observations and precautions will scarcely be wanted for
English surgeons, who have laid aside that instrument.

Sometimes a lymphatic vesel is wounded; in which case
the patient experiences no extraordinary pain, nor does the
surgeon foresee the injury that is still to arise, and confe-
quently cannot be immediately discovered. After the ban-
daging, the vein heals up, no inflammation is left behind, but
there daily flows out of the orifice of the skin a quantity of
clear peculiar lymph, which continually keeps the dressings
wet. This circumstance often gives the surgeon much
trouble. Here we may apply with advantage, Gouard's
fathom water, or a solution of alum, or mere cold water.
The cure is best completed by means of dry lint, applied
daily once or twice in the form of a tourn. We may also
sprinkle pulverized alum, or apply a strong profusion upon
the vesel; and sometimes we may use the lapis infernalis
with advantage. Mr. Jaeger, however, thinks (Fumfrig,
chirurg. prakt. Cantelen. &c. Frankf. a. M. 1788, p. 3.)
that the cure may most speedily be effected by immediately
promoting suppuration.

It may happen, that in letting blood at the arm a lymph-
atic vesel becomes inflamed; in which case we feel upon
examination, a hard absorbent vesel both above and below
the wound of the vein, which, last, however, is not yet healed,
but generally uninfamed: if the affected limb is used, the
pains become more violent, and sometimes extend themselves
into the axilla, where also the glands swell; generally the
tore arm likewise swells and becomes painful, and at last
absceses take place in different parts. Besides keeping the
affected arm at rest, we must cover the wound with an
emollient ointment, and apply to the hard vesels and tumours,
cataplasm of emollient, cicatrizant, and anodyne remedies,
upon which they are generally discouced. When absceses
have already been formed, they must be opened and healed,
according to the rules of the art. See ABSCESS.
Bleeding.

The most common symptom consequent upon blood-letting is fainting, which, however, is in most cases unattended with danger, especially when it does not arise from a too copious evacuation of blood. It may often be prevented, by keeping the patient engaged in conversation, by letting him take a tispoon of vinegar, or a glass of cold water into his mouth, or sprinkling him and washing his hands and face with it. But if it nevertheless supervenes, we must immediately place the patient in a horizontal position, throw open the chamber window, and apply strong stimulating substanfes, such as volatile alkali, to his nostrils; and when he has come to himself, we may give him a glass of wine, provided it be not contra-indicated by his ill state of health.

When persons who always faint whenever they are bled, and who on this account, however necessary the operation may be for them, always dread it, the bell method of preventing their fainting, is to lay them immediately in a horizontal position, with the head low, and at the same time frequently to stop the discharge of blood by holding the veins. This caution is particularly to be recommended with pregnant women, as faintings and convulsions in them, if they continue too long, may prove very injurious to the fetus, or produce abortion.

We have hitherto confined our remarks to the opening of a vein: it therefore now remains for us to describe the operation of arteriotomy, which is the artificial opening of an artery.

This operation was very frequently practised by the ancients, who, perhaps, from having incorrect ideas of the nature of these blood-vessels, were not always aware of the dangerous consequences which follow from this practice, if injudiciously managed. Those who are desirous of reading a full account of the ancient practice in this branch of surgery, may peruse what Oribasius has collected from Galen and Antyllus; to which they may add the observations of Paulus Aegina, and Prosper Alpinus, the latter of whom describes the operation as it was performed in Egypt.

The supposed advantages of opening an artery, rather than a vein, are first, that the blood flows with greater velocity than from a vein; and therefore affords a larger quantity in a given time; 2dly, that it prevents the accumulation of blood in any local inflammation more effectually, because it intercepts the fluid in its passage towards the affected part; 3dly, that its salutary effects more speedily follow, on this account, than from the operation of phlebotomy; and, therefore, it is preferable in cases of a very urgent nature, such as apoplexy and phrenitis, arising from the pressure of blood upon the brain.

But these advantages are speculative, rather than practical, for the following reasons: 1st, No surgeon who is acquainted with the serious consequences of opening a large branch of an artery, and the difficulty of withdrawing the effusion of blood in many instances, will perform this operation in the same parts of the body, and in the same dauntless manner, as the ancients did. And in opening only very small branches, (suppose of the temporal artery,) it rarely happens that the blood flows rapidly, and never with the same freedom as it does from a large vein: 2dly, That we may sometimes, by this means, intercept the blood as it passes towards an inflamed part is certain; but cutting through the principal artery which conveys the blood; but this advantage is not often obtained, because we dare not divide any considerable ramifications, and there are always more arterial branches than one to supply an important organ: 3dly, We admit, that in certain cases, (in ophthalmia, or inflammation of the eyes, for example,) the good effects of blood-letting by arteriotomy near the affected part, is far more useful than by phlebotomy, in a remote part; but, unfortunately, the surgeon cannot always evacuate a sufficient quantity of blood by this means, on account of the difficulty of finding a suitable branch of an artery, which may be easily as well as safely incised.

Therefore, considering all the disadvantages of this operation, it is now very rarely practised, except in the temples, where the pulsation of a small branch of the artery may be often felt with ease; and there is little or no danger in attempting to divide it. If we do not succeed in our attempts, or do not procure so much blood as is requisite, the operation of phlebotomy may then be had recourse to. It should, however, be mentioned as an undoubted fact, that acute inflammations of the eyes, are more effectually relieved by arteriotomy, (when it properly succeeds,) than by opening a vein in the arm; and that the excretion of four ounces of blood in this way, is as useful as twenty or even thirty ounces taken from the venous ycle.

A arteriotomy is now scarcely ever performed in any other part of the body besides the temple, we shall content ourselves with describing this operation alone. In that situation, the artery lies near enough upon the cranium to be compressed readily, when we wish to stop the current of blood; though, in general, the blood does not flow so freely, as to cause any difficulty in restraining it by moderate pressure.

The patient being placed in a proper light, the operator feels for a pulsating stream in the temple, nearly opposite the outer angle of the eye. When he has discovered it, he endeavours to trace the direction in which it runs; and then he places the two foremost fingers of his left hand upon the artery, leaving a space of about half an inch between them for the place of the incision. The vessell is so small, in general, that it cannot be opened by an oblique, or a longitudinal puncture, as in bleeding the veins of the arm; but must usually be cut across, by a single stroke of the lancet, or scalpel. A lancet is not so convenient as a small knife for this purpose, because its fine point is apt to be broken; and it will be found best to draw the instrument over the artery, instead of endeavouring to strike it with the point, (which Dr. Butler, MR. B. Bell, and others, direct to be done,) as in phlebotomy. It may be convenient to make a little impression with the finger-nail, or with ink, on the exact spot we determine upon for the incision, lest we lose our object in operating; for a surgeon cannot always ensure the division or wound of the artery on his first attempt, especially if the incision be made with timidity, or hesitation.

When a sufficient quantity of blood has flowed, (which does by a florid and plentiful stream,) we close the wound; and apply a long bandage over a very firm, thick compress of linen, in which may be included a piece of coin, or some other hard substance. It is a matter of small importance whether or not we first use an adhesive plaster, except when the bleeding is likely to prove troublesome; but the different modes of arresting arterial hemorrhages, are described under the articles Hemorrhage, Ligature, Systole, and Anaemia.

Frequently it is necessary that the surgeon should make himself acquainted with the state of the blood, and often also it is required of him to pass his opinion upon it. As long as the blood is seen and flows out of the vein, it exhibits a pretty uniform red colour, and has a vivid glary feel; but when it grows cool, it coagulates into a mass varying in colour and density. After some hours, there gradually exudes from this coagulated mass a fluid, which separates the more solid parts from the sides of the vessel, so that it swains in it. This water is called serum, but the coagulated red cake is named crum or coagulamentum.
Good venous blood, exsposed to the air, is of a dark red colour: when it cools, it separates a thin and almost colourless serum, and a thick caje, which has no eruit of a different colour from the blood below it; and of which the serum forms a proportion, amounting to between the third part and the half. Such blood has no preternatural acrimony, or sterile quality; and in it are found all its constituent parts in the proper proportions. From this condition of the healthy blood, we may form a judgment of its preternatural state, if it be materially changed.

When the blood remains so fluid that it will not coagulate, it indicates a deficiency of the gelatinous part, and a great redundance of serum. Such blood is to be found in many fevers, especially in malignant ones, or when the patient is in a very debilitated condition.

If there be too much serum in the blood, dropsey and other similar distempers are to be apprehended; for such discoloured blood always indicates a weakness of the vessels, and of the muscular fibre.

When the serum is yellow, it indicates an obstructed flow of the bile, and its regurgitation into the mals of the circulating fluids.

When the blood has much serum and little of the red part, the blood is overloaded with mucus, and it indicates that a cachectic disease is impending; especially when the serum has various different colours, and the texture of the corpus is very flender.

If the blood has its proper and sufficient redness and fluidity, but at the same time exhibits a gory pellicle, it indicates a superfluity of oelaginous particles.

When it separates and yields a very compact, teneacious, yellow, or buffy surface, it is too thick; and the serum may be at the same time small in quality, it shews a great degree of vascularity and inflammation. This is a fact very generally admitted.

Finally, it is to be observed, that we need not be alarmed when the thicker part of the blood seems to swim in a milky fluid; for it commonly happens, in drawing blood only a few hours after a meal, when it proceeds from the chyle, which, about this time, is imperfectly mixed with the blood.

We have thrown out these few hints for the attention of practical surgeons; but they are by no means to be regarded as complet, or absolutely incontrovertible. There is a great deal of fallacy in judging from the colour, and other visible qualities of the blood; and the moderns have therefore, learnt to give their opinion with diffidence. This subject is considered more at large in a subsequent article. See Blood, and its properties.

**Bleeding a Horse, a frequent operation in the Veterinary Art.** principally intended to diminish the mals of blood, and thereby destroy the too great fulness or over-action of the heart and arteries.

When this operation is intended to affect the general system, the evacuation is usually made from the jugular vein. For the relief of particular parts, the vessels which belong to it, or which are adjacent to it, may be opened; as the vein running down the inside of the fore-arm is commonly opened when it is concealed the shoulder is affected: the necessity of this operation, on account of injuries of this part, is less frequent than is generally imagined; the vein itself in general gives out but little blood, and is very apt to swell after the operation.

Affections of the feet are more frequent, and we have often opened the coronary veins with obvious good effects; by puncturing with a lancet various parts of the coronary ring.
punctured, and then if they are drawn parallel to the direction of the vein, the lancet paling between them, there is less resistance than if they presented themselves transversely to the blade, in which case they must necessarily be divided before the incision can take place.

The jugular vein, after bleeding, often ulcerates, and is attended with the most serious ill congequences, the mischief extending in both directions along the internal surface of the vein, from the point of the incision; the cavity of the vein, or its canal, becomes obliterated, and the irritation occasions a thickening of the cellular membrane surrounding the vein, often to some inches in depth. This, in general, if no external irritation happens, subsides gradually, and disappears without any farther ill congequences, and the vein is totally lost on that side; at other times, an oozing and discharge of thin lymph takes place from the injured part, and a sinus forms, running mostly against the course of the vein up the neck, which, being freely opened, soon heals without further inconvenience. At other times, considerable abscesses form, which are opened without danger, and the thickening of the cellular membrane gradually subsides, and the part heals. Again, in others, the inflammation and ulceration extend along the course of the vein to the head, forming abscesses, which burst and discharge blood, and the ulceration extending to the head becomes fatal.

As prevention is often much easier than cure, to avoid this accident great care should be taken to use a clean instrument, with a smooth, keen edge, not to strike where the vein has been already opened, where very often is an enlargement, and the vein becomes thinner in that part, and more extended, not to include any thing but the skin in pinning it up, and not to leave the pin remaining in the neck too long, to become cankered and rufily, and thus produce irritation. The pin should be elipt as short as possible, to prevent the horse rubbing it out against the manger, &c.

The wound will in general close of itself after a few minutes, if all pressure upon the vein be removed, and sufficiently firm to stop the escape of the blood, if the lips of the orifice are pressed together, without any pinning, and the horse's head, to render it more certain, should be tied rather high to the rack for a short time; where, however, the orifice is very large, or the veins very thin, and disposed to bleed, pinning is the surest practice.

Lancets are often made with a spring, suddenly to plunge them into the vein, and are usefully and commodiously employed for this operation, as they do with great suddennes and effect, more so than the blade or the blow of a blood-thick. The only objection is, that the instrument, from the pressure against the neck required in using it, cannot be so suddenly withdrawn as might be desirable, so that if the horse plunges at the moment he might severely cut himself, which we have seen happen. To prevent the possibility of such an occurrence, the instrument might be provided with a second spring to bring back the lancet to its sheath, or cafe, immediately after the stroke, which would render this instrument very useful and perfect.

**Bleeding from the nose.** See Epistaxis.

**Bleeding from the lungs.** See Hæmoptysis.

**Bleeding by meaure**, is where an account is taken of the quantity as it flows from the vein, in order to put a stop to the flux when the requisite portion is had.

**Bleeding at large**, where the flux is continued without regard to the quantity, till such time as some expected effect is perceived. This method is sometimes used in cases of apoplexies, comata, &c.

**Bleeding of a corpse; Cruentatio cadaveris**, is a phenomenon not said to have frequently happened in the bodies of persons murdered, which, on the touch, or even approach of the murderer, began to bleed at the nose, ears, and other parts; so as formerly to be admitted in England, and still allowed in some other parts, as a sort of detection of the criminal, and proof of the fact. Phil. Trans. N. 77. p. 3212. But this kind of evidence derives its weight merely from superstition and credulity. Numerous instances of these posthumous hemorrhages are given by Wehfer, Lennius, Libavius, and especially Horiatus, who has a discourse expressive on this point, under the title, "De Cruentatione Cadaverum."

**Bleeding** is also applied, in a less proper sense, to a flux of sap out of the wounded vessels of plants, either spontaneously at certain seasons, or by art, and the help of incision.

**BLEGNY, NICOLAS, in Biography, a bold, and, for a time, successful adventurer in medicine, to which he was not regularly educated.** Dionysus fays, he married a midwife, which probably first suggested the idea of becoming a rupture doctor, and of contriving an elastic bandage for that complaint. In 1676, he published at Paris, "L'art de guerir des hernies," 12mo. which has passed through several editions. He used to cauterize the skin of the groin with aqua fortis, or the muriatic acid; when the wound healed, a firm cicatrix was left, which contributed in preventing the further descent of the gut. This remedy was invented by the prior De Cabrerus. He relates several remarkable cures performed by him; in one case, part of the urinary bladder had flipped into the ring. In 1679 he published, "Histoire anatomique d'un enfant, qui a demeuré vingt cinq ans dans le ventre de sa mere," Paris, 12mo. The factus was said to be petrifed. It had acquired, from its long residence in the abdomen, and from the pressure of the neighbouring viscera, an almost cartilaginous hardnes, and retained very little of the human form. About the same time, he commenced the publication of a medical journal, under the title of "Les nouvelles decouvertes, fur toutes les parties de la medicine," of which one number came out every month, and he solicited and obtained assistance from a variety of practitioners; he also contributed considerably to it from his own stock. His name appeared as the editor for the first three years, but was afterwards omitted. Bonet thought the journal deserving of being translated into Latin, and published it at Geneva, in 14to. under the title of "Zodiaet medicinae Gallici." He had before this made himself known by a treatise on the venereal disease; "L'art de guerir les maladies venereennes exploqué par les principes de la nature, et de la mecanique," 12mo. 2 vols. Paris. This was soon republished, translated into German, English, and other languages. He says, the disease was known to the ancients, and even to Moses. It may be brought on, he thinks, by immoderate venery. He objects to the use of altringent injections in the gonorrhoea, and professes to cure the lues, equally certainly, and more safely, with decoctions of guiacum and farfaparilla, than with mercury. He had also published, by order of his sovereign, "Remede Anglais, pour la guerison des sieurs," 1682, 12mo. The principal part of this remedy was the Peruvian bark. He had now attained to very high rank in his profession, having been made, in succession, surgeon to the queen, to Philip duke of Orleans, and, in 1687, one of the physicians in ordinary to the king. Soon after he undertook the management of an hospital, for the reception of the sick poor at Pincourt, but for some immoral practices, encouraged in this place, a report of which was made to the king, he was removed from all his appointments, and
and confined in prison for eight years. Released at length from this confinement, he went and settled at Avignon, where he continued to the time of his death, about the year 1722, being 70 years of age. Haller, Bib. Chirurg. Anat. et Med. Eloy Diet. Hist.

BLEICHERODE, in Geography, a town of Germany, in the circle of Upper Saxony, county of Holsteinen, and lordship of Lorza; though small, it is populous and thriving, has some manufactures, and carries on a good trade; 25 miles north of Mulhausen.

BLEIDENSTATT, a town, or large village of Germany, in the circle of the Upper Rhine, and principality of Naufau-Saatbruck-Ulfingen, leaved on the Aar, 9 miles N.N.W. of Mentz.

BLEISTEIN, or PLEISTAIIN, a town of Germany, in the circle of Bavaria, and principality of Newburg, with an annexed lordship, a fief of the kingdom of Bohemia; 22 miles E. N. E. of Amberg.

BLEKEDA, a small town of Germany, in the circle of Lower Saxony, and principality of Luneburg-Zell, leaved on the Elbe, to which belongs a toll on the river of considerable produce; 20 miles E. N. E. of Luneburg.

BLEMINGEN, called by the Swedes Belking, by the Danes Blegind, and by the inhabitants Blegen, a province of Sweden, bounded on the north by Smoldan, on the south and east by the Baltic, and on the west by Scania, Schonen, or Skoe, is about 180 English miles in length, and about 26 in breadth. It is a mountainous country, but various parts of it are more pleasant than any other provinces of the kingdom. It abounds with forests of oak, beech, pine, and birch trees, and carries on a considerable trade in pot-ash, tar, tallow, hides, leather, beans, deal-boards, and masts. The inhabitants also employ themselves in fithing and hunting. The shallow soil does not admit of much tillage, but the pastures afford the best cheese in Sweden; the cattle, however, are of a smaller size than those of Schonen. This country has several lakes and six principal rivers, which furnish good salmon. Its inlands belonging to this jurisdiction are numerous, and the whole province contains 29 parishes. The clergy are subject to the fee of Lund. As to its political division it consists of four barons, or districts, and its principal town is Carlisflon, which fee.

BLEMISH, in Morfe-dolging. By this term, among the venders of herbes, is understood any appearance by which the horse is disfigured, as broken knees, a blind eye, fears of various kinds, &c. The term blemish, by some, may be extended even to any unhappily natural markings of the horse. These blemishes, however, for the most part, are considered as in no wise of themselves constituting an unsouls.

BLEMISH, a term in Hunting, used when the hounds, or beagles, finding where the chase has been, make a prelfer to enter, but return.

BLEMYES, or BLEMYES, among the Ancient Geographers, a fabulous sort of people, suppos'd without heads; having eyes and mouths on their breasts; said to have inhabited part of Ethiopia, on the borders of Egypt.

Some authors imagine that this fable had its origin in a custom which prevailed among this people of depriving their heads between their shoulders, which they forced upwards, so that their necks were very short, and their heads were concealed partly by their shoulders, and partly by their long and thick hair. To this purpose it is alleged, that the Egyptian, or bearded Bacchus, has the head hunk in his beard. We learn from Vopiscus, that some Blemmyan captives, taken prisoners by Probus, in an expedition against them, about the year of Christ 278, made a very odd appearance at Rome. But at this time they could not be quite unknown at Rome, as some of them had appeared there before, on occasion of Aurelian's triumph. In the time of Diocesian, the number of the Blemmyes, scattered between the island of Meroe and the Red Sea, was very inconsiderable, their disposition was unrivalled, and their weapons rude and offensive; yet, in the public disforders, these barbarians, whom antiquity, shocked with the deformity of their figure, had almost excluded from the human species, preferred to rank themselves among the enemies of Rome. With a view of opposing to the Blemmyes a suitable adversary, Diocesian, in his attack on the rebellious Egyptians, A.D. 296, perused the Nubate, or people of Nubia, to remove from their ancient habitations in the deserts of Libya, and assigned to them an extensive but unprofitable territory above Syene, and the catarracts of the Nile, with the population, that they should ever respect and guard the frontier of the empire. We find, however, that at a subsequent period they sent ambassdors to the court of Constantin. The Blemmyes were subdued by Florus, the lieutenant of Marcian, A.D. 450.

Bochart derives the word Blemmyes from 阝 نفسها, which implies a negation, and 阝 자체, in which sense, the Blemmyes should have been people without brains. See Strabo, l. xvii. p. 1. 172. Pomponius Mola, l. i. c. 4. His words, in describing these savages of Ethiopia, are curious: "Intra, fi credere libet, vix homines magique semiferi; 陞gipiae, et Blemmyes, et Satyri."

BLEMNAU, in Geography, a town of France, in the department of the Yonne, and chief place of a canton in the district of Oigny, containing 1065 persons; the number of people in the canton amounts to 5676; the territory comprises 292 kilometres and 9 communes; 2 leagues N.W. of St. Fargeno.

BLEMCH, in Lex., a fort of tenure of land; as to hold land in blench is by payment of a figer-loaf, a couple of capons, a beamer-hat, &c. if the lame be demanded in the name of blench, i. e. nomine albo frime. See ALBA FRIMA.

BLEMDE, in Mineralogy, called also Black-jack, or pseudo-galena, the native sulphuret of zinc. See Zinc, ores of.

BLEND-METAL-IRON, a coarse sort of iron from the Staffordshire mines, used for making nails and heavy war; in some places also for horse-shoes.

BLEND-COUNTER, a different incident to black-cattle, which comes several ways. 1. From blood. 2. From the yellos, which is a ringedler of all diseases. And 3. From the change of ground; for being hard, it is apt to breed this evil, which if not remedied in six days, will be past help.

BLEMHEIM, in Geography, a village of Germany, in the circle of Bavaria, and principality of Newburg, 2 miles N. E. of Hockfleidt, famous for a victory obtained there by the English and their allies over the French and Bavarians, Aug. 13th 1704. For an account of the battle, see Hockfleidt.

BLEMHEIM, a new town of America, in the state of New York, in Schoharie county, incorporated in 1797.

BLEMNA, or BLENA ( англиа) in Medicine, a term used by Hippocrates, and subsequent medical writers, to denote a phlegm or mucus excreted from the nostril. This sort of excretion occurs not unfrequently in acute diseases, and is generally a favourable symptom.

BLEMNIUS, in Ichthyology, a Linnaean genus of juglar fishes.
Steph. Byz. to have derived its name from one of the companions of Cadmus.

BIEG, in Ichthyology, a name given by the Germans to the fish we call the bleak. See bleak, and alburnus.

BLIESCASTEL, in Geography, a town of France, in the department of Sarthe, and chief place of a canton, in the district of Sarrebourg; containing 1278 inhabitants; the population of the canton includes 16,084 persons; and the territory has 30 communes.

BLIESNA SALIN, a harbour on the coast of Lapland, between the river Kola and Kildytun island.

BLIGH'S Cap, a name given by captain Cook, on account of its shape, to an island in the southern Pacific ocean, near Kerguelen's land, before called by Kerguelen “the island of Rendezvous.” It is a high round rock accessible only to birds. S. lat. 48° 29'. E. long. 68° 40'.

BLIGHT, in Agriculture, a general name for various distempers incident to corn and fruit-trees.

It affects them variously, the whole plant sometimes perishing by it, and sometimes only the leaves and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing. Some have supposed, that blights are produced by calmer winds, which, bring vast quantities of insects' eggs along with them from distant places. These being lodged upon the surface of the leaves and flowers of fruit-trees, cause them to shrivel up and perish.

Mr. Knight, however, obverses, that blights are produced by a variety of causes; by insects, by an excess of heat or cold, of drought or moisiture; for these necessarily derange and destroy the delicate organization of the blossoms; but he believes the common opinion, that they arise from some latent noxious quality in the air, or from lightening, to be totally unfounded. The term blight is very frequently used by the gardener and farmer, he remarks, without any definite idea being annexed to it. If the leaves of their trees be eaten by the caterpillar, or contracted by the aphids; if the blossoms fall from the ravages of insects, or without any apparent cause, the trees are equally blighted, and if an eastern wind happen to have blown, the insects, or at least their eggs, whatever be their cause, are supposed to have been brought by it. See ARMS.

The true cause of blights seems to be, continued dry easterly winds for several days together, without the intervention of flowers, or any morning dew, by which the perspiration in the tender blossoms is checked; and if it happen that there is a long continuance of the same weather, it equally affects the tender leaves, whereby their colour is changed, and they wither and decay.

The best remedy, perhaps, is gently to wash and sprinkle over the tree, &c. from time to time, with common water; and if the young shoots seem to be much infected, let them be washed with a woollen cloth, so as to clear them, if possible, from this glutinous matter, that their respiration and perspiration may not be obstrucled. This operation ought to be performed early in the day, that the moisiture may be exhaled before the cold of the night comes on; nor should it be done when the sun shines very hot. Mr. Forsyth recommends their being washed well with urine and soap-fuds, as soon as possible after the diseaee appears.

Another cause of blights in the spring, is laid to be sharp, hoary frosts, which are often succeeded by hot sun-shine in the day-time. This is the most sudden and certain destroyer of fruit that is known. The chief remedy to be depended upon in this case is, that of protecting the fruit-trees during the night-time with nets. This mode, where regularly and correctly performed, has been found highly beneficial.

But, in order to cure this disease, some have advised the burning of wet litter on the windward side of the plants, in order that the smoke of it may be carried to them by the wind, which they suppose will kill and destroy the insects, and thereby cure the mischief. Others direct the use of tobacco-dust, or the washing of the trees with water in which tobacco-flakes have been infused for twelve hours, which they lay will destroy those insects, and recover the plants. Pepper-dust, scattered over the blossoms of fruit-trees, &c. has been recommended as very useful in this case; and there are some who advise the pulling off the leaves that are affected.

What is termed the blight is frequently, however, no more than a debility, or distemper in trees. Mr. Forsyth observes, that "this is the case when trees, against the face wall, and enjoying the same advantages in every respect, differ greatly in their health and vigour, the weak ones appearing to be continually blighted, while the others remain in a flourishing condition. This very great difference, in such circumstances, can be attributed only to the different constitutions of the trees, proceeding from want of proper nourishment, or from some bad qualities in the soil; some distemper in the flock, buds, or scions; or from some mismanagement in the pruning, &c. all of which are productive of distempers in trees, of which they are, with difficulty, cured. If the fault be in the soil, it must, he says, be dug out, and fresh mould put in its place; or, the trees must be taken up, and others, better adapted to the soil, planted in their room. It will be found absolutely necessary always to endeavour to suit the particular sorts of fruit to the nature of the soil; for it is in vain to expect all sorts of fruit to be good in the same soil. If the weaknefs of the tree proceed from an in-bred distemper, it will be advisable to remove it at once, and after renewing the earth, to plant another in its place." But if the weaknefs is brought on by ill management in the pruning, which is frequently the case, he would advise more attention to the method of pruning and training.

Besides this, "there is another sort of blight that sometimes happens pretty late in the spring, as in April or May, which is very destructive to fruit-trees in orchards, and open plantations, and against which we know of no effective remedy. This is what is called a fire-blast, which, in a few hours, hath not only destroyed the fruit and leaves, but often parts of trees; and sometimes entire trees have been killed by it." This, Mr. Forsyth observes, "is generally thought to be occasioned by certain transparent flying vapours, which may sometimes take such form, as to converge the sun's rays in the manner of a burning-glaf, so as to scorch the plants they fall upon; and this, in a greater or lefs degree, in proportion to their convergency. As this generally happens in close plantations, where the vapours from the earth, and the perpiration from the trees, are pent in for want of a free circulation of air to diffuse them, it points out to us the only way, yet known, of guarding against this enemy to fruits; namely, to make choice of a clear healthy situation for kitchen-gardens, orchards, &c. and to plant the trees at such a distance, as to give free admiflion to the air, that it may dispel those vapours before they are formed into such volumes as to occasion their blasts." But blasts may also be occasioned by the reflection of the sun's rays from hollow clouds, which sometimes act as burning mirrors, and occasion excessive heat. Against this there is no remedy yet discovered.

Mr. Marshall, in the Rural Economy of midland counties, observes, that it is well known that this disease is most injurious
Jurious to grain crops in wet seasons; hence, principally, the scarcity and advanced price of wheat after such seasons. It is also remarked to affect the north side of fields, much more than the south, and that the effect is governed by the state of ripeness; consequently, a few days of forwardness may be sufficient to prevent the effect. It is evident, that the forward wheats are least liable to be blighted; for, having paved some certain stage of maturation, they become invulnerable to the attack of this mischievous enemy; at least, no obvious injury is incurred. It is also observable, that no perceptible blight takes place while a dry season continues. The only guard a farmer has against the attack of this secret enemy appears to be that of sowing early.

Blight of corn is called Smut.

BLIGNY-SUR OUCHES, in Geography, a town of France, in the department of the Côte d’Or, and chief place of a canton, in the district of Beaune, 3 leagues N.W. of Beaune, containing 166 inhabitants; the canton contains 6558; and comprehends 265 Kilometres, and 23 communes.

BLIKOOSKOI, a small island in the Frozen sea. N. lat. 17° 30' E. long. 125° 14'.

BLIND. See Blindness.

BLIND, Pork, or Pur, denotes only a great degree of short-sightedness. Phil. Trans., N. 37, p. 713.

BLIND, is also used for occult, or imperceptible. Hence blind rampart, caca volum, among the ancients, was that befit with sharp stakes, concealed by graves or leaves growing over them. Blind testimonies, caca testimonis, those given by absent persons in writing.

BLIND is also used in speaking of bodies without aperture.

Hence.

BLIND wall, caca paries, that without windows. In a like sense we meet with blind chamber, caca cubilcum.

BLIND is also used in speaking of vessels which are not perforated. In this sense the chemists say a blind alembic. A tube is said to be blind, when it is closed a-top. Some anatomists call the third cavity of the ear caca, as having no issue; but it is more usually denominated labyrinth, which see.

BLIND harbour, or Murderer’s bay of Tasman, in Geography, a deep bay at the N.W. part of the southern island of New Zealand, having two small islands near the bottom of it on the west side; 6 leagues to the east of Cape Farewell. In the Military Art, signifies generally every material which serves to cover and protect the besiegers from the fire of the enemy; as wool-packs, sand-bags, earth-baskets, &c. Blinds sometimes consist only of canvas stretched, so as to intercept the view of the garrison from the walls. Sometimes they are planks erected, and in this case are more properly called mantlets. They are also occasionally constructed with a number of baskets or barrels.

More particularly taken, blinds denote wooden frames of four pieces, either round or flat. Two of them are six feet long, and pointed at the extremities; the others, about three or four feet in length, serve as spars, to facade the two former together. These blinds are fixed upright in the ground against the sides of the faps, to hinder the earth from falling in, and to facade fapen upon the upper part. They are likewise of use in covering the faps, and supporting a roof of facade to secure the troops from lones and granades.

Blinds, of another sort are commonly made of oziers, or branches interwoven and laid across between two rows of

fakes, about the height of a man, and four or five feet

Blinds are of essential service at the heads of trenches, or

faps, when they are extended in front towards the glacies;

and when, from the superior elevation of the enemy’s works,

he may overlook, and pour his fire in upon the besiegers.

They are also indispensable, in case the nature of the ground

should oblige the approaches to be carried on in a straight

direction, and the workmen and the guard to be necessarily

exposed to the batteries of the garrison. But in this case,

the faps can only be carried on in the night, as the lots

of men would otherwise prove extremely furious.

BLIND is also sometimes used for Orillon.

BLIND graudo, that which does not light or take fire.

BLIND faith. See Faith.

BLIND gut. See Cecum.

BLIND worm. See Slow-worm.

BLINDING, a species of corporal punishment anciently

instituted on thieves, adulterers, perjurers, and others; and

from which the ancient Christians were not exempt.

Sometimes in vinegar, or barely fleaching vinegar, was poured

to the eyes, till their fballs were confumed; sometimes a

rope was twisted round the head till the eyes flarted out.

Soln. Polyb. c. 4. Lamprid. in Alex. Sec. c. 17. Val.

Max. lib. vi. c. 5. Lastant. de Mort. Perf. c. 10.

In the middle ages, they changed total blindness for a great
darkness, or dimutation of light, which they produced by

holding a red hot iron dib or bafon before the eyes, till their

humours were dried, and their coats harvelled up.

The inhabitants of the city Apollonia executed it on their

watch whom they found asleep. Democritus, according to

Plutarch, Cicero, and A. Cellius, put out his own eyes,

that he might be less disturbed in his mental contemplations,

when thus freed from the disfuction of the objects of light.

c. 71. Cicero Tus. Qu. 5.

BLINDING, olimatio, in the Black Art, denotes a species of

necromancy, whereby a visible body may be concealed, or

hidden by an invisible power. See NECROMANCY.

BLINDING of a captive, signifies erecting a battery against

it, in order to dismount its cannon and render them useless.

BLINDNESS, in Surgery, the privation or want of

sight. This defect may arise from a variety of causes, ex-

citing either in the organ of sight, or in the circumstances

necessary to produce vision. See OPTICS and Eye. Blind-

ness will be complete, when the light is wholly excluded; or

partial, when it is admitted into the eye to imperfectly as to

courte only a confused perception of visible objects. Blind-

ness may again be differentiated into periodical or permanent,

transient or perpetual, natural or accidental, &c.; but these

difficulties do put force to communicate any idea of the

causes of blindness, which are to be slightly mentioned in the

proceed article. For a more particular account of the

causes and remedies of blindness, the reader will consult

the articles which give an account of the doctrine of vision, and

the diseases of the eye.

The ordinary causes of blindness are as follow:

1. In the eyelids and mucus. By a contraction of the eye-
lids; by an elongation of the upper eye-lid; by a paralytic
state, which disables the patient from raising it sufficiently;
by an irregular or defective action in the mucus which are
attached to the eye-ball.

2. In the membranes of the eye. By their opacity, so as to

exclude the rays of light; by their exquisite tenderness, so

as to render vision intolerable; by their blood-veins affuming
a morbid action, and exuding a fluid (luppose pus, for
example) into any of the cavities of the eye.

3. In.
BLINDNESS.

3. In the lumines of the eye. By their defective quantity; by the turbid state, or imperfectly transparent condition, of the humours; by the lops of any one of them, through accident or violence; by an altered figure of the crystalline lenses.

4. In the brain or optic nerve. By compression, producing palsy or GUTTA SERENA (which see); by a state of debility or inertiae in the visual organ, so as to require an uncommonly strong light; by too great sensibility in the optic nerve, enduring but a very feeble impression from the light, and transmitting only a confused perception of visible objects to the mind; by some unknown change in the nervous power, causing depraved vision, and exciting imaginary fencies, which no person can observe besides the patient himself.

It has been generally supposed, that blind persons have not any idea of visible objects, though they can distinguish them by the touch: thus the gentleman mocked by Mr. Cheffelden, though he knew the colours alread in a good light during his blind state; yet when he saw them after recovering, the faint ideas he had of them before, were not sufficient for him to know them by afterwards. Phil. Tran. N. 403. p. 447.

It was even a considerable time before he could remember which was the cat and which the dog, though often informed, without feeling them. Add, that he had no idea of distance; but thought all the objects he saw touched his eyes, as what he felt did his skin.

But a case is recorded by Mr. Ware in the Philosophical Transactions (read to the society June 11th, 1809), which does not accord with Mr. Cheffelden's observation on this subject. It was the case of a young gentleman, who (by a surgical operation) recovered his sight when seven years of age; after having been deprived of it by cataracta, before he was a year old. Mr. Ware gives the following account of the facts in question: "I performed the operation on the left eye, on the 29th of December last, in the presence of Mr. Chamberlayne, F. A. S. Dr. Bradley, of Baliol college, Oxford, and Mr. Platt, surgeon, in London. It is not necessary, in this place, to enter into a description of the operation. It will be sufficient to say, that the child, during its performance, neither uttered an exclamation, nor made the smallest motion, either with his head or hands. The eye was immediately bound up, and no inquiries made on that day with regard to his sight. On the 30th, I found that he had experienced a slight tickling on the preceding evening, but had made no complaint of pain, either in his head or eye. On the 31st, as soon as I entered his chamber, the mother, with much joy, informed me that her child could see.—About an hour before my visit, he was staring near the fire, with a handkerchief tied loosely over his eyes, when he told her that under the handkerchief, which had slipped upward, he could distinguish the tables by the side of which he was sitting; it was about a yard and a half from him; and he observed that it was covered with a green cloth (which was really the cafe), and that it was a little farther off than he was able to reach. No further questions were asked him at that time; as his mother was much alarmed, left the use thus made of his eye might have been premature and injurious. Upon examination, I found that it was not more diminished than the other eye; and the opacity in the pupil did not appear to be much diminished. Delirious, however, to think whether he was able to distinguish objects, I held a little before him, at the distance of about twelve inches, and I told him, after a short hesitation, that it was a piece of paper; that it was square, which he knew by its corners; and that it was longer in one direction than it was in the other. On being desired to point to the corner, he did it with great precision, and readily carried his finger in the line of its longest diameter. I then showed him a small oblong band-box covered with red leather, which he said was red and square, and pointed at once to its four corners. After this, I placed before him an oval silver box, which he said had a shining appearance; and, presentiy afterwards, that it was round, because it had not corners. The observation, however, which appeared to me most remarkable, was that which related to a white stone mug; which he first called a white bason, but, soon after, recollecting himself, said it was a mug, because it had a handle. These experiments did not give him any pain; and they were made in the presence of his mother, and of Mr. Woodford, a clerk in his majesty's treasury. I held the objects at different distances from his eye, and inquired very particularly if he was sensible of any difference in their situation; which he always said he was, informing me, on every change, whether they were brought nearer to, or carried farther from him. I again inquired, both of his mother and himself, whether he had ever, before this time, distinguished by light any fort of object; and I was assured by both that he never had on any occasion; and that when he wished to discover colours, which he could only do when they were very strong, he had always been obliged to hold the coloured object close to his eye, and a little on one side, to avoid the projection of the nose. No further experiments were made on that day. On the 1st of January, I found that his eye continued quite free both from pain and inflammation, and that he felt no uneasiness on the approach of light. I showed him a table knife; which at first he called a spoon, but soon rectified the mistake, giving it the right name, and distinguishing the blade from the handle, by pointing to each as he was defined. He afterwards called a yellow pocket-book by its name, taking notice of the silver lock in the cover. I held my hand before him; which he knew, but could not at first tell the number of my fingers, nor distinguish one of them from another. I then held up his own hand, and defined him to remark the difference between his thumb and fingers; after which he readily pointed out the distinctions in mine also. Dark-coloured and smooth objects, were more agreeable to him than those which were bright and rough. On the 3d of January, he saw, from the drawing room window, a dancing-bear in the street; and distinguished a number of boys that were standing round him, noticing particularly a bundle of cloths which one of them had on his head. On the same evening, I placed him before a looking-glass, and held up his hand after a little time he smiled and said he saw the shadow of his hand, as well as that of his head. He could not then distinguish his features; but, on the following day, his mother having again placed him before the glass, he pointed to his eyes, nose, and mouth, and seemed much gratified with the sight.

Having thus stated the principal observations that were made by Mr. W. I shall now make a short comparison between this statement, and that which is given in the XXXVth volume of the Philosophical Transactions, of Mr. Cheffelden's patient, who was supposed to be born blind, and obtained his sight when he was between thirteen and fourteen years old.

It should be observed, that though Mr. W. was five years younger than Mr. Cheffelden's patient, he was remarkably intelligent, and gave the most direct and satisfactory answers to every question that was put to him. Both of them, also, if not born blind, lost their sight very early, that, as Mr. Cheffelden expresses it, "they had not any recollection of having ever seen."
BLINDNESS.

My first remark is, that, contrary to the experience of Mr. Chefdelen's patient, who is said "to have been so far from making any judgment of distance, that he thought all objects touched his eyes, as what he felt did his skin," Mr. W. distinguished, as soon as he was able to form a table, a yard and a half from him; and proved that he had some accuracy in his idea of distance, by saying, that it was a little further off than his hand could reach. This observation, contrary to the account we have received of Mr. Chefdelen's patient, would have surprised me much more than it did, if I had not previously, in some similar instances, had reason to suspect that children, from whom cataracts had been extracted, had a notion of distance the first moment they were enabled to see. In the instance particularly of a young gentleman from Ireland, fourteen years old, from each of whose eyes he extracted a cataract, in the year 1794, in the presence of Dr. Hamilton, physician to the London hospital, and who, before the operation, assured me, as did his friends, that he never had seen the figure of any object, Dr. Hamilton and myself were much astonished by the facility with which, on the first experiment, he took hold of my hand at different distances, mentioning whether it was brought nearer to, or carried further from him, and conveying his hand to mine in a circular direction, that we might be the better satisfied of the accuracy with which he did it. In this case, however, and in others of a like nature, although the patients had certainly been blind from early infancy, I could not satisfy myself that they had not, before this period, enjoyed a sufficient degree of sight to impress the image of visible objects on their minds, and to give them ideas which could not afterwards be entirely obliterated. In the instance of Mr. W. however, no hallucination of this kind could occur; since, in addition to the declaration of himself and his mother, it was proved by the testimony of the surgeon who examined his eyes in the country, that the cataracts were fully formed before he was a year old. And I beg leave to add further, that on making inquiries of two children, between seven and eight years of age, now under my care, both of whom have been blind from birth, and on whom no operation has yet been performed, I find that the knowledge they have of colours, limited as it is, is sufficient to enable them to tell whether coloured objects he brought nearer to, or carried further from them; for instance, whether they are at the distance of two inches or four inches from their eyes; nor have either of them the slightest suspicion, as is related of Mr. Chefdelen's patient, that coloured objects, when held before them, touch their eyes.

But the judgment which Mr. W. formed of the different distances of objects, was not the only inference in which he differed from Mr. Chefdelen's patient, who, we are informed, "did not know the figure of any thing, nor any one thing from another, however different in shape and magnitude?" for Mr. W. knew and described a letter, not only as white, but also as square, because it had corners; and an oval silver box, not only as shining, but also as round, because it had not corners: he likewise knew, and called by its name, a white rose rug, on the first day he obtained his sight; differing it from a hawn, because it had a handle. These experiments were made in the presence of two respectable persons, as well as myself; and they were several times repeated, to convince us that we could not be mistaken in them. I mention the circumstance, however, with much diffidence, being aware that the observations not only differ from those that are related of Mr. Chefdelen's patient, but appear on the first examination, to subvert a principle in optics, which I believe is commonly and justly admitted, that the senses of sight and feeling have no other connection than that which is formed by experience; and, therefore, that the ideas derived from feeling can have no power to direct the judgment, with respect either to the distance or form of visible objects. It should be recollected, however, that persons who have cataracts in their eyes, are not, in instances of speech, blind, though they are deprived of all useful light. The inferences I have adduced prove, that the knowledge they have of colours is sufficient to give them some idea of distance, even in their darkest state. When, therefore, their sight is cleared by the removal of the opaque crystalline, which intercepts the light, and the colour of objects is thereby made to appear stronger, will it be difficult, or unphilosophical, to conceive that their ideas of distance will be strengthened, and so far extended as to give them a knowledge, even of the outline and figure of those objects with the colour of which they were previously acquainted?" The miseries of blindfolds are feelingly described both by Homer and Milton, in the following impassible passages. The venerable father of epic poetry, who is said, in the person of Democritus the Phocian bard, to have described his own situation, proceeds thus:

"To the god Meth'ippus, who had a great deal of 
Of amber, or red cornelian, I
Of my words and actions, bring the mind to 
"Odyss. 1. o. v. 64.

Dear to the muse, who gave his days to flow
With mighty blessings ming'd with mighty woes,
In clouds and darkness scene'd his visual ray,
Yet gave him power to raise the lofty lay.
"Pope.

In similar strains does Milton bewail his calamity, in his address to light:

"Taught by the heav'nly muse to venture down
The dark defcent, and up to re-ascent,
Though hard and rare; thee I revisit safe,
And feel thy for'v'n'sal vital lamp; but thou
Rev'rit not thefe eyes, that roll in vain
To find thy pierc'ing ray, and find no dawn;
So thick a drop fered hench quench'd their orbs,
Or dim fuffiation fell, Yet not the more
Cafe I to wander, where the muses haunt.
Clear spring, or shady grove, or funny hill,
Smit with the love of sacred song: but chief
Thee, Sion, and the flow'ry brooks beneath,
That was thy hallow'd feet, and warbling flaw.
Nightly I vift; nor fometimes forget
Those other two, equal'd with me in fate,
So were I equal'd with them in renown,
Blind Thamyris and blind Mannides,
And Tiresias and Phineus prophets old:
Then feed on thoughts, that voluntary move
Harmonious numbers: as the wakeful bird
Sings darkling, and in fadefull covert hid
Tunes her nocturnal note. Thus with the year
Seasons return; but not to me returns
Day, or the sweet approach of ev'n or morn,
Or light of vernal bloom, or summer's rofe,
Or flocks, or herds, or human face divine:
But cloud instead, and ever during dark,
Surrounds me, from the cheerful ways of men
Cut off, and for the book of knowledge fair
Presented with an universal blank
Of nature's works to me expung'd and raf'd,
And wildom at one entrance quite shut out."

Paradise Lost. b. iii.

Thus also does he deplore, in the most affecting accents, the misfortune of blindfolds in his "Sampson Agonistes:"

"But chief of all,
'O lofs of sight, of thee I must complain!"

4 11

Blind
BLINDNESS.

Blind among enemies, O worse than chains,
Dread, or beggary, decrepit age.
Light, the prime work of God, to me is extinct,
And all her various objects of delight
Annul'd, which might in part my grief have eas'd,
 Inferior to the vileness now become
Of man or worm. The vileness here excels me:
They creep, yet fee; I dark in light expos'd
To daily fraud, contempt, abuse, and wrong,
Within doors, or without, still as a fool,
In power of others, never in my own;
Scarce half I seem to live, dead more than half.
O dark, dark, dark, amid the blaze of noon,
Irresoverably dark, total eclipse
Without all hope of day!
O first created beam, and thou great word,
Let there be light, and light was over all;
Why am I thus bereaved thy prime decree?
The fun to me is dark,
And silent, as the moon
When he abounds the night,
Hid in her vacant interstinct cave.
Since light to me is necessary to life,
And almost life itself, if it be true
That light is in the soul,
She all in every part; why was the light
To such a tender hand as the eye confin'd?
So obvious, and so easy to be quench'd?
And not, as feeling, throughout all parts diffus'd,
That the might look at will through ev'ry pore?
Then had I not been thus exil'd from light,
As is the land of darknes, yet in light
To live a life half dead, a living death:
And buried; but yet more miserable!
Myself the sepulchre, a moving grave;
Bury'd, yet not exempt
By privilege of death and burial
From worl of other evils, pain, and wrongs,
But made thereby obnoxious more
To all the miseries of life."

The degree in which the calamity of blindness is felt and lamented by those to whom it occurs, may be also partly guessed at by the extasiy into which pertons have fallen on their recovery from it.

Mr. Boyle mentions a gentleman, who, having been blind, and brought to fight at eighteen, was very near going dislimitated with the joy. See a remarkable case of this kind, Toler, N. 55. vol. i. Boyle's Works abr. tom. i. p. 4.

We find various recompenences for blindness, or subtitutes for the use of the ey€, in the wonderful fagacity of many blind persons recited by Zalheus in his "Oculus Artificialis," and others. In one, the defect is furnished by a most excellent gift of remembering what they had seen; in others, by a delicate nose, or the fenfe of smell; in others, by an exquisite touch, or a fenfe of feeling, which they have had in such perfection, that, as it has been said of some, they learned to hear with their eyes; as it may be said of thefe, that they taught themselves to fee with their hands.

Some have been enabled to perform all forts of curious and subtle works in the nicest and moft dexterous manner. Aldrovandus speaks of a sculptor who became blind at twenty years of age, and yet ten years after made a perfect marble statue of Cosimo II. de Medici; and another of clay like Urban Vili. Bartholin tells us of a blind sculptor in Denmark, who distinguished perfectly well, by mere touch, not only all kinds of wood, but all the colours; and F. Grimaldi gives an instance of the like kind; besides the blind organist living in Paris, who is said to have done the fame.

An instance no less extraordinary is mentioned by Dr. Bew in the "Tranflactions of the Manchefter Society." It is that of a perfon, whose name is John Metalf, a native of the neighbourhood of Manchefter, who became blind at early an age as to be altogether unconceivable of light and its various effects. His employment in the younger period of his life was that of a waggoner, and occasionally as a guide in intricate roads during the night, or when the common tracks were covered with snow. Afterwards he became a projector and surveyor of high-ways in difficult and mountainous parts; and in this capacity, with the affiftance of a long flaff, he traversed the roads, ascends precipices, explores valleys, and investigates their several extents, forms, and situations, so as to answer his purpose in the best manner. His plans are defigned, and his estimates formed, with fuch ability and accuracy, that he has been employed in altering moft of the roads over the Peak in Derbyshire, particularly thofe in the vicinity of Buxton, and in constructing a new one between Wilnelflow and Congleton, fo as to form a communication between the great London road, without being obliged to pass over the mountain.

Although blind pertons have occasion, in a variety of respects, to deplore their infelicity, their miserie is in a considerable degree alleviated by advantages peculiar to themselves. They are capable of a more fixed and steady attention to the objects of their mental contemplation, than thofe who are diltracted by the view of a variety of external scenes. Their want of sight naturally leads them to avail themselves of their other organs of corporeal fenfation, and with this view to cultivate and improve them as much as possible. Accordingly they derive relief and affiftance from the quickness of their hearing, the acutenes of their smell, and the fentibily of their touch, which pertons who fee are apt to difregard; and many infancies have occurred, that feem to verify the opinion of Rochefler:—

"That if one feneh should be suppress'd,
It but refines into the reft." To this purpofe we may obferve, that Democritus is faid to have put out his eyes, that he might think more intensely.

Many contrivances have also been devised by the ingenious for supplying the want of fight, and for facilitating those analytical or mechanical operations, which would otherwise perplex the most vigorous mind and the moft re-ative memory. By means of these they have become eminent proficient in various departments of fience. Indeed, there are few sciences in which, with or without mechanical helps, the blind have not distinguished themselves. The cafe of professor Saunderfon at Cambridge is well known. His attainments and performances in the languages, and also as a learner and teacher in the abftract mathematics, in philofophy, and in music, have been truly astonishing; and the account of them appears to be almofl incredible, if it were not almoft attested and confirmed by many other infancies of a fimilar kind, both in ancient and modern times. Cicero mentions it as a fact fearcely credible, with refpect to his master in philofophy, Diotois, that he exercifed himfelf in
BLINDNESS.

In it with greater affulidity after he became blind; and, which he thought next to impossible to be performed without light, that he professed geometry, and described his diagrams so accurately to his scholars, as to enable them to draw every line in its proper situation. Jeron relates a more remarkable instance of Didymus in Alexandria, who, "though blind from his infancy, and therefore ignorant of the letters, appeared to gain a miracle to the world, as not only to learn logic, but geometry also to perfection, which seems (he adds) the most of any thing to require the help of light." Professor Saunders, who was deprived of his sight by the small pox, when he was only twelve months old, seems to have acquired most of his ideas by the sense of feeling; and though he could not distinguish colours by that sense, which, after repeated trials, he said was pretending to impossibilities, yet he was able with the greatest exactness to discriminate the minutest difference of rough and smooth in a surface, or the least defect of polish. In a set of Roman medals he could distinguish the genuine from the false, though they had been counterfeited in such a manner, as to deceive a connoisseur, who judged of them by the eye. His sense of feeling was so acute, that he could perceive the least variation in the state of the air; and it is said, that in a garden where observations were made on the sun, he took notice of every cloud that interrupted the observation, almost as justly as those who could see it. He could tell when anything was held near his face, or when he passed by a tree at no great distance, provided the air was calm, and there was little or no wind: this he did by the different pulse of air upon his face. He possessed a fenangity of hearing to such a degree, that he could distinguish even the fifth part of a note; and by the quickness of this sense he not only discriminated persons with whom he had once conversed so long as to fix in his memory the sound of their voice, but he could judge of the size of a room into which he was introduced, and of his distance from the wall: and if he had ever walked over a pavement in courts, piazzas, &c. which reflected a sound, and was afterwards conducted thither again, he could exactly tell in what part of the walk he was placed, merely by the note which it founded. See Saunderson.

Sculpture and painting are arts which, one would imagine, are of very difficult and almost impracticable attainment to blind persons; and yet instances occur, which shew that they are not excluded from the pleasing creative and extensive regions of fancy. We have known cases in which the form and features of the face have been delineated wholly by the touch, and in which it has been moulded with the utmost exactness. De Piles (Cours de Peint. p. 329.) mentions a blind sculptor, who thus took the likenesses of the duke de Bracciano in a dark cellar, and made a marble statue of king Charles I., with great justness and elegance. However unaccountable it may appear to the abstract philosophers, yet nothing is more certain in fact, than that a blind man may, by the inspiration of the muse, or rather by the efforts of a cultivated genius, exhibit in poetry the most natural images and animated descriptions even of visible objects, without deviously incurring the charge of plagiarism. We need not recur to Homer and Milton for attentions to this fact; they had probably been long acquainted with the visible world before they had loft their sight; and their descriptions might be animated with all the rapture and enthusiasm which originally fired their bosoms, when the grand and delightful objects delineated by them were immediately beheld. We are furnished with instances in which a similar energy and transport of description, at least in a very considerable degree, have been exhibited by those on whose minds visible objects were never impressed, but have been entirely obliterated. Dr. Blacklock affords a fascinating instance of this kind; who, though he had loft his sight before he was six months old, not only made himself master of various languages, Greek, Latin, Italian, and French, but acquired the reputation of an excellent poet, whose performances abound with appropriate images and animated descriptions. See Blacklock.

Another instance, which deserves being recorded, is that of Dr. Henry Moyes in our own country, who, though blind from his infancy, by the ardour and affability of his application, and by the energy of native genius, not only made incredible advances in mechanical operations, in music, and in the languages, but acquired an extensive acquaintance with geometry, optics, algebra, astronomy, chemistry, and all other branches of natural philosophy. From the account of Dr. Moyes, who occasionally read lectures on philosophical chemistry at Manchester, delivered to the Manchester society by Dr. Bev, it appears, that mechanical exercises were the favorite employment of his infant years; and that at a very early age he was so well acquainted with the use of edge-tools, as to be able to construct little windmills, and even a loom. By the found, and the different voices of the persons that were present, he was directed in his judgment of the dimensions of the room in which they were assembled; and in this respect he determined with such a degree of accuracy, as he thought to be sufficient. His memory was originally retentive; so that he was capable of recognizing a person on his first speaking, though he had not been in company with him for two years. He determined with surprizing exactness the stature of those with whom he conversed, by the direction of their voices; and he made tolerable conjectures concerning their dispositions, by the manner in which they conducted their conversation. His eyes, though he never recollected his having seen, were not totally insensible to intense light; but the rays refracted through a prism, when sufficiently vivid, produced distinguishable effects upon them. The red produced a disagreeable sensation, which he compared to the touch of a flaw. As the colours declined in violence, the hardening subsided, until the green afforded a sensation that was highly pleasing to him, and which he described as conveying an idea similar to that which he gained by running his hand over smooth polished surfaces. Such surfaces, musing and dreams, and gentle declivities, were the figures by which he expressed his ideas of beauty; rugged rocks, irregular points, and boisterous elements furnished him with expressions of terror and disgust. He excelled in the charms of conversation; was happy in his allusions to visual objects; and discoursed on the nature, composition, and beauty of colours, with pertinence and precision. This instance, and some others which have occurred, seem to furnish a presumption, that the feeling or touch of blind persons may be so improved, as to enable them to perceive that texture and disposition of coloured surfaces by which some rays of light are reflected and others absorbed, and in this manner to distinguish colours. But the fact is still undecided; and farther trials are necessary, in order to set aside high authorities to the contrary, and absolutely to decide it. Dr. Reid, in his "Inquiry into the Human Mind on the Principles of Common Sense" (ch. vi. § 2.), deduces evidence from acknowledged facts, as well as reasoning, in order to shew, that there is very little of the knowledge acquired by sight, that may not be communicated to a man born blind. One kind of light may be learned and knowing in every science, even in optics; and may make discoveries in every branch of philosophy. He may understand as much as another.
another man, not only of the order, distances, and motions of the heavenly bodies, but of the nature of light, and of the laws of the reflection and refraction of its rays. He may understand distinctly, how those laws produce the phenomena of the rainbow, the prisms, the camera obscura, and the magic lantern, and all the powers of the microscope and telescope. Nevertheless, as to the appearances of colour, a blind man must be more at a loss, because he has no perception that resembles it; though, by a kind of analogy, he may supply even this defect. To those who see, a fseekt colour signifies an unknown quality in bodies, that exhibits to the eye an appearance which they have often observed, and which they well know; but to a blind man, it denotes an unknown quality that exhibits an appearance, with which he is unacquainted. But he can conceive the eye to be variously affected by different colours, as the nose is by different smells, or the ear by different sounds; thus, he can conceive scarlet to differ from blue, as the sound of a trumpet does from that of a drum; or, as the smell of an orange differs from that of an apple. It is impossible to know whether scarlet colour has the same appearance to me which it has to another man; and if its appearances to different persons differed as much as colour does from sound, they might never be able to discover this difference. Hence it is plain, that a blind man might talk for a long time about colours distinctly and pertinently; and if you were to examine him in the dark about the nature, composition, and beauty of them, he might be able to answer, so as not to betray his defect. After all, as a blind man has never had any sensation of light and colour, his knowledge concerning them, however extensive and accurate, must be the result of previous instruction; it must depend on the force of genius, or on the strength of memory; and his language concerning coloured objects must be like that of a parrot, without any precision of meaning, and without any corresponding ideas. On this subject, the reader may derive information from Diderot's "Lettre sur les Aveugles a l'usage de ceux qui voyent," or "A Letter concerning the Blind for the use of those who see," in his "Works," vol. ii.; and they also may consult Chefielden's "Anatomy," and Locke's "Essay on the human understanding."

With regard to the scientific and practical departments of music, every age has supplied numerous instances of blind persons who have attained to great excellence. They will occur among the articles of musical biography in the course of this work.

Of the contrivances that have been devised for the afflance of the blind, we have already mentioned those of Professor Saunders, and of Mr. Grenville, under the article Pupile Arithmetic. We shall here subjoin, from a letter addressed by Dr. Moyes to the editor of the "Encyclopedia Britannica," an account of the papulable notation generally used by him for twenty years, for the purpose of assisting his memory in numerical computations. With this view he made use of a square piece of mahogany, a foot broad and an inch thick, represented by ABCD (Plate I. Alg bras, &c. 3); he divided each of the sides AB, BC, CD, DA, into 24 equal parts; joined each pair of opposite divisions by a groove cut in the board of sufficient depth to be felt with the finger; and perforated the board at intervals, with an instrument 1⁄4 of an inch in diameter. Having thus divided the surface of the board into 576 small squares, perforated at each of their angles, he fitted to the holes in the board three sets of pegs or pins, resembling those in the plates, figs. 4, 5, 6, in such a manner, that when fixed in them they kept their position, and required some force to turn them round. The head of each peg belonging to the first set is a right-angled triangle, about 1⁄4th of an inch thick; the head of each peg belonging to the second set differs from the former merely in having a small notch in its sloping side, or hypotenuse; and the head of each peg of the third set is a square, the breadth of which should be equal to the base of the triangle of the other two. These pegs should be kept in a case consisting of three boxes or cells, each cell being allotted to a set; and the case must be placed close by the board before the commencement of every operation. Each set should consist of 60 or 70 pegs, at least when employed in long calculations; and when the work is finished, they should be collected from the board, and carefully restored to their respective boxes. When a peg of the first set is fixed into the board, it will acquire four different values, according to its position with respect to the calculator. When its sloping side is turned towards the left, it denotes unit, or the first digit; when turned upwards, or from the calculator, it denotes 2, or the second digit; when turned to the right, it represents 3; and when turned downwards, or towards the calculator, it denotes 4. The number 5 is denoted by a peg of the second set, having its sloping side turned to the left; 6, by the same peg turned upwards; 7, by the same peg turned to the right; and 8, by the same peg turned directly down, or towards the body of the calculator. The figure 9 is expressed by a peg of the third set, when its edges are directed to right and left; and the same peg expresses the cipher 0, when its edges are directed up and down. By these different pegs the relative values of the ten digits may therefore be distinctly expressed with facility; and by a sufficient number of each set the freps and reful of the longest calculation may be clearly represented to the sense of feeling. For an example, let it be required to express the value of the number 5389. Take a peg of the first set, and fix it in the board, with its sloping side turned towards the left, which represents 1; take a peg of the second set, and fix it in the next hole in the same groove, proceeding as usual from left to right, with its sloping side turned to the right, and this expresses 7; take again a peg of the same set, and fix it in the next hole with its sloping side turned downwards, and this will represent 8; and lastly, take another peg of the same set, and place it in the next hole in the same position which will denote 9; and thus the whole will express the number required. In order to express a vulgar fraction, the numerator is placed in the groove immediately above, and the denominator in that immediately below the groove in which the integers stand; and in decimal arithmetic an empty hole in the integer groove represents the comma, or decimal point. By similar breaks are also denoted pounds, shillings, pence, &c.; and by the same expedient, the divisor and quotient in division are separated from the dividend. "This notation," says the ingenious inventor, "which supplies me completely with co-efficients and indices in algebra and fluxions, seems much superior to any of the kind hitherto made public in the world of Europe. That invented and described by Mr. Grenville, having no less than ten fets of pegs, is by much too complicated for general practice; and that which we owe to the celebrated Saundcrson is apt to puzzle and embarrases the calculator, as the pegs representing the numerical digits can seldom or never be in the same straight line."
BLINDNESS.

Systematic plan for this purpose was proposed by M. Haüy in an "Essay on the Education of the Blind," printed at Paris in the year 1786, under the patronage of the Academy of Sciences. An English translation of this Essay is annexed to "Dr. Blacklock's Poems," printed at Edinburgh in 1793. The object of this plan is to teach the blind reading, by the aid of books, in which the letters are rendered palpable by their elevation above the surface of the paper; and by the means to instruct them, not only in the liberal arts and sciences, but likewise in the principles of mechanical operations, such as spinning, knitting, book-binding, &c., so that those who are in easy circumstances may be capable of amusing employment, and those of the lower ranks of life, and such as have no genius for literary improvement, may nevertheless, become respectable, useful, and independent members of society, in the situation of common artisans. By these palpable characters, they are taught to read, to write, and to print; and they are likewise instructed, according to their several talents and stations, in geometry, algebra, geography, and every branch of natural philosophy. The institution encourages and cherishes a taste for the fine arts; it teaches the blind to read music with their fingers, as others do with their eyes; and it does this with so much facility, that though they cannot at once feel the notes and perform them upon an instrument, yet they are capable of acquiring any motion with as much exactness and rapidity, as those who enjoy all the advantages of sight. Of this curious and instructive Essay, now before us, we shall give such an account as may serve to gratify those of our readers, who are concerned in the support of plans, somewhat resembling that which it describes, in our own country. The author, after stating the object of his plan, and obviating the difficulties of those who oppose against allowing its general utility, in the two first chapters, proceeds, in the third chapter, to illustrate the method of reading, as adapted to the practice of the blind. This method consists, as we have already observed, in the use of typographical characters, whose elevation above the surface of the paper renders them obvious to the touch, without the intervention of light. From the reception of typographical characters, the transition is not difficult to that of written characters; i.e. of characters not written with ink, but formed by impressions made upon strong paper with an iron pen, whose point is not flat. The characters, thus produced, are distinctly separated and invented; and they are marked on the side of the paper contrary to that which is read; and in such a manner that the position and order of the letters may appear right and in relief when the page is turned. The blind may thus be able to form and decipher musical characters, mathematical diagrams, and all the necessary procecds of arithmetic and geography, as well as those that are printed and written. In the fourth chapter the author replies to several objections that are urged against the method of reading he has proposed. The fifth and sixth chapters contain an account of the art of printing, as it is practised by the blind, for their peculiar use, and also as it is performed for the use of those who see. In the process of printing, the blind compositor has a box for every alphabetical character in use; on the outside of these boxes are palpably marked the peculiar character belonging to each; these are filled with types, which he selects and sets as they are wanted, in a contrary position to that in which they are read. When the types have been arranged and fixed, a page of very strong paper is oiled, so as to be capable of receiving and retaining impressions, and laid upon the types; and then by the operation of the press, or by the easy strokes of a small hammer frequently repeated over the surface, the impression of the type is made to rise on the opposite side of the paper; and it continues, when dry, not only obvious to the sight but to the touch, and is not easily effaced. One the upper side of the paper the letters appear in their proper position; and by their lifted elevation above the common surface, the blind may easily read them with their fingers. The seventh chapter explains the method of teaching the blind to write; which we have already noticed. The eighth chapter shows how they are taught arithmetic; for this purpose they are provided with a board pierced with different lines of square holes, proper for receiving movable figures, and bars for separating the different parts of an operation. To render this board more useful, a case is added, composed of four rows of little boxes, which contain all the figures proper for calculation, and which are placed at the right hand of the blind person while he operates. In order to obtain characters for expressing all the possible fractions, to simple denominators are call, in the order of the figures 0, 1, 2, &c. to 9 inclusively, and likewise to simple numerators in the same order, movable, so as to be adapted at the head of the denominators. By means of this combination, the blind are able to express any fraction. The ninth chapter treats of geography, and in teaching it, M. Weissenbourg and M. Paradis marked the circumference of countries by a tenacious and vivid matter, and covered the different parts of their maps with a kind of sand mixed with glits, in various modes; and distinguished the order of towns by grains of glits, of a greater or less size. M. Haüy satisfies himself with marking the limits of the maps, for the use of the blind, by small iron wire wound; and it is always a difference, either in the form or size of every part of a map, which bids his pupils in distinguishing the one from the other. For the purpose of teaching music, the subject of the tenth chapter, musical characters are call; and these are in numerous, as to represent upon paper, by elevations on its surface, all the possible varieties that occur. The eleventh chapter contains an account of the mechanic arts, in which the blind are employed, and of the method in which they are formed for such occupations. Accordingly they have been successfully employed in spinning, in making paper, thread of the thread they have spun, in weaving garments with this paper, thread, in making nets, in fowling, in binding books, &c. In the twelfth chapter we have a view of the proper mode of instructing the blind, together with a parallel between their education and that of the deaf and dumb. This operation, it is said, is easy in itself, and requires in a manner more courage than knowledge. "By the aid," says M. Haüy, "of our books in relief, every one can teach them to read. Upon the musical works found in our press, every professor of that art may give them lessons. With an iron pen, with plates and moveable characters, executed according to our models, the first maker in writing may teach them that art, and arithmetic." The thirteenth chapter contains a brief account of the elementary books of languages, mathematics, and history, which should compose the library of the blind person. The essay terminates with an historical summary of the rise, progress, and actual state of the instruction for blind children. The success of this institution has fully answered the expectations of its founders, and amply compensated the expense bestowed upon it by the liberal and well disposed. We are happy to add, that institutions of a similar kind have been established in our own country; and to render our particular tribute of respect to the founders and supporters of the "Schule für den Indigenten Blinden," instituted in London in 1799. It is now situated in St. George's Fields, but will probably be removed to Gray's Inn Lane, as soon as the necessary buildings for its accommodation are erected. The object, with a view to which this school was founded, is unquestionably one of the most important and interesting kind that...
that can excite compassion, or demand encouragement. It
provides instruction for the indigent blind, in a trade, by
which they may be able to provide, either wholly or in part,
for their own subsistence; and thus, instead of being alto-
ether a burden to the community, they will be of some ser-
vice to it; and instead of being defribed and cheerless
themselves, under a sense of their total dependence, and for want
of regular employment, habits of industry will relieve their
spirits, and produce the most beneficial effects on their state
and character. The children of this institution, amounting
in the present year (1804) to 32, are completely clothed,
boarded, lodged, and instructed, gratis. The articles at
present manufactured in the school are shoemakers’ thread,
line and coarse thread, yellow felt-linie, and cloaths’-linie (of
a peculiar construction, and made on a machine adapted to
the use of blind persons), by the females; and window and
felt-linie, cloaths’-linie, hampers, and wicker baufets, by
the males. The succifs that has crowned the effects of the
friends of this institution, since its first establishment, affords
sufficient evidence of the degree in which the situation and
faculties of the blind are capable of improvement; and a view
of it in its present prosperous state, will be gratifying to
persons of humane and compassionate feelings. Here they
will not find the scholars sitting in leaflets indolence, which
is commonly the case with the blind, or brooding in silence
over their own defects, and their inferiority to the reft of
mankind; but they will behold a number of individuals, of
a clafs hitherto considered as doomed to a life of sorrow and
disenchanted, and to be provided for merely in almshouses,
or by donations of charity, not less animated in their amufe-
ments, during the hours of recreation, and far more cheer-
fully attentive to their work in thoje of employment, than
persons poofled of sight. This important and useful insti-
tution is under the direction of a president, eight vice-presi-
dents, a treasurer, and a committee of 24 members. A sub-
scription of one guinea annually, or 0 not less than 20 guineas
at once, or within one year, constitutes a member.
To this article we shall subjoin the following directions
given by Mr. Thicknesse, for teaching the blind to write:
Let any common joineer make a flat board, about 14
inches long, and 12 wide; in the middle of which let a
place be sunk, deep enough, when lined with cloth, to hold
only two or three sheets of fool’s-cap paper, which must
quite fill up the space: over this must be fixed a very thin
false frame, which is to cover all but the paper, and fastened
on by four little pins, fixed in the lower board; and across
the lower frame, just over the paper, must be a little slider,
an inch and a half broad, to slip down into several recesses
made in the upper frame, at a proper distance for the lines,
which should be near an inch asunder; and this ruler, on
which the writer is to rest his fourth and little finger, must
be made full of little notches, at a quarter of an inch distant
from each other; and these notches will inform the writer,
by his little finger dropping from noteh to notch, how to
avoid running one letter into another. When he comes to
the end of the line, he must move his slider down to the
next groove, which may easily be so contrived with a spring
to give warning that it is properly removed to the second
line, and so on.
BLINDNESS, in the Veterinary Art, a disease very
frequently happening to horses. The eye of the horse is sub-
jected to various diseases which may occasion blindness, as the
catarâ€”, the gutta perna, opacity of the cornea or its cover-
ings, &c.
The disorder, however, generally inducing blindness among
horses is the catarâ€”, and the inflammation of the external parts
of the globe of the eye, which precedes the obturation of
the crystalline, is termed blindness, as though the disease was
really confirmed; and horses so affected are considered as
such, and denominated blind, though at this period of the
disease the sight is only rendered imperfect.
This destructive disorder, in general commences with an
inflammation of the outer coats of the eye, as the membrana
constrictiva, or cornea, or both together, and extending grad-
ually to the interior, inflames and destroys the transparency
of the crystalline, and obliterates the admission of light.
These attacks of inflammation not unfrequently disap-
pear for a time, or, at least, become much less distinguish-
able, and then return again, observing something like
regular periods of accession and remission; and from hence
the disease has been termed by some the moan blindness,
and these changes were considered as under the influence
of this planet, and corresponding with the periods of its
change: there are, however, other causes more powerful
in their influence, to which these changes in this disorder
may, with more appearance of truth, be attributed, as im-
proper exposure to excessive cold, or drafts of air; to a
clofe, low, over-heated flable, or sudden alternations
from the one to the other; violent exercise and sweating;
then washing with cold water, leaving the hair drenched
with it; acid volatile salts rising from the dung; over-
feeding with too hot, dry, and stimulating food, and all
causes inducing an increased action of the heart and
arteries, naturally tend to induce a recurrence of this com-
plaint.
As this disease is one of the most interrelling in the ve-
erinary art, and the most necessary to be well understood,
as well by poftifional men, as by dealers and poftellers of
horses, we shall deferibe at some length the appearances by
which it is known to exist, and the means that have
hitherto been employed, as far as they have come to our
knowledge, for the removal of it. Those who may desire to
be acquainted respecting this disease, and their practices for
its cure, may be referred to the writings of Abystus and Vegetius:
the latter, in his elegant work de arte Veterinaria, lib. 2,
cap. xvi. de suffusione ocularum, has divided this disorder
into three kinds, under the titles fenocoris, prothesis,
hypochoris; by his definitions, however, of these three
kinds, it appears that he only meant the different stages
of some inflammation of the catarâ€”, from the first inflam-
mation of the eye, to the crystalline becoming perfectly
opaque and burirling its capsule; rushing to the anterior chamber of the eye, and reting, like a white opaque ball,
against the cornea; occasioning a total loss of light, and
which he compares to the yolk of an egg burirling
its situation in the centre of the egg, and to which it can
never be again reduced. He considers the cause of this com-
plaint to be the rupture of the membrane containing the
light; by excessive heat, or more certainly from the fatigue
of a long journey, or the neglected injury of the eye, from
the intarreption of the matter. His hypochoris, which
appears to be the first stage of this disorder, he says, de-
scends from the head; and often shews itself in one eye,
and then migrates to the other, and is attended with a flow
of water or tears. His treatment, in this case, is to
bleed often from the eye-brow, or rather the eye-lids,
and from the temples; to foment frequently with warm
water in which rue and fennel seeds have been boiled; to
anoint the eye “cum collirio opoponato et opolium.” He also recommends applying the actual cautery to the
temples above the veins. This author, in another chapter,
recommends, in this complaint, that you should apply the
n'oil to the fame side with the morbid eye, and you will
find
BLINDNESS.

find a small opening, through which, by inserting a pipe, you may fill the eye with wine, and relieve the disorder; a remarkable proof of the minute and accurate observation of the ancients. The existence of such an opening (for it is, in reality the opening of the lacrimal duct that is alluded to) is not known to many who profess to practise on the diseased of horses at this day.

Abyrus, a Greek writer, who lived about the reigne of Constantine the Great, and prior to Vegetius, recommends, in this disorder, and which he calls ιατρικής, that the ear should be pierced with an awl, and a piece of white hellebore should be inserted in the perforation for its relief.

The following we venture to give as a more natural and true description of the appearances of the eye, during the presence of this complaint, than what has before been exhibited; though, no doubt, subject to many omissions and imperfections, which future observations may lead us to rectify.

The earliest indication of this disease is exhibited by the external transparent parts of the ball of the eye becoming obscured, assuming a blackish glairy hue; sometimes blue or brown, or a dull white, and streaked with blood, according to the degree of inflammation or dilution of the blood-vessels; admitting, according to their capacity, the different parts of the blood which are not transparent; and this inflammation, it may be remarked, takes place more frequently in young horses of five or six years old, than in those of a more advanced age, and the upper half of the cornea generally appears more obscured than the lower; this, however, may be a deception, arising merely from the point of vision, the observer being placed below the eye, and seeing directly through the lower part, and more obscured through the upper. The blood-vessels also may be observed increased in number and size, passing over the opaque white surface of the sclerotic, to the cornea and conjunctiva; for it has not, as far as we know, been ever ascertained from actual dissection or experiment, whether it is the cornea that is inflamed, or the conjunctiva, or both; nor is it absolutely necessary for the treatment, that this should be known.

The eye and eye-lids feel hotter to the hand than usual, and often times there is a deposit of a white matter resembling pus, in the bottom of the anterior chamber of the eye, which, perhaps, proceeds from the vessels of the ciliary fringe, or uvea, which are large in the horse. After this opacity of the cornea has existed some time, the eye of itself, or still more certainly, if antiphlogistic means are tried, returns to its natural brilliancy, and the disorder seems removed; a few weeks or months may elapse before its return; and if these remedies are had recourse to very early, the disorder may even be permanently removed; it very frequently, however, returns, and again disappears, and this several times before the inflammation of the crystalline, and the destruction of light take place. In other subjects, one uninterrupted course of inflammation, without any interval takes place, till the cataract is fully formed.

When this morbid process begins in the crystalline, the inflammation of the exterior parts of the eye often disappears, and they assume their usual brightnes, and afford us an opportunity of distinctly observing the changes which take place in the lens.

And with respect to the cataract itself, or this opacity of the lens, we may remark that the whole crystalline shall assume this milky appearance at once, or a small speck only; this opacity shall be seen, which often remains for years, without the least perceptible increase, and without producing blindnede, or any sensible detriment to the ani-

mal: again, in other cases, no speck is observable but whitish lines which reflect the light, stretching like rays from the centre of the lens to its circumference; and sometimes the capsule containing it is said to be only affected.

The cataract, as it is called, being fully formed, the complete opacity of the lens being established, and light no longer admitted, the iris begins to lose its properties, nearly closing up the opening of the pupil; from its relaxation, the whole eye becomes diminished, and apparently sunk in the head; and the capsule, especially in draft horses, bursts, and the lens is forced from its situation, and falls to the anterior chamber of the eye, resembling, as we have before observed, an opaque white ball.

As perfect cleansers and disinfects in all parts of the eye, with a due contraction of the pupils, are the most certain indications of its goodnes, so the slightest dulness or opacity in the external coats, or diminution of the pupil, should lead the purchaser to be cautious; for it cannot be too often observed, that this opacity, after it has been of some standing, is almost certain destruction to the eye; and there are no remedies at this time known that can prevent its fatal termination, though numerous attempts and experiments have been instituted with this view; and the operation for the cataract is useless in the horse; for if it succeeds, the vision is still so imperfect, that blindnede itself is preferable.

Though various useful offices can be found for horses that have lost their fight; yet it is of importance, for most of the purposes to which they are applied, that it should be preserved. We cannot recommend with too much force, the necessity of an early recurrence to the prescribed remedies for destroying the inflammation; for, at its very commencement, it has probably only the characters of common inflammation, and might be entirely and effectually subdued as in other parts; but neglected, this disorder soon assumes its peculiar properties, arising, perhaps, from the particular structure and functions of the parts affected, and in a short time becomes perfectly beyond the reach of any remedy; for though, no doubt, there are a few infallible instances where this disorder has been removed, yet, as the termination of the generality of cases is of an opposite nature, it would be unwarantable to make a conclusion from such cases of the general possibility of cure in this complaint.

Where the inflammation has not yet received the specific properties above described, the following remedies will frequently remove it; and in more confined cases, we shall mention the means that have been unsuccessfully employed to remove it, that we may shew the insufficiency of such attempts, and promote farther experiment and research respecting it.

In the commencement of this complaint, the use of abstinence from heating food, or hard exercise; exposure to flables of cooler temperature, and well aired, not from partial drafts, but their loftinefs only; exclusion of too much light, or the light altogether; diurem, drinks, and purgatives; such may be employed to the general system. To the part itself, wafties of cold water, or ice and water, or litharge water, or with a small portion of opium dissolved in it; others think more favourably of stimulating or cautic washes, as weak solutions of vitriolated zinc, very dilute acids, and even spirits and water.

Blister applied to the cheek, or over the mafeter muscle, produce an irritation which is very successful in removing this inflammation, and, in particular, the injection of a feton or two in the muscular parts surrounding the eye, care being taken that the fascia over the muscle is divided, otherwise
otherwise there is no suppuration; these will tend, as we have experienced, powerfully to carry off an attack of this disorder. Pricking with a hot iron has also been employed with the same view, on the surrounding skin; and likewise blood-letting from the jugular vein, or from the temporal artery, or locally from the vessels proceeding from the inner canthus, or anterior angle of the orbit; as also the vessels palling over the sclerotic coating, which become very much enlarged and visible in this disease, as well as those in the lining of the lids.

Mr. Coleman, the very ingenious professor of the veterinary college, feared up the vessels of the sclerotic with a hot iron, forming an entire circle round the ball of the eye, at some distance from the cornea, to prevent all access of blood to this part, and so endeavoured, mechanically, to put a stop to the inflammation; it was found, however, insufficient to destroy the disorder, and we believe that any hope of relief from this mode of treatment has since been abandoned; and for this reason, perhaps, this experiment has proved insufficient, that when communication is stopped from the exterior vessels, there are others whole trunks are short of these, which supply the substance of the cornea; and others again, out of our reach, on the inside of the cornea; but above all, the habit in the parts to dilate, and the disposition in the fyllen to generate it, are not overcome, and the morbid tendency is not thereby diminished.

The farriers, who practise medicine, in treating this complaint, often remove the lacrimal gland, which they call the lawn, from its supposed resemblance to this fruit; and as this part partakes of the inflammation, and is much swelled, they mistake it for the source of the disorder. The removal of it, which is easily done, by drawing it out with a hook, and cutting it off, occasions a copious discharge of blood, which, in slight attacks, relieves the eye, and encourages them in this practice; but from our own personal experience we have learned, that in cases of any duration, it is totally inadequate to the removal of the complaint, and the eye must obviously suffer from the loss of a part that is necessary to its well-being: and means lesf injurious to the eye may be equally well employed with as much success, such as we have before pointed out.

An infusion of the polygonum hydropiper injected into the nictitans, so as slightly to inflame the membranes, produces very good effects in this complaint.

It has been observed, that in the human eye, long continued inflammations of the exterior coats rarely produce cataracts, as they do in the horse; and the reason that has been ascribed for this, is, that the same blood-vessels which supply the tinea conjunctiva and cornea, also supply the lens and the humours of the eye, which they lay not the cafe with the human, as these parts are supplied from the eye-lids and integuments; there is, however, in the horse, a singular propensity to inflammatory complaints, and to this disposition, perhaps, it is rather to be attributed.

In the inflammation of the cornea, which is attended with a black, glistening appearance of this part, there is seldom any increased discharge of tears from the eye and nose; but in the other kinds which we have before enumerated, there is, in general, a considerable increase of this secretion. When blood-breaks, or blotches appear, it is probable that the vessels are ruptured, and that this blood is really in a state of extravasation.

BLINK, in Sea Language, denotes that bright, white appearance produced by the ice near the horizon, and perceptible, in approaching the ice, long before it is itself seen. This phenomenon has been often remarked by mariners, and is particularly mentioned in Phripp's (lord Malgrave's) voyage to the North Pole, p. 70.

BLINKS, in Botany. See Montia.

BLINKS, among Ancient Sportsmen, denoted broken down from trees, and thrown in the way where deer are likely to pass, to hinder their running, or rather to mark which way a deer runs, in order to guide the hunter.

BLINKING of beer, in Lincolnshire, signifies letting the wort stand for some time in the vat, till it hath acquired some degree of acidity, in order to dispense it to fame, and be the sooner ready for drinking.

BLISSOM, among Husbandmen, corruptly called blossom, is the act of a ram, when coupling with an ewe.

BLISTER, in Pharmacy. Blisters are nailed on the surface of the body for medicinal purposes, by applying, for a number of hours, some of the most active of the animal or vegetable stimulants. Of these, by far the most convenient, and that which is almost universally employed, is the CANTHARIS, or Spanish flies, (MELIS Venatorius.) These insects are found in Spain, Italy, and the south of France; they have a long body, beautifully bright with green and gold. They are gathered, by shaking the trees which they frequent, and are killed by the vapour of spirit of wine burnt beneath them, or by the fumes of vinegar, after which they are dried in a stove. In this state they are brought over without further preparation.

Cauteritis poffea to much glory, that in reducing them to powder, the face should be covered with a mantle, to prevent the troublesome freezing and evaporation of the fumes, from the inner ducts flying about. Taken internally, in an overdose, they inflame the whole infeetual canal, in a greater or less degree; and they have a peculiar tendency to irritate the urinary organs. Applied to the skin, they inflame the part, but often, with scarcely any attending pain; after which they produce a very copious blisters of clear, yellowish serum beneath the cuticle, which rises in a large bag. This effect appears to produce a vesicating property in a much larger degree, in proportion to the pain excited, than any other stimulant; and hence its peculiar utility in producing this ferox discharge with the least possible inconvenience to the patient. It is not exactly known in what part of the exit the vesicating property resides, or whether it does not equally belong to every part. It is not easily destroyed, or impaired by long keeping, if the effect be unbruised, and preferred in a dry place.

For blistering the skin, the cauteritis are first finely powdered, and then incorporated, with some labour, with a simple mixture of wax and resin melted together, to which some add a little vinegar, and allowed to grow nearly cold before the flies are added. This is a necessary precaution, since it is certainly known that a considerable heat impairs the blistering property. The plaster, thus made, should be of such a consistence, as readily to soften with a moderate heat. When used, it is generally spread uniformly upon leather, of the requisite size and shape, by the assistance of an iron plate, warmed fearfully more than the hand can bear.

To increase the effect, some apothecaries sprinkle the plaster with powdered cantarides, after it is spread on the leather, but this is not necessary, where the plaster itself is good; and the powder is apt, after application, to lodge on the tender cuts, and produce much vaselines irritation. As the blistering plaster adheres very loofely to the skin, it is useful in applying it to children, to maniacal persons, and wherever it is in danger of being too soon pulled off, to surround the blister with a margin of strong adhesive plaster.

The
The plaster of cantharides seldom fails to produce a large blister, in ten or twelve hours; but its operation continues sometimes longer, so that it may be conveniently suffered to remain for twenty-four hours, the large cuticular bags being punctured to let out the fluid. When the plaster is taken off, and the form mostly discharged, the blistered part should be dressed with arnica, or some other mild ointment, unless it is intended to keep up the serous discharge by fluctuating applications.

The pain produced by the action of cantharides varies greatly, according to the part affected, the thickness of the skin, and the general irritability of the constitution, and in particular of the surface of the body. Most frequently the pain is very slight, often amounting to no more than a sense of heat on the part. When very acute, it is of great service to remove the plaster, when it has been on about two hours, to anoint the part with oil or cream; and about an hour or two after, to replace the blistering plaster, which will then often proceed to vesiculate without much further irritation.

The operation of cantharides is much affected by the thickness of the skin beneath; and hence the scalp refills vescication more than the softer skin of the abdomen; and particularly by the heat of the body, so that the plaster should be stronger, and its confidence softer, when applied to an unusually cold surface.

Sometimes, though rarely, the symptoms of strangury produced by this active medicine, follow even its external application.

A more active vesicatory is prepared by being made up of other irritant substances to the cantharides plaster. In the Paris Pharmacopoeia, euphorbium (the moli acid of all the medicinal gums) is added in equal quantity with the cantharides: in the Edinburgh, verdegris, mulfard, and black paper are used.

It is often of advantage to keep up a discharge from a blistered part for a considerable time. It then becomes gradually purulent. For this purpose, a milder form of cantharides is highly useful, and a softer confidence is given to it. This may be done by mixing a small portion of the flies in powder, with any simple ointment; but this is liable to act unequally, and the whole of the fly sometimes create trouble, by lodging upon the tender cuts. To remedy this, the London college use a watery infusion of cantharides, mixed with a stimulating resin ointment, melted, and continued over a slow fire, till all the water is evaporated, leaving a small portion of extractive matter of the flies, equally diffused through the ointment, and strongly increasing its stimulating power.

A few other substances have been occasionally used to produce vescication. One of these is the inner bark of the Mezeron, (Daphne mezeron) and of another plant of the same genus, the Thymbra Lauroce, or Spurce Laurel, (Daphne Laureola) both shrubby plants, well known in gardens. The use of the latter (which will equally apply to mezeron) is thus directed in the Paris Pharmacopoeia. Small twigs of the plant, about the size of a pen, and smooth, are selected, and cut transversely into portions of the requisite length. These are steeped in milk-warm water, or in vinegar, for about half an hour, to loosen the bark, which is then peeled off with a pen-knife, and the wood is thrown away. This bark is applied to the skin to be blistered, previously rubbed with vinegar.

In twenty-four hours a perfect vescication is produced, with little pain, and without the possibility of those symptoms of strangury, which now and then attend the use of cantharides.

BLISTERED, bullaeatus, in Botany, is applied to the Vol. IV.
**BLO**

It is a common habit with farriers practising medicine, to mix corrosive sublimate with their blister; and, where it may be desirable to destroy the skin, this should be used, but not otherwise; for it is no specific, but a violent caustic, soon destroying any living matter with which it comes in contact, and which we have, from the ignorant use of it, the most deplorable effects, by its bringing off extensive sloughings of the skin, and even penetrating to the parts beneath, and so injuring them, as ever after to render the horse unmanageable. There is an effect produced by the cantharides on the skin of the horse, which, as far as we know, has not met with much attention; though it is very remarkable, and not analogous to its effects on the human skin: it is that prodigious thickening of the integuments, after the operation of the blister, which sometimes does not subside for many weeks, being a great disfigurement: a blister, therefore, if one could be devised not producing these effects, would be a desirable thing in the veterinary Pharmacopeia. This effect, we should, however, remark, is not constant.

**BLITAS, L., in Geography, a chaffer of small islands in Nicaragua lake, in Spanish North America.**

**BLITH.** See **BLYTH.**

**BLITE, a river of England, which runs into the Trent, 4 miles N.E. of Litchfield.**

**Biff, Char. Cal. triul. Pet. none. Seed one, with a berried calyx.**

Species 1. *B. capitatum*, berry-headed strawberry-bltie, Lin. Spec. 6. Reich. 11. Hal. helv. n. 1571. Morocarpus capitatus. Scop. Carol. n. 3. Atriplex. Bath. pin. 119. n. 7. Prodr. 58. n. 2. Ger. m. 326. n. 8. Park. 748. f. 1. Mor. hist. 2. 506. f. 51. 3. 52. f. 11. Raff. hist. 157. n. 57. "Heads spikeld terminal." An annual plant, with leaves resembling those of Spinach, and stalk rising, in gardens, about 2 feet high; but in a wild state, upright and only about a foot high; flowers on the upper part in small heads at every joint, and terminated by a calyx of the same; when the flowers are in, these heads swell to the size of wood-flowerberries, and when ripe have the same appearance, full of a purple juice, which stains the hands, and formerly much used in cookery, for colouring puddings, &c. seed black when ripe; commonly called strawberry bltite, strawberry spinach, or bloody spinach, and by some, berry-bearing orch. A native of Switzerland, the Grisons, Austria, the Tyrol, Spain, and Portugal; cultivated by Parkinson, in 1653. 2. *B. virgatum*, slender-branched strawberry bltite. Lin. Spec. 7. Reich. 12. Gmel. flb. 3. 16. Atriplex. Bath. pin. 119. n. 6. Mor. 1. 32. f. 10. Raff. hist. 157. n. 6. "Heads scattered, lateral." Seldom growing more than one foot high, with smaller leaves than the former; flowers produced from the axis, almost the whole length of the stalk; small, and collected into little heads, smaller than the frst, and not so deeply coloured, but of the same shape. A native of the south of France, Spain, Italy, and Tartary.

3. *B. tataricum*. Mill. Dict. n. 3. E. fr. giferum maximum polypermum. Ann. n. 17. "Leaves triangular, harshly toothed; heads simple, lateral." Rising near three feet high; flowers axillary, in small heads; fruits of the same shape and colour with those of the frst, but smaller; differing from it in the shape and indentures of the leaves, and in having leaves placed between the fruits the whole length of the stalk, not terminated by heads, as the frst, but having leaves above the heads. Probably a variety of the second sort. The seeds were sent to Mrs. Miller by Dr. Amman, professor of botany at Petersburg. 4. *B. chenopodioides*. Linn. Syll. Reich. 12. Mast. 176. "Heads in whorls, julceula." A low plant, resembling chenopodium. A native of Tartary; now in Sweden. Probably only a variety; and in reality the four sorts seem to be but one.

**Propagation and Culture.** All are annual plants, which drop their seeds, that will produce plentifully the following spring; or if the seeds of any one of them be sown in March or April, upon a bed of common earth, in an open situation, the plants will come up in a month or six weeks, and remaining in the same place, will require no other care besides being kept from weeds, and thinned out to the distance of six or eight inches apart; and in July the plants will begin to shew their berries, which will make a pretty appearance. By many they are transplanted into the borders of the flower garden, and by others planted in pots, so as to be ready for removal into the court-yard, or for being placed upon low walls for ornament. When these plants are designed to be removed, they should be transplanted before they shoot up their flower-blems, for they will not bear transplanting afterwards; and when planted in pots, they must be watered in dry weather; and, as the flower-blems advance, they should be supported by ficks. Martyn.

**BLITUM.** See **ACHYRANTHES, AMARANTHUS, CHENODIUM, and GUNNERS.**

**BLOATED!** or *herring*, in our *Statures*, are those which are half dried. Vide Stat. ann. 18 Car. 11. c. 2.

Blotted herrings are made by steeping them in a peculiar brine, and then hanging them in a chimney to dry.

**BLOATING, in Medicine.** See **LEUCOPLHEMATIA, and OEDEMA.**

**BLOCH, Mark Eleazar, in Biography,** a Jewish physician at Berlin, and a celebrated lexicographer, was born at Anspach in Franconia. His parents were in a condition so obscure and deplorable that they were scarcely able to maintain him during his infancy, and much less to procure for him any suitable means of education. At the age of 15 he understood neither German nor Latin; and as he had read only a few Rabbinical books, he spoke a kind of Franconian gibberish, intermixed with the Jewish jargon. About this time, however, he was taken into the house of a surgeon at Hamburg, who was a Jew, and employed by him in the instruction of his children; and in this situation he acquired a competent knowledge of the German language. The savings of his scanty salary enabled him to procure attainment in the study of Latin. Having also gained some knowledge of surgery, he repaired to Berlin, where his relations lived, with a view of prosecuting the study of anatomy. After struggling with various difficulties, he was admitted as doctor in the university of Franckfort, and returned to Berlin for the exercise of his profession. Here he became acquainted with M. Martini, who recommended him to be elected a member of the Society of the Friends of Nature. In order to promote the objects of this institution, he undertook a natural history of mice, a fift caught, as it was supposed, only in the lakes of Pomerania. He also began to form a cabinet of natural history; and having made a considerable collection...
of aquatic animals from all parts of the globe, he determined to write a natural history of fishes; and in this design he was encouraged and aided by obtaining possession of the original MSS. of Father Plumer, who had made three voyages to America, and brought with him many objects highly interesting to the natural historian. M. Bloch first published, in German, four numbers of an "Economical Natural History of Fishes, particularly those in the lakes of Prussia, with figures from original drawings," Berlin, 1781 and 1782, large 4to. In the following years appeared an "Economical Natural History of the Fishes of Germany," in 3 volumes, consisting of 188 plates, and including the three numbers already mentioned. He afterwards published, in 9 volumes, "The Natural History of Foreign Fishes," so that his whole work was comprehended in 12 volumes, and contained 432 plates. The last appeared in 1793. He also, at his own expense, procured a French translation of his work, by C. Lavoisier, then at Paris, which he published under the title of "Histoire général et particulière des Poissons," Berlin, 1785—1788, in 6 vols. folio, with 216 plates. In order to defray the expense of this work, his only son, a young man distinguished by his talents, undertook a tour through France and England for the purpose of procuring subscriptions; and in the prosecution of his journey died at Paris, in 1787. This loss, and the embarrassment of his circumstances, preyed upon the spirits of this ingenious naturalist, and sunk him into the deepest affliction. However, he still continued to employ himself in his favourite work, the history of fishes; and having completed it, undertook a journey to Paris. He died at Carlsruhe in Bohemia, August 6th, 1799. Besides the above voluminous works, M. Bloch published many memoirs on subjects of natural history, in the transactions of different societies. That on the musk-ox, in the Memoirs of the Friends of Nature, has been already mentioned; he also communicated, in the same Memoirs, "Observations on the regular depressions in vitriform bones;" "On the worms in the intestines and lungs of birds;" "An Essay towards the natural history of the worms which live in other animals;" "On worms of the bladder;" "Description of the hussar, and some kinds of birds found in marshes;" "On the oil of herrings;" "On the vulgar opinion that the organ of generation in the ray and shark is double;" "On the myxina glutinosa of Limousin," &c.

BLOCK, Daniel, an eminent portrait-painter, was born at Stekkin, in Pomerania, in 1560, and educated for his profession under Jacob Scherer. As a painter of portraits, he gained great reputation, and had the honour of painting the portraits of Christian IV. king of Denmark, and of Gustavus Adolphus, king of Sweden. His merit recommended him to the prince of Mecklenburg, in whose service he was retained for 44 years, and for whom he painted the portraits of his whole family, at full length, as large as life, and in the antique habit. By the agreeable manner of his colouring, and the easy attitudes of his figures, he obtained so much employment, as to enable him, before the decline of his life, to amass a large fortune; of which, however, he was unfortunately deprived by a plundering party, preferring, with great difficulty, his own life. He died in 1661. Pilkinson.

Block, Jacob Roger, was born at Gouda, where he acquired the art of painting; particularly in reference to perspective and architecture, which he principally cultivated. Having spent several years in Italy, where he imbibed that taste of grandeur and elegance in his compositions, by which he was advanced in the public esteem above all his contemporaries, he returned to his own country, and was appointed state-painter to the archduke Leopold, whom he attended in all his campaigns; but whilst he was passing a small rivulet, ever a bridge of planks to view the fortifications of St. Vinsin in Flanders, his horse slipped, and he was unfortunately drowned. Whilst he lived at Gouda, he was visited by Kenvena, who, having examined his works, testified to his honour, that he had not seen any painter in the Netherlands, who could hold in competition with him for the subjects he painted. The time of his birth and death are not ascertained. Pilkinson.

Block, Benjamin, son of Daniel-Block, was born at Leubeck in 1631, and, with a view of improving himself in colouring and design, resided for some time at Rome, Venice, and Florence. Having thus acquired a good taste, and a pleasing tone of colouring, he was introduced to the court of Saxony, where he painted several portraits of the elector and prime-minister; and he also painted several altar-pieces for the churches and convents of Hungary, which are much commended. His capital performance is the portrait of Kircher the Jesuit, which, even at Rome, was exceedingly admired. The time of his death is not ascertained. Pilkinson.

Block is used for a piece of marble as it comes out of the quarry, before it has assumed any form from the hand of a workman. Block, in the Mechanic Arts, a large piece of solid wood, wherein to fasten work, or to fashion it; strength and stability being the requisite properties.

In this sense we say a chopping block; a sugar-melter's block; a smith's block; on which he was felled; an executioner's block, on which the criminal's head is laid to be struck off.

Block, Mounting. See Anabathira.

Block, among Cutters of Wood, is a form made of pear-tree, box, or other hard and close-grained wood, free from knots, on which they cut their figures in relief, with knives, chisels, &c. The line are in use for card-making; and from the same firrll arose the modern art of printing. Phil. Trans. N.S. vol. 100. p. 239.

Block, among Bowlers, the mark which is aimed at, being a small fixed bowl laid on the green for this purpose; it is called also the jack.

Block, in Falconry, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

Block Island, in Geography, called by the Indians "Manilis," lies about 21 miles S.S.W. of Newport, in Newport county, and date of Rhode Island. It was erected into a township, named "New Shoreham," in 1672. This island is 7 miles in length, and its extreme breadth is 4 miles. It has 714 inhabitants. It is famous for cattle and sheep, butter and cheese; and round its coasts are caught considerable quantities of cod-fish. The southern part of it is in N. lat. 41° 8'.

Block, in Nautical Architecture, denotes an eight square, or round part below the heeling of the main and fore topsails.

Blocks are short pieces laid under a mast to raise it from the ground.

Blocks are also pieces of wood belonging to ships, in which the fenders, or threavers, of pulleys are placed, and wherein the running ropes go. Accordingly they possess the properties and powers of pulleys, and they have from one to eight threavers. The blocks in general use are the single-block, the double-block, the treble block, and the four-fold block; but when heavy weights or bodies are to be raised or moved, blocks with a greater number of threavers are applied, the increasing power being as two to one for every threaver moving with the object. See Pulley.

Blocks differing from the common shape are the bee-block, the check-block, the long-tackle-block, the main-tackle-block, the monkey-block, the pine-pulley-block, the rack-block, the
hoe-block, the shoulder-block, the fitter-block, the snatch-block, the strap-bound-block, the viol-block, and the warping-block. The principal parts of blocks are their shells, sheaves, and pins, which are of various sizes and powers, according to the effect which they are to produce. The dimensions of the shells, and the thickens and number of the sheaves, are proportioned to the size of the ropes working in them, and the powers required. The sheaves turn abreast of each other in the shell, on one axis or pin, or one above another, on separate pins. The shell is made of elm or ash, and hollowed between the cheeks, with one or more sheave-holes to receive the sheave or sheaves. On the outside of the sheaves of blocks that are to be strapped, one face is cut towards the ends, in which part of the strap is buried; if they are double-strapped, they have two sheaves. A hole is bored through the centre to admit the pin; which, passing through both lides of the shell, forms the axis for the sheaves. The sheave is a solid cylindrical wheel, and round its circumference is a groove, one-third of the thickness of the sheave deep, in which the rope works. It is commonly made of lignum vitae; but for laborious purposes, it is coated in the middle with metal, or else made of cast metal; if the sheave is iron, it is coated with brass, and if of brass, with the hardest bell metal. The hole in the centre is somewhat larger than the pin. The pin is made of lignum vitae, copper, greenheart, which is a wood imported from the West Indies, or iron, and it is the axis on which the sheaves turn.

The proportions for single, double, treble, four-fold blocks are as follow: viz., the length is eight times the breadth of the sheave-hole, which is one sixteenth of an inch more than the thickness of the sheave; and this is one-tenth more than the diameter of the rope for which it is intended, and the diameter of the sheave is five times the thickens. The breadth of the block is six times the thickness of the sheave, and the thickens about one half the length. Flat thin blocks are three-eighths of the length thick; but all blocks, having more than one sheave, are increased in thickens more than in the above proportion by the additional number of sheave-holes, and middle-parts or partitions; the thickens of each partition being one-sixth less than the breadth of the sheave-hole. These dimensions are variable, according to the uses for which blocks are intended. Very large and four-fold blocks are formed of separate pieces, as the cheeks; partitions, &c.; and when thus made, they are denominated "made-blocks." The sheaves of blocks are firmly fastened to their length, breadth, and thickens; and the corners or angles are taken off. The workman then gauges the size of the sheave-hole in the middle, one sixteenth larger than the thickens of the sheave, and the sheave-hole is gauged equally on each side, and for all blocks with a greater number of sheaves. The blocks are then jambed up edgewise with wedges in a clave, and the sheave-holes are made in this manner: the length and breadth are first gouged out, and holes are bored half way through the block, along the part gouged out, with an auger of the size of the sheave-hole; then the sheave-hole is gouged and bored on the opposite side in the same manner, so as to meet the opposite holes. Blocks from 10 inches and upwards have one hole bored at each end, and cut through with a chisel; and the wood is faved out with a rib-flaw. All blocks have the sheave-holes cleared through by chisels, and by burners at the corners. Blocks that are to have iron straps, should have the iron fitted on before the wood is cut out of the middle. The hole for the pin is bored through the middle of the block, one-tenth less than the diameter of the pin. The outsides and edges of the shell are next rounded off by the block-flame, and neatly finished by the spoke-flame. In the royal navy, blocks are left thick upon the edges of the cheeks; but in the merchant ships, the edges are sometimes thinned off to a small square, and sometimes rounded off. The sheaves for the straps are gouged out along the outsides of the cheeks, and taper in depth from nothing at the pin to half the thickens of the strap at the ends of the block, for a single sheave, and the same on each side of the pin for a double sheave. The sheaves are gouged down, across the breadth of the block, to half the size of the strap, in order to allow for the serving. After the sheave is cut, the sheaves are fitted; they are one-tenth thicker than the diameter of the rope intended for running on them, and five times that thickens in diameter. The hole for the pin should be bored through the centre by a bit fixed in the mandrel of a turning lathe, or with a block and bitt, and reamed with an augre one sixteenth larger than the diameter of the pin, so that it may easily turn; they are then put in a lathe and turned smooth, and the outer circumference hollowed one-third of its thickens, that the rope may embrace it closely. The diameter of the pin is the thickens of the sheave, and is turned in a lathe, except its head, which is left eight square, to prevent its turning in the block, and is driven through the holes in the block and sheaves. After the sheaves are fitted, the middle of the sheave or cheek, or the face of the block, is gouged hollow, to admit the rope, and correspond with the sheave; and a small neat chamfer is taken off the edges.

Blocks, Bes, are made of elm, in length seven-ninths the length of the bee, in depth two inches for every foot of length, and in thickens seven-eighths of the depth. A block of this kind is trimmed square, chamfered on the outside edges, and fitted with a sheave in one end; and in the other end is cut a hole, to be fitted with a sheave, in case the other should fail. The sheave-hole is nine-tenths of the length of the block, and the length of the sheave-hole in breadth, and half the length of the sheave-hole within the end. Bee-blocks are bolted to the outer ends of bowsprits, under the bees, and the bolts serve like the axis or pin for the sheaves to work upon; the fore-top-mast flay-rees through the sheave-hole at the fore-mast end of the fore-board bee-block, and the fore-top-mast prevents, or spring-flay, through the sheave-hole at the after-end of the afterboard bee-block.

Blocks, Bunt-line, are lashed in rigging the lower-yards, like the leech-line blocks in the middle between them and the flings of the yard. There, in rigging the top-fall yards, are spliced round the strap of the top-fall-tye-block, upon the yard.

Blocks, Cat, is employed to draw the anchor up at the cat-head. See CAT-HEADS.

Blocks, Cheek, or half-blocks, are made of elm-plant; the length being twice and a half the depth of the top-mast head; the breadth is seven-eighths of the depth of the top-mast head, and the thickens half that depth. The depth of each tenon, and thickens of the cheek, when the sheave-hole is cut, is each three-eighths of the whole thickens, so that the remaining two-eighths are the sheave-hole. The three tenons are each two inches square, one in the middle, and one at each end; and the length of the holes is more than the breadth of the block, by the thickens of the sheave.

The back of the block is divided into three parts, and one-third on each side is bearded down to one-third the thickens of the cheek on each edge. Pins of iron are made for
BLOCK.

Enlarging them to the top-mast head, and for durability the sheave-holes are coppered. Check-blocks are bolted to the thwart-pin stiles of top-mast heads, close up under the cap, the bolts serve as the pin or axis for the sheaves to work on; the jib-flay and haliards, and top-mast flays, sail-flay, and haliards reeve through the check-blocks at the top-mast head, and the main-topmast flay fail haliards, and middle-flay, fail-flay, and haliards reeve through the check-blocks, at the main-topmast head.

Blocks, Clew-garnet, serve to draw the clews, or lower corners of the courses up to the yards, and are fastened to the clews of those fails. In rigging the lower-yards, these lath through the eyes upon the yard; the blocks hanging underneath, four feet without the middle cleats on each side. See Clew-garnet.

Blocks, Clew-line, in rigging the sprit-flay yard, are flapped with two eyes, and are lathed through those eyes round the yard, three feet without the flings; the lathing to be upon the yard. In rigging the sprit-flay top-fall yard, these blocks are flapped with two eyes, and are lathed through those eyes round the yard, about two feet without the flings. The clew-line blocks, in rigging the top-fall yards, are lathed with two lathing eyes, and lath upon the yard three feet without the flings; the blocks hanging underneath the yard through which the clew-line reeves, and is flapped with a knot, and leads down upon the deck. In rigging the top-gallant yards, these blocks are flapped with two lathing eyes, and lath upon the yard three feet without the flings. The blocks hang under the yard, through which is reeved the clew-line, which is flapped with a knot. The leading part leads down the main, and into the lower yardblocks. Some flaps and light-rigged vessels have no clew-line blocks; they lower the yard.

Blocks, D, are lumps of oak in the shape of the letter D, from twelve to sixteen inches long, and eight or ten inches wide. They are threaded and bearded on the back, and the edges beaded. A sheave-hole is cut through the middle fore and aft. It is bolted to the ship's side, in the channels, to receive the lifts, &c.

Blocks, Deep-seat-blocks, are the same as a wooden match-block (which see), only smaller; generally from nine to eleven inches long.

Block, Derrick, in rigging the mizen-yard, is flapped with eyes, that go round the yard, and lath underneath, between the flings and the outer yard-arm or peck; the other block is cross-feized into the flap, has an eye flapped in each end, and lath upon the mizen cap, and feizes or hangs through the eyes under the cap, or upon the upper side of it.

Block, Fisb, is hung in a notch at the end of the davit, and serves to haul up the flukes of the anchor to the ship's bow.

Blocks, Girt-line, in rigging the fore-mast, and main and mizen masts, are lathed round the mast head, above the fop of the cap, one to hang on each side. The girt-lines that reeve through them lead down upon deck, for hoisting the rigging-tops, and crosstrees, and the perrons employed to place the rigging over the mast-head.

Blocks, Leech line, in rigging the lower yards, are lathed round the yard, and through the eye of the flap, ten feet within the cleats on each yard-arm; the blocks hang on the fore-part of the yard.

Blocks, Lift, in rigging the lower yards, are flapped into the flap of the top-sail-sheet blocks; the lifts reeve through the block in the span round the masts head, between that and the top-mast, then lead down abreast the throuds, and reeve through a block fastened to the side, and are there belayed. In rigging the top-sail-yards, the lift-blocks are flapped with an eye to the side of the yard arm. The lift reeves through the lower sheave in the filler block in the top-mast throuds, and through the block on the yard-arm.

The flanding part hooks to a becket round the topmast-cip, and the leading part leads down the side of the mast, and belays to the dead-eyes in the lower throuds.

Block, Long-tackle, resembles two single-blocks joined together endways, one being two-thirds less than the other. The heel is made of ash, or elm, two-thirds longer than the proportion for a single block. These blocks are used for tackles, and are made according to the size of the rope, as other single blocks. They are used in the Royal Navy and East India service as yard-tackles; but in the merchant service as loading tackles.

Blocks, Middle, have the shell formed of several pieces of elm-plank, fitted to the thicknees of the cheeks, sheave-holes, and middle parts, and are strongly bolted together with three bolts at each end, driven through and clenched on a ring at the points. These blocks have flatter cheeks and more square edges than other treble and four-fold blocks. Of this sort are large treble and four-fold blocks, for heaving down ships, or other heavy purchases. Smaller made blocks, of modern invention, are formed of two pieces, joining in the middle; the pin working on patent rollers, let into the inside of the cheeks, which are bolted or rivetted together at the ends. These blocks are thought too complex for the Royal Navy, and are not fo easily remedied in case of failure.

Block, Main-fleet, is used for the fleet-tackle of the main-foam-booms of small vessels, and is single or double; the fleet or fall being always belayed round the pin. The shell is made of ash or elm, one half longer than the proportion for single or double blocks; the additional length is tapered, and a hole bored through between the sheaves and the end, to admit the flap; the length of the pin is the length of the block, and is similar to a belaying pin, for which purpose it is sometimes used.

Blocks, Monkey, are sometimes used on the lower yards of small merchant ships, to lead (into the mast or down upon deck) the running rigging belonging to the falls. The shells are made of ash or elm; some are only single flangle blocks, attached by a strap and iron swivel to iron-straps that embrace and nail to the yard, the block turning to lead the small running-ropes in any direction; others are nearly eight-square, with a roller working in the middle, the same as a flangle, with a wooden fiddle beneath, to fit and nail to the yard.

Blocks, Nine-pin, are used to lead the running-ropes in an horizontal direction. The shell, made of ash or elm, resemble the form of a nine-pin, though flatted on the sides; their lengths are generally confined to the place in which they are fixed, and this is for the most part under the cross-pieces of the fore-castle and quarter-deck bitts. The breadth of the block, sheave, &c. is governed by the rope, and tapers at the ends to three-eighths of the breadth of the middle; the pin at each end, serving as a vertical axis, is two thirds of the bigness of the end. The thicknees is five-eighths of the breadth. These blocks may be turned in a lathe, and flattened afterwards with a spoke-thaxe.

Block, Quarter. See Thick and thin Block.

Blocks, Raft, are a range of small flangle blocks, made from one fop, by the fame proportions as flangle blocks, with ends, in form of a dove's tail, for the lathing, by which they are fastened athwart the bowfrant, to lead in the running-ropes. They are seldom used.

Blocks, Shos, are two single blocks, cut in a solid piece, transferably to each other. They serve for legs and falls of the shunt-lines, but are seldom used.

Blocks, Shoulder, is a large single block, left nearly square at the lower end, or of the block, and cut floping
in the direction of the sheave. Shoulder-blocks are used on the lower yard-arms, to lead in the top-fall sheets; and, on the topfale-yards, to lead in the topgallant-sheets; and by means of the shoulder, are kept upright, and prevent the sheets from jangling between the block and the yard: they are also used at the outer end of the boomskin, to lead in the fore-tacks.

Blocks, Siller, are made of ash, similar to two single blocks, and are turned out of a solid piece, about twenty inches long, one above the other; between the blocks is a square for a middle seizing: a round head is turned at each end, and hollowed underneath, to contain the end-seizings; along the sides, through which the pins are driven, is a groove, large enough to receive part of the topmast-shroud, in which it is fixed. In these blocks receive the lifts, and reef-tackle-pendants, of the topfale-yards.

Blocks, Slab-line, in rigging the lower-yards, are fraped with a short lashing-eye, that fastens to the span of the quarter-blocks underneath the yard.

Blocks, Snatch, are proportioned by the rope, as a single block, leaving twice the length for the fore and lashing; they taper from the sheave to the lashing end, to half the breadth and thickness at the sheave; one side of the sheel is cut across above the sheave, large enough to admit the rope or fall. In the Royal Navy, snatch-blocks are iron-bound, terminating at the small end with a fivelock, or an eye, large enough to receive several turns of lashing; that part of the lrap, over the notch in the side, lifts up with a hinge, and is confined down, when the rope is in the block, by a small iron hook, or latch, that hooks in the eye of a toggle-bolt, and that secures the upper end of the lrap; the hinged part of the lrap goes over the bolt, with a hole in the end; the lrap is let into the block its thickness, and is confined by the pin and nails: they are used for heavy purchases, and where a warp, or hawser, is brought to the capstern. Snatch-blocks, not iron-bound, have a large hole bored through the tapering end of the sheel, for the lashing. They are used for the main and foresheet blocks of square-rigged vessels.

Block, Spring, a new kind of block, invented by Francis Hopkins, esq. of Philadelphia, and designed to affix a vellel in falling, by increasing the acting spring of her rigging. It is proped to apply it to all such parts of the rigging as will admit of it with safety and convenience, and where its operation will be most advantageous; but particularly to the sheet ropes, and, if practicable, to the dead-eyes, in lieu of what are called the chains. A, (see Plate of Ship) is a block made in the usual manner, having a ring, or eye, B, at one end. C is a spiral spring, linked at one end to the hook D E, and at the other to the ring F, which is to be annexed by a tapple to the timber-head, or by some other means to the place where it is to be applied. The spring C must be of well-tempered steel, and proportioned in strength to the service it is to perform. Within the cavity or pipe, formed by the spiral spring, there must be a chain of suitable strength, called a check-chain (represented separate at G), connected by the links to the hook D E and ring F. When the spring is not in action, this chain is slack; but when the spiral spring is extended, by the force of the wind, as far as it can be without danger of injury, the check-chain must then begin to bear, to prevent its farther extension, and, if strong enough, will be an effectual security against failure.

Fig. 2. represents part of the gun-wale of a ship, with the spring-blocks in action, one of them hooked to a tapple in the timber-head, and the other to the corner of the jib.

The inventor of this machine apprehends, that a vellel thus furnished will be less liable to heel; and that the will receive the impulses of the wind to better advantage, and fail with a more lively and equable motion than if rigged in the common way. Transactions of the American Philosophical Society, vol. III. art. 40.

Blocks, Strap-bound, are single blocks, with a shoulder left on each side, at the upper part, to admit the strap through, a little above the pin. These blocks are used at the ches of the square-fails, for the clew-garrets or cheline, and under the yards; the shoulder preserves the strap from catching.

Block, Thick and thin, or Quarter, is a double block, with one sheave thicker than the other, and is used to lead down the topfale-sheets and clue-lines. In the merchant service they are used single, thick and thin. In rigging the lower yards, they are fraped with a long and short leg, with a lathing eye spliced in the end, and fast to the yard within the ches, in the middle of the yard, the block hanging downwards. The long leg comes up the aft-side, and meets the short leg on the fore-side, and there lathes through the eyes. Although these are used for the topfale sheets, and intended for the clue-lines, a single block would be cheaper and better; as, when the sheave is seldom used for the clue line, it being found rather to impede than to facilitate. Small ships, in the merchant service, have a double block lathed in the middle of the yard, as the quarter block through which the sheets receive, and lead down on opposite sides. Large ships, in the merchant service, have a single block lathed on each side of the middle of the yard, and the sheets receive on their respective sides, and lead down by the mast. A quarter block, in rigging the cross-jack-yard, is fraped with a double strap, with an eye in each of the four ends, and is lathed upon the yard in the middle between the ches.

Block, Top. See Top-Rope.

Blocks, Top-Gallant-Sheet, in rigging topfale yards, are fraped with two lathing-eyes, and lath upon the yard, close within the clue-line-blocks on each side.

Blocks, Topfale-Sheet, in rigging the lower yards, are put over the yard-arms, fraped with an eye of the size of the yard-arm.

Blocks, Triceing, for the yard-tackles, are fraped with a short lathing-eye, that lathes round the yard about one third of the length within the arm ches; the blocks hanging under the yard.

Blocks, Try, in rigging the topfale-yards, last at the topmast-head close up to the rigging, under the collar of the stay, as the lower ones; and the blocks on the yards last under the fore-part of the yard, as the lower ones, and receive with a double tye, in large ships, and with a single tye, like the lower, in small ones. The standing parts of the double ty'es clinch round the main-head, then reeve through the double block upon the yard, and up again, and reeve through the block on each side of the main-head. The blocks are then spliced in their lower ends, and connected by their hallards to a single block, that is fraped with a long strap, with a hook and thimbles, that hooks to a swivel-eye-bolt in the channel on each side; the leading-part comes in through a block lathed on each side; the foremost ones abate the forecastle, and the after ones on the quarter-deck.

Block, Royal or Viol, is a large single-sheave-block; the length is ten times the thickness of the sheave-hole, which is three-eighths more than the thickness of the sheave; the thickness of the sheave is one-tenth more than the diameter of theviol, and the diameter of the sheave is seven times the thickness. The breadth of the block should be eight times the thickness of the sheave, and the thicknesses two-sevenths of the length. This block is double scored,
the sheave is coaxed with brads, and the pin is iron, and nearly as thick as the sheave. It is used in heaving up the anchor. The vol. pages round the jeer-captains, and through the block, which is lathed to the main-malt; and the cable is fastened in a temporary manner to the vol. in several places. It is seldom used except in the largest ships of the Royal Navy.

**Block, Warping,** is made of elm or ash board, shaped like the body of a bellows; the sides or cheeks are 81 inches broad in the middle, and tapered to 12 inches broad at the ends; the back, or longest cheek, is 16 inches long, and 2 inches in thick, with 3 holes bored through the upper end to receive a leather strap; the upper cheek is 12 inches long, and 2 inches in thick, except the lower end, which is 1 1/2 inches thick, and forms the sheave-hole. The sheave is 1 1/2 inches thick, and 7/8 inches in diameter, made of lignum vitae, coaxed with brads; it is let into the cheeks one-eighth of an inch, to prevent the yarn from getting between the sheave and the cheeks. The cheeks are fastened together at the lower end with three screws and nuts; and the pin, which is iron, is fitted to the sheave, driven through the middle of the block, with a shoulder on the upper side, and clinched at the point on the lower side of the field; the upper part of the pin is tapered small, and a wooden handle riveted upon it. The cheeks have a broad chamfer round the outer edges; the inside edges, and inside of the block above the sheave, are lined with thin iron neatly screwed on, to prevent the block from wearing. This block is finished in a neater manner than blocks in general, and is seldom used but by rope-makers, to warp off the yarn into haws for tarring.

**Blocks, Single, double, or treble, in Rope-making,** are provided with a hook and thimble, and reeved with a rope, called the tackle-fall, which is used to stretch the yarn to its full extent, before the press is put on, by a capiller, or crab, at the lower end of the rope-walk. The fall is then belayed, until every yarn is hove thouth the strands and brought down, so that the rope may not exceed the circumference intended. For other blocks, see Bull's-eyes, Dead-eyes, and Euphodors. See Plates of Ships.

**Blocks, Strapping of.** A seventeen-inch block has a five-inch rope fall, and every inch in length above or under, to a twelve-inch block, has half an inch more or less sized rope allowed for the fall; a 11-inch block has a 3-inch fall; a 10 and a 9-inch block, 2 inches; an 8 and 7-inch block, 2 inches; a 6-inch block, 1 1/2 inch; a 5 inch block, 1 inch; and a 4-inch block, 7/8 of an inch. The above round iron-bound blocks are taken out of the size of the iron-fall, sufficient to bury it, except at the pin. Iron falls are from 1/2 of an inch to 1 inch in thickness, and nearly three times the thickness in width; the thickness of these should correspond to the yarn which they are to lift. The end block must have a strong fall and large iron hook, which hooks the ring of the anchor in casting. The top block should have a flat iron binding, with a strong short hook. Top tackle blocks have strong iron bindings, the upper block with a tackle-hook, and the lower block with a fairlead-hook. The fairlead, in iron-bound blocks, serves to turn it occasionally, in order to untwist the parts of the rope that form the tackle, as the mechanical power is greatly reduced thereby.

In rigging, the whole length of all the different sizes of block-falling is got upon the stretch, and hove out tight for working and serving; it is then wound and served, and cut into shorter lengths, to suit the different blocks. The falling of jeer-blocks is wound, parcelled, and served; falling of 4 inches diameter, and above, is wound and served; and all under 4 inches is only served with spun yarn; except the sprit-fall brace, bunt-line, and leech-line blocks, that are lathed under the tops, which are only served with spun-yarn over the splices, and the tail left half a fathom in length. Jeer blocks are double scored, and the double and treble blocks are strapped with a double flarp, thus: it is spliced together at the ends, and, when doubled, to be the size of the block and circumference of the yard; it is then doubled, and the block feized in the bight, with a long and short leg; the splice lying in the arc of the block.

The scores of all blocks are to be well-tarred, and the pin and sheave examined, before the flarp is put on. The block is let well into the flarp with wedges, thus: the four parts are strapped together with rope-yarn under the block, with a chock between, and the wedges are set between the breach of the block and chock. Then the flarp is nipped, with a heaver, round the block; the wedges, chock, and flarp, taken away, and the block hung upon the flake-head, or poll, and the flarp well feized together, close under the block, with nine under and eight riding turns, every turn strained tight round by a heaver, and crossed each way with two turns.

Jeer-blocks, for the main-heads, are strapped with long eyes, to receive many turns of the lathing; and the block is feized into the flarp as before, as are all feizing blocks, in proportion to their sizes. The flarps are cut agreeable to the following table.

**A TABLE of the Dimensions of Straps for Lathing and Seizing Blocks.**

Blocks, strapped with eyes or thimbles spliced in the ends, are feized tight into the bight, and the legs left long enough to lash through the eyes, round a mast, yard, &c. as the top-fall clew lines, clue-garnets, and sprit-fall clew lines, &c.

Blocks strapped with a thimble, or hook and thimble, have the flarp spliced together at the ends. The block is fixed in one bight, for the splice to lay on the arc of the block, and the thimble in the other bight; the feizing is put on, between the block and thimble, with eight under and eight riding turns, according to the size of the block, each turn strained tight by a heaver; the turns double crossed, and the end flapt with a wall-knot crowned.

Blocks strapped with double tails, are fixed in the flarp, similar to blocks with eye-flarps; and those with a single tail are spliced 1 1/2, and served with spun yarn over the flarp.

Girtline blocks are strapped in the house, and the girtlines reeved. See Elements and Practice of Rigging, &c. vol. i.
The approach to the walls on either side was defended by a deep ditch, the earth of which had been used in constructing the rampart. During the night, guards were kept on the several towers; sentinels were established at different posts round the whole extent of the circumference; and a corps de reserve of three hundred men remained always under arms, ready to march on the first signal whereover there might be occasion for their services.

This is the most remarkable instance of a blockade we meet with in the Grecian history. Notwithstanding, however, all the precautions above related, and the seeming impracticability of flight, the intrepid garrison of Platæa, found means to elude the vigilance of their besiegers, and by a well concerted sortie, about one half of them effected an escape across the formidable works of the Peloponnesians, and reached Athens in safety. The event is related in a very interesting and circumstantial manner by Thucydides in his second book. The Romans first invited, and finally furnished the Greeks in this as well as in every other branch of scientific warfare. As early as the siege of Agrigentum, in the first Punic war, we find them dividing their forces, and forming two encampments to block up the place on both sides; connecting these encampments by lines of circumvallation, and braving within these defences every effort made to relieve the town by the enemy from without. But these lines were equally badly guarded against a sortie with those of Platæa. The Carthaginian garrison, imitating the former example, succeeded in a like manner in forming a passage by night over the intrenchments of the besiegers. (Polyb. lib. i. c. 17.) The famous blockade of Lillybaeum, during the same war, which lasted for nearly ten years, is a remarkable instance of Roman perseverance in military undertakings, although, the place being open to receiving supplies from the sea, the dilatory of the besiegers was not attended with such complete success as it deserved. By degrees, however, the Romans improved in the art of reducing fortresses by blockade. Syracuse, which the abilities of Archimedes rendered impregnable by open force, had been thus reduced by Marcellus, but for the treachery of a townman, which in a great measure abridged his labour; and all the military science and manoeuvre of the formidable Hannibal was in vain exerted for the preservation of Capua, during the twelve months the siege lasted. (Polyb. Livy.)

The works contrived by Scipio Amilias for the reduction of Numantia, exceeded in magnitude all which had been raised on any former occasion, and besides surpassing them in strength, embraced a much greater extent of ground, than the intrenchments of the Lacedæmonians before Platæa. Numantia was eighty-four furlongs, or nearly a league in circuit. Scipio, after having invested it, drew a circle including twice the area of the circumscription of the town; and this work being completed, he threw up his lines of circumvallation and contravallation at a reasonable distance from each other. Each of these fortifications was composed of a rampart eight feet thick, and ten in height, defended by sharp palisades, and flanked with towers at a hundred feet distant from each other. We can hardly comprehend or credit the immense labour of such a circumvallation but nothing can be better attested than these facts. (Appian, de Bell. Hisp.)

Among the numerous exploits of Cornelius Sulla, the blockade of Prænestæ, during his civil war with the party of Marius in Italy, is not to be reckoned the least. The confidence and audacity, with which it was kept up during a long period of time, and preferred unbroken against the bloody and almost uninterrupted attacks of several hostile armies, superior in number to his own, conveys the highest idea of
his martial abilities. It was, however, under the auspices of Julius Caesar, that this branch of military science attained its highest point of perfection among the Romans; and whether we consult the annals of ancient or modern warfare, we find no example to equal the talents displayed by that unrivalled general, in the formation of his immense works before Alesia and at Dyrrhachium, which have deservedly excited the wonder and admiration of posterity.

