, in the district
called, before the revolution, Antuoin, in the department of
the S. of the Loire, seated on the point of a mountain,
and supposed by some to be the ancient Bibracte.

BEAUVILLE, a town of France, in the department of
the Lot et Garonne, and chief place of a canton, in the
district of Agen, 3 leagues N. of Valence.
The place contains 1794, and the canton 7672 inhabitants;
The territory includes 122½ kilometres and 11 communes.
N. lat. 44° 17'. E. long. 0° 47'.

BEAUVOR, a town of France, in the department of
Vendée, a chief place of a canton, in the district of
Les Sables d'Olonne; the place contains 1892 and the canton
8537 inhabitants; the territory includes 230 kilometres and
5 communes.—Also, a town of France, in the department of
the Iere, and district of St. Maurein, 5 leagues S. W.
of Grenoble.

BEAUVOR, S. of Niort, a town of France, in the depart-
ment of the two Sevres, and chief place of a canton, in the
district of Niort, 2½ leagues S. of Niort. The place
contains 301 and the canton 5133 inhabitants; the territory
includes 157½ kilometres and 13 communes.

BEAUVOS, Pont de, a town of France, in the
department of the Iere, and chief place of a canton, in the
district of La Tour du Pin, on the borders of Savoy, 11 miles
W. of Chambery. It is seated on the small river Guier le
Vif, which runs through it, and divides it into two parts.

BEAUZAT, a town of France, in the department of
the Rhone and Loire, 1½ league S.W. of Mountril.

BEAUZE, a town of France, in the department of
the Meuse, and chief place of a canton, in the district of
Verdun, 4½ leagues S.S.W. of Verdun.

BEAUZIEL DE LEVOU, St., a town of France,
in the department of Aisne, and chief place of a canton,
in the district of Millau, 2 leagues N.W. of Millau.

EBE', a large village of Egypt, on the west side of
the Nile, distant about 3 leagues from Beniout; the residence
of a knife, and the site of a mosque, and a convent of
Copts.

EBELINGEN, a town of Germany, in the district of
Wurttemberg, seated on a lake from which proceeds the
river Wonn. N. lat. 48° 25'. E. long. 9° 8'.

EBENHAEUS, a convent in the district of Wurt-
temberg, called Schonlack, at a small distance N.E. of
Tubingen; the manor of which contains 9 parishes.
In this convent is an academy, where students are qualified
for admission into the seminary at Tubingen.

EBBENOWA, a town of Poland, in the palatinate of
Breslaw, 14 miles S.E. of Breslaw.

EBERACI, in Ancient Geography, Katzenich, a lake of
Miciop-
Monopoptamia, between mount Singara, and the river Chaboras.

BEBRE, in Geography, a river of France, which runs into the Loire, opposite to Bourbon Lancy.

BEBCYES, in Ancient Geography, the first inhabitants of Bathyria. The origin of their name, and the reason of their being expelled, is uncertain. A people of this appellation, mentioned by Silvius Italicus, in his 'Eclogae,' inhabited that part of Gália Narbonensia, which was situated between Spain and the Alps, or near the Pyrenees, and from them they called themselves Buerci. 

BEC, in Geography, a town of France, in the department of the Loire, 9 leagues W.S.W. of Rome. 

BEC CREVIN, a town of France, in the department of the Lower Seine, 3 leagues east from Havre.

BECABUNG, BROOK, in Britain. See Verona.

BECALI, or BERARDI, a Jewish coin, being half a shilling. In Dr. Arithmetick's table of reductions, the shilling amounts to 17.44; in Dr. Prideaux's computation to 16.6d.

Every drachma paid a hundred bucks a head every year for the support of the temple. Calumet.

BECALMING, in the Sea Language, is when any thing keeps the wind off or away from the vessel.

This one ship is said to be calmed another, when the comes up with her on the weather-side: this is the like said of the shore, when it keeps the wind away. A ship is likewise said to be calmed, when there is no wind luring.

BECANER, in Geography, a town of Hindustan, seated on the Ganges, nearly east of Delhi.

BECARDE, in Ornithology, a name under which Buffon describes some birds of the Linnaean genus LINNUS: as for example, his becares is linus cyanus, Gmel, and becades is centaurus, a small blue bird of the same author.

BECASSE, Bécassine, a general term in Buffon's Nat. Hist. for some of the birds of the Scolopax genus, in the Linnaean system.

BECASSEAU ou COL-BLANC, is also a name given by Buffon to the iberus communis of Linnaeus.

BECCA, in the Materia Medica of the Ancients, a name given to a fine kind of rein collected from the turpentine and mastic-trees of Greece and Syria, and mixed together for use. It was much esteemed formerly, and not only used in the country where it was produced, but carried in great quantities to Mecca, and other parts of the Turkish dominions, where it was valued at a very great rate.

BECABUNGE, in Entomology, a species of Curculio, of a black colour, wing-cases rusius; entirely bordered with black. Fabricius. In Fine and appearance it resembles curculio rubri, but it inhabits Sweden, feeds on the beeches.

BECADELLI, ANDRÉ, in Biography, called Antonio of Palermo, from the place of his birth; was born in 1374, studied the law at Bologna, and entered into the service of the duke of Milan, who allowed him an honourable pension. He also became professor of belles lettres and rhetoric in the university of Pavia, and, in 1432, was honored by the emperor Sigismund, with the poetical laurel. When Alphonso king of Naples left Milan in 1435, he took Antonio with him to his court; and from this time, he became the inseparable companion of this prince, who conferred upon him many honours and gifts, and intrusted him with many important commissions. In 1451 he was appointed to the see of Venice, the papal archbishop of the historic Lide, which he obtained. Such indeed was his veneration for Lide, that he is said to have sold a farm in order to purchase a copy of this city, written by the hand of Pliny the Florentine. After the death of Alphonso, Antonio became the secretary and confidant of his son and successor Ferdinand. He died at Naples in 1451: leaving behind him ample testimonial of his talents as a Latin writer, both in prose and verse. For his work on geography, he received the recompence of a thousand gold crowns; which work has been frequently reprinted, with additions. A collection of five books of his epistles, two harangues, and some verses, was printed at Venice in 1453. His 'Historiophorus,' which was a collection of short poems in two books, excited by its obliqueness loud clamours against its author; and was publicly burnt in several cities of Italy, together with the writer's own effigy. Gen. Biog.

BECADELLI, LUDOVICO, was born of a noble family at Bologna in 1502, studied at Padua, and accompanied cardinal Pole in his legation to Spain. He assisted at the council of Trent, and was delegated by the papal court to Venice and Augsburg. In recompense of his services, he was promoted to the archbishopric of Ragusa; but being appointed in 1505 to superintend the education of the son of Cosimo I., grand duke of Tuscany, and expecting the archbishopric of Fisa, he renounced that of Ragusa. His expectations, however, were disappointed; and he was obliged to content himself with the provostship of the cathedral of Prato, in which office he died in 1572. He was reckoned eminent as a man of letters, and wrote in Latin the lives of the cardinals Bonaro and Pole, and in Italian a life of Petrarch, esteemed more correct than any other. Nouv. Dict. Itui.

BECAFICO CANAPI, in Ornithology, a name of matucina curvica, in Oliva.

BECAFICO and BECOA, are also names given by Oliva and Buffon to matucina fuscata. Linnaeus.

BECAFUMI, DOMENICO, in Biography, called Micaronius and Medoverus, was the son of a peasant near Siena, whose name was Piacio, born in 1484, and employed by his father in keeping sheep. Becafumi, a citizen of Siena, whose name he assumed, being preposessed with a favourable opinion of his talents by observing figures which he drew, with his stick upon the sand, whilst he was surrounded by his flock, took him under his patronage, and placed him under the instruction of a painter, called Cavana; and after having been, as some say, the disciple of Pietro Perugino, or according to others, after having been employed in copying the pictures of this artist, he went to Rome, and made further improvement by studying the works of Raphael and Michael Angelo. After two years he returned to Siena, and finished several pieces, not only in oil, but in charcoal and fresco, which gained him great reputation. But he was chiefly admired for his performance on the pavement of the great church, which he wrought by combining stones of different colours, with pitch poured in holes for the dark shades, in such a manner as the light and shadow of the object required. This kind of performance is said to have been invented by one Duccio of Siena in 1356; but it was brought to perfection by Becafumi. He had a fine invention; his style was elegant; his expression good; and his colouring beautiful. He was also an excellent engraver on wood and metal, and also a founder. His usual mark on his plates is a B divided in the middle by a horizontal line. This artist died at Genoa in 1549. Pickington and Strutt.

BECARRA, CESAR DOMIANA, marquis of, an eminent Italian writer, was born about the year 1720. To the study of philosophy he was attached from his infancy, and he acquired himself either in the schools of the light and intellectual freedom, which his native country, Italy, afforded him, or in the schools of France, England, and other countries. At Naples Grossetti taught the Italians how to think, and Becarras distinguished himself by the title of "his learned and venerable master." At Milan also Count Firmian was a distinguished patron of literature and science, and a promoter of every reform, that had philanthropy for its basis. With such enlightened men Becarras co-operated by writing in 1767...
his famous work, "On Crimes and Punishments," which had an extensive spread, and produced a great change in the prevailing ideas on these subjects. Voltaire, in his commentaries on this work, says, that this short treatise is in morals what a simple drug would be in medicine, which should be adequate to the cure of every disease to which the human body is liable. As the principles of government indirectly supported in this work were hostile to absolute power, they incurred the charge of subverting the legitimate sources of authority; and the marquis owed his protection to the influence of count Ferman. Having escaped the danger that threatened him, he diverted his attention from speculations of this nature to metaphysical subjects. Besides fome papers, contributed to a periodical work, entitled "The Coffee-House," he published "Disquisitions on the Nature of Style," maintaining that by nature all men possess an equal degree of genius for poetry and eloquence, and that the observance of proper rules all would be able to write equally well. Boccari was much attached to men of letters, a patron to those who needed encouragement, and a cordial friend. He was charged, however, with vanity in the exercise of an office of magistracy which he held; and hence his enemies compared him to lord Bacon, with respect both to abilities and corruption. He died November 1794. Month Mag. 1798. Gen. Biol.

BECARIA, GIAMBATTISTA, an eminent philosopher of the eighteenth century, and a monk of the Eclesi-Pie, was a native of Mandovio in Piedmont, and became professor of philosophy and mathematics, first at Palermo, and then at Rome. His established reputation occasioned his removal to Turin, where he occupied the chair of experimental philosophy. In consequence of his appointment to the office of preceptor to the princes of Sardinia, he was introduced to the Sardinian court; but neither this employment, nor the honour connected with it, diverted him from the indefatigable prosecution of his studies; and the pecuniary advantages that resulted from the appointment were principally devoted to the increase of his library and the improvement of his philosophical apparatus. Amidst the variety of his philosophical pursuits, his attention was particularly engaged by experiments and investigations in electricity; and in this department of science he acquired singular reputation. For an account of his principal discoveries and observations, see Atmosphere, and Electricity. His chief work on this subject were "Delli Elettrisimo Artifices et Naturali," Turin 1753, 410; of which an English translation was published, in 1776, 410, and "Lettere dell' Elettrisimo," Bologna, 1758, fol. He also published essays "On the cause of Storms and Tempelst," "On the Meridian of Turin," and on other physical and astronomic subjects. Father Boccari, no let's respectable for his virtues than his knowledge, died at Turin in an advanced age, May 22, 1781. Nouv. Dict. Hist.

BECARIA, JAMES BARTHOLOMEW, born at Bononia, in 1682, received the early part of his education among the Jesuits. Turning his mind to the study of natural philosophy, he soon became distinguished for the variety and depth of his knowledge in physics, and in mathematics, of which he was made public professor, and, in conjunction with Morgagni, and other celebrated characters at Bononia, affiliated in forming an academy there for teaching mathematics, natural history, chemistry, anatomy, and medicine. He first gave lectures in natural history, and in 1712, was appointed to the chair of medicine, which he also now practiced with great success. On the death of Vallad, he was made president of the institution, and in that post introduced many useful regulations for the government of the academy, which are still continued. He was a frequent correspondent with the Royal Society of London, of which he was made an honorary member. Among other communications from Boccaria, which appear in the Philosophical Transactions, are his "Observations on the Weather," and on the Ignis Fatuus," and "On the power some persons have enjoyed of supporting life for a great length of time, without food." This was afterwards published at Padua, under the title of "De jeniusa longis Differtatio," fol. 1748. He died Jan. 1766, being 84 years of age. Among his publications are, "Differtatio Meteorologica Medicina, in qua aeriis temperies et morbi Bononie gravaentes annis, 1729, et frequenti, deserviunt," "De vanumirius phlogis et nunc primum detectis, Commentarum," Bonon, 4to. 1744. "Scriptura Medico-legalis," 1749. For the titles of his other compositions, and of numerous unedited pieces, see Gen. Biol. and Hal. Bib. Anat.

BECLES, in Geography, is a market and corporate town of Suffolke, in England, situated on the northern border of that county joining to Norfolk. It is a fifteen miles S.W. of Yarmouth, and 108 N.E. from London. Though not a borough town, Beccles has its corporation, consisting of a portreeve, and sixty-six other persons, who are distinguished by the names of twelve, and twenty-four. From the twelve, the officer called portreeve is annually elected. The town consists of several streets, which concentrate in a spacious area, where the markets are held every Saturday. Here are a large handsome church, whose tower is detached from it, and the ruins of another called Ingate church, which was formerly the parish church. The church-yard, from its elevated situation, commands many fine and extensive views of the adjacent country, and the meandricals of the river Waveney which adjoins this cemetery. Here are a town-hall and gaol; the former is a substantial building, where the quarter sessions are held; and the latter has been lately much enlarged and improved conformably to the Howardian plan. A public grammar school was founded here in 1712, by Dr. Fauconberg, who endowed it with certain lands for the maintenance of a clergyman, and to qualify youth for the university of John Leeman, knight, also founded a free English school in 1631, for the education of forty-eight boys; also for a master and usher, who are appointed by trustees, being part of the corporation. On the north-west side of the town is a very large common field, containing nearly 1600 acres, where the inhabitants are allowed, under certain restrictions, to turn a number of horses and cattle. Beccles suffered by a destructive fire, which happened on the 29th of November, 1586, when more than 50 houses were consumed, with property calculated at $10,000. It is rather a singular circumstance, that neither mail, nor turnpike roads, communicate with this town though it was some time since proposed at a public meeting to carry the turnpike road to Yarmouth through this place; but the proposition was negatived by a considerable majority of the inhabitants. Here are three annual fairs. The number of houses in the township is 607; of inhabitants 2788, of which 1245 are males, and 1543 are females. In the vicinity of this town are the following, besides other gentlemen's seats. Ravesingham Hall, Sir Edmund Bacon, bart.—Langley Park, Sir Thomas Beauchamp Proctor, bart.—Beecar Hall, Sir Thomas Gouch, bart.—Soterley Hall, Miles Bone, etc.

BEC-D'OISEAU, in Zoology, the name lately given by French naturalists to that most singular Australian animal Platyus anatinus of Vivarium nature, and Duck-billed platypus of Dr. Shaw. It is also called Ornithobirhinos paradoxus, by M. Blumenbach of Goettingen. See Platyus.

BECED, LA, in Geography, a small town of France on the Aude, and chief place of a canton, in the district of Castelnaudary, 14 league north of Castelnaudary.

BECF-AAL, in Ichthyology, a French name of the Electrical eel, anguille electrique.

BECHAN, in Geography, a river of North Wales, which
BECHER, John Joachim, in Biography, an industrious and successful cultivator and improver of chemistry, and an ingenious mechanick, was born at Spire in 1645. After passing through the usual preliminary studies, he was made professor of medicine at Mentz, and from an apothecary to the elector, and to the ducal court at Bavaria. Acquiring considerable reputation in the honourable post, he was called to Vienna by the emperor Leopold; where, besides attending to his medical duties, he was instrumental in forming a chamber of commerce, and in improving its manufactures. He is also said to have projected the plan of an East India company there. But getting into disputes with some of the officers about the court, he left his inquisition, and was obliged to leave Vienna. He then went to Mannheim, and was appointed physician. From Wurtzburg he was driven away, Heller, on being detected defacing a human body, with the view probably of producing some chemical experiments on sons of the learned, as he did not cultivate anatomy. At Hanover, where he now resided, he invented a machine for the improvement of gold, and, as he tells us in his "De falso folio, et liberis de auris," written at Frankfort 1662, made some improvement in the art of printing, in what it consisted, is not now known. In the man while he was not unimpartial of the principal object of his studies, the advancement of the knowledge of chemistry, as appears by a rapid succession of publications on that subject. Getting again involved in disputes with some principal persons at Hanover, and compelled to quit that place, he came to London, where he died in 1675. That he was of a turbulent and restless disposition is evident by his frequent migrations, and by his constantly being the favourite and protector of his patrons, whom he had made his debtors by his abilities and services. Becher gave a new turn to chemistry, which he employed in analyzing and finding out the principles of natural bodies, and thence had the foundation of the great improvements that have been made in that art. But he was fond of mysteries, and employed no small part of his time and labour in his attempts to transmute metals. That he thought this practicable, appears by his "Experimentum chymicum novum, quo artificiali et indolente metallum inter generationem et transmutationem integrum et occulam demonstrativum," and his "Thesaurus, virisque et pulchrioribus tarnen transmutationes metallorum in a metae corporis," in which he states he has discovered the art of transmutation, and which he published in 1642. On this subject he published, 1669, a Latin letter, in which he says that he had the full permission from his masters to publish this art, since known under the name of alchemy, he may therefore he considered as the father of Chemistry. (See Chemistry, and Biographies.) His works are his "Phlogiston," "De falso folio," "Philosophia chymica," and "De ratione chemica," which last he published 1669: "Parallela chemica," 1670, in the latter part of the rest of his works, by Eloy's permission.

BECK, Daniel, in Geography, is a lake of Carmania, in the deanery of Cognos. BECK, town of Hanover, in the department of Hanover, and the place of a market, in the district of Châtillon. The place was then by the Emperor in 1691, and 1694. The population is about 2000.

BECKSTADT, a market town of Germany, in the Herrschaft, or county, in the canton of Hanover. The place was then by the Emperor in 1691 and 1694. The population is about 2000.

BECHTER, in Geography, is a town of Bohemia, and capital of a circle of the same name. It is situated on the river Lusatia, and its citadel is on a steep rock. The circle was miserably ravaged and laid waste in the thirty years' war, and in the town was taken and burned by general Bechtor in 1619. N. lat. 49° 14'. E. long. 15° 12'.

BECKTHEIM, a town of France, in the department of Mont-Tommere, and chief place of a canton, in the district of Mayenne. The place contains 1377 and the canton 13,535 inhabitants: it includes 21 communes.

BECHTELHOLZ, a forest town of Sweden, in the Rhine circle of notary, belonging to four co-heirs, two of whom are Roman Catholics and two Lutherans.

BECK, a little river or brook, called alto rivulet or rill. According to Verbiest, the original word is hétor, which properly imports a small stream of water issuing from some houra or spring.

Hence, bell-hecks, little brooks so called, on account of their glint and depth, or rather from their being covered, or much concealed. See HILL.

Beck is chiefly used among us in the composition of names of places originally situate on rivulets; hence Welbeck, Bournbeck, &c.

The Germans use beck in the same manner.

BECK, David, in Biography, an eminent portrait painter, was born at Arnheim in Gelderland in 1621, and became a disciple of Vandyke, from whom he acquired a fine manner of penelling, and that sweet style of colouring in which this matter excelled, together with that rapidity of execution for which he was so famous. He was appointed portrait painter to Christiana queen of Sweden; and by her recommendation, most of the illustrious persons in Europe fat to him for their pictures. In his person and behaviour he was handsome, agreeable, and polite; and though he was much favoured by his royal mistresses, he wished to visit his friends in Holland, very much against the queen's inclination; but as he soon after died in Holland, at the early age of 55, it was suspected that he was poisoned. As he travelled through Germany, he was frequently taken ill at an inn, where he died, and the illness terminated in his apparent death, by which he was laid out as a corpse. His will, which had been regretted the event, and was only read by his friends, revealed their foresight by drinking it only. One of these, in a state of intoxication, fuddled, that their master was total of a glass while he was alive, and proposed not to spill the grant by giving him a glass, though he was dead. A goodly fire was raised, and endeavoured to put some liquor into his mouth. Upon this Beck opened his eyes, and the servant compelled him to swallow what remained in the glass. The painter revived, and, by due attention, not only closed the instrument, but perfectly recovered. In the midst of his illness, he received from his great patron, old ladies, and several in gold of a large fine. P. L.便捷

BECKM, or BECKM, in Geography, a fauborough town of Germany, in the circle of Weilphalia, and district of Minden, seated on the Weis, 17 miles S.S.E. of Minden. In 1733 it was almost wholly consumed by fire.

BECKER, Daniel, in Biography, was born at Dessau, in December 1594. He took his degree of Doctor in medicine at Göttingen, and was made professor of the same chair, and rector of the university. Becker was one of our medical works, but that which principally contributed to improve his name, is his "De cultura Praetexti, et curato singulare," or the extraordinary care of the Prefix.

M
fan knife-swallower; first published in 1636, and since frequently reprinted. The subject of the history is a young man, aged 22 years, who endeavoured to excite vomiting by introducing the handle of a knife, ten inches long, into the oesophagus; the knife slipping from his fingers, dropped into his stomach, where it continued, occasioning much pain, about six weeks. No probable means of relieving him, or of obtaining the discharge of the knife occurring, it was determined, by his medical attendants, to make an incision through the integuments of the abdomen into the stomach, and to extract the knife through the wound. The operation was performed, the knife taken out, and the patient recovered in a few days. The author relates several other cases of persons who had received wounds, penetrating into the stomach. In some, the wounds were completely healed; in others, the edges of the wounds becoming callous, left fibrous openings into the stomach, through which the food passed, neither when covered with a compress. This work was translated into English, and published in 4to. by Dr. Laki, in 1622, under the title of "A remarkable cure of the Proflitul swallow knife." Laki added other cases of wounds penetrating into the stomach, which terminated in the same ways, as those related by Becker. To both the Latin and English editions of the subject are added. He died the 14th of October 1657. For the titles of his other works, none of which are of much estimation; see Haller's Bib. Chirurg, et Anat. His son Daniel, who was educated under his father, after visiting the principal schools on the continent of Europe, was made doctor of medicine at Strasbourg, in the year 1652; returning to Konigberg, he was appointed professor in ordinary, and soon after physician to the elector of Brandenburg. He died suddenly Feb. 5th 1670, and was succeeded in his honours by his son Daniel Christopher, but they neither of them left any works deserving notice.

Becker, Balthasar. See Becker.

Becket, Thomas, an English prelate, famous as the occasion of much political contention during his life, and as the object of much superstitious veneration after his death, was born in London in 1119, and proceeded his studies at Oxford, Paris, Bologna, and Auxerre. During the interval of his residence at Paris and Bologna, he was introduced to Theobald, archbishop of Canterbury, who, being captivated with his graceful and winning address, gave him two livings in Kent, and obtained for him two prebends in the cathedrals of London and Lincoln. As at this time he was only in the decumns's orders, he probably held these benefices by the pope's dispensation, which his patron might easily have procured. After his return from Auxerre, where he completed his studies, particularly in the civil and canon laws, he was employed by the archbishop as his agent to the pope, in order to solicit the restoration of the lazar-house powers to the see of Canterbury. Having conducted this negotiation with dexterity and success, he was deputed on another important commission, the object of which was to obtain from the pope those prohibitory letters against the coronation of prince Eufiface, by which that design was defeated. Upon his return to England from this successful embassy, the archbishop conferred upon him several new favours, appointing him provost of Beverley and dean of Haftings, with the right of retaining his other benefices, and just before the death of Stephen, investing him with the archdeaconry of Canterbury. Immediately upon the accession of Henry II. to the throne, in 1158, he was appointed chancellor of England at the request of his patron, who thought no dignity or truft above his merit. The chancellor of England, at this time, had no distinct court or judicature in which he presided; but he acted together with the judiciary and other great officers, in matters of the revenue, at the exchequer, and sometimes in the counties upon circuits. The great feal being in his custody, he superintended and sealed the writs and precepts that issued in proceedings pending in the king's court, and in the exchequer. He also supervised all charters which were to be sealed with that seal. In the council his rank was very high; and he had the principal direction and conduct of all foreign affairs, performing most of that business which is now done by the secretaries of state. Such was the office to which Becket was raised; but the favour of his master made him greater than the power of that office, great as it was in itself. In this station he paid his court so successfully to his royal master, not only by his dexterity in business, but also by his splendid manner of living and agreeable conversation, that he became his greatest favourer, and his chief companion in his amusements. Employments and truits of all kinds were heaped upon him without measure or propriety. Besides the office of chancellor, and a scandalous number of ecclesiastical benefices, he had royal cables and forts committed to his custody, the twofold utilities of vacant baronies, and the effects of great baronies belonging to the crown. These resources he expended without account or control; and Henry reproved in him such a degree of confidence, that he seemed almost to share the throne with the sovereign. It must indeed be allowed that Becket professed in a pre-eminent degree all the qualities that could most powerfully engage the affections of a prince, who had a judgment capable of dispassion, and a heart formed to love extraordinary merit, but a temper that required some delicacy of address in those who approached him very nearly, and that yielded most to those friends whose character appeared most congenial to his own. The perfon of Becket was graceful and his countenance pleasing; his wit was lively and facetious, his judgment acute, his eloquence flowing and sweet, and his memory capacious and ready on all occasions. The time he had palled in that school of the most exquisitely polite, the court of Rome, had greatly improved and refined his understanding. Nor was his capacity limited to the sphere of business. He made himself the king's perpetual companion in most of his pleasures, and confided his tattle so naturally, and with so much ease, that in paying his court he seemed only to indulge his own inclinations. He occasionally laid aside the ecclesiastical habit and character. In an expedition with the king to France, he advised the military profession, headed a body of men in his own pay, and commanded at various sieges. In his manners there was a certain inexpressible grace derived from nature and improved by art, which rendered his virtues more amiable, and even his vices agreeable. Thus his profuseness and ostentation appeared like generosity and greatness of spirit; nor indeed was be destitute of the qualities, though he carried them far beyond proper bounds. His expense was enormous, and Henry would have been jealous of it, as intended to acquire too much popularity, if he had not been perfused, by the address of Becket, that all his magnificence, in which the son of a private citizen surpassed even the greatest and most opulent earls, was only designed to do honour to his bountiful master, whose creature he was, and upon whom his whole fortune must absolutely depend. Yet, amid the luxury in which he lived for several years, and all the temptations of a court where gallantry reigned, he was, if the writers of his life may be credited, constantly temperate and invincibly chaste.

At the time of the death of archbishop Theobald, Becket's patron, the king, was in Normandy; but as soon as he heard of it, he resolved to raise his chancellor to the primacy, in hopes by his means of governing the church in tranquility. This advancement however was retarded for about a year.
year by the opposition of the archbishops; the king's mother, and of the clergy and bishops of England. But Henry's resolution was fixed, and his means were so great as to overcome all remonstrances; so that Becket, being nulli prius, was consecrated at Canterbury, June 6, 1162. As soon as Becket found himself firmly seated in the archbishopric of Canterbury, he suddenly changed his whole mode of life, and from being the gayest and most luxurious courtier, he became the most austere and solemn monk. Without the knowledge of his previous knowledge of his intention, and very much to his surprise and dissatisfaction, he resigned the office of chancellor. Before the king's return to England in 1163, he had received many complaints of the severity of the new prelate, that he became irksome, that he was too late, that he had made a wrong choice. In his interview with Becket at Southampton, it was observed by the whole court that his affection was cooled, and he soon after manifested his dissatisfaction with the conduct of the prelate, by obliging him, much against his inclination, to resign the archbishopric of Canterbury. In 1163, Becket attended a council, summoned at Tours by pope Alexander III., where he was treated by the pope and cardinals with particular respect; and where, it is probable, he was satisfied by the pope in his design of becoming the champion of the liberties of the church, and the immunities of the clergy. It is, however, certain, that soon after his return he began to prosecute this design without his former reserve, and the zeal which he manifested produced an open breach between him and his sovereign. Henry was determined to be the sovereign of all his subjects, clergy as well as laity; to oblige them to obey his laws, or to answer for their disobedience in his courts of justice. Becket, on the other hand, maintained, that the clergy were subject only to the laws of the church, and were to be judged only in spiritual courts, and to be punished only by ecclesiastical sentences. In order to bring this question to a speedy issue, which the licentiousness of the clergy, and the atrocious crimes committed by some of them at this time, rendered absolutely necessary: a council of the clergy and nobility was summoned at Wellsminster; and at the council the king required that the archbishop and other bishops would consent to deliver to his officers a clerk, who was degraded for any crime, in order to his being punished for it according to the laws of the land. This request was reasonable; but the prelate's influence refuted the demand; and the council broke up in confusion. Although Becket solemnly professed and swore, in the words of truth, and without reserve, to obey the laws and customs, commonly called the constitutions of Claridon, which reduced all the clergy of all denominations to a due subjection to the law of the church, and preferred the immunities of the clergy; he soon began to insist on points of respect, by extraordinary acts of power, and by disturbing the performance of the sacred office of his functions; and obtained from the pope a bull, allowing him the obligation of his oath, and enabling him to retire the duties of his forced office. The king, however, determined to remove the prelate out of the kingdom; but being prevented from taking his escape by contrary winds, he returned to Canterbury; and after waiting upon the king at Woodstock, to supplicate for pardon for attempting to leave the kingdom without his permission. The king, however, without any act of expression of displeasure, informed him, "if he had left England before he thought it was too late to continue both?" This interview was soon followed by the archbishop on the part of Becket, which induced the king to summon a parliament at Northampton, Oct. 1st, 1163, which unanimously found the prelate guilty of contumacy, by refusing to attend the king's court when he was summoned, and sentenced him to forfeit all his goods and chattels. He was also required to receive a sum of 300 marks, which the king had lent to him, when he was chancellor, and to render an account of 250,000 marks, which he had received from vacant benefices. To this demand he was wholly of fo furious a nature, that, though he appealed to the pope, and his episcopal brother defended him through fear, and urged him to resign his office, affuring him that if he did not he would be tried for perjury and high treason. The letters likewise became loud and vehement in their clamours against him, to this Becket thought it most prudent to leave the kingdom. Accordingly he left Northampton at midnight, accompanied only by two monks, and travelling on foot and by night, he arrived at Lincoln, and from thence he passed by water to a solitary island, where he remained till an opportunity offered of passing over to Flanders. Some fee that he travelled to Sandwich, and hired a sailing boat to carry him to Bologna. However that he was, he retired to the monastery of Saint Bertin. Upon his retreat, the king confiscated the revenues of the archbishopric, and sent ambassadors to the king of France, and the earl of Flanders, demanding these princes from affording Becket shelter in their dominions. The ambassadors met with a cold reception at the French court at Compiègne, and were told by Lewis, who was a superstitious bigot, and a great admirer of Becket, that he would protect the persecuted prelate with all his power. They then proceeded to Sens, where the pope resided, who, after admittance to them by an audience, and confuting his ambassadors, informed them, that no answer could be given to their petition till the archbishop had been heard. Becket, as soon as he was assured of the favour and protection of the king of France, paid him a visit at Soissons, where he was affectionately received, and urged to accept an order on the royal treasury for everything he needed during his stay in France. From Soissons he proceeded with a numerous retinue for Sens, which he entered in a kind of triumph, and here the pope treated him with the greatest respect and kindnefs. At a solemn council of all the cardinals and prelates, he was seated at the pope's right hand, and allowed to keep his feast while he explained his cause. Having produced, in the course of an artful speech, a copy of the constitutions of Claridon, several of which were directly calculated to abridge the power of the pope and cardinals, the whole assembly expressed their abhorrence of them in the strongest terms, and at the same time passing the highest encomiums on the archbishop, declared that his cause was that of God and the church, and that he ought to be supported. Becket, with a view of further increasing his wealth with the pope, urged him to declare his lands, which, however, the pope, with the advice of his cardinals, immediately refused to him, appointing him a residence in the abbey of Pontigny in Burgundy.

When the ambassadors returned to England, and made their report, Henry was highly offended, both with the pope and the archbishop; and in token of his resentment prohibited the payment of pence, and commanded all clerks who pretended to appeal to the pope to be imprisoned. He also commanded all the goods and revenues of the archbishop, and of all the clergy who adhered to him, to be seized; and resolved to confiscate the chancery, and to hand the princes of all the private friends, retainers, and relations, to the number of about 400. Becket, during his residence at Pontigny, employed himself in exercises of devotion, and also in writing expostulatory letters to the
king and bishops of England, in inflaming excommunications against several officers of the crown, and in threatening even to excommunicate the king himself. Notwithstanding a spirited remonstrance addresed to Becket by the English prelates, he persisted in his purpose; and communicated it to the pope in a letter, which represented Henry as a cruel, impious, unrelenting persecutor, who had tried and condemned Chrift at Northampton, in his perfon. Henry was much alarmed; and called a council of his barons and prelates at Chinon in Touraine, to consider what was to be done for preventing his excommunication, or for guarding against its consequences. After a long deliberation, it was thought the most expedient to appeal to the pope. In the mean while Henry sent orders to England to guard the sea-coasts, and to take other measures of precaution. Although Becket was prevented by the interposition of the king of France from executing his design of excommunicating Henry, he excommunicated his miniflers and chief confidents, and declared the impious conftitutions of Clarendon null and void; absolved all the bishops of England from the unlawful oath they had taken to obey him, and excommunicated all persons who paid any regard to them. Upon these precautions the proceedings against Becket threatened to expel all the monks of the Ciftercan order from his dominions, if they any longer entertained his enemies; the archbishop of Canterbury at Pontigny; upon which he removed to Sens about Martinmas, A.D. 1170, where an honourable asylum was provided for him by the king of France. The pertinacity of Becket rendered ineffectual for a long time all the efforts of the English prelates, of the pope, and of the king of France, for terminating the contention between him and the king of England. At length, however, all preliminaries for a reconciliation being adjourned by the papal nuncios, the archbishop was conducted in great state to an audience of his sovereign, July 22, A.D. 1170, in a meadow near Fretville, where the French and English courts, with a prodigious multitude of people of all ranks, were assembled. The conduct of the king on this occasion was singularly condescending; but Becket's lofty and retentful temper was so little improved by it, that he returned Henry's civility and condescension with complaints and remonstrances. After a promise extorted from the king to repair all the injuries which had been done to the church, the archbishop dismounted, in order to throw himself at his feet; but Henry prevented him, and stepped so low as to hold his stirrup, and affult him in re-mounting. This reconciliation, however, was far from being cordial, on the part either of Henry or Becket, and it was not likely to be permanent. Whilft the archbishop was waiting at Whitlaff, a fea-port in Flanders, previously to his return to England, he sent over three bulls, one for fulfeding the archbishop of York, who had been employed in crowning the young king, and two for excommunicating the bishops of London and Salisbury, who had affulted at this ceremony. This conduct, which was inexcusable at the moment when he pretended to return in peace, excited against him universal indignation, and eventually proved the caufe of his ruin. On his reaching the English shore, attempts were made to prevent his landing, and he was infulted by some perfons in arms, who commanded him in a threatening tone to abfolve the excommunicated bishops. In his way to Canterbury he was accompanied by a great multitude of people, and entered the city in a kind of triumph amidst the acclamations of his attendants. Soon after his arrival, application was made to him for abfolving the bishops whom he had fulfeded and excommunicated; and the young king, who conurred in the application, and who had inuited an order for this purpofe, was much incenfed at his refufal, more efpecially as the

cessures which he had affulted on thofe prelates who had affulfed at his coronation seemed to call in quifition its validity. In his progres from Canterbury to Woodluff, where the young king reigned, he was attended on his approach to London by prodigious crowds of people, and conducted to his lodgings in Southwark with loud acclamations; in return for which he feattered among the populace both money and epifcopal benefices. Here his vanity was mortified by a message from the young king, forbidding him to proceed any further, or to enter any royal town or cable, and commanding him to return immediately to Canterbury, and to confine himself within the precincts of his church. After his return to this city, he found himself deferted by many of his friends, and received reports of the infults they fuffered, and the depredations that were committed upon his effufles, fo that he indulged gloomy apprehensions, and laid to one of his chief confidents, "that he was now convinced this quarrel would not end without blood, but that he was determined to die for the liberties of the church." When the excommunicated prelates arrived in Normandy, and implored the protection of the king from the disgrace and ruin with which they were threatened by the paimate, the indignation of Henry was roused, and in the moment of imperfped passion, he exclaimed, "hull this fellow, who came to court on a lame horse, with all his effufes in a wallet behind him, trample upon his king, the royal family, and the whole kingdom! Will none of all these lazy cowardly knights, whom I maintain, deliver me from this turbulent prelate?" This passionate exclamation made too deep an impression on those who heard it; and particularly on four barons, who formed a resolution, either to try the archbishop into tribunafion, or to put him to death. Accordingly, having concerted their plan, they fett out for Canterbury by different routes and arrived at a cable about 6 miles from the city on the 28th of December, A.D. 1170; and on the following day they proceeded to the city, and getting admission into the archbishop's apartments, they told him, that they were fent by the king with a command that he fhould abfolve the prelates, and others whom he had excommunicated, and then go to Winchester, and make fatisfaction to the young king, whom he had endeavoured to dethrone. Becket, after a violent altercation, in the course of which hints were given that his life was in danger if he did not comply, perfeded in his refufal. Upon the departure of the barons, one of them charged his fervants not to let him flee; to which Becket, who overheard them, replied with great vehemence; "flee! I will never flee from any man living. I am not come to flee, but to defy the rage of impious affifants." The barons, with their accomplices, finding their threats ineffectual, put on their coats of mail, and taking each a fword in his right hand, and an ax in his left, returned to the palace, but found the gate fliut. When they were preparing to break it open, Robert de Broc conflucted them up a back flair-case, and let them in through a window. A cry then arose, "they are armed! they are armed!" on which the clergy hurried the archbishop almost by force into the church, hoping that the sacredness of the place would protect him from violence. They would also have fht the door; but he exclaimted "begome, ye cowards! I charge you on your obedience, do not shut the door. What, make a caufe of a church!" The confpirators having searched the palace, came to the church, and one of them exclaiming "Where is that traitor? where is the archbishop?" Becket advanced boldly, and replied, "here I am, an archbishop, but no traitor! I am ready to fuffer in the name of him who redeemed me with his blood. God forbid that I should fly for fear of your fwords, or recede from
from justice." They once more committed him to take off the excommunication and interdiction of the bishops. He replied, "no satisfaction has yet been made; nor will I abdicate them." They then told him, "thou shalt infallibly die according to thy defeat." "I am ready to die," replied Becket, "that the church may obtain livery and peace in my blood. But in the name of God, I forbid you to hurt any of my people." They now raised upon him, and undertook to drag him out of the church, with an intention, as they themselves afterwards declared, to carry him in bonds to the king, or if they could not do that, to kill him in a less sordid place. But as he clung fast to one of the pillars of the choir, they could not free him from there. During the struggle, he shook William de Tracy to the ground, that he almost threw him down; and as Reginald of Tizurrute pressed harder upon him than any of the others, he thrust him away, and called him "pimp." This opprobrious language more enraged that violent man; he lashed up his sword against the head of Becket, who, bowing his neck, and joining his hands together, in a posture of prayer, recommended his own soul, and the cause of the church, to God, and to the saints of that cathedral. Put Edward Grane, one of the monks of Canterbury, interpolating his arm toward the blow, it was almost cut off; and the archbishop also was wounded in the crown of his head. He fled a breton friar, which likewise fell on his head, in the same devout posture, without a motion, word, or groan; but after receiving a third, he fell prostrate on his face, and all the accomplices prostrating now to a share in the murder, a piece of his skull was struck off by one of them; upon which another found out the brains of the dead archbishop with the point of a sword, and scattered them over the pavement of the church.

Thus was assassinated, in the 53d year of his age, and 9th of his pontificate, A.D. 1173. Dec. 29. Thomas Becket—" a man," says lord Lyttelton, "of great talents, of elevated thoughts, and of invincible courage; but of a most violent and turbulent spirit; excessively passionate, haughty, and arrogant; in his resolutions inflexible, in his determinations unchangeable. It cannot be denied that he was guilty of a wilful and premeditated perfidy; that he opposed the sacred cause of public justice, and acted in defiance of the laws of his country, laws which he had most solemnly acknowledged and confirmed; nor is it his evident, that during the heat of this dispute, he was in the highest degree ungovernable to a very kind master, whose confidence in him had been boundless, and who from a private condition had advanced him to be the freestone man in his kingdom. On what motives he acted can be certainly judged of by him alone, to whom all hearts are open. He might be misled by the prejudices of a bigoted age, and think he was doing an acceptable service to God, in contending even to death, for the utmost excess of ecclesiastical and papal authority. Yet the strength of his understanding, his conversation in courts and camps, among persons whose notions were more free and enlarged, the different colour of his former life, and the fundament of the change which seemed to be wrought in him upon his election to Canterbury, would make one suspect, as many did in the times when he lived, that he only became the champion of the church from an ambition of forking his power; a power more independent on the favour of the king, and therefore more agreeable to the haughtiness of his mind, than that which he had enjoyed as master of the crown. And this suspicion is increased by the marks of cunning and selfishness which are evidently seen in his conduct on some occasions. Whether it is impossible, that when first he assumed his new character, he might act the part of a zealot, merely or principally from motives of arrogance and ambition; yet afterwards, being engaged and inflamed by the contest, work himself up into a real enthusiasm. The continual praiseth of those with whom he acted, the honours done him in his exile by all the clergy of France, and the vanity which appears so predominant in his mind, may have conducted to operate such a change. He certainly showed in the latter part of his life a spirit for art as fervent as the warmest enthusiasm; such a spirit indeed as constitutes the zeal of a statesman. But he had defended the established laws of his country, and the fundamental rules of civil justice, with as much zeal and intrepidity as he opposed them, he would have deserted to be ranked with those great men, whose virtues make us easily forget the alloy of some natural imperfections; but unhappily his good qualities were so disfigured, that they became no less hateful to the public mind of the kingdom, than the word of his vices." Mr. Home closes his account of the assassination of Becket with the following concise sketch of his character. He was "a prelate of the most lofty, intrepid, and inflexible spirit, who was enabled to cover to the world, and probably to himself, the enterprizes of pride and ambition under the disguise of futility and of zeal for the interests of piety and religion. An extraordinary perverting, truly, if he had been allowed to remain in his first station, and had directed the vehement of his character to the support of law and justice; instead of being engaged, by the prejudices of the times, to sacrifice all private duties and all public connections to ties which he imagined or represented as superior to every civil or political consideration. But no man, who enters into the genius of that age, can reasonably doubt of this prelate's fineness." Another judicious historian (Dr. Henry) says of Becket: "He was evidently a man of very great abilities, particularly of consummate cunning, unadorned courage, and invincible constancy in the prosecution of his designs. But his schemes were of a most pernicious tendency, to emancipate the ministers of religion from the restraints of law, and to subject his king and country to a foreign power. He was vain, obdurate, and implacable; as little affected by the entreaties of his friends, as by the threats of his enemies. His ingratitude to his royal master admits of no excuse, and hath fixed an indelible stain upon his character. Though his murders were highly criminal, his death was very reasonable, and probably prevented much mischief and confusion."

The respect paid to the memory of Becket, after his death, was extravagant beyond all bounds, and remains on record as an evidence of the superstition and credulity which prevailed at the period in which it occurred. The king of England, to whose command it was generally imputed, was represented as "that horrible persecutor of God, who exceeded Nero in cruelty, Julian in perfidy, and Judas in treachery;" and the pope was loudly called upon by the kings of France and many prelates to draw the sword of St. Peter, and to inflict some exemplary punishment upon him. But none expressed greater grief and horror at this deed than Henry himself, who broke out into the loudest lamentations, refused to see any company, or admit of any consolation for three days. He also deputed an embassy to Rome to vindicate himself from the imputation of having been the cause of it. All the clergy of the whole church were suspended for nearly a year in the church where it had happened; and the church itself was, by order of the pope, interdicted. In 1173, Becket was canonised by a bull of pope Alexander; and a particular collect was appointed to be said in all the churches of the province of Canterbury, for expiating the guilt of his murder.
did not however complete. Dr. Milward, who had formed a similar design, is said to have purchased what manuscripts were left by him on this subject, of his executors; but neither did he carry his intention into execution. It is probable that, while making this search after ancient British writers, Beckett met with accounts of the diocese called a brening, and conceiving that to be a symptom of the venerable diocese, he was induced to publish his three dissertations on the antiquity of that complaint, which was known, he says, before the discovery of the West Indies by Columbus. These were first printed in the Philosophical Transactions. Beckett died at Abingdon in 1738. His works were collected together, and published in 9 vols. 8vo. in 1740, by the noted Mr. Edmund Curll.

Beckett, Isaac, a mezzotinto engraver of some eminence, was born in Kent in 1653, was originally an apprentice to a calico-printer, and obtained the secret of scraping mezzotinto from one Loyd, a print-seller, with whom he lived for some time. He afterwards connected himself with an engraver in mezzotinto, with whom he had been acquainted at an earlier period of his life, and who assisted him, as he drew better and more expeditiously than himself. His mezzotintos are often clear and well fummed; but his middle tints are not sufficiently distinguished, so that his shadows appear flat and heavy. One of his best prints is engraved on a middling-sized upright plate, representing Adrian Beverland drawing from a flute, and having in the back ground monuments, pyramids, and several relics of antiquity. The time of his death is not known. Strutt.

Beckett, William, son of Isaac Beckett, a surgeon of some eminence at Abingdon, in Berkshire, under whom he received his education, was born in the year 1684. At a proper age, he was sent to London, and was for some years pupil to Mr. Jos. Bateman, surgeon to St. Thomas's hospital in Southwark. That he was diligent in cultivating his profession, appears by the early specimens he gave of the result of what he had been in practice: for in 1707, he published a collection of chirurgical observations, containing relations of some curious cases that had fallen under his notice; and in 172, "New discoveries in the Cure of Cancers," and soon after, a recital of the case of Dr. James Keil, the celebrated physician and mathematician, who died of a cancer in his mouth. Beckett had been accused of mismanaging this case, and therefore published the account in vindication of his practice. In his New Discoveries, he pretends to have been frequently successful in removing cancerous tumours, by means of a digestive, the manner of preparing which he does not however disclose. In a subsequent edition of this work, he gives the description of a medicine, which had been used successfully, which was said, in eradicating cancers by the family of the Prince of Northampton. It consists of yellow arsenic and boric acid, mixed with the confidence of a pottle with the pulp of an apple. It is called the red caustic. A familiar preparation has been since used by Plunket and others. In 1721, he published two letters addressed to Sir Hans Sloane, in which he refutes the current opinion of the efficacy of the royal touch in curing the evil, which was perhaps preparatory to his being elected fellow of the Royal Society. About this time he published proposals for printing an account of the lives and writings of the most eminent British writers in medicine, in 2 vols. 8vo. which he
and studied at New College, Oxford, of which he was admitted fellow in 1608. After several ecclesiastical preferments, he became Dean of the archdeaconry of the year 1649, and was employed by a tycoon held in St. Paul's churchyard, London, in conjunction with two other persons, to draw up a form of law, by which the protection of the White Fathers, or Lollards, was to be conducted. While he was about to become king Henry VI, he wrote a letter, preserved in manuscript at the Cottonian library, in which he heartily advised, in opposition to the English law, the rights of the keepers of the bed, and the bishops of England, and in the interest of the abbeys and priories of that place, he made security of that, keeper of the great book, and bishop of Bask and Wells, to which he was consecrated in 1443. He is represented as having been well skilled in public learning and history, and very conversant in the Holy Scriptures; as a good preacher, and as a generous patron of ingenious and learned men, so that he was called the Macer of his age. His works of usefulness and charity were numerous. He founded Lincoln college in Oxford; procured an endowment for New College, in 1455; laid out a considerable sum of money in repairing houses belonging to his see, and erected the west side of the cloisters at Wells, and also conducted in the market place of that city. He died at Wells in 1465. A large collection of his letters is preserved in the library at Lambeth, and a volume of sermons and some other treatises are also left to him. Bisog. Brit.

BECMARIE, in Entomology, a genus of insects established by Godred. See Rhindamner.

PECTOLA, in Geology. See Beka.

BECANGILL, a name sometimes given to a province of Asia, which is a part of Anathola, bounded on the north by the Black sea, on the west by the sea of Marmora and the Archipelago, on the south by Nautia Proper, and on the east by the province of Boli. The capital is Bafa.

BECTIVE, in the county of Meath, Ireland, where there are considerable ruins of an abbey which belonged to the Cistercians. It was founded by Murchard O'Mahon, king of Meath, in 1146; and being richly endowed, the abbot had a place among the peers in the assemblies of parliament, and wore a crown. The cloisters with a tower are almost entire. It was pleasantly situated on the banks of the Boyne, over which river there was a bridge; and at present a new village, called Bective-bridge-end, has two fairs annually. It is 8 miles from Trim, and about 44 from Dublin. Mon. N. H. Hibern. Ware's Antiquities.

BECQUASSE, a lea among the Turks demarcated from their founder Béchàta, preacher to Sultan Amurath.

All the liberties belonging to the Porte are of the religion of Béchatta, and are laid to have derived their origin from the founder of this lea. Their habit is white: on their head a white cap of several pieces, with tassels of wool twined round it. They wear shirts, which are the hour of prayer, which they perform in their own assembly, and they make frequent declarations of the unity of God.

BED, a place prepared to stretch and compose the body on, for rest and sleep: made chiefly of feathers included in a wicker case. Of beds there are several sorts: as a feather-bed, a down-bed, a flaxseed-bed, a lute-bed, a truck-bed, &c.

In the first and rudest ages of mankind, it was the universal practice to sleep upon the floor of beasts. This was the custom among the Greeks and Romans, and also among the Circassians, and among Britons. This custom prevailed till modern times among the common people in some parts of Germany. These beds, some of which are worn in the day, were spread at night on the floors of their apartments. In process of time, these beds were changed for soft rushes and heath, and afterwards for straw. Pliny (l. iv. c. 48. l. xxi. c. 36.) says, that the beds of the Roman gentry were generally filled with feathers, and those of the inns with the soft down of reeds. Straw was used even in the royal chambers of England, so late as the close of the 13th century. Beds, filled with chaff, thatch, or straw, are used by the common people in many parts of Great Britain and Ireland, and also in France and Italy, at this day. Beds were for a long time had upon the ground; till at length the custom of raising the beds on feet or pedestals, which anciently prevailed in the East, and which was introduced into Italy, was adopted in Britain. But all the materials of which beds are made, and the manner of adapting them, vary among different ranks, and in different nations. By the English statutes, no beds are to be held, except filled with one sort of stuffing only: e. g. feather beds with only dry pulled feathers; and down beds with clean down alone. No feather beds are to be mixed with the former; nor on the contrary, there being usually three persons to one bed, whereof the middle place was accounted the most honourable, as well as the middle bed. See Triclinium. These beds were unknown before the second Punic war: the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer; or as Varro expresses it, after the manner of the Lacedemonians and Cretans. An innovation in this practice is ascribed to Scipio Africanus, who brought from Carthage some of these little beds, called “Punicas,” or "Archaica," which were of wood, very low, fluffed only with hay or straw, and covered with the skins of sheep or goats, “bedinis pellicis flarci." These beds in respect of delicacy differed little from the wooden benches; but when the custom of bathing prevailed, the practice of refining themselves more commodiously by lying along than by sitting down, was adopted. As far as the hides, it did not seem at first consistent with their mode of adapting the mode of lying; accordingly, they kept to the old custom all the time of the commonwealth; but, from the first Cæsars, they ate on their beds. As to the youth, who did not yet put on the age of Crises, they were long kept to the ancient dietetic line. When they were admitted to table, they only sat on the edge of the beds of their several relations. Never, says Struma, did the young Cæsars, Cæsius and Lénum, sit at the table of Augustus; but when they were "in manibus," or, as Tacitus expresses it, "ad secta," from the generous simplicity, the Romans, by degrees, contented themselves both to the most forsaken magnificence. Pliny speaks, it was no new thing to furnish their cover with pieces of silver, adorned with the figured mass, and the rubies on spaces. Hist. Nat. lib. xxxix. cap. 11. Indeed, speaking of Helegabulus, that he had both of gold and ivory, and Pompey, in his third triumph, "as did the rest of gold." They had also "bedes et interiex, et..."
and a fae funebo, or euvemile, on which the dead were carried to the pile. See **Funeeral**.

**Bed of State.** See **Parade**.

**Bed of Julier**, Lit de Julier, in the French Law, denoted a throne on which the king used to be seated in parliament. In this style, he was laid to hold his lit de jujif for; when he went to the parliament of Paris, and held a solemn session, under a high canopy erected for the purpose. The bed of justice was only held on affairs relating to the state; on which occasion, all the officers of the parliament appeared in red robes; at other times they wore black ones. Several authors have treated expressly on the ceremonies of the bed of justice.

**Bed of a great Gun**, is a piece of plank laid within the cheeks of the carriage, in the middle transom, for the breach of the gun to rest on.

**Bed, or Stock of a Mortar**, is a solid piece of oak, in form of a parallelled, bigger or less, according to the dimensions of the mortar, hollowed a little in the middle to receive the breach and half the trunnions. On the sides of the bed are fixed the cheeks or brackets by four bolts of iron.

In ships, when the decks lie too low from the ports, so that the carriages of the pieces, with the trucks, cannot mount the ordnance sufficiently, but that they lie too near the gunwale; the method is to make a false deck for so much as the piece will require for her traversing to raise it higher; and this they call a bed.

**Bed, in Gardening**, a small elevated plot or compartment of ground, of three, four, or more feet in breadth, which is useful in the culture of many sorts of plants, especially those of the smaller kinds. It is always an eligible practice to low and pick out different sorts of small plants on beds having narrow alleys between them, for the greater convenience of weeding, watering, gathering, &c. as by this means such operations can be performed without trampling on the crops. Thus the ground intended for asparagus and strawberries should be divided into four feet wide beds, with eighteen inches or two feet alleys between them. Onions are likewise cultivated to the bed advantage on four feet wide beds, having ten or twelve inch alleys; the different sorts of lettuce and endive should also be sown and transplanted into separate beds occasionally; and also various sorts of small plants, which can be more conveniently cultivated on beds, or in borders of similar widths. Early radishes are generally sown on beds, or similar compartments, as being more convenient for the purposes of covering them occasionally in frosted nights, and for weeding, thinning, watering, and gathering them.

All sorts of plants that are particularly intended for transplantation, should be sown in beds or narrow borders, so as to admit of standing to weed, water, and draw the plants, without treading upon them; and for the same reason, all plants necessary to be pricked out previously to their final transplantation, should also be put out on such beds; as celery, cabbage, cauliflowers, broccoli, &c. Aromatic and medicinal herbs of all sorts should also, for the greatest part, be disposed in beds with twelve or fifteen inch alleys between, or at least in borders of similar widths; particularly mint, thyme, savory, marjoram, fage, hyssop, balm, penny-royal, tanley, terragon, feverfew, rue, &c. as this method of bedding all sorts of small plants is not only more commodious for performing the necessary operations without injuring the plants, but has an air of uniformity which is constantly to be observed in garden work.

The most proper dimensions for beds of this sort, as has been observed, is four feet or four feet and a half in width, the length at pleasure, with intervening shallow alleys of from nine, twelve, or fifteen inches to two feet width, according to the different sorts of plants, so that a person in the alleys may easily reach half across them to do the necessary work without trampling the plants down, or treading the surface of the ground.

Where flower gardens are wanted to be distinct from the general pleasure ground, the spaces should be divided into regular parallel beds, of three or four feet in width, with eighteen inches or two feet wide alleys, especially when chiefly intended for the curios sorts of bulbous rooted flowers, such as tulips, hyacinths, ranunculuses, amaranth, and other choice sorts, where, by being deposited together in beds, having intervening alleys, they admit of paling between them, to perform the necessary business of culture more easily, as well as to view the plants when in flower. Many sorts likewise appear to greater advantage in this way.

The beds, in these cases, should be neatly edged with box or thistle. See **Edging**.

The grounds of nurseries intended for raising all sorts of flowers from seeds, slips, cuttings, parting of roots, &c. should also be divided into beds of three or four feet in width. And in large nurseries for trees, the ground intended for the reception of cuttings of most sorts of hardy trees and shrubs, should also be generally divided into three or four feet beds, having twelve or fifteen inch alleys between them.

**Beds in common** should only be raised a very little higher than the alleys, unless in cafes of too much fragrant moisture, three or four inches higher than the level of the alley is mostly sufficient; for when raised considerably, the alleys assume the appearance of trenches, and have a disagreeable effect.

The earth of all sorts of beds should be well broken down, and laid as even as possible in digging them over, being afterwards raked into neat order on the surface.

**Beds for raising melons, mushrooms, and the like, are commonly demarcated ridges.**

**Beds, in speaking of hops, denote the floors whereon they are spread to dry.**

**Bed of Corn,** is a heap, flat at top, three or four feet high; otherwise called a couch.

**Bed-tyfens,** a name given by the Arabic Afoinators to a fixed star of the first magnitude in the right shoulder of Orion. Bed-afoin is of a ruddy colour, by which it is easily distinguished.

**Bed, in Meofony,** denotes a course or range of flones.

**Bed, Joint of the,** is the mortar between two flones placed over each other.

**Bed, in Sea Language,** a flat, thick piece of timber laid under the quarters of casks, containing any liquid, and floated in the ship's hold.

**Bed of a River,** the bottom of the channel in which the stream flows.

**Beds, in speaking of minerals and solidify certain strata, or layers of matter, dis pojed over each ether.**

**Beds, in the New Husbandry, denote the spaces occupied by the rows of corn, in contradistinction from the open spaces between them, which are called alleys.**

**BEDALACH,** in the *Materia Medica*, a name given by some writers to the gun bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yellowish colour, like wax.

**BED-CHAMBRE,** or Gentlemen of the Bed-Chamber, are percons of the first rank, fourteen in number, whole office used to be, each in his turn, to attend a week in the king's bed-chamber, lying by the king on a pallet-
BED

B E D

palled off light, and to wait on the king when he consulted the government. Their salary is £2000 per annum. The list of the scholars is the bed-sitter.

BED BUILDING, in Archit. Art, is a term used by workmen to express those members of a cornice which lie below the corona. A bed-building usually consists of ten or more members, an age, a bit, a large baston, and another bit under the coronet.

BEDA, or Bede, distinguished by the epithet \textit{Praeclarus}, in \textit{Bede's Ecclesiastical History}, a learned monk of the eighth century, and one of the first writers of his time, was born in the neighborhood of Wearmouth, in the bishopric of Durham, in 672 or 673. At the age of seven years he was brought to the monastery of St. Peter, founded near the place of his nativity about two years after he was born; and the care of his education was intrusted with abbot Benedict, his founder's cousin, and John of Beverley, for twelve years. Endowed with an excellent genius, and distinguished by indefatigable application, his progress in various branches of learning, during this period, was very considerable. At the close of it, or when he had attained the age of nineteen years, he was ordained deacon by the last mentioned preceptor, then bishop of Hexham, and afterwards archbishop of York. About this time he seems to have removed from the monastery of St. Peter, at Wearmouth, where he was educated, to that of St. Paul's at Jarrow, near the mouth of the river Tyne. For several years he was labouring at the former had been, by the abbot Bede.

Here he was employed in the prosecution of his own studies, and in aiding those of others who resorted to the monastery for instruction. His whole life, which he spent in this retreat, was devoted, as he himself informs us, to the exercises of devotion in the church, and to those of teaching, reading, and writing. At the age of thirty, A.D. 722, he was ordained priest by the same prelate from whom he had received deacon's orders. Although he lived in retirement, the fame of his learning and character soon spread over Europe; and the pope Sergius addressed a letter to abbot Ceolfrid, in which he urged him to send Bede to Rome. The death of the pope, which probably happened soon after this letter was written, prevented Bede from having his own country; nor did it appear, with sufficient evidence, that he ever quitted Northumberland, though some have laid the credit of the story founded on Grasseleisher or Cambrius, that they alleg a proof of the antiquity of the saint. In the walls of the monastery, in which he was buried, and has been lately in the acquisition of it, there was found a note from him, to his friend and abbot Ceolfrid, written in a communication of it to the Saxon. How many works of his have been, knowledge comprehended ever, kind of learning and fame was at the period in which he was extolled to the appellations of \textit{Dignus}, \textit{Praeclarus}, \textit{Venerable Bede}, conferred on him, and kept up in all uniform and uniformly retained by posterity. For this, as little as any other preexistent monk, he is truly entitled to the appellation of \textit{lost Venerable Bede}, conferred on him, and kept up in all uniform and uniformly retained by posterity. For this, as little as any other pre-existent monk, he is truly entitled to the appellation of \textit{lost Venerable Bede}, conferred on him, and kept up in all uniform and uniformly retained by posterity.

There are also twelve years of his life the bed-sitter.

Bede's \textit{Ecclesiastical History} of the English church is uniformly admitted to be his most popular work. It was the first history of the English church written in English, and it was the first that was published in print. It is not designed to be a history of the church, but of the church of England. It is not designed to be a history of the church, but of the church of England.

The last, and most popular of Bede's works is his \textit{History of the Church}, a printed edition of which was published in 1644, and in which the work was first introduced into Britain. In collecting material, for this history, he consulted several chronicles of the English kings before his time; he kept up a correspondence in the several kingdoms of the heptarchy, and he had records to various records and archives preserved in several monarchies; and his history has been regarded as containing the most accurate and comprehensive account of the early state of English unity in that country. The famous Milton, indeed, is said to have objected to this history, that it is deficient with regard to the civil affairs of the country, which are mentioned very curiously, and which form rather a calendar of dates, than a regular history; but it is be considered, that this defect was the fault of the church, and not the peculiar transactions of the period which his history comprehends, this objection must appear to be urged against it with insufficient reason. Milton himself confessed, that he travailed with much worse guides after he parted with Bede. The change that has been alleged against him, of partiality to the Saxons in preference to the Britons, seems to be his exception. But the chief objection to which his history is liable, is the diffuse account which he introduced of legendary miracles and of other trivial and absurd circumstances, extracted without sufficient discrimination and with apparent concretion from the chronicles to which he had access; and yet, when we collect the period in which he lived, and consider, that the principal transactions of the church upon record consisted of such follies and impurities, we may admit some apology for a writer who wished to approximate himself to a faithful historian. Without advertising to the censure of N. de Pinto, which extend to the fable and subjects of Bede's works in general, and which are amply flated and satisfactorily obviated in the Biog. Brit., it may not be improper to mention the objection urged by father Pezon against the chronology of Bede. This father, who has taken great pains, after Isaac Vossius and father Morin, to support the chronology of the Septuagint, informs us, that Bede was the first who endeavoured, in the western church, to maintain the shorter chronology of the Hebrew text; and archbishop Usher, in his \textit{Sacred Chronology}, observes, that Bede was confided in an heretic on account of this innovation. However, his computation was afterwards received, and scarcely any other was admitted in the west till the three learned men above-mentioned appeared in defence of the contrary opinion. If Bede, therefore, was singular in being an advocate for the Hebrew chronology, this singularity affords evidence of his learning, penetration, and good sense. The author's ecclesiastical history is written in easy, though not very elegant Latin; and as to the faults in his style, which have been particularly Do Pinto, they were not apparent to be very great, if compared with contemporary writings; and to compare him with Usher is certainly unjust. Of the Latin original of the History, I have consulted the editions with notes and commentaries: particularly at Antwerp in 1550, at Heidelberg in 1570, at Cologne in 1604, at Cambridge in 1644, at Paris in 1651, and at Cambridge in 1782. A Saxon version attributed to King Alfred, with learned notes by Abbot Whitby, was printed at Cambridge in 1544: and an English translation by Dr. Saint Joan was printed at Antwerp in 1672. The design of the latter text was to suppress the popish religion; and of course it is not deemed very faithful. But a later, at
Bede, even as he has given it in English, might in many passages be shown to be far enough from favouring the doctrines of the Church of Rome.

The last literary labours of venerable Bede, was "A Translation of the Gospel of St. John into the Saxon Language," which he completed with difficulty on the day and hour of his death, which happened on the 26th of May, A. D. 735. The disorder of which he died was an asthma; and he bore the pain that attended it with exemplary fortitude and patience, discharging the duties of his office, and prosecuting the works in which he was engaged, and which he wished to finish, with unabated activity. During many sleepless nights, he is said to have sung praises to Almighty God; and in the prospect of dissolution, he did not differ from apprehensions of it, though he expressed the utmost confidence in the divine mercy; and was able, on a review of his conduct, to declare seriously that he had so lived, as not to be ashamed to die. During an act of devotion, and while he was pronouncing the last word of it, he expired.

It would be easy to cite a great number of testimonies to the extent of Bede's learning, as well as to the excellence of his character. William of Malmesbury, after giving him an extraordinary character, tells us, "that it was much more easy to admire him in thought, than to do him justice in expression." Bale affirms that he was so well skilled in the writings of Pagan authors, that he had scarcely an equal in that age, and that he learned natural philosophy and mathematics from the purest sources, the Greek and Latin authors themselves. Pits says, that he was so well versed in all the branches of learning, that Europe scarcely ever produced a greater scholar in all respects; that even, while he was living, his writings were of such authority, that it was ordered by a council held in England, and approved afterwards by the catholic church, that they should be publicly read in the churches; that from his earliest years, he was remarkable for his piety and love of learning, alternating without interruption his prayers and his studies; and that his intense application furnished him with a complete knowledge of poetry, rhetoric, natural philosophy, metaphysics, astronomy, arithmetic, music, geometry, cismography, chronology, history, and the whole circle of the liberal arts, and all parts of mathematics, philosophy, and divinity. Camden represents him as the singular light of our England; and many testimonies in his favour may be found in the works of our historians and antiquarians, such as Hollandised, Stowe, Speed, Selden, Sir Henry Spelman, Stillingfleet, Mabillon, Walton, &c.

Besides the History, the translation of St. John's gospel, and the letter to Egbert already mentioned, there are a great many works, both published and in manuscript, that have been attributed to Bede; some of which, however, are of dubious genuineness. They are enumerated in the Biographia Britannica, Cave's Hist. Lit. and in the appendix to the fourth volume of Henry's History. They comprise a very miscellaneous collection of versions and commentaries upon several books of the Old and New Testament, of legends, and theological dissertations; among which are some of greater value on the scripture chronology, and many elementary compilations, for the use of his scholars, on the subjects of arithmetic, grammar, rhetoric, astronomy, music, and natural philosophy. The first general collection of his works appeared at Paris, in 1544, in 3 vols. folio; and again in 1544, at the same place, in 8 vols. 4to. At Basle, in the same size and number of volumes, in 1562, were reprinted at Cologne in 1612, and at the same place in 1688. Several of Bede's works have been separately printed; and those treatises, which are mentioned in his own catalogue of his works, annexed to his ecclesiastical history, were published by the learned and industrious Mr. Wharton, from three manuscripts in the archiepiscopal palace at Lambeth, London, 1693, 4to. Cave's Hist. Lit. vol. i. p. 612, &c. Henry's Hist. vol. iv. p. 26, &c. Wharton's Hist. Poetry, vol. i. diff. 2. Biog. Brit. Gen. Dict.

It is from the Ecclesiastical History of this worthy monk, that we know anything concerning music in our country during the seventh and eighth centuries, the most barbarous period of its annals. In his account of the conversion of the Saxons to Christianity, he speaks of litaniæ and allelujæ being sung in the Gregorian manner, according to the Roman ritual, when bishop Stillingfleet thinks that the goodness of the music was the principal incitement to the reception of the mææ by the Saxons.

Bede was himself an able musician, and is supposed to have been the author of a short musical tract, "De Musica Theorica, et Præctico sive Menfurararut." Of the two parts of this treatise ascribed to Bede, the first may have been written by him; the second, however, is manifestly the work of a much more modern author; for we find in it, not only the mention of music in two or three different parts, under the name of diezant, but of instruments never mentioned in writers contemporary with Bede; such as the orgæus, violæ, aula, &c. A notation too of much later times appears here, in which the longæ, the breve, and semibreve, are used, and the above five lines and spaces, with equivalent initials and pauses. The word modus is also used for time in the sense in which the term modus was applied after it ceased to mean key. Upon the whole it seems as if this last part of the treatise attributed to Bede, was written about the twelfth century; that is, between the time of Guido and John de Muris.

Bede, however, informs us that, in 682, John, prebend of St. Peter's in Rome, was sent over by pope Agapetus to instruct the monks of Weremouth in the art of singing, and particularly to acquaint them with the manner of performing the festival services throughout the year, according to that which was practised at Rome. And such was the reputation of his skill, that "the masters of music from all the other monasteries of the north came to hear him; and prevailed on him to open schools for teaching music in other places of the kingdom of Northumberland."

And it is from Bede's information that we have any knowledge of the social and domestic singing to the harp in the Saxon language, upon our island, at the beginning of the eighth century; which is amply detailed in bishop Percy's essay on the ancient English minstrels. Reliques of Ancient Poetry.

BEDA, or BEDE, NOEL, a doctor of divinity in the university of Paris, was a native of Pecardy, and flourished in the beginning of the sixteenth century. His temper was violent and impetuous, and he was a great enemy to every kind of innovation and reform. Erasmus and Faber Stapulensis, who were great promoters of literature, were the objects of his vehement attack. Against the scriptural paraphrases of the former he wrote a book, in which Erasmus detected many misrepresentations and calumnies; and yet such was his influence among his brethren, that he induced the faculty of divinity to censure the works of his antagonist. In his opposition to the design of Francis I. for obliterating the Sorbonne to concur with the other universities of France in giving a favourable opinion concerning the divorce of VIII. of England, he acted a more judicious part; but he injured his character, and ruined his cause, by his passionate and turbulent behaviour, and involved himself in the crime of perjury. After having made the amende honorable, by publicly acknowledging that he had spoken against truth and the king, before the church of Notre Dame, he was committed to prison in 1535, and afterwards sentenced to
bede was a monk and a holy man, who died in the year 1537. he was a furious preacher of the protestants, and one of the chief promoters of the punishment of lewis de burgin, the protestant martyr. his later works were a treatise "de unica magdalenae," against faber, paris, 1519; "two books against faber's commentaries and erasmus's paraphrases," paris, 1526; "an apology against the secret Lutherans," Paris; and "an apology for the daughters and grandchildren of st. amy," against faber. his works in French were: "a répétition of the discussion of the palmes paper," and "a confosition of faith." gen. dict. nouv. dict. hist.

beda, a friend of the religion and law of the Brahmins of hind, often called also pedam and PEDAM, which see; see also BRACHMANS, and BHASTA.

Bedale, in Geography, a market town of England. It is situated in that division of the north riding of yorkshire called Richmondshire, at the distance of 6 miles from North Allerton, and 223 miles north of London. seated on the bank of a small river, it enjoys a pleasant and fertile situation; but being at some distance from any public road, its principal trade is derived from a weekly market and five annual fairs. these are abundantly supplied with horses; the buying and selling of which is the chief business of many persons in this part of yorkshire. the story of this town is very valuable; and the church, which is a large handstone structure, contains some ancient monuments, one of which commemorates Brian Fitz Alan, the last male heir of that family. a Roman road passed through this town to barnard castle. so and some Roman encampments are remaining on the high grounds between this town and ripon. there is a bakery school, and the township contains 226 houses, with 1225 inhabitants.

Bedang, a commentary on the beda of the Brahmins of Hindostan, called also SHOFER or SHYABAH; which see.

Bedarides, in Geography, a town of France, in the department of VENDOME and chief place of a canton, in the district of Avignon. The place contains 1638 and the canton 4226 inhabitants: this territory includes 1074 kilometres and 4 communes.

Bedarieux, a town of France, in the department of the Roussillon, and chief place of a canton, in the district of Perpignan. The inhabitants carry on a manufacture of druggists and other woolen stuffs. The place contains 3333 and the canton 8621 inhabitants: the territory includes 1424 kilometres and 7 communes. N. Lat. 43° 27'; E. long. 3° 24'.

Bedas, Bedas, or VADAS, a name given to a species of fables, who occupy a small district in the northern part of the island of ceylon, and who seem to be (fable) of a peculiar race. the spot which they inhabit is entirely covered with wood, which they conceal themselves in such a manner, that it is difficult to discover them. their complexion is fair, and their features red, like that of the europeans. their language has no analogy to that of any of the other Indian languages. they have no villages or huts, and hold no intercourse with the rest of mankind. their arms are bows and arrows, with which they kill a number of bears, imps, and other animals. they never destroy their masts, but leave them in the hands of which they have given them.

The wildness of these woodland wanderers recognises no authority, except that of their own chiefs; but others, without formally acknowledging the sovereignty of the king, furnish him with ivory, wax, and deer. such of them as live in the European territories, after their arrival in the city of ceylon for the simple things which they require of them.

To prevent themselves from being trifled or maid pocketed, they carry on this traffic, the method they employ is curious: when the people need of iron, knives, or any other articles of smith's work, they approach by night some town or village, and deposit, in a certain place where it is likely to be immediately discovered, a certain quantity of their goods, along with a talisman expressive of what they want in return. on a following night they repair again to the same place, and generally find their expected reward awaiting them. for although they are easily satisfied, and readily allow the advantage to the person with whom they deal, yet, if their requests are treated with neglect, they will not fail to watch their opportunity of doing him mischief. the case, as they can afterward confirm of the articles afforded by this tribe, for the trade profitable; and in some places frequently go into the woods, carrying with them articles of barter. this trade, however, can only be carried on in the manner already described: for no native of the woods can be more afraid of approaching a stranger than the beads, few will venture even to converse with other natives; but the wilder states, known by the name of "rampi-vadalis," are more fond of even hunting than the most timid of the wild animals. the origin of this small tribe, who live in detached families, is unknown. these beads, as well as the chemelles of jaya, who are both fair and few in number, appear (says buffalo) to be of European extraction; and he conjectures, that some European men and women have been formerly left on these islands by Spanish or other, and that, for fear of being maltreated by the natives, they and their descendants confined themselves to the woody and mountainous part of their country, where they retain a savage life. see CEYLON.

Bedaspex, in Ancient Geography, the name given by pliny to the hydaspex, or modern behut, a river of hindooostan. see HYDASPES, and BEDUT.

Bedat, in Geography, a river of France, which runs into the Allier, near montlucon.

Bedburg, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne, seated on the erft, 14 miles west of Cologne. N. Lat. 51°; E. long. 6° 20'.

Bedding, a number, in respect of horses and other cattle, denotes straw or litter spread under them to lie on.

Bedding, in speaking of a roe, is used by sportsmen for the lodging of that beast. a roe is said to bed; a hart to barbour; a fox to kennel.

Bede Point, in Geography, the eastern cape at the mouth of Cook's river, on the north-west coast of North America.

Bedea, Beddeh, or Baideh, the name of a valley near the red sea, which, according to niebuhr, is 6 german miles from sues, and where the sea (suez says) is something less than 4 leagues broad, by 50 feet deep. this valley ends in a pass between two considerable mountains, called gewonde the south, and bibel the attakah the north; and opens into the low forests of country which runs along the red sea. the mouth of this valley, opening to the flat country and the sea, was called "philamuth," and through this valley has been made a road that the israelites made their passage from the burning army of pharaoh to the red sea; and it is added, that they camped in the bay which terminated this valley, at philamuth, opposite to Bala- zeleon (which see), between migdol and that. in these circumstances, says dr. shaw, the Egyptians might well imagine, that the israelites could have no possible way of escape; insomuch as the mountains of gewonde would stop their flight or progress towards the south, as those of attakah would prevent their passing towards the land of the philistines: the red sea for a half a mile before seen to the sea; whilst pharaoh closed up the valley behind.

N. 2
them, with his chariots and horsemen. This valley, adds
Dr. Shaw, is called "Tiah Beniford," i.e. the road of the
Israelites, from a tradition, that is still kept up by the
Arabs, of their having paused though it. It is also called
"Badeah," he says, from the new and unheard-of miracle,
that was wrought near it, by dividing the Red sea, and de-
stroying it in Pharaoh, his chariots, and horsemen. Bruce
oberves, that Dr. Shaw, by interpreting "Badeah" as the
valley of the miracle, forces an etymology, because there
was yet no miracle wrought, nor was there ever any in the
valley. But "Badeah," he says, means "barren," and
"Banneah," as we may imagine, a valley between two
mountains, a desert valley. To his transliteration of "Jubel Attakah," as the "mountain of deliverance,"
Bruce objects, that so far were the Israelites from being
delivered, on their arrival at this mountain, that they were
then in the greatest distress and danger. Attakah means,
according to this traveller, to "arrive," or "come up with,"
either because they arrived within sight of the Red sea; or
it might more probably derive its name from the arrival of
Pharaoh, or his coming in sight of the Israelites, when en-
camped between Migdol and the Red sea. Shaw's Travels,

A late writer observes, that this hypothesis of the pabbage
of the Israelites at Bedem, has been given up by our best
modem critics; and the "Sinus Heroopolitans," or gulf
of Suez, pitched upon as the scene of action. The idea was
first suggested by Le Clerc, and since adopted and defended
by Michaelis, Niebuhr, and almost all the German com-
mentators. Mr. Bryant, however (Obst. on the Plagues of Egypt,
p. 378.), still contends for Bedem, and calls the arguments of
Niebuhr prejudices and misconceptions. The writer, to
whom we now refer, who excludes from this event every
thing that was miraculous, contends, for the pass at Suez,
or not far from Suez, where, he says, at this day there are
shallows fordable at low water, and which might, in former
times, have been frequently dry. Geddes's Critical Remarks,
vol. i. p. 275. See Suez.

BEDE, a town of France, in the department of the
Ile-et-Vilaine, and chief place of a canton, in the district of
Montfort, one league N. of Montfort.

BÉDEGUAR, in the "Materia Medica," the name of a fun-
ginous, or gall, growing upon the mesophyllum (tallopine),
which belongs to the class of algae, as it is polisched of and
celebrated for its alluring power; but it has hardly yet got
a place in our dispensatories, and we are quite unacquainted

BEDEL, or BEDO, Bay, in Geography, lies in the gulf of
the river of St. Lawrence, on the south-west coast of the
island of St. John's, in North America, and is situated S. by
E. from Enbmont bay, on the same coast of the island.

BEDELL, William, in Biography, an eminent prelate of
the English church in Ireland, was born at Black Notley
in Essex in 1570; and being designed for the church,
was educated at Emmanuel college in the university of Cambridge.
Having been chosen fellow of his college in 1593, and taken
his degree of Bachelor of divinity in 1599, he removed to
St. Edmundsbury in Suffolk, where he continued in high
estimation for his attention to the duties of his profession till
he accompanied Sir Henry Wotton to Venice, as his chap-
lain. Here he became intimately acquainted with father
Paul Sarpi, who taught him the Italian language, into which
he translated the English common prayer book; and in re-
turn for the favour conferred upon him by father Paul,
he drew up an English grammar for his use, and affihed him in
his studies. During his stay at Venice, he availed himself of the
knowledge of Rabbi Leo, in acquiring the knowledge of the
Hebrew language, and of Rabbinical learning; and by
his means he had an opportunity of purchasing a very fair
MS. of the Old Testament, which cost, it is said, its weight
in silver, and which he presented to Emmanuel college. He
also formed an acquaintance with Antonio de Dominis, arch-
bishop of Spalato, and communicated to him several corre-
cctions of his book, "De Republica Ecclesiastic," afterwards
printed in London. Upon his leaving Venice, after a re-
idence of eight years, he received from father Paul, as tokens
of his esteem and friendship, his picture, and several valuable
books, together with a MS. copy of his famous history of
the council of Trent, his histories of the Interdict and In-
quiration, and a collection of letters. At Edmundsbury,
where he settled upon his return to England, he employed
himself in translating the histories of the Interdict and In-
quiration, and the two last books of the history of the council
of Trent into Latin, the two first having been translated by sir
Adam Newton. In 1615, Bedell was presented by sir John
Jermy to the living of Horrington, in the see of Nor-
wich; but having samples about paying the fees of induc-
tion, which he regarded as a species of simony, he declined
accepting it; however, he was afterwards admitted without
fees, and lived in this parish for twelve years unnoticed.
To such a degree, indeed, was he disfigured, that when Diodati,
a famous divine of Geneva, came to England, he discovered
his place of abode by mere accident. Bedell was introduced
by Diodati to Morton bishop of Durham, as the esteemed
friend of father Paul, and was treated by him with peculiar
respect. In this obscure retreat he emitted his talents by the
publication of some letters which had passed between him
and James Wadsworth, formerly his fellow-collegian, but
since become a convert to popery, and a penitent of the
inquisition at Seville, concerning the authority of the church
of Rome. These letters were dedicated to king Charles I.
then prince of Wales, in 1624. In this work there was a
passage which justified reliance to tyrannical princes.
Whilst the author lived, the passage escaped animadversion;
befote the treatise was reprinted in 1685, in order to be bound
up with bishop Burnet's life of Bedell, it could not obtain
the licence of sir Roger P'Estrange, till some words were in-
troduced which made the passage appear like a reference to
arguments that were used by others. In 1623, Bedell was
elected provost of Trinity college, Dublin, which he was con-
strained to accept by the king's special command. Upon
his return to England, for the purpose of taking over his
family, he had serious thoughts of resigning his polt; but he
was purfued to return it by an encouraging letter from the
primate, Usher. He then engaged in the discharge of the
duties of his situation with vigour and activity, and was emi-
nently useful in composing divisions among the fellows, esta-
blishing discipline, and promoting religion by weekly sermons
on the church catechism, which he formed into learned lec-
tures of divinity and morals. In this employment he con-
tinued about two years, when, by the interest of sir Thomas
Jermy, and the application of bishop Laud, he was advanced
to the fees of Kilmore and Ardagh. He was consecrated at
Drogheda in September 1629, being then in the 59th year of
his age. In this new situation he had to encounter many
difficulties; but he determined to adopt plans of reformation,
and to correct the abuses and disorders that had prevailed to
a very great degree in his diocese. In order to secure suc-
cesses in his laudable designs, and the more effectually to aboli-
sh pluralities, he set an example of moderation by separat-
ing the fees of Ardagh from that of Kilmore, though he had been
at a considerable expense in recovering some of its revenues;
these fees, however, have been since re-united, and have so
continued. After the compromise of a dispute, which had
occurred between him and lord Wentworth, afterwards lord
Stratford, who was appointed lord deputy of Ireland in 1633,
on account of his having suffused a petition addressed to him for the relief of certain grievances, Bedell proceeded without interruption in his episcopal duties and reforms. In the exercise of his episcopal functions, he adhered strictly to the rubric; but in cases that depended on his own determination, he appeared to be jealous of all approaches to superstition. He was extremely averse to preaching, catechizing, and employing all means for diffusing religious knowledge; and though he never persecuted the papists, he voted most formidable opposition they had in Ireland. He carried several of their clergy by argument; and honoured to bring over the natives by disseminating among them the scriptures, with popular tracts in their own language, and by causing the common-prayer to be read every Sunday in his own cathedral. Bishop Bedell seems to have considered the theological and religious tenets that subsisted among Protessants in his time at little moment: and it was his wish to promote the well-tended project of Mr. Drury for effecting a reconciliation between the Calvinists and Lutherans.

The character of bishop Bedell was held in high estimation among the Irish, that when the rebellion broke out in 1641, the Catholic bishops of Ireland, it was known to declare, that he would be the last Irishman whom they would expel the country. He had in the county of Cavan an unoffended people for many Protessants who were driven from their own habitations; and he treated them with such humanity and kindness, that the name of the famine found his name there, and was called the Irish bishop's famine. His care was to give them shelter, and to share the fate that awaited them, occasioned his being removed, with his two sons and family, to a remote place in the middle of a lake where they suffered much from the severity of the weather. The bishop and his sons were incessant in preaching and praying with their distressed companions: and their piety inspired the inhabitants and the Irish who guarded them with that respect, that they never disturbed their devotions. At last they were removed from this place to the house of a Protestant minister, and a covert to protestantism, where the bishop was seized with a fever, which terminated his life, July 15, 1642, in the 71st year of his age. At the following of his interment, the Irish attended with great decency, and fired a volley over his grave; exclaiming in Latin, "Requiem in pace ultima Anglorum! May the last of the English be in peace!" And a popular prayer was beseeched on the occasion, is laid to have been paid by him a tribute of respect and veneration, in the following: "O famous men eum Bedell! May my foul be with that of Bedell!"

The character of Bedell, dilthered by Mr. Clegr, who resided in his family, and recorded in bishop Burnet's list of the protestant peers, appears to have been a very eminent one as a man of piety and amiable; so that in the most appropriate sense of the term, he was a patrician and apologetical bishop. He was learned and acute in his habits; his inestimable zeal in clashing at bad credit throughout the whole life of a bishop; his preservation and integrity, displayed however in various ways, and in the most particular occasion at the table of the card of Stratford, which produced the division of the private archbishop Luther, after the bishop had continued long hid, according to his usual manner, "in the church, and you will find good liquor in it": his charity and hospitality, exhibited in the supply afforded to him by many poor Irish families, some of whom he took to Christ a at his own table, and in the liberal relief which the persecuted protestants obtained in his house; his detachment from worldly interest, of which an instance, selected from many more, has been given in the separation of the sees of Kilmore and Armagh; his integrity and humanity, and his pious resignation under all the evils of life, in the obsequies of his humble station, and amid the persecutions which he suffered after the attainments of a higher rank: all these qualities, which have been arply illustrated in the memoirs of his life, exalted his character to the highest degree of professional excellence. His bequests at his death corresponded to the uniform tenor of his life; for out of his very limited fortune he allotted some legacy to every place to which he had any relation. He thus obtained the esteem of the most inferior of his countrymen, and, while he lived, and he has also secured the veneration of posterity, and left a model for the imitation of all his successors. He lived and wrote much on the controversy between the papists and protestants, and he had composed a large treatise in answer to the two questions, adduced by the former to the latter with a kind of triumph: "Where was your religion before Luther? And, What became of your ancestors who died in prosperity?" But this treatise, which the bishop intended to have printed, together with many other MSS., were lost in the conflagration at the times. His Hebrew MS. Bible was preserved, and is now republished by Emanuel college, Cambridge, to which the author bequeathed it.

As bishop Bedell objected to burial in churches, partly because it indicated superstition and pride, and partly because the patrician style of dead bodies annoyed the living, he gave orders for burying his wife in the vault frequented part of the church-yard of Holborn, and directed by his will that he should be placed near her. By his will, who was of the ancient and honourable family of L'Estrange, he had two daughters and two sons, of whom his last surviving him: one provided for by a small benefice of St. Anne, besides the entailed estate of the family in Lincoln, and the other by a small estate of two years, the only purchase made by the bishop.

BEDLINGGIAN, in Domesday, a name given by Avicenna and Seipon to the fomia amoris, or love-apple, a foot of fruit used in food by the Italians, and some other nations, and seeming to be the third kind of the freichkorn, or flesbane, mentioned by Theophilus. That author tells of two kinds of this plant, the one of which occasioned deepy disorders, and the other those people who eat of it into madness. After these, which he properly accounts poisonous kinds, he mentions a third, which was cultivated in gardens, for the sake of the fruit, which, he says, is large and excellent. This is certainly the same the fame with bedlinggian, or fomia amoris.

BEDER, in Ancient Geography. See Beda.

Beda, in Geography, a fortified city of Hindoos, in the territory of the Naxans, about 80 road miles N.W. of Hyderabad; was formerly the capital of a confederate kingdom; and is now celebrated for the number and magnificence of its palaces. 80 lat. 18°. 1 long. 73°.

BEDFORD, Arthur, in Biography, was the son of Richard Bedford, and was born at Toulouse in France, 1668. Having received the rudiments of learning from his father, he was in 1673, at the age of sixteen, admitted a member of Braven Noble college, Oxford, where he acquired some reputation as an orientalist. In 1688 he received holy orders from the bishop of Glenelg. About this time he removed to Brittish, where the mayor and corporation presented him to the vicarage of Temple church. At Brittish he had a few years, devoting a great portion of his time to the reading of Mr. Collier's attack upon the slaters; he was involved in, indeed, in a very brisk controversy with several of the greatest wits and ablest writers of the age, but acquitted himself...
himself with so much force and vivacity, as actually to produce both repentance and amendment, and was a great cause of that decorum which has for the most part been observed by the modern writers of dramatic poetry. From Britain he went to a small living in Somercotshire, where he employed himself in a work on scripture chronology, which, in consequence of Sir J. Newton’s labour, he afterwards relinquished for a time, and was engaged to assist in correcting an Arabic translation of the Painter and New Testament, for the benefit of the poor Christians in Asia. In 1719, he communicated his thoughts to Dr. Charlet, in regard to the foundation of a Syrian professorship at Oxford. The letter which contained there is a most excellent production, and is printed at length in Mr. Ellis’s History of Shoreditch, where he became chaplain to Aske’s hospital, in 1734. About 1730, he renewed his attack upon the stage, particularly directed against a new playhouse in Goodman’s Field, where Garrick made his first appearance. From this period, to the time of his death, we know few particulars of consequence but the 15th of September, 1745, closed a life that had been very useful. Bedfords many single sermons, and his tracts upon the playhouse, his chief publications were, “The Temple of Music,” 1756, 8to. “The abuse of Music,” 1755, 8vo. “Essay on singing David’s Psalms,” 1758. “Animal-versions on Sir Isaac Newton’s Chronology;” 1728, 8vo. “Scripture Chronology;” 1750, 4to. “The Doctrine of Justification by Faith, in Nine Quotations and Answers;” 1741, 8vo: and “History Mathematica;” 1743, 8vo.

Bedford, in Geography, the county town of Bedfordshire, in England, is seated on the banks of the river Ouse, nearly in the centre of the county, at the distance of 51 miles N.W. from London. It is a place of some antiquity, and was called by the Saxons Beda-ford, or Bedican Forda, signifying the fortresses on the ford. At the time of Olla, that powerful king of the Mercians, Bedford was probably of some note, as this monarch directed his corpse to be interred in a small chapel here, which, being seized on the river Ouse, was carried away by the floods during an inundation. In the year 572, a pitched battle was fought here between Cuthwulf the Saxon, and the Britons; when the latter were defeated and driven away, Alfred was obliged to deliver up several of their towns to the haughty conqueror. During the Danish wars, this town suffered materially by the ravages of these plundering marauders; but in the year 911, they were severely beaten, and driven from this neighbourhood. A strong Norman castle was erected here by Pagan de Beauchamp, the third baron of Bedford, who fortified it with a deep intrenchment and lofty wall. “While it stood,” says Camden, “there was no form of civil war which did not burst upon it.” King Stephen laid siege to, and conquered this castle; and, according to Camden, slaughtered the inhabitants; but other historians assert that he granted them honourable terms. During the contests between king John and his barons, it was besieged by the latter, but reconquered again by the forces under Fulco de Breut, to whom it was given by the king as a reward for his services. This rebellious villain occasioned his own destruction with that of the castle, by opposing Henry III., who laid siege to the fortres, and after a contest of sixty days, made himself master of this “nursey of sedition.” De Breut was sent to London and imprisoned, but his brother and twenty-four other knights were executed on the spot. (For an account of this siege, see Beauties of England and Wales, vol. 1. p. 6.) The embankments of the castle form a parallelogram; some of which may be easily traced; but the walls are entirely razed to the ground.

The government of the town is vested in a mayor, recorder, deputy recorder, an indefinite number of aldermen, two bailiffs, and thirteen common councillors. The bailiffs are lords of the manor, and have the right of fishing in Ouse for an extent of nine miles each way from Bedford. Henry III. granted the borough to the burgesses for 40l. yearly: Edward I. feized it for the crown rents, which the burgesses had neglected to discharge. The half renewal of their charter was in the reign of James II. when the mayor and aldermen were removed from their respective offices by a royal mandate, for not electing two burgesses to serve in parliament. The numbers were in consequence chosen by his majesty’s ministers. The right of election is now vested in the burgesses, freemen, and inhabitant householders not receiving alms, amounting to nearly 1400.

This town is seated in a fertile tract of land, called the vale of Bedford, which accompanies the Ouse, and produces abundant crops of wheat, barley, turnips, &c. The land on the north side of the river is a strong clay, that on the south side is much lighter, yet very productive, and its natural fertility is much increased by the overflowing waters of the Ouse. This river flows through, and divides the town, which is connected by a strong old stone bridge. On the centre of this flood the old town gaol, which was taken down about thirty-three years since. The river was made navigable to Lynn in Norfolk, by act of parliament. Bedford contains five distinct parishes, and an equal number of churches, two of which are on the south side of the river, and three on the north side. Of these St. Paul’s is the principal for size and architecture, having a handsome octagonal stone spire. It was collegiate before the conquest. Here are four meeting-houses, appropriated to different religious sects, besides one for the Methodists, and another for Moravians. To the latter is attached a dwelling-house for maiden ladies of this fact, called the single filter’s house.

This town is distinguished by many charitable endowments. The hospital of St. John isiggotip to have been founded in 680 by Robert Depary, who was the first master. It now consists of a master, who is rector of St. John’s, and ten poor men. St. Leonard’s hospital was built and endowed towards the end of the reign of Edward I. The hospital of Gray Friars was founded in the reign of the succeeding monarch by the lady Mahala de Paterhall, who was buried in the cemetery. Mr. Thomas Chritty repaired the old town-hall, founded an hospital for eight poor people, and endowed a charity school for forty children. But the most considerable charity of this town, and one whose augmented revenues have been wonderfully great, was bestowed by Sir William Harpur, whose name and benevolence it perpetuates. This gentleman was a native of Bedford, and made lord mayor of London in 1601. He purchased for 135l. thirteen acres and one rood of land lying in the parish of St. Andrew, Holborn, London. This, with his dwelling-house in Bedford, he gave to the corporation of that town, for the endowment of a school and for appointing young women of the town upon marriage. The annual rent of the above land was only 40l. at first, in 1608 it was leased for forty-one years at the annual rent of 90l. A reverend lease was granted for a further term of fifty-one years at the increased rent of 150l. A number of streets, rows, and courts, were then built on the leased ground, and the annual rent is now 4000l. which in three or four years is expected to increase at least another thousand. In consequence of this almost unparalleled augmentation of revenue, the truces, have applied to parliament for two different acts, to extend the objects of the charity, and regulate the application of the receipts. The school endowed by it is situated near St. Paul’s church, having over the door a statue in white marble of the founder, and a Latin inscription beneath. Besides the above charities a boyl of industry has lately been opened for the reception of all the poor of the five
B E D F O R D.

A new town gaol has lately been erected, and a county gaol is just finished; towards the completion of which the late Mr. Whitbread left a legacy of 500l. This town contains 809 houses and 3948 inhabitants.

Bedford was made a dukedom by Henry the fifth, who constituted John Plantagenet, third son of Henry the fourth, the first duke. After being enjoyed by a Nevill, and a de Hatfield, it was bestowed on John Ruffell, in whose family it still continues. See Sussex.

At Eltow, about one mile from Bedford, was an abbey of Benedictine nuns, founded by Judith, niece to the conqueror. At the dissolution its revenues were valued at £294 12s. 11d. The church of Eltow is a very fine ancient church, with a detached tower. This place gave birth to John Bunyan in the year 1628. His allegory of the Pilgrim's Progress was written during confinement in the county gaol. See Bunyan, Beauties of England and Wales, vol. 1.

Bedford, a township of America, in Hillsborough county, New Hampshire, incorporated in 1739, and containing 598 inhabitants, lies at the west bank of Merrimack river, 56 miles west of Portsmouth.

Bedford, a township in Middlesex county, Massachusetts, containing 523 inhabitants, 15 miles northwesterly from Boston.

Bedford, New, a flourishing town of Bristol county, in Massachusetts, containing 3335 inhabitants, lying at the head of navigation on Acquascot river, 38 miles southward of Boston. N. lat. 42° 41'. W. long. 70° 52'.

Bedford, a township of Westchester county, in the state of New York, containing 2456 inhabitants, including 38 slaves. It lies contiguous to Connecticut, 12 miles N. from Long Island found, and 35 from the city of New York. In the census of 1790, it appeared to have 32 electors.

Bedford, a town on the west end of Long Island in New York, 4 miles N. W. from Jamaica bay, and 6 E. from the city of New York.

Bedford, a village near the Georgia side of Savannah river, 2 miles above Augusta.

Bedford, a county of Pennsylvania, lying on Junatta river, and having part of the state of Maryland on the south, and Hunterdon county north and north-east. It contains 131,124 acres, including 46 slaves; half of its lands is settled, and it is divided into nine townships. Bedford, the chief town of the county, lies on the south side of Raylown branch of the same river, 25 miles E. of Berlin, and 210 W. of Philadelphia. It is regularly laid out, and has a bome gaol, and a market-house, court-house, and record-office built of brick. It was incorporated in 1755. N. lat. 40° 40'. W. long. 78° 55'.

Bedford, a county of Virginia, is separated from this: of America, by the Potomac, and by the Rapids on the east, Botetourt on the west, and Franklin county on the south. It is 34 miles long, 25 broad, and contains 10,531 inhabitants, including 2576 slaves. It is level and good, and it is greatly diversified with hills and valleys. In some parts chalk and gypseum have been discovered. The chief town is New London.

Bedford's bay. See TERRINGTONS LS.

Bedford Cape, is more than 82 leagues E. by N. from the west entrance of Bassin's forts, and the S. E. point of James's island; its latitude is 81° 14' 36", and it forms one of the western limits of Dutch waters.

Bedford Cape, is also the extreme north-east point of the coast of New Holland, opening to the south-west into Endeavour river, in S. lat. 15° 15'. E. long. 145° 15'. The sea to the east and north is almost everywhere full of shoals and reefs.

Bedford Level, is the name given to a large tract of fenny, boggy land in England, which remained a fruitful waste for many ages. It was calculated to contain 400,000 acres, distributed through the several counties of Cambridge, Huntingdon, Northampton, Lincoln, Norfolk, and Suffolk. The chief part of this extensive tract appears, from the various phenomena noticed by different authors, to have been formerly a dry and cultivated land; but other from inundations or embankments, which prevented the waters from the upland-filling at their proper outlets, or from sudden and violent convulsions of nature, it was reduced to the state of a morass: where the waters, stagnating and becoming putrid, filled the air with noxious exhalations; and not only destroyed the health of the inhabitants, but likewise impeded their endeavours to obtain the necessaries of life; the country being almost rendered impassable even to boats, by the fedges, reeds, and slime with which it was covered. The name given to it originated with Francis earl of Bedford, who having large polishing in the fens, mostly granted him by Henry the eighth, the distribution of monasteries, engaged, in conjunction with thirteen other gentlemen, to drain the whole upon the condition of having 95,000 acres in the result of successful accomplishment. These terms were accepted by the commissioners and the country at large, and in 1634 the king granted these adventurers a charter of incorporation. In the course of three years and a half this Herculean task was completed to the satisfaction of the commissioners, who, with the king's surveyor, set out the allotted land to the corporation. Above 100,000l. was expended upon this work. The king, and some persons devoted to his interest, afterwards opposed the right of the earl of Bedford, and dispossessed him of his property. Other persons engaged in the concern, but the civil wars breaking out frustrated all their schemes, and in 1649, William earl of Bedford, the heir and seic ecolor of Francis, was restored by the convention parliament to all the rights of his father. A new act was obtained to repair the decayed works, and extensive operations were adopted. In 1653 the level was adjudged to be fully drained, and after the adventurers had expended 450,000l. more, the 95,000 acres were confirmed to them. In 1697 the Bedford level was divided into three districts, called north, middle, and south; having one surveyor for each of the former, and two for the latter. This distribution, intended for its better government, proved a cause of considerable opposition and contention, and it was many years before the whole was settled in a systematic and equitable manner. To preserve the history of those litigations, charters, and laws, originating in and made for this great concern, would lead us into a narrative too extensive for the limits of our work: we must therefore refer those persons, desirous of further information, to the "Beauties of England and Wales," vol. ii., and to a work recently published, entitled "An Historical Account of the Bedford Level," with the laws, acts, relating to the same, 8vo.

That vast tract was at some former period dry habitable land, is evident from the quantity of trees and various other natural and artificial substances that have been dug from different depths in various spots of it. Daydale, in his "History of Embarking," states that many oak, fir, and other trees, were found in draining the Isle of Axholme. These were at the depths of three, four, and five feet from the surface, lying close to the roots, which were in firm earth below the moor. The bodies or holes of the trees appeared to have been burnt and burnt, and cut down with laws or axes, as the ends of them being rooted do manifest. The oaks were
lying in multitudes, and of an extraordinary size, being five yards in compass, and three or four yards long; and some smaller of a great length, with a great quantity of stones and small turf near them. Other authorities relate similar facts; and Mr. Hallam, in his "Historical Account of the Bedford Level," states that in the year 1792 many roots of trees, standing as the trees had grown, were found near Bolton in Lincolnshire at the depth of eighteen feet below the thin夯实surface. Tacitus, in his life of Agricola, relates, that "the Britons complained of their hands and bodies being worn out and I confounded by the Romans, in claining the woods and embanking the fen." This sentence seems particularly applicable to the forementioned circumstances, and alludes to the period when some great operations of this nature were evinced from the enlivened Britons. The emperor Severus is said to have been the first who introduced the fans with canals: one of which is determined by Diggle as extending about 24 miles from Dover in Norfolk to Peterborough. It was composed of gravel three feet in depth and fifty feet wide, and about five feet beneath the surface. In 1857 some workmen discovered, at eight feet below the bottom of Willesden river, a fford fome feet below, with seven boats lying in it covered with dirt; and at Whittlesea, on digging eight feet beneath the surface, a perfect soil was found with swaths of grass on it; as they lay when first moved. Near Bolton, at the depth of sixteen feet, were discovered a smith's forge, with many of his tools, some horse shoes and other iron articles. Various other things have been found at different times, and in different places, all tending to prove the extraordinary effects that nature has produced here in one of her revolutions. The cause and time of this event are not recorded. Henry of Huntingdon, who wrote in the time of king Stephen, describes this part of the country as then "very pleasant and agreeable to the eye, watered by many rivers which run through it, diversified with many large and small lakes, and adorned with many woods and islands." William of Malmesbury, living in the first year of Henry II. describes the district in glowing colours, as "a very paradisical; for that is pleasure and delight it resembled heaven itself; the very meadows abounding in trees, whose length without knots do emulac the stars. There is not any single place in it; for in some parts thereof there are apple trees; in others vines, which either spread upon the grounds, or run along the poles." From these testimonies it appears that the great inundation of the fans must have occurred after the time of the latter historian. The first attempt at draining them was in the reign of Edward I.; since which time numerous schemes have been proposed, and tried to render this large tract of country fruitful to agriculture.

BEDFORDSHIRE, one of the inland counties of England, bounded on the north by Huntingdonshire and Northamptonshire, on the west by Buckinghamshire, on the south by Hertfordshire, and on the east by the latter, and Cambridgeshire. Its limits are very irregular and artificial, having only two short spaces of the Ouse as natural boundaries on the east and west. This part of the kingdom, with the districts now called Hertfordshire and Buckinghamshire, were inhabited at the time of the Roman invasion, by a tribe of Britons called Cattieuchalani, who's chief or governor Callevallenus, was chosen by unanimous consent to lead them against the arrogant invading Cesar. In the year 310 the emperor Constantine divided this island into five Roman provinces, when Bedfordshire was included in the third division, called Flavia Caesarisiana. At the establishment of the Mercian kingdom it was made part of that government, and continued to till the year 827, when, with the other divisions of the island, it became subject to the west Saxons under Egbert. Alfred having subdivided his kingdom into shires, hundreds, and rythlings, and marked the limits and name of each division, this was called Bedfordshire, since contracted to its present name. Its length is computed at 35 miles, and breadth at 20. It contains an area of about 260,000 acres, which are divided into nine hundreds, containing ten market towns, 124 parishes, 58 vicarages, 550 villages, about 12,000 houses, and nearly 64,000 inhabitants. The face of the country, though not characterised by high hils and deep valleys, is considerably diversified with some inequalities of surface, and on the fottten side is a range of chalk hills. Beneath these is an extensive tract of cold, fertile land. The farther side of the county is mostly sandy and flat, yet, from the improvements adopted and recommended by the duke of Bedford, lord Oliffy, &c. the greatest part is appropriated to some species of agriculture. On the north and north-east the soil is a deep loam, famous from the skill employed in its cultivation, for producing large crops of corn, particularly barley. A large proportion of the land in this county is still cultivated in open or common fields, but within the last five or six years great quantities have been inclosed, and farther inclosures are intended. The chief employment for the lower classes of persons in this county arises from agriculture, making of lace, and the manufacturing of straw hats. In the two latter, numbers of women and children are constantly occupied, and from them derive a bare subsistence. There is no such thing as home lace made in the county, and the fuller's earth pits are all in Buckinghamshire. Bedfordshire is watered by the rivers Ouse and Ivel, and some smaller streams. The former enters the county on the western side, and after a devious course through many fine meadows, falls through the town of Bedford, where it becomes navigable. Flowing easterly it leaves the county at St. Neot's, on the confines of Huntingdonshire. (See Ouse.) The river Ivel rises in Hertfordshire, and falling Baldock and Biggleswade, falls into the Ouse a little above Tempsford.

Bedfordshire is in the Norfolk circuit, in the province of Canterbury, and bishropic of Lincoln. It is crossed by two Roman roads, the Watling-street and the Ichnild-way, and contains some encampments attributed to that people: one at Sandy, near Potton, called Saladun, and another near Dunstable, called Maidon-bower, supposed to be the magicum of Antoninus. The duke of Bedford has a magnificent seat at Woolham Abbey in this county. Laton Fleo, the marquis of Bute's; Ampthill Park, lord Oliffy's; and Wreell-hone, lady Lucas's, are very fine seats in the county. Beauties of England and Wales, vol. 1. BEDRUM, or BEERSON, in Ancient Geography, a town of Africa, in the interior of Libya. Ptolemy. BEDKA, in Geography, a town of European Turkey, in the Sangkhilh of Belgrade, seated on the Kolhura.

BEDMORE, or BIDDANOR, a fine province of Hindostan, lying north-west of the Myfere country, and deriving its name from Bedmore, the capital. Hyder Ally took possession of this province about the year 1763; and it was afterwards comprehended within the dominions of his son Tippoo Sultan, who styled himself regent of Myfere, and who retained it till the time of his death in 1799, when, after the capture of Serangapatam by the British troops, his dominions were distributed among the conquerors. Part of Biddanore was assigned to the Mahattas; the sons and relations of Tippoo were removed into the Carnatic; and a descendant of the ancient rajahs of Myfere, about five years old, was placed upon the throne, under certain conditions.

BEDNOR, a city of Hindostan, and capital of the foregoing province. N. lat. 15° 47'. E. long. 75° 7'.

BEDNOR,
BED

BEDOUINS, or Bamaraws, is Arabic Bedowen, formed of bed, desert, or country without habitations, a denomination given to a wandering tribe of Arabs, who retain the customs and manners of their ancestors, the "Arab Scimitar," and who are said to be descended from Ishmael. They originate from the deserts of Arabia, where they live in tents, and are separated into distinct tribes, subject to their sheiks, who direct and superintend in every transaction: and they have migrated with their flocks and herds, from Egypt and Syria, and other countries both of Arabia and Africa, inhabiting the vault deserts which extend from the confines of Peria to Morocco. They select their spots which afford them fporigs and pastures, and they are in the streeted fews a race of rovers and wanderers, without any permanent abode.

Although they are divided into dependent communities, or tribes, not infrequently hostile to each other, they may still be considered as forming one nation. The resemblance of their language is a manifest token of this relationship. The only difference that exists between them is, that the African tribes are of a latit, or shifting origin, being pertain to the conquest of these countries by the caliphs or successors of Mahomet; while the tribes of the desert of Arabia, properly so called, have been defecled by an uninterrupted succession from the remotest ages.

The Arab, says Mr. Welby, seems to be especially condemned to a wandering life, by the very nature of their deserts. To paint him short, these deserts, the reader must imagine a large soil perpetually inflected, and without limits, immense and boundless plains, without houses, trees, rivulets, or hills, where the eye frequently meets nothing but an extensive and uniform horizon like the sea, though in some places the ground is uneven and rocky. Almost invariably naked in every hide, the earth supplies nothing but a few wild plants thinly scattered, and thickets, a solitary is rarely disturbed but by antelopes, hares, locusts, and rats. Such is the nature nearly of the whole country, which extends 600 leagues in length, and 360 in breadth, and stretches from Aleppo to the Arabian sea, and from Egypt to the Persian gulf. The soil, however, varies considerably in different places; and this variety is the qualities of the soil is produced by remote differences in the composition of the deserts. In the more fertile countries, or those which are situated in low plains, the tribes are free and very independent, which is the rule in the desert of Sinai, that of the Red sea, and the interior of the Great Desert, called the Najd. Where the soil is more fruitful, as between Damascus and the Euphrates, the tribes are more numerous and less distant from each other; and in the cultivable districts, such as the province of Aleppo, the Hauran, and the neighbourhood of Gaza, the camps are frequent and contiguous. In the former case the Bedouens are nearly paddors, and seldom only on the produce of their herds, and on a few dates and flax-men, which they eat, other fresh, or dried in the sun, and reduced to a powder. In the latter they live on land, and add cheeses, barley, and even rice to their flesh and milk. Such is the situation in which nature has placed the Bedouens, to render them a race of men equally regular in their physical and moral character. This gentleman is so striking, that even their sects, their customs, and their modes of dress, are extraordinary things; especially their tribes which dwell in the depths of the deserts, such as those of Amaza, Kairas, Tai, and others, which never approach the cities. In general, the Bedouens are fierce, meagre, and ramsey; mere bed, however, in the heart of the desert, than on the frontiers of the cultivated country; but they are always of a darker complexion than the neighbouring peasants. They also differ among themselves in the same camp: the sheiks, that is, the rich, and their attendants, were always taller, and more corpulent than the common clans. Some of them are more than five feet five inches high; though in general they do not exceed five feet two inches. This difference can only be attributed to their food, with which the former are more abundantly supplied than the latter. The Bedouens of the lower clans live at a rate of habitual want and famine; and it is an undoubted fact, that the quantity of food consumed by each of them does not exceed six oun ces a day. This situation is most remarkable among the tribes of the Najd and the Hezir. Six or seven days foaked in melted butter, a little fresh milk, or curds, serve a man a whole day, and he thinks himself happy when he can add a small quantity of cake flour, or a little ball of rice. Meat is referved for the greatest festivals, and they never kill a kid but for a marriage or a funeral. A few wealthy and generous sheiks only can kill young calves, and eat baked rice with their victuals. In times of dearth, the vulgar, half-starved, eat locusts, rats, lizards, and serpents, which they breed on boards.

It has been already observed, that the Bedouen Arabs are divided into tribes, which constitute so many distinct nations. Each of these tribes appropriates itself to a certain tract of land, and is collected in one or more camps, which are dispersed through the country, and which make a successful progress over the whole, in proportion as it is exhauled by the cattle. Such is the law among them, that if a tribe, or any of its subjects, enter upon a foreign territory, they are treated as enemies and robbers, and a war ensues. Moreover, as all the tribes have affinities to each other by alliances of blood or treaties, leagues are formed which render these wars more or less general. As soon as the offence is made known, they mount their horses, and seek the enemy; when they meet, they enter into a parley, and the dispute is frequently compromised; if not, they attack either in small bodies, or man to man. They encounter each other at full pace with fixed lances, which they sometimes dart, notwithstanding their length, at the flying enemy; the victory is rarely contested; it is decided by the flight, and the ensanguined fly off at full gallop over the naked plain of the desert. The tribe which has been defeated fleares its tents, removes by forced marches to a distance, and seeks an asylum among its allies. The enemy, satisfied with their success, drive their herds further on, and the fugitives from after return to their former situation. Differences, however, are often perpetuated by the slaughter that is made on the occasion; and they have established laws among themselves, that the blood of every man who is slain must be avenged by that of his murderer. This vengeance is called "Tar," or retaliation; and the right of exacting it devolves on the nearest of kin to the deceased. If any one neglects to seek his retaliation, he is for ever disgraced. He therefore watches every opportunity of revenge. If his enemy perishes in any other way, he seeks satisfaction by inflicting vengeance on the nearest relation. These amenities are transmitted, as it were by inheritance, from father to children, and never cease but by the extinction of one of the families, unless they agree to sacrifice the criminal, or purchase the blood for a flated price, in money or in flocks. Such being the condition of society, most of the tribes live in an habitual state of war; and this circumstance, together with the mode of life, render the Bedouens a military people, though they have made no great progress in war as an art. Their camps are formed in a kind of irregular
gular circle, composed of a single row of tents, with greater or less intervals. These tents, made of goat's or camel's hair, are black or brown, or striped black and white, and thus differ from those of the Turkans, which are white. They are stretched on three or four pickets, only five or six feet high, which gives them a very flat appearance; so that at a distance one of these camps appears like a number of black spots. To the colour of these tents, says Dr. Shaw, there is a beautiful allusion, (Cant. i. 5) "I am black, but comely like the tents of Kedar." For nothing, adds this writer, can afford a more delightful prospect than a large extensive plain, in its verdure, or even scoarched up by the sun, with these moveable habitations, situated in circles upon them. These tents are the same with the tents of the ancients called "Mapalai," (Sil. Ital. i. 925; Lucan. i. 354) and are represented by Saluti, (Bell. Jug. § 21) as remem-
bering the bottom of a ship turned upside down. The length of these tents is much greater than their breadth; and they are entirely open on one of their long sides, that is sheltered from the wind, and on that which is exposed they are closed. The tent of the sheik is in some of their encampments distinguished from the others merely by a large plume of black or yellow feathers placed upon its top. Each tent, inhabited by a family, is divided by a curtain into two apart-
ments, one of which is appropriated to the women. In these tents the Bedoweens, when they take their rest, lie stretched out upon the ground, without bed, mattresses, or pillow; wrapping themselves in their hykes or blankets, and lying upon a mat or carpet, in any part of them, where they can find room. A number of these tents, from 10 to 300, are ar-
ranged in a circle, and called Dourar. The empty space within the large circle serves to fold their cattle every evening. As the shade of trees is very agreeable in torrid regions, the Bedoweens in the desert take pains in selecting shaded si-
focations for their encampments: but those of Egypt encamp on spots defilite of trees; and when any happen to be there, it is no consideration with them in the pitching of their tents. They never have any entrenchments, their only advanced guards and patrole are dogs: their horves remain saddled and ready for being mounted on the first alarm; but being strangers to all order and discipline, these camps, always open to surprise, afford no defence in case of an attack. Ac-
cidents, therefore, frequently happen, and cattle are carried off every day. The tribes which live in the vicinity of the Turks, are still more accustomd to alarms and attacks; for these strangers arrogating to themselves, in right of con-
quest, the property of the whole country, treat the Arabs as rebel vassals, or as turbulent and dangerous enemies; and on this principle they never cease to wage secret or open war against them. The Arabs, on their side, regarding the Turks as usurpers and treacherous enemies, watch every oppor-
tunity to do them injury. On the slightest alarm, the Ar-

buses, confounding the innocent with the guilty, cut their harvets, carry off their flocks, and intercept their communica-
tion and commerce. These depredations produce a misunderstanding between the Bedoweens and the inhabit-
ants of the cultivated country, which renders them mutual enemies. Such is the external situation of the Arabs.

As to their internal constitution, each tribe is composed of one or more principal families, the members of which have the title of sheiks, that is, chiefs or lords. One of these sheiks has the supreme command over the others. He is the general of their little army, and sometimes assumes the title of "Emir," which signifies commander and prince. The more relations, children, or allies he has, the greater is his influence. To these he adds other adherents, whom he attracts to himself by supplying their wants. Besides, a

number of small families, who, not being strong enough to maintain their own independence, and needing alliances and protection, range themselves under the banner of this chief. Such an union is called "Kabila," or tribe. These tribes are distinguished by the names of their respective chiefs, or by that of the ruling family; and when they speak of any of the individuals that compose them, they call them the "children of such a chief;" as, e. g. "Beni Temin," "Oulad Tai," the children of Temin and of Tai.

The sheiks and their subjects are born to the life of sheep-

herds and soldiers. The more considerable tribes rear many camels, which they either sell to their neighbours, or employ in the carriage of goods, or in their military expeditions. These smaller tribes keep flocks of sheep, and among the tribes which apply to agriculture, the sheiks live always in tents, and they leave the culture of their ground to their subjects, whose habitations are wretched tents. The peculiar distinctions which characterize their different tribes result from their different modes of living. The genuine Arabs disdain husbandry, as an employment by which they would be degraded. They maintain no domestic animals but sheep and camels, except, perhaps, horses. These tribes which are of a pure Arab race, live on the flesh of their bufaloes, cows and horses, and on the produce of some little ploughing. The former tribes, distinguished as noble, by their possession of lands, are denominated "Abel Ahsar;" and the second "Mooran," which are esteemed a middle clafs, between genuine Arabs and peasants. These are sometimes men-
tioned contemptuously, because they keep bufaloes and cows. The "Mooran," transport their dwellings from one country to another, as pasture fails; so that a village springs up suddenly in a situation where, on a preceding day, was not to be seen a single tent. The genuine Bedoweens, living always in the open air, have a very acute smell; and the feit exhalations produced by cities are one cause of their dislike of them. So acute is their smell, that, according to Niebuh, if they are carried to the spot from which a camel has strayed, they will follow the animal by filelling its track, and distinguishing the traces of its footsteps from those of other animals that have passed the same way. These Arabs who wander in the desert will fulfill five days without drinking, and discover a pit of water by examining the foal and plants in its environs. Like other people that lead an erratic life, they are addicted to robbery, and of course are formidable enemies to those who traverse the deserts; but they never murder those whom they rob, unless travellers in their own defence should chance to kill a Bedoween, in which case the others are eager to revenge his death. Upon all other occasions they act in a manner consistent with their natural hospitality. Of their hospitality Niebuh has recorded several very pleasing instances. The pulling of the car-

vans, he says, is not always owing merely to their propensity for robbing, but their expeditions for this purpose are commonly co~sidered by themselves as lawful hostilities against enemies, who would defraud the natives of their dues, or against rival tribes, who have undertaken to protect those illegal traders.

The government of the Bedoweens is at once republican, aristocratical, and even despotic. It is republican, as the people have great influence, and nothing can be transacted without a majority; it is aristocratical, because the families of the sheiks possess some of the prerogatives which every where accompany power; and it is despotic, because the principal sheik has an indefiniteness, and almost absolute authority, which he may abuse; though the rate of the tribes confines this abuse within very narrow limits; for if he should kill an Arab, it would be almost impossible for him to escape.
escape punishment, and the law of retaliation would be in
force. His subjects, harried by severity, would abandon
him and join another tribe; his own relations would depose
him, and advance themselves to his station. The dignity of
the sheik is hereditary, but not confined to the order of
princely; the petty sheikhs, who form the hereditary nobi-
lity, clasp the grand sheik out of the reigning family, with-
out considering his immediate relation to his predecessor.
Little or no revenue is paid to the grand sheik. In fact, the
principal sheik in every tribe defrays the charges of all
who arrive at or leave the camp. His rank subjects him to
great expense by the entertainment of his allies, and of the
principal men, who assemble to deliberate concerning enc
campments and removals, peace and war, and the litigations
between individuals. To these he must give coffee, bread,
baked on the ashes, rice, and sometimes roasted kid or em-
nel. In a word, he must keep open table. Of his gener-
osity depend his credit and his power. To provide for these
expenses, the sheik has nothing but his lands, a few spots of
cultivated ground, the profits of his plunder, and the tribute
he levies on the high roads, the total of which is very in-
considerable. The most powerful sheikhs among the Bed-
oueens, though sometimes denominated princes and lords,
may be compared to substantial farmers, whose simplicity
they resemble in their dress, as well as in their domestic
life and manners. A sheik, who has the command of 500
horses, does not disdain to faddle and bridle his own, nor
to give him his barley and chopped straw. In his tent, his
wife makes the coffee, kneads the dough, and superintends
the dressing of the victuals. His daughters and kinswomen
wash the linen, and go with pitchers on their heads, and
veils over their faces, to draw water from the fountain.
These manners agree precisely with the description in Ho-
mer, and the history of Abraham in the book of Gene-

The simplicity, or rather poverty of the lower clans of
the Bedoueens, corresponds to that of their chiefs. The
whole wealth of a family consists of moveables, of which the
following is a pretty exact inventory. A few male
and female camels, some goats and poultry, a mare with her
bride, and faddle; a tent, a blanket, a crooked staff, a
rathy mule, with a fillet or martlet, a pipe, a portable mill, a
pot for cooking, a leather bucket, a small coffe-roaster, a
fow split, which serves equally for a seat, a table, and a bed,
some clothes, which are put up in leather bags hung up in
their tents, a mantle of black woolen, and a few glafs or silver
rings which the women wear upon their legs and arms. But
the principal and most important article in the possession
of a Bedouen is his mares, which serve in making his ex-
cursions against his tribe, or stroking plunder in the
country or on the highway. The mares is preferred to the
horse, because, as Volney, Ciecher, and others say, she
does as much, is more docile, and yields milk, which once
often feeds the third, and even the hunger of her master.

The Bedouen of the desert prefers their butter in a
leather bag, and their water in goat skins. Their hearth
consists of a hole made in the ground, and lid with flores;
instead of an oven they use an iron plate in preparing
their bread, which is made in small cakes. In their exter-
iments, they carry with them a tappery of meal, and
their other provisions are dates, milk, cheese, and honey.
They are diluted much like their brethren in Egypt, ex-
cept that they wear flaps of unstreched leather, and of a
peculiar shape; and that many of them walk bare-footed
over the scorching sand, which renders their skin at length
insensible. Their women appear less fby and scrupulous
than the other females of the eath, converse more freely
with strangers, and expose themselves with their faces un-
veiled.

The arts of the Arabs, whose wants are few, consist in
weaving their clumsy tents, and in making mats and but-
ters. Their whole commerce only extends to the exchanging
of camels, kids, filations, and milk, for arms, clothing,
animal, a little rice or cotton, and money, which they bury.
They are totally ignorant of all science, and have not
even any idea of astronomy, geometry, or medicine. They
have not a single book; and nothing is so uncommon
among the sheikhs as to know how to read. Their whole
literature consists in reciting tales and histories, in the
manner of the Arabian Nights Entertainments. For such
stories they have a peculiar passion; and in the evening
they feast themselves on the ground, at the door of their
tents, or under cover, if it be cold, and there, ranged in a
circle, round a small fire of dung, with their pipes in their
mouths and their legs crossed. After indulging for some time
in silent meditation, they amuse themselves with the recital of
tales of this kind. They have likewise, besides their love-stories,
their love-dreams, which have in them more nature and senti-
ment than those of the Turks and the inhabitants of the
towns.

It has been observed, that the Bedouen, though their con-
dition is the depths of the desert, resembles, in many respects,
that of the savages of America, have not the same force.
So that, accustomed to endure hunger, they have never been
addicted to the practice of eating human flesh; and their man-
ners are in general much more sociable and mild. Volney
attributes this difference of manners to the difference of their
situation. The American savages have been induced by the nature
of their country to become hunters rather than shepherds; and
their habits have contributed to produce and cherish a fer-
city of character. But the Bedoueens, whose naked plains,
without water or forests, are dotted with hills and groves,
and possessing the camel, have been determined to a pastoral
life, and hence they have acquired manners which have influ-
enced their whole character. Finding at hand a light, but con-
stant and sufficient nourishment, they have acquired the
habit of frugality. Content with the milk of the camel and
dates, they have not defined flesh; they have had no blood;
their hands are not accustomed to slaughter; nor their ears
to the cries of suffering creatures, and they have preferred a
peaceable and humane heart. Nevertheless, when the Arab
shepherd became acquainted with the life of the horde, his
lust of life was considerably changed. The facility of
palling over extensive tracts of country rendered him a war-
derer. He became greedy from want, and a robber from
greediness; and such is his present character. A plunderer
rather than a warrior, the Arab possesses no language, con-
geny; he attacks only to defend; and if he meets with ref-
nunciation, he will take a small booty, in order to put in com-
petition with his life. To irritate him, you must fill his blood,
and then he is found to be an obdurate in his vengeance,
he was cautious in avoiding danger. The spirit of rapin,
with which the Arabs have been often reproached, is ex-
ercised only towards reputed enemies, and is accordingly
founded on the acknowledged law of almost all nations.
Among themselves they are remarkable for a good faith, a
humanity, and a generosity, which would do honour to the
most civilized people. What each more nobly than the
right of asylum to protected among all the tribes? A
stranger, may even an enemy, touches the tent of the Bed-
ouen, and from that instant his person becomes inviolable.
It would be reckoned a disgraceful manners, an unforgivable

to satisfy even a just vengeance at the expense of hospitality. Has the Bedoween contented to eat bread and salt with his guest, nothing can induce him to betray him. The power of the Sultan himself would not be able to force a refugee from the protection of a tribe but by its total extermination. The Bedoween, so rapacious without his camp, has no sooner set his foot within it, than he becomes liberal and generous. What little he possesses he is even ready to divide; and when he takes his repast, he takes his seat at the door of his tent, in order to invite passengers; and this act of generous hospitality he regards as a matter of duty; and of course he himself takes the same liberty with others. So far does this reciprocal generosity prevail, that one would imagine that Arabs poffesed all their goods in common. Nevertheless, they are no strangers to property; but without that selfishness which the increase of the imaginary wants of luxury has given it among polished nations. Among the Arabs there exist a kind of equality in the partition of property, and a variety of conditions, which have appeared, says Volney, to the wisest legislators as the perfection of human policy. From this state of things, it becomes difficult for their sheikhs to form a faction for enlaying and impoverishing the body of the nation. Each individual, capable of supplying all his wants, is better able to preserve his character and independence; and private property becomes at once the foundation and bulwark of public liberty. This liberty extends even to matters of religion. Whilst the Arabs of the towns crouch under the double yoke of political and religious delopinfy, those of the desert, or the Bedoween, live in a state of perfect freedom from both. On the frontier of the Turks, indeed, the Bedoween from policy preserve the appearance of Mahometanism; but so relaxed is their observance of its ceremonies, and so little fervour has their devotion, that they are generally considered as infidels, who have neither law nor prophets. They scruple not to say, that the religion of Mahomet was not made for them; for, they add, "how shall we make ablutions, who have no water? How can we bellow goats, who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continued fast? And what necessity is there for us to make the pilgrimage to Mecca, if God be present everywhere?" In short, every man acts and thinks as he pleases; and the most perfect toleration is established among them. Volney observes, that there are few polished nations, whose morality is, in general, so much to be esteemed as that of the Bedoween Arabs. If this be the fact, we may reasonably ascribe it to a variety of circumstances altogether independent of that singularity which he mentions in connection with it, and which serve to counteract its effects. Among these Bedoween, as well as the Turk¬men and Curds, religion is the free from external forms, inasmuch that no man has ever seen among these classes of people either priests, temples, or regular worship. We can scarcely imagine, that even Mr. Volney himself, though we are not unapprized of his mode of thinking on the subject of religion, would presume to ascribe the excellence of the morality of these tribes to their total want or diffu¬e of all the outward means of producing and maintaining it; but he would probably sug¬ge t the inefficacy, in a moral view, of those forms and modes of worship which are established and practiced among the Mahometans. The manners of these people are preferred pure and sim¬ply, and such as are described in their ancient histories, as Sosmine observes, by the absence of luxury and fac¬titious pleasures, bringing immorality in their train, which have made no attempt to fix their abode on the parched and barren lands occupied by the Bedoween.

The Bedoween, who live in tents in the desert, have never been subdued by any conqueror, but those who have settled near towns, and fertile provinces, are reduced, in fame measure, to a state of dependence on the sovereigns of those provinces. Such are the Arabs, in the different parts of the Ottoman empire; some of whom pay a rent or tribute for the towns or paturages which they occupy; and others frequent the banks of the Euphrates only in one season of the year, and in winter return to the desert. These last acknowledge no dependence on the Porte, neither are, properly speaking, subject to the Turks; but the police of the latter occasions frequent, but neither long nor bloody, wars among the Bedoween. Whenever the Turks interfere in their quarrels, all the tribes combine to repel the common enemy of the whole nation. Every grand sheikh considers himself as absolute lord of his whole territory, and accordingly exacts the same duties upon goods carried through his dominions as are levied by other princes. The Europeans, therefore, are wrong in supposing the sums paid by travellers to the grand sheikhs to be merely a ran¬som to redeem them from pillage. The Turks, who send caravans through the desert to Mecca, have submitted to the payment of these duties, paying a certain sum annually to the tribes who live near the road to Mecca; and these in return keep the wells open, permit the passage of mer¬chandise, and escort the caravans. If the Bedoween sometimes pillage these caravans, the haughty peridious conduct of the Turkish officers is always the first cause of such holi¬ties. The tribes of Bedoween on the confines of the desert, are those who have preferred the national character in its greatest purity, and who have maintained their liberty unimpaired. Of these, that denominate "Beni Khaled" is one of the most powerful, on account of its conquests and wealth, and the number of other tribes subject to it. It has advanced from the desert of Nedsed to the sea, and conquered the country of Lachfa. That of the tribe of "Kish" inhabits the plains from the Persian Gulf, and rarely encamps. These have possessions in the province of Ghafitan in Per¬sa, in which province there are five different considerable tribes of independent Bedoween. The tribe of the "Beni Lam," inhabiting between Korai and Bagdad, upon the banks of the Tigris, receive duties upon goods carried from Baffora to Bagdad, and sometimes pilage caravans. "The Montel¬fek," or "Montefik," are the most powerful tribe north from the desert, with respect to extent of territory and number of subaltern tribes, acknowledging their authority. They pillefs all the country on both sides of the Euphrates, from Korai to Arjfe. The Arabs of this tribe often plunder travellers passing between Helle and Baffora, and are frequently chastised by the pacha of Bagdad, who de¬poses their sheikh, and substitutes another in his room. This tribe derives its appellation from one Montefik, who came from Gedass, and was descended from a family, illustrious before the days of Mahomet. All these tribes, that live on the confines of the desert, are genuine Arabs, who breed sheep and camels, and live in tents. This, however, is the case with respect to the reigning tribes; though some of the subaltern ones have lost their nobility, by intermixing the practice of agriculture with the habits of pastoral life. The rich plains of Melopotamia and Assyria, which were once cultivated by a populous nation, and watered by fur¬prising efforts of human industry, are now inhabited, or rather ravaged, by wandering Arabs. The lands between the Tigris and the Euphrates are occupied by tribes prac¬tising agriculture, or "Moxdan." All travellers complain of the robberies of the Bedoween of Assyria. This and thievish disposition of these people seems to increase the farther they recede from their native deserts, and to ap¬
approach the country inhabited by the plundering Curds and Turkmens. The pachas of Syria are as much interested in guarding against the depredations of the wandering Arabs, as the Turkish governors on the Persian frontier. As it is of great consequence to the cities of Aleppo and Damascus (which lie) that their caravans travelling to Bagdad or Bafturn should be suffered to pass in safety through the desert, the pachas, in order to protect them from insult and pillage, artfully venture to employ one tribe of Arabs against the other; and with this view they give the title of Emir to the most powerful sheik in the neighbourhood. To him they pay an annual sum, or the produce of a certain number of villages, for guiding the caravans, for keeping the other Arabs in awe, and for levying the dues from those who feed their cattle on the pacha's grounds. The most powerful tribe near Aleppo, is denominated "Maulabi," besides which there are many other tribes, amounting to twenty, or more, who pay a trifling sum to the Emir for liberty to hire out or sell their camels, and to feed their cattle through the country. Other tribes pay a tax for the privilege of gathering falt in the "Defert of Salt." In the vicinity of Damascus there are numerous tribes, one of which, named "Abu Salibe," it is said, consists solely of Christians. The greatest tribe in the desert of Syria is that called "Amife," which is spred into Nedsjed, and reckoned the most numerous tribe in the heart of Arabia. The caravans of Turkish pilgrims pay the Bedowees of this tribe a considerable duty for their free passage through the country; when dissatisfied, they plunder the caravans, and they often make war on the pacha of Damascus. The Bedowees, who occupy those countries that are usually comprehended under the appellation of "Arabia Petraea," or the deserts that lie between Egypt, Syria, and Arabia, properly so called, are distributed into several tribes which wander among dry sands and rocks, seeking some few interperfed spots, that afford scanty food for their cattle. The Arabs of Palistine seem to be poor neglected hordes, who inhabit barren and dismal country; and the pilgrims that visit the Holy Land have given exaggerated relations of the molestations and injury which they have suffered from them.

Of the Bedowees, there are several tribes, who arrive every year in Egypt after the inundation, from the heart of Africa, to profit by the fertility of the country, and who in the spring retire into the depths of the desert. Others of these are nomad tribes, who live in the desert, and which they follow, and assail, in the same manner and customs. Ignorant and poor, they preserve an original character distinct from surrounding nations. Peaceful in their camp, they are everywhere also in a habitual state of war. Some of these, dispersed in families, inhabit the rocks, caverns, ruins, and sepulchred places where there is water; others roamed in tribes, encamp under low and sandy tents, and pass their lives in perpetual migration. Some in the first instance sonne times in the backs of inns; having no other attachment to the soil, fly wherever nature or the indulgence of their flocks. The Bedowees, whom they plunder hate them; the travellers, whom they despise, speak ill of them; and the Turks, who dread them, endeavour to destroy and corrupt them. It is calculated that the different tribes of them in Egypt might form a body of 30,000 horsemen; but these are so dispersed and dilutated, that they are only considered as robbers and vagabonds. The young women among the Bedowees of Egypt might be reckoned not defifute of beauty, but Semites; though they have a tawny hue, and indubitable countenances, not easily reconcilable to the eyes of a European, which they painfully mark on the lower part of the face with a needle, and a black dye. The men are, in general, very handsome.

A simple and uniform mode of life, uninjured by excess, prolongs their existence to the period fixed by nature. They live to be very old, and at an advanced age, they are remarkable for their truly general and patriarchal physiognomy. Those, however, who are wandering, predatory, and wretched, are for the most part of a slender frame and mean appearance.

Some of the Egyptian Bedowees have among them a tradition, that their ancestors were Europeans and Christians, one of whose ships having been wrecked on the coast of Egypt, the crew had been plundered, and reduced to the necessity of living in the desert. The only remnant they have of the supposed Christianitv of their forefathers is the sign of the cross, which they traced with their fingers upon the sand. In the plans that have been adopted in Egypt, under Ali Bey, for preventing robbery and establishing public tranquility, the extermination of the Bedowees has been a principal object. Several hordes fell victims to the policy of the governor; and whole tribes retired into the desert. However, the people of Egypt, far from approving these means of protecting their property, murmured aloud at the scarcity of camels, sheep, and other animals, with which the Bedowees had been accustomed to supply them in great abundance, though it was their practice to steal the property which they had for. It has since appeared, that the prosperity of Egypt is intimately connected with the preservation of the Bedowees.

To the above accounts of the Bedowees, extracted from modern travellers, we shall subjoin the description given of their ancestors above 1800 years ago by Diodorus Siculus, l. xix.

"The wandering Arabs dwell in the open country, without any roof. They themselves call their country a solitude. They do not chuse for their abode places abounding in rivers and fountains, lest that allurement alone should draw enemies into their neighbourhood. Their law or their custom forbids them to low corn, to plant fruit-trees, to make use of wine, or to inhabit houses. He who should violate these usages would be punished infallibly with death, because they are persuaded, that whoever is capable of subduing himself to such conveniences, would soon submit to the yoke in order to preserve them some lead their camels to graze, some their sheep. The latter are the wealthiest; for, besides the advantages they derive from their flocks, they go to sell in the far-points frankincense, myrrh, and other precious aromatics, which they have received in exchange from the inhabitants of Arabia Felix. Extremely jealous of their liberty, at the news of the approach of an army, they take refuge in the depth of the desert, the extent of which serves them as a rampart. The enemy, in fact, perceiving no water, could not dare to traverse them, whilst the Arabs, being furnished with it by means of vell is concealed in the earth, with which they are acquainted, are in no danger of this want. The whole field being composed of clayey and soft earth, they find means to dig deep and vast cisterns, of a square form, each side of which is the length of a acre. Having filled them with rain-water, they close up the entrance, which they make uniform with the surrounding ground, leaving some imperceptibletoken, known only to themselves. They accustom their flocks to drink only once in three days, so that when they are obliged to fly across these parched sands, they may be habituated to support thirst. As for them-
themselves, they live on flesh and milk, and common and ordinary fruits. They have in their fields the tree which bears pepper; and a great deal of wild honey, which they drink with water. There are other Arabs who cultivate the earth. They are tributary, like the Syrians, and resemble them in other respects, except that they do not dwell in houses. Such are pretty nearly the manners of this people." Volney's Travels in Egypt and Syria, vol. i. Niebuhr's Travels through Arabia, &c. vol. ii. p. 183. Somnian's Travels in Upper and Lower Egypt, p. 393. Savary's Letters in Egypt, vol. ii. p. 274, &c. See Arabia.

BED, or Bedder Houjfine, in Geography, a place of Arabia, 20 miles from Medina, and 40 from Mecca, lying in the high road of the caravan of Egypt. The fertile vale of Bedr is rendered famous by the battle fought between Mahomet and the Koreifh of Mecca, in the second year of the Hegira, A. D. 623. In this vale Mahomet was informed by his freedmen of the caravan that approached on one side, and of the Koreifh, consisting of 100 hore, and 80 men, who advanced on the other. After a short debate, the holy prophet sacrificed the prospect of wealth to the pursuit of glory and revenge, and a light intermarch was formed to cover his troops, and a stream of fresh water that glided through the valley. "O God," he exclaimed, as the Koreifh descended from the hills, "O God, if these are destroyed, by whom wilt thou be worshipped on the earth! Courage, my children, close your ranks; discharge your arrows, and the day is your own." At these words he placed himself, with Abu'lbeaker, on a throne or pulpit, and instantly demanded the succour of Gabriel and 3000 angels. His eye was fixed on the field of battle; the Musulmans fought and were prifoners; in that decisive moment the prophet started from his throne, mounted his hore, and called a handful of fan into the air: "Let their faces be covered with confusion." Both armies heard the thunder of his voice; their fancy beheld the angelic warriors; the Koreifh trembled and fled; feventy of the bravest were slain; and seventy captives adorned the first victory of the faithful. The dead bodies of the Koreifh were depoifed and infulted; two of the most obnoxious prifoners were punished with death; and the random of the others, 4000 drams of silver, compensated in some degree the efcape of the caravan. Herbelot. Bib. Orient. p. 180. Gibbon's Hist. vol. iv. p. 360.

BEDRIACUM, in Ancient Geography, a village of Italy, situate, according to Tacitus, between Verona and Cremona, or about 16 miles from the confluence of the Po and Bib. Clavier places it between Cremona and Mantua, and supposes it to have been the present Caneto, a large village on the left of the Oglio. M. d'Aulville thinks that it was the place now called Cividale on the right side of that river. It is famous for two battles fought within a month by Romans against Romans, A. D. 69; in the first of which the emperor Galba was defeated by Otho, and in the second Otho was defeated by Vitellius.

BEDRIEGER, Groote Bedrieger, in Ichthology, a name given by some to the Parnus infidius of Pallas and Gmelin. Vide Rynich, authors &c. BEDRIP, or Bedre, or Bedrepe, the culinary service which inferior tenants anciently paid their lord, by cutting down his corn, or doing other work in the field. The word is formed from the Saxon bidon, to pray, and reft, to reap, or cut corn.

BEDROLA, in Geography, a town of Spain, in Arragon; 8 leagues from Sanguesa.

BEDSTRAW, in Botany. See Galium.

BEDUSTA, in Ancient Geography, the ancient Hindoo name of the river Hydaspes, or the modern Behut.

BEDWIN, Great, in Geography, is an ancient borough town situated on the eastern side of the county of Wilts, in England; at the distance of 70 miles west of London, and 17 miles north from Salisbury. It is an ancient borough by prescription, and sent members to all the parliaments of Edward the first. During some parts of the frequent reigns, it intermitted sending; but from the 9th of Henry V., two members have constantly represented the borough. These are elected by about eighty persons who poifefs freeholds, or inhabit ancient burgage-houses. The town is governed by a port-reve, affifted by a bailiff, and some inferior officers, all of whom are chosen by the former. Bedwin had formerly a market on Tuesday, but this has been discontinued for some years, in consequence of its proximity to the larger market town of Marlborough.

Dr. Stukeley and some other antiquaries have given to this place the honours of a Roman station, and a Saxon city; but there is little proof or probability, that it was ever the former. There are some encroachments remaining on a hill fourth of the town, where it is said Oliver erected a caflle, and where he pitched himself as viceroy of Wilthire and Berkshire. Towards the end of the seventh century, a severe and destructive battle was fought near this town, between Wulfdhere, king of Mercia, and Edmen, a powerful Saxon nobleman, when, as Mr. Turner in his Anglo-Saxon History, characteristically observes, "mutual destruction was more confpicious, than the decision of the battle."

The church of Bedwin is a large ancient structure, built mostly with flats, and shaped in the form of a crofs. Among the monuments it contains, is one to Sir John Seymour, who was father of the protector, and of the unfortunate lady Jane Seymour. According to the tradition of the neighbourhood, this lady was married to the tyrannical monarch at a place called Wolf-hall, near Bedwin, where Sir John Seymour then refided.

Here are two annual fairs. The parish contains 316 houses, and 1632 inhabitants, most of whom are employed in agriculture. The famous Oxford physician, Dr. Thomas Willis, was born here.

About two miles west of the town is Tottenham park, a seat of the earl of Aylebury. The house was built by the celebrated earl of Burlington, on the site of an ancient palace belonging to the marquis of Hertford, who was afterwards created duke of Somerset. Tottenham-park is part of the forest of Savernake, which is the only private forest in England independently belonging to a subject. It is a large tract of wild ground, profusely wooded, and containing much fine old oak timber.

BEE, Apis, in Natural History, a genus of the Hymenopterous order, in the Linnaean classification of insects; in Physiography, in Hymenoptera, more commonly expressive of the common honey-bee (apis mellifica), although likewise applicable to the various other species of honey-bees, and in a still more general sense to those which do not, as well as those which do, produce honey; those which live in societies, as well as those which lead a life of solitude, or in independence from their kindred kinds; all which have a certain appearance and call of character, which, in the common acceptance of the word, claim the distinctive epithet of lec, or honey-bee, humble bee, wild bee, &c.

The bee, or aps tribe, characterised in the Linnaean system as having, in common with other hymenopterous insects, four membranous wings, and the female being armed
armed with a sting. This genus comprehends an amazing number of distinct species, many of which are clearly ascertained; some are doubtful; and many, if we may be allowed to reason by analogy, are as likely yet unknown. Upon the whole, there are many genera of insects that comprehend a greater number or variety of species than the *Apis.* The majority of those correctly known have been already enumerated under the article *Apis,* to which the reader is requested to refer. The principal subdivisions, or natural families of the genus under which they have been described by Linnaeus, and by various writers before and since the time of that naturalist, will be also found there. Descending from the minutiae of critical inquiry into the complicated characters of those subdivisions, it reverts with us in this place to speak of the *Apis* in another point of view—as a race of animals highly entertaining, for their manners, habits, and instinctive properties, to the naturalist; important to the economy in rural life; and familiar to every one by the trivial appellation of “a bee.”

Under this head, the common honey, or domesticated bee, demands the first consideration, as it will serve to elucidate the peculiarities of the whole tribe, at least so far as they are of material consequence in the concerns of human life. By the indiscriminate term of the common honey-bee, we comprehend what are individually named the *queen bee,* or female; the *bee,* or drone; and the *worker bee,* or neuter.

The natural history of the common bee has been more fully and impartially considered than that of any other creature of the insect tribe: with the exception of the silkworm, and the coccus employed in dyeing, there appears to be none more deserving of the regard paid to it. As an object of advantage, the honey-bee has been deemed, by the common sentiment of mankind in all ages, of sufficient consequence to be particularly attended to. We are not to forget the occasional recurrence of classic writers of antiquity to the bee: the pastoral poets celebrate its praise; nor was the cultivation of this useful creature overlooked even by the earliest Britons, of whom we possess any record. Its preservation and its culture were recognized in their laws; the bee itself was considered as a most desirable domestic, and the honey one of the greatest delicacies the bounty of heaven had granted them. In modern days, the importance of the bee has suffered a very sensible diminution in this country: still it is cultivated, and with advantage, by the thrifty agriculturist. But in the warmer regions of Europe, such as the south of France, Italy, and the neighbouring parts of Asia, its cultivation is attended with more success than with us; the climate of those countries, mild, invigorating, and abundantly productive of luxuriant vegetation, is perfectly congenial with the nature of the bee; there it requires but little care from the hand of culture, and amply pays that little bestowed with the spontaneous produce of its industry.

While we are speaking on this particular topic, it will not be thought surprising to advert to a few remarks that have lately fallen from the pen of M. Latiere, an ingenious French naturalist, in an introductory discourse to the study of bees published last year in Paris. *Dans la grasse ferme des animaux apprêts infestes s'ayant faire,* he writes, *n'est pas de plus l'histoire prie et une aussi grande richesse de faits, et une aussi prodigieuse sévérité de preuves, que celle des abeilles.* Sous les rapports de l'histoire, ces insectes font le chef-d'œuvre de la toute-puissance du Créateur; et l'homme humain, si fier de ses dons naturels, est, en quelque sorte, lié à la vue de l'intérieur d'une ruche. Celfenis de nous extasifer sur la cabane inopière du collin, sur la construction inextricable du nid de quelques oiseaux; telle celt est visible, lorsqu'on voit les travaux de l'abeille. Quoi!
Bees, Sexes of. There are in every hive or colony three
forts of bees, which Linnaeus calls regina (femina), fuci,
(mares), and operariz (fadones). The first is the queen, or
female; the second the drones, or males; and the last the
working bees, or neuters. The queen is larger than the
others; she is armed with a sting, and has thirteen joints
in the antennae, including the radicle; those of the male have
one joint more in the antennae; the eyes in this sex are large,
and it is destitute of a sting; the working bees are armed
with a powerful sting, and have fifteen joints in the antennae.
And here it will be proper to observe, that the circumstance
of the antennae in the female and neuter bee, containing the
same number of articulations, were not observed till lately.
Linnaeus tells us the antennae of the female has ten joints,
the male eleven, and the working bee fifteen; the discovery
to the contrary is due to Mr. Kirby, who, to use his own
language, says: "In every one of these affections, with
due deference to a name to great be it spoken, Linnaeus is
mitaken."

Bees, Structure and Anatomy of. There is nothing particu-
larly striking in the structure of the bee. In their form
they vary in different species, and in different sexes, but ge-
erally speaking they are uniformly bulky animals, having
the head large, the eyes oval and conspicuous, the thorax
broad and thick, as well as the body, and molt are com-
monly covered with hair or down; the sexes differinhal
by the number of articulations in the antennae (being one
more in those of the male than the female), and the mouth
furnished with strong instrumenta cibaria. The jaws and lip
of the apius mellifica are membraneous at the tip, the for-
er bidentated; as in other bees, the jaws open to the right
and left, and serve to carry out of the hives any thing
that incommodes them.
To those which have no stinger, the teeth of these jaws are
of essential service in their wars with such as pilfers that formidable weapon; and it is
believed, but on what foundation is uncertain, that the wounds
inflicted by means of these teeth inevitably prove mortal to
the other, or flinging bees, when they bite. The tongue
in different kinds of bees is very different in shape. It has
been observed, that in the more industrious species, this in-
mument, when stretched out, is shorter than in the others;
be this as it may, the tongue of the common honey-bee is
long, inflected, and extremely pliant; by means of this, the
bee not only procures itself necessary subistence, but it is
also employed by the animal to collect the honey, which
we appropriate to ourselves. The parts of which the tongue
connects in different bees are not uniformly distinguished
by the same terms in the works of entomological writers.
Proboscis is that by which Mr. Kirby, after the example of
Linnaeus, when defining the Aris genus, calls the tongue,
together with all the machinery that belongs to it, inclusive
of the sheath or vagina. This is more fully illustrated in
his definitions of the proboscis of the male, the female,
and the neuter of the common honey-bee, wherein the struc-
ture of this instrument, and the several parts of which it
connects, are correctly discriminated. It may not be alto-
gether irrelevant to our purpose to follow this agreeable writer
in some degree, whilst explaining the structure of the
proboscis or langue. This part of the body is composed of
seven pieces; Mr. Kirby speaks of more, viz., the fulcra,
tubus, valvulae, cardo, lora, palpi exteriores, palpi interi-
ores, laciniar exteriores, laciniar interiores, and lingua.
The fulcra is that part upon which the tube is rested, and
has been noticed both by Swammerdam and Reaumur; the
latter of whom calls it le pivot. Tubus is that part called
by Fabricius the base of the tongue, and by Swammerdam
and others the sheath of the tongue, including the base of
that organ; and in a certain measure answering the fame purpose
as the valvulae. The latter, or valvulae, form the exterior sheath of the
tongue. As to the cardo, cardines intervene between the
valvulae and the lora, and seem to perform the office of
hinges. Reaumur mentions these as " filets tendineux par
les quelles les tiges font attachees a leurs appuis." Lora are so
named by Mr. Kirby from their use, which seems to be to
let out or pull in the proboscis, being those parts which
Reaumur calls "les leviers;" when the proboscis is extend-
ed, the angle on which the fulcra of the tube fits, is ob-
served to point towards the breast, but when retracted, its
position changes, and it points towards the mouth. Pal-
pi exteriores are organs noticed in the rude sketch of the
proboscis of the hive bee by Swammerdam, who does not,
however, speak of them. In this kind they are small,
and confining only of a single joint, escaped the obser-
vation of Reaumur; in some bees they are large, and con-
tain from one to six joints. Palpi interiores are those
parts of the proboscis which Reaumur distinguishes by the
term "barbes;" in the common bee, these consist only of
two articulations; in other species they are known to con-
tain a greater number. De Geer calls thee little organs,
"les petit barbillons." Lacina exteriores are to be met with in
almost every family of the apius genus. Lacina interiores
are peculiar to the apius, and embrace and defend the tongue
where it enters the tube; these are called by Swammerdam
the third pair of joints or the proboscis; Reaumur mentions
them as "pieces qui embrastent et fortifient la trompe;" Lat-
relle, in his Nomada family, names them 'lames later-
ales." Lingua, or the true tongue, called sometimes by
De Geer "le levre inferior," or inferior lab, is occasionally
mentioned by Fabricius under the name of labium, or by
Roemer, in a work entitled "Genera Insectorum, &c.
lays down the character of apius thus:—"Jaws dentated,
with an inflected proboscis, with two bivalve shells, in which
the tongue is included." Latrelle, in a work recently pub-
lished, divides the apius genus into two families; the first,
corresponding with the *melitta* of Kirby, has these characters: "Machine et langue tres longues, deux ou trois fois plus longues que la tete, dirigees en avant dans l'action, et don la bave refroidiement de la cavite ou elles sont logees. Partie faillant de la langue evace, a trois divisions plus courte que la gaine: celle-ci longue et cylinrique." The two Fabrician genera, *bylæus* and *andrena*, are arranged under this family; the tongue in *bylæus* is thus described: "langue large; divisions du milieu echancree, dentee, echelle." In *andrena*, "langue oblongue; division au milieu en point renflee." La gaine, or sheath of the tongue, is not invariably cylindrical in this division (*melitta* of Kirby); it is sometimes conical.

