North Carolina is, through its whole extent for 60 miles from the sea, a dead level, and the greater part of this space is for the most part covered with small trees and bushes. On the banks of some of the rivers, particularly the Roanoke, the land is fertile and productive; and in the other parts there are interfingered glades of rich swamp, and ridges of oak land, of a black, fruitful soil. Through this whole level country marine productions are found in depths of 18 or 20 feet below the surface of the ground. At the distance of 60 or 80 miles from the sea, the country rises into hills and mountains, as in South Carolina and Georgia, which fee. That part of North Carolina which lies W. of the mountains is a tract, about 500 miles long from east to west, and upwards of 100 miles in breadth, of fine fertile country, watered by the Tenefee, abounding with oaks, several kinds of locust trees, walnut, elm, lime, and cherry trees of large size, some of them being three feet in diameter. See Tennessee. Wheat, rye, barley, oats, and flax, thrive in the back hilly country; and Indian corn and puffs of all kinds, in all parts. Cotton and hemp are also cultivated in a considerable degree, and might be raised in greater abundance; the cotton is planted annually; the flax dying with the fruit. One man's labour will produce 1000 pounds in the seeds, or 250 fit for manufacturing. The natural growth of the pines is almost universally pitch-pine, which may be called the staple commodity of North Carolina, as it affords various articles constituting about one-half of the exports of this state. White and red oak are excellent and abundant; and the swamps furnish cypress and bay trees in great plenty. The most common kinds of timber in the back country are oak, walnut, and pine; and in the moist gravelly soil is a species of oak, called "black jack." The most common is the black oak. The principal wild fruits are plums, grapes, straw-berrys, and black-berrys. The country also abounds with medicinal plants and roots; such as the gingseng, Virginia snake root, Seneca snake root, and an herb of the cometic kind renfubing ipecacuanha. The rich bottoms are overgrown with canes. The produce of the back country, consisting of tobacco, wheat, Indian corn, &c. is chiefly carried to market in South Carolina and Virginia. The southern interior counties carry their produce to Charleston, and the northern to Petersburg in Virginia. The exports from the lower parts of the state are tar, pitch, turpentine, relin, Indian corn, boards, scantlings, flax, staves, fuirs, tobacco, pork, lead, tallow, bees-wax, myrtle-wax, &c. In which articles a trade is carried on chiefly with the West Indies and the northern states. From the latter they receive flour, cheese, cyder, apples, potatoes, iron wares, cabinet wares, hats, and dry goods of all kinds imported from great Britain, France, Holland, &c.; and from the West Indies, rum, sugar, and coffee. The exports in the year ending September the 30th 1791 amounted to 524,548 dollars; but in 1805, those of the domestic produce amounted to 915,545, and of the foreign to 9,145, being in the whole 928,570 dollars.

In the flat country near the sea-coast the inhabitants are subject, in summer and autumn, to intermittent fevers, which are often fatal; but the western hilly parts of the state are as healthy as any parts of the United States. The country is fertile, and full of springs and rivulets of pure water. The air is serene; and though the days are very hot, the nights are cool and refreshing. Autumn is very pleasant, and the winters are generally very mild; upon the whole, many of the inhabitants live to old age. Wheat harvest commences with June, and that of Indian corn is early in September.

The western parts of this state, which have been settled within the last 40 years, are chiefly inhabited by Presbyterians from Pennsylvania, the descendants of emigrants from the north of Ireland, and are very much attached to the doctrines, discipline, and usages of the church of Scotland. They are regular and industrious. Some settlements of Germans, both Lutherans and Calvinists, are interposed. The Moravians have several flourishing settlements in the upper part of this state, the principal of which are in Wachovia county in the county of Surry, so called after an estate of count Zinzendorf in Austria; and particularly at Salem. The Quakers have a settlement at New Garden, in the county of Guilford, and several congregations at Perguinus and Palmetto. The Methodists and Baptists are also numerous and increasing. The inhabitants of Wilmington, Newbern, Edenton, and Halifax districts, constituting about three-fifths of the state, once professed themselves of the episcopal church; but many of them, during the progress of the late war between Britain and America, emigrated; and the material changes have since occurred. In December 1789, the general assembly of North Carolina passed a law, incorporating 40 gentlemen, viz. five from each district, as trustees of the university of this state, and it has been since liberally endowed. There are also academies at Warenton, Williamborough, and some others.

As to the habits and manners of the North-Carolinitians, we may observe, that they are mostly planters, and live at a distance from one another of one mile to three or four miles, on their respective plantations. Their country is plentiful; but they have little intercourse with strangers; however, they are fond of society and hospitable to travellers. In the lower districts of the country they have but few places for public and weekly worship of any kind, and for want of ministers, these are neglected. The inhabitants of this state appear to have as little taste for the sciences as for religion; and it is remarked, that little attention and respect are paid to the women here than in those parts of the United States where the inhabitants have made greater progress in the arts of civilized life. Temperance and industry are not reconned among the virtues of this state; and much time is consumed in drinking, idleness, and gaming at cards or dice; and also in cock-fighting and horse-racing. Many of the interludes are filled up with boxing-matches, in which persons vie.
wails the brutal practice of "gouging," a species of diversification, if it may be so called, which is thus performed:—when two boxers are worried with fighting and brawling each other, they come, as it is called, to clubs, quarter and each endeavour to twist his fore-fingers in the ear-hooks of his antagonist. When these are fast clenched, the thumbs are extended each way to the nose, and the even slowly turned out of their sockets. The victor, for his expertness, receives shouts of applause from the sporting throng, while his poor eyes and antagonist is laughed at for his misfortune. This barbarous practice, which we could hardly suppose to have existed, is said to be prevalent among the lower classes of people in both the Carolinas, and also in Georgia.

By the constitution of this state, which was ratified in December, 1776, the legislative authority is vested in two different branches, viz. a senate and house of commons, which, convened for business, are styled the general assembly. The senate is composed of representatives, one for each county, chosen annually by ballot; and the house of commons consists of representatives chosen in the same manner, two for each county, and one for each of the townships. The qualifications of a senator are one year's residence prior to his election in the county for which he is chosen, and a freehold of 500 acres; and those of a member of the house of commons are the same residence and a freehold of 100 acres, or such a tenure for the term of his own life. A freeman of 21 years of age, who has been an inhabitant in the state for 12 months immediately preceding the day of election, and who has possessed a freehold of 50 acres within the state for six months next before, and at the day of election, is entitled to a vote for a senator; and all freemen, 21 years of age, who have been inhabitants the year next before the election, and who have paid public taxes, may vote for a member of the house of commons. Judges of the superior court, members of council; judges of admiralty; treasurers; secretaries; attorney generals for the state; clerks of record; clergymen; persons denying the being of a God, the truth of the Protestant religion, or the divine authority of the Old or New Testament; receivers of public monies, whose accounts are unsettled; and military officers in actual service, are ineligible to a seat either in the senate or in the house of commons. The senate and house of commons, or general assembly, annually elect by ballot the governor, who must be 30 years of age, a resident five years, and possess a freehold worth 1000L, and who is ineligible to the office for a longer time than three years in five successive years. The assembly also elects seven persons to be a council of state for one year, with whose advice the governor may grant pardons, except for crimes prosecuted by the assembly, fill vacancies in office till the ensuing feoffon, and lay embarrasses. The governor is liable to impeachment and prosecution in the supreme court for mal-administration. The salary of the governor is dependent on the legislature. The general assembly appoints the treasurer, the secretary. Judges of the supreme courts of law and equity, judges of admiralty, the attorney general, and all the superior military officers, who hold their offices during good behaviour, and are removable by conviction in the supreme court. All bills must also be prepared by the general assembly, and they must be read three times in each house, and be signed by the speakers of both houses, before they pass into laws. Justices of the peace, recommended by the representatives, are commissioned by the governor, and hold their offices during good behaviour. The constitution allows of no religious establishment. The representatives of this state in congress are 12; and the senators are two.

The history of this state in the earliest period of its settlement is confounded with that of South Carolina, from which it was not separated so as to be entitled to a distinct province till the year 1728; and the appropriate boundaries of it cannot be accurately ascertained. See the next article. The first permanent settlement in North Carolina seems to have been made about the year 1729, when a number of Palatines from Germany, who had been reduced to very indigent and distressed circumstances by a calamitous war, were conveyed thither. The proprietors of Carolina, hoping to derive advantage from their labour in the cultivation of their lands, resolved to afford every possible encouragement to such emigrants. Accordingly ships were provided for their transportation and upon their arrival Governor Tryon granted them a tract of land in that province, since called Albemarle and Bath precincts, from which they settled and hoped to have found an unqualified retreat, though in a kind of wilderness, from the devastations of a war, which then raged in Europe. It was not long, however, before their calamities were renewed by a dangerous conspiracy formed against them in 1732 by the Coree and Tuscorora tribes of Indians. The attack was secret and unexpected; and the massacre of the inhabitants was as general and bloody as it was sudden. Some few escaped the indiscriminate slaughter and gave the alarm; and as soon as the news of the sad disaster had reached the province of South Carolina, governor Craven dispatched a force to their relief. The Tuscororas were defeated; many of them were killed, and others taken prisoners. The remainder of the tribe, having lost about a thousand of their original number, soon after abandoned the country, and joined the five nations, with which they have ever since remained. The infant colony from this time remained in peace, and continued to flourish under the general government of South Carolina, till about the year 1729, when seven of the proprietors accepted 25,000L. from the crown, and surrendered its property and jurisdiction. This agreement between the proprietors and the crown was ratified by act of parliament, in 1729; a clause in the act referring to lord Granville, one of the proprietors, his eighth share, which continued legally vested in his family till the revolution in 1776. Lord Granville's share formed a part of the present state of North Carolina. About the year 1729, the extensive territory belonging to the proprietors was divided into North and South Carolinas; and the limits of the former were ascertained and established by an order of George II. Accordingly they remained separate royal governments till they became independent states.

Carolina, South, one of the United States of America, bounded on the north by North Carolina, on the east by the Atlantic Ocean, and on the south and south-west by the Savannah river, and a branch of its head water, called Tugaloo river, which divides this state from Georgia. The western boundary has not yet been accurately ascertained. It lies between 33° and 35° N. lat., and between 79° and 82° 30' W. long.; extending in length about 500 miles, in breadth 150, and containing 25,000 square miles, of which 107,500 acres are improved land. It is divided into nine districts. Charleston, Beaufort, and Georgetown, constitute what is called the "Lower Country," and contain 19 parishes, and 28,694 white inhabitants; and the legislature 70 representatives, and 20 senators, and pay taxes to the amount of 28,831. 5s. 11d. Ninety-six districts, Washington, Pinckney, Camden, Orangeburg, and Cherokee districts are comprehended in the "Upper Country," and contain 23 counties, and 110,902 white inhabitants;
fend to the legislature 54 representatives, and 17 senators, and pay taxes to the amount of $8,920. 28. 30. Sec each of the above articles. The inequality of representation is very obvious; and attempts have been made by the upper districts to rectify it. By a late arrangement the name of county is given to the subdivision of these districts only, in which county courts are established. In the lower districts the subdivisions are called parishes and introduced merely for the purpose of electing the members of the legislature of the state. The whole number of inhabitants in 1787 amounted to 180,000; in 1801 to 240,000; in 1805 to 340,500, being about 14 per sons to each square mile, and including 100,616 white males, 95,319 white females, 146,411 slaves, and 3,185 free blacks and mulattoes. In 10 years the increase of whites has been 15,077, of blacks, 40,644; so that the whole increase has been 65,518. The militia has consisted of 35,753 persons. The capital of South Carolina is Columbia, seated on the Congaree river, in N. lat. 34° 14', W. long. 80° 57', and containing 100 houses and 700 inhabitants. Charleston is also a town of note. The only harbours of any note are those of Charleston, Port-royal, and George-town. The islands that border the sea-coast of this state are numerous and convenient; and serve many useful purposes of navigation. The north part of the harbour of Charleston is formed by Bull's, Dewees's, and Sullivan's islands. Opposite to Charleston, on the other side of the harbour, is James' island, which is the residence of about 50 families. Further south-west is John's island, larger than James'; and these two islands are separated by Stono river, which forms a convenient and safe harbour. Connected with John's island by a bridge is Wadmelaw, having to the east the small islands of Keywaw and Simmon. Between these and Edisto island is North Edisto inlet, which affords a good harbour for small vessels. South of Edisto island is South Edisto inlet through which enter, from the northward, all vessels bound to Beaufort, Afheepoo, Combahee, and Coo-law. On the S.W. side of St. Helena island lies a cluster of islands, one of the largest of which is Port-royal; adjacent to which lie St. Helena, Ladies island, Paris island, and the Hunting islands, being five or six in number and deriving their name from the deer and wild game found upon them. Beyond Broad river is Hilton Head, the most southern sea island in Carolina. West and south-west of Hilton Head lie Pinckney's, Bull's, Dawfulkies', and some smaller islands, between which and Hilton Head are Calibogue river and found, which form the outlet of May and New rivers. The soil on these islands is in general better adapted to the culture of indigo and cotton than the mainland; but lends adapted to rice. The natural produce is the live oak, excellent for ship-timber, besides the pimento or cabbage tree to useful in the construction of forts. The principal rivers of this state, which are navigable, are the Savannah, the Edisto, the Santee, and the Pedee, with their branches; which feed respectively. Thes of a secondary size, being such as occur when you pass from north to south, are Wakkamaw, Black, Cooper, Afheepoo, and Combahee rivers. To the third class we may refer those which extend a short distance from the sea, and by branch ing off into various creeks serve as drains to the inland swamps, or are merely arms of the sea. The tide flows in no part of the state above 25 miles from the sea. Canals are executed, projected, or begun for connecting Cooper and Santee rivers, and for uniting the Edisto with the Alb ley; and it is also proposed to make a waggon-way from the settlements in South Carolina over the mountains to Knoxville, in the state of Tennessee.

This country, with the exception of the high hills of Santee, the Ridge, and some few other hills, is like one extensive plain, till you reach the Tryon and Hog-back mountains, 220 miles N.W. of Charleston. The elevation of these mountains above their base is 38½ feet, and above the sea-coast 454. The mountains west and north-west of these rise much higher, and form a ridge which separates the waters of Tennessee and Santee rivers. The whole state, to the distance of 55 or 200 miles from the sea, is in general low and level, and abounds more or less, especially near the rivers, with swamps or marshes, which are capable of being cleared and cultivated, and which then yield in favourable seasons, an annual income of from 20 to 40 dollars per acre. In the distance more mentioned, the land rises by a gradual ascent from the sea-coast about 150 feet. The traveller, as he proceeds in a W.N.W. course from Charleston, meets with a succession of sand hills, bearing little herbage and a few small pines. The inhabitants are few, and find a scanty subsistence in their corn and potatoes. About 140 miles from Charleston in this direction is the "Ridge" which is a fine high, healthy belt of land, well watered, and with a good soil, and extending from the Savannah to Broad River, in about 60° 30' W. longitude from Philadelphia. Beyond this ridge commences a country exactly resembling the Northern states, Devonshire in England, or Languedoc in France, where hills and dales variously intersected display their verdure and beauty. Wheat fields are common; and the air is found to be much more temperate and healthful than near the sea. The hills are covered with valuable woods, the valleys are watered with beautiful rivers, and the fertility of the soil is equal to every vegetable production. This is called, by way of distinction, the "Upper Country;" and the inhabitants are actually distinguished by their manners and modes of life, their tones of speaking, and the articles which they cultivate. The land still rises as you advance; and at the distance of 220 miles in a north-west direction from Charleston, the elevation of the land above the sea-coast is found to be 500 feet. Here commences a mountainous country, which continues to the western termination of the state. There are four kinds of soil; the pine barren, merely valuable for its timber; with intermixed tracts of land producing only grass; these are called "Savannahs" and furnish a second kind of soil, good for grazing. The third kind is that of the swamps and low grounds on the rivers, which is a mixture of black loam and fat clay, producing naturally and in abundance cane, and also cypris, bays, lobolly pines, &c. The high lands, commonly known by the name of Oak and Hickory lands, constitute the fourth kind of soil, which yields oak, hickory, walnut, pine, and locust. On these lands, in the low country, is cultivated principally Indian corn; and in the back country they also raise tobacco in large quantities, wheat, rye, barley, oats, hemp, flax, and cotton. It is, moreover, well ascertained that olives, silk, and madder may be as abundantly produced in South Carolina (and also in Georgia) as in the south of France. There is little fruit in this state: they have indeed oranges which are four, plenty of figs, a few limes and lemons, pomegranates, pears, and peaches; apples are scarce, but melons are raised in perfection. The river and inland swamps, especially those within the reach of the tide, are well adapted to the culture and growth of rice; the swamps above the head of the tide are occasionally planted with corn, cotton, and indigo; the soil is very rich, yielding from 40 to 50 bushels of corn per acre. It is curious to observe, that in the islands near the sea-coast, and for 40 or 50 miles withinland, and on the rivers much farther, the cultivators are all slaves. No white man cultivates a farm without negroes. The articles produced are corn, rye,
rye, oats, pulse of every kind, potatoes, which, with the small rice, are the food of the negroes; rice, indigo, hemp, and cotton, are for exportation. The plough and harrow are now introduced in the tillage of the land, together with other agricultural improvements. In the middle settlements, the negroes are less numerous; the land is not well adapted to rice; it produces tolerably good indigo weed, and tobacco for exportation; the farmer contents himself with raising corn, potatoes, oats, rye, poultry, and a little wheat. In the upper country, there are few negroes: the plough is almost wholly used; and the farmer depends for subsistence upon his own labour and that of his family. Indian corn, wheat, rye, barley, oats, potatoes, &c. are raised for food; white cotton, hemp, flax, and indigo for exportation. Vines may be cultivated to great advantage; and a great variety of medicinal herbs and roots, as snake root, pink root, ginseng, &c. is furnished in various parts of the state. This country abounds with precious ores, such as gold, silver, lead, black lead, copper, and iron. There are also several pelliculous flakes of different hues, rock crysall, pyrites, petrified substances, coarse carnelian, beautifully variegated marble, vetricious flone and sand, red and yellow ochers, potter's clay, fuller's earth, chalk, crude alum, sulphur, nitre, and vitriol.

The iron works of this country, called the "Aera Aetna iron-work," are situated in York county, within two miles of the Catawba river. The Aera furnace was built in 1787, and the Aetna in 1788. Mr. W. Hill, one of the proprietors of the works, has contrived, by means of a fall of water, to blow all the fires of the forges and furnaces, so as to render unnecessary the use of wheels, cylinders, or any other kind of bellows. The machinery for this purpose is simple and cheap.

In the middle, and especially in the upper country, the people manufacture their own cotton and woollen cloths, and most of their tools for husbandry; but in the lower country, they depend on being supplied by the merchants.

This state furnishes all materials of the belt kind for ship-building. The live oak, and the pitch and yellow pines, are of a superior quality. The indigo manufactured in this country will soon rival that of the French. For the encouragement of emigrants it has been announced that a monopoly capital may be profitably employed in erecting mills, for making paper, for sawing timber, and especially for manufacturing wheat-door; in tanning and manufacturing leather, cattle being easily raised and of cattle hides being very cheap; in making bricks, and in making pot-ash.

The state of education, and, of course, literature, deserves greater encouragement than they have yet found in this state. However, respectable academies have been established in Charleston, Beaufort, Port Royal island, and in other parts of the country. Three colleges have been incorporated by law, one at Charleston, one at Winniborough, in the district of Camden, and the other at Cambridge, in the district of Ninety-six. Farther improvement in this respect may be reasonably expected, as the legislature in 1795 appointed a committee to consider the best means of establishing schools in the different parts of the state. Since the revolution, all denominations of Christians have been put upon an equal footing; and there have been no disputes between different religious sects. The people are allowed by the constitution to choose their own ministers, and they are required, when chosen, to subscribe a general declaration expressing their resolution to conform in their public instruction to the scriptures, to be diligent in the exercise of their ministerial functions, and to be attentive to their own conduct. The upper parts of this state are settled chiefly by Presbyterians, Baptists, and Methodists. The former, including the episcopal and independent churches, are the most numerous; the Lutherans rank next, and are succeeded, with regard to number, by the Baptists, Methodists, &c. The Carolinas are the only nation of Indians in this state; and they have but one town, called Catawba (which see). The Creeks and Cherokees, in the west, will retain their names and a portion of their ancient territories on the frontier of the state. The most noted nations among the aborigines of South Carolina were the Stonoee and Wolofee, the Pamatang, Apalachee, Conogarees, Eakes, and Yamolees, in the salt and in the centre, who are now either extinct, or mingled with other tribes. On the sea-coast the proportion of slaves far exceeds that of freemen, and this great part of the white population is found in the western parts of the state. The Carolinians, it is said, sooner arrive at maturity than the natives of colder climates; but though they are distinguished by quickness and vivacity of genius, they are generally deficient in that enterprize and perseverance, which are requisite for the highest attainments in the arts and sciences. As they inhabit a fertile country, cultivated by slaves, and producing plenty, they have few motives to enterprize. Their wealth furnishes them with the means of hospitality, in the use of which they are very liberal. In their manners the Carolinians are easy and affable, as well as polite and attentive to strangers. Although the ladies want the bloom of the north, they have an engaging delicacy in their appearance and manners, and many of them possess the polite and elegant accomplishments. The most fashionable amusement in this state is hunting; gaming of all kinds is more disconcerted among fashionable people in this than in any of the southern states. Twice a year however they have their horse-races. In the conduct of their funerals the people of the richer classes are less attentive to propriety than they are on other occasions; as wine, punch, and all kinds of liquors, tea, coffee, cakes, &c. are distributed in profusion, when they are assembled to render their last tribute of respect to the dead. The climate varies in different parts of this state. Along the sea coast bilious diseases and fevers of several kinds are prevalent between July and October. The fish are occasioned by a low, marshy country, which is overflowed for the sake of cultivating rice; but though a residence in or near the swamps is very injurious to health, it has been satisfactorily ascertained, that by merely removing 3 miles from them, into the pine land which occupies the middle ground between the rivers, the annual fevers may be avoided. The upper country, situated in the median between extreme heat and cold, is as healthful as any part of the United States.

The little attention that is paid to manufactures in this state occasions a great consumption of foreign imported articles; and yet the exports have a balance in favour of the state, except when there are large importations of negroes. The principal articles exported from this state are rice, indigo, tobacco, skins of various kinds, beef, pork, cotton, pitch, tar, rosin, turpentine, myrtle-wax, lumber, naval stores, cork, leather, pink-root, snake-root, ginseng, &c.; and in the most successful years, 140,000 barrels of rice, and 1,300,000 pounds of indigo have been exported in a year. In the year ending Sept. 30, 1791, the amount of exports from this state was $2,693,517 dollars 97 cents; in the year ending Sept. 1793, $2,988,492 dollars 49 cents; in 1805, the exports of domestic produce amounted to $5,142,100 dollars, and of foreign dation to $2,309,516 dollars, or in the whole to $7,451,616 dollars. At this time the shipping of the state comprehends 70,000 tons. The annual expenditure amounts to $173,000 dollars.

By the constitution, framed June 3, 1792, the legal vote authority...
authority consists of two branches, a "senate" and "house of representatives," styled "General Assembly." The senators are elected by the people for four years, with a biennial rotation of one-half; and it is required that they be thirty years old, resident five years, and possess a freehold worth £150, if inhabitants of the county where they are elected, or worth £1000, if they live elsewhere: the representatives are chosen for two years; and they must be twenty-one years of age, be resident three years, possess a freehold of five hundred acres and ten negroes, or real estate of £1250 value, if they live in the district; but if not resident, a freehold worth £500. The electors must be twenty-one years of age, be resident two years, and possess a freehold of fifty acres, or town lots, or make a payment of a tax of three shillings.

With the house of representatives originate money-bills, and they have the power of impeaching officers of state. It belongs to the senate to try impeachments; and conjointly with the other house to appoint commissioners of treasury, secretary, surveyor, and judge. All officers in the judiciary department are appointed by the General Assembly during good behaviour; and receive a stated salary; the sheriffs are appointed for four years. The executive branch consists of a governor and lieutenant-governor; the former, chosen by the legislature for two years, but re-eligible after an interval of four years, with a certain salary, must be thirty years of age, resident ten years, and possess an estate worth 1500 pounds sterling: to him it belongs to remit fines, if not particularly restricted; to reprove and pardon, except in cases of impeachment; and he is removable, upon conviction of mal-administration, by two thirds of the senate. The lieutenant-governor is elected at the same periods, with the same qualifications. This office has eight representatives in congress, and two senators.

The first settlement in Carolina seems to have been made during the troubles in France, subsequent to the reformation; when Jasper de Coligny, a principal commander of the protestant army, fitted out two ships, and sent them with a colony to America, under the command of Jean Ribaud, for the purpose of securing a retreat from persecution. Ribaud landed at that point which is now called Albemarle river, in North Carolina. This colony endured incredible hardships and was extirpated by the Spaniards. Towards the latter end of the reign of Queen Elizabeth, Sir Walter Raleigh made some unfortunate attempts to fix colonies in Carolina; and in 1668 Carolina, which had been formerly called Carolina, and also Georgia, were thought very proper for propagating silk, wine, pot-ashes, cochineal, &c. In 1670 King Charles I. made a grant to his attorney-general, Sir Robert Heath, and to his heirs, of the country called Carolina, including N. and S. Carolina, Georgia, &c.; and Sir Robert afterwards conveyed this province to the earl of Arundel, who was at the expense of planting several parts of it. But no permanent settlement seems to have been made in Carolina, till after the restoration of King Charles II., when this king granted by his first charter, dated March the 24th, 1662, to Edward Earl of Clarendon, then lord high chancellor of England, and seven others, all lands lying between the 31st and 30th degrees of North latitude, and extending westerly as far as the South Seas; and in 1665, a second charter was granted to the same persons, enlarging their boundaries as far as 29° N. lat. towards the south, and 30° 30' N. lat. towards the north. Of this extensive territory, the king constituted Lord Clarendon and the other seven persons absolute lords-proprietors, and invested them with all the necessary powers for plant-
CAR

COUNCIL, drawn up by the bishops of France, and first published in 1549, by M. de Talley, bishop of Meaux, under the title of Elia Phyrha.

CAROLINE, in Geography, a county of North America in Virginia, situate on the south side of Rappahannock river, which separates it from King George's county. It is about 40 miles square, and contains 17,489 inhabitants, including 10,202 slaves.—Also a town in this county; 6 miles S. of Port-royal.

CAROLINE, a county on the eastern shore of Maryland, bordering on D. havare flute to the back and containing 9,565 inhabitants, including 1,877 slaves. Its chief town is Dan-

ton.

CAROLINE ISLANDS, or, as they are sometimes called, the New Philippines, form the most extensive range of islands in the Pacific Ocean, and comprehend those that lie between about 138° and 165° E. longitude; and about 10° N. lat. This chain of islands appears to have been discovered by the Spaniards in 1686, and to have derived its name from the Spanish monarch Charles II. They are about 30 in number, and very populous, except three, that were uninhabited. The natives relish those of the Philippines, and chiefly live upon fish and cocoa-nuts; nor does their language seem to be very different. Each island, it is said, has its respective chief to whom it is subject, and all of them respect a monarch whose residence is at Lamurte. They believe in certain celestial spirits, and think they defend us in the sacred lake in Fallalo; but they have neither temples nor idols, nor any appearance of worship. Their dead are sometimes thrown into the sea, and others are interred, the grave being surrounded with a stone wall. The inhabitants of Yap, it is said, worship a kind of crocodile, and have their magicians. Polygamy is allowed, and the Tumul, or chief of the large island of Hogoleu had nine wives. Criminals are banished from one island to another. These islanders do not appear to have any instruments of music, yet their dances are accompanied with songs. Their only weapons are lances, armed with bone. Negro slaves are not unknown in this remote region; and in one or two of the islands the bread is said to be mingled: 29 Spaniards having been left on one of these islands, who are supposed to have married and settled. But their principal population seems to have been derived from the migrations of the fairer race from the Philippine islands, and farther eastward; and these were most probably occasioned by frosts of weather, which drove their canoes from island to island, and from one group to another, that had not been before people. The people of Ulrea are reported to be more civilized than the rest, and much to resemble those of the Pellews. The most confiderable of the Carolines is Hogoleu, about 50 miles in length and 40 in breadth. Next to this, but not above a third part of its size, is Yap, in the western extremity of the range. Some few small groups of islands have been discovered in the eastern extremities of this chain, which may be properly classed under the name denomination. In 1732, Caunva, a Jefuit missionary, was massacred with eight Spaniards in the isle of Mogmog. A particular chart of these islands has been constructed after that of this Jefuit, and the relations of other missionaries, which have been printed as a supplement to the "Histoire des Navigations aux Terres Australes," by De Brofies. See vol. ii. See also the Preliminary Discourse to the Missionary Voyage, p. 86.

CAROLINE Waters and Baths. See CARLSBAD.

CAROLINEA, in Botany, (in honour of Sophia Caro-

chira, Aubl. 1291. Juss. p. 179. Pachimar. Savigny in En-

Gen. Ch. Cyl. simple, one leaved, bell-shaped, very short, truncate, oblong, or furrowed, slightly emarginate between each furrow, to 33 to appear somewhat five toothed, sur-
rounded by five globular bodies at the base. Car. petals five, very long, stellate, nearly erect, concave, slowly acute, reflexed at the tip, united into the base of the cup x. thick, caluncous. Stam. filaments about 3252 shorter than the pet-
teals, united in their lower half into a tube, which includes the stem, divided into the middle into from 10 to 15 distinct bundles, which in their upper part are again divided into about as many capillary filaments; these filaments are at times single, but are most commonly held more than half way down, each divided bearing an anther; anthers upright, ob-
long, a little recurved. Pet. stem, furrowed; style filiform, the length of the filaments; stigmas five, lance-
late, acute. Br. sepals very large, egg-shaped, cori-

come followed, one-celled, opening at the summit with numerous valves. Seeds numerous, angular, thick, lying one

upon another.

Obs. The younger Linnæus attributes to his plant an inferior germ, and a two-celled pome, with twin seeds in each cell, whence Jussieu and Savigny have expressed a doubt whether it be the same with that of Aublet; but as he ex-
pressly quotes Aublet's figure, it seems most probable that his description is in these respects erroneous.

Sp. 1. C. princeps, Linn. Jun. Supp. p. 314. Mart. Wild. 1291. Swartz. Prod. 101. (Pachimar aquatica, Aubl. Guian. tab. 291, 292. Cavan. Diff. 3. tab. 72. fig. 1. Lam. Illift. Pl. 580.) "Leaves generally quinate; leaflets ovate-lanceolate." A large tree. Trunk much branched, from 15 to 20 feet high, 2 feet in diameter; bark ash-coloured; wood soft and spongy; branches spreading widely. Leaves digitate; common petiole six or seven inches long, with two stipules at the base; leaflets from three to five, acute, almost sfeilis, smooth, green, very entire, unequal in fize, the middle one often more than seven inches long. Flowers simple, more than a foot long, axillary, solitary; peduncles thick and very short; pe-
tals yellow, caducous; stamens red; anthers purple. Fruit resembling that of the cacao (theobroma), and thence called in Cayman the wild cacao. The seeds are edible, but as they are very flatulent when well taken, they are moft commonly roasted. A native of marily ground in Guiana.

2. C. infinitis, Mart. Wild. 1291. Swartz. (Bomax grandiflorum, Cavan. Diff. 5. p. 295. tab. 124. Fromager grandiflor, Lam. Encycl. "Bomax". Herrard. Mex. 63. with a figure.) See Bomax grandiflorum. The flowers of this species are so similar to those of the preceding, that Swartz seems to be justlyified in removing it from Bomax, under which it was formerly placed; but Savigny observs, that as he is not ac-
quainted with the fruit, he does not absolutely pronounce it either a Bomax or a Carolina, though he is moit inclined to the latter.

CARLOSTADT, or CARLOTTADT, ANDREW BO

DENSTEIN, in Biography, an eminent Lutheran divine, was a native of Carollat, or Carlstadt in Franconia, and having studied in Germany and Italy, he became canon, arch-

deacon, and theological professor at Wittenberg. When Luther took his degree of doctor in this university, in 1512, Carlostadt was dean; and as soon as the former began to

preach
preach against popery, the latter joined him and became his colleague. His temper, however, was ardent, and not a little inclined to enthusiasm; and, determined to extend the reformation, he took the opportunity of Luther's absence, in 1532, for this purpose, and excited a tumult at Wittenberg, by the suppression of private masses, the removal of images out of the churches, and the abolition of the law which imposed celibacy upon the clergy. In these measures, though Moleim charges him with imprudence and precipitance, he acted in conjunction with Bugenhague, Melancthon, Amulndorf, and others; and they were confirmed by the authority of the elector of Saxony. Luther, probably diff

A letter of the second Luther's used town river Caria. See Zurich, Botany, the wife. Nevertheless, and of my R took Geography, extend again Mose's tumult branch the town 15. fnrd little berg, in though approving his having being adopted without his authority, broke with Carolllad on his return. Upon this the latter immediately retired to Orlamund; and attacking the opinion of Luther concerning the eucharist, widened the breach between them. Carolllad rejecting the absurd and unintelligible confabulation of Luther, represented this ordinance as a commemoration of Christ's death, and not as a celebration of his bodily presence; and in order to evade the difficulty attending the expression, "This is my body," he alleged, that Christ pointed to his own body, when he made this declaration, and not to the bread. Carolllad was the first Protestant divine who took a wife; and against this part of his conduct Luther could have had no objection, as he imitated his example. His fanaticism, however, was a just ground of complaint; for, though he did not adopt the most censurable opinions of Munzer and his anabaptist associates, and of those enthusiastic teachers, who pretended to a divine inspiration, he nevertheless inclined to favour them, and was actually chargeable with some extravagancies that were observable in their tenets and conduct. Accordingly he was an advocate for the abolition of the civil law, with the municipal laws and constitutions of the German empire, and he proposed substituting the law of Moses in their place. He also distinguished himself by railing at the academies, declaiming against human learning, and other follies. Having thus incurred the displeasure of Luther, he was commanded to leave the electorate of Saxony; and he repaired to Switzerland, where he successfully propagated his doctrines, first at Zurich, and afterwards at Basl; probably without that attachment to fanaticism, which had given offence; because, after his banishment from Saxony, he composed a treatise against enthusiasm in general, and against the extravagant tenets and violent proceedings of the anabaptists in particular. This treatise was addressed to Luther, and produced such an effect on the mind of this reformer, that he pleaded the cause of the exile, and obtained from the elector a permission for him to return to Saxony. After this reconciliation with Luther, he composed a treatise on the eucharist, which breathes the most amiable spirit of moderation and humility; and, having perused the writings of Zungling, in which his own sentiments on that subject are maintained with the greatest perspicuity and force of evidence, he repaired, a second time to Zurich, and from thence to Basl, where he was admitted to the offices of pastor and professor of divinity, and where, after having lived in the exemplary and conpliant practice of every Christian virtue, he died with the warmest effusions of piety and reparation, on the 29th of December, 1541. Nevertheless, his memory has been very unwarrantably reproached, and his character calumniated, by Morelli, Boffuet, and Roman Catholic writers. Moth. Eccl. Hist. by Machine, vol. iv.

CAROLOSTADITANS, or CARLOSTADITANS, in Ecclesiastical History, an ancient sect, or branch of Lutherans, who denied the real presence of Christ in the eucharist, so denominated from their leader Carollladian. See the preceding article. The Caroloctadians are the same with what are otherwise denominated SACRAMENTARIANS, and agree in most things with the Zuinglians.

CAROLSTADT, in Geography. See CARLESTADT.

CAROLUS, an ancient English broad piece of gold, struck under king Charles I. whole image and name it bears. Its value has been estimated at twenty-three shillings sterling; though at the time when it was coined, it is said to have been only rated at twenty shillings.

CAROULS is used for a small copper French coin, mixt with a little proportion of silver, first struck by Charles VIII. of France, whence it took its name; being, at the time when it ceased to be current, valued at six deniers.

CAROLY, or CARULY in Geography, one of the Laccadive islands in the Indian Sea, off the coast of Malabar. N. lat. 10° 3'. E. long. 72° 35'.

CAROMB, a town of France, in the country of Veainia, 3 miles from Carpentras.

CARO-MOELL, in Botany, Rheed. Mal. See SIDE-RONYLON.

CARON, in Geography, a town of Persia, in the province of Farisian: 75 miles S. of Sula.

CARONCULE, in Ornithology, the French name of the wattle finch, Sturias carunculatus.

CARONI, in Geography, a river of Dutch Guiana, or Surinam, which arises N. of the lake Parima, and flows into the Orinoco.

CARONIA, a town of Sicily, on the N. coast, in the valley of Debona, on a river of the same name; 5 miles N. of Milhetta.

CAROPELLA, a river of Italy, which runs into the gulf of Manfredonia, near Rioli.

CAROPI, in Botany, a name given by the inhabitants of the Philippine islands to a plant more usually known among authors by the name of Tugus, greatly esteemed by the natives, and suppos'd by Camelli to be the true amomum of the Greeks, to much valued in those ancient times.

CARORA, in Geography, a town of Terra Firma, in North America, about 110 miles N. E. from Gibraltar, on Maracaibo lake.

CAROTEEEL, in Matters of Commerce, denotes a certain weight or quantity of divers kinds of goods, ex. gr. of cloves, from four to five hundred weight; of currants, from five to nine hundred weight; of mace, about three hundred weight; and of nutmegs, from fix to seven and an half hundred weight.

CAROTIC is used by some writers to denote those who are feized with the Carots.

CAROTID, in Anatomy, from xxgus, to lay asleep; a name given to the large arteries which supply the head, from a mistaken notion that tying these vessels would induce sleep. There are two common carotid arteries, a right and left; of which the former is a branch of the carotid artery innominata, the latter arises from the arch of the aorta. Each of these vessels is again divided into an external and an internal carotid artery. For the description of these vessels, see Artery.

CAROTID CANDAL, is a winding passage in the petrous portion of the temporal bone, through which pass the internal carotid artery, and the branches of the carotid artery exter-

CAROTINO, or CAROTINO, is a painting of the carotid canal on the surface of the body cranii. See Skeleton.

CAROTO, GIOVANNI FRANCESCO, in Biography, a painter of history and portrait, was born at Verona in 1475, and...
and having learned the principles of the art from Liberale Veronefo, removed to Mantua and became a disciple of Andrea Mantegna. Under his instruction, he acquired a readiness in design and freedom of hand, which rendered him often superior to his master; and many of his compositions were taken for those of Andrea. In order to confute those who attempted to degrade him by asserting that he was incapable of painting in a large size, because he had principally delighted in small figures, he finished a noble design in the chapel of the Virgin at Verona, with figures as large as life; and thus established his reputation. He died in 1546. His brother, whom he had instructed, designed all the curious remains of antiquity in and near Verona, and particularly the amphitheatre, afterwards engraved and published. He was a good architect, and is said to have given lessons to Paolo Veronese. Pilkington.

CAROUGE, in Botany, see Ceratonia Silique.

CAROUGE, in Geography, a town in the department of Leman, and chief place of a canton, in the district of Geneva; the place contains 3250, and the canton 8,323, inhabitants: its territory includes 900 kilometres and 10 communes.

CAROUGE, Point, the northernmost extremity of the island of St. Domingo, in the West Indies; 25 miles N. from the town of St. Jago.

CAROUGE of Buffon, in Ornithology, the Bonana bird of English writers, Oridulus Bonana.

CAROUGES, or CARROUGES, in Geography, a town of France, in the department of the Orne, and chief place of a canton, in the district of Alençon; 4 leagues N.W. of Alençon. The place contains 1550, and the canton 15,130 inhabitants; the territory comprehends 300 kilometres and 25 communes.

CAROVIGNO, a town of Naples, in the province of Otranto; 3 miles E. of Otranto.

CAROUZE, a cape on the north coast of the island of St. Domingo. N. lat. 20° 59′. W. long. 76° 53′.

CARP, in Ichthyology. See Cyprinus.—Common Carp. See Cyprinus Carpio.

CARP, golden. Cyprinus Auratus, Gold Fish. See Auratus Cyprinus.

CARP-meals, a coarse kind of cloth, made in the northern parts of England.

CARP, fleshy, lata carpionis, a kind of gem said to be found in the fauces, by others in the back-bone, of the carp fish, about the size of a pea, of a triangular figure, and white colour without, but yellow within. It is supposed to be of use against the stone, and tubulations of the bile, being taken in powder, or held in the mouth.

CARP, in the Egyptian Dres, a sort of red cap turned up with fur, which borne make a curtain of wearing in common, though it is properly a part of the dres of the interpreters only, the same cap with muslin tied round it being more properly the common dres.

CARP, in Geography. See CARPATES.

CARPAEA, from Carpaea, a kind of dance or military exercise, in use among the Eôians and Magneians, performed by two persons; the one acting a labourer, the other a robber. The labourer, laying by his arms, goes to bowling and ploughing, still looking wary about him as if afraid of being surprized: the robber at length appears, and the labourer quitting his plough, betakes himself to his arms, and fights in defence of his oxen. The whole was performed to the sound of flutes and in cadence. Sometimes the robber was overcame and sometimes the labourer; the victor's reward being the oxen and plough. The design of this exercise was, to teach and accustom the peasants to defend themselves against the attack of robbers.

CARPAL, Ligament, of ligamentum carpi proprium, in Anatomy, is a strong ligament under which the flexor tendons of the fingers, and the median nerve, enter the palm of the hand. See Ligaments.

CARPAS, in Geography, a town near the southern point of the island of Cyprus, in the Mediterranean. It was anciently called Carpasia, by Pliny Carpasum, and by others Carasif.

CARPASIAE, in Ancient Geography, small islands, situated very near to the isle of Cyprus, and north of it, almost opposite to the town of Carpathia.

CARPASIAN, Ligament. See Linum Carpasum.

CARPASUM, in Geography, or Carpasum, in the Materia Medica of the ancients, the name of a poisonous gum, exuding from a tree, so like myrrh in appearance that many perished by the error of using it instead of myrrh, or mixed among it. We are at this time wholly ignorant of its nature; but that it was a gum exuding from a tree, is plain from the account of Dioscorides, who calls it opoparpsium, as do the flowing balm of Gilced, opoelphamn. The wood of the tree which produced it, he calls xylorpsium, in the same manner as the other wood is called xyloschamn. This wood was little used in furniture than the carpium, or gum itself. Galen tells us that the carpium was like myrrh of the very purest and finest kind; and that those people who were most curious of all to have fine myrrh, often met with the carpium among it, and gave death, instead of relief, to the persons to whom they administered it. We find, by the words of Galen, that this gum was not only like myrrh, but was also brought from the same place, and was often mixed with it. The finest myrrh usually had most of this poison among it, and we may collect from the same account that it was a sweet-scented gum, for otherwise no body could have mistaken it for myrrh. Galen de Med. Simpl. lib. vii.

CARPATES, in Ancient Geography, the name given to a long chain of mountains, which terminated European Sar-matia on the southern side; now called the Carpathian Mountains.

CARPATHIAN MOUNTAINS, in Geography, a grand and extensive chain, which bounds Hungary on the north and east, and which are called by the Germans the mountains of "Kropak," probably the original name, but softened by the Russian euphoniism. The Hungarians call them "Tatra." This enormous ridge extends in a semicircular form from the mountain of Javervick south of Silesia towards the north-west. But at the mountain of Trofeika, the most northern summit, it bends to the south-east, to the confines of the Black Sea, where it extends forth two branches, one to the south and another to the west of Transylvania; which is also divided from Walachia by a branch running south-west and north-east. The whole circuit may be about 500 miles. Dr. Townson (see his Travels in Hungary, 4to. 1760), visited these Hungarian Alps from the vicinity of Kefmark, and proceeding to the "Green Sea," in a lake amidst the mountains, passing through forests of firs and pines, in his progress by the thick branches of a tree resembling the pine, called "Krumholz," which were succeeded by rocks of limestone and granite. He computes that the Kefmark peak, which towards Hungary is a perpendicular rock, may be about 8508 feet above the level of the sea. The Lomitz peak, to which he next proceeded, is, as he says, the highest of the whole Carpathian-chain, and placed towards its centre; but he afterwards expresses a doubt, whether it be not rivaled, if not excelled, by the Krivan, situated more towards the west, 20° 45′ of E. long. from London. He attained
attained the summit of Lomnitz with some difficulty, and
computed it to be 8740 feet above the level of the sea, or
not much below half the height of M. Blanc, or M. Rofs.
He found it composed of grey granite like the rocks at the
bottom; but with a small mixture of a greenish black, earthy
substance; nevertheless, the vegetation consisted of little
except a few lichens. Thrice peaks are items visited except
by the hunters of the chamois, and some idle adventurers,
who search for gold and precious stones. The marmot also
appeared; but our intelligent traveller denies that the inhe-
ter, or rock goat of the Swiss Alps, is found in the Carpathian
heights. The Kreian he afterwards ascended with more
care; but found it inferior in height to the Lomnitz, being
8414 feet above the sea. It is probable that summits of
greater elevation are in the eastern part of the chain; but
there are no glaciers nor other tokens of the eternal winter
of great altitude.

Dr. Townsend gives us a curious account of a Carpathian
o K reached," and its inhabitants. This is a small wooden
but in the midst of a wood, built in the Swedish manner;
that is, with balks, whose ends are let into one another,
something in the manner of what carpenters call dove-tail
work; it was only about six yards long, and three broad;
and divided into two apartments, but by no means weather-
tight. In the first apartment the head-shepherd, who
is only a poor common peasant, lives, and makes the cheese;
the other is the magazine, where it is kept till it is sent to
Kesmark, which is every week. The buffoons of the dairy
are very simple: the sheep are driven home thrice a day to be
milked; and each milking is immediately made into cheese,
for they make no butter. The remnet is poured upon the
milk while it is warm, which is soon after beaten together,
and presently the head-shepherd’s gropes together with
both his hands all the curds. This buffoons appeared to be
difficult, and lasted near half an hour: the curds then form
one great mas, and are taken out together, put into a
cloth, and hung up; but no pressure is used. The whey
which remains is boiled, and acquires some consistence, and
this forms the food of the shepherds, and their only food
for the whole season; they have not even bread. After
the shepherd and his men had eaten their supper, the men,
of whom there are four or five, left the hut, and went to
sheep under sheds around the fold. In the night the head-
shepherd got up two or three times and hollowed to his
men, to ascertain whether they were upon the watch; and
they always answered, to satisfy him that they were atten-
tive to their duty. Great vigilance is requisite against the
wolves, and with all their precautions these animals had
carried off their flock this summer.

The Carpathian ridge occasionally branches towards the
north and south; in the former direction the most remark-
able are the hills on the west of Sileia, those which adjoin
to the salt mines of Wieliczka, a few miles south-east from
Cracow in Poland, and those which extend through part of
Buckovina. Towards the south a branch stretches from the
centre of the chain towards Tokay; and there are other branches not accurately defined, which descend in the
same direction from the eastern circuit. Pinkerton’s
Mod. Geog. vol. 1.

CARPATHIAN SEA, a part of the Mediterranean Sea, to the
south-west of the islands of Crete, and the island of
Candia. It derives its name from Carpathos, an island
which contains it partially. This sea has acquired cele-
brity from having been mentioned by Horace, Ovid, Pro-
pertius, and Juvenal.

CARPATHOS, or CARPATHUS, in Ancient Geography,
now Scarpanto, an island of the Mediterranean Sea, situat
between the isle of Crete or Candia, to the south-west,
and the isle of Rhodes, between this and the
island of Candia. It contains four towns, one of which was called Nisyros; Scolaco affixed it only three, and Potokomy one, called Poti-
dium. It was long and broad, and, according to Scolaco,
300 fathoms in length from nearly the south to the north.
Strabo says, that its circuit was 260 fathoms. This island
was anciently inhabited by some soldiers of Minos, the first
of the Greeks who possessed the empire of the sea. Many
generations after his time, Joces, the son of Demoleon,
an Argian, planted here a colony. Homer calls it Cre-
pathos. It was also called Tetrapolis, from its four towns,
Hiptapolis, from its seven towns, and Pallene, after the
son of Tan, the first possessor of this island.

CARPATHOS, a town in the above island, which was a
metropolis.

CARPATHOS, in Geography, a town of South America, in
the country of Paria, and jurisdiction of Guamales; most
of the inhabitants are weavers, and employed in manufac-
turing bays, langes, and other stuffs.

CARPE in Mex, in Botany, the name by which the
common wreath, labra torres, is known in some of the mari-
times parts of France; called also laurel noble.

CARPella, in Ancient Geography, a promontory of Alpes,
placed by Ptolem. in Carpathia, near to the promon-
tory Armoum in the Parian gulf, and S.W. of it.

CARPENTANOS Monte, in Geography, a chain of
Spanish mountains, extending from near Samna on the N.E.
and pursuig a S.W. direction towards Portugal. This
chain is also called that of Urima, or Guarama.

CARPENTARIA, a large bay on the northern coast
of New Holland, discovered in the year 1618. S. lat. 15' 20'.
E. long. 138° 50'.

CARPENTER, an artificer, whose buisness is to cut
fashion, and join timber and other wood for the purposes
of building. The word is formed from the French charpentier,
which signifies the name, formed of charpent, which denotes
timber; or rather from the Latin carpentarius, a maker of
carpenta, or carriages.

CARPENTER, in Ornithology, a name given in St. De-
mingo to a species of wood-pecker, probably the green wood-
pecker, or picus viridis, which it resembles in its colour, form,
note, and habits; because it hollows and injures trees, par-
ticularly the plum trees, which it sometimes bores through,
and the cocoa-tree. The inhabitants of Cayenne give the
name "Yellow Carpenter" to the yellow wood-pecker, the
picus caudatus of Gmelin, the picus Cayennensis albus of Bril-
ton, and picus flaviceps of Latham.

CARPENTER’S WORK, in Architecture, includes the framing,
flooring, roofing; the foundation, carcase, doors, windows,
&c. In the manufature of this kind of work, large and
plain articles are usually measured by the square foot or
yard, &c.; but enriched mouldings and some other articles
are often ellipted by running or linear measure, and some
things are rated by the piece. In measuring of joists, it
should be recollected, that only one of their dimensions is
the fame with that of the floor; and the other will exceed the
length of the room by the thickness of the wall, and ½ of
the same, because each end is let into the wall about ½ of its
thicknes. No deductions are made for hearths, or account
of the additional trouble and waste of materials. Partitions
are measured from wall to wall for one dimension, and from
floor to floor, as far as they extend, for the other; nor is any
deduction made for door-ways, on account of the trouble of
framing them. The measure of centering for cellars is found
by means of a string made to pass over the surface of the
arch for the breadth, and taking the length of the cellar for
the
the length; but in groin-centering, it is usual to allow double measure, on account of their extraordinary trouble.

In roofing, the length of the house in the inside, together with \( \frac{3}{4} \) of the thickness of one gable, is to be considered as the length; and the breadth is equal to double the length of a string which is stretched from the ridge down the rafters, and along the eaves board, till it meets with the top of the wall. For flat-cases, take the breadth of the field, by making a line ply off over them, from the top to the bottom, and multiply the length of this line by the length of a field for the whole area. By the length of a field is meant the length of the whole, and the return at the two ends; and by the breadth is to be understood the girt of its two upper surfaces, or the tread and pitch. For the balustrade, take the whole length of the upper part of the hand rail, and girt over its end till it meets the top of the newel-post, for the length; and twice the length of the baluster upon the landing, with the girt of the hand-rail, for the breadth. For waistbalustrade, take the compass of the room for the length; and the height from the floor to the ceiling, making the string ply close into all the moldings, for the breadth. Out of this must be made deductions for windows, doors, chimneys, &c.; but workmanship is counted for the whole, on account of the extraordinary trouble. For doors, it is usual to allow for their thick-keifs, by adding it to both the dimensions of length and breadth, and then multiply them together for the area. If the door be paneled on both sides, take double its measure for the workmanship; but if one side only be paneled, take the area and half for the workmanship. For the surrounding architectura, girt it about the outermost part for its length; and measure over it, as far as it can be seen when the door is open, for the breadth. Window shutters, jalousies, &c. are measured in the same manner. In the measuring by roofing for workmanship alone, all holes for chimney-flasts and skylights are generally deducted. But in measuring for work and materials, they commonly measure in all skylights, lumbin-lights, and holes for the chimney-flasts, on account of their trouble and waste of materials. Artificers measure flooring, partitioning, roofing, tiling, &c. by the square of 100 feet. See Measure and Carpentry.

Carpenters, Company of. See Company.

Carpenter's Joint rule. See Rule.

Carpenter, Ship, a person employed in the docks, in the construction and repairing of vessels.

Carpenter of a ship, is an officer at sea, whose business is to have things in readiness for keeping the vessels in repair; and to attend the flapping of leaks, filling of masts or yards, also caulking, careening, barming, and the like. He is to watch the timber of the vessel that it do not rot, consult frequently with other officers on the state of the masts, yards, &c. and in time of battle he is to have plugs, tumpions, and planks ready, for repairing breaches made by the enemy's cannon.

The carpenter has a mate under him, and a crew or gang to command on necessary occasions.

Carpentoracte Minorum, in Ancient Geography, now Carpentrax, a town of Gallia Narbonensis, N.E. of Avenio, seated upon an eminence near the river Auvson. It was known to Pliny, who reckoned it among the Latin cities; and the Romans fixed in it a colony, probably in the time of Julius Cesar. It belonged to the Memnicians, and had a triumphal arch, which is supposed to have been erected in commemoration of the victory obtained by Cn. Domitius Aenobarbus over the Allobroges and Auvernates, near the confluence of the Sorgue and the Rhone, about 21 leagues from this city.

Carpentras, in Geography, an ancient town of Vol. VI.
Carpentry.

forauceing; they had wooden cornices, and the stone seats of theatres were covered with boarding. Vitruvius, I. 4. 1. 7. &c. We alread learned of considerable buildings, as amphitheatres, containing tenons of wood; such was that built by Augustus to exhibit the shows on account of the victory of Actium, and many others, at Rome and different parts of Italy. It may be remarked that the beams of the roof were generally left uncovered by a ceiling; and sometimes, in magnificent buildings, enclosed with bronze, and even gilded as in the basilica of St. Peter, erected by Constantine.

In the colder countries of Europe, wood was more plentifully used, particularly in the interior works; and in the middle ages the art of carpentry partook of the bold and florid construction exhibited in that style of building commonly called Gothic; of this the highest pitched weighty roofs and lofty spires of the great cathedrals afford many striking instances.

In more modern times carpentry still improved. The wooden bridges of Palladio are examples of admirable construction. Some French artists also have given eminent instances of ingenious carpentry, as Philibert Dehorne in his method of constructing wooden domes; and Moutonau in his, which was executed at the Halle du Bled, at Paris, and various other works for large halls erected by Perronet, Hupseau, &c. In England the timber work of the dome and scaffolding of St. Paul's, and, in later times, many examples of centres, bridges and roofs may be cited as models of scientific carpentry; while in accuracy of execution, cleverity and neatness of finishing, our workmen are unequalled. In the north of Europe, and particularly in Sweden and Norway, wood is almost the only material used for building; and of course the natives must have considerable practical skill in carpentry.

The art of employing timber in building is divided into two grand branches: carpentry and joinery. The first includes the larger and rougher kinds of work, and that part which is material to the construction and stability of an edifice; and, generally, all the work wherein the timber is used by the cubical foot. Joinery, which is called by the French menuiserie, from the mens hois, or small wood employed in that art, includes all the interior finishing and ornamental wood-work, and is valued by the superficial foot.

In this article we shall treat of the constructive part, or carpentry, strictly speaking, leaving what respects the material and belongs to architecture in general, as the choice of trees, the strength of timber, &c. to the article Timber. We shall therefore suppose the material arrived in the carpenter's yard, and in the flate of whole or squared timber. The operations it undergoes from this period to its final employment in a building may be classified under two general heads, those which relate to individual pieces, and those which relate to their connexion with others. Under the first head are the operations of the pit saw, too generally known to need description, by which the whole timber is divided and reduced to the required scantlings; this term, from the French, ebantillon, means dimensions, relative to breadth and thicknesses without respecting length:—Planing, which is giving a smooth face to wood by means of a familiar instrument called a plane, confining of a chisel fixed in a frame, serving as a handle, by which the workman moves it along over the surface of the timber, shaving off its inequalities: timber thus prepared is said to be wrought:—Mouldings of various forms, and performed with particular planes or chisels:—Rebating, which consists in diminishing the width of a square, or rectangular piece of timber, for a certain depth on one edge, thus taking off a rectangle of the whole width, and less than the depth of the original piece; this method is particularly used in doors, cases, and the frames of casement windows, the rebate forming a kind of ledge for the door or casement to stop against:—Grooving or plowing, in which a narrow channel is excavated out of the thickness of the timber: the groove is either square, forming an equal section in the whole depth, or wider at the bottom than at the top, which is called a dovetail groove. Timber may also be beaked where the piece is formed like a wedge, or rounded; or bevelled in various shapes, which means when the section forms a figure without right angles.

We now come to the second and most important head of the operations by which timbers are connected together. These are generally speaking, by mortice and tenon, the first an excavation, and the second a projection, adapted to it; or by wooden pins or nails, spikes, ferrules, bolts, clamps, and other fastenings of metal, or by glue, though this last is scarcely used except in joinery.

The following is a description of the most general and useful methods of joining timbers. First, by simple tenon and mortise, as when joists are framed into trimmers, the most usual method is to make the tenons in the middle of the breadth of the trimmer with a plain shoulder; see fig. 1. Plate LXII. of Architecture, which represents a section of the trimmer, and a part of the joist, framed in a longitudinal direction. But when binding-joists are framed into girders, as the binding-joist has to support the bridging-joists, and these the floor, the belt method, in order to give strength to the tenon, is to make a rest of a short length under the tenon, with a sloping shoulder above, extending in a line from the extremity of the rest to the perpendicular of the square shoulder below at the upper edge of the binding-joist. See fig. 2. Plate LXII. of Architecture. No. 1. represents a section of the girders through the mortises; Nos. 2 and 3 part of the joists in a longitudinal direction.

When a piece of timber is to be framed between two parallel pieces which are quite inmoveable, the true method, in order to make close work, is to make the extremity of the tenon and the bottom of the mortise at one end, in the arch of a circle, having its centre in one edge of the mortise, and the extremity of the tenon, and the bottom of the mortise at the other end, in a concentric arch from the same centre. As the mortise at this end must be much longer than the breadth of the tenon, there will be a large part of the mortise still open, which may afterwards be filled up. Instead of the bottom of the mortise here being formed in the arch of a circle, it may be cut quite parallel to the edge to the deepest part, as it will not impede the transverse piece in going to its place. This mode of framing is much used in ceiling, joisting for double floors: the long mortises cut in this manner are called chase mortises. In forming the tenon and mortise, at the end where the centre is placed, it is not necessary that the mortise and tenon should be so deep as to form an entire quadrant; in this case the bottom may be quite parallel, and only the further edge opposite the centre made circular. Fig. 3. Plate LXII. of Architecture represents a piece of framing, in the manner above described, A B, the bottom of the mortise, and the extremity of the tenon described from the centre C; D E the running, or chased mortise, which must be quite free from the circumference described by the point D, whether the extremity be in the circumference, or in a tangent, D F, parallel to G E.

The manner of representing the tenon and mortise at the end, when the centre is placed, when the mortise is made of a leaf depth than the breadth of the tenon, is shown at the other end.

When a transverse piece is to be framed between two parallel
CARPENTRY.

valiet joists, of which their vertical surfaces are oblique to each other, the upper edge of the transverse piece is turned downwards upon the top of the joists, and marked at the interval or clear; it is then turned upwards into the position in which it is to be placed, the mark at one end is brought into a right line with the vertical surface of the joist, and a line is drawn by the edge of a rule or flat edge placed vertically in the plane of the joist and the transverse piece; this line marks the shoulder of the tenon. The other end is drawn in the same manner. This mode of framing a transverse joist between two parallel joists is called by workmen tongue-in-joists. The manner of tonguing in a joist is exhibited at fig. 4. Plate LXI. of Architecture. A and B are sections of the parallel joists. C D E F the transverse joist, or the piece tumbled in, G H the straight edge placed for drawing the shoulder C E.

A piece of timber may be joined at right angles to another in the manner of fig. 3. Plate 1.XI. of Architecture, which is a longitudinal section in the direction of the fibres of both pieces. A mortise is cut in the one piece to the breadth of the piece, which exactly fits the perpendicular length of the tenon is cut with a dove-tail notch, so that the piece may be at right angles to the other, and a wedge or key is driven from the other edge of the tenon, which forces it quite close. One inconvenience arising from the dove-tail is, that if the timber of which it is made be not quite dry, the tenon will shrink in proportion to its breadth, and therefore the perpendicular piece will be liable to be drawn to a certain degree. To remedy this defect, instead of the edge of the tenon being cut dove-tail ways, it may be notched, as is to be seen in fig. 4. No. 1. No. 2. shows another view of the perpendicular piece with the wedge.

Another method of fixing one piece of timber perpendicular to another, is to mortise the piece forming the bafe not quite through, enlarging the edges towards the bottom, and making the tenon of the perpendicular piece to fit the upper part of the mortise. Two wedges are then fixed to the bottom of the tenon; where the perpendicular piece is driven, the wedges will be refilled by the bottom, which will split the ends of the tenon, and fill up the mortise to the breadth at the widest place. This mode of fixing one piece at right angles to another is called fox-tail wedging. By this method, so long as the wedges are kept from slipping, the one piece can never be drawn from the other, without breaking the tenon. In order to enlarge the tenon in breadth still more towards its extremity, two other smaller wedges may be put in, of which their ends do not reach quite so far as those of the other two, which, when partly driven, the small wedges will then begin to widen the end of the tenon likewise, and make it fill the mortise completely at the bottom. Fig. 5. No. 1. shows the edge of the piece on which the mortise is cut. Fox-tail wedging is chiefly used when the tenon is to be put together small, and then the wedges are frequently driven in with glue; when the pieces to be joined are large, the former method is generally practised.

The fixing beams to wall-plates is called cocking or cogging. When a beam is to connect two wall-plates, in order to bind the fides of the building together, one method is to cut the end of the beam in the form of a dove-tail, and to make a corresponding notch in the wall-plate to receive it, as is shown in fig. 6. No. 1. No. 2. is a transverse section at the neck of the dove-tail. Fig. 7. shows the same thing, with a small variation in the form of the dove-tail, fitted obliquely to the other piece. But when the timber has not been sufficiently seasoned, and when it begins to dry, the perpendicular piece may easily be drawn from the other, to a certain degree. Therefore, if the sides of the building are affected by lateral pressure, this mode of fixing the one piece to the other will not prevent the walls from coming nearer together, or expanding. The most efficient method of preventing this is shown at fig. 8. No. 1. where a small notch is cut out of the beam, and the contrary piece, viz. a double notch, cut in the wall-plate to receive it. No. 1. the beam fixed longitudinally upon a transverse section of the wall-plates; No. 2. the upper face of the wall-plate. The best method of connecting any number of poles with cross-beams is depended upon this principle. Fig. 9. No. 1. shows a transverse section of a pole with two beams longitudinally bolted to it, in the manner of coxing beams to wall-plates; No. 2. a part of one of the beams, shewing the notches. The firmer method of fixing the pullins of a roof to the rafters also depends upon the same principle. Fig. 10. No. 1. is a section of the rafter, with the pullins longitudinally drawn; No. 2. the upper edge of the rafter; No. 3. the under side of the pullin, showing the notch.

The method of joining timber laterally, by means of keys and dovetails, is ingenious, and not generally known; it will be necessary to exhibit and describe the manner of doing it. Fig. 1. Plate L.XI. of Architecture. No. 1. is a longitudinal section of two pieces joined in this manner, with the dovetail piece and the wedge or key, by means of which they are forced against the ends of the pieces to be fixed, and in order to make the one press harder to the other, the interior angle of the dovetails is greater than the exterior one, formed upon the pieces to be joined; No. 2. is a transverse view of the mortise, exhibiting the ends of the dovetails and keys. Fig. 2. is the same method, applied in joining parallel pieces not touching each other together, which is plain to inspection.

The modes in which beams are lengthened are of infinite variety; some of the most approved forms are as follow. A beam may be continued to any extension by building it in three thicknesses; see fig. 1. Plate L.X. of Architecture. It may also be done by splicing one to the end of another, called by carpenters fearung, which is of various forms, as in figures 1, 2, 3, 4, 5, 6, 7, and 8. When a beam is to be lengthened, as in fig. 2 and 3, it is very difficult to get the joints close when the pieces composing it are very large, and hence they are seldom used but for very small pieces, which may be glued together. To remedy this inconvenience in large works, as well as to make it less dependent on the bolts; and to prevent every possibility of the one being drawn away from the other, is to indent them together, called tabling, as in figures 4, 5, 6, 7, 8, and 9, and to leave a small space at the end or meeting of each table for a wedge. In the operation of joining timbers in this manner, the pieces are laid so as to bring the joint as close as possible, the wedge is then driven while another person strikes the extremity of one of the pieces with a large hammer or mallet, which will bring the joint quite close, if they have been well fitted together previously to the operation; of these two forms, figures 5, 6, and 7 ought to have the preference, as the faces of the tables are parallel to the fibres of the wood, which will make them receive any longitudinal strain with a much greater force; but as a disadvantage arises from this form, that more than half the wood is cut quite through at the two ends of the joints, it has been found necessary to fix plates of iron across them, as are shewn. However, there is less to be apprehended from the tearing of the fibres, by being driven in a direction of their length, than from the bending of the bolts. Fig. 6. is a scarce with several tablings; in this it is to be observed, that the wedges in the two extreme mortises are only effective. A wedge in the middle would tend to force the joints open, and therefore the other two should only be fixed.

4 K 2
fixed. Long shearings add to the strength; but to increase the number of tables more than two, is, it is thought, rather disadvantageous, as it shortens its fibres, and consequently makes its resilience less. Fig. 7, is an excellent method of furring in two pieces, each piece being hallowed together, as in fig. 5. It has been thought by some that tailing shearings below the section of resilience more than is necessary; and for this purpose they prefer fig. 8, with an oblique facet, where the keys are let fall into the one and half into the other; but in this mode, as a draught must be left for the keys, they will be apt to be turned round in the driving, and therefore will have the effect of keeping the pieces together. Fig. 9, is a mode of furring a beam by tailing the pieces together; Nos. 1. and 2. are the half keys; when hallowed together they have the appearance of being quite straight, as is shown in No. 6. The tables are made in the form of obtuse angles, with a ridge in the middle, depressed and raised alternately, in the form of re-entering and slanting angles; No. 3, section across the depressed part; No. 4. section across the raised part: No. 5. section of the beam when hallowed together. In all forms of furring whatever, every butt joint should be furred across with iron on both sides; this will in a great degree prevent the bolts from being bent, and will increase the longitudinal resilience at the weakest section. If a beam is to be furred and tabled as in this half mode, the utmost care ought to be taken in the workmanship, so that all the buttion-places ought to be closely fitted together.

Connected with furring is the method of joining timbers, which may either be endways, sideways, perpendicularly, or obliquely. When two pieces of timber are so joined that the common beam or joint is perpendicular to the fibres of both pieces, then the joint is said to be buttting, and is called by workmen a buttin or heading joint. When two pieces of timber are joined together, so that the common beam is parallel to the fibres of both pieces, this then may be called lateral or longitudinal joining, and the joint may be called a longitudinal joint, as it runs in the direction of the grain; and when the fibres and beam of the one piece run perpendicular to the fibres of the other, this mode of joining timbers may then be called transverse joining, and the joint may be called a transverse or perpendicular joint. Lastly, when the fibres of the one piece run obliquely to those of the other, this is called oblique joining, and the joint is called an oblique joint.

Butting joints for many purposes are preferable to shearings, particularly in small work, such as the hand-rails of stairs.

They are fixed together with bolts, having a ferewed nut at each end, the head of one of these nuts must be quite round and the other square; the round one must be cut in its circumference full of notches. After having let in the bolt perpendicularly to the joint in both pieces, the nuts are sunk from one side across the grain, until the ends of the bolt may be able to pass the interior screw made on purpose to receive the exterior one; the square nut is first put in and the one end of the bolt is firmly driven into the bore made on purpose to receive it, and ferewed to the nut. The other notched nut is then put in, and the bolt in its place; the one piece may be turned round upon the other until the joint is close, but in order to secure the joint from turning round, two dowels may be inserted on each side of the bolt. Drive the one piece as close to the other as the nut will permit. Then by means of a narrow pointed screw-driver and mallet, the nut may be turned round until the joint is quite close.

Fig. 3, Plate LXII. of Architecture represents the meeting of a pair of rafters and the king post, together with the manner of furring them. This need of forming a junction by making the rafters meet each other, without the intervention of the joint, which is generally made to the king-post, has the advantage over the common mode, with a joggle-head, exhibited in fig. 6. Plate LXII. of Architecture, as the shrinking of the king-post at the joggle will allow the roof to deflex, and consequently put it out of shape.

One method of furring the tie-beam to the king-post is exhibited at fig. 7. Plate LXII. of Architecture. The mortise of the flaps on both sides is made obliquely, and that through the king-post is made somewhat lower, in order to give the wedges a proper draught. An idea may be formed by examining Nos. 1. which represents the bottom of the king-post with part of the tie-beam; Nos. 2. is a longitudinal section of the king-post, with a transverse section of the beam, in the upper part of this is shewn the manner of fixing the wedges, with the form of the washers, which are necessary in preventing the furring on each side from penetrating into the wood, the whole force of the friction being taken away from the flaps by them. Another mode of fixing the tie-beam to the king-post is by a bolt, as exhibited at fig. 8. Plate LXII. of Architecture. No. 1. shews the elevation of the bottom of the king-post; Nos. 2. is a vertical section cutting the beam transversely; in order to give greater security, there are two nuts, one let in from the face of the beam and the other from the edge. Fig. 1. Plate LXIII. of Architecture shews the meeting of a brace and framing-piece under a truss beam, as the brace may be formed into two forces, one pushing in a direction of the beam, that is, compressing the framing-piece, and the other tending to break it transversely, the end of the brace is cut in the form of a sally, or bird's mouth, as it is called by workmen. Another method is shewn at fig. 2. Plate LXIII. of Architecture. This mode is used in the roof of Greenwich chapel. See the figures in the article Roof. It may, however, be observed, that this abutment is not of the best kind; the space left for the brace to give prevalence to the framing-piece is much too small; the upper part should not be let into the framing or truss-beam, this prevents the framing piece from acting with its full force, and weakens the truss-beam.

Fig. 3, Plate LXIII. of Architecture shews the method of securing a collar-beam, at one extremity, to its adjacent rafter, in order to prevent its being pulled away at the joint, a bolt is made to pass through the rafter at the angle of their meeting.

Besides what has already been shewn of the varying of king-posts to their principal rafters, fig. 4. Plate LXII. of Architecture is another. The rafters meet each other as in fig. 5. Plate LXII. of Architecture, but instead of the forked flap, a bolt is here used, with a spreading head, so as to form a shoulder at right angles to the rafters, which are notched, in order to receive the bolt. This also prevents the rafters of a roof from sinking in the middle. Instead of any part being of wood, the whole may be of iron, confining of two parts, connected together by means of a screw, which will draw the tie-beam higher and higher at pleasure as it is turned round. Nos. 1. part of the king-post with the bolt; Nos. 2. and 3. part of the rafters; No. 4. view of the upper edge of the rafters. Various forms are sometimes adopted for the abutments at the bottom of the king-post; for the braces, when the king-post is not sufficiently broad at the bottom, as to allow the abutting shouder to be at right angles to the length of the brace, and to its whole breadth. Two of the most approved forms are exhibited in figures 5 and 6. Plate LXII. of Architecture. Fig. 5. shews the form of the abutment, when the part which makes the resilience
in the direction of the king-post is at right angles to it.

Fig. 6 shows the form of the abutment, when the part of the
shoulders which makes the defline is at right angles to the
brace; this mode is better than the former, because it is less
liable to compress the king-post at the bottom.

Fig. 7. Plate LXIII. of Architecture represents one form of
the head of a principal rafter, with the socket cut in the end
of the tie-beam to receive it; but as the small part cut across
the fibres of the beam is too near to the extremity, and as this
part fulls the whole force of the rafters, in drawing the
beam in a direction of its length, it will be liable to be forced
away. To prevent this in some measure, a double defline is
formed, as in fig. 8. Plate LXIII. of Architecture, equally
deep into the beam; this mode gives the length of the inter-
mediate part contained between the two abutments, in addi-
tion to the end defline, which is of itself equally strong
with that represented in fig. 7. The intermediate part in
this mode being cut across the fibres, it is easily split away.
A more effectual method of forming a double defline is
shown at fig. 9. Plate LXIII. of Architecture, where the head
of the rafter and the socket is cut parallel to the fibres of
the beam; the tenon forms the second abutment, being removed
further from the extremity. No. 1, the elevation of part
of the rafter with part of the beam; No. 2, the upper edge
of the beam, showing the mortise. But the most effectual mode
of forming a defline on the head of the rafter and socket
on the extremity of the beam is that represented by fig. 10.
Plate LXIII. of Architecture, where the abutment is brought
nearer to the inner part of the head, which leaves a greater
length on the end of the beam, in order that the defline
may still be greater than what is given by the wood. A lrap
may be placed round the extremity of the rafter, and the two
ends bolted together through the beam, as is shown by this
diagram at No. 1. and 2.

Fig. 11. Plate LXIII. Architecture represents two braces of
a roof meeting an iron king-post, which is only a small
rod of iron sufficiently strong to hang up the middle of
the beam, and to receive the force of the braces by the weight
of the middle rafters. The lrap which prevents the braces
from being pushed downwards has an eye through each side,
and the bottom of the king-rod is formed with a crofs equal
in length to the thickenfs of the braces; this crofs is per-
forated in its length to receive the bolt.

The purposes for which wood is employed in modern
buildings, and particularly in those of England, are very
various. It is used to form the frame work of the roof, and in
laths or boarding, to support the covering of tiles, slates, &c.
Long pieces, called bond or chain timber, are laid in the
walls to strengthen and bind them together; other flat
pieces, called plates or wall-plates, are placed to receive the
ends of the girders, joists, and other timbers, which form
the framing of the floors, and afford them a level bed. Ties
are placed across the building to affiff in keeping the oppos-
ite walls in their situation, and counteract the lateral pref-
ure of the roof, and diagonal ties at the angles. Lintels
are laid over the apertures of doors or windows to support
the incumbent walls. The floors are framed with various
beams and joists. The rooms are divided with quarter par-
titions, being a frame work of small posts and horizontal and
diagonal pieces placed at about a foot abfiend, and defned
to be called with lath and platter on the outside. Door and
window-frames are also placed in the apertures of the walls.
In bad foundations piles are sometimes used; and sometimes
planking, and what are called sapers, pieces of timber, laid
at short intervals trasversely, beneath the foundation wall,
and extending about two feet wider: besides all the fini-
ishing wood work, such as doors, windows, wainscotting, &c.
which belongs to joinery. Carpentry is also employed to con-
struct the cenfors for arching and vauting, and frequently in
entire bridges. Colur damas, caiffons, ford-gates, and all
the methods of building in water, derive large aidance
from this art.

The general principles of measuring and valuing carpen-
ters work may be given very shortly; and to enter into ma-
nume would be fuperfluous in the present work. The timber
used for building in London, and in the greater part of
England, consists entirely of oak and fir; for the first
the growth of this country, the second imported chiefly from
Norway. That timber which is out of fight, as being co-
vefed with lath and platter or other facing at the comple-
tion of the building, which is by much the greater part, is
uft as it comes from the faw, without the operations of the
plane. Of this, part is framed as the roof, floors, parti-
tions. The quantity is meafured by the cubic foot, and either
valued as for framed; or else the quantity of timber being af-
tained, is put down as fir without labour, (for no labour)
in the valuation of which is included the original price of
the timber, with the expence of cartage, fawing, waffle,
and the profit to the carpenter; and a superficial dimension
is taken of the frame or space in which the timber was em-
ployed under the denomination of labour and mafs, to a floor
of such a kind, roof, quarter partition, &c. in which is em-
ulated the value of the workmanship, with the master's
profit. The choice between these two methods is influ-
ced by custom, and the convenience of the measurer.

The timber used in the walls, as the plates, and bond timber, is mea-
sured separately by the cubic foot, and put down under the
denomination of fir in bond; this is valued at a medium price
between fir framed, and fir without labour. As for the tim-
ber which remains apparent after the completion of the
building, it is generally worked in some manner with the
plane, and is meafured by the cubic foot, and denominated
and valued according to the workmanship; thus a dooresane
is framed, wrought, rebated, and beaded. We have men-
tioned only fir because it is infinitely more used than oak,
however the latter is meafured in the same way.

Boarding, such as weather-boarding, boarding for flates,
&c. is meafured by the superficial foot, and valued in the
bill by the square, or 100 superficial feet. Timber used in
very fmall foundations, as billts, is valued, not by the cubic
or superficial foot, but by the foot in length, called foot
run.

Having thus defcribed what is properly included under
the general head of carpentry, the reader is referred, for
more particular information, to the articles CENTRE,
Floor, and Roof; under which articles that part of con-
structive carpentry which depends on certain branches of
mechanics and geometry will be fully explained.

CARPENTUM, in Antiquity, a denomination common
to divers forts of vehicles, affording to coaches as well as
wagons, or even trains among us: sometimes on two and
sometimes on four wheels; and sometimes covered, and at
other times uncovered.

The carpentum was originally a kind of carr or vehicle
wherein the Roman ladies were carried; though in after-
times it was also used in war. The form of this carriage
may be seen on antique coins, where it is represented as a
two-wheeled carr, with an arched covering, and it was some-
times hung with curiously cloth. It was a later invention than
the heliaca, and the areces mentioned in the 12 tables, which
was a covered carriage used by sick and infirm persons.

Some derive the word carpentum a carro; others from
Carmenta, mother of Evander, by a conversion of the m into
x, carpentum for carmentum. Thus Ovid, Fab. lib. i.
"Nunc prius Anusidas matres Carpeeta velbant.
Herc quaque ab Evaduri d Wright parentem.

CARPENZANO, in Geography, a town of Naples, in the province of Calabria Cita; 10 miles S. of Cofenza.
CARPETA, in Ichthyology, a name given by Cuba, and some other writers on fishes, to the common carp, cyprinus carpio.
CARPESIA, in the Materia Medica of the Ancients, a name given to a kind of spices, or aromatic drugs, often mentioned by Aeginita and others, and made an ingredient in cordial and pharmacical medicines. This was a vegetable sublimation, being the top shoots of young twigs of an odoriferous shrub, growing in Pamphylia, and smelling very like the fines cinnamon.

As the ancients used both this drug and cumin, it is certain that had they both been the produce of the same tree, they must have known it; and this is plain they did not know, for they have no where named any such thing; but, on the contrary, they expressly said, that the carpesia was the shoots of a tall tree, which produced no fruit. Avicenna gives also this account, and adds, that it grew, in his time, on mount Lebanon, and that the part gathered for this use was certain twigs, very long, cylindrical, and but little thicker than a needle, which had a very fragrant smell.

Gen. Char. Cal. common, imbricated; outer scales larger, spreading, reflexed; inner ones equal, close, shorter. Cor. compound, equal; florets hermaphrodite in the disk, funnelf-shaped; border five-cleft, spreading; female in the circumference, tubular, five-cleft, converging. Stamina filaments five, short. Pyll. similar in both kinds of florets; germ oblong; style simple; stigma bifid. Seeds ineribly egg-shaped, naked. Recepta naked.
CARPEPIACIUM, in Ancient Geography, a mountain of Asia, in Pamphylia.
CARPESTRIERA, in Geography, a river of Italy, which runs into the sea; 9 miles E. of St. Severino.
CARPET, a fort of covering, worked either with the needle, or on a loom; to be spread on a table, trunk, an eitaire, a pagasie, or a floor.

Persian and Turkey carpets are those most prized; especially the former, for which there is a manufacture at Paris: carpets that had a hair or figg on one side only, were called by the ancients tepetes; such as had a figg on both sides, were called amphiopetas. English carpets, especially those of Axminster, (which see) and those, the manufacture of which was established in London by the late Mr. Moore, are much valued. For a further account of this manufacture, see Tapestry.

Among Jacocks, to shove the carpet, is to callop very close, or near the ground; a fault foreigners charge on English horses.

Figuratively, an affair, proposal, &c. are said to be brought on the carpet, or tapis, when they are under consideration, &c.

Carpet-knights, a denomination given to grown-men, and others, of peaceable disposition, who, on account of their birth, office, or merits to the public, or the like, arc, by the prince, raised to the dignity of knighthood.

They take the appellation carpet, because they usually receive their honours from the king's hands in the court, kneeling on a carpet. By which they are distinguished from those that were created in the camp, or field of battle, on account of their military prowess.

Carpet-knights possess a medium between those called truck, or dunghill-knights, who only purchase, or merit the honour by their wealth; and knights bachelors, who are created for their services in the war.

Carpets, in Agriculture, a term applied to a green plot or path left unploughed up in an arable field; or, in common fields, to such strips as serve for divisions.

CARPETANI, in Ancient Geography, a people of Hifpania Citerior, situate on the W. towards Lutania. Their principal towns were Complutum, Cetribia, Mantua, and Toletum. Tolemy assigns to them 18 towns.

CARPETANIA, a country of Spain, in which Pliny places the towns of Cetribia and Hippona; and where this author, and also Ptolomy, place Oebura. The mountains of Carpetanias are denominated by Pliny "Carpetana juga"; and he says that the chief town was Cetribia.

Gen. Ch. Cal. superior, four-leaved; leaflets ovate, revuned, scarious, permanent. Cor. funnel-shaped; tube long, slender, swelling near the top, hairy within; border four-cleft; lobes acute. Stam. Filaments four, very short, inserted within the tube; anthers linear, erect. Pyll. Germ. inferior; style bristle-shaped, longer than the corolla; stigma bifid. Peric. Capsule crowned with the calyx, two-celled, two-valved, many-seeded; partition opposite to the valves, splitting into two. Seeds unknown. Effort. Ch. Calyx superior, four-leaved, scarious. Corolla tubular. Capsule crowned with the calyx, two-celled, many-seeded.
Sp. C. Madragarescoides, "Leaves opposite, linear-lanceolate; flowers in a corynbous." An short shrub, with leaves like those of hyssop, and terminal flowers in a dense corynbous or rather cyme. In La Marck's figure the younger branches are leafy, the older ones naked; and one of the younger branches there represented has a single pair of opposite leaves near the top, and three sets of fix or seven in a whorl below; the other has five pair of opposite leaves, and appears rough near the bottom with the scars of the fallen whorls. Found by Comeron in the island of Madragas. Jullien observes that it has the habit of Serissa and the calyx of Petrea.
CARP, Ugo da, in Biography, flourished in 1500, and
Carpi, Girolano da, a painter of portrait and history, was born at Ferrara in 1501, and studying under Garofalo, had become the best artist among his disciples. He afterwards studied the works of Correggio, and for this purpose spent several years at Parma, Modena, and other cities of Italy, where the bell of his works are preferred. Such was his success in the imitation of this eminent master's style, that many paintings, copied by Carpi from his pictures, were taken for originals, and eagerly purchased by connoisseurs. It is reported that at the court several of the paintings of Carpi passed for the genuine productions of Correggio. He died in 1556. Pilkington.

Carpi, in Ancient Geography, a people of Valeria, according to Ammianus Marcellinus, transplanted by Diocletian into Lower Pannonia, and placed in the vicinity of the Illyr. The mountains called "Carpates," were probably the first habitations of this people, who abandoned it under the empire of Alexander.

Carpi, a town of Proconsular Africa, according to Pliny, called Carpis by Ptolemy, and placed by him one third of a degree more northerly than Carthage; to this city pertained an episcopal see, noticed in the conference at Carthage. Dr. Shaw (Travels p. 87.) supposes the spot which this town occupies to be that which "Gurbos" or "Hammam-Gurbos" now stands upon; and that the hot-bath near it is the "Aqua Calida" of Livy (l. xxx. 24.) which he places over against Carthage; informing us, that several vessels belonging to the fleet of Octavius were here shipwrecked.

Carpi, in Geography, a strong town of Italy, and capital of a principality in the duchy of Modena; taken by the French and abandoned in 1703, taken again by them in 1705, and retaken by prince Eugene in 1706; the see of a bishop, suffragan of Bologna; 7 miles N. of Modena. N. lat. 44° 45'. E. long. 11° 12'.

Carpi, a town of Italy, in the Veronese, situate on the Adige, and subject to the Venetians; famous for a victory

obtained by prince Eugene over the French in 1701. N. lat. 45° 10'. E. long. 11° 39'.

Carpi extensor radialis, longior et brevis, in Anatomy, are two muscles, which arise close to each other from the lower extremity of the os humeri: the latter having its origin from the external condyle, and the former from the outer margin of the bone, immediately above the condyle. They are closely connected together, being immediately on the radius, and pass under the extensor tendons of the thumb. Their tendons run in a groove of the inferior extremity of the radius, where they are surrounded by a barba musculi, and then separate from each other: the longer muscle being insert into the metacarpal bone of the fore finger, and the shorter into that of the middle finger.

The action of these muscles consists in drawing the back of the hand towards the outside of the fore arm, which motion is termed by anatomists, the extension of the writ.

When the radius is prone, or supine, they will bring it into the middle plane between these positions. The longer muscle may afford in bending the elbow.

Winflow, Albinius and Soemmering call these muscles "Radales externi, longior et brevis."

Carpi extensor ulnaris arises in common with some other muscles from the external condyle of the humerus, and from the upper part of the ulna. Its tendon, which commences about the middle of the forearm, is pulled down at the back of the ulna by a tendinous obliquus muced and is affixed to the metacarpal bone of the little finger. It extends the joint of the writ, and may assist in turning the hand supine. This muscle is the ulnaris externus of several anatomists.

Carpi, a flexor radialis arises in company with the pronator teres, flexor sublimis, flexor carpi ulnaris, &c. from the inner condyle of the humerus. It passes obliquely across the ulna, and forms a tendon towards the writ, which penetrating a canal on the os navicular is fixed to the metacarpal bone of the index. It moves the palm of the hand towards the front of the radius and ulna, or in anatomical terms bends the writ. It turns the radius into the prone position. Winflow, Albinius, &c. call this muscle "radialis internus."

Carpi flexor ulnaris arises by a common origin with the neighbouring muscles from the external condyle of humerus, and also from the margin of the ulna. It passes over this bone, receiving fibers all the way to the writ. Its tendon is inserted into the os pisiforme of the carpus. It bends the writ. It is called by many anatomists "ulnaris internus."

This muscle concurs with the extensor carpi ulnaris in producing a lateral motion of the writ, in which the ulnar side of the hand is moved towards the ulna. The extensors carpi radiales and the flexor carpi radialis draw the radial side of the hand towards the radius. When the writ is bent, or extended without any inclination to either side of the forearm, the effect is produced by the combined action of the radial and ulnar flexors or extensors.

Carpi, in Ancient Geography, a people of European Sarmatia, who, according to Ptolemy, inhabited the district between the Poenic and the Balleri.

Carpiignana, in Geography, a town of Italy, in the Novarese; 12 miles N.W. of Novara. Alfo, a town of Naples, in the province of Otranto; 7 miles N.W. of Otranto.

Scales
As the twigs, whether bare, or covered with leaves, are usually of a red or brown color, so the flowers are pure white, and open in May. The leaves are large, ovate, acuminate, doubly toothed, with serrate margins, pubescent, villous, or silky, at the base. Male catkins are long, pendulous, sessile, or pedunculate, branched, and contain numerous stamens. Female flowers are solitary, with a single ovule. The fruit is a drupe, containing a single seed. The wood is durable, hard, and valued for its beauty and strength. It is used in shipbuilding and for the construction of bridges and other structures.
CAR

common with the heaths, and which honf Evelyn, attentive only to beautiful ell-er, reluctantly calls an infinitum, makes it eminently proper for the left mentioned pofture. Our venerable dendrologift speaks of capture of the elliptic hedge in the Luxembourg garden at Paris, and of the crede walk at Hampton-court; and while the passion for architectural gardening prevailed, the hornbeam was prof-

CARPIS, in Ancient Geography, a city in Pamonia, placed by Ptolemy near the Danube — Alfo, a river, which ran into the Rhine, on the northern bank. See also CARPI.

CARPOBALSAM, or CARPOBALSAMUM, the fruit of the tree which yields the true oriental balsam, or balsam very much resembling, both in figure, size, and colour, that of turpentine. The word comes from CARPO, fruit; and BALSAM, balsam. The carposambum is an oblong fruit with a short foot-stalk, a brown wrinkled rind, marked with four ribs; of a grateful taste and smell. See BALSAM.

CARPOBOLUS, in Botany. See Lycopersicum carpobolus.

CARPOCRATIANS, in Ecclesiastical History, a branch of the ancient Gnostics, so called from Carpos, a fruit, or the second century, adopted and taught philosophical tenets, which agree, in general, with those of the Egyptian Gnostics. He was born at Alexandria, and flourished about the middle of the second century. He acknowledged the existence of one God, eternal and incomprehensible, who made angels and powers of different orders, and to some of them he ascribes the formation of this lower and visible world. He taught that Jesus was the son of Joseph and Mary, according to the common course of nature; that he was endowed with a most pure soul of great capacity and understanding, and that he retained the remembrance of the things which he had seen with the father, in his pre-existent state, which he revealed to men; that he wrought miracles, and excelled in the holiness of his life, and in all virtue; that he lived among the Jews, and suffered death; after which his soul ascended to heaven and returned to God. He also inculcated the pre-existence of human souls; and expected the salvation of the soul only, and not the resurrection of the body. Some have accused, that his doctrine, with regard to practice, was in the highest degree licentious. Accordingly, he is charged with not only allowing his disciples to sin, but recommending to them a vicious course of life, as a matter of obligation and necessity; and with affenting, that eternal salvation was attainable only by those who had committed all sorts of crimes, and had daringly filled up the measure of their iniquity. It is also said, that, though he acknowledged the laws which Christ enjoined on his disciples, he held that lusts and passions, being implanted in our nature by God himself, were not criminal and culpable; that all actions were indifferent in their own nature, and were rendered good or evil only by the opinions of men, or by the laws of the state; that it was the will of God, that all things should be possible in common, the female sex not excepted; but that human laws, by an arbitrary tyranny, branded those as robbers and adulterers, who only used their natural rights. It has been said also, on the authority of some ancient writers, that the Carpoctiians marked their disciples on the back past of one of their ears; that they had pictures and images of Christ and his apostles, and of some heathen philosophers and poets; and that they honoured them with superfluous rites. They are charged also, not only with maintaining the community of women, but with allowing lewd and lascivious practices at their fuppers, or love-feasts; and they were chargeable with unnatural uncleanness, as well as magic. Dr. Lardner, with his usual impartiality and candour, examines the ground of these charges, and inclines to think that the immoral principles and immoral practices ascribed to them are not proved, and that the charges are owing to mistake or prejudice, or both. There might, he says, be loose and wicked

CARPIONE, in Botany, a name given by some old writers to the fifth called in England the cherb. See Salmo-

CARPIE, in Ancient Geography, a city in Pamonia, placed by Ptolemy near the Danube — Alfo, a river, which ran into the Rhine, on the northern bank. See also CARPI.

CARPOBALSAM, or CARPOBALSAMUM, the fruit of the tree which yields the true oriental balsam, or balsam very much resembling, both in figure, size, and colour, that of turpentine. The word comes from CARPO, fruit; and BALSAM, balsam. The carposambum is an oblong fruit with a short foot-stalk, a brown wrinkled rind, marked with four ribs; of a grateful taste and smell. CARPOBOLUS, in Botany. See Lycopersicum carpobolus.

CARPOCRATIANS, in Ecclesiastical History, a branch of the ancient Gnostics, so called from Carpos, a fruit, or the second century, adopted and taught philosophical tenets, which agree, in general, with those of the Egyptian Gnostics. He was born at Alexandria, and flourished about the middle of the second century. He acknowledged the existence of one God, eternal and incomprehensible, who made angels and powers of different orders, and to some of them he ascribes the formation of this lower and visible world. He taught that Jesus was the son of Joseph and Mary, according to the common course of nature; that he was endowed with a most pure soul of great capacity and understanding, and that he retained the remembrance of the things which he had seen with the father, in his pre-existent state, which he revealed to men; that he wrought miracles, and excelled in the holiness of his life, and in all virtue; that he lived among the Jews, and suffered death; after which his soul ascended to heaven and returned to God. He also inculcated the pre-existence of human souls; and expected the salvation of the soul only, and not the resurrection of the body. Some have accused, that his doctrine, with regard to practice, was in the highest degree licentious. Accordingly, he is charged with not only allowing his disciples to sin, but recommending to them a vicious course of life, as a matter of obligation and necessity; and with affenting, that eternal salvation was attainable only by those who had committed all sorts of crimes, and had daringly filled up the measure of their iniquity. It is also said, that, though he acknowledged the laws which Christ enjoined on his disciples, he held that lusts and passions, being implanted in our nature by God himself, were not criminal and culpable; that all actions were indifferent in their own nature, and were rendered good or evil only by the opinions of men, or by the laws of the state; that it was the will of God, that all things should be possible in common, the female sex not excepted; but that human laws, by an arbitrary tyranny, branded those as robbers and adulterers, who only used their natural rights. It has been said also, on the authority of some ancient writers, that the Carpoctiians marked their disciples on the back past of one of their ears; that they had pictures and images of Christ and his apostles, and of some heathen philosophers and poets; and that they honoured them with superfluous rites. They are charged also, not only with maintaining the community of women, but with allowing lewd and lascivious practices at their fuppers, or love-feasts; and they were chargeable with unnatural uncleanness, as well as magic. Dr. Lardner, with his usual impartiality and candour, examines the ground of these charges, and inclines to think that the immoral principles and immoral practices ascribed to them are not proved, and that the charges are owing to mistake or prejudice, or both. There might, he says, be loose and wicked

Vol. VI.
men among the Carpathians, as there were in other sects; but that they were countenanced either by Carpathocrites, or by his son Epiphanius, who taught the same opinions with his father, and had many followers, though he died at the age of 18 years, or by the principles they taught, does not appear to him to be probable. Epiphanius says, that they rejected the Old Testament; but Dr. Lardner conjectures that possibly the fact only was this: that they did not accept the infusions of Moses and the prophets equally with those of Christ and his apostles. He apprehends also, that they received all the books of the New Testament, as they were received by other Christians in their time. Motham, Eccl. Hist. vol. ii. p. 227, 5c. Lardner's Works, vol. ix. B. ii. ch. 3 p. 328—310.

CARPODETUS, in Botany, (from mappa, fruit, and 3e, to kind,) the fruit being surounded or bound by a ring or fillet,) Schreiber, gen. 362. Mart. Willd. 410. Forl. gen. 17, Chis and order, pentadaria monogyna. Nat. Ord. Khamnii, Juff.

Ell. Ch. Corolla pentapetalous, inserted into the margin of the calyx. Berry inferior, dry, five-celled, annulated.

CARPOLOGY is that part of Botany which treats of the fruit of plants in the most extensive sense of the word, describes its various appearances, divides it into distinct kinds, analyses it into its several parts, and forms the whole into a regular system. See Fruit.

CARPUDEMUM, in Ancient Geography, a town placed by Ptolemy in the interior of Thrace. See SKELETON.

CARPUS, in Antiquity, is the term applied to the whet.

See SKELETON.

CARPUTH, in Geography, a town and fortresses of Asiatic Turkey, in the province of Aladalia; 12 miles from Arzengun.

CARPZOVIANUS, in Biblical History, is the denomination of a MS. of the four gospels, marked 78 in the first part of Wetstein's New Testament, which Küster, judging from the letter, supposed to be 600 years old. Gottlob Carpzzow of Leippich had it in his possession, and Küster procured from Dr. Boerncr thosc extracts, which he inserted in Mill's edition of the Greek Testament.

CARPZOVIES, BENEDEIT, in Biography, was born in 1595, and succeeded his father, who was an eminent lawyer, as counsellor to the elector of Saxony, and adviser of the judges of appeals. His acquaintance with the jurisprudence and legal practice of Germany was very extensive; and by availing himself of an indulgent research in the constitution and decisions preferred in the various archives of the country, he was the best writer on these subjects. Of his numerous works the principal arc as follow, &c. "Practica rerum criminalibus," fol. published in 1615, and several times reprinted and abridged; "Definitiones forenses, vel jurisprudentia forensis Romano-Saxonica ad constitutiones electoria Augsbg," 1638, fol.; A commentary "Ad legem regiam Germanorum," 1640; "Repentina juris electoria," fol. 1642; "Definitionum ecclesiasticarum feu confessorialium," &c. 1649; "Decisiones Saxonicarum," 3 vols. 1646—52—54; and "Procesquis Juris Saxonicarum," fil. 1657. The close of his life at Leipzig was devoted altogether to the study of the scriptures, which he had read over, as it is said, 53 times, besides commentaries. He died in 1666. Several others of the same family and name distinguished themselves as theologians and philologists.

CARR, in Ancient Geography, is a fort of cart made use of in some districts for conveying light weights. There is an improved kind of cart, which is much employed in Leicestershire, for conveying dung and other similar matters upon land in an easy and expeditious manner, as a good horse is capable of drawing near a ton weight in it. It is constructed in the following manner. The diameter of the wheels is four feet; the length of the body the same; the width of the body three feet ten inches; the height of the shafts ten feet. Rails are capable of being occasionally put on for the purpose of carrying turnips, or other roots of a similar kind. It is made by Mr. Handford, of Hathern; and carts when complete, 6f. 152. 6d. and, with an iron axle-tree, 6f. 16s. 6d. This fort of carriage was found very useful for various purposes on Mr. Bakewell's farm. And the improved Irish Carr is another useful fort of carriage of this kind, which was much recommended by the same intelligent farmer. It is observed, in the second volume of communications to the Board of Agriculture, that "its principal advantages consist in the facility with which it is loaded, from its own axle; and where gateways and roads are narrow, much room being gained by having the wheels under the body of the cart. In such situations, this cart seems well calculated for carrying manure, especially on meadow or ploughed ground; and for that purpose its wheels ought to have a flat bearing, and be at least six inches in breadth. Another advantage of this cart is, that from its construction the wheels are necessarily cylindrical, at least they are not necessarily conical; and the facility of draught arising from this unobserved circumstance has probably been imputed to some other part of the construction, as we find by experiment, that the resistance to the cylindrical wheel is not increased, but diminished by increasing the breadth, and the flat bearing of its rim. The knowledge of this fact is of very great importance to the farmer, as well as to the waggoner, since by this means, he may be enabled, in almost all situations, to drive his broad-wheeled carts, &c. on his meadow or ploughed grounds when no narrow wheel can be used; the advantages of which are too well known to be here insinuated on: but when the width of gate-ways, and the breadth of roads, will admit of the wheels being placed at the sides of the cart, without confining the width of its body, it will probably be more advantageous to have them sideways than under the cart." A cart of this nature is represented at fig. 2. Plate III. of Agriculture.

CARR, carrum, in the Middle Age, denoted any fort of vehicle, or carriage, either by land or sea.

CARR, Carus, a kind of rolling throne, used in Triumphs, and at the splendid entries of princes.

The word is from the ancient Gaulish, or Celtic, carr; mentioned by Caesar, in his Commentaries, under the name carus. Plutarch relates, that Camillus having entered Rome in triumph mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

Carr is also used for a kind of light or open chariot. Pontanus observes, that Erichthonius was the first that harnessed horses, and joined them in a carr or chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies, either a triumph, or an apotheosis: sometimes a procession of the images of the gods, at a solemn supplication;
supplication; and sometimes of those of some illustrious families at a funeral—the car covered, and drawn by males, only signifies a consecration, and the honour done any one of having his image carried at the games of the event.

See Consecration.

The car used by the ladies was called pilentum, carpentum, and buffeta. See Coach.

Carr, in Geography, a small plantation in the county of Lincoln and district of Maine, North America.

CARRA, a river of the county of Kerry, Ireland, which rises in Magillicuddy's reeks, W. of the lake of Killarney, and after a rocky course of a few miles flows into a lake of the same name, from which its waters are emptied into the bay of Coillmar. On, or very near the banks of this river was the village of Blackstones, a romantic spot where Sir W. Petty erected iron works, which continued as long as the timber on the neighbouring mountains supplied wood for charcoal; but when this was exhausted, from neglect of coping, the works ceased, and the village has gone to decay. Smith's Kerry.

CARRAC, or Carraca, a name given by the Portuguese to the vessels they send to Brasil and the East Indies; being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians.

It is a custom among the Portuguese, when the carrao returns from India, not to bring any boat or flot to the service of the ship, beyond the island of S. Helena; at which place they sink them on purpose, in order to take from the crew all hopes or possibility of saving themselves, in case of shipwreck.

In the year 1592, a Portuguese carrack was captured by Sir John Barrow which is thus described. "This carrack was in burthen no less than 1600 tons, whereof 900 were merchandise: the carried 32 pieces of brass ordnance, and between six and seven hundred passengers; was built with decks, seven flory, one main alope, three clofe decks, one fore-castle, and a spare deck, of two floors apace. According to the observations of Mr. Robert Adams, an excellent stonometrian, he was in length from the beakhead to the stern 165 feet; in breadth near 47 feet; the length of her keel 100 feet; of the main-mast 121 feet; its circuit at the partners near 11 feet; and her main-yard 100 feet;"

CARRACA, in Ancient Geography, a town of Italy, in the country of the Bechini according to Ptolemy; supposed to be Caravaggio.

CARRACCI. See Caracci.

CARE, in Ancient Geography, a town of Asia, in Syria, situated to the east of a chain of mountains, on the banks of a small river, S. W. of Gaetara, and at some distance to the east of Heliopolis.

CARRAGHLOUGH, a very pretty lake of the county of Mayo, Ireland, 5 miles long and 3/2 broad, with wooded peninsulas and islands. In the surrounding barony which is called from it, and includes the town of Carrickbar, the linen manufacture is carried on in a manner superior in neatness to most parts of the country.

CARRAGHRTHOM Mountains, mountains in the western extremity of the county of Tyrone adjoining the county of Down, and North of Lough Derg. Beaufort.

CARRAGO, in Antiquity, a kind of fortification, or de-
CARRÉ, Michael, the younger brother of the former, was born at Amsterdam in 1660, and having commenced the study of his art under his brother, accomplished himself in his profession as the disciple of Nicholas Berchem; he afterwards preferred the style of Vander Ieew to that of Berchem. He resided several years in London, without obtaining much employment or reputation. After his return to his native city, he was invited to the Prussian court and liberally recompensed for his works as an artist. His taste led him to embellish grand palaces, halls, and large apartments; and in works of this kind he was fond of introducing subjects that excited terror; such as storms with lightning, the destruction of castles and towers, and the tearing up of trees by the roots. In his cabinet pictures he had a ready hand, and a neat manner of pencilling. Pilkington.

CARRÉA Poldemia, in Ancient Geography, a town of Italy, in Liguria, N. of Augula Vagiennorum, celebrated for its black wool.

CARRÉ, a people who, according to Pliny, inhabited the interior of Arabia Felix, and to whom he assigns the town of Caritha, called by Ptolemy Carithara.

CARREL, in Antiquity, a cloist or apartment for privacy and retirement. This term, which has been long diffused, was principally applied during what are called the middle ages to the closets for study which were usually given to each monk in the cloister of his monastery. In the visitations of the old religious houses the prior or superior is frequently enjoined to visit these carrels, or cells, once or twice a year. (See Covel's Law Interpreter, v. CAROLA.)

CARRE, in Ancient Geography, a very ancient city of Afa in Meopotamia, near the Euphrates, at the distance of eighty miles from Hierapolis. It was famous for the defeat of the Romans by the Parthians, and the death of Crassus, the Roman general, and also for a temple of the moon. M. D'Anville places it to the west of a small chain of mountains, which separated it from Chaboras. See Haran.

CARRI, in Geography, a town of Italy, in the province of Piedmont; eight miles N.N.W. of Ceva.

CARRIAGE, a vehicle for the conveyance of persons, goods, &c. from place to place.

CARRIAGE Artillery, in French affuts des canons, are wooden frames or machines, on which cannons are mounted and transported from one place to another. They are of various kinds.

Garrison-gun-carriages are those, on which garrison-guns are commonly mounted. Such a carriage with its gun on it moves on four cast-iron trucks or small low wheels seldom exceeding twenty-four inches in diameter.

A Ship-gun-carriage differs from a garrison-gun-carriage only in having its trucks of wood, and breach-rings, which the other has not.

There are copper clouts underneath the axle-trees of garrison-carriages to diminish the friction of the iron on the wood.

Travelling-carriages and field carriages are such as guns are mounted and transported on when employed at sieges or on service in the field. They are much longer than garrison or ship-gun-carriages and are differently constructed. Every such carriage has two wheels and a long trail. And the limber for moving it with by means of the pintle-pin or iron bolt has two wheels also.

Timbers are two-wheel-carriages, made commonly each with two shafts, but sometimes with a beam or pole, for drawing double with. They support the trails of travelling or field carriages, by means of the pintle-pins or iron bolts, when the guns are to be transported, or removed from one place.
place to another. The pieces are generally fired with the
trials of their carriages taken off from the limbers—but they
may be fired with them on the same, and sometimes are
on a march when attacked, or prefled on by an enemy.

Gun-carriages, are for one and a half pounders. Such
a carriage has flats to be drawn without a limber, and is re-
garded by many artificers, as more convenient than other
field-carriages, and preferable to them. It is a carriage,
that answers very well also for a light three, or fix pounder.

Howitzer carriages, are for supporting, and transporting
howitzers. Those for the 6 and 8 inch howitzers are made
with ferews, for elevating them in the same manner as the
light fix pounder-carriages are. They are therefore made
without a bed, and the centre-tranfom is nine inches broad
for fixing the elevating ferew in, instead of four, as in tho
that are made without such a ferew. In the centre, between
the trail and centre-tranfom, there is a tranfom-bolt, which
is not in others, because the centre-tranfom must be made
to be taken out; and when it is, the howitzer may be
elevated to any degree under ninety.

Tumbrel, or Tumbrel-carriages, are carriages with two
wheels, commonly made use of for carrying the pioncers',
makers', and artificers' tools. They are also fometimes
employed for carrying the money of the army.

Block-carriage, is one that is made out of a solid block,
or piece of timber, so hollowed or cut into, as to receive the
gun or howitzer into the cap-squares: the flat, or lower part
of the cap-square is let into the solid wood, and the gun or
howitzer is elevated or depressed by means of a ferew, as on
another carriage. The limber of this carriage carries two
large chests for ammunition, and takes four men. The
pin-tile, or iron bolt of the limber, is so constructed as to
make the gudgeon of the carriage, by which means a greater
relief is obtained when the carriage passes over rough or un-
even ground. Block-carriages are chiefly made for the pur-
pofe of conveying mortars and their beds from one place to
another.

Block-carriages are also used by the horfe-artillery, as
carricules. They are very useful on service. The original
inventor of these is the ingenious General Congreve, to
whom the Board of Ordnance is indebted for many improve-
ments, and the nation for important services; which merit
attention and recompence.

Truck-carriages, are for carrying timber and other heavy
articles from one place to another, at no great distance from
it. They are also employed for moving guns and mortars,
where their own carriages cannot go, and are drawn by men
as well as horfes and other beafts of burthen.

A Ponton-carriage is solely for transporting the pontons.
Formerly it had only two wheels, but now it has generally
four.

Besides these, there are other artillery carriages, as land
and sea mortar-beds, which have no wheels, as mortars are
not transported on their carriages; powder carts; ammunition
wagons; flint wagons; travelling forges; and pontons.