In the former instance, he undertook the arduous task of blocking up an army of 80,000 Gauls, doubly superior in number to his own forces; commanded by a general of the greatest military knowledge, Verecundus, and entrenched under the walls of a fortified city, situated on an enormous inaccessible mountain. Caesar's line of contravallation, extending nearly eleven miles, was composed of a ditch fifteen feet broad, and as many deep, defended by a rampart twelve feet in height, furnished with a parapet, and fortified all round by turrets, at the regular distance of eighty feet. The front of the rampart, looking towards the town, was protected by a pallisade of sharp stakes and boughs of trees, interlaced, cut sharp, and pointing outwards. Before the fosse were planted five different rows of cippi, or large branches sharpened at the ends, fixed in trenches five feet in depth, and so strongly interwoven, as not to be removed or plucked up, without infinite labour. In front of these were arranged eight other rows of Lös, or pits, three feet deep, disposed in the form of a quincunx, stuck thick with strong sharp stakes, and covered over with bushes to deceive the enemy. Before these again were scattered up and down numerous stakes of a foot in length, fastened in the earth, and headed with barbed iron hooks, called by the Romans sirmult. Farther advanced than these last, at 400 paces distance from the rampart, Caesar drew another ditch, twenty feet broad and deep, to keep the garrison at a distance, and prevent them from annoying his soldiers while employed on the contravallation. Not contented with such immense labours, he constructed the like fortifications towards the country, for the purpose of frustrating any attempts the expected Gaulish successes might make for the relief of their beleaguered countrymen. Between the lines, a space of nearly half a mile in breadth, was disposed the investing army, and their principal encampment was pitched in the most convenient situation for communicating with every part of the contravallation. Behind these defences did Caesar battle the utmost efforts of a new army of 250,000 Gauls, sent to extirpate Verecundus; and, after a series of the most brilliant achievements ever recorded, obliged the town of Alesia, and the army included within its walls, to surrender at discretion. Cæf. de Bel. Gal. lib. viii.

No less famous in history, though not productive of equal success, were the celebrated lines at Dyrrhachium, carried over a tract of fifteen miles, and within which, Caesar flattered himself, to surrounder, and compel to a capitulation, an army exceeding his own in strength, and commanded by the great Pompey. But in this instance the conqueror of Gaul had to do with Romans, and the enterprise proved too hard for his strength. Pompey, by a sudden and well-directed effort, broke through the blockade, when it was on the very point of being completed; and had he briskly followed up the advantage, might, according to Caesar's own confession, have converted his adversaries' hopes of success into total defeat. Cæf. de Bel. Civ. lib. iii.

The works thrown up by Augustus at Perusia, and the entrenchments within, which Stilico at Pescula enclosed, and destroyed an inmation of 400,000 Goths, are proofs that in after ages the Romans retained a remembrance of the means by which Caesar had triumphed at Alesia, and were still capable of practising them for the extermination of their numerous enemies. App. de B. Civ. Zozim. Propl. Marc. Chron.

In modern warfare, there are two ways of forming blockades. The frail, and most simple, consists in fortifying and occupying different positions at a small distance from the place, principally upon all the highways and avenues, and along the banks of rivers, both above and below the town. These posts are guarded by distinct corps of infantry and cavalry, who take care to keep up an easy communication with one another, and to prevent all supplies of provisions from being conveyed into the fortresses blockaded. This, by degrees, reduces the garrison to great necessity, causes them to desert, and frequently occasions such murmurings and mutinies among the inhabitants, as to force the governor to a premature capitulation. Such a species of blockade is extremely tedious; for it is almost impossible to prevent provisions from being sometimes introduced in small quantities, and reviving the courage and patience of the besieged. But it is of advantage, after having thus for some time invested a town at a distance, to convert the operations into a regular siege, as the garrison are then generally unpriovided with the materials necessary for protracting their defence.

The second kind of blockade is much closer and nearer. It is effected by means of lines of circumvallation and contravallation, between which the army lies encamped, and is adopted only in particular cases. If, for example, after the loss of a battle, the enemy should retire into a town which is well known not to be over-abundantly supplied with provisions, and which, it is presumed, must be obliged to surrender in a few days. But as it would be the height of imprudence in a beaten general to expose the remains of his army to certain ruin, by shutting them up in a place so ill circumvallated, (a fault, nevertheless, committed by marshal Warwick in 1756, after the loss of the battles of Baflano and Rovereto, and which all the importance attached to the preservation of Mantua can hardly excuse), this kind of blockade is seldom put in practice.

It is rarely a fortresses is reduced to surrender, by the mere process of blockade; but sieges are often greatly accelerated by it, on account of the scarcity of necessaries, whether for the subsistence or defence of the garrison, which, in a greater or less degree, is its never failing consequence.

The blocking up of towns by corps principally of cavalry, posted in the neighbourings places of strength, is more convenient than any other method; because the troops forming the investiture, are not so fatigued as they would be in occupying open positions, and unfortified villages. In the latter case, it is necessary to be always on the alert, not only against the garrison, who, by a well directed sortie, may interrupt the communication, and cut off some of the detachments; but, against the enemy from without, who, by secretly marching a strong force, may surprize, beat up one of the besieger's quarters, and introduce a convoy, or reinforcement into the town. On account of these inconveniences, it is essentially necessary to ascertain the quantity of provisions and stores contained in the magazines of a place blockaded, in order to compute how long it may hold out, and to have an army in the field sufficiently strong to protect and cover the blockade. For, should the enemy succeed in surprising and cutting off one detachment, its defeat might occasion the successfull defention, or capture of all the others, before they could assemble in competent force to repulse the collected attacks of an enterprising and vigorous adversary. (Fauquieres, Mem. chap lxxxii. p. 377.)

It is chiefly, since the contest for the imperial succession 12
in 1792, that the expedient of blockading fortresses of the most formidable strength, has been preferred to the less tedious, but more destructive plan of carrying them by a regular siege. In the latter case, every outwork belonging to the place must be taken, or battered down inch by inch, with an immense loss to the besieging army, and frequently at the hazard of its being forced to the blockade. On the other hand a blockade, well kept up, must, sooner or later, reduce the garrison to the last extremity for want of provisions, or ammunition. The number of troops engaged in the enterprise is comparatively small. The losses of men, necessarily considerable in the frequent and bloody attacks on the fortifications of a well defended place, is entirely avoided; and the major part of an army is still at liberty to continue its advances into the heart of the enemy's country, and to follow up a previous success, without the tedious process of flapping to reduce every strong hold in its way. The inconveniences which might otherwise result from leaving a hostile garrison in the rear, are, in a great measure, obviated, if the blockade is kept up with proper alacrity and deftness. The enemy within the town have enough to do to attend to procuring provisions for themselves, without troubling the convoy's defined for the main army of their besiegers; and by this means, the operations of a campaign, so far from being retarded, are frequently accelerated, by having recourse to a blockade. Had the allied powers, instead of mauldering away their armies before the walls of Mayence and Valenciennes, and afterwards completing their ruin, by the impotent and bloody attempts upon Dunkirk and Maubeuge, adopted this method during the summer of the year 1793, they possibly might have made greater impression on the territory of the French republic. Had, on the contrary, the generals Jourdan and Pichegru endeavoured, in 1794, to carry Landrecy, Valenciennes, Condé, and Luxembourg, by regular sieges, instead of contenting themselves with leaving those fortresses in a state of blockade, it is very evident that the successe of the French, during the latter part of that memorable campaign, would have been by no means so rapid and important as they actually turned out.

When the directory formed, in 1796, the resolution of invading Germany, their armies made no attempt to attack in front the towns of Mannheim, or Mayence, but proceeded to effect a passage over the Rhine, at a distance from those places; and, instead of confining their time, and wafting their strength in long and tedious sieges, they advanced rapidly into Suabia and Franconia. They wished to become matters of Ehrenbreitstein, Mayence, Mannheim, and Philipburg, by the same method by which, in 1794, they had recovered the towns of Landrecy, Oesefroy, Valenciennes, and Condé, and to achieve, by a single manoeuvre, that which would, in former times, have been the result of two or three successive campaigns. Pursuant to this system, they forbore to undertake any siege, and ventured to leave fortified places at a great distance behind them. Their generals therefore, that by carrying the war away from those towns, they should, by force, detach the enemy from them; and judged that if they could obtain and keep possession of the country situated beyond those fortresses, they would, in the end, fall into their hands perfectly unarmied, and without having cost them either blood or treasure. They proposed to acquire the fortified places, by making themselves masters of the surrounding country; as formerly these countries were secured by getting possession of the fortified places. These had hitherto been the means of conquest; they now meant to make them its result. This method, by which the French acquired so great a number of fortified towns in 1794, met not with the same success as in 1795; but their failure did not arise from the strong places which they left behind them; and as these had not impeded the progress of Jourdan and Moreau, neither were they the causes of their first disasters. If the troops of the republic had been victorious at Amberg, or at Wurtzburg, the fortresses of Ehrenbreitstein, Mannheim, Mayence, and Philipburg, would, no doubt, have ultimately fallen, as Luxembourg did in 1795. Hilt. of the Camp. of 1796, Lond. 1796. 8vo.

As a proof of the little danger attending this method of carrying on war, we shall only add, that the garrisons of Philipburg and Mayence remained so closely blockaded by a small part of the French forces, as not to be capable of affording the archduke any essential assistance in cutting off the retreat of the invaders, notwithstanding the rapid and disorderly manner in which more particularly that of Jourdan was conducted. During the same year, Buonaparte, although the reduction of Mantua was the principal object of the campaign in Italy, did not for a moment desist in his other operations in the field. On the contrary, this did not hinder him from carrying his arms into the middle states of that beautiful country; from laying Parma and Modena under contribution; obliging the pope and duke of Tuscany to agree to a neutrality; forcing the English from Leghorn, and fighting the imperialists almost incessantly, on every point of a very extended line, to the destruction of no less than four of their armies successively detached against him.

Notwithstanding the tardy proceedings of a blockade are far from being congenial to French vivacity, yet, where the strength, or peculiarly inaccessible situation of a fortress, have precluded all hopes of success from a coup de main, they have often had recourse to this means. That they are policed of sufficient preservation on these occasions, the three blockades of Luxembourg, Mantua, and Ehrenbreitstein, in 1795, 1796, and 1798, are convincing proofs.

The most famous blockades which, during the last century, have distinguished the military history of Europe, are the following: That of Prague by the Austrians in 1742, is renowned for the gallant defence made by the French forces under the marquises Belflise and Broglie, for the space of five months, during which time they were driven to the last necessity for want of provisions; and for the daring retreat by which the former of these generals preferred the remains of his army from falling into the hands of the enemy. The late war has produced several remarkable instances. The two already mentioned of Luxembourg and Ehrenbreitstein reflect equal honour on the besiegers, whom no obstacle could deter from continuing, with invincible patience, their plan of reduction; and the garrisons, whose resistance was in the highest degree meritorious.

In 1796, public attention was everywhere engrossed by the blockade of Mantua, which gave occasion for the utmost exertion of that military talent by which the first soul of France has so eminently distinguished himself, and for the veteran marshal Wurmser to add fresh laurels to those he had already acquired, and draw even from his conqueror a flattering acknowledgement of the ability he had displayed in its defence. The different exploits of these generals; the entire destruction of four imperial armies, in vain attempts to relieve the place; the bloody battles of Caliglione, Roveredo, Arcle, and Rivoli, the result of those attempts; and the conquest of all Italy by the French,
French, the consequence of its fall, secures to the blockade of Mantua everlasting fame.

The conduct of general Maffia, when blocked up in 1620 within the walls of Genoa, may justly be compared with the most glorious actions of the war. Surrounded on all sides by enemies; cut off from every hope of succour by land or sea, and almost destitute of provisions or ammunition, he maintained, for sixty days, a post the Austrians had flattered themselves to reduce by famine in six; destroyed immense numbers of them in his different attacks on their posts; and having defended the place to the last extremity, obtained a negotiation (for Maffia would not suffer the word capitalization to be invested in the treaty), equally honourable to himself, and advantageous to his country. It was advantageous, inasmuch as it obliged the enemy to divide and scatter their forces, entangle themselves among the defiles of the Alps, and, besides losing a number of men before Genoa, drew them to such a distance from what the French government intended to make the principal seat of action during the campaign, as enabled the Austrians to push the great St. Bernard unopposed, occupy the plains of Piedmont, throw himself in the rear of general Melas, and, by the battle of Marengo, extinguish at once the hopes of the Austrians in Italy.

**BLOCK-battery**, in the *Military Art*, denotes a wooden battery on four wheels, moveable from place to place, whereby to set en barbe, or over the parapet; sometimes also used in galleries and cafemates, where room is wanted.

**BLOCK-book**, a term used in *Heroldry*, to express a bundle or bunch of knee-holm, or ballad myrtle, formerly used by butchers to clean the surface of their chopping-blocks, which forms a part of the armorial enigmas aligned to the company of butchers of London.

**BLOCK-carriage**, in the *artillery*, denotes a carriage used for conveying mortars and their beds from one place to another.

**BLOCK-house**, in the *Military Art*, a kind of wooden fort or battery, either mounted on rollers, or on a wheel, and serving either on the water, or in some counter-scars and counter-approaches. The name is sometimes also given to a brick or stone fort, built on a bridge, or the brink of a river, serving not only for its defence, but for the command of the river, both above and below. Such was that noted block-house anciently on the bridge of Delft, since demolished on enlarging the bridge.

**BLOCK-printing.** See *PRINTING*.

**BLOCKING**, in *Middle Age Writers*, denotes a kind of burial used for persons dying excommunicated.

**BLOCKINGS, circular**, in *Architecture*, are bases to the dome, represented in the *Plate of Archit.* (title *Baglioni*) QQ; which, by their apparent solidity, seem to strengthen the dome, and at the same time taking from its height, add a peculiar gracefulness to its appearance.

**BLOCKINGS, square**, are represented at S (title *Baglioni*), in *Plate of Archit.* Thence, when enriched with base and cap, obtain the appellation of *pedestals*.

**BLOCKING-course.** See *COURSE*.

**BLOCKLAND, Anthony de Montfort, in Biography*, a painter of history and portrait, was born of a noble family at Montfort, in 1532, and acquired his art in the school of Francis Floris, whose manner he always followed. By endeavouring principally to imitate the taste of the Roman school in design and composition, he became a distinguished artist. He well understood the principles of perspective, and he disposed his figures with judgment and accuracy. The style of his colouring was agreeable, and his pencil mellow. He designed every object after nature, and gave to the contours of his figures considerable elegance. His genius was best adapted to grand compositions, of which he designed many, both at Delft and Utrecht. Several of his works, particularly a Venus, and the history of Joseph and his brethren, are in so good a taste, that they seem to have been painted by a master educated in the school of Florence. Pickerington.

**BLOCKLEY, in Geography*, a township in Philadelphia, in the county of Pennsylvania.

**BLOCKY, among Jewellers, a name given to a diamond when its fides are too upright, by its table and collet being larger than they ought to be.**

**BLOEMARTE, Abraham, in Biography**, the most distinguished of a family of Dutch artists, was the son of Cornelius, an architect, engineer, and excellent flattnary of Dorstrecht, who, during the troubles of the Low Countries, removed to Utrecht. He was born at Gorcum in 1573, and died chiefly at Utrecht, where he probably died, A.D. 1657.

In youth, he diligently copied the designs of Francis Floris; but the excellence to which he attained was chiefly owing to his own genius, which enabled him to acquire a style of painting peculiar to himself. He painted history pieces, faced and proune, landscapes, and animals; but though he possessed a facility of invention, and a free-spirited touch, and well understood the chiaro-fcuro, his style and style are said to have too much of the Flemish, and he is charged with having indulged his own fancy, and deviating from nature in his figures. The historical picture of the death of Niobe and her children, gained him great reputation; the figures in the composition being as large as life. Some slight, matterly etchings are attributed to this artist, which are executed in a manner imitating drawings with a pen, from his own compositions. He also published some spirited chiaro-fcuros, the outlines of which, contrary to the usual custom, were not cut on blocks of wood, but etched upon copper. Of this kind are two large prints by him, representing Moses and Aaron, both sitting figures. He left four sons, all artists. His son Frederick worked chiefly from his father's designs, and imitated his style in his etchings and chiaro-fcuros. He also, conjointly with his father, made a large drawing book, consisting of figures, animals, landscapes, &c. *Henry* and *Adrian*, were both painters; and they are also mentioned as engravers: the most eminent, as a painter, was the latter.

**Cornelius**, the most distinguished as an engraver, was Abraham's younger son, and born at Utrecht, in 1603. Devoting himself wholly to the art of engraving, he first studied under Crispin de Pau, and then went to Rome, where he died, at a very advanced age. The manner of engraving adopted by this artist was original, and the source of that style in which the best French masters excelled, or those of them who worked merely with the graver. He covered the lights upon his distances, and the other parts of his plates which required tinting, with great care: whereas, before his time, the lights on the distant hills, trees, buildings, or figures, had been left quite clear; and by so many white spots, scattered in various parts of the same design, the harmony was destroyed, the subject confused, and the principal figures prevented from relieving with any striking effect. By this judicious improvement, Bloemaert gave to his prints a more clear and finished appearance, than all the laboured attempts even of Jerom Wierix had been able to produce. He drew correctly; but as he executed entirely with the graver, the extremities of his figures are heavy; and his heads are not always beautiful or expressive. In the mechanical part of the work few have excelled him,
BLOomen, Norbert Van, brother of the preceding, was born at Antwerp in 1672, and being allured by the reputation of his brothers to visit Italy, he there devoted all his hours to study. He principally painted conversations and portraits; but the colouring of his pictures is too glaring, and wants more truth and nature. Pilkington.

BLOIS, in Geography, lat. Blesa, a city of France, was, before the revolution, the capital of "Le Blaisois," the fee of a bishop, suffragan to the archbishop of Paris, and formerly the residence of the kings of France; but is now the capital of the department of the Loir and Cher, and divided into east and west Blois, the former containing 5400 inhabitants, and its canton 12,885; and the latter 7912, and its canton 11,862: the whole territory comprehends 2373 kilometres, and each canton has eight communes. Blois is seated in a pleasant country, on a small eminence near the river Loir, over which is a handsome stone bridge. The caile is the principal ornament of the city, and has, on the first view, the appearance of two distinct buildings, which are joined by a pittance cut out of a rock. That part of the caile, which was built by the duke of Orleans, instead of that which he demolished in 1652, is a lustrous, but unfinished edifice. The caile before it, where the church of St. Saviour is situated, is very large, and was formerly used for tournaments. The adjoining gardens are magnificent and beautiful. On every gate of the city is exhibited an image of the Virgin Mary, who is thought to have delivered the inhabitants from the plague in 1633. In this caile, famous as the birth-place of Louis XII., are shown the chambers where the duke of Guise, and his brother the cardinal, were murdered by order of Henry 111., December 23, 1587. The church of St. salon is the cathedral, which is a beautiful structure. The front of the Jésuit's college is decorated with the Doric, Ionic, and Corinthian orders of architecture. About three quarters of a mile from the city, water in great abundance descends through the cleats of a rock, in a large aqueduct, by which it is conveyed to a reservoir near the walls, and it is then distributed by leaden pipes to the several parts of the city. The trade of Blois consists chiefly of wine and brandy; though it has manufactures of serges and ticken. Several kings have kept their courts at Blois, and the French language is spoken in the greatest perfection by its inhabitants. N. lat. 47° 35' 20". E. long. 1° 20' 10".

Blois, Peter of, Petrus Bloentch, in Biography, an eminent writer of the 12th century, was born about the year 1120 at Blois in France, whence he derived his name; and as his parents were opulent, he enjoyed all the necessary means of a learned education. In his youth he studied in the university of Paris, where he manifested a strong inclination to poetry, and in his more advanced life, he applied with peculiar ardour to the study of rhetoric. At Bononia, in Italy, whither he removed from Paris, he acquired eminence by his knowledge of the civil and canon laws; and he appeared, by his writings, to have cultivated an acquaintance with medicine, and with various branches of the mathematics. But the principal object of his attention, and in which he is said to have particularly excelled, was theology, or the scholastic theology of the times, which consisted in vain attempts to prove and explain the numerous absurd opinions, which prevail in the church, by the subtleties of Arilhotelian logic. To him some have ascribed the first use of the term "transubstantiation," which was soon after adopted in the church of Rome. Being appointed preceptor to William II. king of Sicily, A.D. 1167, he obtained the custody of the privy-seal, and, next to the archbishop of Palermo, the prime minister, he had the greatest influence in all affairs. However, his power...
power soon terminated; for, upon the banishment of the archbishop, A.D. 1168, he left the court of Sicily, and returned into France. From France he was invited into England, by Henry II., who employed him as his private secretary, made him archdeacon of Bath, and gave him some other benefits. After having spent a few years at court, he conceived a disgust at that mode of life, and retired into the family of Richard, archbishop of Canterbury, who made him his chancellor, about A.D. 1176. After the death of this prelate, A.D. 1183, he acted as secretary and chancellor to archbishop Baldwin, his successor; and was deprived by him on an embassy to Rome, A.D. 1185, in order to plead his cause before pope Urban III., in the famous controversy between him and the monks of Canterbury, about the church of Hackington. When Baldwin departed into the Holy Land, A.D. 1190, he was involved in various troubles in his old age, the caustics of which are not distinctly known, and died about the end of the 12th century. From his works, which may be justly reckoned among the most valuable monuments of the age in which he flourished, and some of which may even now he read with profit, he appears to have been a man of approved integrity and piety, as well as of a lively inventive genius, and uncommon erudition. He is said to have dictated letters in Latin to three different seres, on different subjects, and to have written a letter in the same language himself, at the same time. His printed works consisted of 183 letters, which he collected together at the desire of Henry II.; of 65 seres, delivered on various occasions; and of 17 tracts on different subjects; "Opera P. Bloher. Paris., edit. A. D. 1667," fol.; and afterwards printed in the Bibliotheca Patrum, tom. 24. Cave Hist. Lit. vol. ii. p. 333. Henry's Hist. vol. vi. p. 147.

BLOMZYL, in Geography, a town and port of Oversby, situated at the mouth of the Steenwyk, or Old Aa, where it enters the Zuider sea, with a harbour capable of containing 250 vessels; defended by six bastions, and erected by the Dutch, at the commencement of their republic, to defend them from the invasions of the Spaniards. N. lat. 52 45'. E. long. 5 45'.

BLOMARY, or BLOOMARY, the first forge in an ironwork, through which the metal passes after it is melted out of the ore. (See Iron.) They are also called bllmary-barthils.

BLOMBERG, in Geography, a town of Germany, in the circle of Welfphalia, and county of Lippe, which obtained its first privileges, in the beginning of the 14th century, from count Simon I.; 8 miles S. E. of Lemgow.

BLOMESHOLM, a manor of Sweden, in the district of Bohus, about 3 Swedish miles from Stromlottad, in which is a very ancient monument, containing of large stones, set up perpendicularly, and arranged in the form of a ship.

BLONAI, a barony and castle of Switzerland, near Vers, and about 1 mile from the lake of Geneva. BLOND, LE, CHRISTOPHER, in Biography, a painter, was born in 1670, but little noticed in the more early part of his life. He became known at Rome in 1714, and established his reputation in Italy, as a good painter of portrait in miniature. At Amsterdam he distinguished himself by painting small portraits, for bracelets, rings, and snuff-boxes, first in water-colours, with a very lively and natural colouring, and afterwards in oil. From the Low Countries he came over to England, and projected a new manufacture for impressing colours on paper with copper-plates, which promised to be advantageous, but in the end proved detrimental to himself and his associates, to which his own diffusive life and manners very much contributed. His scheme was to copy the most capital pictures in England, of the greatest masters, so as to give his prints the appearance of paintings in oil. Many of his prints were well executed, and still exist, and are held in estimation. It is said, however, that he was not the original inventor of this method of managing colours; but that he took it from Lufman, and others, who with equal capacities and more diligent conduct, had undertaken it before him, but failed of success. Pilkington.

BLONDDEL, DAVID, a French Protestant minister, eminent for his acquaintance with ecclesiastical and civil history, was a native of Chalon in Champagne, admitted minister in 1614, and settled at Honnay near Paris. His first work in favour of the Protestants was printed at Sedan in 1619, under the title of "Modeste Declaration, &c." or, "A Modeste Declaration of the sincerity and truth of the reformed churches in France:" and intended as a reply to the invectives of the party of the bishop of Luçon, afterwards cardinal Richelieu. This work established his reputation among the Protestants, and occasioned his being much employed in their prisons. He was not distinguished as a preacher; and his style, as a writer, was perplexed, and incumbered with parentheses; but his judgment was penetrating, his memory tenacious, and his erudition extensive. As an honorary professor, with a pension, to which office he was appointed by the syndics of Charlestown in 1645, he had opportunity to devote his time to literature; but though he undertook to refute Baronius's anathemas, it does not appear that he did much besides writing a few notes in his own copy of the work. His works were "Explications on the Ecclesiastic," a treatise concerning "The Primacy of the church," "Pseudolitouris et Turrianus Vapulantes," against the Decretal epistles; a "Treatise on the Sibyls," disproving the truth of their oracles, and refuting the ancient practice of praying for the dead; and a treatise "De Episcopis et Prebendaris." By his treatise against the story of pope Joan, which he rejected as fabulous, he offended some Protestants, who did not wish to be deprived of this topic of satire against the Roman church. Among Blondel's works on civil history, we may reckon his "Genealogy of the kings of France against Chifflet," written in Latin, and printed at Amsterdam in 1642, 2 vols. fol. which is said to have been undertaken at the desire of chancellor Seguier; and his piece "De Formula Regniat Christo." On the death of Gerard Vossius, he was chosen to succeed him as professor of history in the school of arts of Amsterdam, and took possession of his office in 1650; but his affluence in the prosecution of his studies and change of air, occasioned the loss of his sight, after which, it is said, that he dictated his work intitled "Genealogy, &c." At Amsterdam his situation was rendered uneasy by a charge of Arminianism; and he died in 1655. Gen. Dict.

BLONDDEL, FRANCIS, an eminent mathematician and military engineer, was born in 1617, at Ribemont in Picardy. In 1651, he was travelling governor to the young count of Brie and, after a tour of three years he published an essay of the manner of erecting a bridge over the Charente at the town of Saintes. In 1660, he became member of the Academy of Sciences; and in 1670 he was honoured
honoured with letters patent from the king for the superintendence of all the public works in Paris. To him were intrusted the repair and decorations of the gates of St. Anthony and St. Bernard; and the gate of St. Denis, one of the most unfinished pieces of French architecture, was designed and executed by himself. In the office of director and prosector of the Academy of Architecture, established in 1671, he gave "A Course of Architecture," which was published in large folio, in 1668, and which was long considered as a standard book. In 1675, he presented to the king his treatise "On the art of throwing bombs," printed in 1685, 4to., and "On a new method of fortification," which procured for him the rank of marshall de camp. His other works were "Notes on the architecture of Savot," the "Resolution of four principal problems of architecture," Paris, 1676, fol.; "A Course of mathematics," Paris, 1683, 4to.; the "History of the Roman calendar," Paris, 1682, 4to.; and a "Comparison between Pinard and Horace." He also communicated several ingenious pieces to the Royal Academy of Sciences, which are inserted in their Memoires, particularly for the year 1666. He died at Paris, Feb. 1, 1686. Gen. Dict.

**Blondel, Francis.** was admitted doctor in medicine at Paris, the place of his birth, in 1632. As he had acquired considerable reputation as a scholar, he was engaged, on the death of Chartier, to assist in completing his magnificent edition of the works of Hippocrates and Galen, three volumes of which were left uninished. He was an avowed opponent to the admission of animony, and of all chemical preparations, into the practice of medicine, coinciding in that respect with his contemporary and coadjutor, Guy Patin. In 1658, he was made dean of the faculty of medicine, which office he held the following year. In 1665, he published "Statuta facultatis medicae," Paris, 12mo.; and in 1665, an epitaph to Aliot, "De cura carcinomatis, abique ferro et igne," 4to. Aliot used for the purpose a medicine prepared from the arffenicum rubrum, diffolved in aqua foris, and precipitated with the acetum furati. The precipitate was then washed by repeated affulgions of warm water, and its Curtis further mitigated by burning spirits of wine, in which it was immered, until the powder became perfectly inipid. Blondel died Sept. 5th, 1682. Haller. Bib. Chirurg. et Med. Eloy. Dict. Hist.

**Blondel, Francis.** born at Liege in 1613, studied medicine at Cologne, and was for some time physician to the elector of Treves. On the death of that prince, in 1652, he went to Aix, and was appointed physician and superintendent of the baths in that city. In 1662, he published "Lettre de Francisc Blondel a Jaques Didier, touchant les eaux minerales chaudes d'Aix, et de Borret, et les eures qui fe font faites par fou auge," Brux. 12mo.; and in 1671, "Thermarum aquiligranum, et porcetanarum descriptio," which was reprinted in 1688, in 4to. with engravings, and considerable additions. He died in 1703, much regretted by the inhabitants of Aix, having, by his writings, to recommended the waters, as considerably to increase the repute of patients there. Eloy. Dict. Hist.

**Blondel, James Augustus.** of a French family, but born in England, and made licentiate of the college of physicians in London, about the year 1722; published, in 1727, "The strength of imagination in pregnant women examined, and the opinion that marks and deformities in children arise from thence, demonstrated to be a vulgar error," 12mo. Though Dr. B. had not put his name to this work, yet his neighbour and colleague Dr. Turner, discovering that he was the writer, and considering it as an attack upon what he had said on the subject, in the 12th chapter of his treatise on the diseases of the skin, in which he gives numerous influences of marks and deformities in the bodies of children, implored on them by the disturbed imaginations of the parents, thought himself called upon to explain and to defend what he had thus advanced. He therefore, in an appendix to his treatise on gleet, published the following year, gave some additional objections on the subject, in further proof of the influence of the affections of the mother over the fetus in utero. To this Dr. Blondel replied, in 1729, and with much humour, as well as argument, flewed the absurdity and fallacy of the opinion maintained by his antagonist; who, if he infidently on his point, must admit that animals, and even plants, are under the influence of the same affections; their facts being frequently produced equally defective and monstrous as those of the human species. The answer is entitled, "The power of the mother's imagination over the fetus examined, in answer to Dr. Daniel Turner's book, entitled, 'A Defence of the 12th chapter of his treatise, de morbis cutaneis.'" This drew a more serious reply from Dr. Turner, addressed immediately to his opponent, under the title of "The force of the mother's imagination upon the fetus in utero still farther considered, in the way of a reply to Dr. Blondel's last book, by, &c." 1732, 8vo. But though the doctor supports himself with the authority of Schenckius, Hildanus, Horlius, and many other collectors of wonderful and extraordinary stories, the good sense of his antagonist prevailed, and he has the merit of having contributed very largely towards removing the prejudices on this subject, which had prevailed for ages, and, with them, the foolishness and anxiety which never failed to torment the minds of such women as had the misfortune, while pregnant, to see or hear anything, strongly affecting their imaginations, lest their offspring should be born with some defect or deformity. It is now pretty generally known, that no such consequences follow, and that the few cases in which children are produced defective, with redundant parts, or in any way distorted, happen indifferently, where the mother has or has not, if the course of her pregnancy, received some shock or alarm. The power of the imagination in marking, distorting, or deforming the fetus in utero is vanished, with the witches, ghosts, and hobgoblins, formerly equally objects of delight and terror. Haller. Bib. Chir. et Med. Pract. Eloy. Dict. Hist.

There is another writer of the name mentioned by bibliographers.

**Blondel, Jacques.** surgeon of Liege in Flanders. He translated the Chirurgia militaris of Nicolas Godin, under the title of "La Chirurgie militaire, tres utile a tous ceux qui veulent fuivre un camp, en temps de guerre, parallèlement a tous autres en condition peineuse ou dyfenterrique, ecrite en Latin, par Nic. Godin," Anvers, 1558, 8vo.

**Blondel, John Francis.** was born at Rouen in 1705; and was known, not only as architect to the king, member of the Academy of Architecture, and royal professor of the art at the Louvre, but by several useful publications; as "A Discourse on Architecture," 12mo.; "A Treatise on the decoration of buildings," 1738, 2 vols. 4to.; "A Course of Architecture," 6 vols. 8vo. 1771—1773. The two last were published in 1777, 3 years after his death. M. de Baflide also published, in 1774, a posthumous work of Blondel, entitled, "L'homme du monde éclairé, par les Arts," 8vo. 2 vols. Blondel was the author of the articles relating to architecture in the Encyclopedic. He died Jan. 9, 1774. Encycled.

**Blondin, Peter.** a native of Picardy, born Dec. 15th 1682, was a disciple of Tournefort, by whose advice he travelled over Picardy, Normandy, and the ile of France, in order to improve himself in botany. In the course of his excursion, he...
diffused upwards of an hundred and twenty plants, which had not been before described, and several others, which had been supposed peculiar to America. In 1708, he was admitted doctor in medicine at Rheims; and, in 1712, he was received into the French academy, in quality of cme of M. Reneaume, an honour he did not long enjoy, being cut off in the following year, by an inflammation of the lungs. M. Fontenelle, who spoke his funeral eulogium, attributed to him a small work, published in his lifetime, in which he had made some corrections in Tournefort's arrangement of certain species of plants; he also says, he left some curious memoirs on the subject of botany, intended for publication, and which were prevented being printed by his premature death. But his name does not appear in Haller's Bib. Botan. nor in the catalogue of botanical works contained in the splendid library of sir Joseph Banks, lately published by Dr. Dryander. Eloy Dict. hill.

BLONDVAURY, in Geography, a town of France, in the department of the Charente, 5 leagues east of Confolens.

BLONDUS, of Biondi, Michael Angelo, in Biography, was born at Venice, May 4th 1497. After studying under Augustus Niphus, a celebrated teacher of that time, he settled at Naples. He was a voluminous writer. The titles of the most distinguished of his works follow. "Epitome ex libris Hippocratis de nova et prima arte medendi deque dictione decreto," Rome, 1528, 1545, 8vo.; "Libellus de morbis purorum," Venetii, 1529, 8vo.; "De partibus iuuenis sectatis, et medicamento aqua, super invento. In plurimarum opusculorum de origine morbi Gallici, deque ligni ladicil ancipitri proprietate," Venetii, 1542, 8vo. For wounds made with a cutting instrument, and recently inflected, he recommends the application of simple water, as a most valuable and useful remedy. He does not admit that the venereal disease was a new complaint, originating in the West Indies, but believes it to have been known to Hippocrates, and other ancient physicians, and described in their writings. He had used the lignum facatum in his attempts to cure the disease, but ineffectually; the disease returning, he says, after discontinuing the medicine, with increased violence. He placed his principal dependence on mercury, but does not give the rationale, or method of using it. This work is inserted by Conrad Geiner in his "Collectio Serpentorium opti

BLONSK, in Geography, a district of Poland, belonging to the territory of Warsaw, in the palatinate of Czerek, or Mazovia.

BLOOD, is the nutritive fluid of animals. In the human subject it circulates through the arteries and veins (see Circulation), being of a red or black colour in the former, and of a yellow or black colour in the latter; it is of considerable cohesion; of a slightly saline taste, and peculiar smell; its specific gravity is estimated at 1.0527. When blood is drawn into a bottle, it shrinks into a transparent, jelly-like mass; and then spontaneously separates into a solid, heavier substance termed the coagulation, cruer, or the clot of the blood, and a supernatant pale liquor called the serum. If the coagulation of the blood be washed with water, all the red colour may be washed out of it, and a certain white substance will remain. This substance, which did exist in a state of subtle fluidity, so as to be capable of permeating the minute vessels of the body, and which thus spontaneously concretes, has been, therefore, called the coagulating lymph of the blood. If the blood be flourished with a needle, this substance concretes in a fibrous form round about it, and it was in consequence formerly termed the fibrous part of the blood. By this latter denomination, it is also now generally known and described. Thus it appears, that there are three parts readily distinguishable in the blood; the serum; the fibrous part or basis of the coagulation; and the colouring matter; to the more particular consideration of these we now proceed.

Of the Serum.

The Serum of the blood is of a light greenish yellow colour, and its mean specific gravity is estimated at 1.0287. If it be heated to about 163° of Fahrenheit's thermometer, the fluid serum becomes converted into a tremulous solid substance; which, being cut in pieces and compressed, there can be squeezed out of it a muddy and somewhat glutinous fluid, which is termed the coagulability of the blood. If the remainder be boiled, part of it will be found to be incoherent; and this has all the properties of albumen, or that infusible matter which is contained in the white of the egg; for an account of which, see the article Albumen. That part of the serum which is dissolved in boiling water, becomes a jelly, if the water be evaporated to a certain degree, and it is thus cooled to become cold. It is again soluble, if more water be added. This modification of animal matter is now termed gelatine, and to that article the reader is referred for a more full account of its properties. The coagulability of the blood appears to contain albumen mucilage, but no accurate chemical examination has yet been made of it. The serum of the blood turns the syrup of violets green; which effect is owing to soda, that is contained in it. If coagulated serum be heated in a silver vessel, the silver becomes blackened by being converted into a perilur; in consequence of the serum containing sulphur. If the particles of the serum be dissolved in boiling water, and afterwards crystallized, they are found to be carbonat of soda, muriat of soda, phospate of soda, and phospate of lime. Of the Fibrous Matter of the Blood.

This matter spontaneously concretes in open and in close vessels, in the temperature of the animal, or in a much lower degree of temperature, though with some little variation as to the time in which the coagulation happens. Dilution of albumen by water prevents its coagulation, even by those chemical agents which suddenly and firmly coagulate it in its natural state, such as heat, spirit, and acids. No dilution of the blood by water has hitherto prevented even the spontaneous coagulation of its fibrous part. The basis of the coagulation, or fibrous part of the blood, is found to be a whitish solid chalybic substance, of greater specific gravity than the serum. This substance, which is insoluble in water or alcohol, and which resembles the muscular fibres in its chemical properties, has been denominated by the French chemists fibrine, or fibrina, to which article the reader is referred for a more particular account of it. It is right however here to remark, that chemical analysis ultimately converts all animal substances into azot, hydrogen, and carbon; and that the proportion of the former is greater in the fibrous part of the blood than in albumen, or perhaps in any other animal compound.

Of the Colouring Matter of the Blood.

The colouring matter of the blood has an attraction to water and dissolves in it, forming a transparent red liquor. This attraction is perceived in macerating flesh in water; for the colouring part, which is specifically heavier than any other part of the blood, and readily sinks in the serum, yet rises up and becomes dissolved in the water. The watery solution of this part of the blood turns the syrup of violets green, and contains both soda and albumen. If the red part
part of the blood be incinerated by fire, it is found to contain much iron, which Fourcroy and Vaquelin discovered was contained with phosphoric acid in the flate of sulphonate of iron: and this is the only part of the blood which is found in analysis to contain any of that metal. Fourcroy examined the blood of the fetus, and found that the colouring matter was darker and more abundant than in the adult subject. He also found that the blood of the fetus contained no fibrine, but much more gelatine than in the adult.

The colouring matter of the blood is found, by examination with the microscope, to be composed of very minute globular particles. They were particularly attended to by Locuvenoock, and afterwards examined and described by others, chiefly by Senac, Hewfon, and Fontana. They are so small as scarcely to admit of an accurate examination in this climate by the common microscope. This attention will probably be readily admitted, if it be granted that they do not exceed a 200,000th part of an inch in diameter; yet such dimensions may be estimated as the average effimate of their size, drawn from the accounts of various observers. Haller says, that he saw them as large as peas by the polar microscope, and it was by the aid of that instrument that we are enabled to give the following account of them. A drop of blood, much diluted with water, was put upon a micrometer or piece of glass, ruled by a diamond in squares of a 12th an inch, and put before the lens of the polar microscope. The squares were magnified upon the screen to eight inches diameter. The globules of the blood were seen undulating to and fro in vast numbers; they all appeared exactly of the same size; and a few which were separated from the rest were attentively examined. These had all the appearance of globules; they were circular in their thick, and were regularly illuminated on one side, and shaded on the other, with the prismatic colours arranged in the middle or greatest convexity; the violet being next to the light, and the red next to the shade. On varying the focal distance of the lens, indeed, an alteration of appearance took place, some shading appeared in the middle just in the manner represented by Fontana. Upon again varying the position of the lens, the globules appeared as at first. This shadowy appearance in the middle probably led Mr. Hewfon to suppose that they contained a central solid particle. It is, however, generally admitted, that the colouring particles of the blood are spherical; and if their size be calculated from the preceding account, they will be found to be less in diameter than the 200,000th part of an inch.

If, for instance, the square of a 12th of an inch be magnified to a square of eight inches, and the globules appear 12th of an inch in diameter, then 64 may be placed in a line on one side of the square, and 64 x 64 = 4096, is the number that will fill within that surface. Now, this is square is but 12th of an inch, magnified on the screen to a square of 8 inches; then, multiply 4096 by 8, and it gives 24,380, as the number of these globules which would fill in the square of one inch.

The preceding account of the blood imperfect as it is, yet affords as much satisfactory information. We perceive that there are contained in the blood, in a state of subtile fluidity, the materials of which the body is constructed, and which are capable of becoming solid fibres of various degrees of solubility. We find in it also that aqueous liquor which fills all the interstices of the solid parts. It is true, that we find in the animal body many substances which do not exist formally in the blood, and which are new compounds of matter made out of that fluid; and for an account of which the reader is referred to glandular secretion.

With respect to that change which the animal matter undergoes from a fluid to a solid state, and which is called coagulation, but little is satisfactorily known. It seems to have been a problem amongst chemists, Scholten attributed it to the agency of calor; Fourcroy, to that of oxygen; and Dr. Thomson has of late accounted for it, without supposing the addition of any other substance to the coagulated matter. With reference to the last opinion, it should be observed, that in coagulation, a change in the chemical properties of the coagulated substance takes place, which implies, that a chemical alteration has also taken place; and that even if the theory were true with respect to slobber, it will not account for the coagulation of the fibrine of the blood. Where chemistry fails to explain phenomena incident to living bodies, it is fair to inquire if life may not have some share in their production.

Mr. Hunter thought that the coagulation of the blood depended on its living powers, and supported his opinion by many ingenious arguments. To remove any objection which might be made to a fluid or unorganized substance being alive, he adverts to what happens with respect to the yolk and white of the egg, which, in confluence apparently of their puffing a principle of life, are preserved from putrefaction during incubation, and which reflect the effects of heat and cold in a degree and manner similar to the lower kinds of animals. His chief arguments in evidence of the coagulation of the blood depending on life are, that in some cases where death has been caused by lightning, or by violent fatigue in running, as in animals who are hunted to death, or by blows on the stomach, the irritability of the muscles has been destroyed, and the blood has remained fluid, and never coagulated. Mr. Hunter also mentions, that he mixed infusions of bitter vegetables, which are generally considered as tonics, with blood, and these did not retard its coagulation, but that a solution of opium had that effect. As a prosecution of this hint, the writer of the present article caused blood to be much diluted with water, and infusions of noxious vegetables to be blown into it; yet in these experiments the fibrine still coagulated, and that in a sudden manner.

The vegetable infusions were those of opium, tobacco, and the atropa belladonna. It may be proper to relate the particulars of one of these experiments, in order to give a general idea of the whole. Eight ounces of blood were drawn from the arm into ten pints of water of 95° of Fahrenheit’s thermometer, containing a strong infusion of the atropa belladonna. It was blown with a glas rod; the two fluids appeared transparent and homogeneous. In eight minutes, the temperature being 93°, a considerable quantity of flocculent coagulum at once suddenly formed, and no additional coagulation afterwards took place. The thermometer was attentively observed, but no change was remarked in it during this coagulation. The gentleman who performed these experiments, willing to repeat them with some variety in the mode of conducting them, observed, however, that heat was given out during the coagulation of the blood, as will be seen in the following experiment.

Ten ounces of blood were drawn into a wooden bowl, in which a thermometer was held. The temperature of the blood, while flowing from the vein, was 93°. In five minutes the thermometer had sunk to 89°, and coagulation commenced on the surface; on elevating the bulb of the thermometer to the coagulum on the surface, the quicksilver rose to 90 and ½; on depriving it to the bottom of the bowl, it sunk to 89. This was repeated twice with nearly the same result, and on the third trial the quicksilver rose to 91°; and on depriving it again, it was perceived that the blood was coagulated.
BLOOD. 

coagulated throughout. After this, the quicksilver regularly continued to descend, and was no longer influenced by changing the situation of the bulb of the thermometer.

With respect to the use of the red particles, Boerhavus supposed, that they might tend to keep the dissimilar parts of the blood incorporated, as if agitated in a mixture of sand and water, would prevent the subsidence of the former from the latter. It seems, however, no improbable opinion, that this is the matter which has the very peculiar properties of forcibly attracting oxygen gas, even through the medium of the blood vessels, and combining with it, and becoming in confluence of a scarlet colour, yet, of holding it so loosely as to part with it in the round of the circulation to carbon and probably to hydrogen, and thus contributing to the production of animal heat. The writer of the present article is of this opinion, because he has exposed the red parts of the blood to air containing oxygen gas, and always found the oxygen gas diminished in proportion to the quantity of blood which had acquired a scarlet colour by exposure to it. On the contrary, he has exposed the parts of the blood to various kinds of gas, and never perceived any diminution of oxygen gas by that fluid. Thus probably we discover the principles of nutrition of the body and the canafe of its heat. For a further account of the effects of aspiration on the blood and its concomitants, see LUNGS, function of.

Haller's elements of physiology may be consulted for an account of all that had been done respecting the investigation of the nature of the blood till his time; the works of Mr. Hewson and Mr. Hunter may be referred to, for additional information on this subject; the works of Fontana, for microscopical observations; and for novel chemical experiments, the writings of Fourcroy, Vauquelins, &c. in the Annales de Chimie, and those of Deycux and Parmentier in the Journal de Physique, and Dr. Thomson's excellent summary contained in his System of Chemistry.

BLOOD, transfusion of. See Transfusion.
BLOOD, injecting liquor into it. See Injection.
BLOOD, spitting of. See HEMOPTYSIS.
BLOOD, cooling of. Lord Bacon has suggested that the prosecution of experiments on this subject might possibly lead to the means of prolonging life. But this great philosopher appears to have entertained erroneous notions respecting the animal economy, on this and some other points. Nothing accurate was known, in those days, on the subject of animal heat. If the blood were cooled below a certain standard, disease and death, and not longevity, would be the consequence. However, when the quantity of animal heat exceeds what is natural, the excess is carried off by an increased evaporation from the surface of the body, in other words, by perspiration. And in this way, or by the direct application of water of a low temperature to the skin, the blood, as well as every other part of the body, may be had to be cooled, and disease prevented or removed. But this is not what Lord Bacon meant in his proposal for cooling the blood.

BLOOD, duration of. See Secretion.
BLOOD, flux of, is called HEMORRHAGIA. The periodical ones of women, MENSES. Those after child-birth, LOchia. That ordinarily happening on the first edition is by some called and considered as the telf of virginity.

BLOOD, flowing of. See Systole.
BLOOD, vomiting of. See HEMOPTYSIS.
BLOOD, Circulation of the. See Circulation.
BLOOD, morbid alterations of. The alterations which the blood undergoes in various diseases are such as claim the attentive observation of physicians. But, in order to form a just conception of them, it is necessary previously to consider what are the component parts of this vital fluid, and their relative proportions, in the natural and healthy state.

By the accurate analyses of modern chemists it has been proved, that, besides water, and various saline matters (such as soda, phosphates of lime, of soda, and of ammonium, and nitrates of soda and ammonium), the blood consists of what is termed fibrin, albumen (coagulable lymph), and a colouring principle, viz. oxyd of iron combined with phlogoric acid. These several materials constitute the fluid called blood, which, in its natural state, is kept in constant motion, under a temperature of 98 or 101° (in some animals the temperature is rather higher) of Fahrenheit's thermometer. A large proportion of fibrin, some albumen, and the colouring matter, constitute the error, or crassimentum; while the serum is composed of water, with a large proportion of albumen, and the saline substances above mentioned.

Now, it is probable, that considerable alterations take place in the relative proportions of these ingredients, whenever the living body, whether of man or brute, becomes long or violently disturbed in its action, and especially (as Mr. Hewson has shown) whenever the energy of the vascular action is much increased. But in accounting for any remarkable alterations in the blood, there are several other circumstances, besides that of vascular action, which require to be noticed; and particularly the circumstances connected with respiration, such as the temperature, and purity or impurity of the surrounding air, its greater or less degree of humidity, &c. These, by their chemical agency, must have a considerable influence in the production of the various morbid alterations which take place.

Many variations, however, in regard to the relative proportion of the constituent parts of the blood, and other chemical changes in its qualities, which in all probability frequently take place, are not obvious to the senses, in some diseases, whilst in others they are very conspicuous; for instance, in pleurisy, peripneumonia, acute rheumatism, &c. In these disorders, the blood drawn from the veins, and suffered to stand in the cup until it is cold, becomes covered with a tough buff-coloured coat, or fize, and is usually called infiltred, or inflammatory blood. This fize is formed (says Mr. Hewson) by the coagulable lymph (which consists of albumen and a portion of fibrin) being fixed or coagulated, after the red particles have fubduced. The blood in these cases does not appear to be thicker, but on the contrary thinner than natural. It is lower in conglutinating than healthy blood. The coagulation is owing to the action of the air. Perhaps in pleurisy, acute rheumatism, and other disorders belonging to the phlogistic and morbid writers, some chemical change is produced in the fibrous matter of the blood (see Fourcroy's Comnoinance Chimiques, article Sang), whereby it is preternaturally softened or liquefied; or there may be an over-proportion of albumen, and that of an altered quality. Whatever be the real chemical difference, we cannot think with Mr. Hewson, that it is wholly occasioned by the increased force or energy of vascular action, since it sometimes occurs in cases where the action of the heart and arteries is not more vigorous than natural, and even where their action appears to be below the natural standard. Thus a fize has been sometimes observed upon the blood drawn from patients affected with typhus (Parmentier and Deycux in Fourcroy, as above referred to), and even on the blood taken from icteritic patients. (Ibid.) And Mr. Hewson himself remarks, that it is a common occurrence in pregnant women. Increased energy of vascular action is doubtless a principal cause of the changes observa-
able in fizy blood; but much is also to be ascribed, in this
busiest to the circumstances connected with respiration as
before mentioned.

This fizy blood being so constantly seen in pleurisy, peri-
pneumony, acute rheumatism, and other inflammatory dis-
eseases, it has been considered as a proof of the existence of
inflammatory action in all other cases, wherein it has been
observed; and has accordingly been deemed by many prac-
titioners the best and surest test or index when venepo-
tion should be repeated or withheld, as also concerning the
quantity of blood which should be drawn at each op-
eration. But this is a very wrong mode of proceeding. We
have shown that this appearance (the size of a buffalo coat of
the blood) is not restricted to disorders belonging to the clafs
of phlegmatics, but that it occurs in other infances, where
the free and frequent employment of phlebotomy would be
useless, or even pernicious. Indeed, we have often found
it necessary to repeat the use of the lancet, where this ap-
pearance of the blood has been wanting; and to abstain
from a repetition of it, where it has been present. In regu-
lating, therefore, the abstinence of blood, it is necessary to
attend not only to the appearances of the blood, but more
especialiy to the kind of inflammatory action, to the state
of the pulse and respiration, to the degree and fret of the
pain, and to the age and constitution of the patient. Fur-
ther, the term inflammatory blood, as being liable to mis-
conception and abuse, should be discontinued; and the ex-
pression flowy blood, or blood with a buffalo coat, should be
employed in its place. But if the term inflamed blood be
improper, that of putrid blood is much more so. This was
never yet drawn from any living animal, man or brute.
Putridity is easily known. The smell affords an obvious
test; but the chemical products obtained from animal sub-
fiances in a state of putrefaction are, the surest tests. Yet
those expert chemists, Medins, Parmentier and Deyvoux,
could trace no marks of putridity in the blood taken from
patients labouring under the worst forms of typhus, or what
are commonly called putrid fevers. Such blood did not
yield, by distillation in a water bath, any volatile alkali;
nor in a moderate temperature did it run into putrefaction
sooner than the blood of a healthy person. The blood in
these cases, however, has its peculiar appearances; which,
until we arrive at something more certain in regard to the
cause thereof, we should be content to call typhus-fener blood.
In like manner, the dark-coloured blood of scorbatic pa-
patients (which some ascribe to a deficiency of oxygen, and
we would add of albumen also) we should be content to
call scorbute blo d, until we have better data to proceed
upon. Again, it is conjectured that the pale colour and
dilute quality of the blood, in chlorotic and dropical pa-
patients, may be owing to a deficiency of the colouring mat-
fer (iron) of the blood, as well as an under-proportion of
the fibrous and albuminous matter. But we know not of
any experiments by which this has been demonstrated.
Hence we must for the present be content to name such
blood chlorotic and hydroptic blood; taking care at the same
time to have it understood, that in using these terms, it is
by no means intended to convey the idea, that such a state of
the blood is the cause of chlorosis or droopy, but merely the
concomitant of those disorders. Whoever wishes to in-
vigate the subject of the morbid appearances of the blood
more fully, should consult the writings of Hewson and
John Hunter; and for what relates to the chemical part of
the inquiry, Pocreoy.

Blood, Uso of thee, are either in the animal economy (see Blood supra, and Lungs,); or in medicine, religion,
diet, arts, manufactures, &c.

Blood, mechanical and commercial use of thee, are chiefly in
agriculture, where it is found an excellent manure for fruit-
trees; among lapidaries; in the manufacture of sugar, &c.; in
building, stones are sometimes rubbed with blood to
turn them brown. Some also pretend it has anciently been
used in the mortar of old walls. Blood is the basis of that
noble colour called by painters Prussian Blue. See Prussic
Acid.

Blood, eating of. This practice appears to have been
prohibited to Noah (Gen. ix. 3, 4), which prohibition was
renewed by Moses (Lev. xix. 10—14), and observed by the
Jews, principally with a view to the use of sacrifices in
divine worship, and as a token of respect to the altar, at
which the blood of every victim was presented before God.
The prohibition was repeated by the apostles at the council
of JeruEion (Acts, xv. 28, 29), confirmed and defended
by all the fathers except St. Angilicus, and the universal
practice both of the eastern and western churches till this
time; and in many churches, even of the West, much longer,
as low as the middle of the 11th, some say the 14th and even
the 12th century. The practice of the primitive Church
seems to intimate that they understood the apotolical pro-
hibition to be absolute and perpetual, as they abstained from
the use of blood for many centuries. When they were
charged with eating in the night, and drinking blood, by
way of binding one to another to secrecy, in foul immoral
practices, Tertullian replies to this charge, that it was well
known that no Christian would eat blood at all; infomuch,
that it was usual with heathens, when they wanted to know
whether any peron was a Christian, to let blood-puddings
before him as a very sufficient test. Moreover, blood is not
eaten by Christians in any part of the East, or by the
Greeks, or Russians, who are of the Greek church, to this
day; and it has been alleged, that the use of blood was not
introduced into this western part of the world till a very late
period. When the Pomeranians were converted to Chris-
anity, in 1120, they were particularly enjoined to abstain
from blood, as a badge of their profession. It was not al-
lowed to be eaten in the West in the time of Bede, or a cen-
tury afterwards; and blood was not eaten in any part of
Switzerland, till Calvin introduced the practive from some
other place. Dr. Lardner, however, says (ubi infra), that
little regard was paid to these regulations of the apotolical
decree by the Latin Christians, from the end of the fourth
century.

The question is, whether the apotolical precept to ab-

tain from blood, should be considered as only temporary and
occasional, a fort of accommodation to the weaknes of the
Jewish converts; or perpetual, founded on moral principles,
and consequently still obligatory. The former opinion feems
the more probable, and is the most generally received. For
the prohibition in the law of Moses, two reasons have been
suggested; one is, that the blood was appointed to make
atonement on the altar for offence against the law. The
prohibition, according to this view of it, must be restricted
to Jews and others circumcised under the manner of Moses;
for no other persons could offer sacrifices, or be cut off for trans-
gressing the Levitical laws, but such as were of that people.
The other reason is thus expressed: "It is the life of all
flesh; the blood of it is for the life thereof." (Lev. xix.
14); that is, as some have interpreted the passage, it is the
nourishment of the animal, and not fit for your nourish-
ment; and because it was not fit for food, and was unleas-
of and offensive, therefore it was to be poured out upon
the earth, or covered with dust, that is, buried in the earth;
and this order is frequently repeated. Lev. xvii. 13. Deut.
xii. 16. 24. xv. 23. Hence we may account for the con-
duct
duke of David, when his three warriors brought him water from the wall of Bethlehem, at the extreme hazard of their lives (1 Chron. xi. 18.); conferring the water as if it were their blood, which they hazarded to obtain it, he refused to drink it; and there being no rule or reason for offering such water upon the altar, he did what seemed to be next to offering it; "he poured it out before the Lord." The Jewish ordinance answered two obvious ends; it fostered, with other regulations and restrictions, to keep the Jewish people separate from other nations; and it also promoted their bodily health and vigor. But there is no foundation, either in the reason of this thing, or in the prohibition, to support the opinion of those who imagine the eating of blood to be an immoral thing; if this had been the case, God would not have permitted the Israelites (Deut. xiv. 21.) to eat a creature that died in his blood to an alien or stranger, that he might eat it. If, therefore, the eating of blood cannot be reckoned an immorality, the prohibition in the apocryphal decree cannot be binding upon all men in all times, but only at some seasons, when the circumstances of things render forbearance or abstinence expedient. Accordingly, if blood be thought disagreeable and unwholesome, as food, the use of it may be avoided for the sake of health; but we are not obliged to abstain from it upon a religious account, or in virtue of this decree, which would be no better than superstition. It has been supposed, by some approved writers, and especially by Dr. Lardner, that this was only a temporary provision, designed to prevent giving offence to the believing Jews, and to facilitate civil converse and religious communion between believing Jews and Gentiles. Dr. Lardner also supposes that the decree is not to be understood as a precept or commandment, but as delivering advice and counsel concerning some matters of prudence and experience, considering the circumstances of things and persons in that time. It has been farther urged as an argument against the perpetuity of the apocryphal decree, that the apostle Paul never quotes, or alludes to it in his writings.

On the other hand it has been argued, that the prohibition to eat blood, given to Noah, seems to be obligatory on all his posterity: and if it was so accomplished the first expressly given for all his posterity, it seems to be the referred back of acknowledgment to God, as the giver of life, and of the food which supports it. This respect paid to blood, which is fixed when animals are killed for food, and which is the most apparent vehicle of life, may also be intended to inculcate a respect for life, as the most valuable gift of God, and to warn us not to deprive any animal of it, and much less man, without necessity. It has also been pleaded, as an additional argument for abjuring from blood, that it is not a wholesome aliment, especially in hot countries, promoting leprous and scurvy disorders. The advocates of this opinion farther argue, that blood is prohibited because it tends to make men savage; that the prohibition is joined with that of fornication, which is an immorality in the common sense of the term, but which Dr. Lardner understands as denoting marriage with heathens, from which the apostle Paul so earnestly dissuades the Christians at Corinth: and that God has enjoined abstinence from blood on all Christians, in order to manifest his supreme dominion over all their enjoyments. Helden. de Jure Gentium, &c. l. vii. c. 1. Shuckford's Conn. vol. i. p. 93. &c. Lardner's Remarks on Dr. Ward's Dilettamenti in works, vol. xi. p. 329. &c. Prieiiey's Instit. vol. ii. p. 439. &c.

Blood, religious use of. Among the ancients, blood was used for the healing and ratifying of covenants and alliances, which was done by the contracting parties drinking a little of each other's blood; for appeasing the manes of the dead, in order to which blood was offered on their tombs, as part of the funeral ceremony. Thus we read, that twelve youths were sacrificed at the funeral of Patroclus: and eight at that of Pallas. Homer. Iliad. ver. 27. Virgil. Æn. lib. x. ver. 518.

The blood of victims was the portion of the gods, both among Jews and Heathens; and accordingly was poured or sprinkled on the altars, in oblation to them. Some have affected, that the Romans offered human blood to appease their deities, which is denied by others. The priests made another use of blood, viz. for divination: the streaming of blood from the earth, fire, and the like was held a prodigy, or omen of evil. The Roman priests were not unacquainted with the use of blood in miracles; they had their fluxes of blood from images, ready to serve a turn; wusses that had to have approached from the statue of Minerva at Modena, before the battle that at that place. But in the latter part of Christ our Saviour and his apostles. The priests and Levites had the power of dispensing the things of the sanctuary that were in their hands.

Blood, in the Roman Church, is used in speaking of the wine in the eucharist; which they suppose miraculously converted, by the priest's consecration, into the real blood of Christ. See TRANSUBSTANTIATION, &c.

Blood, is also used abusively for the sap of plants; as having much the same office, in the vegetable, as the other in the animal economy. In a sense not unlike this, wine is sometimes also denominated the blood of the grape. Blood is also applied, in Pharmacy, to certain vegetable juices, tears, &c. as dragon's blood. Dragon's blood, sangus draconis, is also used by the Arabs for the juice of the anchusa.

Blood, sanguis, a ruddy liquid produced from the roots of juncum, baked with bread; and liquefied, as it were, into blood, by a long distillation. Blood, in Chemistry and Alchymy, is a denominations given to several artificial compositions, chiefly on account of their red colour.

Blood is more peculiarly used by the alchemists for the tincture of a thing. In which sense we meet with blood of mercury, denoting the tincture of it; dragon's blood, denoting the tincture of antimony.

Blood, Dragon's. See DRAGON'S BLOOD.

Blood is also used in Middle Age Writers, for supreme jurisdiction, exercised by the lord of the fee, in cases where blood is spilt. This is also called "judgment of blood," "justice of blood," sometimes "cognizance of blood." Blood, avenger of, among the Jews, was the next of kin to the person murdered, who was to prosecute the murderer. Ecclesiastical judges retrench judgment to be given in cases of blood, because the church is supposed to abhor blood: it condemns no person to death; and its members become irregular, or disabled from their functions by the effusion of blood.

Blood of Christ, is the denomination of a military order instituted at Mantua, in 1668, by Vinci, Gonzangua IV. Its device was "Domine probasti me;" or, "Whil boke trible receptor." Hermann speaks of this order, and observes that it took its name from some drops of the blood of Christ.
fiald to have been preferred in the cathedral church of Mantua. The number of knights was restrained to twenty, besides the grand master; the office whereof was annexed to himself and his successors.

Blood, in Farriery, denotes a distemper in cattle's backs, which makes them in going draw their heads aside, or after them; the cure is by flitting the length of two joints under the tail, and thus letting the beast bleed plentifully. If he bleed too much, the farriers knit his tail next the body, and then bind fast and nettles bruised on the part.

Blood-running itch, is a species of itch in a horse, proceeding from an inflammation of the blood by over-heating, hard riding, or other sore labour; which getting between the skin and flesh, makes the beast rub and bite himself; and if let alone, sometimes turns to a grievous mange, highly infectious to all ungulates.

Blood, field of, in Syria acedamma, was a field purchased by the Jews, with the thirty pieces of silver which had been given to Judas for betraying his master, and which he had restored. It still serves for a burial-ground, in which all pilgrims, who die in their pilgrimage at Jerusalem, are interred. See Acedamma.

Blood-flower, in Botany. See Hæmatthys.

Blood-bound. See Hound.

Blood-letting. See Bleeding.

Blood, precious, in Ecclesiastical History, a denomination given to a reformed congregation of Bernardine nuns at Paris, first established under that name in 1661.

Blood, Princes of the, in France, are those descended from the blood royal.

Blood-fottten, in Surgery, a diftemper of the eyes, wherein the blood-veeffels are greatly diftended, so as to make the eyes appeare. See Ophthalmia.

Blood-stone. See Hæmatites.

Blood of sulphur, fanguis sulpharius, is a preparation of liver of sulphur, ground with the oil of tartar per dilutionem, then digested with dulcified spirit of nitre. It is reputed a good pectoral and diuretic, but rarely preferred.

Blood-cuffs, in Anatomy, usually include only the veins and arteries; though, in a larger fene, all the vessels in the body, as the nerves, lymphatics, &c. to the very hair, may be comprehended under the denomination. See Artery, and Vein.

Blood-snafe. See Blood-Snake.

Blood-wite, in Ancient Law Writers, signifies blood, and a customary amercement paid as a composition for the shedding or drawing of blood.

The word is also written blodwite, blodwita, blodwyta, bloodwit, bloodwit, bloodwit, and bludcwit; and is formed from the ancient Saxan blod, blood, and wite, or wuits, a fine or penalty.

The word also denotes an exemption from this penalty, granted by the king to certain persons and communities, as a special favour. Thus, king Henry II. granted to all tenants within the honour of Walfingford—"Ut quenf finft de higadie et blodwite et brewite."

Blood-wood. See Hæmatoxylon.

Blood-wort or Bloody Dock, in Botany. See Rumex.

Blood, inheritable, denotes such a regular descent as gives a person legal right to inherit the estate of an ancestor. See Antennder, Escheat, Inheritance, &c.

Blood, Royal, is applied to the regular descendants of the royal family. See Royal Family.

Blood, whole and half; a kinsman of the whole blood is he that is derived from the same pair of ancestors; whereas a person of half blood descends from either of them singly, by a second marriage. Blackit. Com. vol. ii. p. 227. See Descent.

BLOODY Crime, Sanguiniwm Crimen, in Writers of the Middle and Barbarous Age, that which is punished with the blood or life of the offender.

BLOODY Flux, in Medicine. See Dysentery.

BLOODY Hand, in Law, one of the four kinds of trefpasses in the king's foref, by which the offender being taken with his hands or other part bloody, is judged to have killed the deer, though he be not found either hunting or chasing. In Scotland, in such crimes, they lay, taken in the fact, or with the red hand. See Backberond.

BLOODY-heel Cock. See Heeler.

BLOODY Island, in Geography, an island in the harbour of Port Mahon, in the island of Minorca.

BLOODY Point, a cape on the south-west coast of the island of St. Christopher's. N. lat. 17° 24'. W. long. 62° 41'.

BLOODY BRZ, a bay on the north side of the island of Egmont, or New Guernsey.

BLOODY-Farndand Points, a remarkable head-land on the northern coast of the county of Donegal, Ireland, nearly opposite to Tory island. N. lat. 55° 9' 30". W. long. 8° 11'.

BLOODY Rain. See Rain.

BLOODY Urine, in Medicine. See Hæmaturia, and Urine.

BLOOM, in the Iron works, a term used by the miners for a four-square mass of hammered iron, about two feet long, and three quarters of a hundred weight, made from part of a few of cast iron. The bloom, however, is not yet become iron fit for the smith's use, but must undergo many hammerings, and be first made what they call the anoy, or which fee.

Bloom, half, a round mass of metal, which comes out of the fueny of an iron work. See Bloomy.

BLOOMS, in Sea Language, hot burning winds, blowing from the land to the sea.

BLOOMFIELD, in Geography, a township of America, in Ontario county, New York. By the late census of 1726, 151 of the inhabitants were electors.

BLOOMING VALE, a tract of land, in the township of Manlius, and state of New York, or Butternut creek.

BLOOMSOM, in a general sense, denotes the flower of any plant. See Flower. In a more proper sense, the word is restrained to the flowers of trees, which they put forth in the spring, as the forerunners of their fruit, otherwise called their bloom. The office of the blossom is partly to protect, and partly to draw nourishment to the embryo fruit, or seed. Phil. Trans. No. 599. p. 329.

Blossom, in Botany, denotes one of the parts of a flower. See Corolla.

Blossom is also used in the Meanges, for the colour of a horse, which has his hair white, but intermixed all over with foar and bay hairs, called also pencol-coloured.

Horis of this colour generally are hard and inefoluble, both in the mouth and the flank; so that they are little valued; besides they are apt to turn blind.

BLOOM, in respect of sheep. See Elixir.
BLO

BLOT I. "Eloge", or Blot in Rake, in Geography, a
town of France, in the department of the Allier, 16 miles
W. of Gannat.

BLOTED China Ware, a name given by some to a sort
of china that is loaded with colours in an irregular manner.
This pleases some people, but it is a defective sort of ware,
the large blotches of colours having been only laid on to
cover the blemishes or faults in the first baking.

BLOTHNO, in Geography, a town of Lithuania, in the
palatinate of Wilna, on the river Rawie, 16 miles N. of
Lida. N. lat. 54° 5'. E. long. 25° 34'.

BLOTTING Paper, a species of paper, made without
size or stiffening, serving to imbibe the wet ink in books of
account, and prevent its setting off, or blotting the oppo-
site page.

BLOTTING book, a sort of minute book, or memorandum
book, used by some merchants for making imperfect entri-
es in a present hurry, which are to be copied out fairer and
fuller at right into the journal.

BLOUNT, Thomas, in Biography, a learned English
writer, was born at Bordeaux, in Worcestershire, in 1619;
and, without the advantage of an university education, made
a considerable progress in literature. By profession he was a
barrister of the Inner Temple. Upon the breaking out of
the popish plot in the reign of Charles II., he was much
alarmed on account of his being a zealous Roman Catholic,
and, being the only, which terminated in his death, in
1679. His works were numerous; and are as follow: viz.
"The Academy of Eloquence," "Glo-" tographical, or a
dictionary interpreting such hard words, Hebrews, Greek,
Latin, Italian, &c. introduced into the English tongue,"
1656, 8vo.; "The Lamps of the Law, and the Light of
the Gospel, &c." "Boffobel, or the History of his Ma-
jefty's Escape after the battle of Worcester," 1662, 8vo.
the second part was printed in 1681, 8vo.; "The Catholic
Almanac for 1661, 62, 63, &c." "Booker refuted, or
Animadversions on Booker's Ephemeris, 1665, 4to.;
"A Law Dictionary," 1671, fol.; "Animadversions
upon Sir Richard Baker's Chronicle, &c." 1672, 8vo.
"A World of Errors discovered in the New Book of
Worlds, &c." 1673; fol.; "Fragmenta Antiquitatis,

BLOUNT, Sir Henry, was born at the feast of his father
Sir Thomas Pope Blount, at Tattenham, in Hertfordshire,
in 1602; and having completed his education at Trinity
college, Oxford, he commenced the study of the law at
Gray's Inn. Being resolved to travel, he set out on his
tour in 1634, and visited the Turkis dominions in Europe,
and also several parts of Egypt. After a long stay at Grand
Cairo, he returned to England, in 1636, and published an
account of his travels under the title of "A Voyage into
the Levant, &c." Lond. 1636, 4to. which had a rapid
sale, though it was not held in high estimation by the most
competent judges. Charles I. appointed him one of the
hand of pensioners; and, on his father's death, in 1638,
he succeeded to the family seat at Blount's hall in Stafford-
shire, and a considerable estate. In the civil war he joined the
royal party; but abandoning the royal cause, he was well
received in London by persons in power. In 1651, he be-
came one of the committee for reforming the practice of
the law; and he was very zealous against tyrants, and for
the reduction of the flippends of all parish ministrers to an equal
and moderate provision. His general knowledge recom-
ended him to the office of one of the commissioners for
advancing the trade and navigation of the commonwealth.
His brother's death, in 1654, made way for his succession
to the Hertfordshire estate. At the Restoration he was
favourably received by the king; and in 1661 he served
the office of high-sherif for the county of Herts. From
this time till his death, in 1682, his life was spent in a
gentleman; but he seems to have acquired from his travels
an inclination to freedom of opinion, and to have adopted
several singular and paradoxical notions. Six comedies,
ettled "Court Comedies" and published under the name of
John Lilly, have been ascribed to him. Biog. Brit.

BLOUNT, Sir Thomas Pope, eldest son of the preceding,
was born at Upper Holloway, near London, in 1649, and
educated under the immediate inspection of his father. Hav-
ing established an early reputation for learning and worth,
he was created a baronet by Charles II. in 1679. He represented
first the borough of St. Alban's, and afterwards the county
of Herts, and was always esteemed as a friend of liberty,
and a true patron of literature. Of his erudition he gave
evidence in his learned work, entitled, "Centuria Celebrat-
orum Authorum," printed at London, in 1690, folio, and
reprinted at Geneva in 1693 and 1710, 4to. This work is
an accurate and useful compilation, containing an account
of the characters and writings of both ancient and modern
authors. His work "De Re Poetica," published in 1694,
4to, is a similar compilation, comprehending an account
of ancient and modern poets. His "Natural History," printed
1693, 12mo., is a kind of common-place book, containing
observations, many of which are uncommon, selected from
the best modern writers. Of his talents as an original writer,
we have a specimen in his "Effays on several Subjects," 8vo.
in which he discusses many curious points; such as the in-
fluence of the priesthood; the regard due to the ancients;
the variety of opinions; the uncertainty of human know-
ledge; the effects of custom and education, &c. He died at
Tattenham, in 1697, and left a numerous family.

Biog. Brit.

BLOUNT, Charles, brother of the preceding, was born
at Upper Holloway in 1654, and possessed distinguished
talents, which were industriously cultivated by his father, who
affirmed the direction of his studies. As he was the favourite
of his father, he encouraged his marrying and settling in an
independent estate at the early age of eighteen years. If
we except a little tractate, published without his name, and
entitled "Mr. Dryden vindicated, &c." his literary career
commenced in 1678 or 1679, with the publication of his "Ani-
mal Mundi, or an historial narration of the opinions of the
ancients concerning man's soul after this life, according to
unenlightened nature;" in the composition of which he is
said to have been assisted by his father. This work contained
free opinions, which gave great offence; and though it
had been previously licensed, was suppressed by order of
Compton, bishop of London; and during his absence burned
by some officious zealot. Several answers to it were written;
and it was particularly animadverted upon in the second
volume of Nicholl's Conference with a Thief. In the same
year Mr. Blount published some extracts from Hobbes's
Levitathan, in a single folio, entitled "Mr. Hobbes's last
Words and dying Legacy," and intended to expose, proba-
ably, the political principles of this writer. To these, his
ardent zeal for liberty rendered him peculiarly adverse; and
his zealous attachment to this cause was soon after manifested
in a pamphlet, under the signature of "Junius Brutus,"
designed to alarm the nation with regard to a popish plot,
and the prospect of a popish successor to the crown. In 1680
he published his translation of "The Two First Books of
Philostates, concerning the life of Apollonius Tyanaus,
with philological notes on each chapter," fol. which, being
considered as a dangerous attempt to reproach and injure
the Christian religion, was immediately suppressed, so that
new
few copies of it could be obtained. This was followed, in
the same year, by a work entitled "Great is Diana of the
Ephesians, or the Original of Idolatry, together with the
political institutions of the Gentiles' Sacrifices;" which,
though professedly written against the impositions of the
Heathen priests, was thought to be aimed at the Christian
priesthood, and indirectly against all revelation. The author
was now considered as the head of the Deistical sect, and he
was charged with having taken great pains, by conversation
and correspondence, to propagate and defend his opinions.
In a letter to Dr. Sydenham, however, he acknowledged,
that in point of practice, Deism was less satisfactory than the
Christian femehe. The clamour occasioned by his former
publications made him somewhat more cautious and reserved;
and accordingly he flanadly concealed his being the author
of a treatise, entitled "Religio Laici," published in 1683,
and said, by Dr. Leland, in his Deistical writers, vol. i. p. 37,
to be little more than a translation of Lord Herbert's work,
under the same title; and he also abandoned the design
which he had formed of writing a life of Mahomet. From
this time he seems to have changed the objects of his study;
for in 1684, he published "Jamaica Scientiun; or an Intro-
duction to Geography, Chronology, Government, History,
Philosophy, and all gentlle forts of learning," 8vo. which
was intended to affit young persons at an early age in the
acquisition of principles of philosophy and science, without
pursuing the tedious course that had been usually preferred
in to schools.

Mr. Blount was one of those who cordially concurred in
the revolution; and in a letter addressed to W. Lefevon
Gower concerning corporations, and inferred in the "Oracles
of Reason," he expresses his wish, that those counsellors of
the late king, who had injured the independence of parlia-
ment, might be punished, justly considering the purity of
representation as the essence of a free constitution. About
this time he wrote his treatise entitled "A Full Vindication
of Learning, and of the Liberty of the Prefets," which is
elected one of his best performances, and a summary of all
the principal arguments that can be urged upon this topic.
In his zeal for the cause of king William, he wrote a pamphlet
in 1693, intended to prove the right of William and Mary
to the crown, on the ground of conquest; and in explana-
tion of this design, fo llifonnant, one would imagine,
with his principles, and no less obvious than ill-advised,
he declares that he wrote "with an especial regard to such
as have hitherto refused the oath, and yet allow of the title
of conquest, when confecrated to a just war." By this per-
formance he gave such offence, that, on a complaint being
brought before the house of commons against this pamphlet,
entitled "William and queen Mary Conquerors," it was
ordered to be burnt by the hands of the common hangman;
and in the same contempt was involved a pastoral letter of bishop
Burnet, in which the fame notion was advanced, probably
with the same views.

Mr. Blount, having lost his wife, became ardently en-
amoured of her fliter, a lady of great beauty and merit, who
feemed disposed to return his affection; but as the ecclefia-
stical laws opposed their union, he drew up a cafe strongly
argued, and referr'd it to certain divines, who of course
gave their opinions against his wishes. As the lady refused
to comply, after such a determination, Mr. Blount funk into
defpair, and at length fhot himself through the head.

After this act of phreny, he languished for some days,
receiving no nourishment but from the hands of the object
of his affection, till at laft death releafe him, August 1693.
Many of his private letters and fome small tracts were pub-
lished, together with a preface, by Gildon, in 1693, before
the author's death, in a work entitled "The Oracles of
Reason," which was afterwards re-printed, with fome ad-
ditional pieces, after his deceafe, in 1695, in a collection
of "The Miscellaneous Works of Charles Blount, esq.," by
the fame Mr. Gildon, who prefixed to it an account of
the life and death of the author. The learning of Mr.
Blount is unquestionable, and he seems to have possessed
a strong and ardent mind; but his early dislike of superstition
precipitated him into some very considerale errors, and
inclined him to believe all revealed religion to be pretenc-
ious, because he perceived that some priests had converted
religion to their own pecuniary advantage. His sentiments on the
subject of religion were divulged in his writings without dif-
guise, and sufficiently warrant our referring him to the clas-
of deists; but the charge of atheism alluded against him
by fome foreign divines, is certainly unfounded. See an
account of Mr. Blount's writings by Dr. Leland, in the
fourth letter of his View of the D€istical Writers, vol. i.
By this author we are informed that Mr. Gildon, who pub-
lished the "Oracles of Reason," and communicated them
to the world, was afterwards, upon mature consideration,
convinced of his error, and in 1703 published his retraction
part of this book is intended to vindicate the doc-
tines of the existence and attributes of God, his providence
and government of the world, the immortality of the foul,
and a future state. And his avowed reason was, because
many of the deists, with whom he was well acquainted,
did really deny those great principles, which lie at the
foundation of all religion, or at least, represented them as
doubtful and uncertain. And their not admitting natural
religion in its juft extent, formed fome of their principal

Blount, in Geography, a new county of the State of
Tennflee, in America, bounded fouthier by lands re-
tained by the Indians. It contains 5326 inhabitants,
of whom 339 are blacks.

BLOUNTSVILLE, a town of America, in North Ca-
rolina, on the post-road from Halifax to Plymouth, 49 miles
from Plymouth, and 55 from Williamstown.

BLOW, in a general fense, denotes a stroke given either
with the hand, a weapon, or instrument. The effect of
a blow is estimated like the force of percuflion, and ac-
cordingly it is exprfied by the velocity of the body multiplied
by its weight.

In Elingo, blows differ from thrusts, as the former are
given by striking, the latter by pushing. We fay to give,
to return, to party a blow. (See Parrying.) Blows on
the fword make a kind of purrufit, called BEATING.

Blow, blind, iulus oculus or oculo, is that which does not
appear, or is not attended with effufion of blood; in contra-
diftinction from that followed by a wound, discolouring,
tumour, or the like, called iulus aperitus or aparentis, an open
blow.

In the ancient laws, we find blows for remembrance, given
to make persons remember fome transafion, and enable them
to become better witnesses of it in future times.

Blows, military, alula militaris, that given with the fword
on the neck or shoulder of a candidate for knighthood,
in the ceremony of dubbing him. The custom feems to have
taken its rise from the ancient ceremony of manumifion.

In giving the blow, the prince ufed this form: "efto
bonus miles;" upon which the party rofes a complete knight,
and qualified to bear arms in his own right. Sometimes a
double or even triple blow was given, called trina percaro.

Blow, Dr. John, in Biography, born at North Colling-
ham, in Nottinghamshire, was one of the first fet of children
of the chapel royal after the reforation, that was brought
up under captain Cook. He likewise received instructions
from
from Hugelston, domestic organist to Oliver Cromwell, and Dr. Christ. Gibbons. In 1675, he was sworn one of the gentlemen of the chapel; and in 1674, upon the decease of Humphrey, appointed master of the children. In 1687, he was nominated one of the private music to King James II., and in 1689, he was likewise appointed almoner and master of the choristers in the cathedral church of St. Paul; but, in 1693, he resigned this last place in favour of his scholar Jeremiah Clark.

Blow had his degree of doctor of music conferred on him by the special grace of archbishop Sancroft, without performing an exercit for it in either of the Universities. On the decease of Purcell, in 1695, he was elected organist of St. Margaret's, Westminster; and, in 1699, appointed composer to the chapel of their majesties, King William and queen Mary, at a salary of £120 a year, which afterwards was augmented to £51. A second composer, with the like appointment, was added in 1715, when John Weldon was sworn into that office; at which time it was required that each should produce a new anthem on the first Sunday of his month of waiting.

That Blow was a composer of anthems, while a singing-boy in the chapel royal, appears from Clifford's Collection of the Words of the Services and Anthems used in our collegiate and cathedral churches, 1664; for among the ecclesiastical composers mentioned in this book, amounting to upwards of sixty, are included the names of Pelham Humphrey, John Blow, and Robert Smith, children of his majesty's chapel. Humphrey was born in 1647, and Blow in 1648; so that at the redaction, the first being only thirteen, and the second but twelve, their composing anthems fit for the chapel royal, before they had attained the age of sixteen or seventeen, would now be regarded as wonderful proofs of precocity, if Purcell, soon after, at a more early period of his life, had not produced compositions that were full superior to theirs.

Dr. Blow died in 1708, at sixty years of age: and though he did not arrive at great longevity, yet, by beginning his career, and mounting to the summit of his profession so early, he enjoyed a proflorous and eventful life. His compositions for the church, and his scholars who arrived at eminence, have rendered his name venerable among the musicians of our country.

Though his church music was never collected in a body, yet, besides the three services and ten full and verie anthems printed by Boyce, in Dr. Tudway's MS. collection, nineteen of his choral productions have been preserved; and in Dr. Aldrich's collection in Christ-church there are five more. The aggregate of which, amounting to upwards of forty different compositions of this elaborate kind, is but a small part of what might be found in the chapel and choir-books of our cathedrals.

Some of his choral productions are doubtless in a very bold and grand style; however, he is unequal, and frequently unhappy, in his attempts at new harmony and modulation; but, as a composer who ranked so high among our most classical masters should not be praised or cenured indiscriminately, we shall point out a few instances of his great, and to our conceptions, unwarrantable licences, as a counterpoint.

We are so farry to see, as to say, how confined and inaccurate a harmonist he was; but as it is necessary to speak of an artifce so celebrated and honoured by his contemporaries, to dissemble his faults would furpafs candour, and incur the cenure of ignorance and partiality; for it is as much the duty of an historian to blame as to praise, when justice and integrity require it. Indeed, upon whatever subject a man writes, he should aspire at nothing so much as speaking truth of he wishes for the approbation of his conuenience, which is not only the most comfortable of all praise, but, luckily, the most within his own power. The abilities of the dead, we can have no interfet in depreciating; and if our opinion should be unjuft, the mischief will recoil on ourselves; for the dead have more friends than the living, who are ever ready to vindicate such wrongs.

Though there are strokes of pathetic and subjects of fugue in Blow's works that are admirable; yet we have examined no one of them that appears to be wholly unexceptionable, and free from confusion and crudities in the counterpoint. Of the two-part anthem with choruses, "Lord how are they increased," the first movement is very plaintive and expressive; but there are licences in the harmony which look and found quite barbarous. Indeed, these crudities are so numerous as to throw a doubt on his learning, as well as genius. Whether they are notes of paflion, effusions of an unriely spirit, or of ignorance and affectation, we will not venture to determine; but to our ears, they have the full effect of jargon and want of principles.

It does not appear that Purcell, whom he did himself the honour to call his scholar, or Crofts, or Clark, his pupils, ever threw notes about at random, in his manner, or indulged the ear with lawful discord, which no concords can render tolerable.

In an anthem, "Turn thee unto me, O Lord," printed by Henry Playford in the second collection of Divine Harmony, there are so many wanton violations of rule, particularly in the last chorus, that it would be endles to point them out; but they seem such as no rule, authority, or effect, can justify; 7ths resolved on the 8th, ascending and descending; 2ds treated with as little ceremony as 3ds. Indeed, we never saw so blovenly a score in print; and it may, in general, be said of his faults in counterpoint, that there are unaccounted millions of them to be found in his works.

He has been celebrated by Dr. Boyce, for "his success in cultivating an uncommon talent for modulation;" but how so excellent a judge of correct and pure harmony could tolerate his licences, or reconcile them to his monumental character, and the additional praisce he has himself bellowed upon him, is as unaccountable as any thing in Blow's compositions, considering the knowledge and known probity of the late worthy editor of Cathedral Music.

Many of his ballads, though only in two parts, are full of crude discords unprepared and unresolved; the cause of which, in some measure, may be ascribed to the ground-baser, on which it was now the fashion to write: for melody being scarce, both that and the harmony were frequently injured by this Gothic refrain. But the passing-notes and notes of embellishment of the composers, in general, of this period, were uncouth in melody, and licentious in harmony. Perhaps those of the present times, in less than a century, will be equally unpleasing to the ears of politerity; and yet we fancy that both melody and harmony have received their last polish.

The ballads of Dr. Blow are in general more smooth and natural than his other productions, and, indeed, than any other ballads of his time; there is more melody than in those of Henry Lawes, or any composer of the preceding reign; yet it is not of that graceful kind in which the Italians were now advancing towards perfection, with great rapidity. It is either of a Scots call, or of a languid kind, that excites no other sensation than fatigue and drowsines.

His pastoral, "Since the Spring comes on," is, however, as chanzant as any mongrel mixture of Scots, Irish, French, and English, that has been since compiled.
The blow-pipe (more distinctly represented in fig. 2.) is so called from its resemblance to a shoe. It is made of tinned iron, and consists of two parts: the exterior, a, serves to hold the proper lamp, and to retain the oil, which occasionally drops from the wick; the lamp, b, has a fixed cover, except at the tip, e, where a circular aperture is left for the wick, d, which consists of a bundle of cotton threads, about an inch in diameter; at e is a hinge, by which that part of the lid nearest the wick may be raised, in order to pour in fresh oil, or to renew or raise the wick.

The glass-worker's blow-pipe is, however, not sufficiently portable for the use of the chemist and mineralogist, and it was a happy thought of Swab, the Swedish mineralogist, to substitute the lungs for the bellows. Gahn, Engelroth, and Bergman suggested various improvements in the construction of this instrument, which now appears to have attained a great degree of perfection, as it is perhaps capable of.

The common chemical blow-pipe consists of five parts; (Chemistry, Plate XI. fig. 3.) the mouth-piece, a; a plain tube, b; a bulb, c; a curved tube, d; and a nut, e.

The mouth-piece (more distinctly represented by fig. 5.) is made of ivory, the rest of the apparatus being of brass, and fits closely into the pipe, b, so as to be air-tight; the bulb, c, is divided into two hemispheres, which screw into each other, and is designed to collect and condense the moisture of the breath; into the lower hemisphere is fixed the recurved tube, d (as represented in fig. 4.), in such a manner as to prevent the condensed vapour from escaping out of the bulb; the nut, e, is a hollow cylinder sufficiently wide at one end to receive the extremity of the curved tube, and perforated at the other with a small round hole, to allow a passage for the air; each blow-pipe has generally three of these nuts (fig. 6.), with apertures of different sizes, the largest of which does not exceed the diameter of the smallest pin.

In using the portable blow-pipe, the only difficulty is to keep up a constant stream of air; which is to be done by performing the function of respiration through the nozzles alone, diverting from time to time a portion of the expiration into the mouth for the supply of the blow-pipe, and forcing it through the tube by the action of the muscles of the cheek. This knack is by some acquired in an instant, while others are a long time in making themselves masters of it. To those who experience any difficulty in the free use of this instrument, the following directions may be of service. First, let the learner accustom himself to breathe freely with the mouth full; then in making an expiration, let him transfer the air into the mouth, till the cheeks are moderately inflated, and retaining it there, let him discharge the surplus of the expiration through the nozzles, and then make two or three easy inspirations and expirations through the nozzles, without allowing the air in the mouth to escape. When practice has rendered this easy, which may be effected in half an hour, let the nut with the smallest aperture be fixed on the curved tube of the blow-pipe, and introduce the mouth-piece within the lips; then inflate the cheeks by an expiration, and continue breathing easily through the nozzles, till nearly the whole of the air has passed out of the mouth through the tube; then renew the air as before, and, after a few days' practice, the muscles of the mouth will become accustomed to this new mode of exertion, and an uniform uninterrupted stream of air may be kept up for half an hour without any extraordinary fatigue. A wax candle, f, having burnt long enough to allow the wick to be turned down, in the manner represented in the plate, the nut of the blow-pipe is to be applied to the arch of the wick, and the air, as it comes through, will bend the flame into a neat horizontal cone, the exterior part of which is yellow, and the interior...
The substance under examination being reduced to the size of a peppercorn, is to be placed in the platinum spoon (fig. 5), or into a shallow cavity in a piece of compact charcoal, and being first gradually heated by the yellow flame, it is afterwards to be exposed to the full intensity of the blue focus, \( \theta \).

An important use of the blow-pipe in the laboratory is to soften glass-tubes, &c. in order to bend them to any shape that may be required, for which purpose the blow-pipe just described is not very well qualified, the flame not being large enough, and, from its intensity at the blue focus, acting very unequally. It may, therefore, in thefts, and similar cafes, be advantageously superfed by the alcohol blow-pipe.

This instrument, the invention of which is due, we believe, to M. Paul and professor Pickart of Geneva, has received here improvements from English artists, and is figured in Chemistry, Plate XI. fig. 1. and 2. It is made of brasses, and consists of the following parts: \( A \) is an oval bafe, in which are two round holes, for the reception of the two spirit lamps, \( B \) and \( C \), the latter of which has a considerably thicker wire than the former. \( D \) is a piller that screws into the bafe, and supports a moveable brasses collar, \( E \), which may be retained at any convenient height by the screw. \( F \) is the boiler hanging loosely, but securely, in the collar; \( M \) is a screw accurately closing an aperture in the boiler, through which it is filled with alcohol; \( I \) is a conical plug, serving as a safety-valve, the resistance of which to the expansion of the vapour is regulated by the feel flying \( H \), composed between the screw nuts \( G \) and \( K \); \( O \) is the delivering pipe, seen more particularly at fig. 2. It consists of a plain tube, \( a \), somewhat longer than the depth of the boiler, of a hollow and screw, \( b \), by which it is fixed in the bottom of the boiler, of a ball and joint socket (composed of the sphere, \( a \), including the perforated bulb and stem \( f \).), and of the nut \( g \), terminated by a small aperture, &c. screwed on the stem \( f \). \( N \) (fig. 1.) is a hollow cap, screwed into the boiler, and receiving the head of the tube, \( a \), to prevent any liquid alcohol from being thrown into it. This blow-pipe works in the following manner: The boiler being filled with alcohol, and the screw and valve secured, the lamps \( B \) and \( C \), are lighted. The alcohol in the boiler being brought to ebullition by the lamp \( B \), the vapour ascends into the cap \( N \), whence it passes down the tube \( O \), and is discharged at \( P \), upon the wick of the lamp \( C \), producing a long bulky; and continuous flame \( Q \), whose extreme temperature is nearly equal to that of melting copper, and admirably fitted for the working of glass.

Mr. Bache in his History of Chemistry, has given an ingenious method of increasing the intensity of any flame, by alcohol: for a description and drawing of which we refer to that valuable work, vol. i. p. 111.

The blow-pipe is of considerable use to the mineral chemist, in the reduction of metallic ores, for giving them extreme heat, and for the ready and convenient working of various apparatus. We have often used it for the determination of the principal contents of metallic parts, and have had occasion to afford a clew to the cause of some unexpected operations.

The efficacy of the blow-pipe in the separation of metal by sublimation, is, however, greatly to be noticed with oxygen gas; a heat that is produced by any equal that of the solar rays concentrated by the bale lens. The apparatus for this purpose consists of the common blow-pipe, with the mouth piece taken out, and connected to a gaurometer, by a flexible tube of elastic gum; the curved tube and terminating part of the blow-pipe ought, however, to be made of glass, the heat produced being so intense as frequently to fuse and inflame those parts of the instrument, if made of brasses. The operator should also be careful to wear spectacles of green glass, in order to protect his eyes from the intolerable white glare, which is so intense as to cause even the flame of a common wax candle to call a very sensible flame. Sometimes a double blow-pipe is made use of in experiments with oxygen gas, by which the effect is considerably increased.

The construction of this is seen in Chemistry, Plate X. fig. 3. The parts \( a \) which joins the tube of the gaurometer, turns air-tight in the collar, \( \theta \), on the end of the tube \( b \), &c. On this tube are two brass boxes, \( b \), into which are fitted the tubes, \( f \), which also turn in air-tight sockets, for the purpose of directing the operation to near the blow-pipe, \( \alpha \), or farther from each other. The blow-pipes \( a \), \( b \), &c. are also provided with a fine jet, \( \lambda \), by which the action of the flame may be varied to suit circumstances of any angle that may be required.

The effect of the pressure which is produced by the blow-pipe, has generally been attributed to the increased intensity of the flame in a small volume of air, the heat being greater when confined than when diffused. Comte, Rammoldi, &c. have, (as will be seen in p. 69,) supposed that the effect of the blow-pipe is due to the former of these causes; and in support of this hypothesis, he mentions the effects of increased heat produced by himself, which are so contrary to the experiments that were conducted in so inaccurate a manner, as to render, in our opinion, very little confidence.

He begins by saying, "A current of air cannot produce heat, without, at the same time, being decomposed; and, in order to its being decomposed in a fire, it must be brought into actual contact with the burning fuel, or at least with the uninflammable inflammable vapour which rises from it. But can it be supposed that there can be anything inflammable, and not actually inflamed, in the clear, bright, and perfectly transparent flame of a wax candle? A blow-pipe has, however, as well an effect when directed against the clear flame of a wax candle, as when it is employed to increase the action of a common glassworker's lamp. To this it may be replied, in the first place, that flame is not transparent, and, secondly, that a considerable quantity of "inflammable matter" is contained in the flame, as is evident from the foot that may be collected by holding a plate of glass or metal over it, so as just to touch the luminous. The count process is to relate that carbonic acid is being driven by a blow-pipe through the "clear, brilliant flame of a wax-candle just kindled," united a small tube of glass in the same time as when the pipe was charged with atmospheric air, or even with oxygen gas. We have repeated these experiments, and observed, that when the blast was directed to the white part of the flame, no well defined horizontal cone was produced by any of the blowpipes; but when carbonic acid, or the lamp, was united through the flame just above the wick, a well defined cone was produced, the interior of which was of a bright blue, and the exterior of a pale yellow; when atmospheric air was employed, the whole cone was of a bright yellow, with oxygen gas, the whole flame was of a dazzling white. The effect of the second in melting glass was greater than that of the first, and the later was much more noticeable."

Blower, a small bellows, an appellation of contempt, for a bellows given to an alchemist.

In the French king's kitchen, there was among other things
Blowing.

Blowing, under the denomination of yeafiusor, or fire-blower. The Roman mint-men were distinguished by the appellation of blowers of gold, silver, and brass, &c. flatores aurii, argentii.

Blower, among dealers in horses, a term used for such horses as wheeze much, without wanting wind. See Wheezing.

Blowing, in Medicine. One method of administering medicines is by inflation, or blowing them into the part by a tube; thus it is they sometimes convey powders into the eye, and sometimes up the nose, for the cure of a polypus.

Blowing, esflatoit, was also a ceremony in the ancient administration of baptism, whereby the catechumen, upon hearing the recension of the priest who administered baptism, is enjoined to blow thrice on the child's face, making the signs of the cross with his hand, and pronouncing the words exi ab eo Satan. Julius Martyn, Tertullian, St. Cyril, and St. Augustin speak of this ceremony as used in their times.

Blowing of a fire arm, is when the touch-hole is run or gulled, and become wide, so that the powder will flame out.

Blowing is also used in speaking of the natural motion or course of the wind.

In the Secu-Language, the wind is said to blow home, or blow through, when it does not cease, or grow less, till it comes past the place where the speaker is. To blow through is sometimes also used to denote, that the wind will be so great as to blow away the fails. When a wind increases so much that they cannot bear any top sails, they lay, they were blown into their courses, i.e. they could only have out the fails so called. To express an extraordinary great wind, they sometimes say, it will blow the fail out of the boltropes.

Blowing is also used in speaking of the force and effect of kindled gunpowder on bodies which happen to be over it. In this sense we say to blow up a house. Engineers at siege make mines wherewith to blow up walls, bastions, and other defences. Powder-mills are apt to blow up by the gunpowders growing hot, and setting fire to the powder dust flying about.

Blowing, among Gardeners, denotes the action of blowers whereby they open and display their leaves. In which sense, blowing amounts to much the same with flowering and blossoming.

Blowing of Glass, one of the methods of forming the divers kinds of works in the glass manufacture. It is performed by dipping the end of an iron pontellego, or blow-pipe, in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown.

Blowing of tin, a term used by the Cornish miners for the fusion or reduction of tin-ore to the metallic state, after having been roasted to get rid of the sulphur and arsenic.

Blowing-Machine, is used in metallurgical operations on a great scale, for the purpose of exciting combustion in furnaces appropriated for the smelting and reducing of ores.

The history and improvement of machinery of this nature have kept pace with the other branches of our national manufacture, and, in many instances, may be justly said to have gone beyond them.

In the smelting of lead and tin ores, the size and powers of the blowing machines have been left a subject of alteration and improvement, than those used at furnaces and works where iron ore is smelted.

The natural fulibility and easy volatilization of the former metals, in temperatures beyond a bright red heat, have prescribed the size of the furnace, the measure of the blast, and the nature of the fuel.

In the manufacture of copper, air-furnaces are generally used, except where precipitated oxyd of copper is re-revived in small blast-furnaces, resembling those called cupolas, used at iron founderies.

The construction of a lead smelting machine, or what is commonly called a "Lead Mill," is extremely simple. A water wheel is erected in the middle of a square building. To the shaft of this wheel are attached four small wheels of cast iron, about 18 inches diameter. Four pairs of bellows, two pairs on each side of the shaft, are placed at equal distances, and supported upon a strong framing of wood. As the water wheel shaft revolves, the small wheels are carried round, and alternately, or two and two together, depref the extremity of a lever attached by an iron chain to an iron-pole, and the effect of this lever elevates the opposite end of the beam, to which is also attached, by means of another iron chain, the upper or moveable surface of the bellows. The blast produced in this way is in general soft, much inferior in point of either quantity or density to what is found necessary at iron furnaces. The bellows in common measure 10 feet in length, and 5 or 6 feet across the breach, moving about 30 strokes per minute.

In the manufacture of iron it has always been, particularly since the introduction of pit coal, the unceasing object of the iron-maker to improve his blowing apparatus; for uniformly he has found, that in proportion as he can raise air, and make it enter the furnace, so will his weekly quantity of metal be increased.

In the early history of this interesting manufacture, when charcoal of wood was the matter of fuel made use of, the affinities between the latter and the ore were established with more facility. Small furnaces, called boulleries, were sufficiently large, and deemed of profitable capacity, if they produced a bloom or two of iron per day, of 90 to 120 lbs. each.

Hand bellows, and what were called fuel bellows, were sufficiently large for the minor operations. After the general introduction of the refinery furnaces, and the division of the manufacture into the making of pig iron, the refining of this into bar or makable iron, the advantages of a powerful blast were immediately perceived. Water wheels, working two pairs or more of leather bellows, were found to produce powerful effects, and, in consequence, almost every situation that presented a command of materials and a waterfall, became the seat of an iron-mill.

The simple mode of blowing furnaces by means of a trompe was at the same time introduced; but in general it was found, that much greater advantage could be derived from the descent of water upon a wheel, either as to density or quantity, than by means of the bell constructed trompe.

The use of water wheels and leather bellows continued general throughout the iron furnaces, until the principles and mechanism of the steam engine were established upon unerring grounds. This wonderful invention was soon applied with the happiest effect in many situations rich with mineral treasures, but to which nature had denied the advantage of water sufficient to turn machinery. Cylinders, composed of wood, firmly jointed and looped, were first introduced as a substitute for leather bellows; these were soon after replaced by bored cylinders of cast iron; and with
with this great discovery and application of the art of casting, the blowing machine assumed a general and well-proportioned form.

This took place nearly 40 years ago, and continued with a few temporary deviations until the introduction of Bolton and Watt's highly improved engine. The following may serve for an outline of the old blowing steam engine.

A steam cylinder, working with atmospheric preffure from 3 to 7 lbs. upon every square inch of the area of the piston; the diameter of the cylinder for one furnace varied from 23 to 36 inches, and for two furnaces from 36 to 50 inches. Upon the opposite of the man or working beam, sometimes at equal, and sometimes at unequal distances from the centre, was placed the air-pump or blowing cylinder. This was, in common, equal to four or five times the area of the former; and, with the small working power of the steam cylinder, seldom condensed the air beyond $\frac{1}{2}$ to $\frac{1}{3}$ lbs. per square inch. The air-pump was commonly constructed open below, as may be seen in Plate 11, fig. 1. (Chimney.) The plan was sometimes deviated from, and the cylinder inverted. The blowing piston was loaded with weights, and the air expressed by its defcent. In this mode of working, the act of the steam piston, defending in vacuo raised the air-pump piston loaded with weights. Upon the return of the stroke, or while the steam piston ascended in the cylinder, this piston loaded with weights sunk the whole length of the stroke, and by means of this loading, proportioned to the powers of the engine, forced the air either into the regulator or the furnace.

Above, or parallel to the air-pump, was placed the regulating cylinder, as may be seen in the plate above mentioned. This had a valve of communication, which opened every stroke the engine made, and admitted the whole discharge of air. The piston of the cylinder, frequently called the fly piston, was loaded with weights, and kept constantly vibrating; so that when any deficiency of preffure arose from the remitting action of the air-pump piston, the blast was comparatively equalized by the preffure of the fly piston upon the included air. The size of this cylinder was generally in the proportion of 9 to 6 of the air-pump.

The chief objections to this mode of blowing, even when in unavailing use, were founded upon the great inequality of the blast, and a very considerable waste of air that took place at the \textit{foot}, or safety valve, to prevent the fly piston being blown entirely out of the cylinder. The fioret was an opening made in the top of the air-pump cylinder, on which refted a heavy iron valve, faced with leather fluffed with wool; this was, by means of an upright iron rod, attached to a lever, which ran across the top of the regulating cylinder. As soon as the fly piston arose to a certain height, a block of wood, or other contrivance, lifted the one end of the lever, and along with it the valve, to a certain height, and permitted a quantity of the denser air to escape, sufficient to infure the safety of the piston. Notwithstanding these precautions, many accidents and stops ensued; the breaking of a pin, or the loosening of a key, frequently ejected the piston from its cylinder, though loaded with several tons of weight.

Some iron millers, more ingenious than others, contrived to take the space or waste air from the foot, to receive it in an inverted check above water, and blow to its extent弥漫 and fiery sizes. Endeavours of this kind to husband and economic air, raised and condensed at a great expence, were sufficient proofs that a method was still wanting to complete the blowing machine, to render its motions steady and uniform, and to equalize the density of the blast throughout the whole stroke.

This was completely accomplished by inverting large checks, or cylinders, in barrels of wood, stone, or iron. The space between the inner and outer cylinder was constructed of sufficient capacity to oppose to the expansive force of the blast a column of water of equal or superior refilience.

This invention was called the water blast, water preffure, water regulator, &c. The dimensions differed materially from each other; this circumstance being much regulated by convenience, opinion, and the size of the engine.

Plate XIV. fig. 1. (Chimney) represents a ground plan of a very capacious water regulator, sunk in the ground, and built of stone and bricks.

As the inverted check made of plates of cast iron, 40 feet long, 12 feet wide, and 12 feet high. The square superficies of this check is equal to 480 feet, and its cubic contents are 5760 feet. Its weight will amount to nearly 50 tons.

B, the opening to which the air-pipe is attached; 2 feet diameter.

CCCC, open space between the inverted check and stone cylinder, for the column of water to ascend; 35 feet wide.

DDDD, stone or brick-work, of which the great cylinder is built. This work requires to be well jointed, as the motion of the water has a great tendency to open the spaces between the stones. This cylinder is 47 feet long, 19 feet broad, and 14 feet high; its cubic measurement amounting to 12,500 feet, and capable of containing 93,500 gallons wine measure.

eeee, an opening of one foot in breadth left in the middle of the building. This is compactly filled with well trod clay, called pudding, and prevents the escape or circulation of water through the building. Beyond this the common building extends to a sufficient thickness to give general security to the whole.

Fig. 2. is a cross section of the water regulator at B, fig. 1. The letters in this view correspond with those in the plan.

F, the blast pipe from the cylinder entering the check, and branching to the two blast furnaces.

GG, large iron flues, on which the check is supported about two feet from the bottom of the cylinder, at intervals of six feet from each other.

H, loading of how flues, which for this cylinder requires 24 equal in all to 60 tons. If the check weighs 35, then 60 tons of loading will be requisite. This is supposing that the power of the blowing machine is calculated to press equal to 3 lbs. upon every square inch, which many of them are constructed to perform.

To comprehend distinctly in what manner the water regulator performs its functions, and upon the supposition that the compressing power of the engine is equal to 3 lbs. upon every square inch, we shall suppose the engine at rest, and water introduced into the regulator, till it rise to the level of the dotted line $b$, 5 feet from the lower edge of the check, and 7 feet in total depth of water. As soon as the engine is set to work, the compression of the air immediately sets the water in motion; every stroke making the water rise in the space CC, and proportionally falling towards GG, in the interior of the check.

When the inverted check becomes filled with air, and the condensation has reached the maximum of the power of the blowing machine, the water will be found elevated $\frac{3}{4}$ feet to $i$, and the gauge will exhibit a depression in the interior of the check, from $h$ to $k$, $\frac{3}{4}$ feet, making in all 7 feet from $k$ to $i$.

At every turn of the engine stroke the water maintained at $i$ falls a few inches, and elevates itself above $k$ in the interior.
terior of the chest, a similar height. This description takes it for granted, that the spaces CC are equal to the area of the inverted chest; so that every inch of water forced out of the chest adds exactly one inch to the height of the column.

A blowing machine, capable of blowing to purpose two blast furnaces, ought to have the inverted chest of the regulator equal to three or four hundred square feet of area. There cannot arise any error from having this large enough; the want of space and capacity frequently proves a real detriment.

In calculating the proportions and dimensions of water regulators in general, the principle is, to allow the space around the inverted chest equal in point of superficial measurement to the area of the interior of the chest, that the defending column of water may displace no more in the perpendicular ascent, than it is itself absolutely deprest.

If the area or space in which the water rises and falls, is only equal to half the area of the inverted chest, then for every foot of water which is deprested in the bottom of the chest, a column of two feet will be raised and maintained on the outside. On the contrary, if the outside space for water be equal to twice the area, then every foot of water deprested in the chest will only elevate the external column six inches.

It will appear evident from these general facts, that a considerable latitude may at any time be assumed in constructing the water regulator, particularly in old established works, where local circumstances and convenience confine its situation to one spot.

Where it is not inconvenient to use a high perpendicular column of water, the inverted chest may be increased one half, double, or even triple the superficial measurement of the outside space; so that if the power of the blowing machine is equal to 3 lbs upon the square inch, the water in the chest will be deprested 3 1/2 feet nearly, and raised in the perpendicular column 5 feet 3 inches in the fist, 7 feet in the second, and 10 1/2 feet in the last cafe. This plan to suit former establishments may be adopted with considerable modifications, always keeping in mind, that every foot of area gained upon the surface of the water is a material acquisition to the equalizing powers of the regulator.

One imperfection attends this want of equilibrium on the two spaces for the action and re-action of the water,—Whatever space the waters would fall, at the return of the stroke, supposing the inside and outside columns exactly balanced, would in this case be increased one half, double, or triple.

Again, where situation does not admit of the perpendicular column being raised beyond, or not even to the extent of the depression, that takes place within the inverted chest, and where an additional space cannot be procured for an increase of its diameter, an inverted chest of much less height than common may be used, loaded with a material of great weight, such as iron. The water in that case would distribute itself over the surface of the chest, instead of rising in perpendicular height.

One serious objection, however, is made to chests or cylinders, where the eduction pipe approaches within a short space of the surface of the water; namely, water rising in the pipes, and being conveyed along with the air into the furnace. This may take place in two ways; by an insensible and uniform discharge of water into the furnace, making the blast at the tuyere visible, like the respiration of the human body in a frothy day; or in quantity, threatening utter destruction to the furnace and buildings. The former is occasioned by the air from the eduction pipe, at the commencement of the stroke, impinging violently upon the surface of the water, and raising a portion of it in the shape of spray. This is sufficiently divided or entangled in the mass of condensed air before the return of the next stroke, and becomes exprested along with the blast into the furnace. The other hazardous consequence is occasioned chiefly by undulation in the column of water, when the blowing machine is, by derangement or accident, working under its proper power or number of strokes. In these cases, when the pause at the end of the stroke is prolonged, an exhaustion sometimes takes place in the air-pipes, the water rises and is carried in a stream through the blow-pipe into the furnace.

The same casualties may more readily occur, if the surface of the water is upon a level, or nearly so, with the tuyere.

In judicious erections this is most carefully avoided; the surface of water in the inverted chest or cylinder is kept at least, 8, 9, and 10 feet under the level of the tuyere, even at the last period of return, when the water has risen to its greatest height, within.

This very proper precaution ensures an advantage of much importance. A large space is obtained between the top of the chest and the depressed surface of the water; this becomes a spacious reservoir for the condensed air, and, by generating a considerable portion of elasticity, prevents any violent perturbation upon the water at any period of the stroke. The increased distance between the surface of the water, and the pipe which conducts the air from the cylinder, has a complete tendency to prevent the elevation of the aqueous particles, and always ensures a quantity of air comparatively free from moisture.

Upon the principles formerly noticed, it is possible to construct a blowing apparatus of this nature, wherein there could be little or no visible motion in the perpendicular column of water even with the same engine.

Let us suppose a machine of this nature at work, with an accurately balanced column of water, the fall of which, at the return of the stroke, was equal to 12 inches. It is evident, that if the outside space was enlarged 1 1/2 much over its surface as to contain this foot of water, without adding any perceptible height to the column; that included within the chest would, at the return of the stroke, being fed from a more capacious limb, rise a foot, without any sensible diminution taking place in the perpendicular height of the external fluid. It is equally obvious, in this as in every case with water regulators, that the rise and fall of the inside column of water will remain the same, under every modification and form, while the pace and powers of the engine remain the same.

The application of water regulators to blowing machines was soon followed by an attempt to further improvement, by the introduction of the air-vault; the principle of which was to form a receiver of such capacity, that the elasticity or spring of the condensed air would be sufficient to express and equalize the blast during the return of the stroke.

To effect this, an immense magazine was requisite; to erect which of any metallic substance would have been ruinously expensive, and, if constructed of wood, insufficient for retaining the air. It became therefore requisite to try the experiment upon building, or by excavation from the solid rock. In both these ways has the air-vault been tried, and found to produce an excellent effect, as to equalizing the density of the blast; but it has been conceived with such indifferent concomitances as to quantity, that the plan is for the present given up.
**BLOWING.**

Air-vaults were constructed both at the Clyde and Mair-kirk iron works in Scotland, and a constant current of air produced; but nearly one half the quantity lifted by the air-pump escaped through the walls and arched of the building. This was at any time made visible by rubbing foapy water upon the external walls.

At Devon iron works in Scotland, an air-vault was excavated from the solid rock, 72 feet long, 14 feet wide, and 13 feet high; equal to 13,000 cubic feet of cubic measurement. This immense excavation was made comparatively air-tight, by caking the seams and fissures of the rock, plastering and then covering the whole with alternate layers of pitch and clofs wasp paper.

This was the most perfect experiment ever tried upon the air-vault; and if an opinion is to be formed of the perfection of the apparatus by the quantity of iron at one time manufactured, a very trilling portion of air indeed must have been left.

It has been frequently noticed in Scotland, that at works where the materials were in any degree similar, 3000 to 5000 cubic feet of air per minute will, in the course of a week, produce from 20 to 35 tons of pig iron, whatever may be the density at which it is thrown into the furnace.

The Devon furnace at one time averaged 33 tons weekly for 9 months running, and consumed air, per data furnished by Mr. Roebeck in his paper published in Nicholson's Journal, vol. iv. nearly 2400 cubic feet per minute, under a pressure of 2 lbs. per square inch. Notwithstanding this powerful demonstration, strong prejudices were entertained to its disadvantage; and many believed, that any other mode of regulator been attached to the blowing machine, abundance of air would have been obtained to have blown two furnaces equally well. That this idea was incorrect, may be easily gathered by calculation from the area of the air-pump, the length of the working stroke, and the number of strokes per minute, all of which are particularly stated by Mr. Roebeck.

For the general construction of an air-vault formed by building, see Plate XV. (Chemistry.)

Fig. 1. is a section of the vault constructed under the bridge-house, or place where the materials are proportioned, previously to their being thrown into the furnace. One half a blast furnace outline, is seen as connected in point of situation and blast to the air magazine.

A, the termination of the blast pipes that convey the air from the blowing cylinder into the receiver, 3 feet diameter; the length depends upon the contiguity of the engine to the vault.

B B B B, four vaults, 13 feet wide each, 25 feet deep, and 10, 11, 12, and 13 feet high to the springing of the arch; total height to the crown of the arches, 16\(\frac{3}{4}\), 17\(\frac{3}{4}\), 18\(\frac{3}{4}\), and 19\(\frac{3}{4}\) feet. These cells communicate with each other by arched openings in the false wall, which may be distinctly seen in the ground plan at f.

C C, the eduction pipes that convey the air to the furnace; 18 inches diameter.

D, end view of the range of laying pipes at the tycure of the furnace. The dotted lines between D and C are meant to represent the horizontal range of the pipes.

E, part of the outline of a blast furnace to show its proper situation to the air vault.

F F F F, floor of the respective vaults, composed of a mixture of two parts of boring dust, two of fine riddled lime, and one part of fine roasted iron flue, mixed up into platter with water containing a considerable portion of salt.

G G, end walls of bricks or stone, four feet thick.

H H H, lining of brick-work, built in the most accurate manner, with fine riddled mortar, and run every second or third course with mortar made thin and very liquid. These walls are two feet and a half in thickness, care fully plastered, and afterwards covered with several layers of iron paper and piten, to prevent the escape of air. The roofs of the vaults are finished in the same manner.

I, door arch into the vaults; entrance obtained by means of a ladder or wooden staves suspended within.

K, space above the arches, filled with rubbish, to prevent any spring, and to raise the floor to the level of the furnace top.

L, the range of the floor, or acclivity to the furnace mouth.

Fig. 2, is a ground plan of the bridge-house containing the air-vaults, and exhibits one half the ground plan of the furnace through the centre of the tycures arches.

E B B B, corresponding to the same letters in the elevation.

C C, pipes for taking off the blast into the furnace.

D, corresponding to the same letter in the section.

E, main pillar of the furnace, same as E in the section.

G G G G, and H H H, correspond with the same letters in the elevation.

I, square for receiving the furnace hearth.

K, part of the ground view of the hearth, and the approaching blast pipes.

L L L, openings of the cross vaults, which communicate the vaults with each other.

The cubical contents of a vault constructed according to these dimensions, will amount to 20,000 feet.

In general, it may be remarked upon the construction of the blowing machine, that since the period of the introduction of Mr. Watt's engine, the air-pump, or blowing cylinder, has been constructed so as to discharge a cylinder full of air every second and defect of the piston. This, instead of travelling 4 to 5 feet per stroke, more generally moves 8 feet; and the number of cylinders per minute are seldom under 24.

Formerly, in the common atmospheric engine, the movement of the piston from top to bottom, and back again, produced only one cylinder full of air from the air-pump, and the number of cylinders discharged per minute seldom exceeded 16. A steam cylinder of 40 to 44 inches diameter, and an air-pump of 6 feet diameter, the piston moving about 5 feet per stroke, were deemed sufficient in the construction of a blowing machine for two blast furnaces. The quantity of air pumped up and thrown into the furnaces by such an engine seldom exceeded 5000 cubic feet per minute. This, and even a larger quantity, is now thrown into one furnace, and the produce by such means increased from 13 to 25 tons weekly.

The first set of tables following are calculated to show the quantity of air that would be discharged by blowing cylinders of various diameters, the length and number of the strokes being given.

The second set, to show what diameter of blowing cylinder is requisite, with a given steam power, to raise the air to a certain density per square inch. See Engine, Water Regulators, and Regulating Vault.
### BLOWING.

**Notes:**
- The table provides the area, capacity, and air discharged at various rates for cylinders with different sizes.
- The rates range from 33 to 175 cubic feet per minute.
- The table is designed to help in calculating the efficiency of air discharge in blowing operations.

**Further Information:**
- Detailed calculations and formulas are included in the main text for further understanding of the data provided.
- The table is a valuable resource for engineers and technicians working in the field of mechanical engineering.
- The table is part of a larger document that likely contains more detailed data and analysis.

</table>

### Notes
- The table provides data on the flow of air, number of strokes per minute, length of stroke, and areas for various diameters of cylinders and pistons.
- The areas are calculated for both the blowing cylinders and pistons, showing the total area of cylinders and pistons combined.
- The table is useful for understanding the design and efficiency of steam engines in relation to the flow of air and the size of the pistons and cylinders.
# BLOWING

**TABLE III.** of the Powers of Steam Engines working at the Rate of 7lbs. Avoirdupois upon every Circular Inch, or 8.91 lbs. upon every Square Inch of the Steam Pitton, applicable to Blowing Machinery; and the Areas and Diameters of Blowing Cylinders requisite to raise Air of various Densities from 1 3/4 lb. to 4 lbs. upon each Circular Inch, or from 1.90 lb. to 5.092 lbs. Avoirdupois upon each Square Inch of the Air Receiver.

BLOWING of a Flower: among Florists, an artificial process in order to bring a flower to display itself with greater perfection and beauty than it would arrive at in the natural way of blowing. The usual method is thus: about April, when the flower begins to put forth, or spinly, as the gardeners call it, they place by each flower a straw flick four feet long, and tie the spinly to its top as they shoot. As soon as the flower-buds appear, they leave only one of the largest on each flower-stem to bloosom. About ten days before the flowers open themselves, the round-podded kinds will begin to crack their hulls on one side, when the careful gardener, with a fine needle, splits or opens the hull on the side opposite to the natural fracture; and about three or four days before the complete opening of the flower, cuts off with a pair of tongs the points on the top of the flower-pod, and supplies the vacancies or openings on each side of the hull with two small pieces of velum or oil-clotch, clipped in between the flower-leaves and the inside of the hull; by such means, the bloosom will display its parts equally on all sides, and be of a regular figure. Besides this care, when the bloosom begins to show its colours, they use to shine it from the extreme heat of the sun with a treasurer-like board, or other device of the like nature, darkened to the flick which supports it: for the flowers as well as fruits, grow larger in the shade, and ripen and decay sooner in the sun.

In Heraldr, a fleur de lys is said to be blown, &c., when its leaves are opened, so that buds appear among the fleurs. The arms of the city of Florence are argent, a fleur de lys blous, gules.

BLOWING-flake, in Zoology, a name given by the people of Virginia to a species of serpent much resembling the European viper, but considerably larger, and very remarkable for its infatuating and extending the surface of its head before it bites. Its wound is very fatal.

BLOUEN RED, in the manufacture of porcelain. See RED.

BLUBBER, in Physiology and Trade, the fat which invels the bodies of all large cetaceous fish, serving to furnish an oil.

The blubber is properly the adip of the animal: it lies immediately under the skin, and over the muscular flesh. In the porpoise, it is firm and full of fibres, and invels the body about an inch thick. In the whale, its thickness is ordinarily six inches; but about the under lip, it is found two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to forty or fifty, sometimes to eighty or more hundred weight. Phil. Trans. No. 77. p. 2275.

The use of the blubber to the animal seems to be partly to poise the body, and render it equisponderant to the water; partly to keep off the water at some distance from the blood, the immediate contact whereof would be apt to chill it; and partly also for the same use that cloaths serve us, to keep the fih warm, by reflecting or reverberating the hot freams of the body, and so redoubling the heat; since all fat bodies are, by experience, found less sensible of the impression of cold than lean ones.

Its use in trade and manufactures is to furnish train-oil, which it does by boiling down. Formerly this was performed afohere in the countries where the whales were caught; but of late the fishers do not go afohere, they bring the blubber home, flowed in casks, and boil it down there.

BLUBBER-leaves. The livers of cods, which having been barrelled, yield spontaneously a considerable quantity of oil, which, after the tallow is skimmed off, the residue are called blubber-livers, to be boiled down for more oil.

Vol. IV.
B L U

Blue, Prussian. See Prussian Acid.

Blue, Sirius, a solution of indigo in sulphuric acid. See Indigo.

For an account of the processes for obtaining blue liquors from oak dust and vitriol, from log-wood and verdigris, from log-wood and blue vitriol, from an essential oil and volatile spirit; see Dr. Lewis's Commercial Philosophy Technicum, ed. 4to, ann. 1793, p. 382. 427, 436.

Blue, Stone, or Powder, used in washing of linen, is the same with smalt, either in the lump or powdered.

When the smalt is taken from the pot, it is thrown into a large vessel of cold water: this makes it more tractable and easily powdered. Afterwards, when examined after cooling, it is found to be mixed with a greyish matter resembling ashes, which they call eflbet. This grey matter is separated by washing, and then the blue vitriol is powdered and sifted through fine sieves, to bring it to what we call powder-blue. Phil. Trans. N° 396. See Cobalt.

Blue, turnful, is a blue used in painting on wood, made of the feed of that plant. It is prepared by boiling four ounces of turful in a pint and a half of water wherein lime has been slaked. See Turnful.

Blue, ultramarine. See Lazurite.

There is a blue ultramare, something like that Kentman mentions under the name of ursiniun. It was discovered in a past-mofs in Scotland. This earth is at first of a white colour, and only grows blue by being exposed to the air. It has also some resemblance to what Mr. de la Côte in his Nat. Hist. of Foss. p. 103, calls orbres sindilibs cerulea. It is described very minutely by Mr. Douglas, who gives an account of his various experiments upon it, and recommends it as a cheap paint in gun water, particularly as it is levigated and prepared by nature. See Phil. Trans. vol. viii. N° 27. 2a. 1768.

Many similar specimens of blue earth have been discovered in England and Ireland, and several parts of the continent.

Blue-ball, a name given in some countries to the Core.

Wheat.

Blue-bottle, in Botany. See Centaurea.

Blue-cap, in ichthyology. See Blew-Cap.

Blue John, the common appellation, among the Derbyshire miners, of Fluor-Spar.

Blue Mantle Purveyor of Arms. This officer is by patent a member of the corporation of heralds. Sir Henry Spelman conjectures, that the title was taken from the colour of the mantle of the French kings. This office is said to have been instituted by Henry V., and probably might be coeval with that of Garter, and erected with reference to that order; but although the catalogues place John Wrexworth and others by this title under the reign of Henry V.; Anthony Wood discusses the creation of this office to Henry VI., in his 6th year. Both the Purveyors waited on Burgers, Garter king of arms, into France, and also on the bishop of Chichester and others, ambassadors thither. Previous to that date there are not any entries on record relating to this Officer; but from hence to the present time the succession hath been carried on without any intermission.

Blue Nuts, tiles blues, those of the order of the Antherospermum.

BLUEFIELD's Bay, in Geography, a bay in the island of Jamaica, lying S.E. of Savannah-la-Man, and having good anchorage for large vessels. N. lat. 19° 10' 30". W. long. 79°.

BLUEFIELDS, or Bluefields, Bay, a bay on the western coast of Nicaragua, in New Spain, into which a river of the same name is discharged. N. lat. 11° 20'. W. long. 87°.

BLUEHILL, a township of America, in Hancock county and district of Maine, on the west side of Union river, 344 miles N.E. of Boston, and 13 E. of Penobscot; having 274 inhabitants.

BLUEHILL BAY, a bay of America, formed by Nafken point on the west, and Mount Defant island on the east, and extending northerly to a mountain on the east of Penobscot river, which, from its appearance at sea, is called "Blue hill." Union river discharges itself into this bay.

BLUEFILLS, a range of mounds in New England, the first ridge of which in New Hampshire passes through Rochester, Barrington, and Nottingham.

BLUE Mountains, are mountains of America, in Northampton county, and state of Pennsylvania, extending from S.W. to N.E. and through a small interval across the Delaware. Also, a range of mountains, which run from S.E. to N.W. through Sunny county, in the island of Jamaica. Blue mountain peak is laid to rise 7441 feet above the level of the sea, and measured from its base, about 3,000 feet high. Between this and the north mountain is a large fertile vale. The passage of the Potowmack river through this ridge is one of the most stupendous scenes in nature. See Allegheny Mountain, and Potowmack River.

BLUE Lick, a branch of the licking river in Kentucky, and are situated about 8 miles westerly from the Upper Blue Licks. Both of them are on the N.E. side of the river; and the latter is about 5 miles N. E. of Milers.

BLUE Spring, is between Big Barren and Little Barren river, southern branches of Green river, in M. r. county, Kentucky, about 22 miles south-westerly from sulphur spring, and 13 south of Craig's fort, on the north side of Green river.

BLUE Stone Creek, a small western branch of the Great Kanaway.

BLUE-water river, a river of America, that rises among the southern branches of Duck river, and empties into the Tennessee. It is fed by resorts.