In the family which includes the true *apes* of Kirby, the tongue is thus described by Latreille: "langue tres longue, etroite, lineaire presque, cylinrique, un peu coriace, a papillons les extremitie, filee a la fortie de la gaine." *Nomada*, *apes* and *ceueta* of Latreille are included under this head. "Nomada* is thus characterized still further: "langue d'une piece avec deux tres petites foies laterales." *Apes*, "langue de trois pieces (organes de la nutrition plus petits dans les males)." *Ecceta*, "langue de cinq pieces." We have deemed it requisite to be thus minute in following the observations of Kirby, Latreille, and others, who have directed and examined the structure of the proboscis in different bees, with the aid of microscopic glasses, for the purpose of showing the facility of the commonly received opinions, that in all bees the structure of this organ must be the same. For instance, we feel that in one family the tongue is very long, more than twice or thrice the length of the head, with the extremity opening into three divisions, the whole of which is contained within a sheath of a cylindrical form; in others this part is conical. Some have a large tongue, with the middle division of it foping, jagged, and ciliated, and the end truncated; again, others have an oblong tongue, the middle piece of which is cleft and lacerated at the tip. In many, the tongue is very long, straight or linear, almost cylindrical and papillos at the extremity; while the tongue in others consists of a fipple piece, having two lateral laciniae of a small size; and sometimes, on the contrary, the tongue is formed of five pieces; in the *bylæus*, *andrena*, and *nomada* families, the tongue is three-eclft, in *apic* five-eclft, and in *ceueta* seven-eclft.

In the formation of the proboscis, the purpose for which nature has designed this curious instrument is very apparent. That of the common bee has been examined with attention. Tiff, the sheath or external parts are observed to protect and strengthen the organs of nutrition which they contain; the valves of the sheath are disposed on each side of the tongue in pairs; with the tongue itself, which is perversus, the bee extracts and gathers the necessary pieces from flowers, which are shortly after converted into honey. The two pieces of the external sheath are horns or membranous, those of the inner sheath are placed higher above the base than the external ones. The proboscis is partly membranous, and partly of a gritty nature, and is the lower part formed in such a manner that it is capable of considerable dilatation, by means of which the internal cavity may be prodigiously enlarged, and rendered capacious enough to receive a great quantity of native honey. When the proboscis is shut up, and inactive, it is very much flattened, and broader than it is thick. The lower and membranous parts of the trunk at the base have no hair upon them, but are covered with little transparent protruberances that are placed in regular order, and at equal distances from each other; these are tipped to be glandules, and may have a considerable share in charging or preparing the honey that is swallowed or taken up by the proboscis. Down the middle of the proboscis there is a tube of a much harder nature than the flutes which becomes rather tapering towards the apex, where the proboscis is very thick set with small hairs, which may serve to keep it in a proper situation when in use.

The proboscis is not cylindrical, but rather a kind of convex blade, terminating to all appearance in a point; and the sheaths are so contrived as to cover little more than the upper part of it. Thefe exterior sheaths lap over each other on the upper part, so that the outside of the proboscis is protected by a very strong double edge; a covering that was unnecessary for the under part, because, when this instrument is in use, the sheaths are opened, but when inactive, it is to folded, that the under part is protected by the body of the bee. Within the exterior sheath, and near the bottom, are two levers, which are fixed to the end of the proboscis, and by the motion of which it is raised and lowered. If a bee is attentively observed when it alights upon a full blown flower, the activity and address with which it employs this apparatus will prove highly entertaining. The tongue is first protruded, then lengthened, then shortened, and continually kept in motion, bending and turning in every possible direction to adapt itself to the form of the flower.

The fling of the bee is a curious weapon, adapted to the indubitable habits of its life, which expose it to a multitude of dangers. It is truly an instrument in every manner calculated for offensive or defensive operations in the annoyance of its enemies. The wound which the bee inflicts with its fling is feverous, to its little antagonists it oftentimes proves mortal, because it not only strikes deeply into their bodies, but conveys at the same time a powerful poison into the wound which it occasions. In the queen or female bee, the fling is longer as well as fatter than in the working bee, and is bent a little under the belly. The female and the working bee are those only which are furnished with a fling; for the male, as before observed, has none. The fling in both is put in motion by means of certain muscles attached to its base, and contained within the abdomen, where also the glands for the secretion of the poison is concealed. This internal apparatus for the preparation of the poison has been misconceived: every writer, except the late Mr. Hunter, considers it as a fipple receptacle; whereas it appears, from the observations of that judicious anatomist, to consist not of one, but of two small ducts, although those two seem to unite into one: these are situated in the region of the abdomen among the air vesicles, and when pressed, inject into the passage of the fling the poisonous fluid drop by drop. The fling is apparently thick and solid at the base, and at the extremity remarkably acute; such is its appearance to the common observer; but strictly speaking, this is nothing more than the sheath or case in which the genuine fling is contained; the latter is an apparatus consisting of two extremely slender bearded darts, each of which has five or six recurved teeth or barbs placed near their extremity, or, according to Derham, they amount to eight recurved teeth on each dart. The head is of an horny substance, round at the base, and on the sides grooved, ending in a sharp point, and has an opening near the tip, through which the two bearded darts are protruded beyond the sheath, when the bee is in the act of flinging. When the two barbed darts, of which the true fling consists, are united, they easily enter the flesh, and then opening a little, become for a moment very securely fixed by means of the teeth with which they are befej. Some say one of these darts is rather longer than the other, and fixes its head, or tooth, first; and the other instantly following, they penetrate alternately deeper and deeper, holding themselves firmly in the flesh with their heads.
till the whole sting is buried in the wound, and the poison injected. When once the bee has completely transfixed its sting into the flesh, the acid caustic liquor, called the poison, is pressed from the glands in which it is seerected, and passing down the channels of the darts, discharges its malig- nant contents into the wound, occasioning an acute pain and swelling of the part, the inflammation of which continues not unfrequently for several days after. Dr. Hunter, being defirous of ascertaining the force of this poisonous fluid, dipped needles into it, with which he pricked the back of his hand; the like experiment he tried on the same part with needles that were not dipped into it, and found that the punctures occasioned by the former grew fore and inflamed, while the others did not.

But if the wound which the bee inflicts be painful to those who receive it, to the bee it is attended often with more fierce harm, for it inevitably proves fatal if by any accident the sting is broken off in the act of inflicting it. When the creature strikes its sting deep into the flesh, and the person starts, and discomposes the bee before it can disengage itself, the sting is almost certain of being broken off, and left sticking in the wound. On the contrary, if he has patience to stand quiet, the bee will begin the two slender darts close together, and withdraw the whole, in which case the wound is always left painful. A wasp is not so liable to leave its sting in the wound as a bee; the beards of the darts being shorter, and the insect more nimble and vigoro- rous in its operations. When the bee means to sting, it flies about the object of its anger very quickly, and by the velocity of its motions, seems to evade being struck or at- tacked to advantage, while preparing for the assault. The found emitted at this time is also peculiar, and to those accustomed to bees, is perfectly well understood. The danger of being stung by bees (it has been said), may be in a great measure prevented by a quiet composed behaviour. A thousand bees will fly and buzz about a person without hurting him, if he will but stand still and forbear disturbing them, even when near his face; in which case he may ob- serve them for hours together without danger; but if he molests or beats them away, he usually suffers for it.

In the "Edinburgh Medical Commentaries" it has been affirmed, that a person is in perfect safety in the midst of myriads of bees, if he were to keep his mouth carefully shut, and breathe gently through the nostrils only; the human breath, it would seem, being peculiarly offensive to their delicate organs; and merely with this precaution, it is said, the bees may be turned up, and even part of the comb cut out while the bees are at work.

Reamur made use of no other remedy for the sting of the bee than to bathe the part affected with cold water, a remedy which in most cases will allay the pain and inflammation only during the time of its application. Oil of olives, or sweet almonds, applied to it alleviates the pain. Lombard, a late French writer, in his "Manuel necel-ire au villageois pour foigner les abeilles," prefers a better remedy. He recommends that the wound be pelled, to cleanse it as much as possible from the venomous fluid, and then rubbed with alkali, or with a little diluted quick lime, by means of which the properties of the poison will be neutral- ized; the wounded part, after the application of this remedy, must be well washed with cold water, when both the pain and swelling will be found to have received consider- able relief.

Bees. Voice of. The bee is capable of emitting either by the mouth or motion of the wings, a variety of sounds, expressive of its anger, fear, contentment, and other passions; a circumstance hitherto but very slightly regarded by those writers who have, in other respects, entered most minutely into the history of this animal. Mr. Hunter, in his paper on the honey-bee, inserted in the Philosophical Transactions, pays a few words on this subject. Bees, he tells us, may be said to have a voice; or at least, that they are able to form several distinct sounds. They give a sound when flying, which they can vary according to circumstances. One ac-customed to bees can immediately tell when a bee intends to make an attack by the sound, most likely of the wings, that is to say, when the sounds produced by the flying bee are not equally distinct. This is produced by the wind and peevish finding while the wings remain motionless. To ascertain this matter with a flill greater degree of accuracy, Mr. Hunter held a bee by the leg with a pair of pinces, and very clearly observed that the creature made the fame peevish noise while the wings were perfectly still. After he, even cut the wings off, when the poor bee continued to make the same noise as before. Heimmered the bee in water, but it did not then produce any noise, till it was much teized, when the fame found was heard as in the former instance; during this experiment, he could observe the water, or rather the surface of contact of the water with the air, vibrating at the orifice of an air-hole situated at the root of the wing. The fame writer remarks, that the bee, or some kinds of them at least, make a noise the evening before they swarm, which is a kind of ring or sound resembling that of a small trumpet; and by comparing it with the notes of the piano-forte, it seemed to be the same with the lower A of the treble. When the bees return from their daily excursions in the fields, to their hives at evening, loaded with farina and honey, they are well known to ring or hum a soft melodious tone expressive of their content- ment. Entomologists are well aware that the sound emitted by the bee is susceptible of certain modulations. Some of these proceed undoubtedly from the motion of the wings, and vary in tone as they are moved with greater or less velocity, just as we observe in other insects furnished with transparent wings; and in some degree throughout the whole of the insect race, with the exception of those which have very small wings, or are entirely destitute of them. From the observation of Mr. Hunter on the emission of air from the lateral trachea, or air vellum in the fide, it would seem, that a certain sound may be caused by means of these little organs; the remark of this anatomist deferves more consideration than he appeared to be himself purposed of, since we know that the ringing of the cicada, a noisy tribe of insects, proceeds not from the mouth, but from two lateral openings, one on each side of the abdomen; the sound being produced by means of a most singular internal organization, and transmitted through those openings at the pleasure of the creature. It is not unlikely, that many insects may be furnished with lateral organs for the purpose of making a certain noise, although not exactly of the same structure in the cicada, and certainly upon a much smaller scale. That a bee emits a sound from the mouth, is also believed. A gentleman within our knowledge, who has made the manners of bees his particular study, can with the utmost facility declare the sex of any bee that may chance to pass near him, by attending only to the motion and sound emitted by it while in flight.

Bees, Age of. Writers are not agreed as to the duration of the term of life in the honey-bee. Among the ancient
It was thought to extend to more or less ten years. Virgil and Pliny limit it to five. Some suppose that they are annual; others that they live many years, but the latter idea is almost exploded at this time. On the other hand, although they may be considered annual, a few of the females certainly live through the winter and lay the foundation for a new family in the ensuing spring. In the month of August, Mr. Hunter imagines the queen, or queens, to be impregnated by the males, and that they do not provide for themselves, they become burdensome to the working bees, and are therefore destroyed as males, and thrown out of the hives. When the bees are about the hives of providing their winter store, every operation ceases, excepting that of collecting honey and bee bread for the future inheritance of the colony. At this particular crisis, it would seem as if the males were conscious of their approaching danger, for they do not rest before the month of the hive either when going in or coming out; activity apparent in all their actions. But this avails them little, nor does it aver, though it may protract, their fate; for a short time: they are commonly attacked by the labouring bees, one, two, or three together, and seeming to be incapable of making any resistance, or anxious to avoid the contest, attempt only to enure: their safety by hailing out of the way of their cruel enemies as readily as possible. The labourers do not fling the males, Mr. Hunter tells us, but only pinch, torment, and pull them about, as if to wear them out, and, when, by such violent treatment, the death of these hapless creatures, who would die naturally in the space of a little time after.

But, Economy of: When we speak in a familiar manner of the economy of bees, such as the keeping of wax, the constructing of honey combs, ranging the fields and gardens to collect farina and nectarous juices for the preparation of wax and honey; attendance, nurturing, and feeding the young bees or larvae, covering in the dry hives or paper, &c. the busy bee alone is meant, for the females and the males are only implicated in the economy, so far as relates to the wall government of the hive, and generation of the future brood. Among those who have minutely treated on the subject, (the economy of bees) many have resided very wonderful and remarkable circumstances; the moral virtue (as has well been said) have all, at one time or other, been attributed to the bee. They have been celebrated for their prudence, industry, mutual affection, unity, loyalty to their superiors, care, public spirit, liberality, and cleanliness. The quantity of bees in full size, or cold, has been often mentioned; this is evidently true; but for a short time, at least, before we are liable to the alteration in the state of the weather, their conduct previous to which is not ignorant of it. Mr. Hunter lately observed their return home in great numbers on cold weather, &c. without having been present a day or two before, they are seen flying in the air, or coming near the hives, and the like, a situation of bees (as far as I have been able to judge) is not always the same, but in every case, if you are to use the expression of bad weather, by some particular place, it is the same, however, when they are very cold. They, or a female brings them from the work; it is not in the hive; and those that they bring they hurry in with great quickness, so that the doors of their hives are too small to admit them. On the other hand, in the sky, you will find the drones of the hives, which are increasing rapidly. Whether they are the clouds gathering for it, as some imagine, or whether it is much more probable) they feel some other effects of it upon their bodies, is not yet determined; but it is alleged, that no bee is ever caught even in what we call a sudden shower, unless it have been at a very great distance from the hive, or have been injured by some accident, or been sickly, and unable to fly so fast as the rest. Cold is a great enemy to them. To defend themselves against its effects during a hard winter, they crowd together in the middle of the hive, and buzz about, and thereby excite a warmth that is often perceptible by laying the hand upon the glass window of the hive. They seem to understand one another by the motion of their wings: when the queen wants to quit the hive, she gives a little buzz; and all the others immediately follow her example, and retire along with her.

Although many of the accounts that have been given of the bee are fabulous, an intimate acquaintance with them in their domestic operations, has furnished many real facts that are as surprising as those which are apparent, or perhaps wholly, groundless. It is not to be disputed, that at certain times, when they think their stores likely to fall short, they make no scruple to kill and throw out of the hives their own offspring; the large and young bees of the male or drone kind, hastily extricated from their pupa state, have been carried away and left to perish. They may be just in some respects in their own kingdom, and to those who are to be considered as their fellow subjects, but they rob and plunder the strangers whenever they have power and opportunity; and they have frequently battled in committing depredations on neighbouring colonies and hives, or in repelling the aggressions of other invaders, in their own defence, which always terminate fatally to many of their number. This indeed does not often happen, except early in the spring, or late in autumn, when honey is scarce in their hives, and there are no flowers abroad to furnish them with more. In this case, when they have ranged the fields without success, they endeavour to supply themselves at the hazard of their lives, from the flowers of other hives. However, in all these contests, if the queen of either hive that happens to be engaged is killed, the battle ceases, and both parties unite under the survivor.

The industry and activity of bees in their domestic labours, afford a very instructive and amusing spectacle: all are busy, engaged in their several departments. While some are employed in gathering honey and wax, others repair the winter comb; others carry out the dead, and cleanse the hive; others keep guard, placing themselves in five or six files eight or ten deep upon the floor of the hives, so that all the bees when they enter must pass between these; some are even said to serve for bridges or ladders for others to pass over; and when they are tired with labours, they retire with the hive with rest. For this purpose, they form large or smaller clusters in the following manner: each with in two fore-holds, held in the hinder parts of the hive that is next above it, and this a chain is formed by the same simple application of one to another, and the whole supports the weight of all the bee on the bottom of the chain. The larger clusters are only a multitude of the chain, of which there are sometimes as hundreds together. The bees, it is said, never lie hold of any part of one another, except the legs. In this way, they likewise guard themselves from the effects of cold, and continue for several weeks together in a state of society.

Bees, we are told, when they begin to work in the hive, divide themselves into four companies, one of which takes the fields, in search of the wax; another employed in laying out the bottoms, and partitions of the cells; a third in making the frame of brood from the gills...
and corners; and the fourth in collecting and bringing food for the support of the rest, or in relieving those who return heavily laden. Neither of these four companies is kept con- 
finedly to one employment; they often change the tasks assigned them: those that have been at work, for ex- 
ample, in the construction of the cells, are permitted to go 
abroad, and those which have been in the fields already, 
are allowed to take their places in the hive. They are 
believed, and not without reason, to have certain ligas, by 
means of which they understand each other, and one striking 
instance is adduced in proof of this: when any one of the 
bees is in want of food, the creature bends down its trunk 
to the bee from whom it is expected, the latter immediately 
opens its honey-bag, and lets some drops of honey fall into 
the mouth of the other, which is at that time observed open 
to receive it. Many other circumstances might be likewise 
mentioned, were they necessary to confirm this idea. These 
particulars relate almost exclusively to the operations of the 
neuter or labouring bee: the males answering no other 
purpose than simply that of males in their sexual capacity; 
and the queen or female breeder only attending to the dif- 
charge of her more important duties, the laying of eggs, 
and influencing, by her presence, the working bees, to per- 
severe in their respective labours.

Bees, Generation of. These insects begin to breed in the 
upper part of the hive, in the cells adjoining to those which 
are filled with honey, and they descend gradually into the 
lower parts, as the flowers furnish them with wax 
increased in plenty. The cells designed for the working 
bees, are commonly half an inch deep: those for the drones, 
three quarters of an inch; and those intended to contain 
the honey only, half deeper. The queen bee is generally 
concealed in the most secret part of the hive, and is never 
vivable, except when she happens to lay her eggs in such 
combs as are exposed to fight. When the drones appear, 
she is always attended by ten or a dozen of the common 
four, who form a kind of retinue, to follow and guard her 
whenever she goes. Before she lays her eggs, she examines 
the cells where she designs to lay them; and if she finds 
they contain neither honey, wax, nor embryo, she introduces 
the posterior part of her body into the cell, and fixes to the 
bottom of it a small white egg, which is composed of a thin 
membrane, filled with a whitish liquor. In this manner 
she proceeds on, till she fills as many cells as she has eggs 
to lay, which are generally many thousands. Sometimes 
more than one egg has been deposited in the same cell; 
when this is the case, the working bees remove the super- 
numerary eggs, and leave only one in each cell. On the 
first or second day after the eggs are lodged in the cells, 
the drone bee is suppos'd by many to inject a small quan- 
tity of whitish liquid, which in about the course of a day is 
absorbed by the egg. On the third or fourth day is pro- 
duced a maggot, which, when it is grown to as to touch 
the opposite angle of the cell, coils itself up in the shape 
of a cemiacircle; and flows in a certain liquid whereby it is 
nourished, and enlarged in its dimensions: this liquid is of 
a whitish colour, of the thicken's of cream, and of an in- 
fluid taste, like flour and water. The origin and qualities 
of this liquid are not correctly explained: some have sup- 
pos'd that it consists of some generative matter injected by 
the male or drone bee into each cell, in order to give fecun- 
dity to the egg; a more probable opinion is, that it is the 
same with what several writers call the bee-bread; and that 
it is a mixture of water with the juices of plants and flow- 
ers, collected merely for the nutrition of the young while 
they are in a weak and helpless state. Whatever may be 
the nature of this aliment, it is certain the bees are very 
indulgent in supplying the worms with it. The larva, or 
maggot, is fed by the working bees for about eight or ten 
days, till one end touches the other in the form of a ring, 
and when it begins to find itself uneasy in its first posture, it 
ceases to eat, and begins to unroll itself, thrashing the head 
forwards towards the mouth of the cell. The attendant bees, 
observer the symptoms of approaching transformation, 
deurth from their labours in carrying food, and employ them- 
selves in fastening up the top of the cell with lidof wax form- 
ed in concentric circles, and by their natural heat afflait in 
cherishing the brood, and hastening the birth. In this state, 
the larva extends itself at full length, and prepares a kind 
of silky covering, which forms a complete lining for the 
cell, and affords a convenient receptacle for the transforma- 
tion of the larva to the pupa state. Some naturalists sup- 
pose, that as each cell is destined to the successive breeding 
of several larvae, the whole web, which is composed of many 
crafts or doubles, is, in reality, a collection of as many 
webs as there have been larvae. M. Maraldi apprehends, 
that this lining is formed of the skin of the larva, thrown 
off at its entrance into the nymph or pupa state; but it is 
urged by others, that if the cells are opened when recently 
covered by the bees, the larva within will be found in its 
own form, and detected in the act of spinning its web; and 
by means of glatives, it will be found composed of fine threads, 
regularly woven together, like those of other spinning animals.

In the space of eighteen or twenty days, the whole pro- 
cesses of transformation is finished, and the bee endeavours 
to discharge itself from confinement, by forcing an aperture 
with its jaws through the covering of the cell; the piliation 
is gradually dilated; so that one of the maxillas or jaws 
appears first; then the head, and afterwards the whole 
body; this is usually the work of three hours, and some- 
times of half a day. The bee, after it has didigated it- 
self, flings on the surface of the comb, till it has acquired 
its natural complexion, and full maturity and strength, so as 
to become fit for labour. The rest of the bees gather 
round it in this state, congratulate its birth, and offer it 
honey out of their own mouths. The exuviae, and fattered 
pieces of wax which are left in the cell, are removed by 
the working bees; and the cavity is no sooner cleansed, and 
fit for new fecundation, but the queen depositions another egg 
in it; infomuch, that M. Maraldi says, he has seen five bees 
produced in the same cell, in the space of three months. The 
young bees, it is said, are easily distingued from the others 
by their colour: they are grey instead of the yellow 
brown of the common bees, the reason of which is, that 
their body is black, and the hairs that grow upon it are white; 
from the mixture of these that are seen together, refults a 
grey; but this colour forms itself into brownish by degrees; 
the rings of the body becoming more brown, and the hairs 
yellower.

Reaumur suppos'd, before the time of Linneus, the queen 
bee to be the only female in the hive, and consequently, 
the mother of the next generation: that the drones are the 
males by which she is fecundated; and that the working 
bees, or those which collect wax on the flowers that k明白 
it, and form the combs and cells, and afterwards fill them 
with honey, are the neuters.

Schrachi, in his " Histoire Naturelle de la Rius des 
Abbeilles, &c. published in 1752," has advanced a different 
opinion upon this subject. He suppos'd, that all the com- 
mon, or honey bees, are females in disguise, in which the 
organs that distinguisb the sex, and particularly the ovaria, 
are obliterated, or at least from their extreme minuteness, 
have escaped the observer's eye; that every one of these 
bees, in the earlier period of existence, is capable of becom- 
ing a queen bee, if the whole community should think pro- 
per to nurse it in a particular manner, and raise it to that
rank; in short, that the queen bee lays only two kinds of eggs, those which are to produce the drones, and those from which the working bees are to proceed. This author made his experiments not only in the spring months, but even as late as November. He cut off from an old hive a piece of the brood comb, taking care that it contained living or worker bees as they are termed, which had been hatched about three days. This he fixed in an empty hive, together with a piece of honey-comb for food to his bees, and then introduced a number of common bees into the hive. As soon as the bees found themselves deprived of their queen, and liberty, a dreadful uproar took place, which lasted twenty-four hours. On the effusion of this tumult, they betook themselves to work, first proceeding to construct a royal cell, and then taking the proper measures for feeding and hatching the brood enclosed within them; sometimes, even on the second day, the foundations of one or more royal cells were to be perceived, which proved a certain indication that they had elected one of the inclosed larvae to the sovereignty.

The final result of these experiments seemed to be, that the colony of working bees being thus shut up with a piece of brood comb, not only hatch, but at the end of eighteen or twenty days, produce from thence one or two queens, which, it was supposed, proceeded from the larva of the common working bee, and which had been converted by the colony into a queen, merely because they wanted one. — From these, and other experiments repeated, Mr. Schirach concluded, that all the common working bees must be originally of the female sex; although, if they are not fed, lodged, and brought up in a particular manner while in the larva state, their organs are not developed; and that it is this circumstance attending the bringing up of the queen, that allows the full extension in the female organs in the first instance, and produced afterwards that difference in her size and aspect, so dissimilar to that of the working bee.

Mr. Debraw, an ingenious apothecary of Cambridge, made many experimental remarks on bees, which are inserted in the Philosophical Transactions for 1776. He professes to have detected the impregnation of the eggs by the males, as well as to have discovered the difference in size among the drones or males, of which Maraldi and Reanmura, besides some others, had conceived there might be two distinct kinds. Mr. Debraw says, he watched the glass hives with indefatigable attention from the moment the bees (among which he took care there should be a large number of drones) were put into them, to the time of the queen's laying her eggs, which generally happens the fourth or fifth day. He observed, that on the first or second days (always before the third) from the time the eggs are placed in the cells, a great number of bees fastening themselves to one another, hung down in the form of a curtain from the top to the bottom of the hive. They had done the same at the time the queen bee deposited her eggs, an operation which seems contrived on purpose to conceal what is tranfacting; however, through some parts of the wall he was enabled to see some of the bees infesting the posterior part of their bodies, each into a cell, but continuing there only a short time. When they had retired, it was easy to discover a whitish liquor left in the angle of the basins of each cell which contained an egg. In a day or two this liquor was absorbed into the embryo, which, on the fourth day, assuages its larve state, and is attended by the working bees, who bring it a little honey for nourishment, and continue to feed it for the space of eight or ten days after its birth. When the bees find that the larve has attained its full size, they deft from bringing any more food, knowing that the larve has no more occasion for it while in that state; but they have still another service to perform upon it, in which they never fail to perform their duty: this is to shut up the top of the cell in which the larve is enclosed; for eight days longer it remains within the cell after being thus imured, during which time a further change takes place; the larve, which was before idle, begins to work as soon as the bees commence their operation of clothing the cell with wax, and then are employed in making the covering of wax, the larve is at work within the cell, which it lines with a fine film. The larve thus concealed, voids its excrement, quits its skin, and assumes the pupa form; at the end of some days, the young bee acquires sufficient strength to quit the covering of the pupa, tear through the waxen enclosure of its cell, and proceed from thence a perfect winged insect.

To prove still further that the eggs are fecundated by the males, and that their presence is necessary at the time of breeding, Mr. Debraw made the following experiments: he left in the hive the queen, with only the common or working bees, without any drones, to see whether the eggs she laid would be prolific; for this purpose, he took a swarm, and shook all the bees into a tub of water, leaving them there till they were quite infested, by which means he was able to discover the drones without any fear of being flying by the others; he then restored the queen and working bees to their former state by spreading them on a brown paper in the sun, after which he placed them in a glass hive, and they began very soon to work as usual. The queen laid eggs, which to his great surprize were impregnated; for he imagined he had separated all the drones, or males, and therefore omitted watching them. At the end of twenty days, he found several of the eggs had, in the usual course of changes, produced bees, while some had withered away, and others were covered with honey. Hence he inferred that some of the males had escaped his notice, and impregnated part of the eggs. To convince himself of this, he took away all the brood comb that was in the hive, in order to compel the bees to provide a fresh quantity, being determined to watch narrowly the motions of the new eggs should be laid in the cells. On the second day after the eggs were placed in the cells, he perceived the same operation that was mentioned before, namely, that of the bees hanging down in the form of a curtain, while others thrust their posterior end of the body into the hive. He broke off a piece of the comb in which were two of these insects, and found in neither of them any wing; (a circumstance peculiar to the drones,) upon dissection, with the assistance of a microscope, he discovered the four cylindrical bodies which contain the glutinous liquor, of a whitish colour, as observed by Maraldi in the large drones. He was therefore now under the necessity of repeating his experiments, without destroying the males, and even those which might be suspected to be such.

He once more immersed the same bees in water, and when they appeared to be in a flatus state, he gently pressed every one, in order to distinguish those armed with a ring from those which had none, and which of course he supposed to be males. He replaced the same swarm in a glass hive, where they immediately applied themselves again to the work of making cells, and on the fourth and fifth day, very early in the morning, he had the pleasure to see the queen bee deposit her eggs in those cells; he continued watching most part of the ensuing days, but could discover nothing of what he had seen before.

The eggs, after the fourth day, were found in the same state as on the first day, except that some of them were covered with honey. A singular event happened next day about
about noon; all the bees left their hive, and were seen attempting to get into a neighbouring one, on the istool of which the queen bee was found dead, being, no doubt, slain in an engagement. This event Mr. Debraw supposes to have arisen from the desire of the bees to perpetuate their species, to the concurrence of which the males were necessary, and that this consideration alone induced them to desert their habitation where no males were left, and to fix their residence in a new one, where there was a flock of them.

To be more fully satisfied in this respect, Mr. Debraw took the brood comb which had been impregnated, and divided it into two parts; one of which he placed under a bell glas with honey-comb, for the food of the bees, taking care to leave a queen, but no drones among the bees confined in it; the other piece of brood-comb, he placed in another bell glas with a few drones, a queen, and proportionable number of common bees. The result was, that in the piece put into the first glas there was no impregnation, the eggs remaining in the same state as they were when first placed in it, and on giving the bees their liberty on the seventeenth day they all flew away; whereas in the other glas, which contained the second piece of brood-comb, the very day after the bees had been put into it, the eggs were impregnated by the drones, and the bees did not leave the least inclination to abandon their new habitation when the glas was left open to allow them to escape.

Such are briefly the different opinions of those experienced observers of the bee, Reaumur, Maraldi, Schirach, and Debraw, whose several ideas founded, as it must appear, upon the most laborious, indefatigable, and minute investigation, have met with many advocates. On a subject of this interest we ought not to assume any opinion hastily, or in an affair so mysterious, obtrude our own without a considerable degree of caution. Some writers of no mean celebrity have treated, since the time of these observers, upon the same topic, whose remarks divine to be impartially considered. To the foregoing observations, and some others made by Schirach in particular, the late Mr. Hunter has replied, in a paper written by him expressly on bees, and inserted in the Philosophical Transactions for 1792, of which we are to avail ourselves. The experiments performed by Schirach, Mr. Hunter is disposed to think inaccurate, and the result inferred from them of course unworthy of credit: how far the arguments of the latter are likely to refute the observations of Schirach, remains to be decided, when we have considered them in his own words. The criticisms of this anatomist are introduced to notice, in speaking of the queen bee.

"The queen bee, as she is termed, (says Mr. Hunter) has excited more curiosity than all the others, although much more belongs to the labourers. From the number of these, and from their existing themselves, they have their history much better made out; but as there is only one queen, and she is fearedly ever seen, it being only the effect of her labour we can come at an opportunity has been given to the ingenuity of conjecture, and more has been said than can well be proved. She is allowed to be bred in the common way, only there is a peculiar cell for her in her first flage, and Reaumur says, "her food is different when in the maggot flage;" but there is probably but one queen, and that the whole might not depend on one life, it is asserted that the labourers have a power of forming a common maggot into a queen. If authors had given this as an opinion only, we might have passed it over as improbable; but they have endeavoured to prove it by experiments, which require to be examined; and for that purpose I shall give what they say on that head, with my remarks upon it."

\[Abstracts from Schirach—\]

In twelve wooden boxes were placed twelve pieces of the comb; in each box was shut up a handful of working bees. Knowing that when bees are forming a queen, they should be confined, the boxes were kept shut for two days. When examined at the end of that period, (six boxes only were opened) "in all of them royal cells were begun, one, two, or three in each, all of these containing maggots four days old. In four days, the other six boxes were opened, and royal cells were found in each containing maggots five days old, surrounded by a large provision of jelly, and one of these maggots, examined in the microscope, in every respect resembled a working bee."

"This experiment was repeated, and the maggots selected to be made queens were three days old; and in seventeen days there were found in twelve boxes fifteen lively hand-some queens. These experiments were made in May, and the bees were allowed to work great part of the summer. The bees were examined one by one, but no drone could be discovered, and yet the queens were impregnated, and laid their eggs." [Here is a wonder! queens laying eggs, (which we must suppose Mr. Schirach meant we should believe) and they hatched without the influence of the male.]

"The above experiment was repeated with pieces of comb, containing eggs only, in six boxes, but no preparation was made towards producing a queen."

"The experiment of producing a queen bee from a maggot was repeated every month of the year, even in November." "A maggot of three days old was procured from a friend enclosed in an ordinary cell, and shut up with a piece of comb containing eggs and maggots. That, three days old, was formed into a queen, and all the other maggots and eggs were destroyed."

"In above a hundred experiments a queen bee has been formed from maggots three days old. [The working bees, as all females, although the ovaria is too small for examination, &c. Vide Phil. Tran.]"

Mr. Hunter next proceeds to speak of another author who repeated the experiments of Schirach. "Wilhelmi (he says) observes that a queen cell, which is made while the bees are shut up, is formed by breaking down three common cells into one, when the fides are repaired."—"A young queen was put into a hive which had been previously concerted to contain no drones, and whole queen was removed, and yet the young queen laid eggs." [Probable.] In repeating Mr. Schirach's experiment, he shut up four pieces of comb with one maggot in each; after two days the maggots were all dead, and the bees had defiled from labour. [There is no mystery in this; but did they hatch?]—"A piece of comb, from which all the eggs and maggots had been removed, was shut up with some honey, and a certain number of workers in; in a short time they became very busy, and upon the evening of the second day 360 eggs were found in the cells. [This would show that labourers can be changed into queens at will, and that neither they nor their eggs require to be impregnated; if this was the case, there would be no occasion for all the path in making a queen or a male.]

He repeated this experiment with the same result, and the bees were left to themselves; they placed the queen maggots in the queen cells newly constructed, and others in male cells, the reef was left undisturbed. He again took two pieces of comb, which contained neither eggs nor maggots, and shut them up with a certain number of workers, and carried the box into a flave; next evening one of the pieces of comb contained several eggs, and the beginning of a royal cell was empty."

Besides the short observations contained in the brackets, Mr. Hunter tells us he has his doubts respecting the whole
of these experiments of Schirach, &c. from several circumstances that occurred in the course of his experiments. The three following facts appear, in my mind, much against their probability. First, a summer's evening in England is commonly too cold for so small a parcel of bees to be lively, so as to set about new operations; yet they get so benumbed that they could hardly recover in the day, and he suspects, where these experiments were made, it also was too cold; and indeed none even are liable to be tried in this country. Secondly, if the weather should be too warm as to prevent this effect, then they are for it tells that they commonly destroy their females, or wear themselves out; at last, after a few days confinement we find them mostly dead; and, thirdly, the account given of the formation of a royal cell, without mentioning the above inconvenience, which is natural to the experiment, leads him to suspect the whole to be fabricated. To obviate the first objection, which he found from experiment would prevent any success that might otherwise arise, he put parcels of bees with their comb, in which were eggs and maggots, and some trials chrysalides besides, into a warmer place, such as a girl frame over tan, the surface of which was covered with mould to prevent the ill effects of the wholesome effusion arising from ti; but from knowing that the maggots were fed with bee-bread, or farina, he took care to introduce a cell or two with this substance, and also the flowers of plants that produce a great deal of farina, together with some honey for the old bees. In this manner his bees were preserved from the cold, and also provided with necessaries; but after being confined for several days, upon opening the doors of the hive, those which remained alive came to the door-way, walked and flew about, but gradually left it, and on examining the combs, &c. he found the maggots dead, and nothing like an operation going on. He chose to have some chrysalides in the comb, supposing that if the bees died or flew away, those newly hatched afterwards from those chrysalides, which would happen in a few days, not knowing where to go, might fly and take care of the maggots that would be hatched from the eggs; but to his surprise, he found on opening the box that neither the eggs hatched; nor the chrysalides came forth all died; from which he began to suspect that the presence of the bees was necessary for both. "The queen, the mother of all, (he concludes, with caution in whatever manner produced, is a true female, and derives from the labourers and the male." He describes the difference between the female and the male, observing that he thinks a male has only one queen; and mentions bees, who after that there are such numerous queens, who he has killed both by labourers and the male.

With due respect to the memory of so great a man, we have expected better rewarding, and a more copious and extensive investigation of the many fine effects, from the pen of Mr. John Hunter. After following him through his various remarks, we are left at a great loss to conceive their tendency. He sets forward with confiding he doubts as to the accuracy of Schirach's experiments, who had, he thinks, endeavoured to prove, that a queen bee might be reared from the humble condition of the larva of a common worker; the fugitive meets his ridicule, a striking view of which is apparent through his notes, and in the true spirit of critical analysis, he proceeds to examine the experiments by which the suggestion has been supported. Some few inaccuracies of expression in the statement of particulars, are mentioned by him, and after relating two or three insufficient experiments, made in order to invalidate the observations of Schirach, he tells us, that "the queen bee, the mother of all, in whatever manner produced, is a true female," an inference so logical, that no one would be misled, we may presume, to dispute it; but surely it could require no matter of argument, nor criticism, nor series of experiments, to prove, that the mother of all must be a female; nay, still less was it incumbent upon him to support, by the force of any words, that this female was produced in some manner or other; this is apparent enough; we need not be therefore solicitous to enquire whether she is produced, but to know in what manner that production is accomplished; and here we are! it is uncertainty. If Mr. Hunter was convinced that the observations of Schirach were erroneous, he could not, we apprehend, be ignorant of the manner in which she is produced; or, if he was, he must have been unauthorized to censure Schirach. In a word, it ought to be acknowledged in candour, between the two parties, that we had expected, in the outset, Mr. Hunter would have fairly controverted the arguments of his opponent, but in the conclusion perceive, too evidently, that he is content to contradict them only.

But the experiments of Schirach have been found in many respects consistent with the discoveries of later naturalists; experience has proved that in many points his is correct. It is almost enough to say that they are in part confirmed by Huber. The latter writer, after professing his opinion, that there are no such creatures as males or nectars in the society of bees, endeavours to show that the working bees are all originally of the female sex; and that each is consequently provided with an ovaris, or womb, which neither swarmed, REMARK, and perhaps no other before him, had ever seen, although they had conjectured it must be so. He cites in proof of the position that they must be females, the discovery of Schirach; who, although he had not detected the ovaries, had seen the larva of the working bees converted into queen-bees, when the necessities of the state required it; a fact of which Huber had been occasionally himself a witness. Huber is persuaded, that however strange it may appear, it depends entirely on the manner in which the larva is treated while remaining in the comb, whether the individual will become a perfect female, fitted for the purpose of perpetuating the race, the mother of the future swarm; and of being invested with the powers of sovereignty; or be doomed to a life of labour as a common working bee. If the larva be intended for the latter condition, the egg is lodged within the confines of a narrow cell; while, when the larva hatched from it attains a certain size, effectually prevents the diffusion of the organs of the ovaries that are necessary to the great purpose of rendering the creature prolific in the last stage of being. Thus it happens, that unless the larva be allowed sufficient room for those organs to expand, they continue to be crippled, compressed, and afterwards incapable of that expansion which is absolutely requisite in impregnation. Hence we perceive the motives for that unusual care which is being bestowed on the enlargement of the cell of itself with a view of putting an end to that fatal accident it may induce them to adopt for the female parent of the future brood. If the larva of a working bee is to be converted into a prolific female, the cell in which it has been lodged is broken into and made more capable than before; the parts the creature to attain its fulfilment proper: the ovaries, in other terms the glands beneath the cell of its cell, assume a new and more exalted form; and when the insect comes forth in the warmed state, the sexual organs are found to have acquired that degree of maturity which can alone render it capable of fulfilling the ordinary functions for which they were designed. There is also another cause to which the horns of the working bee is attributed, the quantity of aliment which it receives in the larval form. At the time the creature is put up within its narrow cell, and is allowed only a certain portion of the pale
B E E S.

But, contrary to that, every female, and not neuters, is as almost universally believed, may be drawn from the recent discovery of Mr. Kirby, who found that the antennae in both the female and the neuter contain the same number of joints. While we tacitly admitted the assertion of Linneaus, that there were no less than five articulations more in the antennae of the neuter than the female bee, it required no small share of credulity to believe that such an astonishing difference in the formation of these organs could be produced by the mere effect of feeding the creature under the larva form in one particular manner instead of another; but this mistake being ascertained, removes one difficulty most certainly, namely, the impossibility of the working bee having been transformed into a queen, if it does not go very far to prove the fact itself. There are, it must be owned, however, some other objections of a similar nature, which still remain to be removed. Mr. Kirby, whom we know no firmer advocate for the opinion of the working bee being strictly neutral from their origin, does not appear to have been aware, when he corrected this mistake of Linneaus, that his remark would tend, in one material point, to support an idea so contrary to that which he entertains himself in this respect.

Mr. Wildman, who, from his constant habit of rearing bees, was perfectly conversant with their attachment to the female, or queen bee, relates one curious particular; the manner in which he could cause a swarm of bees to follow him, and alight in any particular spot he might think proper. "Long experience," says this writer, "has taught me, that as soon as I turn up the hive, and give it some taps on the sides and bottom, the queen immediately appears to know the cause of this alarm, but soon retires again among her people. Being accustomed to see her so often, I readily perceive her at first glance; and long practice has enabled me to seize her instantly with a tenderness that does not in the least endanger her person; this is of the utmost importance; for the least injury done to her brings immediate destruction to the hive, if you have not a spare queen to put in her place, as I have too often experienced in my first attempts. When posseced of her, I can, without injury to her, or exciting that degree of resentment which may tempt her to sting me, slip her into my other hand, and returning the hive to its place, hold her there, till the bees, missing her, are all on wing, and in the utmost confusion. When the bees are thus diffused, I place the queen wherever I would have the bees to settle. The moment a few of them discover her, they give notice to those near them, and thence to the rest; the knowledge of which soon becomes so general, that in a few minutes they all collect themselves around her, and are so happy in having recovered this sole support of their fale, that they will long remain quiet in their situation. Nay, the scent of her body is so attractive to them that the slightest touch of her along any place or substance, will attach the bees to it, and induce them to take any path she takes."

BEEs, Prefermation of. The preservation of these industrious and useful creatures deserves every consideration. This depends chiefly on supplying them with a sufficient quantity of food, guarding them from their enemies, and deploving them of the produce of their labour without destroying them. Besides the attention which should be bestowed upon the necessities of bees, in the choice of an eligible situation for the Apiary, it may be necessary to feed them towards the close of autumn, in the winter, or in the spring, when they have consumed their winter stock. This should be done, especially in cloudy, miffy weather, when they go abroad but little, and when several days of bad weather immediately follow their swarming. Mr. Thorley directs, that no hive should be kept which does not weigh twenty pounds; and that the supply should be given in quantities of honey, which
which is their proper food, not less than a pound and a half or two pounds at a time. The honey should be first drawn with water, or small beer, and then poured into an empty comb. A drone comb is the strongest and boll for the purpose: and in the evening, when the bees are quiet, the hive should be gently raised on one side, and the comb put under it, and the other hand, which will be conveyed away the next day into the clover meadow.

Reaumur recommends a place of liquid honey unmixed with water, crooked with brushes, and covered with a paper full of holes, through which the bees will suck the honey without catching themselves. But care should be taken that the hive be well guarded from robbers, whenever it is provided with a rich supply. The winter quarters of the bees should likewise be well secured, both against the weather and the enemies that would annoy them. Mice, however, are as injurious in cold winters, because they are then in a torpid state, and require very little nourishment, provided the apiary be well secured from the keen effects of northerly and easterly winds; whereas a small degree of warmth exhales them, when they too often confine their winter flock, and are left destitute of food in a wet unfavourable spring. When bees are chilled with cold, and to all appearance dying with cold, and the clusters of them are broken, so that they drop down in the hive, they may be recovered oftentimes by the means of heat. Some have advised the application of hot or warm ashes to be laid about the hives, or sprinkled over the chaffers of bees which lie영ingly dead at the bottom of the hive. A sufficient warmth may be given them by putting them into an abundance, and breathing upon them, or by laying them before a fire. This precaution should be taken immediately when the symptoms of disease are shewn, otherwise their vital may be impaired, and the bees be irrecoverably lost. Reaumur made many attempts to preserve the bees from the ill effects of cold in the winter without removing the hives out of the places where they stand in the warmer. With this view, he covered some of the hives with straw, by means of sticks fixed round them, and reaching a few inches above the tops, but the most successful method he found to be that of placing them in large tubs, with earth or hay, containing at the same time to convey air to them through a fissure in the sides of wood, two inches in width, and half an inch in depth, which passed through the side of the tub, and was so fitted a length of reach the mouth of the hive, projecting at the base three or four inches beyond the sides of the tube. As the time of Reaumur many rigorous continuations have been found to obviate this, and other objection, against the hives that were formerly in use. A new kind of hive has been suggested by M. H provoke, to be constructed of a glass, and containing the hive of the former. The agricultural committee of France has been recently advised by the examination of the bee, most neglected, and destructive habits of bees, when M. Leharb, a gentleman at the city, presented the invention on place, entirely new, under his name of "karagee," the continuance of which was very much approved. For the sake of preserving the bees, the invention should be paid to the invention in which the hives are placed; they are afterward kept in good order with hay and straw, fruit trees, and the like. The hive should not be placed too near, because they harbor venom insects to the bees, and that more, weeds must not be allowed to flourish close to the hives, since they nourish others far more detrimental to the bees than the former.

It is no unusual circumstance for one colony of bees to attack and plunder the hive of another. This happens chiefly in the spring and autumn. The most effectual way to guard against this insidious, is to keep the entrance into the hive, four to leave room for only two or three bees to go in or out. To do this, to close up the hives that are attacked, till the robbers disapper; or if drones have gained admittance, the proper inhabitants of the hive may be routed to f-fib-defence by disturbing them with a bunch of thinking madder tattered to the end of a small stick, which will instantly rafe their retreat, and make them seize upon the robbers. This is indeed needless while the queen of the hive attacked is safe.

Bees, Enemies of. To the domestic state the bee has many enemies; but in a state of nature these are far more numerous. While in the apiary, wasps and hornets are among the most formidable of these enemies; they will often entrance to enter the hive, and build their nests in it, and harasses the bees without mercy, till they leave their habitation, unless proper care be taken to prevent such encroachments. The fox is a dangerous enemy in the winter, as he is able to make a passage into the hive, and devour the honey. Rats are equally injurious; the house and field-mice should also be guarded against, by diminishing the entrance into the hive, as the cold comes on, when the bees become less able to defend themselves. The hives may be placed in such a manner that it will be impossible for the mice to reach them. Birds are bitter enemies to the bees; the sparrow, house-lark, and swallows in particular. Toads and frogs will place themselves at the entrance of the hive, and devour many. Spiders will expand their webs near the hive, and entrap numbers. The species aranea caliga lies in ambush the bees in the corolla of flowers, and falls upon them when they come to sip the nectarous fluids. Arts of almost every kind penetrate into the hive, attack the young brood, and plunder the combs of the honey. The shake of certain tribes of ants is so offensive to bees, that they will quit their hives to avoid it, or if they remain, become sickly. Some linnii, or caterpillars, are like-wise exceedingly injurious to the bees, the honey, the comb, and hive. Phalina melba, or honey moth, too frequently secures its residence in the hive, and devours its eggs; which latter sometimes a larva of a pale grey colour, which is very injurious on the honey. The eggs of another phalina, the wax moth, P. truncata, are hatched, and smaller, and the larger than the former; for these are formed from the eggs, than their operations commence; they attack the combs, which they perforate, by a series of intricate passages, burrowing and feeding as they proceed, till they reach the bottom of the cells in which they are lodged, and the queen in security, and not uncommonly spoil the colony of bees to leave their residence. The cold comb is a contrivance that are generally infallible by the winter. At the mouth of a bee, phalina melbae, a brownish, in the honey comb, of some bees. Hives of bees that have swarmed more than once, and such also as contain but little honey, are most exposed to the depredations of these insects; for the half-swallowed comb force to shelter them, and the honey or wax is furnished them at least with food to the detriment of the colony. Bees are subjects to a peculiar species of pedalis, called the bee-hone. Hives of bees that have swarmed more than once, and such as contain but little honey, are most exposed to these troublesome vermin. The hive in this case should be cleaned at the farther once every week, and the floors on which they stand every morning, for the latter are likely to harbour the larve and moths, or other insects, as well as the hive.
hives. But these obnoxious creatures cannot be entirely extirpated without taking away the infected hive, removing the bees, and cleansing it, before it is restored to the former station. The lice of bees are of a slender shape, or siliform, and of a ferruginous colour, and may be destroyed by burning tobacco over the bees. In a wild state the common honey-bee inhabits the cavities of hollow trees, where they are unavoidably exposed to a providious host of enemies, especially field and wood-mice of every description, rats, and birds. Of the bird tribe in particular, some species are supposed to feed exclusively on bees, such as the honey-buzzard (falcipapa), the European bee-eater (merops apiaster), &c. wood-peckers, the king-fisher, and many others: they do not feed, indeed, exclusively on them, as is imagined, but they are formidable enemies to the bees in a wild state. The animals and birds which prey upon the honey-bees are numerous likewise; of this kind we might instance the various species of ant-eaters (myrmecophaga), the black bear (ursus arctos), the honey-cuckoo (cuculus indicator), peacocks, &c.

Bees, Maladies of. In the spring the bees are subject to a kind of dyentery, which proves often fatal. The matter which voids at this time, when so affected, instead of being of a reddish yellow colour, is of a muddy black, and has an intolerable smell. COLUMella supposed this annual distemper to be occasioned by the bees extracting too freely the juices from the blossoms of the ipomea and elm trees, or, as others believe, from the lime tree. There are writers who, differing from this opinion, attribute it to the quantity of new honey, of which they are known to eat to excess at that season of the year. Again, others imagine that it is caused only by their long stay in the hive during the winter, when they are constrained to feed on the coarser wax, if their honey fails to afford them a sufficient quantity of food. MADAME Vicat, in the "Memoires, &c." of the Berne Society for 1764, ascribes this distemper to the honey which the cold has candied in the hive during the winter. The true cause of this distemper seems to be unknown; but it is certainly contagious and very destructive. A good remedy for it was long unknown. AvITOMACHUS recommends the removal of the vitiated combs. For the recovery of the bees affected with this distemper, a new remedy has been adopted upon the continent: they prepare a syrup composed with an equal quantity of good wine and sugar, which is administered to the bees in every hive, either by pouring it into the cells, or placing it within the hive in a faucer, or any other hollow vessel; this has been found an excellent restorative.

About the end of the spring, another disorder sometimes makes its appearance, which Du Carne de Blangy calls "vertige," or vertigo. This is supposed to be occasioned by the venomous properties of certain plants on which they feed. The symptoms are manifested by a dizzy manner of flight, by their involuntary flattings, falls, and other gesteats, in attempting to perform their usual operations, or in approaching the hive, and by the latitude that succeeds these symptoms. This distemper has been hitherto found incurable.

Bees are liable to a third distemper, the symptoms of which are a swelling at the extremity of the antennae, which becomes also much inflamed, and of a yellow colour; the head assuming shortly after the antennae, the bees lose their vivacity, and languish till they die, unless a proper remedy be applied. In France, they give them Spanish wine for this disorder.

There is still another distemper which sometimes makes its appearance among bees, for which the continental agriculturists administer Spanish wine, as in the former cases. This is a kind of pellagra by which many bees are cut off. It happens when the queen bee has placed the eggs carelessly in the comb, so that the larve perish in the cells, or that they are killed by the cold, or bed management in nourishing and feeding them; when numbers die, and infect the rest. The only attention requisite in this case is to take away the infected combs, scant the hive with the perfume of aromatic plants, and give them the wine to sip, as above mentioned, in order to strengthen and restore them from their sickens.

For the methods of preserving bees in hives and boxes, and for collecting the produce of their labours, see HIVE, HONEY, and WAX.

Honey-Bees, Varieties and Species of. The cultivation of the common honey-bee, in the warmer countries of Europe, being an object of the utmost consequence to the farmer, every means that ingenuity could devise to improve the breed and management of these profitable creatures have been adopted, and with success. They distinguish three kinds or varieties of the common bee (apis mellifica). The first is large, and of a deep brown colour; the second is smaller and blackish: those of the third fort called "the little Flemings," or "little Hollanders," are much smaller than either, and of a fine glossy yellow colour. It is the latter that is very generally cultivated on the continent at this time. APIS MELLIFICA is an European insect. Mr. Hunter supposes it an inhabitant of Asia and Africa also; its appearance in America may be accounted for on the presumption that it was originally introduced there from Europe, and in the course of time has become completely habilitated to that climate. It is said to have been originally peculiar to the continent of Europe, but this will admit of doubt. In those parts of Asia and Africa nearest to the south of Europe, they cultivate the same kind as ourselves. There are some other species of bees domesticated like the common bee with us, in different parts of the world; and others again, whose wax and honey are sought after by the natives, who do not care to take the charge and trouble of domesticating them. In Cayenne and Surinam, the species called by Olivier annulibera, is an abundant and most profitable creature. This little bee is of a black colour, with white wings and long posterior feet. They build their nest, in the shape of a bag-pipe, upon the tops of the highest trees. The honey is very sweet and agreeable, and thick, and of a reddish colour. From the latter the Indians extract a spirituous liquor, of which they are passionately fond; of the wax they make candles. This is supposed to be the small black innoxious wood-bee of Barrere, which is called apinae in Cayenne. M. LATREILLE mentions this species, and also another, which he calls "l'abeille sociale" (apis fascialis), among his "spaires domestiques," an insect rather smaller than the common honey-bee (melifica), that is found in India. Specimens of it, he tells us, were received at the museum of natural history in Paris, among a collection of other insects from Bengal. If we are not mistaken in the species, the same kind was likewise introduced into the cabinets of the curious in this country, about twelve months since by Mr. Fichelt, who found it to be very commonly cultivated by the inhabitants in the vicinity of Bengal.

Wild Bees. Except those species of the bee tribe which are subfervient to the purposes of human life, mankind has shown a marked degree of inattention to this curious race of creatures. Some few naturalists have regarded them as objects of amusement: and what the common observer is content to name a wild bee, without further inquiry, is discriminated by them as forming many distinct families; each of which have their peculiar manners and mode of life, and display a greater or less proportion of economy, skill, industry, &c. by no means unworthy of being more minutely attended to. Of the wild bees there are certain natural families, whose distinctive characters, in a scientific point of view, have been described already; they are distinguished also by their manu-
A circular plane, composed of many of these little tubes, forms the basis on which it is to be erected; it contains from three to eight cells, which are similar to each other in their form, and equal in dimensions. Each cell is about an inch in length, and six lines in diameter; and, before its office is finished, in form resemble a thimble. When its walls are raised to a sufficient height, our little mason lays up in it a flour of pollen seasoned with honey, for the influence of its future inhabitants; sometimes the provision of honey is so great that this provision is entirely liquid. This business finished, the deposits her eggs, finishes and covers in the cell, and then proceeds to the erection of a second, which the furnishes and finishes in the same manner, and so on with respect to the whole net. These cells are not placed in a line, or any regular order; for are parallel with the wall, others are perpendicular to it, and others are inclined to it at different angles; this occasion some empty spaces between the cells, which this labours and fills up with the same kind of cement, and then hains on the whole group a common covering, made with water and grains of sand; to that at length the net becomes a mass of mortar, very hard, and not easily penetrated, even by the blade of a knife; its form is more or less oblong; its colour depends on the colour of the sand employed in its construction. Another species forms its nests, with earth intermixed with chalk, upon stone walls; and a third for the sake of greater security prefers the hollows and cavities in the stone itself for this purpose.

Bees, Wild Honey, Hunting of. In the Philosophical Transactions, No. 376, Mr. Dudley speaks of a method of hunting bees in order to discover the spot in which their nests are sequestered, as practiced some years ago in the woods of New England in America. It confines merely in catching a bee, then letting it fly, and daily observing the way to which it directs its course; this points out to the hunter the direction in which the nest is to be sought after. To find the distance, he takes an off-set of an hundred perches, and then lets fly another bee, but which must be of the same nest; and it is ascertained, that the angle or point where these two coincide intersect, is the point at which the nest is concealed.

Bees, Swarming and the Bee Swarm. Few numbers have written on bees. Among the ancients, Aristophanes is said to have studied them sixty years. Philistines retired into a desert wood, that he might have the opportunity of observing them to better advantage; Aristotle made a great number of curious observations on this insect, which Virgil has put into Latin verse; they have been enlarged and continued by Pliny and others. Theophrastus has a fragment fall in Latin, "Lib. de natura rerum," concerning bees. Laws, and custom in the bee, having a bee swarm in the bee. Among the moderns, the number of writers who have treated on bees is very great, a few only of which it will be expedient to place in mention. Prince Frederick Carl, tutor to the Roman Academy of Sciences, wrote especially on bees, and deduced an important reason, in fact, on the part of the bee in the production of honey. He had not the one to the production of the future man, or of insects, nor the right to provide a force. All his had to be, not entirely of a kind of matter, the basis of their work and food; and, very cunning in the choice of it, they pass from such a centre, a force made to turn. To flatten her letters I, there for example, of a kind of the, with which he for a time made to turn. To flatten her letters, there for 3. But, in this case, a little, to the spot has fixed upon for the sake of her child.
been published on the continent within the last few years: of this description are the work of Huber of Geneva; "Le
Mémoire de Bernard sur l'Education des Abeilles," "Le
cours d'Agriculture," by Roter; "Abregé de l'histoire
Infestes pour servir l'Histoire Naturelle des Abeilles," by
Bazin Gilles Augustin, first published in 1747; "Le
Manuel Nécessaire au Villageois pour Soigner les Abeilles,
by Lombard; and the works of Berthaud, Duchet, Ducarne,
Bauny, Della Rocca, &c.

**BEE** in *Agriculture*. See APIS.

Bee is also used figuratively to denote sweetness, industry, &c. Thus Xenophon calls the Attic bee, on account of the
great sweetness of his style. Antonius got the denomination
melifera, or bee, on account of his collection of common places.

Leo Allatius gave the appellation of apes urbano to the illu-
lustrious men at Rome, from the year 1639 to the year 1632.

**Bee-bird**, in *Ornithology*. See Trochilus minutus; the
bee humming bird, or le flut piti officie du monde of Buffon.

Some refer this name likewise to Trochilus Bicolor of
Gmelin, the *Calidris* of F. S. Surin. **2.**

**Bee, Black.** See ATHITHOS.

**Bee-Blocks.** See Blocks.

**Bee-box.** See Hive.

**Bee-bread.** See Bee Bread, FARINA, and Bee supera.

**Bee-eater**, in *Ornithology*. See Falco Apivorus, Honey
Daisy.

**Bee-flower**, or *Orchis*, in *Botany*. See OFRYSIS.

**Bee-gum**, a soft unctuous matter employed by bees to ce-
ment the combs to the hives, and to close up the cells.

**Bee-bee.** See Hive.

**Bee-humble, humming bee**, wild bee, synonymous with the
Bourdon family of bees, adopted by French writers.

**Bee-humble fly.** See Bombus.

**Bee, Order of**, was instituted at Sceaux in France, for men
and women, in 1703, by Louise, wife of Louis of Bourbon.

The enigma is a medal of gold, bearing on one side the portrait of
the foundress, and on the other a bee, with this motto, 
"Je suis petite, mais mes pictures font profondes."

**Bee-rocks**, in *Geography*, lie on the coast of France, a little
to the west of North from the point of St. Malo. They are
called the Great and Little Bee; the latter of which is well
of the other, and lies N. W. from the town about a gun-shot.

On each of the bee-rocks is a little house. Ships may fall
within a cable's length of the outermost Little Bee, and an-
chor on the south of it in 5 or 6 fathoms at low-water, when
Bore tower, on the south of St. Malo, is a little caft of the
smallest tower on the point to the south of the town.

**BEECH-TREE**, in *Botany*. See Fagus

**Beech-galls**, in *Natural History*, the name of a species of
galls or protuberances found on the bee-ch-tree, and serving
for the lodgment of insects.

These galls are found on the leaves of the beech, and are
sometimes only upon a leaf, sometimes more; they always
grow from the same point, owing, no doubt, to the fly's
having laid so many eggs in the same spot.

These galls are of an oblong figure, and somewhat flattened.
They resemble the flone of a plum in shape, and are so hard
that they are not to be broken between the fingers; their
fullsence feems of the same nature with that of a nut shell.

In each gall there is only one cavity, inhabited by a white
worm, which in time passes through the nymph flate into
that of the fly, to which it owed its origin.

**Beech-meat**, the fruit of the bee-ch-tree. It fattens hogs
and deer, and has sometimes supplexed men instead of bread.

Chios is said to have endured a memorable feige by means of it.

**Beech, Oil of, Huile de Faine**, the fruit of this tree, the
bee-ch-meat, is an oily farinaceous nut highly nutritious to
hogs, poultry, and other animals, and like the other fruits
of this description may be made to yield a very large quantity
of pure oil by preffure. This oil has long been prepared in
der the districts in the south of France. An interesting ac-
count of this manufacture is published in the *Journal de
Physique* for 1781, by Mr. Verdiere.

The taste of the beech-meat is mild, intimate, and some-
what alluring. About the month of October it falls sponta-
enously from the tree, and is collected in this and the suc-
ceeding month. When gathered and picked it is slowly
dried in the shade, or with the heat of a very dry fove
after which it is at any time fit to be preffed for oil. The
very finest oil is made with the bell nuts picked out by hand,
but for the larger quantity the malt is lifted and winnowed
like corn. It is then ground by a machine similar to the ramping
mill, formed of upright beams of wood alternately rising and
falling, set on motion by a large wheel, and when the fruit
goes too dry in the mill a little water is added. When ground
sufficiently fine, it is wrapped up in a coarse hair cloth once
dobled, and submitted to the same kind of press which is
employed for cakedeed, and other oils.

The beech oil, when well made, and from the best selected
fruit, is equal to the best olive oil, and with this advantage,
that it will keep much longer, olive oil beginning to grow
rancid in about a year and a half, whereas the other improves
by keeping, to the sixth or eighth year. It is fit for use a
month after it is made. To obtain the finest oil, besides the
perfection of the fruit, it is necessary that the working of the
mill in which it is ground, should be very moderate, as not
to overheat it.

The water used to give the fruit a proper confinence in
grinding, mixes with the oil when preffed, so that it requires
some weeks to separate it. In general the oil flands about three months to clarify, after which it is
drawn off clear from the water and dregs, and packed up
either in bottles or in very close casks. The general yield of
oil is about ten pounds from 41 bushels, Paris measure.

The uses to which it is applied are all those of the common
fixed vegetable oil. The bell forts are equally grateful for
the table as the bell olive oil. The inferior are used for
lamps, for preparing leather, and other purposes of economy
and manufacture.

The cakes that remain after the oil is preffed out are par-
cularly useful in the fabrication of the oil from nuts, as this
latter fruit is not alone of a proper confinence for the pre-
f, but must be mixed with some more solid fubftance to make
it work well. Besides this, the cakes of beech-meat are
proper for fattening animals, or make a very good fuel.

An attempt was made in the beginning of the last century
to introduce the preparation of beech malt oil in this coun-
try. The poet and speculator, Aaron Hill, obtained a pa-
tent for this manufacture, and went to some expense in estab-
lishing it in England about the year 1714. It would ap-
pear from a letter of his to the earl of Chelthusfield (in the
Harlam Collection, and infants in the Monthly Magazine
for 1765, p. 559) that he had formed very方案 hope
in the success of this plan. However he was obliged soon
to abandon it, probably in part a want of a proper sup-
ply of the fruit, and certainly in a considerable degree from
the very limited use of oil as an article of food in this country.

**BEEF**, in *Domestick Economy*, the flesh of black cattle
prepared for food. The flesh of the heifer or ox hind, says Dr.
Cullen (Med. vol. i. p. 369,) is the most deafe of all the
quadrupeds; and how far that densiy goes in preventing fo-
libility, we have an instance in the bull, whose flesh is seldom
chosen as a part of our diet. The flesh of the female sex is
of a more foluble nature, and sufficiently fit for nourishment;
but we commonly prefer the castrated ox, in which the fat
is better mixed, and as more alkalefcent, the flesh is more
fapid;
BEETLE, is the Eng. name of *D父母非洲.*, a bird found on the banks of the rivers in Senegal, and the only species of the genus known. See BEEF.

BEETLE, in Geography, a small island near the coast of America, in the south-east angle of the bay of Campeachy, the west end of which is washed by the easterly opening of St. Peter and Paul river. It lies close to Tintal island, is five leagues long, and from 3 to 4 broad, and has a fair sandy bay, where ships may ride in 7 or 8 fathoms and be well sheltered. N. lat. 18 30. W. long. 91 30.

BEETLE is also one of the smaller Virgin islands in the West Indies, situated between Dog Island on the west, and Tortola on the east, near Francis Drake's bay. It is about five miles long, and one broad. N. lat. 18 23. W. long. 63 2.

BEERMAN, a considerable township of America in Dutchess county, New York, containing 3,597 inhabitants, including 106 slaves. In the State census of 1790, there appear to be 52 electors in this township.

BEEL, in *Mansio*, an instrument used by the workmen to break a pit in the rock in which it lies. This instrument is called by the townsmen in Cornwall a "tubber." It is an iron instrument of eight or ten pounds weight, made thin, and fixed at both ends, and having a hole in the middle, where the handle is fixed in. When the ore lies in hard rock, this instrument wears out so fast, that it must have new points made to it every fortnight. The miners who dig up the ore in the mines, are, from the use of this instrument, called seek-men; and those who attend them, and whose business it is to take up the matter the others loosen or break up, are, from their instrument, which is a broad and hollow iron chisel, or a wooden one, with a very strong iron lip, called the "shovellers." In Cornwall, when the ore lies in a hard bed, they allow two shovellers to three seek-men; and when it lies in a soft and earthy matter, two seek-men and three shovellers are the proportion. Phil. Trans. N. 69. p. 210.

BEELIKE, in Geography, a town of Germany, in the circle of the Lower Rhine, and duchy of Westphalia, 4 and 1/2 miles from Rendsen, and 1 E.N.E. of Andernach.

BEELZEBUB, or BEELZEBUB, in *Abend Myst.* was a god of the Philistines, and had a temple and oracle at Ekron. (2 Kings i. 2.) From this point it is said that the name was not given to this object till it was worshipped by way of contempt; because it was used by Abijah at the very time when he was acknowledging the divinity, and defirous of conducting his cause in a recovery. There is further evident, from the meaning of the epithet, and the sake of it being gen. History affords us, that those who lived in hot climates, and where the sea was not, which was the case with the Egyptians, who bordered upon the sea, were exceedingly infidet with fish; and these facts were thought to occasion contiguous disagreement. *Pliny* (N. H. I. c. x. c. 28. § 40.) mentions a people who popped a pedestal which had been there established by sacrificing to the "fly-hunting god." It seems not improbable that some injured care of the Lord, or a general persuasion of his power of driving away from the place they frequented, might be the reason why the god of Ekron was called Beelzebub. For it was customary with the heathens, to call their gods by the name of those infested from which they were beloved to deliver their worshippers. The "god of flies," and the "fly-hunter," were titles ascribed to Jupiter as well as to Hercules. Indeed, some of the Greek fathers thought that this "fly-god" was worshipped under the form of a fly; and it is observed by Mr. Young (on Idolatry, vol. ii. p. 91, 92.) that it was customary with the heathens to represent their gods by some creatures that were sacred to them. However, the supposed power of this god over that noxious insect, the fly, seems to be the most probable reason of the name of Beelzebub. Beelzebub, therefore, being a title of honour, and as such applied by his worshippers to the god of Ekron, there is no reason for doubting, that it was in use among the Philistines, as well as among the Jews. (Bochart, vol. ii. p. 56, &c. Op. vol. iii. p. 502. Hhi de Drev. Scr. Soc. Beng. ii. c. 6. p. 222. ed. Amil. 1660.) Among the Jews the appellations Beelzebub, notwithstanding its feeble merit, could not be used as a term of derision. For the Jews had learned of the heathens to regard a power of driving away flies, as a divine prerogative: as a charge to persuade men, that the temple of Jerusalem, though many sacrifices were daily offered there, never had a fly upon it: thus coupling, rather than deriling, what the heathens failed concerning some of their temples, into which, according to Pinyi, Solomon, and others, no fly could enter. It has been laid, indeed, that the Greek word used in the New Testament, is not "Beelzebub," but "Beelzebul," which signifies the "lord of a dunghill," and hence it has been inferred, that this name could not have been used by the Hebrs; but must have been given by the Jews in derision. Jerom, however, not understanding the common usage, changed Beelzebub into Beelzebul, and this blunder has been approved by several critics, has been adopted by the vulgate, and then transferred into Luther's translation. In the ancient language, it was not uncommon to change b into l (see letter BL.) and, on this supposition, the Greek word will agree with the Hebrew, (2 Kings i. 2.) But if Beelzebub be used as a different name from Beelzebul, there will be no reason for supposing that it was used by the Jews as an expression of contempt. The Hebrew word בֶּלֶזֶבּוּל, properly signifies a "habitation," and as Stockius observes, is applied to the heavens, the maids of the deity. In this sense it will agree with the title of Bel, man, or Beelam, the "lord of heaven," which the Erunomans, and other Physicians, gave to their supreme name. Whether, therefore, Beelzebub and Beelzebul be different names, or the same name with different terminations, they describe the person whom the Hebrans regarded as their chief deity.

Beelzebub, in the New Testament, (Matt. xvii. 24. Mark, x. 39.) is called בֵּלֶזֶבּוּל, the prince of demons, (prince of the devil, Eng. Transl.). And it has been commonly apprehended, that demons and the prince are the same spirit in the devil and his angels. Satan and Beelzebub, say those that adopt this opinion, (See Doddridge on Matt. xvii. 25.) for after Chri was approached with writting out demons by the influence of the present day, he replied, "How can Satan cast out Satan?" (Matt. x. 26. Mark, v. 23. Luke, xi. 15.) Now if Satan, who is called the prince of the demons with the devil (Rev. xii. 12. Matt. x. i. compared with Mark, i. 12.) was the prince of these demons who were cast out by Chri; it is evident that the name Satan is the name of the devil's angel. And as it is necessary, there can be two different names that name the same thing, it is hard to conceive that which is implied between a prince and his lodges, who both partake of one common nature, through the prince, as presiding over the evil, hath a peculiar name of his own. Dr. Lordi (Cate of Dictionaries, p. 42. Works, vol. i. p. 48.)
p. 448.) admits, that the devil, who is supposed to be the chief or prince of the fallen angels, is often called Satan and Beelzebub. Mr. Farmer is of opinion (Essay on the Demonology of the N. T. p. 16.) that it doth not follow from the above cited passages, that the devil is ever called Beelzebub. The term “Satan,” he says, is not appropriated to one particular person or spirit, but signifies “an adversary” or opponent, in general. The Jews called every demon by this name, and used it in the plural number; and the words of our Saviour, “How can Satan cast out Satan,” taken in their strictest sense, imply that there were several Satans; so that our Lord might only mean, “that it was unreasonable to suppose that one demon would cast out another.” Or if you understand him to the following purpose: “were Beelzebub, whom you regard as the chief of the possessing demons, to expel himself, which would in effect be the case were he to expel his agents and instruments, he would act against his own interest, and defeat his own schemes;” it will not follow, that Beelzebub was considered as the same person with the devil. There seems to be no reference to the latter. He and Beelzebub might be regarded as two distinct persons; and yet each be called “Satan,” an adversary, or opponent. “If Beelzebub and his demons were, in our Saviour’s time, conceived to be the very same persons as the devil and his angels, is it not very surprising,” says this author, “that the New Testament, in its original language, should always speak of the dicing persons under consideration as possessed by a “demon” or “demons,” and never by “the devil” or “devils” a word, as all must allow, that is never there applied to evil spirits in the plural number, whatever its use may be in the singular. He adds, “as much as Christ is here replying to the Pharisees, and reproofing them with their own principles, he cannot be supposing to speak of a different order of beings from what they did. Satan, therefore, must be equivalent to demon, in the sense in which demon was used by them.” See Demon. “Should it then appear,” says Mr. Farmer, “that by demons and their princes they understood human spirits, it will from hence follow, that Christ cannot be speaking of spirits of a celestial origin.” If by the devil we are to understand a fallen angel, this writer thinks that he could not be the same with Beelzebub. The Jews, in their ancient writings, were not accustomed to call the devil by this name, but that of Asmodeus, or Samuel; as Bochart, (Oper. vol. iii. p. 527.) Selden, (ubi supra, p. 231.) and others allow. Beelzebub, in the enumeration of the Pharisees, was the prince of the “possessing demons;” and therefore, as Mr. Farmer supposes, he was, in their estimation, a human spirit; and in proof of this he alleges the testimony of Josephus (De Bell. Jud. l. ii. c. 6. § 3). Besides Beelzebub was, as we have already stated, a heathen deity; expressly denominated in the Old Testament, the god of Ekron; and represented by the Pharisees under the same title and character as the heathens themselves ascribed to their gods. “If Beelzebub,” fuljoints Mr. Farmer, “was a heathen demon, or deity, he was no other than a deified human spirit: for fishes were all the heathen demons, who were the immediate objects of the public established worship; and those in particular to whom divination and oracles were ascribed. And if the prince of demons was of human extract, no doubt his subjects were so likewise.

**BEELZEBUL** in Entomology, a species of Scarabæus that inhabits America. On the thorax is a triple prominence; and three horns on the head, the middle one larger than the others. Fabricius.

**BEELZEBUL** in Zoology, a species of Simia that inhabits South America; and is tailed, bearded, and black; tail prehensile; tip, with the feet, brown. Linnaeus. This appears to be the guarila of Meargrave; blazing baboon of Bankcroft; preacher monkey of Remnant; and laouarme of Buffon. It is said to be about the size of a fox, of a black colour, and the hair of its long, glossy, and remarkably smooth. This is a fierce animal, and inhabits the woods of Brazil, and Guiana, in vast numbers; wanders in large flocks in the night time, and howls hideously. Dr. Shaw observes, that this howling facility is owing to the conformity of the os hyoidei, or throat bone, which is dilated into a bottle-shaped cavity. Meargrave, in speaking of the guarila, acquaints us that one sometimes mounts the top of a branch, and assembles a multitude below; he then sets up a howl so loud and horrible, that a person at a distance would imagine that a hundred joined in the cry; after a certain space, he gives a signal with his hand, when the whole assembly join in chorus, but on another signal, a sudden silence prevails, and then the orator finishes his harangue. Virey calls this animal Beelzebub, retaining however at the same time the name laouarme, under which it is described by Buffon.

**BEEMAH,** in Geography, a river of Hindostan, which is a principal branch of the Kishah, joining it near Edgin, rises in the mountains, on the north of Poonah, probably not far from the sources of the Godavery, and passes within 30 miles of the coast side of Poonah, where it is named Beemah as well as Beemah. It forms the eastern boundary of Hindostan, and passes about 20 or 82 geographical miles to the west of Golconda, crossing the road from it to Railcote. The Beemah, according to Mr. Orme, pollutes virtues similar to those of the rivers esteemed sacred by the Hindoos: that is, abutions performed in its stream have a religious efficacy superior to those performed in ordinary streams. Kennell’s Memoir, p. 244, &c.

**BEEMEN,** or **SHEEMEN,** in Astronomy, seven stars of the fourth magnitude, following each other, in the fourth figure of the constellation Eridanus.

**BEEMSTER,** in Geography, a large drained lake or marsh of North Holland. It was formerly a lake, covering a great extent of country, which, by the industry of the Hollander, who, by means of various canals, have drained the waters, is converted into an excellent pasturage ground. It has neither towns nor villages, but a great number of hovels, which are dispersed along the sides of the canals and roads.

**BEEN,** in Music, the name of an Indian flatted instrument of the guitar kind. The finger-board is 24 inches long. A little beyond each end of the finger-board are two gourds, and beyond these are the pegs and half-piece which hold the wires. The whole length of the instrument is three feet seven inches. The first gourd is fixed at ten inches from the top, and the second at about two feet 11 inches. The gourds are very large, about fourteen inches diameter, and have a round piece cut out of the bottom, about five inches diameter. The finger-board is about two inches wide. The wires are seven in number, and consist of two steel ones, very close together, in the right side; four brass ones on the finger-board; and one brass one on the left side. They are tuned in the following manner.
The great singularity of this instrument is the height of the frets; that nearest the nut is one inch, and that at the other extremity about 2½ in. of an inch, and the decrease is pretty gradual. By this means the finger never touches the finger-board itself. The frets are fixed on with wax by the performer himself, which he does entirely by ear.

The frets are nineteen in number. On the wires R and S, which are those principally used, there is an extent of two octaves, a whole note with all the half notes complete in the first octave, but the and are wanting in the second. The performer's apology for this was, that he could easily get those notes by placing the string a little hard upon the frets, &c., which is very true from the height of the frets; but he adhere to that this was no defect in his particular instrument, but that all beaux were made to. The wires, T, U, are seldom used, except open.

The bow is held over the left shoulder, the upper ground resting on that shoulder, and the lower one on the right knee.

The frets are fitted with the left-hand; the first and second fingers are principally used. The little finger of this hand is sometimes used to strike the note V. The third finger is seldom used, the hand shifting up and down the finger-board with great rapidity. The fingers of the right hand are used to strike the strings of this hand; the third finger is never used. The two first fingers strikes the wires on the finger-board, and the little fingers the two wires. The two first fingers of this hand are defended by a piece of wire put on the tops of them in the manner of a thimbike; when the performer plays strong, this causes a very jarring disagreeable sound; whereas, when he plays softly, the tone of the instrument is remarkably pleasing.

The style of music on this instrument is in general that of great execution. The bowing is very regular and subject. The bow has to consist of a number of detached passages, some very regular in their accent and deficient; and those that are played softly, are all of them both uncommon and pleasing. Adam Raffeld, vol. 1, p. 159. See Plate of Muff.

BEEF, a spirituous liquor, made from any farinaceous grain; but generally from barley. Accordingly, it is a liquor of very ancient and general use. See Ale.

The word is Saxon, formed from the German bier, of the Latin bebrew.

Several authors have maintained, that there was no malt liquor known by the appellation of beer, as distinguished from the ancient liquor called ale, till the use of hops was introduced. See Hops. However, we find, by a statute of the twelfth parliament of the 23d year of the reign of Henry VIII, (c. 88.), that it was enacted, that no person should mix wine or beer, under pain of death. Besides this statute, occurring in 1492, many others might be produced confuting the vulgar tradition, that beer, as a liquor, distinct from ale, was unknown in England till the reign of Henry VIII. In the year 1492, we find a licence from King Henry VII, to a London brewery, for the use of the 

Beer is made from malt by extraction with water and fermentation. With this view, a quantity of malt, freed from its germs, and sufficient for one intended brewing, is carefully bruised by grinding, and in the malt-tub, first well mixed with some cold, then heated with hot water drawn upon it from the boiler. It is afterwards strongly and uniformly stirred. When the whole mass has fluid quietly for a certain time, the extract (mash), or sweet-wort, is brought into the boiler; and the malt remaining in the tub is once more extracted by infusion with hot water. This second extract, treated in the same manner, is added to the first, and both are boiled together. This clear decoction is now drawn off, and called boiled wort. To make the beer more fit for digestion, and at the same time to deprive it of its too great and unpleasant sweetness, the wort is mixed with a decoction of hops, or else these are boiled with it. After which it ought to be quickly cooled, to prevent its transition into acetic fermentation, which would cause, if it were kept too long in a high temperature. On this account, the wort is transferred into the cooler; where it is exposed with a large surface to cold air, and from this to the fermenting tub, that by addition of a sufficient portion of recent yeast it may begin to ferment. When this fermentation has proceeded to a due degree, and the yeast ceases to rise, the beer is conveyed into casks, placed in cool cellars, where it finishes its fermentation, and where it is well kept and preserved under the name of "barrelled beer," with the precaution of occasionally filling up the vacancy caused in the vessels by evaporation. Or, the beer is bottled before it has done fermenting; and the bottles are flopped a little before the fermentation is completely over. By doing the bottled beer is rendered sparkling. In this state it frequently burfts the bottles, by the distingagement of the carbonic acid gas which it contains; and it strongly froths, like champagne, when brought into contact with air on being poured into another vessel. Gren's Chymistry, vol. ii. p. 63.

For the proofs of brewing, particularly according to the English mode; see Brewing. Beer, well prepared, should be lambid and clear, possess a due quantity of spirit, excite no disagreeable sweet taste, and contain no diengaged acid. By these properties, it is a species of vinous beverage, and is distinguished from wine, in the first fine, and other liquors of that kind, by the much greater quantity of mucilaginous matter which it has received by extraction from the malted grains; but which also renders it more nourishing. "Brown beer" derives its colour from malt strongly roasted in the kiln, and its bitterish taste from the hops. "Pale beer" is brewed from malt dried in the air, or but lightly roasted, with but little or no hops at all.

Tacitus, in speaking of the ancient Germans, as also Dioscorides, Cebren, &c., commend beer, as prejudicial to the head, nerves, and membranous parts, as occasioning a more lasting and more uneasy drink than wine, and as promoting a suppression of urine, and sometimes a leprosy.

Meff. Perrault, Ramelli, and others, defend the modern beer: urging, that the hops used with it, and which the ancients were strangers to, having a faculty of purifying the blood, and removing obstructions, serve as a corrective, and free our drink from the leavening matter collected to that of the ancient. For the qualities of beer, see Malt-Liquor.

In new England they make beer from maize, or even the bread made thereof. Some physicians recommend beer made of oats and birch-water, as preferable, in nephritic cases.

Mr. Park, in the account of his travels through Africa, informs us, that the negroes make excellent beer of one piece of their corn, by making the seeds nearly in the same manner as barley is malted in England; and he says, that the beer, thus made, was to his taste equal to the best strong beer he had ever tasted in his native country.

Sour or decocted beer may be restored divers ways; as by sail malted of the ashes of barley-straw, put into the vessel, and stirred; or by three or four handfuls of beech-ashes thrown into the vessel, and stirred; or, where the liquor is not very thin, by a little put into a bag, without straining; chalk calcined, ouder-shells, egg-shells burnt, sea-shells, crabs eyes, alkali-coral, &c. to the fame, as they imbibe the acidity, and unite with it in a sweetness. Beer, it is said, may be kept from turning four in summer by hanging into the vessel a bag containing a new-laid egg, pricked full of little pin-holes, some laurel-berris, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Laurel berries alone, their skin being peeled off, will keep beer from deadseas; and the throwing fixed air into it will restore it. Glauer commands his false mirabilis and fixed nitre, put into a linen bag, and hung on the top of the cellar, so as to reach the liquor, not only for recovering four beer, but for preferring and strengthening it. See Ale.

Beer tasting of the calf, may be freed from it, by putting a handful of wheat in a bag, and hanging it into the vessel. The grounds of beer form a very rich manure.

Beer Poetic. See Zythogalia.

Beer, Eager, is used by calico-printers, chemists, larderaries, scarlet dyers, vine-ar merchants, white-leden men, &c. Beer-Measure. See Measure.

Beer-Vinegar. See Vinegar.

Beer Haven, in Geography. See Bear-Haven.

BEERING, BEHING, or BEERING, VITUS, in Geography, an eminent navigator, was a native of Denmark, and born towards the conclusion of the 17th century. After having made two voyages to India, he entered in 1704, as a lieutenant in the Russian navy, in which he afterwards rose to the rank of captain and commodore. In pursuance of a plan conceived by Peter I., and communicated on his deathbed to Beering, for making discoveries in that temperate sea which lies between Kamtchata and America, this adventurous navigator set sail in 1728, accompanied by Tschirikof, from the mouth of the Kamtchata river, with a view of ascertaining whether the two continents of Asia and America were separated, according to the instructions prepared by Peter I. on his death-bed for this purpose. Coasting along the eastern shore of Siberia, he arrived at the latitude of 67° 18', but made no discovery of the opposite continent. In 1729, soon after his return, he failed again in prosecution of the same design, but without success. A third expedition was planned in 1744, and the conduct of it was entrusted to Beering and Tschirikof, who encountered many difficulties, and paved the way to all the important discoveries afterwards made by the Russians.

Two vessels, named the St. Peter, and St. Paul, were defined for this enterprise; the former was commanded by capt. Beering, and had on board 76 persons, including officers, and the latter by capt. Tschirikof, accompanied by Delles, professor of astronomy, and the same number of mariners. From the bay of Awatsha, where they left on the 4th of June, they proceeded northwards; and the vessels parted in a storm, and never more saw one another during the voyage. Beering steered in a southern direction from the 50th to the 40th degree of latitude in search of Tschirikof, but finding the search to be fruitless, he directed his course easterly, and at the end of six weeks from the time of first sailing, deferred land in the latitude of 59° and some minutes, and in the longitude of 40° from Awatsha. On the 25th of July they anchored among some islands, on one of which they landed; but they neglected to accomplish the main object of their mission, which was the discovery of the American coast, which afterwards appeared to be so near their present station. This omission seems to have been owing to the discontent and infurbickation that prevailed among the crew and officers of the ship. Having observed several islands in the course of their voyage; they, at length, viz. on the 6th of November, found themselves, as they apprehended, on the coast of Kamtchata, near the bay of Awatsha; but the land which they perceived proved to be an island, on which the ship was wrecked, and where the commander, and several of the crew, died soon after their landing, on the scurvy, famine, and fatigued, Steller, who accompanied Beering, and wrote a journal of the voyage, observes, in justice to the commodore, that he exerted himself to the utmost of his ability in executing the design of his mission, but that he was himself conscious of his unfaults for the arduous task on account of his age and infirmity. His temper was too mild for the government of a disorderly crew: and his deference to his officers led them to presume on their own importance, and to despise his authority. Worn out at last with hunger, thirst, cold, weakness, and anxiety, the cedematous tumours in his feet, from which he had long suffered, increased by the frequency of the weather, and a mortification of the belly taking place, he breathed his last on the 5th of December, and was buried between his adjutant commissary and two grenadiers. "On our departure from the island," says Steller, "we erected over the grave a wooden cross to serve as a monument, and at the same time to be a testimony of our having taken possession of the country." Steller alleges several arguments to prove that Beering discovered the continent of America, at Cape St. Elias, lying, according to his calculation, in N. lat. 58° 28', and in longitude from Ferro 235°; and that the coast touched at by Tschirikof was situated in lat. 58° 20', and 241'. The coast, says Steller, were bold, projecting chains of high mountains, some of which were covered with snow, and their sides clothed from the bottom to the top with large tracts of thick and bare wood. Steller went on shore and observed several species of birds not known in Siberia, and one in particular, described by Catesby under the name of the blue jay, peculiar to North America. The soil was different from that of Kamtchata, and of the neighbouring islands, and he found several plants which botanists deem peculiar to America.

Besides, it has been alleged that they must at least have approached very near that continent; as the natives of the islands on which they touched, presented to them the "calumet" or pipe of peace, which is a symbol of friendliness universal among the people of North America, and an usage of arbitrary inquisition peculiar to them. Soon after the return of Beering's crew from the island, where he was shipwrecked and died, the inhabitants of Kamtchata ventured over to that island, to which the sea-otters and other sea-animals were accustomed to resort in great numbers. Steller's Journal apud Pallis. Coxe's Russian Discoveries, p. 20. p. 275. &c. Tookes's View of the Russian Empire, vol. i. p. 156, vol. ii. p. 40. p. 499. See Asia, and the following articles, Beering's haven, &c.

Beering's Haven, in Geography, a name given in honour of commodore Beering, to that part of the North Pacific Ocean, compre-
comprehending about 1200 leagues in circuit, which is formed by the Archipelago, called the Aleutian; Aleutitic islands, with the north-west coast of America, and the north-east coast of Asia, and which communicates towards the south with the great Boreal ocean by as many straits as the islands form channels between them, and towards the north, under the 66th parallel, with the Arctic Ocean, by Birning's Straits alone. See Aleutian.

Birning's, or Birning's Bay, a bay on the north-west coast of America, situated between Cape Suckling and Cape Fair-weather, and so called in honour of commodore Birning, who, in 1741, discovered this bay, and anchored in it. The extreme points of this bay, in Vancouver's chart, are port Manby and port Turner; cape Phipps lies to the south of it, and port Mulgrave, formed by islands, and affording a convenient anchoring place secure from all winds, is situated within the bay. In this part of the bay, Birning is supposed to have anchored. Birning's mount, St. Elias, lies at a small distance to the north of this bay. Mr. Dixon called it Admiralty Bay. La Peroufe describes it under the denomination of Birning River. American captain Cook, the opening of this bay was in N. lat. 57° 18'; and la Peroufe makes it 59° 20'. Cook's longitude was 220° 19' E. or 135° 41' W. 142° 1' W. from the meridian of Paris. La Peroufe fixes his longitude at 143° 2', making only a difference of 1' from that of Cook. Vancouver, who reconnoitred this coast more accurately than Capt. Cook, had an opportunity of doing, as he passed it at some distance from the shore, places it further to the north and west, its opening being about 59° 32', and E. long. 220° 35'.

Birning's Island, an island in the north Pacific ocean on the north-east of Kamtschatka, which some have considered as one of the groups, called the Aleutian isles, or "Aleutian" and others have separated from it. This island was discovered by Birning in 1741. This adventurous navigator, having been for some time in a state of indisposition and decay, was unable to concern himself about the management of his ship, and his crew were generally attacked by the fevers, and in a sickly, exhausted condition. Pursuing their navigation, they were at length driven by the winds and seas on this island, with the intention of which, with regard to the two continents, they were unacquainted, and here the ship was cast away. On the 8th of December, Birning died on this island, which has very properly assumed the name of the first navigator who ventured into these seas, and who discovered the west continent of America, in a latitude which, before him, no known voyager had attained. In the following year, the surviving crew continued with great trouble, to construct a boat, which conveyed them to Kamtschatka. This island is situated between the north latitude of 55° and 56°, and E. long. 167° 25', about 50 leagues from the coast of Kamtschatka. It is 165 miles in length, and of various breadths, the greatest breadth being 23 miles; and it consists of a range of bold cliffs and hills, which, separated by several very narrow valleys, being north and south, extend from the sea like a jagged rock. The highest of these mountains are elevated perpendicularly, not above a hundred fathoms, covered with a yellow clay, and much sage by larvino element and weather. The main entrance is composed of granite; the rocks are enveloped that land near the sea, which are strongmoss of turquoise, and form out incessantly, these valleys, that are very steep. In these mountains there are many caverns. In the year 1741, three small pieces of earthquake were perceived in this island; the earth is not covered with ice, and the cold is not great; in fact, although there are mountains on the shore, few near it, Neither thunder nor the aurora borealis has been observed here. The island has springs of excellent water, and beautiful estuaries. Of animals there are only foxes, seals, sea-bears, sea-lions, sea-cows, &c. No wood grows upon this island; but several kinds of plants are found upon it. It is uninhabited. The ships which have been accustomed to navigate these seas have frequently wintered on this island, in order to procure a stock of salted provisions from the sea-cows and other amphibious animals, that are found here in great abundance. Tooko's View of the Russian Empire, vol. i. p. 176, &c. Marchand's Voyage, vol. i. Intro. p. 33.

Birning's Straits, separate Asia from America, being bounded on the American side, by cape Prince of Wales, in N. lat. 67° 50'; E. long. 101° 50', and on the side of Asia, by the cape called in N. lat. 66° 6' and E. long. 190° 22'. The breadth of this strait is about 13 leagues, or near 40 miles; its depth is from 12 to 30 fathoms. It was discovered first by Birning, and afterwards by captain Cook. Birning, in his voyage of 1741, is said to have proceeded as far north as 67° 18', and therefore must have reached the strait, and having driven it about a degree and a quarter than that of the modern chart of the old continent. He had, therefore, entered the Frozen Ocean, and must have actually passed this strait, probably in the usual fog of the climate, without discovering land to the south; however, our great navigator, captain Cook, gave the name of the Danish adventurer to these straits, when he lost his usual accuracy, he afterwards explored them. To the north of these straits the Asiatic shores lead rapidly to the westward; but the American proceeds nearly in a north-east direction, till, at the distance of about 4 or 5 degrees, the continents are joined by solid and impenetrable banks of ice. The sea from the south of these straits to the crescent of islands between Asia and America, is very shallow, and deepens from these straits till foundings are lost in the Pacific ocean, south of these islands. Between them and the straits there is said to be an increase from 12 to 54 fathoms, excepting off Cape Thaddeus, where the channel is of greater depth. From this, and other circumstances, it has been thought not improbable that a separation of the continents may have taken place in some unknown period, at these straits, and that the whole space from the islands to that small opening might once have been dry land; and that the fury of the watery element, actuated by that of fire, might have subverted and overwhelmed the tract, and left the islands as volcanic remains of this great eruption. The famous Japanese map places some islands apparently within these straits, denominated "Ya Zuoo," or the kingdom of the dwarfs. Hence it has been imagined, that America was not unknown to the Japanese, and that they had, as Kempter and Charlevoix have supposed, made voyages of discovery, and according to the last writer, that they had actually wintered upon the continent, where probably meeting with the Equinox, they might, in company with the rest, swiftly disintegrate them by the name of dwarfs. See Asia.

Birero, a Moorish kingdom of Africa, lying to the north of Bambara, and north-west of a Foulah state, called Blafna. Its capital is Watr, According to Mr. Rennell's information, about 240,000 square miles to the west of Benin. In Rennell's map of North Africa, Watr is in N. lat. 15° 45' and W. long. 24° 35'. The kingdom of Birero borders on Sahara, or the Great Desert.

Bireroth, in Ancient Geography, 2 City of the Cis-derites, afterwards of the tribe of Benjamin, Josh. xiv. 11. According to Eusebius, it was distant 7 miles from Jerusalem, in the way towards Nicopolis.

Bireroth, of the children of Jashan, was a nation of the
BEER-SHEBA, called also BERSABE and BARSHEBA, a city given to Joshua to the tribe of Judah, and afterwards transferred to Simon. Josh. xii. 28. It derived its name from יִבְרֶשֶׁבָא ber-esheba, the well of an oath, from the well on which Abraham and Isaac ratified their alliance by an oath with Abimelech. It was distant south from Hebron 20 miles, and had a Roman garrison in the time of Eusebius and Jerom. The limits of the Holy Land are often expressed in Scripture by the terms 'from Dan to Beer-sheba' (2 Sam. xviii. 11. &c.); Dan being the northern and Beer-sheba the southern extremities of the land. It is now a poor village, adjoining a large, sandy, barren desert, altogether uninhabited, except towards the sea-coast.

BEES, in Naval Architecture, pieces of elm-plank bolted to the outer ends of bowsprits.

BELENSTADT, in Geography, a town of Germany, in the circle of Upper Saxony, and county of Mansfield, 6 miles east of Eisleben.

BEER-HEBD, St. a cape of England, in the western extremity of the county of Cumberland, in the Irish sea, about 10 leagues E. by N. from the Isle of Man, and 2 S. of Whitehaven. It has a light-house, and is a noted promontory for fish-fowl. N. lat. 54° 31'. W. long. 40° 43'.

BEESHEN, a town in Germany, in the circle of Westphalia, and county of Lingen.

BEESKOW, a town of Germany, in the circle of Upper Saxony and Uckermark of Brandenburgh, and capital of a lordship, to which it gives name, seated on the Spree; 16 miles S. W. of Frankfort on the Oder, and 34 E. S. E. of Berlin. A cloth manufacture is carried on in this town.

BEES-WAX. See Wax.

BEESTINGS, or BEASTINGS, denote the finest milk taken from a cow after calving.

The beefsteaks are of a thick consistence and yellow colour, seemingly impregnated with sulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the excrescences gathered in its stomack and intestines during its long habituation in uto. The like quality and virtues he fupposes in women's first milk after delivery; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurse, whose first milk is gone.

BEET, in Botany. See Beta.

BEET, bare's, beta vulgaris, a name given by some of the old Latin writers to a small green plant of an acid taste.

BEET-gall-infest. See GALL-infest.

BEETLE, in Entomology, a common English name for all insects that are furnished with wing-cases: those which have them divided by a straight line are properly beetles, and belong to the coleopterous order; but the blattae, or cock-roaches, are also called beetles, though the future is oblique, or in other words one wing-case crofses the other; and therefore it belongs to the hemiptera order. See Coleoptera. The tarbacin are beetles in the Lëgillus fene of the word.

BEETLES, water, is likewise a common name for those insects that have wing-cases that inhabit the water including the dytici, and some other aquatic insects, that are truly beetles, with such as are not of the same order, such as the nepe, hitoneer, &c. See HEMIPTERA.

BEETLE, in a Mechanical Sense, denotes a large wooden instrument, formed after the manner of the mallet, having each face bound with a strong iron hoop, to keep it from spreading, and used for driving piles, faken, palisades, wedges, and the like.

In this sense, the word is corruptly written in some places boyel. Skinner derives it from the English beating. For the military use, beetles called also flammers, are thick round pieces of wood, a foot and a half long, and eight or ten inches in diameter, having a handle of about four feet long. Their use is for beating or settling the earth of a parapet, or about palisades; which is done by lifting up the beetle a foot or two, and letting it fall with its own weight. The name beetle is also given to the pavilion's rammer, or instrument wherewith the flames are beaten down, and fattened.

BEESVES, a general name for oxen.

BEFARIA, in Botany. See BIFARIA.

BEFORT, in Geography, a town of France, and principal place of a district, in the department of the Upper Rhine, ceded to France by the house of Austria in the year 1748, at the treaty of Westphalia. It was fortified by Vauban. In this town several forges are employed in the manufacture of iron. The place contains 4,400, and the canton 11,439 inhabitants: the country includes 155,305 hectares and 32 communes. N. lat. 47° 9'. E. long. 6° 46'.

BEFROI, GRAND BEFROI, and PETIT BEFROI, in Ornithology, the names of the two species of Turdus, called Linneus and Lineatus by Gmelin, in Buffon's Hill Birds.

BEG, or BEY, in the Turkish Government. See Bey.

BEG, LOUGH, in Geography, or the Little Lough, in the province of Ulster, Ireland, a small lake into which the waters from Lough Neagh again expand, after a course of about a mile, through a very narrow channel. The form of Lough-beg, its islands, some wooded points of land with intervening lawns and rocks, a magnificent rotunda at Ballyfelen, and the beautiful lightness of Toome-bridge, produce the most happy effect. It is situated between the counties of Armagh and Londonderry.

BEGA, or BEEGYN, CORNELIUS, in Biography, a painter and engraver, was born at Haelem in 1620, and became the disciple of Adrian Ollade, whose manner he imitated, and by whose instructions he profited, so as to acquire considerable reputation as a painter. But contracting habits of dilipation and licentiousness, he was disowned by his father, and repenting the indiginity, he assumed the name of Bega instead of Beegyn, which was that of his family. He had a fine pencil, and a delicate mode of handling his colours, so as to give them a neat and transparent appearance; and his performances are so much esteemed in the Low Countries, as to be placed among the works of the best artists. He also etched several drolleries, and a set of 34 prints, representing ale-houfe scenes, &c. His death, which happened in 1664, was occasioned by the plague, which he caught from a favourite female, to whom he was so strongly attached that he visited her, against the remonstrances of his friends and physicians, to the last moments of her life; and he outlived her only a few days. Pilkington and Strutt.

Bega, or VEGA, in Geography, a river in Germany, which runs into the Werra, 4 miles N. W. of Lemu, in the circle of Westphalia.

BEGANNA, in Ancient Geography, a town of Arabi Deferta, in the neighbourhood of Melopotamia. Ptolemy.

BEGARD, in Geography, a town of France, in the department of the Northern coasts, and chief place of a canton in the district of Guingamp; the place contains 2394 and the canton 7864 inhabitants: the territory includes 1024 kilometres, and 7 communes.

BEARMEE, or BACHERMI, supposed to be the "Begama" of Edrin, and the "Ghoram" of D'Anville, an extensive kingdom of Africa, situate S. E. of Bornon, at the distance of about 20 days' travelling, or allowing with major Rennell, 15 miles for a day's journey, 500 miles, and separated from it by several small deferts. Th: extent, according to Browne's Travels in Africa, p. 468, is from
from E. to W. 12 days, and from N. to S. 15 days, allowing 12½ geographical miles per day. The inhabitants are rigid Mahometsans, and though perfectly black in their complexions, are not of the Negro cast. Beyond this kingdom to the east, (see Proceedings of the Association for promoting the discovery of the Interior Parts of Africa, p. 155.) are several tribes of Negroes, idolators in their religion, lavish in their manners, and accustomed, it is said, to feed on human flesh. They are called the Kardes, the Sorowali, the Showvah, the Batak, and the Mulghi. These nations, the Begarmees, who fight on horseback, and are great warriors, usually invade; and when they have taken as many prisoners as opportunity affords, or their purpose may require, they drive the captives like cattle to Begarmee. It is said, that if any of them, weakened by age, or exhausted by fatigue, happen to linger in their pace, one of the horsemens lays on the olden, and cutting off his arm, us it a club to drive on the rest. From Begarmee they are sent to Borron, where they are sold at a low price; and from thence many of them are conveyed to Fozzani, where they generally embrace the Mussulman faith, and are afterwards exported by the way of Tripoli to different parts of the Levant. Begarmee, the capital of the kingdom, is in N. lat. 15° E. long. 15° 30'; according to Remell's Map; but according to Browne, N. lat. 15° 40°. E. long. 22° 35'.

BEGARRA, a town in Spain in New Castile, 4 leagues from Alcazar.

BEGEMDER, a province of Abyssinia, north-east of Tigre, bordering upon Angot, and separated from Amhara, which runs parallel to it on the south, by the river Bahalo. Both these provinces are bounded by the river Nile on the west. The greatest length of Begemder is about 180 miles, and its breadth 60; it comprehends "Lalla," a mountainous province, sometimes depending upon Begemder, and often in rebellion. The inhabitants are deemed the best forgers in Abyssinia, being men of great strength and stature, but cruel and uncivilized, so that they are called, in common conversation and writing, the peasants or barbarians of Lalla. They pay to the king 3,000 ounces of gold.

Several small provinces are now dismembered from Begemder, such as Foggora, a small strip of land reaching south and north about 35 miles between Emfara and Dara, and about 12 miles broad from east to west, from the mountains of Begemder to the lake Tana. On the north end of this are two small governments, Dreda and Karota, the only territory in Abyssinia that produces wine; the merchants trade to Caffa and Narea, in the country of the Galli. Begemder is the strength of Abyssinia in horsemen. It is said that, with Lalla, it can bring out 25,000 men; but this account Bruce thinks to be much exaggerated. It is well stocked with cattle of every kind, that are very beautiful. The mountains are full of iron mines; they are not so deep and rocky as in other provinces, if we except Lalla, and abound in all sorts of wild flesh and game. The south end of the province near Nebras Musa is cut into populous gullies, apparently by floods, of which no history remains. It is the great barrier against the encroachments of the Galli, who have made many attempts to obtain a settlement here, but without success; and they have lost whole tribes in these ineffectual efforts. Begemder is a province of such confidence to the flate, reaching to the metropolis and respecting of all sorts of provisions, that none but noblemen of rank, family, and character, able to maintain a large number of troops always on foot, and in good order, are trusted with its government. It lies in about N. lat. 11° 45', and from 37° 30' to 38° 30' E. long.

BEGER, LACARDE, in Geography, a German antiquarian, was the son of a tailor at Heidelberg, and born in 1653. At the request of his father he fled his theological studies, and afterwards gratified his own inclination by the study of the law. Devoting himself to classical literature and antiquities, he acquired such reputation that, in 1657, he was appointed librarian and keeper of the cabinet of antiquities by Charles Lewis, elector Palatine; and he retained the same office under Frederick William, elector of Brandenburg, to whom the cabinet was transferred in 1685. He was a member of the Society of Berlin from its inception, and died there in 1703. He was the author of various learned works. His "Confederations on Marriage, by Daphneus Accuratus," was written in German, as a defence of polygamy, to gratify the elector Palatine, who wished to marry another lady, to whom he was attached, whilst his wife was living. He afterwards gratified the fond by composing a repetition of this work, which was never printed. The principal of his other works, which relate to history and antiquities, are "Theasaurus ex Thesauri Palatini Selectus," 1683, fol.; "Theasaurus Reg. elect. Brandenburgi Selectus," 5 vols. fol.; "Regnum et Imperator. Roman. Num. mimitata," 1700, fol.; "De Nummis Curtiennum heticulifera,", 1704, fol.; "Lecurum Veternum epilchrales," 1702; "Nummitasa Pontif. Roman. aliquotum rara," 1703, fol.; "Meleagrodes et Etofia," 1696, 4to.; "Crane infra Lacemana," 1696, 4to.; "Bellum et Excidium, Trajanum illust," 1699, 4to.; Moreri.

Laurentius Begar, the nephew of this famous antiquarian, was engraver and home G. residence in Berlin about the year 1703.

BEGAR, in Geography, a town in Spain, in the country of Seville, 14 leagues from Medina Sidonia.

BEGGA, in Entomology, a species of Plaethon, (Bombyx) with white wings, having a black rib. This kind inhabits Surinam. The body is white; antennae and legs yellow, black at the tips. Fabricius, Gmelin, &c.

BEGGAR. Beggars pretending to be blind, lame, &c. found begging in the streets, are to be removed by the constables; and refusing to be removed, shall be whipped, &c. flat. 12 Anne; and our statutes have been formerly to direct for punishing of beggars, that in the reign of king Henry VIII. a law was enacted, that thorny beggars convicted of a second offence should be executed as felons. But this statute was afterwards repealed. See ROGUS and VAGARON.

BEGGING ORDER. See Mendicant.

BEGHARDI, BEGUARDI, of Beggard, in Ecclesiastical History, called also in Italy bicochi, and in France beguins, derive their name from the old German word beggen, beggeren, which signifies "to seek any thing with real and importunity." Accordingly perfons of this description were called Beghardi, whence probably the English word beggar is derived; and Begutte denoted female beggars. This was a general appellation, and given to no less than thirty sets or orders, that sprung up in the thirteenth century, which differed widely from each other in their opinions, discipline, and manner of living. It was at first indifferently applied to all persons who embraced, with repugnance and free choice, the horrors of absolute poverty; begging their daily bread from door to door, and renouncing all their worldly possessions and occupations. It was afterwards restricted to those who dilligently subdued themselves by an extraordinary appearance of devotion, and was used much in the fervent fervent right of intermediate order between the monks and people, resembling the former in their manner of living, without assuming their name, or contracting their obligations. They were divided into two classes, which derived their different denominations of perfect and imperfect from the different degrees of suffering that they discovered in their manner of living. The perfect lived upon alms, abasing from well of, and had no fixed abodes. The imperfect conformed to the customs of the rest of their fellow-citizens.
in these respects. The name was at first honourable, but by degrees it sunk into reproach, being adopted by many, who, under the mask of religion, concealed the most abominable principles, and committed the most enormous crimes.

The Beghards of Germany, deprived of the protection of the emperor Lewis, suffered extreme misery under Charles IV. who was advanced, by the interest of the pope, to the imperial throne in 1345. Devisors of gratifying the defires of the court of Rome, he supported by his edicts and by his arms the papal inquisitors, and allowed them to apprehend and put to death all those that were deemed enemies; and among others the Beghards were victims to their pernicious

The emperor himself, who resided at Lucca in Italy, not only approved these violent measures, but issued out in 1369 severe edicts, commanding all the German princes to extirpate out of their dominions the Beghards and Beguines, or, as he himself interpreted the name, "the voluntary beggars," as enemies of the church and of the Roman empire, and to affilt the inquisitors in their proceedings against them. By another edict, published not long after, he gave the houses of the Beghards to the tribunal of the inquisition, ordering them to be converted into prisons for heretics; and at the same time ordered all the effects of the Beguines to be publicly sold, and the profits arising from them to be equally divided between the inquisitors, the magistrates, and the poor of those towns and cities where such sale should be made. The Beghards, being reduced to great straits by this and other mandates of the emperor, and by the constitutions of the popes, sought a refuge in those provinces of Swisserland that border upon the Rhine, and also in Holland, Brabant, and Pomerania. But the edicts and mandates of the emperor, together with the papal bulls and inquisitors, followed them wherever they went, and distressed them in their most distant retreats, so that, during the reign of Charles IV., the greatest part of Germany (Swisserland, and those provinces that are contiguous to it, excepted) was thoroughly purged of the Beghards, or rebelious Franciscans, both perfect and imperfect.

The Beghards of Flanders are a denomination by which certain unmarried persons, both bachelors and widowers, are distinguished, who formed themselves into communities of the same kind with those of the female Beguines, referring to themselves the certainty of returning to their former method of life. The first society of those Beghards was established at Antwerp in the year 1228, and continued till, though the brethren of which it is composed have long since departed from their primitive rule of discipline and manners. This first establishment was succeeded by many others in Germany, France, Holland, and Flanders. These fraternities long enjoyed the toleration of the Roman pontiffs; but most of the convents are now either demolished or converted to other uses. See Brethren of the Free Spirit, Pratricelli, and Tertiaries. Molheim's Eccl. Hist. vol. iii. p. 86. 8vo. 1758.

BEGIA, in Geography. See BAYAH.

BEGIES, in Ancient Geography, a town of Illyria, which belonged to the Trallians. Steph. Byz.

BEGKAVE, in Geography, a town of Bohemia, in the circle of Breslaw; 3 miles west of Melnik.

BEGLASEH, a town of Aflatian Turkey, in the province of Caramania, 8 miles north of Kircheh.

BEGLERBEG, a Turkish title for the chief governor of a province, who has under him several boys or fangaces, that is, subgovernors. The word is also written "beylerbey," "beglerbey," "beglerbegli," and "beylerbeg." It is compounded of "begler," lords; the plural of "beg," lord, with the word "beg," subjunctive; importing as much as lord of lords.

The next to the vizier azem, or the first vizier, are the beglerbeks in Turkey, who, according to Rycaut, may be compared to archdukes in some other countries, being the next miniflers below the prime vizier, and having under their jurisdiction many fangaces, or provinces, and their begs, agas, &c. To every beglerbeg the grand signior gives three enzigns or flaves, trimmed with a horse-tail, to distinguish them from the baflaws, who have but two, and from simple begs, or fangace-begs, who have but one. See BaSHAW.

The province or government of a beglerbeg is called beglerbegli, or beglerbeglik. These are of two forts; the first is called "bafhe beglerbeglik," which has a certain rent assigned out of the cities, countries, and feignories allotted to the principality; the second called "flamme beglerbeglik," for maintenance of which is annexed a certain salary or rent, collected by the grand signior's officers with the treasuries of the empire. The beglerbeks of the first fort are in number twenty-two, viz. those of Anatolia, Caramania, Diarbekir, Damascus, Aleppo, Tripoli, Trebizond, Buda, Temeswar, &c. The beglerbeks of the second fort are in number six, viz. those of Cairo, Babylon, &c. Five of the beglerbeks have the titles of vikars, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda. The beglerbeks appear with great state, and a large retinue, especially in the camp, being obliged to bring a folder for every five thousand livers rent which they enjoy.

The beglerbeks of Romania brought ten thousand effectue men into the field.

BEGLERBEG is also a title given to the chief governors of provinces in the Perian empire, having the command over all khans, sultans, &c. in their respective disstricts.

BEGON, Michael, in Biography, was born of a good family at Blois in 1638. After having occupied some law offices in his native province, he was introduced by his kinsman, the marquis de Scigneau, into the marine department, and became succeccively intendant of Havre, of the French colonies in America, and of the galleys. In 1688, he removed to Rochefort, and possessed the intendancy of that port till his death, which happened in 1710. His leisure hours were affiduously devoted to the cultivation of literature, and he was the owner of a valuable library, which was free of public access. In most of his books was written, "Michaelis Begoni et amicorum," 1. e. the property of Begon, and his friends; and when he way of making a librarian against lending his books for fear of losing them, he replied, "I would rather lose them, than seem to disfrust any honest man." His cabinet was richly stored with medals, antiques, prints, and various curiosities, collected from all parts of the world. Having procured engravings of several eminent Frenchmen of the seventeenth century, he collected memoirs of their lives, which furnished materials for Perrault's "Hombres Illustres." Of his botanical researches in the American colonies father Plumier availed himself in his publication, Nouv. Dich. Hist.

BEGONIA

The whole plant in the Begonias is useful; the stem in most of the species is herbaceous, but some are thickened. The leaves are petioled, in the caulecent species alternate. At the base of the pedioles is a pair of filiform appendices. The peduncles in the greater part are dichotomous, and in the caulecent species axillary. They are natives of Asia and America within the tropics. Three species have been found on the islands near the coast of Africa, but none on that continent. To Mr. Dryand botanists are principally indebted for their knowledge of this genus. Linna. Tranf. vol. 1. p. 159.

Propagation and Culture. These plants increase readily by cuttings; and if kept in the bark-dolve prove highly ornamental.
mental, being much esteemed, both for the beauty of the flowers, and the singularity of the leaves. Where a bark-
flow is wanting, they will do very well over the face of the
dry rock. Martin's Miller's Diet.

BEGRAS, in Geography, a town of Ahatic Turkey, in
Syria, at the foot of the Black Mountain, between Alex-
andretta and Antioch.

BEGUE, Achilles William, in Biography, born in
the district of Orleans, was admitted doctor in medicine
by the university of Paris the 30th of September 1760. He
is known principally by his translations into French of Dr.
Whitty's Treatise on Nervous Afections; Dr. Monroe's Ob-
servations on the Diseases of the Army; Baron Stork's Ef-
fays on the virtues of hemlock, the thorn-apple, henbane, and
other poisonous vegetables; and Baron Van Swieten's account
of the use of the corrosive sublimate in curing the venereal dif-
cese. His original compositions are "Le Confevateur de la
Sante," and "Extreme fatisfes," both published in 12mo. in
1763; the idea of which seems to have been borrowed from
Tiffon's "Avis au Peuple fur la Sante," of which he published

BEGUINS, in Ecclefial History, were, as well as the
Beghards, a kind of half-monks, called Tertiaries, who at-
tached themselves to the genuine followers of St. Francis.
In Italy they were denominated "Bocofchi," and "Bocafo-
ti;" in France, "Beguins;" and in Germany, "Beghards," or
"Beguins," which last was the denomination by which they
were commonly known in almost all places. If we ex-
ccept their forlorn state, and certain obervations and maxims
which they followed in consequence of the injuftions of the
famous faint now mentioned, they lived after the manner of
other men, and were therefore confidered in no other light
than as seculars and laymen. See Beghards, and Ter-
taries.

We mutt not confound, says Mofheim, the Beguins and
Beguines, who derived their origin from an autheutic branch
of the Francifcan order, with the German and Belge
Beguines, who crept out of their obscurity in the 13th cen-
tury, and multiplied prodigiously in a very fhort space of
time. Their origin was of an earlier date than this century; but
they now acquired a name, and made a noise in the world.
It appears from authentic and unexceptionable records, that,
no early as the 11th and 12th centuries, there had been fe-
fveral Societies of Beguines eftablfhed in Holland and Pflan-
ders. However, the only convent of Beguines that existed
before the 15th century, was that of Vilvorden, in Brabant,
where they were settled, as appears by public acts, in the
years 1065, 1129, and 1151. Their primitive eftablfhment
was undoubtedly the refult of virtuous difpofitions and up-
right intentions. A certain number of pious women, both
virgins and widows, in order to maintain their integrity, and
preferve their principles from the contagion of a vicious and
corrupt age, formed themselves into Societies, each of which
had a fixed place of refidence, and was under the inspection
and government of a female head. Here they divided their
time between exercises of devotion, and works of benevolent
industry, referring to themselves the liberty of entering into
the fale of matrimony, as also of quitting the convent,
whenever they thought proper. And as all those among
the female sex, who make extraordinary profefions of piety
and devotion, were disdained by the title of Beguines, i.e.
persons who were uncommonly "affiduous in prayer," as
the name imports (see Beghards); that title was given
to the women now mentioned. All the Beghards and Be-
guines that yet remain in Flanders and Holland, where their
convents have almost entirely changed their primitive form,
affirm unanimously, that both their name and institution de-
ribe their origin from St. Begge, dukes of Brabant,
and daughter of Pepin, mayor of the palace to the king of
Austrasia, who lived in the seventh century. This lady,
therefore, they consider as their patroness, and honour her
as a kind of tutelary divinity with the deepest sentiments of
veneration and repect. Those, on the other hand, who are
no well withers to the caufe of the Beguines, deduce their
origin from Lambert de Begue, a priest and native of Lige,
who lived in the twelfth century, and was much esteemed
on account of his eminent piety.

The first Society of this kind, of which record remains,
was formed at Nivelle in Brabant, in the year 1225; or,
according to other historians, in 1207; and was followed by
so many inf titutions of a like nature in France, Germany,
Holland, and Flanders, that, towards the middle of the
thirteenth century, there were scarcely a city of any note that
had not its "beguines," or vineyard, as it was sometimes
called in conformity to the style of the "Song of Songs."
All these female Societies were not governed by the fame
laws; but in the greatest part of them, the hours that were
not devoted to prayer, meditation, or other religious exercices,
were employed in weaving, embroidering, and other manual
labours of various kinds. The poor, sick, and disabled Be-
guines were supported by the pious liberality of such opulent
persons as were friends to the order. In the 14th century
these Societies were more numerous in various parts of Ger-
mcy; but, adopting some of the extravagant opinions of the
"Mythic Brethren and Sifters of the Free Spirit," they
shared with them in the perfecution which they suffered.
The "Clementina," or constitution of the council of Vienne,
A.D. 1311, against the Beguines, gave rise to a perfecution
of these perfons, which lasted till the reformation by Luther,
and ruined the caufe of the Beguines and Beghards in many
places. From this Clementina, many took occasion to mel-
loft the Beguines in their houfes, to feize and deftroy their
goods, to offer them many other infults, and to involve allo
the Beghards in the like perfecution. In the year 1324,
however, they obtained some relief by a special constitution
of the Roman pontiff, John XXII, in which he explained the
Clementina, and ordered that the goods, chattels, habi-
tations, and Societies of the innocent Beguines should be
preferred from every kind of violence and infult; and this
example of clemency and moderation was afterwards followed
by other popes. The Beguines, on the other hand, in hopes of
diappofting the malice of their enemies, and avoiding their
fifth, embraced, in many places, the third rule of St. 
Francis, and of the Angulines. But this measure was un-
availing; for from this time they were approv'd in several
provinces by the magistrates, the clergy, and the monks,
who call a greedy eye on their treasures, and were extremely
eager to divide the spoil. Mofheim's Ecc. Hist. vol. ii.
P. 232, 377, &c.

Cemrnunities of Beguines, or Beguinage, still fulfil
in Holland, Flanders, and Germany. In Bruffels, there is
a fingular part of it, which is in a little town, inclosed
by a wall and ditch, and divided into streets. It is called
the Beguinage. The number of Beguines is near a thou-
and, governed by matrons, and under the spiritual direction
of the bishop of Antwerp. There are also Beguinages at
Amsterdam, Antwerp, and Malines.

BEGZAM, in Geography, a town of Africa, in the
country of Agades, south of Agad or Agades, the capital
of the country, and at a greater distance south of Afulos, and
end of the desert of Jaffar. N. lat. 19° 28'. E. long. 12° 50'.

BEHAIRAT-EL MARDI, or Lake of the Meadow,
a morass of Syria, about 3 leagues from Damascus to the
south-east, into which flow the rivulets that fertilize the
gardens in the neighbourhood of the city. See DAMASCUS.

BEHAM, Hans, or Joan Sebald, in Biography, an
eminent
of the duchy of Burgundy and Flanders; and having informed her of his designs, he procured a vessel, in which he discovered the island of Fayal in 1460. Here he established a colony of Flemings, whose descendants are said fill to exist in the Azores, which for some time were called the "Flemish islands." For the proof of this fact M. Otto refers to the records of Nuremberg, and to the testimony of Wagenfels, one of the most learned men of the last century, in his "Universal History and Geography." Having obtained a grant of Fayal from the regent Isabella, and after having resided there 20 years, Behem applied, in 1484, eight years before the expedition of Columbus, to John II. king of Portugal, for the means of undertaking a great expedition towards the south-west. In the prosecution of this undertaking he discovered that part of America, which is now called Brazil, and failed to the Strait of Magellan, or to the country of some savage tribes, whom he called Paraguayans, because the extremities of their bodies were covered with a skin more like a bear's paws than human hands and feet. One of the records, preferred in the archives of Nuremberg, and containing this fact, affirms, that "Martin Behem, traversing the Atlantic ocean for several years, examined the American islands, and discovered the Strait, which bears the name of Magellan, before either Christopher Columbus or Magellan failed those fears; and even mathematically delineated, on a geographical chart, for the king of Liutania, the situation of the coast, around every part of that famous and renowned strait." This allusion is supported by Behem's own letters, written in German, and preferred in the same archives; which letters are dated in 1486. The discovery of Behem is also noticed by contemporary writers. In the chronicle of Hartman Schedel, or Hermann Schedel, entitled "Chronicon Mundi," and of which a German translation was published at Nuremberg in 1493, we have the following passage to this purpose: "In the year 1485, John II., king of Portugal, a man of a magnanimous spirit, furnished some galleys with provisions, and sent them to the southward by the Straits of Gibraltar. He gave the command of his squadron to James Canus, a Portuguese, and Martin Behem, a German of Nuremberg; in Upper Germany, descended of the family of Bonua, a man very well acquainted with the situation of the globe, blessed with a constitution able to bear the fatigues of the sea, and who, by actual experiments and long sailing, had made himself perfectly master with regard to the longitudes and latitudes of Portugal, in the world. These two, by the bounty of Heaven, coasting along the southern ocean, and having crossed the equator, got into the other hemisphere, where, facing to the eastward, their shadows projected to the south and right hand. Thus, by their industry, they may be said to have opened to us another world hitherto unknown, and for many years attempted by none but the Genoese, and by them in vain. Having pursued this cruise in the space of 26 months, they returned to Portugal, with the lufs of many of their seamen, by the violence of the climate." This passage is cited by the publishers of the works of Ad association, afterwards pope Pius II. Two years before the expedition of Columbus, Petrus Matur, a writer on the cannon law, remarks, that the first Christian voyages to the newly discovered islands became frequent, under the reign of Henry, son of John king of Liutania. After his death, Alphonfus V. protected the design; and John, who succeeded him, followed the plan of Alphonfus, by the assistance of Martin Behem, a very experienced navigator; so that, in a short time, the name of Liutania became famous over the whole world." Cellinis also says expressly: "Behem did not think it enough to survey the straits of Fayal, which he first discovered, or the other adjacent islands which

eminent engraver, flourished about the year 1540. Like Henry Aldegrever and Albert Durer, whose works were the sources from which he derived his greatest improvement, he engraved in wood, and also on copper, and etched some few plates. He was also a painter of reputation, and celebrated by the poets of that age under the name of Bohemus. He was a man of good genius, and distinguished by fertility of invention. But the Gothic taste which prevailed in Germany in his time, is too apparent in all his works. His brother Bartolomew Behem flourished as an engraver about the same time. He is said to have studied under Marc Antonio Raimondi, whose manner he imitated. His chief residence was at Rome, where he died. Strutt.

BEHAMBERG, in Geography, a town of Germany, in the archduchy of Austria, 3 miles east of Steyr.

BEHAM, in Geography, a town of Germany, in the archduchy of Austria, 6 miles south-east of St. Polten.

BEHAVIOUR, Good, in Law. See Corp. Almogia.

BEHBEHAN, a town of Persia, in the province of Fars.

BEHDUROO, a country of Hindostan, in the northern parts of Lahore, near the Imaus mountains, where one branch of the river Rawee springs.

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an ax, sword, or other cutting instrument.

Beheading was a military punishment among the Romans, known by the name of decollatio. Among them the head was laid on a cippus, or block, placed in a pit dug for the purpose; in the army, without the valum; in the city, without the walls, at a place near the porta decumania. Preparatory to the stroke, the criminal was tied to a stake, and whipped with rods. In the early ages the blow was given with an ax; but in after-times with a sword, which was thought the more reputable manner of dying. The execution was but clumsily performed in the first times; but afterwards they grew more expert, and took the head off clean with one circular stroke.

In England and France, beheading is the punishment of robbers; being reputed not to derogate from nobility, as hanging does.

Beheading is part of the punishment of high treason, affecting the king's person or government. The king may, and often does, discharge all the punishment, except beheading, especially when any of noble blood are attainted. For, beheading being part of the judgment, that may be executed, though all the rest be omitted by the king's command.

In Scotland they do not behead with an ax, as in England; nor with a sword, as in Holland and formerly in France where they now use the guillotine; but with an edged instrument called the maiden.

BEHEM, BEHEEM, BEHEN, BOHEM, MARTIN, in Biography, it is said to be the name with Martin Behemana, to whom Garziafo de la Vega ascribes the first discovery of America, who was a famous geographer and navigator of the 15th century.

The Christian name, says F. Otto, (ubi infra) is the same with that of Garziafo, and the syllable "in" he conceives, were added to his name in consequence of his receiving the honour of knighthood from John II., king of Portugal.

Behem was born of a noble family, of which some branches still remain at Nuremberg, an imperial city in the circle of Franconia. Addicted from his infancy to the study of geography, astronomy, and navigation, and having enjoyed the advantage of Regemontanus's instruction, he entertained the thought, at a mature age, of the possibility of the existence of the antipodes, and of a western continent. Under the influence of this imagination, he paid a visit, in 1439, to Isabella, daughter of John I., king of Portugal, and regent
which the Lusitanians call Azores, and we, after the example of Behem's companions, call Flemish islands, but advanced still farther and farther south, until he arrived at the remotest strait, beyond which Ferdinand Magellan, following his track, afterwards sailed, and called it after his own name."

Magellan, it is said, from a chart of the coast of America, drawn by Behem, and preferred in the archives of Nuremberg, and hence conceived the project of following the flaps of this great navigator. Riccioli, in his Gea. Reform. l. iii. p. 90, says, "Christopher Columbus never thought of an expedition to the West Indies, until some time before, while in the island of Madeira, where, amusing himself in forming and delineating geographical charts, he obtained information from Martin Behem, or, as the Spaniards say, from Alphonfus Sanchez de Huvela, a pilot, who, by mere chance, had fallen in with the island afterwards called Dominica."

In another place he says, "Let Behem and Columbus have each their praise; they were both excellent navigators; but Columbus would never have thought of his expedition to America, had not Behem gone there before him. His name is not so much celebrated as that of Columbus, Americus, or Magellan, although he is superior to them all."

Martin Behem, in consideration of his great services to the crown of Portugal, was knighted by king John in 1485, in the presence of his whole court. In 1492, the chevalier Behem, crowned with honours and riches, undertook a journey to Nuremberg, to visit his native country and his family; and there he made a terrestrial globe of curious contruction, which is still preserved in the library of that city. On this globe is marked the track of his discoveries, under the appellation of the western lands; and from their situation it cannot be doubted, that they are the present coasts of Brazil, and the environs of the straits of Magellan. This globe was made in the same year when Columbus set out on his expedition; and hence it is inferred, that Behem could not have profited by the observations of this navigator. After having performed several other interesting voyages, the chevalier Behem died at Lisbon in July 1506, universally regretted, and leaving behind him no other work besides the globe already mentioned, which was constructed from the writings of Ptolomy, Ptolemy, Strabo, and especially from the account of Mark Paul the Venetian, a celebrated traveller of the 13th century, and of John Mandeville, an Englishman, who, about the middle of the 14th century, published an account of a journey of 33 years in Africa and Asia. He has also added the improved discoveries made by himself on the coast of Africa and America.

Dr. Robertson treats the history of Behem as a fiction of some German authors, who were inclined to attribute to one of their countrymen a discovery which has produced to great a revolution in the commerce of Europe. Nevertheless, he acknowledges with Herrera, that Behem had settled in the island of Fayal; that he was the intimate friend of Columbus; and that Magellan had a globe made by Behem, by the help of which he undertook his voyage to the south sea. He also relates, that in 1492 this geographer visited his family at Nuremberg, and left there a map drawn by himself, a copy of which was procured for him by Dr. Reinhold Fother, and which, in his opinion, partakes of the imperfection of the cosmographical knowledge of the 15th century; as he found it, under the name of the island of St. Brandon, land which appears to be the present coast of Guinea, and which lies in the same latitude with the cape Verd islands; and he conceives that this is an imaginary island, which has been admitted into some ancient maps, on no better authority than the legend of the Irish St. Brandon or Brendan, whose story is so childishly fabulous as to be unworthy of any notice. He adds, that hardly any one place is laid down in its true situation. M. Otto thinks that Dr. Robertson furnishes, in his own history, means of refuting his objections against the truth of Behem's history. This learned historian allows, that Behem was very intimate with Columbus, that he was the greatest geographer of his time, and that he had been the disciple of the celebrated John Muller or Regiomontanus; that he had discovered, in 1493, the kingdom of Congo on the coast of Africa; that he constructed a globe, used by Magellan; that he drew a map at Nuremberg, containing the particulars of his discoveries; and that he placed in this chart, which is found to be in the latitude of Guinea. Whilft Dr. Robertson affirms, without any proof, that this land was but a fabulous island, we may suppose, says M. Otto, upon the same foundation, that the chevalier Behem, engaged in an expedition to the kingdom of Congo, was driven by the winds to Fernambuco, and from thence by the currents, very common in those latitudes, towards the coast of Guinea; and that he took for an island the first land which he discovered. The course which Christopher Columbus afterwards steered, makes this supposition still more probable; for if he knew only of the coast of Brazil, which they believe to have been discovered by Behem, he would have laid his course rather to the south-west. The expedition took place in 1493; it is then possible that, at his returning, Behem proposed a voyage to the coasts of Brazil and Patagonia, and that he requested the affiance of his sovereign, which has been already mentioned. "It is certain," says M. Otto, "that we cannot have too much deference for the opinion of so eminent a writer as Robertson, but this learned man not having it in his power to confute the German pieces in the original, which we have quoted, we may be allowed to form a different opinion, without being too presumptuous."

BEHLMEN, or BÖHM, JACOB, in Biography, commonly called by his admirers, the "German Theosophist," was born of poor parents at a village near Gorlitz, in Upper Lusatia, in 1573. Having been taught to read and write, at the age of 16, he was apprenticed to a flax-maker, or taylor, and in 1594 became a tailor and was married. Although he never entirely forsook his occupation, his eccentric genius soon carried him "ultra crepidam," beyond his limit. Engaging in those theological controversies, which were spreading in his time through Germany, among the lower classes of the people, he was much perplexed concerning many articles of faith, and prayed earnestly for divine illumination. In this state of mind he fell into a trance or ecstasy in 1600, which lasted for seven days, and afforded him an intuitive vision of God. Soon afterwards he had a second ecstasy, in which he found himself surrounded in a sudden with celestial irradiations, his spirit being carried to the immaterial world of nature, and enabled to penetrate through the external forms, lineaments and colours of bodies, into the recesses of their essences. In a third vision of the same kind, other more sublime mysteries were revealed to him, concerning the origin of nature, and the formation of all things, and even concerning divine principles and intelligent natures. These wonderful communications he committed to writing in 1612; and published a book entitled "A Manual of the Principles and Style of which are so mysterious and obscure, that it is not easy to understand or explain them. Indeed the author himself declares that the mysteries of this book are incomprehensible to flesh and blood, and that though the words be read, their meaning will lie concealed, till the reader has by prayer obtained illumination from that heavenly spirit, which is in God, and in all nature, and from which all things proceed. Gregorius Richter, a clergyman of Gorlitz, having seen this work, reproved the author from the pulpit, and procured an order from the senate of the city for suppressing it; and Behmen was required to discontinue his attempts for enlightening the world by his writings. Behmen acquiesced, and refrained from writing for 7 years. A copy of the work, however, found its way to the press at Amsterdarn, in 1619; and in the same year he wrote another book on the three principles, to which in the course of a few years he added several others. In 1624 he travelled to Dresden, where he was examined by a body of divines and dismissed without censure. He died in the same year, after having received the sacrament from the hands of Elias Dietrich, and was honourably interred at Gorlitz. His other works are "Of the Three-fold Life of Man?" "Answer to the Forty Questions of the Soul?" "Of the Incarnation of Christ, his Sufferings, Death, and Resurrection?" "A Book on the Six Points?" "On Celestial and Terrestrial Mysteries?" "De Scriptura Rerum?" "Of the Four Complexions?" "On True Repentance?" "On True Reconciliation?" "On the Second Birth?" "Mythilrum Magnum?" "On the Firik Book of Moses?" "On Spiritual Life," &c. These treatises appeared separately, and were afterwards collected and printed together. The best edition is said to be that in 1720, published in German, at Amsterdam, in 1684. An English edition of his works was given by Mr. William Law, in 1712, 2 vols. 4to.

In Jacob Behmen, a warm imagination, united with a gloomy temper, produced that kind of enthusiasm, which in its paroxysms disturbs the natural faculties of perception and understanding, and produces a preternatural agitation of the nervous system, during which the mind is filled with wild and wonderful conceptions, which pass for visions and revelations. Every page of his works, and even the hieroglyphic figures prefixed to his works, manifest a disordered imagination, and it is vain in attempt to derive his "Theban," from any other source; unless we incline to admit his own account, in which he boasts that he was neither indebted to human learning, nor was to be ranked among ordinary philosophers. He says that he wrote "not from an external view of nature, but from the dictates of the spirit: and that what he delivered concerning the nature of things, and concerning the works and operations of God, had been laid open before his mind by God himself." The conceptions of this enthusiast, sufficiently obscure in themselves, are often rendered more obscure by being clothed under allegorical symbols, derived from the chemical art. As he frequently uses the same terms with Paracelsus, he was probably conversant with his writings. He also appears to have acquired some knowledge of the doctrine of Robert Fludd, a native of England, and the Rosicrucians, which was propagated in Germany with great ostentation during the 17th century. However, he seems, upon the whole, to have followed no other guides than his own inventive genius and enthusiastic imagination; and every attempt which has been made by his followers to explain his system has been only raising a fresh ignis fatuus, to lead the bewildered traveller farther astray. Among other tenets, equally inexplicable, this mystic makes God the essence of essences, and he supposes a long series of spiritual natures, and even matter itself to have flowed from the fountain of the divine nature. Upon these subjects his language resembles that of the Jewish cabala. The whole Divine Trinity, he says, spreading forth bodily forms, produces an image of itself, "as a God in miniature." If any one name the heavens, the earth, the stars, the elements, and whatever is beneath or above the heavens, he herein names the whole deity, who, by a power proceeding from himself, thus makes his own essence corporeal. There is a great deal of this kind in his writings, in which he represents himself, as a spirit, among the stars, where the devil holds his principality; all arts and sciences flow from the fudereal spirit of this world; the seven liberal arts proceed from seven spirits of nature; and all human things are composed of the four first properties, bitter, sour, salt, and sweet. The divine grace, says this chimerical writer, operates by the same rules, and follows the same methods that the divine Providence observes in the natural world; and the minds of men are purged from their vices and corruptions in the same way that metals are purged from their dross; and this maxim was the principle of his fire-theology. But it is needless to give any farther account of a system which exhibits a mollock mixture of chemical terms, crude visions, and mystical jargon. The elements of Behmen's theology may be collected from his "Aurora," and his treatise "on three principles."

Some have bellowed high praisies on this enthusiast, on account of the wisdom which they pretend is contained in his writings, and also of his piety, integrity, and sincere love of truth and virtue. Others have accused him of the most dangerous errors, and have written volumes in opposition to his doctrines. Amongst the most eminent of his followers and admirers, we may reckon John Lewis, Gifftshiel, John Augustus, Werdenhausen, Abraham Franckenberg, who wrote his life, Theodore Tichtech, a Silesian nobleman, Paul Felghenau, Quirinus Kuhlman, who was burnt at Moscow in 1594, John Jacob Zimmermann, and our visionary countryman William Law, author of "Christian Perfection." Among Behmen's numerous followers, no one pretended himself more conspicuous than John Porte, a physician and naturalist, and member of the "Philadelphia Society," who pretended to divine revelation, and declared that he was thus convinced of the truth of Behmen's doctrines. He published a book entitled "Divine and True Metaphysics," with other similar works in favour of Behmen's opinions, which being
BEH

BEI

being soon spread throughout Germany became, together
with his other writings, the standard books of all enthusiasts.
To the class of his adventures we may refer Gilbert Tichet-
ich's, who published an admirable account of his works in
1643, which was answered by Tichetich, Gerard Antag-
nolus, who refuted Tichetich, and who endeavoured to
prove that Behmen entertained the same opinions as the
Manichaeans and Gnostics; Tobias Wagner, and Dr. Henry
More, who wrote a tract against Behmenius, entitled
"Contra Philosophos," printed in his works, p. 520.
Some persons have attempted to prove from Beh-
men's writings, that he did not acknowledge a deity; and
particularly Von Muller, in a work entitled "The Fanatic
Atheist." Brucker's Hist. Phil. by Enfield, vol. ii. p. 494,
BEHMENISTS, or Behmenists, in Eccl. History, the
denomination of a class of mystic philosophers,
who were the followers of Jacob Behmen, commonly called
the Teutonic philosopher. See the preceding article.
BEHN, APHRA, in Biography, a writer of novels and
plays, was defended of a good family of the name of John-
son in Canterbury, and born in the reign of King Charles I.
Her father died at sea in a voyage for Surinam, of which she
was appointed lieutenant-governor by the interest of Lord
Willoughby, to whom he was related; but his daughter,
with the rest of the family, arrived thither. Here she became
acquainted with the lady and person of the American prince
Oromoko, whose adventures she described in a novel under
this title. After her return to England she married Mr.
Behn, a merchant in London, of Dutch extraction.
During the Dutch war in the reign of Charles II. she was em-
ployed for gaining intelligence on the continent, and with
this view she resided at Antwerp. By her intrigues, it is
said, she discovered the design, formed by the Dutch, of
falling up the river Thames, and burning the English ships
in their harbours; but her intelligence was sighted by the
English court, to which it was imparted. On her return to
England the narrowly escaped shipwreck. Her future life
was devoted to pleasure and poetry; and by writing the
poetry, gained a sufficiency. With a good perform, and distin-
guished talents for conversation, she formed an intimate acquaintance
with several poets and writers of her time, as well as men of
pleasure. Her compositions, in verse and prose, were nu-
merous; and she published three volumes of miscellaneous
poems, seventeen plays, and a collection of histories and
novels, besides some translations and letters. She borrowed
much from other writers, and the merit, that was properly
her own, confided in a fluent easy style, occasionally glow-
ing with the ardour of love, when this subject was the topic,
and in some sprightly thoughts and facility of invention.
Many of her plays succeeded on the stage, at a period
when gross indecency of plot and language was no imple-
diment to their reception. Her poetical appellation was
Afrea; and her dramatic compositions are characterized by
Mr. Pope in the following lines:

"The figle how looely does Afrea tread,
Who fairly puts all others to bed."

None of her dramatic pieces are now acted; her poetry
has been long forgotten; but her novels, which were once
popular, are now occasionally read. Her death, which was
hastened by an injudicious physician, happened in 1689,
when she was between the age of 40 and 50; and she was
Gen. Dict.

BEHINESE, or BAHNASA, in Geography, a town of
Egypt, 10 miles north of Abu Girgé.

BEHRENS, CONRAD, BERTHOLD, in Biography, was
born at Hildersheim, in Lower Saxony, August 26th 1662.
After passing through the usual course of studies in the clas-
ses and philosophy, in his own country, and residing for
some time at Strasburg and Leyden, he took the degree of
Doctor in Medicine at Helmstadt, was made physician to the
army of the duke of Brunswick, and in 1712 to the court
of Brunswick Luneburg, and member of the Academy
Nature Curiosorum, to the Memoirs of which he was a con-
considerable contributor. His principal works are, "De Con-
stitutione Animae Medicorum," Helm. 1681, 8vo. "Medicus
Legalis," 1695, 8vo. published in German. In this he treats
of the duties and office of physicians, surgeons, apothecaries,
and midwives, of alchemy, of magnetism applied to medicine,
and of the causes of sudden death, on which he has some
judicious observations. "Scheda Dietetica, five de recta ad
fantastum vivendi ratione tractatus," Franc. 1710, 4to. He
died October 4th 1738. His son Rodolph August Behrens,
who succeeded to his honours and practice, published "De
Felicitate Medicorum Aucta in terris Brunsviciensibus," 1747,
4to. occasioned by some additional privileges accorded to
the physicians there. In this work he takes occasion to
comment on, and refute the opinion of Middleton, as to the
fervile condition of physicians among the Romans.

BEHUT, called also BETUM, HYLUM, OR CHILUM,
in Geography, a river of Hindostan, is the westermost of the
two rivers that water the Panjab; and its general course is
calld, and nearly parallel to that of the Attock, but it is of a
less bulk. This is the famous Hydaspes of Alexander, on
the banks of which he was opposed by Porus, a powerful
monarch of the country, at the head of a numerous army.
By the Ayin Acharne, it is said to be anciently called
Buda. The Behut rises from the spring of Wair, or Waer
Nag, in the south-east part of Cashmere, and after a north-
west course through that valley, enters the mountains at
Barchmool. During this short course it receives abundance
of rivulets and streams from some large lakes, and becomes
navigable at a few miles below its remotest spring. After
entering the mountains it pursues the direction of the Pan-
jab by a very crooked course, being pent up in a deep wind-
ing valley, whilst escaping from the wide base of the Cash-
merian mountains, and rushing with such rapidity and
violence that even the stoutest elephant cannot cross its
footing in it. It emerges from the mountains near the tributary
of Puck-bull, and is afterwards joined by two small but celebrated
rivers named Kifelenom and Nainfook. After it travers-
es the territory of the Ghickers, still holding its course
through a hilly country, until it crosses the upper or great
road leading from Lahore to Attock, where the hilly tract
is confused to the westerly bank. Here Bood, not long since,
a city of the name of Hylum, which communicated its name
to the river, during the remaining part of its course; and
hence it is as commonly named Hylum as Behut. From
Hylum it pursues its course along the eastern borders of the
Joud mountains, and unites with the Chunnaub at about 50
geographical miles above Moutian; losing its name in that
of the Chunnaub, as heretofore it lost its name of Hydaspes in
that of Aceines, the ancient name of the Chunnaub. The
interval between the Behut and the Indus, in the widest part,
is about 94 geographical miles. Pliny allows only 120 Ro-
man miles between the Indus and the Hydaspes. Renolleau's

BEIA, PAX JULLA, an ancient city of Portugal, in
the province of Alentejo, near a lake of the same name. It
is mentioned by Pliny, Ptolemy, and Antoninus. Several
Roman coins and inscriptions have been found near this
place. Its situation is on a gentle hill in a fertile country rich
in corn, and it is surrounded with walls and gates; and it is the
fee
BEI

See of a Babylon, a corregidor, and a veteran. It was taken from the Moors in 1662. N. lat. 57° 52'. W. long. 21°.

BEJA, a large extent of country in Abyssinia, lying between the northern tropic and the mountainous region of the Red Sea, running from Mahali along the coast of the Red Sea to Sukakim; then turning westward, and continuing in that direction, with the Nile on the south, the tropic on the north, to the deserts of Solima, and the confines of Lybia on the west. See ABBASIA.

BEI, of Turia. See BAHIA.

BEJAD, a village of Egypt, opposite to Berbera, partly inhabited by Copts.

BEJAPOUR, or VISAPOUR, a considerable town in Hindustan, and once the capital of a large kingdom of the same name. It is now in the hands of the Poonah Maharattas; distant 234 miles from Bombay, by Calcutta by the Cawra, 1183, and by Aurungabad 1216, from Delhi 916, from Hyderabad 296, from Madras 534, from Poonah 136, from Serampatam 425, from Bﲒres 876, and from Agra 825 miles. N. lat. 17° 28'. E. long. 75° 27'.

BEJAR, a small town of Spain, in the province of Estremadura, situated in the midst of a pleasant valley between high mountains, whose tops are continually covered with snow. It is famous for its baths, and in its vicinity is a lake, which is said to have bad weather by an unusual agitation. It was raised into a duchy in 1448.

PIRAS de MALGA, or Berior, a town of Spain, in Andalucia, near the frets of Gibraltar, 8 leagues south of Cadiz.

BEJAS, 1. B. r. l., Mutis Amer. i. 174. "Leaves with olives, flowers in raceme." A shrub twelve feet high, with radiating spreading branches. A native of Mexico. Found in New Granada by Mutis. 2. B. p., Mutis Amer. i. 174. "Leaves ovate, flowers leafy." A tree with opposite branches, and an irregular, tender, subpubescent bark; corolla purple, very revoluted or furred. Found in New Granada by Mutis. These have a peculiar pungent savour, and are called to the rhodi-odendron. The name was erroneously made "Belara" by Linnæus.

BEBENSA, in Abyssinia, a name given by some to a mountain near the principal Inafla in the same constellation.

The population is more particularly given to the florals of the first order, otherwise called the heart, cora, of the felid constellation; though some would distinguish between cora and bebenza flora, restraining the former to florals only, of the first magnitude, and extending the latter to several grades of beauty, or even third.

Hermen, a poetical express De Stela, Barberini, published by Marotta, in his Speculum Astronomiæ, and also in his opera omnia, written upon Jo. de Sacrobosco's book De Sphera.

BEJINGEN, in Geography, a town of Germany, in the circle of Upper Saxony, and county of Trierhausen, at a distance 28 miles S. W. of Wiche. N. lat. 51° 42'. E. long. 11° 52'.

BELIA, a town of Italy, in Piedmont. N. lat. 45° 3'. E. long. 7° 48'.

BELIAN, a town of Syria, S. E. of Damascus, and SE. of Anti-Atlas. N. lat. 36° 26'. E. long. 35° 11'.

BELINGENIA, a town of Germany in the circle of Franconia, and between of Anhalta and the county of the Arrick. The country is of great extent, and the soil is very rich, and well watered. The building is by the richest hands of Bottin-Borre, and well situated in the midst of the natural Rhein circle. N. lat. 52° 31'. E. long. 8° 11'.—Als, a small town of Germany, in the duchy of Wurttemberg. In 1673, it was burned by the French. Its district comprehends several villages.

BELIUL, a town of Alfious, situated on the Red Sea north of Alchi. N. lat. 14° 3'. E. long. 41° 58'.

BEINA, a river of Norway, in the government of Chriftiana, which runs into the lake of Sperdillon; and serves for exporting timber.

BEINACE, a town of France, in the department of Corrèze, and chief place of a canton, in the district of Baye, 8 miles south of Tulle.

BEINASCHI, Giovanni Battista, in Biography, an historical painter, was born in Piedmont in 1654, and studied at Rome under Pietro del Po, and later lay, was afterwards a pupil of Larinane. He died in 1688. Beinaschi was an admirable designer of a lively invention, and not only expeditious, but correct. As an acknowledgment of his merit, he received the honour of knighthood.

BEINASC, in Geography, a town of Piedmont, 4 miles S. W. of Turin.

BEINGHUR, a town of Hindostan, in the district of Beresse, part of the territory of the Maharratas. N. lat. 15° 15'. E. long. 75° 11'.

BEINE, a town of France, in the department of the Marne, and chief place of a canton, in the district of Reims; the place contains 67,5j; and the canton 84,754 inhabitants; the territory includes 5527 square kilometres and 19 communes.

BEING, in Mythology, includes not only whatsoever actually is, but whatsoever can be. It is the first and most obvious, the most simple and natural conception that we can frame of anything which we see, feel, hear, or know. It is in some sense comprehended in all our other conceptions of things, and is therefore the most general or universal of all our ideas. By the affections of being, we mean all powers, properties, accidents, relations, passions, dispositions, internal qualities, external adjuncts, circumstances, conditions, or circumstances whatsoever; or, in a word, and all those modes which belong to things, either as they are in themselves, or as they stand in relation to other things, or as they are represented or modified by our ideas and conceptions. The various kinds of beings have been referred by writers on this subject into three distinct classes; and they have been considered as either substantives or modes, finite or infinite, and natural, artificial, or moral. For the two former classes, see SUBSTANCE, MODE, FUTURE, and INFINITE. Natural beings are all those things that have a real and proper existence in the universe, and are considered as formed and ordained by God the creator; such are bodies, plants, animals, trees, fruit, fruit-trees, vegetables, fire, flame, light, and air. Artificial beings are made by the contrivance or operation of men, whether they are of a more corporeal nature, such as houses, windows, pictures, statues, arms, armor, utensils, writing, music, and the various utensils of life; or whether they relate more to intellectual matters, as words, sciences,
notices, arguments, propositions, verse, prose, &c. Moral beings are those which belong to the conduct and government of intelligent creatures, or creatures endowed with understanding and volition, considered as lying under obligations to particular actions or abstinence; but these are considered as moral only, if such are law, duty, virtue, vice, sin, righteousness, judgment, condemnation, reward, punishment. These distinctions might, perhaps, be more properly referred to the separate classes of different ideas than different beings. Being is the subject of Ontology. See Ontology. See also Essence and Existence.