Figure 1. (See Artillery-carriages in the plates) is the
outside elevation or profile of a garrifon or ship carriage;
and fig. 2 is the inside elevation of one of the checks or fide-
pieces, showing some of the irons in it, that would not otherwise
be seen; the manner in which these pieces should be
let into the axletrees, and the position of the tranfom.
The height of each fide-piece before, is equal to 43 diam-
eters of the fhot, and its height behind is only half as

The length of the fide-piece is supposed to be
bifected or divided into two equal parts, and of these two,
the hind part is supposed to be divided into four equal parts,
as a fcale for making the steps by. Each of these fide-
pieces is hollowed or cut out beneath, in the form of a cir-
cular arc, of which the radius is about half the length of
the piece. This makes it somewhat lighter without diminishing
its strength. Both the axletrees are let into the fide pieces
in the manner represented in fig. 2. The tranfom is placed
directly over the fore-axletrees, in the middle of the height
of the fide-pieces, and is one diameter of the fhot broad,
and two deep.

The following are the names of the different pieces of
iron-work in a ship and garrifon-carriage, with the number of
each. See Artillery-carriages, fig. 1 and 2.

a. The curved parts of the cap-figures. 1
b. Eye-bolts. 2

The only iron used for these purposes is wrought iron,
and made in the form of a right line. The next step is
to place the pieces in a circle, and to divide them into
equal parts. This is done by making a circle with a
compass, and then drawing lines through the center
and the points of division. The pieces are then
bent to fit the circle, and the edges are filed
smooth. The resulting shape is a series of
right triangles, which are then cut out
and assembled to form the carriage.

The carriages are then placed on the
ground and the pieces are securely
fastened together using nails or screws.

N. B. The garrifon-carriage has all
these irons as well as the ship-carriage,
except the two brecceling-bolts with rings.

The construction of these carriages is as follows. See
fig. 3. Let A B be any indefinite right line. In it take any
two points, C, D, so that the distance between them shall be
equal to three seventh parts of the gun's length, or to the
distance from the centre of the trunnions to the extremity of
the breech. Through these points draw two right lines at
right angles to A B. On the first of these, take C E, C F,
in opposite directions and each of them equal to half the
diameter of the second reinforce-ring of the gun. On the
second take also D G, D H, in opposite directions, and each
of them equal to half the diameter of the base-ring. Then
right lines drawn through the points E, G, and f, H, will
determine the inside width of the carriage.

If parallel to these two last mentioned right lines, there
be drawn two others at the distance of one caliber of the
gun from them respectively; these again will determine the
breadth of each of the side-pieces and the outside width
of the carriage. And if, from D towards B, there be set off
D I, equal to the length of the cañon, and from C towards
A, there be set off C K, equal to half the diameter
of one of the trunnions, with half the diameter of one of
the fore-trucks, I K will be the length of the carriage.
The right line E F, palles through the centre of the trunnion-holes,
the diameter of each of which is equal to a
caliber of the gun. The centre of each of these holes
is about a quarter of an inch below the upper surface of the
side-piece. Six inches are set on each side of G H, for the
axletree, which is always twelve inches broad.
Mr. Muller, in his "Treatise on Artillery," gives another
construction for gun-carriages to suit his construction of
guns. In constructing both he supposes the diameter of
the shot to be divided into 24 equal parts; and on this sup-
position, in constructing the gun-carriage, he takes CD,
(see fig. 3.) equal to six diameters of the shot, and ten parts;
CE, CF, each equal to 34 parts; DG, DH, each equal
to 39.5 parts; the breadth of each of the side-pieces equal
to one diameter, or 24 parts; DI equal to one diameter
and 12 parts; and CK equal to two diameters and a half.
He makes the breadth of the fore axle-tree equal to 30 such
parts; its length equal to six diameters and a third; the
length of each of the arms equal to 44 such parts, and the
diameter of each of them equal to 24 such parts. In the
elevation he makes the height of each of the side-pieces be-
fore, equal to four diameters and three quarters, and equal
to half that height behind. The height or depth of the
fore axle-tree he makes equal to 42 such parts; and that of
the hind axle-tree equal to 30 such parts. The bed-bolt
passes under the middle of the fourth step and is even with
the lat, or hind step.

He makes the breadth, or thickness of each of the wooden
tools equal to that of each of the side-pieces, which by
his construction is equal to one diameter of the shot, or to
24 such parts; the diameter of each of the fore-trucks equal
to four diameters of the shot, and that of each of the hind-
trucks equal to three diameters and a half. These diamc-
ters, however, must of course be increased or diminished to
suit the height of the port-holes in ships.

Of travelling, or field carriages. The long side-pieces,
PQ, RS, (see fig. 12.) are called the cheeks; the fore part,
QR, of the carriage, is called the bealt, and the hind part,
PS, the trail. T denotes the trail-trumom; X the bed-
trumom; V the centre-trumom; and Y the beatt trumom;
GH the body of the axle-tree; W the pintle-hole; and
m, n denote the tramum-holes.
The following are the dimensions of the cheeks.

The names and numbers of the parts and iron of a travelling carriage-wheel are the following.

Nave 1  
Spokes 12  
Felloes, or felloes 6  
Dowel-pins 6  
Streaks 6  
Streak-nails 48  
Nave-boxes 2  
Nave-hoops 6  
Dowel-pins 2  
Dowel-pins 24  
Dowel-pins 9  
Box-pins 6  

The dowel-pins are wooden pegs about three inches long each, and three quarters of an inch in diameter. They serve for joining or fastening the felloes together.

The dowel-pins are iron plates, which are sunk into the felloes on the outside, and are each of them fastened to the nave with four pins, or rivets. They serve to fasten the felloes strongly together, and to strengthen the joints.

The nave is almost always made of elm, cut six months before it is used, and left all that time in the bark. Larch, however, would probably be found on trial to answer full as well, if not much better. The spokes are made of elm, or young oak, and as dry and well seasoned as possible. The felloes are for the most part also of elm, but are sometimes made of split beech, which makes to the full as good, if not better ones. And the axle-tree is generally made out of dry elm, young oak, or young beech. Swamp-maple is, however, much preferable for this purpose to either elm or beech.

The checks and tranfoms are always made of dry elm. But either young oak, or swamp-maple, are preferable to it for both.

The names and the numbers of iron, or pieces of ironwork in the axle-tree of a travelling-carriage, are the following.

Axle-tree bar 6  
Clouts 2  
Axle-tree hoops 2

</table>

The usual construction of travelling-carriages is the following. See fig. 1.

Let A b c d e be the planks, out of which one of the cheeks is to be made, and let A B be the height of the said cheek before. Set off from B to C the sum of the said height, or of the head, A B, and the distance from the hind part of the trunnions to the extremity of the caseable. Then, from the point, A, as a centre with the radius, A C, describe an arc, in which, as a chord, apply a right line, C D, equal to the height of the cheek at the centre, and draw the right lines, A D, B C. On B C, take B E, equal to the head, A B, or height of the cheek before, and from the point, E, set off towards the right lines, E F, G, equal each to half the diameter of one of the trunnions. Then, E F being equal to the diameter of the trunnion, cut the trunnion hole out of the cheek, so that its centre may be about a quarter of an inch below the line, B C, or E F. From the point, F, draw the right line, F P, perpendicular to A D, or parallel to A B, and in A D, take F H, equal to the breadth of the axle-tree, which is to be cut as near as in inches into the cheeks. On the right line, F H, constitute a square, and from I, the point of intersection of its diagonals, as a centre with a radius of 29 inches, which is equal to the radius of the wheel, describe an arc. This arc will represent a part of the wheel; and if a ruler touching the said arc be laid across the plank, that the distance, M L, which is equal to the length of the side, and from the points, M, L, perpendiculars, M N, L O, to M L, be also erected, equal each to the height of the wheel, the right lines, C N, N O, and D M, being drawn, will, with the right lines, A B, C G, and A D, give the figure, A B C N O P M D A, of the cheek required.

The lower part, M P, of the trunnion is round in order that the carriage may slide with more ease on the ground, or on a platform, which is round, formed by first dividing L O into four equal parts, and taking L P equal to one of them; and, secoundly, by erecting right lines at the points, M, P, perpendicular respectively to D M, M P, and meeting in the point, Q; and lastly, by bisecting M Q in the point, R, and from R, as a centre with the radius, R M, describing the arc, R M, P.

The mortise, V, of the centre-tranfom is ascertained or determined by drawing a right line through the point, C, perpendicular to the horizon, K M, in which C P is taken equal to a fourth part of the foot's diameter, and p q equal to twice that diameter for its height. Its breadth, p x, taken in a right line, p z, parallel to K M, is equal to one diameter of the foot. The distance between the centre-tranfom, V, and the bed-tranfom, X, is equal to two diameters of the foot; and the height and breadth of this last are each equal to one diameter. The bed-tranfom, Y, is one diameter of the foot broad and two high. The sides of it are parallel to the head, A B, and terminate above, or at top in a right line parallel to B E, and equally distant from it with the bottom of the trunnion-hole. And the inside of them, if produced, would pass through the point at the side of the said hole, that is next to the head, A B. The mortise of the trail-tranfom is equal in length to the trail itself; its height is equal to one diameter of the foot, and
and it is parallel to the upper side, N O, of the trail. Its lower side, if produced, would pass through the point, P.

All these distances, viz. of the breach-tranform, the bed-tranform, the centre-tranform, and the trail-tranform, are divided by horizontal right lines into four equal parts, the upper one of which is sunk or let in half an inch into each of the cheeks, the two middle ones to the depth of two thirds of the thickness of one of the cheeks, and the lower one not at all.

And the following is the construction of the plan of a travelling gun carriage. See fig. 12.

Draw any indefinite right line, A B. In it take the right line, C D, equal to the distance from the centre of the trunnions to the extremity of the base-ring of the gun. Through the points C, D, draw right lines perpendicular to A B, and let them be produced indefinitely. On that drawn through the point C, take C E, C F, contrary ways and equal each to the radius of the second reinforce-ring.

And on that drawn through the point D, take D K, D L, also contrary ways, and equal each to the radius of the base-rings. Then right lines drawn through the points F, K, and E, K, will determine or ascertain the width of the carriage within; and if two right lines be drawn parallel to these, and at a distance from them respectively equal to the length of either of the trunnions, they will give the equal thicknesses of the cheeks Q P, R S.

The positions of the trunnions holes M, N, are ascertained by setting off a distance both from the point E, and the point F, equal to half the diameter of either of the trunnions. The breach-tranform, Y, must be drawn with a breadth equal to one diameter of the shot, and with its inside in a line with the fore parts of the trunnion-holes. Take C A equal to r B in the last figure. Then a right line, R A Q, perpendicular to A B, will determine the breadth of the carriage; and its total length is ascertained by the immediately preceding figure.

If two diameters be let off from the right line K L, we shall get the hind part of the centre-tranform, V, the width or breadth of which as well as that of the bed-tranform is equal to one diameter of the shot. The distance between these is equal to two diameters, and the position and breadth of the trail-tranform are ascertained as before by the immediately preceding figure. In the middle of this tranform is the pintle-hole, of an oval form, wider above than below, in order that the pintle may have room to play in it when the carriage is moving on or going over uneven ground. The bed, w, is a piece of an inch and half-board one foot broad and is sunk or let down into the bed and centre-tranforms. The plane of the fore-part of the axle-tree would, if produced, pass through the centres of the trunnion-holes. There is a board fixed with one end on the axle-tree and the other on the bed-tranform, for laying hay, draw, &c. upon for wadding. From about one diameter and a half from the centre-tranform, to about a diameter from the trail, the breadth or thickness of each of the cheeks is diminished by a sixth part of the same.

This is the construction that has been commonly observed and made use of for travelling carriages. But Mr. Muller has given a general construction for them to suit his construction of guns, the lengths of which he supposes to be respectively equal to 20 or 21 diameters of their shot.

The general dimensions of travelling gun carriages, according to this construction, are the following. See fig. 11.

The length, A d, of the plank is equal to two feet and a half together with twelve diameters of the gun's shot. The height, A B, of each of the checks is equal to three diameters and a quarter. B b is equal to half a diameter, and the height, D C, at the centre is equal to 70 such equal parts as those, of which the said diameter contains 24.

The length of the trail is equal to three diameters, and its height, M N, is two. The breadth, F H, of the axle-tree is equal to two diameters, and the rest of the dimensions are regulated by the size of the gun.

The following is his construction of travelling carriages for such guns. See fig. 11.

Make the length, A d, of the plank for either check of the carriage equal to seven feet and a half together with 10 diameters of the shot of the gun; its height, A B, equal to three diameters and three quarters of a diameter; and the breadth, A B, of the check itself equal to three diameters and a quarter. Take B C equal to eight diameters, together with 20 such parts as those, of which one diameter of the shot contains 24; from the point, A, as centre with the radius, B C, describe an arc, in which apply as a chord C D, equal to 70 such parts, and draw the right lines A D, B C. On B C set off B E equal to the head A B, or the height of the check, and from the point, E, set off towards the point, B, the right line, E F, equal to each of the other such parts, making E S equal to 18 such parts or the width of the trunnion-hole, of which the centre is about a quarter of an inch below B C or the upper surface of the check. From the point, r, draw the right line r K, perpendicular to A D, and on A D take F H equal to 30 such parts for the breadth of the axle-tree, which is let in or sunk into the check about an inch. On F H constitute a square, and from the intersection, I, of its diagonals as centre with a radius of 20 inches describe an arc, which will represent a part of one of the wheels. Apply a straight ruler touching this arc so as to the said plank that the distance M L, between the points, M, L, where its edge coincides with the edges of the plank, may be equal to three diameters, and from these points draw M N, L O, perpendicular to K M, and equal each of them to two diameters. Then if the right lines C N, N O, and D M, be drawn and the under part of the trail be described as above pointed out from K, the bisecting point of the right line, M Q, as a centre, we shall have A B C N O P M D A for the outline of the check.

And the construction of the plan of such a carriage is as follows. See fig. 12.

Draw any indefinite right line, A B. In it take C D equal to seven diameters and 17 such parts. Through the points, C, D, draw right lines, E F, K L, at right angles to A B, making C E, C F, equal each of them to 27; 5 such parts, and D K, D L, equal each of them to 32; 5 such parts. Then right lines drawn through the points F, K, and E, K, will determine or ascertain the width of the carriage on the inside. And if parallel to these lines two other right lines be drawn at the distance from them respectively of 18 such parts, we shall have the thicknesses of the cheeks and the outside width of the carriage.

The positions, M, N, of the trunnion-holes are determined by setting off on both sides of the points, E, F, nine such parts for the radius of each of the trunnions. And if C a be taken equal to a B in the last fig. or fig. 11. the line, R Q, drawn at right angles to A B, will determine the breadth of the carriage; and its total length, a, is ascertained from the said figure. The other parts of the construction are the same as above.

Figure 13 is the elevation of a fix-powder travelling carriage with the horns marked on it, and figure 14 is the plan of the same.

Field-carriages are shorter and much lighter than those above mentioned, and described, being in these respects proportioned
portioned to the weights and lengths of the pieces mounted on them. They are nearly in the same form, however, but have their wheels eight inches lower, which reduction of height makes them perhaps lower than they ought to be.

Their dimensions are the following:

</table>

The length of the plank for either cheek in one of these carriages is equal to four feet, together with thirteen diameters of the flat. And the width within varies with the thickness of the metal in the piece.

The contrivance for travelling carriages answers likewise for field carriages, if these dimensions be made use of instead of those delivered above. See figs. 15 and 16. The latter, however, differ from the former in the following particulars.

They have no bed-transoms, as sewers, instead of wedges, are made use of for elevating or depressing them; for which reason the centre transom in each of them is two diameters broad, and but one thick, and is so placed in the middle of the height of the cheeks, that the neck of the caseable answers to the middle of the breadth of the transom, where the saw is fixed.

On each side of one of these carriages there is a box or locker, about twenty-three inches, or two feet long, with its upper surface even with, or rather above an inch above the upper part of the axle-tree, and extending from thence to the trail. These boxes, or lockers, serve for carrying shot on a march, and are covered each of them by another box holding cartridges, which slides on and is fastened with a bolt.

The iron-work in one of these carriages is nearly the same as that in a travelling carriage, but not quite so strong. It has but one garnish-bolt, and no garnish-nails. The eye-bolt next to the joint-bolt passes through the axle-tree band behind, and not before, as in other carriages, and the fore part of this band is only fastened by the fore eye-bolt. The draught-locks are fixed sometimes to the break-transom plates, and sometimes to the axle-tree. But the nearer they are fixed on a level with the breaks of the horses the better. There are sometimes book to the trail transom-plates, and sometimes nails about four inches long. The fakers have also hooks, to which are fastened the ropes, by which the gunners or their assistants drag the gun along.

A galloper-carriage is for a pound and a half gun. Fig. 19 is an elevation of one, and fig. 20 a plan of one. The following are its dimensions.

</tbody>
</table>

The shafts of limbers are about two feet open before, two feet ten inches in the middle, and a little less near the axle-tree according as the wood, out of which they are made, happens to be more or less crooked. For it ought never to be cut across the grain for fear of weakening it too much. The height of the bolder diminishes towards both ends, as in fig. 22. That given in the immediately preceding table is for the middle of it.

The following are the names of the iron, or pieces of iron-work in the shafts and beams of limbers with the number of each. See fig. 21, 22, and 23.

- Limber-bolt
- Shaft-rings
- Shaft-pins with chains
- Breech-hooks
- Ridge-chain with hook and loop
- Limber-chain with hook and rings
- Single fore lock keys
- Diamond-headed nails
- Dog-nails
- Bolter-loops
- The pintle
- The pintle-wafers
- Stubs for bolter-loops

The iron-work of a limber is the same as that of a limber for a field-carriage, with this exception, that in iron there are only four garnet nails, viz. two of a side, because it is so short as not to admit of more. The wheels and axle-tree are the same as those of an 18 and 12 pounder-carriage.

The following are the dimensions of an eight-inch howitzer-carriage.

| Diameter of each wheel | 18.0 |
| Length of each check | 8.0 |
| The thickness of do. | 4.5 |
| The height of do. before | 1.0 |
| Do. of do. at the centre | 1.4 |
| Do. of do. at the trail | 1.2 |
| Length of the trail | 1.3 |
| Height of the plank | 1.6 |
| Distance from the head to the centre | 3.7 |
| Do. of trunnions from the head | 0.9 |
| Breach-trunnion | 1.25 |
| Height | 0.2 |
| Thickness | 0.4 |
| Centre-trunnion | 1.45 |
| Height | 0.4 |
| Thickness | 0.4 |
| Length | 1.7 |
| Trail-trunnion | 1.3 |
| Breadth | 0.4 |
| Thickness | 0.4 |

### Of mortar-beds.

A mortar-bed answers for mounting a mortar on as a gun carriage does for mounting a cannon on. Limb mortar-beds are commonly made solid, each of them consisting of four pieces of timber well secured and strongly fastened together with iron-work, except those for royals and coehorns, each of which is made out of a single block.

### Of the trunnions

| Diameter of the trunnions from the fore end | 34.0 | 20.0 | 13.5 | 9.0  |
| The diameter of the trunnions in the middle | 7.2  | 6.4  | 5.4  | 3.4  |
| The depth of the trunnions in the middle | 7.2  | 6.4  | 5.4  | 3.4  |
CARRIAGE.

The distance of the trunnion-holes is measured from the quarter round, and not from the very end of the bed. The joint of the two pieces of the upper bed of a 13, 10, and 8 inch mortar-bed is so contrived as not to be directly over the joint of the two pieces in the lower bed.

The following are the names and numbers of the irons in a 13, 10, or 8 inch mortar bed. See figs. 24, 25, and 26.
a. Cap-squares
b. Eye-bolts
c. Joint-bolts
d. Under and upper bed-bolts
e. Dowel-bars
f. Rings with bolts
g. Riveting plates
h. End riveting plates
i. Middle plate
j. Riveting bolts
k. Square riveting bolts

He supposes the mortars, contrary to what has been the common practice, to be so placed in their beds as to be moveable, and capable of being raised from an angle of 10 degrees to any under 90, and also the cavity in each bed to be so made as to receive the wedges for raising the mortar with.

Sea-Mortar-beds are likewise made solid with very strong timbers but differ from the land-mortar-beds in point of form or figure, and have each of them a hole in the middle, or centre, for receiving the pintle-pin, or strong iron bolt, round which the bed may turn. They are placed on strong wooden frames fixed into the bomb-ketches, to which the pintles are fastened. The fore-part of a sea-mortar-bed is an arc of a circle described from the centre of the pintle-hole.

The following are their dimensions in inches. See fig. 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, and 39.

_Distance_
CARRIAGE.

Distance from the end to the straight cross-box - 12

Fore-guide

Length - 12

Breadth - 30

Height - 21

Interval - 4

The diameter of each truck - 251

The thickness of each truck - 4

The breadth of the cross-piece fixed to the fore end of the side-pieces - 5

The height of do. before - 3

The height of do. behind - 1.5

The breadth of the cross-piece under the side-pieces behind the fore-holder - 10

The thickness of do. - 1.5

The plan and elevation of the carriage shew the iron-work sufficiently.

The following are the dimensions of a ponton, or ponton carriage.

The diameter of each wheel both behind and before - 6.3

The length of each nave - 1.5

The diameter of the body of do. - 14

The diameter of the middle of do. - 15

The diameter of the linch of do. - 12

The breadth of each felloe - 4.5

The thickness of do. - 3.5

The length of each axle-tree - 86

The length of the body of do. - 46

The breadth of the body of do. - 8.5

The height of do. - 6

The length of each arm of do. - 18

The diameter of the body of each arm - 6

The diameter of the linch of do. - 3.8

The length of each of the under side-pieces - 210

The breadth of do. - 7

The height of do. - 6

The length of each of the upper side-pieces - 266

The breadth of do. - 5

The height of do. - 2.6

Of the fore and hind cross-bars

Breadth - 6.5

Height - 3.5

Length - 52

Distance from the centre of the fore axle-tree from the fore end - 10

Distance from the centre of the hind axle-tree from the hind end - 9.3

Opening between the upper side-pieces - 51

Ditto between the under side-pieces - 18

The distance of the fore-supporter from the fore-end - 45

The distance of the hind-supporter from the fore-end - 45

The height of each supporter - 32

The artillery carriage, commonly called a travelling forge, is the carriage of a sort of portable smith's shop, at which all kind of Smith's work is done in camp, and even on a march. Formerly it used to have but two wheels, and had wooden supports to prop up the forge for working at when in the park of artillery. But now it has usually four wheels, and is much more convenient.

The dimensions of such a carriage are the following:

The height of each fore-wheel - 104

The length of its nave - 14

The diameter of the body of do. - 12

The diameter of the middle of do. - 13

The diameter of the linch of do. - 9

The breadth of each felloe - 3

The height of do. - 4

The breadth of each spoke - 1.7

The thickness of do. - 3

The height of each hind-wheel - 6.4

The length of its nave - 14

The diameter of the body of do. - 12

The diameter of the middle of do. - 13

The diameter of the linch of do. - 9

The breadth of each felloe - 4

The height of do. - 3

The breadth of each spoke - 1.7

The thickness of do. - 3

The total length of the fore axle-tree - 76

The total length of the hind axle-tree - 76

The length of the body of each - 42

The breadth of the body of each - 7

The height of the body of each - 7

The length of each arm of each - 17

The diameter of the body of do. - 7

The diameter of the linch of do. - 3

The total length of each shaft with the side - 263

The breadth of do. behind - 4

The breadth of do. in the middle - 4.5

The breadth of do. before - 2.5

The height of do. behind - 3

The height of do. in the middle - 2.8

The height of do. before - 2.7

The opening between them before - 2.7

Ditto behind - 3.2

The length of each rive - 124

The breadth of do. - 3

The height of do. - 6

The length of each upright - 27

The breadth of do. - 3

The thickness of do. - 2.2

The breadth of the fore cross-bar - 3

The thickness of do. - 2.2

The breadth of the hind cross-bar - 2

The thickness of do. - 2.2

Distance from the fore end to the fore axle-tree - 23

Distance from the hind end to the hind axle tree - 14

Distance between - 74

An ammunition-wagon is an artillery carriage for carrying all sorts of military stores. It has four wheels, has its sides raised in flaps and raves, and is lined on the inside with baffle or wicker-work. It carries 12 cwt. and is sometimes employed for carrying bread. Its dimensions are the following. See fig. 49, 52, 54, and 52.

The height of each of the fore wheels - 48

The length of its nave - 13

The diameter of the body of do. - 12

The diameter of the middle of do. - 14

The diameter of the linch of do. - 10

The height of each felloe - 4

The breadth of do. - 3

The breadth of each spoke - 1.5

The thickness of do. - 3

The height of each of the hind wheels - 60

The length of its nave - 13

The diameter of the body of do. - 12

The diameter of the middle of do. - 14

The diameter of the linch of do. - 10

The breadth of each of its felloes - 3

The height of each do. - 4

The breadth of each spoke - 1.8

The thickness of do. - 3.5

Vol. VI.
Round-headed nails to fallen the crofs bars — 4
Bolts with fcrews to fallen the checks — 7
Iron-work complete for shafts and wheels.

The French have been in the practice of using gun carriages on board their ships, or of having their affuts de marins with only two fore trucks, or roulettes pleines, to each, instead of ordinary wheels. Thofe carriages do not recoil so much as thoife with four trucks, and are rather more eafily pointed.

Their garrison carriages ufed to be conftructed a good deal in the fame manner. But the trucks were made considerably larger than thoife of their ship carriages, and confifted each of fix or more pieces. They had also trails like travelling carriages, but much shorter.

Beforef, they have travelling carriages, or affuts a rouage. Each of thefe consift of two long checks of chn, rounded and shaped nearly as thoife of one of our own travelling carriages, and like them are fastened or joined together by means of four oak tranfoms, called by the French entretoifes; the firft of them, or bract tranfom, they call entretoife de voles; the fefcond, entretoife de touche; the third, entretoife de mire; and the fourth, which runs the whole length of the trail, or of thoife parts of the checks that touch or reft on the ground, entretoife de lanette. When fuch a carriage with its guns is to be moved, a timber, or avant tran, is fastened to the trail of it.

Fig. 61. is an elevation in profile of one check of the travelling carriage called l'affut du capitaine Espagnol, representing the relative dimensions of the different parts.

The figure that follows represents the relative or proportional heights or depths of the checks of carriages for the five calibers of 2, 16, 12, 8, and 4 pounds, according to the French ordinance or regulation of 1732.

Carrick, the name of some towns, pa-

}
Carrickfergus, or little Carrick, which has some ruins, especially of an old abbey. A belfry erected on one of the side walls of the church, is accounted a great curiosity. It projects about two feet over the wall, from which it takes its site at a point twenty feet from the ground.

This town is mentioned by the abridge of Camden, in 1701, and called Carrick-mac-Griffin, but it is only of late years it has attained its present consequence. Its distance from Dublin is 75 Irish miles S. by W. N. lat. 52° 20'. W. long. 7° 26'. Beaufort. Smith, &c.

CARRICKAMACHIN after, a cluster of small islands and rocks off the coast of the county of Galway, Ireland, a few miles north of the Isles of Arran. N. lat. 53° 13'. W. long. 6° 43'. McKenzie. Beaufort.

CARRICKAREDE. See Ballintoy.

CARRICKFERGUS, Craighour, Knockfergus, i.e. the Rock of Fergus, a market and port town of the county of Antrim, Ireland, on the northern shore of Carrickfergus Bay, or, as it is now usually called, Belfast Lough. It was an early settlement of the English, and was deemed a place of great importance. In 1232, Hugo de Lacy, Earl of Ulster, founded a monastery there, in the precincts of which he was buried a few years after. In the 14th century, when Edward Bruce invaded Ireland, his brother King Robert landed near Carrickfergus, and besieged the castle; which held out so long that the garrison were reduced to the necessity of eating leather, and furnished only through want of food. In the reign of Henry the Seventh, this castle was one of those which an act of Parliament declared ought to be only entrusted to Englishmen. It was not, however, till the government of Sir H. Sydney, in the reign of Queen Elizabeth, that the adjoining town, the trade of which had become considerable, was surrounded with walls, and it was then made a corporation and endowed with many privileges. On the division into counties, a large district was allotted to it, and it still has a separate jurisdiction. The mayor was also made admiral of the coast of Antrim and Down, and certain duties were paid to the corporation of Carrickfergus by vessels going to any of the little neighbouring ports, excepting Bangor and Belfast. This privilege was purchased in the administration of Lord Strafford, and the customs-house transferred to Belfast. See Belfast. Lord Chichester, ancestor of the present marquis of Donegal, having purchased the grant of the monasteries at Carrickfergus about the year 1610, built a castle which was esteemed splendid in those days; but his attention seems to have been chiefly directed to the improvement of Belfast. Carrickfergus, however, continued a place of strength, and as such was taken possession of by general Monk, on behalf of the Parliament of England. In the year 1660, it was the landing place of King William; but though it continues to have a governor regularly appointed, its fortifications have been neglected and decay. In 1759, Thurot, an adventurer, who commanded a small French squadron, ventured to land here, and took hostages for the ransom of the town, but he was soon obliged to retire, and his ships were taken or destroyed by the English. Carrickfergus is the seaport of the county of Antrim, and sends one representative to the Imperial Parliament. It is distant 88 Irish miles N. from Dublin, and 8 N. E. from Belfast. N. lat. 54° 45'. W. long. 5° 42'.

CARRICKHOULT, a bay or anchorage on the county of Clare side of the river Shannon, Ireland, near its mouth. This bay has clear ground, and good anchorage between Carrickhoul cattle and Kiladarran points. N. lat. 52° 37'. W. long. 9° 36'. Mackenzie.

CARRICKMACROSS, a market and port town of the county of Monaghan, Ireland, near the boundary of the county of Louth. From its being mentioned by St. Brelidil, it must be a place of antiquity, but does not appear to have been of much consequence. It is now an improving town, and a vein of good coal discovered near it will probably contribute to the establishment of some manufacture, especially as there is plenty of water, and a possibility of obtaining water carriage to Dundalk at no great expense. It is 41 Irish miles N. by W. from Dublin. N. lat. 53° 52'. W. long. 6° 43'.

CARRIER, a person who undertakes to convey persons, goods, papers, money, or the like, from place to place, on condition of a certain price, either fixed by authority or custom, or left to private agreement. See Carriages.

In Holland carriers are called koeriers, because they always keep the same road, or route; setting out, and arriving at fixed hours.

All persons carrying goods for hire, as masters and owners of ships, lightermen, flag-coachmen, (but not hackney-coachmen in London) and such like, are legally comprehended under the denomination of common carriers, and are chargeable on the general custom of the realm for their faults or miscarriages. See Bailment. In an action on the case against the master of a flag-coach, it was adjudged that he was not chargeable (e.g. for a trunk lost) unless the master takes a price for the carriage of the goods as well as for the carriage of the person, in which case he is within the custom as a carrier; but by the custom and usage of the ages, every passenger pays for the carriage of goods above a certain weight; and then the coachman shall be charged for the loss of goods beyond such weight. If a common carrier loses goods which he is entrusted to carry, a special action in the case lies against him, on the custom of the realm; and fo of a common carrier by boat. 1 Rol. Abr. 6. An action will lie against a porter, carrier, or bargeman, upon his bare receipt of the goods, if they are lost by negligence. 1 Sid. 36. Also, if a lighterman spoils goods which he is to carry, by letting water come to them, an action on the case lies against him on the common custom. Palm. 528. If a carrier entrusted with goods opens the pack, and takes away any part of its contents, he is guilty of felony. H. P. c. 61. And it is the same also if a carrier receives goods to carry them to a certain place, and carries them to some other place, with intent to defraud the owner. 3 Inst. 607. If a common carrier, having convenience and being offered his hire, refuses to carry goods, he is liable to an action. 2 Show. Rep. 327. But he may refuse to admit goods into his warehouse at an unreasonable time, or before he is ready to take his journey. Lord Raym. 652. A common carrier may have action of trover or trespass for goods taken out of his possession by a stranger; and where goods are stolen from a carrier, he may bring an indictment against the felon, and as for his own goods; and the owner may likewise prefer an indictment against the felon. Kil. 79. By lat. 3 Car. 1. c. 1. carriers are not to travel on the Lord's day or part of 528. By 3 W. and M. c. 13. the justices are annually to affect the price of land carriage of goods that are to be brought into any place within their jurisdiction by any common carrier, who is not to take more, under the penalty of 5l. And by 21 Geo. II. c. 28, § 2, a carrier is not to take more for carrying goods from any place to London than the justices have settled for the carrying of goods from London to such a place, under the same penalty. This act of 21 Geo. II. c. 28, stands repealed by 7 Geo. III. c. 40. so much of it excepted as relates to the price or rate for carriage of goods; and the 7 Geo. III. c. 40. (except so much as repeals the several acts within-mentioned) was repealed by 13 Geo. III. c. 78. § 83. By 24th Geo. II. c. 8 § 9. commissi-
fioners for regulating the navigation of the river Thames are to rate the price of water-carriage; and by 32 Geo. II. c. 22. § 3. Justices of the city of London are to assist in the rates of carrying goods between London and Westminster. By 13 Geo. III. c. 78. carriers and waggoneers are to write or paint on their waggons or carts their names and places of abode; and the owner of every common flage, waggon, or cart, traveling from town to town, shall paint "common flage waggon or cart," as the case may be, under the pain of forfeiting not more than 3l. nor less than 2s.

At common law a carrier is liable by the custom of the realm to make good all losses of goods entrusted to him to carry; except such losses as arise from the act of God, or inevitable accident; from the act of his enemies; and from the default of the party sending them. 1 Inf. 89. 2 Lord Raym. 909. Esq. N. P. 619. But, in order to charge the carrier, the following circumstances are to be observed. 1. The goods must be lost while in the possession of the carrier himself, or in his sole care. 2. The carrier is liable only so far as he is paid, for he is chargeable by reason of his reward. 3. Under a special or qualified acceptance the carrier is bound no further than he undertakes; and, therefore, it seems safest, that in all instances of sending things of value by a carrier, the carrier should have notice and be paid accordingly. 4. A delivery to the carrier's servant is a delivery to himself, and shall charge him; but they must be goods, such as it is his custom to carry, not out of his line of business. 5. Where goods are lost, which have been sent on board a ship, the action may be brought either against the master or against the owner. 2 Salk. 282. 5. Where goods are lost, which have been sent on board a ship, the action may be brought either against the master or against the owner. 2 Salk. 450. 6. It is not necessary in order to charge the carrier that the goods are lost in transit, while immediately under his care; for he is bound to deliver them to the consignee, or fend notice to him according to the direction; and though they are carried safely to the inn, yet if lost there till they are spoiled, and no notice given to the consignee, the carrier is liable. 3 Wil. 429. 2 Bl. Rep. 916. Jacob's Dict. by Tomlins.

Carrier pigeon, a sort of pigeon used, when properly trained up, to be sent with letters from one place to another. This is the Columba Tabellaria of the Linnean System.

It is larger in size than most of the other kinds. Its length from the tip of the beak to the end of the tail being often fifteen inches; but its greatest weight not twenty ounces. Its flesh is firm and its feathers close; it is long-necked, and of a better shape than most other pigeons. The upper chap of the bill is half covered from the head with a white or blackish tuberous furfurance flesh, which projects or hangs over both its sides, on the upper part nearest the head, and ends in a point about the middle of the bill. This is called the bowl. The eyes are surrounded with the same sort of corrugated flesh for the breadth of a filling, and their iris is red. Their beak is long, straight, and thick; their wattle generally broad across the back; short from the head toward the point, and tilting forward from the head; and the head narrow, long, and flat; the neck very long and thin, and the breast broad; the feather is chiefly black or dun, though there are blues, whites, and pyed.

It has its name from its remarkable sagacity in returning to the place where it was bred, though carried to great distances; from which property it was made use of to carry letters to distant places, as a speedy and safe method of conveyance.

They were trained to this method in Turkey and Persia, and were carried first, while young, short flights of half a mile, and afterwards more, till at length they would return from the farthest part of the kingdom. Every basbaw had a basket of these pigeons, bred at the feraglio, which, upon any other occasion, as an insurrection, or the like, he dispatched with letters, braced under their wings, to the feraglio, only sending out more than one, for fear of accidents. Lightow affirms, ush one of these birds would carry a letter from Babylon to Aleppo, which is thirty days journey, in forty-eight hours. This pigeon was employed, in former times, for carrying intelligence from Scanderoon, of the arrival of the Company's ships; in that part, the name of the ship, the hour of her arrival, and whatever else could be comprized in a small compas, being written on a slip of paper, which was secured in such a manner under the pigeon's wings as not to impede its flight; and her feet were bathed in vinegar, with a view to keep them cool, and prevent her being tempted by the sight of water to alight, by which the journey might have been prolonged, or the bill lost. The pigeons performed this journey in 2½ hours. The messenger had a young brood at Aleppo, and was sent down in an uncovered cage to Scanderoon, from whence, as soon as set at liberty, he returned with all possible expedition to his seat. At the season of the arrival of the annual ships, it was usual to send pigeons to be ready at the port. Some have affirmed that the pigeon was at once sent down to Scanderoon in a cage; but others with greater probability affirm, that she was taught by degrees to fly from shorter distances on the Scanderoon road. It is also said, that the pigeons, when let fly from Scanderoon, instead of binding their course towards the high mountains surrounding the plain, mounted at once directly up, soaring still almost perpendicularly till out of sight, as if to survey at once the obstacles intercepting their view of the place of their destination.

The custom of carrying on a correspondence between Aleppo and Scanderoon by means of pigeons was common in M. D'Arvieux's time. Mem. T. 105. 456. Maillet, in his "Description de l'Egypt," vol. ii. p. 271, has given a very circumstantial account of this mode of conveying intelligence; and he also relates a story of a pigeon dispatched from Aleppo to Scanderoon, which, mistakes its way, was absent for three days, and in that time had made an excursion to the island of Ceylon; a circumstance then deduced from finding green cloves in the bird's stomach, and credited at Aleppo. Baumgarten mentions the flying of pigeons in his time (164) in Egypt. Sir John Mandeville also mentions it in his Travels. In the time of the holy war, certain Saracen ambassadors who came to Godfrey of Antioch from a neighbouring prince, sent intelligence to their master of the success of their embassy, by means of pigeons, fixing the billet to the bird's tail. Bochart has collected numerous authorities for the antiquity of this custom both in Syria and Greece, (vol. ii. p. 155) and more respecting its antiquity may be found in Pennant's British Zoology. Hirtius and Bruns, at the siege of Modena, held a correspondence with one another by means of pigeons. And Ovid tells us, that Tarsotheces, by a pigeon painted with purple, gave notice to his father of his victory at the Olympic games, sending it to him at Ashina. Allain. Var. Hist. lib. ix. cap. 2. Phily. lib. x. cap. 24. Anacreon tells us, that he conveyed a billet-doux to his beautiful Bathyllis, by a dove. Ode 9. The use of pigeons, as couriers between Aleppo and Scanderoon, and also Bagdad, has been discontinued for the last 40 or 50 years, because the Cerd robbers killed the pigeons. See Dragoon and Horseman.

CARRIERA, Rosalba, in Biography, an eminent female painter, was a native of Chiozza, in the Adriatic, where she was born, in 1655; and being deified of personal charms, she gave scope to her mental abilities. Having manifested an early taste for painting, her father procured for
for the instruction of an artist, from whom she learned to paint full size in oil; but afterwards succeeding in miniatures, she confined herself to this branch of the art, and carried crayon painting to a high degree of perfection. Her portraits, spread all over Europe, are as elegant and graceful in conception and attitude, as they are fresh, neat, and alluring in colour. Her Madonna, and other religious subjects, blend dignity, and even majesty, with grace. Her reputation was very widely extended; and whilst the exhibited specimens of her skill in Italy, at Paris, and Vienna, she received distinguished marks of respect and esteem. She lived with distinction in her native country, and her works were eagerly sought by the curious in distant nations. Recovery暹生后energized her against during the last ten years of her life. She combined music with painting; and at the advanced age of 82 years, closed her life, in 1757, after having amassed considerable property of her own acquisition, D'Argenville. Pilkington, by Publ. •

CARRIERE. See Carre.

CARRION, in Geography, a river of Spain, which joins the Pisuerga, near Viana.

Carrion de los Condes, a town of Spain, seated on the river Carrion, in the province of Leon, on the frontiers of Old Castrale; containing 10 parish churches, 10 convents, and 2 hospitals; 14 leagues W. of Burgos.

CARRONLISTA, in the Ancient Military Art, denotes a species of ballista, mounted on wheels, and drawn by horses; by which it differed from the manuballista, which, being lighter and lighter, was thrown by the hand.

CARROCIUM, or Carrocerum, in Middle Age Writers, denotes the banner, or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen.

CARRUCK, in Geography, a mountain of England, in the county of Cumberland, 2205 feet above the level of the sea.

CARRODUNUM, in Ancient Geography, a town of Germany, according to Ptolemy, supposed to be the present Radam, in the palatinate of Saxony. — Alto, a town of Waudheia, supposed to be the present Gramberg, on the Inn. — Alto, a town of Upper Pannonia, which the interpreters of Ptolemy suppose to be the present Carnberg, on the banks of the Raba. — Alto, a town of European Sarmatia, seated on the river Tyras. Ptolemy.

CARRON, a river of Wales, which runs into the sea, about 4 miles S.W. from Caernarvon.

CARRON, a river of Scotland, which runs into the sea, near Stonehaven, in the county of Kincardine. — Alto, a small river of Scotland, which rises about the middle of the isthmus between the friths of the Forth and Clyde, and, after a course of about 14 miles, dividing the county of Stirling into two nearly equal parts, falls into the Forth, three miles E. from the Carron works, in the county of Stirling. This river seems to have been the boundary of the Roman province in North Britain; Antonius's wall being in the vicinity of this river, and running parallel to it for several miles. This opinion is rendered probable by the situation of "Arthur's Own," as it is called, which is supposed to have been a temple dedicated to Terninus, and erected near the Roman frontier. It stood on the west side of the river Carron, or between that river and Kinnaird. The moats of Kinnaird, which was without doubt formerly united to that of Foulis, is distant only one mile and a half from the river, and the moats of Kincardine are only twelve miles distant from the flatton at Camelon. Forests, therefore, in either of these places, would have afforded very convenient refuge to the Caledonians, whether they were making incursions into the Roman province, or haraizing the Roman armies in their expeditions towards the north.

Besides, that a people more civilized than the ancient Caledonians must have been in this country before the moat of Kincardine existed, is completely established by the discovery of a road on the surface of the clay at the bottom of that moat, after the peat, to the depth of eight feet, had been removed. The direction of this road is from the Forth across the moat towards a road, supposed to be Roman, which passes between the moat and the river Tenth. These roads probably communicated, and were parts of the military works of the Romans, and designed for the use of the troops employed to repel the incursions made by the Caledonians from the mountains into the Roman province. A passage in Herodotus favours the opinion here advanced. That historician (lib. iii. cap. 48) mentions the army of Seveus passing "in prosouskisoj rixovia ti kai karyma ti Pavora orafe." He adds, that on this frontier the Barbarians usually made their escape, "and concealed themselves in the thickets and marshes." Edinb. Trans. vol. iii. p. 276. Near the middle of the course of this river, in a pleasant valley, stand two beautiful mounts, called the "hills of Dunipace," which are now planted with firs, and between which is seated the church of Dunipace. Tradition reports, that these mounts were raised as monuments of a peace concluded in that place between the Romans and Caledonians, and that their name is compounded of the language of both people; dum, signifying a hill in the old language of this island, and pace, peace, in the language of Rome: to that Dunipace denotes the "hills of peace." Others, however, have supposed that they are sepulchral monuments, which is an opinion, not improbable. See Barrow. As this river runs to the boundary of the Roman province, if it be not itself the precise boundary, the adjacent country must unavoidably be the scene of many encampments and battles. Accordingly, historians mention a bloody battle fought near this river between the Romans ad the confederate army of the Scots and Picts in the beginning of the 5th century; and the translator, or the author, of Ossian's poems lays the scenes of some of them upon the banks of this river. About the distance of half a mile from the river, and near the town of Falkirk, lies the field of that battle which was fought by William Wallace and the English, in the beginning of the 14th century. It bears the name of "Graham's Muir," from the valiant John Graham, who fell there, and whose grave-stone is still to be seen in the church-yard of Falkirk.

Carron, a village of Scotland, in the county of Stirling, seated on a river of the same name; celebrated for its extensive iron forges; two miles N. of Falkirk, and three miles above the entrance of the Carron into the frith of Forth. The river is navigable for some miles from its mouth, and a considerable trade is carried on upon it by small craft; for the convenience of which its channel has of late years been straightened and much shortened, and the great canal is connected with it by a cut and lock. See Forth and Clyde Canal. The Carron ore is described by Mr. Kirwan, (Miner. vol. ii. p. 174.) as being an argillaceous stone, of a bluish grey, internally of a dark ochre yellow. It is found in flatly mafies, and in nodules, in an adjacent coal-mine, of which it sometimes forms the roof. At the Carron works, this ore is often smelted with the red greasy iron ore from Ulverton, in Lancashire, which imparts calfer fusion, and superior value. These works, which have attained such distinguished celebrity, were first established principally under the direction of Dr. Roebuck, an ingenious chemist and physician of Birmingham, and by means of a capital furnished by his relations and friends, as well as those of his associate Mr. Garret, in addition to their own. After a careful and minute comparison of the advantages and disadvantages of different situations in Scotland, he made choice of
of a spot, on the banks of the river Carron, as the most advantageous situation for the establishment of the proposed iron manufacture. There he found they could easily command abundance of water for the necessary machinery, and in the neighbourhood of it, as well as every where along both the north and south coasts of the Firth, were to be found inexhaustible quarries of iron stone, lime-stone, and coal. From Carron also, they could easily transport their manufactures to different countries by sea. The communication with Glasgow, at that time, by land-carriage, which opened to them a ready way to the American market, was short and easy. To aid him in the execution of his undertaking, he engaged the co-operation of Mr. Smatton, then the first engineer in England, and also of Mr. James Watt, then of Glasgow; but latter known for his inventive genius in the mechanic arts, both in Scotland and England. The necessary preparations for the establishment of the iron-works at Carron were made within the close of the year 1759; and on the first of January, 1760, the first furnace was blown; and in a short time afterwards a second was erected. See the article ROEBUCK. For the extension and improvement of this foundry, about 120 acres of land have been converted into ironworks and pools, for water diverted from the river Carron, by magnificent dams built about two miles above the works, which, after turning 18 large wheels for the several purposes of the manufacture, falls into a tide-navigation that conveys its produce to the sea. For a further account of the machinery of these works, the number of its furnaces, the annual amount of iron melted, &c. &c. see BLAST Furnace. See also CANNON. The present proprietors of this foundry are a chartered company, with a capital of 150,000l. stabling, a common hall, &c.; but their flock is confined to a few individuals.

CARRONADE, in the MILITARY ART. See CANNON.

CARRON, in Geography, a town and port of Hinde-foftan, in the country of Mylcor, and province of Comberton, seated on the Ambrevetcy; evaded by the troops of Tippoo Sultan, on the 15th of June, 1790, when general Meadows, commander of the British forces, took possession of it, and made it a depot for provisions; 38 miles W. of Trichinopoly. N. lat. 10° 57'. E. long. 78° 52'.

CARROT, in Botany. See Daucus carota.

Carrot, in Gardening. See Dauccus.

Carrot, in Husbandry, is a large well-known tap-rooted plant, which, at present, is much employed in the feeding of different sorts of live stock; in which view it is a root of considerable utility and importance to the farmer. It is, however, only within these few late years that its application in this intention has been carried to any extent in this country. It was probably first introduced into field culture in the southern parts of the island from the Low Countries. There are several varieties of this valuable plant, but that which is the most proper for being cultivated in the field for the above use is that which is usually termed the orange carrot, in which the colour of the root is of a much more dark orange appearance than in any of the others; and, besides, it rice to a much larger size, and is more fac- charming and juicy. See Dauccus.

This sort of crop is capable of being cultivated probably to the greatest advantage on the warm, light, loamy, or sandy soils; but it succeeds well on other kinds, as on gravelly lands. Mr. Young properly remarks, that the proper sort of soil should not be mistaken through common notions, or confused to a compas much within the reality. It is, says he, a general idea, that nothing but sands will do for carrots, but this is a mistake, the best soil for them is a sandy loam, rather light, but moiti, of a great depth; in which there is little difficulty in ploughing to

the very beam of the plough, all the soil brought up being of the same kind, and as fit for vegetation as the surface." But, though he considers this sort of soil as the most perfectly adapted to this kind of crop, "it will, he conceives, thrive to great profit on the heavier loams, but not on wet ones, or clays. On good wheat loams of the gravelly kinds that plough easily they do well. At first light, he supposes, they might, perhaps, be thought too thin; but they will yield large carrots, though the expences of cultivation will run higher in cleaning the ground, &c."

In the preparation of the land for this sort of crop much tillage is by some considered unnecessary: "the best culture of carrots is," says the above author, "to let the barley or wheat stubble lie till you plough and low, putting them in on one earth." But others are inclined to more tillage, and think that on whatever sort of soil this root may be grown, or after whatever kind of crop, the ground should constantly be ploughed as deep as possible in October, a second time in dry weather in February, and a third in March, for the reception of the seeds. By ploughing the land deep in October, two beneficial purposes are, they suppos, answered; the new soil is exposed to the influence of the winter's frosts, by which it is mellowed and rendered more fit for nourishing the plants; and the roots of the carrots are enabled, with more freedom, to push downwards, a circumstance of considerable importance in this kind of husbandry; for, if the roots meet with any obstruction in getting down, they are apt to grow forked, and throw out lateral roots, by which the crop is injured in a very material degree. Mr. Young, however, only conceives the second ploughing in February necessary, in cases when the surface mould is not expected to be in a state of sufficient fineness at the period of sowing. When the last ploughing or feed-furrow in March has been given, the land should be harrowed, and the surface made as fine as possible for the seed to be put in upon.

Though it is not absolutely necessary to make use of manure for this sort of crop, as good carrots may be grown without it, it is plain, from the numerous trials which have been made and recorded in different works, that it is only by the liberal application of it, that the largest quantity of produce can be afforded. Where it is applied it should be turned into the ground in a well-rotted state during the last ploughing in March.

At this period the seed should be sown in an even man- ner over the surface, in the proportion of five pounds to an acre, and harrowed in immediately in a light way. Mr. Young, however, advises, that where the land is sufficiently fine and mellow at the time of ploughing, in February, and proper for being harrowed upon, not to omit sowing upon that ploughing, "for, although March is the common saxon, the uncertainties of the weather are such, that the state of the land, in most cases, requires a greater attention than the name of the month; and carrot seed, let the weather be ever so severe, will take no harm. It may, says he, be sown without danger in November. In case March turns out very wet, and the sowing is driven into April, it is twenty to one that the crop will suffer." About the 25th of March is, however, the time most generally observed in the Suffolk practice.

In regard to the seed, it has been recommended by the author of "Practical Agriculture," for cultivators to be careful in sowing it, by selecting some of the best and most perfectly formed roots annually of the preceding year's growth, and setting them out separately in the beginning or middle of March, in an open piece of ground for the purpose. The seed in this way will be ready in August; by which means the farmer will always be in possession of such good
good fresh feed as may be fully depended upon; which can seldom or ever be the case when it is purchased. As this fort of feeds is liable to adhere or cling close together, it is almost impossible to saw them with any degree of regularity or exactness, without adopting some method of separating them, before they are made use of in the way of feed. With this intention the belt mode is probably that of mixing them with some fort of material that may render them more capable of being dispersed over the land, such as saw-dust, bran, or a light kind of dry land, uniting the whole well by rubbing them together. By this means the feeds may be so disengaged and separated from each other, as to enable the feedman to scatter them with much more evenness over the surface of the ground. There is also another improvement in the culture of this crop, with respect to the feed, which is that of keeping it from one to two days in water, by which it is said, the vegetation of it is greatly forwarded, which is a circumstance of much consequence to the crop.

Though we have seen that five pounds of feed are made use of to the acre in the broad-call method; where the drill plan is followed, two or three pounds may be fully sufficient. The drill of the above modes of fowing is, however, the most commonly practiced, the feed being afterwards lightly harrowed in by a small harrow; and, as it is not much better for being dispersed or delvered with exactness by the drill-machine, and the young plants easily set out to proper distances by the hoe, it is probably the most suitable method of putting in the crop.

The drill plan, notwithstanding, has been attempted in order to lessen the expense of land labour in hoeing the crops by some farmers. In thefe cases, the feed is put in at equidistant rows, at twelve, fifteen, or eighteen inches distance from each other, according to the land and the mode of hoeing that is employed. In some instances drill-machines are not made use of, but the land is ploughed into small drills or furrows by hoes or other implements for the purpose, and then the feed cast over the ground by the hand, and harrowed in lightly, or covered, by hoeing in the tops of the ridgelets, in a light even manner. When a drill machine is employed for this purpose, it is recommended by Mr. Amos to put the feed in to the depth of one inch in the rows, leaving the space of fourteen inches between them as an interval. The feed is prepared by previous steeping and mixing in the manner mentioned above, and the land afterwards harrowed over once in a place, in a light manner.

It is of great consequence that this fort of crop should be properly thinned out while the plants are in their early growth, and kept perfectly free from all sorts of weeds by repeated hoeings. In the first of the, which should be given as soon as the plants can be fully distinguished from the weeds that are about them, the work should be performed with three inch hoes, having handles not more than two feet in length, and be executed with great care and attention, as it is often extremely difficult to distinguish the young carrot plants from the weeds. The second hoeing should be given in a few weeks afterwards, according to the state of the crop, which may be performed with common hoes, and the plants be set out to proper distances. From eight to fifteen or eighteen inches each way are the most usual distances at which they are suffered to stand; and it has been found, from the experience of many years, in districts where they are the most cultivated, that carrots, which grow at such distances, constantly prove a more abundant crop than when the plants are permitted to stand clover together. The third hoeing is mostly given about the middle or towards the end of June, and in this, besides destroying the weeds, another material circumstance to be attended to, is to set out the carrots at proper distances, and also whenever any have been left double at the former hoeings, to take the world of the two plants away, to as to leave the set perfectly clear and free from interruption. When the crop has been put in earlier than the usual period, the first hoeing should, Mr. Young says, be performed in the latter end of April, and when the weather is fine, as much injury may be done in executing it when there is much wet. And where the first hoeing has been given at the above time, the crops should, in the beginning of May, be well harrowed, and have a second hoeing towards the end of it. The harrowing will not, he affirms, "damage the young carrots, nor pull up one in twenty; but it will displace the weeds yet again by rain, and check the growth of those that are got up since." The crops should likewise be looked over towards the latter end of August, and such struggling weeds as may be met with removed. This is more necessary than farmers in general suppose.

The experience of these different hoeings differs considerably in different situations, but is generally from the to the third hoeing, and in some places rather more.

There are differences in the carrot husbandry in different districts. In Suffolk, the farmers sow their after turnips, barley, and peas, set upon a large crop of grass; the crops upon the soil are generally more productive, as next to that they prefer the latter. In the first case they feed off the turnips by the beginning of February, and then lay the land up in small balks or furrows, in which state it remains till the second week in March, when it is harrowed down, and double-harrowed to the depth of about twelve inches, and the feed sown thereon, at the rate of four pounds and a half to the acre. As soon as the plants appear distinctly, they are set out with a small hoe at the distance of six inches from each other; they are afterwards hoed twice at different times, according to the crop seems to require it; and it is not unusual to harrow them between the hoeings, which does no injury to the root, and frequently saves the expense of the third hoeing. When carrots are intended to be sown after peas, they usually plough the stubble as soon as the harvest is over, in order that the land may clear itself of weeds; in December, it is laid up in small balks to receive the benefit of the frosts; in February, it is harrowed down and manured at the rate of fifteen loads per acre; the manure is ploughed in to the depth of about four inches, and in the month of March the land is double-harrowed and the feed sown. By pursuing this method they lay the manure lies in the centre of the fallow, and not only affords nourishment and support to the carrot in its perpendicular progress, but renders it easy to be turned up by a single ploughing, and greatly promotes the growth of the succeeding crop of barley. But in Norfolk, where it is the practice also to sow carrots after a crop of turnips, the manure, after being put on the land in the beginning of March, is first ploughed in with a common plough, and afterwards the land is trench-ploughed about fourteen or fifteen inches deep, and then harrowed very fine, and the feed sown about the middle of March, though the latter end of that month is probably better, as then plants come up early as soon as the early crop, and are attended with fewer weeds. The carrots are in this way generally ready to hoe in the beginning of May, and when tolerably free from weeds, may be hoed with large hoes. Carrots are also frequently grown with the fame preparations on the same land where potatoes have grown. The manner in which Mr. Billing cultivated his land for these plants, is the following: The wheat and clover
Carrot.

Clover stubbles were split down by him with the plough the preceding November, and he is satisfied, that whether the wheat stubble, be, as it is called in Norfolk, flat work, or in ridges, or the carrots are to be sown after clover or rye grais, the land cannot be ploughed too early, so that the frit and snow may have their full effect in mellowing the ground for the reception of so small a seed; and this is the more necessary to be attended to, the fiffer and tougher the foil is. He ploughs the wheat and clover stubble three times, but the land on which the turnips have been, but twice; the first time shallow, but the last as deep as the flap of the ground will permit, and on this ploughing the carrots are sown. Sometimes the land is immediately dug for the carrots, but at other times only for the previous crop; the farmer is probably the better method. Mr. Billing thinks four pounds of seed an acre is sufficiently. It is generally three weeks after sowing, and sometimes longer before the carrots appear, and they are frequently seven or eight weeks before they are fit for the hoe, which affords the weeds an opportunity to get strength in this season, as they grow fast. Mr. Billing is therefore of opinion, that it is better to sow them as late as you can with safety to the crop, as he found those sown in April on clover-stubble, came much the finest to the hoe, though later sown. In this mode where the crop of carrots is very clean, one hoeing may, he thinks, be sufficient; but, where the weeds are strong, it is necessary to hoe them a second time; but about ten days or a fortnight after the first hoeing, they should be harrowed: this will displace the weeds, and prevent their growing again, which many of them will probably other- wise do, especially if it be showery weather. The harrowing does not hurt the carrot plants, as has been observed above, but, on the contrary, does them service, by bringing fresh earth to them, as well as by defloating the weeds. In about three weeks after harrowing where the ground is not cleared, or in cafe new weeds spring up. Mr. Billing hoe the carrots a second time; and after this, if there still remain any weeds, which will be the case if much rain falls during the time of the second hoeing, a third harrowing is indefatigable. But where the weather has been favourable, and those employed in hoeing have done their duty, the carrots once hoed and harrowed have been, he says, as clean as thoae on which two hoeings and as many harrowings have been practised.

It is the remark of an Effex farmer, that carrots will amply repay every expense of the finest culture, and from their extensive utility, on sound, deep, and friable land, be every where attempted. He sows in March or April; hoes three times, and harrows after each hoeing. The expense of cultivating this crop on poor sandy land of five shillings an acre in the Suffolk method, is thus stated.

Expenses | - | - | £117 10 10 |
Profit | - | - | £54 4 10 |

This is 6l. 13s. 7d. per acre profit, besides the land being left in most excellent order for barley, which fully shews the vast advantage of cultivating this kind of crop whenever the farmer has land capable of admitting it.

Of the advantage of the drill culture there are different opinions, but further trials are necessary. Mr. Amos's method is "two pounds of seed per acre." He stews the seed in rain water twenty-four hours, and lays it upon a floor, until the pears are mixed it thoroughiy, with three pecks of dry sawdust, and three pecks of fine dry mould. Drills one inch deep and fourteen inches between the rows, with the same cups used for wheat or barley. Harrows once in a place. The plants appear in eight or ten days. On exprressing his surprise at seeing good long carrots grown on very shallow lands, to a person who had been many years bailiff to several estates, he told him that he had been accosted to obtain carrots of full length and size, in such land, by dibbling the seed to a great depth, with an iron dibble; and when it was objected, that the plants, from the feed being too deeply buried, would never get above the surface; he assured him, in his numerous trials, he never observed any such consequence.

8 It
It is stated by a writer in the twenty-fourth volume of the Annals of Agriculture, that he sowed broad-cast two acres of carrots, following a potatoe crop, on a light sandy loam of twenty shillings an acre. They were twice hoed, at thirteen shillings the two, in the manner of hoeing cupins; and in the course of the Summer he moved one third of the tops twice; another third of the tops once; and the remaining third of the crop the fecthy did not pass over. The tops were greedily devoured by his horses, cattle, and pigs, in the fold-yard, and were equal in quantity and value to a considerable crop of clover, cut and made use of in the same mode. At the end of October he took up the carrot roots and prepared them in a trench in the manner of potatoes. The crop was full fix hundred bushels per acre; and it was not found that the roots of those carrots whose tops had been twice cut were at all inferior in size or quality to those whose tops had been left untouched. A pastage was left for a small cart to carry off the tops, and another he made by drawing the young carrots wanted for family use. He has reason to consider this mode of cultivating carrots equal to the bell fellow crop, provided the carrots are twice well hoed, and the tops are cut off, as the fecthy prevents any weeds feeding in the autumn. His horses, oxen, milch cows, and pigs, were fed with the carrot roots; his turkeys and other poultry had them in a boiled state, and were fattet well upon them; even his pigeons were fed upon carrots, as they constantly attended in the fold-yard to pick up every particle that dropped from the mouths of the cattle; which supply was sufficient to keep them at home, and to save an expence in feeding them in the severe weather. The market price of carrots near his house, twelve miles east of York, was from tenpence to one shilling a bushel; at which price it must be allowed, he says, that the crop was a profitable one. He further remarks, that the demand for carrots in his neighbourhod for rabbits is not inconsiderable, for it is found that this food is more invigorating and fattening than any other that can be given them.

Though it is a common practice with farmers in Suffolk to allow crops of carrots to remain in the ground all winter, it ought by no means to be generally recommended; as besides the injury the crop may frequently suffer by severe frosts, the farmer must often experience great difficulty in getting up a sufficient quantity of roots for the supply of his live flock, especially when the earth is bound up by frost or covered with snow. On the above grounds it is evident, that the best way of preferring carrots during winter and spring is to dig them up in the end of October, or beginning of November, when their green leaves are decayed, which is a common practice in Leicestershire. In doing this, the best method is to make use of three-pronged forks, though spades are frequently used. By loosening the soil with either of these instruments, and drawing up the carrots at the same time by the tops, the work is performed in a very expeditious manner. The carrots should be allowed to dry a day or two on the field before they are taken home; on being dug up, when they are dry, the tops may be taken off and given to the swine or cattle; and the roots be piled up in heaps in some close dry house, well covered up, either with straw or dry fau, so as to defend them from frost and dampness. Where the busses of taking up the roots is delayed till November, Mr. Young well observes, that in cafe of wet weather they are liable to be much injured. It is observed by an Irish farmer that it is his practice to take them up on a dry day, put them directly into small upright casks of ten bushels each, entirely covered with the tops cut off; they thus appear to dry better than in any other mode; and with very little los, to bear the weather. If after being thus dried, they are carried into any barn, or shed, it will be better, if in large quantities, on account of the hazard of heating, not to pack them close, but rather throw them promiscuously into heaps with a little straw over them. Some however pile them up in a conical manner with a few of the tops hanging down on the outside, and others place them in a ridge of earth in the manner of potatoes.

According to the account of Mr. Arthur Young, in Suffolk, a medium crop may be reckoned at three hundred and fifty bushels the acre, which at fix-pence the buishel, the price at which they are sold to be sent to the London markets, amounts to £1 15s. 9d. the acre. Hence, through the hoeding and digging up of a crop of carrots may be attended with considerable expense, the above crops produce will amply repay, and leave a very handsome profit.

The uses to which this root are applied are various. Large quantities are sent to the London markets, and also given as food to different kinds of live flock. Horses are remarkably fond of carrots; and it is even said, that when oats and carrots are given together, the horses leave the oats and eat the carrots. The ordinary allowance is about 40 or 50 lb. a day to each horse. Carrots, when mixed with chaff, that is, cut straw, and a little hay, without corn, keep horses in excellent condition for performing all kinds of ordinary labour. The farmers begin to feed their horses with carrots in December, and continue to give them chiefly that kind of provender till the beginning or middle of May, to which period, with proper care, carrots may be preferred. As many farmers are of opinion that carrots are not so good for horses in winter, as in spring, they give only half the above allowance of carrots, at first, and add a little corn for a few weeks after they begin to use carrots.

The result of the inquiries made by the above author in Suffolk, as stated in the survey of that district, is, that they give "at Sutton fix horses two loads a week; no corn, and eat little hay. At Shottisham, fix horses one load a week, with corn; in the spring two loads, without corn; eat little hay. At Ramholte, fix horses 72 bushels a week; no oats, and half the hay saved. At Alderton, fix horses 43 bushels a week; oats given, and the faving of hay not considerable. At Alderton oats given, because not carrots enough. At Hollesley, fix horses two loads a week; no corn, fave more than half the hay." And upon reviewing these circumstances, the same author says, it appears that two loads a week are a very large allowance, probably more than are necessary; that with 72 bushels at one place, which is one and three quarters, and one load at another, all the corn is saved; let us therefore decide, that when fix horses eat 80 bushels of carrots a week, which is 13 bushels a week for one horse, they want no corn whatever, and will eat only half the hay of corn-fed ones. This will enable us to ascertain the value tolerably, though not exactly, because we do not, says he, know what would be the fair allowance of oats to balance such feeding with carrots." The whole turn of the intelligence he received ran, he says, upon the vast superiority of condition in which horses are kept by carrots to that which is the result of corn-feeding; for this evident reason, carrots are given nearly, if not quite, in large quantities as the horses will eat them; but the oats are never given in such a manner, they are always portioned out in an allowance far short of such plenty. A quarter and a half of oats would, he is persuaded, from the general turn of every man's conversation, be inferior to two loads of carrots; this at 20s. is 11. 10s. and there is to be added the faiving of half the hay, which may be called 10 pounds per horse a day, or 70 pounds per week, which, at 50s. a ton is 11. 4s. per horse, and 8s. for fix; which added to 11. 10s. for corn, makes at all 11.
...78s. against 80 buills, or 15s. a load: and that this is a
moderate calculation, appears, he thinks, from the decided
preference given by several farmers in favour of carrots at
15s. a load, against oats at 20s. a quarter, not reckoning the
carrots by any arbitrary estimation, but supposing themselves
to be the one or the other. The prime cost is calculated at 78.
a load; and that this is fair, will, he thinks, appear by the following statement of the articles:

| Rent, tythes, and poor-rates | 1 5 0
| Ploughing                   | 0 7 0
| Harrowing, &c.              | 0 1 0
| Saled and fowing            | 0 6 0
| Hoesing                     | 0 1 8
| Taking up ten loads, at 1s. 2d. per load | 0 1 1 8

2 18 8

The tenth of which is, he says, 5s. 1d. or per bui ller one
penny three-farthings; call it, however, two pence per
buiffer, or 6s. 8d. per load, and if to square with one article
of intelligence it is made 7s. it will not amount to two pence
bearing the bui ller: here, therefore, says he, another view
opens upon us, which is the farmers profit; the carrots are
worth, in feeding his team, 15s. but they cost him only 7s;
he has therefore the advantage of 8s. a load as the grower,
on all his horses consume, and on an average 4l. an acre.

Another way by which a friend of his, he says, made his
calculation, was this: at one load and a half of carrots,
ine loads a moderate acre, last six horses six weeks. He
was inclined to think, from the intelligence, that one load and
a half ought to be esteemed the proper quantity, and five six
quarters of oats, which at 20s. is £ 6 0 0
Three cwt. and a half of hay a week faved, 21
cwt. at 23. 6d. - - - - - - - - - - - - 2 12 6
The carrots may coal - - - - - - - - - - - - 8 12 6
Farmers profit per acre by feeding horses - - - - - - - - - - - - 5 9 6

It admits of various calculations, says the writer; but view
it in any light you please, the result is nearly, though not ex-
actly, the same. Two facts result, he thinks, most clearly
from the intelligence; viz. that horses do upon them as
well as upon oats, and that this application will not only pay
the charges of culture, but leave a profit nearly as great as
the grofs produce of a common crop of wheat. He
wonders, therefore, the farmers cultivate them for their own ufe alone,
without any view to a sale. It should farther be reenounced,
he says, that this result takes place, not in a district where
the horses are poor mean animals that betrand a want of good
food, but, on the contrary, amongst the most ufeful teams
that are to be found in England; and that these teams are
the fattest, and in the highest condition, when they are sup-
ported by carrots. No greater proof of the excellency of the
food can, he thinks, be wished for, than the horses going
through the barley-fowing upon it, and the root doing better
at that season of hard labour than earlier in the winter; this
seems to speak, he says, the heartiness as well as wholefome-
ness of the food. One conclusion very naturally arises from
this part of the intelligence, that the crop, or a considerable
part of it, ought to be taken up in autumn, and packed in
a barn, in which they would much sooner lose their juiciness,
and acquire a more withered flate, in which they are found to
yield the best nourishment for animals.

But the author of the New Farmers' Calendar, who says
he has given carrots to horses of every description, and that
the practice is perfectly familiar to him, observes, "that neit-
ther cart nor plad-horses, although they will perform very
well whilst fed with carrots, are able to go through so much
lubour, or to do it with so much grace or safety to themselves,
as when they are allowed corn; and the only proper appli-
cation of carrots to horses is to such as either do not work
at all, or very moderately; but should the carrots be sub-
tituted for hay instead of corn, it makes a very material dif-
tference in the question, and in many cases such a dispensation
might be advantageous in all points. If a man can maintain
his cart-horses in good working order and good health, as
many really do, upon these roots, instead of oats, he has
nothing farther to say, except in praise of his economy; he
only infers, that the very severe labour which he has been
accustomed to fee horses go through, could not be endured
without corn; and that he has known horses absolutely
ruined by working them upon carrots, when the labour was
by no means hard enough to have injured them had they been
properly fed with corn. He has little to say on this subject,
since he has himself sufficiently often ridden and driven
horses carried on carrots, watching their daily condition, and mark-
ing even the dew upon their coats, the heaving of their
thucks, and the comparative tone of their muscular exertions."

This writer's opinion, however, seems chiefly to rely upon
their being a laxative, and consequently a debilitating food,
which is probably not the case when they are taken up and
kept in a dry place for a proper length of time, so that a por-
tion of the juicy material may be disipated.

In March—this sort of food is in the greatest perfection,
as much of the succulence of the roots is disipated, and from
their being in some degree withered, they bend in the hand.
Every part of them is therefore highly nutritious, being full as
hearty a food as oats. It is, of course, an object of vast im-
portance to the farmer to be well provided with this root for
use in February, March, and the following months.

Carrots have likewise been made ufe of for fattening cattle
with great success; fome, indeed, think that this is the most
advantageous way of applying them; and there cannot be any
doubt but that they must be highly useful in this way; from
the great quantity of faccharine matter they contain. They
have also been long proved to be excellent food for milch
 cows, the spring, as they certainly give no bad taste to the
bilk or butter, while the quantity of both is greatly in-
creased by their ufe. For this last ufe they should probably
be employed without being much kept, as in that way there
will be the largest proportion of the juicy liquor in them,
which is of advantage in this intention.

Sheep have also been frequently fattened on this root in
Suffolk; and from Mr. Young's account, who seems to have
fully considered the carrot-husbandry, a good crop will weigh
11 tons, which quantity, he supposes, will feed 20 wethers
for 100 days, in which space they will be completely fat-
tened. In Norfolk it is reckoned a good crop of turnips
that will fatten eight wethers; so that it would seem that one
acre of carrots will go as far in fattening these as two acres
and a half of turnips, which is a circumstance that deferves
the farmer's attention in many situations. The same writer
also further states, that the expense of cultivating carrots ex-
cedes that of turnips by 1l. the acre. To counterbalance
which, he says, the carrots are much more impenetrable to
fruit, if left in the ground to be taken up as wanted; they
are not subject to any deleterious similar to that of the
fly in turnips; and that they are found at a feaflon when they
cannot suffer by drought; while, of late years, turnips have
suffered so much in various ways, as to have subjected the
farmers,
Carrot.

Farmers, particularly those of Norfolk and Suffolk, to very heavy losses. Besides, carrots can be prefered with certainty to an advanced period of the spring, as April or May, when the fattening of cattle is more expensive than at any other season, the superiority of carrots over turnips must, he thinks, appear evident to every practical farmer. He further adds, that with all these advantages, it might naturally be expected that carrots should be more universally cultivated, and that the only reason why they are not, is because their value is not ascertained, or made generally known. Some such reason as this would appear also to be the cause why the cultivation of so valuable a crop should be confined to one particular district of the kingdom; which, without doubt, if it were commonly cultivated, would be the means of saving an immense consumption of oats, beans, and peas, which are at present given to horses and other animals. This sort of crop is likewise of great utility in the keeping of store pigs; but they will not probably fatten them without the assistance of cress or milk. In the experiments of the Reverend Mr. Young, this seems to have been exactly the case, as the hogs, in many instances, gained weight, though they did not become fat under this management. See Swine.

The able writer of the Suffolk report has further remarked, that the next circumstance to be attended to is the advantage of the plant as a preparation for corn; all the minutes agree, says he, that the barley after them is good and clean; several persons were inclined to think it equal to that after turnips fed on the ground; but the fair result is evidently, that if carrots were so fed, the barley would be much superior, of this the intelligence he received will not, he says, permit us to doubt. It is, however, fair to observe, that they one and all declare for putting them in good land, and in this course: 1. turnips; 2. barley; 3. carrots; 4. barley, &c.; from which it appears, that on these sandy soils, they are not to be depended on for cleaning them when foul with coals.

The utility and advantage of the carrot root have been already shown in many instances: it is, however, obvious, that the value of crops of this description must vary in a considerable degree, according to the manner in which they are employed in their consumption. The differences have been found to be from two to three pence halfpenny to two shillings the bushel; in general it may, however, be from about sixpence to eight pence, and perhaps in some instances tenpence or a shilling. In the trials of different experimenters, as stated in the 25th volume of the Annals of Agriculture, under different modes of application, the results were these:

<table>
<thead>
<tr>
<th>Application of crop</th>
<th>Value per Bushel</th>
</tr>
</thead>

</tbody>
</table>

It has been remarked by a late practical writer, that from the great facility of cultivating this sort of crops, the little risk that attends them, their very general application in the feeding and fattening of different sorts of domestic animals, the large proportion of manure that they afford, and their great utility in the preparation of the land for grain crops; they may in most cases be considered not only preferable to turnips, but much more advantageous and better suited to all soils of the pure sandy or light sandy loam kinds.

It has been suggested by Mr. Baker, that the large tops of this root might be rendered more extremely beneficial by having them converted into a sort of coarse hay, by moving them over while in their young, green, juicy state of growth, without injuring the heads or stems of the plants, some what in the manner noticed above; and then letting them become perfectly dry on the ground; as in this way, he affirms, that two tons of fodder may be produced from an acre of land. It is plain, however, that in this practice injury must be done to the growth of the roots, besides its being uneconomical, on account of the great loss that would take place in the drying of such succulent materials, which can be wholly consumed without it. It is unquestionably a much less safe and method of management to have them consumed in the yards by some sort of flock, as they are taken up; because in this way not a particle is lost, from the great avidity with which almost all sorts of animals devour them.

When it is thought necessary to have the roots cleaned before they are given to animals, it may be readily performed in the same manner as for potatoes.

The author of the Agricultural Survey of the County of Suffolk concludes this interesting subject with "carefully calling on all persons who have land, or light sandy loams, to determine to emancipate themselves from the chains in which prejudice or indolence has bound them; to cultivate this admirable root largely and vigorously; to give it the benefit they have; to plough very deep; to hoe with great spirit; and to manure corn from their stables, as a mere luxury and barren expense, that ought to be extirpated: an effect that flows very fairly from the preference which the instinct of the four-footed inhabitants generally gives to carrots." They should not, he thinks, be confined to small clumps of an acre or two, but be introduced regularly in the courses of the crops of the farm in the same manner as wheat, barley, turnips, or any other plant. None, in his opinion, pay better, and very few so well; and besides they are capable of a very general application, no root being fit for serving more useful purposes.

The penalty for fleasting carrots is the same with that for fleasting turnips, potatoes, cabbages, parsnips, and peas; for which see Turnips.

Carrot, wild, in Agriculture, a weed of the biennial kind frequently met with in pastures lands, where the soil is inclined to be dry. Wherever it is found it should be extirpated as soon as possible before it flowers and sheds its seeds, if this is not attended to, it will increase with rapidity, and become more troublesome as well as difficult to remove. It has sometimes the name of birds' nest, from the head, after flowering, contracting somewhat into that form. See Dauclus.

Carrot, Candy, in Botany. See Athamanta cretensis.

Carrot, Deadly, or Scorzing, See Thapsia.

Carrot, Mountain, a species of fennel. See Fennel.

Carrouge, Bertrand-Augustin, in Biography, an ingenious astronomer of France, was born at Dij, on the 8th of October, 1741, and on account of his merit and ingenuity, he was appointed "Administrateur General des Poules," by Reveilleire-Lepaux, the director. Notwithstanding his advancement to this office, which rendered him, in some degree, independent, he applied with diligence to astronomy. He calculated 1000 stars for the celestial globe published by C. Lamarche, successor to Fortin, and made many calculations for the "Connoissances des Temps," and the second edition of Lalande's astronomy. He also published several memoirs in the "Connoissances des Temps," and, a few days before his death, which happened on the 20th of March, 1798, he delivered to Lalande tables for calculating the
CARROUSAL, or CARROWSAL, properly a course, or
countell of chariots and horses: or a magnificent entertain-
ment, on occasion of some public rejoicing: consisting in a
cavalcade of several persons, richly dressed, and equipped
after the manner of the ancient cavaliers, divided into squa-
drons, meeting in some public place, and practising jousts,
tournaments, and other noble exercises. The term is since
become of more general use, and is given to any merry
meetings. The word comes from the Italian carosello, a
diminutive of carro, chariot. Tertullian alibrizes the invention
of chariots to Circe; and will have it inflicted in honour of
the Sun, her father: whence some derive the word from
carrus, or carrus folis. The Moors introduced cyphers,
divisional, and other ornamens of their arms, with trappings,
&c. for their horses. The Goths added crests, plumes, &c.

CARR-TAKERS, are officers of the king's household,
who, when the court travels, have charge to provide wag-
gons, carts, &c. to transport the king's furniture and bag-
gage.

CARRUCA, in Antiquity, a splendid kind of carr, or
chariot, first mentioned by Pliny, mounted either on one
wheel, like our wheel-barrows, or, as is more probable, on
four wheels, richly decorated with gold, silver, ivory, &c. in
which the emperors, senators, and people of condition, were
carried. The carruca, or coaches of the Romans, were
often of solid silver, curiously carved and engraved; and
the trappings of the mules, or horses, were embossed
with gold. This magnificence continued from the reign of
Nero to that of Honorius; and the Appian way was covered
with the splendid equipages of the nobles, who came out to meet St. Melanius, when she returned to
Rome, six years before the Gothic siege. Seneca Epif. 87.
Pliny H. N. xxxiii. 49. The Romans considered it as an
honour to ride in those that were remarkably high. In
the Theodosian code the use of them is not only allowed to
civil and military officers, but enjoined as a mark of their
dignity.

The word comes from the Latin carrus, or British care,
which is still the Irish name for any wheel-carriage.

CARRUCA was also sometimes used for carruca. See
Carrucate.

CARRUCATE, in Rural Economy, a term employed by
some old writers to signify a plough. It is sometimes
written Carruc.

CARRUCATE, in History, a term which denotes the
ploughing of ground, either ordinary, as for grain, hemp,
flax; or extraordinary, as for wood, dyer's weed, rape-feed,
&c.

Carrucate, carucatum, a kind of tax anciently im-
ploved on every plough, for the public service. See
Carrucate and Hidage.

CARRUCATE, or Carucata, in our Ancient Law
and History, denotes a plough land, or as much arable as
could be tilled and managed by one plough and the bealls
belonging thereto in a year: having meadow, pature, and
horses for the householers and cattle belonging to it.

In the Domesday Survey, the hide and carucate appear
to be the same; the hide being the meafure in the Con-
feffor's reign; and the carucate that to which it was re-
duced by the Conqueror's new standard. Thus, different
places are said to have paid gold for so many hides, T. R. E.
in the time of the Confeffor. And then follows the exifing
meafure of so many carucates. "Et alia, Carucatum." Mr.
H. P. Wyndham, however, in his "Wiltshire, extracted from
Domesday Book," 1788, distinguishes between "hides" and
"carucates," though they have hitherto been considered as
synonymous terms. Accordingly, he conjectures, that the
first was intended to signify "the valuation of the efteft,"
and the latter "the meafure of the land."

In some of the counties, as those of Nottingham, Derby,
and Lincoln, only carucates are mentioned. But in others,
as we have already mentioned, both occur.

The contents, however, of the carucate are very variously
flated; and, in fact, we have no enteron in any one county
for judging of its real extent. The Liber Niger, as well as
several of our ancient chartularies, eilem it to contain a
hundred acres; while it is carried by other authorities to
an hundred and twenty: and the Liber Elenensis afferts, that
some carucates even of two hundred and forty acres. In
the early part of the reign of Richard I. it is flated to have
been estimated at fifty acres; and so have continued till his
ninth year, when in the fve milage, it, was fixed the hundred
of Edward I. It appears to have been more than once estimated
at one hundred and eighty acres: and in the 23d of Edw. III. a carucate
of land in Burcefter contained a hundred and twelve acres, and
in Middleton a hundred and fifty. Nor was the calculation
of its extent under other circumstances less liable to varia-
tion. The Monasticus Anglicanus (tom. i. p. 75.) says,
that fourteen carucates made a knight's fee. A manuscript
register of Fountains's abbey, fifteen. Another mentions
twelve. And one of Dodworth's manuscripts in the Bod-
leian goes to forty-eight. A charter of the 5th of Edward III.
records, that each of three carucates of land which the abbot of
Norton held in the New Forest consisted of a hun-
dred acres: and a familiar measure is reported in a patent
of Henry IV.

The measurement of the carucate then appears to have
been arbitrary, and differs considerably not only in different
counties, but even in different districts of the same county.
It appears, likewise, to have been various at various times.
And for different purposes a larger or a less number of acres
appears to have been required. It seems clear, says the
historian of plough-land, that the commissioners, in the surv-
ey of that county, at leat, from the convition that hides
and carucates were of no certain meafure, and that they
differed still more in quality than they did in meafure,
adopted the very rational mode of determining the value of
the land by the number of ploughs that were actually em-
ployed, or in their judgment might be employed on it. "We
sometimes find that the number of ploughs is consid-
ernably less than the number of plough-lands; and some-
times the commissioners tell us the land would have admi-
itted of more ploughs than were then in actual use. And it is but
reasonable to conclude, that certain lands had been in a
better late in the time of king Edward, than they were
in the reign of William I. from their having more ploughs
at work on them; and, on the contrary, that other lands
were much improved at the time of the survey, as they had
more ploughs at work than they had been employed in the
days of the Confeffor. There are few parishes in some of the
counties that can be made intelligible in any other way of
Hutcheson's Diff. of Dom. Pref. to the Riff. of Leic. Antiq. Difc. i. 46, 47. Huchins's Diff.
Hon. 622. By a statute under William III. for charging
perera to the repair of the highways, a plough-land is rated.
CARRUCCI, Jacopo, called Pontormo, from the place of his nativity, in Biography, was born in 1490, polished great natural genius, and in his earliest works was admired by Raphael and Michael Angelo. His instruction, derived in regular succession from Leonardo da Vinci, Alberti, and Pier di Cima, was completed in the school of Andrea del Sarto, who, by jealousy and ingenuous treatment, converted the scholar into a rival. Notwithstanding his talents, he frequently changed his style and became the victim of inconsistency. The "Certosa" of Florence exhibits specimens of the three different manners commonly ascribed to him. The first, being correct in design and vigorous in colour, approaches the style of Andrea del Sarto; the second, combining with good drawing a languid tone, became the model of Bronzino and the subsequent epoch. The third is a direct imitation of Albert Durer. To these might be added a fourth manner, if the freeces of the general deluge and universal judgment, on which he spent eleven years, and his last work, had not been white-washed, with the tact acquireance of all contemporary artists. In this labour he strove to imitate Michael Angelo, and to exemplify, like him, anatomic skill, which was then becoming the favourite pursuit of Florentine art. This artist died in 1558, aged 65. Pilkington, by F u f e l l.

CARRYING, in Falconry, signifies a hawk's flying away with the quarry.

Carrying is one of the ill qualities of a hawk, which the acquires either by a dislike of the falconer, or not being sufficiently broke to the hunt.

Carrying, among Huntmen. When a hare runs on rotten ground (or even sometimes in a brook), and it flies to her feet, they say the carriers.

Carrying, among Riding-Masters. A horse is said to carry low, when, having naturally an ill-shaped neck, he lowers his head too much. All horses that arm themselves carry low; but a horse may carry low without arming. A French branch, or gigot, is prescribed as a remedy against carrying low.

A horse is said to carry well, when his neck is raised, or arched, and he holds his head high and firm, without constraint.

Carrying wind, a term used by our dealers in horsey to express such a one as frequently tolls his nose as high as his ears, and does not carry handomely. This is called carrying wind; and the difference between carrying in the wind, and beating upon the hand, is this: that the horse who beats upon the hand, shakes the bridle and refits it while he shakes his head; but the horse that carries in the wind puts up his head without shaking, and sometimes beats upon the hand. The opposite to carrying in the wind, is arming and carrying low; and even between these two there is a difference in wind.

CARS, Laurence, in Biography, a French engraver of great merit, flourished about the year 1762, and resided at Paris. His prints were numerous; and the following are from Le Moine, viz. a portrait of "Louis XIV. surrounded with emblematical figures;" "Hercules and Omphale;" "Perseus and Andromeda;" "Time and Truth," and "Nymphs Bathing." Strutt.

Cars, in Geography, supposed by some to be the Chorfa of Ptolemy feated on the banks of the Euphrates, a city of Armenia, the last town of Turkey towards the frontiers of Persia. It is built on a rising ground, exposed to the south-west, and behind it a deep valley, watered by a river, which, not far from thence, discharges itself into the Arpad, without ever coming near the city of Erexon, contrary to the description given of it by Ptolemy. These two rivers joined together are known by the name of Arpad, and serve as a frontier to the two empires. N. lat. 41° 30'. E. long. 43° 30'.

Carso, or Ca/e of Gowry, a district of Perthshire, in Scotland, lying on the N. side of the Tay, extending 14 miles in length from Dundee to Perth, and being from two to four in breadth. It is a rich plain country, cultivated like a garden, and producing as good harvests of wheat as any in Great Britain. Its situation, however, is damp and low, so that the inhabitants are subject to agues, and the common people are in great want of fuel for firing.

Carsofli, in Ancient Geography, a town of Italy, belonging to the Sabines at the 22d mile on the Valerian way. Livy calls it in one place a town of the Marsi, and in another a town of the Perusii; and it might probably have been occupied by one and the other of those people alternately. Livy says that it was a Roman colony, established in the year of Rome 454; and in the map of M. D'Anville it is marked in the country of the Sabines. The precise situation of this place was not known till it was discovered, in 1615, by Holtenius, near the mountains called "Rio Fieddo," and it has been again ascertained, in 1766, by the abbé Chauppy. From an ancient inscription found in this place it appears, that this city was a colony, and that it had a college of priests called "Dendrophurn," consecrated probably to some rural deity.

Carsofli, a town of Dacia, according to Ptolemy, supposed to be the present Kurmm.

Carsofli, in Geography, a small ill-built town of Naples, seated on the side of a steep hill, which slants up a defile of the mountains. It is just within the limits of the Neapolitan state, for on the plain below is the point of division at an inn called "Il Cavaliere," where some custom-house officers are stationed. This town bears the name of the ancient city of Carsofli, though its ruins lie near a mile off in the plain. Carsofli is a portion of the immense demesne possessed by the countable Colonna, who has 37 manors in this neighbourhood.

Carpares, William, in Biography, an eminent Scots clergyman, was the descendant of an ancient family, and born in 1640 at Catcgrar, near Glasgow. Having received the rudiments of his education in the academy of a Presbyterian clergyman, where he formed many important connections, and where he acquired a fluency of expression in the Latin language, as no other was allowed to be spoken in his family; he pursued his theological and philosophical studies in the university of Edinburgh, and afterwards at Utrecht, whether his father sent him for the purpose of avoiding those political contests which agitated the reign of Charles II., and to which his active and enterprising spirit seemed to incline him. Here, however, he was involved in those political intrigues which were occasioned by the alarm excited in England about the Popish succession. By means of a letter of recommendation, obtained from a physician in London, who carried on a correspondence with persons belonging to the court of the prince of Orange, he was introduced to the penitent Fagel, and afterwards to the prince himself; and by him he was entrusted, on account of his sagacity and information with regard to the state of political parties at home, and his ardent attachment to the interests of civil and religious liberty, with his deigns relating to British affairs. During his residence in Holland, his principles, both in religion and politics, were strongly confirmed; and upon his return to his native country, he entered...
tered with zeal into the councils and schemes of those noblemen and gentlemen who opposed the tyrannical measures of government. His political engagements, however, did not divert him from pursuing the profession of divinity; and when he had passed through his previous examinations, he obtained a licence to preach. But as he had no prospect of usefulness in his clerical character, and as his mind seemed to have acquired a decided bias towards politics, he determined to revisit Holland. On his way thither he passed through London, and was employed by Argyle, and the other Scotch patriots, in treating with the English exiles. Towards the close of the year 1662, he held various conferences with the heads of that party, which terminated in his being appointed to that body called the "Rye house plot." Accordingly, he was committed to close custody in the Gate-house, Westminster. After several examinations before the privy council, he was sent for trial to Scotland; and as he refused to give any information respecting the authors of the exclusion scheme, he was put to the torture, in order to extort from him a confession. This cruel treatment he endured with invincible firmness; but when milder methods of a more inquisitorial nature were adopted, and a pardon was proposed, with an assurance that no advantage should be taken of his answers as evidence against any person, his resolution failed, and he consented to answer their interrogatories. The privy council immediately caused to be printed a paper, entitled, "Mr. Caria- rares's Confession," which contained, as he said, a false and mutilated account of the whole transaction; and in direct violation of their promise, they produced his evidence, as they termed it, to be produced in open court against one of his most intimate friends. This treachery and its consequences very deeply affected him; but as soon as he was cleared, he obtained permission to retire to Holland, and towards the close of the year 1684, or the beginning of 1685, when he was kindly received by the prince of Orange, who appointed him one of his chaplains, and caused him to be elected minister of the English Protestant congregation at Leyden. In this situation he was singularly useful to the prince and his party in concerting those measures that terminated in the revolution. When the prince determined to transport an army to England, Caritares accompanied him as his chaplain, and continued about his person till the settlement of the crown. During the whole of this reign he was the chief agent between the church of Scotland and the court, and he contributed by his influence with the king to the establishment of presbytery in Scotland, to which his majesty was disinclined, and to that coalescence or accommodation on the part of the Presbyterian clergy with the Episcopalians, which the bigotry of the former made it difficult for him to effect. When an act was passed, in 1693, by the Scots parliament, obliging all officers, civil and ecclesiastical, to take an oath of allegiance, and also to sign an assent, (as it was called,) declaring William to be king by the false, the general refused to sign the declaration, and appealed to the privy council, who recommended to the king to enforce the obligation. Accordingly, measures were adopted for this purpose; and the body of the clergy applied to Caritares, requesting his interference in their favour. The king perfunctory in his resolution; orders were renewed in peremptory terms, and dispatches were actually delivered to the messenger to be forwarded next morning. In these critical circumstances Caritares interposed; he hastened to the messenger at night, demanded the dispatches, which had been delivered to him in the king's name, and instantly repaired to Kennington, where he found his majesty gone to bed. Having obtained admittance into his chamber, he gently waked him, fell on his knees, and asked pardon for the intimation, and the daring act of disobedience of which he had been guilty. The king at first expressed his displeasure; but when Caritares further stated the case, his majesty caused the dispatches to be thrown into the fire, and directed him to send such instructions to the royal commissioners of the general assembly as he thought most conducive to the public good. In consequence of this reasonable interposition, the oath and assurance were dispensed with on the part of the clergy. By this timely service Caritares acquired the confidence of the Presbyterian party to such a degree, and he so successfully cultivated the friendship of the Earl of Portland, and other men of influence, that he was soon regarded in the management of Scotch affairs, as a kind of viceroy for Scotland, though he possessed no public character. Although he acted with consummate prudence and delicacy, he could not escape envy: but he retained the esteem of those whom he most valued; and the king once said of him, "I had long known Mr. Caritares; that he knew him well, and knew him to be a honest man."

Although, after the death of King William, Caritares was not much employed in public affairs, Queen Anne continued him in the office of royal chaplain for Scotland, and obtained for him the offer of an appointment to the vacant place of principal of the university of Edinburgh; which he accepted in 1704, with the hope of profitorium of divinity. After this appointment, whilst he refused any addition to his own salary, he used his influence at court for augmenting the very small salaries pertaining to the regents in the several universities of Scotland; and in the execution of his office, as principal, he secured the affection and respect of those who were subject to his authority, by the dignified deportment and gentlems of his demeanour. In the year of his appointment to the principalship of the university, he was unanimously invited to the pastoral office in one of the parishes of Edinburgh, which he performed with exemplary diligence; and as moderator of the general assembly, which held its four times in eleven years, he maintained great weight in its debates. When the union of the two kingdoms was agitated, it engaged his cordial concurrence, and he was the principal instrument of preventing any public opposition from the Presbyterian clergy. His efforts to control the bigotry of this body rendered him unpopular; and with a view of gaining their good opinion, he accepted the office of one of the agents, sent to London to oppose the bills for the reformation of patronage in Scotland, and for the toleration of the episcopal clergy; though in the latter instance, at least, his opposition must have counteracted his principles. His example seems to have been an apprehension that the Scots episcopalian wished the exiled family to be restored. His efforts, however, whether they were sincere or not, proved unsuccessful. To the incendiarism of the house of Hanover he gave his active support; and he obtained from the general assembly an address of congratulation to George I. on his accession to the throne; and in return for this service his office of royal chaplain was continued. His death happened soon after this event, in December, 1714. "His private character was highly respectable. His religion was free from enthusiasm and superstition, and his charity and bounty comprehended all sects and parties. His memory is revered by his countrymen as that of a true and enlightened patriot, and few have held an active course amidst violent public contentions with less reproach." See State papers and letters, addressed to William Caritares, confidential secretary to King William, during the whole of his reign, afterwards principal...
of the university of Edinburgh, relating to public affairs in Great Britain, but more particularly in Scotland, during the reign of king William and queen Anne; to which is prefixed the life of Mr. Carstairs; published from the originals, by Joseph M'Cormick, D.D. minister at Preston-pans. 1744.

Brock. Brit.

CARSULNE, in Ancient Geography, a town of Italy, in Umbria, situate between Narnia and Mavania, on the Flaminian way. According to Strabo it was a place of considerable note, and from Tacitus we learn, that it was about 10 miles distant from Narnia. Livy alligns it to a people called Carfalli.

CARSUM, a town of Lower Moenia, according to Ptolemy. It is placed in the Itinerary of Antonine between Capidava and Cion.

CARSUMBLIA, in Geography, a town of European Turkey, in the province of Servia; 12 miles W. of Pirecop.

CARSUS, in Ancient Geography, a river of Aetia, in Cilicia; which springing in mount Amans, near the town of Ernea, ran to the fourth-well between the branches of this mountain, watered the town of Epiphania, and discharged itself into the Mediterranean, at the bottom of the gulf "Illicum.

CART, a vehicle mounted on two wheels, drawn by horses, used for the carriage of heavy goods. The word seems formed from the French charette, which signifies the same; or rather the Latin carota, a diminutive of carus. See Carr.

Mr. Sharp's rolling cart is fixed upon two rollers, running abreast, or parallel with each other, and both placed under the body of the cart, working upon pivots like the wheel of a wheel-barrow. The rollers are both cylinders of cast iron, two feet diameter, and sixteen inches broad. An iron spindle passes through the centre of each roller, upon the ends of which rest the four planks that support the body of the cart. Criminals are drawn to execution on a cart. Bawds and other malefactors, are whipped at the cart's tail.

Scripture makes mention of a fort of carts or drags, used by the Jews to do the office of threshing. They were supported on low thick wands, bound with iron, which were rolled up and down on the sheaves to break them, and force out the corn. Norden and Niebuhr, in their "Travels," inform us, that this method of threshing is still practised in Egypt and Arabia. The former says that in Egypt they thrice, or rather, tread, rice by means of a sledge drawn by two oxen, and that the man who drives them is upon his knees, whilst another has the care of drawing back the sledge, and of emptying it from the grain that remains underneath. In order to tread the rice they lay it on the ground in a ring, so as to leave a void circle in the middle. The Arabians, says the latter writer, in threshing their corn, lay the sheaves down in a certain order, and then lead over them two oxen, dragging a large sledge. They use oxen in Egypt, he adds, as the ancients did, to beat out their corn by trampling upon the sheaves, and dragging after them a clumsy machine. This machine is not, as in Arabia, a long cylinder; nor a plank with sharp edges, as in Syria; but a fort of sledge, consisting of three rollers, fitted with irons which turn upon axles. A farmer chooses out a level spot in his fields, and has his corn carried thither in sheaves upon asses or draymules: two oxen are then yoked in a sledge; a driver gets upon it, and drives them backwards and forwards, or rather in a circle upon the sheaves, and thence oxen succede in the yoke from time to time. By this operation, the chaff is very much cut down; the whole is then winnowed, and the pure grain thus separated. Something of the like kind also obtained among the Romans, under the denomination of plagula, of which Virgil makes mention. Georg. I.

Turdagog El有些 matr-veniunt plagulae, Turdagon, turcas—

On which Servius observes, that trotho donates a cart without wheels, and turbula a cart armed on all sides with teeth, used chiefly in Africa, for the thing corn. The Septuagint and St. Jerome represent these carts as furnished with faws, informing that their surface was bevel with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be crushed to pieces under such carts, moving on wheels set with iron teeth; and the king of Damascus is said to have treated inhabitants in the land of Gilead in the same manner. 2 Sam. xii. 31. Amos. i. 3. Calm. Dict. Bibl. tom. i. p. 356.

CART, in Agriculture, is a carriage or vehicle constructed with two or more wheels, and drawn by one or more horses. It is employed for the purpose of conveying manure, hay, grain, and various other articles which are connected with the farm. Carts are made of different forms and dimensions, in some districts according to the nature of the materials they are intended to carry, and the uses to which they are applied; but by suitable contrivances they may be easily constructed, to carry for the farm-cart to serve different uses. In the more southern parts of the kingdom this is mostly the case, where there is not only a considerable saving, in fewer carts being wanted, but likewise in less room being taken up by them in the fields or houses where they are kept. In these situations they are mostly formed into a close manner, having ladders or other similar contrivances applied when they are wanted to convey any of the more bulky sorts of materials, such as hay, straw, &c.

It is obvious that the chief object in the construction of carts should be to adapt the wheels and axle in such a manner, that the power may be applied in the most favourable direction for draught, and that the carriage may move with the least possible force. In this view the height of the wheels should likewise be well adapted to that of the animals which are employed in drawing them; but the exact heights which are the most favourable under different circumstances have not yet been fully shown by any trials that can be fully depended upon. There is likewise another point which ought to be particularly considered in the making of farm-carts, which is, that they are not more heavy than is necessary; which is too often the case in the southern parts of the island. It has been remarked that the large heavy carts and waggons, which are so common in the southern districts, are not only reprobatate, but almost wholly in disuse in those of the north, where small carts are in general use. Though there cannot be any doubt but that carts must vary in their forms, sizes, and modes of construction, according to the nature and situation of the roads, and many other local circumstances; yet for the purposes of farming, especially in field work, probably those of the light, single, and two horse kind may in general be the most advantageous, convenient, and useful.

It has been observed, in the twenty-seventh volume of the Annals of Agriculture, by lord Robert Seymour, that "the advantages of single-horse carts are, he believes, universally admitted, wherever they have been attentively compared with carriages of any other description. By his own observation he is led to think that a horse, when he acts singly, will do half as much more work as when he acts in conjunction with another; that is to say, that two horses will, separately,
separately, do as much work as three conjointly; this
artists, he believes, in the first place, from the single horse
being so near the load be drawn; and, in the next place,
from the power or line of draught being so much below his
breast, it being usual to make the wheels of single horse
wagons very low. A horse harnessed single has nothing but
his load to contend with, whereas when he draws in con-
junction with another, he is generally embarrassed by some
difference of rate, the horse behind or before him being
quicker or slower himself; he is likewise frequently in-
convenienced by the greater or lesser height of his neighbour;
these considerations give, he conceives, a decided advantage
to the cart he is recommending." If any other is
wanted, that "of the very great wheeled cart...is filled
most of all he besieges, added: as a man may load it, with
the help of a long-handled shovel or fork, by means of his
hands only; whereas, in order to fill a heavier cart, not only
the man's back, but his arms and whole person must be
exerted." To the use of single horses in draught he has
heard no objection, unless it be the supposed necessity of
additional drivers created by it: the fact however is, that
it has no such effect; for, horses once in the habit of going
fingly, will follow each other on, and as steadily as they
are drawn harnessed together; and accordingly we see,
from the most frequented roads in Ireland, men
conducting three, four, or five, single horse carts each,
without any inconvenience to the passenger; such likewise,
is the case in this country, in which lime and coal are
generally carried upon pack-horses, where one man manages
two or three, and sometimes more." And in a preceding
volume of this work, Mr. Young is decidedly of the
same opinion, which he clearly shews to be founded in truth,
by entering into a variety of discussion in respect to the
points in which they are preferable to tumbrils or wagons.
In the northern districts they usually draw in these carts
from twelve to twenty-four hundred weight, and where
the roads are good, occasionally thirty, with much ease and
facility.

And Mr. Donaldson, in his view of the "Preferment State
of Husbandry in Great Britain," seems to think that, "for
carrying on the ordinary operations of husbandry, carts
drawn by two horses are greatly superior to large, cumber-
some, unwieldy waggons, that require four, five, or six
horses to move them along. It has of late," says he, "been a
subject pretty much agitated, whether single-horse carts are
not to a great degree superior to those drawn by two
horses, as these have been represented to be wagons.
Single-horse carts are certainly loaded and unloaded with
much less trouble, and are in every way more easily managed,
especially when carrying out dung, or when used for doing
any odd jobs on a farm." It has also been found, from long
experience and the most attentive observation, that "one
horse will draw, on any road, two-thirds of the load that
two horses, drawing in a line, and of equal power, are
capable of doing. The carters of the town of Falkirk,
in Stirlingshire, for example, have long been famous for the
great weights drawn by their carts. Before the navigable
canal between the Forth and Clyde was made, the whole
goods transported to and from Glasgow, and the ports upon
the Forth, were," says he, "drawn upon one and two-horse
carts belonging to those carters; the most expert of whom
have long given the preference to carts drawn by one horse,
as they experience no difficulty in carrying upon a cart,
drawn by a single horse, from Borrowstounness to Glasgow,
a distance of upwards of thirty miles, and of indifferent road,
from twenty to thirty-five hundred weight." It is, he ob-
erves, further worthy of remark, that "at the great iron-
work at Carron, the company engaged in it formerly made
wagons and waggons, to which cart was and other heavy articles upon; but have entirely laid aside the use of them, and on the principles of economy, employed car-
ters with single-horse carts to transport the heavy articles
which they require."

In the agricultural report of Northumberland it is like-
wise remarked, that "single-horse carts are becoming more
prevalent in several parts of that county; and that Mr.
James Johnson, a common carrier at Hexham, has a horse,
six feet high, that commonly carries from Hexham to
Newcastle 24 cwt., and 20 cwt. back again; and there are
instances of his having carried 26 cwt. from Newcastle to
Hexham, which is a very hilly, heavy-pulling road." It is
also further noticed that "the neatest, most useful, and left
conceived carts we know, are those made in many parts of the
North-Riding of Yorkshire. The single-horse carts of this
construction, used for carrying coals from the county of
Durham into Yorkshire, are 60 inches long, 36 inches
wide, and 18 deep, hold 24 bushels of coals, when let round
the fides with large ones and upheaped. A man, or boy,
drives three of these, two of which are equal to the greatest
quantity ever carried by three horses." Mr. Chappell of
Newton, finds three of these carts for coals every day, which
bring 72 bushels, the distance of 26 miles, there and back,
which is performed in 10 hours by one man. The same
gentleman's two-horse carts bring 36 bushels of the same
coals.

And in the agricultural survey of Cumberland, the writers
say, "the advantages of single-horse carts are so well
understood in this county, that we did not see any other used.
Three single-horse carts are driven without any difficulty,
by a man, or boy, or even women and girls."

The author of the Agricultural Report of Mid Lothian,
states, that "the wheel-carriges employed in husbandry
are only the cloce-cart and the corn-cart, both of a light
construction, drawn by two horses, and of late by one.
The large wains, or heavy four-horse wagons, employed
in English husbandry, are discarced there. Two horses in
carts are commonly loaded with 18 or 20 cwt. One horse
draws still more easily 12 cwt.; even 24 cwt. is frequently put
on a single horse; and 30 cwt. on good roads is not uncom-
mon. And that the first cart of hay has lately been much
improved: when placed on its axle, the bottom at each side
projects over the inner head of the naves as far as nearly
touch the spokes of the wheels; from which acquired
broadness the capacity is enlarged; while the side-standards,
being brought nearer to a perpendicular, are able to sustain
more weight." The dimensions are, the length five feet
three inches; the breadth below, four feet; the breadth
above, four feet three inches; the depth, one foot three
inches; containing about a cubic yard. The price of a
cart, painted, 11. 15s. not including wheels, axle, or mount-
ing, which may amount in all to seven or eight pounds
more. The wheels are generally 52 inches high, the axle
commonly of iron, from an idea, that, in the end, it is more
economical to have them so: for it is not found in practice
that iron axles are either more or less difficult to draw, al-
though not half the thickness of those of wood."

It has been suggested on the ground of much experience,
that, in constructing carts of this sort, the capacity of wags-
gons is by no means an accurate rule to proceed by; as on
finding that they contained in the bed, or back, ninety-six
cubical feet, being twelve feet long, four feet wide, and two
feet in depth; it was supposed that to give one horse the
fourth part of the load of four, it would only be necessary
to let the cart have the space of twenty-four cubical feet, or
to make it four feet by three, with the depth of two; but from the vall superiority of horses working finely, over those in teams, it was soon discovered, that they required to be very considerably enlarged, admitting of having the dimensions of five feet one inch in length of bed or back, three feet seven inches in breadth, with two feet in depth; so as to contain thirty-five cubical feet and a fraction. This, therefore, affords a further striking proof of the great superiority these small carts have over those of the large kind, in the quantity of work which they are capable of performing.

In speaking of the advantage of having low call-iron wheels, it is remarked by lord Seymour, in the paper just mentioned, that "the price of iron, cast into wheels, is 1s. per cwt., and the weight of each wheel about three quarters of a cwt. Two inconveniences only, he believes, have been found from the use of low call-iron wheels: the first is, that call-iron is very liable to breakage, upon concussion; the next is, that the course of so small a diameter creates a very quick consumption of grease. The first of these objections is in a degree removed by the case with which the rim of the wheel is repaired by the application of worked iron, which being joined to it by a rivet, the wheel acquires some little elasticity, and thereby becomes perhaps stronger than when it was new. In order that the supply of grease may keep pace with the consumption, he has introduced four grooves, or cavities, in the boxes, increasing a little towards their centres; and in order to defend the axle-tree, which confits of worked iron, against the harder body of the box, he has fixed the extremity of it."