BLUENESS, that quality which denotates a body blue, depending on such a fibre and texture of the parts that compose the surface of a body, as dispose them to reflect the blue or azure rays of light, and those only, to the eye. With respect to the blues of the sky, M. de la Hire, after Leonardo da Vinci, observes, that an black body viwed through a thin white one, gives the effluence of blue; and this he alligns as the reason of the blues of the sky, the immense depth of which being wholly devoid of light, is viewed through the air illuminated and scattered by the sun. For the same reason, he adds, it is that foot mixed with white makes a blue; for white bodies, being always a little transparent, and mixing themselves with a black behind, give the perception of blue. From the same principle he accounts for the blues of the veins on the surface of the skin, though the blood they are filled with be a deep red; for red he observes, unless viewed in a clear, strong light, appears a dark brown, bordering on black; being then in a kind of obscurity in the veins, it must have the effect of a black; and this, viewed through the membrane of the vein and the white skin, will produce the perception of blues.
In the same way did many of the early writers account for the phenomenon of a blue sky; such as Fromondus, Plancius, Otto Guericke, and many others; their opinion long prevailed, and has been adopted by some in more modern times, especially by Wolfius and Mischenthaler. But in the explanation of this phenomenon, Sir Isaac Newton observes that all the vapours, when they begin to condense and coalesce into natural particles, become first of such a bigness as to reflect the azure rays, before they can constitute clouds of any other colour. This, therefore, being the first colour which they begin to reflect, must be that of the finest and most transparent fluxes, in which the vapours are not arrived to a graduufs sufficient to reflect other colours. M. Bouguer, without having recourse to the vapours diffused through the atmosphere, in order to account for the reflection of the blue-making rays, ascribes it to the constitution of the air itself, whereby these fainter-coloured rays are incapable of making their way through any considerable tract of it. And he accounts for these blue shadows, which were first observed by M. Buffon in the year 1731, by the aerial colour of the atmosphere, which enlightens these shadows, and in which the blue rays prevail; whilst the red rays are not reflected so soon, but pass on to the remotest regions of the atmosphere. The abbe Mazeau, in a Memoir of the Society of Berlin, for the year 1732, accounts for the phenomenon of blue shadows by the diminution of light; having observed that, of two shadows which were cast upon a white wall from an opaque body illuminated by the moon, and by a candle at the same time, that which was enlightened by the candle was reddish, and that which was enlightened by the moon was blue. However, the true cause of this appearance seems to be that signified by M. Bouguer, which agrees with the solution given of it about the same time by Mr. Melville. But instead of attributing the different colours of the clouds, as Sir Isaac Newton does, to the different size of those globules into which the vapours are condensed; Mr. Melville proposes, that the clouds only reflect and transmit the sun’s light; and that according to their different altitudes, they may affume all the variety of colours at fun rising and setting, by the laws of the reflected light, as they receive it through a shorter or longer tract of air, and the change produced in the sun’s rays by the quantity of air through which they pass, from white to yellow, from yellow to orange, and lastly to red, may be understood agreeably to this hypothesis, by applying to the atmosphere what Sir Isaac Newton says concerning the colour of transparent liquids in general, and that of the infusion of lignum naphthifium in particular. Edinb. Ill. vol ii. p. 77. Bouguer T. de l’Optique, p. 568. Newm’s Optics, p. 228; or Priestley’s Hist. of Vision &c. p. 435—440.

BLUFF-HEAD, or Bluff-faced, in the Scin Language, is, when a ship has but a timid rake forward on, being built with her trim too straight up.

Bluff-head ships are opposed to those that are sharp-headed. They are short r, lea minded, and tail cheaper.

BLUNTING, or Iron, a method of beautifying that metal sometimes practiced; as for forming buckles, swords, or the like. The manner is thus: take a piece of grind-iron, and whet iron, and rub hard on the work to take off the black surf from it; then heat it in the fire, and as it grows hot, the colour changes by degrees, coming first to a light, then to a dark gold colour, and lastly to a blue. Sometimes they grind and filed oil together, and rub the mixture on the work with a wolen rag, while it is heating, leaving it to cool of itself.

Among sculptors we also find mention of bluing a figure of bronze, by which is meant the heating of it, to prepare it for the application of gold leaf, because of the bluish cast it acquires in the operation.

BLUM, JOACHIM CHRISTIAN, in Eignography, an eminent German poet, was born at Ratzeburg, in 1739, and received the early part of his education in his father’s house, from a lady, who was the governness of his tutors. At the age of eleven years he left his father, and became master of a library, of which he avoided himself to great advantage. During his residence with his mother and tutors, he amused himself with playing hymns on the harpsichord, and with reading moral authors, and reciting orations, which he did in a manner so affecting as to cause his hearers to shed tears. His mother concluded, that he had an inclination to become a clergyman, and with this view placed him in 1754, at a school in Brandenburg, where he manifested by his course of reading, and also by his performances, a strong turn for poetry. In 1757, he removed to the gymnium at Berlin, and gathering up all thoughts of the ministerial office, he devoted himself to the study of philosophy and the belles lettres, indulging himself occasionally in his favourite pursuit. From Berlin he proceeded, in 1759, to Frankfort on the Oder, where he studied for some time under Baumgarten, for whom he professed the highest respect; but when this city fell into the hands of the Russians, he retired to the house of his mother; and as his health was in an infirm and declining state, in consequence of an accident which had almost proved fatal to him in his youth, he determined to continue with his mother, and to devote the remainder of his days to the muses in his native place. Here he closed his life, August 28, 1790. His poetical works were "Lyric Poems," and "Idyls," published at various periods after the year 1765. A dramatic piece, in praise of his native town, entitled "Ratzeburg delivered," was often reprinted at Berlin with applause, but forbidden in compliance with the request of the Swedish ambassador. Blum’s poetry is said to be characterized by softness, simplicity, and correctness, and he ranks among the best poets of Germany. He also published some volumes under the title of "Walks;" two volumes of "Orations;" and a collection of "German Proverbs." His works in general were much read, and approved by persons of the first distinction. The late king of Prussia, Frederick William, honoured him with a very particular token of favour. As Blum’s health required his residence in the country, he purchased, in 1787, a small estate, upon which was a manor in a very ruinous condition; but having in the purchase exhausted almost the whole of his property, he could not repair his house without assistance; and therefore he addressed a poetical epistle to the king, in which he introduced the following lines:
wishes. Besides the Greek and Latin, he well understood the French, Italian, and English languages; and he had studied with great attention the history of the Christian church. Gen. Biog.

BLUMBERG, in Geography, a small town of Germany, in the grand-ducal of Baar.

BLUMENAU, a bailiwick of Germany, in the principality of Calenberg, seated on the Leine.

BLUMENTHAL, a town of Germany, in the circle of Swabia, and commandery of Minau, seated on the river Ach; 8 miles N.E. of Schaffhausen.

BLUMENSTRAST, J. DEO and, in Biography, took his degree of doctor in Medicine in Leyden. Returning thence to Ruffia, his native country, he was soon distinguished by the emperor, who made him archi-biatus, or principal physician to his court. He had also the honour of being appointed the first president of the Royal Academy of Sciences at Petersburg, which had been instituted, Haller says, by his exertions. He died at Moscow at an advanced age, in April 1755, leaving only one publication, which was first printed in the year 1700, 4to. "Medicus Castruis Exercitui Moscovitarum." Haller Bib. Med. Præct. Elyo. Dict. Hiſt.

BLUNICATION, in Geography, a bailiwick of Germany, in the duchy of Bremen.

BLUMIS ALS, a majestic eminence of the Alps, in the canton of Bern, in Switzerland, terminating the valley of Lauterbrunnen, and having at its feet a large glacier, which stretches towards the valley of Gafier. The Blumis Alp, and also the feet of the Alpcheelenhorn, are covered with black schistus; but the granite is not apparent, except at a considerable height. The sides of the Blumis Alp, bordering the glacier, are black slate, in which have been found several Emenites, and a fragment of a Cornu Ammonis, a foot in diameter.

BLUNDERBUSS, in the Military Art, a short sort of fire arm, with a large bore contrived to carry a number of musket or pithol bullets at once. The blunderbus is proper to do execution in a crowd, or to make good a narrow passage, as the door of a house, a fair cafe, or the like.

BLUNT, in Fencing. To fight with blunts, is to exercise or parade with weapons without points or edges.

BLUNTING the angles of a battalion, in the Military Art, signifies to retrench the four corners, and turn the square into an octagon. This is done in order to give an opportunity for presenting the pikes, or firing on all sides, and was a military evolution formerly much in use, but now disused.

BLUSHING, a suffusion or redness of the cheeks, ex- cited by a feve of shame, on account of consciousness of some failure or imperfection. See ELEPHYMA.

Blushing is supposed to be produced from a kind of content or sympathy between several parts of the body, occasioned by the same nervé being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muscles of the lips, cheeks, palate, tongue, and nose; a thing seen or heard, that is shameful, affects the cheeks with blushes, driving the blood into the minute vessels thereof; at the same time that it affects the eye and ear. For the same reason it is, as Dr. Derham observes, that a favoure thing seen or smelt, affects the glands and parts of the mouth; if a thing heard be pleasing, it affects the muscles of the face with laughter; if melancholy, it excites itself on the glands of the eyes, and occasions weeping, &c. And to the same cause Dr. Willis ascribes the pleasure of kissing.

BLUSTERING weather is that where the wind blows with various degrees of strength, attended with a dark sky, rain, snow, &c.

BLUTEAU, DON RAPHAEL, in Biography, a religious theatine, was born of French parents in London in 1628. After having distinguished himself in sacred and profane literature, he visited Portugal and acquired such knowledge of the language as to be able to preach in it with applause. From Portugal he returned to Paris, and was for some time preacher to Henrietta-Maria, queen of England. Upon reviving Portugal, he obtained an office in the inquisition, and became member of the Royal Academy of History. Of his works, the most esteemed is "A Portugueshe and Latin Dictionary," in 8 vols. fol. 1712-1721, to which he added a Supplement in 2 vols. fol. Lisbon. 1727, 1728. He died at Lisbon in 1734, at the advanced age of 96. Morei.

BLUTFINK, in Ornithology, one of the synonymous names of locis pyræhila, the common bullfinch. Frisch. Av.

BLYSING, in Geography, a river of South Wales, which runs into the Tivy, about 3 miles S.S.E. of Cardigan.

BLYTH, in Geography, a small market town of Nottinghamshire, in England, has been the seat of a castle and a priory, but their buildings with their endowments and privileges, being entirely demolished at the dissolution, the town also sunk in the general wreck, and has never since been renovated. The whole parish consists now only of 157 houses, with 570 inhabitants. Here are a small market on Wednesdays, and two annual fairs. The church is a large handsome structure, and contains several ancient monuments. Some of the Greffy family built an hospital here, which bears the name of Blyth-stipple.

BLYTH, or South Blyth, a small sea-port town of Northumberland, in England, is a place that has obtained its sole consequence since the restoration; for, previous to that period, here were scarcely any houses. In the year 1728, its trade had so much increased that above 200 vessels were entered in the custom house books as failing from this port. It is considered as a creek to the port of Newcastle, and its principal trade is in coals. Blyth is 14 miles N.E. of Newcastle, and 28 miles N. of London. The township contains 183 houses, and 1770 inhabitants, of whom 234 are employed in trade. Here is a small market on Saturdays. About three miles south of Blyth is Seaton Delaval, a seat belonging to lord Delaval, whose grandfather, sir Francis Blake Delaval, was an able admiral in the beginning of the last century. He was often projecting some improvements in the ports near his seat, and after furnishing great difficulties, constructed one upon a new plan, which now bears his name.

BMY, in Mafur. See GAMUT.

BOA, in Zoology, a genus of the SERPENT race distinguished by having plates, or undivided feata, both on the belly and beneath the tail; the latter of which, unlike the crocodile, does not terminate in a rattle.

Such is the Linnean character of this genus, the species of which are not very numerous. Gmelin enumerates the following kinds in the Systema Naturæ: contortrix, canina, hippocrepis, contructor, cenchris, ophysara, enydris, murina, scytale, and hortulanus. But in addition to these we are to mention a few other species described by Dr. Patrick Ruffel in a recent publication on the serpents of India, with the observations of Dr. Shaw upon the newly discovered kinds, and several others lately spoken of by continental writers.

Dr. Ruffel in the work above cited, has four new species of
of boa, called, in the Indian language, bungarum pumah, puddy coosie, greel paragoods, or in the young rate cobra musil, and the hornate p.-m. These are the species, fascinata, viperina, linearis, and hornata of Dr. Shaw's zoology. Dr. Shaw has likewise increased the number of the boa by the adoption of a fifth species, crotalus mutus of Linnaeus, which he is induced to remove from the crotalus to this genus, because it is not furnished with a genuine rattle like the rest of that tribe.

But the French writers of the present day have regarded the arrangement of the Swedish naturalist in the amphibious class of animals with much less indulgence, their alterations tending to little less than the subversion of his system. The boa genus, established by Linnaeus, is obviously defective, in one point at least, where nature had herself prescribed those characters which ought not to have escaped the discrimination of the naturalist. Nothing, we must admit, can be more improper, if it could have been avoided, than to include in the same natural family both the venomous and inoffensive kinds of serpents; or, in other words, to unite, under one head, those which, having fangs for the conveyance of poison into the wound inflicted with their bite, are highly dangerous, and such as have no fangs for this purpose, and are therefore comparatively harmless. The first innovation upon the Linnaean genera was made by Lacedepe, whose method has been followed by others; and lastly, by Latreille, with some improvements, in his Natural History of Reptiles.

Latreille retains among his boa those only of the Linnaean species which have no venomous fangs; for the reception of the remainder he establishes the new genus Scytale. This genus forms an intermediate link between the two Linnaean genera boa, and crotalus; having, in common with both, the abdominal plates, and either plates alone, or plates and scales beneath the tail the poisonous fangs removing them from the boa, and the naked tail from the crotalus. F snakes at that have a rattle at the extremity of that part. The boa of Latreille contain the following species: le boa devin (constrictor, Linn.), le boa gant (a species bitherto con- founded with the former), le boa bajoli (boa canina, Linn. and Lacedepe), le boa bipalle (bipale, Linn.), le boa cembris (cembris, Linn.), le boa enhydris (enhydris, Linn.), le boa sphyrie (sphyrie, Linn.), le boa scytale (scytale, Gmel. Schu- cher), le boa broete (brotulana, Linn.), le boa retverso (seba (v. 2. pl. 20. 1.), and le boa tare, a native of the Grecian islands, described by Olivier in his "Voyage dans l'Empire Ottoman."—Thus the Linnaean boa constrictor, a poisonous species, le scytale a jroat of this writer, is removed from among the boa to the genus Scytale, together with another species not before described, le scytale a jroat plate, and the four new species mentioned by Dr. Ruffell belong unquestionably to the same genus, being all of the venomous kind. We have, therefore, five species of the Scytales confounded with the natural family of boa. The boa, taken collectively, exceed in magnitude all the other tribe of serpents. The powers of certain species, like their stature, are prodigious. These enormous kinds are principally the inhabitants of the burning regions of Africa, whose fame, in this respect, was celebrated in ages of remote antiquity. History speaks of the tremendous serpents in terms that stagger credibility; but travellers of our own times, who have had the opportunity of observing these creatures in their native haunts, and, both from the movements of the body, the view of the body, the body, must be of these, the confidence, seeing the strength of the serpent, with the wild, incredible, paralyzing its efforts with the deadly torpor of their poison. Confident in their powers, they attack them openly; oppose their strength to the resist least that of their enemy, with ardor and intelligence; and when they conquer, it is by the manifest superiority of bodily vigour over that of their opponent. It should be observed, that these words of the boa, of which no more than two species are correctly ascertained, although there is reason to believe the number must be greater. Much confusion prevails among travellers who have described these serpents: they have entered largely into the pedigrees of their history, without paying any due regard to the descrip-
tion of the animal's themselves, a circumstance that has hitherto involved this matter in obscurity, and leaves us in considerable doubt as to the real number of distinct species already discovered, and mentioned by those travellers. See Conspectus, &c.

BOA. In Ancient Geography, a place of Italy, on the Aurican way, in the route from Rome to Aricia, through Etruria and the Maritime Alps, Anton Iton.

BOAD. In Geography, a town and port of Hindooftan, in the county of Orissa, near the Mahanundriver; 55 miles S. E. of Sumulpour, and 100 west of Cattack. N. lat. 20° 45'. E. long. 88° 10'.

BODICEA, Boudicca (Tactitus), or Boudicca (as she is called by Dion), in Ancient British History, a queen of the Iceni, celebrated for her misfortunes, and for her formidable, though unsuccessful, resistance to the Roman power in Britain. At the time when the revolt, of which Boadicea was the principal mover, took place, the southern part of the island had tranquilly submitted to the government of the Caesars. Although scarcely 18 years had elapsed since the invasion of Claudius, Britain was already considered an important acquisition. Several flourishing colonies were founded; numerous settlers flocked from the more distant provinces of the empire, and the only expedition which employed the legions, was that undertaken against the fequestrated island of Mona, the principal remaining seat of Druidical superstition. But amidst this seeming security, the oppression excited by individuals excited indignation among the natives. The procurator, Catus Decianus, who, in the absence of the proconsul, possessed the exclusive administration of government, behaved with the utmost irremovable tyranny; and, according to the conception of Tacitus himself, the great men of the nation were treated as slaves, and deprived injudiciously of their estates by this unjust governor. The fear, however, of incurring the imperial retribution, restrained them from expelling their dissatisfaction rather than by murmurs, till the desecration of Praetogus, king of the Iceni, brought matters to a crisis. This monarch, by his attachment to the party of the invaders, had merited the title of friend and ally of the Roman people, and by his last will, had bequeathed his estates as a joint inheritance between the emperor Nero and his two daughters. His policy, if intended as such, failed of the desired effect. The procurator, under pretence of carrying the testament into execution, seized on all the possessions of Praetogus without exception; and as Boadicea dared to murmur against such flagrant injustice, he actually caused herself to be publicly scourged as a slave, and the chastity of her daughters to be violated by his officers.

Such outrages were beyond suffering. The Iceni to a man rose up in arms, headed by Boadicea in person, who to a matron of spirit joined a gift of natural eloquence calculated to inflame the passions of a barbarous multitude. The Trinobantes, and other neighboring nations, alike incensed at the extortions of the procurator, followed the example, and an army of 150,000 invaders being rapidly formed, marched directly against Camulodunum, (supposed to have been Maldon,) the nearest Roman colony. As Decianus could only spare a few soldiers to afflict the inhabitants in its defence, the place was almost instantly formed, and, with a temple lately erected to the divinity of Claudius Cesar, reduced to ashes, all within it being previously massacred. The ninth legion, which had ventured to take the field against the invaders was not attacked and defeated. The infantry were almost totally destroyed. The commander, Feliacus Cerialis, at the head of his cavalry, with difficulty regained his camp, where he carefully intrenched himself; while Catus Decianus, terrified at the consequences of his infamous conduct, made his escape into Gaul, covered with universal odium.

After such a series of ill-fortune, the only hope of the Romans remained vested in the proconsul Suetonius Paulinus, at this time occupied in exterminating the Druids of Mona. On receiving news of the proconsul made by Boadicea, he immediately marched, though by a dangerous route, and through the midst of an hostile country, to Augusta (London), already a considerable place, though not yet dignified with the name of a colony. As he judged this poll untenable, he resolved to unite his scattered forces, accompanied by each of the inhabitants as chieftains to follow his fortunes; but the women and children, the old and infirm, who were left behind, without any other protection than their sex, their age, or their situation afforded, were indiscriminately sacrificed to the fury of the Britons. Verulamium, another colony, shared the same fate. All foreigners were everywhere put to the sword, and the cruelties, said by Dion to have been exercised upon some of the sufferers, are shocking beyond description.

The rebellion had now attained its utmost height. Three Roman stations laid in ashes, and the blood profusely poured of 70,000 of her persecutors, had emplotted all the wrongs of Boadicea. The whole eastern part of the island was in possession of her partizans, and her forces in arms had increased to the amazing number of 200,000, when Suetonius, having taken every measure prudence could suggest in his circumstances, prepared to check this torrent in its course. The proconsul, although accursed, and perhaps with justice, of pride and executive cruelty, yet possessed the most splendid military talents. During the last reign he had signified himself, when commander in Africa, by a complete victory over the rebellious Mauritanians. Nero rewarded his bravery by naming him to the government of Britain. The late reduction of Mona had increased his celebrity; and he appears to have been the only general then in the empire, Corbulo probably excepted, equal to the task of reducing the insurrection raised by Boadicea. His situation was, however, extremely critical. It was in vain that he dispatched instructions to Pannius Pollianus, who commanded the second legion, to march to his assistance. Pannius, in consequence of some difference with his general, or actuated by a secret jealousy, refused to move, in direct disobedience to orders. Thus Suetonius saw his whole force reduced to the fourteenth legion, Gemina, and the Vexillarii of the twentieth, which, added to a few auxiliary cohorts, only amounted to about 15,000 men. With his army, small as it was, he determined on hazarding a battle, and therefore waited the approach of the Britons on a narrow spot of ground, opening in his front into an extensive plain, while his rear was protected by a thick wood. According to the usual disposition observed by the Roman armies, the legions were stationed in the center, flanked by the light armed and auxiliary cohorts; the wings being composed of cavalry. Suetonius did not tarry long in expectation of the enemy. The Britons soon appeared, covering the plain in immense numbers, their wives and children, who had accompanied them to become spectators of a victory already considered as certain, were mounted in heaps on waggons, encircling the field in their rear, like an amphitheatre. Boadicea, with her two daughters, drove in a chariot along the ranks, encouraging her troops in animated language. She renewed the detail of Roman injustice, besought vengeance for the wrongs inflicted by herself and her family, magnified the importance of the victory she had already gained, and adored her followers.
Boa

Boa

followers that their enemies, forsaken by all the gods, would never be able to endure even their threat of over. She finished by exciting them to conquer or die which, she added, was her own resolution. Into his mind, she did not neglect to animate as manly as possible with the admiration and cheerful confidence with which it was received convinced him that he had nothing to hope from the bravery and discipline of his followers.

The Britons came on, uttering loud shouts, menaces, and songs of victory, while the Romans, whose victory was private and at the required distance, gave a first discharge of the pious with terrible effect. Preferring the advantage of the ground, they received the attack of the Britons with such defiance, at checking its impetuousity; till, having expended all their Jones, not without dreadful carnage of their enemy, they rushed forward from all parts at once. Observing the form of a wedge, the more easily to penetrate such an impenetrable multitude. This charge was followed by the Britons with equal ardour. The first ranks of their pikes were instantly borne down, and they in pieces, met the first charge to surround the Romans, a second commenced. The British war-chariots, whenever they descended in battle, among their enemies, occasioned consternation on the Britons, ordering his men to press the Britons, as the huddled bodies of the drivers, by degrees desolate all. From these troublesome invaders. The action was long maintained with fury on both sides, the Britons, though destitute of order or discipline, fighting with great chivalry and courage; but, finally, the superior hand, coolness, and service of the Romans, bore down every opposition. Prodding its numbers perilous beneath the viole of the legs, or by the charge of the cavalry, who trampled all before them, while the crowds that endeavoured to save themselves by flight, met with an impenetrable impendence in their own wagons, which enclosed them in form of a box. Here the slaughter was terrible, for mercy in the circumstances of Sertorius, would have been in the highest degree imprudent. The Romans, in the heat of their fury, spared neither age nor sex. Even the bolds of burden, struck through with darts, increased the horrors of the scene, and the heaps of dead, which covered the plain, the fields, and the surrounding forests. Upwards of 80,000 Britons are computed to have perished on this occasion; while of the Romans about 400 were killed, and severely wounded.

Few victories, even in the most flourishing ages of the republic, deserve to be compared with this of Sertorius. Never had any been more decisive. The remaining rebels, terrified at the dreadful slaughter, that had occurred, dispersed into their respective districts, and Sertorius himself retired soon after the battle, either to die or to live; or as the prevailing opinion, the end of his days by poison. Sertorius' death, which submerged had prevented the second legion from falling in the triumph of their country, fell on his own head, thus avoiding the punishment and disgrace which awaited him on. The vigour with which, though accompanied by acts of the most terrible severity, Sertorius pursued the destroyers, restored tranquility to the whole island before the ensuing spring. The few signs of individuals, and the jealousy of his excreble sovereignty, occasioned his subsequent recall from his government; yet the triumphs obtained under his auspices, conferred everlasting honour and renown both on his own name and that of the legion he commanded.

Boadicea is described by Dion Cassius as a woman of large stature, strong and well proportioned in her limbs, of a manly and stern countenance, bashful, authoritative voice, and posing beauriful golden hair, which reached down below her waist. That she was possessed of uncommon abilities, and had many talents to assist her, is evident from the speeches with which she cut off the Roman generals, and which were given to the historian by his informants. She allowed the authority of Tacitus, referring to her speech. Such passages of Dion as are most necessary to elucidate the situation. The defeat and death of Boadicea are laid to have happened A.D. 61. Tacit. Ann. iv. xiv. c. 32—37. Dion Cassius, Hist. Rom. 16. i. 5. c. 1—12.

Boa or Boa, in Geography, called also Oman, or men, or men of the sea, are a sort of itinerant fishermen in the East Indies, said to have originally from Arabia, at the castle entrance of the straits of Malacca, though some are of opinion, that they must have come either from China or Japan. They live chiefly in small covered boats, on the coasts of Borneo, Celebes, and the adjacent islands. Others dwell near the sea, on these islands: their boats being called on poles, at a little distance in the sea, and always at the mouth of rivers. They are Mahometans: and have a language of their own, but no written character. Many Boas are settled on the north west coast of Borneo, who not only fish but make fish, and trade in small boats along the coast. Some of their boats are from 15 to 20 tons burden, and carry from 15 to 20 men and 15 to 20 men, and form, in some places, a fleet of a hundred. Others of them are about 5 to 6 tons burden, which are managed by women, even in heavy seas. Their method of making salt is as follows; they gather sea-water, burn them, make a large of ashes, filter it, and form a little kind of salt in square pieces, by boiling it in pans made of the bark of the anghar, or cangara-tree; these pieces of salt are carried to the town, and paid as a currency for money. Those who a salt in the north-west coast of Borneo used to fish near the town at Batamanghan with rice, fowl, and other provisions. Many of them are settled at the mouth of the river of Palae, who employ themselves chiefly in catching small fishes with hand-nets, which they push through the mud; the fish are, after being well washed with water, are exposed to dry. They are then beat in a mortar, and made into a kind of paste, called bangbang, which has a strong smell, and is much in request all over India. These last Boas are to be considered as distinct from the former Boas, which are distributed all over the islands. They are described as fishing for ari, i.e. the swallows, or f-a, flags, which they take in seven or eight fathoms water. When they see the swallow in clear water, they strike it with an instrument, consisting of four-bearded iron prods fixed among an almost cylindrical stone, rather small at one end than at the other, about 18 inches long; an iron net is fixed at the end of the stone, next the point of the prod. The swallow is dried in the sun, and sent to the Chinese market. They also dive for it, the bell being found in deep water. The black is reputed the best; but there is some of a lighter colour, found only in deep water, which is more valued
valued in China than the black, and sold even for 40 dollars a picol; some of the pieces weigh half a pound. The white, caught in shallow water and on the dry sand, among coral rocks, is the worst; its value being about four or five dollars a picol. The Boadjoos are very useful to the Dutch East India company, in carrying intelligence speedily from place to place.

Boadoda Bokevuz, in the Turkish Military Orders, an officer of the janizaries, whose business it is to walk every day about the principal parts of the city, with a number of janizaries to attend him, to keep order and see that all things are regular, even to the doors. This office is for three months, and from this the person is usually advanced to be a ferman.

Boe, in Ancient Geography, a town of Peloponnesus in Laconia, at the extremity of the Eacotian gulf. Diana was particularly worshiped in this place; Apollo and Eucubius had their respective chapels here. At some flood from this city was a temple of Seraphis and Isis. Paulan. Boaergius, a river, or rather torrent, of Greece, in the country of the Epicomenian Locrians, according to Ptolemy. Strabo says, that it watered the town of Thynion. Also, a town of the fame country, situate to the west, on the confines of Phocis.

Boanerges, i.e. Sons of Thunder, in Scripture History, a name given by our Lord to the two apostles James and John (Mark, iii. 17.) which some have erroneously supposed to be an appellation of reproach, intimating a fierce and furious temper; whereas it is much more reasonable to consider it, with others, as a title of honor, prophetically representing the resolution and courage with which they would openly and boldly declare the great truths of the gospel, when they were made fully acquainted with them. How well they deferred this title, sufficiently appears in the sequel of their history. See James, and John.

Boans, in Zoology, a species of Rana, or frog, the body of which is smooth, marked with conspicuous spots beneath; and the feet palmed. Gmelin. Two varieties of this kind are considered; 2, having the upper part of the body blackish, lead color, and with, the body inclined to orange. Laurent, Amph. &c.

This kind inhabits America, and differs from rana arbores, the tree-frog, to which it is nearly allied, according to Gmelin, in having all the feet webbed, and the body spotted with white. Much confusion prevails respecting the Linnaeus species, boans. Dr. Shaw supposes it to be the same as the ranar maxima of that author, probably in a younger state. He mentions likewise another supposed variety, the rana virginiol aerata of Seba.

Boar, the wild boar or hog from whence the common hog derives its origin. See Srofa sus. The male of the tame hog is also called the boar.

The wild boar is a native of almost all the temperate parts of Europe and Asia, and is also found in the upper parts of Africa. Formerly it was an inhabitant of this country, as appears from the laws of Howell Dla, who permitted his grand huntsman to chase that animal from the middle of November to the beginning of December. (Leges Wallace, 41.) There are also many places in Wales that retain the name Penarth, or The Boar’s Head, to this day. William the Conqueror punished with the loss of their eyes any that were convicted of killing the wild boar, the hog, or the roebuck. (Leges Saxon. 292.) And Fitz-Stephen tells us, that the wild boar, which in his time grew on the north side of London, was the retreat of flags, fallow deer, wild boars, and hares. Charles I. turned out wild boars in the New Forest, Hampshire; but these were destroyed in the civil wars. (Iennaat.) In France, Germany, Poland, and other countries on the European continent, they are still common, and the hunting of them is a principal amusement among parties of the gentry. Boar-hunting is a favourite diversion also in other distant parts of the world.

These animals are found in the hilly districts of the Pamara and the Volga, in Russia, on the confines of the river Ural in Daoria, and about the Irtysh. Between the Ural and the Yamba they are very numerous, and are hunted in winter by the Cossacks, not without danger, with dogs, and sometimes killed with carbines, and sometimes with hauses. Although they feed solely on the roots of sea-weed and fedge, they grow to such an extraordinary size, that they are frequently found weighing upwards of six hundred pounds; their bacon is nearly four inches thick in fat, though their fleshes in general dry and firm and well-flavoured.

Somnini thinks it probable (see his Travels in Upper and Lower Egypt, p. 348.) that the wild boars of Egypt are not the same with those in Europe. The great difference of climate, and the still greater difference of situation, must have occasioned at least some varieties in the species of these animals. More multiplied in temperate or cold countries, which appear more suitable to their nature, they inhabit the thick recesses of the forests, where they can find abundance of food: They never leave the woods but to pafs from one to another, or to ravage the growing crops, and these predatory excursions are undertaken only by night. In general, they retire to the darkest and cloest places at the rising of the sun, the brightness and heat of which they seem to dread. The wild boar of Egypt, on the contrary, has no shelter. Continually exposed to the rays of a burning sun, he roams over the hottest sands, where he with difficulty finds a few scattered shrubs, which afford him a scanty subsistence, and scarcely any shade. He is also frequently seen in the deserts of Nubia, which is the retreat of a greater number of animals than any other part of the deserts, on account of the streams of water it contains, and of the plants that grow on their banks. These boars are solitary, though a general want of food sometimes drives them into the environs of the lakes of Natron. As the Maometans and Copts do not eat the flesh of the wild boar more than that of the hog, and hold both these animals in equal toleration, it was impossible, says this writer, to procure a wild boar in Egypt, at least without seeking it in the desert. Upon the whole he concludes, that they are not the same as those of Europe. It is perhaps, he adds, in this sense only that we must understand the passages of Aristotle (Hist. Nat. i. viii. c. 24.), and Pliny (Hist. Nat. i. viii. c. 32.), who have asserted that there are no wild boars in Africa. Wild boars, says Buffon, are as common in Asia and Africa as in Europe. But he has given an account and a drawing of an African wild boar, which is remarkable for several particular characters; and hence there is reason to believe, that the "hanziote" of Egypt is the same animal as the wild boar of Africa.

Among hunters, the wild boar has several names according to its different ages: The first year it is called a pig of the lauder; the second, a hog; the third, a hog-feer; and the fourth, a boar. When leaving the lauder, he is called a finger, or fanger. The wild boar inhabits woods, living on roots, mulls, acorns, and other vegetables. Though glutinous, they do not attack other animals to devour them; but they eat flesh when they meet with it. They have been seen to eat hogs’ flesh; and the skin of the deer,
BOAR.

The wild boar is hunted with dogs, or killed by surprise during the night when the moon shines. As he flies swiftly, leaves a strong odour behind him, and defends himself against the dogs, and often wounds them dangerously, a few hunting dogs are unnecessary, and would have their nose spoiled, and acquire a habit of moving slowly by hunting him. Mailiffs, with very little training, are sufficient. The oldest boars, which are known by the track of their feet, should alone be hunted: a young boar of three years is difficult to be attacked, because he runs very fast without flopping; but the old boars do not run far, allow the dogs to come near, and often stop to repel them. During the day, the boar commonly keeps in his hold, which is the most frequented part of the woods, and comes out by night in quest of food; and in summer, when the grain is ripe, it is easy to surprise him among the cultivated fields, which he frequents every night.

The boar lives to twenty-five or thirty years, if he escapes accidents. The time of going to rut is in December, and lasts about three weeks. They feed on all sorts of fruits, and on the roots of many plants; the root of fern, in particular, seems a great favourite with them; and when they frequent places near the fen-coat, they will defend to the thores, and demolish shell-fish. Their general places of rest are among the thickets bushes that can be found, and they are not easily put out of them, but will hold the same a long time. In April and May they sleep more than at any other time of the year, and this is therefore the successful time for taking them in the toils. When a boar is encroaching of the thicket, he always goes from it, if possible, the same way by which he came to it; and when he is once up, he will never stop till he comes to some place of greater security. If it happens that a faun her of them are found together, when any one breaks away, the rest will follow the same way. When the boar is hunted in the wood where he was bred, he will scarce ever he brought to quit it; he will sometimes make towards the hides, to listen to the noise of the dogs, but retires into the middle again, and finally dies or escapes there. When it happens that a boar runs a-head, he will not be flopped or put out of his way by men or beasts, so long as he has strength left. He makes no doubles or croffings, when chaced; and when killed, makes no noise; if an old boar; but the fows and pigs will squeak when wounded.

The reason for hunting the boar begins in September, and ends in December when they go to rut. If it be a large boar, and one that has him long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him; and the huntman, with his spear, should always be riding in among them and challenging the boar as often as he can to discourage him. Such a boar as this, with five or six couple of dogs, will run to the first convenient place of shelter, and there stand at bay, and make at them as they attempt to come up with him. There ought always to be relays also for the belt and haunch-bounds in the kennel; for if they are young eager dogs, they will be apt to feize him, and be killed or spilled, before the rest come up. The putting of collars with bells about the dogs' neck is a great security for them; for, the boar will not soon strike at them when they have thee, but will rather run before them. The huntmen generally kill the boar with their swords or spears; but great caution is necessary in making the blows, for he is very apt to catch them upon his front, or tusk, and, if wounded and not killed, he will attack the huntman in the most furious manner. The places in which the wound is to be given with the spear, are either between the eyes in the middle of the forehead, or in the shoulders; both these places make the wound mortal. When this creature makes at the hunter, his safety consists merely in courage and address; if he flies for it, he is surely overtaken and killed; if the boar comes straight up he is to be received at the point of the spear; but if he makes doubles and windings, he is to be watched very cautiously, for he will attempt getting hold of the spear in his mouth, and if he does so, nothing can have the huntman but another person's attacking him behind. He will, on this, attack the second person, and the first must then attack him again. Two people will thus have enough to do with him; and were it not for the forks of the boar-spear that make it impossible to press forward upon them, the huntman, who gives the creature his death's wound, would seldom escape falling a facicide to his revenge for it.

The modern way of boar-hunting is generally to dispatch the creature by all the huntmen striking him at once; but the ancient Roman way was for a person on foot, armed with a spear to keep the creature at bay; and in this case the boar would run of himself upon the spear to come at the huntman, and push forward till the spear pierced him through.

The hinder claws of a boar are called guards. In the corn he is said to feed; in the meadows or fallow-fields, to root, swarm, or form; and in a close to graze. The boar is followed with as many teeth as he will ever have; his teeth increasing only in bigness, not in number. Among these there are four called tusks, or tucks, the two biggest of which are of no use to him when he strikes, serving only to what the two lowest, which are his habitual weapons of defence. As the boar advances in age, he becomes less dangerous, on account of the growth of these tucks, which turn up or take such a curvature, as rather to impede than afflit him in wounding his adversary. The huge pian boar, or hog, is a still more fierce and dangerous animal than the kind found in Europe. In habits and manners they are pretty much the same, although specifically different; and, like the common boar, is capable of inflicting the most tremendous wounds with its tusks.

The flesh of the boar was esteemed a delicacy among the ancient Romans; a boar served up whole was a dish of state. The boar was sometimes also the military ensign borne by the Roman armies in lieu of the eagle. Certain writers of modern date speak of the flesh being unwholesome, except to those with athletic constitutions.

A remarkable circumstance concerning the wild boar is related by Sommii. In the year 1577, an animal of this kind, of a most extraordinary size, was killed in the neighborhood of Cognac, in Angoumois, which had many times escaped from the hunters, had received many gun-shot wounds, and had cut the hays of several dogs and men each time of attacking him. When this animal was at length slain, several bullets are said to have been found b-
tween his skin and flesh. Had not the above account been
given by hunters of distinguished order, and too well ac-
quainted with these animals to have made any mistake, it
might have been imagined, that this formidable creature,
which had long continued its ravages in the park of Cog-
nac, belonged to a different species. It was of an enormous
size, with a very long head, a very sharp or pointed snout,
and its mouth was armed with teeth of a very singular
form. The hairs of the body were white; those of the head
yellowish; the neck marked with a black band in form of
a cranv; and the ears large and straight; and what
appears surprising, considering its size, it was of uncom-
mon swiftness. For a further history of this animal, see
Scrofa.

Boar, in the Mange. A horse is said to bow when he
shoots out his nose as high as his ears, and tosses in the
wind.

Board, a piece of timber fawed thin, for the purpoes of
building. See Timber.

We say, a deal-board, an oak-board, &c. Boards thicker
than ordinary are called planks. Boards formed ready for
the cooper's use are called clap-boards. We have also mill-
boards, and scale-board, shaved very thin, for cafes, hand-
bases, &c. Deal-boards are generally imported into Eng-
land ready fawed, because they are prepared cheaper abroad,
by means of saw mills. Clap-boards are imported from
Sweden and Dantzick. Oak-boards chiefly from Sweden
and Holland; some from Dantzick. Pipe-boards are
brought from Dantzick. We also import white boards for
fioce-makers; mill and scale-boards, palie-boards, &c. for
divers artificers. Scale-board is a thinner fort, used for the
covers of primers, thin boxes, and the like. It is fawed
with mills, and imported from Hamburg.

Board, feather-edged, graining, fog, post, found, trail, cofle,
weather. See the several adjectives.

Board, is also used for a kind of table or bench, whereon
several artificers perform their work.

In this sense, we say a work-board, a chop-board, a tay-
lor's-board, &c.

Board, is also used for a flat machine, or frame, used in
certain games, and the like.

In this sense, we say a draught-board, a chefs-board, a
feel-board, and the like.

Boards, in Book-binding. See Book-binding.

Board, bureau, is also used for an office where accounts
are taken, payments ordered, and the like.

In this sense, we say the board of works, board of ordi-
nance, board of treasury, and the like.

Board of green cloth. See Green-cloth.

Board of Control, was first instituted in 1784, by flat.
24 Geo. III. ss. 2. c. 25. with a view of directing and aid-
ing the East India company, in the executive government of
India, and establishing a power of control in this kingdom.
This board was further established and regulated by the flat.
33 Geo. III. c. 52. the operation of which commenced in In-
da on the 1st of February 1794. By the former act fix
perons were to be nominated by the king, as commissioners
for the affairs of India; but by the latter, the number, in-
stead of being limited to fix privy-councillors, is indefinite,
depending upon the king's pleasure; of which number the
two principal secretaries of State, and the chancellor of the
exchequer are to be three; and his majesty, if he pleases,
may add to the lift two commissioners, not of the privy-
council; and the person first named in the king's commis-
sion is to be president. The king may give 5000l. a year among
fuch of the commissioners as he pleases; which, together
with the salary of the secretary and officers, and other ex-
}
polity, established in 1723, composed of eight portions of experience in commerce and navigation, where all papers and proposals relating to the improvement of trade are considered, and all difficulties which occur in affairs of navigation and commerce, either within or without the realm, are discussed.

Board-wages, denote a certain annual sum allowed to household servants for maintenance. Board-wages, granted to the menial officers and servants of the crown, commenced in 1629, when the necessities of king Charles obliged him to retrace the expense of his household, by abolishing the greatest part of the daily tables in his palace, which were eighty in number, and substituting this annual allowance in their room.

Board, or Aboard, in the Sea Language, is used in speaking of things within a ship or other vessel.

Hence, to go aboard signifies to go into the ship; to have ever-board, is to throw a thing out of the vessel into the sea; to slip by the board, is to slip down by the ship's side; to fall a-board of, is to strike or encounter another ship, when one or both are in motion; to keep the land a-board, or to keep hold of the land, is to steer near to, or in sight of the land; board and board, is when two ships come to near as to touch one another, or when they lie by side. Weather-board, is that side of a ship which is to windward. To board a ship, is to enter an enemy's ship in an engagement. See Boarding, infra.

Board denotes the distance run by a ship at one tack; and hence to make a board, or as it is otherwise expressed, to board it up to a place, is to turn to windward; and to beat sometimes upon one tack, and sometimes upon another; in which it is to be noted, that the further you stand off to one point of the compass, the better board you will make; and that it is better making long boards than short ones, if you have sea-room. A long board is when you stand a great way off before you tack or turn; a short board is when you stand off a little; a good board is when a ship does not go to leeward of her course, or advances much at one tack, and fails upon a straight line. To leave a land on back-board, is to leave it a-tack, or behind the back-board, being that which in boats or ships, we lean our backs against. A-board main-tack, the order to draw the main-tack; i.e. the lower corner of the main-fall, down to the chefs-tree. See Chess-tree.

Board, Lar, and Starboard. See Layboard and Starboard.

BOARDED Floor. See Floor.

BOARDING, in Naval Tactics, denotes the art of approaching the ship of an enemy so near as to admit of the grappling which are fixed on the lower yard-arms, at the forecastle, gang-ways, &c. being thrown into it, for the purpose of securing the vessels together, and of entering her decks, with a detachment of armed men. The method of conducting or of avoiding this kind of attack depends upon the relative situation of the contending ships; and varies, as it is to be performed to windward, to leeward, with the wind at large, or when the ship proposed to be boarded is at anchor.

In the first case, when the enemy's ship keeps her wind under an easy fall, and is overtaken in a chase by those who intend to board her, the vessel of the latter will get on the weather-quarter of the former, within half a pilothole. She should then begin and continue a brisk action, so that the smoke of the cannon and musketry of both ships may conceal her manoeuvres; and, under the cover of this cloud, she should increase her fall, if she has not way enough, in order to augment her velocity and the rapidity of her movement, that she may more readily lay on board the enemy, on the weather-side, either exactly abreast or a little abaft. This may be easily done, by edging down suddenly upon him, but avoiding being raked by the enemy's fire. By this manœuvre the grappling will be on board of the adverse ship, before or very soon after the suspect the design of the boarders. In this situation, the vessel proposed to be boarded can recur only to one precipitous expedition, which, duly observed by the boarder, will be of little or no avail. For when she braces sharp a-back her head falls, to cause the ship's falling off, and figures those aft, to give her stern-way, the boarder, by performing boldly the same manœuvre, will be as well situated for boarding as before; provided the boarding ship feels the impulse of her fails and helm, which ought to put a-weather, and kept to till the ship's head-way ceases, when it is to be put a-lee, to affill her in falling off, in order to board the enemy to lee-ward; for the boarder ought to be on the quarter of the other, since at the moment the two ships were right before the wind, the who was directly to windward and wished to board, had only to continue her movement of rotation, and render her velocity equal to that of her adversary, by shortening sail in order not to pass her. If, therefore, the circular motion is kept up by the boarder, which at first caused him to fall off, and now brings him to the wind on the other tack, he will join the enemy to lee-ward; for it is evident that, if this motion of turning be more rapid than that of the ship which wishes to avoid boarding, the boarder will close with her before she can range to the wind on the other tack, since the boarder comes round with greater celerity. However, if the ship which fears boarding was preceeded thus closely, she could make no other attempt than to throw once more all her fails to the mail, her bringing them only perpendicular to the keel to give her stern-way, and putting the helm a-weather, to keep her to the wind, as soon as her head-way ceases; observing that, as she is to windward, she may be thus driven on the boarder, who watches for her under her lee. But necessity obliges her to adopt this only expedient; because, if she could go a- stern with sufficient velocity, she might let the boarder pass a-head, veer under his stern, and rake him, if he does not anticipate this manœuvre, and as quickly manœuvre in the same manner; the great velocity with which he comes to the wind, and goes a-head, his fails being still full, reducing him to this state, which may prevent his persifling in the design of boarding. Nevertheless the boarder may attain his purpose, if he throws all his fails a-back at the same time as the ship to windward; because, the attacked ship dropping to leeward, and having stern-way first, approaches the boarder, who has preferred his position on the quarter, and longer kept his helm, by having gone a- stern somewhat later than the weather ship. It should also be observed, that when the two ships are right before the wind, if the vessel which fears boarding moves more quickly to the wind than the one which attacks, she will avoid it, as the retreating ship will be close to the wind before the other, and able to get a-head of her, by making all fail to keep her wind, or to heave in flays, and get upon the other tack. This last movement, however, is disadvantageous; because it will prevent the stern to a ship, which will avail itself of that situation, and rake her, and this may be more destructive than a well opposed attack by boarding. After all, if the ship that is inclined to board fails better than the other, she will always have it in her power to execute her purpose, if she is as well manœuvred as the ship which endeavors to escape.

In the second case of boarding to leeward, when close to the wind, the boarder should arrive within pilot shot, close in
boarding.

the wake, or, at most, to the weather quarter of the ship against which the attack is meditated; taking care to continue steering, so as not to be raked by any of the guns that lie long to the quarter on which he stands. In order to come up with his adversary, he must edge away a little, and range round aft, to clothe upon the enemy's lee-quarter, that his bow-head may almost touch her quarter-gallery. When the ship has shaft sufficiently a-head, and is parallel to that of the adversary, the fore castle being a-breast of the enemy's mainmast, the mizen and fore-fall feet are to be well hauled aft, the helm put hard a-lee, and the head-feetets a-back; then, the ship, coming rapidly to the wind, shivers her bows, and closes with the opposing vessel side to side. In executing this maneuvre, which cannot fail to succeed with the advantage of failing, great attention is necessary; because, if at this moment the weather-ship, which wishes to avoid being boarded, either sets her courses, or lays all along a-back which she had fart, the may chance to break the grapples, if the falls of the boarding vessel have not been trimmed like those of the other; for, by making more fall if the wind be a little fresh, the will shoo a-head through the water, and drag the bow-wood with such force as to break the chains or hawser by which the two ships are confined together. By laying all along the mast the boarded vessel is the more likely to succeed, since the falls of one vessel will be full, while those of the other are a-back.

This mode of boarding may be avoided, if the boarder does not pay strict attention to his own manœuvres, as well as to those of his adversary; and it may be more readily avoided, if the adversary's vessel braces her head-falls sharp a-back, setting only, if necessary, the fore-fall, at the same instant laying to the wind or hivering, according to the necessity for more or less leen-way, all those which arc a-shalt, and putting the helm hard a-lee. This is to be executed, when the boarder is about a ship's length a-lee of the other vessel. The quickness of this operation, and the rapid veering of the weather-ship, may bring the boarding vessel, which is a little to leeward or a-lee of the other, into the most dangerous situation, if she does not manœuvre in the same manner, and with equal celerity; as the boarder's falls being full, keep up his velocity, and may, before he can veer, engage his bow-wood in the main-shrouds of the enemy, who pays short round on her head. Those who wish to board a ship, and to engage the enemy's bow-wood in their main-shrouds, need only to get a little to windward of her, and about one or two ship's lengths a-head, according to the estimated celerity of their movements; then brace sharp a-back the head-falls, shiver the after-ones, or lay them flat to the wind, with the helm a-lee. This manœuvre, well performed, and covered by a brisk fire, will commonly succeed; but care must be taken not to come round to soon, but to range very close to the adversary; because if the boarding vessel be not sufficiently a-head of him, it might fail in boarding by paying too short round, and its bow-wood get foul of his fore-shrouds, which would be very disadvantageous. The design will be frustrated, if the boarding-ship closing too far a-head, passes under the bow-wood of the enemy, who will thus, however, be exposed to be raked at his head, if he does not manœuvre in the same manner and at equal quickness as the boarding vessel, which has the great advantage of priority. In order to engage the bow-wood of the enemy's ship in the rigging of the boarding vessel, this should be ranged very close to the other; because, if this were attempted at only a ship's length large, and to windward of the enemy, he need merely, upon perceiving the design, to put the helm hard a-lee, and heave in flays. If this last method be properly executed, the two ships can only range very near each other, and exchange their broad-sides, and the lee-ship will immediately gain the wind of her adversary. Consequent to execute this maneuvre well, the vessels must be nearly yard-arm and yard-arm.

If the boarder be at a certain distance a-lee on the weather-quarter, the ship wishing to avoid boarding must have in flays, as soon as the other vessel is in the act of veering, in order to close with her to leeward. By this manœuvre they will come head to head, so that they may reciprocally fire their broad-sides, in passing on opposite directions, and the lee-ship will get to windward.

In the third case, when two ships engage with the wind large, the boarding vessel should keep as close as possible on the lee-quarter of the ship she means to attack by boarding, that she may execute her purpose by coming rapidly to the wind, and being careful not to pass a-head of her opponent. The weather-ship, in order to avoid being boarded, must act according to circumstances, in the manner directed in the last case. A ship may be boarded on the weather-side, by conforming to the instructions relating to boarding to windward. When two vessels are engaged with the wind right a-lee, the boarder ought to drop a-lee of the enemy, in order to run up close along-side of him, if the boarder has the advantage of falling; for, as she advances towards her adversary, the adversary can only endure to range rapidly to the wind on the other tack, as soon as the bow-wood of the boarder is a-breast of her stern, and thus gain the wind, in order to be in a situation to extricate herself more easily by a good manœuvre. The boarding vessel should be allowed to come a-breast of the stern of her adversary, before she can lases her wind; because, if this were done sooner, the ship a-lee, at a small distance, would board her perfectly well, even if she failed with equal celerity, since the boarder would be to windward, would run large longer than the other, would range more flowly to the wind, and continue to shoo a-head of the flying ship. This will appear more evident by considering that the boarder coming from windward preserves his velocity longer, trimming his only as the ship comes to the wind, and cuts the course of his adversary with a line less curved than that described by theretreating ship. If, by coming too near or too far to the wind, the boarder chuse to abandon his design, he might do so by veering a few points on the other tack, and shortening sail; so that the retreating ship will shoo her stern, and the boarder can then take her by passing under her stern.

In attacking a ship closely to leeward, the boarder should keep away a little when abreast of her, and seem to yield under her fire. If the enemy's ship should thus be induced to veer, in order to bring the boarder more under her guns, the latter should heave r-pidly to the wind, by putting the helm a-lee, trimming all sharp a-lee, and suppressing the effect of the head-falls; which should be done at the instant when the enemy is perceived to be bearing down. The two ships will by the quickness of this manœuvre, and the priority of the movement thus gained on the enemy, soon close, and, with proper attention, the enemy's bow-wood may be entangled in the fore or main rigging of the boarding vessel, which would be a favourable circumstance in the attempt to board. However it may happen that no attempt can be made to board, if the weather-ship, instead of bearing away, places more and more to windward; fore this faint manœuvre may take the boarder too far off to leeward of the adversary. If the boarder should chance to be a ship's length to leeward, and about the same distance a-head of the enemy's vessel, it may, under cover of a heavy fire, heave in flays; and thus come right athwart the enemy's hawse, rake him fore and aft, and board him, his bow-wood being right
right over the enemy's gang-way; nor can he possibly avoid a broadside; nor if he leave all a-back and make a stern board, which is his only resource, he may avoid being boarded, but his situation will be very perilous.

In the last cage of boarding a ship, which is at anchor, riding head to wind, it must be executed under sail; for if the boarder cannot approach the enemy except by towing a-head, he will never be able to board the latter against his will; because he will be always able to annoy the boats which are hailing on the tow-lines. It should not therefore be attempted, unless the boarder be under way. In order to perform it with success, the boarder must be sufficiently to windward to approach the enemy by a little falling off, without exposing his men to the fire of the latter, which in this situation might be played on with great advantage. If the boarder, then, should be thus to windward, so as to be able to approach the enemy at anchor, he ought to flop his head-way, by taking a-back his mizen topmast and fore-lay fall; and when about a ship's length from the vessel proposed to be boarded, let go an anchor, and then work, so that, as soon as the mizen topmast is taken a-back, the mizen close sail, the top-falls closed up, and the fore-topmast lay fall hauled down, he may come head to wind, and over away cable, till, by falling off, he comes board and board with his opponent, who is full riding at his moment, and who at this instant ought to be also raised by the boarder. This is the only method of maneuvering to which the boarding ship can recur; because, as soon as the anchor is gone, the ship acquires stern-way, and when the cable is checked, the rumps head to wind, in which she is much assisted by the mizen and mizen top-sail, which impel her stern to leeward, till the wind is right, in the direction of the keel; and, as the cable is veered away, till exactly along-side the ship at anchor, her own anchor being right a-head of the vessel the means to board, it follows that, as soon as the boarding ship comes head to wind, she is in a proper situation to throw her grapnels, and send her crew on board of the other, if they are the strongest.

The ship at anchor should never wait for the enemy in that situation, which is always disadvantageous, and as there is much greater probability of escape when under way. But if it be necessary for the enemy to continue at anchor, he should take advantage of the boarder's ship letting go her anchor, to cut the cable by which she rides; and by this maneuver fall astirvate, rake the boarder, avoid being boarded, and bring up with the lee anchor. If time allow, two springs should be cast out, one on each side of the cable by which the ship rides, if there have been no previous opportunity for laying out two anchors, and thus guard against surprize, in case the ship which attacks has it in her power to pass on either side of the other; and when the side for which she is determined is perceived, the said anchor should be hoisted on the spring which is on the same side she has let go on anchor, if the be a-head, and on the opposite, if she be a-fore, or veering out at the same time the other spring and cable, till the said anchor be brought right abreast. Then he may be raked at pleasure, as he has no way of escape. His only course to prevent danger would be having also a spring; and under cover of a brisk fire, veering upon that spring and cable to lay his enemy handomely on board. But if this precaution should have been neglected, he must cut his cable, and drop on board of the ship to leeward; who on the other hand, has no mode of avoiding being boarded, but by cutting, to get under way, or to run on shore.

It is always easy to board a ship at anchor, when the wind will allow approaching to her under sail; in which case it is most advisable to run her along side, or to bring-to to windward of the ship intended to be attacked, keeping her exactly to leeward; then to drift on board of her, by trimming the sails in such a manner as to keep as nearly as possible the broadside of the attacking vessel opposite to that of the adverse ship. In this situation the boarder should annoy the enemy with his guns till he can close with him; and by constantly cannonading, his fire may not be so well served as it otherwise might be. If, while a vessel is underway, it be proposed to board a vessel that is moored, an anchor should be let go at the time of boarding; for if the attacked ship should at this moment cut her cables to drive on shore, this would prevent the assailant and the affaid running a-ground together. Elements and Practice of Rigging and Seamanship, vol. ii. Boarder's Manoeuvrer, or Skilful Seaman, &c. translated from the French by Saucul, 4to. 1783.

**Boarding-netting.** See **Netting**.

**BOAKI,** in Geography, a village of Africa, on the Gold Coast, situated between Sakundu and Sama, where the Dutch had formerly a small factory, which was afterwards removed to Sama.

**BOAKI Lappa** a name given by the ancient Romans to the fruit or rough balls of the common apan or cleavers. Pliny calls this plant sometimes *lappa,* sometimes *lapage,* and the fruit by the names of *lappe binaire,* or *lappe canne,* and sometimes *canne.*

**BOARINA, Boarola,** in Ornithology, the name of a small bird, described by Aldrovandus and others. This is the fig-eater of Albin and Latham; and Motacilla *Novis* of Gmelin.

**BOARULA, a species of Motacilla,** called in England the grey wagtail. The colour of this bird is cincere above, beneath yellow; tail feathers dark, and pale at the edges. This is an European bird, about seven inches and a half in length, and, like the rest of the wagtail tribe, frequents watery places. They are lively, active birds, percutually flit the tail, and seldom perch, but rest upon the ground. They feed chiefly upon insects. The neck of this species is made on the ground, and is composed of dried fibres and moss, lined with wool or feather, and usually contains from six to eight eggs, which are of a dirty white marked with yellow spots. They breed in the north of England, seldom approaching nearer to the southward than Cumberland, till after the month of October. Lin. Dom. Brit. Birds, pl. 40, &c. *Le Bergeete,* of Belon; and *la Bergerette, jaune,* of Drillon, is of this species.

Obs. A variety of *Motacilla Boaria* inhabits Java. The colour is an olive brown, beneath yellow; lower part of the neck grey; first tail-feather entirely white; under-side and tip of the second and third white.

**BOA's,** in Entomology, a species of Scarabeus, that inhabits Sierra Leone. The thorax is reticulate, excavated, bilaterate; horn of the head recurved and simple. Fabricius.

**BOAT,** a small vessel, generally without a deck, managed by sail or oars, or drawn by horses upon canals, rivers, or lakes, for the pur. of of conveying passengers, goods &c. from one place to another. The form, equipment, and names of boats are different according to the purpose for which they are intended, or to the country where they are built. Hence, boats are made flight or strong, sharp or flat-bottomed open or decked, plain or ornamented, as they may be designed for swiftness or burden, for deep or shallow water, for falling in a harbour or at sea, and for convenience or pleasure.

As boats make always a necessary appendage to ships it
BOAT.

will, therefore, be proper to give a brief account of those belonging to the different classes of shipping.

Ships of war, particularly of the line, have usually six boats, and the number decreases with the rate of the ship. The largest is called the long-boat, and sometimes the launch; and its principal employment is to convey heavy stores to the ship. This boat is generally furnished with a mast and sails, and is occasionally decked, armed, and equipped, for cruising short distances against merchant ships of the enemy, or smugglers, or for impressing seamen, &c. The large is the next long-boat, and is particularly appropriated to carry the principal chief officers, as the admiral, captain, &c. to or from the ship; and in consequence of its slender construction, combined with its small breadth, is very unfit for sea. This boat never rows less than ten oars. The pinnace is similar to the barge, but smaller, never rows above eight oars, and is used by lieutenants in going ahoire, or coming off to the ship. Cutters are broader, deeper, and shorter than the former; they are employed on almost all occasions, as for going ahoire, carrying stores, provisous, boarding ships at sea, &c.

Jolly-boat is the smallest boat used in any of the ships in his majesty's service. In Plate VI of Ships are perspective views of a man of war's long-boat, of a barge, and flat-bottomed boat.

In an East Indian there are four boats, the long boat, cutter, jolly-boat, and yawl. The first of these is for conveying stores and goods to and from the ship; the second for going ahoire; and the others are employed occasionally.

Ships in the West India trade use boats in number and size according to the islands at which they intend to take in their cargo. Four boats generally belong to a ship in the Jamaica trade. The largest, called a galalo, will carry from eighteen to twenty hogheads of sugar. The next less in size is usually called a ten hoghead boat, from the number of hogheads it carries; these two are left in the country. The next less boat called a double master, or pinnace, carries two hogheads a short distance; and the smallest boat is called the jolly-boat, and is generally suspended from the taffrail.

Ships in the Windward Island trade, loading at Barbadoes, Martinico, Dominica, &c., generally use a flat launch with oars, each about thirty-six feet long, one end being upon the boat's stem, and the other upon the beach, upon which the sugar hogheads are rolled from the beach into the launch. At St. Vincent, Grenada, and Tobago, a one hoghead moses is used. At Trinidad a launch as flat as can be built is used. At Demerara, Berbice, and Surinam, they generally use sailing craft that will carry from twelve to twenty hogheads.

Ships employed in the whale fishery have six or more boats. These are very narrow in respect to their length, for the purpose of pulling fast; they are strong built, and sharp at both ends. Smaller vessels of one hundred tons and under, have in general one boat.

Bacbot, a fishing boat on the rivers in France; it is provided with a mast, oars, fishing lines, a flast, a pole to fall the boat on the river when they are fishing, &c.

Balosa or balosa, a boat, or rather raft, composed of five, seven, or nine logs or trunks of trees, used in South America. This boat is so called from balza or balba, the name of the wood of which it is constructed, but which is called puerro by the Darien Indians. The balza is a whitish fpuny wood, and so very light that a boy can easily carry a log four yards long and a foot in diameter. The following account of this boat is extracted from the Relacion Historica del Viage a la America Meridional, necho de Orden, de 8. Magg, &c. Imprefa de Orden de Rey en Madrid, 1748.

The balzas are not only adapted to this river (Guayaquil), but venture to sea, and carry on the trade as far as Payta. Their dimensions are proportionate to their use, or the voyage for which they are intended; some being only for fishing, others for the river trade, bringing fruits, and all sorts of merchandise from Bodega to Guayaquil, and from thence exporting them to the Pusa, Salta de Tumbes, and Payta; others are yet more commodiously contrived for carrying families, with all their furniture and necessaries, to their plantations or country houses. The puerro trees, of which they are built, are twelve or thirteen toises long, reckoning five feet to the toise, and two feet, or two a half diameter, so that the whole breadth of nine logs, of which some of them consist, is between twenty and twenty-four feet; and those of seven or fewer logs are proportionate.

These logs are fastened to each other only by the beuces or withies, with which the crofs logs are also lathed to them, yet so securely as never to give way, if not worn out by long use, though in their voyage to the coast of Tumbes and Payta the sea runs very high; but the negroes neglecting to examine if the beuces are not too much worn to sustain another voyage, before they put to sea, it too often happens that the lashing breaks, the logs separate, and both cargo and passengers perish: indeed the Indians, being more active, get upon a log and safely work it to the nearest harbour.

One of these melancholy infurances happened while we were in the jurisdiction of Quito, and are wholly to be imputed to the foard negligenoe of the Indians, who seem to have no sensibility of danger.

The thicked log of the balza is placed so as to reach farther than the others; at the stern, another log is lathed to this, on each side, and others to these, till the intended number be completed, which is always odd; the large one in the middle being, as it were, the flay and foundation of the others. The larger fort of these vejels usually carry about twenty-five tons, without damaging the cargo in consequence of its being too near the water's edge, for the sea never breaks over them, nor does the water swell between the logs, or ever ride above them, because the whole body of the vehicle accommodates itself to the motion of the water in all weathers.

These rafts work and ply to windward like a keeled vejel, and keep their course before the wind almost as exactly, which is the effect of another contrivance besides the rudder; some large planks, three or four yards long, and half a yard broad called guares, are set up vertically at the stern, and also forward between the main logs. By pushing some of these under the water, and taking others a little up, the float fails large, bears up, tacks, or lies to, according as the machine is worked; an invention which has hitherto escaped the atuences of the most ingenious Europeans; and though the Indians have indeed contrived the instrument, they are yet utter strangers to the principles of machinery, and the caufes of its operations.

Had it been known before in Europe, the lofs of many lives in shipwreck might have been prevented, as appears by the following, among many other infurances: in the year 1750, the Genouela ship of war, being loft in the Vivora, the mariners made a jangada, or raft, to save their lives, but mifcarried by committing themselves to the winds and currents, without any freorage; and the frequency of such melancholy events induces me to give a minute explanation of this infurance, from a memoir of Don Jorge Juan, relating to it.

The direction in which a ship moves, when under sail, is in a line perpendicular to the sail, according to the demonstration of Renou, in his Theory of Manual Arts, cap. ii. art. 1; Bernouilli, cap. i. art. 4; and Plutot, sect. ii. art. 13. The reACTION
BOAT.

Holland, Boats of. In almost all the Seven United Provinces there are boats which serve for public carriages, which set out from every city at all hours of the day, and carry passengers very conveniently from one place to another, at a very small expense. They are long, narrow, and covered, and contain about sixty persons; each boat is drawn by one horse, and has only two men to manage it, the one attends the helm, and the other takes care of the rope; the horse is generally rode by a boy. In these boats there is a room which can easily contain six persons; this room, which is called a roof, has glass windows, whereas the other openings in the boat are shut with oil cloth in bad weather. A passenger may take a place in this room, or the whole room. These boats which carry goods from Amsterdam to the Hague, and which leave Amsterdam at eight at night, arrive at the Hague next morning. In those boats, however, designed for passengers only, a person is obliged to change boat several times. From Amsterdam to Haarlem, he must change boats half way, because the canal there is cut by a dyke. At Haarlem, the passengers must cross the town and get into the boat that is to carry them to Leyden. At Leyden the man again crosses the town to meet the boat in which he is to go to the Hague. All this can be performed in ten hours and a half; for, at eight o'clock precisely, a boat sets out from Amsterdam to Haarlem, where it arrives about half an hour after ten; at eleven a boat sets out from Haarlem for Leyden, and arrives there at three in the morning; half an hour after three a boat sets out from Leyden, and arrives at the Hague half an hour after six. There is such a good order kept, that at the ringing of a bell the boat must set out immediately, without waiting for any passenger. There are few countries where people can travel so conveniently as in Holland.

Ipoobah, a boat or canoe of the Society Islands, of which captain Cook gives the following description. The iroobah is used for short excursions at sea. These boats are all of the same figure, but of different sizes, and used for different purporses; their length is from ten to seventy-two feet, but the breadth is by no means in proportion; for those of ten feet are about a foot wide, and those of more than seventy are scarcely two feet. They have the fighting iroobah, the fishing iroobah, and the travelling iroobah, for some of those go from one island to another. The fighting iroobah is by far the longest; and the head and stern are considerably raised above the body, in a semicircular form, particularly the stern, which is sometimes seventeen or eighteen feet high, though the boat itself is scarcely three feet. These never go to sea singly, but are fastened together side by side at the distance of about three feet, by strong poles of wood, which are laid across them, and lashed to the gunwales. Upon the head of the fore part, a flap or platform is raised for ten or twelve feet high, and somewhat wider than the boats, which is supported by pillars about six feet long; upon this flap stand the fighting men, whose muzzle weapons are flings and spears; for, among other singularities in the manners of these people, their bows and arrows are used only for diversam as we throw stones; below these flaps lie the rowers, who receive from them those that are wounded, and furnish fresh men to assist in their room. Some of these have a platform of bamboo, or other light wood, through their whole length, and considerably broader, by means of which they can carry a great number of men. The fishing iroobahs vary in length from about forty feet to the smallest size, which is about ten feet; all that are of the length of twenty-five feet and upwards, of whatever fort, occasionally carry sail. The travelling iroobah is always double, and furnished with a small neat house, about five or six
fix feet broad, and fix or seven feet long, which is fastened upon the fore part, for the convenience of the principal people, who sit in them by day, and sleep in them at night. The fishing vessels are sometimes joined together, and have a house on board, but this is not common. Those which are shorter than twenty-five feet, seldom or never carry sail; and though the stern rises about four or five feet, they have a flat head and a board that projects forward about four feet. The ivahabas are the only boats used by the inhabitants of Otaheite.

"Life-boat," a boat invented by Mr. Henry Greathed of South Shields, for the purpose of recovering the lives of shipwrecked persons. The following circumstance gave rise to this invention:

In September 1789, the ship "Adventure of Newcastle," stranded on the Herd sands, on the south side of Tyreemouth haven, in the midst of tremendous breakers; and all the crew dropped from the rigging one by one, in the presence of thousands of spectators, not one of whom could be prevailed upon, by any reward, to venture out to her assistance, in any boat or coble of the common construction.

On this occasion, the gentlemen of South Shields called a meeting of the Inhabitants, at which a committee was appointed, and premiums were offered for plans of a boat which should be the best calculated to brave the dangers of the sea, particularly of broken water.

Many proposals were offered; but the preference was unanimously given to that of Mr. Greathed, who was immediately directed to build a boat at the expense of the committee.

This boat went off on the 30th of January 1790; and so well has it answered, and indeed exceeded, every expectation that the boat is now a tremendous broken sea, that since that time, not fewer than two hundred lives have been saved at the entrance of the Tyne alone, which otherwise must have been lost; and in no instance has it ever failed.

The principle of this boat appears to have been suggested to Mr. Greathed by the following simple fact—Take a sphaeroid, and divide it into quarters; each quarter is elliptical, and nearly refembles the half of a wooden bowl, having a curve curve projecting ends; this, thrown into the sea or broken water, cannot be upset, or lie with the bottom upwards.

The length of the boat is thirty feet; the breadth, ten feet; the depth, from the top of the gunwale to the lower part of the keel in midships, three feet three inches; from the gunwale to the platform (within), two feet four inches; from the top of the stems (both ends being similar) to the horizontal line of the bottom of the keel, five feet six inches. The keel is a plank of three inches thick, of a proportionate breadth in midships, narrowing gradually towards the ends, to the breadth of the stems at the bottom, and forming a great convexity downwards. The stems are segments of a circle, with considerable relief. The bottom is a curve curve and flat, with the sweep of the keel. The floor timber has a small rise curving from the keel to the floor-heads. A bilge plank is wrought in on each side next the floor-heads, with a double rabbit or groove, of a similar thickness with the keel; and, on the outside of this, are fixed two bilge-trees, corresponding nearly with the level of the keel. The ends of the bottom have form that fine kind of entrance observable in the lower part of the bow of the fishing boat, called a "cable," much used in the north. From this part to the top of the stem it is more elliptical, forming a considerable projection. The sides, from the floor-heads to the top of the gunwale, slant off on each side, in proportion to above half the breadth of the floor. The breadth is continued far forwards towards the ends, leaving a sufficient length of straight side at the top. The flter is regular along the main side, and more elevated towards the ends. The gunwale fixed to the outside twelve inches thick. The sides, from the underpart of the gunwale, along the whole length of the regular flter, extending twenty-one feet six inches, are caled with layers of cork, to the depth of sixteen inches downwards; and the thickness of this casing of cork being four inches, it projects at the top a little without the gunwale. The cork, on the outside, is secured with thin plates or slips of copper, and the boat is fastened with copper nails. The thwarts, or seats, are five in number, doubled; consequently the boat may be rowed with ten ears. The thwarts are firmly flattened. The side oars are short, with iron tholes and rope grommets, so that the rowers can pull either way. The boat is steadied with an oar at each end; and the steering oar is one third longer than the rowing oar. The platform placed at the bottom, within the boat, is horizontal, the length of the midships, and elevated at the ends, for the convenience of the steerer, to give him a greater power with the oar. The internal part of the boat next the sides, from the underpart of the thwarts down to the platform, is caled with cork; the whole quantity of which, affixed to the life-boat, is nearly seven hundred weight. The cork indubitably contributes much to the buoyancy of the boat, is a good defence in going along-side a vessel, and is of principal use in keeping the boat in an erect position in the sea, or rather for giving her a very lively and quick disposition to recover from any sudden "cant or lurch," which she may receive from the stroke of a heavy wave. But, exclusively of the cork, the admirable construction of this boat gives it a decided pre-eminance. The ends being similar, the boat can be rowed either way; and this peculiarity of form alleviates her in rolling over the waves. The curvature of the keel and bottom facilitates her movement in turning, and contributes to the ease of the steerage, as a single stroke of the steering oar has an immediate effect, the boat moving as it were upon a centre. The fine entrance below is of use in dividing the waves, when rowing against them; and, combined with the convexity of the bottom, and the elliptical form of the stem, admits her to ride with wonderful buoyancy in a high sea, and to launch forward with rapidity, without shipping any water, when a common boat would be in danger of being filled. The slanting or spreading form of the boat, from her floor-heads to the gunwale, gives her a considerabe bearing; and the continuation of the breadth, well forward, is a great support to her in the sea; and it has been found by experience, that boats of this construction are the best sea boats for rowing against turbulent waves. The internal hollows of the boat from the gunwale down to the platform, the convexity of the form, and the bulk of cork within, leave a very diminished space for the water to occupy; so that the life boat, when filled with water, contains only a considerable less quantity than the common boat, and is in no danger either of sinking or overturning. It may be presumed by some, that in cases of high wind, agitated sea, and broken waves, a boat of such a bulk could not prevail against them by the force of oars; but the life-boat from her peculiar form, may be rowed ahead, when the attempt in other boats would fail. Boats of the common form, adapted for speed, are of course put in motion with a small power; but for want of buoyancy and bearing, are over-run by the waves, and sink, when impelled against them, and boats constructed for burthen meet with too much resistance from the wind and sea, when opposed
to them, and cannot in such cases be rowed from the shore to a ship in distress.

Mr. Greathead gives the following instructions for the management of the life-boat.

The boats, in general, of this description are painted white on the outside; this colour more immediately engaging the eye of the spectator when rising from the hollow of the sea than any other. The bottom of the boat is at first varnished (which will take paint afterwards) for the more minute inspection of purchasers. The oars she is equipped with are made of fir, of the best quality; having found by experience, that a rope ash oar, that will dress clean and light, is too slight among the breakers; and when made strong and heavy, from rowing double-banked, the paddle being short, sooner exhausts the rower, which makes the fir oar, when made fliff, more preferable.

In the management of the boat she requires twelve men to work her; that is, five men on each side rowing double-banked, with an oar flung over an iron thole, with a grometer (as provided), so as to enable the rower to pull either way, and one man at each end to steer her, and to be ready at the opposite end to take the flise-oar, when wanted. Also, from the construction of the boat, she is always in a position to be rowed either way, without turning the boat; when manned, the person who steers her should be well acquainted with the course of the tide, in order to take every possible advantage: the best method, if the direction will admit of it, is to head the sea. The rower should keep his eye fixed upon the wave or breaker, and encourage the rowers to give way, as the boat rifes to it; being then aided by the force of the oars, she launches over it with vast rapidity, without shipping any water. It is necessary to observe that there is often a strong flux of sea occasioned by the frayed wrecks, which requires both dispatch and care in the people employed, that the boat be not damaged. When the wreck is reached, if the wind blows to the land, the boat will come in shore without any other effort than flieving.

The following additional observations and instructions are given by Mr. Hinderswell of Scarborough.

The life-boat at Scarborough is under the direction of a committee. Twenty-four fishermen, composing two crews, are alternately employed to navigate her. A reward, in cases of shipwreck, is paid by the committee to each man actually engaged in the affistance; and it is expected the vessel receiving assistance should contribute to defray this expense. None have hitherto refused.

It is of importance that the command of the boat should be entrusted to some ready experienced person, who is acquainted with the direction of the tides or currents, as much skill may be required in rising them to the most advantage, in going to a ship in distress. It should also be recommended, to keep the head of the boat to the sea, as much as circumstances will admit; and to give her an accelerated velocity to meet the wave, much exertion is necessary in approaching a wreck, on account of the strong reflux of the waves, which is sometimes attended with great danger. In a general way, it is safest to go on the lee quarter; but this depends on the position of the vessel; and the master of the boat should exercise his skill in placing her in the most convenient situation. The boatmen should perform themselves in the use of the boat, that they may be the better acquainted with her movements; and they should at all times be strictly obedient to the directions of the person who is appointed to the command.

Plate 12 of Boats contains a perspective view of the life-boat riding a heavy surge, and going out to the assistance of a ship, which appears in the horizon in distress. In the life-boat are ten rowers pulling to get to the ship. At the lower end of the boat, a man is rowing her with a long oar towards the ship; and another person is stationed with an oar at the higher end, to fleer the boat on her return; both ends of the boat being formed alike, in order to use either at pleasure in going to or coming from the ship. The fleer, or curve of the boat, rising considerably from the middle to the feet, or ends, is clearly distinguished; also the coating of cork secured by slips of copper along the outside of the boat, near the part where the rowers are seated.

As every thing relating to this important invention must be interesting to the public, it is, therefore, premised the following additional information will not be unacceptable, especially as it contains the strongest evidence of the great utility of this boat.

The life-boat having been submitted to a trial of twelve years' experience, during which period Mr. Greathead sacrificed a very considerable portion of his time in furnishing plans, and otherwise rendering the invention as extensively useful as he could; on the 25th of February 1802, he presented a petition to the house of commons, the prayer of which was as follows:

"Your petitioner having been instrumental in saving the lives of so many persons; the utility of the boat being now established; and your petitioner having derived little or no pecuniary advantage whatever from the invention, his models having been made public; humbly hopes that this honourable house will take his cause into their consideration, and grant your petitioner such reward as to this honourable house shall seem meet, &c."

The petition, having been recommended by his majesty, was referred to the consideration of a committee; from whose report the following is a brief abstract:

"It appeared to your committee to be necessary to direct their inquiries particularly to the three following subjects.

1st. The utility of the life-boat.

2nd. The originality of the invention claimed by Mr. Greathead.

3rd. Whether he had received any and what remuneration.

And in order to ascertain these facts, your committee proceeded to examine,

Ralph Hillery, a seaman, who stated, that he had been forty-five years at sea, in the Greenland and coal trade, and has refixed always at Shields. About three years ago, he was in the Northumberland life boat, which was presented to North Shields by the Duke of Northumberland, the first time he went off, which was to the relief of the ship Edinburgh. This vessel was seen to go upon the Herd sands, about a mile and a half from those; she was brought to an anchor before the life-boat got to her, and the continued striking the ground so heavily, that she would not have held together ten minutes longer, had they not got to her; they made her cut her cable, and then took seven men out of her, and brought them on shore. The sea at that time was monstrously high, so high that no other boat whatever could have lived in it.

"He was then asked, whether he had been out in the life-boat on any other occasion? to which he replied, that he had been five times out in her to the relief of different ships; from one ship they saved fifteen men; and in every instance when he, the witness, was in the boat, they saved the whole of the crews of the wrecked ships. Besides the times he has been himself in the boat, he has seen her go off scores of times, and never saw her fail in bringing off such of the crews as layed by the ship. But many times part of the crews of the vessel wrecked have taken to their own boats,
and have been drowned by the boat's upsetting; whilst the remainder of the crew that continued on board have been saved by the life-boat. And the witnesses declared his conviction, that no other boat that ever he saw could have been upset. When this boat was adrift and full of water, the men all went to one side of the boat, in order to try the possibility of upsetting her, which they could not effect.

"Mr. Thomas Henderwell, of Scarborough, ship-owner, stated, that the peculiar nature of the curvature of the keel of this boat is the foundation and basis of its excellence. It regulates, in a great measure, the lower water, with elevation towards the ends. This construction spreads and repels the water in every direction, and enables her to ascend and descend with great facility over the breakers. The ends being reduced regularly from the centre to less than one-third proportion of the midships, both ends are lighter than the body of the boat. By means of the curved keel, and the central gravity being placed in the centre of the boat, the fore-and-aft equilibrium in the middle of the breakers. The internal shallowness of the boat in the body of the boat, occasioned by the convexity of the keel and the sheer at the top, leaves a small space for the water to occupy, that the boat, though filled with water, is in no danger of sinking or upsetting. The buoyancy of the boat, when filled with water, is also assisted by the cork being placed above the water-line.

"Mr. Samuel Plumb, of Lower Shadwell, described himself to have been bred to the sea, and to have acted in the capacity of master of a ship from 1777 until within these eighteen months; that he had been chiefly employed in the coal and Baltic trades, and had refitied at Shields the whole of his life till within the last five years. He is acquainted with the Shields' life-boats; and from every information he has received, Mr. Gresheam has been universally considered as the inventor of them.

"He went out in one of them to the relief of a ship, which was wrecked on the coast near the mouth of the Tyne. The first time they reached the wreck, the rope, which they threw from the wreck to the life-boat, broke, and the boat was drifted to the northward by the violence of the wind and strong current of the tide; they then landed, and by two horses dragged the boat along the sand to the southward, and then launched her again through the breakers to the vessel. In the second attempt they succeeded in bringing the crew on shore. The witnesses never saw any other boat in which he would have ventured to the relief of the crew, or which he thinks could have executed the purpose of saving them.

"Mr. William Mangerman of South Shields, ship-owner, was one of the original committee that ordered the life-boat at South Shields in 1789. He corroborated the evidence given by captain William Carter; and stated, that from the situation of his residence, he has seen the performance of the life-boat more frequently than probably any other of the committee at South Shields, and has frequently seen and afflicted in the launching of the life-boat from the beach into the sea during a storm. That this is done with the assistance of low wheels, or what may be called rollers, upon which she is dragged to the water's edge, and by means of hands proportioned to the weight of the boat, she can be launched with as much ease as any other boat. He remembers the influence stated by Mr. Samuel Plumb, in which the life-boat, being drifted to the northward by a strong tide, was landed, and again launched to the southward opposite to the wreck, in the face of a very heavy sea. When the gate-way, Planter, and other ships were wrecked, it was first discovered that the life-boat could act with perfect safety adroitly, and since that time, the boat has been rowed adroitly, or otherwise, indifferently,
as the object to be relieved required it; and that she goes with the same safety from one object to another, in a broken sea, as an ordinary boat would pass from one ship to another in a smooth sea. He is confident, since the establishment of the life-boat, that there have been at least 300 persons brought on shore from ships in distress, and wrecks off Shields, the greatest part of whom must otherwise have perished. And the witnesses added, that it was his opinion, founded upon experience and the observations he had been enabled to make, that no sea, however high, could overflow or sink the life-boat.

The originality of Mr. Greathead's invention is there proved by proper certificates and attestations; and the remuneration that he had received over and above a profit of from ten to fifteen pounds each, upon building a few boats, is flated to be,

From the Literary and Philosophical Society of Newcastle, five guineas,
Royal Humane Society, a medallion.
Corporation of the Trinity House, 100 guineas.
Society of Arts, a gold medallion and 50 guineas.

The vote of parliament, on the 3d of June, in consequence of the foregoing report, was, "That a sum not exceeding 1200 pounds be granted to his majesty, to be paid to Henry Greathead, of South Shields, in the county of Durham, boat builder, as a reward for his invention of the life-boat, whereby many lives have already been saved, and great security is afforded to seamen and property in cases of shipwreck."

The subscribes at Lloyd's, on the 20th of May, voted to Mr. Greathead the sum of 100 guineas, "as an acknowledge-ment of his talents and exertions in inventing and building a life-boat," and 2000 pounds "for the purpose of encouraging the building of life-boats on different parts of the coasts of these kingdoms."

At the beginning of 1804, Mr. Greathead received a very valuable diamond ring from the emperor of Russia, whose munificence to ingenious men of all countries is well known.

The following extract from the Tyne Mercury of the 29th November 1803, is another proof of the great utility of the life-boat.

The Bee of Shields, John Houlton master, having put to sea (21st Nov.) in an easterly wind, had not proceeded far, when it began to blow strongly from the south-west, which obliged him a few hours after to put back. In taking Tynemouth bar at the last quarter ebb, in a very heavy sea, she struck the ground, and unshipped her rudder. Being now completely unmanageable, she drifted towards the north side of the bar, and at length drove on the Black Middens. They who have witnessed the tremendous sea which breaks on the north-east part of this harbour, in a south-easterly wind, may form a conception of the dreadful situation in which the crew of the vessel were situated. In the midst of rocks, where the sea runs mountains high, so as frequently to obscure the ship, and where any vessel might be expected immediately to go to pieces; their only refuge from being swept into the gulf, was to climb up into the shrouds, which the captain, with six men and boys, being the whole crew, infantly effected. The dangerous situation in which they were placed, immediately attracted an immense number of spectators from both North and South Shields. The flutes in every direction were lined with people who expressed, by their anxious looks, the most sympathetic apprehensions for their safety. The making use of the life-boat was by most people thought impossible; and at all events, the attempt was attended with extreme dan-ger, owing to the tremendous sea, and the immense rocks which lay where the vessel was stranded. So confident, however, was Mr. Greathead, the inventor, of the life-boat being able to live in any sea, if properly navigated, that he, without hesitation, and with the greatest alacrity, volunteered his services to bring off the men from the brig. This intrepid offer operated like electricity among the sailors; and immediately the Northumberland life-boat was launched, and manned with Mr. Greathead and South Shields pilots. In the course of a few minutes they reached the vessel, without much difficulty, and picked off the men from the shores floating with cold, and almost perished by fatigue. One man, in making too much haste to enter the boat, fell into the breakers, but was immediately recovered. When the whole crew was in the boat, they rowed towards the shore, and in less than an hour from the time the boat was launched, did they return in safety; to South Shields, without a single accident!

Upon the 8th of August 1777, some trials were made on a boat, or sloop fit for inland navigation, coasting voyages, and short palaiges by sea, which is not, like ordinary vessels, liable to be overflow or sunk by winds, waves, water-foots, or too heavy a load, contrived and constructed by M. Bernardes, director of the bridges and canals in France, &c.; at the gate of the invalids in Paris, in the presence of the provost of the merchants, of the body of the town, and of a numerous concourse of spectators of all conditions.

Thee experiments were made in the way of comparison with another common boat of the same place, and of equal size. Both boats had been built ten years, and their exterior forms appeared to be exactly similar. The common boat contained only eight men, who rocked it and made it incline so much to one side, that it presently filled with water, and sunk; so that the men were obliged to save themselves by swimming; a thing common in all vessels of the same kind, either from the imprudence of those who are in them, the strength of the waves or wind, a violent or unexpected shock, their being overloaded, or over-powered in any other way.

The same men who had just escaped the boat which sunk, got into the boat of M. Bernardes; rocked and filled it, as they had done the other, with water. But, instead of sinking to the bottom, though very full, it bore being rowed about the river, loaded as it was with men and water, without any danger to the people in it.

M. Bernardes carried the trial still farther. He ordered a mast to be erected in this same boat, when filled with water; and to the top of the mast had a rope fastened, and drawn till the end of the mast touched the surface of the river, so that the boat was entirely on one side, a position into which neither winds nor waves could bring her; yet, as soon as the men, who had hauled her into this situation, let go the rope the boat and mast recovered themselves perfectly in less than the quarter of a second; a convincing proof that the boat could neither be sunk nor overturned, and that it afforded the greatest possible security in every way. These experiments appeared to give the greater pleasure to the public, as the advantages of the discovery are not only so sensible, but of the first importance to mankind.

Marine boats, so called from being employed on the river Marine in France. They are flat, and curvy, with narrow body, &c, from the province of Champagne.

Norway boat, or waw, is sharp at both ends, and of various dimensions. This boat, from its construction, is admirably adapted for enduring a high sea, and will often ven-
ture out to a great distance from the land, when some ships can scarcely carry any sail.

Pahie, a boat of the Society islands; it is bow-sided, and sharp-bottomed. The pahie, according to captain Cook, is of different sizes, from thirty to sixty feet long, but like the iwalah, is very narrow. One that was measured was fifty-one feet long, and only one foot and an half wide at the top; in the widest part it was about three-feet, and this is the general proportion. It does not, however, widen by a gradual swell, but the sides being straight and parallel for a little way below the gunwale, it swells abruptly, and draws to a ridge in the bottom; so that a transverse section of it has somewhat the appearance of the mark upon cards, called a spade, the whole being much wider in proportion to its length. These, like the largest iwalahs, are used for fighting, but principally for long voyages. The fishing pahie, which is the largest, is fitted with the flage or platform, which is proportionably larger than those of the iwalah, as their form enables them to sustain a much greater weight. Those that are used for fishing are double, and those of the middle size are fized to be the half sea-boats. They are sometimes out a month together, going from island to island, and sometimes, as is credibly reported, they are not unfrequently a fortnight or twenty days at sea, and could keep it longer, if they had more storage for provisions, and conveniences to hold fresh water.

When any of these boats carry sail, they make use of a log of wood which is fized to the end of two poles that lie across the vessel, and project from six to ten feet, according to the size of the vessel, beyond its side; something like what is used by the flying proa of the Ladrone islands, and called, in the account of lord Anson's voyages, an Outrigger; to which the swamps are fastened.

Some of them have one mast, and others two; they are made of a single fick; and when the length of the canoe is 30 feet, that of the mast is somewhat less than 25 feet; it is fixed to the frame that is above the canoe, and receives a fall of matting about one-third longer than itself; the fall is pointed at the top, square at the bottom, and curved at the side, somewhat resembling what is called a shoulder of mutton fall, and used for boats belonging to men of war; it is placed in a frame of wood, which surrounds it on every side, and has no contrivance either for reefing or furling, so that if either should become necessary, it must be cut away, which, however, in these climates, can seldom happen. To the top of the mast are fastened ornaments of feathers, which are placed inclining obliquely forwards, the shape and position of which will be conceived at once from the figure in the plate of Boats.

The oars or paddles that are used with these boats, have a long handle and flate blade, not unlike a baker's peel. Of these, every person in the boat has one, except those that sit under the awning, and they push her forward with them at a good rate. These boats, however, admit so much water at the seams, that one peron at least is continually employed in throwing it out. The only thing in which they excel is landing and putting off from the shore in a surf; by their great length, and high sterns, they could land every day, when the English boats could scarcely land at all; they have also the same advantages in putting off by the height of the head.

The exact dimensions of a pahie, given from a careful admeasurement, will go very materially contribute to the elucidation of the description subseqently given, as to the manner and particular form in which this class of canoes is built, that they might perhaps enable a European draughtsman, to construct one so nearly resembling them as to create some difficulty in pointing out the true form from that which was fictitious:

To illustrate the description of the manner in which these vessels are built, it will be necesaary to refer to fig. 2.

Plate II.
The first flage or keel under a a, is formed of a tree hollowed out like a trough, for which the longest trees are chosen that can be procured, so that there are never more than three in the whole length; the next flage under b b, is formed of straight planks, about four feet long, fifteen inches broad, and two inches thick; the third flage under c, is like the bottom, made of the trunks hollowed into its bilging form; the last is also cut out of trunks, so that the moulding is of one piece with the upright. To form these parts separately without saw, plane, chisel, or any other iron tool, may well be thought no easy task; but the great difficulty is to join them together.

When all the parts are prepared, the keel is laid upon the blocks; and the planks, being supported by fchalions, are fowed or clamped together with strong thongs of plaiting. These are plaited several times through holes that are bored with a gauge or auger of bone, which performs its office with tolerable exactness; and the nicety with which this is done, may be inferred from their being sufficiently water-tight for use without caulking. As the plaiting soon rots in the water, it is renewed at least, once a year, in order to which the vessel is taken entirely to pieces; the head and stern are rude, with respect to the decks, but very neatly finished, and polished to the highest degree.

These boats are kept with great care in a kind of house, built on purpose for their reception; the houses are formed of poles let upright in the ground, the tops of which are drawn towards each other, and fastened together with their strongest cord, so as to form a kind of Gothic arch, which is completely thatched quite to the ground, being open only at the ends; they are sometimes fifty or sixty paces long.

Peter-boat, a boat employed in the river Thames in fishing. They are in general flat well, and are good sea-boats.

Pound-boat, a vessel employed by gentlemen in excursions upon the water, for their amusement. Their size and manner of equipment are very various, being from a few tons burden, to upwards of two or three hundred tons, and having one or more masts.

Pott-boat, are boats established on the river Loire in France, for the convenience of the public. They are long in respect to their breadth, and go very fast. There are also some on the Rhone, which go from Lyons to Avignon in 24 hours.

Pote; see that article.

Punt, a sort of flat-bottomed boat, whose floor resembles the platform of a floating flage. It is used by the naval artificers,
BOAT.

Mandarin's sampans are greater or less red-painted boats, ornamented with dragons and such like figures, or with little flags.

The Stage-boats, called in French, bateaux coches, and more commonly coches-d'eau, water coches, are large covered vessels, which serve, particularly on the river Seine, for the convenience of travellers, and for carrying all sorts of merchandise. The names of them are the pagfage boat, or water coach of Sens, of Auxerre, of Montereau, and of Fontainebleau, or Valvins.

Till-boat, one with a cover, to defend the passengers from rain, &c.

Troll-boat, a boat employed in a canal in conveying passengers, &c., from one place to another. This mode of travelling, though not expeditions, is indeed very pleasant, and certainly much cheaper than by any land carriage. From Grangemouth to Port Dundas, a distance of nearly 30 miles, the fare is only one shilling, or eighteen pence.

Well-boat, a boat having a well in the bottom, to preserve full alive.

A Wherry is a light sharp boat, used in a river or harbour, for carrying passengers from place to place.

The boats, or wherries, allowed to ply on the Thames about London, are either bellows, wrought by a single person with two oars; or oars, wrought by two or more persons, with each an oar.

The following are some of the terms used in the management of a boat.

Bail the boat, is to throw out the water which remains in her bottom, or the well-room. See BAIL.

Find the boat, to save her from beating against the ship's fides.

Man the boat, an order to those appointed to manage her to go on board the boat immediately.

Moor the boat, the order to fasten a boat with two ropes, so that the one shall counteract the other.

Trim the boat, the order to fit in the boat in such a manner as that the shall float upright in the water, without leaning to either side.

Wind the boat, the order to bring her head the other way.

The boat's gang, includes those who are employed for rowing in the boat; such as the cockpitman and his gang, to whom the charge of the boat immediately belongs.

A small boat is that which will endure a rough sea well.

To preserve boats from foundering at sea when flap founder. To take a small, yard, boom, &c., that may be found floating from the ship; the longer the better; make fast to each end of the boom a rope about twice its length; and bend one end of another rope, about ten fathoms long, exactly in the middle of the span, and the other end is to be made fast to the foremost of the boat, so that she may drive flm on to the sea. When this misfortune happens far from land, and the storm ceases, in moderate weather the drift boom may be towed end on to the boat's stern, that they may either row or sail towards land.

Mr. Hutchinson, in his treatise on practical seamanship, gives an account of a boat being preferred by this method, as follows. The Bafi, in her passage from the West Indies, took up ten men in a small boat, twelve feet long, which was preferred from foundering after the vessel had foundered, by having a rope fast to a log of wood, as they called it, and tied to the boat's bow, which kept her to drive end on with the head to the wave, and broke their violence so much as to preserve her from filling with water, when one half of them was obliged to lie down in the bottom of the boat, to prevent her being top-heavy. By particular inquiry of the master
at the Boats, for example, and that those people belonged to a schooner bound from Bermuda to the West Indies; that it was after a hard gale of wind when they met with the boat, which had two oars for sails, and two blankets set upon them for sails, and was steering for Bermuda, when they were fortunately taken up, and that the log of wood, as it was called, they drove by, was their fore square sail yard, lapped with a rope to each yard-arm, and a rope about ten or twelve fathoms long, to the middle of the span, and made fast to the boat's bow, to drive by. The mate of the schooner told the master of the Bafil, that they had been favored in this manner in a boat once before, by driving to leeward of a mast, in a hurricane in the West Indies.

In order to account for this wonderful effect of the drift-boom, in preventing the broken water from swamping the boat, it may be observed, says Mr. Hutchinson, that waves never break till their tops are forced forwards by their great velocity beyond the perpendicular of their base; that then water falls down forward, and inclines and compresses a quantity of air, which, by the power of its elasticity, blows this force of the waves to pieces, forwards and upwards, in an oblique direction, and makes it appear like froth. They then have no buoyant power to lift a boat; but when they are high, they fill and sink her. And they break more in shallow water than in deep, in proportion as their bottoms or base are more obstructed in their velocity by the ground than their tops; hence, in very shallow water, they are continually breaking, so that they make nothing but what is called broken water, by which foals may be seen and known at a great distance in clear weather.

If we endeavour to account for the wonderful effect of so small and simple a machine, to preserve such a small boat, deeply laden as the must be with ten men, from being filled with water in such a form; in our opinion it is owing to the boat driving end on by the drift boom, that keeps it always swimming on the surface, broadside to the wind; and the waves that are running towards it, within the length of the drift boom, must certainly obstruct the velocity of the upper part of those waves, so as to lessen their increase in height, and prevent the top from running beyond the perpendicular of the base, or bottom of these waves, that occa-
sions their breaking, as has been described, but spend themselves without breaking. These reasons we hope will be thought sufficient to recommend this method to be tried and brought into practice on such dreadful occasions; and we cannot help thinking, that the same method should be tried, when under the dreadful necessity of saving lives by boats landing on a lee shore in a storm, where broken waves run high. The only difference we would recommend in the management, is to proceed with the boat's item to the drift boom, and here head to the shore, to be ready to row and steer for the bell apparent landing-place; and if it is a long flat shore, as soon as the boat strikes the ground, cut or flip the drift boom rope, that it may not haul the boat off the shore again by the back sweep of the waves.

Upon land ng a boat in a surf. Before the boat comes near the shore, pour a little oil on the water, which will prevent its breaking, and greatly allay the swell, so that the boat may approach the shore without the dread of being swallowed up in the breakers.

M. Danzel has lately invented an hydraulic machine for making a ship or boat advance during a calm, and even against a current.

The mechanism of this machine is very simple; it consists of a long pole, to the anterior extremity of which an appa-

ratus, shaped like a drawer without back or front, is attached in such a manner, that when pushed forwards it folds itself back under the pole, to which it (as it were) adheres, and presents to the water the thin cutting surface of its three edges, viz. of the bottom and two sides, which can neither oppose to the water a resistance capable of preventing the pole from penetrating farther, or of making the ship recede. When the pole, which is pushed forwards from the vessel, has attained to its full reach, the drawer, as soon as the pole is pushed back, assumes a vertical position, and presents to the water its whole cavity. By these means it embraces a column of water, which, without finding means to escape, preys on a surface much larger than that of a common ear, and keeps the drawer immovable; so that those who draw the pole towards them, instead of making the vessel recede, cause it to advance. This machine, which may be multiplied more conveniently than oars, has this visible advantage over the latter, that it opposes to the water a resistance infinitely superior, while the passive reaction of this resistance renders the labour of the mariners less laborious and more effectual.

De Chales proposes the construction of a boat, which, what burden ever it bear, shall not only move against the current, without either fails or oars, but also advance so much the faster, as the rapidity of the water is greater. Its make is the same with that of the others, excepting only a wheel added to its side, with a cord, which winds round a roller as fast as the wheel turns.

Something of the like kind has also been since done by M. Pitot. Vide Mem. Acad. R. Scien. an. 1729, p. 379, and p. 749.

M. de la Hire has given us an examination of the force necessary to move boats, both in stagnant and running water, either with ropes fastened to them, or with oars, or with any other machine: wherein he shews, that the larger the surface of the oars plunged in the water, and the smaller that of the boat presented to the water, is; and again, that the longer that part of the oar between the hand and the places where the oar rests on the boat, and the shorter that between this last point and the water, the freer will the boat move, and the greater effect will the oar have. See Oar.

Hence it is easy to calculate the force of any machine that shall be applied to rowing; viz. if we know the absolute force of all the men who row, it must be changed into a relative force, according to the proportion of the two parts of the oar; i.e. if the part out of the vessel be double the other, and all the men together can act with the force of 500 pounds, we compute first, that they will exert 300; which 300, multiplied by the surface which the oar presents to the water, gives a solid water of a certain weight, which weight may be found, and of consequence the velocity impressed on the vessel by the oars. Or, the velocity of the oars may be found in the same manner, by multiplying the 300 pounds by the surface of all the parts of the oars plunged in the water. Now would there be any difficulty in finding first the relative forces, then the absolute ones, the velocities either of the oars, or of the vessel being given, or the proportion of the two parts of the oar.

Boats fail more slowly and heavily over shallows than over deep waters. See an account of experiments for explaining this, in Dr. Franklin's Letter to Sir John Pringle. Experiments, sec. 410, 5th ed. p. 510.

Boats, Confusion of. In order to illustrate this by an example, let it be required to lay down the several parts of a long boat, the extreme length being 31 feet, and breadth moulded 9 feet.
BOAT.

Draw the straight line PO, \( P T \), \( P Q \) (Ship-building) equal to \( 31 \) feet, the extreme length of the boat, and also to represent the station of the midsip frame. From the points \( P \), \( Q \), and \( O \), draw the lines \( P T \), \( Q M \), and \( O S \), perpendicular to \( P O \). Make \( M Q \), \( Q N \), equal to the upper and lower heights of breadth respectively at the main frame, \( P T \), the height of breadth at the transom, and \( O S \), the height at the stern. Describe the curve \( T M S \), to represent the flue, or extreme height of the sides, which, in a ship, would be called either the upper height of breadth line, or the upper edge of the water. Through the point \( N \) draw a curve parallel to \( T M S \), to represent the breadth of the upper Drake of a boat, or the lower edge of the water if in a ship. The dotted line \( T N S \) may also be drawn to represent the lower height of breadth.

Set off the rake of the polled from \( P \) to \( T \), and draw the line \( P T \), to represent the aft side of the polled; then \( T R \) will represent the round up of the transom. Set off the breadth of the polled from \( P \) to \( R \), and from \( T \) to \( S \), and draw the line \( P S \) to represent the foreside of the polled, which may either be a curve or a straight line at pleasure. Set up the height of the tuck from \( S \) to \( K \). Let \( t K \) be the thickness of the transom, and the line \( Z X \) to represent the foreside of the transom.

There is given the point \( S \) the height of the flue on the foreside of the flue; now that side of the flue is to be formed either by sweeps, or frost some contrivance. Set off the breadth of the flue, and form the aft side of it.

Set up the dead-rising from \( O \) to \( J \), and form the rising line \( r i z \). Draw the line \( K L \) parallel to \( P O \), to represent the lower edge of the keel, and another to represent the thickness of the pants of the rabbet. The rabbet on the polled and flue may also be represented; and the stations of the timber agreed, as \( O \), \( 1 \), \( 2 \), \( 3 \), \( 4 \), \( 5 \), \( 6 \), \( 7 \), \( 8 \), \( 9 \); and \( Q \), \( A \), \( B \), \( C \), \( D \), \( E \), \( F \), \( G \), \( H \); and the flue plan will be completed.

The half-breadth plan is to be formed next; for this purpose the perpendiculars \( T P \), \( O G \), etc., must be produced. Upon \( M Q \) produced set off the half-breadth from the line \( K L \) to \( R \) (fig. 2); set off also the half-breadth at the transom from \( K \) to \( L \), and describe the extreme half-breadth line \( R X \), making the fore part of the curve agreeable to the proposed round of the rabbet.

We may next proceed to form the timbers in the body plan. Let \( A B \) (fig. 3) be the breadth moulded at \( O \). Erect the perpendicular \( C D \) in the middle of the line \( A B \), draw the line \( B D \) from the middle of the half-thickness of the flue, and \( x y \) the half-thickness of the frame. Then take off the several portions of the perpendiculars \( O \), \( 1 \), \( 2 \), \( 3 \), etc., intercepted between the upper edge of the keel and the rising line in the sheet-plant, and set them up from \( C \) upon the line \( C D \); through these lines draw parallel to \( A C \); take off also the several lower heights of the breadth at \( O \), \( 1 \), \( 2 \), \( 3 \), etc., from the sheet-plant, and set them up from \( C \) upon the middle line in the body plan; and draw lines parallel to \( A C \) through these points; then take off the several half-breadths corresponding to each from the floor plan; and set them off on their proper half-breadth lines, from the middle line in the body plan.

Construct the midsip frame according to the directions mentioned in that article, the form of which will in some measure determine the form of the rafter. For if a mould be made on any side of the middle line to fit the curve part of it, and the rising line, or that marked bend mould, (fig. 4.) and laid in such a manner that the lower part of it, which is straight, may be upon the several rising lines, and the upper part just touch the point of the half-line from in the breadth line corresponding to that rising upon which the mould is placed, a curve may then be drawn by the mould to the rising line. In this manner we may proceed so far as the rising line is parallel to the lower height of the breadth line. Then a hollow mould must be made, the upper end of which is left straight, as that marked hollow mould (fig. 4). This is applied in such a manner, that some part of the hollow may touch the side of the keel, and the straight part touch the back of the curve before described by the bend mould; and beginning afresh, the straight part will always come lower on every timber, till we arrive at the midsip timber, when it comes to the side of the keel. Having thus formed the timbers, as far as the whole mouldings will serve, the timbers shall then be next formed. Their half-breadths are determined by the flue and floor plans, which are the only fixed points through which the curves of these timbers must pass. Some form these after timbers before the whole is moulded, and then make the hollow mould, which will be straighter than the hollow of either of these timbers. It is indifferent which are first formed, or what methods are used; but after the timbers are all formed, though every timber may appear very fair when considered by itself, it is uncertain what the form of the side will be. In order to find which, we must form several ribband and water lines; and if these do not make fair curves, they must be rectified, and the timbers formed from these ribband and water lines. In using the hollow mould when it is applied to the curve of each timber, if the straight part is produced to the middle line, we shall have as many points of intersection as there are timbers; and if the heights above the base be transferred to the corresponding timbers in the floor plan, a curve passing through these points is called a riving line. This may be formed by fixing a point for the after-water timber that is whole moulded, and transferring that height to the flue plan. The curve must pass through this point, and fall in with the rising line somewhere abaft dead-flat; and if the several heights of this line be transferred from the flue to the middle line in the body plan, these points will regulate what is called the hauling down of the hollow mould.

The timbers in the after-body being all formed, those in the fore-body are formed in the same manner, by transferring the several heights of the riving and breadth lines from the flue to the body plan; the half-breadth corresponding to each straight must also be transferred from the floor to the body plan. The fame hollow mould will serve both for the fore and after-body; and the level lines, by which the water lines to prove the after-body were formed, may be produced into the fore-body, and by these the water lines to prove the fore-body may be described.

Another method of proving the body is by ribband lines, which are formed by sections of planes inclined to the flue plan, and intersecting the body plan diagonally, as before observed, of which there may be as many as may be judged necessary. In this, four ribband lines are laid down, marked \( D U \), which are drawn in such a manner as to be perpendicular to as many timbers as conveniently may be. After they are drawn in the body plan, the several portions of the diagonal, intercepted between the middle line and each timber, must be transferred to the floor plan. Thus, fix one foot of the compass in the point where the diagonal intersects the middle line in the body plan, extend the other foot to the point where the diagonal intersects the timber, for example, timber \( 9 \). Set off the same extent upon the perpendicular representing the plane of timber \( 9 \), from the point where it intersects the line \( K L \), on the floor plan; in like manner proceed with
with all the other timbers, both in the fore and after-body, and we shall have the points through which the curve must pass. If this should not prove a fair curve, it must be altered, observing to conform to the points, as nearly as the nature of the curve will admit; and, therefore, it may be carried vii. his one point and without another, according as the timbers will allow. For after all the ribband lines are formed, the timbers must, if necessary, be altered by the ribband lines; this is only the reverse of forming these lines; for taking the portions of the several perpendiculars intersected between the line KL and the curve of the ribband line in the floor plan, and setting them off upon the diagonal, from the point where it intersects the middle line, we shall have the points in the diagonal through which the curves of the timbers must pass. Thus, the distance between the line KL, and the ribband at timber 3, on the floor plan, when transferred to the body plan, will extend on the diagonal from the middle line to the point where the curve of timber 3 intersects that diagonal. The like may be said of all the other timbers; and if several ribband lines be formed, they may be so contrived that their diagonals in the body plan shall be at such distances, that a point for every timber being given in each diagonal, will be sufficient to determine the form of all the timbers.

In footing the timbers upon the keel, for a boat, there must be room for two futtocks in the space before, or abaft; for which reason the distance between these two timbers will be as much more than that between the other, as the timber is broad. Here it is between (a) and (A), which contains the distances between (a) and (A), and the breadth of the timber befides.

The timbers being now formed, and proved by ribband and water lines, proceed then to form the transom, fashion-pieces, &c.; see these articles.

This method of whole moulding will not answer for the long timbers afore and abaft. They are generally caoted in the same manner as those for a ship. In order to render this method more complete, we shall here describe the manner of moulding the timbers after they are laid down in the mould loft, by a rising square, bend, and hollow mould.

It was shown before how to form the timbers by the bend and hollow moulds in the draught. The fame method must be used in the loft; but the moulds must be made to their proper facings in real feet and inches. Now, when they are set, as before directed, for moulding each timber, let the middle line in the body plan be drawn acros the bend mould, and draw a line acros the hollow mould at the point where it touches the upper edge of the keel; and let them be marked with the proper name of the timber, as in fig. 4. The graduations of the bend mould will therefore be exactly the same as the narrowing of the breadth; Thus, the distance between (a) and 7 on the bend mould is equal to the difference between the half breadth of timber 7 and that of a.

The height of the head of each timber is likewise marked on the bend mould, and also the floor and breadth firmarks. The floor firmark is in that point where a straight edge batten touches the back of the bend mould, the batten being so placed as to touch the lower edge of the keel at the same time. The several risings of the floor, and heights of the cutting-down line are marked on the rising square; and the half-breadth of the keel set off from the side of it.

The moulds being thus prepared, we shall apply them to mould timber 7. The timber being first properly fided to its breadth, lay the bend mould upon it, so as may best answer the round according to the grain of the wood; then lay the rising square to the bottom of the bend mould, so that the line drawn across the bend mould at timber 7 may coincide with the line representing the middle of the keel upon the rising square; and draw a line upon the timber by the side of the square; or let the line be scored or cut by a tool made for that purpose, called a raise knife; this line so scored will be the side of the keel. Then the square shall be moved till the side of it comes to 7 on the bend mould, and another line shall be raised in by the side of it, to represent the middle of the keel. The other side of the keel must likewise be raised after the same manner, and the point 7 on the rising square be worked on each side of the keel, and a line raised acros these points to represent the upper edge of the keel. From this line the height of the cutting down line at 7 must be set up, and then the rising square may be taken away, and the timber may be fided by the bend mould, both inside and outside, from the head to the floor firmark; or it may be carried lower if necessary. After the firmarks and heads of the timbers are marked, the bend mould may likewise be taken away; and then the hollow mould applied to the back of the sweep in such a manner, that the point 7 upon it may intersect the upper side of the keel, before set off by the rising square; and, when in this position, the timber may be raised by it, which will complete the outside of the timbers. The inside of the timbers may likewise be formed by the hollow mould. The fanning at the keel is given by the cutting down before set off. The mould must be so placed as to touch the sweep of the inside of the timber formed before by the bend mould, and pass through the cutting down point.

The use of the firmarks is to find the true places of the futtocks; for, as they are cut off three or four inches short of the keel, they must be so placed that the futtock and floor firmarks may be compared and coincide. Notwithstanding which, if the timbers are not very carefully trimmed, the head of the futtock may be either within or without its proper half breadth, to prevent which a half breadth staff is made use of.

The half breadth staff may be one inch square, and of any convenient length. Upon one side of it are set off, from one-end, the several half breadths of all the timbers in the after-body; and those of the fore-body, upon the opposite side. On the other two sides are set off the several heights of the feather, and the feather on one side, and the fore-body on its opposite. Two sides of the staff are marked half breadths, and the other two sides heights of the feather.

The staff being thus prepared, and the floor timbers fanned on the keel and levelled across, the futtocks must next be fastened to the floor timbers; but they must be set first to their proper half breadth and height. The half breadth staff, with the assistance of the ram-line, serves to set them to the half breadth; for as the keel of a boat is generally perpendicular to the horizon, therefore the line, at which the plummet is suspended, and which is moveable on the ram-line, will be perpendicular to the keel, whence we may by it set the timbers perpendicular to the keel, and then set them to their proper half breadths by the staff; and when the two firmarks coincide, the futtock will be at its proper height, and may be nailed to the floor timbers, and also to the breadth ribband; which may be set to the height of the feather, by a level laid across, taking the height of the feather by the staff, from the upper side of the keel; by which means we shall discover if the ribband is exactly the height of the feather; and if not, the true height may be set off by a pair of compasses from the level, and marked on the timbers.

Juvenal (Sat. xx. v. 126—128) describes the boats of the ancient Egyptians, as if they were earthen-ware; and it is alleged, that such earthen-ware ships were used on the Nile, and that they were called "picta," painted, because these boats...
boats of baked earth were marked with various colours. However, it is much more probable, that the Egyptians formerly, as they have done in more modern times, made use of rafts, which were made to float by empty vessels of earthen-ware fastened under them. The word 'picta,' it is suggested, does not denote their being beautified with a variety of colours, but means their being rubbed with some substance that might fill up the pores, so as to prevent the water's penetrating into the cavity of the pitchers, and causing them to leak, for the Egyptian earthen-ware is said to be very porous. These rafts, however, were not constructed to pass up and down the Nile like boats, or properly designed for carrying goods upon them, but it is an easy mode of conveying their earthen-ware from Upper Egypt, where it is manufactured, to the lower parts of that country, where, when they reach the delineated place, the boat is taken to pieces and sold to the inhabitants. Harmer's Observations, vol. iii. p. 36.

Boat-hook, an iron hook with a sharp point, having a socket in which a long pole is stuck. This is a very necessary appendage to a boat, as by means of it, any thing floating past may be hooked; the boat may be held on to the ship, or pulled along, &c.

Boat-steer. In the whole fishery a person is appointed to each boat, whose express duty is to steer the boat towards the fish, &c.

Boats, bridge of. See the article Bridge.

Boat, removed with stcam. An experiment was lately tried on the canal between Grangemouth and Glasgow, to make a large boat lighter move by the power of steam. As, it is presumed, the series of experiments is not yet completed, the reader is, therefore, referred to the article Steam.

Boat skiff, the officer who has the care of the boats, fails, rigging, colours, anchors, and cables committed to him, which he receives by indenture from the surveyor of the navy, and is enjoined to use great care in the disposition of them.

It is the duty of the boatswain particularly to direct whatever relates to the rigging of a ship, after she is equipped from a royal dock-yard. Thus, he is to observe that the masts are properly supported by their throns, flays, and back-flays, so that each of those ropes may sustain a proportional effort when the mast is strained by the violence of the wind, or the agitation of the ship. He ought also to take care that the blocks and running-ropes are regularly placed, so as to answer the purposes for which they are intended; and that the flays are properly fitted to their yards and lyes, and well furled or reefed when occasion requires. It is likewise his office to summon the crew to their duty, to all with his mates in the necessary business of the ship; and to relieve the watch when it expires. He ought frequently to examine the condition of the masts, flays, and rigging, and remove whatever may be judged unfit for service, or supply what is deficient; and he is ordered by his instructions to perform this duty with as little noise as possible.

The boatswain is not to cut up any cordage or canvas without an order in writing from the captain, and under the inspection of the master; and always to have by him a sufficient quantity of small plate for securitv of the cables.

He is not to sign any accounts, books, lists, or tickets, before he has thoroughly informed himself of the truth of every particular therein contained. His accounts are to be audited and vouched by the captain and master, and presented to the surveyor of the navy; and until such accounts are passed, he is not to receive any wages. If he has cause of complaint against any of the officers of the ship, with relation to the disposition of the stores under his charge, he is to represent the same to the Navy-board before they pay off the ship. Fifteen years service entitles a boatswain to superannuation.

The Boatswain's Mate has the charge of the long boat, anchors, cables, &c.; he must give an account of his stores, and he is appointed to execute the sentence of a captain or court martial.

Boats, train of, a number of small vessels fastened to each other, ascending up the Loire in France, by falls when the wind serves, otherwise towed by men, sometimes to the number of twenty or sixty to a single rope.

Boat-bill, in Ornithology, the English name of a species of Canicroma, cachicn, Brown's Illustrations. Or, more properly, at this time the English name of the Canicroma genus, C. Cachicn, being called by the modern writers the crafted boat-bill, and C. Canicroma, g. the white-billed boat-bill. These are the two only species known. See Canicroma.

Boat, scapha, in Surgery, a species of bandage, used when the crown of the head and the part between that and the forehead are to be bound. It is likewise called thes douleurs.

Boat fly, in Entomology. See Notonecta.

Boat island, Geography, a small island in the gulf of St. Lawrence, near the south coast of Labrador. N. lat. 50° 2', W. long. 60° 55'.

Boat Passage, a channel into Flecable harbour, in Duty Bay, New Zealand.

Boating, a kind of punishment in use among the ancient Persians for capital offenders. The manner of boating was thus: the person condemned to it being laid on his back in a boat, and having his hands stretched out, and tied fast on each side of it, had another boat put over him, his head being let out through a place fit for it. In this posture they fed him, forcing him to eat by thrashing sharp iron instruments into his eyes, till the worms, which were bred in the excrements he voided as he thus lay, eat out his bowels, and thus caused his death, which was usually twenty days in effecting; the criminal living all this while in most exquisite tortures. On his face, placed full in the sun, they poured honey, enticing the flies and wasps to torment him. Pittarch tells us, that Mithridates, whom Artaxeres condemned to this kind of punishment, for pretending to have killed his brother Cyrus, lived seventeen days in the utmost agony; and that, when the uppermost boat was taken off at his death, they found his flesh wholly consumed, and swarms of worms gnawing his bowels. Hiero- nat. I. c. 143, 150. Phil. in cri. Artaxeres.

Boatium civitas, in Ancient Geography, a town of Gaul, and one of the twelve cities of Novampopolania.

Boat's kids, in Naval Architecture, are long square pieces of fir, extending across the ship from the gang-boards, on which the boats, long masts, &c. are rowed.

Boa, or Ball, in Horology, is the metallic weight which is attached to the lower extremity of a pendulum rod, by means of a tapped adjusting nut, at such a distance from the point of suspension as the time of a given vibration requires. (See the articles Centre of Oscillation and Pendulum.) In fixing upon a proper bob for any pendulum, two things are particularly to be attended to; the shape which is bell calculated for meeting with the least refraction from the air; and the weight which is best adapted for preserving the isochronism of the vibrations with a given maintaining power. Each of these considerations has been the subject of much investigation. A sphere is a solid, the surface of which bears the least proportion to its solidity of any other, and a cube is one with great extent of surface compared to its solid contents; consequently, the former shape...
has obtained in cannon balls, intended to pass through the air: with as little obstruction as possible, and has sometimes, for the same reason, been applied as a bob for a pendulum. Such a figure is better adapted for a large bob than a small one; for the increase of the surface is in proportion to the square of the diameter, whereas the increase of weight or quantity of matter is as the cube. Mr. B. Martin (Mathematical Institutions, vol. ii. p. 417.) proposed two equal frusta of similar cones, to be joined together at the bases, as a figure approximating nearly to a solid of least resistance, and recommended it as that out of which the middle one of three segments, cut longitudinally, will constitute the best shape for an appended weight, to answer the purpose of avoiding resistance. Such a section, he conceived, would displace but a small quantity of air in one vibration, and the impulsive force of that quantity, being made obliquely on the sloping surfaces of the ends, would produce but a small effect. The lenticular shape, however, composed of two segments of a large globe joined to the line of section, has been generally adopted by clock-makers, probably because two plates of brass of that shape can be easily folded together, and left hollow, so as to be filled with lead, or other heavy metal, in order to obtain a due degree of weight without adding to the thickness, which is an advantage that brads or copper cannot have of itself in any shape. M. Ferdinand Berthoud (Elle 1t l'Houlergerie, tome ii. chap. xiii.) made some experiments with bobs of both a spherical and lenticular shape, of equal weight, attached successively to the same free pendulum, from which it appeared, that, in the same temperature, the latter continued to vibrate seconds much longer than the former before they arrived at the quiescent state, which experiment was considered as a proof that the lenticular shape has the advantage in escaping the effect of resistance; it was discovered, however, on a repetition of the experiment, with seconds and half-seconds pendulums, that the friction at the point of suspension occasioned by heavy weights, particularly when vibrating in long arcs, made considerable alterations in the results, and proved itself a second source of resistance to the free motion of the pendulum.

The second condition to be attended to in making the bob, as has been said, is the weight which a given pendulum requires, with a given maintaining power. No theory is adequate to determine this deference of itself, because the diminution of the maintaining power by the friction of the pivots and the plate of the oil, the duration of the impulse on the pallets, the nature of the escapements in other respects, the resistance of the air, and at the point of suspension, and particularly the nature and quantity of momentum of the pendulum, must all enter into the calculation; and these are data, many of which are constantly varying. The momentum, or whole quantity of motion of any pendulum, is the weight multiplied into the square of its velocity, so that a large arc with a small weight, and a small arc with a corresponding large weight, ceteris paribus, ought to have an equal effect upon the isochronism of the same pendulum; but the theory is not perfect; for first, large circular arcs deviate considerably from cycloidal ones, which, it has been demonstrated by Huygens and others since, are those which have the isochronal property in an uniformly dense medium; and secondly, they require a greater maintaining power than calculation gives: for instance, where the arc is 10 from the point of rest, the addition to be made to the maintaining power beyond calculation is 57 parts in 100, according to Berthoud's experiments, which consideration induces him to conclude, that irregularities in the maintaining power will affect the momentum principally composed of velocity, more than the momentum principally composed of weight; each kind of momentum, however, has its peculiar disadvantage; for great velocity is subject to great resistance from the air; and great weight to much friction at the point of suspension.

Mr. Alexander Cummings was an advocate for a large arc with a small bob; but modern practice is in favour of a large ball or bob with a short arc of vibration. It seems to be generally allowed, that the momentum of a pendulum ought to be as great as possible for a given maintaining power, provided the latter be sufficient to overcome all obstacles to constant motion; but as the momentum is obtained in two different ways, it may be proper to subjoin here an illustration of them.

If a pendulum, moving in an arc of one degree from the quiescent point, with a bob or ball of fix pounds, has its momentum denominated by unity, then the square of any given momentum will give its corresponding weight for another bob, moving in the same arc; or the square root of the given momentum will give the arc of semivibration with the same weight; for instance, a momentum 4 will require $6 \times 4 = 24$ for the weight where the arc remains unaltered; but the root of $4 = 2$ will be the arc from the point of rest with the same weight; again, if the momentum be required to be 9 for a given maintaining power, the weight must be $54$, or the arc $3^\circ$ from the point of rest, and in the same proportion for any other momentum; but, in fact, both the weight and arc may be varied according to circumstances, which latitude affords great variety in the adjustment of the bob, and matter for multiplied experiments to determine what weight and arc shall be most desirable, taken conjointly under different circumstances.

The most practical method of adjustment of the momentum of a pendulum, where a weight is used as a maintaining power, seems to be, to try this power instead of the weight of the bob or ball, which, when once finished, of the requisite shape, is not so easily altered. In pendulum clocks, actuated by a spring as a maintaining power, such adjustment cannot indeed be made in the power properly without changing the spring, or altering the fusee after they are adjusted to each other; but sundry instruments are not intended to measure time with great nicety, the adjustment of the bob to the maintaining power is exactly done by guesses. In Huygens's bell clock, the maintaining power was equal to three pounds, falling about 90 inches in 24 hours, and the ball of its seconds pendulum, together with the pendulum itself, was also three pounds; but the nature of his escapement required the vibrations to be performed in long arcs. Cummings tried different weights for his pendulums from 6 to 16 pounds, and various arcs from 3° to 6° from the point of rest; but it does not appear that any other standard has been adopted by clock-makers than what agrees with the individual opinion of each. See Maintaining Power.

Bob, in Ringing, denotes a peal confining of several courses, or fets of changes.

Bow-fly, in Sea-Language, a rope used to confine the bowspirt of a ship downward to the stem, or cut-water, and to counteract the force of the stays of the fore-mast, which draw it upwards.

It is fixed by thrashing one of its ends through a hole bored in the fore-part of the cut-water and then flogging both ends together, so as to make it two-fold, or like the link of a chain; a dead-eye is then felled into it, and a hawser passing through this, and communicating with another dead-eye upon the bowspirt, is drawn extremely tight by help of mechanical powers. The bow-fly is the first part of a ship's rigging, which is drawn tight to support the masts. With this view, it is usual to suspend a boat anchor, or other weighty body, at the bowspirt end, to press it downwards during the operation.

Bow-fly-holes, are those holes in the stem, or fore-part of the knee of the head, to which the bow-fly is fastened. 

BOBAC,
BOBAC, in Zoology. The bobac of the French and English writers is a sort of *Marmot* with small, and somewhat oval ears; tail hairy; a claw upon the fore thumb; and the body grey above, and yellowish beneath. Guenel calls this animal *arctoynus bobac*.

There appear to be two varieties of this species, if not more. The bobac of Rzzaczinski (Nat. Hist. Pol. p. 253.) described by Briffon, in his History of Quadrupeds, under the name of *marmotta polonica*, is of yellowish colour, inclining to reddish upon the head; but the bobac described by Pallis is of a greyish brown colour, with only the under parts yellow. In every respect, except the colour of the hair, these two varieties agree.

This creature is rather larger than the rabbit, measuring about sixteen inches from the nose to the base of the tail, the latter of which is four inches and an half in length; so that the whole animal measures above twenty inches. Dr. Pallis, to whom we are chiefly indebted for an account of the bobac, tells us, that it is a native of the high, but milder and funny sides of mountainous countries, which abound with fiftile, or free-stone rocks, where it is found in dry situations, and such as are full of springs, woods, or fand. It abounds in Poland and Ruffia, among the Carpathian hills; it swarms in the Ukraine, about the Borithenes, especially between the Salo and Supoy; and again between the Borithenes and the Don, and along the range of hills which extend to the Volga. It is found about the Yakk and the neighbouring rivers; and inhabits the southern part of Great Tartary, and the Altay mountains, east of the Iris. It caues to appear in Siberia, on account of its northern situation, but is found again beyond the lake Bai-kal, and about the river Aragh and the lake Dalay, in the funny mountains about the Lena, and very frequently in Kamtchatka, but rarely reaches as high as latitude 55°.

The bobac is not considered as an article of food by the Mahometan Tartars. The Coslacks and the Calburns, on the contrary, hunt and kill them for eating; the flesh, however, is very fat, and not in much esteem for the goodness of its flavour. In its manners of life the bobac resembles those of the Alpine marmot, with which it has been apparently sometimes confounded. It inhabits deep burrows, in societies of from twenty to twenty-four in each receptacle. Their habitation is lined with the finest hay; and it is said, the quantity found in every such receptacle is sufficient for a night's provender for a horse. In the morning, or the middle of the day, when the fun shines, they go abroad in search of food, always taking the precaution to station one of the party at the entrance of their cell as a sentinel, who announces the least approach of danger with a whistle; and all, if within hearing, are thus enabled to provide for themselves in the best manner circumstances may require, either by returning for shelter to their cell, or remaining at a distance till the danger is over. The marmot, when attacked, rear's itself upon the haunches, and defends itself with the fore paws. It eats with the fore paws, in the same posture. The bobac is an animal of a mild and gentle disposition, and may be easily domesticated. They are torpid throughout the winter, unless kept in a warm room. They breed early in the spring, and are ready to produce five or eight young. The fat of this creature is used for dressing furs and leather.

BOBAN, in Geography, a town of Arabia, 32 miles S. of Saudo.

BOBART, Robert, in Biography, curator of the botanical garden at Oxford, which had been lately instituted by Lord Danby, published in 1698, "Catalogus plantarum horti medi ci Oxoniensis," 8vo. The catalogue gives the names of about 1600 plants, many of them from Canada, first the Latin, then the English names, in alphabetical order. This was re-published in 1678, considerably improved and enlarged to more than double its bulk; Bobart being assisted in the work, as he acknowledges, by Dr. Philip Stevens and Wm. Brown, M. A. Besides the trivial names of the plants, there were now added those from Gerard, Parkinson, and Baubine, which were not in the first edition. Bobart died in 1679, at the age of 81 years.