BEINHEIM, in Geography, a town of Germany, in the circle of Swabia, seated on the left side of the Rhein, and belonging to the march of Baden; 6 leagues N. E. of Stralsburg.

BEINIGKEMEN, a town of Lithuania, 12 miles north of Pillallen.

BEIRA, a large and fertile province of Portugal, bounded on the north by the province of Entre Doura a Minho, from which it is separated by the river Douro or Douro, and by Traulos Monte; on the west by the ocean and part of Estremadura; on the south by another part of that province and by the Tagus; and on the east by the Spanish Estremadura, and the Kingdom of Leon. It is divided into Upper and Lower Beira; the former being the northern part, and lying on the sea-cost; the latter lying towards Spain and Estremadura. Its extent from coast to coast is generally computed at between 30 and 36 Portuguese miles; and from north to south about as many. It was erected into a principality by John V. in honour of his grandson, the elder son of the prince of Bragel. It produces wheat, rye, and millet; and, in several parts, excellent wine and oil in such abundance, that considerable quantities of each are exported. Beira comprehends eight jurisdictions, and its principal cities and towns are Coimbra, Leiria, Guarda, Viseu, Miranda do Corvo, Tentugal, Aveiro, Ovar, Pampilho, Almeida, Francofo, Meda, Caltella Branco, Penamacor, and Covilha; the four first are episcopal cities. The militia of this province consists of eight regiments, each regiment including about 1000 men.

BEIRAGUR, a town of Hindoostan, on the west of Band, and near the Mahamadry river, noted in the Aya Acehain, as having a diamond mine in its neighbourhood.

BEIRAM. See Bairam.

BEIRUT. See Bactor and Berytus.

BEISCHOT, Joachim Francis, in Biography, a painter of landscapes and battles, was born at Rauenburg, in Swabia, in 1665; and having received the first rudiments of the art of painting from his father, who employed himself in this way for his amusement, he became a good artist by the force of his own genius and by assiduous practice. He was engaged at the court of Munich, and painted the battles fought in Hungary by the elector Maximilian Emanuel. During the abdication of the emperor on some of his expeditions, Beisch visited Italy, and there, with a view to his further improvement, Studied and copied the famous models to which he had access. Before his journey to Italy, his manner was firm; but too dark; his second had more clearness and more truth; and his last was more clear but more weak. The scenes of his landscapes are agreeably picturesque; his touch is light, tender, and full of spirit; and his style of composition frequently resembled that of Gaspar Poulin, or Salvador Rosa. He died in 1748. Pilkington.

BESHEWA, or Besharm, in Geography, a town of Asiatic Turkey, in Caramania, felled near a lake. N. lat. 37° 45'. E. long. 32° 11'.

BEISSKER, in Ichthyology. See Beissker, of Deizker, and Combes Fossils. Linn.
B E K

BANK, and county of Ayr. It is seated on a small eminence, and the streets are pretty regularly laid out. A lace manufactury gives employment to many of its inhabitants, and others are engaged in making flax-gut and cotton. Some considerable manufacturers reside in the town, and though it is too small to have returned only a few inhabitants at the commencement of the last century, yet the population now amounts to about 2,000.

The parish, extending about five miles in length, by four in breadth, contains principally arable land; but some farms, with others at Dunlop, are appropriated to the dairy system, and have long been famous for a particular cheese called the Dunlop cheese. Within the boundary of the parish is a small loch, containing abundance of fish, and near it is plenty of peat moss. Coal is found in many places; freestone is abundant, and the limestone quarries are almost inexhaustible. In the latter subsoil are frequently found various petrifications of shells, and other marine exuviae; and all manner of fossiliferous petrifications of woods, mosses, &c. The population of the parish and town in 1792 was 2,782. Sinclair's Statistical Account of Scotland.

BETHAM, B. S., in Biography, a learned Arabian botanist, called Mjafad, the botanist, from his skill in the science of plants, was born in Spain; and after visiting Africa, travelled into the Levant, Asia, and even as far as the Indies, to improve his knowledge. After his return he was patronized by Saladin at Cairo, and died in 1238. He wrote a General History of Plants, or of Plants, arranged in alphabetical order; in which he gives the Greek, Arabic, and vernacular names, with the descriptions of each, and particularly in a more detailed manner, those not deferred by Dioscorides and Pliny. Bothar's work is extant in the Persian, Eusenial, and other libraries. Herold. Pulteney's Hist. and Bio. Sketches, &c., vol. i. p. 19.

BEITSTADT, in Geography, a lake in the northern part of Norway.

BEJUO, in Botany. See Hippocratia.

BEJWA, called also Hofbeurpoor, in Geography, a town of Hindoostan, in the country of Lahore, about 3 journeys or 36 miles from Sirhind, 16 miles N.E. of Jallandhar, and about 25 geographical miles north of Rheem, and on 35 miles south of Haurpur.

BEIZA, or Beizath, a Hebrew word, signifying an egg, in Hebrew Antiquities, a certain measure in use among the Jews; they say that the heiza contains the fifth part of a log. The heiza is also a sort of gold coin common among the Persians; it weighs forty drachmas, and from this word, not from the city of Byzantium, the heza was formed. A heza is worth two dinars, and every dinar twenty or five and twenty drachmas.

BEK, David, in Biography. See Bick.

BEKA, in Geography, a valley of Syria, anciently called Cure-Syria, or the hollow Syria, separates the chain of mountains denominated by the ancients Anti-Libanus, from the Libanus of the Druses and Maronites, and by being the depository of the water of the mountains that enclose it, is rendered one of the most fertile districts of all Syria; but the heat of the sun, the rays of which are concentrated by the mountains, is in summer not inferior to that of Egypt. The air, however, which is perpetually refreshed by the north wind and by the stagnation of the waters, is not unhealthy. Before the earthquake of 1759, this whole country was covered with villages and plantations of the Motonellis; but the destruction occasioned by this terrible calamity, and the subsequent wars with the Turks, have occasioned a general defoliation. In this vale is situated the famous Balbec.

BEKAV, or Beka, a small town of Poland, in the palatinate of Lublin.

BEKES, a town of Upper Hungary, on the river Koros, which gives name to the Gepchenschatz.

BEKI, or Beka, or Bek, a river of Hungary, which runs into the Tama, near Tombor.

BEKIA, BECOURY, or BOCOUR, a small Brit, and of the Western Isles, about 12 leagues in compass, and containing 3,720 acres, being the head of the Grunald, called by the French, "Little Martiniac"; 35 miles N.E. of Grenada, and 63 leagues from Barbados. It has a safe harbour, called "Admiralty-bay," but no fresh water; and is principally visited by the inhabitants of Grenada and St. Vincent's for the purpose of catching turtle. The foils produces wool cotton, and plenty of water-melons. This island is depopulated of the residents of St. Vincent.

BEKKER, called BENCHER, BELLASAR, in Biography, a famous Dutch divine of the 17th century, was born in 1634, at Wartholten, a village in the province of Groningen, and pursued his studies first in the university of Groningen, and afterward at Franeker, where he became rector of the Latin school. In 1665, he took his degree of doctor of divinity at Franeker, and in the following year he was chosen one of the ministers of that city. In 1679, he published a catechism, intended for persons of mature age, in which he maintained some opinions concerning the right of Christian congregations to chuse their own ministers, and concerning the antiquity and usefulness of bishops, archbishops, &c. and in which he introduced some illustrations that implied his doubt of the eternity of hell torments, as inconsistent with the divine goodnes, which gave offense to several divines, and which incurred a profecution before the ecclesiastical authorities. This catechism, however, was approved and recommended by several learned professors; and it appears that the author had not, at the time of its publication, adopted those sentiments which involved him in future difficulties. In 1679, he was elected minister at Amsterdam; and in 1683, he published his "Inquiry concerning Comets," in which he concurred with Mr. Bayle in maintaining that they are not prelages of any evil. By this work, as well as his "Exposition upon Daniel," he gained great reputation; but having attached himself from an early period of his life to the Cartesian philosophy, he adopted Descartes' definition of spirit, and he was hence led to deny all those operations of the devil and other infernal agents upon mankind, which are related in the scriptures. His argument, as it is briefly stated by Dr. Machlane, the translator of Rother's history, is as follows: "The essence of mind is thought, and the essence of matter is extension. Now, since there is no sort of conformity or connexion between a thought and extension, mind cannot act upon matter, unless these two substanlces be united as soul and body are in man; and therefore no separate spirits, either good or evil, can act upon mankind. Such acting is miraculous; and miracles can be performed by God alone. It follows of consequence, that the scripture accounts of the actions and operations of good and evil spirits must be understood in an allegorical sense." To this argument it is replied, that by proving too much, it proves nothing at all: for if the want of a connexion or conformity between thought and extension renders mind incapable of acting upon matter, it is hard to see how their union should remove this incapacity, since the want of conformity and connexion remains notwithstanding this union; besides, according to this reasoning, the Supreme Being can, not act upon material beings; and it is in vain that Bekker maintains the affirmative by having recourse to a miracle.
for this world imply, that the whole course of nature was a series of miracles, or in other words, that there are no miracles at all. The author suggested doubts concerning the agency of the devil in several of his fables; and he alleged, that several were ascribed to the devil, in which this evil spirit had no concern. He was at length, viz. in 1691, permitted to publish his fables at large, in an elaborate work, entitled, "The World Bewitched." This work is divided into four books. The first contains an account of the opinions of the ancient and modern heathen concerning gods and demons, or spirits. In the second book the author examines all the passages of the Holy Scripture, which mention either angels or the devil, and endeavours to make them agree with his opinion, that the devil has not the least power in this world, and to shew that those passages, which ascribe several actions to god as well as bad spirits, or angels, must be explained in an allegorical manner. Accordingly, he denies that our first parents were tempted by the devil; alleging that this temptation is ascribed to the devil, only because it does not agree with the good of God, though Moses does not mention the devil, and that the punishment mentioned by Moses does not suit the devil, but only the serpent. He also urges several objections against the literal sense of our Saviour's temptation; and he maintains that those possested with evil spirits, which our Lord cast out, were merely sick or lunatic persons whom he cured, and in whose sickness the devil had no concern. (See Dagonian.) Bekker's work, though its fable was not new, occasioned great commotion not only in all the United Provinces, but in various parts of Germany. The author, persisting in his opinions, was publicly deprived from his paternal charge in 1692; but the magistrates of Amsterdam continued his salary till his death, which happened in 1698. Bekker not only retained his opinions after his deposition, but strenuously defended them against a multitude of adversaries as long as he lived. He was a man of a warm imagination, of an active mind, and of a firm resolute temper. His character was irreproachable; and he avowed to the last his full conviction of the truth of the Christian religion. In his defences he exhibited a moderation which he did not experience from his antagonists. A satirical medal was struck at his deposition, which exhibited the devil, in the habit of a minstrel, riding upon an ass, and holding a banner in his hand, as a token of the victory which he had gained in the synods. His opinions found several advocates; and he became the head of a sect which was called after his name. Gen. Dict. Moësheim's Eccl. Hist. vol. v. p. 632.

Bekkerism, in Ecclisialical History, the fable or sentiments of Balch. Bekker, who denied that spirits can act or operate on bodies. See the preceding article.

BEL, Matthias, in Biography, a learned historian of Hungary, was born at Orfova, in 1684; and after studying divinity at the university of Halle, he became first, viz. in 1708, rector of the evangelical school at Neufold, and in 1713, rector of the school at Pragburg. In 1719, he was hofen preacher by the German evangelical congregation in that city, and died junior minister in 1740. His two most valuable works are his "Apparatus ad Historiam Hungariae," and his "Notitia Hungariae Nova." The latter work was held in such high estimation, that it procured for him from the emperor Charles VI. the appointment of imperial historiographer, and the honour of being admitted into the royal academy of sciences at Berlin, and also into that of Petersburg. Pope Clement XII. also testified his approbation of it by conferring on the author his portrait and eight gold medals. The emperor, upon receiving the second volume of the work, raised him to the rank of nobility, but this circumstance Bel had only concealed. Among his other works are "Prodromus Hungariae antiquae et recentissimae," Vienna, 1735-1742, 4 vols. fol.; "Apparatus ad Historiam Hungariae," five Collectio Miscellae Monumentorum, &c. dec. 1 & 2; Pofon. 1735-1746, fol. He also translated into the Bohemian language the Bible, and some other books.

BEL, Charles Andrew, son of the former, was born at Pragburg in 1717, and studied at Jena and Altdorf. In 1741, he became extraordinary professor of philosophy at Leipsic; and in 1756, he was appointed public professor of poetry, and librarian to the university, with the rank of counsellor of state. He died suddenly in 1782. Among his writings are "De vera origine et epoca Humorum, Aranum, Hungarorum, in Pannonia," Leips. 1777, 4to. After the death of Menck, he was employed as editor of the Acta Eruditorum, and of the Leipsic literary gazette, which he conducted from the year 1754 to 1781.

BEL, John James, was born at Bourdeaux, in 1695, and having pursued his studies with great advantage in the college of the fathers of the oratory, and made distinguished acquirements in belles lettres, and also in metaphysics and morals, he was admitted councillor of parliament in 1720. After several visits to Paris, he finally settled at Bourdeaux; and in 1735, he was chosen director of the academy: but the excess of his application to a variety of scientific and literary pursuits hastened his death in 1738. To the academy of Bourdeaux he left the house in which it holds its sessions, and his valuable library. Besides several professional works, M. Bel published "An Apology for Mr. Houdart de la Motte," 1724, 8vo, which is an ironical criticism on the works of that author, and particularly his tragedies; "An Examination of the tragedy of Romulus, by la Motte;" "A Dissertation on the Abbé DuBois's opinion concerning the preference to be given to the perceptions of taste above reasoning, in judging of works of genius;" "Letters containing Observations on Voltaire's tragedy of Mariamne;" all which are inserted, together with some other papers of M. Bel, in "Memoirs of Literature and History," collected by father des Molets of the oratory. He was also the author of the "Neological Dictionary," arranged by Dr. Fontaine, and intended to expound the new words and advanced philosophy of several modern writers. Nouv. Dict. Hilar.

BEL, in Botany, the name of a plant, and also of its fruit, called by some the cucumis capparis, or coper-cucumber. A meta has given the most copious account of this plant, which is imperfectly described by others; and he says, that the fruit, which resembled a caper, was used in medicine, and resembled ginger in the fiery heat of its taste.

BEL. Sr. in Geography, a town of France, in the department of the Rhone and Loire, on the Breven; 31 leagues west of Lyons.

BEL, in Mythology. See Belus.

Bel and the Dragon. History of, in Biblical History, an apocryphal part of the book of Daniel, which, although it was annexed to this book, and formed the 14th and last chapter of it, was uniformly rejected by the Jews, and made part of their canon of scripture. It occurs neither in the Hebrew or Chaldee text, nor in the Greek version of the Septuagint, but was taken out of the Greek version of the Toldoteh. Africanus, Eusebius, and Apollinaris, have rejected the narration, not only as uncanonical, but also as fabulous; and Jerome also concurs in their opinion. Origen maintains the truth of the history contained in the 13th (or Susannah,) and 14th chapters, against Africanus, but does not assert it to be canonical. This history is also cited, as part of
BELA, in Geography, a town of Egypt, on the coast of the Mediterranean, 19 miles east of Trench.

BELBIA, in Ancient Geography, an island of Greece, in the Saronic gulf, near the promontory of Sounium, and opposite to the Scyliian promontory: mentioned by Pliny, Strabo, &c.—Alio, a town of the Peloponnesus, in Laconia, near which was a temple of Minerva.

BELDO, in Geography, a river of Italy, which rises about 2 miles east of Cae-sa, and runs into the Tanaro, five miles S.W. of Alexandria.

BELIUCH, a town of Germany, in the circle of Upper Saxony, in Pomerania, one mile N.E. of New Treptow.

BELVEN, and Zemiuduns, in Mythology, were regarded among the Vandalis as the good and evil gods. The former signified the white god, and the latter the black god. They were objects of divine honours.

BELCA, in Ancient Geography, a place of ancient Gaul, between Brivadiunum and Genabium, where was an amphitheatre.

BELCAIRE, in Geography, a town of France, in the department of the Ardeche, and chief place of a canton, in the district of Limoux, 31 leagues S.W. of Quillan. The place contains 915, and the canton 6757 inhabitants; the territory includes 2274, kilometer square, and 17 communes.

BELCANA, a town of Asia, placed by Ptolemy in the greater Armenia.

BELCASTRO, a small episcopal city of Naples, in the province of Cefalba Ultra; 10 miles N. E. of St. Severina.

BELCHER, a township of America, in the county of Hampshire, and state of Massachusetts, containing 1485 inhabitants, who subsist chiefly by farming.

BELCHERS, a cluster of islands in Hudson's bay, N. lat. 56° 10' W. long. 80° 33'.

BELCHIER, John, in Biographia, aurgeon of eminence in London, was born at Kingstown-on-the-Thames in 1766.
BELCHING. See Rucketation.

BELCHITE, in Geography, a small town of Spain, in the country of Aragon, seated in a fruitful soil, on the river Almonazir; 8 leagues south from Saragossa. N. lat. 41° 19'. W. long. 0° 36'.

BELCIANA, in Ancient Geography, a town of Asia, in Assyria. Ptolemy.

BELDEK, in Geography, a town of Hungary, 15 miles south of Zatmor.

BELDIRAN, a town of Asiatic Turkey, in the province of Caramania, 28 miles south of Cogni.

BELEBEV, or BSEBEFET, a town of Russia, in the government of Ufa, on the rivulet falling into the Diema, 60 miles south-west of Ufa. N. lat. 54° 14'. E. long. 54° 14'. This is also the name of one of the nine districts, comprehended by the province of Ufa.

BELÉKIS, a town of Sclavonia, 10 miles north-west of Belgrade.

BELEM, a town of Portugal, in the province of Estremadura, or in the vicinity of Lisbon, on the north side of the Tagus, in which are a considerable monastery and a royal palace. In its magnificent church, which suddenly funk in 1756, many kings and princes of the blood have been interred. Below Belem is a square tower called "Torre de Belem," fortified with cannon, which no vessel must pass till it has been visited. Near this tower, which is near a league west from the city of Lisbon, in N. lat. 38° 40'. W. long. 9° 40', are several batteries, and a small irregular fort, commonly called San Giao, built on a rocky point, and covering the entrance of the harbour, and opposite to it is another tower called "Torre velha," or old tower, strengthened by a few cannon and soldiers.

BELEM, a town of North America, in the country of New Navarre, 180 miles north-west of Ciaola.

BELEM, BELM, or BELM, a town and district of Germany, in the circle of Welfphalin, bishoöric of Olmbruck, and prefecture of Iburg; 3 miles east of Olmbruck.

BELEM, or PARA, a sea-port town of South America, in the country of Brazil, seated at the north head of the river Guanna, which falls into the river of the Amazonas. See PARA.

BELEM Cape, a high steep point, on the coast of Galicia, in Spain, about N.N.E. from cape Finisterre, between which is the projecting point of Cape de Toriase, bearing south-west four leagues from Belem. The principal rock of this rugged point, appearing like a black tower, is called the Monk, or Munich.

BELEMNITA, in Natural History, a species of Nautilus, in the sublence order of Vermes, with an uniform, smooth, conic, and acute shell, frequent among the rocks of Europe. See the next article.

BELEMNITE, or Thunderstone, Ptilie%te, Donnerstein, German. Belemnites, pierre de foudre, Dololyre, Fr. Belemnites, Lapis Lyncureus, Ideas Daftylus, Lapis Creanarius, Lat.

The belemnite is a fossil, which has obtained its name from the Greek Belem, an arrow, on account of its resemblance to an arrow-head. Its lengthened conical or spindle-shaped figure suggested a likeness to the finger, hence the name daftylus. The ignominious supersition of some of the ancients attributed the origin of this sublimates the congealed urine of the Lynx, on account of its strong smell when pounded or scraped; by others it was supposed to be one of the materials of the thunderbolt, and it has derived names from both these circumstances.

The form of the belemnite is generally intermediate between a long cylinder and a very acute-angular cone; the apex is a plain rounded point; the base is somewhat concave: at a distance between the base and apex, varying in length from one-third to one-fifth of the whole, the diameter of this fossil begins to increase towards the base in a considerably greater ratio than it did from the apex; the most correct idea, therefore, of its figure, will be formed by imagining a truncated cone terminated by another much longer and more acute-angular, rounded off at the extremity instead of coming to a sharp point. It is by no means common, however, to find belemnites thus perfect, being for the most part broken off at one extremity, and not frequently at both. Considerable variations are observed in the form of this fossil: it is sometimes expanded and somewhat flattened at the extremity, or nearly cylindrical, or enlarged and rounded off at the apex, so as to resemble a club. In the flattened varieties a longitudinal furrow on each side is occasionally observed. The colour of the belemnite is generally brownish yellow, with a transparency resembling alabaster. It uually consists of calcareous spar, mingled however with animal matter; for when exposed to a red heat it gives out an odour like burnt horn; sometimes it occurs converted into flint, at other times is found filled with pyrites, or even according to Volkmam, (Silefia Subterrana. § 155.) with galeana.

If a longitudinal section is made of a perfect belemnite, it will appear to be composed, like a cow's horn, of a number of elongated conical lamellae, inflected one into the other, covering a core or alveolus, also of a conical shape, but extending never more than a third of the length from the base towards the apex. A croês fracture of this fossil beyond the alveolus exhibits a number of rays converging from the circumference towards the centre, and as many concentric circles as there are conical lamelle.

The alveolus of the belemnite is a conical body, divided transversely into cells by bony parietes resembling watch-glasses; the centre of each of which, according to Platt, Robinus, Sage, &c. is perforated to receive a tube or fihnelus, which pusses from the apex to the base of the alveolus, and thus communicates with all the cells, in the same manner as is observable in the nautilus, the ammonite, and orthoceras.
Two such fires, says Toland, were kindled near one another on May-eve in every village of the nation, as well throughout Gaul, as in Britain, Ireland, and the adjoining isles, where between which fires the men and beasts to be sacrificed were to pass; from whence came the pagan "between Bel's two fires," meaning a person in a great rout, not knowing how to extricate himself. One of the fires was on the caur; the other on the ground. On the eve of the full day of November there were also such fires kindled, accompanied with sacrifices and feasting. All the people of the country on this eve extinguished their own fires entirely; and every matter of a family was religiously obliged to take a portion of the consecrated fire home, and to kindle the fire anew in his house, which for the ensuing year was to be prosperous. The Celtic nations also kindled other fires on Midsummer eve, which are still continued, says Toland, by the Roman catholics of Ireland, making them in all their grounds, and carrying flaming brands about their corn-fields. This is done likewise in France, and in some of the Scottish isles. These Midsummer fires and sacrifices were intended for obtaining a blessing on the fruits of the earth, now ready for gathering; as those of the fril of May, that they might prosperously grow; and those of the full of October were a thanksgiving for finishing their harvest. But in all of them regard was had to the several degrees of incense and decrease in the heat of the sun. Toland’s Hist. Druids in his Works, vol. i. p. 60, &c. Henry’s Hist. vol. i. p. 156, &c.

BELERIUM, (Dodd. Soc. i. v. c. 22.) or Bolerium, (Ptol. i. ii. c. 3.) called also by Ptolemy “Antiveilbnem,” in Ancient Geography, is the promontory formed by the most westerly point of Britain, now known by the name of “Land’s End.”

BELESEME, in Geography, a town of France in the department of the Orne, and chief place of a canton in the district of Mortagne, 3 leagues S. from it. The place contains 2768 and the canton 13,022 inhabitants; the territory includes 170 kilometres and 15 communes.

BELESTA, or BELESTAT, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, 10 miles west of Quillan.

BELLETTE, in Zoology, a name under which Buffon describes the common weevil, meyella sfviron of Gmelin.

BELZE, in Geography, a town of South America, in Terra Firma, and province of New Grenada.—Also, a river of Spain, which runs into the Mediterranean, between Barcelona and Tarragona.

BELFAST, a considerable town of Ireland, in the county of Antrim, and province of Ulster, situated at the mouth of the river Lagan, which separates it from the county of Down. The town, except a small portion of it, is not elevated more than six feet above high water mark at spring tides. Belfast, or the bay of Carrickfergus, into which the Lagan flows, is a spacious estuary, a great part of which is left dry every tide, which is the case likewise with Strangford lough, another great estuary, the nearest extremity of which is distant about 8 miles S.E. Between Belfast and Lough Neagh, which is about 12 miles wide off it, there is a chain of mountains, the height of which, called Devils, is about 1580 feet high. The roots of these mountains extend to the neighbourhood of the town. Mr. Arthur Young found them to consist of very good loam to their summit, and complain of their being neglected. As tillage, however, is improving in that neighbourhood, it may be supposed that there is no longer cause for such complaint. There was formerly a castle at Belfast, which seems to have been a poll of importance, as it was twice taken and destroyed by the Earl of Kildare.
B. E. L.

lord deputty, in 1503 and 1512. After the complete reduction of Ireland at the beginning of the 17th century, Belfast became the property of Sir Arthur Chichelester, afterwards lord deputty, and baron of Belfast, who exerted himself in the settlement of Ulster. Through his influence it was made a borough, and lent two members to the Irish parliament; and an English gentleman, who travelled through part of Ireland in 1557, and whose manuscript journal is in the possession of general Vallancey, mentions that lord Chichelester had a lately palace at Belfast, which was the glory and beauty of the town, and which was his chief residence. Through the influence of this bottmerman, the custom-house was removed from Carrickfergus to Belfast by the earl of Strafford in 1638, for which a compensation of £20,000 was paid to the corporation of Carrickfergus. In 1648, Belfast was taken possession of by colonel (afterwards the celebrated general) Monk, for the parliament of England. So late as 1726, when Boate's Natural History of Ireland was re-published by Dr. Molyneux, it was a small place of little consequence. But situated in the centre of a populous and industrious country, it has since become one of the most interesting objects in Ireland to the political economist. The town is well-built, lofty of brick, and the streets are broad and straight. The bridge over the Lagan is 250 feet long with 21 arches; it was built about the time of the revolution, at the joint expense of the counties of Antrim and Down, and cost £12,000. Eighteen of the arches are in the former, and three in the latter county. With regard to size it is the fifth, and with respect to commerce, is generally reckoned the third town in Ireland, being next to Dublin and Cork. Vessels of 200 tons hayl loaded usually come to the quay, there being about ten feet water at spring tides, but now the water at the quays is from nine to thirteen feet deep according to the time of the moon, having been deepened by the exertions of the ballast corporation. Vessels which cannot come to the quays lie two miles and a half below the town, where there is very good anchorage. The West India trade was considerable before the late war, and has revived since the restoration of peace. The trade in pork and butter has increased very much of late years; and also the American trade. The export of linen both to England and America is very considerable. In 1773, the gros custom, according to Mr. Young, amounted only to 64,800l. including the excise upon tobacco and foreign spirits. In 1792, it amounted to £87,016l. 6s. 2d. In the following year it decreased on account of the disturbed state of the country, but it has since gradually risen; and in the year ending 5th April 1802, amounted to £236,800l. 64s. 3d. The excise of Belfast in 1796 was only 909l. 13s. 2d. but previous to the frappage of the distilleries it had risen to 22,165l. 3s. 6d. exclusive of Carrickfergus and Templepatrick, which walks are included in the same district. The duty on licences in 1801, amounted to 4300l. Though the increase, as in other places, must be partly attributed to the increase of duties, yet the extension of trade must also have been considerable. The population of Belfast was taken at different periods by a gentleman who filled the office of high constable: but not officially. In 1782, the number of inhabitants appeared to be 13,105; and in 1791, 18,320, exclusive of 1,258 in Ballymacarret, the suburb on the Down side of the river Lagan. There were in 1791, 655 looms, of which 522 were employed in the cotton manufacture, 129 in that of cambric and linen, 28 of sailcloth, and 16 of flaxwork. There are also manufactories of glass, linen, and earthen-ware. The public buildings are not many; the linen hall is large and commodious, and there is a good assembly-room over the Exchange. There is a barrack which contains about 800 men. The church is a handsome structure, but is too small for the parish. Other places of worship are, four presbyterian meeting-houses, one sconce, and one Methodist meeting house, and one Roman Catholic chapel. The charitable institutions are, a poor-house and infirmary, which maintains and clothes 300 of variousages, and is conducted on the same plan as the Dublin house of industry: several hospitals, a dispensary, a lying-in hospital, a charity-school for boarding girls, a day-school for boys and girls, a Sunday-School, and a school of industry for the blind, besides of them very extensive, but sufficiently for such an industrious country. It is probable that the Hamburg plan, described by Mr. Voglt, from which such unceasing benefit has been derived, would succeed better in Belfast than in any other town of Ireland, and from the public spirit and active disposition of the inhabitants, it would, without doubt, be well attended to. In such a town as Belfast, many commercial institutions might be expected; and we accordingly find a chamber of commerce, a ballast office corporation, two insurance offices, &c. There are also a library society, under the title of the Belfast Society for Promoting Knowledge: and a literary society, lately established on a plan similar to that of other societies for philosophical and literary pursuits. An academy for the education of the higher classes in this town, was founded by the inhabitants in 1785, and has been hitherto under the care of a presbyterian minister, but the advantages of it are not confined to any sect. Belfast is situated 80 miles north of Dublin, and lends one member to the imperial legislature. W. long. 5° 49'. N. lat. 54° 43'. Variation W. August 8th, 1789, 11° 15'. P. M. 26° 20'. Arthur Young's Tour. Dr. Beaumont's Memoir, &c. &c.

BELFORD. A market town of Northumberland, England, is seated on the great post road from London to Edinburgh, at the distance of 322 miles from the former. This town, though small, is particularly neat, and its houses are ranged on the ridge of a hill, which commands a view of the North sea. The church was built in 1700; near it are the ruins of an old chapel, and at a short distance are the tombs and vault of an ancient encampment. Here are a weekly market on Tuesdays, and two annual fairs. The number of houses in the township is 161, and of inhabitants 902.

About four miles east from Belford, is Damborough castle, the origin of which is attributed to king Idas, who began his reign about the year 550. The present remains are considerable, and appear to be wholly the relics of Norman architecture, though our historians are decidedly of opinion that they occupy the site of a Saxon fortress or palace. This was besieged in the year 624, by Penda, the pagan king of the Mercians, but without success. In the year 710, king Oigh, on the death of Alfred his father, fought refuge here, with Britthric, his tutor or guardian, and after a gallant defence, repulsed Edulph and his partizans. In the reign of Egbert, this castle was made the prison of Kenneth, bishop of Lindisfarne, who was confined here from 750 to 780. In many subsequent periods, it was the scene of repeated sieges, and suffered successively by the Danes, by the Normans, and by the Yorkists.
BELFORT, a town of Italy, in the duchy of Parma, 19 miles S.S.W. of Parma.

BELFRY, Belfredus, is used by middle-aged writers of the middle age for a fort of tower, erected by belges to overlook and command the place besieged. They were all called belvedus, bercedus, vercedus, and belfragiun. Their structure and use are described in verses by a poet of those days.

Belfry originally denoted a high tower, wherein sentinels were placed to watch the avenues of a place, and prevent surprize from parties of the enemies, or to give notice of fires by ringing a bell. Du-Cange.

In the cities of Tindars, there is no belfry on purpose, the tower of the chief church serves the same end. The word belfry is compounded of the Tentonic "bell" and "fire," hence, because the bells were hung for preserving the peace.

Belfry is also used for that part of a fleape wherein the bells were hung. This is sometimes called by middle-aged writers companius, eclacaria, and triflegium. Du-Cange. This is sometimes used in heraldry as a crest.

Belfry is more particularly used for the timber-work, which sustains the bells in a fleape; or that wooden structure, to which the bells in church-fleapes are fastened.

Belfry, Graus, in Orylogy, the alarum trump of Latham, and turbus trumpus of Gmelin, le grand heaut of Buffon, is so called by this latter naturalist, from the angular form which it makes in the evenings and mornings, and which resembles the din of an alarum bell. The succession of sounds is as rapid as the quick strokes of a bell, and continues about an hour. See Turdis Tintinnans. The "small belfry," is the speckled trump of Latham, and Turdis Lithus of Gmelin, which see.

BELGIA, in Ancient Geography, were Scythians or Goths, who, according to Aesop, drove the Cimbri or northern Celts before them; and at a long period preceding the Christian era, settled on the north-west part of Gaul, where they acquired the provincial denomination of Belgia; and from them the country which they inhabited obtained the name of Belgic Gaul. Writers are not agreed as to the etymology of this appellation. As they were a fierce, contentious, and warlike people, and dispersed over all their neighbours, according to the character which Caesar (Comment. 1. b. c. 4.) has given of them, some have supposed that they were called "Belga" or Belga, on that account; the word "Belga" in the old Tentonic signifying "fierce" and "quarrelsome." Others have suggested, that the term "Belga" is synonymous with the Celtic "Belghies," and that the inhabitants, who inhabited that, were Celte belga, of the more northern part. Others again have derived the word from "Belgen" or "Belgen," signifying stranger. Some time after their settlement in Gaul, but at an unknown period, they penetrated into Britain; and accordingly when Cesar first explored this island, he informs us (1. v. c. 12.) that the primitive inhabitants were driven into the interior parts, whilst the regions on the south-west were peopled by Belgic colonies. The Belga may, therefore, be justly regarded as the chief ancestors of the English nation. On the continent, the Belgia having taken possession of part of Gaul, and being naturally a ferocious people, engaged frequent wars with the Germans; so that these two nations continued in a state of hostility and friendship, sometimes invading each other's territories, and at other times afflicting each other against the Romans. In the time of Cesar, the Belga, alarmed at the success of the Romans in their expeditions against the Germans, formed a great alliance with the Celts, Germans, and Gauls, in order to drive them further from their neighbourhood. Cesar, according to his usual manner, found means to sow such discontents among them, that many of these allies submitted to him; however, the Nervii, Attrebutae, and Veromandui, stood firm, and though at length defeated, it was one of the decisive victories which Caesar had ever obtained; and, in consequence of this defeat, the whole Belgic nation was compelled to submit to the Roman yoke. The Belga of Britain were feated to the east of the Durutriges, on the same coast, and inhabited the counties now called Hants, Wilts, and Somer-Set. When Cesar invaded Britain, some part of this country was polli-fi ed by the Segontiaci, whose chief town was Winchester, called by the Britons "Curn-fagent," from the name of these, its ancient inhabitants. But these people seem to have been soon after subdued by and incorporated with the Belga, as they are never afterwards mentioned. As to the first introduction of the Belgia into Britain, history is silent; but with respect to some few of the latest colonies who settled here not very long before the Roman invasion, and who inhabited the south parts of Britain, Caesar informs us (1. v. c. 12.) "that the sea-coast of Britain is peopled with Belgia, drawn thither by the love of war and plunder." "These left (he says) purposing to settle upon distant parts, and settling in the country, till they take the names of the several fates from whence they were descended." The late Belgae of these Belgic colonies came into Britain only a few years before Caesar's invasion. This colony was confined by the Britons, king of the Sudones, one of the most powerful of the Belgic nations in Gaul; and had obtained a footing on the British coast, but was continued to reign over the Belgia in this island, as well as over his ancient subjects on the continent. In his continental territories, he was succeeded by Galba, and in his British dominions by another of his sons, perhaps Segonax, who attempted to destroy Caesar's fleet. Although the Segontiaci submitted to Caesar, we have no account of the submision of the Belgia to that conqueror. The honour of subduing that British nation was reserved to Vespasian, who, landing an army in these parts, A. D. 49, fought battles, took more than 20 towns, subdued two very powerful nations, one of which was the Belgia, and the site of Wight. After this time, the country of the Belgia was much frequented by the Romans, who made in it many excellent military ways, and built several beautiful towns, which are mentioned by both Procon and Antoninus. The most remarkable of these towns were Venta Belgarum, Winchester, famous for the imperial worship which was there established, and Aquae Solis, Bath, even then renowned for its warm and salutary springs. The country of the Belgia was included in the Roman province, called Traia Caeranis, and governed by the president of that province, and his inferior officers. Henry's Hist. vol. i. p. 276, &c.

BELGARD, or BELFERD, in Geography, is a town of Germany, in the circle of Upper Saxony, and chief place of a circle to which it gives name, in the district of Permanitz, seated on the Perfahr, and noted for its market for horses. It was placed of some distinction as early as the 11th century, for strength and for the number and value of its inhabitants; but it has suffered much by fire and by war; particularly by the 32 years' war. By the treaty of Westphalia, it devolved to the house of Brandenburgh. It has a castle and a provostship, and is the seat of a royal bailiwick. N. lat. 54° 10'. E. long. 16° 51'.

BELGAR. N, a town of Germany, in the circle of Upper Saxony, and marginate of Meifen, seated on the river Elbe, 36 miles N. W. of Dresden, and 24 N. W. of Meissen.

BELGERS, a town of Avarie Turkey, in the province of Caramania, 78 miles west of Cogn.

BELG EVAN, a town of Avara, in Tartary, in the kingdom of Bucharia, and province of Cutland.

BELGICA, in Conology, a species of Sabella, very briefly
BELGIUM, a canton of Gallia Belgica, from which it is distinguished by Caesar (l. v. c. 42.) as a part from the whole; to this canton he assigns the Bellovaci, to whom Hirtius (l. viii. c. 46 and 47.) adds the Attrebat. And as the Ambiani were situated between the Bellovaci and Attrebat, these also must be included in Belgium, which must have extended to the sea. These three people, says Cellarius, were the proper and genuine Belgae, all the rest being adventurous, or foreigners. See Ambiani, Attebatii, and Bellovaci.

BELGIUS, a river of Africa in Libya. Helychius.

BELGNA, a town of Arabia Deserta. Ptolemy.

BELGOROD, in Geography. See Belgorod, and Akerman.
cope with an army much superior in number to his own. He accordingly began to call up lines of circumvalation and contravallation, strengthening them with entrenchments, redoubts, and other field works of the necessary description. Within these lines the army encamped to the south of Belgrade; its front towards the open country, its left relying upon the Danube; its right extending towards the Save. A bridge of boats was thrown across the latter river, and, as well as that already constructed on the Danube, secured by strong trèfes de pont. The line of contravallation, looking towards Semelria, consisted of a ditch, sixteen feet wide, of proportionable depth, and defended by a strong parapet. The proper openings were left for the troops to issue and form in order of battle without confusion, covered in front by ravelins and redans; and upon the right, a large flèche, or redoubt, was erected for the purpose of commanding a hollow ground, which the Turks might otherwise have found serviceable in their approaches. The field pieces of all the different battalions, planted at regular distances along the front of the contravallation, secured it from any sudden inful.

As, however, the army was not sufficiently numerous to occupy the whole extent of ground between the two rivers, cross entrenchments were formed, connecting the principal lines on the right and left, and still preparing a communication with the different bridges.

As the Turkish garrison consisted of between twenty and thirty thousand regular troops, and had also a florid flotilla on the Danube, Prince Eugene found it absolutely necessary to maintain two flying camps: one of several thousand men at Semlin, to keep up a communication with Peterwaradin, from whence the Imperialists derived their supplies of provisions, under Count de Haseben; and another of five battalions and some cavalry to cover the head of the bridge over the Danube. Four ships of war protected the navigation of that river, and watched the motions of the Turkish flotilla. But a violent storm which happened on the 13th of July, had nearly rendered abortive the projects of the besiegers. The bridges of the Danube and Save were broken by the force of the tempest. Several vessels, detached from the ret, were carried floating at random down the stream, and the Turks took advantage of this accident to make a sally across the Save, and attack the redoubt which covered the head of the bridge. The gallant defence of a captain and 64 men, who alone garrisoned the post, preferred it, together with that part of the bridge which remained on the north side of the river, from falling into the hands of the enemy. To prevent such forties in future, the camp of Semlin was strongly reinforced, and the command entrusted to Count Marigny. More serious operations commenced; and during the night of the 18th, trenches were opened against Belgrade to the north of the Save by 1,200 pioneers, covered by a large detachment under General Marigli. The Turks, however, the following morning, opened a dreadful fire upon them from all the batteries of the place, the flotilla on the Danube, and the islands in that river, and making a forte with 4,000 men in boats, assaulted to furiously the guard of the trenches, that if Prince Eugene had not animated the troops by his personal presence and bravery, in repulsing the attack, a total defeat must have ensued. As it was, General Marigli, with twenty other officers of state, and 400 soldiers, persisted in this affair. It became necessary to augment the guard of the trenches to nine battalions, and construct new lines. In six days a complete chain of works was established from the bridge along the Save to its influx with the Danube, and from thence ascending the course of the latter river to the camp of Semlin, defended with redoubts, and well provided with artillery: infomuch, that from the moment of their completion, the garrison attempted no further falls.

On the 23rd of July, the cannonade and bombardment commenced from all the Austrian batteries, with dreadful effect, and by the 29th, Belgrade resembled, towards the water, a heap of ruins. But the excellent state of their fortifications on the side of the besieging camp, and expectations of approaching succours, alarmed the garrison to maintain a most vigorous resistance. Their expectations were not delusive. The grand vizier, having drained the Turkish provinces of soldiers to complete his army, had already begun his march, and on the 28th his advanced parties appeared in sight, and began to skirmish with the Austrian out-posts. The number of these marauders daily increased, and on the last of July, the vizier with his whole army arrived in presence of the Imperialists, as if they had literally been a town besieged. Eugene found himself compelled, by this mode of attack, to adopt new dispositions. He instituted additional artillery on his own lines, defended all the avenues with chevaux de frize, mined the ground before the flèche already mentioned, and called in part of his troops from the opposite bank of the Save. Nevertheless, the Turks, pursuimg their projected plan of operations, pushed their approaches in spite of the dreadful havoc which the Austrian bombs and grenades incessantly made among them to within musket shot of the contravallation. Their army amounted to upwards of 200,000 men. Their works were mounted with 120 pieces of cannon and mortars. The garrison, who now fullained some repulse from the fire of the Austrian batteries, directed their own upon the tents of the besiegers, and thus situated, between two hostile armies, who from their situation commanded more or less every part of his position, Eugene found himself enfiladed by the fire of upwards of 250 pieces of artillu. His situation became day after day more precarious. The dyfentery, which for the last month had done great mischief in his camp, now raged to such a degree that hundreds were buried in a day. A mortality prevailed among the foragers, in consequence of which half of the cavalry were difmounted; and an army which, at the opening of the campaign, amounted to above 80,000 men, could now only muster 60,000 effective. Though no immediate scarcity of provisions or ammunition was experienced, yet the disappointment of the expectations Prince Eugene had conceived, that the Turks would be obliged to retire for want of provisions, obliged him to determine without delay on some decisive measure: specially as the vizier had occupied an eminence adjoining the Save, with a considerable body of troops, and might, by sending 20 or 30,000 men across the river, have rendered a retreat, in case of defeat, impracticable to the Austrians. Under these circumstances, it was resolved, in a general council of war held on the 15th of August, to be before-hand with the enemy, by making a decisive attack on their camp. The detachments beyond the Save were immediately called in, except about 1,400 foot, and 250 horse. Seven regiments of cavalry and ten battalions with all the dismounted horse and dragoons, were left in the lines to observe the garrison. Eleven regiments of cavalry, commanded by field marshal count Palu, and general count Merci, composed two lines on the right, and marched out before midnight. The left wing, consisting of 12 regi...
ments, marched out at the same time, commanded by general Montecuccoli and Martiguy. The infantry, under prince Alexander of Wurtemberg, in chief, was drawn up in the centre; the first line of 22 battalions, conducted by count Maximilian of Staremberg, and count Harrach; the second, of 18 battalions, by the prince of Bevern. The corps de reserve, with which marshal Seekendorf remained in the lines, ready to act as occasion should require, was composed of nine battalions. The effective force of the two lines, on whom the success of the day in a great measure depended, did not amount to more than 40,000 men; yet, notwithstanding this immense inferiority, the confidence of the soldiers in their commander was such, that they received the orders to prepare for action with the greatest cheerfulness, and marched out, as if inspired with a certainty of victory.

At one in the morning the Imperialists, favoured by a thick fog, quitted their trenches; the right advancing towards the fleeces, which was assigned as its point of formation, and the left over the open ground adjoining the Danube. Two hours were spent in making the necessary preparatory movements; but the fog, which had hitherto favoured the Imperialists, increased to such a degree as to become productive of serious inconvenience. The right wing, missing its way, stumbled, instead of the fleeces, upon one of the Turkish advanced works. The surprise was equal on both sides; but a discharge which immediately opened upon the Austrian cavalry from the guard of the trenches, spread the alarm throughout the whole of the grand vizier's army. His troops instantly rushed from every part of the camp towards the scene of action, and in a few minutes count Palli became hotly engaged. The Austrians, formed in a hurry, and their battalions, through fear of losing the support of the cavalry, inclining successively to the right flank, a wide vacancy was left in the centre, and afforded the Turks an advantage of which they did not fail to profit. Meantime, the combat, once engaged on the right, quickly commenced on the opposite flank. Prince Eugene had intended to begin the attack with both wings at the same time; but convinced by the heavy firing he heard towards the Save, that Palli had already begun the battle, he himself obliged to come to blows, before the battalions of his left wing were completely formed. It was now between four and five o'clock in the morning. The fog continued so thick as to prevent the combatants from discerning each other, till they arrived almost close to the masses of their adversaries' pieces; and owing to this obscurity several small detachments of Austrians, whom a desire to signalize themselves carried unawares into the thickest of the enemy, were entirely cut off. The assailants nevertheless gained ground. As the darkness obliged them to march with their firelocks always presented, the fire they poured in, the moment they perceived their enemies, was so close, so well directed, and did such prodigious execution, that the Turkish battalions, as they advanced in succession, were broken, disordered, and precipitated headlong into their trenches, where the bayonet and sabre made dreadful havoc among them. The cavalry were not equally successful; the broken nature of the ground obliged them to perform frequent evolutions in order to find some passages of easier access, and the Turks, who lined the trenches, called them with severe and incessant firings. The centre of the enemy's army too finding nothing to oppose them, threw several battalions into the void space between the flanks of the Imperialists, and completely intercepting all communication, opened a heavy fire to right and left upon the divided forces. The battle, under the present circumstances, seemed irrecoverably lost, but the fog, at this critical moment clearing up, discovered to prince Eugene the disposition of both armies, and his own perilous situation. The advance of the second line prevented his total defeat. The prince of Bevern, who commanded it, marched up to the Turks, whose success had thrown them into disorder, and charged with such fury, that the infidels, unable to sustain the shock, fled in disorder, and were pursued up to their very trenches, leaving the space where they had been defeated covered with their dead. This success gave a new turn to affairs. No time was lost in filling up the interval that had been so unwarily left, and in forming the two wings of the imperialists for a new effort. The impatience of the soldiery to engage prognosticated success. The right began the attack; carried with irresistible impetuosity the batteries whose fire they had hitherto sustained, and turned the cannon against the entrenchments which protected the Turkish camp. The left experienced more opposition. The enemy had their principal forces on that side, and these, reinforced by several corps whom the succours of count Palli had driven from the right, constituted an immense superiority. The janizaries defended themselves with great bravery, and repulsed the Austrians in their first attack; but these rallying, returned to the charge, beat the Turks from their outermost entrenchment, and pursuing their advantage, advanced regularly up to the second, without firing a musket till they came within ten paces of the enemy. This work was carried in less time than the first: the Turkish entrenchments were forced one after another, as well as several capons with which their camp was defended; and notwithstanding the resistance was attempted at each of them, and the Austrians experienced everywhere a terrible fire, yet the courage and conduct of prince Eugene outmatched every obstacle, and obliged victory, after a struggle of six hours, to declare in his favour. The left serious hand made by the infidels, was at the grand battery mounted with 18 pieces of cannon, and defended by 30,000 janizaries, sustained by 10,000 infidels, the bravest troops in the Turkish army. It was necessary to halt and form the troops anew for this perilous attempt; but when the word to charge was given, they rushed forward with an impetuosity nothing was capable of_solvering. The Imperial grenadiers, in defiance of the fire from the battery, bore down all opposition, mounted through the embrasures, and drove the Turks from their guns; while the rest of the army made such slaughter, that the bodies of the slain roved in heaps round the redoubt. The routed forces, driven on all sides from their entrenchments, retired into the plain, as if to form once more for the defence of their camp; but observing the Imperialists, after having gained the heights, advancing towards them in good order, they betook themselves to flight in every direction, leaving their camp, baggage, and ammunition, at the mercy of the conquerors. The victory was complete by 9 o'clock in the morning. The plunder of the infidels' camp, which resembled a large city, was given to the soldiery.

This battle, fought on the 16th of August 1717, cost the Turks 10,000 of their best troops killed in the action, and 3,000 in the pursuit. About 5,000 were wounded, and nearly the same number made prisoners. In the Turkish camp and lines were found 131 pieces of brass cannon, 30 mortars, and an immense quantity of powder, bullets, bombs, and grenades. There were also taken 52 colours, 9 horsetails, and other military trophies. The loss on the German side, by reason of the fog, was not in proportion to the length of the light. Their killed amounted to nearly 3,000 men, among whom were the generals count Hauben and Dalberg; and about 4,500 were wounded. Of the latter, however, only about 2,000 recovered. In consequence of this great victory,
BELGRADE was rendered on the 19th; the garrison still consisting of more than 25,000 men, being allowed to march out with all their effects. Its fortifications towards the land were in a marred exalted state, and more than 400 pieces of cannon and mortars placed on the works, in the artillery, and on the head of the Danube.

Belgrade, which its defenders or Palfronowitz left in possession of the Austrians, was successfully attacked by the Turks in 1739; but the treaty concluded that year under the mediation of France, it was restored to the Porte. Its fortifications were, however, previously demolished. In 1759, it was besieged (Sept. 12) by an Austrian army under Marshal Landolin, who in his approaches made use of the old lines of circumsallation constructed by Prince Eugene, and with which the Turks, from an unresolvable negligence, had neglected to fill up. The works, aided by a numerous and well-armed train of artillery, proceeded with such rapidity in its attacks, that after all the suburbs and outworks were held on guard, the garrison, apprehensive of a storm, surrendered (Oct. 8) upon honourable terms. Imme- diately, with about 300 pieces of artillery, were found in the place. Belgrade was, however, anew given up to the Turks in 1791, at the peace of Silava, since which time it has continued quietly in their possession.

BELGRADE, a township of America, in the county of Lincoln and district of Maine, incorporated in 1765; formerly called Washington-plantation. It lies well of Sidney, and between Androscoggin and Kennebec rivers.

BELGRAO, a town of the Venetian states of Italy, in Friul, situated near the river Tagliamento. N. lat. 46° 15' E. long. 13° 51'.

BELHAVEN, the former name of Alexandria, in Fife, county, Scotland. See ALEXANDRIA.

BELI, in Entomology, a species of Pappilo, with entire white wings; the lower ones yellow, and slightly faceted with grey beneath. A native of Barbary. Fabricius.

BELIA, in Ancient Geography, a town of Hesperia Tera- pografia, is the country of the Hesperitani (Pol.); called of Belisus, and nearly south-east of Caezar-Augusta (D'Aubin); now Belchina, which is.

BELIAL, formed of BEL, no, nothing, and YAL, denoting in Hiphil, to profl, p. d. unprofitable; in Scripture His- tories, signifies a wicked wrathful person who failed to endure subjection. Thus the inhabitants of Gebaon, who shone as the Levites' wif, are figuratively of the name of Belial. (Judges, xix. 23.) Hophni and Phineas Eli's sons, are called sons of Belial (1 Sam. i. 12). On account of the fearful crimes they had committed, and their indecent behaviour in the temple of the Lord. Sometimes, says Calmet, the name Belial is used to denote the devil. To that purpose, he cites 2 Cor. vi. 15, where the apostle Paul says, 'What concord hath Christ with Belial? Where it appears, as the supposition that in the apostle's time, the Jews, under the name of Belial, commonly understood the devil in the place where this term occurs in the Old Testament. Others are of opinion, that the heathen demons might be called "Belial," either because they were of no use; or because so much wickedness was contained in the idea which the Pagans entertained of them. However, it has been suggested, that there may be no reference to the heathen god at all, whether they were devil ghosts or not; the word Belial being often applied to living men; and it being the general name of the apophis in this place to disgrace Christians from suffering themselves to be drawn into any thing criminal by the heathens. Grot. in loc. Farmer's Diction.

BELING, the learned Bryant (Analysis Anc. Mythol. vol. ii. p. 161.) considers Belial as the title of the chief Sylian god, called Bel or Belus, and rendered by the Greeks Belus, bed lar. Hence, Clemens Alex. (l. ii. p. 662.) instead of saying what agreement can there be between Christ and Belial, says, 'et in suppliciis non est solum hono. This Belial, or Bel- lar, was the same as Belorus and Oroes, who were worshipping the sybus of the earth. Hence Hesychius explains the term Beliar by a serpent.

BELIAS, in Anc. Geography, a river of Afa, which sprang in Dyana, and discharged itself into the Euphrates. Ammian. Marcell.

BELICIA, an episcopal town of the Gauls, in the fifth Legionary.

BELICENA, a town of Spain, in Grenada, 2 leagues from Grenada.

BELICLI, a river of Sicily, which empties itself into the sea near Bigini, in the Val de Mayura. It resembles (says Swallows, vol. iii. p. 374.) the Mole in Surrey in size and colour; and winds very agreeably between high banks overgrown with elms, willows and tamarisks. The vale on both sides is wide and well laid out in corn-fields, and palestres crowded with herds and harnessed cattle.

BELIDA, See BELIDA.

BELIDES, in Antiquity. See Danaides.

BELIDOR, Bernard Forest de, in Biography, a French mathematician and engineer, was born in Calais, about the year 1698, and became professor-royal at the artillery school of la Fere, and provincial commissary of artillery. By various exploits, he first discovered that the proportion of gun-power in the loading of cannon might be reduced to two-thirds of the quantity, without lessening its effect, but as he communicated this economical idea to cardinal Fleury, without previously consulting the grand-mastery of artillery, he left both his places. Upon this the prince of Conti took him to Italy, and by his patronage, Belidor was again brought into notice at court. Marshal Bellefeu, the war-marshal, appointed him inspector of artillery, and allotted to him apartments at the arsenal of Paris, in which he died, Sept. 8, 1761. Belidor was chosen an associate of the academy of sciences in 1751; and was the author of several useful works on civil and military architecture, hydraulics, fortification, and engineering; viz. 'Somme, d'un cours d'Architecture Military, civil et hydraulique,' 1736, 12mo.; 'Nouveau cours de Mathematiques, &c.' 1735, 4vols.; 'La Science des Ingenieurs,' 1729, 4vols.; 'Le Bombardier Francois,' 1734, 4vols.; 'Architecture Hydraulique,' 1757-1761, 4vols.; 'D'etornage portatif de Pinceaux,' 8vo.; and 'Traite des Fortifications,' 4vols. Several of his pieces are also inserted in the memoirs of the academy of sciences for the years 1737, 1755, 1753, and 1756. Nouv. Dict. Histoire Math. Dict.

BELIEF, in its general and natural sense, denotes a persuasion, or a strong affent of the mind to the truth of any proposition. In which sense, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever. Thus we are said to believe our senses, to believe our region, to believe a witness, &c. And hence, in rhetoric, all sorts of proofs, from whatever topics deduced, are called 'beliefs,' because apt to produce belief, or persuasion touching the matter in hand.

Belief, in its more refined and technical sense, invented by the schoolmen, denotes that kind of affent which is produced only on the authority or testimony of some person or persons, affecting or attesting the truth of any matter proposed. In this sense belief stands opposed to knowledge and science. We do not say we believe that snow is white, or that
that the whole is equal to its parts; but we see and know them to be so; that the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things credible, but scientifical; and the comprehension of such truths is not belief, but science. But when a thing propounded to us is neither apparent to our senses, nor evident to our understanding; neither certainly to be collected from any clear and necessary connection with the cause from whence it proceeds, nor with the effects which it naturally produces; nor is taken upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding, appears as true, not by a manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it—that is said to be properly credible; and an assent to this is the proper notion of belief or faith.

A judicious writer (Price's Review of the principal questions in Morals, p. 158.) is of opinion, that all the general grounds of belief or assent, may be comprehended under the three following heads: viz. 1st. Immediate conceptions (which see), or feeling; whence we acquire the knowledge of our own existence, and of the several operations, passions, and sensations of our own minds; and to this head may be referred the information we derive from the powers of recollection and memory; 2dly, Intuition (which see); and to this we owe our belief of all self-evident truths, our ideas of the general, abstract affections and relations of things, our moral ideas, and whatsoever else we discover, without making use of any process of reasoning; and 3dly, Argumentation or Induction. See these articles. See also Assent and Faith.

BELIENE, in Geography, a village of Egypt, depending on the grand febek, and agreeably situated between two canals; 12 miles south of Girgë.

BELIEVERS, in Ecclesiastical History, an appellation given towards the close of the first century to those Christians who had been admitted into the church by baptism, and instructed in all the mysteries of religion: they had also access to all the parts of divine worship, and were authorized to vote in the ecclesiastical assemblies. They were thus called in contradistinction to the catechumens, who had not been baptized, and were debarred from these privileges.

BELILLA, in Botany. See Mussenda.

BELIM, in Geography. See Belen and Para.

BELIN, a town of France, in the department of Gironde, and chief place of a canton in the district of Bordeaux. The place contains 1212, and the cantons 7008 inhabitants; the territory includes 585 kilometres and 6 communes.

BELINA, a town of European Turkey, in Bofnia, about midway between Banjaluka and Belgrade.

BELION, a name given to a river of Lusitania, called also Limia, Limus, Lethe, and the river Oblivion, in Ancient Geography, was the boundary of the expedition of Deinimus Bratus. His followers, when they arrived at this river, refused, from motives of superstition, to cross it; upon which he snatched an ensign out of the hand of the bearer, and passed over, by which his army was encouraged to follow (Livy). He was the first Roman who ever proceeded so far, and ventured to cross. The appellation, according to Strabo, took its rise from a fedition that occurred in a military expedition between the Celtici and Taurduli after crossing this river, in which the general was slain, so that they remained dispersed there; and from this circumstance it was called the river of Lethe, or Oblivion. (Cellarius.) It is now called "El Lima," and runs westward into the Atlantic, to the south of the Minho.

BELISAMA, or Belizana, in Mythology, a name given by the Gauls to their Minerva, or to the goddess who was the inventor of the arts. She was represented with a helmet adorned with a plume, clothed in a tunic, without sleeves, and covered with a mantle called "peplum." Her attitude, with her head leaning on her right hand, was that of a person in a profound reverie. Human victims were sacrificed on her altar.

BELISAMAE. See Belasama.

BELISARIUS, in Biographies, the Africanus of New Rome, was born, and probably educated, among the Thracian peasants; and advanced from the humble station of one of the private guards of Julianus, then general of the Roman forces, and afterwards emperor, in which he had served with valour and reputation, to distinguished military command. Under the new title of General of the Eait, he encountered the Persian army near the fortresses of Dara, on the confines of Persia, with a much inferior force, both as to the number and quality of his troops, and obtained a decisive victory. In the next campaign, A.D. 530, he advanced from Dara to the relief of Syria, which was invaded by the Persians; and though he was defeated in an engagement which the impatience of his troops had precipitated, he saved his army from the consequences of their own rashness. The victory of the Persian commander was so far purchased, that it was followed by a peace

Belisarius, on his return to Constantinople, rendered efficient service to the emperor Julianus, by quelling a dangerous sedition. In 533, the supreme command of the fleet and army, destined for the African war, was delegated to Belisarius, with an unlimited power of acting according to his own discretion, as if the emperor himself were present. After a voyage of three months, in which he had repeated opportunities of exercising his talents as a commander, he disembarked his troops on the African coast. Immediately upon their landing an inulence of pillage occurred, which gave him occasion for inculcating the maxims of justice, moderation, and genuine policy. "When I first acceded the commission of subduing Africa, I depended much less," said the general, "on the numbers, or even the bravery of my troops, than upon the friendly disposition of the natives, and their immortal hatred to the Vandals. You alone can deprive me of this hope; if you continue to extort by rapine, what might be purchased for a little money, such acts of violence will reconcile these implacable enemies, and unite them in a just and holy league against the invaders of their country." His exhortations, accompanied by rigid discipline, produced the most salutary effect. The inhabitants, instead of defearing their houses, or hiding their corn, supplied the Romans with a fair and liberal market; the civil officers of the province continued to exercise their functions in the name of Julianus; and the clergy, from motives of confidence and interest, affidavitiously laboured to promote the cause of a catholic emperor. In his progress towards Carthage, he defeated, with great slaughter, the formidable army collected by Gelimer, and entrapped to the conduct of his brother and nephew, and reduced the king himself to the necessity of seeking his safety by a precipitate flight.

Belisarius, having taken possession of the city, restored, with incredible dispatch, its walls and ditches, which the heedlessness and indolence of the Vandals had suffered to decay. The defeat of Zano, the brother of Gelimer, and the pugilistic flight of the king himself, terminated the conquest of Africa in the manner already related under the article Africa, which see. Belisarius, on his return to Constantinople in 534, obtained a splendid triumph, and was created sole consul for the ensuing year. The day of his inauguration resembled the pomp of a second triumph; his curule
The next object to which the attention of Belifarius was directed was that of terminating the dominion of the Ostrogoths in Italy. With this view he invaded Sicily A.D. 537, and having had siege to Palermo, which was soon reduced, and which was the only place where he met with any resistance, he soon after entered Syracuse in triumph.

In the spring of the following year he was diverted from the prosecution of his designs by a dangerous revolt of the African forces, which demurred his presence at Catthage. By a easy victory he would have reduced the peace of Africa; if he had not been hastily recalled to Sicily, for the purpose of appeasing a faction which had broken out in his own camp. Having effected this object, and sufficiently garrisoned Palermo and Syracuse, he embarked his troops at Messinia, A.D. 537, and landed them, without resistance, on the opposite shores of Rhegium. From Rhegium to Naples, his fleet and army, almost always in view of each other, advanced nearly 500 miles along the coast; and he received the submission of the inhabitants of the several countries of Bruttium, Lucania, and Campania, through which he passed. The capture of Naples, to which he had long set his heart, was, for some time delayed; and he had recourse himself to the defence of abandoned isles, that he might march, before the winter set in, against Rome and the Gothic king. But in the moment of anxious suspense a signal event occurred. Intimations of the death of the chasal of an aqueduct, a file of which led into the heart of the city, who gained admission to his companions, by whom the walls were formed on solid rock, and the gates burst open. Belifarius, having succeeded in this enterprise, restrained the cruelty and ferocity of the Huns; and, for this purpose, he appeared alone in the streets and churches of Naples, and exerted himself in moderating the calamities of the inhabitants. "The gold and silver," he repeatedly exclaimed, "are the just rewards of your valor. But spare the inhabitants; they are Christians, they are suppliants, they are your fellow subjects. Rejoin the children to their parents, the wives to their husbands; and shew them, by your generosity, of what obedience they have obstinately deprived themselves." The city was thus saved by the virtue and authority of the conqueror.

From Naples, Belifarius proceeded to Rome; which, on his approach, was evacuated by the Gothic garrisons; and which, after sixty years' servitude, was delivered from the yokes of the Barbarians, and surrendered, without opposition, Dec. 10, A.D. 536. The Gothic chief, who had himself a trophy of victory, was sent with the keys of Rome to the throne of the emperor Julianus. In the following year, 537, Vergi, who had been elected by the Gothic the successor of the feeble and deposed Theodatus, collected an army of Barbarians, and attempted to recover the capital. But on the approach of the Barbarians, Belifarius fell back to survey their camp; but being surrounded by the enemy, he extricated himself by vigorous exertions of strength and valour. When the whole army of the Gothic, having passed the Tiber, forced the siege of the city, which was continued above a year, before their final departure. Belifarius, led by his wife Antonia, his constant companion in every expedition, made many efforts for the relief of its distressed inhabitants, and for repulsing the besiegers, which at length, in concurrence with a force sent by the emperor, were crowned with success; so that Rome was relieved from the hostile attacks of the Gothic army, which raised the siege, and, after attempting the recovery of Rimini, took shelter within the walls of Ravenna. Upon the arrival of an army from Constantinople, under the command of Julianus, a diffusion arose between the two generals, whose respective authority was not accurately defined; but Belifarius was appointed, by the emperor's special commission, to the supreme command. He incurred, however, considerable offence by the hasty execution of Constanus, governor of Spoleto, who had committed an act of robbery, and in consequence of this measure, the two armies separated, and Narses was exercised by the leader of the discontented faction to affirme an independent and supreme command. Belifarius, by his prudence and perseverance, regained his reputation and influence, and procured the recall of Narses, and the establishment of military subordination. In the interval of discord, the Goths, aided by the Franks, captured Milan, with circumstances of aggravated cruelty. In 539, the destruction of Milan was succeeded by the invasion of Theodbert of Auvergia, the most powerful and warlike of the Merovingian kings, who, besides the succour which he afforded to the Goths, invaded the plains of Italy with an army of 100,000 barbarians, and marched his way by road and by water. The formidable of his conquering army, diminished by famine and disease, at length reduced Theodbert to listen with respect to the mild admonitions of Belifarius; who, as soon as he was delivered from his foreign and domestic enemies, formerly employed his forces in the final reduction of Italy. Having reduced Ollone and Faleria, he proceeded to invade Ravenna; and whilst he was engaged in the blockades of this city, he received from Julianus a treaty of peace, which he had actually signed without deigning to ask his counsel and concurrence. By this disgraceful and precarious treaty, Italy and the Gothic treasures were divided, and the provinces beyond the Po were left with the legal title to Vitiges. Belifarius rejected the treaty of partition, and declared his firm resolution of leading Vitiges in chains to the feet of Julianus. Upon this the Goths retired with doubt and dismay, and perceiving their own defeat and perils estate, offered their arms, their treasures, and the fortifications of Ravenna to Belifarius, if he would do him the authority of a master, accept their choice, and assume, as he had deserved, the kingdom of Italy. The Roman general, seeing to acquiesce in their proposal, flippulated the surrender of Ravenna at an appointed day; and in December 540, he entered the city without opposition, secured the royal treasures, and placed Vitiges under a guard in the royal palace. The fulmination of the capital was followed by that of the towns and villages in Italy; and the independent Goths, who still remained in arms at Aries and Verona, were ambitious only to become the subjects of Belifarius. But his inflexible loyalty rejected, except as the inhabitants of Julianus, their oath of allegiance; nor was he offended by the reproach of their deportment, till he rather chose to be a flame than a king. Julianus, hereupon, being to the suggestion of envy and jealousy, recalled Belifarius, who obeyed the summons, and departed for Constantinople, carrying with him the treasures of Ravenna, and the person of Vitiges, his wife, and chief sides. The emperor received him with seeming cordiality, but without granting him the well earned honours of a second triumph. Belifarius, however, was the object of universal adoration, and applause among the people; and by the number of soldiers in his private pay, and the attachment of the army, whose affection he secured by his justice and liberality, he
might well be reckoned the second person in the empire. To the husbandman he was endeared by the peace and plenty to which they enjoyed under the shadow of his standard. Such had been the rigid discipline of his camp, that the country, instead of being injured by the march of the Roman legions, had been enriched by them; and not so much as an apple was gathered from a tree, nor could a path be traced in the corn fields. As to his personal conduct, he was sober and chaste to a great degree, that, in the licence of a military life, none could boast that they had seen him intoxicated with wine, and that he was never suspected of violating the laws of conjugal fidelity. "The spectator and historian of his exploits," says Gibbon, "has observed, that amidst the perils of war, he was daring without rashness, prudent without fear, slow or rapid according to the exigencies of the moment; that in the deepest distress he was animated by real or apparent hope; but that he was modest and humble in the most prosperous fortune. By these virtues he exalted or excelled the ancient masters of the military art. Victory, by sea and land, attended his arms. He subdued Africa, Italy, and the adjacent islands; led away captives the successors of Generica and Theodosius; killed Constan tinople with the spoils of their palaces; and in the space of six years recovered half the provinces of the western empire. In his fame and merit, in wealth and power, he remained, without a rival, the heir of the Roman subjects; the rose of envy could only magnify his dangerous importance; and the emperor might applaud his own discerning spirit, which had discovered and ratified the genius of Belisarius." Nevertheless, the fame, and even the virtue of Belisarius, were polluted by the guilt and cruelty of his wife, Antonina. This proud woman was the daughter of a theatrical professor; and in the various situations of the fortune of her parents, she became the companion, the enemy, the servant, and the favourite of the empress Theodora. Before her marriage with Belisarius, she had one husband and many lovers; and after their conjugal union, she contrived to gratify her luxurious passions, and to impose on the credulity of her husband, whom she dissembled, and whom, by her influence she mitigated to transactions that fix an indelible stain on his memory.

When Syria was invaded by Chofroes king of Persia, in the year 540, and Antioch, its rich capital, destroyed, Belisarius, the conqueror of Italy, was appointed to the defence of the east. Accordingly, in the year 541, he encamped beyond the Euphrates, within six miles of Nisibis, in order to restrain the progress of the Persian monarch on the coast of the Euxine. Having succeeded, without the support which he had reason to expect, in forcing Chofroes to return with loss and precipitation, he was recalled, at the close of the campaign, to Constantinople, by an ungrateful court; but the dangers of the ensuing spring restored his confidence and command; and the hero, almost alone, was dispatched with the speed of post-heres, to repel by his name and presence the invasion of Syria. On the banks of the Euphrates his firm attitude restrained Chofroes from advancing towards Palestine, and compelled him to repulse the river: thus accomplishing his purpose by a safe and bloodless victory, more glorious than his African and Gothic triumphs, in which neither fortune, nor the valour of his soldiers, can subtract any part of the general's renown. But the danger threatened to Italy by the rapid conquests of Totila, who had been advanced to the Gothic throne, required the presence of Belisarius; and accordingly he was again recalled from the east, and in 544, he arrived at the port of Ravenna with an inconsiderable number of ill-provided recruits. Thus supported, he was able to impede the progress of Totila, and to prevent his laying siege even to Rome. When the city was reduced to extreme distress by the want of provisions, the supply of which had been long obstructed by the besieging army, Belisarius made a bold attempt for its relief. But his enterprise for this purpose having failed, Rome was obliged to submit to the Gothic yoke; and Belisarius could only prevail by interposing to prevent its threatened destruction. Totila, however, pillaged the city, and removed many of its inhabitants, marched into the south of Italy; upon which Belisarius took possession of it, and hastily fortified himself within its circuit; so that he was able thrice to repulse the Gothic army which Totila brought against it. But whilst he was engaged in its defence, he was commanded by the emperor to leave a sufficient garrison at Rome, and to transport himself into Lucania, in order to suppress a revolt which had taken place in that province. In this warfare he was basely vanquished by the delay, disobedience, and cowardice of his officers; and having reposed in his winter-quarters at Crotona, he was obliged by the rapid march of the Goths to make his escape to the coast of Sicily. At length Antonina, who had been sent to Constantinople to solicit succours, obtained, after the death of the empress, permission for Belisarius to return. Accordingly, after failing to deliver Italy from the Goths, and wandering like a fugitive along the coast, without daring to march into the country, or to accept the bold and repeated challenge of Totila, he was recalled in September 548. The subsequent success of Narses in recovering Italy, threw a shade over the military reputation of Belisarius; though about 10 years afterwards he distinguished himself by facing the capital from an invasion of the Bulgarians, who had advanced to its long walls, about 40 miles from the city, and occasionally an universal alarmed. The enemy were put to flight by the military veteran at the head of aLAND AMIRAL; though it was necessary to purchase their return into their own country by a heavy ransom. This was the last exploit of Belisarius; and his remaining days were doomed to misfortune and disgrace. The jealousy of the emperor, increasing with his years, led him to dispute Belisarius of being concerned in a conspiracy against his crown and his life; and the veteran general, after thirty years' service, and on incompetent testimony, was judged guilty, Dec. 5, A.D. 563. His life, indeed, was spared, but his fortunes were fleeced, and he was guarded for several months, as a prisoner, in his own house. At length, July 15, A.D. 564, his innocence was acknowledged; his freedom and honour were restored; and death, which might have been hastened by resentment and grief, removed him from the world about eight months after his deliverance, March 13, A.D. 565. "The name of Belisarius," says Gibbon, "can never die; but in the funeral, the monuments, the statues, faithfully due to his memory, I only read, that his treaties, the spoils of the Goths and Vandals, were immediately confiscated by the emperor. Some decent portion, however, was reserved for the use of his widow; and as Antonina had run so repent, she devoted the last remains of her life and fortune to the foundation of a convent. Such is the simple and genuine narrative of the fall of Belisarius and the ingratitude of Julian. That he was deprived of his eyes, and reduced by envy to beg his bread, Givemoney to Belisarius the general, is a fiction of later times, which has obtained credit, or rather favour, as a strange example of the vice of "flavus fortunus."

The source of this ill-fated may have been derived from a miscellaneous work of the twelfth century, the Chilidns of John Tzetzes, a monk, who relates the blindfolds and beggary of Belisarius in vulgar or political verse. (Vid. Corp. Poet. Graec. tom. ii. p. 311.)
B. F. L.

This moral or pathetic tale was imported into Italy with the fragments and manuscripts of Greece; repeated before the end of the sixteenth century by Cimabue, Pietro da, and Visentinius; attacked by Alciat for the honour of the law, and defended by Baronius for the honour of the church. Yet Tracez himself, in other chronicles, that Belarius did not write his nigh, and that he conceived his history and fortune. Gibbon's Hist. Decl. and Fall of the Rom. Emp., vol. i.

The theme is the will. Raphael, at Rome, in a sitting posture, with an open hand, holding a glass, is evidently addressed to Belarius, but it may be added with great propriety to Augustus, represented under the character of a magistrate, propitiating the genius of Nemi. Sueetzaix, in Aug. 99, for in Rome, that on a certain day every year, he handed himself to the condition of a large, recurring, heavy hand, and soliciting thus from the people. Vide Voltaire, tom. iv. p. 265.

BELÉSIO, or Belezia Geography, a town of Spain, near its frontier of Andalusia.

BELITZ, a capital of Spain, according to Pliny.

BELIZ, in Germany, a town of Germany, in the province of Brandenburg, in the circle of Zalzen's Consistory, on both sides of the Nei, and 300 miles south of Berlin, and 12 miles west of Petzam.

BELITZKY, a town and district of the Russian empire, in the government of Mohileh, stated on a rivulet falling into the sea.

BELKANI, a town of Achaia, in the province of Argolida, in the circle of Zalzen's Consistory, near the town of Nei, and 34 miles south of Dalmatia, and 44 miles south of Cairo.

BELKOVA, a river of Russia, in the government of Archangel, which runs into the Frozen sea. N. lat. 69° 30'. E. long. 53° 34'.

BELLE, a popular machine, ranked by musicians among the numbers of musical instruments of percussion. The noise of bells is altogether melody; but the pleasure arising from it consists in the variety of interchanges, and the various successions and general predominance of the harmonies in the sounds produced.

The parts of a bell are the body or clavel, the clapper or handle, and the ear or casing, when by it is hung to a large bar of wood.—Its usual material is a kind of compound lead, called bell-metal. The thickness of its edges is usually 1/2 of its diameter, and its height twelve times its thickness. The bell-founders have a dross, or baffle, in which they measure the fret, or level, weight, and form of their bells. For the method of calling bells, see F. H. B. N. 2.

The sound of a bell arises from a vibratory motion of the parts thereof, much like that of a musical chord. The stroke of the clapper, it will be observed, changes the shape of the body, and, of round to oval; but the metal is but a great deal of elasticity, that part of which the clapper drives fast into the sound waves by backward, and this even faster than to the other; but so for the two points of the clapper. In the large cast, the damage, so to speak, of the clapper. Thus the clapper is the source of the bell, and the other acoustic changes of the air, and by means of that it makes sound to the air, in which it sounds.

M. Percussion must, that the sound of the large bell chord is a compound of the sound of the local parts thereof; so that where the parts are homogeneous, and the dimensions of the figure uniform, there is such a perfect mixture of all these sounds, as constitutes one uniform, smooth sound: and the contrary circumstances produce harshness. This he proves from the bell's differing in tone according to the part you strike, and yet strike it at any where, there is a mixture of all the parts. He therefore considers bells as composed of an infinite number of rings; which, according to their different dimensions, have different tones, as chords of different lengths have; and when struck, the vibrations of the parts immediately fuse, determine the tone, being supported by a sufficient number of constant tones in the other parts. Mr. Hawkins, and others, have found by experiments, that the sound of a bell struck under water, is a fourth deeper than in the air; though Memorius says, it is of the same pitch in both elements. This water has treated largely of the different metals of which bells are formed, of their figure, cadence, and degrees of sonority, as they respect each other in a given form.

Bells are to be heard further, placed on plains, than on hills; and still farther, in valleys, than on plains; the depth of which it will not be difficult to assign, if it is considered, that the higher the sonorous body is, the more air; and, consequently, the less impulse it receives, and the less power it has to convey it to a distance. There is a curious observation in a paper of M. Reaumur's in the Memoirs of the Paris Academy, relating to the shape most proper for bells, to give them the loudest and sharpest sound. He observes, that as pots, and other vessels more immediately necessary for the service of life, were doublets made before bells, it probably happened, that the observing these vessels to have a sound when struck, gave occasion to make bells, intended only for sound, in that form: but that it does not appear that this is the most eligible figure; for lead, a metal which is, in its common state, not at all sonorous, yet becomes greatly fo on being cast into a particular form, and that very different from the common shape of bells. In melting lead for the common occasions of casting in small quantities, it is usually done in an iron ladle; and as the whole is seldom poured out, the remainder, which falls to the bottom of the ladle, comes into a mass of the shape of that bottom. This is consequently a segment of a figure, thickened in the middle, and thinner towards the edges: nor is the ladle any necessary part of the operation, since, if a mass of lead be cast in that form in a mould of earth or sand, in any of these cases it is found to be very sonorous. Now, if this shape alone can give sound to a metal, which in other forms is perfectly mute, how much more must it unnecessarily give it to other metals naturally sonorous in whatever form. It should seem that bells would much better perform their office in this than any other form, and that it must particularly be a thing of great advantage to the small bell, of common hound-chocks, which are required to have a shrill note, and yet are not allowed any great size.

M. Reaumur very judiciously observes, that if our forefathers had opportunities of being acquainted with the found of metals, in this plan, we should probably have had all our bells at present of this form. Mem. Acad. Par. 1726.

With regard to the origin of bells, that of a bell for an any uncertain; but the idea of a large bell, hung by ropes, was introduced at a much later period. Among the Jews, it was ordained by Moses, that the priests of the blue robe, which was worn by the high and lesser priests, should be adorned with their necklaces and gold bells, according to equal numbers. Ex. xxxiv. 22, 23. The king of Persia, to have heard the sound of the royal seal, like that of the bell, in process with princes, and gold bells, the Arabian race have worn on their legs a hollow gold ring, being
with small flints, which found like bells, when they walk; and these, with several appurtenances, give notice that the mithreps of the house is passing, so that the servants of the family may behave with respect, and strangers may retire to avoid seeing the person who advances. Calmet supposes, that it was with some such design of giving notice that these little bells at the hem of his robe; and it was also a kind of public notice that he was about to enter into the sanctuary. In the court of the king of Persia, no one entered the apartments without some warning; and thus the priest, when he entered the sanctuary, desired permission to enter by the sound of his bells, and in so doing he escaped the punishment of death annexed to an indecent intrusion. The prophet Zachary (ch. xiv. 20.) speaks of the bells of the horses, which were probably hung to the bridles or foreheads of war-horses, that they might thus be accustomed to noise. Calmet.

Among the Greeks, those who went the nightly watch rounds in camps or garrisons, carried with them a little bell, which they rang at each century-box to keep the soldiers appointed to watch awake. A bell-man also walked in funeral processions, at a distance before the corpse, not only to keep off the crowd, but to advertise the flamen dialis to keep out of the way, lest he should be polluted by the fight, or by the funeral music. The priest of Proserpine at Athens, called "herophantus," rung a bell to call the people to sacrifice. The hour of bathing, at Rome, was announced by the sound of a bell, and hence it has been supposed they were used to mark the hours of devotion, and funerary people to church. Servants in the houses of great men were called up in a morning by the sound of bells. Zo-

naran informs us, that bells were hung with whips on the triumphal chariots of their victorious generals, in order to remind them that they were still amenable to public justice. Bells were affixed to the necks of criminals going to execution, to warn persons to avoid so ill an omen as the sight of the executioner or condemned criminal, who was devoted and about to be sacrificed to the "di manes." To this superflition some persons have attributed the custom in England of ringing parish bells, while a malefactor is on his way to the gallows; though others have generally supposed it was intended as a signal to all who heard it, admonishing them to pray for the soulful fasting. Phaedrus mentions bells annexed to the necks of brutes: "Cella cervica eremium, clarumque, collo jacans tintinnabulum." Taking these bells away was confined by the civil law to he theft; and if the beast was thus lost, the person who took away the bells was to make satisfaction. Sempis had them tied about their necks, to frighten away wolves, or rather by way of amulet, or to direct herds where to find their flocks; and since the practice of blessing them has been introduced, they have been thought to preserve animals from epidemic disorders.

The uses of bells are summed up in the Latin difhich:

"Laudo Deum verum, plebem voco, congrego clerum, Defunctorum ploro, petlem fungo, festa decoro."

To the same purpose is the following inscription on bells, mentioned by Weever, in his "Funeral Monuments," p. 122.

"Funera plango, fulgura frango, fabbata pango, Excito lentos, diffusos ventos, pace cruentos."

The first bells are said to have been made about the year 400, at Nola, in Campania, whereof St. Paulinus was made bishop in 409; at least it is asserted, he was the first who brought them into use in the church. Notice here this expression of the Romanists that bells were "firma ligma," to call the congregation together; no bells being allowed by government to a prescribed set. Hence, it is added, they had their Latin names, Nola, first used by Quintilian, and

Campana, a term which was adopted in the time of St. Jerom. But others say, they take these names, not from being invented in Campania, but because it was here the manner of hanging and balancing them in flections, now in use, was first practised; at least, that they were hung in a model of a fort of balance invented or used in Campania. For in Latin writers we find Campania flutes, for a flett-yard; and in the Greek καμπαναί, for ponderam, to weigh. At first they were called fanta; and hence are derived a tofant, or tofif.

Polydore Virgil ascribes the invention of church bells to pope Sabinius, St. Gregory's successor; but this is a mistake: for St. Jerom, contemporary with Paulinus, makes mention of one. Pope Sabinius did not invent bells; but he was the first who appointed the canonical hours to be distinguished by them.

We even find mention made of bells in Ovid, Titullus, Martial, Statius, Manlius, and the Greek authors, under the appellations of tintinnabula, and sounding brays. Suetonius, Dion, Strabo, Polybius, Josephus, and others, mention them under the names of peltae, tintinnabula, aramentum, crotalum, sistrum, &c. But these appear to have been no more than babbles, and not like the huge bells in use among us.

Hieronymus Magnus, who has a treatise on bells (written when in chains in Turkey, and which is accounted very remarkable, purely from his memory, without the assistance of any book), makes large bells a modern invention. Indeed, we do not hear of any before the fifth century, when they were applied to ecclesiastical purposes in some of the monastic societies of Caledonia, as they were in those of Northumbria before the conclusion of the 7th century; and they seem to have been used from the first erection of parish churches in this kingdom. In 670, we are told, Lupus, bishop of Orleans, being at Sens, then besieged by the army of Clotharius, frightened away the besiegers by ringing the bells of St. Stephen's. The first large bells in England are mentioned by Bede, towards the latter end of that century, or about the year 670. They seem to have been pretty common in the year 816. Ingulphus mentions that Turkeutus, abbot of Crowland, who died about the year 870, gave a great bell to the church of that abbey, which he named Guthlac, and afterwards fixes others, all which rang together; and not long after this time, Kinfeus, archbishop of York, built a tower of stone to the church of St. John at Beverly, and placed in it two great bells, and at the same time provided that other churches in his diocese should be furnished with bells, J. Stubbs. Act. Pont. Ebor. fol. 1700. Mention is also made by St. Aldhelm, and William of Malmsbury, of bells given by St. Dunstan to the churches in the weft. See Spelman. Glofl. voc. Campana; and Bingham's Aut. Chrif. Church, book viii. ch. vii. § 15.

The Greeks are usually said to have been unacquainted with bells till the ninth century, or about the year 865; when their construction was first taught them by a Venetian.

Indeed it is not true, that the use of bells was entirely unknown in the ancient eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his Differtation on the Greek temples, proves the contrary from several ancient writers. It is his opinion, that bells first began to be diffused among them, after the taking of Constantinople by the Turks; who, it seems, prohibited them, left their found should disturb the repose of souls, which, according to them, wandered in the paradise of souls. He adds, that they still retain the use of bells in places remote from the intercourse of the Turks; particularly, very ancient ones in mount Athos. F. Simon thinks the Turks rather prohibited the Chalians the use of bells out of
of political than religious reasons; inasmuch as the ringing of bells might serve as a signal for the execution of revolts &c. The city of Bourdeaux was deprived of its bells for rebellion; and when it was offered to have them restored, the people refused it, after having tasted the ease and convenience of being freed "from the constant din and jangling of bells."

Matthew Paris observes, that anciently the use of bells was prohibited in the time of mourning; though, at present, they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient custom to ring the bells for persons about to expire, to advertise the people to pray for them; whence our pealing-bells. The pealing-bell anciently served two purposes: one of which was engaging the prayers of all good people for departing souls; and the other was, driving away the evil spirits which haunted the bed and house, and which were ready to seize their prey, or to terrify, and molest the soul in its passage; but by the ringing of this bell, it was said they were kept at a distance. To this circumstance we may probably ascribe the high price demanded for tolling the largest bell of the church; which being louder, and heard at a greater distance, might keep these evil spirits more remote, and also procure for the dying man a greater number of prayers.

Lobineau observes, that the custom of ringing bells at the approach of thunder is of some antiquity; but that the design was not so much to shake the air, and so dissipate the thunder, as to call the people to church, to pray that the parish might be preserved from mischief by it.

Whatever occasion some cathedrals may have given for the reproach, that they attribute to bells the power of driving away demons, and dispelling storms; it is certain the ancient canons of the church only ascribe this power very remotely to bells. Their meaning seems to be this: Satan bears and flies from the bells, because he knows that bells summoned good people to church to pray, and they dreaded their prayers. It was therefore to prayer, occasioned by the ringing of bells, and not to the bells, that such good effects were ascribed.

The custom of churlish noise or bleating bells is very ancient. The charge of baptizing bells, alleged by protestants against the Roman Catholics, has been denied by the latter; but they allow that they bells with certain ceremonies, as they do all other church utensils; and that one of the ceremonies is the giving of a name to the bell, in order to distinguish it from others, or in honour of some saint. It seems reasonable, therefore, to acquit them of the blame of prostituting baptism in this cause, and to charge them merely with consecration and benediction. Before bells were hung, they were washed, croosed, blessed, and named by the bishop. This is what some protestants have called baptizing of them; but others say, it might be denominated the benediction of them, resembling the benediction of trumpets among the Romans. Cardinal Bona observes (Rec. Liturg. t. ii. c. 22.), that the name of some saint is given to a bell at the time of its consecration, that the people may think themselves furnished to divine service by the voice of the saint whose name the bell bears. Some say that this custom was introduced by pope John XIII., who occupied the pontificate from 955 to 972, and who first consecrated a bell in the Lateran church, and gave it the name of John the Baptist. But it is evidently of an older standing; there being an express prohibition of the practice in a capitular of Charlemagne in 789: "Ut cloax non baptizetur," See Huppinian de Origine Templores, p. 113, where there is a particular account of all the religious ceremonies practiced about bells. See Dr. Franklin's Observations on consecrated Bells, and the Form in consecrating them, Experiments, Observations, &c. p. 487, ed. 1769.

Nanking, a city of China, was anciently famous for the largeness of its bells; but the enormous weight having brought down the tower in which they hung, the whole building fell to ruin, and the bells have ever since been disregarded. One of these bells is nearly twelve English feet high, the diameter seven and a half, and its circumference twenty-three; its figure almost cylindric, except for a swelling in the middle, and the thickness of the metal about the edges, seven inches. From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that at Erfurt, said by father Kircher to be the greatest bell in the world. These bells were cast by the first emperor of the preceding dynasty, above three hundred years ago. They have each their name, the larger tehoni, the eater ch, the sleepier shonf, the will s. Latelle Compte adds, that there are seven other bells in Pekin, cast in the reign of Yonou, each of which weighs 120,000 pounds.

But the sounds of these bells are very poor; being struck with a wooden instead of an iron clapper.

The Egyptians have none but wooden bells, except one brought by the Franks into the monastery of St. Anthony.

In the churches of Ruflia their bells are numerous, and distinguished by their enormous size. They are hung, particularly at Mofcow, in belfreys or towers detached from the churches, with guilts or silver cupolas or crosses; and they do not living like our bells, but are fixed immovably to the beams, and rung by a rope tied to the clapper, and pulled sideways. One of these bells in the belfrey of St. Ivan church at Mofcow, weight 127,836 English pounds. It has always been observed a meritorious act of religion to present a church with bells, and the pietv of the donor has been estimated by their magnitude. According to this mode of estimation, Boris Godanoff, who gave a bell of 280,000 pounds to the cathedral of Mofcow, was the most pious sovereign of Ruflia, and he was buried by the empress Anna, at white expenses; a bell was cast, weighing 432,000 pounds, which exceeds in silver seven bells in the known world. Its dimensions, as ascertained by Mr. Cox (Travels in Ruflia, vol. i. p. 332.), are as follow: the height is 19 feet, the circumference at the bottom 63 feet 11 inches, and its greatest thickness 23 inches. The beam to which this wall machine was fastened, being accidentally burst by a fire in 1737, the bell fell down, and a fragment was broken off towards the bottom, which left an aperture large enough to admit two persons abreast without flapping.

The ringing or striking of the bells, though it forms no part of divine worship, if some writers have farthered, serves, however, by the number of strokes, to inform any person without the church, what part of the religious service is beginning within it. Thus, several strokes are struck just before the mass; and this is called "blag owes," i.e. the agreeable sound, as a summons to the praises of God. Before the commencement of the liturgy, it sounds twice; and in the middle of it, a few strokes are given to the bell, to let the people without know that the hymn to the holy virgin is now beginning to be sung. All persons, on hearing this throw aside their work, bow, and cast themselves, repeating in the verse then singing in the church. In the same manner is regulated the number of strokes at the several periods of the vespers and the matins. On some holidays they are sounded through the whole day. Tucko's Hist. of Ruflia, vol, i, p. 128.

The same writer also informs us, that ringing the bells on church and court holidays, is a species of exercise of which the Ruflians are very fond; but they produce nothing like harmony from them. The sole excellence consists in striking the clapper the fastest.

For further particulars relating to bells, see Changes in a given
a given number of bells, Tintinnologia, Carillons, and Ring.

Bell Bay, in Geography, a harbour on the south-west coast of East Greenland, to the north of Horn Sound.

Bell Sound, is situated on the west coast of Spitzbergen, in the interior. N. lat. 75° 12'. E. long. 12° 43'.

Bell, bearing the, See Racing.

Bell, fountory of. See Foundry.

Bell, diving. See Diving.

Bells, electrical, are used in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, consists of three small bells suspended from a narrow plate of metal (Plate, Electricity,) the two outermost bells, and that in the middle, from which a chain hangs to the floor, by a silk cord. Two wooden knobs of braids are also hung by silk strings, one on each side of the bell in the middle, which serve for clappers. When this apparatus is connected with an electrised conductor, the outermost bells suspended by the chains will be charged, attract the clappers, and be fricte by them. The clappers becoming electrified likewise, will be repelled by their bells, and attracted by the middle bell; and discharge themselves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermost bells, and thus, by striking the bells alternately, occasion a ringing, which may be continued at pleasure. Flashes of light will be seen in the dark between the bells and the clappers; and if the electrification be strong, the discharge will be made without actual contact, and the ringing will cease. An apparatus of this kind, connected with one of the conductors that are erected for securing buildings from lightning, will serve to give notice of the approach and passage of an electrical cloud.

Bell-glafls, in Chemistry, a convenient vessel for many chemical operations, particularly upon gaseous bodies. It has the advantage of not being easily overthrown, and is readily manageable by the knob of glass at the top. When used, it is always inverted or standing with the open end downwards. See Plates in Chemistry.

Chemical bells are a sort of receptacles chiefly used in preparing the oil or spirit of camphor, for gathering and condensing fumes into a liquor.

Bell, in Building, is used to denote the body of the Corinthian and Composite capital, by reason of its resemblance to the figure of a bell inverted. In this sense, bell is the same with what we call bell-shaped or tambour, sometimes also corbel. The neck of the bell is always to be even and perpendicular with the bottom of the fluting of the column.

Bell flower, in Botany. See Campanula.

Bell, hair. See Hyacinth.

Bell-metal, an important alloy, composed principally of copper and zinc. See Copper.

Bell, a name given by some of the early writers on microscopical discoveries, to creatures of the Hydra genus. The bodies of these animals are shaped like bells, and they have very long and slender tails, by which they fling themselves to the roots of little plants. They are usually found in great numbers together, in a sort of clusters or bunches; and all of the same bunch have always the same motion, very frequently contracting themselves, and afterwards expanding all together to the full length of their tails. They usually contract instantaneously; but are more flow in the expanding themselves again. Baker's Microf. p. 96. See Hydra.

Bell-myrtus. See Botany, a name given by some authors to the plant called hama myrtus, and moch-foed.

Bell-pepper. See Capsicum.

Bell-polype, in Zoology, is the name applied to one particular species, the extremities of whose branches resemble bells, and which is now called Percula off Umbellaris.

Bell-weed, an English name used by some authors for the Jacca nigra, or common knapweed, called also by many English writers Mustard.

BELLA, STEFANO DE, in Biography, an eminent engraver, was born at Florence in 1615, and after having been for some time employed in the studio of his father, who was a goldsmith, applied to the study of engraving, and became the Disciple of Santi Chiusi. At first he imitated the manner of Cellot, who had been a disciple of the same master; but acquiring a facility in handling the point, he adopted a manner of his own, which is said to have first shewed, in freedom and spirit, that of Cellot. At Paris, whither he removed in 1632, he formed an acquaintance with Israel Silvestre, and was much employed by Henriette, the uncle of Silvestre. Upon his return to Florence, he obtained a pension from the grand duke, and was appointed to instruct the prince Colonna, his son, in the art of design. But being habitually subject to violent pains in the head, they at length terminated his life in 1664. The free and masterly etchings of this excellent artist are well known, and his distinguishing excellence consists in the freedom of his point, and the lightness and elegance of his figures. He drew correctly, and with great taste; and his works display much genius and great fertility of invention. Their lightness is compensated by their fire and animation. He is said to have engraved 1400 plates; among which are, "Six Views of Livorno;" several sets of "Shipping;" "A Holy Family;" several "Madonnas;" a "View of Pount-neuf, at Paris;" "St. Prother, a fierce count; five small oval, in which is represented "Death carrying away persons of various ages;" "Death mounted on the skeleton of a horse;" "Pamphilus;" and the "Rocky," both scarce; "Animals;" "Beggars;" and various sets of "Hunting;" "Shipping;" "Landscapes;" "Ornaments," &c. Strutt.

BELLA PALLA, or TERRA PALLA, in Geography, a small hill, resembling two islands with lofty round hills, 10 leagues N. E. by N. from Cape Angelo, and 4 leagues N. N. W. from Grava island; ituate on the coast of the Morea in the Archipelago.

BELLA, in Entomology, a species of Philena (bombyx,) found in North America. The wings are yellow, with six rows of black dots; posterior wings red, with black tips. Lin. Maj. 1758, p. 507.

BELLABRE, in Geography, a town of France, in the department of the Indre, and chief place of a canton, in the district of Le Blanc. The place contains 895, and the canton 6672 inhabitants; the territory includes 300 kilometres and 11 communes.

BELLAC, a town of France, and principal place of a district, in the department of the Upper Vienne, seated on the Vineon. It derives its name from an old fortified castle, erected in the 10th century, and contains about 2500 inhabitants. The place contains 3901, and the canton 16,854 inhabitants; the territory includes 255 kilometres and 9 communes. N. lat. 46° 7'. E. long. 0° 57'.

BELLADAC, a town of Aisne, in the province of Dijon, 35 miles west of Raba.

BELLADONNA, in Botany. See Amaryllis.

BELLADONNA, a name given by the Italians to the deadly nightshade, because the ladies make a colicene of the juice, or distilled water, which they use to make their complexion fair and white. Ray.

Others derive the name from the intoxicating quality of this plant; "Quod intoxicat pulchras offendit virgines feminacita." Bosc. Comment. in Theophrast. 10, 8. See Atropa.
BELLAGA, in Entomology, Papilio Carolus, is described under the name in the Fauna Surtensis. Lin. n. 1. 278.

BELLARIUS, in Geography, a post town of America, near the centre of Hartford county in Maryland, and the chief town of the country. It contains a court-house and jail, and has but few inhabitants. Distant from Hartford 12 miles N.W. N.E. from Baltimore, 166 W. S. W. from Philadelphia.

BELLA, or Bella, a town of Italy, in the Milanese, 17 miles north of Como. It is situated at the foot of a precipice, rest from top to bottom by a chain, through which a ferry insures its way. A bridge is thrown across the chain, from which the spectator looks down into a deep gulf, and an aqueduct is constructed along the steep sides of the rock.

BELLAGUS, in Geography, a species of Papilio (Phi. rur.) described by Fries, and is Papilio Adonis, Gmel, &c.

BELLARMIN, Robert, in Geography, a cardinal of Rome, and one of the most famous ecclesiastical writers of his time, was born at Monte Pulciano, a town of Tuscany, in 1542, and entered into the Society of the Jesuits in 1562. He was ordained priest by I. L. White in 1569, and in the following year advanced to the theological chair in the University of Louvain. Having remained seven years in the Low Countries, he returned to Italy, and in 1576, began to read lectures at Rome on controversial subjects; and having been honoured by three successive popes with important commissions, he was, in 1599, nominated to the cardinalate by Clement VIII. with the following elegy: "We choose him because the church of God does not prevail in learning." In 1602, he was created archbishop of Capua, and it was reported he would have been raised to the papal see if he had not been a Jesuit. In about four years he resigned his archbishopric, and being precluded to Rome by pope Paul III. and here he continued his services to the church, till they at 1621, when he retired from the Vatican to a house of his order, in which he died the same year, at the age of 79. When he was visited in his old age by pope Gregory XV. he expressed his profound veneration for the pontiff, as Christ's vicar on earth, by kneeling him on his entrance with the words of the coronation to Christ: "I. Lord, I am not worthy that thou shouldest come under my roof." On the day of the consecration it was necessary to keep off the popes by a strong guard, as they passed on, either to should似y or to procure some relief of his garments, as he laid in a faint.

BELLARMIN. As Rome's defender, and the cardinal residing in the closing period of the 16th century, he is the subject of most of the polemical literature of the period. His name, indeed, is almost synonymous with a period of papal history, and his writings are of course the literature of that period. The work on the authority of the church is his most important work, and is, indeed, one of the most important works of the period. His other writings, though less important, are equally valuable, and include works on theology, politics, and history. Among his most important works are "A Commentary on the Psalms," "A Commentary on the Apocalypse," "A Treatise on Ecclesiastical History," "A Treatise on the Temporal Authority of the Pope," and "A Treatise on the Objections of the Popes." Some of his works, and particularly his book on the temporal authority of the pope, raised difficulties against him in his own commendation, whilst his declaration of the right of the pontiff to depose princes, caused it to be condemned by the parliament of Paris; his assertion of the direct power of the pope in temporal matters, foisted the court of Rome, that the pope, caused it to be forbidden in the Index of the Inquisition. Some princes, by excess of zeal, injured their own cause, by circulating unfounded and malignant calumny against his words, &c. Joseph Scaliger has even affirmed, that he did not believe a word of the doctrines he defended, whereas it is most probable that he inclined to superstition in fact, and to scrupulosity in practice. At his death he bequeathed one half of his wealth to the Virgin Mary, and the other half to Jesus Christ; and it is said, that he would not allow the vermon that infected his body to be molested under the plea, that these animals had no other parable than their present existence, of which it was cruel to deprive them. His right to canonization was strongly urged; and the popes were prevented from allowing his claim merely by the fear of giving offence to those foreigners who did not understand the local rights he had opposed. Gen. D. Ch. Nouv. D. dit. Hill. Mohr. Ecol. Hist. vol. iv. p. 221, &c.

BELIAS, in Geography, a small town of Portugal, in Braganza, containing about 1240 inhabitants.

BELLATOR, in Entomology, a species of Cimex (Gmelin). It is brown above, beneath yellowish; antennae black annulated with white. Gmelin. A native of Ceylon. This is Corus Bivator of Fabricius.

BELLATRIX, in Anatomy, a ruderal, glittering star of the second magnitude, in the first house of Orion.

It takes its name from Bellum, a name given to it by the ancients, from its first appearing in the heavens, and forming a part of the constellation of the first house of the signs.

BELLAY, William, in Geography, a French general, legalized himself in the service of Francis I. by his valour as a soldier, and by his talents as a negociator. He was a man of strong and forcible in his efforts for inducing some of the nobility of France to support his designs in favour of the Duke of Anjou. He was employed in several embassies to Germany for the purpose of concluding the peace of the pontiff league, and deviating their objects against the king his master's interests in punishing heretics. Bellay was eminently distinguished for his abilities in penetrative, by his boldness and resolution, into the depth of enemies; he succeeded in the French, with the best in quality of victory, and with the least in the number. From the beginning of the reign of Francis, his name became the most illustrious in France, between 1512 and 1513, he conducted the most splendid war at St. Zeno, and the most famous battle of his life. In his letters, among which the most important was a letter to the Parlement of Paris, in which he defended the right of the king to the estates, and particularly to the estate of the clergy. He was a man of great learning, and a great writer. He was the author of several works, of which the most important was "The History of the World," in which he wrote his history books, or described the events in a cursive, in a clear style. Of this Bellay, 1565, is the first, and can be trusted by variations. The style is written in a simple and lively manner, but it is somewhat partial in favour of France. Bellay
BELL

Bellay was one of the first French writers who expressed a doubt of the miraculous facts recorded of Joan of Arc. Gen. Dict.

Bellay, John du, a cardinal, younger brother of the preceding, was born in 1492; and having made considerable proficiency in literature, was highly esteemed by Francis I. By him he was employed in several embassies, particularly in negotiating a reconciliation between Henry VIII. of England and the see of Rome; and he was advanced by him to several cardinal preferments. Bellay, in the business of king Henry, visited the pope at Rome, where he continued, and in 1535, he was made cardinal by Paul III. As soon as he received intelligence of the hostile designs of Charles V. he returned to France, and refilled that prince's invasion of Provence in 1536, as the lieutenant-general of Francis, with as much military vigour as prudence, and he exerted himself in putting the metropolis, and other places in Picardy and Champagne in a formidable state of defence. After the death of Francis I. his credit declined by the intrigues of the cardinal of Lorraine, and retiring to Rome, he resigned his preferments to France, and was made bishop of Ofla. He was so much respected by his brother cardinals, that they had thoughts of raising him to the pontificate, when he died in 1560 at Rome, aged 68 years. Bellay was distinguished as a patron of literature, and by his advice, in concurrence with that of Budaeus, Francis I. founded the royal college in 1529. He was an elegant writer, both in Latin and in French. In the Latin language he wrote some harangues, and an apology for Francis I. and in the latter three books of poems, confounding of elegies, odes, and epigrams, published by R. Stephens, in 1549. Gen. Dict.

Bellay, Joachim du, a French poet, was born at Lire in Anjou, about the year 1524; and amidst various domestic misfortunes, which marked his earlier years, he directed his attention to the study of the ancient and modern poets. At length his own performances in verse made him known at court, and he became the delight of Francis I. Henry II. and Margaret queen of Navarre. He was characterised by the appellation of the "French Ovid," which seemed to have not improperly been bestowed upon him, on account, partly, of the sweetness and facility of his muse, and partly of the licentiousness of some of his pieces. In the former he particularly excelled, and a rank has been assigned to him as a poet next to that of Rouard. He followed his relation the cardinal to Rome; and on returning with him to France as his agent, he left his favour in consequence of charges of irreligion and immorality that were alleged against him. But another relation, who was bishop of Paris, gave him a canonry in his church in 1555, and he had the prospect of further preferment; but was carried off by an apoplexy, January 1, 1561. His French poems were published in 1561, and his Latin ones in 1561. Nouv. Dict. Hitt.

BELLE DE NUIT, in Botany, a name which the French give to the flower of the Jalap.

Belle, bay, in Geography, a harbour on the N. E. part of the great bay, called Fortune bay, on the south coast of the island of Newfoundland, in the Atlantic ocean.—Alfo, another bay on the N. W. side of the same island, 6 or 8 leagues N. W. from the bay of Isles, and about as much S. W. from the small bay of Higoumancourt.

Belle Dune, La, or Handford Town, a long projecting barren point, on the south side of Chaleur bay in North America, about 8 leagues N. W. of Nipiguitou, where temporary cod and herring fisheries are carried on by different people; no trade being established at the place.

Belle Isle, Belleisle-en-Mer, or Belleisle, an island in the bay of Bifcoy, near the W. coast of France; about 9 miles long, and from 2 to 4 broad, surrounded by steep rocks, which, together with the fortifications, render the conquest of it difficult. It was taken by the English in 1761; but restored at the peace in 1763. The soil is various, rocky, with salt marshes, and some fertile grounds. Before Paris, the capital, it contains three other small towns, and about twenty villages. N. lat. 47° 17'. W. long. 5° 6'.

Belle Isle-sur-Mer, in the department of Norbihan, and chief place of a canton, in the district of L'Orient, by the late French arrangement, contains 2,496, and the canton 5,569 inhabitants: the territory includes 107 kilometres and 5 communes.—Alfo, a small island of France, in the river Loire, in the department of the Mayenne, half a league west of St. Mathurin.—Alfo, an island on the east side of the northern part of Newfoundland, eait of Caribou head between 50° 4', and 52° 50'. N. lat. and between 55° 39' and 55° 45'. W. long.—Alfo, an island of North America, at the mouth of the straits of this name, between the country of the Esquimaux, or New Britain, and the north end of Newfoundland. The island is about 7 leagues in circuit, and lies 16 miles from the nearest land on the coast of Labrador, or New Britain. On the north-west side it has a harbour for sailing vessels, or small craft, called "Lark harbour;" and, on the E. point, it has another small harbour or cove, which will admit sloops. The narrow channel between Newfoundland and the coast of Labrador, called the " Straits of Belle Isle," receive several rivers from the coast of Labrador. These straits lead into the gulf of St. Lawrence from the N. E. and are distant 3 leagues N. from Newfoundland. The north point of the island is in N. lat. 51° 57' and the south point in N. lat. 51° 48'; and W. long. 55° 46'.—Alfo, an island of Ireland in Lough Erne, in the county of Fermanagh, 6 miles S. E. of Enniskillen.

Belle-ille-en-Terre, a town of France, in the department of the Northern coast, and chief place of a canton, in the district of Guingamp. Situated on an island in the river Guer; 3 leagues west of Guingamp. The place contains 812, and the canton 9,118 inhabitants: the territory includes 1,524 kilometres and 6 communes.

Belle Plaine, a valley of Piedmont, in the Alps, situate partly in the county of Nice, partly in the county of Tenda, a few miles N. W. of Saorgio.

Belle D'Entente, a town of France, in the department of Cote-d'Or, and chief place of a canton, in the district of Beaune. The place contains 17,174, and the canton 10,324 inhabitants: the territory includes 215 kilometres and 17 communes.

Belleforest, Francis du, in Biography, was born at a village called Sarzana, in the province of Guinée in 1530, and after an early education in the court of Navarre, was sent to study the law at Toulouse. But employing himself in writing panegyrics in bad verse, on all the noblest in and about Toulouse, by whom he was rewarded with praise and entertainment, he removed to the capital: and by attention and industry attained to some reputation in the reigns of Charles IX. and Henry III. so that he gained the poét of historiographer-royal, which he afterwards sold for want of paying due regard to fact in his productions. He is said to have composed more than 50 works on different subjects, during a life of 53 years, as he died at Paris in 1583. It is related of him, that there was neither tongue nor science which he did not profane. His most fertile topic was history: and he published compilations of "Tragical Histories;" and "Wonderful Histories." These two works wearisome are, "The History of the nine Kings of France, of the Name of Curie"; folio; and "The Annals of general History of France,"
FRANCE," Par. 16. 2. 2. vol. 5. folio. in which last work, are several curious facts, most useful to writers, and to the literary and scientific world. Gen. D. Nov. 28. 1817.

BELLE POLICE. Louis D'Artigues, generally called the "Abbe," was born in a family in the isle of N. S. in 1683, and entered into the society of the Jesuits. He took a principle of D. riches, which were opposed by the Jesuits. He also lived in the world, preaching occasionally with applause, but devoting himself chiefly to the profession of a writer. Under this character he wrote many books, and supported himself chiefly by the profits accruing from them, attending to the poor every thing that exceeded a bare maintenance. Some time before his death he was driven from his literary labours, sold his books, and retired to the community of St. Francis de Sales at Paris, established for the support of poor priests, and here he died in 1734. His various publications consisted chiefly of translations from the works of St. John Chrysostom, St. Paul, St. Gregory Nazianzen, St. Ambrose, Thomas a Kempis, etc., and also from Ovid, Virgil, and other prose writers. He is a pure and simple writer, but he often violates the laws of elegance, especially of the Greek fathers. The index of his works is very extensive, in general, morals, and matters of style. Those that have been most favorably received are: "Le de la Création," and "Le Rêve," both of which may pass and diffuse in the world; and "Récits de l'Antiquité," and "Récits de l'Antiquité," to mention only the works of Style. They, and some other pieces, from a collection of his small volumes, New, Dill, Beller, Belle Reader, in Geography, a fortified town of France, is the capital of the province, it was taken by the Spanish in 594, and sacked by the annual Moorish invaders. After the peace of Nanua, Louis XIV. built a regular fortress with five batteries to defend the Pyrenees; 3 leagues S. of Paris.-Allo, a town of France, in the department of the Loire, and chief place of a canton, in the district of Montargis. The town contains 790, and the canton 670 inhabitants: the territory includes 1731 square, and 12 communes.-Allo, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Aubusson. The town contains 1002, and the canton 673 inhabitants: the territory includes 1753 square, and 9 communes.

BELLE-TOURAY, a town of the kingdom of Germany, in the canton of Ures, and 3 leagues of Buda, with a rich soil of the rivers. It is about 10 miles from Paris, and is a pleasant situation, surrounded by mountains, and many lakes, and deep woods. In this place is situated a monastery of monks and canons.

BELLE-PRENE, a town of France, in the canton of N. E. of the 57.

BELLE-NEUVILLE, a town of France, in the department of the N.-E. and chief place of a canton, in the district of Grasse, 3 leagues S. of Cannes, and 5 leagues E. of Nice. The town contains 242, and the canton 520 inhabitants: the territory includes 1024, and 55 communes.

BELLE-SUSSON, William, (E. 7. e. 7. L. V.) in Geography, a native of France, and author of a Memoir, was born in 1682, and finished the society of the 17th century. He was professor of the Belles-Lettres in the university of Paris in 1622, and continued for a considerable time in that office, even after he was made master of the place, and taking James I. of England. At Paris he published, in 1614, his "Chierco Praxev," containing a sort of extracts from Cicero's writings, relative to the laws of nature, the duties of a prince. This work was reprinted to 1111, prince of Wales, and he procured it by a prize a "De jecor et Sempiterni Regum polit.," in which there is a rich vein of metaphysical, etc. He died in 1621. The origin of such errors in religion, and of such defects in policy and morals, is traced out with considerable accuracy and learning. But while the author condemns the monstrous tenets of ancient idolatry, and the gross corruption of philosophy, he believes many judicious remarks on the wisdom and the patriotism of some ancient legislators. In 1612, the author published a work similar to the former, under the title of "Chierco Consul, auctor Sempiterni Romanorum;" on the nature of the consular office, and the constitution of the Roman Senate, but with the reception given by the public to these works, he conceived the plan of a third work, "De Statu proori Orbis," which was to contain a history of the projects of government and philosophy from the ancients up to their various degrees of improvement under the Hebrews, Greeks, and Romans. This work was dedicated to Charles, prince of Scotland and Wales; but when he had proceeded so far as to print a few copies of this work, in the year 1615, it was suggested to him, that his three treatises, "De Statu Princ. 1. "De Statu Republica;" and "De Statu Orbis," being on similar and connected subjects, might be united in one work; accordingly they were reprinted in this form under the title of "Belendemus de Statu," in 1616. Bellerophon, afterwards projected a more extensive work, "De Trib. Itineribus Romanorum," in which he endeavored to join Cicero and Plutarch, but death prevented the execution of his whole plan. He was an able writer, and a man of extensive knowledge and sound judgment. His Latin style is formed upon that of Cicero; and he embraces every opportunity of introducing the most choice and proper proverbs from the Roman orator, even whilst he is expressing his own sentiments, so that it is not always easy to distinguish sentences cited from Cicero, from his own language. The book "De Statu," was reprinted in London in 1657, 8vo, by a certain publisher; (supposed to be published by the learned Dr. Park,) with a Latin preface by the editor, relating to the public and public characters of that period, and beautiful engravings of Mr. Burke, lord North, and Mr. Fox, to whom the three treatises are respectively dedicated. To preserve the memory of every composition which flowed from the pen of Bellerophon, the editor has inserted an epitaphium on the marriage of Charles I. and a "panegyricum carmen" on the embassy to Spain. These verses were found in the British Museum.

The editor owns his firm conviction that Dr. Mablyton, in his celebrated history of Cicero, was much indebted to the writings of Bellerophon; although he has never mentioned his name. Pref. to Belleandemus de Statu. POLIO. 16, vol. 58, p. 491, 21c. vol. 58, p. 5. 45. &c.

BELLE-EAU, in Geography, a town of France, in the department of the Meuse, and chief place of a canton, in the district of Nancy, 2 leagues S. of, Port-a-Moulin.

BELLE-ROCHE, in Fabulous History, the lion of Glauce-king of Ephrasy, or Cornwall, was contemporary with Julius. Under a charge of humanity, as he lay on his own breast, he was forced to return to the court of Britain, Long of Angier, whom he was accosted by Glauce, or as Homer says, Anta, the wife of Praxev, of an attempt upon her chastity. For this insult Praxev sent to Jobotos, his father.
BEL

father-in-law, king of Lycia, with private instructions to put him to death. Jobates demurring against the execution of these orders, employed him in several dangerous expeditions against the Solymi, and against the Amazons, from which he returned victorious. Having thus ingratiated himself with Jobates, he obtained his daughter in marriage, and a settlement in a fertile part of Lycia, where he reigned and brought up his family. From Homer's account, which represents him as "hated by the gods, and wandering in the Aeolian plain, a prey to melancholy, and avoiding all commerce with men," he seems to have become insane, and to have died in that state. To his various exploits Homer and other writers have annexed the story of his killing the triform monster called the Chimaira, by the aid of the flying horse Pegafus, granted him by Minerva and trained for his use. Of the numerous conjectures that have been offered for the explanation of this fable, we shall only mention that of Bochart, (Phleg. 1. i. c. 6.) who suggests, that in his expedition against the Solymi, he overcame them, and also their three gods, which they painted on their ensigns, in the several forms of a lion, a goat, and a dragon; and which he probably joined together on his own, in memory of his conquest; and this gave birth to the tale of his killing the monster Chimaira. Homer. Iliad. vi. Anc. Univ. Hist. vol. v. p. 97. &c.

BELLES LETTRES, considered as synonymous with polite literature, however vaguely and indefinitely these terms have been often used, properly comprehend those subjects that relate to man as a being endowed with senses of taste and imagination, which were intended to embellish his mind, and to supply him with rational and useful entertainment. In this restricted sense they include the origin, structure, and various kinds of language, or grammar, universal and particular, criticism, rhetoric in its whole extent of composition, style, and elevation; history, in its several departments, ancient and modern, general and special, and all the different kinds of poetry. In the distribution of the Lyceum of Arts, established at Paris in 1792, the belles lettres comprehend general grammar, languages, rhetoric, geography, history, antiquities, and numismatography; whereas, those parts of learning that are of a more grave, philosophical, or abstruse kind, and that are more immediately the objects of the understanding, such as logic, metaphysics, ethics, and the various branches of the mathematics and natural philosophy, are usually referred, by way of distinction, to the classes of sciences. This distinction, however, is not rigidly observed, even by Rollin and others, who professedly treat of the belles lettres. In their confined and appropriate meaning, they open a field of investigation peculiar to themselves. Their province comprehends everything that relates to beauty, harmony, grandeur, and elegance; everything that can foil the mind, gratify the fancy, or move the affections. They present human nature under a different aspect from that which it assumes, when viewed by other sciences. They bring to light various springs of action, which, without their aid, might have passed unnoticed; and which, though of a delicate nature, frequently exert a powerful influence on several departments of human life. Such studies have also this peculiar advantage, that they exercise our reason without fatiguing it. They lead to enquiries acute, but not painful; profound, but not dry or abstruse. They flower in the path of science; and while they keep the mind bent, in some degree, and active, they relieve it at the same time from that more toilous labour to which it must submit in the acquisition of necessary erudition, or the investigation of abstract truth. Besides, the study of polite literature furnishes an agreeable amusement for those intervals of leisure which occur in every man's life; and thus prevents his being a burden to himself, or recurren to the indulgence of pernicious passions, and the pursuit of licentious pleasures. The satisfactions which this study imparts, occupy a kind of middle station between those of mere science and those of pure intellect: they refresh the mind after the toils of intellect, and the labours of abstract study; and they gradually raise it above the attachments of sense, and prepare it for the enjoyments of virtue. Of those, whose minds in early life incline to polite literature, good hopes may be entertained, as this liberal and elegant turn is favourable to many virtues; whereas, to be entirely void of relish for eloquence, poetry, or any of the fine arts, is an unpromising symptom of youth, and furnishes suspicions of their being prone to low gratifications, or defined to disgrace in the more vulgar and illiberal pursuits of life. A cultivated taste increases sensitiveness to all the tender and humane passions, by giving them frequent exercise, while it tends to weaken the more violent and fierce emotions:

" — Ingenias didicisse sidelicet artes,
Emoluit morese, nec flix effe foras.

" These polite arts have humanized mankind,
Soften the rude, and calm'd the hoit'rous mind."

The elevated sentiments and high examples which poetry, eloquence, and history, are often bringing under our view, naturally tend to nourish in our minds public spirit, the love of glory, contempt of external fortune, and the admiration of what is truly illustrious and great. Although it should not be said that the improvement of taste and virtue are the same, or that they may be always expected to co-exist in an equal degree; yet it must be allowed, that the exercise of taste is, in its native tendency, moral and purifying. From reading the most admired productions of genius, in poetry or in prose, almost every one riles with some good impressions left on his mind; and though these may not always be durable, they are at least to be ranked among the means of dispelling the heat of virtue. Indeed, without poifessing the virtuous affections in a strong degree, no man can attain eminence in the sublime parts of eloquence. He must feel what a good man feels, if he expects greatly to move, or to interest mankind. They are the ardent sentiments of honour, virtue, magnanimity, and public spirit, that only can kindle that fire of genius, and call up into the mind these high ideas, which attract the admiration of ages; and if this spirit be necessary to produce the most distinguished efforts of eloquence, it must be necessary also to rehish them with proper taste and feeling. Blair's Lectures on Rhetoric, and Belles Lettres, vol. i. p. 1. Rollin's Method of treating and studying the Belles Lettres, vol. i. p. 3. &c. M. de Rohan's Quotation, delivered before the Swedish Academy, translated by N. G. Agander.

BELLESME, in Geography. See BELLESME.

BELLEVILLE, a town of France, in the department of Paris, and chief place of a canton, in the district of St. Denis, half a league east of Paris.—Alfo, a town of France, in the department of the Rhone, and chief place of a canton, in the district of Villefranche, 24 leagues north of Villefranche. — The place contains 2239, and the canton 11,528 inhabitants: the territory includes 147 kilometres and 12 communes.—Alfo, a town of France, in the department of Vendée, and the district of Montagne, one league north of La Rochefur-Yon.

BELLEVOS, in Biography, a painter of sea pieces, known through all parts of Europe as a good painter, died in 1654. His subjects are views of havens, sea-ports, shores, calms, and storms at sea; but in his calms he fiews his peculiar excellence. Histouch is light, and his colouring clear; the perspective of his sea-ports and buildings is true, and has an agreeable effect; his skies are generally bright, and judiciously
Judiciously managed; and his colouring is transparent. His figures are brilliant, and without much expression. His pictures occur in public sales, and some of his best style fetch a tolerable price. Pitkington.

BELLEVUE, or, the Martyr, in Geography, a town of France, in the department of the Same, and Loire, as a chief place of a canton, in the district of Chârolles. The place contains 1,260 and the canton 9,456 inhabitants; the territory includes 322 square kilometres and 13 communes.

BELLOT. La, or, Le, a town of France, and principal place of a district in the department of the Ain, before the revolution the capital of Le Burguy, and one of a bishopric, seated among hills and small eminences, about 2 miles from the Rhône, and twelve miles east of Lyons. The place contains 5,522 and the canton 12,116 inhabitants; the territory comprehends 195 square kilometres and 22 communes. N. lat. 45° 47'. E. long. 5° 35'.

BELLMORE, a town of America, in Bergen county, New Jersey, on the road to Albany, within half a mile of the line that separates New York from New Jersey, which extends from Delaware river to that of Hudson; distant 24 miles N. by W. from the city of New York.

BELLI, in Modern History, the name of a society or sect among the Negroes of Africa, in the interior kingdoms of Sierra Leone, which is properly a school of seminary for the education of children, renewable every 27th year by order of the king, who is visitor or superior of the college. Here the young men learn to dance, fight, fish, hunt, and above all, to chant a certain hymn, which, in the language of the college, they call "bellum," or the prades of bell: these songs consist of a repetition of the same low expressions, endured by the most indolent and lascivious boys. When a young negro becomes an adept in this practice, he is admitted a fellow of the college, deemed to be qualified for all employments, temporal and spiritual, and entitled to a number of important privileges.

BELLICA columnar is, in Antiquity, a column near the temple of Belona, from which the consul or feckles cell jad to against the enemy's country, by way of declaration of war.

BELLICONUS, in Botany, a species of Calex, (euphorbus) that inhabits Africa. It is of a brown colour: posterior thighs arched, and destated; four spines on the abdomen. Fabricius.

BELLI, or, the Bell, in Natural History, desert species of low-herb of an umbelliferous figure, some of a white colour, spoted with yellow; and some of a yellow, flecked with black lines, after the first fallion.

BELLIDIASTRUM, in Botany. See Dromition.

BELLIDOIDES. See Cystanthemum.

BELIEFRE, Pompon Da, in Biography, Chancellor of France, was born at Lyons in 1529, studied at Tours and Paris, and in 1555 became superintendent of the finances, and in 1579 president of the parliament of Paris. Having been employed in several important embassies by Charles IX. and Henry III. and IV., he was created chancellor by the latter in 1599, as a recompence for his services at the peace of Vervins. In the execution of his office he was enlightened, inflexible, inclined to austerity, and, by the warmth of his temper, to occasional precipitance. He was distinguished by his learning and eloquence, as well as by his talents for business. In 1641, he left the seals, but continued in the polls of chancellor and president of the council; however, he used to say, regretting his loss, "that a chancellor without the seals was a body without soul." He died in 1697; and several eulogies were bellowed on his memory, in honour of the regard which he always exhibited to learning and its professors. The grandsons of the former were distinguished, in the reigns of Louis XIV. and XV., by his legal and diplomatic talents; and was founder of the general hospital at Paris. New Dict. Hist.

BELLINO, in Modern History, a model of trial, or a kind of purgation, practised by the Negroes in the interior countries of Africa, when persons are accused of murder or theft, and confessing of a composition of certain herbs or barks of trees, which they oblige the accused to hold in his hand, under a full persuasion, that, if he be guilty, blisters will immediately rise upon the skin. Sometimes the bellino consists of obliging the accused to swallow a large glass of a liquor composed from the bark of the nemo and quiote trees, which the negroes believe to be virulent and poisons. The innocent immediately reject it by vomit; but the guilty flew a froth about the mouth, and are accordingly judged worthy of death.

BELLING of Haps, denote their opening and expanding to their customary shape, supposed to bear some relation to that of a bell. Haps blow towards the end of July, and bell the latter end of August or the beginning of September.

BELLINGHAM, in Geography, a small town of Northumberland, England. It has a market on Tuesday, one fair annually, and is 500 miles north of London. In 1780, this town was nearly consumed by fire, and its houses now only amount to 70, and inhabitants to 337. About four miles to the south is the village of Wark, where are the keep and some ruins of an ancient castle.

BELLIINGHAM, a small farming township of America, in Norfolk county, Massachusetts, containing 735 inhabitants, 20 miles N. from Providence, and 34 S. from Boston.

BELLINI, Lucrèce, in Biography, a learned and ingenious physician, was born at Florence in 1642. He had the advantage of being educated under Mancherti, Redi, and Borelli, and profited so well by their instructions, that he was made professor in mathematics and philosophy at Pisa, where he was only twenty years of age. He was also no mean proficient in oratory, poetry, and music, but proposing to practice medicine, he was soon advanced to the chair of professor in anatomy, a post he continued to fill with reputation for nearly thirty years. He was one of the principal supporters of the medico-mathematical school, who attempted to explain the causes of the body, the causes of diseases, and the operations of medicines on mechanical principles. In this he was followed by Archibald Pitcairne, who read his works at the schools in Edinburgh during the lifetime of Bellini, and dedicated one of his own works to him. When he was fifty years of age, he was called to Florence, by Colnìo III., who appointed him his physician, and about the same time, on the recommendation of Lancellotti, he was made honorary, or consulting physician to pope Clement XI., but having more imagination than judgment, and. endeavoring to square his practice to his theory, he was generally unsuccessful in his treatment of diseases, and thus soon forfeited the favour, and was cast, both of his prince and the public. In his anatomical researches he was more successful, as he was the first who accurately described the nervous pulp of the tongue, and discovered them to be the organ of taste, of which he gave an account in his "Gullus Organum novissimis Deprecationibus." Bonon. 1683, 1684; and he had before, viz. in 1682, published "De Structurâ Ruminis," Florence, 4to, which had been well received, as containing additional information on the anatomy of that organ. These works have been frequently reprinted, though now, from the great improvements that have been made in anatomy, but little noticed. In 1683, he published "De Urinis et Pulphas." De Maffoni Sarumans, "De Morbis Capitis et Pretoris," being in act, distinct treatises on those subjects, 4to. Bonon. This is a work of in ch research and observation, though often obscure and too theoretical.
It was much celebrated in its time; and BeckerAVE, who published an edition of it in 1717, accompanied it with a commendatory preface. For the titles of the remainder of Bellini's productions, see Fuller's Bib. Med. et Anatom. He died in 1704. Gen. Biog.

Bellini, Gentile, a painter of history and portrait, was born at Venice in 1421, and instructed by his father Giovanni, who was himself an artist in the art of painting, both in ditemper and in oil. He was employed by the doge to paint the hall of the great council, and he executed several considerable works for others of the nobility. His reputation reaching to the Ottoman court, he was invited by Mahomet II. to Constantinople, where he lived in urbane entertainment, and employed in painting the portrait of the emperor, and in various other performances. It is said, however, that the emperor ordered the head of a flayed to be cut off in the presence of Bellini, in order to convince him of the incoherence of a picture which he had painted, of the decollation of St. John the Baptist; but the sight affected his mind so much, that he was never easy till he obtained leave to return to his own country. Mahomet, before his departure, put a gold chain about his neck, and dismissed him with letters of recommendation to the Senate of Venice, which procured for him a pension for life, and an admission into the order of St. Mark. Vafari mentions a sea-fight, painted by this master, which had extraordinary merit. He died in 1501.

Bellini, Giovanni, the brother of the former, was born at Venice in 1430, and surpassed both his father and brother in every branch of painting. He is accounted the founder of the Venetian school, by introducing the practice of painting in oil, which had been communicated to his father by Domenico and Andrea del Castagno, as one says; or which, according to De Piles, he obtained from Antonia of Meli; and by teaching his scholars to paint after nature, the school of Giovanni produced two memorable disciples, Titian, and Giorgione, who brought the art of colouring to its highest perfection; and Giovanni himself, by observing the works of these famous artists, improved his own manner very considerably; so that in his latter pictures the colouring is much better, and the air of his head are noble, although his design is somewhat gothic, and his attitudes not well chosen. He died in 1516. Pilkington.

Bellino, St. in Geography, a town of Italy, in the Polefino di Rovigo, 10 miles W. S. W. of Rovigo.

Bellinzone, or Bellinzona, one of the Italian bailiages of Switzerland, on the south side of the river Teva, north of the lake Maggiore, of Lake of Locarno, and on the confines of the Milano, which, together with the two bailiages of Riviera or Poles, and Val di Benaco, Beogo or Breno, comprehend 110 square geographical miles, and 33,000 inhabitants, and before the French revolution belonged to the cantons of Uri, Schwyz, and Unterwalden. In the 15th century, this country belonged to the counts of Sax, who sold it in 1432 to the original cantons; but Philip Maria, duke of Milan, opposing this sale or exchange, exerted himself to prevent from falling into their hands a town like Bellinzona, so important from its situation and natural strength, to check their inroads and cover his dominions. Having therefore taken possession of it by force of arms, a body of 8000 Swiss passed the Alps. The force of both nations met; the Italians were led on by Caracciolis; a bloody battle ensued, of which both sides claimed the victory: but the Swiss retired with a standard taken from the enemy, and they remained masters of the town. In 1500, however, the three cantons obtained what they long contended for; the inhabitants of Bellinzona, vexed by the frequent changes in the Milanese, submitted to them. The French, when they had conquered the duchy, in vain reclaimed it; the Swis returned possession, and the four Italian bailiages, and this stronghold of the old were formerly ceded to them by Maximilian I., in gratitude for their having upheld him in the dual war. It was likewise made an article of the perpetual peace concluded between Francis I., king of France, and the cantons. The bailiages remain in office two years; he is nominated alternately by the three cantons, and is generally removed from Riviera the poorest, to Bellinzona, the most lucrative of the three governments. An appeal lies from his decision to the syndicate, and from that court to the three cantons: in ecclesiastical affairs, the inhabitants are corrigible to the bishop of Como, excepting three parishes. The inhabitants are catholics; and most of the natives understand Italian, but the language is a corrupt German. After the French revolution, Bellinzona, according to the division of 1799, became a distinct department or canton, including the bailiages of Bellinzona, Riviera, and Val Leonzing, of which the chief town was Bellinzona. By the constitution of 1801, the Italian bailiages formed the 15th department or canton of Switzerland, and was empowered to elect five representatives to the diet. The riches of this district consist in its pastures and cattle; the deficiency of corn is supplied by the Maline; and the plain near Bellinzona produces good wine.

Bellinzona, or Bellinzona, Lat. Bellino, Bellino, Belli- zona, or Bellinzone, the capital of the above bailiages or department, is a beautiful town, situated at the foot of mount Cenero, on a delightful plain on the east side of the Tefino, a little below its junction with the Moesa or Mafa, and about 51 British miles above the northern extremity of the lake Maggiore. The town is encircled with ancient walls and battlements in good repair; on the right are seen the majestic ruins of an ancient castle, and on the left, separately embosomed in trees, are the clefts of the bailiages of the three regent cantons, Uri, Schwyz, and Unterwalden. The interior of Bellinzona is far from corresponding with its external beauty and situation; the streets being narrow, and the houses ill-built. It is, however, rich in fine churches, dedicated to St. Peter, St. Stephen, St. Blaise, and St. Rock; and it has numerous convents of Augustines, Ursulines, and Recollets. There is also a convent, or nunnery, called the "Residence," lately founded for the education of youth. The valley that lies between this town and the lake is level, and had walk by numerous torrents: the road runs along the sides of the hills through continued vineyards; bounded on the west, and also on the east, by ridges which are clothed to their summits with woods of chestnuts and walnut trees, half concealing frequent spires and numerous hamlets. N. lat. 46 4 E. long. 10 43.

letter to the author, though after Bello's death he retracted his praise. This piece was succeeded by his "Bayard," "Peter the Cruel," and "Gabrielle de Vergy." But the failure of the second of these hastened his death in 1755, to the regret of numerous friends, who were attached to him by the goodness of his heart. As a dramatic writer his distinguishing excellence consisted in his knowledge of flage effect, and of the method of producing it by new and unusual situations; but in pursuing these he quitted the true and natural pathetically, and aided in degrading the modern theatre. His verification is often negligent, and his style hard and inflated. M. Gaillard of the French academy, published a collection of his works in 6 vols. 8vo. 1779, with a life of the author prefixed. Nonv. Dict. Hist.

Bellon, or Belland, in Medicine, a distemper very common in Derbyshire and other counties, where they smelt lead ore, to which beasts, and even poultry, as well as men, are subject; and for this reason a certain space round the melting-houses is called bellon-ground, where it is dangerous for any animal to feed. This disorder is attended with languors, weakens, and intolerable pains, fenation of gripings in the belly, and generally cothiveness. It frequently proves fatal.

The method of cure which has been found most successful in this distemper, is, to give ewenor, or caustics of tartar, in small doses, and to repeat them frequently, as two or three times a day.

Bellonaria, in Mythology, the goddess of war, sifter or wife to Mars.

Hyginus (Fab. 274.) says, that Bellona was the inventress of the shield, called the Greek armor, and hence her name has been fancifully derived. Others with greater probability, deduce it a bella, war; and Bryant (Anal. Anc. Mythol. vol. i. p. 45.) supposes it to be formed from Belon, a compound of Bel, Bal, or Bal, the original Babylonish title appropriated to the sun. This goddess was of a savage disposition, and delighted in slaughter and blood: and she was not only represented as the attendant of Mars, who prepared his chariot and horses for war, but, as taking pleasure in sharing his dangers. She is commonly represented in an attitude expressive of fury and distraction, her hair being composed of snakes clotted with gore, and her garments stained with blood. She is generally exhibited driving the chariot of Mars, with a bloody whip in her hand, and sometimes as holding a lighted torch or brand, and at other times a trumpet. Bellona had a temple at Rome, near the Porta Carmentalis, in which the senate gave audience to ambassadors; and before it stood the pillar or column of war, against which a lance was thrown whenever war was declared. She was also worshipped at two places called Comma, one of which was in Cappadocia, and the other in the kingdom of Pontus; and Camden observes, that in the time of Severus, there was a temple of Bellona in the city of York. Poets and artists have often confounded Bellona with Pallas.

Bellona, in Entomology. Under this name Cramer describes papilio brefiellis of Fabricius. The species bellona of Fabricius and Gemina is a native of North America, has dented falvous wings, spotted with black; posterior ones, beneath yellow at the tip, with fix ocellar barulous spots. A variety of it is figured by Cramer under the trivial name of hirsuta.

Bellonaria, in Antiquity, priests of Bellona, the goddess of war and battles.

The Bellonarii cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are singular, that they offered their own blood, not that of other creatures, in sacrifice. In the fury and enthusiasm with which they were seized on these occasions, they ran about raging, uttering prophecies, and foretelling blood and slaughter, devastations of cities, revolutions of state, and the like; whence Martial calls them "turba enthousia Bellonarum." Lactant. Infl. lib. i. cap. i. Lucian, lib. 1. Tert. Apol. cap. 9. Minut. Ptol. p. 298. In after-times they seem to have abated much of their zeal and transport, and to have turned the whole into a kind of farce, contenting themselves with making signs and appearances of cutting and wounds. Lampridius tells us, the emperor Commodus, out of a spirit of cruelty, turned the farce again into a tragedy, obliging them actually to cut and mangle their bodies. Lamp. in Commod. cap. 9.

The Bellonarii celebrated feasts on the eve of the nones of June, and the ninth of the calends of April, on which occasion they chewed a plant called Bellonaria, which produced a kind of fury, and disposed them to mangle their bodies in the manner which characterized these feasts.

Eff. Char. Cor. wheel-shaped. Cal. one celled, inferior, many-seeded, beaked with the calyx.

Propagation and Culture. It is propagated by seeds which should be sown early in the spring, in a pot filled with light fresh earth, and plunged into a hot-bed of Tanner's bark, and frequently watered. When the plants are come up half an inch high, they should be transplanted into pots filled with light fresh earth, and plunged again into the hot-bed, watered and shaded till they have taken root; then air should be admitted to them every day in warm weather, and they should be frequently watered. When the plants have filled these pots with their roots, they should be carefully shaken out of them, and their roots trimmed, and put into larger pots filled with light fresh earth, and put into the hot-bed again. In warm weather fresh air should be admitted to them every day; but in autumn they must be plunged into the bark-flove, and treated like other tender exotic plants. These plants will sometimes flower in the second year, but they rarely produce good seeds in this climate. Nevertheless, they may be propagated by cuttings in the summer months, provided they are planted in light earth on a moderate hot-bed, and carefully watered and shaded till they have taken root. They must be constantly kept in the flove, and have a large share of free air.
BELLORI; John Peter, in his works, a noted antiquary, was a native of Rome, and derived from his uncle Francis Angeloni, under whose care he was placed, his taste for antiquities. He was appointed by Chidio, queen of Sweden, the keeper of her library and cabinet of curiosities; and by pope Clement X. ancient town of Rome. He died in 1656, above 80 years of age. His valuable cabinet was afterwards annexed to that of the king of Prussia at Berlin. Of his various publications, relating to his favourite pursuits, the principal are the following: viz. "Notul in Numeat, tum Lithoph. tum aaurum urbis, apologia, 1658," fol.; "Fragmenta Veltign veteris Romae," 1653; fol.; "La Colonna Traiana," fol.; "Le Pette Antich. del Sepolcro de' Nafoni," 1653; fol.; "Le Antich. nec eocr. lapicida figurata," 1691; fol.; "Gli Anti. e lapidiere. sac. Mauv. Romae & Ern.chei," 1693; fol.; "Veteres Areus Augustorum," 1695; fol.; "Vite de Pittor, Sculptor, et Architelli Moderni," 1692, 4to.; "Imag. vetereor. Philosophorum," 1683, fol. Several treatises of this author are inserted in the 7th volume of Gronovius's Greek Antiquities. He also reprinted, in 1685, with large additions, Angeloni's "Historia Augusta," illustrated by Medals. Moteri. Gen. Biog.

BELLOSTE, Augustin, a surgeon of eminence in his time, inventor of a mercurial composition, called after his time, "Belloste's pill," by which he is supposed to have acquired a considerable fortune. After practicing several years at Paris, where he was born in 1631, and as an army surgeon, he was invited to Sardina, and made principal surgeon to the queen's mother, and continued to reside at Turin to the time of his death, which happened July 15th, 1726. The work by which he is principally known, is his "Chirurgie de l'Hôpital," published 1695. It has passed through numerous editions, and been translated into all the European languages. In 1725, he published a continuation of it, under the title of "La suite du Chirurgien de l'Hôpital." Among other useful observations, he recommends piercing carious bones, with the view of accelerating extraction; a practice advised by Celsus, though long discontinued. He reprobates the custom of frequently removing the dressings of wounds, as tending to retard the cure. The work has much merit, though now little noticed, being superseded by later publications. Halier Bib. Med. Pract. et Chir.

BELLOTTI, Pietro, a painter of history and portrait, was born at Venice in 1625, and learned the art of colouring from M. hadal Tarebobo, whose disciple he was. As a portrait painter, he attained the first rank, but was less eminent in the composition of his historical subjects. In the imitation of nature he was peculiarly happy; the colouring of his portraits appears to be real flesh, and the variety in the cast of his heads is inexhaustible; in all his attitudes there is much grace, and the disposition of his figures is natural and becoming. He died in 1750. Pilkington.

BELLUSCIA, in Ancient Geography, a people of Gaul, comprised in the nation of the Helveti, and limited south of the Ambrois. Their country was particularly distinguished by the name of Belgium, and corresponded to the modern Basins; their territory was called by the Latins Cadurca, and Caesar speaks with commendation of their valor and their number.

BELLOWING, among Sportmen, is used for the noise which rays make in cutting-time.

BELLOWS, a machine used to give a brisk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inhaling the air by turns.

This machine is used in chambers and kitchens, in forges, furnaces, and foundries, for driving up the fire; and it is annexed to organs and other pneumatic instruments, in order to supply them with a due degree of air. They are constructed of various forms, and furnished with different kinds of apparatus for giving them motion, and for discharging their air, according to the purposes which they are intended to serve. However, they are in general composed of two flat boards, sometimes of an oval and sometimes of a triangular figure; between these boards are placed two or more hoops, bent to fit their figure; on the edges of the boards is nailed a piece of leather, broad in the middle and narrow at the ends, which unite them together, and it is also affixed to the hoops of the boards, that the latter may move the more easily open and fold again; to the undermost board is fastened a pipe of iron, braze, or copper; and within is a valve, which covers the holes in the under board so as to keep in the air. Strabo informs us (Georg. vi. vol. i. p. 454.), from an old historian, that Anacharsis, the Scythian philosopher, who lived in the time of Solon, about 625 years before Christ, invented the bellows, as well as the anchor and potter's wheel; but this account is very doubtful, as Pliny, Senece, Diogenes Laertius, and Suidas, who likewise speak of the inventions ascribed to that philosopher, mention only the two last, and not the bellows. It appears, however, that they were known in ancient times to the Greeks; and Virgil mentions them in the following passage (Georg. iv. 175.):

"Alius taurinus foliibus auris
Accepiunt, reddantque."

Upon which it may be remarked, that bull's leather is unfit for bellows, and ox and cow's leather only can be used for that purpose; but accuracy, in the description of a mechanical engine, is not to be expected in a poet. In more modern times, wooden bellows have been introduced in metalurgical operations, instead of those of leather. The latter require careful management: the repairs of them are expensive; and they seldom last more than six or seven years. When thin leather is employed, it suffers a great deal of air to escape through it; and this evil must be guarded against by continually bimbling it with train oil, or other fat substances; and this is even necessary when thick leather is used, to prevent it from cracking in the folds. Whenever they are repaired, it is necessary again to soften the leather with oil, and this occasions a considerable loss of time. To obviate these, and similar inconveniences, and with a view to some peculiar advantages, wooden bellows have been invented in modern times, of which we shall give some account in the sequel of this article. In the oldfet melting-houses, the bellows were moved by a handle, like those of the smith's forge, or by the pressure of the foot upon a treadle, or by other means, requiring the force of men. But since the force of water has been employed to move the quantity of one man has not only been far greater, but the separation of the metal more complete; infomuch, that that great part of the metal now prepared at some considerable works, particularly in the county of Gloucester, has been no other than what had been left in the flag of cinders, for want of sufficient force of air.

The action and effect of bellows of every kind, whether leathern or wooden, wrought by water or men, depend on this, that the air which enters them, and which they contain when raised, is again compelled into a narrower space, and as consequence fly out of the pipe or aperture with a velocity propor-
proportional to the force by which it is compressed, and
must therefore blow stronger or weaker, as the velocity
with which the top and bottom of the bellows meet is
greater or lesser. The blast also will fall in proportion to
the quantity of air that was drawn into the bellows through
the valve or wind-clap.

The action of bellows bears a near affinity to that of the
lungs; and what we call blowing in the latter, affords a
pertinent illustration of what is called respiring in the former.
Accordingly, bellows have been employed in respiring sus-
pended animation; and Dr. Hooke found, by renewing the
interrupted action of the lungs by blowing air into them, by
cutting away the ribs and diaphragm, and pericardium, &c.
and laying the thorax of a dog bare, and having cut off the
aorta, arteries below the epiglottis, and bound it on the nodule
of a bellows, that as he blew the dog recovered, and as he
ceased, became convulsive; and thus the animal remained
alternately alive and dead above the space of an hour. See the
methods of recovering suspended animation, under the arti-
cle Drowning.

The bellows of smiths and founders, whether single or
double, are wrought by means of a rocker, with a string or
chain fastened to it, and pulled by the workman. The bel-
lows-pipe is fitted into that of the towel. One of the boards
is fixed; so as not to play at all. By drawing down the
handle of the rocker, the moveable board rises, and by means
of a weight on the top of the upper board, links again.

The bellows of the Chinese smiths is of a very simple kind,
and is composed of a square pipe of wood ABCDE. (Plate
XIII. Pneumatics, fig. 167;) with a square board G, which
exactly fits it, moved by the handle FG. At the farther
end is the bellows-pipe HR, and on each side of it a valve in
the end of the square pipe, opening inward. The piston
is sufficiently tight for their purposes without any other.

The bellows of forges and furnaces of mines usually re-
ceive their motion from the wheels of a water-mill, or in our
large furnaces they are worked by a steam-engine. Others,
as the bellows of enamellers, are wrought by means of one
or more flaps or tresses under the workman's feet.

The bellows of an organ are six feet long, and four broad;
each having an aperture of four inches, that the valve may
play easy. There should likewise be a valve at the nose of
the bellows, that one may not take the air from the other.
To blow an organ of sixteen feet, there are required four
pairs of these bellows.

The bellows of organs are wrought by a man called the
blower; and, in small organs, by the foot of the player. See
Organ.

The method of constructing wooden bellows for the pur-
pposes of metallurgy, was an important and useful invention,
for which we are indebted to the Germans. This is ex-
pressly affirmed by Grignon in his "Memoires pour l'art de
fabriquer le fer," Paris, 1775; and in the time of Debech,
they were to be found in Germany, but not in England.
Gentiane, in his "Tracté de la fonte des mines par feu du
charbon de terre," Paris, 1779, erroneously ascribes the in-
vention to the Swiss; being probably led into this error in
consequence of a Swiss having first made known these
bellows in France. The name of the real inventor, how-
ever, has not been ascertained. From a catalogue of ma-
chines given to the magistrates of Nuremberg in 1558, by
an artist, called Hans Lobfinger, Doppelmayr concludes,
that he understood the art of making small and large bel-
lows without leather, and entirely of wood, which could
be useful in foundling-houses and for organs, and likewise cop-
er-bellows, that always emitted a like degree of wind. As

Lobfinger made organs, Beckman (Hist. Inventions, vol. i.
p. 109.) suggests, that this invention might occur to him;
but he has not been able to learn in what it actually con-
sisted, or whether it might not die with him. Agricola,
who died in 1555, makes no mention of wooden bellows.
Samuel Reyher, formerly professor at Kiel, in the improved
edition of his dissertation on air, printed there in 1669, re-
printed with additions at Hamburg in 1725, and entitled "De
Pneumatica, sive de Aere et Aerometria," informs us,
that "about 30 years ago a new kind of bellows, which
ought to be called the pneumatic chefs, was invented in the
village of Schmälauch, in the principality of Cobourg, in
Franconia," by two brothers, Martin and Nicholas Schel-
horn, who were millers in that village. These brothers
kept the invention secret, but not so concealed as to elude
conjecture. Reyher relates, how he himself formed an idea
of it. Schütter, who has given a complete description and
figure of these bellows in his "Unterricht von Hätten-Wer-
ken," Brunswick, 1758, fol. ascribes the invention to them
to a bishop of Bamberg; and according to his account they
were employed so early as the year 1620, in the forest of
Harz, to which they were first brought by some persons
from Bamberg, "What Calver says (according to Beck-
man, in op. cit.) respecting the introduction of these bellows
into the forest of Harz, is much more probable; that in
1621 Lewis Plancheclam from Thuringia, settled at Ois-
feld near Goislar, and began to make wooden bellows. The
bellows-makers of that place conspired therefore against him,
and swore they would cut him to death; but he was pro-
tected by the government. He would disclose his art to no
one but his son, who, as well as his grandson, a few years
ago had the making of all the bellows in the forest." From
Germany, the art of making these bellows was introduced
into some parts of France, and into Sweden, and became
general though various parts of Europe. This kind of
bellows consists of two boxes placed upon one another;
the uppermost of which may be moved up and down upon
the lower one, in the same manner as the lid of a snuff-box,
which has a hinge, moves up and down, when it is opened or
shut: but the sides of the uppermost box are so broad as to
contain the lower one between them, when it is raised to its
utmost extent. Both boxes are bound together, at the small-
est end, where the pipe is, by a strong iron bolt. It
may be readily comprehended, that when both boxes fit
each other exactly, and the upper one is raised over the
under one which is at rest, the space contained by both will
be enlarged; and consequently more air will rush in through
the valve in the bottom of the lower one; and when the
upper box is again forced down, this air will be expelled
through the pipe. The only difficulty is to prevent the air,
which forces its way in, from escaping any where else than
through the pipe; for it is not to be expected, that the
boxes will fit each other so closely as entirely to prevent the
air from making its way between them. This difficulty,
however, is obviated by the following simple and ingenious
method. On the inner sides of the uppermost box there
are placed movable slips of wood, which, by means of metal
springs, are pressed to the sides of the other box, and fill up
the space between them. As these long slips of wood might
not be sufficiently pliable to suffer themselves to be pressed
close enough; and as, though planed perfectly straight,
they would, in time, become warped in various direc-
tions, incisions are made in them across their whole length,
at the distance of from 15 to 18 inches from each other, so
as to leave only a small space in their thicknees, by which
means they acquire sufficient pliability to be very well
pressed close enough to the sides. This description may be
illu-
illustrated by a figure, (see Plate XIII. Pneumatics, fig. 108) in which the outer box A B C D E F E has its top and two sides flat or straight, and the end B A E E formed into an arched or cylindrical surface, of which the line F P at the other end is the axis. This box is open below, and receives within it the hollow box K I G N M L (fig. 109) which exactly fits it. The line F P of the one coincides with F P of the other, and along this line is a set of hinges on which the upper box turns, as it rises and sinks. The lower box is fastened to a frame fixed in the ground. A pipe O Q proceeds from the end of it, and terminates at the furnace, in a small pipe called the "tewer," or "tuyere." This lower box is open above, and has in its bottom two large valves V, V, opening inwards. (See fig. 110.) The conducting pipe is sometimes furnished with a valve opening outwards, to prevent burning coals from being sucked into the bellows, when the upper box is drawn up. The joint along F P is made tight by thin weather nailed along it. The fits and ends of the fixed box are made so to fit the sides and curved end of the upper box, so that this last can be raised and lowered round the joint F P without feasible friction, and you will not suffer much air to escape; but as this would not be sufficiently air-tight by reason of the thickness and wabbing of the wood, a further contrivance is adopted. A slender lath of wood is divided into several joints, and covered on the outside with very soft leather, is laid along the upper edges of the fits and ends of the lower box. This lath is so broad, that when its inner edge is even with the inside of the box, its outer edge projects about an inch. It is kept in this position by a number of steel wires, which are driven into the bottom of the box, and stand up, touching the sides, as represented in fig. 111, where a b c are the wires, and e the lath, projecting over the outside of the box. By this contrivance, the laths are pressed close to the sides and curved end of the movable box, and the spring wires yield to all their inequalities. A bar of wood R S (fig. 108) is fixed to the upper board, by which it is either raised by machinery, to sink again by its own weight, having an additional load on it, or it is forced downward by a crank or wiper of the machinery, and afterwards raised. The operation in this case, is exactly similar to that of blowing with the chamber bellows. When the board is lifted up, the air enters by the valves V, V. (fig. 110,) and is expelled at the pipe O Q, by depressing the boards. These bellows are made of a very great size, A D (fig. 108), being 15 feet, A B 5 feet, and the circular ends 7 feet. The rive, however, is but about 3 or 3 1/2 feet. They expire at each stroke about 50 cubic feet of air, and make about 8 strokes per minute. The advantages of these wooden bellows are very considerable. When they are made of clean fir wood without knots, they will last 30 or 40 years, and even longer, though continually kept in motion 45 or 46 weeks every year. Some have said, that, when properly made, they will last a century. The effect produced by them is stronger, as well as more uniform, and can be moderated according to circumstances. They are worked also with greater facility. The slips of wood on their sides are apt to be damaged: but they can soon and easily be repaired. Every three or four months, however, the outer sides only of the inner box, and the lath which keeps the boxes together, must be freed with oil. If we calculate the price of such bellows, and the yearly expense, they will, according to Gunning's account (infra supra) be only a fifth part of those of the old leather bellows. They have, indeed, their defects; though they are less expensive and more durable than those of leather, for it is scarcely possible to make the junctures so tight as to allow no exit to the compressed air, and the friction must necessarily be very great. Some, therefore, have had recourse to water, for performing the office of the lower board of the bellows. A bellows on this principle is described by Mr. Trewhall, engineer to his Serene Majesty, in the Philosophical Transactions, under the name of a "water bellows." Of bellows of wood we have one preserved in the repository of the Royal Society; and Dr. Plot describes another, that was used at the copper-works at Ellaston in Staffordshire, Nat. Hist. Stutt. Sch. 4, 1758. Such are the bellows in general use on the continent. In this kingdom, a different, and a preferable form is adopted; for an account of which and other contrivances for animating the large fires of furnaces, &c., see Blowing Machine. See also Furnace.