These small carts are considered by many, from actual experience, to be better adapted to the carrying of all kinds of materials except those of the very bulky kinds, and such as trees, blocks of stones, &c. the weights of which might injure them, and which cannot from their nature admit of division. In all hilly districts, where the roads are of an inferior kind, and the inhabitants poor, these are the carts that are in most general use, and which are found the most advantageous. The superior goodness of the roads in some of the northern parts of the kingdom have likewise been ascribed to the use of these kinds of carts, as large carriages of all sorts that require the wheels to be locked in descending hills, are the destruction of roads.

By the author of the New Farmer's Calendar it is stated that "of the great saving to be made by one-horse carts there can be no doubt, since it has been experimentally proved, and was moreover, easily to be discovered from just theory. More weight may be drawn by fix horses in so many carts, than by eight in a large wagon; and one man may manage two carts in the country." There are, however, he thinks, "some peculiar inconveniences attendant upon this plan, which are sufficiently obvious; and, says he, notwithstanding it has been, for years past, so warmly recommended by very powerful pens, it never has, nor probably ever will, be relished by the generality of farmers."

After this view of the nature of carts in general, and of the particular advantages of single-horse carts; it may be useful to describe the different sorts of carts that are employed in the humour of husbandry.

Close cart, a name given to all such carts as have no ladders, rails, or wings, attached to them. They are made close by boards, and molly employed in conveying dung, gravel, earth, or such other materials as have considerable weight, in a small compass. By the application of wings or ladders to them, they are however, frequently made to serve the double purpose of conveying heavy clofe matters as well as those of a light bulky nature. This sort of cart is represented at fig. 4, Plate 111. of Agriculture.

Corn cart, is that sort of cart which is only placed occasionally on wheels, for carrying hay, corn in the straw, or other bulky articles: carts of this kind are generally composed of flatiron rods, and spars, without decks, but broader and much longer than the close cart, that they may hold a more bulky load. They call from 30s. to 50s. in Scotland, but in England they are considerably higher. They are commonly employed in the northern parts of the kingdom for carrying hay, grain in the straw, and other similar bulky materials. A cart of this sort is shown at fig. 4, Plate 111.

Cone cart, a cart of the close kind, so denominated from the body-part rolling on a sort of frame, to which it is kept by means of staples, or other contrivances, through which a call-bar, or wooden pin, is put, by which it is confined, and which can be readily removed when the load is to be either partially or wholly discharged. Carts of this sort are generally used in putting dung upon land, and are convenient for many other purposes in husbandry. See fig. 3, Plate III.

Drag cart, a sort of cart invented by lord Somerville, which is connected with a drag, or some other contrivance, for checking, or regulating the rapidity of the motion in going down hills, or other declivities. A full account of this cart has been given in the second volume of "Communications to the Board of Agriculture." At fig. 5, in Plate 111, is a perspective view of a cart of this sort to be drawn by two strong oxen, by a pole, yoke, and bows, made to carry 45 cwt. In the front of this figure is represented the method which his lordship has contrived for adjusting the position of the centre of gravity of the load, to prevent its preloading too much on the cattle in going down hill, the front of the cart being elevated by means of a toothed rack screwed to the front of the cart, and worked by a pinion, and the handle, a, immediately connected with the pole, e. By means of this pinion and rack, the front of the carriage is elevated more or less, in proportion to the declivity of the hill, by which means the weight of the load is made to bear more on the axis, and less on the necks of the oxen.—On the side view of this cart is represented the manner of applying the friction-drag, which is made to press more or less on the side of the wheel, according to the steepness of the descent: —bb is the friction-bar, or drag, the one end of which is connected with the tail of the cart by a small chain, and the other end to the front, by means of a toothed rack, bd, which catches on a staple in the front of the cart, by which the friction-bar is made to press on the side of the wheel, more or less, at the discretion of the driver: the notches or teeth in this rack, it is observed, should be as close to each other as circumstances will permit. And in this representation, the friction-bar is, he remarks, applied lower upon the wheel than was at first proposed, in order to divide the pressure and friction more equally on the opposite sides of the wheel, so that the pressure on each is diminished, the risk of over-heating and destroying the friction-bars is also rendered less, than if the whole pressure was applied in one point on the top of the wheel. The weight of the iron-work of this cart is 2 cwt, 20 lb. This is unquestionably a useful contrivance for hilly districts. At fig. 3, in the same Plate, is a side view of a cart of this kind of a smaller size, to carry 25 cwt. and to be drawn by one or two small oxen, with the friction-drag, bb, out of use; and representing another and more simple method of adjusting the centre of gravity of the load to the declivity of the descent: ab is part of the arch of a circle, whose radius is nearly equal to its distance from the axis of the cart, and having several holes in it, through which a strong iron pin is put, to keep
the body of the cart at any desired inclination with the pole:—\(1\), a small chain to prevent the body of the cart being thrown too far back, through the carelessness of the driver in adjusting it; \(1\), the upper flange of the cart, for carrying bulky loads.—The weight of iron in this cart is \(1\) cwt. 30 lb. This is a very useful, neat, light fort of cart for many purposes.

The advantages of the friction-drag, and other contrivances in this cart, according to the ingenious account of Mr. Cumming, contained in the same volume, are,

1. The method, which is equally simple and expedient, of adjusting the centre of gravity of the load, so as to have a proper bearing on the horses or cattle in going down hill, the advantage of which must be obvious to every man of science, more especially with bulky loads, in which the centre of gravity lies high.

2. The method of applying friction to the side of the wheel to regulate the motion of the carriage in going down hill (instead of locking the wheels), the advantages of which method appear to be as follow: namely, 1st. The pressure and degree of friction may with great expedition be adjusted to the steepness of the declivity, so that the carriage will neither press forward, nor require much exertion to make it follow the cattle. 2dly. The friction is so applied to the wheel, that a given pressure will have twice the effect in retarding the progress, that it would have if immediately applied to the body of the carriage, or to the axis: and by applying the friction on both sides of the wheel, the risk of heating and destroying the friction-bar is much less than if the same degree of friction was applied in one place. 3dly. This apparatus is so conveniently placed, that it can be instantly applied or adjusted, without stopping the carriage, or exposing the driver to the same danger as in locking a wheel. And, 4thly. This useful contrivance, in which he lays simplicity and ingenuity are so happily blended, will assume yet greater importance when applied to both the hind wheels of waggons, by which means the reliance may always be proportioned to the steepness of the declivity, the tearing up of the road prevented, the unnecessary exertion of the cattle in drawing the locked carriage down hill avoided, the danger to which the driver is sometimes exposed in locking the wagon wheel totally avoided, and the time now lost in locking and unlocking the wheel saved to the proprietor." These are certainly advantages of much importance in many districts where the roads are hilly.

At figs. 7 and 8 in the same Plate are views of carts to be drawn by a single horse, by shafts. By an attentive comparison of those drawn by shafts, with those that are drawn by the yoke and bows, the superiority of the pole to the shafts, and the advantage of making the cattle to draw by the yoke in preference to drawing by the forehead, become evident. When cattle draw by the shafts, says his lordship, the one before the other, it is impossible for the driver to know that each exerts an equal force, so as to contribute equally to the draught; but when they draw by the pole and yoke, the point of draught being in the middle of the yoke, when the beasts draw equally, the yoke will stand square with the pole, and the position of the yoke will always enable the driver to discover the defaulter, and to bring him to a proper exertion: it is, he says, this harmony of draught, and equality of exertion, that gives so great advantage to drawing by the yoke, that it is scarcely possible to say what weight of load two good large oxen can draw on a level road." The powers of cattle drawing by the forehead, on lord Shannon's elate, are recorded by Mr. Young and Mr. Billinglsey:—an ox of the late Mr. Tatterfall, near Ely, drew four tons of wood on a level surface without apparent difficulty. What then, says he, "might not be expected from the equal exertion of two such powerful animals, acting at the equal ends of the same yoke?" Notwithstanding these judicious observations, further trials are wanting with respect to the best modes of draught.

**Hay Cart**, a cart made use of for conveying hay from the field; it is constructed in the same way as that made use of for corn. See Corn Cart.

**Quarry Cart**, is a light, strong fort of cart, employed in quarries. Carts for this purpose are variously constructed, according to the nature of the materials to be conveyed by them. When flat stones of great length and breadth are to be carted, they should be low, for the convenience of loading and unloading; and at the same time very firmly put together.

It is stated in the Agricultural Survey of the County of Perth, that "Mr. Mylne, of Mylnfield, employs a cart of a particular construction in his quarry of Kingoodie, which merits the attention of those who have works of a similar nature. This cart has a bend in the axle, which brings it within fourteen inches of the ground, although moving on wheels more than five feet high. The cave with which it is drawn, loaded, and unloaded, is superior to the common cart, in the proportion of 7 to 3." It is seen at fig. 9, in Plate III. He also uses in this quarry "a cart for carrying very large stones, such as mill-stones, &c. which is drawn as easily upon wheels of two feet two inches in height as upon wheels of a greater diameter. In this cart the axle is only about five feet long, so that the wheels run under the body of the frame, which is flat, and may be made of any breadth or length required."

**Single horse Cart**, that light fort of cart in which only one horse is employed. The term is made use of to distinguish them from those of the large kind, in which three, four, or even a greater number of horses are made use of. Carts of this small construction are extremely useful for all the various little purposes of cartage about the farm, as has been fully shown above. See figs. 3, 7, and 8 in Plate III.

**Three wheeled Cart**, a kind of cart that is constructed with three wheels, one being commonly placed in the middle, before, and generally of a smaller size. Carts of this sort are mostly close, and used when great quantities of earth or other materials are to be conveyed at once to some distance.

**Carts, laws relating to.** By 13 Geo. III. c. 58, no cart, having the sole or bottom of the fellies of the wheels of the breadth of nine inches, shall be drawn with more than five horses; and no cart, having the said sole the breadth of fix inches, shall be drawn with more than four horses; and those of les breadth than fix inches shall not be drawn with more than three horses, under a penalty on the owner of 5l., and on the driver (not being the owner) of 10s. for every horse above the stipulated number: the information to be laid within three days and the action commenced within one calendar month after the offence committed. Exceptions are admitted in favour of carriages, moving upon wheels or rollers of the breadth of 16 inches on each side, with flat surfaces, and such as judiciously allow by licence to be drawn up steep hills, or on roads that are not turnpike, or in deep snow or ice, or carrying any one stone, block of marble, cable rope, piece of metal, or ammunition and artillery for his majesty's service. Two oxen or horned cattle are considered in the contemplation of this act, as one horse. Moreover it is enacted by 6 Geo. I. c. 6, that no person in London and Westminster, or within
10 miles, shall carry at one load in carts or waggons having their wheels fixed with iron, more than 15 sacks of meal or flour bulks each, nor more than 12 quarters of malt, nor more than 750 bricks, nor more than one hundred weights, on pain of forfeiting any one of the horses, with geers, bridles, &c. And by 18 Geo. II. c. 37, wheels of every cart, car, or dray, within the bills of mortality, shall be five inches broad in the felly, and not wrought about with iron, nor be drawn with more than three horses, after they are up the hills from the water-side, under a penalty of 40s.; but this act does not extend to any country cart or waggon, that shall bring any goods, or shall carry any goods half a mile beyond the paved streets of the said cities and places. Any person, within the said limits, using any cart, car, or dray, having the wheels full five inches broad, when worn, may have the fame bound round with tine of iron, provided it be five inches broad, and made flat; and not set on with rose-headed nails. No person shall drive any cart, within the said limits, unless the name of the owner, and number of such cart, &c. be placed in some conspicuous place of the cart, &c.; and his name be entered with the commissioners of hackney-coaches, under the penalty of 40s. and every person so convicted of having broken the same shall be liable to the penalty of 40s.

On changing property, the names of the new owners are to be affixed, and to be entered with the commissioners of hackney-coaches, 30 Geo. II. c. 22. And stat. 24 Geo. III. st. 2, c. 27, compels the entry of all carts driven within five miles of Temple-bar. By 13 Geo. III. c. 78. §. 11. a person, who leaves any cart or other carriage, &c. in any high-way, beyond the reasonable time allowed for loading or unloading, so as to obstruct the passage of any other carriage, &c. shall forfeit 40s. By 1 Geo. flat. 2, c. 57, by 24 Geo. II. c. 43, and, more generally, by 13 Geo. II. c. 78, it is enacted, that if the driver of any cart, car, dray, or waggon, shall ride upon any such carriage in any street or highway, not having some other person on foot or on horseback to guide the same (such carriages as are conducted by some person holding the reins of the horse or horses drawing the same excepted) — or if the driver of any carriage whatsoever, on any part of any street or highway, shall by negligence or wilful misbehaviour cause any hurt or damage to any person or carriage passing or being upon such street or highway — or shall quit the highway and go on the other side of the hedge or fence inclosing the same; or wilfully be at such distance from such carriage, whilst it shall be passing upon the highway, that he cannot have the direction and government of the horses or cattle drawing the same; or shall, by negligence or wilful misbehaviour, prevent, hinder, or interrupt the free passage of any other carriage, or of his majesty's subjects, on the said highways; or if the driver of any empty or unloaded waggon, cart, or other carriage shall refuse or neglect to turn aside and make way for any coach, chariot, chaise, loaded waggon, cart, or other loaded carriage; or if any person shall drive, or act as the driver, of any such coach, poll chaise, or other carriage let for hire, or waggon, wagon, or cart not having the owner's name (as by this act is directed) painted thereon, or shall refuse to discover the true christian and surname of the owner of such respective carriage; he shall on conviction by confession. view of the justice, or oath of one witness, before one justice, forfeit any sum not exceeding 10s., in case such driver be not the owner of such carriage; and if he be the owner, then any sum not exceeding 20s.; and in default of payment he committed to the house of correction for any time not exceeding one month, unless the same be sooner paid. And every such driver offending in either of the said cases, may by authority of this act, with or without any warrant, be apprehended by any person who shall see such offence committed, and shall be immediately conveyed or delivered to a constable or other peace officer, to be conveyed before a justice, to be dealt with according to law. And if any driver, in any of the cases aforesaid, shall refuse to discover his name, the justice may commit him to the house of correction for any time not exceeding three months, or may proceed against him for the penalty by a description of his person and the offence, and compelling in the proceedings that he refused to discover his name.

And for the better discovering of offenders, the owner of every waggon, wagon, or cart, and also of every coach, poll chaise, or other carriage, let to hire, shall cause to be painted, upon some conspicuous part of his waggon, wagon, or cart, and upon the panels of the doors of all such coaches, poll chaises, or other carriages, before the same shall be used in any public highway, his christian and surname and place of abode, in large legible letters; and continue the same thereupon so long as such carriage shall be used upon any highway; and the owner of every common flagge waggon or cart shall, over and above his christian and surname, cause to be painted on the part and in the manner aforesaid, the following words, common flagge waggon or cart, as the case may be. And every person using any such carriage as aforesaid upon any highway, without the said names and descriptions respectively, or causing to be painted thereon any fictitious name or place of abode, shall forfeit not exceeding 5l. nor less than 20s.

"Taxed carts," constructed, kept, and used under the regulations of the stat. 43 Geo. III. c. 99, are exempted from the annual duty of 5l. 5s. charged for carriages with less than four wheels and drawn by one horse. Such carriages are thus described: they shall be built wholly of wood or iron, without any covering other than a tilted covering, and without any lining or springs, made of iron, wood, leather, or other materials, and with a fixed seat, without flings or braces, and without any ornament whatever, other than paint of a dark colour, for the preservation of the wood or iron only, and which shall have the words "a taxed cart," and the owner's christian and surname and place of abode, marked or painted on a black ground in white letters, or on a white ground in black letters, on the outside of the back panel or back part of such carriage, in words at full length, and of a breadth in proportion, and the price of which (repairs excepted) shall not have exceeded, or the value thereof shall not at any time exceed the sum of 1s. 11d. For such a carriage kept by any person for his own use, and not for hire, the annual duty to be paid is 1l. 5s. The exemption from all duties specified in the forefaind act extends to any cart kept to be used wholly in husbandry, or in the carriage of goods in the course of trade, and whereas the name and residence of the owner, and the words "common flagge cart" shall be legally painted; although the owner, or his or her servant, shall occasionally ride therein or thereon when laden, or when returning from any place to which, or when going to any place from which any load shall have been or shall be to be carried in such carriage, or for conveying the owners thereof or their families to or from any place of divine worship on Sunday, or on Christmas-day, or on Good Friday, or on any day, appointed for a public fast or thanksgiving, or for carrying persons going to or returning from the election of members to serve in parliament.

Cart, in Artillery. See Carriage.

Cart-bate, in our Ancient Cuffions, denotes wood to be employed in making or repairing instruments of husbandry.
C A R

Cart-ladder, a kind of rail or rack, placed occasionally at the head, sides, and tail of a cart to make it hold a larger quantity of hay, straw, or other familiar bulky material. Rails of this sort are framed and made very strong.

Cart-lidges, a small anti-foune for sheltering carts from the weather. Farmers should be very careful to place their carts, &c. under proper shelter, when out of use, as they will last much longer by this means than if left exposed in the yard to the effects of the weather; for, as they are thus sometimes wet, and sometimes dry, they soon rot, and become unfit for use. The shut and nallines should also be constantly washed off before they are laid up in these places. These sheds should always be as close to the farm yards as possible, for the sake of convenience.

Cart-rake, a provincial term applied to the cart-track, or furrow made by the wheels of the cart.

Cart-wright, a name applied to a person whose business is to make carts, waggonis, &c. generally called a wheelwright.

Cart-water, in Geography, a river of Scotland, which runs into the Clyde, 3 miles N. of Paisley.

CARTA, Ital. literally means paper; but it is used in Muse for a folio, a leaf, or page of musical characters.

CARTA, in Ancient Geography, a town of Asia, in Hircania, according to Strabo.

CARTAGO. See CARthage.

CARTAGO Nova. See CARTHAGena.

CARTAGO, in Geography. See CARTHAGO.

CARTAL, a town of European Turkey, in Becharabia, situate on the Danube; 28 miles W. of Ipsmal.

CARTAMA, a town of Spain, in the province of Granada, seated on an eminence; 4 leagues N.W. of Malaga.—Also, a town of Spain, in the province of Grenada, 6 leagues S.W. of Alhama.

CARTE, THOMAS, in Biography, a learned and laborious English historian, was the son of the Rev. Samuel Carte, vicar of Clifton upon Dunsmoor, in Warwickshire, and born there, or at least baptized there by immersion, on the 23d of April, 1686. In 1698, soon after he had entered the 11th year of his age, he was matriculated in the university of Oxford, and he was afterwards incorporated at Cambridge, where he took his degree of master of arts in 1705. Having entered into holy orders, he became reader of the abbey-church at Bath; and in consequence of a sermon preached on the 30th of January 1713-14, and vindicating the character of king Charles I. from the slanders cast on his memory with regard to the Irish rebellion, he was engaged in a controversy with Mr. Chater, a dissenting minister at Bath and father of the celebrated Dr. Samuel Chandler. This controversy occasioned his first publication, entitled “The Irish Malaface, set in a clear Light, &c.,” which was afterwards inserted in “Somers’s Tracts.” On the accession of George I. he fruited taking the oaths to the new government, and assumed a lay habit. In 1715 he was suspected of being concerned in the rebellion, and in order to elude orders that were issued for apprehending him, he was for some time concealed in the house of a clergyman at Colehill. Whilst he afterwards acted as secretary to bishop Atterbury, he incurred suspicion of being a party in the conspiracy attributed to that prelate, and being charged with high-treason in 1722, a reward of 1000l. was offered for seizing his person. He fortunately escaped to France, and resided in that country several years under the name of Philips. At this time he had access to many persons of learning and rank, and to several libraries, and thus had an opportunity of collecting materials for an intended English edition of the history of Thuanus. His collections were purchased by Dr. Mead, and employed in Buckley’s splendid edition of that work, which appeared in 1733. By the interest of queen Caroline he obtained permission to return to his own country, and soon after engaged in his important work, “The History of the life of James duke of Ormonde” comprized in 3 vols. fol. and published in 1735-36. This work contained useful materials with respect to the history of those times, and particularly relating to the affairs of Ireland, of which Dr. Leland and other writers have avoided themselves; but as it displayed the author’s attachment to arbitrary principles of government, it raised his reputation with the Tory party. As he and those with whom he was more immediately connected disapproved the principles of Rapin’s History of England, and thought it chargeable with many errors, he announced his intention of writing a new history; and having, in 1738, printed an account of the materials as well as the encouragement that were necessary for the completion of his plan, he obtained subscriptions, or reason to expect them, to the amount of 600l. per annum. Accordingly he commenced his researches in the libraries of Cambridge, retired for some time in the house of Sir John Hinde Cotton, and employed himself in arranging his large collection of pamphlets and journals. In 1744, when the Habesc Corpus act was suspended on account of apprehensions from the Pretender, Carte was again inspected, and being taken into custody underwent an examination; but as no evidence appeared against him, he was soon discharged. Deriving from this circumstance additional encouragement to prosecute his history, and a handsome subscription from the city of London, voted by the common council, as well as from some of the London companies, he was enabled to complete the first volume in folio, terminating with the death of king John, towards the close of the year 1747; but the introduction of an absurd story concerning a man who went from Somers-shire in 1716 to Avignon to be touched by the Pretender for the king’s evil, and who was said to have been cured, excited his credulity and want of judgment to such a degree, that his history sunk into disrepute, and the author was dis-appointed with regard to several subscriptions which he had reason to expect. However, he persevered, and published two additional volumes in 1750 and 1752; and the fourth, which was posthumous, appeared in 1755, and he continued the history to 1754. In this history, which in point of style is indifferently written, much useful information, procured by indefatigable researches, is blended with inveterate prejudice. Mr. Carte was the author of various other works, which are chiefly compilations, collections, and translations. The most considerable is “A catalogue of Gaeceon, Norman, and French Rolls preferred in the Tower of London,” printed in French at Paris, in two vols. fol. 1743. He died at Cadocott house, near Abingdon in Berkshire, on the 2d of April, 1754. His papers are de-potized in the Bodleian library; and they have been perused by the earl of Hardwicke, and also by Mr. Macpherson, who availed himself of them in the compilation of his History and State papers. Mr. Carte was a man of strong constitution, indefatigable in his application to study, negligent with regard to his outward appearance, but when the labours of the day were closed, fond of society, and in conversation cheerful and entertaining. He left a widow, but no children. Nichols’s Anecdotes of Bowyer. Biog. Brit.

CARTE, in Fencing, denotes a thrust with a sword at the inside of the upper part of the body, with the nails of the sword
foward hand upwards. _Low carte_ is a thrill at the infide of
the lower half of the body; the position of the hand being
the fame as in the former.

_Carte Blanche_, a French term, seldom used but in this
phrase, 'To give, or fend any one the _carte blanche_; i.e. to
fend him a blank paper, signed, for him to fill up with what
conditions he pleafes. Much like this is the French _blanc
feve_, a paper without writing, except a signature at the
bottom, given by contending parties to arbitrators, or com-
mon friends, to fill up with the conditions they judge rea-
fonable, in order to end the quarrel.

_Carte Blanche_, in Military Language, is an absolute
power or authority given by a sovereign to a general of
his army to do whatever may appear to him most proper or ad-
visable without waiting for order from his court; or it is
permiiffion granted to a general to act in conformity to his
own will, his knowledge, intelligence, and information, and
according to circumstances, without specific orders from his
chief. A general in confequence of fuch a power conferred
on, and confidence reposed in him, may attack his enemy
in point both of time and manner as he thinks fit, without
having either received a particular fresh order, or waiting for
any.

In ancient times the general of an army had commonly
the power of executing, with the troops under his command,
his own plans and designs. The Grecian, Roman, and
Carthaginian generals had almost always a carte blanche.
But they were answerable to their respective governments
for their want of fuccefs, and they rarely escaped punifh-
ment as criminals when they were unsuccessfiil. And even
the excufing of them from banifhment was a favour, or in-
dulgence, which was regarded as a mark of disgrace or dif-
honour. In modern times the republics of Venice and Ge-
neva have particularly afforded examples of this severity even
towards generals who had gained many victories, and had
rendered essential service to their fates; from which it may
fairly be inferred, that the general who accepts a perfect
carte blanche, is at leaft imprudent, if he is not ambitious.

The Ottoman history also furnishes feveral instances of
generals engaged on their return from campaigns for having
been unsuccessfiil, or defeated.

Scignor de Gordes, governor of Picardy, having engaged
at Guinegale, without the orders of the court, the archduke
Maximilian of Austria, Louis XI. was fo vexed on being
informed, that though his troops had at first the advantage
in the action, they at laft lost it by betaking themselves to
pillage, that he determined his generals should afterwards
undertake nothing of confequence without express orders.
Since the time of that prince, the kings of France, who
have indeed been generally themselves at the head of their armies,
have not granted a carte blanche but very rarely, and only
to generals whose valour and abilities have been frequently
tried and acknowledged.

As mofl of our expeditions are carried on at a great
distance from this country, it is perhaps more neceflary for
fuch generals who command them to have a discretionary
power of acting, than it is for fuch of any other nation.
But none should be invested with fuch authority, or entrusted
with the command and management of fuch distant expedi-
tions but men of approved knowledge, discretion, and capacity.
Had a general of talents been employed with a
fort of carte blanche at the beginning of the American
war, commonly called the American rebellion, he would
probably have fettled it completely in the coufe of a few
months.

The king being generalissimo of all his forces may grant a
carte blanche to fuch of his generals as he either knows, or
supposes to possess great prudence and superior talents. In
like manner the general of an army may give a carte blanche
to a general officer commanding a division of the fame.
When a general possesses all the talents and qualifications
necessary for his situation or employment, his sovereign
ought to confert on him this power or authority in order to
prevent the want of it from retarding, embarrafing, or
crippling his operations. It is neceflary indeed that every
general should have a discretionary power of acting to a cer-
tain degree. One of the great advantages, which a king
capable of commanding his own armies enjoys, is that of
doing what he chooses, and when he chooses, without
losing occasions and opportunities of acting by waiting for
orders. It is for the fame reason useful and advantageous
for a sovereign to be present with his army, if he have even
not the talents necessary for commanding it. For their or-
ders are obtained promptly and expeditiously. Intrigue and
jealousy have not time to operate and produce their baneful
effects; and the general has it more in his power to guard
himself against them.

In engagements, the commander of an army ought to give
only cefide and general orders, leaving a fort of carte blanche,
or discretionary power of acting, with all his general
ennessee, or to matters of detail. For in every action there is an-
almost an infinite number of circumstances, which neither
the commander himself nor the generals under him can foresee,
that require sudden changes of diaption and prompt movement,
which every general should have in his power to direct,
and caufe to be made without waiting for orders.

_Carte geographique_ of Argenville, in Genealogy, the map
conwy, _Cypraea mappa_.

_Carte geographique, Fauve_, in Entomology, the trivial
French name of the European kind of butterfly, called by
Linn. and Fabr. _papilio profa_.

_CARTEIA_, in Ancient Geography, Roccellio, a town in
the southern part of Bactica. Some difference of opinion
has hiftified about its precise situation; but the researches of
ingenious geographers lead us to conclude, that it was
feated at the bottom of the bay of Gibraltar, and that it
was called "Tartessos" by the Greeks, though the Latins
transferred this name to Gades. Some authors have con-
ftimated it with "Calpe," which was at the extremity of
the mountain. Strabo fays that it had been founded by
Hercules, and that it had formerly been called "Heraclea."
This city fuffered much when Cefar pursed the army of
the fon of Pompey, defeated at Munda. Carteia, is it faid,
confubtilt till the arrival of the Moors; and the town, now
called Cadiffion, is faid to be the remains of Carteia.

_CARTEIA_, a town of Spain, in Celtiberia, called by
Polybius Althra.

_CARTEL_, in Military Language, is a particular agree-
ment, or convention between two belligerent powers, and has
commonly only for its objects the exchange or ramon of
prisoners, and the mutual delivering up of each others' defeters at cer-
tain times, and under certain conditions.

There are also cartels agreed on or settled between princes
in time of war, for carrying on commerce without interrup-
tion, notwithstanding bollificities.

_Cartel_ originally signified a placard, or manifello in writ-
ing, posted in public places, for the purpose of notifying,
or announcing its contents.

It comes from the Italian word _cartella_, or the Latin
word _cartellis_, both of which have the fame signification,
being diminutives of _carta_, signifying paper.

The term _cartel_ has also been made use of to denote
the agreement or convention which contained the rules or regu-
lations, that were to be observed by the knights, or che-
valiers.
valiers who jousted and combated at a tournament, or{car}
cavalry.

This name is likewise given to the billet, or note of chal-

lenge which the person offended or infuriated sends to the

aggrieved, requiring him to meet him at the place and time

appointed to give him satisfaction, and settle their quarrel by

single combat.

This term has also been often employed to signify a letter

of defiance, or challenge to single combat. Such letters

were in frequent use, when under the feudal system combats

of this nature were not only practised, but were functioned

and enjoined by princes, and even by bishops and the dignified

clergy as the best method of settling difficult points of law

and controversy that could not easily be otherwise deter-

mined. Such challenges, or letters of defiance, were not al-

ways confined to single combats. They sometimes extended

to small bodies of men of an equal number on either side, and

sometimes even to armies. Rymer gives the cartel which

Edward III. sent to Philip de Valois challenging him to

fight him within ten days before the gates of Tournay, ei-

ther body to body, or one hundred men to a hundred men,

or army to army.

Challenges of this nature, however, took place long be-

fore the existence of the feudal system, and as far back in-

deed as either history or poetry carries us. For instances of

them to be found in Homer, Virgil, and other Greek

and Latin poets, as well as in their historians.

Cartel is also a term used to denote a ship commissioned

in time of war for exchanging the prisoners of any two belli-

gerent powers, or for carrying a requisition or proposal from

to one to the other. The officer who commands her is per-

mitted to carry a single gun only for the purpose of firing

signals.

Cartel likewise denotes a measure of capacity for corn in

diverse parts of France, varying in different places.

CARTENAGA, in Ancient Geography, a town of In-
daia, placed by Ptolemy on this side of the Ganges.

CARTENNA, or CARTENNE, a very considerable city of

Africa, in Mauritania Caesariensis, or the western prov-

cince of the kingdom of Algiers, called Temfian, or Tre-

meccen, situated near the mouth of the river Cartenna,

to the north-east, and S.S.W. of that of the river Chinalaph,

or Shelliff. Piny and Ptolemy mention it. It was a Ro-

man colony, and Augustus settled in this place the fol-

diers of the second legion. Its situation corresponds to that

of Multy-gannim, or Mofigan, and also of Mafagran. The

strength and beauty, says Dr. Shaw, (Travels, p. 16.) of

the walls of Multy-gannim to the N.W. may well allow us

to suppose them to have been formerly a portion of some

Roman fabric. For both Multy-gannim and Mafagran

are so copiously supplied with water; they are so commodi-

ously situated with regard to the fertile and extensive lawns

that are spread far and near behind them; they enjoy, be-

sides, such a delightful prospect of the sea, and of the rich

maritime country that lies in view, to a great distance, on

each side, that, without doubt, they were stations too va-

lable to have been neglected by the Romans. Piny and

Ptolemy place their Cartenna in this direction; and in the

Itinerary we have the same dilation betwixt Arfena and

Cartenna that is found betwixt Arzew and these places.

One or other of them, or both, might have formerly made

up this colony; for, considering that their situations are

nearly contiguous, and that the intervening plantations be-

long indifferently, as perhaps they always did, to both of

them, there is some probability at least that they had like-

wise the same intereil, and were accordingly one and the

fair community, under the name Cartenna, as it is written

in the plural by Ptolemy. See MOSTAGAN.

CARTENNUS, a river of Africa, which discharges it-

self into a gulf of the Mediterranean Sea, N.E. of the port

of Arimania. It is now, as Dr. Shaw conjectures, the Halah,

which fer.

CARTER, in Geography, a new county in the flate of

Tennessee, in North America, formed of a part of the county

of Washington.

CARTERET, John, earl Granville, in Biography, an

eminent statesman, was born in 1659, and educated at

Wellsminster school and Christchurch college, Oxford, from

which he was distinguished for the degree of classical

learning, and also for high principles of government, and

a fondness for constitutional pleasures, which marked the

prospects of his life. Upon being introduced into the House of

Parliament, in 1711, he distinguished himself as a zealous

advocate for the Hanover succession, and was successively

advanced by king George I. to several polls of honour. As a

foreseeable and eloquent speaker, he strenuously supported the

measures of administration during that reign. In 1719 he was

deputed as ambassador extraordinary and plenipotentiary to

the queen of Sweden; and negotiated the peace between that

crown and Denmark, which terminated the troubles of the

north of Europe; and in 1721 he was appointed secretary of

state, which gave him an opportunity of vigorously defending

the bold, yet mealy measures of the existing administration.

Having accompanied the king to Hanover in 1723, he was,

on his return, in the following year, appointed lord lieutenant

of Ireland, and exerted himself in compounding the difficul-

ties in that country, which had been fomented by Swift's

famous Drapier's letters. When Swift expostulated with him

for his prosecution of the printer of those letters, he replied

in a line of Virgil, no lea appropriate as an apology for

many measures of that reign, "Regni novitas me tali cogit

moli's, i.e. the unconcerned state of the throne compels

me to make use of these means. After his return to Eng-

land, in 1726, he continued his firm support to the govern-

ment. After the accession of George II., in 1727, he again

occupied the vice-royalty of Ireland, and conducted the

affairs of government till the year 1730, in a manner that

conciliated contending parties. On this occasion, Swift

wrote an inflammatory vindication of his lordship from the

charge of favouring none but Tories, high church-men,

and Jacobites. After his return to England, he joined the

opposition to Sir Robert Walpole, and in the parliament

contested with his ministry, adopted maxims and language

very different from those which he had avowed and used,

whilst he himself was a member of administration. Having

at length succeeded, in connection with his coadjutors, in

procuring the dismissal of Walpole in 1742, he became se-

cretary of state, and supported measures similar to those

which he had been lately censuring. In 1744, upon the death

of his mother, he succeeded to the titles of viscount Carter-

cart and earl Granville. After a course of various political

changes, he closed his life the 2d of January, 1763, in the

73d year of his age. Although he possessed disinterested

talents and acquirements, his temper was so ardent and

overbearing, that he was fitter for being the minister of an

absolute monarch than of a limited sovereign. Ambitions.

and fond of sway, he was neither mercenary nor vindictive;

and the elevation and dignity of his genius were exalted by

his confidence and presumption; so that he is said never to

have doubted. Learned himself and an encourager of liter-

ature, he particularly patronized Dr. Taylor, the celebra-

ted Grecian, and Dr. Bentley. In social life he was plea-

6
CAR

CARTETT, in Geography, an island in the Southern Pacific Ocean, discovered by captain Carteret in Augušt 1567, 8. lat. 30° 3′. E. long. 145° 14′. CARTETT, a maritime county of New-Haven district, in the flate of New-Carolina, in North America, on Cape and Pandoufoue sounds. It contains 17,712 inhabitants, including 7,113 slaves. Its chief town is New-York.

Carterette Harbour, a bay on the south-east coast of New-Holland. 3. lat. 40° 49′ 5″. E. long. 150° 45′ 36″. This harbour forms a sort of basin, where the clouds, loaded with water, after passing over the high mountains of New-Holland, experience a chill, which prevents the air from supporting them. To this circumstance are owing those excessive rains, which render the anchoring-place far from desirable to navigators. Nevertheless, this harbour furnishes plenty of good water, which may be procured with great facility: but the wood obtained in this place introduces into the ships a prodigious number of leprosions and scolopendres, of the species called "scolopendra mortifera," which are very troublesome. This harbour affords no refreshments. The tides take place once a day, and rise only about 6 feet. The thermometer, observed at noon in the middle of July, varied from 10° to 21°; and the barometer from 28 inches 147 4th line to 28 inches 147 5th line. Voyage in search of La Peroufe, vol. i.

Carterette Point, the N.W. extremity of the island of Egmont, in New-Guernsey. 8. lat. 10° 42′. E. long. 163° 70′.

CARTERIA, in Ancient Geography, an island of Alia Minor, near Smyrna, according to Pliny.

CARTEROMACO, or CARTEMACUS, Scipio, in Biography, a learned Italian, whose proper name was Fortignera, was born at Pifio in 1467; and having studied in his native city at a college founded by his family, at Rome, and at Florence, where he learned Greek under Angelo Poliziano, and having passed some years at Padua, he was appointed by the republic of Venice, in 1500, with a liberal salary, to teach the Greek language to the Venetian youth. Upon an invitation to Rome by pope Julius II, he was placed by this pontiff with his nephew, cardinal Galetti de la Rovere; and upon the death of this cardinal, he attached himself to cardinal Francis Aldoino, who was killed at Ravenna in 1511. His next patron was cardinal John de Medici, afterwards pope Leo X.; but his rising expectations were suddenly frustrated by death, at the age of 46, in 1513. Scipio was equally distinguished for morality and learning; and both these qualities are ascribed to him in a very eminent degree by Erasmus (Epift. 471.), who consulted him and Marcus Mufurus upon such difficulties as occurred to him in the explication of Greek proverbs. His principal works are, "A Latin Oration in praise of Greek learning," Venice, 1504; "A Latin Translacion of the Greek Oration of Arifordes in praise of the City of Rome," Venice, 1518; "An Edition of Polyan's Geography," Rome, 1507; and various prefaces, epigrams, and letters in Greek and Latin, inserted in other publications. Gen. Diet. Tiraboschi.

CARTERON, or CARTERUM, in Ancient Geography, a town of Afgian Sarmatia, situated on the coast of the Euxine sea, according to Ptolemy.

CARTES, RENT-DER, in Biography, an eminent philosopher, and founder of a numerous sect, called Cartesians, was a native of France, the descendant of an ancient and noble family, and born at La Haye in Touraine, on the 31st of March 1556. As he discovered in his infancy an eager curiosity to inquire into the nature and causes of things, his father called him "the Philosopher," and placed him, at the early age of 8 years, under the tuition of a relation in the Jesuits' college at La Fleche, where he made an uncommon proficiency in the learned languages and polite literature, and formed an intimate acquaintance with several persons, who afterwards became eminent in the republic of letters, particularly with Merfenne. After spending 5 years in the diligent study of languages, and in reading the principal parts, orations, and orations, he directed his attention to mathematics, physics, and morals; but disapproving the mode in which those sciences, and more especially the two latter, had been hastily taught, he formed a plan of study for himself, and sketched out a concise syllem of rules or canons of reasoning, in which he followed the strict method of the geometricians. Dissatisfied, however, with the course of study which he was pursuing, he left the college at the close of 8 years, and returned to his parent, lamenting that he had derived no other benefit from his past application than a fuller conviction that he had hitherto known nothing with perfect clearness and certainty. He therefore determined to throw aside his books, and to seek knowledge in the study of himself and of the great volume of nature. Having spent some time in the city of Rome, where he employed himself in learning to ride and fence, and other exercises preparatory to a military life, he proposed to devote himself to the profession of a soldier; but his constitution being feeble and unfit for the fatigues of this kind of life, his father sent him to Paris in 1613, and confiding in his discretion, left him to his own uncontrolled direction. Here the love of pleasure and a propensity to gaming would probably have wholly diverted his attention from the pursuits of literature, if he had not fortunately renewed his acquaintance with Merfenne, and other learned persons, who reclaimed him from the frivolity and folly to which his time was devoted, and engaged him to renew his application to the study of mathematics, which he professed in retirement for the space of about 2 years. But still unsteady in his purpose, and dissatisfied with the result of his speculations, he again laid aside his books, and determined to embark in the military profession, under a notion that he should thus enjoy favourable opportunities for gaining a knowledge of the world. Accordingly he departed for Holland in 1616, and entered himself as a volunteer in the Dutch army. Whilist he regularly performed his military duty, he spent his intervals of leisure in study; and during the encampment of the army at Breda, he solved a problem in mathematics to the satisfaction of Beeckman, an eminent mathematician, principal of the college of Dort, and he also wrote a treatise on music, which was printed at Utrecht in 1650, 4to., and at Amsterdam in 1656, 4to., under the title of "Compendium Musices," of which an English translation was published at London in 1653. During his stay at Breda; he also laid the foundation of several of his works, and is said to have composed a philosophical dissertation, in which he attempted to prove that brutes are automata, or mere machines. See BRUTUS. In 1619 he quitted the Dutch service, and entered as a volunteer in the army of the duke of Bavaria. Whilist he remained in winter-quarters, he had many intervals of solitary leisure, which he employed in a course of meditation upon important subjects; and as he was still perplexed with doubts and difficulties, he had recourse for satisfaction to the Roscruccans, who boasted of divine inspiration; but failing to find any one who could unfold to him the mysteries of this sect, he returned from his short excursion into the regions of enthusiasm to the humble path of rational inquiry, and preferring the society of learned men to that of his military brethren, he appeared more like a philosopher than a soldier. Having been present at several sieges, and having, in 1621, made the campaign in Hungary, under the count de Bucquoy, who was killed that year, he abandoned
abandoned the military profession; and after a tour through the northern parts of Germany, he returned, in 1622, to his own country, with no other profit from his travels, as he himself confesses, than that they had freed him from many prejudices, and rendered his mind more fit for the reception of truth. Some time after he fixed his residence at Paris, where he cleared himself from the imputation of being a Rofeniusian, and applied to the study of mathematics, with a view of discovering general principles of relation, measure, and proportion, applicable to all subjects, by means of which truth might be investigated with certainty, and the boundaries of knowledge enlarged. But not succeeding to his wishes, he turned his attention to ethical inquiries, and attempted to raise a superstructure of morals on the foundation of natural science; being of opinion, that the best means of discovering the true principles and rules of action, is the contemplation of our own nature, and the nature of the world around us. This investigation in course of time produced his treatise "On the Passions," or "Traité des Passions de l'Amé," written in 1646 for the use of the princess Elizabeth of Bohemia, and printed several times in the 17th century. It was published at Amsterdam in 1655 and 1656 in 4to. From the physical nature of the passions he deduces his principles of morals; and his doctrine on this subject is as follows: "Whatever happens, is called passion, with respect to the subject to which it happens; and action, with respect to that to which it causes it to happen. Nothing acts upon the mind more immediately, than the body to which it is joined; whence what is passion in the mind, is action in the body. Heat, and the motion of the limbs, proceed from the body, and thoughts from the mind; but the mind cannot give motion and heat to the body. The more vivid and subtle parts of the blood, which heat rarifies in the heart, are incessantly entering into the cavities of the brain, and form animal spirits, which are in the brain separated from other less subtle parts of the blood. These animal spirits, which are corporeal, excited as by the soul itself, so also by the action of external objects upon the senses, are the immediate cause of all the original motions of the body. Whence all the limbs may be moved by means of the objects of sense, and the animal spirits, without any action of the soul. Nothing is to be attributed to the soul but thoughts: and these are of two kinds: active, or volition, including desire and aversion; and passive, including intelligence, perception, and feeling, or passion."

"The soul is united to all the parts of the body, but its chief functions are exercised in the pineal gland of the brain, where it receives notice of the impressions made upon the senses, and whence it sends forth animal spirits through the nerves, which put the muscles into motion. The passions are feelings of the soul, produced and continued by the action of the animal spirits; the chief effect of the passions is, to excite the soul to volition. All volition is in its nature free, and consists in causing the gland, with which it is intimately connected, to move in that manner which is most suitable to produce an effect corresponding to the volition. Judgment comprehends not only the perception of the understandings, but the effect of the will, and it is from the abuse of its natural liberty of ascertaining or not ascertaining to a proposition that error springs. The soul, in the act of recollection, exercises a volition by means of which the pineal gland inclines itself successively this way and that way, and impels the animal spirits to different parts of the brain, till that part is found upon which the object which we wish to recollect has left traces.

"The soul of man, which is one, is both sensitive and rational; and the conflict between its inferior and superior parts is nothing else but a struggle between the motions which the body, by means of its animal spirits, and the soul, by its own volition, are at the same time endeavouring to excite in the pineal gland. By the result of this conflict, every one may judge of the strength or weakness of his soul. The soul acquires the dominion over the body by means of firm and clear decisions concerning good and evil, produced by the contemplation of truth, which it determines to follow without suffering itself to be seduced by present passion. The passions belong to the body, and are to be imputed to the soul only as it is united to the body. Their use is, to excite the mind to exert those volitions which are necessary to the preservation or perfection of the body, and the attainment of that which is in its nature good. All the passions are useful, and only become injurious by excess. The general remedy against the excess of the passions is, to consider all the appearances which they present to the imagination as deceitful, and to polipone volition and action till the composition which they have excited in the blood is appeased, or where immediate action is necessary, to follow reason in opposition to passion. Since nothing beyond our own thoughts is absolutely in our own power, it is wiser to endeavour to subdue ourselves than fortune, and to change our own defects than the order of the world."

But to return from this digression, Des Cartes having been employed for some time in the studies above recited, he left Paris, and took a journey to Italy, where he spent about 2 years, conversing with eminent mathematicians and philosophers, and informing himself concerning various objects in natural history. After his return to Paris, he found his studies so much interrupted, and his mind remained in so sceptical a state, that he was unable to pursue any regular plan of life; and, therefore, in 1629, he determined to withdraw to some more retired situation, where, without the interruption of visitors, he might have leisure to complete his grand design of forming a new system of philosophy. In order to prevent any interference on the part of his friends from diverting him from the execution of his purpose, he left Paris without communicating his intention to any; and none, except his friend Merlenne, knew for some time the place of his retirement. Having transiently visited several towns of Holland, he at last fixed upon Egmond, a pleasant village near Franeker in Friesland, as the place of his fixed residence. Here he prosecuted his philosophical labours, and enjoyed the satisfaction of observing how much he engaged the attention of the learned world. In this state of retirement, he employed himself in investigating a proof from reason, independent of revelation, of the fundamental points of religion, viz. the existence of God, and the immortality of the soul, and also in other important metaphysical speculations. The result of these speculations afterwards appeared in his treatise entitled "Meditations de primi Philosophia, &c." and printed at Paris in 1641, 8vo.; a second edition was printed at Amsterdam, in 1642, 12mo. Another edition was published at Amsterdam, in 1719, 8vo. A French translation was printed at Paris, in 1647, 4to.; a second edition appeared at Paris in 1661, 4to.; but the best is the third edition, divided into articles, with summaries, by R. F. i.e. René Felé, doctor of physic of the faculty of Angers, and printed at Paris in 1675, 4to. Whilst Des Cartes remained in Friesland, he pursued the physical inquiries which he had begun in France; and these researches gave occasion to his "Découvre de Meteoros," which he published some years after. After his removal to Amsterdam, he directed his industrious attention to medicine, anatomy, and chemistry; and
and he spent a whole winter in dissecting animal bodies, and in chemical operations. About the year 1630 or 1631, he made a short visit to England; and in the neighbourhood of London he employed himself in observations on the variation of the compass. In the spring of the year 1633 he removed to Deventer, where he completed several works which were left unfinished, and resumed his studies in philosophy, in the summer following he finished his "Treatise of the World," which contained an abridgment of his natural philosophy: but when he heard in what manner Galileo had been treated by the court of inquisition, he was deterred from publishing it, and concealed his opinion concerning the true system of the world. An abridgment of this treatise was published at Paris in 1644, 4to., under the title of "Le Monde des Cartes, &c." and a correct edition of it in 1647, 4to., at the end of Des Cartes's "Traite de l'Homme." It is printed in Latin in his "Opera Posthuma." The treatises of Des Cartes made their full appearance in the schools at Deventer in 1633, where they were introduced by the professor of philosophy, Henry Rorer, a learned man, and an intimate friend of Gassendi. In the following year he returned to Amsterdam, and soon after took a journey into Denmark, and the lower parts of Germany. In 1635 he went to Leewarden in Friesland, where he remained till the year 1637, and wrote his "Treatise of Mechanics," published in Latin in his "Opera Posthuma." In the same year he published his four treatises concerning "Method," "Dioptrics," "Meteors," and "Geometry." These were printed in French at Leyden in 4to. and published at first without his name. The three first were translated some years later into Latin by Burcellius, which translation was revised by Des Cartes; and they were published under this title, "Renati Des Cartes Specimina Philosophica, &c." Amst. 1644, 4to. and 1656, 4to. Van Schooten, professor of mathematics at Leyden, afterwards translated his "Geometry" into Latin, adding his own commentaries and the notes of Mon. de Beaune. This translation, entitled "Renati Des Cartes Geometria, &c." was published at Leyden in 1649, 4to. and with the "Compendium Musicae" at Frankfurt on the Main in 1655, 4to.

In his treatise of "Method," Des Cartes lays down the following rules for the discovery of truth, which are derived from the practice of geometericians. Nothing is ever to be admitted as true, which is not certain, or evident known to be so; that is, in judging of truth all prejudice and preconception are carefully to be avoided, and nothing more is to be admitted in the conclusion, than what appears to the understander to distinctly and clearly, that it cannot possibly be doubted. Difficulties must be accurately examined, and divided into so many parts, as may be most convenient for their easy solution. In proving any truth, the ideas are always to be brought forward in a certain order, beginning from the most simple and most easily known, and advancing, by regular steps, those which are more complex and difficult. All the parts of a demonstration should be distinctly numbered, that the relation of each to the whole may be clearly seen, and that it may be certainly known that nothing is omitted.

When the specimina of his philosophy in the above-mentioned four treatises appeared, the number of his followers and admirers increased; and his new doctrine had also many opponents. At Utrecht, Leyden, and Amsterdam, and in other Dutch schools, the Cartesian doctrines were zealously espoused by many learned men; while several theologians, alarmed at the idea of innovation, strenuously opposed them, and even attempted to subject their author to the confines of the civil magistrate. In Great Britain, the Cartesian doctrine gained such a degree of credit, that for Charles Cavendish, brother to the earl of Newcastle, invited Des Cartes to settle in England; nor did he appear disinclined to accept the invitation, when he was assured that the king was a Cartesian in his heart. Charles I. indeed gave him reason to expect a liberal appointment; but the civil war frustrated the design, and Des Cartes remained in Holland. In his native country his doctrine was at first well received; but a strong party among the Jesuits combined against it; and a violent contest was long kept up between the Jesuits and the Cartesians. In the course of these disputes, Des Cartes himself appeared earnestly desirous of becoming the father of a sect, and discovered more jealousy and ambition than became a philosopher.

In 1641, Des Cartes was invited to France by Louis XIII. upon very honourable conditions; but no proposal could induce him to quit his retirement. It appears, however, that, during his residence in Holland, he made three visits to his native country, viz. in 1645, 1647, and 1648, and that he was amply paid with the promise of an annual pension of 3000 livres, which he never received. Having, in 1641, published his "Meditations," which occasioned a controversy with Voss, rector of the university of Utrecht, he afterwards visited France, where he found the edition of his "Principes," and the Latin translation of his essays finished, and the copies sent from Holland. His "Principes" were dedicated to his illustrious disciple, Elizabeth, princess Palatine daughter of prince Frederic V., elector palatine, and king of Bohemia. The edition of his "Principes" was printed at Amsterdam, by Elsevir, in 1644, 4to. under the title of "Principia Philosophiae," and a French translation, by the abbé Picot, revised by himself, was published at Paris in 1647, 1650, 1658, 4to. An English translation, with remarks, was printed at London in 1653, 4to. This work is divided into four parts; the first contains the principles of human knowledge; the second treats of the laws of nature, the principles of natural things, the properties of bodies, space, motion, &c.; the third contains a particular explication of the system of the world, and more especially of the heavens and celestial bodies; and the fourth treats of the earth. In 1645, Des Cartes applied again to anatomy, though he was somewhat diverted from this study by the problem concerning the quadrature of the circle, which was then agitated, and which he declared impossible to be solved. During the winter of this year he composed a small tract against Gassendi's "Institutes," and another "On the Nature of the Passions." About the same time he had a dispute with Roberval concerning vibrations, and he carried on a correspondence with the princess Elizabeth upon moral philosophy. In the year 1647, he was appealed to as an umpire in a dispute between Christina, queen of Sweden, and M. Chanut, the French resident in that kingdom. The question in debate was this: "When a man carries love or hatred to excess, which of these two irregularities is the worst?" On this occasion he drew up the "Dissertation upon Love," that is printed in the first volume of his letters, which proved highly satisfactory to the queen; though she objected to one passage, which seemed to intimate that the world was not finite. This learned prince, having, by M. Chanut, desired his opinion of the sovereign good, was so much pleased with his answer and with his treatise on the passions, which he sent her, that she expressed a wish to be instructed by him in the principles of his philosophy, and invited him to Sweden. Des Cartes, notwithstanding the apprehended injury that might attend the severity of the climate, accepted the invitation, and arrived at Stockholm in October, 1648. The queen received him with respect, engaged him

Vol. VI.

Queen Chriflina early solicited this eminent philosopher to remain in her kingdom, and to affift her in establishing an academy of sciences; and with this view propofed to allow him a revenue of 3500 crowns a year, with an estate which should defend to his heirs and afligns for ever. But Des Cartes had not been more than four months in Sweden, when a cold, which he caught in his early visits to the queen, brought on an inflammation of the lungs, which foon terminated his life, on the 11th of February, 1650, in the 54th year of his age. The queen is faid to have lamented his death with tears. His remains were interred, at the requeft of the French embaffador, in the cemetery for foreigners, and a long historical enulogium infcribed on his tomb. Seventeen years afterwards his bones were carried from Sweden to France, and interred with great pomp in the church of St. Genevieve du Mont, where a magnificent monument, with his build in buflfo-relievo, and an appropritate infcription, is erected to his memory.

Des Cartes, as his various writings amply teftify, poifefled an accurate and penetrating judgment, a fertile invention, and a mind superior to prejudice; qualities which, united with an early acquaintance with ancient learning, and indefatigable industry in the investigation of truth, might ferve to promote no inconfiderable share of fuccefs in the great defign of reforming and improving philosophy. He would have been more fucceful if he had been lefs defirous of applying mathematical principles and reafonings to fubiects which do not admit of them; if he had fett lefs value upon mere conjectures; and if he had been lefs ambitious of the honour of founding a new fect in philosophy. See the next article. We fhall here fubjoin fome additional tesimonials to his character. M. Bullet, in his account of his life, &c, highly commends him for his contempt of wealth and fame, his love of truth, his modesty, diligence of defire, moderation, prudence, and fubmission to the authority of the church. Dr. Barrow, in his "Optica, tells us, that he was undoubtedly a very good and ingenious man, and a real philofopher, and one who f seems to have brought thofe affiduitics to that part of philosophy which relates to matter and motion, which, perhaps, no other had done; that is, a great fkill in mathematics, a mind habituated both by nature and cultum to profound meditation, a judgment exempt from all prejudices and popular errors, and furnished with a con- siderable number of certain and fect experiments, a great deal of lecture, entirely difengaged by his own choice from the reading of useless books, and the avocations of life, with an incomparable acutenefs of wit, and an excellent talent of thinking clearly and distinctly, and regulating his thoughts with the utmost perfection. Dr. Halley (of Wotton's Reflections upon Ancient and Modern Learning), fays, "as to Dioptrics, though a great number of previous experiments, obferves nevertheless, that 'to a vail genius he joined an exquisite skill in geometry, so that he brought upon intelligible principles in an intelligible manner, though he very often failed in one part of his end, namely, a right explication of the phenomena of nature; yet, by marrying geometry and physics together, he put the world in hopes of a malenee expiring in process of time, though the firit productions should prove abortive." Dr. Keil, in the introduction to his "Examination of Bunten's Theory of the Earth," annexing to Wotton's reflections, &c. tells us, that Des Cartes was fo far from applying geometry and obfervations to natural philosophy, that his whole fylem is but one continued blunder on account of his negligence in that point; which he could easily prove by fhowing, that his theory of the vortices, upon which the whole fylem is grounded, is absolutely falf: and that the Isaac Newton has fhown, that the periodical times of all bodies, which fhim in a vortex, must be directly as the fquares of their difiances from the centre of the vortex. But it is evident, from obervations, that the planets, in turning round the fun, obfere quite another law; for the fquares of their periodical times are always as the cubes of their difiances; and therefore, fince they do not obfere that law, which they necessarily muft, if they fhim in a vortex, it is a demonstration that there are no vortices, in which the planets are carried round the fun; with more to the fame purpofe. Mr. Baker, confidering the natural philosophy of Des Cartes, obferves, that, "though it would be very unjust to charge Des Cartes with the denial of a God, who is fupofed by him to have created matter, and to have imprefled the first motion upon it, yet he is blameable, that after the first motion is imprefled, and the wheels fe et going, he leaves his vail machine to the laws of mehanifm, and fuppofes that all things may be thereby produced without any further extraordinary affifiance from the firft impreflor. The fuppofition is impreflor, and, as he fates it, deftructive of itself; for, not to deny him his laws of motion, most of which have evidently fhown to be falf, and confequently fo muft all he that is built upon them, his motion of matter is inconsistent with any motion at all; for, as space and matter are with him the fame, upon this fuppofition there can be no motion in a fpace." Dr. Keil condemns Des Cartes for encouraging the prepuflitious pride of the modern philosophers; who think they understand all the works of nature, and are able to give a good account of them. Mr. Leibnitz, whilst he acknowledges that Des Cartes was a very learned man, and had read more than his followers imagine, and that he was one of those, who has added more to the discoveries of their predeceffors, obferves, that some of whom have entirely in them, are much miftaken in their conduct; and this, he fays, is true, even with regard to geometry itself. He alfo remarks, that Des Cartes endeavoured to correct fome errors with regard to natural philosophy, but that his prepuflitious and contemptuous manner of writing, together with the obfcurity of his fyle, and his confufion, and fevere treatment of others, are very disagreeable. Voltaire, in his "Letters concerning
CARTESIAN PHILosophy.

Concerning the English Nation," (Lett. 14) observes, that nature had favoured Des Cartes with a strong and clear imagination, whence he became a very singular person both in private life, and in his manner of reasoning. This imagination could not conceal itself even in his philosophical writings, which are every where adorned with very brilliant and ingenious metaphors. Nature, says he, had almost made him a poet; and, indeed, he wrote a piece of poetry for the amusement of Charles, Queen of Sweden, which, however, was afterwards enlivened in honour of his memory. He extended, continues he, the limits of geometry as far beyond the place where he found them, as he did Newton after him; and first taught the method of expelling curves by equations. He also applied this geometrical and inventive genius to dodiscrises, which, when treated by him, became a new art; and if he was mistaken in some things, it was because a man who discovers a new tract of land, cannot at once know all the properties of the soil. Those who come after him and make these lands fruitful, are at least obliged to him for the discovery. Voltaire, however, acknowledges, that there are innumerable errors in the first of Des Cartes's works; and then adds, that geometry was a mode by which he himself had in some measure formed, and which would have falsely conducted him through the several paths of philosophy; but that at last he abandoned this guide, and gave entirely into the humour of framing hypotheses; and then philosophy was no more than an ingenious romance, fit only to amuse the ignorant. After other appropriate remarks, he concludes with these observations: "He destroyed all the absurd chimera's with which youth had been intoxicated for 2000 years. He taught his contemporaries how to reason, and enabled them to employ his own weapons against himself. If Des Cartes did not pay in good money, he however did great service in curing down that of a base alloy." Father Rapin, in his "Réflexions de Physique," after observing that Des Cartes's principles of motion, figure, and extension, are almost the very same with those of Democritus and Epicurus, tells us, that father Merfenne mentioned in an assembly of learned men, that Des Cartes, who had gained great reputation by his geometry, was preparing a system of natural philosophy, in which he admitted a vacuum; but the notion was ridiculed by Roberval and some others; upon which Merfenne wrote to him, that a vacuum was not then in fashion at Paris, which induced Des Cartes to change his scheme, in compliance to the natural philosophers, whom he flattered to please, and admit the plenum of Leucippus: "so that," says father Rapin, "the exclusion of a vacuum became one of his principles, merely from political considerations." Rapin produces no authority for this story; and it should be recollected, that he was a very zealous Aristotelian, extremely prejudiced against any new system of philosophy.

Des Cartes, it is said, imagined it possible to prolong life very considerably beyond the common period, and thought he had discovered the method of doing it. In conversation with Sir Kenelm Digby, Des Cartes assured him that, having already considered that matter, he would not venture to promise to render a man immortal; but that he was very sure it was possible to lengthen out his life to the period of the patriarchs. It seems evident to me, says he, in a letter written to M. de Zuylichem from Egmund, in 1636, that he had attacked the age, and that he had guarded against certain errors, which are accustom'd to commit in the course of our diet, we might, without any other invention, attain to an old age, much longer and more happy than now we do. However, twelve years after this declaration was made, our philosopher died. Des Cartes was never married, but had one natural daughter, named Francisc, who died in 3 years of age. Of his works there have been several editions, several of which have been already mentioned.

For an account of the improvements made by Des Cartes in algebra and geometry, see the article Algebra, and Montucla's Hist. Mathæn. sub infra. In reference to the dispute between his friends and those of Harriot, as to the priority of their discoveries, we shall here add, to what occurs under the article Full Circle, an anecdote told by Dr. Pell, and recorded by Dr. Wallis in his "Algebra." Sir Charles Cavendish, then resident at Paris, had a conversation with M. Roberval concerning Des Cartes's geometry, then lately published, to this purpose: "I advance," says Roberval, "that method of Des Cartes, of placing all the terms of the equation on one side, making the whole equal to nothing, and how it occurred to him: the reason why you admire it, says Carls, is, because you are a Frenchman; for if you were an Englishman, you would not admire it. Why so? asked Roberval. Because, replied Sir Charles, we in England know where he had it; namely, from Harriot's Algebra. What book is that? says Roberval; I never saw it. Next time you come to my chamber, said Sir Charles, I will shew it to you; which, some time after, he did; and, upon perusal of it, Roberval exclaimed with admiration, "Hic est! hic est! I have seen it! He had seen it! He had seen it! finding all that in Harriot which he had before admired in Des Cartes, and not doubting that Des Cartes had it from thence. Besides, as Harriot's "Artis Analytice Praxis" was published in 1631, and Des Cartes was in England about this time, and as he follows the manner of Harriot, except in the method of noting the powers, it is highly probable that he was more indebted to the English algebra than his partial advocates are willing to allow. For an account of Des Cartes's philosophy; see the next article. Gen. Dict. Brucker's Hist. of Phil. by Leibnitz, vol. ii. c. 2. § 6. Montucla, Hist. Math. t. ii.

P. 112, c.

CARTESIAN Philosophy, or CARTESIANISM, the system of philosophy advanced by Des Cartes, and maintained by his followers, the Cartesians.

The Cartesian philosophy is founded on two great principles, the one metaphysical, the other physical. The metaphysical principle is this, I think, therefore I am. This principle has been attacked and defended, with great spirit, zeal, and partiality on both sides; for though it be true that we are as sure by an inward perception or consciousness, that we exist, as that we think; yet it is true, too, that the conclusion of this reasoning, I am, is drawn from the antecedent I think; since to think supposes to be, or exist; and the mind sees clearly the necessary connection between thinking and being.

In order to acquire this fundamental principle, this first and most certain truth in philosophy, Des Cartes recommends to divest the mind of every kind of prejudice, and for this purpose to begin with doubting of everything. Since the senses err, and dreams deceive, it is first to be doubted, whether sensible objects have a real existence; and we ought also to doubt concerning every mathematical axioms, because we are not sure that we may not have been so formed as to be under a perpetual deception. But whatever else we doubt of, it is impellible we should doubt, whether we ourselves, who are capable of exercising the power of thinking, exist. Of such importance, in the estimation of Des Cartes, is this kind of scepticism, that he advises his readers to consider his reasons for doubting of all things, not once only, but to em-
own existence, we are next to inquire what sort of beings we are, before we admit the existence of any thing external; and in the prosecution of this inquiry, we perceive belonging to our nature "an idea," which has neither extension, figure, local motion, nor any other property which we commonly ascribe to bodies, and of the existence of which we have a prior or more certain knowledge, than of that of any thing corporeal. The mind having thus gained a knowledge of itself, but still doubting the existence of external objects, proceeds in the enlargement of its knowledge, and finds within itself "an idea," concerning the existence of which, as long as it retains its contemplation merely to itself, without offering or denying any thing like them to exist externally, it cannot be deceived. It also finds within itself certain "common notions," and from these frames various demonstrations of the truth of which, as long as its attention is directed to them, it is thoroughly persuaded. But because it does not yet know, whether it may not be so formed, as to be deceived in those things which appear most evident, it perceives it to be impossible to admit any certain science, till it has discovered the author of its being. Revolving within itself its various ideas, it finds one of a being supremely intelligent, powerful, and perfect, in which it discovers an existence, not possible and contingent only, as in its ideas of all other things, but necessary and eternal. Since it finds within itself this idea of a supreme being, which could not be a fiction of its own, it concludes with certainty that it must have proceeded from a really existing deity, and consequently that it represents a true and immutable nature, which cannot possibly not exist, that is God. According to this innate idea of Deity, we find him to be eternal, omnipotent, omnipresent, the fountain of all good and truth, the creator of all things; and as nothing can be an attribute of the divine nature, which implies limit or imperfection, he is, therefore, incorporeal, indivisible, and void of passion, and exercises his understanding and volition, not by continued operations, but by the most simple action. Upon the will of this being, infinitely perfect, and necessarily existing, Des Cartes makes the certainty of self-evident propositions or axioms, as well as of all other necessary truths, to depend. From the knowledge of the caufe thus established, he proceeds to deduce a complete knowledge of his effects by necessary steps; and he rejects all final causes from philosophy; the most perfect kind of science being, in his judgment, that of effects from their causes. From the veracity of the Deity, he infers the reality of material objects, which are represented by our senses as existing without us. The idea of extended matter is presented to the mind; if, therefore, matter did not really exist, God, who presents this idea before the mind, would be a deceiver.

The physical principle of Cartesianism is this, that nothing exists but substances; and these are of two kinds, viz. one which thinks, or mind, and another which is extended, or body. The essence of the former is thought, and that of the latter extension; so that the thinking substance cannot be without some actual thought; nor can any part be detached from the extension of a thing, without taking away so much of its substance. Other attributes ascribed to each of these substances are modes or quantities. The first article is opposed by Mr. Locke, who endeavours to show, that thinking is not essential to the soul, or that its essence does not consist in thought; but that there are various occasions wherein it does not think at all. See dream. The latter is strongly opposed by the Jesuits, &c. as inconsistent with the doctrine of transubstantiation; but is much better confuted by the modern writers, from the principles of the Newtonian philosophy.

The sole essential property of body being extension, and quantity differing from extended substance, only in our conceptions, space, and the corporeal substance contained in it, are in reality the same; for extension in length, breadth, and depth, which constitutes space, also constitutes body. Since extension is universal, Des Cartes maintains there is no vacuum, nor any possibility thereof in nature; but that the world is absolutely full: for mere space is excluded by this principle; because extension being implied in the idea of space, matter is so too. If there were any such thing as a vacuum, says he, it might be measured: the vacuum, therefore, is extended, and of consequence is matter; every thing extended being matter. See Vacuum.

He adds, however, after denying a vacuum, or extension without matter, or properties of matter, that its parts are separable and moveable; though these seem to imply more than mere extension. He defines motion to be the translocation of a body from the neighbourhood of bodies that are in contact with it, and considered as contiguous, to the neighbourhood of other bodies; and thus defines the distinction between absolute or real, and relative or apparent motion; though both equally agree in this definition. He maintains that the same quantity of motion is always preserved in the universe; because God, he says, must be supposed to act in the most constant and immutable manner. And hence he likewise deduces his three laws of motion: according to which God, the first universal cause of all motion, in the beginning communicated motion to matter; viz. that a body must continue in its state, as to rest, motion, figure, &c. till some external influence produce a change, which is his first law of nature; that the direction of motion is naturally rectilinear, or that a body never changes its direction of itself; which is his second law:—and that a body in motion, when it meets with another moving with a greater force, is reflected without losing any part of its first motion; but when it meets with a body moving with less force, it then carries this body along, and loses as much motion as is transferred to it; and this is his third law of nature. He accounts for the hardness of bodies from their parts being quitted with respect to each other; and for fluidity from their being perpetually moved in all directions. These principles, says Des Cartes, are sufficient for explaining all the phenomena of nature; and no others ought to be admitted or even wished for: and yet there is not hardly any one of them, that is not liable to insuperable difficulties. Des Cartes concluded, from the immutability of the deity, that the same quantity of motion is always preserved in the universe; whereas this quantity is continually varying: it is diminished in the composition of motion, and in many cases, in the collision of bodies which have an imperfect elasticity; and it is increased in the resolution of motion, and in some cases, in the collisions of elastic bodies. Moreover, it requires an active principle to account for the hardness of bodies, not as it sufficient for this purpose that the particles be at rest; for this would not hinder their being separated from each other by the least force.

These principles of physics once supposed, Des Cartes explains mechanically, and according to the laws of motion, how the universe might have acquired its present form, and may be for ever preserved; and whence the present appearances of nature do arise. He supposes, that God created matter of an indefinite extension; that he divided this matter into little cubic portions, or malleus full of angles; so as to replenish space without leaving any interstices between them; and that these particles, deriving from the motion impressed upon them an incessant agitation, which broke off their angular parts, became round, and formed what this ingenious
genious and fanciful philosopher, calls the matter of the second element. The angular parts themselves, being ground into the null fubtile particles of all, became the matter of his first element, and forced to fill all the pores of the other. But there being more of this first element than was necessary for that purpose, it became accumulated in the centres of the vortices, of which he imagined the universe to consist, and formed there the bodies of the sun and stars. For, according to this philosopher, the solar system were infinite in number, each fixed star being the centre of one; and he, indeed, is among the first of the moderns, who thus removed the boundaries of the universe; even Copernicus and Kepler themselves, having confined it within, what they supposed, the vault of the firmament. The centre of each vortex being thus occupied by the null active and moveable parts of matter, there must necessarily among them be a more violent agitation than in any other part of the vortex, and this violent agitation of the centre cherubled and supported the movement of the whole. The heavens were filled with the matter of the second element, the medium of light. But the planets and comets composed of a third element greater than the other two, the generation of which our philosopher traces through all its steps. According to him, the matter of the first element must have constantly flowed out through the interstices between the spherical particles of the second element, where the circular motion is greatest, and must have returned continually at the poles of this motion towards the centre of the vortex; where, being apt to cohere together, they at length produced the greater particles of the third element; and when these came to adhere in a considerable quantity, they gave rise to the spots on the surfaces of the sun or stars. Some being crowded out with such spots became planets or comets; and the force of their rotation becoming languid, their vortices were absorbed by some more powerful neighbouring vortex. In this manner the solar system was formed, the vortices of the secondary planets having been absorbed by the vortex of the primary, and all of them by that of the sun. Des Cartes also maintains, that the parts of the solar vortex increase in density, but decrease in celerity, to a certain distance; beyond which he supposes all the particles to be equal in magnitude, but to increase in celerity as they are farther from the sun. In those upper regions of the vortex he places the comets; in the lower parts he ranges the planets; supposing those that are more rare to be nearer the sun, that they may correspond to the density of the vortex, where they are carried round. He accounts for the gravity of terrestrial bodies from the centrifugal force of the other revolving round the earth; which, he imagined, must impel bodies downwards that have not a greater centrifugal force, much in the same manner as a fluid impels a body upwards that is immersed in it, and has a less specific gravity than the fluid. From the same principles he professes to explain the phenomena of the magnet, and to account for every phenomenon in nature.

The system of Des Cartes, notwithstanding its defects and errors, and though in some respects it has more the appearance of a romance than of a just philosophy, was distinguished in an eminent degree by its subtility, ingenuity, and originality; so that it not only engaged the attention of the learned, but long continued, in the midst of all the opposition with which it had to encounter from the professed enemies of innovation, to be zealously defended by many able writers, and to be publicly taught in the schools throughout all Europe. If we trace Cartesianism to its origin, we shall find that some parts of it appear to have been derived from the Grecian philosophy; particularly the notion of innate ideas, and of the action of the soul upon the body, from Plato; the doctrine of a plenum from Aristotle; and the elements of the doctrine of vortices from the atomic school of Democritus and Epicurus; but Des Cartes contrasted, by the vigorous powers of his genius and the fertility of his imagination, to form of these and similar materials a new system of philosophy, which professed to resolve all difficulties, and to comprehend a satisfactory explanation of all the phenomena of nature. His labours, however, would have been more valuable, if he had not sacrificed himself to be led allay into the romantic regions of hypothesis by the false notion, that the nature of things may be better understood by endeavouring to account for appearances from hypothetical principles, than by inferring general principles from an attentive observation of appearances. Accordingly, his followers for hypothesis led him to confound the ideas of attribute and substance, as in his definitions of matter and space; and those of possibility and probability, as in his doctrine of vortices. Even his celebrated argument for the existence of God, which, indeed, had long before his time been advanced by St. Anselm, archbishop of Canterbury, in his book "Contra Inseiptentem," and by St. Thomas Aquinas, and other scholastic writers, confounds the idea of an infinite being with the actual existence of that being, and substitutes a mere conception of the idea of a term in the place of the idea of a being really and substantially existing. Not to add, what is much to be regretted, that, though his whole system is built upon the knowledge of God, and supposes his agency, in establishing the doctrine of a deity, he foresees the clear and satisfactory ground of final causes, and had recourse to a subtle argument, which few can comprehend, and with which fewer still will be fully satisfied.

In the revolution which the system of Des Cartes produced among metaphysicians and philosophers, the superiority of his genius was assisted by the peculiar circumstances of the times; and it required the efforts of such a genius to demolish the structure of Aristotelian philosophy. Aristotle had been, for more than a thousand years, regarded as an oracle; and his authority was the rule of truth. The Peripatetic doctrine were so incorporated with the whole system of scholastic theology, that to differ from Aristotle was to abominate the church. However, the prevailing system was beginning to lose its authority. Des Cartes perceived its defects; and he feized the favourable moment to introduce and establish a new system. Having applied much to the mathematical sciences, and having made considerable improvement in them, (see the preceding article,) he wished to introduce that peripetia and evidence into other branches of philosophy which he found in them. To him we must allow the honour of having been the first who drew a distinct line between the material and intellectual world; which in all the old systems, were so blended together, that it was impossible to say where the one ended and the other began. In that part of philosophy which relates to the mind, Des Cartes laid the foundation, and put us into that track, which all wise men now acknowledge to be the only one in which we can expect success. With regard also to physics, or the philosophy of body, if he had not the merit of leading men into the right track, we must allow him that of bringing them out of a wrong one. By the diffusion of the Cartesian system, materia prima, substantial forms, and occult qualities, with all the jargon of the Aristotelian physis, fell into utter disgrace, and were never mentioned by the followers of the new system, but as a subjeet of ridicule. Aristotle, after a reign of more than 1000 years, was now exposed as an object of derision even to the vulgar, arrayed in the mock majesty of his substantial forms and occult qualities. Queens and
and principles, the most distinguished personages of the age, courted the conversation of Des Cartes, and became adepts in his philosophy. In this number we may reckon Christiana, queen of Sweden, and Elizabeth, daughter of Frederic, King of Bohemia, the mother of our royal family. The latter, though very young when Des Cartes wrote his "Principia," he declares to be the only person whom he knew, who perfectly understood not only all his philosophical writings, but the most abstruse of his mathematical works. The triumph of the Cartesian system over that of Aristotle is one of the most remarkable revolutions in the history of philosophy. When his authority ceased, that reverence for hard words and dark notions, by which men's understandings had been brougth in early years, was turned into distrust, and every thing suspected which was not clearly and distinctly understood. This is the spirit of the Cartesian philosophy; and it is a more important acquisition to mankind than any of its particular tenets; and although after the sober method of philosophizing, introduced by lord Bacon, began to be generally adopted, and the fabrications of romantic theories gave way to the experimental study of nature, the system of Des Cartes, like "the bassefs fabric of an air-vision," had disappared, and has fearlessly "left a wreck behind;" yet for exciting this spirit to zealous, and spreading it so successfully, Des Cartes deserves immortal honour. Besides, by introducing geometry into physics, and accounting for natural pheno-menon from the laws of mechanics, he did infinite service to philosophy; and contributed both by his practice and example, to free it from that venerable ruff, which in a long succession of ages it had contracted; and thus to him, in some measure, is owing the present system of the mechanical, and even of the Newtonian philosophy.

After the above detail, we shall not wonder that the Peripatetics, or Aristotelians, seconded by the influence of the clergy, who apprehended that the cause of religion was aimed at and endangered by the philosophical innovations of Des Cartes, should excite a clamour, and exert their utmost efforts to prevent the overthrow of their old system, and to diminish the growing reputation of the new philosophy. To order the more readily and effectually to execute this invicious purpose, they not only accused Des Cartes of the most dangerous and pernicious errors, but proceeded, in the extravagance of their maliginy, to allege against him a charge of atheism, which those who are acquainted with his revered principles, and with the basis of his system, must perceive to have been altogether unfounded. The Theophils, Rohemans, and Chemists also entered into the conflict against Des Cartes, though they conducted themselves with greater moderation than the Aristotelians. The consequences of this dispute were, however, favourable to the progress of science; for many European philosophers, who were adverse to the disquieting sentiments of Des Cartes, were nevertheless encouraged by his example to pursue their inquiries with greater freedom from the restraints of tradition and personal authority than they had formerly done, and to emancipate themselves from that yoke of servitude under which Aristotle and his followers had so long kept them in subjection. Among the most eminent contemporaries of Des Cartes, who applauded, in general, the efforts he made towards the reformation of philosophy, and the noble resolution with which he broke the shackles of magisterial authority, and who also acknowledged that he had made valuable discoveries in philosophy, there were some who denounced several essential defects in his philosophy, and who considered it in various respects as hypothetical, founded on fancy rather than experience. They actually attacked the fundamental principles upon which his whole system of philosophy was built, such as his ideas of the Deity, of the universe, of matter and spirit, of the laws of motion, and other points that were connected with these. Some of these principles they pronounced to be uncertain; others of a pernicious tendency, and adapted to produce the most dangerous errors; and others again they considered as directly contrary to the language of experience. At the head of these objectors was his own fellow-citizen Gassendi, who had made war before him upon the Aristotelians and Chemists; who, in genius, was his equal; in learning, far his superior; and whose mathematical knowledge was most uncommon and extensive. Gassendi first attacked those mathematical principles, which supported the whole structure of the Cartesian philosophy; he then proceeded to refutations, in the spirit of the Cartesian system, one that refuted the natural philosophy of Epicurus, though much more rational, consistent, and perfect. See Gassendi. The controversy between these philosophers, Gassendi and Des Cartes, produced two leading philosophical sects, denominated the Mathematists and Metaphysists, which fer.

Cartesianism was nearly prohibited by an arrest of the parliament of Paris; and all had been so in effect, if it had not been prevented by a hurleau address presented to the first president. After the Cartesian philosophy had been favourably received, it was vehemently attacked, in the year 1639, by Vost, professor of theology at Utrecht, who regarded it as a system of impiety; and this affection he grounded upon the following principles by which it was introduced: viz. "that the person who affirms after the character of a true philosopher must begin by doubting of all things, even of the existence of a Supreme Being—that the nature or offence of spirit, and even of God himself, confounds in thought—that space has no real existence, is no more than the creature of fancy—and that, consequently, matter is without bounds." Des Cartes defended his principles; but Vost was seconded by the most eminent Belgian divines, and applauded by the greatest part of the Dutch clergy. In 1656, when the principles and tenets of Des Cartes were applied to the illustration of theological truth, an alarm was raised in the Dutch churches and schools of learning, and it was resolved in several of their ecclesiastical assemblies not to permit that "impiety" philosophy, as Cartesianism was called, to make such encroachments upon the domain of theology. The states of Holland approved this resolution, and issued a public edict, forbidding both the professors of philosophy and theology either to explain the writings of Des Cartes to the youth under their care, or to illustrate the doctrines of the gospel by the principles of philosophy. It was further resolved by an assembly of the clergy, held at Delft in the following year, that no candidate for holy orders should be received into the ministry before he made a solemn declaration, that he would neither promote the Cartesian philosophy, nor disfigure the divine simplicity of religion, by loading it with foreign ornaments. Laws of a like tenor were afterwards passed in the United Provinces, and in other countries. But all these measures were inefficacious to stop the progress of Cartesianism, which, at length, obtained a bold and permanent footing in the universities of learning, and was applied, both in the academies and pulpits, and sometimes indeed very preposterously, to explain the truths and precepts of Christianity. See on the subject of this article, M. la Motardin's Account of the State of Newton's Philosophical Discoveries, b. i. c. 4. Brucker's Hist. of Phil. by Enulio, vol. ii. c. ii. § 6. Cudworth's Int. Syll. ch. v. § 1. Reid's Essays on the Intellectual Powers of Man, ch. viii. Smith's Essays on Philo. Subjects, p. 176. Motheim's E. H. vol. v.

CARTHAGE, in Ancient Geography, one of the most powerful
powerful cities of antiquity, was for many ages the capital of Africa Procula, called also the territory of Carthage. See Africa. It was at first called Cadaram, i.e. the cataract, from the name of Cadmus, which was common to the chiefs of the Phoenician colonies. It was also denominated Tharros, which in the Phoenician language signified a horse’s head, found, as tradition reports, by the Tyrians, when they were digging for the foundations of the fortress called Byrsa, and considered as an omen portending the mortal disposition of the inhabitants, and the future greatness of the city. To this circumstance Virgil refers, Aen. i. i. v. 447. 

"Eliudere loco lignum, quad regis Juno
Mundaretur caput aries equi; hic nam facto bello
Egypigum, et faciem vetu per terram gentem.

"The Tyrians landing near this holy ground,
And digging here, a prodigious omen found;
From under earth a courser’s head they drew,
Their growth and future fortune to forebode:
This fated sign their founder’s Juno gave,
Of a foal fruitful, and a people brave." — Dryden.

On account of this event the Carthaginians had frequently, upon the reverences of their coins, either a horse’s head, or the body of a horse dimitted, or a horse entire, with Victory mounted upon him. Others say, that when Dido arrived in this country, a city actually existed called Utica, or the ancient; and that she called her city Carthago-lata, or Cartudades, Ναυτία Ναντία, that is, the new city; and from this appellation the Greeks, interchanging Χ and Σ, deduced Ἀρχαντία, Carthago, and the Romans Cartago. Among the more ancient Romans, however, the name of this city, derived from the Carthaginians themselves, was Catoce, as appears from the Columna Rostrata of Dioclus.

Authors are much divided as regard to the era of the foundation of Carthage. It was built, according to Velcius, 65 years, but according to Trogus and Julian, 72 years, before Rome. Livy seems to place its foundation 20 years higher than tbe; and Solinus exceeds him 27 years. From Menander the Ephesian, cited by Josephus, and the Tyrian Annals, it appears to have preceded the Roman era 150 years. According to Livy and Appian, Carthage flood somewhat above 700 years, and Solinus, adding the odd number of years, reckons the period of its existence 717 years; and as it was destroyed by the confidante of Mentuelus and Mammius, in the year of the Julian period 428, the 66th of the Roman era, and the 146th year before Christ, if we reckon backwards 737 years, we shall arrive at the 883d year B.C., the second year of Athaliah, queen of Judah; and the conciliar, or dedication of the city, says Sir Isaac Newton (Chrom. and Works by Horsey, vol. v. p. 520), will fall upon the 16th year of Pygmalion, the brother of Dido, and king of Tyre. She fled in the 7th year of Pygmalion, i.e. in the year 874 B.C. the 4th year of Josiah king of Judah; but the era of the city began with its conciliar. Josephus (Cont. Ap. l. i. c. 18.) reckons 143 years from the building of Solomon’s temple to the building of Carthage, which has since been extinct and which is not to be distinguished from the flight of Dido in the 7th of Pygmalion. The temple was dedicated in the year 1003 B.C. and thus the 7th of Pygmalion will be the 861st year B.C. and the 16th of Pygmalion will be the 852d year B.C. Solomon surmounted the building of the temple 30 years; and therefore the interval from Solomon’s death to the flight of Dido will be 113 years, from which subtracting 7 years, there will remain 106 years for the interval between Solomon’s death and the beginning of Pygmalion’s reign; and allowing that Solomon died in the 975th year B.C. the 7th of Pygmalion will be the 862d year, B.C. and the 16th of Pygmalion will be the 853d year, B.C. Petavius (Rat. Temp. i. c. 11), after confounding the contradictory opinions of the ancients with great attention, fixes the Carthaginian era with an apparent exactness; for, according to Petavius, Dido began to build Carthage 177 years before the foundation of Rome, i.e. with Vartus, we place this in the 4th year of the 6th Olympiad (753 B.C. or 142 years, if with aehubius Uther, we prefix the account of Fabius Pictor, the most recent of the Roman historians, and a writer of great authority, who maintains it to be near the beginning of the eight, or 128 years. B.C. Blair, in his Tables, has assigned the same of the building of Carthage to the 869th year, B.C. In order to reconcile the discordant accounts that have been given of this era, it has been suggested, that Carthage consisted of different parts, which are supposed to have been built at different times. Cato, or the part, together with the buildings belonging to it, was built first; Megara, which, in respect of Cation, was called the new town, or Carthada, was built about 194 years later, and Byrsa, about 166 years after Megara.

Whatever difference of opinion may have subsisted among the Georgians about the era of Carthage, it is generally agreed that the Phoenicians were its founders. Eufebius (in Chron.) and Procopius (de bell. Vand.) affirm positively, that the Carthaginians who fled from Jethin retired hither; and St. Austin (in Expos. ad Epip. ad Roman.), is of opinion, that the Carthaginians were descended from the Canaanites. Philo of Byrsa, who lived 530 years before Christ, related, (apud Eufeb. in Chron.) that the first traces of Carthage were owing to Zonius and Charchodon, two Tyrants or Phœnicians, 70 years before the destruction of Troy in the year 1181 B.C. according to Eufebius. Appian (in Lycy.) attributes this event to the fame two Phœnicians, 50 years before that period; and from him Scaliger corrects the numbers of Eufebius. Accordingly, Dido was induced to choose this place for her Tyrians in preference to any other, because it had been inhabited for some time by the Phœnicians, who were her countrymen, and from whom she had, therefore, reason to expect a friendly reception. To this Tyrian prince the concurrent voice of antiquity ascribes the first settlement of Carthage. See Juft. l. xxvii. c. 4. 5. 6. App. de bell. Punic. p. i. Strabo, l. xvii. p. 852. Paterc. l. i. c. 6. This prince, called Elina, but better known by the name of Dido, was the grand daughter of the famous Jezbal, called in Scripture Ethbaal, and the great grand-daughter of Ishbal, king of Tyre. She married her near relation Acerbas, otherwise called Sicharbas and Sichaeus, a very rich prince, and her brother was Pygmalion, king of Tyre. When this prince murdered Sichaeus, in order to seize his immense treasures, Dido, in order to elude the avarice of her brother, withdrew secretly with her deceased husband’s possessions; and after having long wandered in quest of a commodious settlement, she, and her Tyrian attendants, landed on the coast of the Mediterranean, in the gulf where Utica stood; fixed her residence at Carthage; and either founded, or most probably, much enlarged this noble city. The wealth of her husband, and the skill of the Tyrians, who accompanied her, and who were at this time the most polished and ingenious people in the world, enabled her to enlarge and beautify the place, if she did not lay the foundation of it; to wall it round, and build a strong citadel in it; to lay the bases of a most flourishing and extensive commerce for which the Tyrian nation was so renowned; and to introduce a form of government, which we are fared to think one of the most perfect that ever was known in the world. Some writers have affirmed, that Dido outwitted the natives, by defying to purchase of them, for her intended...
temed settlement, only so much land as an ox's hide would compass. This modest request was infallibly complied with; upon which the ox cut the hide into the smallest things, and with them compassed a large tract of ground, on which the built a citadel, called Byrsa, from the hide. But this tale is generally exploded by the learned. This prince, it is said, was afterwards courted by Jabin, king of Gethulia, and threatened with a war in case of refusal. Dido having bound herself by an oath not to contract a second marriage, and being incapable of violating her engagement to Sichæus, defined time for deliberation, and for appeasing the name of her first husband by sacrifice. Having therefore ordered a pile to be raised, she ascended it; and drawing out a dagger which she had concealed under her robe, stabbed herself with it. This story is related with some different particulars by Justin, l. xviii. c. 6.

Virgil has much altered this history, by supposing that Aincas, his hero, was contemporary with Dido, though there was an interval of nearly three centuries between the one and the other; the area of the building of Carthage being fixed 300 years lower than the destruction of Troy. However, in the plan of his story he has displayed great judgment; for as he wrote for the Romans he has contrived to interest them the more, by introducing the implacable hatred which subsisted between Carthage and Rome, and ingeniously deducing the origin of it from the very remote foundation of these two rival cities.

Carthage was situated at the bottom of a gulf, upon a peninsula 560 fadia, or 45 miles in circumference; the isthmus joining this peninsula to the continent of Africa being 25 fadia, or three miles and a half in breadth. Dr. Shaw, (Travels, p. 82.) concludes from an estimate made on the spot, that the peninsula is about 50 miles round, and that the city may have taken up nearly half that space. On the west side, a long tract of land, half a stadium broad, projected from it, which running into the sea separated it from a lake, or morass, and was strongly fortified on all sides by rocks, and a single wall. In the middle of the city stood the fortress, or citadel, erected by Dido, called Byrsa, which is a Greek corruption of the Punic, or Phænician name Bœrsa, Bûsa, or Bûsa, denoting a fortress, or citadel; and this etymology excludes the fable of the ox's hide. Byrsa, according to Servius, (in Virgil,) was 22 fadia, or near three English miles in circumference; though Diodorus maintains, that it did not much exceed 2000 fadia, or not quite two miles. It contained a rich, beautiful, and spacious temple sacred to Æsculapius, seated on a very high hill, which was ascended by 60 steps. Acrabal's wife set fire to it, and entirely consumed it, together with herself, her children, and 900 Roman defectors, who had fortified themselves in this place in order to avoid falling into the hands of Scipio. On the south side, towards the continent, where Byrsa stood, the city was surrounded by a triple wall 30 cubits high, exclusive of the parapets and towers, with which it was flanked at equal distances, each interval being 480 feet. Each tower had its foundation sunk 30 feet deep, and was four stories high; though the wall was but two: they were arched, and in the lower part, corresponding in depth with the foundation above-mentioned, were slats, large enough to hold 300 elephants, with their fodder; over these were flaries for 4000 horses, and lofts for their food. There was likewise room enough to lodge 20,000 foot and 4000 horse. Here were two harbours, dipsoped in such a manner as to communicate with each other, and having a common entrance, 70 feet broad, secured with chains. The first was appropriated to the merchants, and included a great number of places of refreshment and all kinds of accommodation for the leaven.

The second, or inner port, was, as well as the islet, called Cohen, in the middle of it, lined with large keys, in which were distinct receptacles for securing and sheltering from the weather 220 vessels, and it was defended chiefly for ships of war. Strabo calls the small islet Cohen; but Appian applies the term likewise to the port, or harbour itself. So active were the Carthaginians, that before Scipio had blocked up the old port of Cohen, they in a short time built a new haven, the traces of which are still to be seen. See Cohen. Near the Cohen was a temple of Apollo, in which was a statue of that deity of massive gold; and the inside of the temple was covered with plates of the same metal, weighing 1000 talents. Over the receptacles just mentioned were magazines, or three-houses, containing all necessaries for the arming and equipping of fleets. The entrance into each of these receptacles was adorned with two marble pillars of the Ionic order; so that both the harbour and the islet represented on each side two magnificent galleries. The admirals palace was so situated on the island, just opposite to the mouth of the harbour, that he could see whatever was doing at sea, although no one there could perceive what was transacting in the inner part of the harbour; nor had the merchants, when they entered the port, any prospect of the men of war, being separated from them by a double wall, and each port having its separate gate that led into the city, without passing through the other. The Byrsa was considered as the interior part of Carthage, and was surrounded by the Megara, or Megaria, that is, the houses or towns, for so the word signifies in the Phænicians tongue, or its exterior part; and thus taken together, they formed a kind of double town.

As to the extent of the city, Livy informs us, that it was 23 miles in circumference; and Phiny (l. c. a.) intimates, that Carthage, when poissified by the Phænicians, was much larger than when it became a Roman colony; and Suidas affirms, that it was the greatest and most powerful city in the world. The number of inhabitants contained in this city amounted, at the beginning of the third Punic war, to 700,000. The forces which they were able to bring into the field, and the power which they were capable of exerting at sea, were very formidable. Hamilcar, in his expedition against Gelon, the tyrant of Syracuse, commanded an army consisting of 300,000 men, and the seamen, who had served with the land forces, was composed of more than 2000 ships of war, and above 2000 transports. Their riches were likewise immense; for at the final destruction of the town, even after it had been plundered, and supposed to be entirely exhausted and consumed, Scipio carried away nearly a million and a half flering. The dominion of Carthage was not long confined to Africa. Strabo observes (Geog. lib. xvi.) that the Carthaginians poissified 300 cities in Africa, before the beginning of the third Punic war; nor is this incredible, if we consider, that the dominions of this state in Europe, before that war extended from the western confines of Cyrenæa to the pillars of Hercules, or the straits of Gibraltar, a tract of land near 1500 miles in length. The inhabitants of its ambitious city extended their conquests into Europe, by invading Sardinia, feizing a great part of Sicily, and the islands W. of it, and reducing almost all Spain, even as far as the Pyrenées, and having sent powerful colonies everywhere, they enjoyed the empire of the sea for more than 600 years, and formed a State which was able to dispute pre-emience with the greatest empires of the world by its wealth, their commerce, their numerous armies, their formidable fleets, and, above all, by the courage and talents of their officers.

Carthage, as Dr. Shaw informs us, (Travels, p. 81.) was built upon three hills, somewhat inferior in elevation to the
those upon which Rome was erected. This famous city, after undergoing a variety of revolutions, was at length destroyed by Syrius Aemilius, under the confulure of Lentulus and Mummius, in the 146th year B.C. The Romans, after having completely destroyed it, ordered that it should never bei inhabited, announcing dreadful imprecautions against those, who, contrary to their prohibition, should attempt to rebuild any part of it, especially Bytha and Megara. About 34 or 35 years after this event, C. Gracchus, tribune of the people, in order to ingratiate himself with them, undertook to rebuild it, and with that view conducted thither a colony of 6000 Roman citizens; and this was the first Roman colony that was ever sent out of Italy. Plutarch intimates, that Grecchus executed his design, which was done in a very imperfect manner; but it is more probable that the work was entirely discontinued, however vigorously begun, in compliance with the orders of the senate. Julius Cæsar, as Appian informs us, conceived a design, in consequence of a nightly dream or vision, of rebuilding Carthage. But his untimely death prevented the completion of his purpose. However, Appian says, that his adopted son, Augustus Cæsar, built a city at a small distance from the spot on which ancient Carthage flourished, and called it by the same name, thus avoiding the ill effects of those imprecautions, which had been pronounced at the time of its destruction. Thither, it is said, he sent a colony of 3000 men, who were soon joined by considerable numbers from the neighbouring towns. Strabo, on the other hand, intimates, that both Carthage and Corinth were rebuilt at the same time by Julius Cæsar; and he affirms, that Carthage in his time, that is in the reign of Tiberius, was equal, if not superior, to the largest city in Africa. Plutarch confirms the testimony of Strabo. Pliny also mentions it as a considerable colony in his days. Carthage was elevated the second city in the Roman dominions, and considered as the capital of Africa for several centuries after the commencement of the Christian era. Its bishops, who were subordinate to the bishop of Rome, and not to the patriarchs of Alexandria, occupied a distinguished rank in the western church. Maximus laid it in ashes about the sixth or seventh year of Conflantine's reign, A.D. 311 or 312; and Genric, king of the Vandals, took it A.D. 439. At this time Carthage contained the manufactures, the arms, and the treasuries of the six provinces. Schools and gymnasia were instituted for the education of the African youth; and the liberal arts and manners, grammar, rhetoric, and philosophy, were publicly taught in the Greek and Latin languages. The buildings of the city were uniform and magnificent; a shady grove was planted in the midst of it; the new port, a secure and capacious harbour, subdued the commercial industry of citizens and strangers; and the splendid games of the circus and theatre were exhibited almost in the presence of the Barbarians. The reputation of the Carthaginians was not equal to that of their country, and the reproach of Punic faith fell adhered to their humble and faithftil character. The habits of trade, and the abuse of luxury, had corrupted their manners; but their impious contempt of monks, and the shameless practice of unnatural lusts, are the two abominations which are particularly reprobated by Salvin, the preacher of that age. The king of the Vandals, however, severely reformed the vices of a voluptuous people; and the ancient, noble, ingenious freedom of Carthage was reduced by Genric into a state of ignominious servitude. After he had permitted his licentious troops to satiate their rage and avarice, he instituted a more regular system of rapine and oppression. An edict was promulgated, which enjoined all perfon, without fraud or delay, to deliver their gold, silver, jewels, and valuable furniture or apparel, to the royal officers; and the attempt to sequestrate any part of their property was in extremity punished with death and torture, as an act of treason against the state. The lands of the proconsular province, which formed the immediate district of Carthage, were accurately measured, and divided among the Barbarians; and the conqueror reserved, for his peculiar domain, the fertile territory of Byzantium, and the adjacent parts of Numidia and Gotulia. Belisarius retook it in 533 and annexed it again to the Roman empire. In this revolution the trade of Carthage was not interrupted; the floops continued open and busy; and the soldiers, after sufficient guards had been posted, modestly departed to the houfes, which were allotted for their reception. Belisarius fixed his residence in the palace; seated himself on the throne of Trenchic; accepted and distributed the Barbaric spoil; granted their lives to the suppliant Vandals; and laboured to repair the damage which had been sustained by the suburbs in the preceding night. At supper he entertained his principal officers with the form and magnificence of a royal banquet. He restored with incredible dispatch the walls and ditches of the city, and re-established the strength of an impregnable fortress. At length the Saracens, under Mohammed's successors, towards the close of the seventh century, A.D. 698, so completely destroyed this city, that few traces of it are left. All the remains, says Dr. Shaw, of this once famous city are the area of a spacious room upon one of the hills on which it stood, commanding the south-east there, with several smaller ones at a little distance from it; the common fewers, which time hath not in the least injured or impaired; and the cisterns, which have shared only in a small degree the general ruins of the city. The harbour, indeed, is now filled up, and by the north-west winds, with the river Megeda, the ancient Bagrada, moved almost as far distant from the sea as Africa; though it is still called "El Merfa," or the Port, lying to the north and north-west of the city, and forms, with the lake of Tunis, the peninsula on which Carthage flourished. Livy tells us, that Carthage was only 12 miles from Tunis, and this is the distance that still subsists between that city and a fragment of the western wall of Carthage. Polybius indeed makes the distance of Tunis and Carthage 15 miles. The spot on which it stood is, according to the latest observations, about N. lat. 36° 52'. E. long. 10° 40'. See Carthaginians.

CARTHAGENA, in Geography, New Carthage, a sea-port town of Spain, in the province of Murcia; seated on the declivity of a hill, and separated from the harbour by an intermediate plain. The city is protected from the south and from the west by high mountains and barren rocks; but to the north and east it is open, and communicates with an extensive valley, which is divided from the plains of Penilla by a ridge of hills, whilst to the north, another chain of mountains separates it from the vale of Murcia. On the summit of the hill, commanding the city, is a castle now decaying; but, on the adjacent heights, are raised considerable works, to defend the harbour, with the arsenal and dock-yard. The harbour is the best in Spain, well sheltered from winds, and well defended. The arsenal is large, and is amply furnished with naval stores; a slip of the line, as it is said, may be got ready for sea in three days. The number of inhabitants is reckoned to be 60,000, who are distributed in 15,000 families. The streets are wide, and the houses commodious. They have generally flat roofs, which afford, in this climate, an agreeable

Vol VI.
able and cool retreat, where, after sun-fet, the inhabitants assemble to enjoy the refreshing breeze; the new parade, extending from and well at the head of the harbour, and looking through its entrance into the Mediterranean, is built on a regular plan, and as a high schillicous rock has been cut away to make room for this long range of habitations, excellent vaults are excavated behind each house, for the service of the merchants. At the end of this stands the royal hospitall, defined to receive the sick from the dock-yard and the army, with the "predisarios," or criminals condemned to the galleys, and in Spain reduced to the lowest state of servitude. The cathedral, which is a wretched pile, is now degraded, and the bishop's seat being removed to Murcia, it is become a parish church. Of nine convents, eight are occupied by the men. In the midst of the dock-yard is a spacious basin, and in this the ships of war are moored, each in front of the magazine defined to receive her rigging and her stores. The docks are kept dry by fire-engines, of which three are almost constantly at work. They have here 2000 criminals, chiefly smugglers, who, being condemned to work in chains, are called "predisarios." They are employed in the most servile labour, for 5 or 7 years; and at the expiration of their terms, they are turned loose upon the public, fitted only to pursue their original occupations. These 2000 slaves require a constant guard of 500 soldiers; and independently of this expense, they cost each to government, five reals a day for their maintenance, whilst their work cannot be estimated at one-tenth of what they eat. In this dock-yard the mults and timber are floated in water, without any apprehension of injury from the worm; because, as they never open their sluices till the water is become putrid, the rapid evaporation leaves a strong brine, in which it is impossible for the worm to live.

The fisheries of this sea-port are considerable; and is divided into two branches, independent of each other; that within the port being the property of a fishing company, consisting of 18 associates, establisht here by charter, whilfe, in the open sea, all enrolled mariners are at liberty to fish. Within the port they take chiefly the tunny and the melvas; but the former is the most profitable. Half the quantity of fish that is taken in the harbour, must be sold for the benefit of the poor at a stipulated price; and the king takes one-half of all their profits, amounting to about 1000l. a year, as a compensation for his claim of one-quarter of their fish. In the open sea the fishermen are free from oppression and have peculiar privileges.

At Carthagena they manufactory a large quantity of the "efpanto" ropes and cables, some of which are pun with hemp, and others platted. These cables are excellent, as they float on the surface of the water, and are not therefore liable to be cut by the rocks on a foul coart. The efpanto ruff makes good mats for houses, "alparrages" for pavements, and has lately been spun into fine thread for the purpose of making cloth. This ruff, it is said, is peculiar and natural production of all the high and uncultivated mountains in the south, and affords in the dry and elevated regions, where neitherto hemp nor flax will grow, materials proper for clothing, and for the employment of industry. The most important production of this country, and the most valuable article of commerce is barilla, used for making soap, for bleaching, and for glass. The country producing it is about sixty leagues in length, and eight in breadth, on the borders of the Mediterranean. The quantity exported annually from Spain is about 150,000 quintals, paying a duty of 17 reals per quintal. The chief imports are bale goods and balassas; the later directly from Newfoundland; and of the former muffins and cottons are prohibited, though they are secretly introduced in great quantities. The soil of the adjacent country is loamy, composed of calcearous matter, sand, and clay, from the disolution of the neighbouring mountains, which consist of schillicous rock covered with limestone. In some places is found the fuscineous grit or sand-stone, with flinty or smooth gravel and sea-shells; and at no great distance from the city is a mountain, from which they obtain the gyptum used for plaster. The whole country abounds with salt-pan. Oxen are used for draught; but in tillage they employ mules and asses. Their course of husbandry is wheat, barley, and fallow. They sow their wheat in November, and in July reap from 20 to 100 for one, according to the wetness of the season. They grind all their corn by wind-mills, 30 of which may be counted near the city; and water for common use is scarce and dear. The trees most common in the adjoining valley are elms, poplars, olives, figs, pomegranates, mulberries, apricots, palms, palmtos, and the ginjolero; the last of which bears a small fruit resembling, in size and form, the olive, with a smaller kernel, and remarkably sweet. The palmtos is the chameros. bundis. The most endemical diseases at Carthagena are intermittent and putrid fevers, which arise from the proximity of an extensive swamp, containing many hundred acres. The municipal government of Carthagena is vested in a military governor, with his alcaldes mayor; 30 regidores, whose office passeth by inheritance, if not previously sold; and two syndics chosen by the people as their peculiar guardians. The governor is the supreme and independent judge for the army, and for strangers settled in the country, while his alcaldes presides in the tribunal for the citizens. In consequence of the vicious formation of the government and the mal-administration of the laws, murder and affractions are frequent in Carthagena, and the most atrocious villains escape punishment. Want of fidelity to matrimonial engagements is equally prevalent at Carthagena, as in the other provinces of Spain. N. lat. 37° 37'. W. long. 10° 8' 30". Townsend's Journey through Spain, vol. iii.

This city was founded in the year of Rome 525, (B. C. 229.) by Afrodal, the Carthaginian general, in order to secure the subjection of the country. It was taken by Scipio Africanus in the year of Rome 512 (B. C. 212.), after the defeat of Hannibal under the walls of Carthage in Africa. It became a Roman colony in the time of Cæsar, who establisht a colony in it after the battle of Munda, and was one of those denominated "conventus;" its jurisdiction extending over 65 towns. After having been destroyed by the Goths, it was rebuilt by Philip II. Diamonds, rubies, amethysts, and other precious stones were formerly found in its vicinity, so that it was reckoned the Indies of the Romans; and it was famous for its silver mines. Strabo (i. iii. p. 148.) mentions a mine near this city, which yielded daily 25,000 drachms of silver, or about 300,000l. a year.

Carthagena, a province or government of South America, in the country of Terra Firma, the jurisdiction of which reaches easterly to the great river of de la Magdalena, and along this river southward, till, windings away, it borders on the province of Antioquia; from thence it stretches westward to the river of Darien; and from thence northward to the ocean, along the coasts between the mouths of these two rivers. The extent of this government from east to west is generally computed at 53 leagues; and from south to north 85. In this space, besides mountains and forests, are several fruitful valleys, called by the natives Savannahs; as those of Zamba, Zenu, Tolub, Mompox, Baranca, and others; and in them many settlements,
Large and small, of Europeans, Spanish creoles, and Indians. According to an existing tradition this country formerly abounded in gold, but the old mines are now either neglected, or exhausted. But the riches of the country were principally owing to the trade which it carried on with Choco and Darien; from whence were brought, in exchange for this metal, the several manufactures and works of art which were needed. Gold was so plentiful, that it was the common ornament of the Indians, both men and women. The country, more especially about the capital, is so luxuriant, that the trees and plants which it spontaneously produces frequently present a rich and perpetual verdure; and the interwoven branches of the trees form a shelter impregnable both to heat and light. The trees are large and lofty, very various, and altogether different from those of Europe. The principal, with regard to size, are the cedar or acajon, of which they make their canoes and champanees for fishing, the cedar both white and reddish, the maria, and the ballam tree, which two last, besides the utility of their timber, dill the admirable balsams called maria oil and ballam of Tolu, so called from a village, where it is found most excellent and most abundant. Besides these trees, there are also the tamarind, the madlar, the fatpole, the papay, the guayabo, the caffia, the palm, the manarico, and several others, most of which yield a wholesome and palatable fruit, as well as a durable and variegated wood. In the woods about Carthagena is found a great quantity of bejesco, of different magnate, figure, and colour; one species of which is particularly noticed on account of its fruit, called "habilla de Carthagena," or the bean of Carthagena, which is considered as one of the most effectual antidotes which that country affords against the bites of vipers and serpents. See Hippocrates. This country also abounds with various animals, both tame and wild. The only tame eatable animals are the cow and the hog, which are very plentiful. Wild geese and other poultry are good and very abundant. There are also different kinds of game, as deer, rabbits, and wild boars, called fijones; but these are eaten only by the country negroes and Indians, except the rabbits, which find a good market in the city. The wild beasts are tigers, leopards, foxes, armadillos, lizards, and monkeys, the wildcat and the most common of which are the micos. The birds are innumerable in number, and their various plumage is exquisitely beautiful and brilliant. The most fin gular are the guacamayo, beautiful beyond expression in plumage, but no less disagreeable for its croaking noise, the tucan, or preacher, and the gallinazos, which latter are of great service in cleaning the city of all dirt and ordure, by devouring dead animals, &c. Bats are very common, and they are so numerous at Carthagena, that when they begin to fly, they may be said to cover the streets like clouds. Among the insects and reptiles, the principal are the snakes, the centipedes, the scorpions, and spiders. The constant moisture and heat of this climate will not allow the cultivation of wheat, barley, and other grains of that kind; but maize and rice are produced in great abundance. Of the maize they make a kind of bread, called bollo, which is generally used; and they also use it in feeding hogs and fattening poultry. The cafava bread, made from the roots of yuca, names, and monitos, is very common among the negroes. Plantations of sugar-canes are so general, as to reduce the price of honey; and part of the juice is converted into spirit. Cotton-trees are also in part spontaneously produced, and others, which are the best, are planted and cultivated. The cacao trees of Carthagena excel those of the Caracas and neighbouring districts both in the size and goodness of the fruit. Besides melons, grapes, oranges, dates, and fruits which belong to other countries, Carthagena has some more appropriate to itself, such as the pineapple, the plantain, the banana, the papayas, &c. The chief town of this country is "Carthagena." 