BOBART, Jacob, who succeeded his father, as curator of the garden, published, in 1699, the third volume of Morrison's "Plantarum historia universalis Oxoniensis, seu herbam distributio nova, per tabulas cognoscitios. ex natura libro dicta," fol.; making up by his own industry and sagacity what was deficient in the loose and imperfect sketches left by the author at his decease. There is an ingenious paper by this writer in the Philosophical Transactions for the year 1683, on the effects of the great flood, which happened the preceding winter, on trees and other plants. Many oak, elm, ash, walnut, and other trees, were found, he says, with large rents or clefts in different parts of their trunks, in the large branches, and in such parts of their roots as were not sunk deep into the earth. Parts, he adds, that were so knotted, that they could not have been split but with great difficulty with hedges and wedges, were rent atunder the force of the ice contained within them, making, at the time of freezing, a noise like the explosion of gunpowder. It was supposed, that the trees which suffered were diseased, that some of the vessels were diileden or burst, and that the effect was produced by the freezing of the sap or other juices contained in these cavities. Philos. Tran. abr. vol. iii. p. 89. Hailer. Bib. Botan.

BOBARTIA, in Botany, (named in honour of James Bobart, formerly professor of botany at Oxford,) a genus formed by Linnaeus for a plant said to grow in the East Indies, with the following essential character:—Glance of the calyx numerous; the exterior one short, univalved; the interior longer, bivalved; glance of the coroll single, shorter than those of the calyx, sitting on the cor; the leaves, in the genus *Bobartia*, are serrated. This generic character was first published in the Amicitiae Academicae, vol. i. p. 113. (Lund. Bat. Ed.) and in the Species Plantarum a reference is given to Scheuchzer, Gram. 369. Reichard added another supposed synonym from Phutenet tab. 50. fig. 17. Schreber, Juliana, La Mark, and Bosc, have all taken it up from Linnaeus; and La Mark, in his Illustrations, has copied Phutenet's figure. Wuldenew, in his new edition of the Species Plantarum, has abolished the genus; ascertaining on the authority of Schmacher (Act. Soc. Nat. Hafn.), that Linnaeus drew up the character of his botaria from a mutilated specimen of *morea* spadicea, first completely described by Thunberg, and adopted by Linnaeus the younger in the Supplementum Plantarum, p. 99.

The mistaken synonyms of Scheuchzer and Phutenet are referred by Wildenow to cyperus arenaria of Retz, of which Phutenet's figure, copied by La Mark, is said to be a good representation. A figure of *morea* spadicea is also given by La Mark under its proper genus.

BOBARTIA. See also Ruboeeria Prepara.

BOBBIN, in Commerce, a term denoting about a quarter of a hundred of undressed flax.

BOBBING, or Bobbin, a little piece of wood turned into a cylindrical form, wherein thread is wound, to be used in the weaving of bone-lace. The French also give the denotation bobine to what among us is more properly called a jet or quilt. In which they are also followed by several English.

In this general sense, bobbins are used to wind threads, worsted, hair, cotton, silk, gold, and silver; and they are
of different lengths and sizes, according to the materials which are fpun or wound.

Borsing for Eels, among Fishermen, is an amusing method of catching eels, generally prated from the side of a boat, the ends of bridges, wharf, or other situations where deep water can be at once reached. The bait made up of may be either foucred lob worms, or garbage of any kind; which bait of whatever kind is fixed lengthways on worldled, so as to completely cover it; some yards are prepared in this way, which are then tied up in links, making something like a bundle of fringe. So prepared, the bait is suspended from a strong rod or pole by two or three yards of pack-thread, led about a foot of the worms with more or less weight according to the strength of the current. The bait and lead must be sunk to the bottom, and suffered to remain, when the fish will soon be felt to nibble; but time must be allowed for them to take their hold securely, after which they may be gently pulled up to within a small distance, when a flight jerk will secure them. The mouths of rivers, muddy and deep places, where the tide reaches, are particularly favourable for this sport.

BOBBIÖ, or Bobio, Bobium, in Geography, a small town of Itay, and capital of a district of the same name, formerly belonging to the duchy of Milan, seated on the river Trebia, the tee of a bishop, suffragan of Genoa, 50 miles N.E. of Genoa. It is now a canton of the district of Alexandria, in the department of Marengo.

Bobbio. See Bobbio.

BOBENHAUSEN, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Hesse; 17 miles east of Giften.

BOBENNEUKIRCHEN, a town of Germany, in the circle of Upper Saxony, and the Vogtland; 6 miles S.W. of Oellnitz.

BOBER, a river which runs into the Oder, at a small distance to the west of Croffen in Silefia.—Allo, a town of Lithuania. N. lat. 55° 49'. E. long. 25° 46'.

BOBERG, a high promonoty in the prefecture of Bohning, and dioce of Ripen, in Denmark, near which the coal is very dangerous, and has proved fatal to many ships.

BOBERSBERG, a town of Silefia, 9 miles S.W. of Croffen, and 28 S. of Franckfort on the Oder.—Allo, a town of Germany, in the circle of Upper Saxony, and duchy of Croffen, 6 miles S. of Croffen.

BOBI, in Conchology. Adamson gives this name to the variety of velutina pericusta.

BOBISATIÖ, or Boberisatio, in Music, denotes the using of the seven syllables, bos, ce, di, gi, lo, ma, ni, to express the seven musical notes in lieu of the six usual ones introduced by Aretine, ut, re, mi, fa, sol, la, as has been sometimes done by the Netherland and German musicians since the beginning of the seventeenth century, to avoid the mutation necessary in the use of these latter.

BOBLINGEN, in Geography, a small town and district of the same name, of Germany, in the duchy of Wurttemberg, situate in a fertile country, and in the forest of Schonbuch, which abounds with game, having a castle seated on an eminence lying above the town. The district contains 12 parishes; and the vicinity produces fome wine.

BOBR, a river of Lithuania, which runs into the Dnieper; 5 miles S.S.E. of Rohaczow.

Bons, in Zoology, a kind of marine otter, so called by the Russians, who reside at Kamfchakta, the precise species of which is doubtful. Some have imagined it to be allied to the catler.

BOBRTZSCH, in Geography, a town of Germany, in the circle of Upper Saxony; and country of Erzgeberg, 4 miles S. E. of Freyberg.

BOBROE, a district of the government of Voronez, in Russia, seated on the Bilinik, falling into the Don.

BOBROWNÍK, a town of Poland, in the palatinate of Lublin, 24 miles W.N.W. of Lublin.

BOBRYSEL, a town of Lithuania, in the palatinate of Minsk, seated near the river Berezyna. N. lat. 53°. E. long. 20° 42'.

BOBÍI, a town of Lithuania, in the palatinate of Troki. N. lat. 55°. E. long. 24° 15'.

BOCA. See Bocca.

Boca Efond'da, in Geography, a bay of North America, in the bay of Campechy, on the coast of Yucatan. N. lat. 18° 50'. W. long. 91° 46'.

Boca Grand, a bay of North America, at the mouth of the river Zucar, on the S.E. coast of Colita Rica. N. lat. 10° 50'. W. long. 83° 26'.

Boca Terra, a bay of North America, in the Caribbean sea, on the coast of Veragua. N. lat. 8° 38'. W. long. 82° 11'.

BOCABRITO, a town of North America, in the country of New Navarre, 65 miles east of Cibalaba.

BOCA-CHICA, the strait or entrance into the harbour of Cartagena, in South America; which was filled up since the attack of the English in 1741, who, having made themselves masters of the forts which defended it, entered the bay with an intent of taking the city; but their attempt miscarried, and they were obliged to retire with considerable loss. This event produced orders for opening the old entrance, by which all ships now enter the bay.

BOCA-DEL-DRAKO, a strait between the island of Trinidad and Andalucia, in the province of Terra Firma, South America.

BOCAGE, a small corner of France, in Normandy, of which the principal place was Vire.

BOCALIEAU, a small island, near the east coast of Newfoundland. N. lat. 49° 15'. W. long. 52° 26'.

BOCAMELE, in Zoology, the provincial name of an animal of the Mustella tribe found in the island of Sardinia. This is believed to be the creature described by Aristotle by the name of Bist.

BOCANA, in Ancient Geography, a town situate in the eastern part of the island of Taprobana. Ptolemy.

BOCARDO, in Logic, the fifth mode of the first figure of syllogisms, wherein the first proposition is particular and negative; the second, universal and affirmative; and the third, or conclusion, particular and negative, Thus:

BOC Some animal is not man.

AR Every animal has a principle of sensation.

DO Therefore something has a principle of sensation, that is not man.

BOCAS, LAS, in Geography, a town of North America, in New Biscay, 120 miles E. of Parmal.

BOCAT, the name of a valley in Syria, in which are the ruins of Balbec, of which Mr. Wood says, it might by a little care be made one of the richest and most beautiful spots in Syria; for it is more fertile, he adds, than the celebrated vale of Damascus, and better watered than the rich plains of Edfracon and Rama. In its present neglcted state, it produces corn, some good grapes, but very little wood. Here, it is supposed, was situated "Baal-hamon," which was the marriage portion of the bride of Solomon. Sol. Song. viii. 12. This estate was leased out to a variety of tenants, each of whom paid her a clear rental of a thousand flocks of silver, amounting to about 120,168 s. sterling. Harmer's Outlines of a New Commentary on Solomon's Songs, p. 35. Good's Songs of Solomon, Pref. p. 13.

Bocat was also called "Bekah," which see. See also Balbec.

BOCAUD
BOCAUD, John, in Biography, born at Montpellier, where he received his education. In 1543, he was made doctor; and in 1544, on the death of Denis Fontenau, professor of medicine in the university there, an office he is said to have filled with distinguished honour to the time of his death, which happened in 1558. We have only one work published by this writer; "Tabula curationum et indicationum ex profuso Galeni methodo, in summa rerum capita contracta," fol. Lyons, Haller, Bib. Med. Pract. Eloy, Dict. Hist. Med.

BOCCA, a term used both in the Levant and on the N.W. coast of South America, or the Spanish main, for a mouth or channel into any part or harbour, or the entrance into a found which has a passage out of it by a contrary way. See Boca.

BOCCA, in Geography, a town of Italy in the duchy of Mantua, in the Comesicia, 5 miles N.N.E. of Sабione ta.

BOCCA Tigris, a name given by foreigners to the river Pe-kiang of China, near its discharge into the southern sea of China. See Pe-Kiang.

BOCCA, in Gia's making, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be filled with a cover made of earth and brick, and removable at pleasure, to prevent the eyes of the workmen from the violence of the heat.

BOCCACCIO, or BoccacinCio, Camillo, in Biography, a painter of history and portrait, was born at Cremona in 1511; and, having received instructions in the art of painting from his father, removed to Rome, and assumed the Roman name. His application was indefatigable, and his improvement so observant, that he was immediately employed in several noble works for the churches and convents. He died young in 1546, when he was making rapid progress towards very high perfection. Pilkington.

BOCCACCINO, Anthony, a surgeon of Comacchio, a town in Ferrara, flourished in the early part of the last century. Reviving the practice of Magatus, in the cure of wounds and ulcers, which had fallen into disuse, he admitted no oily or greasy applications in the treatment of them, nor made use of tents or injections in the cure of abscesses, which, by irritating the parts, prevented, he said, their union, and frequently occasioned the offices to become callous. His works, illustrating his practice, are "Cinque difingiulgri Chirurgici, per la cura delle ferite," Venice 1713, 8vo. treatment of the cure of gun-shot wounds; "Cinque disingiulgri Chirurgici, per la cura delle ulcere," Ven. 1714, 8vo. with observations explaining and defending the doctrine of Magatus. Haller Bib. Chirurg. Eloy. Dict. Hist. Med.

BOCCACIO, or Boccace, John, an eminent Italian writer, and one of the reformers of literature in Europe, was born of parents in low condition at Certaldo in Tuscany, in 1313. Declining that mercantile occupation for which he was originally designed, and in which he spent some of his earlier years, he devoted some time to the study of the canon law; but as soon as he had an opportunity of cherishing for himself, he purged a course of literature; and with this view sought instruction from the best masters, and at Florence put himself under the tuition of Leonzio Pilato for the Greek language. Heavies the advantage he derived in furnishing his mind with stores of literature, and in cultivating a good taste, from conversation with the most learned men of his age, and from collecting and copying the most approved Greek and Latin writers of antiquity, he was particularly indebted for his progress in learning, and for his future reputation to the instruction and patronage of Petrarch, who was eminently useful to him both by his advice and by supplying him with money for aiding the prosecution of his studies, when his own patrimony was exhausted. By a diligent improvement of all these advantages, he acquired such reputation, that the republic of Florence conferred upon him the honour of citizenship, and employed him in a variety of public transactions. Among other important commissions with which he was entrusted, that of negotiating the return of his friend Petrarch to Florence was particularly agreeable to him. But though his message to this purpose did not succeed, it afforded him an opportunity of establishing a more intimate and confidential correspondence with this patron of his youth. In 1353, two years after his visit to Petrarch, he was sent to pope Innocent VI at Avignon. At this time he lived freely, and devoted himself chiefly to poetry and compositions of a lighter kind. During his rambles in Italy, he visited Naples, as some have said, in the year 1341, where he was favourably received by king Robert, and where he resided for some time. Here he fell in love with a young person whom he calls Fiametta, and who is commonly supposed to have been the natural daughter of Robert. In 1359, he had, with a conference with Petrarch at Milan, the result of which was his indulging more serious reflections than he had hitherto done; and having received an admonition in 1361, that his life would not be of long continuance, and that he would soon abandon poetry, his mind was so impressed that he immediately determined to relinquish his poetical labours, and even the perilous and prolix authors, and, against the counsel and remonstrances of Petrarch, to part with his library. About this time he transferred the clerical habit, and adopted a plan of conduct more guarded and regular than that of his past life. In 1362 or 1363, he again visited Naples; and without making any long stay there, went to Venice, and passed three months with his friend Petrarch. He was again deputed by his countrymen as ambassador to pope Urban V. at Avignon; and in 1367 he attended the pontiff under the same character at Rome. A public lecture on the "Comedia" of Dante, having been instituted at Florence, he commenced his explications of that author in October, 1373; but, preferring the retirement of Certaldo, his native place, towards the close of his life, he died there in December, 1375. Boccacio was a voluminous writer both in prose and verse. His works in Latin were, a mythological treatise in 15 books, "De Genealogia Deorum," Baii, 1532, fol. claimed excellent at the time when it was written, but long since superseded by more valuable publications of a similar kind; to this was annexed a "Tractate on Mountains, Rivers, Seas, Lakes, &c.;" with respect to both thefe he has been charged with plagiarism; "An Abriffment of the Roman History," from Romulus to the year of Rome 724, with a parallel of the seven kings of Rome and of the emperors to Nero, inclusively, Colong. 1534. 8vo.; an historical treatise, in nine books, entitled "De Calibus vivorum et farnata rum illuftrum," beginning with Adam, and terminating with John king of France taken prisoner by the English at the battle of Poitiers, 1356, which work was translated into Italian, Spanish, French, and English, printed at Augsburg, in 1544, and in French at Lyons, in 1453, and at Paris in 1578, by Claudius Vitart, under the title of "Traite des Meuifaetures des Personnelles figures," 8vo.; and another book "De claris mulchibus." He also wrote in Latin a number of eclogues. In Italian poetry, his compositions were the "Thriacije," in 12 books; the "Filo rat," the "Ninfal Fiocchez," &c. &c. But though he was reckoned one of the three princes of the poets of that age, he is ranked only as the third of the triumvirate, precedence being assigned to Dante and Petrarch. It is
tial, that he was duly sensible of his inferiority; and that, after having seen the sonnets and songs of Petrarch, he determined to throw his own into the fire. His profane works, which are more valuable, are his "Commentary on Dante," printed at Rome in 1544, 16to.; and at Florence, in 1576, 8vo. some romances of an amorous kind, intermixed with verse, as "Il Filicone," "La Flaminetta," "L'Amorito," "Il Laberinto d'Amore," &c. &c. But his most celebrated production of this kind is his "Decamerone," or collection of one hundred stories, or novels, feigned to have been recited in ten days by a company of ladies and gentlemen, who had retired into the country from the plague of Florence in 1548. These stories are partly founded on fact, and partly the productions of the author's own imagination; and they present a curious exhibition of character and manners in all the ranks of society. They abound with fictitious strokes levelled against the vices and frauds of the priests, and even the mysteries of religion; and the language, in some parts, is so free and licentious, that we may well wonder at their being recited before females of character and condition. However ripe and vulgar many of the reflections may now appear, the style in which they are delivered is considered as a model of elegance and purity for the age in which they were written, and places the Italian language far beyond that of any modern nation at so early a period. No work was ever more popular, or more generally translated, than the Decamerone. The stories that occur in this work have furnished materials for some of the most popular pieces of La Fontaine and other similar writers. Boccace assumes the liberty of having lifted the writings of Homer and of several other Greek authors from Greece to Tuscany, and he was, without doubt, a most industrious and indefatigable copyist of the remains of antiquity. His poetry is pronounced by his countrymen to be as fecile and languid in its character, as his prose is exquisite and admirable. His valuable library was bequeathed to a convent in Florence, where it was long preserved. For a further account of his life and writings, see Fabriucius's Bibl. Lat. medi. vol. 1. p. 248; &c.; and Tiraboschi, tom. v. p. 82. 439—451. Gen. Dict. Burney's Gen. Hist. Musée, Vol. II. p. 338, &c.

BOCCAILE, or Bocca, a liquid measure used at Rome, answering to what among us is called a bottle, being equivalent to about an English quart. Seven boccale and an half make the rubbia.

BOCCALINI, Trayan, in Biography, a satirical writer of the 16th century, was the son of an architect at Carpi, and born at Loretto in 1536. At Rome, where he principally resided, he had access, by the vivacity of his genius, to several persons of rank, and among others to cardinal Bentivoglio, whom he instructed in geography. Protected from the danger to which his satirical turn exposed him, by the influence of the cardinals Borghese and Gaetani, he also, by their recommendation, obtained several offices of trust and honour in the ecclesiastical state, and was appointed to the government of Beuceno. But his public conduct occasioned complaints, and he became obnoxious to the Spaniards, by exposing with freedom and severity their delinquencies against the liberty of Italy, so that he was under a necessity of retiring to Venice in 1612. In the following year, it is said that he was assassinated by four ruffians, who broke into his chamber at an early hour in the morning, and beat him to death with sand-bags as to occasion his death. Of his works, the most celebrated is his "Ragguagli di Parnaso," or news from Parallus, in which, under the fiction of a court in which Apollo presides, he takes occasion to satirize the actions and works of several persons who pass under review; but his reflections frequently betray the want of critical judgement and of a regard to truth. A second part of this work written with the same views, is entitled "The Secretary of Apollo." His "Political Touchstone," levelled against the Spaniards, is of a similar kind. He also wrote the "Political Balance," "Commentaries on Tacitus," and some other works. Tiraboschi. Gen. Dict.

BOCCARELLO, in the Glas.-Manufacture, a small hole or aperture of the furnace, one of which is placed on each side of the bocca, almost horizontally with it. Out of them the fitters take coloured or finer metal from the piling pot.

BOCCAS, in Ichthyology, the Arabian name of a fish belonging to the Scorber genus, observed by Forfkal in the Red Sea. Vide Scorber Sansun.

BOCCHERINI, Luigi, in Biography, was born at Lucca in 1756, where he refused till 1763, when he went to Paris, and where he continued till 1780. He then removed to Madrid, where, if living, he still remains. His instrument is the violoncello, and though he writes but little at present, he has perhaps supplied the performers on bowed-instruments and lovers of music with more excellent compositions than any master of the present age, except Haydn. His style is at once bold, masterly, and elegant. There are movements in his works, of every style, and in the true genius of the instrumets for which he writes, that place him high in rank among the greatest masters who have ever written for the violin or violoncello. There is perhaps no instrumental music more ingenious, elegant, and pleasing, than his quintets; in which invention, grace, modulation, and good taste, coalesce to render them, when well executed, a treat for the most refined hearers and critical judges of musical composition. A complete list of the works of this excellent composer would be of use to judicious collectors, as his genius, taste, and judgment were too fertile and refined, to suffer him to commit to paper frivolous or indigested thoughts. His productions of 40 years ago have lost nothing of their worth, nor will 40 years more wholly deprive them of their bloom.

BOCCETTA, in Geography, a chain of mountains, over which is the high road between Lombardy and Genoa; on the summit of the highest, which is very steep, is a way so narrow that three persons can hardly go abreast, called "The Pafs of Bocchetta," defended by forts, and considered as the key to the city of Genoa. In 1746 the inhabitants, having made themselves masters of this pass, found little difficulty in proceeding to that capital. In 1758, a magnificent road was made from the Bocchetta to the north of Genoa, through the Polvezera, which, for the space of three years, employed from 5 to 800 men, by the patriotic munificence of one noble family, the Cambias. The Polvezera in the Bocchetta yields a beautiful stone which is ferruginous, of various colours veined with marble.

BOCCIANICO, a town of Italy, in the kingdom of Naples, and province of Abruzzo citra, 3 miles S.E. of Civita di Chieti.

BOCCIARDI, Clementi, called Clementone, in Biography, a painter of history and portrait, was born at Genoa in 1620, and after having been the disciple of Bernardo Strozzi, went to Rome for improvement, by a judicious observation of the ancient sculptures, and the works of the celebrated modern artists. By the efforts of his own excellent genius, and a diligent application to design, he discovered the art of blending the antique and modern gifts in a style both of grandeur and gracefulness. Most of his works (his portraits excepted, which were lively, natural, and graceful,) are in the chapels of Genoa, Pisa, and other cities of Italy, where they are much admired. Pilkington.

BOCCOLD, Boscold, of Beverley, John, commonly called "John of Leyden," a journeyman-taylor, of Leyden, who, in the earlier part of the 17th century, connected
BOC

connected himself with John Matthias, a baker of Harlem, and with his assistance displayed the alarming effects of fanaticism and enthusiasm. These two anabaptist prophets, for this was the appellation which they assumed, fixed their residence at Munster, in Weitphalia, and at length gained such a number of profelytes, that they became matters of the city, and established in it a new form of government, directed by Matthias, who issued his commands, with the fyle, and with the authority of a prophet. Matthias, having pillaged the city, unballied large hoards of wealth, and reduced all ranks to an equality, provided for its defence, by repairing and extending its fortifications, by forming all his followers, who were capable of bearing arms, into regular bodies, and by endeavouring to add the vigour of discipline to the impetuosity of enthusiasm. After these preparations, he sent out emissaries to the anabaptists in the Low Countries, inviting them to assemble at Munster, which he dignified with the title of Mount Zion, and from thence he proposed that they should set out to reduce all the nations of the earth under their dominion. The bishop of Munster, justly alarmed at these horrible appearances, assembled an army, laid siege to the town, and slew Matthias, with 300 of his attendants, in their first frantic folly. Matthias in the same year 1534. was succeeded by Boccold, who, more cautious than his predecessor, satisfied himself with carrying on a defensive war, whilst he waited for the succours from the Low Countries, which he encouraged his deluded followers to expect. But though less daring in action than Matthias, he was a wilder enthusiast, and of more unbounded ambition. Accordingly he marched naked through the streets, and proclaimed with a loud voice, "That the kingdom of Zion was at hand; that whatever was sown on earth should be brought low, and whatever was low should be exalted." In order to verify his declaration, he commanded the churches, and the most lofty buildings in the city to be levelled with the ground; and depriving Chipperdorling one of the most considerable of their profelytes of the confiftuhip, the highest rank in the commonwealth, he degraded him to the humiliating office of common executioner. In place of the deposed seniors, he named 12 judges, according to the number of tribes in Israel, and referred to himself the authority possessed by Moses as legislator of the people. He further declared to the assembled multitude, that it was the will of God, that John Boccold should be king of Zion, and sit on the throne of David. Accepting this heavenly calling, which he pretended to have received by a special revelation, he was immediately acknowledged as monarch by the deluded multitude, and assumed all the flate and pomp of royalty. He wore a crown of gold, and was clad in the most sumptuous garments. A Bible was carried by him in one hand, and a sword in the other; he appeared in public attended by a body of guards, coinced money with his own image, and appointed the great officers of his household and kingdom, among whom Chipperdorling was nominated governor of the city, as a recompence for his former submission. As the exults of enthusiasm have usually led to culutral gratifications, Boccold instructed his prophets and teachers to inculcate the lawful% of a plurality of wives, as one of the privileges granted by God to his saints; and he himself fet the example of this Christian liberty, as he called it, by marryng at once three wives, one of whom was the beautiful widow of Matthias. He proceeded with augmenting the number of his wives to fourteen, restricting however the title of queen to Matthias's widow, and allowing no other to have with him the splendour and ornaments of royalty. The multitude availing themselves of this example indulged their desires to the most licentious and extravagant excess; and polygamy and freedom of divorce universally prevailed. The bishop of Munster, in the mean while, aided by the German princes, prelled closer the blockade of the town into which the siege had been converted; but its fortifications were so strong and so diligently guarded, that they durst not attempt an assault. But no succours arrived to the besieged; and after a close blockade of about fifteen months, they began to feel and lament the effects of scarcity. However, such was the demoralizing influence of Boccold's promises and predictions, that no one seemed inclined, or at least possessed resolution enough to propose a surrender. One of his wives intented a small doubt of his divine mission, was summoned before him as a blasphemer, and commanding her to kneel, he cut off her head with his own hands; his frantic followers at the same time dancing with joy round the bleeding body of their companion. Notwithstanding all the horrors of famine, the people of Munster still refused to capitulate. At length, however, a defterer made his escape to the enemy; and offered to head a party of the besiegers, under cover of the night, to a weak part of the fortifications, and left vigilantly guarded than any other. The proposal was accepted; and the party seized the walls, feized one of the gates, and admitted the roye of the army. A dreadful carnage ensued; the king and Chipperdorling were taken prisoners. The former, loaded with chains, was carried about from city to city, as a spectacle to the people; but notwithstanding all their insults, he maintained a firm and unridden spirit; and adhered inflexibly to the tenets of his sect. He was afterwards brought back to Munster, and suffered the most exquisite as well as lingering tortures of death with astonishing fortitude; thus fulfilling an extraordinary course of delusion, at the age of 26 years. Kayle, Art. Anabaptists. Robertson's Hist. of Ch, V. vol iii, p. 296 &c. Mofheim's Eccl. Hist. vol iv. p. 452, &c.

BOCONE, Paolo, or Paul, an ingenious naturalist, was born at Palermo, in Sicily, April 24th 1653. He was a man of a wealthy and respectable family, or rather, by birth, from Savona in Genoa. To improve himself in natural history, particularly in botany, to which he was early attached, he travelled over Sicily, Coties, Malta, many parts of Germany, Holland, and England, conversing with the most eminent literary characters in the places he visited, with whom he afterwards kept up a communication. In the course of his travels, he was admitted doctor in medicine at Padua, was elected member of the Academy, Nature Curios. and made botanist to the grand duke of Tuscany. In 1682. he entered among the Cistercian monks at Florence, and with the habit of the order took the name of Sylvio, which he adhered to his latter works, but he was still permitted to continue his researches in natural history. Returning at length to Sicily, he retired to one of the houses of the Cistercians near Palermo, where he died, Dec. 22nd 1704. As he had been indefatigable in his researches, his collection of plants and other natural productions was very considerable. S librarian, who saw his hortus focus or specimens of dried plants, in 1697, was so struck with their number and beauty, that he engaged him to give a catalogue of them to the public, which he did in his "Museo plantarum rare," published at Venice in 4to. the same year. The catalogue was also published by itself. Several of his works appear to have been pirated while he was on his travels. The first of them, "De abstrato mare notum," in 1698; and in the same year, "Manifescum botanicum, de plants Sicilis," Catania, 4to. By an advertise- ment at the beginning of the work he offers to hotmills the seeds of many of the curious and rare plants he had collected at moderate prices. Marrion published an edition of this work at Oxford in 1674, 4to. under the title of "Historia plantarum in plantarum Sicile, Malta, Gallie, et Italia." Many of the plants, Haller says, were new. The figures are small, and in general not well delineated or engraved. His next production was "Recherches et observations naturelles," published at Paris in 1675.
Ameliam Jollh. called, contentphono and was Botany, to is its Notes June, bed Gen i6mo. replied, filicule for, "the green The he alternate, In See good Paleftine was brafted Boccoma which The lie Vazioni carp, ©f pears globular, P'ifl. flower, JufT. of two-valved. willd." BCCONIA, boconia, botany. Is of popular genus Car. of Pericarp, capulce, filamentous, reflex. Pericarp. capulce fib. vate, attenuated to each end, compressed, one celled, two-valved. Vitalus coruscus, ojering at the bafe; the annular petaled with the permanent style. Seed one, globular, involved in pulp at its bafe, fixed to the bottom of the capulce. Obfem. The capulce refembles a filicule in its general shape, and in the permanent future terminated by the style.

Species. 1. Bocconia frutescens, shrubby boconia tree, celandine, or parrot-weed. "Leaves oblong, finnate. Wild." An ornamental shrub, 10 or 12 feet high, with a straight, hollow trunk filled with pith, covered with a smooth, white bark, and divided near its summit into several cylindrical branches. It abounds in all its parts with a thick, yellowish juice, similar to that of celandine. Leaves fix or even inches long, and about three broad; alternate, oblong, fimbriated; a little finnate, with oval, unequally toothed segments; green and smooth above, glaucous, and a little tomentofe beneath; on short petioles; flowers small, greenish, numerous, in large pyramidal, terminating panicles; bractes lanceolate.

It is a native of Mexico and the West Indies, where its acid juice is used to take off tetter and warts, and is also said to be employed in dyeing yellow. It has an evident affinity with the celandines in its tenable qualities and two-leaved daudous calyx, but differs remarkably from them in its incomplete flowers and monospermous fruit. La Mark conjectures that its want of a corolla is owing to the change of its natural petals into flaments: for, he observes, after the fall of the true flaments, four are conflantly left, which continue as long as the calyx. See La Mark. Encyc.

The shrubby boconia was first cultivated in England by Mr. Miller in 1739, and has flowered and ripened its seeds, in the phylae garden at Chelsea. It is propagated by seeds, which should be sown in a pot filled with light fresh earth, early in the spring, and then plunged into a bed of tanner's bark, and occasionally watered. When the plants are come up, they should be transplanted into separate pots filled with light sandy earth, plunged in the hot bed, and shaded from the sun in the heat of the day, till they have taken root: at first they should be sparingly watered, but when their stems are become woody, they will require a larger supply. In about two months, they should be transplanted into larger pots, and plunged again into the bark. In warm weather they should have a good share of fresh air, but should never be taken out of the house.

B. cordata. 'Leaves cordate, a little lobed.' A native of China. Panicule elongated, with single, not divided, branches. Calyx white. as in the preceding species, but larger. Stamens about 24. Style none. Stigma bilamellated, fimbriate. Wildenow, by whom it was first described, as it should seem, from a dried specimen.

BOCCORE, in Natural History, Parii. q. d. first and early fruit, a name given in the kingdoms of Algiers and Tunis, and also in Palestine, to the early fig, which was produced in June, in Palestine, though the kermes, or kermeuse, the fig properly so called, which they preserved and made up into cakes, was rarely ripe before August, and sometimes hung upon the trees all the winter. These latter figs continued a long time upon the tree before they fell off; whereas the bocones dropped as soon as they were ripe, and, according to the appropriate and beautiful allusion of the prophet Nahum. (iii. 12.) fell into the mouth of the eater, upon being shaken. We learn from Tiny (N. H. l. xvi. c. 26.) that the fig-tree was biferia, or bore two crops of figs, viz. the bocones, as we may imagine, and kermes: and it is well known that the fruit of these prolific trees always precedes the leaves; consequently, when our Saviour gave one of them, in full vigour, having leaves (Mark xi. 13.) he might, according to the common course of nature, very justly look for fruit, and could find some bocones, if not some winter-figs likewise upon it. The time of the year in which the event referred to in this passage occurred, was undoubtedly three or four days before the passover, at which our Saviour was crucified, and the passover in that year fell in the beginning of April. But it has been inquired, how Christ could expect to find ripe figs on the tree at the latter end of March? to which it is replied, because figs were ripe to soon in Judaea. It has been satisfactorily proved, that the harvest in Judæa began at the passover, and ended at pentecost; and as the barley in Judæa was ripe in March, and the wheat in April, we need not wonder, if there were ripe figs in the beginning of April too, or before the time of the passover. This, indeed, was the usual time for the first ripe figs; and therefore it was natural to expect that there should be figs at this season, more especially as the tree had leaves, before which the fruit came forth; and as the "time of figs" as bishop Kidder has shown, the time of gathering in ripe figs, was not yet come. When St Mark says, 'for the time of figs was not yet,' he does not design to give a reason of what he said in the immediately foregoing clause, viz. 'he found nothing but leaves,' but he gives a reason of what he said in the clause before that, viz. 'he came, if he found anything, he might find anything thereon.' And it was a good reason for our Saviour's coming and seeking figs on the tree, because the time of gathering them was not yet come. The translation above haplophore, is not uncommon. See Mark. vi. 34. Gen. xiii. 10. John. xxii. 22. See Hallilat's Notes on Texts of Scripture, vol. ii. p. 115, &c. Harmer's Observ. vol. i.

BOCH, John, in Biography, a modern Latin poet and classical scholar, was born at Bruchels in 1555; and having entered
entered into the service of cardinal Radziej, accompanied him to Rome, and there studied theology under Bellarmín. He afterwards travelled into Poland, Livonia, and Ruffia, and was in danger of losing his feet by the frost in his journey to Moscov. Upon his return to the Low Countries, the duke of Parma appointed him secretary to the town-house of Antwerp. He died in 1609. His poetical works, consisting of epigrams, elegies, heroic poems, &c. were collected, and printed at Cologne in 1615. He has lived highly esteemed as a Latin poet by the critics of his country, and called the "Bolyk Virgil." Gen. Dict. Boem., in Geography, a river of the Netherlands which runs into the Meuse, 5 miles below Dinant.

BOCHARIA. See Bucharia.

BOCHART, Samuel, in Biography, a learned orientalist, was the son of a minister of the reformed church at Roven, where he was born in 1599. Having studied polite literature at Paris, philosophy at Sedan, and divinity, with the oriental languages, at Saumur, and made a surprising progress at a very early age, he completed his course of oriental literature under Erpenius and Ludolf at Leyden. On his return to France, he settled as minister at Caen. In 1646, he published his "Phaeg" and "Canaan," the two parts of his "Geographia Sacra," a work of very extraordinary erudition and research, in which he investigates the history or the human race as recorded in the Bible, the difference of mankind, and the origin of nations and languages, together with a variety of collateral subjects. Notwithstanding the charge of fanciful interpretations and chimeraical conjectures, which has been alleged against some parts of this work, it has long maintained a high degree of reputation, and furnished an ample supply of materials for modern writers. In the progress of this work, the author was led to pursue a variety of inquiries concerning the animals, vegetables, and minerals mentioned in the sacred writings, on which he intended to have composed distinct treatises; but he only completed that relating to animals, which was printed at London in 1663, under the title of "Historico." In this work the errors are such as must unavoidably occur at a period when the knowledge of natural history was very imperfect, compared with that of more modern times. In compliance with the invitation of queen Christina, Bochart visited Sweden in 1652, accompanied by the learned Huet, who wrote an honourable and elegant Latin poem on their journey. But finding that the capricious levity of the Swedish queen was not suited to his own grave character, he returned to France in 1653, and resumed his former studies. He was a member of the Academy at Caen, and, by his moderation and candour, maintained the distinguished reputation which he acquired by his profound erudition, together with the esteem and respect of persons of all parties, till the time of his death, which happened in consequence of a apoplectic stroke, during a disputation with Huet in the academy, May 16, 1667. Besides the learned works already mentioned, Bochart left several dissertations, particularly one, in which he attempts to prove that Æneas never was in Italy. His works were collected and printed by M. de Villedamond at Leyden in 1712, in 3 vols. folio. Gen. Dict. BOCHO, in Geography, a town of Germany, in the circle of Upper Saxony, and principality of Querfurt, 3 miles S.E. of Juttorbeck.

BOCHOLNICEZ, a town of Poland, in the palatinate of Sandomierz, 29 miles E.S.E. of Radom.

BOCHOLT, or Bockolt, a town of Germany, in a prefecture of the same name, in the bishopric of Münster, and circle of Westphalia; seated on the Aa, and having iron mines in its vicinity; 36 miles W.S.W. of Munster.

BOCHOLT, or Bockolt, a town of Flanders, situate on a canal cut from the Schelde; 4 miles N.W. of Sa-de-Gent.

BOCK, Blauer Bock, in Zoology, a synonymous name of the blue antelope, antelope cervicapra. Kolbe.—Bock also signifies the male of the common goat. Gen. Thier.

BOCKA, or Bockau, in Geography, a mine town of Germany, in the circle of Upper Saxony, and country of Erzgebirg, 3 miles W. of Schwartzenburg.

BOCKENBURG, a town of Germany, in the circle of Westphalia, and bishopric of Minden, one mile from Minden.

BOCKENHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Hanau-Münzenberg; 2 miles W. N.W. of Frankfurt on the Main.

BOCK HORD, or Book-Hoard, in Antiquity, a place where books, evidences, or writings were kept.

BOCKHORST, John Van, in Biography, a painter of history and portrait of the Flemish school, was born at Munster, about the year 1610; and removing to Flanders, acquired the art of design and colouring in the school of Jacques Jordana. He designed well; the heads of his women are generally graceful, and those of his men distinguished by character; his tone of colouring sometimes resembles that of Rubens, but more frequently that of Vandyck. His pictures have great force and harmony; and his skillful management of the chiaro-afuro produces an agreeable effect. An altar piece at the church of St. James in Ghent, representing the martyrdom of this saint, and a picture of the Annunciation in another church, painted in 1664, are distinguished performances of this master. Defamps. Filiation.

BOCKI, in Geography, a small town of Poland, in Podlachia, in the palatinate of Bilek.

BOCKING. See Brainstree.

Bocking herring, in the Dutch Trade, signifies the fame with bloated herring among us.

BOCK-KOCO, in Geography, a vast peak of the Brunner mountains in the Tyrol, rising little inferior to Geirorn, and in the same latitude, but towards the west.

BOCK-LAND, or Book-Land, formerly denoted that which we now call Feeling-land, or Charter-land; and it was by that name distinguished from Folk-land, which was Copyhold land. In Ancient Law-Writers, it denotes a possession or inheritance held by evidence in writing. The word was doubtless written book-land, quasi book-land, answer- ing to free-land, or land held by book or charter, which was regarded as free property, and descended to the heirs of the poelfeir. It flood opposed to Folk-land, which was held without writing.

BOCKUM, Boshum, or Bochum, in Geography, a town and prefecture of Germany, in the circle of Westphalia, and county of Mark; seated in a very fertile district, 24 miles N. E. of Düsseldorf, and 35 N. of Cologn.

BOCNA, a town of Poland, in the palatinate of Cracow, famous for its salt-mines, first discovered in 1531. The small river called Raoa, that falls into the Vitula, runs near this town, which is surrounded with hills and cairnices. The salt-mine of Bocnia is in a narrow slip of land, about 1750 feet in breadth from north to south, and about 10000 feet in length from east to west, and its greatest depth below the surface is about 1200 feet. The salt lies in veins, and is somewhat finer, especially at a certain depth, than that of Wieliczka. It is cut in small pieces, and put up in casks. Large pieces of black wood have been found in this mine, which are incrustated with salt; and likewise alab.
Bonter. The mines, which are very dry, are under the direction of the magistrates of Wieliczka. The town is 20 miles E. of Cracow.

BODZOW, a small town of Lithuanian Russia, in the diocese of Polock.

BODEUS A. Stapel, John, in Biography, was born at Amsterdam the beginning of the 17th century, where, at a proper age, he was admitted doctor in medicine, but attached himself particularly to botany, in which he acquired considerable celebrity. He died in 1636, at an early age, leaving a work, on which he appeared to have bestowed much labour, prepared for the press, which was published two years after, viz. Joannes Bodeus, a Stapel, in Theophrastus Historiam Plantarum, fol. Amtl. 1644. Eloy's Dict. Hist. Med.

BODAIKA, in Geography, a town of Hungary, 7 miles W. of Patak.

BODDAERTI, in Ichthyology, a name given to a species of Caritodes. This has the body variegated with brown and blue bands, and the ventral fins armed with two spines. Schr. der. berl. naturf. Gmel. The habitat of this fish is unknown.

BODAERTI, a species of Gobius, found in the Indian ocean. Pallas describes it specifically as having the rays of the anterior dorsal fin circleform, and the third ray very long. This fish is fixed inches in length; the body bluish brown, pale and yellow behind, of a convex shape, tapering in a slight degree towards the tail, and covered with small fin scales. The head is thick, blunt, somewhat convex, and spotted with brown and white. Jews nearly equal. Lips thick and fleshy; eyes vertical. Lateral line with scarcely perceivable papillae, and a few snowly white spots. Each side of the back marked with seven brown spots, and on the sides below three as many dots of white. Vent near the head than the tail; surrounded by a black circle, with a conic peduncle behind. Dorsal fins, blueish black the anterior ones spotted with white, the other with fucate rays, and fix transverse white lines between each ray. Pectoral fin rounded. Tail blueish white. In the first dorsal five fins, in the second twenty-five; pectoral twenty-one; ventral thirty-four; anal twenty-five; caudal eighteen. Pallas. Gmel. &c.

BODECKEN, in Geography, a town of Germany, in the circle of Weilphalia, and bishopric of Paderborn, 4 miles N. N. E. of Euren.

BODEGAS, a town of North America, in the province of Veraz, on the north-east coast of Dolce-bay. N. lat. 15° 40'. W. long. 70° 35'.

BODEGENET, a town of France, the principal place of a canton, in the district of Huy, and department of Orthe; the place contains 320, and the canton 7422 persons; the territory comprehends 1075 kilometres, and 17 communes.

BODEGON, a town of Spain, in Andalusia, 6 leagues from Seville.

BODEKER, in Biography, a painter of portraits, was born in the province of Cleves, in 1650, and abandoning the profession of mufic, for which his father intended him, he was placed as a disciple, in the art of painting, under John de Baan at the Hague. He commenced the exercise of his profession at Poitou-Duc and Brede with great reputation; and having resided some time at the Hague, he closed his life in 1727, at Amsterdam, where his performances were much esteemed. Pikington.

BODENBURG, in Geography, a town of Germany, in the circle of Lower Saxony, and bishopric of Hildesheim; 8 miles N. E. of Alfeld.

BODENETZ, a town of Bohemia, in the circle of Crudim; 10 miles N. of Crudim.

BODENFELDE, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg, seated on the Wefer in the quarter of Gottingen.

BODENHAUSEN, a town of Germany, in the circle of the Upper Rhine, and principality of Hesse; 18 miles N. E. of Caffel.

BODEN, in Antoniet Geography, a people of European Sarmatia, according to Ptolemy.

BODENLEICH, in Geography, a town of Germany in the circle of Lower Saxony, and principality of Luneburg-Zell; 32 miles N. E. of Zell.

BODEN SEA, a name sometimes given to the gulf of Bothnia, which fee.

BODENSTEIN, Adam, in Biography, a celebrated German physician, son of a famous theologian, called from the place of his residence, Carolstadt, was born there in 1528. He was a pupil, and fervenous defender of the doctrines of Paracelsus, in which he appears to have placed an entire confidence. For a malignant fever raging at Bale, in 1577, he went there, armed with a Theriaea, composed on the principles of his master, with which he boasted he should be able to subdue the fever; but taking the infection, he fell a sacrifice to his credulity and temerity. Besides editing several of the works of Paracelsus, he left the following, which were collected and published in one volume folio, at Bale, in 1581.

... Epitola ad Fuggeros, in qua Argumenta Alchymiam inulmenta, et controversy adducitur; quibus et artem esse veritatem demonstratur; lactique vero inventus ofdendi... “De Podagra praeventione, tracialius.” De herbis duodecim zodiaci figuris, dicatis, &c.” Adamus records his epitaph, placed on his monument, he says, at his own desire, in which he is laid to have died, anno Salutis, 1577, aetatis hebdomada septima, for seven times seven, or 49 years. Also the following lines, in which Bodenlein is supposed to say:

“Ne omnia, nec omnes meli.
Pleurece; quinam ego omnibus?
Non omnibus corfenex,
Non eremita spapigrus.
Nam tu viator omnibus?
Dec placere cura. Abi.”

BODENWERDER, in Geography, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg, seated on the Wefer; 16 miles S. of Hameln. It has some trade with Bremen and Hamburgh in coarse linen.

BODEN-ZEE, a name given by the Germans to the superior lake of Collinc, which fee.

BODERIA, or Bodoria, in Antoniet Geography, an illustrious mented by Ptolemy in his description of Great Britain, which is the present Firth of Forth in Scotland.

BODET point, in Geography, lies on the north shore of Lake St. Francis, near the boundary line between Upper and Lower Canada. Bodet River runs into Lake St. Francis, E. of Boded point.

BOGUVA, a town of Asiatic Turkey, in the province of Nataki, 25 miles N. W. of Kaffanoni.

BODIANUS, or Bidianus, in Antoniet Geography, a borough of Italy, which was repeased by a decree of Julius Cesar.

BODIANUS, Bodian, in Ichthyology, a genus of Thoracia fishes, first established by Dr. Bloch, for the reception of such species of the two Linnaean genera Sparus and Perca, as have certain characters common to both, and are not therefore sufficiently distinct to be divided into two genera. The character of this new genus, as laid down in the first instance, consists in having the gill covers scaly, armed, and...
smooth, or even, at the edges. Under this head Dr. Bloch

describes ten species only, namely, Bodianus bodianus, bo-
dianus guttatus, bodianus pectoralis, bodianus bennii, bod-
dianus aur, bodianus maculatus, bodianus apus, bodianus
megaloplatys, bodianus flustris, and bodianus argentus.

Lacèpede, in adopting the genus Bodianus, considerably
augments the number of its species by the addition of others
not previously described under either of the Limnanth genera.

In his "Histoire Naturelle des Poissons," there are altogether
no less than four and twenty species. The generic character
is modified, and two sections formed to admit them. Its
efficient character is thus expressed: one or more spines to
the gill covers, the margins of which are neither dentecu-
lated, nor jagged; only a little beard, or sometimes none to
the jaws; and a single dorsal fin.

The first section of the Bodians include those which have
the caudal fin furcated in the form of a crescent, of which
there are fourteen kinds: Le bodian aquatic (bodianus pector-
alis), le bodian bennii, le bodian jaguar (bodianus pecten-
anthus) le bodian maculatus, le bodian argentus, le bodian
bennii (bodianus bennii), le bodian aur, le bodian tacheté, le
bodian vivanct, le bodian Ficher, le bodian décancanthe, le
bodian bujian, le bodian groffe tête, and le bodian cycclomme.

In the second division, the species which have the tail fin
entire, Lacèpede describes only ten, le bodian roga, le bodian
lunaria, le bodian melanoenque, le bodian Jacob, Evertlen, le
bodian bennii, le bodian bennii, le bodian apas, le bodian
tétacanthe, le bodian bennii, and le bodian six races.

The genus Bodianus is recognised, and admitted by Dr.
Shaw into the general zoology. He includes in this tribe
precisely the same species as those described by Dr. Bloch,
with five additional species described by Lacèpede as Bodi-
anus, namely, porca bennii, Gmel. Saperis pectoralis, Gmel.
porca roga, Gmel. porca lunaria, Gmel. and bodianus
melanoenque of Lacèpede. But the generic character of
the Bodianus, as given by this author, is evidently at vari-
nance with that alligned to it by others. The great object
of the leithyologist, in establishing the new genus Bodianus,
must have been to separate from the two genera perca and
Saperis, such species as do not strictly belong to either; and
unless this could be accomplished in a satisfactory manner, it
would be better to permit them to remain under Limnæus
placed them. By some usual oversight Dr. Shaw appears to
have failed in this respect; his bodiani are not sufficiently
distinguished from the Limnanth porca, as the following ge-
neric character will show: "Habit of the genus porca. Gill
covers feaily, ferrated and acamlicated. Scales (in molt species)
smooth. The gill covers of the porca, according to this
writer, are acamlicated ferrated and the scales of the body (in
molt species) hard and rough. According to this definition;
perca with smooth scales, and the denticulations of the gill
covers conspicuously large, may be mistaken for a bodian; and
a hard scaled bodian, on the contrary, for a perca. If
we are to allow an innovation on the Limnæan arrangement
by the inference of the genus bodianus, its true character
seems to be that the plates which constitute the gill-covers are
smooth at the edges, and only armed with one or more
distinct spines; while the ferrated edges of those plates as
plainly point out the perca: and if the plates be both fer-
rated and acamolated, the converse is highly proper to retain
them under the old limnanth genus porca.

BODIN, JOHNS, in Biographia, a famous lawyer of France,
was born at Angers in 1536; he studied the law at Toulouse,
and preferring the common to the civil law, quitted Toulouse
and entered at the bar in Paris; but not succeeding to his
expectations, he devoted himself to literature. He com-

Original: Latin verse of "Oppian's Cynegestion," 7r books of hunt-
ing, accompanied with learned notes, claimed as his own by
Turnebeus. His "Method of History," was published in 1566,
and his "Discourse on Coins," with an answer to the paradoxes
of Malfretot in 1568; but these were introductory to his great
work in French, "Concerning a Republic," printed in 1576, in
folio, and frequently reprinted in Svo. To this work the president
Thotius bears very honourable testimony; it was also much commended by other persons
of learning; and obtained for the author a high degree of
reputation throughout Europe. It became the text-book
of private lectures both at London and Cambridge. His
tables of law, entitled "Juris Universi Distributio," were
printed in 1576, and in the following year his "Demon-
manie des Serciers," to which was annexed "A Refutation
of the book, de Lamini," of John Wier, physitian to the
duke of Cleves, who had undertaken to prove that the
flowers of witchcraft and forresey have chiefly arisen from
impudence or delusions of fancy. The literary character of
Bodin, who defended this kind of superstition, incurred re-
proach, and he himself was shipwreck of being a magician.
Before this time he had been invited by Henry III. to his
court, who was much delighted with his conversation and
advised him with attention and respect. But the royal fa-
vour was of no long continuance; for Bodin, who held an
office in the prefidial court of Laon, was sent, in 1576, as a
deputy of the third cilee of Vermandois, to the Assembly
of the Provinces; where he remonstrated against the
project of alienating the royal demesnes belonging to
that province; and this he did with such effect, that Thun-
anus principally ascribed the defeat of the injurious scheme
of alienation to his conduct on this occasion. Bodin also re-
olutely opposed the party of the Guifes, who were endeav-
ouring to procure a decree for compelling all the king's
subjects to profess the catholic religion. By such measures
he became obnoxious at court; and he, therefore, accepted
a proposal made to him by the king's brother, the duke of
Anjou and Anjou, to accompany him to his government
of the United Provinces. He afterwards attended him to
England, and, it is said, that he advised the seizure of Anto-
werp, in consequence of which the duke lost both credit
and influence. After the death of his patron, Bodin re-
turned to Laon, and discharged the office of chief magistrate
with great integrity. In this city he died of the plague in
1596. A work, written by him but never printed, and en-
titled "Heptaplomeron, five de abditis rerum sublimitum
areana," is said to have been an attack upon religion, and
deigned to invalidate the authority of revelation. By the
seeming advantages which he gave in this work to the Jewish
religion, he was suspected of being a convert to it; but it is
more probable, that he was a lepetic with regard to religion,
and alike indifferent to all modes of faith. A little while
before his death he published a Latin treatise, entitled
"Theatrum Universae Naturae," in which he purifies the
causes and effects of things to their principles. Bodin is
an ardent and inquisitive thinker; and his condition was

BOOLEY, Sir Thomas, was born at Exeter in 1544
and at 12 years of age removed with his father to Geneva,
where with his family thither to avoid the persecution of
Queen Mary's reign. In the University of the city he commenced
his studies; and when his father returned to England, on
the accession of Queen Elizabeth, he was sent to Magdalen College,
Oxford, where he remained for some years, and be-
came fellow of Merton College. Here he read lectures in
Greek and philosophy, and officiated as proctor and public
orator. In 1576 he went abroad for improvement, and
spent...
spent four years in his travels. In 1583 he was made gentleman-sitter to the queen; and having married, he entered into public life, and was employed in various foreign embassies. At the Hague, where he resided several years, his chief business was the negotiation of money-concerns between the States and queen Elizabeth. After his final return to England, in 1597, he found that his further advancement was obstructed by the intrigues and jealousies of persons in power, and he therefore formed a fixed purpose of retiring from all public affairs, devoting the remainder of his life to the laudable employment of refounding the university library at Oxford, furnishing it with books, and enlarging the building. See Library. At the accession of king James, Mr. Bodley received the honour of knighthood. He died in 1612, and was buried in Merton college choir. An annual oration is still spoken in his praise. Biogr. Brit.

Bodley, John, who practised physic in London, in the beginning of the last century, published, in 1741, a critical essay on the works of various authors, particularly on those treating on medicine, with the view of shewing that neither those physicians who wrote the most correct and valuable treatises on medicine, nor those who were the most intelligent practitioners, were usually the most encouraged; fame and success being more commonly the appendages of craft and policy, than of skill and judgment. A similar opinion was held by the late Dr. Samuel Johnson, who thought a judicious history of the fate of physicians might prove both an entertaining and useful work. Something of this kind was done by Pehrus, in his book "De Literatorum Infelicitate," but on a larger scale, embracing the whole community of letters. Elov. Dict. Hist.

Bodinocomacum, in Ancient Geography, the name of a borough of Italy in Liguria, where, according to Pliny, the river Eridanus was at its greatest depth; called in his time "Industria."

Bodiontici, a people whom, according to Pliny, Galba annexed to Gallia Narbonensis; but before this time they formed a part of the Ligurians. M. D'Anville has placed them in the maritime Alps. Their capital was Dinia.

Bodkil, in Geography, one of the channels between Flanders and Walcheren island, in Zealand, by which great ships may fail in.

Bodmer, in Biography, a celebrated professor and writer of Swissland, was born at Zurich in 1568; and became professor of Helvetic history and politics in his native place. In this office he taught his pupils to think for themselves, and to make such observations on historical facts as might render them intimately acquainted with the human heart. He wrote the history of his own country in the form of dramatic dialogues. Although he became one of the most voluminous of the German poets, and contributed in a great degree to reform the taste of his contemporaries, and to familiarize them to the sublime beauties of Homer and Milton, he had carelessly written a verse in the German language before he was 50 years of age, when the first canto of Klopotock's Melish fell into his hands, and excite his emulation. His first essays were in epic poetry, the subjuncts of which he took from the Scriptures, but he afterwards devoted his muse to other topics; and it is observable, that old age, which generally increases austerity of manners, had the contrary effect on Bodmer; insomuch that his last pieces were the most gay, and that when he was 80 years old, he frequently amused himself with Tibullus and Petronius, and also with Boccace and la Fontaine. At the age of 77, he began a translation of Homer's Iliad and Odyssey, which he finished; he was 86, also, when he published his version of the Argonautics of Apollonius Rhodus. He died in 1783, at the age of 85 years. Bodmer has been deservedly styled by the unanimous voice of his contemporaries, "the father of German literature," whose just criticism and correct judgment animated the poetical genius of Klopotock, Haller, and Goecke. Bildnisse, &c. or Portraits of celebrated German Literati, &c. Rome, 1793.

Bodmin, in Geography, an ancient borough and market town of Cornwall, England, is seated near the eastern borders of the county, on the confines of Devonshire. This town appears to have been formerly the principal seat of religion in the western district, and contained a priory, a collegiate church, and, according to Hals, thirteen other churches, or free chapels. The remains and foundations of some of their religious structures still exist; and the sites of others are remembered by the old inhabitants. Among these were the priory with its chapel, &c. St. Peter's church, St. Paul's church, on the northern side of the town, of which a solitary square tower remains; St. Nicholas, or the friary. The present town-hall and felion house occupy the site, and are confluted with parts of the latter building. The first religious foundation of Bodmin was removed to it from Padstow, a town on the northern coast of the county, which being much infested by the Saxons and Danes, was the retreat of the monks for greater protection and safety. Here they established the priory and its various dependent buildings; all of which gradually decayed after the removal of the foe. The town occupies the northern face of a hill, and consists principally of one long street stretching east and west. Near the eastern end of it is the parish church, a large ancient structure, consisting of three ales, and a tower which is attached to the north side. The chancel part is certainly the most ancient, and was formerly connected with the priory-building. An old chapel, now appropriated to a school-room, still remains near the east end of the church, and a little further east is a neat modern manison, occupying the site of the domestic part of the priory. A monument richly and curiously sculptured, of one of the priors of this house, is carefully preserved in the chancel. This was made to commemorate the name and official character of Thomas Vivian, who was bishop of Megara, and died in 1533.

Bodmin is distinguished among the numerous boroughs of Cornwall, as being the only one free from the control of a patron. It was first made a borough in the time of Henry II. and its privileges were afterwards confirmed by king James I who incorporated it in the 15th year of his reign. In 1799, a new charter was obtained, which vested the government in a town clerk, twelve aldermen, and twenty-four common council-men, who hold the sole privilege of electing two members for parliament. About half a mile N.W. of the town is a regular, commodious county gaol, which was begun building in 1779, from designs by Sir John Call, who planned it according to the system recommended by the philanthropic Howard.

Bodmin gave birth to Dr. Richard Lower, an ingenious physician and anatomist, who made various experiments on the transfusion of blood from one animal into another. This town has a market on Saturday, is 235 miles south west from London, and contains 278 houses, and 1951 inhabitants.

Bodobrica, in Ancient Geography. See Baundricum.

Bododo, in Geography, a town of Africa, in the kingdom of Benin, containing about 50 houses, or little cabins, built of reeds and covered with leaves. Here a viceroy has his residence, attended by a council, whose jurisdiction extends over this canto-in all civil affairs, levying taxes, and rating duties and fees on merchandise. In criminal cases of
of great importance, the viceroy and council are obliged
tend to Beinan the capital, for the orders of the court.

BODOK, a district of Lower Hungary, in the province of
Nitra, containing 101 large villages.

BODOK. See WIFI.

BODROG, a district of Hungary, near the Danube, 30
miles S. E. of Colozsa, inhabited by Roumans and a few
Hungarians. Also a River of Upper Hungary, which has
its source in the Carpathian mountains, and discharges itself
into the Theiss near Tokay.

BODTY, in Zoology, the name of a certain kind of
American snake, supposed to be of the amphihiema tribe, bat
of which this species is apparently doubtful. The same
snake is likewise called Bijaara.

BODUNGEK, Great, in Geography, a market town in
Germany in the circle of Upper Saxony, and county of Klet-
tenberg, 5 miles north of Bleicherode. Little Bodungen lies
in the bailiwick of Lora, 4 miles north of Bleicherode.

BODWELL'S FALLS, lie in Merrimack river, between
Andover and Methuen, in North America, about 5 miles
below Patucket falls.

BODY, in Physics, a solid, extended, palpable substance;
of itself merely passive, and indifferent either to motion or
rest; but capable of any sort of motion, and of all figures
and forms.

The word alludes to the Saxon bodice, flature; and to
the Belgoic bodis, a cover, q. d. the tabernacle of the soul.
Body is composed, according to the Peripatetics, of matter,
form, and privation; according to the Epicureans and Cor-
piculicators, of an affemblage of hooked, heavy atoms; ac-
cording to the Catenians, of a certain quantity of extension;
accoring to the Newtonians, of a system or association of
solfid, hard, imperceptible, moveable particles, ranged or
dispersed in this or that manner; whence refults bodies of
this or that form, distinguished by this or that name. These
elementary or component particles of bodies must be infinitely
hard; vastly harder than the bodies compounded of them;
may, to hard as never to wear, or break in pieces. "This
for Isaac Newton observes, "is necessary in order to the
world's persisting in the same flate, and bodies continuing
of the same nature and texture in several ages."

Body, affections of. See AFFECTION.

Body, colours of. See COLOUR.

Body, elements of. See ELEMENT.

Body, effence of. See ESSENCE.

Body, existence of. See EXISTENCE.

Body, extension of. See EXTENSION.

Body, modes of. See MODE.

Body, motion of. See MOTION.

Body, qualities of. See QUALITY.

Body, solidity of. See SOLIDITY.

Body, fluid, that whole particles cohere, or are some way
connected with each other. See SOLID.

Body, fluid, that whole particles easily slide over each
other, and are of a fit size to be agitated by heat; or that
whole particles do not cohere, but are easily put in motion
by the inalst force. See FLUID.

Body, rough, that whole surface is beted alternately with
eminences and cavities, in contradistinction from a smooth
body.

Bodies, disfable, those which being stretched do not break,
but extend one way as much as they shrink another. Some
of these are hard and malleable, as metals; others soft or
viscid, as glue, gums, &c. Mem. Acad. Seien. an. 1713.
p. 268.

Bodies, flexible, those which admit of being bent without
breaking: such are thread, wire, fibre, and even glass, when
spun very fine. These are contradistinguished from brittle
bodies.

Bodies, specific gravity of. See GRAVITY, and Weight.

Body, dense. See DENSITY.

Body, rare. See RARE.

Body, luminous, or lucid, that which emits its own rays, or
shines by its own light.

Body, illuminated, that which diffuses the light of another
by reflection, or which shines by borrowed light.

Body, opaque, that which intercepts the rays of light, or
prevents their passage through it.

Body, transparent, diaphanous, or perilucid, that which tran-
smits the rays of light. See TRANSPARENCY.

Body, the inertia of. See VIS INERTIA.

Bodies, homogeneous. See HOMOGENEOUS.

Bodies, congruous, those whole particles have the same
magnitude and velocity, or at least harmonical proportions
of magnitude and velocity.

Bodies, incongruous, those which have neither the same
magnitude, nor the same degree of velocity, nor an harmonic
proportion of magnitude and velocity.

Body, hard. See HARD.

Body, volatile, that which rises by the force of heat. See
VOLATILE.

Bodies are divided into animate and inanimate; i. e. into
those informed by a soul, and those which are not; or those
that have life and those that have none.

Some confer bodies, either as natural and sensible; viz., as
formed by physical causes, and clothed by physical qual-
ties (in which sense, body makes the object of physics); or,
hat intellectual or quantitative, in the general or abstract;
and according to three dimensions: in which sense, body makes
the subject of geometry.

Bodies alkaline, coaliferous, elastic, fixed, heterogeneons, atmo-
sphere of, defect of, mercury of. See the several articles.

Body, with regard to animals, is used in opposition to
soul; viz. for that part of an animal, composed of bones,
muscles, canals, juices, nerves, &c. concerned in digestion,
circulation, &c.

In which sense, body makes the subject of comparative
anatomy. See ANATOMY.

Body, faculties of the. See FACULTY.

Body is also applied by anatomists to several particular
parts of the animal fabric.—As the cavous body of the
brain, the cavernous or spongy bodies of the penis, &c.

Body, reticular. See RETICULAR.

Body, in speaking of a horse, denotes the chet, but chiefly
the flanks.

A horse is said to have a good body when he is full in the
flank; a light body, when he is thin or slender in the
flank. If the lat of the short ribs be at a considerable
distance from the haunch-bone, though such a horse may
have a tolerable body for a time, if he be much laboured,
he will lose it. It is a general rule never to buy a horse that
is light bodied and fiery, because he will presently destroy
himself.

Body of a plant, in Botany. See BOTANY.

Body of a piece of ordnance, in Gunnery, that part com-
prehended between the centre of the trumpons and the calca-
bel. It ought always to be more forntified than the rest. See
CANNONS.

Body of a pump, in Hydraulics, the thickest part of the
barrel or pipe of a pump, within which the piston moves.
See PUMP.

Body, in Geometry, denotes the same with solid, which fee.

Bodies, regular, or Platonic, are those which have all their
sides, angles, and planes, similar and equal.
BOE

Of these there are only five; viz. the tetrahedron, consisting of four angles; the octahedron, of eight; the icosahedron, of twenty; the dodecahedron, of twelve pentagons; and the cube of six squares. See Regular bodies; see also Tetrahedron, &c.

Body, in Law.—A man is said to be bound or held in body and goods; that is, he is liable to remain in prison in default of payment.

A woman, though in other respects she cannot engage her person but to her husband, may be taken by the body, when the creditors have a separate trade.

Body of the place, in Fortification, denotes either the buildings included, or more generally the inclosure itself. Thus, to construct the body of the place, is to fortify or inclose the place with bastions and curtains.

Body is also used for an assemblage of various different things collected into one; more particularly a number of persons united into a company or college.

A state or nation, under the administration, of one sovereign, is called a body politic. All large empires are unnatural, because the relation between the head and limbs is here too remote. No body, either natural or politic, can long remain found without exercise. See Corporation.

Body, corpse, in War, is an aggregate or assemblage of forces, horrid and foot, united and marching under some chief.

An army, ranged in form of battle, is divided into three bodies: the van-guard, the rear-guard, and the main body; which last is ordinarily the general's post.

Body of reform, in the Military Art, a draught or detachment of a number of forces out of an army, who are only to engage in case of necessity.

Body, in matters of Literature, a name given to a collection of whatever relates to any particular science; thus we say, the body of the canon law; the body of the Saxon law. King James I. had a design to compile a body of the English law.

The body of the civil law consists chiefly of the Institutes, Pandecte, Codex, and Novels. A glosseated body, is that to which glosses are added in the margin, composed by several lawyers.

Body is also used figuratively, for confidence, solicitude, and strength. In this sense, we say the body of a cloth, wine, &c.

Vintners have divers arts of increasing or diminishing the body of wine.

Body, among Painters.—A colour is said to bear a body, when it is capable of being ground so fine, and mixing with the oil to entirely, as to seem only a thick oil of that colour; as white lead, lamp-black, vermilion, lake, indigo, &c. But verdiers, imalt, &c. will not embody with the oil, but are still apt to separate from it in working.

Body plan or plane of projection, in Ship-building, is a section of the ship at the midship frame, or bawset place, perpendicular to the keel and half-breadth planes. The several breadth, and the particular form of every frame of timbers, are described on this plane. As the two sides of a ship are similar to each other, it is therefore unnecessary to lay down both, hence the frames contained between the main frame and the stem are described on one side of the middle line, commonly on the right-hand side; and the after frames are described on the other side of that line.

BODZELIN, in Geography, a town of Poland, in the palatinate of Samborin, 24 miles south of Radom.

BOE, in Ancient Geography. See Boe.
vulfimic affinitii." Helmin. 1550, 8vo. This may be considered as the earliest record of the contagious catarhal fever, which has many times since visited the world, and which has, in this country, been familiarly denominated the influenza.

BOECLER, John-Henry, an eminent German philologist, was born at Cronheim in Franconia, in 1610, and, preferred, at the age of 21, on account of his great learning, to the office of professor of eloquence at Strasbourg. In 1649 he was invited to Sweden by Queen Christina, and appointed to the chair of eloquence at Upsal, and to the office of royal historiographer; but being obliged by ill health to quit the country, he became professor of history at Strasbourg. He was counsellor both to the elector of Mants and to the emperor, and received a pension from Louis XIV. He died in 1692. His principal works are "Commentationes Pliniansi," "Timur, vulgo Tamerlanus," 4to. 1657; and " notitia St. Romani Imperii," 1651, 8vo; "Hillo in, schohs princiwm;" "Bibliographia critica," 1715, 8vo; "Diflertationes Academicae," 3 vol. 1710; "Animadversiones in Polybius." 1710; "Commentatio in Grimli librum de jure belii et pacis," 1712. He wrote, besides, Latin commentaries on various ancient authors, and several tracts on German history. Nouv. Dict. Hist.

BOEDROMIA. In Antiquity, from 2: Hapta, helper, derived from 2, I cry, and Cpa, I run. Folk mms feats held at Athens, in memory of the fuccour brought by Ion, son of Xuthus, to the Athenians, when invaded by Eumolpus, son of Neptune, in the reign of Euricthens Plutarch gives another account of the beecromia, which, according to him, were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month Buedromion, called by the Corinthians "Panemos;" which was, in the ancient chronology, the third month of the Athenian year. It consisted of thirty days, and answered to the latter part of our August and beginning of September.

BOEFIA, in Biological. See Breemen.

BOEHEM, Philip Adolphus, son of Julius B, professor of anatomy at Hall in Saxony, under whom he received his education; was admitted doctor in medicine in 1736. As he applied his mind particularly to the study of midwifery, he gave, for his inaugural thesis, "De precavenda polypo uteri generatice." His next dissertation, which was published in 1741, in 4to. was "Situs uteri gravidici, ac testiculi ac fidei placentae in utero. In this he has given a critical examination of the midwifery forces used in England, which he compares with, and prefers to Leuert's. These pieces were added by the author to his edition of Sir Richard Manningham's "Compendium artis obstetriciae," published in 1746, 4to. Having acquired celebrity by these and other works, he was adopted member of the Acad. Nat. Curius. and foreign associate of the Royal Academy of Surgery at Paris. He was also appointed to succeed his father as professor of anatomy and medicine in the university at Hall. In 1749 he published "Institutiones ophthalmologiae, in usum prelectionum," 8vo. Haller particularly commends in this work the engravings of the embryos, and some facial skeleton. His "Observationum anatomicorum, faciculis primus," folio, was published in 1752. Among many rare and curious objects are, an engraving of a pregnant uterus, to shew the membranous decidua, and a fetus in one of the Fallopian tubes, with the placenta. The second collection, also in folio, published in 1756, contains a smaller fetus in one of the tubes, and a child with two bodies and only one head. For the titles of the remainder of his dissertations, see Haller. Bib. Anat. and his collection of med. cal thufes, in which the greater part of them is inserted.

Species. 1. B. cundata. Brown Jam. 258. "Leaves opposite, ovate, acute, ferrate; racemes very long, pendulous; flowers discous; item suffrutesco. A shrub ten or twelve feet high. It grown calls it the nettle-tree. 2. B. littoralis. "Leaves opposite, ovate-lanceolate, ferrate; flowers conglomerate, axillary, monoeccus; item herbaceous, four-cornered." Native of Hihpania. 3. B. cymbacea. "Leaves opposite, ovate, acuminate ferrate; racemes spiked, axillary, erect, fimple." An annual plant, with a lucid, herbaceous stalk, dividing into several branches; leaves with three longitudinal veins; on pretty long petioles. A native of North America and Jamaica. 4. B. ramiflora. "Leaves alternate, broad-lanceolate, acuminate, ferrate, wrinkled; flowers aggregate, axillary and lateral, monoeccus, distinct. Male three-flowered. A shrub, eight feet high, with long branches; leaves fickle-shaped, flowers greenish, placed towards the end of the twigs; very different in size, some being two inches, and others a foot in length on the same twig. Male flowers small, yellowish, numerous, aggregate, on the kafles old branches. Female flowers whitish on the younger twigs to the very end. Native of Jamaica and other Islands of the Well Indies. 5. B. hirta. "Leaves alternate, ovate, acute, ferrate, hirsute; flowers monoeccus, heaped, axillary, mixed." A native of Jamaica.

La Mare is has not inserted this genus either in the alphabetic part of the Encyclopedia, or in the subsequent systematic folio of figures. He follows Linnaeus in referring the cymbacea to urtica, and the ramiflora to cactus.

BOEL, Peter, in Biography, an excellent painter of fruit, flowers, and animals, was born at Antwerp in 1625, and having been a disciple of Snyder, whose widow he married, he went to Italy, where his uncle Cornelius de Waal resided, and in his return through France, was much employed, particularly at Paris, where he continued for some time. He died in 1690. As an art it he copied after nature, with a free and bold pencil, and a tint of colour that was natural and beautiful. There are some few flight, but spirit'd, etchings by Boel, from his own compositions, representing various animals, &c. Cornelius Boel, who flourished in 1611, and Coryn, or Quirin Boel, who flourished in 1658, both engravers, were of the same family. Pickering. Strutt.

BOELE-
BOELE-BOELE, in Geography, a district of the island of Celebes, situated in the bay of Boni, at and near a river of the same name. To the west it has Wawoo Wolee; to the south, the river Calfa; to the north, the river Tasika; and to the east, the shores of the bay. It is sometimes called Telhampoe, and has three chief townships, viz. Boele-boele, Lamant, and Radja, which are all independent of each other. The kings of Boni consider it as an appanage of their crown.

BOELE-COMBA, a territory of Celebes, which was anciently a separate kingdom, but in later times it was subjugated by the Macassers; and is become one of the provinces belonging to the Dutch East India Company. It stretches from the river Kalenkongang, which divides it from Boutain, to Bera, or rather to the river Bampang, which runs between them; to the north of it lie the mountains of Kyndang, which separate it from Boni, or rather from the highlanders of Tournay; and to the south, it is washed by the sea. The land is fertile in rice, and abounds in game and extensive forests; but the timber is not adapted to the construction of houses. When the wet monsoon renders it dangerous for ships to lie in the road before Boele-Comba, they run into the river Kalenkongang, near the mouth of which stands the palisaded fort Carolina, in which the resident of the Dutch East India Company, who is a junior merchant, has his abode. The province of Bera reaches from the river Bampang eastward, along the sea-coast to the point of Lallem or Laffos, and thence northward to the point of Cadjang; and on the land side, it borders upon Boele-Comba, Tournaj, and Kadjang, belonging to Boele-Boele. This country belongs to the Dutch company. It is barren and rocky, but has some woods which furnish timber for building proas. The men are good warriors both by sea and land; the rich are merchants; and others employ themselves in building proas, and in manufacturing a sort of coarse white cloth from the cotton which the place supplies.

BOELON. See Belon.

BOEN, in Geography, a town of France in the department of the Loire, and chief place of a canton in the district of Montbrison, seated on an eminence near the river Lignon; 6 leagues south of Roanne, and 3½ north of Montbrison. The territory contains 1220, and the canton 10,929 persons; the territory comprehends 395 kilometres, and 22 communes.

BOENAC, in Ichthiography, a species of Doriomus, described by Dr. Bloch. The body is of a clear olivaceous colour, marked with seven oblique brown bands; and the caudal fin is rounded. This fish is mentioned as a native of the seas about Japan, where it is called yean bonacem. There are seven rays in the Gill membrane of this species, fifteen in the pectoral fin, six in the ventral fin, eleven in the anal fin, sixteen in the caudal fin, and twenty-five in that on the back.

BOENA, in Ancient Geography, a town of Cappadocia, in the interior of the Galatian Pontus. Ptolemy.

BOEON, a town placed by Ptolemy in the interior of the Tauric Chersonesus.

BOEON, or Boelo, a town of Greece, in the Doric region, according to Thucydides, near mount Parnassus. This was one of the four cities which, according to Pliny, Strabo, and Steph. Byz, gave the name of "Tetrapolis" to the country peopled by the Dorians, near mount Oeta.

BOEONUS, Diu, an island of India, according to the Periplus of the Erythrean sea, placed by M. d'Anville at the south-west entrance of the "Barygazenus finus."

BOETIA, a name given to two ancient kingdoms of Greece; one founded, or rather restored by Cadmus, and called by him Boeotia, from the ox (bas), which is said to have directed him to the place where he built the capital of his kingdom, afterwards known by the name of Thebes; the other in Thedaly, called to have been founded by Boeotus, the son of Neptune, and brother of Geonus, by Are, the daughter of Geonus king of Celis. This Boeotus, according to Bryant (Anal. Anc. Myth. vol. ii, p. 326.), from whom the Boeotians are supposed to be descended, and from whom this country is said, by some, to have derived its name, was an imaginary personage, and merely a variation of Bouts and Butus, the ark; which in ancient times was indifferently styled Theba, Argus, Are, Butus, and Boeotus. This Boeotus of Greece, according to the mythology of this writer, is the same with Bouts of Egypt, Battus of Cyrene, and Buto or Budge of the Indians. The history of the origin of this kingdom is intermixed with fables; but it is more certainly known, that the possessors of this settlement held it for more than 200 years; and that when they were expelled from it by the Thebans, they fought a new establishment in that country, which till that time had been called Cadmeis, and which was then named Boeotia. We are informed by Diodorus and Homer, that these Boeotians signalized themselves at the Trojan war; and the latter adds, that five of Boeotus's grandsons were the five chiefs who led their Boeotian troops thither. Whatever be the true etymology of the name Boeotia, given to this country, it was distinguished by several other appellations, according to its supposed founders: those, who ascribed it to Ogyges, called it Ogygia; others called it Cadmeis, from Cadmus; and the others it was demominated Aonia, from Aon, the son of Neptyne; and Hypsis, from Hypis, the son of Aths. It is now called Straumvilia, and Thebes its ancient capital, Thive, and corruptly by the Greeks, Stibes or Stives.

It bordered on the east with Attica, and was in time joined to it, being parted from it by the mountain Citheron; on the north, it was bounded by the Euphrates river, now called the Negropont; on the west it had the kingdom of Phocis; and on the south, the gulf of Corinth. Its utmost extent from sea to sea was i½ to, and it was nearly of the same length from north to south, but approaching to a point eastward. Ephorbus, from Strabo, calls it ἔποικη τοιχατία, ἔποικη τοιχατία, because it was contiguous to three seas; and by means of its commodious havens it could carry on a commerce on one side with Italy, Sicily, and Africa; and on the other, with Egypt, the isle of Cyprus, Mauritania, and the Hellespont. It had also the large lake Coa, and the two large rivers, the Aipus and Teneius, besides other streams, by which it was watered and rendered fertile. This country is partly hilly, especially Aonia, properly called; the soil is and flat, and abounding with excellent pasturage and corn; but the air was so dense and foggy, that Horace thought it influenced the genius of the inhabitants. The Boeotians, in general, were reckoned not to possess its penetration and vivacity, which characterized the Athenians, whose air was remarkably pure, though separated from them only by mount Citheron; but this, perhaps, might have been attributed more to education than to nature. As they employed their time more in bodily than in mental exercises, they were deficient with respect to that faculty of expeditious, those graces of elocution, the knowledge derived from study, and those pleasing manners, which are more the work of art than nature. But it is thought by some, that Boeotia produced no men of genius. Several Thebans have done honour to the school of So-crates. Epaminondas was not less distinguished for his knowledge than for
for his military talents. It should also be remembered, that Bocotia was the birth-place of Herod, Corinna, and Pindar. Its most remarkable places were the Trophonian cave, Theopis, Antis, the limits of Thermopylae and Thebes, which see respectively.

The government of Bocotia was altogether monarchical, and peculiarly despotic, the will of the kings being the law; and of these some governed more like tyrants than moderate sovereigns. Plutarch, in his "Morals," mentions an ancient custom that prevailed among them; which was the manner of introducing their new-married women into their new habitations. They were brought home in a kind of chariot, or cart, the axe-tree of which was immediately burnt, thus intimating to the bride, that she was fixed with her husband for life, and must not expect to return to her parents.

The Bocotians, as to their general character, were courageous, inflexible, and vain; and with them the transition was very short from passion to inault, and from a contempt of law to a total disregard of the dictates of humanity. The smallest expectation of advantage gave occasion to the groffest acts of injustice; and murders were frequently the consequence of the most frivolous quarrels. The women were tall, well-formed, and generally of a fair complexion; and their voice was remarkably sweet and tender; whereas that of the men was harsh and disagreeable, and in some menfure suited to their character. Of this character for inulence and ferocity, which generally distinguished the Bocotians, no traces were to be found in a body of young warriors, called the "Sacred Battalion," consisting of 300, who were brought up together, and maintained at the public expense in the citadel. Their exercises, and even their amusements, were regulated by the melodous sounds of the flute. To prevent their courage from degenerating into blind fury, care was taken to inspire them with the noblest and the most animated sentiments. From this band each warrior chose a friend, to whom he remained inseparably united, whom it was his ambition to please, and to share his pleasures and sufferings in life, and his labours and dangers in battle. These 300 warriors were at one time distributed in troops at the head of the different divisions of the army. Pelopidas, who had frequently the honour of commanding them, having made them fight in a body, the Bocotians were indebted to them for almost all the advantages they gained over the Macedonians. Philip defeated this cohort, that had been invincible, at Cheronza; and the prince when he saw these young Bocotians flattered on the field of battle, covered with honourable wounds, and lying side by side on the ground on which they had been stationed, could not refrain from tears, but bore a noble testimony to their virtue as well as to their valor. Plut. in Pelop. t. 1. p. 187.

For the succession of the kings of Bocotia, after Cadmus, and the history of the kingdom as a monarchy, see Thebes. The Bocotians, after having expelled their kings, who had reigned in succession from Cadmus to Xanthus, for about 300 years, formed themselves into a republic, of which the chief magistrates were the prator, or strategus, the Beotarchi, and the Polearchi. The authority of the prator, who was chosen from among the Beotarchi, lasted only one year, and resembled that which was vested in the pratores of Achaia and Etolia. The Beotarchi affixed him with their advice, principally in time of war, and commanded under him; and they constituted the supreme court in military affairs; so that the prator could not act in a manner contrary to their determinations. They also bore a great sway in the civil administration, and hence derived their title. Their number was uncertain, being 7, 9, or 11; they were chosen yearly, and obliged by law, as well as the prator, to resign their office on pain of death, before the first month of the new year was expired. The Polearchi were altogether civil magistrates; it being their province to maintain peace and concord at home, while the Beotarchi were employed in the wars of the republic. Besides these officers, there were four councils in which the whole authority of the state was vested. These were composed of the deputies that were sent by all the cities of Bocotia; and without their approbation, the Beotarchi could not declare war, make peace, conclude alliances, or transact any business of importance. The Beotians, and specially the Thebans, were continually harassed by the princes of Macedon; nevertheless they took part with Philip against the Romans, and could not be prevailed upon by the Athenians and Achaeans to desert him, and to join the other states of Greece, till he was entirely defeated in the famous battle of Cynocephale. They then, foreseeing their danger, sent deputies to Flaminius, imploring his protection. He received them with great humanity, and put them upon the same footing with the other allies of the republic in Greece. Flaminius, at their request, obtained the release of the Beotians who fell in the Macedonian army; but notwithstanding this favour granted them by the interposition of the proconsul, they neglected to make the necessary acknowledgments, and filled up all vacant offices with persons who were enemies to Rome, and attached to the interests of Macedon. Flaminius was exasperated by this conduct; and Brachylus, their praetor, was murdered by the friends of Rome. The murderers, however, were discovered, and one of them, Philitrus, was put to death. For this murder of their praetor the Beotians determined to be revenged; and they took occasion to asemble all the Romans whom they found wandering about in the fields. In consequence of this outrage, Flaminius ravaged their territories; but, upon their consenting to deliver up the offenders, he defied from any further acts of severity; and the Beotians duly apprized of his lenity, continued ever afterwards faithful to the Romans. But as some of their leading men joined Perseus, king of Macedon, in his wars against the Romans, the whole country was, on that account, treated with great severity; Rome being at this time under no apprehension of an invasion from Antiochus, as she was when Flaminius was so easily appeased. At the dissolution of the Achaean league, Beotia, with the rest of Greece, was reduced to a Roman province. See Achaeans.

BOEHEMIA, in Geography, a province of Germany, in the circle of the Lower Rhine, and county of Rockingham, 6 miles W.S.W. of Rockingham, and 42 N. of Cologne.

BOERHAAVE, Herman, in Biography, a professor of medicine and chemistry, of such eminence as to form a new era in these sciences, was born at Voorhout, about two miles from Leyden, in Holland, the 31st of December 1668. His father, James Boerhaave, the pastor of the village, having nine children, took on himself the care of their education; and, as he intended Herman for the church, he was careful to ground him well in Greek and Latin. In these languages he made such rapid progress, that when he was only fourteen years of age, his father sent him to complete his education to the public school at Leyden; and, in 1731, he went from thence to the university. His father dying soon after, and in slender circumstances, the progress of our young student's attainments would have been interrupted but for the friendly assistance afforded him by Daniel Van Alphyn, burgomaster of Leyden, who furnished him with the means of continuing his studies. The kindness of this worthy man was remembered by Boerhaave, with gratitude, to the end of his life. He now applied to the mathematics, and to acquire a knowledge of the Hebrew and Chaldee languages; propounding, agreeably to the intentions,
of his father to qualify himself for the ministry; and that he might relieve his patron from a part of his expense, for his influence, he gave private lessons to the students in mathematics, and here probably laid the foundation of that excellence in the art of communicating knowledge by lectures, for which he in time became so celebrated. In 1692, he took his degree in philosophy, and gave for his inaugural thesis, "De distinctione mentis et corpore," in which he refutes in a solid and judicious manner, the errors of Hobbs and Spinoza. This, however, did not prevent his being suspected of Spinozism, which made him quit his intention of entering into the service of the church, and turn his mind to medicine, particularly to the study of chemistry, as more suited to the activity of his disposition. To acquire a knowledge of anatomy, he read the works of Vesalius, Fallopius, and Bartholin, and attended dissections under Nuck. In medicine, he studied Hippocrates, and the rest of the Greek and Latin writers in succession, but returned to Hippocrates, whose works were always mentioned by him with veneration. Among the moderns, he gave the preference to our countryman Sydenham, whom he called the Divine Sydenham.

Thus qualified, in 1693, being 25 years of age, he was admitted by the university of Harderwyck, in Guelderland, to the degree of doctor in medicine. His thesis on this occasion was "De utilitate explorandorum excrementorum in aegris, ut signum." To the urine he paid the greatest attention. He now applied to the practice of medicine, from which, however, he is said to have derived but little profit. As his practice, therefore, employed but a small portion of his time, he had leisure for examining all the theories of medicine which had prevailed, in succession, from the earliest time, and of forming from them a theory, if far from perfect, much less excusable than that which had preceded it; and which, when matured, superseded them, and became the reigning doctrine over all Europe for more than half a century. Drelincourt, who had long been professor of the theory of medicine, dying in 1701, the university of Leyden seized the opportunity this event afforded them of attaching him farther to that place, by placing him in the vacant chair. This they were prompted to by gratitude as well as by prudence; and Boerhaave having refused an advantageous offer of settling at the Hague, and though in no public office or capacity, he had already acquired a considerable reputation, and drawn a great many foreigners to Leyden, to hear his lectures in chemistry. On the occasion of this promotion he read his "Oratio de commendando studio Hippocratico." In Hippocrates, he particularly admired the correctness of his descriptions and histories of diseases, his patience in attending to the indications of nature, or the constitution, to which, with little interference, he frequently committed the cure of the diseased, and his honest and sincere account of the termination of the disease, whether in health or death. In this he has not been always followed by writers of cafes. In 1703, he was invited to accept a professor's chair at Groningen; but as he had refused, when much less known, an establishment at the Hague, he had no difficulty, now that his fame was more extended, and pupils were flocking to him from all parts, in rejecting this offer. The university at Leyden thought it necessary to reward this fresh proof of his attachment to the country by augmenting his salary. About this time he delivered his "Oratio de usu ratiocini in medicina." These compositions were all published; and as they were drawn up and polished with care, they doubtless contributed in extending the fame of our professor over Europe. On the death of Peter Hotton, curator of the university garden, in 1709, he was appointed his successor, and made professor of botany. He now read his "Oratio qua repurgate medicine faculta affertiur simplicitas," showing that the knowledge of medicine would be easily obtained by avoiding hypotheses, and attending to facts and observations; and that diseases would be more certainly cured by using only a few choice and simple medicines, than by the heterogeneous compositions then in vogue. He now, in addition to his other studies, employed himself sedulously in acquiring a more extended knowledge of plants; and this continued to be his amusement and delight to the end of his life. "Often have I seen," Haller says, "the good old man, moving slowly along the garden, at a very early hour in the morning, attending to the culture of the numerous exotics he had introduced there, clasping and arranging them for his lectures." One year only after being appointed professor in botany, he published "Index plantarum quae in horto Lugduno Batavo repeririunt," 8vo. This work was re-published by him in 1720, much enlarged and improved, including a history of the garden, 2 vols. 8vo. In 1709, appeared his "Aphorismi de cognocendis et curandis morbis," 8vo.; "aurum in numbrare abellibus," Hallerays. A work universally read and admired, on which Baron Van Swieten, his illustrious pupil, who had attended his instructions for near twenty years, published his Commentaries, in 1742, extending it to five volumes in 4to. About the same time he published his "Institutiones rei medicinae in usu annua exercitationis domnestica," 8vo. These two works, the one treating of the history and cure of diseases, the other of the physiology of the human body, improved and enlarged at different times by the author, have passed through numerous editions, and have been printed in every country, and translated into every language in Europe. Schultens says, there is a version of them also in the Arabic. Boerhaave was now in the zenith of his reputation, and had such a confidence of students from all parts of the world, as never previously occurred to any one professor. He gave lectures on the theory of medicine, in botany, and in chemistry, and delivered them with such clearness and precision, as to fill his pupils with equal admiration and delight. Haller, who was two years under his tuition, speaks of him with enthusiasm. "Vix fui parum habitus." We have hardly since seen, and perhaps may never again see his equal. In 1714, he was made rector of the university. On laying down this office at the end of the year, he read his discourse "De comparando certo in physis." It is only to be acquired, he says, by experiment, and by a careful and minute examination of natural objects. Bidloo dying at this time, he was advanced to the chair of professor in the practice of medicine; and on the death of Le Mort, in 1718, he was made professor of chemistry. He was now at the head of every branch of medicine; and his pupils were become so numerous, Dr. Matty says, that Leyden was scarcely sufficiently capacious to contain them. In addition to these numerous vocations, he was frequently consulted, in cases of difficulty and danger, by physicians in all parts of the world. With these advantages, it will not excite surprise, that his wealth should accumulate and become extremely abundant. As his diet was frugal and sparing, and he was plain in his apparel, he has been accused of being too parsimonious; but it should be considered, that attached as he was to science, and immured in humours of such variety and magnitude, he had no time for expense or luxury, except in what regarded the improvement of science. In procuring rare and valuable books, and in collecting plants from distant countries for his garden, he spared, we are told, no expense. In 1718, Boerhaave had published "De Chemia, sive errores expurgantes," which was all he professed giving on that subject; but some of his pupils having at the instigation, he says, of the book-sellers, ventured to print, in his
name, transcripts of his lectures, so incorrectly taken as to materially injure his fame, to vindicate himself from the disgrace this might bring upon him, he found himself under the necessity of preparing his lectures for the press; and, in 1732, he published them under the title of, "Elementa Chemiae, que annuvariorum labore decedit, in publica privatius scholis. Hermannus Boerhaave," 2 vols. 4to. The work is dedicated by a most affectionate address to his brother James Boerhaave. The first volume contains the history and the theory of the art, and is furnished with numerous engravings and descriptions of furnaces, and other instruments of chemistry. The second contains the procels, or operations chemical. In the first volume he gives a catalogue of all the works he had published, preceding it, with much modestly, with this declaration; "Scientia, me mihi edificavit omnium, praeter sequentia, quae non alicui verrecundia recensenda isto." At the back of the title-page he says, "Ut certam sit lector, hume librum a me editum prodisse, propriam manus adievidendum putavi; nec pro me agnosco, ubi huc adscriptio abest, H. Boerhaave"; uniting, as his custom was, the H and the B.

The character of Boerhaave, as a chemist, is thus given by Maccouer, in his Preliminary Discourse to his Dictionary of Chemistry. "Next to Stahl we place the immortal Boerhaave, though he excelled in a different way. This powerful genius, the honour of his country, of his profession, and of his age, threw light upon every subject which he treated. To the view which he took of chemistry, we owe the finest and most methodical analysis of the vegetable kingdom; his admirable treatises on air, on water, and on earth, and particularly on fire, which is an almighty matter-piece. To be complete, that the human understanding can fearfully make an addition to it." To his moral character his disciple Haller bears the following honourable testimony: "Some, though few, will render him in eternity; his divine temper, kind to all, beneficent to foes and adherences, detracting from no man's merits, and binding by favours his daily opponents, may, perhaps, never be paralleled." In his conversation he was easy and familiar, and in his demeanor grave and sober, but at the same time disposed to pleasantry, and occasionally indulging in good-humoured raillery; so that he was compared to the admirable Socrates, whose hull he is also said to have embellished in features. By his pupils, whom he regarded with the kindness of a parent, he was beloved and respected in a very high degree. Piety formed a distinguishing feature of his character; and devotion was his daily exercise.

A Boerhaave was of an athletic make, had accosted himself to exercise on horseback, to spend much of his time in the open air, and to use a frugal and plain diet, he had been enabled thus far to endure the extreme fatigue of his professional labours, with only some occasional interruptions from illness; but being grown corpulent, and incapable of riding, his constitution began to be on the decline. So that, in 1732, he found it necessary to resign his offices of professor in chemistry and botany. The speech he made on this occasion, was published under the title of "Oratio cum cathedrae chemiae et botanicae vacatiensi," 4to. In this he recounts some of the most memorable occurrences of his life, and speaks with gratitude of the patronage and favours he had received from individuals, in enabling him to complete his walk in life, as well as from the members of his own profession, who had admitted his improvements in the theory and practice of the arts he taught, with more kindnes and less opposition than is usually given to innovators of any kind. This doubtless arose in part from the great learning and abilities he was known to posses, and from the high reputation he had thence acquired, demanding respect; and partly from his disposition, averse from contention, and thinking but modestly of his endowments. From whatever cause it might arise, there was never perhaps so great a revolution in any science brought about with so little opposition as was made to that produced by Boerhaave. He had before, viz. in 1728, been admitted foreign associate of the Royal Academy of Sciences in Paris; and in 1730, he was elected a fellow of the Royal Society in London. The same year he was again made rector of the university at Leyden. On quitting that office, he read his "Oratio de honore medicis servitute," which was also published in 4to. In this he again indulges on the necessity of attending to the method nature takes in curing diseases, or the manner in which they terminate spontaneously, as practised by Hippocrates. Though this accedence from public employment procured him some repose from his labours, he still continued revising and correcting his original works. He also spent much of his time in revising the works of other writers, and published more correct editions than were before extant; as the "Opera Anatomica et Chirurgica. Acc. Vefalii," fol.; Albinus contributed to this work; of Bellinus, "De minis et publisis," 4to. 1730; of Proper Alpinus, "De praefagienda vita et morte," 4to. 1733; Arznei," "De cauis, significis morborum," fol. 1731; Luidinus, "De loca venearum," fol. 1725, and some other works. Still, however, he enjoyed coffee and relaxation from the more fatiguing part of his duties, and he passed the principal part of his time, during the remainder of his life, at his manor, a small distance from Leyden, in domestic recreations, with his wife and daughter, to whom he was much attached. Here he had a garden well-rocked with every thing that could contribute to his pleasure, and here he amused himself with his violin, in which he was a proficient. Towards the end of the year 1737, he became sensibly affected with difficulty of breathing, and a sense of suffocation, which incommoded him, whether walking or lying down. This went on increasing; and a small time before his death, he perceived a strong pulsation on the right side of his neck, which he attributed to a polypous concretion in the aorta. No remedy being competent to combat this dreadful disease, he expired calmly, in the midst of his family, on the 23d of September 1738. He was buried in the church of St. Peter's at Leyden, where his fellow-citizens erected an elegant monument to his memory. The pedeslab is of black marble, supporting an urn, decorated with emblems: figures, representing the four ages of man's life, and the lances in which he excelled. On one face of the pedeslab is a medallion with the head of Boerhaave, surmounted with suitable decorations, his feet being under it, on which is engraved his favourite motto, "Simplicissimum veri," simplicity the seal of truth; and underneath, "Salutifer Boerhaai genio facrum," faired to the healing-reforing genius of Boerhaave.

In the course of this sketch of the life of Boerhaave, his principal works have been not ed; for a more complete catalogue of them, see Haller's Bib. Med. Pract. Anat. et Bot., and Ely's Dict. Hist.
BOE

1740 he went to Peterburgh, where his talents soon procured him the situation of professor in medicine in the university there, and of one of the members of the imperial academy. By Portal and Blumenbach, he is called archiatherian, or auricular physician, and first physician to the emperors, confounding him with his brother, Herman Kaan B. who about the same time enjoyed that honour. In the course of a few and tedious illness, from which he with difficulty recovered, he lost his hearing. This happened in 1749. He died in 1753. His works are, "Periplus dicta Hippocrati, per universum corporis anatomiae illustrata," Lugd. B. 1738, 12mo; in which he shews there is a constant inhalation or absorption, and an exhalation, or periphrasis, carried on, not only on the surface of the body, but in all the principal cavities. "Impetus faciens dictum Hippocrati per corpus contenciens, philiologic e et physiologic illustratum," Lugd. Pat. 1745, 12mo. In this he treats of the action of the mind upon the body, by the means of the nerves; of the fabric and motion of the muscles; of the effects of opium, given to a dog, &c. He also gave the anatomy of an elephant, which he had an opportunity of dissecting; and of two monstrous infants, and a dissection on what has been called, improperly he says, hemorrhoiditis; no real hemorrhoiditis having ever been produced. Haller. Bib. Anat. Portal. Bib. Chir.

Gen. Char. Cal. oblong, tubular, and angular, placed beneath the corolla, with a contracted, entire mouth, permanent. Coroll. monopetalous, bell-shaped, upright, obtuse, five-cleft, plaited, fixed on the calyx. Nect. flabby, sub-cylindrical, with a mouth slightly toothed, surrounding the base of the germ. Stam. filaments one, two, three, or four, inserted on the margin of the calyx, between its teeth; capillary, near the bottom (within the calyx) more slender, upright, about the length of the corolla; anthers twin-globular. Fil. germ. roundish, pedicelled. Pedicel round, surrounding the corolla; style thread-shaped, twisted, as long as the filaments; stigma capitate. Pericarp. none; calyx enlarged, closed, encroaching the seed. Seed one, oblong, obtuse, angular. Observ. It is nearly allied to Mirabilis. The toothlets of the corolla are sometimes triangular, very small, and sometimes obsolete.

Dahl has injudiciously abolished this genus, and placed its species with the Valerian. In the opinion of Willdenow, it belongs properly to the class Tritaniria, and may readily be distinguished from valeriana by its very entire calyx, so minute, as scarcely to be visible, without the assistance of a lens, on which account it appears to have been overlooked by Linnaeus and La Marec. Professor Martyn, in his edition of Miller, has inadvertently given Calyces none, as part of its essential general character; though in the natural character translated from Schreber, he had properly assigned it one.

Species. 1. B. erica, upright hawgweed. "Stem erect, smooth; Stems two." Jacq. and Miller. "Stem tetragonal, smooth, with vicious joints, and flowers in a corymbose panicle." Willden. Stem two feet high, sprinkled with very minute protuberances as fine as hairs. Leaves waved, ovate, acute, rough at the margin, growing by pairs on long petioles from the joints of the stem, which are placed at a considerable distance from each other. Corolls cylindrical, white, with live reddish shades; segments acute, with small teeth interposed. Stigma capitate. Discovered by Dr. Houton at La Vera Cruz in 1731, and since found at the Society Isles. 2. B. adscendens. "Leaves oblong-ovate, somewhat flabby; flowers panicled; peduncles two- or three-flowered; stem ascending." Willden. Stem smooth, tetragonal; leaves petiolate, opposite, veined, entire, smooth; the young leaves and the margin and petioles of the older ones hairy; hairs joined as in veronica aphylla; panicle terminal, spreading, naked; peduncles two-flowered, involved in membranaceous bracts; fruit club-shaped, rough with small tubercles. A native of Guiana. Willden. 3. B. diffusa. "Stem smooth and even, spreading; leaves ovate." Linn. "Stem round, pubescent; flowers in corymbose heads." Willden. Leaves white underneath; flowers purple, with one stamen. A native of the East and West Indies. Cultivated in the royal garden at Hampton Court 1690. Mr. Miller received seeds from Jamaica by Dr. Houton. 4. B. birifera. "Stem spreading; pubescent; leaves ovate, repand, or serpentine." Reich. "Stem roundish, hairy; flowers in heads." Willden. Stems a foot high; peduncles axillary, flattening small close heads of scarlet diandrous flowers, which generally fall off in about half a day. A native of Jamaica. 5. B. plumaginosa. "Leaves subcordate, orbicular-acute, pubescent beneath; flowers in umbels." Willden. Umbels axillary, on long peduncles; coroll of a pale rose colour; flowers three; fruit turbinate, flat-topped, crowned at the apex with pedicelled tubercles. Willden. A native of Spain. 6. B. Jeandeauss. Lugd. Mar. Tab. 4. "Stem erect; flowers two-flowered; leaves cordate, acute." Linn. "Stem erect, flowers two-flowered, in umbels; leaves cordate." Willden. Stem Sharma, very flint, smooth, with alternate branches; leaves smooth; umbels of six green flowers; involucr of five leaves. A native of the rocky coasts of Jamaica and other West India islands. Cultivated in 1691, in the royal garden at Hampton court. 7. B. clystis. "Stem erect; lower leaves cordate-ovate, upper ones ovate, flowers with three stamens in umbels." It resembles the last genus, but differs from it in its smaller stem, in its upper ovate leaves, in its double larger purple flowers, and in the number of its stamens. Native place unknown. Described by Willdenow from a living plant. 8. B. repiculata. "Stem erect; leaves cordate, repand, truncate; flowers in umbels, with three stamens." Willden. Resembles the last genus, but differs from it in its herbaceous stem and opposite branches and peduncles. A native of India and China. 9. B. chlrophyllodes. (Valeriana Chlrophyllodes. Smithic. ind. fuic. 5.) "Leaves bipinnatid, toothed; flowers with three stamens in umbels." Willden. It has entirely the habit of a Boerhavia, and agrees in all the generic characters, excepting only the style which is triquet. 10. B. repens. "Stem creeping." Linn. Native of Nubia, between Mocho and Tangos. 11. B. angustifolia. "Leaves linear, acute." Linn. Native place unknown. 12. B. tetrandra. Willden. Stems creeping; flowers with four stamens. Fort. Prod. 2. Native of the Society Isles, found by Forster in the island of Hahine 1774. These are all the species in Willdenow's edition of the Sp. Pl. La Marec (Illuff.) has made the hirufata and the repens the same as the diffusa, and appears to have been acquainted with the adefendens, plumaginosa, excelsa, repanda, chlrophyllodes, angustifolia, and tetrandra; but has inferred two others, which as far as can be determined from their specific characters, seem to be distinct species. B. paniula. "Stem erect; leaves ovate, acute, panicled naked, filiform, very vicis." A native of South America. B. tuberofa. "Stem erect, thrubby; root tuberose, effusent." A native of Peru. The following may possibly be the hirufata, though he unites that species with the diffusa. B. acuta. "Stem procumbent, spreading, vividly pubescent;

Boe

Boe; leaves ovate, obtuse; umbels small, somewhat in heads, lateral. A native of South America.

Propagata in Culture. None but the first, third, fourth, and fifth, have been cultivated in England. They will not thrive in the open air, but must be raised from seeds, and treated like other tender exotic plants. The first three are annual, and when they grow too tall to remain under a common frame, may be planted in a warm border, where, if the fesent prove favourable, they ripen their seeds; but a plant or two should always be placed in the house, to ensure a succession of seeds. The fourth, which is perennial, may be preferred in a warm floré two or three years. See Martyn's Miller.

Boernner, Frederic, in Biography, professor in medicine at the university of Wittenberg, in Saxony, and an active member of the Acad. Nat. Curif. received his education at Leipsic, where he was born, June 17, 1723. He published several dissertations on medical subjects, but his principal work is "Noctes Graphicae, sive opulenta medicina literaria," Rollock, 1755, 5vo. He died June 1751.

Boerneri, Codex, in Biblical History, a MS. of part of the N. T., noted G, in the second part of Wetstein's N. T. It belonged to Dr. C. F. Boernner, was collated by Kuller, and described in the preface to his edition of Mill's Greek Testament. It contains the epistles of St. Paul, that to the Hebrews excepted, which was formerly rejected by the church of Rome; it is written in Greek and Latin, according to one of those versions, which were in use before the time of Jerem. The Latin is interlined between the Greek, written over the text, of which it is a translation. Stemmmer supposes that the Latin was written since the Greek; but professor Matthi, who published this MS. at Meiden in Saxony in 1791, suggeests that an uniformity in the handwriting, and a similarity in the colour of the ink evidence, that both the Greek and Latin texts proceeded from the same transcriber. That it is an ancient MS. appears, says Michaelis, from the form of the characters, and the want of accents and marks of aspiration. It seems to have been written in an age when the transition was making from the uncial to the small characters; and from the correspondence of the letters r, s, and t, in the Latin translation, to that form which is found in the Anglo-Saxon alphabet, it is inferred, that this MS. was written in the Well of Europe, and probably between the 8th and 12th centuries. This MS. is preserved at present in the electoral library at Drefsen: and a copy of it is kept in the library of Trinity College, Cambridge, among the books and MSS. that were left by Dr. Bentley. Michaelis on the N. T. by Marth, vol. ii. and iii.

Boero, in Geography. See Burro.

Boeschot, a town of Brabant, on the river Nethe; 12 miles N. of Malines.

Boseroens, or Budgeroons, three small uninhabited atls of the East Indies, situated in the strait that lies between the island Saleyer and the point of Celbes, called Lassen. There these islands almost block up the passage between the southern part of Celebes and the northern part of Saîber, the whole space between which is about a league and a half. The strait is divided by the southermoor and middlemoor, or between the latter and the northermoor of the Budgeroons. This one of the most dangerous parts of the navigation, for ships failing to or from the Moluccas, or Spice islands; and it cannot be avoided without going round to the south of Saleyer, which is a much more dangerous route, on account of the great number of shallows and sunken rocks, which abound there, and are not accurately laid down in the charts.

Boesiippo. See Besippo.

Boethicus, in Entomology, a species of Hisperia (Pleb. Rir. Linn.) that inhabits India. The wings are tailed, blueish-brown, pale ath colour beneath, and undulated with whitish; a double ocellar spot in the anal angle.

Boethius, Anicius Manlius Torquatus Severinus, in Biography, descended from one of the most illustrious consular families of Rome, lived in the time of the emperor Zeno, near the end of the 5th century. He was born at Rome about 470, the same year with Martianus Capella, another Roman writer on music. He is said to have spent 18 years in the schools of Athens, pursuing the study of philosophy under Proclus; others, however, have questioned this fact, and it has generally been allowed, that the term of 12 years is too long. Nevertheless, his visit to Athens is intimated by much internal evidence, adduced by Brucker, Hist. Crit. Philol. t. iii. p. 524—527. and by an expression, though vague and ambiguous, of his friend Caesiodorus, (Var. i. 45) "longe potius Athenas introitus " It is certain that the erudition of the Latin language was insufficient to fatigue his curiosity; and that he devoted much of his time and attention to the study of Greek science and letters. From a letter of Caesiodorus, written in the name of Theoderic, it appears that he had the honour of introducing to the Romans in their own language, the music of Pythagoras, the astronomy of Ptolomy, the arithmetic of Nicomachus, the geometry of Euclid, the logic of Aristotle, and the mechanics of Archimedes. He alone was esteemed capable of dazzling the wonders of art, a fun-dial, a water clock, and a sphere which represented the motions of the planets. He commented upon parts of Aristotle, Cicero, and Porphyry; and from the commendations which he bestowed upon the latter, as the best interpreter of the former, he seems to have united the Platonic with the Aribotelian doctrine. Boethius seems to have been the first who applied fellohistic philosophy to the service of Christian theology; and he employed himself in defending the orthodox creed against the Eutychian, Ari, and Nestorian heresies, in a treatise "De Unitate et Uno." In civil life he attained to peculiar honours; as he was confus in 487. and also in 510; and he was also created patron, and advanced to the post of master of the offices. He married the daughter of his friend, the patronic Symmachus, and he enjoyed the peculiar satisfaction of seeing his two sons elevated to the consulare together in 522. Few perfons passed through life with a greater share of outward respect and honour; and few could be more distinguished by the testimonies that were given to his benevolence and liberality, his virtue and patriotism, as well as to his singular talents and learning. His own avowal claims our attent, that he had reluctantly obeyed the divine Plato, who enjoined every virtuous citizen to refuse the laws from the usurpation of ignorance and vice. For the integrity of his public conduct he appears to the memory of his country. His authority had restrained the pride and oppression of the royal officers; he had always pitied and often relieved the distresses of the 300,000, whose fortunes were exhausted by public and private rapine; and he alone had the courage to oppose the tyranny of the Barbarians, exalted by conquest, excited by avarice, and as he complained, encouraged by impunity. In their honourable contests, his spirit soared above the consideration of personal danger, and perhaps of prudence. In addition to his other learned labours, he had formed a design of translating all the works of Plato and Aristotle into Latin; but was prevented from executing his purpose by a premature death. Having for some years enjoyed the favour of Theodoric, the Gothic king of Italy, he was at length suspected of being hostile to
BOETHIUS.

his government, and of concurring with others, and particu-
larly with Albinius, who was accused and convicted on the
presumption of 
, as it was said, the liberty of Rome.
6 If Albinius be criminal, explained Boethius in the pre-
fence of the king, "the senate and myself are guilty of the
same crime. If we are innocent, Albinius is equally entitled
to the protection of the laws." The advocate of Albinius
was soon involved in the danger and perhaps the guilt of
his client; their signature, which they affixed to be a for-
gery, was affixed to the original address, inviting the emperor
Julian to deliver Italy from the Goths; and three witnesses
of honourable rank, but probably of infamous character, at-
tested the tenable desigil of the Roman patrician. Upon
this kind of evidence, Boethius was committed to custody,
and rigorously confined in the tower of Pavia; and a forril-
fenate, at the distance of 500 miles, pronounced a sentence
of confiscation and death against the most illustrious of its
members. During his confinement, he composed his treatise
"De consolatione philosophiae," mentioned in the sequel
of this article; and at length the executioners of Theodoric's
mandate fulfilled the savage commission with which they
had been entrusted, or, perhaps, even exceeded it, by the mode
of putting him to death. Some say that he was beheaded;
but others relate, that a strong cord was fastened round
his head, and forcibly tightened, till his eyes almost started
from their socket; and he was then beaten with clubs till
he expired. This event happened, according to some, in
the year 526, but according to others in 524. Boethius,
in his last hours, derived some comfort from the safety of
his wife, of his two sons, and of his father-in-law, the ve-
nerable Symmachus. But Symmachus, perhaps inadvertent
in the mode of mollifying his grief, was sometime after dragged
in chains from Rome to the palace of Ravenna, and there
put to death. A. D. 525. Theodoric, it is said, experienced
the bitternefs of self-reproach, and the anguish of an un-
avoiding repentance for the murder of these two illustrious
patrons, Boethius and Symmachus. His daughter Amala-
funtha is said to have referred to the sons of Boethius the
confiscated estates of their father.

His celebrated tract on music, divided into five books, was
first printed in black letter, with his treatises on arithmetic
and geometry, at Venice, 1495. It is remarkable, that in
the first book of the German famous 

or 

in the same manner as it is printed in the Oxford
edition of the Ancients, (see Diller, on the Muf. of the Ancients,
p. 27.)

It seems necessary here to give some account of this fa-
mous tract on music by Boethius, which, to read, was
long thought necessary to the obtaining of a musical degree
in our universities; and which, with great parade, has been so
frequently prized, quoted, and pronounced, by writers on
that art, to be of the greatest utility to every musician,
yet contains nothing but matters of mere speculation and
theory, translated from Greek writers of higher antiquity;
which, if necessary to be known at this time, would be more
profitably studied in the original; but the theory of every
art being vain and useless, unless it guide and facilitate
practice, the definitions, calculations, and reverses of boe-
thius, are no more useful or essential to a modern musician
than Newton's Principia to a dancer.

In the proemium, or introduction to his first book, "De
Mufica," he treats of the morality of music, and gives us all
the old stories concerning its miraculous powers of exciting
virtue, repelling vice, curing diffeales, &c. And in this book
we find whence Zarlinus, and all the Italian writers on music,
down to Padre Martini, drew their extensive divisions of mu-
fic into mundane, human, and instrumental. For Boethius says,"
"Tres effe Musica," lib. i. cap. 2. So had Arrhi. Quintilians
informed us, long before the birth of Boethius. And as far
as we are able to divine at present concerning these distinc-
tions, the ancients meant by mundane music, the music of
the spheres. By human, or humane music, the perfect or-
organization of our frame, and the union of soul and body.
By the last only, the instrumental, we are brought to real music,
by the grateful production and union of tuneful sounds.

Then we have definitions, such as are given in Euclid,
and all the Greek writers, on harmonies and speculative
music in Meibomius. After which, we have the doctrines
of proportion and ratio, inferred by Pythagoras, who
would not trust to the various and fallacious judgment of the
senses, but had recourse to reason and calculation to settle his
doubts. The account of the discoveries and harmonic laws estab-
lished by Pythagoras, not only infested in Boethius, but all sub-
sequent writers, is taken from Nicomachus, one of the seven
Greek writers on music in Meibomius. In the same book,
we have a very superficial and unsatisfactory account of the
genera. But we are indulged with several chapters on the
music of the spheres from "Cicero de Repub." lib. vi., where
the supposed analogy between the planets and the fentenary,
or seven sounds in music, is affected.

At the close of this book, chap. xxxiv. Boethius estimates
theory and speculation far above practice in music. But
what, we may ask, is the use to the world of such a theory
as he describes, without practice? Or, indeed, practice,
without the support of what is now underfood by theory?
The speculative theorems, confined to meditation and ex-
periments in harmonies, talk of music without hearing it;
and the mere practician hears it without understanding it.

Boethius allows him only to be a musician who can examine,
judge, and give reasons for what is done. Here we have the
origin of the verses ascribed to Guido:

Muficam et cantam, Maturam et distantiam, etc.

The whole second book is relative to the dispute between
the Pythagoreans and Aristoxenians, which is not yet settled,
about dividing the scales, whether by the ear, or by numbers.
All the musicians in Europe are now disputing whether we
should temper our scales on fixed instruments, or adopt the
triple progression of Pythagoras, and tune by perfect 4ths.
See Trifl: Progression, and Temperament. We have here
the tone-major and tone-minor to discuss; which we talk
about, but never feel or think of the distinction in our
modulation or performance. The apotome, comma, and limma,
are left for the amusement of speculative harmonists to talk
about, and for musicians to practice with their ears and fingers,
fans y penfer.

In the third book, Boethius continues his controversy
with the Arifloxenians, and proves what has been long
settled, that there is no such thing in music as a literal half-
note. The octave is said to contain five tones and two femi-
tones; and in the temperament of equal participation, the
twelve femitones of the octave must be nearly equal.

In book iv. the subject is purified of splitting of tones;
for the ancients could "divide and subdivide a tone from
south to south-west side."

We were very much disappointed formerly at the non-
performance of a promise made, book v. at chap. 3, the
title of which is "Mucicarium per Graecas ac Latinas literas
notarum m emancipari." But Meibomius says the promise
does not extend to the Roman notation in the Selden MS.
at Oxford; nor had the Romans any notation of their own
in the time of Boethius; and all the musical terms he uses are Greek, as were those of Vitruvius.

Even the eulogists of Boethius confess, that his work is so purely theoretic, that in reading it we never think of practice. Let us leave it then to philosophers who are content with imaginary sounds. The mention of instruments, or of the voice as employed in singing, never occurs. No allusions to the music of his time, but all is abstract speculation, tending doublets to the perfection of the art, but seeming little connected with it. The harmony he talks of is more the "harmonia mundi" of Kepler, than that of Handel and Haydn. Guido said, that Boethius's work was only fit for philosophers. In the middle ages, so few understood Greek, that those who were curious to know something about the miraculous powers of that music, imagined that they should find it in Boethius's translation, who had been educated at Athens. Such speculations are curious and amusing, in moments of meditation, to scientific and inquiring minds; but practical musician, whether composers or performers, can afford little time for such sublime and spiritual amusements. Nevertheless, he must be a dull and incurious professor, who seeks not the reason of things, the principles of his art, and origin and end. If he be at a metaphysical turn, let him read Galilei, Daniel Bartoli, D'Alembert, Holdc, Romanelli, Tartini, and Smith's harmonics. They are all intelligible, and lead to knowledge which he will be expected to profess; but for any thing useful that he can acquire from Boethius's speculations, or from the Greek theorists, his prototypes, that will make him a better composer or performer, the case is hopeless. Yet there are, who, after allowing that "it was of so little use in practical music, that they never thought of it in reading Boethius;" yet returning afterwards to former prejudices, it is infixed on, that "he has communicated to the world such a knowledge of the fundamental principles of the music of the ancients, as is absolutely necessary to the right understanding of our own system."

When we speak of the inutility of Boethius's work on music to the musical students of modern times, we presume not to extend our censures further. The writings of this great and good man on other subjects have been too long in evidence to be depreciated lightly. His most celebrated production was his ethical composition "De consolatione philosophiae," and has always been admired both for the style and sentiments. It is an imaginary conference between the author and philosophy personified, who endeavours to comfort and soothe him in his afflictions. The topics of consolation contained in this work, are deduced from the tenets of Plato, Zeno, and Aristotle, but without any notice of the sources of consolation which are peculiar to the Christian system. It is partly in prose, and partly in verse; and was translated into Spanish by king Alfred, and illustrated with a commentary by Afler, bishop of St. David's; and into English, by Chaucer and queen Elizabeth. It was also translated into English verse by John Walton, in 1410, of which translation there is a correct manuscript at the British Museum. Few books have been more popular, especially in the middle ages, or have passed through a greater number of editions in almost all languages. It has been observed by Mr. Harris, in his "Hermes" that "with Boethius the Latin tongue, and the lai remains of Roman dignity, may be said to have sunk in the western world." To the same purpose, Gibbon says, "that the favor Boethius is the lai of the Romans, whom Caesar or Tully would have acknowledged for their countryman." Fabr. Bib. Lat. tom. ii. p. 146, &c. Le Clerc. Bib. Choix, t. xvi. p. 163 — 275. Burney's Hist. Mus. vol. ii. p. 31, &c. Gibbon's Hist. Rom. Emp. vol. vii. p. 43, &c. Brucker's Hist. Phil. by Enfield, vol. iii. p. 313.

BOETTICHER, Gottlieb, a physician of eminence, and in considerable practice at Berlin during the early part of the last century, published various works on the theory and practice of medicine. The principal are, on the existence of a nervous fluid, "De vera fluidi nervorum existentia," Berlin, 1721, 4to.; "De morborum maligniorum, imprinis peptis et petitulentis explicatio," 4to. 1713; this has been several times reprinted. He contends that the plague is contagious; and that the infecting effluvia may be retained, and conveyed in full vigour, in the clothes or bedding of the sick, to distant countries; a doctrine that has been lately strongly opposed. Pregnant women, affected with the plague, constantly part with the fruit of the womb before they die. Hypochondriac psoriasis, he thinks, are not susceptible of the contagion. But in this he is probably mistaken; as we know lunatics do not enjoy such an exemption from contagious diseases in this country. He recommends bleeding on the first attack of the fever, and then to have recourse to绍orics. "De respirations festus in utero," 4to. 1703. Haller Bib. Med. et Anat.

BOEUF, Le, in Geography, a place in the north western corner of Pennsylvania, at the head of the north branch of French creek, and 50 miles distant by water from Fort Franklin, where this creek joins the Alleghany. The French fort of Le Beauf, from whence the place has its name, lies about two miles east from Small lake, which is on the north branch of French creek; and from Le Beauf, is a portage of 14 miles northerly to Preque ile in lake Erie, where the French had another fort. N. lat. 42° 1' W. long. 79° 55' 20".

BOEUR de Marais. The French call the common bitttern (ardea bellina), because it frequent marshes, and has a loud cry, and emits a sort of roaring noise that has been compared to that of an ox or bull, by this name. "Il n'y a," says Belon, "beuf qui puit crier ici haut."

BOEUR d'Afrique, in Zoology. By this name some French writers distinguish the buffalo; the epithet is misapplied, because that animal is equally common in India, whereas in Africa, it is suppressed, the African buffalo first originated.

BOEUR a Boeuf, synonymous with bufon. By some it is likewise called beauf des Inds.

BOEUR Guerir. Under this denomination the French describe a race of African oxen, which the Hottentots call backleys; the word backley in their language signifying war, to the purposes of which they are trained up, in the same manner as elephants are by the Indians. War oxen of this description are instructed also to guard the herds of the common oxen.

BOEUR de Mer, in Ichthology, is the name of the long-beaked ray, raja oxyrhyncha of Linnaeus.

BOEUR de Mer, in Zoology, the common French name for any of the Phocæ tribe of animals, corresponding with the general English name of sea-cow.

BOFFRAND, Germain, in Biog. phy. A celebrated French architect and engineer, was born at Nantes in 1667, and having been educated at Paris, he employed himself for some time in sculpture during the winter, and studied architecture in the summer. His talents at length engaged the attention and patronage of Hardouin-Mansart, an eminent architect, who obtained for him a place in the commission for the royal buildings. In 1709, he became a member of the Rey
BOG

Royal Academy of Architecture, and was much employed at Paris, and by several German princes, in furnishing designs for various edifices. His style of building was grand and noble, and formed after the model of Palladio. He was likewise a skilful engineer, and constructed a great number of canals, sluices, bridges, and similar works. As architect to the general hospital of Paris, he gratuitously served the institution; and, as he was disinterested in his temper, he was lively and amusing in conversation; and he indulged his taste for literature by the composition of several pieces, adapted to the purpose of producing temporary gaiety and mirth, for the Italian comedy. His "Book of Architecture," with plates, was printed at Paris in 1745, folio; and contains an account of the general principles of the art, exemplified in his own works. In this work he has also introduced a curious memoir, describing the method of casting the bronze equil-trian statue of Lewis XIV. He retained his gaiety of disposition to the age of 87 years, and died at Paris in 1755. Encyc. Hist. Gen. Biox.

BOFIN, Boffin, or Baffin, Lough, in Geography, one of those large lakes in Ireland into which the river Shannon expands, situated between the counties of Roscommon and Leitrim.

BOG, derived from the Italian buca, a hole, or rather from the Belgic buigen, to bend, on account of its giving way when trod upon, in Agriculture, a quaggy sort of earth, generally met with in low situations, covered with coarse grasses, but of so little solidity as to be incapable of supporting the tread of heavy animals; caused by the dilution, decay, and deposition of different vegetable and other substances, from the stagnation and detention of the water that oozes along on the clayey or other thin tenacious strata below, or which springs up through the fissures, or other openings of them. They are of different kinds, depths, and consistencies, according to the different circumstances of the case, and the nature of the situation of the ground on which they are formed, as well as that of the earthy material that enters into their composition. Dr. James Anderson, in his treatise on draining bogs and swampy grounds, remarks, that clay is a substance that strongly resists the entrance of water into it; but, when it is long drenched with water, it is in process of time, in some measure diffused thereby, losing its original firmness of texture and consistence, and becoming a sort of semi-fluid mass, which is called Bog. And as these bogs are sometimes covered with a surface of a particular kind of grass, with very matted roots, which is strong enough to bear a small weight without breaking, although it yields very much; it is in these circumstances denominated a sedge.

But whatever be the nature of the bog, it is invariably occasioned by water being forced up through a bed of clay, as just described, and diffusing or softening a part thereof. A part is only mentioned, because, whatever may be the depth of the bog or sedge, it generally has a portion of solid clay between it and the reservoir of water under it, whence it originally proceeds. For if this were not the case, and the quantity of water were considerable, it would meet with no sufficient resistance from the bog, and would of course, issue through it with violence, and carry the whole semi-fluid mass along with it. This would more inevitably be the case, if there was at first a crust at the bottom of the bog, and if that crust should ever be broken, especially if the quantity of water under it was very considerable. And as it is probable that, in many cases of this sort, the water slowly dilutes more and more of this under-crust, no doubt is entertained but that in the revolution of many ages, a great many irruptions of this kind may have happened; although they may not have been deemed of importance enough to have the history of them transmitted to posterity.

It has been remarked by Mr. King, in the Philosophical Transactions, No. 176, that the springs, with which Ireland abounds, are generally dry, or nearly dry in the summer time, and that grasses and weeds grow thick about the places where they built out. In the winter, he observes, they swell, run, and dry, and loosen all the earth about them. The sword or turf of the earth, which consists of the roots of grasses, being lifted up and made fuzzy by the water, at that season (he has seen it lifted up a foot or two at the head of some springs), is dried in the spring, and does not fall together, but withers in a tuft, through which arise new grasses, which is also lifted up the next winter. By this means the spring is more and more stopped, and the turf grows thicker and thicker; till at last, it makes the appearance which we call a quaking bog; and as it grows higher and drier, and the roots of the grass and other vegetables become more putrid, together with the mud and slime of the water, it acquires a blackness, and grows into that which we call a tufbog.

It is, however, confessed, that there are quaking bogs caused otherwise. When, it is observed, a stream or spring runs through a flat, the patination, if not kept open, fills with weeds in summer, trees fall across it and dam it up; then in winter the water stagnates further every year, till the whole flat is covered. Afterwards a corser kind of grasses flourishes up, peculiar to these bogs; this grass grows in tufts, its roots coalesce together, and its height increases every year, in some that he has seen it as tall as a man. This grass rots in winter, and falls on the tufts, and with it the feed, which sometimes up the next year, and so continues making an annual addition. Sometimes the tops of the flags and grasses are interwoven on the surface of the water, and this becomes by degrees thicker till it lies like a cover on it; then herbes take root in it, and by the matting of their roots, it becomes very strong, so as to bear a man. He has gone on bogs which would rife before and behind, and sink where he flood to a considerabledepth, under which was clear water.

It is further observed, that Ireland abounds in mofs more than any other country; this mofs is of divers kinds, and that which grows in bogs is very remarkable. The light spongy turf is nothing but a congrissy of the threads of this moss, before it be sufficiently rotten; the turf then looks white, and is light. It has been seen in such quantities, and so tough, that the turf-spades could not cut it. In the north of Ireland, they denominate it old-wives tow, being not much unlike flax. The turf-holes in time grow up with it again; and all the little gutters in bogs are generally filled with it. To this he chiefly imputes the red or turf bog; and from the same cause even the harden turfs, when broken, is friction, though there plainly appear in it parts of other vegetables; and he is almost, from some observations, tempted to believe, that the seed of this bog-moss begets heath, when it falls on dry and parched ground. However, the moss is so fuzzy and quick-growing a vegetable, that it greatly cheapens the蹿g, and contributes to thicken the turf, especially in red bogs, where he remembers to have observed this most particularly. The situations of land may sometimes contribute to the formation of bogs in it, as flat spots of ground lower than the level of an adjoining river or lake; for when that part is filled up by the flume and earth brought from the surrounding grounds, and the rotten plants and animals, which are buried in it, have choked it up, it will become a bog; and then the water will continue to flow into it from the river or lake, especially when either of these is swelled by a fall of rain or melting of snow. These waters may also sometimes have this
this effect, without a communication above ground, by seeping through a sandy or gravelly soil. And another cause that may contribute to the production of bogs, may be the fall of a number of trees, which, by occasioning a stagnation in the water brought down from higher grounds, may cause the deposition of much earthy vegetable, and other materials, and consequently the production of boggy appearances in the places where such obstructions are not with.