BELLOWS. Apothecary, so called by the inventor M. G. Carey, physician to the military hospital at Neufbrilack, and denoting "a refiner of respiration," an instrument used for inflating the lungs. It is described in the "Journal de Medicine" for June 1792; and consists of a double pair of bellows B C L M (Plate XIII. Pneumatics, fig. 112) the two different parts of which have no communication with each other. In the lower side B M is an aperture A for a valve, constructed on the principles of those of Mr. Nairre's air-pump. It consists of a rim of copper, closed at one end by a plate of the same metal, in which plate are four small holes placed at equal distances. This plate is covered with a piece of silk coated with clathic gum, in which are fix transverse incisions of two, or three, lines in length. Each incision is so made as to be situated between two of the holes, and at an equal distance from each, as represented at D. (fig. 113.) The silk must be made very supple, by a thread passing several times round the rim. It is obvious, that a stream of air applied to that side of the plate which is opposite the silk, will pass through the holes, and, lifting up the silk, escape through the incisions. On the contrary, a stream of air applied to the other side will press the silk upon the plate, and thus close the holes, so that it will be impossible for it to pass through them. This valve opens internally, so as to admit the air from without. At B is another valve, upon the same construction, but opening in a contrary direction, thus permitting the air to escape out of the lower part into the tube E F, but preventing its entrance. At C is another valve, opening internally to admit the air from the tube E F; and at D there is a fourth, opening externally to discharge the air from the upper part. The flexible tube E F, fixed on at the end C B, being introduced externally into one of the nostrils, whilst the mouth and the other nostril are closed by an applicant, if we separate the two handles I, M, which were close together at the introduction of the tube, it is evident, that the air in the lungs will rush into the upper part through the valve C, whilst the external air will fill the lower part through the valve A. The two handles being again brought into contact, the atmospheric air will be forced into the lungs through the valve B, and at the same time the air in the upper part will be discharged at the valve D. Thus, by the alternate play of the double bellows, the lungs will be alternately filled and emptied as in respiration. In using the instrument, care should be taken not to be too violent; as the more perfectly the natural motion of respiration is imitated, the better. To prevent any fulness from without injuring the valves A, D. (fig. 112) the rim is made with a screw B. (fig. 114) in order to receive a cap A, A. (fig. 114) full of small holes. This screw has also another use. It stopplicated air be preferred, a bladder filled with it (fig. 113) may, by means of the screw A, be fastened to the valve A, (fig. 112); and to prevent walk, as this air may serve several times, a flexible tube may be screwed in the valve D. (fig. 112) communicating with the bladder by means of the opening d, (fig. 115.) Thus it may be employed as often
often as the operator thinks proper. There is a handle K to the partition in the middle in order that, if it be at any time necessary to use either of the divisions alone, the other may be confined from acting. c. b. (fig. 116) represent the two valves to be applied at the end of the instrument CB. (fig. 112); and (fig. 117) is a section of the end CB, showing the valves in their proper places. It is proper to add, that the capacity of the instrument should be proportioned to the quantity of air received into the lungs by inspiration, which Dr. Goodwin has ascertained to be twelve cubic inches, or something more. Each division of the instrument, therefore, should be capable of containing that quantity. (See Analytical Review, vol. iv. p. 427.) Roulard presented, and described at a meeting of the Lyceum of Arts at Paris, in 1757, the model of a pair of bellows, constructed on this plan, intended to relieve life to perishing drowned and in a swoon, by drawing out the vitiated air from their lungs, and replacing it with ordinary air, or even with oxygen, or vital air, if necessary; at the same time producing the motion of the lungs, independently of the concurrence of the patient, to the very instant when his strength fails return. The experiment was submitted to public inspection; a bladder being made up to represent the lungs.

Bellows, Bone, globular valves, occur in Herodotus for those applied by the Scythians to the gentials of mares, in order to defend the uterus, and by this compression, make them yield a greater quantity of milk.

Bellows, Bellian, a contrivance for driving air into a mine for the respiration of the miners. This was improved by M. Papin, who changed its cylindrical into a spiral form; and with this, by working it only with his foot, he could produce a wind to raise a weight of two pounds.

Bellows Hydrostatic. See HYDROSTATIC.

Bellows, or Triumph-fish in Ichthyology, a name given by Ray, Willughby, &c. to the species of Centriscus SCOLOPAX. Gmelin.

Bellows Rocks, in Geography, rocks that lie in the Atlantic, near the west coast of Ireland, and county of Galway. N. lat. 53° 11'. W. long. 10° 4'.

BELL, Canterbury, and Coventry, in Botany. See CAMPAULUM.

Bells. Hair. See HYACINTHUS.

Bells Mill, in Geography, a settlement in North Carolina, near the Moravian settlements, at the source of Deep river, the north-westernmost branch of the north west branch of Cape Fear, and about 50 miles west of Hillsborough.

Bells, in Heraldry, are represented as round, when fixed to the legs of a hawk; in which case the hawk is said to be belled.

BELLUFE, in Zool.ogy, a name of the sixth order of animals in the Linnaean system, including the genera of the cyamus, or harp, the bipedipus, the tapir, and jut. These have obtuse-truncated toes, and hoofed feet.

BELLUCCI, Antonio, in Biography, a painter of portrait and history, was born at Venice in 1634, and manifestly an early inclination to painting, became the disciple of Domenico Deforia, from whose instructions he acquired a good manner of handling and colouring, an elegant taste of historical composition, and an expertness in painting portraits with grace and resemblance. Having established, by a variety of performances, his reputation for invention, elegance and spirit, he was invited by the emperor J. leop to his court, and appointed his principal painter. But after remaining five years at Vienna, he entered into the service of the prince palatine, in which he long lived, much respected for his personal accomplishments as well as for his excellence in his profession. Pilkington.

BELLUDGE, in Geography, a tribe of Arabs, inhabiting that part of Persia which lies on the coast of the entrance into the Persian gulf, between Miniau and Cape Jale. They are matters of several tribes, and carry on a considerable trade with Baffora, and even venture as far as the coasts of India. These Arabs are Soumich, and unity of religious sentiments has occasioned their joining the party of the Afghans in the late revolutions of Persia. Some geographers represent these Belludes as inhabiting all along the Persian coast to the mouth of the Indus, and have described them as a warlike people addicted to piracy. Niebuhr is not able to ascertain whether they are to be considered as independent, or contributory to Persia. He thinks it probable, however, that they acknowledge no sovereign authority but that of their own sheiks.

BELLUGA, in Ichthyology. See BELUGA.

BELULLA Bos, a name given by Paulus Jovinus to that species of RAJA called by the old Greek and Latin writers BOM BOMNUS; the same kind which Limonium, and other later naturalists, name specifically OXYRINCHUS.

BELUNESE, in Geography, a small mountainous territory of Italy, but rich in iron mines, forms a part of the marquisate of Trevillo, and belongs to the republic of Venice. It is bounded on the north by the Cadorn and part of Pedia, on the east by a large forest, which separates it from Friuly, on the south by the Trevilian and Peltrin, and on the west by the bifertre of Trent.

BELUNO, the capital of the Bellunese, and see of a bishop, suffragan of the archbishop of Udine, seated on the Pavia, between the town Cadoro and Trevillo; 43 miles N. of Venice, and 40 E. of Trent. N. lat. 46° 10'. E. long. 15° 17'.

BELLY, in a general sense, denotes the whole abdomen, or that region of the body contained between the septum transversum, the hypochondria, and pectoral.

Belly is also used, in a more confined sense, for the intestines alone, as containing the faces. In this sense we speak of the bowels or colic of the belly, &c.

Belly is also sometimes used for a pregnant woman. In this sense we are to understand the phrase among Civil Lawyers, to put the belly in possession of an estate.

Belly is also used in speaking of the bodies of animals; is synonymous with abdomen, and may be comparatively said. It is variously characterized, according to their food and habits. In those which feed on vegetables, it is in general capacious, and hanging low; in the carnivorous, light, and drawn up at the flanks. In a horse, a barrel-shaped or cylindrical belly is most admired; if hanging low, he is said to be cow-bellied; if two much contracted, he is said to be stuck up at the flanks. Gras, too much water, broken wind, and in mares the gravid uterus, occasion the belly to relax and become pendulous; dry food, as oats, beans, and hay, &c. and also acute pain, contract the volume of the belly. The free moving rumination animals, as oxen, &c. have the belly the most capacious and pendulous of all quadrupeds. This increased volume of the intestines and stomach appears to be designed for the purpose of enlarging the surface for digestion and chylogization, and extracting more completely all the nutritious particles, so that a lesser quantity of food will suffice; this circumstance is particularly remarkable in the sheep, which can fatten on the shortest grass, and almost barren glebe.

In the abdomen of the horse, and other graminiferous quadrupeds, whilst its vast surface exposes it more to action upon by changes of weather, as cold, rain, wind, &c. than in the carnivorous animals, to it has appeared to us to be also provided with a thinner and less fatty membrane, or mesentery, to cover the intestines from their influence. Hence appears
appears to be a cause for the frequent indigestions in these animals, often speedily terminating in death, to which their capacity also greatly contributes by receiving a large quantity of food at once. See the article Gastroenteritis.

The abdomen of the horse and ox, and other quadrupeds of this description, from its small size, figures below the pinnia or knuckle, which occurs above the third of the hoof, to be mostly overlooked or taken for some other part; the pinnia or knuckle being the real termination of the thigh in these animals.

In the horse, the volume of the abdomen is formed by the vast magnitude and length of the intestines, and a four-footed animal of great stature; in the cow, on the contrary, the swelling base of the abdomen is occasioned by four large cervices, and the intestinal canal is proportionably small and short. The sheep with four stomachs possesses a vast length of intestine.

The abdomen, in Anatomy, denotes the body thence as contributing not from the two extremities, or terminal. From the condition of this, muscles are divided into rectus, or Pallas, and oblique, or donaldus, and giganteum, or donaldus.

Pall Trauf. N. 158.

Low will have the muscles to be digital, or subdivided, in which he is incessant by Hefman and others.

Belly named, a name given in America to a species of the Jatrophaceae.

Belly, Dru. m., center de plus, is used by some Astrologers to denote the point in a planet's orbit, where it has its greatest latitude, or is distant but distant from the ecliptic; more frequently called its limit.

BELMONT, in Geography, a town of France, in the department of Seine, a chief place of a canton, in the district of Rouen, 14 miles northeast of Rouen. The town contains 175, and the canton 72, inhabitants; the territory includes 937 hectares and 980 acres. — Also, a town of France, in the department of the Aveyron, and chief place of a canton, in the district of St. Africa, nine leagues east of Alby. The town contains 5,703 inhabitants; the territory includes 220,000 hectares and 50,000 acres.

BELMONT, a town of Italy, in the kingdom of Naples, and province of Calabria, Cita, having a castle on an eminence near the sea, 11 miles WSW of Calabria. N. lat. 37° 20'; E. long. 16° 53'. — Also, a small town of Portugal, in the province of Beira, and jurisdiction of Correia do Corte and Brancas, containing about 11,490 inhabitants, two countries, and a district of two parishes.

BELON, or Belon, in Ancient Geography. See BeLON.

BELOR, a name given by some to a horse, otherwise called Winderus.

BELONGY, Belangor, a kind of divination by means of arrows, practised in the East, but not among the Arabsians, among whom it continued till Mahometanism prevailed, which latterly banished it. The word is from the Greek or Latin forms of the word, and belongs to the place of the place, which is a signal hill, being within the borders, or the place where the sand was collected. In ancient arrows were kept in the temple of the gods. Another way was to have the arrows put up on one of which was written, 'Mephisto I am armed me,' on another, 'Mephisto I am armed me,' and on the third, nothing at all. These were put into a water, out of which they drew one of the three at random; if it happened to be that with the first inscription, the thing they considered about was to be done; if it was the second, that said the second inscription, it was let alone; and if it proved to be that without inscription, there was no more to be done. These divining arrows were generally consulted before any thing of moment was made taking; when a man was about to marry, or to go a journey, or to the like.

Belongy is an ancient practice, and probably that which the Pahlavi nations, chap. xx, ver. 21. At least St. Jerome marks this, and above, that the practice was frequent among the Advocates and Babylonians. Something like it is also practised in China, chap. iv. only the arrows had no inscription and were dipped in a vessel filled with water, which is rather a habit than by divination. Certain, as well as St. Jerome, containing is the two together, and that they pretended to read the future, Chaldeans, and Scythians, to whom they were given, and to the Romans, with the Tacitus observes, made use of belonging.
which many people conclude, though very unjustly, that it cannot be a wholesome food.

All the upper part of the back and head of this fish is of a beautiful green colour: faces and belly silver. The number of rays in the dorsal fin are about sixteen; pectoral thirteen; ventral eight; anal twenty-two; and in the tail twenty-two; but these are liable to vary in number, as in other fishes.

BELOW, or Belan, in Geography, a river of England, which runs into the Eden, 2 miles north of Kirby-St Stephen, in the county of Westmoreland.

BELZERO. See Belo-Ozero.

BELERG, a mountain of Switzerland, about 7 or 8 miles from Bern, being part of the chain of the Alps; the fronts of which are full of different species of chemists, ophides, globidicis, sphalidicis, and other similar perforations.

BELFICH, a town of France, in the department of the Ande, and chief place of a canton, in the district of Callemandry, 32 miles south-west of Callemandry. The place contains 2081, and the canton 5318 inhabitants; the territory includes 140 kilometres and 12 communes. N. lat. 43° 12'. E. long. 5° 39'.

BELPRE, a small town and small settlement of America, in the territory north-west of the Ohio, on the north-west bank of the Ohio river, between the Bockhocking and Muskingum rivers, and opp. site the mouth of the little Kanahaw; about 14 miles below Marietta, and 480 miles S.W. by W from Philadelphia.

BELSHAZZAR, in Scripture History. See BABYLONIA.

BELSUN, in Ancient Geography, a town of Hapsamn Tarragonensis, in the country of the Celtiberians. Proeminy.

BELSUNCE, Henry-Francis-Xavier de, in Biography, denounced, by way of honourable disdination, "the good bishop of Marfelles," was the son of the marquis of Belfonce, a nobleman of Guener. After quitting the society of the Jesuits, into which he first entered, he was in 1709 nominated to the bishopric of Marfelles; where he distinguished himself by his fortitude and charity, during the dreadful plague which afflicted that city in 1720 and 1721.

Such was the effect produced by his attention and liberality on occasion of this calamity, such the attachment cemented between him and his diocesans, by their gratitude and his own sympathy, that he declined accepting the bishopric of Lyon, to which he was annexed a pendant and a dukedom, which was offered to him by the king in 1723. He died in 1755. Now, D.M. Hilt.

BELT, Baltheus, and among the ancient and middle ages writers, zeno, cinugam, remumiam, finia, or finia, and holidelas, in Armour, a kind of military girdle, in which a sword or some other weapon is commonly hung.

That the belt, or girdle, formed a material part of the Hebrew armour, may be gathered from the expressions frequently repeated in the sacred Scriptures. The Almighty girded himself, imported not only his giving notable displays of power, but his readiness to act, and his girding others expressed the ability he had bestowed upon them to perform magnificent exploits.

The belts of the Hebrew soldiers, with which they girded on their arms, went not about their shoulders but their loins, and were supposed to strengthen them. (See Neh. iv. 18. Ezek. xxiii. 36.) They were generally valuable, especially those of commanders, and were sometimes given as rewards to soldiers. Jonathan presented his to David (1 Sam. xviii. 4.) and Joab tells the priest, who had seen Absalom hanging from the tree, that if he had smitten him to the ground, he would have given him ten shekels of silver and a girdle.

The Greeks called it -chevron, or cheiros, and they thought it so essential to a warrior, that cheiros became a general term for clothing themselves in armour. Whence Agamemnon is decribed by Homer

"-μη ęs σαρκα, δὺ διοικέσθαι αυτόν;"

and which no doubt occasioned Pausanius to suppose that cheiros had a reference to the whole armour. So Herodotus, relating the flight of Xeres to Athens, describes him, when arrived at Abdera, and believing himself free from danger,

νυν οὐ κατώ, ἵνα διαφελιτη αυτοῦ.

(Urania. cxx.)

Among the Greeks, the belt was worn very differently from the manner already described, and reached even to the thigh, whence Homer's hero, (Odyss. i.)

"-δοσε μου ἄρειν ἐπέσπερ οὖς μεγάς,"

and Virgil's Aeneas (l. x. 186.)

-οὗτος ἀσθημα.

Enipit a femore.

Foot soldiers, we are told, wore their swords on the left; horsemen, on the right side. Josephus, describing the downfall of Jerusalem (l. iii.), expressly mentions horsemen with their swords on the right. But whether this was constantly the case, or frequently varied, as Lippius has observed of the Roman sword, cannot easily be determined.

Herodotus, mentioning the military habits of the Persians, says, they had daggers suspended to the right thigh by a belt.

Riger has given a bull of Scipio, copied by Montfaucon (vol. iv. pl. vii. f. 4.), which has an embroidered belt hanging from the right side; while a soldier on the arch of Conftantine is represented in scale armour, with a belt suspended from the left shoulder. Montfaucon, vol. iv. pl. xx. f. 2.

In our own country, like those of ancient times, it was frequently ornamented in the richest style; and it is worthy of observation, that in some of the most magnificent illuminations of our ancient manuscripts, even in the same picture, the sword is represented as indiscriminately belted on the right side or the left. In later ages, the belt was given to a person when he was raised to knighthood; whence it has also been used as a badge of the knightly order.

Belt is also a denomination applied to a sort of bandages in use among surgeons. &c. Thus we meet with quicksilver belts, used for the itch. A later writer describes a belt for keeping the belly right, and discharging the water in the operation of tapping. Medic. Ed. Edinb. tom. i. p. 218.

BELT, or BARTIS, in Ecclesiastical Writers of the Middle Age, denotes a sort of girding of beads.

Belt is also a frequent elicafe in sheep, cured by cutting their tails off, and lying the fore bare; then causing mould on it, and applying tar and groof-grease.

BELTEIN, in Mythology, a superstitious custom, formerly observed in Scotland and Ireland; and according to Dr. Ledwich, on the authority of Wurmius, in Scandinavia. Dr. O'Brien, in his Irish Dictionary, explains it ignis Beli Dei Affociati; and mentions, that on the first of May the Druids were used to light large fires on the summits of hills, into which they drove four-footed beasts, uling at the same time certain ceremonies, to expiate the sins of the peopie. This pagan ceremony of lighting these fires in honour of Belus, or the sun, gave its name to the month of May, which is called Beltane, and May-day la Bealtine. On this day all the inhabitants of Ireland quenched their fires, and kindled them again out of some part of the faced fire. That celebrated Irish antiquarian, general Vallancey, infers from the name of this custom, that it was derived from the Persians, Scythians, or Phcenicians, by whom the sun was worshipped under the same name of Belus, or Bel, and on the tops of hills also, as appears from the high places mentioned in scripture.
scripture. In Gaul also there are traces of the same sup- 
ported deity being worshipped under the name Belinus. The 
Irish still preserve the custom; and to this day in many 
places fires are lighted on the first of May in the milking 
yards, when the men, women, and children pass through or 
leap over, and the cattle are driven through the flames of 
the burning straw. In the western isles of Scotland, Mr. 
Martin found a like ceremony called by the same name; and 
Mr. Pennant thus precisely describes it. "It is a kind of 
rural festival, performed by the herdsmen of every village 
on the first of May. They cut a square trench on the 
ground, leaving a turf in the middle; on that they make a 
fire of wood, on which they dress a large cauldron of eggs, 
butter, oatmeal, and milk; and bring, besides the ingredi- 
ents of the cauldron, plenty of beer and whisky; for each of 
the company must contribute something. The rites begin 
with spilling some of the cauldron on the ground by way of 
libation: on that every one takes a cake of oatmeal, upon 
which are raised nine square knots, each dedicated to some 
particular being, the supposéd protector of their flocks and 
herds, or to some particular animal the real destroyer of 
them. Each person then turns his face to the fire, breaks 
off a knot, and slinging it over his shoulder, says, This I 
give to thee, quarter thou my bread; this to thee, quarter 
my flesh; and so on. After that, they use the same 
ceremony to the noxious animals. This I give to thee, O fox! 
quarter thou my lands; this to thee, O barded crow! this to thee, 
O eagle! When the ceremony is over, they dine on the cauld- 
ron; and after the fast is finished, what is left is hid by two 
persons designated for the purpose; but on the next Sunday 
they reassemble, and finish the relics of the fest entertainment." 
That fire was adored in Ireland, is sufficiently 
proved from this celebrated festival, independently of other 
circumstances; but whether it can be urged in proof of the 
colonization of Ireland by the southern Scythians or Per- 
fins is not equally clear. Dr. Ledwich says, that this fire 
was adored by the Celts and Northern Scythians, and mentions 
from Worsinim the manner of kindling it. On the other 
hand, the name bears a striking resemblance to that of the 
Aryan deity; and the early naval expeditions of the Phoenici- 
ans render it being communicated by them less improbable. 
The writer of this article has not, however, yet met with 
any account of a similar practice amongst the nations in the 
south of Africa, or with any attempt to explain the name 
from those languages which are undoubtedly of Celtic 
origin. The circumstance, indeed, of all languages having had 
one common source, lends the force of those arguments 
which are derived from a resemblance in words denoting the 
same thing; and yet great discreet is laid on such resemblance 
in the arguments for the Phoenician colonization of Ireland. 
Collectanea de rebus Hibernicis pellium. Pennant's Tour in 
Antiquities of Ireland. See Bellus.

BELTS. In Geography and Navigation, denote certain 
flags near the Sound, through which ships pass from the Baltic to 
the German ocean. They belong to the kingdom of Denmark, 
which exacts a toll, varying in its amount, and in some 
circumstances attending the collection of it, from all ships that pass 
through them as well as the Sound. They are divided into the greater and the lesser. The greater belt forms a 
communication between the Scaggeck or Cattegat sea and 
the Baltic, separating the island of Zealand and Fynen. The 
lesser or little belt forms a communication between the 
Cattegat and Baltic, and separates the isle of Fynen from the 
continent. The passage from Aflens to Armar Sound, 
in the duchy of Schleswig, across the little belt, is 9 miles.

BELTURBET, a market and post town of Ireland, 
in the county of Cavan, situate on the river Erne, 3 St. 
Irish miles north-west of Dublin. It has a navigation 
through Lough Erne to Belfeck, within three miles 
of Ballyferran, where it is interrupted by considerable falls. 
The navigation from Lough Erne is open to the town, 
with water enough in winter, and by reducing a few flats 
might be made completely so in all seasons. No place 
indeed can be better situated for trade or improvement. 
The beautiful expansion of water and picturesque views are 
highly engaging, and the land is a sound limestone. Yet 
the market is indifferently supplied, which may in great measure 
be attributed to the custom of being taken in kind, without 
any lawful standard or measure, so that it is more advantageous 
for the buyers and sellers to go to other markets. These 
culms are individual property, and free for 100, per annum.

The town was regularly divided into compartments, 
term'd homesteads; each of which contains 56 square 
yards, to which is annexed a proportionate quantity of 
land. Every household has also a right to pasture on 
an extensive common belonging to the town, which was 
given by the Lamphoun family, to which it formerly belonged, 
and which seems to have spared no expense for its improvement. 
Another grant of two hundred acres has become the 
property of the burgesses, who divided it, and have 
transmitted it down in their respective families. There are 
fine meadows, especially the one lately erected on the post 
now belonging to lord Farnham; but in general they are mean 
and unhealthy. There are an excellent flour-mill, a brewery, 
distillery, and malt-houses in the town; and some 
itute is brought to market, but few sold. Cultivation is 
improved in the neighbourhood, but is yet very defective. The 
manors of affairs are unlike, and many; through there is good 
limestone, and much of the soil consists of deep clays which 
could be so well reclaimed with humus; yet this is never used, 
but kept by the lake to the county of Farnham. In the 
church-yard is the vestige of a great fortification, including 
an extensive plot of ground, the bastions and salient angles 
of which are yet perfect; they were admirably planned and

full, sometimes dry. M. Azouz rather imagined the spots 
to be protuberances of the belts. Phil. Trans. Sc. 1708. 
Vol. 24. p. 1. 15. But other astronomers take the spots, which are transparent and movable, for 
the shadows of Jupiter's satellites. The belts of Jupiter 
were first observed, and described by Huygens in his sys. 
Satur. p. 7. See Jupiter.

Coffini also speaks of belts of Saturn: being three dark, 
straight, parallel bands, or fusiuni on the orb of that planet. 
Saturn's belts do not appear to be inherent on his globe, as 
those of Jupiter's are; but rather to be large dark rings at 
a distance from the planet, and surrounding his body. Some 
then imagine them to be clouds in his atmosphere. The middle- 
most seems to be the shadow of Saturn's ring. Phil. Acad. 
1715. See Saturn.
of great strength. Belturbet was a borough town, and, previous to the union, sent two members to parliament.

BELTZ, or Bell, a pataline of that part of Poland which was formerly called Little or Red Russia, and which included three districts, viz. Belk, Horodla, and Hrabowice. Its capital, bearing the same name, is a large town, nestled among marshes in the confines of Volhynia. N. lat. 50° 15', E. long. 23° 50'.

BELITZ, a town of Croatia, 12 miles S. S. W. of Varna.

BELVEDERE, or Belvédère, a town of European Turkey, and capital of a province of the same name, in the Morea, which province lies on the western coast, and is the richest and most fertile in the Morea. From this province the ruins called "belvederes," derive their name. The town lies 20 miles south of Chairentza. N. lat. 35° 3', E. long. 22° 2'.

Belvedere, in Architecture. See Belvidere.

BELVIDERE, in Geography, a town of France, and chief place of a canton, in the department of the Dordogne, and the district of Sarlat, 91 leagues S. E. of Perigueux. The place contains 2000, and the canton 7587 inhabitants, the territory includes 147½ square miles, and 15 communes. N. lat. 44° 30', E. long. 0° 52'.

BELUGA, in Zoology, the name of Delphinus Leucas in Pennant's Quadrupeds.

Beluga, in Natural History, the name of a calculated or lone found in the beluga fish. This fish is found in both fresh, but more frequently in the same; and in those of all ages and sizes. It occurs, however, but seldom; whence it is inferred, that these fishes are not a natural part of the fish, but mere morbid concretions, like the peculiar stones in the animals which produce them, or like the stone in human bladders. It is of various shapes and sizes; but most usual figure is either globular or oval. It is of a yellowish-white colour, and of a smooth and naturally polished surface, and in size it is between a pigeon's egg and that of a goose. It is usually compact, pendent, and solid, not friable, but requiring a strong blow to break it; however, it yields easily to the saw, which dissects its internal structure, that is naturally, very elegant and regular. It consists of several concentric coats, adhering firmly to one another, and form 8 about a nucleus, which generally appears to be some heterogeneous substance. It d green from all other stones of the same kind in its radiated structure, as is composed of a number of regular and even rings proceeding from the centre to the circumference, and representing, both in colour and form, the staves of the "terra soliata tartari," or the flattish pinnacles of antimony. If the stone be scraped to powder and sprinkled upon a hot iron, it gives a faint silver fmall, and calcium into a light, insipid, greyish earth. The people about the Volga hold it in high estimation, and ascribe to it great virtues. They say, it promotes delivery; and they give it in cases of the stone, and disorders of the urinary parts, in doses of 10 grains to a dram. Phil. Trans. vol. lxi. p. 2. n. 4.

BELVIDERE, or Belvédère, in Architecture. This word meaning beautiful view is used in Italy, to denote those edifices built for the purpose of enjoying a fine prospect; these are of two kinds, either detached buildings, or little cupolas (or, to use the expressive English term, look-outs) raised on the tops of houses which terminate them ornamentally, and where one may enjoy the freshness of the evening and the beauties of nature. Almost all the houses in Rome have belvederes of the last kind, the others generally belong to the palaces and pleasure grounds of the great. The most celebrated and remarkable of all is the Belvedere of the Vatican. This large edifice was originally built by Bramante, detached from the pontifical palace, to which it has since been united by two long galleries. It commands the view of the rich campagna, which surrounds the town on this side; the chain of the Appennines forms the magnificent distance of the picture, while the foreground is occupied by the city itself, which is seen in its whole extent. It is from thence that one may fly with Martial: "Fince legem dominus videre muntus."

Et totum hicet ultimum Remanni."

Belvedere are common in France; they are generally single buildings open to the air, or enclosed with doors and windows. They are, however, sometimes composed of various apartments, verandas, balconies, cabinets, &c. Such is the Belvedere in the menagerie of Scans. When, however, these buildings are at a considerable distance from the mansion, and contain several apartments for the purpose of enjoyment, they are called Triumoves.

In England, though the name of Belvedere is not used, it may be properly applied to many of our garden buildings. The old mansions were very commonly gloomy both in situation and in construction, but they generally possessed a summer-house, which was built in an elevated and agreeable part of the garden, where in the most genial months of the year the family might enjoy the air, the prospect, and the social pleasures, without the ceremony of the drawing-room. In our modern villas the beauties of situation are consulted, and every idea of gloom is banished by the long windows, the French doors, and the wide extended lawn; the sublunial summer-house is, therefore, unnecessary; but of the temples, cottages, objects which adorn the modern grounds, while some are merely the ornaments of the landscape, others very exactly answer the description of the Belvedere.

Belvidere, or Belvedere, in Botany. See Scoparia.

Belvidere, in Geography, a new township of America, in Franklin county, and state of Vermont.—Also, a village in New Jersey, in the Sussex county, on the Delaware river, and at the mouth of Pequid river, 11 miles north of Easton, in Pennsylvania.

BELVIS, a small town of Spain, in Estremadura, with a castle, seated between two mountains.

Belulcum, a surgical instrument of various figures, contrived for extracting darts, arrows, or the like from wounds. Hence also the denomination belulcum; quasi biderac sanguinis.

BELUNUM, in Ancient Geography, a town of Italy, in Rhezia, and the country of the Veneti, now Beluno.

Belur, in Geography, the general name given to the Alpine region, which divides the southern parts of the ancient Scythia, or Great Buccharia, from Little Buccharia, lying in about N. lat. 37°, and E. long. 71°, between Ketlin to the north, and Katan to the south, and Badakhan in Great Buccharia on the west, and Balfistan, or Little Thibet on the south-east. Stahrhelen has introduced a town of the same name into his map, but its existence is dubious. Rennell places it at the foot of the mountain, in N. lat. 37°, and E. long. 71°. He has also marked a lake near it, from whence flows the Amu, which, after its junction with several others, proceeds to Badakhan.

Belur Teg, denoting, in the Mongol language, "the dark or cloudy mountains," part of that ridge of mountains which, in a nearly meridional course, terminates Great Buccharia on the east, and divides it from Little Buccharia. These mountains are covered with perpetual snow. They form a chain, supposed to be the ancient Imaus, which proceeds nearly north and south, and is continued by the mountains of Aakor Alak Oola, on the north of Little Buccharia, which join the Bogdo, and on the south is more intimately connected with the Hindoo Koh than with the northern ridges of Thibet. Those who live at the foot of these mountains gather a great quantity of gold and silver dust in the spring,
bring, which is brought down by torrents when the snow melts.

Belus, in Etymology, a species of Papilio, that inhabits Britain. The wings are greenish; inner margin of the posterior pair rather pale; beneath brown, with red lunar marks. Fabricius and Jabolinsky.

Belus, in Ancient Geography, a town of Spain, situated near the column of Hercules. Steph. Byz. This was probably the same with Belo or Belon.

Belus, now Kurdistan a river of Persisicia, which flowed at the distance of two baths south from Prolemais. It had its source in the mount Carmel, about 4 miles to the east of the Kishon, in the lake called by Pony Cendevia. The bed of this river and its vicinity was peculiarly excellent, according to Strabo, for the manufacture of glasses, and here, according to Pliny, the manufacture of glass was first discovered.

Belus, in Ancient History and Mythology, is supposed by some to have been the Pulp of Scripture; and the founder of the Assyrian monarchy; and they add, that he left his kingdom to his son Nebu, or Tshath-Pilefer, who reigned over the city of Babylon. Others conceive Belus to have been the Nomad of Scripture, and more ancient than the Assyrian kingdom. (See Assyria and Babylon.) The tower of Belus was afterwards used by the Chaldeans as an astronomical observatory; and it is said, that Belus told the priests the study of astronomy, in order to encourage that vocation in astrological predictions, which he knew how to apply to political purposes. Hence, as Belus was honored with a place among the divinities, have traced the origin of those fables that are found concerning him in the Grecian mythology, to this circumstance.

Belus, considered as the founder of the Assyrian and Babylonian empires, became the principal object of veneration and worship among the later Babylonians, Persians, and others, over whom the successors of his family exercised the dominion he had founded. According to one story, a temple was erected to him in the city of Babylon, and also a tower; though it is not improbable, that the honour of this temple and tower was meant to be divided between him and the true God. This building (see Babylon) consisted of eight towers raised above one another; and in the apartments were placed a magnificent bed, with a golden table near it, but without any image; nor was any priest suffered to be here in the night, except a particular woman, who, as the priests reported, was preferred by the god to all others. In this place, according to their account, he used to come and repel himself, so that they must have revered him as the Supreme God, who either could not be represented, or not bear the representation in them of attempting his solemn place. Beneath this there was another temple, in which was a gigantic image of Jupiter or Bel, made of gold; gold, with a table and a throne of the same metal. The Jupiter, supposed to be the great Pulp, or Belus, by some inscribed below the ground, and inscribed in gold, seemed to have been, that Belus, or Bel, had placed the image of himself beneath him, and in the altar the god of heaven. The latter was at least 50 feet high, and 40 feet in diameter. Both temples were placed on high terraces, and the rooms below were approached by four stories of stairs. Some were stipulated, that the Babylonian altar was without doors, except the im, which was closed by a golden plate, and was the general object of veneration, and the image of Belus used perhaps for a pinnacle; and that of Bel was certainly, and another much larger: nor the tower were facilitated

none but the king and his sons.

Belus, in Geography, a town of Spain, situated near the column of Hercules. Steph. Byz. This was probably the same with Belo or Belon.

tongue inflamed, and five cleft; lip advanced, mouth involved. See Vespa. 

BEMBO, Peter, Cardinal, in Biography, an eminent ref- 

fessor of literature, was the son of Bernardo Benbo, a Venetian nobleman, and born at Venice in 1470. Having studied Latin and polite literature, in 

his early youth, under Urticciu, he went to Maffia in 1492, to pursue the study of the Greek language, under Constanine Laecariu. At Padua, whither he removed in 1495, he received instructions in philosophy from 

Nicholas Leonico Tomeo. Upon his father’s settlement at Ferrara in 1498, he had an opportunity of forming an intimate friendship with Leoniceno, Tebaldeo. Sadoleto, 

and Hercules Struzzi, and he soon afterwards began to dili- 

guishes himself as a writer. His "Azolani," which were 

difficulties on love, written in the Italian language, and so 

named from the castle of Azoli, where they were composed, 

became very popular throughout Italy. At this time he 

was also one of the principal ornaments of the academy, 

founded by Aldus Manutiu in his native city. In 1512 he 

visited Rome, and was well received by pope Julius II. and 

by his successor Leo X. He was appointed secretary, with an 

ample salary. Although, in conformity to the licentiousness 

of the papal court at this time, he kept a mistress, by whom 

he had three children, he discharged the duties of his office, 

to the pope’s satisfaction, and was employed by him in 

various important embassies. In 1520, he removed to Padua, 

for the recovery of his health, where, upon the death of the 

pope, he fixed his residence, passing a tranquil life in the 

profession of his studies, and in the conversation of men of 

letters. To his house, which was richly furnished with books 

and MSS, a select collection of medals and antiquities, 

and a botanical garden, men of science resorted as to a literary 

academy. In 1529, he was nominated to the dignity of 

cardinal by pope Paul III. which with some reluctance he 

accepted, and he then removed to Rome. He was previously 

ordained priest; and, it is said, that he altogether changed his 

mode of life, and sedulously devoted himself to the duties of 

his ecclesiastical functions. Although he was nominated to the 

bishops’ of Gubbio in 1541, and in 1544 translated to that 

of Bergamo, he retired at Rome, and was much honoured 

by the pope, as well as respected by persons of the first cha-

racter in the court. He died Jan. 18, 1547, and was buried 

in the Dominican church, called St. Maria Alla Minerva. 

As a writer of Italian verse, cardinal Bembo formed himself 

upon the model of Petrarch, and contributed to reform and 

polish the poetry of his own country. His prose compositions 

are written with elegance and purity of expression, but 

without any distinguisning traces of genius. In his Latin 

style, he was "Ciceronian," to the extreme of affectation; 

and on this account he was cenured and ridiculed for apply-

ing the terms "heros" to Chrill, and "dea" to the Virgin 

Mary; and for using "perluatio" for faith, and for denot-

ing Leo’s election by "dearan immortum beneficia." 

Like many others of the Italian literati of that age, he seems 

to have thought lightly of his religious creed; and to have 

been more afraid of transgressing with regard to his Latinity 

than with regard to the decorum which religion required. 

To this purpose, he diffused a friend from reading St. Paul’s 

epistles, left he should injure his style; and it is said that he 

would never read the briefs or breviary for fear of corrupting 

his own Latinity. Nevertheless his own epistles have 

been charged with gross faults, and even follies. Some 

compositions of his early days were licentious and obscene. 

His "History of Venice," written in classical Latin, in 12 

books, was undertaken in 1530, by the order of the council 

of ten, and is more admired for elegance of diction than for 

proficiency and accuracy. His principal works are, "Epis-

tola, nomine Leonis pont. Max. lib. xvi." Venet. 1536; 

comprehending his poetical verses, in one volume, Rom. and 

Venet. 1548; "Le Profe," held in high estimation by the 

Italians, in allusion to which Apollolo Zeno says, that "Bembo was the first who explained to his countrymen the 

mechanism and construction of their native language.” "Hi-

toria Rerum Venetarum, lib. xii." Venet. 1551. All his 

works, both in Italian and Latin, were collected and pub-

BEMBRIDGE POINT, in Geography, lies at the eastern 

extremity of the isle of Wight, in N. lat. 50° 40' 15", and 

W. long. 1° 4' 45", and is well known to fishermen as a ledge 

that runs more than two miles into the sea. E. N. E. 

BEMI-CURINI, in Botany, See Justice. 

BEMELS, in Geography, a town of the Netherlands, 

in the duchy of Luxemburg, seated on the east side of the 

Moelle; 2 miles N. E. of Graven Macheren. 

BEMICARY Point and Bay, are situate between Dry 

and Meik river, about N. W. by W. from the port of 

Portland, the southern extremity of the island of Jamaica. 

The point or eastern limit of the bay is in N. lat. 17° 55' 

and W. long. 72° 17'. 

BEMILCUIU, in Mythology, a surname of Jupiter, re-

presented young and bearded. 

BEMISTER, or BEMINSTER, in Geography, a town 

of considerable antiquity in the county of Dorset, England. 

It is seated on the small river Birt, which rises near the town, 

and running southward falls into the British channel at Bre-

port harbour. This manor, and two others connected with it, 

belong to two of the prebends of Salisbury cathedral. 

Though of remote origin, Bemister does not contain any 

particular object of antiquity, and its chapel, a hand-some 

large pile of building, is dependent on the parish church of 

Netherbury, which is nearly two miles distant. The town 

is large and respectable, having many manufacturers settled 

in it, and most of its inhabitants employed in making sail-

cloth, locks, copper goods, leather, &c.; and some of these 

trades are greatly facilitated by the water of the river Birt, 

and the machinery operated on by it. Bemister has suffered 

repeatedly and materially by fire, and the destructive 

sword of civil war. These two were united on the 14th of April 

1644, when prince Maurice was quartered in the town, but 

forced to quit it on that day, as the enemy had fired it in 

five places. From the report of a person who visited it soon 

after, we are informed it was "the pitifullest spectacle that 

man can behold, hardly a house left not consumed by fire. 

There were fourteen and four dwelling-houses, besides 

barns and fléakes burnt," and the lofs sustained was estimated 

at above twenty-one thousand pounds. The inhabitants 

soon afterwards received from the parliament 2000l. with 

which, and other sums, they rebuilt the town; but in June 

1664, it was again conflagrated, when the lofs amounted to 

nearly 10,000l. In March 1751, another fire occurred here, 

and in a few hours upwards of fifty dwelling-houses, with 

several barns, stables, outbuildings, &c. were reduced to 

ruins. In spite of these calamitous events, Bemister is now 

a populous and flourishing town, consisting of 337 houses, 

and 2440 inhabitants. Its principal public buildings are 

the chapel, a free school, an alm-noule, and a market-houle. 

The first stands on high ground at the southern side of the 

town, and consists of a body, two aisles, a chancel, a chantry, 

and a high tower. On the western front of the latter are 

some ornamental statues in niches. Within the chapel are 

some handsome monuments to the Strodes, and other families, 

The free-school was founded by Mrs. Frances Tucker, 

in 1684, for the education of twenty of the poor boys of the 

town. The Rev Samuel Hood, father of the lords 

Hood and Bridport, was master of this school in 1777. 

The
The above house was built and originally occupied by Sir John Sanderson, bart.

In this town are one annual fair, a weekly market on Tuesday, and two usual public fairs for cattle, cheese, &c. About a mile and a half south of Berwick is Barnard, an ancient market town belonging to Sir William Osyler, bart. At Barnard, the market town, is a hill of the same name, near the three springs, which are the source of the river Ait, and known in the Holy Bible. Hutchinson's History of Northumberland, vol. iv.

BENNELL, William Vans, in Geography, a printer of the 16th century, was probably active in 1652, and after having been in the service of Sir W. Sackville, visited Rome for the improvement of his taste and knowledge. His colouring is lively and natural, but sometimes including too much to form; however, as such, he was a subject, and others who, though stained by the rivers, or shaded by the banks, were less lively, and touched with spirit. The lights and shadows of the landscapes are executed with judicious detail, and the sky is distinctly clear, warm, and natural. He died in 1703. Pickworth.

BENMAST, R., in Geography, a town of Perufia, in the province of Taranto. 148 m. s. E. of Siracusa.

BEMOL, R. E. de, in Guido's Scale of Majors, implies B flat, the 4th of the key of F natural, and the mollie hexachord.

In early times of compeotition, before transfixed keys were used, i.e., keys different from the authentic and plagal modes, (See Ecclesiastical Modes) the 4th of a major key, defecting, and 5th of a minor key, were understood to be flat, and the 7th, ascending, sharp, without being marked. And though two of the modes are in the key of D minor, and two in F major, which require flat to the clef, and two in E minor and two in G major, each requiring a sharp to the clef, they were left to the divination of the singer, without characters of indication. See Hexachord and Mode.

The Abbe Fevotte, in speaking of these mysteries, must be allowed to have exercised science and ingenuity, yet it is to be feared, that the young student will be more puzzled and perplexed than enlightened by his labours in this article.

BENJ. POSTA, in Geography, a small town of Portugal, in the province of Tinta-Mos, containing about 400 inhabitants.

BENB, BEN, or BENEN, Oil of, is a fine inodorous and neutral fixed oil, procured from the Ben nut. (Glam. W. M. Pl. 6. p. 390. Moretti) the fruit of the Guiana

The oil of Ben is prepared in the Levant; in Egypt, Syria, and also in Italy, by a process of the nut. Goldrake gives the quantity of oil procured to be 150, from about 8 pounds of the nut. The oil is valuable on account of its great purity, and freedom from smell and taste; hence it may be kept for a long time without altering, or becoming in any degree rancid and acridious. On this account it is not disposed to become drying, like many of the other fixed oils. It is used very largely in perfumery as a basis or vehicle in which the art of the perfumer is able to dispense the fine fragrant scent of various delicate flowers, that do not of themselves retain a sufficient hint in which to fix their tincture. Thus a great proportion of the perfume of the rose are prepared of oil of Ben, and the finest flowers which are probably a very scarce quantity of the oil only can be separated from this oil by distillation. This perfumed oil we have described in another article. 

The medicinal utility of this oil as well as its other qualities make it one of the most useful substances for the perfumery of drugs and essences, and the most suitable for the purpose of pharmacy, were it sufficiently common. It is actually employed for this purpose in many parts of Italy.

Ben Duth, in Geography, a mountain of Ireland, sits partly in King's county, and partly in the county of Tipperary: 16 miles west of Kilkenny.

Ben Cruachan, a mountain of Scotland, in Arrickshire, the elevation of which is 3,500 feet above the sea.

Ben Ledi, a mountain of Ireland, in the county of Galway: 4 miles S. W. of Ros.

Ben Lomond, Ben Ledi, Ben Lamond, Ben More, Ben Macdhaidh, S. Garbaloyn Hill.

Ben Nevis, or Ben Vuirachain, a mountain of Scotland, in the Highlands, reckoned to be the highest mountain in Great Britain, being estimated at 4,370 feet above the level of the sea, and yet not much above the summit of the height of Mount Blanc. It is found in the parish of Kilmallie, Invernesshire. This omnipotent mount is never seen by any meteorologist, but Dr. Williams says, that it forms mostly of porphyry, "of a reddish cast, in which the pale rose, the blue, and yellowish white colours are finely blended, and shaded through the body of the stone." Many specimens of green porphyry are also intermixed, with angular specks of white quartz. A red granite also prevails, which contains a vein of lead ore impregnated with silver. On the north side this mountain presents a precipice nearly perpendicular, and of a prodigious height, being by some accounts 1,500 feet. The view from the summit is grand, exhibiting most of the western islands, from the paps of Jura to the hills of Cullen in Skey; and on the east it extends to Ben Lawers in Perthshire, and the river Nevis; and the extent of view is about 80 miles. The upper half of the mountain is almost destitute of vegetation. The summit is flat, with a gentle acclivity. Snow remains in the crevasses throughout the year; but here are no glaciers, nor other magnificent Alpine features. Drumblain, the "Dorfin Brittania," of the old writers, seems to be Ben Nevis, with the high defter moor of Raas, extending 20 miles to the east of that ground. To the north-west of Ben-nevis is the long mountain of Corri-rok, near fort Angullas, over which a military road has been formed in a zigzag direction. Next the foot of this mountain rises the rapid river Spey, and various other streams, all running to the west. Sircolin's Account of Scotland, vol. iii. William's Natural History of the Mineral Kingdom.

Ben Hark, a mountain of Scotland, in the Highlands, on the west of Rothes, elevations 3,725 and 3,511 feet.

See other mountains of Scotland are distinguished by the appellation Ben, in conjunction with some other word.

BENABARRI, or Benacbarri, a valley, and a place of the same name, located among the Pyrenees, in the province of Aragon, in Spain, on the frontier of Catalina.

BENAC, a town of France, in the department of the Ille-et-Vilaine, and chief place of a canton in the district of Redon; 8 leagues S. of Rennes.

BENALL, a populous town of Egypt, between Modern and Asiat, of Moct. Their three places, with Gorg, constitute the chief market of the trade of Upper Egypt.

BENAMARIS, a town of France; in the department of the Meuse, and chief place of a canton in the district of Longeville. 27 leagues E. of Lunselles.

BENAK, a kingdom of Hindoostan, bounded on the north and north-west by Oude, on the south by Bahr, and on the south and west by Allahabad. The district is also 428 square miles, and contained, with its dependencies, 1,776,291 British miles; its soil is fertile, and the
the country populous. The Zemindary of Benares, which
includes all the circars of Gazypour and Chunar, con- 
stituted a part of the dominions of Oude, until the year 1775, 
when its tribute or quit-rent of 24 lacs, fixed in-creased to 45, 
was transferred to the English, on occasion of the cap-
tion of the province to the India Company. This Zem-
indary, lately in the hands of Cheet Singh, occupies the principal 
part of the space between Bahar and Oude, and that only a 
small part of the territory of the latter touches Bahar on the 
north-west. In 1786 the clear revenue of Benares amounted to 
380,000. Almost in every village of this province, 
which is in a very prosperous state, a peron is employed 
for teaching the youth to read and write; and they have a sin- 
gular mode of teaching reading and writing at the same 
time. The boys are collected upon a smooth flat of sand, 
and with a finger or a small reed form the letters there, 
which they pronounce at the same time. As often as the 
space before each scholar is filled up with writing, it is ef-
faced, and prepared for a new leson: thus the expense of 
pens, ink, paper, and even a house is avoided. The educa-
tion at Benares is chieflly instituted for the Brahmins.

Benares, the chief city of the forementioned district, is 
very rich, and the most completely built of any. It occu-
pies the north bank of the Ganges, and is distant from Cal-
cutta by the road, about 460 miles, and by Moorshedabad 
565 miles. Its ancient name was Kali; but there are no 
notices concerning it in the works of the ancient geogra-
phers. If it had existed during the time of the Syracu-
sean ambassadors, Pliny would have noticed it, as he has done 
Methota or Matura, and Chilasara, which lay near the Jumna 
river. The city is about six miles long and four wide, and 
may be viewed in its utmost extent from the tops of the Mi-
narets of the mosque, erected by Aurungzebe, on the Found-
ation of an ancient Hindu temple, and lately repaired by 
Mr. Hofflings. It abounds in costly structures; but Mr. 
Forster, in his "Journey from Bengal to England," says, 
that the irregular and confused manner which has been in-
variably adopted is forming the streets, destroys the effect 
which symmetry and arrangement would have bestowed on a 
city, entitled, from its valuable buildings, to a preference of 
your capital, seen by him in India; and it is also very inju-
rious to the celebrity of the town. At Benares the num-
ber of Europeans is very small; a judge, registrar, collector, 
with a few civil servants, constitute the whole of the com-
pany's establishment there; and a few private merchants and 
planters make up the whole society. Of natives, however, 
the number is great; and many of the bankers are the prin-
cipal creditors of the India Company, and possess immense 
fairtures. The poor in Benares are still more numerous, 
owing to the crowd of pilgrims, who come from all parts 
to visit to sacred places. Mr. Hodges, in his "Travels 
in India," informs us, that in examining one of the temples 
of Benares, he was surprised to find most of the ornamental 
parts of Grecian architecture in a building erected on the 
plains of Hindoosan. Benares has been from time imme-
morial the Athens of India, the refuge of the most 
learned Brahmins, and the fest of both of science and literature.

Here, it is probable, whatever remains of the ancient astro-
nomical knowledge and discoveries of the Brahmins is still 
preserved. M. Bernier (Voy. ii. p. 148.) saw, in the year 
1668, a large hall in this city filled with the works of the 
Indian philosophers, physicians, and poets. Sir Robert 
Chambers has described the gith, prospect, and church 
which he visited in 1772. (See Observatorv.) He has more 
lately discovered in this city the "Surya Siddhanta," on the 
principles of which the whole Indian astronomy is founded. 
Several considerable extracts of this work have been tran-
lated by Samuel Davis, esq. to whom this valuable work 
was communicated. It is composed in the Sanscrit language, 
and promises to be a divine revelation, communicated to 
mankind more than two millions of years ago, towards the 
close of the Sutty or Satya Yuga, the first of the four fabu-
ous ages, into which the Hindoo mythologists divide the 
period during which they suppose the world to have existed. 
It appears from what is already known of this book, that 
indeed the fiction and romance which are blended in 
the account of its origin, it contains a very rational and 
clarificate system of astronomical calculation, and several rules 
and tables, for the calculation of eclipses, &c. which seem 
very much to favour the hypothesis adopted by M. Brilly, 
Dr. Robertson, and others, that affirms a very high anti-
quity to the astronomy of the Brahmins. In the rules con-
tained in this work, is included a system of trigonometry, 
-founded on certain geometrical theorems, with which, 
though unknown to Ptolemy and the Greek geomctricians, 
modern mathematicians are well a quainted. For an ac-
count of the astronomical computations of the Hindoos, 
by Samuel Davis, esq. see Asiatic Researches, vol. ii. p. 225, 
&c. 8vo. and for remarks on the astronomy of the Brahmins, 
and an account of the principles on which the Hindoo 
system of trigonometry is founded, by professor Playfair, 
see Edinb. Transf. vol. ii. p. 135. It appears, however, from 
an elaborate dissertation on the antiquity of the Surya Sidd-
hdanta, by Mr. J. Bentley, published in the Asiatic Researches, 
vol. vi. p. 530, &c. that the system, so eagerly applauded 
and referred to by the above mentioned writers to fuch remote 
antiquity, cannot be of a greater age than 731 years; or 
that it was composed about A. D. 1668.

Notwithstanding the science and literature that have been 
cultivated by the Brahmins at Benares, we discover traces 
of superfluous, and even of inhumanity, in some of their cus-
toms, which, it is hoped, the interference of the court of 
justice, established there in 1785, will gradually restrain 
and reform. As the person of a Brahmin is inviolate, no ato-
ment can expiate the crime of occasioning his death. Hence 
originated a practice, which was formerly frequent at Be-
ares, and which in its effects approaches the nearest to our 
caption, or arrest. The Brahmin, who adopts this expedi-
cnt, in order to procure redres, proceeds, armed with a 
dagger or poison, to the door of his adversary's house, where 
he deliberately sets himself down, and threatens to commit 
suicide, if the offender should attempt to pass or molest 
him. He falls with insensible rigour, to which the other 
party likewise submits, and perseveres in his resolution until satisfaclion is obtained. This practice, calledfitting in "Dharna," is not confined to the male Brahmin only; for 
an instance occurred at Benares in 1789, of a widow's re-
curring to this expedient, in order to obtain, in a litigation 
with her brother-in-law, that justice, which neither the 
award of arbitration nor the decision of the court had granted 
her. Both failed pertinaciously during thirteen days, 
when, worn out with hunger, her antagonist at last yielded 
the contest. Another instance occurred in 1793. An inha-
bitant of a district in the province of Benares, lay in Dherna 
before the house of some Rajpoots, for the purpose of ob-
taining the payment of a debt, or a charitable subsistence, 
to which he had a claim; and in this situation destroyed 
himself by swallowing poison. Some of the relations of the 
deceased retained his corpse for two days before the house of 
the Rajpoots, who were thus compelled to forego taking 
subsistence, in order to induce them to settle the Debt on 
the heirs of the deceased Brahmin. This practice is not spe-
cifically pointed out by the shifter, but depends merely on 
the junctor of usage. Another practice of the Brahmins, 
equally
In miles

aged 1582, secondarily called narrow. The town of them occurred for many years, improved even, Benares in 1788; but the ancient and noble were removed by the timely interpolation of

is rather flat, and measures only about nine miles in transect, diameter. Its soil is sandy and barren; but the quantity of a weed constantly driven on shore, is appropriated to meliorate some portions of the land. In one part of the island is an ancient fort called Elvine Nenam fixtures, and several stone monuments are found in different parts of it. It has a harbour for small fishing vessels, and several fresh water lakes, fringed with fish and fowl.

BENBRICK, a mountain of Scotland, in the county of Perth; 12 miles N. N.W. of Crieff.

BENBALBEN, mountains of Ireland, in the county of Sligo; 7 miles N. of Sligo.

BENBERRY, in Geography, the name of one of those islands of Scotland called the Hebrides. It lies between the isles of N. and S. Uist, from the fall of which it is separated by a narrow channel, nearly dry at low water. This island is rather flat, and measures only about nine miles in transect, diameter. Its soil is sandy and barren; but the quantity of a weed constantly driven on shore, is appropriated to meliorate some portions of the land. In one part of the island is an ancient fort called Elvine Nenam fixtures, and several stone monuments are found in different parts of it. It has a harbour for small fishing vessels, and several fresh water lakes, fringed with fish and fowl.

BENCHEEDUO, See Window.

BENCINGERS, in the Laws of Court, the senior members of the house, who have the government and direction thereof; and out of whom is yearly chosen a treasurer, &c.

BENCOOLEN, in Geography, a sea-port town and fort on the northeastern coast of the island of Sumatra, where the English have a settlement and a factory. This is one of the four English possessions, or governments, to which all the other factories are subordinate; the other three are Madras, Bengal, and Bombay. Bencoolen, which is about 2 miles in compass, is known at sea by a high fielder mountain, called the "Sugar Loaf," and rising 20 miles beyond it in the country. Before the town lies an island, within which the ships usually ride, and with this, the point of Sillekar, extending 2 or 3 leagues southward of it, forms a large and conical bay. A convenient river on its north-westiblshing, the pepper, of which the trade of the town chiefly consists, from the inland country; but it is supplied with a convenience, on account of a dangerous bar at the mouth of the river. It is principally inhabited by natives, who build their houses on piles of planks notched. The English, Pottugese, and Chinese, have each an European quarter. The adjacent country is mountainous and woody, and there are many volcanos in the island. As the town stands upon a morass, the air is loaded with vapours, and the mountains are covered with thick clouds, that produce lightning, thunder, and rain. The climate of Bencoolen has proved more sickly and fatal than that of any of the other British settlements, not only to the English, but to all who have been accustomed to live in a pure air. In 1763, upon the conclusion of Manilla to the Spaniards, and the restoration of Bencoolen to the English, many Chinese merchants, with other
their families, quittd Messiah in order to settle under the English government at this place; but the air of this country proved fatal, that most of those Chinese and their families died soon after their arrival. Many Englishmen have also fallen a sacrifice to the temperature of this climate; and, indeed, few of them arrived until they built a fort on a dry elevated situation, at the distance of about 3 miles from the town. This is called Fort Marlborough," where, during the rage of sickness at Bennekoop, the garrison is sometimes very healthy. Tame buffaloes may here be had in great plenty; but fish and poultry are scarce and dear. The soil is a fertile clay, producing high grass; but near the sea it is a morass. N. Int. 8 49'. E. long. 102. See Sumatra.

BENDA, a town of Persia, in the province of Farsian, 160 miles N. E. of Shiraz.

Bend Dexter, in Heraldry. The bend was a saff worn across the shoulder from the Italian la benda; it is one of the nine ordinaries in heraldry, and occupies one-third part of the field when charged and one-fifth when plain; it consists of two equal lines drawn diagonally from the dexter chief to the sinister base of the shield. This ordinary hath more subdiments or diminutives than any of the others, viz. the bendlet, gorget, entily, and ribbon, none of which diminutives can properly be charged.

Bend Sinjir, denotes lines drawn diagonally from the sinister chief, to the dexter base of the shield; it hath not the same diminutives as those of the bend dexter; but according to some heraldic writers, is subdivided into a saff or scroll which is in breadth half that of the bend sinjir; and a baton, or fife, as Upton and Holme call it, containing half the breadth of the saff. Here, however, arises an objection to the admitting the baton to be a diminutive of the bend, sinjir, or as any part of one of the ordinaries. According to many years practice, the baton doth not touch the extremities of the field, nor the extremities of the quarter where the paternal arms are placed, as all the ordinaries and their diminutives constantly do; but on the contrary, is couped, that is, cut short, and so born as a mark of illegitimacy, and not as an ordinary or charge, or any part of the cost for, although some instances are to be met with of ancient arms, where a baton is passed from the sinister chief to the dexter base, over all; and others, where it passes from corner to corner, over the paternal quarter, and not over the other quarters; yet, in every one of those instances, the baton is used as a mark of bad faith, and not either as an ordinary or charge. Hence, therefore, we may fairly conclude, that the baton is not to be deemed as any part diminutive of the bend, but as a mark of illegitimacy; which mark or baton, when granted by princes to their illegitimate children, may be of metal or fur, or both, but, when granted to any under their degree, must be of colour only.

BENDA, in Architecture. See Fascia.

Benda, Francis, in Biography, concert-maister to the late Frederick II. king of Prussia, from the year 1738 to the time of his death. He was one of the most touching and expressive players on the violin in Europe, during the last century. He was a native of Alt Benacly in Bohemia 1709, and a chorister at Prague and Dresden, till he lost his treble voice. There is a very natural and amusing life of this excellent musician, compiled from his own materials, by M. Hiller of Leipzig, but as we have no room for copies of mere amusements, we must adhere to matter of fact. It was not, till he was dismissed as a musician, that he seriously applied to the fiddle to procure him a subsistence; but he knew not when or under what manner; but remembered that, as soon as he was able, he joined a company of swirling Jews, in playing dances about the country; in which, however, there was a blind Hebrew of the name of Lobeid, who, in his way, was an extraordinary player. He drew a good tone from his instrument, and composed his own pieces, which were wild, but pretty; some of his dances went up to A in allfinio; however, he played them with the utmost purity and accuracy.

The performance of this man excited in Benda so much emulation, that he redoubled his diligence in trying to equal him; and not to be inferior in any part of his trade, he composed dances for his own hand, which were far from easy. He often speaks of his obligation to the old Jew for stimulating him to exceed on the violin.

It has often excited our wonder, that in the principal capitals of Europe, wherever there is a synagogue, we generally found a vocal performer or two, who sung in the Italian manner, and in exquisite table, though the rest of the singing in the service of religion, was to the last degree incoherent, rude, and barbarous. Where it was acquired, or by what kind demon this table was inspired exclusively, is not easy to conjecture; but so it was at Paris, Amsterdam, Milan, Venice, Rome, and Naples; and we have had instances at home of exquisite Hebrew singing in our own country.

After various adventures, our young violinist entered into the band of count Uhslefeld at Vienna, with whom he had frequently the advantage of hearing the famous Francichello, who taught the count, and of playing trios with this great musician and his scholars.

Francichello was the most exquisite performer on the bafe-viol of his time. Geminiani related of him, that in accompanying Nicolini, at Rome, in a cantata composed by Alessandro Scarlatti, for the violoncello, the author, who was at the harpsichord, would not believe that a mortal could play so divinely; but said, that it was an angel who had assumed the figure of Francichello; so far did his performance surpass all that Scarlatti had conceived in composing the cantata, or imagined possible for man to express.

At length, Benda was invited by Quantz, the German flute maister to the late Frederick II. king of Prussia, during the time when he was only prince of Prussia, and refided at Ruppin, before his ascension to the throne.

It was by health, that this prince indulged his passion for music, during the life of his father, the late king, who had forbidden him not only to study and practice music, but to hear it. M. Quantz told us afterwards, that it was the late queen-mother, who at this time encouraged the prince in his favourite amusement, and who engaged musicians for his service; but to necesssary was secrecy in these negotiations, that if the king his father had discovered that he was disobeyed, all these sons of Apollo would have incurred the danger of being hanged. The prince frequently took occasion to meet his musicians a hunting, and had his concerts either in a forest or cavern.

Benda still, in 1772, led the king of Prussia's band at the opera, and at his concerts; and could boast of having had the honour of accompanying his majesty, during the 40 years which he had been in his service, in nearly 50,000 different concerts. What an excellent economist of time must his late Prussian majesty have been; who, though his own maister, could spare two hours every day, when he was not in the field, for music!

When we heard the admirable Benda perform, it was an excellent composition of his own, which he played con for- dando; his hand, he said, wanted force sufficient to play without. The gout had long enfeebled his fingers, and age, perhaps, still more. There were, however, fine remains of a great hand, though he was probably always more remarkable
able for feeling than force. His style was truly military, that scarcely a passage could be found in his writings, which it would not have been in the power of the lowest, the rudest, and the slowest, enthusiast to understand. He always labored to show that the forces which he drew from them were powerful. Thus, he acquired this style of writing and public speaking. It might be of importance to musical students to trace and develop. His style was not that of Tamerlane, Venetian, or of that of the head of any one faction, political, literary, or religious, of which, there is little room here; it was his own and formed from that model which had been exemplified by the most excellent orators and philosophers.

BENDALI, in Geography, a town of Africa lying between the countries of Damar and Wario, the capital of Benga. It is inhabited by the slaves of the sultan of Benga. The people are idle.

BENDALI, a town of Perza in the province of Kerma, 120 miles S. of Sirgan.

BENDAR MALANKA, a town of Hindostan, in the circuit of Rajamurthy, situated between the branches of the river Beal, at their outlet into the ocean, 52 miles S. of Rajamurthy. 50 N. E. of Musubulpan, and 358 miles N. E. of Madras. N. lat. 16° 30'. E. long. 82° 30'.

BENDIK, a mountain of Scotland, in the county of Fife, 7 miles N. of Blair Athol.

BENDER, formerly called Issie, and denoting in the Turkish language a pigstye, a fortified town of European Turkey, in Ebraria, tented on the Desleiter. It is celebrated as the place of retreat and residence of Charles XII. of Sweden, when he put himself under the protection of the Turks after being defeated by the Russians at the battle of Pultowa in 1709; but upon refusing to leave their territory, he was attacked, taken prisoner, and removed to Adramile, where, after a year's confinement, he returned freely to his own dominions. It was besieged by the Russians in 1772, and after a resistance of nearly three months, invested and reduced to Panin, the Russian general; and the capture of the fortress was secured by the reduction of the Forts of Buljak and Oetakoff to the Russian fleet. The loss which Bender, in 1772, suffered from the Russians was remarkable, on account of the desperate defence made by the garrison, the carnage which attended its reduction, and the adoption on the part of the besiegers, of that dreadful instrument of modern warfare, the globe of compulsion. The Russian army, commanded by Grinod Panin, opened their trenches on both sides of the river, the 30th July, after which, a furious cannonade and bombardment were begun from all quarters, and vigorously returned from the town. The garrison and inhabitants defended themselves with the utmost bravery: in sixteen days they made seven sorties, with little advantage, but great loss on both sides, and held out for more than two months with unabated courage, even when the defeat of the main army by the Russian general Romanzow seemed to deprive them of every hope of relief. The besiegers in the mean time pushed forward their lines (See Mine) with industry, particularly one of an improved construction lately invented by a French engineer, and which has been since denominated the globe of compulsion. In this labyrinth of mines, interwoven and included one within another, it was maintained, that a certain quantity of gunpowder would cause a greater explosion, and throw up a greater portion of earth than in any other method. The globe of compulsion being brought to perfection, was charged with the amazing quantity of 1,000 cb. of powder, and the garrison continuing obstinately to refuse every proposal of surrender, count Panin prepared for a general assault to take place on the night of the 27th of Sept. The firing of the mine was to be the signal of attack, and it was hoped, that besides ruining the outworks, it might make a breach in some of the principal walls of the town, and bury the defenders in the ruins. The Russians themselves were impressed with the consequences, as it was not easy to define how far the effects of such an enormous mass of powder might extend, and two troops destined to make the assault in that quarter were stationed at a considerable distance. In fact, the globe of compulsion, which was blown up at 10 o'clock at night, with a most horrid concussion, shook the whole of Feraistan, and amidst the amazement and confusion excited by this dreadful phenomenon, the attack began in three places with great fury. Nothing could restrain the impetuosity of the Russian soldiers, who rushed forward at the main point of assault. The double ditches before the glais were passed and filled up; the double row of palisadoes before the covered way destroyed; the main ditch furmouted, and all the outworks carried in succession. The body of the place could not oppose an effectual resistance to enemies who had already overcome such difficulties; the Russians got over the walls in every quarter, and a new and dreadful contest commenced in the dark, as well among the fortifications, as in the streets, lanes, and palisades, and from the houses. The desperate resistance of the garrison and inhabitants obliged the Russians to set fire to the town, which they did in several places at the same time, but the contest nevertheless continued, amidst the ruins and the blazing houses, for the whole of the night, nor seemed decided, but by the almost total extermination of the Turks. At eight in the morning, the seraskier, with most of those that survived, retired to the citadel, which the flames had already reached. A select body of 1000 cavalry and 500 infantry, attempting to cut their way through the besiegers, were surround and cut off to a man. As for the seraskier, after demanding in vain an honourable capitulation, the fury of the flames, which had now reached every part of the citadel, obliged him to surrender with his followers, as prisoners of war. The fire raged for three days, and could not be restrained till it had consumed the whole city. The total number of prisoners, including the inhabitants of all ages, amounted to 11,739, of whom 5,574 were janizaries and officers, with their commanders, besides the seraskier and two bailoys. The residue of a population of 30,000 souls, of whom the half were fellos, perished in the flame. The Russians found in the place a vast quantity of arms, bombs, grenades, gun-powder, and other military stores, besides above 200 pieces of brais cannon, and 85 mortars. They also took 4 horse-tails, 14 batons of command, and 40 pair of colours.

Bender, hardly recovered from this blow, was again taken, but not till after a long siege, by prince Potemkin, in November 1789. It was, however, restored to Turkey by the subsequent treaty of peace in 1792. Bender is reckoned to contain between 10 and 12,000 inhabitants; and its governor is a bailaw. It is distant 100 miles W. of Otehakov or Oezakov, and as many miles S. E. of Jaffy. N. lat. 47° E. long. 29° 20'.

Bender-Alasaff. See Gombran.

Bender-Congo. See Congo.

Bender-Delam, a town of Perza in the province of Far-filia, on the north coast of the Perzan gulf; 130 miles W. of Schoras.

Bender du Ser, a town of Perza in the province of Kerma, 160 miles S. of Sirgan.

Bender Ibrahim, a town of Perza, at the mouth of the river Ibrahim, in the Perzan gulf.
BENDER MAFFIA, or BENJAR-MAFFIA, the capital of a kingdom of the same name in the southern part of the island of Borneo, possessing a good harbour, formed by the river Benjar, flowing from the centre of the country almost due south. S. lat. 2° 47'. E. long. 113° 50'.

BEND & RICHER, a town of Persia, on the north coast of the Persian gulf, in the province of Farsitan; 160 miles S.S.W. of Shiras.

BENDER RIGK, a city of Persia, in the province of Kerman, on the north-east coast of the Persian gulf. It is encompassed with walls in an indifferent state, and lies north from Abuscheh or Busheer. The petty state, of which this is the capital, comprehends several other places in Kermeer, which render its sovereignty in some measure dependent upon Kerim Khan. The Arabs of this principality are chiefly addicted to a sea-faring life; the Persians inhabiting its back parts are husbandmen. The reigning family of Bender Rigk is of the Arabian tribe of Benti Saab, and produces originally from Oman; but the grandfather of one of its princes, having become a Schiite, and married a Persian lady, this family is no longer reckoned by the Arabs among their genuine nobility. A late reigning prince of Bender Rigk, Mir Mahenna, was notorious through the country for his vices and cruelties, as one of the most execrable tyrants that ever existed. He caused his servants to murder his father in his own presence, because the old man had a prodigality for his eldest son. He killed his mother, because she reproached him for his crimes. He caused his brother, and sixteen other relations, to be assassinated, that he might establish himself in the undisturbed possession of the throne. He drowned two of his sisters, because a neighbouring prince had asked one of them in marriage. He expostulated with all the children that happen to be born to him. In 1765, this detestable monster was under the age of thirty years. After having been twice captured by Kerim Khan, he recovered his liberty, and immediately upon his return to his own dominions began to pillage the caravans which travelled between Schiras and Abuscheh. He seized upon the sea, and to invade piracy. Kerim Khan had unsuccessful siege to his capital; and when he sent in 1765, to demand payment of the tribute due for his possessions in Kermeer, Mir Mahenna treated the officer deputed for this purpose, and caused his beard to be shaven. Upon which Kerim Khan sent against him a powerful army, which conquered Bender Rigk and all its territories. Mir Mahenna, however, had previously retired with all his troops, and some of his subjects, into a desert, called Khueiri, where he waited till the Persian army retired from his country. As soon as they were gone, he left the island, expelled the garrison from Bender Rigk, and regained possession of his dominions. The tyrant had abandoned himself to drunkenness; and had begun to exercise such cruelties upon his troops, that he cut off the noses and ears of some of the principal officers; and yet so attached to him were his soldiers, that, in the period of his exile, he took the title of Karek from the Dutch. Bender Rigk is distant 132 miles W.S.W. from Schiras. N. lat. 29° 26'. E. long. 51° 20'.

BENDIDA, SEBEDA, in Antiquity, a colony of the Athenians on the twenty-first day of the month Thargelion, in honour of the goddess Diana. The word is formed of βεντισα, a denomination of Diana, according to Schedo, or of the moon, according to Suidas, which amounts to the same. The Bendida were held in the Piraceus, and bore some resemblance to the bacchaeans.

BENDING, in a general sense, denotes the reduction of a straight body into a curve, or giving it a crooked form. M. Bernoulli has discussed the bending of strings, or elastic bodies. (See Strings.) M. Amontons gives several experiments concerning the bending of ropes. (See Rope.) The friction of a rope, bent or wound round an immovable cylinder, is sufficient, with a very small power, to sustain very great weights. Mem. Acad. Sci. 1753, 1755, 1697. Divers methods have been contrived for bending timbers, in order to supply crooked planks, and pieces for building ships. M. Dalmeny ingeniously enough proposed to have the young trees bent, while growing in the forest. The method of bending planks by a hand-heat, now used in the king's yard at Deptford, was invented by captain Cumberland. Phil. Trans. No. 571. p. 75.

The bending of boards, and other pieces of timber for curved works in joinery, is effected by holding them to the fire, then giving them the figure required, and keeping them in this figure by tools for the purpose.

A method has been lately invented and practiced for bending pieces of timber, so as to make the wheels of carriages without joints. See Wheels.

The use of bending wood for the purpose of bending it is evidently to supply it, so as to make it capable of being brought, the more easily into the form required, as well as to adapt it for retaining that form, after the prejudice by which it was originally reduced to that figure has been removed. By means of bending, heat and moisture are applied to it. If it has already moisture enough, as in the case of green wood, heating in any other way, without the modification of steam, may be sufficient; or the effect may be produced by heating and wetting at the same time. The result of bending by heat and moisture, has been practiced from time immemorial in Ruris, and applied to wheels, and some other sorts of wood-work. In England,uchs, or similar modes, have been applied for a long time in the dock-yards, and also under a patent granted to Mellis, Jacob and Young, but now expired, in the construction of wheels; and by Mr. Livan, under a patent still in force, to circular wooden fishes, foills, fan-light, door moldings, and hand-rails for chairs; and, without patent, by cabinet and chairmakers in general. When the thickness required, compared with the sharpness of the curvature, is such as to render it impracticable to bend the piece entire, it may be divided for this purpose into different thicknesses, in the manner proposed by Mr. Samuel Bentham, under a patent obtained in 1793, for methods of working wood, metals, &c. with very little, if any, loss of strength; and if the firata are connected by proper fastenings, with a degree of strength far superior to what a piece of the same dimensions would possess, if grain-cut. In this mode, curvature may be given to the wood-work of all sorts of engines, and of carriages of all sorts; to all timbers designed for receiving a carved shape and employed in buildings; and to any of the timbers, that may be used in the construction of boats or vessels, not excepting lips of the largest class. Thus, it is said, a very considerable saving with respect to quantity and value might be obtained, whilst at the same time the strength would be augmented.

In the operation of bending, care should be taken, if as fast as possible, so as to force any piece to adapt itself to the curvature of the mould to which you are bending it, you apply a pressure, by means of screws or wedges, &c. to that part, and along the whole piece, particularly at its sharpest convexities; so that the piece may not be only kept to its proper curvature, but the exterior fibres be prevented from starting out. In forming ship-rails of all shapes and sizes, so as to supercede the use of crooked-grown timber, which is straight would be cheaper, Mr. Bentham proposes to use one or other of the two following methods, which, he says, would effectually answer the purpose. First, having
lons and a mould or block to the shape of the rib in question, completing the whole of its extent from top to bottom, for, on the face of the bend, bend the components parts suitably to the shape of the block, and fasten them together so that, when the wood rib in its curvature, support, or hold, in those parts where the frame is a bending to change, and to convey the rib, to enter with its hands, it shall have sufficiently conferred to be curbed, by the connection given to it with the plan, beams, and other parts of the ship. Or, secondly, you may form the half of the ship first, without timbers, beginning to build as if were by the planks, using only a few of temporary moulds or false ribs, to determine the position of, and give a temporary support to, the planks. When this is done, insert the timbers afterwards, pressing and bending the component parts successively into their places and removing the false ribs, in proportion as the real ones are put together and secured. Or, thirdly, instead of the false ribs, you may inflect a sufficient number of real ribs, put together as in the first method, and then proceed with the planks and the roll of the ribs, as in the second method. As to bending, it may, in this case, be performed with or without the assistance of fluming, and with or without the use of the expedient of dividing into thicknesses according to the degree of curvature may require. In chinker-work built boats, the ribs have been four times inserted by bending them to the planks, but this is only done in boats of the slightest class. See Ship.

Bending, in the S a Language, denotes following one rope to a knot, or to different objects, and fastening a failure to its yard.—They lay, bend the cable, when it is to be made fast to the ring of the anchor.—To bend two cables, signifies to tie them together with a link, which, though less than a splice, is a nearer case. To unbind the cable, is to loosen it from the ring of the anchor; which is done when a ship is design to be long at sea. To bind a main sail, is to make it fast to its proper yard or stay.

BENDLET, in Heraldry, is the first diminutive of the bend, and signifies one half of the breadth of the bend.

BENDOAN, in Geography, a small island, 5 leagues S.W. from cape St. Martin's, on the coast of Spum, in the M. d'America, which lies to the south of the west of Yylica island. It is south-east from Alice, and forms the limit of the bay of Calp, or Caria, of which the mouth is called the south-west limb.

BENDORAN, a mountain of Scotland, in the county of Argy.

BENDORF, a town of Germany, in the circle of Weil-heim, and county of Bary, and in a profligate S. E. from the Rhine, into which the river Saun empties itself at this place. It is inhabited by Roman catholics and Lutherans, each of whom enjoy the public exercise of their religions.

BENDORF, a town, on the west coast of Ireland, and is the southernmost of the roads between Ballybanamon and the island of Mayo, or Enniscowry, as Enniscowry is the more western. In both, ships may ride with safety.

BENDS, in a ship, are the same with masts, or masts, which are the outward, timber of a ship, on which men rest their feet in climbing up. They are reckoned from the water, the first, second, and third bends; they help much to strengthen the ship, and have the beams, knees, and fastenings bolted into them.

Bends denote also the small ropes used to confine the cloth of a cable. For a common or first bend, pass the end of the rope through the eye of another rope, then round and underneath the standing part; but, to prevent its jamming, pass it round again under the standing part. The sheet of a haul has the end passed up through the eye, then round the eye, and underneath the standing part. The rope of a halyard is passed into a boat, and has the end flapped. Bends of a halyard are passed as a seizing. For a carrick bend, lay the end of a rope or halyard, across its standing part; then take the end of another rope, or halyard, and lay it under the first standing part, at the clew, and over the end; then through the bight, under the standing part; then over its own standing part, and underneath the bight again; it is often used in haste to form a greater length, or to warp or tow with. For a fig-of-leaf bend, take a round turn with the end of a rope, or halyard, through the ring of an anchor, and pass the rope through both parts, and another half bight round the standing part; then slip the end. Halyard bend is a hitch, with a throat and end feizing made on one end, and the end of another hawser received through the bight, and hitched with a throat and end feizing. Temporary bend is commonly made to receive through large blocks, thus: lay three fathoms of the end of two hawsers together, and put on a round feizing in the middle; then reverse the ends to each standing part, and put on a slight feizing between each end and the middle, and a round feizing on each end. See Plate, Ship-Rigging.

BENDWAYS, or in Bend, in Heraldry, is such charges as are placed so as to occupy that part of the escutcheon to which the bend is allotted; or such as are placed obliquely, resembling a bend.

BENDY, a term used in Heraldry, when the escutcheon is divided bendways into an equal number of partitions; the field may be bendy of eight, ten, twelve, or more.

Poly-Bendy. See Paly.

BENE. See De Brbe Effi.

Bene, in Geography, a town of Italy, in the principality of Piedmont, and district of Monfoco, defended by an ancient castle, and containing about 4000 inhabitants; 28 miles south of Turin.

Beneaped, in the Same Language, is said of a ship, when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENICARLO, Binacional, or Bincardo, in Geography, lies north-west from Penicola point, on the coast of Valencia, in Spain; it the Mediterranean, faced on a bay to the north-east of the gulf of Valencia. It has no good road; so that ships usually lie at Penicola.

Benedetto, in Biography. See Castiglione.

Benedetto, St., a town of Italy, in the duchy of Mantua, 15 miles S.S.E. of Mantua—Alto, a town of Italy, in the marquisate of Gozzogno, 12 miles east of Bene.

Benedicite, in Ecclipsographical History, is a name given to the hymn, or song of the three children in the fiery furnace; by reason of its beginning with the words, "benedicite omnia opera Domini." The use of the benedictio is very ancient; it appears to have been sung in all the Christian churches as early as St. Chrysostom's time.

Benedict, St., in Biography, founder of the monastic order of Benedictins, was born in the province of Nursia, in Italy, about the year 480. After having been educated at Rome, he retired, at the age of fourteen, to Subiaco, about 40 miles from that city, where he secluded himself from the world in a cavern for several years, till at length he was discovered by the monks of a neighbouring monastery, and chosen for their abbot. Dissatisfied, however, with their manners, he withdrew from their society to his solitude,
Benedict, a name assumed by several of the popes. The first of this name, called by the Greeks Bonafus, was advanced to the pontifical chair in 574, at the period when the Lombards overran Italy, and fixed their seat in it under Alboin; and he is said to have died after four years, in consequence of the grief occasioned by their ravages. Benedict II. was elected in 683, and distinguished by his learning and virtues. He died in 685, and obtained the honor of canonization. Benedict III. was advanced to the pontifical in 855, and by the firmness of the Roman clergy, supported on the papal throne in opposition to Amalarius, which he occupied with mildness, piety, and charity. In his time, Ethelwold, king of the west Saxons, visited Rome with his son Alfred. Two epistles of this pope are extant. Benedict IV., was raised to the papal chair about the year 900; and died with a good character in 903. Benedict V. was elected pope in 904, and although he was a man of extraordinary learning and sanctity, he was stripped of the pontifical and priestly dignity by the authority of the emperor Otto, and sentenced to exile; upon which he retired to Hamburgh, where he died.
BENEDICT.

... died in 952 or 966. Benedict VI. was elevated to the papacy in 972, and being seized by a faction which attacked the Lateran palace, he was imprisoned in that city. In 974, Benedict VI. was elected in 975, and after a prudent government of nine years, died in 984. Benedict VIII. was made pope in 1012, but displaced by Gregory an anti-pope, and afterwards restored. Under his pontificate Henry, king of Germany, marched to Rome; and Benedict crowned him emperor under the title of Henry II., and his queen Cunegunda, empress. In 1018, this pope, collecting his dependents, defeated the Saracens, who made a defeat at Luni in Tuscany, and put them all to the sword. He also waged war with the Greeks, who ravaged Puglia. In 1019, the emperor bestowed on him and his successors the newly erected fee of Bamberg. He died, after having approved himself a great friend to the monks, and zealously for the order and discipline of the church, in 1024. Benedict IX. succeeded his uncle John XIX. in 1023, in his 18th year; and was expelled from his fee on account of his vices, but restored by the emperor Conrad I. and after a life of various expulsions and reconstructions, fold or resigned the pontificate in 1049. He refumed it, however, occasionally under succeeding pontiffs, and finished his scandalous career in 1054. Benedict X. was elected to the papal throne by a party in 1058, and after holding the fee nine months and twenty days, was deposed and excommunicated. Benedict XI. was the son of a herdsman, or of a notary, at Trevigi, in the state of Venice, became a schoolmaster, general of the Dominicans, and cardinal bishop, first of Sabina, and afterwards of Oliana, and succeeded pope Boniface VIII. in 1303. He exerted himself by various efforts for the good of the church, but death terminated his labours on the ninth month of his pontificate, A.D. 1304. This pope conducted himself with moderation, and behaved with singular respect to his mother and relations; but would not suffer any interference on their part in public affairs. He wrote commentaries on the books of Job, the Psalms, St. Matthew, and the Revelations, as well as a ritual, and some sermons. Benedict XII. was the son of a miller in the county of Foix, and after several subordinate ecclesiastical promotions, was advanced to the papal see in 1324. He was skilful in law and theology, and distinguised by his probity, but little versed in politics. Wishing to restore the apostolic see to Italy, but obliged by the circumstances of the times to remain at Avignon, he laid the foundation of a magnificent and strongly fortified palace, which, however, he did not live to finish. He observed a laudable caution in the creation of cardinals, and the appointment of benefices; and he exercised singular self-denial with respect to his own relations, observing, that "James Toucher (his family name) has relations, but pope Benedict none."

As he was industrious and active in reforming discipline and morals among several religious orders that were become corrupt, he incurred the ill-will and enmity of the monks. During his efforts for reforming the kings of England and France, he was treated with ill-favour, which terminated his life in 1324. Among his printed works are his "Decretum de animabus capitatorum," and his "Constitutiones de reformis variorum rerum orders." He left also sermons for the chief festivals of the year, commentaries on the Psalms, letters, and poems. Benedict XIII. was of a noble family, being the eldest son of the duke of Gravina, in the kingdom of Naples, and born at Rome in 1649. Against the views and wishes of his family, he took the habit of the Dominican order in 1667, and applied with diligence to the studies and duties of his office, preferring the humble life of a monk to that of a superior station. However, by the alliance of his family with that of the pope Clement X., he was promoted, against his inclination, to the cardinalate in 1672; and after several successive advancements to different fees, in which he maintained the character of an exemplary Prelate, he was elected to the papacy in 1724, and constrained to accept it against his own remonstrances. In the exercise of his office, he laboured incessantly in repressing the luxury of the pontifical court, and in correcting the licentiousness of the clergy; but he was thwarted in his projects by the Jesuits, on account of his attachment to the Dominican doctrine concerning grace and predestination, which left them all. His well-meant attempts to unite all Christian tenants in one church and faith, manifested a greater degree of charity, than of discernment and knowledge of the world. Avoiding all pomp connected with its high station, and restricting the expenses of his own table to 5s. per day, in the difufe of wine and animal food, he lived in the Vatican like a monk in his cloister. Nevertheless, the doors of his palace were always open to the poor, and he was ever ready to hear their complaints, and to the utmost of his power to relieve their distresses. Divesting himself of all the marks of sovereignty, and willing even to dismiss his guards, he frequently went out in the evening in the most private manner, for the purpose of visiting the sick. He closed his pontificate of six years, in 1730, at the age of 86 years. His sermons, poems, and other writings, together with his bulls, were published at Rome in 5 vol. fol. in 1728. Benedict XIV. was descended of the noble family of Lamberti, at Bologna, and born in that city in 1675. After several previous promotions, he received a cardinal's hat in 1728; and from the archbishopric of Bologna, to which he was nominated by Clement XII. in 1731, he was advanced in 1740 to the papal see. Possessing a grace of temper, united with profound learning, an elegant style, liberal sentiments, and great goodness of heart, he was singularly amiable; and as he diminished the number of festivals, abolished idle ceremonies, and manifested a dislike of superfluous practices and simoniacal frauds, he was re-illuminated by some of his enemies as a "protestant pope." As a munificent patron of literature, he founded academies at Rome, bestowed benefactions on that of Bologna, corresponded with, and rewarded learned men at home and abroad, caused a meritorious line to be drawn, retired from the duft the celebrated Egyptian oblik, called that of Sesostris, and adorned Rome with various other monuments of antiquity. Fond of the pleasures of literary retirement, and of occasionally enjoying the mirth of the lower classes, his aversion to buffoons was insurmountable, and he frequently lamented the drudgery and fatigue of his official situation. Attached to life, he dreaded the symptoms of dissolution; and, as it were, confiding in the prayers of the Jesuits for his life, he would not consent to sign the bull for the reform of their order in Portugal, till he was absolutely given over. On the king of Portugal he conferred the title of "his most faithful minister." He governed the church with great wisdom, and manifested on all occasions a strong desire of conciliating those differences with regard to doctrine by which it was divided. After a pontificate of 28 years, he died in 1758, at the age of 89 years. His works have been published at Rome in 12 vol. 4to; and they display a greater degree of profundity and critical application, than his levity and factious disposition would lead one to expect. Pope's Hist. of the Popes. Mofheim's Eccl. Hist. Nov. Hist. Iiil.
ryland, on Fratunet river; opposite Mackall’s ferry; 30 miles southeaft from the Federal city.

BENEDICTIN, or BENEDICTIN ORDER, in Ecclesiastical History, is an order of monks, who professed to follow the rule of St. Benedict, which he formed only for the Celibates, or for those who live in a monastery under the direction of an abbot.

Having given instructions as to the qualifications and duty of the abbot, he proceeds to recommend to the monks obedience, silence, and humility; to note the hours for divine service by day and night, as well as the order and manner of performing it; and to specify the punishments that were to be inflicted on offenders. These punishments were to be excommunication or a separation from the fellowship of the brethren, at table or at prayers; the chastisement of the more disorderly with rods; and expulsion from the monastery. He further states the mode of their admission, the dress they were to wear, and the labour in which they were to be employed. From his rule, which is still extant, we learn that it was not his intention to impose it upon all the monastic societies; for he expressly excludes the Anachorists, who, having learned the exercises of a monastic life in a convent, retired separately into deserts, the Sarabantes, who live two or three together in a cell, and the Gyratory, who removed from one monastery to another without fixing anywhere. It was his purpose to form an order, whose discipline should be milder, their establishment more solid, and their manners more regular, than those of other monastic bodies; and whose members, during the course of a holy and peaceful life, were to divide their time between prayer, reading, the education of youth, and other pious and learned labours. However, in process of time, the followers of this celebrated ecclesiastic degenerated very lamentably from the piety of their founder, and lost sight of the duties of their station, and the great end of their establishment. Having acquired immense riches from the devout liberality of the benevolent, they sunk into luxury, intemperance, and sloth, abandoned themselves to all sorts of vices, extended their zeal and attention to worldly affairs, took part in political cabals and court factions, made a vast augmentation of superfluous rites and ceremonies in their order, to blind the multitude, and supply the place of their expiring virtue; and among other meritorious enterprises, laboured most ardently to swell the arrogance, by enlarging the power and authority of the Roman pontiff.

This new order made a very rapid progress in the west, and, in a short interval of time, arrived at the most flourishing state. In Gaul, its interests were promoted by Maurus; in Sicily and Sardinia, by Placidus; in England, by Augustin and Mellitus; in Italy, and other countries, by Gregory the Great, who himself is reported to have been for some time a member of this society; and in Germany it was afterwards received by the instrumentality of Boniface. This sudden and amazing progress of the new order was ascribed by the Benedictins to the wisdom and fanaticity of their discipline, and to the miracles wrought by their founder and his followers. But upon a more attentive view, the impartial observer will be convinced, that the protection of the Roman pontiffs, to the advancement of whole grands and authority the Benedictins were most fervently devoted, contributed much more to the elevation and influence of their order than any circumstances, nay, than all other considerations united together.

The Benedictins are those properly called monachi, monks; the other orders are better denominated friars, or religious. In the canon law, the Benedictins are called Black Monks; being distinguished from the other orders by the colour of their habit, and not by the name of their patriarch St. Benedict. Among them they were formerly also denominated Black Friars. The Benedictins wear a loose dark gown, with large wide sleeves, and a capuche on their heads, ending in a point behind. The lift of saints of the Benedictin order is very ample; but they are accursed by Baromus, and many other writers, of putting many in the lift who were never of the order. For six hundred years after the erection of the Benedictin order, most of the European monks were followers of this rule; whatever other names they went by, Cistercians, Cistercians, Grandimontes, Premonstratenses, Chinhus, &c. they were but different branches of the Benedictins, till about the year 1520, when the Dominicans and Franciscans took new rules. Holpina reckons no less than twenty-three religious orders that sprang from this one. According to the Benedictin computation, there have been of this order 24 popes, 200 cardinals, 7000 archbishops, 100,000 bishops, 15,000 abbots, 40,000 friars, 40,000 confessors, above 5000 martyrs and apostles, who have converted 30 provinces to the Christian faith, besides emperors, kings, &c. This order has produced a great number of eminent writers and learned men.

The Benedictins, though but one order, are divided into several congregations, which have their peculiar customs and observances different from the rest. Each of these is subdivided into provinces, which have their general chapters. This order is said to have been brought into England about the year 996. The English congregation, which had been filled from the time of the mission of St. Aulfin, was destroyed under Henry VIII., and by degrees reduced to one single man, father Buckley; who, in 1667, procured a re-establishment of the congregation at Douay, in the Netherlands, where it still subsists in a kind of dependency on that of St. Vallaldolid in Spain. At the general chapters, they chuse provincials, with their assistants, for each of the provinces of Canterbury and York, who have jurisdiction over the monastic officials employed therein. They are governed by a president-general, and three definitors, chosen every three years. At their admission they make a fourth vow, viz. that they will go to the mission in England, and return when their superiors think fit.

Benedictin Nuns, are religious women, who embrace the rule of St. Benedict.

BENEDICTION, in a general sense, the act of blessing, or giving praise to God, or returning thanks for his favours. Hence also benediction is still applied to the act of saying grace before or after meals. Neither the ancient Jews, nor Christians, ever ate without a short prayer. The Jews are obliged to recite a hundred benedictions per day; of which, eighty are to be spoken in the morning. Vitring. de Synag. Vet. lib. iii. Rabbi Nehemiah Baruch, in 1688, published a discourse on the manner wherein the ferial benediction is to be pronounced. In the synagogue of Ferrara, it is rather sung than spoken. Among the ancient Jews, as well as Christians, benedictions were attested with the imposition of hands; and Christians, in process of time, added the sign of the cross, which was made with the same hand, elevated or extended. Hence, in the Romish church, benediction was used to denote the sign of the cross, made by a bishop or prelate, from an idea that it conferred some grace on the people. The custom of receiving benediction by bowing the head before the bishop, is very ancient, and was so universal, that emperors themselves did not decline this mark of sublimity. Under the name benediction the Hebrews also frequently understand the presents which friends make to one another, in all probability because they are generally attended with blessings and
and compliments, both from those who give and those who receive them.

Benefiction, Nuptial, the external ceremony performed by the priest in the office of marriage. The nuptial benediction is not essential to, but the confirmation of a marriage in the civil law.

Benefiction, benetic, benedicito beneficio, is the viaticum given to dying persons. The pope begins all his bulls with this form: "Saltem et apollinare benedictionem."

Benefiction, regular, that conferred by abbots on their monks, or by a prior on a junior.

Beneficia prioris, to be deprived of benediction, was a kind of punishment inflicted on monks, whereby, when the rest received the abbot's blessing, the offenders were dismissed without it.

Benefiction is also used for an ecclesiastical ceremony, whereby a thing is declared sacred or venerable. In this sense benediction differs from consecration, as in the latter union is applied, which is not in the former. Thus the choice is consecrated, and the pix blessed, as the former: not the latter, is ass tossed; though in the common usage these two words are applied promiscuously. The spirit of piety, or rather of superstition, has introduced into the Roman church benedictions for almost every thing. We read of forms of benedictions for wax-candles, for bouquets, for ashes, for church-vessels, and ornaments; for flags or censers, arms, fruit-fruits, hones, flags, patched eggs, cillum, or the hair-cloth of penitents, church-yards, horses, moles, &c. which are sprinkled with holy water.

Benediction of Arms, was a sort of public consecration of the weapons and ensigns, before the entering on a war, by a formula of words, and ceremonies appointed for that purpose.

Benedictional is liber, an ancient churchbook, containing the forms of the divers sorts of benedictions given by bishops, priests, &c. Such was the benedictional liber of Gregory the Great, described by Lanciani.

Benedictum, an epithet, formerly given to lenient or gentle operating medicines, more especially rhubarb. In this sense it is used, in some dispensatory writers, benediction bullionem used for lenitive elecution. Though in others, benedicta laxativa, or the blistered laxative, denotes another cafy purge, made up of turpitude, daqammenium, purgans, hermosclyntch, anime-feeds, fennel-seeds, fat gomazon, and honey. Salcido also gives the appellation aqua benedicta to his eucal; and Myllwood does the same to his aqua forte, or water of wild thyme. Some have called the philosopher's stone lapis benedicent.

Benedictionum Visum. See Visum.

Benedictus Cardo. See Thistle.

Beneditto Saco. See San Blessed.

BeneFaca, in Geography, a town of Spain, in the province of Valencia, 10 leagues from Valencia.

Beneficce, Beneficium, in the feudal system, is a term applied to those portions of land which the kings and churchmen bestowed on their adherents. As long as they had no fixed property in land, they could only bestow an house, a stock of armour, or such like recompence, on those who in peace or war were attached to their person, and devoted to their service. But upon their deserting the country which they conquered, and when the value of property came to be understood among them, they conferred upon their followers the more substantial recompence of land. Accordingly the term benefice was the principal name, and most familiar form of the feudal position. These grants were called "benefice," because they were gratuitous donations; and they were also called "honours," because they were regarded as marks of distinction. What were the services originally exacted in return for these "benefices," cannot be determined with absolute precision; because there are no records to ascertain. M. de Montefiquieu (Sp. Laws, b. iii. c. 3. & 16.) considers these "beneficia" as fees, which originally subjected those who held them to military tenure. M. de Mably (Observ. sur l'Histoire de France, i. 335.) contends, that such as held them were at first subjected to no other service than what was incumbent on every free man. But when it is considered, that alienable property subjected those who possessed it to serve the community, it is reasonable to conclude, that these "beneficia" subjected such as held them to personal service and fidelity to him from whom they received these lands. They were granted originally only during pleasure. (See Montel, ubi supra, and Du Cange voc. Beneficium and Feudum.) But the possession of benefices did not continue long in this state. A precarious tenure during pleasure was not sufficient to satisfy those who held them, and to attach them to their superior lord; and, therefore, they soon obtained the confirmation of their benefices during his.

(Du Cange Gloss. voc. Beneficium.) After this it was easy to obtain or extort charters rendering "beneficia" hereditary, first in the direct line, then in the collateral, and at last in the female line. Leg. Langob. lib. iii. vii. viii. Du Cange.

It is not easy to account for the precise period when each of these changes took place. M. de Mably (ubi supra, tom. i. p. 103—162. 329.) conjectures, with some probability, that Charles Martel first introduced the practice of granting "beneficia" for life; and that Louis le Debonnaire was among the first who rendered them hereditary. Mabillon, however, (De Re Diplomatica, l. vi. p. 353.) has published a plactum of Louis de Debonnaire, A.D. 562, by which it appears, that he still continued to grant some "beneficia" only during life. And in 889, Odo, king of France, granted lands to Ricaboda, "for his faithful service, and to the church," during his own life; and if he should die, and a son were born to him, that right was to continue during the life of his son. This was an immediate step from mere life to mere life, and from hereditary to the perpetuity. While "beneficia" continued under their first form, they were held only during pleasure; he who granted them not only exercised the "dominium," or prerogative of superior lord, but he retained the property, giving his vassal only the usufruct. But under the latter form, when they became hereditary, although feudal lawyers continued to define a "beneficia" as agreeable to its original nature, the property was in effect taken out of the hands of the superior lord, and lodged in those of the vassal. At length the word "feudum" came to be substituted in the room of "beneficium," but Muratori observes (Antiq. Med. X. v. 1. p. 594.) that no influence of this kind occurs in any authentic charter previous to the eleventh century; and Dr. Robertson (Hist. Ch. V. vol. i. p. 269.) informs us, that a charter of king Robert of France, A.D. 1008, is the earliest deed in which he has met with the word "feudum."

Beneficce, Beneficium, in an Ecclesiastical Sense, a church endowed with a revenue for the performance of divine service; or the revenue itself, affixed to an ecclesiastical person for life, in return for his performing the service of the church.

All such preferments, except bishoprics, are called benefices; but they must be given for life, not for years, or at will; and all benefices are, by the canons, sometimes called dignities. But we now observe a marked distinction between benefice and dignity, by applying the word dignity to bishopric.
and secular. Regular or titular benefits are those held by a religious, or a regular, who has made profession of some religious order: such are abbeys, priories conventional, &c. Or rather, regular benefice is that which cannot be conferred on any but a religious; either by its foundation, by the institution of some superior, or by prebendation. For prebendation, forty years possession by a religious makes the benefice regular. Secular benefices are those which are only to be given to secular priests, i.e. to such as live in the world, and are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made appear. They are called "secular benefices," because held by seculars; of which kind are almost all curacies. Some benefices, regular in themselves, have been secularised by the pope's bull.

A Benefice in commendam, is that, the direction and management whereof, upon a vacancy, is given or recommended to an ecclesiastic for a certain time, till it may be conveniently provided for. See COMMENDAM.

Benefice, Possession of a. See Possession.

Beneficiarii, in Roman Antiquity, denote soldiers who attended the chief officers of the army, being exempted from other duty. Beneficiarii were also soldiers discharged from the military service or duty, and provided with "benefice" to subsist on. These were probably the same with the former, and both might be comprised in the same definition. They were old experienced soldiers, who, having served out their legal time, or received a discharge, as a particular mark of honour, were invited again to the service, where they were held ingratia eam, exempted from all military drudgery, and appointed to guard the standard, &c. These, when thus recalled to service, were also denominated eos suis; and before their recall, eterni.

Beneficiarii was also used for those raised to a higher rank by the favour of the tribunes, or other magistrates. The word "beneficiarii" frequently occurs in the Roman inscriptions found in Britain, where consulatus is always joined with it; but besides beneficiarii consulatus, we find in Gratian beneficiarii tribuni, praefecti, legati, praefecti, praefuncti, &c.

Beneficiary, in a general sense, something that relates to benefices.

Beneficiary, beneficarius, is more particularly used for a benefited person, or him who receives and enjoys one or more benefices.

Beneficiary is more particularly used among Roman Writers, for a person exempt from public offices. In which sense, beneficiarius is contradistinguished from municipis: It also denotes, in Middle Age Writers, a feudatory or vassal: and it is also used for a clerk or officer, who kept the account of the beneficia, and made the writings necessary for it. The same denomination was likewise given to the officers who collected the rents and duties belonging to the fiscus.

Beneficio. See Deprivation à Beneficio.

Beneficio, Suspendit à. See Suspensio.

Beneficio primo ecclesiasticum habendo. See Primo.

Beneficium, Sebastian, in Biography, an eminent English divine, was born at Pordenon, in Gloucestershire, in 1559, and educated at the university of Oxford, where he occupied the chair of Margaret professor of divinity for 14 years with great reputation. Towards the close of his life he retired to his rectory of Meysey Hampton, near Fairford, in his native country, and there died in 1630. Dr. Benefield was a most eminent scholar, disputant and divine, and particularly well versed in the fathers and schoolmen, that he had not his equal in the university. In his theological opinions he was a rigid Calvinist; and in his general conduct he was remarkable for strictness of life and sincerity.
His works, consisting of commentaries on the 1st, 2d, and 3d chapters of Amos, sermons and lectures in divinity, are now sunk into oblivion.

BENEFIT, is used for a privilege granted to some person, as of an immunity, or the like.

Benefit of Clergy. See Clergy.

BENE AMI, BENENATH, BENENASCH, or BENENAT, in Astronomy, the outermost star of the second magnitude, in the tail of the Ursa Major.

This is sometimes also called Abilinus.

BENENCASA, Count, a Venetian nobleman, born in 1745, not more distinguished by his birth than talents, taste, and knowledge in literature, is counted, by M. Laborde, in his "Effi la Musique," in 4 vol. 4to, published at Paris in 1780, to have furnished him with the chief part of his information concerning the poets, composers, musicians, and authors of Italy; and for enriching his researches. M. Laborde acknowledges with gratitude his obligations. See vol. III. of "Effi la Musique," where there are many articles concerning Italian composers and singers with which count Benencasa has furnished the editor, that breathe the true spirit of taste, finitude, and knowledge. This acknowledgment has cleared us in the first perusal of M. Laborde's work; but we always thought the articles concerning the Italian composers and singers in this work, of a different colour from the rest of the book: more liberal, more enthusiastic for genius and talents, and a taste more determinative and refined, than either that of M. Laborde, or his guide, the Abbé Rouyer.

When the account of the commemoration of Handel was writing, the editor being very desirous to know what judicious foreigners thought of those exhibitions, particularly Italians, accustomed to good music in their churches, as well as theatres, he applied to count Benencasa, who was then in London, and had been present at the performance of the Messiah in Westminster-abbey, for information concerning the comparative grandeur and excellence of the band, with any other which he had heard, or of which history or tradition had preferred the memory in his own country. As they had not time for a full discussion of the subject, when it was first proposed, count wrote, ignoring Benencasa was so obliging as to honour him with his opinion in a letter, which, before his departure from England, he entreated to publish, and it will not only serve as an honourable record of this splendid exhibition, but may well be the more flattering to the projectors of the plan, as the count is an excellent judge of music; having heard, read, meditated, and written on the subject, with a degree of feeling and intelligence, that is equally honourable to himself and the age. For this letter, see the commemoration of Handel, p. 116.

BENEDICTO, ItaL, a music term, implying at pleasure; equivalent to ad libitum, al suo piacere; which see.

BLERMOND, in Geography, a mountain of Scotland, in the county of Sutherland.

BENEFIT, in Geography, a town of Sifta, in the province of Oppid., 8 miles east of Trappan.

BENESW, a town of Bohemia, in the circle of Kuranz, in which fairs are held.

BENESOW, Benjaz, Pfeif, or Pozzen, a town of Bohemia, in the circle of Leutmet, 6 miles S. S. W. of Kamens; famous for the manufacture of the bell paper that is made in Bohemia.

BENET, a town of France, in the department of Vendée, and chief place of a canton, in the district of Fontenay-le-Conflent; 3 leagues south-east of Fontenay.

BENET Cape, a bay, lying on the south-side of the western peninsula of the island of St. Domingo, and forming with the line to Petit Goave on the north side, the narrowest part of it, 18 20', W. long. 72° 47'. The cape is the west point of the bay, and cape Jacqueline the east point, nearly east and west from each other.

BENETTO, a river in the island of Crete, 2 miles south from Barbacan island, having on the south side a small fort upon a hill, under which is a good road to 15 fathoms.

BENEVENT, a mountain of Scotland, in the county of Inverness, 21 miles east of Fort William. See Ben. N. 2d.

BENEVENTE, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Bourganeuf; 10 miles N. N. W. of Bourganeuf. The place contains 1141, and the canton 8788 inhabitants; the territory includes 252 kilometres and 12 communes. —Also, a town of Spain, in the province of Leon, seated on the river Esla. N. lat. 42° 4'. W. long. 5° 5'.

BENEVENTO, a city of Italy, in the kingdom of Naples, in a duchy of the same name, comprehending besides the city, a district of nine miles. This capital of the Principato Ultra, or principality of Benevento, and tee of an archbishop belonging to the pope, is situated at the point of a hill, between two narrow vallies, in one of which runs the river Sabato, and in the other the Calore, near the confluence of these two streams. N. lat. 41° 6'. E. long. 14° 57'.

One of the entrances into the city is through the arch of Trajan, now called the "Porta Aurea," which is in tolerable preservation, and one of the most magnificent remains of Roman grandeur out of Rome. The architecture and sculpture are both singularly beautiful. This elegant monument was erected in the year of Christ 114, about the commencement of the Parthian war, and after the submision of Decebalus had entitl'd Trajan to the name of Dacicus. The order is composite; the materials, white marble; the height, 60 palms; length, 37 1/4; and depth, 24. It consists of a single arch, the space of which is 20 palms, and the height 35. On each side of it, two fluted columns, upon a joint pedestal, support an entablature and an attic. The intercolumniations and frize are covered with baltsichios, representing the battles and triumph of the Dacian war. In the attic is the inscription. As the fifth year of Trajan's consulship, marked on this arch, is also to be seen on all the military columns erected by him along his new road to Brundisium, it is probable, the arch was built to commemorate his beneficent undertaking. No city in Italy, Rome excepted, can boast of so many remains of ancient sculpture, as are to be found in Benevento. Scarce a wall is built of any thing but altars, tombs, columns, and remains of sculpturals. The most considerable are in the upper town, fupposed by Swiburne (Travels in the two Sicilies, vol. II. p. 336) to be the site of the old one.

The cathedral is a clumsy edifice, in a style of Gothic, or rather Lombard, architecture. This church, dedicated to the Virgin Mary, was built in the sixth century, enlarged in the eleventh, and altered considerably in the thirteenth, when archbishop Roger adorned it with a new front. In the court stands a small Egyptian obelisk, of red granite, crowded with hieroglyphics. In the adjoining square, are a fountain, and a very indifferent statue of Benedict XIII., long archbishop of Benevento.

The writers of the Benedictine history fix its origin in the years immediately succeeding the Trojan war, and claim Dionys, the Eolian chief, as its founder. Others apply it to the Samnites, who made it one of their chief towns, whether they frequently refected for refuge, when worshipt by the Romans. In their time, it was called "Malayum," of uncertain etymology, but after the conquest of Samnum, changed by the Romans into "Beneventum," in order to introduce their colony under fortunate auspices. Near this place,
place, in the 479th year of Rome, Pyrrhus was defeated by Curis Dentatus. In the war against Hannibal, Beneventum signified its attachment to Rome, by liberal teneed of succours, and by real services. Its reception of Gracchus after his defeat of Hannibal, is extolled by Livy, and from the gratitude of the senate, many solid advantages accrued to the Beneventines. However, it shared the devastations of the Roman empire, attending the eruption of the northern nations. When the Lombards invaded Italy, they fixed the seat of their empire at Pavia, and sent a detachment to take possession of the southern province. In 571, Zotto was appointed duke of Benevento, as a feudatory to the king of Lombardy, and seems to have confined his government to the city alone, from which he occasionally fellforth to seek for booty. The second duke, called Arechis, conquered almost the whole country that now constitutes the Kingdom of Naples. Upon the fall of Deidericus, last king of the Lombards, the state of Benevento was not materially affected. Arechis the second kept possession, and availing himself of this favourable conjecture, averted his independence; threw off all feudal submission; assumed the title of prince; and coined money with his own image upon it; a prerogative exercised by none of his predecessors, as dukes of Benevento. Afterwards, when Radelchis and Siconulphe aspired to the principality, each of them invited the Saracens to his aid. For the termination of these fatal diffusions, the dominions of these competitors were divided into two distinct sovereignties. In 851, Radelchis reigned as prince at Benevento; and his adversary fixed his court, with the same title at Salerno. From this treaty of partition, the ruin of the Lombards became inevitable; and the erection of Capua into a third principality was another destructive operation. From this time the inroads of the Saracens, and the attacks of the eastern and western emperors, together with anarchy and anarchy at home, reduced the Lombards to such wretchedness, that they were able to make a very feeble resistance to the Norman arms. Benevento, however, was chiefly governed by its own dukes and feovergines, till in the year 1653, the emperor Henry III. transferred it conditionally to pope Leo IX. From the year 1033, to this day, the Roman fee, with some short interruptions of possession, has exercised temporal dominion over this city. In a plain near the city a bloody battle was fought in 1265, when Charles of Anjou defeated and killed Mainfrym, his competitor for the sovereignty of the two Sicilies. In 1721, this city suffered greatly from an earthquake.

BENEVIS. See Ben Neri.

BENEVOLENCE, in Ethics, denotes a hearty desire of the good of mankind, evidencing itself, as ability and opportunity offer, in the cheerful and diligent practice of whatever may promote the well-being of all. Some have traced the origin of this affection in self-love; others again in some "infinite" or determination of our nature, antecedent to all reason from interest, which influences us to the love of others and they have accordingly made it the foundation of universal "virtue." Others ascribe it to the intelligent constitution of human nature, and observe, that it arises not from self-love, but from the natures and necessity of things. Hutcheon's Inquiry concerning Moral Good and Evil, p. 140, &c. Price's Review, &c. chap. iii.

Benevolent of God, in Theology, denotes his disposition to do good and to communicate happiness. This perfection of the deity has been referred to the class of moral attributes. (See Attributes.) For the illustration and proof of divine benevolence; see Goodness.

Benevolence is used, both in our Statutes and Chronicles, for a voluntary gratuity given by the subjects to their love-reign, to which each person contributes in proportion to his estate. Stow (Annals, p. 701.) says, that it grew from the days of Edward IV. It may be found also Anno 11, Henry VII. c. 10. yielded to that prince in regard of his great expenses in war, and otherwise. (12 Rep. 19.) But as benevolences had been extorted under many succeeding princes, without a real and voluntary content, it was made an article in the petition of right, (2 Car. I.) that no man shall be compelled to yield any gift, loan, or benevolence, &c. without common content, by act of parliament.

Nevertheless, by act of parliament, (13 Car. 2. c. 4.) it is given to his majesty king Charles II. with a proviso that it should not be drawn into future example. It was, therefore, declared by the statute 1 W. & M. 2. c. 2. that levying money for, or to the use of the crown, by presence of prerogative, without grant of parliament; or for longer time, or in other manner, than the same is or shall be granted, is illegal. See Aid and Tax.

In this sense, benevolence amounts to much the same with what in other nations is called "subsidium charitatum," given sometimes by tenants to their lords, by the clergy to their bishops, &c. In France it is called free gifts, excepting that this latter is restrained to the act of the clergy.

BENEVOLENTIA Regis Habsburg, in Law, the form of purchasing the king's pardon and favour, in ancient fines and subventions, to be referred to estate, title, or place. Pachon. Antq. p. 72.

BENEVOLENI, Orazio, in Biography, maestro di capella to the pope in 1650, and extremely applauded by his contemporaries for polyphonic compositions. Antonio Liberati, his disciple, in a letter which he published at Rome in 1645, in which he characterizes all the eminent contrapuntists of that school, speaking of Benevoli, says: that he surpassed all the masters of his time in writing for four and even six choirs, in which, by the construction and order of the parts, the imitations of beautiful passages, inverted fugues, double counterpoint, new contrivances, ligatures, preparations and resolutions of discord, the texture, connection, and fluidity of the whole, which, like a river, proceeds slowly; in short, with the wonderful richness and beauty of his harmony, he so completely vanquished every herself, as to obtain the applause of great masters, while he excited no other with in the rest, than to imitate his powers in the management of ecclesiastical harmony; by uniting numerous choruses, without dulness, confusion, or breach of rule. He was many years maestro di capella of the Basilica of St. Peter at Rome, and composed his famous masses for six choirs of four parts each, for that cathedral, on the cessation of the plague. It was performed by a band of more than 200 singers, arranged in different circles of the ducan, the fifth choir occupying the summit of the cupola. Besides this masses in 24 parts, there is extant a motet by the same author, for twelve sopranos, or treble voices of equal extent. There can be little melody in any of these multiplied parts; but to make them move at all, without violation of rule, requires great meditation and experience. No author of polyphonic compositions, perhaps, ever equaled Benevoli in the kind of science, except the Netherlander, Okenhem, the master of Jüquin, and our countrymen Tallis and Bull, of whose faculties and invincible patience in these achievements, there will be further occasion to speak elsewhere. The effect of such multiplied parts can so seldom be tried, that it seems an experiment which never can be fairly made, and is only amusing to the imagination. If there had been more frequent rehearsals of the misferey in eight:
eight real parts by Leo, which Anfani had performed in 1781 at the Pantheon by more than forty voices, it may be suppos'd, from such movements as were correctly executed, that the effect of the whole would have been wonderful! but I. o. lived in a more polished age, and was gifted, not only with patience, but with taste and genius.

BENEF. in Geography, a small island of Africa, on the river Sierra Leone, where the English had formerly a factory and a small fort, which was taken by the French in 1704, and razed to the ground.

BENFIELD, or BENFIELD, a town of France, and principal place of a canton, in the district of Barr, and in the department of the Lower Rhine, dated on the III; 45 leagues south of Straburg. The place contains 1220, and the canton 12,240 inhabitants; the territory includes 150,000 square feet, and 15,000. N. lat. 48° 15'. E. long. 7° 45'.

BENFIOL, a mountain of Scotland, in the island of Coll.

BENGAL, a name given among the Mohammeads to the leaves of hemp formed into pills or confects; the use of which, as well as opium, the more rigid Mahommen are to be lawful, thought not mentioned in the Koran, because they intoxicate and disturb the underlings, as wine does, and in a more extraordinary manner. These drugs, however, are now commonly taken in the East; but those who are addicted to them are generally regarded as debauchees.

BENGAL, in Geography, the most easterly province of the empire of Hindoostan, lying on each side of the Ganges, and bounded by Assam, Butoon, and Bahar on the north, by Bahar, Barar, and Orissa on the west, by Orissa and the bay of Bengal on the south, and by the mountains that separate it from Caflis, Assam, and the Birman dominions on the east and south-east. It extends from about 21° 30', to about 26° 40' N. lat.; and from about 56', to about 33° 30' E. long., but its boundaries are not accurately ascertained. About 50 miles beyond Tammangali, which is the termination of a fluctuating range of mountains, that accompanies the course of the Ganges from the sea, these mountains begin to form the northern boundary of Bengal on the western side of the Ganges; and from hence to another range of mountains strike in from the south, but in a curve frequently, which terminates within sight of the sea, about 30 miles from Balasore. To the north those mountains divide Bengal from the southern divisions of Bahar; and to the south they seem to be the natural separation of Bengal from Orissa. Eastward the province of Bengal extends as far as Ramgong, a town belonging to the king of Almora, and placed on the river Burmanpur.

The whole of Bengal, between the mouth of the river Hooghly and that of the Ganges, extends from east to west about 250 miles; and the whole is a country of tolerable size, which food and whiskers render accessible to ships of burden. For several miles in land the country is interspersed by numerous channels, through which both rivers discharge themselves, by many mouths, into the ocean; and the islands formed by these channels are covered with thickets, and occupied chiefly by salt fisheries. According to A'chard's division, Bengal is divided into the eleven subdivisions, or provinces, of Hindoostan proper; and its government is divided into the two districts of Orissa and Cutch, and the island of the Madaderry, whose dominions lay on the south, and who were either tributaries to, or powerful governors under, the Mogul, were apt to make, and sometimes actually made, arbitrary demands of duties for selling that way. However, it was in the reign of Ferokeen, great-grandson of Aurungzebe, who was deposed in 1717, that the English East India Company obtained the famous "ferryman" or grant, by which their
their goods of export or import were exempted from duties or customs; and this was regarded as the company's commercial charter in India, while they flooded in need of protection from the princes of the country. In the years 1742 and 1743, Bengal was invaded by both the Mahratta states, with armies consisting, as it is said, of 20,000 horsemen each; nor did they depart out of the provinces until the year 1744, when they had collected a vast mass of plunder, and had established the claim of the "Chout," or a fourth part of the net revenues of the provinces, as this proportion was called in the language of Hindooistan. In 1753, the Bear Mahrattas obtained possession of the province of Orissa, partly by conquest and partly by cession from Alverdy, the nabob of Bengal; and their proximity to Bengal, from which they were separated only by a shallow river, afforded them frequent opportunities of plundering its frontier provinces; and it was not till the year 1761, when Clive, nabob of Bengal, ceded the provinces of Burdwan and Midnapour to the English, that the Mahrattas ceased to plunder them. In 1756, Alverdy Cawn, nabob of Bengal, was succeeded by his grandson Surajah Dowlah, who, pretending to be irritated at the conduct of the English within his dominions and really jealous of the rising power of Europeans in general, in other parts of India, determined to expel the English from Bengal, and accordingly took their fort at Cuttack, the chief British settlement in the province, upon which their trade depended, and compelled those among them, who were not made prisoners, to retire, and others he caused to perish by confining them in a small chamber called the "black-hole" of Cuttack. In the following year, however, an armament from Madras, under admiral Watson and colonel Clive, not only recovered Cuttack, but brought the nabob to terms. With a view to permanent security for the future, they negotiated with Jaffier Ally Cawn, an amrah in high trust and favour with the nabob; and he engaged, on condition of their affitting him in his views towards the throne, to be their future ally and confederate. The famous battle of Plassey, fought in June 1757, and in which Jaffier aided the accomplishment of their wishes, by remaining neutral, laid the foundation of the future power of the British nation, not only in Bengal, but in Hindooistan. From that time they became the conquerors of the nabobship of Bengal, which speedily led to the possession of the powers of government; for Clive, nabob of Bengal, who had been placed in the room of Jaffier, dilating his duration, resolved at all events to hazard a change. This brought on a war, which terminated in the expulsion of Clive, and left the Bengal provinces in the possession of the English, who restored Jaffier to the nabobship. Lord Clive, alluming the government of Bengal in 1765, seized the opportunity, afforded by the recent death of nabob Jaffier Ally, of taking possession of the Bengal provinces; and obtained from the nominal Mogul, Shah Alimun, a grant of the dummy, or administration of the revenues of Bengal, Bahar, and Orissa; on condition of paying the Mogul 26 lacks of rupees (260,000l.) per annum. Thus a territory producing at that time at least a million sterling per annum, after every expense was defrayed, and containing at least ten millions of inhabitants, was gained to the company, on the side of Bengal; together with the northern circars, valued at nearly half a million more, and for which a grant was also obtained. The Bengal provinces, which have been in our actual possession from the year 1765, have, during that whole period, enjoyed a greater share of tranquility than any other part of India; or indeed, than those provinces had ever experienced since the days of Aurungzebe. Previous to the establishment of our influence, invasions were frequent, particularly by the Mahrattas, and one province or other was ever in rebellion; owing to a want of energy in the ruling power, an ill-paid and mutinous army, and an excess of delegated power.

The government of Bengal, and its extensive dependencies, was first vested in a governor-general and a supreme council, consisting of a president and eleven councillors; but in 1773, these were restricted to four, with Warren Hastings, the governor-general, who were to direct all affairs, civil and military, in the provinces of Bengal, Bahar, and Orissa; and to control the inferior governments of Madras on the coast, and Bombay on the west, with Benecoolen, in the island of Sumatra. The court of judicature consists of a chief justice, and three other judges, with civil, criminal, naval, and ecclesiastical jurisdiction. The Hindoos are governed by their own laws, nor would it be easy, if practicable, to extinguish the influence of the Brahmins, or totally to abolish the castes, to whatever degree they may countenance and maintain fanaticism and superstition. The military establishment in Bengal is always respectable, but varies according to the situation of affairs. The British troops are supported by the Sepoys, a native militia, who are accustomed to have numerous idle followers, so that the effective men seldom constitute more than a quarter of the nominal army. A force of 20,000 British soldiers might probably encounter and vanquish 200,000 blacks or Hindoos. The decisive battle of Plassey, which secured to us the possession of these opulent provinces, was gained with an army of about 3500 men, of whom 900 only were Europeans; and at the battle of Buxar, in 1764, the whole number of combatants on the side of the British did not exceed 7000, and of these 1200 only might be Europeans.

The climate of Bengal is reckoned by Dr. Lind, in his *Essay on diseases incident to Europeans in hot climates*, &c. the most infamous and fatal to Europeans of any of the British settlements in India, that of Benecoolen excepted. This is owing partly to the heat of the air, and more especially to that of the land wind, which, passing over a tract of country much heated by the sea, and confiding in various districts of extensive sandy deserts, becomes hot and suffocating, that it can scarcely be endured. These hot winds, occasionally loaded with sand, are for this reason, particularly to perfons exposed to them whilst sleeping, that they produce a kind of paralytic delirium, called the "sandbugs," which is attended with a total loss of the use of the limbs, and for which no relief can be obtained but by removing to some other climate. But the unhealthiness of this climate is principally owing to the inundations of its rivers, and to its level or flat surface, so that the waters flagrate; and of course when, in the month of October, the flagrated waters begin to be exhaled by the heat of the sun, the air is greatly polluted by the vapours that arise from the slime and mud that are cast by the rivers, and by the putrefaction of dead fish, and other animals. Although the falsitude of the climate of Bengal has been considerably improved by clearing the country of trees and jungle, by canals, and by draining the marshes, yet fogs are at this time common, very thick and very unhealthy; and excessive fogs also prevail at other seasons, and they often occur in the months of January and February. In Bengal, the hot, or dry season, begins with March, and continues to the end of May. the thermometer sometimes rising to 110°; and this intense heat is occasionally interrupted by violent thunderstorms from the north west. The rainy season continues from June to September or October; but the three last months of the year are generally pleasant. The cold season commences in November, and lasts till the beginning of February; northerly winds are then prevalent, and the mornings, especially before sun-rife, are cold. It is also frequently very fogg.
foggy, but about 8 or 9 o'clock, when the sun begins to be powerful, the thick mist is dispersed. For the remainder of the day the sky is perfectly clear, so that no clouds appear in the air for several days together. In the months of September and October there is a fall, and cloddy attack those that are late arrived; but here, as in all other places, sickness is more frequent at that season. For meals the regular dietary of the most prevalent dinners are feasts, of the remittent or intermittent kind; for though sometimes they may continue for several days without any perceptible remission, yet they have in general a great tendency to it, and are commonly accompanied with violent paroxysms of rigours or shiverings, and with discharges of bile upwards and downwards. If the stool be very sticky, fame are seized with a malignant fever, of which they soon die. The body is covered with blotches of a livid colour, and the corse in a few hours become quite black and corrupted. At this time fumes prevail, which may be called bilious, or putrid, the better to distinguish from others, which are accompanied with an inflammation of the bowels. In all these feasts at Bengal, the lancet is customarily to be used. The mode of treating fevers and bilious complaints being now well understood, they are less alarming and fatal. Dr. Link has it is a common observation, both at Bengal and Benadesco, that the moon or tides have a remarkable influence on intermittent fevers; and he informs us, on the testimony of a gentilman of undoubted veracity, and of great knowledge in medicine, that at Bengal he could set the precise time when the patient would expire; it being generally about the hour of low water. From these and other observations, the doctor deduces an useful hint, which is, to take doses of salt at the full and change of the moon, as being the season most liable to an attack or relapse in these intermittent fevers.

Although the rainy season does not commence in the flat countries of Bengal till the latter end of the month of June, the Ganges and other rivers begin to swell in the mountains of Thibet early in April, and by the latter end of that month, when the rain-water has reached Bengal, the rivers rise here. This circumstance is accounted for partly by the melting of the snow on the mountains, but principally, as Mr. Rennell observes, by the salt collection of vapours wafted from the sea by the southerly or south-well monsoon, and suddenly stopped by the lofty range of mountains that runs from east to west through Thibet. Hence it appears that the rainy season must commence sooner in places that lie near the mountains than in those that are more remote. In Bengal the rivers rise by degree; the increase being only about an inch per day for the first fortnight. It then gradually augments to two and three inches, before any quantity of rain falls in the flat countries; and when the rain becomes general, the mean increase is about five inches per day. By the latter end of July, all the lower parts of Bengal, contiguous to the Ganges and Burmapooter, are overflowed, and form an inundation more than 100 miles wide; nothing appearing but villages and trees, excepting, very rarely, the top of an elevated spot, the artificial mound of some deferted village, appearing like an island. The inundations in Bengal are as much occasioned by the rain that falls there, as by the waters of the Ganges; in proof of which it is alleged, that the lands in general are overflowed to a considerable height long before the bed of the river is filled. It ought to be observed, that the ground adjacent to the bank of the river, to the extent of some miles, is higher than that which is at a greater distance, and thus it forces to separate the waters of the inundation from those of the river, until it overflows. This high ground is, in some feasons, covered a foot or more; but the height of the inundation within vares, of course, according to the irregularities of the ground; and is in some places 12 feet. When the inundation becomes general, the river attains, as well by the rages and reeds on his banks, as by its rapid and muddy stream; for the water of the inundation acquires a blackish hue, by remaining long flagrante among rages and other vegetables; nor does it ever lose this tinge, which flows the prevalence of the rain water over that of the river; and the fluctuation of the motion of the inundation, which does not exceed half a mile per hour, indicates the remarkable flatness of the country.

In order to guard those tracts or land, which, by the nature of their culture and productions, and by the looseness of their situation, would be injured by too long an inundation, dikes or dams are raised at an enormous expense, extending in the whole of their length to more than a thousand English miles. Some of these are at the base equal to the thickness of an ordinary rampart, and yet, on account of the want of tenacity in the soil of which they are composed, they are often found insufficient, and need frequent repairs. One particular branch of the Ganges, navigable only during the rainy season, and then equal to the Thames at Chelsea, is conducted between two of these dikes, through an interval of 70 miles; and when it is full, the passengers in the boats look down, as from an eminence, on the adjacent country. During the flood tide of the river, the tide becomes incapable of counteracting the stream, and in a great measure of obliterating and flowing, except near the sea. At such a season, a strong wind, that blows up the river for any continue, makes the waters two feet above their ordinarly level; and such accidents have occasioned the loss of whole crops of rice. This rice is of a particular kind, for the growth of its flake keeps pace with the increase of the flood at ordinary times, but is destroyed by too sudden a rise of the water. The barley is often reaped in boats. There is also a kind of grass which overtops the flood in the same manner, and at a small distance has the appearance of a field of the richest verdure. Mr. Rennell informs us, that in the year 1764, a tragical event happened at Luckipur, about 50 miles from the sea, by a strong gale of wind, confining with a high spring-tide, at a season when the periodical flood was within 14 feet of its high peal. The waters then rose 6 feet above the ordinary level. On this occasion the inhabitants of a considerable district, with their houses and cattle, were totally swept away; and the calamity was aggravated by its happening in a part of the country which formerly produces a single tree, to which a drowning man might cleape. These inundations are traversed by every kind of embarkation; such as are bound upwards taking advantage of a direct course and still water, at a season when every stream rushes like a torrent. The wind too, which at this season blows regularly from the south-west, although in the gulf or bay of Bengal the monsoon blows from the S.S.W. and S.W., favours their progress in the eastern and northern parts of Bengal, where it blows from the S.E. or E.S.E.; so that a voyage which would take up nine or ten days by the course of the river, when confined within its banks, may be performed in six days. Husbandry and grazing are at this time both suspended; and the peasant travels in his boat these fields which, in another season, he was used to plough: happy, however, that the elevated rice of the rivers banks places within his reach the husbandry which they afford; without which his cattle must perish. Towards the middle of August, the inundation begins to subside; for though great quantities of rain fall in the flat countries in August and September, yet, by a partial ebb of the rains in the mountains, the buggies fall that are necessary to keep up the inundation. However, the decrease of the inundation does
not always keep pace with that of the river, on account of the height of the banks; but after the beginning of October, when the rain has nearly ceased, the remaining inundation goes off quickly by evaporation; and the lands are left highly manured, and in a fine fit for receiving the seed, after the simple operation of ploughing. For an account of the "boore," to which the rivers of Bengal are subject, see the article Bengal.

From the time of the change of the monsoon in October, to the middle of March, the rivers are in a turbulent state; and then the "north-westers" begin in the eastern parts of Bengal, and later as we advance westwards; and they may be expected once in three or four days, until the commencement of the rainy season. These "north-westers," so called from the quarter in which they usually originate, are the most formidable enemies to the inland navigation of Bengal. They are sudden and violent squalls of wind, and though they are of no long duration, they are often attended with fatal effects, and have caused whole fleets of trading boats to sink almost instantaneously. They are more frequent in the eastern than in the western part of Bengal; and happen oftener towards the close of the day than at any other time. For some hours before they arrive, they are indicated by the rising and singular appearance of the clouds; and thus the traveller is warned to seek shelter. But in the great rivers they are truly formidable; more especially about the latter end of May, and beginning of June, when the rivers are much increased in width. After the commencement of the rainy season, which period varies, in different parts, from the middle to the end of June, tempestuous weather must be occasionally expected; but at this season places of shelter are more common by the filling of the creeks and inlets, as the river increases, and, on the other hand, the bad weather is of longer continuance, than during the season of the "north-westers." The inland navigation of Bengal is performed with safety, with respect to the weather, during the long interval between the end of the rainy season, and the beginning of the "north-westers." At this latter season peculiar attention and care are necessary. For an account of the boats that are used in this inland navigation, see Dudgeon's Row.

Bengal is a low flat country, fertilized by numerous rivers and streams, and interspersed with a few ranges of hills. The triangle formed by the Cooumbazar and Hoogly rivers to the west, by the Ganges to the east, and by the sea-coast to the south, as well as a large tract on each hand to the north of this Delta (see Delta), is as level as the lower Euphrates. Such parts of this extensive plain as are not watered by the Ganges or its branches, are fertilized by other streams from the mountains; and for the space of three months, when the sun is merrily vertical, heavy rains fall every day. The periodical rains and intense heat produce a luxuriance of vegetation, almost unknown to any other country in the globe; and therefore Aurungzebe emphatically denominated Bengal "the paradise of nations," and it has been peculiarly styled "the paradise of India." The soil is a mixture of black vegetable mould, rich and loamy, extending to the depth of six feet, and in some places fourteen, and even twenty feet, lying on a deep sand, and interspersed with shells and rotten wood, which indicate the land to have been overflowed, and to have been formed by materials deposited by the rivers. It is easily cultivated without manure, and bad harvests seldom occur. In this country they have two harvests; one in April, called the "little harvest," which consists of the smaller grain; and the second, called the "grand harvest," is only of rice. The chief grain is rice, on which the natives chiefly subsist, and which is exported from hence into other countries. Bengal produces also very good wheat; and it furnishes the inhabitants of the mountains of Caffrerie, and of the elevated plains of Tibet, with both rice and wheat, in return for their shawls, gold, and muffs. Upon the failure of their crop of rice, a grievous famine ensued. Of this many melancholy instances have occurred, both in Bengal and in other parts of India. One of the most deplorable of this kind occurred in the year 1770. On this occasion, the nabobs, and great men of the country, distributed rice grists to the poor; but when their own flocks began to fail, they withdrew their donations, and Calcutta was crowded with multitudes of persons who came thither to solicit relief. But the whole stock being expended, the famine prevailed, and many thousands fell down as victims to hunger in the streets and fields, so that their bodies, mangled by dogs and vultures, corrupted the air, and seemed to threaten a plague. Many persons were employed daily, on the company's account, in throwing dead carcasses into the river, so that the waters were contaminated, and the fish could not be eaten without danger. Hogs, ducks, and geese, fed chiefly on the dead bodies; and the only meat which could be procured was mutton, which, on account of the dryness of the season, was so small, that a quarter of it would scarcely weigh a pound and a half. This dreadful famine was occasioned by a preternatural drought, which caused both the great harvest of 1769, and the little one of 1770, to fail. As a preservative from the miseries attending a dry season, and as a source of supply of water for domestic purposes, the inhabited part of the country is furnished with numerous reservoirs of an oblong square shape, and of various sizes, frequently more than an acre in extent, dug in the earth, and called "tanks." These are filled with water in the rainy season, and afford the inhabitants, during the dry months, a supply of water of a better quality and appearance than that of the Ganges, which is always thick and muddy. In these tanks is bred a sort of fish, in taste resembling our carp. Among the other vegetable productions of Bengal, the most important of which are tobacco, sugar, indigo, cotton, mulberry, and poppy, we may enumerate the banana tree, the cocoa-nut palm, which supplies a manufacture of cordage, called "coir," (see Cork), gourds, plantans, pomele, potatoes, lime trees, and orange trees. They have also the pifang, or banana; the furi tree, which affords, by incision of the item, a clear and sweet juice, of an intoxicating quality, and when turned four is used as vinegar; and the mango tree, the fruit of which is preferred to all others in the country, except very fine pine apples, and which is assisted in the hot months. Mr. Ives (Voyage from India to Europe, &c. 4th, 1773) mentions a beautiful tree, called "chulta," which has a flower that is at first a hard green ball, on footstalks about four inches long. When this opens, the calyx appears to be composed of five round, thick, and succulent leaves, and the corolla of the same number of fine beautiful white petals. After one day the corolla falls off, and the ball clothes again; of these there is a succession for several months. In the walks of Bengal they have a tall tree, called the "tattoon," and near Calcutta a spreading tree, called the "ruffa," making a fine appearance when in full bloom. In their gardens they cultivate most of the vegetables that are natives of other climates, and fit for culinary purposes. Among the animals of Bengal, we might mention the elephant, tiger, wild buffaloes, jackals, dogs, snakes, scorpions, &c. and a kind of birds, named "ar-gill," or "hurgil," a species of Ardea, which are very large and ravenous, and held in great veneration by the Brahmins. Game, poultry, fish, and water-fowl of all kinds, are very plentiful in Bengal. The horses used by the Europeans in this province are either of Persian or Arabian extraction.
BENGAL.

The island commerce of Bengal is very considerable, and is carried on by means of their rivers and canals that intersect the country, and along the banks of which are many towns and villages, with plenteous fields of arable and pasture land, which determines the face of the country, and renders it very beautiful. Some of the canals, formed either by the hands of men, or by the operations of nature, are wide and deep enough to be navigated by large ships. One of the most considerable of these is the "Hoz," or "Harc" channel, that runs straight through the country into the arm of the river that flows by Dacca. The chief articles of commerce which the country yields are silk, muslin, calicoes, cotton, and other piece-goods; opium, saltpetre, gum-lac, and indigo. Rice, wheat, &c. can only be reckoned casual branches of trade. Bengal has an inland trade with Thibet, which it supplies with cottons, besides some wine and clothes of European manufacture, receiving in exchange musk and rhubarb; and a much more extensive commerce with Agra, Delhi, and their adjacent provinces, in salt, sugar, opium, silk, silk stuffs, and an immense quantity of cottons and muslins. The mistress of trade of Bengal, managed by the natives of the country, has been divided into two branches, viz. that of Cuttack by means of its port Balmore with the Maldives, whether they transmit rice, coarse cottons, and fine silk stuffs, and where they receive in exchange cowries, used for money at Bengal, and sold to the Europeans. The inhabitants of Cuttack also carry on a considerable trade with the coast of Africa, to which they supply with faith in great quantities, reckoning in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk. A more considerable branch of trade, which the Europeans carry on with the rest of India, is that of opium, which is cultivated at Patna. The Dutch send rice and sugar to the coast of Coromandel, for which they are usually paid in specie. They have also formerly imported Cotton with rice, Malabar with cottons, and Surat with silk, whence they brought back cotton, usually employed in the coarse manufacture of Bengal. Some ships laden with rice, gum-lac, and cotton stuffs, are sent to Bal- fora, and return with dried fruits, rice, sugar, and gold. The rich merchandise carried to Arabia is paid for entirely in gold and silver.

The articles that are disposed of to advantage in Bengal, are all kinds of spices, Japanese copper, sandlewood, and Japan wood, and also tin, lead, pewter, and other European commodities, of various kinds. See EAST INDIA COMPANY, and CALCUTTA.

Bengal is peopled by various nations, but the principal are the Mogul, or Moors, and the Gentoo, Hindoos, or Bengalee, and both the Bengalees and Moors have each a distinct language. The Moguls, or Moors, are descendants of those who between two and three centuries ago reduced this kingdom, and the whole empire of Hindostan, under their dominion. They were originally natives of Tartary. They yearly re-

linda the Europeans in traits and features; but they are or left from them in color. The Moguls are called the Hindoos in the Indian language, and are distinguished white. The women are very handsome, and much the same as the men, who are of an olive colour, and different from the women of Europe. Their hair is black, and their bodies short. According to the account, the Mogul woman are chaste, very frugal, and bring forth with much care, that they frequently wash the streets the very next day after delivery. Stavovus says, that their morals are universally bad, and that they are addicted to the most unnatural vices. The Moguls are more courageous than the Bengalees; and their "Sipahis" form good soldiers when they are trained and commanded by European officers. Their religion is that of Mahomet; and consequently they hold in abhorrence the idolatry of the Gentooos. The Bengalees, who are much more numerous than the Moors, do not differ much from the Europeans in stature; their colour is dark brown; the complexion of some of them approaches to yellow; their hair black and uncurled; and they are generally handsome and well made. They are moderate, licentious, and voluptuous; and nothing but hangings or thirst routs their activity. Some of them, however, are intelligent and ingenious; and though most of them are poor, some of their banyans, or merchants, are very wealthy, and very expert in matters of trade. Their women are said to be uncommonly wanton and intriguing: prohibition is not thought by them a disgrace; and they have licentious places, in which the law allows them, under a certain allowance, to distribute their favours. Their artificers in gold and silver are very ingenious, and imitate any model that is fast before them with great exactness. Europeans are often surprized to observe the perfection to which they have arrived in those branches of spinning cotton, and of repairing muslins that are torn, and in almost all the handicraft operations in which they are employed. The common people go almost naked. They wear nothing but a piece of linen, wrapped round the waist, and palled between the legs. Those of a higher rank have a dres of white cotton, which doubles over before as high as the shoulders, and is fastened with lings round the middle, and which hangs down to their feet. Most of them shave their heads, and eradicate the hair from all parts of the body. Rich people wear turbans, and many of them wear small ear rings. The dres of the women consists of a piece of cotton cloth thrown over the shoulders, under which they wear a kind of coat and drawers. Those who can afford it adorn their hair with gold bodkins, and their arms, legs, and toes with gold and silver rings and bands, and also their ears, and the ear-trapping of the nose. The inferior women wear familiar ornaments, made of a sort of cowries, and called "chance." Their heads are bare, and their hair turned up, and fastened at the back of the head. Rice is the chief article of their food, the remainder of which consists of vegetables and milk. They eat no fish, flesh of animals, nor any thing that has had life. Their beverage is pure water.

Both the Moors and Bengalees are fond of the amusement of dancing; and for this purpose they employ young women, who are trained up from their infancy to this diversion, and who are richly decorated whenever they are engaged to perform. Dancing is accompanied with music, both vocal and instrumental. For an account of the other inhabitants of Bengal, see GENTOOOS and HINDOOS. See also BRAMINS and FAKIRS. Besides these, several of the eastern nations, Persians, Armenians, and others, resort to Bengal, allured by the advantageous trade which they are enabled to pursue there.

Four European nations have established themselves in Ben-

B 2
BENGAL.

Bengal, for the purpose of commerce, viz. the English, the Dutch, the French, and the Danes. The English are the principal, and their chief settlement is at Calcutta, the present capital of the country. (See Calcutta.) Europeans lead, in Bengal, a very easy life. The men, who are almost all in the service of the company, devote a part of the morning to business, and perform of fortune keep in daily employment a black writer, for which he receives 20 or 25 rupees per month. They spend the remainder of their time in personal improvement or recreation. Besides the black writers, most Europeans have also one or two banyans, who note down all payments and receipts, and who attend all pecuniary matters in buying and selling. Moorish domestics are kept for the menial services of the house, and "peons," to run before the palankeens, and to carry an umbrella, or parasol, over the head of their master, when he goes out; and every house has likewise a porter, whose sole occupation is to answer the door; and one or two sets of "berras," or palankee brewers, together with a "harry-maid," or "matarani," who carries out the dirt; and a great number of slaves, both male and female.

The current coins in Bengal, and in the whole extent of Hindostan, are gold and silver Rupees; which see. See also Mohur. Copper coin is not seen in Bengal. For change they make use of cowries, 85 of which make a "poult," and 60 or 65 cowries, according to the scarcity or plenty of cowries in the country, make a Rupee. However, there is great variation in the value of cowries in Bengal. Weights are calculated by the Sar, answering nearly to two pounds avoirdupois, of which 40 make a maund; which see. The measures of length are cobidos, and gefs or gefs, which see. Diftances between places are measured by coins. See Coss. The vessels used for inland navigation are burs, budgetors, and pulwahas, which see. The general enumeration of passengers by land is on a fort of letters, called palankeens, which see. For an account of the manners and customs of the inhabitants of Bengal, and various other particulars; see Calcutta, Hindostan, and India. See also Gentoo, Hindoo, and Brahmin.

Bengal, bay of, is a large gulf in the Indian ocean, between the two peninsulas of India; bounded on the north by the coast of the province of Bengal, on the east by the kingdoms of Arakan, Pegu, Siam, the peninsula of Malaca, or Malaya, and part of the island of Sumatra; on the south by the great Indian ocean; and on the west by the coasts of Onfha, Coromandel, and the island of Ceylon. The Ganges and several other rivers, discharge themselves into this gulf; it contains many islands; and it abounds with bays, harbours, and port towns. Its widest extent is about 86 leagues, and its length about 72 leagues. In a more confined view it may be said to begin at cape Palmaris.

Bengal, Language of, or Bengalee, is derived from the Sanscrit (which see), and dilithed from the Persian, Moors, and Hindoustanic, which are spoken in several parts of this province, and each of which has its peculiar department in the business of the country. Its alphabet, like that of the Sanscrit, consists of 50 letters, of the form, found, and arrangement of which Halhed has given a very particular and detailed account in his "Grammar of the Bengal Language," printed at Hoogooy in Bengal in 1778. The only impediments in acquiring the knowledge of this language are the great number of letters in its alphabet, the intricate variety of their combinations, and the difficulty of pronunciation; but the grammatical part is simple, though diffuse, and complete without being complex. Its rules are plain, and its anomalies few. The vowels are distributed into long and short, the latter of which are often omitted in writing, and they are invariably subjoined to the consonant with which they are uttered, and never precede them. At every consonant, therefore, inherently pooffies the short vowel on which its utterance depends, it is plain that no two consonants could have been joined together, and successively pronounced in the same syllable, but that a vowel must necessarily have intervened. In order to remedy this inconvenience, a set of distinct characters was invented, called "P.holaas," or adjuncts. These are certain interdinate and subsidiary figures, eleven in number, that may be attached to each of the consonants in the alphabet respectively, and thus provide against the too frequent recurrence of the internal vowel. Exclusively of these "P.holaas," almost any two or three consonants may be blended together, for supplying the omission of the internal vowel. The compound letters may be formed by placing one letter immediately under another; or by blending two letters together, so as by their union to make one character; or by making the first of the two consonants much smaller than the other letters: which latter mode is the most common. The genders of this language are three, and the terminations usually distinguishing the masculine are "he," and those of the feminine are "ee," but it is not necessary that every noun comprehending be shouled be distinguished by a particular termination, or mode of formation, expressly to denote its gender. The Bengalese has four cafes besides the vocative, and in this respect it is much inferior to the Shanfcr, which comprehends eight different cases. The Bengali nouns have neither dual nor plural numbers; and the same form of noun serves for the singular or plural. In compositions of this language, though the first and second persons occur very frequently, the use of the pronoun of the third is very rare; and in order to avoid the application of the words he and they, the names of persons are repeated in a manner that is very tiresome and disfiguring. The second person is always ranked before the first, and the third before the second. The personal pronouns have seven cases, which are very irregularly varied. The indefinite pronouns are all aptotes in Bengalese, as they are in Latin and Greek. The Shanfcr, which is the parent of the Bengalese, as well as the Arabic, Greek, and Latin verbs, are formed with a set of inflections and terminations, so comprehensive and so complete, that by their mere form they can express all the distinctions both of person and time. By their root they denote a particular act, and by their inflexion they express the time when it takes place, and the number of the agents; and thus their separate qualities are perfectly united. Every Shanfcr verb has a form equivalent to the middle voice of the Greek, used through all the tenses with a reflective fene, and the former is the most extensive of the two in its use and office; because in Greek the reflective can only be adopted intrinsically when the action of the verb depends to no extraneous subject: but in Shanfcr, the verb is at the same time both reciprocal and transitive. Neither the Shanfcr, nor the Bengalee, nor the Hindostanee, have any word corresponding to the fene of the verb have, and therefore the idea is always expressed by ofi mihi; and of course there is no auxiliary form in the Bengalese verb answering to have written, but the fene is conveyed by another mode. As the verb substantive to be in all languages is defective and irregular, it is called in Shanfcr a "semi-verb;" and it is observed, by the ingenious writer above cited, that the present tense of this verb, both in Greek and Latin, and also in the Persan, appears evidently to be derived from the Shanfcr. In the Bengalee, this verb has only two distinctions of time, the present and the past; and the terminations of the several persons of these fene as a model for those of the same tense in all other verbs.
The Bengalese verbs may be distributed into three classes, which are distinguished by their penultimate letter. The simple and most common form has an open consonant immediately preceding the final letter of the infinitive. The second is composed of those words whose final letter is preceded by another vowel or open consonant going before it. The third consists entirely of cautes, derived from verbs of the first and second conjugation. The Greek verbs in are formed exactly upon the same principle with the Sanskrit conjugations, even in the most particular; of which instances occur in many verbs, which form from a root a new verb by adding the syllables, α and β (Bengal) or Δ (Gimlik) belonging to the first conjugation. In forming the past tense, the Shanferit applies a syllabic augment, like the Greek; and the future is characterized by a letter analogous to that of the same tense in the Greek, omitting the reduplication of the first consonant. Nor, indeed, is the reduplication of the first consonant always applied to the present tenses of the Shanferit, any more than to those of the Greek. It is observed, that the natural simplicity and elegance of many of the Asiatic languages are very much debased and corrupted by the continual shufle of auxiliary verbs; and this inconvenience has evidently affected the Persian, the Hindostan, and the Bengalee idioms. The infinitives of verbs in the Shanferit and Bengalee, are always used as subiective nouns; and a similar mode of figurative often occurs in the Greek. In the Shanferit language, as well as in the Greek, certain forms of infinitives and of participles comprehend time; and there are also other branches of the verb that seem to resemble the gerunds and infinitives in the Latin. All the terms which serve to qualify, to distinguish or to augment, either "subiective" or "action," are claffed by the Shanferit grammarians under one head; and the word used to express it literily signifies increase or addition. According to their arrangement, a simple subject consists of three members, viz. the agent, the action, and the subject: which, in a grammatical sense, are reduced to two, viz. the noun and the verb. They use a particular word for specifying such terms, as amplify the noun, which imports quality, and corresponds to our adjectives or epithets. Such are applied to denote relation or connection, are expressed by another term, which may be translated "proposition." The simple adjectives in Bengalee have no variation of gender, case, or number; neither the subject adjective to inflection, but the sign of the case is confined to the substantive, with which it agrees; and its form is confined to the singular number, even when joined in a plural noun. But the de- resent attributes, which are alternately adjectives and concrete nouns, generally preserve the distinctions of gender, which they all possess in the Shanferit. Propositions are substitutes for cafes, which could not have been extended to the number necessary for expressing all the several relations and predicaments in which a noun may be found, without occasioning too much embarrassment in the form of a declaration; thence in the Greek language are too few, and hence results great inconvenience. The Latin, which is less polished than the Greek, bears a nearer resemblance to the Shanferit, in words, inflections, and terminations.