Carthagena, a city and sea-port of South America, and metropolis of the province above described. It is situated on a peninsula, or sand island, which is joined to the continent by two artificial necks of land, the breadth of which is not above 70 yards wide. The fortifications are regular and strong, and constructed after the modern manner. At a small distance from the suburb, called Zecchimani, founded on an island, and connected with the city by a wooden bridge, is a hill, on which is constructed a fort called St. Lazaro, that commands both the city and suburb. The height of the hill is between 25 and 21 toises, and it is joined to several higher hills, which run off in an eastern direction. Thence terminate another hill of the height of 84 toises, on the top of which is a convent of bare-footed Augustines. The city and suburbs are well laid out; the streets are straight, broad, uniform, and well paved. The houses are mostly built of stone; they consist chiefly of only one story above the ground-floor; and the apartments are well contrived. All the houses have balconies of wood, which is more durable in this climate than iron. Carthagena has several churches and convents; and, including its suburbs, it is equal to a city of the third rank in Europe. It is well peopled: the number of its inhabitants, most of whom are descended from the Indian tribes, being estimated at 25,000. The governor resides in the city, and in civil affairs, an appeal lies to the audience of Sta. Fé; and when in 1730 a vice-roy of Sta. Fé was created under the title of vice-roy of New Granada, the government of Carthagena became also subject to him in military affairs. Carthagena has also a bishop, whose spiritual jurisdiction is of the same extent as the military and civil government. The ecclesiastical chapter is composed of the bishop and prebends. There is also a court of inquisition, whose power extends to the three provinces of Ila Española, where it was first settled, Terra Firma, and Santa Fé. Besides these tribunals, the police and administration of the city are conducted by a secular magistracy, consisting of regidores, from whole number are annually chosen two alcaldes. There is also an office of revenue, under an accountant and treasurer, where all taxes and royal revenues are received, and whence the proper issues are directed. A person of the law, under the title of "auditor de la gente de Guerra," determines processes. The bay, which we shall more particularly describe in the sequel of this article, and the country before called "Calamaí," were discovered by Roderigo de Balbís; and in 1504, Juan de la Cofa, and Christopher Guerra began the war against the Indian inhabitants, who, being a martial people, and joined by their women in the fatigues and dangers of war, resisted them with a valour and obstinacy which they did not expect. Their common arms were arrows, which they poisoned with the juice of certain herbs, so that the slightest wounds were fatal. They were succeeded by Alonso de Ojeda, attended by Juan de la Cofa, as his chief pilot, and Amerigo Velasquez, a celebrated geographer of those times; but they met with similar resistance, and made little impression. Nor was Gregorio Hernandez de Oviedo more fortunate. At length, the conquest of the Indians was accomplished by don Pedro de Heredia, who, after gaining several victories over them, subjected this part of America to the crown of Spain in 1533. The advantageous situation of Carthagena, the extent and security of its bay, and the great share it acquired of the commerce of that southern continent, soon caused it to be erected into a bi-...
Carthagena, to which the importance and prosperity of this city has been chiefly owing, is one of the belts, not only on this coast, but also in all the known parts of this country. It extends 2½ leagues from north to south, has a sufficient depth of water and good anchorage, and is so smooth that the ships are no more agitated than on a river, though the numerous shallows at the entrance render it necessary to secure a good pilot. The entrance into the bay is through the narrow irrigation of Bocca Chica, or Little mouth, which, since the invasion of the English, has been shut up, and a more commodious one opened and fortified. Towards Bocca Chica, and 2½ leagues distant seaward, there is a shoal of gravel and coarse sand, having in many parts of it not more than a foot and a half of water. This bay abounds with great variety of fish, such as the flad, &c. The turtles are large and well tainted. But it is very much infested with sharks, which are very dangerous to feamen both in the water, and even in their boats.

The inhabitants of Carthagena and its adjacent territory may be distributed into different castes, or tribes, who claim their origin from a coalition of whites, negroes, and Indians. The whites may be divided into two classes, viz. the Europeans and Creoles, or whites born in the country. The former are commonly called "Cipontones," most of whom, when they have acquired a competent fortune, return to Spain, or remove into inland provinces in order to increase it. Those who are settled at Carthagena carry on the whole trade of the place, and live in opulence; whilst the other inhabitants are indigent, and obliged to recur to hard and mean labour for a subsistence. The families of the white Creoles compose the landed interest; and many of them have large estates. Others, however, are in mean circumstances. Among the other tribes, which are derived from an intermarriage of the whites with the negroes, the first are the "Mulattos;" next to these are the "Tercerones," produced from a white and a Mulatto; after these follow the "Quinterones," proceeding from a white and a Terceron; and the last are the "Quinterones," who owe their origin to a white and Quiteron. The children of a white and Quiteron are called Spaniards, and consider themselves as totally exempt from all taint of the negro race. Between the several tribes, or castes above enumerated, there are other intermediate classes, formed of an intermixture of the former. The several castes from the Mulattos affect the Spanish dress, but wear very light clothes, on account of the heat of the climate; and they compose the mechanics of the city. The clafs of negroes consists of the free and the slaves; and these are again subdivided into Creoles and Bozareos, some of whom are employed in the cultivation of the lands belonging to the city. On account of the extreme heat, the only covering both of the males and females is a small piece of cotton stuff about their waist. The dress of the whites, both men and women, differs very little from that worn in Spain. The whole exccrile of the females in the house consists in fitting in their hammocks, made of twilled cotton, and commonly knot in the form of a net, and swinging themselves for air. Thus they pass the greater part of the day; and men, as well as women, often sleep in these hammocks. Of both sexes it is remarked, that they possess a considerable share of wit and constrution, and are generally adapted to excel in all kinds of mechanical arts. But their females seem to attain an early maturity, and they retain them in a great degree of vigour to an advanced age. The females of every ccl are distinguished by a mild and amiable disposition, and by the promptitude with which they relieve the indigent and destitute. The principal cultums, in a great degree prevalent to this place, are the use of brandy, chocolate,
CARThAGINIANs.

chocolate, honey, sweetmeats, and smoking of tobacco: and the latter practice is common among persons of all ranks and of both sexes. One of the most favourite amusements of the natives is a ball, or "tandango," which, among the populace, consists principally in drinking brandy and wine, interspersed with indecent and scandalous motions and gestures. Their burials are conducted with great pomp and ostentation; and their lamentations over the dead are attended with the most frantic gestures and the most clamorous vociferations. The mourning is continued in the house of the deceased for nine days after the corpse has been laid in the grave.

The climate of Carthage is excessively hot; the degrees of heat being continually the same as that of the hottest day at Paris. The nature of this climate is chiefly manifested from the month of May to the end of November, the season here called winter; during which time, there is almost a constant succession of thunder, rain, and tempests; and the rain descends in such quantities, that the streets appear like rivers, and the country like an ocean. This is the only opportunity which the inhabitants have for filling their cisterns with fresh water; the water of their wells being thick and brackish. From the middle of December to the end of April the rains cease, and the weather is agreeable; the heat being somewhat abated by the N.E. winds, which then set in. This season they call summer; besides which they have another summer of short continuance about the festival of St. John. The invariable continuance of great heats occasioned such profuse perpiration that the complexion of the inhabitants appears wan and livid, and all their motions are sluggish. Yet upon the whole, they enjoy a good state of health, and commonly live even to 80 years and upwards.

The singularity of the climate occasions disorders of a peculiar kind: some of which attack the Europeans upon their first landing; and the others are common both to Creoles and Chapetones. Tho' of the first kind are rapid in their progress, and terminate fatally when they bring on the black vomit. The inhabitants of Carthage and its territory are very subject to the leprosy, in order to stop the contagion of which they have, without the city, a hospital called "San Lazaro," from the hill on which it stands, and in which persons of both sexes, labouring under this distemper, are confined. Another very singular distemper is the cobrilla, or little snake, which is a kind of tumour, which most commonly affects the arm, thigh, or leg; and which they cure by first applying a suppurgative plaiter, and fermenting the whole tumour with oil, and then softening a thread of silk to a kind of white fibre, that diffuses itself, called the cobrilla's head, and winding the other end of it about a card, rolled up like a cylinder: they repeat the fermentation with oil, and the following day continue to wind about the cylindrical card the part of the small fibre, which appears in sight, and thus proceed till the whole is extracted, and the patient cured. N. lat. 10° 26' 33''. W. long. 75° 36' 45''. Juan and d'Ulloa's Voyage to South America, by Adams, vol. i.

CARThAGINIANs, in Ancient History, are supposed to have derived their origin from the Canaanites. See CANAAn and CANAANITeS. They were called by the Greeks, sometimes Libyans, on account of the country they oppress'd; and sometimes Phoenicians, on account of the country from which they were originally defenced. The Romans called them Punic, or Phoenicians, for the same reason; and every thing belonging to them, or their city, Punic, or Phoenic, is Phoenician, or belonging to the Phoenicians. Between the Phoenicians and Carthaginians there always subsisted the strictest union. To this purpose Herodotus informs us (lib. iii.) that when Cambyses had determined to make war upon the latter, the Phoenician, who formed the chief strength of his fleet, positively declined to leave him against their country; and on this account he was obliged to lay aside his design. The Carthaginians, on their part, were never forgetful of the country from which they derived their origin. Accordingly, we learn from Polybius and Quintus Curtius, that they regularly sent every year to Tyre a ship freighted with presents, as a quit rent or acknowledgment paid to their ancient country; and its tutelary gods had an annual sacrifice offered to them by the Carthaginians, who considered them as their protectors. They never failed to send thither the fruits of their revenues, and also the tythes of the spoils taken from their enemies, as offerings to Hercules, one of the principal gods of Tyre and Carthage. The Tyrians, on the other hand, when they wished to consecrate their wives and children from Alexander, who was besieging their city, sent them to Carthage, where they were kindly received and hospitably entertained.

The language of the Carthaginians must at first have been the Phoenician; and this was the same with that of the Canaanites or Hebrews, that is, the Hebrew, or at least a language wholly derived from it. In process of time, however, considering their disunion from Phoenicia, their mother-country, and their intercourse with other nations, their original tongue would be subject to some variation; and yet, notwithstanding these variations, it ever continued to be the same in substance with the Hebrew or Phoenician. In the latter ages the Punic tongue acquired a tincture of the Chaldee and Syriac. As the island of Malta was, for a considerable time, subject to the Carthaginians, the Punic tongue must have long remained in it; and it appears, that about the middle of the 16th century, there were some pillars in the island, which had Punic inscriptions upon them, and so late as that period the Punic tongue was spoken in Malta. The Punic letters, as well as language, must certainly at first have been the Phoenician; and though time produced a change in them, yet they always retained a great resemblance of their original, as the curious inspector may discern in the characters that are found upon the most elegant Phoenician and Punic coins.

The first government settled at Carthage was probably monarchical; for it expired either with Dido, or during her life, and was changed into a republic. Arriostes says, that it was partly aristocratical, and partly political, that is, democratic. According to Polybius, it was composed of monarchy, aristocracy, and democracy. But Horeiates represents the civil government as oligarchical, and the military as monarchical. Arriostes, who intimates, that the Creto, Lacedemonian, and Carthaginian republics were the most perfect of any in the world, gives the preference, in several respects, to the Carthaginian. Of its excellent constitution it has been alleged, as a striking evidence, that notwithstanding the great authority vested in the people at Carthage, no iniquity occurred, from the foundation of the city to his time, of any popular commotions sufficient to disturb the public tranquility, nor of any tyrant, who had been able, at the expense of liberty, to introduce oppression. Hence, it has been inferred, that the three principal powers, of which the constitution of Carthage was composed, were of such a nature as to counterpoise one another, and by their mutual harmony, to preserve the public tranquility and promote the public happiness. These were the suffetes, the senate, and the people. The suffetes, lophetim, signifying, with the Hebrews and Phoenicians, judges, were two in number, of equal dignity and power, and the chief magistrates of Carthage. They corresponded to the two kings of Lacedemon, as well as to the Roman consuls; and hence they are sometimes called kings and consuls. They were annually
CARTHAGINIANS.

200 years after the first establishment of the tribunal of 100. The principal, if not the only, civil officers, established at Carthage, besides the suffetes, were the praetor, who had great influence in passing and repealing laws, and to whom was committed the charge of the public revenues; the quaesor, who belonged to the bench of judges, who collected and managed the public money under the quaesor; and the censores, whose business was to inspect the manners of the citizens.

The religion of the Carthaginians, as they were defended from the Tyrians, agreed at first in all points with that of the Phoenicians. But by their intercourse with the Greeks, they were led to adopt several new deities before unknown, and to blend some of the religious ceremonies of the Greeks with the Tyrian. Besides, by their extended commerce, they became acquainted with the various kinds of superstition established in other nations, which of course would give a tincture to their own; and hence it happened, that the religion of Carthage was a very gross and multifarious idolatry. It may be also presumed, that the Greek and Roman writers, in transmitting to us the history of these people, and of the objects of their worship, would affix the notions of their own gods to those of the Carthaginians. The principal deity at Carthage was Chronus, or Saturn, to whom were offered in sacrifice children of the most distinguished families. We read that upon the signal defeat of the Carthaginian army by Agathocles, 300 citizens voluntarily sacrificed themselves in order to render him more propitious to their country. This deity had a brazen statue with extended arms, so disposed that a child presented to it dropped down into a hollow where was a fiery furnace. This deity, from various circumstances, appears to have been the Moloch or Milchem of Scripture, the famous idol of the Ammonites, Canaanites, and neighbouring nations. This is supposed to have been the same god with the Baal, Bel, or Belus of the Sidonians, Babylonians, and Assyrians. The goddes Cælestis, or Urania, was held in the highest veneration by the Carthaginians. This is supposed to have been the deity called by the prophet Jeremiah, (vii. 18. xiv. 17.) Baalith Shemai, the queen of heaven; by Megalithenes, in Ezech. Belethi; by sarcophagi, Dione and Baalits; and by Hecubus, Belthes, which name was applied both to Juno and Venus. St. Augustin informs us that Venus established her reign at Carthage; and Virgil says, that Juno preferred that spot to all others. Afteroth and Aithart were synonymous to Urania and Baalits, and denoted the moon as well as Venus and Juno, who was involved in great calamities, particularly in droughts, to obtain rain. Jupiter was worshipped by the Carthaginians under the name of Belus or Baal (see Baal); Mars also was divinized by the same title; and so were likewise Bacchus and Apollo or the sun. Baal-famen, or Baal-shemaim, that is, the god of heaven, appears to have been the sun, and Beli-rama, or the queen of heaven, the moon. The Carthaginians introduced Ceres and Proserpina as Greek deities, and also Mercury, who received divine honours under the name of Afumes or Aoumes. The worship of the Tyrian Hercules was brought to Carthage by Dido, and diffused itself afterwards over all the coasts of Africa, and as far as Gades or Cadiz, where he had a magnificent temple. Besides other honours that were rendered to him at Carthage, he was annually gratified with human victims. Jolana, as the relation of Hercules, was honoured as an object of veneration at Sardina, which island was for a considerable time in the possession of the Carthaginians. The Dea Syria, or Syrian goddes, who is supposed to have been either Juno, or a group of all the goddesses, was a deity of the Carthaginians. The people of Carthage likewise addressed themselves to

Æclusapius,
from every thing that had the least appearance of wit or
rivalry. Some of them were vain, arrogant, and ambitious
to a very high degree, and, indeed, avaricious and ambitious
seemed to be with many of them ruling powers.

As commerce, the army, and the marine, were the principal
objects of attention at Carthage, and as those engaged the pur-
poses and engrossed the thoughts of the people in general, we
cannot expect to find that they should have cultivated any very
distinguished taste for the liberal arts and sciences. However,
they must have been acquainted with the rudiments of litera-
mony, without which they could not have been tolerably ves-
ed in the art of navigation. They had some notion
like a collection of temples, magnificent palaces, rich furniture, and great
variety of arms, and domestic utensils. Their records
of literature were destroyed by the Romans; nevertheless, the
names of their principal writers have been transmitted with
honour to posterity. Hannibal, it is said, was well ac-
quainted with the Greek, and wrote several pieces in this
language. Mago, another celebrated Carthaginian general,
composed 28 volumes upon husbandry, which, after the
taking of Carthage, were held in such high estimation by
the Roman senate, that they ordered them to be translated
into Latin. Philinus, who wrote a history of the wars by
the Romans and the flight of Carthage, is reckoned by
Polybius a good though a partial historian; but no part of
his work is extant. Himilco, a sea-officer, who was deput-
cated by the senate of Carthage to discover the western shores
and ports of Europe, wrote a journal of his voyage, together
with an account of his discoveries. Hanno, another Cartha-
ginian general, failed, by order of the senate, along the coast
of Africa. Having entered the ocean through the straits of
Gibraltar, he arrived first at the island of Carthage, supposed
to be the modern isle of Arguin, which became the chief
flotilla of the Carthaginians on that coast; proceeding thence
he reached a promontory, which he called the "Well Horn," probably
Capo Palmas; and from this he advanced to an-
other promontory, which he named the "South Horn,"
which is the present Cape de Tres Palmas, about 5 degrees
N. of the line. He wrote a relation of his voyage, and a
Greek fragment of it is still remaining: the authenticity of
some of whom have doubted. See Afric.

Among other inventions ascribed to the Carthaginians,
that of the quadrirames, or four-oared galleys, deferves men-
tion; and it is not improbable, that they were the first who
made cables of the shrub "spartum" (see Carthagena); at
least they were the first who communicated this invention
to the Romans. Their navigation was extended to all the
ports of the Mediterranean, both to the east and to the west;
Britain and the Canaries are said to have been known to
them; the western coast of Africa they were acquainted
with to a considerable extent, as we have already observed;
and some have asserted, but without sufficient evidence, that
their nautical skill had led them to traverse the ocean and to
visit the coast of America. They were, however, without
doubt, for a long time universally acknowledged masters of the
sea. It must be allowed, that, with the exception of those
already mentioned, to whom we may add Clitomachus the
philosopher, called in the Punic language Afdrubal, and the
celebrated poet Terence, who was born at Carthage, the Car-
thaginians could not boast of their men of literature and
science; although they had a correspondence with Greece
and the most civilized nations, their views were directed to
trade;
trade; nor do they seem to have had any emulation to avail themselves of their learning. Eloquence, poetry, philosophy, and history seem to have been little known among them; and the education of youth, though Carthage was provided at an early period with an excellent school, must have been very much neglected. The knowledge that was principally sought and valued was reflected in a considerable degree to writing, arithmetic, book-keeping, and the buying and selling of goods; so that it was subordinate to trade. In the latter years of their state the laws forbade any Carthaginian to learn the Greek tongue, lest it might qualify him for carrying on a dangerous correspondence with the enemy, either orally or by letter.

After all, commerce, independently of the wars in which they were engaged, must occupy the chief place in the history of the Carthaginians. This formed the greatest strength and chief support of their commonwealth, and we may venture to affirm, that the power, the conquests, the credit, and glory of the Carthaginians, all flowed from trade. From their Tyrian progenitors they inherited their genius for commerce, and in process of time eclipsed the glory of their ancillors, inasmuch that Pliny derives the origin of trade, not from the Phoenicians, but from the Euxinus or Carthaginians. The natural fertility of its soil, the surpassing skill of its artificers, and its peculiarly happy situation for commerce, rendered Carthage the centre of traffic, the great mart, not only of the Mediterranean, but even of the most remote nations. Without contending for the trade of the coast with their mother-country, they extended their navigation chiefly towards the west and north. Following the course which the Phoenicians had opened, they passed the straits of Gades, and visited not only all the coasts of Spain, but those of Gaul, and penetrated at last into Britain. They also extended their refractions towards the south, and planted along the western coast of the great continent of Africa several colonies, in order to civilise the natives, and accustom them to commerce. They made considerable progress, by land, into the interior provinces of Africa, traded with some of them, and subjected others to their empire. The commodities with which they supplied other countries, seem to have been corn and fruits of all kinds; divers sorts of provisions, and high fæces; wax, honey, oil, and the skins of wild beasts, all the natural product of their own territories. Their staple manufactures were utensils, toys, cables, all kinds of naval flores, and the colour from them called Punic, the preparation of which seems to have been peculiar to themselves. From Egypt they fetched fine flax and paper; from the coasts of the Red Sea, spices, frankincense, perfumes, gold, pearls, and precious stones; from Tyre and Phoenicia, purple and scarlet, rich luffs, tapetery, costly furniture, and various artificial curiosities; from the western parts of the world, in return for the commodities carried thither, they imported iron, tin, lead, and copper. By thus purchasing the superfluities of all nations, with which they had intercourse, at an easy price, and selling them at an advanced rate, they brought immense treasures to Carthage, rendered this republic formidable to her neighbours, and enabled her to contend with Rome itself for the empire of the world. The gold and silver mines of Spain furnished the Carthaginians with an inexhaustible source of wealth. Polybius, quoted by Strabo, says, that in his time upwards of 40,000 men were employed in the mines near Nova Carthago, and supplied the Romans, at a subsequent period, every day with 25,000 drachmas, or 859l. 7s. 6d. Herilng. Besides, the Carthaginians carried on, by means of their caravans, an annual intercourse with the Perians, Garamantes, and Ethiopians; and brought from these remote nations, together with other rich commodities, catherine's of inestimable value; which gems, from the plenty of them at Carthage, were called by the ancients Carchedonian or Carthaginian. We may add, that no profession was more honourable than that of the merchant in the dominions of this state; nor is it any wonder, when we consider the numberless advantages that accrued from it. Herodotus (lib. iv.) mentions a singular mode of carrying on traffic between the Carthaginians and the Libyans, who bordered on the sea-coasts, beyond the fruits or pillars of Hercules. After they had run into some creek, they landed their goods, and leaving them exposed on a point of land, returned on board their ships. They then caused a great furnace to be raised, at the sight of which the Libyans came to the spot where the march had been left, and laying down a quantity of gold, retired a distance. The Carthaginians went on shore a second time, and if the gold appeared to them sufficient, they carried it off and failed without delay; if not, they remained quiet on board their ships for some time. The Libyans, finding they were not satisfied, made an addition to what they had before deposited; and they continued increasing the quantity of gold, till the Carthaginians were satisfied and the bargain made. Neither of these nations offered the least injustice to the other. The Carthaginians did not touch the Libyan gold till it was of equal value with their wares; nor did the Libyans meddle with the Carthaginian merchandise till the gold they offered as an equivalent was accepted and taken away. A similar mode of trade seems to have flourished among the Bedas of Ceylon. See Bedas.

In order to sketch out the history of the Carthaginians, as our limits will not admit of a minute detail, we shall distribute the duration of their state, which, according to Appian, was 700 years, and which others make 746 years, but which we consider to have been 700 years, towards the end of which the Carthaginians were engaged in the following nearly contemporary events, mentioned by Solinus, at 727 B.C., into three distinct periods or epochas. The first commences with the foundation of Carthage, in the year 883 B.C. and extends to the invasion of Sicily, in the year 480 B.C.; comprehending an interval of 403 years. The second extends from this invasion to the rupture with the Romans, in the year 264 B.C. or the commencement of the first Punic war, being an interval of 216 years. The third period lasted 115 years, during which the three Punic wars occurred; the first commenced 24 years, from the year 264 B.C. to 241 B.C.; the second commenced 17 years, from the year 221 B.C. to 204 B.C.; and the third continued 9 years, from the year 149 B.C. to 140 B.C. when Carthage was destroyed.

The first period, according to the above distribution, is imperfectly known. We have already related (see Carthage) that Elisa, known by the name of Dido, fled from Tyre in the 7th year of the reign of Pygmalion, king of that city, and landing on the coast of Africa, founded either the city of Carthage, or at least the citadel of Byrsa, by the year 814 after the troglodyte of Dido; there is a chain in the history of the Carthaginian state. During this period their whole attention seems to have been engaged in the extension of their commerce, and in forming establishments, with this view, in various parts of the world. It appears that at a very early period this republic had made considerable acquisitions in Sicily and Sardinia, and other places; and that it was formidable by sea in the time of Cyrus and Cambyse. This latter prince, in the 6th year of his reign, was obliged to abandon an expedition which he had projected against the Carthaginians, because the Phoenicians would not succour him; and hence it appears, that the whole naval power of the Perisan empire was unable to contend with that of Carthage, without the assistance of the Tyrians. In the year 508 B.C. the year after the re-
the Carthaginians concluded a treaty with the Romans, chiefly relating to navigation and commerce; and they were the first people out of Italy with whom the Romans entered into an alliance. From this treaty, which was signed 28 years before Xerxes invaded Greece, we learn, that the whole island of Sardinia, and part of that of Sicily, were then subject to the Carthaginians. At this time they were well acquainted with the coasts of Italy; and they manifested on various occasions a jealousy of the enterprise of the Romans; nor would they permit them to fail beyond the promontory called the "Fair Promontory," lying to the north of Carthage, left they should discover the fertility of the land, as well as the favourable situation of the cities, and be tempted to make a settlement. Under Mago, a Carthaginian general of consummate abilities and merit, and who is said to have first introduced military discipline among the soldiers, the dominions of Carthage were much enlarged, its commerce extended, its riches increased, and virtue alone was countenanced both in the army and the state. He left the country in the most flourishing condition, and was succeeded in his high employments by his sons Adrhnal and Hamilar. To them was committed the command of the army against Sardinia, which had revolted, and in the war that was protracted on this occasion, Adrhnal was mortally wounded. His death was much lamented by the Carthaginians. About this time the Carthaginians, determined to flake off the African yoke, by discontinuing the tribute which, by their original contract, they were obliged to pay, declared war; but being unsuccessful, it was terminated by a treaty, the chief article of which required, that the tribute as at first imposed upon them for the ground on which the city stood, should be continued. In process of time, however, the tribute was abolished. It was about this time that Darius Hyllaphis, king of Peria, sent an embassy to Carthage, requiring the inhabitants to abstain from human sacrifices, and from eating dog's flesh; to burn their dead, and not to bury them, as had been the usual practice; and to furnish him with a body of auxiliary forces to serve in the war which he had declared against Greece. With the last article the Carthaginians did not think proper to comply, because their troops were otherwise engaged. Towards the close of Darius's reign, it seems probable that an offensive and defensive league was formed between these two powers; however, it is certain, that an alliance was entered into between Xerxes, the successor of Darius, and the states of Carthage: and that the Carthaginians engaged to invade Sicily with all their forces, and endeavour to drive the Greeks from thence, as well as the continent of Italy, whilft that prince marched in person, with the whole strength of the Persian army, against Greece itself. The first settlement of the Carthaginians in Spain must have preceded the period of which we are now speaking; and it is most probable that the nerves of their power were the mines of Spain, by which they were enabled to equip such powerful fleets and collect such formidable armies; and that, by their affidavit, they made such extensive conquests in Sicily and Africa. But, though the first Carthaginian settlement in Spain must have preceded the reign of Xerxes and Darius, and even that of Cyrus, and have occurred when the city of Gades, now Cadiz, was in its infancy, yet we learn from Livy and Polybius, that the greatest part of Spain remained unfubbled till the wars of Hamilar and Hannibal. Dichorus Siculus informs us, that the Carthaginians sent a colony into the island Ebusus, or Ercus, now Yvica, 160 years after the foundation of their city; and it is highly probable, that about this time the Balearic islands, now called Majorca and Minorca, were likewise either planted or reduced by the same people, and that they were furnished by those islands with the most expert fishermen in the world, who did them great service in their battles and sieges. See BALEA R I S I N F O R E . To this period also it is reasonable to refer the first descent of the Carthaginians in Spain. As Sardinia was in the possession of the Carthaginians when they made their first treaty with the Romans, we are warranted in concluding that Carthage, separated from the former by a strait of about 3 leagues in breadth, was possessed by them, either wholly or in part, in very ancient times; and Herodotus expressly informs us, that the Cyrenians, or Carthicans, were one of those nations which enabled the Carthaginians to form that great army, with which they invaded Sicily, in the days of Gelon. After the conclusion of the treaty with Xerxes, already mentioned, the Carthaginians, in pursuance of their engagements, made great preparations for war against the Greeks of Sicily, both by sea and land. This brings us to the second period of the history of Carthage, which commenced with the year 481 B. C. The preparations for this expedition lasted 3 years, and large sums of money were sent by Xerxes from Persia to assist the Carthaginians in completing them. When every thing was ready, Hamilar, the son of Hamus, according to Herodotus, but of Mago, according to Polybius, was appointed to the command; and he failed from Carthage with 300,000 men, composed of different nations, and a fleet of above 2000 ships of war, with 3000 transports, not doubting to make an entire conquest of Sicily in the first campaign. B. C. 480. Notwithstand ing an ominous disulter in the passage, by which the horses and chariots of Hamilar perished in a storm, the general, on his arrival at Panormus, now Palermo, endeavored to dissipate the gloomy apprehensions of his followers, by representing the certainty of success, and expressing his fear lest the Sicilians, by reason of the storm, would escape the danger that threatened them. Having laid siege to Himera, he was attacked by Gelon and Theron, the tyrants of Syracuse and Agrigentum, with their united forces; and after a long and bloody contest, Hamilar was slain, and the whole Carthaginian army either put to the sword, or obliged to surrender at discretion. The Carthaginian fleet was likewise totally destroyed. The news of this defeat arrived at Carthage by one small boat, the solitary remnant of their fleet; and produced lamentation and terror through the whole city. Such was the indignation which this disulter produced in the public mind against Hamilar, that, notwithstanding all his past services, it was determined to make his family suffer; and therefore Gisco, his son, was banished, and retiring to Selinus, he died there for want of necessaries. Gelon granted the Carthaginians peace on the following terms: that they should pay two talents of silver towards defraying the expenses of the war; that they should build two temples (one to Eres and another to Proserpine) where this treaty should be deposited; and at all times be exposed to public view;—and that, for the future, they should abstain from human sacrifices. From this time to the close of the 5th, or beginning of the 5th Olympiad, B. C. 469 or 468, the Carthaginians are scarcely mentioned in the Sicilian history; though during this interval they turned their arms against the Moors, Numidians, and other African nations, and greatly extended their frontiers in Africa; they also released themselves from the tribute which they had been accustomed to pay, and became absolutely independent. They had likewise warm disputes with the people of Cyrene, the capital of Cyrenaica, and after shedding much blood, accommodated their differences by the interposition of two brothers, called Philæans, who extended their territory, and contented to be buried alive in the place fixed upon as their boundary. See PHILÆN. In the year B. C. 469, the Egestines, or Segestians, who had declared in favour
of the Athenians, against the Syracusans, dreading their re-
fentment, and being actually attacked by the people of Sel-
nuntum, implofed the aid of the Carthaginians; and for their
more effeclual succour, Hannibal, one of the Sutfetes, grand-
son to Hamilcar, and fon to Gifco, who had been exiled, was
enrolled with the command of an army, confiding, as some
say, of 200,000 foot and 4000 horfe, or, according to others,
of about 100,000. Having captured Seluntum, or Sel-
nus, with circumftances of peculiar barbarity, and also Hí-
mea, he returned to Carthage, laden with fpoils, and was
received with loud and joyful acclamations. The Carthagin-
ians, elated with this fucces, meditated the reduction of the
whole ifland of Sicily; and in the year B.C. 406, they deputed
Hannibal, aided, on account of his age and infirmities, by Im-
lickar, or Imilcon, the fon of Hanno, with a large fleet and
army, for this purpose. The campaign was opened with the
fiege of Agrigentum, which, after a vigorous resistance, was
taken and plundered, and laid in ruins. See Agrigentum.
Gela and Camarina shared the fame fate. This war
was terminated by a treaty with the tyrant Dionyfius;
after which Endorfer, who had been much weakened
by the cafes of war, and by the plague, which had
broke out in it, returned to Carthage, where this dif-
order made dreadful havoc, as it also did in other parts
of Africa.
Dionyfius, having by the fore-mentioned treaty gained
time for eftabliffing his authority at Syracuse, began his
preparations for renewing the war with the Carthaginians;
and when he had fortified the city and completed his naval
and military arrangements, he communicated his design to
the Syracusans, which was that of ifantly attack ing
the Carthaginian territories, without a previous declara-
tion of war. Accordingly in the year 357, B.C., he commenced ho-
ilities, by abandoning to the fury of the populace the perfo ns
and the defiileons of the Carthaginians who retired at Sy-
acuse, and traded on the faith of treaties. This example of
perfidiousnefs and barbarity was followed throughout the
whole ifland of Sicily. Having thus begun, he di-}spatch ed
a herald to Carthage, with a message to the senate and peo-
ple, requiring them to withdraw their garrisons from all the
Greek cities in Sicily, and threatening them, on refiufal, with
treating all the Carthaginians that were found in them as
enemies. This intelligence occafioned a general alarm
through the city, which the plague had already reduced to a
very miserable condition. But the Carthaginians, though
alarmed, were not intimidated; nor did they lose any time
in preparing for defence, and in collecting an army, the
command of which they conferred on Himilco. Diony-
fius, without waiting for their reply, put his army in motion, and
opened the campaign with the siege of Motyz, which was the
magazine of the Carthaginians in Sicily: and after a
long and obdurate refiiftance, the city was taken by inor-
mal, and all the inhabitants put to the sword, thofe ex cepted
who took ifanctuary in the temples. Himilco, unable to
prevent its capture, returned to Africa; but in the fol-
owing year he was appointed one of the Suffolkes, and re-
turned to Sicily with a far greater army than before. He
landed at Panormus or Palermo, took feveral cities, and re-
covered Motyz by force of arms. Animated by these suc-
ccefses, and also by the capture of Mefina, he advanced to-
wards Syracuse, with a defign of gaining it; marching his
infantry by land, whilst his fleet, under the command of Mago,
failed along the coast. His army confifted, as fome fay, of
300,000 foot, and 3000 horfe, or as others fay, 40,000
foot, and his fleet of 200 ships, and 500 barks. Whifh he
was making progres in the fiege, a contagious def汜-erme
dmade dreadful havoc among his troops. Dionyfius availed
himself of this favourable opportunity for attacking the
Carthaginian forces; whilst most of the ships were either
taken or burnt, great slaughter was committed in the Car-
thaginian camp; and Himilco, by a private capitulation
with Dionyfius, and for the sum of 300 talents (54,000)
according to fome, or by another estimate 61,800, ob-
tained permission to depart in the night, with all the fur-
viving citizens of Carthage, to Africa. The remainder of
his army was left to the mercy of the conqueror.
The Carthaginians received intelligence of this diflarious
event with inexpreflible grief and confternation; and Himilco,un-
able to survive his misfortune, and bewailing his own fate
and that of his country, put an end to his own life. The
news of Dionyfius's fucces induced the Africans to revolt
from the Carthaginians, whom they naturally hated, and
againft whom they were now particularly incenfed for hav-
ing faved only their own citizens, and for having left the
confederates to the mercy of the enemy. Accordingly an
army of 200,000 effective men was foon collected;
and having taken Tunis in their march, they advanced
towards Carthage; but, defirous of experienced commanders,
and undisputed command, had been obliged to difperse, and Carthage was delivered from one of the moft imminent dangers that ever threatened it. Not-
withstanding the great lofses which the Carthaginians had
sustained in the coufe of this war, which latted about five
years, they could not forbear making new attempts upon
the ifland of Sicily; and an army of 80,000 men was com-
mited to the conduct of Mago. Although he gained many
advantages, he found himself in an enemy's country, and dif-
tressed for want of provifions, he thought it most prudent to
conclude a treaty of peace with Dionyfius, and to return to
Carthage. For nine years after this peace the Carthagin-
ians feem to have enjoyed uninterrupted tranquillity; but
in the second year of the 99th olympiad, B.C. 383, Dio-
yfius, meditating a war againft them, formed a project for
improving his finances, that he might be enabled to carry it
on with succes. The Carthaginians, apprized of his in-
tentions, strengthened themselves by alliances with their neigh-
bours, and adopted all other neceflary measures for self-de-
fence. After some alternate succefses and defeats, Mago,
the Carthaginian general, and fan of the former general,
who loft his live at the battle of Cabala, concluded a peace
with Dionyfius upon condition of his ceding to the Cartha-
ginians the city and territory of Selinus, as well as that part
of the island of Agrigentum, bordering on the territory of
Selinus, and extending as far as the river Halycon, and also
of his paying them 1000 talents towards defraying the ex-
penses of the war. Between three and four years after the
conclusion of this war, (B.C. 378,) Carthage suffered much
from the plague, which swept away a very great number of its
inhabitants. The Africans and Sardinians took the advantage
of it, and made some attempts for throwing off a yoke
which was hateful and grievous; but their efforts were ine-
effectual, and they were soon reduced to their former ali-
gence. Towards the beginning of the 103d olympiad
(B.C. 368) Dionyfius, emboldened by the weakened state of
Carthage, formed an enterprise in Sicily, which was un-
succesful and terminated in a truce; but he did not long
survive this event. This truce was changed by his fon and
successor, Dionyfius II., into a perpetual peace. Soon after
this time, A. U. C. 402, (B.C. 353) the Carthaginians
concluded a fecod treaty with the Romans, nearly of the fame
tenor with the fift, excepting that the inhabitants of Tyre
and Utica were expressly comprehended in it, and joined
with the Carthaginians. After the death of the elder Dio-
yfius, Syracuse was involved in great troubles; and Dio-
yfius, the reigning prince, was under a necessity of quitting
his throne, and continuing 10 years in exile; but he was after-
wards restored, and found means to reimburse himself in his dominions. However, his temper was savage and brutal, and he exercised great cruelties among his subjects. This seemed a favourable opportunity for the Carthaginians to make themselves absolute masters of Sicily; and accordingly they equipped a large fleet, and entered into an alliance with Ictæas, tyrant of the Leontines, who had taken Syracuse under his protection. The two powers engaged, by this treaty, to unite their forces in order to expel Dionysius; and, after his expulsion, to divide Sicily between them. The Syracusans, discovering this design, applied to the Corinthians for assistance; who sent over Timoleon, a general of consummate abilities, and an ardent friend to liberty, with a body of troops to their assistance. Accordingly, in the year B.C. 345, he set sail from Corinth for Sicily with 10,000 armed soldiers, and purposing his voyage over the Ionian sea. He arrived safely, with his small fleet, at Metapontum, on the coast of Italy. From thence he advanced to Rhegium, where, by a happy stratagem, he induced the vigilance of the Carthaginians, and landed his forces at Tauromenium in Sicily. His small forces advanced boldly on the relief of Syracuse; and made his way into one part of the town before the enemy had any notice of his approach.

Here he defended himself with such resolution that he could not be dissuaded by the united powers of Ictæas and the Carthaginians. Dionysius, having surrendered the citadel to Timoleon, with all the forces, arms, and ammunition in it, escaped, by his assistance, to Corinth: and a dissatisfaction having taken place among Mago’s soldiers, in consequence of an artful representation made by the emissaries of the Corinthian general, that it was Advantageous to fee Greeks, who formed a great part of the Carthaginian army, using their endeavours to make barbarians masters of Sicily, from whence they would, in a very little time, pass over into Greece: Mago himself, wanting a pretence to retire, intimated that his forces were about to betray and defect him, and, therefore, failed with his fleet out of the harbour, and deserted Carthage. Ictæas could not maintain his position against the Corinthians; and thus they got possession of the whole city. Mago, on his arrival at Carthage, was impeached; but he prevented the execution of the sentence passed upon him, by a voluntary death. The Carthaginians, with a view of repairing the losses they had sustained, levied new forces, and sent to Sicily a greater and more powerful fleet than the former. It consisted of 200 ships of war, besides 1000 transports; and the army amounted to upwards of 75,000 men. They landed at Labrænum and Timache with 7000 men, marched out to meet them. Of the 4000 mercenaries, which composed his small army, a thousand deserted upon the march to the river Crimcus or Crimisa, on the banks of which the enemies were encamped: and yet, with perfect confidence in the value of his own soldiers, he was determined to hazard a battle. The event justified his expectations: the Carthaginians were completely routed; more than 10,000 fell on the field of battle, of whom 3000 were Carthaginian citizens, and 2500 formed what was called the sacred cohort, so that this event filled their city with mourning and consternation. Their camp was taken; and with it immense riches, and a great number of prisoners. This memorable battle was fought on the 27th day of the month Thargelion (June 13th) B.C. 340. It was followed with a treaty of peace, between Timoleon and the Carthaginians, which stipulated that all the Greek cities should be declared free; that the river Halycus or Lyuce should be the boundary between the territories of both parties; that the natives of the cities subject to the Carthaginians should be allowed to withdraw, if they pleased; to Syracuse, or its dependencies, with their families and effects; and that Carthage should not for the future afford any assistance to the remaining tyrants against the Syracusans. It was about this time that Hanno, an opulent and powerful citizen of Carthage, formed a design of subverting the constitution, and introducing arbitrary power. With a view to the accomplishment of this project, he proposed to invite the senators to a grand feast made on occasion of his daughter’s marriage; and by mixing poison with wine to destroy them all; not doubting but such a tragical event would at once make him master of the republic. The plot was discovered, but Hanno’s interest in the city was so great, that the government could not venture to punish him, even for so execrable a crime. Hanno, finding that his first stratagem was defeated, had recourse to arms, and collected together all his slaves for the execution of his purpose. This plot was also discovered. In order to avoid merited punishment, he retired with 20,000 armed slaves to a castle that was strongly fortified; and from thence fought the assistance of the Africans, and of the king of Mauritania. When all his projects had failed, he was taken prisoner, and carried to Carthage; where, after being severely scourged, his eyes were put out, his arms and thighs broken, and his body was suspended on a gibbet. His children and all his relations, though they had not participated in his guilt, shared his punishment. They were all sentenced to die, that not a single person of his family might survive, either to imitate his crime or to revenge his death. It was probably about this period, or somewhat later, that the Tyrians sent ambassadors to Carthage, to implore assistance against Alexander, but being incapable of furnishing them any succour, they dispatched 30 of their principal citizens to Tyre, to conclave with them on this afflicting occasion, and to express their concern, that the bad situation of their own affairs would not permit them to spare any troops. The Carthaginians themselves, when they heard of Alexander’s progress in the East, began to entertain apprehensions for their own safety; and deputed Hamilcar, or as Gellius says, Adrurar, famed Rhedanus, a person of wonderful address and eloquence, to wait upon that prince; and having been introduced to him by means of Parmenio, he so far ingratiated himself into his favour, as to have the honour of attending him in all his future expeditions. Having obtained this degree of confidence with Alexander, he did signal service to his country, by communicating many important discoveries relating to the conqueror’s schemes. Although the treachery of this Carthagian escaped the discovery, or even the fulmination of Alexander, he was, after his return to his own country, notwithstanding all his services, considered as a betrayer of his country, and was accordingly put to death at Carthage, by a sentence as barbarous as it was ungrateful. About the year 319 B.C. Agathocles, a Sicilian, of obscure birth and low fortune, rose into notice; and supported at first by the power of the Carthaginians, he invaded the sovereignty of Syracuse, and made himself tyrant over it. In the infancy of his power, the Carthaginians kept him within bounds, and Hamilcar, their chief, forced him to agree to a peace, which restored tranquillity to Sicily. But he soon infringed the stipulated articles of it; and declared war against the Carthaginians themselves, who under the conduct of Hamilcar, obtained a signal victory over him, near Himera, in the year B.C. 310, and forced him to flit himself up to Syracuse. The Carthaginians purified him thither, and laid siege to that important city; and if they could have taken it, they would have gained possession of all Sicily. Agathocles, finding himself deserted by his allies from an abhorrence of his cruelties, formed a most daring
and to appearance, an impracticable scheme, of transferring the war to Africa, and invading Carthage, at a time when he himself was beguiled, and had only one city left in Sicily. His profound secrecy in the execution is no less astonishing than the design itself. Without importing his scheme to any confidential friend, he merely declared that he had discovered an infallible method of reforming the Syracusans from the dangers that surrounded them, so that inconvenience would attend a short siege; but that those who chose to escape, might freely leave the city. Sixteen hundred persons quitted it; and all slaves who were able to bear arms were let at liberty, and joined his forces. With a fleet of 30 talents for the funds of his present wants he set sail with two of his sons, without informing either of his followers whether he intended to distress his foes. The Carthaginians endeavoured to prevent the departure of the fleet, but Agathocles eluded their pursuit, and made his escape to the main ocean. When he arrived in Africa, he communicated to his troops the design of this expedition and the motives that had prompted him to undertake it. The soldiers heard his speech with acclamations; flattered themselves with the prospect of foes, and thought that they were already masters of Carthage. As he approached the city, the inhabitants were alarmed, and could not help imagining that their army before Syracuse had been defeated and their fleet lost. After some deliberation, they resolved to arm the citizens; and with 40,000 foot, 1000 horse, and 2000 armed chariots, under the command of Hamanu and Bamilcar, they marched to meet the enemy, whose force composed of 13 or 14,000 men. The battle was obstinate and bloody; at length Hamanu and the sacred cohort, who long sustained the fury of the Greeks, were overwhelmed with a shower of stones, and the general fell, sword in hand; while Bamilcar proved treacherous, retired with the army under his command, and left the field to Agathocles.

After this defeat, the Carthaginians determined to recall Hamanu from Sicily; accordingly he sailed the siege of Syracuse, withdrew his troops from the place, and sent a detachment of 5000 men to reinforce the troops in Africa. Bamilcar and his remaining forces were attacked by the Syracusans; upon which, being defeated by his army, which before the engagement amounted to 120,000 foot, and 7000 horse, he was taken prisoner and carried into Syracuse. In the mean while Agathocles, having gained several advantages in Africa, was preparing to besiege Carthage itself; and advancing to the camp of the Carthaginians who covered the city, he communicated to them the dificult intelligence of the total devastation of their army in Sicily. This news filled them with consternation, and Carthage itself would have been lost, if an unexpected mutiny had not occurred in the camp of Agathocles, which proved shod in fatal to the tyrant himself, and gave the Carthaginians an opportunity of rallying and recovering strength. This was followed by an indecisive battle between Agathocles and the Carthaginians, who had sent an army to punish and reclaim Numidz, which had revolted. During these transactions, Bamilcar, who possessed the first employment in the state, attempted to effect a revolution at Carthage, and to obtain the sovereignty of that city, to which he had long aspired. A dreadful massacre was the means by which this revolution was to be accomplished; but as soon as it was known that Bamilcar was the cause of this disturbance, and that he had casted himself to be proclaimed king of Carthage, the indignation of the people was roused; the traitor was apprehended, and executed on a croas in the middle of the forum; and thus the Carthaginians were rescued from the most dangerous domestic enemy their state had ever produced. Agathocles finding himself at the head of a numerous army, assumed the title of king of Africa, and proposed soon to complete his conquests in that country by the reduction of Carthage. But after having taken Utica, he was diverted from his further progress by a commotion in Sicily, which required his presence. His son Archagathus, with whom he had entrusted the command in Sicily, was for some time successful in extending his conquests; his career of victory, however, was interrupted by some decisive advantages gained by the Carthaginians; and it became necessary to summon Agathocles from Sicily. Upon his arrival in Africa, he took the earliest opportunity that occurred of attacking the Carthaginian camp, but met with a total defeat. This disaster, together with some other unfavourable circumstances that happened, induced Agathocles to quit Africa. After his departure his two sons were affiliated by the followers, (B. C. 285.) who, chusing leaders from among themselves, concluded a peace with the Carthaginians, which was in the following year ratified by Agathocles. The Carthaginians by this peace, had all the cities restored to them, which they had formerly possessed in Sicily, and deriving this advantage from the termination of the war, they left Agathocles at liberty to pursue his designs in Sicily. Urged by his implacable hatred to the Carthaginians he prepared for a new war; but this, and other projects which he had formed, were frustrated by his death, B. C. 283. In the year, B. C. 280, Pyrrhus, king of Epirus, turned his arms against Italy; but before he landed, the Romans renewed their treaties with the Carthaginians, with an additional engagement of mutual alliance, if either of the contracting powers should be attacked by this prince. Accordingly the Carthaginians, as soon as they heard of Pyrrhus's descent in Italy, sent a fleet of 120 sail under the command of Mago; who, in an audience before the senate, signified the concern with which his principals had heard of the hostilities of Pyrrhus, and offered, in the name of his republic, a body of auxiliary troops to enable them to repel their foreign invader. The senate returned thanks for this obliging offer of the Carthaginians; but at the same time declined accepting it. Some days after this interview with the senate, Mago repaired to Pyrrhus, on pretence of offering the mediation of Carthage for terminating his quarrel with the Romans; but the real motive of this visit was to discover, if possible, what were his design with regard to Sicily, which common fame reported he was going to invade. The Syracusans, indeed, who had been for some time besieged by the Carthaginians, had sent pressing intreaties for succour to Pyrrhus. Accordingly he at last failed from Tarcentum, passed the Strait, and arrived in Sicily. His conquests were at first so rapid, that he left the Carthaginians, in the whole island, only the single town of Lilybæum. To this he laid siege, but finding a vigorous resistance, and being summoned back to Italy, he gave up his siege. Upon his departure, Sicily immediately returned to its former masters; so that he left the island with the same rapidity that he gained it. As he was embarking, turning his eyes back to Sicily, he exclaimed, "what a fine field of battle do we leave to the Carthaginians and Romans!" and his prediction was soon verified. After his departure, Hiero was appointed prætor of Syracuse and general of the Syracusan army. Under his command they obtained several advantages over the Carthaginians, and in a short time became formidable to that republic. It was not long, however, before the Romans, who were extending their views beyond the boundaries of Italy, formed a resolution of establishing themselves in Sicily; and this soon occasioned a rupture between them and the Carthaginians, which was followed by the first Punic war: and
CARTHAGINIANS.

and with this commences the cruel period in the history of Carthage.

The first Punic war commenced in the year, B.C. 644, and it arose from the following circumstances. Some Carthaginian soldiers, who had belonged to the army of Agathocles, were kindly received at Messana, as they were leaving Sicily and embarking for their own country. But with an atrocious ingratitude and perfidy, they took occasion, in the night, either to expel or affright all the men; after which they married their wives, freed their effects, and remained sole masters of that important city. After they had divided the land and riches of the inhabitants among themselves, they called the city Mammaertina, and affirmed the name of Mamertinus, that is, a mortal or unholy people, from Mamers, a word which, in their language, signified Mars, the god of war. In imitation of their conduct, and by their affright, a Roman legion treated in the same cruel manner the city of Rhegium, which lay directly opposite to Messana, on the other side of the strait. These two perfidious cities, concurring and mutually supporting each other, became formidable to their neighbours. Messana, in particular, being very powerful, gave great alarm and uneasiness both to the Syracusanians and Carthaginians, who possessed one part of Sicily. The Romans, after the departure of Pyrrhus, determined to punish the revolters at Rhegium; and for this purpose they took the city, killed most of the inhabitants in the attack, and carried about 300, who survived, to Rome, where they were scourged, and publicly behelded in the forum. By this ignominious execution the Romans wished to terrify to their allies their own innocence and integrity. Rhegium was then restored to its lawful posterity.

The Mammaertines were thus considerably weakened; and while they were concerting means for their own safety, they disagreed among themselves, so that one party surrendered the citadel to the Carthaginians, and the other called the Romans to their assistance and refused to put them in possession of their city. Thus commenced the first Punic war. Although the Romans sent an embassage to make terms of peace, the Mamertines, who had acted a treacherous and cruel part; the people were left sporadical, and determined to affright them. With this view the confidant Appius Claudius crossed the strait with his army, and continued to enforce the vigilance of the Carthaginian general. The Carthaginians, partly by art and partly by force, were driven out of the citadel, and the city immediately surrendered to the confidant. The Carthaginians having executed their general, prepared to besiege the town with all their forces, which were also joined by those of Hiero. The confidant, however, defeated them separately, and having raised the siege, laid waste the country. This was the first expedition, which the Romans made out of Italy. Hiero afterwards entered into an alliance with the Romans, which the Carthaginians were unable to prevent. The Carthaginians, thus defeated by their ally, determined to make every possible effort for driving the Romans out of Sicily; but these efforts were so far from being effectual, that they lost several towns, and particularly Agrigentum, which Hanno, commander in chief of all the Carthaginian forces, had made a place of arms, and his principal magazine. Notwithstanding these acquisitions, the Romans were well apprized, that as long as the Carthaginians retained the dominion of the sea, it would not be in their power to drive them out of Sicily; and, therefore, they now formed the first design of having a fleet, and of disputing with the Carthaginians the empire of the sea. At this time they had not a single vessel, which they could call their own; but though they were deficient of experience in maritime affairs, they applied to them with such ardour and industry, that in two months they built 450 four-decked galleys, and after some time spent in exercising the rowers, their fleet put to sea, under the command of the confidant Dido, and sailed in quest of the enemy. The Romans, coming up with the Carthaginians near the coast of Mylae, prepared for an engagement; and, viewing themselves of a grappling instrument, called Carraia or cross, they were able to board the enemies' ships and to come to a close fight. The Carthaginian fleet consisted of 180 galleys, under the command of Hamilcar. At first the Carthaginians defied their enemies; but when they saw the above-mentioned engines nailed on the prow of every one of their ships, and found that they were thrown forcibly into their vessels so as to grapple them in spite of all resistance, they were not a little astonished. Being thus compelled to fight as if they had been on land, they were unable to sustain the attack of the Roman vessels, which produced a great slaughter among the Carthaginians, and the loss of 80 vessels. This unexpected victory raised the spirits of the Romans; and extraordinary honours were conferred on Dido, as the first Roman to whom a naval triumph was decreed. After several maritime conflicts, in which sometimes the Romans and sometimes the Carthaginians were victorious, the advantage upon the whole was on the side of the former. Determined, however, to combat the Carthaginians in their own country, they both prepared for a decisive engagement. The Roman fleet, consisting of 350 galleys, on board of which were about 140,000 men, was commanded by the consuls L. Munius Vallo and C. Attilius Regulus, and rendezvoused at Messana; and the Carthaginian squadron, composed of 350 sail, and about 150,000 men, and commanded by Hanno and Hamilcar, after assembling at Lilybaeum, took their station at Heraclea Minos. The two fleets at length came within view of each other, and made the necessary dispositions for battle. The Roman squadron consisted of four divisions; the first of which was stationed on the right and the second on the left, and the third in the rear of the other two, so as to form a triangle, the vertex of which was composed of the two admiral galleys, in which were the confidants, placed in the front of their respective squadrons. The triarii, forming the fourth division, were drawn up in the rear of the whole fleet, parallel to the third division, the base of the forementioned triangle, but extending beyond the two angles. The transports, with the horses and baggage on board, lay between the third division and the triarii, this being the situation in which they would be most secure from any attacks of the enemy. The Carthaginians, having perceived the disposition of the Roman squadron, immediately ranged their own in order of battle. They divided it into four smaller squadrons, which they drew up in one line. The three first divisions, posted to the right, stretched far into the sea, as if they intended to surround the Romans, pointing their prows directly upon them; the fourth lying to the left, kept close under shore, being disposted in the form of an outwork or tenaille. Hanno commanded on the right, and Hamilcar on the left. In this action, which was conducted on both sides with great skill and valour, the Romans lost 24 galleys; but the Carthaginians, who were entirely defeated, had 37 sunk, and 65 taken by the victors. After this battle, which happened near Heraclea Minos, Hamilcar made proposals of peace to the Romans, chiefly with a view of diverting them from the African expedition; but the Romans, rejecting the proposal, carried on the war; and the confidants, after failing for Africa, with their whole fleet, and a powerful army on board, landed at Clypea without opposition. Regulus with the forces under his command committed great ravages.
CARTHAGINIANS.

The Carthaginians advanced to meet him; an encounter ensued, and the Carthaginians were defeated, with the loss of 17,000 men, and 18 elephants. Regulus, after this action, burnt all the open places, and, as Eutropius informs us, conquered 73 towns. Utica and Tunis were both obliged to submit, and nothing seemed now to remain but the siege of Carthage itself. To complete the misfortunes of the Carthaginians, the Numidians entered the territories of Carthage and committed such dreadful devastations, that a famine seemed to be inevitable. The African nations likewise, more immediately subject to Carthage, being weary of the Carthaginian yoke, joined the Romans. Regulus, well knowing the disfavour of the Carthaginians, offered to negotiate a peace; but his terms were so humiliating, that the Carthaginians resolved to suffer any extremities rather than submit. Regulus and the Romans were become insufferably arrogant, in consequence of their success; and after having defated the country, had advanced to the great morals, on which Carthage stood, refusing, upon the rejection of his proposals, to make the capital of an African republic. At this moment of alarm and danger, Xantippus, a Lacedaemonian of great bravery and military skill, with a body of Greek mercenaries, arrived at Carthage. Having assumed the command of the Carthaginian forces, he taught them to form all the evolutions and movements of the military art, according to the Lacedaemonian manner. The Carthaginians, thus instructed and inspired, thought themselves invincible under the conduct of Xantippus, who drew them up in order of battle in a large plain before the city, and boldly advanced towards the Romans. After calling a council of war, in deference to the Carthaginian commanders, it was resolved to give the enemy battle on the following day. Regulus was become vain and self-confident, and by his misconduct occasioned the total ruin of his army. Xantippus availed himself of the error which he committed, and either put to the sword, or took prisoners, all, except 2000 men, who broke his right wing and made their escape to Clypea. Of the Carthaginians 800 were slain; and on the side of the Romans the number of those who fell in the battle and pursuit must have been about 13,000. Xantippus took Regulus himself, and 500 of his men, prisoners in the pursuit, and immediately carried them to Carthage, where all, except Regulus, were treated with great humanity. Regulus had in his prosperity so inflicted the Carthaginians, that he is said to have been confined in a dungeon, with suffocance barely sufficient to keep him alive, and a huge elephant, at the sight of which animal he was always greatly terrified, was constantly placed near him. On this occasion the Carthaginian army did not consist of above 10,000 men, besides the elephants; and therefore, considering the number and valour of the Roman legions, this was a wonderful victory, and justly attributed to the conduct and bravery of Xantippus. This battle was fought in the year, B. C. 256. The Romans were not discouraged; but in the following campaign they put to sea with 350 vessels, and in an engagement with the Carthaginians, who met them with 200, proved victorious, took 114 ships and failed to Africa in order to bring away the small remnant of the army of Regulus. The Romans afterwards sailed, by storms and other occurrences, such prodigious losses at sea, that they entertained thoughts of declining all preparations for the future against the Carthaginians, and to leave them masters of the ocean. However they were encouraged to renew their attention to maritime operations by some favorable events of a more favourable kind; and arriving in Sicily with a fleet of 200 ships, they formed the bold design of besieging Lilybaeum, the strongest town possessed by the Carthaginians on that island, the loss of which would be attended with that of every part of it, and open to the Romans a free passage to Africa. In the prosecution of this siege the Romans encountered many lofts and disasters, and were at length reduced to the necessity of turning the siege into a blockade, and of drawing a line round the place, to prevent the garrison from receiving any succours. The besieged, on the other hand, repaired their works and determined to defend the town to the last extremity.

In the year B. C. 249, the consul Claudius put to sea with a powerful fleet in order to repriprfe Drepanum; but he was vanquished by Adherbal, a Carthaginian admiral of great conduct and bravery. Claudius, with 30 vessels, escaped out of the engagement to the camp at Lilybaeum, with intelligence of this defeat; which was the greatest ever sustained by the Romans at sea since the commencement of this war. In the consulates of Lutatius, Claudius, and Xantippus, B. C. 248, the Romans equipped a fleet of 200 vessels, at the expense of private persons; and the command was given to Lutatius. As the Carthaginian fleet had retired to Africa, the consul feized all the advantages left in the neighbourhood of Lilybaeum, and prepared for an engagement, which he knew to be inevitable, by excercising his soldiers and seamen at sea. As soon as he was informed that the Carthaginian fleet drew near, under the command of Hanno, he assembled all his forces and sailed for the small island Gergulf, which lay near Eryx, whither Hanno proposed to have repaired in order to obtain a supply for his army, and to reinforce his troops. The engagement commenced with great advantage on the side of the Romans, as their vessels were much better equipped and manned than those of the Carthaginians. They were, therefore, unable to sustain the first attack. Forty of their vessels were sunk, and seventy taken with their whole crews. The refit, favoured by a wind, which rose very favourably for them, made the bealt of their way to Hiero, the little island opposite to Drepanum, from which they had failed. There were upwards of 10,000 taken prisoners. Lutatius then advanced to the city of Eryx, where he engaged the Carthaginians, and cut off 2000 men. This last action concluded the operations of the first Punic war, in the year B. C. 241; after it had continued twenty-four years, and was followed by a peace, the terms of which were dictated by the victorious conful. The treaty, though it adjoints the interests both by sea and land of two powerful republics and their allies, is comprised in a small compass, and very clearly and accurately expressed. "There shall be peace between Rome and Carthage (in case the Roman people approve of it) on the following conditions: the Carthaginians shall evacuate entirely all Sicily; and shall no longer make war upon Hiero, the Syracusans, or their allies; they shall restore to the Romans, without ransom, all the prisoners which they have taken from them; and pay them, within twenty years, 2200 Euboic talents of silver;" amounting to 515,000l. sterling. When these conditions were brought to Rome, the people, disapproving them, sent ten commissioners to Sicily, to terminate the affair. These made no alteration as to the substan& of the treaty; but required that the time appointed for the payment of the sum demanded should be reduced to ten years; that 1000 additional talents should be paid immediately; and that the
CARthagINiANS.

Carthaginians should depart out of all the islands, situate between Italy and Sicily.

Soon after the conclusion of the war waged by the Carthaginians against the Romans, they were under a necessity of commencing another with their mercenary troops, who had served under them in Sicily; which has been commonly called the African or Libyan war. It was principally occasioned by a neglect on the part of the Carthaginians in settling the arrears of their pay, or fulfilling the promises made to them by Hamno; and although it lasted only three years and four months, terminating in the year, B.C. 238, it was uncommonly barbarous and bloody. Hamno, who was employed to negociate with them at Sicca, whether they had been compelled to retire, imprudently proposed, that they should be content with receiving only a part of the arrears due to them, and remit the remainder on account of the profuse exigencies of the republic. This proposal was heard with disatisfaction and murmurs, which terminated in open rebellion. Accordingly about 20,000 of them marched towards Carthage, and encamped at Tunis, not far from that metropolis. No conciliatory measures succeeded; but the ensuing confoundment of the Carthaginians was ascribed to weakness and timidity. At length the settlement of this business was referred to some general of their own choice; and as they elected Gisco, for whom they professed great respect, he was employed to mediate between the contending parties. This general addressed them in mild and soothing language; recalled to their memories the long time they had been in the Carthaginian service, as well as the considerable sums they had received from the republic; and granted almost all their demands. When the treaty was almost concluded, two mutineers occasioned a tumult in every part of the camp. These were appointed chiefs of the furious multitude; Gisco’s tent was plundered of the money designed for the payment of the forces; and the general himself, with his attendants, were dragged to prison and treated with great indignity. All the cities of Africa, which they had solicited to join them in the recovery of their liberty, united with them; except Utica and Hipparchees, which they besieged. Carthage had never been before this time in circumstances so distressing and perilous. Every thing seemed to conspire to its ruin. The citizens drew their subsistence from the rents or revenues of their lands, and the public expenses from the tribute paid from Africa; of which they were not only deprived at once, but it was employed against them. They were also destitute of arms and forces either for sea or land; they had made no preparations for sustaining a siege, or equipping a fleet; and, to complete their misfortunes, they had not the least prospect of receiving assistance from any foreign friend or ally. At the same time they had reason to reproach themselves for numerous instances of oppression and cruelty in their conduct towards the African nations. The Africans were therefore easily prevailed upon to engage in this rebellion; and the women, whose husbands and fathers had been dragged to prison for non-payment of heavy tributes, were more exasperated than the men, and were eager to deliver up all their ornaments towards the expenses of the war. The Carthaginians, however, though deeply distressed, did not despair; but elected themselves to levying troops and fitting out ships, the command of which was intrusted with Hamno. The army of the rebels had increased to 70,000 men, and whilst they were besieging the two cities already mentioned, their camp was pitched at Tunis, and Carthage was held in a kind of blockade. Hamno’s first object was the relief of Utica; but on account of several errors with which he was chargeable in the conduct of this business, he was superseded by Hamilcar Barca. Hamilcar having obliged the rebels to raise the siege of Utica, marched against their main army, defeated part of it, and took almost all their advantageous posts. Being afterwards joined by a young Numidian nobleman, named Narvalus, with 2000 of his countrymen, he fell upon the rebels, killed 10,000 of them, and took 4000 prisoners. Those who survived were treated with singular lenity. Spondus, the chief of the rebels, with a view of counteracting this clemency and preventing a defection among his troops, engaged them in a service which would deprive them of all hopes of being remitted to the enemy; and this was no other than the murder of Gisco, and about 700 of his comrades, who had been confined with him in prison. The rebels also resolved to treat all such Carthaginians, who should fall into their hands, in the same barbarous manner. Several circumstances occurred at this time that served to dispirit the Carthaginians; one of which was the revolt of Utica and Hipparchees, the only cities which had uniformly preferred their allegiance, and always adhered inviolably to the republic, even when African authors and the Romans had made their defeats in Africa. A division also took place among their generals, and Hannibal was deputed to supersede Hamno. After Hannibal’s arrival in the camp, the affairs of the Carthaginians took a favourable turn; Hiero, king of Syracuse, afforded them assistance; and in a battle with the rebels, distressed by famine, and deprived of their chiefs who had been seized, 40,000 of them were cut to pieces. The consequence of this victory was the reduction of almost all the cities of Africa, which immediately returned to their allegiance. Hamilcar, without loss of time, marched against Tunis, which, ever since the beginning of the war, had been the asylum of the rebels and their place of arms; and Hannibal joined him in besieging it. In order to strike terror into the enemy, crocusses were set up near the walls, and Spondus was hung on one of them, and his companions who had been taken with him, on the red, and thus they all expired. Matho, the other chief of the rebels, who commanded in the city, saw what he had to expect, and became desperate in his own defence. Perceiving Hannibal off his guard, through confidence of success, he made a sally, attacked his quarters, killed many of his men, took several prisoners, among whom was Hannibal himself, and plundered his camp. He then placed Hannibal on the crocusses, in the room of Spondus, after having first made him to endure inexpressible tortures, and sacrificed around the body of Spondus, thirty citizens of the first quality in Carthage, as many victims of his vengeance. When the news of this event reached Carthage, it caused great conflagration, and it was thought advisable to make one grand effort. Accordingly, all the young persons capable of bearing arms were pressed into the service. Hamno was sent to join Hamilcar; and thirty senators were deputed to conjure those generals to forget past quarrels, and to sacrifice their resentment to their country’s welfare. Their interposition was effectual; the generals were reconciled; and from this time the Carthaginians were peaceable in all the measures which they adopted. Matho was eager to hazard a battle; and when an engagement took place, victory did not long remain doubtful. The rebels gave way, the Africans were almost all slain, and the rest surrendered. Matho was taken alive, and carried to Carthage, where he and his soldiers, after having adorned the public triumph, were led to execution, and sacrificed, by a painful and ignominious death, a life that had been polluted with the blood of treachery, and unparalleled barbarities. From the execrations of cruelty committed,
in it, Polybius informs us, that this war was generally dis-
distinguished among the Greeks by the name of the "Inex-
plicable war." During the Libyan war, the mercenaries in
Sardinia declared against the Carthaginians, excited by the
example of Matho and Spordinius in Africa. They feized
upon the person of Doftar, who commanded in the citadel
of Olbia, and massacred both him and the Carthaginian
garrison. The senate, apprised of this revolt, sent Hannu,
with a strong reinforcement of troops, to bring the muti-
neers to reason; but Hannu, on his arrival, was abandoned
by his men who joined the mercenaries, and not only cruci-
fied their leader, but put to the sword all the Carthaginians,
whom they could find in the island. They then besieged
all the cities one after another, and soon gained possession
of the whole country. Fends, however, arising between them
and the natives, the mercenaries were driven entirely out
of the island, and took refuge in Italy. Thus the Cartha-
ginians lost Sardinia, which was to them an island of great
importance, an account of its extent, its fertility, and the
great number of its inhabitants. The Sardinian war began
in the year 234 B.C. and continued three years.

The Romans ever since their treaty with the Cartha-
ginians, had behaved towards them with great justice and
moderation; and yet, notwithstanding their professions of
friendship, they countenanced and protected the fugitive
mercenaries. They sent the confid Sémporius, on trivial
pretences, with a fleet, to reestablish the malcontents, and
take possession of Sardinia, which the Carthaginians were
obliged to cede. They also obliged the Carthaginians to
defray the expense of their armament, and, besides, ex-
torted from them the sum of 1200 talents. Such perfidious
conduct could not fail of heightening the avarice Ham-
icar had already conceived, and did not a little contribute
to the second Punic war, and to those dreadful devastations
which Hannibal afterwards committed in Italy.

Hamilcar, by the happy conclusion of the Libyan war,
not only restored tranquility to the republic, but greatly
extended the conquests of the Carthaginians in Africa.
But as his country was not in a condition to commence an
immediate war with Rome, he determined, by a new plan of
operations, to place it upon a level with the imperious
republic; and with this view to make an entire conquest of
Spain, that the Carthaginians might have troops capable
of defending the kingdom. For this purpose Hannibal im-
spired both his son-in-law Afdrubal and his son Hannibal
with an implacable avarice to the Romans, as the invete-
rate enemies both of his grandeur and that of his country.
Immediately after the troubles in Africa were appeased,
the senate sent Hamilcar on an expedition against the Na-
midians, in which he conducted himself with such a degree
of skill and valour, and also with such success, that he was
vexed with the command of the army defined against
Spain. His son Hannibal, although at this time only nine
years of age, imported his father for permission to ac-
company him on this occasion; and Hamilcar having grant-
ed his request, previously ordered him to put his hand on the
altar, and to swear, that he would be an irrecusable
enemy to the Romans, and act as such when his age allowed.
He likewise took with him Afdrubal, after he had beffowed
his daughter in marriage upon that general.

As soon as the military preparations were completed,
Hamilcar advanced with a powerful army to Abysin, and
crossing the straits of Hercules, landed in Spain without
opposition. He commanded in this country during nine
years, in that interval subdued many warlike nations, and
acquired an immense treasure, which he wisely distributed,
partly among his troops, and partly among the great men at
Carthage; thus securing his interest with both these power-
ful bodies. At length, in a battle with the Vettones, or
Vettonians, a nation of Lusitania, he fell on the field, and
died gloriously, as Polybius says, at the head of his troops,
in the year B. C. 248. Upon Hamilcar's death, the army
elected his son-in-law Afdrubal, then the Carthaginian
admiral, to succeed him in the command. The choice was
confirmed by the senate; and it was amply justified by his
subsequent conduct, though Hannu and his adherents
affected to depreciate his merit. He built, or at least for-
tified, New Carthage. See Carthage. The Romans,
allured by the great proffes which Afdrubal was making in
Spain, prevailed upon him, partly by menaces, and partly by
persecution, to conclude a new treaty with them, impor-
ting, that the Carthaginians should not pass the Iberus, and
that Saguntum, a colony of Zaeuthians, and a city between
the Iberus, and that part of Spain, subject to the Carthaginians,
and as well as the other Greek colonies,
should enjoy their ancient rights and privileges. Afdrubal
did not pass beyond the limits stipulated by the treaty;
though he still pushed on his conquests, and subjected all
that part of Spain extending from the western ocean to the
Iberus, within five days' journey of the Pyrenees. His en-
gaging address and efficacious deportment made him popular
among the Reguli of Spain, and brought them over to the
interest of Carthage. Having governed the Carthaginian
dominions in Spain eight years, he was treacherously mur-
dered by a Gaul, whose master he had put to death, B. C.
220. Three years before his death, Afdrubal had written to
Carthage, requesting that Hannibal, who was then in the
24th year of his age, might be sent to him; and on his first
arrival in the camp, he manifested indications of extra-
ordinary courage and greatness of mind, and interceded the
attachment of the whole army. Under Afdrubal he made
three campaigns, and was always employed in enterprises
of the greatest importance; and after his death, the army
immediately saluted him general. At this time (viz. 226,
B. C.) he was in the twenty-seventh year of his age, ad-
mitting (See Blair's tables) that he was born in the year
247 B. C. The senate, as well as the people of Carthage,
confirmed this election, although Haman and his faction
were secretly averse from his promotion. As soon as he
affirmed the command, he commenced a plan of operations,
which all the censors approved. He began his career with
Marching against the Oceader, who were seated near the
Iberus, and having reduced Altbera, their capital, their
other towns immediately submitted. With the opening of
the next campaign he subdued the Vaccani, and prepared to
meet an army of 120,000 men, collected by the Carpetani,
one of the most powerful nations in Spain, who had been
induced to declare war against the Carthaginians. Having
routed this formidable army, he depossessed the whole
country of the Carpetani, who thought proper to submit to
the conqueror. His next object was the siege of Saguntum,
and as the inhabitants had applied to the Romans for assis-
tance, he made a vigorous effort for reducing the place before
they could take any step towards its relief. The progress
of this siege was retarded by the valiant resistance of the
Saguntines, who, by their repeated sallies, destroyed many
of the besiegers; though they were hardly fenerable of their
loss, as Hannibal's army consisted of 150,000 foot, and
20,000 horse. The fate of the city, however, was for
some time repited, by a wound which Hannibal received
as he was reconnoitring some of the works. As soon as he
recovered, hostilities recommenced, after a short cessation,
with double fury; but the Saguntines, irritated by despair,
at length forced the Carthaginians not only to abandon the

branch
began to make in the wall of the city, but to take refuge in their camp. After their return, Hannibal remained for some days in a state of motion; but, having inspired his troops with courage and promised them great rewards from the plunder of the place, they made a vigorous attack, which he placed himself on the top of a tower, which overlooked the works of the besieged and the whole city. At last the Saguntines, having defended themselves with an almost invincible valor and obstinacy, found themselves reduced by want of provisions to the greatest extremities, and to increase their distress, the Romans seemed to have entirely defeated them. In this state of despair, the senators brought all their gold, silver, and precious effects into the market place, and caused a great fire to be kindled there to burn their treasures and themselves into the flame. At this time a tower, which had been battered by Hannibal's arms, falling with a dreadful crash, the Carthaginians entered the town by the breach, soon made themselves masters of it and the citadel, and cut to pieces all the inhabitants who were able to bear arms. The reduction of Saguntum, after a siege of eight months, took place in the year B.C. 219.

The capture of Saguntum has been misrepresented as the end of the second Punic war, which commenced in the year B.C. 218. But Polybius affirms this to have been a very mistaken notion. The regret of the Carthaginians, for their having so long given up Sicily, by the treaty which terminated the first Punic war, the injustice and violence of the Romans, who took advantage from the troubles excited in Africa, to dispossess the Carthaginians in Sardinia, and to impose a new tribute on them; and the successes and conquests of the latter in Spain, were the true causes of the violation of the treaty, as Livy (agreeing with Polybius) intimates, in few words, in the beginning of his history of the second Punic war.

When the news of the reduction of Saguntum arrived at Rome, it occasioned inexpressible grief and consternation. As soon as the Romans were able to refrain or suppress the first emotions occasioned by this humiliating and discrediting intelligence, an assembly of the people was convened, and war against the Carthaginians was unanimously decreed. That no ceremony might be wanting, deputies were sent to Carthage, to inquire whether Saguntum had been besieged by order of the republic, and if so, to declare war; or, in case this siege had been undertaken solely by the authority of Hannibal, to require that he should be delivered up to the Romans. The deputies perceiving that the senate gave no direct answer to their demands, one of them took up the folded lappet of his robe, "I bring here," says he in a hearty tone, "either peace or war; the choice is left to yourselves." The senate answering that they left the choice to him: "I give you war then," says he, unfolding his robe. "And we," replied the Carthaginians, with the same haughtiness, "as honestly accept it, and are resolved to execute it without the farther ceremony." When war was resolved upon and proclaimed on both sides, Hannibal, who, after the reduction of Saguntum, had put his troops into winter-quarters at New Carthage, and remained during the winter in a state of inaction, made several wise regulations for the security of the Carthaginian dominions in Spain and Africa. With this view he marched the forces out of the one into the other, so that the Africans served in Spain and the Spaniards in Africa. The command of the Spanish forces was entrusted by Hannibal with his brother Afdrubal, with a fleet of about 63 ships to guard the coasts; and he also gave him the chief counsel for the direction of his conduct. Before Hannibal himself set out for his expedition, he went to Gaul or CarOutputStream
to make another effort with alacrity, from one of the high-<br>cell hills he gave them a prospect of the fruitful plains wa-<br>tered by the Po, the day before he decamped. He likewise<br>pointed towards the place where Rome stood; which, he<br>said, a battle or two would make them masters of, and<br>consequently put a glorious period to all their toils. This<br>prospect inspired them with such vigour, that they<br>seemed to have forgot all the sufferings they had undergone,<br>and to think only of taking possession of that haughty city,<br>whose conquest towards their state had been nothing but one<br>continued series of insults since the conclusion of the Sicilian<br>war.<br>
They therefore pursued their march; but the difficulty<br>and danger increased, in proportion as they approached<br>nearer the end of the defeat. We are told, that about this<br>time Hannibal meditated a retreat; but from the genius of<br>that general, as well as the whole tenour of his conduct, this<br>conjecture seems highly improbable. To omit many<br>particulars, they came at last to a path naturally very steep<br>and craggy; which being rendered impracticable by the<br>late falling of the earth, terminated in a frightful precipice<br>above a thousand feet deep. In short, Hannibal found it<br>would be impossible to accomplish this design, without cut-<br>ting a way in the rock itself, through which his men, horses,<br>and elephants might pass; and this, with immense labour,<br>he effected. Approaching, therefore, gradually the In-<br>brian foot of the Alps, he detached some parties of his<br>horse to forage, there appearing now some spots of pature<br>where the ground was not covered with snow. Livy in-<br>forms us, that in order to open and enlarge the path, large<br>trees were felled, and piled round the rock, after which fire<br>was let to them. The wind, by good fortune, blowing<br>hard, a fierce flame soon broke out; so that the rock glowed<br>like the very coals with which it was surrounded. Then<br>Hannibal, according to the same author, caused a great<br>quantity of vinegar to be poured on the rock; which pierc-<br>ing into the veins, that were now cracked with the intense<br>heat of the fire, calcined and softened it. In this manner,<br>taking a large compass, in order that the defeat might be<br>easier, he cut a way along the rock, which opened a free<br>passage to the forces, baggage, and elephants. As Poly-<br>bius has paffed over in silence the use Hannibal made of<br>vinegar on this occasion, many regret that incident as<br>fabulous.<br>
At length Hannibal gained the fruitful plains of Insfubria,<br>where, in reviewing his army he found, that in five months<br>and a half's march (for so long was it since he had left New<br>Carthage), he had lost by sickness, defection, fatigue, and<br>various engagements, thirty thousand foot, and three thou-<br>sand horse. His army now amounted to no more than<br>twenty-six thousand effective men. Above twenty thousand<br>had perished since his departure from the Rhodanus. That<br>we may have a more distinct idea of Hannibal's march, it<br>will be proper to give the names and distances of some of<br>the principal places through which that general passed in<br>his way to Italy, transferred from Polybius. From<br>New Carthage to the Iberus were computed two thousand<br>six hundred italies; from the Iberus to Emporion, a small<br>marine town, which separated Spain from the Gauls, ac-<br>cording to Strabo, fifteen hundred italies; from Emporion<br>to the banks of the Rhodanus, fifteen hundred italics;<br>from the Rhodanus to the Alps, fourteen hundred italics;<br>from the Alps to the plains of Insfubria, twelve hundred<br>italics. In all eight thousand four hundred italics, making<br>much about a thousand English miles.<br>
Upon Hannibal's arrival in Italy he refreshed his troops,<br>and then marched against the Taurini, who had refused to<br>enter into an alliance with him; and having encamped be-<br>fore Taurium (Turin) their chief city, he carried it in<br>three days, and put all who had opposed him to the sword.<br>This expedition so terrified the neighbouring Gauls, that<br>they surrendered at discretion. The rest of the Gauls<br>would probably have followed their example, if they had<br>not been awed by the terror of the Roman arms, which<br>were now approaching. Hannibal therefore, as he had no<br>time to lose, thought it the wisest course which he could<br>pursue to march directly into their country, and to make<br>such an attempt as would induce those who had an inclina-<br>tion to join him to put themselves under his protection.<br>They therefore pursued their march; but the difficulty<br>and danger increased, in proportion as they approached<br>nearer the end of the defeat. We are told, that about this<br>time Hannibal meditated a retreat; but from the genius of<br>that general, as well as the whole tenour of his conduct, this<br>conjecture seems highly improbable. To omit many<br>particulars, they came at last to a path naturally very steep<br>and craggy; which being rendered impracticable by the<br>late falling of the earth, terminated in a frightful precipice<br>above a thousand feet deep. In short, Hannibal found it<br>would be impossible to accomplish this design, without cut-<br>ting a way in the rock itself, through which his men, horses,<br>and elephants might pass; and this, with immense labour,<br>he effected. Approaching, therefore, gradually the In-<br>brian foot of the Alps, he detached some parties of his<br>horse to forage, there appearing now some spots of pature<br>where the ground was not covered with snow. Livy in-<br>forms us, that in order to open and enlarge the path, large<br>trees were felled, and piled round the rock, after which fire<br>was let to them. The wind, by good fortune, blowing<br>hard, a fierce flame soon broke out; so that the rock glowed<br>like the very coals with which it was surrounded. Then<br>Hannibal, according to the same author, caused a great<br>quantity of vinegar to be poured on the rock; which pierc-<br>ing into the veins, that were now cracked with the intense<br>heat of the fire, calcined and softened it. In this manner,<br>taking a large compass, in order that the defeat might be<br>easier, he cut a way along the rock, which opened a free<br>passage to the forces, baggage, and elephants. As Poly-<br>bius has paffed over in silence the use Hannibal made of<br>vinegar on this occasion, many regret that incident as<br>fabulous.<br>
At length Hannibal gained the fruitful plains of Insfubria,<br>where, in reviewing his army he found, that in five months<br>and a half's march (for so long was it since he had left New<br>Carthage), he had lost by sickness, defection, fatigue, and<br>various engagements, thirty thousand foot, and three thou-<br>sand horse. His army now amounted to no more than<br>twenty-six thousand effective men. Above twenty thousand<br>had perished since his departure from the Rhodanus. That<br>we may have a more distinct idea of Hannibal's march, it<br>will be proper to give the names and distances of some of<br>the principal places through which that general passed in<br>his way to Italy, transferred from Polybius. From<br>New Carthage to the Iberus were computed two thousand<br>six hundred italias; from the Iberus to Emporion, a small<br>maritime town, which separated Spain from the Gauls, ac-<br>cording to Strabo, sixteen hundred italias; from Emporion<br>to the banks of the Rhodanus, fifteen hundred italas;<br>from the Rhodanus to the Alps, fourteen hundred italas;<br>from the Alps to the plains of Insfubria, twelve hundred<br>italias. In all eight thousand four hundred italas, making<br>much about a thousand English miles.<br>
Upon Hannibal's arrival in Italy he refreshed his troops,<br>and then marched against the Taurini, who had refused to
battle, Hannibal not having opportunity of inflaming his impetuous spirit, and of accelerating the action in which he wished to engage. He therefore laid waste with fire and sword the country through which he passed, and advanced in his progress towards Rome. Having gained an eminence, at the termination of a narrow defile formed by the mountains of Cortonum and the lake Thurmfemone, being purged by the Roman confid, he prepared for battle; and the event was the total defeat of the confederate army. Flaminius himself with 15,000 men were laid dead on the field, and about 10,000 escaped to Rome by different roads. Hannibal lost only 1500 men, most of whom were Gauls; though great numbers both of his soldiers and of the Romans died afterwards of their wounds. Having made diligent but ineffectual search for the body of Flaminius, for the purpose of giving it an honourable burial, he put his troops into quarters of refreshment, and solemnized the funerals of 50 of his chief officers, who had been slain in the action. This battle was fought in the year B.C. 217. Hannibal, not thinking it proper to advance directly to Rome, pursued his route through Umbria and Picenum; and after ten days' march arrived in the territory of Adria. As he plundered the country through which he passed, he was loaded with booty. Having attacked Spoleto, and being repulsed with loss, he proceeded to the frontiers of Apulia, and ravaged the adjacent territories. Polybius informs us, that Hannibal treated the allies of the Romans with the utmost cruelty in this expedition. At this time Fabius, followed by Minucius and four legions, had marched from Rome in quell of the enemy; but with a firm resolution not to let him take the leaf advantage, nor to advance one step till he had first reconnoitered every place; nor hazard a battle, till he should be sure of success. Hannibal made various attempts to provoke Fabius to a battle, but they were all ineffectual. The dictator, notwithstanding all the artifices, the marches, counter-marches, and feints, of the Carthaginian general, inflexibly adhered to his first resolution, and gave his crafty enemy to understand, that the Romans, instructed by their defeats, had at last made choice of a general capable of opposing Hannibal. Reflected on leaving Campania with his immense spoils, Hannibal marched with his army towards the confines of Samnium; but was much incommode of his progress by the prudent dispositions and movements of Fabius. Having encamped at the foot of the mountains, he found himself involved in great difficulties, as the Romans had seized upon Castrinum and Callicula, and pent up his army in such a manner, that it seemed impossible for him to escape. Whilst Fabius was preparing for an attack, the inventive genius of Hannibal contrived a stratagem, by which he eluded the efforts of the Roman dictator, and preferred both himself and his army, when they were upon the very brink of destruction. He afterwards returned to Apulia, and having taken the town of Germanium by assault, made this the place of his encampment. In the mean time, Fabius, being ordered to Rome, left the command of the army to Minucius, his general of horse, with orders to observe the motions of Hannibal at a proper distance; but by no means to engage him. The sequel is related under the article CAMPA, where the Carthaginian general obtained a complete victory over the Romans. See also CAMPA.

Whilst Hannibal was purging his conquests in Italy, the Carthaginian affairs in Spain, in consequence of the defeat of Adrabil by Scipio, began to wear an unpromising aspect. Scipio, improving his naval victory, took Honofca by storm, and leveled it with the ground. From thence he proceeded to New Carthage; laid waste the adjacent territory, and set fire to the suburbs of that city. He also obtained several other advantages in the island Ebora, now Yville, and in other places; and concluded a treaty with the inhabitants of the Balearic islands. After these exploits Livy says, that 20 different nations of Spaniards submitted to the Romans, and Adrabil was compelled to retire into Lusitania, and the parts of Spain, that border upon the ocean. The Carthaginian commander was also reduced to great difficulties by the interruption of the Carthaginian princes, under the order of Scipio, into the Carthaginian territories; by their capture of three fortresses; and by two defeats, in which 15,000 men belonging to Adrabil's army were killed, and 45,000 taken prisoners. The two Scipios in this campaign passed the Ebro, and penetrated into the Carthaginian dominions, as far as Saguntum. Whil'st their arms were making considerable progress in Spain, Adrabil received orders from Carthage to march into Italy for the relief of his brother; but the two Roman generals resolved to prevent, if possible, his leaving Spain. They therefore forced him to fight, and defeated him, so that he could neither continue his march for Italy, nor remain with any safety in Spain. In Sardinia the Carthaginians were no less unsuccessful; for, in a battle fought against the Romans, they lost 12,000 men, and a greater number of prisoners, among whom were Adrabil, named Calvus, Hanno, and Mago, who were distinguished by their birth as well as military exploits. Afterwards the face of affairs was very much changed in Spain. The two Scipios were defeated and killed, and the Roman territories in that country seemed to be inevitably lost. They were preferred, however, by the valour of L. Marcus, a private officer of the Equestrain order; and shortly after, the younger Scipio was sent thither, who revenged the death of his father and uncle, and restored the affairs of the Romans in Spain to their former flourishing condition. From the period of Hannibal's absence at Copua, the Carthaginian affairs in Italy no longer supported their reputation. M. Marcellus, first as pretor and afterwards as consul, contributed very much to this revolution. He harassed Hannibal's army on every occasion, forced upon his quarters, forced him to raise siege, and even defeated him in several engagements; so that the latter called the siege of Rome, as Fabius had before been named his butcher. But what most affected the Carthaginian general, was to see Carthage besieged by the Romans. In order to preserve his reputation among his allies, he flew to his relief, attacked the Romans, and fought several battles in order to oblige them to raise the siege. But all his measures for this purpose being defeated, he marched hastily towards Rome, that he might thus make a powerful diversion. Rome was at first much alarmed; and one of the senatorss proposed to recall all the armies to succour the capital. Fabius, however, declared, that it would be shameful in them to be terrified, and forced to change their measures upon every motion of Hannibal. They, therefore, contended with themselves recalling only part of their army; and whilst Hannibal and the Roman confid, having drawn up their respective armies before the city, were preparing for a decisive battle, of which Rome was to be the recompense, a violent storm obliged them to separate. When they again repeatedly rallied, the same impediment to action occurred; so that Hannibal, believing something supernatural in the event, said, according to Livy, that sometimes his own will, and sometimes fortune, would not suffer him to take Rome. At length he retired, and in his march plundered the rich temple of the goddess Feronia. The success of the Romans in the siege of Copua gave them a visible superiority over the Carthaginians; and displayed, at the same time, how formidable
able the power of the Romans was, when they undertook to punish their perfidious allies; and the feeble protection which Hannibal could afford his friends, at a time when they most wanted it. It remains that we mention one unforeseen defeat that ruined all the measures, and baffled all the hopes of Hannibal with regard to Italy. The confu

sion of the 11th year of the second Punic war (B.C. 207.) were C. Claudius Nero, and M. Livius. The province of the latter was the Cisalpine Gaul, where he was to oppose Afdruibal, who, according to report, was preparing to pass the Alps. The former commanded in the country of the Bruc
tians, and in Lucania, that is, in the opposite extremity of Italy, and was there making head against Hannibal. The passage of the Alps gave Afdruibal very little trouble: the way having been previously cleared by his brother, and all nations being disposed to receive him. Some time after this he dispatched couriers to Hannibal, who were intercepted; and by their letters Nero found, that Afdruibal was hastening to join his brother in Umbria. In order to disconcert and defeat this plan, Nero set out with a detachment of his army consisting of 7000 men, and marching with extraordinary diligence, joined the other confeder in the night. When Afdruibal discovered, by reconnoitering the enemy's army, that the fresh troops were arrived, he concluded that they belonged to the other confeder, and was thus led to conjecture, that his brother had sustained a considerable loss, and also to fear, that he was come too late for his assistance. He therefore founded a retreat, and his army began to march in great disorder. Whilst he was preparing to cross the river Metaurus, the army of the enemy came up with him, and in this extremity it was impossible to avoid an engagement. The battle that ensued was long and obstinate; and Afdruibal distinguished himself by his self-possession and valor. At length, when victory declared for the Romans, being unable to survive the loss of so many thousand men, who had quitted their country to follow his fortune, he rushed at once into the middle of a Roman cohort, and there died in a manner worthy of the son of Hamilcar, and brother of Hannibal. This was the most bloody battle which the Carthaginians had fought during this war; and whether we consider the death of the general, or the slaughter made of the Carthaginian forces, it may be looked upon as a reprimand for the battle of Cannae. The Carthaginians lost 55,000 men, and 6000 were taken prisoners. The Romans lost 8000. These were so weary of killing, that some professed Livius, that he might very coldly cut to pieces a body of the enemy who were flying: "It is fit," says he, "that some should survive, in order that they may carry the news of this defeat to the Carthaginians." Afdruibal's head was thrown into the camp of the Carthaginians, informed Hannibal of his brother's fate. Hannibal perceived by this cruel stroke the fortune of Carthage; "It is done," says he, "I will no longer trust triumphant messengers to Carthage. In loosing Afdruibal, I have lost at once all my hope, all my good fortune." He afterwards retired to the extremity of the country of the Bruc
tians, where he assembled all his forces, who found it a very difficult matter to subdue there, as no provisions were sent them from Carthage. The fate of arms was not more propitious to the Carthaginians of Spain. The three Carthaginian generals in that country, Afdruibal, son of Gifeo, Hamo, and Mago, having been defeated with their numerous armies, by the Romans, in several engagements, Scipio the younger at last possessed himself of Spain, and subjected it entirely to the Roman power. Upon his return to Rome, he was declared consul, at the age of 30 years, and Sicily was allotted to him. He set out with all imaginable expedition for this province; whilst his colleague in the consulate, P. Licinius Cæfalus, was to command in the country to which Hannibal had re
tired. Soon after Scipio crossed over to Africa, the latter made this country the seat of war. The devastation of the country; the siege of Utica; the entire defeat of the two armies under Syphax and Afdruibal, whose camp was burned by Scipio; and afterwards the capture of Syphax himself, in whom the Carthaginians repaid their chief confidence;—all these things forced them at last to turn their thoughts to peace. Accordingly, they deputed 30 of their principal senators, selected out of the powerful body at Carthage, called the "Council of the Hundred," to wait on the Roman general in his tent; who accused Hannibal as the author of all their calamities, and promised, in the name of the senate, an implicit obedience to whatever the Romans should please to order. Scipio replied, that he would grant them a peace, upon condition that they should deliver up all the prisoners and defectors to the Romans; that they should recall their armies out of Italy and Gaul; should never again set foot in Spain; should retire out of all the islands between Italy and Africa; should deliver up all their ships, 20 excepted, to the victor; should give to the Romans 500,000 bushels of wheat, 300,000 of barley, and pay 10,000 talents—and that, in case they were pleased with these conditions, they then might send ambassadors to the senate. The Carthaginians yielded compliance, in order to gain time till Hannibal returned. A treaty was then granted to the Carthaginians, who immediately sent deputies to Rome, and at the same time an express to Hannibal to order his return into Africa. Hannibal received the orders from Carthage with inexplicable concern; and he returned home, turning his eyes wistfully to Italy, accrying gods and men of his misfortunes, and calling down a thou
tand curses, as Livy says, upon himself for not having marched his soldiers directly to Rome after the battle of Cannae, whilst they were still recking with the blood of his citizens. The decision of the whole matter was referred by the Roman senate to Scipio, who, being upon the spot, could best judge what conditions were most suitable to the welfare of the state. About this time a Roman fleet of about 200 vessels of burthen was dispersed near Carthage by a storm; and Afdruibal failed out of the harbour, by order of the senate, seized the greatest part of them, and brought them to Carthage, though the truce was still fulfilling. This act of aggression was complained of by Scipio; but his remonstrances were little regarded by the Carthaginians. Hannibal's approach had revived their courage, and inspired them with very flattering hopes. This circumstance afforded a new occasion of war between the two nations. Hannibal, now deeming peace more than a renewal of the war, flattered himself that the conditions of it would be more honourable, as he was at the head of an army, and as the fate of arms might still appear uncertain. He therefore solicited an interview with Scipio, which was agreed to at a time and place that was fixed. This interview proving ineffectual, the generals left one another with a resolution to decide the fate of Carthage by a general battle, fought on the plains of Zama, about five days' march from Carthage, in the year B. C. 202. The Carthaginians, after a very obstinate fight, were obliged to fly, leaving 20,000 men on the field of battle, and the like number of prisoners were taken by the Romans. Hannibal escaped in the tumult, and entering Carthage, owned that he was irrecoverably defeated, and that the citizens had no alternative left, but the acceptance of peace on any conditions. Thirty deputies waited upon the conqueror at Tunis, and sued for peace on the most submissive terms. Scipio called a council, the majority of which were for
racing Carthage and treating the inhabitants with the utmost severity. But the consideration of the time which it would require before a city to strongly fortified could be taken, and Scipio's fear left a successor might be appointed to him whilst he should be employed in the siege, made him incline to clemency. Accordingly a peace, terminating the second Punic war, was concluded between the Carthaginians and Romans, upon the following conditions dictated by Scipio: “that the Carthaginians should continue free and preserve their laws, their territories, and the cities they possessed in Africa before the war—that they should deliver up to the Romans all their fenders, flaves, and captives belonging to them; all their ships, except 10 vessels; all their tame elephants, and that they should not train up any more for war:—that they should not make war out of Africa, nor even in that country, without first obtaining leave for that purpose from the Roman people:—that they should restore to Mafinissa all they had dispersed either him or his ancestors of:—that they should furnish money and corn to the Roman auxiliaries, till their ambassadors should be returned from Rome:—that they should pay to the Romans 10,000 Euboic talents of silver, (1,750,000l.) in 50 annual payments; and give 100 hostages, who should be nominated by Scipio:—3rd in order that they might have time to send to Rome, it was agreed to grant them a truce, upon condition that they should restore the ships taken during the former war, without which they were not to expect either a truce or peace.” Soon after the treaty of peace with the Romans, an article in this treaty involved the Carthaginians in a dispute with Mafinissa. This article required them to restore to Mafinissa all the territories and cities which he possessed before the war; and, moreover, Scipio, in recompense of the zeal and fidelity which that monarch had shown with regard to the Romans, had added his dominions to those of Syphax. From this circumstance originated the contention that afterwards took place between the Carthaginians and Mafinissians. Syphax and Mafinissa were both kings in Numidia; but occupied different parts of this country. The subjects of the former were called Mafafelli, and their capital was Carth: those of the latter were the Mufylli; but the name of Numidian was common to both. Their principal strength consisted in their cavalry; and they always rode without saddles, and even without bridles, whence Virgil (Aen. i. iv. 541.) called them “Numidi Infranti.” A contest having occurred between these two princes, in the progrès of which Syphax was defeated and captured, the dominions of this prince were bestowed upon Mafinissa, and the Carthaginians were obliged to restore all which he possessed before. Mafinissa had likewise seized part of a fertile territory, situated towards the sea-side, near the lesser Syrtes, which had been consecrated to pay tribute to the Carthaginians. Appeals had been made to Rome; but the contest remained undecided, though it was evident that the Roman senate favoured Mafinissa. In a course of time the Carthaginians farther remonstrated against the encroachments of the Numidian prince; and complained to the senate of Rome, that, besides the lands at first contested, he had dispersed them of upwards of 50 towns and castles. They likewise stated that they were restricted from seeking redress by the above-mentioned article of the last treaty. To their earnest application, and the counter-statement of Mafinissa, the Roman senate replied, that the ancient limits should be preferred; and that it was far from being their intention to have the Carthaginians dispersed, during the peace, of those territories and cities which had been referred to them by the treaty. But these assurances, apparently impartial and even favourable to the Carthaginians, were mere words. The Romans were secretly in the interest of Mafinissa, and contrived the business, in order to give him an opportunity of establishing himself in his dominions, and of weakening his enemies. A new dispute was next to arise from Rome in order to settle the dispute; and Cato was one of the commissioners. Mafinissa professed to acquiesce in their decision; and the Carthaginians avoided their adherence to the treaty which they had concluded with Scipio. The dispute, after having visited the country and examined the state of Carthage, expressed their acknowledgment, that, after the calamities which it had suffered, it should have risen again, and to soon, to such a pitch of power and grandeur. When the numbers of the senate received this intelligence from the deputies, they declared, that Rome must never be in safety so long as Carthage should indulge. From this moment, whatever affair was debated in the senate, Cato always uttered the following words to his opinion: “I conclude that Carthage ought to be destroyed.” At this time divisions brooked in Carthage: 40 citizens were sent into banishment; and the exiles withdrew to the court of Mafinissa, who sent his sons to Carthage, to solicit their return. But the gates of the city were shut against them, and one of them was closely pursued by Hamilcar, one of the generals of the republic: this gave occasion to a new war; armies were levied on both sides; and a battle was fought in the presence of the younger Scipio, which afterwards named Carthage. The fight was long and obstinate, but at last the Carthaginians gave way. When the battle had terminated, the Carthaginians intreated Scipio to put an end to their contests with Mafinissa; but having completed the object of his mission, he returned to Rome without settling the dispute, and reconciling the contending parties. In the progress of the contest, the Carthaginians, reduced to the greatest extremity by famine and the plague, surrendered to Mafinissa, promising to deliver up the defectors, to pay him 5000 talents of silver in 50 years, and to restore the exiles, notwithstanding the oaths by which they had bound themselves to the contrary. They all submitted to the ignominious ceremony of passing under the yoke, which was a kind of gallows, made by two forked flocks flanding upright, with a spear laid across, under which vanquished enemies were obliged to pass: and of 58,000 men, very few returned to Carthage.

The Carthaginians in this humbled and distressèd state renewed their application to Rome; but their deputies, commissioned once and again to the senate, returned without satisfaction. At Rome disputes occurred between Cato and Scipio Nasica with respect to the measures that were proper to be pursued. Cato delivered a speech, in which he decried on the powerful and prosperous state of Carthage, and ending his speech threw down some African boys, the size and beauty of which were much admired by the senators: “Know,” says he, “that it is but three days since these boys were gathered; such is the distance between the enemy and us.” Nasica, on the contrary, was of opinion, that the Carthaginians were too weak to subdue the Romans, and, at the same time, so powerful, that it was not for the interest of the Romans to consider them in a contemptible light. The senate, however, resolved to declare war against the Carthaginians; and the reasons or pretences for it were, their keeping up ships, contrary to the tenor of treaties, and their sending an army out of their territories, against a prince who was in alliance with Rome, and whose son they treated ill, at the time he was accompanied by a Roman ambassador. At the moment of their deliberation, deputies arrived from Utica, the second city of Africa, polifpering a spacious harbour, and within 60 furlongs of Carthage, so that it might
force as a place of arms in the attack of that city, surrendering themselves, their effects, their lands, and their city, into the hands of the Romans. They, therefore, hesitated no longer; but immediately proclaimed war, committing the conduct of it to the consuls Mamilius and L. Marcus Censorinus, and giving them their first orders for the war but by the destruction of Carthage. To them was committed a considerable fleet, on board of which were 80,000 foot, and about 4000 horse. Thus commenced, in the year B.C. 149, the third Punic war, about 53 years after the termination of the second, which, though much less considerable than either of the former, with regard to the number and importance of the battles that were fought, and its continuance, which was less than 4 years, was nevertheless much more remarkable, with respect to the fierceness and event of it, as it ended in the total destruction and ruin of Carthage.

As soon as the Senate had formed its resolve, a courier was sent to Carthage with its decree, and with information that the Roman fleet had sailed. After many former and recent lofes, which the Carthaginians had sustained, they were by no means in a condition to resist such an enemy, since they had not been able successfully to oppose Mamilia. Troops, provisions, ships, allies. in a word, every thing was wanting; and hope and vigour more than all the rest. As soon as it was known that the fleet was arrived at Utica, the deputies of Carthage repaired to the Roman camp, signifying that they were come in the name of the republic, in order to receive their commands, which they were ready to obey.

The consul required the immediate surrender of all their arms. The order was instantly complied with; and there arrived in the camp a large train of wagons, loaded with all the preparatory implements of war, taken out of Carthage; 200,000 complete suits of armour, a numberless multitude of darts and javelins, with 2000 engines for floating darts and stones. The deputies, accompanied by the most venerable senators and priests, followed, and received from Censorinus the consul, the heart-rending decree of the Senate, 'that it was their absolute will and pleasure that you depart out of Carthage, which they have resolved to destroy, and that you remove into any other part of your dominions, as you shall think proper, provided it be at the distance of 80 statis from the sea.' This decree was received with the most bitter anguish, and when it was communicated to the people, nothing was seen and heard in every part of the city but howling and despair, madness and fury. After this transference, the consuls made no great haste to march against Carthage, as they knew the city was disarmed. However, the inhabitants, being unanimously resolved not to quit the city, took the advantage of this delay to put themselves in a posture of defence. They appointed as general, without the walls, Afdrrabal, who was at the head of 20,000 men, and within the walls the command was given to another Afdrrabal, the grandson of Mamilia. They then applied with great diligence and expedition to the manufacture of arms. The temples, the palaces, the open markets and squares, were all changed into arsenals, where men and women worked day and night. Every day were made 100 shields, 300 swords, 700 pikes or javelins, 1000 arrows, and a great number of engines to discharge them; and because they wanted materials to make ropes, the women cut off their hair for this purpose. During this interval the consuls were advancing towards the city in order to besiege it. The Carthaginians defended themselves with incredible resolution and vigour; and renewed the bold old stances, for repelling the besiegers, burning their engines, and harassing their foragers. Censorinus attacked the city on one side, and Manuelius on the other. Scipio, afterwards named Africanus, was then a tribune in the army; and distinguishing himself above the rest of the officers, by his prudence as well as his bravery. The besieged, though thus powerfully affailed, were recovering their spirits, in consequence of some advantages which they gained. Their troops increased, and they obtained an accession of allies. This news occasioned some uneasiness at Rome; but the fame of Scipio had also arrived in the city; and when he appeared in the assembly, as a candidate for the multitude, a general perfuasion prevailed, that he was designed by the gods to end the third Punic war, as the first Scipio, his grandfather by adoption, had terminated the second. Indeed, therefore, of granting him the multitude, for which he was a candidate, they foronce disregarded the laws, and conferred upon him the consulship, assigning him Africa for his province. As soon as Scipio had compleated his recruits, he set out for Sicily, and soon after arrived at Utica. Immediately upon his arrival, he revived the discipline among the troops, and made several necessary regulations. Having ordered his troops to provide themselves with axes, levers, and scaling ladders, he led them in the dead of the night, and without the least noise, to a district of the city called Megara; when ordering them to give a general and sudden shout, he attacked it with great vigour.