Bogs are distinguished by different titles, according to the nature of the circumstances under which they occur; as peat-bogs, quaking-bogs, spring-bogs, and turf-bogs. The first being that fort of bog which is principally composed of peat earth. The second such a kind of bog as, when trodden upon, affords an elastic kind of motion, or shaking under the foot. The third is such a bog as arises from the ozing or springing up of water through the fluff effects of materials on which it is formed. Mr. Elkington, the celebrated drainer, makes two classes of this sort of bog; the first of which is distinguished by the springs rising out of the adjoining grounds, in a regular line, along the upper side of the wet surface; while, in the latter, the number of springs that appear are not confined to one regular direction along the upper side, but burst out promiscuously over the whole surface, especially towards the lower side, forming quagmires all round, that shake and bend under the feet like a suspended cloth, over which it is dangerous for the lightest cattle to pass, and which flow themselves at a distance by the verdure of the graps, which the quags or spots immediately round the springs produce. The last is a fort of bog constituted of materials which partake of the nature of turf.

Wherever bogs are met with, draining is unquestionably the first step to be taken towards their improvement. For the full accomplishment of this purpose, Mr. Elkington's mode may in many cases be successfully resorted to, and with great and sudden effect; though the improver should not be too fainque in his expectations, or imagine that it is in every case an easy operation to free this sort of land from an excess of moisture. There are probably some bogs which cannot, without great difficulty, be drained at all; and others that would cost the value of the land, in drains and machinery, to effect such improvements in them. But notwithstanding unsuccessful trials may sometimes be made, the drainer ought not to be totally discouraged from further attempts, where there is a tolerable prospect of succeeding in the business at last; as the caies are no doubt very numerous, in which this sort of land may be effectually drained at an easy expense, and thereby brought from a state of mutiny to yield considerable profit to the owners and the public. See Draining of Boggy Lands.

It is observed in the appendix to Mr. Johnston's account of Mr. Elkington's mode of draining, that in the improving of bogs, after their being drained, as the great object is to get the ground brought to such a state, as to be fit for being laid down with grass seeds, when it may be considered in such a state of improvement, that any sublentuous crops will require no more than ordinary management to cultivate them, the first thing to be done, where they are extensive, is to have them divided into proper meloires by open ditches, by which means much surface water may be carried off, as well as by properly attending to the formation of the ridges and furrows in ploughing, and giving them a direction towards the open ditches, by which the rain or surface water may be discharged as it falls; and after this has been effected, to have the surface well levelled by means of the spade, as being in moll caies more effectual than by the plough. The better sorts of the materials thus removed may be mixed up with lime or other substances, and set upon the land; while those of the coarser kinds are made use of to fill up the inequalities on the surface. Paring and burning, where there is much coarse vegetable matter, may be practiced with advantage. In order to this, whatever earth remains unemployed, in filling up hollows, should be burnt, together with that taken out of the ditches, unless the latter has been already carried off for fuel. The greater quantity of ashes there is, the greater will be the improvement of the soil itself, and the more will the earth be benefited. The ashes, after being well incorporated with the soil by means of light or superficial ploughings, frequently to enrich it, as to produce excellent crops for two years or more. The effects of the ashes and burnt materials have been said, in some cases, to be incresced by the addition of a little lime. When the turfs have been reduced to ashes, spread over the surface of the ground, and turned in with a little furrow, turnips or potatoes ought to be the first crop. If the former, they may be sown broad-call, and led off by sheep, by the dung and urine of which the soil will be greatly benefited, as well as by the refuse of the plants, and the condensation produced by their treading upon it. It will then be in a state for a crop of oats or barley, which should be sown with grass-seeds, and well rolled down. The ploughing after the turnip crop, thus eaten off, should be very light, in order not to bury the enriching materials too deep; in which view oats ought to be preferred to barley. If the soil be full of the roots of rushes, weeds, and coarse plants, a summer fallow may be necessary before any crop be taken: and when the ashes have been made in a particular part of the field, they may be spread over the surface before the feed furrow is given, and the roots and tough clods, after being collected and burnt, may be spread along with them.

If the bog be very soft and deep of peat, so as not to admit horses for ploughing the first year, a crop of turnips broad-cast may be got by sowing the seed among the spread ashes, harrowing it in with a light harrow and roller drawn by men. This crop, being cut off as above, will leave the land the ensuing year so much consolidated as to admit the plough.

When the surface has not been pared and burnt, following for two years may be necessary to reduce the soil to a proper mould, in the last stage of which the lime or other manure must be applied. In this case two white crops, with an intervening one of turnips, potatoes, &c. may be taken before the grass-seeds are sown.

Boggy soil, of whatever kind, after being once broken up and pulverized by tillage and a course of fallow, should not be over-cropped before being laid down in grass; and when brought into a good sward of grass, should not be too soon broken up again, but continue so, by harrowing and top-dressing it when the herbage begins to moss. Repeated rolling is also necessary in such soils.

It is probably a better practice to feed sheep the first and second years of the grass, than to cut it for hay, as it causes the roots of the grass to strike more horizontally through the soil, and more closely to cover the surface. With this view a greater proportion of white and yellow clover, and other short grasses, should be sown.

In the manuring of soft boggy lands some caution is necessary; for, though the ploughings, previously to the application of the dung, may be made deep with advantage, the sublentuous furrows should be very superficial, and the dung regularly and uniformly blended with the soil; for, when this is not the case, it is apt to sink down too much, and be of little utility. The same thing takes place with respect to lime; and even when marble is buried too deep it is said to lose its power as a manure.
B O G.

On soft boggy ground, merely intended for pasture, nothing will produce a more rapid improvement than the application of a thin covering of marle. In order to this, the directions already given, with respect to paring and burning, should be observed.

Marle, which is often found under a gravel or clay, may also be of great service: but if a loamy earth be near at hand, it will, perhaps, be less expensive to the farmer to bring such earth to cover the bog, than it will be to dig up the clay. But of whatever kind the earth be which is laid upon the bog, the quantity should always be sufficient to cover its whole surface four, five, or six inches deep, according to the thickness of the soil so brought.

Sea-fand, as being frequently mixed with shells, is well suited to this purpose, if the boggy ground be situated near the sea, so that it can be easily procured. The great weight of these materials tends equally to consolidate the bog, and serves to smooth the surface from the spungy peaty earth; therefore the thicker they are applied the better. A slight sprinkling of lime over it will add to the effect, and bring up much white clover and other sweet grasses.

The most barren earths or soils, when used in this way, may have good effects; but lime-bone gravel, where it can be procured, is to be preferred to all others. After the land has been treated in this manner, and lain some years in pasture, it may be broken up for tillage, and crops of grain taken before being laid down with grass-feeding. By ploughing, part of the natural soil will be turned up, and intimately mixed with the earth, &c. that has been laid upon it, and, if lime or dung be added, will together form a very fertile mould. When boggy grounds are much over-run with rushes and other carole, four, aquatic plants, scarcely any thing tends more to the full part of its improvement than that of over-catching it with different sorts of cattic, as soon as ever it is sufficiently solid to bear them with safety; care must, however, be taken not to put them on till it is quite firm, as if that be done they will not only poach the surface, but the coarse herbage will remain without being eaten closely down. The practice of cutting the rushes frequently in their young and tender state, is also of considerable utility. By these means alone a better kind of herbage is speedily brought up, and much improvement produced.

Another considerable means of improving this sort of land, where the situation is such as to admit of it, or when it lies near the side of a large river or stream, of which, by means of proper dams and cuts, a command can be obtained, is that of floating it with water, a process that, when judiciously managed, never fails to produce abundant crops of grass. And that it is a mode of improvement well fitted to this sort of land, is evident from the effects that have been produced in different instances, and from the observations of Mr. Boswell, that it requires more and longer watering than any sandy or gravelly soil: the larger the body of water that can be brought upon it the better, its weight and strength will greatly affect in comprising the soil, and destroying the roots of the weeds that grow upon it; neither can the water be kept too long upon it, especially in the winter season, immediately after the after-math is eaten; and the sooner it is eaten the better. The manner of conducting the business of watering must be suited to the circumstances of the particular case.

After being thus improved, it must next be determined to what lasting purpose it may be best applied. The too great moisture of these soils, which always lie flat, renders them unfit for continued tillage, and their mould becomes so loose by frequent ploughing that it frequently does not afford sufficient fluidity to the roots of corn. For this reason barley, oats, and rye do better here than wheat, which requires a firmer footing; but neither of them should be sowed thick, because the fruitfulness of the soil will always make up in the size of the plants, what some might think wanting in their number. The most beneficial method of employing this sort of land is, undoubtedly, that of converting it into meadow, because, when thus prepared, and not injudiciously exhausted by crops of corn, it will yield great quantities of excellent grass. It is, however, usual to begin with sowing some kind of grain on this prepared surface, to indemnify the farmer by the plentiful crop which it generally yields; such, indeed, as sometimes defrays at once the whole expense of the improvement. In some cases the most profitable method may be to sow it in the autumn with rape, the leaves of which shading the surface in hot weather, and rotting in the winter, contribute greatly to mellow the earth; the strong roots of this plant open the soil too, and its seed brings a great return when sold for making oil. One or two ploughings after this will prepare it for a crop of wheat. After this is taken off, and the stubble turned down, white clover and grass-feed should be sown, and the ground laid down for a lasting meadow; or if turf and be sown, or cabbages planted in the autumn, these in the spring may be succeeded by barley, with which the grass-seeds may be sown.

In a rude moory or black peat boggy improved lands, Mr. Marshall remarks, that what is most desirable is a crop that is sown and reaped during the summer months, and which demands neither labour nor attendance in the humid seasons of autumn, winter, or spring; and such a crop is found in rape, which is luckily natural to the climate, and at the same time highly profitable. Trials with this may be made at but a trifling expense on a small portion of the ground, the proof of which answering, it is observed, is not whether the plant will thrive as herbage, but whether it will mature its seed on the given soil in the given situation.

After a recumence has been obtained by crops of this sort, which may be repeated, as there is no danger of exhausting such deep soils, the foundation of more lasting profits is to be laid; which may be effected by sowing grass-feeds, with or over the rape crops, or after the flax have been drawn, according to seasons and the circumstances of the land, lodging, as directed above, till such time as the surface becomes sufficiently firm, and the soil has attained a suitable texture for mixed cultivation, which time may be much shortened by the application of suitable sublunaries of the calcareous kind in any period of the improvement.

When either through necessity, or want of other arable land, or out of choice, the farmer intends to continue ploughing his improved bogs, the surface must be raised in ridges, and the further management of it may be like that of most other ploughed grounds.

If a soil of this kind happens to be situated near a town, a greater profit may accrue from planting it with garden fruits than from any fort of grain, as beans, peas, cabbages, potatoes, turnips, carrots, &c. are found to thrive exceedingly well in earth of this kind.

Bog, moving or migrating. These soft marshy earths have been sometimes known to move out of their place. An instance of this there was in Ireland, in the year 1697, about Charleville in the county of Limerick. There was heard for some time a noise under ground like that of thunder at a great distance, or almost spent; and soon after this the earth of a large bog in the neighbourhood began to move, and a hill or ridge situated in the middle of it banked no longer above the level of the soil, but sunk flat. The bog not only moved itself, but carried with it the neighbouring pastures.
Islands, though separated by a large and deep ditch; the motion continued a considerable time, and the surface of the moving earth rose into a sort of waves, but without breaking up or burrying any where. The palstire land rose very high, and was covered with the same motion till it rested upon a neihbouring meadow. The whole surface of which it covered, remaining sixteen feet deep upon its surface. The whole quantity of the bog was torn from its former seat, and left great gaps in the earth where it had joined, which threw up foul water, and very looking vapours. Phil. Trans. N. S. 233. The whole country came in to see the strange sight as this, for it continued moving a long time; but few noticed the true caule of it, which was this: a more than ordinary wet spring oceasioned the raising of the bog to a great height in one part, and thence propagated itself through the whole bog; so that the hill in the middle was undermined, and naturally sunk flat; this and the more ordinary weight of this large bog proffed upon the adjoining palstire-land, forced up its foundations, which were only a loose sand. This was pushed on side ways, where there was a dissect from the bog, and at length having given the bog more room, all was quiet and remained in that state. The bog was more than forty acres of ground.

Another instance of this kind occurred, in March 1745, at the bog of Alderground, about a mile and a half from the town of Dunmoo, in the county of Galway. In consequence of a violent storm, attended with a fall of rain, resembling a water spout, the turby, which the turf cutters had just left, containing about twelve acres, was put into motion, and floated till at last it subsided upon a piece of low pallure of near thirty acres, by the side of the river, where it spread and settled. The moving-bog choked up the river, which consequently overflowed the back grounds, and in a little time a lough or lake of near 57 acres covered the adjacent fields. A paigeage for the river was formed as speedily as possible; but before it could be finished, and the lake discharged, it was supposed to have covered 300 acres; however, in seven or eight days it gradually decreased to 50 or 60 acres, of which extent it continued. Irish Transact. vol. ii. p. 4.

Bog, ancient Hypanis, in Geography, a river of Poland, which rises in Podolia and joins the cituary of the Dnieper or Nieper, a little above Ozakov, about N. lat. 46° 43' E. long. 32° 32'. This river separates Poland and a portion of European Turkey from Russia. By taking up the Ingul, the Simuch, and the Gulon, befores other streams in its course, it becomes a very considerable river.

Bog bean, in Botany. See Menyanthes.

Bog berry. See Vaccinium.

Bog moss. See Sphagnum.

Bog bay. See Schoenus.

Bog wood. See Wood subterraneus.

Bog ore. See Iron.

Boga, in Ichthyology, synonymous with Bogus, and Sparus bogos.

BOGAERT, Martin Vanden, surnamed Desjardins, in Biography, an eminent sculptor, was born at Breda, in Holland, in 1648, and settling in early life at Paris, he became a member of the Royal Academy, at the age of 31 years. The art of his most considerable works was an equestrian statue of Louis XIV. erected at Lyons in the place Bellecour. He also adorned the gate of the church of the Malzarin college with six groups of stone, representing the evangelists and the Greek and Latin fathers of the church; and besides many other works, the most distinguished was the monument erected in the place of Victory, at the expense of

BOG, in Doctrine, a tree held sacred in Ceylon, on account of the imagined preference given by the deity Buddha to the shade of this tree, above all others. Wherever it is found throughout the island, persons are appointed to watch over it, and preserve it from hurt or injury. It is held in the same estimation among the followers of Buddha, as the banyan tree is among the Brahmins. The Can- dians hold their great festival under the shade of a tree of this kind, which stands at Amaramburro, an ancient city in the northern part of the island of Ceylon's dominions; and none but his own subjects are permitted to approach this sanctuary. Tradition says, that the bogha tree suddenly flew over from some distant country and planted itself in the spot where it now stands. It was intended as a shelter for the god Buddha, and under its branches he was wont to repose, while he journeyed on earth. Near this hollowed foot 99 kings are interred, who all marked admittance into the regions of the skies by the temples and images they constructed for Buddha. They are now sent as good spirits to preside over the safety of his followers, and protect them from being brought into subjection to Europeans; a calamity against which they continually pray. Around the tree are a number of huts, erected for the use of the devotees, who repair hither: and as ever fort of fish and dirt must be removed from the sacred foot, people are retained for the purpose of continually sweeping the approaches before the worshippers, and to attend the pious during the performance of the ceremonies. Percival's Ceylon.

BOGANEU, in Geography, a town of Bohemia, in the circle of Chrudim; 6 miles S. of Chrudim.

BOGAR. See Bokhari.

BOGAROVSKOJI, a town of Siberia, 165 miles N. of Tobolik.

BOGAS, or Boghas, a small town of Egypt, at the mouth of the Nile; 3 miles N. of Damietta. See Bogass.

BOGATOI, a town and district of Russia, in the government of kurak, lying on the rivulet Panna, falling into the Piel; 48 miles S.S.W. of Kurfik.

BOGAI, a town of Asiatic Turkey, in the country of Diarbekir, 50 miles W. of Diarbekir.

BOGAZI, signifying in the Turkish language a "canal," or a "fray," a name given by the Turks to two braids, adjoining to the island of Samos; one, called Little Bogazi, and scarcely half a league broad, separates Samos from the continent of Asia; the other, called the Great Bogazi, and nearly two leagues broad, lies to the west, and separates this island from the small Fournis islands, famed for the copper, which, at a distance, they appear like the roofs of ovens; they were anciently called "Corces infus." This is a passage frequently much frequented by ships falling from Constantinople to Syria and Egypt, and they find here good anchorages.

BOGDAN, a town of European Turkey, in Moldavia, on the borders of Transylvania; 60 miles S. of Niemecz.

BOGDEN, Martin, in Biography, a favourd pupil of T. Bartholomae, and eminent painter of picture, was born at Dresden, about the year 1638. After visiting France, England, and other parts of Europe, to improve himself in knowledge, he took the degree of doctor in medicine at Basel in Switzerland, in 1652, and at the
end of four or five years, passed principally with Bartholine, to whom he was strongly attached, he settled at Bern. His works are principally controversial, defending the priority of the discovery of the lymphatics by Bartholine, against Rudbeck the Swede, who claimed it; and who, if he did not discover them, Haller says, has the merit of having more fully and accurately described them, than Bartholine had done. Bogden, in this context, displayed much learning, but equal roughness and ill-humour. The titles of his works are: "Rudbeckii infimae structurae vasorum lymphaticorum Thomas Bartholini," 1740, and "Apologia pro vasorum lymphaticiorum Bartholini, adversus infimam structuram abolit Rudbeck." Haller, 1754, 2 vols. "Simeonis Seth, de alimentum facultatibus," Gr. and Lat. 8vo. 1768. "Observationes Medicas ad Thomam Bath." The observations, 12 in number, are published in the "Culter Anatomicus," of Lyser; Copenhagen, 1665. Haller Bib. Anat. Ely. Dict. Hist.

BOCKIKOTZ, in Geography, a town of Russian Siberia, on the Tchulim; 6 miles N.W. of Atchinsk.

BOGINSKII, or BOGDOM DABANS, an inexhaustible salt-plate of Siberia, in the steppe towards Tzaristin; the salt of which, according to Pallas, is better than that of the Elton.

BOGDO, GREAT; the highest mountain of central Asia, according to the reports of the Monguls and Tartars, is properly a central summit of the Altai chain of mountains, which gives source to the Upper Iriish, and seems to be delineated in Arrowsmith's map of Asia at longitude 94°, and latitude 47°. See Altai and Belur.

Bogo, Little, is a mountain of Abatic Russia, lying to the north of the Caspian sea, near which is a salt lake of the same name.

BOGDOMANTIS, in Ancient Geography, a country of Asia Minor. Polonmy.

BOGDON, in Geography, a name given by the Russians to the Manchews, or Mandshurs, who inhabit the eastern part of Chinese Tartary, an extensive and populous district N.N.E. of China, and who are subject to the Chinese empire. See Mandshurs and Chinese Tartary.

BOGENSEE, a town of Denmark, in the island of Funen; 12 miles N.W. of Odeneke.

BOGSEUND, a small town of Sweden, in West Gothland, 4 leagues S. of Falkoping.

BOGIKLUND, a district or cirque of Allahabad, in Hindooistan, situated west of Benares.

BOGGY CREEK, a creek of America, which rises among the eastern branches of Poplar creek, and empties into the Tennesse; just above the Muscle shoals. Hurricane creek is a branch of Boggy creek.

BOGHASS, a canal or branch, so called in the language of the country, at the mouth of the western or Bolistic branch of the Nile, now called the branch of Rosetta. This passage is not navigable through its whole width; there being only a narrow channel, which, owing to the instability of the bottom, and the agitation of the sea, is continually shifting. A pilot or master of the Boghass is continually employed in sounding this changeable passage, and giving directions to those who navigate it. The increasing danger of this passage led to the operation of cleaning the canal of Alexandria, and thus to facilitate the communication between Alexandria and the rest of Egypt. See Bogas.

BOGIA. See BOUJIAN.

BOGILLANA. See BOGLANA.

BOGLIASCO, a town of Italy in the state of Genoa, near the sea-coast; 6 miles E. of Genoa.

BOGLIO, or BEVIL, a mountainous territory of Italy, in the principality of Piedmont, and county of Nice, celebrated near the Alps; its chief place has also the same name. This country was surrendered to France in May 1796.

BOGLIPOUR, a town of Hindooistan, capital of a province in the country of Bahar, near the Ganges; 35 miles S.E. of Monghir, and 115 N.W. of Murshidabad.

BOGLORAY, a town of Poland, in the palatinate of Sandemir; 24 miles E.S.E. of Sandemir.

BOGMUTTY, a river of Hindooistan, which runs into the Ganges near Monghir, in the country of Bahar.

BOGNOR, or HOUGHTON, (as it is sometimes called in honour of its founder,) is a pleasant retired hamlet on the southern coast of England, in the county of Sussex. This place has only risen into notice within a few years, being, previous to 1750, merely inhabited by a few fishermen. About this period Sir Richard Hotham purchased some ground here, where he built a house for himself, and had others erected for the accommodation of bathers. His plan of making this a fashionable bathing place has succeeded, but it was not much frequented till after his death, which happened in 1790. Soon after this event, the ground and houses were sold in different lots. Some of the purchasers have built additional dwellings, and Bognor is now become a place of great resort during the summer months. The adjacent villages of Birted, Felpham, &c. also receive a number of summer visitors, who resort to this coast for the purpose of its fine beach and mild air. Bognor is 7 miles S. of Chichester, and 67 S.W. from London. It has a good hotel, an assembly-room, a library, and some other establishments for the accommodation and amusement of its visitors.

BOGODUKHOF, a town and district of Russia, in the government of Kharkov, seated on the Merlo, falling into the Vorkla; 84 miles N.N.W. of Kharkov.

BOGOS, See Borg.

BOGOKNOT, a town of the island of Corfica, 5 leagues N.E. of Ajaccio.

BOGOIAVLIENSKIO, a town of Russia, in the government of Ufa; 48 miles S. of Ufa.

BOGOIALAVLIESNSKIO, a town of Russia, in the government of Archangel, near the coast of the White Sea; 72 miles S.W. of Archangel.—Also, a town of Russia, near the river Onega, 180 miles S. of Archangel.—Also, a town in a small government, on the Pigea; 70 miles E. of Areangel.—Also, a town of Russia, in the province of Uving; 57 miles E.N.E. of Uling.—Also, a town of Siberia, on the Tchulim; 80 miles E.N.E. of Tomsk.

BOGOMILI, or BOGARMIT, in Ecclesiastical History, a seat sprung from the Manichaeans, or rather from the Malalians, towards the close of the eleventh century; whose chief, Balil, was burnt alive by order of the emperor Alexis Comnenus. Being condemned to be burnt, he declared that the fire would not hurt him; upon which the Greeks who carried him to execution, first took off his cloak, and flied it into the fire, to try whether it would prove incombustible; whilst it was burning, the poor fanatic cried out, "Do you not see that my cloak is un touched, and carried away in the air?" upon which they call him also into the fire, where he was soon consumed to ashes. Du-Cange derives the name from two words in the Bulgarian language; Bog, Deus, and milvel, miserere, have mercy. The Bogomili denied the Trinity; maintaining that God had a human form; that the world and all animal bodies were created by evil angels; and hence they concluded, that the body was the prison of the immortal spirit, and that it ought to be enervated by fasting, contemplation, and other exercises, so that the soul might be gradually refixed to its primitive liberty; and that wedlock
BOG

was to be avoided; and they also maintained that it was the archangel Michael that became incarnate. They rejected the books of Moses, and only admitted seven books of jurisprudence; they maintained the Lord's prayer to be the only eucharist; that the baptism of the Catholic was only that of St. John, and their's that of Jesus Christ; and that all those of their sect conceived the Word, or Logos, as much as the Virgin, denying the reality of Christ's body, which they considered only as a phantom. They also held, that the body, upon its separation by death, returned to the malignant mals of matter, without either the prospect or the possibility of a future resurrection to life and felicity. Moshi. Eccl. Hist. vol. iii. p. 110. Jortin's Rom. on Eccl. Hist. vol. vi. p. 46.

BOGORODSKOI, in Geography, a town of Ruffia, in the government of Archangel; 8 miles S. W. of Mezen.

BOGORODITZK, a town of Ruffia, in the government of Archangel, on the Dwina; 44 miles S. S. E. of Archangel.

BOGORODSK, a town and district of Ruffia, in the government of Moscow, on the Kinafa; 28 miles E. of Moscow.

BOGORODSKOI, a town of Russian Siberia, in the province of Tomki, seated on the Obi. The church belonging to this town is famous for a celebrated picture of the Virgin Mary, called "Orchidita," which is brought every year, on the 21st of May, in procession to Tomik. There are iron works in this place.

BOGOROSTAN, a town and district of Ruffia, in the province of Ufa, seated on a river falling into the Samara.

BOGOTA, a town and province of New Granada, in Spanish South America, seated near the river Magdalena. The town is called Santa Fe de Bogota, and is the capital of the kingdom of New Granada; it is seated on the banks of the small river Pati, which runs into the Magdalena. It was made an archbishop's see by pope Julius III. in 1554, and an university was erected here in 1610. It has a sovereign court of judicature, the president of which is governor of the whole province or kingdom of New Granada. Near it are some gold mines, and the chief modern mines of Peruvian emeralds, justly preferred to all others, since those of Egypt have been neglected. Among the numerous cataracts of this country Bouguer mentions that of the river Bogota, which passes the city of the same name about 8 leagues before it joins the Magdalena, said to be a vertical fall of more than 1200 feet. N. lat. 4° 20'. W. long. 73° 40'. When the Spaniards took possession of this part of South America, they found in Bogota a nation more considerable in number, and more improved in the various arts of life, than any in America, except the Mexicans and Peruvians. The people of Bogota cultivated chiefly by agriculture. The idea of property was introduced among them, and its rights secured by laws, handed down by tradition, and observed with great care. They lived in large towns; they were decently clothed, and their houses, compared with those of surrounding tribes, might be termed commodious. Government had assumed, in this state of civilization, a regular form, and a jurisdiction was established, which took notice of different crimes, and punished them with rigour. They were acquainted with the distinction of ranks, and their chief reigned with absolute authority. He was attended by various officers and guards, carried with much pomp in a fort of palanquin, and the road was swept before him and furred with flowers. For the support of this expense taxes were levied on the people, who regarded their prince with veneration, and seldom approached him but with an awed countenance. One of the chief causes of that obsequious spirit, which prevailed among the people of Bogota, was the influence of superstition. The respect they paid to their monarchs was inspired by religion; and the heir apparent of the kingdom was educated in the innermost recedes of their principal temple, under such austere discipline, and with such peculiar rites, as tended to fill his subjects with high sentiments concerning the sanctity of his character, and the dignity of his station. This superstition, which, in the ruled period of society, is either altogether unknown, or waifles its force in childish meaning practices, had acquired such an ascendant over those people of America, who had made some little progress towards refinement, that it became the chief instrument of bending their minds to an untimely servitude, and subjected them, in the beginning of their political career, to a delusory hardly less rigorous than that which awaits nations in the last stage of their corruption and decline.

The people of Bogota (as well as the tribe of the Natchez) had advanced beyond the other uncultivated nations of America, in their ideas of religion, as well as in their political institutions. The sun and moon were the chief objects of their veneration. They had temples, altars, priests, sacrifices, and that long train of ceremonies, which superstition introduces wherever she has fully established her dominion over the minds of men. But the rites of their worship were cruel and bloody; they offered human victims to the deities and many of their practices resembled the barbarous institutions of the Mexicans. Robertson's Hist. America, vol. ii.

BOGRA, an uncultivated mountainous tract on the north of the barony of Mullery, in the county of Cork, and province of Munster, Ireland. It is upwards of ten miles long, and in some parts six miles in breadth; and is a common to the adjacent estates. In winter it is for the most part deep, marshy, and impassable; but in summer hard and firm, producing grass and heath, and is then grazed by vast herds of cattle, which are removed to the lower lands when this season is over. Large quantities of turf are also procured from it. Dr. Smith has applied to it these lines of Thomson:

"The brown burnt earth
Of fruits and flowers, and every verdure spoiled,
Barren and bare, a joyless dreary waste
Thin cottaged; and in time of trying need
Abandoned."

Many considerable streams flow from this high and wild tract, which discharge themselves into the Lee or Blackwater, as their direction is south and north. Smith's Cork.

BOGRUSH, in Ornithology. The Motacilla Schrenkianus, Linn. and Red Warbler of Latham, is described under this name in the Arctic Zoology.

BOGUE, in Ichthyology, the French name of a fish of the Sparus genus, Sparus boops of Linnaeus.

BOGUE, Bely, in Mythology, the white god to whom the Slavonians paid their adorations. His face, smeared with blood, was covered with flies. His rites consisted in diversions, games, and feasts. He was a beneficent deity, corresponding to the good principle, the "Oromazes," of the Persians. "The black god, " Thohery Bogue," corresponded on the contrary to the evil principle, the maleficent being Arimanis. He was worshipped by bloody sacrifices, and the prayers of his votaries were addressed to him in a mournful and plaintive voice.

BOGUSLAW, in Geography, a town of Poland, in the palatinate of Kivioia; 32 miles S.E. of Bialacriew. N. lat. 49° 30'. E. long. 31° 12'.

BOGUTCHAR, a town and district of Ruffia, in the govern-
government of Varazet, on a rivulet of the same name, falling into the Dan. 

BOGWANDOT, a town of Hindooslan, near the Ganges: 12 miles N. of Moorheadshah.

BOHABOL, in Ancient Geography, a town of Aisa in Sylva.

BOHADCHIA, in Botany. See Peltaria.

BOHAIN, in Geography, a town of France, in the department of the Arlar, and chief place of a canton, in the district of St. Quentin; 10 miles N. of St. Quentin. The place contains 2152, and the canton 13,818 inhabitants. The territory comprehends 1725 square kilometres, and 14 communes.

BOHAR, in Ichthyology, a species of Scilena, described by Forbkal, as a native of Arabia. The colour is red, lined, and clouded with white. Forke, Fn. Arab.

This bears a strong affinity to another fish described by the same writer, as an inhabitant of the same country, Kafimira. Gmelin expresses a doubt whether it does belong to the Scilena genus. The body is of an oblong form, and covered with smooth scales. When alive there are two large spots on the back, which disappear after the fish is dead. There are two short cirri, or bristles before the nostrils; in the upper jaw two subulate teeth, which project beyond the lower, the two middlemost of which are placed remote. The lateral line runs nearer to the back. Dorsal and anal fins rounded behind, and the armed part of both, the spines of the latter growing gradually larger; vertical connected by an intermediate membrane. Tail bifid. Gmelin.

BOHAROWCZE, in Geography, a town of Poland, in the palatinate of Kamnitz; 60 miles N.W. of Kamnitz.

BOHIDANGUE, a town of Bohemia, in the circle of Chrudum, which has the privilege of holding fairs.

BOHEA, in Botany. See Thea.

BOHEMIA, in Geography, called in German Boisheim, Bohein, Bohein, and corruptly Bohemian; that is the habitation of the Boi (see Bohi), a kingdom of Europe in the Austrian dominions; bounded on the north by Milania, Lofaitia, and Sileia; on the west, by the circle of the Erzgeber, the Voghtland, the marginiate of Cupmbach, and the Upper Palatinate; or, in general, by Francemia; on the south, by Bavaria and Austria; and on the east, by Moravia, Sileia, and the county of Gintz. Bohemia is environed on all sides with high mountains and large forests; towards the south it is separated from Austria by a ridge of considerable elevation, which passes to the north-east of Bavaria; and on the north-west, it is parted from Saxony by a chain of metallic mountains, called the Erzgeber, a word denoting hills that contain mines. On the west of the river Eger, near its junction with the Elbe, stands the mountainous group of Mileflou, near which is Donncberg, supposed to be the highest in the province; and on the north-east is the Sudetic chain, which branches from the Carpathian, and divides Bohemia and Moravia from Sileia and the Prussian dominions. This country was formerly remarkable for an extensive forest, a remain of the ancient Hercynia Sylva, which extended from the Rhine to Sarmitia, and from Cologne to Poland. The Gabreta Sylvai lay on the south-west of the same county, where a chain of hills now divides it from Bavaria.

Bohemia, as we have already observed, derived its name from the Boi, who under their leader Segoveus, settled in that country about 590 years before the Christian era. The Boi were soon after expelled by the Marcomanni; and these, being weakened by their wars with the Romans under the conduct of Tibérius, were subdued by the Scavi (see Sclava). Bohemia, as we have already observed, derived its name from the Boi, who under their leader Segoveus, settled in that country about 590 years before the Christian era. The Boi were soon after expelled by the Marcomanni; and these, being weakened by their wars with the Romans under the conduct of Tibérius, were subdued by the Scavi (see Sclava).

VOHIANI), who, like the other Scythians, wandered from place to place with their families and cattle; and, as Strabo informs us, even in the time of Augustus Caesar, lived promiscuously with the Thracians. Afterwards, foreseeing themselves well, in a few centuries they posish-d Millium, Poland, Moravia, and Bohemia. But retaining their ancient manners, they neglected to build cities; and inhabiting the country in detached hordes, they regarded only pasturage and the care of their flocks. The first ruler, or chief, mentioned by historians, was one Czechus, from whom the nations derived the appellation of Czechs, or Czechs, who, quitting Croatia, migrated first to Moravia, and from thence to Bohemia, about the middle of the sixth century, which he founded covered with wood, and puffed rather by herds of wild cattle than by men. Here he settled his final colony, and taught the few inhabitants of the country to cultivate the land, and to sow corn. After his death, the Bohemians remained for several years without a ruler or judge; but being now assembled in villages, they were anxious to obtain a more settled form of government than that which they had found eff. Dual during their pastoral life. With this view they chose for their governor a young man, whose name was Croc, distinguished by his prudence, who restored peace and order, and maintained the authority of the laws. He was succeeded by the youngest of his three daughters, Lybulla, who was respected for her skill in the art of divination; and who, about the close of the seventh century, married a country labourer of the name of Premilianus, who, being called from the plough to the dignity of governor, carried his cloak and shoes along with him, as memorials for his posterity, to prevent their being clathed with the propriety of their condition. This Premilianus is said to have founded the city of Prague, to have distributed the people into different ranks, and, after quitting some temporary intercommunications, to have reigned peacefully till his death. He is said to have been the first duke, though others trace the origin of the ducy to an earlier period, and say that Czechus was the first who bore this title. The government seems afterwards to have continued hereditary in his family, though with some form of election, and a descendant, whose name was Borrorious, or Borzivora, embraced Christianity about the close of the ninth century, and, after some opposition, introduced it into his dominions. On this occasion several churches were built, and schools erected; but upon the death of his son Wratifias I. in the beginning of the tenth century, his wife Drahomira, who assumed the government during the minority of her sons, manifested her hatred against the Chalians, massacred about 900 of them in one night, burnt their temples, and ordered them to deliver up their arms. However, upon the accession of her son Wenceslaus II. A. D. 916, the Christian religion was again encouraged; and, in order to prevent disputes with his brother Boleslaus, who had been educated under his mother, he acceded to that part of Bohemia, which lay beyond the Elbe. Wenceslaus, having obtained a victory in a duel, a challenge to which he accepted for the purpose of sparing the lives of his rebellious subjects, was invited by Otho the Great to the diet at Worms, where he offered him the title of king, which Wenceslaus declined accepting. In the year 935, Wenceslaus was murdered by his brother Boleslaus I. surnamed the Cruel, who, succeeding him, conducted his administration with great cruelty, percuting the Chalians, and expelling them the kingdom. His son and successor Boleslaus II. surnamed the Pious, founded and endowed 200 churches, and obtained leave from pope John IX. to create a bishop at Prague. His subjécts formed a conspiracy against him, on account of some reforms which he attempted to introduce;
BOHEMIA.

...and encamping on a mountain in the vicinity of Prague, they were expelled thence by the Christians, with the assistance of the Jews, and obliged to remain in peace. In recompense of this service, the Jews were allowed to build a synagogue at Prague. In the eleventh century, Brehovlus, the son of Ulrichus, having obtained the government of Moravia, kept possession of it by repelling the Poles who invaded it; and, succeeding to the government of Bohemia, on the death of his father, A. D. 1043, he again defended it against Hungarian robbers, by which it was ravaged, and having concluded a perpetual peace with Casimir, king of Poland, he died, leaving five sons, of whom the eldest inherited Bohemia; and Moravia was divided among the four youngest. Wenceslaus II. succeeded his brother, A. D. 1061; and, in 1086, was honoured with the regal title by the emperor Henry IV., who also invested him with the domains of Lusatia, Moravia, and Silesia. This dignity, however, was merely personal; and the constant title of king only commences with Premislao II., in 1199. He and his immediate successors, were styled Otto- cari, or Othogari, on account of their attachment to the interest of the emperor Otho. 

Upon the death of Wenceslaus IV. A. D. 1275, his son Premislao Othogar succeeded him, and having settled his affairs in Bohemia, took possession of Austria, Stiria, part of Carnitia, and other provinces to the south, and carried his arms into Prussia for the defence of the Christians; and having defeated his opponents in several engagements, he prevailed on many of the people to abandon Paganism. After his return to Bohemia, in 1274, he is said disdainfully to have rejected the imperial crown, which was afterwards given to Rudolph, count of Hapsburg; but Othogar refusing to do him homage, and to take from him the investiture of his states, alleging that he owed him nothing, and that he had paid him his wages, Rudolph having been a great friend of his court, was at length obliged to comply, and to deliver five fiefs to the emperor for the five fiefs which he possessed. A reconciliation, however, afterwards took place, and Othogar received the investiture of Bohemia and Moravia, on condition of reviving Austria, Carnitia, and Stiria. Wenceslaus V. succeeded his father in 1293, and was elected king of Poland, but refused the crown of Hungary, that was offered him in favour of his son, in 1300. The policy of his government failed; and John, the son of the emperor Henry VII., of the family of Luxemburg, who had married the youngest sister of Wenceslaus VII., obtained possession of the kingdom of Bohemia. John, having restored Bohemia to his son Charles, and procured for him the imperial dignity, proceeded with him to France, to the eclipse of Philip against the English, and was slain in the famous battle of Crecy, in 1346. Charles IV., emperor, having succeeded his father, erected his brother John marquis of Moravia, erected an university at Prague upon the plan of that at Paris, and engaged pope Clement VI. to erect the see of Prague into an archbishopric, and other privileges annexed to it, that the archbishop should have the honour of crowning the king of Bohemia. He enlarged and beautified his capital, by adding what is called the New City, in which he founded the college of Carleman. With the assistance of several learned persons, he reduced the laws of the kingdom to writing, which are still extant under the name of "Carolina Constitutiones." He greatly extended the boundaries of his hereditary dominions, and caused his son Wenceslaus to be crowned king, in the second year of his age. He also prevailed with the electors to choose him king of the Romans, in the sixteenth year of his age; and having commenced the junction of the Mohaw with the Danube, he died before he had executed his design; and in 1378, was succeeded by his son Wenceslaus VII. In the reign of this prince, who was notoriously dissolute, profligate, and licentious, and who, by his licentiousness and cruelty, incurred the hatred of his subjects. John Hufa and Jerome of Prague introduced the doctrines of the reformation into Bohemia. See HUS, and JEROME. Wenceslaus died suddenly in 1439; and before his brother Sigismund, who succeeded him as king of Bohemia and emperor of Germany, could come from Hungary to take possession of the crown, the Hufites, under John Zdes, had acquired great strength, and, upon a his approach to the kingdom, they first deputies to him, defining liberty of conscience; but, instead of granting their request, he only declared, that he intended to govern the kingdom as his father had done. A civil war ensued, in which the troops of Sigismund sustained several defeats; and which, after a continuance of fifteen years, concluded by his retreat of faith to Hufa and Jerome, terminated in mutual conciliations, and in his admission to Prague with great solemnity and rejoicing. Upon the death of Sigismund, in 1438, Albert of Austria, who had married his daughter, received the crowns of Bohemia and Hungary. The succession was, however, afterwards disputed and infringed by George Poudobrad, a Hufite chief; by Uladislao, son of Casimir, king of Poland; and by Matthias, king of Hungary. Uladislao ultimately succeeded, being elected, in 1471, by the majority of the electors, and soon after receiving the investiture from the emperor. Upon the death of Uladislao, in the 45th year of his reign over the Bohemians, and the 23d over the Hungarians, he was succeeded by his son Lewis in both the kingdoms of Bohemia and Hungary, A. D. 1516; but, in 1526, he engaged the Turks at Mohatz, and being utterly defeated, was drowned in the Danube, in his flight. After the death of Lewis, his dominions fell to Ferdinand, archduke of Austria, infant of Spain, and afterwards emperor, who had married Anne, the only daughter of Uladislao; and both the empire, and the kingdom of Bohemia, have ever since continued in the house of Austria. Ferdinand, at a diet of the electors held in 1547, declared the kingdom hereditary and absolute; and when Ferdinand II., in 1625, had routed the army of his rival Frederick at the White Mountain near Prague, Bohemia was declared to fall solely to the condition of an hereditary kingdom, so that from that time the electors had no concurrence with the right of succession. The crown, however, is conferred with some appearance of election, which right the electors of that kingdom pretend to claim; although, by the treaty of Westphalia, Bohemia is declared hereditary in the house of Austria. The king of Bohemia is the full feudal, and as such pays homage to the emperor and the empire for his fiefs; and with this exception, he has a right to exercise, through all his dominions, the royal authority agreeably to the laws of the kingdom, which prohibit his raising contributions or taxes otherwise than at the time when the fiefs are assessed, the appointment of which is entirely in their own power. He gives his opinion as elector, after the elector of Cologne, and formerly affixed at the assembly of the electors only at the election of an emperor, nor did he appear always at the diets of the empire. He is arch-butter, or arch-custos-boter, of the holy Roman empire; and on this office, his right to choose a king of the Romans is said to depend. It has been alleged, that Bohemia has been of old time a genuine state of the German empire, without contributing to its taxes, which was a privilege conferred upon it by Frederick II., in 1217, who at the same time exempted it from the jurisdiction of the supreme judiciary of the empire. In 1703, it was acknowledged by the three colleges of the empire, at an act of the diet called "the admission," that the king and elector of Bohemia has an undoubted right of seat and voice in all its assemblies; in consequence of which the emperor promised...
ruled, that on account of his hereditary kingdom of Bohemia, and of the countries belonging to it, he will pay an electoral proportion of all taxes and imposts of the empire and circle, and also 500 florins yearly to the chamber-judicators; the collective body of the empire engaging at the same time to take the kingdom of Bohemia, and the countries united with it, under its protection and defence.

Bohemia, ever since the time of Charles IV., has been divided into twelve circles, besides Prague, which is considered as a distinct territory. These are Kauzimer (comprehending Great Prague), Pilnitz, Leutmeritz, Koniggratz, Rakownik (including Broum), Chrubinski, Prachiner, Sia-ner (comprehending Little Prague), Bunsflauer, Sazters, Czafiauer, and Bechin. Each circle has two head-men, or captains, appointed annually, for the administration of the government, one from the file of lords, and the other from that of knights. The Duchy of Sileia, the marquisate of Moravia, and that of Lusatia, formerly held by this crown, but at present only Moravia, which is incorporated with the kingdom of Bohemia, and is in possession of the house of Austria. In 1742, the county of Glarz was ceded to the king of Prussia, and by him added to Sileia. The government of Bohemia is managed by six different courts; viz., the council of the regency, or great royal council, in which preëdies the great judge or burgrave of Bohemia, who has under him 18 lieutenants of the king's and other subjects; the council, or superior chamber of justice, at which the great matter of the kingdom is presided; the chamber of lieutenants of the new tribunal, to judge the appeals of the German vassals, with its president, vice-president and affifiers; the royal chamber of finance, with a president, and vice-president; and the chancery, which always follows the court. The states, consisting of the clergy, nobility, and gentry, and representatives of the towns, met at Prague, where a commissioner from the sovereign points out the necessity of granting such supplies as the court demands, which, however exorbitant, are granted without hesitation or examination, though not sometimes without subsequent complaint. The clergy are composed of the archbishop of Prague, several bishops, provosts, and abbots, besides the inferior clergy. The nobility consist of princes, counts, barons, and knights; the others are burgheers, husbandmen, and peasants.

The established religion of Bohemia is popery; but there are many protestants among the inhabitants, who are now tolerated by the wise regulations of Joseph II. in the free exercise of their religion. The Jews at Prague are indulged also with a toleration. The archbishop of this city is born legate of the holy apostolic see of Rome, and crowns the king of Bohemia; he is also a prince of the holy Roman empire, primate of the kingdom, and perpetual chancellor of the university of Prague. His suffragans are the bishops of Leutmeritz and Xoniggratz. The government of the church and clergy is vested in the archiepiscopal collitory, from which an appeal lies to the king or the pope.

The extent of Bohemia, and also its population, have been variously estimated. Its length is about 622 miles, and its breadth 142. Some centuries ago, the inhabitants were estimated at three millions; but in later times they have been very much diminished. It is said, that in the year 1693, and the three or four following years, no fewer than 300,000 families, and many other individuals quitted the country, among whom were many of the nobility, on account of the inefiine religious wars, and the succeeding irruptions of the Swedes. In M. Hoeck's "Statistical View of the States of Germany, &c." 1801, the kingdom of Bohemia is stated to contain 962 1/2 square miles, 250 cities, 308 market towns, 11,475 villages, 430,000 houses, 1,342,550 men, 1,466,817 women, and the total of the population 2,806,903. The number of Lutherans has been estimated at 9050, of the reformed at 25,110, and of Jews at 36,000. Some writers have stated the number of Protestant at 56,000, and that of the Jews at 40,000, of whom 8800 are settled at Prague. In their disposition, habits, and manners, the Bohemians resemble the Germans; being indeed a mixture of Slavonians and Germans, the former of whom live in villages and are slaves. They have no middle rank of people; for every lord is a petty sovereign, and every tenant a slave. The Bohemian peasants, on the imperial demesnes, have been lately relieved from the state of villainage, in which they had been so long and so unjustly retained; and it is hoped, that the example of the emperor will be followed by that of the Bohemian nobility in general, so that their vassals may recover those rights of which they have been long deprived. The natives of this country are singularly robust and strong-built, hand- some, except that their heads are somewhat too large, and active, thrwed, courageous, and sincere. The gentry are ingenious, brave, and more inclined to arms than arts. Learning in Bohemia is in a low state: though the kingdom possesses one university, 12 gymnasias, 2,219 German schools, 200 schools of industry, and 33 ladies' schools.

The Bohemian language is a dialect of the Slavonie, but somewhat harsher than that of their neighbours, who speak the same language, and who change the consonants, and particularly the f, more into vowels. The Bohemians formerly used the same letters with the Ruthenians; but in the time of Dateslaus the Pious, the Latin was introduced among them. Upon the first introduction of Christianity in this reign, the religious service was performed in the Latin tongue, a language unknown to the people; but in consequence of the representation of Methodius to pope Nicholas the Great, he allowed the prayers to be rehearsed in the vulgar tongue. But some years after, when a bishop was sent into Bohemia, the Latin tongue was again ordered to be introduced in all their churches. Perfons of a superior class, from their intercourse with the court of Vienna, speak high Dutch or German, with which the language of the common people is also intermingled.

Bohemia is, upon the whole, one of the highest countries in Europe, and forms a large extended plain, surrounded, as we have observed, by high hills covered with wood. The vale in the middle, which is watered by the Elbe, the Moldau, and the Vaga, is protected from the wind, and it has neither lakes nor morasses which taint the air, which is dry and clear, with wholesome vapours. The climate is therefore salubrious, and not liable to those sudden changes, which are so fatal to health in other places. The heat of summer, and the cold of winter are alike moderate. The soil is in general rich, though in some places it is sandy. It is fertile in corn, wine, fruits, pasture, fritt, ginger, hops, wool, flax, and timber. The Bohemian hops, which are much valued, are carried as far as the Rhine in great quantities. Bohemia produces a strong large breed of horses, many of which are purchased for the use of the French cavalry. Its mountains are the richest in Europe, in gold, silver, precious stones, copper, quicksilver, iron, lead, tin, sulphur, and saltpetre. The Bohemian tin is reckoned the belt of any except the English. All kinds of marble are also found in this country, together with pitch, coal, alum, molybdenum, excellent mineral waters, and hot baths. It also furnishes numerous herds of cattle, and abundance of game and wild fowl, and also bears, lynxes, wolves, foxes, badgers, martens, beavers, and otters. Its rivers and ponds afford a plentiful supply of fish, and such as are of the best quality and flavour.
According to the statement of M. Hocck (ubi supra.)
Bohemia had, in 1787,

The territorial produce of grain, forage, vines, woods, and rivers, amounted, in 1789, to 30,057,939 florins. Of cattle there were, in 1771, 97,800 oxen, 2,338 bulls, 3,688 cows, 2,773 calves, 84,523 hee, 1,67,343 hogs, 364 he-goats, 2,758 he-goats, and 3,338 rams. The produce of grain amounted to two millions of minots (a troy equal to three bushels) of which, ten millions of grains, four millions of minots of barley, and eight millions of minots of oats. In the list of natural productions are also to be reckoned fruit-trees, hops, principally in the circle of Saaz, flax, tobacco, saffron, poultry, bees (of which, in 1791, there were 20,257 hives), tin (chiefly at Schlenckenwaide, and there are ten mines of tin in the circle of Saaz, and two in that of Leutmeritz), cobalt, 10,000 quintals in the circle of Saaz, silver, alum, at Commothan, in 1788, 1,715,574 quintals. This author also states, that Bohemia had, in 1781, 95 manufactures, which employed 19,613 workmen. These manufactures are of linen, wool, cotton, silk, paper, glass, leather, &c. amounting in the whole to 25,843,447 florins, of which salaries take to the value of 11,840,77 florins. The articles of export, according to his enumeration, are alum, Epsom-fall, butter and greese, fish, flax, poultry, grain, mineral waters, harne-stines, wood, hops, cobalt, hides and skins, fruit, horses, pork, bismuth, vitriol, game, flax, tin, dimity, articles in iron, articles in glafs, garnets, bals, luens, brafi, paper, pot-alh, aqua fortis, lace, cloth, and thread. The articles of import are cotton, lead, white leen, books, iron, and iron articles, colours, flax, jewellery, lace, horned cattle from Hungary, coffee, cotton, fluffs, galls, merchandise of Lyons, liqueurs, silks, Hungarian cattle to the value of 806,000 florins, and wine to the value of 750,000 florins. The balance of trade is said to be in favour of the country. M. Hocck also informs us, that the revenues of the state are fifteen or sixteen millions; but that the expenses are so high, that out of this sum the frusius amounts only to 63,000 florins; that the contribution in 1789 was 3,056,017 florins, and the tax on the Jews 214,000 florins; and that the annual revenue from the domains of the crown was, during the life of Maria Theresia, 337,220 florins; these domains are now estimated at 177,774 acres. The number of soldiers to be furnished by Bohemia, in time of peace, is 54,674; and, in time of war, 72,092. The capital city of Bohemia is Prague; which is four.

Bohemia, a broad navigable river of North America, 12 miles long, which runs W. N. W. into Elk river, in Maryland, 11 miles below Elkton.

Bohemian, or Moravian, Brethren, in Ecclesiastical History, is an appellative anciently given to the Protestant in Bohemia. By their adversaries they were called Picards, i.e. Beypards. They were descended from the better sort of Hulstes, and were distinguished by several religious institutions of a singular nature, and well adapted to VOL. IV.

BOHIO, in Geography, a river of Chili in South America.

Bohk, in Ichthyology, is the Arabic name of a sort of Ray that inhabits the Red sea, and is described by Forfikul under the appellation of Roja glutinosa. Bohme, in Geography, a river of Germany, which runs into 4 X.
BOHN, John, in Biography, was born at Leipsic the 20th of July 1640, where he received the rudiments of his education. At a proper age his father sent him to Jen. to be initiated into the study of medicine. In 1669, he returned to Leipsic, continuing his studies there, until 1673, when he was called to Copenhagen, Holland, England, France, and Switzerland, every where attending the lectures of the most celebrated masters, but particularly attaching himself to Malpighi. Returning, at the end of two years, to Leipsic, he took his degree of doctor in medicine, and was in succession advanced to the rank of professor in anatomy, and in therapeutics. In 1691 he was appointed public physician to the city of Leipsic; and, in 1700, dean of the faculty of medicine, which offices he continued to hold with credit to the time of his death, in 1718.

Besides numerous dissertations on the different branches of medicine which had great merit, he published, in 1668, "Exercitaciones physiologicae xxvi," 4to. This work was afterwards considerably enlarged and reprinted in 1685, under the title of "Circulus anatomico-physiologicus, five economia corporis animalis," 4to. In this he examines, with accuracy and judgment, the different hypotheses then prevailing in medicine. He here first showed the difference between the systemic and the hepatic bile. Finding the liquor amni minguabile, he supposed it contributed to the nourishment of the foetus; which, however, later experience contradicts, as foetuses born without heads, or where the passage through the oesophagus into the stomach has been closed, are found to attain, in utero, equal bulk and firmness, as those that are perfect. He supposed the heart to be excited to contraction by the stimuli of the blood; and shews the ova pubis are not separated in parturition, to allow a free passage to the foetus; which was in his time the prevailing doctrine.

In his "De variolis, baccentes in patria graffatis," published in 1679, he advices giving purgatives with calomel, on the first attack of the complaint, with the view of rendering the disease more mild; a practice of which later experience has proved the utility. In his "De Renuntiatione vulnerum," 1689, 4to. Amsterdam, he shews what wounds are necessarily fatal. His treatise "De Officio medici duplici, clinico, et forensi," 4to. 1704, gives rules for the conduct of physicians, in attending their patients, and in giving evidence before a court of judicature. This is a work of great merit, and has fearfully been exceeded by any later production on the subject. These have all been frequently reprinted.

BOHOL, in Geography, one of the Philippine islands between Manila and Mindanao, about 16 leagues long from north to south, and 8 to 10 broad. The south coast towards Mindanao is the most populous; that is, from Lobag, the metropolis, to the little island or peninsula of Panglao. The soil does not produce rice, but is said to be rich in gold mines, and to yield, in great abundance, cacao, bananas, and severals sorts of roots which serve instead of rice. In the mountains there are multitudes of cattle and fowl in the sea, which the natives exchange with those of the neighbouring islands for cotton. N. lat. 10°. E. long. 122° 5'.

BOHONIZZ, a town of Bohemia, in the circle of Dechin, 2 miles S.S.W. of Teia.

BOHRAN, a town of Sileia, in the principality of Brodaw, 16 miles south of Brodaw.

BOHLITZ, a town of Moravia, in the circle of Brunn, 9 miles W.N.W. of Auigaiz.

BOHUS, or Bohus, a fortified island of Sweden, in Gotland, encircled by two branches of the Gotha, about 9 miles north of Gotheborg. The fort stands on a rocky eminence, and was formerly celebrated in the history of Norway, as a place of considerable strength, and forming the frontier fortresses during the constant wars between the Danes and Swedes. It was erected in 1599 by Hacquin IV. king of Norway, and, before the invention of gun-powder, it was a wooden fortress; but in 1448 was built with stone by Christian I. The situation is strong, and it is garrisoned by 100 men. The summit affords a pleasing view of the Gotha, wending at the feet of barren rocks. Bohus gives name to a jurisdiction of which it is the capital. It formerly belonged to Denmark, but by the treaty of Roschild, in 1658, it was ceded to Sweden.

BOHUSLAW, a town of Poland, in the palatinate of Kow, near the river Ros. N. lat. 46° 57'. E. long. 15° 11'.

BOJA, in Antiquity, a collar or chain fastened about the necks of criminals, to prevent their escape.

The word is also written boga, bodha, and baza.

BOIA, in Ancient Geography, an island in the Ægean Sea.

Anton. Itin.

BOJADOR, Cape of Bajadore (which see), in Geography, lies on the western coast of North Africa, placed in the Tables of the Commissioners of Longitude, in N. lat. 26° 23' 52", W. long. 14° 27'. and, in Rennell's map, in N. lat. 26° 26', W. long. 14° 17'—W. long. 14° 49', by M. Fleurieu, and 14° 28' Conn. de-Tems. This cape was doubled by Galiano and the Portuguese navigators, under the direction of Prince Henry, and embellished by their voyages to Madeira, which required their quitting the coast and venturing into the open sea, in the year 1413. For 20 years before this time, this cape had been the boundary of their navigation, and it had been deemed impassable. But this successful voyage, placed by the ignorance of the age on a level with the most famous exploits recorded in history, opened a new sphere to navigation, as it discovered the vast continent of Africa. Still washed by the Atlantic ocean, and stretching towards the south. Of such consequence was the doubling of this cape, that the Portuguese soon after advanced within the tropics, and in the space of a few years discovered the river Senegal, and the whole coast extending from cape Blanco to cape de Ver.

BOIANO, a town of Naples, in the county of Molife, the see of a bishop, suffragan of Benevento, who resides at Campo-Basso; 9 miles south of Molife. See BOVINUM.

BOARDO, Matteo-Maria, in Biography, count of Scandiano, a person eminent for literature, was born at Fratta near Ferrara, about the year 1430, and educated at the university of that city, where he principally resided. Being highly esteemed by the dukes Borso and Hercules I., he was appointed by the latter governor of Reggio in the Modenese, where he died in 1494. He was well acquainted with the Greek and Latin languages; and translated into Italian, from the former, the history of Herodotus; and from the latter, the golden age of Apuleius, and the chronicle of Ricobaldo. His essays in Latin verse are reckoned among the most elegant productions of that age. He also wrote in Italian verse a comedy, entitled "Timon," taken from a dialogue in Lucian, and other pieces. But his greatest fame was derived from his "Orlando Innamorato," which combines with the ancient epic the extravagance of modern romance. His style was rude, and his verification stiff and harsh; but the fervour of his fancy and the liveliness of his imagery rendered this work, which he left unfinished, captivating and popular. It was continued by Niccolo Agostino, and
and recomposed and polished, about half a century afterwards, by Lud. Dominoeco and Fr. Berni. The work of the latter is so well executed, that it has almost superseded the original. The best edition of Boiardo's own performance is that of Venice in 1544. This work served as the model and groundwork of Ariofto's "Orlando Furioso"; which is properly a continuation of it with new adventures. Boiardo's sonnets bear the character of a much purer style than his Orlando. Morei.

BOIARKI, in Geography, a town of Poland, in the pala-

tinate of Kiov, 38 miles S.S.E. of Bialaceiwick.

BOICINGNA, or, more properly, Boicincuga, in Zoology, the Brazilian name of the most common kind of rattle-snake that is found in South America:—Crotale boa-
guana of Boie.

BOICUAIBA, a kind of Peruvian serpent, supposed to belong to the boa genus. It is described as being twenty feet long, black on the anterior part, the rill yellow.

BOIGA, the name of an American snake, called by Lin-

nus Cthaler abdattula.

BOIGUACU, the name of a sort of serpent, called also ikeia, and by the Portuguese Cobra de venado. The relations of those writers who speak of this extraordinary creature partake rather of the marvellous, insomuch that we cannot but entertain considerable doubt as to the identity of the species; that it is of the boa tribe there can be no dispute. Perhaps it is no other than the ibideresa and Boiguacu of Sibs, which Dr. Shaw describes under the name of Bua regia; a species somewhat allied to, and confounding of which the history has probably been confounded with that of the latter kind. The boaiguacu is represented as the largest of all the serpent tribe, in which it agrees with the constrictor. It grows, we are told, to the length of four and twenty feet, and more. The middle of the body very thick, but becoming smaller at the head and tail. Down the middle of the back runs a chain of black spots, a hand's breadth distant from one another, each having a spot of white in its middle; and below these are two other rows of smaller black spots, towards the belly. Each jaw is said to be furnished with two rows of sharp teeth, white as pearl. The head very broad, with two protruberances over the eyes, and, in some of this species, two claws, like those of birds, behind the anus, towards the tail. The half particular of which must evidently be an absurd mistake, arising from the inattention of the describer.

We are further told, that the boaiguacu is a terrible creat-

ure, one that preys upon the larger animals, and will feize upon a man. That it either lies in ambush in the thicket, or on the branches of large trees, from which it throws itself upon its prey. It has no venom in its bite; and its flesh is eaten and esteemed a delicacy. This fact is common in the Brazils. The size to which it attains sometimes is astonishing. Borrius preferred the skin of one (supposed to be the same) which had been killed by himself, that was twelve yards long; and he relates, that there was a serpent of this kind destroyed in Java, that measured thirteen yards and a half in length, and had, when killed, a boar in its belly. And de Lact relates, that in Rio de la Plata there are some of this kind of serpents so large, that they will swallow a whole flag, the horns not excepted. This is probably exaggerated. It is affirmed of the boa constrictor, by others, that when the enormous creature has gorged an animal of this kind, the horns remain sticking out of the mouth of the serpent, till the digestion of the flesh takes place, and the horns drop off. The boaiguacu is eaten by the natives of Brazil.

BOII, in Ancient Geography, a people, who, according to Cesar (lib. vi. c. 24.), were a Gaulish nation, but from Gaul passed into Germany, and, settling in the present Bohemia, continued there till they were expelled by the Marcomanni. Strabo calls them at different times Celts and Gauls; and M. Pelloutier is of opinion that they were a tribe of the Celts, who inhabited Thrace and Illyria. Some of these, he says, occupied the Hernicin forest on the other side of the Danube, and migrated into Bohemia; others were mixed among the inhabitants of Thrace; and others remained in Illyria, between the Danube and the Drave. Of these Boii there were, therefore, several distinct tribes. After Belo-

vius had made an irruption into Italy through the country of the Taurini, the Boii and Lingones entered it by the Pen-

nine Alps. These Boii occupied the more southern part of Galia Cipadaniss, or Cifalpine Gaul, and were separated from Etruria by the Appennines, and from the Senones by the Ru-

beo. Their principal city was Bononia. In the year of Rome 395, they advanced in Italy as far as the plain of Frascati, and were defeated there by the Dictator C. Sul-

picius. Pursued by the Romans, they retired over the Da-

nube, and inhabited the confines of Pannonia and Illyria, along with the Taurini and Scordisci. In this country they contended with Boebeibis, king of the Geterz, and were destroyed by his troops. Their country afterwards remained desert and uncultivated, and was called the "district of the Boi." The Romans in process of time built here the towns of Scabariania and Sabaria. Cesar is supposed to have re-

ferred to these Boii, when he says, that the Boii who had remained on the other side of the Rhine, and who had de-

scended from Noricia, where they had fled to the town of Noreia, were summoned by the Helvetii to unite with them in an irruption into Gaul. Another body of the Boii hav-

ing entered into Germany, settled on the north of the Da-

nube, in an extensive country, almost wholly surrounded by mountains, and having on the western part the Hercynian mountains. This country was afterwards occupied by the Marcomanni, and is now called Bohemia. These Boii were blended by degrees with other nations; but retaining some kind of importance, they preferred an imperfect trace of their name in that of Bozarii, whence proceeded Bavaria. The Boii, who joined the Helvetii on their attack of the Gauls, were overpowered by Cesar; but after their defeat, the Edii prevailed with Cesar to allow them a settlement, on account of their distinguished valour, in a small district of their terri-

tory. It is said that he built for them a small town called "Gegovica," of which no trace now remains. M. d'Anville places these Boii in a kind of peninsula, formed by the rivers Liger and Elaver, before their re-union. Another body of the Boii, denominated by Aufonius "Peci," occupied the western part of Gaul, comprehended in Noven Populana, fourth went of the Diturges Vivicia, upon the sea-coast.

BOII, or Peruncule, in Surgery, is a painful, circums-

fered, and inflammatory tumour, feldom larger than a

pigeon's egg, generally of a conical figure, seated in the sub-

cutaneous adipose membrane, and proceeding from an

internal cause. It's apex or central point is but slightly raised above the skin, and commonly tends to suppuration. Part of the surface of the body is exempt from the attacks of this disorder, but those parts are more liable to boil which abound with cellular substance. The purulent fluid they contain is usually inclosed in one or more cysts or sacculi, and is very slow in coming to a state of full maturation; so that it is re-

quie
quire particular medical attention. But it is a very bad prac
tice, though it by no means uncommon, to administer frequent purges in such cases, which tend still more to diminish the
tone of the patient, already too much exhausted. The state of
the sytem must be remedied by such means as are indicated
by the peculiar circumstances of the patient; for no general
plan can be prefcribed, which is proper in all cases.

Before a considerable boil appears, the patient sometimes
feels himself indisposed, rather feverish, and is troubled with
a number of slight complaints, which all disappear as soon as
the tumour is formed: so that in this case it seems to have
some similarity with a critical metalasis. Otherwise, boils,
on account of the sense of tenion and pain which they occasion,
are more troublesome than dangerous.

The best common method of treating these tumours
locally, is to bring them as soon as possible to suppura-
tion, as this seems to be their natural tendency; and as
the attempt to discuss them generally succeeds either very
imperfectly or not at all, some few cafes excepted. For
discussing them are recommended the external applications of
spirit of vitriol mixed with honey, strong wine-vinegar, car-
phorated oil, &c. In most cafes, however, it is necessity
that we should immediately endeavour to promote suppuration,
which may be done by means of simple emollients;
such as bread and milk poultices, linseed cataplasm, or a
mixture of oatmeal and honey. If the pain be extremely
great, we may add a small quantity of the extract of hemlock
or poppies, and give a grain or two of opium internally.

When the inflammation is moderate, but the hardnes con-
derable, dilatant and caudal part remedies, such as roasted
onions, white-lily roots, gum ammoniac, &c. must be
combined with the emollients. Mr. Wielitz affirms that no re-
medy brings boils so easily and quickly to suppuration, as the
leaves of the ricinus communis boiled in milk, and applied in
the form of a poultice.

When the tumour does not burst spontaneously, which it
generally does at its point, it is to be opened with a lancet.

Besides the general rules, according to which such an abscess
must be treated, it is necessary also that the core or mem-
branous part of the boil should be extracted in due time,
and that all the remaining hardnes about the circumference
of the fore should be discussed. For as long as this core
remains in the cavity, the fore will not heal perfectly; neither
can it be brought to heal mafee the hardnes be discussing, but
either an ulcer or a fibula is produced, or the fore scis over,
whilst an induration still remains behind, which gives rise,
according to the part in which it is situated, to various trouble-
some symptoms, and after some time becomes again in-
flamed, nor does it disappear entirely till it is discussed by
a complete suppuration.

We may indeed attempt to discuss such indurations by
means of the usual deoblitents, such as the external applica-
tions of mercury, hemlock, soap, belladonna, &c. but they
will generally fail of their effect, and we shall be obliged to
wait till a new inflammation is produced. It is therefore best
to support and promote the suppuration from the very com-
menccement, and not to suffer the abscess to heal up till all re-
manes of induration have disappeared; and when the suppuration
does not proceed with sufficient vigour, it ought to be
promoted by means of warm turpentine, and digestive oint-
ment. If this do not produce the requisite effect, it should
be mixed with red precipitate; and to the indurated parts
we ought to apply externally hot fomentations, with other
emollient and stimulant remedies, according to the general
rules laid down under the article ABSCESS.

Boiis, gum. See Gum.

BOILEAU, NICHOLAS, named Defpreaux, in Biography,
an eminent satirical poet and critic, was born either at Paris,
or at Cron near that city, in 1636. Boileau himself, after
having been truly enabled by his writings, had the silly
vanity to pique himself on the high antiquity of his lines.
He pretended that John Boileau, the ancestor of his family,
was ennobled in 1571 by Charles V. king of France; and he
boasted, in consequence of a suit instituted against his
family, and occasioned by a severe scrutiny into the validity
of titles assumed by the noblesse of the kingdom, under
a commission of inquiry established by Louis XIV. in 1695,
that he had gained his cause with flying colours, and that he
had a patent in his possession which allowed him a nobility of
400 years' antiquity. It is said, however, that the sentence
passed in favour of Boileau's nobility was the result of his
reputation as a poet, honoured with the protection of the
king; that the titles produced had been fabricated:
and that a writ had been found among the papers of the
poet for 20 louis d'ors, paid by him for his share in the titles
which had been forged by an obscure person of the name of
Hauquier. However this be, his own writings were un-
questionably his best "lettres de noblesse." As a younger
brother, he was hardly treated in his youth, more especially
because his father regarded him as a heavy and stupid lad,
delicate of that vivacity of temper and understanding for
which his elder brothers were distinguished. We are in-
formed also, that he underwent an operation for the stone at
eight years of age. These circumstances probably induced
him to declare, that if he could be restored to infancy, on the
hard conditions he had experienced, he would not have ac-
cepted the grant; and hence he always diftincted the common
opinion that infamy is the happiest period of our lives.

Defpreaux, indeed, seems not to have thought the other
parts of his life more happy than his infancy; to him all ap-
peared equally miserable; youth tormented with passions, ma-
turity with cares, and old age with infirmities; and he seemed
to have adopted in some measure that philosopher's opinion,
who, when he was asked "what was the happiest period of
a man's life?" answered, "that which is past." "It would
be difficult," says Defpreaux, "to determine this question;
we are sure, however, that it is hardly ever the present time."

Boileau was intended by his father for the profession of an
advocate; but his taste for polite literature, to the culture
and gratification of which he devoted his leisure hours,
derived him for this mode of life; and his repugnance to it
was strongly indicated by his dropping asleep, while his
brother-in-law, M. Dongois, a clerk of parliament was reading
an arret, which he had taken great pains to compose.

Upon this, he was sent home to his father as an invincible
dunch, who would be nothing else but a simpleton during his
life. Relieved from the embarrassment of pursuing a profes-
sion which he detested, his attention was next directed to schola-
tic divinity, from which he was equally averse. When hisfather
found, that his views repelling him were altogether frust-rated,
he allowed him to indulge his own inclination, and to devote
himself wholly to literature. At the age of thirty years, Boi-
leau's true character, which had long been unknown to any
but his intimate and confidential friends, was developed;
and he appeared before the public as a "writer of fai-
ture." He began with ridiculing the numerous tribe of bad writers,
and he thus excited a host of enemies. Among others the
duke de Montesfiier reproached him on account of the fe-
v'y of his personal faiures as injurious to society; but he
contrived to disarm his enmity by a single stroke of flatter-
try, which verified, says D'Alembert, the lines of La
Fontaine:

"Amuse the great with adulation,
Your praise to all their faults extend,
BOILEAU.

Whatever their former indignation,
The bait goes down, and you're their friend."
Twelve of his Epistles were published; one of these was his satire against women, the most bitter and outrageous of all, which is said to have been occasioned by his having been in early life jilted by a young person to whom he was going to be married, and who ran away with a molequaire. Racine, the younger, one of his particular friends, however, says, that he never had a mistress, nor ever thought of marrying. On the publication of this satire he was attacked from all quarters; but his friend Racine confided all as he could: "Courage," says he, "you have attacked a numerous corps, which is all tongue: but the storm will blow over." The best of his satires was that entitled "A fin Epirite," a piece of irony, abounding with the most keen and polished ridicule. Whatever reproach Boileau incurred for the personality of his satires, it is mentioned to his honour, that he always distinguished between folly and vice; and that he never attacked bad taste and dunces with any other arms than ridicule, whose vice and profligacy were treated by him with just indignation.

The Epistles of Boileau were followed by his "Art of Poetry," which is reckoned the best of all the poetical works of criticism existing, equally admirable for the good sense of its maxims, and the appropriate beauty of language by which its precepts are explained. This was succeeded by his "Epistles," tinted around the model of Horace; and rendered peculiarly pleasing by the union of morality with criticism, and description with sentiment; interspersed with characteristic traits and anecdotes of himself. In one of these, addressed to the king, he artfully, at the instigation of Colbert, endeavoured to divert the sovereign's mind from the schemes of conquest to the glory of promoting the welfare of his subjects by plans of utility and beneficence. Lewis was gratified by the delicate praise with which this advice was accompanied, and applauded the epistles; but went to war with Holland. In 1674, he published his "Lutrin," a mock heroic kind of composition, founded on a trifling dispute between the treasurer and charter of the holy chapel, and ranking among the first productions of this clafs. Boileau had now acquired a degree of reputation which recommended him to favour and patronage at court; and the king honoured him with a pension, an exclusive privilege for publishing his own works, and the office, conjointly with his friend Racine, of royal historiographer. In this latter capacity, neither he nor his associate had an opportunity of appearing before the public. Boileau, indeed, published his "Ode on the taking of Namur," which is more an historical than a poetical effort. At this time he attended frequently at court; and yet he maintained a freedom and frankness of speech, more especially on topics of literature, which are not common among courtiers. When Lewis affixed his opinion of some verses which he had written, he replied: "Nothing, fire, is impossible to your majesty; you wished to make bad verses, and you have succeeded." He also took part with the persecuted members of the Port-royal; and when one of the courtiers declared, that the king was making diligent search after the celebrated Arnauld, in order to put him in the Bastille, Boileau observed, "His majesty is too fortunate; he will not find him!" and when the king asked him, what was the reason why the whole world was running after a preacher, named le Tourneux, a disciple of Arnauld, "Your majesty," he replied, "knows how fond people are of novelty:—this is a minister who preaches the gospel." Boileau appears, from various circumstances, to have been no great friend to the Jesuits, whom he offended by his "Epistle on the Love of God," and by many free speeches. By royal favour, he was admitted unanimously, in 1684, into the French academy, with which he had made very free in his epigrams; and he was also associated to the new Academy of Inscriptions and Belles Lettres, of which he appeared to be a fit member by his "Translation of Longinus on the Sublime." To science, with which he had little acquaintance, he rendered, however, important service by his burlesque "Arret in favour of the University, against an unknown performance called Reason," which was the means of preventing the establishment of a plan of intolerance in matters of philosophy. His attachment to the latter, as the true models of literary taste and excellence, occasioned a controversy between him and Perrault concerning the coporative merit of the ancients and moderns, which was prosecuted for some time by epigrams and mutual reproaches, till at length the public began to be tired with their disputes, and a reconciliation was effected by the good offices of their common friends. This controversy laid the foundation of a lasting enmity between Boileau and Fontenelle, who inclined to the party of Perrault. Boileau, however, did not maintain his opinion with the pedantic extravagance of the Dacierists; but he happily exercised his wit on the misrepresentations of the noted characters of antiquity, by the fashionable romances of the time, in his dialogue entitled "The Heroes of Romance," composed in the manner of Lucian. In opposition to the absurd opinion of father Hardouin, that most of the classical productions of ancient Rome had been written by the monks of the 13th century, Boileau pleasantly remarks, "I know nothing of all that; but though I am not very partial to the monks, I should not have been forc'd to have lived with friar Tribulus, friar Juvenal, Dem Virgil, Dom Cicero, and fuch kind of folk." After the death of Racine, Boileau very much retired from court; induced partly by his love of liberty and independence, and partly by his dislike of that adulation which was expected, and for which the close of Lewis's reign afforded more feamy materials than its commencement. Separated in a great degree from society, he indulged that austere and milantropical disposition, from which he was never wholly exempt. His conversation, however, was more mild and gentle than his writings; and, as he used to say of himself, without "nails or claws," it was enlivened by occasional fables of pleasantry, and rendered instructive by judicious opinions of authors and their works. He was religious without bigotry, and he abhorred fanaticism and hypocrisy. His circumstances were easy; and his prudent economy has been charged by some with degenerating into avarice. Influences, however, occur of his liberality and beneficence. At the death of Colbert, the pension which he had given to the poet Corneille was suppressed, though he was poor, old, infirm, and dying. Boileau interceded with the king for the restoration of it, and offered to transfer his own to Corneille, telling the monarch, that he should be ashamed to receive his bounty while such a man was in want of it. He also bought, at an advanced price, the library of Patrie, reduced in his circumstances, and left him in the possession of it till his death. He gave to the poor all the revenues he had received for eight years from a benefice he had enjoyed, without performing the duties of it. To indigent men of letters his purse was always open; and at his death he bequeathed almost all his possessions to the poor. Upon the whole, his temper, though naturally austere, was, on many occasions, kind and benevolent, so that it has been said of him, that he was "crue only in verse;" and his general character was distinguished by worth and integrity, with some alloys of literary jealousy and injustice.
judges. He died of a dropy in the breast in 1711, at the age of 75, and bequeathed the greater part of his property to charitable uses. His funeral was attended by a very considerable number of person of rank and literature. How came this man (exclaimed a woman in the street) to have so many friends? They say he never spoke well of any body in his life.

As a poetical writer, he has been denominated the "poet of good sense," correct in his verification, choice and pure in his language, just and rational in his sentiments, always guided by judgment and taste, observing the limits of decorum, and never betrayed by wit or fancy into extravagances. Few, if any writer, ever composed so much, with so little occasion for erasure or alteration. Voltaire, who often denied the equity of his decisions in matters of criticism, says of him, in a letter to Helvecius: "I agree with you that Boileau is not a sublime poet; but he executed admirably whatever he undertook. He is clear, easy, happy in his expression; he seldom rides very high, but he never stinks. Behold the subjects of which he treats are not of a kind to require great elevation.—I shall, therefore, always warmly recommend that kind of writing which he has so well taught, that respect for language, that quick succession of ideas, the art and facility with which he conducts his reader from one subject to another; and above all, his simplicity, which is the true fruit of genius." Boileau, was the first writer who formed the national taste of France, and by his translations and imitations gave his countrymen a true relish for the epistles and Satires of Horace, which before his time used to be much less esteemed than his odes. The great defect of Boileau, according to D'Alembert, is want of feribility; and if enthuasiam, which is incompatible with that coldness of heart that distinguished his character, is essential to a true poet, his claim to this honourable appellation must be disallowed. Nevertheless, his works may be justly regarded as master-pieces of their kind, and can never die, as long as the language in which they are written exists. Having taken great pains in the composition of them, he was not insensible of their peculiar and characterific excellence; accordingly, in some lines written by himself, and intended to be placed under his portrait, he makes no hesitation in affirming that he had united the merits of Perius, Juvenal, and Horace. Boileau and Pope have been thought much to resemble one another, as to both the kind and discriminating character of their writings; but, says a very competent judge, "Boileau, with a nearly equal portion of wit, has much more delicacy and correctness; while Pope as much surpasses him in force and fancy. Both abound in good sense, and each has enriched his language with nervous lines that have passed into proverbial sentences." In another place the same writer observes, that after we have rendered to Boileau Delspreaux all due homage as a great poet, and as the legislator of taste, his faults as a satirist indicate an acrimonious and unfeeling character, a high conceit of his own powers and consequence, and an unparnoble disregard of the happiness and reputation of others. "If the English poet had as much causticity as the French, and more peculiarity irritability, he seems to have had a more feeling heart, and a more true sense of justice." We may remark, that pernicious satire soon loses its salt and poignancy; and that the fatires of Boileau, as well as the Dunciad of Pope, are les read now than any of their other works.

Besides the works of Boileau, already mentioned, there are several smaller pieces both in prose and verse. Of the whole there have been various editions, with explanatory notes; and of the rest the principal are that of Geneva, 2 vols. 1716,
BOIL

breadth of the boiler, and at about twelve inches distance from one another. These are placed twenty-four inches above the surface of the fire. On these many bars of iron they lay, cross-wise, the common flat bars of iron, as close as they can lie together, and then make up the sides with brick-work. In the middle of the bottom of this boiler is laid a trough of lead, wherein they put at first about a hundred pound weight of the rock. They use Newcastle coals in the boiling; and if they find the liquor not strong enough, they add more of the rock at times, as it boils. Phil. Trans. N. 142.

The boiler for making colours, &c. must be made of pewter; because iron and copper will be corroded by the saline substances used in the manufacture of them.

Count Runford (see his Elays, vol. i. p. 220.) recommends double bottoms to boilers, and also to saucepans and kettles of all kinds, used for culinary purposes; which contrivance, he says, will, in all cases, most effectually prevent what is called by the cooks, "burning-to." The heat is so much obstructed in its passage through the thin sheet of air which, notwithstanding all the care that is taken to bring the two bottoms into actual contact, will still remain between them, that the second has time to give its heat as fast as it receives it to the fluid in the boiler; and consequently it never acquires a degree of heat sufficient for burning anything that may be upon it. He suggests that it will probably be best to double copper saucepans and small kettles throughout: and as this may and ought to be done with a very thin sheet of metal, it would not cost much, even if the lining were to be made of silver. When the two sheets of metal that form the double bottoms of boilers are made to touch each other throughout, by hammering them together, after the false bottom has been fixed in its place, they may be tacked together, by a few small rivets placed here and there, at considerable distances from each other, and when this is done, the boiler may be tinned. In this operation, if proper care be taken, the edge of the false bottom may be folded by the tin to the sides of the boiler, and thus the water or other liquids, put into the boiler, will be prevented from getting between the two bottoms. The Count adds, that this invention of double bottoms might be used with great success by distillers, to prevent their liquor, when it is thick, from burning to the bottom of their stills. (See STILL.) Having found in the course of his experiments, (See Phil. Trans. 1792. Part I.) that confined gas, the heat exerted by that can be opposed to heat for the purpose of confining it, he proposed to confine the heat in the boilers of his contrivance, and to prevent its escape into the atmosphere, by means of double covers. These covers were made of tin, or rather of thin iron plates tinned, in the form of a hollow-cone; the height of the cone being equal to about one-third of its diameter; and thus the air which it contained was entirely shut up, the bottom of the cone being closed by a circular plate or thin sheet of tinned iron. The bottom of the cone was accurately fitted to the top of the boiler, which it completely closed by means of a rim about two inches wide, which entered the boiler; which rim was folded to the flat sheet of tinned iron that formed the bottom of the cover. The steam, generated by the boiling liquid, was carried off by a tube about half an inch in diameter, which passed through the hollow conical cover, and which was attached to the cover, both above and below, with solder, in such a manner that the air with which the hollow cone was filled remained completely confined, and cut off from all communication with the external air of the atmosphere, as well as with the steam it generated in the boiler. For his various contrivances in the most advantageous construction of boilers for the saving of fuel, and for producing the desired effect, we refer to his Elays, vol. ii. p. 18, &c.

BOILERY, or BOILY, in the Salt Works, denotes a salt-house, pit, or other place, where salt is made.

BOILING OF MEAT, in Cookery, is the exposing of meat to the heat of boiling water, while it is immersed in it for a certain time. By this joint application of heat and moisture, the texture is rendered more tender and more soluble in the flomach; and it is only in this way, that the former parts, as the tendinous, ligamentous, and membraneous parts can be duly softened, and their gelatinous substance duly extracted. A moderate boiling renders the texture of animal flesh more tender, without much diminution of its nutritious quality; but if the boiling is extended to extract every thing soluble, the substance remaining becomes less soluble in the flomach, and at the same time much less nutritious. But as boiling extracts in the first place the more soluble, and therefore the saline parts; so the remainder, after boiling, is in proportion to the communiction of the operation is alkaline, and lefs heating to the fystem.

Boiling is commonly practiced in open vessels, or in vessels not closely covered; but it may be performed in digester; or vessels accurately and tightly closed; and in such vessels the effects are very different from those that take place in open vessels. As we can hardly employ any other degree of heat than that of boiling water, the water in the digester is never made to boil, so there is no exhalation of volatile parts; and, although the solution is made with great success, and may be to any degree required, yet if it be not carried very far, the meat may be rendered very tender, white it still retains its most rapid parts; and this kind of cookery will always give the most desirable state of boiled meat. Boiling, in the ordinary way, is different, according to the proportion of water that is applied. If a small quantity be applied, and the heat in a moderate degree is continued for a long time, this is called "boiling," and has the effect of rendering the texture more tender, without extracting much of the soluble parts; and of course it leaves the meat more rapid, and sufficiently nourishing. Cullen's Med. vol. i. p. 400, &c.

BOILING, evaporation, in Physics, is the internal commotion excited in a mass of water or other liquified substance, by the successive conversion of the lower portions of the fluid into vapour, and their violent effort under this expansive and elastic form to make their escape. It is usually, though not necessarily, produced by the application of heat. The circumstances which precede or accompany the phenomenon of boiling, are best observed in a thin transparent vessel nearly filled with water, and suspended over a lamp or a charcoal fire. Numerous minute globules are seen collecting from all points towards the fides and rising in a stream to the surface; occasioned evidently by the discharge of air, which is always in some proportion combined with water. As the heat increases, the liquid particles near the bottom of the vessel suddenly burst into steam, and shoot upwards; but in ascending through the colder mass, they again collapse, drop their progres, and seem lost. Such alternate expansions and contractions; by throwing the fluid into a gentle tremor, frequently causes a peculiar sort of singing noise, which is rightly supposed to betoken the approach of actual boiling. This singing is more likely to happen in the case where heat is applied partially; for instance, if a tea-kettle be placed at the side of the fire, since the heat is then more slowly and unequally diffused through the body of the water. But after the whole contents being fully penetrated, are warmed up to the requisite degree of intensity, the steam, as salt as it is formed,
processed, afeenda continually and escapes uneapired through
the fluid, which it, therefore, leaves with violent agitation.

The same appearance almost is produced by removing or
even diminishing the atmospheric pressure. Thus, if a tum-
bler holding warm water be introduced under the receiver
of an air-pump, as the exhaustion proceeds, or the incumbent
weight is gradually withdrawn, the latent portion of air is
discharged in a rapid flow of expanded bubbles. But this
process, at some certain point of rarefaction, is succeeded
by the vehement commotion which constitutes boiling; and
the water, assuming its invisible form, fills the imperfect
void with vapour, which betrays its existence by condensing
against the sides of the receiver in copious dew. Nor is heat
positively necessary towards vaporization, for it only confines
in accomplishing that effect, and supplies the want or the
imperfection of our means of producing exhaustion. By
help of an air-pump of the bell construction, the colder
water may be made to boil, nay, ice itself could be changed
into invisible steam. Hence the utter impossibility of ever
obtaining a perfect vacuum, because the restraining influence
of pressure being entirely removed, the liquid matter un-
avoidably presented would always diffuse a thin vapour.

The opposite influence of heat and pressure on the con-
stitution of fluids is well exhibited by a very simple yet
striking experiment. Take a large thin phial, and having
warmed it gradually to avoid the risk of cracking the glass,
fill it completely with boiling water, cork it tight, and ex-
pel it to a current of cold air. As the water cools, it
necessarily contracts its volume, and leaving an imperfect
vacuity below the neck of the phial, it hence becomes to a
considerable degree relieved from the load of atmospheric
pressure. It therefore soon begins again to boil, nay, it
will boil more briskly the fatter it cools; and this singular
appearance, if contrary to our usual notions, may continue
perhaps for the space of half an hour, till the water has
grown as cold almot as the temperature of the human body.

On the same principle depends the construction of what is
called the pulse glass: this consists of two balls connected by
a pretty long tube; one of these balls is filled with coloured
water or spirits of wine, which having been made to boil and
despel the air by its vapour, at the same instant the projecting
from the other ball is hermeticallysealed. As that vapour condenses with cold, it will leave the included
liquid then in a sort of vacuum, and the heat of the hand is
then sufficient to cause it to boil and to flow from one ball
into the other.

If a vessel containing water be placed over a steady fire,
the water will grow continually hotter till it reaches the
limit of boiling, after which the regular accensions of heat
are wholly spent in converting it into steam. The water
therefore remains at the same pitch of temperature, how-
ever fiercely it boils. The only difference is that, with a
strong fire, it sooner comes to boil, and more quickly boils
away. Hence the reason why a vessel full of water, and
plunged into the centre of a larger one, which is likewise
filled with that fluid, barely acquires the boiling heat, but
will never actually boil.

The formation of steam occasions a prodigious consump-
tion of heat; for if the time be noted in which water, by
the action of a strong fire, is raised from the limit of freezing
to that of boiling, it will be found to require more than five
times longer a space to boil entirely away. Thus, a portion
of heat corresponding to above 400 degrees by Fahrenheit's
scale, is always consumed in the act of boiling, or rather it
is transferred and enters into the composition of steam,
the gaseous product. This absorbed heat is as constantly
evolved when steam condenses and returns to its liquid form.

Hence in distillation a very large refrigeratory is required for
condensing a comparatively small quantity of aqueous or
spiritious vapour. Hence too the explanation of the fam-
miliar remark that steam scalds more cruelly than boiling
water.

The heat of boiling water, being subject to the influence
of the atmospheric pressure, is thus not absolutely fixed.
It varies with the variation of the barometer, and decreases
as the mercury descends. The extent of this fluctuation
may in our changeable climate amount to five degrees by
Fahrenheit's scale, the successive difference of a degree cor-
responding nearly to each twentieth part of the remaining
incumbent weight. On the tops of lofty mountains water
will boil much sooner than in the plains below. This curi-
ous fact has been noticed by several travellers, and was par-
ticularly observed by Sauvile on the summit of Mont Blanc.
A still greater variation would be experienced on the peak
of Chimborazo, the highest point of the Andes, where
water would boil with a heat farcierly superior to that which
is commonly ascribed for the boiling of spirits of wine.

It is therefore evident that, under an augmented pressure,
all liquids will more slowly reach the crisis of ebullition and
will then have acquired a more intense heat. Thus water
may be heated up many degrees above the mean point
of boiling, if it be subjected to the action either of condensed
air or of confined steam. Such is the principle of Papin's
Digerator; which, being nearly filled with water, is shut
perfectly close, and let on a good fire. As the steam thus
formed is prevented from escaping, it necessarily concentrates, and
exciting accumulated energy, it by its prodigious compression
enables the water continually to receive additional heat.
Nor would this progress at all stop, till the elasticity of the
imprisoned vapour comes to ferment every obstacle, and
bursts the vessel with terrible explosion. Accidents of that
form are extremely dangerous, and the experiment has conse-
quentiy never been pulled to its utmost practicable limits.
When the fracture takes place, not only the confined steam
is liberated, but the pressure being now removed, the excess
of heat instantaneously converts a part or the whole of the
water likewise into steam, which augments the general
effect. This we may perceive in the burling of a glass cracker; for the little bafe is shivered into atoms, and
the water which it contained is entirely dispersed, beating down
flat the wick of the candle by the violence of the sudden ex-
plosive blast.

Hence the boiling heat of a deep cauldron is always rather
greater than that of a shallow pan. This excess we might
estimate at nearly one degree of Fahrenheit, for each foot of
depth. The heat of ebullition must also rise somewhat
higher, if the steam be not allowed to escape as fast as it is
generated; for which reason there may be a slight difference
of energy between rapid and slow boiling. Hence by the
combined operation of both these causes, water deeply lodged
in the bowels of the earth, or concealed under the dark bed
of the ocean, is capable of acquiring the most intense heat
from the action of subterranean fires; a principle of which
Dr. Hutton has ingeniously availed himself in framing his
Theory of the Earth.

But the position of the boiling point is likewise modified
by the influence of chemical attraction. Thus sugar, com-
non salt, and other saline substances, have all of them a
tendency to fix water and retard the crisis of its conversion
into elastic vapour. Strong brine will not boil until it is
heated several degrees above the ordinary limit. Hence
a vessel containing fresh water, and immered in another
which is filled with brine, will gently boil, while the sur-
rounding fluid only simmeres. On the other hand, the addi-
tion
tion of alcohol renders water more volatile. In the distil-
ladion of spirits, the fermented liquor in the copper bolls
always at a lower temperature, or at some intermediate point
between the ebullition of water and that of alcohol. The
spirifuous fumes which rife carry along with them a portion
of evaporated water. Hence the necessity of rectification;
or repeated distillations, to procure alcohol in its purest state;
for the boiling boll is lowered, and consequently the pro-
portion of aqueous admixture is diminished, at each succe-
sive process. See Digest, Ebulition, Fire, Fluid, Heat, Pressure, Steam, Vapour.
Boiling of silk with soap, is the first preparation in order
to dyeing it. Thread is also boiled in a strong lixivium of
ashes, to prepare it for dyeing.

Boiling is also a part of the process for bleaching warp
threads.

Boiling to death, caldariis descuere, in the Middle Age,
a kind of punishment inflicted on malefactors, thieves, and
other criminals.

This punishment was inflicted on those who were guilty
of murder by poison, 22 Hen. VIII. cap. 19. but this act
was repealed by 1 Edw. VI. cap. 12.

Boiling is also a method of trying or assaying the good-
ess or falseness of a colour of a dye, by boiling the stuff in
water with certain drugs, different according to the kind or
quality of the colour, to try whether or not it will discharge,
and give a tincture to the water.

With this intention, red crimson silks are boiled with alum,
and scarlet with hoop, in quantity equal to the weight of the
stuff.

Boiling waters, in Natural History. See Spring, and
Water.

BOINITZ, in Geography, a town of Hungary, eleven
miles W.N.W. of Kremnitz.

BOIOI, in Zoology, the Brazilian name of the Lin-
nean fish, Anguilla.

BOIOIUM, or BOINUM, the country of the
Boii, answering to the present Polonia, which see. On
the south of it lay the Gabrea Syles, and to the south,
west, and north, the Hercynian montes. The interior of
it was penetrated with difficulty, and was little known.

BOJOWAKA, in Geography, a town of Poland, in
the patinate of Braclaw, forty-eight miles call of Braclaw.

BOQUIRA, in Geography, a town in Poland, in
the patinate of Braclaw, forty-eight miles call of Braclaw.

BOQUEIRA, in Zoology, a name by which the natives,
in some parts of America, call the rattle-jake. Supposed
to be the Ostraca borealis, of Naturalists.

BOIREL, Anthony, in Geography, born at Arguim,
in Normandy, about the year 1625, applied himself to the
practice of surgery, in which he acquired considerable reputa-
tion. In 1657 he published a Traite de places de teste, 2vo,
extracted principally from the works of Hippocrates,
Galen, and of Ambrose Paré, which he appears to have
made use of in his practice. He has added some improvements to
their practice.

Nicholas Boirel his brother, physician at Arguim, pub-
lished, in 1722, " Nouvelles observations sur les maladies
venimeuses," 12mo. Paris, which was reprinted 1711, but

Hill. BOIS, CARDINAL DU. See DEBOIS.

BOIS, GEORGE, a member of the congregation of the
Oratory, and a Latin professor in it, was born at Orléans,
in 1620. Having succeeded father Le Comte, in his place
of librarian to St. Honoré, and having presided over the pa-
pers, he finished for the press his eighth and last volume of
the "Ecclesiastical Annals of France," which was printed in 1683;
and in consequence of it he obtained a pension from the French
clergy. He afterwards undertook to write the history of the
Paritian church, and in 1690, published the first volume in folio.
The second, which he did not live to finish, appeared after his
death, which happened in 1696. This work is written in pure
elegant Latin, and contains a variety of interesting facts relat-
ing to civil as well as ecclesiastical history. Now. Dict. Hill.
and sometimes once in three weeks, and by not studying after supper, particularly towards the close of life, but diverting himself with cheerful conversation for two hours among his friends. When he was a young student at Cambridge, he received from the learned Dr. Whitaker three rules for avoiding those dilemmas which usually attend a sedentary life, to which he adhered with equal constancy and success. The first was to study always standing; the second never to study in a window; and the third never to go to bed with his feet cold. Accordingly he attained the age of 84 years, and died in 1643. Biog. Brit.

Bois, Du Lake, in Geography, lies in North America, to the north-west of Lake Superior, and receives the river de la Plaisie, in N. lat. 49°. It was formerly famous for the richness of its banks and waters, which abounded with all the necessaries of a savage life. The French had formerly several settlements in and about it; but it has since declined, though it is now recovering its primal state. The few Indians who inhabit it might live very comfortably, if they were not so immediately fond of spirituous liquors. This lake is rendered remarkable by its having been named on the part of the Americans, as the spot from which a line of boundary between them and British America was to run west till it struck the Mississipi, which, however, as Mr. Mackenzie observes, can never happen, because the N. W. part of the lake du Bois is in N. lat. 49° 37', and W. long. 94° 31', and the northernmost branch of the source of the Mississipi is in N. lat. 47° 38' and W. long. 95° 6', ascertained by Mr. Tomson, astronomer to the North-west company, who was sent expressly for that purpose in the spring of 1793. He, in the same year, determined the northern bend of the Missisipi to be in N. lat. 47° 32' and W. long. 101° 25', and according to the Indian accounts, it runs to the south of well, so that if the Mississipi were even to be considered as the Mississipi, no western line could strike it. It does not appear, says Mackenzie, to be clearly determined what course the line is to take, or from what part of Lake Superior it strikes through the country to the lake du Bois; if it were to follow the principal waters to their source, it ought to keep through Lake Superior to the river St. Louis, and follow that river to its source; close to which is the small branch of the Lake de la Plaisie, which is a common route of the Indians to the lake du Bois; the St. Louis passes within a short distance of the branch of the Mississipi, where it becomes navigable for canoes; and if the navigation of the Mississipi is considered as of any consequence by this country, from that part of the globe, such is the nearest way to get at it. The lake du Bois is nearly round, and the canoe course lies through the centre of it, among a cluster of islands, some of which are so extensive that they may be taken for the main land. The reduced course would be nearly north and south. But, according to the navigation course, the distance is 75 miles, though in a direct line it would not be so long. At about two-thirds of it there is a small carrying place where the water is low. The carrying place out of the lake is on an island, and named Portage du Rat, in N. lat. 49° 37' and W. long. 94° 25', and is about 50 paces long. The lake discharges itself at both ends of this island, and forms the river Winnebago, which is fed. Mackenzie's voyage, &c. through the Continent of North America, Introd. p. 59.

Bois-belle, or Henrichezmont, a small sowerey of France before the revolution, situate in Berry, between Bourges and Saonec, about 10 leagues in circuit, containing about 8,000 inhabitants; its principal towns are Bois-belle and Henrichezmont, which fee.

Bois-belle's, a town of France, in the department of the Cher, 15 miles N. E. of Bourges.

Bois Blanc Island, situated in Upper Canada, lies in the strait between Lake Erie and Lake St. Clair, containing from 150 to 200 acres of good land, covered with wood; the common channel, which is narrow, lies between it and the eel shore, and forms the best harbour in this country. This island commands the Detroit river from Lake Erie. A wider ship-channel, though often frequented, lies on the west of the island.

Bois-carcan, a town of France, and principal place of a district in the department of the Loiret, containing about 1,003 inhabitants; 7 leagues N. E. of Orleans, and 5 W. of Montargis.

Bois, Glacier de, one of the lower glaciers of the Alpine mountains adjoining to Mont Blanc, and the valley of Chamouny in Switzerland, from the thawed ice of which flows the river Arveron. This glacier is more than 15 miles long, and above three in its greatest breadth. The general thickness of the ice was found by M. Sauviatte to be from 80 to 100 feet.

Bois-le-duc, or the Duke's wood, a city of Dutch Brabant, seated on the river Dommel, where it receives the waters of the Aa; so called from its situation in a woody country, to which the dukes of Brabant were accustomed to return for the purpose of hunting. The wood was cut down by order of Godfrey III. duke of Brabant; and he laid the foundation of a city in 1184, which was finished in 1196, by his son duke Henry I. and much enlarged in 1252, 1453, and 1559. The city is encompassed by the Dommel and Aa, by the waters of which it may be easily inundated; and it is sometimes inaccessible except by boats. The principal forts that defend it are those of Creveœur, near the Moule; another called Ilibella; and a small fort called St. Antoine, towards Brabant. It has also a cafile, built by order of the States General, in the 17th century, as a check on the Roman Catholics then more numerous than the reformed. It has four gates; and its walls are flanked with bastions; the approach to it by land is on canways, and by water at three gates or avenues. The cathedral, erected in 1566, and dedicated to St. John the Evangelist, is one of the most beautiful structures in the Low Countries. Its wooden tower which was very lofty and supported by four stone pillars, was destroyed by lightning in 1584. It has had several other churches and monasteries. This city suffered very much in the 16th century, during the religious wars; but at length the Dutch made themselves masters of it in 1629. Pope Paul IV. founded a bishopric at Bois-le-duc in 1559, having jurisdiction over ten cities and 189 villages; the chief revenue of which arose from the abbey of Tonderlo. The district of Bois-le-duc, called "Mayerey," is situated between Holland and Gelderland, having Holland to the N., Upper Gelderland and the duchy of Cleves to the E., the quarter of Antwerp to the W., and the bishopric of Liège to the S. It is divided into five small districts, and comprehends 102 villages, and three cities, Bois-le-duc, Helmond, and Eyndhoven. On the 14th of September 1794, an engagement took place near this town between the British army and the French, in which the latter were victorious; and on the 9th of October, in the same year, the town was taken by the French. It is 18 miles E.N.E. of Breda, and 42 S.S.E. of Amsterdam. N. lat. 51° 42'. E. long. 4° 59'.

Bois, St. Maris, is, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Charolles, 7 miles S.E. of Charolles.

Bois d'Oingt, a town of France, in the department of the Rhone, and chief place of a canton, in the district of Villefranche, 4½ leagues N. W. of Lyons. The place contains 900, and the canton 13,501 inhabitants; the territory comprehends 1928 kilometres, and 18 communes.

BOISBEAU, in Commerce, a measure of two buflells and half of a peck at Bourdeaux in France.

BOISMONT,
BOISSEY, St. Joger, in Geography, a town of France, in the department of the Seine-et-Oise, and principal place of a canton, in the district of Coindre; the place contains 47,142 inhabitants; the territory comprehends 1,277 square kilometers, and 26 communes.

BOISZKY, a town of Poland, in the principality of Bielik, 12 miles S. W. of Bielik.

BOITIAGO, in Zoology, a sort of serpent that inhabits Brazil, and is called by the Portuguese ostra de cip. This is an amphibious species. It is decorated, as being seven or eight feet long, as thick as a man's arm, round, and pointed towards the tail, like a fisherman's awl. The body covered with five sub-triangular fans, the colour olive and yellowish. It lives on frogs, and must be of the poisonous kind, since its bite is represented dangerous.

BOITMAXDÖRF, or BOISSERD, in Geography, a town of Silefia, in the principality of Neys, 5 miles N. N. E. of Neys.

BOITZENBURG, a town of Germany, in the circle of Upper Saxony, and Ucker Mark of Brandenburg, 8 miles S. W. of Prenzlau.

BOITZENBURG, or BOTZENBURG, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg, at the conflux of the Boitzn and the Elbe. It was surrounded with walls in the 14th century; at this town, vessels that pass the river pay a toll, producing annually 40,000 dollars, of which the duke of Mecklenburg-Schlitz is entitled to 9000; 3 leagues E. of Lauenburg.

BOIVIN, Louis, in Biography, a distinguished scholar and pedagogue of the academy of belles lettres, was born at Montreuil l'Argile in Upper Normandy, and educated, first under the Jésuits at Rouen, and afterwards at Paris, where he settled. His acquirements in literature were various and extensive; but his temper, according to his own account, was intractable and unfeoff, enterprising, vain, and versatile. He was employed by several eminent magistrates at the associate and director of their private studies; but the litigiousness of his disposition involved himself in great trouble and expense. He published some learned dissertations on historical subjects, in the "Memoirs of the Academy of Belles-Lettres." and made great progress towards a new edition of Diodorus. He died in 1744, aged 75 years.
Boiffin, John, a younger brother of the preceding, was born in 162, and instructed by his brother, established his reputation as a man of letters at Paris, at the age of 18 years. His disposition was a counterpoise to that of his brother, and he was much esteemed for his amiable temper and manners. The abbé de Louvois assigned him a considerable pension, and in 1714 procured for him the place of under-keeper of the king's library. In 1721, he was admitted member of the French Academy, and became pensionary of that of belles lettres in 1724, on the death of his brother. He excelled in the Greek language, of which he was professor in the royal college. His printed works are "An apology for Homer, and the shield of Achilles," 1700: a French translation of "Homer's Batrachomyomachia"; a French translation of the "Oedipus of Sophocles, and the birds of Aristophanes;" "Greek Poems," much admired for their ana-creontic deficiency; an edition of the "Mathematici Veteres," 1693, fol.; a Latin "Life of Claude Pelletier," a Latin translation of the "Byzantine History of Niceratus Gregorius, with notes," 1702, which is esteemed faithful, learned and elegant. He also published several dissertations on historical and literary topics in the "Memoirs of the Academy of Belles Lettres." He died in 1726. Nouv. Dict. Hist.

Boinum, in Ancient Geography, one of the four principal cities of the Doricu country in Greece. It was celebrated on the river Pindus, to the east of Ereushus.

Bokea, in Batney, (Aubl. Guian. Sup. 58 t. 391.)

Bokeu, in New Guinea, (Aubl. Guian. Sup. 58 t. 391.)

Bokara, Bucharia, or Bogar, a famous city of Great Bucharia (see Bucharia), seated on the river Sogd, in that district, lying N.E. of the river Jihon, or Ouxus, called Sogdiana, or Al Sogd. It is situated very advantageously for trade, in a delightful and fertile country, and has repeatedly contended the metropolitan dignity with Samarcand. Besides its own wall, which was very strong, it had an outward inclosure, comprehending not only the suburbs, but a district about four leagues in extent on each side, which contained several villages and farms, watered by the river Sogd. The Sogd, which is the valley or plain of Samarcand on the east, and the mountain called Vorka on the north, were the boundaries of this territory; although its jurisdiction extended to several towns which were situated beyond its great wall. Mirkhond, in his history of the polity of Japhet, affirms, that Bokhara was the capital of Tarqueqian, in the time of Oguz Khan, one of the most ancient kings of the Moguls, or Tartars, and reckoned by the Mahomedan Tartars the eighth in descent from Japhet; and enumerates several towns which were dependent upon it. Bokhara afterwards became the capital of the state of the Samanides founded by Ismael, the great grandson of Saman, in the year of the Hegira, 257, or of Christ 909, under the caliph Motadheh. After the fall of the empire of the Samanides, the Moguls of Cathai made themselves masters of this city; but it was retaken by Mohammed, king of Karrum, in the year of the Hegira 594, or A.D. 1197. This conquest of the Karafsians alarmed the nations of the north, and drew towards Jihan very powerful armies of Moguls and Tartars, who defoliated some of the finest provinces of Asia. In the year of the Hegira 617, or A.D. 1220, Jenghiz Khan, after a siege of nine months, took this city, and ordered it to be set on fire; so that notwithstanding it remained, except the fullan's palace, called "Ark," constructed of stone, and some private houses built of stone, all the rest having been wooden edifices. He then caused a search to be made in the palace and houses, and commanded all the foldiers, who had concealed themselves, to be put to death. Bokhara continued for some years in this desolate state; but at length the Khan ordered it to be rebuilt, not long before his death. In the year of the Hegira 772, or A.D. 1370, Tamerlane took this city from Sultan Haffain, who was the last prince of the house of Jenghiz Khan; and the Timourides, or descendants of Tamerlane, retained possession of it till about the year of the Hegira 904, A.D. 1498; when Babur was defeated in the battles of Kandahar and Khurasan by Schaiik Khan, who obliged him to fly to India; and from that time Bokhara has always belonged to the Ufeks, who have maintained it by frequent wars with the Perisans. Herbelot Bib. Or. p. 190.

Bokhara was eminently distinguished in former times by the arts and sciences which flourished in it, and by its famous university, to which students resorted from all parts, and in which the celebrated Avicenna was educated. As an emporium of commerce, it was also a great famous house, to which merchants repaired from all parts of India, from the different countries inhabited by the Tartars, from Persia, and even from the dominions of the grand dignitary on one side, and from Russia and Poland on the other: so that in the warehouses and markets of this city might be seen a great variety of oriental and European merchandise. About the middle of the 16th century it was visited by Anthony Jenkins, an Englishman, who made a curious and interesting account of the part of this city that has been translated into several languages, and copied by the belles lettres. See Hackluyt's Collection, p. 355. At that period, indeed, it furnished some injury from the vicinity of Samarcand; but since it became the seat of the khan of the Ufek Tartars, who is master also of Samarcand, which he visits only in the summer season, its commerce has revived, to which the convenience of its situation in no small degree contributes. When it was visited by the English agents in 1741, (see Hanway's Travels, i. 242.) it was large and populous, subject to the Khan; standing on a rising ground, with a thick wall of earth; the houses of clay, but the numerous mosques of brick. The citizens manufactured soap and calico; and the chief products were cotton, rice, and cattle. From the Kalmucks they received rhubarb and musk; and from Bakhshan, they used to receive lapis lazuli, and other precious stones, that city being computed at 16 days' journey from Bokhara.
BOKHARA. There was gold and copper coin; and after Nadir took this city, the Persian and Indian silver became common. The inhabitants were civilized, but perfidious. In the 10th century it was distinguished by the manufacture of fine linen. N. lat. 37° 24′. E. long. 62°.

BOKI, a river of Africa, which rises in the country called Jallonkadov, between the heads of the Senegal and Joliba, and joins the Barfeling, or an arm of the Senegal, in the district of Brooko, in N. lat. 13° 11′. W. long. 6° 3′.

BOKIRA, a river of India, which runs into the sea, 50 miles W. of Jumagur.

BOKSAN, a town of Hungary, 10 miles south of Lugos.

BOL, FERDINAND, in Biography, a painter of history and portrait, was born at Dort in 1611, educated at Amsterdam, and placed as a disciple in the school of Rembrandt. He was chiefly distinguished by his portraits, which he painted in a fine, bold manner, but not with that clearness of flesh, and remarkable relievò, for which his master was famous. His colouring was too much tinged with brown in the carnations; but with this exception, his portraits had a great appearance of life and nature. As a painter of history, he manifested a good taste of composition, as well as a tolerable expression in some of his figures; but he was deficient in grace and elegance. His "Appointment of the 70 elders in the camp of the Israelites," and "Moses breaking the tables of stone," in the council chamber of Dort, are well designed and executed. In the chamber of the burgomasters there is an historical picture of "Fabricius in the camp of Pyrrhus," which is exceedingly admired. The etchings of this artist are bold and free. The following, from his own compositions, are generally much esteemed; viz. "Abraham's Sacrifice," "St. Jerom, seated in a car., holding a crucifix," and "Philosopher, holding a book." Bol died in 1681. Pilkington and Strutt.

BOLT, JOHN, a painter of landscapes, history, and animals, was born at Mechlin in 1534, and completed his studies at Heidelberg. His subjects were views of several cities and towns in the Low Countries, and different prospects of Amsterdam; and in his pictures the vessels, with the reflections of them from the water, are admirably executed. His invention and composition were very pleasing; his colouring poetizes great harmony and union; and his manner of sketching and pencilling is broad and free. Van Mander highly commends one of the paintings of Bolt, in dilluirer, the story of which is "Dedalus and Icarus." This artist etched a set of landscapes, which are "views in Holland," in the style of a master. He died in 1593. Pilkington and Strutt.

BOL, in Ancient Geography, a town of Italy, the capital of the country of the Equi, situate, according to Plutarch, 30 miles from Rome. Pliny places it in Latium. See Equi.

BOLABA, more usually pronounced BOLABABA, in Geography, one of the Society islands in the southern Pacific ocean, situate four leagues N. W. of Otaha, and inferior to it in extent, being about seven leagues in circumference. The reef that surrounds it is nearly full of fish, much larger than those that are scattered among the rocks, enclosing Otaha and Uleita. It differs from those islands, and from Hinahine, in having only one harbour on its coast; whereas the shores of the others, being strongly indented, form, like the coasts of Eimeo, numerous places of shelter for shipping. It is also distinguished by a very lofty, double-peaked mountain in its centre, and more rude and craggy than the other Society islands. Its eastern side appears barren; the western is more fertile; a low border, which surrounds the whole, and also the islands on the reef, are productive and populous. Its earthen inhabitants are said to have been malefactors banished from the neighbouring islands. As their number rapidly increased, and their military prowess gained reputation, they established their authority in Uleita and Otaha, and also in Manaholo and Tooar. Their conquests acquired so much respect, that the supposed tutelary divinity of Bolabola, named Ova, or Ora, had been adopted by the people of Taeraafo, in preference to two imaginary deities whom they formerly worshipped. The Bolabola warriors are punctuated in a different manner from those of the more eastern islands. Bolabola was discovered by captain Cook, together with the group called by him the "Society islands," in July 1769; but though he took possession of it in the king's name, he did not land upon it either in his first or second voyage. But in 1777, he landed on this island, notwithstanding the account which he had received of its inhabitants, and was introduced to Opooone, who had been represented as a very formidable chief, but whom he found old and feeble, though still much esteemed and feared. Opooone was succeeded in his government of this and the neighbouring islands by his daughter, who, in 1773, at the age of 12 years, had been betrothed to a chief named Boba, who governed Otaha under Opooone, and was designed to succeed him in the sovereignty. In 1791, when captain Edwards visited Bolabola, a man named Tafahou, had the chief authority. S. lat. 16° 32′ 30″. W. long. 151° 52′. Missionary Voyage. Introd. p. 41.

BOLACA, in Ancient Geography, a town of Poloponifus in Tripilhy, a country of Elis. Polyb. 165.

BOLAVOSANSKA, in Geography, a town of Siberia, in the government of Irkutz, 50 miles N. W. of Irkutz.

BOLBACH, a river of Germany, in the duchy of Stria, which rises in a lake, 10 miles S. W. of Völting, and runs into the Sula, near Wippelsbach.

BOLBE, in Ancient Geography, a town of Asia Minor, in Caia, called also Heralcades.

BOLBE, a marsh of Macedonia, near the Ionian sea, before Apollonia, according to Sclavus.

BOLBEC, or BOLBEE, in Geography, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Havre; the place contains 4921, and the canton 14,171 inhabitants; the territory comprehends 105 kilometres, and 18 communes.

BOLBENA, in Ancient Geography, the name of a country in Asia, in the greater Armenia. Polyb. 165.

BOLBITINA, a town of Egypt, situate near the second month of the Nile, adjoining to the spot where Rosetta now stands.

BOLBITINUM QFIUM, a name given by Polyb. and Pliny to the second month of the Nile, from that of the town, Bolbitina, seated near the canal called "Tali." The Bolbitine branch is now called that of Rosetta, Rosettia, or Rafchid, which see. Strabo informs us (L. 17. tom. ii. p. 153.) that under the reign of Ptolemy the Elder, the Milesians, with 30 vessels, landed at the Bolbitine, or Bolbicite branch, and there fortified themselves.

BOLBONACH, in Botany. See Lunaria.

BOLBULE, in Ancient Geography, a name given by Pliny to an island of Asia Minor, situate on the coast of Ionia.

BOLCA, in Geography, a branch of the Tyrol, and Alps, situate 50 miles N.W. of Venice, and noted for its fine hills, in argilaceous schistus.
BOLCHERETSKOI, a town of Kamchatka, N. lat. 53° 34' 30", E. long. 158° 27' 30".

BOLCHOV, or Bolkhov, a town and district of Russia, in the government of Orel, situated on the river Nogra, falling into the Oka; 32 miles N.N.W. of Orel.

BOLD SHORE, in Sea Language, a steep coast or shore, so that ships may approach close to it.

BOLDSON, an island of Sweden, in the province of Halflingland, having a good harbour.

BOLE, in Mineralogy, Bol, Gem. Bol, Fr. Arcilla bolus, Werner. The colour of bole is generally an obscure Iba
tella yellow, or reddish, or whitish brown; it is also sometimes,
tough, rare, met with a greyish yellow, or flesh
red; its surface is often marked with black spots and den-
dritic figures. It occurs generally massive, seldom diffimi-
nated. Internally it exhibits a slight shining lustre. Its
fracture is perfectly conchoidal. It fuses, when broken, into
irregular, sharp-edged fragments. The dark coloured va-
rieties are opaque, the lighter coloured are more or less tran-
lucid. It has a greatly feel; adheres strongly to the tongue;
gives a thinning break; is very soft, and easily frangible. Sp. gr. 1.4 to 2.

When put into water it absorbs a portion with great eas-
genese, and then breaks down into small fragments, with a
very tenible crackling noise; but is not reduced to an im-
palpable powder. When finely pulverized, and diffused
through boiling water, it remains suspended in this fluid a
much less time than any of the phallic clays, and is entirely
separable by the filter.

Before the blow pipe it turns black, and melts without
addition, though with some difficulty, into a porous, green-
ich, grey flack.

According to a somewhat inaccurate analysis of Bergman,
the Lemnian bole contains:

Siliceous Powder  -  47.
Carbonated lime -  -  54.
Carbonated magnesia -  -  62.
Alumine  -  -  21.
Oxyd of iron  -  -  54.
Moisture and volatile matter  -  17.

102.4

Bole occurs in beds of wacke at Strigau in Silezia, and
in bafalt at Scheibenberg in Saxony; it is found also in
Tuscany and Sienna in Italy, and in the island Lemnos in
the Archipelago.

The only use of bole, at present, is as a coarse red pig-
ment; for which purpose it is calcined and levigated, and is
vended in Germany under the names of Berlin and England
red. Anciently, however, a very high rank was assigned to
bole among the articles of the Materia Medica; it was con-
sidered as a powerful astringent, sudorific, and alexipharmic,
that from Armenia and Lemnos being particularly esteemed.
The Lemnian bole, in the time of Dioscorides, was dug up in
the presence of the priests of Venus, and after being mixed
by them with goats' blood, was moulded into cakes, which
were impressed with the figure of a goat, in order to authen-
ticate them; hence it was called have.  arvensis, sigillum capri-
num: It still continued to be a consecrated remedy even in
the 17th century; according to Belon, the veil was opened
annually on the 6th of August, and after prayers said by the
priests, as much of the earth was taken out as was thought
sufficient for the ensuing year; the entrance to the veil was
then closed, and the severest punishments were denounced
against any one who should open it without permission. Part
of the earth was sent to Constantinople, where it was made up
into small cakes, and received the seal of the emperor; the
remainder was preserved in the isle itself, and was impressed
with the seal of the governor. The profits of this manufac-
ture were too considerable not to be encroached upon, and
the bolar earths, and even the clayey marls of Italy, France,
and Germany, obtained a place in the Materia Medica, under
the general name of Terra sigillata, from which, however,
you, together with the Lemnian earth, have, been at
length considerably exceeded.

Bole is also used for the body or trunk of a tree; and
hence boiling trees are those whose heads and branches are
cut off.

BOLEMOW, in Geography, a small town of Poland, in
the palatinate of Raw.

BOLENA, a town of the Morea, in the duchy of Cle-
rence, 5 leagues from the gulf of Lepanto; the see of a
bishop, suffragan of the archbishop of Patras.

BOLENBERG, a small town of the duchy of Mecklen-
burg, on the Baltic.

BOLENE, or Bollene, a town of France, in the de-
partment of Vaucluse, and chief place of a canton in the
district of Orange, 5 leagues north of Orange. The town
contains 4664, and the canton 10652, inhabitants; the
territory comprehends 1325½ kilometres, and 7 com-
muines.

BoLENI, or Bollini, in Natural History, a name given
by ancient writers to a sort of fungus of a roundish figure,
and marked with fewed ridges and lines. They are impeded
by the name called Brontici et Umbria, both being imagined
to fall from the clouds in time of thunderstorms; but they are really no other than a common species of
Echinus.

BOLESA, in Geography, a town of Spain in Arragon,
4 leagues from Huesca.

BOLEZ, a small town of Lower Hungary, in the
upper outward district of the county of Preburg.

BOLESKO, a town of Hungary, 28 miles north
of Topoltzan.

BOLESLAW, or Buntszlaw, a circle of Bohemia, on
the confines of Lusatia and Silezia, from which it is sepa-
rated by mountains. The capital is Buntszlaw.

BOLESLAVIEC, a town of Poland, in the palatinate
of Sireia, 24 miles S.S W. of Sireia.

BOLETS, in Botany [Grec. Bolos, from its globular
form], a genus of the class cryptogamia, and of the order
fungi, formed by Linneus, and distinguished from the agaries
by having what is generally the lower surface composed of
tubes instead of gills. The name was given by the Romans
to a species of excellent fungi, esteemed by them a great
delicacy, and celebrated by their historians and poets for being
the vehicle of the poison administered to Claudius Cæsar,
by his wife the younger Agrippina. This has been generally
supposed by modern botanists to be the Agarius scamplentus,
then called by Scheffer Cacarus; but Withering thinks it the
delicius of Linneus. See Agarie.

Among the moderns it was first adopted as a generic name
by Tournefort, who applied it to the common morel, the fungus
favaginosus of some of the older botanists, afterwards referred
by Linneus to his genus phallus. L. Marec, diplpated
with Linneus for altering Tournefort's names, has restored
the name boletus to the morel, and has separated it from
phallus on account of its not being perforated at its summit.
He has, in consequence, divided Linneus's genus boletus into
two; calling those that are soft and woody, agaries, and
those that are pedicelled and soft, tulius. The Linnean
agaries he has named amanita, as Dillenius and Haller had
done before him. Jussieu and Poiret concurred with him in
these alterations. But this, as Bolc well observet: Nouveau
Dictionnaire,
BOLETUS.

Dictionary, sub voce Boletus), is to increase a confusion already too great, and to overturn a nomenclature which has been generally adopted in Europe since the publication of the sexual system. For, however, Linnaeus may in some cases have capriciously changed ancient names, and however it may be wished that, in the present instance, he had called his boletus, agaricus, which would have preferred to the official agaric its customary generic denomination, it is better to let things remain as they are, than again to unsettle the language of the science, and thereby to impede its farther advancement. We shall, therefore, go on as we have begun, in adhering strictly to the Linnaean nomenclature, where we are not induced to depart from it by weighty scientific reasons.

Linnaeus has enumerated only fourteen species, and Reichard has made no addition to the number. Gmelin has extended them to a hundred and seven; but there is reason to suspect, that he has sometimes given the same species more than once under a different name. The settling of synonyms is in every part of botany an intricate and often unsatisfactory business, but peculiarly so in the class cryptogama. Withering, in the third edition of his Arrangement of British plants, has described fifty-one species, many of which have several varieties. In this number are included eight of the Linnaean species. He has also divided the three grand divisions, as they have central, lateral, or no stumps; and subdivides them according to the colour of their tubes. None of them being cultivated, we shall confine ourselves to those which are of British growth.

Stem Central.

*Tubes echites. 1. B. mollis.** "Tubes decurrent, very short; pores minute, angular; pileus concave, rich brown, fleshy; item whitish, thick, short." 2. B. fulgineus. "Tubes very short; pileus light brown, smooth, clothly to the touch, regularly convex; flesh very white; pileus pale brown, covered with a beautiful white net-work over its whole surface; root conical; resembles the elephantinus in habit." 3. B. cyanescens. "Tubes brownish with age, not decurrent; pileus brown, convex, very fleshy; flesh white, changing to a fine blue when exposed to the air; item brown, rounded at the base." 4. B. polyporus. "Tubes very short; pores circular, extremely minute; pileus brown, irregular; flesh very thin; item brown, varying from perfectly central to perfectly lateral, tough, thickening upwards." 5. B. luteocollybush. "Tubes very short; pileus tawny bay, flat, thin, leather-like; item brownish, thick as a crow-quill." First observed in Britain by Mr. Dickson, growing on rotten fitches. 6. B. aurantiacus. "Tubes not decurrent, readily parting from the pileus; pileus convex, full orange-red, vifcid, thin at the edge, and without tubes for about one-tenth of an inch; item whitish, rough, with coloured pimples; spongy, fikken." It is eaten in France when young.

* Tuber brown. 7. B. bovinus, Linna. "Tubes not touching the item, unequal in length; pileus thin at the edge, brown or olive, clammy, large; flesh spongy, white; item dirty white, with reddish flans, from three to seven inches high, and about an inch in diameter." It varies in the colour of its tubes and pileus, and in the smoothness or roughness of its item. 8. B. fuscopannosus. "Tubes decurrent, oblong; pileus yellowish brown, with red brown, scurfy, scales, the centre hollowed; flesh folid, pure white; item brownish, tapering downwards." 9. B. perennis, Linna. "Tubes decurrent, not separating from the pileus, very short; pileus flattish, hollow in the centre, fritated with hairs, marked with alternate circles of brown and tawny, leathery; item red brown, often eccentric, short, wiry, frequently coming up so thick that the pile runs into one another." There is a variety of a cinnamon colour, within and without, the B. cinereascens of Jacquin, first found in this kingdom by Mr. Dickson. 10. B. subtomentosus, Linna. "Tubes rather angular, of different shapes; pileus yellow, convex, fleshy, somewhat woolly; item yellow." 11. B. rubecullaris. "Tubes olive-colour, fixed to the item; pores rich red brown, mostly oval; pileus red cinnamon, convex, soft to the touch, rather clannpy; flesh thick, spbuggy, buff-colour, instantly turning blue when wounded; item red cinnamon, spungy within, and rich yellow, but instantly changing to a blue." 12. B. piperatus. "Tubes decurrent, deep orange, or earthy red; pores brown, open, irregular; pileus yellow, smooth, nearly flat, thin at the edge; item greenish yellow." Its pungency on the tongue and throat is like that of a capsicum. First found in England by Mr. Sowerby, in Hainault forest, Essex. * Tuber butt. 13. B. nummularius. "Tubes look from the item, very short; pores angular; pileus colour of brown horn, with a black circle at the edge, convex, dimpled, leathery, smooth, very thin, about an inch in diameter; item colour of brown horn, black at the base, smooth." Chiefly found on rotten branches of hazel. 14. B. steripes. "Tubes decurrent, very short; pileus whitish, the line of a fingsence; item black at the bottom." 15. B. felleus. "Tubes short, adhering firmly to the item; pileus yellow, convex, but very irregular; pileus yellow, thick and short." 16. B. edulis. "Tubes not fixed to the item, readily parting from the pileus; pores circular, small; pileus brown, with soft-coloured ed patches, nearly glabular, seven or eight inches across when fully expanded; flesh white, greenish when wounded; item light brownish yellow, tapering upwards." Bulliard reckons it a variety of bovinus. 17. B. gregarius. "Tubes short; pores oblong, unequal; pileus cheflnut, smooth, thin, flatish; flesh white, about three inches over; pile pale cheflnut, pinkly below, imesely swelling into the pileus. 18. B. lutes. "Tubes readily seperating from the pileus; pores round, small; pileus deep bay, rather conical, fritated, viscid; flesh white, not changing; item dirty white, cylindrical, widening at top; ring permanent." 19. B. olivaceus. "Tubes instantly turning blue when wounded; pores bright yellow, round or oval; pileus olive-brown; flesh bright yellow, turning blue when exposed to the air; item brown below, yellow or crimson above." 20. B. angustiscinus. "Tubes a little decurrent, unequal in length, changing to deep blue; pores lemon-yellow, angular; pileus crimson, changing to rich red brown, semi-globular; flesh white, changing slowly to a bluish cast when wounded; item yellow, with broad crimson flakes, apparently twisted." Found by Dr. Withering, near Birmingham, but only in one place. 21. B. chrysenteron. "Tubes decurrent; pileus gently convex, pinky-red; item yellow below, pinky upwards, swelling in the middle." 22. B. flavus. "Tubes a little decurrent; pores irregular in shape and size; pileus convex, deep orange when young, fibbing with a vivid varnish; item yellow, cylindrical; carpet white, leaving a ring." 23. B. laticlavinus. "Tubes in contact with the item; pores very minute; pileus red-fiis-bull, very convex, viscid; item bright yellow." The plant abounds with a mild milky juice. Its flavour is like that of the agaricus campesiris. 24. B. subflavus. "Tubes short; pores minute; pileus yellow, brown, olive, convex, thin, smooth, leathery; flesh thin, white; item dirty yellow, hard, tough, sometimes excentric.