The Bengalee method of computation, among the merchants, for the largest sums is by "hars," derived probably from the original mode of numbering by the fingers. To this day the Bengalee reckon by the joints of their fingers, beginning with the lower joint of the little finger, and proceeding to the thumb, the value of which is also included in the number, the whole hand containing 15. From this method of performing numerical on the joints, arises that well known custom among the Indian merchants of letting all matters of purchase and sale: by joining their hands beneath a cloth, and then touching the different joints, as they would increase or diminish their demand. See BANIAN.

It is peculiarly in the Bengalee computation, that the ninth numeral of every series of ten is not specified by the term of nine, in the common order of progression, but takes its appellation from the series immediately above it, as twenty-nine is not expressed in our manner, or by what we should conceive to be its proper denomination, but by a term denoting one less than thirty.

The Shanferit language, besides other advantages, has a great variety in the mode of arranging its vowels; the words are so connected together, that every sentence seems to be one complete word. When two or more words come together, "in jarring," the last of them only has the termination of a case; the others are known by their position; and the whole sentence, so connected, forms but one compound word, which is called a "foot."

For further particulars relating to the language of Bengal, its grammatical construction, and the method of acquiring it, we must refer to Hallad. 

The verbs of the Bengalee are regulated by accent, and by the number of syllables in a line; no regard whatever being paid to quantity, but as it coincides with accent. Their pooms, like those of the Arabsians and Persians, are in rhyme; and the Bengalee poets have many rules for controlling such words as are too long, and for extending those that are too short, for their metre. The Bengalee measures are altogether borrowed from the Shanferit, and may be divided into three species, viz. heroic, lyric, and elegiac.

In music, the Bengalee always use the minor key, and their gamut proceeds by the very small intervals of the chromatic scale. They have no idea of counterpoint, and always play or sing in unison or octaves.

The natives of Bengal write with a slender and tough reed, very common in all the east, which they shape almost like an European pen. They write with the hand closed, in which they hold the pen as the Chinese do their writing-pencil; pressing it against the ball of the thumb with the tip of the middle finger. The nib or point of the pen is turned down towards the wrist; while the thumb pointing upwards, and lying on the pen with its whole length, keeps it firm against the middle joint of the fore-finger. As they have neither charts nor tables, they fix upon their hands, or sometimes on their hams, whilst they are writing; and their left hand, held upon, serves as a desk on which to lay the paper on which they write, which is kept in its place by the thumb.

BENGALIENSIS, in Conchology, a species of 

Venus, described by Lillier. The shell is oblong, somewhat equilateral, with thick perpendicular flanks, and the beak turned back. inhabits Bengal.

BENGALIENSIS, in Ornithology, a species of Vultur, found in Bengal. It is of a brown colour, with the head and fore-part of the neck bare of feathers, and pair chieftain; bill lead colour, black at the tip. Linnaeus. Indien.

BENGALIENSIS, a species of Oris, called by G. Edwards the Indian Bipland. The colour is black; space round the eyes brown; back, rump, and tail, shining brown. Gmelin. Indien.

BENGALIENSIS, a species of Rallus, of a white colour, with the head and neck black; wings and back greenish, primary quill feathers spotted with red. Gmelin. This is the
BEN

the Bengal water-rail of Albin; Tattanus Benghalensis of Trillon; and Cheviller vert at Buffon. The bill, irides, and legs are yellow; crown, area of the eyes, lower part of the back and body beneath white, temples and throat black brown; primary quill feathers purple, secondaries green; tail purple, with fulvous spots.

BENGALLA, in Geographer, a city of Hidostan, which existed during the early part of the 17th century, near the eastern mouth of the Ganges, but of which no traces now remain.

BENGASI, or Berniche, a chief-port town on the coast of Africa, in the Mediterranean. The merchants of this place usually join the caravan from Cairo at Anga in their way to Mazar, the capital of Perz, and import tobacco, manufactured for chewing, and snuff, and sundry wares fabricated in Turkey. N. lat. 32° 10'. E. long. 26°. This town is said to be the ancient Berenice, built by Ptolemy Philadelphia.

BENGUILLA, a town of Peru, in the province of Segudn, 346 miles south of Zareng.

BENGUL, a town of Peru, in the province of Calbi, 32 miles north of Cabil.

BENGUL, or Bengo, a mountain of Scotland, in the county of Perth, the highest point of which is said to be 3744 feet above the level of the sea; 5 miles N. E. of Blair Athol.

BENGUL, or Benga, a province of the kingdom of Angola in Africa, situated on the river of its name, but more commonly known by that of Zenza. It has the sea on the west, and the province of Mofco on the east. The Portuguese have cultivated large tracts of land in this province, which now abounds with maize- and manioc root, with which they make their bread. It produces also plenty of banana and bacco trees. It is divided into several districts, of which the chiefs are natives, though tributary to Portugal.

The inhabitants are Christians, and have eight churches.

BENGORE HEAD, a cape of Ireland, on the north coast of the country of Antrim, 10 miles N. E. of Coleraine. N. lat. 5° 15'. W. long. 6° 15'.

BENGUELA, a province of Angola in Africa, retaining the name of a kingdom, bounded on the east by the river Rumba, or Cumari, on the north by the Coanaza, and Culogi, at about 16° 51'. S. lat. and reaching westward quite to Cape Negro, according to the generality of geographers. But M. de Lisle extends it no farther north than Old Benguela, in 9° 54', and according to him, it is bounded on the east by the Giiga Calangi, or Giigane chief, and on the south he places the province of Olba, between the Hotentots and Benguela, which tract is mostly inhabited by such savage nations as the Caffres and Giigas. Benguela was formerly governed by its own kings; and most parts of the kingdom were fertile and populous; but it suffered so much from the incursions of the Giigas, and its wars with neighbouring states, that, with the protection of the Portugese, they have not been able to recover their importance. Its valuable productions are similar to those of Angola and Congo; and from the humility of the soil they have two fruit seasons in the year. It furnishes likewise a considerable quantity of fowl, though of inferior quality to that of Chilima. The Zimbas, whose fields are current as money through several parts of Africa, are caught upon its coast, and pass in payment either by weight or measure. The country, being mostly mountainous, swarms with wild beasts, such as rhinoceros, elephants, and wild mules. The lions, tigers, crocodiles, and other carnivorous animals, destroy great numbers of their cattle. Their fertile plains towards the sea-side formerly produced numerous herds of cattle, both small and great, but they are now become very scarce. The air of the country is so wholesome as to afford its produce, and take even its waters. Few Europeans have, therefore, ventured to visit it, so that it remains in a great degree unknown. The chief towns are Old Benguela, St. Philip, or New Benguela, Mankikondo, and Katchik. The commerce of slaves is so prevalent in this province, that the natives will sell their relations or children from mere wantonness.

BETINGUELA, Old, a town of Africa, in a province to call-d, south of a bay of the same name, near the Atlantic ocean. The town is situated on a high mountain, near large beves, sheep, poultry, and other provisions, have been told in great plenty, together with elephants' teeth; all which the inhabitants have bartered for muskets, and other firearms. S. lat. 14° 5'. E. long. 15° 30'.

BENGUELA, New, or St. Philip, a town in the province of Benguela, seated on the south of a large bay, about 2 leagues long and 1 broad, called by the Portuguese "Bahias-des-Vaces," where they have a settlement and a fort, with a small garrison. S. lat. 12° 5'. E. long. 12° 20'.

BENIHADAD, or the Son of Adad, in Scripture History, the name of several kings of Syria. Benahadad I. was the son of Tabrimon, and began his reign about the year 904 B.C. He was induced by envy to profess to aid Ahab, king of Judah, against Damascus, king of Israel, whom he obliged to return to the succession of his own country, and to abandon Ramah, which he had undertaken to fortify. 1 Kings, xvi, 18, &c. Benhadad II. was the son of the preceding, and his accession to the throne of Syria is dated to have taken place about the year 901 B.C. In his war against Ahab, king of Israel, he was totally defeated; and in the following year, renewing his attack upon the Israelites, in the plain of Aphek, he lost a great part of his army, and was reduced to the necessity of submitting to the mercy of Ahab, by whom he was treated kindly, and allowed to return peaceably into his own country. In a new war for the recovery of Ramoth-Gilead, the possession of which was retained by Benhadad, Ahab, joined by Jehoshaphat, king of Judah, marched against the Syrians, and a battle ensued, in which Naaman was the general of the Syrian army, and Ahab lost his life. Benhadad having afterwards laid siege to Samaria, and failing in his attempts to reduce it, fell sick; and sent Hazael his minister, to the prophet Eliahu, with presents, in order to consult him concerning the issue of his disorder. Hazael, on his return to Damasus, informed Benhadad that his health would be restored; but Eliahu having predicted that Hazael would succeed to the throne of Israel, the minifter accomplished the prediction by rushing Benhadad with a wet towel. Benhadad was reckoned a great prince, who contributed to advance the glory of his country, and his memory received divine honours in Syria. 1 and 2 Kings. Josaphus Ant. i. viii. and ix. Benhadad III. succeeded his father Hazael on the throne of Syria, in the year 856 B.C. After having been several times defeated by Josiah, king of Israel, he was expelled from all his father's conquests. 2 Kings. Jof. Ant. i. ix.

BEN-HINNON, or Geh-hinnom, the valley of the children of Hinnom, lay in the south-east suburbs of Jerusalem. See Gehenna.

BENI, Paul, in Biography, a learned writer, was born in Candia, about the year 1552, and educated at Engubio in the duchy of Urbino. In early life he entered among the Jesuits; but afterwards quitted them. He was for some time professor of theology at the college of Sapienza at Rome; of philosophy, at Perugia; and of rhetoric and belles lettres, in the university of Padua, from 1590 to the time of his death in 1625. He was more lively than judicious;
close; fond of maintaining singular opinions, and much engaged in literary controversies. He attacked the dictionary of La Crucefa, in a work entitled "Anti-Crucefa, &c." and defended Tanis, whom, with Anello, he preferred to Horace and Virgil. He also wrote on the pastor-fido of Guarini. All these works were written in Italian. The most considerable of his Latin productions are, "Commentaries on the poetry and rhetoric of Ariosto," Venice, 1627; "A poetical and rhetorical extract from the works of Plato," "Commentaries on the first books of Virgil, and on Salvius," "Disput. de annal. Eccl. Card. Boroni," and "De Historia Scribenda," lib. iv. Ven. 1611, 4to. All his works were printed at Venice, in 5 vols. fol. Gen. Dict. Nat. Dist. Hist.

BEN AIWOS, in Geography, a district of the western province of Algiers, about N. lat. 35° 45'. E. long. 30° 5'.

BEN Anesl, one of the eighteen provinces into which the Turks divided Algiers, so called from its capital.

BEN After, a town of Upper Egypt, on the east side of the Nile; 2 miles north of Alna, or Efeln.

BEN After, a town of Egypt, on the east side of the Nile, remarkable for its grottes, dug in the mountains, which were formerly temples; 6 miles north of Achmounin.

BEN Heta, called by Leo Africanus Habat, a province of Morocco, bounded to the north by the river Mamora, and extending south to that of Sarat: 4 leagues from Rabat, to the east, are the provinces of Fez and Tessa, and to the west the ocean. This province is very extensive, rich, and commercial; and produces wool of a very excellent quality.

BEN Jarch, a town of Egypt, on the west side of the Nile, 12 miles mouth of Achenouanin.

BEN Headab, and BEN Hozab, two districts of the western province of Algiers, bordering on the Mediterranean, about N. lat. 36° 30'. and E. long. 2° 12'.

BEN Jabar, mountains of Algiers, lying about 20 miles south of Beyjeha, or Bagja, and extending a considerable way along the coast, both in length and breadth, being parts of the little Atlas. They are steep and rugged, and furnish a great number of streams. They abound with fruit-trees, especially walnuts and limes, and produce plenty of barley, with which the inhabitants feed their numerous herds. The people are warlike, and have a great deal of their own, and among them are excellent archers; and the whole ridge hath several villages, inhabited by the tribe or people whose name it bears.

BEN Maran, a town of Egypt, 9 miles south of Achenouanin.

BEN Menafer, a district of the western province of Algiers, about N. lat. 36° 30'. and E. long. 2° 42'.

BEN Mezab, a district of the eastern province of Algiers, between 12° and 33° N. lat., and from 7° to 7° 10' E. long. This district is destitute of water, except that which they draw from wells.

BEN Mida, a district of the western province of Algiers, N. lat. 35° 45'. E. long. 2° 12'.

BEN Mijur, a town of Egypt, on the west side of the Nile, 3 miles south of Abu Gerge.

BEN Moha'rit II Ryur, a town of Egypt, west of the Nile, and 4 miles south of Abu Gerge.

BEN Reyhad, a town of Egypt, north of the river Shefiff and near it. N. lat. 37° 10'. E. long. 2° 10'.

BEN Mihnt, a town of Egypt; Situles N.W. of Marfeliou. BEN Smou, and BEN Smoufs, two adjoining districts of the western province of Algiers, on the confines of the Tell, about 35° N. lat. and between 18° and 17° E. long.

BEN Zeneel, a district of the western province of Algiers, to the north of the Monte Chahriqin, and east of the river Mala, or Mullouah; about 34° 34' N. lat. and 19° 30' W. long.

BENZ Zentola, a branch of Mount Atlas, in the western province of Algiers.

BENZA, a river on the coast of Africa, 3 leagues E.N.E. from Asperita, and E. from Comenda.

BENJAMIN, in Biography, the younger son of Jacob by Rachel, and one of the twelve patriarchs of Israel. He was the object of his father's peculiar affection, and reluctantly permitted to accompany his brethren to Egypt, when his return with them was made by Joseph the condition of their receiving supply of corn. Joseph, who was his only brother by both parents, treated him kindly, and contrived a pretext for detaining him in Egypt, but he afterwards, when he disclosed himself, permitted him to return to his aged father. The tribe of Benjamin, which formed part of Judah, properly so called, lay between the tribes of Judah and Joseph contiguous to Samaria on the north, to Judah on the south, and to Dan on the west, which last parted it from the Mediterranean. It had not many cities and towns, but this defect was supplied by its possessing the most considerable, and the metropolis of all, the celebrated city of Jerusalem. The other cities were Jericho, Gibsam, Bethul, Gibeah, Hal, Gilgal, Anathoth, Nebos; to which may be added the two noted villages of Bethany and Gethsemane. This tribe was at length almost exterminated by the others, in revenge of the violence offered to the concubine of a Levite, in the city of Gibeah. Genus: Joshua, Judges.

BENJAMIN, of Tudla, a city of Navarre, a Jewish rabbi, flourished in the 12th century. Possessed of a rhetorical genius for the law of Moses, and licentious to visit his countrymen in the cold, whom he hoped to find in such a state of power and opulence as might redound to the honour of his feet, he set out from Spain in the year 1160, and travelling by land to Constantinople, proceeded through the countries to the north of the Euxine and Caspian seas, as far as China's Tartary. From thence he took his route towards the south, and after travelling various provinces of the farther India, he embarked on the Indian ocean, visited several of its islands, and returned, at the end of 13 years, by the way of Egypt, to Europe, with much information concerning a large district of the globe, altogether unknown at that time, to the western world. He died in 1175, but long after his return from his travels. His "Historical" contains a narrative of his travels, intermixed with many fabulous accounts, that serve to raise the credit of his nation. Calpur Oudin, however, (Comment de Script. Eccl. tom. ii. col. 1521. Laps. 1722.) represents him as a man of sagacity and judgment, and well-skilled in the sacred laws; and says that his observations and accounts have been found upon examination to be generally exact, and that the author was remarkable for his love of truth. The first edition of the itinerary appeared at Constantinople in 1549, with a translation from the Hebrew into Latin, by Benedict Arias Mantuan; and it was printed by Plantin, at Antwerp, in 1575, 8vo. It was afterwards translated by the emperor Constatine, and his version was printed at Leyden, by Elzevir, in 1637, 8vo. A French translation of it was published by John Philip Baratier, in 1734, 2 vol. 8vo. Robertson's America, vol. i. p. 45. Gen. Dict.

Benjamin Tree. See LAUPUS.

Benjamin in Pharmacy. See BENJAMIN.

BENJAR RIVER, in Geography. See BENJAMIN.
BENIFADJO, a town of Spain in Valencia; 5 leagues from Valencia.  

BENIFAO, a town of Spain in Valencia; 3 leagues from Benifadjo.  

BENILET, a town of Asia, in the Arabian Trak; 145 miles N.W. of Diffahco.  

BENIMERIN, the denomination of an African dynasty, which succeeded that of the Almohadees, which see.  

BENIN, an extensive kingdom of west Africa, comprehending the slave coast, bounded on the west by Guinea proper, or, more particularly, the Gold coast; on the north by Bagno, Nigritia, and a chain of mountains; on the east by Muscarak and Makoko, and part of Congo, with the Ethiopean ocean; on the south, where it extends about one degree beyond the equinoctial line. It is commonly divided into three parts, viz. Whydah and Ardrah, containing the Slave coast, and Benin proper, which has the same boundaries with the former on the north, east, and south, and is terminated on the west by part of the gulf of Guinea and the Slave coast. Its extent from west to east is about 600 miles, but from north to south it is not ascertained. From the river Lagos, where it commences, its coast forms a gulf or bay, ending at cape Lopez, in which are the trading places, or villages, seated on several rivers, of Benin, Bonny, Old and New Calabar, Camaron, and Gabon. Benin is watered by several streams, of some considerable rivers. Towards the sea-coast the land is low and marshy, and of course the climate unhealthy; but at a greater distance from the sea the land rises, and the air is more pure. In some districts of the country, water is so scarce, that travellers are often supplied with it for money by officers, to whose department it belongs. The rivers teem with crocodiles, sea-horses, a particular species of torpedo, and various kinds of excellent fish. The country abounds with elephants, tigers, leopards, wild boars, asses, civet and mountain-cats, hares, hare, and hairy facex; and among its birds the principal are parrots, pigeons, partridges, flocks, and drachers. The soil is generally fertile, and produces a great variety of trees and plants, such as orange, lemon, and cotton trees. The pepper of this country is not so plentiful nor so good as that of the East Indies. The native negroes are in general mild and good humoured, civil to strangers, and yet referred, easily wrought upon by gentle means, but inflexible and refractory in resisting harsh treatment. In the conduct of bussinesf they are expert; but attached to their ancient customs and manners, which renders them fond and tedious in their negotiations. Honest and faithful in their dealings, they seldom or ever disappoint the confidence that is reposed in them. Their trade is carried on by a kind of brokers, called mercadores, or fidors, who treat with strangers about all merchandise; but all their contracts are made with great secrecy, through fear of exciting the jealousy or aversatce of their governors; and the richest persons exhibit the appearance of poverty, in order to escape the rapacious hands of their superiors.  

The population of Benin is distributed into three classes of persons. The first is composed of three persons, called great lords, who attend the king; and present petitions to him. Such is the influence of these, that the supreme government may be said to be lodged with them. The next class consists of those petty princes called "ares de rey," or direct kings, of whom some preserve over the commerce, others over the slaves; some over military affairs, and others over every thing pertaining to cattle and the fruits of the earth. Out of this class are chosen the viceroy's and governors of provinces, who are responsible to the three great lords, to whose recommendation they owe their appointment. Each of them is prefixed by the king with a firing of coral as a badge of office, which he is obliged always to wear about his neck, under the penalty of degradation, and even death. The third order consist of the fidors, the merchants, or merchants; the founders, or pleaders, and the vellies, or exiles, all of whom are respectively distinguished by some peculiar mode of wearing the coral chain. The lowest class is formed by the plebeians, who are generally indolent and poor. The whole burden of labour, such as tilling the ground, spinning cotton, weaving cloth, and even clearing the forests, is devolved upon the women. The chief workmen are smiths, carpenters, and leather-makers; but in every occupation of this kind they are extremely awkward and artless. The common diet of the natives is beef, mutton, or fowls, and their bread is made of yams, beaten into a sort of cake. The meal is usually made upon a fried, and bread made of yams, bananas, and beans, mixed together. The drink of the poor is water, and that of the richer, water mixed with European brandy. The king, and persons of rank, support a certain number of poor, selected from the blind, lame, and infirm; the lazy, who will not labour, are suffered to starve; and by this excellent police, not a beggar or vagrant is to be seen. The natives of Benin are distinguished by their liberality; but in the exercise of it they are extravagantly vain and ostentatious. The dress of the natives is neat and ornamental; that of the rich, in which they appear in public, consisting of white calico, or cotton drawers, covered with another fine piece of calico plaited in the middle, and bound under a scarf, the ends of which are adorned with a handle lace or fringe. The upper part of the body is mostly naked. The ladies of better fashion wear fine calico, beautifully chequered with various colours. The face and upper part of the body is covered with a thin veil, and the neck adorned with a flying and chain of coral. Upon their arms and legs they wear bright copper or iron bracelets, mostly wrought. The persons of the women are not disagreeable. The children go naked till the age of ten or twelve years; their whole dress, before this period, consisting of a few bindings of coral tied round the waist. The men neither card nor adorn their hair; but they form part of it into locks, to which they suspend a bunch of coral. The women drefs their hair with great art in a variety of forms, and occasionally apply to it a kind of nut-oil, which destroys its black colour, and in time changes it into green or yellow. The men marry as many women as their circumstances allow; but they have no strictly nuptial ceremony. Jealousy is very prevalent, and adultery is never punished; but the violation of the marriage-bed is less known in Benin than in any other country. Male infants, as soon as they are born, are presented to the king, as rightfully belonging to him; but the females, being deemed the property of the father, are left wholly to his care and disposal. Both male and female children are circumcised, when they are about a fortnight old; and they are marked over their bodies with various incisions, that express certain figures. In some parts of Benin twin births are reckoned a happy omen; but at Akerbo, they are reputed a bad omen, and both the twins and their mother
mother are put to death. The inhabitants of Benin are less afraid of death than the other natives of the same coast. Such is their attachment to their own country, that those who die in other provinces are preferred for years, till they can be conveyed for burial to their native soil. On occasions of mourning, which is usually limited to 14 or 15 days, some shave their hair, others their beard, and others but half of either. The left obsequies of their kings are performed with some very extraordinary ceremonies. When the tomb is laid, they crown it with a banquet of the most delicate wines and sweetmeats, of which all are allowed to partake; and the mob, intoxicated with liquor, are guilty of the wildest excesses and riots. Those who obstruct them, as men, women, children, and even brute animals, are put to death; and having cut off their heads, they carry them to the royal palace, and throw them in as offerings to the deceased king, together with all the clothes and effects of those whom they have sacrificed to his majesty. Nevertheless, amid these barbarous customs, the kingdom of Benin is governed by laws, which breathe nothing but humanity, and sympathy for misfortune and distress.

As to the religion of this country, it is a strange mixture of good sense and absurdity. With some just notions of a Supreme Being they blend many absurd and idolatrous ceremonies. The “Tetiflo” is worshipped here, as well as in all the other countries on the western coast of Africa. To every evil they give the name of devil, and worship him from fear, and to prevent his doing them injury; and they honour both God the Creator, and the evil spirit, by sacrificies and offerings. They are believers in apparitions; and they conceive that the ghosts of their deceased ancestors walk on the earth, and occasionally appear to them in their sleep, to warn them of their danger, which they endeavour to elude by sacrificies. All their houses are full of idols, and they have particular huts or temples for the residence of their gods. Their priests also are numerous, and the grand, or high priest of Lecbo, a town seated at the mouth of the river Formosa, is particularly famous for his skill in magic, and is never approached without the most profound reverence and awe. Baffles their Sabbath, a day of repos which occurs every fifth day, they have many other days appropriated to religious purposes. At some of their feasts they sacrifice not only a great variety of brutes, but likewise a number of human victims, who are usually condemned criminals, reserved for this purpose. They have one annual feast in commemoration of their ancestors; but their greatest festival is that called the coral feast, on which day alone the king appears to his people in great pomp, attended by 600 of his women. Wine and provisions are distributed on this occasion among the people, and the day ends in gluttony, drunkenness, and riot.

The government of Benin is despotic. The empire is divided into a great number of petty royalties, all of which are subject to the king of Benin, whose authority is absolute, and commands the most blind and servile obedience. The reigning monarch, when he apprehends his dissolution to be approaching, commands one of his foes to kill the throne, with an infraction, under pain of death, not to reveal the secret till after his death. When this happens, the defined sovereign is removed to the town of Lecbo, a few miles from Benin, the capital, where he remains for some time to be instructed in the art of government, and the duties of a king. Upon his return, his first care, for securing his future tranquillity, is to murder his brothers, and thus to remove every rival to the crown. The royal revenues are very considerable; so that every governor contributes a large sum; and the inferior officers pay their taxes in cattle, fowls, cloth, and other commodities. Certain duties are also laid upon foreign trade; besides the annual taxes paid to the governor for the privilege of commerce, a sixth of which belongs to the king. It is said that the sovereign of Benin is a powerful prince, that, in one day, he can assemble an army of 20,000 men, and in a few days more 100,000. His troops, however, are destitute of courage and conduct; and, indeed, are merely a cowardly tumultuous rabble, which leave him exposed to the incursions of pirates and robbers, that are suffered to pilage and destroy, and sometimes to advance even to the capital. The arms used by them are swords, poniards, javelins, bows, and poisoned arrows.

The capital of this kingdom is Benin. The other principal towns, or rather villages, are Bododo, Arebo, Agatton, Aferri, and Meheberg.

All the slaves purchased on this part of the African coast, except a tribe distinguished by the name of “Moeces,” are called in the West Indies “Eboes,” probably from Arebo, on the river Benin. In language they differ both from the Gold Coast negroes, and those of Whydah, and in some respects from each other; and in complexion they are much more yellow than the others; but their colour is a sickly hue, and their eyes appear as if suffused with bile, even when they are in perfect health. These Eboes appear, in general, to be the lowest and most wretched of all the nations of Africa. The great objection to them is slavery, their constitutional timidity, and dependancy of mind; which lead them very frequently to seek, in a voluntary death, a refuge from their own melancholy reflections. They require, therefore, the gentlest and mildest treatment to reconcile them to their situation; but if their confidence be once gained, they manifest as great fidelity, affection, and gratitude, as can reasonably be expected from men in a state of slavery. The females of this nation are better labourers than the men, probably from having been more hardly treated in Africa. These Eboes, notwithstanding the depression and timidity which they manifest, on their first arrival in the West Indies, and which give them an air of softness and submission, forming a striking contrast to the frank and fearless temper of the Komorantyn Negroes, are in reality more savage than the people of the Gold Coast; infomuch, that many tribes among them, and especially the Moces tribe, have been accustomed to the shocking practice of feeding on human flesh. In their religious worship, they adore certain reptiles, of which the guana, a species of lizard, is in the highest estimation, and in the worship of this animal, it is said, that they offer human sacrificies.

Benin, a city of Africa, and capital of the kingdom above described. It is pleasantly seated on the river Benin, or Formosa, about 60 miles from Agatton, at the mouth of the river, and is said to be 4 miles in circumference, and to contain 30 long, broad, and straight streets of low houses. The streets are adorned with a variety of shops filled with European wares, as well as the commodities of the country, such as cattle, cotton, and elephant’s teeth. In their markets they expose to sale, for food, dogs, of which the Negros are fond; and also roasted monkeys, apes, and baboons. Bats, rats, lizards, dried in the sun, palm-wine, and fruit, form the most luxuriant entertainment, and flesh always exposed to sale in the streets. As the country affords no stone, the houses are built with mud and clay, covered with reeds or straw: and they are separated from one another by chains and rails, that indicate its decay. The entrance into the city is by a gate of wood, which is defended by a bastion of mud and earth: and it is surrounded by a deep ditch 40 feet wide. A guard is stationed at this gate to receive the tolls, duties, and imports collected from the merchandise. None but natives are permitted to enter.
permitted to live in the city; and of these some are wealthy, and carry on an extensive trade, which is committed to their wives, who go to all the circumjacent villages, and traffic in all sorts of merchandise, and who are obliged to bring the greatest part of their gains to their husbands. A principal part of the city is occupied by the royal palace, which is more distinguished by the extent of its dimensions than by the commodiousness or elegance of the structure. All the male slaves in this town are foreigners; for the inhabitants cannot be sold for slaves, and only bear the name of the king's slaves. This is one of the European mart's for the purchase of slaves. N. lat. 6° 10'. E. long. 5° 0'.

BEN, River of, called by Juan Alonso de Aveiro, a Portuguese, who is said to have first discovered the country, Formosa, on account of the verdure and beauty of its banks; a navigable river of Africa, in the kingdom of Benin. It divides itself into several branches; and has some tows or villages on its banks, in which Europeans, and particularly the Dutch, carry on a commerce. Notwithstanding the beauty of its adjacent scenery, the air is noxious and pestilential, on account of the vapours exhaled by the hot sun from its marshy banks; and it is much infested by the mosquito flies. The entrance into this river is in N. lat. 6° 38', and E. long. 4° 47'.

BENACOUR, St. a town of France, in the department of Nièvre, and chief place of a canton, in the district of Nevers. The place contains 1583, and the canton 10,655 inhabitants: the territory includes 350 kilometres, and 21 communes.

BENISH DAYS, among the Egyptians, a term for three days of the week, which are days of love in ceremony than the other four, and have their name from the lefth, a garment of common use, not of ceremony. In Cairo, on Sundays, Tuesdays, and Thursdays, they go to the bath in the day; and there are the general days of bufnifs. Fridays they stay at home, and go to their mosques at noon; but though this is their day of devotion, they never abjure from bufnifs. The three other days of the week are the benish days, in which they throw off all bufnifs and ceremony, and go to their little summer-houses in the country.

BENISOUEDE, Geography, a town of Egypt, on the west side of the Nile. According to Savary, it is half a league in circumference; and Sonini says, that of all the places situated along the Nile, from Cairo, or for the space of more than 50 leagues, this is the largest, as well as the most affluent. The houses are only cottages of brick and earth, coarsely constructed; but the lofty minarets, rising in height with the surrounding date-trees, and discovered through their highest branches, present an agreeable object to the view. A manufacture of coarse carpets renders this a commercial town; and the adjacent plains are fertile and productive, so that the people who cultivate them appear less distressed and wretched than those who live near the capital. Benifouf is the residence of a bej, or, in his absence, of a kiachef, who levies with an armed force his arbitrary tribute. Over against Benifouf lands the village of "Baird," partly inhabited by Copts; and on the same side of the river, and at the distance of 3 leagues, is "Bebe," a large village, the residence of a kiachef, where are a mosque and a convent of Copts. Benifouf lies in N. lat. 40° 19'. E. long. 30° 38'.

BENITO, St. a small island of the north Pacific Ocean, on the north-west coast of America, surrounded with rocks and islets. N. lat. 25° 41'. E. long. 124° 38'.

BENITO, St. or St. Benett, a river of Benin, in Africa, which discharges itself 7 leagues S. by W. from the bight of Biafra, and on the south side of the river Campo, into the gulf of Guinea. On the north side of this river flows a great hill, called the Hayburn. N. lat. 1° 45'. E. long. 8° 10'.

BENIVIENI, Girolamo, in Biography, was born at Florence, in 1452, and contributed under the auspices of Lorenzo de Medici, to reclaim the Italian poetry from its mean and trivial state, and to renew the style and manner of Dante and Petrarch. The principal topic of Benivieni was divine love, which he cloathed with the sentiments of Pindar, and thus obscured the poetical beauties of his works by mysticism. He was esteemed on account of his integrity and virtue, and employed by Pico, prince of Milan, as his almoner. He died at Florence in 1532, and was buried in the same tomb with his friend Pico. His works were printed at Florence in 1500, and again with additions in 1510. Not. D. A. Hist.

BENLOWERS, in Geography, a lofty mountain, being the chief summit of the Granadum chain, near Kenmore, in Perthshire, Scotland. One of its sides rises from the banks of the Tay, and, assuming a conical shape, elevates its summit about 4015 feet above the level of the sea.

BENLOMA, in Ethnology, the name by which the Swedes call the common leek, cepinthus alburnus of Linnaeus.

BENLOND, in Geography, a mountain of Scotland, situated in the parish of Buchanain, in Dumbartonshire. Though not so lofty as Benives or Benlowers, yet its isolated situation, with respect to the neighbouring hills, and broad lake of Loch Lomond spreading at its base, give it great magnitude and grandeur. It is computed to be 3200 feet above the level of the sea, and 3240 from the surface of the lake. The form of it resembles nearly a truncated cone, and its sides, particularly towards the lake, are finely mantled with natural woods. Its north side is exceedingly steep, but on the south-west it may be easily ascended. On the north-east side is the source of the river Forth, which, like most mountain streams, soon becomes a rapid river, and is alternately seen expanding into a lake, or darting over some craggy precipices. Benlomond is mostly composed of granite, interspersed with large masses of quartz, and near the base are large strata of micaceous schistus, some of which is also found at the top of the mountain. Sinclair's Statistical Account of Scotland.

BENNA, in British Antiquity, a kind of carriage, which was used for traveling rather than for war. It contained two or more persons, who were called "Combemone," from their fitting together in this machine. The name was probably derived from the British word "Ben," or pen, which signifies head, or chief; and these carriages might, perhaps, have got this appellation from the high rank of the persons who used them.

BENVENNEA, or BAVANNAYnt, in Ancient Geography, a town of Britain, in the itinerary of Antonine, placed by Camden, Gale, and Stukeley, at Weedon, a village five miles west of Northampton, but by Mr. Horrey, for reasons which he has stated, and which seem to be satisfactory, at or near Daventry.

BENNECKSTEIN, a town of Germany, in the circle of Upper Saxony, and county of Klettenberg; 22 miles S.S.W. of Halle in Rheinland.

BENECUM, in Geography, a town of Guelderland, 2 miles north of Wageningen.

BENNET, CHRISTOPHER, in Biography, was born at Raynton, in Somersetshire, about the year 1617. After the usual school education, he was entered at Lincoln college, Oxford, in the year 1632, where he proceeded bachelor, and then master of arts, but seems to have acquired his knowledge of medicine at Leyden, or some other university, where he took his degree of doctor. He then came to London, was admitted fellow of the college of physicians, and appears to have had a considerable share of reputation and practice. In 1646,
1662, he published "Theatrum tabulorum, seu picturis, e lectionem xenodochi," in two volumes. London: a work of learning and largeness, but abstruse and theoretical. He made a number of curious experiments to discover the qualities of the blood in phthisical patients. He had been deaf since the age of fourteen, disabled by discharges from the ears; and on the other hand, phthisical complaints occasioned by supposing his marriage from the spirits. He observed, that consumption not infrequently occurs in England, unattended with affection of the lungs. The work has been translated into most of the modern languages, and passed through numerous editions, though now a great forgotten. It was republished, with observations, Father's treatise, called "Health's Instructor." He died, aged 21, in April 1645, and probably had been induced to employ so much of his time and labour in acquiring a knowledge of the diseases from his own sufferings. Haller. Bib. Med. Pract.

Bennet, Henry, Earl of Arlington, an eminent statesman, and favourite minister of King Charles II., was born of a good family in the county of Middlesex, in 1618. Educated at Christ-Church College, in the University of Oxford, where he did gratify himself by his application, and by his turn for English poetry; and under the king's coming to Oxford, at the breaking out of the civil war, entered himself into service, both as a volunteer in the royal army, and as private secretary to Lord Digby, secretary of state. Upon the failure of the royal cause, he went over to the continent, and became secretary to the Duke of York, and performed the full confidence and office of the royal family. In 1632, he received the honor of knighthood from Charles II., and was sent by him in the quality of his minister to the court of Madrid. Soon after the king's restoration, Sir Henry Bennet was recalled from Madrid, and in 1662, promoted to the office of secretary of state. In 1663, he was created Baron of Arlington, and at that time was considered as the king's chief minister and favourite servant. He is supposed to have been at the head of the party which procured the fall of the chancellor Clarendon. The conduct of foreign affairs was chiefly intrusted to him, and he had a great share in the first Dutch war. About this time he introduced Mr. (afterwards Sir) Wm. Temple, into public employment. He took one of the principal characters in the navigation of that period, especially in the capture of the "Golden Lion," from the East India. A book published by John Dalrymple, it appears, that the king's gift to him of the monastery of Dover, with Mo. Sir. Coham, the French and Spanish, a secret league between Charles II. of England, and Louis XIV. of France; by which Charles agreed to declare himself a Roman Catholic, and to engage in a war for the distinction of the United Provinces. By the terms of the treaty, a naval settlement was to be made in the north of England, but the shipping was to be of a king a year, with the trade of the United Provinces. In consideration of the free navigation to and from the United Provinces, and a revenue for other than the common means, the earl of Arlington was paid in 1672, the duty of one in the Admiralty, a sort of insular, and decreed with the consent of the court. In 1673, his conduct, and that of his minister, was to under the scrutiny of the lords; and a plan was moved against him, which was defeated by a false report. In that year he obtained the office of lord chancellor, for the first time, and paid his salary. He had been a member of the House of Commons, and soon after he was dispossessed with other candidates, and was put of importance to the interests of Orange; but not succeeding in the conduct of it, his interest at court declined. Thus was partly owing to his affair at a private paper, though he had been always regarded as a secret friend to the papal party, and was in reality a convert to that religion. He retained, however, in outward appearance, the favour of the king; and after the accession of James II., who had no affection for him, held the office of chamberlain. He died in July, 1679, having previously, on his death-bed, as it is said, reconciled himself to the church of Rome. By his wife, who was daughter of Lewis de Nassau, lord of Bevernast in Holland, he left two daughters, married to the earl of Rutland, afterwards duke of Grafton, natural son of Charles II.

"The character of lord Arlington seems to have been that of a thorough courtier; accommodating, easy, civil, with the habits of public business, rather than exacting abilities, and the moderation of timidity rather than the want of principle. He had little knowledge of the English constitution, and least regard to it; but he wished Henry and resolution to take the lead in army and marine. His public letters, when secretary, were published in 1672. 2 vol. 8vo." Brig. Brit. Gen. Dio.

Bennet, Thomas, an eminent divine of the church of England, was born in the city of London, in 1617, and went for completing his education to St. John's college, Cambridge, in the beginning of the year 1638. Before he had attained the age of 21 years, he took the degree of bachelors and master of arts; and he was chosen fellow of his college. In 1645, he wrote a copy of Hebrew verses on the death of queen Mary, printed in the Cambridge edition of verses on that occasion. In 1649, he entered into the controversy between the church and the divines, and published "An Answer to the dissenters' plea of separation, or an abridgment of the London cases." In 1650, he was presented to the church of St. James's at Colchester, where he became a very popular preacher. During his residence in this place, he published "A confutation of Popery," several tracts of controversy with the dissenters on the subject of "Schism," and also "A Confutation of Quakerism," and also published "A Paraphrase, with Annotations upon the book of Common Prayer," with two letters, relating to the same subject, and "The Rights of the Clergy of the Christian Church." About the year 1711, he took the degree of doctor in divinity. As his popularity declined at Colchester, and his salary, which partly depended on voluntary subscriptions, was reduced from 50l. to 60l. a year, he determined to remove to London, and accordingly accepted the office of deputy chaplain to St. George's hospital, and this appointment was since declared by the two last letters of St. Olow, Southwark, and St. Lawrence Jury. Before his removal to London in 1716, he published, in 1714, an essay entitled "Directions for Studying," and in the following year, his "Essay on the thirty-nine articles of Religion," etc. and the case of his subscription to the article considered in point of law, history, and conscience, with a preface to the article to the article entitled "the bequest of Anthony Collins, Esq.," supposed to be the author of "Protestants in Pulpit," published in London in 1719. In 1716, he published a pamphlet entitled "The Nonjurors' separation from the church of England examined," and found to be schismatical on their own principles," and a sermon on "The case of the Reformed Episcopal churches in Great Poland, and Polish Prussia." Soon after, he was presented by the lord de la meme, at the secular of St. Giles, Capelle, etc., which afforded him another income, amounting after several deductions, to 450l. a year. For this preferment he was indicted to the private interference and recommendation of bishop Hadley. After his settlement in this parish, in 1717, his tranquillity was inter-
interrupted by some law-suits in which he was engaged for recovering deeds that belonged to the church. However, he published, in the same year, "A Spital Sermon;" and in 1718, "A Discourse of the ever-blessed Trinity in Unity," with an examination of Dr. Clarke's Scripture Doctrine of the 'Trinity.' From this time the harassed state of his mind, and the weight of parochial duties, prevented his undertaking any new work, except "An Hebrew Grammar," published at London, in 1716, 8vo. and intended for the use of such as want to learn Hebrew without the assistance of a master. He died at London of an apoplectic fit, in the 56th year of his age, on the ninth of October 1728, and was buried in his own church. Dr. Benet, though a man of strong passions, and not altogether exempt from the charge of haughtiness, was distinguished by his piety and integrity, by the diligence and zeal with which he devoted himself to the studies and duties of his profession, and by his extensive learning, more especially by his skill in the oriental and other learned languages. As an acute reasoner and accurate writer, he had few equals. His talents for controversial writing, which perhaps he indulged to excess, gave him a decided advantage, particularly in his disputes with dissenters, over incompetent antagonists; but on some occasions they led him to recur to dilutions and ruminations, which would not always bear examination, and which laid him open to the attacks of his adversaries. Several of his writings, as they related to temporary controversies, have been confounded to oblivion. Those which have excited attention in modern times, are his "Discourse of the Trinity," and his "Catechism of the Articles of the Church of England." His exposition of the Trinity has been charged with inclining to that heterodoxy which he wished to avoid, and which, without doubt, he sincerely abhorred; and his defence of subscription has undergone some severe strictures by the acute and learned author of the "Confessional." It redounds much to the honour both of Dr. Benet and bishop Hoadly, when we consider the disparity of their opinions, that the latter contributed to the preferment of the former. Gen. Dict. Bost. Brit.

**BENET, herb, in Botany. See Geum.**

**BENNEVAGH, in Geography, a large mountain in the northern part of the county of Londonderry, province of Ulster, Ireland, about 8 miles west of Coleraine.**

**BENNEVIS. See Ben Nevis.**

**BENNI, in Lichnology, a name given by Bosc after Sonnini, to the species of Cyprinus which inhabits the river Nile, and is described by Forsskal under the specific name of bynni. See Bynni.**

**BENNINGTON, in Geography, a county of America, in the south-west corner of Vermont, bounded by Windham county on the east, the state of New York on the west, Rutland county on the north, and the state of Massachusetts on the south. It contains 19 townships, of which Bennington and Manchester are the chief. It has 12,524 inhabitants, including 16 slaves. The mountains abound with iron ore, which employs already a furnace and two forges.**

**Bennington, the shire town of the above county, and the principal town in Vermont, including in the compact part of the town about 160 houses, is situated near the foot of the green mountain, near the south-west corner of the state, 24 miles easterly from the junction of Hudson and Mohawk rivers, and about 52 miles from the south end of lake Champlain, at the confluence of the east and west bays; 55 miles from Rutland, 202 north-easterly from New York, and 300 in the same direction from Philadelphia. N. lat. 42° 43'. W. long. 73° 10'. It has a number of elegant houses, and is a flourishing town, containing 2,400 inhabitants. Its public buildings are a congregational church, a court-house, and jail. It is the oldest town in the state, having been first settled in 1764. Within the township is Mount Anthony, which rises to a great height in a conical form. The defeat of the British in two battles fought near this town, in 1777, contributed in a great measure to the subjection of the Indians, and to the surrender of General Burgoyne's army.**

**BENNISCH, a town of Silesia, in the principality of Jägerndorf.**

**BENOIST, St. a town of France, in the department of the Loiret, and chief place of a canton in the district of Gien; 6 leagues south-east of Orleans.**

**BENOIT, St. du Saulx, a town of France, in the department of the Indre, and chief place of a canton, in the district of Argenton; 34 leagues S. S.W. of Argenton. N. lat. 46° 27'. E. long. 10° 17'.**

**BENOIT, St. de Sercyf, a town of France, in the department of the Ain, and chief place of a canton, in the district of Bellelay, 13 leagues south-west of Cléry.**

**BENOIT, or Benedictus, Renatus, in Biography, a famous doctor of the Sorbonne, and curator of St. Eulphius at Paris, was born at Sevinieres near Angers; and being a secret favourite of the Roman Catholic religion, he published, for the benefit of the people, a French translation of the Bible, which had been made by the reformed ministers of Geneva; but as soon as it was published, it was condemned. Benoit was appointed by Henry III. in 1587, regius professor of divinity in the college of Navarre at Paris; and some time before the death of this prince, he published a book, entitled "The Catholic Apology," the design of which was to shew that the Protestant religion, professed by Henry, was no just reason for depriving him of his right of succession to the crown of France. This was followed, in 1590, by a defence of the same book. Benoit afterwards assisted at the assembly in which Henry IV. abjured the reformed religion; and he was promoted by the king, in 1597, to the bishopric of Troyes in Champagne; but he was so obnoxious to the pope, on account of his translation of the Bible, his favour to the protestants, and his fireminded assertion of the liberties of the Gallican church, that he could never obtain his bull, to be installed; however, he retained the temporalities till the year 1604, when he resigned the bishopric. He died at Paris in 1608. He was the author of several treatises, which are now not worth mentioning. Gen. Dict.**

**BENOIT, Elias, a learned French Protestant minister, was born at Paris in 1640. After the revocation of the edict of Nantes, he fought refuge in Holland, and became pastor in the church at Delf, where he died in 1738. He was patient, timid, submissive, and laborious, and in his domestic connection he found ample occasion for the exercise of the virtues that distinguished his character. Of his wife he gives the following account: "I married a wife possessed of all the faults that could torment a peaceable husband; covenient, pert, peevish, and capricious; by her unwearied spirit of contradiction, she plagued, in every possible way, her wretched mate for the space of 47 years." His only relief was incessant study, the fruits of which were the following publications, written in French, viz. "A History of and Apology for the Retreat of the Paltors on account of the Persecution in France," 2 vol. 1658; "A History of the edict of Nantes," 5 vol. 4to. Delit. 1693; and "Miscellaneous Remarks, critical and historical, on Toland's two Differtations," 8vo. 1712. Noiv. Dict. Hill.**

**BENOIT, Father, a learned Marinone, whose Arabic name was Ambaruch, was born at Gufta, in Phcenicia, of a noble family, in 1603. Having studied from the age of nine years to twenty-two, in the Maronite college at Rome, he returned...**
returned to the east, and was ordained priest by the Moravian patriarch of Antioch, and from thence he was sent to Rome, in order to transact some affairs referring to the church at Antioch. Previously to his proposed return, he was invited to Florence by the grand duke Cosmo III. where he was employed in arranging the types which Ferdinand de Medina had caused to be founded for printing books in the oriental languages. Under his inspection several caligra manucripts were printed. Cosmo, in order to retain Benoît in his service, appointed him Hebrew professor at the university of Pisa, where he acquired great reputation for his character and learning among the literati of Italy. At the age of 44, he entered into the society of Jesuits, and was employed by Clement XI. as one of the correctors of the editions of the Greek fathers; and on the solicitation of cardinal Quirini, whom he had assisted in his studies, he published, at an advanced age, an edition of 4 Ephrem Syrus; the two first volumes of which, begun in 1736, were, after twelve years' labour, given to the public; but in 1742, whilst he was prosecuting the third, and after he had advanced through one half of it, he was carried off by a severe illness in his 86th year. This volume was completed by Affenianni, in 1744. Benoît also translated part of the Greek Menology, and wrote some dissertations relating to the works of Ephrem Syrus. Moretti. Gen. Biog.

Benoît, du Sautu St. in Geography, a town of France, in the department of the Indre, and chief place of a canton in the district of La Blan. The place contains 1591, and the canton 316 inhabitants; the territory includes 355 kilomètres, and 14 communes.

Benon, a town of France, in the department of the Lower Garonne, and chief place of a canton, in the district of Rochefort; 1/4 leagues N.N.E. from Rochefort.

Benou, a town of Arabia, 110 miles south-east from El Catt.

Benown, the capital of Ludmansk, an interior kingdom of Africa, placed by Rennell in N. lat. 15° 6' W. long. 67° 58'. See Ludmarch.

Benrad, a town of Germany, in the circle of Welfphalia, and duchy of Berg; 7 miles S.S.E. of Duffeldorp.

Bensel. See Beneslow.

Bensberg, a town of Germany, in the circle of Welfphalia, and duchy of Berg; 7 miles east of Mulheim.

Bensera, Isidore de, in Biography, a celebrated French poet, was born at Lyons, near Rome, in Normandy, in 1612. The vivacity of his genius, and the pleasantery of his conversation, were so well calculated to secure his reception at court, and to promote his advancement under the patronage of cardinals de Richepin and Mazarin, who provided for him in a liberal manner, gifts and pensions. The poetry in which he excelled was that of the gallant and satirical kind, composed for the court-ballets, before operas came into vogue; and in these ingeniously adapted to the personages of antiquity the known characters and adventures of those who represented their partes in fiction. His success in this way induced him to make an attempt for turning all Ovid's Metamorphoses into rondels; but this work, though favoured by the king, and set off by all the ornaments of engraving, was rejected from its first appearance. As he aimed at point and concis, the prevalence of a better taste in the age of Lewis XIV. sunk him in neglect. In 1674, he was chosen a member of the French academy. Towards the close of his life, he abandoned the court, and retired to Gentilly, where he embellished his house and gardens with a variety of ornaments that indicated his poetical genius. He was much afflicted with the stone, the exterminating pain of which he is said to have endured with fortitude and resignation. His later years were consecrated to works of petty and devotion; and he translated almost all the Psalms. He died in 1691, and after his death his works were printed in three volumes. Gen. Dict. Nouv. Dict. Hist.

Benshausen, in Geography, a town of Germany, in the circle of Franconia, and county of Henneburg; 7 miles south-east of Smalkalden.

Bensheim, a town of Germany, in the circle of the Upper Rhine, and archbishopric of Mayence; 20 miles north of Heidelberg.

Benson, George, in Biography, a distinguishing divine of considerable reputation for biblical learning, was born at Great Salkeld in Cumberland, on the 14th of September 1693. When he had finished his preparatory studies, he completed his education for the ministry at the university of Glasgow. At Abingdon in Berkshire, where he first settled as pastor in the year 1722, he continued for about seven years; and besides a fœdulous attention to the duties of his office, he employed his time in a critical study of the sacred writings. His first work, published during his residence in this town, was "A Defence of the Reasonableness of Prayer," accompanied with a translation of a Cicerone of Maximus Tyronus, on the same subject, together with remarks upon it. A new edition of this, and of his piece on predetermination, was published in 1737, under the title of "Two Letters to a Friend, &c." In 1729, he left Abingdon, and removed to the charge of a congregation in Southwark, with which he continued for eleven years. In 1731, he published "A Paraphrase and Notes on St. Paul's Epistle to Philemon," in imitation of the manner of Mr. Locke; and to this he added "An Appendix, shewing that St. Paul could neither be an enthusiast nor an impostor, and consequently the Christian religion must be, as he has represented it, heavenly and divine." This argument was afterwards illustrated and improved in the most masterly manner by lord Lyttelton. This work, being favourably received by the public, was succeeded by Paraphrases and Notes, after the same manner, on the two epistles to the Thessalonians, the first and second epistles of Timothy, and the epistle to Titus; together with disquisitions on several important subjects, particularly on inspiration. In 1735, he published, in three thin volumes, 4to. "The History of the first planting of the Christian religion, taken from the Acts of the Apostles, and their Epistles, &c." A second edition of this work, commonly bound up in one large volume, was published in 1756. In 1743, Mr. Benson was chosen pastor of the congregation of protestant dissenters, in Crouch End Friars, London, in the room of Dr. Harris; and in this connexion, with the learned and candid Dr. Lardner as his assistant for some years, he continued till his death, which happened on the 6th of April, 1762. In 1743, he published his treatise "On the Reasonableness of the Christian Religion, as delivered in the Scriptures;" and in consideration of his great abilities and learning, the university of Aberdeen conferred upon him the degree of doctor in divinity. Dr. Benson, having finished the epistles of St. Paul, on which he intended to write Paraprases and Notes, proceeded to explain, after the same manner, the seven cathoic epistles, viz. that of St. James, the two epistles of St. Peter, that of St. Jude, and the three epistles of St. John. A volume of miscellaneous terms, in 1747, was the last of his public works. His pathological writings, edited by Dr. Amory, appeared two years after his death, containing a life of Chrift, and other theological essays. The labours of Dr. Benson in sacred literature met with a very favourable reception in foreign countries, as well as in Great Britain and Ireland, from the truly inquisitive and learned, and introduced him to a friendly acquaintance and correspondence with many persons, eminent for their literature and rank in the established church, as well as among the dissenters. Of thes
BEN

there we may enumerate for Peter King, lord chancellor of England; lord Barrington; archbishop Herring; bishops Hoadly, Butler, and Conybear; Dr. Leland, and Dr. Dulach of Ireland; Dr. Jonathan Mayhew of New England; professor Michaelis of Gottingen; Dr. Whistham of Edinburgh; Dr. Watts of London; Dr. Taylor of Norwich; and Mr. Bann of Birmingham. His commentaries and notes on the epistles are defendedly held in high estimation. The learned John David Michaelis, one of the professors in the university of Gottingen, proposed translating them into Latin, and in 1745, published his paraphrase on the epistle of St. James, with additional notes. Several of his other tracts were translated into German by M. Bamberger, a Protestant divine at Berlin. As a zealous friend to religious toleration and free inquiry, and with a view of vindicating and recommending them, he published a defence of Servetus, and an account of Dr. Leighton's performance of Dr. Leight. Biog. Brit.

BENSON, in Geography, the north-westernmost township of Rut and county, in the state of Vermont, North America, is situated on the west side of Lake Champlain, 57 miles N.N.W. of Bennington, and has 659 inhabitants.

BENTAVEO, in Ornithology, the French name of that species of Smike, called Larina phalina, by Linneus.

BENTENDORF JELPEZIA, in Geography, a town of Hungary, 6 miles north west of Rosenburg.

BENT GRASS, in Botany. See AGrostis.

BENTHAM, JAMES, in Biography, was born at Ely in 1708, and educated for the church at Trinity College, Cambridge. After having held in succession several livings in the counties of Cambridge and Norfolk, he obtained, in 1729, a prebendal stall in the church of Ely, where he had an opportunity of cultivating his natural taste for church architecture and antiquities. The result of his observation and research was published under the title of "The History and Antiquities of the conventual and cathedral church of Ely, from the foundation of the monastery, A. D. 675, to the year 1771, illustrated with copper-plates," Cambr. 1771, 4to. The introduction to this work contains an account of Saxon, Norman, and Gothic architecture, and has been frequently cited as authority by later writers on these subjects. The grand repair of this church, entrusted to the superintendence of Mr. Bentham, afforded him an opportunity of investigating the principles upon which edifices of this kind were constructed, and lugged to him the idea of a general history of ancient, architecture in this kingdom; and for this purpose he occasionally employed himself in collecting materials almost to the close of his life. He also interceded himself in the improvement of his native country, by planning turnpikes roads, and proposing the drainage and inclosure of parts of the Ely Fens; and some of his schemes were beneficially executed. In such useful occupations, and the faithful discharge of his professional duties, he conducted his life, by a course of temperance which his naturally tender constitution required, to his 80th year. He died Nov. 17, 1791. G. G. Biog.

BENTHEIM, in Geography, a county of Germany, in the circle of Westphalia, about 40 miles long, and from 12 to 15 broad. It is bounded by the province of Overyssel and the bishopric of Munster, and abounds with wood, quarries of stone, game, and venison. The chief part of this territory is distributed into fertile corn-fields and beautiful meadows, which feed a great number of sheep and cattle; furnishing the inhabitants with an ample supply of the necessaries of life, and enabling them to make profitable exports. The principal river is the Vechte, which traverses the whole country. It is inhabited by Lutherans, Calvinists, and Roman Catholics; and its traffic conflicts in linen, thread, wool, yarn, flax, wood, cattle, and honey. Its towns are Bentheim, Schuettorf, Northorn, and Niehous. In 1754, count Frederic Charles Philip, mortgaged this county to the house of Hanover, for an advance of money. The count of Bentheim or Benth, has a seat and voice in the college of the Westphalian courts of the empire, and at the diet of the circle.

BENTHEIM, a town of Germany, and capital of the above county, is seated partly on an eminence, and partly on a river of the same name. It contains one Calvinist, and one Roman Catholic church. The castle or palace stands on a high rock north of the town, and is surrounded with towers. Bentheim is distant 26 miles N.N.W. from Munster, N. lat. 50° 21'. E. long. 7° 1'.

BENTHOORN, a town of Holland, 6 miles S.S.W. of Leiden.

BENTHULUD, a town of Africa, in the kingdom of Fez, at the foot of Mount Atlas.

BENTHUYSEN, a town of Holland; 6 miles south of Leiden.

BENTINCK, WILLIAM, earl of Portland, in Biography, a favourite minister of king William III. was born in Holland, and descended from an ancient and noble family in the province of Gelderland. He accompanied the prince of Orange to England in 1679, as gentleman of his bed-chamber; and when the prince became stadholder, he was promoted to the command of the favourite regiment of Dutch guards. In 1675, he manifested his attachment to this prince, by sleeping in the same bed with him when he had the small pox, in consequence of medical advice; and by thus exposing himself to the infection of a dilterminer with which he was actually infected, he laid the prince under an obligation, of which he was never unmindful. He took an active part in the preparations for the revolution in 1688, and in the progress of that event; and upon the prince of Orange's accession to the throne, he received many marks of royal favour. Sustaining several high offices near the king's person, he was naturalized, and in 1689, he was advanced to the rank of an English nobleman, with the title of baron of Cirencester, vicount Woodstock, and earl of Portland. In the following year, he acted as envoy to king William at the grand congress held at the Hague. The royal favour, however, by which he was distinguished, and particularly the grant of several lordships in Denbighshire, which were part of the demesnes of the principality of Wales, occasioned, in 1693, a warm opposition in the house of commons; but though this grant was revoked, in consequence of an address to the king, the earl was recommissioned by other liberal grants from the crown, which constitute a great part of the present ample possessions of the family. This nobleman attended king William in his campaigns in Ireland and Flanders, and distinguished himself, as a military officer, on various occasions. After the conclusion of the peace of Ryswick, in the negotiation of which he had a principal concern, he was nominated embassador-extraordinary to the court of France, where he received the highest distinctions. On occasion of a jealousy, excited by the royal favour to a young Dutchman, named Keppel, afterwards earl of Albemarle, the earl of Portland resigned his posts in the king's household, and withdrew from affairs of state: but he still retained some portion of the king's esteem and confidence, and was entrusted with the administration of Scotland, and with the negotiation of the famous treaty for the succession to the throne of Spain, called the "partition-treaty," which was afterwards the subject of an impeachment of the earl by the house of commons. The king's death, in 1701, terminated the earl of Portland's public life, and all hostilities against him. Of the attachment of his royal matter, however, he had the most satisfactory evidence; when, on his death-bed, with his last words he inquired
inquired for him, and on his approach, laid hold of his hand and pressed it to his heart. The close of the earl's life was spent in retirement at Bath, where he employed himself in acts of charity, and in the improvement of his fine gardens. He died Nov. 23, 1709, in the 69th year of his age, and was buried in Wellminder Abbey. He left children of both sexes by his two wives. Anne, daughter of Sir Edward Villiers, and Jane, daughter of Sir John Temple.

His temper was, like that of his royal master, grave, sedate, and in fine to reformers; and his denominations lofty, without pique. Although he was an object of jealousy and envy, there were more natural and politcal than personal; and his general character was that of an able and upright man, connected with private virtue. Bung Britt.

BENTIVOGLIO, Guido, Cardinal, was born of a noble family at Ferrara in 1573; and after having studied at Padua with great reputation, he returned, in 1577, to his own country, where he displayed much dexterity in reconciling his brother, the marchese Hippolito, with cardinal Albani, and the general of the church, and in concluding peace between the pope and Cesar. Having filled this transcendent post, he was appointed by pope Clement VIII. his private ambassador, and a moved to complete his dynasty at Padua. He then settled at Rome, and by his prudence and industry acquired great esteem. After having performed, from 1577 to 1589, the office of nuncio in Flanders and allied in France, in the year 1621, he was raised to the dignity of cardinal by pope Paul V. He was also appointed by Lewis XIII. protector of the French nation in Rome; which office he declined on becoming bishop of Terracina in 1641. On the death of Urban VIII. in 1644, he was sought to be the most proper person for the honour of succeeding him; but when he entered the conclave, in the hottest and most vital fray of the year, he was seized with a fever, which terminated in his death on the 7th of September, at the age of 65. The principal of his works, which are held in high estimation, are his "History of the Civil Wars in Flanders," written in Italian; and a work published at Cologne in 1644, and since translated into foreign languages; "Memoirs" of Lewis I. an "Account of Flanders," and a collection of "Letters," read by the most approved specimens of epistolary writing in the Italian language. Moreni. Gen. Dig.

BENTIVOGLIO, in Geography, a small town and fortified palace of Italy, in the state of the church; 18 miles north of Bologna.

BENTLEY, Richard, in Biography, a very eminent critic, was born at Otton, near Wakefield in Yorkshire, on the 27th of January 1662-3, and after receiving the rudiments of classical learning at the free school of Wakefield, was entered in his 16th year at St. John's college, Cambridge. In 1681, he left the university, and became a schoolmaster at Spalding. From this situation he was soon removed to be preceptor to the son of Dr. Thibald Pegell, dean of St. Paul's, who appointed him to be his domestic chaplain. In February 1681-2, he published his first work, which was a Latin epitome to Dr. Molière, containing "Critical Observation on Molière's Chronicon," and at the same time be had the honor of being selected as the first pencil to preach Boyle's lecture, founded for the verification of natural and revealed religion. The failure of the eight editions, which he delivered on this occasion, and which were afterwards published and transcribed into most of the modern languages of Europe, was the loss of much time, and the confusion of so absurd and jestless system, from the fanciful of the soul, from the doctrine and origin of human bodies, and the origin and name of the world itself. While he carried on this lecture, he maintained a philosophical correspondence with Dr. Isaac Newton, whose friendship he ardently cultivated, nor did he write anything on this occasion without this shun to philosopher's approbation. In 1692, he was installed by bishop Stillingfleet at a pulpit of Worcester; and in the following year, he was appointed keeper of the royal library at St. James's. In 1695, he was admitted to the degree of doctor of divinity; and he delivered a discourse on the day of the public commencement from 1 Pet. iii. 15. It should, that he was soon afterwards, "ad eundem," in the university of Oxford. His Annotations on Calimachus, were, inserted an edition of that poet, published in 1657, by Gravina; and in the same year Dr. Bentley himself published, at the end of Weston's Reflections on ancient and modern learning, his "Difficulties on the Epistles of Themistocles, Socrates, Euclid, Phalaris, and the fables of Aesop." This publication was succeeded by a literary controversy, which engaged at the time a great degree of public attention. The immediate subject of this controversy was the genuineness of the epistles of Phalaris. In order to give our readers some notion of its rise, progress, and issue, we will detail the following particulars. Soon after Dr. Bentley was made royal librarian, the honourable Mr. Boyle, who was about to publish an edition of the supposed epistles of Phalaris, applied, by means of a book-seller in London, to Dr. Bentley for the use of a MS. in the king's library, which, after much solicitation and delay, was at length obtained; but before the collation could be completed, and indeed, about six days after the manuscript had been delivered, it was remanded by Dr. Bentley, with many urging and disparaging expressions, both of Mr. Boyle, and the work. This conduct, Mr. Boyle, in the preface to his edition of Phalaris, publicly retracted; and in return, Dr. Bentley, in the above-mentioned dissertation, endeavored to elince the spuriousness of the epistles that had been published, adding some reflections on Mr. Boyle's edition and version. In 1668, Mr. Boyle retorted, with effusives of wit and perusal abuse, in a treatise entitled "Dr. Bentley's Difficulties on the epistles of Phalaris, and the fables of Aesop examined," and commonly known by the title of "Boyle against Bentley," a second edition of which was published in 1672. In 1669, Bentley re-established in the same style, in a piece usually denominated "Bentley against Boyle," reprinted in 1777, by Melito. Bowyer and Nichols, with slight notes and observations, collected from, or communicated by bishops Warburton and Lowth, Mr. Upton, Mr. W. Clarke, Mr. Markland, Dr. Salter, Dr. Owen, and Mr. Touph. Among the wits and critics, who united as auxiliaries of Boyle, were Swift, Pope, Gilt, and Molyneux; and it must be allowed, that they proceeded with an unwarrantable severity in attacking the moral character and literary acquirements of their adversary. Bentley, however, though wounded, published the contest with mighty imputations, and in the event with full force, so far as the authenticity of the epistles refuted to Phalaris was concerned. By prejudice and passion have inflamed, it has been very generally acknowledged that Bentley had not only the evident advantage in respect to learning and argument, but that he is little, if at all, inferior to his antagonist in point of wit and farce. The reputation of Dr. Bentley, during the progress of this literary quarrel, was in very materially affected; but before its complete termination, he was presented by the crown in 1703, with the honourable and lucrative office of master of Trinity college, Cambridge; and in the following year collated archbishop of Ely. In the former station, he introduced reform, and curtailed faculties, and thus improved the
the ill will of some of the senior members of the college; but as he appeared to have exercised undue authority, and to have consulted his own advantage more than the public, a charge was exhibited against him in 1729, by the vice-chancellor, thirty of the senior fellows, and other members of the college, for peculation, breach of the statutes, and other acts of mal-administration. The charge was presented to the bishop of Ely, as visitor of the college. But Dr. Bentley contended, that the crown was the visitor; and upon this a law-suit commenced, which was not terminated till the year 1731, when the crown asserted its visitatorial power, but declined interfering in the present instance. It appeared afterwards, that, upon the whole, the charges against the matter were well founded.

In 1710, Dr. Bentley published at Amsterdam his critical annotations on the two first comedies of Aristophanes; and, about the same time, at Rheims, his emendations of the fragments of Menander and Plulemon, under the figured name of "Philaleutherus Liphienus." This latter was undertaken with the view of disparaging a similar performance of Le Cleer, and thus by degrading his literary character in the public estimation, to set aside a scheme, which was then in agitation, for inviting him to England, by the offer of some considerable church preferment. In the year 1711, he published his long expected and much commended edition of "Horace." This correct and elegant edition of Horace, which was pronounced by Dr. Hare to be the completest work produced by criticism since the restoration of learning, was printed in 4to. and dedicated to the earl of Oxford. It was succeeded, in 1713, by some excellent remarks on Collin's discourse of free-thinking, published under the former name of "Philaleutherus Liphienus," and dedicated to Dr. Hare. In 1716, Dr. Bentley was appointed regius professor of divinity; and in the same year he circulated proposals for a new edition of the Greek Testament, with St. Jerom's latin version. These proposals were the subject of severe animadversion by Dr. Middleton, who professed a serious conviction, that Dr. Bentley had neither talents nor materials proper for the work, and that religion was much more likely to receive detriment than service from it. Several pamphlets were published on the occasion; and it is much to be regretted, that a work of such importance to sacred literature and biblical criticism was abandoned. The completion of this noble undertaking was the principal employment of the latter part of Dr. Bentley's life. In the prosecution of it he had collected and collated all the MSS. of Europe to which access could be obtained; and for this purpose, his nephew, Thomas Bentley, L.L.D. well known in the republic of letters, had travelled through Europe at his uncle's expense; the whole was completed for publication; but when he determined not to let it appear during his own life, the sum of 200L. which he had received in part of the subscriptions, was returned to the subscribers. A circumstance occurred in 1717, which materially affected the doctor's reputation, and which was attended, at least for a time, with detrimental conseqences to himself. Upon the creation, by royal mandate, of several doctors in divinity, Dr. Bentley demanded from each of them, besides the customary perquisite, an extraordinary fee of four guineas. In this demand they acquiesced, on condition that the money should be restored, if it should appear that Dr. Bentley had no right to enforce it. Dr. Middleton, however, same time after, obtained a decree for the repayment of the money; and in consequence of this decree, Dr. Bentley was arrested, and appeared by his proctor before the court of the vice-chancellor. On this occasion, the beadle testified on oath, that Dr. Bentley had declared, "I will not be concluded by what the vice-chancellor and two or three of his friends shall determine over a bottle;" and for this expression he was imprisoned by the vice-chancellor, without a citation or hearing, from all his degrees, and afterwards by the caput deprived of all his privileges and honours, as well as degrees, in the university. Dr. Bentley appealed to the king, and after successive references to the council and to a committee of council, and to the court of king's bench, and many delays, the university received a mandamus in February 1718, which reversed all their proceedings, and required a restoration of Dr. Bentley to all degrees, honours, &c. of which he had been deprived. In 1726, he published an edition of "Terence and Phadrus," and in 1734, the last of his works, which was his edition of "Milton's Paradise Lost," and which made no addition to his reputation, though it has been said that many of his corrections of that poet have been unreasonably objected to by bishops Pearce and Newton. This work was undertaken at the request of queen Caroline. Dr. Bentley died on the 14th of July 1742, in the 81st year of his age, and was buried in the chapel of Trinity college. When we consider the unquestionable abilities and erudition of Dr. Bentley, it may excite some degree of surprise, that his literary character should have been held in much higher estimation by foreigners, than by his own countrymen. This may be partly owing to that pride, petulance, and irritability of temper, with which he, in common with many others who have excelled in verbal criticism, seems to have been chargeable; to the personal disputes in which he was engaged; and to the political differences that disquieted the period in which he lived. But, perhaps, it arose principally from his having, in the clafs of his adversaries, the poets and wits of the age, and from their having made him the object of their satire and ridicule. The aperoiir of Mr. Pope, who attacked him in the character of Ariftarchus (works, vol. iii. p. 207—211.) has, however, been ascribed to personal resentment. Whilst they were both together at dinner with bishop Atterbury, Dr. Bentley was questioned as to his opinion of the English Homer; and, after some demur, being urged to speak out, he said "the verses are good verses, but the work is not Homer; it is Spondatus." Another circumstance, which contributed to degrade Dr. Bentley in the estimation of some of his contemporaries was that love of money, which he seems to have unduly indulged, and which involved him in disputes that were dishonourable to him. As to the charge of scepticism, with respect to revelation, alleged against him by Mr. Whilton, it does not appear to have been well founded. Dr. Sailer deiphers him as having been a very amiable and pious man in private life, and as possessing much good nature, though he has been otherwise represented. Against the disparaging judgment of the learned bishop Lowth, who allows him to rank only among grammatical and verbal critics, may be confuted the encomium of Dr. Samuel Clarke, eminently distinguished by his literature and critical discernment, who, in the preface to his edition of Cæsar's Commentaries, speaks of him as "vir in hujusmodi rebus peritissimus, incomparabiliter et criticis omnibus longe sumptuosissimo, et fugacissimo auctore." The judgment of posterity, more impartial than that of his contemporaries, has allowed Dr. Bentley's profound skill in the idioms of the Latin and Greek languages; and though, as a verbal critic, many of his emendations are un sanctioned by the authority of ancient MSS. they frequently approve themselves as just and reasonable, and are regarded as real improvements. It must be acknowledged, however, that those corrections of ancient and modern authors, which depend upon mere conjecture, and which suggest what might, or ought to have been written, rather than what
what they actually did write, extend the province of criticism beyond its just limits; and when they afford scope for the unwarrentable exercise of fancy or judgment, they should be very cautiously admitted. In this way doctor Bentley is said to have incurred the charge of temerity and presumption. The son of Dr. Bentley, who was called after his own name, was a gentleman of acknowledged ingenium, taste, and learning, and is known as the author of several publications, and particularly of a tragedy, entitled "Philodamus," published by D. J. in 1767, and deemed by the late eminent poet M. Gray, as one of the most capital pieces in the English language. His youngest daughter married a gentleman of the name of Dr. Cumberland, Bishop of Peterborough, whose fame is well known, "De Legibus Naturae," Dr. Bentley is said to have corrected upon a visit to his for- bidden, who was Bishop of Kilmore in Ireland. The son of this bishop, Richard Cumberland, Esq., is well known by his ingenious writings, and generally by his judicious and elegant prose, "De Bata."

BENTON" in Geography. See CULTA.

BENTLY, a mountain of the island, in the county of Penz, 2,520 feet high. See GRAMPIAN MOUNTAINS.

BENY, a town of France, in the department of the Calvados, and the canton of Caen, 24 leagues N.W. of Caen.

BENTINO, Le, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Vire, 72 leagues S.W. of Caen. The town contains 742, and the canton 13,913 inhabitants; the territory includes 775,950 acres, and 21 communes.

BENZ, a town of Hungary, in the county of Zemplins-puszta, situated on the river Bodrog, and noted for its excellent wine, not inferior to Tokay.

BENYOWSKY, MAURITIUS AUGUSTUS. Count de, in Biography, magnate of the kingdoms of Hungary and Poland. A singular adventurer, was born at Verbowa, in the county of Nitra, in Hungary, in the year 1741, and educated for military service, to which he devoted himself from his youth. Being wronged in his paternal inheritance by his family, he fled by force the cattle which was his father's inheritance; in consequence of which he was deprived of his whole property by a decree of the chancery at Vienna, and was obliged to fly for refuge into Poland. Here he resided, in 1765, in the conspiracy against king Stanislaus, and in the course of the irregular service he was taken prisoner, held in 1768, and after wards in 1769, by the Russian army; he was treated with severity, because he had edited his papers, and because he was forming plans for the liberation of himself and his companion. The Russian conveyed him to Cahan, where he was allowed to live at large, under the watch of the guards, as a state-prisoner; but here his temporary disposition recommended him to a party, which was then forming a conspiracy against the Russian government, in the execution of which he was invited to assist. But the plot being discovered, he was exiled to Siberia; and after a tedious journey and voyage of twelve months, during which the count made five unsuccessful efforts for escape, he arrived on the 20th of December 1770, at Kamtschatka, and was conducted to the town called Novoretzkoy Olgop, or Bolshevikle, where he and his companions in exile were informed that they must provide for themselves, and where they were furnished with the necessary articles and provisions. Bisected with the prescribed mode of savage life, the count began to concern measures with his fellow-prisoners for their escape; and in the mean time, he improved his circumstances by opening a school, in which he educated the son and three daughters of the governor, M. Nilow, or Niloff, and by his knowledge of the game of chess, at which he played with some merchants, on behalf of the Hettman of the Cossacks, who allowed him a certain proportion of the fish which he won. Having gained the confidence of the governor and the inhabitants of Aphanasia, one of his daughters, he proceeded in maturing and accomplishing his plan of liberation; but before its execution, the secret was disclosed, and the force of the settlement was employed in preventing the contrivances. In the course of this occupation, the governor was killed; but the copies had succeeded; seized a vessel, and, accompanied by Aphanasia, who chief to follow a margin, was invited to take their final leave of Kamtschatka. Their whole number, including the exiles, women, and the ship's crew, amounted to 96 persons. After enduring many naval hardships at sea, the vessel arrived at Japan; and on the 14th of August 1771, he anchored on the island of Unmy Lagoon, which he places in N. lat. 29°, and which must consequently he between Japan and the island of Looekio. This island, according to his account, is absolutely independent both of China and Japan; its inhabitants are mild, virtuous, and in a high state of civilization; and they are said to have been converted to Christianity by a Portuguese missionary John Ignatius Salis, who arrived in the island in 1749. Upon visiting this island, whither he promised to return, he failed for forming a colony, and arrived here on the 7th of August; but meeting with an opposition on his landing, he made a great slaughter among the natives. At length he opened, by means of a Spaniard, who resided on the island, a more friendly intercourse with the inhabitants of another island, and offered Huzapo, their prince, in a war against one of his neighbours. After a stay of about sixteen days on this island, he departed and sailed for Macao, in the harbour of Canton, in China. Here his female companion, Aphanasia Nilow, died. During his stay in this place, he made some attempts for procuring leave to go to Canton; but when these proved ineffectual, he determined to fail for Europe. Accordingly, in his way thither, he arrived at the isle of France, March 16th 1772, and having touched at the isle of Madagascar, he landed in France in July, and was well received by the French ministry.

Of the proposals made to the ministers of France by this adventurer, we have no documents; but he seems to have been regarded by them as a fit person to be employed in establishing a settlement in the island of Madagascar. With this view they furnished him with a body of troops, in 1773; and in his way thither he touched at the isle of France, in order to solicit the co-operation of the chiefs of that island. Jealously, and the dread of a rival settlement, prevented his obtaining their concurrence; and therefore, after some delay, he proceeded to Madagascar, and landed there in February, 1774; forming his settlement at the bottom of the bay of Antongil, at the mouth of the river Binghalle. The count made little progress in accomplishing the object of his mission, although he expended on account of the French government a sum amounting to 550,000, and therefore, towards the end of the year 1779, commissioners were deputed to examine the state of the settlement, and convey the count to France. In the mean time, the enterprising adventurer had contrived to raise himself to consequence in the island by a curious stratagem. The Spanish, constituting one of the distinct nations of Madagascar, had been formerly governed by a chief, whose name was Hamaca, and as he had left only one daughter, who had been taken prisoner and sold to foreigners, his family was supposed to be extinct. Of this circumstance the count artfully availed himself; and obtaining the testimony of an old negro woman whom he had brought with him from the Loo. l.
life of France, who declared that she knew him to be the son of Ramini’s daughter, her own companion in slavery, he succeeded in his views of being publicly acknowledged as the heir of Ramini. Under this character he was vanned with sovereignty, formed alliances with other tribes, made war and peace, and received tributes from the vanquished.

But as his European resources were with-held, he renewed the service of France, and procured his subjects to permit him to return to Europe, for the purpose of forming an alliance with France, or some other power, and for making commercial arrangements with a view to the improvement of a settlement on the island. Accordingly, he departed for Europe in November 1776, on board a brig which he had freighted to the Cape of Good Hope. With this event his own narrative terminates. Among his state papers, however, we find his proposal to the king of Great Britain, dated Dec. 25, 1783, of which the preliminary article is his being acknowledged sovereign of the island of Madagascar; under which character he offers terms for an offensive and defensive alliance with this country. But it appears, from a declaration prefixed to this paper, that he had previously applied, probably with similar views, to the emperor of Germany. The application to the British ministry, if it was ever made, and if it was ever the subject of discussion, as some have alleged, was not attended with success. The court, therefore, determined to return to Madagascar with such supplies as he could obtain from individuals; and having procured goods and merchandise in London to the amount of 2000l, and finding it difficult to get the flag of any European power to sail beyond the Cape of Good Hope, he departed for Maryland in America, in April 1784. A respectable commercial house engaged in his undertaking, and supplied him with a vessel and goods to a considerable amount.

In this vessel he sailed for Madagascar; and after escaping the hazard of shipwreck on the lee shore of America, and doubling the Cape of Good Hope, he touched at Sofala, and on the 7th of July 1785, anchored in Antangara bay, 10 leagues S.W. of Cape St. Sebastian, in Madagascar, where the cargo was landed. Under an apprehension that the count had been cut off by the natives, the party on board the ship set sail for the island of Joanna, and at Obo, on the opposite continent, sold the ship. The count having a body of natives, commenced hostilities against the French by seizing their house-at-Angouzii. Here he began to build a town after the manner of the country, and from thence he detached 100 men to seize their factory at Foul Point, which he defended and a few of his men at anchor. In consequence of these transactions, M. de Sculliac, governor of the island of France, sent a ship with sixty regulars, who landed, and attacked the count on the 23d of May 1785, in a redoubt which he had constructed, mounting two cannon, and in which he, with two Europeans, and thirty natives, awaited their approach. The blacks fled, and Benoyfley, receiving a ball in his breast, fell behind the parapet, whence he was dragged by the hair, and soon expired.

Whilst none can question the ability and bravery of count Benoyfley, the principles of his conduct are not easily ascertained. His enemies represent him as a tyrant and a robber; and his friends, on the contrary, exhibit him as distinguished by a noble, humane, and generous disposition. Mr. Nicholson, the editor of his “Memoirs and Travels,” who had all the letters and documents before him, declares, that he has “not seen any thing against the count, which will not bear two interpretations, or which has not been written by men who contradict each other, and had an interest in traducing him.” “His conduct in Madagascar,” says Wadstrom, in his “Effay on Colonization,” “defeaves no small portion of admiration, and even of respect; and, all things duly considered, I see no reason, why a monument might not be erected to his memory, inscribed ‘Magnis Tarnis Excidit Ausis.’” A very different character is given of him by M. de Lefeps, in his “Travels in Kamtschatka,” who represents him as perfidious and cruel, and by the Abbé Roehlin, in his “Voyage a Madagascar, &c.” who says, “that he aimed at the conquest of Madagascar by fire and sword, and treated the natives with such cruelty, that he was called by no other name by them than the “Wicked White.” Memoirs and Travels of count Benoyfley, written by himself, 2 vols. 1750.

BENZELIUS, Eric, a learned Swedish divine, was born in 1642, in Wettro-Gothland, and educated under the patronage of a rich uncle at Upsal. He was first preceptor to the sons of the count de la Gardie, chancellor of Sweden; and having completed their education, he travelled through various parts of Europe, cultivating an acquaintance with the learned, and consulting the principal libraries. Upon his return to Upsal in 1665, he was appointed professor of history and morality in the university, and afterwards promoted to the theological chair, and to a seat in the consistory. In 1675, he was made doctor in theology; in 1677, bishop of Strenges; and, in 1700, archbishop of Upsal, occupying also the vice-chancellorship of the university. He died in 1709; and was the author of several dissertations on the lives of the patriarchs, and other parts of ecclesiastical history. He wrote also various theological works, and translated the whole Bible into the Swedish language. Morei.

BENZELIIUS, Eric, son of the former, was born at Upsal in 1673, where he began and completed his studies. Having travelled into Germany, England, and France, he returned to Upsal in 1702, and was appointed librarian to the university, an office which he held for 22 years. In 1724, he was nominated professor of divinity; and afterwards successively created bishop of Gothenburg, Lindskoping, and archbishop of Upsal. He died in 1743. Benelius undertook, in conjunction with other learned men, a review, as well as all books published in Sweden, or by Swedes abroad, as of those works printed in other countries, which had any relation to this kingdom. This publication, containing, besides reviews, some few original acts, was denominated “Acta Literaria Suecia,” and continued for 10 years on this plan by a society of gentlemen, who afterwards formed the royal society of Upsal. See Society.

BENZIE, Island. See Geography, lies on a river of the same name, within Sierra Leone, on the coast of Africa.

BENZOINE, in Botany. See Crotona.

BENZONII. See Laurus.

Benzoin, Benjamin Gum, and Benzoic Acid, in Chemistry and Pharmacy.

The gum benzoin or benzoile, by some called also Aja Duleis, is a very fragrant resin, procured from a large tree found in many parts of the East Indies, Sumatra, Arabia, Perâia, &c. See Styrax Benzoil.

The resin is brought in large brittle masses of a light yellow, intermixed with white nodules, which last are confidered as the finest, and called by some Benzoin Amygdanosides. The smell of Benzoin is extremely fragrant, especially when rubbed or heated: it has scarcely any taint, except previously dissolved in spirit of wine, which it does with ease, into a yellowish tincture. On adding water to this tincture, the resin again separates into a white pulverulent mass, which has received the singular name of Lac Virginiæ, and also Magistery of Benzoin. When gently dried, it forms a white powder, formerly in great request as a cosmetic. It is at least innocent, and its scent is one of the most agreeable. But the most striking ingredient of this resin is the Benzoe Acid, which is of sufficient importance to require

being
being described more at large. If benzoin is gently heated a little above the degree of boiling water, it melts into an adhesive mafs, and at the same time sends out a very copious, derfe, white fume, of an extremely fragrant, diffufive, penetrating fmal, and fo acrid as irresistibly to excite coughing and tears in thofe who are in any degree exposed to it. This fume four fentences on the felf cool body, and then appears in the form of very beautiful fparian crystals, which gradually collect into a bulky fparian mafs, extremely light, and of remarkable elegance and luflre. This cryftalline mafs is the benzoic acid, and its acid property is proved by reddening limes, neutralizing alkalies, and forming with them peculiar falfets: in modern chemical nomenclature called Benzoin. After the greater part of the acid has risen by fublufion, or before it, if the heat be at all increafed, a thin yellow oil rises highly fepmutaneous, but fhrewly imbued with the fcent of the reinf. On further heating, an acidulous liquor comes over, together with a thick fputidations matter: but, however, containing fome of the cryftalline acid, which is not totally expelled till the end of the procfs.

This oil is readily fohibwe in alcohol, and in hot water, but fo fparsely in cold water, that a hot faturated folution will depofit in vacuo almoft its fcent content by cooling.

Several methods have been diveded for obtaining the benzoic acid. The oldest and moft expeditious is by simple fublimation. To procure any quantities of it, put benzoin in an earthen pan; apply to the veflid a large cone of clean white paper,让大家 to the edges of the pan, and let it over an externally fman charcoal, or other fire, just fufficient to melt the benzoin. The acid will rife and cryftallize upon the vefild of the paper cone. However, as in this method the vapour has hardly room to converge, instead of the paper cone, another vefild inverted over that which contains the reinf, and with a small hole drilled through its bottom, may be substituted; and when full, it may be gently shaken, to detach the acid, and again applied. From nine to twelve days may be thus obtained from ftelve ounces of benzoin. The remaining reinf is still very aromatic, and should not be lost.

Another method has been recommended by Scheele, who in his excellent practical observations upon this falt, has treated it with that precision and ingenuity which fo eminently distinguifhes this chemiftr in every fubfjeft of greater or lefs importance and difficulty, which he has illustrated by his labours.

He observes, that besides fublimation, the acid may be extracted by infuion, and with the advantage of obtaining it free from any admixture of oil, which is apt to impair its whitenefs and lufure. If benzoin is boiled with water, and the folution fained while hot, and fuffered to cool, moit of the acid taken up by the hot water & points when cold, and may then be collected pure. This method, however, is imperfect; for as the water does not mix with and divide the gum, this laf foon foyfens, and flinks down, clofly adhering to the bottom of the vefild, and does not allow the water easily to penetrate it. Hence the folution takes place only at the surface of the benzoin.

The fame chemiftr boiled powdered chalk and benzoin in water, and ftriflated the liquor. His cryftals were now depofited on cooling, for the acid had diflocated part of the chalk into a prismatic fhape, which, being very fubtle, remained in the liquor. But on adding fome of vitereric acid, the benzoin acid was again separated from the lime and fell to the bottom in a prismatic form. Subfiftuting alkali for the chalk, the fame effect took place, and the benzoin acid, as before, was precipitated by the vitereric. But this method was still attended with the inconvenience of the benzoin concreting together, which floated on the surface during the boiling. But on substituting quick-lime this inconvenience was avoided; and it is therefore in the following method that the benzoic acid may be procured the moft copiously and the pureft. Upon four ounces of unfurfaced lime pour twelve ounces of water, and after the ebullition is over, add fix pounds more of water; then put a pound of benzoin, finely powdered, into a tin pan; pour on it briskly over sixtens of the above lime water; mix them well together, and then fuccefsively the ret of the lime water. By this method the reinf will be prevented from running together into one mafs. Boil down this liquor (which is of a light yellow) to two pounds, and drain. When cold, add to the liquor muriatic acid gradually, which will produce a white cryftalline deposition, and cont:inue to add the acid till the liquor is supersaturated, and tablets form. The stronger acid thus unites with the lime, and the benzoic acid, now free, being of itself very soluble in cold water, falls down as a white coagulum, which should be washed with more cold water, and gently dried. To give it a cryftalline appearance, difolve it in boiling water, filter it through a cloth, and by cooling it will separate in the form of fparian cryftals, but with fome loss of the acid.

The above procfs of Scheele's may however be a little shortened, if the lime in fubfuance be mixed with the lime water, previous to the addition of the benzoin; for by this method the folution may be at once more concentrated, and lefs of the liquid will fufficie, fo that much of the evaporation will be faved. Any of the stronger acids will difplace the benzoin from lime, but the muriatic is the moft convenient.

Scheele obtained from 12 to 14 drachms of the concrete acid from a pound of benzoin by this procfs.

The benzoic acid, when pure, is quite white; for if yellow, it is mixed with a small portion of the oil of the reinf. Though cryftallized, it is considerably fubtle, and difficult to be reduced to powder. Its taste is fharf, pungent, and acridulous. It roldens tincture of liquor. When cold, it is without fmmel, but on applying heat it fends forth the peculiar graceful odour by which it is characterifed. Heated by itfelf, it chiefly fublimes, but a part is decomposed, giving an acid phlegm, much oil, and carbonated hydrogen gas. It is not alterable in the air, and does not evaporate by keeping in a moderate temperature. Cold water diffoves only about 1/10 of its weight, but boiling water 2/3; and hence the vapours cryftallization from a hot water folution. It makes readily to molt of the alkalies and earths forming benzouts, the properties of which have been but little examined.

The benzout of lime is almost the only falt of this kind found nature. It is contained in the urine of fome animals, particularly the herbivorous quadrupeds, and is affayed by adding to this folution some muriatic acid, by which the benzoic acid is made perceivable.

With potasf this acid forms a readily cryftallizable falt, decomposable, like the reinf of the benzouts, by a ftrong acid.

Most of the metallic oxides are difsolved by this acid, but not the pure metals.

Mr. Hermblund, in a feries of experiments on the action of nitrous acid on the benzout, found that the latter regularly aflumed in the procfs a smell like that of water diffused over bitter almonds, but on the whole, this acid is but with dif-
cult altered in its nature by the nitrous. Distilling the nitro-benzoic acid with pure alcohol, he obtained ethereal liquor, part of which was nitrous ether, but the remainder appeared, by the smell of almonds, to be a dulceif, or ethereal benzoic acid. But these experiments require to be repeated with accuracy, as the powerful operation of the nitric acid on vegetable matter, though highly instructive, is often not a little embarrassing.

Several other substances, besides the resin of benzoins, contain more or less of this acid. The balsam of Peru, and of Styrax, appear to owe to this acid much of their fragrant smell. Ambergris, vanilla, and some of the aromatic barks, and even urine, contain a small quantity of it. When combined with an alkaline or earthy base, it is generally known by a pungent fragrant smell, and dense white smoke, on applying a heat less than is necessary to burn or decompose the substance with which it is united. When kept down by an alkaline or an earth (as in the case of urine), it is separated by a strong acid. It has been supposed, with probability, that the fragrant feet is not proper to the acid: but is owing to the presence of a portion of resins or effamental oil, combined with it in intimate, as to be inseparable by any means hitherto known, without entire decomposition of the acid; and hence too may be explained the very weak affinity of this acid for all bases, which is generally superior to no acid but the carbolic.

Gum benzoins is a substance used in medicine, though still retained in a few preparations of the London and Edinburgh pharmacopoeias. The compound tincture Tinctura Benzois Composita, formerly Basilanum Traumaticum, contains gum benzoins, balsam of Tolou, and aloes; and the benzoic acid enters into the Edinburgh Tinctura Offici Ammoniata, and in some other compounds of foreign importances.

The fragrance of this resin has caused it to be used in perfumery of various kinds. Where the object is merely to produce a penetrating agreeable scent, it may be of considerable use; but as a corrective of foul or contagious air, its powers are very small, by no means comparable to those of the mineral acid vapours, whilst the irritation which it gives to the lungs is more intolerable. Scheele's Essays. Tourcy. Hermblad in J. Phy. tom. 34. &c.

BEOLIPA GULY, in Geography, lies on the east side of the Strait of Dardanelles, near the opening into the sea of Marmora.

BEORI Animal (Laet. Amer.), in Zoology, the Tapir Americanus of Gmelin, &c.

BEOSTER ISLAND, in Geography, one of the Shetland islands, between which and Green island, at the north end of Braha, or Brathy found, is a good channel, that runs out into the sea.

BEOTIA, Cape, lies within the island of Neoropotnt, to the north of Corinth, on the north side of the peninsula, stretching south-cast from Corinth.

BEQUIA, a small island of the West Indies, dependent on the government of St. Vincent, and containing 3,500 acres. It is chiefly valuable from the commodiousness of its fine harbour, called "Admiralty bay." 

BER, a district of Switzerland, in the government of Velen and canton of Beren, comprehending two parochial villages.

BER. See BERSIEE.

BER. See Boule-Comba.

BERABYAN, a long lake in New North Wales, lying N. and S. and running gradually from its north end, till it mixes with the waters of Shoulder lake, at the south end, and where these waters form Seal river, which empties into Hudson's bay, at Churchill fort. The north end of Berabzan lies in about 60° 30' N. lat. and 93° 50' W. long.

BEREA, in Ancient Geography. See BEROVA.

BERAMS, in Commerce, a coarse cloth, made altogether of cotton thread, which is brought from the East Indies, and particularly from Surat.

BERAMUN, in Geography, a town of Egypt, on the Nile; 3 miles north-east of Mansura.

BERAR, a founah, or kingdom of Hidoodtan, bounded on the north by Allahabad and Mawar; on the west by Candeels and Amadeagur; on the south by Tellingana and Golconda; and on the east by Oosif. It contains 13 circuits, divided into 42 pargammahs. The western parts of this province were reduced by Aced; and its revenue under Aurungzebe, as stated by Mr. Fraer, in his "Life of Nadir Shah," amounted to 17,536 lacs of rupees. The principal part of this province is policed by the Berar or Nogpour rajah; and the remainder is held by the Nizam, or founah of the Deccan, who pays to the rajah a "chout," or fourth part of its clear revenues. The inferior parts of Berar are less known than most other countries in Hindooatan; but it is thought to be neither populous nor rich. Its present capital is Nogpur, about midway between Bengal and Bombay. This province produces wheat, rice, poppies, and many sorts of legumes. In the southern part is found the deer, which yields the Berar bone; and the sheep of this province differ from the common species, their neck being lengthened, their tail very short, their ears long, and their wool not curled.

BERARDI, Angelo, in Biography, an Italian writer on music, who published at Bologna a considerable number of musical tracts, between the years 1681 and 1693, which, with a large portion of pedantry and common-place information, contain much curious and useful knowledge. Their titles are: "Ragionamenti Musicali, Musical Differents;" "Documenti Armonici, Harmonical Documents;" "Mismellanea Musicale, a Musical Miscellany;" "Arcani Musicali, Dialogo, Musical Arcana, a Dialogue;" and the "Perche Musica, Musical Definitions." If the whole had been compiled, methodised, and digested into a single treatise, and all the musical information dispersed through these several tracts arranged in a regular and gradual order, a more useful and practical didactic work might have been produced, than Italy seems to have furnished during the 17th century.

BERASTEGUE, in Geography, a mountain of Spain, in the province of Guipuzcoa, 3 leagues from Tolosa.

BERAULT, Nicholas, in Latin Beraldus, in Biography, one of the learned men of the sixteenth century, was either a native of Orleans, or for a long time resided in this place, where he was prosector of the civil law. He was tutor to admir de Coligny; and well acquainted with Erasmas, who, in his "Ciceronianus," speaks with commendation of his ready and flowing elocution, and who, in 1522, dedicated to him his tractate, "De Curtenses Epistolas." Among the Latin works of Berault, were "A Graeco-Latin Dictionary," Paris, 1521; an "Oration on the Peace of Cambray," Paris, 1528; another "On ancient and modern jurisprudence," Lyons, 1533; and "A Dialogue on the faculty of speaking extemporarily," Lyons, 1534. He also wrote paraphrases on the Politics and Economics of Aristote, and notes on the Ruffus of Politian. His comments on the Natural History of Pliny, though not mentioned by Hardouin, are much commended by Erasmas. He was esteemed for his integrity, and greatly regarded by Poncher, archbishop of Sens, a prate distinguished in France by his patronage of literature.

BERAON, in Geography, a royal borough of Bohemia, in a circle of the same name. The chief produce of the circle is wood and corn, and in some parts are found mines of iron.
iron. The town is seated on the river Miss or Mix, 14
m. S. W. of Prague. N. lat. 50° 21', E. long. 14° 25'.

BERBEZC, a river of European Turkey, which runs
through the Bucel, near Tenceni, in the province of Moldavia.

BEREGAL, a town of Spain, in Aragon 3 leagues
from Bailva.

BERERESA. See Brees.

BERBERINA, in Botanologia, a species of TIPULA,
with four, incumbent wings, having the base and marginal
spots white. Schneider. This insect has the thorax and
abdomen red; it feeds on the barberry, and forms small
excreta on the branches.

BERBERIS, in Natural History, a species of VORTI-
CEREA, of a simple oval form, with a broad rigid stem,
and white granulations. Goeze. This is Vorticosa com-
pacta, Druce, ovata pluteus, filipendula of Linn. S. E.
Nat. edit. 12. It is also Berberis berberiformis of Pallas,
and P. dufedipus britannica of Ray. Found in
fish water in Europe; usually in clumps.

BERBERIS, Barberry, or Pippardia Ducis, in Botany.
Gen. 1. 242. Tourne. 375. Smith 131. Cais and Or-
patulous; stigmas ovate, with a narrower base, con-
cave, alternate finer, coloured, deciduous. Cor. petals
fix, roundish, concave, erect-expanstion, scarcely la ger
than the calyx; nectary two, small, roundish, coloured bodies, fast-
tened to the base of each petal. Stam. filaments fix, erect, corn
pressed, obtuse; anthers two, tatterd on each side to the
edge of the filaments. Fr. barbelliform, the length of the
filaments; style none; stigma orbicular, broader than the
germ, surrounded with a sharp edge. Per. berry cylindric,
obtuse, umbellated with a point, one celled. Seed two,
oblong, cylindric, obtuse. B. cretica has three seeds.
Rech.

Elf. Char. Cal. fix-leaved; pet. fix, with two glands at
the claws; style none; berry two-seeded.

Species. 1. B. vulgaris, common barberry; B. dum-
torum. Ray, Sm. 495. Spina acida or oxycantla. Ger-
Eng. 1525. B. vulgaris, purple-leaved barberry. 77. B. can-
adicum, Canada barberry. P. berberis, a species of the
barberry tribe. A shrub rising to the height of 6 or 8 feet; with
leaves upward and branchet, smooth, and finely organised,
leaves, below a large white path, and curved with a whitish
or ash-coloured basis, yellow on the inside; leaves and
branches are armed with sharp thorns, commonly growing
by threes; first leaves elongate, ferteil cliseate, not paited;
stem-leaves alternate; secondary leaves in pairs, entire,
and fertile, with smaller leaves concealed between the lower
leaves and the thorns; flowers toward the ends of the
branches in pendulous raceme, with a leaf to each petal oval;
corolla yellow; petals frequently serrate along the edge, and
at the base of each are two orange-coloured dots, which
are probably the nectaries; anthers red, yellow; stigma
greenish; berries at first green, and, when ripe, changes to a
fine red colour; seeds two, rarely three, fastened at bottom
to a minute tubercle, oblong, smooth, of a purplish red, or
colour, and hard; the seed-bas of an elliptic form. A native of
the eastern countries, and now of most parts of Europe in
woods, coppices, and hedges; in Linn. Eng. only in a few
places, as particularly among the Waal in Holland. The
flowers appear in May and June, and the fruit ripens in Septe-
ber. Miller mentions three varieties of this shrub, viz. B.
fine leaves; B. vulgaris, or with the leaves, occasioned
by the age of the plant; B. with white flowers, having leaves
of a lighter green colour, and the bark water than the
common barberry, and B. creticae procer; erecta nigra flavida.

Tourne, conf. differing only in the colour and flavour of the
fruit. He makes the Caddis barberry a distinct species, and
states, that the leaves are much broader and thicker, and
than that of the common sort, and that the fruit is black when ripe.
It has been formerly observed by Linnaeus, that when bees
in search of honey touch the filaments of this shrub, the
anthers approximate to the stigma, and explode the pollen.
This irritability is so remarkable, that if the filaments are
bent near the base with the point of a pin, a sudden
contraction is produced, and this may be repeated several
times. Dr. Smith, who has made this property the subject of partic-
ular examination, observes (see Phil. Trans. vol. xxviii. p. 153.)
that neither the outside of the filament, nor the hinder has
any irritability; and that the spring of the flaments is owing
to an high degree of irritability in the side of the flament
next the germ, by which, when touched, it contracts, that
side becoming shorter than the other, and consequently
the filament being bent towards the germ. After irritation,
the flaments will return to their original place, and on being
again touched, they will contract as before. The pur-
pose which this curious contrivance of nature is designed
to answer is evident. When the flamma stand in their original
position, their anthers are effectively sheltered from rain
by the conavity of the petals. Thus they probably remain till
some infest, in order to extract honey from the base of the
flower, thruiufs itself between their flaments, and almost
unavoidably touchces them in the mott irritable part; in
this way the imprigation of the germens is performed; and
as it is chiefly in fine funny weather that insects are on the
wing, the pollen is also in such weather most fit for the pur-
pose of imprigation. Another peculiarity ascribed to this
shrub is, that ears of corn growing near it constantly prove
abortive, and that it extends this infestation over them to the
distance of 3 or 400 yards across a field.

Dahanel long since looked upon the salubrious power of
barberry as totally void of foundation, and M. Brouillcot
affirmed Dr. Smith, from his own observations, that the opin-
on, though very prevalent, was altogether groundless.
ham's Bot. Arrang. vol. i. p. 15.

The leaves of barberry are greately acid; the flowers are
often to the smell when near, but at a proper distance their
davour is extremely agreeable. The berries are so acid that
birds will not eat them. The barberry however is cultivated
for the sake of the leaf, which are picked and used for garnishing
dishes; being boiled with sugar, they form an agreeable rob
or jelly; they are used also as a dry sweetmeat, and in sugar-
plains or comfits. They are moderately refringent, and are
said to be of great use in bilious fluxes, and in all cases where
hiccoughs, and the pruritude of the humours prevaile. On
the authority of Prosper Alpinus (Med. Egypt. l. iv. c. 1.) we
are informed, that the Egyptians employ them in poliehing
fenders and fluxes with great success; and Simon Flavtli
relates, that he was cured of malaignant fever, accompa-
nied with a headache, by using these berries according to the
Egyptian practice; that is, macerating the fruit for a day or two night in twelve times its quantity of water, with
the addition of a little steeped bread; and then straining and
filtering the liquor, and using it as a common drinl. Dr.
Woodville observes, Med. Bot. vol. iv. p. 62. that these
berries are well calculated to alloy hest and thirst, and to
correct a prevalent tendency in the fluxes; but that in this re-
cpect they seem to posseses no peculiar advantage over moll
of the other acid fruits; hence the colleges of London and
Edinb. have resung this fruit from the Materia Medica,
and retained only that of the currant. The bark is said to
be purgeative, and Ray experienced its good effects
taken
taken as a decoction in the jaundice. The roots boiled in lye dye wood yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root: and the inner bark of the stem dyes linen of a fine yellow, with the assistance of alum. Withering, "ubi supra." Kine, sheep, and goats, are said to eat this shrub, and horses and swine to refuse it.

**Propagation and Culture.** The common form is generally propagated by suckers; but as the plants thus propagated tend to lose their fruitfulness in greater abundance than those which are propagated by layers, the latter method should be preferred. The best time for laying down the branches is autumn, and the young shoots of the same year are the best; which will be well rooted by the next autumn, when they may be taken off and planted where they are to remain. When this plant is cultivated for its fruit, it should be planted single, and not in hedges; and the suckers taken away every autumn, and all the gross shoots pruned out; by this method the fruit will be fairer and more abundant. A few of these shrubs will make an agreeable variety in wild gardens or plantations of shrubs; and the fruit will be food for birds; but they should not be planted in too great quantities, or near walks that are much frequented, because their flowers emit a very strong disagreeable odour. The Canada form may be propagated in the same way as the common form, and is equally hardy. The box-leaved form, which is now very rare in England, may be propagated by laying down the branches in the same manner as the first; but the young plants should be set in pots, or sheltered under a frame in the winter; and when they have acquired strength, they may be turned out of the pots, and planted in a warm situation. Martyn's Millar's Bot.

**BERBI,** in Geography, a town of Africa, on the Ivory coast, N. E. of cape Palmas. N. lat. 4° 30'. W. long. 5° 31'.

**BERBICE,** the seat of a colony of Guiana in South America, formerly belonging to the Dutch, on a river of the same name, about 25 leagues N. W. by W. 1/2 N. distant from Surinam, which runs from N. to S. and discharges itself into the Atlantic ocean. The coast on each side of the river forms a bay at its entrance, nearly a mile broad, in the middle of which is a small island, called "Crab island." Opposite to this island, on the eastern shore, is a fort, with several pieces of artillery, and some folders; but the channel on the other side, which is navigable for ships of any burden, is undefended, and covered by the island from the guns on the opposite shore. Without the entrance of the river is a bar, which, at high tide, has seldom more than 16 feet of water; but within the water is of sufficient depth, and the river is navigable for ships of burden 200 miles from its mouth.

The plantations are situated on each side of the river, and extend nearly 500 miles from its entrance at fort Naffau, which was formerly the seat of government, and contiguous to which were the public offices and houses of the civil and military officers, about 100 miles from the mouth of the river. But the seat of government is now fixed at a point of land on the eastern shore of Berbice, about a mile from its entrance, which is formed between Berbice and the river Conya, which there discharges itself into the former. This is a narrow, but deep river, running from south to north, but discharging somewhat coarsely from Berbice. On the sides of this river are several plantations, which form a part of the colony of Berbice. The produce of these plantations consists chiefly of sugar, coffee, cotton, and cacao, and other articles, such as are furnished by Surinam. Bancroft's Nat. Hist. of Guiana, p. 350, &c. The colony of Berbice surrendered to the British arms in September 1805. The river Berbice discharges itself into the Atlantic in N. lat. 6° 50'; and W. long. 57° 20'.

**BERBUDA.** See Barbuda.

**BERBURG,** a town of the Netherlands, in the duchy of Luxemburg; 12 miles N.E. of Luxemburg.

**BERCAD,** a town of Poland, in the palatinate of Breslaw, near the Bog; 32 miles S.S.E. of Breslaw.

**BERCARIA,** Berquaria, or Berckeria, in Middle Age Writers, denotes a sheep-fold, sheep-cote, sheep-pen, or other inclosure, for the safe keeping of a flock of sheep.

The word is abbreviated from berckaria; of berckex, detorted from berexx. Hence also a shepherd was denominated berkarianus, and berquarianus.

**BERCHEM, or Berghem, Nicholas, in Biography,** an eminent painter of landscapes and cattle, was born at Haarlem in 1624, and formed for the practice of his art under some of the best masters of his time. In his manner of painting he was early and expeditions, and though he selected a very great variety and beauty of sites for his landscapes, he executed them with a surprising degree of neatness and truth. He possest a clear and strong judgment, and a facility in exprefsing his ideas; and, therefore, in the lower kind of subjects to which he directed his attention, his choice of nature was judicious, and he gave to every subject as much beauty and elegance as it would admit. The feeling of his tree is exquisitely and freely touched; his skies are clear; and his clouds float lightly, as if supported by air. The distinguishing characters of the pictures of Berchem are the breadth and just distribution of the lights; the grandeur of his masses of light and shadow; the natural cafe and simplicity in the attitudes of his figures; the just degradation of his distances; the brilliancy and harmony, as well as transparency, of his colouring; the correctness and true perspective of his design; and the elegance of his composition. He painted every part of his subject so well, as to render it difficult to determine in which he excelled most; his trees, buildings, water, rocks, hills, cattle, and figures, being all equally admirable. One of the most capital pictures of this master was painted for the principal magistrate of Dort, in whose family it is preserved; it exhibits the prospect of a mountainous country, enriched with a great variety of sheep, oxen, goats, and figures, excellently pencilled, and most beautifully coloured. Berchem was indefatigable, partly from his love of labour, and partly to gratify the avaricious disposition of his wife, who never allowed him to relax; and he painted, in the summer months, from four in the morning till day light failed; in consequence of this close application, his pictures are very numerous; and yet at this day they are rarely to be purchased, and always afford a very
very high price. Berchem died in 1681. We have several etchings by this master, that are executed in a fine, bold, masterly style; and from these John Vithier seems to have formed that admirable style in which he engraved the copies from Berchem's pictures. Pilkington and Strutt.

BERCHENI, Peter, in Biography, an historical painter, was born in France, in 1649, and placed, at the age of 15, under the care of La Fille, to that in 3 years he was qualified to be employed in the royal palaces. In 1681, he came over to England, and worked under Rambou, a French painter of architecture. Berchet painted the ceiling in the chapel of Trinity college, Oxford, the staircase at the duke of Schonberg's house in London, and the summer-house at Ranelagh. His drawings in the Academy were much approved. Towards the close of his life he only painted small historical pieces, the subjects of which were taken from fabulous history; and his last performance was a Bachmanian picture, to which he affixed his name the day before he died, in the year 1721. He occasionally amused himself with the point. Pilkington and Strutt.

BERCHING, in Geography, a small town of Germany, in the bishopric of Lichtfett, or Archdait, seated on the river Sulz.

BERCHORIUS, Bercher, Peter, in Biography, a learned divine and voluminous writer of the 14th century, was born at the village of St. Pierre du Chemin, 3 leagues from Poictiers in France, and was constituted grammatical preceptor to the novices of the Benedictine monastery at Cluny, in the year 1340. He died prior of the Benedict convent of St. Eloi at Paris, probably in an advanced age, in the year 1362, as we learn from his epitaph in that monastery. Berchorius was one of those writers who affected to interpret allegorically, not only texts of Scripture, but also poetical fables and profane histories, which they arbitrarily applied to the explication or confirmation of the mysteries of Christianity. His three grand printed works are: "Reductorium Morale super totam Biblia," in 26 books, first printed at Argentorat, 1473, fol. and containing all the incidents and stories in the Bible, reduced into allegories, "Repertorum, or Reductorium, Morale," in 14 books, which is a dictionary of things, persons, and places, all which are supposed to be mythical, and are therefore explained in their moral and practical sense; and "Dictionarium Morale," in two parts, and seeming to be principally designed as a moral repository for students in theology. These pieces were all printed at a very early period; and a folio edition of them was printed, in 3 volumes, at Venice, in 1583. Berchorius was also the author of a comment on a prophecy, called "Judgmentis Mysticum," which was used as a school-book in France. Gaius, in his "Philosophia Sacra," written about the year 1623, and of which a third edition was printed at Frankfort and Hamburg, in 1659, affixes to this author the famous work entitled "Gesta Romanorum," the writer of which has for a long time remained unknown to the most diligent inquiries into Gothic literature. The learned Mr. Thomas Warton concurs in this opinion, and thinks it amply confirmed by the general coincidence of the plan, manner, method, and execution between the "Gesta Romanorum," and the three works of Berchorius above-mentioned. He supposes it was written about the year 1340, with a view of rendering the exercises of his scholars, in the monasticlay at Cluny, in Latin, more agreeable and easy, by means of an entertaining Latin story-book, capable of being readily applied to lessons of religious. This piece operated powerfully on the general body of our old poetry, and afforded a variety of inventions, not only to Chaucer, Gower, and Lydgate, but to their distant successors. It was first printed in the Gothic letter without date, and as it is appended, before or about the year 1473, in folio; and contains 153 chapters. The second edition was printed in the same year or following year at Louvain, in 1470, and contains 151 chapters. Another edition was printed in folio, in 1530. At the commencement of typography in England, a translation of it in English was printed by Wynken de Worde, and it was afterwards frequently reprinted. This work is compiled from the obsolete Latin chronicles of the later Romans, or rather German story, heightened by romantic inventions, from legends of the saints, oriental apologues, and many of the shorter fictitious narratives, which came into Europe with the Arabian literature, and were familiar in the ages of ignorance and imagination. The classics are sometimes cited for authorities; but these are of the lower order, such as Valerius Maximus, Macrobius, Aulus Gellius, Seneca, Pliny, and Boethius. To every tale is subjoined a moralisation, reducing it into a Christian or moral lesson. Warton's Hist. Eng. Poetry, vol. iii.

BERCHTOLDSDORF, or Peterssdorf, in Geography, a town of Germany, in the archdeacony of Austria, 9 miles south-west of Vienna.

BEROHTSGADEN, or Berchtolsgaden, a province and principality of Germany, in the circle of Bavaria, environed by the archdeaconry of Salzburg, but exempt from the jurisdiction of that see. It is wholly mountainous, and contains two towns and a few villages, and sixty several lakes. At Bergoldtsgaden, as well as at Hallem, in the principality of Salzburg, salt is found in its saline flats. In order to obtain it, large cisterns, or chambers, are dug in the mines, and filled with fresh water. Some of these are so large that the water must stand in them during two years before it is sufficiently impregnated with salt; in others, this process does not require more than a few weeks. When the water is saturated, it is carried through the mount in by pipes into a retavor, whence it is conveyed to the factories. Of these there are four at Hallem, and two at Bergoltsgaden, which are not above four leagues distant from each other. The salt annually made at the former of these places, amounts to 400,000 quintals, and at the latter to 160,000. Count Zamenhoff's lipides (Hist. et Mem. de la Société des Sciences Physiques de Lauenau, vol. ii., for 1876 and 1877), that the mines at Hallem, and those at Berchtoldsgaden, are parts of the same base of salt, of which, in his opinion, is a continuation of that of Ground in Austria, about 8 leagues from Hallem; and the irregularity of the strata seems to indicate that the connexion between the two mines must have been broken by some violent convulsion.

BERCK, a town of Holland, 5 miles east of Delft. —Also, a river of Germany, which rises in the bishopric of Munster, and runs into the Ijssel at Zutphen.

BERCKSNEBROECK, a town of Holland, 6 miles north of Rotterdam.

BERD, a river of Siberia, which runs into the Ob, near Berdou.

BERDA, in Ichthyology, a species of Squalus, that inhabits the Red sea. It is of a whitish grey: lateral scales marked in the middle with a fingle transverse brown band; dorsal spines recurved. Turk. Fin Arab. The body of this fish is oval; back gibbous, with pale bands; beneath white; scales
BER

scales broad, rounded, entire. The crown is naked, convex, gneous; iris white; nectar large, linear, with a conic cirrus; four long, conic, subulate, olive tepals; grinders numerous, hemispherical, those behind largest; upper lip long, protostylite; gill-covers entire; lateral line near the back; fins brown, pectoral ones transparent and lanceolate; tail two-tailed. Gmelin.

BERDA, Cape, or Berinskaya, in Geography, the east point of a large bay of the Sea of Azof; cape Visharionova, or Besarionova, being the west point. Several rivers empty themselves into this bay. N. lat. 4° 42'. E. long. 56° 24'.

BERDA, a town of Asia, in Armenia, 160 miles east of Erevan.

BERDANIEH, a town of Russian Turkey, in the province of Caramania; 32 miles north of Amashch.

BERDASCHIR, See Barsir.

BERDASH, In Antiquity, was a name formerly used in England for a certain kind of neck-dress; and hence a person who made or sold such necklets. This was called a berdenier, from which it is derived our word laberdyer.

BERDICZOW, in Geography, a decayed town of Poland, in the palatinate of Volhynia, 148 miles E.S.E. of Lucke, and 324 S.W. of Warsaw.

BERDIN, or Berlin, in Genealogy, the name by which the bishop, or popes-allers, pontica of Linn., is known on the coast of Normandy. It is also called in some places berlice, or berenice.

BERDOA, in Geography, a province of Africa, in the eastern division of the great desert of Sahara, constituting one of the Oases or fertile islands, which forms a part of that extensive desert that separates Egypt from Fezzan, and contains the wandering tribe of Lebata or Lebata. It is situated to the north-east of Agadez, and has Kuar or Kawar to the south and east, to the north Angola, and the desert of Bara, and to the west Fezzan. It extends northward from N. lat. 25°, and lies between 20° and 25° E. long.; but its exact boundaries are not ascertained. Berdoa, its capital, lies north of the mountains of Tibeche; and, according to Rennell's map, is placed in N. lat. 26° 32'. E. long. 21° 35'.

BERE-ALSTON, though only a small inconsiderable hamlet, in the parish of Berc-Ferris, Devonshire, has the privilege of returning two members to the English parliament.

The right of election is vested in those persons who possess land in the borough, and pay three-pence acknowledgment to the lord of the manor, who varies the number of electors at pleasure, by granting burgage tenures to his own partizans only. The first return of members for this borough was in the 27th of Elizabeth. In the vicinity of this place are several lead mines; but none of them produce much ore, though in the time of Edward I. they were not only very rich in this metal, but yielded a great quantity of silver. It is said that 1600 weight of the latter was obtained in the course of three years.

BECYNTUS, in Entomology, a species of Papilio, with entire wings, black above, with a yellow marginal band; fix ocular spots on the under side of the posterior pair. Fabricius. This is papilio brevicauda of Cramer, is of a large size, and inhabits Sumatra.

BECINTIA REGIA, a country of Asia, towards the river Sangar. Steph. Byz.

BECYNTIUS TRACTUS, a canton of Asia Minor, in Caria. Pliny.

BECYNTUS, a mountain of Asia Minor, in Phrygia, consecrated to the mother of the gods.

BECZYNA, in Geography, a river of Lithuania, which rises in the palatinate of Vilna, and runs into the Neman, 16 miles north-east of Novogrodek.

BEREFORD, a trading place and port of the island of Iceland.

BREGRA, or BERETRA, in Ancient Geography, a town of Italy, in Picenum, at a small distance north from Ueteramna.

BEREGSZAZ, in Geography, a town of Hungary, 24 miles north of Zatmar. It gives name to a county, and derives its appellation from a Saxon colony established there; but its present inhabitants are Hungarians.

BERELTA, a town of Africa, north of Sierra Leone, at a small distance from the coast. N. lat. 8° 58'. W. long. 15° 26'.

BERELLY, or BARELLY, a city of Hindoostan; is the capital of Rohulejund, which was added to the dominions of Oude in 1772. It lies about half way between Lucknow and Delhi. N. lat. 25° 27'. E. long. 79° 45'. See Barley.

BERELOS, a lake of Egypt, between Damietta and Rosetta; about 32 miles long and ten broad in the middle, but gradually contracting towards each end. It has within it several islands.—Allo, a town of Egypt, 30 miles west of Damietta.

BEREN, an island of Asia, 40 leagues west from Congo island in the gulf of Baffin.

Beren or Berow, a town of Silecia, in the province of Ratibor; 34 miles east of Ratibor.

BERENBOURG, called also Main Island, an island in the north seas, near the coast of East or Old Greenland. N. lat. 71° 10'. W. long. 6° 10'.

BERENGARIUS, in Ecclesiastical History, a religious poet, adhering to the opinions of Berengarius, who, in the latter part of the eleventh century, a considerable time before Luther, opposed the doctrine of transubstantiation, and the real presence, strenuously maintained by Lanfranc and Anselm. See Berenger.

He is further charged by the Romanists with decrying marriage, and maintaining the common use of all sorts of women, and affecting baptism of no effect.

His followers were divided on the head of the eucharist: though they all agreed, that the bread and wine were not essentially changed, yet some allowed, that the body and blood of Christ were contained in them, though concealed under an impanation; others denied any change at all; and resolved the whole into figure; others again allowed a change in part; and others an entire change, with this restriction, that those who professed themselves unworthy it was changed back again.

Mobilin has an express disputation on the manifold condemnations of Berengarius, his retractions, relapses, and repentance.

BERENG, JAMES, in Biography, a native of Carpi, in Modena, from whence he took his name, being much more known by the name of Carpus, than by that of his family, Berengarius; one of the reformers and improvers of anatomy, was born about the end of the fifteenth century. He was initiated into the knowledge of surgery by his father, who practised that art, and had for his instructor in languages and philosophy, the celebrated Albertus Magnus. At a proper age he went to Bologna, and afterwards to Padua, where he filled for some time the office of professor of anatomy. Returning in 1418 to Bologna, he was there raised to the same office, which he continued to fill until about the year 1525. While teaching here, he is said to have diffused upwards of an hundred human bodies: a prodigious
prodigious number for the time, when the prejudice against handling or disturbing the dead was so strong. To that circumstance, aided by his known antipathy to the Spaniards, perhaps may be attributed the story of his having dissected two of the natives of that country alive, with the view of seeing the motion of the bowels, and of his being on that account obliged to fly his country. A similar story had been told of Herophilus, and was afterwards told of Vesalius. That this, however, had been done by some anatomists, or that he was accused of it, seems probable by his speaking of such a practice in his commentary on the works of Mundinus, with disgust and horror. He is with more reason said to have offended the ministers of religion by the levity and indecency of his conversation on the subject of his dissections, and by the profanity of his life; and on that account to have been obliged to quit Bononia.

By his numerous dissections, he was enabled to correct many erroneous opinions, as to the structure of the interior parts of the body, which prevailed at this time, and thence to pave the way for the further improvements made by Vesalius, his immediate successor. If he was not the inventor, as Douglas calls him, he was one of the first who used mercurial fumptions in curing the venereal disease, by which he is said to have acquired a large fortune, which he left, at his death, to the duke of Ferrara, to whose territory he retired, and where he died, about the year 1527. His works are, "Commentary, cum amplificationibus, suprap anatomen Mundini, cum textu ejus in primum liberties deducto." Bononia, 1527, 4to., containing, besides numerous corrections of Mundinus, a prodigious number of anatomical facts, which bear abundant testimony to his diligence and ingenuity. "De omnia sanare, quae recte videat (Haller says), minister fore?" and further on, "Invenio apud hunc virum, tellinonium irrefragabile pro antiquo more, quo cardienses tenes pontificis, super cetera, contra chartum." There are several rude engravings of the muscles of the abdomen, and of other parts, in this volume. "Haggrae brevis, perculitque et uberrimae in anatomia humana corporis ad suorum felibis licentiam pressos in lucem edita," Bononia, 1522, 4to., also with plates. Both these works have passed through numerous editions. In 1664, it was published in London, with the title, "A Description of the Body of Man, being a practical Anatomy." He also published, in 1516, 4to., "Veneris et Genitalium Fractura." Douglas, Bib. Anat. Hebr. Bibl. Chicago.

Berenger, Berengarius, an eminent logician and controversialist, was a native of Tournai in the eleventh century, and having studied under Albert at Chartres, he returned to Tournai, where he was made principal of the schools of St. Martin, and treasurer of the church. From Tournai he removed to Angers, and became archdeacon of the city. Distinguished by his acute and subtle genius, by his extensive learning, and by his peculiar talents for controversy, as well as by the exemplary piety of his life and manners, he was held in very high estimation. At length, however, he found reason to deviate from the doctrines of the church concerning the eucharist; and in 1049, he began to maintain publicly the doctrine of Secundus, in opposition to the opinion of Radbert; and he persisted in teaching that the bread and wine were not changed into the body and blood of Christ in the eucharist, but preserved their natural and substantial qualities, and were merely figures and external symbols of the body and blood of our Saviour. Although the church of Rome had not, in this century, adopted any settled and decided opinion concerning the nature and manner of Christ's presence in the eucharist, the doctrine of Berenger was not only opposed by several doctors in France and Germany, but attacked with peculiar vehemence and fury by the Roman pontiff Leo IX., who, in 1050, convened two councils, one at Rome, and the other at Verceil, in which it was solemnly condemned; and the book of Secundus, from which it was deduced, was committed to the flames. The council of Paris, summoned in the same year by Henry I., concurred in its condemnation, and denounced Berenger, and his numerous adherents, with all sorts of evils, both spiritual and temporal. The heretics were deprived by Henry of all his revenues, but he continued for some time afterwards firm and resolute in his adherence to the doctrine he had embraced, and enjoyed un molested tranquillity. The prevalence of his doctrine, notwithstanding the opposition with which it encountered from the writings of its antagonists, and particularly from those of Anselm and Lanfranc, archbishops of Canterbury, alarmed the church; and two councils were summoned by Victor II. at Tours, in 1054, to examine anew this dangerous doctrine. In one of these councils, Hildebrand, afterwards pope Gregory VII., appeared as the pope's legate, and took the lead in opposing this new heresy. Berenger, who was present, was at length overpowered by threats, and only abandoned his opinions, but solemnly abjured them, and made his peace with the church. This abjuration, however, was only an act of timidity and dillillation; for he soon after taught the opinions he had formerly professed, though the dread of danger rendered him more circumstint and cautious. As soon as Berenger's perjury was announced to Nicholas II., the exasperated pontiff summoned him to Rome in 1057, and in a council held there the following year, he was so terrified, that he declared his readiness to embrace and adhere to the doctrines which that venerable assembly should think proper to enjoin. Accordingly, Humbert was employed by the pope and council to draw up a confession of faith, which Berenger publicly signed, and to which, by a solemn oath, he avowed his adherence. As soon as Berenger returned to France, and found himself constemanced and protected by his ancient patrons, he expatiated his detestation of the doctrines which he had been obliged to profess at Rome, abused them boldly, both in his discourses and writings, and zealously incited his former opinion. Pope Alexander II. attempted to soothe and friendly expostulations to regain the apostate; but his remonstrances were ineffectual; the controversy was prolonged for many years, and the followers of Berenger continually increased. As soon as Hildebrand was advanced to the papal chair, he undertook to terminate the controversy; and with this view required Berenger, in 1079, to repair to Rome. Towards the conclusion of this year, a council was held in this city, and Berenger was permitted to draw up a new confession of his faith, and to renounce that which had been composed by Humbert, and approved by Nicholas II. and a Roman council. On this occasion the perjured prelate made a declaration, confirmed by an oath, that he would for the future adhere to the following proposition: viz., "that the bread laid on the altar became, after consecration, the true body of Christ, which was born of the Virgin, suffered on the cross, and was fitted at the right hand of the father; and that the wine poured upon the altar became, after consecration, the true blood which flowed from the side of Christ." This declaration satisfied the pontiff, but was thought by the council of Berenger to be too vague and equivocal. Gregory yielded to their clamours; and at a council held at Rome, in 1079, a new confession of faith was drawn up, to which Berenger, after reading and subscribing it, declared his assent by a solemn oath. This confession expressed his belief, "that the bread and wine were, by the mysterious influence of the body prayer,
prayer, and the words of our Redeemer, substantially changed into the true, proper, and vivifying body and blood of Jesus Christ; and this was followed by a solemn declaration, “that the bread and wine, after consecration, were converted into the real body and blood of Christ, not only in quality of external signs and sacramental representations, but in their essential properties, and in substantial reality.” Gregory disapproved him with the most honourable testimonies of his friendship and liberality, and he returned to his own country. But Berenger, not conceiving himself bound by this declaration, publicly retracted the sentiments which he had solemnly avowed at Rome, and even composed an elaborate refutation of the doctrine to which he had been compelled to profess his assent. Gregory, who seems not to have approved the last confession imposed upon Berenger, when appealed to, declined interfering, and took no measures for molesting him. From this time, Berenger observed a profound silence amidst the clamours of his incensed adversaries, and made no reply to their bitter and repeated insinuations.

At length, decaying with age, overpowered by the opposition with which he had ineffectually struggled, and probably deprived with the reproaches of his own mind for the philistine and diffident part he had acted, he abandoned all his worldly concerns, and retired to the isle of St. Côme, in the neighbourhood of Tours, where, in a course of penitential and pious exercises, he finished the short remainder of his life; and in 1088, he was released by death. On the minds of the people, he left behind him a deep impression of his extraordinary faculty; and an annual service is still performed for him in the church of St. Martin at Tours. His un预备 conduct was unquestionably very disgraceful to himself; and there is reason to believe that it embittered the reflections of his retirement and closing scene. It is therefore a question of little importance, whether he abandoned his original opinion before his death, as the Roman catholic writers maintain, or whether he adhered to it in the last period of his life, as the protestants, with greater probability, have affirmed. All his works, which were numerous, have been lost; except two letters, his three professions of faith, and part of his treatise against one of them. Cave's Hist. Lit. tom. ii. p. 130. Morelly's Eccl. Hist. vol. ii. p. 559, &c.

BERENICE, or BERNA, a Jewish queen, the daughter of Agrippa the elder, and sister of Agrippa the younger, king of Judea. She was born about the year of Christ 28, and at the age of 16 married her uncle Herod, king of Chaldea. After her husband's death, A. D. 48, she was suspected of having criminal intercourse with her brother Agrippa; and in order to remove suspicions, and to silence rumours of this kind, she consented to marry Pontiac, king of Puntius and part of Cilicia, on condition of his embracing Judaism. She lived with him, however, but a little while, and returned to her brother, with whom she lived on terms of intimacy, which festigated her to repose. Juvenal refers to this incestuous connection (Sat. vi. v. 155):—

“Deinde Adamas notulissimus, et Berenices
In digito factus pretiosissim; hunc dedicavit olim
Barbarus: incolae dedicat hunc Agrippa foror.”

When Agrippa heard the discourse of St. Paul before Felix at Cæsarea of Palestine, Berenice was present with him. After the commencement of the Jewish war in 67, when Agrippa was driven from Jerusalem by the irreligious people, she remained for some time after him, and interceded for the Jews with the Roman governor Florus, by whom she was treated with great disfavour. She afterwards accompanied Agrippa to the army of Vespasian in Syria; and contrived, by costly presents, to engage the good will of that avaricious emperor as long as he lived. Her beauty and ad-

drew had also captivated Titus; and on the death of Vespasian she followed him to Rome. The emperor was much attached to her, and disposed to make her his queen; but in deference to the sentiments of the Roman people, who disliked the idea of a foreign queen, and who well knew that her character was not irreplaceable, he dismissed her, and sent her away to her own country. What became of her afterwards history does not inform us. Jof. Antiq. i. xix. xx. De Bell. Jud. i. ii. Tacit. Hist. i. ii. Crevier. Gen. Dict.

BERENICE was likewise the name of several Egyptian and eastern queens. One of them, the wife of Ptolemy Euergetes, king of Egypt, under an apprehension of the danger to which he would be expos'd in his expedition to Syria, made a vow to consecrate her hair, which was her chief ornament, in case of his safe return. When the prince returned, not only in safety, but crowned with glory and success, she immediately cut off her hair, and dedicated it to the gods in the temple which Ptolemy Philadelphus had built in honour of his beloved Arsinoe, under the name of the Zephyrian Venus, on the promontory of Zephyr in Cyprus; but this hair being lost by the negligence of the priests, Ptolemy was enraged, and threatened to punish them. Upon which Conon of Samos, a flattering courtier, as well as skilful mathematician, with a view to appease the king's anger, and to conciliate his favour, affirmed, that the queen's locks had been conveyed to heaven, and pointed out seven stars near the tail of the lion, which till that time had not belonged to any constellation, declaring that they were the queen's hair. Several other astrologers confirmed the affer-
BERESOF or Berezov, a district of the province of Tobolsk in Russia, in the country of the Samoeds, situated on the river Sovol, which falls into the Obi; and bounded to the north by the districts of Wargats; on the east by the Urals mountains; on the south by the river Konda, and a large bay of the Obi; on the west by the river Tezov, and the Bay of Oby, and the other Tazovka Guba, or by the bay of Tazov. Into the former the river Obi empties itself, and into the latter the Taz; and from these two rivers the bays derive their names. This district was added to the Russian empire by the czar Gabriel, in 1532, long before the other parts of Siberia were conquered. The town of Berecsof is situated on the west side of the river Oby, 372 miles N. N. W. of Tobolsk. N. lat. 64°. E. long. 65°. 14'. This district is famous for its gold mines, in the mineral mountains of Ural, opened in 1754, and amounting annually to 5, 5, or 6, and in later years 7 or 8 pounds of gold. From the commencement of the work, in 1754, till the year 1778, during an interval of 34 years, the quantity of about 120,000 had been generally gathered, which, estimated in value, amounts to about 1,000,000 rubles, and after deducting the costs, to above 400,000 net profit. Taking the gold and silver here obtained, according to its standard in coinage, and balancing it with the expenses paid in copper money, according to its true value, a profit accruing of nearly 600,000 rubles. Took a View of Russia, vol. iv. p. 255.

BERIW is also a town of Russia, in the government of Omsk. N. lat. 64°. 15'. E. long. 59°. 34'.

BERETILSKO, a town of Poland, in the palatinate of Volynia, 24 miles S. S. W. of Lublin.

BERETHALOM, or BERTHELOOM, a spacious town of Transylvania, in the district of Westland, which is the residence of the Protestant bishop. The church is seated on a high rock, and its vicinity produces good wine.

BERETZHUSEN, a town of Germany, seated on the Labe, in the circle of Bavaria, and principality of Neuburg, 12 miles W. N. W. of Ratibon.

BEREWICH, or BEREWIC, in our Old Writers, denotes a village or hamlet belonging to some town or manor, situated at a distance from it.

The word frequently occurs in Domesday-book: in berewich, or berwich, e. g. in parochia berewich manentur.
BEREZINSKOI, a town of Siberia, on the north side of the Irtish; 40 miles of Tobolik.
BEREZNA, a town of Russia, in the district of Kargapol, on the river Omgna. N. lat. 62° 18'. E. long. 38° 7'.
BEREZNE, a town of Poland, in the palace of Wielunia, near the river Slez. N. lat. 51° 10'. E. long. 26° 57'.
BEREZNIKI, a town of Lithuania, in the palace of Troki; 10 miles of N.N.W. of Troki.
BEREZOV, See BEREZ.
BEREZOVOL, a fortress of Asiatic Russia, in the government of Orenburg, on the Uvelka, 240 miles east of Ufa, and 68 S. E. of Tchelabinsk.
BEREZOVSKOI, a fortress of Asiatic Russia, in the government of Orenburg, on the Ural, 140 miles E. N. E. of Orenburg.
BER-FISCH, in Ichthyology, a name given by the Germans to the common perch.
BERG, Matthias Vandem, in Biography, a painter of portrait and history, was born at Ypres in 1615, and, as one of the disciples of Rubens, he obtained some distinction. In his drawing he was correct, and being pious in designing after the life, and after the best models, pictures of his own invention are uncommon; although excellent copies after the finished pictures of his master are numerous. He died in 1657. Pilkington.
BERG, in Geography, a duchy of Germany, in the circle of Westphalia, called in Latin "Ducatus Montefius," berg and mahn being synonymous, and denoting mountain or hill, is bounded on the west and south by the archbishopric of Cologne, from which it is separated by the Rhine; on the north by the duchy of Cleves; and on the east by Naaf-Siggen, the duchy of Westphalia, and the county of Mark. It is about 72 miles long, and from 10 to 25 in breadth. The country, which upon the whole is mountainous, is, nevertheless, along the Rhine flat, very fertile, and produces corn in abundance; on the hills the inhabitants cultivate vines, and the higher tracts are covered with extensive forests; and the valleys afford excellent pasturage. In this duchy there are mines of lead, iron, and coal; its principal manufactures are fwords, knives, and other articles of iron and lead; and also those of cloth, ribbands, and handkerchiefs. The principal rivers are the Rhine, which flows to the east of this country, the Wipper, the Sieg, and the Ruhr. Its capital is Duffeldorf; and its other principal towns are Elberfeld, Germark, Lennep, Rattingen, and SoIingen. Hoeck computes the number of inhabitants to be 261,504. Rendier (Tour, vol. ii. p. 294.) says, that this duchy contains 9 cities, 8 market towns, 35,942 hearths, 202 churches, 44,646 Calvinists, 36,807 Lutherans, and 1,300 Jews: and he adds, that this duchy, and that of Juliers, contain a number of manufacturers, who are computed to be about 150,000. The duchy of Berg belonged to the elector palatine; but in the year 1795, it was entirely over-run by the French. See JULIERS.
BERG. See Berges.
BERG Reichenftein, or Kischperfi Hory, a royal town of Bohemia, in the circle of Prachaltiz, seated on a mountain, in which are mines of silver, 20 miles W. of Prachaltiz.
BERGA, a town of Norway, 60 miles E. N. E. of Christiania. N. lat. 59° 50'. E. long. 9° 38'.—Alfo, a small town of Spain, in Catalonia, seated on the river Llobregat.—Alfo, a town of Germany, in the circle of Neufledt, and prefecture of Weyda, seated on the Elfter, 5 miles W. of Weyda.
BERGAMASCO, or BERGAMO, a country of Italy, being part of Lombardy, and belonging to the states of Venice, is bounded on the north by the Valetlin, on the east by the Breciano, on the south by the Cremona, and on the west by the Milanese. It extends about 36 leagues from north to south, and 50 from east to west. Towards the north it is mountainous and uncultivated, but the vicinity of Bergamo, its capital, is fertile. Some of its valleys produce wine and oil; others are barren. In the mountains are mines of iron, and quarries of marble and of stones. The inhabitants are inclined to coruplency, and are subject to the gout; nevertheless, they are industrious, and intelligent in commerce, and carry on a considerable traffic in iron, wool, carpets, and tapestry, which they manufacture; cattle, marble, and mill-Stones. Their language is a very corrupt Italian. Bergamasso now belongs to the Cisalpine Republic.
BERGAMO, James Philip de, in Biography, an Augustin monk, was born at Bergamo in 1444, and wrote a "Chronicle" in Latin, from the creation of the world, to the year 1503, and "Treatise of Illustrious Women." He died at the place of his nativity in 1518. Gen. Dict.
BERGANO, anciently Bergomum, in Geography, a fortified city of Italy, and capital of Bergamasso, is seated on several hills, at the bottom of which are some handsome harbours. Between the city and the strong castle on the mountain, is a subterraneous communication. Bergamo is the seat of a bishop, and contains 12 parish churches. It contains for men, 10,000 women, and about 30,000 inhabitants. The old church, of mingled Gothic and Greco architecture, contains several valuable pictures, and deserves notice. It is a place of considerable trade, and has a large fair on St. Bartholomew's day, which is resorted to by a great number of merchants from other parts of Italy, Germany, and Switzerland. The principal articles of commerce are wool and silk; and the serge and tapestry of this place have been celebrated. Their silks equal those of Turin. The inhabitants are diligent and active, and by their industry render fertile the sandy environs of the town. Bergamo is 25 miles N. E. of Milan, and 26 N.W. of Brescia. N. lat. 45° 42'. E. long. 9° 38'.
BERGAMO, a name given by the Turks to the ancient PIRGAMUS.
BERGAMOT, in Botany, cedri or bergamot citron-tree, and the CITRUS MILIAR-ROSA of Lamarck, and a variety of the CITRUS MEDICA of Linneas. It is distinguished from the common citron-tree by its leaf, which has the odour of the rose, by its fruit, which is red, and by the pith of its flower, which is short. The fruit has a fine taste and smell; and its essential oil is in high esteem as a perfumery.
BERGAMOT, Oil, or Effluence of, is a fragrant essential oil procured from the outer rind of the bergamot orange, and prepared in a very large quantity for the table and perfumery in the south of France, and especially in Italy and Sicily. There are several other species of oranges used for this purpose, but the bergamot is esteemed the most fragrant. As the oil exists pure and ready formed in the orange peel, being simply deposed in small cells, the extraction is very easy. There are two methods of procuring it, either by distillation, as with all other essential oils, (for which, see the article Oil, Essential) or by expression. The latter is in some respects the best, as the oil is not liable to be altered by heat. Sellini relates, that in Sicily, a vast quantity of the oil is procured simply by squeezing the peel in the hand, and holding a small piece of sponge to the surface, which imbibes the oil as fast as it flows out; when the sponge is full, its contents are pressed out into a vesel in which the oil is collected. It is not easy to imagine a more indolent and inartificial method; but in Italy, and the south of France, the orange peels are first torn to pieces on a small machine, and over with nails, with the points projecting, like
BERG.

like a carding mill, whereby they are entirely torn to pieces, from which much of their oil flows out on the small mill, and is conducted away by a channel cut for the purpose, leading to a large bottle, where it is collected. After this, the peel, now in a pulpy state, is strongly compressed between two plates of glass, and the remainder of the oil is forced out. This last being mixed with the other parts of the pulp, is at first turbid, but gets clear by separation.

These expressed essential oils, or as they have sometimes been distinguished by the term "fructose", are more fragrant than the oils prepared by distillation, but being mixed with a little mucilage, they are somewhat thicker, and do not keep quite so long as the distilled. The Swedish method of preparing the essence by hand, though attended with great waste of materials, certainly affords a purer oil, than where a mill and press are used.

If the pulp, remaining after presurse, is mixed with spirit of wine and distilled, an addition of water to the distilled spirit separates an additional quantity of the oil, and leaves the liquor highly flavoured with its exquisite scent.

Bergamot, in Commerce, is also the denomination of a coarse tapery, manufactured with fleeces of filks, wool, cotton, hemp, os, cow, or goats' hair, and supposed to be invented by the people of Bergamo in Italy.

BERGANDER, in Ornithology, a name by which some have called the *fliegenkatze or nachtigall dulce*, a very beautiful species of duck, common on the Lancashire, and some other coasts of England; but not in much esteem for eating. This is anas *gardina* of Linnaeus, which see.

BERGARA, in Geography. See VERA.

BERGAISE, a town of Romania, in European Turkey, seated on the Larissa. N. lat. 41° 21'. E. long. 27° 24'.

BERGIBETHEIM, a large market-town of France, in the department of the Lower Rhine, and district of Dachtum.

BERGEN, Dirk Vandern, in Biography, was born at Haerlem, and was reckoned one of the best disciples of Adrian Vandevelde. His colouring is more glowing than that of his master; but his cattle, and other objects, are less correctly drawn. He spent some time in England; but not succeeding, returned to his own country, and for want of economy, died poor in 1689. Pilkington.

BERGEN, Charles Augustus de, son of George Bergen, professor of medicine in the university of Frankfort on the Oder, was born Aug. 11, 1714. After being initiated by his father into the knowledge of anatomy and medicine, he was sent to Leyden, where he studied under Bœchave and Albinus, and thence, to complete his education, to Paris and to Strasburg. In 1734, being thought qualified to assist his father, he recalled him to Frankfort, where he was made doctor, and the year following, professor in medicine. On the death of his father in 1738, he was promoted to the chairs of professor of anatomy and botany. With what zeal and ability he filled those offices, his numerous, learned, and ingenious dissertations on those subjects witness. In 1744, he was appointed to succeed Goëche in reader in therapeutics and pathology, which post he filled to the time of his death, October 7, 1765.

His works, consisting chiefly of academic dissertations, were collected by Haller, and published with his "Theics Anatomiae." The titles of a few of them follow. For the remainder, see Bibl. Anat. et Botan. Haller. "De nerve intercofali," 1731: "Icon nova ventriculorum Cerebrorum," 1734; "Methodus Crucii Offa differendi, et machine hunc in Bras constructae per figuram, ligno servata, delineatio," 1735; "Flora Franconia Theuton, eacmod elaborata, &c." 1752.

BERGEN, or Berygen, in Latin Berygia, in Geography, the capital of Norway, and of the province of Bergenshus, was founded in the year 1059 or 1070. It is a sea-port town, seated in the middle of a valley, and forming a kind of semicircle round a small gulf of the sea, called by the inhabitants Waag. On the land side it is defended by high mountains, constantly overhung with clouds, which descend upon the town in frequent rains, and towards the sea by several fortifications. All the churches and public edifices, as well as many of the dwelling-houses, are built of stone. The most remarkable buildings are the castle, and the cathedral school, founded in 1534. This city carries on a large trade in all kinds of fish, fish-oil, tallow, tar, hides, and timber, which are brought from the northern parts of the kingdom; and exported from hence. The returns confirm the city in corn and foreign commodities. Bergen was formerly connected with the Hans-towns, and enjoyed the privilege of coming till the year 1575. The origin of its commerce was owing to the merchants of the Hanseatic league; fifty-eight store-houses are still to be seen on the quays, which were established by those merchants for the convenience of their exportation of fish. They had also a particular court here, the decisions of which tended to exclude the native inhabitants from all share in the trade; but they were at length entirely expelled, chiefly by the vigour of a bulllet, Walkendor. This city, being chiefly conducted of wood, has been subject to frequent conflagrations, as in 1428, when eleven parishes churches were entirely consumed, and also in 1472, 1623, 1649, 1752, 1756, and 1771, on which last occasion, the flames, it is said, were visible in the isles of Shetland, or at least, the red reflection in the sky. It has now only four parishes churches, three Danish, and one German, together with some private chapels. The population is computed at 19,000. The harbour is reckoned one of the best in Europe. Bergen publishes a very laudable institution for the encouragement of the useful arts. N. lat. 60° 23'. E. long. 5° 33'.

BERGEN, Bergen, or Bergenhus, the most westerly province of Norway, situates between Aggehus and the northern ocean. It is about sixty leagues long, and seven miles wide. Its capital is Bergen. This province, or diocese, is very populous, and is remarkable for having 7 marble quarries. It includes 5 counties or districts, and the same number of provostships. The voege are 11 hardanger, Sunnhord-Lein, Nord-hord Lein, Sogn, or Sygna-Filke, Sunnhord, Nordhord, and Sunndom.

BERGEN, a county of America, in New Jersey, on Hudson river, lies opposite to New York on the east, and was first planted by the Dutch from New York. It is a mountainous country, and its extent is about 30 miles long and 25 broad; forming part of the eastern and northern extremities of the state, and at its north-western extremity meeting the north-eastern part of Suffolk county. Bergen contains 6 townships, the chief of which are Bergen and Hackensack, and 12,601 inhabitants, including 2312 slaves. Here are 7 Dutch Calvinist churches, and 2 of Dutch Lutheran.

BERGEN is the flire town of the above country, and lies surrounded by water, except on the north. It is separated by the Hudson river, from New York, at the distance of 3 miles; on the south, a narrow channel lies between it and Staten island; and on the west, it has Hackensack river. The inhabitants are chiefly descendants of the Dutch settlers.
Bergen Nerf, is the southern extremity of the above township.

Bergen, a town of Germany, in the circle of the Upper Rhine, and principality of Hanau Munzenberg. The environs produce excellent wine. — Also, a town of Germany, in the circle of Upper Saxony, and capital of the isle of Rügen; its ancient name was Ger. It is situated in the centre of the isle, where are held the tribunals of Swedish Pomernia. N. lat. 54° 28'. E. long. 13° 40'.

Bergen on the Domme, a town of Germany, in Lower Saxony, and principality of Zell, 12 miles S. W. of Dannenberg.

Bergenhuys. See Bergen, supra.

Bergen-op-Zoom, a fea-port town of Dutch Brabant, seated on an eminence, in the middle of a marsh, near the eastern shore of Zoom, at its junction with the Scheldt. It was first surrounded by a wall in 1287, by the first lord of the town, and erected into a marquise by the emperor Charles V. in 1533. The church, which is a beautiful structure, was made collegiate in 1442. The houses are well built, and the market places and squares handsome and spacious. It has a good track of land under its jurisdiction, with several villages, and some islands in the Scheldt. This place, naturally strong on account of the morasses that secure it, was regularly fortified in 1629, and defended nearly impregnable. The fortifications are reckoned the master-piece of that great engineer Cochorn. It was unsuccessfully besieged by the prince of Parma in 1588, and also by the marquis of Spinola in 1622. In 1746, the mareschal Saxe deputed count Lowendahl to lay siege to it with 30,000 men; and after persevering attacks, and a vigorous, obstinate defence, in which many lives were lost, it was surrendered to the French, who became masters of all the works of the Scheldt. At the peace of Aix-la-Chapelle, it was restored to the Dutch. It is distant 18 miles N. N. W. from Antwerp. N. lat. 51° 30'. E. long. 4° 15'.

Bergente, in Ornithology, one of the names of anat mearus. (Scap. Duk.) Bloch, boh dereler natur. 1: 2.

Eff. Char. Col. five-parted; Pet. five; Calyp. one, globose, with bellows, five-celled, five-valved; valves reflexing petals; Seeds very many.

Bergier, Nicholas, in Biography, was born at Rheims in 1557, and became professor of the university in his native city, where he was educated for the law, and became syndic. Under this character he visited Paris, and there formed an intimate friendship with Peiresc, and du Puy, by whom he was induced to execute a work which he had projected on the high roads of the empire. M. de Belle Vue took him to his house, and procured for him a pension, with the brevett of bibliographer. He died in 1623. The principal of his works are his "Histoire des grands chemins de l'Empire Romain," first printed in 1622, 400.a and reprinted, with notes, at Brussels, in 2 vols. 400. in 1729. This valuable work was translated into Latin by Heminus, and is included in the 10th volume of Graevius's Roman Antiquities. Bergier also wrote in French "A Sketch of the History and Antiquities of Rheims, with curious remarks concerning the establishment of the people, and the foundation of the towns of France," 400. 1635.