The enemy, though somewhat terrorized by this unexpected attack, defended themselves so courageously, that Scipio could not scale the walls. But perceiving a tower that was forfaken, and which stood without the city, near the walls, he detached thither a party of intrepid soldiers, who, by the help of pontons, got from the tower to the walls, and from thence into Megara, the gates of which they broke down. Scipio entered it immediately after, and drove the enemies out of that part; who, terrified at this unapprehended assault, imagining that the whole city was taken, fled into the citadel: whether they were followed even by those forces that were encamped without the city, who abandoned their camp to the Romans, and thought it necessary to fly into a place of security. At day-break, Afdrrabal perceiving the ignominious defeat of his troops, in order to be revenged on the Romans, and at the same time, to deprive the inhabitants of all hopes of accommodation and pardon, brought all the Roman prisoners he had taken upon the walls, in the sight of the whole army. There he put them to the most exquisite tortures; putting out their eyes, cutting off their noses, ears, and fingers; tearing their skin to pieces with iron rakes or harrows; and then threw them headlong from the top of the battlements. This inhuman treatment filled the Carthaginians with horror; however, he did not spare even them, but murdered many senators who had been so brave as to oppose his tyranny. Scipio, having made himself absolute master of the illusmus, burnt the camp which had been deserted by the enemy, and built a new one for his troops; and by means of a high wall which he constructed, equal to the whole breadth of the illusmus, that is, 25 statis, with towers and redoubts at proper distances, he lodged his forces in safety, and cut off all provisions from the besieged, thus producing a famine which soon after raged in the city. To deprive them more completely of necessary supplies, he attempted to leap up the mouth of the haven by a mole. This effort, however, was ineffectual; as the Carthaginians opened, on a sudden, a new outlet on the other side of the haven, and appeared at sea with a numerous fleet, which they had then built with the old materials found in their magazines. Having thus offered a kind of insult or bravado to the Romans, without immediately attacking their fleet, which it is said they ought to have done, they returned into the harbour. In a subsequent naval engagement, they were defeated. Scipio having made some further advances towards the distrefs and capture of the city, terminated this campaign.
campaign. During the winter-quarters, he endeavoured to overpower the enemy's troops without the city; and in his last action cut to pieces above 70,000 of the enemy, as well as their two and a half miles of a neighboring fort, called Neapolis, after following a siege of 12 years. The execution of this task was followed by the further advance of almost all the strongholds in Africa; and contributed very much to the taking of Carthage itself, into which, from that time, it was almost impossible to bring any provisions. Early in the spring, Scipio attacked, at one and the same time, the harbour called Calon, and the citadel. In the progress of this business a dreadful slaughter took place for six days; but on the 7th day, when it was expected the siege would have continued much longer, and much more blood have been shed, there appeared a company of men in a suppliant posture and habit, who declared no other conditions but that the Romans would please to spare the lives of all those who should be willing to leave the citadel. The request was granted to all, except the defectors; and, accordingly, 50,000 men and women came out. The defectors, about 40,000 in number, finding that they had no quarter to expect, fortified themselves in the temple of Astarte, with Afdrubal, his wife, and two children; where they might have held out a long time, though their number was small, as the temple stood on a very high eminence of rocks, to which the ascent was by 60 steps. But at length their patience was exhausted, and they abandoned the lower part of the temple, and retired to the uppermost story, resolving not to quit it but with their lives. Afdrubal came down privately to Scipio, and, being desirous of saving his life, threw himself at the feet of the Roman general; by whom he was exhibited to the defectors, who, transported with rage at the sight, poured out their imprecations against him, and set fire to the temple. While it was burning, we are told, that Afdrubal's wife, disregarding herself as splendidly as possible, and placing herself with her two children in flight of Scipio, addressed him with a loud voice:—"I call not down," says she, "curse upon thy head, O Roman; for thou only taketh the privilege allowed thee by the laws of war; but may the gods of Carthage, and thou, in concert with them, punishest, according to his deserts, the false wretch, who has betrayed his country, his gods, his wife, his children!" Then, directing herself to Afdrubal, "Perfidious wretch," says she, "thou bastafet of creatures! this fire will presently confound both me and my children; but as to thee (too shameless general of Carthage!) go—adorn the very triumph of thy conqueror—fiend, in the fight of all Rome, the tortures thou so justly deserve!" She had no sooner pronounced these words, but seizing her children, she cut their throats, threw them into the flames, and afterwards rushed into them herself, in which she was imitated by all the defectors.

Under the magnificence of this city, he shed tears over its fate; and reflecting that cities, nations, and empires, are liable to revolutions no less than individuals; that the like kind fate had befallen Troy, anciently so powerful; and, in later times, the Athenians, Medes, and Persians, whose dominions were once so extensive; and, lastly, the Macedonians, whose empire had been so glorious throughout the world; these mournful ideas suggested to him the following verses of Homer, which he repeated:—

"Ωκτεθνήκες Ὀμήρου, ἦς ὅδε ἐς ἀλήθειαν ἅλατον ἐς τῇ Καλλιφασκόλεον, ἐν ἀληθείᾳ ἔγραψεν."

I. 2. 164, 165.

"The day shall come, that great avenging day,
When Troy's proud glory in the dust shall fall,
When Priam's pow'rs and Priam's self shall fall,
And one prodigious ruin swallow all." Pind.
tary; down none, or only. _R._ flat, hairy; hairs longer than the seeds.

Eff. Ch. Outward calyx-scales with more than one spine, Lam.

Sp. 1. C. tinctorius, birked farron, or safflower, Lam. Sp. Pl. 1. Mart. 1. Wildl. 1. Gært. tab. 161. fig. 2. Lam. 18, Pl. 661. fig. 3. Carthamus officinarum, Tourne. Bauh. pin. "Leaves ovate, entire, ferrate-acutellate." Lam. "Stem perfectly smooth; leaves ovate, entire, spinous-toothed; seeds naked." Wildl. Root annual. Herb in shock in all its parts. Steem about two feet high, erect, cylindrical, woody, branched toward the summit. _Leaves_ simple, entire, acuminate, wined, with spinos at their edges; root-leaves oblong, narrowed at the base; stem-leaves small, ovate, half-emvbracing the stem. _Flowers_ rather larger, terminal, solitary; calyx-scales broad at the base, flat, reflecting the leaves; flowers of a fine farron colour. _Seed_ white, naked. A native of Egypt and the warmer parts of Asia. The seeds have a pungent quality, and are said to be particularly useful when the flesh is parched with a viscid viscid mucus. They are a favourite food of parrots, on whom they do not produce a similar effect. The flowers are supposed to have the same medicinal properties as farrons; but they are chiefly used as a material for dyeing silk and cotton stuffs, to which they give a beautiful, but fugitive rose-colour. A red pigment is likewise prepared from the flowers, used by painters, and known as a coum-

tic rouge by the Pariían ladies, under the name of vegetable rouge, Spanish vermillon, or lake of carthamus. C. _florousus_, Wildl. 2. (C. orientalis, Tourn. cor. 33.) "Stem perfectly smooth; leaves oblong, entire, spinous-toothed, seeds crowned with down." Wildl. Root annual. Stem erect, white, branched. _Leaves_ oblong, narrower than those of C. tinctorius, fimbriated, divided, toothed; teeth spinous; spines awl-shaped, yellowish, long. _Flowers_ yellow. A native of Armenia. C. _fronsis_, Willd. 4. Desfont. "Stem perfectly smooth; leaves lanceolate, entire, spinos-toothed; outer calyx-scales longer than the flower, spreading, spinous-toothed at the base." Root annual white. A native of Peru. 4. C. atus., Willd. 4. Vahl. syl. 1. tab. 17. Fo. vol. 217. (Cicinus atrac-
tylidiol folio, flore purpureascens, Tourne. Cor. 35.) *'Cicinus villosus, leaves prostrate, lanceolate, entire, spinos-toothed, inner calyx-scales somewhat rounded, obtuse at the summit, fe
totheed. A native of Africa Minor. 5. C. lanatus, yellow diUaff thistle, or wooly carthamus, Lam. 2. Mart. 2. Lam. 2. Wildl. 5. (Cicinus atrac 

tylidiol folio, flore purpureascens, Tourne. Cor. 45.) Atradeya lutea, Bauh. pin. 379. Atradeya fuscus agriditis, Gært. tab. 161. fig. 2. Claudio beni of the Peris-

ians.) "Stem hairy, woolly towards the top; lower leaves pinnatifid, upper ones embracing the flem, toothed." Lam. "Stem woolly; lower leaves pinnatifid, toothed; upper ones embracing the flem, pinnatifid, toothed." Wildl. Root annual. Stem about two feet high, upright, cylindri-

cal, branched towards the summit, cobwebbed between the branches. _Leaves_ oblong, spinous. _Flowers_ yellow, foli-

tary at the end of each branch, forming all together a kind of corymb; outer scales of the calyx foliaceous, reticulately

nerved, pinnatifid-spinous, very prickly; inner ones carbo-
lignious, appended, ciliate, ending in a sharp spine; rece-
ceptacle befit with bristle shaped chaff. _Seed_ inverly py-

ramidal; thole in the circumference differing a little in shape from those of the circumference. Lam. and Gaert. The leaves are rather bitter, and are sometimes used as a febrifuge and sudorific. A native of uncultivated ground and the borders of fields in the south of France, Spain, and Italy, where the women use its battle for dittails. C. _creticus_, Lam. 5. Mart. 3. Lam. 3. Wildl. 6. (Cicinus creticus flore leucophaeus, Tourne. Cor. 33.) "Stem nearly even; calyxes a little woolly; florets about nine; lower leaves lyrate; upper ones half-embracing the stem, toothed." Linn. "Stem even; calyxes nearly smooth; flowers white." Lam. Root annual. Stem near four feet high, very white. _Tourn. 451._ deeply indented, armed with strong spines. _Flowers_ few, white, and according to Haller with five black lines at the opening, which divide and make the edges of the segments black. Haller also affirms that the radical florets of this and the preceding species are stouter and abutives, whence Jut-

sen refers them both to his genus calastraps, formed from the centaurus of Linnaeus. Gathered by Tomnordt in the island of Cadora, who sent the seeds to the royal garden at Paris. 7. C. peltatus, Wildl. 7. Desf. Ath. tab. 232. "Stem villous; calyxes smooth; leaves petiunculate toothed, spinous; lower ones linear-lanceolate; upper ones ovate." Lam. Root perennial. _Leaves_ smooth. _Flowers_ in a cor-

ymb; calyx-scales spinous-ciliate on each fl.; and shapled and pungent at the summit. Desf. A native of uncultivated

mountains in Barbary. 8. C. m. multijihla, Wildl. 8. Desf. Ath. tab. 217. "Stem febrifuge; lower leaves pinnatifid; segments gaft-toothed, spinous; upper ones ovate-lanceolate, spinos-toothed." _Flowers_ in a corymb; calyx-

scales ciliate-spinous at the edges, ask-shaped at the tip. Desf. A native of uncultivated hills about Algiers. 9. C. tinctorius, Linn. 4. Mart. 4. Wildl. 9. (Cardium carules errectus, Moris. hist. tab. 33. fig. 19.) "Root leaves pinnat-

ic; stem leaves pinnatifid; stem one flowered." Linn. Root perennial. Stem a foot and half high, feldom branched. _Leaves_ narrow-spear-shaped, densely ferrared; each of the ferratures ending in a sharp point. _Flowers_ blue; scarcely different from the next species. Linn. A native of Barbary, about Tangier. 10. C. carules, Linn. 5. Mart. 5. Lam. 4. Wildl. 10. (Onobroma carules, Gært. tab. 162. fig. 7. Cincus carules affector, Bauh. pin. 578. Tourne. 451. Cn. alter, Chif. hist. 2. p. 152. Lob. ic. 2. p. 19.) "Leaves lanceolate, spinos-toothed; stem generally one-flowered." Linn. Root perennial. Stem single, purplish, hairy and channelled. _Leaves_ covered with a short, hairy down. _Flowers_ blue; outer calyx-scales broad, long, with sharp spines on their edges; inner ones narrow, terminated with a sharp yellow. A native of Spain and the coast of Barbary. Miller affirms that it is extremely different from the preceding: but La Maree observes, that though the tinctorius of Linnaeus may perhaps be a different species, Montio's cardium carules appears to him to be only a variety of the present. 11. C. bellii, Wildl. Desf. Ath. tab. 230. "Stem gen-

erally one-flowered; leaves ovate; lower ones quite entire; upper ones slightly toothed, not spinous." Root annual. _Leaves_ smooth, embracing the flem. _Flowers_ yellow; cal-

cy-scales ferrated, a little spinous. A native of corn fields in Barbary, near Mafcar. 12. C. fumatus, Wildl. 12. Desf. tab. 229. "Stem one-flowered; leaves pinnate; pinnate often trihls, spinous ferrated; inner calyx-scales fic
tious and toothed at the tip." Root perennial. _Flowers_ blue. A native of Barbary. 13. C. carduncellus, Linn. 7. Mart. 7. Lam. 5. Wildl. 14. (Cicinus carules hemisbia montis Lupi, Tourne. 451. Carduncellus, Moris. tab. 33. fig. 15.) "Stem-leaves linear, pinnate, the length of the plant." Linn. "Stems weak, one flowered; leaves long, scarcely spinous; root-leaves lyrate; stem-leaves pinnate; stem pinnate, deciduous." Lam. Root perennial. Stems several, about six inches high, simple, sometimes a little woolly. _Flowers_ blue, large, terminal: outer calyx-scales foliaceous, inner ones smooth, ciliate at their summit, and terminated by a small barious appendage; down of the seed capillary,
CARATHAMUS.

capillary, unequal, deciduous. A native of the south of France. 14. C. nitidiflorus, Lam. 6. Matt. 6. Willd. 13. (C. humilis, Lam. 6. 2.) " Leaves not spinous; root-leaves rounded; stem-leaves pinnate." Lam. " Generally bifid; leaves spreading on the ground; flower large." Lam. " Root perennial. Leaves long, spinous, deciduous, 6 inches high, smooth, slightly fertilized, with one or two leaves. Root-leaves, some lanceolate, dilated at the end, and very smooth, toothed from the middle to the side; teeth turned upward, sharp, ending in a small thorn; other spinous; pubescent, lanceolate, reflexed, quite entire, some of them curled at the base underneath. Stem leaves intermediately pinnatifid. Flower bright blue; calyx: base; outer scales foliaceous, concave, spine-shaped, obtuse, quite entire, laciniate, dilated, and generally dilute of conical veins or nerves; inner ones narrower, obtuse; minute, acuminate, dilated, and ciliated at the tip. Drown of the elder genus, Gumnium. A native of France. 15. C. arboriflorus, Lam. 9. Mart. 8. Lam. 7. Willd. 15. (Ceratocarpus arboreus, Tamm. 431.) " Leaves furred, flaped, garni-toothed." Lam. Root perennial. Whole plant pubescent. Stem six feet high, firm, evergreen: Leaves clasping the stem, green, veined, very spinous at their edges; lower ones near a foot long, rounded or pinnatifid, with spinous teeth. Flower most commonly solitary, yellow, of a pleasant smell; outer calyx-scales foliaceous, spinous; inner ones ciliated; down of the feed capillary. A native of Spain. 16. C. monilifera, Lam. 8. (Carduus marianus, Lam. Engl. Bot. 976. Crott. Lond. tab. 54. Silybum marianum, Gaert. tab. 162. fig. 2.) " Leaves furred, toothed, spinous, embracing the stem; calyx-leaves pinnatifid, spinous at the margin and tip." Lam. Root annual. Stem five or six feet high, branched, furnished, smooth. Leaves large, deep green, beautifully variegated with milk-white veins; root-leaves pinnatifid; stem-leaves alternate, recurved, oblong, acute, repand, generally smooth, ciliated at the edge with unequal spines. Flowers purple, terminal, solitary, large, on naked peduncles; calyx-scales very different from those of carduus, distinctly appendicled, armed with lateral and terminal spines. A native of road sides, &c. in England, France, and other parts of Europe. There is a variety not unfrequent in the neighborhood of London without variegated leaves. The common fort was held in great veneration by the physicians and botanists of the dark ages, having, as they imagined, derived its white veins from the milk of the Virgin Mary, which accidentally dropped upon it. Its root, leaves and seeds are feodoric, cooling, and diuretic. It has also been recommended as a pectoral, and is said to have been taken with effect in pleurisy. 17. C. corymbosus, Lam. 8. Mart. 10. Lam. 9. (Chamaecistus minor, Bawhr. p. 580. Dalech. hift. 1454. Lob. f. c. 2. p. 5. Carduus chamaeleon. Morit. tab. 33. fig. 17. Broteria corymbosa, Willd.) " Flowers in a corymb, numerous." Lam. Whole plant formidable spinous. Root perennial. Stem from six to nine inches high, upright, channelled, branching into a corymb at its summit. Root-leaves rather large, spreading on the ground, dark green, smooth, deeply divided; divisions pinnatifid, toothed, and spinous. Stem-leaves small, oblong, fleshy, armed at their edges with short, stiff, double spines. Flowers small, of a clear blue colour, (white, Miller,) forming with their branches a dense cluster at the ends of the branches; calyx oblong; scales armed with spines at their edges and summit. A native of the south of Italy, Romania, and Sardinia. It has the habit of echinops, and according to Willdenow, properly belongs to the order segregata, where he has placed it as a distinct genus next to echinops, but La Maree affirms that it has all the characters of calamus, and ought not to be so included from the other species of this genus. No author Gilmour, Willdenow has mentioned a proper ally to corymbosus. 18. C. nanus, Lam. 13. (C. acanthi, f. 2. Lam. 7. Mart. 5. Willd. 8. Chinese polyanthus, Linn.) " Leaves and flowers much smaller than ordinary. Each petal of Chinese flaminia bicolor, Choit. hift. p. 195. Lob. 8. 2. 1765. " Leaves, narrow lanceolate, decurrent; flowers small, white or yellow, with yellowish spines; calyx long, white; flower spinose, pinnate, pubescent near the tip." Lam. Root perennial. Stem four and half high, erect, winged, branching, forming a corymb at its summit. Leaves wheel-shaped. Flower purple, oblong or nearly oval, armed and dilated at the summit of the branches, terminated by bracts; fruits small; calyx woolly; seeds terminated by an appendix, armed with yellowish lateral and terminal spines. A native of Spain. and the south of France. 19. C. melanospermum, Lam. 14. " Leaves linear, quite entire, smooth; few herbaceous, one-flowered." Stem six or seven inches high, simple. Leaves smooth, without spinos; lower ones long, numerous, growing near together. Flower terminal, small, naked; outer calyx-leaves ovate, smooth, a little appendicled, with very short lateral spines. Found in the Straits of Magellan by Connexion. 20. C. sichierianus, Lam. Jun. Supp. p. 550. Mart. 9. Lam. 15. Willd. 16. " Stem thorny; petals spinous; leaves lanceolate, entire, downy and much prickly at the tip; branches one flowered." Bracteoes long, white, cottony. Leaves furred, nearly fleshy, smooth and veined above, clothed with a white cottony, or silky pubescent down underneath, terminated by a feathery spine. Flowers white, solitary, terminal, naked; calyx short; scales unattached, appended, white on the outside, bordered with spinous teeth, down of the feed feathery, on which account Ventenat is inclined to think it an atrachilis. A native of the island of Madeira. La Maree, Enye. vol. i. p. 639, 640, has removed atrachilis caneculata and gummiifera of Linnaeus to this genus; but his successor Boret has remanded them back again to their former station. See Enye. vol. vi. p. 29, 30, sub Quenouillat and Atrachilis of this dictionary.

Obf. Gartner makes naked seats an essential part of the generic character. His carthamus of course includes only the first species, all the others having their heads crowned with down; and even in that, the heads are said by Jussieu, Ventenat, and du Tour, not to be naturally naked, though the down, being extremely caducous, has escaped the notice of most authors.

Propagation and Culture.—The first species has been cultivated in Egypt from the earliest ages for the use of dyers. From 16 to 12,000 hundred weight of flowers is the present average annual produce; seven eighths of which are exported to Europe; the rest is consumed in the country and other parts. It was not known in Italy in the time of the elder Pliny, but it is said by Allon to be now found apparently wild, or at least perfectly naturalized in the neighbourhood of Nice. It is cultivated with success on some parts of Germany, where its feeds come in copious quantity, and was introduced into England, as appears from Turner's herbal, as early as 1574. In the year 1683, twenty-five acres in the vale of Exeham, in Gloucestershire, were sowed with its seed, and the produce was such as might have justified a farther trial. No attempt of the kind, however, has since been made; and there is perhaps reason to apprehend that in our variable climate, and with our frequent wet summers, the crop would always be uncertain; for the quality of the flowers is considerably impaired if they are exposed to rain in the interval between their open-
ing and being gathered for use. In Germany it is found in the lightest land, which has always a double fallow given to it, first to destroy the weeds, and afterwards to make it fine. After it has been followed a summer and a winter, and has been ploughed and harrowed four times, it receives its last ploughing and harrowing in the latter end of March. The seeds are then scattered thinly in drills, made with a small plough, about a foot and half from each other, and the earth is drawn into them with a harrow, whose teeth are little more than an inch long; a roller is finally drawn over the ground to smooth and to settle it. After the plants are come up they are hoed three times, about five or six weeks between each time; and as soon as the flowers begin to open, the field is gone over once a week to gather such as are ready. There is usually a succession of flowers for five or six weeks; but great care should be taken that there be no dew upon them when they are gathered. They are immediately dried in a kiln, and may then be pressed close without fear of detriment. In Spain this plant is cultivated in their gardens, as marigolds are in England, to give a colour to their fields, olives, and other vines. Considered merely as an ornament, it is worthy of a place in the borders of our large gardens, as it continues in flower eight or ten weeks. The seeds should be sown about the beginning of April, in the ground where the plants are intended to remain, for the roots are injured by transplanting. Most of the other species will stand our winter in the open ground, but several of them will scarcely ripen their seeds; such of them as are perennial may, however, be readily increased by parting the roots. See Saltwort.

CARTHARA, in Ancient Geography, a town of Mero- potamia.

CARTHEUSER, John Frederic, in Biography, professor of medicine at Frankfort on the Oder, acquired considerable reputation about the middle of the last century, by several very luminous works on the subjects of botany and pharmacy. The principal of these are "Rudimenta Matrice medicæ rationalis," Francof. Svo. 1741, reprinted in 1749, much enlarged and improved, in two volumes Svo. Besides describing the simples, and the method of preparing and compounding them, the author has given the refult of his own experience of their virtues. "De Generica quibusdam Plan- tarum Principiis, haecorum plurimum negleoticis," Francof. 1754, 8vo. A valuable work. Haller says, in which the author introduces several articles not before found in similar publications, particularly of the trees producing wax, a substance like butter, and a kind of fuel. The trees are natives of China. Besides the above, there is a variety of differtations, mostly on interesting subjects. The titles, with short accounts of them, are given in Haller's Bib. Botan. See also Eloy. Dict. Hill.

His two sons, Frederic Augustus, and William, became also doctors in medicine, under the auspices of their father. The importance of the works left by them are," "Elementa Mineralogiae syltematica digesta." "Francof. 1755, 8vo, by the elder; and "Differtations phylico-chemico-medicae; de quibusdam materic medicæ subjunctis," Svo. 1774; and "Differtations nonsoluta; feleciors, phy. chem." Svo. 1775, including some written by the father, and by other writers.

CARTHUSIANS, in Ecclesiastical History, a branch of the BENEDICTINS, an order of religion, instituted by St. Bruno, about the year 1084 (some fix at 1080, and others in 1085), remarkable for the austerity of their rule, which obliges them to a perpetual solitude; a total abstinence from flesh even at the peril of their lives; and to feed on bread, water, and salt, one day in every week; and absolute silence, except at certain stated times.

Their houses were usually built in deferts, their fare coarse, and their discipline severe. It is observed, that the monas- tical piety is still better preferred in this, than in any of the other orders. M. l'Abbé de la Trappe, however, endeavours to shew, that the Chartusians do not live up to the austerity enjoined by the ancient statutes of Guigues, their fifth general. M. Maffon, general of the order, answers the abbé; and shews that what he calls the statutes, or constitutions of Guigues, are, in real ly, only customs compiled by father Guigues; and that they did not become laws till long after.

The word is formed from Carolus, or Cartusius, a denomination given them in Latin, from a village in Dauphiné called Chartreux, in Latin Cartusium, Charteretus, as foue say, where the first monastery of this kind was erected. Hence the French call the religious of this order Chartreux, and their convents Chartreuxes; an appellation which also appears to have anciently obtained in England; whence the name of that celebrated hospital, or rather college, in London, the Charter-house; by corruption from Chartreux.

The Chartusian habit is all white within, their sepulchral being joined in the sides by two pieces of the same stuff. They wore a hair shirt next their skin. Their prior and procurator, who may go abroad upon the necessary affairs of the house, appear in a black cloak down to the ground, and a black hood over the white one; the hood not round, but tapering to a point.

There are few nunns of this order. There have, however, been some female Chartusian convents; but the increase of them was prohibited in 1568; so that there remained only five, four in France, and one at Bruges in Flanders. As the rigorous discipline of the Chartusians is altogether incon-istent with the tenderness and delicacy of the female sex, the austerity of the order has been diminished in the female con- vents; and it was more particularly found necessary to ab-rogate those severe injunctions of silence and solitude, that are so little adapted to the known character and genius of the fex. They were brought into England by Henry II. about the year 1180, and had only nine nuns; their first house being at Witham in Somersétshire.

Carthuser powder, poudre des Chartreux. See Kernes mineral.

CARTIER, or QUARTIER, James, in Biography, an eminent navigator, was born at St. Malo's, where he distinguished himself as a skilful pilot. Francis I. employed him to prosecute discoveries in Canada, for which purpose he made a voyage thither in 1534, examined the country with great attention, and gave an exact description of all its islands, coasts, capes, bays, &c. which was of great use to subsequent navigators.

Cartilage, in Anatomy, is a semipellucid substance, of a milky-white or pearly colour, entering into the composition of several parts of the body. It holds a middle rank in point of firmness, between bones, or hard parts, and the softer constituents of the human frame. It appears, on a superficial examination, to be homogeneous in its texture; for, when cut, the surface is uniform, and contains no visible cells, cavities, or pores, but resembles the fection of a piece of glue. The cartilages of the ribs, however, particularly in adults, present a kind of fibrous appearance in its texture: and Dr. Hunter has discovered, by microscopic examination, that the cartilaginous crists of articular surfaces are composed of straight parallel fibres directed towards the cavity
C A R

cavity of the joint. (Philos. Transact. N° 470.) This sub-
flance pouldists a very high degree of elasticity; which pro-
perly distinguishes it from all other parts of the body.
Hence it enters into the composition of parts, whose func-
tions require the combination of firmness, with pliancy and
flexibility: the prevention of sliding and external form, with
the power of yielding to external force or pressure.

Cartilages are covered by a membrane, resembling in tex-
ture and appearance, as well as in its office, the periodien-
or of bones; this is termed the perichondrium. They receive
arteries and veins from this membrane: these vessels, how-
ever, have never been demonstrated in the cartilaginous
crusts of articular surfaces. Absorbed vessels cannot be
actually shown: but their existence is abundantly proved by
many phenomena. The conversion of cartilage into bone
is alone sufficient for this purpose. The cartilaginous sub-
flance is gradually removed as the formation of the bone
advances. In affections of the joints their cartilaginous cov-
erings are often both entirely destroyed, or partially re-
 moved; which appearance can only be ascribed to the action
of absorbent vessels. It does not seem to pouldea nerves,
as it is entirely deficient of sensibility.

Its colour is not affected by feeding an animal with madder.

It refuits the effects of preflure from contiguous diseæase,
longer than the bones, or the soft parts of the body. Dr.
Hunter has observed in the cartilages of the ribs; and the
fame fact is also witnified in the bone in the cafe of amenorrœ in the defending sort.

It does not exfoliate like the substance of bones.

When destroyed, it is never reproduced. We have ob-
served a curious exemplification of this fact in the case of
unhealed joint; in which the head of the disintegrated bone has its
cartilaginous crust gradually worn away by friction against
the surrounding parts; this is never replaced; but the sub-
flance of the bone itself becomes highly polished. The new
cavity, which is ultimately formed for it in the bone, on
which it lies, has no cartilaginous surface, but is polished
in the fame way.

The thinner cartilages of the body are resolved by macera-
rion into a kind of fibrous subflance: e. g. those of the
organs of sense. These are the softest, and most flexible in
the body. Thoese of the ribs, if boiled or macerated for
some months, seem to consist of oval laminae, surrounding
each other concentrically, and connected by transverse fibres.
These are much more dense and elastic. The intervertebral
and interarticulate cartilages, with that of the symphyses
pubis, obviously contain a considerable intermixture of tendi-
nous fibres; and may be resolved into a cellular tex-
ture.

Digestion, in a cloac vessel, dissolves cartilages, and con-
verts it into a jelly.

The cartilages of the body are divided, by anatomists,
to two kinds: the temporary and the permanent. The
former are confined to the earlier stages of existence; the
latter commonly retain their cartilaginous structure through-
out every period of life. The temporary cartilages are thoese
in which the bones of the body are formed. They are
here called by Latin writers Osteochrtes. All the bones
in the body, except the teeth, are formed in a nidus of car-
tilage. The form of the bone, with its various proceces, is
accurately represented in these cartilaginous primordia; and
it is the sublinace alone which changes. In the early peri-
ods of fetal existence, these cartilages are of a soft and
gelatinous texture; they become firmer and harder as the
growth of the subject advances. No difference is observed
in the cartilage, whether a long or a broad bone is to be
formed in it; whether the future bone be of the reticulated
or compact structure. As the cellular matter is depoited,
the cartilaginous subflance is absorbed. The cartilages
are thus connected to the body of the bone by cartilaginous
crusts, after they are completely ossified; but this part
is ultimately comphnoluted.

The permanent cartilages are of various kinds. The ex-
ternal ear, the external aperture of the eyeballs, and the
cylids, are composed of a thin and flexible cartilage, enclosed
in a duplication of the common integuments. See Ety,
EAR, and Nose.

The larynx is entirely composed of this subflance, and
the traæha, with its branches, is furnished with pieces of
cartilage, by which these tubes are kept permanently open,
for the ready passage of air to and from the lungs. See La-
rynvs and Trachea.

Portions of a dense and elastic cartilage are annexed to
the anterior extremities of the ribs; and in the seven first ribs
are articulated to the side of the sternum. The elasticity
of these parts constitutes a chief instrument of respiration, by
reforin the ribs to their former position when the action
of the intercostal muscles has ceased.

Contiguous bones are sometimes united by the interven-
tion of cartilage: as the two ossa pubis, the sacrum and
ossa innominata, and the two bones of the sternum. This
species of junction is technically termed synchondrosis.

The bodies of the vertebœ are joined by large masses of
a peculiar subflance, partaking of the properties and ap-
ppearance of cartilage and ligament; which allow of the
motions of these parts on each other, without weakening
the support which is afforded to the upper parts of the
body in general, and to the head in particular, by the ver-
tebreal column. These cartilages impart a great elasticity to
the spine, by which the effect of concussion, from jumping,
from falls, &c. are weakened, and destroyed, before
they can be propagated to the head. When the body has
been long in an erect position, the comprefion of these car-
tilages by the weight of the upper parts of the body, dis-
nipishes the height of the person. They recover their for-
mer length, when freed from the preflure of the superci-
cumubant parts. Hence a person is taller when he ripes in a
morning, than after suffusing the fatigue of the day; and
the difference has sometimes amounted to an inch. (Philo-
osophical Transactions, N° 383. Hist. de l'Acad. des
Sciences, an. 1725.)

Cartilages are sometimes interposed between the articular
surfaces of bones; where they fill up irregularities, that
might otherwise impede the motions of the part; and in-
crease the security of the joint, by adapting the articular
surfaces to each other. Influences of this are found in the
articulation of the lower jaw; in the connection of the
clavicle with the sternum, and in the knee-joint. These are
called interarticular cartilages.

The articular surfaces of bones are in every instance cov-
ered by a thin crust of cartilage, having its surface most
exquisitely polished, by which all friction in the motions
of the joint is avoided, and the ends of the bones glide over
each other with the most perfect facility.

These permanent cartilages become not unfrequently
more or less ossified in old persons. The cartilages of the
larynx, particularly the thyroid and cricoid, and those of
the ribs, are generally affected in this way in an advanced
age; yet some instances have been observed, where this
change had not taken place, even in very old subjects, as, e. g.
in the case of Thomas Parr, who was examined by Harvey,
(See Thoms Parre, Lond. 1669, Svo.) and of another per-
son of 130 years old by Keill. (Phil. Trans. N° 366.) The
symphyses
favour to the formation of the French. The fishes of this tribe are distinguished by having, as their name implies, a cartilaginous instead of bony skeleton.

The cartilaginous fishes are numerous, embracing the whole of the two last orders of ichthyology, the Branchio-
fidae, and Chondropterygii, in which the following genera are contained, Mustelus, Otobranch, Petromyzon, Diadromus, Sphy-
nathus, Pegasus, Centriscus, Boidae, Cyclopterus, Lophius, Aetipendel, Chimera, Squalus, Raja, Petromyzon, and Gla-
trobranchus.

Linnaeus separated the cartilaginous from the other fishes, and placed them in the class Amphibia, where they constituted the order Nantes. This division was made under the supposition that the cartilaginous fishes were, being both with lungs and gills, an idea apparently confirmed by the observations of Dr. Garden of South Carolina, who at the desire of Linnaeus examined the organs of the genus Diadromus, and found, as he conceived, both external gills, and internal lungs. These supposed lungs, however, have been since ascertained by naturalists to be only a peculiar modification of the gills, and it therefore now appears that this cartilaginous tribe are, in reality, fishes, differing principally, if not entirely, from other fishes in having, as before mentioned, a cartilaginous skeleton. They differ from the generality of other fishes, in having the gills delitute of bony rays, or in the gills being cartilaginous; and they are deficient, for the most part, at least, of obvious scales, those being either very judicious, minute, or so deeply imbeded in the skin as to be scarcely visible: in many of the cartilaginous fishes there is not even the slightest appearance of scales on the surface of the skin. See Fishes and Ich-
thyology.

Cartilaginous leaf, among Betonyla. See Leaf.

CARTILI, in Ancient Geography, a bay of Africa, where vessels sheltered themselves from the easterly wind; situate N.E. of the mouth of the river Chialalpul.

CARLISLE, a place of Africa, in Mauritania Caffari-
enis, between Cartagen and the colony of Caesarea, ac-
cording to the Itinerary of Antonine.

CARTINAGA, a town of India, on this side of the Gauges. Ptolemy.

CARTISMANDUA, in Biography, queen of the Bri-
gantes in Britain about the middle of the first century, justly incurred infamy by causing Caractacus, who had put him-
self under her protection with promises of safety, to be ar-
rested and delivered up to the Romans, A.D. 49. By this act of treachery, she gained their favour and increased her
own power and wealth. But afterwards, preferring to her husband Venonus, who was celebrated the bold warrior among the Britons (Caractacus excepted), her country Vallicatanus, and advancing him to the partnership of her throne and bed, she occasioned two contending parties; one in favour of Venenus, which maintained his right to the throne, and another which adhered to the interest of Cartismandua. When she found herself likely to be overpowered, she sought the protection and alliance of the Romans, who secured her safety, and in the issue of the contest made themselves masters of the country. Tacitus, Annal xii. Hist. iii.

CARTMEL, in Geography, is a market town of Lancas-
shire, England, leated in a woody vale, near a tract of sands which run out into the Irish Sea. These sands bear the respective names of three rivers, which here discharge them-
elves into the ocean. To shorten the distance from one place to another many persons travel across these sands, but from the danger that attends these pathless roads, it is found necessary for strangers to employ guides, who are confidently waiting for that purpose. These are employed, and paid, by the government. In the vicinity of the town are some high hills, known by the name of Cartmel Fells. Here was formerly a priory, which was founded by William Minshull, earl of Pembroke, in the year 1188, for canons regular of the order of St. Austin. The church, which originally belonged to this religious foundation, is appropriated to the parish, and is a large handsome structure. Its tower is very peculiar, being square for some distance from the ground, and the upper part fat diagonally within the lower. The interior of the church is fitted up in a very neat style, and contains a number of fine and ancient monuments. The parish has five chapels of ease, at small places in the vicinity of the town. Here is a free grammar school well endowed, and its buildings were erected in 1795. Though Cartmel has no particular manufactories, yet in its vicinity are three very large cotton-mills. Here are two weekly markets, Tuesdays and Saturdays; and two annual fairs. Cartmel is 16 miles from Lancaster, and 265 N.W. from London. It contains 140 houses and 852 inhabitants.

About three miles south of the town are Cartmel Wells, which are reported to in the summer season, and their waters are found serviceable in the combative complaints. A pleasant walk through the woods of about a mile leads to Villa-
Hall, the seat of Lord George A. Cavendish. The mansion is ornamented with several fine pictures by Vandyke, and other artists.

CARTON, or, as we pronounce it, Cartou, in Paint-
ing, a design made on ivory paper, to be afterwards car-
qued through, and transferred on the fresh plaster of a wall, to be painted in fresco.

Carton is also used for a design coloured, for working in mosaic, tapestry, &c. The word, in the original French, signifies thick paper or paste-board.

In Italian, whence the term seems to be derived, cartoune, or cartoni, signifying large paper, denotes several sheets of paper pasted on canvas, on which large designs are made, whether coloured or with chalks only. Of these cartoons there are many by Domenichino, Lionardo da Vinci, Andrea Mantegna, Michael Angelo, &c; but the most celebrated performances of this kind are the "cartoons of Raphael" or Raffaello Sanzio, Da Urbino, which are seven in number, and form only a small part of the sacred historical designs executed by this famous artist, while en-
gaged in the chambers of the Vatican under the auspices of pope Julius II. and Leo X. As soon as they were finished, they were sent to Flanders, to be copied in tapestry, for adorning the pontifical apartments; but the tapestries were not conveyed to Rome till after the decease of Raphael, and probably not before the dreadful sack of that city in 1527, under the pontificate of Clement VII.; when Raphael's followers having fled from thence, none were left to inquire after the original cartoons, which lay neglected in the store-
rooms of the manufactury. The revelation that happened soon after in the Low Countries prevented their being no-
ticed during a period in which works of art were wholly neglected. The few, however, escaped the wreck of the
others, which were torn in pieces, and of which some frag-
ments
ments remain in different collections. These were purchased by Rubens for Charles 1., but they had been much injured by the weavers. In this state they are fortunately escaped being sold in the royal collection, by the disproportionate appretiation of their seven at 300; and the nine pieces, which were the triumph of Julius Caesar by Andrea Mantegna, appraised at 1050. The cartoons seem to have been little noticed till King William III. built a gallery for the purpose of receiving them at Hampton-Court. After having suffered much from the damp of the situation in which they were placed, they were removed by order of his present majesty king George III. to the queen's palace at Buckingham-house, and thence to the castle at Windsor, where they are open to public inspection. These cartoons are justly represented as 'the glory of England, and the envy of all other polite nations;' and his majesty is entitled to a tribute of respect and applause for his care in preserving these precious treasures. They have been long deferredly held in high estimation throughout Europe by all authors of refined taste, and by all the admirers of the art of design, for their various and matchless merit, particularly with regard to the invention, and to the noble expression of such a variety of characters, counoetenues, and attitudes, as they are differently affected and suitably engaged, in every composition. The Abbé du Bos, in his treatise on poetry and painting, has committed a very gross error in his development of one of the characters in this collection. Having described the carton of the miraculous draught of fishes, he points out with propriety the expression of St. Peter, St. John, and other disciples, and then proceeds to illustrate a singular character, which he seems particularly to admire, for the strength and justness of the expression; that figure, according to his opinion, being represented with a confounded countenance, and melancholy complexion, and seeming to be devoured by black jealousy, in which person (he says) it is easy to distinguish Judas. Whereas if this ingenious writer had maturely considered the time which Raphael chose for his subject, and which was, as the evangelist informs us, the third time of our lord's appearing to his disciples after his resurrection, and consequently some weeks before the death of Judas, who hanged himself, then Christ was condemned; or if he had counted the number of figures in the composition, which is only eleven and our Lord himself, he could never have committed so unaccountable an error, as to imagine that Raphael deferred commendation for being so absurd as to introduce so infamous a wretch, at such a point of time, when Christ was directing his disciples to take care of his flock; or for grouping such a person among the apostles, who, as he was dead before, could not associate with them, and whom they would have avoided, if he had been alive, with abhorrence and detestation. The discernment and judgment of Raphael could not have allowed him to be guilty of so gross an anachronism. "Perhaps the best apology, and the truest (says Pilkington), that can be made for this mistake of Du Bos, is, that he was much more conversant and better accustomed with the works of Raphael than with the works of the Evangelist. Mr. Fuseli, however, remarks, that Mr. Pilkington has miscalculated the number of the cartoons; as he mentions that which represents the miraculous draught of fishes, and the subsequent one of the donation of the keys, with regard to which Du Bos committed his error, as if they were the same. Pilkington's Dictionary of Painters by Fuseli, art. Raffello Sanzio, Du Erino.

CAR TOUGH, in Architecture, Sculpture, &c. denotes an ornament representing a scroll of paper; being usually in form of a table; or flat member, with wavings; wherein is some inscription, or device, ornament of arms, cyphers, or the like. It is nearly akin to a medallion; from which it only differs in this, that the latter is used under the cornice in the eaves of a house, and the former in window-cutting within doors. Some workmen call the cartouches dentici. The word is French, forced from the Italian cartoccio, which signifies the same. Cartouches are sometimes drawn on paper, as in the titles of maps, &c., and are sometimes made of stone, bricks, plaster, wood, &c. for buildings.

Cartouches, in Heraldry, a name given to a sort of oval shields, much used by the papal and secular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on. Many suppose this form decorative to the honour of the person; but though the square shield, with the roundend and pointed bottom, is more to be liked with us, it is also with the French and Germans; yet this is supposed more truly the figure of the Roman shield worn by the soldiers, and therefore more ancient and honourable than either that or the indicated shield of the Germans.

Cartouch, in the Military Art, a wooden case about three inches thick at bottom, and gilt round with marine, holding two, three, or four hundred musquet balls, with eight or ten iron balls weighing one pound each, to be fired from a mortar, gun, or howitzer, for the defence of a pass, defile, ditch, breach, retrenchment, &c. It ought not to be confounded with the gargouge, gargouche, or gargouff, which is simply the case or roll of paper, palte-board, parchment, or flannel, &c. filled with the charge of powder necessary for the caliber or bore of the piece or fire arm made use of; whereas the cartouch contains, besides the powder, balls of lead, old nails, chains, pieces of iron, &c. &c., which are put into the piece instead of a bullet, whether on a breach or on a retrenchment, in defending a pass, or against an enemy near to you in battle. Thoie, who make use of this fort of firing, are said to fire with the cartouch, in French tirer a cartouche.

Cartouches, in Artillery, are made of leather for slinging over the shoulders of the matrofes; who carry in them the ammunition from the magazines or wagons for the pieces of the artillery, when they are either at exercise or on actual service.

Cartouch de congé absolue, known under the name of congé d'ancienneté, or leave of seniority, is a sort form of absolute, final, or unlimited leave of absence from military service, inured on a sheet of paper called or known by the name of cartouche, on which are expressed the merits or defects of the military person, to whom the discharge or congé absolue is granted, whether for having finished the time or number of years he was engaged to serve by his contract of enrollment, that on account of the impossibility of his finishing the fame through his wounds or infirmities, or for other reasons, that exempt him definitively from service.

Cartouch de soldat, cartouchier, a cartridge-box, pochon, cartouch. It is a case of light wood covered with leather, with a flap over it of the floutelled blackened calf-skin, sufficiently thick and substantial to bear the wettest and severest weather. The case is considerably longer than broad, and has two rows of holes in it for about 44 musquet-cartridges. As it hangs from a buff cross-belt over the left shoulder, and is worn in that manner by the infantry, before the body of the soldier a little below the right pocket-hole for the purpose of carrying his ammunition, it is made of a form somewhat rounded or circular in order to apply equally every where to his body. It is worn by him in this way upon a belt both on ordinary duty and in the time of action. The flap is generally ornamented with a bras crown, &c.
for the battalion-men; a fuse for the grenadiers; and a single-horn for the light infantry. The pouches or cartridge-boxes used by the cavalry are smaller than those made of wood by the infantry. Cartridge-boxes have often been made of iron, but seldom or ever are now.

**CARTRIDGE**, in French *garogne*, *garouque*, or *garoufle*, and sometimes, but erroneously, *carrouche*, which signifies not merely the cartridge and charge of powder as the word *garogne*, *garouque*, or *garoufle* does, but the whole charge, consisting of the cartridge and charge of powder with the bullet, grape-shot, grape-shot, chain-shot, double-headed shot, balls, pieces of brass or iron, or whatever else is discharged from the piece by the inflammation of the powder. A cartridge, in the ordinary accoutrement of the soldier, is a case or cover holding exactly the charge of powder allotted for any piece, and so fitting the bore of the same as to be rammed home without difficulty. Cartridges have been made of various substances, such as paper, palte-board, parchment, bladders, and flannel. The bottoms of paper-cartridges are apt to remain in the fire-arm or piece, and to accumulate to such a degree as to prevent the priming from reaching the powder, besides which inconvenience they are attended also with others. Palte-board-cartridges are liable to nearly the same objections. The fire kindles up those made of parchment or bladders in such a manner, that they enter into the vent and become so hot, that the priming iron cannot sufficiently clear it. Nothing has as yet been found to answer better for cartridges than flannel, which is now generally made of for artillery-ones of all forts, because as it does not keep or retain fire it is not apt to occasion accidents in loading, which the others frequently used to do. But as the dust of powder paffes through them, parchment covers are sometimes made and put over them, which are taken off as they are used. Fanned carriages, however, may be rendered much more commodious or manageable, and not only a great deal fliuffer but also proof against the dust of powder penetrating or passing through them, by boiling the flannel, of which they are made, in fat. Without some such precaution to stiffen them, they are so pliable, and when large contain so much powder, that it is with difficulty they are put into the pieces. The loading and firing of guns with cartridges are much quicker and less liable to accidents than with loose powder.

The cartridge for a heavy brafs 42 pounder, or an iron 42 pounder for service, used to contain, and does now, 1 lb. of powder; that for a heavy brafs 32 pounder used to contain, and does now, 10 lb. 11 oz. of powder; that for an iron 32 pounder used to contain 9 lb. 4 oz. but contains now 10 lb. 11 oz. of powder; that for a heavy brafs 24 pounder or iron 24 pounder used to contain, and does now, 5 lb. of powder; that for a heavy brafs 18 pounder used to contain, and does now, 6 lb. of powder; that for an iron 18 pounder used to contain 6 lb. but contains now 6 lb. of powder; that for a heavy brafs 12 pounder or an iron 12 pounder used to contain, and does now, 4 lb. of powder; that for a heavy brafs 9 pounder used to contain 3 lb. of powder, and that for an iron 9 pounder now contains the same weight of powder: that for a heavy brafs 6 pounder used to contain 2 lb. 8 oz. of powder, but now contains only 2 lb. of powder; that for an iron 6 pounder used to contain 2 lb. 8 oz. of powder, but now contains only 2 lb. of powder; that for a heavy brafs 3 pounder or for an iron 3 pounder used to contain, and does now, 1 lb. of powder; that for a medium brafs 24 pounder used to contain, and does now, 6 lb. of powder; that for a medium brafs 12 pounder used to contain, and does now, 3 lb. 8 oz. of powder; that for a medium brafs 6 pounder used to contain, and does now, 2 lb. of powder; that for a medium brafs 3 pounder used to contain the same weight of powder as one for a heavy brafs 3 pounder, viz. 1 lb. of powder; and one for a brafs 3 pounder, according to general Defaghiers' construction, contains the same charge of powder now; that for a light brafs 24 pounder used to contain, and does now, 5 lb. of powder; that for a light brafs 12 pounder used to contain, and does now, 3 lb. of powder; that for a light brafs 6 pounder used to contain, and does now, 1 lb. 8 oz. of powder; and that for a light brafs 3 pounder used to contain 1 lb. 8 oz. of powder, but contains now only 8 oz. There ought not strictly speaking, to be fixed or determine charges for guns of different calibres. But they should vary as to the weights and quantities of the powder with the services, to which the guns themselves are to be applied. And it may with truth be admitted, that the charges of powder usually allotted for canons are generally greater than what are either proper or necessary for them on any service whatsoever. The ball charges even for one and the same piece, when applied to different uses or services, have never as yet been correctly ascertained, or even nearly so.

**Ball-cartridges**, in French *cartouches*. For the convenience of quick firing, the shot is fixed to the cartridge by means of a wooden bottom so hollowed or cut into on one side as to receive nearly one half of the shot, which is fastened to it by two small flaps of tin, which pass or cross over the shot and are fastened to the bottom, to the other side of which the cartridge holding the charge of powder is tied.

The cartridges are likewise fixed in the same manner to the bottoms of grape shot, which are used with field pieces, and are called in French *cartouches a grapes de rafin*.

**Cartridge-box.** See *Cartouches de pliat*. **CARTWRIGHT, Thomas,** in Biography, a learned Puritan divine, was born in Hertfordshire about the year 1575, and admitted into St. John's college in the university of Cambridge in 1590. Such was the affability of his application, commenced at college and continued through life, that he allowed himself only five hours of sleep. Upon the death of king Edward VI., he quitted the university, and became clerk to a councelor at law; but in this situation he prosecuted his former studies with unremitting diligence, at every interval of leisure which occurred. Being afterwards recommended by the gentleman who employed him to Dr. Pilkington, master of St. John's college in Cambridge, he was restored upon giving satisfactory evidence of his abilities and attainments, to that seminary of learning, and in 1560 was chorister fellow of his college. From hence he was removed to Trinity college, and on account of his peculiar merit, made one of the eight senior fellows. When queen Elizabeth visited the university in 1564, Mr. Cartwright was much distinguished; and in 1570 he was chosen lady Margaret's divinity professor. At this time his popularity as a preacher was so great, that when it was his turn to officiate at St. Mary's church, it was necessary to take down the windows for the accommodation of the multitude that attended him. The sentiments concerning church discipline, which he delivered in his lectures, were unfavourable to the established hierarchy, and complaints were preferred against him to sir William Cecil, chancellor of the university, both by archbishop Grindal and Dr. Whitgift, who defined that he and his adherents might be silenced. The chancellor, to whom Cartwright wrote in his own defence, seemed disposed to treat him with moderation; but his adherents renewed their accusations; and he was cited before the vice chancellor, to give an account of the obnoxious sentiments delivered in his lectures. Incapable of giving satisfaction, he was suspended from his office as a lecturer, and prevented
prevented from obtaining his doctor's degree. In 1571, Dr. Whiget was appointed vice-chancellor; and by his influence Mr. Cartwright was first deprived of his Margaret-professorship, and afterwards of his fellowship. As danger was apprehended from the differentiation of his principles in the university, he was constrained to leave it and of returning to his native country. While he was abroad, he formed an acquaintance with the most celebrated divines in several Protestant universities, who treated him with great respect on account of his learning and character, and he was chosen minister to the English merchants that resided at Antwerp, and afterwards at Middleburg, where he continued two years. His friends in England, however, were anxious for his return to his own country, and he at length yielded to their importunity. Upon his return he found that the prosecution against the Puritans continued with unabated violence; and though the authors of a piece in their favour, entitled "An Admonition to the Parliament," had been committed to Newgate in 1572, Mr. Cartwright wrote "A Second Admonition to the Parliament," which involved him in a controversy with Dr. Whitgift, that obliged him to leave the kingdom, while it was the means of advancing his opponent to the bishopric of Worcester. During an absence from his country of five years, he officiated in some of the English factories; and in 1580, James VI., king of Scotland, having an high opinion of his abilities, and learning, offered him a professorship in the university of St. Andrew's, which he thought proper to decline. Upon his return to England, he was arrested as a promoter of sedition, and thrown into prison; but being liberated by the intercessing of the lord treasurer Burleigh, and the earl of Leicesters, the latter conferred upon him the post of master of the Hospital, which he had founded in Warwick. In compliance with the solicitations of several learned friends at home and abroad, he undertook to write against the Rhenish translation of the New Testament; but some time after he had commenced the work, archbishop Whitgift, by an arbitrary and unjust mandate, prohibited his prosecution of it; the performance, however, was nearly completed; and was published some years after his death. In 1583 some new complaint was alleged against him, and he was committed to prison by Dr. Aylmer, bishop of London; and again in 1591, the same prelate ordered him to be lodged in the Fleet, where he was kept in a very close and rigorous confinement. Many applications were made on his behalf, but they were ineffectual till about the middle of the year 1592, when he was released, referred to his master of the hospital at Warwick, and permitted to preach. 'Towards the close of his life, the zeal with which he had, in the earlier period of it, opposed the church, was somewhat abated, and he seems to have lived on terms of friendship with archbishop Whitgift, who used him kindly and tolerated his preaching at Warwick. Long confinement and application to study had much impaired his health; and at length terminated his life in December, 1603, in his 68th year. In his private character, he was pious, disinterested, and charitable; and though the persecution against him was hard and severe, it originated with that contempt for superiority, which the intolerant principles of each party would lead them to abuse, and therefore demands some kind of apology from the censure of more enlightened and liberal times. Besides the works already mentioned, Cartwright wrote "Commentaria practica in totam Historiam evangeli- cam," 4to. 1639; reprinted at Amsterdam in 1647; "Commentarii succeincti et dulciadi in Proverbia Salomonis," 4to. Amst. 1638; "Metaphrasia et Homiliae in librum Salomonia, qui inscribitur Ecclesiastes," 4to. Amst. 1647; "A Directory of Church-government," 4to. 1644; and "A Body of Divinity," 4to. Lond. 1666. Biog. Brit. CARWRIGHT, William, a poet and divine of the 17th century, was born in 1601 at Northawe, near Tewksbury, in Gloucestershire, educated at Westminster school, and elected a student of Christ-church in Oxford, in 1628. Having gone through the course of studies, he took orders, and became, as Anthony Wood expresses it, "a mild and scholastic preacher" in the university; where he performed the office of junior proctor, and also that of metaphysical reader. His poetical productions amanised him in the course of these greater studies; and procured for him unbounded applause. But a malignant fever closed his career in his 33d year, December 1653. The king and queen, being at this time in Oxford, testified their respect for him, by their inquiries during his illness, and his majesty wore black on the day of his funeral. Mr. Cartwright was much distinguished both by external and internal endowments, and few persons shared a greater degree of attention and applause. Four plays, and four other poems, compassed in one volume, and prefixed by about 50 copies of commendatory verses, by the university wits, are the principal production on which our author's fame was founded. But his popularity does not seem to have been very extensive or durable; as only one edition of his works was published, and that at present very little known. He is also said to have written some Latin and Greek poems, a "Passion fermo," and two or three occasional poems. Biog. Brit. CARVA, in Botany, a name given by the Indians to one of the kinds of cinnamon tree. This is of all others the most esteemed amongst them, and serves for the greatest number of purposes. They extract camphor and liquid oil from the roots; they extract oil of cinnamon from the bark, and from the leaves they make another oil, which is called oil of cloves, and sold as such. The fruits yield them an oil resembling that of juniper, and afterwards they extract from them a thick, soft substance, like wax, serving them for the making of unguitants and plasters, and also for the making of their candles. CARVAGE, caravagia, the fame with CARRUCAGE. Henry III. is said to have taken carvage, that is, two marks of silver of every knight's fee, towards the marriage of his sister Isabella to the emperor. Carvage could only be imposed on the tenants in capite. Carvage also denotes a privilege whereby a man is exempted from the service of carvage. CARVALHAL, in Geography, a town of Portugal, in the province of Beira; five leagues S.E. of Porto. CARVALHO, a town of Portugal, in the province of Beira; four leagues S.E. of Coimbra. CARVALHO D' ACOISTA, ANTONY, in Biography, was born at Lisbon in 1650; and having devoted his life to the study of the mathematics, astronomy, and hydrography, undertook to give a topographical description of his country: with this view he traversed the whole country, following the course of its rivers and crossing its mountains. The result of his investigation is the best work on the subject, contained in three volumes fol. which appeared between the years 1706, and 1712. It comprises also the history of the principal places, the illusory men to which they have given birth, their natural curiosities, &c. He also wrote an abridgment of geography, and a method of astronomy. He died in 1715 in such a state of indigence, that he did not leave enough to pay the charges of his funeral. Nouv-Dict. Hist. CARVANCAS, in Ancient Geography, a mountain mentioned by Ptolemy, which terminated Norica, and also Pannonia to the west.
CAR

CARVANIS, a town of Cappadocia, placed by Ptolemy in the Pontus Polemaicus; probably the Carvans of

CARUCARIUS, in Ancient Law Books, he that
held land in soccage, or by plough tenure.

CARUCATE. See Carricate.

CARVE, in Rural Economy, a term signifying the fouring
of any sort of fluid; thus, to carve implies to grow four,
and is generally applied to cream.

CARVEL, in Ship-building. When the edges of the
planks are towards each other, the vessel is said to be car-
vel-built, in contradistinction to clinker or clinker-built, where
the edges of the planks over lap each other.

Carvel of St. Thomas, in Geography, a rock islet be-
tween the Virgin isles E. and Porto Rico on the W. At a
small distance it appears like a fmall, as it is white, and has
two points. Between it and St. Thomas, pacifies for Francis
Drake's channel.

CARVENDONCK, a town of Germany, in the circle
of Wittphalia, and duchy of Cleves; eight miles S.E. of
Cleves.

CARVENTUS, in Ancient Geography, a town of Italy,

CARVER, a cutter of figures or other devices in wood.
See Carving.

Carvers answer to what the Romans called sculptores, who
were different from caliatores, or engravers, as these lab
wrought in metal.

Carver is also an officer of the table, whose business is
to cut up the meat, and distribute it to the guests. The
word is formed from the Latin carpiter, which signifies the
same. The Romans also called him corpus, sometimes febr-
for, feundei majigler, and fevitor.

In the great families at Rome, the carver was an office
of some figure. There were masters to teach them the art
regularly, by means of figures of animals cut in wood. The
Greeks also had their carvers, called karpis, q. d. deribatore,
or distributores.

In the primitive times, the make of the fealt carved for all his guests. Thus in Homer, when Aga-
mennon's embassadors were entertained at Achilles's table,
the hero himself carved the meat. Of later times, the same
office on solemn occasions was executed by some of the chief
men of Sparta. Some derive the custom of distributing
every guest his portion, from those early ages when the
Greeks first left off feeding on acorns, and learned the use
of corn. The new diet was so great a delicacy, that to
prevent the guests from quarrelling about it, it was found
necessary to make a fair distribution. Athen. Deipn. lib. 1.
cap. 15. Potter. Arch. lib. IV. cap. 10.

In Scotland the king has an hereditary carver in the
family of Annluther.

Carver, in Geography, a township of America, in the
state of Massachusetts and county of Plymouth. Here is a
pond containing such quantities of iron-ore, that 300 tons
have been taken out of the clear water in a year. Upon the
stream which runs from the pond is a furnace; and the iron
made of this ore is better than that made of bog ore, and
some of it is as good as refined iron.

Carver's river, a branch of St. Peter's river, which
discharges itself into the Millifiopi. See St. Pierre.

CARUGNA, in Geography, a town of Piedmont; in
the merquitate of Ivrea; 8 miles S.W. of Jurca.

CARUI, in Botany, pratense officinarum. Bauh. pin.
138. (Tourn. Cl. 7. gen. 4.) See Carum Carui.

Carui, folius tenuissimi; Tourn. See Sismon verticillatum.

Caru alpina; Bauh. pin. See Seseli Pyrenaeum.

Caruifolia; Bauh. pin. Villars. See Selinum caruifolia.

CARVILLAN, in Geography, a small island near the
W. coast of Scotland, a little to the N. of the island of
Gigo.

CARVIN-EPINOVY, a town of France, in the depart-
ment of the Aisats of Calais, and chief place of a canton,
in the district of Bethune; 4 leagues E. of Bethune. The
place contains 4562, and the canton 14,887
inhabitants; the territory includes 50 kilometers and 11
communes.

Carving, in a general sense, the art or act of cutting
or fashioning a hard body by means of some sharp
instruments, especially a chisel. In which sense, carving
includes matting and engraving, as well as cutting in wood.

Carving, in a more particular sense, is the art of en-
graving or cutting figures in wood. In this sense, carving,
according to Pliny, is prior both to matting and painting.
See Cutting in wood.

CARVIST, in Ulteria. See Falcon.

CARULA, in Ancient Geography, a town of Spain, in
Bretica, between Batavillo and Lipia, according to the An-
tiquine Itinerary, supposed to be the present Villa-Nuevo-del-
Rio.

CARUM, in Botany. (Said to derive its name from
Carum, in the wild, where the original species grows abun-

Gen. Ch. Cal. Umbel universal, long; rays ten or more,
ofen unequal; umbel partial, crowded; involues universal,
omonophyllous; parthenium febrceis. Ccr. uni-
versal, unico; forces of the disk frequently abortive.
Cor. proper unequal; petals five, unequal, obtuse, keeled,
infex-embarrate. Stam. Filaments five, capillary, length
of the corolla, caducous; anthers roundish, very small.
Pil. germ inferior; styles two, very small; stigmas simple.
Peric. none; fruct ovate-oblong, twisted, divaricate into two.
Seeds two, convex on one side, flat on the other.

Eli. Ch. Fruit ovate-oblong, divaricate, general involuclo
most commonly monophyllous. Petals keeled, infex-
embrate.

Woodville. Med. but. pl. 45 Eng Bot. 1523. (Sefeli
carui; Roth Germ.) * Stem branched; straths of the
leaves dilated; partial involuclo, molt commonly none.
Wild. Rost spindle-shaped, biennial. Stem about two
feet high, angular, furrowed, smooth. Leaves fesh,
doubly pinnate; cut into linear narrow segments, the
lowermost of which cross each other. Umbels numerous,
terminal, uprjght. General involuclo of one, two, or three
small, narrow, entire leaves; partial one almost always none.
Petals nearly uniform, white or very pale flesh-colored,
infexed so as to become heart-shaped; calyx entire.
The central flowers only fertile, according to Dr. Smith;
but Linnaeus describes the flowers of the cef as being sometimes
abortive, and Dr. Withering affirms that they are all fertile.
Fruit small, oblong, twisted, each seed almost cylindrical.
Dr. Smith. The seeds are well known to have a pleasant
fruity smell, and a warm aromatic tale; and on that account
they are a common ingredient in cakes, and are encrusted
in figur for comfits; they are also distilled with spirituous
liquors to improve their flavour. The tender leaves in
the spring are boiled in soups; and the roots are said by Parkin-
son to be better eating than parnips. The seeds are esteemed
to be carminative, cordial and galactochic, and recommended
in dyspepsia, flatulenties, and other symptoms attending
hysterical and hypochondriacal disorders; they are also re-
ported to be diuretic and to promote the secretion of milk.

An
CAR

An essential oil and a distilled spirit are directed to be prepared from them by the London college. They give off the whole of their virtues by moderate digestion, to rectify the spirit. Watery infusions are stronger in nux oil than in the distilled tincture, but weaker in tincture. In distillation or evaporation, water clears all their aromatic part; the remaining extract is almost inodorous, and thus discovers that there is in them less of a bitterish or ungrateful matter joined to the aromatic than in most of the other warm European seeds. Along with the aqueous fluid there arises in distillation an essential oil in the proportion of about one ounce from thirty, which is hotter in tincture and more pungent than that obtained from most of our other warm seeds. Woodville. A native of many countries in the northern part of Europe. In England it is found apparently wild, but, as Dr. Smith thinks, only accidentally naturalized, in Bedfordshire, Cambridgeshire, Suffolks, Norfolk, Lincolnshire and Yorkshire. On the banks of the Humber, near Hull, it is so abundant, that great quantities of the seeds are collected every year by the poor people and sold to the apothecaries and confectioners. It is cultivated in several counties, particularly in Essex; and in others, intermingled with coriander and teasels. Twelve pounds of caraway, ten of coriander, and twelve of teasels, are a proper quantity for one acre. They require flesh land which has lain long in pasture, and a soil consisting of a strong clayey loam. The plants should be ploughed, fowed, and harrowed about the beginning of March. In about ten weeks the plants will be strong enough to bear hoecing, which should be repeated three times in the course of the summer. The coriander being annual will be fit to cut about the beginning of July, and is threshed in the field on a cloth in the manner of rape. The ground should be hoed when the flowers begin in April and June, and needs no other culture; the caraway will be ready in the beginning of July, and the teasels about the middle of September. Mart. Miller, 2. C. simplex, Willd. 2. *Seml quite simple; theheads of the leaves pressed close to the stem; partial involucre of many leaves.
was confined by sickness to his bed, a furious tempest arose in the camp, accompanied with angular darknes, and incessant flashes of lightning, and a loud clap of thunder was succeeded by a sudden cry that the emperor was dead. It soon appeared that his chamberlain, in the paroxysm of their grief, had set fire to the royal pavilion, and hence a report originated that Carus was killed by lightning; when in truth he died of the disorder with which he had been seized. Such is the account given by his own secretary to the prefect of the city. Aelius Aper, the pretorian prefect, is accused by Vopiscus with having occasioned this catastrophe, and as he afterwards contrived the murder of Numaecian, and the emperor's tent was set on fire, the suspicion against him is confirmed. The death of Carus happened in the close of the year 283 after a reign of 16 or 17 months. His temper was haughty, and his manners harsh and int substantial; however he was startled by an eclogue on his accession to the throne, and after his death ranked among the gods. Carus and his two sons bore the names of Marcus Aurelius. Creveri's Hist. of the Emperors, vol. ix. Gibbon's Hist. vol. ii.

Carus, in Medica, a disease which, according to the definitions of Sauages, and some other noalologists, differs from apoplexy only in the absence of the tertian noise in breathing; and in the forer (or morbid sleep) being somewhat to profound. It is properly considered by Dr. Cullen as a minor degree of apoplexy. (Synop. Nosol. Meth. p. 184.) See Apoplexy.

Carusa, in Ancient Geography, a town of Asia Minor, in Paphlagonia, seated on the Euxine sea. Seylax calls it Carus, and says that it was a Greek city, between the river Halys and the town of Sinope. Ptolemy calls it Carisa.

Carwaite, or Carvattus, in Geography, a town or rather village of Prussia, in the country of Samband, belonging to the government of Memel, the inhabitants of which infift by fishing: 44 miles N. of Konigberg.

Carwar, a maritime town of Hindoostan, situate on the coast of Malabar, between Merzaw, or Merhree, and cape Ramas in the neighbourhood of Gos, where the East India company have a factory; but better known to the English in the early period of their India trade, and before they were in possession of Bombay. The vallors about it supply plenty of corn and pepper of an excellent kind. The woods on the mountains abound with quadrupeds, such as wolves, monkeys, wild hogs, deer, elks, and beees of a prodigious size. It is distant about 40 miles S.E. from Goa. N. lat. 15° E. long. 74° 16'.

Cary, Lucius, in Biography, vicount Falkland, was the son of Henry vicount Falkland, and lord deputy of Ireland in the reign of king James I; and born, probably at Burford in Oxfordshire, about the year 1610. Being removed at an early period to Ireland, he received part of his education at Trinity college in Dublin, and completed it at St. John's college in Cambridge. In his youth he was chargeable with some irregularities; but before he had attained the age of 20 years, he came into possession of a large and independent fortune, that had descended to him in consequence of the gift of a grandfather, and he terminated his career of distinction by marrying a young lady of distinguished accomplishments but small fortune, whom he passionately loved. In forming this connexion he gave great offence to his father, who had entertained hopes of amending his own circumstances by his son's marriage; and though he made ample concessions, and even offered to surrender his whole estate to the disposal of his father, and to depend wholly on his kindnes for a subsistence, his father remained unrelenting and irreconcilable. Distressed by this circumstance, he determined to leave England; and accordingly he removed, with his wife, to Holland, where it was his intention to pursue some military command; but failing to accomplish this object, he returned to his own country, where he lived in retirement and prosecuted his studies, with uncommon affluence and ardour, maintaining at the same time an intercourse with some of the best scholars of that age. In a very short time he is said to have made himself perfect master of the Greek tongue, and to have read with an accurate attention all the Greek historians. Before he was 23 years of age, he had perused all the Greek and Latin fathers; he also made himself acquainted with all books, which he procured at a great expense from different countries; he likewise diligently studied ecclesiastical and theological controversies; and his memory is said to have been so retentive, that he remembered, on all occasions, whatever he read. In fame of his poetical attempts he was so successful as to have gained the esteem and admiration of the most eminent poets of his time. About the time of his father's death, in 1635, he was made one of the gentlemen of his majesty's privy chamber. He spent the remainder of his life, and frequently retired to his seat near Burford, which by the visits of literary men from the neighbouring university was a kind of academy. Here Chillingworth wrote his admirable work against popery, deriving applause in the composition of it from the suggestions of his lordship. In this retreat various questions of literature, morals, and theology were freely discussed; and here lord Falkland himself, whilst he was entitled to pre-eminence on account of his extensive literature, blended with it that modesty and candour, and sweetness of temper, which commanded the admiration and esteem of his learned visitants, no less than his disinterested abilities and attainments. His habits, however, were not formed in this literary retreat for those public scenes in which he afterwards engaged. In 1639 lord Falkland joined the expedition against the Scots; and in 1640 he was chosen member of the House of Commons for Newport in the Isle of Wright; his parentage, being Scotch, not entitling him to a seat in the House of Lords. By his attendance on the debates of the house, he acquired a high degree of veneration for the authority of parliament; and he was to rigid an observer of established laws and rules, that he thought no mischief so intolerable, as the presumption of ministers of state in breaking positive rules for reasons of state, or of judges in transgressing known laws, upon the plea of convenience or necessity. Accordingly he was more severe than his natural gentleness of temper allowed in other cases, against lord Finch and the end of Straford; and he had conceived such a dislike to archbishop Land, and some other bishops, that he concluded in the first bill for depriving them of the right of voting in the House of Lords. Hence some persons were led erroneously to conclude that he was no friend to the established government of the church; whereas on subsequent occasions, when he began to suspect the designs of the parliamentary leaders, he opposed the same measure to the utmost of his power. For some time he continued averse from the court, and manifested even a moroseness to councillors; but at length he was prevailed upon to accept a seat in the privy-council, and the office of secretary of state. But he was not for tablets of this kind, as he was totally unacquainted with the forms of business, and as he was actuated by scruples which impeded the prosecution of it. He would not agree either to the employment of spies, or to the opening of suspected letters. When the breach between the king and parliament came to a crisis, lord Falkland took a decided, firm, and active part with his matter;
waller; and attended him, with considerable danger to himself, at Edgehill battle, at Oxford, and at the siege of Gloucester. During his residence at Oxford, a circumstance occurred which shall here restate. When he jealously visited the library, he was thrown, among other books, a Virgil elegantly printed and bound; and Lord Falkland, deeming of amusing him, desired him to try his fortune by that mark of divination which was called Santa Virgine. When the king opened the book, the page which presented itself was part of Dido's incantation against Aeneas (L. iv. v. 613, &c.), thus translated by Dryden:

"Opprest with numbers in th' unequal field,
His men disencourag'd, and him He expell'd,
Let him for forcour fortune from place to place,
Torn from his subjects, and his son's embrace, &c."

The king's mind seemed to be impressed by this accident; and, therefore, Lord Falkland, hoping for a more favourable occurrence, determined to try his own fortune in the same way; but the page which chance presented him was more suited to his own destiny than the other had been to the king's. It was the following exclamation of Evander upon the untimely death of his son Pallus (Aeneid, lib. xi. v. 172, &c.), thus rendered by Dryden:

"O Pallus! thou hast fail'd thy piastred word,
To fight with caution, not to tempt the sword:
I warn'd thee, but in vain; for well I knew,
What peril youth and valor would pursue;
That boiling blood would carry thee too far,
Young as thou went in dangers, raw to war!
O curst effay of arms, disfatast doom,
Prelude of bloody fields, and fights to come."

When Lord Falkland perceived the calamities that were impending over his country, his spirit sunk; he left the gaiety and licentiousness of his temper, became negligent of his drees and appearance, reserved and morose, and indicated a mind dissatisfied with itself and the world. While sitting among his friends he would frequently, after long silence and deep sighs, with a shrill voice repeat the words "peace."

"peace," and declare himself incapable of living in such a state of perpetual grief and anxiety. The offending scene proves almost a determination to throw away life that which was becoming a burden. Although poisselling no military command, he resolved to be present at the battle of Newbury, fought September 20th, 1643; and in the morning called for clean linen, that if he were slain his body might appear with decorum. Having put himself in the first rank of Lord Byron's regiment, he received a musket shot in his belly, and fell from his horse. His body was not found till the next day. Such was the fate of Lord Falkland, in the 54th year of his age; generally esteemed the most virtue public character, in a period fertile of virtue. His praises have been reflected by poets, historians, and moralists, and are, as it were, interwoven with English literature. His fame perhaps owes most to his intimate friend Lord Clarendon, who has drawn an elaborate character of him, and in some respects makes him the moral hero of his history. Lord Falkland left behind him some poems, and various speeches and pamphlets on political and theological topics. Biog. Brit. Gen. Biog.

CARY, ROBERT, a learned chronologer, was born at Crockettin, in Devonshire, about the year 1615. He finished his education at Oxford, whither he went in 1631, and where he took his degrees, and was created doctor of laws in 1644. He travelled into foreign parts, and on his return was presented with the rectory of Portland, near Kingsbridge, in Devonshire. During the troubles he joined the Presbyterians party, but upon the restoration of Charles II. he was one of the first who congratulated him on his return, and was soon after preferred to the see of Exeter. But after about two years he was ejected, in 1664, and retired to his rectory, where he passed the remainder of his life with reputation, and died in September 1683. He published his "Eadologia Cornucopia, or a chronological Account of Ancient Times, in three parts, 1. Didatical, 2. Apodictical, 3. Canonical," Lond. 1672, fol. Of this book we have an account in the Philosophical Transactions, N. S. cxxxii. p. 395. He was, in his younger years, skilled in poetry, both Latin and English; but his only publication of this kind was those hymns of our church which are appointed to be read after the lessons, together with the credal, &c. They were translated by him into Latin verse. Biog. Brit.

CARY, in Geography, the name of a small river in the county of Antrim, Ireland, which uniting with some other mountain streams falls into the North Channel, at Bailey-caul.

CARY, the northern barony of the county of Antrim, Ireland, opposite to the Island of Rathlin, and remarkable for the Basaltic region of which the Giant's Causeway is a part. It was anciently called the Route, or Rest, and was taken possession of by the clan of McDonalds from the Hebrides, some time previous to what has been called the plantation of Ulster, in the reign of James I., the Baronie received its present name from a caille now in ruins. Some old maps have also a cape marked Ca-Cary, which must be what is now called Torr-point. Hamilton's Antrim.

CARY Bay, a large bay on the south coast of Cornwall, round the point of the Deadman to the westward, and extending almost to the eastern point of the entrance into Falmouth haven.

CARYA, in Ancient Geography, a country of the Peloponnesus, in Laconia, the country of which was of the same name. Vitruvius mentions the destruction of this city, because it united with the Persians, who were enemies to the Greeks. The male inhabitants were put to the sword, and its females were made captives. Pausanias says, (Lacon. l. iii. c. 10. p. 270) that it had a temple of Diana Caryatis, and a statue of that goddess in the open air. It was situated on the banks of the river Eaus, a little to the west of Gympes. See Carlytes and Caryatides.

CARYA, See Cary.

CARYANDA, an island of Alia Minor, in the Mediterranean, on the coast of Caria. Pliny.—Allo, a town of Alia Minor, in Caria. Steph. Byz. says, that it was a sea-port, near Minius and Ces. Selvax, who was of this city, says, that Caryanda was an island, town, and port. It has since been called Carcasson.

CARYATES, in Antiquity, a festival in honour of Diana, furnished Caryatis, held at Caryum, or Carya, a city of Laconia. The chief ceremony was a certain dance, said to have been invented by Calliror and Polux, and performed by the virgins of the place.

During Xerxes' invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the anger of the goddeses by such an intermission, the neighbouring swains are said to have assembled and sung pastoral, or bacchylides, which are said to have been the origin of boculic poetry.

CARYATIDES, in Architecture. Besides columns and pillars, statues of various kinds have been employed by architects for the same purposes. Female figures of this nature clothed in long garments were called by the Greeks Caryatides, the reason of which is thus explained by Vitruvius, lib. i. The inhabitants of Carya, a city of the Peloponnes-
Sculpture appears to have been in Egypt entirely subordinate and subservient to architecture, an art which had no motive but religion, no object but the decoration of its edifices; whether it led up to the temple gate the long avenue of sphinxes, emblems of the mystery which overshadowed its walls or seated in sublime tranquillity, the colossal effigies of its gods; or inscribed on columns triumphally ite its secret doctrines and exclusive knowledge.

When we consider the nature of the Egyptian statues and the timidity of the artists who never separated the legs, and generally attached the figure behind to a square slab or pillar referred out of the blocks, we shall not be surprised that independently of any religious motives which might lead to the use of Caryatides, the idea should originate of employing for the support of buildings slates which did not yield in real solidity and apparent height to any species of columns. If also we consider the style of sculpture, its rigid symmetry of attitude and motionless inflexibility of appearance, we must allow that no statues were better adapted to take the place of columns, and no where were the objections which may be urged against the use of Caryatides left founded. Accordingly, it seems probable that no where was this custom more prevalent than in Egypt.

We may perhaps form the best idea of the Egyptian Caryatides from those which at present support the entablature of the great door of the Museum Vaticano. These statues were found in the villa of Adrian, and were probably among those which that emperor, so deftful of imitating Egyptian customs, caused to be made in the manner of those which existed in Egypt. They are seven feet in height, including the plinth. The capitals which rest above their heads are of the bell shape so commonly observed in the Egyptian remains. The appearance of these Caryatides is singularly grand, in spite of all the incongruities of their situation and of the details of the architecture which accompanies them.

The Hindoo excavations in the mountains of Ellora near Aurungabad in the Deccan; works of whose origin history has preserved no memorial, but whose stupendous execution ranks them among the wonders of human labour, may be cited among the instances of the use of Caryatides. In one of these the Kailasa, or paradise of the gods, a monument which presents the appearance of a vault and elaborate building, standing in a considerable area, the whole of which is excavated in the granite rock; the basement of this afromishing edifice is sculptured with the figures of elephants and lions, giving the whole mighty mass the appearance of movability by these powerful animals. The excavated rocks of Mauelpiporam offer singular pillars, each being composed of the figure of a lion sitting on a double plinth, forming the lower part of the shaft, which rising octagonal-ly and tapering, terminates in a capital consisting of three horses, which support the entablature. In one of the excavated temples on the island of Salsette, there are capitals well executed, and composed chiefly of elephants, to which, in some instances, are added horses and human figures. In Jaganatha Sabha, another of the excavations of Ellora, the pillars rest upon elephants. Danieli's Antiquities of India and Hindoo excavations.

The description of the temple of Jerusalem preserves some traces of this custom. Hiram's molten sea was supported by twelve bulls, and on the walls of the oracle he placed alternate cherubim and palm trees, supporting wreaths of flowers and probably the ceiling.

In the ruins of Persepolis also, there remain some capitals consisting of horses and camels. And in geographical, though not in chronological order, we may mention some
CARYATIDES.

Influences at Paulyra. The colossal cornice of the great temple has multitudes in the form of bulls and lions, supporting the cornice, and in more than one example figures of genii are used to sustain a kind of projecting balcony in the singular tower-shaped massalumna which are found there.

Though however the idea of employing Caryatic figures is not original to Greece, the most complete and interesting example of this practice is among the ruins of ancient art at Athens. "To the north of the Parthenon, at the distance of about one hundred and fifty feet, are the remains of three considerable temples. That towards the east was called the Erechteum; to the westward of this, but under the same roof, was the temple of Minerva, with the title pallas, as protectress of the city; adjoining to this, but under the same roof, is the Pandroseion, so named because it was dedicated to the nymph Pandroseion, one of the daughters of Cecrops." This is an open portico, composed of six Caryatides, four being placed in front and two in the sides, five of the flutes remain to the present time. Within the Pandroseion was the olive tree, said to have been produced by Minerva in her contest with Neptune for the patronage of the city; it was called paxianthus, incircated, from its branches having bent downwards after it had grown up to the roof; and under the tree stood the altar of Jupiter Hercule. (Stuart's Athens.) These Caryatides agree perfectly with the description of Vitruvius: they are designed in a large and broad style, their drapery is ample and flowing, their hair arranged with art. The height of the figures is nearly nine feet, including the capital and plinth: their attitudes are simple and symmetrical; their air serene and tranquil. The flutes are placed upon a continued pedestal, but with separate plinths to each. Above the head rises a capital, somewhat resembling that of the Doric order, and upon the capitals is placed an entablature, very nearly three feet high, but consisting only of architrave and cornice, the frieze being suppressed. The cornice is dentiled and the mouldings enriched; the upper fascia of the architrave is singularly ornamented with little round cloisons equal in size. It is not easy to account for the singularities of the entablature and its extraordinary height compared to the figures; probably Caryatic portico was not intended as subject to any of the common rules of architecture. The reader will find an elevation of this monument in Plate XIX. of Architecture.

The Caryatides of the Villa Albani are another beautiful example; they are female statues clothed in long garments, the arms and necks ornamented with bracelets and necklaces, the head-dresses carefully arranged. A Greek inscription on one of them informs us, that they were the work of two Athenian sculptors, Crito and Nicholas. Winckelmann is of opinion that these artists arrived at Rome about the time of Julius Caesar; but whether these figures were executed at Rome, or transported there by some Roman plunderer, cannot be known. It seems probable, from a certain want of symmetry in their attitude and ornaments, that they are only part of a larger number and were not intended to be arranged contiguously. One of them has the head enveloped in a veil, which ascends to the top of the capital. The capital of another is plain and without ornament, the others are decorated with as much elegance as richnefs.

Among the antiquities of Rome there are various fragments of statues, which, from their attitudes and the capitals on their heads, may be supposed to have served as supports to the entablatures of buildings. It appears, that the inside of the Pantheon was ornamented in this manner by Dioneus the Athenian; they were probably executed in brass relief, and employed in the Temple of the Sun.

In the tomb of the freedman of Sextus Pompeius, on the Appian way, there was an example of Caryatides of both sexes. They are in brass relief, and decorated rather than support the different stories of the colonnade. The first order consists of female figures, draped, with extended arms, supporting a great volute which entirely surrounds them. They have no capitals; but their feet are mounted on small plinths. The Caryatides in the upper story are of a particular kind, and of an invention sufficiently explications. They are staked figures, whose heads, adorned with capitals, support the cornice, and in their hands each holds a column, proper duly, which supports nothing. This fancy form has given rise to one still more whimsical, which has been executed by Daniel de Volterra, in his chapel of La Trinita del Monte, where there are figures supporting in one hand a capital, and in the other the column adapted to it.

These freaks of imagination, it is hardly necessary to observe, are only tolerable in the arabesque, where may be found an ample collection of figures, which the caprice of decoration has adapted to the office of Caryatides.

It would be generalizing too far to include, among the subjects of this article, the compositions of various gods, terms, grimis, and so many other fantastic animals which adorn and support altars, tripods, vases, and other antique utensils. These objects, though confined by the realities of execution and the convenience of use to more connection and probability than the dreams of arabesque, are not amenable to the grave laws of architecture. It is on account of not having perceived the limits of imagination in these different walks of arts that the Caryatides, which were originally a licence in architecture, have become, under the chisel of the moderns, abuses intolerable and unworthy of indulgence from the least inquisitive reason.

This censure is not, however, applicable to the earliest receivers of this style of decoration; and we must do the justice to that distinguished artist Jean Goujon, to allow, that in the beautiful Caryatides which support the tribune of the former faute des jardins de Louvre, he has conceived an idea just, grand, and superior to every other modern influence. This monument consists of four female figures, twelve feet in height, elegantly draped, with capitals on their heads, and standing on circular pedestals; which support an entablature of the Ionic order, richly ornamented, one quarter of the height of the statues and pedestal. What is remarkable, the artist has represented the arms of the figures as terminated a little below the shoulder. It is certain, that this influence bears considerable resemblance to the Caryatic portico at Athens, by the general idea of a gallery projecting from a larger mass of building, by the number of figures being in both cases four in front, their symmetrical arrangement, and particularly by the arms, which may be thought to be truncated in imitation of those which time has mutilated. We cannot say, however, whether or not Jean Goujon had any knowledge of the Athenian Caryatides; if not, the merit of the invention and composition does the greatest honour to his genius; and even if he were acquainted with them, such an imitation shows consummate taste and judgment, while the details remain intirely his own.

It is difficult to find a subject of approbation in any other modern influence of Caryatic figures. Thoie of the celebrated Loggia de Lanzii, by Orcagna at Florence, and a multitude of other Atlantes in that town and elsewhere, which are seen bending under the weight of an architecture which crushes
CARYATIDES.

crushes them, are but capricious inventions, where the sculptors have rather considered their art than its harmony with the architecture.

Every one who is acquainted with the history of the fine arts after their revival in Italy, knows how much the style of sculpture and architecture was influenced by that of painting. Painting was the favourite art, that which produced most genius, and was often exercised in common with the other arts by the same perfon. But it would not be difficult to show, were this the proper place, that the principles of painting are very frequently in contradiction to those of sculpture, and still more of architecture. Hence, arose a most abundant crop of abusés, from which the immediate proximity of antique examples could not preserve the building art, when the painters of decorations became its arbiters, and fictitious architecture its model. Among these must be reckoned the Caryatic figures, which became the common ornaments of ceilings and vaults under the Carraci, Doremi, Lanfranco, and many inferior artists and imitators.

The composition of these had no other rule than the caprice of the painter, who regarded them as a kind of academy figure, susceptible of all the extravagancies of attitude and all the orientation of anatomy.

We now come to the theoretical and critical portion of this article; and, in the first place, it merits consideration, whether the employment of Caryatides is not radically faulty as violating nature and the essential principles of imitation. It may be urged as an obvious improvidence to make the figures of men and women support the enormous load of the entablatures and coverings of buildings. The sight and imagination seem to be equally offended by the necessity of admitting the representation of circumstances of which the reality cannot for an instant be supposed possible.

If the example and authority of perhaps all nations who have been distinguished in architecture were considered sufficient, these objections would be answered by the preceding article; but as this custom might have no other than religious and political motives, it is not impossible that taste and rational criticism might be at variance with such institutions, and agree to banish from modern works a practice which, having no longer any connection with these motives, or any other object than the gratification of the sight, offends gratuitously the principles or the appearance of solidity. We do not doubt, however, that Caryatides may be defended on the following considerations.

Sculpture, though it realizes in its imitations the external forms of objects, departs so widely from them in colour and texture, that no art is less capable of producing illusion: the sight is more affected by colour than figure. Zeuxis might deceive the birds with his bunch of grapes, and his competitor him with the curtain; but certainly a statue was never taken for a man. Accordingly, every production of sculpture may be considered both with regard to the object imitated, and the matter of which that imitation is composed. With regard to the first, nothing undoubtedly is more absurd than to cause a man to perform the impossible function of a column; but with regard to the second, nothing is less unreasonable and more possible than to give that office to a statue, whose solidity is equal, and material the same. Why not support a flown entablature with a statue equally of stone. When therefore figures are employed as Caryatides, it must be understood, that these figures are not the living and animated expression, but the material and motionless image of the object represented. On this occasion a kind of counter-illusion is required of the spectator; and it is necessary that, overlooking every thing of deception, which might lead him to forget the material, he should flout at the first impression of the facade, and instead of yielding flesh, see only inflexible marble and bronze. This is not a difficult effort but the natural imputation, when the sculpture in harmony with the architecture does not pretend to too much motion, action, and life. Nobody, in seeing the Egyptian statues, can say, that nature and probability could be violated by such allegorical supports.

On the other hand, when the defiderant of Kallafa observes, that the basement, sculptured with elephants and lions, gives the whole the appearance of mobility on these mighty animals; he reports a severe cenure, for this is exactly the air that a great edifice ought not to have.

From what has been advanced, it cannot be denied as a general proposition, that Caryatides are admissible in the most regular and consistent architecture. Reaflon demands real, and tells apparent, solidity in supports; now the first exists inseparably in the material of which these figures are formed, and the second may be preferred with attention to the rules of propriety, indicated by the nature of the objects, and which we shall proceed to discuss.

Considering the preceding observations, good taste will include in a general censure, all the figures so commonly seen bending under the masses which overwhelm them, those symbols of every whole laborious attitudes affect the spectator with ideas of oppression and misery. The more the sculptor displays of anatomy, the more forcibly he expresses the contraction of the muscles; in short, the more he gives of truth, in the action and movement, the more he will incur of blame from sound criticism. His figures appear weaker as they make the more effort; and though good statues, they will be bad Caryatides.

Let the figures intended for this purpose, broad and grand in their proportions, approaching the colossal in dimensions, simple and upright in attitude, severe in expression, present to the spectator an immovable tranquillity in their appearance. Let symmetry prevail in their position and accessories. Let the apparent weakness of the neck be corrected by trebles of hair defending on their shoulders, and the drapery, agreeably defining the forms of the limbs, but tending to perpendicular folds, strengthen the figure below, and give solidity to the whole. Thus we have almost described the Caryatides of Athens, or of Jean Goujon. This artif, a sculptor and architect, had so well conceived the rules of taste proper to the species of sculpture in question, that to take away all pretence of illusion, he has represented the figures, as has been already mentioned, without arms, and under the appearance of mutilated effigies. However, without carrying our speculations so far on this point as Jean Goujon, it will be sufficient to imitate him in the general character of gravity and austerity which he has imprinted on this performance.

It seems necessary to give capitals to Caryatic figures to prevent the disagreeable sensation produced by the architectural reeling immediately on the head, and to avoid the abrupt contact of the forms of sculpture and architecture by an intermediate object partaking of both. The capitals in antique examples sometimes approach the Doric form, as in the Athenian Caryatides, and sometimes the Corinthian bell-flame, as in those of the Villa Albani. The first is rich and well adapted to the shape of the head, the other has more lightness and elegance. It is proper in these things to keep a medium between the rigour of architecture and the caprices of mere ornament. Some antique capitals have been found imitating a basket, but these cannot be recommended.

Caryatides as statues require to be raised on pedestals. In the Athenian instance a continued stylobata answers this purpose.
purpose. Jean Gecon has used inflated pedestals, which are circular, apparently to give more of the air of a column to the whole.

The Pandæmonium at Athens, though only one example, is of the highest importance as being complete in itself, giving not only the best model of the figures proper for the purpose, with their appropriate pedestal and entablature, but also the relative proportion of such a portico to the adjoining building, and of Caryatides to columns. The entablature, as has been before observed, is very remarkable in several respects, and first, in height compared to the figures being 2 feet 8 inches to 7 feet 9 inches. We may perhaps find the motive of this extraordinary weight in considering that a human figure appears draped as though it were, present a larger mass than any column. However, it cannot be denied, that the proportion of the entablature is greatly exaggerated, and produces an unpleasing effect. In the next place, the frieze is supprefled, a singularity which we believe is not to be found in any other antique monument of the smallest credit, neither is the effect very good, as the mass is too much divided into equal parts. On the whole, though it would be absurd to conclude from a single example, that the ancients had adapted any one particular entablature to this kind of order, we may infer from such remarkable deviations that these objects are not to be considered within the limits of regular architecture, but are at the discretion of the designer within the limits of reason and taste.

The proportion of Caryatides to columns when seen together, is another point that will require attention in execution. That the first should be less evident, but it is impossible to say what dimensions will in all cases have the best relation. The figures ought to appear colossal without cefcething the effect of the columns. The proportion observed in the Athenian example, where this effect has been very happily attained, are, 7 feet 9 inches, the figures, 18 feet 5 inches, the columns which are the nearest in contact.

The proper application and allegory of Caryatides will come next under consideration. Chambray, an able and eloquent author, whose opinions always merit attention, observes in the "Parallele de FArchitecture antique avec la moderne," that there are few occasions in which Caryatides can be employed with propriety, though the generality of modern architects have introduced them indiscriminately in all kinds of buildings. For not only in the palaces of princes, and without, but in private houses, and in churches, even, and sepulchres, every place is filled with them without any regard to history or decorum; and often, by an insupportable absurdity, they substitute for their miserable captives the venerable figures of virtues, muses, graces, and even angels, where they ought rather to enliven and confine the vices.

In reply to this, we must observe, that if the art be confined directly to the origin and motive attributed to this practice by Vitruvius, he can never employ Caryatic figures. The memorial of an outrageous severity inflicted on the fair and innocent, is unworthy to be perpetuated.

The Persian gallery of Sparta, though not consistent with the delicacy of modern feelings, was a noble trophy of valour and patriotism worthy of the occasion, and worthy of the people; but the people were Greeks, and the occasions Thermopylae and Plata. Such deep injuries, and such glorious revenge, may well justify a triumph, that in moderate wars would be barbarous and unmanly. Thus did the boney heap of Murten record and inspire the patriotic valor of the Swiss. But the modern artist is called upon by every feeling of propriety, to reject these emblems of vengeance, these miserable captives, whose figures only excite contempt towards the inflicting conqueror.

Caryatic figures are in themselves more picturesque and interesting than any columns, but the proper employment of them is on this account more difficult. They have too much character to enter indifferently into ordinary works. Of a nature we demand an explanation, and the occupation of Caryatides seems to render it proper that they should be the representations of allegorical personifications rather than of human individuals. A full and consistent allegory is then the requisite of Caryatides; but to represent them as mere statues, without any meaning, as Jean Gecon has done, forms both an impropriety and a poverty of invention; and with deference to M. Chambray, we can conceive situations where the figures of virtues, muses, and angels, would be both beautiful and proper. Purcell, Norden, Denon, Dict. Math. Stuart, Dandie, Chambray.

CARYLL, JOHN, in Biography, one of the ministers ejected by the act of uniformity, was born in London in 1622, educated in Exeter college, Oxford, and afterwards became preacher to the society of Lincoln's Inn. He was a member of the assembly of divines, and one of the taylers for approbation of ministers; and in all the stations he occupied maintained a respectable character for learning, piety, and modesty. By order of parliament he attended the king at Holmeby house, and was one of the commissioners in the treaty of the Isle of Wight. After his ejectment in 1662, he lived privately in London, and preached to his congregation whenever the times allowed. He was a moderate "Independent," and distinguished himself by his learned and voluminous "Exposition on the book of Job." He died in February, 1572-3, in the 71st year of his age. Neal's Hist. of the Puritans, vol. II. p. 689. 4to.

CARYLL, JOHN, an English poet of the Roman Catholic persuasion, was secretary to queen Mary, the wife of James II.; and having shared the fallen fortunes of his master, was rewarded for his attachment, first with knighthood, and afterwards with the honor titles of earl Caryll and baron Dartford. In the reign of queen Anne he was in England, and recommended to Mr. Pope the situation of the "Rape of the Lock," who at its publication addressed it to him. He was the author of two plays, viz. "the English Princes," &c. 1667, 4to.; and "Sir Solomon, or the Cautious Coxcomb," 1671, 4to.; and in 1700, he published the "Psalms of David, translated from the Vulgate," 12mo. He was living, at a very advanced age, in 1717; but the time of his death is not ascertained.

CARYOCATACTES, in Orchidology, the nut-cracker of English writers, is so denominated by Gesner, Willughby, and Ray, whence its Linnaean specific name. See Corvus Caryocatactes.

CARYOCOSTYNUM, in Pharmacy, a kind of purging elecary, the two principal ingredients of which, that give the denomination to the whole, are cloves, and coccus. It works briskly, and fetches the humours from the most remote parts; whence, and by reason of its warmth, it is prescribed against rheumatic, arthritic, hydroptic, paralytic, &c. disorders.

CARYOLOBIUS, in Botany, a genus formed by Gartner for the seed of an unknown East Indian plant, remarkable
marked for its singular structure, having within it a central pillar which perforates the axis of the embryo. It is laid by Boe., to be nearly allied to Coccuba.

CARYONES, in Ancient Geography, a people placed by Ptolomy in European Sarmatia, between the Alans and Amanobians. M. Peyfond clasps them among those who bore the name of Vandals.

CARYOPHYLLAST, in Botany. Rumph. emb. See DONAT. eifofea.

CARYOPHYLLATA. Tournefort, clafs 6, § 7, gen. 6. La March, Flor. Franc. 742, and Encyc. sub Denote. See Geum.

CARYOPHYLLATA, virginiana, Henn. par. See Geum virginianum.

CARYOPHYLLATA alpina, afpi foliis, Bauh. Pin. C. alpina tenusfolio, Barcel. See Geum repentum.

CARYOPHYLLATA alpina quisquefolia, Bauh. Pin. See ANEMONE narciisiflora.

CARYOPHYLLUM, in Botany, the forty second natural order in the Philosophy Botanica of Linnaeus, and the twenty-second in the Praefilection published by Sishe; so called, not as including the Caryophyllus of Linnaeus, which actually belongs to a different natural order; but in reference to the Caryophyllus of Tournefort taken up by him from the older botanists, which Linnaeus called Dianthus without affigning a sufficient reason for changing the name, and as he still continued to call the natural order of which his dianthus may be considered as the prototype, by its ancient appellation, with a certainty of introducing a palpable confusion into the nomenclature. He has been followed in both cases by Jussuf, without a comment; and by Ventenat, with a remark pointing out the incoherence. Linnaeus gives it the following character. Stem fibrous. Stem herbaceous, seldom shrubby, jointed: branches generally alternate. Leaves simple, almost always inclining to lanceolate, undivided, sessile, or narrowing into a petiole, opposite, most commonly smooth. Flower rarely sessile; flaments either equal or double the number of the petals; pistils from one to five. Fruit a capsule, one-celled, or with as many cells as there are flyles.

The genera enumerated in Philosophy Botanica are dianthus, faponaria, drypis, cuculus, filene, lychnis, coronaria, agrolcmmna, frankenia, aline, ceraflum, holocum, arenaria, pharnaceum, fipergula, fatama, moehringia, fcleranthus. In the pollinurn lectures they are divided into four sections: a. dianthus, faponaria, gypophila, veleiza, drypis, filene, cuculus, lychnis, agrolcmmna, thefieldia; β. fipergula, ceraflum, arenaria, filicana, aline, holocum, cherleria, fatama, moehringia, fupinana. γ. pharnaceum, glinus, mullugo, polycarpum, minutaria, quercia, ortega, luflingia, rota. ε. fcleranthus, polycrmmna. The first section comprehends the proper caryophyllace flowers of Tournefort, which have a tubular calyx, and unguiculated petals with a flat border.

Jussieu and Ventenat have given in most respects the same general character, and assign'd nearly the same genera to their caryophyllaceae. According to Ventenat the plants of this family are in general herbaceous and natives of Europe. Their flymes are comonly cylindrical, and never more than three or four feet high; branches axillary, opposite and apparently articulated at each knot. Leaves opposite and conuate at their base, very rarely whorled, always simple and entire, generally deflexed of filpules. Flowers almost always hermaphrodite, subject to become full or double by cultivation, commonly axillary, sometimes terminal. Calyx once- or twice-divided, almost always permanent. Corolla rarely none; petals generally unguiculate, equal in number and alternate with the segments of the calyx. Stamens in some genera less numerous than the petals; more frequently equal in number and alternate with them; or twice as many, half of them inserted into the receptacle, and the other half alternately into the petals. Germ simple; style rarely fingle; filgmas equal in number to the styles. Fruit capular, almost always many-seeded, one or many-celled. Seeds inserted into a central placenta or receptacle, or each of them attached to the bottom of the capsule by a small umbilical cord. Perispem farinaceous, central, i.e. surronded by the spiral embryo. Radicle inferior.

The whole order is divided by Jussieu into seven sections: 1. Calyx divided; flaments three; style fingle or triple. ortegi, helwingia, holocum, polycarpum, donatia, mollugo, minutaria, quercia. 2. Calyx divided; flaments four; styles two or four. Buffonia, fagina. 3. Calyx divided; flaments five or eight; styles two, three or four. Aline, pharnaceum, helwingia, chatina. 4. Calyx divided; flaments ten; styles three or five. Bergia, fipergula, ceraflum, cherleria, arenaria, filicana. 5. Calyx tubular; flaments less than ten; styles two or three. Velwia, drypis, farothra. 7. Genera allied to the caryophylaceae. Rotala, frankenia, linum, lechea. Ventenat has adopted the same divisions, but has omitted donatia, bergia, and rota; added cognes, and githago; and removed farothra to the gentianeae.

CARYOPHYLLON Pfini, the fruit of the cajfa caryophylwletas, or cloveberry tree, whose bark is used in medicine

Gen. Ch. Cal. Perianth superior, small, permanent; segments four, concave, spreidng. Cor. petals four, roundish, larger than the calyx and alternate, with its segments caducous. Stem numerous; flaments capillary, a little longer than the petals (but not so expressed, either in Sonnerat's, Woodville's, or La Mare's figures). attached to the outside of a quadrangular, hollow elevation within the segments of the calyx; anthers small. Pfl. germ inferior, oblong, two-celled; style simple, in the centre of the quadrangular elevation, but perfectly distinct from it; fligma simple. Peric. Berry oval oblong, one or two-celled, crowned with the permanent calyx, and quadrangular elevation. Seeds one or two, large.

Eff. Ch. Cor. four petalled. Cal. four-cleft. Berry inferior, one or two-celled.

CAR

philus, Lab. ic. 2 p. 147. "Thekinds, Bibou. arom. p. 177.)

-4. Leaves lanceolate, acuminate. A small tree. Trunk from fifteen to thirty feet high, a foot thick, dividing into branches four or five feet from the ground, and forming a dense pyramidal head; branches opposite, slender, generally horizontal, but to weak to stand in need of support when loaded with fruit. Leaves from two inches and a half to four inches long, near an inch and a half broad, with a strong midrib, and parallel lateral nerves, opposite, tapering at both ends, quite entire, smooth on both sides, reddish and rather shining above, bright green underneath, and bluish-green with minute reddish spots, which placed under a magnifier in a strong light, are generally transparent; petals from six to nine lines long, red, and according to Sonnert, the most aromatic part of the plant. In Sonnert's and Woodville's figure, they are much shorter than in La Mare's, and seem to begin to expand into the proper leaf. Flowers odorous, from nine to fifteen or more on a branch, growing often by threes on partial peduncles in terminal cymes, or rather corymbose panicles; filaments white; anthers yellow; peduncles smooth: bracteoles under each division of the panicle, and at the base of each flower very small, caducous. There is a variety figured by Rumphius with four larger bracteoles, which Linnæus feems to have mistaken for a second calyx, or as he calls it a perianth of the fruit placed under the germ, in contradiction to the superior perianth of the flower. Fruit coracceous, reddish brown, oval-oblong, not falling spontaneous from the tree till the ensuing year. The bark, fruit, roots, and leaves, are all more or less aromatic. A native of moist situations in the Molucca islands and New Guinea.

2. C. obtusifolia. Sonn. nov. guin. pl. 120. "Leaves ovate-oblong, obtuse. All parts of the plant scented. Leaves rounded at the summit, pale green, on long petioles; claws bitter. Sonnert's figure represents a branch with only two terminal flowers. A native of New Guinea.

Sonnert mentions another scentless species or variety differing from the preceding, in having the segments of the calyx extremely long and acute.Labourion found in Cochin-china what appears to be a still different species with scarcely any fimbri or tail, which he thus describes. A middle-sized tree with few branches. Leaves broad-lanceolate, quite entire, smooth, opposite, petioled. Flowers white; peduncles many-flowered, regular, upright, terminal; calyx tubular, oblong, four cleft; segments acute, short, somewhat upright; petals roundish, convex, small. Pericarp a calycine berry, ovate oblong, corticose, pale brown, crowned with the segments of the calyx. Seed fingle.

Ohb. The clove spice does not appear to have been known by the ancient Greeks and Romans. Dioscorides, indeed, has conjectured, and Diosenus a Stapel agrees with him in thinking, that the tender branches of this tree are the real cinnamon of the ancients; but as far as we are able to judge, the supposition is without probability. The first distinct mention of it is by Paulus Cognus, a Greek physician of the seventh century, who observes that it does not correspond with its name which seems to imply a leaf in the shape of a nut, and of which Mr. Ray long after acknowledged that he could not guess the meaning; but is properly a kind of rod-like flower, the produce of an Indian tree. He says it is of a dark colour, about the thickness of a finger in length, aromatic, acid, somewhat bitter, warm and dry in the third degree, much used, both in food and as a medicine. It was probably first brought into Greece from Arabia, as it corresponds sufficiently with the description of the Cerusel of Scarpion, an Arabian physician nearly con-

CAR

temporary with Paulus Cognus, and of the Charneil bel-

lom of Arabia, another physician of the same country, who flourished at the beginning of the eleventh century. When the Portuguese began their troublesome intercourse with the Indian sea, about the close of the fifteenth century, they found it became feasible of the value of the clove as an article of commerce, and are said to have fown many thousand cberos in the island of Amboyna, about four years before it was taken by the Dutch. To this island and the neighbouring smaller ones of Homimba, Oma, and Nussa lat, commonly called the Spices, its new malwers, with that narrow spirit of ex-

"costly selfishness which is so generally attributed to them, as a national characteristic, have long wished to confine cultivation, that they might monopolize the sale of it to them-

selves and have it in their power to fix upon it their own price. For this purpose, about the middle of the last century they compelled the kings of Ternate, Tidore, Macahau and Bak-

chian, and afterwards made a similar contract with the king of Bontum, to accept an annual payment, as a recompense for suffering the clove-tree to be extirpated throughout their dominions, and for affording the Dutch agents in their periodical circuit of devolution. The king of Ternate is laid by Du Tour to have received annually about eighteen thousand rix-Dollars, near four thousand pounds sterling: but according to Stavorinus, the king of Bontum received lately only 170 rix-Dollars, or 321. 14s. 6d. which is represented as a considerable sum in his treasury. The Dutch East India company are also bound to take at a fixed price all the cloves raised by the inhabitants of Am-

boyna. Besides these restrictions, they have sometimes thought fit to reduce the number in the islands appropriated to their growth. In 1709 it was ordered by them that more than five hundred thousand should not be suffered to re-

main in the island of Ambon; in 1733, fifty thousand more were destroyed. But not withholding all the efforts of their illeterable policy, the clove tree is now known to grow abundantly in New Guinea and many other islands over which they have never obtained any influence, that even if there were a probability of their rising from their present degraded state, and recovering their former rank in the scale of nations, it would not be possible for them to renew so odious a monopoly. So long ago as 1770 the patriotic M. Poivre, then intendant of the Isle of Bourbon, sent two ships to the spice islands under the direction of M. Prevoil, a confidential friend well acquainted with the navigation of the coasts, for the express purpose of obtaining living plants and seeds to be cultivated in the French colonies. After several unsuccessful attempts, this able negotiator obtained from the kings of Gebi and Palam in the island of Ceram, sovereigns entirely independent of the Dutch East India company, a great number of plants both of the clove and nutmeg tree, as well as of ripe berries and nuts. In the year 1771 M. Prevoil made another voyage to Gebi and returned in 1772 with a still more abundant cargo of trees and seeds. They were planted by M. Poivre in a magnificent garden prepared for them in the Isle of France, whence they were afterwards exported in considerable quantities to Cayenne and Martinico. In Cayenne 4,400 clove trees were gradually raised between the years 1779 and 1784, exclusive of those which had been distributed among private individuals. In 1783 the eldest of them, then of six years growth, produced a few small flowers; and two pounds and a half of cloves were collected from them. In 1786 the crop amounted to 1,200 pounds; and in 1787 to 273 pounds, when Lavrinier and the Count de la Luzerne were appointed to examine them and report their quality to the French government. The cloves of Cayenne proved equal to those of the East Indies.
and were even found to afford a larger proportion of essentinal oil. In 1792 the plantation contained 4,500 fruit-bearing trees; and a merchant of Bourdeaux had sold it in the preceding year 700 pounds of Cayenne cloves at a lower price than was asked for those from the Moluccas. The success of the plants sent to Martinico was not known to Du Tour, from whom these details are taken, that island having soon afterwards surrendered to the British arms; but we learn from the translator of Stavorinus's voyages to the East Indies, that in 1797, 305 pounds of cloves were imported into the port of London from Martinico, and in 1798, 200 pounds from the same island and 581 from St. Kitts.