Stem lateral.

* Tuber albus. 25. B. albidus. "Tubes decurrent, not perpendicular to the pileus; pores angular, very irregular in shape; pileus white, lobed; item solid, sometimes only a knob." The whole plant white, with a cottony substance, which
which is easily rubbed off. 26. B. rugosus (Lindl.) (Curtis).

"Pores very small; pileus chestnut coloured, shining, flat, marked with concentric grooves; edge thick, wrinkled; item chestnut coloured, hard, uneven, firm." 27. B. fomentarius.

"Tubes decurrent; pores very small, sometimes confluent; pileus brown, lobed, tined, leathery; item black at the base, very irregular and misshapen; sometimes nearly two feet across." 28. B. betulinus. "Tubes very short; pileus pink-brown, smooth, oblong, convex, thin, curled in at the edge; flesh white; item black; whole plant leathery." 29. B. erythros. "Tubes short, not separating; pores irregular, pileus golden yellow, variously shaped, jagged, curved; item brown, woody, dilated, thick, porous." 30. B. fimbriatus. "Tubes short, flattening; pores large, angular; pileus pale buff, speckled with feather-like scales; flesh firm, white, elastic; item dark coloured, white within." * TUBES YELLOW. 31. B. rangiferinus. "Tubes decurrent, ragged at the extremity; item an expansion of the item, dirty yellow; item dark brown, with one or more lateral branches, splitting at the end into several horn-shaped branches, either expanding into the pileus, or barren with yellow tops." The whole plant resembles the palmarined branches of some of the larger species of deer. 32. B. calcatus. "Tubes decurrent; pores small, unequal; item deep buff to chestnut, of a substance like cork, hollowed in the middle, thin, and waved at the edge; item tough, white, conical." 33. B. lateralis. "Tubes very short; pores very minute; item yellow, smooth, flat, very thin leathery; item yellow, spreading out at the top to form the pileus." * Stumble. * TUBES WHITE. 34. B. fimbriatus. "Tubes pointed; pores irregular; item white, convex, thin, downy when young, smooth when old, perfectly ressembling cork." 35. B. nudulatus. "Wholly white; eutelaceous, spreading; pores small, on the upper surface only. On decayed wood and branches of trees. 36. B. falcatus. "Tubes very short; pileus facimicellar, white, smooth, thin, soft, leathery." 37. B. fuscocolons (disdebon, Dickson). "Tubes very long, changing first to straw-colour, then to yellow; pores irregular; item smooth, semi-circular, white or tawny; flesh yellow brown." 38. B. fuscogena. "Pores fringed, angular; pileus often very large, brown, woolly, turning quite black when old. 39. B. leucogena. "Pileus orange; coloured, wrinkled, reticulated, with broad, white, arch-shaped border; pores chiefly on the upper surface of the white border." Frequent in damp cellars. 40. B. siccifolius. "Tubes short, minute; pileus thin, velvety, fringed with concentric circles of various colours." * TUBES BROWN. 41. B. cuticulatus. "Tubes long; pores minute, rich yellow brown; pileus rich dark red brown, facimicellar, very uneven, with concentric ridges." 42. B. crysanthus. "Tubes very long; pores minute; pileus leathery, thin, supine, becoming woody when old." 43. B. labriniformis. "Tubes long; pores fimbriated; pileus rugose, zoned, woody; lobes many from one root." 44. B. nitulé. "Tubes short; pores labriniformed; pileus leathery, woolly, with different shades of the same colour. * TUBES RED. 45. B. laevis. "Tubes very short; pileus brownish, arched, warty, thin, fringed at the edge." 46. B. ochraceus. "Pores angular; pileus thin, gently convex, wrinkled, woolly, greyish, whiter at the edge." 47. B. hispidus. "Tubes fringed; pileus bright red brown, in old age black, rough with brilly hairs." Posibly a variety of the velutinus. * TUBES YELLOW. 48. B. sulphureus. "Tubes short; pores minute, irregular; pileus bright aurora, streaked." 49. B. velutinus. "Pores angular, irregular; pileus large, very irregular in shape, covered with a dense pile of a livery grey colour." 50. B. igniarius. "Tubes very slender; pores very fine, yellowish, changing to red brown; pileus shaped like a horse's hoof, smooth, red brown to blackish." It is the official agaric, the agarić amadower of La Mare. For the domestic and surgical uses to which it is applied, in different parts of the continent of Europe, and the manner in which it is prepared, see the article AGARIC, in PHARMACY. 51. B. fomentarius. "Pores circular, equal; pileus white, convex, thick at the edge, uneven." To these La Mare adds the agaricus quercinus of Linnaeus, and observes, that it properly belongs to this species; for though it has the appearance of galls, they are really tubes with large misshapen pores, which near the edge of the pileus have a more regular form. Bulhaid and Woodward incline to the same opinion; and we ourselves have already ascertained that it seems to connect the agarici with the boleti. See AGARICUS.

BOLETUS (Haller). See Helvella Mitra. BOLETUS (Toumefort). See Clathrus Cancelatus. BOLETUS (Toum Michiel, and Haller). See Phallus Esculentus. BOLETUS (Gled.). See Hydnium Repandum and Aerulapium. BOLI, or BOLI, in Geography, a town of Asphalt Turkey, in the province of Natalis, 140 miles east of Conflantinople, and 74 N.W. of Angora. This town is situated on a small river, which discharges itself into the Black Sea. It is the capital of a maritime county, called by the Turks Bolivitieli, and in the interior part of its extent very mountainous. N. lat. 40° 49' E. long. 31° 26'. BOLIDES, in Meteorology. See Fire-Balls. BOLINA, in Ancient Geography, a sea-port town of the Peloponnæus, in Achæa, near Argyra. BOLINÆUS, a river of the Peloponnæus, which watered the towns of Argyra and Bolina, according to Pausanias. It discharges itself into the small gulf of Panormus. BOLINAO, in Geography, a sea-port town of the island of Lucan, or Maleía. BOLINBROKE, a town of America, in Tolbot county, on the eastern shore of Maryland, 5 miles E. of Oxford. It lies on the N.W. point of Cape town river. BOLINGBROOK, in Ancient Geography, a people of India, near the Indus, mentioned by Pliny, Ptolemy, and Steph. Byz. BOLINGBROOK, in Geography, a small town of Lincolnshire, England, is seated in a valley between the river Witham and the sea-coast. Here was formerly a very considerable castle, which was nearly demolished by Oliver Cromwell and his partizans, who also laid other parts of the town, with the church, in ruins. In the times of feudal vassalage, the castle at Bulingbroke was distinguished among the plentiful mansions of the nobles. Here the celebrated John of Gaunt, duke of Lancaster, occasionally held his court, and it was the birth-place of his fourth son, who was afterwards crowned king of England. He was the fourth Henry who sat on the English throne, and from the place of his birth was known by the name of Henry of Bolingbroke. The St. John family also derive the title of viceroy from this town. The only manufacture of the place is earthenware, and that is very inconsiderable. In the parish are 72 houses, and 283 inhabitants. BOLINTHOS, in Natural History, a name given by Arisotle, and some of the other ancient Greeks, to the name of Aelian, that is, the Donatus.
BOLPLEIRA, in Geography, a town of Russia, in the
government of Saratoff, on the west side of the Volga; 124
miles south of Saratoff.

BOLLISSUS, in Ancient Geography, a town of Asia, in
Asia Minor, near Chios, according to Herodotus. Three dates
(98 B.C.) mention a victory gained by the Athenians over the
inhabitants of Chios near this town.

BOLKOF, in Geography. See BOLCHOF.

BOLKOWITZ, a town of Silesia, 20 miles south of
Glogau.

BOLLANDISTS, in Literary History, a denomination
given to certain Jesuits of Antwerp, who were a considera-
tible time employed in collecting the lives and acts of the
saints.—Thus called from J. Bollandus, one of the first
and chief of the association.

BOLLANDUS, John, in Biography, a famous ecclesiastical
historian, was born at Tillemont in the Low Countries, in
1596, and educated among the Jesuits, by whom he was em-
ployed in collecting memorials of the church-fathers, under
the title of "Acta Sanctorum." The plan of the work was
formed by father Rothe, and it was to be arranged ac-
cording to the order of celebrating their memories in the
calendar. Bollandus, in 1643, published "The Lives of the
Saints of the Month of January," in 2 vols. fol.; followed in
1658, by those of February, in 3 vols. fol. He had begun
thofe of March, when he died in 1665. This work was con-
tinued by Hennequin, Paperboeck, and others, on a scale of
such extent, that the commencement of October reaches the

BOLLARDS, large polls set in the ground on each side
of a dock. On docking or undocking ships, large
blocks are lashed to them; and through these blocks
are received the transporting haulers to be brought to the
captains.

BOLLEN, in Geography, a town of Germany, in the
circle of Aulfs, and duchy of Carinthia, 7 miles call of
Mehlbit.

BOLLENZ. See BRENO.

BOLLIN, a river of England, which runs into the Mer-
sey, 4 miles N.E. of Warrington.

BOLLITO, in the Glafa Works, a name by which the
Italians called a sea-green colour, or artificial crytal.

To prepare this colour you must have in the furnace a
pot filled with forty pounds of good crytal, finely
ground, boiled, and purified, without any mangansey;
you must then have twelve ounces of the powder of small
leaves of copper, thrice calcined, and half an ounce of zaffer
powder; mix them together, and put them at four times
into the pot, that they may the better mix with the glafs;
boiling them well at each time of putting in the powder,
likewise they should swell too much and run over.

BOLLOS, in the mines of Peru, a denomination
given to the ingots or bars of silver procured there from
the ore by the operation of the fire, and the use of
aqua fortis.

BOLN, in Geography. See DULAM.

BOLNIAST, Edward, in Biography, practised medicine
in London in the beginning of the 17th century. He
published, in 1603, "Chemia Medica illustrata," or the true
grounds and principles of the art of physic, 8vo. London,
and the following year a translation of it into Latin, "De
linetio fundamenti et princip. art. med.:" also "Aurora
chemica fiv natura methodus preparandii animalia, vegeta-
alia, et mineralia," 1675, 8vo. An edition of this work
was published in English, in 1672. "A rational way of
preparing animals, vegetables, and minerals, for physical
use." Haller, Bib. Med.

BOLNIK, in Geography, a town of Lithuania, in the
province of Wilna, 14 miles E. S. E. of Wilkomira.

BOLOGNA, or BOLONIA, a city of Italy, the capital of
the Bolognese duchy, is, next to Rome, the largest,
finest, and richest city in the Ecclesiastical State. Its
ancient name was Tufonia, derived from Tulliano, a Tuscan
king, who is supposed to have built it 25 years before the
foundation of Rome. The name of Bologna is traced by
some to a successor of Eudoxus, called Eunus; but others
deduce it from the Boli. Its circuit is between five and six
Italian miles, and the number of its inhabitants is estimated
at 100,000; but the whole city, which includes 350 cities,
towns, and villages, is said to contain 350,000 persons.
Its figure is oblong, the length of it much exceeding the
breadth; and viewed at a distance, it bears some resemblance
of a ship, the tower of Asinelli, which is 371 feet high, being
the mast. It is surrounded by a solid and lofty brick wall,
well built, and adorned with piazzas, which extend through
the streets, and under which passengers may walk without
being incommoded by the sun or rain. The houses in
general have lofty porticoes, which would have a better effect
if the streets were not so narrow; but in this particular,
magnificence is sacrificed to convenience. For, in Italy, build-
ing is considered as a luxury. This city is seated at the foot
of the Apennines, in an extensive, fertile plain, which liber-
ally supplies the inhabitants with its rich produce. The river
Savona washes it walls, and the rivulet Reno paffes through
it, partieing into several small streams; and the latter, by
means of a canal, communicates with the Po, and affords
great advantage to the city.

The public edifices of various kinds are numerous and mag-
nificent. In the centre of the city stands a high tower, called
Degli Asinelli, from Gerardo Amelii, who built it at his own
charge in 1209; near it is the leaning tower, called Garfenda,
which by a fall of part of it is now reduced to the height of
120 feet, and which inclines, so that a plumb-line let down from
the top deviates seven feet from the wall at the bottom. Of
the palaces in Bologna, which is denominated the Public
Palace is much the most spacious, though not the most ele-
gant. In this the cardinal legislate is lodged: and it has also
apartments for the Grand Pre, as well as halls, or chambers,
for some of the courts of justice. This edifice contains
some very magnificent apartments, and a few good pictures,
of which the most esteemed are, a large one, by Guido, of
the Virgin, and the infant Jesus, seated on a rainbow; a
Sampson, also by Guido, refreshing himself with the water
which flows from the jaw-bone, with which he has just de-
feted the Philistines; and a St. John the Baptist, by Ra-
phael. The first object which strikes the eye of a stranger
on his arrival at this town, is a noble marble fountain in the
area before the Palazzo Publico. The principal figure is a
statue of Neptune, 11 feet high, with one hand stretched
out, and the other holding the trident. The body and
limbs are finely proportioned, the anatomy perfect, and the
character of the countenance fierce and majestic. This
figure of Neptune, as well as all the others of boys, dol-
phins, and sirens, which surround it, are in bronze. The
whole is the workmanship of Giovanni di Bologna, and is
highly esteemed: and yet there seems to be in impropriety
in making water flow from the breasts of the sea nymphs or
from the mouth of Neptune. Over the entrance of this palace is a bronze
figure of pope Gregory XIII., weighing 11,300 pounds,
and executed by Mougri. Near it is another statue of
pope Boniface VIII. The interior between the emperor
Charles V. and pope Clement VII. in 1539, when that
prince submitted to be crowned by the pope, is recorded by
an inscription on a copper-plate. In the Sampieri palace
see...
are several pieces by the three Caracci; one of the best ever done by Albano, representing Cupid killing his mother Venus, and, with an air of triumph, pointing at the rape of Proserpine by Pluto; and another, more admired than all the rest, and considered by the judges as the master-piece of Guido, the subject of which is the "Repentance of St. Peter," and consisting of two figures, that of the saint who weeps, and a young apostle who endeavours to comfort him. Although the nobility of Bologna are not now very rich, many of their palaces are furnished in a magnificent taste, and contain paintings, particularly those of the celebrated masters which this city had the honour of producing, that are their chief ornaments, and are held in high estimation. The palaces were built, and ornamented, when the proprietors were richer, and when the hand works of architecture, sculpture, and painting, could be procured on easier terms than at present. The galleries and apartments are spacious and magnificent; and yet there are circumstances in the most splendid, that must hurt the eyes of those who are accustomed to that perfect exactness in finishing, which prevails in English houses. The glows of the windows of some palaces is divided into little square panes, which are joined together by lead; and the floors of all are so indifferently laid, that you often feel a loose brick shakling under your feet, as you walk through the finest apartments.

Bologna is also embellished with a great number of churches and convents, which are enriched with a variety of paintings, sculptures, &c. Of the churches, of which there are said to be 208, that of St. Petronius is the largest. In this church the emperor Charles V. was crowned in 1530; and on the pavement of it, Cellini drew his meridian line, confining of pieces of red and white marble inlaid, of a hand's breadth; those in which the figures of the zodiac are cut, are a foot square. This line is half the length of the church, which is 360 feet; and at its commencement is a Latin inscription, expressing that "the whole length of this meridian line, distinguished by the figures, &c., is the fix hundred thousandth part of the circumference of the terrestrial globe." On the pavement, at the end of the line, is an inscription in white marble, denoting "the meridian line from the zenith to the tropic of Capricorn." Opposite to the vertical point, is the date MDCLII. A small round aperture has been made in the roof of the church, towards the south, through which the rays of the sun form a circular luminous spot, about eight inches in diameter, on the pavement, which shews the proper meridional point on the line every day. The church of the Dominicans is one of the most magnificent in Bologna. The chapel, dedicated to the honour of St. Dominico, who is said to have died at Bologna in 1221, is much admired. It consists of a curious dome, in which the glittering of gold appears throughout, adorned with the most capital paintings, representing the history of his life. His monument is of white marble, ornamented with beautiful baso-relieves, by Michael Angelo; and the altar, together with the large candlesticks that stand upon it, are of silver. The pavement and the walls are inlaid with marble of different colours. In the vault is deposited, amid jewels and various treasures, a manuscript of the Old Testament, or at least of the Pentateuch, pretended to have been written by Ezra himself. See Bible. It is a large folio, carefully preferred in a glass case, and was presented to the convent by the Jews, when they removed hither from Rome, and were allowed to erect a noble synagogue about the middle of the 13th century. The other principal churches are the Franciscan, in which are paintings by Guido, Luigi, Caracci, Brizio, Guido, and Tarsini; that of St. Agnes, containing, over the high altar, the martyrdom of the faint; by Domenichino; St. Bartholomew, before which stands a marble statue of St. Petronius, by Bernelli, and in which is an announcement, the nativity, and the flight into Egypt, by Albano; the church of the Capuchins, in the vaults of which is a crucifixion, by Guido; that of S. Giovanni in Monte, famous for an admirable picture of St. Cecilia, by Raphael, which is much extolled by Addison, and reckoned one of Raphael's capital pieces, &c. &c. The convents also are enriched with valuable paintings and other ornaments, as well as the palaces and churches. A Dominican convent, seated on the top of a hill, about three miles from the city, is in possession of a portrait of the virgin Mary, said to have been painted by the S. Signor Barbari. That it is lighted over the church of Sanèta Sophia at Contadnino in 1620, and it is thought to have brought many miracles in favour of the inhabitants of Bologna. A curious gallery, open to the south and closed by a wall to the north, is built all the way from the city to the convent; on the open side it is supported by a long row of pillars; and was erected by voluntary contribution in honour of the virgin, and for the convenience of pilgrims. This long colonnade is about twelve feet in breadth, from the pillars to the wall, and about fifteen feet high; all the communities of the town walk, once a year in solemn procession, to the convent, and bring the holy picture to visit the city. It is carried through the principal streets, attended by every inhabitant who can afford to purchase a wax taper. During this procession, the bells continue ringing, the cannon are fired, and the troops under arms practical the same ceremonies when the picture passes, as if it were commander in chief of the forces. In the library of the convent, belonging to the church of S. Salvatore, are many curious MSS.; particularly one of the history of queen Elia, written on yellow coarse leather in large Hebrew characters, and done up in a roll or volume, according to the original signification of the word. The canons pretend that this was written by Ezra. Here is also shown a Hebrew MS. of the O. T. written on vellum, in 3 vols. fol. said to have been written in 5531; it has, however, points or vowels. Among other MSS. amounting to about 300 in number, are the N. T. called the "Codex Bononiensis," said to be of the 11th century, containing the whole N. T. except the apocryphes, abounding with abbreviations; and a Greek version of the minor prophets and Daniel, supposed to be of the 10th century; and among the printed books are Manutius's edition of Cicero's works, 4 vols. fol. published at Milan in 1498, and a Latin bible in folio, which, by a printed advertisement annexed to it, appears to have been completed at Mentz by John Fult and Peter Schoiifer in 1462.

The univeristy of Bologna is one of the most ancient and most celebrated seats of literature in Europe; it was founded, as some say, by the emperor Theodorus in 432, but others, with greater probability, attribute it to Charles the Great. For an account of the academy of sciences, see Academy. Over the gate of the magnificent edifice appropriated to that academy, is the following liberal inscriptions: "Bononienfe Scientiarum atque artium inffituunt ad publicum totius orbis ulum." Here are observatories, with the necessary instruments for astronomical observations; a very valuable library, in three spacious rooms, where any person may study and have the use of the books four hours every day; also, apartments for the students of sculpture, painting, architecture, chemistry, anatomy, alchemy, and every branch of natural philosophy. They are all ornamented with designs, models, and statues, and every day a different statue requisite for illustrating those sciences. There are also professors who regularly read lectures. There is a hall full of models,
models in architecture and fortification, a valuable collection of medals, and another of natural curiosities, as animals, earths, ores, minerals; and a complete collection, to exhibit the study of the materia medica, and every part of natural history. There is also a gallery of statues, consisting of a few originals, and very fine casts of the best statues in Italy.

Honorary premiums are distributed every year among the artists, for the best designs in painting, sculpture, and architecture.

The anatomical theatre is adorned with statues of celebrated physicians; and the museum belonging to it supplies an abundance of anatomical preparations, and a complete suite of anatomical figures in wax: a man and woman are exhibited in the natural state; the same with the skin and cellular membrane removed, so that the external muscles of the whole body and limbs appear. In the subjacent figures the more external muscles are gradually removed, till nothing but the simple skeleton remains. These figures are very well formed, preserving the natural appearance and situation of the muscles and blood-veils with as great exactness as could be expected in a work of this nature. There are also models in wax, of particular parts, and of several of the viscera of the human body separately.

The inhabitants of Bologna carry on a very considerable trade in silks and velvets, and leather bottles, which are manufactured here in great perfection. The country produces immense quantities of oil, wine, honey, wax, flax, and hemp; and furnishes all Europe with hams, dried tongues, sausages, macaroni, sweetmeats, olive, perfumes, wax-balls, liqueurs, and essences. The people are industrious, and allowed to enjoy the fruits of their labour: the nuts are very ingenious in making artificial flowers, and imitating fruits of various kinds; and very beautiful works are also made of walnuts and rock-crystal. The markets are plentifully supplied for provisions; fruit is had in great variety, and of excellent quality; and the common wine of the country is a light white wine of an agreeable taste, which is preferred by strangers to any of the French or German wines that may be had there. The inhabitants, in general, are facetious and polite to strangers, who may receive at Bologna every kind of accommodation that may suit their taste.

Bologna long retained the name of a republic, sent an ambassador to the pope's court, and the word "Libertas" was inscribed on the arms and coat of mail, with the flattering capitals S. P. Q. R. The civil government and police of the town were allowed to remain in the hands of the magistrates, who were chosen by the senate, which formerly consisted of 40 members; but since this republic came under the protection, as it is called, of the pope, he thought proper to add ten more; but the whole 50 still retain the name of "Quaranta." One of the senators presided in the senate, and was called the "Gonfalonier," from his carrying the standard (Gonfalone) of the republic. He was the chief magistrate, was attended by guards, and was constantly at the palace, or near it, to be ready on any emergency; but he remained only two months in office, and the senators took it by turns. In the midst of all this appearance of independence, a cardinal legate from Rome governed this republic; he was appointed by the pope, with a vice-legate, and other affillants. The orders which the legate issued, were supposed to be with the approbation of the senate; or at least, they never disputed the office, which was of higher dignity than any other in the gift of the court of Rome, and continued for three years; at the expiration of that time, his holiness either appointed a new legate, or confirmed the old one in the office for three years longer. This ecclesiastical vicerey lived in great magnificence, and had a numerous suite of pages, squerries, and halberdiers, who attended him in the city. When he went into the country, he was accompanied by gamus on horseback. The gonfalonier and magistrates regulated all the usual matters which regarded the police, and decided, in common causes, according to the laws and ancient forms of the republic; but in affairs of great importance, and, indeed, as often as he chose to interfere, the cardinal legate without doubt influenced all decisions. This must be mortifying to the senators and noble families; but was left felt by the people in general, who exhibited every appearance of living under a mild and beneficent government.

Bologna was the see of an archbishop; who led for his suffragans the bishops of Crema, Borgo, St. Donnino, Modena, Parma, Piacenza, and Reggio. Bologna is 33 miles S.W. of Modena, and 145 N. W. of Rome. N. lat. 44° 29' 36". E. long. 11° 21' 15".

See BOLOGNE.

BOLOGNE, in Geography, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Chaumont, 6 miles north of Chaumont.

BOLOGNESE, Francisco, in Biography, an eminent painter of landscape and history, whose original name was Francesco Grimaldi, was born at Bologna in 1606, and educated in the school of Amial Caracci. He completed his studies at Rome; and his improvement was such, as to attract the attention of pope Innocent X. by whom he was employed both in the gallery of his palace at Monte Cavallo, and in the Vatican. Among his numerous admirers and friends were the prince Pamphilii, the pope's nephew, and many of the principal nobility at Rome; Lewis XIV. and cardinal Mazarin at Paris, who procured for him a large pension; and employed him in decorating the Louvre; and after his return to Italy, the pope Alexander VII. and Clement IX. He was peculiarly happy in his execution of landscape; and was distinguished by his fresh and cold colouring, light and fine touch, and an elegant mode of composition. His landscapes in the manner of Caracci are models of the style of that school, though the colouring of them is thought to be somewhat too green. He understood architecture, and also etched, with great freedom, talent, and spirit, a great number of landscapes, partly from his own designs, and five after Titian. His agreeable manners and amiable disposition attached universal esteem. His benevolence was singularly manifested towards a Sicilian gentlewoman and his daughter, who had retired to Rome from the troubles of his country. They lodged near him, and were known to be so poor as to want bread. As soon as Bologna was apprised of their situation, he repeatedly knocked at their door in the morning, threw in some money, and withdrew undiscovered. The Sicilian at length detected him in one of his acts of beneficence, and in token of gratitude fell at his feet. The painter raised and embraced him, and they continued mutual friends through life.

Bologne died at Rome in 1683, and bequeathed considerable property to his six children. His principal works are at Rome, and consist of large landscapes, and historical pieces in fresco. The pictures of his best time are very rare, and afford large prices. His son Alexander was a good painter in the style and taste of his father, though much inferior. Among his engravings are the "Braven Serpent," from a composition of his own, which, though flight, is a spirited, free etching, in the style of a painter. Pilkington and Strutt.

BOLOGNESE, or the duchy of Bologna, in Geography, a territory
BOL

ritory of Italy, in the ecclesiastical state, bounded on the north by the Ferrarese, on the east by Romagna, on the south by Tuscany, and on the west by Modena; anciently inhabited by the Boii and Ligures. It was formerly a republic, under the protection of the emperor of Germany; but, in 1278, it became subject to pope Nicholas III. After many vicissitudes, pope Julius II. in 1513, annexed the city of Bologna, and all its dependencies, to the papal dominions; and in consequence of its voluntary submission to the see of Rome, it was indulged in several privileges, which it continued long to enjoy without molestation. But after the city of Bologna was taken by the French in the campaign of 1556, the legations of Bologna, Ferrara, Modena, and Reggio, entered into a treaty to form a republic, under the name of the "Republica Cispadana," or "Cisalpine Republic," which was confirmed by the eighth article of the treaty of Campo Formio, October 17, 1797.

The soil of this territory is rich and fertile, and in the vicinity of Bologna it is so much improved by cultivation, that it appears like one continued garden. The vineyards are not divided by hedges, but by rows of elms and mulberry trees; and the vines hang in a very beautiful picturesque manner, in foignons from one tree to another. The country is not only fertile in vines, but likewise in corn, olives, and peltzorage, and has, not without reason, acquired the name of "Bologna la Grasa." The Bolognese affirm, that their cheese is not inferior to that of Parme, and they sell a great quantity of it under the name of Parmesan cheese. See Bologna.

BOLOGNETTI, POMPÉII, in Biography, was born at Bologna, in Italy, about the year 1616, where he received his education, and attaching himself to the practice of physic, was admitted doctor, and then professor in medicine; at the university there, in which capacity he was much admired, his lectures being numerously attended. His works are "Consilia de praecuttione occasione mercurium, ab infinitis immunitatis contagio," 1636, folio; which, perhaps, gave birth to Dr. Mead's work on that subject, or suggested the idea of it. "Remora sempcticis," 1650, 4to. Haller. Bib. Med. Ely. Dict. Hist.

BOLOGNINI, ANGELO, a celebrated professor of medicine and surgery, who flourished in the beginning of the 16th century, was born in the neighbourhood of Padua, but practiced and taught medicine at Bologna. At the earnest importunity of his pupils, he says, he published, in 1508, "De sua ulcerum interiorum, et de uguguentis communibus in solutione continui," 4to, which has frequently been re-printed. He was of the school of Avicenna, on whose works he commented in his lectures. He gives forms for preparing ointments with mercury, which he highly extols, and says, they cure the lues, though the falivary glands should not be affected, which, however, he admits to be defirable. The latter part of his life was spent in retirement at Padua. Afric. de Moro. Gal. Hall. Bib. Med.

BOLOTOVA, in Geography, a town of Siberia, 24 miles N.E. of Nertefhink.

BOLSKHAI, a town of Siberia, on the Irrith, 240 miles E.S.E. of Tobolsk.

BOLSKHAKINA, a town of Siberia, 68 miles south of Orelva.

BOLSÉC, JERÔN, in Biography, a carmelite of Paris in the 16th century, who defected his order on account of some free opinions, and became a refugee at Ferrara. There he commenced the profession of physic, and being acquainted with Calvin, he removed to Geneva. In this city he divulged his free opinions concerning predetermination, which excited the resentment of the Genevan reformer, and which induced the magistrates of Geneva, probably at his instigation, first to imprison him, and finally to banish him, as one convicted of sedition and Pelagianism. He was afterwards expelled from the canton of Bern, whither he had retired; and failing in his endeavours to ingratiate himself with the Protestants of Paris and Orleans, he returned to the bosom of the Catholic church. He then revenged himself by writing a very flan- derous account of the life of Calvin in 1557, and another of that of Beza in 1558, the falsities of which ferox Catholics are ashamed to quote. He also wrote against Calvin's instituti6n, and his arguments were afterwards made use of by Cardinal de Richelieu. Bolec practiced physic at Autun, and at Lyons, in which latter city he died, a few years after he had written Beza's life. Gen. Dict.

BOLSENA, in Geography, a town of Italy, in the ecclesiastical state, and patrimony of St. Peter, delightfully situated on a lake that is of the name, which is about 52 Italian miles in circumference. In this lake are two islands, namely, Bifentina and Martana, with a church in each island; in the former the unfortunate Amafulnta, daughter of Theodoric, king of the Ostrogoths, is said to have been put to death in 534, by order of the ungrateful Theodatus, her cousin, whom she had admitted to a share in the government. We learn from Pliny, (Hist. Nat. i. c. 95,) that in his time these two islands were floating. He calls this lake "Tarentinum," a name which it derived from "Tarquinium," one of the principal 12 Eturian cities, whose territories extended to this lake; but it has been doubted, whether Pliny refers to the islands of this lake. Bolsena is environed with mountains, covered with trees, forming a kind of august amphitheatre. On an eminence near it may be seen the ruins of the ancient "Volatium." It is 7 miles S. of Orvieto.

BOLSOVER, a considerable market town of Derbyshire, England, has been noted for its manufactories of buckles, spurs, bridge-bits, flirrup-irons, and other similar articles; but the greater part of them is now made in Birmingham, and its vicinity. The town is governed by a constable, and two headboroughs; and a copy-hold court is held here every three weeks. Here was formerly a castle, which, according to the Domesday book, was poifessed, at the Norman conquest of England, by William Peverel. It was of considerable extent, and from its remaining fortifications was evidently of great strength. Its fortresses are mentioned by Leland, as being in ruins when he visited this part of England, in the time of Henry the Eighth. A modern mansion, still called the castle, occupies the site of the ancient buildings, and was erected by Sir Charles Cavendish in 1615. It is of square shape, and assumes the castellated character by towers at the four corners, and an embattled parapet. In this mansion, a superb entertainment was given by William Duke of Newcastle, to Charles the First and his queen in the year 1633. Upon this occasion, all the neighbouring gentry were invited to partake of the festival, which was conducted upon so magnificent a scale, that the expenses were estimated as amounting to 70,000l. Grand pageants, &c., were represented before the royal gueifs, and the fancy and taste of Ben Jonson were employed in preparing speeches and feizery upon the occasion. It now belongs to the duke of Portland, whose family obtained it, by marriage with a daughter of the earl of Oxford. In the parish church is a magnificent monument to the memory of the above-named Sir Charles Cavendish, many of whose family are also interred here. Bolsover has a weekly market on Fridays, one annual fair, and a statute fair for hiring servants, &c. It is 8 miles from Mansfield, and 145 N.W. from London. In the parish are 435 houses, and 1701 inhabitants.
At Eton, a small village three miles N.E. of Bolsover, was born Jedediah Baxter, a man who, though only a poor labourer, acquired extraordinary celebrity, for his retentive memory, and reconcile powers of calculation.

Three miles north of Bolsover are the great coal works, called Norbrig's Colliery. These belong to the Duke of Portland, and are let out to a company of persons who lend great quantities by the canal to Workop, Redford, Stockwith, &c. Bibliotheca Topographica, No. 32.

BOLSTER, among Surgeons, a soft yielding substance either laid under the head or a broken limb. Bolster is also used for a stuffing, intending to fill out or raise a flat, flapping, or hollow part. In which sense bolsters are contrived for crooked, bunched, and other distorted backs, shoulders, &c.

Bolsters, or cushions, in the Mansion, those parts which are raised on the bows, both before and behind, to rest the rider's thighs, and keep him in a posture of withstanding the disorders which the horse may occasion. Common saddles have no bolsters behind or even before.

Bolsters, in Sea Language, small cusion or bags, filled with tarred canvas or rope yarn, &c. and placed under the throusards and flays, to prevent their chafing against the treel- trees, by the motion of the sail, when the ship rocks at sea.

Bolsters are also pieces of fir fayed upon the upper side of the treel-trees, and against the thwartship sides of the main-head. They must be sufficiently long to clear the fulk-hole and after crofs-hole, and broad enough to project one inch and a half, or more, without the treel-trees, and the same in depth, and rounded from the upper to the lower edge on the outside, and nailed to the treel-trees at each end. Their use is to prevent the throusards chafing by the motion of the masts.

Bolsters of an anchor are cylindrical pieces of iron, with a hole through the middle, used when holes are to be punched, or opened with pins.

Bolsward, Bolswerd, or Bolswert, in Geography, a town of Friesland, in the United Netherlands, said to have been built in 713 by Bolswine, son of Radbode, king of Friesland, from whom it took its name. It was almost burnt down in 1475, and again in 1515, when it was rebuilt and encompassed with a rampart of earth. About a league from this town is a port, which, though much obstructed by sand, is very useful to the inhabitants.

Bolswert is about two miles in circumference, and was formerly one of the Hanse towns; and a great part of the Friesland baize, which formed a considerable article of exportation, was wove in this place. It is distant 13 miles S. W. of Leeuwarden, and 7 S. S. E. of Harlingen. N. lat. 53° 2'. E. long. 5° 24'.

Bolsward, or Bolswerd, Boetius Adam A, in Biography, an engraver and printseller of Antwerp, derived his name from Bolswert in Friesland, where his family resided, and flourished about the year 1620. He worked only with the graver, and successfully imitated the free, open style of the Bloemarts, in whose school he probably perfected himself in his art. When he worked from Rubens, he altered that style, and his plates are nearer, fuller of colour, and more highly finished. His plates from Bloemart are a set of "Twenty Landscapes," "The forefet of the hermits and hermitesses of Egypt and Palestine," and "The Nativity of Christ." The plate from Rubens, in a more finished style, are the "Resurrection of Lazarus," and its companion "The Last Supper," which is a very beautiful engraving. Strutt.

Bolswert, or Bolswerd, Somfetijs A, brother of B.
BOLTS, in Carpentry, denote pieces of wood cleat with wedges, in order to be split into half.

BOLTS, or iron pins, in a Ship, are of several forms, of which the most common have small round heads, and are used to unite two or more pieces together. Some have round flat heads, called flange-heads, with a mortise in the other end, or point, and are used to fasten moveable pieces to thole that are fixed; others have an eye at one end, for lashing or hanging blocks, &c. and are driven in half-holes, yards, caps, &c. Some have a square part left at the back of the eye, that they may not be driven on the eye, and endanger splitting. Bolts are frequently distinguished according to the places where they are used; as, 

**bain-bolts**, bolts fore-carpenters, &c.; 
**ring-bolts**, serving for the bringing-to of the planks, &c.; 
**drive-bolts**, used to drive out others; 
**set-bolts**, employed for forcing the planks, and other works, and bringing them close to one another; 
**rig-bolts**, on each side full of jags or bars, to keep them from falling out of their holes; 
**clinch-bolts**, those which are clinched or fastened at the ends, where they come together; 
**fore-lock-bolts**, made like locks with an eye at each end, which are driven into the innermost bolts or wales of a ship, to safe her fides from bruising and harts.

The following machine for drawing bolts in and out of ships was invented by Captain Bolton of the Navy, and obtained from the Society of Arts their prize of the gold medal. A model of it is preferred in the repository of the society for the use of the public. The description of it (See Transactions of the Society, vol. xvi.) is as follows:

**AAAAA** (**Plate of Ships**) is the frame of the machine. 
**B,** a cylindrical tube, having a female screw in the inside. 
**C,** a wheel with teeth attached to the cylinder B. 
**D,** an endless screw adapted to the wheel C. 
**E,** handle of the winch. 
**F,** the bolt drawing out. 
**G G,** blocks to support the frame. 
**H,** a hollow piece of steel, having on its outside a male screw, whose threads work within the female screw in the cylinder B. 
**I,** a piece of steel the bolt is to be riveted. 
**J,** a semicircular piece of steel, which is to be introduced into the notches on H, when a similar notch has been cut in the head of the copper bolt, by this means is prevented from turning in H, while drawing, K, the bolt, as prepared to receive the machine. 
**L,** a steel bar, somewhat smaller than the bolt to be drawn, having at one end a male screw, L, and at the other end another male screw that fits into the female screw of B. 
**M,** a section of a male screw, having a square hole larger than the bolt. 
**N,** a bolt with a male screw at one end ready to be drawn in.

The machine, of which a plate is annexed, consists of a frame supporting a cylindrical female screw tube. On this tube is mounted a wheel with teeth adapted to an endless screw fitted to the frame, and worked by a handle.

**To draw the bolts out.**

The head of the bolt must be cut off, and a hole made in the timber big enough to receive the male screw H, which is put over the bolt; a fit is then to be made, either by a saw or cold chisel, in the head of the bolt, to receive the key I, and which corresponds to the fit in H; the bolt head is then to be riveted as firmly as possible upon H; the cylindrical tube, B, is then to be screwed on, turning the whole machine round till it can be done no longer, when the endless screw is to be used. If the machine is of a proper strength, and the riveting well done, the power is such as to extract the bolt or break it, but generally it will be drawn out uninjured. See Drawing, &c.

To draw bolts into ships.

It will be necessary to have a bar, L, which is recommended to be made of steel, long enough to pass from the inside to the outside of the ship, and somewhat smaller than the copper bolt intended to be drawn in. This may be called a conductor. On one end should be a male screw, α; the bolt to be drawn in should be tapped at one end to receive the male screw, α, on the conductor, and at the other end should be another male screw that fits into the female screw in B; after which the operation is the same as drawing a bolt out, and the machine should be applied accordingly. When the bolt arrives at its destined place, it may be secured on the inside by a nut, which is as good a way of fastening as clinching, and much more expeditious.

This machine though only of the height of eighteen inches, will draw bolts in or out of any length; for, after the bolt has risen to the top of the tube, it will only be necessary to screw the machine back, and follow up the work with blocks of timber, as represented in the drawing.

**Note.** If the upper part of the hole in H be made square, larger than the round hole as shown at M, and the head of the bolt riveted into it, it will do away the necessity of the key, I, render the machine less complicated, and save much time and trouble.

BOLTS of an Anchor, are cylindrical iron pins for fastening the two parts of the flock together.

BOLTS for whirls, in Rope-making, are large iron pins with round heads, driven in the board over the crank-wheel for the whirls to run on.

BOLT is also used for a measure or certain quantity of canvas, amounting to twenty-eight ells.

Bolt of silk or stuff denotes a long narrow piece of indefinite measure.

BOLT of peas, in Ely, denotes the pea-flax, when the grain is threshed off of it.

BOLT, thunder. See Thunder-bolt.

BOLT-rope, in Sea Language, is a rope fowled to the edges of a sail, to prevent it from rending by the force of the wind, or any other cause.

A bolt rope should be made of fine yarn spun from the belt hemp, and sewed neatly on with good twine. To avoid fraying, the rope must be kept well twisted while sewing on, and care taken that neither too much nor too little slack is taken in: that part of the rope at the leech of the sail is to be croos flitches at every foot in length, at every seam, and in the middle of every cloth at the foot, with three croos flitches; four croos flitches should be taken at all the beginnings and fastenings off: the flitch given twice, and the last three times. Small fails have two croos flitches at every seam, and three at every fastening off.

**BOLTED flour,** which has passed through the bolters.

BOLTEL, in Building, any prominence or jutting out, as of a piece of timber, end of a beam, or the like, advancing beyond the naked of the wall.

BOLTERS, or Bolters, a kind of spikes for meal, having the buttons made of woolen, hair, or even wire. The word seems derived from the German, beulen, a fice; whence also beaten, to bolt. The bakers use bolters, which are worked by the hand; millers have a large fort, wrought by the motion of the mill.

BOLT-HEAD, a vessel used by the chemists, the same as matrats; which see.

BOLT-HEAD, in Geography, a promontory of England, on
the south-east of the county of Devon, 19 miles S.E. of Plymouth. N. lat. 50° 6'. W. long. 30° 47'. The most prominent 45 miles W.N.W. of this is called Boltiel. BOLIN and Tun, in Herclody, is a bird bolt in pale piercing through a ton.

BOLING, or Boulting, the act of separating the flour from the bran, by means of a sieve or boiler.

Boling-cloth, or Bolter-cloth, sometimes also called bolting-cloth, denotes a linen or hair-cloth for lifting of meal or flour.

That kind of bolting-cloth which is used for fitting of meal, and also for a variety of needle work, for young ladies' furbelows, and for filling up the frames of windows, &c. is woven after the manner of gauze of fine spun woollen-yarn. The wool necessary for making this cloth must be long, well-washed, and spun to a fine equal thread, which, before it is woven, must be reeled in hot water, to prevent it from shrinking. The web must be thickened; and in the manufacture of it the English have the advantage of the Germans, whose cloth of this kind is much cheaper, but much inferior in value to that of England. The bolting-cloth of this country is differ, as well as smoother, and the flour passes through it much better than through that of the Germans, which is either very little or not at all thickened. A manufactory of this cloth was established at Oltra, near Dresden, by one Daniel Kraft, about the end of the 17th century; and at Hartch near Zittau, it was introduced by one Pásky, who learned the art of making it in Hungary. The cloth which is lent from hence for sale, not only everywhere round the country, but also to Bohemia, Moravia, and Silesia, is woven in pieces, containing each from 64 to 65 Leipzig ellis; the narrowest being 16, and the widest 14 inches in breadth. Large quantities of it are also made by a company in the duchy of Wurtemberg. Bolting-cloth is also made at Gerä, as well as at Portfand and Berlin; at the latter of which places there is a manufactory of it carried on by the Jews.

Bolting-mill, a verifiable engine for fitting with more ease and expedition. The cloth round this is called the bolter.

The method of applying a sieve in the form of an extended bag to the works of the mill, that the meal might fall into it as it came from the Rolls, and of caus'd it to be turned and shaken by the machinery, was first made known in the beginning of the 16th century, as we are expressly told in several ancient chronicles.

Boling, or Boulting, among Sportmans, signifies routing or dislodging a fox, rabbit, or badger, from its resting place.

Boling, in Law, a method of pleading, or arguing, formerly in use in the courts of court; inferior to mooting. The case is argued first by three students, then by two barristers; an ancient, and two barristers sitting as judges.

The word comes from the Saxon bolte, a house; because done privately within doors, for instruction.

BOLTON, EDMUND, in Biography, an English antiquarian writer of the 17th century. By religious profession he was a Roman Catholic, and probably enjoyed some office under Villiers duke of Buckingham. He was diligent in his researches into subjects of history and antiquities, and was the author of several works, of which the principal are the following: viz. « A Life of Henry II. » « Elements of Armories, » Lond. 1616. « A translation of Florus, » « Nero Caesar, or Monarchy deprav'd, » Lond. fol. 1624, in which he attempts to establish the improbable opinion, that Stonehenge was a monument to the memory of queen Boadicea. His « Vin diece Britannica, » left in MS., was designed to prove the great antiquity and early importance of London. From his performances, Bolton appears to have professed the credulity, nationality, and love of trifles, often attendant on antiquarian studies, when they are not directed by taste and judgment. The time of his death is not known. Biog. Brit.

Bolton, in Geography, a village of Yorkshire, in England, had a very considerable manufactory of canons regular, of the order of St. Austin, founded in 1120 by Robert de Romet, and this had afterwards other benefactors, and at the dissolution its annual revenues were valued at 212s. Part of the religious house still remains, and one room is appropriated to a free school, which was founded by Robert Boyle, esq. This village is rendered remarkable from being the birth-place and residence of Henry Jenkins, who was born in the year 1500, and lived to the great age of 160 years. He enjoyed a constant rate of good health, and poll'd his faculties to the last year of his life. See Longevity.

Bolton-le-Moors, is an ancient manufacturing town of considerabe consequence in Lancashire, in England. It may be considered as the original seat of the cotton trade in this country, and for the manufacture of ornamental and fancy goods is still particularly celebrated. Leiland, in his Itinerary, notices the cottages (then a species of woollen) and coarse yarns which were brought to this town in his time, and observes, that many villages in the vicinity were engaged in this manufacture. Coal-pits were also worked at that time, and coal-scarcely obtained in abundance from pits in the neighbourhood. The making of fullians was introduced into this town, at a very early period, and still continues a prominent object of trade. During the civil wars in the reign of Charles I, Bolton was besieged by prince Rupert in 1644, and many of the inhabitants were killed. The town is well built, and has rapidly increased in size and population. It is seated in a flat district, as its name partly implies. The advantage of canal conveyance to Manchester and Bury, has proved highly important to the town, whose manufactories are thereby greatly promoted. Bolton has a free school, of which Ainsworth, the author of the Latin dictionary, was once a master. The prosperity of Bolton may be partly estimated from the following comparative rate of its population. In the year 1775, there were 5,339 inhabitants in this town and Little Bolton. These were augmented to 11,759 persons in 1789; and in 1801, when the population of the county was estimated by order of the house of Commons, there were found to be 14,766 houses, and 17,413 inhabitants in the township and chapelry of Great and Little Bolton. The principal mart for the sale of goods made at this place is Manchester, where the manufacturers resort on Tuesdays, Thursdays, and Saturdays. "The neighbourhood of Bolton," observes the judicious Dr. Aikin, "has been distinguished for producing men of great talents in mechanical invention, who have generally been wholly uneducated, and indebted only to native powers, and the habit of observation. The most celebrated of these was Sir Richard Arkwright, of whom false pride and prejudice alone can think it derogatory to say, that he palled a great part of his life in the humble station of a barber in the town of Bolton. His mind was so ardently engaged in the improvement of the mechanism used in the manufactures, that he could fearlessly keep above want by the exercise of his proper profession; but his perseverance and ingenuity were at length rewarded with a measure of opulence, which nothing but the tide of prosperity in a commercial nation could bestow." See Arkwright.

At Smithfield, an old hall, or manse, north of Bolton, formerly belonging to the Paucong family, is a curious old
old wainscotted room, the panels of which are adorned with upwards of 50 heads, cut in wood. This hall is flown and visited as a curiosity, from a superfluous prevalent opinion that an impression of a foot may be seen in the stone floor made by one Martha a martyr, in the reign of queen Mary.

Rivington, in the parish of Bolton, is a conspicuous hill, crowned with a building called Rivington-pike. Some veins of lead and calamine have been worked in this neighbourhood, but have not hitherto proved very fortunate to the adventurers.

Bolton is 11 miles from Manchester, and 157 miles N.W. of London. It has a market on Mondays, and two fairs annually. Aikin's Description of the Country round Manchester, 4to. 1795.

Bolton, a township of America, in Chittenden county, Vermont, tented on Onion river, about 144 miles N.N.E. from Bennington, containing 88 inhabitants.—Alfo, a township in Tolland county, Connecticut, incorporated in 1720, and settled from Weathersfield, Hartford, and Windsor, 14 miles E. from Hartford.—Alfo, a township in Worceler county, Massachusetts, 18 miles N. E. from Worceler, and 20 W. from Bolton; containing 935 inhabitants, and a good bed of lime-tree.—Alfo a township in Washington county, New York, between Sroon lake and lake George, distant 10 or 12 miles S.E. of Ticonderoga, and containing 959 inhabitants.

Gen. Char. Coll. common; innumerable, with nearly equal linear, acute scales. Cor. compund, radiate; florets of the disk tubular, funnel shaped, Ieave-numeros, of the ray many, linear, entire, piliferous. (Schreb.) three-toothed. (Bofc.) Pyl. germ oblong; style filiform; frugmas two, onle of the ray revolute. Parietum. none; calyx un- changed. Seed solitary, comprifed, flightly toothed, two- horned; receptacle naked, honey-combed, hemifpheric.

Species. 1. B. afeeroides, (matricaria aft. Linn. Mant. 116.) "Leaves quite entire." Stem upright, two feet high, even, scarcely angular, slightly bræcked; leaves alternate, remote, fowle, lanceolate, even, at the base down to the fave, ragged about the edge; panicle thin, flufih, with one- flowered peduncles; disk yellow; ray pale fcelor-colour.

2. B. glaflyfola. "Lower leaves fett." Five or fix feet high. Both species are natives of South America, flower late in the autumn, and were cultivated by Mr. Miller in 1788.

BOLSACKEN, or BOLTSACK, in Geography, rocks at the N. entrance of the Great Belt, 5 miles S.E. from the island of Samöe. N. lat. 55° 48'. E. long. 10° 40'.

BOLTY, in Ichthyology, a fift of the Labrus genus. (Labrus niloticus of Linnaeus), that is found in the Nile. It is figured and defcribed by Sonnini, in his "Voyage en Egypte." This, it is observed, is one among the small number of fiftes that inhabit the river Nile, the fleth of which is delicate, and of a good flavour. Dumberton, in the French Encyclopedia, calls the species Nébulens, on account of the obscure spots with which the fins are marked.

BOLZNITZ, in Geography, a river of Germany, which runs into the Elber near Elberwerda, in the margrave of Meifen.

BOLU, a mountain of Asia, in Armenia, 144 miles S.E. of Erivan.

BOLUADIN, a town of Asia Minor, in the province of Natcha, 38 miles N. of Karni-fufer.

BOLUCKOIF, in the Turkish Affairs, denotes the chief of a company, or a captain who has the command of an hundred janizaries.

BOLURUS, in Ancient Geography, a town of Greece, in Thesprotia.—Alfo a town of Illyria, which belonged to the Trallians. Steph. Byz.

BOLUS, in Pharmacy, is a very useful form of extemporary prescription adapted to a variety of cases in which a more solid or a more liquid form would not answer the purpose. The confidence of a bolus is the same as that of an elixir, that is, about as soft as dough, so as easily to float down the throat without falling to pieces. As it must in some degree be tasted while swallowed, it generally consists of the medicine in powder, worked up to the proper tenacity by means of some graceful syrup; soft extract of liquors, or a palatable conserve; or, if the medicine be an oil, balsam, or other liquid, dry sugar, with flour, almond-paste, and the like, are added to bring it to the due consistence. It is intended to be only a single dose.

The substances most proper to be exhibited in this form are those that are very heavy, and scarcely to be suspended in any liquid so as to be drunk off, such as calomel, tin-powder, flatulents, ethiops mineral, or those that are too bulky to be made into a convenient number of pills, and are nauseated by the patient in a liquid form, such as cinnchona, chamomile, burnt-powder, Dover's powder, valerian root; or some of the stronger acids and aromatics, as guaiacum, camphor, musk, esir, ammonium; or those that are little soluble in the stomach, unless previously mixed with some easily soluble matter, and yet do not readily combine with liquid sufficient to be drank off, as oil of turpentine, the balsams and the like, mixed with sugar and flour. Dolaxis differ from troches in this, that the latter are made firmer, though equally soluble, and being intended for flow solution in the mouth; they consist only of infusip, or not unsalable ingredients. Substances that readily become very moist, such as the kali preparation, should not be used in this form, unless the bolus is intended to be taken immediately: but on this head least caution is required than in compounding elixirs.

This form of medicine should be avoided where the patient is in a state in which the power of swallowing is with difficulty exercised, as in apoplexy, and other comatose disorders; in some ptyalostomic and painful affections of the throat; or where the ophaghus is naturally very narrow. Alarming accidents have sometimes arisen from a neglect of these precautions. It is likewise difficult to get very young children to swallow them, unless made extremely thin. These minutiae will not appear trivial to those who are in the habit of personally watching the trouble and difficulty which daily attend the exhibition of medicines, and are so liable to defeat the most judicious plans of the prescriber.

In hospitals and dispensaries this form is very commonly adopted, as it is prepared with little trouble, and is economical in the more expensive drugs, no more of them being employed than the immediate wants of the patient require.

BOLUS-HEAD, in Geography, a cape of Ireland, on the south-west coast of the county of Kerry, 38 miles S.W. of Killarney. N. lat. 51° 44'. W. long. 10° 12'.
BOLWYCK, a town of Norway, 49 miles W. of Tonsberg.

BOLZANI, Urbano Valeriano, in Biography, one of the revivers of literature in the 15th century, was born at Bellano about the year 1420. Having entered, when young, into the order of the Minorities, he travelled through Egypt, Palestine, Syria, Arabia, Greece, and Thucsus, observing whatever was curious either in nature or art. In the course of his perambulations, he twice ascended the summit of Zima, and surveyed its crater. As a strict observer of his vows, he declined accepting the honours and dignities which were offered him. His fixed abode was at Venice, where he taught the Greek language, and, among other scholars, instructed the learned Gesu-Antonio Diamasso, and John d'Anclis, afterwards pope Leo X. He was the first who facilitated the attainment of the Greek, by composing a grammar in that language; of which the first edition was printed in 1497, and a second, much enlarged, in 1512. He died in 1524.

BOLZANO, or Bolzen, in Geography, a town of Germany, in the Tyrol, seated on the river Etsch, near its confluence with the Adige, famous for its four annual fairs, each of which continues a fortnight, which are much respected by Italian and German merchants; 6 leagues S. W. of Brixen, and 9 N. of Trent. It was taken by the French in March, 1797. N. lat. 46° 28', E. long. 14° 12'.

Bolzano, a town of Italy, in the Vicentine, belonging to the state of Venice, 2 leagues E. of Vicenza.

BOM, in Zoology, the name of an American serpent of the Boa genus, called likewise boma, and boma. It is said to grow to a vast size, and to be perfectly harmless; but the latter assertion is improbable; it is not certainly of the poisonous race of serpents. This is called the boma, because it emits a remarkable noise resembling the sound of that word, when pronounced with a deep hollow voice.

BOMAL, or Bohemal, in Geography, a town of Germany, in the duky of Luxembourg, seated on the Ourte, 7 miles S. W. of Spa, and 53 N. W. of Luxemburg.

BOMANGIY, a town of Africa, in the kingdom of Angoy, or Gov (which fee), situate on the north bank of the river Zaire. S. lat. 5° 36'. W. long. 14°.

BOMARZO, a town of Italy, in the ecclesiastical state, and patrimony of St. Peter, once episcopal; 14 miles from Civita Castellana.

BOMB, in the Military Art, a hollow iron ball, or shell, furnished with a vent, by which it is filled with gun-powder, and which is fitted with a fuse, or hollow plug, by which it gives fire, when thrown out of a mortar.

In the English artillery, bombs are now commonly called shells.

The word bomb comes from the Latin bombus, crepitus, or fibratus ani: by reason of the noise it makes.

The method of preparing a bomb is as follows: a hollow iron globe A B (Plate Gunny), is call'd pretty thick, having a round aperture A, by which it may be filled and lighted; and circular angle C D, of hammered iron fixed in the mould when they are cast, for the commodious putting it into the mortar, as well as for carrying it from one place to another. In France, the handles are cast iron; but they are thus rendered more clumsy, and liable to break sooner than the others.

It has been used to make the lower part of the bomb the required shape, that it may fall on that side, and never on the fusee, and that it may also better resist the shock, or imprefion of the powder by which it is discharged from the mortar; but Mr. Muller thinks that neither of these considerations is of any great importance, and recommends rather to make the rounds equally thick, because they would thus burst into a greater number of pieces. Artillery, p. 151., in his System, &c. vol. v.

After the shells have been gauged and examined as to their dimensions and weight, they must be well searched within and without by means of a copper grater, to ascertain whether there be any holes or cavities in them; and the iron pins or spikes at the bottom of the inides, which supports the corps when they are cast, should be beat down or broken off. They are then to be hammered all over, to knock off the laces, and discover flaws; and no hole, in the large shells, is allowed, of more than a § of an inch deep. An empty fusee is then driven into the fuse hole; and the shell is suspended in a tub of water, so that the water may cover it, without running into the fusee; in this situation the nose of a pair of helves is introduced into the fusee hole, and several strong pins given with the helves; and if no bubbles rise in the water, it is concluded that there are no holes in the shell, but that it is found and fit for service.

When the shell has been thus proved, and is found to be dry within, gun-powder is introduced into its cavity, by means of a funnel; but it is not quite filled. Artilleryists, through they agreed that shells shou'd not be quite full, have not ascertained the precise quantity which would serve for their bursting into the greatest number of pieces. Captain Detaguilliers, after having made several experiments, apprehends, that the most proper quantity of powder is two thirds of the weight which would fill the cavity. A little space or liberty is left, that when a fusee or wooden tube, ρ, of the figure of a truncated cone, is driven through the aperture, the powder may not be bruised. This fusee is pressed in at first by the hand as far as it will go, and then drove with a mallet as hard as possible, taking care, however, not to split it; for if the lead crack were in it, the composition would give fire to the powder, and the shell would burst either in the mortar, or in the air, and thus do no execution. For the method of preparing and filling the fusee, see Fusees.

This fusee is set on fire, and burns slowly till it reaches the gun-powder, which goes off at once, bursting the shell to pieces with incredible violence; whence the use of bombs in besieging towns. Special care, however, must be taken, that the fusee be fo proportioned, as that the gun-powder do not take fire before the shell arrives at the defined place; to prevent which, the fusee is frequently wound round with a wet clammy thread.

The fusees are driven into the shell, so that only about an inch and a half come out beyond the fuse hole; and then the shell is said to be fixed. They are charged long before there is occasion to use them; and in order to secure the composition with which they are filled, the two ends are covered with a mixture of two parts of pitch, one of rosin, and three of bees-wax, which will guard the composition within from the access of air; and it will thus keep as long as you please. When the fusee is to be put into the shell, the little end is opened or cut off; but the great end is never opened till the mortar is to be fired.

Bombs or shells are made of different magnitudes, from that of 17 or 18 inches diameter downwards; the very large ones are not used by the English, that of 13 inches diameter being the largest size now employed by them. The following table shews the weight, dimensions, &c. of English and French shells.

Mr. Muller gives the following proportions, from the 13 inch bombs, now commonly used, and observes that they may be easily adjusted to any other calibre, by making the diameter of the shell to 30, as any part expressed in inches, to the same part expressed in parts of the diameter divided into 30 equal parts.

- Diameter of the bore = 30
- Diameter of the shell = 29.5
- Diameter of the hollow sphere = 21
- Thickness of the metal at the fuelle-hole = 3.5
- Thickness at the opposite part = 5
- Diameter of the fuelle-hole = 4

Weight of the powder contained in the shell

|       | 236.5  |

In order to find how much powder will fill a shell; divide the cube of the internal diameter of the shell in inches by 37.3, which will be the number of pounds of powder. To find the size of a shell for containing a given weight of powder; multiply the number of pounds of powder by 37.3, and the cube root of the product will be the diameter in inches.

Bombs only differ from granades, in that the latter are much less; and instead of mortars are thrown out of the hand. Bombs are thrown not only out of mortars and howitzers; but out of cannon. The following shells may be fired from guns; viz. hand-granades from 6-pounders; 4 1/2 shells from 12-pounders; 5 1/2 shells from 24-pounders; and 8-inch shells from 68-pdr. cannonades. Shells may be also thrown from guns to short distances, in case of necessity, though the shell be not of a diameter sufficient to admit the shell. For this purpose the gun may be elevated to any degree that will retain the shell upon its muzzle, which may be affixed by a small line passing from the lugs of the shell round the neck of the gun. To produce a greater effect, the space between the shell and the charge may be filled with wads, or some other substance.

Bombs may be used without mortar-pieces, in the manner practised by the Venetians at Candia, when the Turks had poifTed themselves of the ditch, rolling down bombs upon them, along a plank set sloping towards their works, with ledges on the sides to keep the bomb right forwards. They are sometimes also buried under ground to blow up.

See Caisson.

M. Blondet, who has written on the art of throwing bombs, observes that the first bombs were those thrown into the city of Wattehendouch, in Guelderland, in 1585, though others pretend they were in use a century before, viz. at the siege of Naples by Charles VIII. in 1495. Stowe says (p. 584), that mortars and bombs were invented in 1544 by foreigners, whom Henry VIII. employed. But they came not into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus, an English engineer, is said to have first carried them into France, where they were put in use at the siege of Collioure, in 1642.

The art of throwing bombs makes a branch of gunnery, founded on the theory of projectiles, and the laws and quantities of gun-powder.
Meil. Blondel, Guifié, de Ressons, de la Hirt, and others have written expressly on the art of throwing bombs. 

**BOMB-battery.** See **Battery**.

**Bom-bay,** is a kind of cloth filled usually with bombs, sometimes only with gun-powder, placed under ground, to tear and blow it up in the air, with those who stand on it.

Bomb-cheets were formerly much used to drive enemies from a post they had seized, or were about to take possession of; they were set on fire by means of a flame held at one end, but they are now much disused.

**Bomb-cats.** See **Water-bomb**.

**Bom-bells,** which are small ships formed for throwing bombs into a fortress, are said to be the invention of M. Reyneau, or Reuari, and to have been first used at the bombardment of Algiers, in 1681. Till then, it had been judged impracticable to bombard a place from the sea.

The bomb-barges on the old establishment carry one 13-inch, and one 12-inch mortar; with eight 6-pounders, besides swivels, for their own immediate defence. The modern bomb-veffels carry two 10-inch mortars, four 68-pounders, and six 18-pounders caronades; and the mortars may be fired at as low an angle as 20 degrees; though these mortars are not intended to be used at sea, but on very particular occasions, their principal use, at these low angles, being to cover the landing of troops, and to protect our coasts and harbours. A bomb-barge is generally from 60 to 70 feet long from stem to stern, and draws eight or nine feet water. The tender is generally a brig, on board of which the party of artillery remain, till their services are required on board the bomb-veffel. The following instructions serve for their management and security in action.

1. A Dutch pump, filled with water, must be placed in each round-top, one upon the fore-cable, one on the main-deck, and one on the quarter-deck; and furnished with leather buckets, for a fresh supply of water.

2. The booms must be wetted by the pumps before the tarpaulins and mortar-hatches are taken off, and a wooden beam, 5 feet square, is to be hung under the booms, over each mortar, to receive the fire from the vents.

3. The embrasures being fixed and properly secured, the port must be let down low enough to be covered by the sole of the embrasure. Previous to its being let down, a spar must be lashed across it, to which the tackles are rigging it again; but it must be fixed; this spar serves to project the tackle clear of the explosion.

4. The mortars must not be fired through the embrasure at a lower angle than 20 degrees, nor with a greater charge than 5 lbs. of powder.

5. Previous to firing, the doors of the bulk-head, under the quarter-deck, must be shut, to prevent the cabin being injured by the explosion.

6. The bed must be wedged in the circular curb, as soon as the mortar is pointed, to prevent re-action; the first wedge being driven tight before the rear ones are fixed, in order to give the full bearing on the table, as well as the rear of the bed. The holes for dog-bolts must be corked up to prevent the sparks falling into them.

7. When any shells are to be used on board the bomb, they must be fixed on board the tender, and brought from thence, in boxes in her long-boat; and kept along-side the bomb-ship till wanted, carefully covered up.

8. In the old constructed bomb-veffels it is necessary to hoist out the booms, and raise them along-side previous to firing; but in these new ones, with embrasures, only the boats need be hoisted out; after which the mortars may be prepared for action in 10 minutes. See **Ketch**.

**BOMBA,** in **Zoology,** a species of **Trichoda,** one of the genus of **Animalecula** or **Vermes* infaufiora.** This kind is briefly described as being of a changeable form, with a few hairs on the anterior part. This is found abundant in stagnant water; the body is thick, somewhat pellucid, of a yellowish colour, and filled with paler molecules. **Mull.** Gen. &c.

**BOMBARDE, BOMBARDE,** a piece of artillery anciently in use, exceedingly short and thick, and with a very large mouth, by some also called *klaaflyk,* by the Dutch *donderbewi.*

Some derive the word, by corruption, from Lombard, as supposing this piece and used in Lombardy. Du-Cange, after Vitellus, derives it from *bombis et ardeus,* Menage, from the German *bombarden,* the plural of *bombe,* *balle.* But we doubt whether the Germans knew any such word. It is no unusual thing with Menage, and many other etymologists, to give derivations from words of their own making.

There were some of these pieces said to have carried ball of 600 pounds weight; Froissart mentions one of fifty feet long. To load them, they made use of creases, &c. The bombard is supposed to have been in use before the invention of cannon.

Bombs can hardly be supposed to have been of metal, nor charged with gun-powder. They were rather a fort of baliste for throwing stones, and were played with ropes.

**BOMBARDE,** in **Geography,** a fort and village of the island of St. Domingo, about 3 leagues N. of La Plate-Tonne, 6 S.E. of the Mole, and 22 from Port-de-Paix. N. lat. 19. 42.

**BOMBARDEUR,** an engineer, or perfon, whose business is to take care of the firing and throwing bombs out of mortars. He first drives the fuse, then fires the ball, points, loads, and fires.

**BOMBARDET,** in **Entomology.** See **Carabus**.

**BOMBARDEING,** the art or evil of attacking a city or fortress, by throwing bombs into it, in order to ruin or let on fire the houses and magazines, and do other mischief.

Bombarding is not reckoned the most honourable method of making war, as it rather tends to do mischief to the inhabitants than to the works.

**BOMBARIN,** in **Zoology,** the name used by some old writers for the Hippopotamus.

**BOMBASINE,** in Commerce, a kind of silk fluff manufactured at Milan, and thence sent into France and other countries. The French also use the word bombasse for fluff made of cotton, more properly called dimity.

**BOMBAST,** in Rhetoric, denotes a style too high and pompous for the subject and occasion; or a certain manner of eloquence and action, which is grand when supported by dignity in the sentiment, and force in the expression, but never fails to appear ridiculous where the sentiment is mean, and the expression flat. See **Style**.

**BOMBAK,** in **Botany,** a name given to the common cotton tree by Scarpion an Arabian physician in the beginning of the ninth century; Pliny had before called cotton *bombyx.* Gen. **BapBex.** Suld. j cotton. Lin. Gen. 835. Reich. 194. Schreb. 117. Jussieu, 275. Wilden. 1284. L. Marc. Fromanger. Chas. and order of *Morinda Phylania.* Nat. Ord. *Colomusfera.—Malvaceae.* Jaff. Gen. Char. Col. permanent, either of one leaf, tubular-campanulate, three, four, or five-cleft; or of five unequal leaves. Cor. either five petals, or one petal five-cleft. Stamin filaments five or more, connate at the base, sometimes flitily, sometimes tubular. Fil. germ superior, turbinate-oblong. Stigma capitate, with five teeth more or less developed. **Pericarp** large, oate-oblong, membranous and almost woody, five-celled, five-valved. **Seds** numerous, round, woolly. **Recept.** columnar five-corned, forming the partitions.
BOM

Species, 1. B. pentandrum. (L. Marc. Tab. 587.) "Flowers peptandrous." Linn. "Anthers bent; leaves in fieves." Willd. A tree fifty or eighty feet high. Bark greenish, smooth, easily separated from the wood; often sprinkled, especially when young, with large, conic, fimplici tubercles; branches near the summit, pendant; leaves on long petioles, digitate, foliades from five to nine, either entire or serrate, lanceolate, ending in a point; flowers in a simple umbel; partial peduncles about an inch long, with several alternate bracts; petals five, white and velutery without, smooth, concave, and of a purple or delicate rose colour within; anthers two or three, on a filament, twisted together; fruit half a foot long, shaped like a cucumber, very slender at its base; seeds oval with a sharp point, enveloped with a great quantity of short dark cotton which is not firm, but used for stuffing pillows, mattrales, &c. Rumphius says that the valves open at the base. Plumer affords the contrary. Jaquin, who saw the living plant in fruit, gives no information on the subject. A native of both Indies. Cultivated by Mr. Miller in 1739.
2. B. criophorus. (Cavan. Tab. 152.) "Flowers peptandrous; anthers simple, erect; leaves in fieves." Wild. Trunk very spiny; leaves terminated by a filament, very smooth; calyx short and very large; petals three inches long, white, covered without with a short thick down, smooth within, concave, and rounded at their extremity; tube formed by the lower part of the filaments, bottle shaped; anther linear, longitudinally fixed to the upper part of the filament. Found by Commeron in Brazil.
3. B. pyramidalis. "Stem without thorns; leaves cordate, angular; flower peptandrous; anthers united; fruit very long, pyramidal." Cavan. A large tree with very spreading branches; wood white and fo light that fitters use it instead of cork; bark thick, fibrous, cinnereous, marked with whitish spots, and reddish wrinkles; leaves a foot in diameter, strongly curved, green on the upper, yellowish and downy on the lower surface, long and thick petioles; flowers numerous on long peduncles; coroll large, monopetalous, campanulate, deeply divided into five segments; calyx large, reddish, green, campanulate, with five blunt divisions; filaments five, thick, supporting as many large nearly arrow-shaped anthers which are spirally united and enclose the summit of the filaments; filament long; calyx and petals one, the other; flower filiform, club-shaped, marked at the end with five spiral furrows; capsule furrowed, from eight to ten inches long; seeds very small, somewhat egg-shaped, enveloped with fine, short, reddish cotton. A native of the Antilles.
4. B. grandiflora. "Leaves in fieves; flowers pentapetalous, large, polyanthrous; filaments united into a tube at the base." Cavan. Calyx large, expanding with four blunt divisions; corolla super, of five petals, each five inches long, but narrow in proportion to their length, whitish, flabby at their base, velvety without, smooth within, and rounded at their extremities, inerated at the base of the tube of the filaments, which is naked, entire in its whole length, and terminated by a prodigious number of red filaments a little shorter than the coroll; anthers kidney-shaped, small and loosely attached to the filaments; filiform, thick, longer than the filaments, with five small teeth; fruit unknown. Described by Cavanilles from a specimin in the Herbarium of Thouin. It grows about Rio-Janeiro.
5. B. Ceiba. "Flowers polyanthrous; leaves in fieves." Linn. Trunk closely armed with short, strong spines, so large as to be hallowed out into canoes of twenty-five tons burden; calyx small, campanulate, with five small teeth; coroll monopetalous; tube straight, twice as long as the calyx; border divided into five long, concave oblique segments; filaments numerous, proceeding from five distinct bodies, which are united at the base and form a conic tube adhering to the base of the coroll; anthers oblong, large, germ somewhat ovate, with five angles; capsule oblong, small at the base; seeds nearly round, covered with down, which is used by the lower ranks to stuff pillows and chairs. A native of South-America, near Carthagena. Cultivated at Hampton Court in 1622.
6. B. bijortifolium. "Flowers polyanthrous; leaves in fieves." Linn. "Stamens in five bodies." Cavan. A tree fifty feet high, five feet diameter at its base; wood soft, light, and brittle; bark thick, cinnereous, spiny when young; leaves digitate; calyx four-cleft; flowers numerous, large, odorous; coroll of five petals, downy without, attached by its base to the bottom of the tube of the filaments; filaments very numerous, kidney-shaped, shorter than the coroll, loosely attached; fruit elongated.
7. B. globosum. "Leaves in fieves or fieves, obovate, emarginate; fruint globular." Willd. (Aub. Guat. Tab. 281.) A tree thirty feet high; trunk a foot and a half in diameter; leaves palmate, green, smooth, oval, obtuse, slightly crenulated at the summit, the middle one the largest, on long petioles, with two long, pointed, caducous filipules at their base; flowers unknown; fruit in axillary and terminating racemes. A native of Cayenne.
8. B. golospermum. "Leaves five-lobed, acuminate, tormentose beneath." Linn. A large tree with green, nearly smooth bark; leaves alternate on long, slender, pubescent petioles; flowers large, in simple panicles on downy peduncles; calyx of five unequal leaves; petals five, as long again as the calyx, expanding, yellow; filaments numerous, slightly united at their base; anthers oblong, curved; capsule oval-obtuse; seeds kidney-shaped. A native of the coast of Coromandel.

The species known to Linnæus were at first placed by him with the common cotton and its congeners, under the old Greek name Xylon; but afterwards separated on account of the simple calyx. Those with the double calyx he then called golospermum; those with the simple one obxylon. The species of the genus bom, as it now stands, differ so much from each other in most of the parts of fructification, as to almost justify the division of them into distinct genera. The calyx, the coroll, the number and fuppor of the flowers, the form and inferration of the anthers, all vary; nothing is constant but the simple calyx; the five-celled, five-valved capsule, and the woody seeds. We have altered the natural and essential generic characters, and so formed them as not to exclude any of the species.

Propagation and Culture. Silk cotton is propagated by seeds sown in a hot-bed in the spring. In about two months it should be transplanted into a small pot filled with fresh loamy earth, and plunged into a moderate hot-bed of tanners' bark. At first it should be shaded from the sun; but afterwards, when the weather is warm, should be allowed fresh air, and frequent supplies of water in small quantities, with a uniform degree of heat. In autumn it must be removed into the bark-love and sparingly supplied with moisture. It makes a pleasing fancy in a large flower, but is not likely to produce flowers in England. See Miller, Gardner's Dictionary.

BOMBAJ, in Geography, a small island in the Indian Sea, near the western coast of Hindoostan, about 7 miles in length and very narrow, containing a very strong and capacious fortresses, a large city, a dock-yard, and marine arsest. It is separated on the N.E. by a narrow strait from Salsette, another island, and these two, together with the neighboring shores of the continent, form a large found, in which are several other islands, particularly Caramboll and Elephanta;
Elephant; the latter (which see) being famous for its subterraneous temple, and both of them acquisitions from the Malrattas. It was first taken possession of by the Portuguese, soon after their arrival in India, and called by them Luon Baboo, or Good Bay, from the excellence of its harbour, which is so spacious as to accommodate, as it is affirmed, a thousand ships at anchor, and well sheltered from all winds. The Portugueseced it to the English in 1662, as part of the dower of the Infanta, queen of Charles II. After the king's marriage, a fleet under the command of Lord Malborough was sent to take possession of it; and Mr Abraham Shipman was appointed governor. But upon the death of señor in September 1663, the city, acted by the Papal clergy, who objected to the cession of the island to heretics, refused to surrender it. At length, however, in 1664, he was terrified into compliance, and a treaty was established, by which Mr. Cook, upon the death of Shipman, was invested with the possession of the island, in quality of governor. By this treaty the inhabitants were to be continued in the free exercise of their religion, and in the undisturbed possession of their estates under the crown of England. Although the trade of Bombay was at this time very prosperous, it was soon found, that the royal revenues were not sufficient for defraying the charge of the establishment, and that the trade itself was subject to very considerable obstructions; so that the king found it expedient to make a full grant in fee-tail of the port and territory to our East India Company, which was done by charter, dated 2d March 1668, and thus they have continued to hold it to the present time.

The city of Bombay, the principal port and settlement of the English in this part of India, is situated in the northern part of the island, N. lat. 18° 58', E. long. 73° 38'. It is about a mile in length, but narrow; and defended both towards the sea and land with various fortifications, which have been constructed at a great expense, and which have rendered it the most considerable fortress in India. On the island also there are small forts sufficient for protecting it from any irruption of the Indians; and in the harbour there are batens bewm out in the rock, for the purpose of carrying ships. The houses of Bombay are in general neither splendid nor commodious; but there are several handsome buildings, among which are the governor's palace, and a large, elegant church near it; the houses are not flat-tiled, as they are in other parts of the East; but they are covered with tiles in the European fashion. The English have glass windows. The other inhabitants of the island have their windows of small pieces of transparent shells framed in wood, which render the apartments very dark. The soil of the island is fertile, and incapable of any great improvement; its chief produce consists of coconuts and rice, besides mangos and some Indian fruits. It draws a considerable supply of provisions from the continent, and from the fertile island of Salfette. Large quantities of salt are manufactured on the shore, from the sea-water that flows into pits adapted to this purpose. The sea-breezes and frequent rains cool the atmosphere, and render the climate of this island temperate; and though the air is not so pure as at Madras, yet it is much more wholesome than at Bengal; the coast of Malabar being pretty healthy, though less so than the coast of Coromandel. The island of Bombay has been rendered much more healthy than it was formerly, by a wall, which has been built to prevent the encroachment of the sea, where it formed a salt-marsh, by draining the marlakes in its environs, and by an order that none of the natives should manure their cocoa-nut trees with putrid fish. Nevertheless, many Europeans, especially on their first arrival, are seized with fevers, fluxes, and other disorders, which prove fatal; and others shorten their days by not adhering to a mode of life suitable to the climate. The natives, however, and others, who abstain from excess of animal food and strong liquors, enjoy a good view of health, and live to a considerable age. The want of fresh water is an inconvenience to which the inhabitants are subject; the best being that which they preserve in cisterns after rain; whereas that which is supplied by their wells has a brackish taste.

This island is become very populous, in consequence of the settlement which is granted by the English to persons of every religious profession. The number of inhabitants is estimated by Nicholls at 14,000, and of these the Europeans form the most considerable clafs. The other inhabitants are Portuguese, or Indian Catholics; Hindoos, the original possessors of the country; Persians from Kerman; Mahometans of different sects; and some Oriental Christians. The English have a handsome church at Bombay, but they are disposed to conduct it with decency and order, and to obey the laws of the country. The Catholic churches are decent buildings, and are within proportionately ornamented. The Jews have once a college and a synagogue in the middle of this island; but the college was converted into a country-house for the English governor, and the synagogue into a suite of assembly rooms.

Bombay is the seat of the English government for the coast of Malabar; as Madras is for the Coromandel coast, Calcutta for Bengal, and as Bengal was for Sumatra. These four governments, of which that of Bengal has the superiority and control, are obliged, by an act of the British parliament passed in 1773, (13 Geo. III. c. 63.) to afford mutual assistance in cases of extraordinary exigence. The different establishments are under similar administration, and all proceed under subjects of the company are determined by the law of England. The council or regency of Bombay (as well as that of Bengal) consists of a governor and three members of council. The other servants of the company are factors and writers of different ranks, and are sometimes transferred from one department to another. The governor and members of council of the other preponderacies are to be under the control of the government-general of Bengal, with respect to treaties with the native powers of India, levying war, making peace, collecting and applying revenues, levying and employing forces, or other matters of civil and military government; and they are required in all cases to obey the orders of the said government-general, unless the directors of the company shall have sent to these governments any contrary orders not known to the government-general, of which, in that case, they are to give this government immediate advice. The Court of Directors are to appoint to these several governments, and likewise the commander in chief of all the forces, and the three provincial commanders in chief. All governors and counsellors are prohibited from trading, except from the company. 24 Geo. III. feff. 2. c. 25. 33 Geo. III. c. 52. See Board of Control and East India Company.

Bombay Hook, an island of America at the mouth of Delaware river, about 8 miles long and 2 broad, formed by the Delaware on the eastern side, and Duck Creek and Little Duck Creek on the Maryland side; these are united together by a natural canal. The N. W. end of Bombay Hook is about 47 miles from Cape Henlopen and May; from the Hook to Reedy Island is 10 miles.
BOMBELLA, in Entomology, a species of BOMBYX, of a middle size, that inhabits Austria, the wings of which are cinnamon, sprinkled with fucious. Fabr. Mist. This is *Tinea Bombellica* of the Vienna catalogue. (Wien. Schmett. terl.)

BOMBERG, Daniel, in Biography, one of the early printers, was a native of Antwerp, and settled at Venice, where, in 1518, he printed a folio edition of the Hebrew Bible. See Biblia. He also began an edition of the Tal- mud, in 1526, and completed it some years afterwards in eleven volumes folio. Each of the three impressions of this immense work is said to have cost him 100,000 crowns. His whole property was devoted to the impressions of valuable editions of Hebrew Bibles and rabbinical works, for which purpose he employed a great number, as some say, more than 100 of learned Jews. Bomberg was himself a Hebrew scholar. He died about the middle of the 16th century.

BOMBIC Acid. The silk worm has a small reservoir near the anus, from which, when full grown, or especially when in the chrysalis state, a minute quantity of an acid liquor is seen to ooze out. If the entire animal is bruised, it gives a liquor containing the usual solid animal matters, together with a native acid. Alcohol separates the former, and leaves the latter in solution, which, by evaporation, furnishes a very pure pungent yellow fluid, which shows all the marks of an acid by reddening blue vegetables, and uniting with alcalies and some earths. The discoverer, Chaffeur, considers it as peculiar, and hence it has obtained a separate place in the list of animal acids; but from analogy with the experiments on the formic acid, and other circumstances, the separate existence of the bombic acid is very questionable. No other chemist has yet undertaken to confirm or dispute the original statement. Mem. de l'Acad. de Dijon. 1783.

BOMBICHIE, in Geography, a town of Asia in Syria, 44 miles E. N.E. of Aleppo.

BOMBINA, in Entomology, a large species of CURCU- LIO, described by Fabricius, as a native of Cayenne. The colour of this insect is ferruginous brown, and the wing-cases fringed, with black elevated tubercles.

BOMBINUS, in Zoology, a species of RANA, or frog, the belly of which is orange, spotted with sky-blue, and the pupil of the eye triangular. Blumenb. This kind appears to be extremely variable in point of colour and markings. In the tenth edition of the Linnean Syn. Nat. it is described as the *Rana variegata* Koefsel. In his "History of Frogs and Toads," he calls it *Bufo igneus* (bufo vulgo igneus dictus). It is likewise *La femmante*, and *le couleur de feu* of Lacépède, and *Rana ignea*, or fire-frog, of Dr. Shaw.

The permanent varieties, if they may be so expressed, of this particular species, do not seem to be very correctly ascertained. Gmelin, upon the authority of preceding writers, constitutes the following varieties: 8 has the belly black, with clear white spots and speckles; 9 is of a fucious colour; and 10 is distinguished by its loud honoraous noise. This is the smallest of the European kinds of either the frog or toad. The general habit resembles that of a toad, but it is said to leap and swim with as much or even greater facility than the common frog. Dr. Shaw observes, that he places it among the frogs instead of toads, on account of its depositing its eggs in clustered heaps; not in strings like the latter.

animals. In Germany, Italy, and other European countries, which this creature inhabits, it is known to delight in marshy places. The found of the male, which alone is vocal, is clear and sharp, and is thought by some to resemble, in a very peculiar manner, that of a man giggling with laughter. This, indeed, is not the universal opinion; some authors compare it to the tone of a bell, or the note of a cuckow, for which reason it has obtained the name of bombycina.

This animal, according to Dr. Shaw, may be considered rather as an aquatic than terrestrial species; being rarely found on land, but chiefly inhabiting turbid stagnant waters, in which, in the month of June, it deposits its spawn, the ova being much larger in proportion than in most others of the genus. The tadpoles are hatched towards the end of June, and are of a pale yellowish brown colour; and, when young, are often observed to hang from the surface of leaves, &c. by a glutinous thread proceeding from the small tube or sucker beneath the lower lip. They arrive at their full size towards the close of September, and at that period are remarkable for the fleshy muscular appearance of the tail, which is stronger in proportion than in most other tadpoles. About the beginning of October they assume their complete or ultimate form; and when the tail has so far decreased as to be little more than a quarter of an inch in length, that remaining portion becomes entirely obliterated in the space of about twelve hours. The fire-frog is a lively active animal; leaping and bounding admirably well. When涉足 on land, or unable to elude, it frequents close to the ground; at the same time turning back its head and limbs in a flagellar manner, and if further teased and irritated, evacuates from the hinder part of the thighs, a kind of saponaceous frothy fluid, of no bad fcent, but which, in some circumstances, has been found to excite a flight sensation of serenity in the eyes and nostrils. This species is observed to breed at the age of three years, and may be supposed to live about ten; but this is not entirely ascertained.

It ought not to be forgot, that the triangular form of the pupil of the eye, which Gmelin and others consider as the most striking criterion of this species, can only be observed in a full light, for when examined in the shade its shape is circular.

BOMBESKIE, in Zoology, the Scirius Asiaticus in Le Brun's It. p. 134, t. 254.

BOMBUS, in Medicine. See Flatulency. Bombus, in Mafic, an artificial motion with the hands, imitating, in cadence and harmony, the buzzing of bees. The word is originally Greek, and signifies the buzz or noise of bees, gnats, and the like. In this sense, Bombus made one of the species of applause used by the ancient auditors.

BOMBICILLUS BOHMINICA, in Ornithology, the name under which Bridfon defines the Bohemian chatterer, An- pelis Garrulus. The same author likewise calls an American variety of this bird Bombicilla Carolinensis.

BOMBICINUM, in Ancient Writers, properly denoted a species of filk, brought from Assyria and the island of Cos. In which sense it fiood divided from Scirsum, another fort of folk brought from the Indies.

BOMBICINUM volatilum. See Velamentum.

BOMBILIUS, in Entomology, a genus of Disherafus insects, distinguished by the following character: beak or beak very long, fetaeaces, ftraight, and confluling of two unequal valves, within which three fetaeaces bristles are contained; feelers two, short and hairy; antennae subulate, and connected at the base. Linne. Gmel. &c.

The antennae of the insects in this genus are short, and contain three articulations, the first of which is long, the second short, and the third or half conical, and terminating in
in a kind of appendage, almost forming a fourth joint, as is to be observed with the assistance of glascies. Those who have carefully examined the structure of the trunk with the microscope affirm, that the number of valves or brizilles concealed within the external bivalve sheath are four instead of three, as Gmelin describes. The antenna are infected at the base of the trunk.

Insects of this genus have the head comparatively of a small size, of a form somewhat rounded, and almost wholly occupied by the eyes. The thorax large, the abdomen bulky, and rounded at the extremity as in the bee. Both the thorax and abdomen are hairy, or covered with down. The wings longer than the body, and extended horizontally. Legs long and slender.

The size and rotundity of the body afford an excellent natural character, by which this tribe of insects may be distinguished from those of the genera empsis and ailinus, with which some naturalists have confounded them. The Fabrician species of volucelles, cyathaea, and anthrax, have been referred to the bombylius genus with very little propriety.

The true bombylius is a lively tribe of insects, that subsist entirely on the nectarous juice they extract from flowers, with the assistance of their long proboscis or trunk. They fly with much rapidity; making all the time a soft humming noise similar to that of the bee. In England the largest species (major) has acquired the name of the humble bee fly. The insects of this tribe are found in the winged state in the summer, but their metamorphosis is utterly unknown.

Only a small number of species in this genus are at present known, namely major, medius, minor, minimum, atus, fusus, griseus, viriceps, and albifrons: these are natives of Europe. The extra-European kinds are equalis, capucins, cupreae, maculatus, pygmaeus, and versicolor.

BOMBYX, a genus of LEPIDOPTEROUS insects, or rather one of the subdivisions of the PHALANEA, an extensive genus, in which all the insects of the moth tribe are comprised by Linnaeus. Fabricius, in his "Entomologia Systematica," admits the bombyx as a genus, applying the term phalena, which Linnaeus gave indiscriminately to all the species of the moth tribe, as a generic name to that particular description of moths which have the palpi cylindrical, the tongue advanced and membranaceous, and the antenna filiform.

The true definition of the bombyx, whether considered as a subdivision of the phalena, or as constituting a genus of themselves, is not sufficiently explicit. A great number of species may be readily referred to their proper station in the genus, by observing with attention the characters laid down by Linnaeus; but there are others which cannot be so accurately distinguished from the noctua as we could wish, by the assistance of those characters. If, for instance, we advert to the earlier editions of the Linnean System nature, we shall find even in the small number of species which that naturalist describes, that the greatest confusion prevails in this respect. Had Linnaeus been himself correct in his ideas of the natural character of the bombyx, we are almost persuaded he would not have confounded phalena bucephala as a noctua, any more than dominula, fuliginosa, jacobaeae, and some others, which he includes as such in his arrangement of the lepidoptera.

Linnaeus thought at first the pectinated antenna of the lepidoptera a sufficient criterion of the bombyx, provided the wings were incertant and depressed, while the insect remained in a resting position, because the geometria, though often furnished with pectinated antennae, have the wings expanded horizontally when at rest. But later observations of other naturalists have determined this character of the bombyx to be insufficient to distinguish it.

In the System nature, Linnaeus divides the bombyxes into fections in the following order; the eugenes or those without a manifest spiral tongue, and the spirilinques, having an involuted spiral tongue. These two principal fections are subdivided again; the eugenes, into those with the back smooth or not creased,—with expanded wings,—with reversed wings,—with deflected wings,—with erect crests, or tufts on the back; and the spirilinques, those smooth, with expanded wings,—with deflected wings,—and with the back creased.

This mode of arrangement is entirely superseded by the Entomologia Systematica of Fabricius. The latter writer takes his characters, as usual, chiefly from the tongue and palpi. His bombyx is thus generally described; feeders two, comparred, reflected; tongue short, and membranaceous; antenna filiform. By this means the Linnean bombyxes are excluded, for the reception of which he establishes two other genera, those of Coquus and Hepialus, both of which most strictly appertain to the Linnean bombyxes. The bombyx coquis gave Fabricius the idea of forming a distinct genus of the species analogous to this insect. The characters, he lays down for the coquis are these; the palpi or feeders two, comparred, cylindrical; with no tongue; and the antenna short and filiform. His hepialus has two hairy feelers, between which is the rudiment of a bifid tongue; and the antenna are moniliform.

Gmelin, in the last edition of the Syll. nat. endeavours to reconcile the Fabrician genera as subdivisions to the principal Linnean genus phalena. His bombyxes consist of the attack, which have the wings expanded, and the bombyxes (strictly so) which have not the wings expanded, and these latter are again arranged in subdivisions in the following order; first, those with reversed wings, as in quercifolius; second, those with deflected wings, as in eupehena and heca; third, those with incumbent wings, as in antiques; and fourth, those with convoluted wings, as in bella. The four families, into which Olivier separates the bombyxes, scarcely differ from the preceding; they consist of those with expanded wings, with wings reversed, with wings bent down (deflected), and with wings recovered (incumbent).

The bombyxes are to be considered as a true natural family of the moth tribe, which for the most part may be distinguished by the casual observer, who will attend to the structure of the antenna, the form of the body, the position of the wings, and some few other particulars to be mentioned hereafter. The antenna, which are filiform, and either pectinated or ciliated, differ greatly in the two sexes of the same species; the male being generally distinguished by having the antenna much broader, or larger, than in the other sex. The thorax of the bombyx is rather more bulky, and the body thicker than in the noctua, especially in the females. Thus far coincident with the Linnean character; but if we confine our attention to the feelers and structure of the tongue, as Fabricius observes, we shall be also necessary to determine many of the bombyxes, which approach close to the noctua as not to be accurately distinguished by any other means. For this reason Fabricius is commendable in having endeavoured to define the precise limits between the bombyxes and other analogous tribes: his character is more definite than that which Linnaeus had previously assigned to this family. The discrimination of Fabricius is obvious in separating the two tribes or genera of coquus and hepialus from the bombyxes, under which head Linnaeus comprehends them; for these insects certainly form distinct natural families, both in their general appearance, their metamorphoses, their habits of life, and other peculiarities, from that
which ought to be considered as the natural family of bombyces.

The insects of the bombyx tribe never fly except in the evening. During the day time they encase themselves under the leaves, or beneath the branches, in the clefts of trees, where they may remain secure till about sun-set, at which time they appear to be on the alert, at first crawling about the branches, then fluttering their wings, and becoming brighter in all their motions as the evening comes on. The larger fort of moths, which we see first fluttering from the woods or hedges after some of the geometra, are the _casti_, the Fabrician healip, which fly twistly as their trivial name implies, but low or near the surface of the ground; these at twilight are succeeded by the bombyces and nocturne, whose flight is more elevated. They continue to sport about till it becomes quite dark. The males of the bombyces are commonly first upon the wing in search of the females, which latter are in some few species entirely destitute of wings, or at least have only the rudiments of them close to the thorax; in which case the female waits upon the trees or herbage for the arrival of the male; the female of bombyx antiqua, the vapourer moth, is a striking proof of this, for it has so little the appearance of a moth that any one, except an entomologist, would mistake it for an apetrous or wingless insect. These females which have wings are commonly larger even than the males.

The bombyces are produced from a larva, or as it is more usually termed by common observers, a caterpillar. This is of a long cylindrical form, having in some species a smooth skin, or in others more or less tuberculated; sometimes the skin is covered with a fine silky down, or with hairs; and some of the larger kinds are armed with spines and bristles. All the larvae of the bombyces subsist on vegetables. Their jaws are strong, and of a horny texture, and below them is a small opening, through which the creature draws the silky thread of so much utility in its general economy. Most of these larvae have sixteen feet, some have only fourteen feet, and others no more than twelve, six of which are hooked, and situated on the three first annulations near the head, the others towards the lower extremity of the body are short, broad, and very different in structure.

The greater number of species in the bombyx tribe, when in the larva state, lead a solitary life, in which case they separate as soon as they are hatched from the eggs, and crawl about to provide for themselves, the smallest of these even being able to obtain its own subsistence; they can eat as readily, and spin, or throw out the silky thread with as much facility as when grown bigger. The latter is of considerable utility to the larva, for when it wishes to defend from one branch of the tree or bush to another, instead of being obliged to pursue a circuitous course, by crawling or walking, it need only fasten one end of the silken thread to any particular spot and lower itself by its affligence to the branch desired; or when suspended midway between the branches, it can pass aside with a fwing to any other point within a convenient distance. In like manner, when observed by birds or other enemies, it can drop in an instant and elude the enemy, waiting concealed below among the leaves or on the ground till the danger is over, and then remounting to the former spot by the aid of this thread. This is a provision of nature for the security of the larve of the bombyces, in common with that of other lepidopterous insects.

Some species of the bombyces live in societies, as may be observed, for instance, in _bombyx neustria_ of entomologists, (the _lackey-moth_ of English collectors). The larvae of this species, by their united labours, spin a capacious habitation, in which the infant brood is hatched from the eggs, and after undergoing their several transformations finally become moths.

Like other larvae of the moth tribe, those of the bombyces call their skin several times. When full grown, and approaching the pupa state, those of the bombyx kind spin a fort of web, in which we find the most valuable kind of silk produced by these creatures at any time of their lives. The silk spun by the hairy larvae is observed to be of little value, because the creature interweaves it with the hairs it plucks off its skin for this purpose. The common silk worm (_bombyx mori_), whose cocoon consists of the most valuable kind of silk, as is well known, has the skin perfectly smooth, or free from hair. There are certain species of the larger bombyces, the larvae of which have smooth skins, but still beset with annular series of spines or bristles, that produce very strong silk, and are reared with the view of obtaining the cocoons for the manufacture of silk in the East Indies. The breed of these useful insects has long been cultivated in India, although the silk produced from them is very little, if at all, known in Europe. See Silk. The bombyces remain in the pupa state for a certain time, varying according to the species, some only a few days or weeks, others six or twelve months, two years, or even three. The same day that the umbrellas emerge from the pupa state, they are in a condition to perpetuate their race. Almost immediately after coupling the males die; the females live long enough to deposit the eggs in a proper place for their security, and where the infant brood may find subsistence, after which they perish likewise.

The species of the bombyx tribe are numerous. Those already described by naturalists amount to a large number; and there are, in the cabinets of the curious, many more, especially of the extra-European species, that have never been described; even in the collections of this country, those of the latter description are numerous. The following are described by Linnaeus and Fabricius, and enumerated by Gemini: atlas, heucher, aurous, cecropia, paphia, polyphemus, cypria, cytheera, mulitta, promethea, erytina, janus, mangraea, hippodamia, nicitan, semiaris, boreas, luna, epimethea, argus, pavonia, minor, media, major, achelous, angulata, libeira, tau, jo, abas, falmonoe, proteria, pinus, fenestra, pendulo, tyrrhea, peripieu, armada, militari, callita, populifolia, quercifolia, illicifolia, promulsa, ccastrata, capensis, aluco, australiae, quadricinta, rubia, pruni, amphiochus, potatoria, ocularia, hibici, cynria, cerbi, pini, trifoliis, aegris, filgra, lutea, dumetis, catax, lanetris, vinula, fagi, vericolor, mori, populi, eufira, neustria, tricolor, calidrienae, graphica, traxaconae, cinerea, mali, avellanace, procotiona, pittocampa, rures, atis, rufa, lagopus, imperialis, craficos, hypophla, cyane, bucephala, helops, oleaginous, caja, pudica, calia, maculfo, virgo, menete, delforata, tarquinius, tarquiniius, hebe, villica, plantagine, vittata, monacha, flavia, lutea, diarif, amalis, chrysorryzea, auriulius, bicolor, falcis, calinia, controlinea menda, advena, rutila, lentifera, crataegi, eridanus, tibialis nitida, plumigera, obsolenta, coronas felsiva, dryas, corni, flavomaculata, nuda, funcula, curtula, rechina anachoreta, ananlomana, teludo, affela, bufo, cippus, pudibundus, popula, falcinella, falcinella, tremula, cerulaeolephogaster, argentina, deora, rufa, dicta, elegans tritephus, zizac, dromcharius, tecreba, coiffus, palpita trepida, quercia, giona, anreae, moron, rubia, alpina, purpurea, serraria, marina, nebulosa, frigida, frigida, alnica, helia, hindarii, lubricetas, longa, laeta, continuitaa, comprefia, milhauser, spteca, lucus, frigula, begna, vaugir, ruflula, ruflina, grammica, anitra, matronius, partenies, leporina, celda, dione, capacina, camelina, os, acsculii, antiqua gonotigma, paradox, rona, pyletis.
pylotis, granialis, popularis, fulminea, gloriosa, crinial, rota, luforia, cribrum, libatrix, lectrix, credula, dominula, hera, faugnholenta, ricini, coratulas, colon, populetis, secola, comperfa, fulgianos, ornatrix, priverna, frangie, vieta, viola, mufella, bombellia, pontellia, annulata, grafa, jacobem, rubicollis, pulchella, bella, hiftrio, and umb. To which are to be added bombyx argula Donov. Ind. lfs.; hepialus mappa Donov. Brit. lfs.; eosa lathyrilicus, argenticus, lituratus, and nebuliferus, Donov. Inf. New Holland.

In adhering to the Fabrician system, in preference to that of Linnaeus, we are to exclude from the foregoing list of bombyxes the following species: lagopus, rotilata, fagata, gemina, deflorata, and fagata, all of which are to be referred to the Fabrician genus hyleca; humuli, jodatta, lupinina, hecita, obliqua, cam, crux testudo, alleta, burfo, and mappa, species of the hepalus genus of Fabricius: and coiinis, ungulifer, teretia, aecufu, scalaris, pyrina, lathyrilicus, argentus, lituratus, and nebuliferus, which chiefly belong to the Fabrician genus eosa.

Bombyx is also a name given to the Silk-worm.

Bombyx, in the Ancient Mosaic, a kind of instrument, which, in Aristotle's time, was made of a rose, calamus, and, by reason of its length, was difficult to play on.

The word seems also to have been used for a key, or contrivance for shutting and opening the holes of wind instruments.

Bombyx, in the Ancient Naturalists, signifies indiscriminately either silk or cotton.

Bomene, in Geography, a port town of Zealand, one of the provinces of Holland, on the north shore of Schouwvin island, one league east of Brouwerhaven.

Boming, an island of Afia, in the mouth of the Ganges. N. lat. 22° 45'. E. long. 91° 25'.

Bomo, in Ancient Geography, a station near Axbridge, according to Antonine's Itinerary; but placed by Camden and Gale at Boverton, in Glamorganshire.

Bomel, in Geography, a town of Holland, in the island of Over-Flahe, 7 miles W. of Willemslaat.

Bommel, a strong town of the duchy of Gueldres, seated on the Waal, in the island of Bommel-West, first surrounded with a wall by Otto III. count of Gueldres, in 1229; 60 miles N. E. of Antwerp, and 7 N. of Bois-le-Duc. Bommel was taken by the republican troops of France, October 4, 1704.

Bommel-West, a kind of island, in the province of Gueldres, about five leagues in length from Louwvein N.W. to Fort St. Andrew S. E., and two in its greatest breadth, formed by the rivers Maas and Waal. It is defended by three forts, viz. St. Andrew, Voorn, and Crececar. The first has five bastions, and was built in 1599 by the admiral of Aragon, and the cardinal Andrew of Austria, lieutenant-general of the Spanish forces; the second is situated at a small island, called Voorn, at the exit end of Bommel-West, and was fortified by the prince of Orange, and on that account is sometimes called Fort Naasen, and the third is at the south side of the island towards Bois-le-Duc. These three forts were continued to surrender to prince Maurice in the year 1660. In 1672, the French took the island under marshal Turenne, who, after destroying the fortifications, abandoned it in the following year. At the commencement of the religious disputes, count Charles de Mansfeld, passing this island with some Spanish troops, was encompassed by several Dutch ships under the command of count Hohenlo, who ordered the dykes to be opened, and thus totally inundated the island, so that the Spaniards were obliged to retire to the citadel, and would have miserably perished, if a sudden frost had not constrained the count to abandon the siege, and to allow them liberty to retire. In commemoration of this deliverance a chapel was built at Brussles, in honour of the immaculate conception of the Virgin, next the Dominican church, which being destroyed in 1695, was afterwards re-built with greater magnificence. In 1794, the republican troops of France, having compelled the Dutch to abandon Bommel, overtook them in their retreat, and compelled a great part of them to surrender. They afterwards availed themselves of the frozen state of the Waal, and were making progress towards Corum and Calemburg; but they were attacked by the British troops in conjunction with the Hessians, and driven across the river, with the loss of a considerable number of men and four pieces of artillery. But this temporary successes was of no permanent avail for reining the progress of the French army.

This island belonged to the province of Guelderland, except the town of Louwvein, which, with a very small district, at the western end of the island, belonged to Holland.

Bomo, in Ancient Geography, a name given to the island of Eubea, from the cattle with which it was fed; the ancient Arabians word banea, or bokhoa, signifying, according to Hefychius, cattle, or herds of cattle. This is, probably, the most ancient appellation; the island having been first peopled, as Strabo informs us, by the inhabitants of Arabia and Phoenicia.

BOMOA, in Geography, a town of North America, in New Naves, 10 miles S. of Cinaboa.

Bomonica, in Antiquity, an appellation given at Sparta to the children, who, in the sacrifices of Diana, broke the greater number of trixes with rods, which they sometimes continued to do the whole day, and even, as Plutarch relates, to death itself.

The word is formed from the banea, altar, and vom. victorius; importing as much as victor ad aras, or conqueror at the altar.

Bompart, Marcellus, in Biography, practised medicine at Clermont Ferrand the early part of the seventeenth century, and was public counsellor to the king. No memorials of his life are known; but his work "Milier Homo," in which he gives a succinct account of all the principal diseases affecting the human frame, was much esteemed. It was dedicated to Pietro, Riolan, and Guy Patin; and to be patronized by them was highly creditable: also "Neuve Chaffe Pelle," Paris, 1630, 8vo.; and "Lettres d'Hippocrates traduites et commentees," 1632, 8vo. Haller. Bib. Med. Elyo. Dict. Illis.

Bopel, in Geography, a town of Hindoollan, in the Pamib, 15 miles N.W. of Decib, and 10 miles S.E. of Radone, a town on the Bexy. N. lat. 31° 55'. E. long. 75° 57'.

Bomrauze, a town of Hindoollan, in the Carnatic, 30 miles N.W. of Madras, and 96 miles W. of N. Arcot. N. lat. 13° 24'. E. long. 75° 9'.

BOMY, a town of France, in the department of the frats of Calais, and chief place of a canton in the district of St. Omer, 8 miles S.W. of Aire.

Bon, John, L, in Biography, a native of Anterverle, in Champagne, and eminent in his time for his knowledge in medicine, physician to the king of France, and to the cardinal de Guise, published in 1571, "Therapie Puerorum," 1610. Paris, "induced to it," he says, "by the ignorance of the furgens, midwives, and toniers, who attended women in child-birth. By their blunders and inexpertness in their art, many women lost their lives, and many children..."
BON

BON

children were destroyed." His work is very full on the subject, giving rules for the management of women before, during, and after parturition. He has left formulae for a variety of ointments, with which he directs the pudenda of the women to be anointed, and which he thought conduced much to the acceleration of the birth of the child. When these failed, lapis elisites was to be tied to one of the thighs of the woman, and polypody of the oak to the foot. But these, he gravely admonishes, are to be taken away as soon as the child is born, lest they should draw away the womb. Such mighty power was attributed to these trileis. It is probable, however, that the author only meant by these precautions to gain time and to prevent the too hasty interference of the midwives, surgeons, &c.; and as there was nothing in the remedies that could injure the woman, who would frequently be delivered by the natural pains, during their use, he might not be forry to find the attendants attributing the safety of the woman and child, and the happy termination of the labour, to them. Whatever his real opinion might be, it is certain that, among the people, these kinds of remedies acquired great credit, and the use of them was continued for near a century after his time. Among other objects that engrossed the attention of this writer, we find him giving formulae for ointments for smoothing the wrinkles of the abdomen, and for preventing the breasts of women who had borne children from becoming large and pendulous. "Ne venter rugis indecoris," he says, "et flatares, et viris fuis ingratas, parum anabiles, et abominandas reddat; ne manasse in majorem molest extantur." His book appears to have been in great request, as it passed through many editions, and is inserted in the "Collection of Treatises on disorders attending pregnancy and child-birth," by Cappar Wolius, published in 1586, re-edited by H. Spachius, fol. 1597, under the title of "Gynecia, lib. de mulierum morbis," from which the above quotations have been taken. Haller Bib. Med.

Bon, John Philip, probably of the same family with John de Bon, published at Padua, "De Concordantia Philosopher et Medicina," 4to. 1573; he was also author of several poetical works, which were much esteemed in their time. Eloy. Dict. Hill.

Bon, in Botany. (Alpinus.) See Coffea.

Bon, Cape, in Geography, called by the Moors Ras Almar, and the prominent of Mercury, or Hermes, of the ancients, is a cape of Africa, in the kingdom of Tunis, in the Mediterranean sea, distant 11 leagues E.S.E. from that of Zibeeb, and forming the eastern point, as Zibeb does the western, of the gulf of Tunis. It is so high, that from its summit the mountains of Sicily, distant more than 20 leagues, may be discovered in fair weather. See Aegyptus, and Damascus. Cape Bon is situated about N.N.E. from Tunis. N.lat. 35° 56'. E.long. 11° 15'.

Bon, in Modern History, the name of a feast celebrated annually by the Japanese in honour of the dead. On this occasion they use a great number of lights, and run with cagernets to the tombs of their departed relations with such choice meats as they conceive to be suited to the taste and nourishment of the dead.

Bon, Fr.; Buono, Ital.; as tens bon, and tempo buono, used, in Maffe, to express the accepted parts of a bar. It is the first note of binary measure of two minimi or two crotchetts in a bar; the first note of the ternary measure of 3 or 4, and the first and third notes of common time. It is opposed to tens mauvais and tempo cattive, the unaccepted part of a bar. The French at present, distinguishing these portions of a bar by the terms tens fort and tens faibles, strong and weak, and almost loud and soft parts of a bar. It is on the accented part of a bar that a discord regularly prepared is struck, and resolved on the unaccented part.

Eona, John, Cardinal, in Biography, was born at Mondovi, in Piedmont, in 1609, and entered at an early age into a reformed congregation of Cistercians. After having studied philosophy and theology at Rome, he returned to his own country, and became, in 1651, general of the congregation; and he was, at length, viz. in 1665, nominated a cardinal by pope Clement IX. Upon his death at this pontiff, he was thought of as a fit person to succeed him; but another was elected. The cardinal spent the remainder of his days in studious and pious exercises, and died at Rome in 1674. He was the author of several works, chiefly of a devotional kind; such as, "De Divina Phialis, de qua varis ritibus omnium ecclesiasticum in psalmodia divinis officiis," 4to. containing an historical account of the practice of psalmody in the Christian church; and "Rerum Liturgicarum libri duo," 4to. giving a similar account of the celebration of the mass. Both these works have been often reprinted; and of the latter an edition much enlarged was published at Turin, in 1747, by father Salas, in 4 vols. fol. Gen. Dict.

Bon, John de, professor of medicine at Padua, published, 1576, "Historiae aliquot curantium, mercurii utilis, coronae, morbosi corrodente, perfectarn," Verona, 4to. This medicine was much commended by baron Von Swieten, and forms probably the basis of most of our nostrums celebrated for their power of removing pimples, blisters, &c. from the face and other parts of the skin. It was intended by the author to supersede salivation in the cure of hæmasa and, in some cases it has been used with complete success; but it too often disappoints the expectation of the prescriber, to be entirely depended on. "Tractus de Scorbuto," 4to. 1751. The author shows that this disease, though most frequent in cold marshy places, is not infrequent in warm countries. "Dall uo e dell abuol della cattiva," Venice. 1761. Coffe, which is hot and drying, should only be used, he says, by persons of cold phlegmatic constitutions. In the quantity it is usually taken in this country, it will scarce be hurtful to any habit or constitution. "Observationes medicæ ad præsum in nofocomico, anno," 1765, 8vo. Patav. 1766. Haller Bib. Anat.

Bona, in Botany (Didaco). See Vicia Narbonensis, and Paba.

Bona Nax. See Milan.

Bona, in Geography, a sea-port town of Africa, in the eastern or Levantine government of the kingdom of Algiers, and province of Coquilantia; known to the Moors by the name of Blaid el Aneb, or the town of jubes, from the plenty of fruit which is gathered in the neighbourhood. Bona, says Dr. Shaw (Travels, p. 46.), is, without doubt, a corruption of Hippo, or Hippona, though the ruins of the ancient Hippoegnas are situated somewhat more than a mile to the south, and furnished materials for the erection of Bona, which is the Aphrodium of Ptolomy, and placed by him 15° to the north of Hippo. Bona was formerly rich and populous, but is now poorly built and thinly inhabited. Bona, besides its capacious harbour to the east, had formerly a convenient little port under its walls towards the south; but by the constant discharge of ballast into the one, and a neglect of cleansing the other, both are rendered unsafe and incommmodious. However, a great quantity of corn, wool, hides, and wax, are every year permitted to be shipped off from this place; and, by proper management, it might be rendered the most flourishing city in Barbary; and, by introducing a supply of fresh water, it would also become one of the most convenient and delightful. The
BONA.

adjacent country produces corn and fruit, and great numbers of small and large cattle, but is much exposed to the incursions of the plundering Arabs. The French have a factory at Bona, where they purchase corn, oil, leather, wax, and wool, and constantly keep a resident agent, who has charge of the correspondence between Bona, Algiers, La Calle, and Marsilles. N. lat. 37°. W. long. 7° 50'.

Bona Fortuna, Cafe, is a cape of Rutilin, in the White Sea. N. lat. 63° 35'. E. long. 58° 25'.

Bona Schola. See BASSEWS.

Bona Dea, the good goddess, in Mythology, a mysterious kind of divinity, whose name was unknown to men, and whose sacred rites, performed by the Vestal virgins for the safety of the Roman people, were attended only by women. Some have supposed that this name belonged to Cybele, or the earth, as the source of all good things. Phalaris confounds her with Flora. Varro pretends she was the wife of Faunus; and that he maintained her character for chastity to such a degree, as never to allow herself to look upon any man besides her husband. Laetantius, on the contrary, says, that this wife of Faunus, having drank wine in violation of the prevailing custom of the period in which he lived, was whipped to death by her husband with rods of myrtle; and that, he afterwards repenting of the deed, and lamenting the loss of his wife, placed her in the rank of divinities. The feasts of the Bona Dea were annually celebrated, with peculiar solemnity, on the first day of May. The house, in which the rites of the festival were performed, was adorned at a great expense; and as the night was the seafon appropriated to this purpose, the apartments were illuminated with a great number of lights. The veils were conveyed into the house of the foreign pontific, or one of the chief magistrates; and rags was taken to exclude tal males, and all animals of this species; and every thing masculine was so scrupulously excluded, that even pictures of that sort were covered during the ceremony. To this purpose, Juvenal (vi. 339.) says:—

"ubi velarí pictura jabetur
Quaeque alterius fænis imitata figuram efl."

It was supposed, that if a man by chance, and without any deliberate intention, became the witness of these mysteries, he would be struck blind. Clodius, however, was guilty of polluting these mysteries. Whilom Pompeia, the wife of Cæsar, with whom he had an intrigue, was, according to annual custom, celebrating in her house the awful and mystic sacrifices of the "Bona Dea," Clodius determined to gain access to his mistress, even in the seclusion of her holy ministry. Accordingly, he dressed himself in a woman's habit, and, with the benefit of his smooth face, and the introduction of one of the female servants who was in the seeret, hoped to pass without discovery. But by some mistake between him and his guide, he lost his way when he came into the house, and unluckily fell in among the other female servants, who, detecting him by his voice, alarmed the whole company by their shrieks, to the great amazement of the matrons, who preternaturally threw the veil over the sacred mysteries, while Clodius found an opportunity of making his escape by the favour of some of the damsels. This folly was preternaturally spread abroad, and raised a general scandal and horror through the whole city. Cæsar put away his wife upon it; and perrons of all ranks were deified of availing themselves of this circumstance to get rid of a citizen, who by this, as well as other specimens of his audacious, seemed born to create much disturbance to the state. It had been the constant belief of the populace, that a man should ever pay into these mysteries, he would be instantly deprived of light; but it was not possible, as Cicero says, to know the truth of it before, till Clodius ventured upon the experiment; though it was now found, as he tells him, that the blindfolds of the eye was converted to that of the mind. The affair was soon brought before the Senate, and by then referred to the college of priests, who declared it to be an abominable impiety: upon which the confus was ordered to provide a law for bring Clodius to a trial for it before the people. Clodius's faction, however, ultimately prevailed: and when the trial came to the issue, 25 condemned, and 31 absolved him. When Caesar, on this occasion was summoned to give evidence, he declared, that he knew nothing at all of the matter, though his mother Aurelia, and sister Julia, who were examined before him, had given a partial relation of the whole fact; and being interrogated, how he came then to part with his wife? he replied, "that all who belonged to him ought to be free from suspicion as well as guilt." Cicero, in his dissertation for Milo against Clodius, often refers to this sacrilege, with a view of rendering his adversary odious to the people. Many Roman writers have exclaimed against the licentiousness and innumerable of these mysteries, called by way of eminence the Roman mysteries, and celebrated on the 5th of December, though those of the goddesses Cybele were celebrated on the 1st of May. Nevertheless, this goddess is called holy in an inscription recorded by Gruter. "Bona Dea Sanctae facrum., &c." Laetantius (ii. 598.) depicts the good goddess as bearing a mural crown, and drawn in a chariot by horses. She is also thus represented on the medals of the emperor Philip. The Greeks also had their good goddess, whom they denominated the gods of women; and the Carthaginians paid divine honours to a goddess under this appellation, whom they believed to be Juno.

Bona Fide, or Bona Fide, is used in speaking of things done with an honest intention, in opposition to those done with a design of fraud and deceit, said to be mala fide. In this sense, we say, a grant, a conveyance, bona fide.

In many cases, in the civil law, the bona fide of an action excuses the want of some of the customary forms.

Costraets bona fide among Civilians, stand contrasted with those seelitaiuris; the former being gained by plain honesty and confidence, which sometimes include several things not expressly mentioned; whereas the latter are restrained to the express terms of the deed. A buyer bona fide, is he who really believed the thing to belong to the seller at the time when he purchased it. A possessor bona fide, is he who is in possession of a thing belonging to another, but which he truly believes his own. To be entitled to the benefits of next ascension, it is requisite the persons have possessed the thing bona fide, or really thought themselves the proprietors.

Prescription cannot arise from acts done mala fide; since what was unjust in its origin, can never be made just by time and continuance. See PRESCRIPTION.

Bona Fidee Afciens, those wherein for farther light, the judge might take cognizance of things not mentioned between the parties. Bona Fide Judgment, that wherein the parties are obliged to pay each other what is due bona fide, i.e. justly and equitably; and the judge has a power of estimating what is thus due to the actor or plaintiff; a power given him by the forum, of the praeator, viz., ex fide bona, vel quantum egressi melius. Bona Gestura. See GOOD ABEARING.

Bona Gratia, a phæbe antiently used in speaking of divorces, which were brought amicably about for some just reason, with the consent of both parties, and without any
crime on the part of either, as in case of old age, difcafe, barrenness, monachism, captivity, or the like.

**Bona Disputati ad colligendum.** See Colligendum.

**Bona Mobilia.** See Mobilia.

**Bona Notabilis, in Law.** Where a perfon dying has goods, or good debts, in another diocefe, but within the fame province, besides his goods in the diocefe where he dies, amounting to the value of five pounds at least, he is said to have *bona notabilis:* in which case, the probate of his will, &c. belongs not to the bishop of the diocefe where he dies, whole jurisdiction cannot extend beyond the bounds of his own diocefe, but to the archbishop of the province.

Though if a perfon happens to die in another diocefe than that wherein he lives, on a journey: what he hath about him above the value of five pounds, &c. shall not be* bona notabilis.*

**Bona Patria, a jury or affize of countrymen, or good neighbours.** See Assize and Jury.

**Bona periurata, perillable goods.** By Stat. 13 Ed. I. cap. 4, the cargo of a ship that hath been cast away shall be kept for a year and a day, and restored to the rightful owner; but if the goods be such as will not endure to long, they are *bona periurata,* which the sheriff is allowed to sell, and to account in money for the value.

Bona vacantia, goods, such as royal fish, shipwrecks, treasure-trove, wafis, and etrayers, in which no one can claim a property. These goods, by the law of nature, and by the imperial law, belonged to the first occupant or finder; but in the modern constitutions of European governments, they are annexed to the supreme power by the positive laws of the state.

**BONACCIOLO, Lewis,** in Biography, a physician of great eminence and authority, practifed medicine at Ferrara, in the early part of the 16th century. His great work "Années millebirs, live de factus formation," was printed in 1503, in fol. "qua, praeter alia, plurima quaque ad coitum, et ad rem veneram faciunt, dictione liberíma deferventur." It was nevertheless dedicated to Lucretia, daughter to pope Alexander VI. But the dedication, Blomenbach observes, is only to be found in the edition, prinicip, which is extremely rare. A copy of this edition was fold by Paterfion, in 1791, with the fplendid Paris library. This writer, Douglas lays, was the first who diflinguifhed the stories from the nymphs, and threw them to the diftineft parts. The "Années was again printed in 1587. It was alfo increased by Cafpar Wolius in his Collection of Treatifes, called "Gynæca, live de mulierum morbis," 1608, re-edited by H. Spachius, fol. 1597; and with Piereus's physicalfical treatifes. Though of little value now, the work was for a long time held in great efteem; the author having given in it a more accurate anatomy of the fatus, and of the partes generationi subfervientes, than any preceding writer. Douglas Bib. Hal. Bib. Anat.

**BONACHI,** in Geography, a town of North America, in New Nanvae, 180 miles S. of Saca grand.

**BONACOPUS, Hercules,** in Biography, of Ferrara, and for some years professor in medicine at Bologna, publifhed, in 1552, "De affectu quem Latini tormenta appellant," 4to.; "De humorum exeruptam figuris ac ferapis, de compositione Theriacæ, de modo preparandi aquam ligni faini, &c." 4to. 1553; the latter medicine was now in the zenith of its reputation for its powers in curing the hæs venereæ; "De curatione pleuritis, ad Hippocrati, Galeni, &c. monumentis dempeigna," 4to. 1553. He died in 1558. Bonacopus had much learning, and contributed by his works to revive among his compatriots a taste for literature, particu-
This woods. The nest of this species is of a curious structure, being composed of leaves and fibres of vegetables, sewed with the greatest ingenuity to the leaf of a banana plant, in such a manner that the leaf itself forms one of the sides to the nest; when completed, it is laid to be exactly in thape of the fourth part of a globe.

Another bird, of a species very analogous to the above, is described by Ray and Sloane under the names of watchy picket, Spanish nightingale, American long-neck, and idurus minor nidium fuipend. This appears to have been confounded with the former kind. Briffon, deeming them both the same, included the synonyms of the two species together, which led later observers into an error. Dr. Latham separates them; and, upon the authority of this able ornithologist, Gmelin gives the watchy picket as a distinct species under the name of oriolus nudipendulus. This specific name is chosen, in allusion to the manner in which the nest is fastened to the extremity of the further twigs of the trees in which it lives. The nest of the banana bird is before described; that of the watchy picket is very different, being of a long cylindrical form, composed of flax, fibres, and the inward hairs of the "old man's beard," which latter bears a strong resemblance to horse-hair. The two opposite methods of constructing, as well as placing the nest, as Dr. Latham judiciously observes, cannot fairly belong to one bird. See Nudipendulus.

Gmelin places the watchy picket, with a note of scepticism, as a synonym to motacilla calidris. This might possibly mistake, without observing that Sloane, Ray, &c. describe more than one bird under that name; the latter is the American nightingale of Edwards, and the long-neck spider of Latham, the bird called the watchy picket by Sloane, Hift. Jarn. 2. p. 299.

BONANNI, Padre Filippo, in Biography, a Jesuit, who published at Rome, in 1722, in 4to. drawings of a curious collection of musical instruments, reprinted in the hands of the performers; entitled "Gabinetto Armonico Tieno d'Illumentoni Sonori indicati e spiegati ed offerto al Santo Re David." The collection is curious, and the instruments are not ill executed; but we are not sure that the drawings are always correct.

BONARATTE, in Geography, a small island of the Indian ocean, south-east of Salyer, ceded by the Macassers to a rajah of Boni, in Celebes, who used it as a place of education for his dancing girls, and appropriated to the same purpose by the kings of Boni. It is chiefly inhabited by Bougonet.

BONARELLI, Guidobaldo, Count, in Biography, an Italian poet, who was born in 1565, in the palace of the duke of Urbino, to whom his father was favourite minisller; and, after previous instruction at home, was sent to study theology at Pont a Mousson, in France, where he made such proficiency, that he was invited, at the age of 19, to take the chair of philosophy at the Sorbonne. He returned, however, into Italy, and was employed by Cesare, duke of Modena, in some important negotiations at the courts of Rome and France; but incurring disgrace by his marriage, he withdrew to Ferrara, and, in 1607, published the pastoral drama by which he acquired celebrity. This drama was acted by the academy of "Intrepid." at this place, of which Bonarelli had been one of the founders. In his way to Rome, for the purpose of affirming the office of major-domo to cardinal Effe, he was taken at night with a disorder, which terminated his life, Jan. 8, 1668. The drama of Bonarelli, entitled "Fiili di Sciro," was much applauded both in Italy and other countries at its first appearance, and was ranked by common opinion next to the Aminto of Tasso, and the Pastor Fido of Gravina. Although this pastoral has many poetical beauties, it strongly indicates the corrupt taste which then prevailed; nevertheless it maintains its place among Italian pastorals. Many editions of it have been printed; and it has been translated into the French and English languages. Gen. Biog.

BONARES, in Geography, a town of Spain, in Aula- lufa; one league from Lucena.

BONARIENSIS, in Ornithology, that species of Locia or grasseck, described by Buffon under the name of noir fonci. The head and back of the neck are blue; body above blackish, beneath yellow; belly and vent sulphur colour; wings and tail blackish, edged with blue.

This bird is about seven inches long, and is observed generally to fly in pairs; they haunt gardens, where they do much mischief, as they feed on seeds. The bill is blackish; legs reddish; claws acute, curved, and grooved; the hind claw largest. This is the marijuana grass beck of Latham.

BONARIENSIS, a species of Tanagua, that inhabits Bonaria. This is eight inches long; the colour black, glossed with violet, and with greenish on the wings and tail. Gmel. &c. Buffon calls this bird tanguvio. The beak is black, the legs blackish, with large claws. The female is of a brown colour, with the head black, and glossed with blue.

BONARIENSIS, a species of Motacilla, of a black colour; throat and sides ferruginous; face, chin, middle of the belly, and exterior tail feathers, white. This bird is of the size of a linnet; bill blackish; hind-claw large. Buffon calls this deminutiva noit et tonti. It is the white-shouldered warcher of Latham.

BONAROTA, in Botany, Michel, and Scopoli. See Pederota.

BONASCOLA, in Geography, a town of Italy, in the state of Guaron, near the sea-coast, 4$ miles S.E. of Brugnetto.

BONASIA, in Entomology, a species of Cicada (membranae, cruciata) found in America. Fabricius describes it as having the thorax bicoloured, produced behind, and edged with white; at the base of the wings is a white spot.

BONASIA, is also the name of a species of Papilio (Heliconia), the wings of which are fuscous, with a common fulvous band; the lower pair spotted at the base with black.

BONASIA, in Ornithology. Under this name Briffon describes several species of the Tetrao genus; as for instance, tetrao Camadenfis he calls bonasfa freti Hudsonis; tetrao Canadens, bonasfa Camadenfs; tetrao lagopus, bonasfa scoticus; and tetrao togatus, bonasfa major Camadenfs.

BONASUS, in Zoology, one of the synonyms of the wild ox. See Bos Taurus.

By some the bonasus is understood to be that particular kind of wild ox which has the horns bent back, and the mane very long. Bonasus of Miny, &c. hos cornibus in fex Bexis, juba longifirma. Linn. Syll. Nat. The bison is thought by Geffier to be the bonasus of Ariolus.

BONAT, in Geography, a town of France, in the department of the Creusit, and chief place of a canton, in the duchy of Guert, 33 leagues N. of Guert.

BONAVENTURA, St., in Biography, a cardinal of Rome, and entitled the "Seraphic doctor," was born at Bagnara, in Tufcani, 1221; and having entered into the order of Minorites, in 1242, studied at Paris under Alexander de Hales, and there taught theology with great applause. He received his doctor's degree in 1255, and in the following year was made general of his order. He declined accepting the archbishopric of York, to which he was
was nominated by pope Clement IV. in 1265; and, after his death, the choice of a successor was referred by the cardinals to Bonaventura, who fixed on Gregory X. by whom he was made cardinal, and whom he attended to the second council of Lyons, in 1274, where he died in the same year. He was canonized by Sixtus IV. in 1482, and declared a doctor of the church by Sixtus V. in 1588. His works have been collected in 8 vols. fol. and were printed at Rome in 1588; and an edition of them in 14 vols. 8vo. has also been published. Among these are his "Life of St. Francis," the founder of his order, and "A Commentary on the Matter of the Sentences," in which he appears to be a complete master of the theology of the 13th century. To him has been ascribed the influence of religious controversies, and through his private character, and literary talents, are commended both by protostats and catholics, he has incurred some reproach for the zeal with which he promoted the worship of the virgin Mary, as the mother of God. "Moriæ. Eneicy. Mofheim, vol. iii.