Bergimus, in Ancient Mythology, a deity peculiar to the inhabitants of Brefcia, in Italy, where he had a temple, and an order of priests. Gruter, Muratori, and Span, have recorded many inscriptions relating to this deity. It is thought that he was the god of the mountains, because berg, in Celtic, signifies a mountain.
BERGMANN, TORBERN. In Biography, professor of chemistry at Upsal, was born at Catanberg, in West Gotland, March 20th 1715; and after having finished the first course of his education, entered at the university of Upsal. His application, particularly to the study of mathematics and natural philosophy, was so intense, that his health was endangered; and as these sciences afforded a peculiar prospect of employment, a relation, who had the charge of him, discouraged his profession of them, and rendered it necessary for him to conceal the books which affid him in his favourite studies.

At the close of a year his health was so much impaired, that the resumption of it required an interval of his application, and a course of exercises, which obliged him to return to his family. His hours of relaxation were, however, occupied in the study of botany and entomology, and his discoveries in the lap of these sciences were communicated to Linnaeus. As soon as his health was re-established, he returned to the university, with a determination to pursue those studies which were most agreeable to his inclination. Besides mathematics and natural philosophy, he directed his attention to natural history, under the patronage of Linnaeus; and began with a mentor on the nature of the sublunium found in certain waters, and called coccos aquatics, which he found to be the egg of a leech, including 13 or 12 young. This was followed by other memoirs on the history of insects which attack fruit-trees, and the means of preventing their ravages; and he proposed a method of classing these insects from the form of the larva, in which state the destruction of noxious insects is most essential. About this time, the famous Swedish naturalist testified his esteem of Bergmann's character and talents, by giving his name to a new species of insects. In 1761, Bergmann was appointed professor of mathematics and natural philosophy in the university of Upsal; and both before and after this time he enriched the volumes of the Swedish act with several papers on philosophical subjects.

His paper, containing "A Review of the several explanations which Natural Philosophers have given of the Rainbow," was published in 1759; and in 1760, he published some thoughts on "the origin of those meteoric, which are not accompanied by any sensible cloud or explosion," and also "On the opinions held by Philosophers relating to the Twilight," when he prefixed an account of Mairan's "Antique Locomotion," or that of the horizon opposite to the sun.

In 1761, and in 1762, professor Bergmann wrote on the "Electricity," in consequence of a correspondence with Mr. Willow; and particularly on the electrical quality of iron and gold, and double reflecting glass. His remarks on the electric, or fly-fly, showing how to distinguish between the Carpenter's brush and those of the butterfly and moth, and describing the electric fish in the latter to be never more than 17, 28th of the time by the clock extending, that number, were published in 1753; and the fame year produced the satisfactory result of some electrical experiments, made with fide of various colours. In 1764, the professor wrote a paper to the "Academy," from a number of observations, the height in the atmosphere at which the aurora borealis appear (see Aurora Borealis); and in 1765 and 1766, he wrote again on electrical bodies; and particularly on the property and laws of electricity in the vacuum, which had been referred to his examination by the Royal Academy of Sciences at Stockholm. At this time it does not appear that the subject of chemistry employed much of Mr. Bergmann's attention; however, in 1765, on the death of Willems, he was chosen to succeed him as professor of chemistry and metallurgy. This appointment was much opposed by the party of the former professor, united with others who envied Bergmann's rising merit; and their opposition was supported by some severe criticisms on two papers, which the professor published at this time, relating to the preparation of alum, in which he recommends the use of argillaceous earth, and proposes tobacco-pipe clay, instead of alkali, to free it from the vitriol. But the prince royal of Sweden, who afterwards succeeded to the throne, and who was then chancellor of the university of Upsal, determined the dispute, and fixed him in the professor's chair. With enlarged views of the practical importance and utility of chemistry, of what had already been performed in this department of science by preceding authors, and of what yet remained to be done, Bergmann prosecuted his chemical researches, and by a combination of experimental analysis with mathematical reasoning, he extended and improved this science by a variety of valuable discoveries and observations. In order to pursue his experiments and inquiries with the greater facility, and to communicate the result with advantage to his pupils, he formed, near his laboratory, a cabinet, in which all the mineral substances were ranged in order, together with the products of those experiments which had ascertained their composition. Another collection exhibited all the minerals of Sweden, arranged according to the places where they are found. In a third, were exhibited models of the various machines and apparatus by means of which these substances were converted into useful articles, which articles were placed near the materials from which they were formed. From this philosophical arrangement Bergmann derived peculiar advantage in his profession as a teacher. While he excelled as a professor of chemistry and mineralogy, and devoted much of his time to this occupation, he was actively and incessantly employed in making discoveries which have placed him in the first rank of philosophical chemists. He examined the carbonic acid, discovered by Black, and denominated fixed air, in its several properties and habits. Nickel, manganese, the magnesian earth, and barites, which were newly-discovered substances, were particularly investigated by Bergmann, and afforded materials for regular and perpicious tinctures. The acid obtained from sugar, and many other vegetables, by the ab-\raction of the nitric acid, and those acids which are obtained from arsenic, molybdena, fluorspar, and tungsten, were discovered either by himself or some of his disciples; and to him we are indebted for leading the way in the investigation of their properties, and for ascertaining many interesting phenomena attending their combinations. From him we learn, that iron contains a number of foreign admixtures, chiefly of a metallic nature, and that the three states of crude iron, and malleable iron, and steel, principally depend upon the greater or less abundance of carbon. In his analysis of waters, he added, to the reagents before used, other substances more effectual, and whilst he evinced the imperfection of this method, he rendered it much more accurate. He also ascertained the quantities of metals, without separating them from all their combinations; and in this way he infers the quantity of metal from the weight of precipitate it affords, by the addition of an alkali, or some other known substance, from tables founded on former experiments.

He likewise analyzed the precious stones, known by the name of gems, and devised peculiar methods for separating them into the known metals in determinable proportions. Professor Bergmann covered the necessity and utility of performing scientific operations in the humid way, or by means of a flux, in which liquid solvents are used; and he also exhibited the advantages of the process by fire, applied to materials in minute portions, by means of the blow-pipe, either upon a piece of charcoal, or in a spoon of pale salt. This mode of examining mineral substances, united with that of the habits which they exhibit, with a few simple reagents, facilitated the classification of them, according to their chemical properties; a method adopted by the ingenious chemist, without
out the exclusion or disparagement of that method of investigation which regards the external character. This appears from his short eflay on the forms of crystals. The subject of elective attractions engaged the particular attention of professor Bergmann; and he engaged in the laborious undertaking of improving and extending the tables of Geoffroy, for which he perceived that, according to his views, no less than 36,000 experiments would be necessary. He therefore, under an apprehension that his life would not allow the completion of his plan, contented himself with publishing, what appeared to him to be an imperfect work, though it was otherwise regarded by the scientific world. His table of simple affinities is the first, that exhibits the laws of affinities as they are observed in the dry way; and in his scheme it is seen at once whether the operation takes place in the humid or dry way; what are the labilates presented to each other; their component parts and proportions; the numerical expressions of their attractions; what new compounds take place; and whether they fall down, or sublime, or remain in solution, and which of them are thus respectively affected. (See Afinity.) In this work, as well as in his work on mineral compounds, Bergmann, not apprised of those effects of oxygen, which have been developed in later times, considers the existence of phlogiston, or a common principle of inflammability, as an acknowledged truth. He also admits of the matter of heat as a self-existent independent principle, and seems not to have apprehended that it may be a distinct modification. Accordingly, these two principles enter into many of his explanations of facts; but in all those explanations, the matter is arranged with such order and perspicuity, that it is extremely easy to subsist the absorption of oxygen instead of the extraction of phlogiston, and the contrary effect wherever the latter imaginary principle, as it is now thought to be, is absorbed. The life of professor Bergmann, like that of other luminous and scientific men, admits of little variety. Attentive to the duties of his profession, he resided constantly at Upsal, and had the honour to be elected rector of the university, which in his time was divided into two parties, of theologians and civilians on one side, and of natural philosophers on the other, between whom Bergmann maintained peace and equality. The king of Prussia wished to engage the professor of Upsal to become a member of his academy, and to remove to Berlin; but attached to his office, though exhausted by it, and in a declining state of health, which might have been relieved by a warmer climate, and under obligations of gratitude to Gustavus, king of Sweden, who had been his benefactor, and who had honoured him with the order of Vasa, he declined the proposal, and remained at Upsal. The disciples of his school, of whom the celebrated Scheele obtained a very distinguished rank and character, reflected honour on their master, who never failed to encourage their researches, and to mention their discoveries in terms of approbation and respect. How much fir Torbern Bergmann was esteemed while he lived, in every part of Europe, it is needless to say; and of his works it is sufficient to observe, that, notwithstanding the rapid improvements which have taken place since his time in chemical science, they will long remain repositories of facts and reasoning, to which every philosopher must recur. When it is considered that he began this pursuit rather at a late period of life, and that he made his various discoveries in the course of 17 years, and that he died before he attained his 50th year, his death will be regretted as a premature event, by which society suffered a very considerable loss. He died on the 8th of July 1783, at the baths of Medel in Sweden. His works were very numerous; the principal of them are as follows: viz. * Opuscula physis et chemica, pleraque feorum antea edita jam ab autore collecta, revifa et aucta;" published in Latin in 3 vols. Svo. in 1779, 1780, 1783, and translated by Dr. Cullen of Dublin, in 2 vols. Svo. with illustrations and notes by the translator. "Meditaciones de ferramenta naturalis," printed in the 4th volume of the Transactions at Upsal for 1784, and translated into English in 1788, in Svo.; 'Physick Beskrifnung ochda Jordkloet,' or physical description of the earth, in 2 vols, in which he has given lucubrations on the structure and form of the earth; Eflay on the useful-
contains a few small places as Berheim, Oppenheim, and Weidheim. It has in it a highway, commanding prospects of wide extent. The left part of this continued chain of hills runs from Fuldeberg to Berheim, where it is about 8 leagues long and four broad. On the right hand it is cut by woods near the top, and nearer the plain with vineyards. The level road is planted with rows of walnut trees, and on either side are fields and meadows. On each of these trees of Berheim and the Olen, Wood a considerable profit to the country by the wood and the fruit; and the wood produced is an unmatchable source of supply to the inhabitants. In one year they have exported 40,000 rough made walnut tree market flock, from these parts to Saxony. From the nuts they make an excellent oil, which vears the com a people instead of butter, and the inferior fort is used for lamps. The almond trade, of which great quantities grow along the Bergraths, is very considerable. The warmth of the climate, and good-hold of the soil in the Bergraths, are rich, that after eye-reap the land may be tawn a second time with field, buckwheat, or oats, which are always ready in the markets.

BERGUES, or Burg, or Beruges St. Vino, a town of France, and principal place of a distric, in the departmen of the North; so called from St. Vino, a Flemish lord, who lived here. It is seated on the river Colne, at the union of several canals, which pass to Dunkirk. Gravelines, St. Omer, Forres, &c., and contains two parishes. Berg was the last town of West Flanders which held out for the Dutch in the 16th century. It was taken by the French in 1678, and confirmed to them by the peace of the Pyrenees in the following year. Since that time it has been fortified by new works, and the country round it may be laid under water by means of sluices; 13 league south of Dunkirk. It contains 10,052 inhabitants, and in the canton are 14,026. The territorial exint comprehends 130 kilometres, and 13 communes. N. lat. 56° 57' E. long. 2° 35'.

BERGUN, a town of Switzerland, in the country of the Grisons, near a river which flows from a lake of the same name, and discharges itself into the Albula. It lies between the Albula and the Inn, about 6 miles from the latter, and 12 miles from the former. N. lat. 46° 31'. E. long. 13° 55'.

BERGWERDEN, a town of Germany, in the circle of Upper Saxony, two miles north of Welfenthals.

BERG, a town of Hungary, 13 miles west of Steinam.

BERG-ZABERN, a town of Germany, in the circle of the Upper Rhine, and duchy of Deux Ponts, seated on the Erbach, 13 miles south of town of Deux Ponts. By the new arrangement of the French, it is the chief place of a canton in the department of the Lower Rhine, and district of Welfemburg, containing 5,917 inhabitants. The canton has 6,751 residents, is 150 kilometres, and the communes are 21. N. lat. 49° 57'. E. long. 7° 47'.

BÉRICA, Bérite, Bery, in Middle Age Writers, denotes a large open field; and the cities and towns of England, which end with that word, are built in plain and open places, and do not derive their names from borough, as Sir Henry Suckling imagines. That the word “beris,” which has been confounded with “bury,” and “brough,” as a flat wide campaign, is proved from sufficient authorities, by the learned Du Frene, who observes, that “Béris St. Edmonds,” mentioned by Matt. Paris, in ann. 1174, is not to be taken for the town, but for the adjoining plain. Besides, many flat wide meads, and other open grounds, are called by the names of “berries,” and “berry fields;” thus the spacious meadow between Oxford and Iffley was in the reign of king Athelhelm called “Bery;” and the largest paleth ground in Quarrenden in the county of Buckingham is known by the name of “Beryfield.” And though these meads have been intersected demesne, or minor meadows, yet they were in reality any flat or open meadows, that lay adjoining to any vill or farm. (Cw.) Hence also “berries affurrate,” signifies to dry or plough up heaths and downs; and hence our warreners are called “coney-berries.”

BÉRIBÉRIA, or Béreibung, in Medicine, a kind of stock in the East Indies. It is called by some British authors, who have written on the diseases of hot climates, the barbas. According to Bontius, it comes on with great warmth, trembling, numberless, and peculiar tingling sensation of the limbs, so that the patient is rendered incapable of walking, or otherwise using them. The upper as well as lower limbs are often affected. Sometimes it is accompanied with a fainting speech. Is attack is generally sudden. Those whom it afflicts are chiefly the lower chiefs of people, who imprudently get chilled after being heated, by drinking cold water; but more especially by sleeping in the night air, after great fatigue or intoxication. The remedies against this obstinate complaint are strong friction, purgative fomentations, warm-bathing, and sudorific decoctions. According to Bontius, the most efficacious topical application is a species of washes, or petroleum, from Sumatra, used as a limet. The natives of India (says Dr. Lind) have a method of putting the patient into a hole dug into the ground, and covering him with land up to his neck; this is done in the middle of the day, and he remains there as long as he can bear the heat of the land, which is considerable. Camphire, and a decoction of guaic wood, have sometimes produced a good effect; also the expressed bitter oil of the m DGerog, an Indian plant. But notwithstanding the use of the most powerful nervous medicines, the patient generally continues paralytic for some months, unless he is removed into another air.

On the Malabar coast (continues the last mentioned author) this disease is most violent and frequent, and attacks both natives and strangers, especially in the months of December, January, February, and March. During these months, the land winds blow every morning about fun-rife, from the neighbouring mountains, with remarkable coolness; and such as, being tempered by the scarcity of they, and exposed to these winds, are often suddenly seized with a very painful sensation in the periphery of the arms and legs. In persons of a good constitution, this pain abates as the day advances, and as the air becomes warmer; but in others it continues for a considerable time, attended with a weakness of the knees, and uneasy sensations in the calves of the legs and feet, especially on any attempt to walk. This is fearfully cured by medicine, till after the shifting of the maw, unless the patients can be removed to the coast of Coromandel, or to any place to the eastward of the Balagat mountains, where, by the change of air, they quickly recover. See Bontius de Med. Lhariam; and Lind on Disases incidental to Europeans in Hot Climates.

BÉRICA. See BÉRICA.

BÉRILZEN, in Geography. See BERISA.

BÉRIGAN, a town of Africa, in the kingdom of Algiers, and capital of the country of Bérim-Mezzab. N. lat. 32° 18'. L. long. 2° 55'.

BÉRINGAL, a town of Egypt, on the west branch of the Nile, 7 miles S. E. of Rosetta.

BÉRING, in Biography and Geography. See BÉRING.

BÉRINGEN, in Geography, a town of Germany, in the circle of Weizphab, and bishopric of Liege, 18 miles N.W. of Mainz.

BÉRINSCHIUL, a rocky island in the Mediterranean, near the coast of Algiers.
BERISIA, a town of Africa, in Kaffaia, west of the town of Kaffaia, seated on the river N. el Abcoed, or Guin. N lat. 16° 45', E. long. 56° 10'.

BERRY, a simple mentioned in Scripture, used for cleansing, or taking out spots. Jerem. chap. ii. ver. 22. See also, the fuae, or El Tay, another of the people of Judah, and a town of Germany, in the circle of Upper Saxony, and principality of Weimar, on the Ilm; 6 miles S.S.W. of Weimar.—Alto, a town of Germany, in the same circle, and principality of Eisenbach, on the Werla, 9 miles W. of Eisenbach.

BERKA, or Berku. See BARRACO.

BERKASZSTI, a town of European Turkey, in the province of Moldavia, on the Berbecz, 56 miles N.W. of Galatz.

BERKELEY, Dr. George, in Biography, the learned and ingenious bishop of Cloyne in Ireland, was born March 12. 1684, at Kilriner, near Thomastown, in the county of Kilkenny; and having received his preparatory education at Kilkenny school, under Dr. Hinton, was admitted at the age of fifteen, a pensioner of Trinity college, Dublin, of which he became a fellow, June 9, 1707. In this year he published his first literary essay, written before he was 20 years of age, entitled "Arithmetica absque Algebra aut Euclide demonstrata," and evincing his talents for those sublime metaphysical studies, by which he was afterwards so eminently distinguished. In 1709 was published his "Theory of Vision," being the first attempt that was ever made to distinguish the immediate and natural objects of our senses from the conclusions which we have been accustomed from infancy to draw from them, and to trace the boundary that divides them. For this purpose he flew, that although habit hath connected the ideas of light and touch, so that they are called by the same names, they have originally no such connection, nor that when a person born blind, and suddenly made to see, would, at first, be unable to tell how any object that affected his sight would affect his touch, and from light could not derive any ideas of distance or external space, that would imagine that all the objects he saw were in his eye, or rather in his mind. In proof of this assertion, the case of a young man born blind, and coughed at the age of 14, by Mr. Chefeledan, mentioned at the close of his anatomy, has been added. This work was succeeded in the following year by the "Principles of Human Knowledge," in which Berkeley controverted Mr. Locke's account of abstract ideas and general names, and attempted to prove that the commonly received notion of the existence of matter is false, and inconsistent with itself; that those things which are called sensible material objects are not external, but exist in the mind, and are merely impressions made upon our minds by the immediate act of God, according to certain rules. terms laws of nature, from which, in the ordinary course of his government, he never deviates; and that the steady adherence of the Supreme Spirit to these rules is what constitutes the reality of things to his creatures, and so effectually distinguishes the ideas perceived by sense from such as are the work of the mind itself, or of dreams, that there is no more danger of confounding them together on this hypothesis than on the common supposition of matter. See Abstraction, Body, Existence, and Matter.

In the year 1712, Berkeley's attention was directed, by the perusal of Locke's "Two Treatises of Government," to the doctrine of passive obedience; in support of which he printed the substance of three common-places or sermons, delivered in the college chapel. In consequence of this publication, he was represented as a Jacobite, and prevented from obtaining some prebend in the church of Ireland; to which he had been recommended; but the unfavourable impression that had been thus made on the mind of the prince of Wales, afterwards George II., was removed by Mr. Mollyneux, who took occasion of introducing Berkeley to queen Caro of his "System of Materialism," in "Three Dialogues between Hylas and Philonous." Such was the reputation which he had now acquired by his writings, for acentics of parts, and a beautiful imagination, that his company was sought even by those who did not embrace his opinions, and he was introduced to the acquaintance of persons of rank and learning, by two gentlemen of opposite principles, Sir Richard Steele, and Dr. Swift. For the form, he wrote several papers in the "Guardian," and at his house formed an intimacy with Mr. Pope, which lasted during his whole life. Dean Swift also introduced him to lord Berkeley of Stratton, and to other valuable acquaintance; and procured for him the appointment of chaplain and secretary to the earl of Peterborough, who being appointed ambassador to the king of Sicily, and to the other Italian states, took Berkeley with him, in November 1713. On his return to England, in 1714, he found that his hopes of preternatural had expired with the fall of queen Anne's ministry; and he therefore accepted the offer of accompanying the son of Dr. Alhe, bishop of Clogher, in a tour through Europe. At Paris he visited the illustrious father Malebranche, whom he found in his cell, cooking, in a small pîquin, a medicine for an inflammation of the lungs, with which he was afflicted; and as they engaged in a conversation on Berkeley's System, Malebranche, in the heat of discussion, raised his voice so high, and indulged the natural impetuosity of his temper to such a degree, that he brought on an increase of his disorder, which caused him to leave the house a few days after; viz. October 13, 1715. During four years' absence from England, Mr. Berkeley not only prostituted, what is usually called by travelers the grand tour, but he visited Apulia, Calabria, and Sicily. The materials he collected, with a view to the natural history of the latter country, were unfortunately lost in his passage to Naples; and this circumstance is the more to be regretted, as he has given to the world satisfactory specimens of his talent for lively description, in his letters to Mr. Pope and Dr. Arbuthnot. At Lyons, in his way home, he drew up a curious tract, "De Motu," which he sent to the royal academy of sciences at Paris, and which he committed to the press soon after his arrival in London, in 1721. The dastardly South Sea scheme of 1720, engaged his attention at this time, and he wrote "an Effay towards preventing the ruin of Great Britain," which was printed at London, in 1721. By his travels, his natural politeness, and his talents for conversation were so much improved, that he found easy access to the best company; and he was introduced by Mr. Pope to lord Burlington, who conceived for him a very high esteem on account of his distinguished taste and skill in architecture, which had been the object of his particular study in Italy. By this nobleman he was recommended to the duke of Grafton, lord-lieutenant of Ireland, and accompanied him thither in 1721. Having been elected senior fellow of his college in 1717, he now took the degrees of bachelor and doctor in divinity. By the death of Mrs. Vanhomrigh, the celebrated "Vanella," to whom he was introduced by Dean Swift, in 1715, and who altered her purpose of making the dean her heir, in consequence of discovering his connection with "Stella," Dr. Berkeley became possessed of half her property, amounting to about 400l. and in the discharge of his office, as one of her executors, committed
BERKELEY.

committed to the flames several letters that had paled in correspondence between her and the dean, not, as he declares, because there was any thing criminal in them, but because he observed a warmth in the lady’s style, which delicacy required him to conceal from the public.

On the 18th of May 1724, Dr. Berkeley resigned his fellowship, and was promoted by his patron to the deanship of Derry, worth £100. per annum. Having for some time conceived the benevolent project of converting the savage Americans to Christianity, by means of a college to be erected in the Summer islands, otherwise called the isles of Bermuda, he published a proposal for this purpose at London, in 1723, and offered to resign his own opulent preference, and to dedicate the remainder of his life to the instruction of youth in America, on the moderate subsistence of £100. a year. Such was the influence of his distinguished example, that three junior fellows of Trinity college, Dublin, concurred with him in his design, and proposed to exchange, for a settlement in the Atlantic ocean, at £50. per annum, all their flattering prospects in their own country. The proposal was enforced on the attention of the ministry, not merely by considerations of national honour and a regard to the cause of Christianity, but by the immediate advantage likely to accrue from it to the government. Having, by diligent research, ascertained the value of the lands in the island of St. Christopher’s, ceded to Great Britain by France at the treaty of Utrecht, he proposed to dispose of them for the public use, and thus to raise a sum of money, part of which was to be applied to the establishment of his college. The scheme was communicated by the intervention of the abbé Guistieri, or Atteri, to king George I. and by the royal command introduced into the house of commons by sir Robert Walpole. A charter was granted by his majesty for erecting a college, by the name of St. Paul’s college in Bermuda, which was to consist of a president and nine fellows, who were obliged to maintain and educate Indian children at the rate of £1 per annum for each. The first president, Dr. George Berkeley, and the first three fellows named in the charter, those junior fellows of Dublin college above-mentioned, were licensed to hold their preferments in these kingdoms till the expiration of one year and a half after their arrival at Bermuda. The common, in 1726, voted an addit to its majesty, praying a grant of such a sum to effect the above purposes out of the lands of St. Christopher’s already mentioned, as his majesty might think proper. The sum of £500 was furnished by the ministry, and several private subscriptions were immediately raised for promoting the proposed undertaking.

The dean having, in 1725, married the eldest daughter of the right honorable John Fuljier, esq. speaker of the Irish house of commons, prepared to set sail for Rhode island, in the execution of his scheme, and took with him a pretty large sum of money of his own property, as a collection of books for the use of his intended library. Upon his arrival at Newport in Rhode island, he contracted for the purchase of lands on the adjoining continent, and fully expected that the purchase money would, according to his grant, be immediately paid. His expectations, however, were disappointed; and after various excuses he was at length satisfied by bishop Goldston at that time bishop of London, in whose diocese the whole west Indies is included, that an appeal to his grace to Sir Robert Walpole, he received the following answer:—

‘If you put this question to my lord, as I think it a matter too important to be left to me, it may be paid as soon as this war shall be over. But if you ask me again whether Dr. Berkeley shall receive income in America, expecting the profit of £1000, I must write by a man of business in Europe, and to give up his present expectations.’ According ly, the dean, after having expended a great part of his private fortune, and more than seven years of his life in the prosecution of a laudable scheme, returned to Europe. Before he left Rhode island, he distributed the books he had brought with him among the clergy of that province, and upon his arrival in London, immediately returned all the private subscriptions that had been advanced for the support of his undertaking. In 1732, he published the ‘Minute Philosopher,’ a work consisting of a series of dialogues, on the model of Plato, in which he pursues the free-thinker through the various characters of atheist, libertine, enthusiast, forzer, critic, metaphysician, fatalist, and feticist, and employs several new arguments from his own system. Of the company, which at this time attended the philosophical conversations that were carried on in the presence of queen Caroline, according to a practice which had commenced when she was princesse of Wales, some of the principal persons were doctors Clarke, Houdly, Berkeley, and Sherlock. The debates that occurred were chiefly conducted by Clarke and Berkeley; and Houdly adhered to the former, as Sherlock did to the latter. Houdly affected to consider the philosophy of Berkeley, and his Bermuda project, as the reviver of a visionary. Sherlock, on the other hand, epithetized his cause; and on the publication of the ‘Minute Philosopher,’ preferred a copy of it to the queen, and left it to her majesty to determine, whether such a work could have been the production of a disordered understanding. The queen honoured Berkeley with admitting him to frequent visits, and took pleasure in his conversation on subjects relating to America; and upon a vacancy in the rich deanship of Down in Ireland, procured it for him. But as lord Burlington had neglected to give proper notice of the royal intention to the duke of Dorset, then lord-lieutenant of Ireland, and to obtain his concurrence, the duke was offended, and the appointment was not urged any farther. Upon this, her majesty declared, that since they would not suffer Dr. Berkeley to be a ‘dean,’ in Ireland, he should be a ‘bishop,’ and accordingly, upon a vacancy in the see of Clony, in 1733, he was promoted by letters patent to that bishopric. In consequence of this appointment, he reigned continually at Clony, and devoted his time and attention to the faithful discharge of all episcopal duties. He resided in his diocese the useful office of rural deacon, visited often parochially, and confirmed in several parts of his see. In the prosecution of his duties, however, his diligence was unabated; and about this time he engaged in a controversy with the mathematicians of Great Britain and Ireland on the subject of Fluxions. He was led to it by the following occurrences: Mr. Addison having visited Dr. Gath in his study, adduced some difficulty on the necessary of preparing for his approaching disputation; but the doctor replied, ‘Surely, Addison, I have good reason not to believe those things, since my friend Dr. Hale, who has dealt much in demonstration, has reduced me that the doctrines of Christianity are incomprehensible, and the religion itself an impossibility.’ This disputation being reported by Addison to the bishop, took up arms against this reducible dealer in demonstration, and addressed to him ‘the Analyt’; with a view of showing that mysteries in faith were unjustly objected to by mathematicians, who admitted much greater mysteries, and even falsehoods in science, of which he endeavoured to prove that the doctrine of fluxes was furnished an eminent example. See Fluxions. In 1741 came the controversy on this subject, the bishop, in 1743, published a reply to his bishop, suggested to be by Dr. John, called ‘A Defence of Free-thinking in Mathematics.’ In this controversy, he directed his thoughts to objects of more apparent utility; and printed in 1745, by “Quaker,” for the good of Ireland. In 1746, his “Defence of Free-thinking in Mathematics.”
ecurie addressed to Magistrates;" and in 1750, his "Maxims concerning Patriotism;" all of which evince his knowledge of mankind, and his zeal for the service of true religion, and of his country. In 1745, during the Scots' rebellion, he addressed a "Letter to the Roman Catholics," of his diocese, and in 1749, another to the clergy of that persuasion in Ireland, under the title of "A Word to the Wife," which was so well received by them, that they returned him their public thanks, with expressions of marked esteem and respect, which deserve him as "the good man, the polite gentleman, and the true patriot." That he discovered this character in a very eminent degree, was very generally acknowledged, and particularly by lord Chesterfield, who, as soon as he was advanced to the government of Ireland, in 1745, offered him the see of Clogher, then vacant, and the value of which was double that of Cloyne. This offer the bishop, moderate in his views, disinterested in his support of government, and particularly attached to his customary place of residence at Cloyne, and to the connections and duties attending it, respectfully declined. Towards the close of his life, he laboured under a nervous colic, the effect of his sedentary course of living, in which he found considerable relief from the use of tar-water; and he therefore communicated his thoughts on this celebrated medicine to the public, in a treatise entitled "Siris, A Chain of Philosophical Reflections and Enquiries concerning the Virtues of Tar-water," printed a second time in 1747, and followed in 1752, by "Farther Thoughts on Tar-water," which was his last performance.

In 1752, he removed, with his lady and family, to Oxford, for the purpose of superintending the education of one of his sons, who was admitted a student at Christ Church college, in that university: but sensible in a high degree of the impurity of non-residence, he endeavoured first to procure an exchange of his high prebend for some canony or headship at Oxford; and failing of success, he afterwards, by a letter to the secretary of state, requested permission to reign his bishopric, worth at that time not less than 1,400l. per annum. When the petition for this purpose was presented to his majesty, he declared he should die a bishop in spite of himself, and gave him full liberty to reside wherever he pleased. Before he left Cloyne, he signed a lease of the demesne lands in that neighbourhood, renewable yearly at the rate of 200l. and directed this sum to be annually distributed, until his return, among poor housekeepers of Cloyne, Youghall, and Aughadda. At Oxford he was highly respected by the members of the university; but his residence among them was of no long duration. On Sunday evening, January 14, 1753, whilst he was surrounded by his family, and his lady was reading to him one of Dr. Sherlock's sermons, and also the leffon in the burial service, taken from 1 Cor. xv. whilst he was commenting upon it, he was suddenly seized with a disorder, called the palsy of the heart, and instantly expired. His remains were interred at Christ Church Oxford, and a marble monument was erected to his memory by his widow, with a Latin inscription, drawn up by Dr. Markham, head master of Westminster school, and now archbishop of York. In this inscription he is said to have been born in 1684, and his age to be 73; whereas his brother, who furnished the particulars of his life, states the year of his birth to have been 1684, and of course he died at the age of 69.

The person of bishop Berkeley was handsome, his converse easy and benign, and his constitution robust, till it was impaired by his sedentary life. At Cloyne he constantly rose between three and four in the morning; and often spent the greater part of the day in study; his favourite author, from whom many of his notions were borrowed, was Plato. The enthusiasm of his private character, which was singularly excellent and amiable, entered into his literary one; and it was manifested in his public works, as well as in his life and conversation. Few persons were ever held, by those who knew his worth, in higher estimation than bishop Berkeley. When bishop Atterbury was introduced to him, he lifted up his hands in astonishment, and exclaimed, "So much understanding, so much knowledge, so much innocence, and such humility, I did not think had been the portion of any but angels, till I saw this gentleman." This testimony serves to remove the air of hyperbole from the well-known line of his friend Mr. Pope:—

"To Berkeley every virtue under heaven."

In matters of speculation, his natural armour might, possibly, have led him to imbibe some notions that are more fanciful than just. It has been said, that towards the close of his life, he began to doubt the solidity of metaphysical speculations, and that he therefore turned his thoughts to the more beneficial studies of politics and medicine. He has been charged by some considerable persons, and particularly by bishop Hoadly, with corrupting the native simplicity of religion, by blending with it the futility and obscurity of metaphysics; and Mr. Hume affirms, that his writings form the bell lemons of scepticism which are to be found either among the ancient or modern philosophers, Bayle not excepted; that "all his arguments," against Sceptics, as well as against Atheists and Free thinkers, says Hume, "though otherwise intended, are, in reality, merely sceptical, appear from his, that they admit of no answer, and produce no conviction." That his knowledge extended to the minutest objects, and included the arts and beauties of common life, is testified by Dr. Blackwell, in his "Court of Augustus." The infidelity of his research, and the acuteness of his observations, comprehend not only the mechanic arts, but the various departments of trade, agriculture, and navigation; and that he possessed poetical talents in a considerable degree, is evident from the animated letters that are found in the collection of Pope's Works, and also from several compositions in verse, particularly the beautiful stanzas written on the prop. & of realizing his noble scheme relating to Bermuda. The classical romance, entitled "The Adventures of Sigrior Cavendio di Lucca," has generally but not truly been attributed to him.

Besides the writings already mentioned, bishop Berkeley published at Dublin, in 1735, a small pamphlet relating to the doctrine of Fuxions. entitled "Reasons for not replying to Mr. Walton's full Answer," &c. His smaller pieces were collected and printed under his inscription at Dublin in 1752, under the title of "Miscellanies." The works of George Berkeley, D. D. late bishop of Cloyne; to which is added an account of his life, and several letters, &c." were published in 2 vols. 4to, in 1784. Biog. Scot.
degree of doctor in that faculty. The theses he wrote on this occasion is intitled, "Differtatio medica inauguralis de podagra," and is dedicated to his Grosser de Bielfeld. On his return to England, he settled at Tilehouse, near the Thames; and soon after published his "Pharmacopoea medica," which has been so much approved, as to pass through several editions. But he seems to have been of too active a disposition to remain long in the practice of medicine, in which he never made much progress. In 1778, he was appointed by government one of the commissioners who were sent to America with a view of setting the differences between that country and England, and was the only one of them that was permitted to go to Philadelphia, where the congress was sitting. Here he remained some time, but left Paris at length by the congress, and perhaps without realising, or carrying on a secret correspondence with some of the Americans, who disapproved of their proceedings, he was first sent to prison, but was soon released, and then sent to his brother commissioners at New York. On his return to England, he received a pension from government for the services he was engaged in to render his country; on which, and his own fortune, he lived as a private gentleman to the time of his death, which happened on the 3rd of April 1791.

Dr. Berkenthout was author of various works, besides those mentioned above. In 1770, he published "Outlines of the Natural History of Great Britain and Ireland," a useful manual for students in that line. In 1778, "First lines of the theory and practice of philosophical chemistry," which he dedicated to Mr. Eden (Lord Auckland), who had been one of the commissioners with him to America. He also wrote "An Essay on the bite of a mad dog; "An Answer to Dr. Cadogan's Essay on the Gout; "A Prize to the translation of Pomme's treatise on the disease of the spleen. He was also the author of "Lucubrations of wars and means," from which the idea of several of our present taxes is said to be taken; and of "A Translation of Count Tellin's letters to the late king of Sweden." New Bng. Dict.

BERKLEY'S CREEK, Ariam, in Geography, a land which floods off from the land towards the sea, to the south of Berkley, or the south end, on the coast of Holland. It is situated on the south of the Land Deep channel into the Tweak, the coast trending nearly N. and S. from the Mass to the Tweak.

BERKHAMSTED, a market town of Hertfordshire, England, is situated in a fertile country, on the southern bank of the small river Bulbarne, at the distance of 26 miles N. W. of London. This town and its vicinity have been the seat of war, and noted by historians as the property and residence of some of the Sixties kings, and other distinguished characters of that nation. After the Norman conquest, it was possessed by some princes of the blood, and Duke of Cornwall. On the north side of the town are the embankments, and other remains, of a considerable castle, which Camden supposes was built by Robert Bruce, earl of Cornwall, who was brother to the conqueror, and enjoyed the manor, &c. from him. At this place the conqueror had an interview with the English nobility, after his successful battle against Harold. The castle raised by earl Morten, was demolished in his later time, who was accused of rebellion, and the town and manor forfeited to the crown. Henry II. granted the inhabitants many privileges, among which was the liberty of felling their goods free of tolls and duties, either in the country of the commonalty, Aquitania, or Anjou. In Donne Yew-hack, there were fifty-two burgesses named in this town, whose merchandise was chiefly wool, which was manufactured into cloth on the continent. Henry II. kept his court here, as appears from a grant dated at that place, conferring the church of Havering in Essex on the monks of St. Bernar de Monte Lovis, to provide for the poor. King John, in the 7th year of his reign, granted this castle and honour to Geoffrey Fitzneer earl of Essex, but two years after his death, these places were again in the king's hands. The dauphin of France, in concert with the barons, besieged this fortress, which was bravely defended. The besiegers made two unsuccessful sallies, and held out until the king sent them orders to surrender. Previously to the second year of Henry III., the markets were held here on a Sunday, but in that year they were changed for Monday, which is still the market day. This castle and lordship continued for a long period in the possession of the earls and dukes of Cornwall, and were repeatedly the scene of rendezvous and baronial conundam. The castle was surrounded by a fos and vallum, including about four acres of ground, and the keep, or caistel, was placed on the north side; upon the dilapidation of its walls, a large house was constructed with the materials, which was poisselled in the rebellion by colonel Axtel. The town is much reduced from its former confluence, and consists of one long street, having St. Leonard's hospital at one end, and St. James's at the other. The church, dedicated to St. Peter, is a large honefime pile of building, and has several small chapels, or oratories, included within its walls, and some curious old monuments. Here is an almshouse for six poor widows, who are jointly allowed 301. a year towards their maintenance. The town has also a charity-school and a free grammar school; the latter of which was endowed by king Edward VI. for 144 boys, and provided with a master and usher. Besides these charitable foundations, here is another almshouse, which was endowed by John Laver and his wife, with a legacy of 12001. Berkhamstead, and gives the title of marquis to the duke of Cumberland. The chief trade of the place consists in the turning of bowls, of shovels, spoons, and other articles, made of hickory wood. Here are three annual fairs, and a latite fair for the hiring of servants, &c. The houses in the parish are 328, and the inhabitants amount to 1972. This town is called Berkhamsted St. Peter's, in contradistinction to another parish, a little to the north of it, which was formerly separated from this, and called Northchurch, or Berkhamsted St. Mary's. Salmon's History of Hertfordshire.

BERKLY, a town of Atlantic turkey, in the province of Nova Scotia, near the river Canter; 35 miles E. of Smyrna. N. lat. 38° 21'. E. long. 25° 47'.

BERKLEY, a county of Virginia in North America, lies well of the Blue ridge, north of Frederick county, and separates from the state of Maryland, on the north and east by Poyntopick river. This fertile county, about 40 miles long and 20 broad, has 16.751 free inhabitants, and 2932 slaves. Its chief town is Martinsburg.

BERKLY, the name of a county and town in Charleston district, South Carolina, lying near Ashley and Cooper rivers. In the census of 1791, it was called St. John's parish, in Berkeley county, and contained 75 free persons and 517 slaves.

BERKLY, a township of Bristol county in Massachusetts, Contain 57 inhabitants; 5 miles S. of Boston.

BERKLY, or BERKLY, an ancient town of Gloucester, England, and distinguished in the history of this country for its mild and woolly cattle, and the popular arts that have occurred within its walls. The town is barely mentioned in the page of history, whilst the cattle is repeatedly mentioned, and referred to in the Norman conquest to the dilutious warfare in the seventeenth century. In some old records this
this place is called Berchelai, and is distinguished by the appellation of borough, though it does not appear ever to have tenent members to parliament. Formerly the great public road from Brilifl to Gloucester, and from the western to the northern counties, passed through the town, and consequently gave it some advantages; but this road is now conducted through Newport, and some other places, to the eail of the town. This circumstance, with the powerful attractions of Gloucester and Bristol, have conpired to reduce the size and consequence of this place, which at present consists of one street only. The river Avon skirts the southern side of the town, and is navigable to the Severn for vessels of 40 or 50 tons. These must wait for high tide, which flows round the castle gardens, and extends a short distance above them. This part of the county is distinguished by its fine fertile land, the rich cheese made in its dairies, and the golden and London-pippin cyder, obtained from its orchards. The cheese mostly made here is distinguished by the double name of Gloucester, the best of which is bought up by the London factors, at high prices. (See Cheese.) The town is one of the five ancient boroughs of this county, which subsisted in the time of Edward I. and though deprived of most of its ancient privileges, yet a mayor is annually elected.

The manor of Berkley is one of the largest in England, and was taxed in the Domesday book at 160 hides, and 294 plough-tillages and a half. It was possessed, immediately after the Norman conquest, by Roger de Berkeley, who came into England with the conqueror, and was rewarded by him with this manor. It has continued in this noble family without interruption to the present time, and is now enjoyed by Frederick Augustus, the fifth earl of Berkeley, who is the twenty-ariit in descent from Harding the Dane.

The castle of Berkeley is one of the most perfect of the English baronial edifices, and has suffered less from the scourge of war and injudicious alteration, than any other English castle belonging to a subject. Some parts of the original structure are full perfect, and are interesting examples of the first Norman architecture, which was employed in constructing the baronial castles. The site of this building occupies an area of ground whose outline is nearly circular. It rises from a valley on the south and east, and its other sides are guarded by embattled walls, towers, and fortified gates. The great entrance gate opens into a bailey court, having the keep on the left, and the domestic apartments on the right, and in front. The keep, whose walls are lofty and massive, resembles the form of a Roman D, and is flanked by three semicircular towers, besides that in which the great flone fairs are contained. This is square, and has a small dark room near the top, where Edward II. was secretly murdered by the machinations of the bishop of Hereford, who invented and directed the execrable deed.

The elegant and energetic poet, Gray, notices this event in the following expressive terms:

"Mark the year, and mark the night,
When Severn shall re-echo with affright,
The shrieks of death through Berkley's roof to ring,
Shrieks of an agonizing king."

The hall, chapel, and most of the apartments, are fitted up and preferred nearly in their ancient style, and in some of them are several curious relics of antiquity. Among them are many fine old historical portraits, and the ophsa, chairs, and bedstead, which belonged to the cabin of the circumnavigator sir Francis Drake. The hall, which is 34 feet by 33, was built in the reign of Edward III. and has a fine old raftered roof, with a gallery at one end for the accommodation of mindrels, in "days of yore." Leland mentions several parks and chases, as connected with this castle at the time he visited it; but all, except two, have been converted to the more useful purpose of farming. One of these, called Whitley park, which is inclosed with a wall seven miles in circumference, still remains, and contains much fine forest timber.

At Parton near this castle, the present earl of Berkeley has made a lily pool, which is the only one in this county, and where a great number of wild ducks are annually netted. The celebrated Dr. Jenner, the great promotor of the vaccine inoculation, was born in this parish.

To the north of the castle is the parish church, which is a large handsome structure, and contains several handsome and ancient monuments of the Berkeley family. The tower is a modern building, and constructed at a small distance from the church.

In this township are 99 houses, and 698 inhabitants. In the hundred of Berkeley there appear to be, by the late population act, 34.50 inhabited houses, 9,148 males, 10,074 females, 3968 persons employed chiefly in agriculture, 61, 51 employed in trade, manufactures, and handicraft, and the whole number of persons amounts to 19,272. Rudge's History of Glossester. Rudder's History of ditto.

Berkley's Point, lies on the north side of oldt Eglum's island, or New Giderley, the principal of the groupe called Queen Charlotte's islands, in S. lat. 10° 40'. E. long. about 100° 10'.

Berkley Sound, so called from captain Berkeley, who visited it in 1787; an inlet, or bay, on the N. W. coast of North America, being the entrance into the supposed island of Juan de Fuca, terminated on the fourth by cape Flattery, and on the north by the southern part of Quadra, or Vancouver's island; about 10° 51' south-east of Nootka found. N. lat. 48° 30'. E. long. 24° 5' 37''.

BERKS, a county of Pennsylvania in North America, has Northampton county on the N. E. Northumberland on the N. W. part of Luzern on the N. Dauphinv and Lancaster on the S. W. and Chelten and Montgomery on the S. E. It is watered by Shelaykill river, and is 53 miles long, and near 29 broad, and contains 1,234,450 acres. Iron and coal, which are plentiful, supply several iron works.

The northern parts are rough and hilly. Berks contains 30,179 inhabitants, of whom 65 are slaves. It has 29 townships of which Reading is the chief.

BERKSHIRE, a county of the state of Massachusetts, is bounded on the N. by the state of Vermont, on the S. by that of Connecticut; on the E. by Hampshire county, and on the W. by the state of New York. It runs through the whole extent of the state from N. to S. and contains 26 townships; and the number of inhabitants is 20,291. White and coloured marble is found in several towns, in the rough and hilly parts of this county.

Berkshire, a newly settled township of Franklin county in the state of Vermont.
BER

Berkshire, its native, Egbert, gave the whole country the name of Engla d Alfred, grandson to Egbert, and a native of Wantage in this county, proceeding on the plan of his grandfather, more firmly cemented the kingdoms which Egbert had united, divided the whole into hundreds, tithings, parishes, &c. and gave this division the name of Berkshire, which was afterwards contracted and fixed to Berkshire.

This county is bounded by the shires of Oxford and Buckingham on the north, having the river Thames running the whole course; on the south by Surrey, on the south by Hampshire, and on the west by Wilshire. In the estimation of the like authors are at variance, but the most accurate statement gives its length from E. to N.W. at 45 miles, and its breadth, in the widest part, at 25 miles; though a narrow part near the centre is little more than 6 miles across. It contains about 550,000 acres of land, and is locally divided into twenty hundreds, containing 12 market towns, 130 parishes, 62 vicarages, about 670 villages and hamlets, 21,195 houses, and 109,515 inhabitants. A range of chalk hills enters this county from Oxfordshire, crosses it in a westerly direction, and forms the southern boundary of the vale of White Horse. Independent of this range of hills, the county is characterized by gentle eminences and valleys, having much rich fertile land, and abounding with picturesque and beautiful scenery. Though almost every kind of grain is cultivated in the county, yet that of barley is raised in greater quantities than either of the other species, and when made into malt, is chiefly sent to London. Many large dairy farms are found in the White Horse vale. Berkshire is well stocked with timber, particularly oak and beech in the western part, and also with numerous deciduous and evergreen trees in Windsor forest and park, and in the various ornamental plantations scattered through the county. The open commons and uncultivated fields of Berkshire are supposed to constitute nearly half the county. Of these, Windsor-forest, Maidenhead-fficket, Tylbury-beath, Wickham-beath, and the numerous commons and marishes, that are found in almost every parish, contain above 40,000 acres. The county derives but little advantage from manufactures, there being only a few clothiers established in the western part of it, and some paper-masters, &c. at Reading.

On the banks of the river Kennet, in the vicinity of Newbury, are some large beds of peat, which furnishes the poor with fuel, and the farmer with ashes to meliorate his land.

The principal rivers of Berkshire are the Thames, the Kennet, the Lambourn, the Ock, and the Loddon. The first, though it leaves to urgate and fertilize a great part of this county, does not strictly belong to it, being the natural boundary line between this and the counties of Oxford and Buckingham. It enters Berkshire almost one mile south of Lalelade, and in its progress eastward, waters the inland valleys of Abingdon, Wallingford, Henley, Maidenhead, Windor, &c. and having received the tributary waters of various streams, leaves the county near Rannymead.

The Kennet enters the county on its western side at Hungerford, and passes through a narrow baggy valley to Newbury. Flowing eastward, in nearly a direct line, it runs through the county town of Reading, and thence afterwards unite with the Thames.

The Lambourn, a tributary stream to the former river, rises near a town of its own name, and after a course of about 11 miles,' falls into the Kennet at Newbury. This river has been described as a phenomenon, by many topographical writers, some of whom have asserted that its current is more powerful and copious in summer than in winter. To account for this singular occurrence, they would have found, that the river has no remarkable characteristic different from others, whose course is through a short tract of flat country.

The Ock rises in the vale of White Horse, near Kingdon Luffe, and flowing eastward, receives several other streams before it reaches the town of Abingdon, near which it unites with the Thames.

The Loddon enters the southern side of the county near Swallowfield, and running directly north, forms the western boundary to Windsor forest, and falls into the Thames near Wargrave.

Berkshire is in the diocese of Salisbury, and included in the Oxford circuit. It sends nine members to parliament; two of whom are returned for the county, and two for each of the towns of Reading, Wallingford, and New Windsor. The other member is elected for the borough of Abingdon. The Lent assizes, and the Epiphany county fesions, are constantly held at Reading; the Easter sessions at Newbury; the Summer assizes at Abingdon; and the Michaelmas sessions alternately at the latter town, and at Reading.

Among the objects of antiquity in this county, is the celebrated White Horse; which the most learned antiquaries refer to Saxon origin; and Mr. White, who has published two small pamphlets on the subject, endeavours to prove that it was defigured by Alfred, to commemorate a victory obtained by the Saxons over the Danes. It was formed on the side of a chalk-hill, by the simple process of cutting off all the green turf within a certain line, which resembled the shape of a horse. This trophy is now nearly obliterated by the grass growing on its surface. Near the White Horse is a very large encampment, called Uffington-castle, and about one mile westward of the latter is a Druidical monument, named Wayland-Smith. It is a large cromlech on a barrow, with several smaller stones, which were formerly placed in a circle round it. Another Druidical relic is to be found at Park-place in this county. This was brought from the site of Jerfey, and all its stones were placed here in the exact position, and relative situation in which they were originally found. See Henley.

Besides several ancient encampments of different sizes and shapes, this county had two Roman itations, which are named in Antoninus's Itinerary "Spinus," and "Calleva," and are found in the thirteenth Iter of that work. In the seventeenth Iter is another iteration, named Pontibus, or Pontis, which antiquaries agree in fixing near the eastern border of the county. The Roman Walling-street passed across the northern corner of Berkshire, entering it near Wallingford, and leaving it on the north-western side. Reading is the county town of Berkshire, and the castle of Windsor its greatest ornament. Camden's Britannia. Coates's History of Reading. Horley's Britannia Romana. Beautiful of England and Wales

BERKOUSSA, a town of Croatia, on the river Kupia, 11 miles south of Petricha.

BELIAI, a town of Croatia, on the river Kulpa, 6 miles south of Shum.

BERLAMONT, a town of France, in the department of the North, and chief place of a canton, 12 leagues E.E. of le Quesnay. It contains 1755 inhabitants, and a church; the canton amount to 5759. The territory includes 35 kilometres, and 14 communes.

BELASREUT, a town of Germany, in the circle of Bavaria, 5 leagues E. of Palatia.

BERLEBURG, a town of Germany, in the circle of the Upper Rhine, 26 miles E. of Cologne.

BERLEUX, a town of France, in the department of the Somme, and chief place of a canton, in the district of Pernem, 3 miles S.W. of Pernem.

BERLIN, a city of Germany, in the circle of Upper Saxony,
BERLIN.

Saxony, a capital of the electorate of Brandenburg, and of the whole Prussian dominions, is situated on the banks of the river Spree, and has been reckoned one of the most beautiful cities in Europe, as it is one of the largest and most populous in Germany. Its extent is about 44 miles in length, from the Mohlsterr to the south-east, to the Oranienburgerthor on the north-west; and about 3 miles broad from the Berenberthor, on the north-east, to the Potsdamerthor on the south-west; but within this extensive enclosure there are many gardens and corn fields. The streets are disposed with great regularity, and are of a convenient breadth. In the new town they are perfectly straight. Frederick street is reckoned 24 English miles in length; and others, which intersect this at right angles, are a mile or a mile and a half long. Some have asserted that it covers as much ground as Paris; but though this be not true, and it be allowed to occupy more than half the extent of the capital of France, its number of inhabitants is much smaller in proportion. The number of houses has been variously estimated. Reiffbeck computes them at 6000; count Hertzberg states the number of buildings, public and private, as amounting, in 1790, to 6725; and according to Horeck, the number of houses is 6930. The number of inhabitants, according to the latest statement, is 143,000; Horeck computes them at 143,099; and Hertzberg at 150,803, being, at an average, more than 22 inhabitants to each house.

There are a few very magnificent buildings in this town; and the rest are neat houses, built according to a plan prescribed by the late and present king, who have directed their particular attention to the external decorations of the city, either of a fine white freestone, or of bricks covered with a thin coating of plaster, painted with a light colour, and generally one, or at most two stories high. The situation of the city, in a barren sandy plain, exposes it very much to dust, which, in dry windy weather, is not only inconvenient to the eyes and lungs of the inhabitants, and injurious to their health, but detrimental to the beauty of the buildings, which exhibit a foiled and shabby appearance. The heating of the houses within by no means corresponds with their external elegance; the rooms are in a ruinous condition, the furniture covered with dust and dirt, and the variety of persons of the meanest condition, who inhabit them, altogether inconsistent to their outward magnificence and decoration. In these handsome houses, soldiers are quartered even on the ground floor, in rooms looking out to the street; and the lowest mechanics occupy the different stories. The principal edifices are the king's royal palace, and that of the prince-royal. The former is a magnificent structure of freestone, begun by Frederick I. in 1608; but as it has been constructed at different periods, and by several architects, its fronts are not exactly regular. It consists of four stories, with large apartments, fine ceilings, and superb furniture. The noble chambers are decorated with capital paintings and rich tapestry, and furnished with tables, stands, inlaid, cantheliers, looking-glass frames, fercens, couches, &c. of solid silver. The library, though a mean apartment, is well furnished with books; among which is a collection of 500 Bibles in different languages and editions, particularly the Bible used by our Charles I. when he was beheaded, presented as a kind of relic by Dr. Juxon to the elector of Brandenburg, and also the first Bible printed in America, and one of 1450, the first printed in the German language; and also a koran, in a character so small, and on a paper so thin, as to form only 1½ inch in bulk. The arsenal is a noble structure, forming a spacious quadrangle, and containing arms, ranged in excellent order, for 200,000 men. Over the principal gate is a portrait of the elector, William the Great, in a large model of gilt brafs; and the four cardinal virtues, of a gigantic size, are placed on pedestals on each side of the portico, and seem to look towards the picture. Theolders of the garrison amount to about 30,000. The royal stables are very magnificent, adjoining to which are grand apartments for the master of the horse, and his inferior officers; and in the rooms over the stables, may be seen the rich accoutrements of the horse on which Frederick I. rode, when he made his public entry; all the ornaments of the bridles, the bridle-leather and crupper, as well as the bits and bitrings, being of gold, adorned with brilliants. The opera-houfe is a beautiful structure, and on the front bears this inscription, "Fredericus rex, Apollini et Minerva." The king allows the free admission to the public; and, accordingly, in Berlin are 25 churches, 14 of which are Lutheran, 10 Calvinist, and one Roman Catholic, which is the most elegant in the city. The churches are decorated with Mercuries, Apollos, Minervas, and Cupids, "which might lead a stranger to suspect," says Dr. Moore, "that the Christian religion was exploded from the Prussian dominions, and old Jupiter and his family restored to their ancient honours." Instead of fants and crucifixes, says the same writer, Frederick III. proposed to adorn the church of Berlin with the portraits of men who have been useful to the state; those of the marshals Schwerin, Keith, Winterfield, and some others, were actually placed in the great Lutheran church before his death. We may also reckon among the public buildings and establishments of Berlin, the academy of sciences, (See Academy), another of arts and painting, an anatomical college, 5 gymnasia, 2 public libraries, and many excellent and important fabrics and manufactures of silk, woolen stuffs, and flockings, cotton, linen, lace, porcelain, &c. which supply it with a very considerable and advantageous trade, to the prosperity of which, the unlimited toleration granted to Roman Catholics, Lutherans, Calvinists, and Jews, has very much contributed. In Berlin, there are several large squares, in one of which is an equinoctial statue of marshall Schwerin, holding the ensign with which he advanced at the famous battle of Prague, and which he seized from one of his officers when his troops were giving way, exclaiming, "Let all, but cowards, follow me." On the new bridge over the Spree, stands also an equinoctial statue of William the Great, which is highly esteemed as a piece of fine workmanship: the man and horse in one piece, cast at the same time, and the statue weighs 3,000 quintals. The suburbs are adorned with the magnificent garden of Count Reußen, the beautiful house and garden called Mombijon, the house and garden of Belvidere, and the lately hospital of invalids, for the maintenance of about a thousand officers and soldiers. In the new Calvinist church of Old Coln, is the burying place of the royal family. At Berlin there are many public walks and gardens. The principal walk is that in the park, on the south side of the Spree, which is upwards of three miles in circuit, and reforted to by the inhabitants of the city in great crowds on a Sunday; and here they are provided with every kind of refreshment, and indulged with any fort of amusement. The most fashionable walk in the city, is that which lies in the middle of one of the streets. Before the houses at Berlin, on each side, is a caufe-way, and between these two caufe-ways, are fine gravel walks planted with lime-trees. Under these are pitched tents, in which are sold ice, lemonade, and other refreshments. In the summer, the bands of music belonging to the regiments practife in this walk. In all the private houses a very rigid economy is observed; the chief article of expense is that which pertains to the drets of the ladies, who deny themselves common indulgences, for the sake of powder and millinery. The ladies...
adies of the court have much of the air of French women. There are some kinds of irregularities that prevail to a

Ber

frequent silly and flippant, and friendly or not friendly in a German character. Jealousy is held in equal contempt and detestation by the inhabitants of Berlin, and scandal is very little known. The environs of this city are remarkably pleasant, being interspersed with villages, vineyards, canals, pleasure houses, and gardens. Among the palaces in the neighborhood belonging to the royal family, Schonhausen and Charlottenburg are the most worthy of notice. The former is situated about two miles from Berlin, on the Pankow, which supplies the pond in the summer garden of this palace with water. Charlottenburg also, one of the royal or electoral palaces, seated on the river Spree, was only a small village, till the electors, comfort to Frederick 1. being pleased with its situation, began to build in it, and after her death the works were carried on by the elector, who gave it its name in commemoration of his wife Sophia Charlotte. This palace is one of the most delightful structures in Germany, and is adorned with a most beautiful garden.

Berlin is divided into five wards, called Berlin proper, Coln on the Spree, Frederick's Werder, Dorotheenstadt, and Fredericksbad. The proper Berlin was founded in the 12th century, by some colonists invited thither from the Netherlands, and the vicinity of the Rhine, under the margrave Albert, the Bear. The suburbs of this town are frequently called Königsflad, and by others divided into three vicinities, or quarters. Berlin proper is separated by a principal arm of the Spree from Coln, over which are four bridges, three of timber, and one of stone, called the Pontoncol. Coln was probably built about the same time as Berlin; and it is formed into a kind of isle by two branches of the Spree, which environs it. New Coln is now a considerable part of the old town of Coln, from which it is separated by the Spree. The suburbs of Coln were included in 25 ø6, within the outer wall. The Fredericksbad was built by the elector Frederick William, on a swampy werder, or island. This ward is separated by a rampart and ditch from the Dorotheenstadt, or Neustadt, founded by the elector Frederick William, and named after his consort, Dorothy. This new town is the most beautiful part of Berlin, and it is chiefly inhabited by the French. In a street of this town is the walk above mentioned. Fredericksbad, founded by the elector Frederick III. immediately on his ascension to the government, communicates with the new town and the Werder, and is the pleasantest ward in the whole city; the streets being spacious, straight, and planted with lime-trees. Behind this is erected a new ward, which ranges to the end of the new town, where many of the nobility have built palaces. In the suburbs, the houses are generally of timber, but in well plastered, that they seem to be of stone, and the streets are broad and straight. From this town there is a free communication, by means of canals, between the Spree and the Oder, and the Spree and the Elbe. Berlin lies in N. lat. 52° 32' 30". L. long. 13° 26' 15". The annual average of temperature of Berlin for fifteen years, from 1769, to 1784, was, according to Mr. Beugeln's observations, 43°, nor could he find that the temperature decreases. The Baltic, within 120 miles N. of it, tempests the north winds, says Kirwan (see his Estimate of the temperature of different latitudes, p. 71) and to this is owing the moderate temperature which it enjoys. The influence of the vicinity of the Baltic must be allowed, when it is considered that the temperature of Berlin is higher than that of Dresden, Altenburgh, or Gotha, whose latitude is one degree lower, but more distant from the Baltic. Reisbeck's Travels, vol. iii. Moore's Travels through France, &c. vol. ii.

Berlin, a neat and flourishing town of America, in York county, and state of Pennsylvania, containing about 100 houses. It is regularly laid out, on the S. W. side of Conewago Creek, 13 miles westerly of York town, and 100

E. of Alleghany county, Vermont, on Dog river, a branch of Oniim river from the south, which falls separates Berlin from Montpelier on the N. N. W. Berlin contains 134 inhabitants, and is about 94 miles north-easterly from Bennington. Also, a township in Hartford county, Connecticut, 12 miles S. W. from Hartford, 42 N. W. from New London, and 26 N. S. from "New Haven. Also, a township in Worcester county, Massachusetts, containing 512 inhabitants, 34 miles W. from Bolton, and 15 N. E. from Worcester. Hops have been cultivated here, and promise to be a valuable article of husbandry.

Also, a township of Somerset county, formerly in that of Bedford, Pennsylvania, which lies on a branch of Stone creek, a fourth water of Conemaugh river on the west side of the Alleghany mountains; 25 miles W. from Bedford; 23 N. W. from Fort Cumberland, in Virginia, and 200 W. from Philadelphia. Stone creek, the chief source of Kiskimiatrics river, rises N. N. E. of Berlin. N. lat. 36° 54'.

Berlin, a fort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though some attribute the invention of it to the Italians, and derive the word from Berdnia, the name given them by the Romans, wherein persons are exposed to public shame. It seems to have having derived its origin, as well as its name, from Berlin, it is alleged, that Philip de Chicieu, a native of Piedmont, and defended from the Italian family of Chiefa, was a colonel and quarter-master in the service of Frederick William, elector of Brandenburgh and that he was much esteemed by the elector on account of his skill in architecture. Being once sent to France on his master's business, he caused to be constructed, for the convenience of this journey, a carriage capable of containing two persons; which in France, and every where else, was much approved and called a berline. This Philip de Chicieu died at Berlin in 1673. Beckman's Hist. of Inventions, vol. i. p. 135.

The Berlin is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot. The body of it is hung higher fore and aft, by kettledrums; there being a kind of rim around or sheathing, for the convenience of getting into it; instead of side windows, they have shrouds to let down in bad weather, and draw up in good weather.

Berlin, in Natural History. See BEER.

BERLIN, in Geography, a town of Germany, in the curve of Upper Saxony, and New Mark of Brandenburg, 60 miles E. N. E. from Berlin, and 36 N. N. E. from Kurlan.

BERLINECZ, a town of Poland, in the patrimony of Buczaw 72 miles W. from Breslau.

BERLOCH, a town of Bohemia, in the circle of Czaslaw, 9 miles N. E. from Czaslan.

BERME, in垣Nish an, a small space of ground, four or five feet wide, left without the rampart, between its foot

and
BER

and the side of the moat, to receive the earth that rolls down from the rampart, and prevent its falling into, and filling up, the moat.

This is also called sfero, relinh, retraite, pas de secrs, foreland, &c.

Sometimes for greater security, the berme is palisaded.

BERMEJO, in Geography, the name of an island and port on the S.W. coast of South America, in about 2 degrees N. lat. a little W. from Lima. It is a four leagues distant from Menguon on the north, and 6 from Guarmey on the south. The island is a small white island, in the middle of which is a bay: the land from hence to Menguon is high, and abounds with hillocks, having large spots of white sand. It has a good harbour and fine fresh water at a small distance from the shore; and the harbour is known at sea by a large high hill with a cleft in it, which runs down southward to the sea-side; on the north it is very steep.

BERMEO, or VIBRIMEO, a sea-port town of Spain, in the province of Biscaia, near cape Machichaca, 5 leagues N.W. of Bilbao.

BERMUDA HUNDRED, or CITY POINT, is a port of entry and port town of America, in Chesterfield county, Virginia, seated on the point of the peninsula formed by the confluence of the Appamattox with James river, 56 miles west from Williamsburg, 64 from Point Comfort, in Chesapeake bay, and 515 S.W. by S. from Philadelphia. City Point, from which it is named, lies on the southern bank of James river, 4 miles S.S.W. from this town. The town has about 40 houses, including some warehouses. It trades chiefly with the West Indies, and the different states. City Point, in James river, lies in N. lat. 37° 16', W. long. 77° 51' 30'.

BERMUDAS, or SOMER'S ISLANDS, vulgarly called Summer Islands, a cluster of small and rocky islands, forming the figure of a shepherd's crook, and amounting in number to about 400, situated in the Atlantic, and distant from the coast of Carolina about 200 leagues. N. lat. 35° 35', W. long. 63° 58'.

They derived their first name from John Bermudas, a Spaniard, who discovered them in 1527; and their second appellation they owe to Sir George Somers, who was shipwrecked on these rocks in his passage to Virginia in 1609, and lived there nine months. But he and his companions, having built a ship of cedar wood, sailed hence to Virginia. Sir George Somers, it is said, was driven a second time on these islands, and died there. But his companions returning to England, made so favourable a report of their beauty and fertility, that the Virginia company, who, as the first discoverers, claimed the property, sold them to about 120 persons, to whom King James I. granted a charter. Accordingly, in 1612, they planted the largest of them, viz. St. George's isle, with 160 persons, and in 1619, sent thither 500 persons more: upon which they instituted an assembly, with a governor and council. It is said, that they are much incommoded by want of fresh water, and by the storms, thunder, &c. to which they are subject. Shakespeare has therefore justly described them as ever " vexed with storms; but the poet Walter, who resided there for some time, on being condemned for a plot against the parliament in 1643, reprehends them as enjoying a perpetual spring. In 1725, the benevolent bishop Berkeley proposed to erect a college in these islands for the conversion of the savage Americans. See Berkeley.

This group of islands is said to contain about 400: but the greater number seem to be mere rocks and islands, not of sufficient importance to have received a name. From the chart by Lem Pereire, 1797, it should seem that the largest island, called "Bermuda," resembles a book, the great foot on one of the north. The length is about 35 geographical miles, and the breadth between one and two. The other islands which have received names are St. George's, St. David's, and Sommert. The island of St. George's lies eastward of the main land, and has a capital town of the same name, containing about 500 houses. Contiguous to this is St. David's, which supplies the town with provisions. The air is healthy, and a continual spring prevails; so that most of the productions of the West Indies might probably be cultivated in these islands. The houses are built of a soft stone, which is found on timber, and seemingly resembling that of Bath; and the stone is much used in the West Indies for retarding water.

With regard to the supposed fertility and productivity of these islands, it appears, from the answers of governor Brown to the inquiries of the privy council of England, that they contain from 12 to 13 thousand acres of very poor land, of which 9 parts in 10 are either uncultivated, or reserved in woods for a supply of timber towards building small ships, sloops, and shallop{s} for sale, this being the principal occupation of the inhabitants; and the vessels which they furnish, being built ofcedar, are light, buoyant, and unexpensive. Of the land in cultivation, 40 part was appropriated to any other purpose than that of raising Indian corn, and excellent roots and vegetables, of which a considerable supply is sent to the West Indies, until the year 1755, when the growth of cotton was attempted, but without much success; there being at present more than 500 acres applied to this species of culture. The number of white people of all ages in Bermudas is 5492, and of black, 4919. The Bermudians are generally lessening men, and the negroes are expert mariners. In the war between Great Britain and America, there were at one time between 15 and 20 privateers fitted out from hence, which were manned by negro slavers, who behaved irreproachably, and such is the state of slavery in these islands, and so much are the negroes attached to their masters, that such as were captured always returned when it was in their power. Some part of the trade of the Bermudians consists in carrying the salt which they fetch from Turks isle and America, where they fell it for provisions or for cash. These islands are frequented by whale-fishers. The government is conducted by a governor named by the British crown, a council, and a general assembly; the religion is that of the church of England. There are 9 churches under the care of 3 clergymen; and one Peculiar church. The women of these islands are said to be handsome, and both sexes are fond of drest. Edward's Hill of West. Ind. vol. i. p. 470.

BERMUDAS Cedar, in Botany. See JUNIPERUS. BERMUDIANA. See SISYRINCHIUM.

BERN, in Geography, was, before the French revolution, one of the thirteen cantons of Swifferland, bounded on the east by the cantons of Uri, Unterwalden, Lucern, and the county of Baden; on the north by the Aulryan forest-towns and the cantons of Basle and Soleure; on the west by the canton of Soleure, the county of Bienne, and a part of France; and on the south by the lake of Geneva, the Valais, and the duchy of Savoy. In the year 1352, Bern acceded to the Helvetic confederacy; and polled rich power, even at that early period, as to obtain the second rank among the Swiss cantons. Since the acquisition of the Pays de Vaud, the domains of this canton formed nearly the third part of Switzerland, and about the fourth of the actual population. It contained 3840 square miles; its population was estimated at 374,600 persons, and its contingents amounted to 2000. At the introduction of the reformation in 1528, government acquired a large increase of revenue by secularising the ecclesiastical
eclesiastical privileges. At the same period the whole canton followed the example of the capital; and the reformed religion was permanently established. This canton was divided into two great portions, the Pays de Vaud, and the German district. The Pays de Vaud having been conquered from the house of Savoy, and the German district from the States of the Empire, justice was administered, and taxes regulated in each by peculiar laws and customs. Each of these divisions had its treasurer and chamber of appeal resident in the capital; the chamber of appeal belonging to the Pays de Vaud judged in the laft resort; but the inhabitants of the German district were allowed to appeal to the foreign council.

The sovereign power of this canton rested in the great council of two hundred, which, when complete, consisted of 299 members chosen from the citizens, from whom they were considered as deriving their power, and as acting by deputation. The authority with which they were invested, was in some respects the most uncontrolled of any among the aristocratical states of Switzerland. The great council of Bern, since the year 1682, when it was declared the foreigne, was restrained by no constitutional check, like some of the others. As a general assembly of the citizens was never convened on any occasion, the executive powers of government were delegated by this sovereign council to the senate, chosen by themselves from their own body; the former ordinarily assembled three times a week, and extraordinarily upon particular occasions; the senate, every day, Sundays and festivals excepted. The senate, comprising the two avoys, or chiefs of the republic, was composed of 27 members; and from this select body were taken the principal magistrates. On a vacancy in the senate, 26 balls, 3 of which were golden, were put into a box, and drawn by several members; and those who drew the three golden balls, nominated three electors out of their body. In the same manner, seven members were chosen from the great council, who also nominated seven electors out of their own body. These ten electors fixed on a certain number of candidates, not exceeding ten, nor less than five; and such among these candidates as had the fewest votes in the foreign council, retired till their number was reduced to four; then four balls, two golden and two silver, were drawn by the four remaining candidates; the two who drew the former were put in nomination, and he who had the greatest number of ballots in the foreign council was chosen. The candidate, in order to be eligible, must have been a member of the great council ten years, and must be either a married man or a widower. The greatest excellence of this mode of election consisted, as Mr. Planta observes, in making the choice of laws apply chiefly to the electors, and not to those who might pretend to the succession, by which the dangerous effects of calumny were in a great measure abated, and yet a fair prospect of success was given to the meritorious, while those wholly unqualified could entertain little hopes of being preferred. The elected candidates drew lots only in one state of the proceedings; and when their number being reduced to only four, an even chance was given to those few to whom eminent qualifications had insured the marked approbation of their fellow-citizens; and when fortune proved unfavorable in one instance, repeated opportunities would occur, in which, unless the proved singularly unpromising, the elected object would be ultimately obtained.

The great council was generally elected every ten years; as within that period there was usually a deficiency of 50 members to complete the whole number of 299. When this deficiency occurred, and not before, new election was proposed; nor could it be deferred when there was a deficiency of 100. The time of election being determined by vote, each avoyer nominated two of the new members; each seigneur, and each member of the senate, one; and two or three other officers of state enjoyed the same privilege. Some few persons claimed, by virtue of their office, a right of being elected, which was generally allowed. These several nominations and pretensions generally amounted, on the whole, to about 50; and the remaining vacancies were supplied by the suffrages of the senate, and the seigneurs. These seigneurs were sixteen members of the great council, drawn yearly from the abbeys or tribes; and the candidates were generally taken from those who had exercised the office of bailiff, and were elected by lot. They were invested with an authority similar to that of the Roman centors; and in cases of maladministration, might remove any member from the great council or senate, though they have seldom exercised this power. The principal magistrates were two avoys, two treasurers, and four bailiffs; each chosen by a majority of voices in the foreign council, and yearly confirmed in their respective offices. The avoys held their posts for life; the treasurers, six years; and the bailiffs, four. The two treasurers, one for the Pays de Vaud, and the other for the German district, formed, in conjunction with the four bailiffs, an economical chamber of council of finance, which passed the accounts of the bailiffs, and received the revenues from those who were accountable to the government. The four bailiffs, the ex-avoyer who was the first senator in rank, and president of the secret council, the senior treasurer, and two members of the senate, composed a committee or secret council, in which all state affairs, requiring secrecy, were discussed.

Although the form of this constitution was aristocratical, and the senate possessed a very considerable influence, yet it did not enjoy (says Mr. Coke) that almost exclusive authority which exists in many aristocratical governments. For, by several wise and well-ordered regulations, the foreign council, although it delegated the most important concerns of government to the senate, yet assembled at stated times, and superintended the administration of public affairs. Mr. Burke asserts, that the republic of Berne was one of the happiest, most prosperous, and best governed countries on earth.

The canton of Berne, by its old constitution, was divided into a certain number of districts, called bailiwicks (see Bailwicks), over which bailiffs were chosen from the foreign council. These were the most profitable polls in the disposal of government, and very eagerly pursued. They were formerly nominated by the bailiffs, but the mode of election was altered in 1712, and they were chosen by lot. The bailiffs were representatives of the sovereign power in their respective districts; whose business it was to enforce the edicts of government, to collect the public revenues, to act as judges of the peace, and to be judges in civil and criminal causes, except where there was any local jurisdiction. In civil cases, beyond a certain value, an appeal lay to the courts of Berne; in criminal affairs, the process underwent a revision in the Senate, and was referred to the criminal chamber, which inflicted punishments for small misdemeanours; but in capital cases, the sentence was to be confirmed by the Senate, and by the foreign council, if the deliquent was a citizen of Berne. The bailiff delivered his accounts to the economical chamber, to which court an appeal lay in case of exaction on his part, or on the part of his officers. The profits of the bailiff's office arose from the produce of the demesnes, of the tithes, certain duties paid to government in the respective bailiwicks, and from the sums imposed
for criminal offences. In some parts of the German division, the bailiff became entitled, upon the death of every paean, to a determinate part of the inheritance, which proved in some situations an oppressive tax upon the family. The bailiff, being governor and judge in his own district, and having a magnificent chateau for his accommodation, not only possessed great power, but in the course of his administration, which lasted six years, was able to live with proper magnificence, and, to lay up two or three thousand pounds without extortition or unbecoming parsimony.

In Bern, the militia was so well regulated, that government was able to assemble a very considerable body of men at a moment's warning. To this purpose every male at the age of 16 was enrolled, and about a third of the whole number was formed into particular regiments, composed of fullers and electoraries; the former being bachelors, and the latter married men. Every person thus enrolled was obliged to provide, at his own expense, an uniform, a musquet, and a certain quantity of powder and ball; and no paean was allowed to marry, unless he produced his uniform and arms. Every year a certain number of officers, called land-majors, were deputies by the council of war, to inspect the arms, to complete the regiments, and to exercise the militia. The regiments were, besides this annual review, occasionally exercised by veteran soldiers appointed for that purpose. Beside the arms in the arsenal of Bern, a certain quantity was also provided in the arsenal of each bailliage, sufficient for the militia of that district, and likewise a sum of money amounting to three months' pay, which is appropriated to the electoraries in case of actual service. The draughts were chosen from the substantial farmers, each of whom provided his horse and accoutrements. In time of peace the avery out of office was president of the council of war; but during war, a general in chief was nominated for the forces of the republic. A certain number of regiments being thus always ready, signals are fixed on the highest part of each bailliage, for assembling the militia at a particular place in each district, where they receive orders for marching. As the page of history does not exhibit a greater curiosity than what was called the "exterior flate" at Bern, we shall here subjoin a brief account of it. It was a model of the sovereign council, and composed of those burghers who had not attained the age requisite for entering into that council. It had a great council, a senate, two avoyers, treasurers, bannerets, and feicenners; all of whom were chosen in the usual manner, and with the accustomed ceremonies. The poll of avoyer in this mimetic legislative community was solicited with great affidavit, and sometimes obtained at a considerable expense, as the feucal-fain candidate was always admitted into the great council without any farther recommendation. This body possessed 66 bailliages, consisting of several ruined castles dispersed throughout the country, among which Harzburg was the principal. It had also its common treasurers, and its debts, differing in this latter respect from the actual government of Bern, which was not only free from debts, but possessed of a very considerable fund in reserve. Great honours were paid to this singular institution, as it was in fact a kind of political fenility for the province of the canton, who were likely to arrive in some future period at the highest offices in the state. Its badge, or coat of arms, which was an ape sitting on a lobster, and viewing itself in a mirror, was no bad emblem of its mock consequence.

The revenues of Bern, out of which were paid the salaries of the principal magistrates, which were extremely moderate, the reigning avoyer being allowed 400., each of the senator's 150., and the banneret 230., and which were applied to the expenses of the government, were derived principally from the public demesnes appropriated at the time of the reformation; the tithes, sequestered at the same period, and assigned to the maintenance of the clergy, public farnilies, and charitable institutions; quit-rents, and monopoly of salt and gun-powder; produce of the post-office; customs and tolls; duty on wine imported into the capital; and fines imposed for misdemeanours; also a tax on the alienation of landed property in the French district; the interest of money accumulated from a regular provision of savings, of which nearly 500,000. were lodged in the English funds. The whole revenue has been flated by the bail authorities as not exceeding 300,000. crowns, which were always more than sufficient to cover the expenditures, and to construct and support the magnificent public works. A large treasure was always reserved in a vault of the capital lor sudden emergencies, and the care of this vault entrusted to the principal magistrates, each of whom had a separate key, and without their concurrence, and a special order from the sovereignty council, the door could not be opened. The amount of this treasure could not be accurately ascertained, but it must have been very considerable, as not less than 160,000. bullion was deposited in the mountains of Hasli and Oberland. The pillage of this treasure was one of the principal objects of the French directory, to deprecate the expenses of their armament against Egypt. In the plunder of Bern, it is said that the French did not acquire less than 400,000. in specie.

When the directory of France determined to revolutionize Switzerland, it directed its whole force against the canton of Bern, on the conquest or submission of which the reduction of the country at large depended. Its hollibilities were preceded, in 1797, by requiring Bern, and the other Helvetic cantons, to dismiss the British minister, who withdrew, and voluntarily announced the termination of his embassy in a dignified note addressed to the rulers of Bern. France, having accomplished the first part of its plan, which was that of dividing the confederate states, proceeded to the attainment of their second object, which was the subjection of Bern. With this view they secured the passes which facilitated the invasion of the Bernefe territory, by feizing the Eurgel and the town of Bienne. The subsequent attempt to detach the Pays de Vaud from Bern, and to erect it into a republic, under the auspices of France, was equally successful, from the pusillanimity and infatuation of the Bernefe government. Bern, after some feeble and ineffectual remonstrances, relinquished its claims on the Pays de Vaud, and made overtures of conciliation to the French directory, and to Mengaud, their agent, in Switzerland. But these degrading measures served only to alienate the rest of the republic. At length, after some fruitless negotiations, they had recourse to arms; and the forces of Soleure and Fribourgh ranged themselves under the land ard of Bern; and the chief command was entrusted to general Erbisch, a member of the sovereign council, who was a veteran distinguished for military skill and undaunted courage. The combined forces of Bern, Soleure, and Fribourgh, amounted at this time to 25,000 men, and extended from the northern frontiers of the canton of Soleure beyond Fribourgh; occupied the strong position of Vally, between the lakes of Morat and Neufchatel, and pulshed their advanced corps as far as the valies of Ormond, towards the fourth-eastern extremity of the lake of Geneva. By this position they covered the towns of Soleure, Bern, and Fribourgh, and prevented all communication between the two French armies, in the Pays de Vaud, and the bishopric of Baile. Erbisch, having arranged his plan of offensive operations in a masterly manner, was confident of success, and his troops were eager for the combat. In this
transmitted the plan of a new constitution; according to which, Switzerland, including the Grisons, was divided into 17 cantons. Accordingly, this constitution of 1801, Bern, in its former extent, except the Pays de Vaud and Argovie, was the seat of the 17 departments, or cantons, and the number of its representatives elected to the diet was nine. The whole body consisted of 57 members, chosen by the representatives of each district, and assembled at Bern, to organize the new constitution. The legislative authority was vested in the senate, composed of two landamanns and twenty-three counsellors. The executive power was lodged in a little council of four senators, in each of which the landamanns presided in turn. The landamann in office was to receive a salary of 50,000 French livres, and the other landamann and four counsellors 10,000 each. The salaries of the senators were not to exceed 6,000 livres. Each canton was governed by a prefect, nominated by the landamann, and was provided with its interior administration, which approved or rejected the projects of laws presented by the senate. By the conditions of eligibility, universal suffrage was abolished; and no person admitted to any public office, unless he was proprietor of land, or exercised an independent profession, and paid a contribution to the public burdens, the amount of which was regulated by each canton. A counter-revolution afterwards took place, by which the diet was dissolved, and the provincial government established as it existed before the 29th of May 1801. But the state of Switzerland is not yet decided. For a further account of the alterations that have taken place from this period in the constitution and government of the Swiss cantons, see Helvetia. Cox's Travels, vol. i. & ii. Piaut's Hist. of the Helvetic Confederacy, vol. ii.

The canton of Bern is fertile and well cultivated; the plains produce corn and fruit; and the Alpine eminences afford excellent pasture, which supports herds of cattle and flocks of sheep, from which they make butter and cheese. The inhabitants of the district of Zanenland in this canton, are principally herdsmen and shepherds, who hold a middle rank between that of cultivators and wandering Tartars or Armenians. Each family changes its habitation five or six times in a year; and every week it is customary to meet the father of his household, with his wife and children, and preceding them, herds, a chaise, kettle, and some wooden utensils, travelling, like an ancient patriarch, in search of a new residence. The country abounds with cows, and hens, most of which are constructed of wood and in such a manner as to be easily taken to pieces and removed for the convenience of their migration. In some of the valleys, the meadows are sometimes twice mowed, and thistled. The mountain herbage for the cattle continues ten or twenty weeks, according to its height and situation. When their winter forage is finished, they remove to the lowest parts of the mountains, and returning thence their whole flock, proceed with their flocks towards the summits. Their progress is regular and majestic. The most beautiful cow of the herd, adorned with a magnificent collar and bell, takes the lead, accompanied by the master of the family. Then follow his attendants, with the rest of the flocks. Shepherds and cattle are all bedecked with garlands of flowers; and every part is adorned with the jingling of bells, baying of cows, and cheerful notes of the herdsmen. The smaller flocks bring up the rear, and the procession is closed with the wife and children. Towards the end of August they again descend toward the lower parts, pasturing the last grass in the valleys, and at last retire to their warm retreats in the vale, to wait the return of spring and the same pleasing migration. In this part of the country no attention is paid to the culture of the meadow land; for though they couple
contrive to water their meadows without any fixed rules, and drain them in winter, they never drain those that are marshy, and water is left to flagrant on the sides of slopes and declivities. In the cold valleys, where in April the snow remains at the depth of some feet, they frequently flow mould on its surface, which soon melts it, and thus various gardens are cultivated in the midst of large tracts of snow. Potatoes have been lately planted, and are become a favourite food of the people, and in many cafes have been sublimated for bread instead of corn. The Alpine bean, ground into flour, serves the same purpose; whilst its leaves supply fodder for the sheep, and its stalk litter for the pens. Since the introduction of the commerce of cheese, the cultivation of corn has been annually decreasing. Some few spots of ground are, however, sown with wheat and barley, and others with hemp and flax, which are very thriving. The operations of the dairy render them negligent in the culture of fruit-trees; nevertheless, plum, cherry, pear, and apple-trees, are scattered here and there, but are nowhere collected into an orchard. In the German parts of Sanenland, they boil cherries with cloves and cinnamon into a kind of paste, which is preferred good for thirty years. Mixed with a few grains of mustard-seed, and other spices, they use it as a sweet mustard; and beaten together with spices and juniper berries, they allow it to ferment, and drink it as a red beer. For want of some regulation about their woods, whole forests are cut for palings to inclose their meadows, which soon become rotten, and useless even for fuel. Madder grows in this district wild and high. The most beautiful and most fertile spots of the canton of Bern are on the sides of the lakes of Geneva and Neuchâtel, where grow the most excellent fruits, and where are made the most valuable wines. In this canton are found a variety of coloured earths and clays, some of which are used for pottery, and stones of different sorts, pitted of Pairs, crystal, salt springs, coal, sulphur, mines of iron, copper, lead, and silver, and medicinal baths. They count in this canton 39 towns, great and small, and 1300 villages. The rivers that water it, are the Aar, the Emmat, the Wigger, the Reuss, the Limmat, the Sanen, and the Kandil. The principal lake is that of Geneva; besides which there are those of Neuchâtel, Biel, Murat, or Murten, Thun, Brienz, and Hasl, all which abound in fish. The part of the chain of the Alps seen from Bern, is distinguished by the different names of Wetterhorn, Schreckhorn, Füllter Aar-horn, Viefchernhorn, Exterior and Interior Eger, Engrace horn, Gletcher horn, Ebenfluh, Mittaghorn, Brithorn, Lauterbrunnen, Blumlis Alp, and Neïs; and it forms an amphitheatre, gradually rising from the environs of the city to elevated peaks, covered with eternal snow, and hitherto inaccessible. The Jungfrau, or Virgin, is one of the highest and most beautiful mountains in the canton of Bern.

The following table exhibits the height of the principal Alps in this canton.

The prevailing language is the German; but the people of fashion speak either French or Italian; and the common people in the Pays de Vaud, and in those parts that border on France and Italy, use a corrupt French or Italian, or a jargon, founded on both. The established religion is Calvinism; and the ministers are divided into deansaries and clerks, and hold yearly chapters or synods. They are more independent of the civil power than in the other cantons, and are forbidden to interfere in matters of state. The nobility of Bern are accused of an extraordinary degree of pride and fandelines, and affect to keep the citizens and persons of lower rank at a great distance. As the whole power of government, and all the honourable offices of state, are in their hands, they are not permitted to engage in trade; and without the places and pensions which they enjoy, they must be poor and wretched. The lucrative offices being thus in the hands of the nobility, it might be imagined that people of the middle and lower ranks are indigent and oppressed. This, however, is by no means the case; for the citizens, i.e. the merchants and trades people, feel in general to enjoy all the comforts and conveniences of life; and the penury is uncommonly wealthy throughout the whole canton of Bern. They possess the privilege of bearing arms, and form a very respectable body of military, that have been usually attached to the existing government, and particularly favoured by it. The manufacturer, in this respect, feels more than the peasant, is less regarded; and the government of Bern has been charged with discouraging, or at least not zealously promoting, manufactures and commerce. Mr. Coxe informs us, that, in his first visit to Switzerland, he found the people of Bern much less informed, and more indifferent about the encouragement of literature, than those of the other cantons; their academical studies being principally directed to those branches of knowledge that fitted them for the church; and the society for the encouragement of agriculture, which was almost the only establishment tending to promote the arts and sciences, obtained little countenance from government. However, in his second journey, after an interval of about ten years, viz. in 1786, he says, that the government, raised from the former slumber, had learnt to perceive that it is the interest of every state to educe and protect the sciences; and that the magistrates had lately purchased and appropriated at Bern a large manufactory for the public library, increased the collection of books, and procured from England an extensive apparatus for experimental philosophy. A literary society had also been instituted for the promotion of physics, and natural history in general, and that of Switzerland in particular. In January 1788, this society consisted of ten members resident at Bern, of whom several possessed, and others were forming, collectionsagreeable to the plan of the institution. A regular correspondence was also established in various parts of Europe; and the members have been disposed to satisfy the inquiries of foreign naturalists relating to the natural history of this country. The principal articles of exportation from this canton are horses, cheeves, linen cloth, coarse cloth and canvas made of hemp, cloth of cotton, and woollen stuffs. It is said that 10,000 pieces of linen have been sent annually from this canton; the principal part of which has been conveyed to Lyons. At Bern they have manufactures of silk, chiefly stuffs, and coloured stuffs. In the western part of the mountains, the principal employment is clock-making, and the polishing of sable stones.

Bern, a city of Switzerland, and capital of the canton of that name above described, derives its name, as it has been said, from a "bear," which was found there when its foundations were laid; "berno" in German signifying bears; and
and accordingly, it bears this animal in its arms, and always maintains one. It was built by Berchtold the 4th, duke of Zähringen, and was, from its foundation, an imperial city. Upon his death in 1218, the emperor Frederick II. conferred upon the inhabitants considerable privileges, and compiled a code which forms the basis of their present civil law. The liberty which this city enjoyed attracted many perfidies from the adjacent country; who found a sure asylum from the oppression of the nobles. Although Bern, from its foundation, was engaged in perpetual wars with its neighbours, and for some time with the house of Aulibr. yet it continued to aggrandize itself by degrees, and considerably enlarged its territory.

This is a regular well-built town, with some air of magnificence. The principal streets are broad and long, not straight, but gently curved; the houses are built of a greyish stone upon arcades, and are mostly uniform, and of the same height. On each side are piazzas, with a wall raised four feet above the level of the streets, which are very commodious in wet weather. A stream of the Aar runs in a clear current, and along a stone channel, through the middle of the streets, which furnishes several fountains not less ornamental to the place than beneficial to the inhabitants. The river Aar almost surrounds the town; winding its course over a rocky bed much below the level of the streets, and forming by its deep and craggy banks a kind of natural rampart. The stream that flows through the town serves to keep the streets always clean; for which purpose criminals are also employed in removing rubbish, both from the streets and public walks. The more atrocious delinquents are chained to wagons, while those who are condemned for smaller crimes are employed in sweeping the light rubbish into the rivulet, and throwing the heavier into the carts or wagons, which their more culpable companions are obliged to pull or draw along. These wretches have collars of iron round their necks, with a projecting handle in the form of a hook to each, by which, on the slightest offence or mutiny, they may be seized, and are entirely at the command of the guard, whose duty it is to see them perform their work. People of both sexes are condemned to this labour for months, years, or life, according to the nature of their crimes. The public buildings at Bern, as the hospital, the granary, the guard-house, the arsenal, and the churches, are magnificent, and announce the riches and grandeur of the republic. The cathedral is a noble pile of Gothic architecture, standing upon a platform raised from the bed of the river, and commanding a most extensive view. The arsenal contains arms for 60,000 men, and a considerable quantity of cannon, which is cant in the town. The Berne value themselves on the trophies contained in it, as well as upon the quantity, good condition, and orderly arrangement of the arms. Here is exhibited the statue of William Tell, who, with an arrow, is said to have struck off the apple placed upon his son's head by the governor Griffler, and by that means saved his life, which occasioned the beginning of the Swiss republic. The granary always contains a large provision of corn, supplied in consequence of particular treaties by France and Holland. The charitable institutions in this town are numerous, and well regulated. The hospitals are in general large, clean, and airy; and in the almshouse for the reception of 50 poor citizens, is a curious establishment similar to one at Delft, which provides for the reception of distressed travellers, who are accommodated with a meal and lodging at night, and each receives a small sum on their departure; if sick or wounded, they are maintained till their recovery. The house of correction is conducted partly on the plan of the benevolent Mr. Howard, and in consequence of his forgiveness. The delinquents are separated and distributed in two houses; one called the house of correction for greater crimes, and the other the house of labour for minor canons. The prisoners are all discriminated by the appendages of "brown" and "blue," from the colour of their clothes; the former being appropriated to the house of correction, and the latter to the house of labour. The men and women occupy separate apartments; and both are constantly employed in cleaning the streets and other servile occupations, and at other times in learning to read and write, and in acquiring the knowledge of various trades, which may enable them to gain a maintenance when their time of confinement expires. By these means the expense of the establishment is nearly supported, and a benevolent education is afforded to those who would otherwise prove useless or pernicious members of society. There are four tables, at which the respectively seats are made of distinction appropriated to good behaviour, and a larger or lesser share is distributed to each in proportion to their industry. After earning their food, the prisoners in the house of labour receive 10 per cent., those in the house of correction 8 per cent., for their extra-work. The torture at Berne is now formally abolished, by a public act of government: and justice is wisely and impartially administered. The solemnity used in passing capital sentence on a criminal deserves to be mentioned. When the trial is finished, the prisoner is informed of his condemnation by the "grand facteur," or lieutenant of the police, and attended by two clergymen to prepare him for death. On the day appointed for execution, a large scaffold, covered with a black canopy, is constructed in the middle of the principal street. The avoyer, with a sceptre in his hand, is seated on an elevated kind of throne between two senators, and attended by the chancellor and lieutenant of the police, holding an iron fiek, called "the rod of blood," all habited in their official robes. The criminal, being brought to the foot of the scaffold, without chains, receives the sentence of condemnation, which is read aloud by the chancellor, at the close of which the avoyer commands the executioner to approach, who instantly binds the arms of the culprit, and leads him away to the place of execution.

The public library is a small, but well-chosen collection, containing 20,000 volumes, to which additions have been made by purchase, and by the liberality of private contributors; to this belong also a few antiques, a cabinet of Swiss coins and medals, some curious manuscripts, particularly of the thirteenth century, confiding of several fables and romances of the Troubadours, written in that and the preceding ages, and some other curiosities. The small figure of the priest pouring wine between the horns of a bull, is merely valuable, because it illustrates a passage of Virgil, and has been mentioned by Addison.

To the account of the public buildings of Bern, we may add that of an elegant cloister, built by the voluntary subscription of the nobility, furnished with accommodations for many public amusements, such as halls, concerts, and theatrical entertainments, which latter are seldom permitted in this city. The walk by the great church was formerly the only public walk, and much admired on account of the view from it, and the peculiarity of its situation; being on one side a level with the streets, and on the other some hundred feet of perpendicular height above them. Besides this, there is now another walk on a high bank on the side of the Aar, and at some distance from the town. This walk is singularly magnificent, commands a view of the river, the town of Bern.
Bern, the country about it, and the glaciers of Swifferland. The adjacent country is richly cultivated, and agreeably diversified with hills, lawns, wood, and water; the river flows rapidly below, and an abrupt chain of rugged and snow-capped Alps bounds the distant horizon.

The population of Bern is estimated at about 13,000; the society is extremely agreeable; and foreigners are received with great care and politeness. The men do not meet in separate societies; and the women are the life and ornament of their daily assemblies, which begin about four or five in the afternoon, and continue till eight, when the parties usually retire to their respective houses. The inhabitants are particularly fond of dancing, which of course is a frequent amusement; and this diversion commences at the early hour of five in the afternoon, on account of a standing order of government, which prohibits their continuance after eleven. There is but little trade in the capital. Some few manufactures, chiefly of linen and silk, have been established; but they are carried on only by those who have no prospect of being admitted into the sovereign council, and who would think themselves degraded by commerce. But as offices of the late, thole of the bailifges excepted, are neither numerous nor very profitable, many enter, as their sole resource, into foreign armies. As for the peasants, who have acquired opulence either by manufactures or commerce, they seldom quit their farms, but retain the habits acquired in early life, and, however wealthy, never give their daughters in marriage to any but persons of their own description. Of the burghers of Bern, those only are qualified for the magistracy and government of the city, who are the defenders of such as were made burgesses before the year 1635; and, besides, they must not be under 50 years of age, and must be enrolled in one of the twelve companies. The British envoy to the Swiss cantons usually resides at Bern. N. lat. 46° 55', E. long. 7° 26'. Coxe's Travels, vol. ii. Moore's View of Society, &c. in France, Switzerland, &c.

**Bern-Machine, in Agriculture, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland.** This machine, of which there is a model in the machine-room of the Society for the encouragement of Arts, is represented in Plate 111. Agriculture; and consists of three parts, the beam, the ram, and the lever. The beam ABC (N° 1) of which only one side is seen in the figure, is composed of two flout planks of oak, three inches thick at least, and separated by two transverse pieces of the same wood, at A and C, about three inches thick. These planks are bored through with corresponding holes, as represented in the figure, to receive iron pins, upon which the lever rests between the two sides of the beam, and which is shifted higher and higher as the tree is raised, or rather plucked out of its place. The sides are well secured at the top and bottom by strong iron hoops. The iron pins on which the lever rests should be an inch and a quarter, and the holes through which they pass, an inch and a half in diameter. The position of these holes is sufficiently indicated by the figure. The foot of the beam, when the machine is in action, is secured by flakey representations at G, driven into the earth. The ram D, which is made of oak, elm, or some other strong wood, is capped with three strong iron spikes, represented at f, which take fast hold of the tree. This ram is six or eight inches square; and a slit is cut lengthwise through the middle of it, from its lower end at K to the first frnace a, in order to allow room for the chain gb to play round the pulley K, which should be four inches thick, and nine inches in diameter. This ram is raised by means of the chain gb, which should be about ten feet long, with links four inches and three quarters in length, and an inch thick. One end of this chain is fastened to the top of the beam at C, while the other, after passing through the lower part of the ram, and over the pulley K, terminates in a ring or link, represented N° 3, the two ears mn of which serve to keep it in a true position between the two planks of the beam. In this ring the hook P is inserted. The hook is represented in profile N° 2, where F is the part that takes hold of the ring. But it must be observed, that the parts of this machine, represented in N° 2, 3, are drawn on a scale twice as large as the whole engine. The hook F, N° 2, should be made of very tough iron, as well as the handle G, and the arch E. This handle should be two inches thick at a, where it joins to the hook, and the thickness gradually lessens by degrees up to the arch, which need not be more than half an inch thick. On each side of the pin z, is a semicircular notch, x, y, which rests alternately on the pins when the machine is worked. The hole D, and the arch E, serve to fix a long lever of wood EF, N° 1, by means of two iron pins; and by this contrivance the lever is either raised or depressed at pleasure, in order to render the working of the machine easy in whatever part of the beam the lever may be placed; for without this contrivance the extremity of the lever EF, would, when the handle is near the top of the beam, be much higher than men standing upon the ground could reach. It must however be remembered, that the lever is often shortened by this contrivance, and consequently its power lessened.

The machine is worked in the following manner: It is placed against a tree, in the manner represented in the figure, so that the iron spikes at f may have hold of the tree, and the end of the beam A be supported by flakey represented at G. The iron handle N° 2, is placed in the opening between the two planks of the beam, and the wooden lever fixed to it, by means of the iron pins already mentioned. The hook F takes hold of the chain, and one of the iron pins is thrust into the outer row of holes, by which means the outer notch x will rest on the pin, which will be now the centre of motion; and the end of the lever E, N° 1, being pressed downwards, the other notch y, N° 2, will be raised, and at the same time the chain, and consequently the ram. The other iron pin is now to be thrust into the hole in the inner row, next above that which was before the centre of motion, and the end of the lever E elevated or pushed upwards, the latter pin on which the notch y rests now becoming the centre of motion. By this alternate motion of the lever, and shifting the pins, the chain is drawn upwards by the pull of the pulley K, and consequently the whole force of the engine exerted against the tree. There is a small wheel at L, in order to lessen the friction of that part of the machine.

From this account the reader will very easily perceive that the machine is nothing more than a single pulley compounded with a lever of the first and second order. It must, however, be remembered, that as the path of the engine is given in an oblique direction, it will exert a greater or less force against the horizontal roots of the tree in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greatest force against the horizontal roots of the tree.

**BERNABEI, Ecorel. in Musical Biography, the schollar and successor of Benvenuti at St. Peter's, and insector of the abate Steffano, may be ranked among the greatest masters of harmony, in the ancient ecclesiastical style, or the 17th century. This composer being invited by the elector of Bavaria to Munich, about the year 1650, entered into the service of that court, where he continued the rest of his life. His son, Giuseppe Ant. Bernabei, after following his father's steps in the study of ecclesiastical harmony,urnished him considerably.
considerable in melody and modulation, as he lived long enough to be a great relaxation in the figure of ancient rules. There is a canon by this composer in the first edition of Paulusdi, page 158, and an excellent Agnus Dei, in D. Martini Sag. in Contrap. H. 1. 125, extracted from his mass, for four voices, intitled, "Laudate cœlia, quia sicut in triuitia." After succeeding his father as maestro di capella to the elector of Bavaria, by whom he was honoured with the title of cantor unico, and publishing several compositions for the church, replete with musical science of the first class, he lived till the year 1572, extending his existence to the greatest age of eighty-four.

Their masters, with many other good harmonists, in the style of the 17th century, supplied the churches of Italy with numerous compositions, in which the chief most confederated in pure harmony, and the contrivance of canon, fugal, and imitation on simple and often aspolid subjects; but to these excellent the best moderns have added melody, a more varied modulation, and not only an attention to long and short syllables, but to the expulsion of words. In the 15th century almost every mass was composed upon the subject of some well-known song or ballad; but these all being palemonodic, and a little more lively or varied than cantus firmus, admitted of no greater variety of modulation than the ancient charts of the mass, upon fragments of which, during the 16th and part of the 17th centuries, it was thought necessary to construct the chief part of choral music. Though the present fluctuations in counterpoint at Naples, and other parts of Italy, fill exercise themselves in harmonizing cantus firmus, the writing masses or motets to which the subjects of these chants is seldom done but in pure pedantry, and to give an air of antiquity to dry and fanciful compositions.

The church style of composition was, however, much altered during the 17th century, not only by the imitation of dramatic music, and the introduction of instruments, but by writing in transposed keys, and supplying the deficiencies in the scales, which too strictly an adherence to the species of octaves, and modes of the church, had occasioned. Indeed, before this time, there was no decision of keys, either in sacred or secular music, according to our present rules of beginning and ending upon the chord major or minor, or the key note, or of forming determinate notes in the scale. The prohibitions were so numerous in the writings of the old theorists, that if the most regular modern compositions were tried by such rules as published at the beginning of the 17th century, they would appear extremely hecious. No part was to be extended above or below the flaut, or five regular lines, on which it was written; the combination of chords was never to be broken by moving to an inharmonious harmony; and the intervals of the sharp seventh, the tritons, or sharp fourth, flat fifth, flat second, and even the major fifth, were prohibited. Indeed, an excellent composition might now be produced, merely from ancient dispositions.

BERNAGORE, a town of Hainaut, in the country of Belgium, on the canal of the Ganges, 15 or 12 leagues below Chiafulah, and 3 miles N.W. of Moorfield. The coast forts of Saint-Clouds are here made. It is famous on account of the great number of lakes of pleasure, which are there, and who pays a monthly recognition to the festival of Chiafulah, for the fine exercises of their profession. It belonged to the Dutch; but was taken by the British forces in October, 1593.

BERNAL, a hill on the west coast of New Mexico, near the road, and 4 leagues W.S.W. of the burning mountain of San Salvador. N. lat. about 117°. W. long. about 97°.

BERNARD, in Biography, abbot of Clairvaux, and a faint of the Romish church, was born of a noble family at Fontaine in Burgundy, in 1091, and educated at the church of Chartillon, where he manifested at an early period an ardent spirit of devotion. At the age of 23, he, and 50 of his companions, entered into the abbey of Citeaux, lately founded by St. Robert. Here he acquired such reputation, that, within two years, viz. A.D. 1115, he was deputed, with a colony of monks, to found the abbey of Clairvaux in the diocese of Langres, of which he was created the first abbot, and where he continued, without exciting or accepting any higher pre-eritance. In a short time he found himself at the head of 700 novices, and by his eloquence and zeal, Clairvaux became a seminary of the most distinguished reputation, so that, during the life of the founder, it produced one pope, six cardinals, and thirty prelates. In this retreat the influence of Bernard was greater than if he had occupied the throne of St. Peter; he was consulted as an oracle; his counsels were regarded as wise in the remotest parts of Europe; and the Cistercians, by his example, became so powerful, that it produced 100 convents, which acknowledged him as their head. Having exerted himself in restoring peace to the church, which had been interrupted by the schism that had happened between the years 1139 and 1138, he engaged in the suppression of the order of Abalard, who had propagated some opinions that were thought to militate against the doctrines of the church; and proceeded in destroying his abbeys by the council of Sens, in 1146. He also refuted the errors of Peter de Bruys (see PETERBRUS), and combated the fanaticism of the APOSTOLIÆ, which had a stroke of the sword against the Saracens. In this romantic expedition, he engaged, by his eloquence, Lewis VII. of France, with his principal nobles, and the curii Plenariarum; and he bore, that from Constance to Cologne, he impelled and guided all his adherents, and ventured the peril of the only man being left to defend women. Many of the monks of Clairvaux, who were required to leave and close him, he obtained the appointment of "Pius Manning," or wanderer of the world. The enterprise which he had entered with Conrad and Lewis proved unfortunate; and the abbot, who had predicted their success, incurred a variety of calumnies and reproaches on account of the calamities which had fallen upon them. He died in 1153.
been instrumental in bringing upon Europe. He attributed its failure to the sins of the croises, which had hindered the accomplishment of his prophecies. How far he was affected by the difcomfiture and general dillets in which this expedition terminated, or by the accumulations he suffered, is it impossible to say. However, it is certain that he did not long survive that disastrous event; for he died at Clairvaux, in 1153, in the 63rd year of his age.

Few men possessed a more extensive and uncontrollable command over the minds of men than St. Bernard; and his influence was wholly owing to his personal qualifications. But though he had an absolute command by his eloquence and writings, he seems to have been more an enthusiast than a politician, and to have wanted worldly wisdom to direct and manage the various engines which he put into motion. With good intentions he blundered passion and prejudice, and the love of power. He was, without doubt, a man of distinguished piety, as well as integrity; and, considering the time in which he lived, an elegant and learned scholar. Erasmus gives the following character of him: "Christiane doctus, et sancte facundus, et festus". As a writer, he was copious; his style was characterized by force, vivacity, elevation, and sweetness; and his imagination furnished him with figures of comparison and strong antitheses in great variety and abundance; so that he has been regarded as the last of the fathers formed upon the models of St. Ambrose and St. Augustine. The best edition of Bernard's works is that of the learned Benedictine Mabillon, in 2 vols. fol. first printed at Paris in 1666, 1667, and reprinted in 1690 and 1719. A Latin impression of this edition was made at Venice, in 6 vols. fol. Cave's Hist. Lit. ii. p. 186. Gen. Ditt. Nouv. Ditt. Hist.

Bernard of Menthon, the founder of a religious community, was born in the Genevois 905, and defended from one of the most illustrious houses of Savoy. Having dedicated himself to the ecclesiastical profession, he retired to Aosta, a small town at the foot of the Alps, and became arch-deacon of its church. Here he employed himself in missions among the unconverted Pagans, who inhabited the mountains, and professedly them to Christianity. Having witnessed the hardships and dangers encountered by the French and German pilgrims, in their passage to Rome over the Alps, which Hannibal had anciently traversed with singular fortitude and perseverance, this benevolent monk founded two monasteries, or hospitae, for their relief, on Mont-joux, called from him "Great and Little St. Bernard." These were peopled with canons-regular of St. Augustine, and Bernard himself became their first prior. He obtained several important privileges for his establishment from succceptive popes, and it acquired great popularity and large possessions. Bernard died at Novaro, at the age of 85, and was canonized by the Roman church. His cult has undergone a variety of vicissitudes, and lost great part of its riches; but it still subsists, and is eminently useful. There are ordinarily between twenty and thirty monks belonging to the convent; eight of whom are usually dispersed among the Alpine parishes, under their patronage; and ten or twelve constantly reside, being fitted, from their age and health, to be able to bear the keen atmosphere of the mountain. The few others, who can no longer bear it, are permitted to reside with the aged provost of the whole, in a house belonging to the convent, and situated at Martigny below. The monks of the mountain are industriously employed in the prosecution of their private labours, in the instruction of their novices, in the education of some scholars who are sent to board and lodge with them, and in managing the temporal economy of the whole. They have a prior, the deputy of the provost, and governor of the convent in his absence; a sacristan, who takes care of their chapels; a cellarer, serving as purveyor, controller of the kitchen, and managing all the exterior concerns of the monastery; a inquirer who keeps the keys, and dispenses the requisite articles to the monks and to the travellers; and an infirmier, who takes care of the sick in the apartment appropriated to them. The cellarer keeps twenty horses constantly employed during the summer in fetching the magazines of flour, bread, cheese, liquors, and dried fruits, for themselves and their guests; and forage for the milk cows and fattening cattle, during winter. Their fire-wood, of which they expend a great quantity, is brought to them on the backs of mules, from the distance of four leagues, and by a steep path, that is passable only for six months in the whole year. Before the winter sets in, they fend down their horses for the season to a farm which they have on the northern side of the Rhone. To a sympathetic and compassionate mind it is peculiarly pleasing to observe the solitude of these amiable monks on such days as the pas is most frequented, in personally receiving, warning, and recovering travellers, that are exhausted by their excess of fatigue, or indisposed from the severity of the air. With equal attention they relieve both their own countrymen and foreigners. They make no distinction of state, sex, or religion; and ask no questions concerning the constry or the creed of the wretched. In winter and in spring, their solictude has a larger range of attention and activity. From that very time nearly, in which Hannibal conducted an army over the Grisons pass, into which the Romans reckoned the general winter of Italy to commence, from the 1st of November, through the winter, to the 1st of March, the Alpifalian fervant, who, as an Alpin, is denominated a Maronner, and one or two dogs of an extraordinary size accompanying him, are constantly engaged in going to meet travellers a considerable way down the descent towards the Vailais. These dogs possess an instinct, and receive a training, which fit them to be peculiarly useful in their employment. They point out the road to the guide and the travellers, through fogs, tempests, and snows; they have also the sagacity to discover travellers that have lost their way, that have fallen amidst the drifts of snow, and that are lying upon them, wearied and exhausted. The monks themselves often accompany the guide, and aid him in administering necessary relief. Apprized of the benumbing and stupefying effect of extreme cold, they route the sleeping travellers, and exert themselves in a variety of ways in preserving and recovering them from approaching or apparent death; and in doing this, they expose themselves to great danger. In order to avoid the numbness occasioned by the cold, they carry with them short thick flaps, armed at the ends with iron, and with these they continually strike their hands and feet. About three miles below the convent, on the road of Hannibal's ascent, they have built a small vaulted room, called the hospital, which is intended for the casual refreshment of travellers benumbed, and unable to reach the convent. The trysty Maronner visits it frequently, in order to meet the traveller; but principally at the approach of night, and on his return leaves bread, cheese, and wine. On extraordinary occasions, when a storm subsides, he falls for this building, with his flock of wine and meat, and affails all whom he finds disfreted. The monks themselves are often seen on the tops of these rocks, watching opportunities for the extricate of their humanity. When the snow just fallen is deep on the ground, they employ themselves in making roads through it, and thus by timely vigilance prevent many fatal accidents. But notwithstanding all their charitable efforts, scarcely a winter passes in which some traveller is not brought to the convent with his limbs benumbed and frozen. The traveller is sometimes overwhelmed at once, and plunged into the body of descending snow. When he is not very deep, the dogs discover
BERNARD.

discover him by the scent; and when they fail, the monk engages in the laborious office. They range upon the snow, and find it with long poles; and they have thus redeemed many from imminent danger of being lost. Nouv. Dict. Hist. Savoirs Voy., des Alpes, vol. ii. Whitaker on the Course of Hanover over the Alps, &c. 1794. See BERNARD, Geography.

BERNARD, Andrew, a Latin scholar, and successively post-laureate to Henry VII and Henry VIII, was a native of Thoulouze, and an Augustin monk. He was not only the king's post-laureate, as it is supposed, but his historiographer, and preceptor in grammar to prince Arthur. He obtained many ecclesiastical preferments in England. The pieces which he wrote under the character of post-laureate, are in Latin. There are, "An Address to Henry VIII. for the most suppurpicious beginning of the 10th year of his reign," with an Epithalamium on the marriage of Francis, the dauphin of France, with the king's daughter; "A new year's gift," for the year 1515; and "Veves," wishing prosperity to his majesty's 15th year. He has left some Latin hymns; and many of his profe pieces in Latin, written as historiographer to both monarchs, are extant. Warton's Hist. Eng. Poetry, vol. ii. p. 132.

BERNARD, Edward, a learned English mathematician and linguist, was born at Perry St. Paul, near Towcester, in Northamptonshire, in 1638, and educated at Merchant-Taylor's School in London, whence he was removed, in 1655, to St. John's college in Oxford. Here he applied himself with the utmost diligence to the study of history, philology, and philosophy; and acquired an accurate knowledge, not only of the Greek and Latin languages, but of Hebrew, Syriac, Arabic, and Greek. He also directed his attention to the mathematics, which he studied under the celebrated Dr. Wallis. Having taken several academical degrees at Oxford, and engaged the esteem of all who knew him, by his distinguished talents and learning, and no less amiable temper, he removed in 1668 to Leyden, with a view of examining several MSS., and particularly the Arabic version of the three chief Greek books of Apollonius Pergamus's conic sections, sought from the east by James Gollis. These books were transcribed, with an intention of publishing them at Oxford, but his design was never executed. Upon his return to Oxford, he resumed his studies with fresh vigour, and by his collection of the most valuable MSS. in the Bodleian library, the result of which was always ready to communicate, he was engaged in a very extensive correspondence with learned men of most countries. About the year 1669, he was recommended by the famous Dr. (afterwards Sir Christopher) Wren, to be a professor of astronomy at Oxford, to be his deputy, and he succeeded this eminent professor, on his resignation in 1673. He had been previously inducted to the rectory of Cheene in Surry, and appointed chaplain to Dr. Mervin, bishop of Bath and Wells. A scheme having been projected in the university of Oxford, which was chiefly proposed and encouraged by Bishop Pell, for collecting and publishing all the ancient mathematicians, Bernard, who first formed the project, assiduously engaged in accomplish it, by collecting all the old books and MSS. in the public libraries, and drawing up a synopsis of their contents. He also printed, at his own expense, as a specimen of this noble design, a few sheets of Euclid in folio, containing the Greek text and a Latin version, with Drury's commentary in Greek and Latin, and learned scholia and collations. With a view of promoting this study of astronomy, he also took an edition of the "Parva Synthetica Mathematica," or "Novus Epitome," of which there is an account in the "Veterum Mathematicorum Syntagma," and in which, besides Euclid, are contained the small treatises of Theodorus, Autolycus, Menelaus, Arisarchus, and Hipparchus; but this was never published. In 1666, he was sent to France by king Charles II. as tutor to his two natural sons, by the duchess of Cleveland; but his disposition and habits not being adapted to this situation, he returned, after a year's absence, to his studious retirement at Oxford. During his stay at Paris, however, he cultivated an acquaintance with several learned persons, collated various ancient and valuable MSS., and bought many scarce and curious books for his own library. At Oxford he pursued his studies with renewed acuteness; and besides mathematics, to which he applied according to the duty of his professorship, he devoted himself to inculcation to the prosecution of history, chronology, and antiquities. At this time he undertook a new edition of Josephus, which he never completed. In 1683, he visited Holland, for the purpose of attending the sale of Nicholas Heinsius's library, where he purchased many valuable books; and on this occasion he renewed, or contracted an acquaintance with several persons of eminent learning. As he experienced many civilities from the Dutch, and found that in Holland he should enjoy favourable opportunities for making great improvement in original learning, he seemed much inclined to settle at Leyden; but, disappointed in his expectation of being chosen professor of the oriental tongues in that university, he returned to Oxford. In 1684, he took his degree of doctor in divinity; and in 1691, he was presented to the rich rectory of Brightwell in Berkshire, which, being at the distance of about 9 miles from Oxford, allowed of his occasional residence in that city. Soon after he resigned his professorship of astronomy, which had been for some time irksome and unpleasant to him, in favour of Dr. David Gregory, professor of mathematics at Edinburgh. In 1692, he superintended the preparation of a catalogue of the MSS. fold by the library of Great Britain in Ireland, and in some foreign libraries; and in the following year he married an agreeable lady in the bloom of youth, with whom he lived very happily. In 1696, he attended the sale of Golius's MSS. in Holland; and not long after his return fell into a constitutional decline, of which he died in January 1697; and he was interred in St. John's college chapel. His widow erected a monument of white marble, in the middle of which there is carved the figure of a 'heart,' circumscribed, according to his own direction, by the words: "Habemus Cor Bernardi." The publications of Dr. Bernard, were some astronomical papers in the Philosophical Transactions, N. S. 158. p. 587, N. S. 163. p. 721 and N. S. 164. p. 747. "A Treatise on the ancient weights and measures," first printed at the end of Dr. Pococke's Commentary on Horae, and afterwards reprinted in Latin, with great additions and alterations, Oxon. 1668, 8vo. ; "Private Devotions," &c. Oxford. 1670, 12mo. "Orbis eruditissimae, a character Samaritico deducta," in a large leaf of engraving, exhibiting at one view the alphabets of many nations, together with the abbreviations used by the Greeks, physicians, mathematicians, and chemists; "Etymologianum Britannicum," Oxon. 1689, printed at the end of Dr. Tucker's Grammar Anglo-Saxonica, &c.; "Chronologia Samaritarum Synopsis," published in the "Acta Eruditorum Lippomensi," April 1691. He was also the author of some notes and commentaries, printed in editions of learned works. He likewise affixed several learned prefaces to their editions of books, and collated MSS. for them. Among his papers were found many MSS. of his own composition, with very large collections, which, together with several of his books, he purchased by the curators of the Bodleian library. The rest of his books were sold by auction. Of his great and extensive learning, his works are a sufficient evidence. Dr. Smith, his biographer, represents him as a man of a mellow, mild, and conciliating disposition, worse from constell of

Doit faire encore les délices du monde,
Quand de premiers on ne parlera plus.

BERNARD of Bragelone, a painter of animals and hunting-pieces, in which he excelled, by giving to his wild animals a strong and spirited expression. He was patronized by Margaret, countess of the Netherland, for whom he designed febrickets for tapestry, and in the service of the emperor Charles V. he painted hunting pieces, in which he introduced the portraits of the emperor and of all his attendants. In a picture of the last judgment, he covered the pannels with leafs, before he laid on his colours, and thus preserved them from changing, and gave to his tints a heightened luire. His method is said to have produced a happy effect, particularly in the sky. He died in 1549: the time of his birth is not known. Polkington.

BERNARD, SOLOMON, an ingenious engraver, was a native of France, and resided chiefly at Lyons. He worked chiefly for the booksellers, and his engravings were designed with spirit, and executed in a clear, neat style. He appears by his works to be a man of great genius, and fertile invention. His most esteemed performance is a set of prints for the Bible. He flourished from 1550 to 1580. Strutt.

BERNARD, FRANCIS, doctor in medicine, was principal physician to king James II., and in considerable practice. He left a large collection of scarce and valuable books, which was sold in 1698, the year after his death, for 1600/. His brother Charles, who was surgeon to the princess Anne, and who had the same passion for collecting books, left also a curious library, which was sold by auction in 1711. The "Specchio della Bellea triumfante," by Jordano Bruno, an Italian atheist, which was in this collection, was sold, as we learn from the Spectator, No. 589, for 30/. This book was printed, Ames lays, in England in 1584, by Thomas Vant-roller. An English edition of it was printed in 1715. New Gen. Biog. Dict.

BERNARD, CHRISTOPHER. This surgeon, who lived in the beginning of the 18th century, is only known as the author of two books, very popular in their time, though now in little request. "The present state of surgery, with some remarks on the abuses committed in it," London, 4to. 1723. "The crafts and frauds of physick exploded, discovering the low prices of the bell medicines," 8vo. 1703. Haller. Bib. Med.

BERNARD, Sr. in Geography, a town of Germany, in the archduchy of Austria, 2 miles N.W. of Horn.—Also, an island of North America, in the lake of Nicaragua.

BERNARD, south end of a small land between Southward and Lecolof, on the coast of Southof, the north end of which is called "Newcomby," about a mile from the shore, within which small vessels may pass in good weather and a full sea.

BERNARD River, a river on the west coast of France, which falls into the bay within the island of Belleisle.

BERNARD's Bay, lies on the N.W. side of the gulf of Mexico. The passage into it, between several islands, is called Pasc des Devals near Savoy, and particularly from the duchy of Aosta, in the principality of Piedmont, and from which flows into the former country the river Drance, and into the latter, the Doire. On the summit of this mountain is the monastery of St. Bernard (see Bernard), supposed to be 8006 feet above the level of the Mediterranean. N. lat. 45°, 48'. E. long. 7° 2'. It was by this track that Hannibal is supposed to have conducted the Carthaginian army into Italy;
BER

Italy; and it was in the same direction that Bonaparte, the end of France, led his army of revenge over the Alps, previously to the battle of Marengo, in the year 1800.

BERNARD, "Little St., a part of the Alps, anciently Alpes Grana, with the duchy of Aosta from Savoy, and lying to the south-west of the former. Over this lies a road into Savoy, and upon it is a monitory or hospitium for the convenience of travellers.

BERNARDI, the Hermits, in Entomology, the name by which Carenotherus is very commonly known. This creature is also called the hermit crab; a name inerratically applied to all species of the genus Carens, or, in other words, to all those which, having no shell covering to protect the body, inhabit the shells of whelks, or other gastropod shells. See PAGURUS FABER.

BERNARDI, STEFFANO, in Biography, was a learned theologian in Church, as well as composer of masses and madrigals, of great elaboration and correct form. He flourished from 1611 to about 1643, and in 1623 was made a doctor of theology at Verona. He published a didactic work, called "Porta Musicae," the first part of which appeared at Verona, 1617, in quarto, and, as an elementary tract, it has met with universal applause. See PAGURUS FABER.

BERNARDI, in Biography, see ANELLI.

BERNARDI, ANTONIO, was born in Roma, in Tuscany, in 1820, according to Mr. Warton, but in 1825, according to M. Du Puy. After studing at Sienna, he entered into the confraternity of the hospitalers of San Giuliano, and distingushed himself by his attendance on those who were afflicted with the plague. In 1402 or 1403, he became a member of the Franciscan order, and afterwards an emigrant preacher. Besides the natural and acquired talents which he possessed, the power of working miracles was ascribed to him both during his life and after his death. He visited Jerusalem under the character of commissary of the Holy Land, and after his return visited several cities of Italy, where he preached with great applause. Being accused to pope Martin V. for maintaining some erroneous opinions, he explained himself to the factotum of the pontiff, and was absolved. Such were his humility and devotedness that he refused several bishoprics, and contested himself with the office of vicar-general of the confraternity of St. Francis in Italy, and as such he found 360 monasteries. He died at Avila, in April 1444, and was canonized 1450 by Pius II. He left about 110, which were printed at Venice in 1569, 4 vols. 4to.; and at Paris in 1636, 2 vol. 1to. They consist of religious treatises, sermons, commentaries on the Apocalypse, &c. See PAGURUS, Gen. Dict.

BERNARDI, in Geography, a mountain of Switzerland, being one of the Alps, separated from the Rhine by a range of hills. It is situated between the valleys of Cottolengo and Viso. In the mountain springs therein are mineral waters, which are esteemed of great use to sick persons. BERNARDI, or BERNARDINI, in English History, the name of a religious order, differences very greatly to that of the Cisterceans. They derived their name and order from St. Bernard, abbot of Cluny, who was the second parent and founder of the Cistercians in the Roman Church. Their usual habit is a white gown, with black cap and scapular: but when they officiate, they put on a large white cope, with a hood of the same colour. See PAGURUS, lap., and 3rd, or other group of the South Sea, called St. Bernard, in Madagascar, and supposing by M. Heuneck, in his "Dei Regni," 1768, and 1769, "to be Mr. Byrnes's "Isle of Longi." Mendes fay, that St. Bernard was in S. lat. 10° 30' and 14° 30' (Spanish) leagues from Lima, allowing Lima to be in W. long. 77° 50' and 14° 30' (Spanish) leagues from the latitude of 10° 30' to make 87° 50' of longitude. The latitude of St. Bernard will be about 15° 20'. But the situation of St. Bernard may be more accurately determined from that of the Marquesas, placed by Capt. Cook, in his second voyage, in W. long. 139° 9', for Figueroa says, that Mendes fay, that Mendes fay, that the Marquesa died 14° 30' (Spanish) leagues from the Marquesas, before he made St. Bernard, and 4° 30' Spanish leagues in the lat. of 10° 30', making 21° 30' difference of longitude; if this be added to 139° 9', we shall have 162° 23' W. for the longitude of St. Bernard. Com. Byron places the Islands of Danger in S. lat. 10° 38', and W. long. 169° 53'; but Mr. Wabes, who collected and published the astronomical observations which were made in Hawkefirth's voyages for the Board of Longitude, reduces this longitude to 162° 25' W., exceeding that of Peru only by 2° 37'. Mr. Heuneck, in "Memoire pour la Tranfet de Venet," Paris, 1767, p. 51.) in thinking that this diocese is not the same with that which Quiros faw, and called St. Bernard, in 1625; but Mr. D'Alambré thinks that they are the same; and it is probable that Quiros thought for; for in enumerating his own discoveries, Philip H. of Spain, in the memorial which he presented to that monarch for "D'Alambré's collection," vol. i. p. 145.) he omitted this island, whence it may be inferred, that he thought it to be a discovery which belonged to another period.

BERNARDI, ST. DE TARIBAH, a town of South America, and principal of the district of Chicar, or Tarijah.

BERNARDSTOWN, a township in Somerset county, New Jersey, America, containing 3377 inhabitants, including 93 slaves. — Alto, a township in Hampshire county, Massachusetts, containing 697 inhabitants; 8 miles 100 miles W. from Boston.

BERNASCONI, ANDREA, in Biography, born at Verona, but who resided chiefly at Venice, was a pleasing and graceful composer. He flourished at the same time as Hass, and though inferior to him in force and resources, it is said that Fauthia, the wife of Hass, used to prefer the melodies of Bernasconi. He resided long at Munich, in the service of the elector of Bavaria, where he died about the middle of the 17th century.

BERNASCONI, LA SUGNA, daughter of the composer of that name, arrived in England, 1778, as first woman at the Lyceum, when Pacchierotti appeared there for the first time. She had gained considerable reputation as an actress at Vienna, in the part of Eurydice, when playing with Mache in Gluck's Orfeo, which had much grace derived from its novelty of style; that der long period of this success to the Bernasconi's vocal powers, we expected more than we found. And little is to be said of her as a performer, except that she had an artistic and elegant manner of singing, though her voice was pleasant, and in day.

BERNAY, of geography, a town of Germany, in the archbishopric of Aix-la-Chapelle, in the North of W.; a town of Germany, in the archbishopric of Aix-la-Chapelle, and in the diocese of Freiburg, surrounded with walls, ramparts, and ditches; containing an army; the principal citadels of which is the, of which large quantities are brewed in this town; 141° 17' N., 9° 54' E.

BERNAYVILLE, a town of France, in the department of Somme, and chief place of a canton; 1,272 miles of Doullens, 2,270 leagues north-west of Dijon. The population of the town is considered 9943 persons. The parochial extent contains 15° 14' 9"., and 27 villages.

BERNAY, a town of France, in the department of the Eure; 71 leagues south-west of Evreux. Its population amounts to 6122, and that of the canton to 13,957 persons. Its extent in kilometres is 181,
and it contains 21 communes. N. lat. 49° 6'. E. long. 0° 52'.

BERNINA, in Latin Berninam, Arpepolis, and Urfae, a town of Germany, in the circle of Upper Saxony, the capital of Anhalt Bernburg, and the residence of the prince, seated on the Saal. It is divided into the Old and New Town, which had each its own magistracy, till they were united in 1560; besides which, there is a third part, called "Vordenburg," seated on a hill on the other side of the Saal, under a distinct magistracy. The church in this part serves for the castle and the court. The castle is one of the most ancient and most celebrated fortresses in the principality of Anhalt; 20 miles west of Delfn. N. lat. 51° 55'. E. long. 12° 36'.

BERNECASTEL, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves, and chief place of a canton, in the district of Treves, and department of the Sarre, seated on the Moselle, and owing its privileges to the emperor Rudolphus I.; 8 miles E.N.E. of Treves. Its population includes 1263, and that of the canton 11,718 persons. It contains 34 communes. N. lat. 52° 1'. E. long. 6° 36'.

BERNE, a township of America, in Albany county, New York. According to the late census of 1796, there appear to be 477 electors.

BERNECK, a town of Germany, in the circle of Franconia, and principality of Bayreuth.

BERNECOURT, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Pont-à-Mousson, 3 leagues S. W. of Pont-à-Mousson.

BERNERA, or Bernay, one of the westerham islands of Scotland, is only about four miles in length, and one and a half in breadth. The soil of it is sandy, but when well-measured proves extremely fertile, and produces some fine com and clover. It has a freshwater lake, called Lochbruis, which has some small islands, and abounds with eels. These are frequently caught in great numbers by the inhabitants, who resort in the night, with lights, to a small rivulet, where the eels are found going towards the sea. They are often caught twilled together in heaps. The tides of the sea often produce very singular effects round this island. In their ordinary course the flood runs east in the Frith, where Bernera lies, and the ebb runs west; the sea-ebbing and flowing regularly for four days before, and as long after the full and change of the moon. The spring tides commonly rise to the height of 14 feet perpendicular, and the others proportionably; but for four days before and after the quarter moons, there is a singular variation; at those times the tide runs eastward for twelve hours successively, from nine o'clock in the morning till nine at night, when the current turns, and runs westward for the twelve following hours. Thus the recurrences continue; one flood and ebb running eastward, and another westward, till within four days of the full and change of the moon, when they refine their ordinary course, running east during the six hours of flood, and west during the six hours of ebb. There is another phenomenon in these tides equally remarkable. Between the vernal and autumnal equinoxes, the tides about the quarter moons run all day to the east, and all night to the west; and during the other six months, their course is reversed, being westward in the day, and eastward in the night. The number of inhabitants in Bernera and the isle of Pabbay, which lies between the former and Harris, was 204 in the year 1792. W. long. 5° 36'. N. lat. 6° 45'. The Rev. Mr. M'Cleod's Account in Sir J. Sinclair's Statistical History of Scotland.—Allo, a town of Scotland, in the county of Inverness, in which are barracks; 32 miles N.W. of Fort William.

BERENCES, a town of Piedmont, in the district of Coni, 43 miles W. N. W. of Coni.

BERNEVILLE, a town of France, in the department of the Strights of Calais, and chief place of a canton, in the district of Arras, 4 miles S. W. of Arras.

BERNEUT BAY, lies at the point of Quiberon, on the coast of France.

BERNEX, a town of Savoy, 44 miles N. E. E. of St. Julien.

BERNARDUS, in Entomology, a species of Cancer, with heart-shaped, mutilated hand claws; that on the right side larger. Habits wheels, &c. common on moss features. See Bernard the Hermit.

BERNHARTS, in Geography, a town of Germany, in the archdiocese of Andern, 7 miles E.S.E. of Feldsburg.

BERNI, or Berna, Francis, in Geography, an Italian poet, was a descendant of a noble and indigent family of Bibiena, in Tuscany, and born at Campcvecchio about the close of the 15th century. He passed the first 15 years of his life in poverty at Florence; and though he was afterwards patronized by cardinal Bernardo of Bibiena, Angelo, and Giberti, bishops of Verona, his love of unrestrained liberty, and inclination to pleasure and rillery, prevented his deriving any permanent advantage from their patronage. At Rome, however, he was greatly esteemed by the literati, and was one of the most illustrious men of the famous academy "De Vignaiouli." At length, he retired to Florence, and published on a canonry in the cathedral, under the protection of cardinal Hippolito de' Medici, and duke Alexander. It had been said, that he was taken off by poison, because in a quarrel between these two princes, he refused to comply with the desire of one of them, who requested him to administer poison to the other. The era of his death, as well as the truth of this story, are uncertain; it has been fixed by some to the year 1576; but others have supposed he lived to a later period. Mr. Roscoe, in his "Life of Lorenzo de' Medici," says, that he cultivated a branch of poetry (a kind of burlesque) with so much success, that it has from him obtained the name of "Beresche." The characteristic of this species of poetry is an extreme simplicity, which the Italians denominate "ideotimo." The most extravagant sentiments, the most feverish strokes of fatire, are expressed in a manner so natural and easy, that the author himself seems scarcely to be conscious of the effect of his own work. Perhaps the only indication, says Mr. Roscoe, of a similar taste in this country, appears in the writings of the facetious Peter Pindar. Berni, though he seems to have blotted and corrected much, has nevertheless not been sufficiently careful in expunging licentious images, and free equivoca; and his wit is often more buffoonery. One of his principal performances, was the recombination of Boiardo's "Orlando Inamorato," which he has rendered much more pure and poetical. The best edition of it is that of Venice, in 1545. His other poems were collected and published, with those of other burlesque writers, in 1548, in 2 vols. 8vo, and reprinted at London in 1721 and 1724, after the edition of Venice. Berni was a pious fatirist, and the avowed enemy of Peter Areth, whose life he wrote in a strain of bitter invective. He excelled in Latin poetry, and imitated the style of Catullus with success. Gen. Bing.

BERNICA, in British Geography, one of the kingdoms of the Saxons heptarchy. Although the Saxons, soon after the landing of Hengist, had been planted in Northumberland, their progress was slow in overcoming the obdurate resistance with which they were opposed, and none of their princes for a long time assumed the appellation of king. At first, in 547, Ida, a Saxon prince of great valour, who claimed a descent, as did all the other princes of that nation, from Woden, brought over a reinforcement from Germany, in
BERNIN, in Geography, a town in France, in the department of the Here, and chief place of a canton, in the district of Grenoble, 8 miles north of Grenoble.

BERNINI, John Lawrenet, in Biography, a celebrated sculptor and architect, was the son of a sculptor, and born at Naples in 1598. At a very early age, he manifested the inclination of his genius; for upon the removal of his family to Rome, when he had attained only the age of 12 years, he flung himself up from morning till night, in the Vatican, for the purpose of copying the master-pieces which it contained. Having about this period wrought a head in marble, that excited great admiration, he was sent for by pope Paul V. who desired him to sketch with a pen the head of St. Paul, in his presence; upon which the young artist delighted it so well, that the pontiff recommended him to the care of cardinal Maffi Barberini, as one who might become the Michael Angelo of his age. Stimulated by the encouragement he had received, his application was indefatigable, and his perseverance invincible. To this purpose, it is related concerning him, that after having finished with much attention and assiduity a bust of Scipio Borghese, the pope's nephew, he discovered a defect of the marble, in the forehead. Upon this he immediately procured another block, and in the interval of 15 nights he executed another to his satisfaction. When the first was exhibited to Borghese, he could not avoid manifesting his chagrin; but he was agreeably surprized when the second was exposed to his view. Both these are preserved in the villa Borghese. Among the productions of his youth, we may mention his statues of St. Lawrence, and of Aeneas carrying off his father at the siege of Troy; and more particularly his David and Goliath, which have reckoned among his best works. His group of Apollo and Dafnes, cut from a single block of marble, and the second not more than half a foot from the first, executed for cardinal Borghese, at the age of 18 years, has been regarded as the chef d'oeuvre of sculpture. It is said, that when Bernini saw these performances of his youth 40 years afterwards, he lamented the little improvement he had made in sculpture during this long course of years. In the pontificate of Gregory XV. Bernini was created a knight of the order of Chrift; whence he had been commonly distinguished by the appellation of the "Chvalier Bernini."

Upon the accension of his patron Barberini to the pontifical dignity, and the title of Urban VIII. Bernini was engaged in executing the projects which he had formed for the embellishment of Rome. The decoration of the place called the "Conclafam," in St. Peter's, employed him for 9 years, and for this exercise of his art he was liberally rewarded. He also contrived a fountain, displaying the niches of his invention, in the place de l'étoile; he created the great niches of the pillars, which support the dome of St. Peter's; and contrived a grand mandament for the pope, which is one of the most ornaments of that cathedral. So much did the pope intimate himself in the welfare of Bernini, that he implored him to marry; accordingly, in 1639, he commenced a matrimonial union, which lasted 15 years, and produced a numerous family. Bernini's reputation was not confined to Rome; but Charles I. of England, hearing of his fame, sent
over a fine picture of Vandyke, from which he made three busts of the king in different aspects, which gave great satisfaction, and were unanimously rewarded. A bust of the queen was intended, but on account of the troubles which occurred in England, was never executed. Bernini was invited to Paris by Lewis XIII. just before the death of Urban VIII., and allured by very lucrative proposals; but the pope upon being consulted, said, "that he was made for Rome, and Rome for him," and this determined his stay. The grand fountain of the piazza Navona, constructed under the pontificate of Innocent X., is reckoned among his master-pieces. The fine portrait of St. Peter's was erected by this artist, under the pontificate of Alexander VII. and about this time queen Christina visited Rome, and treated him with singular respect. In 1664, he was consulted by Lewis XIV. of France, in consequence of the recommendation of Colbert, concerning the improvement of the Louvre, and at the age of 68 years yielded to an urgent invitation to visit Paris for this purpose. In his journey thither, he was honoured in various places through which he passed, by the most respectful attention; and after his arrival, he began with making a bust of the king, and while he was sketching his portrait, turned back his eyes for a better discovery of his forehead, observing at the same time, with the politeness of a courtier, "that he was a king who might freely throw his face to the whole world." This, it is said, gave rise to a French fable, that the emperor "visit a la Bernini." His design for the completion of the Louvre was not executed. He returned to Rome before winter, and as an acknowledgment of his obligations, for the civility and munificence with which he was treated by Lewis, formed a colossal equestrian statue, representing the king as supported by a rock. Upon its removal to Paris, Girardon changed it, on account of its want of sufficient resemblance to the monarch, into a Curtius leaping into the fiery gulf. Among the remaining works in which he employed himself, the most considerable was the tomb of Alexander VII. in St. Peter's. Whilft he was repairing the old chancellery palace, by order of Innocent XI. he was seized with a fever, which terminated in an apoplexy, that closed his life in 1680, in the 82d year of his age. His funeral procession to the church of St. Maria Maggiore was attended by all the nobility of Rome.

The genius of Bernini was singularly fertile and comprehensive; and on a medal struck in honour of him by Lewis XIV. he is characterized as "singularis in linguis, in omnibus minibus," i.e. singular in each, in all. Several of his pictures, painted for his amusement, amid his other occupations, and sufficiently indicating his talents in this department of the arts, are preserved in the Florentine gallery, and the Barberini and Chigi palaces. In architecture he displayed a fine taste and rich imagination, though he is said to have departed from the rules and proportions observed by the ancients. But he owed his highest and most distinguishing reputation to sculpture. D'Argenville, however, observes, in his "Vies des Architectes et des Sculpteurs," that, whilst he wrought marble with a surprising suppleness, admirable taste, and singular grace, he often deviated from truth, and was much of a mannerist; that he abandoned the simple drapery of the Grecian statuaries; and that he enveloped his figures with such an enfeillement of folds and drapings as to disguise and partly conceal them by the flatter and feeming agitation of their draps. Some of his single busts, or portraits after nature, are much admired, and are said to retain the whole spirit and character of the original. His St. Theophila in ecstasy is thought to surpass all his other works for expression. His own talents he estimated with modesty; but by an enthusiastic attachment to his art, and unwearied fidelity in the exercise of it, he arrived at that eminence for which he was distinguished, and multiplied his works to such a degree as to occasion its being said, that posterity would be apt to suppose as many Berninis as Hercules. "Eloquence. Beaums Arts, i. ii. p. 1. p. 282. Gen. Biog.

BERNINO, in Geography, a mountain of Switzerland, being a branch of the Rhaetian Alps, about 26 miles N. E. of Chiavenna.

BERNO, in Biography, abbot of Richenon, in the diocese of Constance, flourished about the year 1008, and is celebrated as a poet, rhetorician, musician, philosopher, and divine. Of his works, the principal are his treatises "De Instrumentis Muficalibus;" "De Mundura Monochordio;" and "De Mufica feu Tonis," containing a summary of the doctrines of Boethius, an explanation of the ecclesiastical tones, intermixed with pious exhortations, and the application of the muse to religious purposes. His learning and piety recommended him to the special favour of the emperor Henry II. and his endeavours to promote literature were so much encouraged, that his abbey of Richenon was as famous in his time as those of St. Gall, or Cluny, then the most celebrated in France. He died in 1049, and was buried in the church of his monastery.

BERNON, in Geography, a town of France, in the department of the Aube, and chief place of a canton, in the district of Erivy; 4 miles S.E. of Erivy.

BERNOULLI, James, in Biography, a celebrated mathematician, was born at Basel, December 27, 1654. His father, who was a man of rank and learning, intended him for the profession of a minifter, and paid great attention to his education. Having passed through the usual course of preparatory studies, and taken his degrees in the university of Basel, he applied, in deference to his father's wishes, to divinity; but his inclination leading him to mathematics, he made great proficiency in geometry, without any collateral assistance either of teachers or of books, from the use of which his father rigorously restrained him. In reference to this restraint, he took for his device Phaeton driving the chariot of the sun, with this motto, "Iuvvo patre lidera verfe," i.e. I traverse the stars against my father's inclination. Notwithstanding the disadvantages under which he laboured, he made such progress in mathematical studies, that he was able, before the age of 18 years, to solve a difficult problem in chronology, or to find the year of the Julian period, when the year of the cycle of the sun, the golden number, and the indiction, are given. In 1676, he began his travels, and at Geneva taught a blind girl to write; and at Bourdeaux composed universal gnomonic tables. Upon his return to his own country, in 1680, he derived great pleasure from the perusal of Malbranche's "Search after Truth," and Descartes's philosophy; and predicted the return of a comet, of which he gave an account, in a short treatise written in his own language. He soon afterwards travelled into Holland, Flanders, and England; and having completed his peregrinations, he settled at Basel in 1682, and commenced a course of public experiments in natural philosophy and mathematics. In this year he published, at Amsterdam, in Latin, his "Essay of a New System of Comets," in order to calculate their Motions and to foretell their Appearance; and the following year, at the same place, his "Discourses upon the Weight of the Air;" Lat. 8vo. In 1684, he accepted the professorship of mathematics at Heidelberg, and devoting himself to the laborious study of these sciences, he took occasion about this time to investigate the analytical system of Leibnitz, contained in some essays on the "Calculus differentialis," or "Infinimus petitis," published in the "Acta Eruditorum," the extent and beauty
BERNOUILLI, which was offered him in 1692, he undertook, in 1695, a course of philosophical experiments at Groningen, and was furnished by the curators of the university with the necessary apparatus. The next time he discovered, what has been called the momental phenomenon, occasional, as it is now known, by the friction of mercury against glass, in a partial vacuum; for which Frederic I, king of Prussia, honoured him with a gold medal, and with the rank of member of the academy of sciences at Berlin. He was also a member of the royal society of London, and of other learned bodies. He succeeded his brother James at Basel, in 1705, on which occasion he delivered a discourse, "De Fatis Novae Analyseos, et Geometria Sublimatis," and continued till his death in this situation, though he was solicited to remove to Leyden, Padua, and Groningen. He collected his works in 1743, and printed them at Lausanne, in 4 vols. 4to. His correspondence was extensive, and he was much engaged in a controversy with the English mathematicians concerning the invention of fluxions; in another with Renou, concerning the manoeuvring of ships; and in another on mathematical subjects, with Jurin, Brook Taylor, Keil, Pemberton, and Riccati. In 1726, he gained a prize of the academy of sciences for a memoir on the elliptic figure of the planets, and the motion of their aphelia; and in 1734, he received the half prize, jointly with his son Daniel, from the same academy, for a memoir on the physical cause of the inclination of the planetary orbits. Bernouilli died January 1, 1748, in the 81st year of his age, and left four daughters and five sons, three of whom were mathematicians. Fontenelle's Eloge. More. 

BERNOUILLI, JOHN, son of the preceding, was born at Basel, January 17, 1675, and died at Peterborough, July 26, 1726. He was licentiate of law, professor of law at Bern; afterwards professor of mathematics at Peterborough, and member of the institute of Bologna.

BERNOUILLI, NICHOLAS, nephew of the two preceding, professor of mathematics at Padua, afterwards of logic, and then of law at Basel, member of the academy of sciences and belles lettres at Berlin, and also of the royal society of London, and of the institute at Bologna, was born at Basel, October 15, 1687, and died there, November 29, 1759.

BERNOUILLI, DANIEL, M.D. son of John Bernouilli, was born at Groningen, Feb. 9, 1700. Preferring mathematics to commercial pursuits, he pushed the earlier part of his life in Italy, and at the age of 24, declined the presidency of an academy about to be established at Genoa, and in the following year accepted an invitation to Peterborough, where he spent several years. On his return to Basel, in 1733, he was successively professor of anatomy and botany, and of natural and experimental philosophy; and had the honour of being a member of the academies of Peterburgh, Paris, and Berlin, and of the royal society of London. In 1744, he published his "Exercitationes Mathematicas," and, in 1748, his "Hydrodynamica." Many other pieces have been published in the memoirs of the academy of sciences at Paris, and in those of other foreign states. He gained and divided ten prizes from the Parian academy; and on the division of the prize respecting the inclination of the planetary orbit, he father expressed dissatisfaction; more especially as Daniel had enshrined the Newtonian philosophy in preference to that of Descartes, to which he had still maintained his attachment as long as he lived. In 1749, he divided the prize on the tide with Euler and Machamer. At Basel he was much respected, not only as a man of distinguished talents, but for his simple and modest manners. Although he paid external respect to the religion of his country, he was charged by his pupils with a excessive freedom of opinions.
which he incautiously divulged. At the age of 80, he retained his mental powers in their full vigour; but from this time they began to decay. He died March 17, 1782. Nova Acta Acad. Scient. Impr. Petropol. vol. x.

BERNOUILLI, John, L. L. D. brother of the preceding, was born at Basel, May 18, 1710, and died there, July 17, 1790. He was professor of eloquence, and afterwards of mathematics at Basel, and member of the academies of Paris and Berlin.

BERNOUILLI, James, licentiate of law, member of the physical society at Basel, and correspondent of the royal academy of sciences at Turin, was the son of John Bernouilli. He was born at Basel, October 17, 1759. His natural talents, for which he was distinguished at an early period, were improved by long assiduous application. On his return from Neuchatel, whither he went to study the French language, he was admitted to the degree of master of arts, and devoted himself to the study of the law. In 1780, he made the tour of several cantons of Switzerland, of which an account was published in the third volume of the collection of travels, published at Berlin by John Bernouilli. The study of the law, however, did not divert his hereditary inclination for the mathematics; and in these sciences he made such rapid progress, that in 1789, he was thought qualified to supply the place of his uncle, whole age and infirmities rendered him incapable of continuing his lectures on experimental philosophy, though he did not succeed him in the vacant chair of professor after his death. He had also experienced a similar disappointment in his views with regard to the chair of eloquence in 1780; on which occasion he published his Theses on the sublime. After these disappointments, he determined to indulge his taste for travelling, and accepted the office of secretary to count de Breuner, minister of the imperial court of Vienna to the republic of Venice. He still retained his attachment to the mathematical sciences, of which he exhibited proofs to the public in the memoirs of the royal academy of sciences and belles lettres at Berlin, and in those of the royal society of Turin; and as he wished to occupy a station in which he might make use of the knowledge he had acquired, he was recommended by his countryman Mr. Fujs to the princes of Daishof; and by her influence he was elected adjunct in the academy at Peterburgh, with a salary of 600 roubles, and the promise of being promoted in the course of a year. Accordingly, he quit Venice in 1786, and removed to Peterburgh. Here he applied with unintermitting activity to physical mathematics, and was soon honoured with the title of ordinary academican. In the interval of about 2 years, he prefented eight memoirs, which were inserted in the first volumes of the "Nova Acta Academia Scientiarum Imperialis Petropolitanae," which display singular acuteness in analytical calculations. In 1788, he was appointed one of the professors, who instructed the imperial corps of noble land cadets, and to the office of teaching algebra to the two first classes he devoted himself with great zeal and affability. In 1789, he married the youngest daughter of Mr. John Albert Euler; but being always of a weak and delicate constitution, he was seized with a fit of the apoplexy whilst he was bathing, on the 3d of July in the same year, which speedily terminated his life, in the 29th year of his age, very much to the regret of those who knew and valued him on account of his scientific talents, and modeft, amiable disposition. Besides a variety of mathematical and philosophical pieces, which were published in the "Nova Acta," &c., "Kozier's Journal," &c., "Mem. de l'Acad. Royale, de Berlin, Ann. 1781;" "Mem. des Corresp. de l'Acad. Royale de Turin, Ann. 1783; 1785;" "Nova Acta Helvetica, tom. ii." and "Leipsic Magaz. &c. Part 1, 1783;" and some distinct treatises; he also translated "Merian's Philosophical Memoirs," from the French into German, 2 vols. Nova Acta Acad. Scient. Imper. Petropol. vol. x.

BERNOVITZKO, in Geography, a town of Russia, in the government of Smolensko; 42 miles northwest of Smolensko.

BERNSTADT, a town of Silefia, in the principality of Ole, on the river Weyda.

BERNSTEIN, a town of Germany, in the circle of Upper Saxony, and new mark of Brandenburg; 4 miles N.E. of Berlinchen.—Allo, a town and castle of Germany, in the circle of Bavaria; 2 miles W.S.W. of Gravenau.