This spice is so much fought for in commerce, and is so much esteemed by epicures, that the ripe fruit of the plant, but the bud of the flower, which is found by experience to lose much of its aromatic quality if suffered to remain on the tree till the authors have discharged their pollen, and the germ has become impregnated. In Ambon it makes its first appearance at the beginning of the rainy season, and is of a dark green colour. In August and September it acquires its proper shape, and then gradually passes from green to yellow, and from yellow to red; but still has its flameless point in the unopened petals, which form a kind of globular button at the top of the calyx and germ. In that state it has a strong resemblance to a small nail; of which the closed petals and expanded segments of the calyx compose the head, and the germ, gradually tapering to a blunt point, the lower extremities. The resemblance is so striking, that it has given rise to the vulgar name by which this article of commerce is known in most nations of Europe. The Dutch call it naghel, the Spaniards clove, the Italians chiolo, and the French clove, from which the English word clove is evidently derived.

When the cloves have thus arrived at what may be properly called their mercantile state of maturity, those within reach are gathered by the hand, and the rest, as most authors assert, are beaten down by poles or reeds; but, according to Stavorinus, are cut off with long hooks. The latter is the more probable account; for, as Mr. Ray observes, it is not easy to conceive how unripe fruit which in a healthy state is usually strongly attached to the tree, can be forcibly beaten off, without breaking or materially bruising the tender branches, which at the same time is expressly laid to be carefully avoided, as a certain detriment to the crop of the ensuing year. The season of gathering continues from October to February. The cloves, as soon as they are gathered, are dried either in smoke over a fire, in the sun, or in a kiln. Stavorinus asserts that those which are dried in smoke are not good, and may be distinguished by their blacker colour, and their bending between the fingers: whereas those dried in the sun are of a reddish cast, and are not flexible, but brittle, snapping at once when being filipped by the finger. Du Tour observes, that the oily part of the clove is best preferred when it is dried in a kiln. Those are always preferred in the market which appear plump, and leave an oiliness on the fingers when pressed, which have most of the aromatic taste and smell, and which retain the globular unexpanded corolla, a certain proof that they have not continued too long on the tree.

They are used in their native climate, and in almost every part of the civilized world, as an article of luxury, communicating a pleasing flavour to preferred fruit, sauces, ragouts, and liqueurs. They are likewise employed by the perfumer. In medicine they are esteemed tonic, cordial, and exhilarating, acting as a powerful stimulant to the muscular fibres, and superior to most of their class in cases of alto sour, paralysis, &c. They have a strong agreeable smell, and a bitterish, hot, but not very pungent taste, qualities which are completely extracted by rectified spirit. To water they communicate more of their smell, but less of their taste; and in distillation with water, they yield one-sixth of their weight of essentinal oil, smelling strongly of cloves, but less pungent than the spirirous extract. This oil is an article of the Pharmacopoeias, and enters into several officinal compositions. It often gives infallible ease in the tooth-ache; and is used with benefit as an external application in paralytic and lachrymose affections. That which is commonly met with in the shops, and received from the Dutch, is much more aromatic than the genuine distillate oil, and is probably sophicated by an admixture with the pungent part of the cloves, from which it receives its peculiar acrimony and high colour.

Valentin describes four sorts of cloves; that which he calls the male is the fruit used for drying; the female is of a pale colour, and the bunt for extracting oil; the king's clove is a very scarce species, bearing larger and double fruit, and is perhaps that figured by Rumphius, who he calls regium; the fourth sort, or rice-cloves, are very small, and likewise very rare. Whether the trees which produce these different kinds are distinct species, or only varieties, we cannot determine.

The berries which ripen on the tree are emphatically called mother-cloves, as being chiefly destined to give birth to a future progeny. The Dutch, however, preserve them in sugar, and value them as an useful astringent to digestion, and a pleasant anticoagulant fea-flower. See Bodan's a Stapel's Notes to Theophrastus, Rali Hiltoria Plantarum, Stavorinus's Voyages to the East Indies, Sonnert's Voyage to New Guinea, Woodward's Medical Botany, La Marsh in Encyclopædia, and Du Tour in Nouveau Dictionnaire, under Epice and Geroufr. On re-considering the subject, since the article Caryophyllus was drawn up and sent to the press, we are convinced that Linnaeus was right in retaining for the Atlantic spice the name of Caryophyllus, which had been originally formed for it by the Greek merchants of the middle ages, who seem to have mistaken the dried cloves for the leaves of the plant; and that he had no alternative but to invent a new one for the European plants, which could not possibly be arranged under the same genus, although they had received the same appellation from the earlier modern botanists, on account, as Mr. Ray has observed, of some resemblance to the smell of the original caryophyllus, or clove, in one of the species at least which is still called by gardeners the clove-pink. (Dianthus caryophyllus, Linn.). He is to be cifted only for distinguishing, by the name of Caryophyllus, a natural order which does not contain the true Caryophyllus, and which he might have been led by an obvious analogy to call Dianther. It is surprising that he should have been followed by Jussieu in so gross an impropriety.

CARYOTA, Linn. See CARYUS, Mamm. See MARMOR.

CARYSTUS, in Ancient Geography, a town of Greece, in the island of Euboea, situated in the southern part of the island, at the bottom of a small gulf which opened to the south-west. It was famous for the quarries of marble which were found in mount Ocha, at the foot of which it was situated. This marble was in high estimation among the Romans. Strabo says that this high mountain furnished the well known abbeles or amanthis. Protocles calls this town Caryile, and it is said to have derived its name from Caryaus, the son of Chiron; whence it was also called Chironia; and it was likewise denominated Aegon, from Aegon, who is said to have reigned here, and is supposed by Stephanus to have given his name to the Aegonian sea. The inhabitants of Caryus worshipped the god Briareus, who, according to Homer, was the name of Aegon, adored by the Chalcidians; the name of Aegon being given to him, as he calls us, by men, and that of Briareus by the immortal gods. Caryus has been since called Calia, and Calioli. 

CARYUS, in the Materia Medica, a name given by Dioscorides, and some other of the ancient Greeks, to the eryngium, or sea-holly, called by us eryngius. It was thus named from its having a small head or cluster of flowers like a walnut. See ERYNGIUM.

CAS, St. Bay, in Geography, a bay of the English channel, on the N.W. coast of France, where in 1553 the English made an unsuccessful landing, with the loss of about 1000 men. It derives its name from that of a village near it. It is 10 miles W. of St. Malo, and 5 S.E. of cape Frehel.

CASA, John De Ia, in Biography, a celebrated Italian writer, was the descendant of a noble family at Florence, and born in 1503. Having been educated at Bologna, and afterwards having purfied his studies for some time at Florence, under Ubaldino Bandinelli, he settled at Rome, and, in 1548, became clerk of the apostolical chamber. With the elegant and classical studies to which he was devoted, he combined, as was too frequently the case, the licentious manners of the capital, and as the fruit of his amours, he CSPD.
had a natural son, whom he named Quirino. In 1540 he became a member of the newly established Florentine academy; and in 1544 he was made archbishop of Benevento, and also dispatched as nuncio to Venice. Failing to engage the Venetians to join in a league with pope Paul III. and Henry II. king of France, for controlling the(dreaded power of Charles V., which was one object of his mission; he succeeded in another, for the purpose of carrying on a procels against Vergerio, formerly the pope’s nuncio in Germany, who had become a Lutheran. But although he drove him from Italy, Vergerio amply avenged himself by the injury which he did to Cafa’s reputation in Europe. Under the pontificate of Julius III. he was involved in the disgrace of Cardinal Alexander Farnese, and obliged to quit Rome, and to retire to Venice, in the vicinity of which he passed several years in the private prosecution of his studies. Upon the election of Paul IV. he was recalled to Rome, and appointed secretary of state; but he never advanced to the rank of cardinal, which some have ascribed to the licentious writings of his youth. He died of the gout in 1556, at the age of 53 years.

John de Cafa has been always regarded as one of the politest writers of the most flourishing age of Italian literature, and one of the principal models of the pure Tuscan dialect. His verses, though defective in style, excel in elevation of sentiment and lineaments of imagery. Deviating from the course pursued by Petrarch and his imitators, he aimed at substituting a sublime and noble gravity to their perpetual softness and tenderness. He also adopted in his youth the burlesque manner of Berni, and other writers; and in this style of composition he wrote his famous “Capitol del Forno,” which, by its extreme indecency, fixed an indelible reproach on his name and character. This piece, and some more of his performances, have been superseded in all late editions of his works; but they are printed among other compositions of a similar kind by Berni, Mauro, and others, at Venice in 1538. His Italian letters are elegant, but defective in point of ease and familiarity. His most celebrated work in Italian prose is the “Galazzo,” or Art of living in the World, which is a kind of fytel of palatines, that has been much esteemed, and translated into most of the languages of Europe. His orations have been much admired, as finished pieces of artificial eloquence. As a writer of Latin in prose and verse, Cafa is one of the happiest imitators of the ancients, and his lives of the cardinals, Contarini, and Benno, are masterpieces of their kind. His knowledge of Greek was displayed by elegant translations of the orations in Thucy-dides, and of that of writer’s description of the pellicise at Athens. Of the numerous editions of his works, that of Venice in 5 vols. 4to. 1728, is reckoned the most valuable, on account of its illuminations and biographical anecdotes.

Casa, in Ancient and Middle Age Writers, is used to denote a cottage or house.

Casa Santa, denotes the chapel of the Holy Virgin at Loreto. This is properly the house, or rather chamber, in which the Blessed Virgin is said to have been born, where she was betrothed to her spouse Joseph, where the angel saluted her, the Holy Ghost overshadowed her, and, by consequence, where the Son of God was conceived, or incarnated. It is pretended to have been carried in May, 1524, through the air from Galilee to Tarsu in Dalmatia, by angels; and 45 years afterwards to have been removed to Italy, where about midnight, in December 1594, it was set down in a wood, in the district of Recanati, about a thousand paces from the sea. But it was nearly 200 years in Italy before any author of that country took any notice of it. Of this building the Catholics tell many other wonderful stories, too childish to transcribe.

The Santa Casa, or holy chamber, consists of one room, the length of which is 15 feet, the breadth 15 feet and nearly 3 inches, and the height 18 feet. Formerly it had only a timber ceiling; but, felt by a great number of lights continually burning, it should happen to take fire, Clement VII. caused a vaulted roof to be made. It was also strongly compacted with rafters, boards, and ropes, and supported by machines till the new foundation was carried up, so as to be joined with the old walls of the house. On the ceiling is painted the assumption of the Virgin Mary. On the well side of the window, through which the angel came into the house, and fucic it, in a niche, stands the image called the great Madonna, or lady, five feet high, made of cedar, and, as they say, wrought by St. Luke, who was a carver as well as a physician. The mantle or robe she has on, is covered with innumerable jewels of inestimable value. She has a triple crown of gold, enriched with pearls and diamonds, given to her by Lewis XIII. of France, and a little crown for the child Jesus. The niche in which the image stands is adorned with 71 large Bohemian topazes; and on the right side of the image is an angel of cast gold, profusely enriched with diamonds and other gems, which is said to have cost 50,000 ducats, and which was offered by Maria Beatriz Eleonora, of the house of Este, queen of king James II. of England, that, by the intercession of the Virgin Mary, she might conceive a son. Accordingly, soon after, as it is said, she had a son; who has since occasioned so much noise in Europe, under the name of the pretender to the British crown. On the left side of the Virgin’s image is a silver angel; and on the right hand another costly one, which was the gift of Lewis XIII. king of France for the birth of the dauphin, afterwards Lewis XIV. The robe which this famous image wore, when it was brought from Dalmatia into Italy, is of red camlet, and kept in a glass shrine. The dirt out of which the robe and divine infant are said to have eaten is a shallow bowl, of glazed earthen ware, plated over with silver. This utensil is not only kîted, butراری, medals, sanguis, crucifixes, and paper caps, painted with the image of the Madonna of Loreto, are rubbed against it, from a firm persuasion that they thus become an infallible remedy against the head-ache, and other diseases. Seven golden lamps are continually burning before the image; and other parts of the Cafa Santa are illuminated by 37 silver lamps, which are filled with oil out of legacies bequeathed, and ample funds established for this purpose. Notwithstanding the mean appearance of the walls within the Cafa Santa, the outside is elegantly adorned with the finest Carrara marble, which was marble was begun in 1514, in the pontificate of Leo X. and consecrated in 1535 by Paul III. The expense of this caving was enormous, and the most celebrated sculptors of the age were employed in adorning it. The arch which encloses the holy house was designed by Damaite, and the sculpture was designed and executed by the most famous artists. It was completed in 1579, and Gregory XIII. bid the honour of finishing this superb work. On the top of the Cafa Santa is a little tower, in which are hung two small bells, that are rung in violent tempests of thunder and lightning, under a notion that their sound will difperse the storm, and prevent any injurious effects. There is one part of the Cafa Santa which may be regarded as the holy of holies: for it is separated from the other part by a silver balustrade, and a gate of the same metal. It is said to be the spot where the Virgin was fitting when the angel Gabriel appeared to her at the time of the announcement. The large church in which the cafe of the Cafa Santa stands, as
if it were under a tent, is built of Ilirian stone, resembling the Trævettino stone used at Rome. The front is wholly of marble, and embellished with very fine sculpture, and over the portal is a statue of the holy Virgin. The three doors on this side of the church are bronze, with beautiful baldaquin-reliefs, representing different histories of the Old Testament. Over the middle door are these words "Domus Deipara, in quæ verbum Caro factum est." Keyler's Travels, vol. iii. See Loreto.

Casa Caldana, in Geography, a town of Italy, in the kingdom of Naples, and county of Mohits; 21 miles E. N. E. of Mohits.

Casa de la Contratarion, or the house of trade, in Commerce, a tribunal of Spain established at Seville, to the port of which the commerce of the New World was confined, as early as the year 1501, for the regulation of such commercial affairs as required the immediate and personal inspection of those appointed to superintend them. It may be considered both as a board of trade, and as a court of judicature. In the former capacity it takes cognizance of whatever relates to the intercourse of Spain with America; regulates the commodities that should be exported thither, and has the inspection of those that are received in return. It decides concerning the departure of the fleets for the West Indies; the freight or burden of the ships, their equipment, and their dilution. In the latter capacity it judges with regard to every question, civil, commercial, and criminal, arising in consequence of the transactions of Spain with America; and in both these departments, its decisions are exempted from the review of any court but that of the Council of the Indies, which fee.

Casa Grand, in Geography, a town of North America, in the country of New Mexico, and province of New Navarre, seated on a river N. of Buenaventura. N. lat. 29° 30', W. long. 107° 20'.

Casa Magdala, a town of Naples, in the country of Baris; 17 miles S.W. of Converfarno.

Casa Villari, a town of Naples, in the country of Lavara; 7 miles S.E. of Soran.

Cass, or Cazac, a country of Asia, in the dominions of Persia, on the frontiers of Armenia, governed by princes of its own, nominally subject to Persia; about five leagues from north to south, and somewhat more from east to west. The inhabitants are divided into the Caspian and Cascafs, and are reckoned a rude and barbarous people. Cacac, or Casac Loros, is the name of the capital.

Cassaggi, in Ancient Geography, a town of Asia, situate on the mountains of Pamphylia. Ptolemy.

Casa Bajdaios, or Calaenaios, an episcopal see of Africa, in Numidia.—C. Calabinti, a place of Africa, in Mauritania Tauritensis, between the colonies of Tipasa and Fesfum, according to the Itinerary of Antonine.—C. Derejaig, an episcopal city of Africa; but the province in which it was situated is not ascertained.—C. Melchaefer, an episcopal city of Africa, in Numidia. C. Nigres, an episcopal city of Numidia.—C. Sybaris, an episcopal city of Africa, in Byzacium.—C. Villa Aurea, a place of Africa, according to the Itinerary of Antonine, in the route from Carthage to Leptis, between Tceepsa and the colony of Sarcarsa.

CASCADE, in Geography, a town of Italy, and capital of Mantua, seated on the Po, formerly well fortified, and defended by a citadel, which was much admired. It was taken from the Spaniards in 1649; sold by the duke of Mantua to the king of France in 1681; taken in 1685 by the French, who destroyed its fortifications; but retaken by the French and refortified. The king of Sardinia became master of it in 1766; but it was taken by the French in 1777, retaken in 1796, and captured again by the French in 1797. The bishop is suffragan to the archbishop of Milan. N. lat. 45° 7', E. long. 9° 17'.

Casa—Magrana, a town of Italy, in the duchy of Milan, and county of the Campas, seated near the Po, and made a town in 1754. N. lat. 45° 7', E. long. 9° 17'.

CasaMacha. See Litern.

Casa Nova, a considerable town of Naples, in the province of Terra di Lavoro, containing about 2000 inhabitants; noted for nothing but its table for deer's bolts. At this place, as well as at Cece, the Custom-house and ten their hides into an imitation of Turkey leather, with which they supply the gentlemen of the neighbourhood who are nice in their dress. This demand for Cordero occasioned the slaughter of many dogs, and, without doubt, the custom of eating their flesh commenced among the needy sufferers. Hunger and experience have taught their countrymen to consider the discovery as a very beneficial one. N. lat. 40° 4', E. long. 15° 56'—Alfo, a town of Naples, in the province of Principato Città, N. E. of Pobaliron. N. lat. 40° 16', E. long. 15° 34'.

CasaLus Sitios, in Ancient Geography, a gulf on the western coast of the island of Corfu.

CasaMara, a town of Asia, placed by Ptolemy in the Palmyrene territory, which was a country of Syria. The Notitia Imperii places it in Phcenicia. It was situated on a small river to the east of Carma.

CasaMAN, a town of Asia, probably towards Armenia.

CasaMARRI, a people placed by Pliny in Ethiopia, near Egypt.

CasaN, or Kazan, in Geography, a government of Russia in Europe, seated on the river Volga; bounded on the north by that of Viatka, on the east by the governments of Perm and Ufa, on the south by that of Simbirsk, and on the west by that of Neftten Novgorod. It contains 13 districts, of which one is Cahan, or Kazan, situate on the rivulet Cazanka, which falls into the Volga. Its capital bears the same name. The kingdom of Kazan was conquered by the Tartars by Joan Vaflievitch 11. or Batilo-witz, after a service of seven years; the capital of it surrendering to the victor in 1552; and at this time the empire of it was united to Russia for ever. In the Turkish and Tartarian language, Kazan signifies a large cauldron, of sufficient size to contain victuals for many persons; and this name is given by the Crim or Kairidzhi Murics to the families of their subjects, or valets, reckoning about ten to a kazan. The present Kazan Tartars are but a feeble remnant of what they once were—the very confiding of those who remained in their old habitations, and partly of those who settled as fugitives in other districts of Russia.

CasaN, or Kazan, a city of Russia, and the capital of the above government, situated near the Volga. This city was built in the year 1537, by a son of Basy, a kinfman of the great Tchinghis; and its kharar provided its independence about the year 1441, when the Krim disjouined itself from Kazaksheh, or Capellac. Kazan consists of a strong fort, built with stone, the wooden town as it is called, and several adjoining suburbs, one of which is inhabited by Tartars. Here are several churches, most of which are constructed with stone, and also 10 convents in or near the town. The government chancery which is held in the fort, is under the direction of the governor and deputy governor. All the garrisons and regiments within the government of Kazan are under the command of the governor. The garrison of the city consists of three regiments, for the service of which a good hospital is provided. Kazan is an arch-
archbishop's fee. At one end of the town is a manufacture of cloth, which is purchased by government for the clothing of the troops. In a convent, called Siliandouo, seated on the river Casanka, about two miles from the town, is a school, where the children of Tartars are taught the Russian and Latin languages, the principles of the Christian religion, and the elements of philosophy, in order to qualify them as preachers for the conversion of the nations to which they belong. In 1749, and again in 1752, this city was totally destroyed by fire. The adjoining country is fertile in all kinds of fruits, corn, and pulse. The commerce of this government consists of furs, and oak timber for the building of ships. For the prosecution of the large oak-trees that grow in this district Peter I. appointed foresters, who had under them discharged soldiers; but these people committed every kind of excess among the inhabitants, and, therefore, they were abolished in the year 1762. However, every landowner is careful of his oaks, as they fetch at all times a good price. In Petersburg every pool of oak timber, including the expense of transport, sells for 15 to 25 kopeeks. Casan or Kazan is distant 400 miles E. of Moscow, and 660 S.E. of Petersburg. N. lat. 52° 43' 58". E. long. 59° 8' 14".

CASANDRA, in Ancient Geography, an island placed by Pliny in the Persian gulf over against Peria Propria.

CASA-NOVA, Marc-Antonio, in Biography, called in his time, the prince of Latin epicormatists, was born at Rome, where he flourished in the beginning of the 17th century. Attaching himself to the imitation of Catullus and Martial, he affected the wit and severity of the latter, but deviated from the nature and purity of the former. Whilst he was engaged in the service of the Colonna family, he excercised his fatire against Clement VII, with so little moderation, that he was imprisoned and condemned to death, but pardoned by the pontiff. After the fall of Rome he was reduced to such extreme indigence, that he wandered about the streets begging bread, and died either of want or of the plague in 1727. Besides his epigrams, he wrote short allegories or interlusions on the principal characters of ancient Rome. A selection of his pieces may be found in the first volume of the "Dithicer Poetar. Italor."

CASAPE, in Ancient Geography, a town of Africa, placed by Ptolemy in the interior of Hircania.

CASAQUE, an ancient military habit considerably larger than an ordinary coat. It was formerly the common vestment or garment of all the French. And as this caque was of a different colour in each company of their troops, it was easily and immediately discovered by this distinguishing difference, to what company any soldier belonged, who had been guilty of any disorder, outrage, or irregularity. When the caque was abolished, it was succeeded by the echarpe or scarf, which was also of different colours in different companies.

CASAS, De Las, Bartholomew, in Biography, a prelate eminently distinguished by his humanity, was born at Seville in 1474, and in his 89th year accompanied his father, who failed to the West Indies with Columbus. On his return to Spain after an absence of five years, he pursued his studies, and entered into the ecclesiastical order. When Columbus made his second voyage to Hispaniola, Las Casas was one of the clerics who attended him thither, with a view of settling in that island. On the reduction of Cuba, he was obliged to take the rector of Zaguarama in this island. Adopting the opinion which was prevalent at this time among the ecclesiastics, and particularly among the Dominicans, that it was unlawful to reduce the natives to servitude, he concurred with them in exclaiming against the "repartimientos," or distributions which were made of them by the governor as slaves to their conquerors. In order to demonstrate the sincerity of his conviction, he relinquished his share in the distribution, declaring that he should ever bewail his own misfortune and guilt, in having excercised for a moment this impious dominion over his fellow creatures. From that time he became the avowed patron of the Indians, and by his active interposition in their favour contributed to restrain the excesses of his countrymen. Actuated by a laudable zeal in their cause, he set out for Spain in 1516, for the purpose of stating their distressed situation to king Ferdinand and intreating his compassion in their favour. This monarch, being in a declining state of health, was much impressed by the eloquence of Las Casas, and promised to adopt means for redressing the evil of which he complained and the guilt of which he forcibly charged on Ferdinand himself. Death, however, prevented him from executing his resolution. Las Casas, with unabated ardour, determined to try his cause before Charles of Austria, who was then in the Low Countries, but whilst he was preparing to set out for Flanders, the regent, Cardinal Ximenes, with the vigour peculiar to his character, adopted a plan for accomplishing the object which the benevolent xeclesiastic had in view; and accordingly he resolved to send out three reputable commissioners, with ample powers to examine all circumstances upon the spot, and to decide finally with respect to the point in question. As the Dominicans and Franciscans had already espoused opposite opinions in this controversy, he excluded both these fraternities from the commission, and refuffed his choice to the monks of St. Jerome. Having selected three persons, whom he deemed equal to the charge, and joined to them a private lawyer of distinguished probity, Las Casas was appointed to accompany them, with the title of "Protector of the Indians." Upon their arrival at St. Domingo, they began to extort their commissio by liberating all the Indians, who had been granted to the Spanish courtiers, or to any person not residing in America. This measure excited a general alarm; but the fathers of St. Jerome proceeded with prudence and caution; and finding it necessary to tolerate the "repartimientos," they used their utmost endeavours to prevent the injurious effects of this establishment, and to secure to the Indians the best treatment that was compatible with their state of servitude. For this purpose they enacted several useful regulations. Las Casas, however, was dissatisfied, and remonstrated against that unhallowed timid policy, which led them to accommodate their conduct to the state of the colony, and to tolerate what was unjust, because it was beneficial. The commissioners adhered to their system; and Las Casas, in order to avoid the effects of the relentment which he had excited among the Spanish planters, was under a necessity of seeking an asylum in a convent. Receiving that all his efforts in America were fruitless, he set out for Europe, with a fixed purpose not to abandon the protection of a people whom he deemed to be cruelly oppressed. Upon his arrival, he found Ximenes dying; and soon after Charles V. took possession of the Spanish government, which he chiefly committed to his Flemish ministers. Las Casas interceded them in his cause, and induced them to recall the fathers of St. Jerome, and to appoint a chief judge to re-examine the points of controversy between the friends of Indian liberty, and the colonists. Whilst Las Casas was thus zealously promoting a scheme, supported by humanity and a liberal policy, for the emancipation of Indian slaves, he was betrayed by the ardour with which he prosecuted his purposes into the inconsistency of extending the miseries of servitude to the inhabitants of Africa. Accordingly,
accordingly, in order to furnish the Spanish planters with labourers, instead of those Indians whom he wished to emancipate, he proposed to purchase a sufficient number of negroes from the Portuguese settlements on the coast of Africa, and to transport them to America, that they might be employed as slaves in working the mines, and cultivating the ground. Thus, while he continued earnestly for the liberty of the people born in one quarter of the globe, he laboured to enslave the inhabitants of another region; and in the warmth of his zeal to save the Americans from the yoke, pronounced it to be lawful and expedient to impose a still heavier yoke on the Africans. Fortunately for the latter, Las Casas's plan was adopted. Charles V. granted a patent to one of his Flemish favourites, containing an exclusive right of importing 4,000 negroes into America. He sold his patent to some Genevo merchants for 25,000 ducats, and they were the first who brought into a regular form that execrable commerce for slaves between Africa and America, which has since been carried to such an amazing extent. Las Casas, however, connected with his very censurable plan of enslaveing the Africans the most lefK exceptable project of supplying the new settlements in Hispaniola and the other islands with a sufficient number of labourers and husbandsmen, who should be allowed by feasible pre- missions to remove thither. This scheme was countenanced by the Flemish ministers, but defeated by the bishop of Burgos, who thwarted all the projects of Las Casas. Las Casas, defparing of procuring any relief for the Indians in those places where the Spaniards were already settled, formed an idea of establishing a new colony; and with this view, he applied for a grant of the unoccupied country, stretching along the sea-coast from the gulf of Paria to the western frontier of that province now known by the name of Santa Martha. He proposed to settle there with a colony composed of husbandsmen, labourers, and ecclesiastics. He engaged, in the space of two years, to civilize 10,000 of the natives, and to instruct them so thoroughly in the arts of social life, that, from the fruits of their industry, an annual revenue of 15,000 ducats should arise to the king; and in 10 years he expected that his improvement would be so far advanced as to yield annually 60,000 ducats. In forming this scheme Las Casas had evidently conceived ideas concerning the method of treating the Indians, similar to those by which the Jesuits afterwards carried on their great operations in another part of the same continent. After encountering much opposition from the bishop of Burgos and the council of the Indies, he at length obtained a territory of 300 miles along the coast of Cumaná, with liberty to extend it as far as he pleased towards the interior part of the country. However, with all his efforts, he could not prevail on more than 200 persons to accompany him, with whom he sailed, in 1551. Several of these died or left him at Porto Rico, where he first landed: and with the few that adhered to him, he proceeded to Cumaná, which he found much disturbed on account of a recent invasion of the Spaniards. He was therefore under a necessity of repairing to Hispaniola in order to solicit succours; but during his absence, the natives, exasperated by the injuries they had suffered, attacked the enfeebled colonists, destroyed many of them, and obliged the rest to take refuge in the island of Cubagun. Soon after this island was abandoned, and not a Spaniard remained in any part of the continent, or adjacent islands, from the gulf of Paria to the borders of Darien. Las Casas, ashamed to chew himself after such a succession of disasters, and after this fatal termination of all his splendid schemes, flung himself up in the convent of the Dominicans at St. Domingo, where he resumed the habit of the order and devoted himself to the performance of religious duties. Frustrated in all his projects for the benefit of the oppressed Indians, he nevertheless not only retained his former anxiety and zeal for their relief, but an increased knowledge of their sufferings had augmented his ardour. In 1572, he was sent by a chapter of his order to Chiapa to Madrid, and he took this occasion of pleading their cause before Charles V. and ventilating his favourite maxims concerning the proper mode of treating them. Not considering for success in the powers of his oratory alone, he enforced them by computing his famous tracts entitled "Dictio Relation de la Destructior des Indes," in which he related, with many lurid circumstances, probably exaggerated by his powers of description, the devastation of every province, which had been visited by the Spaniards. This treatise excited throughout Europe a detestation of the cruelties practiced by the Spaniards in America; and Las Casas so far succeeded with the Spanish court, as to induce them to adopt several new regulations which he proposed, and which contributed in a considerable degree to alleviate the sufferings of the oppressed natives. With a view to their further relief and protection he accepted the dignity of bishop of Chiapa, and returned thither in 1544. Having continued in his see till the year 1551, he left it on account of his declining health, resuming his historic into the hands of the pope, and retired to Madrid, where he finished his course of active and indefatigable benevolence in 1576, at the advanced age of 92 years. Besides his work on the destruction of the Indians, he wrote a Latin treatise on the question, "Whether sovereigns may in conscience, by virtue of any right, alienate their subjects from their crown, and transfer them to the dominion of any other lord?" Tubing. 1625, 4to.

In this treatise he discusses, with singular freedom, many points of a delicate nature respecting the rights of sovereigns and people. He also composed many other works, which have never been published, among which is "A General History of the Indies," of which Antonio de Herrera is said to have availed himself in the compilation of his history. Moret. Robertson's Hist. of America, vol. i. and vol. iii.

CASASA, or CaSaCa, in Geography, a sea-port town of Africa, in the kingdom of Fez, at the mouth of a large river in the Mediterranean; 18 miles S. of Mechila. N. lat. 32° 8'. E. long. 32° 41'.

CASATI, PAUL, in Biography, a learned Jesuit, was born at Padua in 1517, and became a professor of mathematics and theology at Rome. He was one of the two Jesuits who attended Christina queen of Sweden at her request, and professed her to the Roman Catholic religion. Upon his return to Italy, in 1532, he was superior over several houses of his order, and occupied the first dignity in the university of Parma for two years; in which city he died in 1577. He composed the following works: "Vacuum proscriptum," "Terra machinis motis," "Fabrica et ufo del compasso di propertione," "Mechanici libri viii;" "De Ignis," "Hydrostaticae differtationes;" "Opticae disputationes," written at 85 years of age, after he was blind: "Problematum ab anno. geom. Lud. Batav. propoli posit," a Paulo Caffaro expicata."

CASaubon, ISAAC, an eminently learned critic and commentator, was born in 1559, at Geneva, whither his father retired to escape persecution, and received his early education at Creil in Dauphiné, under his father, where he was settled as minifter, when the persecution ceased. So rapid was his proficiency, that, at the age of nine years, he was
was able to speak and write Latin with facility and correctness. But, on account of his father's frequent absence, he did not follow the ground which he had gained, that, at the age of 12 years, he was obliged to recommence his studies. In 1578, he went to Geneva, where he made such progress in the Greek tongue under Francis Portius of the isle of Candy, the Greek professor, that, in 1582, he was appointed to succeed him. At the age of 25 years he published his "Diogenez Laertius," which were added, in 1584, to the 5to. edition of Henry Stephens. His "Lettera Tionon Thocritus," were published at Geneva in 1581, 12mo. and dedicated to H. Stephens, whose daughter he married in 1586, by whom he had 20 children. These notes were likewise published under the assumed name of " Horatius," synonymously with Cafauboni, because Cafa, in Dauphine, means a garden; which he preferred to his own as more suitable to a Latin book. In 1587, he published his "Strabo" at Geneva, fol.; and in the same year his edition of the New Testament with notes, afterwards inserted in the "Critici Sacri." Having studied philosophy and civil law under Julius Paccius, he also applied to the oriental languages and Rabbins. His notes on " Dionysius Halicarnassensis," were published at Geneva, in 1588, fol.; and his " Polyphemus Stragatagem.," at Lyons, in 1589, 12mo. His "Ariosto," in Greek and Latin, was printed at Lyons, in 1590, and reprinted at Geneva, in 1603, fol.; and in the following year he published an edition of "Pliny's Letters," with notes, and the ancient "Panegyrics," Geneva, 12mo. His " Theophrastus' Characters," 12mo. was published at Lyons, in 1592, with a Latin version and commentary, and a third more correct edition appeared at Lyons, in 1611, 12mo. His "Apuleius' Apology," appeared in 1594, 4to. dedicated to Joseph Scaliger; and his "Commentary on Suetonius," was printed at Geneva, in 1596, 4to. and another enlarged and corrected edition was printed at Paris, in 1610, fol. Dissatisfied with his situation at Geneva, he removed to Montpellier, in 1596, and accepted the office of professor of the Greek and of polite literature; but here he was so much disappointed in his expectations of encouragement and support, that he thought of returning again to Geneva. However, in 1598, he removed to Lyons, with the view of printing his edition of "Athenaeus' Deipnosophistae," which was published in 1598, and again in 1613, in 2 vols. fol.; and in the mean while he accompanied M. du Vieux to Paris, where he was introduced to king Henry IV. and whose invitation to the office of professor of polite learning he accepted, in 1599. But jealousy, on the part of the other professors, and his own adherence to the Protestant religion, rendered this office untenable. In 1600, he was one of the judges on the side of the Protestants at the conference held at Fontainbleau, between Cardinal du Perron and du Plessis-Mornay, and by his conduct on this occasion he led some perfons to expect that he would become a convert to popery; but though he was no zealot in religion, he invariably declined complying with the solicitations of his Roman Catholic friends, who wished him to change his profession. The king, who had conferred upon him a pension, promised him also the reversion of the post of his librarian, which office he obtained in 1603, together with an increase of his pension. At this time he published several works of the ancients, viz. " Historia Augusti Scriptores cum Commentario," Paris, 1597, 4to.; " Diatriba ad D. Chrysolomini Orationes," published in Morel's edition of that author at Paris, 1604, fol.; " Perii Satriae ex recensione et cum Commentariis J. Cafauboni," Paris, 1605, 8vo., and London, 1647, 8vo. of which Joseph Scaliger says, that in this edition "the fauce is worth more than the filth."" "De Satyrich Gospelium Poëth. et Romanorum Satyri, lib. ii." Paris, 1605, 8vo.: in which work he maintains that the satirical poetry of the Latins was very different from that of the Greeks; an opinion which was attacked by Daniel Heinsius, and vindicated by Eckfeld Spanheim; and "De Esuli Epitola ad Epitaphium, Ambrosian, et Daliliani, Gr. et Lat. cum notis J. Cafauboni," Paris, 1664, 8vo. and Hanau, 1611, 8vo.; which letter was first published by him. In 1667, he composed his treatise "De Libertate Ecclesiastic," 8vo.; which was occasioned by the disputes that had occurred between pope Paul V. and the republic of Venice, and contains a vindication of the rights of the Romish see against the pretensions of Rome; but these disputes being adjusted whilst the work was printing, it was suppressed by order of king Henry IV. His edition of "Polybius," to which is annexed "Épites des tacles de toleranda obidiones, Gr. et Lat," was published at Paris in 1609, fol. His Latin version of both these authors was much approved; and the dedication to Henry IV. is reckoned among the masterpieces of modern Latin composition. The best edition of his letters "If. Cafauboni Epistola, &c." containing all his prefaces, dedications, poems, &c. with those of his son Merci, is that by Almeoven, Rotterdam, 1709, fol. In consequence of several controversies which he held with cardinal du Perron on the subject of religion, a report was spread that he had promised to abandon the Protestant faith, which he thought it necessary publicly to contradict: and his uniform adherence to his profession sufficiently refutes the charge of indifference to religious doctrines, which has been alleged against him. Although he was perpetually in his attachment to his own profession, he avoided controversy, and in his opinion, with regard to those who differed from him, he was liberal and tolerant. When one of his foes became a capuchin, and afterwards fought his blessing, "I give it you," says he, "with all my heart; I do not condemn you, neither do you condemn me: we shall both appear at the tribunal of Christ." As a farther evidence of the liberality of his sentiments, and love of peace, it is alleged, that he was one of those who thought an union between the Papists and Protestants to be both practicable and desirable; and in this opinion he concurred with the learned Grotius and many others of the age in which he lived. His attachment to his own profession, notwithstanding his liberality, was evinced by the uneasiness he felt on occasion of his eldest son's becoming a profyte to the Catholic religion. After the death of Henry IV., an event which he much lamented, he determined to comply with the repeated invitation of James I. to visit England; and, accordingly, in 1610, he accompanied Sir Henry Wotton bishop, and was received with great civility by the king and many other persons of learning and distinction. Upon his arrival, he was made a denizen, liberally pensioned, and presented to a prebend at Westminster and another at Canterbury. In return for these favours he was engaged by the king, much against his own inclination, in controversial writings against the Papists. Accordingly, his translation of Baronius' Annals, or "Exercitationes contra Baronium," was published at London, in 1614, fol. at Frankfort, in 1615, 4to. and at Geneva in 1655 and 1663, 4to. He did not live long after the completion of this work; for he died of a singular and painful disease of the bladder, of which his Theodore Maircer has given a particular account in his medical writings, in 1614, in the 55th year of his age. He was interred in Westminster Abbey, and a handsome monument was erected to his memory by Thomas Morton, bishop
of Durham. The laudatory epitaph, inscribed upon it, reads:

"Qui mole vult Cæsaranum,\nNon fundit, sed chartas legat,\nSuperfatas manum,\nEt profuturas polles."

Casaubon's character was that of a model, studious, upright man, though somewhat reticent and quiescent in his temper. As a critic, he is always ranked among the first, and his numerous publications, the principal of which we have recounted, afford sufficient evidence of his indefatigable industry and extensive erudition. Gen. Dict. Biog. Brit.

CASAUBON, Music, son of Isaac, the subject of the preceding article, was born at Geneva in 1599, and, accompanying his father to England, in 1610, finished his education at Chirill-church college, Oxford, where he took the degree of M.A. in 1621, and acquired the reputation of extensive learning. At the age of 23, he published a book, vindicating his father against the calumnies of the Roman Catholics, and entitled "Pietas contra maloedicis Patrii Nomini et Religionis Holi," 8vo. This was followed, three years after, viz. in 1624, by a second vindication of his father, "Vindicatio Patris adversus Impolones, &c." written by command of King James I. and occasioned by a publication of the same year, entitled, "The Original of Idolatries, or the Birth of Heresies, &c." falsely ascribed to I. Casaubon. About this time he was promoted to the rectory of Bleton in Somersetshire; and, in 1628, by the interceding and recommendation of Bishop Laud, he was made prebendary of Canterbury. This prelate, upon his own advancement to the see of Canterbury, gave Casaubon two vicarages in the Isle of Thanet; and, in 1636, he was created doctor in divinity by mandate of King Charles I.; but, during the heat of the civil wars, about the year 1644, he was deprived of his preferments, fined, imprisoned, and reduced to extreme indigence. In these circumstances he declined accepting some advantageous offers that were made him in 1649, on condition of his undertaking to write the history of the late war; and he also rejected an invitation that was conveyed to him soon after by the Swedish ambassador from queen Christina, to superintend the universities in her kingdom. On the restoration he recovered his preferments, and, in 1662, exchanged one of his vicarages for the rectory of Eekmam near Canterbury. He died in 1671, and was buried in the cathedral of that city. His literary character was that of a general scholar, but by the aid of his father's rules and papers more skilful in criticism than in any other department of literature. In private life he was distinguished by his piety and charity, and by the courteousness of his disposition and manners. Of his publications the principal are as follows: viz. "Opuscula Libri VII. de Scholasticae Dominantia," 1635, 8vo.; "A Treatise of Use and Custom," Lond. 1635, 8vo.; "The Life of Daily Public Prayers in Three Parts," Lond. 1634, 4to.; "Marci Antonini Imperat. de feipso et ad ejusdem, &c. with Xylander's Version, &c. &c." Lond. 1643, 8vo.; also, "An English Translation of this Work, with Notes, &c." 1634.; "De Verborum Ue, et accurate eorum Cognitionis Utissimae Dissertatio," Lond. 1647, 5vo.; "De quatuor Linguis Commentationes, Pars I." comprehending the Hebrew and Saxon, but left incomplete as to the Greek and Latin; Lond. 1672, 8vo.; "Terentiae, cum Notis T. Farinabili in quattuor priores comedias, et M. Caasab. in Pharnaceum et Hecyram," Lond. 1671, 12mo.; "Some Annotations on the Psalms and Proverbs," inserted in one of the latter editions of the "Afflictabi's Annotations on the Bible;"

In Hierochis Commentarium de Providentia et Fato, Note Vot. VI. of Emendationes," Lond. 1644, 8vo. and 1651, 4to.; "A Treatise concerning Entusiasms, as it is an effect of Nature, but is mistaken by many for either Divine Inspiration, or Diabolical Possession," Lond. 1655, 8vo.; a work highly commended by Sir William Temple, as a happy attempt to account for delusions upon natural principles, though it has been observed, that the author was too much inclined to credulity and superstition to discuss the subject philosophically, which appears from his "True and Faithful Relation of what passed for many years between Dr. John Dee and some Spirits," in the preface to which he attempts to confirm what is said in that relation concerning spirits, Lond. 1670, fol.; and also in his work "Of Credulity and Incredibility in Things Natural, Civil, and Divine; wherein the Sadducism of these Times in denying Spirits, Witcheries, and Supernatural Operations, is fully confuted," &c. Lond. 1698, 8vo. 1672, 8vo. 1672; "De Nupera Homeri Editori Commentario Langianno-Hastievi HACKNAM, &c." Lond. 1679, 8vo. reprinted in Almavovea's edition of Casaubon's letters; "Epistola Exceptionis et Cebetis Tabula, Gr. & Lat." Lond. 1679, 8vo.; "An English Translation of Lucius Florus's History of the Romans, with Notes," Lond. 1679, 4to.; "A Vindication of the Lord's Prayer, &c." Lond. 1660; "Note et Emendations in Doigenem Laertium, &c." annexed to the editions of Laertius, printed in Lond. 1664, fol. and Amt. 1692, 4to.; "Of the Needesse of Reformation in and befor Luther's Time, &c." Lond. 1664, 4to.; "Note in Pidemur," first printed in Graumvius's edition, Amtl. 1670, 8vo.; and "Epistle, Dedicationes, &c." annexed to I. Casaubon's letters by Molnover." Besides the works above recited, M. Casaubon wrote several other pieces, learned, controversial, &c. which it is needless to enumerate. He also left, by will, a great number of MSS. to the university of Oxford. His English style is harsh and perplexed, and much intermixed, according to the custom of the time, with Greek and Latin. Gen. Dict. Biog. Brit.

CASAVOLI, in Geography, a town of Naples, in the province of Bari; 14 miles S.W. of Monopoli.

CASKA, a town of Africa, in the kingdom of Tunis, which was once a Roman colony, is situated on a large, fertile plain, about 25 or 30 miles S. of Tunis. The walls of this town are still standing, though it has been almost destitute of inhabitants ever since it was destroyed by the Turks.

CASKIA, in Ancient Geography, a town of Asia Minor, in Lycaonia. Ptolemy.

CASBVIN, in Geography, a city of Peris, in the province of Irak Ageni, is situated in an extensive pleasant plain, about 3 leagues from the noted mountains of Alaved or Elwend. It was formerly a very considerable city, being about nine miles in circumference, and containing 12,000 houses, occupied by 100,000 inhabitants; but it has been so reduced by the civil wars of the country, that, in Hasaway's time, its civil and military towns did not exceed 1,100. Its beautiful palaces are now in ruins, its walls are destroyed, and it has neither garrison nor forts to defend it. The Hippodrome, or Royal Piazza, was 700 paces long, and 250 broad. Its situation for commerce in many respects, advantages, as it lies open to Georgi, Adarbeizan, and the Caspian sea. Its adjacent territory produces excellent grapes, some of which yield a strong wine, and others are dried, and sent with other fruits to all the provinces of the country. In its vicinity are found yellow orpine and copper ore. In the 18th century Shah Tahmas, unable to defend Tunis against the Turks, retired to Casbin, which he established as the capital city of his empire; but Abas the Great transferred this dignity to Isphahan. The European geographers allur...
that Caucas is the ancient Arfaria; but the Persian historians will not allow it to be so ancient. N. lat. 36° 3′. E. long. 49° 33′.

CASBUONA, a town of Naples, in the province of Calabria Citera; 5 miles W. of Strongoli.

CASCADE, the hindermost part of the breech of a cannon from the base-ring to the cap or extremity of the knob or button. See CANNON.

CASCADE, a deep fall of water, from a higher into a lower place.

The word is French, formed of the Italian cascata, which signifies the name of a cascade, or falls, and that from the Latin cadere.

Cascades are either natural, as that of Tivoli, &c. or artificial, as those of Verfallies, &c. and either falling with a gentle descent, as those of the Senaun; in form of a buffet, as at Trianon; or down steps, in form of a person, as at St. Clou; or from bason to bason, &c.

A natural cascade, falling with a great noise, is more properly called a cataract, which fee.

In a military sense cascade signifies, in hollowing out, or digging galleries or mines, a sinking down into the earth by a fort of rep below the common level, or a raising above the figure in like manner. When a miner rather sinks deeper into the ground or rises up higher by means of such repus at different distances, or turns, he is said to proceed by cascades, or to ennemen par cascades.

CASCADE of fire. See PYROTECHNY.

CASCADE point, in Geography, a cape on the western coast of New Zealand, in the South Pacific ocean. S. lat. 44° 5′. E. long. 159° 4′.

CASCAES, a sea port town of Portugal, on the N. side of the mouth of the Tagus, situated on a slip of land under which ships lie; 5 leagues W. of Lisbon. N. lat. 38° 44′. W. long. 9° 33′. Cape Cascas lies 2½ miles S.W. of the town.

CASCANS, in French corses, holes sunk in the ground in the form of pits or wells, near the ramparts, from which galleries are carried under ground, either to mines of your own, or to give vent to those of the enemy. Caercans also denote a kind of cellars made under the capitals of a fortification.

CASCANTE, in Geography, a small town of Spain in Navarre; 2 leagues from Tudela. Its ancient name was Caecanum, and it was a municipal town. Ptolomy attributes it to the Viscun. It was situated near the Iberus; S.E. of Calagris.

CASCARILLA, in Botany. See CROTON CAFOARILIA.

CASCARILLA, in the Materia Medica, is placed by Dr. Cullen in the class of terebinths. It approaches, he says, to the aromatic by its essential oil; but its bitter, to be extracted either by water or spirit, is its most considerable part. It was introduced in the 17th century as a medicine of great value, both in continued and intermittent fevers; and the Italians, fond of any thing as a substitute for the Peruvian bark, against which they had declaimed, employed the cascarilla in their practice and added many testimonies of its efficacy: but these testimonies have not been supported by succeeding practitioners, and in this country particularly it has been found a weak substitute for the Peruvian bark. In several trials it has entirely failed. Bergius, though he affirms its inefficacy in fevers, recommends it in hemoptysis. But Dr. Cullen observes, that in hemorrhages of all kinds it seems to be rather hurtful, as might be inferred from its aromatic and bitter qualities, while it does not in any instance manifest an astringent power. Its tonic and stimulative power may be allowed; but in these respects its virtues are not peculiar nor considerable: nor is there any just foundation for the prejudices which the German physicians have conceived in its favour. Cullen, Med. vol. II. p. 89. It has however, maintained its place in our Pharmacopoeia. The extract of cascarilla, prepared in the same manner with that of Cinchona (which fee), has been lately introduced into the London Dispensatory, as a medicine of considerable use, and serving as a tonic in dyspepsia, debility of bowels, and in some circumstances of epidemic fevers. It may be given from 10 to 20 grains, two or three times a day. The tincture of cascarilla, prepared by digesting four ounces of powdered cascarilla in two parts of proof spirit of wine with a gentle heat for eight days, and straining it, is given in debility of the stomach and bowels, and may be sublimated in some cases for the tincture of cinchona.

CASCE, CASCA, or CASCIE, in Ancient Geography, a town of Asia in Aria. Peloponnes.

CASCHARA, a town of Asia, in Mesopotamia, garnished by the Romans to guard their frontiers.

CASCAU, CASSCIA, KASSE, or KASSICHE, in Geography, the capital of Upper Hungary, a royal free town seated on the river Hernath, or Hundert, surrounded with a triple wall, a moat, and a bulwark, and furnished with a good arsenal. It is a well built place and the seat of a tribunal. The wine, beer, and ale of this town are very bad. In 1510 it was besieged in vain by the Poles. In 1535 king Sigismund besieged it by Bretagem, and in 1556, it was destroyed by fire. In 1614, its large and beautiful parish church was taken from the Lutherans, upon which, and in consequence of other oppressive measures, the Caeschians were so incensed that they took part with Stephen Bottfay, who died here in 1656. In 1661, it surrendered to Bethlem Gabor; in 1644, to George Rakotzy; in 1681 to Tokoly; and in 1685, to the Imperialists. Its university was suppressed in 1782. It is distant 100 miles S. from Cracow, and 124 N.W. from Claustenburg.

CASCHIVE, (Mormyrus Caschive), in Ichthyology, the name under which Haseliquint describes the Linnaean Mormyrus anguillitus, which fee.

CASCHOU, in Botany, Merian, Surin. See Anacardium occidentale.

CASCO-BAY, in Geography, a bay of North America, in the district of Maine, which spreads N.W. between Cape Elizabeth on the S.W. and Cape Small on the N.E. Within these points, which are about 45 miles apart, are about 300 small islands, some of which are inhabited, and almost all more or less cultivated. The land in these islands, and on the opposite coast on the main, is the belt for agriculture on the sea-coast of this country. Casco includes several bays. Mount Bay lies about 20 miles N. of Cape Elizabeth. On the E. side of this cape is the arm of the sea called Stroudwater. Farther to the E. is Presumpscot river, formerly called Pufumpac, or Pufumpkeag, which rises in Saco pond. This river opens to the waters of Casco-bay on the E. of Portland, and upon it are several valuable mills. Royal's river, called by the natives Weskecutego, falls into the bay six miles from Presumpscot river. It has a good harbour at its mouth for small vessels; and it has upon it several mills; but two miles higher a fall obstructs the navigation. Between it and Kennebeck there are no rivers: some creeks and harbours of Casco-bay extend into the main land, affording harbours for small vessels, and interfacing the country in various forms. N. lat. 43° 40′. W. long. 70° 10′.

CASCUMPAC Harbour lies on the North coast of the island of St. John in North America. N. lat. 46° 45′. W. long. 63° 53′.
CASE, sometimes denotes a vessel or receptacle in form of a tomb, commonly decorated with gold and silver, wherein the body of a saint, or some relics of it, are preserved.

In which sense, the word is formed from the French chasse. Originally these cafes were made in the figure of little Gothic churches, purportant to that ancient Christian maxim, that the saints, having been the living temple of the Holy Ghost, are entitled, after their death, to have their bones enclosed in the figure of the visible house of God.

The case of St. Genevieve is never brought down without great ceremony, nor except in time of extreme public dangers or calamities.

CASE, John, M. D., in Biography, was born at Woodflock, where he received the rudiments of his education. In 1561, he was elected scholar, and in consequence, master of arts, and one of the fellows of St. John's college, Oxford. Wood celebrates him for his skill in disputations, in which he is said to have excelled all his contemporaries. Marrying some time after, he was permitted by the chancellor to read lectures to the students, in logic and philosophy. He also wrote, for the use of his pupils, short treatises on Aristotle's organon, ethics, politics, economics, and physics. One of them, "Sphera Civitatis fve de Politia," printed in 1580, was pirated on the continent, and copies coming over, Barnes obtained an order, obliging every fellow in the university to take one of his books. In 1580, he was made doctor in medicine, and the same year, prebendary of North Anston, in the church of Surm. He was much respected, both as a physician, and teacher, and acquired, Wood says, a handsome fortune, the greater part of which he left at his death, (which happened on the 23d of January 1590,) to charitable uses. He was buried in the chapel of St. John's college, where a handsome monument was erected to his memory. Wood gives a catalogue of his productions, which are now little noticed. Athene Oxon.

CASE, John, M. D., Granger gives an account of this man. He was a noted astrologer in the time of queen Anne, and succeeded Lilly, who left him possession of his apparatus, particularly his darkened chamber, and pictures, with which he pretended to show his customers their absent friends. Case used to exhibit these to his intimates, in the hours of conviviality, laughing at the folly, and credulity of the people. Over his door was written:

Within this place
Lives Dr. Cafe;

by which delitich he probably got more than Dryden did by all his works. Haller also mentions a doctor John Cafe who published in 1694, "Compendium Anatomicum, nova methodo instructum," 12mo, in which the writer fluently defends the opinion of De Graaf, that quadrupeds, and all other animals, as well as birds, proceed ab ovo.

CASE, or Caso, in Ancient Geography, a small island situated S. W. of Carpathos, and N. E. of the isle of Crete.

CASE, in Grammar, is understood as all the different inflexions or terminations of nouns; serving to express the different states or relations they bear to each other, and to the things they represent. For the reason of the name, see Declension.

There is a great diversity among grammarians, with regard to the nature and number of cases; they generally find six cases even in most of the modern languages, which they call the Nominative, Genitive, Dative, Accusative, Vocative, and Ablativus; but this seems only in compliance with their own ideas, which are formed on the Greek or Latin, and which they transfer to other languages.

The truth is, if by case be only meant an occasional change in the termination of the noun, or name, which seems to be the just idea of case; there will, in this sense, be just as many cases as there are different terminations of nouns in the same number, i.e. in some languages more, in others less, and in others none at all.

Indeed, the generality of authors either have not any precise notion of cases at all, or they wander strangely from that notion: for they always reckon five cases of nouns in the Greek, and fix in the Latin: though several of these cases he frequently alike, as the genitive and dative singular of the first declension of the Latin; the dative and ablative plural of the second, &c. the genitive and dative dual of the Greek, &c. So that with these authors the termination is not the sole criterion of the case.

It seems, however, much more agreeable to the principles of grammar, which only confers words materially, to make as many different cases, as there are changes in the terminations of a name; which would free the English, and other modern tongues, from the embarrassments of cases; and of them expressing the various relations, not by changes in termination, as the ancients; but by the situation of the substantive, as in the nominative and accusative cases, or by the apposition of articles and prepositions. On this footing it is certainly wrong to say, v. g. that of a father, is the genitive case of father; and to a father, the dative; for in to are not part of the noun father; they are no places or terminations, but articles or modifiatives, which shew the different relation of the word father. And the same may be said of the cases of nouns, in the French, Italian, Spanish, Portuguese tongues, &c. Nevertheless, the relation of possession, which answers to the genitive case, is often expressed by a different termination of the substantive: "as God's grace," or, as it was formerly written, "Gods grace," the grace of God. So that the English substantives may be considered as having two terminations for cases; that of the nominative, and that of the genitive or possessive case. In this respect it bears some resemblance to the German, which is probably derived from the same Teutonic original. In the Greek and Latin languages, the words Gen and Patris are real cases of the words Genus, and Patruer, and different from those words; and somewhat like this may be said of the Hebrew, Arabic, Armenian, Polich, and German languages; which in the same number admit of changes in the terminations of words: and yet in these languages, cases are different from what they are in the Greek and Latin. The Hebrew names, for instance, are not properly declined by cases, and to be distinguished by any peculiar terminations; but they are determined principally by the construction and meaning of the sentence or discourse in which they occur, or by certain prepositions, or letters serving the purpose of prepositions, prefixed to the respective words, as in the following example:

| Nom. | Rex. |
| Gen. | Regs. |
| Dat. | Reg. |
| Accus. | Regem. |
| Vocat. | ò Rex. |
| Ablat. | à Reg. |

Hebrew nouns very frequently occur in the oblique cases, although they have no letter or particle denoting these cases; and the letters or particles which make particular cases are frequently connected with other cases. The article 'a which grammarians commonly specify as the mark of the genitive, is applied to all the other cases, and chiefly to the vocative. The relation expressed by the genitive case of nouns sometimes occasions an alteration in them; but this alteration, instead of being in the noun governed, as in other languages, occurs in the Hebrew in that which go

412

vortis,
The letter $ ב$, which is an abridgment of the prepositions $מ$, $ל$, or $ל$, generally denotes the dative, and not rarely the genitive, and it is also joined to the accusative, ablative, and even the nominative. The particle or preposition $ו$ or $ו$ is connected, not only with the accusative, but with the dative, ablative, and nominative; and the letter $ כ$, which is the preposition $כ$ abridged, is almost always joined to the ablative, and very rarely to other cases. For the changes that express Hebrew pronouns, see Pronouns.

The cases in the Chaldee language are determined in the same manner with those of the Hebrew; either by the sense of the passage in which words occur, or by prefixing the particles $ י$ or $ י$ to the genitive, $ ב$ to the dative, $ י$ or $ י$ to the accusative, and $ כ$ or $ כ$ to the ablative. The Syriac differs from the Chaldee only in two points, viz. that the mark of the accusative is $ ב$, and not $ י$, and that the note of the ablative is $ כ$, and not the abbreviation $ כ$. The cases in the Samaritan language are formed like those of the Chaldee, by prefixing $ ה$ to the genitive, $ ב$ to the dative, $ כ$ or $ כ$ to the accusative, and $ מ$ or $ מ$ to the ablative. See Macrill's Grammat. Heb.

An ingenious writer suggests that the Greek cafes are formed by certain syllables, which constitute no part of the primitive names of things, but were originally short words, having an independent meaning of their own, and retaining that meaning when joined to these names: thus $συαρα$, $ςαρα$, were originally $συαρα$, $ςαρα$, $ς$, and $ς$, being annexed to mark them as subjects or agents. In ascertaining the precise meaning of the prepositions $ἐν$, $ο$, which are the cognates of the Greek cafes, he intimates, that though the termination called the genitive cafe be rendered by $ ὦ$, it means invariably $ἐν$, $ο$, $ο$, and this appears to be the true signification of the term $ ὦ$, if we regard its etymology, which this author derives from $συα$, $ςαρα$, $ς$, $συαρα$, $ςαρα$, although custom seems to have assigned it a different undeniable meaning, it is in all cafes resolvable into the sense of $ ὦ$. Thus, $συαρα$ or $ςαρα$, being annexed to mark them as subjects or agents. In questioning the precise meaning of the prepositions $ἐν$, $ο$, it is clear, that the termination called the genitive cafe be rendered by $ ὥ$, for it is taken, as he supposes, from an oriental verb signifying to aim, pursue, or stretch after a thing, and hence denotes the thing or object aimed at. Into Greek the original verb has passed in the form of $ἐν$, $ο$; but in Persian, Latin, German, and Welsh, as in English, it has with little variation in found, and none in sense, migrated into a preposition. But $ἐν$ and $ο$, or if the terms are applied to moral actions, $μετα$ and $δειβο$, are often the same. Hence it is that the force of these two prepositions is expressed in Latin by the same termination, the dative or ablative cafe. Hence also, in all languages which admit of cafes, the dative, ablative, and genitive, have a near affinity to each other; and in Greek, the first language, as this writer imagines, in which the use of cafes was introduced, they were all three at first represented by one termination. Jones's Grammar of the Greek tongue p. 194.

Some writers, therefore, granted only the dative, ablative, and genitive, have a near affinity to each other; and in Greek, the first language, as this writer imagines, in which the use of cafes was introduced, they were all three at first represented by one termination. Jones's Grammar of the Greek tongue p. 194.

Some writers think, that the relations signified by the addition of articles and prepositions to the noun may properly be denominated cafes, in English; and that, admitting this principle, there are, in our language, as many cafes as in the Latin tongue. But Mr. Lindley Murray, in his "English Grammar," (p. 54. cd. 1.) observes, that to this mode of forming cafes for our substantives there are strong objections. If an arrangement of this nature were to be considered as constituting cafes, the English language would have a much greater number of cafes than the Greek and Latin tongues: for, as every preposition had its distinct meaning and effect, every combination of a preposition and article with the noun would form a different relation, and would constitute a distinct cafe. Thus our language would be incumbered with many new terms, and a heavy, as well as useless, load of distinctions. Mr. Murray is of opinion, that although this variety of cafes does not at all correspond with the idiom of our language, we may with great propriety admit a cafe in English substantives, which shall serve to denote the objects of active verbs or of prepositions; and which is, therefore, properly termed the objective cafe. He allows however, that the general idea of cafe has undoubtedly a reference to the termination of the noun; and yet there are many instances, both in Greek and Latin, in which the nominative and accusative cafes have precisely the same form, and are distinguished only by the relation they bear to other words in the sentence. Analogy, therefore, warrants our applying this principle to our own language, as far as utility, and the idiom of it, will admit. It is obvious, that in English, a noun governed by an active cafe, or a preposition, is very differently circumstanced, from a noun in the nominative, or in the possessive cafe; and that a comprehensive cafe, corresponding to that difference, must be useful and proper. The infinitives of part- phere, says this ingenious grammarian, and of showing the connection and dependence of words, will be most conveniently accomplished by the adoption of such cafes; and the irregularity of having our nouns sometimes placed in a ca-

Although it should be maintained, that many of the modern languages have not, strictly speaking, any cafes of nouns; yet most, if not all of them, have a kind of cafe in their pronouns, without which it would be hard to conceive the connection, or syntax of a discourse; and which, therefore, make a necessary part of grammar; e.g. in English I and me; and in French, je and me. See Pronouns. For the relation expressed by each cafe, and the mode of denoting them, see Nominative, Genitive, Dative, &c. &c.

Case, in Printing, a large flat, oblong frame, placed above, divided into several compartments, or little square cells; in each of which are lodged a number of types, or letters of the same kind; whence the compositor takes them out, each as he needs it, to compose, and make a page, or form. A frame of cafes, in printing, usually consists of two pairs, viz. an upper and lower, Roman and Italic. A shallow cafe shows the letter best, as being least shadowed by the sides of the boxes. A deep cafe has the advantage of holding a great number of letters, so that the compositor need not distribute so often.

They say, a cafe, or rather pair of cafes, of Greek, of Hebrew, of Pinx, &c.

Case of a filik worm, is a lodge framed within its web, wherein to deposit its cafe. Case is also used for a certain numerous quantity of divers things: a cafe of pilules implies a brace; a cafe of glafs, &c. see Glass.
CASE

Case is also used for a frame surrounding a door, window, or the like. In which case we lay a down or window-curtain, &c.

CASE, when open this, in Law. See ACTIONS.

CASE, spiculated, relates to a kind of special verdict, in which the jury find a verdict generally for the plaintiff, but facilitate exceptions to the opinion of the judge or the court above, on a special case, litigated by the counsel on both sides with regard to a matter of law. This has the advantage over a special verdict, of being attended with much less expense, and of obtaining a much more speedy decision; the point (which fee) being litigated in the hands of the officer of nisi prius, till the question is determined, and the verdict is then entered for the plaintiff, or defendant, as the case may happen.

CASE flotted out of Chancery, refers a question of law in the process of any cause referred by this court to the opinion of the judges of the court of King's Bench or Common Pleas; before whom it is heard, and who certify their opinion to the chancellor in order to a decree.

CASE-hardening, a method of preparing iron, so as to render its outer surface hard, and capable of retaining the file, or any edged tool. It is used by file-cutters for coarse files; by gunsmiths to harden the barrels of guns; and by others, on other occasions.

The process of case-hardening, which is no other than a superficial conversion of iron into steel, depends on the cementation of it with vegetable or animal coal. This treatment converts the external part into a coating of steel, which is usually very thin, because the time allowed for the cementation is much shorter than when the whole is intended to be made into steel. Immersion of the heated pieces into water hardens the surface, which is afterwards polished by the usual methods. Among the receipts given for this purpose are the following: cow's horn or hoof is to be baked, or thoroughly dried and pulverized, to this add an equal quantity of bay-felt; mix them with fine chamber leys, or white wine vinegar. Cover the iron with this mixture, and bed it in the same in loam, or inclose it in an iron box: lay it then on the heath of the forge to dry and harden: then put it in the fire, and blow till the lump have a red heat, and no higher, the mixture he burned much too. Take the iron out, and immerse it in water, to harden. See IRON and STEEL.

CASE-shot, are musquet-balls, flones, old pieces of iron, or the like, put up into cages, and so shot out of great guns.

Case-shot is chiefly used at sea, to clear the enemies' decks when they are full of men.

Gen. Ch. Cul. Perianth four or five-leafed, or four or five-cleft; leaves oblong, flat, coloured; widely spreading. Cor. none. Ned. four or five-leafed; leaflets oblong, obtuse, hirsute, rather erect, half the length of the flaments, and alternating with them. Stam. Filaments eight or ten, awl-shaped, rather erect; anthers oblong, incumbent. Pill. Germ roundish; style filiform, erect, the length of the flaments; stigma capitata, obtuse. Pet. Capule roundish, obtuse, crowned with the permanent base of the style, one-celled, conicoll, thick, trivalved. Seeds generally more than one, compressed, angular, fixed to the valves, immersed in a soft pulp.

Eff. Ch. Cul. four-cleft. Cor. none. Ned. four or five-leafed. Stamen alternate, with the leaflets of the corolla. Calyx barrel, trivalved, one-celled; seeds in a soft pulp.

Sp. 1. C. spinotha, Willd. 1. (C. aculeata; Jacq. Amer. 77. Samyda spinotha; Linn. Sp. Pl. 2. Swartz. Obs. p. 9. Proset Bede. 11.) Flowers obovatus; leaves egg-shaped, serrated, smooth; peduncles axillary, one-flowered; baccifera flowers. A shrub about three feet high. Branches numerous, diffuse, branched when young with a few dilated and broad leaves. Leaves one inch and half long, coriaceous. Flowers white, calyx slightly oblong, obtuse, filaments awl-shaped; anthers oblong. Fruit greenish, purple, mucronate at its summit. A native of St. Domingo. 2. Samyda nitida, Willd. 2. Jacq. Amer. 152. Affl. Herb. 8. p. 52. fig. 1. (Samyda crenata; Poiret Bede. 12.) Flowers obovatus; leaves egg-shaped, serrated, smooth; cymes axillary, peduncled. A shrub about fifteen feet high. Branches numerous, spreading. Leaves from an inch and half to four inches long, alternate, petiolate, very variable in size and form. Flowers small, whitish; leaves of the calyx oblong, Fruit roundish; pulp scarlet or purple. Seeds two, sometimes only one. A native of America in the neighborhood of Carthagena. Perfectly distinct from Samyda nitida. 3. C. bieta, Willd. 4. Swartz. Fl. Ind. Occid. 2. p. 756. (Samyda tomentosa; Swartz. Prod. 68. Poir. 12.) Flowers obovatus; leaves egg-shaped, serrated, rough with hairs underneath. A shrub from seven to eight feet high. Branches alternate, cylindrical, a little angular, pubescent. Leaves alternate, acute at the summit, a little narrowed at the base, nerves and veins, on very short petioles. Flowers axillary and lateral, fascicled, on short peduncles, with membranous scales at their base; calyx four-leaf; segments deeply divided, linear, lanceolate, obtuse, pubescent, whitish, green underneath, permanent, filaments straight, awl-shaped; anthers heart-shaped, erect, yellowish, style trigonous; stigma capitata, a little trifid. Fruit oblong, somewhat acuminate. A native of Jamaica. 4. C. parviflora, Willd. 5. (Samyda parviflora; Linn. Sp. Pl. 1. Poir. 12. 8. folis ovatis cum acuminis; Brown, Jam. 217. Arbor baccifera, &c. Sloane Jam. 157. hist. tab. 214. fig. 2.) "Flowers deciduous; leaves oblong, acuminate, slightly crenate, smooth on both sides, shining; peduncles crowded, axillary, one-flowered." A shrub. Branches diffuse, cylindrical, rather crooked, smooth, blackish brown, sometimes sprinkled with very small oval greyish or yellowish spots. Leaves about three inches long, an inch and half broad, alternate, thin, almost membranous, rather pale underneath; with a few lateral, simple, alternate nerves, and reticulated veins; on short petioles. Flowers whitish, axillary, solitary, or in small tufts; peduncles not less than half an inch long, simple, cylindrical, upright; calyx deeply five-cleft, smooth, ciliaceous. Fruit small, globular; pulp yellowish. A native of Cayenne. 5. C. parviflora, Willd. 6. Jacq. Amer. tab. 85. (Anavanga; Linn. Hist. Pl. 37. fig. 2. Samyda parviflora; Poir. 14.) "Flowers deciduous; leaves egg-shaped, acuminate, serrated, smooth; peduncles one-flowered; aggregate, lateral." A shrub about fifteen feet high. Stems erect. Branches diffuse, slender, long. Leaves alternate, about an inch long. Flowers not axillary; peduncles small; leaves of the calyx whitish, reflexed, egg-shaped, obtuse; filaments unequal, nearly as long as the calyx. A native of Martinique. 6. C. fylleiflora, Willd. 7. Swartz. Flor. Ind. Occid. 2. p. 752. (Samyda fylleiflora, Poir. 15.) "Flowers deciduous; leaves egg-shaped, acuminate, quite entire; branches rodd-like; peduncles axillary, crowded." A shrub. Stems smooth. Branches long, slender, loose, cylindrical. Leaves alternate, acuminate to a great length, thin, smooth on both sides, shining, veined, porous when held against the light, on short smooth petioles. Flowers twenty or thirty together; peduncles about three.
lines long; simple; furnished at their base with small, dry, imbricated scales; calyx very small, whitish; leaves oval, often pubescent; filaments the length of the calyx; anthers whitish, heart-shaped; gero ovate; style trigorne. Fruit about the size of a pepper-corn, redish. A native of Jamaica. 7. C. macrophylla, Willd. 8. Vahl. 9. vol. 2. p. 122. (Pitunja guianense; Blush. vol. 2. tab. 985. Samyda pittum; Poir. 16.) "Flowers decussate, somewhat tomentous; leaves elliptical, acuminate, slightly crenate. A shrub. Branches cylindrical, smooth, spotted. Leaves from six to eight inches long, more than three broad, petioled, alternate, firm, thick, coriaceous, sprinkled with pellucid dots, smooth on both sides, deep green above, paler and somewhat rufous beneath; marked with lateral, curved, deep brown nerves; and with transverse, fearlessly reticulated veins. Flowers in small axillary branches; peduncles short, simple; calyx small. Fruit about the size of a walnut. A native of Cayenne and many other parts of South America. 8. C. formulata, Willd. 9. Swartz. Flor. Ind. Occid. ii. p. 213. (Samyda ni-viana; Poir. 17.) "Flowers deciduous; leaves ovate-lanceolate, fliglty ferrat; little branches zig-zag; peduncules axillary, crowded. A shrub. Branches smooth, cylindrical, long, covered with a cinereous bark; ramifications scattered, almost filiform, fritated. Leaves an inch and half long, alternate, a little acuminate, smooth on both sides, bright green above, revved and veined, on short petioles. Flowers whitish, very small, axillary, ten or twelve in a bunch; peduncles about a line long, furnished at their base with small membranous scales; calyx-leaves oval, concave, ciliate; filaments very short; anthers ovate-heart-shaped; style awl-shaped; stigma obtuse. A native of the island of Nevis. 9. C. hirsuta, Willd. 12. Swartz. Flor. Ind. Occid. ii. p. 215. (Samyda hirsutra; Poir. 18.) "Flowers decussate; leaves egg-shaped, acuminate, tooth-ferrat; hairy, villous underneath; peduncles lateral, crowded." A shrub. Stems woody. Branches cylindrical, flexible, pubescent. Leaves large, alternate, petioled, soft. Flowers in small lateral branches, not axillary; calyx-leaves ovate-lanceolate, whitish, pubescent, a little villose; filaments straight, awl-shaped; anthers oval; style trigone, the length of the filaments. Fruit oval, trigonous. A native of Jamaica and Hispaniola. 10. C. viridiflora. (Samyda viridiflora; Poir. Encycl. 17.) "Leaves ovate-elliptical, smooth, somewhat coriaceous; flowers nearly fife, axillary, falciculated." A shrub. Branches smooth, cylindrical, long. Leaves from four to five inches long, two and a half broad, alternate, membranous, glaucescent green, inclining to yellowish, nearly entire, with lateral nerves and reticulated veins, on short petioles. Flowers pubescent, greenish, short, with five ovate, rather obtuse segments. A native of the East Indies, described from a dried specimen in the herbarium of La Marck.

CASEARIA versicolor, Willd. 3. See Atheros gua-nenfis. Willdenow is right in his arrangement. This plant is properly a caferia; and the genus athenum of Schereber, (Truncana of Aubelet,) ought to be abolished. The number of flaments, it is now allowed, cannot determine a generic character. C. elliptica and ovata, Willd. 9. 10. See Ana-vina lanceolata and ovata.

Profess Martyn has omitted all our species, having inadvertently referred from caferia to samyda, and from samyda back again to caferia.

Poiret has united caferia to samyda, and observes, that these two, anavinga and aquaria, are all nearly allied, agreeing with each other in the infection of the flaments into a particular body, attached to the inner part of the calyx near its base; and differing only in the manner of their infection, and in the number of the valves and cells of the capsule. The rim into which the flaments are inserted, and which has been usually called a nectary, he thinks is properly a monopetalous corolla, adnate with the calyx, and toothed or divided almost to its base. Into this corolla the flaments are inserted, either alone, or in anavining, aquarian, and the original caferia, or adnating, through their whole length, to its teeth, as in the original samyda, and then giving the answers the appearance of being felix. Considered in this point of view, they would form one well-marked genus, having for its essential character "a very short, monopetalous corolla, with the flaments inserted into its tube." It is sufficiently evident from the description of the species of caferia given above, that a monopetalous or polyphalian calyx can by no means be admitted as generic distinctions. Such an union would, in our judgment, be a real improvement to science, as it would render our ideas of the subject more compact and not less distinct. Though the species at present known are not very numerous, they might be conveniently thrown into separate families, nearly corresponding with the present genera. There is not one species now constituting the whole of the genus aquarian, that would differ from its congeners on account of its two-celled, two-valved capsule. See Poirert in Ency. Method. vol. vi. p. 82.

CASEI DI CAVALLI, the name of a peculiar cheese, famous in Italy, and many other places, and made of the milk of the female buffalo, that species being as commonly tamed and kept there as the ox and heifer with us.

CASEL, John, in Biography, a learned German, was born at Gottingen in 1533; and having studied in several universities, travelled to Italy, and was made doctor of laws at Pisa. In 1553 he became professor of philosophy and eloquence at Rollock, and afterwards at Helmstadt, where he died in 1613. He excelled in his knowledge of the Greek fathers; and he warmly opposed Daniel Hoffman and others, who maintained that philosophy is adverse to theology, and that many things are true in the latter which are false in the former. He carried on a correspondence with some of the most eminent scholars of his age; and left many works, both Greek and Latin, in verse and prose. A collection of his letters was printed at Frankfurt in 1687, 8vo. Moreto.

CASELLA. We used to imagine that this was only a poetical character in the Purgatorio of Dante; but as his commentators call him an ancient Italian musician and composer, he must not be passed without a salutation; particularly as his existence has been acknowledged by Lucio da Figoli, who flourished in 1360, and in a note to one of his madrigals, prefixed in the Vatican library, which says, Caila dize il fiore, "this madrigal was set to music by Casella." There is something in the description of this imaginary correspondent which flatters and affections, that I cannot help wishing to convey an idea of it to my English reader. Dante, after visiting the infernal regions with Virgil, is conducted by the same poet into purgatory; where, soon after his arrival, he saw a veil spread over the shore laden with departed souls, under the conduct of an angel, who brought them thither to be cleansed from their sins, and rendered fit for Paradise: as soon as they were disembarked, says the poet, "they began like beings landed on a foreign shore, to look around them:"

"On me when first these spirits fix their eyes,
They all regard me with a wild sur prise,
Almof forgetting that their firm require
The purging remedy of penal fire:"

When
When one of these advance'd with eager pace, 
And open arm, as me he would embrace; 
At sight of which I found myself impell'd 
To imitate each gesture he beheld. 
But vain, alas! was every effort made, 
My disappointed arms embrace a shade: 
Three did vanity my graceclude, 
Yet fill the friendly phantom I pursued. 
My wild astonishment with smiling grace 
The spectre saw, and chide my fruit's chance. 
The voice and form now known, my fear subsided, 
O flay, cried I, one moment with thy friend! 
No suit of mine is vain, the vision found, 
I love thee living, and I love thee dead. 
But whence this halfe—not long allow'd to flay, 
Back to the world thy Dante takes his way— 
Yet let this fleeting hour one boon obtain, 
If no new laws thy tuneful pow'r's restrain, 
Some long predominant o'er grief and woe, 
As once thou forg'd above, now flog below; 
So shall my foul, releas'd from dire difmay, 
O'ertake the horrors of this dreadful way. 
Caffella kindly degird his voice to raife, 
And fang how Love the human bofom awakes, 
In brains to exquisitely fweet and clear, 
The found fill vibrate on my ravip'd ear; 
The shadowy troops, extatic, lifting round, 
Forgot the past and future in the found."

Cafella, Itali. a small house, but in Myfie it implies a 
lar, a compartment, containing fuch a portion of notes as 
the character or characters for time direct at the begining of a movement. See Time, Bar, Measure. 

CASELLE, in Geography, a town of Italy, in the 
principalty of Piedmont, on a small river which runs into the 
Stura; 6 miles N. of Turin. 

CASEMATE, or CAFEIMENT, in Architecture, the 
name with casement, denotes a hollow moulding, which 
some architects make one-fifth of a circle, and others one-
fourth. 

CASEMATE, from the Spanifh word cofaminata, or from the 
Italian word cofaminata, in Military Language, a low, 
covered, or concealed house. A cafeinate may in general be 
defined to be a subterraneous or covered arched work. Cafe-
mates are made in garrison'd places, in order to place the 
troops of the garrifions, when off duty from, under, from 
shells, &c. They are alfo made sometimes under different 
parts of the rampart of a place with embrafures, for cannons, 
or loop holes for musquetry. 

This name is alfo given to subterraneous or covered arched 
works, on that part of either flank of a baftion, which is 
next to the adjoining cafeine made there for placing some 
guns in, to defend the paffage of the moat or ditch, the face 
of the oppofite baftion, and the approaches to any breach 
that may be made in it. That part of the flank is taken 
inwards towards the capital of the baftion, that it may be 
covered from the enemy's or foe's fire, by the remaining 
part of it, which, when rounded, is called a round orifil, 
but when let without being rounded, is called a square 
orifion. The part of the flank thus taken inwards is there-
fore called the retired or covered flank, as alfo cafeimate and 
place baflhe; and the side of it next to the curtain is generally 
in the continuation of the line of defence, which part of the 
said line is called the retirade, or retracment of the flank, or 
the continuation of the cafeinate. The vauts or cafeimates in 
this retired flank have commonly the foles or bottoms of their 
embrafures a little above the terre plain or level of the 
place or country, in order that the guns in them may fire 
over the parapet of the faflie brawe, in the ditch before it, if 
there be any. 

Cafeinated flanks are rarely made ufe of at prefent, 
because the enemy's batteries can generally bury the ca-
non contained in them under the rubbifh and ruins of their 
vaults, and because the baffle, with which they are always in 
a short time filled, renders them imprefant to thofe who 
fire the guns, notwithstanding all the flues, vents, or air-
holes that can be made in them. Besides these inconve-
niences, muflinery, if they be exposed to its fire, will, within 
a certain diftance, when properly made ufe of, always 
flame cannon, whether they be in cafeimates or not. 
Engineers, therefore, at prefent commonly make their re-
tired flanks open at top, and call them low flanks, or plaque 
bar. 

A low flank ought to have a horizontal depth or thicknefs 
of at lead 16 yards; to wit, 3 for its parapet, and 5 for its 
terre-plains, or rampart behind the parapet, and if there be 
two of them, they ought together to have a breadth or 
thicknefs of at lead 32 yards. 

Low flanks have feveral disadvantages. If there be more 
than one of them in the fame flank, they cannot well be 
made ufe of at once on account of the flame and flashing 
of the powder and the rubbifh that is constantly tumbling down 
from one of them into another. They become almoft ule-
less when the ravine is once taken, by reafon of the com-
mand it has over them, unless they be remarkably well 
covered by the orifions. And the rubbifh which falls down 
from the higher flanks upon the lower, forms a gentle flope 
for the enemy to mount on to the affault. The left low 
flanks, perhaps, are the tenailles, or thofe parts of the 
small brawe of the ditch, that are in front of or oppofite to 
the flanks, and diftant from them reffpectively from 20 to 24 
yards. 

The chevalier Antoine de Veille, in speaking of the inconve-
niences and uiltility of cafeinated low flanks, exprefsed 
his sentiments thereon in the following words: "Autrefois 
on faifoit aux flanes des voutes ou on mettoit le canon tout 
couvert, et par deffus ils en faiifoient d'autres pour mettre 
d'autres canons; mais cela n'est plus en ufage, à cause des grandes incommodez, qu'ont à veu arriver en ces places. 
Car aprés qu'on avoit tiré, la fumée remplifoit de telle façon 
ces voutes, qu'il estoit impoffible d'y demener dedans, ni rien 
voir pour recharger, quelques foupiraux qu'on y peut faire, 
oultre que l'etonnement du canon'ébranloit tout; et l'ennemy 
tirant dans ces voutes bafles, les eclats et debris bleftoient et 
touchoient ceux, qui eloient dedans, et en peu de coups les 
eloient en ruine. C'est pourquoi on a laiffé ces voutes et on 
fait les places bafles découvertes. Et pour avoir deux places 
on fait le premier plus baffe un peu par deffus les parapets 
de faflie-barmes, s'il y en a. Les merlons quand a leur face 
sont du tiers du flanc, ou de la morte, comme nous vous dirons. 
Lieu profond en dedans et de quatrejeps, qui font pour les 
merlons, fix pas pour le dedans a mettre les canons, et trois 
pour les voutes lorsqu'on les met en ce lieu. La place baffe 
doit aller en clargifant du cote de la courtine afin que le 
canon, qui eft là, puisse etre pointe vers la contre-
ecarpe. 

Du cote de la courtine doit être l'entree ou voute, qui doit 
commencer au dedans de la ville, passant par defous le ramp 
part de largneur et hauteur suffisante pour pouvoir mener par 
la le canon et munitions." 

CASEMENT, is used in building for a little moveable 
window, usually within a larger, being made to open or turn 
on hinges. We say, a single cafeament, a folding cafeament, a 
cafeament.
CASFONMENT with a lock, with a turn-about, or turn-buckle, a
cafemint with a cock-pour or pull-back at the hind-side,
wherewith to draw it to.

CASENA, or CASSena, in Geography. See Kasa-

CASENDORF, a town of Germany, in the circle of Franconia, and principality of Cuimbach; 7 miles S.W. of
Cuimbach.

CASEM, a tow of Perfa, in the province of Iraq; 160
miles E. of Hufan.

CASEOUS, something that partakes of the nature or
qualities of cheese, which see.

CASERNS, in French caserne, in Military Language,
are, briefly speaking, small houses built along by the ramp-
part of a fortified place, for lodging the folders of the gar-
ron, in order to render them as little troublesome as possible
to the inhabitants. Each casern or barracks for the infantry has gen-

eral, in Germany, four beds for six soldiers, three and three. One-half of
these mounts guard whilst the others remain there to secure
that quarter. And each casern for the cavalry commonly
holds four horsemen. But neither these nor any other ca-
ferns that are erected, either adjoining the rampart or
partly connectd therewith, are carried along any other
parts of it then those that are behind the curtains, or lie be-
tween the batallions, across the gorges of which they seldom
or ever extend.

Cafemint signifies not only such small houses as we have just
been speaking of, but also any buildings or edifices, however
large or extensive, erected, and designed for the reception and
accommodation of troops. In a city of war, or fortified
place, they are commonly constructed between the rampart and the houses of the town or city, as being there most
convenient for guarding against and preventing surprisals. The
caserns or barracks for the infantry should be kept separate
from those of the cavalry and dragoons, as they are at Nimes
and several other places in France; and the list of these
ought to be placed as near as possible to convenient or com-
modious watering-places for horses. In France, and some
other countries on the continent of Europe, these buildings
have generally been erected in large towns and cities at the
expense of the inhabitants, and in small ones at that of the
state. But in this country the expenditure on all such erec-
tions is defrayed by the public. They should as much as
is possible, when it can conveniently be done, be placed to-
wards the east, on account of the air. When there is ground
enough for the purpose, it is of advantage to include with
them a square or rectangular space, sufficiently large, not
only for parading, but also for exercising the troops. The
folders are then easily confined to their quarters, and

kept out of the way of quarrels, riots, and mischief. They
are more obiservant of order and regularity, being imme-
diately under the eyes of their officers, than they are when
distributed among the houses of the inhabitants. And as
they then are, as it were, in one body, and the rooms they
are lodged in are contiguous to one another, and not far
from the apartments of their officers, orders can be executed with
more dispatch and privacy than when they are either
dowered in separate or detached places, or are billeted and
disperses among the citizens. In time of war, or
during a siege, many inconveniences may arise from having
the folders scattered about in the houses of the inhabitants of
a fortified town or city, instead of having them collected
together in the body or in a few separate and distinct bodies,
under the inspection at all times of their officers. In case of
any alarms happening, the governor or commandant of the
place cannot afford the garrison without a good deal of
trouble and a considerable loss of time. Should he wish to
send a party or corps out of it either in fortes or other duty,
he cannot do it without the knowledge of the whole town
or city. Such a dispersion of troops tends to render them
disorder, diffluent, and negligent of discipline; whereas
the keeping of them together in barracks or cafemint, contributes
much towards the observance and maintenance of it.

Cafemint or barracks are built and constructed differently,
according to the situations on which they are placed. When
the ground will admit of it, as we have already observed, it
is advantageous to enclose with the buildings a square or
rectangular space, yard, court, or area sufficiently large for
not only parading the troops, but also for all the exercises
of detail, and that too for either infantry or cavalry, who ought to
be kept separate. For a large court or area is necessary
for the one as well as for the other. In such buildings gal-

deries should be carried along their whole extent, to furnish
an easy communication between the different rooms or cham-
bers. When they are erected for cavalry, the men ought to
be lodged immediately over the stables for their horses.

When barracks are built along by the rampart opposite to
the curtains, as Marshal Vauban has practiced in a good many
places, they are generally composed of large bodies of
buildings for the troops to lodge in, and at the end or ex-

tremities of them are barracks or pavilions erected for the
officers. These barracks or cafemints are commonly two
stories high, independent of the ground floor or stock; and
sometimes three.

In every body of double barracks, there are, for the most
part, on each story four rooms, each two of which answer to
the fair-cafe next to it. Every room ought to be at least
22 feet long and 18 feet wide, which is a size sufficient for
four beds. Those on the ground floor should be not less
than 12 feet high, those in the next story 12, and those
in the upper story should be at least 8 feet high. The
doors ought to be 6 feet 4 inches high, and 3 feet at the
bald.

And whether they be built with bricks or stones, the walls ought to be two feet thick or upwards. A fort of
casern is sometimes made in the walls, at the upper part of
each story, which is useful in helping to preserve the faces
and outsides of them, by preventing water or moisture from
running or trickling down them. In the barracks at
Woolwich the rooms are too small, being each of them
only 16 feet square. There has been no general rule, in-
deed, either established or observed in this country for such
buildings, and the sizes of the rooms or apartments in
them.

Though barracks or casemint of any form or description
are seldom or ever erected along by those parts of the ramp-
part, where the flanks and faces of the batals are, as
they are along by those that lie between the batals, yet
when these works are empty, instead of being as they gen-

erally are, especially of those of them as are not likely to form
part of any front, that may be attacked by a besieging en-
emy, it may not only be advisable, but extremely useful,
to erect barracks, or cafemint, opposite to their gorges, and
at some little distance from the same, converting the interior
areas or parts of them into gardens to be cultivated by
the troops inhabiting these buildings. These would furnish
them not only with a considerable proportion of their nour-
ishment, but also with proper and useful exercise, and
agreeable walks, without following worthless strolling in any
way, or manner whatsoever. The strength or defence of the
place. In fortified towns or cities, however, with enclo-
sures of considerable extent, and large garrisons, the bar-

acks,
racks, or cafeneas, are generally erected along by the works in different places separate and distant from one another, but with easy and speedy communications, there being seldom more such buildings in one of those places than what are sufficient for lodging two battalions. In consequnce of this precaution, arrangement, and distribution of their garrisons, those entrusted with their defence are less apprehensive of being surprised than they otherwise would be, as the different parts of the works are thereby equally guarded and defended. Such an arrangement, however, is not always made or observed in fortified places. For barracks, that have been formerly erected without any regard to such a distribution, are commonly repaired as long as they are capable of receiving repairs, or being rendered useful. And in Roman Catholic countries old religious edifices and buildings originally erected for pious purposes, which for the most part are agreeably and elegantly fitted, are frequently converted into barracks if they happen to be near the gates or principal works.

While the feudal system existed, and chivalry was in repute, the militia, which was supplied in every state or country where it prevailed, formed all the troops that either the barons made use of in their feuds and contentions, or sovereigns employed in the forcible assertion of their claims and pretensions. During the prevalence of that system there was no standing army or regular military establishment either in this country or on the continent of Europe. And as such forces were seldom assembled or brought together but on the spur of the occasion, or at the moment, when they were going to attack, repulse, or engage their enemies; as they very rarely took the field but in mild and favourable weather and were generally dismissed, before the setting in of winter or the rainy season to return to their respective homes and places of ordnary abode, it was not necessary to erect barracks for them to lodge in. As the strength of that system became somewhat broken, and the rigour of it began to decline in the time of Charles VII. of France and his contemporaries, he and some others of them, instructed by experience and influenced by mutual example, began the practice of keeping bodies of troops constantly on foot and in pay. From this originated the necessity of considering the belt and most advantageous manner of providing habitations or lodgings for them. But as the military establishments under these princes and their successors were but small, even in time of war, and very trifling during peace, the difficulty of procuring lodgings for them was not great. At present, however, when such establishments are much increased and augmented, the belt manner of lodging them, either in garrisons and along the frontiers, or in the interior parts of a country, becomes a matter of serious concern to the prince or state.

When troops are to remain for a considerable time in one place there are four different ways, in which they may be lodged or disposed of, namely, in tents, in huts, in barracks, or in the houses of the inhabitants. To make soldiers live constantly either in tents or huts would be precariously and absurd, as it would operate injuriously to their health and fitness for service when necessary, subjects them to unnecessary hardships and inconveniences, without any favoring or diminution of expense to the nation to which they belong. No question then on this subject remains but between the propriety of keeping them in barracks or the distributing of them among the houses of individuals.

As a soldier is a man, and ought to be regarded as a citizen or member of the community in every country, but more especially in a free one like Great Britain; and is moreover entrusted with the defence of our persons and property, some attention should be paid to his comfort and convenience. To preserve, however, public tranquillity during peace, particularly in a nation under an arbitrary or monarchical government, and enforce fidelity to its operations in time of war, soldiers should be subjected to an exact and a rigorous discipline; for the due observance of which they ought to be so disposed of as to be frequently visited and looked at without much trouble or difficulty, to be easily assembled, to have their conduct liable to constant notice and inspection, to have their mode of eating and living daily and properly attended to, and to be able to execute with promptitude and expedition the orders that may be given to them from time to time. But strict attention to these essential circumstances is in a great measure incompatible with their being scattered or dispersed over the whole of a large town or city. For it must certainly be allowed that such a dispersion of them has a great tendency to weaken and destroy discipline, to render them restless and dissolute, and to create in them a dislike of order and subordination, and a strong inclination for indolence, softness, and ease. In despotic countries, or where mercenaries are partly employed, it is not only destructive of discipline, but extremely dangerous. It is, therefore, a natural and invariable maxim of such governments to keep their troops as separate and distinct as possible from the rest of their subjects, to inspire them with views and sentiments repugnant to theirs and incompatible with civil liberty, and to make them believe, that their interests are not only different from, but opposite to those of the people; as their despotic mandates, oppressive impositions, and arbitrary regulations must be enforced when necessary by the soldiers, and the people must be rendered sullen and obedient to them by the terrors of military execution. In this free country, however, things of this kind ought to be guarded against with the utmost caution and circumspection. Special care should be taken to prevent the soldiers from forgetting that they are citizens, or from supposing that their interests are in any way distinct from or inconsistent with those of their fellow subjects. It ought to be inculcated into their minds, that they are serving and are to fight, not only for their king, but also for themselves, and for their country, her constitution, her liberties, and her laws. An intercourse between them and the people, instead of being prevented or disconcerted, should not only be permitted but countenanced. And they ought never to be confined to barracks to the prevention of such an intercourse, but in certain circumstances, and on certain occasions. Our learned commentator on the laws of England, in expressing his sentiments on this subject, makes use of the following words. "Nothing ought to be more guarded against in a free state than making the military power, when such a one is necessary to be kept on foot, a body too distinct from the people. Like ours, therefore, it should wholly be composed of natural subjects; it ought to be enlisted for a short and limited time; the soldiers also should live intermixed with the people; no separate camp, no barracks, no inland fortresses should be allowed. And perhaps it might be still better, if, by diminishing a rated number, and enlisting others at every renewal of their term, a circulation could be kept up between the army and the people, and the citizen and the soldier be more intimately connected together." Blackstone's Commentaries, book i, page 113. See Army.

In attempting any reformation or improvement of our military establishments we ought never to forget, that Great Britain is an island, and rests not principally on her troops for her defence, that we have seldom or ever any necessary occasion for employing them on the continent, and that it is therefore proper to extend and abridge in thinking of affording our military system
in every respect to those of the other nations of Europe, which have no other security, protection, or defence. The maxims, that those employed as the defenders of this island should think of nothing but their misfortunes, that they should be rendered a sort of mere machines at the will of undergoing even a degradation of intellect, and that they will not fight better in defence of it for having flaves in it to lose, are not only ridiculous, but truly abominable. Were not the nobility, the most glorious and most successful struggles in support of freedom and independence, that are recorded in the annals of mankind, made by states who did not even enjoy the immense advantages of our insular situation, who had no separate military establishments, whole troops were their citizens, who after the emergencies that called for their services and exertions were paid, returned to their various occupations in society, and to the peaceful pursuits of life? And were not the troops of that people who conquered the world, composed entirely of citizens, who after performing the services they were employed on, returned to mix with the rest of the community? As to the idea of these united islands having a regular standing military force sufficient for enabling us to restore the continent of Europe to an equilibrium, or to perpetrate to the different powers in it their relative degrees of strength and territory, it is too extravagant to be entertained by any but the most visionary and wildest of men, who, cherishing such chimeras, lose sight, not only of the constitution of this country, but of every principle and consideration that ought to govern their deliberations respecting her welfare, security and defence.

We will not, like the learned judge, go so far as to assert, that no barracks ought to be allowed. For within works and fortified places, such as Portsmouth and Plymouth, if the latter, indeed, deserves the appellation, they may be proper, allowable, and necessary. But out of such places they ought not, on any account or pretext whatsoever, to be tolerated to any great extent.

In this country there never has been any certain or established rule for the building of barracks, and the relative dimensions of their several component parts. But in France, which has always been a kind of arbitrary government, and is at present a peculiar species of military despotism, ordinances for that purpose were made from time to time. Even in that country, however, such regulations have not been at all times rigidly observed or extended to

CASELLA. In Geography, a city of Naples, in the country of Lavora, about 16 miles from the capital, situated at the foot of a lofty ridge of hills and irregularly built. This place is famous for the magnificent palace caused to be erected by Charles III. of Spain, according to the designs of Vanvitelli, and furnishing in size and solidity almost every royal edifice in Europe. The vast dimensions of its apartments, the bold span of their ceilings, the excellence and beauty of the materials employed in building and decorating it, and the strength of the masonry, claim the admiration of all beholders, who must confess it to be a dwelling spacious and grand enough to have lodged the ancient masters of the Roman world. The two principal fronts are 787 feet in length, and contain five stories of 37 windows each. The two other sides are 616 feet long, and consist also of five stories, in each of which are 27 windows. The interior is divided into four courts, and in the centre of the palace is a superb hall-cafe, crowned by a circular hall which affords a communication to every part of the apartments. The richest marbles are displayed with profusion, most of them being dug out of quarries within the realm. The chapel is inlaid with panes of yellow marble. The theatre is a master-piece of art; antique columns of alabaster support the roof and divide the house into 42 boxes richly decorated, and so arranged as to set off both actors and spectators to the best advantage. The gardens are very extensive, but formed with wide sultry alleys and crowded rows of statues. A broad canal intersects the garden and paffes to the hills at the distance of nine miles from the city, where it collects, for the supply of the palace, the freams that in ancient times were conveyed to Capua; and ifhe are conftituted to one regular channel, and conducted by an easy fall along the faufonities of several vallies. The depth of one hollow, and the height of the opposite ridge of hills, made it neceffary to build an aqueduct across for their conveyance. This aqueduct, distant 6 miles from the city, about two miles in length, and proportionately broad, is an edifice of three stories of arcades, of which the upper one is divided into 43 arches, the lower ones, on account of the declivity of the hills and contraction of the valley, consist of fewer. From hence the waters are carried in a channel to the cascade near the royal gardens, and falls under the city. The pavement of this aqueduct is formed of calcareous stone, with which the neighbouring mountains abound; and the remainder of the edifice is constructed with volcanic tufa, in which are intermixed some pieces of enamel. Sir William Hamilton informs us, that in the environs of Capua, below a stratum of vegetable earth four or five feet in thickness, we meet with cinders, pumices, and fragments of lava; and that in digging near the foundation of the aqueduct volcanic earths are discovered. Spallanzani (see his Travels, vol. i.), on examining the adjacent country, found that it was wholly calcareous, not excepting the highest mountains, almost all of which are of the same consistence and colour with the chains of hills between Naples and Loretto. This place was at first a hamlet, built by some families that escaped from the ruins of Capua; and from the weakness of its situation it was called Casaerta, or clumsy house. It now feems, says Swinburn (Travels in the Two Sicilies, vol. iii.), very likely to relapse into its pristine state by the emigration of its inhabitants, drawn into the plain by the conveniences of the new city and the charms of its court. The monarchs of the country have lately expended large sums in embellishing the environs of Caperta, in planting groves, and building places of rendezvous for hunting. Nat. 41° 50'. F. long. 6° 5'.

CASES referred to the Romish Policy, are considerable sums, the abolition of which is referred by the superiors to themselves, or their vicars.

There are some cases referred by the pope, and others by the bishops; in convents some are referred by the chapter, &c. None but these, or their vicars, can absolve in such cases; except at the article of death, when all referred cases are abatable, by the ordinary.

CASH, in Commerce, theflock or ready money, which a merchant, or other person, has in his present disposal, to negotiate; so called from the French term, caif, i.e. chef, or coffier, for the keeping of money. M. Savary tefts, that the management of the cash of a company is the most considerable article; and that whereron its good or ill success chiefly depends.

CASH BOOK. See Book.

CASHAN, in Geography, a populous and wealthy city of Persia, in the province of Irak-agami; situated about 98 miles N. of Ifpanah, in a large plain near a high mountain, which being opposed to the south is so much affected by the reverberation of the sun's rays in summer as to be intolerably hot. The bazaars and baths of this place are elegant structures, and the royal inn founded by Abbas the Great, in the suburbs, is the fairest in all Persia. Adjoining to it stands the royal palace,
CASH, a city and port town of the county of Tipperary, Ireland, situated about three miles east of the river Suir. It was anciently a place of great importance and the residence of the kings of Munster, who are supposed to have had a house of florne on the rock in the 15th century. Cormac Mac Cullinan in particular, who was at the same time prince and bishop of Cashel, resided here at the beginning of the 10th century. In 1172 Henry II. of England visited this town, in which he received the homage of Donald O'Brien, king of Limerick, and held a synod by which the supreme lordship of Ireland was confirmed to him, and some ecclesiastical regulations were adopted.

Cashel was surrounded by a wall which, though now moulderimg, seems, from two gates of tolerable workmanship yet remaining, to have been of better materials than the generality of such enclosures. But its ecclesiastical ruins are those for which Cashel is chiefly distinguished. The chief of these are on the celebrated rock of Cashel, which is seen at a great distance and in many directions, and which of course has a very extensive prospect.

The old cathedral appears to have been a large as well as handsome Gothic structure, the dimension of the nave and choir from east to west being about 200 feet. Some have supposed that it was the first florne building in Ireland, but this appears to be a mere conjecture. Donald, brother of Morrough, king of Munster, about 1080, is generally recorded as the founder of it, and his grant of lands was confirmed by king John, as appears from an old statute. Sir James Ware, however, was of opinion that it was not built till about the time of the arrival of the English under Henry II, perhaps supposing with that prejudice which blinds many writers, that the Irish were incapable of raising such a structure.

Cormac's chapel, the ruins of which join the cathedral, and which is 50 feet by 18, is a very curious structure of a style of architecture totally different from that of the cathedral, and supposed to have been built by Cormac, about 902, which would be near two centuries earlier. There is also on the rock near the east angle of the north aisle, a lofty round tower, which is 54 feet in circumference and is divided into 5 stories with holes for joiils. This tower has a communication with the church by an subterraneous passage, which implies that it was used for some religious purpose. From its having been built of free florne, when the rock and all the other buildings upon it are limestone, Dr. Campbell infers its being of greater antiquity than the rest. The whole rock was enclosed by a wall, within which was the residence of the archbishop; and it is supposed by Mr. Ledwich to have been a Maniera, or habitation of a great number of monks.

The church being long in a ruinous condition was repaired by Richard O'Heden, archbishop, in 1430, and part of it was used as the metropolitan church till 1730, when it was prematurely unroofed by Alexander Price, and thus exposed to the effects of the weather. In the unhappy civil war of 1641, the rock having been taken possession of by lord Tallie, was stormed by the Earl of Inchiquin, and many persons were put to death. Cashel is a tolerably well-built town, containing about 622 houses, but without trade.

There is a handsome market-house, a feilions-house, the county hospital, a chaplery, and a barracks. The church is a new and neat structure, and the archbishop's palace, though plain, is large and commodious. The city is governed by a mayor, recorder, and bailiffs, and it sends a member to the imperial parliament. Distance S. W. from Dublin 77 Irish miles. N. lat. 52° 30' 30", W. long. 5° 54' 59", Dr. Beaumont. Campbel's Philosophical Survey. Collectanea de Rebus Hibern. Ledwich's Antiquities, &c. &c.

CASH, Archibishopric of, in Ireland; chiefly confined to the county of Tipperary. It was founded or restored by Cormac Mac Cullinan at the beginning of the 10th century; was made an archbishopric by cardinal Paparo, the pope's legate in 1152, and was united to Emly in 1568. The united sees are very compact, extending 32 Irish miles in length, and 70 in breadth. There are in the union 15 parishes, which make 47 benefices, and have only 35 churches. The cathedral, which serves also for a parish church, is a large and handsome modern edifice, completed by archbishop Agar, who also established a choir. The archbishop is primate of Munster, and ranks next to the archbishop of Armagh and Dublin; his suffragans are the bishops of Killaloe, Limerick, Cork, Cloncye, and Waterford. Beaumont's Memoir.

CASH, Pfister of, an historical poem, or rather a collection of poems in the Irish language, written by Cormac Mac Cullinan, prince and bishop of Cashel, about 902. This Cormac is mentioned by Caradocus Llanecavenus in his Chronicle of Wales; and was slain in battle in 908 either by the Leinster forces, or by the Danes. He is represented to have been learned and well skilled in the Irish antiquities, and his pfister is highly valued by many as an authentic record. It has not been published, but part of it, at least, is said to be in the Bodleian library, and has been seen by respectable writers. Extracts from it have been published, and it is often referred to for the events of some centuries preceding. Stillingfleet and Pinkerton have, however, perhaps too rashly, affirmed it to be a collection of poetical fiction, compiled in the 13th century, an opinion adopted by Ledwich. Is it not probable that whilst an unreasonahle acct has been laid upon its authority by the advocates of early Irish literature, the others have been influenced by a prejudice against this? Testimony in favour of the authenticity of the work, and there does not seem to be any reason for calling it in question on this occasion, but an unwillingness to admit an Irish work of so early a period. As to the degree of credit such a work is entitled to, admitting its authenticity, it seems to be such as is usually given to poetical records, in which the facts related are generally so mixed with fable, or so exaggerated, that it is very difficult to draw the line of distinction. Ware's and Ledwich's Antiquities of Ireland. Nicholson's Historical Library, &c.

CASHENDAL, Bay, called also the Red bay, and sometimes confounded with Cullhendow bay, which lies a little north of it; an inlet on the north-east coast of Ireland, in the county of Antrim, where a ship may lie in moderate weather, above two cables length from the shore on from three to nine fathoms water. White limestone is found near this part of the coast. N. lat. 53° 4'. W. long. 5° 54', Hamilton's Anton. McKenzie.

CASHFORD, in Botany. See ANACARDIUM.

CASHIGAR, anciently CASIA, in Geography, formerly a remarkable town of Little Bithania, giving name to a considerable kingdom, the limits of which nearly corresponded
with those of Bucharia. This town, though fallen from its ancient splendour, still retains some commerce. See Little Bucharia.