Bonaventura, Frederick, an eminent scholar and physician of Urbino, in Italy, who flourished in the early part of the 17th century, published, in 1601, "De natura partus octometrici, adversus vulgarem opinionem, libri decem," Trancus. folio; an enormous volume, containing upwards of one thousand pages, on this interesting subject, in which he has introduced the opinions of different writers, and accounts of all the controversies that have been held on the legitimate period of utero-getation in women. The author had published a dissertation on the subject, in the preceding year, which he incorporated in the great work, but with which a modern reader would probably have been fully contented. Haller. Bib. Med.

Bonaventura, Capo, in Geography, is situated on the coast of New Guinea, in lat. 6° 15', and about 65 leagues N.E. from port St. Augultine. The land is low and luxuriant, and produces the cocoa-nut, bread-fruit, plantain, &c.

Bonaventura, the name of an island, north-east of the bay of Chaleur, off the coast of New Brunswick, in the gulf of St. Lawrence, and a little to the south-west of the point which forms the south-east entrance into that river; about a league from Gaspe bay.—Also, an island on the flaboard side of the entrance into Porto-Bello harbour, opposite to the mouth of Guanche river. See Porto-Bello.

Bona Ventura, or Buenaventura, a river, bay, harbour, and fort, on the coast of Papayan, in South America, nearly south from Panama bay. N. lat. 3° 20'. W. long. 75° 18'. Banks and shoals of 4 or 50 tons may go up to a village a league beyond the fort. Bonaventure is the flab port of Call, Papayan, Sta. Fe, &c.

Bonaventura, Cape and Port, are situated on the east coast of Newfoundland, about mid-west of Bonavista cape, and form the north entrance into Smith's found, from whence the coast runs S. by W. into Trinity bay.—Also, a bay on the eastern side of the island of St. Vincent. N. lat. 13° 9'. W. long. 61° 18'.

Bonavista, so called in reference to its beautiful appearance at sea, the most easterly of the Cape de Verde islands, about 20 miles long, and 12 broad, and distant about 70 leagues west of the coast of Africa. Its surface is low towards the sea, but within hilly, particularly towards the north-east extremity, where is a hill, which, from its conical and truncated shape, appears to have been a volcano; and there is another hill, much higher towards the south-east end, with high land to the westward of it. The soil is sandy, barren, and uncultivated; milk, goats, fowl, and turtle, are the principal food of the inhabitants. It affords some salt; and if the culture of it were not neglected, it

would yield cotton and indigo. It is known at a distance by several white banks on its north side, where the shore is bold, and where a rapid river discharges itself into the sea. This island has a good harbour on its west side, where vessels may lie in 15 or 16 fathoms water. At the distance of a league or a league and a half from the south-east point of the island is a reef of rocks; and over this point, says Capt. Cook, there is a pretty high round mountain, rising not far from the shore. This point, by his observations, is in N. lat. 16° 0', and longitude from London, by account, 21° 51' W. The latitude of the north end of the island is 16° 12' N. and of the south end 15° 57' N. but that at the east end was not ascertained. Mr. Wales, in the second voyage, determined the latitudes of these three points as follows: north point 16° 13' N., call point 16° 31' N., and latitude of the south point 15° 58' N. Stavi-rinus says, that this island has two eminences of a middling height, that appear distinctly upon it; and that there are two reefs, one at the north side, and one at the south side, which stretch out to the eastward, and which are both very dangerous. According to the account in lord Macartney's embassy to China, the east-coast was guarded by rocks; but towards the south-east end the shore was much covered with white sand. On that tide there seemed to be neither cultivation nor inhabitants. The latitude of Bonavista, was 16° 6' N. and the longitude 22° 47' W. The variation 12° 30' to the westward of the pole. This island belongs to the Portuguese. Bonavista, Cape, the extreme N. W. point of the island of Cuba in the West Indies, opening into the gulf of Mexico, from whence the land falls off southerly to cape St. Antonio.

Bonavista, Cape and Bay of, lie on the east side of Newfoundland island, the cape lies in N. lat. 48° 54', and W. long. 52° 33', and was discovered by John Cabot and his son Sebastian, in 1497, under a commission for exploring unknown lands, obtained from Henry VII. The bay is formed by this cape and cape Freels, 15 leagues apart.

BONAYE, a town of France in the department of the Lower Loire, and chief place of a canton, in the district of Nantes. The place contains 834, and the canton 9,532 inhabitants; its territory comprehends 135 kilometres and 7 communes.

BONCAT, a town of France, in the department of the Lower Pyrenées, 6 leagues S. of Bayonne.

BONCHAMPs, a town of France, in the department of the Mayenne, 2 miles S. W. of Cron.

BONCONICA, Offenheim, in Ancient Geography, a town of Gaul, placed between Mogontia to the north, and Borbatomagus to the south, seated on the river Rheus, in Germany prima.

Bona Venturo, or Bon-convento, in Geography, a town of Italy, in the territory of Sienna, where the emperor Henry VII. died; 12 miles S. of Sienna.

BONCORE, Thomas, doctor in philo, by, medicine, and law, in Biography, has left a memorial of a defractive pellifere, which raged at Naples, where he was in high credit, as a practitioner in medicine, in the year 1622. "De populi, horribili, ac pelliferi gutturas affllicatione, nobilissimum urbem Neapolim vexante, cothilium," 140, 1622. Neap. An early account of the scervitana anginosia, or malignant for throat, which has of late years made such frequent appearance, and proved so defractive, among children particularly, in this country. Elrey. Bib. Hil.

BOND, John, an English grammarian of the 16th century, was a native of Somersetshire, and after finishing his
his grammatical education at Wincheste school, was entered, in 1569, at the age of 19 years, a student in the university of Oxford, where he was distinguished by his proficiency in academical learning: Having taken his degrees of bachelor and master of arts, the former in 1573, and the latter in 1579, he was promoted by the master and wardens of New College to the mastership of the free-college at Taunton, in Somersetshire, which office he occupied with reputation for several years. At length he quitted the laborious station of school-master, and directed his attention to physic, which he practised more for amusement than profit. He died in 1612, and was buried in the church of the town. He wrote "Commentaries on Homer and on Persius."

**Bond, or Obligation, in Law.** is a deed whereby the obligor, or person bound, obliges himself, his heirs, executors, and administrators, to pay a certain sum of money to another called the obligee, at a day appointed. If this be all, the bond is called a single one, "Simplex obligatio;" but there is generally a condition added, that if the obligor does some particular act, the obligation shall be void, or else shall remain in full force, as payment of rent, performances of covenants in a deed, or repayment of a principal sum of money borrowed of the obligee, with interest, which principal sum is usually one half of the penal sum specified in the bond. In such condition is not performed, the bond becomes forfeited or absolute at law, and charges the obligor while living; and after his death the obligation depends upon his heir, who, on defect of personal effects, is bound to discharge it, provided he has real effects, by defect as a recompense. So that it may be called, though not a direct, yet a collateral, charge upon the lands.

This security is called a "specialty;" the debt being therein particularly specified in writing, and the party's seal, acknowledging the debt or duty, and confirming the contract, rendering it a security of a higher nature than those entered into without the solemnity of a seal. In order to make a good obligation, it has been held that three things are necessary, viz. writing in paper or parchment, sealing, and delivery; but it hath been adjudged not to be necessary, that the obligor should sign or subscribe his name, sealing being deemed sufficient, and subscribing being no essential part of the deed. And though the seal be necessary, yet if the word sealed be wanting, it is remedied by verbal and pleading over, for all necessary circumstances shall be intended; and if it were not sealed, it could not be the deed or obligation of the party. Moreover, though sealing and delivery be essential in an obligation, it is not necessary to mention in the bond, that it was sealed and delivered, because, according to lord Coke, (2 Co. 5 a.) these are things which are done afterwards. The name of the obligor subscribed is sufficient, though there is a blank for his Christian name in the bond; and where the obligor's name is omitted to be inserted in the bond, if he signs and seals it, the court of chancery may make good such an accident.

An obligation is good, though it has no date; or a false or impossible date; the date not being of the substance of the deed; but the day of the delivery is the day of date, though no day be set forth. Every deed is supposed to be delivered and made on the day of its date; and if the plaintiff declare on a date, he cannot afterwards reply, that it was first delivered at another day. A plaintiff may suggest a date in a bond which has none, or one that is impossible, &c, provided that the parties and sum are sufficiently expressed. A person shall not be charged by a bond, though signed and sealed, without delivery, or words, or other act, amounting to a delivery. But it may be delivered by mere words; and an actual delivery without speaking any word, is sufficient. If a bond be altered by interpolation in a material part, it becomes void, and it may be made void by nascitur, &c, or by raising the date, &c, after delivery. If the words at the end of the condition, "that then this obligation to be void," are omitted, the condition will be void, but not the obligation. If the condition of a bond be impossible at the time of making it, or be to do a thing contrary to some rule of law that is merely positive, or be uncertain or indefinite, the condition alone is void, and the bond shall stand final and unconditional; for it is the folly of the obligee to enter into such an obligation, from which he can never be released. If it be to do a thing that is malum in se, the obligation itself is void; for the whole is an unlawful contract, and the obligee shall take no advantage from such a transaction. And if the condition be possible at the time of making it, and afterwards becomes impossible by the act of God, the act of law, or the act of the obligee himself, there the penalty of the obligation is saved; for no prudence or foresight of the obligor could guard against such a contingency. Co. Litt. 256. When a condition is doubtful, it is always taken most favourably for the obligor, and against the obligee; but so that a reasonable construction may be made as nearly as possible according to the intention of the parties. If no time be limited in a bond for payment of the money, it is due presently and payable on demand. 1 Brown. 53; and if a condition be impossible in respect of time, it shall be paid presently. Jones 122. 1 Leon. 121. If the party, who is bound to perform the condition, discharges himself, this is a breach. A bond made with condition not to give evidence against a felon, &c, is void; but the defendant must plead the special matter. 2 Will. 744, &c. Condition of a bond to indemnify a person from any legal prosecution is against law, and void. 1 Lutw. 667. And if a surety takes a bond as a reward for doing a thing, it is void. 3 Salk. 75. See Condition.

On the forfeiture of a bond, or its becoming stale, the whole penalty was formerly recoverable at law; but here the courts of equity interposed, and would not permit a man to take more than in confidence he ought, viz. his principal, interest, and expenses, in case of the forfeiture accrued by non-payment of money borrowed; the damages sustained, upon non-performance of covenants; and the like. And a similar practice having gained some footing in the courts of law, see 2 (Keb. 57). 555. Salk. 596, 597. 6 Mod. 11, G. 121), the statute 4 and 5 Ann. c. 10, at length enacted, in the same spirit of equity, that, in case of a bond, conditioned for the payment of money, the payment or tender of the principal sum due, with interest and costs, even though the bond be forfeited and a suit commenced thereon, shall be a full satisfaction and discharge. The court of Chancery will not generally carry the debt beyond the penalty of a bond; yet in a case, where a plaintiff sought relief against such penalty, though it was decreed, it was on the payment of the principal money, interest, and costs; and notwithstanding they exceeded the penalty, this was affirmed, 1 Vern. 350. 1 Eq. Ab. 92. 6 Vin. tit. Penalty. 3 Comm. 435. And where the condition of a bond is to perform a collateral act, damages may be recovered beyond the penalty, and the court of K. B. will not stay the proceedings on payment of the money into court. 2 Term Rep. 388.

All persons who are enabled to contract, and who are supposed in law to have sufficient freedom and understanding for that purpose, may bind themselves by bonds and obligations. 5 Co. 119. 4 Co. 124. 1 Roll. Abr. 342. If a person, illegally imprisoned, enters into a bond, during such restraint, to the person who causes it, the same may be avoided.
avoided for dures of imprisonment. Co. Lit. 253. 2 Inf. 483. The bond of a femme covert is in fact void, and shall bind neither her nor her husband. The bond of an infant, even for necessaries, with a penalty for payment, is void. But if an infant, femme covert, &c., enter with a stranger, who is not subject to their disabilities, into an obligation, the stranger shall be bound by it. However, infants, idiots, femme coverts, and aliens, may be obliges. Sole corporations, such as bishops, prebends, parlons, vicars, &c., cannot be obligees; but a corporation aggregate may take any chattel, as bonds, leases, &c., in its political capacity, which shall pass in succession, because it is always in being. Cro. Eliz. 464. Dyer, 48 a. Co. Lit. 9 a 46 a. Hob. 64. 1 Rol. Abr. 515. If a drunken man gives his bond, it binds him; and a bond without consideration is obligatory, and no relief shall be had against it, for it is voluntary, and as a gift. Jenk. Cent. 109. But on the general issue, the defendant may give in evidence that they made him sign the bond when he was drunk that he knew not what he did; and though a voluntary bond cannot be relieved against in equity, it may not be paid in a course of administration, so as to take place of real debts, even by simple contract; yet it shall be paid before legacies. 1 Chan. Cai. 157. An heir is not bound, unless he be expressly named in the bond, though the executors and administrators are. Dyer 13. Two or more persons may bind themselves jointly in an obligation, or they may bind themselves jointly and severally; in which last case, the obligee may free them jointly, or he may free any one of them at his election; but if they are jointly and not separately bound, they must be freed jointly; and in such case, if one of them dies, his executor is totally discharged, and the survivor or survivors only chargeable. 2 Rol. Abrid. 148. Dyer 19 310. 5 Co. 19. 1 Salk. 393. 1 Lutw. 696.

With regard to discharge of bonds, if a lesser sum be paid before it is due, and the payment is accepted, it shall be good in satisfaction of a greater sum; but after the money is due, a lesser sum, though accepted, shall not be a satisfaction for a greater sum. Moore, 677. 3 Bullst. 301. 1 Lutw. 464. It has been adjudged, that the acceptance of one bond cannot be pleaded in satisfaction of another bond. Cro. Car. 85. Moore, 872. Cro. Eliz. 716. 727. 2 Cro. 579. A bond, on which neither principal nor interest has been demanded for 20 years, will be presumed in equity to be satisfied, and be decreed to be cancelled; and a perpetual injunction granted to stay proceedings thereon. 1 Ch. Rep. 79. Finch Re. 78. Satisfaction, moreover, may be presumed within a less period, if any evidence can be adduced in aid of the presumption, such as the settlement of an account in the intermediate time, without any demand. Yet length of time is no legal bar; and is only a ground for the jury to presume satisfaction. 1 Term Rep. 270. As to the pleading of performance of a condition, the defendant must set forth in what manner he has performed it. By lat. 8 and 9 Will. 11. c. 11. § 8. in actions on bonds for performance of covenants, the plaintiff may affirm as many breaches as he pleases, and the jury may assess damages. In debt on a bond, the defendant may have several pleas in bar. 1 Salk. 180. But a defendant in an action on a bond cannot plead, "Non est factum;" and a tender as to part. 5 Term Rep. 97. In debt on an obligation the defendant cannot plead, "Nil debet," but must deny the deed by pleading "Non est factum;" for the seal of the party continuing, it must be dissolved, "EO ligamine quo ligatur." Hard. 532. 1 Hob. 218. In bonds to save harmless, the defendant being prosecuted, is to plead "Non damnificatus, &c." The sealing of any bond, bill, &c., for money, being the property of any one, is made felony, as if offenders had taken other goods of like value. Stat. 2 Geo. II. c. 25.

Form of a bond or obligation, with condition for the payment of money. "Know all men by these presents, that I David Edwards, of Lincoln’s Inn, in the county of Middlesex, esquire, an held and firmly bound to Abraham Barker, of Dale-hall, in the county of Norfolk, esquire, in ten thousand pounds of lawful money of Great Britain, to be paid to the said Abraham Barker, his executors, administrators, or assigns; for which payment well and truly to be made, I bind myself, my heirs, executors, and administrators, firmly by these presents, sealed with my seal. Dated the fourth day of September, in the twenty-first year of the reign of our sovereign lord George the third, by the grace of God king of Great Britain, France, and Ireland, defender of the faith, and so forth, and in the year of our Lord one thousand seven hundred and ."

The condition of this obligation is such, that if the above bounden David Edwards, his heirs, executors, or administrators, do and shall, well and truly pay, or cause to be paid, unto the above named Abraham Barker, his executors, administrators, or assigns, the full sum of five thousand pounds of lawful money of Great Britain, with lawful interest for the same, on the fourth day of March next ensuing the date of the above written obligation, then this obligation shall be void and of none effect, or else shall be and remain in full force and virtue.

David Edwards, (L. S.)

Sealed and delivered, being first duly ramped, in the presence of

George Carter,

William Browne.

Bond of Arbitration. See Arbitration.

Bond of Affirmation. See Assignment.

Bond, bail. See Bail.

Bond, counter. See Counter-bond.

Bond of resignation. See Resignation.

Bond-tenants, are the same, in respect to the nature of their tenure, with copy-holders, and customary-tenants. Blackstone’s Com. vol. ii. p. 148.

Bond, in Majority and Brick-laying, is when bricks or stones are, as it were, knit and interwoven; and when they sly, make good bond, they mean that the joints are not made over, or upon other joints; but reach at least six inches, both within the wall and on the surface, as the art of building requires.

BONDAGE properly denotes a state of servitude or slavery.

Bondage, bondaegium, in English Law Writers, the same with VILLAGE.

Tenants in bondage, paid heriots, and did fealty; they were not to fell trees in their own garden, without licence of the lord.

The widow of a tenant in bondage held her husband’s estate, quamdiu visserit sua maritui.

Bondage by the forelock, or bondaegium per anteciores crimina capit, was when a freeman renounced his liberty, and became slave to some great man; which was done by the ceremony of cutting off a lock of hair on the forehead, and delivering it to his lord; denoting, that he was to be maintained for the future.

Such a bondman, if he reclaimed his liberty, or were fugitive from his master, might be drawn again to his servitude by
The Romans had two kinds of bondmen; one called servi, who were either bought for money, taken in war, left by succession, or purchased by some other lawful acquisition; or else born of their bondwomen, and called servi. Both are called in our law villains in grofs, as being immediately bound to the person and his heirs. We may add a third kind of bondmen mentioned by Justinian, called adscripti sive glebe, or agriculsi; who were not bound to the person, but to the ground or place, and followed him who had the land. These, in our law, are called villains regardants, as belonging to the manor or place.

In the English as well as Scottish laws, those called by the Romans servi are sometimes also denominated naturi, as being born on the land. See NATUR.

BONDORF, in Geography, a country of Germany, in the circle of Swabia, about five leagues long, and between one and three broad, lying between the Drigaw and the Landgravites of Baar and Stuhlingen. It had formerly lords of its own, but in 1613 was purchased by the abbey of St. Blaise. It is affected in the imperial mariculata, at 25 florins, 33 krutzens; and its contingency to the chamber, at Wetzlar, is 12 rixdollars, 15½ krutzens. This territory comprehends the town of Bondorf, 28 miles N.N.W. of Zurb, and several villages.

BONDOUT, a kingdom of Western Africa (formerly a part of the kingdom of Bambouk), the capital of which is Fatteconda, near the eastern bank of the river Falame. This kingdom is bounded on the north by Kajagga, on the east by Bambouk, on the south-east and south by Fenda and the Simbani wilderness, on the south-west by Woulili, and on the west by Fouta Torra. It lies between N. lat. 12° 32' and 14° 32', and between W. long. 10° 8' and 11° 18'. Mr. Park, in his journey through this kingdom towards the east, found that the country, though covered with woods, like that of Woulili, rose into hills, especially towards the Falame river, and that the soil varied to a considerable degree; but wherever the land was cleared, great natural fertility was observable. Bondou, in particular, may literally be pronounced "a land flowing with milk and honey." Both these articles, together with rice, and 1-inch corn of two or three species, were to be obtained at a small expense. Of their honey, the unconverted or pagan natives make an intoxicating liquor, much the same as the mead, or metheglin, of Europe; and this, and the wine of the palm-trees, constitute their principal liquors. The price of a fowl in Bondou was a button, or a small bit of amber; goat's flesh and mutton were proportionably cheap; and for six or eight amber beads Mr. Park might at any time have purchased a bullock. The domestic animals are nearly the same as in Europe. Swine are found in the woods, but their flesh is not esteemed. Probably the marked abhorrence with which this animal is held by the natives of Mahomet has spread itself among the Pagans. Pottery of all kinds, the turkey excepted, may be had everywhere. The Gourin tree and red partridge abound in the fields; and the woods furnish a small species of antelope, of which the venison is highly and deservedly prized. Of the other wild animals in the Man-
BON

slave corporally; but cannot deprive him of life for any offence, nor even fell him to a stranger, without first bringing him to a public trial, called a "Palaver," before the chief men of the town; and on such occasions the cause of the slave is pleaded by the native Mahometans, who are a sort of professional advocates. These inducements indeed extend only to native or domestic slaves; for captives taken in war, and those who are obtained in traffic, may be sold at pleasure, and treated as the owner thinks proper. Park's Travels into Africa. Rennell's Proceedings of the African Association.

BONDUR, a town of Asia Minor, the province of Natois, 23 miles west of Tarsus.

BONDEE, in Ornithology, the honey buzzard (Falcio apivorus,) stands under this name in Buffon's History of Birds. The French writers of the present day also call it bondree.

BONDUC, and Bonduccella, in Botany, (Plumiier.)

See Guillaudina.

BONDUCH, in the Materia Medica, a name by which many authors have called the Molucca, Marfao, or Berzoar nut.

BONE, in Anatomy. The bones are the most solid parts of animals, and may be regarded as the walls of a building supporting and containing the other parts. The human body is composed of a pile of bones, the extremities of which are variously shaped, and adapted to each other, and calculated to admit of a variety of motions. Bones appear to be composed of a vascular substance, not differing materially in structure from that of the rest of the body, except that there is deposited in its interstices phospfat of lime, which gives to the whole mass rigidity, strength, and a permanent figure. That state of the vessels in which they secrete, and deposit, earthy matter, occurs in diseases of other parts of the body. The nutrient vessels of arteries, membranes, and ligaments, occasionally deposit lime, and cause the ossification of those parts. The earth of bone is also deposited in some species of tumours, and often in considerable quantity, and in an irregular manner in the cellular substance of a limb, when the bone of it is diseased. After this general view of the subject, we proceed to give an account of the structure of a bone, both with respect to the arrangement of its earthly particles, and with relation to its vascular texture.

It is customary, however, in giving an account of the structure of bones, first to describe their original formation in the fetus; and this is useful, because it demonstrates the simplicity of the process, and tends to refute old and erroneous ideas respecting it. The parts of the young fetus which are afterwards to become bones, are merely a veiicular, gelatinous substance, scarcely distinguishable from the other parts; afterwards the outline of the bone becomes evident, and its substance is rendered white and firm, in proportion to the quantity of lime deposited in it. The quantity deposited in it, even at the time of birth, is only sufficient to give firmness to the whole mass, but not to prevent its flexibility. The extremities of all the long bones consist of large portions of cartilage, and thence, by degrees, become bony. This change is effected by an alteration, first, in the organization of the part; the cartilage is absorbed, the vessels enlarge, so as to admit of injection, and then they appear to have the power of depositing earthly matter, or forming bone. The formation of bone begins in the centre of a cartilage, and gradually extends from thence to the remote parts, so that the separate piece of bone, formed at the extremity, remains to nearly the period of puberty, conjoined to the body of the bone, by a crust of cartilage. In this state it is technically termed an epiphysis. The observation of these facts led formerly to the erroneous notion, that it was necessary that cartilage should exist, prior to the formation of bone; and that it was converted by pressure, or in some inexplicable manner, into bone. It was a wall of argument to refuse this opinion. We can perceive a striking advantage that results from the bones of the fetus being formed as they are. Their flexibility admits of the form of limbs becoming adapted to the varying figure of the pelvis, through which they must pass, and their elasticity, which is powerful, refles them afterwards to their natural shape.

The subject which first engages our attention, in examining the structure of bone, is the arrangement of the earthy parts. The phospat of lime is deposited by the arteries in minute points or particles, and these being placed lengthwise, with respect to each other, form fibres; again these fibres being placed parallel to one another, form bony plates, scales, or lamina. That bones are fibrous and laminous, is evident from a mere inspection of them in the fetal state; that they are so in the adult subject may be demonstrated by calculation, or long exposure to weather: in which cases the connecting vascular substance is more suddenly or slowly diffipated, and thus the arrangement of the earthly matter is rendered visible. The earthly fibres of long bones extend themselves in a direction parallel to the axis of the bone; in broad bones they shoot out in every direction, like rays from a centre. In long bones the earthly matter is consolidated in the circumference and sides, so as to form thick and strong walls; whilst a tube or more spongy bony structure is found in their centre. In broad bones a similar structure is observed; the earthly matter is consolidated exteriorly, so as to form dense plates or plates; whilst interiorly the fabric of the bones is spongy or cancellous. In the internal spongy part of bones the marrow is deposited. In the middle part of long bones the walls are very thick, being composed of a great number of bony lamelles, and these walls gradually become exinated as they approach to the extremities of the bone, where they are proportionally very thin. Long bones are also slender in the middle, but at the same time strong, on account of the great quantity of earthly matter thus consolidated to form their walls; whilst there is but little cavity or medullary structure. These bones expand greatly at their extremities, in order to afford an extent of surface for the formation of joints, and for the support of the weight of the body. In the extremities of long bones, though the walls are thin, there yet exists a great deal of bony matter, which is deposited so as to leave interspaces between its fibres, forming what is termed the cancellous structure, or lattice-work of bones. It has been therefore concluded, that the quantity of earthly matter may be nearly equal in each part of a bone, and give to it an equal degree of strength; but that it has this difference of arrangement, that the tibia is consolidated so as to form very thick and dense walls, occupying but little space, and leaving but little internal cavity, whilst in the extremities it occupies a greater space, and forms a less solid kind of fabric. It would be desirable to ascertain, with some precision, where similar circumstances are to be met with in broad bones; and though no precise rule can be given, yet this may be admitted as a general truth, that where a broad bone swells out into a protuberance, there we shall find the walls or tables thin, and the cancellous structure abundant; and, on the contrary, where a broad bone is condened so as to occupy but little space, there we shall find the tables proportionately thicker, and the cancellous structure leaves in quantity.

Having thus described the arrangement of the earth of bones, we may next enquire into the advantages which result from this structure. The long bones are made slender.
in the middle, to allow of the convenient arrangement of large muscles round them; they become expanded at their extremities to afford an extent of surface for the formation of joints, and the support of the weight of the body. A cavity is left in the middle; for if all the earthy matter had been compacted into the smallest possible space, the bones would have been such flender items, as to be very unfituble to their offices; and if they had been of their present dimensions and solid throughout, they would have been unnecessarily strong and weighty. Besides, it can be proved by mathematical demonstration, that the strength of the bone becomes augmented, in proportion as its fibres are placed at a greater distance from its centre.

With regard to the vascular structure of bones, there can be no doubt but that it exactly resembles that of the rest of the body. That bones poifles numerous arteries, is proved by the injection of young bones from the general arterial sytem of the subject; for they are made very red by the injection conveyed into them by numerous, though minute arteries, which enter them by pores evident on their surface. The effect of feeding animals with madder is an additional and striking proof of the same fact; for the bone becomes deeply tinged with the red colour of the madder. The cause of this phenomenon has of late been explained by Dr. Rutherford: he has shewn that it arises from a chemical attraction that exists between earths and certain colouring materials, which causes them to combine to intimately as to form pigments which are called lakes by painters. Dr. Rutherford dissolved madder in distilled water, and added to it muriate of lime, which produced no change of appearance in the solution; on the further addition of phosphat of soda, a double decomposition took place; the muriatic acid combined with the soda, and the phosphoric acid with the lime. The phosphat of lime also combined with the madder, and they were together precipitated, forming a beautiful red powder. If blood be constantly conveyed into bones by numerous arteries, it must be returned from them again by veins, or otherwise it must accumulate in them in considerable quantities. That bones poifles absorbents in common with other parts is equally clear, and is proved by their mode of growth, and also by their discharges. The growth of the tube of a bone is a proof of the mutation of its parts by absorption; for if bones grew merely by new matter deposited on the surface, the tube of the bone should be of the same dimensions in the adult as in the foetus: on the contrary, however, the tube enlarges, and bears the same proportion to the whole bone in either state. If any number of lamina of the sides of a bone, or if a portion of its whole substance perish, the mortified part is detached in the same manner that it is in soft parts; and this detachment is manifestly the effect, in the first instance, of the agency of the absorbing vessels. Though a portion of animal substance has perished, it still poifles the same powers of cohesive attraction that it did while living; it still tenaciously adheres to the living parts; but a space takes place all round the dead portion, and the production of that space can only rationally be attributed to the removal of parts by the absorbing vessels. In diseases of bones their form becomes entirely altered, if an incised depression of matter takes place in their internal parts; and this alteration of form could not happen unless the walls were removed by absorption, and deposited anew in conformity to the augmented bulk and figure, which the diseased deposition had occasioned. Not to cite lesser instances, one may be mentioned, which Mr. Hunter used to shew in his lectures, of a very large and globular bony tumour, which had formed in the extremity of one of the bones of the leg in an ox. The tumour was so solid, that the section of it admitted of being polished, and the walls of the bone had become thin, and of a spherical form, so as to make a neat kind of case containing this bony tumour. That bones poifles nerves as well as arteries, veins, and absorbents, cannot be doubted; for though they have naturally but little fusibility, they become extremely painful when diseased; and again a fungus sometimes grows out of a bone, which is sensible, though it may have no connection whatever with the surrounding soft parts; of course it must have derived its nerves, by means of which it poifles its sensation, from the bone out of which it arose. That the vessels and nerves of a bone are connected together by common cellular fusibility, as in other parts of the body, is demonftrated by soaking a bone in dilute muriatic acid, which dissolves all the lime, and leaves the vascular matter a little thickened, but perfectly flexible. We then see that this vascular and cellular matter has a laminated arrangement corresponding to that of the earthy, which has been described, so that between each layer of earthy matter, there is a layer of soft substance, and of course the different layers of soft substance are connected by vessels and cellular membrane, which intervene between the bony fibres, and connect the different strata together. Bones are covered by a strong, firm, fibrous substance, termed periosteum, on which the vessels are first distributed; from this they descend, connected by cellular substance, between the fibres of the bone. The vessels and nerves of the bone enter it through holes which are evident on the surface, and which are larger and more numerous in the extremities of the long bones than in the middle. The vessels do not penetrate the bone in a transverse direction, but obliquely, running transversely through a certain number of lamelle, and then taking a perpendicular course between others, which prevents the bone from being weakened, particularly at any one part, by that want of earthy matter which is necessary to leave room for the admission and distribution of vessels.

The marrow that is contained in bones is of an unctuous nature, and in herbaceous animals, hardens when it becomes cold; but it remains fluid in those which are carnivorous. Some of the red parts of the blood are deposited with it in young animals, but in those that are adult it is no longer tinged with blood. The marrow is contained in fine cells, which do not communicate with one another, like those of the common cellular substance. This is proved by sawing a bone through, and keeping it in a temperature which will preserve the marrow fluid, with the part which is sawn downwards. Under these circumstances, if the cells communicated, the gravitation of the liquid marrow would cause it quickly to drop out, and leave the cells empty; but this does not happen. The cells which contain the marrow are lodged in the cancelli of the bone, at the extremities of the long bones; but in the middle they are unsupported by this kind of osseous structure. The cellular substance which contains the marrow, being condenfed upon the inside of the walls of the bone, and adhering to them, has been termed the periosteum internum. In the principal bones we perceive arteries, much larger than those for the nutrition of the bone, which penetrate the walls obliquely, and spread their branches upon the medullary cells, for the nourishment of these parts. That these are the chief nutrient arteries of the marrow cannot be doubted; and it has been contended, that they have exclusively this power, and that they do not communi-
fidered as a very strange peculiarity, were not the minute contiguous nutrient arteries to interconnect with one another. The writer of this article is of opinion, that they do in this, as in other instances, for it is common in amputation to cut off the trunks of the medullary arteries, and yet the marrow of the remaining bone does not perish; and, again, the bone may be injected from the medullary artery alone. We may next inquire into the uses of the marrow. Havers thought that it transmuted through the bone, and by this means prevented it from becoming brittle; nay, he even described the pores through which such transmutation was supposed to take place. The cells, however, which contain the marrow are perfect vessels; and we know that no transmutation of contained fluids takes place through the membranes which contain them during life, though in consequence of putrefaction it does after death. If a bone be deprived of its periosteum in a living body, no transmutation of oil from its surface takes place; and even after death a recent bone may be deprived of its periosteum, and put in warm water for a considerable time, and yet no sudden transmutation of oil from the surface will take place, as might be expected if there were natural channels for this purpose. The canals which Havers described, are probably the passages through which the vessels are transmitted. If then this opinion of the use of the marrow be unfounded, we have still to inquire, for what purpose is it designed? The utility of the bones being formed as they are, small and tubular in their middle, expanded and spongy at their extremities, has been already explained. If then spaces are necessarily left in their interior parts, those spaces must be filled with something, for they cannot be left void, or the immense pressure of the atmosphere would crum their parietes, and aboli the vacuum. There is no matter than the animal body more suitable to fill their spaces than the marrow; and it is to be regarded as a part of the adipofol fylm of the animal. In corroboration of this remark, it has been observed, that in impoverished and drophical subjécts, where there is no fat in other parts, there is likewise none in the bones; and if a bone be sawn, and the medullary cells broken down, so that the fluid which they contain may drop out upon paper, that it will not penetrate it, and render it transparent like oil; but, on the contrary, that it will encrust upon it, from its being of a gelatinous nature, like that fluid which is found in the interstices of the common reticular or cellular substance. From the circumstances which have been detailed in the foregoing account, viz. the great and general vacuolity of bones;—the quantity of soft substance existing in every part of them;—their growth and mutation of form in disease, &c.;—it is natural to conclude, that there exist in the composition of every bony fibre, arteries for its formation, absorbents for its removal, cellular substance for the connection of its parts, and nerves to give animation to the whole. In this view of the subject, we perceive no essential difference of structure between bones and other parts of the body; nor do we expect any essential difference in the functions of their nutrient, and other vessels. We naturally conclude that bony fibres are formed and repaired, and that they undergo mutation or removal in the same manner, and from the same causes, that soft parts do. Mr. Hunter, however, from observing the disintegrated appearance of the bones of animals, who have been at one time fed with madder, and at another with common food, and observing that the exterior fibria was red if the animal was killed after having been for some time fed with madder, and white, if it had only taken its ordinary food, concluded that bones grew by a deposition on their surface, and a correspondent removal of the internal part of the walls of the bone. Mr. Hunter also, to investigate the truth of Du Hamel's opinion respecting the growth of bones, bored two holes in the titia of a pig, one near the upper end, and the other near the lower; the space between the holes was exactly two inches; a small leaden shot was inserted into each hole: when the bone had been increased in its length by the growth of the animal the pig was killed, and the space between the two holes was exactly two inches. Mr. Hunter's experiments and opinions are published by Mr. Home in the second volume of Transact.ions of a Society for the improvement of Medical and Chirurgical Knowledge. We forbear to give a more detailed account of them, or enter into any discussion of the subject, but refer the reader to the original paper, because we believe that no theory will be found, on consideration, to be adequate to account for the phenomena of the growth and difeases of bones, except that which admits the bony fibres to be of the same structure as the soft fibres of the body, and consequently concludes that both are formed, removed, and renovated in the same manner. We subjoin some references to the instructive works on the structure of the bones. Albini icones ossium fictus, cui accedit osteogen. brevis historia.—Ann. Acad. J. G. Bones, in Chemistry and the Arts. The analysis of bone, and the products obtained from it by various chemical processes, deserve considerable attention, as this great class of animal substances ranks among the most important to the chemist. So great a similarity is found in the composition of the bones of different animals, that their properties may first be described generally. Bone, when first taken from the animal, is moist and greasy on its surface; and if cylindrical, it contains a quantity of the peculiar fat called marrow. When this is separated, and the bone exposed to the air, it gradually dries, becomes brittle and white; but the articulating heads long remain moist, greasy, and yellow. When once dry, and kept in a dry and airy place, they are scarcely susceptible of further spontaneous alteration. The effect of mere heat on bone has long been known to chemistry and the arts, as furnishing bone very important articles of chemical manufacture. Heated in the open air, bone first becomes oily and yellow, gives out a watery vapour, to which succeeds a thick, dense, fetid smoke, which readily takes fire, and when once kindled, affords heat enough, when the bones are in sufficient quantity, to complete the entire calculation, which lasts for many hours, during which they become successively black and carbonaceous, brittle, and at last, when every thing combustible is consumed, they remain nearly white, friable, light, and extremely porous or cellular in texture, and retaining their original shape and bulk. This process of burning bones in the open air, in large heaps, is performed near great towns for the sake of the earthy fult bone-off, which is left behind, and forms on an average about half the weight of the fresh bone. It is composed chiefly of phosphate of lime, and is used by the allied arts as the material for tiles, and for a few other purposes. But the volatile products which are wafted in the above procefs, are highly valuable when the bones are diffilfed in close vessels, without addition as before, but with a proper apparatus to receive and condense the volatile products. In those circumstances, with a heat at first gentle, but gradually increasing,
increasing, bone yields, at first, a limpid water, with a peculiar animal oily fluid, which soon becomes impregnated with carbonic acid ammonia, together with an oil, at first of a clear yellow, pungent, and not unpleasant to the smell, but afterwards tawny brown, and even black, by the increasing heat, strongly fluid and ammoniacal. With the empyreumatic oil, a large quantity of sulphurated hydrogen, of carbonated hydrogen, and of carbonic acid gas escapes. The products of this distillation, when condeised, are the ammoniacal water, and the empyreumatic oil; the former contains, besides carbonat of ammonia, a portion of sebacic and proceic acid united with the alkali; the oil may be separated into the fats and more empyreumatic, by charging the receiver occasionally, and keeping apart the first portions of the oil as the purest. If this oil is again repeatedly distilled by itself from clean vessels with gentle heat, it becomes at last as colourless as water, pungent, and not very unpleasant to the smell, so volatile at a common temperature as only to be kept by inverting under water the mouths of the vessels that contain it, and acting in medicine as a powerful sudorific. It is called from the name of the inventor, Dippel's Off., which fee.

The only valuable part of the products of the distillation of bone is the ammoniacal, or volatile alkali, which is mixed with every part of the distilled liquid, and is afterwards purified by subliquefactive affilating in the formation of the Murtri of ammonia, or forming the pure Carbonat of ammonia of the fluids, the fat volatile, spirits of hartshorn, &c. When the distillation is discontinued, the bones remain in the retort of a brown colour, and swimming in a black, thick, extremely fetid, terebinous oil. If they are then gradually heated to redness in close iron vessels, every thing volatile is disdiffated, and the earthy part remains dry and friable, still retaining the original form of the bones, but thoroughly impregnated with the charcoal of the oil, so as to become a fine glossy black. This is afterwards ground to a fine powder, mixed with size into cakes of a convenient weight, and forms one of the species of lamp-black, used very largely as a pigment. The harder and compacter bones, such as ivory, furnish a similar and more valuable black pigment, simply by heating to redness in close vessels.

But the analysis by heat, though it furnishes some valuable articles of commerce, is not well calculated to exhibit the constituent parts of bone in their proper characters.

In fact the ammonia, probably much of the oil, and all the fats, are formed by the action of heat out of the real constituents of bone, as they exist in the animal.

Water and acids are the chief agents to be used by the chemist.

Cold water has scarcely any action on bone, but by long maceration its texture becomes more loose and open, and the gelatinous part becomes gradually changed, as by slow animal putrefaction.

Hot water acts with great ease upon bone, when reduced to small pieces by rubbing or bruising; the first effect is to separate most of the natural oil of bone which tiles to the top, and when cool congeals to a fatty fat. The water then dissolves the gelatine, which is found to compose a very considerable part of the substance, even of the dried and most compacter bone; and in this method a clear infusible pure jelly is extracted, rendering the water, even when in large proportion, of a fiff, tremulous consistence when cooled, which, by evaporation, leaves at last a strong, hard glue.

The experiments of M. Pelletier on this subject are important. This accurate practical chemist took six pounds of dry bone shavings, procured from the button-mould makers, macerated them for two days in cold water, and then boiled them for nine hours with 24 quarts of water. The product was a very strong clear jelly, and at the bottom of the vessel the marc, or earthy residue, which was pressed in order to separate the portion of somewhat turbid jelly, with which it was intermingled. By subsequent boiling down, the jelly became solid when cold, so as to bear to be cut into firm flakes, which were hung up on wires in a place under cover from the weather (as in the common manufacture of glue), and in a fortnight became hard, brittle glue of inferior quality. The produce was 1/3 of ounces of clear glue, half an ounce more from the marc, and somewhat foul, and the marc itself weighed 4 lb. 3 oz. The loss in the operation amounted to 13 oz. In like manner 50 lb. of ivory shavings, exhausted by repeated boiling, gave 9 lb. of clear glue, and 50 lb. of the marc remained.

These facts are important to the manufacturer; nor is the use of bone less interesting as an article capable of supplying much good and wholesome nutriment to man and other animals. In the making of soups it is a matter of common observation, that bones contribute, when boiled with the meat, to the richness of the liquor; but it is not commonly known how much they may be made to add to the nutritive quality; nor is it generally known that the hard and drift bones, even those that have been kept for years, retain their gelatinous part unchanged.

The exact proportion of jelly cannot easily be ascertained by extraction with water, for even when converted into the hardell glue, it has become intimately united with a portion of this fluid; and it is by no means certain that the utmost degradation of glue equals the degree of hydros of natural gelatin, as it exists in the more solid bones.

The quantity of jelly is also much increased, either by giving the water by which it is extracted a higher heat than the boiling point, or by reducing the bones to a fine powder, and using repeated coction and pulverization.

The former method was used by Papin, who, in his valuable experiments on the solubility of animal substances, when confined with highly heated water in his Dig/er, found that he was able to extract every thing from powdered bone, but the more earthly part. The latter mode has been brought into notice by M. Proult, in an important economical-chemical memoir on the "Method of ameliorating the subsistence of the Soldier," published at Madrid, in 1791.

Though there is a great general similarity between the bones taken from different parts of the body, they differ much in the relative portion of fat, of gelatin, and of earth. The younger animal is, the less earthly silt, ceteris paribus, is contained in its bones. The large, round, joint-heads of the thigh, and other large bones, contain much more oil than the rib or blade bones, as is seen when they are exposed to the air; the latter soon becoming dry and clean, but the former remaining long foul and greasy.

No method of extracting all the soluble part of bone answers the purpose so completely, as long boiling in Papin's digester with a very great heat; the earthly residue then remains quite friable in the fingers, and gives little, if any, volatile, oily, or ammoniacal product on burning. But the jelly which remains in the water, and the oil which swins at the top, are found to have acquired a burnt unpleasant taste; and in the proces of a considerable quantity of gas is generated, which diffuses from partial decomposition of the soluble part. On the other hand, even after repeated boiling and laborious pulverization, unfilled by a higher heat than that of boiling water, the earthly residue still feels clammy and cohesive between the fingers, and retains some of its oil.

M. Proult affirms, that the knuckle and joint bones simply chopped into small pieces, and boiled for a quarter of an hour in a common copper, yielded no less than one fourth of their weight of fine inhipid fat, which rose to the top of the
the water, and on cooling concreted into the confidence of fact. The hallowed bones yielded about one eighth of fat. The utmost economy of bones, therefore, when used as human food, may be obtained in the following method. First chop the fresh bones into small pieces, and extract the fat in the way just mentioned; then dry the bones, and powder, or reduce them to a fine paste, by some pretty strong mechanical power; and boil them with about ten times their weight of water, for some hours, till half the water is wasted, more or less according to the kind of bone; the joint and thick bones making a richer jelly than the thin bones, and therefore requiring somewhat less boiling down to make a jelly of a determinate consistence.

M. Proust finds that this proportion of water is sufficient to leave a jelly of about the same richness as would be produced by dissolving one ounce of bone jelly, dried to the consistence of portable soup, in thirty-one ounces of water, and makes a jelly of a very agreeable degree of richness. The extraction is much assisted by using an iron vessel with a close lid, to give a heat somewhat greater than that of boiling water, though not to the degree of a Papin's digester.

In all the above experiments on the extraction of jelly and fat from bones, the uncooked bone is understood to be used. The bones of built meat, though deprived of some of their extractive matter, are still rich in nutriment; but roasting renders them entirely unfit for this purpose.

The earthly part, which compose cries, an average about half the weight of the larger bones of animals, was discovered by Gahn, a Swedish chemist, to consist of the phosphoric acid united with a large proportion of lime. It will be more minutely described under the article Phosphat of Lime: and it is the most convenient sub stance from which Phosphorus is prepared. It may here be mentioned, that the stronger acids, such as the sulphuric or nitric separate a part of the lime from this earthly part, but only a part, for when sulphuric acid is added to bone ash, sulphat of lime is formed in great quantity, most of which remains at the bottom of a supernatant liquor, consisting of a great excess of phosphoric acid united with a small portion of lime, and also some sulphat of lime dissolved therein. It should be remarked in the analysis of this salt, that this acid phosphat of lime, is not decomposed by any single acid, nor even by the pure or carbonated alkalies; for, on adding the latter, the precipitate is not carbonated lime, but still the phosphat.

This earthly salt, when in solution, is, however, entirely decomposed by the nitrat or acetate of lead; the lime remaining dissolved in the liquor by the nitric or acetic acid, and the phosphat of lead forming an infusible precipitate. Phosphat of lead is diftinguishable from sulphat of the same metal by being readily soluble in nitric acid. If the phosphat is sprinkled on hot charcoal, the lead is reduced, and the luminous fibres and peculiar smell of phosphorus are perceptible. The phosphat of lime is equally distinguishable from the sulphat of lime by being very soluble in most acids, even when dilute.

Much light has been thrown on the analysis, and with it the physical structure of bone, and of most other of the hard supporting or protecting parts of the body, by the accurate and numerous experiments of Mr. Hatchett, whose researches into these subjects are admirably calculated to shew the extreme advantage which physiology derives from the labours of the chemist, when assisted by accurate knowledge, and guided by a philosophical spirit.

When bones, boiled or fresh, are steeped in any acid, a slight effervescence is perceived, and they presently are rendered soft and flexible by the gradual abstraction of the earthly bases (chiefly phosphat of lime), which becomes dissolved in the acid. If the bone be previously boiled for a long time in water, its gelatin is removed by this liquid: but if the bone is in its natural state, the gelatin also is gradually dissolved in the acid, rendering it yellow and somewhat tenacious. The insoluble residue (except in a few kinds of bone, such as the enamel of the teeth) is either a membrane or a spongy cartilage, retaining the form of the original bone; for, in the process of ossification, membrane or cartilage forms the first basins or rudiments of bone, which is afterwards completed by the gradual deposition of the earthy salts. Though phosphat of lime forms the chief ingredient in the earth of bones of all animals, a small portion of sulphat of lime is mixed with it: and Mr. Hatchett has detected also a little carbonate of lime. The carboenic acid of this is that which occasions the flight of effervescence during the action of the acid; the lime remains dissolved in the acid after the precipitation of the phosphat of lime by pure ammonia. A carbonated alkali then precipitates it together with the now decomposed earth of the calcareous sulphat.

We have thus shewn the great constituent parts of bone to be gelatin, soluble by boiling in water, and giving a line clear jelly; oil, separable, during the boiling, by rising to the top of the water, and when cold concreting into a salt; phosphat of lime, soluble in dilute nitrous muriatic or acetic acid, and precipitable thence by pure ammonia; some sulphat of lime: a little carbonate of lime; and a membranous or cartilaginous substance, retaining the form of the bone after every thing else has been extracted by water and an acid.

For a highly probable opinion on the nature and origin of this membrane or cartilage, we are indebted to Mr. Hatchett, who has shown a number of characteristic marks, in which it most strongly refines its insolubility in water, and which it differs from gelatin. The chief of these are the following:

When dry, it is semi-transparent like horn, and more or less brittle. In this state it refines the action of water very powerfully: for when boiled for many days with this fluid, a scarcely perceptible precipitate is given by nitro-muriatic of tin; a test of dissolved albumen. In this it strikingly resembles coagulated albumen, and as pointedly differs from gelatin, which, as we have seen, is readily extracted by water even from the dryest and hardest bones.

This bony membrane, as well as albumen, is scarcely acted on by cold muriatic and sulphuric and dilute nitric acids, which last readily extracts gelatin from bone. However, after an immersion in these acids of some weeks, the bony cartilage, when taken out and steeped in ammonia, gradually dissolves into a blood-red liquor. But if the nitric acid is heated, the albuminous membrane is rapidly dissolved with the copious discharge of nitrous gas.

With caustic fixed alkali, the bony membrane or cartilage is readily dissolved into a perfect animal soap (a strong mark of resemblance to albumen, and difference from gelatin), and during the process much ammonia is given out. Acids again separate the albumen from the soap, unaltered in chemical properties.

Lastly, the bony cartilage is extremely slow to enter into a state of putrefaction, though kept moist and warm for many weeks; and in this too it resembles coagulated albumen.

Therefore in addition to the above-mentioned constituent parts of bone, we may add albumen, in a condensed state, forming the substance of the original cartilaginous or membranous structure, both of all the organized bones, and, as Mr. Hatchett has also shown, of most of the hard parts which serve for the covering, protection, and armament of almost
almost every part of the animal creation. See the articles Shell, Horn, &c.

The enamel of the tooth is a tangential variety of the bone, being entirely deficient of the albuminous membrane. When an entire tooth is immersed in dilute nitrous acid, the enamel totally dissolves without residue; but the core of the tooth is acted on like other bone, leaving a cartilage of the same shape. The solution of enamel is found to be almost entirely phosphat of lime, by the tests already mentioned, being precipitable by pure ammonia, giving phosphat of lead, by adding the acetate of this metal, &c.

Fifth-bones Dr. Hatchett found to contain rather a larger quantity of cartilage, in proportion to the phosphat of lime, than the bones of quadrupeds. Of the different kinds of horn and defensive weapons, the flag's horn, elephant's tusks, and the other hard and heavy defences, entirely refusible bone; but the horns of cattle, rams, and the softer species, contain soft little earthly residue, that they owe their solidity entirely to the extreme concretion of the other constituents, the gelatin and albumen.

Bones may be softened by a short immersion in a weak acid. This arises from the partial abstraction of the earthy basis; and advantage may be taken of this property in the working of bone, for the various purposes of manufacture to which this article is applied by the turner, comb-maker, cutter, &c. Bone thus softened, is again made hard, by being steeped in alum-water. Alkalies also soften bone, as they do every other animal matter, by beginning to act upon the softer parts. See Ivory.

Bones readily take various colours, which, if diffused in an acid, sink deep into the substance of the bone, and produce a pleasing effect. The metallic solutions are generally preferred for this purpose. To give a green, diffuse verdigris in distilled vinegar, immerse the bones in the solution, put the whole in a vellum, very well clofed, and bury it in a dung-hill, or give it a flow and uniform warmth in any other way for about ten or twelve days. The bones are then found very deeply and permanently dyed green, and capable of a good polish. The once prized Turquoise bone is fibrous bone of various animals, accidentally impregnated with sulphur of copper whitish buried in the earth. To give the artificially dyed bones a finer colour, boil them in nut-oil, and they will then take a very high polish.

A permanent black is given to bone, either by nitrated silver, or in the following manner: boil equal parts of littharge and quick-lime in water, and the bones along with them for some hours, flirring them frequently. Other metallic solutions may be used for different colours.

Or the dye may be given by preparing the vegetable coloured laques, or concentrated dyes; and by rubbing the bone, first with dilute nitrous acid to open its texture, and then rubbing in the dye for some time. This may be applied in various ways, first softening the bone by a weak acid, whereby it is made fit to receive the colour.

Bones are whitened by simple exposure to sun, wind, and weather, being first thoroughly cleaned, and particularly by occasional immersion in brine; thus the bones of seagulls and fish, left for some time on the shore, are found beautifully white and clean. The same effect is produced much more speedily, but perhaps less permanently, by the oxymuratic acid, the bone being exposed for some hours to this acid gas in close vessels, as Mr. Smith of Britoll has observed. The acid first makes the bone yellow, which, by exposure to air goes off, and leaves the bone beautifully white. This colour a little fades, when the bone is kept in close cafes excluded from the light. See Skeleton.

From all that has preceded, it will appear obvious that to the chemist and manufacturer, bone is one of the most curious and valuable of the animal sublimates, though considered vulgarly as little better than refuse, and fettered about without care. Besides its use as a hard and good material for turnery and workmanship of various kinds, it gives, by chemical decomposition, a large quantity of useful, nutritive jelly, fit for human food, or the fame, in the form of glue, for the arts. When subjected to fire, it yields a vast quantity of ammonia, and is actually the material used in very many manufactures of the ammoniacal salts; and the residue, strongly calcined in close vessels, and therefore retaining its carbonaceous ingredient, produces useful and fine black pigments; or, burned with acfes of air, leaves an earthly salt, necessary to some important chemical processes.

Some of the preparations from bone are only used in medicine. Of these, are Dippel's oil, and the left rectified oleum cornu cervi, (oil of hartthorn,) both powerful fungicides, and supposed antispasmodics; the spiritus cornu cervi, (spirits of hartthorn,) so universally known as a stimulant and cordial; and the carbonat of ammonia, often called falt of hartthorn. The white calcined earth of bones, cornu cervi calcinatum, enters into the composition of one or two pharmaceutical preparations, but without exhibiting any obvious properties. In diseases of the bones, where the softening and spontaneous deformity shews an evident want of their earthy basis, this calcareous phosphen has been given with apparent advantage. Of the unprepared bones, the elk's tooth, rhinoceros's horn, and shavings of the dried human skull, &c. are medicines entirely exploded only within a few years from the European pharmacopoeias, and still maintaining high credit in the countries whose characteristic credulity and superstitutions in medicine first brought them into repute. The only real utility of unprepared bone in medicine is found in furnishing, when boiled in water, a light and nutritive jelly for the invalid; and for this purpose, hartthorn shavings are employed with advantage. Memoirs de Pelletier, tom. ii. Proult in the Journal de Physique, tom. ii. Hatchett in the Phil. Tran. for 1799 and 1800. Smith in Beddoes's Wefl of England Contributions. Johnson's Animal Chemistry. Encyc. Method. Arts and Metiers, (Article Ecaillé), &c. &c.

BONES, Diseased of in Surgery. As bones are organized parts of the animal body, they are liable to most of the diseases with which the softer organs are afflicted. These arise from internal causes, or accidentally degree of the hardness of their composition, and the small degree of vascularity, and sensibility they possess, there must necessarily be a considerable difference between the phenomena and symptoms of diseased bones, compared with those of the soft parts. They are naturally endowed with little or no sensibility; but are extremely painful in an inflamed state, when the blood-veffils, which enter their substance, are distended, and the nerves filaments are kept upon the stretch, as in the case of venereal nodes, &c.

Bones may be wounded with a sharp instrument, or contused with a blunt one, in the same manner as the muscles, or integuments; and they will re-unit again, if the injury suffer be not so extensive as to intercept the circulation, or destroy their vitality. But, if a bone be so injured as to perifh, its substance will either be gradually comminuted and dissolved, or cast off in a larger portion, by the process we denominate esfolution. If any two ulcerated surfaces of flesh (fuppoze two contiguous fingers) be applied together, and allowed to heal, they will coalesce, and the vessels from one part will shoot into the other: in like manner, if the articulating surfaces of two contiguous bones (fuppoze
Bone.

(tussock of the tibia and femur), be divided of their carthilage by ulceration, their extremities may coalesce, and form one continuous bone, which is named amphiolys. A stiff joint, from this cause, is irreparable, and in general it may be considered as the most favourable termination of diseased joints: for they too commonly are attended with such disagreeing symptoms as to require amputation, in order to preserve the patient's life. See White Swelling, and DISEASES OF THE JOINTS.

The consideration of Fractures and Dislocations is referred for their proper places in the Cyclopaedia, where will be likewise described the manner of reducing bones, vulgarly called bone-setting. This art, (which requires a very correct acquaintance with the anatomy of the joints and muscles), has, most unaccountably, been often left to ignorant farriers and mechanics, who are totally destitute of knowledge on these subjects! We might, with as much reason, entrust the repairing of a watch, or a mill, to persons who never had an opportunity of examining their mechanism! By accident, it is rarely possible, some good might be done; but the greater chance is, that the instrument would be damaged rather than rectified, in the hands of such unskilful operators.

Bones will, in ricketty and ferous constitution, pass into a state of spontaneous enlargement, or decay, or flexibility, &c. The spongy parts of bones, e. g. the extremities of cylindrical bones, are most liable to become diseased in such subjects, especially during the early period of life; but in venereal patients, who are also very susceptible of morbid changes in the bones, they are their hard parts chiefly which become affected, as in the middle of the tibia, or tibia, or upon the central portions of the frontal and parietal bones. See Rickets, Scrofula, and Lues Veneria.

Some observations on the surgical treatment of diseased bones will be also made under the heads of Caries, Necrosis, Spina Bifida, Distortion, Curation, Mollities, and EXOSTOSIS.

The structure of bones may be altered from several causes; but principally, from either a deficiency, or a redundancy of the phosplait of lime, which enters into their composition, and gives them solidity. When there is too little phosplait of lime, the gelatinous parts of the bones being unable to sustain much weight or resistance, they will become preternaturally flexible; and, on the contrary, when there is too much phosplait of lime, in proportion to the gelatinous part, the bones will be very fragile, and perhaps, may even break from the mere action of the muscles. The flexible state is most common in young persons, and the superabundance of osseous matter is chiefly predominant in old age; but either condition of the bones may occur at any period of life, from peculiar morbid dispositions. The popular notion of our bones being more fragile in cold weather than in hot, is erroneous, and without foundation; since the difference of season makes no difference in the texture of the living bones: and the only natural caule to be affirmed for the fracture of our limbs more frequently in the winter that in the summer, is that of an increased slipperiness and hardness in the ground from frost, &c. which must necessarily occasion more physical violence and frequency in our falls.

Bones, in the funeral solemnities of the ancients.—Divers usages and ceremonies relating to the bones of the dead, have obtained in different ages: as gathering them from the funeral pyre, washing, anointing, and depositing them in urns, and thence into tombs; translating them, which was not to be done without the authority of the pontiffs; not to say worshipping them, still practised to the bones of the saints in the Roman church. Among the ancients, the bones of travellers, and soldiers dying in foreign countries, were brought home to be buried, till, by an express S. C. made during the Italian war it was forbid, and the soldiers' bones ordered to be buried where they died; the reason was, lest the melancholy sight should discourage the people from venturing their lives. Antiquaries are divided as to the manner of distinguishing the bones of the deceased, from those of the beasts and slaves, who were sacrificed at his funeral, and thrown into the fire; probably it was done by disposing the body of the dead in the middle of the pile, and the others towards the fides. Potter's Arch. tom. ii. lib. iv. cap. 6.

The Romans had a peculiar deity, under the denomination of Osfeous, to whom the care of the illumination and knitting of the human bones was committed; and who, on that account, was the object of the adoration of all breeding women. Pitid. Ant. tom. ii. p. 341.

Bones, ossified or petrified, are found in the earth, frequently at great depths in all the strata, even in the bodies of bones and rocks.

There are divers sorts of osseous bone; some of a huge size, usually suppoled to be the bones of giants, but more truly of elephants or hippopotami; others smaller, as vertebræ, teeth, and the like.

It has been disputed whether these be truly animal substancess, or mineral, that is, bones thus figured. Modern naturalists generally allow them to be animal, not merely on account of their figure and resemblance, but of their chemical principles, which are found to be wholly of the animal kind. It is suppos'd that they were reposed in those strata at a time when all things were in a state of solution, and that they incorporated and petrified with the bodies where they happened to be lodged.

In the Philosophical Transactions (vol. lxxiv. p. 427, &c.) we have some observations on osseous bones by the late Mr. John Hunter. They were occasioned by an examination of bones of this kind, found in the caves of Gaienreach and Klaushein, two small villages in the principality of Bayreuth, (or Baireith), and presented to the Royal Society by the marquise of Anspach. These bones are considered more as incrusted bodies than extraneous fossils, since their external surface has only acquired a covering of crystallized earth with little or no change in their internal structure. The principal earth with which bones are most commonly incrusted is the calcareous; and this happens either by the bones being immered in water, in which this earth is suspended, or by water's passing through nativess of this earth, which it dissolves, and afterwards deposits upon bones which lie underneath. Bones which are incrusted seem never to undergo this change in the earth, or under the water, where the soft parts were destroyed; while bones that are fossilized become so in the medium, in which they were deposite at the animal's death. The incrusted bones have been previously exposed to the air; which is evidently the case with these bones, and also with those of the rock at Gibraltar, those found in Dalmatia, and those of the island of Cerigo. They are thus distinguished from fossilized bones; but as they are found in different situations, it is more difficult to account for their present state. Those in Germany are found in caves; the coast of Dalmatia is said to be wholly formed of them; and this is the case with a large portion of the rock of Gibraltar. With respect to the first class of bones, as they are those of carnivorous animals, resembling, in some respects, those of the white bear, and yet differing, in some circumstances, from the present animal of that species, Mr. Hunter figures, that the animals to which they
;

BONE.
\hij be'oT.g refortej at diRereiit periods to tlicfe caves, as

places of retreat, and perifhed in ttiem.
are inoftly the bones of animals of the ruminating tribe, of
the hare kind, and of birds, with fome of a fmall dog, or
Thofe in Dalmatia appear to be
fox, and likewifs Ihells.

From thcfe fafts, it may
moftly of the ruminating tribe.
be prefumed, that their accumulation did not arife from any
inftir.ctive mode nf living, as the fame mode could not fuit
both carnivorous and herbivorous animals. As to the local
tiiftribution of thefe bones, it is neceflary to recur to fuccefiive
fliiflings of the fituation of the fea, in confequence of whicli
vvc may have a itratum of marine extraneous foflils, one of
earth, mixed probably with vcgctKoles and bones of land
animals, a ftratum of teneitrial extraneous foffils, then one
of marine produdiions ; but as the fea carries its inhabitants
along with it, wherever there are thofe of land animals,
there will alfo be a mixture of marine ones; and from the fea
com.monly remaining thoufands of roars nearly in the fame
fituation, we have marine foffils i'.;,mixed with any others.

As all operations rcfpecling the decompolition, as well as
the growth, of animal and vegetable fubftanccs, proceed more
rapidly on the furface of the earth, to which the air has
Hccefs, than within it, we fliall llnd fewer changes as v/e
dcfcend into the earth, and at laft probably arrive at a certain depth, where no change takes place.
Subllanccs,
therefore, that aie foffilizcd at a great depth, and depolited
in Hone, clay, &c. are preferved for a very long time from
putrefaction ; as much to as if they were in a vacuum ; the
beat alfo in fuch fituations being uniform, consmonly about
52' or 53'; and in the colder regions they are ilill longer
preferved.
It has been generally underftood, that in extraneous foflils the animal part is dellroyed
but Mr. Hunter has not found this to be the cafe.
Shells, and bones of
fifh, mull probably have the leall in quantity, having been
longeft in that ftate, otherwifc they {hould have the moll
for the harder and the more compact the earth, the better is
the animal part prelerved ; and this is an argument in
proof of their having been longed in a foflil Hate. In the
foffil bones of fca-a;iimals, as the vertebra of the whale, the
animal part is in large quantity, and exifts in two ftates ;
the one having fome tenacity, but the other like wet dull; ;
in fome of the harder bones it is more firm. In the foffil bones
of land animals, and thofe which inhabit the waters, as the
fea-horfe, otter, ciocodile, and turtle, the animal part is in
In the horni of Hags dug up in Great
great quantity.
Britain and Ireland, when the earth is dilTolved, the animal
part is in confiderable quantify, and very firm.
The fame
obfervations apply to the fodil bones of the elephant found
in England, Siberia, and other paits of the globe; alfo
thofe of the ox kind ; and more particularly to their teeth,
efpecially thofe from the lakes in America, in which tiie
animal part has fuffered verj- little : the inhabitants finding
b'ttle difference in the ivor\- of fuch tulks from the recent,
except its having a yellow ftain ; the cold may probably
afiill in their prefervation.
In incrufled bores, the quantity of animal fubdance is very different in difTcrent bones :
in thofe of Gibraltar, there is veiy little; it partly retains
its tenacity, and is tranfparent, but the fuperficial part dif:

rcfults.

and teeth, feem to contain all the animal fubdance natural
to them, though in this rcfpcft they differ amon"- themfclves.

The bones of land animals have their calcareous earth united
with the phofphoric acid of the aerial, and retain it, when
foffilizcd, as Mr. Hunter thinks, in proportion to the quantity of animal matter they contain.
This he infers from the
quantity of effervefccnce. In fome bones of the whale, put inVOL. IV.

to the muriatic acid, the effervcfcence

is

Dalmatia and Gibraltar bones

;

very great ; in the
and in thole of the
German caves, it is very little, fince they contain by much
the largeil proportion of animal fubllance.
From the experiments and obiervation of the ingenious Mr. Hatchett,
(foe Phil. Tranf. vol. Ixxxix. p. 333. we learn thatthe bones
of the Gibraltar rock confift principally of ph.ofphat of lime;
and that the cavities have been partly filled by the carbonate of lime, which cements them together.
Foflil bones, he
fays, refemble bones which, hj combudion, have been deprived of their cartilaginous part
for they retain the figure
of the original bone, without being bone in reality, as one
of the moll effential parts has been taken away.
Such
fufiil, or burned bones, can no more be regarded as bone,
than charcoal can be confidered as the vegetable of v.hicivit
retains the figure and fibrous texture.
Bones which keep
their figure after combullion, refemble charcoal made from
vegetables replete with fibre ; and cartilaginous bones,- which
lole their fnape by the fame caufc, may be compared to lucculent plants which are reduced in bulk and fhape in a
finiilar manner.
Hcnc he i'5 led to quedion if bodies, couiilling of phofphat of lime, like bones, have concurred materially, to fonn drata of limeftone, or chalk
as it appears
to be improbable, that phofphat is converted into carbonat
of lime, after thcfe bodies have become extraneous foflils.
Thededruftion, ordecompofition of thecartilaginou3par^s of
teeth and bones in a foffile itate, mud have been the work of
a very long period of time, unlefs accelerated by the action
of fome mineral principle; for, after having, in the ufual
manner, fteeped in muriatic acid the 03 humeri of a mart,

brought from Hythe in Kent, and faid to have been taken
from a Saxon tomb, Mr. Hatchett found the remaining
cartilage nearly as complete as that of a recent bone.
M. Cuvier communicated to the Societe d' Hidoirc Naturelle at Paris, a curious memoir upon the foffil bones of
animals.
The following abridgment has been taken from
the Societc Philomatique, N^ iH. Year VI.
In order to
determine the relations and differerrces that fubfid between
the feveral fpecics of animals that do exid, or have exided
on the furface of the globe he direcled his attention to
the following,
i. The animal which afforded the bones
and teeth, called the bones and horns of the mammouth,
by the Ruffians and Siberians, and of which remains are
found in Europe, is a fpecies of elephant, refembling the
elephant of Afia but differing from it in the alveolx of its
teeth, its tnllis being longer, the angle of its lower jaw more
obtufe, and the laminx of which its grinders are compofed
;

thinnei".

though

The

true analogous living animal is not known,

it

phant.
the banks of the Ohio in North America, which the Americans and Englifh have alfo named man mouth, though it
(liflers much from the former.
Remains of it are found
in Europe and Afia.
It mnl): have been r.early as high as
the elephant, but more bulky; its tuflcs are fmallor; its
grinders are armed with large cutting points, of which the
leclioi by wi>ar prefents double tranfverfal lozenges. There
arc three molar teeth on each fide, one of four, one having
fix, and one eight points.
3. The animal of which the
teeth tinged by copper afford the turquois done, and of
which there v/as a mine at Siinore, in Languedoc. The
remains of this fpecies are found in the department of Ain,
in Peru, and elfewhere.
It mull have confidcrably refemblcd
the former ; but the points of its molar teeth are round, and
when worn, their feftion prefents fird, a ci-.cle, then a femioval, and afterwards a figure of a trefoil, which has caufed
them to be confounded with the teeth of the rhinoceros

5

D

fo;ni!


Some of these teeth have 12 points, others 6, others 4-4. The rhinoceros. The feet and fragments of the jaws of this animal are found in France, and elsewhere, in which the author has hitherto observed nothing which differs from the common rhinoceros; but, as he has not yet seen an entire bone, he cannot positively affirm that they are identical. 5. The species of rhinoceros, with an oblong cranium, which is found in Siberia, Germany, and other countries. The author has seen teeth, and parts of the jaw-bones, found in France, which appeared to him likewise to belong to this animal; the principal character of this species consists in the long closefit of the nose; the living analogous animal is unknown. 6. A molar tooth with two transversal eminences, which is in the possession of Citizen Gillot; and of which the National Museum posseé a young tooth that resembles neither the teeth nor the germs of any animal yet known, whether living or fossil: the only tooth which this slightly resembles is the last molar tooth of the rhinoceros. This tooth, therefore, indicates the existence of a sixth fossil species, of which the living analogous animal is unknown. 7. The animal twelve feet in length, and fix in height, of which the skeleton was found under ground at Paraguay, and is preserved in the royal cabinet of Spain, at Madrid. The author proves by a detailed comparison of the bones, with those of all the known quadrupeds, that it is a larger and distinct species, more nearly approaching the flinth than any other genus, and that it may be called the giant flinth. Citizen Cuvier, in this place, communicates the interesting discovery he has made, that the flinth (Rhagopus tridactylus, Linn.) has naturally and constantly nine cervical vertebra. It is the first known exception established by Citizen Daubenton, that all quadrupeds have neither more nor less than seven cervical vertebra. 8. The animal, of which the remains are found in the caverns near Caylenreuth and Muggendorf, in the marquatie of Bayreuth, in Franconia. Various authors have considered it as a white bear; but it differs from this animal, as well as from all the known bears, in the form of its head, which is particularly characterized by the projection of the front, by the absence of the small tooth, which all the known bears have behind each canine tooth, by the ossoon channel of the humerus, in which the brachial artery passes, and by several other circumstances in the figure and proportion of the bones. This animal, however, resembles the bear more particularly than any other kind. 9. The carious animal of which the bones are found in the plaiiter-flone of Montemarte: the form of its jaws, the number of its molar teeth, and the points with which they are armed, indicate that this species is referable to the genus Canis; but it does not completely resemble any species of this genus. The most striking distinctive mark is, that the seventh molar tooth is the greatest in the animal of Montemarte, whereas the fifth is the largest in dogs, wolves, foxes, &c. 10. The animal of which the lower jaw was found near Verona, has been considered by Joseph Monti as a portion of the cranium of the hea-cow; a notion which all the geologists have adopted, though it is contrary to the most simple notions of comparative anatomy. This jaw, according to Cuvier, has belonged to an animal resembling, though specifically different from, the mammoths, the animal of the Ohio, and that of Simore. Its most particular character consists in the curve which forms its lympthys. 11. The animal of the flag kind of which the bones and the antlers are found in Ireland, in England, at Macdericht, &c. It is sufficiently different from all the flags, and even the elk, to which it has been referred, by the enormous magnitude of its antlers, the flattening of their superior part, and the branches which spring from their base. Several figures of these are given in the Philo- sophical Transactions. 12. The genus of the ox or beene alone affords several fossil species: the cranium of two were found in Siberia, which have been described by Pallas, who referred one of them to the ordinary buffalo; but he has since attributed them to a peculiar species, natives of Thibet, named anna. Citizen Cuvier proves, by osteologic comparison, that those craniums have not belonged to the buffalo. The other appeared to Pallas to have belonged to the buffalo of the Cape, or the musk ox of Canada. Citizen Cuvier shows that they cannot have belonged to the former; but not being in possession of the cranium of the anna, nor the musk ox, he makes no decision respecting their identity with the fossil craniums.

The author likewise describes two kinds of cranium which have been found in the turf-pits of the department of La Somme, which greatly resemble our common ox, and that of L'Auroiude, but are more than one fourth longer.

From this inquiry the Citizen Cuvier concludes, 1. That it is not true to affirm that the animals of the fourth have formerly lived in the north, of their species not being perfectly identical. 2. That in every country there have lived animals which do not at present exist, either on the same spot, or elsewhere in any known country. Hence he leaves to geologists, the task of making in their systems, such changes or additions as they may think best suited to explain the facts which he has thus established.

Bone is also applied abusively in speaking of other matters which bear some analogy, either in respect of structure or office, to the bones of animals.

In these fensc rocks are sometimes called the bones of the earth. Divers species of figured bones, as the repabiles, carolites &c., are denominated mineral bones, cufola, oles, &e. Some naturalists consider shells as a species of bones. The lobbler, according to Fontenelle, is an animal which carries its bones on its outside.

BONETTA Sbeat, lies about N. E. by E. from Bonavista island, one of the Cape de Verde islands, distant from it about 12 or 14 leagues.

BONEZIDA, a town of Transylvania, on the Samos, 12 miles N. of Clujenburgh.

BONTADO, James, in Biography, an eminent Italian scholar of the 16th century, was born at Gorzana, in the Drefian territory, and studied in the university of Padua. From thence he went to Rome, where, for some time, he served the cardinals Merino and Chinkel, as secretary; and after wandering from place to place, he resumed his studies at Padua, where he was probably employed in the instruction of youth. Driving from none of his employments more than a precarioy subilibrium, he was, in 1555, invited to the chair of philosophy, in the city of Genoa, to which he was united the office of historian, with a considerable pension. While he was busily prosecuting his studies, he was charged and convicted of an unnatural crime; beheaded in prison; and his body was publicly burnt in July 1550. As a writer in the Latin and Italian languages, both in prose and verse, he
he excelled; and his translation of Cicero's oration for Milo, is reckoned one of the most elegant pieces of Italian prose which the century affords. His capital work is the "An-

nals of the republic of Genoa," written in Latin, and cop-

prising the history from 1528, where Giustiniani left off, to

February 1530. It was first published at Padua, in 1586, 4to, and translated into Italian by Psichetti. The style is
elegantly simple, the narrative lively, and the sentiments

elevated. His Italian letters and poems were printed at

BONAFATI, in Geography, a town of Italy, in the kingdom

of Naples, and province of Calabria, on three leagues

north of St. Marco.

BONFINI, Anthony, in Biography, was born at Ac-
coli, and after being some years professor of belles-lettres, at

Reccanati, was invited by Matthias Corvinus king of Hun-
gary, in 1454, to his court, where he was employed in

writing the history of the Huns. Here he enjoyed the of-

cice of tutor to the queen, Beatrice of Arragon, and received

many honours from Matthias, and his successor Ladislas.
He died in 1504, aged 75. Of the history of Hungary he left 43

decades, brought down to 1495; of which 3, or 30 books were

printed, by Martin Brener, in 1543, and the remaining 15 books

were added to a new edition by Sambus, in 1568. This work is

written with elegance, and is charged among the best modern histo-

ries in Latin. He also wrote an account of the capture of Belgrade by Maho-

net II., and a work entitled "Symphonia Tragicum, seu
dialogum de fide conjugal et virginitate, lib. iii." He
likewise translated, from the Greek into Latin, the works of Philolaus, Hermogenes, and Herodan. Gen. Dict.

BONGARS, James, a polite scholar and able negotiator,

was born of protestant parents at Orleans in 1551. Having

studied first at Strasburg, and attended a course of law under

Cujacrus, he entered into the service of the king of Navarre,

afterwards Henry IV., by whom he was employed for 30

years in various negotiations, particularly with the German

princes. Being at Rome in 1585, he wrote a severe reply to

the violent bull fulminated by Pope Sixtus V. against

Henry IV.; and he also published a spirited answer to a German

piece, imputing the bad success of the joint expedition in

1587, to the misconduct of the French. He was distin-
guished by his knowledge of books, and had collected a

large library, a great part of which was at length annexed
to the public library of Bors. As a critic he became known by a valuable edition of "Juvenis," Paris, 1581, 8vo. He
also edited a collection of the Hungarian writers, and the
"Gesta Del per Francos." But his reputation was prin-
cipally owing to his Latin letters, written during his nego-
tiations, and published after his death, at Leyden, in 1674, and

afterwards translated into French. The style is clear,

cautious, and polished, and they seem to have been dictated by

an honest heart. A collection of his French letters, "Le

Secretaire fans fard," has also been published. Although

a Calvinist, Bongars disapproved of the religious wars of

BONGO, or Bungo, in Geography, one of the islands

of Japan. The principal town, seated on the coast side of

the island, is called by the same name. This is a port op-

posite to Tonfa, and separated from it only by a narrow

channel. N. lat. 32° 41'. E. long. 131° 57'.

Bongo Palu, in Botany, Pito, See Mystisca aromatica.

Bonhampton, in Geography, a town of America,
in Middlesex county, and state of New Jersey; about 6
miles N.E. from New Brunswick.

BONI, a kingdom of the island of Celebes, which lies
on the western side of a bay, called on that account the bay
of Boni, is the second kingdom, in point of importance, in
the island. Its extent from the river Chiarmo to the river
Salimico is about 20 leagues; and within land it is bordered
upon Saping, Lamore, Macaffer, and Boshooche. In

ancient times this kingdom was independent of, and uncon-

nected with any other. It is still in close alliance with the
two small kingdoms of Saping and Looboe, or Looboe. The
natives of Boni, that they may not appear inferior to the
Macaffers, declare their origin in like manner from the
gods. The first king they lay, descended from heaven, and was

known by the name of "Matuu Salompo," that is, the

all-seeing. This sovereign, their first monarch, inflated the
laws of the country, which are still observed; made the
royal standard, called "Worong Porong," and appointed
seven electors, under the denomination of "Matuu potees."

The prince or sovereign is called "pajong," and he is elected
for life by seven nobles, which number is kept up by the
pajong, and they are appointed by him from certain free-

holders. The pajong is often restrained by a sort of par-

timent, elected by the freedholders; it consists of 400

members, 200 of which are called "matun," 100 are called
"pajong," and 100 are called "galangan." The first

sovereign, after reigning 50 years, resigned the kingdom to

his son, and, with his wife, ascended again to heaven; and

from him all the succeeding kings of Boni are descended

none others, besides his posterity, born of marriages with

royal princes, being entitled to the crown. Notwith-

standing the common deception of the rulers of Boni and Ma-
caffer from the gods, these two nations are arrowed enemies.

About the beginning of the 17th century the Bouguine,
or people of Boni, and their queen, were compelled to con-

form to the mahometan religion; and the condition imposed upon

them was, that the enemies of Macaffer should likewise be the

enemies of Boni, but not the enemies of Boni themselves.

At this time Boni was able to bring 70,000 fighting men

into the field. The hatred which was thus excited among the

Bouguine against the Macaffers, and their incessant quar-

rels, enabled the Dutch, who, as their interest required,

favoured sometimes the one party, and sometimes the other,

to make themselves masters of the island. The princes of

Boni, Saping, &c. united themselves to the Dutch by the

Boni contract, which was concluded November 18th, 1667;

and to this the Macaffers were afterwards compelled to

accede. At present the Bouguine are the most powerful, as

the Macaffers were about a century ago.

The Bouguine, or Buggefes as they are usually called by

the English, are of a middle size, and have a brown, but not
dark, complexion. Among the female sex in particular,
some are found almost entirely fair. Their features in gen-

eral are agreeable, only that their nose is a little flattened.

They are as open and more treacherous in their dispositions

than the Macaffers; and never attack their enemies openly,

but endeavour to fall upon them by surprise. Those who

never did them an injury are not feart from being murdered

by them, when they can do it with secrecy; and they often

commit such actions for no other reason, as the wish to

try the goodness of their knives, or daggers. Many Ma-
caffers, as well as Europeans, have fallen sacrifice to this

thirst for blood. Their daggers and affagays are com-

monly poisoned, as well as their small darts, which they can

flint at their enemies to a considerable distance by blowing

them through a tube. Their clothing consists of a piece of red

or blue cotton cloth wrapped round the body, and drawn

between
between the legs. The upper part of the body is quite naked. On the head they wear a piece of cotton cloth in the form of a handkerchief, with which they cover their hair, which is as black as pitch, and very long. On the other parts of the body, neither the men nor women suffer any hair to grow; they pull it out by the roots, in the same manner as the Mahometans and Indians do, as soon as it appears. The food is chiefly rice, fish, and piainguas; and their beverage is water, though they are not deftive of "faqueroc, or palm wine. The Bonginefe women are in general much handsomer than those of the other Indian tribes; some of them, if their complexion had the same mixture of red and white as our females, would be accounted beauties in Europe. They are naturally of an amorous disposition, and are capable of undertaking any thing to gratify their inclinations. The Bonginefe, who have in general adopted the mahometan religion, may have four wives, provided the husband can maintain them; but if they are not satisfied with each other, they may separate with as little trouble as they were united. They are a high spirited people, fond of adventures and emigration, and capable of undertaking the most dangerous enterprises. The appellation "Bonguefe," has become, among Europeans in the east of India, synonymous with soldier, just as feapoy is in the west. The people of Celebes are very industrious, and they are very adventurous merchants; and the Bonguefe, in particular, often find their way to the spice islands, in spite of the vigilance of the Dutch. They write their language from left to right, in a character peculiar to themselves; on the sea-coast they universally speak the Malay tongue, and have many Malay phrases in their own language.

There are frequent earthquakes in the neighborhood, and the body is wrapped up in a piece of white cotton cloth, and deposited in the grave, over which some sweet scented flowers are strewn, and two fones are erected, one at the head and another at the feet. Stavorinus's Voyage to the East Indies, vol. ii.

**Boni**, bay of; a bay in the kingdom of Boni, in the southern part of the island of Celebes. It is called Sewa by the natives, and Bugguefs, or long bay, by the English. Of this bay we have the following account by Captain Forrest. Having paddled the lraft between Celebes and Suleyer, called the "Budgeeroons," keep on in a direction N.E. by N. about 130 miles, and you will find, near the west coast of the Sewa, a small island called "Balooonoo," visible 8 or 10 leagues off, and having some rocky iflets at its east end. Farther on, about a day's sail, or about 60 miles, is the mouth of the river Chimana, which takes its rise in the Warjoo country, the capital of which is Tolorro, lying a day's journey by water from the mouth of the river; it afterwards passes through Boni; it has a good muddy bar, passable by large frigates, and is navigable a good way up; it has several mouths, and on its banks are many towns, which carry on a great trade in gold, rice, fago, caffia, tortofehell, pearls, &c. The anchorage is good off the river's mouth. Half a day's sail farther north, along the west coast of the Sewa, is the river Poonekee, which is not very considerable. Farther on are two places called Akoligan and Telludopin, which are pretty well inhabited. Continuing still north, you come to the river Sewa, not very considerable; then to the river Loo, famous for boat-building; then you come to Mankskoo, where gold are plentiful of fago, very cheap, and also caffia and feed-pearl. Being now come to the bottom of "Bugguefs bay," the fago-tree abounds very much; and in many parts of the Sewa, there are spots of foul ground, on which they fish for swallow, which they generally carry to Macaofer, to sell to the China junk. On the east side of the Sewa the country is not so well inhabited as on the west side. The fourth-east point of the Sewa is called "Pajugan;" where is a cluster of islands, rather small, among which is good anchorage. Stavorinus's Voyage, vol. ii. p. 213.

**Boneux**, a town of France, in the department of the Vauches, and chief place of a canton, in the district of the Apt. The place contains 2,550, and the canton 67,786 inhabitants; the territory comprehends 150,000 square meters, and 6 communes; 8 leagues E. of Avignon.

**Bonacci**, in Biography. There are nine popes of this name. Boniface I. succeeded Zolimius in the year 418; and when the felurn, occasioned by a part of his subjects, terminated, he was fully established in possession of the papal see in 419. Before his election he was a prebendar of irreproachable character, and after his advancement he was a lover of peace; and though he maintained what he called the just rights of the Roman see, in the jurisdiction which his predecessor had exercised over the bishops of Illyricum, he made no attempt to extend his authority and claims. He revoked the privileges granted by Zolimius to the see of Arles, and restored them to the sees of Narbonne and Vienne, which had been unjustly deprived of them; and with a moderation which redounds much to his honour, he refused to interfere in a dispute which took place between the clergy of Valence and Maximus, their bishop. He died at a very advanced age, November 4, 422; was canonized as a saint in the church of Rome; and his festival was kept on the 25th of October. Bede gives credit to the relation of miracles wrought by this pope, and Baronius (ad ann. 423) says, that he relieved Rome in the time of a famine.

**Boniface II.**, a Roman by birth, and a Goth by descent, supplied the vacancy occasioned by the death of Felix III. in 520; and upon the death of a competitor, named Dioecorus, obtained quiet possession of the papal chair. This pope confirmed the decrees of some Gallican bishops, who condemned the femipelagian doctrine; and in 531 he proposed to alter the mode of electing a pope, and to assume the prerogative of appointing his successor. He obtained a decree for this purpose, and actually nominated a deacon, whose name was Viglius. But at a second council the Roman senate, in concurrence with the bishops and clergy, obliged the pope to revoke his former decree, and to acknowledge himself guilty of high treason. Boniface died in October, 532.

**Boniface III.**, a native of Rome, succeeded Sabianus, after a vacancy of almost a year, in 607; and having ingratiated himself with the emperor Phocas, to whom he was deputed as a nuncio by pope Gregory, in 603, he obtained from this tyrant the title of "universal bishop," and "head of the church," which was taken from the bishop of Constantinople, and transferred to Boniface and his successors in the see of Rome. Thus, says Bover, was the power of the pope, as universal bishop and head of the church, or in other words, the papal "supremacy," first introduced. It owed its original to the work of men; it was procured by the bafest means, or by flattering a tyrant in his wickedness and tyranny; and according to the previously declared judgment of Gregory the great, it was in itself "anti-christian, rhetirical, blasphematic, and diabolical." Boniface afterwards assembled a council for settling the election of bishops, in which they were forbidden to nominate their own successors, and the content of the people, clergy, and sovereigns, and the confirmation of the pope, were made necessary. Boniface died in November 607.

**Boniface IV.**, a native of Valeria, in the country of the Mark,
BONIFACE.

Marl, was elected to the papal see in August 6:8; and having obtained from Phocas the grant of the pantheon, converted it into a church, dedicating it to the Mother of God and the Christian Martyrs. He held a council at Rome to settle some affairs of the English church, at which Mellitus, the first bishop of London, is said, by Bede, to have attended; but the acts of this council, and some pieces ascribed to Boniface, are thought to be spurious. He died in 615, and was sanctified.

Boniface V., a native of Campania, and a prebend of the Roman church, succeeded Deudedit in December 619. In 624 he sent the nuncius, the successor of Mellitus in the see of Canterbury, and interested himself in the propagation of Christianity in Britain, by sending letters and presents to Edwin the king of Northumberland, and also to his queen Edelberga, sister of Eadbald king of Kent, who having assumed the Christian profession, was allowed by her marriage articles the free exercise of it. He died in October 625. Some decretal epistles, relating to matters of small importance, are ascribed to him. According to Mósthein (Ecc. Hist. vol. ii. p. 185), this Boniface enacted that infamous law, by which the churches became places of refuge to all who fled thither for protection; a law which procured a fort of impunity to the most enormous crimes, and gave a loose rein to the licentiousness of the most abandoned prelates.

Boniface VI., was a Roman of infamous character, and succeeded Formosus in 856. Baronius (ad ann. 897) will not allow him a place among the popes. He died soon after his election.

Boniface VII., denounced "Anti-pope," was a deacon of the Roman church, of the name of France, and advanced to the papal chair in 975, upon the death of Benedict VI. to whose murder he is said to have contributed. Soon after his election he was constrained by an adverse party to leave Rome and to fly to Conflantinople; but he carried with him the treasures of St. Peter. Gerbert styles him "of all monarchs of wickedness the most wicked." Upon the death of the emperor Otho II. in 984, he returned to Rome, and occupied the see in the room of John XIV. whom he displaced, imprisoned, and put to death. Franco died in 985; and he had rendered himself odious by his tyrannical conduct, that his corpse was treated with the utmost indignity, and dragged naked through the streets.

Boniface VIII., a native of Anagni, and a descendent of the noble family of Cajetani, was employed by popes Martin IV. and Nicholas IV. in several important legations, and succeeded pope Celestine V., whom he artfully prevailed to resign, in December 1294. The beginning of the following year he was enthroned at Rome with great solemnity and parade; in the procession from St. Peter's, where he was consecrated and crowned, to the Lateran, for the purpose of being enthroned, he was mounted on a white horse, richly caparisoned, with the crown on his head, whilst the king of Apulia held the bridle in his right hand, and the king of Hungary in the left, both on foot. His subsequent conduct corresponded to the haughty grandeur of his installation. In order to secure himself against any future trouble from Celestine, he confined him in prison at Anagni, where he died. Failing to mediate a peace between James king of Aragon, and Charles II. king of Sicily, he formed an alliance against Frederic of Aragon, whom the Sicilians had made their king, and proceeded to excommuniucate him and all his adherents; but he was at length obliged to confirm him in his dominions. His next measure was that of humbling the family of Colonna, two cardinals of which had opposed his election; for this purpose, after having declared the whole family infamous by a public decree, confiscating their estates, and excommunicating all who countenanced or protected them, he ordered a crusade to be preached against them and their friends, demolished their houses and castles, and obliged them to seek shelter in foreign countries; and he moreover punished with utter demilitization the city of Prezelle, for its attachment to them. To Boniface is commonly ascribed the institution of the jubilee in 1300. See JUBILEE. In his attempts to mediate a peace between Philip the Fair, king of France, and Edward I. king of England, he was charged with partiality to the latter, so that Philip could be prevailed on merely to agree upon a truce; and his enmity against Boniface, which was fomented for some time, at length broke out into a flame. Philip, with a view of supporting the war against England, prohibited the exportation of any gold or silver from the kingdom without his permission; and Boniface, apprized that this order was levelled against the see of Rome, invaded a bull, forbidding ecclesiastical princes to exact, and the clergy to pay, any sums from the ecclesiastical revenues, without his approbation. The animosity between the pope and the French potentate was increased by the arrogance with which a legate from Rome delivered the pope's message, enjoining the king of France, in common with other Christian princes, to aid the king of Tartary in a war against the Saracens, and by the subsequent arrest of the legate. Boniface, much enraged, dispatched a nuncio to demand his release; and in case of refusal, threatened to declare the kingdom devoted to the holy see, to abrogate its subjects from their allegiance, and to foment all the Gallican bishops to Rome. The king resented this violent proceeding, renewed the prohibition against carrying money out of the kingdom, and forbade his ecclesiastics on any pretence to visit Rome. In these hostile measures the king was supported by the states of the nation, which appealed to a general council, and Boniface prepared to fulminate a decree of excommunication and forfeiture of his crown against Philip. Nogaret and Sciarra Colonna were sent, on this occasion, into Italy to excite the perfecuted Chilubines against the pope, who was then at his palace in Anagni. They fearfully approached it with a body of troops, and made themselves masters of the see of Boniface and all his treasures. During the three days of his confinement the pope was treated with great indignity, particularly by Colonna. At length the people of Anagni, recovering from their confusion, rescued the pope from his captivity; who returned to Rome, where he was feized with a fever, which terminated his life in October 1303. He was buried at St. Peter's in a grand mausoleum, which he had erected for himself. Although Boniface has been justly extolled for his learning, intrepidity, and experience in public affairs, and for his patronage of literature; he was arrogant and overbearing, ambitious, crafty, and violent, and avaricious to such a degree, that he was intent upon accumulating riches to exalt the church and aggrandize his own relations. He was the author of several works, such as epistles and decrees, two discourses on the canonization of Lewis IX. of France, called St. Lewis; two famous prayers, one to our Saviour, and the other to the Virgin. He also caused to be published the sixth book of the decretals, and wrote a treatise entitled "De regulis juris."
in which were displayed on both sides much cunning and artifice, and at the same time an inflexible resolution of retaining the tiara. Boniface was arbitrary in the exercise of power, and towards the end of the year 1234 he would have been massacred by the people, if he had not been fearfully rescued from the enraged multitude by the interposition of Ladislaus, king of Naples, who happened to be then at Rome. He afterwards retired to Perugia, and from thence he removed to Afflit; but on the approach of the jubilee year, 1249, the Roman people, apprehending, that in the absence of the pope it would not be celebrated with the usual solemnity, and the pecuniary interests affected, deputed an embassy to invite his holiness to Rome. Upon his arrival he was received with joy and invoked with extraordinary powers, in the exercise of which he repaired and fortified the walls and towers of the city, and the castle of Angelo, and also placed garrisons in them, so that he made himself absolute master of the city. Some ascribe to Boniface the institution of Annates (See Annates); but though the origin of these is of more ancient date, he is allowed to have been in a very high degree avaricious and rapacious, to have sold church prelomates to the bidder, without regard to merit or learning, and to have made it his constant study to enrich his family and relations. He died of a paroxysm of the stone in 1244. Bower's Hist. of the Popes.

Boniface, called the "Apostle of the Germans," was a native of England, whose original name was "Winifred," born in Devonshire, A.D. 670, and was educated in a Benedictine monastery at Exeter. This famous ecclesiastic, who was ordained a priest A.D. 700, with two companions, sailed over into Friesland in 723, in order to preach the gospel among the heathens; but failing in his first attempt, on account of a war which broke out between Radbod, the king of that country, and Charles Martel, he returned to England. However, he returned his pious undertaking in 718; and at Rome he was solemnly empowered by the Roman pontiff, Gregory II., to preach the gospel not only in Friesland, but throughout Germany; which commission he executed with considerable success. In the year 723, he was consecrated bishop by Gregory II., who changed his name of Winifred into that of Boniface; and he is said to have been the first who took a solemn oath of obedience to the pope, which he did at this time. Upon his return to Germany, with the instructions of the pope, and the peculiar protection of Charles Martel, he preached in Thuringia, Hessia, and Bavaria, and erected a great number of Christian churches. As these were too numerous to be governed by one bishop, this prelate was advanced to the dignity of archbishop, in 732, by Gregory III., under whose authority, and the auspicious protection of Carolman and Pepin, the sons of Charles Martel, he founded in Germany the bishopric of Worms, Bamberg, Erfurt, and Aichlaft; to which he added, in 744, the famous monastery of Fulda. His laud promotion, and the lait recompense of his affiduous labours in the propagation of the truth, was his advancement to the archiepiscopal see of Mentz, A.D. 746, by pope Zachary, by whom he was at the same time created prince of Germany and Belgium. In his old age he returned again to Friesland, that he might finish his ministry in the scene of his commencement; but his piety and zeal were rewarded by that barbarous and treacherous murder, by whom he was murdered in 754, together with fifty ecclesiastics who accompanied him, and who shared the same fate. He was interred in the abbey of Fulda, and canonized by the church of Rome, to which he was ardently devoted. His zeal for the glory and authority of the Roman pontiff equalled, if it did not surpass, his solicitude for the service of Christ, and the propagation of his religion; and in combating the heathen superstitions, he recurred to other weapons than those which Christianity recommended, employing violence and terror, and sometimes artifice and fraud, in order to multiply the number of Christians. His epistles, and those of his coadjutors, first published with notes by Serrarius, in 1625, and republished in 1629, are written in a barbarous style, and discover an impious arrogant temper, a cunning and insidious turn of mind, an exulting zeal for increasing the honours and pretensions of the secular order, and a profound ignorance of many things, the knowledge of which was indispensably necessary in an apostle, and particularly of the true nature and genius of the Christian Religion. The Benedictines have published his statutes, and some of his sermons. Bower's Hist. of the Popes, vol. iii. Mofheim's Eccl. Hist. vol. ii. p. 205, &c. Cave's Hist. Lit. t. l. p. 622. Dupin, Eccl. Hist. cont. 8.

Boniface, count of the Roman empire, one of the two being other (see Aetius), who have been severally named as the last of the Romans; was the intimate friend of St. Augustine, bishop of Hippo, but incurred his displeasure by marrying a wife of the Arian sect, after a solemn vow of chastity, and a resolution of retiring from the world, and by some other inculcations of licentious conduct with which he was charged. However the people applauded his spottles integrity and the army dreaded his impartial and inexorable justice. Of his justice, the following singular fact is recorded. A peasant, who complained of the criminal intimacy between his wife and a Gothic foal, was directed to attend the tribunal the following day; in the evening, the count, who had diligently informed himself of the time and place of the afflication, mounted his horse, rode ten miles into the country, surprised the guilty couple, punished the foal, with instant death, and silenced the complaints of the husband by presenting him, next morning, with the head of the adulterer. Boniface, having defended Marselles, when attacked by Ataulphus, was rewarded by the emperor Honorius with the command of the troops in Africa, which province he refused from the repeated attempts of John, who usurped the empire. Placidus, who coveted the government of the empire during the minority of her son, highly pleased with his bravery and loyalty, called him to court upon the death of that usurper, preferred him to the post of "comes domesticorum," and sent him into Africa with unlimited power. These marks of favour excited the jealousy of Aetius (see Aetius), who artfully contrived, under the mask of friendship, to engage Boniface in a revolt, which took place in 427. Accordingly, Placidus declared him a public enemy, and sent troops against him. Having defended himself for some time, he found at length that he was likely to be overpowered; and therefore, after some hesitation, the last struggle of prowess and loyalty, he dispersed a truly friendly to the camp of Gonderic, king of the Vandals, with the proposal of a truce alliance, and the offer of an advantageous and perpetual settlement. The Vandals accepted the proposal, and Genericus, who succeeded his brother, and whose ambition had neither bounds nor cepules, transported his troops from Spain into Africa in 429, and obtained, by the concurrence of several favourable circumstances, an easy conquest. Placidus discovered, when it was too late, the artifice that had been practised by Aetius; and Boniface, who also perceived and lamented his error, returned to his allegiance. But his efforts to recover Africa were unavailing; and he was under a necessity of abandoning the country, and of returning to Ravenna, where
where he was kindly received by Placidia, and advanced to the rank of patrician, and the dignity of maior-general of the Roman armies. The haughty and perfidious soul of Actius was exasperated by the honourable mode of his reception, and he hardened in return from Gaul to Italy, with an army of Barbarian followers, and to decide his quarrel with Boniface in a bloody battle. Boniface was successful; but in the conflict he received a wound from the spear of his adversary, of which he expired within a few days, A.D. 433. Before his death he is said to have testified his forgiveness of Actius's treacherous conduct, to such a degree, as to exhort his wife, a rich heiress of Spain, to accept him for her second husband. Anc. Us. Hist. vol. xiv. Gibbon's Hist. &c. vol. vi.

Boniface, Natalis, an engraver of great merit, who flourished in Italy, towards the conclusion of the 16th century. His works are chiefly etchings, performed in a fine style; and his small figures he executed with great spirit. His chief work was the plates composed by D. Fontana, architect to pope Sixtus V. concerning the removal of the Vatican obelisks. Strutt.

Bonifacio, in Botany (J. Bauhin). See Rhuscus racemosus.

Bonifacio, or Bonfacio, in Geography, a seaport town of the island of Corsica, department of Limeudone, and chief place of a canton, in the district of Sartene, on the south coast, and in the rift between the islands of Sardinia and Corsica. The town is small and fortified, and the canton contains 3,172 inhabitants; 28 leagues south of Lautia. N. lat. 41° 24′. E. long. 9° 2′.

Bonifacio Point. See Baldovia.

Bonifacio Strait, commences near the town of the same name, on the S. E. of the island of Corsica; and its length to point Tico, the most northerly point of Sardinia, is 23 leagues.

Bonning, in Surveying and Levelling, &c. is the placing of three or more rods or poles, all of the same length, in or upon the ground, in such a manner, that the tops of them all may be in one continued straight line, whether it be horizontal or inclined, so that the eye may look along the tops of them all, from one end of the line to the other.

Bonjour, William, in Biography, a learned Augustinian, was born at Toulouse in 1670; and at Rome, whether he was sent for by cardinal Norris in 1693, he became distingued by his learning and piety. He was employed by pope Clement XI. in several matters of importance, and particularly in the examination of the Gregorian calendar. Bonjour had also the superintendence of the seminary established by cardinal Barbingh at Montefalco, and nominated the Academy of Sacred Letters. He was acquainted with almost all the oriental tongues, and more especially with the Coptic, or ancient Egyptian. Aflinated by a zeal for acquiring knowledge, and for propagating the gospel, he visited China, where he died in 1714, whilst he was employed in forming a map of that empire. His works are, "Select Dissertations on the Scriptures!" "An Account of the Coptic MSS. in the Vatican;" "A Coptic Grammar;" and "A Roman Calendar." Moreri.

Bonis arrestandi ne dissipetur. See Arrestandi.

Bonis non amph_sp. a writ directed to the sheriffs of London, &c. where a writ of error is brought, to charge them that the person against whom judgment is obtained be not suffered to remove his goods, till the error is tried and determined.

Bonis, terris, et catalis robabundia post fugationem. See Terris.

Arresto stato super Bonis mercatorum. See Arresto.

Bonito, in Ichthyology, synonymous with the French bonite. This appears to be a name alluded indifferently to more than one or two kinds of fishes, although it seems to be confined in form: degree to those of the Scophenius genus.

The bonite pelvis of Locell, is the fish mentioned under the name of bonito by Olbeck, who also calls it boniter pellicer. The bonito is vaguely described as a large sea-fish, with a long, broad, and thick body; eyes, and likewise the gills, large; and the greater part of the body free from scales. It is observed still further to be a fish of great beauty, and very common in some seas; our East India ships usually falling is with immense shoals of them. It is impossible to say whether this may be the boniter pelvis, or not; but as a matter of opinion, we think it to be the same, because the latter is found in immense shoals between the tropics, and in the Atlantic ocean. The bonito of Black (le bonite de Black) bears the Latin name of boniter pellicer.

Bonifacius, the common French name of Scombro amia of Linnaeus.

Bonizo, in Geography, a town of Italy, in the duchy of Mantua, on the south side of the Po, opposite to Olgina.

Bonkose, in Ichthyology, the Scilena arborifera, a fish discovered by Forith in the Red sea. Bonkose is the name it bears in Arabia.

Bonlieu, in Geography, a town of France, in the department of the Ardeche; 5 leagues N. N. W. of Touron.

Bonn, in Latin Bonum, a small but populous and fortified city of Germany, in the circle of the Lower Rhine, and electorate of Cologne, or, according to the French arrangement, the chief place of a district, in the department of the Rhine and Moselle; the place contains 8837; and the canton 18,951 inhabitants; and its number of communis is 51. The number of houses is said not to exceed a thousand; and as it has little foreign trade, most of the inhabitants are attracted thither by its being the residence of the elector of Cologne. The streets are narrow, crooked, dirty, and badly paved, and in winter badly lighted. The public walks are few, and not very agreeable. The churches are flat; and the town-hall is adorned with fine paintings. The Jews at Bonn have a house to themselves, consisting of 21 houses; and their number is estimated at 250. Bonn was taken from Louis XIV. into whole hands it was surrendered by the elector, in 1673, by William prince of Orange; in 1689, by the marquis of Brandenburgh; in 1703, by a detachment of the duke of Marlborough's army, after a siege of three weeks, and the loss on both sides of 2000 men; and on the 6th of October, 1794, by the troops of the French republic. It is situated 14 miles S. E. of Cologne, 30 E. of Aix-la-Chapelle. and 28 N. N. W. of Coblenz. N. lat. 50° 40′. E. long. 7°.

Bonna, in Zoology, synonymous with Bonasus; which see.

Bonnaghit, or Bonnagh, an old term, which occurs frequently in Irish history, and was the same with coin and ivury; being a certain proportion of meat, drink, and money for the maintenance of a soldier, and sometimes free quarter. Hollinghead speaks of it as an Irish imposition, which beggared the farmers; and Sir John Davis, the eminent attorney-general of Ireland in the reign of James I. in his justly admired tract, entitled "A Discovery of the Caules, why Ireland was never subdued," has these words: "But the most wicked and mischiefous custom of all others, was that of coin and ivury, which confild in taking of man's meat, horse meat, and money, of all the inhabitants of.
of the country, at the will and pleasure of the soldier, who, as the phrase of the Scripture is, did eat up the people, as it were bread, for that he had no other entertainment. This extortion was originally Irish, for they used to lay bonnights upon their people, and never gave their soldiers any other pay. But when the English had learned it, they used it with more inefence, and made it more intolerable; for this oppression was not temporary, nor limited either to place or time, but because there was everywhere a continual war, either offensive or defensive, and every lord of a country, and every marcher, made war and peace at his pleasure, it became universal and perpetual, and was indeed the most heavy oppression that ever was used in any Christian or Heathen kingdom." The curious reader will do well to consult the whole passage in Sir J. Davis's Historical Tracts, p. 132, et seq. of the edition printed in 8vo. Dublin, 1757. This practice was forbidden by the statute of Kilkenny passed in 1450, and by several succeeding acts, in one of which (under Henry VII.) it is called a damaunble eflau, Spencer, in his "View of the State of Ireland," seems, however, to think the statute unnecessarily severe in making it treason. Hollinghead, Irish Statutes. Spencer's State of Ireland.

BONNART, JOHN, in Biography, barber-surgeon, and master of the college of Surgeons at Paris, published, in 1629, "La Semaine des medecins observée, et chefs d'oeuvres des maistres barbiers chirurgiens de Paris," 8vo. It contains a course of study necessary for young men previous to their being elected into the college, with observations on the method of treating such complaints as come under their care. The author strongly recommends opening the jugular vein in cases of quinsey. "Methode pour bien feigner les accideus qui arrive pour etre mal fait," 8vo. 1628. Haller Bib. Med. Eloy.

BONNAT, in Geography, a town of France, and chief place of a canton, in the department of the Creuse, and district of Gueret; the place contains 2032, and the canton 16,824 inhabitants; the territory comprehends 2575 kilometres, and 12 communes.

BONNAD, in Biography, published, in 1770, "Degradation de l'epice humaine par l'ulige des corps de baleine," 12mo. Paris. In this very sensible and ingenious little work, the author forcibly represents the various evils consequent on using oils distilled with whale-bone: these are indigestion, and other disorders of the stomach, ruptures, and difficult respiration, often terminating in consumptions; besides, they are unfrequently occasion deformity of the body, which they are supposed by their admirers to contribute in preserving. Haller Bib. Med.

BONNAY, in Geography, a town of France, in the department of the Doubs, and chief place of a canton, in the district of Besançon, 2 leagues N. of Besançon.

BONNE, a town of Savoy, in the Lower Faunegny, 10 miles E. S. E. of Geneva. N. lat. 46° 11'. E. long. 6° 7'.

BONNE, a bay on the west coast of Newfoundland. N. lat. 49° 35'. W. long. 53°. - Also, a bay on the coast of Spain in the Mediterranean, nearly east from Malaga. N. lat. 36° 42'. W. long. 2° 40'.

BONEBOSQ, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Pont-l'Evêque, 2 leagues S. W. of Pont-l'Evêque.

BONNEFONS, JOHN, or BONNEFONIUS, in Biography, was born, in 1544, at Clermont in Auvergne, became an advocate in Paris, and, in 1584, lieutenant-general at Barfurl-Seine, and died in 1614. He was distinguished as a Latin poet, and particularly by that kind of poetry, which is the short verse of Catullus, abounding with diminutives and tender expressions. Of this kind is the piece entitled "Pancharhis," which is reckoned the most elegant performance of any modern writer. It seems to have been the aim of Bonnefons to imitate Johannes Secundus, the celebrated author of the Bafs; and his resemblance, with regard to hislsues and sweetness, has approached the extreme of fictitiousness and effeminacy. His poems in heroic verse have also been esteemed. The Pancharhis was published at Paris in 1588, and translated into French by La Bergerie; and all the poems of Bonnefons are printed after those of Bocc, in Burbon's edition of the latter, Paris, 1577. There are London editions in 1620 and 1727. A son of Bonnefons distinguished himself by Latin poetry, chiefly written on public characters and events. Novi. Dict. Hist.

BONNER, EDMUND, an English prelate of detectable memory as a percursor of Protessants, was born, as it is generally believed, of poor parents at Hanley, in Worcestershire; but some have affirmed that he was the natural son of George Savage, rector of Davenham, in Cheshire. About the year 1512, he was admitted a student of Broadgate hall (now Pembroke college) in the university of Oxford, famous at that time for the education of civilians and canonists. In 1519, he took his degrees of bachelor of the canon, and bachelor of the civil law; and about the same time entered into holy orders. In 1525, he was created doctor of the canon law. More distinguished by his talents for business than for his learning, he was appointed commissary of the faculties by cardinal Wolsey, who conferred upon him a plurality of ecclesiastical benefices. After the cardinal's death, he continued to intrigue himself into the favour of king Henry VIII., and became a zealous promoter of the reformation, as well as an advocate for the king's divorce from Queen Catharine, and a frequent supporter of the causes that were adopted for abolishing the pope's supremacy in this kingdom. He was also patronized by Cromwell, secretary of state, and employed as ambassador at several courts. In 1532, he was deputed on an embassy to Rome, to secure the king's appearance to a citation at that court; and in 1538, he was sent to pope Clement VII., then at Marceilles, to deliver the king's appeal from the pope to the next general council against his excommunication; and on this occasion he exposed himself by his boldness and indomitable warmth to personal danger. He was likewise employed in other embassies to the kings of Denmark and France, and to the emperor of Germany. Being recalled from France in 1538, on account of the boldness with which he remonstrated against the protection afforded to an English traitor, he was nominated to the bishopric of Hereford, and, before his consecration, translated to the see of London in 1539. At the time of the king's death in 1547, he was ambassador at the court of Charles V. Till this time he appears to have concurred in promoting the reformation; and by the subversion of his principles to his interest, as well as by his capacity for public business, he secured the favour and confidence of his tyrannical master. But from his subsequent conduct it is evident that he was secretly attached to the Roman religion; for soon after the accession of Edward VI., he ventured to take the oath that was required for renouncing the pope's authority; and he protected against the king's injunctions and humilies, which, however, he had never read. But being committed to prison for disobedience, he afterwards recanted, and was released. Whilst he outwardly professed zeal for the reformation, he privately used all the means in his power for obstructing its progress and establishment. His conduct warranted the suspicions that were entertained of his sincerity; and in order to bring it to a test, he
he was ordered by the privy council to preach at St. Paul's
crofs on certain articles; connected with the principles of
the reformation; and given to him in writing. But he per-
formed this service in a manner so unsatisfactorily, that, upon
the complaints of Hooper and Latham, commissioners were
appointed to proceed sumamrly against him; the result of
which was, that he was committed to prison, and deprived
of his bisholpice. These proceedings, allowed even by his
enemies to be arbitrary and severe, roused his resentment;
nor was he long obliged to wait for an opportunity of ample
recantation. Upon the accesion of Mary to the throne, he
was restored to his bisholpice, by a commission dated August
1553; and in the convocation of the following year, he was
appointed presnt in the room of Cranmer, who was com-
titted to the tower. In this year he visited his diocese,
and industriously rooted up all the seeds of the reformation.
In the four succeeding years he was an active and savage per-
fector; and he is said to have committed to the flames
200 persons, who avowed their firm adherence to the
protestant religion; and who refused to embrace the gross errors
of popery, besides imprisoning and torturing many more.
Bonner's detraction was in the highest degree cruel and
ferocious; and religious bigotry, grafted on a temper natu-
ral savagely, rendered him a fit instrument to be employed by
the artful Gardiner in the condemnation and execution of
heretics. But though his nature did not seem to recoil at
this savage employment, he dreaded the incensed odium that attended it, and refuld any longer to be the executioner
of the laws. However, in 1556, he concurred in the
degradation of Cranmer, and enjoyed the malignant pleasure
of triumphing over him with his usual incoherence. In the
following year his name was infected in a kind of inquisitorial
commission for searching after, and punishing all heretics, as
all persons who were of the protestant religion were then
denominated. Upon the accession of Elizabeth, he had
the onerous and difficult task to accompany the other bishops in their progress for meeting her at Highland; but he looked upon him
with feelings of just indignation and horror, as a man pol-
luted with blood. He remained for some months un-
 molested; but in May 1559, he was summoned before the
privy council; and refusing to take the oaths of allegiance
and supremacy that were tendered to him, he was deprived
of his bisholpice, and committed to prison. In this state of
imprisonment he remained for some years, bearing his reverse
with condition with a degree of cheerfulness which might have
become a better man, and occasionally warding off, by keen
and humourous repartees, the popular insults that were offered
him. He died in prison, September 5, 1560; and was
buried at midnight in St. George's church-yard, Southwark,
lest any indignities should be offered to his remains by the
incensed populace. Bonner was singularly savage in his
natural temper, blustering and profane in his conversation
and manners, furious and violent in his conduct, grofs and
corrupt in his person, and in every respect fitted for the
part he acted, as an uncultivated and brutal persecutor.
Hewas generally regarded as the true of any fixed principles;
and he has been charged even with Arianism. As a canonist
and politician he was allowed to excel; but his knowledge
of divinity was very imperfect, and he had no reputation for
learning. However, several pieces, theological, controver-
sial, and pastoral, were published under his name. By his
interest with queen Mary, he obtained several advantages for
the see of London, which his successors have enjoyed. Biog.
Bnt.

BONNET, Charles, an eminent natural philosopher,
was born at Geneva in 1720, and educated under a domestic
tutor, whom his father provided for him, as attending lice-
rior advantages to those which he enjoyed in any of the public
schools. At the early age of 16, he discovered that pecu-
liar inclination of his mind, which led him to those studies
that laid the foundation of his future fame and excellence.
From the perusal of the Spectacle de la Nature, he was in-
duced to direct his particular attention to the structure and
manners of the ant-hill, and added many curious observa-
tions relating to it, to the facts that had been previously
collected by Meff. Poupart and Reaumur; and he was fur-
ther led by the Memoirs on Insects, published by the latter,
to repeat many of his experiments, to discover new
facts, which indicated in a youth of 18, a degree of sagacity
and research that surpassed and gratified this eminent
naturalist, by whom he was encouraged to proceed. The
interesting observations which he made on different species
of caterpillars, and other insects, in the years 1738 and 1739,
were communicated by him to Reaumur. His father had
defined him to the profession of the law; but the study of
natural history was his chosen and favourite employment.
Having, in 1740, decided a question that had been left un-
settled by Reaumur, respecting the multiplication of cree-
se, or aphides, without actual conjunction, he communi-
cated a paper on this subject to the Academy of Sciences
at Paris, and in consequence of it, he had the honour of be-
coming a correspondent of that illustrious body. His eye-
fight was irremediably injured by the minuteness of his re-
searches on the generation of these animals. In 1741, he
found that many species of worms poiffed, in a degree, the
reproductive power of the pupae; and in 1742, he dis-
covered that the respiration of caterpillars and butter-
flies, was effected by means of their pores called "Sigmata."
The tarantula, or tape-worm, was also a subject of his succes-
sful investigation. In 1743, he was advanced to the rank of
doctor of laws, and on this occasion he totally abandoned
the profession of the law. A paper on insects, which was
this year communicated to the Royal Society of London, ob-
tained for him the honour of being elected a member. His ob-
servations on aphides and worms, under the title of " Insecto-
yology," were published in 1744; and this work was intro-
duced with a preface, in which he gave a brief sketch of his
ideas concerning the development of germs, and the scale
of organized beings. This work was very favourably received
by the public; but such had been the nature of his re-
sarches and the affinity of his application, that his eyes
and his health failed him; and he was reduced to the dis-
tressing necessity of laying aside his microscope, and of
deferring from reading and writing. This self-denial, pecu-
liarily afflicting to his ardent mind, he bore; however, with
philosophical resignation; and by a total intermission of his
studies he had the satisfaction of regaining a considerable
degree of health and ease. Though he was never able to em-
ploy his eyes as he had been accustomed to do. In 1746,
he commenced a course of experiments on the vegetation
or plants in mofs and other singular substances; and in the
following year he examined with minute attention the leaves
of plants, with a view of ascertaining the appropriate action
of their upper and under surfaces. He also employed
coloured injections for the purpose of determining whether
the sap ascends by the bark or wood; and he made various
observations on vegetable monsters, and other circumstances
of vegetation, which were communicated to the public in
one of the most curious and original of his works, entitled,
"Inquiries into the use of the leaves of plants," first pub-
lished at Leyden, in 1754, 4to.; to which supplements
have been added as late as the year 1779.

Bonnet, probably constrained to remit his attention to ex-
periments by the circumstances already mentioned, directed
5 E his
his speculative researches to the faculties of the human mind; and having collected a mass of materials on this subject, he published a kind of abridgment of them, under the title of an "Essay on Physiology," in 1755, at London. This work, which appeared without his name, and which he did not acknowledge for 39 years, contains a concise statement of the fundamental principles of his philosophy; "it traces the origin and progress of the human mind, from the first germ of life, to the development of all its faculties, the mutual dependence of which it points out, as deduced from actual observation. It enters into the difficult subject of human liberty, and endeavours to reconcile it with the divine preference, and with the philosophical principle, that every effect must have an adequate cause. From the essential properties of the activity of the soul, and the effects of habit upon it, the whole art of education and government is deduced; and a system of the former is laid down, materially different from the usually established methods."

Our author's metaphysical ideas were evidently founded on the principles of Malebranche and Leibnitz; but as he had freely discussed some points of a delicate nature, and which were likely to involve him in personal controversy, he chose to conceal his name. His next work, the fruit of five years' labour, was an "Analytical Essay on the faculties of the Soul," first printed at Copenhagen in 1760, 4to, at the expense of the king of Denmark. In this work he assumes the hypothesis of a nature organized like the human body, which he animates by degree, and shows how its ideas would arise from impressions on the organs of sense. Although this performance was well received by some philosophers, it soon subjected the author to the charge of materialism and fatalism; but to this charge he made no reply. Accustomed to retirement, to which mode of life he was obliged to recur, on account of his deafness and other bodily infirmities, he sought the comforts of a domestic life; and in 1759, he married a lady of respectable family, the aunt of the celebrated Sauffre, with whom he passed 37 years of communal felicity. In the prosecution of his physical system, Bonnet published at Amsterdam in 1762, his "Confessions on organized bodies," 2 vols. 8vo. The principal objects of this work were, to detail, in an abridged form, all the most interesting and well-afterd facts, respecting the origin, development, and reproduction of organized bodies; to refute the different systems founded upon "epigenesis;" and to explain and defend the theory of germs. His "Contemplation of Nature," which appeared in 1764, Am. 2 vols. 8vo., was a popular work, displaying the principal facts relating to the different orders of created beings, in an instructive and entertaining manner, and recommended by the charms of an eloquent style, with a constant reference to final causes, and the proofs of wisdom and benevolence in the creator. This was translated into several European languages, and enriched with notes by the author himself, and other writers, in a new edition, printed at Geneva in 1769, 2 vols. 8vo. This treatise on the past and future state of living beings, and supports the idea of the revival of all animals, and the perfecting of their faculties in a future state. To this work he annexed "An inquiry into the evidences of the Christian revelation, and the doctrines of Christliamity, which, with a piece "On the existence of God," was published separately at Geneva in 1770.

Towards the year 1773, he resumed his attention to natural history, and published, in Rozier's journal, a memoir on the method of preserving insects and fish in cabinets. In the following year he sent to the same journal a memoir on the loves of plants, originating in the discovery of a kind of cleft or mouth in the pupil of a lily. Other memoirs contained a detail of his experiments on the reproduction of the heads of fossils, and of the limbs and organs of the water salamander. He also made observations on the pips or Surinam toad, on bees, on the blue colour acquired by mushrooms from exposure to the air, and on various other subjects in natural history. His reputation introduced him as an advocate into most of the literary societies of Europe; and in 1783 he was elected to the select number of foreign associates of the academy of sciences in Paris. His correspondence was extensive, and his attempts to popularize his experiments in the great council of the republic in which he entered in 1732, and in which he had a seat till 1768, he distinguished himself by his manly eloquence in the support of wife and moderate measures, and his constant zeal in the cause of morals and religion, with which, in his opinion, the prosperity of the state was essentially connected. The last 25 years of his life were spent altogether in the country, where he enjoyed, with a competence, the intercourse of chosen friends. Some part of his time was employed in the education of youth, for which office he was admirably qualified. The revival of his works occupied near eight years of his life, and required a degree of application which was injurious to his health. This collection appeared at Neuchatel, in 9 vols. 4to. or 18 vols. 8vo., and contains, besides the works already mentioned, several smaller pieces in natural history and metaphysics. They are all written in French. Towards the year 1788 he manifested alarming symptoms of a dropy in the breast; and these became more aggravated in process of time, and occasioned a variety of sufferings which he endured with patience and tranquillity, till at length he was relieved by death, May 20, 1793, at the age of 73 years. Public honours were rendered to his remains by his fellow citizens; and his funeral oration was pronounced by his illustrious friend and kinsman, M. de Sauffre. Mem. pour servir a l'Hist. de la Vie et des ouvrages de M. Charles Bonnet; Berne 1794. Gen. Bioi.

Bonnet, Jacques, published, in 1725, at Amsterdam, "Histoire de la musique," the history of music and of its effects from its origin to the present time, explaining, in what its beauty consists, 4 vols. 12mo. This history was at first undertaken by the abbé Bourdelot, uncle to the editor of this work, and distinguished by his erudition. Bonnet, brother of Bonnet, the first physician to the duchess of Burgundy, continued it after the death of his uncle, and at length arranged and digested the materials which he found among the MS. papers of his uncle and his brother. Indeed the first volume only was written by Bonnet; the three last were compiled in a patriotic fury by France, a physician, in 1758, who died in 1797, in the flower of his age, having only arrived at his 33rd year. He seems to have been wholly devoted to this undertaking by the abbé Ragnemer's parallel between the music of the Italians and the French, which, though written with the utmost circumspection and civility to France, M. Frenetze thought too favourable to Italy; and instead of a continuation of the history of music, has given us nothing but a violent philippic against the abbé Ragnemer, for daring to draw a parallel between the music of France and Italy, and a censuring of all the most illustrious Italians of the 17th century, such as Carulli, Luigi Rossoli, Scarlatti, and Corelli; and setting up Lulli against them all, has formed his refutation of the abbé into three dialogues; in which two of the interlocutors are champions for Lulli, and only one, and that a lady, neither a deep logician, nor a powerful advocate for the Italians, is the heroine that undertakes their defence. But the poor Italians have no quar-
The execution of the Italians he compares to the dexterity of the fiddler who was brought to Alexandria, to exhibit a trick which he had acquired by infinite pains and practice, of chucking a pea into a distant hole which just fitted it. When all the reward which the great conqueror bestowed upon the fiddler for his unfailing application of time was, to order him a peck of peas.

Indeed all the praise that is due to Bonnet for the first part of what he calls a history of music, is, the having collected materials towards a history of the art; but he was no musician, and equally unable to explain the theory of the ancients as the practice of the moderns; so that his work is totally devoid of taste, order, and useful information.

Bonnet, or Bonnet. Theorophus, an eminent and respectable practicing physician, and voluminous writer in medicine, of Geneva, where he was born, March 5th, 1650. Following in the steps of his father and grandfather, he early attached himself to the practice of physic. After visiting several foreign academies, he was admitted doctor in medicine at Bologna, in 1643, and was soon after made physician to the duke de Longueville. Though he soon attained to high credit in his profession, and had a large share of practice, he dedicated a considerable portion of his time to reading, and to dissecting such objects as the hospital afforded him, with a view of discovering the seats of the diseases, under which the patient had laboured; minuting every deviation he observed from the natural structure of the victims, or other parts of the body, and thus opening a new road for improving the science he cultivated. He also appears to have made extracts of every thing he deemed worthy of notice, from the various works he read. His hearing from some accident becoming defective, he withdrew from practice, and employed the last ten or twelve years of his life in arranging the materials he had collected. The first fruit of his labour, which he gave to the public, in 1665, was "Pharmacum," 2 vols. 12mo. This was printed again, much improved and enlarged, in 1679, in 4to. under the title of "Lavandieris medicus, extricati," &c. compiled principally from Bellaniius and Septuages. In 1675, "Prothomus anatomiae practicae, de abditis morborum causis," &c.; the precursor of his principal work, "Scaphelechrum, saepe ab anatome practicae, ex cadaveribus morbo denatis proponeos illorum et observationes," &c. 2 vols. fol. Geneva 1679, which far exceeded the expectation raised by the prothomus. It was enlarged by nearly a third part, and republished by Mansuet, 2 vols. fol. 1720, and was afterwards taken by Morgana, as the basis of his work, "De sedibus, et causis morborum," by which the feaculechrum is in a great measure superseded. The author begins with observations on the appearances of the brain and other parts of the head; then on the contents of the thorax, abdomen, and pelvis; and lastly, of the extremities; forming an immense body of dissections, which he has illustrated by many pertinent and ingenious observations. "Cours de medicine, et de chirurgie," 2 vols. 4to. 1679. An epitome of the art of surgery, with some sections relating to the practice of medicine, selected from the most accredited authors of the age. "Medicina feptentorialis, collectitio," 2 vols. fol. 1684, shewing how largely the practitioners of the northern parts of Europe, Sweden, Denmark, Germany, Holland, and England, have contributed to the improvement of anatomy, surgery, and medicine, by extracts and accounts of the works of the principal writers of those countries. "Mercurius compositus, seu index medico-practicus, decimae, cautiones, observationes in fugulis aff. libnu, &c. offendit tutam medici viam," fol. 1692. A most useful work, shewing under the name of every disease or affection where cures or observations may be found, and what authors have written upon them. Such an index continued to the present time, though very voluminous, would be highly useful. Bonnet also published "Epitome operum Bennettii," fol. 1655, and "J. D. Turqueti de Maxime, de Arithetica," 1671, 12mo. and "Robauti tractatus phlygenus, et Gallico in Latinam versus," 1675, 8vo. He died of a dropping, March 3, 1689. Hall. Bib. Med.

Bonnet, is a general name. See Cap, Hat, Miter, &c.

Bonnet, in Fortification, a kind of little ramlet, without a ditch, having a parapet three feet high; anciently placed before the points of the salient angles of the gheeis; being paliaded round; of late advanced before the angles of bastions, and the points of ravelins, and faulx-ibrayes. See Plate Fortis.

The bonnet has two faces, from ten to fifteen, or more rods long; the parapet is made of earth, from thirty to thirty-six feet thick, and from nine to twelve feet high; it is environed with a double row of paliades ten or twelve paces distant from each other; both a parapet three feet high, and is like a little advanced corps de garde.

Bonnet à petit, or petit's cap, is an outwork, having at the head three salient angles, and two inwards.

It differs from the double tetradice only in this, that its sides, instead of being parallel, grow narrower, or closer at the gorge, and open wider at the front; on which account it is denominated queue d'arène, or swallow's tail.