BERNSTORF, John Hartwig Ernest, Count von, in Biography, an eminent statesman, was born at Hanover, May 13, 1712, and possessed distinguished talents, which were cultivated by study at the high school of Tubingen, which he entered in 1727, and by travelling through various parts of Europe, under the learned Keyoller. Upon paying a visit to Denmark, Bernstorff was taken into the service of Christian VI. and employed in affairs of state from the year 1732 till the year 1737. In 1742, he was envoy to the diet of that year, and to the court of the emperor Charles VII. and from the year 1744 to 1750, he was ambassdor to France. In November 1756, he received the chamberlain's key; in June 1764, he was made a knight of the order of Dannebrog; and in October 1749, he was appointed a privy-councillor. After his recall from France, in 1750, he formed an intimacy with the prince of Wales at Hanover, who wished him to employ his talents in his service; but by the death of the prince, in 1751, he was released from his engagements; and upon this event he was immediately introduced into the privy-council, and entered upon the office of minister for foreign affairs, and first secret of the German chancery, and, in 1752, was admitted into the order of the elephant. To Bernstorff were owing the conducting and execution of those beneficial measures which distinguished the reign of Frederick V. Upon a plan suggested by him, was established, in 1753, the hospit at Copenhagen, for the education of poor boys; and he was appointed president and governor of this patriotic and useful institution, to which he gave a donation of 4000 rix-dollars.

In 1754, he adviced the crown to purchase from the East-India company all their policies, privileges, and merchandise; and by this act he promoted the prosperity of the Danish West India islands, which had suffered from the exclusive rights of the company. He also distinguished himself by his activity and zeal in promoting the manufactures of the kingdom, which the king entrusted to his management in 1752, and he thus contributed to increase the population, and to excite a spirit of industry and emulation. He concurred in the designs that were formed for the abolition of slavery in Denmark, by the extinction of communes, and by freeing the farmers from the burthen of personal service. He was also one of the first persons in Denmark who counteracted the general prejudice against inoculation for the small-pox, and who endeavoured to reconcile the people to the practice. Bernstorff was likewise indefatigable in his exertions for promoting the instruction of the poor; and he projected a fund for the encouragement and recompence of meritorious, but poor, schoolmasters; nor was he less solicitous to extend the benefits of education, so as to furnish a supply of competent teachers, for which purpose he proposed to establish a seminary at Altona, in connection with the orphan-house of that city; but adverse circumstances prevented the completion of his design. He also distinguished himself by the protection which he afforded to science, and 10
to men of letters. With this view, having been one of the first who discovered the beauties of the "Mishah," he invited the young author, Klopfcke, who then resided in Switzerland, to Denmark, and for several years entertained him in his own house. By his influence, Oeder was appointed professor of botany; a botanical garden was established, and the professor was sent on a tour through the Danish provinces, the result of which was the "Flora Danica," published at the king's expense. Cranmer, Malest, Schlegel, and Bajazet, were also much indebted to his patronage.

To Bernstorff Denmark owes the establishment of two useful societies; one, the society of the Danish language and the arts, founded in 1765; and the other, the royal agricultural and economical society, established in 1769, of which the count himself was president. To him it was principally owing, that a society of learned men were sent, in 1761, to travel in Arabia and the east, at the king's expense, for the purpose of making useful discoveries. In consequence of the important services which he rendered, in various ways, to his sovereign and the state, he was created, in 1767, a Danish count; and he was the only minister who had the honour of attending the king, in 1768, on his tour to England. After their return, however, the count was obliged to resign all his employments, in January 1770, and the king, in acknowledgment of his past services, settled on him an annual pension of 6,000 rix-dollars. On this occasion he found it necessary to leave a country to which he had devoted the service of 38 years of his life; and, accompanied by his counsellors and Mr. Klopfcke, he repaired, in October 1771, to Hamburg, where he spent the winter. Here he spent his time in local intercourse with his friends, but in the beginning of the year 1772, some rheumatic affections, under which he had laboured for several years, returned with an alarming violence, and terminated in a threatening fever. This fever was succeeded by a fit of apoplexy, which carried him off in a few minutes, on the 18th of February. His remains were interred, without pomp, agreeably to the instructions of his will, at the church of Siebeneichen, on one of his paternal estates. Two medals were afterwards struck in honour of him, by two societies of patriots.

Bernstorff possessed a retentive memory, great penetration, and a sound judgment. Learned and accomplished himself, he was the liberal patron of literature and the arts. He was well acquainted with the Italian, French, and English languages; intimately conversant with the laws of nations in general, and attached to the rights of mankind; well informed in the ancient and modern history of different states; and not unaffected in the concerns of religion and the church. He corresponded with many learned men of different countries, and collected a valuable library of select books. His political views were founded on truth and justice; in his transactions with foreign states he was upright and sincere; and he combined, with a vigilant attention to the privileges of the crown, a constant regard to the rights and liberty of the subject.

**General:**

**BERNSTORFF.** Andrew Peter, Count Von, the nephew of the former, was born at Gartow in Lauenburg, August 20, 1735, and at an early period acquired the knowledge of ancient and modern history, as well as of geography, mathematics, natural history, and the ancient languages. His studies were principally in Copenhagen. Several of his earlier years were spent in travelling through England, Switzerland, France, and Italy. Having occupied, after his return, some subordinate stations, he was made a member of the privy-council in 1760; but soon dismissed along with his uncle. Towards the end of the year 1771, after the fall of Stureeck, he was recalled; and about the close of the following year he obtained the foreign department, and was at the same time appointed minister of state, and director of the German chancery; and he was employed in negociating with Russia the exchange of the Gottorp part of Holstein for Oldenburg and Demerhout. In 1776, he was made a knight of the order of the elephant; and in 1780, during the American war, when an order was issued by the British government for intercepting all vessels belonging to neutral powers, laden with naval stores, and bound to any of the enemy's ports, he had an opportunity of exercising his diplomatic talents; and in a note transmitted by him to the courts of the belligerent powers, the Baltic was declared a mere delusion, and it was further stated, that the king of Denmark had determined not to grant a passage through the Sound to armed ships belonging to the powers at war. It was also added, that the other northern powers had adopted and professed the same system. In a subsequent note transmitted to the three belligerent powers, England, France, and Spain, Bernstorff expressed himself in the following terms: "An independent and neutral power never likes, by others being at war, the rights which it had before that war, since peace exists for it with all the belligerent powers without its having to receive or follow the laws of any of them. It is authorised to carry on trade, contraband excepted, in all places, where it would have a right to do so, if peace existed throughout all Europe, as it actually exists in regard to it." Soon after, Denmark and Russia entered into a treaty for the protection of their trade, to which Sweden, Prussia, and other states acceded; and the result was that league formed against Great Britain, known under the title of the "armied neutrality." Towards the end of the year 1780, Bernstorff resigned all his employments, and retired to his estates in Mecklenburg, where he resided till 1784, when he was recalled, and resumed his diplomatic functions; and to his exertions of these, Denmark owed the preservation of peace, when hostilities broke out between Sweden and Russia, in 1788. In 1791, Bernstorff interposed his mediation when the British ministry were preparing to affix the "Turks against the Russians, to restore and promote tranquility. In consequence of the French revolution, his Danish majesty was invited by the courts of Prussia and Vienna to join in the treaty which had been concluded between them. To this proposal Bernstorff replied, in 1793, with considerable address; and in 1793, when his Britannic majesty's envoy extraordinary at Copenhagen presented a note to that court, in consequence of the plan concerted by the allied powers for blockading the ports of France, Bernstorff returned an answer, which was alluded to by the marquis of Lansdowne in the house of lords, February 17, 1794, in the following terms: "The reply of count Bernstorff to our remonstrances was one of the bold, wise, and most honourable replies I have ever read. It is a state paper, which should be kept as a model by every cabinet of Europe." The conduct of Bernstorff was highly satisfactory to his fellow citizens; various institutions were distinguished by his name; and medals were struck to perpetuate the remembrance of his virtues. At length, he fell a victim to the gout, to which he had been subject for many years, and which baffled all remedies, on the 21st of July, 1797; and his remains were interred with great pomp, and attended by a numerous concourse, who lamented the loss of him, in Frederic's church at Christianshavn.

His figure was agreeable, and his manners engaging, his disposition lively, and his temper natural. In business he was active and indefatigable; in conversation communicative and concise; warm from history, and yet respectful in his behaviour; sparing of pretexts and pomps; and prudently judicious in his counsels.
punctual in performing them; prudent in his plans, and firm and zealous in executing them. His memory was tenacious, his benevolence extensive, his reverence of the Deity unfeigned, and his attachment to the Christian religion unwavering. Gen. Biog.

BERNUS, in Geography, a mountain of European Turkey in Macedonia; 10 miles S.E. of Salomki.

BERNY, a town of France, two leagues south of Paris.

BERALDO, PHILIP, the Elder, in Biography, was born at Bologna in 1453, and at the age of 19, became professor of the belles lettres in his native city. He also read lectures at Parma, Milan, and Paris, and at the latter place, or, as some suppose, Persigia, he held a public school of eloquence. But, recalled by his countrymen, he renewed his logistic labours at Bologna with such reputation, that he had 600 hearers at a time. To the study of polite literature, he added those of philosophy, medicine, and jurisprudence; and he also engaged in public employments assigned to him by his country. His disposition was convivial, and his conduct not exempt from the charge of licentiousness, before his marriage in 1498. By his good humour he escaped or conciliated literary contrels, and maintained an uninterrupted intercourse with the greatest number of learned persons of the age in which he lived. He died in 1505. His commentaries and notes extended to all the Latin writers of eminence, and are more distinguished by their erudition, than their elegant taste and sound criticism. With the more obscure authors of antiquity he was particularly conversant, and he took pleasure in reviving the use of words that were barbarous or obsolete. Besides his commentaries on the "Golden Age of Apleius," printed in 1501, and affording a specimen of his manner, he published a great number of his own orations, letters, poems, and other works, of which a collection was printed at Bardi in 1513. Most of his observations on authors are contained in Gruter's Thesaurus Criticus. Moreri. Gen. Biog.

BERALDO, PHILIP, the Younger, nephew of the former, was a native of Bologna, and professor of belles lettres in the university of that city, and afterwards at the Sapientia in Rome. In 1516, he was appointed librarian of the Vatican by Leo X., but about two years after, before he took regular possession of the office, with its emoluments, he died at the age of about 40 years. His Latin poems, by which he acquired great reputation, are published with those of his uncle, to which they are prefixed, in the first volume of the "Deliciae Poetarum Italorum." A collection of his elegies and epigrams, in 3 books, was published at Rome in 1530. His Latin version of an oration of Iocrates, and notes on the first five books of the Annals of Tacitus, were published by order of Leo X. Now. Digt. Hist.

BEROE, in Entomology, the name assigned by Cramer, to the species of Papilio Europa of Fabricius and Gmelin.

BEROS, in Natural History, the name of a species, Melissa (Filica) in Act. Helm. Beroe with an octagonal body, and very long tentacula, Gronovius. Beroe is also the name under which medusae is found in the edenium cibarium (Mill. and Fabr.) is figured and described in Brown's Hill. Jan.—I. In the tenth edition of his "Systema Naturae," calls it medusa beroe, and in the twelfth, voce (Beroe) ovata, angusti elatia nova.

Beroe, in Mythology, one of the nymphs, who, according to Virgil, was companion to Cyrene, the mother of Arifaeus. Beroe was also the name of the nurse of Semelae. BEREA, BERRHOS, or BEHS, in Ancient Geography, Cerneania, a large and populous city of Macedonia, south-west of Egea or Edeisa, north-west of Pella, and east of Cyrenia, at the foot of mount Bermius. Under the Greek Christians, it became the see of a bishop. This was the city to which Paul and Silas fled from Thessalonic, where they found a synagogue of Jews and proselytes, who were commended for their unprejudiced and impartial investigation of divine truth, and where, in consequence of this disposition, they gained many converts to Christianity. Acts, xvii. The medals of this city are bronze, gold, and silver. —Alfo, a town of Syria, between Antioch and Hierapolis, which some have supposed to be the modern Aleppo, anciently called Chalep. (See Aleppo.) In the collection of Dr. Hunter, there was a bronze medal of this city, with a legend and a dolphin twisted about a trident. At this city there were triune Imperial Greek medals in honour of Trajan, Antoninus, and Adrian.

BEROLHEIM, in Geography, a town of Germany, in the circle of Franconia, and principality of Anspach, seated on the Altmuth, with 2 churches, 5 miles west of Weilhineg. BEROLINENSIS, in Entomology, a species of Cantharis, of a black colour: bale of the antenae, wing-cases yellowish; tip of the last black; legs ferrugineous. Herbst.

BEROLINENSIS, a species of Curculio that inhabits Europe. It is whitish, varied beneath; thorax rufous, black, tides vagnated; on the wing-cases, two undulated black bands. Herbst.

BEROLINENSIS, a species of Cryptoccephalus, (Cricoter) found in the vicinity of Berlin. The head and thorax are scarlet and glossy; wing-cases granulated, black; eyes of the same colour; legs fulvous. Herbst.

BEROSUS, in Biography, a famous ancient historian, was a native of Babylon, and priest of the temple of Belus, and flourished about the time of Alexander. Tatian informs us, that he dedicated his work to Antiochus Theos, the third king after Alexander. While the Macedonians were masters of Babylon, he learned of them the Greek language, and passing from Babylon to Greece, settled in the island of Cos, and there opened a school, in which he taught astronomy, and astrology. From Cos he removed to Athens, where he acquired such reputation by his astrological predictions, that the Athenians erected to him a statue in their gymnasium, with a golden tongue. (Vitruvius, lib. ix. c. 7.)

The ancient cites three books of his history of the Chaldeans of Babylon, of which Josephus, Alexander Polyhistor, and Eusebius, have preserved some fragments, that are useful in forming the series of Babylonian kings. Josephus says, that he agreed with Mofes in his accounts of the deluge, the fall of man, and the ark, in which the restorer of mankind was saved; and adds, that he mentions the descendants of Noah and their respective ages, to Nabalaffar, king of Babylon; and that, relating the actions of that prince, he speaks of the taking and burning of Jerusalem by his son Nebuchadnecor, on which occasion, says he, the Jews were carried captives to Babylon, whence ensued the defection of that city for 70 years, till the time of Cyrus. He is quoted by Pliny, Tatian, Clement of Alexandria, Tertullian, Vitruvius, and Eusebius; whence we may infer, that he was esteemed a writer of authority. In the series he gives us of the ten kings, whom he supposes to have reigned at Babylon before the flood, there are some small variations in the authors who have transcribed that historian. These ten successions exactly answer to the ten generations from the creation to the flood: the first king, by name Olorus or Alones, has been supposed by some to be the same with Adam, by others Nimrod, as Xubruthus, the last in the series, plainly appears to be Noah. Pliny (H. N. l. vi. c. 55. l. vii. c. 34 and 37.) informs us, that his book contained the astronomical observations of 450 years, commencing from the
BER

Bera of Nabonitar. Ammian, a monk of Viticio, published a work under the name of this historian, full of fables, which obtained some credit among the learned, but was soon recognized to be a forgery. Berosus is said to have had a daughter who uttered predictions like himself; and became the Cumaean Sibyl. Brucker's Hist. Phil. by Endl., vol. i. p. 34. Bryant's Anal. Phys., vol. iii. p. 25. See Fabricius, Bib. Graec. vol. xiv. p. 175.

Berosus, in Ancient Geography, a mountain of the Tauric Chersonesus, south of mount Trachzus. This chain of mountains comprehends, according to M. Ptolomy, the mountains now called "Teuchrus-dagi," the height of the whole peninsula, and those of "Balykharra," and "Cabarta."

BEROTI. See BEROTH.

BEROTH, or Beroth, a city situated on the northern frontier of Padina. Supposed to be the same with "Berotai," one of the cities of Hadadezer, which David took, and in which he found many brah. (2 Sam. viii. 8.) According to some, this was Berotai of Syria, according to others, Berytus of Phoenicia, or the same that is mentioned by Ezekiel (xli. xvii. 16) between Hethalon and Emesa.

BERQUET, in Commerce, a weight of 173 pounds, by which hemp and other goods are sold in Russia.

BERQUIN, Louis de, in Biography, was born in Artois about 1492, and was much esteemed at the court of France, where he obtained the title of king's commissary. Although he does not appear to have left the Catholic church, or joined the Lutherans, he followed the example of Erasmus, in declaring against the ignorance and superstition of the clergy. Having incurred the charge of heresy by his publications, which were chiefly books of Erasmus, and extracts from his works and those of others, with his own notes, he was twice prosecuted; but in the first instance acquitted, and in the second condemned, unless he retract his errors, and gave satisfaction, to be burnt. His spirit was resolute, and he determined against submission; his judges, however, deprived of saving him, suffered the execution of the sentence; and upon the return of Francis I. from Spain, he was set at liberty. But Berquin, though distast from it by Erasmus, publicly accused his enemies, Noël, Bédard, and others, of idolatry; and upon a third prosecution, he was sentenced to make a public recantation, and to suffer perpetual imprisonment. Refusing to acquiesce in this sentence, because it implied an acknowledgment on his part, that his sentiments were erroneous, he was condemned as an obstinate heretic, and accordingly dragged on the Greve, a public place near the Seine, appropriated to bonfires and the execution of criminals, and afterwards burnt. He suffered death with great constancy in April 1529; and though the monk who attended him announced that he discovered some signs of abatement at the stake, Erasmus attributes the satisfaction to the fraud and falsehood usually practiced on such occasions. Berquin was a person of great abilities, invincible fortitude, and incorruptible character. Gen. Dict. Jortin's Life of Erasmus, vol. ii. p. 470-478.

BERRA. See BIRIA.

BERRE, in Geography, a town of France, is the department of the month of the Rhone and chief place of a canton, in the district of Arles, situated at the mouth of a river, running into the lake of Martigues, called "the lake of Berre," in an unexcelled climate. It was formerly one of the strongest towns of Provence. It was taken after a long siege, in 1571, by Charles, Duke of Savoy, during the wars of the League; and even the seat of the province was transferred to him. IV., he could not drive the 5,000 yards from Berre, till it was given up in 1578, in consequence of the peace of Vercelli; 41 leagues S.W. of Arles. The population of the town is estimated at 8,000, and of the canton at 67,697 persons. The territory comprehends 257,332 hectares, and is divided into 66 communes.

BERREA, in Ancient Geography, Brea, a town of Bulgaria, 10 or 12 leagues from Philippopolis, upon the river Braea.

BERRETINI, Peter, commonly called Pietro da Cortona, in Biography, an eminent painter of history and landscape, was born at Cortona, in Tuscany, in 1596; and acquired the first rudiments of his art under Andrea Commodi, and Baccio Ciarpi. At Rome, whither he went in his youth, he studied the antiques, in the works of Raphael, Bono-nari, and Polidoro, with such diligence, that he attained to great excellence as an artist. At this early period, he was patronized and employed by the marquis Sacchetti; and in his palace, he painted the "rape of the Sabines," and the "battle of Alexander," which were much admired for invention, disposition, elevation of thought, and an excellent tone of colour, and deemed to be equal to the performances of the best masters. His fame was completely established at Rome, by the fable of the Barberini palace, and by several works in the Vatican, and in some of the principal churches of the city. For further improvement, he travelled through Lombardy and Venice; and returning by way of Florence, he was employed by the grand duke Ferdinand II. in decorating some rooms in the Pitti palace, with pictures of virtuous and heroic actions from ancient history. At Rome, where he afterwards resided, he adorned the gallery of the palace of Innocent X. on the piazza Navona, with various subjects from the Aeneid; and as an architect, in which profession he excelled, he gave designs for a number of churches, palaces, chapels, and monuments. To the church of St. Martin, which was of his own construction, he left a large fum for the creation of a grand altar-piece of bronze, and of his own manufacture. Pope Alexander VII. was so well satisfied with the portico he built for the church of Peace, that he made him a knight of the golden spur, and gave him a rich crown, appendant to a gold chain. In his more affluent and more humble condition, Berretini displayed the same equanimity, and uniformly maintained a respectable character. The gout, to which he was subject, disabled him, towards the close of life, from undertaking any great works, and at length confined him to his bed. He died at Rome in 1668. "As an artist, his character was richness of invention, with grace, beauty, and facility of execution. His dispositions are fine, his management of lights good, and his ornaments and back-grounds charming; but his drawing is incorrect, his figures defective in expression, and too much alike. His fresco paintings were uncommonly brilliant and clear. He succeeded better in great compositions than in small. An Italian writer has said of him, that "he had fire in his colours, vehemence in his hands, and fury in his pencil." Besides his capital works in the palazzo Sacchetti, the Barberini palace, and the palazzo Pitti at Florence, there is, in the palace of the king of Sardinia at Turin, a small sketch representing the "Annunciation of the Virgin," which is touched with exquisite skill and spirit, and in the palace of the prince della Torre, at Naples, there is an incomparable picture of the "Flight into Egypt." The design is correct; the heads are wonderfully great full; the composition is extremely fine, and the colouring is excellent. Many of his works have been engraved by the best artists. D'Angiviller's Vie des Peintres. Pollarion.

BERRETTONI, Niccolò, a first-rate painter, was born at Macerata in 1617, and under Carlo Maroni, who discipled him. He studied design and colour for some years, and became so distinguished as a painter, that he was the judicious
BER

jealousy and envy even of his master. His early works, after he quit school of Maratti, were in the style and taste of Guido; a circumstance which, of itself, highly recommends them. He died in 1682. Pilington.

BERRICA, in Ancient Geography. See Beroea.

BERRINOM, a town of Thrace, between Nicopolis of Mecia, and Philippopolis of Thrace. Ammianus Marcellinus speaks of it as a large city.

BERRIMAN, William, in Biographie, a learned English divine, was born in London in 1608, and from Merchant Taylors' school was removed, at the age of 18, to Oriel college, Oxford, where he professed his studies with great affluency and success. With a view to the critical examination of the Scriptures, he combined with skill, in the Greek tongue, the study of the Hebrew, together with the Chaldee, Syriac, and Arabic; and in explaining the sacred writings, he had recourse to the rules of grammar, criticism, logic, and the analogy of faith. The articles of doctrine and discipline, which he deduced from the scriptures, he traced through the primitive church, and confirmed by the evidence of the fathers, and the decisions of the more generally received councils. After he left the university, where he was graduated M.A. in 1711, he served two churches in London. His first appearance in print, was on occasion of the Trinitarian controversy, in 1719, when he published "A reasonable Review of Mr. Whiston's Account of Primitive Doxologies," which was followed in the same year by "A Second Review." The performances recommended him to the patronage of Dr. Robinson, bishop of London, who, besides conferring upon him a living in the city, and appointing him his chaplain, left him at his death the fifth part of his large and valuable library. In 1722, he accumulated, at Oxford, the degrees of bachelor and doctor in divinity. In the years 1723 and 1724, he was appointed to preach lady Mower's lecture in defence of the commonly received doctrine of the Trinity, and his eight sermons, delivered on this occasion, were published, in 1725, under the title of "An Historical Account of the Trinitarian Controversy." In consequence of this service, he was elected, in 1727, a fellow of Eton college. His "Historical Account" contained some observations relating to miracles, and drew upon him the animadversions of Dr. Conyers Middleton; in answer to which, he published, in 1731, "A Defence of some Passages in the Historical Account." By his "Brief Remarks on Mr. Chandler's Introduction to the History of the Inquisition," printed in 1733, and followed by a "Review of the Remarks," he incurred the charge of favouring the principles of intolerance, and in this controversy he incurred the severe frittures of that acute and learned nonconformist. His next publication was his course of sermons at Boyle's lecture, preached in the years 1730, 1731, and 1732, and given to the world in 2 vols. 8vo, in 1733. In this work he expatiates the evidence of our religion from the O. T., and the ancient prophecies; and points out the historical chain and connection of these prophecies. In the preface, he affirms the authority of Moses, as an inspired historian and lawgiver. Besides the writings already enumerated, Dr. Bertram printed a number of occasional sermons. He departed this life at his house in London, on the 5th of February 1750-51, in the 62d year of his age, and in his funeral sermon, preached by Mr. Ridley, a great character is given of him, both as a minister of his parish, and as a private Christian. His piety was unaffected and sincere; and his benevolence extensive. In the year of his decease, two volumes of his sermons were published in 8vo., under the title of "Christian Doctrines and Duties explained and recommended," and in 1763, 19 sermons appeared in one volume, under the same title. "With respect to Dr. Bertram's practical discourses, it is allowed that they are grave, weighty, and useful, and well fitted to promote pious and virtuous dispositions; but when he treats on the powers, rights, and dignity of the priesthood, or on doctrines which have been greatly disputed, different opinions will be formed, according to the different sentiments of his readers." Biog. Brit.

BERRINGEN, in Geography, a town of France, in the department of the Lower Meuse, and chief place of a canton, in the district of Hacq. The place contains 646, and the canton 16,760 inhabitants; the territory includes 232, kilometres and 9 commun. BERRY, Basset, a grain, fruit, or seed, produced by several herbs, trees, and shrubs, hence called "haccifers," for the conservation and reproduction of their kind. Some define berries as a fruit smaller than apples, growing in bunches, not so thick or close as grapes. Others, a flat, flabby, succulent fruit, having stones or kernels within them. Such are the fruits of laurels, olives, currants, and the like. The berry, or baccia, in a strict sense, denotes a pulpy perecardium without valves, in which the seeds are naked. See Bacca.

Berries are of various sizes, forms, properties, and uses, according to the plants whereon they grow. Some are used in medicine, as juniper-berries, buckthorn-berries, &c. Others in dyeing, as French or yellow berries, &c. The yellow berry-wash may thus be prepared: take a pound of the French berries, and put them to a gallon of water, with half an ounce of alum; boil them an hour in a pewter vessel, and filter off the fluid; put them again into the boiler, and evaporate the fluid till the colour appear of the required strength.

BERRY-Bearing Alder. See Rhamnus Frangula.

BERRY, Ayignon. See Avignon.

BERRY, All. See Ale.

BERRY, in Geography, a province of France, before the revolution, now comprehended under the departments of Indre and Cher, of which Bourges was the capital; bounded on the north by Orleanois, on the south by Bourbounois and Marche, on the east by Nivernois, and on the west by Poitou. Berry was divided into the Upper and the Lower, and extended about 90 miles from north to south, and 73 from east to west; it is watered by several rivers, as the Loire, Creuse, Cher, Indre, &c. enjoys a temperate air; is fertile in corn, fruit, wine, hemp, flax, and paturage; and contains several fine quarries, and some mines of silver, iron, and ochre. Besides the trade in wine, carried on at Bourges, the principal commerce of this province consists in fat cattle sent to Paris, and the great number of sheep, which produce fine wool, manufactured in this and other parts of the kingdom. In Berry there are two kinds of manufactures; one for clothes and ferges, and the other for hats and wave stockings. Berry Horne, lies about a mile south of the entrance into Doremgel haven, on the west coast of Ireland, and 5 miles N.N.E. from the haven of Ballyhannan.

BERRY HEAD, a noted promontory on the south coast of Devon, being the south-west limit of Torbay, and running far out south into the sea. Off this head, out of the way of the entrance into the bay, is a rock, called Berry-rock.

BERRY'S ISLANDS, a small cluster of islands on the north-west point of the great Bahamas bank, in the channel of Providence. N. lat. 25° 30'. W. long. 75° 40'.

BERSABA, in Ancient Geography. See Beer-Sheba.

BERSABORA, a large, strong, and populous town of Peru.

BERSARRI, in Writers of the Middle Age, a kind of hunters, or sportmen, who pursued wild beasts in forests and chases. The word farms derived from the barbarous Latin bersfur,
Berschitz, or Berschesiz, in Geography, a little town of Carnola, seated on a high rock near the Adriatic sea, and containing a small harbour. In this place is produced a thick and sweet wine, of a black red colour.

Bersello, or Brissello, a town of Italy, in the vicinity of Modena, seated on the Po. It was taken by the imperial troops under prince Eugene in 1702, and by the French under the duke of Vendome in the following year. The emperor Otho died here, after his defeat by the army of Vitellius. The town is small, but fortified; 27 miles north-west of Modena. N. lat. 44 55'. E. long. 10° 43'.

Bersheek, a mountain of Peru, on the north-west side of the lake of Zura, noted for a fire-temple, the resort of the Quechus.

Bersima, in Ancient Geography, a town of Aflia, in Mecopetamus, seated on the left bank of the Euphrates, south-west of Nerciphorum.

Berskoi, in Geography, a town of Siberia, 20 miles north-east of Polivan.

Berstadt, a small town of Moravia, in the circle of Olmutz.

Bert. See Brit.

Bertaunt, John, in Biography, an early French poet of reputation, was born either at Creys, or at Combe, in Porche, in 1553; and being known at court by his wit, was appointed first amanuensis to Catherine de Medici, private secretary and reader to Henry III., and was much esteemed by Henry IV., in whose conversion he was eminently instrumental. In 1594, he was made abbot of Aubin, and, in 1596, Bishop of Sées. After his advancement to this see, he conducted in reprehensible, though force blanche attached to him, because, in lieu of suppressing the free poems of his youth, he published them with the plain styles of his advanced age. He died in 1611. As poet, he has tried to have been more natural and clear than Ronsard, more facile than Defortes, and more genial and polished than either of his contemporaries. Some of his Poems are said to form the chief and elegance of a more refined period. He died in Paris, where he was buried, having left behind him a son and two daughters.

Bertie, in Biography, a maritime county of America, in New England; and Edenton district, having for its southern boundary the Roanoke, and on the east Albemarle Sound. In this county is situated the ancient Indian tower of the Wero. It contains 1,262.6 square miles, of which 374.1 is water.

Bertius, or Coel., turbinate, five-toothed. Cor. tube short, with a villous mouth; berry globiferous, inferior, two-celled, many-seeded.

Species,
Species, t. B. guianensis. Aublet. Guian. 180. t. 69. This is a shrub six or seven feet high, and the thicknefs of the human arm; branches opposite, knotty, tomentose; leaves opposite, ovate, acuminate, and tomentose beneath; petals short, convex beneath, channelled above; stipules leaf-clipping, two-lobed; flowers in terminating racemes; corolla white. Found by Aublet in the wood of Arouca, in Guiana, flowering and fruiting in the month of June.

BERTIN, Nicholas, in Biography, an historical painter, was born at Paris in 1667; and after Studying under some of the principal artists, and gaining, at the age of 18 years, the prize of merit in the academy, was sent to Rome for further improvement, where he acquired a great taste for composition, and in Lombardy he completed his knowledge of colouring. Some time after his return to Paris, he was made academician in 1703, and professor in 1705. His drawing was correct; his invention ready in all sorts of subjects; and he painted in a strong, pleasing, and finished style. He was much employed by Louis XIV.; and his performances were valued and sought after by foreigners. He excelled more in small works than great ones; and from this circumstance, and some others, he was referred only to the second rank of artists. Among his most considerable performances we may reckon the ceiling at the chateau of Pleiss-St. Pierre, the subject of which was the adoration of the Magi, and an historical composition, representing the baptism of the eunuch of the queen of Candace, by St. Philip. His temper was reserved, and he was much addicted to religion. He died at Paris in 1736.

BERTIN, Joseph, Expuru, was born at Tremblay, in the department of Renne, June 28th, 1712. Having gone through the usual course of study, in anatomy, physiology, and therapeutics, he was created doctor in medicine at Paris, in 1740. The following year he published "Non datur imaginationis materne in factum actio," combating an opinion, which had long prevailed, that the imagination of the mother had the power of marking and disfiguring the fetus in utero. His next production, which is much commended by Haller, is a treatise on "Osteology," in 4 vols. 12mo. The bones of the head are described more exactly and minutely, Haller says, than in any other work extant. About the same time, he had a long, but not very interesting dispute, with M. Ferrein, on the formation of the voice. In the year 1764, he joined Meins, Le Bas, Petit, and others, in defending the cause of Madame Renne, who had been delivered of a male child ten months and twenty days after the decease of her husband, and who wished to get the child acknowledged as his. Bertin, with his condutors, endeavoured to establish as a principle, that there is no fixed term for the birth of the child, and that, according as the constitution of the parents was more or less vigorous, a greater or less portion of time might be required for the perfection of the fetus. A child might be ripe, and fit for the birth, they maintained, at the end of the seventh month, if the parties enjoyed great strength of constitution; or in an opposite state of them, it might require ten, twelve, or more months, to fit it for expiration. This doctrine was attempted to be established by recurring to a great number of cases and observations, and to the decisions of the courts, of which they produced several, legitimate children, supposed to have been born in the eleventh or twelfth month after conception. Recourse was also had to the histories of monstrous births, to show the aberrations of nature. These arguments and cafes were ably and judiciously opposed by M. Louis. The cases adduced by his antagonists were shewn to be defective in evidence, and though he admitted that the time of gestation in women, as well as in animals, might be prolonged for a few days, yet he much doubted whether, in any influence, it had been extended to the end of the tenth month, or at the most to more than two or three days beyond that term. In support of this opinion, he cited the authority of some of the ablest philosophers, physicians, and lawyers; and the court, according to this determination, declared the child to be illegitimate. Though the court in this decision were probably influenced by the peculiar circumstances of the case, the husband being 76 years of age at the time of his death, and for the last month in such a state as to be incapable of performing the conjugated rites, yet the arguments and authorities adduced by M. Louis must have had great weight with them. and was deserved to be had recourse to in deciding on general principles, what is the utmost term to which a woman may carry a living child.

BERTIN, Peter, in Biography, an eminent geographer, was born at Beruren, a village in Flanders, in 1565, and acquired the knowledge of the learned languages in England. Having travelled through Germany, and other countries, he settled at Leyden, where he became professor of philosophy; but after occupying this post for 26 years, he was expelled for joining the Arminian party. Upon his expulsion he migrated to Paris, where he abjured the protestant religion in 1620, and was made cosmographer to the king, and professor-royal extraordinary of mathematics. He died in 1629. His principal works are "Theatrum Geographicum Veterum," Amst. 2 vols. fol. 1618, 1619; which is a collection of the works of almost all the ancient geographers, illustrated by notes, and esteemed a valuable publication; "Introducit in universalim Geographicam"; "Comment. Rerum Germanic. lib. in." Amst. 12mo. 1635, containing a good description of Germany, and a map of the empire of Charlemagne; "Noticia Episcopatum Galliae," Par. fol. 1625; "De Aggeribus et Pontibus," Par. 8vo. 1629. The works above enumerated are held in high estimation by geographers. We may add "Illud. Vironum. Epit. select. inferiori faculo scep. vel a Belgis vel ad Belgas," 8vo. 1617. Bertin also wrote several pieces in the controversy between the Gomarists and Arminians, and published discourses on various occasions. Now. Diet. Hist.

BERTON ROAD, in Geography, lies within Dalkey island, at the south point of the entrance into Dublin bay, Ireland.

BERTONA, Bertonia, Bertidea, Berton, or Bertin, properly denotes that part of a country farm where the barns and other inferior offices stand, and wherein the cattle are foddered, and other bullocks is managed. Bertin is also used to signify a farm, as distinct from a manor. Du-Caige. In some parts of the west of England, they call a great farm a bertin, and a small one a living. Hence also bertonarii was anciently used for those we now call farmers, or tenants of bertonarii.

BERTON-
BERTONCOURT, in Geography, a town of France, in the department of the Moëlle, and chief place of a canton, in the district of Bayeux, 10 miles north-east of Bayeux.

BERTRAM, Conradus Bonaventure, in Biogra-

BERTRAND, Gabriel, a surgeon of eminence at Paris, published, in 1616, in 8vo. "A Refutation of the Errors contained in Guillemau's Description of the Muses of the Human Body," which is much commended by Portal; also "Les Verités Anatomiques et Chirurgicales des Organs de la Respiration, et des artifices moyens dont la nature se fera pour la preparation de l'Air," Paris, 1629, 12mo. He had observed performed in the chest to be absorbed and conveyed out of the body by the hair. Bib. Anat.

BERTRAND, John Baptist, born at Antignes, July 12th 1670, was member of the academy at Marib. There, he also practised medicine with reputation and success. He published "An Historical Account of the Plague," which defeated that city in the year 1719, of which he wrote; also "Letters addressed to M. Deidier on the Causes of Muscular Motion," and "Dissertations on the Effects of Sea Air." He died September 10, 1752, aged 82 years. Eloy. Dict. Histoire.

BERTRAND de Comminges, St. in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of St. Gaudens. Before the revolution, it was the see of the bishop of Comminges, 7 miles; 3 miles south-west of St. Gaudens. Its population was at 1639, and that of the canton at 1655 persons. Its territory comprehends 1351 square kilometres, and 18 communes.

BLERANDI, Ambrosius, in Biography, a celebrated architect and surgeon of Turin, where he was born, Oct. 8th 1734. Showing early marks of an uncommon genius and talent for his profession, he was sent by his sovereign to Paris, and afterwards to London, to acquire a knowledge of the improvements making in those places. At London, he was for six months under the direction of Mr. Broomfield, then at the head of his profession. Having employed three years in his travels, in 1755, he returned to Turin, where he preferred to the office of physician an extraordinary, and principal surgeon to the king. In 1748, he published, in 8vo, "Dif-
fertations de l'anatomie, de l'ophtalmie, de l'outrage," which have considerable merit. But his principal work was pub-
lished at Nice in 1763, 8vo, under the title of "Trattato della operazione di chirurgia," in which he has described the manner of performing the principal operations in surgery. The work was translated into French by M. Sabot, and published at Paris, in 1769, with engravings. He died in 1769, in the 43rd year of his age. Hall. Bib. Chap. Eloy. Dict. Hist.

BERTROMONTIER, in Geography, a town of France, in the department of the Vosges, and chief place of a canton, in the canton of St. Dié, 15 miles east of St. Dié.

Boc A. of Africa, in the tenth part of the Vol. IV.

country called "Kisera" by the Arabians, and by us "Caffaria." See Brah.

BERVAN, a town of Asia, in Tartary, in the kingdom of Thibet, near the lake Bervan, which lake is said to be 40 leagues long and between 30 and 34 broad.

BERVIE, or HERBIVIE, a royal burgh in the county of Kincardine, Scotland. N. lat. 56° 44'. W. long. 7° 4'. It is seated on the eastern coast, at the mouth of the river Bervie, called Bervie bay, which forms a small harbour for fishing-boats. This town was constituted a royal burgh in 1542, by charter from king David, who, being at sea, was forced to land here by storms at weather, and kindly received and entertained by the inhabitants. The place where he landed is still called crois David. In 1595, James VI. renewed the charter, with all its former privileges and immunities. This town has lost nearly the whole of its trade and commerce, and many of its houses are fallen to decay. Most of the fishermen who frequented this port are removed to Gourdon, a village about two miles south, where they enjoy a more eligible situation. Fresh water has lately been brought into the town by means of pipes, and a new bridge has been recently thrown across the river Bervie. The population of the borough is about 607 persons.

BERVINE, a river of the Netherlands, which passes by Delft, and runs into the Meuse, near Vlissingen.

BERVISH, in Hebrew, the name by which the Hollanders call the lamp-plant "cyclomorpus lunaumus" of Linnaeus.

BERULLE, Peter d', in Biography, cardinal and founder of the congregation of the fathers of the oratory in France, was born at Serilly near Troyes, in 1575, and educated with a view to the ecclesiastical profession, first among the Jesuits, and afterwards in the university of Paris, where he was distinguished by his proficiency in literature, and by the amiable features of his disposition. Such were his attainments in doctrinal and controversial divinity, that he bore a principal part in the conference at Fountainebleau, in 1600, between cardinal du Perron on behalf of the catholics, and de Poff-}

Morny on the side of the protestants. At this time he was almoner to king Henry IV.; and in 1604, he was employed in bringing over a colony of Cornishmen from Spain, and settling them at Paris; of this order he was constituted superior-general. The first foundations of the congregation of the oratory of Jesus were laid by him in 1611, and from this institution he derived the greatest honour. See Orato-
ry. After the death of Henry IV., Berulle was chief of the council of the queen-mother, Mary of Medici, and he took an active part in promoting conciliatory measures between the contending parties during the minority of Louis XIII. In 1623, he was deputed on a commission to Rome, to solicit a dispensation for the marriage of the princes Henrietta Maria, to Charles I. of England; he was appointed her confessor, and accompanied her to take possession of the throne. But as he was unwillingly maintained her disputed rights, he contributed in some measure to the misfortune that resulted from this impolitic union, and at length incurred the reproach of a dissimulator. The duke of Buckingham, as he says, complained of him to the king of having conspired against his life and fortune. On his return to France, he was active in urging the proceedings against the Calvinists at Rochelle. Having refused several rich benefices and bishoprics, he was nominated cardinal by Urban VIII., without his knowledge, in 1627; but he continued his abstinence and mortified mode of living; and at length, exhausted by his labours and toil, he died during the celebration of mass, Oct. 2d 1629. His numerous pieces in controversial theology were collected and published in two volumes folio, in 1634, and have since appeared in two other editions. Gen. Dict.
BERUS, in Geography, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Sar-Louis, 4 miles S.S.W. of Sar-Louis.

BERUS, in Zoology. Coluber burus is the common European viper. Linnaeus, who, in describing the amphiblia ferentes, conceived it quite sufficient to distinguish all the species of the several genera included in that order, by the number of abdominal feets, or plates on the belly, and the scales on the tail, states them at 146—39. F. N. Suec. Amoen. Acad. &c. The opinion entertained in this respect by that eminent naturalist, we perceive from later observations on the species he describes, was not perfectly correct. This is exemplified for instance in the common viper, in which both the abdominal plates and caudal scales are liable to vary in point of number; one writer speaks of the viper having 148—42, Weigel, &c.; another (Scopoli) mentions 177—68, &c. Notwithstanding therefore the example of Linnaeus to the contrary, we cannot but approve of characters taken rather from the various marks, spots, and other distinct particulars in the general appearance of the species in this order, as Linnaeus has done himself in the reptile tribe. Dr. Shaw seems also to prefer the latter, confounding the number of plates on the belly, and scales on the tail, in a secondary point of view. He thus describes the common viper: Coluber cinctus, maculatus bilobus, vitta dorala dextra dentata repanda. G invasive vipers, with a bilobate spot, and a black flexuous zigzag bend down the back.

Gmelin, in the Syllema Natural, has four varieties of coluber burus; namely, (2) a native of India, in which the spots along the back are roundish and confluent, so as to form almost one continued stripe; those spots near the tail are disposed transversely. In the island of St. Eustache, another variety (3) is also found, of a fulvous colour, with the head variegated, and the neck flecked. (4) This inhabits India, and is distinguished by having the arch of the occiput, or hind head, intercepting a white spot. The fourth fort (5) has an aggregated spot of many parts on the head; and is a native of the Celebes. Figures of all these varieties of coluber burus are to be found in the magnificent work of Seba.

The common viper of Europe and northern Asia is the same that is found in this country. With us, the viper seldom exceeds the length of eighteen inches or two feet. Pennant tells us, there is one sort of the female almost three feet in length, observing at the same time, that the females are usually one third larger than the males. The colour, generally speaking, is of a silvery greyish, or tawny brown, paler or more vivid in different individuals, and sometimes blackish all over; but in all these varieties the spots are nearly the same, the back being marked with a chain or series of rhomboidal spots connected with each other, and forming one continued indented stripe from the head to the extremity of the tail. A series of dark or dull red spots extends likewise along each side of the body; other spots appear again on the belly, which in most specimens is almost entirely black, and finely glossed with purple. The situation of the fangs proves the viper to be one of the poisonous kinds of serpents; they are situated on each side of the fore-part of the upper jaw, and are commonly two in number, with a few smaller ones near them. Petiver describes a black viper, vipera Angelica nigra, which is thought to be nothing more than a dark variety of the common kind, burus. This, however, is not certain, and we should hesitate in admitting it as a variety only, since Linnaeus considered it, from the description which Petiver has given, as the coluber prefacer of his Fauna Sucec. For a further account of coluber burus, see Viper.

BERWICK, NORTH. in Geography, a royal borough of East Lothian, in the county of Haddington, in Scotland. This town is of very remote antiquity, and has been a scene of considerable manufacture and commerce, but is now reduced to poverty, its harbour being in ruins, and a few cargoes of grain are the only exports from its quay. Its original charter was lost or destroyed, and James V. granted it a new one, under which it has since been governed. The parish extends about three miles along the sea-coast, and consists wholly of arable land, except a fine conical hill called North Berwick Law. This rises immediately above the town, and forms a conspicuous landmark to the sailors who navigate the Frith of Forth. The ancient castle of Tantallon stands about two miles from this town, and is elevated on a high rock, three of whose sides are lined by the Surge of the sea, and the fourth guarded by a deep fosse and drawbridge. See Bass. N. lat. 56° 48'. W. long. 1° 45'. The ground, on which the town stands, rises gently from the river, and from its southern aspect, is renderd cheerful by the sun. Its circumference, within the present walls, is about one mile and three quarters, but the circumference of the old walls extended two miles two hundred and eighty-two yards. The town of Berwick is mentioned as a place of strength in the reign of Robert I., one of the last kings of Northumberland, who died in the beginning of the ninth century. It was successively conquered and possessed by the Saxons and Danes, until the Scotch king Gregory, who was contemporary with Alfred the Great, took it by assault. It continued part of the Scotch dominions till about the year 1008, when it was given by Edgar to the earl of Durham, but was again restored to the Scots. During the repeated wars between England and Scotland, this town and its castle were frequendy taken and retaken by the armies of each kingdom, and in each direful conflict suffered materially. In one of these, between Alexander of Scotland and John of England, the greater part was destroyed by the latter, who made it a practice to confine the house every morning in which he had lodged the preceding night. On the 2d of August 1291, the rates of England and Scotland, with Edward I., assembled at Berwick, to settle the claims of Robert Bruce and John Balliol to the Scotch crown, when the latter was appointed on the 17th of the following November. During these reigns Berwick was besieged and conquered by Edward I.; and the conflict was so great, that Matthew of Waltham flatters the loss of the Scots to amount to 60,000 persons. An English parliament was summoned here in 1296, when the Scotch nobility paid homage to king Edward. In the following reign, Robert Bruce collected an army of 30,000 combatants, with which he entirely routed and discomfited Edward II. and his army near Stirling castle. This battle, commencing on Midsummer day, 1314, continued several days, and it is acknowledged by most authors, that the English suffered more in this conflict than in any other since the time of William the Conqueror. It was in this battle that
BERWICK.

that the privy seal was lost; and Edward issued a proclamation from Berwick, informing his subjects of the circumstances. Berwick was afterwards a scene of great rejoicing and rejoicings. The marriage of Jean, sister to Edward III., with David of Scotland, was performed at this place with great pomp and solemnity. In spite of this family alliance, the two kingdoms soon returned to their former hatreds, and Berwick became the seat of many battles and destructive sieges. It was several times afterwards in the possession of each country, and never relinquished by either without a vigorous and obstinate resistance. In the reign of Richard II., of England, and James II., of Scotland, commissioners were appointed by each crown to ascertain the limits of Berwick; and it was agreed, that the ground in dispute should remain unoccupied, unbuilt, and uninhabited. But in 1522, this agreement was annulled by another, which stipulated that the town and country should be "pleased in God's peace, friendship, league, and condescension." In the same year was solemnised the marriage of Margaret, eldest daughter of Henry VII., with James IV., king of Scotland; but this circumstance did not terminate the jealousies and animosities between the two kingdoms, as Edward VI. marched to Berwick with a large force, which was augmented by a fleet of 34 ships, 30 transports, and a galley. Thrice he encamped her; for some time, and were destined to invade Scotland. This monarch, and Mary queen of Scotland, by treaty, made Berwick a county town, and declared it independent of both states. Queen Elizabeth fortified and invested it with a strong and expensive military establishment, consisting of 980 men, whose annual salaries amounted to 12,734l. 195. 2d. All this was abrogated, and the place rendered peaceable by James VI., of Scotland, who was proclaimed at Berwick, in the year 1603, king of England, France, and Ireland. The union of the two kingdoms, in 1707, terminated the long series of hostilities, which had proved so destructive to the commerce, population, and agriculture of the borders, and to this place in particular.

Berwick, though originally a Scots town, was erected into an English borough, at a very early period, and its bail charter was granted by James I.; under which the burghers claim their various privileges, immunities, &c. as well as other large territorial possessions and domains. It has an exempt jurisdiction, and is independent of the adjoining counties of Durham and Northumberland, yet it is not a county in itself. Since the union, it has been partly subject to the English laws, but is locally regulated by its own code. The town is governed by a mayor, recorder, four bailiffs, and an infinite number of aldermen. The fire is annually elected, and receives 100l. during his majority. Two members of parliament are returned from this town, and the number of electors amounts to nearly one thousand, though not more than seven hundred have been known to vote at one election. Several manufactures are established here; the principal of which are for making damask and diaper, fustian, cloth, cotton and muslin, flocking, carpets, felts, hats, boots, shoes, besides several others connected with the shipping. The coaling trade and foreign commerce of Berwick are very considerable, though about sixty years since, only two small vessels of fifty tons each were employed between this place and London. Now about 400 vessels belong to this port, whose principal lading consists of fish, and eggs. The trit are mostly caught in the rivers Tweed, which before fifteensford offer a great revenue to the proprietors, and give employment to about 350 men. The salmon fishing continues from the 1st of January till the 1st of October, during which time above 40,000 kits of these fish, besides a vast quantity of salmon trout, have been sent to London. The latter are often conveyed alive in the holds of the vessels. About 300 boats are employed on the Tweed; and they yearly remove all the salmon water 2500 tons. The article of egges is also a curious and lucrative branch of trade, as they are brought to this town in carriages and packhorses from all parts of the adjoining country, and mostly partake of the same price. From the 1st to the 21st of October 1793, 52,000 pounds of egges were sent hence to London. The salt trade of trade at this port may be obtained from the inhabitants' revenue, which has risen in the last 20 years from 100,000 to 600,000l. a year.

It was the universal practice, till within these few years, to boil all the salmon before it was packed up in the kites; but in 1788, a new mode was adopted, and has continued ever since. This consists in packing it with ice, which being wanted to great quantities, induced the merchants to construct several ice-houses near the town. In the year 1798, the two companies of Berwick had in 7,000 cart loads, which cost them about 450l. There are 32 salmons coops in this town. Four modes of catching salmon are practised here; the sweep, the spill, the bob, and the hanging net. (See Salmon.) Besides the salmon-fishery, the herring and lobster fishery employs several hands. The latter are caught in crevices, which are three feet in length and one and a half in height. These have a hole at each end, where the lobsters are tempted to enter for the enclosed baits.

The Public Buildings are the governor's house, the barracks, the ordnance-house, the main-guard, the town-hall, and the county-town. Among the buildings is an ancient tower, built of stone, and ornamented with several windows. The town hall is a handsome building of three stories, with an ornamental tower, and spire at one end. It was built from the designs of Joseph Doolis, and finished in 1754. Church was built, in 1652, under the direction of Colonel George Fenwick; but it has neither tower nor bells; these are annexed to the town hall. The bridge over the Tweed is constructed with fine hewn stone, and has fifteen spacious arches. It extends 146 feet in length, and 15 in width, and was finished building October 12, 1654, after a period of 24 years 4 months and 4 days, from the commencement.

Here are a charity-school, and six free-schools, also a custom-house and excise-office. Berwick's hill surrounded with fortified walls, which are mounted with 54 guns. It has four principal gates, and has a complete garrison establishment, to which Holy Island is an appendage. Among the antiquities of the town are the remains of its ancient castle, and a pentagonal bell tower near it, a square fort of Magdalen lane field, entrenchments on the top of Hallydown hill, and an old pier called the bishop's pier.

Here is one weekly market on Saturday, and one annual fair; but the corporation has abolished three annual markets, called High markets, for the hiring of servants, and selling of horses, cattle, &c. Fuller's History of Berwick upon-Tweed,Rob. 1709.

BERWICK, or ALBION, a neat town of America, in York county, Pennsylvania, at the bend of Conewango creek, 13 miles by W. by S. of Philadelphia, 23 miles by W. of York, and 26 miles by S. of New York. The town is laid out, and contains about 1000 houses, and a German Lutheran, and Calvinist church. N. lat. 40 54'.

BERWICK, or NEW BERWICK, a small town of Northumberland county, in Pennsylvania, on the north-westerly fork of the catt branch of Susquehanna river, opposite N-cookeck falls and Ncepeock creek, 324 miles north-east from Nor.

K K 2 thumberland
BERWICK, a township of York county, and district of Maine, containing 3894 inhabitants. It has an incorporated academy, and lies on the east side of Salmon Fall river, 7 miles N. W. of York, and 86 E. by N. from Boston.

BERWICKSHIRE, a county of Scotland, famous in the historical annals of Britain for the many desperate battles fought between the English and Scots within its boundaries. This county formerly constituted about half of the earldom of Dunbar or March, and is generally called by the country people *Merse*. It is nominally divided into three districts, respectively called Lauderdale, Lammermuir, and Merse, or Marth. The latter comprehends the most beautiful subdivision, and follows the course of the Tweed, from the foot of the Eildon hills to within a few miles of Berwick.

Lauderdale is the valley which accompanies the river Leader, or Lauder, whose waters are celebrated in Scottish song. Lammermuir comprehends the ridge of hills, which separates this county from east Lothian, and is chiefly appropriated to the feeding of sheep and black cattle. This county is bounded on the north by Haddingtonshire, on the east by the German ocean, on the south by the river Tweed, which divides it from Northumberland in England, and on the west by the counties of Roxburgh, Peebles, and Midlothian. Its length is estimated at 32 miles, and breadth at 17 miles. It is divided into 52 parochial districts, and besides the royal borough of Lauder, has the towns of Greenlaw, Dunse, Coldstream, Coldgingham, Ayton, and Eyemouth, within its limits. The chief rivers of the county are the Tweed, the Leader, the Eye, the Whiteadder, and the Blackadder. The slates of agriculture in this county is highly improved within the last twenty years; and many parts that were then uncultivated, are now included and rendered profitable to the landlord and the husbandman. By way of agricultural pre-eminence, this county is often called the Norfolk of Scotland. Many farms now let at 500l. and 400l. per annum, which at no very distant period were scarcely deserving of notice. This increase of prosperity enables the county to export from the ports of Berwick and Eyemouth "above 80,000 bolls of wheat annually," and nearly the same quantity is conveyed to the markets of Edinburgh, Dalkeith, Haddington, and Dunbar. The minerals of this district hitherto discovered are few, and these not very valuable. Coal is found in small quantities near Eyemouth; freestone is abundant; and rock and shell marl are found in different places. Copper has been obtained in the vicinity of Lauder; and some few years past a mine of the same ore was discovered in the parish of Bonkle. A small quantity of iron ore is found in the parish of Morington. The rocks, which compose the Lammermuir hills, are mostly schistus, with alternate strata of sandstone. At Eyemouth is a rock of Pudding-stone, which is found to contain fragments of porphyry, granite, and limestone. In the parish of Chirnside, is a species of gypsum, which is advantageously used to manure certain lands. Near Dunse is a celebrated mineral spring, which is much resorted to. Its water, somewhat similar to that of Tunbridge Wells, contains iron diffused in fixed air, with a little sea salt and bitter; and its effects prove rather diuretic and corrodant. Among the gentlemen's manors of the county, those of Hinchin, the seat of the Earl of Home, and of Marchmont, the seat of the Earl of Marchmont, are the most considerable; though there are some other handsome mansions. Besides the castle and fortifications of Berwick, there are several others in different parts of the county, particularly at Lauder, Cockburnspath, Home, and Chapel on Berwick. There were also seven nunneries, two hospitals, and one Dominican convent. Among the eminent natives of this county, the following names occur: James Thomson, the poet; John Scott, or Duns Scotus, who was born at Dunse. Of the same place, was John Brown, author of the Brusonian system of physic; Thomas the Rhymner, and sir Thomas Lernmont, is distinguished in the history of metrical romance. The real land-rent of this county is estimated at 118,820l. sterling. Home's Agricultural Report of Berwickshire. Sir John Sinclair's Statistical Account of Scotland. Fuller's History of Berwick.

BERWIN, or BURWYN, a considerable range of mountains, which pales through parts of the counties of Montgomery, Merioneth and Denbigh, in North Wales. The prospect from different spots on the summit of this ridge strikes the mind with awful solemnities. "Nature," says lord Lyttelton (Works, vol. iii. p. 337.), "is in all her majesty there; but it is the majesty of a tyrant frowning over the ruins and desolation of a country. The enormous mountains, or rather rocks, of Merionethshire, inclose us all around. There is not upon those mountains a tree, or shrub, or blade of grass; nor did we see any marks of habitations or culture in the whole place. Between them is a solitude fit for despair to inhabit; whereas all we had seen before in Wales seemed to inspire the meditations of love.

BERW, BERWS, or BERES, was anciently the name of the vill or site of the habitation of a nobleman, or of a dwelling or manor-house, being the chief of a manor; formed of the Saxo "beorg," which denotes a hill or castle; for noblemen's seats were formerly castles, situated on hills, of which there are still some remains. It was anciently taken for a sanctuary. See BERIA.

BERYL, or BERYLL, *βερυλλος*. Aquamarines of Sikelia, Beryl, Germ.; Emerauds, vert blondier, Hauy; jaspe *ferragadae beryllus*, Werner.

The colour of the beryl is a blueish green, passing into mountain apple, or aparagus green, and honey yellow on one side, and light sky blue on the other. It is almost always found crystallized in rectangular six-sided prisms, sometimes truncated on the edges and angles; the sides of the prism are occasionally alternately broad and narrow, and sometimes convex, which gives the whole crystal a cylindrical form. It is not unfrequent for the prisms to have the appearance of having been broken across and imperfectly cemented together. Sometimes, instead of having plane surfaces at their extremities, they are convex or concave, like articulated bivalves. The face of the crystals varies considerably; the smallest being always the longest, in proportion to their diameter; some are of no greater magnitude than a hair, while others have been found a foot long and three or four inches in diameter. The beryl has many points of resemblance with the emerald; and in particular the crystals of both are divisible parallel to the sides and extremities of a regular hexahedral prism, on which account M. Hauy has comprehended them both under one species.

The beryl is externally shining, or little-shining, with a vitreous luster. Its parallel fracture is minute-conchoidal; the crosf fracture is completely conchoidal. It is generally transparent, but sometimes is only semi-transparent or translucent. It is sufficiently hard to scratch quartz, though with some difficulty. Specific gravity of the light blue variety 2.67; of the blueish green 2.75; of the mountain green 2.65.

This mineral appears to have been first analyzed by Vauquelin, and afterwards by Rose and Schaub, with the following results:

Silex,

Is a common fire the beryl undergoes scarcely any change of colour, but it loses its transparency, and flies to pieces. At a more intense heat it becomes opaque and milk white, but shows no signs of fusion; by the affluence, however, of oxygen gas, it melts without much difficulty. Borax is a perfect flux for it.

The beryl is found in Daouris, upon the borders of China, near Nertshimik, also in the granite ridge between the rivers Onon and Onomboi. It is found in rivers, accompanying rock-cristal, indurated clay, mica, flint, wolfram, and arcanium pyrites. The beryl, when cut and polished, has a considerable luster; but its colour is for the most part indifferent. It is ranked among the gems, but its value is trifling when compared with the ruby, sapphire, topaz, &c. "Haury. Emmengen. Widemann.

**BERYLL, Oriental.** See CORUNDUM.

**BERYLL, Beryllus.** See TOUREMAL.

**BERYLLUS, a species of Cimex (Spinifex).** The species of Cimex, Kryerite, a learned and pious bishop of Bofor, or Bozrah, in Arabia, flourished about the year 235, and taught that Christ had no proper subordination or divinity distinct from that of the father, before his birth of Mary; or that Christ did not exist before Mary, but that a spirit issuing from God himself, and therefore superior to all human souls, as being a portion of the divine nature, was united to him at the time of his birth. Many conferences were held with Beryllus on this opinion, and at last it was so completely refuted by Origen, and so much to the satisfaction of Beryllus himself, that he gave up the cause, and returned into the bosom of the church. The acts of these conferences were beg preserved, and the dialogue between Origen and Beryllus was extant in the time of Jerome. Eusebius also refers to them. *Eccl. Hist.* v. vi. c. 33. Cave's Hift. Lit. vol. i. p. 122. Mohr. *Eccl. Hist.* vol. i. p. 306.

**BERYLLUS, in Entomology, a species of Cimex (Rotundatus), that inhabits India.** It is of the middle size; pale; border of the thorax orange; wing-cases with a ferruginous spot, and marginal black lines. Fabricius.

**BERYUS, BERSIT, Beersheba, or Beraus, a town of Phoenicia, situated about 24 miles south of Byblus. Stephanus Byz. says, that it was so called on account of its waters. Others deduce its name from Berys, as it was sometimes called by the poets, who was a nymph of the ocean, and the nurse of Semel. Bryant supposes it to have been derived from Baris, Barst, or Barbis, the ancient name of the ark, but properly signifying a covenant; and that it was the city of the ark, where the Canaans, or Phoenician deity Baal-Berith had a temple, and where the rites of his worship were performed. This city is not much inferior to Byblus in antiquity, since it is laid to have existed in the time of Cronus. The kings of Egypt had possession of it, but when Alexander the Great subdued this province, it became subject to the kings of Syria, and remained under the successors of this prince till the time of Diodotus, denominated "Tryphon," who entirely destroyed it about 140 years before the Christian era. The Romans, after the conquest of Syria, rebuilt it near the spot where the ancient city had stood. Agrrippa, the grandson of Herod the Great, decorated it at an immense expense with a theatre and amphitheatre, baths, and porticoes, and embellished in magnificent games, mentioned by Josephus in his "Antiquities." It was in this city that Herod the Great, by permission of Augustus, held an assembly which condemned to death his sons Alexander and Aristobulus, under the false accusation of Artaxerxes, their most dangerous brother, for having conspired against the life of their father. Titus, the son of Vespasian, came to Berythus, after the capture of Jerusalem, to celebrate the feast of the birth of his father; according to Josephus "De Bell." Berythus enjoyed the privilege of the "jus Italicum," according to a law of the Digest. Pliny (H. N. i. c. c. 20.) and Josephus (De Bell. Jud.) informs us, that it was a Roman colony. Under the Roman emperors, Berythus was no less famous for the study of the law in the east, than Rome was in the west; and hence it was styled by the emperor Julian the "mother and nurse of the laws." The civil law was taught there in Greek, as it was at Rome in Latin. It is not certainly known by whom the academies were founded; but that it flourished long before the reign of the emperor Diocletian, is manifest from a decree of that prince. According to Heinorcius (Jur. Rom. Hist. p. 351—356), the splanéde of this school may be computed to have lasted from the third to the middle of the sixth century; and its institution has been ascribed to Alexander Severus. From this academy the two famous civilists Doctorides and Aristobulus were called by Julianus, that they, in concurrence with others, might be employed in composing the Digests; and that prince would allow of no other academies, but those of Rome, Berythus, and Constantinople, to explain the laws. This city was overthrown by an earthquake in the 25th year of Julianus, A. D. 551, July 3; and as the schools of Berythus were filled with the rising spirits of the age, many youths were probably left on this fatal occasion, who might have lived to be the sages or guardians of their country. The metals of this city are bronze, gold, and silver. After it became a Roman colony, its medals had a legend, Col. Fin. Ber. i. c. "Colonia felix Berythus," and were struck in honour of Carus, Augustus, Titus, Claudius, and other Roman emperors. For the present state of Berythus, see BAIKOUT. The faburbs are almost as large as the city itself, containing of gardens, with a house for the owner in each; and these, interfiled among the numerous fruit trees, particularly olives and figs, which this fertile soil supports, give the whole a picturesque and beautiful appearance. Latopan velinals, in the farther, anchor near a small point of land, which runs into the sea before the city, and is called "Berythus point." But in the winter they anchor to the north, in a kind of gulf, which is sheltered from the north and west winds by the mountains, and is said to be very fertile. The rape commodity of the country is raw silk, which is carried to Cairo, Damascus, and
and Aleppo, and part of it to Europe. They also fabricated a kind of jars and jugs of earthen ware, which, from the peculiar nature of the clay in the adjacent country, are highly esteemed, and carried to all parts of the coast.

Berytus, a town of Arabia, formerly called Diospolis.

Steph. Byz.

BERZETIN, in Geography, a town of Hungary, in the district of Gomor, not far from the river Széjo, and formerly noted as the residence of many noble families.

BERZETTO, a town and abbey of Italy, in the duchy of Parma.

BERZOWITZ, a town of Hungary, 12 miles N.N.E. of Leutich.

BES, or Bessis, an ancient Roman weight, containing two-thirds of the as, that is, eight uncia. See As.

The bes originally weighed two asses; whence the origin of the word *quadrina as.* Though Scaliger conjectures it to have been formed from *aetas;* *as bellum from dactulum,* or *bonum from duumum.* Bes was also a linear measure of the ancient Romans. Bes was also a measure of capacity. Bes was also used in the measurement of lands, to denote two-thirds of a jugerum, or acre. See Measure.

Bes was also a money of account, and a current coin among the ancient Romans. See Coin, and Money.

BESA, in Ancient Geography, an ancient city of the Thes współ upon the Nile, consecrated to a god of that name, but formed into a new city by Adrian, who built a temple in it in honour of Antinous, and called it *Antinoe,* or *Antinopolis,* which fee.

BESA, in Mythology, a deity belonging to the city of Abydos in the Thes współ, mentioned by Ammianus Marcellinus in his History, lib. xix. The mode of cultulating the oracle of this deity was by writing the subjects of inquiry on sealed hides, which the priests carried into the sanctuary of the god, and to which they brought back the answers. Isaac Caphabon has conjectured, in consequence of a passage occurring in the Bibliotheca of Photius (Cod. 279.), that this deity was adored at *Antinoe,* or *Antinopolis,* which fee.

BESAILLE, or BESAVLY, Fr. denoting the father of the grandfather, in the Common Law, a writ that lies where the great-grandfather or great-grandmother was feigned the day that he or she died, of any lands or tenements in fœt u p i t ; and after his or her death, a stranger entered the fame day upon him or her, and keeps out the heir.

BESA EU, in Geography, a town of Spain, in Catalonia, at the foot of the Pyrenees, erected by pope Benedict VIII. into an archbishopric, but soon after suppressed; 7 leagues from the Mediterranean, and 5 north from Gerona.

BESANTON, a city of France, and before the revolution the see of an archbishop, and capital of Frank被 Compte, now of the department of the Doubs. This city is surrounded by mountains, and seated on the river Doubs, which divides it into the upper and lower town, joined by a handomé bridge. Of the former, nothing remains except the castle, or citadel, which is a long square built on a sharp rock, and commanding the city, which is defended by a wall flanked with eight towers like bastions. The latter has three long and handomé streets, which are adorned with houses built of free stone, and covered with slate; chiefly about the square called "Battan," which is ornamented with a fountain, whose water proceeds from the statue of Bacchus. The metropolitan church is built at the bottom of St. Stephen's hill, and is a handomé structure, with a high tower. In the middle of the choir is the great altar, on which they expound at certain times, relies in silver shrines enarched with gold and jewels. Near the church of Notre Dame is a triumphal arch, erected in honour of the emperor Aurelian, on which are seen several mutilated figures of men and animals. This serves as a gate to the cloister of St. John the Great. The great hospital of the order of St. Éfprit, for foundlings, is a structure worthy of notice. The priory is remarkable for its excellent economy, and the humane attention paid to its unhappy occupants. The town-house is a large edifice with four wings, having in its front the statue of Charles V. in bronze, with a globe in one hand, and a sword in the other. The imperial eagle is raised over a large baflon, and supported by two its beaks. The government of the palace is magnificent; and beyond it is a fountain, adorned with the figure of a naked woman discharging water at her nipples. Under the Romans, this was one of the most magnificent places which they had in Gaul, and many remains of its superb buildings are yet visible. After the death of Julian, it was almost destroyed by the Germans, and a second time by Attila. It afterwards became an imperial city, till the time of Lewis XIV., who, in 1674, made himself master of it, repaired its fortifications, and united it to France. The university of this city is an ancient and celebrated foundation; and in the year 1772 a literary and military society was instituted in this place. It contains 5 parishes; and the number of inhabitants, which was formerly estimated at 40,000, is now supposed to be reduced to 30,000. The canton of north Besançon is divided into 15 districts, and that of south Besançon 16,662 persons. The territorial extent of Besançon comprehends 975 square miles; the former canton includes 3, and the latter 4 communes. N. lat. 47° 13' 45". E. long. 6° 40'.

About 20 miles from Besançon, near the abbey of "Grace Dieu," there is a natural ice-cellar, in a very romantic situation. On the highest part of a mountain, covered with a thick grove of lofty trees, is the opening of the cavern, which resembles by its depth, faid to be above 220 feet, and by the solemn gloom of the surrounding wood, what poets have feigned of the descent into the infernal regions. The cavern itself is 60 feet in length and height, and 40 in breadth; the bottom is covered with ice, of which vail pyramids rise from it, while others appears suspended from the arched roof, with their points opposite to those of the former. Within the cave is a hole or well, always full of water, and never frozen; and, at the entrance, some mould, which seems to have been accidentally thrown there, and adorned with primos and other wild flowers. The ice, which in the cavern appears of a beautiful azure, is, when seen by day-light, remarkably white. From this natural repository, the ice-bats in Besançon are supplied, when the winters are too mild to freeze water in the open air. This cavern has been the subject of repeated investigation, the result of which may be seen in the "Memoirs of the Academy," for 1712 and 1726.

BESANT, or BIZANT, BIZANT, or BYZANT, a fort of coin, frnacd at Byzantium, in the time of the Christian emperors, and well known in England, and indeed all over Europe, for some ages before the Norman conquest. Few coins ever had a longer or more universal currency than these befants or byzantines; having been current from the very beginning to the end of the eastern empire, not only in all its provinces, but also in all those countries which had been provinces of the western empire, and amongst others in Britain. With us gold and silver bezants were received in payments. But though they are frequently mentioned by all the historians of the crusades, they are rarely spoken of by ours. Neither are they named in Domesday book, nor in the public acts of Henry I. or Stephen, nor in the last will of king Henry II. However, some mention is made of them in private deeds and leases, and also in the Exchequer rolls under Henry
Henry II. The gold beast was pure, or twenty-four carats fine; but writers are not generally agreed with respect to its value. Out of the Greek pound of gold, which was the same with our Tower pound, 72 drachmas were coined, each weighing 3 Troy grains, and worth 40 Saxon pennies, 8 Saxon half-galles, and 9 galleys and four-quarter half-pence of our present money. (Henry's Hist. vol. iv. p. 275.) The silver beast, in the 12th century, was rated at two half-galles. (Lestellion's Hist. et Henry II. vol. i. p. 411.)

Hence the gold offered by the king at the altar, or festivals, is still called beast, or bifan. Thirteen beasts, or bifanias, were presented at the masts at the coronation of the kings of France. Henry II. had that number coined on purpose.

BEZANTS, in Herodotus. See BEZANTS.

BEZARABA, in Geography, a town of European Turkey, in the province of Bulgaria, 48 miles north of Ternov.

BECICUS, in Ancient Geography, a small island of the Propontis, now the sea of Marmora, situated between Cyzicus and the mouth of the Rhyndacus. This, according to Phylly (N. H. i. ii. c. 8), is one of those islands which, being frill joined to the continent, were separated from it by the violence of the sea, or by earthquakes.

BESBOROUGH, in A. Geography, an island in Norton sound, on the west coast of North America. N. lat. 64° 10'. W. long. 141° 15'.

BESBRE, a river of France, in Nivernois.

BESERG HENRU, a town of Asiatic Turkey, in the province of Carasmania; 24 miles north of Askhia.

BESHARRAI, a village of Syria, situated among the mountains in the pachalie of Tripoli, on the road to the Cedars, and distant from them 4 leagues, which is frequented by the Europeans, and where the missionaries have a house. During the winter, many of the inhabitants keep their houes under the snow, with some persons to guard them, and remove to the sea-coast.

BESHTZK, or BESZTK, a district in the government of Tver in the Russian empire, situated on the Maloga. N. lat. 58° 25'. E. long. 42° 25'.

BESFEGER, or BESFEGER, in the Military Art, a place that has been a stage to a fortified place, and those who defended it. See Stage.

BESHEIM, in Geography. See BESSHEIM.

BESILLU, in Ancient Geography, a river of Spain, in Biscay.

BESISTAM, or BESISTAM, a term given to the places of Castile and Lepe. Adena, and some other terms of the dominions of the Grand Seignior, where the Turks have their stations, and expose their goods: 8. A post is often between each of these stations and villages. These huts or races are commonly large, galleried, and covered, with white grasses and thyme ever green. The doors are small, and for convenience are placed on the side of the race, for each room to be entered through the door. See Race.

BESLER, or BESSLER, in Botany, born at Nuremberg, Sept. 29th, 1663, and created doctor in medicine at Augsburg in 1595, went into Italy for his learning, and stayed in his professorship; he was seven times appointed dean of the university of Rome, and professor of the medicine of the university of Padua. He died November, 1632. Bev. Bessler, brother to Bessler, was born at Nuremberg in 1595, and in 1612, was created an apothecary. Applied to the use of this profession he soon became celebrated in that country. In 1643, he published "Herbes cystatorum præcizados, unius ordinarium plantarum ex variorum ortibus patris, singulari studio collectarum, qua in celeberrimus viridarium armencis effectum jvem luidem cingenterum, hæc temporis contrariorum, demonstrat, et sivum represejiant," Nurem. 1613, in 4 vols. 8vo. folio. The work splendidly illustrated, the plates, 350 in number, and delineating 1533 plants were engraved at the expense of Conrad, bishop of this see. The work is accused to its execution, as before the errors committed in the description of many of the plants, and none of the delineations are fictitious, taken from fancy, or from the rude accounts of ignorant travellers. But the far greater part of them are correctly drawn, and beautifully executed. As Bessler was ignorant of the Latin language, his brother Jerom furnished the preface. He also published "Falcifolus rarius, et admiranda ignotis variis genus, quae non sequuntur," Nurem. 1616, 4to. Max. de tris etiam some marine plants and fruits: also, "Icones florum et herbarum, &c." fol. 1622. It is a continuation of the hortus eystettes, which have been several times reprinted. The time of his death is not known. Haller Bib. Pet.

BESLER, MICHAEL RUPERTUS, born at Basf, was born in 1667. Having studied some years at Altdorf, where he was admitted doctor in medicine, he returned to Nuremberg, and was advanced to the same offices that had been enjoyed by his uncle. In 1631, he published, in 4to. "De fagine sectundum et prater naturalum," and in 1640, folio. "Admiranda fabrica humana multibies partum generatione potissimum infirmitum, et fictus ficedis quique tabulis hactenus nonquam viva delineatio." The work is ingenious, but the plates, which are copied from Fabriacus, are ill executed. This work was followed, in 1642, by "Gazophylactum rerum naturalium ex regno vegetabilis, animalis et minerali de promptuarum fiduciis illustratum," fol. and the same year, by "Observatio medie familiaris, cum alios tres libros continet," 4to.

BESLERIA, in Botany, so named by Plinius after Basl, that was by Nuremberg, editor, with the assistance of Jungermann, a famous work, entitled "Hortus eystettensis," 1613. Lin. Gen. n. 755. Reich. 513. Schw. 1612. Plun. 8. Jacc. Amer. 187. Joff. 121. Garin. t. 52. Chas. and other "Botanicae insignis, &c." Nat. Ord. De nat. Speciunis, Scophelaria, Joff. Gen. Char. Cat. Periath one-half, five-parted, ornamental, erect, spiny, with reflexed tops. Cal. campanulata, ringed; tube the length of the calyx, rounded, gibbous on one side at the base, and at the top hard; five-lobed, divided into the lowermost half, the two upper having divided. Stem. Leaves four, within, the tube of the corolla, of which two are a little shorter; others oblong, twin, hanging down on each side. P. 4. Gyn globular, sitting on a glandulous body, which embraces it, and is permanent, coriaceous where the corolla is gibbous; hy vy subfuscum, erect; stigma filiform, obtus. P. 1. Berry subglobular, one-lobed; pendent, two opposite lanceolate leaves, not con- caved. G. 3. Seeds numerous, round, very small, thick, fixed to the inner surface of the berry.

BES. Char. Cat. five-parted; berry subglobular, many-lobed.

Sec. 1. B. meliloti. "Peduncle brunching; leaf oblong. It has a smooth, woody, pointed stalk; with two ovate nerves; leaves opposite at each joint, which are erect at their edges; the flowers proceeding from the wings of the leaves upon short branching stalks, each following in one with short leaves. A native of South America. 2. H. latif. Cham. Brown. Jan. 275. S. & C. fl. latum, major, Pinn. Gym. 29. "Peduncle terminal, or united; leaves lanceolate." Edging with the immediate leaf, or even seven feet high, divided to the top into many irregular branches, with spear-shaped bracteate leaves, having many twining branches, the flowers arising at the wings of the leaves in large clusters, each
on a separate footstalk, and small, tubulous, of a pale yellow colour." A native of Martinico, Jamaica, &c. 3. B. crista: a shrubby plant, differing in its habit from the foregoing, climbing up trees, and adhering to them by roots issuing from the joints; the twigs round, hispid, and long; the leaves ovate, acute, ferrate, hisped, wrinkled, veined, petiolar, opposite, two inches long; peduncles one-flowered, axillary, bent down, almost as long as the leaves; calyx bright scarlet; corolla yellow; stamens proceeding from a common membrane, faldened to the tube of the corolla, and eleft longitudinally at its gibbous part. Before the diffusion of the pollen, the filaments are upright; afterwards interwoven as in Martynia. A yellow conspicuous gland embraces the germ. A native of Martinico, in moist mountainous woods. 4. B. biflora. "Calyxes bivalve, torn." Stem herbaceous, long, creeping, hairy, round; leaves opposite petioloed, veined, hairy, nerved, a hand's breadth long; peduncles latered, opposite, shorter than the leaves, two from each axis, one-flowered; berry oval, with a hard two-celled nucleus; resembling the third species in the leaves and calyx, but very different in the fruit, and in wanting the five-leaved perianth. Observed at Sarmam by Dahlberg. 5. B. tigris. "Calyx semi-erect, falcate, ovate." A native of the island of Otaheite. 6. B. cyamens. "Peduncles cymose; pedicles with little bractes; leaves ovate, crenate." A native of the island of Tanna.

Propagation and Culture.—These plants grow naturally in the warm parts of America. The seeds should be sown on a hot-bed early in the spring, and the plants, when half an inch high, transplanted each into a small pot filled with light fresh earth, and plunged into a hot-bed of tuner's bark, watered and shaded till they have taken root; afterwards according to the warmth of the season, and the bed in which they are placed. When the plants have filled these small pots with their roots, they should be shaken out, and their roots trimmed and put into large pots filled with light fresh earth, and plunged again into the hot-bed, where they should have much air in warm weather, and be frequently watered. Thus managed, the plants will thrive in summer, but in winter they must be removed into the liove, and often, but sparingly, watered. In the second year these plants will flower; they sometimes perfect their seeds in this country; but as they will not live in the open air, they must be constantly preferred in the liove. Martyn.

BESONS Rocks, in Geography, are two small rocks off the western point of Cornwall, bearing W.S.W. from Cape Cornwall, and N.N.E. from the Long ships. Ships may fail within them without danger.

BESORCH, in Commerce, a coin of tin, or of some alloyed metal, current at Ormus, at the rate of about 12 parts of a farthing sterling.

BESS, or BEFULUS, in Geography, a river of Spain in Catalonia, which runs into the sea not far from Barcelona.

BESSARABA, in Ancient Geography, a town of Thrace, situate 12 miles from Philippolippos.

BESSAR, a town of Asia in Byzantium, situated near the Tigris. Potemkin.

BESSARABIA, BUDZIAC, or BODJAK, in Geography, is a small country of Turkey in Europe, situate between the north branch of the Danube and the river Dnieper, and bounded on the west by Moldavia, on the south by the Danube, on the east by the Black sea, and on the north by Russia. It was anciently the country of the Gete and Puceini; but it is now inhabited by the independent Tatars, of whom some have fixed habitations in their villages, and others lead a kind of wandering life, subsisting on the flesh of their oxen and horses, and on the milk of mares, and the cheese which is made of it. In their religion, manners, and customs, they resemble the Cimb Tartars. When an army is sent to attack them, they retire into inaccessible mountains, on the coast of the Black sea, whence it is impossible to expel them, on account of the moraLees and defiles. The chief towns are Bender, Akerman, Kismi, and Imsil. This country, and also Wallachia, on which it borders towards the south-west, contain some lakes of considerable extent, as those round Imsil, and that to the east of Suraz, which communicates with the Danube, and forms a part of that river.

BESSARION, Cardinal, in Biography, was born at Trebliod in 1395, and educated at Constanfa, under some of the most learned Greeks of that period. In the course of his education, he adopted the principles of the Platonic philosophy, and was more confirmed in them by the lectures of George Gemistus Pletha, on whom he attended in the Morea. These principles he combined with his system of Christian theology. Having taken the religious habit of St. Basil, he was soon advanced to the bishopric of Nicea, and employed by the Greek church to attend on their behalf at the council held under pope Engelius IV, first at Ferrara, and afterwards at Florence, in 1439; with a view of effecting an union between the Latin and Greek churches. But he incurred the displeasure of the Greeks by including to the party of the Latins, and proposing an union of the two nations, to the prejudice of the former, who were required unequivocally to declare that the Roman pontiff was the supreme head of the universal church. Beffarion became unpopular in his own country, nor could he venture to revisit Constantinople; but remaining at Rome, and subserbing the articles of the Latin church, he was recompensed, in 1439, by a cardinal's hat, and he was also created titular patriarch of Constantinople. Having perfected himself in an acquaintance with the Latin language, he was from this time employed by the popes in several concerns of moment. Nicholas V, after naming him to the bishopric of Sabina, and afterwards of Praetut, sent him as legate to Bologna, where he resided from the year 1450 to 1455, and contributed to revive and increase the reputation of the university. Upon the death of Nicholas, the cardinals had an intention of advancing him to the papal see; but when they waited upon him with this view, they were prevented from seeing him by one of his attendants, who would not allow him to be disturbed in his studies; upon which Beffarion, when he was informed of the fact, said to him, "Perot, thy inactivity hath cost thee a hat, and me the tiara." Beffarion was engaged by the popes Calixtus III and Pius II, in negotiating the mutual league against the Turks, and deputed for this purpose to Alphonso, king of Naples, and the emperor Frederic. During the pontificate of Paul II, he lived at Rome, and distinguished himself in the promotion of literature, by opening an academy in his palace for the study of philosophy, and for gaining a critical knowledge of the Greek and Latin languages: nor was he less liberal and active in encouraging every other branch of science, by countenancing with his presence and patronage those affinities that were frequented by the Greeks and Italians for the purpose of mental improvement. His library, which contained many Greek MSS, is said to have cost him 50,000 crowns; and this he presented, in 1468, to the republic of Venice, where it became the chief foundation of the library of St. Mark. Having received from pope Sixtus IV the appointment of legate to France for the purpose of reconciling king Lewis XI, and the duke of Burgundy, he paid his first visit to the duke, and thus offended Lewis to such a degree, that he treated him with rudeness, and disfitted him without
without entering on the business for which he was deputed. This kind of reception affected him so much, that on his return he fell sick at Turin, and died at Ravenna in 1572. He was regarded as a person of unparalleled genius and erudition; and he was the author of many works, both in Greek and Latin, some of which were printed, and others left in MS. The chief of these was his defence of Plato, against George of Trebizond, in a treatise entitled "In calumniatorum Platonis, lib. iv.," first printed without a date at Rome in 1570, and re-edited at Venice in 1523 and 1516, folio. In this publication he examines Plato’s opinions, particularly with regard to morals, and shews that they approach much nearer to the doctrines of Christianity than those of Aristotle. Of his printed works are letters, orations, and translations of Xenophon’s Memorabilia, the metaphysics of Aristotle, and that, falsely ascribed to Theophrastus. According to Brucker, these translations are very obscure; but Huet comments Hefferon as the model of all good translators.

BESARKNOVA, in Geography, is the well point of a bay in the sea of Azof, of which the east point is Cape Berdinsky. N. lat. 46° 35’, E. long. 36° 46’.

BESSAGNO, or Besa-sen, a place of Iceland, (N. lat. 64° 6’) the residence of the king’s precent. In this place is a woollen manufactury, with a fulling mill belonging to it.

BESSAY, a town of France, in the department of the Allier, and chief place of a canton in the district of Montluin, 3 miles south of Moulins.

BESS, in Commerce, a Persian copper coin, in value 1/4 d’Ahering.

BESSON, in Geography, a town of France, and principal place of a district, in the department of the Puy-de-Dôme, 5 leagues south of Clermont. The town contains 1013, and the canton 11,016 persons. Its extent comprehends 435 kilometres and 12 communes. N. lat. 45° 31’, E. long. 2° 32’.—A11o, a town of France, in the department of the Var, and chief place of a canton in the district of Brignoles, 6 miles south of St. E. of Brignoles. The town includes 1578, and the canton 83 65 persons. The territory contains 374 5 kilometres and 7 communes. —Also, a town of France, in the department of the Sarte, and chief place of a canton in the district of St. Caimais, on the river Brave, 5 miles south of St. Calais.

BESSENEY, a town of France, in the department of the Rhone, and the district of Lyon, 4 leagues west of Lyons.

BESSENBACH, a town of Germany, in the circle of the Lower Rhine, and archbishopric of Mentz; 6 miles east of Aachenburg.

BESSERNE, a small island of Denmark, 2 miles S. E. of Veyore.

BESSI, in Ancient Geography, a people who inhabited a district of Thrace, near mount Hemus, called Bifcia. They lived in huts, and maintained themselves by plundering their neighbours. They were the mild savage and inhuman of all the Thracians, according to the account given of them by Str. Jerom, Paulinus of Nola, Eutropius, and Ovid. Their chief city, Ufculana, is now known by the name of Adrianople. They lived under their own kings, undisturbed by the neighbouring princes, till the conquest of M. Licinius Lucullus and C. Cassius Varus. Lucullus invaded their country; after a signal victory took possession of it, and subjected the whole nation to the Roman laws. The Romans afterwards allowed them to live under their own kings; but Piso, while he governed Macedonia so confusly, having treacherously seized Rabocentus, whom Strabo calls prince of the Bessi, caused him to be publicly beheaded; and this front of fornice raged among the whole nation, that they flung off the Roman yoke; however, they were vanquished in a considerable battle by Octavius, the father of Augustus. During the civil wars of Rome, they again attempted to recover their liberty, but were subdued by the famous M. Brutus, junior. In the reign of Augustus, one Vologeses, a native of the country and priest of Bacchus, having, under pretence of religion, assembled a numerous body of people, made himself master of the whole country, and entering the Chersonesus, committed most dreadful ravages; but was at last overcome by L. Piso, who obliged the savage inhabitants to lay down their arms, and submit to such conditions as he was pleased to impose. From this time the Bessi continued subject to the Romans, without making any further attempts to recover their ancient liberty. Eutrop. l. ii. Orph. l. iv. c. 3. Flor. l. iv. c. 12. Suicton, in Octav. Dio Cass. l. xvii.

BESSIERES, in Geography, a town of France, in the department of the Upper Garonne, 5 leagues N. E. of Toulouse.

BESSIGBEIM, a town of Germany, in the circle of Swabia, and duchy of Wuertemberg, near the conflux of the Ems and Neckar, 8 miles south of the Heilbronn, and 13 north of Stuttgar. The district of the same name is a good wine country.

BESSIN, the name, before the revolution, of a small country of Irance, in Lower Normandy, near the sea-coast.

BESSINES, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of Belle, situated in a deep, narrow, rocky valley, 6 leagues north of Limoges. The town contains 2511., and the canton 9372 persons. The territory includes 180 kilometres, and 77 communes.

BESSIS. See Bis.

Bessis Centum, denotes twiehords of cubic inches, orậyy at eight per cent.

BESSONTE, J., in Geography, a town of France, in the department of the Savoie, and chief place of a canton in the district of Caltres, 3 leagues N. N. E. of Caltres.

BESSY BEU, a mountain of Ireland, in the county of Tyrone, 10 miles south of Strabane.

BESTAAD, a town of Norway, 56 miles N. N. E. of Drontheim.

BESTAGNO, a town of Italy, in the duchy of Monteg, on the Borinda, 18 miles E. of Alba.
BESTAIL, or BESTIAL, in Ancient Statutes, is used for all kinds of cattle. 4. Edw. III. c. 3. It has been appropriated more, in former times, particularly to those that were purveyed for the king's provision.

BESTARCHA, a dignity in the courts of the emperors of Constantinople, supposed to answer to that of the Master of the wardrobe among us.

The word bestarcha seems to have been formed from *bestarca*, by a change of τ into β.

BESTERTZ. See BISTRITZ.

BESTIARI, among the Ancient Romans, those who were hired to combat with beasts, or those who were exposed to them, by sentence of law.

We usually distinguish two kinds of bestiarii: the first were those condemned to the beasts; either as being enemies taken prisoners, or as being slaves, and guilty of some enormous crime.—Those were all exposed naked, and without defence, to the beasts; nor did it aught avail to conquer and kill the beast, frenz ones being continually let loose on them, till they were dead. But it seldom happened that two were required for the same man; on the contrary, one beast frequently dispatched several men. Cicero mentions a lion, which alone dispatched two hundred bestiarii.—Those who succeeded the first were called τεχερες, and the last *τεχερες*; among the Romans, *meridians*.

The Christians were bestiarii of this kind, even some of them who were Roman citizens; though it was the legal right of such to be exempt from it.

The second kind of bestiarii, Seneca observes, confined of young men, who, to become expert in managing their arms, fought sometimes against beasts, and sometimes against another; and of bravoes, who, to show their courage and dexterity, exposed themselves to this dangerous combat. Augustus encouraged this practice in young men of the first rank; Nero exposed himself to it; and it was for the killing beasts in the amphitheatre, that Commodus acquired the title of the Roman Hercules.

Vigeneor to these adds two kinds of bestiarii more: the first were those who made a trade of it, and fought for money; the second was where several bestiarii, armed, were let loose at once, against a number of beasts.

BESTOROZIN, or BESZERMEY, in Geography, a town of Hungary, 8 miles N.N.W. of Debreczin.

BISTRITZA, or BISTRIZA, a large town of Lower Hungary, on the Wagg, with a cable facing it, seated on a high rock on the opposite side of the river.

peta difta. Park. par. 489. Turnep-rooted red beet. 5. *B. lutea* major. Bauh. pin. 118. Rall hilt. 204. n. 5. —*arya*. Park. theat. 751. n. 3. Yellow-rooted beet. 6. *B. pallide viricas* major. Bauh. pin. 118. Green-leaved red beet. "Flowers headed; leaves of the calyx toothed at the base." This species has large, thick, succulent leaves, generally of a dark red or purple colour. The roots are large and deep red, on which their goodness depends; for the larger they grow, the more tender they will be, and the deeper their colour, the more are they esteemed. A native of the coast of the southern parts of Europe. The variety alba has the leaves shorter than in the white beet, more or less red, and sometimes so dark, as to be called black beet; its root white. 8. *B. fusa* has leaves large and red, as is the whole of the plant, as well root as stalk, and flowers full of a purple juice, tending to redness; the midrib of the leaves are very broad and thick, like the cabbage leaf, and equal in goodnews when boiled. Gerard says, that it grew with him in 1596, to the height of eight cubits, and brought forth its roots feeds very plentifully. These, though taken from a plant of one colour, produce plants of many and valuable colours. 9. Stem higher than the common red beet; root thick, within and without of a high blood colour. 8. Leaves paler than those of the white beet, of a greenish yellow colour; the root of a fine, high yellow, sweet and well tasted. All these are mere feminine varieties. The beet is subject to change, and to degenerate, at least in our climate. It has been supposed, that the *B. ceto* is not specifically different from the *vulgaris*, and that both are derived from the *maritima*, cultivated on a rich soil, in southern climes. The beet is said to be prejudicial to the stomach, and to yield little nourishment. Taken in quantity, it tends to loosen the belly. The juice of the root and leaves is said to be a powerful emetic, and to occasion a copious discharge of mucus, without provoking freezing. A good sugar may be obtained from the juice of the fresh roots. This species was cultivated in 1636 by Mr. John Tradescant, jun. 2. B. ceto, white garden beet. B. hortensis. Mill. Diff. n. 2. B. vulgaris, z. Lin. Spec. 322. B. alba. Ger. 251. n. 1. emac. 318. n. 1. Rall hilt. 204. B. communis alba. Park. par. 490. 1. B. alba vel palletecas, quæ cicca offic. Bauh. pin. 118. and B. communis viridis *spinthyl*. "Flowers three-fold; leaves of the calyx unarmed at the base." The root of this for t is seldom grows larger than a man's thumb; the stalks grow erect, and have oblong, spear-shaped leaves growing close to the stalk; the spikes of flowers are axillary, long, and have narrow leaves placed between the flowers; the lower leaves are thick and luscent, and their footstalks broad; and for the sake of the cheese it is cultivated. A large variety of this has been lately introduced from abroad, under the titles of "Racine de diettier," "Root of Scarlet," and "Mangel Wurzel." The anciently called the white beet *Ceto*, or rather *Seto*, by contradiction from *Sicula*, Sicilian beet; as we call the Savoy-cabbage, *Savoy*. Mr. Miller mentions three varieties of this, viz. the white, the green, and the Swiss or chard beet; by the latter of which he probably intended the name as the modern "Mangel Wurzel." He says that they vary from one another in culture, but that they never alter to the first or the third. 3. B. maritima, sea-beet. Lin. spec. 322. S. 262. Reich. 623. Hudf. 108. Witter. 275. Eng. "Flowers double or twin; stalks decumbent; leaves of the calyx even, not toothed." It differs from the others, according to Linnaeus, in flowering the first year; in having oblique or vertical leaves; and in the leaflets of the calyx being equal, not toothed; according
BETA.

ing to Ray, in having a perennial root. This is probably the original parent of all the garden beets. A native of Holland and Great Britain, on the sea-coast, and in salt marshes; it is also found plentifully about Nottingham. It is perennial, and flowers in August. 4. B. patula, spreading beet. Nut. hort. kew. p. 435. "Flowers heaped; all the leaves linear-lanceolate; branches divaricated. " Stem short, hardly a foot high, very branching; branches long, terminal; calyx-inner petals at the base, but not toothed." Flowers in August. A native of the island of Madeira. Introduced in 1798. Martyn.

BETA, in Gardening, comprehends several different useful edible roots and culinary herbs of the hardy kind, as the B. cicla, or common culinary beet, which has a small, oblong, white root, producing from its crown many large, oblong, succulent leaves, on broad footstalks, and erect branching feed; stems two or three feet high, garnished with close-set ting leaves, and long spikes of greenish flowers, which are succeeded by plenty of ripe feed in autumn. The varieties of which are the common green-leaved beet; {large white beet; chard, or great Swifts beet, having very broad leaves, with thick foot-stalks and ribs. These often vary from one to the other, the feed of one frequently producing some of each sort, though by proper care in sowing it, the difference may be preferred.

The B. major, or great German beet, commonly called mangel wurzel, has a large, long, reddish, or sometimes whitish red root; and very large, oblong, thick, succulent leaves. The varieties of which are—dark green-leaved—light green-leaved—red-stemmed beet. This species has been very much recommended, on account of its vast growth and great utility both in its root and leaves; experience has, however, shown the former to have little claim to eileem for domestic uses, as it is of an inapid and unpalatable taste; but the leaves being large and succulent, are good to use occasionally, in the manner of common beet, and particularly to boil as spinach, or put into soups; and the stalks and midrib of the leaf to be dried and eaten as aparagus. Dr. Lettson, who took much pains to introduce the mangel wurzel, informs us, that on his own land, which was not favourable to its growth, the roots, upon an average, weighed full ten pounds; and if the leaves were calculated at half that weight, the whole product would be fifteen pounds of nutritious orch, upon every square of 18 inches.

The B. rubra, or red beet, has a large, red, edible root, crowned by many large, oblong, reddish-dark-purple leaves; and when it shoots, sends up erect stalks and branches, terminated by long spikes, of flowers and seed. The varieties of which are common red beet, with a large, long, dark-red root; turnip-rooted red beet, with a stout, large, dark-red root; with a red root; and green leaves; with a yellow root; but the first of these varieties is most preferred for general culture, though the second is equally good, but the root is not of so good a shape as that of the former; the other two are not proper to cultivate for a crop.

Methods of Culture of the common Beet. All the varieties are propagated by seed sown annually in the spring, in February, March, or April; in the places where the plants are to remain, in order to attain proper growth for use in summer and autumn. They will continue till spring, when they shoot for feed. If the feeding be neglected in the spring, some feed may occasionally be taken in summer, any time till the beginning of August. In a month from then, but the spring is the most eligible season for obtaining a good crop. They may be sown in any common soil, allowing each foot a separate plot or bed. The soil should be dug one foot deep, in the usual way; the seed then either sown broadcast on the surface, and raked in; or, as it is a large feed, shallow drills may be drawn, at the distance of six inches for the common green and white varieties, but almost double that for the large white and chard beet, sowing the seeds thinly, and raking the earth over them, about an inch deep, then trimming the surface smooth. The plants come up in about a month, and when they have leaves an inch or two broad, they should be hoed, to thin and destroy weeds, cutting out the common green and white sorts to about six inches distance; but the chard beet should be allowed ten or twelve inches room every way, that their large succulent leaves may have full scope to spread. They are commonly in perfection in June and July, and it is necessary to observe, in gathering them, to take the large outward leaves, the others coming in for use in their turn, an abundant succulent supply rising from the root. A succulence crop must be raised every year from feed in the spring, &c. for although the same crop might be occasionally continued two years, by cutting down the feed-items of the year-old plants, according as they advance in spring and summer; the roots abiding, produce a supply of leaves, but which are much inferior in quality to those of the annually-raised feeding plants; it is better, therefore, to grow every year, in order to have a good production. The large white and great chard beet are in much esteem, for the stalks and ribs of the large leaves, being divested of the leafy part and peeled, are good improvers of soup, and useful also for flaving, and to be dried and eaten like paragus, and the leaves themselves are fine pot-herbs; for all which uses, the several varieties of this species may, as has been seen, be obtained almost the year round.

The Mangel Wurzel Beet. This fort has generally been reckoned a variety of the B. cicla; but some botanists have made it a distinct species, under the title of B. altiflora. It is raised from feed sown annually in the spring, the same as the other sorts, in any open situation, but should generally be sown thinner, either in drills one or two feet asunder, or broadcast on the general surface, and raked in; and when the plants are come up one, two, or three inches in growth, they should be thinned to a proportionate distance, to give room for the full expansion of their large leaves. Some, however, advise transplanting, when the young plants are of two or three inches in growth, setting them in rows one or two feet asunder; this seems, however, unnecessary; especially, as they have long, downy, tap roots, which generally are the most successful when they remain where sown; the method may, nevertheless, be practised occasionally by way of experiment. The plants generally continue to produce leaves the greatest part of the year, and the roots attain perfection for use in autumn and winter, till spring; but when it is required to have a principal crop of full-sized roots, some should be allotted for that purpose, without cutting or gathering the leaves. This fort is valued most generally for its leaves, for which it principally is cultivated in the gardens; as we cannot much recommend the root, which, although it grows very large, sometimes of several pounds weight, is greatly inferior in use, both to the red beet, and to that of most others of our edible roots, for any domestic purposes. It is sometimes used in the manner of carrots and parsnips, &c. dried, and used up with butter, but is generally of a meagre, unpalatable quality.

The leaves, however, which, it the plants have large scopes of room, grow twelve or fifteen inches broad or more, and of proportionable length, are exceedingly good, when young, to use as the common white and green beet; and the young, thick, fleshy stalks, divested of the leafy part, peeled or
scraped, then boiled and served up with butter, are tender and agreeably tasted; also the leaves to boil occasionally as spinach and other small greens; and of which the root is remarkably productive in quick growth, to afford frequent succedaneous gatherings all summer and autumn, either cutting them off close, or gathering only the larger outward ones, as in either method they soon shoot up again in plentiful succession.

The Red Beet. This is raised from seed sown annually in March or April, in the place where the plants are to remain, being careful to procure that of the best dark red root. It should be allowed a light, rich, deep soil, in an open exposure. The market gardeners often sow this root thinly among their crops of onions, carrots, &c. that are to be drawn off while young; so that when these are gone, the beet commences a full crop.

It is, however, a better practice to sow the principal crop separate. The ground should be dug one spade deep at least, and well broken, the seed sown directly, which may either be broadcast on the surface, or raked well into the ground; or, as observed of the first root, in drills drawn an inch deep, and at the distance of ten or twelve inches; or you may do it or prick it, as is often practiced, with a blunt dibber, in lines at the above distance, making the holes an inch deep, and eight or ten inches, the rows, dropping two or three seeds in each hole, though only one good plant should be left in each place. In May or June, when the plants have leaves an inch or two broad, they require thinning and clearing from weeds, which may be performed either by hand-weeding or small hoeing; the latter is the most expeditious for large crops, and it loosens the surface of the earth, to the great advantage of the young plants; carefully eradicate all weeds, and thin the plants to ten or twelve inches distance. Some of the roots will be fit to take up for use about the end of August, though they will not attain full perfection until October. In November, a quantity of the roots should be taken up, their tops trimmed off, not too close, and then laid in land or dry earth, under shelter, to be ready for winter use.

This sort of beet is highly valued for its large red root, which in the common variety, often grows twelve or fifteen inches long, and three or four inches thick or more; but that of the turnep-rooted sort is much shorter, and generally thicker, and of equal goodness in every respect for use; and in both of which, those that are of the largest growth and darkest red colour, are the most valuable: these roots being tender, sweet, and palatable, are boiled, sliced, and eaten cold, &c. are also sliced and scraped in fullal'd, both as an edible ingredient, and by way of garnish; slices of the root are also in request not only as garnish to dishes, but as a pickle: the other varieties are never cultivated for any principal crop.

Saving of Seed. In order to save seed from any of the varieties, either mark some of the best plants in spring, to be left to run up, or transplant some of them in February or March into a convenient place, to have shelter from winds; they shoot up flalks in May; in June they must be supported with flales; and the seed will ripen in September.

That a great quantity of sugar might be obtained from white beet, has been long known. The famous chemist Margraaf made experiments, half a century ago (published in the year 1747) for determining the quantity of sugar contained in various European plants. He found that the white beet produced a much greater quantity than any of the other plants. The beet has of late been much cultivated, particularly in Germany, with a view to the sugar that is obtained from the root. M. Achard of Berlin, first introduced this subject into general notice, and recommended that the sugar should be procured by boiling the beet-roots, when taken out of the earth; that they be sliced when cold; that afterwards the succedaneous gathering is collected; and that it be filtered, evaporated, and, after evaporation, the sugar be procured by crystallization and purified. He has published his method at full length, in "Ausführliche Bechlerburg," Berlin 1799. 8vo. He lays much stress on the mode of culture, and observes, that red sugar can be produced at about three-pence a pound. His peculiar mode of culture consists chiefly in planting the seeds at a certain distance from each other, and in not transplanting the roots. M. Achard reckons three varieties of the beet-root; but he prefers that which has the skin of a red earth, and the flesh white. The kinds of beets which have been used for this purpose, are varieties of the B. vulgaris. Mr. John Taylor of Leipzig has given a particular account of the method of cultivating the common beet, and of preparing sugar from its root, in a letter addressed to his father, the secretary of the society for the Encouragement of Arts, &c. and published in the 18th volume of the Transactions. He observes, that the soil should be a good black earth, too moist; and that it should be prepared, like that designed for cabbages, by dunging it in autumn with short rotten dung, and ploughing it, and by turning it again in spring, and ploughing it at a third time to a greater depth than before. After the third ploughing, says M. Achard, it should be carefully harrowed, to render it smooth and even, and to break all the hums of earth which may happen to be in it. The seeds are usually placed at the distance of from 12 to 18 inches from one another, from 9 to 12 inches according to M. Achard, and at the depth of one inch in the earth. One seed is laid in each hole, and immediately covered with earth. In four or five weeks time the ground must be weeded, and afterwards hoed. Some prefer transplanting the roots, to sowing the seed in the ground where the plants are intended to remain. M. Achard forbids all transplanting; and one of his reasons for this prohibition is, that the lower part or points of the roots are liable to be thus broken off, which part, he says, gives more sugar than the upper part. After they have been some time in the ground, the earth should be loosened with a hoe, and the weeds destroyed. The method invented by professor Guttling for separating the sugar from the beet-roots, is easily practicable, and adapted to this country. It is as follows:—He recommends the taking of the beet-roots out of the ground from the middle of September to the middle of October, that the weather may be favorable for drying them, which should be done carefully, left, as M. Achard observes, they should be damaged, and any of the juice which oozes out left; and washing them as speedily as possible from the earth that adheres to them, and cutting off their small fibres as well as such part of the root as had arisen, whilst they were growing, over the surface of the earth. The roots are afterwards wiped with a cloth, and laid upon a dry floor; the heads are cut off and given to the cattle; and the roots are sliced lengthways, along the middle, each half being cut again into slices, and loosely hung, not too near each other, left they should spoil, on strong thread, suspended on nails, in an airy chamber or place secure from the rain. In the course of two or three weeks, with proper attention, they will be sufficiently dry for the extraction of their sugar. If the drying season is far advanced, or a frost expected, the beet-roots should not be exposed to the outward air; they should be dried in the kitchen or warm rooms, either on strings or netted frames, resembling the flake used in Yorkshire for drying oat-cakes; or they may be dried in rows-rooms by artificial
artificial heat, taking care to prevent their being smoked or burnt. If an opportunity does not occur for delaying the roots immediately after being taken out of the earth, they should be placed in cellars, and covered with straw, or put into holes in dry sandy earth, and preserved till they are wanted.

M. Achard says, that after the roots are washed and cleaned, they should be dried by means of a machine, or ground in a mortar mill, consisting of a cylinder furnished with points, like a rasp, which turns round in a box. The roots are put in this box, and prefixed, by means of a weight against the cylinder, which, upon being turned round,soon reduces them to a kind of pulp. When the beet-roots are dry, they are ready for the extraction of their sugar. For this purpose, three wooden tubs, wids, but not deep, made of oak, ash, or willow, should be provided, or, for family use, earthen mugs. Near the bottom of the tub, cocks or spigots should be fixed, and the tubs should be placed in a cool situation of about 52° Fahrenheit, upon a shallice near each other, and at such a height from the ground that smaller vessels may stand below them for receiving the liquor when drawn off, and clear water should be at hand so as to be pumped into the higher vessels. When the beet-roots, thoroughly dried, have been lifted, so as to be free from the dust and loose fibres, one of the higher tubs should be half filled with them, and clear cold water poured upon them, about one-third in height above the roots. In this state they should remain for about three hours, stirring them at different times with a wooden paddle. At the end of this time, the same number of clean dried roots should be put into the second tub; and the sweet liquor drawn from the first tub into the vessel under it, should be poured upon the roots in the second; and the first tub should be supplied with fresh water in such quantity as just to cover the roots, and the tubs should remain three hours more, and the roots be repeatedly stirred, as before. The liquor which had been poured from the first tub to the second, will be now much abridged by the roots in the latter tub. After standing again for three hours, the sweet liquor from the second tub must be drawn off, which, if the roots were of the red and white sorts, will be of an agreeable red colour. It must then be passed through a sieve, or filtered through a flannel, and thus be rendered fit for boiling down for sugar. After this, draw the liquor from the first tub, pour it on the second, and put into the first tub more fresh water, and let it stand three hours longer. Then put into the third tub the usual quantity of dry roots, and pour on them the liquor drawn from the second tub; remove the liquor from the first to the second; and the roots in the first tub being now deprived of their saccharine matter, may be used for feeding hogs or cattle. After three hours more, the liquor should be drawn from the third tub and filtered as before, and then boiled down for sugar. Then draw off the liquor of the second vessel, and pour it into the third; add fresh water to the second vessel, and let it remain three hours more, the roots being occasionally stirred. During this time clean out the first tub, and add fresh roots, as before. After three hours, draw the liquor from the third tub, and pour it upon the fresh roots in the first; then draw the liquor from the second tub, and pour it on the third. The roots of the second tub will be now exhausted, and may be given to the cattle. After three hours draw off the liquor from the first tub, filter it, and it will be ready for boiling down. On the contents of the first, pour the liquor of the third, and put fresh water in the third tub; let it remain three hours, and stirred as usual; during which time clean out the second tub, and let the roots be given to the cattle. In the second tub place again fresh roots; and proceed by extracting the saccharine matter, as before; and continue the operation, till all the dried roots have been thus freed from their sugar.

By this management, the liquor becomes more charged with saccharine matter, than when the juice is pressed out of the roots, and a considerable quantity of fuel is spared. The roots from which the liquor has been extracted will have swelled much in the operation, and have lost their sweetness: their farmaceous residuum will, however, afford good food for cattle. Whenever there is a sufficient quantity of dried roots ready, the proc. is of extracting the saccharine liquor should be continued day and night, as it is not proper to let the liquor remain longer than three, or at most four hours, before you boil it, lest a diffusion of the mucilaginous particles of the roots should take place. If it be not convenient to boil down all the saccharine liquor at once to a state of crystallization, yet it should be daily boiled down to the confine of a syrup, in order to prevent its fermentation. In boiling the liquor, the feum that arises should be carefully taken off.

The proceeds of boiling, crystallizing &c., the beet sugars is as follows. First boil the extracted saccharine liquors down to the confidence of a syrup; then put it into a copper, of which one-third at least is empty, and let it boil away by a moderate fire, until a phial, which holds one ounce of water, will contain eleven drams of the syrup, or until the syrup pours somewhat broad from the ladle.

The syrup must not cool too much before this filtration, or else it becomesropy. When the filtered syrup is somewhat cool, it should be laded into shallow wooden or tin vessels, to crystallize; for this purpose, shallow earthen vessels, such as are used to produce cream, or vessels made of tin, are proper. These vessels, filled with syrup, must be placed in a room heated to about 68° of Fahrenheit, and care must be taken to keep them free from flies and dust. If the syrup has been of a proper confection, crystals will soon begin to form at the bottom of the vessels; and in an interval of 18 or 21 days the crystallization will be completed. The mass must then be put into a strong linen sack, well secured, and placed under a press, to squeeze out the liquid from the sugar which remains in the bag. The liquid matter may be set to crystallize a second or third time, and will yield sugar of a coarser quality. A cheesepress, or long lever, will serve for the purpose of pressure. The sugar first obtained, may be rendered purer by mixing with it a small quantity of clear spring water, and placing it again under the press; the coloured syrup will then run out, and leave the sugar in the bag in a much purer state than before. By repeating the operation, it is in far improved, that, when dried and rubbed, it becomes a fine white powder sugar. The separated syrups should be again carefully boiled, and more sugar will be obtained from them by crystallization. If the sugar procured by the first pressure be dissolved in as much clear water as will form a syrup, and placed again in a warm room to crystallize, it will yield a much purer and harder sugar: the syrup may then be separated without pressure from the sugar, merely by inclining the vessel, and allowing the syrup to run off from the crystals. All the syrups thus prepared, are fit for family use, and are much superior in taste to those prepared from the press of the raw or boiled roots. The remaining thick syrups may be used as treacle or molasses, and will serve to distil form or spirits. From the experiments
of professor Lampadius of Freyberg, near Dresden, it appears, that beet-roots contain water, fibrous matter, sugar, mucilage, glair, flarch, colouring matter, scented matter, and a bitter subflance. The water is in the proportion of from one-half to one-third of the weight of the roots; the fibrous matter of the roots differs, and is considerably more in poor than in rich roots; the faccharine particles vary from two to five per cent.; the mucilage is from three to five per cent.; and the glair, or matter resembling white of eggs, is about one per cent.; the flarch is in very small quantity, being only about two or three ounces in a hundred weight; the colouring matter undergoes several changes by exposure to the air, as yellowish, brown, and red, and may be precipitated by acetate of lead; the scented matter is volatile, rising in distillation of the root with water, combining clofy with spirits of wine, and producing a peculiar conatraction in the organs of taste. By boiling the beet roots, the smell and taste are very much leskened. The bitter subflance is soluble in water, and remains behind in the first syrup after the crystallization of the sugar. From other experiments of the same professor, it appears, that 11 lbs. of beet-roots, the beta cica of Linnaeus, or white English beet, washed, peeled, cleaned, and then grated, gave a mass which weighed 57 pounds; out of which were pressed 41 1/2 pounds of juice, which was boiled with 20 1/2 ounces of charcoal powder. This, when filtered and evaporated down until crystallized, produced five pounds of a brownish yellow-grained sugar, and also five pounds of brown syrup. The above brown sugar, after being distilled in six pounds of lime-water, mixed with one pound of blood, then boiled, filtered, and afterwards evaporated, yielded four pounds 5 1/2 ounces of purifried brown sugar, and 61 ounces of syrup. The four pounds 5 1/2 ounces of sugar, thus prepared, were again distilled in six pounds of lime-water, mixed with one pound of milk, and then boiled for a quarter of an hour; during the boiling, a small quantity of white wine vinegar, and a little more milk, were added; the faccharine matter was filtered, and treated as before; the product was four pounds of well-grained white powder sugar. The residuum after preasure, the brown syrups of the two first processes, and the remains of the filtrations, weighed, when collected, 40 pounds; they were mixed with one quart of yeast, and 80 quarts of water, heated to 112° Fahrenheit, and after fermenting 48 hours, were distilled. They furnished, at the first distillation, 15 quarts of weak spirit, which, on a second distillation, gave eight quarts of a better; from which, when rectified, were produced 5 1/2 quarts of spirits resembling rum. 

From the result of this series of experiments it appeared, that after paying the farmer for the roots, and discharging all incidental expenses whatever, a profit was yielded of nearly 60 per cent. on valuing the four pounds of white powder sugar at one thilling per pound, and the three quarts and a half of rum at one thilling per quart. The produce of beet-roots and their quality for yielding sugar, have, however, been variable; and of course the profit accruing from them. From M. Achard's account we learn, that 24 measures of roots, each of which weighs about 70 pounds, (in all 2160 pounds) and costs about 6d. English, produce 1200 pounds of raw sugar; that is, 200 pounds of roots produce nearly one pound of sugar. One hundred pounds of raw sugar give 55 pounds of refined sugar, and 25 pounds of molasses. Another statement informs us, that 14 pounds of raw sugar gave 1 1/2 pound of lump-sugar, 1 pound of white powder sugar, and 1 1/4 of darker-coloured powder sugar, and eight pounds of brown syrup; from which more sugar might have been obtained. It is computed, in M. Achard's account, that a German square mile of land, (that is, 16 square miles, English), properly cultivated, would produce white beet sugar sufficient to furnish the whole Prussian dominions with sugar.

**BELENSOS, BETANZOS, or BITANZE, in Geography, a town of Spain, in Galicia, 2 leagues from Corunna, 9 from Compostela, and 7 from Ferrol. It has a good harbour in the mouth of the river Mandeo. N. lat. 32° 15' W. long. 7° 50'**

**BETEL, in Botany, an Indian plant, in great use and esteem throughout the East, where it makes a considerable article of commerce. See Piper.**

The betel bears some resemblance to the pepper-tree. It grows like ivy, and twists round other trees. Its leaves are long and sharp-pointed, but broad towards the stalk, and of a pale green colour. They are like thoke of ivy, only softer, and full of red juice, which, among the Orientals, is reputed of wonderful virtue for fortifying the teeth, and rendering the breath sweet. The Indians are continually chewing these leaves, which renders their lips red, and teeth black, a colour by them vailly preferred to the whiteness affected by the Europeans.

The consumption of betel leaves is incredible; no body, rich or poor, being without their box of betel, which they prefix to each other by way of civility, as we do snuff. In many places they chew the areca nut, either alone or mixed with the betel leaf and lime, and the leaves of this plant are sometimes chewed alone; but they are too hard, and usually injure the teeth, and it is not uncommon to find men of 25 wholly toothless in this part of the world, merely from their having chewed this plant to an excessive degree. The prepared betel is a very common present among the poorer fort; and on taking leave of a friend, it is always the custom to make him a present of a purse of the leaves prepared for use. When the poorer fort are to appear before the rich, they always chew a large quantity of betel to give them a sweet breath; and the women, on certain occasions, never fail to take largely of it as a provocative. On all visits, the company is regaled with prepared betel. The principal time of using it is after dinner, at which time, they say, it preventsickness at the stomach; and they never abstain from it, except on the solemn occasions of the funerals of their relations, and their days of fasting. Moderately used, it is said to strengthen the gums, corroborate the heart, and stomach, diffuse flatulencies, purge both the stomach and brain, and prevent the fever. If chewed after breakfast, it makes the breath sweet for the whole dry. The Portuguese women are as fond of the betel as the Indians themselves, and cannot live a day without it. It is said, however, that few Europeans can accustom themselves to the use of it. On many occasions it produces sickness, and sometimes intoxication, of no long continuance. The Chinefe also use the leaves of betel, covered with quicklime, and wrapped round the nut areca, which in shape much resembles a nutmeg. They chew these leaves continually, and pretend that they strengthen the gums, comfort the brain, expel bile, nourish the glands of the throat, and serve as a preservative against the a tinha; a discharge which, from the heat of the climate, is very common in the southern provinces. They carry betel and areca (see Areca) in boxes, and prefer it when they meet one another.

**BETELGUELE, or BDELGAZEE, in Astronomy, a fixed star of the first magnitude in Orion's hind shoulder.**

**BETESKO, in Geography, a town of Siberia, on the west side of the Irith, 230 miles S.E. of Tobolik.**

**BETHE,**
BETH, in Literary History, makes the title of a multitude of books in the Hebrew language; e. g., "beth avoth," or, the house of the fathers; "beth Elohim," or, the house of God; "beth Isra'el," or, the house of Israel, &c.

BETHABARA, i. e., the House of Passage, in Ancient Geography, is supposed by many to be the place at which the Israelites passed over Jordan, over against Jericho, at the common ford of this river where the Israelites passed it under Joshua. Ch. iii. 16. Lightfoot refers it to the passage at Scythopolis, out of the precincts of Judaea, where the Jews dwelt among the Syro-Greeks, over against Galilee. Cellarius places it between these two, observing that there were many passages over Jordan. At this place, beyond Jordan, John is said to have baptized. Chap. i. 28. Origen found, as he tells us, in almost all his MSS., or, if we may judge from what follows, in every one of them, without exception, this verse thus written, "These things were done in Bethany beyond Jordan, where John was baptizing." But he rejects this reading for the following reason: "As I have been in that country, in order to trace the footsteps of Christ and his apostles, I am persuaded that we ought not to read Bethany in this passage, but Bethabara. For Bethany, as the evangelist himself relates, was the birthplace of Lazarus, Martha, and Mary, and only 15 stadia from Jerusalem; but the Jordan was at least, to speak in round numbers, 150 stadia from that city. Nor is there any city whatsoever of the name of Bethany near to that river. But there is a city of the name of Bethabara on the banks of the Jordan, where, it is said, John baptized." To this alteration it has been objected, that Origen grounds the reading, which he has substituted for Bethany, on no other authority than the relation of such persons as conduct travelers to the places in Palestine, which are mentioned in the sacred writings. These persons either had no inclination to conduct Origen to the Bethany, which lay on the other side of the Jordan, as the journey might have been attended with danger, on account of the tribes of wandering Arabs, who infested that country; or they were wholly ignorant of the place. Not to foregoing, therefore, their profits arising from conducting strangers, they showed Bethabara to Origen, as the place where John baptized, and the learned father was credulous enough to believe them. Besides, if the text itself be examined, Origen's objections to the common reading will vanish. He says, that Bethany lay near to Jerusalem, and therefore at a distance from the Jordan. But it may be added, whether there was not more than one city of that name, and whether we must needlessly suppose, that the city in question was the place where Lazarus resided. It appears, even from the expression used by St. John, that, whether we read Bethany, or Bethabara, there was more than one city of the name, which he mentioned. St. John mentions a circumstantial by way of distinguishing it, and when he speaks of Bethany beyond Jordan, we are led to suppose, that there were two cities of that name, and that the city which he meant was different from that which was situated on the mount of Olives. But Origen says, that there was no town of the name of Bethany on any part of the Jordan. To this it might be replied, that Origen hardly visited all the towns on the bank of the Jordan, as he probably took the route pointed out by his guides, or that the wars between the Jews and the Romans had so defeated, or altered the face of the country, that many towns had existed in the time of John the Baptist, of which no traces remained in the days of Origen. But this mode of reply is needless, because the evangelist uses a very indeterminate expression, when he says, that the place, where John baptized, was on the other side of the Jordan; an expression which by no means implies that the town lay on the banks of that river; for it might have been situated either on the Jabbok, or on some other stream conteradibly to the eastward, where John had a sufficient supply of water for the purpose of baptizing. The alteration, therefore, made by Origen, and which upon his authority, and that of Chrysostom and Epiphanius, is introduced into our copies, was wholly without foundation. See Michaelis's Introd. to the N. T. by Mathl, vol. ii. p. 428.

BETHABARA, in Geography, the first settlement of the Moravians in America, in the lands of Wachovia, in North Carolina, begun in 1753, 6 miles N. of Salem, on the west side of Grassy creek, which unites with the Salisbury, and several others, and falls into the Yadkin, and containing a church of the United Brethren, and about 50 dwelling houses.

BETH-ACHARA, or BETH-ACHEREE, (Jer. vi. 1.) i.e., house of the vineyard, a city situated on an eminence, between Jerusalem and Tekoa. See Nehem. iii. 14.

BETHAGLA, or BETH-AGLA. A TOWN of the tribe of Benjamin, (Josh. xviii. 21.) on the northern boundary of the town of Judah. In the time of Jerome and Eusebius there was a village in this situation of the name of Agha, distant 10 miles from Eleutheropolis, towards Gaza.

BETHA-CABRIS, now BAIT-DJERM, a village of Syria, about 3/4 of a league to the south of El-Tell; situated between Jerusalem and Asealon.

BETH-ANATH, House of a Song, or of Affliction, a city of Naphtali. Josh. xix. 38.

BETHANO, Cape, in Geography, lies on the coast of Chian, or Quinan, off which is Pulo, or Island Canton, which is about 9 or 10 miles from the coast. N. lat. 16° E. long. 108° 32".

BETHANY, in Ancient Geography, a village at the foot of the mount of Olives, called Jerusalem, in the way to Jericho. It took its name from a part of ground so called from "Atheni," which signifies the dates of palm-trees, which grew there plentifully. The town of Bethany, where Lazarus and his sisters dwelt (John xi. 1.) and where he was raised from the dead, was 15 furlongs, or about 2 miles distant from Jerusalem (John xi. 18.), but the district, or tract of ground, that bore that name, reached within 8 furlongs from Jerusalem, it being only a Sabbath-day's journey from it (John xxiv. 50. Acts i. 12.); and then commenced the tract called "Bethphage," from the "plagh," i.e. the green figs which grow upon it, extending to near Jerusalem, that the outward street within the walls was called by that name. A charge of self-contradiction has been alleged against the evangelist Luke, from the passage above cited. In the Gospel he tells us, that John ascended into heaven from Bethany, and in the Acts of the Apostles, of which he is the reputed author, he informs us, that he ascended from Mount Olivet. This charge is founded on an apparent diversity of ancient geography, or made to suit an unavoidable prejudice against Christianity, because Bethany, as we have above observed, was not only the name of a town, but of a district of Mount Olivet adjoining the town. See Bethabara.

BETHANY, or Bethania, in Geography, a Moravian settlement and poet town of America, in the lands of Wachovia, in North Carolina, begun in 1752, 6 miles N.W. of Salem; containing about 60 houses and a church.

BETTI-ARABAH, in Ancient Geography, a city of Judah (Josh. xv. 6.); afterwards given to Benjamin (Judg. x VIII. 22.)

BETHARAMFITHA, a town of Galilee, on the right bank
BETH, the House of God, a name given to that town, which was before called Luz, on account of Jacob's vision. (Gen. xxviii. 19.) They feem, however, to be distinguished in Joshua xvi. 2. though they were contiguous places; and the name Luz might probably be loth in that of Bethel. It was a city of Samaria, on the confines of the tribes of Benjamin and Ephraim. Eusebius says, that it was 12 miles from Jerusalem in the way to Sichem. It obtained among the prophets the name of Bethaven, on account of its idolatry. The Mahometans believe their temple of Mecca to be founded on the site on which the patriarch Jacob slept at Bethel, and hold it in great veneration. Some have supposed that the superfluous reftitute manifested by the ancients to their Betyli, or Hones anointed and consecrated to great men, after their death, derived its origin from Jacob's pouring oil on the stone of Bethel. See BETLOYS.

Bethel, Geography, a small Moravian settlement in America, on the Swetara river, in Pennsylvania, 14 miles from Mount Joy.—A township in Dauphin county.—Alfo, a township in Windfor county, Vermont, containing 473 inhabitants, N.W. of, and bounded by Stockbridge, and about 67 miles N.N. eafier of Bennington. Hence rises a small branch of White-river.—Alfo, a township in Delaware county, Pennsylvania.

BETHENCOURT, John de, in Biography, a Norman baron, in the beginning of the 15th century, obtained a grant from Henry III of Caffile, of the Canary islands, erected into a kingdom in 1341, by pope Clement VI. Having visited these islands in 1402, Bethencourt returned to them, and by alliance from Henry, conquered them, held them under the title of king, as a fief of the crown of Caffile, and tramitted the possession of them to his family for some generations. His pofterity settled in Spain. Although his conquest of these islands was not complete, Bethencourt is reckoned the first Christian who subdued the Canary islands, which before his time had been occasionally visited by freebooters. Robertson's Hill. Amer. vol. i. p. 54.

BETHENCOURT, James de, physician at Rouen, where he practiced with much reputation, towards the end of the 15th

and the beginning of the 16th centuries, is now only known by his treatise on the venereal disease, published in the year 1527, under the singular title of "Nova Penitentialis Quadrig-uma, nec non Purgatorium, in Morbum Gallicum, feu Venereum, una cum Dialogo aquae argentii et ligni guiae luctantium super dii morbi prelatura. Opus fructifera." Paris, 8vo. By his penitence, he means the strict regimen enjoined those who underwent the guiacum, or sweating process, for the cure of the les, and by the purgatory, the pains and torments endured while under the falfivation by mercury, for the fame purpofe. Though he treats of the method of curing by the guiacum, as well as that of mercury, yet he manifeftly gives the preference to the latter mode, which is laid down by him, Alfruc fate, in a more judicious manner, than it had been by any preceeding writer. He fays the difeafe was unknown to the ancients, and that it made its first appearance, or was first noticed in Europe, about the year 1.95. He does not consider it as imported from America, or the Weft Indies, by the Spaniards, but as procured from causes fimilar to thofe that occur the plague, and other infectious difeaces. Alfruc commends the work, but it has not obtained a place in Luitinus's collection of treatifes on the complaint. Alfruc de Morb. Gall. Haller. Bib. Med.

BETH-ENABRIIS, in Ancient Geography, a town of Peræa, into which the Jews, who fled from Gadara after it was taken by Vefpaian, retired, and which was forced by the tribune Placidus, before his complete reduction of Peræa.

BETHER, Mountains of, are mentioned in the Song of Solomon, ch. viii. 14. Some fuppofe Bether to be Bethoron, called Bether by Eufebius, and Bethara by Jofephus. Bether was taken by the emperor Adrian, in the rebellion of Barchochebas, (See Barchochebas.) Others will have it to be Betharis, between Cafarea and Difpolis; and others again Bether, mentioned in the LXX. (Jof. xv. 60.) among the cities of Judah. Calmet fuppofes it to be Upper Bethoron, or Bethora, between Difpolis and Cafarea. Eufebius speaks of Betharim near Difpolis, and when he mentions Bether, which was taken by Adrian, he fays, it was in the neighbourhood of Cafarea. Ec. Hill. i. iv. c. 6.

BETESDA, the name of a pool at Jerufalem, of which we have an account in the Gospel by St. John, ch. v. 1—7. It was called in the Greek λυξωρος, and in the vulgar "Piscina probatia," becaufe, as fome have fuppofed, the fheep of the facrifices, called in Greek περασσα, were washed in it; or, according to others, becaufe the blood of the facrifices ran into it. But neither of these fuppofitions is fatisfactorily proved. The fheep were probably washed as soon as they were brought in the adjoining market, from which they were driven into this pool, which alfo contained a fufficient quantity of water for this purpofe. The latter fuppofition could not poftibly have been realized; fince, in that cafe, the blood must firft have defcended, and afterwards ascended to this pool, as there was a drain or ditch between the pool and the temple, and a bridge over it for paffing into the temple. Hence Dr. Poecoke, who adopted the idea of the blood's running into the pool, was obliged to fearch for lower ground on the other fide of the temple, and to place it in a situation where it did not eft, as any one may fatisfy himfelf by adverting to the plan of the temple at Jerufalem. The situation of the fheep-gate, near which this pool, or bath, flood, was on the south-east wall of Jerufalem, and therefore a great part of the city lay between that and the temple, as the accurate Dr. Lightfoot has fhewn in his "Harmony of the Evangelists," p. 666. The appellation "Bethefda" has therefore been erroneoufly derived from בְּתֵלֶשׁ, domus effusis, the sink-houfe, or drain.
The etymology, therefore, of those who derive "Bethesda" from Ἱλαρός, ἱλαρός, the δήλος of mercy, is much more judicious and appropriate; because it expressed the kind design with which this bath was contrived, and the salutary purposes to which it was applied. The history informs us, that this pool had five porches, porticoes, or chalies, which might very reasonably have been the cause, notwithstanding its oblong figure, being on each hand of the entrance on the middle of one side, and three on the other sides. Dr. Lightfoot supposes, that the lepton itself might be in the form of a pentagon, and that those chalies might correspond in five facts. Mr. Maundrell (Journey, p. 157) who took a view of this pool, in 1696, informs us, that it is 130 yards long, 40 broad, and 8 deep, but without water; and that at the west end he found some old arches, then dammed up, which, though only three in number, were supposed to be the five porches, in which the lame, halt, and blind. This pool, he adds, is contiguous, on one side, to St. Stephen's gate, and on the other to the area of the temple. In these porticoes dictated and dedicated perfunctory lay, "waiting for the moving of the water," for at the time of a certain feast, which some have supposed to be the passover, and others the pentecost, or rather, according to the season, i.e. occasionally, at certain intervals of time, "an angel descended into the pool, and troubled the water; whosoever then first, after the troubling of the water, leaped in, was made whole of whatever disease he had." Some have supposed that the miraculous cure, recorded in this history, was referred to the feast of the particular lepton mentioned in the first verse of the chapter; and thus they account for the silence of Philo and Josephus with regard to this miracle. But those, who imagine that these waters had a fanatical quality on other occasions, think the silence of these Jewish writers to be of little importance; as they have omitted the mention of other more important occurrences in our Lord's history, which they had an opportunity of knowing; such as the variety and multitude of signal miracles which he performed in the course of his ministry. The majority of writers have regarded the cures wrought at this place as a banding miracle among the Jews, and yet they have been forprised that Josephus, in particular, should omit to mention a fact so honourable to his nation. Others have, therefore, conjectured, that the miraculous healing quality of these waters was a peculiar honor conferred on the persons appearing before the Son of God upon earth. To this purpose Dr. Doddridge in loc. after Calvin, of server, that God, to add the greater luster to his Son's miracles, as well as to shew that his ancient people were not entirely forgotten by him, had been pleased to bestow some supernatural cures at this place. With respect to the defeat of the angel into the pool, and the effect produced by his stirring the water, different hypotheses have been proposed. Grotius thinks, that the angel is said to have descended, not because he was ever seen to do so, but because the Jews were persuaded that God brought such things to pass by the ministration of angels; so that, from the violent motion of the water, and the effect produced by it, the presence of an angel was reasonably supposed. Dr. Hammond (in loc.) supposes, that the blood of the great number of facrifices, washed in this pool, communicated a salutary efficacy to the water, upon its being stirred up by an angel, or messenger, reputed for this purpose by the high-priest; which hypothesis Dr. Doddridge represents to be a philosophical, as it is unsupported by history and antiquity. Mr. Fleming (Chriology, vol. i. p. 13: 15:) in order to avoid the apparent difficulties of the literal interpretation, accepts the latter part of the third and the whole of the fourth verse, as a spurious addition of some ignorant monk in the 8th or 9th century; because that part is wanting in the Cambridge, or R-va's MS., and is written by a later hand in the margin of that in the French King's library, highly extolled by Erany in his "Harmony." But this passage is found in all the other most celebrated MSS. in the Syriac version, and in the other versions of the Polyglott. Kühler's observations, relating to the genuineness of this text, in the preface to his edition of Mill's New Testament, deserve to be considered. But with regard to the subject in dispute, it should be recollected, that the fourth verse, which makes question, implies, that the water, after being troubled, had a miraculous virtue, which extended only to the first that went in, and cured his disease, whatever might be its nature. Dr. Doddridge supposes the following solution of this difficulty; the greatest, as he acknowledged, that occurs in the history of the evangelists, and with respect to which none of the numerous writers who have replied to Mr. Woolton has given him satisfaction. He supposes this pool might be remarkable for more medicinal virtue attending the water; and this circumstance, together with its being so near the temple, where a bath was so much needed for religious purposes, may account for the fact: clefs, chalies erected around it. Some time before this passover, an extraordinary commotion had been probably observed in the water; and Providence so ordered it, that the next person who accidentally bathed here, being under some great disorder, experienced an immediate and unexpected cure. The like phenomenon, in some other dedicate cloister, was probably observed in a second commotion. These cures might happen periodically, perhaps every sabbath, for some weeks or months. This the Jews would naturally ascribe to some angelic power, so did afterwards the voice from heaven, (John xii. 29.) though no angel appeared. On account of their ingratitude to Christ for this miracle, and those wrought at the former passover, and in the intermediate space, that celestial visitant probably returned no more; and therefore, it may be observed, that though the evangelists spoke of the pool as still at Jerusalem, when he wrote, yet he mentions the defeat of the angel, as a thing which had been, but not as still continuing. This may account for the silence of Josephus, who was not born when it happened; and who, if he heard the report of it, would oppose it with hypothesis to fact, and recur to some indigested and unmeaning harmonies on the unknown force of imagination; or he secretly suspected it to be true, his dread of the miraculous, and his fear of confusing his Pagan readers with it, might as well lead him to suppress this, as to dispute the passage through the Red Sea, and the Divine voice from mount Sinai, in so mean and foolish a manner, as it is known he does. Besides, the relation which this fact bore to the history of Jesus, would make him peculiarly cautious in treating upon it, as it would have been difficult to handle it at once with decency and safety. The ingenuous and honest bishop Pearce, in his excellent "Vindication of Christ's Miracles," p. 68, &c., agrees with Dr. Doddridge in the most material circumstances of his hypothesis.

BETH-GAMILU, the house of the sovereign, or of the camel, a city of the Moabites, in the tribe of Reuben. Jer. xlii. 37.

BETJESHIMOTH, the house of definition, or, of position, or of denominations, a city of Reuben (Judg. xiv. 20.), afterwards passed by the Moabites. Josh. xxxvi. 9.

BETIL-EBAOATH, the house of or the town, a city of Simeon, (Josh. xix. 6.) sometimes called Lachish. Josh. xvi. 32.

BETILHEM, the house of bread, a city of Judah, (Josh. xvii. 7.) generally called "Bethlehem of Judas,"
to distinguish it from another of the same name in Zebulon. It is seated on the declivity of a hill, 6 miles south from Jerusalem, according to Eusebius and Jeron. It is likewise called "Ephratah," (Gen. xlvii. 7. Mic. v. 2.) This city was not very considerable either for its extent or riches; but it has acquired peculiar distinction on account of its having been the place of our Saviour's nativity. It was also the city of David's nativity. In and near this city travellers are shown the place where our Saviour was born, which is said to have been a cave south of the city, and belonging to the inn, or caravanserai, whither Joseph and Mary retired. Jeron informs us, that Adamin, in order to erase the remembrance of the place where Christ was born, planted over the cave a grove of tall trees in honour of Adamin, so that when the festivals of this infamous deity were celebrated, the holy-grotto echoed with the lamentations made in commemoration of Venus's lover. Here is also seen a large church built by St. Helena, in the form of a cross, and so lofty as to command an extensive prospect of the adjacent country. The roof is elevated, flat, and composed of cedar within, and leaded without. The nave is supported on both sides by two rows of marble pillars, each made of one piece, and 11 in a row, forming as it were five naves, separated from each other by those rows of pillars, on each of which is the picture of some saint. Over the pillars the wall is covered with mosaic work, on a gold ground. The marble which formerly surrounded the walls has been removed by the Turks for adorning their mosques. The three upper ends of the cross terminate in three semicircles, having in each an altar. Over the chancel is a fluted cupola, covered on the outside with lead, and within adorned with mosaic work. Adjoining to the church is the monastery of the Franciscans. The gardens are defended with strong walls; and through the chapel is a passage to a square cave, in which they lay the Innocents were buried. Beyond this are passages to the tombs of St. Jerom, St. Paula, and Eulochium, and of Eusebius of Cremona; and beyond these is a grotto or cell, called the school of St. Jerom, where he is said to have lodged when he translated the Bible. At the end of another vault or chapel, 12 feet wide and 40 long, whose floor is paved and sides lined with white marble, and roof adorned with mosaic work, now much decayed, is an arched cove, with an altar, having over it the picture of the nativity, and under it a vault, in the middle of which is a flar formed of many coloured stones, marking the place where they say our Saviour was born; and near this is the manger where they pretend he was laid, which is hewn out of a rock, and now flagged with white marble. See Mount Calvary, and Jerusalem.

Bethlehem is now called Bait-el-babam; which fee. The country in which it is situated is happy with respect to soil, air, and water. With the latter it is supplied by a low aqueduct, or stone channel, which formerly passed to Jerusalem. The "fons ignatus" is an exuberant spring; it is received successfully by three large cisterns, one of which is well preserved. In coming from the cisterns, and at a small distance, is seen what is termed the "delicius Solomonis," a beautiful rivulet, which flows murmuring down the valley, and waters in its course some gardens of excellent soil. The brinks of this brook are adorned with a variety of herbage. The convent at this place contains, under the same roof, the different tenets of Latins, Armenians, and Greeks. Brown's Travels in Africa, &c. p. 353.

We shall here observe, that no inconsiderable pains and ingenuity have been exercised to reconcile the quotation of the evangelist Matthew, ch. ii. 6, relating to Bethlehem, with the original text of the prophet Micah, ch. v. 2. The difficulty may be obviated, lays an ingenious writer, or at least the appearance of inconstancy removed, by a proper translation of the latter text. "And thou, Bethlehem Ephratah, art little in being among the thousands of Judah; for out of thee shall come forth unto me a ruler over Israel. That is, thou hast but little honour in being among the thousands of Judah, compared with that which will accrue to thee from giving birth to the Messias. Thus the LXX feem to have understood it. Forms of speech similar to this, οἰκίαν αὐτοίς, by no means the λέον for the greatest, are not uncommon. (See Homer. II. A. 177. Callim. Hym. Di. 33. Hym. Ap. 31. Eurip. Androm. St. &c.) This mode of interpretation is confirmed by Lightfoot from the Chaldee paraphrast; and seems to be preferable to that of St. Jerom, or of Dr. Pococke. The former, who has been followed by some others, is of opinion, that Matthew produced the passage in Micah historically, not as it was written by the prophet, but as it had been propounded by the priests to Herod, so that they should be accused of false reading, if that were the case. The latter, in his notes on the Porta Moos of Maimonides, thinks, that "Θϊυ", in Micah, rendered little in the English translation, has the contrary signification to its usual one of mean or little, viz., that of noble or illustrious, and for countenancing this conjecture he cites Jer. xviii. 4. and the Chaldee paraphrase upon that passage. Grothus, Olearius, and others, have proposed that the Hebrew text and the Greek LXX version should be read and translated by way of interpolation. Heb. "Art thou, Bethlehem Ephratah, the least among the thousands of Judah? No, out of thee shall he come forth to me, &c., i.e. I will raise him up, &c. of the Greek LXX. Art thou, Bethlehem, the house of Ephratah, the least to be among the thousands of Judah? No: out of thee, &c." The learned bishop Pearce has adopted this mode of translation; and in favour of it he urges, that the Hebrew word θϊυ, in Micah, rendered little, may be rendered the lefth, as it actually is in Judges, vi. 15. 1 Sam. ix. 21. Jerom. xlix. 26. and l. 45. He also observes, that both in the Hebrew and in the Greek of the O. and N. T. it is not unusual for a sentence to be underwooded by way of interrogation, though there is no mark placed at the beginning of the sentence, used in either of the languages for a mark of interrogation. To this purpose he refers for the Hebrew to 2 Sam. xviii. 29. 1 Kings. xxii. 7. Job ii. 10. xl. 11. Zech. viii. 6. and for the Greek to 2 Sam. xvii. 29. Matt. xxi. 3. Mark iv. 61. He adds further, that when words are thus used interrogatively, there is often at the end of them an anwver of Υς, or No, to be supplied in the sense, though it is not expressed in the words. This is very common with those who write in the Hebrew language, or with those, who, being Hebrews, write in Greek. In the N. T. the word, No, is to be supplied in 1 Cor. x. 19. 20. The same mode of speaking is found in 1 Cor. xii. 31. Acts viii. 31. and an inference, where Υς is to be supplied, is to be found in 1 Cor. ix. 20: From these remarks the learned prelate concludes, that, if this be the case, an interrogation with a No to be supplied as an anwver to it, is the same as a negative not put in interrogation; or, in other words, to ask whether any thing is the lefth, and to anwver No, as the Hebrew text and LXX version do, is the same as to affirm, that it is not the lefth, as Matthew does. Either of the above interpretations will effectually supercede the perplexity of St. Jerom, and the objections of Dr. Middleton, in his "Works," vol. ii. p. 59. See Wakefield's "New Translation of the Gospel of St. Matthew," p. 26. "Pearce's Commentary," vol. 1. p. 10.

Bethlehem, a town of the tribe of Zebulon, (Josh. xix. 15.) of obscure and unknown situation.
BETHLEHEM, in Geography, a town of the Netherlands, in Brabant. N. lat. 51° 2'. E. long. 4° 45'.
BETHLEHEM, See BETH.
BETHLEHEM, a town of America, in Albany county, New York, fruitful in pastures, and affording large quantities of excellent butter. By the late census of 1790, 358 of the inhabitants are females. — Alfo, a township in Berkshire county, Massachusetts, containing 261 inhabitants. It lies about 10 miles S. of E. from Stockbridge, and 130 from Boston, and borders on the Tyingham and Loudon. — Alfo, a township in Hudson county, New Jersey, situate at the head of the south branch of Raritan river, and containing 1335 inhabitants, including 21 slaves. — Alfo, a township in Litchfield county, Connecticut, joining Litchfield county on the north, and Woodbury on the south. — Alfo, a post-town in Northampton county, Pennsylvania, which is a celebrated settlement of the United Brethren of the Protestant Episcopal church, as they term themselves. It is situated on Lehigh river, a western branch of the Delaware, 53 miles northerly from Philadelphia, and 18 southerly from the Wind Gap. The town stands partly on the lower banks of the Manakes, a fine creek, which affords trout, and other fish, in a healthful and pleasant situation, and in summer is much frequented by gentry from different parts. In 1787, there were 60 dwelling-houses of stone, well built, and 600 inhabitants. Besides the meeting-house, this place has three other public buildings, which are spacious; one for the single brethren, one for the single sisters, and the other for the widows. In a house adjoining the church is a school for females, and since 1787, a boarding-school for young ladies, under the direction of the minister of the place, who also superintends the boys' school, kept in a separate house. Both these schools are in high repute, and much frequented. At the lower part of the town there is an hydraulic machine of simple construction, that raises the water from a spring to a reservoir, at the height of 100 feet, whence it is conducted by pipes into the several streets of the town. In this town are also a store, with a general assortment of goods, a large tan-yard, a grist-mill, a fulling-mill, an oil-mill, and a saw-mill, and on the banks of the Lehigh, a brewery. N. lat. 40° 37'. W. long. 75° 14'.
BETHLEHEM, Star of, in Botany. See ORNITHOGALUM.
BETHLEHEMITES, or Bethlehemites, in Church History, a sort of monks introduced into England in the year 1257, inhabited like the Domicani, except that, on their breal, they wore a far with five rays, in memory of the far or comet which appeared over Bethlehem at the nativity of our Saviour. They were cell at Cambridge, and had only one house in England.

There is also an order of Bethlehemites still subsisting in Peru, who have convents at Lima; one called of the incarulata, the other of our Lady of mount Carmel. These Bethlehemites came originally from the city of Guatemala in Mexico, where they were instituted by the venerable Peter Joseph of Betanour, a native of the town of Chalma, or Villa Fuerte, on the island of Teneriff, in 1625, for the service of the poor. After his death, which happened in 1667, his congregation was approved of by a bull of Clement X. in 1673, and in 1674, Innocent XI. in 1685, erected it into a community of regulars. Before this time it had paffed from Guatemala to Mexico, and from thence, in 1671, to Lima. In the city of St. Miguel de Pira, they took possession of the hospital of St. Ana, in 1676, and of that of St. Sebastian, in Truxillo, in 1629. Their probity and diligence in discharging these trusts induced other places to select them as directors of their hospitals, and among the rest, the city of Quito. The fathers of their order go bare-footed, and wear a habit of dark brown colour, nearly resembling that of the capuchins, whose order they also imitate, in not shaving their beards. On one side of their cloak is an image of our lady of Bethlehem. Every fifth year they meet to choose a general, which ceremony is performed alternately at Mexico and Lima.

The Bethlehemites, though outwardly of great simplicity, pass for the most refined politicians; infomuch as to be called the quintessence of the Carmelites and Jezuites. They are all friars. For their almoner they choose a peculiir friar, whom they hire, and who has no vote in the chapter.

BETHLEM, GABRIEL, in Biography, prince of Transylvania, was a descendant of a family of rank, but very small property, and attached to the reformed religion. By his valor he obtained the favour of Gabriel Battori; but having ingratiated himself with the Porte, in a visit to Constantinople, he obtained a force which enabled him to expel Battori, and to establish himself as prince or waivode, in 1613. He was afterwards led by ambition to extend his dominions, and under the advantage of an alliance with Frederic, the elector palatine, and newly declared king of Bohemia, he made an irruption into Upper Hungary, in 1619. Having reduced this country, he received the submission of Lower Hungary, and in his march towards Vienna he took Preßburg, and was acknowledged prince of Hungary. The affiance which was afforded him by the oppressed protestants, induced him to establish liberty of conscience throughout Hungary. At an assembly of the estates, he was declared king; but in consequence of a treaty concluded between him and the emperor, he renounced the title and dignity of king of Hungary, and was made in return prince of the empire, with the possession of two dukedoms in Silesia, and several caffleks and districts in Hungary. His refusals disposition however led him to violate the treaty, and, in 1624, he overran Hungary, till he was defeated by the imperial general, and obliged to take refuge in Caffovia. Upon this a treaty of peace was negociated, by which he renounced all pretensions to Hungary, and all connexions with the enemies of the house of Austria, and was invovled with several lordships in Silesia, and with authority over Transylvania during life. After this period he remained quiet; and falling into a droopy, died in 1629. He left legacies both to the emperor and grand seignior. Gaber married the daughter of John Sigismund, elector of Brandenburg. Mod. Univ. Hist. vol. xxvii. p. 2, &c.

BETH-MON, the house of habitation, or, of iniquity, in Ancient Geography, a city of the Moabites, in the tribe of Reuben. Jer. xviii. 23.

BETH-MARCHABOTHI, the house of chariots, or, of bitterness existing, a city in the tribe of Simon.

BETH-MAUS, a village of Galilee, between Sophonias and Tiberias, distant, according to Josephus, 4 itlades from the latter. Lightfoot supposes it to be the Beth-mat win of the Talmud.

BETH-NIMRAH, the house of the lapron, or, of rebellion, or, of bitterness, a city in the tribe of Gad. Num. xxx. 36.

BETH-OANANNA, or BETH-HANNUNAH, a town, according to Eusebius, 4 miles east from Doripolis. The name signifies, some remains of the word Neb, where the tabernacle continued for some time, in the reign ofSolah. 1 Sam. xxii. 1. According to Jerom, Neb was not far from Doripolis.

BETH-OGLA, the house of the lilies, or, of lilies, or, of bitterness, a city in the tribe of Gad. Num. xxx. 36.

BETHOANNABA, or BETH-HANANABA, a town, according to Eusebius, 4 miles east from Doripolis. The name signifies, some remains of the word Neb, where the tabernacle continued for some time, in the reign of Solomon. 1 Sam. xxii. 1. According to Jerom, Neb was not far from Doripolis.

BETHOGIELA, the house of the lilies, or, of lilies, the name of two places; one fixed by Eusebius, 8 miles from Gaza; the other by Jerom, 2 miles from Jericho. The Bethogiel of Eusebius is probably part of the tribe of Judah. Josh. xv. 26.

BETHOOLBA, or BETH-HOLLBA, belong to that of Benjamin. Josh. xvii. 24.
a BETH, or BETHRA, was otherwise called Julius, and was the birthplace of the prophet Joel. The inhabitants of Bethemide rebelled against Alexander Janneus. The town was taken, and they were sent captives to Jerusalem.

BETHONEA, or BETHANOVA, was situated 15 miles east from Carea, and was famous, according to Eusebius and Jerome, for its beneficial hot baths.

BETHORON, a town of Samaria. The Scriptures mention two cities of this name, the Upper and Lower, both belonging to the tribe of Ephraim (Joth. xxiv. 3, 5), and given by this tribe to the Levites (Joth. xxii. 22). They were both built by Solomon, grand-daughter of Ephraim (1 Chron. vii. 24.), and retrenched by Solomon after they had fallen to decay (1 Kings xi. 17, 2 Chron. viii. 5). Their distance from one another was about the breadth of the tribe of Ephraim; the Upper being in the north, and the Lower in the south of that tribe. The former was situated in the road from Constantinople to Antioch, and the latter was a little to the south of it, on the border of the tribe of Ephraim. The latter was named in the time of Josephus, grand-daughter of Ephraim (1 Chron. vii. 24), and retrenched by Solomon after they had fallen to decay (1 Kings xi. 17, 2 Chron. viii. 5). Their distance from one another was about the breadth of the tribe of Ephraim; the Upper being in the north, and the Lower in the south of that tribe. The former was situated in the road from Constantinople to Antioch, and the latter was a little to the south of it, on the border of the tribe of Ephraim.

BETH-PALATH, or BETH-PELETH, the house of deliverance, or of expulsion, a city in the most southern part of the tribe of Judah. (Joth. xv. 27.) Nehem. xi. 26. This city was surrendered to the tribe of Simeon.