Mr. Rennell has taken great pains to investigate and ascertain the position of Cashgar; and he observes, as the result of his inquiry, that Cashgar, Koter, &c. by their known situation with regard to Samarcand, must bear to the west, rather than to the east, of Cashmere; and also that the ridge of mountains, (the Imaus of the ancient geographers,) on the west of Cashgar, Koter, and Karia, can be no other than that which separates those countries from Little Thibet and Badaikhan, and that joins on the south to Cashmere. By a mean deduced from the tables of Abulfeda, Uling Beig, and Nasreddin, Cashgar is about 7° 39' of longitude east of Samarcand; and of course 2° W. of Cashmere. The parallel of Cashgar, given in the tables, is 44° 5', which would place it nearly N.E. from Samarcand. That it bears considerably to the north of east from Samarcand is strongly implied by the direction of the roads, which lead to it, from Samarcand and Bokhara; that of the former being through Copend and Anakand (or Fergana,) both of which lie to the north-east of Samarcand; the former at seven, and the latter at ten days' journey from it. From Bokhara, the road to Cashgar lies through Tahkund, still more northerly than Cashgar. Hence, if the direction of the road be north-east for 11 days out of 25, the distance of Cashgar from Samarcand, and 14 out of 30 from Bokhara, nearly N.E. by N., it furnishes a strong presumptive proof that the direction of the whole line is very far to the north of east. The only line of distance that would aid us in ascertaining the latitude of Cashgar is that given by Bernier, (vol. ii. ktt. 9.) in which it is stated, that the distance of Cashgar from Cashmere is 44 journeys, through Little Thibet; but that a shorter road lay through Great Thibet; and these journeys, though not so expressed, may be understood to be those of a caravan. Such journeys, says Mr. Rennell, on a distance that requires 44 days of travelling, cannot, in any country, be taken at more than 14 geographical miles of direct distance each day; and through such countries as those between Cashmere and Cashgar, perhaps at 12 or 12 only. The distance, according to this proportion, would reach to the parallel of 43° 44'; on a supposition that 7½ or 8 degrees of longitude were allowed between Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were supposed, the bearing line from Cashmere is so nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude assigned to Cashgar. Hence it may be generally inferred, that Cashgar cannot be in a lower parallel than 43° 44'; and then, admitting either of the distances from Samarcand and Cashgar; but even if 9 or 10 were suppos
of Aia, situate at the northern extremity of Hindooftan, northward of Lahore, and reftituted to a valley of an oval form, surrounded by hills, which has its largeft extent from S.E. to N.W., or more strictly, from S.E. by E. to N.W. by W. Mr. Forther reckons its dimensions 85 British miles by 40. Mr. Renfaw affirms that the deftimate of 80 miles for the length of the flat part of the valley, does not exceft the truth by more than a very few miles; for he fays, that 74 or 75 can be clearly made out. But its breadth is fuppofed to be 52 miles, or more; for Heerapour, at the entrance of the valley from the fide of Bembar, or the fouth side, is nearly 25 British miles acrofs from Sirinagur; and Lar, according to Bernier, is about as far from Sirinagur as Barehooloo is, i.e. 27 British miles; but as Sirinagur does not lie directly between Heerapour and Lar, a confiderable angle takes place, and may probably reduce the 2 miles to 50 in direct distance. In the Ayin Acharace, Cashmere is divided into two parts, viz. "Meerae" and "Kamaeja," the former being the eafier part, and containing the districts ftituated to the E., the S.E. and the N.E. of Sirinagur; and the latter, the western part, containing the N.W. and S.W. districts. On the fourth call of Sirinagur, at fome distance beyond the great circle of mountains that surrounds the valley of Cashmere, is the district of Benhal. With regard to its general poftition, Cashmere is bounded on the weft by the district of Puchkhol; on the S.W. by the territory of the Glickers; on the S.E. and S. by that of Jammoo and Kihrewar; and on the E. by the river Chunaub. On the N.E. lies Great Thibet, fpared from it by the fummit of mount Kantel; and on the N.W. is Little Thibet. Tradition reports, that the fite of this valley was formerly a lake; nor is this at all improbable. It is fuch an effect as might be expected, in every cafe where the waters of a river are inclofed in any part of their course by elevated lands: and with refeft to the river Behut in the prefent inftance, it appears that the lake exifted long enough to deposit a vall depth of foil before it difperfed. The Cashmerian hiilory names the lake "Sutty-Sirr," and adds, that Kutup led a colony of Bramins to inhabit the valley, after the waters had fpolded. Cashmere, previously to the Mahometan conqueft of India, was celebrated for the learning of its Bramins, and the magnan-"me conftruction of its temple. Although we are not able to affertain the period of its fpcription to the M hometans, yet it is reafonable to fuppofe, that a country supplying articles of valuable commerce, and furnifhing a profition of natural beauties, would at an early date have excited their notice, and invited their conqueft. It was governed for a long feries of years by a race of Tartar princes of the Jaga-"tay or Zagarbay tribe, until the year 1586, when it was fpolded by Akbar, more, as it is faid, by intrigue than by the force of arms. After having been annexed to the houfe of Timur for 160 years, it was betrayed by the Mogul govern-"or to Ahmed Shah Duranm, who formed it into a pro-"ince of the Afghan empiue. Cashmere is tributary to the fultan of Cabul, and at the period of Mr. Forther's re-"idence, (A.D. 1783,) it was governed, or rather defolated, by his viceroy. See CANHAR.

The valley, or country of Cashmere, is celebrated throughout Upper Aia for its romantic beauties, the fertility of its foil, and the temperature of its atmosphere. Nor is its excel-lence in these repects to be questioned, when we confi-"der that it is an elevated and extensive valley, surrounded by steep mountains that tower above the regions of fnow; and that its foil is compofed of the mud depofited by a capital river, which, as we have already faid, originally formed its waters into a lake, that covered the whole valley, until it opened itself a passage through the mountains, and left this fertilized valley an ample field to human induftry, and to the accommodation of a happy race; for such the ancient inhabi-"tants of Cashmere undoubtedly were. The author of the Ayin Acharace dwells with rapture on the beauties of Cashmere; and on this account it was visited by Achar and by other empe-rors of Hindooftan, who during the summer heats used to retire thither for the fake of enjoying a cool and refreshing climate, and who feemed to forget the anxieties of government during their refidence in this "happy valley," "this garden in perpetual spring," "this paradise of India," as it was denominated by the multitude of its admirers. It ap-"pears that the periodical rains which almost deluge the reft of India, are that out of Cashmere by the height of the mountains, fo that only light flowers fall there; and yet there are fo abundant as to feed fome thousands of cafes, which are precipitated into the valley from every part of the fpandous and romantic bulwark that encircles it. The foil is the refbft that can be conceited; and its productions are thofe of the temperate zone. As it has generally a flat surface, copiously watered, it yields abundant crops of rive, which is the common food of the inhabitants. At the bafe of the surrounding hills, where the land is higher, whea,-"barley, and various other grains are cultivated. A superior species of faffron is also produced in this province, and iron of an excellent quality is found in the adjacent mountains. But the wealth and fame of Cashmere have been chiefly owing to its manufacture of fhwals, which are unrivalled, and which are distributed all over the western and southern parts of Aia. The delicate wool of which thefe fhwals are made, is the produce of a species of goat, either of that country, or of the adjoining one of Thibet. It is originally of a dark grey colour, and is bleached in Cashmere by the help of a certain preparation of rice flour. The yonf of the wool is flained with fuch colours as may be judged the bell suited for fale, and after being woven the piece is once washed. The border, which ufually displays a variety of figures and colours, is attached to the fawl after fabrica-"tion; but in fo nice a manner, that the junction is not visi-"ble. The texture of the fawl refembles that of the haloon of Europe, to which it has probably communicated the name. The price of an ordinary fawl, at the loam, is eight rupees; and thence, in proportional quality, it produces from 15 to 20; and fome have been fed at 40 rupees the fawl. But the value my be very much enhanced by the introduction of flowered work; and hence the weaver occa-"fonally receives for a single fawl the sum of 100 rupees. These fhwals initially confift of three fizes, two of which, the long and the small square one, are in common use in India; the other, long and very narrow, with a large mixture of black colour in it, is worn as a girdle by the northern Aftics. A portion of the revenue of Cashmere is transmitted to the Afghan capital in fawl goods. The manufacture, however, is declind to one-fourth of the former quantity; which may be ascribed to the decline of the Persia and Hindooftanie empires. In this diffrcit are fheep, called "hudoo," which, like those of Peru, are employed in carrying burdens. A wine is made in Cashmere refembling that of Madeira; and a spirituous liquor is also diffilled from the grape, in which, as well as the vine, people of all classes freely indulge. The Cashmirians fabricate the bell writing paper of the East, which was formerly an article of extensive traffic; as were also its lacquer ware, cutelry, and fufges; but the heavy oppreffions of the government, and the rapac-iity of the bordering fates, which prey upon the foreign traders and often plunder whole cargoes, have reduced the commerce of Cashmere to a declining and languid state. In proof.
proof of this fact, the Cashmirians say, that during their subjection to the Mogul dominion, the province contained 45,000 shawl looms, and that at this day there are not 15,000. In Cashmere are seen merchants and commercial agents of most of the principal cities of northern India, also of Tartary, Persia, and Turkey, who at the same time advance their fortunes, and enjoy the pleasures of a fine climate and a country, over which are profusely spread the various beauties of nature. The country is plentifully watered by a number of streams and rivers, which bring their tribute to the Beutu, (which see,) the parent of the soil; and many lakes are spread over the surface, some of which contain floating islands. The whole country indeed resembles a garden intermixed with towns and villages, varied with beautiful trees, green meadows, fields of rice, hemp, labor, and different legumes, and intersected by canals winding through them in all forms. The scenery is in a high degree picturesque; and a portion of the romantic circle of mountains forms a part of every landscape. The pardonable superlition of the sequestered inhabitants has multiplied the places of worship of Mahadeo, of Bihen, and of Drama. Cashmere is altogether holy land; and it abounds with miscellaneous fountains. However, they are obnoxious to one dreadful evil, which is the frequent recurrence of earthquakes; and in order to preserve themselves from their injurious fatal effects, all their houses are built of wood, which the country supplies in great abundance. The annual public revenue of Cashmere, in the time of Aurungzebe, appears to have been only about 35,000l. In the time of Shah Jahan the actual and realized revenues were about 25,000l. and only 20,000l. in the time of Mahomed Shah. A revenue, says Forster, of between 20 and 30 lacs of rupees is collected from this province, of which a tribute of seven lacs is remitted to the treasury of Timur Shah. The army of Cashmere consists of about 3000 horse and foot, chiefly Afghans, who are poorly paid, and who for want of better subsistence were under a necessity of living on the kerf of the finger, or water-nut, which is plentifully produced in the lakes of this country. The drefs of the Cashmirians consists of a large turban, a great woollen veil with wide sleeves, and a fall wrapped in many folds round the middle under the veil, which may be properly called a wrapper, people of the higher class wear a phiran, or shawl, and drawers; but those of the lower order have no under garment, nor do they even grid up their loins. The drefs of the women is no less awkward than that of the men. Their external, and often only garment is of cotton, and shaped like a long loose skirt; over the hair, which falls in a single braid, they wear a close cap, tufted with woollen cloth of a crimson colour; and to the hinder part of it is attached a triangular piece of the same colour, which falling on the back conceals much of the hair. Around the lower edge of the cap is rolled a small turban, fastened behind with a short knot, which seems to be the only artificial ornament about them. The women of the higher classes are very abstemious. The Cashmirians are stout, well-formed, and as the natives of a country lying in the 34th degree of latitude, may be termed a fair people; and their women in southern France and Spain would be called brunettes; but their figure is coarse, their features broad, and their legs often thick. They are generally gay and lively, and much addicted to pleasure, although the Afghan government has somewhat depressed their spirits. Young and old have a taffe for mofic. Mr. Renell says they have a language of their own, said to be anterior to the Sanscrit; but according to Mr. Forster, it is evidently derived from the Sanscrit, and resembles in sound that of the Mahbrattas, though more harsh; on this account the inhabi-
the rough, and the purified or reduced; the latter is a composition of purified calhoo, mixed with aromatic drugs, and made into lozenges. This calhoo is made for the use of the Indians, who chew it either alone, or mixed with pinang or areca. Rough calhoo is a commodity which is brought down the Ganges as far as Bengal; whence it is distributed throughout the Indies, where there is a great consumption of it; and to the Europeans, who fend it into Europe. What is sent into Europe, however, is mostly purified; for calhoo is not used rough any where.

Calhoo is much valued in medicine: among other effects ascribed to it, is the stopping a cough, and strengthening the stomach; beside which it sweetens the breath, when being reduced to an impalpable powder, mixed with amber-grafe, and mucilages of gum adragant, it is made into pills. Calhoo must be chosen of a tanned red on the outside, of a bright red within, very fining, and not burnt. Kempfer observes, that they prepare at Odowara perfumed calhoo, of which they make pills, small idols, flowers, and other figures, which they put into little boxes for sale. The women are very fond of it, and use a great deal of it, because it palpates the teeth, &c. The thickened juice is carried to Japan, by the Dutch and Chinefe; and after it has been prepared at Macao, or at Odowara, they buy it again, and carry it to other places.

CAS, in the Persian Policy, one of the two judges under the nadab, who decide all religious matters, grant all divorces, and are present at all public acts; having deputies in all cities of the kingdom.

CASI OA, in Botany, fructu nigro, Amm. Ruth. See Nitraria fruteberti.

Casia, in Ancient Geography, a country which the ancients placed near mount Imaus in Scythia. M. D'Anville places it in the angle formed towards the west by the two chains of mountains, which he calls Imaus, one of which is to the north-call, and the other declining to the south-call. This country corresponds to the present Casciar; which see.

Casia, a promontory on the coast of Carmania, at a small distance from the mouth of the river Hydracius.

CASAAR, or CASAREA, in Geography, a town of Asia, on the coast of the Mediterranean, in Palestine; anciently called Casarea Stratonitis, which see. In the year 625, it was taken by Omar, one of the succerores of Mahomet, and was alternately in the possession of the Chrisfians and Mahometans during the religious wars, till it was finally left, with the loss of its ancient splendour, in the power of the latter.

CASI, or CASI Montes, in Ancient Geography, a chain of mountains in Asia, situate in Secria, to the south of Armenia, and of Issedon Secria, according to Ptolemy.

CASILINUM, a river of Italy, in Campania. The town of Casilium was seated on the opposite banks of this river, and a bridge connected its two parts. Agathias says, that this river descended from the Apennines, and discharged itself into the Tyrrhenian sea.

CASILINUM, a town of Italy, in Campania, N.W. of Capua, seated on the Vaviturnus, at a considerable distance from the sea. It once occupied both sides of the river. During the fierce Punic war it distinguished itself by the resistance which its garrison made to Hannibal. Julius Caesar established a colony in this place. Modern Capua was built on its ruins. See CAPUA.

CASIMERSBURG, in Geography, a town of Germany, in the circle of Upper Saxony, and district of Pomerania.

CASIMIR, in Biography and History, the name of several kings of Poland.

CASIMIR I. was the son of Mieszlaus II. and at the death of his father, in 1034, was placed under the tutelage of his brother, Rixfa, who was appointed regent of the kingdom. The Poles, aggrieved by his oppressive administration, revolted, and expelled both him and his son. Casimir took refuge in France, and, having a propensity to literature, studied in the university of Paris; and, when the sovereign orders, he became a monk, first in Italy, and afterwards in the abbey of Chun, in France. Poland, having suffered much during the interregnum, the nobles of the country discovered the place of Casimir's retreat, and recalled him from his exile; but it was necessary that he should be released from his clerical vows; for which purpose, a dispensation was obtained from the pope, on condition of the payment of Peter-peece by the Poles, and some other stipulations favourable to the holy see, and he was then crowned with unusual solemnity, in 1049. By marrying the sister of Jafferus, grand duke of Rufia, he secured peace from that quarter; and by the vigour of his government, he suppressed the banditti who had infested the country, and restored law, order, cultivation, and prosperity to Poland. He civilized his subjects by the establishment of churches and monasteries, and by encouraging the arts of peace he made his kingdom flourish to a degree before unknown. In 1044, he quelled the rebellion of Maltus, who had risen from the rank of a private soldier to the highest offices of the state, and who at last assumed the title of prince of Mazovia. He also expelled the Bohemians from Silefia, and established an episcopal see at Breslaw. After an honourable and happy reign of 18 years, he died, in 1058, much regretted, and left the crown to his son, Bolechis.

CASIMIR II. surmamed the Jad, was the youngest son of Bolechis III., who, at the death of his father, in 1123, was left an infant in the cradle, without any provision. In mature age, he was advanced to the dignity of prince of Sandomir; and, as an evidence of the property with which the appellation of Jad was bellowed upon him, the following anecdote is recorded: Having won at play all the money of one of his nobility, the loser, incensed at his ill fortune, struck the prince a blow on the ear. The offender instantly fled; but being pursued and taken, he was condemned to lose his head. Casimir interposed. "I am not surprised," said the prince, "that, not having it in his power to revenge himself on Fortune, he should attack his favourite." He revoked the sentence, returned the nobleman his money, and declared that he alone was faulty, as he had encouraged, by his example, a pernicious practice, that might terminate in the ruin of his people. The Poles, dissatisfied with the conduct of his brother Mieszlaus III., deposed him, and elevated Casimir to the throne, in 1177. The new sovereign proved himself worthy of the honour, by subduing the Lower Poland and Pomerania, abolishing all exorbitant imposts, reforming the abuses of his predecessor's administration, and restoring rights and privileges that had been alienated from their possessors. The brother of Casimir, deprived of his crown, and reduced to a state of extreme indigence, supplicated compassion; and so far succeeded, that the reigning prince determined to evacuate the throne in his favour, and pledged himself for his future good conduct; but the lates, to whom Casimir applied for permission to reign, peremptorily refused it. He conformed, however, at the irregularities of his brother, and particularly at his taking forcible possession of Gneina and Lower Poland, where he might have lived in splendour and
and in peace. But his restless spirit led him to extend his encoemantments, and he perfilled in his endeavours to wrest the crown from his brother. It became necessary, at length, to restrain his usurpations; and to compel him to evacuate all his conquests. The last enterprise of this prince was a kind of pious crusade against the relapsed heathen of Prussia, whom he subdued rather by the reputation of his wisdom and generosity than by force of arms. Soon after his return to Cracow from this expedition, he died, in 1410, after a reign of 17 years, lamented as the most amiable prince that had ever filled the throne of Poland. With his distinguished virtues, however, he blessed culpable foibles.

In his palace he was the flower of his minstrelies.

Casimir III., surnamed the Great, succeeded his father Uladislaus III. in 1323, and soon after his accession engaged in a contest with the Teutonic knights, who obtained the support of the kings of Bohemia and Hungary. His subjects wished him to vindicate his claims and punish the usurpation, perfidy, and turbulence of these knights, by declaring war against them; but Casimir, fertile of his power, thought it most prudent to wait for a more seasonable opportunity, and acquiesced in the retribution of Cum and Cujavia. At this time he had another more important object in view than that of regaining Pomerania, which had been adjudged by the royal umpires to the knights; and this was the conquest of the province called Black Russia, which, together with Volhina and Mazovia, he completely subdued and annexed to his Polish dominions. Having accomplished this object, he directed his attention to the civilization and improvement of his country. Accordingly, he first gave the Poles a regular code of written laws, such as had never before been seen in Poland, which he caused to be observed by all ranks of people, and he thus introduced justice and order in the room of arbitrary decision and undefined extortion. This written code he pe rented to a general diet, where it was examined, approved, and enlarged. He also strengthened the frontiers of the country by fortresses, inclosed the chief cities of his dominions with walls, built churches, founded monasteries, and purloined every measure that was likely to conciliate the affection and attachment of his subjects, and to increase the wealth and prosperity of the kingdom. His incontinence cast cloud over his other virtues; and he incurred peculiar reproach by fluttin up one of his wives in a monastery that she might not interrupt his licentious intercourse with a favourite concubine. His works of piety and charity recommended him to the favourable judgment of the clergy; and they not only extenuated the criminal indulgence of hisrul ing passion, but lavished upon him the highest encomiums. He was thrice married, but left no children; he was the laft Polish king of the direct line of the Piasts. His death, which happened in 1370, at the age of 60 years, and after a reign of 37, was occasioned by a fall from his horse in hunting.

Casimir IV., the second son of Jagello, was grand duke of Lithuania, when, in 1445, his brother Uladislaus was killed in the battle of Varna against the Turks, and was crowned as king of Poland, in 1447.

The first operations of his reign were directed against Bogdan, who usurped the vadechop of Moldavia, whom he obliged to flee for peace. He afterwards undertook the protection of the Prussians against the tyranny of the Teutonic knights, whom he expelled from many of their cities. But whilst his army covered the siege of Marienburg, the knights attacked his camp with great impetuosity, and constrained him to secure himself by an ignominious flight, after 4000 of his troops had been slain or taken prisoners. In consequence of this defeat, he returned to Poland, and, having recruited his forces, he resumed the siege of Marienburg and took it; and thus humbled the knights to such a degree, that, by a treaty of peace concluded at Thorn, they ceded the territories of Cula, Michlow, and the whole duchy of Pomerania, together with the towns of Elbing, Marienburg, Tallmitz, Schutt, and Chriftburg, to the crown of Poland. The king, in return, restored to them all his other conquests in Prussia; granted a seat in the Polish senate to the grand-masters; and indulged him with other privileges, on condition that six months after his accession, he should do homage for Prussia, and take an oath of fidelity to the king and republic. Such were the conditions on which Casimir terminated the war, and humbled an order which had given perpetual disturbance to the northern hemisphere, for nearly the space of two centuries. Moldavia was also made tributary to Poland; and when the crown of Bohemia became vacant, the barons bullied it upon Uladislaus, the eldest son of Casimir, in opposition to the intrigues of Matthias Corvinus, the king of Hungary, whom Uladislaus pursued into his own country, and defeated. Thus the three crowns of Poland, Hungary, and Bohemia, were united in the same family, and Casimir's power was greatly augmented, though the felicity of his people, oppressed with grievous taxes, and diminished in number by a variety of bloody engagements, did by no means increase in the same proportion. Casimir wished to retrieve his domestic affairs by the arts of peace; but before he could accomplish his purpose, he died, at the age of 64, in the year 1430, more admired than beloved or regretted. In this reign the deputies of the provinces first appeared at the diet, and assumed to themselves the legislative power; all laws before this period having been framed by the king, in conjunction with the senate. Casimir is also said to have published an edict, enjoining the study of the Latin tongue, in which both he and his subjects were before grossly ignorant, and thus he rendered this language ever since almost vernacular among the gentry of Poland.

Casimir, John, second son of Sigismond III., king of Poland, was originally destined for the church, and entered the society of the Jesuits, after having visited most of the courts of Europe. From pope Innocent X. he had obtained a cardinal's hat; but upon the death of his brother Uladislaus VII. in 1648, the Poles elected him to the crown. Upon his accession he expressed his disapprobation of the measures which had irritated the Cossacks and excited them to rebel; and, after some actions with them, he concluded a treaty of peace which was much in their favour. Afterwards the war was renewed; the Cossacks were defeated, and again obtained a peace, which occasioned dissatisfaction to the nobility. In 1653, the Cossacks availed themselves of the hostile disposition of the Cossacks, and of the divisions that subsisted between Casimir and the Polish nobility, to commence hostilities against Poland; and, uniting with the Cossacks and Tartars, entered Lithuania, ravaged the country, and treated the inhabitants with great barbarity. At the same time Charles Gustavus, king of Sweden, invaded Poland by the way of Pomerania, and, reducing the whole country as he advanced, with Cracow its capital, obliged the unfortunate Casimir to seek an asylum in Sileia. Casimir's flight being interpreted by the Poles as an abdication of the crown, they took an oath of allegiance to the conqueror; and Gustavus became master of all Poland and Prussia, the city of Danzig excepted. The impositions of the Swedes, aided by the exactions and example of the clergy, roused again a spirit of resistance. Casimir was privately invited to return to his dominions; and he immediately put himself at the
the head of a considerable army, assembled by the nobility. The Tartars formed an alliance with the Poles, and, attacking a body of Swedes, totally defeated them. The Lithuanians also revolted from the Swedish monarch, and, taking advantage of the dispersed condition of his soldiers, attacked and massacred them before they could unite and form themselves into a body for their own defence. Gullava, however, procured the war, and took Warsaw by storm; but at length he was obliged, in 1657, to withdraw his army from the Polish territories, and to employ it in the defence of his own country, which was attacked by the Danes. Soon afterwards the Swedes were under a necessity of wholly evacuating Poland. After the death of Gullava, Casimir made a peace at Oliva, in 1660, with Charles XI. his successor, upon condition that he should renounce all claim to the Swedish crown, and that the Swedes should restore all their conquests in Poland, Prussia, and Livonia, Riga and a few other places excepted. Peace being thus established between the Poles and the Swedes, Casimir determined to commence a war with the Russians, who had made divers incursions into his dominions; and having succeeded in two decisive engagements, he led siege to Wilna, the capital of Lithuania, which had been taken by the enemy during the late war with Sweden. The siege was protracted till diffusions occurred between the king and some of the nobility, who inflamed that he should dismiss his German mercenaries, under a plea that they were introduced to deprive the liberties of the republic, and not to recover her territories. The animosity produced an open variance; forces were raised on both sides; a battle ensued; the royal party was defeated; and the contest terminated with the dismission of the German levies. Upon this compliance on the part of Casimir, the discontented party threw off the mask, lost all respect for the person of the king, and occasioned to him so much vexation, aggravated at the same time by the loss of his wife, who had been his brother's widow, that he reneged the crown in dignily, A.D. 1668, and retired to France, where he was honourably received and hospitably treated by Lewis XIV. He died at Nevers, in December, 1672, and a magnificent monument was erected for him at the church of the Abbey of St. Germain des Prés, of which he was abbot. The turbulent reign of John Casimir gave rise to the privilege assumed by each single nuncio at the diet, of putting a flop to any public affair by his negative, called the "librum veto! a fruitful source of anarchy and violence. Mod. Un. Hist. vol. xxx. Moreci.

Casimir, Matthias Sarbesskyi, a Polish Jew, and an excellent Latin poet, was born in 1597; and, in the judgment of M. Baillet, he is an exception to a general maxim of Aristotle and others among the ancients, which teaches us to expect nothing ingenious and delicate from the northern climates. His odes, epodes, and epigrams, have been thought not inferior to some productions of the finest wits of Greece and Rome. Grotius, D. Heinrichs, and others, have not scrupled to affirm, that he is not only equal, but sometimes superior, even to Horace himself. Such was the respect which he entertained for Virgil, that he had begun to imitate him in an epic poem, called the "Lefciade," which he had divided into 12 books. But his death, which happened at Warsaw in 1640, put a stop to his progress in this work. His epigrams, however, are allowed to be much inferior to his odes. We have a translation of one or two of his small pieces in Dr. Watts's lyric poems. There have been many editions of his poems, the best of which is that of Paris in 1759.

Casimir, in Geography, a town of Poland, on the Vistula, on the side opposite to that of Cracow, from which it is only separated by a bridge, built by king Casimir the Great, for a university, which contains 11 colleges and 14 schools.

Casinates, in Ancient Geography, the inhabitants of the town of Caunum, which fea.

Casini, among Hunters, denotes the flippin off the skin of a hare, fox, or badger. They say, "lay a dear, cast a hare, and all sorts of vermin. This is done by beginning at the front or nape of the head, and afterwards his skin over his ears down to the body, and the very tail.

Casing of Timber-work, is the planter of a wooden house all over on the outside with mortar, and dividing it, yet wet, by a riler, with the corner of a trowel, or the like instrument, to make it receive the joints of free-stone; by which means, the whole house appears as if built thereof. It is best done on heart-laths, because the mortar is apt to decay the lap-laths in a short time. It is commonly laid on at two thicknesses, the second before the first is dry.

Casings, a provincial term applied to dried cow's dung, which is used in several parts for fuel.

Caso, in Geography, a river of Italy, which runs into the sea, 2 miles N.W. of Cape Stilo.

Casinum, in Ancient Geography, a considerable town of Italy, in Latium, upon the Latin way from Campania. Hannibal encamped two days under its walls. After the wars of the Samnites, under the confuente of M. Valerian and Publius Decius, the Romans, having made themselves masters of Caunum, sent a colony thither in the year of Rome 442. Its ruins are visible near Sab. Germaino.

Casinus, a river of Italy, which, according to Strabo, joined the Iltis at the place where was situated the town of "Interamnus." It is suppos to have been the present Saco.

Castrorum Insulae, small islands situate near the small island of Casus, to the south of the island of Carpathus.

Casirotæ, a people of Asia, who inhabited the territory N. of Aria, on the side of Drangiana, according to Ptolemay.

Casius, the name of two mountains of Phoenicia, one to the south, on the frontiers of Egypt, the other to the north, near "Seleucia Pieria," to the right of the mouth of the Orontes. The term "Causus," in the Eastern language, denotes limit or boundary, and the situation of these mountains, in their relation to Phoenicia, justifies this etymology. The mount Casus of Syria (see Pliny, N. H. 1. v. c. 22.) was situated to the south of the mouth of the Orontes, near Seleucia to the south-west. The present mount Casius rises above Antioch to a prodigious height; but Pliny furiously hyperbole when he says that from its summit we may discover at once both the morning's dawn and the evening twilight. The mount Casius that lay on the frontiers of Syria and Egypt was situated on the northern coast of the island of Suez, and was distant, according to Strabo, 300 stadia from Pelusium. According to this geographer (1. xvi. vol. ii. p. 1102.) it resembled heaps of sand, and projected into the sea. On this mountain the body of Pompey the Great was deposited; and it had a temple of Jupiter, named Casius. Jupiter has also a temple, under this application, on mount Casius in Syria, near Seleucia, as is evident from the effigy of the inhabitants thither every year to celebrate a feast in honour of Triptolemus. He was also worshipped under this title at Callisope, a city in the island of Coreya, situate on the westernmost cape of the island, and nearest the main land. Suetonius represents Nero as landing on
on this point, and singing before the altar of Jupiter Catus.
There are medals full extant, which exhibit Jupiter with
these inscriptions,  "ZCYC KACIOC," and  "ZSYE
KAYOCT," excreptive of this legend.

Catus, a river of Albania, mentioned by Pliny and
Plutarch; and the mouth of which is placed by the lat-
ter between those of Gheusus and Albarion.

Cask, in French  "caiss", a head-piece or helmet, a
defensive armour for covering the head and neck. For-
erally all the gene d'armes of France wore  "caisse".
The king had one gilt with gold, the dukes and counts had
their with silver, gentlemen of extraction wore them of
polished steel, and the rest of plain iron. The word is
commonly supposed to come from  "caissa", the Latin term for
a helmet.

The Romans had their caiques of brass or iron, which
were proof against the strokes of any sword or saber, and
were ornamented to the height of two feet with plumes of
feathers, or tufts of horse hair, of different colours, which
made them look grander and taller, and struck more terror
into their enemies. The chief and principal officers wore
caiques gilded and enriched with precious stones, with the
tops of them ornamented with plumes and argent of value,
which served to distinguish them from others. The Skandi-
navians, and other people of the north, used to wear them,
and the invention of them is ascribed by some to the Sey-
thians and the Celts. It is supposed, however, to have been
one of the most ancient of all coverings for the head, and it
is frequently seen on ancient medals in a variety of forms or
fashions, as the Grecian, the Roman, &c. Kings and
emperors wore it; and even the gods themselves are figured as
wearing it. That which covers the head of Rome, has gen-
erally two wings, like those of Mercury. Those of some
kings are furnished with horns, like those of Jupiter Ammon,
whilst those of some others have only bulls' or rams' horns,
to denote their uncommon strength.

Cask, in Heraldry, the same with helmet.

Cask is also used as a common name for vessels of
divers kinds; in contradistinction from the liquor, or other matter
contained therein. Thus a hoghead of spirits, &c. is said to
weigh 4 Cwt. 1/3 and 22 lb. cask and liquor; a tuncheon, 6
Cwt. 1/4 and 2 lb. cask and liquor. See Tun, &c.

Cask of Sugar, is a barrel of that commodity, containing
from eight to eleven hundred weight.—A cask of almonds is
about three hundred weight. No one shall transport any
wine cask, &c. except for vitualling ships, under a certain
penalty, by 35 Eliz.

For the method of imitating the solidity or content of a
cask, see  "Frustum of a Pyramid," and  "Gauging."

CASKET, in a general sense, a little coffier, or cab-
inet. See Cabinet.

Caskets, in Geography, two high rocks at W. by N. and
W.N.W. from the W. end of Aldey, and besides many
smaller ones, several of which are covered by the flood-tide.
On the westermost of the Caskets there are three little
houses, disposed in a triangular form. N. lat. 40° 45' 30".
W. long. 2° 24' 40". High water at spring-tides at 9
o'clock. See Alderney.

Caskets, in Sea-Language, are small ropes made of sinnet,
and fastened to gromets, or little rings upon the yards;
their use is to make fast the fail to the yard when it is to be
furled.

Caskets, breadth, are the longest and highest of these, or
those in the midst of the yard, betwixt the ties.

CASLEU, in the Hebrew Chronology. See Cislue.

Caslon, William, in Biography, an eminent letter-
founder, was born at Hales Owen in Shropshire, in 1672;
and having served an apprenticeship to an engraver of orna-
ments on gun-barrels, he embarked for himself in this busi-
ness in London, connecting with it the manufacture of tools for
the book-binders, and for the chasing of silver plate. Whilst
he was thus engaged, he became acquainted with the elder
Mr. Bowyer, who introduced him to a foundry; and being
furnished with his abilities for undertaking the business of cut-
ting types, though he had never before seen it performed,
he concurred with two other eminent printers (Mr. Bettau-
man and Mr. Watts) in advancing the sum of 500l. towards
enabling him to commence the undertaking. Accordingly
he immediately applied to it with singular facility and suc-
cess. In 1720, the society for promoting Christian knowledge
proposing to print, for the use of the Eastern churches, in Pak-
tein, Syria, Mesopotamia, Arabia, and Egypt, where printing
was not allowed, the New Testament and Psalter in the Ara-
bic language, engaged Mr. Caslon to cut the font of letter;
in his specimens of which he distinguished it by the name of
"English Arabic." Having finished this font, he cut the
letters of his own name in "Picar Roman," and placed them
at the bottom of one of the Arabic specimens. When Mr.
Palmer, the reputed author of the "History of Printing"
(which was in fact written by Philmanazar), saw the
name, he advised the artifiq to cut the whole font of Picar
in the execution of which he surpassed the other founders of
the time. Mr. Palmer afterwards repeated of the advice he
had given him, and dreading the competition of such a for-
dable rival, endeavoured to discourage his further progress.
Mr. Caslon, distrusted by this treatment, applied to Mr.
Bowyer, and under his inspection he cut, in 1722, the bea-
"tiful font of "English," which was used in 1726, in print-
ing Selden's works, and the Coptic types that were made
use of for Dr. Wilkins's edition of the Pentateuch.
Under the further encouragement of his three first patrons, he
proceeded with vigour in his employment, acknowledging his
particular obligation to Mr. Watts as his master, from whom
he had learned his art. Such was the perfection to which
he attained, that it was no longer necessary to import types
from Holland; and his own were so beautiful and elegant,
and so far exceeded the productions of the best arti-
ciers, that they were frequently exported to the continent.
A more beautiful specimen than his, it has been justly said, is
not to be found in any part of the world. After some
previous changes of habitation, he settled, viz. in 1735,
establihed his foundry in Chiswell-street, where in proces-
t of time it became the most capital of any existing in this or in
any foreign countries. Having acquired opulence in the
course of his employment, he was introduced into the com-
munication of the peace for the county of Middlesex; and to-
wards the close of his life, devolving the active part of his
business on his eldest son, he retired to Bethnal green in the
vicinity of London, where he died in January 1766 at the age
of 74 years. Mr. Caslon was universally esteemed as a frati-
rate artist, a tender master, and an honest, friendly, and be-
nevolent man; and Dr. John Hawkins (Hift. of Music, vol. v.)
has particularly celebrated his hospitality, social qualities,

CASLUHIM, in Scripture, Geography, one of the na-
tions descended from Mizraim, who are supposed to have settled
somewhere towards the entrance of Egypt; about mount
Caius, in that part of the Lower Egypt called Calotis by
Ptolemy and others, which places, it is thought, retain some
likeness of the name; but, without relying on that argument,
they appear to have been planted near the Caphtorim, be-
cause the Philistines seem to have been descended from both
these people, and consequently to have been settled in Egypt.
Bochart, misled by following the Jewish notion about Caphtor,
fancies
fancies them to be the inhabitants of Colchia, at present called Mungrelia.

CASMA, in Ancient Geography, a town mentioned by Ptolemy, and placed in the eastern part of Mauritania Cezarensis between Aques Calidus and Ida.

CASA LA BAREA, in Geography, a town of South America, in the country of Peru, and jurisdiction of Santa Catarina, or Caxama part is 4 leagues N. from Morgon, and 11 S.E. from Arequipa, or the coast of Peru, in the South Pacific Ocean. S. lat. about 9° 40'. This is a good harbour, though subject to hard gales.

CASCHEMA, a town of Sicily, placed by some near the source of the Hippatis, and by others between Arca and Camarina. This city, according to Theophrastus (v. i. c. 75) was built by the Syracusians 92 years after Syracusa, or about the year 668 B.C.

CASMONEA, a people of Italy, who inhabited the mountains of Liguria. Pliny.

CASOAR, in Ornithology, the French name of the cai-son, or Cassius. (Bopp.) See STRUTHIO CASARUS.

CASOLI, in Geography, a town of Naples, in the province of Abruzzo Citera; 15 miles S.S.E. of Cività di Chieti.

CASOS, or CASUS, CASO, an island of the Mediterranean, one of the Cyclades, is laid to have received its name from Cafl, the father of Cleomachus. This little island lent a colony to mount Caflus, dependent on Syria. According to Strabo, it is distant from Carpathus, now called Scarpanto, 70 stadia or 24 leagues, and 250 stadia, or 9 leagues, from Samos, a promontory of Crete. It is 80 stadia, or 3 leagues, in circumference; on it was formerly a town of the same name, which no longer exists, and round it are several smaller islands. The population of this island at the present time is not considerable; and entirely composed of Greeks, though subject to the Turks. It is little frequented by shipping, its road being difficult of entrance, and more dangerous of access. The inhabitants, however, are on that account more happy and more free; as the Turks fielded venture to go thither to exercise the despotic with which they oppress the countries subject to their dominion. The Greeks of Caffo, being more independent and more secure in their property, are more laborious than others; their toil and industry have introduced fertility on a foil of which the flattest even of vegetable earth, which covers the rocks, appeared not to render it susceptible; the vines which grew on this sandy ground, furnish them with very good wine; and the honey, which they gather, is still, as in ancient times, abundant, and of an excellent quality. The Caffians, like all the inhabitants of the small islands which cannot supply the wants of their population, are navigators and traders; but their industry in that way does not extend beyond the limits of the Archipelago. The women of the island wear a jacket, fash, and long robe of cotton; the only difference consisting in the embroidery, which varies according to their different tastes, and in the manner of wearing their hair, which some发音 to flow upon their shoulders, in one or more tresses, and others fasten to the crown of the head, letting it fall down again upon the neck. Their employment is that of spinning cotton and embroidery, and making the fine linens which they wear. Several of them are handloom, and their amusements are dancing and music. The men, during the spring, summer, and part of autumn, are out at sea, so that the island seems to have few males. Their trade to different islands of the Archipelago, and return from time to time with provisions for their families, and only pass the winter with them. They sow the land with barley and wheat at the commencement of the rainy season, which lasts from October to February; collect the harvest in March, and then return to sea, supplying from other countries the deficiency of the produce of their own island. The cultivated part of the island is divided into compartments, and shared among the Caffians. The town is not continual in the above-mentioned months, but some falls in any other; during the remainder of the year the air is pure and serene, and both days and nights fine and clear. The heats are moderated by the fresh breezes, and beneath a beautiful sky, the inhabitants enjoy a delightful temperature, and are almost insensible to every kind of disease. The men enjoy their repasts, consisting of poultry, eggs and rice, and good wine, dining together seated in a circle on the carpet, and the women in a separate apartment. Savary expresses his admiration of the regularity and wisdom of this little republic, the peace and harmony that prevailed among its members, and, above all, that cheerfulness and content which was so visible in their countenances. "In the midst of these bustling beneath the Ottoman yoke, I have found," says this writer, "a rock only 3 leagues in circumference, on which the Turk dares not set his foot, and inhabited by a free and happy people. There each father of a family is a sovereign within his own house; he decides every difference, and his decrees are laws, which cannot but be equitable, since they are only dictated by paternal tenderness. When any disputes arise, the priest and the old men assemble, and decide them; but disputes cannot be frequent among citizens, who are all equal and alike unacquainted with poverty or riches. All the members of this little society are employed, and I have seen the handmaids of their women go down into the valley, to wash their linen at the fountain, as in the days of Homer. They cheer their labours with a song; and, for they imagine themselves disgraced by their humble employment. Several flocks or flocks lie near the northern coast of the island of Casso, called by the ancients the Caffian islands; they are barren, and scarce covered with a few bushes; but they shelter the road of Casso from the winds and the sea to the north.

CASPARGUS, in Ichthyology, a name given by Salvian, from Aelian, to a fish supposed to be the Sparus genus, and probably the Sparus annularis of modern naturalists: it is described as being of a plain yellowish colour, with a large annular (ocellated) spot near the tail, which perfectly agrees with Sparus annularis.

CASPASUS, or CAUASUS FLUMEN, in Ancient Geography, a river placed by Pliny in Asiatic Scythia.

CASPATYRUS, or CASAPARUS, a town of Asia, placed by Herodotus (ii. i. c. 52) in Paitya, upon the Indus; but by Hecatæus, cited by Steph. Byz. in Gandara, in the vicinity of the Sagdians and Bactrians, and south of these people. The modern name of this town, according to M. d'Anville, is Tepahre.

CASPE, in Geography, a town of Spain, in Aragon, situated at the conflux of the Guadalope and the Ebro. The adjacent country produces corn, wine, oil, and flax. Here Ferdinand IV. was elected king of Aragon; 44 miles S.E. of Saragossa, and 55 S. of Balbastro.

CASPÉAN, or BEAUTIFUL, a small lake of North America, in Greenborough, Vermont. On its western side is Hazen blockhouse. It is a head-water of La Moille river.

CASPERIA, in Ancient Geography, a town of the Sabines, mentioned by Virgil; towards the south-east of Reate. It is called Casparina by Silinius Latius, I. viii. v. 416.—Also, a country of India, on this side of the Ganges, below the sources of the Bhadaf, Rhoas, and Sandubal, according to Ptolemy.

CASPÍN, or CASPHIUS, a small but well fortified town.
of Palehine, in the tribe of Dan, seated on a small lake about 6 miles E. of Jamnia. It was fenced with high walls, and so well provided within, at the time of the Maccabæan wars, that the inhabitants, trusting to their own strength, threw out many stoutful sarscans on the Jewish army; but Judas Maccæus assaulted it with such unexpected bravery, that he made himself master of it, and put all the inhabitants to the sword, infomuch that a neighbouring lake, about 2 furlongs broad, was seen running with blood. 2 Maccab. xii. 12—16.

CASPIL PYLE OF PORTF, an important defile between the mountains and the Caspian sea. See Caspian Gates.

CASPIL SEA, in Geography, a detached sea of Asia, which has no visible connection with any of the great oceans, nor apparent outlet, and which, on this account, some writers have clasped among the larger lakes, not thinking that it properly deserves the appellation of a sea. It is bounded on the north by the province of Alfrachan and the Caucasus, and on the south, east, and west, by different provinces of Persia. The governments of Ufnik and Caucasus border on the Caspian. It was anciently called by the Greeks the Hyrcanian, i. e. the Persian Sea; by the Tartars, it is denominated Akdinglis, or the Black Sea; by the Georgians it is termed the Kuraflcan Sea; and the Persians denominate it Gurben, from the old Persian capital, Gurgan, which is said to have flood in the province of Alfrachan, only seven versts from the sea. It reaches in length about 15 degrees, from about the 37th to the 47th degree of north latitude, or about 625 miles from Gurien to Medlehitfar, and in breadth from 100 to 260 miles, where it is the widest. Its superficial contents amount to above 36,000 square English miles.

The ancient geographers were very imperfectly acquainted with this sea, and have given very unfounded and absurd deprivations of it. According to Strabo, (lib. xi. p. 773.) the Caspian is a bay, that communicates with the Great Northern Ocean, from which it issues at first by a narrow strait, and then expands into a sea, extending in breadth 500 fæd. With him Pomponius Mela (lib. iii. c. 5.) agrees, and describes the strait by which the Caspian is connected with the ocean as considerable in length, and in breadth so narrow, that it had the appearance of a river. Pliny (N. H. i. v. c. 13.) gives a similar description of it. In the age of Justinian, this opinion concerning the communication of the Caspian Sea with the ocean was still prevalent. Some early writers, by a mistake more singular, have supposeth the Caspian Sea to be connected with the Euxine. Quintus Curtius (v. c. 16.) has adopted this error. Arrian, (iv. c. 26.) though a more judicious writer, and who, by residing for some time in the province of Capadocia, as governor, might have obtained more accurate information, declares in one place, that the origin of the Caspian Sea was still unknown, and expresses a doubt whether it was connected with the Euxine, or with the Great Eastern Ocean which surrounds India. These errors appear more extraordinary, as Herodotus, near 500 years before the age of Strabo, had given a just description of this sea. "The Caspian," he says (lib. i. c. 203.) "is a sea by itself, unconnected with any other. Its length is as much as a vessel can sail with oars in 15 days, and its greatest breadth as much as it can sail in eight days." Arilottu (Meteorol. i. ii.) describes it in the same manner, and with his usual precision contends, that it ought to be called a great lake, not a sea. Diodorus Siculus (vol. ii. l. xiv. p. 261.) concurs with them in opinion. Ptolemy, however, maintained its communication with the Euxine, affirming that the waters of both had a subterraneous connection; as, otherwise, it was not to be explained how so many large rivers should flow into the Caspian; for, which there was not one channel out of it. What, it might be said, becomes of the waters of the Volga, the Yaik, the Yenba, the Kur or Cyrus, the Araxes, the Bylal, the Akia, the Kosia, the Terek, and the numberless others that flow into it? By the sun alone they cannot be evaporated; there is no visible outlet for them; and yet the sea is never perceptibly swollen, except merely in the Spring on the melting of the snows. See this subject discussed by captain Perry in his voyage of Russia, p. 102, &c. printed at London in 1716. Those who have recourse to subterraneous passages, by which its water must flow into the Persian sea, or more probably into the Euxine, allege two arguments in support of their opinion. In the first place they say, that the Caspian rises very high with a weedy wind; whereas the Euxine, on the contrary, rages mott when the wind is at eæt: consequently, the eæt wind favours the exit of the waters of the Caspian, and the wind impedes it. But this is one of those fallacies, denounced by logicians, "Causa pro non causa," all the winds that bring humid vapours with them are more stormy than those which proceed from arid regions. But the wind will come hither from the Euxine; just as from the Palus Macedon; and consequently the Caspian must necessarily be put into more vehement agitation by it. Secondly, it is pretended, that this sea has a whirlpool, which, with a horrid noise, swallows up all the superfluous water, and discharges it into the Euxine. In proof of this, it is farther urged, that a species of sea-weed, growing only on the shores of the Caspian, is found at the mouth of this tremendous vortex. To which they add, that near to this vortex is a fort of fish, which is only caught in the Euxine; and lastly, that in former days, a fish was taken in the Caspian sea, with a golden ring about its tail, on which was this inscription: "Mithridates mihi datbat in urbæ Sinope liberta em et hoc domum." See Kircher’s Mundus Subterraneus, lib. ii. c. 15. But later accounts are silent with regard to a whirlpool, the fishes said to be found only there and in the Euxine are yet to be more accurately described; and the story from Kircher has very much the air of a fiction. Sea-weed grows everywhere on the shores of this sea, from Alfrachan to Sulak, and thence again to the Mughanian Steppe. Upon the whole, therefore, we may conclude, that the escape of the waters of the Caspian into the Euxine is an ungrounded hypothesis. Seleucus Nicator, indeed, the first and most sagacious of the Syrian kings, at the time when he was still inundated with the wilder thoughts of forming a junction between the Caspian and Euxine seas by a canal, and of thus extending the trade of his subjects in Europe and supplying all the countries in the north of Asia, on the coast of the Euxine Sea, as well as many of those which stretched eallward from the Caspian, with the productions of India; but his felons failed. See Canal. None of the ancient authors above cited have determined whether the greatest length of the Caspian was from north to south, or from east to west. In the ancient maps that illustrate the geography of Ptolemy, it is delineated, as if its greatest length extended from east to west. In modern times, the first information concerning the true form of the Caspian, which the people of Europe received, was given by Antony Jenkinson, an English merchant, who with a caravan from Russia travelled along a considerable part of its coast in the year 1588. The accuracy of Jenkinson’s description was confirmed by an actual survey of that sea made by order of Peter the Great, A. D. 1718; when it was found to be in length about 1100 versts from the mouth of the Ural to the coast of the Mofanderan; its greatest width from the mouth of the Terek to the extremity of the bay of Mertvoi Kultuyk.
Kultuyk being 8°, rather more than 700 veris. At its southern extremity, from the point of Lekeron to the peninsula, situate at the mouth of the bay of Balkan, it is 8°, somewhere more than 225 veris, and at its greatest width 2° 32' or 225 veris. Its circumference, comprehending the great gulfs, but excluding the little inlets, is 4180 veris.

The Caspian is supposed at a former period to have extended further to the north, where the defects are ill fondy and fertile, and present the same fields that are found in the Caspian; but the chain of mountains which branch from the whole of the Ural to the north of Orenburg, and reaches to the Volga, muft, in all ages, have restricted the northern bounds of the Caspian. In the east this sea is generally supposed to have extended at no very remote period to the lake of Aral; the defects on that side presenting the same features as those to the north, though now an elevated level lies between the sea of Aral and the Caspian. Occasionally perhaps by the quantity of sand rolled down by the Gihon, the Sirr, and other rivers which now flow into the sea of Aral. The coasts of the Caspian northward, from the Terrek towards the west, as far as the cataract extremity of the bay of Mertvoi Kultuyk, are low, flat, swampy, and overgrown with reeds; the water too is shallow. On the other shores from the Terrek to the defect of Korgor near Alfarbad, and from the northern part of the bay of Balkan to that of Mertvoi Kultuyk, the country is mountainous, the shores bold, and the water very deep. The ground in many places, not far from the shore, is so deep that a line of 450 fathoms will not reach it. This sea is the receptacle of many large rivers, as the Emka, or Yemka, the Ural or Yak, and the Volga from the north; the Kuma, Terrek, Kur, and Kizil Ozen from the west; those from the south are inconsiderable: but from the eait it is supposed ill to receive the Tejeen; and of the rivers that were formerly supposed to disemboque into it, several do not exist, such as the Jaxartes and the Oxus (Gihon), which were pretended to flow either from the casl; the latter, in particular, is said to have flowed into it by one or two branches, till it bent northward and joined the sea of Aral. Some writers have reported, as a striking peculiarity of the Caspian, that during 30 or 35 years, its waters are constantly increasing, and then for the same term continually decrease; but this report is not confirmed by any stated observations. This sea has no regular flux or reflux; and, on account of fountains, it is navigable only by vessels drawing from 9 to 10 feet of water; it has strong currents, and, like all inland seas, is subject to violent and dangerous storms, which the Russian vessels, badly constructed, weather with difficulty. The water is in general salt, though not in all places, particularly in those where the large rivers empty themselves into it.

The Caspian has been observed to remain equally full; the true reason of which is perhaps to be sought in the quality of its bottom; which consists, not of a thick slime, but of a shell-fond, the particles of which, touching in few points, render it very porous. Of the fame substance the whole shore is likewise formed. Layer upon layer it lies three fathoms deep. This indeed lets the fresh water through, but it becomes immediately felt again by means of the salt water that prevails upon it. Through this fluid the water is filtered, and falls into the abyss beneath in the same quantity which flows into the sea. In the bay of Emka, above the river Yak, the water is seen. The water that is not let through, it therefore flagellates, and even the fishes putrefy. Its exhalations are extremely noxious. The wind that blows over this bay has been known to come on with such surprising force as to throw down the fennuda of the Russian forts, erected here, with so much violence as to kill them. In this sea there is a considerable number of islands, which are mostly sandy. The Caspian abounds with a great variety of fish. The salmon is as good as that of Riga and Archangel, and even much fishier and fat. The herings too are remarkably large, and plumper than the English and Dutch, but not so tender. To these we may add the hertel, two kinds of sturgeon, seals and porpoises. The birds most generally seen in the vicinity of this sea are hawks, herons, bitterns, fopomials, red geese, red ducks, and many others. The most beautiful of these is the red gourge, which, though so called, is white, with the tips of the wings, the orphs of the head, and feet, scarlet. It is about the size of a hok, has a long neck and high legs, is very favourab to the table, and lives on fish. It may be denominated "Cimba, vel Arica, rothro adunco lato brevi." A species of red wild ducks is also frequent, which fly in the evening to the tops of the trees or the roofs of houses, where they perform a noisy concert. Their flesh is well-tasted, not oily, though, like other water-fowl, they feed on fish. The leeches here are of two kinds, the hog-leeve and the dog-leeve. Their holes have two aptures, one towards the south and the other facing the north, which they open and shut according to the change of the wind. On the shore, between Terrek and Derbent, grows a grass on which all the quadrupeds feed with avidity to the horse alone the eating of it is fatal. They die upon the spot. Peter the Great is said to have caused an experiment to be made in his presence, and the common report was found to be true.

The parts of the Caspian may be divided into Russian, Persian, and Tartar. The Russian ports and trading places are Astrakhan, Gierief, and Kiflar. The Persian havens are Derbent, Nizzabad, Baku, Einzelker, Farabat, Melhetifar, and Alfarbad. The Tartar havens are the bay of Balkan and Manguliak. See each of these respectively.

The commerce of the Caspian is of a very ancient date; though at present it is not so considerable as it might be made. The exports amount in value to about 1,250,000, and the imports to about 1,000,000 of rubles. The articles of exportation are nearly the same with those that find purchasers on the Euxine, (which see); and in return scarcely any thing is taken but fik.

In ancient times Egypt long enjoyed a monopoly of the commerce by sea between the eait and west, and hence it derived that extraordinary degree of opulence and power for which it was conspicuous. The kings of Egypt, by their attention to maritime affairs, had formed a powerful fleet, which gave them such decided command of the sea, that they could easily have crushed any rival in this kind of trade. The Persians, however, though they carried on no commercial intercourse at sea with India, were no less deoruous than the people around them to pouff its valuable productions and elegant manufactures; and accordingly the se were conveyed to all the parts of their extensive dominions by land-carriage. The commodities, defined for the supply of the northern provinces, were transported on camels from the banks of the Indus to those of the Oxus, down the stream of which they were carried to the Caspian Sea, and distributed, partly by land-carriage, and partly by navigable rivers, through the different countries, bound on one hand by the Caspian, and on the other by the Euxine Sea. The commodities, intended for the southern and interior provinces, proceeded by land through the Caspian gates to some of the great rivers, by which they were circulated through every part of the country. This was the ancient mode of intercourse with India, while the Persian empire was govern-
ed by its native princes. In the mean while the monarchs of Egypt were allowed to continue in the un molested possession of the trade with Indry fea: but though the sovereigns both of Egypt and of Syria laboured with emulation and ardour to secure to their subjects all the advantages of the Indian trade, the power of the Romans, by a series of revolutions, proved fatal to both. Having extended their dominion over Syria, they directed their victorious arms against Egypt, which was annexed to the Roman empire and reduced into the form of a Roman province by Augustus. As early as the 14th century the Venetians and Genoese, by means of the Caspian, brought the Indian, Persian, and Arabic commodities, with which they supplied the southern parts of Europe, through Astrachan to their magazines at Azof and Caffa. From Astrachan the goods were conveyed up the Volga, then by land to the Don, and afterwards forwarded down that river to the Azof. The northern part of this continent was likewise supplied, through Astrachan, with Asiatic goods, by the Russian traders, who went to their principal magazine at Wizby, a Hafenic town in the ile of Gothland. The devellations occasioned by the wars of Timur or Tamerlane, towards the end of the 14th century, caued a transfer of this trade from Astrachan to Smyrna and Aleppo; and the Arabian commerce, more commodious for these parts, never returned to Astrachan; but part of the Persian traffic was afterwards reformed to its old channel. While the provinces of Caffan and Astrachan remained under the government of the Tartars, the camp of the khan was a mart for the Russian and Persian merchants. But as, agreeably to the customs of the Tartars, this was frequently changed, Astrachan and Turki became at length two principal places of resort. This commerce, frequently obstruited and interrupted by numerous banditti, was precarious; until the conquest of Caffan and Astrachan opened a ready communication between Moscow and the Caspian Sea; Ivan Vasilievitch II. having garrisoned Astrachan with troops, rendered it the chief emporium of the eastern trade. See Astrakan. This conquest being completed in 1554, soon after the discovery of Archangel, the English obtained the czar’s permission to pass through his dominions into Persia, and to carry on an exclusive trade over the Caspian. In 1558, Jenkinson, the first Englishman who navigated that sea, landed at Mangnifiluk upon the easterne shore, passed by land through the country of the Turkoman Tartars to Bokhara, capital of Great Bucharia, and returned to Moscow in the following year. In 1591 he again failed over the Caspian, and, proceeding to the coast of Shirvan, went by land to Caffin, and obtained from the Soffy permission to trade into Persia. Several merchants followed his example. In 1597, Christopher Barrowks conducted an expedition, which was attended with many dangers, and at length arrived at Astrachan. During these expeditions, the traffic was chiefly confined to the ports of Tauron, Derbent, Baku, and the coast of Ghilan. This infant commerce was much impeded by the banditti that frequented the shores of the Caspian, and by the wars between the Turks and Persians; and therefore during above a century and a half no Englishveil appeared upon this sea. At length, in 1741, the British merchants of St. Peterburgh, at the persuasion of captain Elton, an Englishman in the Russian service, renewed the commerce, and established a factory at Khild in the province of Ghilan. In consequence of some disputes with the Russians, he entered into the service of Nadir Shah, and asisted in constructing some veiils on the Caspian. This circumstance gave umbrage to the court of St. Peterburg; and Elizabeth, in 1746, withdrew her permission to the English merchants of passing through her dominions for the Caspian commerce. On the death of Nadir Shah, who, by Elton’s influence, had permitted the English to trade to Persia, their factory was pitched by one of the pretenders to the throne, and their commerce annihilated.

The Russins pursued, with perseverance, the track opened by our merchants, and under Alexy Michaelovitch, Astrachan became the centre of the Persian trade; to which place merchants from Bucharia, Cem Tartary, Armenia, Persia, and even India, resorted. By the rebellion of the Collacks of the Don, under Stenko Razin, and the devastations occasioned by it, the trade of Russia was annihilated. When this revolt was quelled, the greater part of the commerce fell into the hands of the Armenian merchants established in Astrachan, who settled factories in both the Russian and Persian territories. During this whole period the Russian and Armenian traders penetrated no further than Nizabab, a port between Derbent and Baku; and their chief settlement was at Samske, capital of Shirvan, until the year 1712, when that town was taken by the Ledges, and the factory destroyed. In 1721, this commerce was renewed by Peter I. who obtained the cession of the provinces of Dagefsan, Shirvan, Ghilan, and Masanderan, on the eastern and southern coasts of the Caspian. Soon afterwards he established a Russian merchantable company trading to the Caspian; the whole capital of which consisted only of 400 achins or flowers, of the value of 135 rubles or 5d. each. The chief settlements were formed at Astrachan and Kifhar. At the possession of these distant provinces was very expensive. Anne reformed them to the Soffy, on condition that the Russian merchants should enjoy liberty of trade to all the havens of the Caspian without paying duty, be allowed to build houses and magazines, and be subject to the laws of the country. The privileges of this company were confirmed by Anne and Elizabeth; but in 1762, Catharine II. abolished the exclusive right of this company, and permitted all her subjects to trade with Persia; prohibiting, on account of the numerous banditti that infelt the roads, the inland traffic from Kifhar, and the other Caspian ports to Shamasee. Two Russian castles reside at Baku and Elizaulee. The Armenian merchants, however, carry on a contraband trade, and from their knowledge of the country and language, under-riiff the Russins. See Astrakan. In the year 1760, the exports and imports of the whole commerce, both by sea and land, to and from the Caspian Sea, amounted only to about 400,000 rubles; in 1768, to upwards of 350,000; and in 1775, to more than a million of rubles; without reckoning the contraband trade. At present it may be estimated at the same amount.

The fishery on the Caspian is the most important branch of this business in Russia. This is owing in a great measure to the excellent kinds of fish with which it abounds, to its commodious situation in the centre of the empire, facilitated by water communications, and the advantageous method in which this trade is prosecuted. Pallas observs, that the fishery on the Caspian is in some respects as important to Russia as the herring, the cod, and the whale fishery are to other maritime powers of Europe. The fishery on the northern or Russian shores of the Caspian is partly let out to merchants of Astrachan, whose great opulence is founded on it; and it partly belongs, in virtue of ancient privileges, to the Urallian Kozsks or Collacks. See Astrakan and Urals.

As the Caspian is usually free from ice towards the latter end of March, the fishery commences about the middle of March or beginning of April; and it is carried on by several contractors,
contradictions, each of whom has his particular station or "vataga," commonly bearing the name of the proprietor. Every vataga is occupied by from 50 to 80 to 120 men, most of whom carry on a separate trade; and here are also pilots, fishermen, farters, preparers of ingsluts and cavear, &c. The vatagas have also their own vessels of various dimensions and constructions; and near the habitations of the people that are employed are several fhefs, where the races are prepared, the ingluts dried, and the block of fish kept in order. For preserving the salted fish, deep and well-secured ice-cellarfs of considerable magnitude are dug under ground, and they are furnished with large reaefs, in which the fresh fish are picked in a strong hine. There are various other conveniences adapted to the necessary operations. The taxes paid by the vatagas to the crown are rated according to the quantity of prepared races and ingluts; and for every pound of ingsluts free rubles, but for a pound of races two rubles 8o Kopeeks are paid into the caife. In autumn and winter only the beluga is caught, which then collect into the bays, either for palling the winter or to spawn. About the middle of March, when the sea begins to be free from ice, myriads of little fish drive towards the shore, and of these the "olila," a fort of scale-fish, is caught and kept alive in wells, in order to furnish a suply for baiting the hooks while the season lasts. This fry is followed by prodigious swarms of ravenous belugas; and whilst this swarming lasts, a vein may bring up within 24 hours 50 of them and more. The beluga is caught by means of a machine consisting of a rope 70 ells in length, to which 150 lines of the length of 1 fathom each, with as many large angling-hooks, are tied. This rope with its hooks is technically termed a neal, and 50 of these neals tied together commonly belong to a machine, which is therefore several hundred fathomfs in length. Between every two neals a done is tied of some pounds in weight, and the two ends of a whole machine are furnished with wooden anchors. The machine, when laid, is visited twice a day, and the hooks cautiously taken up along the rope. Pulling a rope through the gills of the fish brought up, they let them down again into the water in order to bring them on flore alive. Here they are dragged with hooks to the beach, which is laid with planks, and cut up in the following order: the lower part of the flomach, with the guls, is thrown away; the fishy gellet is salted for eating; the roe lies through the whole body adjoining to the entrails; this is taken out with the hand and cut into tubes, in which it is carried away by the canever-makers; then follows the float or founds, which runs along the whole back, and is given to the ingsluts-makers. Lastly, they cut off the cartilage of the back, in order to extract the doral fins, which are washed, hung upon poles, and dried in the air. The fish, being cleared of its entrails, the fat adhering about the meat and to the fins is scraped away with knives, collected into tubes, boiled down, and cleansed. This fresh fat, being of a good taste, is used during the fools instead of butter or oil. The cleansed fish are at last brought into the cellar above described, pickled in brine, and then frozen with salt, and laid up in courses on each other. When the freezing of the beluga has ceased, the train of the ingsluts comes on, which happens only once a year and lasts not much above two weeks. At one vataga, it is usual, with a favourable sea-breeze, to catch 16 and sometimes 20 thousand of these fish. The nets made use of for this purpose are so thick that the machines are only a span wide. Twenty-five of them are tied together and laid at the depth of one fathom on sunk pofts, as the fervugas go to shallow places. The largest of these fish are never above 4½ ariehus (each arieh 28 English inches); but their roes, as well as their founds, are much more esteemed than those of the beluga, and consequently bear a greater price. The fish is partly salted down, and partly dried in the sun. In May, when the spring-capture on the sea-coast is over, the fishermen repair with their goods to Astrachan, where they are laid up in the store-cellarfs, and thence disposed of wholly to the merchants of that city. The autumn-capture begins in the middle of September, and continues through the whole of October. The winter-capture begins as soon as the ice is set on in the sea, and lasts the whole winter. For taking the beluga in this season, the machine with the angling-hooks already described is set under the ice; through which apertures are cut at the distance of eight paces asunder, and through these the rope is introduced, by means of long poles. When two neals are tied together, the machine is fastened to a crosspole, which rests on the brink of the aperture. The fish, when taken, are conveyed over the ice on sledges to the vataga, and thence carried to Astrachan. Besides the great vatagas, the proprietors of them have fishing-huts in different places on the sea-coast, where there is no capture of lucrative, at which, mostly in summer, fish and barbels are taken with drag-nets. The lands here usually weigh eight pounds (of 20 pounds each), and the barrel a pound and a half; the former are extremely fat in summer. The roes of this fish are thrown away, but of its founds an ordinary fort of fish glue is made. For an account of other fisheries in the rivers that run into the Caspian Sea, see VOLGA and URAL. See also ASTRACHAN. The seal-capture, which is carried on by the more opulent part of the Astrachan merchants on the Caspian, is likewise very profitable. The seals are killed in spring and autumn on the islands, where they are immediately gutted and powdered with salt, and then brought to Astrachan, where they are salted, and the tallow of them is melted. The Astrakhanfs by salting their feals immediately on the spot gain this advantage, that the tallow is much cleaner and better than that of the seals taken at Archangel. The fishermen affirm, that the Caspian is incomparably richer in feals than any other sea on the Russian coasts. Robertson's India. Coke's Travels in Russia, vol. iii. Tooke's View of the Russian Empire, vol. i. and iii.

CASPRAIN Gates, Cafsfic Pyle, or Cafsfic Ports, in Ancient Geography, denote passes that lie between the mountains of Caucasus and the Caspian Sea. The name of Caspian or Alazanian gates is properly applied to Derbend, which occupies a short defile between the mountains and the sea: the city, if we give credit to local tradition, had been founded by the Greeks; and this dangerous entrance was fortified by the kings of Persia with a mole, double walls, and doors of iron. The Iberian gates, sometimes called by geographers with the Caspian, are formed by a narrow passage of six miles in mount Caucasus, which opens from the northern side of Iberia or Georgia, into the plain that reaches to the Tanais and the Volga. A fortress, designed by Alexander, perhaps, or one of his successors, commanded that important post. Procopius, with some confusion, always denominates them Caspian. This pass is now styled "Tatar-topa," the Tatar-gates.

CASPIS, a people who inhabited the environs of the Caspian Sea, called "Caspia regio," to the west and the east of the river Cambyses, between the Sopyrri and the Caspian Sea. They occupied also the country towards the north of this sea; and to the east of the Tigris, between Parthia and Media.
CASPIRA, now Cashmere, a town of India on this side of the Ganges, near mount Emnodus, and towards the north of the source of the Hydaspes. See Cashmer.

CASPIRAS, a people of India on this side the Ganges, to whom Ptolemy has assigned 16 cities, of which Cragaun was the capital.

CASPIRIA, a name given by Ptolemy to the Fortunate Islands, situate in the Atlantic ocean.

CASPIRUS, a town of Asia on the frontiers of India, in the country of the Parthians, according to Herodotus, (cited by Steph. Byz.), who calls it Caspius.

CASPIUS, the Caspian mountain, a name given by Ptolemy to a mountain which bounded the Greater Armenia. The ancients gave this name to two mountains; one, just mentioned, bounding Armenia; the other in Parthia.

CASQUE, in Conchology, a term among the French, synonymous with the Latin Cassilia, a genus of the univalve shells established in the new System of Bruguière for the reception of a particular family of the Linnean Buccinum. See Buccinum in article Conchology.

CASQUE, in Military Language, a small beginning. See Cask.

CASK, a town of Persia, in the province of Meccan; 185 miles W. of Meccan.

CASKONI, a canton of Golof, the department of the island of Corsica, according to the French arrangement, including 1,112 inhabitants.

CASSADA, or CASSAYA, in Botany. See Iatropha Manihot.

CASSAGATH, in Geography, a lake of North America; N. lat. 62° 33'; W. long. 166° 15'.

CASSAGNAS, a town of France in the department of the Lozere, and district of Florac; eight miles S.E. of Florac.

CASSAGNES, BEGONZ, a town of France, in the department of Aveyron, and chief place of a canton in the district of Rodes or Rhodes; 10 miles S. of Rhodes. The place contains 1,432, and the canton 7,208 inhabitants; the territory comprehends 217,470 kilometres and 223 communes.

CASSALAGAS, a town of Spain, in Old Castile; four leagues from Talavera.

CASSAMUNAIR, or CASSUMUNAIR, in the Materia Medica, an aromatic vegetable drug, brought from the East Indies, highly valued as a nerve and tonic, and reputed a specific in epileptic and convulsive diseases. It is supposed by some to be a species of galangal, and by others of zedoary: its true name is not known, that of Caffamunair being apparently feigned to hide it; of late it has been imported by the name of benzoin.

CASSANA, NICOLÒ, called NICOLINO, in Biography, a painter of history and portrait, distinguished by the beauty of his colouring, and the gracefulness of his figures, was born at Venice in 1659, and received instructions from his father Giovanni Francesco Cassana, a Genoese, who had been taught the art of painting by Bernardino Strozzi. At the court of the grand duke of Tuscany, whither he was invited, he distinguished himself by the portraits of that prince and his confidants; and during his residence at Florence, he painted several historical subjects, of which the most considerable feoms to have been the conspiracy of Catilina, consisting of nine figures as large as life, drawn to the knees; the two principal figures being represented as with one hand joined in the presence of their companions, and holding in the other a cup of blood. Nicolo was also invited to England with flattering promises of encouragement; and on his arrival was introduced to queen Anne, whose portrait he painted, and who distinguished him by many tokens of favour: but his good fortune was of no long duration, as he died in London in 1713, universally regretted. Pilkington.

CASSANO, GIOVANNI ANTONINO, called L'Abate Caffana, the younger brother of the preceding, was born in 1661, and after receiving the rudiments of his education from his father, finished his studies at Venice, where his brother Nicolò resided for some time. Although he was a good portrait or historical painter, he declined interfering with his brother in these departments of his art, and restricted himself to the representation of animals and various fruits, in which he excelled. His pictures of these classes are frequent in the collections of Italy, and sometimes ascribed to Castiglione. He closed his life at Genoa, after having indulged a liberality and profusion, which his circumstances did not warrant, in neglect, indigence and wretchedness. He had a sister, Maria Vittoria Caffana, who painted images of devotion for private amateurs, and died at Venice in the beginning of the 17th century. Pilkington.

CASSANDER, a king of Macedon, was son of Antipater, and one of Alexander's chief captains. Upon the death of Alexander, and the subsequent division of his empire, the province of Caria was assigned to Cassander, and he was also appointed by his father general of the horse. When Antipater died, in the year B.C. 319, he bequeathed his high offices of protector and governor of Macedon to Polyperchon; by which preference the remission of the ambitious Cassander was routed, so that he soon began to form a party for the subversion of the new protector's power. Accordingly he withdrew to the court of Antigonus, and having obtained some succours from him, failed for Athens, and secured it. He afterwards marched to Macedon, for the purpose of opposing the tyranny of Olympias, widow of Philip, and mother of Alexander; and having besieged her in Pydna, he took possession of the place, and ordered her to be put to death. After her death, he sent Roxana and her son Alexander to Amphipolis, where they were made Prisoners; and thus set aside the line of Alexander, in Macedonia, his own country. Cassander having provided for his own safety, affirmed the government: built a new city in Pallene, which he called Cafsandria, repaired many others, and by various measures manifested his inclination to restore peace and plenty to his native country. Having established tranquillity in Macedon, he returned into Greece in order to drive from thence Polyperchon, his son Alexander, who was protected by Antigonus, and his other enemies. In the mean while he rebuilt Beotian Thebes, which had lain in ruins about 20 years, and caused it to be re-inhabited. After various military contests, the captains of Alexander became weary of the wars in which they had engaged with each other, and therefore unanimously desiring peace, it was easily concluded on the following conditions; viz. that each of them should retain possession of the provinces which they belonged to them; that the Greek cities should be free, and that they should be friends, and allies of each other. Cassander, in order the more effectually to secure himself in the possession of Macedon, put to death Roxana and her son Alexander, whom he had kept in a state of confinement;
CASSANDRA, in Entomology, one of the Fabirician species of Phalarna, (Bombyx), decribed from the Hunterian museum. The wings are ferruginous, with darker streaks; anterior part of the thorax chestnut.

Obf. Cramer describes a variety of the Fabrician bombyx erythrina as a distinct species under the name of cefandria.

CASSANDRA, Gulf of, in Geography, a bay on the coast of Europe, in the north-west part of the Archipelago, east of the gulf of Salomiki. It is so called on account of a small island of the same name that lies at its extremity; and it was formerly called "Toronacius Sinus." N. lat. 42°. E. long. 23° 44'.

CASSANDRA Nyma, a town of European Turkey, in the province of Macedonia, situated on the north coast of the entrance into the gulf of Salomiki; 15 miles E. of Salomiki.

CASSANDRA, in Fabulous History, daughter of Pram, king of Troy, and Hecuba, who is said to have received the gift of prophecy from Apollo, on condition of gratifying his passion. Having obtained the gift, she violated her engagement; and Apollo, being thus deceived, instead of revoking the gift, cau{ed her to be considered as mad, and her predictions to be disregarded. Many of the predictions, which she delivered, during the impending calamities of Troy, were afterwards verified in the event. During the sack of that city, she fled for safety into the temple of Minerva, where she was barbarously violated by Ajax, the son of Oileus. See Ajax Oileades. In the distribution of the plunder of Troy, Cassandra fell to the lot of Agamemnon, who took her home, where she excited the jealousy of Clytemnestra; so that she fell a victim, on occasion of the affiliation of that prince. Cassandra was singularly beautiful, and had many suitors of distinguished rank in the flourishing time of Troy. She had a temple at Leucra, in which a statue was erected to her honour, under the name of Alexandra, by which appellation she was as well known as by that of Cassandra. This appears from Lycephon's poem, still extant, entitled Alexandra, because it is a prophecy made, as the poet supposes, by Cassandra. This poet also speaks of a temple of Cassandra built by the Damnians, and by the inhabitants of the city of Dardanus; where her statue was re-erected to an asylum by young women who rejected their suitors on account of their uncles' death or men's extraction. Plutarch says, that there was in Thalamus, a city of Peloponnesus, an oracle of Paphos; and that, as some writers reported, Cassandria died in that place, and was called Paphos, because she delivered oracles to all who consulted her. See DICTUS.

CASSANDRIA, in Ancient Geography, a maritime town of Macedonia, more anciently called Paphos, and rebuilt by Cassandra, whom it derived its name. See CASSANDRA.

CASSANDRA, in Geography, a town of Dutch Flanders, in the island of Cassandria; one league N. of Sluys.

CASSANITAE, in Ancient Geography, a people of Arabia Felix, on the banks of the Red Sea.
CASSANO, in Geography, a town of Naples, in the province of Principe Ulta; 12 miles W. of Conza.—Albo, a town of Naples, in the country of Bari; 15 miles S. of Bari.—Albo, a town of Naples, in the province of Calabria Cuts, the ice of a fountain, infarrant of Cosenza; 21 miles N.W. of Rosello. N. lat. 30° 55'. E. long. 16° 30'.—Albo, a town of the duchy of Milan, seated on the Adda; 16 miles N.E. of Milan. N. lat. 45° 20'. E. long. 10°.

CASSARANO, a town of Naples, in the province of Otranto; 8 miles W.N.W. of Alessano.

CASSAREEN, the ancient Colonia Scalitana, memorable for the martyrdom of its citizens, a town of Africa, in the inland country of the ancient Bizantium, and present kingdom of Tunis, seated on an eminence, 6 leagues W.S.W. of Spalita. The river Derb runs winding below it; and upon a precipice that hangs over this river is a triumphal arch, with an attic structure above it, with some rude Corinthian-like ornaments upon the entablature, though the pilasters are Gothic. In the plains below Cassareen are several Mausolea, from which the town is laid to derive its name; these appearing at a distance like to many Cassareen, i.e. towers or forts.

CASSATION, derived from the Latin quasit, to quaff, or shock down, in the Civil Law, the act of abrogating, or annulling any act or proceeding. In the occurrences of cassation are, 1st, when a decree is directly contrary to another decree; and both against the same party. 2dly, When decrees are directly contrary to the express decision of flates or customs. 3dly, When the formalities prescribed by the laws have not been observed.

CASSE, in Military Language, a breaking or caatinger, is a disgraceful or an ignominious deprivation of, or dismission from, any military office, rank, situation, or employment.

This punishment has been and may be extended to an entire corps, to a company, to an officer, to a non-commissioned officer, or to a soldier of a chosen or select company.

To break or caftinger a body of troops, as a regiment or a company, for example, is to degrade and depose or dismiss it after having adjudged it guilty of an offence that renders it unworthy of serving its country.

To break or caftinger an officer, is to deprive him of, or dismiss him from, his employment, because his conduct and behaviour have been unworthy of, or unbecoming the rank he holds, or because he has been guilty of some great offense against military discipline.

To break or caftinger a non-commissioned officer is, to withdraw from him the authority he was entrusted with, to deprive him of the employment he filled, and to reduce him to the condition of a common soldier.

And to break or caftinger a soldier or member of a chosen, particular, or select company, as a grenadier, for instance, is to send him back to the company from which he was taken or selected, after showing him to be undervaluing or unworthy of the distinguished situation he was placed in.

The practice of breaking or caftinger whole regiments or companies ignominiously, for misconduct or misbehaviour, is now, however, and perhaps, with reason, altogether laid aside. For, to let a regiment or company behave ever so ill, it rarely, or rather never happens, that every individual in it is in fault. Some other military punishment should, therefore, be adopted, that has a tendency to make those in a company or other body of troops, who are naturally disposed to behave well, feel interested in the good behaviour of the rest, and act as a check on them. The Romans had a practice which was admirably calculated to produce this effect. When a maniple, cohort, or other body of their troops beha

...
CASSERIUS, Julius, in Biography, a distinguished anatomist of humble parentage, but of great talents, was born at Placentia in 1545. His genius leading him to the study of anatomy, he went to Padua, and became a servant to Fabricius, who, discovering his propriety, made him his pupil, and, in succession, his assistant, and, at length, coadjutor in the professorship of anatomy. To this honour he was preferred in the year 1609, and he continued to fill the office with credit until the year 1616, when he died. As his diligence and industry equalled his genius, he became, in a few years, more knowing and skilful in his profession than his preceptor. Fabricius, in the opinion of Dougla, excelled in philosophy, Cafferius in anatomy. This excited, however, no jealousy. Fabricius, who was far advanced in years, was well pleased with the prospect of leaving a successor, so well qualified to advance the knowledge of the art; but in this he was disappointed, as he surmised his pupil by more than three years. He was succeeded by Spigelius, who had been their common pupil. Of Cafferius's anxious desire to leave behind him a name, we have numerous proofs. Almost the whole of the revenue he obtained by teaching anatomy was expended in procuring subjects for dissection, and in paying draughtsmen and engravers to delineate figures of such parts of the body as he either discovered, or thought he had Fuller conceptions of than his predecessor. In the presence of his anatomical works he is not backward in affirming that he has furnished future anatomists with delineations of the parts of human and animal bodies, exceeding in elegance, perspicuity, and correctness, all that had preceded them. It will be observed he made use of animals, not as successes, but only to enable him to discover minute parts which were not readily distinguishable in the human body. In giving this account, principally from Dougla's Specimen and the Diet. Hist. of Med. Elyot, we cannot help observing in how many points, in genius, in industry, and zeal for the advancement of the art, a late celebrated anatomist, Mr. John Hunter, resembled the character we are here depicting. The title of his first work, published in 1652, is, "De Voscis Audituque Organis Huius Anatomica, &c. Trajecti duobus explicata," Ferrara, fol. Figure partim tam in honore quam in multis aliis animantibus, tabulis 53 comprehendunt."

He here lays claim to the discovery of a muscle, moving the maleus, one of the osseous auditis. He also improved. Haller says, the anatomy of the larynx.

"Punctuallipherfeion, id est, de quinque Sensibus Liber, Organum Fabricam, Actionem et Usum continens, Venet. 1659, fol. Iconibus fidicier oxe incis illustratum." This is an extension of the former work to the retic of the fences, executed with equal skill. They have both been several times reprinted. It was not until some years after the death of Spigelius, which happened in 1652, that the remainder of Cafferius's works, consisting of 78 anatomical plates, with the explanations, was published. Bucretius, to whom Spigelius had left the care of his productions, incorporated the works of Cafferius with them, and published them together in royal folio, in 1627, at Venice. Two of the plates by Cafferius, viz. one representing the phalanges, and another the tympani, are printed with Spigelius's work, "De Formato Fumico," fol. 1627. Dougla, Bib. Anat. Spec. Histor. Bibl. Anat. Elyot, Diet. Hist.

CASSETTES, or Coffins, in the Manufactory of China Ware, are utensils made of Stourbridge or other good potter's clay with a third of sand, in which the China ware is baked. They are generally made of a round form, with a flat bottom. They are either turned or formed in a mould. See Porcelain.

CASSI-a-oficer, a name given to the grand provost of the Turkish armies.

CASSIA, in Botany, (κασσά, Diosic.; κασσια, Theophrast.) in its original acceptation, is the name of an oriental shrub, the bark of which has been held in high estimation, from the earliest antiquity, on account of its aromatic qualities, which resemble those of cinnamon. The grammarians who for the most part think it better to invent a bad etymology than go entirely without one, tell us, that it is called ταται to κασσια, ab orando, quasi κασσαίοις, κασσαίοις, κασσαίοις, κασσαίοις, quod huic fragrantissimae venustatis. But the word is indifferently of Asiatic origin, and was brought into Greece, along with the commercial article which it denoted, by the Phoenician merchants. It is no other than the τάται, kethel, of the Hebrews and other orientals. In the books of the Old Testament it occurs, indeed, only once, and that in the plural number. "Thou lovest righteousness and hatest wickedness: therefore God, thy God, hath anointed thee with the oil of gladness above thy fellows. All thy garments shall smell of myrrh and aloes, and cassia." Ps. lxi. 5, 8. This psalm, we apprehend, may be referred without hesitation to the reign of Solomon. The plural termination was probably
CASSIA.

bably adopted by the Hebrews, on account of the small detached pieces into which the bark was usually divided when it came into the hands of the merchants; but the seventy in conformity with the general usage of Greek writers, give it in the singular number and with a fuggle σ, which appears to be the original orthography. But though the Phoenicians communicated the name to the Greeks, they did not themselves adopt that by which this precious commodity was known in its native climate. In the Hebrew language, of which the Syro-Phoenician is only a different dialect, the verb יָּשַׁר signifies to strip any thing of its covering; and thence was naturally applied to a figurative term to denote the bark of a tree separated from the trunk; and the high value which was set on the aromatic bark brought from the remotest regions of the then known earth, might as naturally cause it to be called bark by way of eminence; in the same manner as another kind of bark is thus distinguished in modern times. The word caffia occurs in two other passages of our common translation of the Old Testament: Exod. xxx. 24. Ezek. xxvii. 19.; but in thebe the original כָּשַׁה, which the Septuagint in Exodus renders φυκόν, in Ezekiel appear not to have had in their copies. It was probably somewhat different from Caffia; but from its connection in the book of Exodus with myrrh, cinnamon, and sweet calamus, appears to have come from the same family, and to have poleilized similar properties.

This oriental aromatic is the caffia of modern cookery, but not of modern botany. We must, therefore, refer for its character and history to the article laurus, under which genus it is now placed.

The naturalist has often reason to lament that travellers and merchants have given the name of one thing long known to another recently discovered, on account of a real or fancied resemblance in a figure particular, although in every other respect it is entirely different. Such has been the fate of Caffia. The Romans used the word with considerable latitude. When Virgil, extolling the simple fare of the happy husbandman, says,

"Nee caffia liquidi corrositum usus olivi,"

he cannot be supposed to speak of the caffia which he mentions in his second eclogue, as interwoven with the flowers of the violet, poppy, narcissus, and sweet-smelling anise in the garland made for Alexis by the naiad. In the former passage he undoubtedly alludes to the aromatic bark which the luxurious citizens of Rome infused in their table and culinary oil to give it a grateful smell and flavour. In the latter he must have intended some odoriferous herb, or shrub, which is a native of Italy; but by what name it is now known cannot easily be determined.

In the middle ages, the Arabian and Greek physicians, as appears from the writings of Avicenna and Myrephus, acknowledged two kinds of caffia; one, caffia aromatic, a native of India, the caffia of the ancients; the other, caffia foliata, a native of Egypt, totally different in its general appearance, botanical characters, and medical qualities; and which appears to have been honoured with the same name as that which from time immemorial had distinguished the precious oriental spice, merely on account of its pleasant smell; for we are informed by Alpinus, that when he was in Egypt in the latter part of the sixteenth century, the natives took great delight in walking early in the morning in the spring leaen near plantations of this kind of caffia, and regaling themselves with the fragrance of its flowers. To this species, and its numerous congener, the term caffia, as a generic appellation, is confined by modern botanists.

cce, Linn. Leguminosae, Juss.

Gen. Ch. Cal. Perianth five-leafed, (five-cleft, Gart. Juss.) lax, concave, coloured, deciduous. Cor. Petals five, roundish, concave; lower ones more dilant, more spreading, larger. Stam. Filaments ten, declined; the three inferior ones longer; three inferior anthers very large, arcuate, beaked, opening at the tip; three lateral ones without a beak; three upper ones very small, barren. Pjfl. Germ somewhat cylindrical, long, pedicelluted; style very short; stigma exerted, ascending. Peric. Legume oblong, with transverse partitions. Seeds several, roundish, affixed to the upper future.

Eff. Ch. Calyx five-leafed. Petals five; three upper anthers barren; three lower ones beaked. Fruit a legume. Obi. Tournefort divided the genus into two; caffia with oblong legumes, entire partitions, and generally pulpy cells; and fenna, with gibbous, infected partitions, and very thin partitions. Gartner has adopted his two genera with the following essential characters.

Caffia. Flower as in fenna. Legume long, cylindrical, woody, not opening by valves, many-celled; cells filled with pulp. Seeds albuminous; albumen with a chink on each side. Embrio straight.

Sp. 1. C. diphylla, Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. (Niella-wari Indorum, Burm. Pl. Ind. 94.) "Leaves conjugate; stipules cordate-lanceolate." A shrub. Stem cylindrical. Leaves on a short petiole; leaflets two, semi-ovariable, oblong, dilated. Stipulae covering the branches. A native of the East Indies. La Marck observes that it must have been marked as an annual in the Species Plantarum by mauleuse; for no shrub can be an annual. 2. C. Abus, Linn. Sp. Pl. 2. Mart. 3. Lam. 2. Willd. 2. (Senna quadrifolia, Burm. Zeyl. 212. tab. 97. Senna exiguus, &c. Pluk. alm. 341. tab. 62. fig. 1. Loto affinis Aegyptica, Bauh. pin. 532. Abusus, Alp. Aeg. 97.) "Leaflets in two pairs, inerely egg-shaped; with two awl-shaped glands between the leaflets." Root annual. Stem herbaceous, scarcely a foot high, weak, villous, branched. Leaves alternate. Flowers reddish, marked with purple veins, axillary, two or three together; peduncles shorter than the leaves. Legumes about an inch long, compressed, hispid. Seeds from four to six, blackish, shining. 3. C. omissa, Linn. Sp. pl. 2. Mart. 4. Lam. 3. Willd. 3. Brown. Jam. 233. Suse Jam. 2. 49. tab. 189. fig. 6, 7. Swartz obf. 156. "Leaflets in two pairs, ovate-oblong, acuminate; with an oblong gland between the leaflets; and an obsolete, three-toothed spine, or callous scale under each petiole." A shrub. Stem forty or fifty foot high, inflated, stiff; branches diver- cated, loose, stiffly, round, inflated, smooth, fimbriate when old. Leaflets petioled, entire, nervet, veined, very smooth; lower pair bent down, spreading; upper pair bent down perpendicularly, approximating; general petals thickened at the base, round, usually directed one way. Flowers numerous, large, in axillary racemes, on long peduncles; calyx leaves egg-shaped, reflexed, spreading, small, pale green; four upper petals smaller, egg-shaped, with claws; the fifth largish, concave; germ linear, longer than the corolla, curved back. Legume short, compressed. Swartz. A native of Jamaica in the woods of the higher mountains, in the anterior of the island. 4. C. batillaris, Linn. jun. Supp. p. 231. Mart. 2. Lam. 4. Willd. 4. (C. fruticosa, Mill. dict. 10. Mart. 39. C. americana tetraphylla, Houft. Reilq,
Cassia

Reliq. tab. 17) "Leaflets egg-shaped, oblique in two pairs, with an obtuse gland between the small; racemes axillary, penduncled; legumes cylindrical, long." A shrub, twelve feet high, very much branched. Leaflets alternate, trifoliate; leaflets smooth on both sides; lower ones exactly egg-shaped; upper ones more elongated. Stipules minute. Flowers yellow, of a middling size; racemes solitary, few-flowered, erect; pedicel dependent, angular. Leaves so like that of C. fistula as not to be distinguished from it. A native of Surinam and Vera Cruz. Miller attributes terminal racemes to his C. fistula, but as La Marck refers Linnent's figure to basilicaris, and as Miller's description agrees sufficiently with that of the younger Linneas, we have ventured to consider them as one and the same species. C. arborea, (C. arboreus, Mill. 40. Mill. dict. 15. Hooff. MS.) "Leaflets in two pairs, oblong-egg-shaped, vilous underneath; flowers in corymbs; stem erect, arborescent. Sometimes twenty-five or thirty feet high, much branched. Leaflets on long petioles; leaflets four inches long, near two broad. Flowers deep yellow, inclining to orange, lateral and terminal; lateral ones few, scattered; terminal in large round branches, proceeding from one centre. Legumes near nine inches long, compressed, with a border on each side. Seeds oval, smooth, compressed. A native of Vera Cruz. 6. C. tetraphylla, Linn. 24. (C. procumbens, Mill. dict. 20. Hooff. MS.) "Leaflets in two pairs, egg-shaped; flowers yellow, axillary; legumes bifluate; stems procumbent." Root annual. Stem about two feet long, herbaeous. Leaflets on long petioles, at a considerable distance from each other. Flowers pale yellow. Leaves short, flat. Stems flat. A native of Vera Cruz. 7. C. tagetes, Linn. Sp. Pl. 5. Lam. 6. Wildfl. 5. (V. Tagetes, Rheed. Mal. 2. p. 103. tab. 52. Ral. hist. p. 1743. Caffia 6. Senna spuria, &c. Ann. herb. 633. 53.) "Leaflets in three (two) pairs; gland petiolar; stipules ciliate, heart shaped, acuminate." Linn. "Leaflets in two pairs, inerexy egg-shaped; peduncles one-flowered, very short; legumes narrow, linear." Lam. A shrub. Stem procumbent; branches silky. Leaflets, four, semi orbicular, veined, the two outer ones larger; petioles very short. Linn. Stem three or four feet high, hard, cylindrical, greenish. Leaves alternate; leaflets thickish, flat, with parallel nerves, the two upper ones largel. Flowers yellow, axillary. A native of Malabar. La Marck questions whether his plant be the tagetes of Linneas, and observes that it is distinguished from the next species by the number of its leaflets. We are persuaded that tripus is in Linneas's specific character is merely an error of the press. 8. C. tora, Linn. Sp. Pl. 5. Mart. 6. Lam. 7. Wildfl. 6. (Senna orientalis, tala Zeylanicum Henn. Lugd. 557. Ral. hist. 1743. Galaga indica, Ral. hist. 911. Gallinaria rotundifolia, Rumpl. Amb. 5. p. 283; tab. 97. fig. 2. Caffia filiga from Grezzi, Plum. spec. 18. tab. 76. fig. 2. Caffia filiga quaeratur, Dill. Elth. 72. tab. 73. fig. 73.) "Leaflets in three pairs, inerexy egg-shaped; outer ones larger; an awl-shaped gland between the four lower ones." Linn. "Leaflets in three pairs, inerexy egg-shaped; peduncles short, generally one-flowered; legumes linear, long, very narrow." Lam. Root annual. Stem from one to two feet high, herbaceous, upright, cylindrical, sometimes simple, more frequently branched, smooth. Leaves alternate; leaflets smooth, somewhat glaucous, with a pointed gland between each of the lower ones; stipules linear, bristle-shaped, a little villous. Flowers yellow, axillary. Legumes from four to six inches long, with a small border on each side, more or less curved, smooth. A native of the East Indies. 9. C. limoniflora, Lam. 8. Miller dict. tab. 82. "Leaflets in three or four pairs, inerexy egg-shaped, very obtuse; smooth; racemes penduncled, elongated, axillary." Nearly allied to the preceding, but easily distinguished from it by the inflorescence. Root annual. Stem a foot and a half high, smooth, clustered to the summit, somewhat branched. Leaves becoming larger as they proceed from the root; lower ones with only one pair of leaflets, those above with two, those still higher with three, and those near the summit sometimes four; stipules awl-shaped. Flowers yellow; from seven to ten together in penduncled axillary racemes. Found by Dombey about Lima. 10. C. bicapsularis, Linn. Sp. Pl. 6. Mart. 57. Lam. 9. Wildfl. 7. (C. hexapetalus; filica bicapsulati, Plum. spec. 18. Barm. Amer. tab. 76. fig. 1.) "Leaflets in three pairs, inerexy egg-shaped, smooth; inner ones rounder, with a globular gland between them." A shrub. Stem six or eight feet high, singed, branched near the summit; branches cylindrical, somewhat Leaflets alternate. Flowers bright yellow, vented; from three to five together in axillary, penduncled racemes, held longer than the leaves. Legumes, according to Pluurn, long, cylindrical, divided in their whole length into two cells, forming contiguous tubes. La Marck, from a living plant in flower, but not perfecting its fruit. A native of South America. The bicapsularis of Millar is an annual plant, a foot and half high; with a erect, herbaceous stem, three pair of oval leaflets to each leaf; the flowers yellow, small, axillary, solitary; pods taper, a native of the West Indies and Madeira. It must therefore, as professor Martyn observes, be a different species. 11. C. emarginata, Linn. Sp. Pl. 7. Mart. 8. Lam. 10. Wildfl. 8. (C. minor hexaphylla, foma folis, Sionen Jan. 2. p. 44. tab. 182. fig. 1, 5, 34. Brown Jan. 22. 7. Swartz. Obs. 157. C. racemosa; Mill. Dict. 19.) "Leaflets in three pairs, egg-shaped, rounded, emarginate, equal." Linn. "Leaflets in three or four pairs, egg-shaped, almost entire; flowers in irregular racemes, stem arborescent." Swartz. A small tree. Trunk ten or twelve feet high; branches round, ash-coloured, pubescuent. Leaves scattered, spreading; on round pubescent petioles, two inches long; leaflets petioled, blunt, nervet, thickish, tormentos, hoary underneath. Flowers yellow; racemes axillary, solitary, spreading, shorter than the leaves, many-flowered; three leaflets of the calyx larger, ovate-oblong, spreading, concave-arched, pubescent on the outside; petals unequal; upper one larger, in shape of the letter S placed obliquely, concave, waved at the edge; filaments very short, equal, awl-shaped; anthers thick, curved in, fertile. Leaves flat, broad. Swartz. A native of Jamaica, where it is called the wenn tree. Its leaves are purgative, and are sometimes used instead of the true fenna. The pulp of the leaves has the fame flavour and the fame medicinal qualities as cahia fistula. 12. C. obtusiflora, Linn. Sp. Pl. 8. Mart. 9. Lam. 11. Wildfl. 9. Swartz. Obs. 139. (C. americana folis subtundmis, Tourn. 6. 9. C. fustida; Dill. Elth. 71. tab. 62. fig. 72. Senna minor, Sionen Jan. 2. p. 47. tab. 185. fig. 53.) "Leaflets in three pairs, egg-shaped, rather obtuse." Root annual. Stem two feet high, cylindrical, smooth, greenish, herbaceous but strong, branched. Leaflets a little narrowed towards the base. Obtuse, with a small point at the summit, green, soft; upper ones larger; petals one a villous; a conical gland between the lower pair. Flowers in short axillary racemes near the top of the stem and branches. Lam. A native of the West Indies. 13. C. senanaitis, Wildfl. 10. Icar. rar. 1. p. 79. Collect. 1. p. 74. "Leaflets in three pairs, elliptical, obtuse, with a gland between the lower pair." A tree. Stipules awl-shaped. Leaves alternate. A native of the East Indies. 14. C. acuminata, Wildfl. 11. (C. spoucousia; Lam. 5. Aubl. guian. 1. p. 79. tab. 146.) "Leaflets in three pairs, egg-shaped, acuminate, with a stellate..."
feet or gland between each pair." A tree. Trunk seven or eight inches in diameter, branches spreading. Leaves alternate; leaflets sessile, smooth, the upper ones the largest, petiole winged, ending in a short point. Flowers yellow, with red veins, in small racemes which are either axillary or on the naked part of the stem and branches. A native of Guiana. 17. C. coriophora, Lam. 12. Willd. 12. Bot. Mag. 63. "Leaflets in three pairs, lanceolate, somewhat falcate, smooth; a gland between the lowest; corioryms peduncled, axillary, legumes cylindrical." A shrub. Stem about six feet high, brown, dotted, rough, about the thickness of a finger, branching near the top into a loose but tolerably regular head. Branches smooth, cylindrical, greenish, small. Leaflets green, quite smooth; upper ones longer, narrower, and more falcate. Flowers bright yellow, from five to seven in a corimb. Legumes inflated, cylindrical, an inch and half long, four lines thick, straight, quite smooth. A native of South America about Buenos Ayres, described by La Marek from a living plant, and a dried specimen of the legume gathered by Copeson. 16. C. villifera, Mart. 41. Miller Dict. 4. Howt. MSS. "Leaflets in three pairs, oblong-ovate, entire, yellow; pods jointed; flume erect, peduncles hoxiform." A tree. Trunk fourteen or sixteen feet high; branches numerous. Flowers pale straw-colour, small, in loose terminal branches. Legumes long, narrow, jointed. Seeds oval, brown, each lodged in a port of thorns. A native of Campaspe. 17. C. woifera, Mart. 42. Mill. Dict. 5. Howt. MSS. "Leaflets in three pairs, ovate-acuminate, villous; flowers foliarly, axillary; legumes erect." Root annual. Stem single, feldom more than a foot high, herbaceous. Flowers yellow, small. Legumes two inches long, narrow, taper. A native of Campaspe. 18. C. longiflora, Linn. jun. Supp. p. 230. Mart. 11. Lam. 13. Willd. 13. (C. argoreefcos difflua; Brown Jam. p. 223.) "Leaflets in four pairs; upper ones lanceolate; an awl-shaped gland below the lower ones and between the upper ones." Root perennial. Stem erect, somewhat cylindrical, obtusely furrowed; branches scarcely pubescent. Leaflets green, paler underneath, oborate-oblong, quite smooth; upper ones rather linear than lanceolate; an oblong-awl-shaped gland between or below the lowest pair, a more acute one between the uppermost, fildom any between the intermediate ones; petiole erect, roundish. Stipes near, acute, florius. Leaves tetragonal, hairy. Leaflets six or seven, the flanks during the night with its petioles closely ered, and its leaflets pendulous near the flme. A native of America. 19. C. minimus, Mart. 45. (C. biflora; Mill. Dict. 14. Howt. MSS.) "Leaflets in four pairs, oblong-ovate; stems procumbent; flowers axillary; peduncles two-flowered." Root annual. Stems two or three, slender, pubescent. Leaflets pale green, roundish. Flowers small, yellow; peduncles jointed. 20. C. falcatum, Linn. Sp. Pl. 10. Mart. 10. Lam. 14. Willd. 14. "Leaflets in four pairs, ovate-lanceolate, retrorsicate; a gland at the base of the petioles." Root annual. Leaflets tapering to the base, almost felter; the inner side fiddle; outer side fiddle most near the base, so that they appear curved backwards. A native of America. 21. C. fletes, Mart. 49. Willd. 15. Swartz. prod. 66. Flor. Ind. Occid. 2. p. 724. (C. ffortia; Jacc. ic. rar. 3. tab. 459. Collect. 2. p. 563. Psammirobiza 2. Plf. Braf. 185.) "Leaflets in about four pairs, egg-shaped, hairy, with an awl-shaped gland between each pair; peduncles four-flowered; legumes tetragonal." Root annual. Leaflets ciliate. A native of Jamaica in open spots on the hills elevated mountains. 22. C. grandiflora, (C. Chinenis; Lam. 15. Van-Bezian-naam feu Telz-dian-Zan Zinicum. Conf. Flora flavus; Rumph. Amb. 4. p. 63. tab. 23.) "Leaflets in five pairs, egg-shaped, pubescent at the edges; peduncles axillary, short, generally three-flowered; flowers large." Stem flabri-tubular, also two or three feet high, herbaceous, erect, angular, a little villous at its fomt. Leaflets green, with a fleshy globular gland between the lower pair. Flowers bright yellow, remarkably large. Described by La Marek from a living plant, said to come originally from China. As the Chinenis of Wildenow appears to be a different specie (see n. 75.), we have found it necessary to give a new trivial name to the present. 23. C. crothipodes, Lam. 16. "Leaflets in four pairs, ovate-wedge-shaped, pointed; legumes linear, jointed, erect, tomentous, terminating in a recurved point." Stem a little angular, scarcely ligneous, covered near its fomt with a rufh-coloured down. Leaves alternate, short; leaflets tomentous on both sides; their edges, nerves, and pedicles rufh-coloured; a conical, awl-shaped gland between each pair; fipules long, awl-shaped, villous. Flowers in axillary racemes, shorter than the leaves. A native of South America, communicated to La Marek by Thouin. 24. C. occidentalis, Linn. Spec. Pl. 1. Mart. 12. Lam. 17. Willd. 16. (C. americana folidzia, folis oblongis, fola pedunculata; Tourne. 3. 619. Psammirobiza. 1. Pifon. p. 185.) Seed ovoidalis; Comm. Flott. 1. p. 51. tab. 26. Shan. fam. hir. 2. p. 48. tab. 175. fig. 3. 4.) "Leaflets in five pairs, ovate-lanceolate, fexistous at the edges; outer ones larger, a gland at the base of the petioles." Root perennial, woody, fihbrous, blackish, striking deep into the earth. Stem herbaceous, two or three feet high, greenish, rough with irregularly fettered dots, fored downwards from each petiole with two grooves. Leaflets acuminate, smooth, f-exd, growing gradually larger to the upper ones; in old plants only three pairs. Flowers yellow, in loose terminal racemes. Legumes from four to six inches long, three lines broad, a little comprifled, slightly curved in the fame manner as that of C. falcatum. A native of Jamaica, where it is called finking weed. It is esteemed a powerful refolvent, and uful ingredient in baths and fomentations for inflations of the limbs. 25. C. flatflies, Linn. Sp. Pl. 13. Mart. 13. Lam. 18. Willd. 17. (C. fiquis planis; Plum. Spec. 18. Brum. Amer. tab. 77.) "Leaflets in five pairs, ovate-lanceolate, smooth; a gland at the base of the petioles." A tree about the fize of the common walnut tree. "Hod firm, whith; bark fihly wrinkled, dark brown. Flowers yellow, in terminal racemes. Leaflets six or seven, the flanks during the night with its petioles closely ered, and its leaflets pendulous near the flme. A native of Guadaloupe. 26. C. flacula, Linn. Sp. Pl. 14. Mart. 14. Lam. 19. Willd. 18. Rumph. Amb. 2. p. 83. tab. 21. Woody. Med. Bot. tab. 163. Gart. tab. 147. fig. 1. (C. flacula alexandrina; Bauh. pin. 402. Tourn. 6, 9. Rat. hir. 1746. Caffia nigra; Dod. pef. 787. Conna, Rhed. Mal. 1. p. 37. tab. 22.) "Leaflets in five pairs, egg-shaped, acuminate, smooth; pediciles without glands." A tree forty or fifty feet high. Trunk large, much branched. Leaves from three to five inches long, near two broad, equal at the base, lower ones largest, finely nerves, with a prominent midrib underneath, alternate, petioled; fipules scarcely apparent. Flowers large, yellow, veined, growing about five and twenty together in axillary racemes; partial peduncles two inches long, calyx smooth, three times shorter than the corolla; anthers oval, divided into two lobes at their base; gern flender, cylindrical, curved into a femicircle. Leaflets about two feet long, cylindrical, dark brown, moderately, with a longitudinal seam on one side, divided by transverse partitions into numerous cells, each containing one seed lodged in a fweetish black pulp. A native of Egypt, and almost all the warmer parts of the East Indies; and now naturalized in the Welt Indies and
and South America. It is the caffia foliata of the Arab and Greek physicians of the middle ages, and its pulp has been very generally employed as a mild laxative, seldom producing uneasiness in the bowels, and therefore peculiarly proper for children and delicate or pregnant women. Dr. Cullen is of opinion that it does not differ from other sweetish acid fruits, and that the pulp of prunes may be employed with equal effect. The pods of the East India caffia are of lecs diameter, smoother, and afford a blacker, sweeter, and more grateful pulp, than those which are brought from the West Indies, South America, or Egypt. The pulp is of a bright shining black colour; and of a sweet taste, with a slight degree of acidity. It differs both in odor and rectitude; readily in the former, slowly in the latter, and not totally in either: the seed has little or no activity. See Woody. Med. Bot. p. 149. The principal elementary of caffia is directed to be prepared in the following manner: take of the fresh extracted pulp of caffia, half a pound; manna, two ounces by weight; tamarind, one ounce by weight; rofe-syrup, half a pound. Beat the manna, and dissolve it, in a water-bath saturated with sea-salt, in the rofe-syrup, then add the pulp; and with the same degree of heat, evaporate the whole to an electuary of proper confection. The dose of caffia is from 3/2 to 3/4. Lond. Pharm. 1796. 27. C. poflafa, Mart. 40. Willd. 19. Hort. Kew. 2. p. 51. "Leaflets in five pairs, oblong, somewhat acute, smooth; a gland at the base of the petiole; branches with an even furfuce." Root perennial. Leaflets sometimes in fix pairs. It differs from C. occidentalis and planifolia in the leaflets not tapersing to the extremity. A native of the West Indies, introduced into England in 1778. 28. C. pilofa, Linn. 12. Mart. 16. Lam. 21. Willd. 22. Swartz. Ob. 160. (C. fuffruficola erica hiftrux; Brown Jam. 224.) "Leaflets in five pairs, without glands; biplices ferecorate, acuminate; lem fliff, hairy." Stem somewhat shrubby, from one to two feet high, upright, redifh; branches short, nearly upright. Leaflets nearly fifole, oblong, rounded at the tip, sharp, with a very small britle fixed obliquely to the petiole, veined, a little hirifute at the edges; common petioles thicker at the base, round, hirifute; glands extremely minute, concealed in the hairs under the lower pair of leaflets. Flowers yellow, axillary, two or three together, small; peduncles one-flowered; petals nearly equal, with claws, concave. Bractes two, whitifh. Legumes nearly cylindrical, linear, pubefcent. A native of Jamaica. 29. C. lineata, Mart. 50. Willd. 20. Swartz. Prod. 66. Fl. Ind. Occ. 2. p. 729. "Leaflets in five pairs, somewhat oblong, pubefcent underneath, nearly equal; an obfolute gland under the lower pair; peduncles one-flowered." Root perennial. Stem more shrubby and rigid, with lefs hairy branches, than the preceding species. Peduncles and biplices short. Legumes linear. 30. C. atomaria, Linn. Mant. 68. Mart. 15. Lam. 20. Willd. 21. "Leaflets in five pairs, egg-shaped, some- what tomentous; petioles round, without glands." Stem the height of a man, woody, alif-coloured, much branched: little branches and petioles scarcely feebly pubifcent; pe- tirole cylindrical, not channelled,befprinkled with small fult-coloured points. Leaflets green on both fides, pubefcent to the touch; lower ones not smaller, more obtufe, somewhat emarginate, equal at the base; biplices awl-shaped, often permanent. 31. C. fruticifrons, Mart. 43. Mill. Dict. 2. Houil. M.SS. "Leaflets in five pairs, egg-shaped, smooth; outer ones longer; lem shrubby." Stem five or fix feet high, much branched towards the top. Flowers yellow, in loose racemes lateral and terminal. Legumes long, taper. Seeds in a double row. 32. C. arborifolius, Willd. 40. not of Miller. ScL n. 5. Vahl. Symb. 5. p. 56. (C. Glauca, Lam. Wellia Taggeta Rhed. Mal. 6 p. 17. tab. 9. 16. "Leaflets in about five pairs, elliptical, smooth; an oblong gland between the lowest; biplices awl-shaped, curved; racemes axillary." "Leaflets in fix pairs, egg-shaped, glaucous and veined underneath; glands oblong, fever; legumes linear, straight, compressed, mucronate." Lam. A shrub five or fix feet high. Branches pubescent at their summit. Leaflets two inches and a half long, more than one broad, a gland between each pair. Flowers yellow in axillary racemes at the summits of the branches. Legumes four or five inches long. Lam. A native of the East Indies. As both Willdenow and Linnæus refer to Wehmann of Rhed, we have put their species together, although we do not think a shrub only fix feet high can any propriety be called arboreceus. Linnæus's definition was formed from specimens in flower, and young fruit lent by Sommerc. 33. C. Senoa, Lam. Sp. Fl. 9. Mart. 15. Willd. 24. (C. lancolata, Lam. 22. Forskall Egypt. 87. p. 58. Senoa officinallis; Gart. Senoa alexandrius; Bann. pin. 307. Tourn. 6. 8. Reih. hist. 1742. Morin. 5. 2 tab. 24. fig. 1. Sena orientalis; Tabern. i. 517.) "Leaflets in five pairs, lanceolate, equal; a gland above the base of the petioles." Lam. from Forskall. Stems from two to three feet high, somewhat woody; branches flender. Leaves alternate; leaflets an inch long, lively green, smooth, on short petioles. Flowers pale yellow, in terminal racemes, on long peduncles. Legumes oblong, recurved, compressed. Lam. Legumes ovate-kidney-shaped, membranous, compressed, with foliaceous appendages, protuberant at the seat of the seeds; marked by capitular, transverse, parallel strie; from fix to nine-celled, two-valved; partitions transverse, very thin. Gart. A native of Arabia and Upper Egypt, whence the leaves are brought to Grand Cairo; and as Alexandria is the port from which it is shipped for Europe, it has obtained the name of Alexandrian fenna or fen. The leaves of fenna, as they are imported for medicinal use, have a rather disagreeable smell and a somewhat acrid, bitter, nauseous taste; they give out their virtue both to watery and spiritous meftrix, communicating to water and proof spirit a brownifh colour, more or less deep according to the proportion. It is commonly called a feem spirit. As far as is now known, it was first introduced as a purgative by the Arabian physicians Scorpion and Mefue, who flourished about the beginning of the ninth century. The firth of the Greeks by whom it is noticed is Aetaurus in the thirteenth. Aetaurus, however, speaks not of the leaves but the fruit. Mefue likewife seems to prefer the pod, as more efficacious than the leaf. In fact the pod purges less powerfully than the leaves, but has the advantage of not gripping the bowels, like the leaves, and of being without their nauseous bitternefs. For covering the tale of fenna, Dr. Cullen recommends coriander seeds; and for preventing its griping, the warmer aromatics, as cardamoms or ginger. The formule of fenna given by the colleges, are those of an infusion, a powder, a tincture, and an electuary. See Woodville's Medical Botany. The London Pharmacopeia, 1796, directs the simple infusion of fenna to be prepared by macerating 1/4 oz. by weight of fenna, 1 dram of powdered ginger by weight, and one pint of boiling distilled water, for one hour, in a covered vefsel, and straining the liquor, when cold. For the tartarified infusion of fenna, take of fenna 1/4 oz. by weight, bruised coriander 1/2 an ounce by weight, cryftals of tartar 2 drams by weight, and one pint of dis- tillated water. Boil the cryftals of tartar in the water, until they are difolved; then pour the water, yet boiling, upon the fenna and seeds; mace rate for an hour in a covered vef-
The text appears to be a page from a botanical book, discussing Cassia, a genus of flowering plants. It includes information on the leaves, flowers, and other characteristics of the plant. The text is written in Latin, and it seems to be a detailed description of the plant's anatomy and morphology.