Bonnet, in Geography, a river of the county of Leitrim, in Ireland, which passes within four miles of Lough Clean, from which the Shannon issues, and carries boats into Lough Gilly, and thence into Sligo bay. Dr. Beaumont observes, that the day may come, when the spirit of enterprise and commerce will open itself a passage by this channel also. Beaumont.

Bonnet, St. a town of France, in the department of the Higher Alps, and chief place of a canton, in the district of Gap, 25 leagues N. of Gap. The town contains 1528, and the canton 10,284 inhabitants; the territory comprehends 24,5 kilometres, and 20 communes.

Bonnet le Chateau, St., a town of France, in the department of the Loire, and chief place of a canton, in the district of Montbrison, 4 leagues S. of Montbrison. The town contains 1586, and the canton 12,445 inhabitants. The extent of the territory includes 192-4 kilometres, and 10 communes.

Bonnet le Casteil, St., a town of France, in the department of the Pyr de Dome; 5 leagues E. of Brioude.

Bonnet de Beugènes, St., a town of France, in the department of the Rhone and Loire, and chief place of a canton, in the district of Villefranche, 6 leagues N. of Villefranche.

Bonnet de Charolles, St., a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Charolles, 24 leagues N.E. of Charolles. The town contains 1321, and the canton 6140 inhabitants; the territory comprehends 160 kilometres, and 7 communes.

Bonnet, in Heraldry, a cap of velvet worn within a coronet.

Bonnet pepper, in Botany. See Capsicum annuum.

Bonnet, in Sewing, an additional part of a sail, 51. 2

laced
Jaced at the bottom or foot of the fore-fall, try-fall, and forest main-fall, of some vessels with one mast, in moderate winds. It is made like the foot of the fall for which it is intended, and has leaching in the upper part, to correspond with and fall through holes in the foot of the fall, by which it is fastened.

The words in reference to it are, lace on the bonnet, that is, fasten it to the course; shake off the bonnet, that is, take it off the course.

**BONNET** chinon, in Conchology, is the common or trivial name applied by French collectors to the *Pattella Chinesis*, in the same manner as we should call it in English the *Chinon bonnet*, or limpet shell; thus also the French *Bonnet deologne* for the *Lamarck Buclum officinale*, etc.

**BONNET** ebinor, in Zoology, the French name of *Simia Sinica*, Gmel. or Chinese ape of Pennant’s Synopsis, a species that inhabits the country of Bengal. See *Simica*.

Oft the same animal is called *Cacusen corvone*, by late French writers.

**BONNETABLE**, in Geography, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Mayenne. The place contains 4587, and the canton 11051 inhabitants; the territory comprehends 105 kilometres, and 10 communes.

**BONNETEILLA**, in Entomology, an European species of *Tinea*, described by Linnaeus, in *Z. Succ. Fabricius and others. The wings are white, with two little silvery lines, the posterior one of which is waved.

**BONNETIA**, in Botany, (in honour of Charles Bonnet of Geneva,) Schreb. 915. Willden 1050. Mahuria Aublet 222. Jaff. 434. Encyc. method. Chfs and order. *Polypadria Monogynia*. Nat. Ord. uncertain. Jaff. Geo. Chaf. Cal. of one leaf deeply divided into five ovate, acute, concave segments, two larger than the others. Cor. petals five, ovate, somewhat obtuse, concave, longer than the calyx, the three superior smaller, upright; two lower larger, inclined, at a distance from each other. Stam. filaments very numerous, inserted into the receptacle, shorter than the corolla, dilated at the top. Anthers yellow, oblong, tetragonal. P. germ superior small, oblong. Style incurved. Stigma hollow, three-lobed. *Pericarp* capsule dry, membranous, oblong, three-celled, three-valved, valves sharply pointed. *Seeds* many, small, black, oblong, involved in a coloured membrane, affixed to the three-folded receptacle. Eff. Chaf. Cal. in e-parted, two parts larger. Cor. five-petalled, three smaller upright, two larger inclining. Corf. oblong, three-celled, three-valved, many-seeded. Species. B. palustris. Lamark, Illust. tab. 464. A tree fifteen feet high, even or eight inches in diameter; branches upright, chiefly towards the top of the trunk; leaves alternate, petioled, ovate, entire, smooth; petioles channelled, with two small stipules at their base; flowers purple, finked, one, two, or three together, furnished with three caly bracts, one larger at the base of the peduncle, the two others lateral. Native of Cayenne and Guiana.

**BONNEFOIL, Claude-Alexander, Count of**, in Biography, a descendant of an ancient family of Limoulin, was born in 1672, and having entered betimes into the army, served with distinction in Italy under Catzinat and Vendome. Abandoning his country in 1706, and entering into the service of the emperor, a sentence was procured against him by the minister Chamillart, which subjected him to decapitation. Notwithstanding this prostration, he ventured to Paris, and publicly married a lady of the family of Biron. In 1716 he served against the Turks under prince Eugene, and was a major at the battle of Peter-Waradin, where he behaved with singular valour; but in 1720 he had a dispute with prince Eugene, and challenged him, for which offence he was deprived of his employment, and condemned to a year’s imprisonment. Upon regaining his liberty he meditated revenge, went over into Turkey, became a mufli man, and was created a bahshaw of three tails, general of artillery, and at last master of the ordinance. In this situation he introduced European improvements among the Turks, and lived much esteemed to the age of 75 years. He left a son, who succeeded him in the office. He was a man of quick parts, courage, and ability; but singular in his conduct, quarrelling in his disposition, and addicted to fatigue. Upon changing his religion, he said, "It was only changing his night-cap for a turban." With all his eccentricities he preferred a calm temper; and said, "In all my perfections I never lost my appetite or good humour. Happy those who have philosophy in their blood!" His "True Memoirs," and his "New Romantic Memoirs," were published in London, in 1755. Nouv. Dict. Hist.

**BONNEVILLE, a town of Savoy, the chief place of a district in the department of the Savoie and Oife, and chief place of a canton, in the district of Chateaudun, fested on the Loire. The place contains 1151, and the canton 10638 inhabitants; the territory comprehends 3371 kilometres, and 27 communes.

**BONNEVILLE, a town of Savoy, the chief place of a district in the department of the Savoie and Oise, and chief place of a canton, in the district of Mont; the place contains 769, and the canton 11984 inhabitants; the territory comprehends 2071 kilometres and 27 communes.

**BONNY, a town of France, in the department of the Loiret, and chief place of a canton in the district of Gib; containing about 1300 inhabitants; 3 leagues S.S.E. of Gib.**

**BONNY, a river of North Africa, which forms the eastern shore of New Calabar, in the kingdom of Benin, discharging itself into the bay of Biafra.**

**BONTE, in Mineralogy, a name given by our miners to a bed of ore found in many places in hills, not forming a vein, nor communicating with any other vein, nor terminating in firings, as the true veins do; it is a bed of ore of five or six fathoms deep, and two, or somewhat less left than that, in thickness, in the larger sort; but there are smaller, to those of a foot long. They have their trains of shoal-stones from them, and often deceive the miners from the expectation of a rich lead vein. They differ from the liquats only in being round beds of ore, whereas those are flat.**

**BONO et male, Writ, de, in Law, a special writ of gaol-delivery was anciently used for each particular prisoner under this title: but these being found inconvenient and oppressive, a general commission for all the prisoners has long been established in their stead.**

**BONONCINI, Gio. Maria, in Biography, Modanele Accademico Filarmonico di Bologna, and father of the celebrated John and Anthony Bononcini, published in 1673, a work...**
work entitled "Il Musico Practico," or the Practical Musician, dedicated to the emperor Leopold, in thin quarto. This treatise contains many useful precepts and examples of composition; but is neither so accurate as to be implicitly followed, nor so ample as to supply all the wants of a musical student of the present times. Page 18, he speaks of a canon, in his opera terza, for fifteen hundred and ninety-two voices, or six hundred and forty-eight choirs; which, on account of the difficulty of finding such a number of fingers, assembled together, he has reduced to twenty-two. In the historical part of this tract, his knowledge is not very profound, or reading extensive; and the authors he cites, in support of his information, give it no additional weight. The examples he has given of the use of the second, page 64, are, in many instances, erroneous, and such as can be found in the works of no good contrapuntist of the last century. The second is not only confounded with the ninth by this author, page 64, but improperly prepared and resolved.

This discord of the second seems to require one of the parts to remain stationary, till the suspended harmony is completed; but Bononcini often puts both parts in motion. In his example of counterpoint upon a plain song, page 76, there are other disallowances.

Much explanation and instruction are given for the ecclesiastical modes, but none of the keys, used in secular music, are defined or ascertained.

Bononcini, John, the celebrated opera composer and rival of Handel, was the son of Gio. Maria Bononcini, of Bologna, the subject of the preceding article. He first arrived in England in 1720, on the establishment of our famous "Corporation of the Royal Academy of Music," under the auspices of king George I. and the principal nobility and gentry in the kingdom; for the support of which, 50,000l. were subscribed. We have now before us the original deed and covenant, with the seal and signature of all the subscribers, who became academicians, and bound themselves and their respective executors, administrators and assigns, to pay all such respective sums or sums as shall from time to time be demanded out of their subscription, &c. The king subscribed 105l. and the rest, to the number of 73, in this original lift, 200l. each.

It is a curious record to be in possession of the autography of such a number of the heads of our most ancient and illustrious families thus preferred. It is not, indeed, equally important or honourable with the lift of the barons who signed the Magna Charta; but it is such a memorial of our prosperity, good-humour, patronage of a polite art, and happiness, that we would give a fac-simile of each signature on a copper-plate, if we had room.

In order to render this academy as complete as possible, it was determined by the directors not only to engage a lyric poet in their service, but the best vocal performers that could be found in the several parts of Europe where there was a musical theatre, and the three most eminent composers then living who could be prevailed upon to visit this country. For this purpose Bononcini was invited from Rome, as he tells us himself, in the dedication of his Cantatas and Duets to George I. (Qui mi trovo, chiamato da Roma per servigio della reale Accademia di Musica). Attilio Ariosti, from Berlin, was likewise engaged as a composer on this occasion; and Handel, who resided at this time with the duke of Chandos, at Cannons, was not only included in the triumvirate, but commissioned to engage the singers.

During the first year of this establishment, these three composers furnished new operas alternately, till January 1721, when, for dispatch, an act of the opera of Muzio Scacchi was assigned to each of these masters; the first act to Attilio, probably from levity, as he was far from young when he came hither; the second act to Bononcini, at that time about 50; and the third to Handel, the youngest of the three.

As this division of the drama seemed to imply a contention and trial of skill, the public took sides, perhaps less from feeling than the spirit of party; for party whores our appetites for pleasure as well as politics. Many of the nobility and gentry, who had been in Italy, and had witnessed the applause which Bononcini had received there as a composer, were partial to him here. While others who had visited the court of Hanover before the decease of queen Anne, and knew the favour in which Handel had stood with the electors, as a great performer on the organ and harpsichord, before his compositions were much known, and afterwards had heard his productions performed in London, were unwilling to be pleased with the compositions of his principal rival. Attilio, though a good musician, seems to have been out of the question; neither his fame nor talents being equally splendid with those of the other two, by whom, and for whom, the conflict continued with as great a rage as between the houses of York and Lancaster, till the year 1727; when Bononcini, after the run of the last and belt opera which he had composed in England, "Alfyana," quitted the contest with Handel, and ceased to write for the stage. But the feuds among the friends of these great musicians, which Swift's epigram had rendered so ribald, did not end here, but continued as long as Bononcini remained in this country.

Here, as his biographer, it seems our duty to give his real character as a composer. He was seldom heard on the violoncello in this country, though as a performer on that instrument he was extremely admired in Italy; and his melody was, perhaps, more polished and vocal, though not to new as that of his powerful saxun rival. Having been born and nurtured in Italy, where singing was far more highly cultivated, he was reported by all his countrymen to sing in a most exquisite taste. His recitative too, both in writing and utterance, was universally allowed to be the best of the time, and the true genius of the Italian language; but as a correct, powerful, and inventive composer, he was an infant compared with Handel.

Of all the works which this celebrated composer published in England, his book of "Cantate e Duetti," dedicated to his
his majesty George I. in 1721, the year after his arrival here, seems the bell. In 1722, his "Divertimenti da Camera," tradotti (transposed or accommodated) pel Cembalo da quelli compositi pel Violino e Flauto," were published by himself, and sold at his lodgings in Suffolk-Street. In these we meet with pleating and mallerly passages, but they are far inferior in force, contrivance, and invention, to the lemons of Handel, that even his admirers, on a comparative view, must have regarded them as frivolous and trivial. The adagios are the bold movements in them, and have notes of talle and passages of expression, which must have been then new to English ears. Bononcini, however, like other composers of his time, is very sparing of his passagis, and indulges idlenefs and want of invention by frequent refrains, or repetitions, which Handel seems always to avoid more than any composer of this period, except the Scarlatti, father and son. In several of these lemons the subject is heard in one part or other throughout a whole movement; as in the minuet, page 35, the first bar is perpetual.

His funeral anthem for the duke of Marlborough was set and performed the same year, 1722. The short symphony, and whole first movement are grand, and of a melancholy cast. The second movement has not much to recommend it. The third is more lugubr, than passionate or pathetic. The fourth is plaintive, but was not new at the time it was written. The fifth and last movement has musical merit, but none of true feeling, or genius; no "heart-eating sighs," or such exclamations of sorrow and affliction as would naturally be expected from a man of great abilities, who either felt the words or the loss of his patron.

Bononcini was a celebrated and voluminous composer long before he arrived in England: his eighth work, confining of "Duetti da Camera," was dedicated to the emperor Leopold, and published at Bologna in 1691. The seven operas he composed during his residence in England, make but a small part of his dramatic productions. He produced two operas at Rome in 1694; after this he went to Vienna, where he composed many operas and oratorios for the imperial court and chapel. In 1726, he was again in high reputation as a dramatic composer at Rome, whence he was invited to London by the directors of the Royal Academy of Music. In 1727, he published "Twelve Sonatas for two Violins and a Bafe." It was about this time that he was accused of arrogating to himself a madrigal composed by Lotti of Venice, and published in that city in 1705, in a work entitled "Duetti, Terzetti, e Madrigali a piu Voci," dedicated to the emperor Joseph. The title of this madrigal is "La vita ed amiche," and has for initial line "In una flpe ombrosa." We are in possession of the book in which this composition was printed, and, upon examination, are extremely astonished that Bononcini would risk such great reputation of which he was already in possession, for a production which could increase it so little. The countenance of this madrigal is certainly correct, it is dry, and, all the subjects of fugue are such as had been used by thousands before Lotti was born. There are many madrigals by much older masters, particularly Luca Marenzio, Stradella, and the elder Scarlatti, that are learned and pleasing in modulation, and more facetious and agreeable in the taste of melody that are used as subjects of imitation. Indeed, Bononcini's plagiarism was as weak as wicked. We need to do the truth of the charge, from an idea that his reputation was so well established, as his genius fortunate, that he had not the least occasion to have recourse to such illicit means of extending it. The crime of theft is very much aggravated, when the thief is not impelled to it by want. Rich men and milers have, however, been often detected in illegal appropriation. Yet upon a careful and critical examination of the works of John Bononcini, we think his wealth did not conflict in rich and deep mines of science, nor were his resources in sound and elaborate composition, either in the ecclesiastical or madrigal style, very great. His performance on the violincello, his cantatas, and his operas, had been admired in every part of Europe; but not content with partial fame, he aimed at universality. In his anthem for the funeral of the duke of Marlborough, he attempted to rival Handel in his grand church style; and finding in how much veneration well written madrigals were held at the Academy of Ancient Music in London, where Handel at this time was regarded as a modern, and an innovator, he was tempted to risk the reputation he had fairly acquired, by trying to augment it in an illegal manner. Tradition had filled our minds with ideas of his abilities, which the examination of his works has diminished; while a strict scrutiny into the productions of Handel has greatly augmented our veneration for this composer. We have now before us, in a printed pamphlet, all the letters that passed between the Secretary of the Academy of Ancient Music and signor Ant. Lotti on this occasion, with such testimonies and certificates, from the most respectable professors at Venice and Vienna, in proof of the madrigal in dispute having been composed by that master and not by Bononcini, that not the least doubt remains of the fact.

Soon after the funeral of the duke of Marlborough, the countess of Godolphin, who, upon the decease of her father, became duchess of Marlborough, as settled in his patent of creation, received Bononcini into her house in the Stable-yard, St. James's, and settled him on a pension of 500l. a year. Here he lived in ease and affluence, enjoying as an artist the olim enm digitate in its full extent; the duchess having concerts twice a week, in which no other music was performed to the first people in the kingdom than the compositions of her favourite master, executed by the principalingers of the opera. It is supposed that he gained a 1000l. by the book of cantatas which he published by a two guineas subscription; many of the nobility subscribing for five or ten copies; the duke and duchess of Buckingham for twenty-five books each, and the countess of Sunderland alone for fifty. After the dispute concerning this madrigal, his importance diminished in England; and in the year 1733, he quitted the kingdom. After which he resided at Paris for several years, where he composed masses and motets for the chapel royal. At the conclusion of the peace of Aix la Chapelle in 1748, he was invited to Vienna by the emperor of Germany to compose the music for that occasion, and is said to have been presented with eight hundred ducats for his trouble. After the conclusion of the peace was over, quitting Vienna in company with Monticelli, he fell off in the same post-chaise with this celebrated singer for Venice, where they were both engaged, Bononcini as composer, and Monticelli as first man, in the opera for the ensuing Carnival in that city. Here we lose sight of this renowned composer, who, if we suppose him to have been more than thirty years of age in 1691, when his eighth work was printed at Bologna, and dedicated to the emperor Leopold, he must at this time have attained his eighty-seventh year; which will give weight to the general opinion, that his life was extended to near a century!

Bononcini, Antonio, brother of John, and an opera composer, little if at all renowned in Italy, than the author of Gryphius and Affranus. It has always been imagined that the famous opera of Camilla, the second attempt at that species of drama in England, in 1706, was set by John Bononcini; but we can find no proof of it in any one of the numerous volumes of operas in our possession, or dramatic records.
records that we have been able to consult. “Camilla Regina de Vollet,” written by Stampiglia, and set by Marc Antonio Bononcini, the brother of John, for the imperial court of Vienna, about the year 1697, was in such favour all over Italy, that it was performed at Venice, 1698; Bologna, 1705; Ferrara and Padua, 1707; Bologna again, 1709; Udine, 1715; and a third time at Bologna, 1719; and seems to have been the opera that was performed in England, during 1706, fifteen times; 1707, twenty; 1708, ten; and 1709, eighteen; in all sixty-four times.

BONONIA, in Ancient Geography, a town of Gallia Cispadana, called Felinsa, at the time when the Etruscans were masters of the northern part of Italy, and then their capital; supplied by fame to have been founded by an Etruscan prince, denominated Felinsus. But when these first professors were driven away by the Boians, it acquired the name of Bononia. In the year of Rome 554, the Romans conducted a colony to this place, with a view of fortifying this side of the country. It afterwards became a municipal city; and owed much of its magnificence to Augustus. See BOLOGNA.—Also, a town of Upper Panonia, placed by Theodorus on the Drave.—Also, a town of Dacia Ripenit. Not Imp.—Also, a town of Upper Moa, in the route from Viminacium to Nicomedia, between Dortican and Ratariaria. It. Antonius.—Also, a town of Lower Panonia, in the route along the Danube, between Culi and Cucci, 19 miles from Sermon, according to Annamnus Marcellinus.

BONONIAN Stone; a small, grey, soft, glossy, fibrous, ponderous, sulphurous stone, about the bigness of a large walnut, or even of an orange; when broken, having a kind of crystal, or sparly tale within; found in the neighbourhood of Bologna, or Bononia, in Italy; and, when duly prepared, making a species of phosphorous. It is of no certain figure; but in sometimes round, sometimes oblong and cylindrical, and sometimes conical, which last kind is said to be the most shining and transparent. Its colours are various; some being ascoloured, others of a sky-blue, some of a ferruginous colour, others yellow, others greyish white, and some almost perfectly white. The best for use are said to be the fly-blue-coloured and the white. This stone is found in several parts of Italy, but especially in the district of Bologna, towards the Apennine mountains, and on mount Patero, or Patera, about five Italian miles from Bologna. They are most commonly found after heavy rains, among the earth washed off from the neighbouring mountains. In this case the several masses of it appear, when the earth is washed away, as bright as burnished silver, or with the glittering of tale resembling the globs of a smoking-gifhs. This stone is the ponderous spar, or combination of vitriolic acid with ponderous earth. See SPAR.

A chernel, whose name was Vincenzo Cancliarolo, having gathered some pieces in a river at the foot of mount Patero, carried them home, in hopes by the fire to draw silver out of them; but instead of what he expected, found that admirable phenomenon they exhibit, which consists in this, that having been exposed to the light, they retain, and shine in the dark. This discovery was made about the year 1630.

The property of this stone is, that though it has no lucid appearance in the dark, until it undergoes a particular calcination, it becomes capable, by previous preparation of inhaling, when exposed for a few minutes to the light of day, or even to the flame of a candle, such a quantity of light, that it afterwards shines in the dark for an interval from eight to fifteen minutes, like a glowing coal, but without any visible heat. The light it emits is sufficient to read by; if the letters be placed near it. It does not retain its light long, but requires often renewing it, and when well prepared, its virtue will last five or six years, but seldom longer.

The method of using it to the greatest advantage, is to remain for some time in a dark room, and to introduce the calcined substance immediately after its being exposed to the light.

M. Homberg is said to be the first person who taught us the true manner of preparing and calcining the Bononian stone, having made a journey to Italy on purpose to learn it. Though others allege, that the true art of preparing and calcining the stone is lost; there having been but one, an ecclesiastic, who had the true secret, and who is since dead, without communicating it to any person. See Phil. Trans. N 21.

M. Homberg, on his return from his travels in Italy, brought with him a great number of these stones, and calcined 200 of them in so many different ways, that he at last found out the secret. His method was as follows:—He first tempered the stone all over, till it appeared like tale; then, having founcked it thoroughly in brandy, and imbibed it in a pailte or crucible made of other stones of the same kind pulverized, he calcined it in the fire, or in a small furnace. After this operation, he took off all the powder of the crust in which the stone was included. Both the powder and the stone, when brought into the dark from the open air, make a luminous appearance; and the former, if kept in a strong and well-skilled phial, when exposed to the air, imbibles the light, and if sprinkled on pictures and letters, illuminates them in the dark. In preparing the paste, the stone must be pulverized in a brass mortar. This circumstance is mentioned by Lemery, who, in his “Cours de Chimie,” describes at large the whole process of preparing this stone, which he acknowledges to have learnt from Homberg himself.

The whole art of preparing this stone, so as to make it shine in the dark, is described at large in E lovck’s “Philosophical Collections,” by Sir Marc Antonio Cello; and in a book of the same author, published at Rome in 1719, on this subject: and the substance has hence been called “ Il Fosforo de Marc Antonio Cello.”

The following has been stated as an approved method of calcining this stone. Make a cylindrical furnace of iron or copper plates, 7 inches in diameter, and as many in height. Line the inside of it with a strong lute, so that the inside may be 6 inches wide in the clear hollow; at the top of this make four notches, 2½ inches deep, and 1½ inch wide; to this annex a cylindrical part of the same diameter, but a little higher; and at the bottom make two all-holes, or airholes, big enough to admit the hand. Line this, like the other, with good lute, and give it a bottom of lute, that it may more powerfully reflect the heat; and line the cover for the top with lute. Into this furnace introduce a monowire grate near the bottom, for retaining the coals, and form to admit of free access of air. On this grate lay some pieces of lighted charcoal, and over these some pieces not lighted; all bruised to the size of about a walnut. Some of the stones must be powdered, and those which are to be calcined must be dipped in strong aqua viva, and while wet rolled in the powder, or the powder itself may be made up into thin cakes with mucilage of gum tragacanth. The stones, thus covered, or the cakes, must be laid upon the bed of charcoal close to one another, and another bed of small pieces of charcoal laid over them to the top of the furnace; the cover of the furnace is then to be put on, and the fire lighted. When the charcoal is entirely consumed, and the whole is cold, take out the stones, and, separating the crust from them, wrap them up in flax or cotton, and keep them close in a box for use. Preserve the crust taken off the stones;
for this flies as well as the flone; and being pulverized, may be rubbed over any surface for emitting light, the surface being first dusted over with the white of an egg in order to make it adhere; and this will shine like the flone. This kind of furnace is not absolutely necessary to the operation; but it is convenient to know the quantity of charcoal requisite for giving the shining quality to the flone; since an excess of heat destroys it, and too small a degree is not sufficient to produce it. The greatest degree of phosphorus seems to depend on a due application of the heat. An extreme degree of heat suffices the flone. For other methods of preparing this kind of phosphorus, see Phosphorus. See also Light.

This property of affording a phosphorus by calcination, is common to the other gypsnum, when pure from metallic or other heterogeneous mixtures; the artificial gypsnum succeeded equally with the natural, and it is found to belong to a variety of other substances. M. Margraf observes, that all substances which have this property contain a vitriolic acid, united to an alkaline or calcareous earth.

M. Elpigni observes, that one Zagonia had a method of making flatus and pictures of the Bononiense flone, which would shine variably in the dark; but he adds, the period died without discovering his secret. See Phil. Trans. N° 134.

BONONIENSIS, in Ornithology, the specific name of the greater lapwing, tringa bononiensis of Gmelin, and canellius bononiensis major of Brisson. The legs of this kind are ochraceous; head and upper part of the neck chestnut; body above black, beneath white; throat and breast spotted with ferruginous. Gmel. Ol. This is larger than the common lapwing (tringa canellius); the beak is yellowish and black at the tip.

BONONIENSIS; pafferculus bononiensis of Brisson. This is fringilla brachyura of Gmelin, or short-tailed sparrow.

BONOSIANI, or Bonosiaci, in Theological History, an ancient branch of Adoptiani, in the fourth century, denominated from their leader Bonosius, a bishop of Macedonia.

Gen. Char. Col. tubular, five-toothed. Cor. monopetalous, almost labiate; tube longer than the calyx; border with five emarginate divisions; the two superior long and straight, the three inferior pendant. Stam. five inclining. Pjpf. germ superior; style capillary; stigma bifid; Pericarp, capsule ovate; three-fid; cells three; seeds three.

Species. B. geminifora, an annual plant; leaves alternate, smooth, lanceolate, toothed; flowers violet, large, axillary, growing in pairs. A native of New Spain.

BONPORNKEL, a denomination given to a coarse kind of bread used in Weiphulm. See Bread.

BONN-HOMMES, or Bon-Hommes, in Ecclesiastical History, a sort of hermits of St. Auguitn, founded by F. de Paula. They were brought over into England in 1289, by Edmund, earl of Cornwall, and settled at Alhong, in Bucks, besides which they had only one house more at Edington in Wilts. They followed the rule of St. Auffin, and wore a blue habit.

The name is said to have argen from Louis XI. of France, who used to call F. de Paula, prior of the order, le bon homme. Till then they had been called the Minimi, or order of Grammont. See AEBIGENSES.

BONSDORFII, in Entomology, a species of Cerculio, of an oblong form. Colour white, with a black band and spots; mouth falcated and brown. Bonf. Curc. Succ. Inhabit Sweden, and is half the size of cerculio fuligignaris.

BONTAIN, in Geography, a kingdom of the island of Celebes, situate on the south coast, and on the east shore of the bay of Boni. It is bounded on the west by the river Tino, which divides it from the kingdom of Touratte, on the north, by the mountains which bear its own name; on the east, by the river Kalekongang; and on the south by the sea. It was anciently considered among the dependent allies of Maeasiers, and governed by their kings; but it has been twice conquered by the arms of the Dutch East India company and their allies, and was ceded to them, in property, by the treaty of Boni. The country is pleasant, and fertile in rice. It has a large bay, where ships may lie in perfect safety during both the monsoons. The foundings are good and regular, and the bottom soft mud; nor is there any danger in coming in, except from a ridge of rocks, which are above water, and are a good mark for anchoring. The highest land in sight is called "Bontain-hill." S. lat. 5° 30'; and when a ship is in the offing, at the distance of 2 or 3 miles from the land, she should bring this hill N. or N.W., and then run in with it and anchor. In this bay there are several small towns; that which is called "Bontain," lies in the N.E. part of it (S. lat. 5° 10'; E. long. 117° 28'), and here is a small palisaded fort, on which are mounted eight guns, that carry a ball of about eight pounds weight; it is just sufficient to keep the country people in subjection, and is intended for no other purpose; it lies on the south side of a small river, and there is water for a ship to come close to it. Wood and water are to be procured here in great plenty; likewise plenty of fresh provisions, at a reasonable rate; the beef is excellent, but it would not be easy to procure enough of it for a squadron. Rice may be had in any quantity, and also fruits; in the woods there are herds of wild hogs, which may be purchased at a low price, as the natives, who are Mahometans, never eat them; and fish may be caught with the seine. The tides are very irregular; it is commonly but once high and once low in 24 hours; and there is seldom a difference of six feet between them. The inhabitants of Bontain, and those of Boelo- Comba and Bera, are the belt humoured, most peaceful and most tractable of all the subjects belonging to the Dutch company, in the whole island of Celebes.

BONTEMPI, Angelini, in Biography, a native of Perugia, and author of the first history of music in the Italian language, with which we are acquainted. He was an able proficer, of considerable learning, who flourished about the middle of the 17th century. His work, which has for title "Historia Musica di Gio. And. Angelini Bonemp," was published at Perugia, in small folio, 1695. It is become somewhat scarce, which enhances its value with collectors of books, and having been long unable to procure a copy, we imagined when one was found, from Brodard's character of the work, that we were in possession of a greater treasure than on examination it proved to be. For with great parade of his learning, science, and acquaintance with the Greek theorist, that are come down to us, he leaves us in an utter darkness concerning the practicis of ancient music as ever; and to say the truth, he has furnished us with but little information concerning the modern of his own time, with which, however, as a contrapuntist, he seems to have been perfectly well acquainted. Indeed, by the frequent use he makes of scientific terms, his book, when casually opened, has more the appearance of a dry mathematical treatise, than the history of an elegant art.
BON

grailed themselves in writing "Aia Palatrina" for the
church; secular music was then but little cultivated, and
less respected there, till opera and oratorios had made some
progress in polishing melody, and in the just accentuation
and expression of words.

BONTIA, in Botany, (in honour of Jacobus Bontia, a
physician at Batavia, author of a treatise "De Medicina In-
dorum"). Linn. species 800. Syll. 579. Reich. 2. 200.
Wilden. 1208. Sch. 1632. Schult. 217. Clas and
order, Didynamia Anginiformis. Nat. Ord. Perforatae—
allied to the Solanis. Juff.

Gen. Char. Per. calyx one-leaved, five-parted; segments
ebrous, erect, permanent. Cor. one-petalled, ringed,
tube long, cylindrical; border gaping; upper lip erect,
reflexed near the end, emarginate; lower semitrifid, the size
of the upper. Stam. filaments stalked, bending to the upper
lip, the length of the corolla; authors simple. Pet. germ
ovate; style simple; stigma bifid, obtuse. Pericarp a
ovate, with an oblique apex. Seed, nut oval, one-celled,
egermating.

Eff. Char. Cal. five-parted. Cor. two-lipped; lower lip
three-parted, revolute. Drupes ovate, one-seeded, with an
oblique apex.

Species, B. dagbeoides. Barbadoes wild olive. (La Marek
IIlllul. Tab. 546.) "Leaves alternate; peduncles one-
flowered." Linn. A shrub four or five feet high; leaves
rather stiff, laciniate, smooth, green on both sides, lower
ones ferrate, upper ones entire. Flowers yellowish, with a
line of dusky purple across the lower lip; axillary, fidget, or
in pairs; tube and lower lip hairy. It was cultivated by
Mr. Bentick in 1693, and flowered with Dr. Sherard in
June 1723.

Propagation and Culture. It is cultivated in Barbadoes for
making hedges, and may be raised in England from seeds
fowl on a hot-bed early in the spring. It must afterwards
be transplanted into a small pot filled with light earth, and
planted into a moderate manner's hot-bed, with a large
allowance of air and water in hot weather, but should always
remain in the flore. It may also be propagated by cuttings
in the summer. Being evergreen, and growing in a pyra-
midal form, it makes a pretty variety in the flower.

BONTIA, (Brown Jamaica.) See Avicevnia germin.
ans.

BONTIA, (Pet.) See Epi ден in carinatum.

BONTIA, in Conchology, a species of Helix, of which
several varieties are described by Chemnitz. This shell
is somewhat conic, ventricose, perforated, and pellicoid, with
the tip black; on the first whorl three yellowish bands;
 aperture ovate. Helix botnia is a native of Bengal; the shell
is extremely fragile.

BONTIUS, JANES, in Biography, a native of Leyden,
was educated in philosophy and medicine, under his father
Gerard; and being sent to the East Indies, practised physic
at Batavia about the middle of the seventeenth century. On
his return to Europe he wrote several valuable works on the
diseases and practice of medicine in India. These are, "De
conservanda sanitac a, ac dieta sania in India observandis;"
"Methodus medendi, qui aportat in India orientali uti;" "Ob-
servations selecta ex divinationes cadaverum ac autopha
descripta." He also published curious observations relating
to the botany and natural history of those regions, more es-
specially the vegetables used in medicine and diet in his work
titled "De Medicina Indorum," in 1642, and afterwards,
with Alpinus's work "De Medicina Egyiptorum," 4to.
1718. He also published "Hortus Nat. et Med. Index
orientalis," fol. in 1658. His brother Regnier was many years
professor of medicine at Leyden, and rector of the university.

Vol. IV.

BONTORY, in Geography, a town of Poland, in the
province of Bracaw, 20 miles south of Brlawcz.

BONVINCINO, ALESSANDRO, called Le Moretto, in
Biography, an eminent painter of historia and portrait, was
born at Rovato in 1524, and studied for some years under
Titian, but he was enamoured with the designs of Raphael,
which he accidentally saw; and devoting himself to the affi-
duous study of those master-pieces of art and genius, he be-
came an exalted good painter. His works are eagerly
purchased, and much admired for the tenderness of the pencil-
the, the correctness and spirited expression of the figures,
the neatness of the finishing, and the rich variety of the de-
signs, consisting of velvets, damasks, or satins, copied after
nature, and wonderfully imitated. He was equally excellent
in portrait, and placed by some artists in competition with
Titian. He died in 1564. Iphigonton.

BONUS HENRICUS, in Botany, (Bath. &c.) See Ch-
nojobium.

BONZES, or BONZUS, a name given to the priests and
religion of China, Japan, and Tonquin. This is the ap-
pellation under which the priests, who are attached to the
worship of Fo (see Fo), are generally known among Euro-
peans. They are called "Talapoini" by the Siamese, "La-
mas" by the Tartars, "Ho-thing" in China, and "Bonzes" in
Japan. They generally live in a sort of community, in
places apart, or confin'd wholly to them. The island
Pou-to, near Chufan, is a famous seat of bonzes, being
entirely inhabited by them, to the number of 3000, all of
the sect of Hothing, or unmarried bonzes.

They live a kind of Pythagorean life, and have not less
than four hundred pagodas, or temples, in this little island.
They have ano' females, called bonzesses, a fort of nuns,
who dedicate themselves to the worship and service of some
temples or idols. They are obliged to abstain from all con-
verse with men, and on that account are clapttered in large
monasteries, like those of the Romish and Greek church.
For incontinency these bonzesses are condemn'd by the
mandarins to a kind of pillory called Ranghi, which fee.

These bonzes, or Chinese priests of Fo, worship him
under the forms of several animals, through which they
pretend that he had transmigrated before he was defined;
and ingroving the worship of this imaginary deity to them-
sehls, in the Chinese temples, they support and propagate
it, with a view to their own personal emolument and in-
fluence, by the most unwarrantable impostures. They ad-
mit, however, the distinction between good and evil; and
they declare that, after death, rewards will be bestowed on
the good, and punishments inflicted on the wicked, in place
defined for the souls of each. They teach, that the god
Fo appeared on earth for the purpose of sobering mankind,
and of retarding to the paths of salvation those who have
frayed; that it is by him their sins are expiated; and that
he alone can procure for them a happy regeneration in a fu-
ture life. They enjoin the strict observance of five precepts;

of which the first forbids the killing of any living creature,
of whatever nature it may be; the second, the taking away
of the goods of another; the third forbids men to pollute
themselves by uncleanness; the fourth, to lie; and the
fifth to drink wine. They, above all, recommend the prac-
tice of certain acts of mercy; such as, treating their bozes
well, building monasteries and temples for them, and sup-
plying them with every thing necessary for their main-
tenance, as the most effectual means of promoting the ben-
fit of their prayers, mortifications, penances, and other mi-
ritious actions, towards the amelioration of their own souls,
and for obtaining a happy training abon in another life.
On the other hand, they terrify those who withhold their
benefactions from them with menace; affirming them, that they

5 F

1st
shall hereafter revive in the form of dogs, rats, serpents, horses, 
and mules; and that they shall be for ever exposed to the 
most degrading and wretched transmigrations. These me-
naces seldom fail of making a deep impression on the minds 
of the credulous vulgar, in such manner that they often persuade 
them to burn, at the funerals of their deceased relatives, 
paper gilt, or wafheil with silver, silk, cloth, and other gar-
ments, which, they pretend, will be converted into substan-
tial gold and silver, and superfluously, for the use of 
their parents and friends. Composed of a florin of an 
old man, who was led to believe, by the representa-tions 
of these bonzes, that his soul should pass into the body of one 
of the emperor's post horses. The poor man was so dishearten-
ed, that he could neither eat nor sleep, and his grief was such 
as to threaten the speedy termination of his life. He learned, 
however, that the souls of the Christians were exempted 
from these dreadful metamorphoses; upon which, he applied 
to one of the Jesuits for Christian baptism, affuring him, that 
he would rather be of that, or any religion, than transmi-
grate into a post-horse. The Jesuit complied with his re-
quest, and made his mind easy. Those bonzes are perfectly 
aquainted with all the arts of hypocrisy and deceit; and 
dextrously practive them as occasions occur. They addict 
themselves to rigorous fasting, frequent watchings, and long 
prayers before the altars of Fo. When they cannot obtain 
gifts by cunning and address, they endeavour to procure 
them by exciting compasion, and by submitting to the 
severest penances, and practicing the most rigorous austerities. 
With this view they often appear in public places, as fright-
ful spectacles of mortification. They often drag along the 
streets heavy chains fastened round their necks, arms, and 
legs: they beat their heads against the fiones and poles, and 
mane their bodies, so that they are smeared with blood; 
they carry burning coals upon the tops of their naked 
heads; and some of them are carried about in a kind of 
stenan, the infide of which is stuck full of nails and spikes, 
so that they cannot stir without wounding themselves; and 
these nails they fell to the populace for a few pence, as 
amulets and preservatives against all harm, and as efficacious 
means of bringing down blessings on the purchaser and his 
family. By pretending to know the present state of the 
dead, and the future condition of the living, they contrive 
to extort money from the surviving friends, in order to pro-
cure for the deceased a speedy release and passage into a bet-
ter state. Many other infinite of their knavery are related 
by Du Halde, Le Compte, and other writers. Some of 
these are so atrocious in their nature, that the relation of 
them cannot be read without horror; and we are led to hope, 
that they are rectified by the Jesuit missionaries, to whom 
the bonzes have been great enemies, and against whom they 
have excited various persecutions, with some exaggeration.

We read of their privately feizin men and women, and 
hurrying them away in a clofe sedan, where nothing is to be 
seen but the tops of their heads, and their eyes moving in a 
terifying manner, to the next river or canal, and drowning 
them without mercy, before crowds of spectators, who are 
harangued by one of the fraternity into a firm belief that 
the persons so treated had earnestly requested to be thus dis-
patched out of the world, in order to obtain immortality in 
a future state. With all the external appearances of fanctity 
and austerity, these bonzes unite voluptuous manners and 
secret proficieny, of which various instances are recited. 
Notwithstanding the infatuation which induces the vulgar to 
support the superfluous superstition of the country, the condi-
tion and character of a bonze are generally despised in China. 
Most of these fanatical impostors are sprung from the dregs 
of the people. Thiole of Pegu, however, are said to be 
generally gentlemen of the highest extraction. See Pegu. To 
recruit and perpetuate their sect, they purchase young chil-
dren, whom they betimes initiate in all their mysteries, and 
whom they instruct in every trick and deception which may 
render their profession profitable; these afterwards succeed 
them, and transmit their arts to other young bonzes, who 
are educated in the same manner. They are, in general, 
very ignorant, and unable to give an exact account even of 
the true doctrine of their sect. Although they have no re-
gular hierarchy, they acknowledge superiors, whom they 
call "tah-so-chang," or bonzes. This rank descends to 
those who have attained it particular distinction, and the 
fifth place in all religious assemblies at which they may 
be present. There are bonzes of all conditions; some defined 
only for collecting alms; others, better skilled in the art of 
speaking, and who have acquired some knowledge of the 
Chinese literature, are commissioned to visit the literati, and 
to intimize themselves into the houses of the great; old 
men, rendered venerable by age, and by a grave deportment, 
are employed to exercise their talents among the female sex; 
these prefide in all their assemblies, which, though not com-
mon, are held, however, in several provinces. These religi-
ous clubs are very lucrative to the bonzes. One of these 
priests enters the chapel, where the female devotees are af-
femled, and fings some anthems to the god Fo. At length, 
after having for some time repeated "Onito Fo," (Onito 
being the name of another deity more ancient than Fo, and 
worshipped by the Japanese under the name of Anida, which 
foe), and after being flaved with the tinkling noise of several 
small kettles, upon which they beat, they place themselves 
at table, and the noyous devotion terminates with mirth and 
a good repart. On days of greater solemnity, the bonzes 
adorn their places of worship with several idols, and numer-
ous paintings, exhibiting under various forms the different 
punishments inflicted on the wicked in hell. The prayers 
and feating continue seven days, during which their chief 
bufnefs is to prepare and confecrate treasures for the other 
world. In every province of China there are temples, to 
which numerous votaries repair; some of them making pil-
grimages thither from very remote places. The pilgrims 
climb the sacred mountains with great difficulty, and are 
sometimes dragged up on their bended knees. Thiole, whole 
age or infirmities, or urgent bufinefses, will not allow of 
their joining these devout caravans, commemfion fome of 
their friends to bring them a large leaf filled with characters, 
and famped by the bonzes in a particular corner. The centre 
of this leaf is occupied by the image of the good Fo. On 
the veiments of the god, and around his figure, are traced 
a multitude of circles, intended for the following pur-
pofe. —The devotees of the god, whether male or female, 
dragging from their necks, or around their arms, a kind of 
chapel, composed of 100 beads of moderate fize, divided 
by threads which are much larger; and a bead, still bigger, 
in form of a small gourd, ornaments the top of the chapel. 
These beads they roll between their fingers, pronouncing 
the mysterious words "O-mi-to, Fo!" and each of these in-
vocations is accompanied by a genu-flection. When they 
have completed the number of 100, equal to that of the 
beads, they mark with a red froke one of the circles which 
form around the figure of the god Fo, on the leaf famped by 
the bonzes. This leaf becomes the register of all the prayers 
which they have repeated in the course of their lives. To 
verify its authenticity, the bonzes are, from time to time, 
invited to their houses, where they must atfref the number 
of circles marked with red frokes, and imprint their feals on 
the leaf. When any of them dies, this valuable memorial 
is carried at the funeral with the greatest solemnity, and depo-
fited in a small box closely flut and fealed: this they call 
"lou-in," or a passport for the other world; and it 
colls
costs a large sum of money to have all these formalities observed.

It has been already hinted, that the bonzes are peculiarly imitable to the progress of the Christian religion in China, Japan, &c. and that they have excited a spirit of persecution against the European missionaries, who have hitherto been chiefly the objects of the church of Rome. These strangers, they say, have introduced themselves into China for the purpose of invading it; the new doctrine they preach is calculated, as they pretend, to procure followers, and a number of partisans, sufficient to second their efforts, when European troops and fleets shall be ready to attack them; and sometimes they allege, that the missionaries persuade people to embrace their doctrine merely by the aid of bribery, and that they gain converts, and fix their attachment by lavishing gold and silver among them, of which they have great abundance, because they puftle the secret of imitating and counterfeiting these precious metals. By such and similar representations, they have checked the zeal, and counteracted the efforts of Christian missionaries.

It has been observed (see Embassy to China, vol. ii. p. 100.), that the likenesses are strong between the apparent worship of many of the priests of Fo, and that which is exhibited in churches of the Roman faith, that a Chinese, converted into one of the latter, might imagine the votaries he saw were then adoring the deities of his own country. On the altar of a Chinite temple, behind a screen, is frequently a representation which might serve for that of the Virgin Mary, in the person of "Shin-mao," or the sacred mother, sitting in an above with a child in her arms, and rays proceeding from a circle, which are called a glory, round her head, with tapers burning constantly before her. The long coarse gowns of the Ho-tangse, or priests of Fo, bound with cords round the waist, would almost equally unfit the friars of the order of St. Francis. The former live, like the latter, in a state of celibacy, reside together in monasteries, and impose occasionally upon themselves voluntary penance and rigorous abstinence.

BOO-HADIAK, in Geography. See AGAR.

BOO-Jemon, a river of Africa, in the province of Conti, which runs along the western side of the marsh which separates/bit between Bona and the ancient Hippo. Over this river is a bridge of Roman structure.

BOO-Scatter, a town of Africa, in the kingdom of Tunis, said by Shaw (Trav. p. 79.) to be built on the ruins of the ancient Utica, which lies.

BOOBERAK, a river of Africa, in the kingdom of Algiers, formed by the junction of the Nifah and Bugdorah. Its mouth, which is made up of a number of branches, is the eastern boundary of the province of Tittere.

BOOBY, a word of uncertain etymology, derived by Skinner from the Spanish bobo, foolish; but deduced by Junius from bowbard, an old Scotch word for a coward or contemptible fellow; denotes a dull, heavy, stupid person.

BOOBY'S island, in Geography, a small island in the West Indies, lying directly opposite to Molquito bay, at the S. E. extremity of the island of St. Christopher's, and more than half a league from it, off the north end of Nevis island. Also, a small island, supposed to be one of the islands called Prince of Wales's islands, extending from thence and Wallis's island, as far as New Guinea.

BOOBY, in Ornithology, the name of pelicanus solita in Catesby's Natural History of Carolina. The great booby of Catesby is a variety of pelicanus boojus. Brown booby of Latham, pelicanus fiber; lesser booby, pelicanus varieus; spotted booby, pelicanus maculatus.

BOODGE-BOODGE, or BOOGE-BOOGE, in Geography, a town of Hindoozzan, the present capital of the territory of Cutch, and residence of its raja. It is also called Boodz, and placed in a map, to which Mr. Remell refers, about 34 geographical miles to the E. or E. S. E. of the eastern branch of the Indus: 120 miles S. E. of Tatta, and about 200 W. of Ahmedabad.

BOODHI, Buddha, Budh, or Buddon, in Mythology, a deity very anciently and very generally worshipped in India. The name of this deity is variously expressed by different writers. In the Pali language, and among the Cingalese, his common name is Buddha. Mr. Chambers, in the Asiatic Researches, writes Buddon; and Paulinus (Muf. Borg.), Budha; and from these two appellations we may easily deduce the Budda or Utta of Beaufobre and Bochart, the Bod of the Arabsians, Bodd of Edrisi, Bodd of Clemens Alexandrinus, and Bonth of M. Gentil. The name is said to be an appellation, synonymous with sage or philosopher, and expressive of wildness. By Budda, says the learned Bryant, (Anah. Anc. Mythol. vol. iii. p. 575.) we are certainly to understand the idolatrous symbol, called by some nations Buddo; the same as Argus and Theba. In the mythology transmitted concerning it, we may see a reference both to the machine itself, and to the person preferred in it. In consequence of which we find this person also styled Bod, Budha, and Buddo; and in the west Butus, Battus, and Bautus. He was said by the Indians not to have been born in the ordinary way; but to have come to light indirectly through the side of his mother. By Clemens of Alexandria, he is called Butus; and in the history of this person, however varied, we may perceive a relation to the Arkite deity of the sea, called Poseidon; and to Arcadius and Dionysus; styled Bautus and Thebanus. Different learned men have supposed Buddha to have been the name with Noah, Mole, or Siphoas the 35th king of Egypt; and Mr William Jones supposed Buddha to have been the name with Sefec or Setkris, king of Egypt, who by conquest spread a new system of religion and philosophy from the Nile to the Ganges, about 1000 years before Christ. In order to reconcile these differences of opinion among the Hindoos, with regard to the time of Buddha's appearance, this learned writer agrees with Giorgi in supposing, that they have confounded two Bouddhas; the younger of whom established the new religion, which gave great offence to the braminis in India, and was introduced into China in the first century of our era; whereas the more ancient Bouddha preceded him by many centuries, and is referred by Sir W. Jones, after a variety of computations, to the year 1027 before Chiril. For want of adverting to this circumstance, he confounded the latter Bouddha with the Woden of the Goths. Mr. Chambers also remarked, that Pood or Pudon, which is the Siamene mode of pronouncing the Boodh of the Indians and Birmans, bears a striking resemblance to the Gothic Woden; and it is further suggested, that Boodh is the Dies Mercurii, the Wednesday, or Woden's day, of all Hindoos. But etymological reasoning, more especially when it interferes with chronology, is not sufficient to establish the identity of Boodh and Woden. According to the chronology of the Hindoos, which Sir W. Jones has minutely investigated and detailed, Boudha was the ninth "Avatar," or deficit of the deity, in his capacity of preverber, or the ninth incarnation of Vishnou, which was long antecedent to the existence of the deified hero of Scandinavia, who, according to some writers, was a contemporary of Pompey and Julius Cesar, and who is placed by the author of the Northern

5 F 2

Antiquities,
BODDHA.

Antiquities, 70 years after the Christian era. Besides, the attributes of Boddh and Odin are very different. The deity, whose doctrines were introduced into Scandinavia, was a god of terror, and his votaries carried defoliation and the sword throughout whole regions; whereas the ninth Avatar (see Maurice's Hist. of Hindoostan, vol. ii. part 3.) introduced the peaceful olive, and appeared in the world for the purpose of preventing fanguny acts. He severely scourged the face of nature, or depriving any being of life, and is denounced the author of happiness. His place of residence is said to have been discovered at Boudha Gaya in Bengal, by the illustrious Amara, renowned amongst men; and according to an inscription in Sanscrit, found on a stone in this place, and translated by Mr. Willius, (Aristic Researches, vol. i. p. 234.) he caused an image of the supreme spirit Boodh-tha to be made, and worshipped it according to the law, with perfumes, incense, and the like; and he thus glorified the name of that supreme being, the incarnation of a portion of Vishnu: "Reverence be unto thee in the form of Boodh-tha! reverence be unto the lord of the earth! reverence be unto thee, an incarnation of the deity and the eternal one! reverence be unto thee, O God, in the form of the God of mercy, the dispeller of pain and trouble, the lord of all things, the deity who overcometh the sins of the Kales Yogo, the guardian of the universe, the emblem of mercy toward those who serve thee!" &c. As the doctrines of Boddh and Woden are different, and their deities are very remote, they must of course be different persons. The Buddha of the Hindoos is unquestionably, says Sir W. Jones, the Foe or Fo of China; and M. de Guignes, on the authority of four Chinese historians, affirms, that Fo was born about the year before Christ 1027, in the kingdom of Cashmir. Mr. Chambers, following M. Gentil, and followed by Paulinus, conceives, by a very forced train of etymology, the Fo or Fohi of the Chinese to be a corruption of Boodh-tha. Nor is the derivation of Tsautos, Toth, or Touth, the Egyptian name for Hermes from Boudhtha, less fanciful; and yet Fohi, the progenitor of the Chinese, a military tribe, whom the Hindoos call the Chandravans, or children of the moon, was, according to their Paranas or legends, Buddha, or the genius of the planet Mercury.

Among the various appellations by which the deity Buddha is known in several parts of the East, that of Godama is very common. This Godama, Gaudama, or Gotama, &c. as his name is differently expressed, is said to have been a philosopher, and is believed by the Birmans to have flourished about 2300 years ago; he is said to have taught in the Indian schools the heterodox religion and philosophy of Boddh. See Godama. The image that represents Boddh is called Gaudama or Goutum, which is now a commonly received appellation of Boddh himself: this image is the primary object of worship in all countries situated between Bengal and China. The lecteries of Gaudama are attended with those of Brahma for the honour of antiquity, and are certainly far more numerous. The Chins are in Ceylon are Boddhis of the purest source, and the Birmans acknowledge to have received their religion from that island, which they call Zehoo. From thence it was brought, as the Rahasans say, to Arracan, and it was then introduced into Ava, and probably into China; for the Birmans confidently assert, that the Chinese are Boddhis. Kempfer, speaking of the Budz, or Seaka, (Shaka, Shaky, Sjaka, or Sakyay, denoting, according to Paulinus, the cunning, or the god of good and bad fortune,) says, (Hiit. Japan. b. iv. c. 6.) "I have strong reasons to believe, both from the affinity of the name, and the very nature of this religion, that its author and founder is the very same person whom the Brahmans call Buddha, and believe to be the essential spirit of their Vishna (Vishnot) or their deity, who made his ninth appearance in the world under this name; the Peguers call him Saman Khantama." Where he treats concerning the introduction of Boddh into China, he says, (id. ibid.) "about the year of Chrift 518, one Darma, a great saint, and twenty-third successor in the holy fce of Seaka (Buddha), came over into China from Sutenicku, as the Japanese writers explain it, that is, from that part of the world, which his weltward with regard to Japan, and Taid, properly speaking, the first firm foundation of the Buddhaifm in that mighty empire." Others say, that the fect of Boddh was introduced into China in the year of our era 630, and that from China it proceeded to Jap, to Taid, to Japan, to Tainiun, China, and the remotest parts of Tarty.

Whatever may be the antiquity of the worship of Boddh, or Buddha, we cannot entertain no doubt of the wide extent of its reception and prevalence. In the isle of Ceylon, in the extensive Brahman empire, in the kingdoms of Siam and Cambogia, the prevailing religion is that of Boddh or Godama, and Mr. Chambers (Aristic Researches, vol. i. p. 162, &c.) has given very good reasons for believing that the worship of Boddh extended all over India, and was not rooted out by the Bradmaids in the Dececan, so lately as the 9th, or even the 12th century of the Christian era. From the history of Cashmir, presented to the fultan Abbar, on his first entrance into that kingdom, we learn, that Jelawok, one of its most powerful princes, tolerated the doctrine of Boddh; and that it was not till the reign of Nerkh the 59th prince, A.D. 343, that the Brahmins acquired the ascendency over the followers of Boddh, and burned down their temples. In Nepal the most ancient religion is that professed by a sect who call themselves "Baryeuf," and who seem to be worshippers of Boddh. In Narooara or Nangewal, the capital of the kingdom of Guzerat, we find that even after the Mahometan invasion, in the 11th century of our era, Edrihi, who wrote in the 12th century, informs us, that the people continued in the worship of the idol Boudha or Bud. This Arabic geographer adds, that the worship of the prince of this country, who reigned on the Malabar coast, with the title of Balhara, and whose dominions extended over Guzerat, and the greatest part, if not the whole of Kitiapur, was addressed to Boddh, who, according to St. Jerome and Clemens Alexandria, was the founder of the sect of the Gymnoophils, in like manner, says M. d'Anville, that the Brahmins were nbed to attribute their institution to Brahma. If the conjectures of Sir William Jones, relating to the inscriptions found at Mongheer, and on the pillar of Boddal, be well founded, the governing powers on the banks of the Ganges, as late as about the time of the birth of Chirih, were of the sect of Boudhtha; and however idle and ridiculous the legends and notions of the worshipers of Boudhtha may be, they have been in a great measure adopted by the Brahmins; but with this, all religious defects and extravagances much aggravated, rajahs and heroes being converted into gods, and impossibilities accumulated on improbabilities. From various authorities, to which we might refer, it sufficiently appears, that the worship of Buddha, or Boddh, has prevailed in several parts of India at a period prior to that of the Brahmins; and that this has been the cafe even so late as the 9th and the 12th centuries of the Christian era; and that this system forms the basis of that religion which the Brahmins have brought with them into the southern part of the peninsula of Hindoostan, into Madura, Tanjore, and Mylore. In those parts of India, and chiefly on the coast of Coromandel, and in Ceylon, the god Baudh, says M. Gentil, of whom, at present, they know no more in India than the name, was the object of worship;
but it is now totally abolished; except that there may be found some families of Indians, who have remained faithful to Braoath, and do not acknowledge the religion of the Brahmins; and on that account separated from and de-

fended by the other castes. It is generally allowed, that about the time of Chirii, the Brahmins gained a superiority over the worshippers of Buddha; and about 1100 years afterwards, we find them totally overpowering his doc-

trace in its native country; and perfecting his followers.

The Vedas, which are commonly supposed to be

the oldest books of the Brahmins, are of later date than the time of Buddha, as is evident from the mention which they make of that peripon. Asiatic Researches, vol. i. ii., and iv. Symes's Embassy to Ava, vol. ii. ch. 13. For a further account of the vocaries of Buddha, as well as the principles and rites of his worship; see Brahmanes, Go-

doma, Rahans, Samanakas, and Tirinanes. Seculno

mam.

BOOK, a writing composed on some point of knowl-

dedge by a person intelligible therein, for the instruction or

amusement of the reader.

The word is formed from the Saxon bec, which comes

from the Northern bech, of buchus, a beech or service-tree,

on the bark of which our ancestors used to write.

Book may be defined more precisely, a composition of

some man of wit or learning, designed to communicate,

to prove, or illustrate some science, art, truth, or invention.

Book is distinguished from pamphlet, or single paper, by

its great length; and from tome or volume, by its containing

the whole writing on the subject. Before makes this distinc-
tion between liber and codex; that the former denotes a single

book, the latter a collection of several; though, according to

Scipio Maffei, codex signifies a book in the square form; liber,

a book in the roll form. The primary distinction between

liber and codex seems to have been derived, as Dr. Heylin has

observed, from the different materials used for writing, among

the ancients. From the inside of the bark of a tree, used

for this purpose, and called in Latin liber, the name of liber

applied to a book was deduced; and from tablet, formed

from the main body of a tree, called caudex, was derived the

appellation of codex.

We say an old book, a new book; a Latin, a Greek

book; to read, to write, to publish a book; the preface, the

title, the dedication, the index of a book. To collate a book, is to see that it be perfect, and that none of the sheets be either wanting or transposed. Book-binders speak of

folding, faying, beating, pressling, covering, gilding, and

latttering of books. See Bookbinding.

A large collection of books is called a library. An inven-
tory of a library, in order to the reader’s finding any book,

is called a catalogue.

The history or notitia of books makes the first part, ac-

cording to some of the whole, of the literary science.—The

principal points of the notitia of a book are, its author, date,

printer, edition, version, comments, epistles, fucces, eul-

gogies, confusions, condemnation, supplication, adverbaries, vin- 

icators, continuators, and the like.

The history of a book is either of its contents, which is

given by analysing it, as is done by journalists and reviewers; or of its appendages, and accidents, which is the more immediate province of those called literators, and bibliothecarians.

The contents of a book are the matters delivered in it;

which make the province of the author. Of these there is

one principal matter, called the subject; in respect of

which the rest are only incidents.

The appendages of a book are, the title, preface, epistle

dedicatory, summaries, table of contents, index, and the

like, which are the proper province of the editor, unless per-

haps the title page, which is frequently usurped by the

book-seller.

In the composition of a book, there occur sentiments,

which are also the materials of it; method, the order where-
in these are disposed; and stile, or expression, which is the

language in which they are clothed.

The giving of histories, catalogues, and bibliothecers of

books, is said to have been first introduced by the Germans;

we may add, that they have held succeeded in them; and to

them the chief works of this kind are owing. 1. Alb. Fa-

bricius has given us the history of the Greek and Latin

books; Wohius, that of the Hebrew books; Boecker, of the

principal books in each science and faculty; Struvis, of the

books of history, law, and philosophy; the abbob Fa-

bricius, of the books of his own library; Lambecius, of those

in the Vienna library; Le Long, of the books of Scripture;

Mattaire, of the books printed before the year 1550; and

Morrhof, a general literary history of this kind, under the

title of Polybiblion. The various catalogues of choice lib-
aaries are useful and necessary for the same purposes: fo are

likewise the relations, &c. and the reviews which have been

periodically published. See Bibliotheca.

Books, as to the materials of, they were first written on

stones, witnesses the Decalogue given to Moses (which is the

oldest book we have any warranted account of); then, on

the parts of plants, c. gr, the leaves, chiefly of the palm-tree; the

rinds and barks especially of the tilla orphylma, and the E-

gyprian papyrus. By degrees, wax, then leather, were introduced, especially the skins of goats and sheep, of which at length, parchment was prepared: then lead came in use; also linen, filk, horn, and bai-ty, paper itself. See Paper.

The parts of vegetables continued long the common mat-

ter of books; innumerable that most of the names and terms

belonging to books, in most languages, are taken thence:

as the Greek libri, the Latin liber, codex, folium, tabula, and

the English book itself. We may add, that vegetable barks

appear still in some measure retained for books in certain

of the northern countries, as among the Calmuts Tartars, where

a library was discovered by the Ruffians, of an unusual form

as well as matter: the books were exceedingly long, but of

no breadth; the leaves very thick, and made of barks of trees,
fined over with a double varnish; the ink, or writing, being white on a black ground. Hist. Acad. R. Infer.

V. iii. p. 6.

Whatever were the materials used by the ancients for

their books, they were liable to be easily destroyed by the

damp, when hidden in the earth; and in times of war, de-

vastation, and rapacity, it was necessary to bury in the earth

whatever they wished to preserve from the attacks of fraud

and violence. Accordingly, it is well known that perons,

whole property was, thus exposed, concealed in this manner,

not only silver and gold, but wheat, barley, oil, and honey;

and also their garments, and their writings. With this

view, Jeremiah ordered the writings, which he delivered to

Baruch, to be put in an earthen vessel. See chap. xxxii.

In the same manner the ancient Egyptians made use of

earthen urns, or pots of a proper shape, for containing

what-
BOOK.

whatever they wanted to inter in the earth, and which, without such care, would have been soon destroyed. We need not wonder then, that the prophet Jeremiah should think it necessary to enclose those writings in an earthen pot, which were to be buried in Judah, in some place where they might be found without much difficulty on the return of the Jews from captivity. Accordingly, two different writings, or small rolls of writing, called books in the original Hebrew, were designed to be enclosed in such an earthen vessel; but commentators have been much embarrassed in giving any probable account of the necessity of two writings, one sealed, the other open; or, as the papyrus has been commonly understood, the one sealed up, the other left open for any one to read; more especially, as both were to be alike buried in the earth and concealed from every eye, and both were to be examined at the return from the captivity. In order to solve this difficulty, the ingenious Mr. Harmer (Obs. on Script. vol. iv. p. 4.) remarks, that though one of them is said to be sealed, it doth not follow that it was sealed in such a manner as not to be opened. Like modern deeds for the conveyance of land, it might have been sealed, though not with wax, yet, according to the present eastern manner, with ink, so as to be valid. Moreover, the word translated open, in reference to such evidence, or book which was open, is not the same word that is twice used by Nehemiah, ch. 3. 5.; nor is it a word, which signifies (1 Sam. iii. 7. 21. Dan. ii. 19, 20. x. 1.) the revealing of future events to the minds of men, by a divine agency; and it is particularly used in the book of Esther, (ch. viii. 17.) to express a book’s making known the decree of an earthly king. Consequently the open book of Jeremiah seems to signify, not its being then lying open or unrolled before them, while the other was sealed up; but the book that had revealed the will of God, to bring back Israel into their own country, and to cause buying and selling of houses and lands again to take place among them. This was a book of prophecy, opening and revealing the future return of Israel, and the other little book, which was ordered to be buried along with it, was the pur chase deed. By advertising to the different modes of writing in the East, we obtain a satisfactory interpretation of a passage in the book of Job, (ch. xix. 23, 4.) and a distinct view of the beautiful gradation which is lost in our translation: “O that my words were now written! O that they were printed (written) in a book! that they were graven—in the rock for ever!” In the East there is a mode of writing, which is designed to fix words in the memory, but the writing is not intended for duration. Accordingly, we are informed by Dr. Shaw, (Trav. p. 194.) that children learn to write in Barbary by means of a smooth thin board, lightly covered with writing, which may be wiped off, or renewed at pleasure. As many occurrences were effaced from the memory of the Arabs in the time of Job, as well as from their writing tables, as it now often happens in Barbary; Job expresses his wish not only that his words were written, and written in a book, from which they should not be blotted out, and graven in a rock, the most permanent mode of recording them, and much more effectual for perpetuating them than a book.

We find in Signior Caltagiratia’s account of the abbebos, a scheme for the making of a book, which from its impenetrable nature, he is for calling the book of eternity. The leaves of this book were to be of the abbebos paper, the covers of a thicker sort of work of the same matter; and the whole sewed together with thread from the same substance. The things to be commemorated in this book were to be written in letters of gold, so that the whole matter of the book being incombusible and everlastingly permanent against the force of all the elements, and subject to no changes from fire, water, or air, must remain for ever, and always preserve the writing committed to it. See PAPER.

Books, form of. The first books were in the form of blocks and tables, of which we find frequent mention in Scripture, under the appellation papyrus, which the Septuagint render rικον, q. d. square tabule; of which form the book of the covenant, book of the law, book, or bill of divorce, book of curfes, &c. appear to have been. As flexible matters came to be written on, they found it more convenient to make their books in form of rolls, called by the Greeks καρπος, by the Latinς volumina, which appear to have been in use among the ancient Jews as well as Grecians, Romans, Persians, and even Indians. And of such did the libraries chiefly consist, till some centuries after Christ. The form which obtains among us is the square, composed of separate leaves; which was also known, though little used, among the ancients; having been invented by Attalus, king of Pergamus, the same also who invented parchment: but it has now been so long in poleciion, that the old led manuscripts are found in it. Mentone an tells us, that of all the ancient Greek manuscripts he has seen, there are but two in the roll form; the rest being made up much after the manner of the modern books. See Book-binding.

The rolls, or volumes, were composed of several sheets, fastened to each other, and rolled upon a stick, or umbilicus; the whole making a kind of column, or cylinder, which was to be managed by the umbilicus, as a handle; it being reputed a kind of crime to take hold of the roll itself. The outside of the volume was called front; the ends of the umbilicus, were called cornua, horns; which were usually carved and adorned likewise with bits of silver, ivory, or even gold and precious stones. The title χειρογραφία was fluck on the outside. The whole volume, when extended, might make a yard and a half wide, and fifty long. Fabric. Bibl. Antiq. c. 10. 67. p. 607.

Sir John Chardin informs us, in a note on II. viii. 1. that the easterm people roll their papers, and do not fold them, because their paper is apt to fret. Whilstathe Egyptian papyrus was in common use, its brittle nature made it proper to roll up what they wrote: and as this had been a customary practice, many continued it when they used other materials, which might very safely have been treated in a different manner. This method of rolling up their books is referred to in the New Testament; and that they were of the same form much more anciently, we learn from Jer. xxxvi. 2. Pf. xi. 7. &c. &c.

It is customary not only to wrap up Oriental books and letters which are rolled up, in an elegant and closely covering; but to inscribe words on these coverings, which give a general notion of their contents. This practice of writing on the outside of the case of a letter, or book rolled up, seems to be at least as ancient as the time of Chryfofom, as we learn from a note of Lambert Bos on Pf. xxxix. 7. as it occurs in the LXX. v. 40, in our version. Chryfofom remarks, that they call a wrapper (πακρος) the χειρογραφία, which is the word the Septuagint translators make use of to express the Hebrew word we translate volume: “In the volume of the book it is written of me.” The learned father seems to suppose, that there was written on or in the covering of the former volume, a word or words which signified the “coming of the Messiah.” But Chryfofom would hardly have thought of such an interpretation, if it had not been frequently done at Constantinople in his time, or by the more eastern princes that had business to transact with the Greek emperors, or been known to have been practised.
practised before those times among the Jews. Chrysolomon lived in the 4th century. Aquila, who is thought to have lived above 100 years sooner, and is allowed to be a most close translator of the Hebrew, uses, according to Boe, the same word καὶ τις, or wrapper, to express the Hebrew word םוֹתָלָה. He therefore supposed that what was written, to which this passage refers, was written on the covering or wrapper of the sacred books. This explanation fuggels a much more agreeable mode of rendering the word than our English term volume; since every ancient Hebrew book was a volume, or roll, and consequently the passage merely expresses: "In the book it is written of me." But if we understand it of the safe in which their books were wrapped up, the thought is not only clear and distinct, but very energetic, and amounts to this, that the sum and substance of the sacred books is, that "the Meilish cometh;" and that those words accordingly might be wrote or emblazoned, with great propriety, on the wrapper, or safe in which they were kept.

Another translation renders the word τὸ τόπος, which intimates that the motto was inscribed on the cylinder, round which books of this form were wont to be rolled. In this case, it was probably written on the side of that part of the cylinder which reached beyond the parchment, linen, or whatever material was used, and which was convenient enough for exhibiting, in brief, what the purport of the volume was. Mr. Harmer (Obf. on Script. vol. iv. p. 11.) fuggels, that the circle of gold, with the name of one of our Saxon princes upon it, and ornamented after the manner of those times, might be designed to safe the end of the cylinder, or one of the cylinders, on which some book belonging to that monarch, or relating to him, was rolled; or on which ancient piece of gold an engraving is given in the seventh volume of the Archologia, or Transactions of the Antiquarian Society. This sort of ong to those cylinders used to be called the "As tell." To the form of books belong the economy of the inside, or the order and arrangement of points and letters into lines and pages, with margins, and other appurtenances. This has undergone many varieties: at first, the letters were only divided into lines, then into separate words; which, by degrees, were noted with accents, and divided by points and slants into periods, paragraphs, chapters, and other divisions. In some countries, as among the Orientals, the lines began from the right, and ran to the left; in others, as in Northern and Western nations, from the left to right; others, as the Grecians, followed both directions alternately, going in the one, and returning in the other, called boyaphroded. In the Chinese books, the lines ran from top to bottom. Again, the page in fome is entire, and uniform; in others, divided into columns; in others, distinguished into lines and notes, either marginal, or at the bottom; usually it is furnished with catchwords and catchwords; also with a register to discover whether the book be complete. To these are occasionally added the apparatus of summaries, or fide notes; the embellishments of red, gold, or figured initial letters, head-pieces, tail-pieces, ligatures, schemes, maps, and the like. The end of the book now denoted by finis, was anciently marked with a Σ, called corinis, and the whole frequently washed with an oil drawn from cedar, or citron chips, burned between the leaves to preferve it from rotting. There also occur certain formula at the beginning and end of books; as among the Jews, the word בָּרָו, open foris, which we find at the end of the books of Exodus, Levitical, Numbers, Ezekiel, &c. to exhort the reader to be courageously, and proceed on to the following book. The conclusions were also often guarded with imprecaions against such as should falsify them; of which we have an instance in the Apocryphal. The Mahometans, for the like reason, place the name of God at the beginning of all their books, which cannot fail to procure them protection, on account of the infinite regard had among them to that name, wherever found. For the like reason it is, that divers of the laws of the ancient emperors begin with the formula, In nomine Dei. At the end of each book the Jews also added the number of verses contained in it, and at the end of the Pentateuch the number of sections; that it might be transmitted to posterity entire. The Malorctes and Mahometan doctors have gone farther; so as to number the several words and letters in each book, chapter, verse, &c. of the Old Testament, and the Alcoran. See Alcoran, Bible, Massora, &c.

The kinds and denominations of books are various. Books, with regard to their use and authority, may be divided into human and divine, also called sacred and inspired books.

Books, Sybilline, those composed by certain pretended prophets of these, deposited in the Capitol, under the care of Donuviri. See Sybils.

Books, Canonical, those received and allowed by the church as parts of holy scripture. Such are the books of the Old and New Testament, as commonly bound up together. See Canon and Bible.

Books, Apocryphal, those excluded out of the canon, yet received and read in some churches. See Apocryphal.

Books, Authentical, those which are decisive, and of authority: such, in the civil law, are the Code, Digest, &c. in our law, the Statutes, &c. Bacon de Augm. Sci. i. 8. c. 3.

Books, Auxiliary, those left off, yet of use, as subfervient to the others: as in the study of the law, books of Inlinutes, Formula, Maxims, Reports, &c.

Books, Elementary, those which deliver the first principles of sciences: such are those under the titles of Rudiments, Methods, Grammars, &c. by which they stand and are distinguished from books of a superior order, which aim at making further advances in the sciences.

Books, Library, such as are not ordinarily read over, but turned to, and consulted occasionally; such are dictionaries, &c.

Books, Exteries, those intended for the use of popular and ordinary readers.

Books, Aeromannic, those containing more secret and sublime matters, calculated for adepts and proficient in the subject.

Books, Public, the records of past times and transactions kept by public authority.

Books, Church, or Ecclesiastical, those used in the public offices of religion.

Books, again, with regard to their scope and subject, may be divided into historical, those which relate facts, either by nature or mankind; dogmatical, those which lay down doctrines, or general truths; miscellaneous, those of a neutral kind, containing both facts and doctrines; bisterior-dogmatical, those which only revere doctrines, or, as milk, indicate the arguments by which they are proved, as Mallet's Geometry; scientifich-dogmatical, those which not only recite the doctrines, but demonstrate them, as Euclid's Elements. Wolf. Phil. Rat. § 3 c. 1. § 744. 750. 751, &c.

Books, Pontifical, among the Romans, were those appointed by Numa to be kept by the pontiffs maximus; describing
cribing all the ceremonies, sacrifices, feasts, prayers, and other religious matters, with the manner, and circumstances, whereby each was to be celebrated; these were also called *indigiamata*, as containing the names of all the gods and the occasions, and formula of invoking each. Liv. i. p. 23.

**Books, Ritual.** Those which directed the order and manner of founding, building, and consecrating cities, temples, and altars; the ceremonies belonging to walls, gates, tribes, curias, camps, and the like.

Those, *Augsular*, called by Cicero *reconditi*, were those wherein the *Legends* of the founding *Futurity*, from the flight and chattering of birds, was contained. Cic. Orat. de domo fuæ ad pontif., Serv. ad Æn. l. 5, v. 738. Lomei, de Bibl. c. 6.

Books, *Aruspicin*, those wherein the mysteries of divining from the entrails of victims are preferred.

Books, *Achænetic*, those wherein the ceremonies and discipline of Achæron were contained; sometimes also called *libri Etrusci*, as being supposed to have been composed by Tages the Hetrurian; though others pretend, that he had received them from Jupiter himself: some suppose these to have been the same with the *libri futuriales*, others with the *libri aruspiciani*. Serv. ad Æn. l. 8, v. 89. Lomei, ubi supra.

Books, *Fulgaral*, those written touching thunder and lightning, and their interpretation. As that composed by the Tufcan nymph Biggs, preferred in the temple of Apollo. Serv. ad Æn. l. 6, v. 72.

Books, *Fatai*, those wherein the ages, or terms of the life of men were written, according to the Hetrurian discipline. Those were condemned by the Romans in all public calamities; and instructions taken from them, how to expiate the offended deities. Confer. de Dic. Nat. c. 11.

Books, *Black*, those which treat of necromancy, and witchcraft; or those which are printed in the old black letter, the Celtic character, now only retained by the Germans. The same denomination is also given to some other books, on account of the colour of their backs, or the disfigurement of their contents; whence also *Red-book* and *Donkey-book*.

Books, *Good*, in the common usage, are those of devotion and piety, as dogmatic, meditations, prayers, &c. Vide *Scafitab. Chor. tom. i. p. 155. idem, tom. iii. p. 327.*

A *good book* in the bookseller's language, is a saleable one; in the language of the curious, a scarce one; in that of men of fensé, an useful and instructive one.

Among five principal things which Rabbi Akiba recommended to his son, one was, that if he studied the law, he should take care to do it in a *good book*, lest he should be obliged to unlearn all again. Vide Cren. de Furib. Libr. See also farther, on the head of judging and chusing of Books.

Books, *Spiridinal*, those which treat more expressly on the spiritual or Christian life, and their exercises, as to contemplation, &c.

Books, *Proprieties*, such as do not treat of matters of religion.

Books, with regard to their authors, may be divided into *anonymus*, those without any author's name; *cryptonymus*, those whose authors' names are concealed in some anagram, or the like; *pselonymus*, those which bear false names of authors; *polibonum*, those published after the author's death; *genuine*, those really written by the persons whom they pretend for their authors, and still remaining in the state wherein they were left by them; *spurious*, or *suppositi-
BOOK.

where it makes four leaves; in 8°, where eight; in duode-
cime, where twelve; in 16°, where sixteen; in 24°, where twenty-four.

Books, with regard to circumstances and accidents, may be divided into two, those which have perished by the injuries of time, or the malice or zeal of enemies. Such are divers even of the ancient books of Scripture, written by Solomon and others of the prophets. Fabr. Cod. Plead. Vet. Telv. tom. ii. p. 171. p. 237. Books promised, those which authors have given expectations of, which they have never accomplished. Jahn. ab Almeloveen has given a Bibliotheca of books promised, but till latent, or not published. Books fictitious, those which never existed; to which may be added divers feigned titles of books. Loeoeh has published a great number of plans, or projects of books, many of them good and useful enough, if there were but books written corresponding to them. M. Dugon has a whole volume of schemes or projects of books, containing no less than 5000.

Books in Ana. Anti, &c. See Ana, Anti, &c.

Books, the scope or design of; is various; that of some is to trace the origin of things discovered; of others, to fix and establish some truth, or raise some doctrine to a higher pitch or subtlety; of others, to remove some scruple, or prejudice, which had before obtained, or fix more accurate and precise ideas of things; of others, to explain the names and words used in different nations, ages, and sects; of others, to improve our knowledge of facts, and events, and shew the order and ways of Providence; lastly, others aim at divers, or all of these ends.

Books, the nes of; are numerous; they make one of the chief instruments, or means of acquiring knowledge: they are the repositories of laws, and the vehicles of learning of every kind; our religion itself is founded on books: Without them, "Fays Bartholin," "God is silent, justice dormant, physic at a stand, philosophy lame, letters dumb, and all things involved in Camminian darkens." De Libr. Legend. Diff. i. p. 5.

The eulogiums which have been bestowed on books are infinite: they are represented "as the refuge of truth, which is banished out of conversation; as standing censellers, and preachers, always at hand, and always interested; having this advantage over oral instructors, that they are ready to repeat their leson, as oft as we please." Books supply the want of matters, and even, in some measure, the want of genius and invention; and can raise the dulled persons, who have memory, above the level of the brightnest without them. An author who wrote not indecently, though in a barbarous age, fums up all their praisef Vide Lucas de Penna ap. Morhof. Polyhist. lib. i. cap. 3. p. 27. "Liber est lumen cordis, speculum corporis, virtutum magistri, vitiorum depulor, corona prudentum, comes inimici, domelicus amisus, congesto talentis, collega & confidarius praedentis, myrothecum eloquentiae, hortus plenus-infructus, pratum floribus diffumum, memory penes, vita recordationis; vocatus properat, jujus felinea, desperato eft, nuncam non morigerus, nogetus concellum reprehendit; arca revelat, obtura illuflrat, ambigua certiorat, perplexa refolvit, contra adverfam fortunam derobam, lecundum moderato, opes adaduet, jacturam propulsat," &c.

Perhaps their greatest glory is, the election borne them by many of the greatest men in all ages; M. Cato, the elder Pliny, the emperor Julian, and others, are on record for a very extraordinary devotion to books. This last has perpetuated his passion by some Greek epigrams in their praise. Richard Bury, bishop of Durham, and lord chancellor of England, has a treatise expres on the love of books. Philobiblion, Sive de Amore Librorum. Vide Plin. Epift. vii. lib. iii. Vol. IV. Cato's attachment to books may be observed in the following paragraph.

M. Catonem vidi in bibliotheca sedentem multis circum-
susum Stoicorun libris. Exst entum, ut fcri, in eo inaequali aviditas legendi, nec fattari poterat: quique qui, de repreheni-
fione veli inamnem reformandam, in ipso cura tolerat legere, spee dum fennus cogetur, nihil operae reipublice detra-
hens." Vide Cic. de Divin. lib. iii. n. 11. See also Cic. Orat. pro Arch. tom. iv. p. 2182.

Books, the ill effects objected to, are, that they employ too much of our time and attention; engage us in pursuits of no use to the commonwealth, and indispose us for the functions of civil life; that they render men lazy, and prevent their exerting their own talents, by furnishing them, on every occasion, with things that are the productions of others; and that our natural lights become weakened and extinguished, by inuring ourselves to see only with foreign lights: besides, that ill men are hereby furnished with means of poisoning the people, and propagating superstition, immorality, enthufiasm, or irreligion, which will always spread faster, and be received more greedily, than leflons of truth and virtue. Many other things are added concerning the emptines of books, and the errors, fables, and follies they are fraught with: which, together with the multiplicity and perplexity of them, are such, that it may seem easier to discover truth in the nature and reason of things, than in the uncertainty and confusion of books. Add, that books have turned the other instruments of knowledge out of doors, as experiments, observations, furnaces, and the like, without which the natural sciences can never be cultivated to purpose; and that, in mathematics, books have so far superseded the exercise of invention, that the generality of mathematicians are now contented to learn the solution of problems from others; which is to relinquish the chief end of their science; since what is contained in mathematical books is properly the history only of mathematics, not the science, art, or talent of solving questions; which is hardly to be had from books, but only from nature and meditation.

Books, for the art of rewriting, or compounding, we have much fewer helps and instructions than for the art of speaking; though the former be the more difficult of the two; as a reader is not so easy to be imposed upon, but has better opportunities of detecting faults than a hearer. A great car-
dinal, indeed, reduces an author's business to a few heads; were they but as easily practised as preferred; "Let him consider who it is he writes, what, how, why, and to whom." Auguf. Valer. de Cand. in edend. lib. The conditions required in a book are, according to Selden, "solidity, perperecity, and brevity;" the first will be best attained, by keeping the piece long by us, often reviewing and correcting it by the advice of friends: the second, by disposing the sentiments in a due order, and delivering them under proper and usual expreptions: the third, by throwing every thing aside that does not immediately concern the subject. Were these rules observed, it would scarcely be possible for any, except an angel from heaven, to write many books. "Vix totidem quot thebarum portae vel divitis oftii Niti." The custom is much altered since the times of the ancients, who carried their ferupoloufets into what relates to the composition of books beyond all that has been written expressed: to annum it was the idea they formed of a book, that nothing would suffice less than its being a treasure: the

neuds saepe postulat, non libros?" no labour, no affiduity and exactnes, were thought enough to fit a work for the public view: every sentiment and expreption were to be maturely weighed, and turned on all sides; and not suffered to pass, uncles every word were a pearl, and every page beft with 5 G
Books, for the origin of, we have nothing that is clear: the books of Moses are doubtless the oldest of all that are extant; but there were books before them, for Moses cites several. A book of Enoch is cited in the epistle of Jude, v. 14. and 15. from which some endeavor to prove the reality of ancient Jewish writings; but the book cited by that apocryphal writer is generally allowed both by ancient and modern critics to be spurious. See Bible.

Of prophetic books, the oldest extant are Homer's poems, which were even so in the time of Sextus Empiricus; though we find mention in Greek writers, of about seventy others prior to Homer; as Hesiod, Orpheus, Daphnis, Horus, Linus, Mæseus, Palamedes, Zoroaster, &c., but of the greater part of these, there is not the least fragment remaining; and of the others, the pieces which go under their names are generally held by the learned supposititious. F. Hardouin goes farther: charging all the ancient books, both Greek and Latin, except Cicero, Pliny, Virgil's Georgics, Horace's Satires and Epistles, Herodotus, and Homer, as spurious, and forged in the thirteenth century, by a club of persons under the direction of one Severus Arcanitus. Feb. Bib. Grac. lib. i. cap. 1. § 1. 6, tom. i. Hardouin de Num. Herod. in Proph. Act. Erud. I. p. 1710. p. 70.

Among the Greeks, it is to be observed, the oldest books were in verse, which was prior to prose; Herodotus's history is the oldest book extant of the profaic kind. Strabo. Geog. lib. i. Heueman. Via ad Hift. Liter. § 20. p. 50. § 21. p. 52.

Books, the multitude of, has been long complained of: the complaint is as old as Solomon, who lived three thousand years ago; they are grown too numerous, not only to procure and read, but to fee, to learn the names of, if even to number. England has more to fear on this score, than other countries; since, besides our own produce, we have, for some years past, drained our neighbours. However, as bishop Caramell's scheme misfitted, which was to write about a hundred volumes in folio, and then prevail on the civil and military powers to oblige all their subjects to read them, we need not much regret the multitude of books.

In reality, there are few of the immense number of books which deserve seriously to be studied: for the rest, part of them, like this, are only to be occasionally consulted, and the rest read for amusement. A mathematician, for instance, ought not to be entirely ignorant of what is contained in the mathematical books: but then a general knowledge is sufficient, which may easily be had by running over the chief authors; out of whom references may be made, directing to the places where they may be found, when wanted. For there are many things which are much better preferred in books than in the memory: astronomic observations, tables, rules, theorems, proportions, and in fine, whatever does not spontaneaously adhere to the memory, when once known. For the less we crowd that faculty, the reader and hearer will the genius remain for inverting.

Other books may be valuable in themselves, for some special purpose, or in some peculiar science, but are not fit to be perused except by those who are engaged in that particular science, or business. To what use is it for a divine, or a physician, or a tradesman, to read over the huge volumes of reports of adjudged cases in the law? Or for a lawyer to learn Hebrew and read the Rabbins, unless his inclination leads him, and his leisure allows him to employ himself in this way? For improvement of knowledge and faving of time, it is of great importance for young persons to have the most proper books for his reading, recommended by a judicious friend.

Books of importance of any kind, and especially complete treatises on any subject, should be first read in a more general and curiously manner, to learn in some degree what the treatise promises, and what you may expect from the writer's manner and style. For this purpose let the preface be read, and the table of contents, if there be any, before this first survey of the book. By this means you will not only be better fitted to give the book a first reading, but be much assisted in a second perusal of it, which should be done with greater attention and deliberation, and you will learn with more ease and readiness what the author professes to teach. In reading it will be useful to mark what is new or unknown to you before, and to review those chapters, pages, or paragraphs. Unless a reader has an uncommon and mott recentive memory, we may venture to affirm, that there is scarcely any book or chapter worth reading once, that is not worthy of a second perusal. At least it will be proper carefully to review all the lines or paragraphs which were previously marked, and to recollect the fections which were thought truly valuable. There is another reason why it will be useful to take a superficial and curiously survey of a book, before we sit down to read it, and to dwell upon it with judicious attention; and that is, that there may be several difficulties in it, which we cannot easily understand and resolve at the first reading, for want of a fuller comprehension of the author's whole scheme. Many such difficulties would be unravell'd when we have proceeded farther in such books, or would vanish themselves upon a second reading.

What we cannot thoroughly understand at first may be noted down as matter of subsequent consideration and inquiry, if the pages that follow do not happen to strike a complete light on those which went before. In perusing books that treat of subjects of national, moral, or divine science, it should be considered that it is our business, not merely to know the opinion of the author, for this is but the mere knowledge of history; but truly to reflect, whether his opinions are just or not, and to improve our own knowledge of the subject by a careful investigation of it. With this view we should deal freely with every author whose works we read, and yield our assent only to evidence and just reasoning. If a writer on any particular subject, to which your attention is directed, maintains sentiments similar to your own, but does not explain his ideas, or prove his opinions to your satisfaction, mark his defects, or faults, and endeavour to do it better, either in the margin of your book, or rather on some papers of your own, e. g. When the author is obscure, enlighten him; where he is imperfect, supply his deficiencies; where he is too concise, amplify, and let his notion, in a fairer view; where he is redundant, mark the paragraphs that ought to be retrenched; where he trifles and indulges in impertinence, abandon those passages, or pages; where he argues, observe whether his reason be conclusive; if the conclusion be true, but the argument weak, endeavour to confirm it by better proofs; where he deduces any propositions obscurely, or doubtfully, make the justness of the inference to appear, and add further inferences or corollaries, if such occur to your mind; where you suppose he is mistaken, propose your objections, and correct his errors; what he writes so well as to approve itself to your judgment, as both just and useful, treasure up in your memory, and count it a part of your intellectual gains.

If the method of a book be irregular, reduce it into form, by
BOOK.

by an analysis of your own, or by hints in the margin: if those things be hoarded together, which should be separated, distinguish and divide them. If several things relating to the same subject be scattered through various parts of the same treatise, let them be brought together into one view, by suitable references; or if the matter of a book be really valuable and deserving the labour, you may arrange it in a better method, reduce it to a more logical scheme, or abridge it into a letter form. All these practices will have a tendency to advance your own skill in logic and method, to improve your judgment in general, and to give you a more comprehensive survey of that subject in particular. When you have finished the treatise, with all your observations upon it, recollect and determine what real improvements you have made by reading that author. If a book have no index, or good table of contents, it is useful to make such as you are reading it; taking notice merely of those parts which are new and well written, and well worthy of remembrance, or review. If the writer be remarkable for any peculiar excellencies, or defects in his style, or manner of writing, attentively observe them, and whatever ornaments or blemishes occur in the language, or manner of the writer, you may make just remarks upon them. One book perused in the manner now proposed, will tend more to enrich the understanding, than flimming over the surface of 20 authors.

There are many who read," says the excellent author of whole useful observations we are now availing ourselves, (see Watts's Improvement of the Mind) "with confluxion and diligence, and yet make no advances in true knowledge by it. They are delighted with the notions which they read, or hear, as they would be with stories that are told, but they do not weigh them in their minds as in a just balance; in order to determine their truth, or falsity; they make no observations upon them, or inference from them. Perhaps their eye slides over the pages, or the words slide over their ears, and vanish like a repast of evening tales, or the shadows of a cloud flying over a green field in a summer's day; or, if they review them sufficiently to fix them in their remembrance, it is merely with a design to tell the tale over again, and to shew what men of learning they are. Thus they dream out their days in a course of reading without real advantage. As a man may be eating all day, and for want of digestion is never nourished; so these endless readers may cram themselves in vain with intellectual food, and without real improvement of their minds, for want of digesting it by proper reflection."

"Never apply yourselves," says the sage writer, "to read any human author with a determination, before-hand, either for or against him, or with a settled resolution to believe, or disbelieve, to confirm, or oppose whatsoever he faith; but always read with a design to lay your mind open to truth, and to embrace it wherever you find it, as well as to reject every falsehood, though it appear under no fair disguise. How unhappy are those men, who seldom take an author in their hands, but they have determined before they begin, whether they will like or dislike him! They have got some notion of his name, his character, his party, or his principles, by general conversation, or perhaps by some slight view of a few pages; and having all their own opinions adulterated before-hand, they read all that he writes with a prejudice either for or against him: unhappy those who hunt and purvey for a party, and ferape together out of every author, all those things, and those only which favour their own tenet, while they omit and neglect all the rest! The author subjoins an useful caution; and wishes not to be understood, as perceiving a person to live without any settled principles, by which to judge of books, men, and things, or to be always doubting about his foundations. Yet having settled, upon good grounds, the most necessary and important principles of science, prudence, and religion, we should read, with a just freedom of thought, all those books which treat of such subjects as may admit of doubt, or reasonable dispute. When we peruse those authors who defend our own settled sentiments, we should not hastily conclude that all their reasonings are just and solid; nor eagerly embrace all their lesser opinions, because we agree with them in the greater. When we read those authors who oppose our most certain and established principles, we should be ready to receive any information from them in other points, and not abandon every thing they say, though we are well fixed in opposition to their main object:

"Seize upon truth where'er it's found, Amongst your friends, amongst your foes, On Chriftian, or on heathen ground; The flower's divine where'er it grows; Neglect the prickers, and assume the rose."

Upon the plan of reading above stated and recommended, a few books well chosen, and thoroughly studied, may suffice. It may be added, that a knowledge is naturally advantageous, and as every man ought to be in the way of information, even a superfluity of books is not without its use, since hereby they are brought to obtrude themselves on us, and engage us when we had least design. This advantage, an ancient father observes, we owe to the multiplicity of books on the same subject, that one falls in the way of one man, and another befits the level, or the apprehension, of another. "Every thing that is written," says he, "does not come into the hands of all persons: perhaps some may meet with my books, who may hear nothing of others which have treated better of the same subject. It is of service, therefore, that the same questions be handled by several persons, and after different methods, though all on the same principles, that the explications of difficulties, and arguments for the truth, may come to the knowledge of every one, by one way or other." Add, that the multitude is the only security against the total loss or destruction of books: it is this that has preferred them against the injuries of time, the rage of tyrants, the zeal of peripaters, and the ravages of barbarians; and handed them down, through long intervals of darkness and ignorance, safe to our days. "Solaque non movit hanc monumenta mori." Bac. de Augm. Sc. lib. i. Augufi. de Trin. lib. i. cap. 3. Barthol. lib. cit. Diff. i. p. 8, &c.

Books, the curiosity of, is an evil much more to be lamented, in the survey of past ages, than their multitude at any later period. Before the art of printing was invented, the trouble and expense of procuring copies very much retarded the progress of literature. The universal ignorance that prevailed in Europe, from the seventh to the eleventh century, may be ascribed to the scarcity of books during that period, and the difficulty of rendering them more common, concurring with other causes arising from the state of government and manners. The Romans wrote their books either on parchment, or on paper made of the Egyptian papyrus. The latter, being the cheapest, was of course the most commonly used. But after the Saracens conquered Egypt, in the seventh century, the communication between that country and the people settled in Italy, or in other parts of Europe, was almost entirely broken off, and the papyrus was no longer in use among them. They were obliged on that account to write all their books upon parchment; and as the price of that was high, books became extremely rare and of great value. We may judge of the scarcity of materials for writing them from the circumstance.
BOOK.

There still remain several manuscripts of the 8th, 9th, and following centuries, wrote on parchment, from which some former writing had been erased, in order to substitute a new composition in its place. Thus, it is probable, several of the works of the ancients perished. A book of Livy or of Tacitus might be erased, to make room for the legendary tale of a faint, or the superstitious prayers of a misfial. As the want of materials for writing accounts for the loss of many of the works of the ancients, and for the small number of MSS. previous to the 11th century, many facts prove the scarcity of books at this period. Private persons seldom possess any books whatever; and even monasteries of note had only one missal. Towards the end of the seventh century, even in the papal library at Rome, the number of books was so inconsiderable, that pope St. Martin requested Sanctamond, bishop of Maastricht, if possible, to supply this defect from the remote parts of Germany. In the year 855, Lupus, abbot of Ferrières in France, lent two of his monks to pope Benedict III. to beg a copy of Cicero de Oratore and Quintilian’s Institutes; “for,” says the abbot, “although we have part of these books, there is no complete copy of them in all France.” At the beginning of the tenth century books were so scarce in Spain, that one and the same copy of the bible, Jerome’s epistles, and some volumes of ecclesiastical offices and martyrologies, often served several different monasteries. Among the constitutions given to the monks of England by archbishop Lanfranc, in 1072, the following injunction occurs: At the beginning of Lent, the librarian is ordered to deliver a book to each of the religious, for the perusal of which a whole year was allowed; and at the returning Lent, those monks who had neglected to read the books they had respectively received, are commanded to prostrate themselves before the abbot, and supplicate his forgiveness. In 1299, John de Pontiffara, bishop of Winchester, borrows of his cathedral convent of St. Swithin, at Winchester, “libibam bene glossatam,” that is, the bible, with marginal annotations, in two folio volumes; but gives a bond for the return of it, drawn up with great solemnity. For the bequest of this bible to the convent, and 100 marks, the monks founded a daily mafs for the soul of the donor. If any person gave a book to a religious house, he believed, that so valuable a donation merited eternal salvation, and he offered it on the altar with great ceremony. The prior and convent of Rochester declare, that they will every year pronounce the irreconcilable sentence of damnation on him, who shall purloin or conceal a Latin translation of Ariosto’s Poetry, or even obliterate the title. Sometimes a book was given to a monastery, on condition that the donor should have the use of it for his life; and sometimes to a private person, with the reservation that he who receives it should pray for the soul of his benefactor. In the year 1255, Roger de Infula, dean of York, gave several Latin bibles to the university of Oxford, on condition that the students who perused them, should deposit a cautionary pledge. The library of that university, before the year 1290, confisted only of a few tracts, chained or kept in chests, in the choir of St. Mary’s church. Among the statutes of St. Mary’s college at Oxford, in 1446, one is, that no scholar should occupy a book in the library above one hour, or two hours at most, so that others shall be hindered from the use of the fame. The famous library established in the university of Oxford by Humphrey duke of Gloucester, a munificent patron of literature, contained only 600 volumes. About the beginning of the 14th century, there were only four clasicles in the university of Paris, which were single copies of Cicero, Ovid, Lucan, and Boethius.

The price of books became so high, that perfons of a moderate fortune could not afford to purchase them. In the year 1174, Walter, prior of St. Swithin’s at Winchester, purchased of the monks of Dorchester, in Oxfordshire, Bede’s homilies and St. Aulins’s psalter for twelve pieces of barley and a pail, on which was embroidered in silver the history of St. Birinus converting a Saxon king. About the year 1250, a copy of John of Meun’s “Roman de la Rose” was taken before the palace-gate at Paris for 40 crowns, or 53l. 6d. The counts of Anjou paid, for a copy of the histories of Haimon, bishop of Haberlandt, 200 liepms, five quarters of wheat, and the fame quantity of rye and millet. Even so late as the year 1451, when Louis XI. of France borrowed the works of Rhusis, the Arabian physician, from the faculty of medicine at Paris, he not only deposed by way of pledge a considerable quantity of plate, but he was obliged to procure a nobleman to join with him as surety in a deed, binding himself under a great forfeiture to restore it. Many other instances might be cited, in order to shew how scarce books were at the period to which we now refer, and with what difficulty, and at what extravagant prices, copies of them were procured; and therefore we can be at no loss in accounting for the extreme ignorance that prevailed. But when, in the 11th century, the art of making paper was invented, and more especially after the manufacture became general, the number of MSS. increased, and the study of the sciences was wonderfully facilitated. Indeed, the invention of the art of making paper, and the invention of the art of printing, are two very memorable events in the history of literature and of human civilization. It is remarkable, that the former preceded the first dawning of letters and improvement in knowledge, towards the close of the eleventh century; and the latter ushered in the light which spread over Europe at the era of the reformation. Murat, Antiqu. Ital. vol. iii. vol. ix. Mem. de l’Acad. des Infcrip. tom. ix. Hill, Lit. de France, par des Religieux Beneficiums, tom. vii. Naudé Addit. a Philofoire de Louis XI. par Comines, ed. Frevet, tom. iv. Robertson’s Hist. Ch. v. vol. 1. Wharton’s Eng. Poetry, vol. i. diff. 2.

BOOKS, to form a judgment of. Those who have treated of the subject, direct us to observe the title, the author’s or editor’s name, the number of the edition, the place where and the year when it is printed (which in old books is frequently marked at the end), and the printer’s name, especially if it be a celebrated one, proceed then to the preface, and index of contents, and look for the author’s design, and the occasion of his writing; consider also his country (each nation having its peculiar genius), which may sometimes be learned from the dedication; if his life be annexed, run it over, and note his profession, what rank he was of, and any thing remarkable that attended his education, studies, conversation, or correspondences with learned men; not forgetting the eulogies which have been given to the author, which often occur at the beginning, or even any critique or censure, especially if made by a man of judgment. If the preface does not give an account of the method of the work, run briefly over the order and disposition of it, and note what points the author has handled; observe whether the things and sentiments he produces be true and vulgar, or solid, and fetched from greater depths. Note, whether he go in the common road, or make any innovation, and introduce any new principle.

But it is a small number of books we have opportunity of thus judging of by perusing them; besides, when we have read a book over, the judgment comes too late for many purposes. Life is too short, and time is too precious, to read every new book quite over, in order to find that it is not
not worth reading. It seems necessary, therefore, to have other indications, whereby to prevent our being at the charge of procuring, or the pains of perusing a worthless book. Divers rules of this kind are given by Baillet, Struvin, Stollius, and others; which, though in reality no more than presumptions, and frequently liable to be falsified, are not without their use. The journalists de Trevieres objected to them all: "The shortest way," say they, "to judge of a book is to read it, if you be qualified in the subject; other-wise to refer yourself to those who are." Heuman is somewhat more explicit: making it a mark that "a book is good, when it is esteemed by persons intelligent in the subject it treats of; and when those who commend it receive no advantage from the appliance they bestow on it, nor are leagued with the author in any cabal, for expounding any particular principle, system, or party, in religion or learning." Baillet, Jugen, des Squav. tom. i. b. ii. p. 121. Struiv. introd. ad Not. Rei liter. cap. 5. § 3. p. 350. Stoll. introd. Hist. Liter. p. i. s. 11. p. 9. Budd. de litteris boni libri, paffum. Mem. de Trev. an. 1712. Art. 17. Heuman. Comp. Rei. publ. liter. cap. vi. s. 11. p. 283.

But more particularly, it is an indication that a book is good: 1. If the author be known to excel in that talent more immediately necessary for such a subject; or have already published anything on the same that is esteemed. Thus we may conclude, that Julius Cesar will teach us the art of war better than Peter Ramus; Cato, Palladius, and Columella, agriculture better than Aristotle; and Cicero, oratory better than M. Varro; add, that it is not enough the author be skilled in the faculty, but that he be so in the particular branches of it, concerning which he treats; for instance, excel in the civil law, yet not in the public law; Salminius proved himself an excellent critic in his Exercit. Plinius, but was much inferior to Milton in his Defence Regia. 2. If the book be on a subject that requires great reading, it may be presumed good, if the author had a copious library, or could have access to one; or if he lived in a place where books were not wanting; though here is danger too of running into excess of quotations; especially, says Struivius, if the author be a lawyer. 3. A book which took up a long time in compounding, cannot often fail of being good. 4. Books on points of doctrine by edictive writers, are to be presumed better than those writ by the retainers to particular sects. 5. The age of a writer may also give us some indication: books, which require labour, are usually better performed by younger persons than those who are far advanced in years. 6. Another indication may be taken from the author's flate and condition; thus, history written by a person who was an eye-witness to what he relates, or is concerned in public affairs, or has access to the public records, or other monumens, from whence intelligence may be drawn; who is not biased by party, or any other indirect or sinister motive, will be suppos'd to be good. Thus Salluft and Cicero were well able to write the history of Catiline's conspiracy. D'Avila, de Comines, Guicciardino, Clarendon, &c. were present in the civil wars they describe; Xenophon, having an employment in the Spartan flate, has treated excellently of that commonwealth; and Amelot de la Houssaye, by living long at Venice, was enabled to explain the secrets of their policy. Camden wrote annals of the affairs of his own time; Thucylus had correspondence with the best writers in every country; and Puffendorf had access to the public archives. So, in literary matters, we give credit to those who have the direction of libraries. 7. The time or age wherein the author lived may give some light; every age having, according to Barley, its peculiar genius and excellency. See Bartholin. Struiv. Budd. Heuman. Baill. lib. cit.

Some judge by the bulk or size of books; following the grammarians Callimachus's rule, that every great book is of course an ill one, μεγαί βιβλιά, μεγαῖς καπνος; a single leaf of the Sybil was doublets preferable to the vail annals of Vohusis: yet Pliny's observations will not unnecessaries hold true, that "a good book is so much the better by how much it is bigger." Plin. Epist. 20. lib. i. Martial prescribes a remedy against the largeness of a book, when that is the only complaint, read but a little of it: "St animus video, feraque corone longus Elle liber, legitur paucis, libellus ero." Yet is the smallness of a book a real presumption in its favour: he must be a poor author, who cannot furnish a pamphlet, or loose sheet, with things curious, and written with spirit; but to support the fame through a volume in folio, requires very extraordinary abilities indeed. Addif. in Spec. N° 124.

There are some general mistakes, which persons are frequently guilty of in pellaging judgment on the books which they read. One is, when a treatise is written but tolerably well, we are ready to pronounce a favourable judgment of it, and sometimes to exalt its character far beyond its merit, if it agree with our own principles and support the opinions of our party. On the other hand, if the author be of different sentiments, and espouse contrary principles, we can find neither wit nor reason, good sense, nor good language in it. For avoiding or correcting this error, it should be considered, that books are never to be judged of merely by their subject, or the opinion they represent, but by the judgements of their sentiments, the beauty of their manner, the force of their expression, or the strength of reason, and the weight of just and proper argument, which appear in them. Another mistake, which some persons fall into, is this: When they read a treatise on any subject, with which they have but little acquaintance, they find almost every thing new and strange to them, their understandings are much gratified and improved by many things unknown to them before; and hence they are led to admire the treatise, and commend the author, whereas, if they had previously attained a considerable degree of skill in that science, perhaps they would have found that the author had written very indifferently, that neither his sense nor his method was just and proper, and that he delivered nothing that was not very common or very trivial, in his difcourses on that subject. On the other hand, if we have made ourselves masters of any particular theme of knowledge, and surveyed it long on all sides, there is scarcely any writer who much pleases us afterwards, because we find little or nothing new in him; and yet in a true judgment perhaps his sentiments are exceptionally just, his illustrations clear, and his reasonings forcible, and all the parts of the discours are well connected and fit in a happy light; but we knew most of these things before, and therefore they do not strike us, and we are in danger of discommoding them. There are some other follies into which persons are apt to be betrayed in forming their judgment of books. Some persons, who are of a forward and lively temper, and who are fond of intermeddling with all appearances of knowledge, will give their judgment of a book as soon as the title of it is mentioned; for they would not seem ignorant of any thing that others know; and especially, if they happen to have any superior character or possessions, they fancy they have a right to talk freely and to pronounce magisterially on every thing, even of a literary kind, that occurs. Thus, blind men will talk of the beauty.
BOOK.

beauty of colours, and of the harmony or disproportion of figures in painting; the deaf will prize of discords in music; and those who have no pretensions to literature, will pronounce, with an unadorned presumption, on books of science; and those who have little or no acquaintance with either the speculative or practical principles of religion, will arraign the best treatises on divine subjects, though they do not understand the very language of the Scripture, nor the common terms or phrases used in Christianity. Judges of another description set themselves up to decide in favour of an author, or against him, according to the company they have kept, and the judgment pronounced concerning a book by others of their own stamp or size, though they have no knowledge or sense of the subject themselves. These, with a fluent and voluble tongue, become mere echoes of the praires or cenfures of other men. Others, again, pass judgment from the secret stimulations of vanity, pride, or envy; and in order to justify an unwarrentable and severe cen- Sure, they will alle: a mistake or two, which they have discovered, or a few sentiments and expressions not suited to their capricious taste and humour. It is, however, an indication of perverfeness and prejudice, to rail at any human performance because it is not absolutely perfect. Horace has given us a better example:—

"Sunt delicata tamen, quibus ignoville velimus: 
Nam neque chorda fonsam reddit, quem vult mansuets, et 
meus, 
PoeÜique gravem peripie remittit acutum; 
Nec femper seriem quodcumque minabitur arcus 
Verum, ubi plura intet in carne, non ego paucis 
Offendas maculis, quas aut incuria, aut 
Ant humana parum cavat natura."—De Art. Poet.

"Be not too rigidly censorious: 
A thing may jar in the best master's hand, 
And the most skilful archer mis his aim; 
So in a poem elegantly writ, 
I will not quarrel with a small mistake, 
Such as our nature's frailty may excuse." RoscUomom.

Another, and very frequent fault in passing judgment upon books, is this, that perions spread the false praires, or the fate reprecipitates, over a whole treatise, which are justly applicable only to some detached parts of it. After all, when any perion pretends to give his judgment of a book, we should consider whether he be a capable judge, or whether he may not lie under some unhappy bias or prejudice, for or against it, whether he has made a sufficient inquiry to enable him for forming a just opinion, Watts's Improvement of the Mind apud Works, vol. v. ch. 4-5.

The importation or sale of fable-books, or other populi books, is by flat. 3 Jac. li. c. 5. § 25. liable to a penalty of forty shillings.

The importation of books first printed in this kingdom, and reprinted abroad, is prohibited under a penalty of 5l, and double the value of every book imported and sold. Vide flat. 12 Geor. ii. c. 36. § 1.

There was a clause in the statute of the 8th of queen Anne, c. 10. empowering the chancellor, and some other great officers of state, to let the price of books; but this is now repealed by 12 Geo. ii. c. 36. § 2.

The sale right of printing books bequeathed to the two universities of England, the four universities of Scotland, and the colleges of Eton, Welfmouth, and Winchell, are secured to them by flat. 15 Geo. iii. c. 53. See Literary Property.

Books, burning of, was a kind of punishment functioned, both among the Greeks and Romans, by legal sentence. At Athens, the works of Protagoras were prohibited; and all the copies of them which could be collected, were burnt by the public erey. Diogenes Laert. i. ix. 52. At Rome, the writings of Numa, which had been found in his grave, were, by order of the senate, condemned to the fire, because they were contrary to the religion which he had introduced. Liv. i. xl. c. 29. Plin. xiii. 15. Platarch. in vit. Numae. As the populace of Rome were, in times of public calamity, more addicted to superition than deemed proper to the government, an order was issued that all superitions and antrological books should be delivered into the hands of the prator. This order was often repeated; and the emperor Augustus caused more than 20,000 of theses books to be burned at one time. Liv. i. xxv. c. 1. L. xxi. 16. Tacit. Annal. vi. 12. Sueton. l. lii. c. 31. Sometimes the care of the execution of the sentence for burning books, was committed to triumvirs appointed on purpose; sometimes to the prator; and sometimes to the auxilia. Labienus, who from his fatirical spirit some have called Rubeus, is said to have been the first who undertook the severity of it, under the emperor Augustus. His enemies procured a senatus-consultum, whereby all his books, published during several years, were ordered to be collected and burnt. The thing, says Senea, (in the introduction to the fifth, or as others reckon, the 10th book of his "Controversia:"?) then appeared new and strange to take revenge on learning! "Res nova et infalca, sapficia de studis fumi!" Callius Severus, a friend of Labienus, hearing the sen- tence pronounced, cried aloud, that they must burn him too, since he had got all the books by heart; "Nune me vivum uri oportet, qui illos edideri," Labienus could not survive his books; but flaming himself up in the tomb of his ancestors, pinned away, and was buried alive. It is related as somewhat singular, that a few years after, the writings of the perion, who had been the cause of the order for burning Labienus's books, shared the like fate, and were also publicly burned. In a manner some- what similar, the works of Ben-Arias Montanus, who affidated to make the first catalogue of prohibited books, in the No-
therlands, were afterward inserted in a catalogue of the fame kind. The repetition of Cæsars above cited gave occasion to a law of Augustus against abusive writings. Tacit. Annal. i. iv. c. 72. When Cremutius Cordus, in his History, called C. Cæsars the last of the Romans, the senate, in order to slatter Tiberius, caused the book to be burned; but a number of copies were concealed and preserved from the flames. Tacit. Annal. i. iv. c. 35. Antiochus Epiphanes caused the books of the Jews to be burned; and in the first centuries of our era, the books of the Christians were treated with equal severity, of which Arso- nius (Adv. Gentes, i. iii. & iv.) bitterly complains. Euse- bius informs us (Hist. Ecccl. i. viii. c. 2.), that Diocleian caused the sacred Scriptures to be burned. After the spreading of the Christian religion, the clergy exercised against books that were either unfavourable or disagreeable to them, the same severity which they had confined in the heathens as foolish and prejudicial to their own cause. Thus, were the writings of Arius condemned to the flames at the council of Nice; and Constan tine threatened with the punishment of death those who should conceal them. Socrates, l. i. i. c. 6. The clergy assembled at the council of Ephesus, requested the emperor Theodorus II. to cause the works of Nestorius to be burned, and their request was complied with. Cod. I. 1. tit. 5, 6. The writings of Eutyches shared the like fate at the council of Chalcedon; and the fame practice of burning books thought to be heretical with regard to religion, or injurious to the state in a political view, has been imitated in subsequent ages, and in various nations even of the Christian world.

Books, Privileges of. See Privelege.

Books, Whitening of. The following processes for whitening prints, printed books, and paper, has been announced and described by M. Chaptal. Simple immersion in oxygenated muriatic acid, for a longer or shorter space of time, according to the strength of the liquid, will suffice to whiten an engraving. But in whitening the paper of a bound book, it is necessary that all the leaves should be moistened by the acid, and therefore the book must be well opened, and the leaves separated; and the boards must be made to rest on the edge of the vessel containing the whitening liquor. This liquor in the process attains a yellow tint, and the paper becomes proportionably white. At the end of two or three hours, the book may be taken from the acid liquor and plunged into pure water; and the water should be renewed every hour to extract the remaining acid, and to disperse the disagreeable smell. In order to render this process more effectual, the book-binders destroy the binding, unfast the book, and separate its leaves; they then place these in cafes formed in a leaden tub, with very thin slips of wood or glafs, so that the leaves may lie flat and separate from one another at very small intervals. The acid is then gently poured into the tub, without disturbing the leaves. When the paper is become sufficiently white, the acid liquor is drawn off by a cock at the bottom of the tub; and its place is supplied by clear, fresh water. The leaves are then dried, and, after being proofed, re-bound. The leaves may with greater advantage be placed vertically in the tub. With this view, M. Chaptal confructed a wooden frame, adjusted to the proper heights, according to the size of the leaves proposed to be treated. This frame supported very thin slips of wood, at the distance from one another of half a line. In each of these intervals he placed two leaves, and kept them fixed in their place by two small wooden wedges, pushed in between the slips. When the paper was whitened, he lifted up the frame with the leaves, and plunged them into cold water, to take off the remaining acid, as well as the smell. By this operation books are not only cleansed, but the paper acquires a degree of whiteness superior to what it possessed when first made. This acid will also serve to destroy ink spots; but it has no action upon spots of oil, or animal greave; however, a weak solution of potash will effectually remove stains of that kind. To oxygenate the muriatic acid, it is only necessary to dilute it, and mix it in a very strong glafs vessel with managanese, in such a manner that the mixture may not occupy the whole content of the glafs. Air-bubbles are formed upon the surface of the liquors the empty space is filled with a greenish vapour; and, at the end of some hours, the acid may be further diluted with water, and then used. In order to remove spots of greave from books and prints, M. Deichamps, member of the Philosophical Society at Lyons, recommends to take out as much as possible of it by means of blotting paper; and then to dip a small brush in the essential oil of well rectified spirit of turpentine, heated almost to ebullition, and draw it gently over both sides of the paper, which must be carefully kept warm. This operation must be repeated as often as the quantity of greave imbibed by the paper, or the thickens of the paper, may render necessary. When the greave is entirely removed, the paper may be restored to its former whiteness, by dropping another brush in highly rectified spirit of wine, and drawing it, in like manner, over the place which was stained, and particularly round the edges, to remove the border that would fill prevent a stain. Bibliotheca Economica, vol. i. See Bleaching.

Books, common-place. See Common-Place.

Books, texts. See Text.

Books, is also used for a part or division of a volume, or large work.

In this sense we say the book of Genesis, the first book of Kings, the five books of Moses, &c. The Digist is contained in fifty books, the Code in twelve books.

Books are usually subdivided into chapters, sometimes into paragraphs, or paragraphs; accurate writers quote chapter and book.

Book is also used for a list or catalogue of persons' names.

—Such among the ancients were the centurial books, being tables or registers containing the names of all those who were confined or taxed under Augustus. Tertullian affers us, that our Saviour's name was found in the centurial book of Augustus, Adv. Marci. lib. iv. cap. 7. See Census.

Books, in Matters of Commerce, denote the several registers wherein merchants and other dealers keep their accounts. Hence to book, is to register in a book.

We say, such a person's books are in good order; merchants cannot possibly do without books; they are even obliged by the laws to keep books. But more or fewer are required, according to the nature or extent of their dealings, or the precision and exactness they desire therein.

The ancients had also their books of accounts; witnesses the codex accept & expend, is often mentioned in Roman writers; and the patrimonial books, which were rentals, containing an account of the lands, goods, and chattels, and other effects belonging to each person.

Among the defects to which the trial by jury is subject, one is the want of a compulsive power for the production of books and papers belonging to the parties. In the hands of third parties, they can generally be obtained by rule of court, or by adding a clause of requisition to the writ or "sumpagna," which is then called a "sumpagna duces toemis."
BOOK.

But, in mercantile transactions especially, the sight of the party's own books is frequently decisive; as the day-book of a trader, when the transaction was recently entered, is really understood at the time; though subsequent events may tempt him to give it a different colour. And, as this evidence may finally be obtained, and produced on a trial at law, by the circuitous course of filing a bill in equity, the want of an original power for the same purposes in the courts of law is a material defect.

Book-binding, the art of sewing together the sheets of a book, and securing them with a back, and strong paste-board sides, covered with leather, &c.

Binding is distinguished from fitcheting, as in the latter the leaves are only sewed, without bands or backs. We say, French-binding, law-binding, marble-binding, binding in parchment, in sheep, in calves leather, &c. also half-binding, wherein the leaves are generally left uncut, and only the back covered with leather, the pasteboard sides being covered with marbled, or blue paper. Dutch-binding is where the backs are of vellum. The Italians are still contented to bind in a coarse, thick paper, called binding alla ruga, the inconvenience of which is its being liable to wear out without careful use. Without doubt, the art of binding is almost as ancient as the science of composing books; and both the one and the other followed immediately the first invention of letters. Whatever the matter might be, on which men first wrote, there was a necessity of uniting the several parts together; as well for the making of them of one piece, as for the better preserving them; hence the origin of book-binding.

According to Olympiodorus (apud Phot.) it was one Philatus, a learned man at Athens, who first taught the use of a kind of glue, to lessen the several leaves together; on which account a name was erected to him.

Books, the manner of binding in volumes, i.e. of gluing the leaves together; that of rolling them on round piece, or cylinders of wood, appears the most ancient; though that of binding them square, and of sewing several quires one over another, lays claim to considerable antiquity. The first of the two, which we call Egyptian binding, held a long time after the age of Augustus; but it is now diffused, excepting in the Jewish synagogues, where they continue to write the books of the law on vellum sewed together; making, as it were, only one long page, with two rollers and their claps of gold and silver, at each extremity.

The form now in use is the square-binding, which is said to have been invented by one of the Attal, kings of Pergamus, to whom we likewise owe the manner of preparing parchment, called in Latin, from the name of his capital, Pergama, or Charta Pergamana.

Books, manner of binding. The first operation is to fold the sheets according to the form, viz. into two leaves for folios, four for quartos, eight for octavos, &c. which the workmen do with a slip of ivory or box, called a folding-flick; in this they are directed by the catch-words and signatures, which are the letters with the numbers annexed to them, at the bottom of the pages. The leaves thus folded, and laid over each other in the order of the signatures, are beaten on a stone with a heavy hammer to make them fold and smooth, and then pressed. Being thus prepared, they are sewed in a sewing-press, upon pack-stretches or cords, which are called bands, at a proper distance from each other, and in a convenient number; which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first, and proceeding to the last. The common number of bands is fix in folios, and five in quartos, octavos, &c. Sometimes they use a law to make places for the bands, which are sunk into the paper, so that the back of the book, when bound, is smooth, without any appearance of bands. After this the backs are glued, the ends of the bands being opened, and ferved with a knife, for the more convenient fixing of the paste-boards; then the back is turned with a hammer, the book being fixed in a press between boards, called back-boards, in order to make a groove for admitting the paste-boards. The boards being then applied, holes are made for drawing the bands through, the superficial ends being cut off, and the parts hammered smooth. Then the book is prefixed in order for cutting; which is performed by a particular machine called a plough, to which is fixed a knife. After this the book is put into a press called the cutting-pre, betwixt two boards, the one laying even with the press, for the knife to run upon; the other above it, for the knife to cut against.

The book being cut, the paste-boards are squared with a proper pair of iron shears, and it is then ready for sprinkling, gilding, blacking, or marbling the leaves. The colours with which it is sprinkled, are usually vermillion, or caps; and it is done with a brush made with hog's bristles, rubbing the brush in one hand, and moving the hair with the other.

In the French-binding a book is put in parchment, i.e. a slip of parchment is applied over the back between each band, and the ends pasted on the inside of each paste-board. This preparation, called indorsing, seems peculiar to the French binders; who are enjoined by ordinance to back their books with parchment on the penalty of 30 livres, and the re-binding of the book; it is done in the press, where the back being grated to make the paste take hold, the parchment is applied; and they afterwards add glue to fortify it.

In 1799 a patent was granted to Mr. John Williams and Mr. Joseph Williams, stationers, London, for an improved method of binding all sorts of books. By the specification it appears, that this invention consists of a back, of a semicircular, semi-oval, or any other curved form; turned a little at the edges, made of iron, steel, copper, brass, tin, or any other metal, ivory, bone, wood, vellum, paper, leather, or any material capable of retaining a firm situation. This back, being put on the book before bound, so as to cover but not to press the edges of the paper, will, when the book is opened, prevent its spreading on either side, and cause it to lie in any part which is opened to nearly a level surface. This firm back, turned at the edges, so as to cause all sorts of books to open freely, is the object of this patent.

The method of binding, practised by the inventors, is as follows: they forward the paper in the usual manner; few on vellum slips, glue, cut, clothes, and board, or half-board; and put on the firm back by fastening it at the sides, through holes, by vellum, or securing it by inclosing it in vellum or ferret wrappers, or other matters, padded down upon, or drawn through the boards. Mr. Ebenezer Palmer, stationer of London, obtained a patent in 1800 for an improvement in the mode of binding books, particularly account books of merchants. This confits in the addition of a certain metallic chain, which is made or applied in the following manner: firll, provide several small bars of metal, about the thickness of a shilling, or more, according to the size and thickness of the book; the length of each bar being from half an inch to several inches long, in proportion to the strength required in the back of the book. At each end of every bar is made a pivot of different lengths, in proportion to the thicknesses of two links, which they are to receive. Each link is made in an oval form, and contains two holes, proportioned
BOOK.

portioned to the sizes of the pivots; and these links are of the same metal as the hinge; each of them being nearly equal in length to the width of two bars. The links are then riveted on the pivots, each pivot receiving two of them, and thus holding the hinge together, on the principle of a link-chain or hinge. There are further two holes or more of different sizes, as required in each bar of the hinge or chain, by means of which each section of the book is strongly fastened to the same; which hinge, so fastened, operates with the back of the book, when bound, in such manner as to occasion the several sections to open so as to bring them on a parallel with each other, and consequentially admit the ruled lines being written into, without any inconvenience, close to the back.

Manner of gilding books on the edges: The book, being put tight into the press, between two boards, is scraped with a knife called a scraper; and after that with another called a smoother, in order to take out all scratches. Being thus made smooth, they scrape a little yellow ochre upon the book, wet it with a little fixe-water, and rub it off with some clean shavings. The gilding-fixe is made with the white of an egg, mixed with water, and beat well together. The leaves being wetted with the fize-water, with a brush, the gold is then laid upon it, and afterwards dried before the fire. When dried, it is burnished off with a dog's tooth set in a handle. See GILDING ON PAPER, &c. Blacking the leaves is done with fine antimony, the leaves being wet, and the antimony rubbed upon them until quite dry, when it is burnished like the gold.

The head-band is now added, which is an ornament of thread or silk, of two or three colours, placed at each extreme of the book, acrost the leaves, and woven or twilled, sometimes about a fingle, and sometimes a double piece of rolled paper, or, what is more lasting, of glued paper-thread.

For the covers; the skins used undergo several preparations, which we shall explain in full, as being the leather most used; and as being that to which all the rest with a little variation may be referred. The calf-skin, being moistened in water, is cut to the size of the book, and the thickness of the edges pared off on a marble stone kept for that purpose. The cover is next smeared over with paste, made of wheat-flour; then fretched over the paste-board on the out-side, and doubled over the edges within. They then cord the book, or bind it firmly between two boards, to make the cover stick the stronger to the paste-boards and the back; on the exact performance of which depends a great part of the truth and neatness of the book. The back is then warmed at the fire to soften the glue, and the leather of the back is rubbed down, with a folding-flick or bodkin, to set and fix it close to the back of the book. It is now set to dry, and when dry, uncorded; the book is then washed over with a little paste and water, the edges and figures blushed with ink, and then sprinkled fine with a brush, by striking it against the hand, or a fick; or with larger spots mixed with vitriol, which is called marbling. Two blank leaves, on each side, are then to be pasted down to the cover, and, when dry, the leaves are burnished in the press, and the cover rolled on the edges.

The cover is now glazed twice with the white of an egg; it is then filleted plain, or with gold; and at last polished with a polishing iron, passed hot over the glazed colour. If the book be required to be lettered, they paste a piece of red Morocco on the back, between the first and second band to receive the title in gold letters; and sometimes a second between the next bands underneath, to receive the number of the volume.

The plain binding, properly so called, is now complete; the gilding on the back and cover, as it makes a part of the book-binder's business among us (though, with the French, &c. it is a distinct profession), we shall here subjoin.

Manner of gilding books on the back and covers. In ordinary binding, they gild little else but the backs, and the outward edges of the cover. On the backs are gilt the title of the book, &c. with flowers, roses, knots, flars, &c. between the bands: on the covers are sometimes added compartments, arms, &c. All these ornaments are made with each its several gilding tool, engraved in relieves; either on the points of puncheons, as those of letters, roses, flars, &c. or around little cyllinders of brars, as the lines, embroideries, &c. The puncheons make their impression, by being pressed flat down; and the cylinders by being rolled along by a handle, to which they are fitted on an iron fay, or axis.

To apply the gold, they glaze those parts of the leather, wherein the tools are to be applied, three or four times with a liquor made of the whites of eggs diluted with water by means of a sponge; and, when nearly dry, they slightly oil them, and then lay on pieces of leaf-gold, and on these apply the tools, with a careful even pressure of the hand, or roll the cyllinders, both the one and the other, reasonably hot. If the figures be large, and require a great relieve, as arms, &c. they are beat or pressed down. The gilding thus finished, they rub off the superfluous gold, and polish the whole; the gloss of which is greatly sufficed by a final pressing between horns peculiar for the purpose.

Our book-binders, for gilding on rough leather, make use of resin dried and powdered, instead of whites of eggs; and the gold leaf, first cut to a proper size, is laid on a fhot somewhat oiled flat, and pressed down; and thus the resin melts only in those parts where the hot am in applied, and the gold fixes on it, while the other parts of the leather remain rough as at first. Dr. Lewis's Com. Phil. Tech. p. 615. See GILDING.

Aha! Fritsch, chancellor of the university of Jena, has a dissertation expres concerning book-binders, De Bibliopogia; wherein he treats of the laws prescribed by these artificers, and the tax or price settled by the magistrates for binding books, of every sort in sheep-skin, vellum, &c.