BETH-PAZZEZ, the house of division, a city in the tribe of Issachar. Joth. xix. 21.

BETH-PEOR, or BETH-PHAGOR, the temple of Poor, a city of Moab given to the tribe of Reuben, (Deut. iv. 46.) where the idol Baal-Peor was worshipped. Num. xiv. 3. It was situated on the other side of Jordan, opposite to mount Peor, or Phagor.

BETHPHAGE, a village at the foot of mount Olivet, between Bethany and Jerusalem, and about 15 furlongs from the latter. See Bethany.

BETHSaida, a city of the half tribe of Manasseh, near the desert of the same name. It was situated, according to Pliny, on the east, or on the Arabian shore of the lake of Gennesareth, in Batanah, and the lower Gaulonites, according to Josephus, at the beginning of the mountainous country. It was a place of fishing, according to Bochart, and a place of hunting, says Dr. Lightfoot, so called because it stood near Naphthal, where were many deer. Gen. xlix. 21. It was raised by Philip, the brother of Herod the tetrarch, from the rank of a village to the honour of a city, and called Julias, in honour of the emperor's daughter. It seems to have been different from Betharamphita, called also Bethsaida Julian. See Betharamphita. This latter Bethsaida, which was on the western shore of the lake of Gennesareth (Mark vi. 45, viii. 22), was one of the cities against which Chrust denounced a woe (Matt. xi. 21) on account of its impudence and impiety, after the mighty works which he had performed in it. It was also the city where three apostles dwelt, viz. Philip, Andrew, and Peter. John i. 45.

BETH-SHALISHA, or BAA-salissa, a town of Palæstine, in the canton of Timna, 15 miles north of Diospolis, according to Eusebius, and south-call of Antipatris.

BETHSAN, or BETHSEAN, a town of Samaria in the half tribe of Manasseh, upon the borders of Galilee, on this side Jordan, and about half a league from it. It was the capital of a district of the same name, extending to Peraza. In 2 Maccabees xii. 29, it is placed 600 stadia, or 75 miles from Jerusalem. Josephus says, that it was the largest town of the Decapolis, and that it was 120 stadia, or 15 miles from Tiberias. It was upon the walls of this city that the Philistines, after the battle of Gilboa, hung the bodies of Saul and Jonathan, which were removed in the night by the inhabitants of Jabesh-Gilead, and honourably interred, under a grove of oaks near the city. (1 Sam. xxxi. 19, &c.) In process of time it was called Scythopolis, which name it derived from the Scythians, who, in the reign of Josiah, king of Judah, about 675 years before Christ, made an incursion into Palestine, and left a colony at Beth-far, Steph. Byz. and Pliny call it Nysa. Bryan (Anal. Myth. vol. iii. p. 415.) deduces its name Bethania, i.e., house, from Beth, house, or templet, and san, an ancient denomination of the sun, under which it was worshipped; and he supposes, that he had a temple in this city, to the walls of which the body of Saul was interred. Images of the sun, under the appellation of Zanes, were peculiar to Sparta. This city, according to him, was built by the Cuthite Ophite, or Hevites, some of whom settled in that part of Caraea, called Galilee. As Ophite, they worshipped the sun under the figure of a serpent, and they were foppised to be Helladse, or offspring of the sun. The serpent they styled fan or san; but as the Hebrew fion signified also a tooth, the Grecians instead of saying that the Sparti had their origin from the serpent's teeth, the sun, made them take their rise from the teeth of a serpent.

BETH-SHEMESHE, the house of the sun, or of service, a Levitical city in the tribe of Dan, or of Judah, for it is ascribed to the one and to the other; distant, according to Eusebius, 10 miles from Eleutheropolis, in the way to Niciporis, or Emmaus. 1 Sam. vi. 12. Joth. xiv. 41. 1 Kings iv. 5.—Allo, a city of the tribe of Issachar. Joth. xix. 38. —Allo, a city of the tribe of Naphtali. Joth. xix. 38. Judg. i. 33.

BETH-SUR, or BETH-ZUR, the house of the rock, or of the band, a city with a strong fortres, seated on a high rock, in the tribe of Judah (Joth. xv. 38) distant, according to Eusebius, 29 miles from Jerusalem, on the road to Hebron. It was fortified by Rehoboam, to keep the Danites in awe. (2 Chron. xi. 7.) When it was besieged by Lycaon, under Anti chus. The son of Antiochus Epiphanes, with an army of 60,000 foot, and 5000 horse, Judas Maccabaeus came with 10,000 men to its succour, and obliged Lycaon to raise the siege, and defeated his army. B. C. 165. 1 Maccab. iv. 28. vi. 7. Bryan derives the name of this city from both, temple, and fur, a name given to the fur, under which appellation he had temples and worship.

BETH-TAPPUA, the apple or orchard house, a city of Judah (Joth. xv. 53.) said, by Eusebius, to be the last city of Palæstine in the way to Egypt; 14 miles from Raphia.

BETHUL, or BETHUEL, a city of Galilee, belonging to the tribe of Simeon, (Joth. xix. 4.) probably the same with Bethulia, represented by Sozomen in his history, as belonging to the inhabitants of Gaza, well-peopled, and adorned with several temples remarkable for their structure and antiquity; particularly a pantheon, or temple, dedicated to all the gods, seated on an eminence made of earth, which commanded the whole city. Jerome, speaking of Bethulia, says, that from thence to Pelium was a short journey of five days. Among the bishops of Palæstine, we find one of Bethulia, Roldan, I. i. 35. p. 268. This was probably the name with Bethulia, celebrated on account of its siege by Holofernes, at which he was killed by Judith, Judith, vi. 7.

BETHUNE,
BETHUNE, in Biography. See Sully.

BETHUNE, in Geography, a town of France, and principal place of a district, in the department of the Ain's, situated on a rock in the little river Dixtre. The number of inhabitants in the town is estimated at 35,000, and in the canton at 15,952. Its territory contains 125 square kilometres, and 17 communes. It formerly belonged to the counts of Flanders, but being taken by Gaston Duke of Orleans, in 1629, it was returned to France by the peace of Pyrenees, and the fortifications were repaired under the direction of M. Van-son. In 1710, it was captured by the allied army, under Prince Eugene and the duke of Marlborough, and restored to France in 1715, at the peace of Utrecht. This city and the castle are together of a triangular form; but the castle is in a ruinous state. The towers are near, and the streets are narrow, but it contains several churches and convents, and a large handsome square. In the main body, near the city, several canals are cut for the convenience of watering grain. N. lat. 49° 52'. E. long. 2° 43'.

BETIS, a river of France, in Upper Normandy, in the county of Caamp.

BETLA, a town of Asia, in Armenia, Persia.

BETLIGOA, in Geography, a town of Poland, in Saratoga, 10 miles S.S.E. of Reference.

BETH Quar, a town of Africa, in the kingdom of Coaug.

BETLIO, a town of European Turkey, in the Morea, 22 miles north of Missol.

Propagation and Culture. All the sorts may be propagated by seeds, or parting the roots: they require a sandy situation and a moist, stiff soil. The best time for transplanting and separating the roots is in autumn, but the seeds should be sown in the spring upon a sandy border; and they will need no other care besides keeping them from weeds, and thinning them when they are too close. Martyn's Miller. Woodville Med. Bot. vol. ii. p. 79.

*Betonica Aquatica*. See *Scrophularia*.

*Betonica Pauli*. See *Veronica*.

*Betoulo*, in *Geography*, a small island in the Grecian Archipelago. N. lat. 37° 1'. E. long. 23° 33'.

*Betony*, a town of Poland. In Samogitia, 16 miles west of Rofienne.

*Betchow*, a town of Bohemia, in the circle of Cracau, 9 miles N. W. of Cracau.

*Betse*, or *Betsetter*, a town of Hungary, in the county of Beth, feated on the Theis, near its influx into the Danube.

*Betthomtem*, in *Iran*, a mutual promise or com- pact between two parties for a future marriage. The word imports as much as giving one's tooth; that is, true faith, or promise. Betthomtem amounts to the same with what is called by civilians and canonists frequens, or epiqfren; sometimes deprecation; and by the French fiancées. Betthomtem is either solemn, made in the face of the church, or private, made before witnesses out of the church. To betthomtem by giving arrebs, or earnest, is called, by *Middle Age Writers*, subbarrere. In Russia, the betthomtem is performed with ecclesiatical rites, generally eight days previous to the marriage, and is indissoluble. During this interval, the bride is only visited by the bridegroom, and the girls of her acquaintance, who anoint her with finging. On the last evening, the young women bring the bride into the hot bath, where they plait and tie up her hair, finging at the same time ballads de- scriptive of her future happiness. Among the ancient Jews, the betthomtem was performed, either by a writing, or by a piece of silver given to the bride, or by cohabitation and consummation. This latter engagement, according to the Rab- bias, was allowed by the law (Deut. xxiv. 1.), but it has been widely forbidden by the ancients, on account of the abuses that might happen, and for preventing clandestine marriages. After the marriage was contracted, the young people had the liberty of seeing each other, which was not allowed them before. If during this time the bride should trepasis against that fidelity she owed to her bridegroom, she was treated as an adulteress. (Seld. Usur. Heb. i. ii. c. 1.) The nuns of the Annunziada hold an annual feast, in honour of the desposition, or betrothment of the Virgin Mary to Joseph.

*Betta*, in *Geography*, a town of Aftic Turkey, 70 miles S.S.W. of Erzerum.

*Bettembourg*, the chief place of the canton, in the district of Luxemburg, and department of Forêts; containing 812 persons: the number in the canton amounts to 10,139. The territory comprehends 290 kilometres, and 72 communes.

*Bettern, Thomas*, in *Biography*, a famous actor, the English Roficius of his time, was the son of an under cook in the household of king Charles I., born in 1635, and after a tolerably liberal education, apprenticed to a book-feller. This book-feller, being the publisher of sir William d'Avenant, introduced Bettern into an acquaintance with him, and by this means he was brought upon the stage, under his patronage, about the year 1656 or 1657. After the refor- mation, he engaged in the company called the Duke's company, formed in virtue of a patent granted to sir William d'Avenant, which acted at the theatre in Lincoln's-inn-fields. Bet- tern, whole talents had attracted notice, was lent to Paris, by command of Charles I., that he might acquaint himself with the French stage, and contribute on his return to the improvement of the English theatre. A new theatre was accordingly built for d'Avenant's company, in Dorset gar- dens, and the exhibitions conducted in it were attended with great success. In 1670, Bettern married a Mrs. Sanderfon, who excelled as an actress on the fame stage, and who contributed, in concurrence with his own exertions, to procure for them not only a comfortable subsistence, but such a surplus as might have served to maintain them in their advanced age. After the coalition of the two companies above mentioned, which took place about the year 1685 or 1686, the merit of Bettern shone with unrivalled lustré; and he ac- quired the honour of being at the head of his profession. From the account which Cibber has given of his dramatic talents, it appears that no actor entered with a more dis- criminating judgment into his part, or posed a greater com- mand over his audience. The leading style of his acting was the grave, dignified, and forcible. His voice, perton, and aspect concurred in giving more spirit to terror than to the softer passions, and Cibber adds, in bearing ample testimony to his merit; "I never heard a line in a tragedy come from Bettern, wherein my judgment, my ears, and my imagi- nation were not fully satisfied." His powers, however, seem to have been restricted to a particular walk in tragedy; and Othello, Hamlet Bruttus, and Hotspur, are enumerated among his striking parts, "and in these the range is from calm dignity to fiery impetuosity."

With respect to his private character, we are told that it was, like his theatrical, manly, decent, and elevated. Having acquired a moderate property, he embarked it, by the advice of a friend, in a commercial project, in which it was lost; and yet that friend's daughter, when she became an orphan, was maintained by him as if he had been his own. In consequence of some disputes which occurred, he was compelled by flaggy-tyranny, to quit the company, with which he had been long engaged; and a new play-house was opened by his efforts in Lincoln's-inn-fields, in 1695. The growing infir- mities of advanced age made it necessary for him to withdraw from the stage, and to acquiesce, which he did with self-poiseffion and serenity of mind, in the narrow circumstances of
BETULa, AldER, And BIRch, in Bot any. Lin. Gen. n. 1052. Reichl. 1147. Schreib. 1419. Tourn., 350. Juff. 409. Gartn. t. 90. Chais and Order, moroea listanica. Nat. Ord. ammianee. Gen. Ch. * Male flowers in a cylindric amert. Cal. amert imbricate on every side, loose, cylindric, confiding of three-flowered feales, in each of which are two very minute feales, placed at the tides; three equal florences fixed to the disk of each calyx. Perianth in each one-leaved, small, entire, three or four-parted; diviitians ovate, obtuse. Cor. none. Stam. filaments to each four (or three, or two), very small; authors twin. * Female flowers in an amert of the same plant. Cal. amert cylindric or roundish, imbricate; with two-flowered feales. Cor. none. Pet. germ proper, ovate, compressed, very small, two-seeded; styles two, tetacces; stigma simple. Per. none; amert under each disk cherishing the seeds of two florets Seed solitary, ovate. Obs. Betula T. has the fruits in cylindric aments; feales three-forked; seeds with a double lateral wing. Alnus T. has them in a roundish fructose; feales roundish; seeds angular, without wings.

Species. 1. B. alba, common birch-tree. Lin. Spec. 1395. Hudif. Angl. 416. Withei. 1657. Ger. 1293. Emac. 1478. Park. 1468. Rainhill. 1410. Hunt. Evelyn. 218. Varieties. B. pendula, weeping-birch. B. alba Dakcarlic. Lin. Suppl. 416. "Leaves ovate, acuminate, ferrate." The common birch-tree is known at first sight by the fluffy colour of its bark, epidermis, or thin outer covering of the bark; the smallness of the leaves in comparison with other timber-trees; and the lightness and airiness of its whole appearance. The branches are alternate, very flexible, covered with smooth brown or rufset, and smooth bark, generally dotted with white; the leaves alternate, bright green, smooth, shining beneath, with veins crossing like the meshes of a net; the petals about half an inch long, grooved above, and having at the base ovate green glands; the male amers or catkins, which have their seeds tipped with brown, appear in autumn at the ends of the twigs, abide in winter, and unfold their flowers, when the female catkins appear in spring at the ends of the shorter branches, on pedicles near a quarter of an inch long; the blossom is egg-shaped, concave, and green; the germ, two or more, are compressed; and the styles and fringes are reddish. A native of Europe, from Lapland to the subalpine parts of Italy; and of Asia, chiefly in mountainous situations; found with us in woods and noild hedges, and flowering in April and May.

Evelyn observes, that although the timber of birch is the worst of any, it has its various uses: as for the farmer's ox-yokes, for hoops, small serews, paniers, brooms, wands, bavin-bands and wythes for faggots, and formerly for arrows, bolts, and shafts. It served also for ditches, bowis, laddles, and other domestic utensils. In New England, he says, our Northern Americans made canoes, bowis, buckets, baskets, kettles, dishes, &c. of this wood, which they curiously joined with threads made of cedar-roots; and out of an excerulence from the bore, boiled, beaten, and dried in an oven, they made excellent spunk or touchwood, and balls for playing. They also constricted it pinnaees, which they ribbed with white cedar, and covered with large flanks of birch-bark, fewed with threads of spruce roots, and pitched: to which use it was anciently applied even in Britain. It served also for fuel; birch-trees having been dug in many of the moors of the west riding of Yorkshire, which burn and flame like fir and candle-wood; and Pliny says (N. H. I. xvi. c. 18)
c. 18.) that the Gauls extracted a kind of bitumen out of birch. The inner white cuticle and silken bark, which strips off of itself almost yearly, was anciently used for writing tables, before the invention of paper; and with the outward, thicker, and coarser part are covered divers houfes in Rustia, Poland, and other northern terrains, instead of flutes and tile; and in Sweden, the poor have even ground the bark to mingle with their bread corn. From the accounts of more modern writers, we learn, that the wood of birch; which is very white, is used for women's shoe-edges and patterns, and for packaging-casks. It is planted along with hazel to make charcoal for forges; and in the northern parts of Lancashire, and in the vicinity of London, beamfs are made with its twigs, for home consumption, and also for exportation. The twigs smeared with bircholine are also used by the tlowards; and in Norway they are given to horses, when fodder is scarce. The bark is serviceable in dyeing wool yellow, and in fixing fugacious colours; for which purpose it should be used dry, and trees of 18 or 20 years growth should be disbarred at the time when the sap is flowing. The Highlanders of Scotland use the bark for tanning leather, and for making ropes; and they sometimes burn the outer rind instead of candles. In Norway it is dried, ground, and mixed with meal, and boiled up with other food for swine, who thrive much upon it. The outer bark, as it escapes putrefaction in the dampk places, is employed for covering the roofs of houses, ufed on a layer of turf three or four inches thick. The inner bark is applied by the Norwegians for tanning hides, for fishing-nets, and for fials. With the fragments dexterously braided the Laplanders make shoes and bסקets, and they ufe large pieces of it for outer garments to keep off the rain. In Kamtschatka, they convert it into hats and drinking cups. The wood was formerly ufed by the Scots Highlanders for their arrows, but it is now employed by the hoop-binders and wheelwrights, and for a variety of rustic implements. The turner ufes it for trechers, bowls, ladies, &c.; and that which is of a proper size serves for gates, rails, &c. In France it is generally ufed for wooden fences. It irfords good fuel, and some of the bock charcoal; and the foot is a good lamp-black for printer's ink. The small branches serve the Highlanders for hurdles, and for fide-fences to their houses. Moxa is made of the yellow fungous excrescences of the wood, which sometimes uveu out from the fissions. The leaves afford good fodder to horses, kine, sheep, and geats. The seeds are the favourite food of the falken; and the tree supplies a variety of infects with food.

The usual sap of the birch-tree poffefles a faccharine quantity, and has been ufed both in a fermented and unfermented state, as a wholesome diuretic wine. It was formerly in great repute againfe all nephritic disorders; but has been discarded from the modern practice. Van Helmont extols a drink prepared with this juice, daceus-keads, and brook-line. Mr. Boyle fays (Work, Abr. vol. i. p. 51, vol. iii. p. 338.), that he has seen extraordinary medicinal effects of the juice itself, even when other remedies failed; and accordingly he provided himself with a quantity of it every spring. He fays, it may be eafily prepared by pouring a little oil on the top of it, or by dilution; but the belt way is to impregnate it with the fumes of sulphur. The juice has been ufed for wine, and also for brewing, being in the latter cafe employed in lieu of water; and it is faid Phil. Tranf. N. 46. p. 563.), that a barrel of malt will afford as much, and as good ale, as four with common water. In order to obtain this juice, let holes be bored in the bodies of the larger trees, about the beginning of March, while the sap is rising; and before the leaves fliet out, and in these holes fix foffets of elder flicks, cleared of their pith, placing vesfels under them to receive the liquor. A large tree may be tapped in four or five places at a time; and from several trees may be drawn in this way several gallons of juice in a day. If a fufficient quantity be not obtained in the day, what has been gained may be referved by bottling it up closely till more be procured; but the sooner it is boiled the better. It has been observed, that in the space of 12 or 14 days as much juice may be obtained from one tree, as will outweigh the whole tree, body, and roots. And Evelyn, in his "Sylva," (Hunter's edition, p. 234.) informs us, that a great difference is found between the efficacy of that liquor which diffus from the hole, or parts of the tree nearer the roots, and that part which flows from the higher branches; the former being more crude and watery, and the latter more pure and refined. When the sap is obtained, boil it as long as may fume arises, and well skim it during the operation. To every gallon of liquor add four pounds of sugar, and boil it afterwards half an hour, well skimming it; then put it into an open tub to cool, and when cold turn it into a cafe. When it has done working, hang it up clofe, and keep it three months; then either bottle it off, or draw it out of the cafe, when it is a year old.

The birch, independently of the ufe to which its various parts have been applied, merits culture in parks and ornamental woods for the sake of variety; its fragrant flem, smooth and white bark, and neat foliage, exhibit a pictruelike appearance, when properly placed here and there in the openings, so as to show the foliage and hanging down of the twigs, or within to display its fibly bark through the glom; and, besides, its fragrant fmeu after rain, judifily entitles it to a place in the wilderfens. Moreover, the birch-tree deferves cultivation, because it will grow to advantage upon barren land, where better trees will not thrive. It will flourifh in moist fpunge land, in dry gravel and fand, with the surface is shallow; and upon ground, producing only moss, thefes trees have succeeded so well, as to be fit for cutting in ten years after planting, and to yield a coniderable profit at a fmall expence. Of this species there are feveral varieties. In the variety 8, the twigs of young trees are ereb, but being lender and plant, they are apt to become pendent with age; and hence proceeds a variety no lefs beautiful than the weeping willow. n, is a remarkable variety found in Dalecarlia, and defcribed as having leaves almost palmate, with the fegments toothed. Other varieties of a trifling nature, with small differences in the shape of the leaves, are mentioned by Linnæus in his Flora suecica.

2. B. nigra, black Virginia birch-tree. Lin. Spec. 139. Reich. 4. 126. Gard. frut. 2. 54. t. 90. Grun. Virg. 188. 146. Rauv Dendr. 12. n. 2. Ait. Hort. Kew. 3. 336. "Leaves rhomb ovate, acute, doubly ferrat, pubifcent underneath, entire at the base; scales of the frutules villofe, segments linear, equal." This species being of foreign growth, is propagated for wilderfens and ornamental plantations; but as it now begins to be more common, it is to be hoped that it will soon make a figure among our forest trees. It is equally hardy with our common birch, and attains to a much greater magnitude, as it grows to upwards of 60 feet in height. The branches are fptoe, and more sparingly set on the trees than thoee of the common fort. The leaves have their larger ferratures more deep and remote, besides several very small, fime, crowded ones; they are broader, grow on long foot-Halks, and add a dignity to the appearance of the tree. The twigs are pubifcent, and the petiules villofe. A native of Virginia and Canada; and introduced into Kew gardens in 1736, by Peter Collifon, L.Iq.

It is very defirable in pleafure-gounds, as it is the firft tree in the spring which presents us with leaves, which are of a light
BETULA.

Light and lively green. Its white bark makes a beautiful variety, when intermixed with other trees. It is said to be the most useful tree in North America for building both of houses and boats; and will grow will in any soil or situation, whether wet or dry; and it may therefore be planted in places where few of other trees will thrive, and much deserves cultivation. There are several varieties of this species, differing in the colour, size of the leaves, and shoots; such as the broad-leaved Virginian birch, the poplar-leaved Virginian birch, the paper birch, brown birch, &c.

3. B. lamia, Canada birch. Lin. Spec. 1394. Reich. 4. 126. Gross. Virg. 115. 1. 146. "Leaves cordate, oblong, acuminate, ferrate." The leaves are smooth, very hard and shortly ferrate. The female catkins are ovate, sessile, with acuminate entire scales. This species grows to more than 60 feet in height. The liquid flowing from its wounds is used by the inhabitants of Kamtschatka without previous fermentation; with the wood, and also with the bark, which is very light, tough, and durable, they construct hedges and canoes; and they convert the latter into food by filleting it off when green, and cutting it into long narrow pieces, like "vermicelli," drying it, and stewing it with their caviar. It was cultivated by Mr. Miller in Kew garden in 1739. The varieties differ in colour, and are distinguished by the names of duskly Canada birch, white paper birch, poplar-leaved Canada birch, low growing Canada birch, &c.

4. B. secta, smooth dwarf birch. Lin. Spec. 1394. Reich. 4. 127. Hudson. Angl. 416. Wither. 2. 207. Hill. Helv. i. 1629. Fl. Dan. t. 97. Pallas Rofs. t. 40. D.-G. Fl. Lapp. 1. 4. Light. Scot. 575. t. 25. "Leaves orbicular, crenate, or circular, folioloosed." An upright shrub, seldom rising above two or three feet high, with a hard, thick trunk, and broad, rough bark, resembling that of the ulmus campaginea; branches expanding, flat, frutiferous, tapering, woody, somewhat gummy at the ends; leaves either broader than they are long, commonly three from each bud, but frequently five and alternate, generally entire at the base, folioloosed often pinnate; catkins about half an inch long; spikes purple. A native of the northern parts of Europe, and of the Alps; grows on mountains and wet banks in Scotland; and flowers in May. Here it is planted for the sake of variety, but is of no use; however, Linnaeus says, that it is very serviceable in the economy of the Laplanders, affording them timber, when they live on the mountains, feed for their flocks, which they are obliged to keep constantly in their way to feed them from the forest; and, covered with the horns of the rein-deer, forming their beds. The seeds are the half of the stamens, which supplies a considerable part of the forest sauce. The moose also, regard it, which they consider as an efficacious remedy in all painful diseases. The leaves, according to Linnæus, dye a yellowish red that is afforded by the B. secta.

wedge-form, very obtuse, gluttonous; axils of the veins villous underneath." The common alder, which appears generally as a shrub, sometimes grows to the height of 95 or 40 feet. The bark is blackish, and in old trees full of clefts; the wood is red and brittle; the leaves are of a dark green colour, and roundish figure, crenate, smooth, villous to the touch; the petals grooved above and near an inch long, with lanceolate blunt stipules at their base; the male catkins are cylindrical, appear in autumn, and continue to the spring; the females are of a short conical form, like a small fir cone. Many botanists have separated the alder from the birch; but Linnaeus, in his latter works, has joined them in the same genus. Garrick prefers them distinct, alleging that they differ not only in the fruit, but in the flower. A native of Europe, from Lapland to Gibraltar; and of Asia from the White sea to Mount Caucasus, in wet and boggy grounds, and on the banks of rivers; flowering with us in February, March, and April. The varieties of this tree are the long-leaved American alder, the white alder, the black alder, and the dwarf alder. The half with a round ferrate leaf, grows naturally on the Alps and Apennines; it is a very humble shrub, seldom rising more than a foot high, with its branches always trailing on the ground. The first, or long-leaved alder from America, grows to 30 feet in height, and deserves a place in all plantations. The branches are slender, smooth, numerous, and dark brown or purple; the leaves are long, and free from the charnicles of the common sort; and sometimes continue on the tree even in December, so as to give it the appearance of an ever-green.

The wood of the alder is valuable for piles, pumps, sluices, and in general for all works intended to be constantly under water. It is said to have been used under the Rialto at Venice; and we are told that the mortars about Ravenna were piled with this timber, in order to serve as the foundations of buildings. For this purpose it has been much cultivated in Flanders and Holland. It serves also for many domestic and rural usages, as for cart-wheels, spinning-wheels, mill-vehicles, bowls, tripods, small trays, trenchers, and other turnery ware, troughs, handles of tools, clogs, patteus, and wooden hoes. The roots and knots furnish a beautiful veined wood for cabinets; and the Scotch Highlanders often make chairs of it, which are very handsome, and of a colour of mahogany. The wood that has lain in hogs is black like ebony. It is generally planted for coppe wood, to be cut down every ninth or tenth year for poles. The branches make good charcoal.

The bark is used by tanners and leather-dressers, and also by fishermen for flattering their nets. This and also the young shoots dye yellow, and with a little coppers a yellowish grey, useful in the demiatins and shadows of cloth in tapestry. The shoots cut in March dye a cinnamon colour, and a fine tawny, when dried and powdered. The youth wood yields a dye of the colour of rapped-fur. The catkins dye green. The bark is used as a base for black; can ounce of it dried and powdered, and boiled in the quarters of a pint of water, with an equal quantity of log wood, with solution of copper, tin and bismuth, six grains of each, and 10 drops of solution of iron vitriol, will dye a strong deep "Le de Paris." The leaves have been sometimes employed in tanning leather. The Lappiards chew the bark, and dye their both garments and with their tallow. The whole tree is very alluring.

The alder grows in hedges by the sides of streams and ditches, and in all wet and marshy soils, and keeps up the banks; but if it be planted in a low meadow, it is said that the ground about it will become boggy; whereas, if it be planted, the roots of which penetrate a great way, and run

N N

330
near the surface, the ground will become firm and dry. The growth of grass is not materially obstructed by the shade of alder. In the highlands of Scotland, near Dunoon, Mr. Pennant says, the boughs cut in the summer spread over the fields, and left during the winter to rot, are found to answer the purpose of a manure. In March the ground is cleared of the decayed parts, and then ploughed. The fresh gathered leaves are covered with a glutinous liquor, which some people throw upon their floors to destroy fleas; the fleas entangling themselves in the tenacious liquor, as birds do in bird-lime. This tree affords food to many kinds of moths, and other insects. Horses, cows, goats, and sheep, eat it; but swine refuse it. The tongues of horses who feed upon it are turned black; and some persons suppose that it is not wholesome for them.

14. B. davieti. Pallas it. 3. 234. t. kk. f. 4. ab. fl. ros. 60. t. 39. Gmel. Sib. 1. 157. & 2. "Leaves ovate; acuminate, serrate, hairy on the nerve." Scarcely distinguishable, when young, from the common birch, except by the leaves, not growing so tall, and the trunk not exceeding a foot in diameter; bark greyish, clef longitudinal, and divided into brown scales, as if burnt; branches more subdivided and upright; leaves harder, commonly smaller, on shorter petioles; strobiles lanceolate, grey, subpubescent, deciduous; male catkins at the end of the twigs of the preceding year, two or three together, larger than those of the common birch; females from the same twigs lateral, thicker, with larger, and more rounded scales; the seed larger, surrounded by a narrower membrane; differing from the black American birch by having smaller strobiles, and leaves less thick and never doubly serrate. The wood is hard, yellower than that of the common forest, and in old trees marked with brown and grey towards the middle; tougher, and therefore more fit for cart-timber and the use of the wheelwright; also employed in making charcoal. A native of Dauria.

15. B. fruticosa. Pallas it. 3. App. 758. n. 133. t. kk. f. 1, 2, 3. fl. ros. 6. 2. t. 40. A. D. C. Gmel. Sib. 1. 157. var. 3. 1. 36. f. 2. "Leaves rhomboid-ovate, equally serrate, smooth." Always shrubby, rising with several stems from the same root, in boggy places not an inch thick, nor higher than a man's stature, but on mountains attaining the thickness of the human arm, and growing to a much lofter height; much branched from top to bottom, and of a very different habit from the common birch; the cuticle ash-coloured with transverse striae; the wood not so white, and waving transversely; the twigs almost covered with little resinous dots found more or less in the other species; buds more copious and always alternate; two leaves commonly from the same bud, softer than those of the common forest, and deeying sooner; having three seeds to each scale, of the same size and form with those of the B. nana. Abundant in marshes and on rocky mountains, and in the cold subarctic regions of eastern Siberia, especially towards the lake Baikal.

Propagation and Culture. The birch tree may be cultivated either by young plants procured from the woods where they naturally grow, or by seeds carefully gathered in autumn, as soon as the scales begin to open, otherwise they will drop and be lost. As these seeds are small, they should not be buried above a quarter of an inch deep in the ground. Mr. Miller recommends autumn as the best season for sowing them; but Mr. Boutecher directs to spread the seeds thin on a floor till dry, to mix them with loofe sand, and to keep them in an airy place till the beginning of March, when they should be sown on fresh light sand, trampled or dug the preceding autumn, made very loofe, raked fine, and divided into beds three feet and a half wide. It is needless to throw any earth over them; but in dry and frosty weather, a small quantity of peatial haulm may be thrown over them for three or four weeks, till the seed begin to vegetate. The ground should then be kept clean, and three or four gentle waterings may be given at noon in April, and repeated to the middle of June in mild evenings. In the following March they may be removed into the nursery, and planted in rows two feet and a half distant, and ten, or twelve, or eighteen inches asunder. Here they may remain two years, or, in cafes where they make little progress, three years; cutting after the second year's growth such as are least thriving or crooked, close to the ground in March. Mr. Miller recommends
to sow the seeds in the frame, allowing that they will thus thrive better than when exposed to the full sun. In all places where large trees, their seeds fall, and the plants spring up without any previous care. If these wild plants are taken up without any injury to the roots, they may be transplanted into any ground, with little or no preparation; where the land will admit of the plough, it will be best prepared by a crop of corn. In the spots where they are to stand, it will be sufficient to level the soil with a spade or mattock; and they may then be let into holes capable of receiving their roots, which should be covered with earth attached closely to them. After they have taken root, they require no further care. Hedges being kept clear of weeds, which may be cut down two or three times in a summer for the first two years; and afterwards the plants will be strong enough to keep the weeds down, so that they can receive no injury from them. These plants may be set any time from the middle of October till the middle of March, when the ground is free from frost; but in dry land autumn is the best season, and for a month later spring is preferable. The distance at which they should be placed is six feet square, that they may form cover the ground, and that by standing close, they may draw each other up; for situations that are much exposed, if they are not planted close, they will not thrive well. If the plants take kindly to the ground, they will be fit for cutting in about ten years; and afterwards, they may be cut every fourth or fifth year, if they are merely destined for the窄 rude making, but if they are intended for hedges, they should be cut after every year or every tenth year.

At the birch is native of Britain, it suits itself to a field of any kind. It will thrive extremely well on barren land, whether it be wet or dry, sandy or stony, marshy or boggy. It is fair-stalk, and will come up in places where hardly any other tree will grow. It may be cultivated at a moderate expense, and being easily disposed of to the broum-makers, hops breeders, turners, and for purposes of husbandry, it will yield a considerable profit.

The second and third species, or the American forts of birch, may be propagated by seeds in the same manner as the first, and are equally hardy. Seeds sown in beds of the usual kind, and covered about a quarter of an inch deep, will generally grow. They should be carefully weeded and watered dry, and at the age of one or two years, according to their strength, they should be planted in rows in the nursery, in the usual manner. In summer, weeding should be quite free, and in winter, digging between the rows; and when they are about three or four feet high, they will be of a good size for being transplanted into the wilder quarters. As these American forts grow with greater vigour than the common fort, and thrive on the most barren ground, they may be cultivated in England to great advantage. The variety of the different species may be propagated by layers. For this purpose a sufficient number of plants should be procured, and set on a spot of double deep ground, at the distance of two yards from each other. In the following year, if they have made young shoots, they should be cut off within half a foot of the ground, to form the wood, with all their shoot vigorously the following year; and during the young shoots should be planted about the wood, at the distance of a layer near their ends. They should take root, and become good plants in the following season; and if they will have sprouted up from the wood, and be ready for the same operation. The layer should not be kept, and the operation performed in the winter. If the plants do not root, they should not be headed down, but planted near the ground, and all the young twigs layered. An immediate crop may thus be raised; whilst young shoots will spring out in great plenty below the platted part, for the purpose of laying in for the succeeding year. This work may be repeated every autumn or winter; when some of the strongest layers may be planted out, if they are immediately wanted; whilst the others may be removed into the nursery, in order to become stronger plants, before they are removed to their destined situations. Cuttings also, if set in a moist shady border in the beginning of October, will frequently grow; but as this is not a sure method, and as these trees are easily propagated by layers, it hardly deserves to be practiced.

In Sweden, the budding and planting of the birch-tree is conducted as a directory for growing barley. See Poli- nation.

The fourth and fifth species, being of no use with us, are not cultivated, except in botanic gardens.

The fifth species, or alder-tree, delights in a very moist soil, where few other trees will thrive, and greatly improves such lands. It may be propagated by layers, cuttings, or suckers about three feet long. The best time for planting suckers, which is the best eligible, though perhaps a little expensive method, is in February or the beginning of March. These should be sharpened at one end, and the ground loosened with an iron crow, that when they are thrust in, the base may not be torn off. They must be planted at least two feet deep, that they may not be disturbed by strong winds, and at the distance of three feet. The plantations should at first be cleared of all weeds; and after every fall, in the following winter, the floods ought to be looked over, and all the weak suckers taken off. This will strengthen those which are already the strongest, and will enable them to shoot up more vigorously for poles. Many of the suckers will not grow; and Hunter, in his edition of Evelyn's Sylva, says, that he has never seen a cockle, raised in this way, so luxuriant and beautiful, as when raised from regular plants. If the alder be raised by layers, this operation must be performed in October, and in the following October they will have taken sufficient root for transplantation. They should then be set at least one foot and a half deep in the ground, and their tops should be cut off about nine inches above the surface, which will occasion their shooting out many branches. The method of raising these trees by suckers, is practiced abroad, and, says Hunter, (ubi supra) is greatly to be commended. If these trees are designed for coppices, they should be placed at the distance of six feet square, or they may be planted at six feet from each, and at the end of seven years, when they are fell for poles, every other flood may be taken away; and if the small lateral shoots be taken off in the spring, it will very much strengthen the upright poles, provided a few small suckers be left at certain distances upon the body to detain the sap for the increase of its bulk. In planting alders for coppices, Hunter (ubi supra) says, it is much better to raise them from young trees than from suckers. To obtain these in sufficient quantity, plant father, taken out of the meadows where the alder-trees grow, on a prepared piece of ground, and afterwards laid them down for floods; by the shoots in the succeeding autumns, and in twelve months they will have taken root, when they should be removed and planted in rows, and in one or two years they may be transplanted where they are to remain. If the coppice is raised upon barony or wetty ground, they may be removed from the nursery, and planted three feet asunder, in beds previously prepared for receiving them. Here they may be laid for six or seven years, when every other tree should be taken away, and the rest cut down for floods. Every ninth or tenth year will afford a full of these trees for poles;
BET

BEV

poles; which should be taken off smooth and fine, so that the flood may not be damaged, or hindered from producing a fifth crop.

These trees will thrive exceedingly on the sides of brooks, and may be cut for poles every fifth or sixth year. They may be also planted for hedges in moist ground, and trained into thick as are very close and thick, to the height of twenty feet and upwards. The banks of rivers may be fenced by planting, truncheons very close, and crosswise. As the leaves are large and of a deep green colour; these trees, if the beauty of aquatic plantations be regarded, should be preferred to others usually planted in swampy grounds.

The seventh species, or hoary alder, growing naturally in dry sandy soils, may perhaps be cultivated with the birch, where land is of little value, as an underwood, and may be propagated either by layers or cuttings, as well as by seeds, where they can be obtained. Martyn's Miller, Hunter's Evelyn's Silva, p. 225, 240. Withering's Bot. Arr. vol. ii. p. 296.

BETULA Americana. See Bursera.

BETULÆ, in Entomology, a species of CURCULO, entirely of a golden green colour in one sex, and blue in the other, with a spine on each side of the anterior part of the thorax of the latter. A native of Europe. Linnaeus.

BETULA, a species of Cryptoselphalus, that inhabits Berlin. The colour is black; thorax somewhat orbicular and hairy; wing-cases brownish with obscure streaks. Herb. &c.

BETULA, a species of Attelulus, of a black colour, with legs formed for leaping. Lin. Fr. Spec. This is curculio excisitator-niger of Degeer.

BETULA, a species of Cimex (Acanthus membranaceus), that lives on the white alder in the north of Europe. The thorax is denticulated; head muricated; anterior part of the wing-cases dilated. Lin. Degeer, &c.

BETULA, a species of Papilio (Pleb. Rur.), found in Europe. The wings are somewhat tailed, brown, yellowish beneath; posterior ones with two white streaks. Fabricius. Donov. Brit. Inf. &c. The larva is green, with pale oblique lines, and white on the sides; pupa glossy, and ferruginous. Feeds on the alder. The male distinguished by a fuscous spot on the upperwings.

BETULA, a species of Tenthredo, with the body red; thorax, vent, and eyes black; wings behind brown. Lin. Fr. Spec. This is tenthredinaria ferruginea of Degeer. Inhabit Europe.

BETULA, a species of Coccus, found on the white alder. It is round, and of a bay colour. Gmel. &c.

BETULEUS, SIXITUS, in Geography, whose true name was Birk, was born at Memmingen, in the year 1500, and obtained the reputation of an able grammarian, as well as a good Latin poet and philosopher. He taught the belles lettres and philosophy; and became principal of the college of Augsburg, where he died June 16th 1555. He published several works in prose; and his dramatic pieces of Joseph, Sufannah, and Judith, have been esteemed.

BETULINUS, in Ornithology, a species of Tetrao, described by Scopoli. The tail is black, varied with transverse rufous spots; rump whitish, falculated with black. Scop. Anim. Latham. This is the argusalis minor of Aldrovandus; and birch grus of Latham. The body is varied with black and rufous; bill and legs black; breast greyish; quill-feathers white at the tip; eyebrows not red.

BETULUS, in Botany. See Carpinus.

BETUWE, BETAW, or BATAVIA, in Geography, a tract of land, in the duchy of Guelderland, in the United Netherlands, situated betwixt the Rhine and the Waal, and forming part of the "Insula Batavorum," where the Batavians settled on their migration out of Germany. It has been divided into two bailiages, viz. the eastern or upper, and the western or lower Betuwæ. The former, by a change in the course of the Rhine, has been separated from Betuwæ, and removed into the duchy of Cleve, where the fortifications of the Schonenber-Schwanze, erected in 1586, by general Martin Schenk, have been gradually washed away by the water. The bailiages of lower Betuwæ comprehends a number of villages that lie on the Rhine. See Batavia.

BETWEEN DECKS, in Sea Language, denotes the space contained between any two decks of a ship.

BETWHA, in Geography, a river of Hindostan, which runs into the Jumna, 25 miles south-east of Calpy. This river, from its source south of Bopal, to its confluence with the Jumna, describes a course of 340 miles in a north-easterly direction.

BETZ, the principal place of a canton, in the district of Selmis and department of the Oise, containing 358 persons; the number of the canton being 2364. Its territory comprehends 2225 kilometres, and 29 communes.

BETZALEL, in Geography, a Jewish doctor of Prague, in Bohemia, flourished about the middle of the 16th century, and was chief of the Moravian academies, and judge of the nation in that country. He left several learned works, among which is that entitled "The Redemption and Eternity of Israel," in which he affirms the Jews of the certainty of the Messiah's advent, and of his settling them in a state of permanent prosperity.

BETZANDORFF, in Geography, a small town or borough of Germany, in the old mark of Brandenburg.

BETZDORF, the principal place of a canton, in the district of Luxembourg, and department of Foréts, containing 1286 inhabitants; those of the canton being 8195. Its territory comprehends 2125 kilometres and 7 communes.

BETZKO, a town of Hungary, 18 miles west of Topolcan.

BETZIRVA, or BARSAN, a town of Persia, in the province of Alderbeizan; 100 miles north-east of Taurus.

BEVAGNA, a small town of Italy, in the duchy of Spoleto, seated on the river Tinis, or Tinea.

BEVECUM, a town of Brabant, 8 miles south-east of Louvain. N. lat. 50° 45'. E. long. 4° 50'.

BEVEL, in Geography, and among Romans, a kind of square, one leg whereof is frequently straight, and the other bevelled, according to the sweep of an arch or vault; being also moveable on a point, or centre, so that it may be set to any angle. The make and use of the bevel are pretty much the same as that of the common square or mitre, except that the latter are fixed; the first at an angle of ninety degrees, and the second at forty-five; whereas the bevel, being moveable, may, in some measure, supply the office of both, and yet, which it is chiefly intended for, supply the deficiencies of both, serving to set off or transfer angles, either greater of less than ninety or forty-five degrees.

Bricklayers have also a bevel, by which they cut the under sides of the bricks of arches, arched or circular, to such oblique angles as the arches require, and also for other uses.

BEVEL, Graduated, is that which has about the centre of one of its arms a semicircle graven, and divided into 180 degrees, whose diameter stands square with the sides of the same arm; so that the end of the other arm, being divided at right angles, almost to the centre, shows by its motion the number of degrees contained in the angle to be measured. This is also called reciprocate, and pantometre.

Bevel angle is used among the workmen, to denote any other angle beside those of ninety or forty-five degrees.

The
BEVEL.

The BEVEL (see Plate II. Geometry, fig. 35.) consists of two rulers moveable on a common centre, like a carpenter's rule, with a contrivance to keep them fixed, at any required angle. The centre C must move on a very fine axis, so as to be in a line with the fiducial edges CB, CD of the rulers, and project as little as possible before them. The fiducial edges of the legs represent the sides of any given angle, and their intersection on centre C, its angular point. A pin, fixed in the lower ruler, and passing through a semicircular groove in the upper, serves by a nut A, which screws upon it, to fix the rulers, or legs, when they are placed at the desired angle.

The use of this instrument may be illustrated in the following examples:

1. Let three points, A, B, C, be in the circumference of a circle, which is too large to be described by a pair of compasses, and let it be required to find any other number of points in the same circumference. Bring the centre of the bevel to B, (fig. 36.), the middle point of the three given ones, A, B, and C, and holding it there, open or shut the instrument till the fiducial edges of the legs be upon the other two points, and fix them there by means of the screw A (fig. 35): this operation is called setting the bevel to the given positions. Then removing the centre of the bevel to any point between B and A or C, the leg lying at the same time kept upon A and C, the centre will describe, or be always found in the arc which passes through the given points, and will thus determine as many others as may be required between the limits of A and C. In order to find points without these limits, proceed in the following manner: the bevel being fixed, bring the centre to C, and mark the distance CB upon the left leg; remove the centre to B, and mark the distance BA upon the same leg; then placing the centre on A, bring the right leg upon B, and the first mark will fall upon A, a point in the circumference of the circle, passing through A, B, and C, whose distance from A is equal to the distance BC. Removing the centre of the bevel to the point A, a point found, and bringing the right leg to A, the second mark will find another point C* in the same circumference, whose distance from A is equal to AB. By proceeding in this manner, any number of points may be found, whose distances on the circumference are alternately BC and BA. In the same manner, by making similar marks on the right leg, points on the other side, as at a and c are found, whose distances Cc, c'a, are equal to BA, BC respectively. Intermediate points between any of the above are given by the bevel in the same manner with those between the original points.

2. Three points, A, B, and C, being given, to draw a line from any one of them, tending to the centre of the circle, which passes through them all. Set the bevel to the three given points A, B, and C (fig. 37); lay the centre on A, and the right leg to the point G, and the other leg will give the tangent AG. Draw AD perpendicular to AG for the line required. For BA E being BCA, the angle EAC is the supplement to the angle ABC, or that to which the bevel is set; hence, when one leg is applied to C, and the centre brought to A, the direction of the other leg must be in that of the tangent GE.

3. Three points being given as before, let it be required to draw from a fourth given point D, a line tending to the centre of a circle passing through the first three points. On D (fig. 38.), with the radius DA describe an arc AK; set the bevel to the three given points, A, B, and C, and bring its centre, always keeping the legs on A and C, to fall on the arc AK, as at H; on A and H severally, with any convenient radius, strike two arcs, crossing each other at I; and the required line DI will pass through the points I and D. For a line drawn from A to H will be a common chord to the circles A H K and A B C; and the line I D bisecting it at right angles, must pass through both their centres.

4. Three points being given as before, together with a fourth point, to find two other points, such, that a circle passing through them and the fourth point, shall be concentric to that passing through three given points. Draw AC and CE tending to the centre, by a former problem: set the bevel to the three given points A, B, and C; bring the centre of the bevel to D, and move it upon that point till its legs cut off equal parts AN, C Q, of the lines A E and C E; and N and Q will be the points required. For, supposing lines drawn from A to C, and from N to Q, the segments A B C and N D Q will be similar ones; and consequently, the angles contained in them will be equal.

5. Two lines tending to a distant point being given, and also a point in one of them; to find two other points (one of which must be in the other given line), such, that a circle passing through these three points may have its centre at the point of intersection of the given lines. Draw E H (fig. 39.) at right angles to A B, and make E H = F E; let the bevel to the angle G D O, and keeping its legs on the points H and E, bring its centre to the line A B, which will give the point I.

An improved bevel is exhibited in fig. 40, by which the arcs of circles of any radius, without the limits attainable by a common pair of compasses, may be described. It consists of a ruler A B, composed of two pieces riveted together near C, the centre or axis, and of a triangular part C F E D. The axis is a hollow socket fixed to the triangular part, about which another socket, fixed to the arm C B, of the ruler A B, turns. These sockets are open in the front for part of their length upwards, as represented in the section at I, which shows the point of a tracer, or pin, fitted for sliding in the socket. The triangular part is furnished with a graduated arc DE, by which and the vernier at B, the angle D B may be determined to a minute. In this arc is a groove, by means of which, as well as by the nut and screw at B, or some similar contrivance, the ruler A B may be fixed in any required position. A scale of radii is put on the arm C B, by which the instrument may be set to describe arcs of given circles, not less than 20 inches in diameter. In order to set the instrument to any given radius, the numbers expressing it in inches on C B, is brought to cut a fine line drawn on C D, parallel and near to the fiducial edge of it, and the arms are fastened in that position by the screw at B. Two heavy pieces of lead or brass G, G, made in form of the sector of a circle, the angular parts being of steel, and wrought to a true upright edge, as shown at H, are used with this instrument, whose arms are made to bear against those edges when the arc is drawn. The under sides of these sectors are furnished with fine short points to prevent them from fishing. The fiducial edges of the arms CA and C D, are each divided from the centre C into 200 equal parts. This instrument might be furnished with small cursors, like the pentagram; but little buttons, fixed on its under side, near A, E, and D, will enable it to slide with sufficient ease.

The use of this instrument may be exemplified in the following problems:

1. To describe an arc, which shall pass through three given points.—Place the sectors G, G, with their angular edges over the two extreme points; apply the arms of the bevel to them, and bring at the same time to its centre C, that is, the point of the tracer, or pen, put into the socket, to the third point, and there fix the arm C B; then, bringing the tracer to the left-hand sector, slide the bevel, keeping the
arms constantly bearing against the two factors; till it comes to the right-hand factor, by which the arc required will be described by the motion of its centre C. If the arc be wanted in some part of the drawing without the given points, find by case 1. under simple bevel, other points in those parts where the arc is required; and thus a given arc may be lengthened as far as is necessary.

2. To describe an arc of a given radius, not less than 10 inches.—Fix the arm CB so that the part of its edge, corresponding to the given radius, always reckoned in inches, may lie over the fine line drawn on CD for that purpose; being the centre to the point through which the arc is required to pass, and dispose the bevel in the direction in which it is intended to be drawn; place the sectors G, G, exactly to the divisions 100 in each arm, and strike the arc as above described.

3. The bevel being set to strike areas of a given radius, as in the last instance, let it be required to draw other arcs, whose radii shall have a given proportion to that of the first arc. Suppose the bevel to be set for describing areas of 50 inches radius, and it be required to draw arcs of 60 inches radius, with the bevel so set. Say, as 50 is to 60, so is the constant number 100 to 120, the number on the arms CA and CD, to which the sectors must be placed, in order to describe arcs of 60 inches radius. When it is said that the bevel is set to draw areas of a particular radius, it is always understood that the sectors G, G, are to be placed at No. 100 on CA and CD, when those arcs are drawn.

4. An arc ACB (fig. 41.) being given, let it be required to draw other arcs concentric to it, which shall pass through given points, e.g. P. Through the extremities A and B of the given arc, draw lines AP, BP, tending to its centres, by case 3. under simple bevel. Take the nearest distance of the given point P from the arc, and let it from A to P, and from B to P. Hold the centre of the bevel on C, any point near the middle of the given arc, and bring its arms to pass through A and B at the same time, and fix them there. Place the sectors to the points P and B, and with the bevel, let as before directed, draw an arc, which will pass through P the given point, and be concentric to the given arc ACB.

5. Through a given point A (fig. 42.) in the given line, to strike an arc of a given radius, and whose centre shall lie in that line, produced if necessary. Set the bevel to the given radius, by case 2. Through A, at right angles to AB, draw CD; lay the centre of the bevel, let as above, on A, and the arm CA on the line AC, and draw a line A E along the edge CD of the other arm. Divide the angle DAE into two equal parts by the line AF, and place the bevel so that, its centre being at A, the arm CD shall lie on AF; while in this situation, place the sectors at No. 100 in each arm, and then strike the arc.

6. An arc being given, to find the length of its radius. Place the centre of the bevel on the middle of the arc, and open or shut the arms till No. 100 on CA and CD, fall upon the arc on each side of the centre; the radius will be found on CB (in inches) at that point of it, where it is cut by the line drawn on CD. If the extent of the arc be not equal to that between the two Nos. 100, make use of the No. 50, in which case the radius found on CB, will be double of that sought; or the arc may be lengthened by prob. 1., till it be of a sufficient extent to admit the two Nos. 100.

Adams's Geometrical and Graphical Essays, by Jones, 1757.

BEVELAND, in Geography, the name of two islands, formed by the separate branches of the Schelde, belonging to the state of Zealand; the one, called North Beveland, is about 2 leagues long, and 1½ broad; it is south of Schoone island, and on the south side of the channel of the east Scheldt; that here runs into the sea; the other, called South Beveland, or Zuid, is near 8 leagues long, and 2½ wide, and comprehends the town of Goes and several villages; it divides the coast from the west Scheldt, and the two points of its west end approach to the ports of Armgard and Flushing. Both these islands have suffered much from inundations.

BEVELLING, in Ship Building, the art of hewing timber with a proper and regular curve, according to a mould which is laid on one side of its surface.

In order to know any piece of timber to its proper bevel, it will be very expedient to make one side fair, and out of windings; a term used to signify that the side of the timber should be a plane. Now if this side be uppermost, and placed horizontally, or upon a level; it is plain, if the timber is to be hewed square, it may be done by a plummet and line; but if the timber is not hewn square, the line will not touch both the upper and lower edge of the piece, or if a square be applied to it, there will be wood wanting either at the upper or lower side. This is called within or without a square. When the wood is deficient at the under side, it is called under-bevelling; and when it is deficient in the upper side, it is called standing bevelling; and this deficiency will be more or less according to the depth of the piece: so that before the proper bevels of the timbers are found, it will be sometimes very convenient to assign the breadth of the timber; may, in some cases, it will be absolutely necessary, especially afores and abait; though the breadth of two timbers, or the timber and room, which includes the two timbers, and the space between them, may be taken without any sensible error, as far as the square body goes. For as one line represents the moulding side of two timbers, the fore-side of the one being supposed to unite with the aft side of the other, the two may be considered as one entire piece of timber. For further observations on this subject, and particular instructions with respect to the mode of bevelling by ribbon lines, and by water-likes, see Murray's Treatise on Ship-building, p. 166, &c. See Ship.

BEVENSEN, commonly called Bahmen, a town of Germany, in the principality of Luneburg-Zell, seated on the Elbmun, not far from Minden.

BEVER, a river of Germany, which runs into the Weeler near Beverungen, in the circle of Westphalia.

BEVERHEAD, a cape on the south-east coast of Nova Scotia. N. lat. 44° 42'. W. long. 62° 20'.

BEVERA, a river of Italy, which passes by Spofello, in the county of Nice, and runs into the Po, two miles north of Vintimiga.

BEVERAGE, in a general sense, signifies drink. Hence nectar is said to be the beverage of the gods. In Writers of the Middle Ages, beverage, beveragium, or libation, denotes money given to an artisan, or other person, to drink, over and above his hire or wages. Du Cange.

BEVEREN, in Geography, a town of France, in the department of the Elfaunt, and chief place of a canton in the district of Ternonde. The place contains 4927 and the canton 15,740 inhabitants; the territory includes 167½ square kilometres and eight communues.

BEVERGEM, a small town of Germany, in the circle of Westphalia, and bishopric of Munster, situated in the midst of a morass, and having near it a salt spring; 21 miles north of Munster.

BEVERIDGE, William, in Biography, a learned and pious prelate of the English church, was born at Barrow in Leicestershire, in 1638, and admitted in 1653 into St. John's college Cambridge, where he took his degrees of bachelor of arts in 1656, of master of arts in 1660, and of doctor of divinity in 1679. At the university he distinguished himself by his application to the learned languages, and particularly to oriental
BEV

oriental literature, in which he so much excelled, that at the age of 18 he wrote a treatise on the excellency and use of the oriental tongues, with a Syrian grammar. He was no less distinguished at college by his early piety and exemplary sobriety and integrity. Having taken orders in 1661, he was collated by Dr. Sheldon, bishop of London, to the vicarage of Elsing in Middlesex, which he resigned in 1672, upon being chosen rector of St. Peter's Cornhill, by the lord mayor and aldermen of London. In this situation, such were his zeal and affiduity in the discharge of the duties of his office, not only in the pulpit but out of it, and such was the feculars that attended his labours, that he was denounced "the great reviver and reformer of primitive piety." His singular merit recommended him to the favour of his diocesan, bishop Herringman, who, in 1672, collated him to one of the prebends of St. Paul's; and in 1681, bishop Compton promoted him to the archdeaconry of Colchester, every part of which he visited in person. In 1683, he was installed prebendar of Canterbury, and he also became chaplain to king William and queen Mary. Declining to accept the fee of Bath and Wells, which was offered to him in 1691, he was consecrated, in 1704, bishop of St. Asaph. In this elevated station he prosecuted, with his accustomed zeal and diligence, every practicable measure for advancing the honour and interest of religion, both among the clergy and laity: recommending to the former the "duty of catechising and instructing the people committed to their charge, in the principles of the Christian religion, to the end that they might know what they were to do, in order to salvation," and furnishing them with a plain and easy "Exposition upon the Church Catechism." After having possession this new dignity for between three and four years, he died March 5th, 1728, in the 71st year of his age, and was buried in St. Paul's cathedral. He left the greatest part of his estate to the societies for propagating the gospel, and for promoting Christian knowledge. Of his numerous works, those published by himself were, 1. "De Linguarum Orientalium, prefentim Hebreaicis, Chaldaicis, Syriaco, Arabicis, et Samaritana, praefertim ac usu, cum Grammaticâ Syriaca tribus libris traditâ," Lond. 1658, 8vo.; 2. "Institutionum Chronologicarum libri duobus, cum editis in Nova Testamenti libris," London, 1669, 4to., 1705, 4to., and 1724, 8vo.; 3. "Codex Canonicum S. S. Patrum Epistolorum, et Conciliorum ab Ecclesiae Graecae receptorum; necnon Canonicarum S. S. Patrum Epistolorum: unus cum Scholis Antiquiorum linguis et scriptis alias habens spectabilibus; quorum plura et Bithenicae et Dadiuae sacrarum MSS. codices et principum edidit; regius utrumque MSS. fummi fade et diligenter collata, &c." Oxon. 2 vol. 12mo. 1672; 4. "Codex Canonicum Ecclesiae primitivae vincentiis et illustrit." Lond. 1679, 4to. (see Canons.) 6. "The Church Catechism explained, for the use of the diocese of St. Asaph." Lond. 1714, 4to.; several times reprinted in a smaller volume. After his death, several of the bishop's works, not intended by himself for publication, and in various respects injurious to his memory, were published by his executors. The following of devotional tracts, among which are his "Private Thoughts upon Religion," a great number of sermons, a Body of Divinity, or "The Theology of the Church," vol. 2, and "Exposition of the 39 articles, &c." In his "Private Thoughts" the bishop has incurred serious animadversion, particularly with respect to his meditation upon the Trinity, in which he unreservedly adopts the Calvinistic system. The author, however, "proceeds not in the false manner of Dr. Beveridge, but in the true manner of Dr. Compton, in which the choice of the learned, his extensive labours have been very extensively allowed; his devotion included: a genuine, and as a real man and writer, he has been extraordinarily esteemed by his admirers and panegyrists, and no less severely censured by others, for the quaintness and puerility of his style, the fallacies of his conceptions, and incommensurability of his reasoning, and his avowed opposition to rational sentiments of religion. These reflections, however, result from a perusal of his polemical writings, the publication of which has been ascribed to avarice or want of judgment on the part of his executor. All have concurred in allowing him the praise of the strictest integrity, of sincere piety, of exemplary charity, and of great zeal for religion. Bio. Brit. Gen. Dict.

BEVERLACKE, in Geography, a river of Germany, which runs into the Aland, 3 miles south of Schlesauen, in the old mark of Brandenburg.

BEVERLAND, Adrian, in Biography, a man of genius and learning, who profitted his talents in the composition of several obnoxious books, was a native of Middle-
of Bede, whose preceptor, John of Beverley, archbishop of York, founded and erected a monastery here, to which he retired, and wherein he died in 721. King Athelstan having made a vow, before he proceeded against the Scots, instituted a college of secular canons, on his return to this town in 935, and also granted the freemen many immunities and privileges, which were allowed and confirmed by Henry I. and most of the succeeding monarchs to queen Elizabeth. By the last charter, which contains the heads of those previously granted, the government of the town is vested in a mayor, recorder, aldermen, and other subordinate officers. Though within eight miles of Hull, this town prefers great respectability and commercial consequence, from its fairs, markets, and trade. The fairs for the eafli riding of Yorkshire are held here in a handsome hall, called the Hallgarth, which contains a regifter office for deeds and wills, that relate to any lands in this part of the county. Beverley has sent two members to parliament from the 26th of Edward I., except a few intermissions in the reigns of Edwards II. and III.

Here were formerly four churches, but only two remain; one of which is a large handsome edifice, and is called the Minster. King Edward VI. and queen Elizabeth granted certain revenues for the support and repairs of this edifice; but those revenues being improperly applied, a Mr. Moyser, M. P. for the town, procured a brief for the repair of it in 1708. His own contributions, with those from his friends, amounted to 1500l.; which, with 800l. raised by the brief, were placed in the funds, and by the rife of the South sea stock, in the year 1720. he was enabled to complete the repair and adornment of the church in his lifetime. King George I. not only encouraged this work by a liberal donation of money, but gave the stone of the disolved monastery of St. Mary's in York towards the building; for Michael Warton also gave 500l. and bequeathed 400l. more as a perpetual fund towards keeping it in repair. The east window contains some fine painted glasses; and the screen between the nave and choir is much admired for its ornamental workmanship. The north wall of the great chros-aile was at one period inclined from its perpendicular, but Mr. Thornton of York invented a machine, which, by means of levers, &c. restored it to its original position. The ancient fabric was consumed by fire in September 1778. Here are several monuments for the Piercys, earls of Northumberland, who built a private chapel in the choir.

The principal trade of Beverley consists in making of malt, oatmeal, and in the tanning of leather. The colthing trade was, at a former period, an object of much consequence here, but at the time of Leland it was falling fast to decay. Connected with the borough, are four large common fields, containing nearly 1000 acres, in which every burgess or freeman is allowed to pasture a certain number of cattle. In one of these fields is a mineral spring, which has proved serviceable in favouring the medicinal disorders. There are seven almshouses in the town, and legacies left for erecting two more. Here is also a free-school, whose scholars are allowed two fellowships in St. John's college Cambridge, also three scholarships and three exhibitions. Beverley is 193 miles north from London. It has weekly markets on Wednesdays and Saturdays; five fairs in the year; and five annual great markets for fogs, &c. This town consists of three parishes, called St. Martin's, St. Nicholas's, and St. Mary's; and according to the official population report in 1860, included 122 houses, and 5401 inhabitants.

BEVERLY, John of, in Biography, archbishop of York in the eighth century, was born at Harpham in Northumberland, and having embraced the monastic life, he became afterwards abbot of the monastery of St Hilda. He was instructed in the learned languages by Theodore, archbishop of Canterbury, and was justly esteemed one of the best scholars of his time. Some say that he studied at Oxford, and took there the degree of master of arts; but as no degrees were then conferred in this university, this fact has been disputed. By Alfred, king of Northumberland, to whom his merit recommended him, he was advanced, in 685, to the see of Haugufall, or Haworth, and in 687, translated to that of York. Beverley was tutor to the venerable Bede, and intimate with A&lca and other famous Saxons doctors, several of whom he engaged in writing comments upon the Scriptures. In 704, he founded a college for secular priests at Beverley, which, in honour of his memory, was endowed by his kings, and particularly by Athelwine, with considerable immunities, so that it became an asylum, or sanctuary, for debtors and persons suspected of capital crimes. After he had governed the see of York 34 years, being tired with the tumults and confusions of the church, he divested himself of the episcopal character, and retired to Beverley, and four years after died in the odour of sanctity, on the 7th of May 721; and the day of his death was appointed a festival by a synod held at London in 1416. Bede, and other monkish writers, ascribe to him several miracles. Between three and four hundred years after his death, his body was taken up by Alfric, archbishop of York, and richly enshrined. He was the author of several homilies, and other religious pieces. Biog. But.

BEVERLY, in Geography, a township, and post-town of America, in Essex county, Massachusetts, separated from Salem by a handsome bridge, and distant about 20 miles east of north from Bolton, and 22 south-east from Newbury port. It has two parishes, containing 3250 inhabitants. Those of the parishes next the harbour are devoted to the fisheries, and the other branches of navigation. In the other part of the town, which is chiefly agricultural, is a cotton manufacturer. N. lat. 42° 31'. W. long. 7° 50'.

BEVERLY'S Manor, or Irish trail, is a tract of land, in Virginia, in N. lat. 38° 10', at the head of Mattawen's river, a western branch of the Shenandoah, which rises here by three branches, viz. Middle river, Lewis, and Christian creeks, and lying between the Blue and the North ridge.

BEVERN, a town of Germany, in the circle of Upper Saxonxy, and duchy of Brunswick, seated on the Wefer, 20 miles west of Einbeck.

BEVERON, a river of Savoy, which runs into the Drance, 4 miles south-west of Evian.

BEVERS, Little, head of the coast of point de la Hune, on the southern coast of Newfoundland island, in North America, between cape de la Hune on the east, and cape Raye on the west, being the south-west point of the island.

BEVERSTADT, a town of Germany, in the circle of Lower Saxonxy, and duchy of Bremen, 24 miles north of Bremen.

BEVERSTONE, a village of Gloucestershire, England, is situated about two miles west of the town of Tetbury, and is noted for the lately remains of its ancient castle. This fortress is of uncertain foundation, but was undoubtedly a strong place prior to the conquest. Earl Godwin, Swane, and Harold here met under the pretence of affiting Edward the confessor against the Welsh in 1048. Maurice, lord Berkeley, or de Gaunt, fortified and repaired it, and in 1227, was prosecuted by the king for doing so, without royal permission. It was purchased by Thomas lord Berkeley soon after the return of Edward III. from the battle of Poictiers. Many of the spoils and ransom from that battle were appropriated to enlarge and beautify this castle, which was used as a manion till the great rebellion, when it was strengthened, and held for the king, but besieged by, and surrendered to Col. Maffie. Great part of the castle, with a dwelling-house within its walls, was soon afterwards destroyed.
stroked by fire. It was originally a square building, with a tower at each corner, one of which still remains, with fragments of walls, and the greater part of a chapel. This has a beautiful archtectural roof, and on the right side of the altar is a statue of tabernacle work, with a statuette, a chalice in which is a consecrated, and over it a parament. The mast surrounding the whole was about 200 yards in circumference. At a short distance north of the castle is the parish church, which is a small plain building, Rudge's History of the County of Gloucester.

BEVERUNGEN, a town of Germany, in the circle of Weltphalia, and bishopric of Paderborn, at the confluence of the Bever and the Weir, near which are springs of fast water, 20 miles south-east of Paderborn.

BEVERWYCK, Louis Van der, of Beverwyck, in Geography, not more known and esteemed as a physician than as a magistrate, and member of the administration in his country, having attained to high honours in both the occupations, was born at Dordrecht in Holland, in 1591. Being of a distinguished family, he had the advantage of receiving instructions in classical literature from Gerard John Vossius, and afterwards of studying the different branches of medicine under the ablest masters in France and Italy. Returning to his own country, he took the degree of A. D. in medicine at Padsa, about the year 1624. His works are numerous. Most of deserving notice are, "Epithetica quibus, de terminis zvzis fatalis un mobilis, cum docet mum repulslas," 8vo. 1634, Dordt. Whether there is a fixed term, beyond which life cannot be extended, he determines in the negative. "Montanus, Refutation argumentorum, quibus medicine necessitatem impugnat," 8vo. 1634, Dordt; in which he affrays the cavils of the fierce Montague against physicians, and draws the necessity of the art. "Epithetica quibus, de terminis zvzis fatalis un mobilis, cum docet mum repulslas," 8vo. 1634, Dordt. A compendium of the practice of medicine, taken from the most valuable writers on the subject.

"Epithetica quibus, de terminis zvzis fatalis un mobilis, cum docet mum repulslas," 8vo. 1644, Roter. A collection of letters on subjects pertaining to medicine, to which are added, the Eloge of Medicine by Lagra, Cardan, and Melanchon. His works, of which Haller has given a complete list, were published together in 8vo. at Amsterdam, 1651. They have most of them passed through several editions. He died Jan. 19th, 1645, and was honoured with an epitaph by his friend Heinicus. Haller Bib. M. D. Gen. Biog.

BEVERWYCK, in Geography, a town of North Holland, with a small harbour in the Wyckmeere, which is a continuation of the Ye, 31 leagues north of Harlingen.

BEUF, John Le, in Biography, a learned and laborious French writer, was born at Auxerre in 1685, and educated at Paris. After his return to his native town, he was made canon of its cathedral in 1714, and during his residence there frequently attended the debates of the clergy of Sees, to acquaint them in reforming the liturgies of that diocese. In 1724, he was engaged by the archbishop of Paris in the composition of the chart in the new breviary and missal of that city; and from this time he chiefly resided at Paris. He was one of the most indefatigable, industrious, and fast-literate ecclesiastical antiquaries of France. The catalogue of his works, from 1716 to 174, fills 12 pages in folio in the Bibliotheca Leopoldina; and his quickness for productions for the last 24 years of his life, are nearly as numerous. His "Traite sur l'histoire de France" is full of curious references, and 1,153 pages, the chief part of which a munificent endowment of the first ages of the church can consult. The poverty of learning died in 1760.

The best known of his numerous works, besides that already mentioned, are "A Collection of various writings, tending to illustrate the history of France," 2 vols. 12mo. 1724; "Dissertations on the ecclesiastical and civil history of Paris," 3 vols. 12mo. 1724; "Memoir on the History of Auxerre," 2 vols. 4to. 1745; "History of the city and of all the diocese of Paris," 15 vols. 12mo. more than 200 Memoirs," or "Historical Dissertations," inserted in the memoirs of the Academies, and a variety of dissertations printed in the Memoirs of the Academy of Inscriptions. He also liberally communicated a number of original pieces, which he found in his subsidious research, to learned men engaged in different works. Noun. Dict. H. 8.

BEUK, Small Le. See Le Bureu.

BEULES, a village of Switzerland, in the government of Aigle, in that part of the Valais which belongs to the republic of Berne. Beulex is distant about 5 miles from the small town of Berne, and is famous for its salt springs. Mr. Coxe informs us, that he went into the mountains about 3000 feet, almost horizontally. The galloway is 6 feet high, and 2 broad, and nicely heaved and hollowed in a black rock, veined in fume places with white gypsum. The salt is produced from springs, which are found within a fold rock, perforated at a great expense; the richest source yields 28 pounds of salt per cent, and the poorest but half a pound. Near these springs are several warm sources, which contain a mixture of salt, but are strongly impregnated with sulphur, as a flame when a lighted candle is put into the pipe through which they flow. No solid salt, except a few cubic, has been yet discovered; but the mountain is replete with its particles. Rocks of white gypsum, or alabaster, mixed with whitish clay, are common near the springs, in the same manner as may be observed in the pits of Northwich in Cheshire. After traveling in this subterraneous passage near three quarters of a mile, Mr. Coxe observed a great wheel, 57 feet in diameter, which raises the brine from the depth of about 70 feet. From this place is a shaft 300 feet high, which is cut through the mountain to the surface, for the purpose of introducing fresh air. He noticed two reservoirs hollowed in the solid rock for holding the brine; one was 160 feet square, and 3 deep. In process of time, the workmen pierced the rock 25 feet deeper, and cut a gallery 100 feet long, and they formed a third reservoir, containing 5500 cubic feet. The brine deposited in these reservoirs is conveyed by means of 2000 pipes, about a league to Berne's, where the salt is extracted. The brine pipe near Aigle contains only two to one, a half per cent, and yield annually about a third as much as those of Leuven, or about 500 quintals. The salt is much whiter and finer than that of Leuven, and consequently Leuven is dearer than price. There, which are only salt rocks, are situated about 10 miles west of the annual production of the town. The remainder is procured chiefly from Berne, at a moderate price, stipulated by treaty. Coslin Travels, vol. iv. p 135.

BEVER, in Geography, the chief place of a canton, in the duchy of Franche-Comte, and part of the Rhine, 426 inhabitants; 5 miles from the town of 1493. Its territory comprises 225 kilometer and 6 annates.

BEVRIER, in Heraldry, denotes a third broken, or opened, as a copperer's rule. This he bears as argent a chief vert, by the name of Beveri.

BEVIN, Elway, in Biography, among our ecclesiastical compeers in the time of James I., justly deserve to be ranked...
B E U

marked with the musical luminaries of that reign. He was a
fellow of Trinity, which is discoverable by his works; but it
is not so easy to discover how it could have been at the
recommendation of his master, who died 1589, that he was
appointed extraordinary of the chapel royal, in 1589,
as has been said. His service in D minor, printed in Boyce's
collection, has the true ancient cast of modulation, the
fer-
rego periodic upon it, which gives a dignity to its effects,
for which we can now hardly account. The accents, as
usual with old masters, are often carelessly placed; but if
that imperfection be removed, or regarded with indulgence,
the composition must be allowed, in point of harmony and
modulation, to be admirable. And there are some grand
effects produced by pauses and long notes without changing
or infringing the original measure, that afforded us very plea-
sing sensations. Elway Bevin was, indeed, a man of genius;
and it is to be lamented that more of his compositions have
not been preserved. Besides his appointment in the chapel
royal, he was organist of Bristol cathedral, and the master of
Dr. Child. But notwithstanding his abilities and greatness,
he was dismissed from all his employments, in 1659, on being
discovered to adhere to the Roman communion.
In 1631, he published a work complete with harmonical en-
coragement, entitled "A Briefe and Full instruction of the art
of musicke, to teach how to make difficult of all proportions
that are in use: very necessary for all such as are desirous to
attain to knowledge in this art; and may, by practice, if they
can sing, soone be able to compose three, four and five parts;
and also to compose all sorts of canons that are usual, by
these directions of two or three parts in one, upon a plains-
ong," by Elway Bevin, thin 4to, of 52 pages.
This work, however useful it may be discovered now, must
have been of singular service to young students in times when
canons were regarded as the greatest efforts of human intel-
llect, and the solution of these enigmas was equally difficult
with that of the most abstruse and complicated problems in
Euclid. Micheli Romano published a similar work at Venice, 1615,
and Valentini another at Rome, 1655. See
Micheli and Valentini.
BEVIO, in Geography, a small village of Switzerland,
seated near the Julian Alps, upon the Little Rhine, in the
high road leading to Coire. Bevio and Valmor area one
community, governed by 11 magistrates; though the number
of voters, who appoint these magistrates, scarcely exceeds
40. The chief is called "Minifrale," and is confirmed
every year, for which each voter receives a florin. About
one-third of the merchandise from Como to Coire passes by
Bevio; the greater part is sent by Splugens.
BEUNTERSHEIM, a town of Germany, in the circle
of
the Upper Rhine, and bishopric of Worms, 6 miles south
of Worms.
BEURATH, a town of Bohemia, in the county of
Glatz.
BEURRIA, and Beurreia, in Botany. See CA-
LYCANTHUS and ERRETIA.
BEURRE, in Geography, a town of France, in the
department of the Doubs, and chief place of a canton in the
distric of Belfo Shank, 2 miles south of Belfo Shank.
BEURRY, a town of France, in the department of the
Meuse, and chief place of a canton in the distric of Barle-
Duc, 13 league west of Bar-le-Duc.
BEURS, William, in Biography, a painter, was born at
Dor in 1656, and discovering a natural genius for drawing
and designing, he was placed, at the age of 18, under the
instructin of William Drumilgen. He painted in the style
and manner of his master, almost equalling him in the freedom
of his hand, and the clearness of his colouring, and surpa\sion
him in the correctness of his design. Addiciting himself to
a dissolute life, he obtained neither the reputation nor the
wealth which his talents, diligently exercised, might have
enabled him to acquire. He painted portraits, landscapes,
and flowers. Pilkington.
BEUS, in Ancient Geography, a river of Macedon,
mentioned by Livy and Steph. Byz., near which was a town
called Bica, Bice, according to the latter.
BEUTHEN, or Nieder Beuthen, in Geography, a
town of Germany, in the circle of Upper Saxony, and prin-
cipality of Carinthia, on the Oder, containing two churches;
5 miles S. W. of Ziegenbrueck.
Beuthen, Nieder, a town of Silesia on the Oder, in the
duchy of Glogau. It has suffered much by war and fire;
distant 13 miles W. N. W. from Ober Glogau. N. lat.
51° 42'. E. long. 15° 51'.
BEUTEN, Ober, a town of Silesia, formerly belonging to
the principality of Jagendorf, but since to the principality
of Oppeln. It had anciently a productive mine of silver;
distant 40 miles E. S. E. from Oppeln. N. lat. 50° 16'.
E. long. 18° 52'.
BEUTSCHEN, a town of Poland, in the palatinate of
Posen, 44 miles west of Posen.
BEUVON, a town of France, in the department of the
Calvados, and chief place of a canton in the distric of Pont
l'Evque, 12 miles south of Caen.—Also, a river of France,
which runs into the Loire, 2 leagues below Belois.
BEUVRY, a town of France, in the department of the
Straits of Calais, and chief place of a canton in the distric
of Bethune, half a league east of Bethune.
BEVY, among Sportmen, is used to signify a brood of
quails. Thus also we say, a covert of partridges, a hide of
keets, and a pack of greyhounds. Bevy is sometimes used
among foresters to express a herd of deer, though it is much
less frequently used in this sense than in the former.
BEZEEVILLE, in Geography, a town of France, in the
department of the Eure, and chief place of a canton in the
distric of Pont-Audemer; 25 leagues west of Pont-Aude-
mer. It contains 2457 per sons, and the population of the
canton amounts to 12,254. Its territory includes 192 1\kilo-
metres and 20 communes.
BEWCASTLE, a parish and village of Cumberland,
England, is rendered interesting to the topographer and an-
tiquary from the Roman relics that have been discovered
within its limits, and from the singular obelisk in the church-
yard. This parish is supposed to have included the Roman
fation where part of the Legio-Seconda Augusta was gar-
risoned to guard the workmen employed in erecting the
famous Roman wall that separated England from Scotland.
Many vestiges of ancient buildings are yet remaining; and
numerous Roman coins, and some inscribed stones, have been
found here. The obelisk, which has furnished a theme for
much dissertaion, contains various sculptured ornaments,
with a Roman inscription, and some figures in baso-relivo.
The church, with the castle, are included within an entrench-
ment. The latter, now in ruins, appears to have been of a
scaurform, and was battered down by the parliament's
forces in 1641. In this parish are two schools supported
by subcription, whose masters have about ten pounds each per
annum, with the privilege of a whistle gate. This was a pe-
cular custom, formerly very common in Cumberland, and the
neighbouring counties, and now prevails in some villages.
It is a privilege given to the master of applying to his pupils'
parents in rotation, for provisions, Several thousand
sheep and black cattle are fed on the hills and moor parishes.
Hutchinson's History of Cumberland.
BEWDELEY, a market and borough town of Worcerc-
shire in England, is pleasantly situat ed on the banks of the river
Severn, whose navigable stream has given prosperity to the place.
BEY

It was formerly included within the marches of Wales, but by a statute of Henry VIII., was annexed to the county of Worces-
ters. Leiria defends this place as remarkable for the "wonderful height of the trees in the adjacent forest of Whip," for its "beautiful situation," and for the palace of Tashishwall, which Henry VII. built to be a place of retire-
ment for prince Arthur. The cemetery of this prince's marriage is said, with Catherine of Arragon, by proxy, was performed here on the 26th of May, 1547. King
Henry VII. gave all the land for building the bridge across
the Severy, which was erected by Edward IV. On the
middle pier of this, stands a gate-house, part of which is for
the corporation's prison.

The town is in the parish of Ribbesford, where there is an
ancient manor house, in which was found the manuscript
copy of the title of lord Herbert of Cherbury. Here is a chapel,
which was built on the site of an ancient wood structure in 1742.
A set of hambles was also erected in 1743; and the
town parish of the benefits of a free grammar school, which
was founded in the latter part of queen Elizabeth's reign; little alms-houses, and a charity school. The
manufacturers and trades of this town were formerly con-
"iderable, but they are now principally confined to tanning,
nmork, cutting, and a few others. Bewdley seems to
have been first incorporated by king Edward IV, whose char-
acter grants the freemen great privileges and immunities by sea
and land. These were confirmed by Henry VII., and again by
James I. This charter was surrendered in the time of
Charles II.; but in the next reign another was granted, which
on a trial in 1725, was determined to be void. A new one
was thereafter obtained from queen Anne, but this produced
some litigation, which at length was determined in its favour.
This empowers the bailiff and a capital burgesses to return
one member to parliament. Here are formerly two weekly
markets, on Wednesdays and Saturdays; but the latter is
only continued; which, with three fairs, annually attract
much company and trade to the town.

Bewdley is 129 miles N.W. from London. It contains
849 houses, and 3671 inhabitants. Nath's History of Wor-
cesterhshire.

BEWITS, in Falconry, denotes a piece of leather to which
a hawk's bells are fastened, and buttoned to his legs.

BEY, in Geography, a small town of Switzerland, in the
canton of Berne, about 4 miles N.S.E. of Aigle, and 5 miles
from the fast-works at Berneck. [BEY, BEX.] Between
Aigle and Bex is a pictured view of the castle of St.
Trophoin, on the summit of a lofty rock in the middle
of the plain; it is built of a fine brown wood, and resembles
Milton's description of a manor, c.

"... and hight in torted tree,"

It is said to be built of tile, and probably of a beauti-
ful black stone in the ancient, St. Trophoin was a
Phrygian, and is said to have left the picture at Nice
in the year 251, under the protection of the emperor
Diocletian.

BEXQUIILLO, in the Materia Medica, a name given to
the white pericanta, which the Spanish bring from Peru, at the ports of the coast in Brazil.

BEY, or BEY, denotes a governor of a county, or town,
in the Turkish empire.

The Turks use the word beyl, or Bahl, to designate
by" p. one of their nobles, or lords, but in modern speaking to a
baronet, whom in English they call
fickel, or Bahl, which is a derivative of the
word Bahl, which probably has its
origin in the Arabic word Bah, which is the
expression of love, or kindness, but under them
is considered of a more polite phrase, and later is
often the subtitle of a poem. But under him
are some 2,000; of the pasha, 1,000.

In practice in Turkey, there are a great many

fungi, or lycera, each of which qualifies a bey; and these
are all commanded by the governor of the province, whom
they also call also dehler-dehler, or Beyler-bey, i.e. lord of the
lords, or bey of the province.

These beys are, in a great measure, the same that ban-
nerets formerly were in England.

It has already been observed, under the article Bahnar,
that when the military autonomy of the Mamluks in
Egypt was abolished by Selim, Sultan of the Ottomans in
1557, he established a form of government, which was cal-
culated to preserve all the different branches of the state in
a condition of dependence upon himself. With this view, he
appointed, besides a pasha, a divan, or council of regency,
composed of the pasha and the chief of the seven military
Corps. At the time of this appointment it agreed, that the
seven governors, or beys of the provinces, should be chosen
from the Mamlouks; and to them were entrusted the care of
reforming the Arabs; superintending the collection of the
tributes, and the whole civil government of the country;
but their authority was purely passive, and they were to be
considered merely as the instruments of the determina-
tions of the council. By this institution, which is still
observed in many instances, it was ordained, that the pasha should be
contented to share the power of the beys, and that the
duration of his authority should depend on their collective
will. The power of the pasha was very extensive; but it
has been gradually diminished, and almost annihilated by
the intrigues and ambition of the beys. His jurisdiction
was rather civil than military. He was always president of
the divan, which was held in the castle where he resided.
But that council has, in later times, commonly assembled in
the palace of one of the chief beys, except when a firman
or mandate is received from Constantinople, when the
beys are summoned to the castle to hear the commands of the
Porte. The few who attend, as soon as the reading is
finished, answer, as is usual, "Efimana wa talaa," "we have
heard, and we obey;" but on leaving the castle, their gen-
eral voice is "Efimana wa awfana," "we have heard, and shall
disobey." All these beys had been Mamlouks, or military
slaves, who were not natives of Egypt, but imported when
very young from Georgia, Circassia, and Mingrelia,
and purchased for 50, or not more than 100 sequins. Many of
these are descended from Christian parents, and have been
slaves from their youth. Some laws have been professed,
taken from the Aulfrans and Raffian, who have exchanged
their religion for an establishment. When the supply
obtained in this way proves insufficient, or may have been
expended, black bees from Cuba, and other minor parts of
Africa, are substituted in the room of the older, and
found diocese, are armed and accounted the like. The
Mamelukian in general, and the Egyptians in particular,
treat these slaves with great kindness. At Cairo, when a
case is locally purchased in the market, if he feel detec-
ted with his master, he has only to say, "May God be
with the master," and the man readily compells his master
for his help. The child of a slave, though begotten by his
master, is "upbodied," and a free may authorize a free
person to purchase his emancipation. The Christian
children, bought by the beys, and the principal officers
of Cairo, are educated with the same care, or their own
children; every young man necessary to render the character of a
Mamelukian good. They are instructed in military, as well
the exercise of agility and strength, and in the various duties
attendant on the defence and beauty of their province;
and the law is exacted from all, but many may not
obey. When that custom is finished, they go
the complement of the army; and after training, he
they have been received with lively gratitudes. No
affection to the generous masters, to whom they owe their fortunes, and both their political and moral existence; nor do they ever quit them in the hour of danger. Thus it often happens, that a master, when he finds any of his slaves possessed of extraordinary talents, and tried fidelity, spares no pains or expense to raise him to a more considerable employment than that which he himself occupies; and thus he at length acquires sovereign power. In order to attain this power, it is necessary to be a Mamlouk, that is, the native of a foreign country, as even the children of those who rise to office by flate, do not enjoy the right of succession. Hence it happens, that as the son of a bay is not honoured with any particular confidence, the women, perhaps, procure abortions. Of 18 bays, whose history was known to Mr. Browne, only two had any children living. Volney observes, that during 530 years Mamlouks have been in Egypt, and that not one of them has left an legitimate issue; but all their children perish in the first or second defect. Hence he infers, that those who are transferred from the vicinity of mount Caucasus, to the banks of the Nile, are incapable, by the influence of the climate, of perpetuating their progeny. To this circumstance it is owing, that the Mamlouks are replaced by slaves brought from their original country. From the time of the Mogul, this commerce has been continued on the confines of the Cuba and the Phasis, in the same manner as it is carried on in Africa, by the wars among the numerous tribes, and by the misery of the inhabitants, who sold their own children for a subsistence.

Distinguished by favouritism or merit, the Mamlouk becomes a caicn or kiaichef, and in time a bay. The chief cause of preference arises from political adulation to some powerful leader. The number of these bays has seldom or ever been complete; and the revenues of the vacant places were probably shared among the rest, who were actual occupants of their office. Each of these bays is nominally chosen by those that remain; but in fact appointed by one of the most powerful.

The "Yen-tchery Aga," and several other officers, are enumerated among the 24 bays. Besides being governors of certain districts of Egypt, several of the bays receive other dignities from the Porte. Such are the "Shebek-el-belud," or governor of the city, which is an office merely civil, unaccompanied with any military power; the "Defterdary," or accountant-general; the "Emir el Hadj," or leader of the sacred caravan; and the "Emir el Said," or governor of the Upper Egypt; which last two offices are annual. These officers have also revenues allotted them by the Porte, ill-defined, and liable to much abuse. Of the other bays, each appoints all officers and governors within his district, putting into it some flave of his own, who is compelled to render an account of the receipts; of which a part is appropriated to support the grandeur of his master. An opulent bay may have from 600 to 1000 purses annually; the revenue of Murad Bey more than double that sum. The inferior bays may have 300 purses, or 15,000 l. The revenues of the bays are raised by a land-tax and the produce of the customs, amounting together to near two millions sterling, of which but a small proportion reaches the coffers of the Porte. Every bay sits in judgment on cases of equity. These personages are very observant of their respective jurisdictions; and no bey will imprison a man liberated by another. Although sometimes too impetuous, they nevertheless display great acuteness and knowledge of characters. This government poises itself at least every advantage of publicity, as every bey is a magistrate. But the justice of the rulers is ever liable to the omnipotent influence of gold. Each bey appoints his captives, or lieutenants. These officers preside over a town or village, collecting the revenues, and judging small causes; but an appeal lies to the bey. The bays and the caicnes are, from their ignorance, constrained to employ Copts as acountants in adjusting and receiving the revenues, that duty being of an intricate nature, and requiring great local knowledge. The authority of a caicne is as arbitrary as that of a bey.

The bays in Egypt have been gradually acquiring an increase of authority and influence, and reducing the power of the Ottoman Porte to a feeble and degraded state. To this several circumstances have contributed; such as the unrestrained traffic of slaves; the neglect of the affairs of this province on the part of the Ottoman Porte; the extension of the power of the divan, and the restraint of that of the pachas, and the consequent uncontrollable influence of the janizaries and Arabs. To which may be added the change that took place in the condition of the soldiers, by their becoming citizens, and by the marriages they contracted, and the change also introduced into their discipline; and, more especially, the permission granted to the chiefs of possessing distinct property, lands, and villages, dependent on the Mamlouk governors, whom it became necessary to conciliate, in order to prevent their opprobrium; and the ascendency acquired from that moment by the bays over the soldiers, and increased by the great riches accruing from their governments. These riches they employed in multiplying their slaves; and, after emancipating them, advancing them in the army, and promoting them to various employments. By such means Ibrahim, one of the kiaias or veteran colonels of the janizaries, rendered himself, in 1746, master of Egypt; for he had multiplied and advanced his freedmen, that of the 24 bays, which should be their number, no less than eight were of his household. His influence was also the more certain, as the pacha always left vacancies in the number, in order to receive the emoluments. On the other hand, the largeflses he bestowed on the officers and soldiers of his corps, attached them to his interest, and Rodvan, the most powerful of the Arab colonels, uniting with him, completed his power. The pacha became a phantom, and the orders of the sultan vanished before those of Ibrahim. At length, about the year 1766, Ali Bey gained a decided ascendancy over his rivals, and under the titles of "Emir Hadj," and "Shebek el Belde," rendered himself absolute master of the country. (See Ali Bey.) Mohammed Bey, surnamed "Aboudahab," or father of gold, from the luxury of his tent and caparisons, which succeeded him in 1773 during a reign of two years, displayed nothing but the ferocity of a robber, and the bafeness of a traitor. Upon his death in 1776, Murad, a favourite of Mohammed, was advanced to the dignity of bay; but he had a formidable competitor in Ibrahim, who had been a slave of Ali Bey the Great. The two rivals, however, adopted conciliatory measures, and entered into an agreement to divide the authority, on condition that Ibrahim should retain the title of "Shebek el Belde. This union was a prudential measure, and necessary to their safety; for since the death of Ali Bey, the bays and caicnes, who owed their promotion to his house, repined at seeing all the authority transferred to a new faction; and after several intrigues and cabals, formed a confederacy, under the denomination of the house of Ali Bey. The chiefs of this confederacy were Hassian Bey, formerly governor of Dji-dja, and Ismail, the only remaining bey of those created by Ibrahim Kiaya; and they conducted their plot so well, as to oblige Murad and Ibrahim to abandon Cairo, and retire as exiles into the Said. These exiles, being reinforced by the refugees, returned, and compelled the confederates, Ismail and Hassian, to make their escape.
escape into the Said. Ibrahim and Murad have since ruled Egypt, the former as "Sheikh el Belled," and the latter as "Deffer-dar," though not without mutual jealousies and attempts to destroy each other. They, however, conspire together to recruit the number of the Mamlouks, and to collect treasure from all quarters. In the year 1791, Sahib Aga, a slave of Murad Bey, was deputed, from the government of Egypt, to negotiate their peace with the Porte. He carried with him presents of horses, rich stuffs, &c. He was well received, and was afterwards appointed "Waqi'd el Sultan," i.e. agent or attorney to the sultan in Cairo. This office was probably given him to engage him in lobbying the courts for the accession of the bey; but it was ineffectual. These had formerly experienced the evils of division, and were now united by common interest, grown rich, and well provided with slaves. It is said, that no tribe has since that time found its way to Constantinople. Ibrahim and Murad are considered as usurpers by the bey of Upper Egypt, who are favoured by the Porte. The most powerful house is that of Ibrahim, who has about 600, according to Volney, but about 1000, says Mr. Browne, Mamlouks. Next to him is Murad, who has not above 400 Mamlouks, says Volney; but according to Browne, they amounted, in 1796, to about 1700. He was originally a slave of Mohammed Bey, and succeeded in defeating and taking prisoner Ali Bey the Great. He is detested by the Porte. He is described by Sonnini, as handsome and martial in his appearance; his chin is covered with a thick black beard; his thick eye-brows describe arches of ebony over his large eyes, which sparkle with vivacity and fire. A long fear in one of his cheeks adds to the fierce part of his countenance. To great bravery, he joins singular address and extraordinary strength. He has been known, when riding by an ox, to cut off its head with one stroke of his scimitar. An intrepid warrior, capable of enduring the severest hardships, an excellent horsemanship, dexterity and power in the use of the saber, courageous in adversity, bold in enterprise, cool in action, but terrible in onset. Murad, with instruction, might have become a great general. His proud deportment, and magnificent disposition, give him the dignified appearance of a sovereign; but iniquity, ignorance, and cruelty, have rendered him a ferocious tyrant. Murad, says Mr. Browne, is one of those beys who can neither read nor write. Of the profusion of this bey, Sonnini has given the following account. In his camp were erected immense tents, divided into several apartments, for the accommodation of himself and his principal officers. The floors were covered with the most beautiful carpets, and the interior decorations consisted of the richest gold and silver fluffs that the manufactories of Lyons could afford. Nothing could equal the magnificence of his cavalry. Gold and silver ornaments, with the choicest embroidery on Morocco leather, glittered with a dazzling lustre in the rays of a burning sun; and the brilliancy of the saddles, trimmed with a broad gold lace, were made of those handsome velvets, the small and delicate patterns of which display the elegant taste that prevails in the productions of the manufacturers of Lyons. His profusion is supplied by his rapacity. He is accustomed to have from the mint daily, for his pocket expenses, 500 half mabulbes; and his wife the same. This amounts to 1500 piastres, and is only a small part of his disbursements. He is married to the widow of his master, the daughter of the celebrated Ali Bey. Next in power to Murad, is Mohammed Bey Elia, whose name imports that he was bought for 1000 piastres. His master was Murad Bey; but mentioned. He represented as quick in apprehension, and impetuous in action. His power is great and menacing; he has two Mamlouks. Ibrahim Bey, "el Ualb," a name derived from the second military magnificence in the city of Cairo, is a young man about the same age with the last mentioned, of a sedate, but firm character, married to the daughter of the elder Ibrahim, and attached to his interests. He has 6 or 700 Mamlouks. Alih Bey, "al Zogheir," or junior, is another powerful leader, distinguished by his superior capacity, and on all occasions consulted by the bey. He has no many Mamlouks; he is prudent and economical, and rarely acceded to extortion. Fatima, now the aged daughter of the famous Ali, is held in much respect by all the beys. Even Murad, her husband, treats her with reverence. When a bey is appointed to a government, he never fails to pay a visit to this old lady, who attentively to his duties, and will say to him, "Do not pillage the people; they were always spared by my father."

Of the systematic capacity of the beys, the following instance is mentioned. Ibrahim Bey, at a felicity occasioned by the marriage of his daughter to another powerful bey in 1792, invited to his house a famous figner, who had been employed, during the preceding day and night, in the exercise of her profession, and who had received considerable donations. She readily complied, expecting employment, and liberal remuneration. The bey asked her: "How many half rixdouns did you collect yesterday?" She replied, "about ten thousand." "Pay me eight thousand then," said the bey, and "I will give you a note of credit on Ibrahim Jouhari, my secretary." The money was paid, but the woman was turned out of the house without receiving any security whatever; and is said to have died of the disappointment. Volney's Travels through Syria and Egypt, vol. i. Sonnini's Travels in Upper and Lower Egypt, p. 444, &c. Browne's Travels in Africa, &c. p. 47, &c. See Bashaw, and Mamlouk.

Bey of Tunis, denotes a prince, or king thereof; answering to what at Algiers is called the dey. He is chosen out of the army; each order, even the most inferior, having an equal right and title to that dignity with the highest.

In the kingdom of Algiers, each province is governed by a bey or vice-roy; who is appointed and removed at pleasure by the bey; but has a despotic power within his jurisdiction; and at the season for collecting the tribute from the Arabs, is assisted by a body of troops from Algiers.

The kingdom of Tunis is not divided into provinces, like that of Algiers, and governed by provincial beys, or vice-roys; but the whole is under the immediate inspection of the bey himself, who collects the tribute in person. For this purpose, he visits, with a flying camp, once every year, the principal parts of it; travelling, in the summer season, the fertile country in the neighbourhood of Kef and Bajj; and in the winter, the several districts between Kairwan and the Jerved.

BEYAH, in Geography, anciently called Brayfisla, and the Hypophis, or Hypophis of Alexander, a river of Hindostan, that rises in the great chain of snowy mountains, extending from Sirinagar, to the north of Cashmere, or the ancient Imaus; and after traversing the Punjab, it joins the Sondez at Peshawur; about 24 miles below the conflus, a separation again takes place, and four different streams are formed; the northward and most considerable of which recovers the name of Brayah, and is a deep and rapid river. The others are named Herani, Dond, and Noornay; and near Mountan they unite again, and bear the name of Sondze, until both the subflance and the name are lost in the Indies, about 80 miles, or three days' sailing, by the course of the river, below the mouth of the Chunnah. Renell's Men. p. 102.

BEYENBERG, or BIENBERG, a town of Germany, in the
the circle of Welfphalia, and duchy of Berg, on the Wipper, 3 miles north of Lenep.

BEVERLAND, an island belonging to Holland, situated on the Meuse, with a town of the same name; 4 leagues west of Dort.

BEYERN, a town of Germany, in the circle of Swabia, and county of Fuftenberg, situated on the Danube, 6 leagues from Durlingen.

BEYHARTING, a town of Germany, in the circle of Bavaria, 24 miles E.S.E. of Munich.

BEYKE. See Beri.

BEYLA, a town and district of Abyflinia, in Sennar, about 11 miles west of Teawa, and 31 1/2 miles due south, in lat. 31° 42' 4". Between Teawa and Beyla there is no water. Immedegmeda, and a number of villages, were supplied with water from wells, and had large crops of Indian corn about their poltfections. But the Arabs Daraeina have destroyed these places, filled up their wells, burnt the crops, and expelled all the inhabitants to die by famine.

BEYMONT, or BREWORT, a town of Germany, in the bishopric of Liege, 3 miles south of Liege.

BEYNAT, the chief place of a canton, in the district of Dives, and department of Corcoze, containing 1462 inhabitants; those of the canton being 5488. The territory comprehends 133 kilometres and 6 communes.

BEYS, GILLES, in Biography, a printer at Paris, in the 16th century, who first introduced into his editions the distinction suggested by Ramus in his grammar between i and u consonants, and the vowels i and u. He died in 1595.

BEYSZKER, (Geofa Tychert.) in Ichthyology, a name of the cobitis fuscis. Gmelin.

BEZA, THEODOR, or THEODORE DE BEZ, in Biography, an eminent divine among the first reformers in Geneva, was born of parents nobly defended, in 1519, at Vezelay in Burgundy, and sent by his uncle, who was a counsellor in the parliament of Paris, to Orleans, in 1528, to be educated by Melechir Wolmar, a protestant, and an excellent teacher. Having continued seven years under his tuition, he commenced the study of the law at Orleans; but his taste led him to the cultivation of polite literature, and he composed several Latin poems, which were confederated by the learned as a promising specimen of his talents. After taking a law-degree, he returned, in 1539, to Paris, where his parents, who had intended him for the ecclesiastical profession, had procured for him a valuable abbacy. Addicted to the delights of an easy and voluptuous life, he remained for some years at Paris; but under the influence of sentiments imbied in his youth from his protestant preceptor, he determined sooner or later to break his fetters. A marriage contracted from confecientious motives rendered it necessary for him to resign his benefices, and hastened in the execution of his purpose by the reflections attending a severe illness, he and his female companion fled, in 1548, to Geneva. In the following year he accepted the offer of a Greek prebendaryship at Lausanne, in the exercice of which he continued with reputation for nine or ten years. Here he read lectures in French on the New Testament, and published several books; one of which was a tragi-comedy, in French, entitled "Abraham's Sacrifice," which passed through several impressions. Having frequent opportunities of visiting Calvin at Geneva, he was induced by his persuasion to finish the version of the Psalms, which had been begun by Marot. During his residence at Lausanne, he published a treatise, "De Hereticis et Magistratibus pontificis," in reply to a book written by Caflalo, after the execution of Servetus; and in this treatise he maintained a doctrine so leis dangerous in its tendency than inconsequent with his principles as a reformer and protestant, that it was the duty of the civil magistrate to punish hereby. He also wrote on predetermination, and the eucharist, in opposition to the Lutherans, and others, and in a style of militery which a natureur judgment and after-reflection led him to correct. In 1558, he was elected as one of the deputies summoned by the protestants, to engage the German princes in favour of their brethren imprisoned at Paris, and of the perfécuted inhabitants of the valleys of Piedmont. In the following year he removed to Geneva, where he became the colleague of Calvin, both in the church and university, and where by his abilities, learning, and zeal, he co-operated with him in advancing the reformation. In 1561, he distinguished himself by his eloquence on behalf of the protestant party, at the conference of Poissy; although he gave offence by his declared opposition to the doctrine of the real presence. Continuing in France, he attended the prince of Condé as a minister, when the civil war broke out, and accompanied him to the battle of Dreux. Upon his return to Geneva, in 1563, he wrote several books in theological controversy, with an acrimony that cannot be justified by perfons of moderation and candour. In 1571, he officiated as moderator in the national synod of Reoch ré, and in the following year assisted at that of Nîmes. In 1586, he held a disputation with Andreas, a Lutheran divine of Tubingen; and through the whole course of his life, the party to which he belonged availed itself, on many occasions, of his talents and reputation. Having lost his first wife in 1588, he soon married another. Although the infirmities of his advanced age required his withdrawing from the duties of public instruction, the admir of his genius remained to the close of his life, and he wrote Latin verses a few years before his death, which happened in October 1665, after he had passed his 86th year. Of his singular natural talents and literary acquisitions no doubt can be entertained; nor need we wonder that bigoted Catholicks should have calumniated him whilst he lived, and reviled his memory after his death. He has indeed, by his enemies, been unjustly traduced as a hypocrite, and a perfó of lax morals; but charges of this kind are refuted by the uniform tenour of his life. His partial advocate, however, much regret that, as a disputant, he was violent, impetuous, and dogmatical, and deficient in candour and charity. His juvenile pieces, in Latin poetry, in which critics have detected many numerous deviations from classical purity, were first printed in 1548. Some of these, with corrections, together with others of a more serious cast, were printed by the Stephenfes at Paris, in 1597, 4to, under the title of "Theod. Bezæ Poëmat. varia." His French works are of an inferior kind. His theological works are numerous. Of these, the most generally read, and the most highly esteemed, is his "Latin version of the New Testament," with critical and theological remarks. For an account of the MS. in his possession, see CAMBRIDGE MS. Gen. Dict.

BEZABA, in Geography, a river of Spain, which runs into Orio, in the province of Guipúzcoa.

BEZABDA, or GOZERTA, Geozert cho- Omar, in Ancient Geography, a town of Aasia, on the right bank of the Tigris, south-west of Tigranocerta, in the country called Zabdi- cana.

BEZANT, represents, in Heraldry, round flat pieces of gold. They were first borne by the soldies of the holy wars, being the current coin of Byzantium (the modern Constantinople), with which the sigs of the army were discharged, and from whence they took their name. They are always embazoned gold, but the foreign heralds make them both gold and silver.

BEZÀNTTE, is when the field is powdered with bezants, or when supporters, or crests, are crowned with them. The proper heraldic term is bezant. When a
BEZ

BEZANTIER signifies the second branch of the horn of a hart or buck, that sweets from the main beam, and is the next above the brow-antler.

BEZARA, in Ancient Geography, a town of Galilee near the Sea, south of Ptolemais.

BEZELKINO, in Geography, a town of Siberia, 80 miles north of Balaganskoi.

BEZDZIEZ, a town of Lithuania, in the palatinate of Brzez, 24 miles west of Pinsk.

BEZE, a town of France, situate near the source of a river of the same name, in the department of the Côte d'Or, and chief place of a canton, in the district of Is-sur-Tille. 24 leagues E.S.E. of it.

BEZER, or BEZARA, in Ancient Geography, the place where Saul reviewed his army, before he marched against Jabshe-Gilead. 1 Sam. xi. 8. Enebius mentions two cities of this name, near one another, 7 miles from Sicheim, in the way to Scythopolis.

BEZENSTEIN, or PETZENSTEIN, in Geography, a town of Germany, in the circle of Bavaria, and territory of Nuremberg, 19 miles N.E. of Nuremberg.

BEZER, in Ancient Geography, a city beyond Jordan, over-against Jericho, in the wilderness, assigned by Moses to the tribe of Reuben, intended by Joshua to be a city of refuge, and given to the Levites of Gerhom's family. Deut. iv. 49. Josh. x. 21. The vulgate in both places denominates it BEZIER. Enebius confounds it with Bethra of Arabia, which lay much farther to the east. See BOSTRA.

BEZETH, a city of Philistia, on this side Jordan, in the territory of Jerufalerm, which Bachiades surprised, and the inhabitants of which he threw into a pit; probably the name with Bezechath. 1 Maccab. vii. 19.

BEZETHA, or BETSETA, a division or part of Jerusalem, situated on a mountain, and encompassed with walls, built by Josephus, a new city attached to the old one, and called in Greek SELEUKI, Canopus. It lay north of Jerusalem and the temple.

BEZETZ, in Geography. See BETSESH.

BEZILEI, a town of Transylvania, 12 miles N.N.E. of Focsita.

BEZIER, a city of France, and principal place of a duchy, in the department of the Herault, situated on the left bank of the Orze, not far from the grand canal. Before the revolution, it was the residence of a governor, and a seat of a bishop, of the diocese of Narbonne; its cathedral was small, but beautiful; it had besides a collegiate church, several religious houses, two hospitals, a college founded by the inhabitants in 1599, and an academy of sciences and belles letters. It is surrounded by a wall, flanked with old towers, and defended by a moat.

The number of inhabitants in both its sections is estimated at 14,221, and the population is small in proportion to its extent. The canton of the feudal fief has 11,423, and that of the feudal 1,174. The former has 9, and the latter 7 communes. The territorial extent of both comprehends 556 square kilometres. The situation is healthy, and it commands a view of several cities of the grand canal of Languedoc. In the Not. Int. it is called "Citius Bateraertis, Moderna Septimania." In the 5th century it was ravaged by the Vandal; in the Saracens, in 729; by Charles Martel, in 737; and by John, Count Montfort, in 1229; when the city was destroyed. Allegro took it by assault, and put to flight 10,000 of the inhabitants to the sword. Since this time it has not recovered its ancient litte. It was re-united to the crown by S. Louis, in 1247.

Its territory is fertile in corn, oil, and wine. It has also mineral waters. N.lat. 43° 26' 41". E. long. 3° 12' 55".

BEZIRA. See BAZIRA.

BEZOAR, BEZIARD, primarily denotes an antidote, or counter-poison. The word is formed from the Persian paz-sahr, which denotes the same, pā signifying against; and subar, poison.

BEZOAR, LAPIS BEZOARDICUS, is a term applied in a general way to various substances found in the stomach, intestines, and other internal cavities of the bodies of quadrupeds.

The true bezoar, however, is a calcined concretion, usually formed in the stomach of some of those animals which ruminate, or chew the cud. There are two forts of the bezoar stone; one is brought from the East Indies, and Peru, and thence known under the name of Oriental bezoar. The other kind comes from the Spanish West Indies, or South America, and is called Occidental bezoar. The Oriental is considered by far the more valuable kind, and is exceedingly scarce, even in India. The larger the stone the more highly it is esteemed; its price increasing, like that of the diamond, in proportion to its size. A stone of one ounce has been sold in India for 100 livres, and one of six ounces and a quarter for 2000 livres. The price of the smaller stones, in Germany, in the year 1600, was from 16 to 32 ducats the ounce; but it had then much declined. The larger bezoars had no regular price, being often extremely dear. As long as it retained its fancied reputation, as an antidote to every kind of poison, and as a cordial for the support of life under the most tryling circumstances of disease, its price was advanced beyond its weight in gold, and it found a high place for many centuries among the most costly collections of precious stones. The size varied from that of a pea to a hen's egg, or even larger.

Boetius relates, that in his time, the emperor Rudolph II. possessed one of the size of a goose's egg, which he ordered to be hollowed out into a cup, when the nucleus was found to be a small mass of herbs full strongly aromatic. The most anciently known bezoar stones were procured from the stomachs of goats feeding in the mountains of Peru, and those from the mountain goat were in such high request, that the emperor Shah-Abbas (who died in 1628) claimed all above a certain standard as a royalty, and appointed collectors for the purpose. The Oriental bezoars passed through the hands of the Armenians and Peruvian merchants, and were formerly brought to Europe in considerable quantities. In the east, the were the most esteemed that were obtained from goats feeding in the mountains, as the aromatic herbs found there were supposed to add much to the virtues of the calculi.

Authors disagree with respect to the animal in which the genuine Oriental bezoar is found; some attribute it to a species of goat, others to the antelope genus. Most naturalists allow this substance to belong to the gazelle. Antilope gazella, Gmel. Aldrovandus calls the species of antelope, Antilope gazella; Linnaeus, capra bezoardica; and Pennant, the gazelle ashen. Pallas, however, in his Spicilegium Zoological, gives the same name to the Egyptian antelope, (Antilope Oryx, Gmel.) Cuvier describes the Oriental bezoar as being found in the intestines of the capra napagi of the Lusitan system, and Gmelin ascribes it to the capra capraria.

By the account of Chabi, the animal furnishing this secretion would seem to be larger than the goat, and more resembling the Nylogan. These can be little question but similar substances have been occasionally met with in each of these animals, and in several other species.

The bezoar stone, when genuine, varies much in its form; depending upon the size of the nucleus upon which the calculous matter is deposited, there being generally some foreign...
foreign body in the centre of the bezoar. The substan-
ces which usually serve for nuclei to these concretions are straw, 
hair, small pebbles, nuts, hard seeds, stones of fruit, &c.
and the most frequent nucleus of the real oriental bezoar, 
is the pod of a fruit, much like that of the Acacia vera 
Egyptiana: though it at first sight resembles a coffee, or 
tamarind bean. In some of the bezoar stones formed on this 
crout, the outer membrane of the bean having perished, and 
the bean shrunk in drying, there remains a vacuity between it 
and the inner surface of the bezoar, so that it rattles within 
it, when shaken, in the manner of an oyster, or eagle stone. 
It is of little moment what the figure or nature of the body 
may be, which is to serve the purpose of a nucleus, as it 
cannot, in the slightest degree, affect the quality of the cal-
culus substance which is to be collected on its surface; any 
extraneous matter will suffice for this purpose, which may 
happen by any accident to be long enough detained in the 
flomach or intestines. The formation of bezoars ap-
pars to be effected in a manner similar to that observed in the 
production of the calculi of the urinary bladder of the 
human subject. We may presume that the bezoar is only 
formed when there is a tendency in the animal to generate an 
extraordinary quantity of calculous matter; for if it were 
otherwise, as these substances were produced by any 
combination of the ordinary contents of the stomach and 
intestines, what animal, that is liable to such collections, 
could ever be without them? whereas, on the contrary, 
they are so scarce in the East, that those which are 
brought into this country are supposed to be in general 
artificial compositions; nay, some have doubted if we ever meet 
with a genuine oriental bezoar in this country.

The feast of the year also appears to influence their 
production. Camerarius remarks, that these bodies begin to 
form towards the month of November; and when the Paris-
ians anatomiasts discovered a bezoar in the stomach of the 
Cha-mois (Antilope Rupicarpa,) it was the month of December. 

The number of bezoar stones varies, in different animals, 
from one to ten; hence, it is said to be customary, previous 
to purchasing a bezoar animal, to reckon the number of 
stones it contains, which can be ascertained by feeling exter-
nally, and by this the price of the animal is regulated. 

Velchius affirms, that the bezoar is only found in the 
first or second stomachs of ruminant animals, but the anatomiasts 
of the French academy state, that they met with it in the 
third stomach; and others have mentioned its being some-
times situated in the intestines.

All bezoars are made of concentric layers, or by stratum 
super stratum, after the manner of the common urinary 
calculus. This proves their formation to be gradual; and 
as this mode of increase cannot be easily imitated, it is prob-
able one of the best marks for distinguishing the genuine 
bezoar from that which is counterfeited.

The oriental bezoar is smooth and glossy on the surface, 
the colour a dark green or olive; on removing the outer 
coat, which lies next it appears likewise smooth and 
shining; it is generally less than a walnut; it is most ef-
tremely for its medicinal properties, and is the only fort 
retained by the London college. The Edinburgh college, in 
some of the former editions of their pharmacopoeia, directed 
both this and the occidental bezoar, but they now seem to 
allow them to be used promiscuously, retaining in their cata-
ologue only the name of lapis bezoar.

The imitations of this stone have been carried to such per-
fection, that as far as respects form, colour, or other external 
characters, the deception cannot well be detected. Mr. 
Neumann supposed that those which come nearest the genuine 
bezoar, are a composition of plaster of Paris, chalk, or 
other earth stained of the proper colour by some vegetable 
tincture. Those which are palpably counterfeited, are com-
pofed chiefly of some refractive substance, and may be easi-
discovered by their liquefying in the fire, and being soluble 
in spirits of wine; he never could discover any mark of an 
animal nature in any of these. Chemical works, by Dr. 
Lewis, p. 533, &c.

The models of trying if bezoar be genuine are, 1st. To im-
merge a portion of it, for some hours, in moderately warm 
water, when the water ought to remain untainted, and the 
stone undiminished in its weight: 2d. to apply it to a sharp 
red hot iron, which it should stick without frying or thriv-
elling: the 3d. which is considered the most certain experi-
ment, is to rub the bezoar over a paper which has been pre-
viously smeared with chalk or quicklime; if it leave a yellow 
tint on the former, or a green one on the latter, there is no 
doubt of its being genuine.

The occidental bezoar is uneven on the surface; of a dirty 
green colour; it is heavier and more brittle than the oriental, 
with which it is considered much inferior in value; it is of a 
looser texture, and when fractured, the layers appear thicker, 
and exhibit a number of fibres curiously interwoven. It is 
also found of a much greater size; sometimes being as large 
as a goose’s egg.

The occidental bezoar has been found in some of the camel 
tribe, especially the guanaco Camelus Huannacu and the Vienna 
(Camelus Pinguus,) which are inhabitants of South America.

This kind of bezoar, Mr. Neumann apprehends, is more 
likely to be an animal production than the other, because it 
yielded, on distillation, a small portion of volatile urinous 

The analysis of bezoar stones, as related by different 
chemists, is very contradictory, which has given rise to the 
opinion of the specimens which they submitted to experi-
ment, being spurious. Those stones examined by Scarr, as 
oriental bezoar, did not divide in acids. Those which 
Grew and Boyle made trial of, did. Those employed by 
Geoffroy (in some experiments related in the French Me-
moirs, 1715,) did not seem to be acted on by spirits of wine, 
whilst those specimens examined by Neumann, at Berlin, 
amost entirely dissolved in spirits. For an account of the anal-
ysis and chemical properties of the bezoar and similar sub-
stances; see CALCULUS.

In the early ages, when a knowledge of difcaeses was con-
fidered an occult and mysterious science, rare and unknown 
plants, or unifial, and what were considered wonderful 
animal productions, were chiefly employed in the way of 
meditcines; at this period we accordingly find the bezoar-
tic stone possessed great reputation as a remedy for many 
dificases; it owed, not doubt, much of its fame to the fabulous 
accounts which were related with respect to its origin.

It is not known to the Greeks. The first person who 
has mentioned it was Aesculapius, an Arabian physician. He 
defines it to be generated in the stomach, or gymnasium 
of the eyes of frogs, who, after eating serpents, were accustomed 
to run into the water up to the roof, where they swim till their 
eyes began to ooz a humour, which collecting under their 
eye-lids, gradually thickened and coagulated, and when it 
became quite hard was thrown off by the animal rubbing itself 
against the trees. Other stories concerning the history of the 
bezoar, equally wonderful and ludicrous, were credited, 
until the time of Garcias el Horto, physician to the Portu-
guese vicroy of the Indies, who gave the first true account 
of the origin of this substance. Kempfer afterwards gave 
a description of it with some new particulars.

The bezoar was first employed to prevent the fatal con-
sequences of poison. This is expressed by the very name which
BEZOAR

which is derived from the Persian word badzeichor, or bezezar, amakher, oramak, or from panthar, of which po signifies eggynin, and zahar, a foon. Others derive the term bezozar from the Persian pasar, a goat.

It was afterwards given in vertigoes, epilepsies, palpitations of the heart, jaundice, colic, and a great many other diseases; so that if its real virtues were answerable to its reputed ones, it would doubtless a panacea. Even later writers have bestowed extraordinary commendations on it, as a fudoric and alepharmic; but there is every reason to doubt its polishing any such virtues. It is an earthy substance, devoid of taste or smell. The history of its formation proves that it is not digestible, or otherwise affected by the juices of the intestinal canal. If it can ever be employed as a medicine, it should be on account of its absorbent quality, which, however, it appears to possess but in a very slight degree. It has been administered to patients in the quantity of half a drachm, and in some instances a drachm has been taken, without producing any sensible effect: the dose has been generally flated at a few grains, which were probably on account of its fecracy and great price. While it retained its medical reputation, it was laid to act as an antidote to every poison, vegetable or mineral, and to the bite or sting of all poisonous animals, in the dose of about 8 grains; but it would equally prove a counter-poison when taken regularly in the quantity of two grains daily, in a glass of wine, or especially of distilled water of carduus benedictus. To preserve a youthful constitution and vigour, an oriental's recipe is to take twice a year (purging being premised) ten grains of bezozar daily, for five successive days, with a cup of rofe-water. Bezoaric productions are at present so little regarded for their medicinal properties, that few druggists now think it necessary to have them in their possession.

BEZOAR, Equinox, is the name given to the calculous concretions occasionally met with in horse's. They appear to be formed in the same manner as the bezozar of the antelope or camel genus. They grow to a considerable size; have usually an irregular form, something between a comprehefed sphere and a rhomboidal figure; when divided, they exhibit the usual succession of flates, of which they are composed, but which are not so distinct as in the other bezozars; each layer is formed of concentric flizes, which are in many places more evident than the division into flates; consequently the section of the bezoar gives the appearance of its having been made of radiated, rather than concentric layers. The surface of the calculus bears great resemblance to a piece of polished lime-flone.

BEZOAR, German, is called by some cow's egg, from the circumstance of its being occasionally found in the flomachs of cows, but the animal from which it is most commonly obtained is the shamois (Antelope Rupicapra).

The nucleus of the German bezozar is either the hair which the animal may have swallowed, when licking itself, or the fibres of undigested vegetables, which are rolled into a round smooth ball. The quantity of calculous subfstance which is collected upon this ball is in general very trifling, often being merely a thin pellicle.

The bezozar which was found in the shamois by the Persian academicians, was made up of the woody fibres of the plants the animal had eaten; it was smooth and beflowered with mucus on the surface; and was broken at one end, exposing a cavity in the centre of the ball, which had formerly, no doubt, been occupied by some solid subfstance, such as a pebble, or done of some fruit.

German bezozars have been found, according to Bartholin, and others, in horse's and sheep, in which they are chiefly composed of wool, which these animals accidentally swallow.

From these species of bezozar having little, if any, calculous matter in their composition, they have been called by some writers, with propriety, baggzepilh; which see, and Bals.

Besides what have been already described, there are concretions found in the gall bladder of animals, to which the term bezozar has been applied; these appear to be no other than biliary calculi.

The Hog, or Bear Bezozar, called by the Dutch Pedra de porco, and by the Portuguese, who first brought it into Europe, Pedra de vacaria, is found in the ball bag of an East India boar; in form and magnitude it resembles a fteril, though more irregular; it is most commonly white, with a tinge of green; the surface is smooth and shining, and is valued at ten times its weight in gold.

The Indians attribute extraordinary medicinal powers to this bezozar. They call it Moglica de jaba, and prefer it to that obtained from the Gazelle; they consider it a sovereign remedy for the merdon, a disease to which they are liable, and which is not less dangerous than the plague in Europe. They allow it to have great efficacy also in malignant fevers, small-pox, and most diseases of women not with child, it being supposed to produce abortion in those who are pregnant, if they use it indirectly. When it is to be used as a medicine, it is infused in water or wine, until it has communicated a little bitterness to it. To facilitate the infusion, and at the same time preserve to precious a tione, they usually inclose it in a gold case, which is pierced with holes.

The Porcupine and Monkey Bezozars, are also the biliary calculi of these animals. Tavernier afferts, that they are not taken from the gall bladder, but the heads of the ape and the porcupine, which is highly improbable, and contrary to general anlyysis; he calls them Malaca flones, and says that they are held in such estimation by the inhabitants of Malacea, that they never part with them, except as presents to ambassadors, or the greatt princes of the Eait.

According to Neumann, single flones, taken from the porcupine or monkey, have been sold for sixty and eighty pounds sterling.

It is not impossible but that those bezozars which are formed in the gall bladder may possess some power as medicines; perhaps also solutions might be employed with advantage in surgery, but their great reputation amongst the Indians seems to arise altogether from ignorance and superstition.

BEZOAR, bovinum, is a yellowish flone, found in the gall bags of the ox. It has been used by miniature-painters in several calls of yellow.

BEZOAR, in Conchology, a species of Buccinum, that inhabits China. This shell is subround and rugose: anterior part of the whors lamellated: pillar perforated. Cubital. The colour is dirty ochreous, varied with brown: within yellow; carafe, decussated with wrinkles, or striae: tal space, bent, rugose with imbricated leaves: spire angular with straight sides: anterior part flatish, plated, or dentated above.

BEZOARA, or Buzwara, in Geography, a town with a fort in the peninsula of India, situate on the north side of the Kifina river, distant 403 geographical miles from Madupatam. N. lat. 10° 35'. E. long. 80° 31'. In the town is a magnificent pagoda, and another stands on a eminence without it, which attract a great number of pilgrims, whose contributions are distributed in alms to the poor.

BEZOARDICS. The peculiar virtue of the bezozar being that of redding and expelling poisons; the term bezozar (now, however, nearly obsolete,) has come to be almost synonymous with antidote. Thus, when a bezozaric medicine is mentioned, it implies, with the older writers, either a Pp medicine.
medicine into which bezoar enters, or one that resembles the bezoar in its supposed power of counteracting poisons, or, afterwards, simplifying a cordial. A few medicinal preparations have had this epithet.

BEZOARDICUM TERRA, a name used by some authors for a medical earth dug in the pope's territories, and more frequently called TERRA SARRACENA.

BEZOARDICUM MINERALI, or Mineral Bezoar, is a perfect oxyd of antimony, made by adding nitrous acid to the butter of antimony, and described under the article Antimony.

BEZOARDICUM FEVERIAE, is a mixed oxyd of antimony and tin, formed by fusing together these metals, distilling with corrosive sublimate to convert both metals into a butter, or muriated oxyd, and adding nitrous acid to reduce them both to a perfect simple oxyd. It is entirely different.

BEZOLA, in Ichthyology, the name of a kind of Salmo, called by Giesey Albula carcades, and supposed to be in no respect different from Salmo Laronus.

BEZOUT, Stephen, in Biography, a celebrated mathematician of France, was born at Némours, March 19, 1736. O. S. and notwithstanding opposition on the part of his father, devoted himself to the abridgment and propagation of the mathematical sciences, to which his taste strongly inclined him. In 1758, he was appointed a medallist at the Paris academy of sciences, after having communicated two memoirs on the integral calculus, and affording other proofs of his proficiency in the mathematics; in 1763, he was nominated examiner to the marine; and, in the same year, member of the academy of marine affairs, and examiner of the pupils of the royal corps of artillery; and, in 1776, royal censeur. His particular attention was directed to the solution of algebraic equations, and he had the honour of first discovering a method of resolving a particular class of equations of all degrees. In this work of investigating the roots of such equations, he was occasionally engaged from 1762 till 1779, when he published his treatise on the subject. To distinguished talents, and elaborate researches in the abstruser parts of mathematics, Bezout added a judicious discharge of the duties of the public stations which he occupied, and a private character which was deservedly esteemed. The following anecdote furnishes a pleasing specimen of his regard to justice in the exercise of his office, and at the same time of the benignity and consideration of his temper. When two of his pupils were confined by the small-pox, and incapable of attending for the purpose of an examination, the want of which would have delayed their advancement for a whole year, he, ventured, though he had never had that disorder, to visit them in person, and to ascertain their proficiency, by which he was enabled to make a report in their favour. His constitution was at length impaired by his unremitting application, the fatigue of his various offices, and some personal chagrin; and he fell a sacrifice to a malignant fever, September 27, 1783, in the 54th year of his age. His publications were "A Course of Mathematics for the Use of the Marine, with a Treatise on Navigation," 6 vols. Svo. Paris, 1764; a "Course of Mathematics for the Corps of Artillery," 4 vols. Svo. 1770; "General Theory of Algebraic Equations," 410. 1779; with a considerable number of Memoirs, chiefly mathematical, in the volumes of the French Academy.

BEZOZZI, Alexander and Jeron, brothers in the service of the king of Sarhonia, at Turin, the most celebrated performers of their time; the one in the hautbois, and the other on the violin. These kindred instruments were rendered famous all over Italy during the middle of the last century, not only by the exquisite performance, but by the amiable regular character of these two brothers. Their long and uninterrupted affection and fidelity together, were as remarkable as their performance.

The eldest, when we heard them in 1770, was 70, and the youngest 68. The idonea interprete et idonea voce, as perfectly in tune as their instruments: so that they had always lived together in the utmost harmony, carrying their familiarity of taste to their very dressing, which was the same in every particular, even to buckles and buttons. They had lived for so long, and in such a cordial manner together, that it was thought, whenever one of them died, the other would not long survive him; which was exactly the case, both dying in 1780, within a few months of each other.

The composition of these exquisite performers generally consisted of select and detached passages, yet so highly polished, that like apothegms or maxims in literature, each was not a fragment but a whole; their pieces being in a peculiar manner contrived to display the genius of their several instruments and powers of performance. The eldest played the hautbois, and the youngest the violin; but it was difficult to describe their peculiarities of expression. Their composition, when printed, gave but an imperfect idea of their sweetnefs and delicacy: there were such a perfect acquittance and agreement together, that many of the passages seemed heart-felt sighs breathed through the same red. No brilliancy of execution was aimed at: all were notes of meaning. The imitations were exact: the melody equally divided between the two instruments; such forte, piano, crescendo, diminuendo, and appogiatura (see all these terms in their places), were observed with a minute exactness that could be attained only by a long residence and study together. The eldest brother had lost his under-front-teeth, and comprehended of age; and it was natural to suppose that the performance of each had been better: however, to me (says Dr. Burney), who heard them now, for the first time, it was delightful! If there was anything to commend in so exquisite a performance, it arose from the equal perfection of the two parts; which disdained the attention, except when in dialogue, so much as to render it impossible to listen to both, when both had diffamal melodies equally pleasing.

They were born at Parma, and had been upwards of 40 years in the service of his Sarhonian majesty, without ever quitting Italy, (except one short excursion to Paris, in 1755,) or ever Turin, but for that journey, and another to visit the place of their nativity. They were men of a sober, regular, and moral character; in easy circumstances; had a town and country house, and in the former many good pictures by the first painters.

The Bezzoezi family has furnished many admirable musicians to Italy, and other parts of Europe. Gastano Bezzoezi, a celebrated performer on the hautbois in the court of France's service, was born at Parma in 1737, entered into the service of the king of Naples in 1736, and into that of the king of France in 1765. We heard him perform a concerto at the concert spirituel at Paris in 1771, with great applause; and thought him superior to all whom we had then heard on the hautbois, except Fischer. His father, Joseph Bezzoezi, had taught the celebrated brothers at Turin, Alexander and Jeron, his brothers, to play on the hautbois and buffoon. "M. Bezzoezi of Paris," says Burney, "in 1780, had during 25 years meritised and enjoyed the highest reputation, as well as the esteem of all who knew him. His fon was
of this town is owing to the illustrious family of Bianchi, whose palace adjoins the town, and who have contributed to ornament their place of refuge. This palace is a large building, in the Italian taste, and, on account of its magnificence, generally called the 'Villa of the Popes.' It was formerly only a royal hunting seat, but given by John Calvin, together with Balliol, and other estates, to Czarnecki, a general highly distinguished by his victories over the Swedes, when Poland was nearly crushed by her enemies. Czarnecki left one daughter, who married Bianchi, the father of the late great general, and conveyed the estate into that family.

DIALOBORS, a town of Poland, in the patriciate of Lemberg, 48 miles S.W. of Lemberg.

BIANA, a town of Hindooistan, 20 leagues from Agra, which was formerly a large city, and included Agra among its dependencies. The town is still considerable, and contains many large stone houses. It was formerly the residence of a powerful rajah; but his principal city and fort were built on the top of an adjoining hill, and the present town was only a suburb. The whole ridge of the hill is covered with the remains of large buildings, among which, the most remarkable is a fort, called "Bigay-Murder," containing a lofty pillar of stone, called "Bleemlat," or the Teller of the lion's stat or staff. This pillar is conspicuous at a great distance. The town and district now belong to the "Ranjah Sing," the rajah of Bhirtipoor. This place is famous for its excellent indigo. N. lat. 26° 25'. E. long. 77°.

BIANCA, La, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, 12 miles N.E. of Bova.

BIANCA, Itál. for the note in music, which we denominate a minima; and the Fr. une blanche. This, though now almost the least note in use, three or four hundred years ago, was the shortest. See Time-Table, and Musical Characters.

BIANCHI, Francesco, called Il Frari, in Biography, an historical painter, was born at Modena, and was the disciple of the celebrated Antonio Correggio. His colouring was delicately fine, his attitudes graceful, and his invention very grand. His works poofleed an astonishing beauty, and are prized as highly as the stones of Correggio. He died in 1560. Pilkington.

BIANCHI, Peter, a painter of the Roman school, was born in Rome in 1694, and united with his talents as a painter the accomplishments of literature. He painted historical subjects, portraits, rural and natural scenes, animals, plants, and flowers, in fresco, oil, and enluminure. His reputation caused him to be employed in painting a picture in the church of St. Peter. He is said to have been a severe judge of his own performances, and to have destroyed many of his works after they were finished, because they did not please him. He died at Rome in 1759. Encyclopedic.

BIANCHI, John Baptist, born at Turin, Sept. 12th, 1681, of an ancient and respectable family. After being educated with the greatest care, and under the ablest masters at home, he was sent early to the university, and made such progress in his studies, that at the age of 17 he was admitted doctor in medicine, and was soon after made physician to the hospital, a situation for which he was peculiarly qualified, for being fond of anatomical pursuits, he had the opportunity, from the number of subjects a large establishment of that kind necessarily furnished, of dissecting and examining the human body at every age, and labouring under every species of disease or deformity. He had the happiness also of finding his talents properly cultivated by his brethren, and his labours rewarded, as he was advanced to be public teacher of anatomy at Turin, where his sovereign built for him, in the year 1715, a spacious and convenient amphitheatre. He also read lectures in philosophy, in pharmacy, chemistry, and on the practice of medicine. These honours were not however entirely without alloy, as he had the mortification to find his doctrines cenured by Morgagni, and by Haller, and even the existence of some parts he supposed he had discovered, disputed. The principal of his works are "Hijoria hepatica, seu de hepatis structura, usibus, et morbis," 1710, 8vo. Morgagni has published some severe criticisms on this work, in his "Adversaria Anatomica." It has passed, however, through several editions, and in 1725, was reprinted in two vols., 4to., with figures, "De larynx male novo, cornus usus, morbi, curatones," 1741, 4to., also cenured by Morgagni. "Storia de monasteri, de dio corpi," 8vo. 1749, the most laboured and perfect, Haller says, of all his works. He wrote also an history of the generation of man, with figures, in which he attempts to delineate the facts in its various stages, but the figures, Haller says, are principally fictitious. Many of his dissections are inserted by Mangeti in his "Theatrum Anatomicum." Haller. Bibl. Anat. et Chirurg. Eoy. Dict. Hist.

BIANCHI, John, born at Rimini, Jan. 3, 1693. After receiving a liberal education, he went to Bologna, where, in 1719, he was admitted doctor in medicine. Returning the following year to Rimini, he practised medicine there with success for many years. He revived the academy of Lynxus, a philosophical society, collecting the members together at first at his own house. In gratitude for this, a medal was struck, with his figure on the face, and on the reverse, a lynx, with the motto "Linceis reliquitus." His works are various, of which the principal are "A Tractate on the Cataract," 4to. 1720, in Italian. "Epistola ad Josephum Putyem," 1726. "De monasteri, et rebus monastica," 4to. 1749, and in 1751, an account of an impotumte of the right hemisphere of the brain, occasioning paralytic on the opposite side of the body. Eoy. Dict. Hist.

BIANCHINI, Francis, a mathematician and philospher, was born at Verona, Dec. 13, 1662, and devoting himself to the church, became a doctor in theology, and distinguished by his unfeigned piety. But his principal celebrity was acquired by his literary and scientific performances. In early life he contributed to the establishment of the academy of the "Atletoli," or the lovers of truth, and in the progress of his studies rendered it considerable service. His literary reputation attracted that notice to which the rank of his family also entailed. He was appointed his librarian; and he was promoted to the dignity of canon in the church of Santa Maria della Rotunda, of the Delegio, to that of St. Lawrence, in Damafo. He was also secretary to the congregation for the reform of the calendar, to which office he was nominated by pope Clement XI. The senate created him one of the nobility of Rome, and after his death the citizens of Verona placed his bust in their cathedral. He died of the dropsy, March 2, 1729, with a character distinguished for the benevolence and candour of his manners, as well as for his piety and universal learning. His letters are preserved in the possession of one of the foreign members of the academy of sciences at Paris. His first work was "An Universal History," on a new plan, serving to give pertinency to the chronological distribution. The first part of this work was published in 1697, under the title of "La Historia Universale" propta con monumenti et epitome con Simplici de gli Antichi." It extends, from the creation
creation of the world, to the destruction of the great Assyrian empire, and is held in high estimation for industry of research, and ingenuity of disquisition with regard to the genuine monuments of antiquity. The succeeding parts were never written. On occasion of the reform of the calendar, Bianchini wrote two learned and scientific treaties published in 1725, and entitled "De Calendario et Cyclo Cesariano ac de Canone Pachiani Sancti Hippolyti Martyris, Dissertationes duo." Of his astronomical skill and labour in tracing the meridian line, in the church of the Chartreux at Rome, he published an account in a dissertation "De nummino et gnomone Clementino." In 1727, he published "Camera ed Inserizioni Sepolcreti di Libert, Serviti Officidali della Caffa di Augllco, &c." on the occasion of the discovery of a subterranean sepulchral building, in 1726, on the Appian way. His observations on Venus were published in 1728, under the title of "Helenari et Phosphorl Nova Phenomena, five Observatione s circa Planctum Veneris." The results of his observations on the rotation of Venus, and the position of its axes, though very interesting to astronomers at the time of their publication, have not, however, been confirmed by those of a later date, made by Herchel and Schroeter, with instruments of much greater power than any which were known in his time, and inserted in the Philosophical Transactions. The cause of this difference has not yet been ascertained, and defers investigation. (See Venus.) Bianchini was employed for eight years in preparatory measures for tracing a meridian line through the whole extent of Italy, but his death prevented the commencement of this enterprise. His edition of "Anastasius's Lives of the Popes," in 4 vols. folio, with notes, dissertations, prefaces, &c. displays much genius and erudition; but it is said to abound with typographical errors. He left an unedited dissertation in Latin, on the three kinds of musical instruments of the ancients, which was published at Rome 1742, in 4to., under the following title: "Francisci Bianchini Veronensis utroque signaturae referendari, libri domi cuius, de tribus generibus instrumentorum musicorum vetere organiset dissertatius." In dividing ancient musical instruments into three classes, namely, wind instruments, stringed instruments, and instruments of percussion, the first class includes flutes, trumpets, horns, the syrinx, and hydraulic; the second, the cornuchoth, the lyra trichordus, tetrahordum, the seven-stringed lyre, the cithara, the psaltery, the harp, &c.; the third class comprises the tympanum, cymbalum, crotalam, sistrum, and the tinnitubulum. Of all these, the author has given descriptions and representations well engraved on plates. Fontenelle Elogie des Academicians. Nouv. Dict. Hist.

BIANDRATE, in Geography, a town of Piedmont, in the Novarese, 6 miles N.W. of Novara.

BIANDRONA, a town of Italy, in the duchy of Milan, 15 miles W.S.W. of Como.

BIANOR, in Entomology, a species of Papilio, nearly allied to P. Paris, and a native also of the East Indies. The wings are above and beneath of the same black colour, with five rows of spots on the posterior pair. Fabricius, &c.

It may be doubted whether there is a distinct species from Paris; perhaps only a sexual difference.

BIAR, a small town of Valencia, in Spain, seated on a river which runs into the Ebro, on the confines of New Castile. It is chiefly remarkable for its honey, which is distinguished by its whiteness and fertility, unadulterated by any change of weather; distant two leagues east of Villena.

BIARCHIUS, from bis, annus, annum), ditribn, andistics, tribus, an officer in the court of the emperors of Constantinople, intrusted with the care and inspection of the provisions of the folliery. The bisarchus was the same with what the Latins call pretextum annone. His function was called bisarchia; by the Latins pretextura rei civitatis. He belonged to the schola agitatarum in rebus. See Agntes.

BIARMIA, in Geography, a name given by the Scandinavian navigators, in the middle ages, to the whole country between the White Sea and the Ural. See Parnia.

BIARUM, in Botany, a name by which the people of Egypt at this time call the root of the nilusf or flix esculenta, growing on the Nile.

BIAS, or BMAS, in a general sense, denotes the tendency or propensity of a thing towards one side more than the other; particularly the deviation of a body, or a plane, from its rectilinear course, or its level. See Inclination. It signifies also the inclination of a person's mind to one thing more than to another. The word is French, bias, which signifies the same.

Bias of a bow, is a piece of lead put into one side, to load and make it incline towards that side.

Bias, in Biography, one of the seven wise men of Greece, was a native of Priene, in Ionia, and flourished in the reign of Alyattes II. king of Lydus, about 605, according to home, but according to Blair's tables, about 565 years before Christ. He was eminently distinguished not only by his wisdom, but by his generosity and public spirit, and for these qualities held in the highest estimation by his countrymen. Alyattes was obliged by a flaragement of his contrivance to raise the siege of his native town, when it was reduced to the utmost distress by famine. He first sent two fattened males into the enemy's camp; and the king, observing with admiration their good condition, sent deputies into the city under a pretence of offering terms of peace, but with a real intention of observing the state of the town and of the people. Bias, suspecting their design, ordered the granaries to be filled with large heaps of sand, and the heaps to be covered with corn; upon which, when the deputies returned, and reported the plenty of provision with which the city was furnished, the king no longer demurred, but concluded a treaty, and raised the siege. As an influence of his generosity, it is related of him, that when several young female captives were brought from Meneifie to Priene, he redeemed them, educated them as his own daughters, and then restored them with a dowry to their parents. As an evidence of the low estimation in which he held the gifts of fortune, compared with the endowments of the mind, it is said, that when Priene was once threatened with a siege, and the inhabitants were leaving it, loaded with their most valuable effects, Bias took no pains to preserve any part of his property, alleging as a reason of his conduct to one who expressed his surprise at it, "I carry all my treasures with me." The following maxims of wisdom are ascribed to him. "It is a proof of a weak and disorders mind to desire impossibilities." "The greatest infelicity is not to be able to endure misfortunes patiently." "Great minds alone can support a sudden reverse of fortune." "The most pleasant state is to be always gaming." "Be not unmindful of the mistakes of others." "If you are handsome, do handsome things; if deformed, supply the defects of nature by your virtues." "Be slow in undertakings, but resolute in executing." "Prate not a worthless is man for the sake of his wealth." "Whatever good you do, or do all the good you can, and ascribe the glory of it to the gods." "Lay in wisdom as the store for your journey from youth to old age, for it is the most certain provision." "Many men are dishonest; therefore love your friend with caution, for
BIBIEN, in Zoology, a name given by Ridinger, &c. to the beaver, barbarus. Linnaeus.

BIBER, Henry John Francis, in Biography, vice-chaplain to the archbishop of Salzburg, seems to have been the greatest performer on the violin of the 17th century. Baltzar from Linz, about the middle of that century, had so alarmed the Oxonians by his execution on the violin, that according to Ant. Wood, Dr. Wilson, the music professor, after hearing him, flopped down to examine his feet, whether they were not cloven; that is, ‘whether he was a devil, or not, because his performance was beyond the faculties of man.’ But if we may now judge of his performance by his compositions that are still extant, it was very inferior to that of Biber, who published in 1681, folios for a violin and base, the most difficult and the most fanciful of any music of the same period. One of the folios is written on three separate flares, as a score for two violins and a base; but the trebles are to be played in double flutes. Others are played in different tunings of fourths and fifths, as for a treble violin. A second work by this musician, intitled fiduciun, facro profanum, consists of twelve fantasias in four and five parts, to be played on three instruments; and a third, harmonia artistico-arioia, published at Nuremberg, consisting of pieces in seven parts, to be played on three instruments. In this last work he is styled Dijifer. In knowledge of the finger-board, double flutes, and use of the bow, as well as composition, he seems to have surpassed all preceding violinists.

BIBERACH, in Geography, an imperial city of Germany, in the circle of Swabia, situated in a valley, watered by the Ries, near the Danube. The magnificents and people are partly protestants and partly catholics; and the church, as well as the hospital, are common to both. The treaty of Westphalia requires that it should have as many catholics as Lutherans in the senate. It is governed, as to its offices, like the city of Augsburg. It has a large manufacture of fluylins. The number of houses is estimated at 900, of inhabitants at 6,600, and of burghers at 900. This city is very ancient, and was known in the year 751, under Pepin. By the plan of indemnities agreed upon by France and Russia, this imperial town was conceded to the margrave of Baden. N. lat. 48° 4'. E. long. 10° 27'.

BIBERSTEIN, a small town of Switzerland, in the canton of Bern, leaced on the north-welt side of the Aar. N. lat. 47° 17'. E. long. 7° 56'.—Ariu, a bailiwick, with a castle, in the circle of the Upper Rhine, and bishopric of Fulda. 8 miles east of Fulda.

BIBIENA, Bernardino Da, Cardinal, whose proper name was Doni, or Doria, was born of an obscure family at Bibiena, in the Cefantina, in 1470, and entered into the service of the family of Lorenzo di Medici. He attached himself to cardinal John, afterwards pope Leo X., whom he accompanied in his exile and served with affection and fidelity. At Rome he ingratiated himself with pope Julius II., by whom he was employed in some concerns of importance, and by whom his services were approved. On the death of Julius, he artfully perfused the cardinals, that his mather, though only 36 years of age, was not likely to live long, and by this artifice obtained his election. Leo was not inoffensible of his obligations, and made him his first treasurer, and in 1513, cardinal. In the direction of the works of the holy house of Loretto, in which he was employed, he encouraged men of literature, and engaged the best artists, particularly Raphael. Leo also deputed him as legate to the pontifical army against the duke of Urbino, then to the emperor Maximilian, and afterwards, in 1518, to Francis I.

he may hereafter become your enemy.” Bias is affected to have written more than 2000 verses concerning Ionia. His death was no less honourable than affecting; for he expired in the arms of a grandson, while he was playing a caufe for a friend. Dio. Laert. 1. i. 82. Val. Max. i. iii. c. 2. v. 2. Aul. Gell. l. v. c. 11. Cicer. de Amicit. c. 62. Plat. Conv. vii. Ariflot. Rhet. i. ii. e. 13. Stobæus Serm. 28. Brucker’s Phil. by Enfr. vol. i. p. 135.

Bias, in Entomology, a species of Papilio (Pleb. Rur.), that inhabits Cayenne. The wings are entire black, glistened with blue; beneath brown, with a white posterior margin. Fabricius.

BIAS, St. in Geography, a town of Italy, in the kingdom of Naples, and province of Principato Cirta, 15 miles W. N. W. of Piletira.

BIATHANATI, Sabella, from βιο, violence, and Σάφειρ, deaths; the same with fiduces by Lipsius.

BIBAN, in Geography, a town of Egypt, in Bahira, the residence of a kiafikfat. Once a week, on Monday, a fair for camels and other cattle is held in the fields adjoining to this place.

BIBBONA, a town of Italy, in the duchy of Tuscany, 50 miles north of Arezzo.

BIBBS, BIBS, or BRACKETS, in Naval Architecture, are made of elm plank, and bolted to the hounds of masts, as supporters to the trefle trees. They are from three to five inches thick, and nine elevenths of the hounds in length, and in breadth fix fiftieths their length. The after edge is first lined straight, and the upper part fquare from that, and the fore part tapered by a moulding to four or six inches of breadth at the lower ends. The after edge is fayed on the checks, and the upper part against the under side of the trefle trees on the fore fide of the mast; viz. In the middle of the after edge, fet up one inch and a half, and line straight from that to nothing at the lower end, which makes a butt in the middle; then place the bibbs on the mast, their thicknes within the fides of the checks, and their upper parts to the outside of the trefle trees; then let one inch and a half be rased by the lower edge of the bibbs upon the checks, and the wood taken out to that depth, and the thicknes of the bibbs, that they may bed firn therein; they are then bolted edgewayes through the checks with four bolts driven from the fore fide and clenched on a ring on the aft-fide. The bolts are to be in diameter from one inch to seven eighths, or three quarters in small trip’s masts, and only three in number. The lower end of the bibb is rounded off to the surface of the check, and the edges chamfered.

BIBEN, in Geography, a town of Peria, in the Irak Agem, 140 miles eatt of Lipahan.

Biber, otherwise called Pitsheim, and in Latin Pedena, or Perina, a town of Carniola, leaced in a very fertile spot, on a high mountain; and the fee of a bishop, to whose jurisdiction belong two towns and eleven villages, in which are fourteen parishes, tillfargan to the prelate of Gorz.

Biber, a town or village of Germany, in the circle of the lower Rhine, the electorate of Mentz, and prefecture of Steinheim, 5 miles E. S. E. of Frankfort on the Main. This is one of eleven villages which are polluted in a common of a wood named the “Biber Mark.” At Biber, all things relating to it are managed by the sheriffs of the Mark: and before the village, under a great lime-tree, lies the sheriff’s bench, where the Mark court is fenced in, and tranfegriers are openly cited and punished.
BIB

BIBILE, a town of Egypt, two miles south of Feltum.

BIBLIO, in Etymology, one of the Fabrician genera of ANGILOTTA, and which in the Linnaean system forms a section of the Musca genus. Fabricius defines the generic character of Biblios from theucker, feeders, and antennae. Theucker consists of three bristles and a tuft of a single valve; feeders very short; antennae connected at the base, and pointed at the tip. Ent. Syst. See Musca.

BIBLE, a book by way of eminence to be called, containing the Scriptures, i.e. the writings of the Old and New Testament; or the whole collection of those which are received among Christians as of divine authority.

The word Bible comes from the Greek Βιβλιον, or βιβλα, used to denote any book; but, by way of eminence, applied to the book of Scripture, which is "the book," or "book of books," as being superior in excellence to all other books.

From £ to again comes from βιβλα, the Egyptian reed, from which the ancient paper was procured. See Bibles.

The word Bible seems to be used in the sense now specified by Chrysolofum (In Col. H. 9. tom. xi. p. 59.)...I therefore exhort all of you to procure to yourselves Bibles.

BIBLIA, a celebrated painter and architect, was born at Bologna in 1647; and losing his father when very young, was placed under the direction of Carlo Longhiera, who, by his talents for architecture, obtained for him the instruction of Paradisi, Albionbomini, and Alberti, the best masters of that period for prescriptive and architectural ideas. In consequence of the recommendation of Longhiera, he was appointed by the prince of Parmo, who employed him in executing a variety of decorations, and settled upon him as an annual pension. For the dukes of Parmo, he painted the scenes for Hercule, tyrant of Syracuse, in 1684; for Theophilus in love with Alexander, 1693; for Domestic: Scenery, 1694; for Franchises, 1700; and for R. Scenna, in 1711. From Parmo he went to Milan, where, in 1709, he painted the scenes for L'incoronazione, and there went to Venice, and was appointed painter and architect to the emperor Charles VI., by whom he was highly honored. He was the master of those wonderful and magnificent scenes which filled the curiosities of the city, and filled a book of prisoners for the imperial court. He had left for several places,

The first canon or catalogue of the sacred books was made by the Jews; but the original author of it is not exactly ascertained. It is certain, however, that the five books of Moses, called the Pentateuch, were collected into one body within a short time after his death; since Deuteronomy, which is, as it were, the abridgment and recapitulation of the other four, was laid in the tabernacle near the ark, according to the order which he gave to the Levites (ch. xxxi. v. 24.) Hence it appears that the first canon of the sacred writings consisted only of the five books of Moses; for a further account of which, see Penta- 

t euch. It does not appear that any other books were added to these, till the division of the ten tribes, as the Sma- 

ritans acknowledged no others. However, after the time of Moses, several prophets, and other writers, divinely in- 
fpired, composed either the history of their own times, or prophetic books and divine writings, or psalms appr pri- 
ated to the praise of God. But these books do not seem to have been collected into one body, or comprised under one and the same canon, before the Babylonish captivity. This 

was the case in their order rather from the prophet to the prophet, which time the Jews had a certain number of books digested into a canon, which comprehended none of those books that were written since the time of Nehemiah. The book of 

Ezechiel affords sufficient evidence, that the canon of the sacred books was completed when that tract was composed; for that author, in chap. xlix. having mentioned among the famous men and famed writers, Isaiah, Jeremiah, Ezekiel, adds the twelve minor prophets, who follow those three in the Jewish canon; and from this circumstance we may in-