Propagation and Culture. Some species of Cassia are cultivated for their beauty, and others for their rarity. They are all propagated by seeds, but as they are natives of warm climates, they must be reared in hot-beds. Such as grow naturally between the Tropics, require the protection of a roof; and few will endure the rigour of our winters in the open air. The seeds of Cassia fistula may be procured from the druggists, who import the pods for official purposes.

CASSIA CINNAMONUM, Herm. Lindg. See LAURUS CINNAMOMUM.

CASSIA MALABARICA, Herm. Lindg.—Ligneae. Black—cinnamomea, Pluk. Alm. 88, 89. See LAURUS CASSIA.

CASSIA LINEI JAMAICAENSIS & CASSIA LINEI BARBADENSIS, Pluk. Alm. See CANNELLA ALBA.

CASSIA, in Geography, a country of Sumatra, the inhabitants of which live in villages, independent of one another, and are always at war. See SUMATRA.

CASSIA FLAVA, in the Glass Trade, is that iron with a piece of wood placed on it, on which they lay the glasses after they have taken it off the pipes, and on which they turn the glasses, to soften the pontic to it.

CASSIAN, JOHN, in Biography, an ecclesiastical writer of the chas of monks, was most probably born in Syria, though others say that he was a native of France, and others
of Africa. He was brought up in the monastery of Bethle- 
hem, where he formed an intimacy with a monk named 
Germanus; and from whence he went together into Pale-
stine and Egypt, and passed seven years with the solitaries of 
the Thebais. The theological disputes that prevailed even 
in these deserts, occasioned their withdrawing to Constan-
tinople, where Caiffan was ordained deacon by St. Chryfodom. 
Upon the expiration of this prelate from his see, he was de-
puted, together with Germanus, in 403, to lay the com-
plaints of the church before pope Innocent I., by whom he 
was ordained priest. When Rome was taken by Alaric, he 
removed to Provence, and in 410 fixed at Marcellis. Here 
his founded two monasteries, one for each sex, and inculca-
ted in Gaul, both by his discourse and writings, the opinions 
of the Semipelagians on the doctrine of grace, together with 
the rules of discipline which were observed among the Syrian 
and Egyptian monks; and here he is supposed to have died, 
between the years 430 and 433. His works, some of which 
detailed the mode of living among the Egyptian monks, and 
the discourses of their most famous abbots, were published in 
folios in Frankfort, in 1722, with a large commentary by 
Alaric Gaut. Caiffan has been regarded as a faint by 
several popes; and though he was never canonized by the 
church, his memory has been so much revered in Provence, 
that a day was observed as his festival; and his works were 
held in very high estimation by the devotees of the church 
theim, E. H. vol. ii.

CASSIANI, a feit in Cival Laws, who adhered to the 
system and interpretations of Caffius, a celebrated lawyer, in 
opposition to those of Pegasus, a timid flame of Domitian, 
who derived his name from the galley which his father com-
manded, whose adherents were denominated Pegasifani. 
These parties were also denominated Sabiniarios and Procu-
lians. See Capito. The popular canes was in the hands of 
Pegasus, while the favourite of the Caafars was repre-
ented by Caiffan, who gloried in his defeat from the patriot 

CASSIANISM, from Caffian, a teacher in Gaul to those 
who were called Semipelagians towards the close of the fifth 
century, is sometimes used for Semipelagianism. See Cas-
stian.

CASSICAN, in Ornithology, caffican de la nouvelle Gui-
née, Buffon: the pied roller of Latham, Coracias varia, 
which see.

CASSICUS. Brifon calls the oriois Pericuss by this 
name, cafficus luteus. See ORIOUS PERICUS.

CASSIDA, in Botany, Tourn. Hall. Ray. Petiv. See 
Scutellaria.

CASSIDA, in Entomology, a genus of coleopterous in-
sects, which, according to Linneus, have moniliform anten-
nae that become rather thicker towards the end: thorax 
and wing-cases with a broad margin, the former flat, and 
forming a kind of shield, beneath which the head is concealed. 
To this Mr. Marsham adds, that the body is oval, convex, 
and flat beneath. Marsh. Ent. Brit. The Fabrician char-
acter as usual is taken principally from the parts and struc-
ture of the mouth: he observes that the anterior feelers are 
elated, and those behind filiform; lip elongated and en-
tire, and the antennae moniliform.

The above are the essential characters of this genus, to 
which a few general particulars may be added. The retu-
aduate figure of the body, gibbous back, and flattened fur-
face beneath are a strong criterion of this genus. The surface 
above is commonly smooth, and in some species glossy; 
eyes oval, and placed near each other; antennae inserted be-
tween the eyes; scutel triangular and small; wing-cases 
fame length as the abdomen; legs short, thighs compressed, 
shanks rounded, and the tarsi consisting of four joints. 
Many of the species are very beautiful when alive, some of 
which retain their brilliancy of colours in the height of per-
fusion after death; in others, however, and those especially 
of a small size, these are altogether evanescent, their 
rich metallic or golden hues fading as the insect dies, and 
totally disappearing in the dried specimens. Caaffida im-
merced in spirit of wine alive, are observed to retain the 
splendour of those golden hues for years in as high perfecti-
on as they appear in the living insect: but if taken out 
and allowed to dry, these change colour in the same manner 
as the insect would in dying with not being steeped in spiri-
to. For immediate observation, the true colours of the 
living insect may however be revived in the dried specimens 
at any time by leaving them for the space of fifteen or twen-
ty minutes in warm water; the colours re-appearing while 
the insect is kept moist, and fading again as the insect dies.

The larvae of the caffidae are commonly found concealed 
on the under surface of the leaves of the plants on which 
they feed, and often hide themselves under a cover of their 
own excrements, which they support in the air above their 
odies by means of their lateral spines, and the bristles at 
the extremity of their tail to shelter themselves from the sun 
and rain. The larvae call their skins several times before 
they pass into the pupa state. The perfect female insect 
deposits the eggs in regular order on the leaves of plants, 
and covers them with excrements to conceal them. The 
common English name of the insects of this tribe is the to-
toise beetle. We have only an inconsiderable number of the 
species indigenous to this country, and those only of a small 
size; many of the larger kinds, and those distinguished for 
their vivid hues and colours are natives of South Ame-
rica. The following species are described by authors.

VIRIDIS. Green sprinkled with confluent dots. Marth. 
Ent. Brit. Caifida viridis. Linn. La caffide verte de 
Geooffroy. Frequent on thistles in Europe. Length one 
third of an inch.

CAESSENTIA. Green, with a fanguineous dot near the 
Inf. Caifida fanguineolenta of Paykull.

SIMILIS. Green; wing-cases triate with dots. Found 
on anthemide cotula. Marth.

Obi. Perhaps caffida prasina of Herbst. Inhabits Eu-

SPERGULII. Pale green; shield smooth; wing-cases 
triate with impressed dots. Discovered by Mr. Kirby. Marth. 
Ent. Brit.

MURRAEA. Black; shield red; wing-cases fangue-
itous, sprinkled with black dots; named by Fabricius after 
Murray. Size of caffida viridis, and inhabits Europe.

LIRIOPHORA. Black, above green; thorax emarginate; 
future and two dots on the shells black.

EQUESTRIS. Green; a silverly streak at the top of 
the wing-cases; abdomen black, with a pale border. Olivier. 
A native of Germany: found on the water mint.

NEBULOSA. Pale clouded and dotted with brown. Linn. 
Found on thistles in Europe.

MACULATA. Greenish, with numerous black spots on the 

NOBILIS. Greenish-grey, with a shining blue line on 
the wing-cases. Found principally on thistles, and inhabits 
Europe. Donov. Inf. &c.

SPPINIDULAE. Grey, with a coppery gold line, and 
feather in the middle of the wing-cases near the apex. A 
new British species allied to caffida nobilis. Marth. Ent. 
Brit.

5 D 2
CASSA. Deep black; anterior part of the shield fuscous. Inhabits Germany. Fabr.

AFFINES. Wing-cases grey, dotted with black; thorax yellowish, and without spots. Inhabits Europe. Olivier.

AUSTRIACA. Thorax and wing-cases dusky, dotted with black; margin fuscous and immaculate. A native of Austria.

CIBRASIA. Reddish; thorax with four black dots; those on the wing-cases numerous; shield emarginate. Inhabits America. Olivier.

DEBUSA. Reddish; numerous blue black dots on the wing-cases, and two on the thorax; shield entire. A native of New Holland. Olivier.

OCTOPUNCTATA. Reddish; thorax with two blue black dots; wing-cases with four on each. Inhabits Siam. Fabr.

INTERUPTA. Yellowish; thorax immaculate; wing-cases with a broad black interrupted line. Inhabits New Holland. Fabr.

ST. CRUCIS. Tesselaceous; wing-cases golden with three tubercles at the base; margin pale, with two black bands beneath.

SEX-PUNCTATA. Yellowish; disk of the wing-cases ferruginous, with six black dots. Inhabit Cayenne. Fabr.

ANNUVLUS. Yellow; disk of the wing-cases black, with two yellowish rings, and posterior band. Inhabit Cayenne. Fabr.

JUDICA. Ferruginous; disk of the wing-cases marked with impressed dots, and spots of black. Found in South America. Fabr.

HEBAREA. Pale, with numerous small black lines. Inhabit Cayenne.

CINCTA. Thorax and wing-cases dusky, with yellowish margin; wing-cases with a white hyaline spot before the edge. Inhabit Africa.

MARGINELLA. Green; margin of the thorax and wing-cases yellow. A native of Brazil.

LIMBATA. Head, thorax, and wing-cases dusky, with reddish margins. Found in Germany. Olivier.

FERRUGINEA. Black; thorax and wing-cases ferruginous and immaculate. Fabr. Cassida subferruginea of Schrank. Smaller than cassida viridia, and inhabits Germany. Rarely found in England.

VIBEX. Greenish; dorsal future fuscaceous. A native of Germany. Olivier.

AFFINES. Wing-cases greyish, with black dots; thorax yellowish, and without spots. An European species described by Fabricius.

TRUNCATA. Rufous; wing-cases slightly reticulated, and spotted with black; back gibbous. Fabr. This is of a large size; native place unknown.

GIBBOSA. Black, with two villous golden spots; wing-cases reticulated with greenish; an oblique spine on the future. A large species, described by Fabricius as a Brazilian insect.

BIDENS. Black; anterior part of the wing-cases projecting, and an erect spine at the future. Inhabit the same country as the preceding, and is of a large size.

SPINIFEX. Ferruginous; wing-cases with a projecting spine at the anterior angle; thorax with a transverse spine on each side. Inhabit India. Voet.

BICORNIS. Cyaneous; a truncated spine at the anterior angle of the wing-cases. Inhabit South America.

PERFORATA. Tesselaceous; wing-cases spinous at the anterior angle, and perforated at the base. Pallas.

JAMAICENSIS. Pale yellow, brassy; wing-cases immaculate with hollow dots. This kind inhabits Jamaica. Olivier.

Margaritacea. Greenish; wing-cases polished silvery green; head and breast black. Inhabit Saxony. Schaller.

FASTUOSA. Black; wing-cases brassy red, with black spots. Inhabit the same country as the preceding. Schaller.

FUSCA. Tawny, with two raised lines on the wing-cases. Laidhart.

CRUCIATA. Pale; disk black, with four yellowish spots. Fabr. Spec. inf. Found on plants in Europe.

CRUX. Yellow; thorax with a ferruginous dorsal line; disk of the wing-cases ferruginous, with four yellow spots. Fabr. Inhabits Cayenne, and is strongly allied to C. cruciata.

UNDECIMPUNCTATA. Yellowish, single dot in the middle of the thorax, and eleven on the wing-cases black. A native of Cayenne. Fabr.

BIFASCIATA. Pale; body with two fuscous bands. Inhabit South America. Gmelin.

FLAVA. Yellow, and without spots; body tesselaceous, with a black spot on the feutel. Fabr. Found in the south of Europe.

PURPUREA. Yellow; body above purple. This is a small species, and inhabit America.

LEUCOPHORA. Tesselaceous; margin dotted with yellow. Found in America. Linn.

TUBERCULATA. Tesselaceous; margins yellow; three tubercles on the wing-cases. Inhabit Sierra Leon.

BITUBERCULATA. Brown, with white margin; wing-cases spotted with black; and a single tubercle at the base. A native of Cayenne. This is greatly allied to tuderetata, but is only half the size.

SUTURALIS. Brown; wing-cases yellow, with brown future. An African species. Fabr.

BIGUTTATA. Thorax yellow; wing-cases reddish; margin black, with two yellow spots.

MILLARIS. Yellow; thorax immaculate; wing-cases dotted with black, and two marginal bands. Inhabit the island of St. Helena.

PUNCTATA. Black; shield brown; wing-cases yellow, with black spots.

RETICULARIS. Yellow; wing-cases variegated with azure, and a fuggle lateral band. Fabr. A species of large size found in South America.

VARIEGATA. Rufous; wing-cases variegated with azure, and a fuggle lateral band. Inhabit America.

TRIFASCIATA. Rufous; wing-cases with three lateral bands. Fabr. This kind inhabits India.

ANNULATA. Azure; two spots on the thorax, and six rings on the wing-cases, rufous. Fabr. Is of a large size; inhabit South America and India. A variety of this insect is described by Herbit under the name of cassida ornata.

GRAESSA. Sanguineous; disk of the wing-cases sprinkled with black dots, and ramose black lines on the margin. Inhabit South America.

CLATHRATA. Ferruginous; margin of the wing-cases, longitudinal line, and one half transversely black. Described by De Geer. This species is a native of India. The thorax is immaculate; wing-cases very broad. The female is distinguished by having three distinct lines across.

SEPTEM-GUTTATA. Black, with seven white spots on the wing-cases. Gmelin. This is rather an ambiguous species.

EXCLAMATIONIS. Yellow, with three black lines, the middle one interrupted, and resembling the note of exclamation, (!). This inhabit South America. Fabr.

LINEATA.
**Linata.** Greyish, with four whitish lines on the wing-cases. Fabr. Inhabits the Cape of Good Hope.

**Jamaicensis.** Pale brassy yellow; wing-cases immaculate, with hollow or excised punctures. Fabr. Described by Sloane in his Natural History of Jamaica.

**Dorsata.** Thorax and wing-cases dull, the last with a spine in the future, and whitish at the margin; base dullky. Fabr. Inhabits South America.

**Quadrifusulata.** Thorax dull; wing-cases fungous; margin blue, with two red spots. Inhabits America.

**Cyanea.** Brassy blue; wing-cases immaculate, with excised dots. A Limnean species described by Petiver and Deger. Inhabits America.

**Marginata.** Wing-cases telfaceous; body and wing-cases edged with black; thorax brassy. A native of South America.

**Nigra.** Brassy ferruginous; wing-cases with a subovate yellow spot in the disk. Inhabits the same country as the preceding.

**Supposita.** Wing-cases black, annulated anteriorly, with a linous dot in the middle. A small American species. Lechem.

**Lateralis.** Brassy fuscous, with a yellow lateral spot on the wing-cases. De Geer, Subzer, & c. Inhabits South America.

**Decisata.** Brassy green, with two approximate yellow spots on the disk of the wing-cases. Fabr. Cassidia quadriraculata. Deger. Inhabits South America.

**Decimens.** Bluish black; wing-cases spotted with yellow; the dorsal spots reticulated, those on the sides ditinct. Inhabits Jamaica. Fabr.

**Bipunctata.** Yellowish, with two black spots on the wing-cases. Fabr. Inhabits India.

**Bipustulata.** Green, with two lateral fanguineous spots on the wing-cases. Linn. Amcan. Acad. A native of Cayenne.

**Sex-pustulata.** Azure, with three red spots on the wing-cases. Inhabits Brazil. Fabr.

**Sexdecim-pustulata.** Black; two dots on the thorax, and seven on the wing-cases red. Fabr. A native of South America.

**Angustata.** Yellowish; wing-cases narrowed behind. Gen. Inhabits India.

**Bittuberulata.** Brown, with a white margin; wing-cases spotted with black, and a single tubercle at the base of each. Fabr. Inhabits Cayenne. This species is allied to cassidia tuberculata, but is only half the size.

**Taurus.** Black; wing-cases with a truncated spine at the anterior angle. Inhabits Cayenne. Fabr. Refleches C. bicorinum, except in being rather smaller.

**Retiformis.** Black; thorax with two yellowish spots; wings yellow, reticulated with black. A native of Cayenne. Fabr.

**Palliata.** Black; thorax villos greenish; wing-cases greenish, with the margin and middle line ferruginous. Fabr. Inhabits Cayenne.

**Rubiginosa.** Ferruginous; thorax and wing-cases fuscous, dotted; outer margin ciliated. Linn. This species is found in Europe.

**Cuprea.** Above coppery; edge of the thorax, and two marginal spots on the wing-cases rufus. A native of Cayenne.

**Nitens.** Black; thorax and wing-cases grey, glossed with gold; legs livid. Linn. Native country unknown.

**Superba.** Black; wing-cases dotted, and with the shield golden green; antennae, abdomen, and legs greenish. A Limnean species. This is found in Europe; the golden hue mentioned by Limens varifies at the time the insect dies.

**Sanquicolenta.** Golden yellow; oval ring on the wing-cases, and tubercle on the future fanguineous. Inhab. America.

**Acuta.** White, with a common black disk; the border, oval ting, and posterior arched blue fine yellow. Sweden. A native of Rio Janeiro. This is of the middle size, and has the breast and abdomen black.

**Cassida.** In the Ancient Geography, a town of India, on this side of the Ganges. Potenii.

**CASSIDARIUS.** An ancient name given by the Italians and Germans to a sort of heads made of the yellow and red chalcodony, a very beautiful stone, or of an agate resembling it in colour. They also call the stones themselves by this name; but are by no means determinate in the meaning of the word, not restraining it to any one peculiar species.

**CASSIDONIA.** In Botany. Ril. Hist. Plant. See LAVANDULA STATIACHAS.

**CASSII.** In Ancient Geography. See CATTIVELLALI.

**CASSILLACUM.** A town of Rhettia Prusa, now called Roma-Kesself.

**CASSIMBUZAR.** In Geography. See CASSIMBA-ZAR.

**CASSIMER, or CASINER.** In Commerce, a thin twilled wooden cloth, much in use for summer wear.

**CASSIMIRE, or CASHMERE.** In Geography. See CASHER.

**Gen. Ch. Cal. perianth small, five-cleft, permanent. Core deeply five-cleft, fo as to be almost pentapetalous; segments somewhat egg-shaped, spreading, larger than the calyx.

**Stam. Filaments five, awel-shaped, alternate with the segments of the corolla; anthers roundish. Fil. germ superior, conical; style none, stigmas three. Peric. Berry dry, deep-paucious, roundish, three-celled, unedicated with the stigmas. Seeds solitary, homestaw egg-shaped.

**Eff. Chi. Calyx five-cleft; corolla deeply five-cleft; segments alternate with the ilamens. Stigmas three. Berry dry, three-celled, three-seeded.

or dull red. Leaves generally opposite, smooth, convex above, particularly the upper ones, with the edges a little reflected underneath. Flowers small, white, in short axillary bunches or corymbs, three or four together, on a slender common peduncle; filaments inserted into a flat disk which surrounds the germ, and covers the face of the corolla. A native of South Africa. 1. Cassina, Lam. Illus. 2. "Leaves alternate, ovate lanceolate, acute, obtusely serrated; flowers axillary, nearly subulate." A native of Magellan found by Commenon.

Propagation and Culture. The first two species have long found a place in European collections on account of the beauty of their leaves, which continue on the tree all the year. They require no artificial heat, but must be removed into a well-sheltered greenhouse in the winter. The best method of increasing them is by laying down the shoots that are nearest the ground, which should be twisted to facilitate their throwing out roots. Those which are laid down in autumn will be fit to remove in the autumn succeeding. They may be propagated also by cuttings; but in this case they will seldom be rooted enough to transplant in less than two years. The full kind is the leaf hardy, requires greater care in winter, and seldom runs its seeds in England. The other produces plenty of fruit, and cultivates the greenhouse through the winter. All of them, however, are propagated by any of the usual methods for the kind from profecuting his astronomical studies and observations. He discovered many particulars relating to the planets Mars and Venus, and more especially the revolution of the former round its axis; and he directed peculiar attention to the theory of Jupiter's satellites, which after much labour, and many observations, he settled with accuracy, and published at Rome, among other astronomical pieces, in 1660. When Picard, the famous French astronomer, had an opportunity of examining these tables, he found them so accurate that he conceived a high opinion of the skill and judgment of the author, and they contributed so much to extend his reputation that he was invited to become a member of the Academy of Sciences, established about this time by Lewis XIV. As he could not leave his station without the permission of his superiors, the French monarch applied to the pope and senate of Bologna for that purpose; and they granted him leave of absence for 6 years, so that he came to Paris in 1669, and was immediately appointed royal astronomer. At the expiration of the stipulated term, the pope and senate of Bologna infirled his return, but it was threatened by his government and envoys, which had been hitherto continued without interruption; but he was nevertheless prevailed upon by the minifter to remain in France, where he was naturalized in 1673, and about the same time entered into the marriage state.

The royal observatory having been completed in 1670, Caffini took possession of it in the following year, and affiduously prosecuted the duties of his profession. In 1672, he determined the parallax of Mars and the sun, by comparing some observations which he made at Paris with others that were made at the same time in America; in 1677, he demonstrated that the diurnal rotation of Jupiter about its axis was performed in 9 hours 58 minutes, by means of the motion of a spot in one of his larger belts; and in 1684, he discovered four satellites of Saturn, in addition to that which Huygens had before observed. A new edition of his "Tables of Jupiter's Satellites," corrected by later observations, was published in 1693; and in 1695, he visited Bologna for the purpose of examining the meridian line which he had fixed there in 1653, and by the present of his rice to the rector of Bologna, in the presence of several eminent mathematicians, that it had not for forty years undergone the least variation. In 1700 he continued the meridian line, begun by Picard, to the most southern limits.
limits of France. Cassini was a resident at the Royal Observatory of Paris more than 40 years; and in that long period he did the greatest honour to the establishment by various observations and discoveries, which it would far exceed our bounds to recite in this article, but which will be duly noticed in their proper places. The titles of his publications occupy nearly five pages in the closely printed index of Römer. He had the misfortune to be deprived of his sight during the latter years of his life; and he died on the 14th of September, 1712, at the age of 87 years. Mem. of the Paris Acad. for 1714.

Cassini, James, the younger son of the former, was born at Paris in 1677; and having studied mathematics and philosophy, filled his father’s shoes, and afterwards at the Marais college under Varignon, who was mathematical professor, his proficiency was such that at the age of 15 years he acquired great reputation in supporting a mathematical thesis. When he was 17 years old, he was admitted a member of the Academy of Sciences, and at this time accompanied his father to Bologna, and assisted him in verifying the meridian, and other operations. On his return he took a journey to Holland, where he discovered some errors in the measurement of the earth by Snellius, the result of which was communicated to the Academy of Sciences in 1702. In 1696 he visited England, and became a member of the Royal Society. In 1712 he succeeded his father as astronomer royal at the observatory. In 1717 he communicated to the academy his researches on the distance of the fixed stars, in which he showed that the whole annual orbit is a mere point in comparison with this distance; and in the same year he prefented his discoveries concerning the inclination of the orbits of the planets in general, and especially of those of Saturn’s satellites and ring. In 1725 he undertook to investigate the cause of the moon’s libration. See Libration. His attention was directed in 1732 to an important question relating to the planet Venus. The diurnal rotation of this planet had been determined by his father to be performed in 23 hours, and in a work published by Bianchini in 1729, it was settled at 24 days eight hours. Cassini upon examining Bianchini’s observations of the spots of Venus, found that he had intermitted his observations for three hours, and thus had probably been led to mistake new spots for old ones, so as to deduce from the whole an erroneous conclusion. Soon afterwards Cassini ascertained the nature and quantity of the acceleration of Jupiter’s motion, at half a second in the year, and of the retardation of Saturn’s at two minutes annually; and that these quantities would go on increasing for 2000 years, and then would decrease again. In 1740 he published his “Astronomical Tables,” and his “Elements of Astronomy;” both of which are very comprehensive and accurate works. Cassini, though he particularly excelled in the department of astronomy, extended his researches to other branches of science. Accordingly he published some experiments on electricity, or the light produced by friction; the recoil of fire-arms; the ascent of the mercury in the barometer at different heights above the level of the sea; the improvement of burning glasses, &c. In 1700, he affixed his father in the measurement of the meridian; and in 1718 he finished the operation begun by M. de la Hire north of Paris, in concurrence with Maraldi and the younger de la Hire. Hence he was led to conclude, that the degrees of the meridian were not only of different lengths in different parts, but that they decreased more and more towards the pole; and that consequently the figure of the earth was that of an oblong spheroid, having its axis longer than the equatorial diameter. He also measured the perpendicular to the same meridian, and compared the measured distance with the differences of longitude as before determined by the eclipses of Jupiter’s satellites; and he also inferred from this measurement, that the length of the degrees of longitude was smaller than it would be in a sphere, and that therefore the figure of the earth was an oblong spheroid. These conclusions induced the French government to appoint two classes of mathematicians, one for measuring a degree at the equator, and the other at the polar circle; and the result of the whole was a determination that Cassini’s conclusions were erroneous, and that the figure of the earth was an oblate spheroid, conformably to Newton’s inference from the theory of gravity. Cassini prolonged a life of inestimable labour to an advanced period, and at length lost his life by a fall in April 1766, in the 86th year of his age. His publications were: “A Treatise on the Magnitude and Figure of the Earth;” “The Elements or Theory of the Planets,” with Tables; and a great number of papers in the Memoirs of the Academy of Sciences from the year 1699 to 1755.

Cassini, De Thury, Cesar-François, the second son of the former, inherited his talents and supported the reputation of the family in scientific researches and discoveries. He succeeded his father as director of the observatory, and he had the honour of being a member of most of the learned societies in Europe. He was born at Paris, June 17th, 1714, and received his first instructions in mathematics and astronomy from M. Maraldi and Camus; and his proficiency was such, that he was scarcely 10 years of age when he calculated the phases of the total eclipse of the sun of 1727. At the age of 18 he assisted his father in drawing the perpendicular to the observatory-meridian from Strasburg to Brd; and the business of traversing the country by several lines parallel and perpendicular to the meridian of Paris, with a view to the formation of a general chart of France, was entrusted to Cassini. He also undertook to measure the meridian of Paris by a new series of triangles, of a smaller number, and more advantageously disposed than those employed by his grandfather and father, for the purpose of obtaining a more accurate result. This great work was published in 1740, with a chart, showing the new meridian of Paris, by two different series of triangles, differing along the sea-coasts, to Bayonne, traversing the frontiers of Spain to the Mediterranean and Antibes, and thence along the eastern limits of France to Dunkirk, with parallel and perpendicular lines described at the distance of 8000 toises from one another, from one side of the country to the other. In 1735, he was admitted into the academy as adjunct supernumerary. A particular chart of France, constructed at the special request of the king, took its rise from a tour made by Cassini in Flanders, in company with his majesty, about the year 1741. He also published various works relative to these charts, and a great number of the charts themselves. In 1761, he undertook an expedition into Germany; for the purpose of continuing to Vienna the perpendicular of the Paris meridian; of unifying the triangles of the chart of France with the points taken in Germany; of preparing the means of extending into this country a plan similar to that of France; and of thus establishing successfully for the whole of Europe a very useful uniformity. His observations of the transit of Venus, on the 6th of June, 1761, made during his stay at Vienna, were published in his “Voyage en Allemagne.” Availing himself of the peace which afterwards took place between England and France, with a view to the accomplishment of his great object, he proposed the joining of certain points taken upon the English coast with those which had been determined on that of France, and thus connecting the general chart of the
the letter with that of the Bailey tiles, in a manner similar to that by which he had united it with those of Flanders and Germany. This proposal was favourably received by the English government, and carried into effect, under the direction of the Royal Society, by which the execution was committed to the late general Roy. After his death it was for some time suspended; but the further execution of it was committed, under the auspices of the duke of Rich- mond, then maker-general of the ordinance, to the care of col. Edward Williams and captain William Mudge, respecti-
able officers of the artillery, and Mr. Isaac Dalby, who had before assisted general Roy.

The volumes of the Memoirs of the French Academy, between the years 1733 and 1768, contain a prodigious number of papers communicated by M. Cassini, and consis-
ting of astronomical observations and questions; among which are "Recherches concernant le Parallax du Soleil, the Moon, Mars, and Venus; "On Astronomical Re-
fractions, and the Effect caused in their Quantity and Laws by the Weather;" and "Numerous Observations on the Obliquity of the Ecliptic, and on the Law of its Variations."

In short, Cassini cultivated astronomy for 50 years, a period the most important, in relation to that science, that ever elapsed, with regard to the magnitude and variety of objects in which he commonly obtained a principal part. His con-
stitution was strong and vigorous, and enabled him to fur-
mount the fatigue that attended those laborious operations in astronomy and geography, which he had the merit of con-
ducting. However, the last twelve years of his life were rendered painful and disheartening by an habitual retention of urine; and it was at length terminated by the small-pox on the 4th of September, 1784, in the 71st year of his age; being succeeded in the academy, and as director of the ob-
servatory by his only son, count John-Dominic Cassini, the 4th in order by direct descent in that honourable family. Hatton's Math. Dict.

CASSINIAN Curve, or CASSINOID, in Astronomy, a curve of an elliptic form, propounded by M. John-Dominic Cassini, to be the orbit of a planet. The property of this curve is, that the product of two lines drawn from its foci to any point in the curve, shall be equal to a given quantity, viz. to the rectangle under the apothem and perihelion distances of the planet; whereas, in the common ellipse, the sum of two lines from the foci to any point in the curve is equal to the sum of the above distances, or transverse diameter. M. Cassini supposed that a planet would describe this curve about the sun, in one of its foci, in such a manner that the angles at the other focus are proportional to the times, which he calls the focus, or centre of mean motion; and that in which the sun is placed, he calls the centre of true motion. Whence, any two distances of a planet from the focus of the true motion are reciprocally as its distances from the focus of mean motion. In this figure, if the left axis exceeds the distance of the foci, the curve is every where concave towards the centre; if, while the principal axis remains the same, the distance of the foci is lessened, the minor axis will be increased; and, when the foci meet in the centre, the figure will become a circle; but if, on the contrary, the distance of the foci be increased, the left axis will be lessened, and will become equal to the said distance, since the distance is to the principal axis as unity to a mean proportional between one and three. If the distance of the foci be farther increased, the minor axis will be lessened, the curve will at length have a point of contrary flexure, and will, at the ends of the minor axis, be convex towards the centre; and when the distance of the foci is so far increased, as to be in the same proportion to the greater axis as the side of a square to the diagonal, that is, as $1: \sqrt{2}$, the left axis will become nothing, and the curve extend to the centre on each side. If the distance of the foci be greater in proportion to the trans-
verse diameter, than in the above ratio, the left axis is im-
possible, and the figure turns into two conjugate ones, at a distance from each other; which, upon the increase of the distance of the foci, will be lessened, till at length the figure runs into two conjugate points. The distance of the foci increasing, the two conjugate figures do again emerge, and they increase after the same manner as they decreased before, differing from the former in the order of the foci, and of the vertices, and are increased till they become in-
finite. Afterwards, this system will again approach to a circle by the same degrees as it receded from it. After-
tracing a few of the properties of this curve, it must be evident that it cannot possibly be the orbit of a planet; for it is certain, that in all those cases, where it passes into two conjugate figures, it deviates from what is essential to the nature of an orbit, namely, continuity; and in all those cases where it is, at the end of the minor axis, convex towards the centre, the planet would need a centrifugal force to describe such parts of its orbit; that is, it would require at equal distances from the sun, sometimes a centrifu-
gal, and sometimes a centripetal force to retain it in its orbit, which is totally incompatible with all the laws of nature. It may be fairly concluded, that when all the species of a figure beyond a certain limit are unfit for discharging any office of nature, the remaining species on the other side of the limit should be rejected also: and when, in addition to this, it is considered that the celestial observations are not consistent with this curve, it can by no means be ad-
mitted into astronomy.

CASSINOMAGUS, in Ancient Geography, Chafferton, a place of Gaul in Aquitanica Prima, 30 French leagues from Germanomagus, and 17 from Augustorium or Lu-
mores.

CASSIOBERRY-BUSH, in Botany. See VIBURNUM leviatum, and Ilex comitoria?

CASSIODORUS, MAGNUS AURELIUS, in Biography, a Roman senator, born at Bruttium, on the confines of Calabria, who flourished in the time of Theodoric the Goth, in the 6th century, who died in 602, at the great age of 93, and who has been enumerated among the few Roman writers on music; but to whom neither the art nor the science has great obligations. Cassiodorus, contemporary with Boethius, has given us even less information on the sub-
ject than the excellent author of the discourses "De Consul-
tione Philosophi:" for, writing on the seven liberal arts (de septem disciplinis), all that he says concerning music is contained in one chapter only, consisting of but four 40.

tables, and these few pages, which hardly contain the skeleton of a treatise, give us nothing but repetitions of what his predecessors had said more fully. And it may, indeed, be asserted, without exaggeration, that all the Gr. and Lat. treatises that are come down to us, are but bulletins of the same calibre, which teach us no part of music but the alphabet, nor can any thing be acquired by the most inten-
tive study of them, except to dispair and the head-ache.

CASSIOPEI.A, or CASSIOPH, in Ancient Geography, a port of the sea of Epirus, in the southern part of Chonia, S.W. of the port of Panormus. Pliny, Strabo, and Pto-
lemey, mention this city; but M. D'Aubigny has not placed it in his map. Cassioph, or Cassiop, was famous on account of the temple of Jupiter Cassius, whence some derive its name.

CASSIOPÆ, a people of Greece, mentioned by Strabo, who
who inhabited Caffiopea, or Cæsir. This author assigns to Caffiopea a town and part of the same name, and three other small towns in the interior of the country. Pliny also mentions the Caffiopearis, and places them in the vicinity of the Doryphos. M. D'Anville fixes their situation on the face of it in Thespis, towards the upper extremity of the southern part of the island of Cœcyra.

CASSIOÆUM Promontorium, a promontory of the island of Cœcyra.

CASSIOPE, a town and sea-port in the northern part of the island of Cœcyra, according to Ptolemy and Strabo, who place also a promontory of the same name in this island. It is also mentioned by Cicero and Pliny.

CASSIOPIA, a town of Greece, in Caffiopea, according to Ptolemy. He places this in the mountains, and more easterly than the other.

CASSIOPIA, or CASSIOPEIA, in Fabulous History, wife of Cepheus, king of Ethiopia, and mother of Andromeda. Believing that she was more beautiful than the Nereids, they were so incensed that they besought Neptune to revenge the affront; upon which he sent into the country of Cepheus a sea-monster, who committed dreadful ravages. In order to appease the god, Andromeda was chained to a rock, and exposed to the monster; but was rescued by Perseus, who married her, and obtained of Jupiter, that Cassiopeia might be placed, after her death, among the stars. This circumstance is said to have given occasion to the constellation of that name.

CASSIOPEIA, in Entomology, a name given by Cramer to an African butterfly described by Fabricius under the title of Papilio Aergia. The wings are roundish, of a white colour; anterior pair white, black at the apex, and marked on the lower surface near the tip, with a large brown spot.

CASSIOPEIA, or CASSIOPEIA, in Astronomy, one of the 48 constellations of the northern hemisphere, situate next to Cepheus, not far from the north pole.

In 1572, there appeared a new star in this constellation, which at firstfparkled in magnitude and brightness Jupiter himself; but it diminished by degrees, and at last disappeared, at the end of eighteen months. It alarmed all the astronomers of that age, many of whom wrote dissertations on it; among the rest Tycho Brahe, Kepler, Maurolycus, Lyctor, Gramineus, &c. Beza, the landgrave of Hesse, Rothe, &c. wrote to prove it a comet, and the name which appeared to the Magi, at the birth of Jesus Christ, and that it came to declare his second coming; they were answered on this subject by Tycho. Several astronomers are of opinion that this star has a periodical return, which Keil and others have conjectured to happen every 150 years. Mr. Pigot adopts the same opinion; and he accounts for its not being noticed at the completion of every term by its variable light at different periods, so that it may sometimes increase only to the 5th magnitude: and if this be the case, its period is probably much shorter. Phil. Trans. vol. lxxvi. p. 192.

Dr. Herschell has given a statement of the comparative light of the stars of this constellation in the Phil. Trans. for 1796, vol. lxxvi. p. 463.

The stars in the constellation Cassiopeia, in Ptolemy's Catalogue, are thirteen; in Hevelius's, thirty-seven; in Tycho's, forty-six; but in the British Catalogue, Mr. Flam-

CASSITANEA, in Ancient Geography, a name given by Ptolemy to a country in Egypt, in the vicinity of mount Caris; bounded, on the east, by a part of Judea and Arabia Petraea.—Also iny, a country in Syria, in which Ptolemy has placed 12 towns. This country took its name from mount Cassius in Syria.

CASSITANEA, in Botany, Anith Jaff See Lig-

CASSIR, q. d. Cylis, in Geography, a town of Africa, in the northern part of the rufian province of Algiers, situate among the Beni-Ghaddery, N. of mount Aphronia, and W. of Boujouia or Bouga. Upon the mountains adjacent to this place the Algerians frequently dig up large pipes of lead, supposed to have formerly conveyed the excellent water of these parts to Sable.

CASSIS, in Geography, a town of Africa, in the kingdom of Tunis, near the gulf of Hammet; about 60 miles S.E. of Tunis. This lies upon the ruins of a city, called by the ancients "Civitas Siguerana."

CASSIS, in Military Language, the name of a Castle; which see.

CASSITANIA, in Geography, an Indian town of America, which, as well as the Coweta town, is 60 miles below the Horfe-ford or Chattahooche river.

CASSITERIA, in Natural History, the name of a genus of crystals. The word is derived from κασσιτηρος, tin; and expresses crystals which are influenced in their figures by a mixture of the particles of that metal. These are all pyramidal without columns, and composed only of four sides or planes. Of this genus there are only two known species, the whitish and the brown; found in Devonshire and Cornwall.

CASSITERIDES, in Ancient Geography, an appellation which formerly comprehended Great Britain and Ireland, and which was afterwards restricted to the isles of Scilly, famous, as well as the neighbouring coast of Cornwall, for their tin, which, according to Pliny, (l. xxxiii. c. 16.) was white and the most valuable, and called by the Greeks κασιτηρον. Strabo says (Geog. vol. 1. p. 265. ed. Caesab.) that they were 10 in number, situated near one another and toward the north from the port of the Artabri. One was a desert island; the rest were inhabited by a people wearing black garments, which hung down to their heels and were bound round their breasts. They subsisted on their herds and had no fixed habitations; but they supplied those who traded with them with tin, lead, and fenns, in exchange for which they received earthen vessels, flints, and beads. The Phoenicians, says this geographer, were in ancient times the only persons who carried on this commerce with them, fasting hither from Gades, but concealing their navigation from the rest of the world. The Greeks succeeded the Phenicians, and they were at length followed by the Romans. Cassiterides, in the Greek language, denotes "the islands of tin;" but this name was probably derived from some Phoenician or Celtic term. The Chaldæans and Arabsians used words very fimilar to sstina. Thus in Numh. xxxvii. 22., for the Hebrew יְלָדָה, and Greek κασσιτῆρος, Jonathan has יְלָדָה, and the Jerusalem interpresר יְלָדָה, and the Arabs יְלָדָה, יְלָדָה. and in the Talmudic tract of the Sâbæni, יְלָדָה, יְלָדָה, is to.

From the different modes of expression, we may infer that the term was borrowed from other nations by the Greeks.

E. B. Ch.
Bochart, Georg. Sacr. apud. Oper. vol. i. p. 672. These islands were also denominated "Sorlings," which, in the language of the Britons, signifies "separated from the height of the land;" and it has been inferred, that the term "Casiteride" may be composed of Briton or Celtic words, viz. "Kasiter" signifying "they are almost separated." According to this etymology, the name casiteride succeeded that of "Casiteri;" and it has been inferred that the Phoenicians derived their tin from the islands denominated Sorlings, as well as from the country of Cornwall.

CASSIUS, in Bailmy, Tabern. See CASCUSA.

CASSIUM, in Geography, a town of Africa in the country called Caecilius. Prolem.

CASSIUS, C. JULIUS, in Biography, a celebrated Roman, was the descendant of an ancient and honourable family, zealous for the public liberty, that one of his ancestors, Sp. Cassius, after a triumph and three consulships, is said to have been condemned, and put to death by his own father, for aiming at dominion. C. Cassius himself manifested at an early age his hatred of tyranny; for hearing, when he was a boy at school, Faustus, the son of Sylla, boasting among his school-fellows of his father's greatness and absolute power, he gave him a box on the ear; and he afterwards declared, in the presence of Pompey, who demanded an account of the quarrel, that if Faustus should dare to repeat the words, he would repeat the blow. In the Parthian war he was quartered to Cassius, and signified himself both by his courage and skill, and if Cassius had followed his advice, would have preferred the whole army. After the defeat and death of this leader, B.C. 53, he made good his retreat with the remains of the broken legions into Syria; and when the Parthians who pursued him blocked him up in Antioch, he preferred that city and province from falling into their hands; and, watching his opportunity, gained a considerable victory over them, with the destruction of their general. In the civil war between Caesar and Pompey, he took part with the latter, and commanded his fleet. After the battle of Pharsalia, B.C. 48, he sailed with 70 ships to the coast of Asia, with a view of raising forces, and renewing the war against Caesar; and as soon as he had obtained intelligence where Caesar, who crossed the Nile on a small force, designed to land, he lay in wait for him, in the bay of Cilicia, at the mouth of the river Cydaurus, with a resolution to destroy him; but Caesar landing on the opposite shore before he was aware, and his project being thus baffled, he thought it most prudent, whilst all the people of the country were declaring for him, to make his own peace, by joining the conqueror with his fleet. He fled, however, retained his strong dislike of usurped authority; and when Caesar had been created perpetual dictator, and seemed to aspire after royal honours which every true Roman detested, he formed a conspiracy against his life, and urged his friend and brother-in-law, Brutus, to take a lead in the execution of his purpose. His resolution to destroy Caesar has been ascribed to motives of private difficulty and resentment, and particularly to his being refused the consulship and to Caesar's having conferred on Brutus the more honourable praetorship in preference to him. Hence it has been said, that he hated the tyrant rather than the tyranny, and that in the prosecution of the whole design he manifested a peculiar rancour. But we need not be at a loss for the true motive of his conduct, if we advert to his temper and principles. He was famously inquisitive and violent, impatient of contradiction, and much more of subjection, and passionately fond of glory, virtue, and liberty. From these qualities Caesar apprehended his danger; and when admonished to beware of Antony and Dolabella, he used to say, that it was not the gay, the cursed, and the jovial, whom he had cause to fear; but the thoughtful, the pale, and the lean; meaning Brutus and Cassius. For the progress and termination of this conspiracy; see M. J. BRUTUS and Cæsar. After Caesar's assassination, the conspirators withdrew from Rome. Cassius proceeded to Greece and joined Brutus at Athens. Having raised a considerable body of troops in Lusitania, he marched into Syria, the government of which had been affliged him by Caesar, and having made himself master of the country, he pushed into Phœnicia and Judea, and then laid siege to Laodicea, whither Dolabella, who was endeavouring to take possession of Syria, had been under a necessity of retreating. Cassius, having taken the town, treated it with great severity; plundering its temples, levying oppressive contributions, and putting to the sword many of the chief inhabitants. Whilst he was preparing to invade Egypt, Brutus urged him to oppose Antony and Octavianus, who were preparing to cross over into Macedonia. He joined Brutus at Sidone, and at his recommendation, it was determined that Brutus should reduce the Lycians, whilst he undertook the expedition against the Rhodians. After some unsuccessful engagements on their part, the city of Rhodes was invested by sea and land, and compelled to surrender. Cassius treated the vanquished in the true spirit of a Roman general. Having placed his tribunal in the forum with a spear planted before it, he restrained his soldiers from all plunder or violence; and summonoing go of the principal citizens before him, cauished them immediately to be put to death. Having accumulated from the spoils of the city the sum of 8000 talents, and ordering the commander of the garrison, which he left behind him, to levy from the inhabitants 500 more, he returned to the continent, and proceeded to join Brutus, exacting from all the provinces of Asia, as he pulled, a payment of 10 years' taxes. His junction with Brutus at Sardis was followed by occurrences, of which a brief recital has been given under the article Brutus. On the plains of Philippi the combined army of these two commanders met that of the triumvirs; and in the engagement that ensued, the ardour of Brutus in pursuing the troops of Octavianus left him exposed, and at length obliged him to retire with a small band from the field of battle. Titinius in the mean while was dispatched to gain intelligence; and when Cassius, perceiving from the eminence on which he stood that he was surrounded by a body of cavalry, which he apprehended to be that of the enemy, and not a detachment of friends coming to their relief, as in fact it was, imagined that Titinius was taken prisoner, he reproached himself for exposing a dear friend to such an accident, and withdrew to his tent. He was accompanied by Pindarus, one of his freedmen, who had constantly attended him ever since the battle in which Cassius was slain, for the purpose of performing the last office for him, if occasion should require it. The circumstances of his death have not been ascertained; some say that he dispatched himself with the dagger with which he stabbed Caesar; but the fact was, that his head was found severed from his body, and that Pindarus no more appeared. This event occurred on the birth-day of Cassius, B.C. 42.

Cassius was a prudent and valiant commander, and an ardent lover of his country; and though he was in many respects inferior to Brutus, and charged with avarice and cruelty, he has been honoured as an affiler of the liberties of Rome, when they were just expiring, and he has shared with Brutus in the distinguishing appellation of "sall of the Romans." He was learned himself, and a patron of literature;
Cassius.

literature; several of his letters to Cicero are extant; and that great orator beheld praise on him in various parts of his works. If we compare Cassius with his friend Brutus, the latter was the more amiable friend, and the former the more dangerous enemy. Cassius has been charged with violence and cruelty in his mode of treating money and other necessaries from the cities of Asia. But it has been urged in vindication of his conduct, that he was engaged in an inexpressible war, where he must either conquer or perish with the republic itself, and in the prosecution of which his legions were not only to be supported, but rewarded; the revenues of the empire were exhausted; contributions were scanty; neighbouring states wished to maintain their neutrality. In these difficult circumstances, when money was necessary, and it could only be obtained by force, extortion, it is said, became necessary; the necessity of the end justified the means; and when the safety of the empire, and the liberty of Rome were at stake, it was no time to hie to fumptures. This was Cassius's mode of reasoning, and the ground on which he acted; whilst he applied all his thoughts to the support of the cause which he had undertaken. Brutus, on the other hand, being of a temper more mild and sentimental, contented himself generally with the regular methods of raising money; and from his love of philosophy and the polite studies, he had contracted an affection for the cities of Greece, instead of levying contributions, used to divert himself, whereto he pallied, with feating their games and exercises, and preluding at their philosophical disputations, as if travelling rather for curiosity than to provide materials for a bloody war. When he and Cassius therefore met, the difference of their circumstances showed the different effects of their conduct. Cassius, without receiving a penny from Rome, came rich and amply furnished with all the stores of war. Brutus, who had received large remittances from Italy, came empty and poor, and unable to support himself without the help of Cassius, who was obliged to give him a third part of that treasure, which he had been collecting with so much envy to himself for the common service. In his latter years Cassius defected the Stoics, and became a convert to Epicurus, whose doctrine he thought more natural and more reasonable; constantly maintaining, that the pleasure, which their master recommended, was to be found only in the habitual practice of justice and virtue. Whilft he professed himself therefore an Epicurean, he lived like a Stoic; being moderate in pleasures, temperate in diet, and through life a water-drinker. In the letters addressed to him by Cicero, though he raises his Epicurism, and change of principles, yet he allows him to have always acted with the greatest honour and integrity; and piously says, "that he should begin to think that feat to have more nerves, than he imagined, since Cassius had embraced it." Plutarch, Vit. Brutus and Cato, T. i. p. 984. Middleton's Life of Cicero, vol. ii. Anec. Un. Hist. vol. x. & xi.

Cassius, Aurelius, an eminent military commander in the reign of Marcus Aurelius and an usurper of the empire, was, according to Dion Cassius, a native of Syria, and a son of Heliodorus, the rhetorician; but the author of his life, Vulpianus Gallicanus, seems to make him the son of Avidius Severus, who was raised from the rank of a centurion to the highest dignities of the state, and as a man of merit, much regarded by Aurelius. The same writer represents him as by his mother's side a descendent from the ancient Roman Cassii. Crevier disputes that genealogy, though, as he says, he polished all their haughty airs, infamies, and antipathy against monarchal government; adding to these qualities great skill in the art of war, and that he commanded the fear and gladness of the soldiers. The full account we have of him is that of his commanding an army against the Parthians under the emperor Verus, about the year 164, whom he entirely defeated near Nisibis, a city of Syria. Imposing this victory over Vologeses II. king of the Parthians, he passed the Euphrates, took Ctesiphon, and subdued the royal palace. He likewise subdued Edessa, Babylon, and al Media; and though Seleucia on the Tigris opened its gates to him, he ordered the inhabitants, amounting in number to 40,000, to be unmercifully massacred, and the city to be utterly destroyed. On his return he held great numbers of his foes by famine and death; however, he put an end to the war, and obtained for the indolent Verus, who had never joined him at Antioch, the title of conqueror of the Parthians and Median. Cassius, having acquired the reputation of a rapid disciplinarian, was invited by Aurelius with the command of the legions of Syria; nor did he disappoint the hopes which the emperor had conceived of him. Whilft he had this command, he marched against the Egyptians, who had revolted, and contrived to subdue them by policy rather than force, and he afterwards performed great exploits in Armenia and Arabia. In the war against the Sarmatian Jazagars, he punished with an ignominious death some centurions who had crossed the Danube without orders, though they had killed 3000 of them and returned to the camp with very considerable booty. This severity occasioned a mutiny in the army; but Cassius, with invincible intrepidity, appeared unarmed in the midst of the mounted multitudes, called out aloud to them, "kill me; and to your neglect of duty, add the murder of your general!" and by this intrepid valor, he quelled their fury and recalled them to their duty. Whilst he inspired his soldiers with awe, he likewise engaged their attachment; and though, among the inequitable accounts that occurred of his character, he is generally represented as chargeable with atrocious vices, infidnuch that he has been denominated a second Catiline, he seems to have possessed the qualities necessary for constituting a great commander. When he commanded in the Parthian war, Verus suspected his ambitious designs, and communicated his apprehensions to M. Aurelius, his partner in the empire. But the philosophical emperor took no notice of the charge that was alleged against him; but continued to entrust him with the command of the army in the East. In the 15th year of Aurelius's reign, A. D. 175, Cassius threw off all disguise, and ventured to declare himself his rival in the empire. With this view he availed himself of an illness, under which Aurelius laboured during his war against the Marcomanni, to circulate a report of his death, and to cause himself to be proclaimed emperor in his room. Having assumed this title, he soon reduced all the countries beyond mount Taurus, and the governor of Egypt declared in his favour; several foreign princes and nations respected his name, and many with greater zeal than the Jews. Whilft he was successfully pursuing these measures for the establishment of his power, he ignominiously respected for the memory of Aurelius, and placed him among the gods. As soon as the news of this revolt reached Rome, the senate instantly declared Cassius a traitor, and confiscate his effects; but the emperor, with singular moderation, left Germany and pursued his march as far as Illyricum towards the east; proposing to reign the empire to his competitor, if the gods should judge it expedient for the public good, that Cassius should reign, and not Marcus Aurelius. He had not proceeded far before he received the news, that Cassius had been killed in consequence of a conspiracy among his inferior officers. When the head of Cassius was brought to the emperor, he expressed
CASSUMUNAR, in Ancient Geography, a fountain of Greece, in the Phocide, and in the vicinity of Delphos. Panhens.

CASSOVA, in Geography. See CASSON.  

CASSONADE, in Commerce, cafe sugar, or sugar put into cakes or waffles, after the first purification, but which has not been refined. It is sold, either in powder or in lumps; the white, and that of which the lumps are largest, is the best. Many imagine it to sweeten more than loaf sugar; but it is certain that it yields a great deal more. See SUGAR.

CASSOPO, in Geography, a town of the island of Corfu, 8 miles N. of Corfu.

CASSOTIS, in Ancient Geography, a fountain of Greece, in the Phocide, and in the vicinity of Delphos. Panhens.

CASSUTHA. in Botany, Rumph. See CASSYTA.  

CASSUVIUM, Rumph. Lam. Juft. See ANACARDIUM.

Gen. Ch. Cal. perianth three-leafed, very small, permanent; leaves semi-oval, acute, concave, erect. Cor. petals three, roundish, acute, concave, permanent; nectary of three glands, oblong, truncate, coloured, the length of the germ, and flanding round it. Stam. filaments nine, erect, compressed; glands two, globular, seated on the side of the bafe of each of the three interior filaments; anthers adnate to the filaments below their tip. Pfl. germ egg-shaped, within the corolla and calyx; style rather thick, the length of the flaments; figg. slightly trifid, obtuse. Peric. receptacle incrusted into a deformed globular drupe, crowned with the converging calyx and corolla, perforated with a navel. Seed, nut globular, acuminate, with the converging flaments. Linn. Schreb. and Mart.  

Cal. one-leafed, permanent; segments fix, ovate-acute, straight, concave; three interior ones resembling petals. Cor. none. Stam. nine, in several ranks; filaments compressed; anthers fixed below their tips; accompanied by nine yellowish, glandular bodies; six of which are fixed to the bafe of the three interior flaments, one on each side; the three others alternate with those flaments, oblong, truncate. Pfl. germ superior, ovate; style thick, fligma obtuse, slightly trifid. Lam. and Boic.

Cal. one-leafed, globular, stellated at the border, fix-cleft, converging; the inner alternate, segments (petals, Linn.) a little larger; bracts at the bafe (calyx, Linn.) three, very small. Cor. none. Stam. filaments twelve, inserted in a double order into the top of the calyx; the fix exterior ones fertile, naked at the bafe, opposite to the segments of the calyx; the fix interior ones opposite to the former; three fertile, with two glands at the bafe of each; three alternate with them, barren (nectary, Linn.), resemblling tubercles; anthers adnate to the anterior side of the fertile flaments, two-celled (two-valved from the bafe to the tip). Pfl. germ superior; style thickish; fligma obtuse (slightly trifid?). Peric. capsule globular, one-seeded; covered by the converging, somewhat-berried, calyx. Juff.
CASSIA papyrifera, Hort. Kew. See Rhipsalis.

CAST, a term in Scripture, for the impression of any figure taken in bronze, plaster, wax, or other oblong material. The original of this word is כָּשׁ, tash, because the filled matter is thrown on the figure of which the impression is to be taken. The process is as follows: plaster of Paris is mixed with water in a basin or pan, and poured with a ladle until its consistency is like that of better for pan-cakes; it is then poured on any figure, for instance, an human hand, or foot, previously heated or oiled in the flightman manner possible, which will prevent the adhesion of the plaster; after a few minutes the plaster will dry to the hardness of solid bone, taking the exact impression of every part, even the minutest pores of the skin. This impression, the reverse or hollow of the original subject (like a leaf in comparison with its impression), is called the mould, which being taken off from the figure that produced it, must be lightly greased, and then plaster, mixed with water as before, may be poured into this first impression or mould, and remaining until it is hardened, and then relieved, or taken from the mould, is the exact image of the original figure. If the figure is flat, having no deep hollows or high projections, it may be moulded in one piece; if its surface is varied with great hollows and projections, it must be moulded in many pieces, fitted together, and held in one or more outside or containing pieces. Pllow mentions casting faces from nature in the early practice of Greek sculpture. This useful art supplies the painter and sculptor with exact representations from nature of limbs, bodies, heads of men and inferior animals, anatomical subjects, draperies, and plants; it multiplies models of all kinds, and is now practiced in such perfection, that casts of the antique statues are made so precisely like the originals in proportion, outline, and surface, that no difference whatever is discoverable, excepting in colour and materials. See BRONZE and BRONZE CASTING.

CAST, among Wax Chandlers, denotes a half-cell of melted wax, poured on the wicks of candles made by the laie.

CAST, among Founders, is applied to tubes of wax, fitted in divers parts of a mould of the same matter, by means of which, when the wax of the mould is removed, the mellow metal is conveyed into all the parts which the wax before possessed.

CAST, among Bowlers. See BOWLING.

CAST also denotes a cylindrical piece of brass, or copper, fitted in two, lengthwise, in the founders in found to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be cast from the same mould.

CAST, among Plambers, denotes a little brass funnel, at one end of a mould, for carrying pipes without folding, by means of which the metal melted is poured into the mould.

CAST of the country, with Miners, the colour of the earth.

CAST, in Falconry, denotes a set or couple of hawks.

To cast a hawk to the perch, signifies to set her upon it.

CAST, in Rural Economy, a term applied to these kinds of insects. Thus a call of bees signifies a swarm or flight of bees. See BEEs.—Also, a word sometimes applied to poultry, when they lose their feathers, or molt. It is also applied to the changing of the hair: and hоofs of horses. Horses call or shed their hair at least once in a year. Every spring they call the winter coat, and take a summer one; and sometimes in the end of autumn they put on their winter hair, in cafe they have been ill fed, farriied, or clothed, or kept in a cold stable. Sometimes they call likewise their hoofs; when this happens, they should be turned out into a pasture for some length of time.
C A S

Case, among the Hindoos, denotes a tribe; or number of families of the same rank and profession; and this division, which is ancient and peculiar, has variously been preserved in India. This distinction seems to have proceeded, from a craftsman, particular to order his own insufficiency or predominance. Prior, 1854, Dr. Robertson, in his India, concerning India, p. 157.) to the Hindus of authentic history, and even from the very remotest era, to which their own traditions pretend to reach. This separation of profession has not only taken place among the natives of India, but the perpetuity of it was secured by an institution which must be considered as the fundamental articles in the system of their policy. The whole body of the people was divided into four orders or castes. According to all the writers of antiquity, indeed, the Hindoos are said to be divided into seven tribes or castes. See Strabo, l. xiv. p. 1039. Diod. Sicul. lib. ii. p. 173. Arius, Ind. c. 17. But they were probably led into this error by confounding some of the subdivisions of the castes, as if they had been a distinct independent order. However, from the concurrent testimony of the best informed modern travellers, we learn, that there were no more than four original castes. In a work entitled, "La Porte Ouverte, ou la Vraie Representation de la Vie, des Moeurs, de la Religion, et du Service des Brahmines, qui demeurent fur les Colles de Choromandel, &c." compiled before the middle of the 17th century, by Abraham Roger, chaplain of the Dutch factory at Pulicat, we have a distinct account of these castes. No doubt can now be entertained with respect either to the number or the functions of the castes, as both are ascertained from the most ancient and sacred books of the Hindoos, and confirmed by the accounts of their own institutions, given by Brahmins of note for their learning. According to them, the different castes proceeded from Brahma, the immediate servant of the creation under the Supreme Power, in such a manner as to establish both the rank which they were to hold, and the office which they were required to perform; so that to mingle or confound them would be deemed an act of the most daring impiety.

The members of the first caste, called the brahmins, from the mouth (widow), and deemed the most sacred, had it for their province, to pray, to read; to instruct, to study the principles of religion, to perform its functions, and to cultivate the sciences. They were the priests, the instructors, and philosophers of the nation. The members of the second order, called Chederees, from the arms (strength); to draw the bow, to fight, to govern; were entrusted with the government and defence of the state. In peace they were its rulers and magistrates; in war they were the generals who commanded its armies, and the soldiers who fought its battles. The third order, called the Diis, from the belly and thighs (nourishment); to provide the necessaries of life by agriculture and traffic; was composed of husbandmen and merchants. The fourth castes denominated the Squder from the feet (subjection); to labour, to serve; composed of artisans, labourers, and servants. Subordinate to these castes is a fifth, or adventitious class, denominated Boursah Sunder, supposed to be the offspring of an illicit union between persons of different castes. These are mostly dealers in petty articles of retail trade. (See preface to the code of Gentoo laws, p. 156 and 500.) This adventitious cast is not mentioned, as Dr. Robertson supposes, by any European author. The distinction was too fine to be observed by them, and they seem to confound the members of this cast as belonging to the Squder. Besides these acknowledged castes, there is a race of unhappy men, denominated on the Coromandel coast Pariaus, and, in other parts of India, Chandals. These are outcasts from their original order, who, by their misconduct, have forfeited all the privileges of it. Their condition is, without doubt, the lowest degradation of human nature. If a Paria approach a N郭r. i.e. a warrior of high cast, on the Mahabarata, he may put him to death with impunity. Water and milk are considered as defiled even by their shadow passing over them, and cannot be used until they are purified. (Areya Akbery, vol. iii. p. 244.) Every Hindoo who violates the rules or institutions of his cast fixes into this degraded situation. Hence it is that the Hindoos do religiously adhere to the institutions of their tribe, because the loss of caste is, to them, the loss of all human comfort and respectability; and is a punishment, beyond comparison, more severe than excommunication in the most triumphant period of Papal power.

The four original castes are named, and their functions described in the "Mahabarat," the most ancient book of the Hindoos, and of higher authority than any with which Europeans are hitherto acquainted. Baghvat Greta, p. 150. The same distinction of castes was known to the author of Hecto-pades, another work of considerable antiquity translated from the Sanscrit, p. 257.

The members of one cast can never quit his own, or be admitted into another; so that the imitation of every individual is utterly fixed, his destiny is irremovable, and the walk of life is marked out, from which he must never deviate. Moreover, the members of each cast adhere in general to the profession of their forefathers; and from generation to generation, the same families have followed, and will always continue to follow, one uniform line of life. However, though the line of separation be so drawn as to render the ascent from an inferior to a higher cast absolutely impossible, and it would be regarded as a most enormous impiety if one in a lower order should presume to perform any function belonging to those of a superior cast; yet, in certain cafes, the Pundits declare it to be lawful for persons of a high cast to exercise some of the occupations allotted to a cast below their own, without losing their cast by doing so. Pref. of Pundits to the Code of Gentoo Laws, p. 106. Accordingly we find Brahmins employed in the service of their princes, not only as ministers of state (Orme's Fragments, p. 257), but in subordinate stations. Many officers of the army, particularly in the Mahatta states, have been Brahmins; and many sepoys in the service of the East India company, especially in the Bengal presidency, are of the Brahmin cast. Another fact concerning the castes deserves notice. An immense number of pilgrims, amounting in some years, to more than 150,000, visit the pagoda of Juggernaut in Onda, one of the most ancient and revered places of Hindoo worship, at the time of the annual festival in honour of the deity to whom the temple is consecrated. The members of all the four castes are allowed promiscuously to approach the altar of the idol, and fear themselves without distinction, eel indiscriminately of the same food. This seems to indicate some remembrance of astate prior to the institution of castes, when all men were considered as equal.

Such arbitrary arrangements of the various members, composing a community, seem, at first view, to be adverse to improvement either in science or arts, and the artificial barriers that separate different orders of men tend to circumscribe the operations of the human mind within a narrower sphere than nature has allotted to them. Hence genius must sometimes be checked in its career, and talents fitted to shine in an higher sphere be confined to the functions of an inferior cast. Nevertheless, these arrangements of Indian policy are adapted to the general state of society, though they may be attended with partial inconvenience; and they serve to accomplish the object of the first Indian legislators, which was
was to employ the most effectual means of providing for the sufficiency, the security, and the happiness of all the members of the community over which they presided. With this view they set apart certain races of men for each of the various professions and arts necessary in a well-ordered society, and appointed the exercise of them to be transmitted from father to son in inheritance. This fudong, though repugnant to the ideas which we, who are placed in a very different state of society, may have formed, and better adapted to the attainment of the end proposed, than a careless observer is apt to imagine. An Indian, on his entrance into life, knows the station which he is destined to occupy, and the functions which he is to perform; and from his earliest years, he is trained to the habit of doing, with ease and pleasure, that which he must continue to do through life. To this may be ascribed that high degree of perfection conspicuous in many of the Indian manufactures; and though reverence for the practices of their ancestors may check the spirit of invention, yet, by adhering to these, they acquire such an expertise and delicacy of hand, that Europeans, with all the advantages of superior science, and the aid of more complete instruments, have never been able to equal the exquisite execution of their workmanship. To this early division of the people into castes, we must likewise ascribe a striking peculiarity in the state of India; the permanence of its institutions, and the immutability in the manners of its inhabitants. What now is in India, says Dr. Robertson, always was there; and is likely still to continue; neither the ferocious violence and illiberal fanaticism of its Mahometan conquerors, nor the power of its European masters, have effected any considerable alteration. The same distinctions take place, the same arrangements in civil and domestic society remain, the same maxims of religion are held in veneration, and the same sciences and arts are cultivated; and hence, in all ages, the trade in India has been the same. This ingenuous writer adduces the division into castes as one evidence of the ancient and high civilization of the Hindoos. But it has been observed by Mr. Pinkerton (see Mod. Geog. vol. ii. p. 259) that the error of his argument consists in his confounding castes with trades, while in reality they are totally distinct, as neither a priest, a soldier, a farmer, nor a labourer is a tradesman. Separation of trades argues refinement; but from the Hindoo caste nothing can be concluded, except that agriculture existed at their institution. Besides, when he adds that "what now is in India, always was there," he evinces rather a singular love of hypothesis. All we know from antiquity is, that the castes existed in the time of Strabo, Arrian, and Pliny, and perhaps were not known even in the time of Alexander. If we suppose that they existed three centuries before the Christian era, we have only a proof that agriculture and merchandise were then known in Hindoostan; and yet the first tribe that passed from the centre of Asia might, even in that state, have only begun to people the north of Hindoostan a few centuries, or a thousand years before the Christian era. Among the followers of Boudha or Buon, in the Birmian empire, and in Siam, the distinction of castes is utterly unknown. Dr. Buchanan (Aristot. References, vol. vi. p. 253.) in tracing the origin of the doctrine of castes established in Hindoostan, refers to Pliny, (N. H. i. x. c. 179) who mentions a division of ranks among various Indian nations, which he calls "vita multipartita," but from what he says, it does not appear to have been universal at the time he received his intelligence; neither is it by any means clear, that his "vita multipartita" means caste. It is to be observed, that all Roman citizens, followed nearly the same mode of life; they were soldiers and statesmen; and when not employed in either of these capacities, they were all cultivators of the land. To them, therefore, a distinction of professions among the citizens of a state would appear strange; and hence this writer inclines to think, that the "vita multipartita" of Pliny more resembles the division of ranks and professions among the Barzani, or in modern Europe, than it does the castes of the Brahmins. The description of Pliny, in the passage above referred to, neither agrees with the present divisions of the different castes, nor does it call the learned Brahmins; on the contrary, Pliny speaks of the Brahminas not as a class, and order in society, but as a nation, and as a name common to many nations. He mentions, that Seneca had attempted to procure the names of all the people inhabiting India, and had actually heard of 118 nations. The most considerable of these he afterwards enumerates, lib. vi. c. 17. See Birmian Empire, Boudh, Brahmins, and Hindoos.

CASTAWAY, in Sea Language, the state of a ship which is lost or wrecked on a lee shore, bank, or shallow.

CASTABALA, in Ancient Geography, a town of Asia, in Cidia Propria, according to Ptolemy, who places it in the neighbourhood of Mopseulia. In the Itinerary of Antonine it is in the route from Constantinople to Antioch. M. d'Aulville places it at a very small distance to the north-west of Ilius. - Alto, a town of Asia Minor, in Cappadocia, placed by Strabo near the mountains, which fays that it had a temple of Diana Peraasia. M. d'Aulville places it at the source of a river which discharged itself into the Euphrates. It was at some distance E. of Cibyrha.

CASTABUENA, in Geography, a town of Iliria; six miles S. of Capo d'Iliira.

CASTACIUS SIVUS, or Ancient Geography, a gulf of Asia Minor, on the Thracian Bosporus, S. of the gulf Cylindrium.

CASTAGNEUX, in Ornithology, a name given to a species of Columb us, which fec.

CASTAGNO, ANDREA, DAL, in Biography, an eminent historical painter, was born at a small village called Castiglione, belonging to Tuscany, in 1469, and being deprived of his parents when young, was employed by his uncle to attend the herds of cattle in the fields. His singular talents, which were fully manifested in surprising efforts to imitate an ordinary painter, whom he accidentally observed at work, became the common topic of discourse in Florence, and excited the curiosity of Bernardetto de Medicis, so that he placed him under the tuition of the best masters at that time in Florence. Andrea, affidiously improving his advantages, became particularly eminent in design, and found full employment. At first he painted only in tempera and fresco; but at length he learned the secret of painting in oil from Domenico Venetiano, who had derived his knowledge of it from Antonella da Meffina. He was the first of the Floreniite artists who painted in oil; but enjoying the merit of Domenico, from whom he obtained the secret, he determined, with the greatest ingratitude, to affix his own name and benefactor. At this time Domenico and Andrea lived together, and were partners in buffets. Incautiously, however, of every obligation, and combining treachery with ingratitude, he way laid Domenico in the corner of a street, and killed him with such ferocity, that he escaped unobserved and unsuspected to his own house, where he sat down with apparent composure to work; soon after Domenico was conveyed thither to die in the arms of his assassins. The real author of this atrocious act was never discovered, till Andrea, through remorse of conscience, disclosed it on his death-bed, in 1480. Andrea finished several considerable works at Florence, by which he gained great wealth.
C A S

wealth and a pertaining; but as soon as his complicated villany became public, his memory was afterwards held in the utmost detestation. The most noted of his works is in the ball of justice at Florence, and represents the execution of the conspirators against the house of Medici. Pilkington.

CASTAGNOLA, in Geography, a town of Piedmont, on the Po; 8 miles S. of Turin.

CASTAGNOLLE, in Italy, a name given by the Italians to the fish called by the generality of authors Acipenser, while for Acipenser in Scotland.

CASTALDI, Cornetli, in Biograph, the descendant of a noble family, was born at Feti about the year 1730, and though educated to the bar, he devoted himself to poetry and the study of polite literature. On his marriage he settled at Padua, where he founded a college, and gained universal esteem. He died in 1756. His poems were both Italian and Latin. The former contain ingenious and elevated sentiments, but are defective in sweetness and elegance of style. The latter are a happy imitation of the ancients. They were published at Venice, in 4to. in 1737, by the abbe Canti, with a life of the author prefixed by Signor Fafetti. Nouv. Dict. Hift.

CASTALDUS.

CASTALDY.

Gen. Chi. Cal. perianth four or five-leaved, surrounding the margin of the receptacle. Cor. petals from twenty to thirty, inserted into the pericarp from the base to the middle. Stema. filaments from fifty to a hundred and fifty, inserted into the pericarp above the petals, free. Pd. 5. Astyle none. iligma with as many rays as there are cells in the fruit. Peris. from twelve to twenty-celled, patryfying as the seeds ripen. Nett. one, in the centre of the iligma, globular. Seeds from two to three hundred, fiddle on the inner side of the pericarp, surrounded with a folicle.

Flowers white, red, or blue, rivalling the magnolias. It differs from the proper nymphaea in the insertion of the petals and ilamens into the pericarp, and not into the receptacle. We have adopted Mr. Salisbury’s generic name, from a confirmed unwillingness to change any name once given, unless urged by the most cogent reasons; but, at the same time, we feel ourselves constrained to add, that we cannot concur with that excellent botanist in the principle on which he has been induced to choose it. Every attempt to extend the sexual analogy between plants and animals to the mode of operation and its essential circumstances, appears to us to be no less adverse to philosophical precision and truth, than it is unfairly to moral purity, and to that delicacy of decorum, which is one of the best characters of a rightly cultivated mind.

* Leaves with a fissure extending to the petiole.

Sp. 1. C. odora. (C. pudica, Salis. Nymphaea odorata, Hort Kew, Bat. Rep. pl. 207. “ Lobes of the leaves divided, acuminate; receptacle fiddle-shaped like the nave of a wheel.”) Medulliformis, Salis. to the word is spelt both in the Annals of Botany, and in Paradisif Lundelius, but as we are not acquainted with such a Latin word, we presume it should be modified, which means either a small conical measure, or the nave of a wheel.” A native of Virginia. The flowers diffuse a spicy odour, somewhat resembling aniseed. 2. C. alba, white water-lily. (C. fiscoe, Salis. Nymphaea alba, Linn. Eng. Bot. pl. 160.) “ Lobes of the leaves approximate, fearcely acuminate; receptacle cymbal-shaped.” Caltha-leaves four, oblong, green underneath, white above, often tinged at the base with a light bluish-colour. Petals white, lanceolate, in several rows, gradually diminishing in size. Stamens yellow; outer ones dilated, resembling petals, with only the rudiments of an anther. Fruit scarred with the marks of the foliaceous petals and ilamens. A native of various parts of Great Britain; in ponds and slow streams.

** Leaves pedate.

CASTALIA, in Entomology, a species of Phalaena, (Bombyx), found in New Holland.
CASTALIA, or CASTELLO, Sebastian, whose proper name was Castellion, in Biography, was born in 1515, in the mountains in the district of Dauphine, or, as some say, of Savoy. Although nothing certain is known concerning his education, he appears to have obtained the elocution of Calvin, by his acquaintance with the ancient language; and then he was introduced to that reformer at Strasbourg, in 1540 and 1541. On his recommendation he was appointed teacher in the college of Geneva; but the intolerant temper of Calvin obliged him to leave this situation, after having occupied it about three years. He disagreed with Calvin with regard to the doctrine of predetermination; he disapproved of the civil punishment of heretics; he considered the Canticles of Solomon as a profane piece; he entertained an opinion peculiar to himself concerning Christ's descent into hell; and he was suspected of having imbued some of the sentiments of the Anabaptists. Such were the offences for which he was expelled Geneva, and became an object of the persecution both of Calvin and Beza. At Basle, whether he removed, he obtained the professorship of the Greek language; but having a large family, and his circumstances being indigent, he found it very difficult to procure for them a subsistence, and to prosecute the studies to which he was devoted. Calvin, who could not be ignorant of his disaffected situation, but who seems to have felt no compassion for him, accused him of stealing wool. Calilay's own relation of the facts is as follows: "Being totally occupied with my translation of the Scripture, and resolved rather to beg than to quit it, as I dwelt on the banks of the Rhine, I employed myself at leisure hours in catching with a hook the floating wood, which was brought down by the stream by its inundations, that I might warm my family. This wood is public property, and belongs to him that first takes it." He appeals to the whole city of Basle for the truth of his narration, and concludes with thus addressing the unsympathizing Calvin: "I could not have thought that you, who knew me, could have credited such a charge; but that you should publish it to the whole world, and transmit it to posterity, is what (although I know you) I could not easily have believed!" The contumacy at Basle would not allow him to publish his works in that city without animadversion; he was cited before them; and the curators of the university wished to restrain him from theological topics. But whilst his opinions met with no indulgence, he was too much esteemed for his poetry and learning, that his enemies were not able to expel him. However he peaceably closed his life of anxiety and indignation at Basle, in 1543, at the early age of 48 years. Calvin was an elegant, though not a profound scholar; and his Latinity resembles that of the modern Italian schools. In 1545 he printed at Basle four books of Scripture-histories in elegant Latin, with a view of communicating to children a knowledge of the facts of their religion, and at the same time of giving them a taste for polite literature. In 1546 he published a poetical translation of the Sibylline Veres, with notes, together with a prose version of the books of Moses, which was followed by a translation of David's Psalms, and the other Scripture songs. In 1548 he published a Greek poem on John the Baptist, and a Latin poetical paraphrase of the prophet Jonah. He likewise translated some parts of Homer, some books of Xenophon, and St. Cyril. His translation of some Italian treatises of Otho, and particularly his "Thirty Dialogues," favouring polygamy, furnished one ground of the accusations against him. But his greatest work was his Latin translation of the Bible, for an account of which see Latin Bibles. This version was the most elegant and classical that was ever made; but whilst it has been highly commended by some, it has been censured by others for an affected use of terms, not properly belonging to Jewish or Christian theology, and for an improper and paraphrastical deviation from the original phraseology. His "New Testament," however, is read with pleasure, and very properly put into the hands of young scholars. It is no improbable conjecture, that the holiness of Beza against him might have been partly owing to the rivalry of his version. Castalia's French translation of the Bible (see French Bibles), dedicated to Henry II. of France, and printed at Basle in 1555, has been charged with the adoption of a low and vulgar phraseology. Bayle in Gen. Dict.

CASTALOGNE, or CASTELOGNE, a covert made of fine wool, on the weaver's loom.

CASTAMENA, or KASTAMONI, in Geography, a town of Asiatic Turkey, in the province of Notokia, formerly a large and flourishing city, and the see of a Greek archbishop, but now much reduced in size and magnificence: 240 miles east of Confiantinople. N. lat. 44° 42'. E. long. 34° 22'.

CASTANEA equina, Ray. See Aesculus Hippo-castanum.

CASTANEA, in Entomology, a species of Chemere, which see.

CASTANEA, in Natural History, a species of Turbo, and also of Helix, which see respectively.

CASTANET, in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of Tolones, 2 leagues S.S.E. of Tolones. The place contains 1520, and the canton 6339, inhabitants; the territory includes 1074 kilometres and 16 communes.

CASTANETTS, CASTAGNETTES, or CASTANETTAS, small musical instruments of percussion, in pairs, each of which the Moors, Spaniards, and Bohemians mark the measures and steps in their dances, holding two in each hand. They consist of two little round pieces of dried wood, and hollowed in the manner of spoons, of which the concavities are placed over each other, fastened to the thumb, and beat from time to time with the middle finger, to mark the steps and gestures.

5 F. Each
Each caftanet is kept in its place by a string passing through a hole pierced through an eminence left for that purpose at the side of the caftanet, and which serves as a neck. There is a notation for caftanets to mark the time, and the two hands ought at least to have as many characters as there are notes in a bar. Dextrous performers will double and triple the notes affixed them.

The tablature for the caftanets is marked with the usual characters of the time-table, placed above and below the same staff or line; those above for the left hand, and those below for the right. The bars, whether a single line or a five line staff, are to be marked by a perpendicular line. There ought likewise to be a clef, and a character for time at the beginning of each tune.

This article is taken from the new *Encykl. Meth.*; but we are unable to discover the use of clefs for a monotonous instrument, or rather for an instrument on which no tuneable sound can be produced.

CASTANETTO, in Geography, a town of the island of Corsica; 13 miles N.E. of Corte.

CASTANHEIRA, a town of Portugal, in the province of Beira; 24 leagues E. of Aveiro.

CASTANIA, in *Ancient Geography*, a town of Italy, near Tarentum; supposed to be that which is now called Castel-laneta.

CASTANVITZ, in Geography, a town of Croatia, seated on the river Unna, and subject to the house of Austria. N. lat. 45° 42'. E. long. 17° 20'.

CASTAX, in *Ancient Geography*, a town of Spain, mentioned by Appian, and supposed to be the fame with the Caftalen of Livy.

CASTEL, Louis Bertrand, in Biography, a geometrical and philosopher, born at Montpellier in 1688, and who entered into the society of Jesus in 1703. He made himself known to Fontenelle and to father Tournemine by his essays and sketches of new invention, which promised the greatest successes. The young man was at this time in Provence, but was invited to the capital. Caftel removed from Thoulouze to Paris in 1720. He supported the idea of his talents which his essays had excited. The first work he published was his "Treatise on Universal Geography," in 2 vols. 12mo. 1724. All nature, according to him, depends on two principles, the weight of bodies and their tendency to motion; the one, which incessantly precipitates them to repose, the other, which re-establishes their motion. This doctrine, the key of the system of the universe, as he pretended, did not satisfy the abbé de Saint-Pierre. Though a friend of the mathematician, he attacked him; the Jesuit answered. The writings on both sides manifested a considerable portion of wit and ingenuity in the combatants, but it was of a singular kind. The second work of father Caftel was his "Plan for an Abridgment of the Mathematics," Paris, 1727, in 4to. which was soon followed by a "Universal Mathematics," 1728, 4to. This work was applauded both in England and France, and the Royal Society of London opened its doors to the author. Diet. Histo.

His "Clavecin Oculaire," or ocular harpsichord, though silent, made a considerable noise in the world, and excited much curiosity and considerable expectation among opticians as well as musicians. His idea of producing the same pleasure to the eye by the melody and harmony of colours, as the ear received from the succession and combination of musical tones, was published in 1725. Sir Isaac Newton, having discovered (Optics, book 1. p. 2. prop. 3.) that the brightness of the seven primary colours in the sun's image, produced, by the refraction of his rays through a prism, are proportional to the seven differences of the lengths of the eight musical strings, D, E, F, G, A, B, C, D, when the intervals of their sounds are T, H, t, i, T, T, t, h; which order is remarkably regular. Smith's Harmonics. From this analogy, Père Caftel sets off by telling us that there is a fundamental and primitive found in nature to which we may give the name of red, or C.

There is also a primitive and original tone which serves for base and fundamental to all colours, which is blue.

There are three essential tones which depend on this primitive tone of C, and which together compose the perfect, primitive, and original chord, which is CEG.

There are likewise three original colours dependent on the blue; they are compounded of no other colours, and they produce the red; these three colours are blue, yellow, and red. The blue is the key-note, the red the fifth, and the yellow the third. There are five tunes, C, D, E, G, A; and two semi-tones, F and C. In the same manner there are five principal colours, blue, green, yellow, red, and violet; and two semi-tone colours, which are orange and indigo.

The musical scales, c, d, e, f, g, a, b. The scale of colours is blue, green, yellow, orange, red, and violet. These are the data of father Caftel, upon which he has founded his organ or harpsichord of colours.

It would be useless to analyze and critically examine his plan, which is truly visionary, false in its ratios, and incapable of producing the promised effects.

After being tried in all parts of Europe, particularly in London, about the year 1756, when the plan and pretended effects were published in an English pamphlet—but its exhibition was soon neglected and forgotten, and has been fearedly heard of since:—he died in 1767, leaving behind him the character of a visionary projector, whose eccentricities, though wild, were innocent; and if he did not inculcude mankind, he contributed to their idle amusements.

Père Caftel was the dupe of a fertile and lively imagination. His systems were at first mere hypotheses; but he cherished them so long, that, by degrees, he fancied he had realized them. "The New General System of Nature," by Newton, in 1743, in 4to. did him more honour, but it diffipated others. He respected the English philosopher, without allowing his doctrine to be the true fyltem of the world. "Newton and DeCartes," says he, "have infinite merit for their invention. The latter had more facility and elevation, the former less faculty and more depth; which is nearly the character of the two nations; the French build loftly, the English profoundly. Both were ambitious of framing a world, as Alexander was of conquering it; and both saw nature on a large scale." Caftel wrote much in the "Memoirs de Trevoux;" he treated an infinite number of subjects, but none deeply. However, "he thought (says his biographer,) a great deal, and often well."

CASTEL, in Geography, a town of Germany, in the duchy of Carniola; 15 miles S.S.W. of Gottschec. — Alfo, a town of Germany, in the circle of Bavaria, and Upper Palatinate; 10 miles S.W. of Amberg.

CASTEL de las Guardas, a town of Spain, in the province of Andalusia; 8 leagues from Seville.

CASTEL Belforte, a town of Germany, in the country of Tyrol; 11 miles N.N.W. of Trent.

CASTEL-Branco, a town of Portugal, in the province of Beira; encompassed by a double wall, flanked with seven towers, and defended by an old castle; containing two churches, two hospitals, a poor-house, two convents, and
CASTELL, Edmund, in Biography, a learned divine, was born in 1605 at Hatley, in the county of Cambridge, and educated at Emanuel college in the university of Cambridge, whence, after a residence of many years, he removed to St. John's college for the benefit of its library. The great work which engaged his chief attention for 17 years, and as he says, cost him almost the incredible sum of £2000, was his “Lexicon Heptaglotton,” or Dictionary of seven tongues. After expending upon it his whole fortune, and being thus reduced to great distress, he was appointed, in 1665, king's chaplain and Arabic professor at Cambridge, and presented to a prebend at Canterbury. His Lexicon was published in 1669, but most of the copies remained unfolded. Besides some other preferments, the laft that was conferred upon him was the rectory of Higham Gobion, in Bedfordshire. Among other ill-requited and unprofitable labours, he affifted Dr. Walton in his Polyglott Bible, for which he translated several books of the Old and New Testament, and diligently examined the eastern versions. At the restoration, he published a thin 4to. pamphlet to the honour of Charles II., containing copies of verses in all the languages of his Lexicon. He died at his rectory in 1685, and bequeathed all his MSS. to the university of Cambridge. About 550 copies of his Lexicon, which came into the possession of his niece and executrix, were configned in an old houfe to the mercy of the rats, so that scarcely one complete volume was left.

CASTELL, county of, in Geography, a principality of Germany, in the circle of Franconia, situated between the bithorphic of Wurzburg, the principality of Anhalt, the lordship of Limburg, and the county of Schwarzenburg; deriving its name from an ancient castle, which was destroyed by the peafants in 1525. It pays 18 florins for a Roman mouth, and is taxed at 18 tix-dollars 84 kreuzers. CASTELLA, Castles, in Italia Antiqua, were one of the three kinds of fortifications that were built along the line of Severus's wall; the other two being denominated stations and towers. These castles were neither so large nor so strong as the stations, but much more numerous, being no fewer than 81. In shape and dimension they were exact squares of 66 feet every way. They were fortified on every side with thick and lofty walls, but without any ditch, except on the north side, on which the wall itself, raised much above its usual height, with the ditch adjoining it, formed the fortification. The castles were situated in the intervals between the stations, generally at the distance of about seven furlongs from one another; and guards were constantly kept

CASTELLAIN, Caffellanus, the lord, owner, or captain of a castle; and sometimes the confable of a fortified house. Brct. lib. v. tract. 2. c. 16. 3 Edw. I. c. 7. It has likewise been taken for him that hath the custody of one of the king's manor-houses, called by the Lombards curtes, in English courts; though they are not castles or places of defence. 2. Inft. 31. And Manwood, in his Foref Laws, says there is an officer of the forest called Caffellanus.

CASTELLAN, in Biography. See Chatel.

CASTELLAN, the name of a dignity or office in Poland. The caftellans are senators of the kingdom, but senators of the lower classes; and in diets, sit on low seats behind the palatines, or great senators. They are a kind of lieutenants of provinces, and command a part of a palatinate under the palatine. They are divided into grand and petty caftellans: their office, in time of peace, is merely nominal; but when the military or feudal services are required, they are the lieutenants of the palatines, under whom they command the troops of the several districts.

CASTELLANA, CVITA, in Geography, a town of Italy, between Otricoli and Rome, the first of ancient Latium, on the approach to Rome by the Flaminian way. This town is considered by many antiquarians as the Pelmeneum of the ancients. It stands upon a high rock, and must formerly have been a place of great strength, but it is now in no very flourishing condition.

CASTELLANE, in Geography, a town of France, and principal place of a district in the department of the Lower Alps, situate at the foot of a mountain, on the river Verdon, in a pleasant and fertile spot; 12 leagues W. of Nice. The place contains 1562 and the canton 2477 inhabitants; the territory includes 225 kilometres and 13 communes.

CASTELLANETTA, a town of Naples, in the province of Otranto, the see of a bishop, suffragan of Tarento; 18 miles E.S.E. of Matera.

CASTELLANI, in Ancient Geography, a people of Spain, who inhabited the Tarragonensis, to whom Ptolemys assigns four cities. They occupied a part of Catalonia at the foot of the Pyrenees.

CASTELLANIA, a Spanish word, derived from Castello or Castle, and denoting a separate territory, in the manner of a province, independent of any other; in which its particular laws are observed, and which has a jurisdiction over all the places dependent on its capital.

CASTELLANO, a town of Naples, in the province of Bari, eight miles S.W. of Monopoli.—Also, a town of Italy, in the Venetian, belonging to the state of Venice; 16 miles S.W. of Verona.

CASTELLANUS, or Du Chatel, Honore, in Biography, a native of Brabant, studied medicine at Montpellier, where he took his degree of doctor in 1544. Being soon disdained for his learning, and abilities, he was sent for to Paris, and in succession filled the office of physician to Henry II., Francis II., and Charles IX. By his intercourse with Charles, he obtained a considerable addition to the salaries of the several professors of the university at Montpellier, which they have acknowledged by an inscription, in Latin, placed over the entrance into the college, the only memorial left of him, excepting an oration, on the excellence of the practice of physic, spoken on some occasion, not now known, and printed in 1555, 8vo. He died in November 1569, attending a part of the army of his sovereign to which he was also principal physician. Eloy. Dict. Hist.

CASTELLANUS, or Du Chatel, Peter, was born at Grammont in Flanders in the year 1585. Shewing an early disposition to literature, he was sent to Mons, and afterwards to Orleans, where he acquired such a proficiency in the knowledge of the Greek language, that he was invited to Lovain, in 1609, to fill the chair of Greek professor, then vacant. In 1618, he took the degree of doctor in medicine. The same year he published at Antwerp, "Vita illustrium Medicorum, qui toto orbis adhuc uque temporis, floruerunt," 12mo. It is a small volume, but the author has contrived, within that compass, to introduce the most striking passages in the lives of the more eminent physicians, who had flourished from the earliest period, to his time, with brief notices of their works. Although the accounts are taken almost entirely from other writers, whose words are frequently copied, yet the volume will always be esteemed, both as a monument of the learning, and diligence of the author, and for the perpetual references given to the sources from whence he obtained his information. He died in February 1652, aged only 47 years. Haller. Bib. Med. Eloy. Dict. Hist.

CASTELLANY, the district or extent of land under the jurisdiction of a lord caftellan.

The province of Flanders is divided into so many castellanies, each of which bears the name of the capital; as the castellany of Lille, of Ypres, of Ghent, &c. The court of castellany was anciently composed of the castellan, a fiscal procurator, notary, regifter, &c. In Poland, a castellan is a petty government under the administration of a castellan.

CASTELLARIUS, the keeper, or curator, of a castellum. Gruter gives an ancient episcopal inscription in memory of a castellarius.

CASTELLARO, in Geography, a town of Italy, in the duchy of Mantua; 10 miles E. of Mantua.—Also, a town in the state of Genoa; 11 miles N.E. of Vintimiglia.

CASTELLATION, Castellatio, in Middle Age Writers, the act of building a castle, or of fortifying a house, and rendering it a castle. By the ancient English laws, castellation was prohibited, without the king's especial licence. Dr. Cano.

CASTELLAUN, in Geography, a town of France, in the department of the Rhone and Mofelle, and chief place of a canton, in the district of Simmen, 22 miles S.S.W. of Coblenz. The place contains 620 and the canton 4977 inhabitants; the territory includes 28 communes.

CASTELLENGO, a town of Italy, in the country of Vercelli; eight miles S.E. of Biella.

CASTELLI, Benedict, Abbe, in Biography, an eminent mathematician, was born of an ancient and noble family at Brescia, in the year 1577. In 1605, he entered into a monastery of the order of St. Benedict in his native city. He was for some time a disciple of Galileo at Florence, and assisted him in his astronomical observations, and afterwards maintained a regular correspondence with him. Under his name the apology of Galileo against the censures of Leudo- vico delle Colombe and Vincent di Grazia appeared, though it was principally written by Galileo himself. From 1615 to 1625, he occupied the mathematical chair at Pisa. In 1625, Castelli was invited to Rome by pope Urban VIII., and made mathematical professor in the college della Sapienza. The subject of his particular attention, and in the investigation of which he chiefly excelled, was the motion of waters; and in 1628, he published two works upon it, which gained him much reputation; viz. "The Mensuration of running Waters," and "Geometrical Demonstrations of the Mensuration of running Waters." These have
have been lately inferred in the collection of the author's
works on similar topics, printed at Florence, with other
treatises, on the laguna of Venice, on the improvement of
the Pontine, Bolognese, Ferrarese, and Romagna marshes,
&c. Guglielminis, though in other things he impugns Caste-
elli, allows him the honour of having first applied geometry
to the motion of water; and Montinola (1 Hil. Math. t. ii.
p. 201.) calls him " The Creator of a new Pant of Hydraul-
ics." He died at Rome in 1644.

CASTELLI, Bernardo, an eminent painter of history and
portrait, was born at Genoa in 1577, and studied his art
under Andrea Semini and Luca Cambiaso, preferring the
principles of the first, and, in his practice imitating both. He
afterwards visited Rome for farther improvement; and there
he acquired distinction. He had a ready invention, and
when he chose to exert himself, he had sufficient correctness
and grace; but he became a mannerist, and frequently
adopted the colour and disposition of Vassali and Zuccheri.
The most distinguished poets of his time, whose portraits he
painted, celebrated him in their verses. Marino and Tasso,
in particular, were his intimate friends; and he made designs
for the Jezuista of the latter. The subject of his altar-
piece for St. Peter's at Rome was the call of St. Peter to
the apostleship; but this was afterwards removed, to make
room for one executed by Lanfranco. The principal works
of Castelli are at Genoa and Turin. As an engraver, his
style somewhat resembled that of Cornelius Buë. Among
other works in this department is a set of prints for
Tasso's poems. He died in 1639. Pilkington, by Fufili.
Strutt.

CASTELLI, Valerio, son of the former, was born at
Genoa, in 1625, and received his first instructions in the
school of Domenico Fiafella; but he gained his principal
knowledge in the art of painting by studying the works of
the most celebrated masters at Milan and Parma. He thus
much improved his taste of design, composition, and colouring.
His reputation for drawing, colouring, and the ele-
gant turn of his figures, placed him in a rank far superior
to his father. His most favourite subjects were battles; and
his horses are drawn in an admirably fine style. In this style
of painting he is said to have united the fire of Tintoretto
with the fine taste and composition of Paolo Veronese.
With respect to historical subjects he polished great merit
both in easel pictures and in those of larger dimensions.
The cupola of the church, and the anunciation at Genoa,
which is described as a noble composition, was painted by
this master; and at Florence, in the palace of the grand duke,
there is another excellent painting, the subject of which is
the Rape of the Sabines. His picture, representing Christ
taken down from the Cross, is in the collection of the earl
of Pembroke at Wilton; and it is said that more of the
easel pictures of Castelli are to be found in the collections
of England than in any other part of Europe. His health
was injured by his arduous labours; and he died at Genoa at
the early age of 34, in 1659. Pilkington.

CASTELLI, G. B. See CASTELLO.

CASTELLAR, in Geography, a town of Germany, in
the county of Tyrol; 7 miles S.S.E. of Bolzano.
CASTELLINA, a town of Italy, in the duchy of Par-
ma; 12 miles W.N.W. of Parma.
CASTELLO, a town of Naples, in the province of
Principato Cita; 16 miles W.S.W. of Policastro.
CASTELLO DELLA ABATE, a town of Naples, in
the province of Principato Cita; 29 miles S.W. of Can-
giano.

CASTELLO d'Albori, a town of Naples, in the province of
Principato Ultra; 10 miles N.E. of Benevento.

CASTELLO AERAGNO, a sea-port town on the N.W. coast
of the island of Sardinia, with a good harbour, the seat of a
bishop, suffragan of Saffiari; 18 miles N.E. of Saffiari. N.lat.
43° 55' E. long. 8° 37'.

CASTELLO BIANCO, a town of Genoa; 7 miles N. of Al-
benga.

CASTELLO di Chiuro, a town of Sardinia; 44 miles N.E.
of Cagliari.

CASTELLO Franca, a town of Naples, in the province of
Calabria Cita; 4 miles N.W. of Colona. Also, a town of
Naples, in the province of Principato Ultra; 14 miles E.N.E. of Benevento.—Also, a town of Italy, in the Trevisan,
belonging to the state of Venice; 9 miles W.S.W. of Tre-
viglio.—Also, a town in the state of Genoa; 11 miles N. E.
of Vintimigia.

CASTELLO St. Giovanni, a town of Italy, in the duchy of
Piacenza; 19 miles W. of Piacenza. It was taken by the
French in 1796.

CASTELLO a Mare, a town of Sicily, in the valley of
Mazara; 19 miles W.S.W. of Palermo.

CASTELLO a Mare di Stalia, a sea-port town of Naples, in
the province of Principato Cita, built near the ruins of
Pompeia and Stabia, the seat of a bishop, suffragan of Sor-
rento, containing 6 parish churches and 10 convents; 4 miles
N.E. of Sorrento. This is a long town, lying at the bottom
of the bay, sheltered to the south by high mountains that
approach so near to the water-edge, as to leave only a very
narrow slip for the buildings, many of which are boldly
and beautifully placed on the lower points of the hills.
The king has a charming villa above the city. The port
is small and artificial, more frequented by latinnail barks
than by ships. This place rofe by the ruin of the inland
towns.

CASTELLO a Mare della Brucia, a town of Naples, in
Principato Cita; 18 miles W. of Policastro.

CASTELLO Marini, a town of Portugal, in the province of
Entre Duero e Minho; 5 miles N.W. of Barcelos.

CASTELLO della Minerva, a town of Naples, in Principato
Cita; 16 miles S.W. of Amalfi.

CASTELLO Marchese, a town of Naples, in the province of
Abruzzo Ultra; 14 miles S.W. of Aquila.

CASTELLO Monferrato, a town of Portugal, in the province of
Beira; 2½ leagues E.N.E. of Beira.

CASTELLO Novato, a town of Italy, in the duchy of
Milan; 20 miles W. of Milan.

CASTELLO Nuova, a town of Italy, in the duchy of
Trulla, belonging to the state of Venice; 18 miles N.W. of
Udina.

CASTELLO Nuovo di Torri, a town of Italy, in the duchy
of Piacenza; 5 miles S. of Buffalo.

CASTELLO Nuovo, a town of the duchy of Modena; 9
miles N.N.W. of Reggio.

CASTELLO Nuovo, a town of Italy in the Brescian; 22
miles S. of Brescia.

CASTELLO de Nabrega, a town of Portugal, in the province
of Entre Duero e Minho; 2 leagues N. of Braga.

CASTELLO de Oniga, a town of Italy, in the Trevisan,
belonging to the state of Venice; 12 miles N.W. of Tre-
viglio.

CASTELLO della Orfo, a town of Naples, in Principato
Cita; 6 miles S.S.W. of Salerno.
CASTELLUM, in Geography, a town of Naples, in the province of Capitanata; 6 miles from Troja. This is a kind of double town; one part of which is magnificently situated upon a rocky eminence, with a declivity that sent the housetops as if they were upon terraces, and the other part, built at its foot, amidst a delightful tract of fields, rich in vines and fruit-trees, and bounded by rows of towering oaks.

CASTELLUM, in Ancient Geography, a place of Palestina, on the sea of Galilee, near Tiberias. - Alfo, an Episcopal see of Africa, in Numidia. - Alfo, an African episcopal see, in Mauritania Cezarianis. - Alfo, a place and episcopal see of Africa, in Mauritania Cezarianis. - Alfo, a place of Italy, S.W. of Faentia, belonging to the Boi.

CASTELLUM Dachii et Germanici, a place mentioned by Tacitus (Annal. 156), on the other side of the Rhine; the ruins of which still bear the name of "Ali Konigstein," or the old royal monument.

CASTELLUM Flabriitanum, an episcopal city of Africa, in Mauritania Cezarianis. - C. Medium, an episcopal see of Africa, in Mauritania Cezarianis; called "Monumentum Medium" by Ammianus Marcellinus. - C. Memphiterum, Caxtel, a fortress of Gaul, on the left of the Meuse. - C. Ministerianum, an episcopal see of Africa, in Mauritania Cezarianis. - C. Moricerum, Caxtell, a place of Gaul, called simply Caftellum in the Itinerary of Antonine; it was at some distance to the east from Bononia, and N.E. of Tarraconae. See Caxtel. - C. Pietonae, an episcopal see of Africa, in Mauritania Cezarianis. - C. Romanum, Brittenum, a fortress at the extremity of the Rhine, called by some authors Arx Brittainum, which see. - C. Tutoportus, an episcopal see of Africa, in Mauritania Cezarianis. - C. Tutilianum, or Titoianum, an episcopal see of Africa, in Numidia. - C. Triarius, Caxtel, a fortress situate to the right of the Rhine, at a place where it received the name of Menus, the Maevus. This fortress was repaired by Julian, and is different from another situated a little more to the east, and which is mentioned by Tacitus.

CASTELLUS, BARTHOLOMEEUM, in Biography, an Italian physician of considerable learning and eminence, practised at Melilla the latter part of the 16th and beginning of the 17th centuries. He was author of two works, both for a long time extremely popular. "Tutius Artis Medicae, Methodus divisa, Compendium et Synopsis, in qua quidquid ab Hippocrates, Galeno, Avicenna, humanissque in Arte Doctoribus scriptum est, collector um." Melian. 1597, 4to. This has been many times reprinted, the last time at Geneva, in 1649. "Lexicon Medium Graeco-Latinum," Venice, 1607, 4to. This work still retains its popularity. It has passed through numerous editions, and been much enlarged and improved, particularly by Vander Linde, and afterwards by Jacob Bruno. The last edition was printed at Naples in 1741. Haller Bib. Med.

CASTELUZZA, in Geography, a town of Naples, in the province of Principato; 12 miles E. of Salerno.

CASTELUZZA DI SCHIANO, a town of Naples, in the province of Capitanata; 8 miles E. of Troja.

CASTELMARMORA, a town of Asiatic Turkey, in the province of Natoia; 28 miles S.W. of Mogla.

CASTELMIRABEL, a town of the island of Candia, in the Mediterranean, on the north coast of a large bay; 18 miles W. of Sestia.

CASTELNAU, MICHAEL DE, in Biography, an eminent commander and statesman in the reigns of Charles IX. and Henry III. of France, was employed in many important negotiations, and being five times ambassador in England, resided here for 10 years successively in his first embassy. He took an active part in favour of Mary queen of Scots; endeavoured to reconcile her to her husband Darnley, and intervening in her favour under the harlots treatment of Elizabeth. He died in 1592. The memoirs of his negotiations, published by Le Laborde, in 2 vols. fol. in 1675, and repeated at Brussels in 1731, are regarded among the most curious and valuable materials of the age, and written in a pure and unaffected style, without passion or partiality. His daughter Catherine was mistress of four languages, and translated her father's memoirs into English, Nouv. Dict. Hist. Robertson's Hist. of Scotland, vol. i. p. 318, &c. vol. ii. p. 128.

CASTELNAU de Bonnafous, in Geography, a town of France, in the department of the Tarn, and district of Alby; one league W. of Alby.

CASTELNAU SUR GUPIE, a town of France, in the department of the Lot and Garonne; 14 league N.N.W. of Marsanne.

CASTELNAU de Magnoas, a town of France, and seat of a tribunal, in the department of the Higher Pyrenees, and chief place of a canton in the district of Bagneres; 20 miles E. of Tarbes. The place contains 1200, and the canton 10,296 inhabitants; the territory comprehends 1924 kilometres and 32 communes.

CASTELNAU de MEUX, a town of France, in the department
ment of the Garonne, and chief place of a canton in the district of Bordeaux; 13 miles N.N.W. of Bordeaux. The place contains 1,598, and the canton 12,574 inhabitants; the extent of the territory comprehends 1,950 kilometres and 19 communes.

CASTELNAUD-DE-MONTIGNAC, a town of France, in the department of the Tarn, and chief place of a canton in the district of Graulhet; 2 leagues N.W. of Carcassonne. The place contains 2,573, and the canton 974; inhabitants; the territory includes 1,019 kilometres and 15 communes.

CASTELNAUD-LE-CHATEAU, a town of France, in the department of the Lot, and chief place of a canton in the district of Cahors; 4 leagues S. of Cahors. The place contains 4,771, and the canton 8,801 inhabitants; and the territory includes 1,824 kilometres and 8 communes.

CASTELNAUD-DE-SOUTHEAUX, a town of France, in the department of the Lot, and chief place of a canton in the district of Cahors; 4 leagues N. of Cahors.

CASTELNAUDARY, a town of France, and principal place of a district, in the department of Aude; before the revolution, the capital of Lauragais; seated on an eminence, near the grand referror which supplies the canal of Langdoc. The place contains 7,919, the north canton 13,815, and the south canton 12,629 inhabitants; the territory of the former includes 28,5 kilometres and 19 communes; that of the latter 14,5 kilometres and 13 communes. N. lat. 43° 30' E. long. 1° 51'.

CASTELMONTE, a town of Piedmont, in the marquisate of Ivrea; 7 miles S.S.W. of Ivrea.

CASTELPROTISSA, a town on the south coast of the island of Candia; 25 miles S.S.W. of Candia.

CASTELVETRO, Lewis, in Biography, an eminent Italian scholar, was a native of Modena, descended from a noble family, and born in 1535. Educated in the universities of Bologna, Ferrara, Padua, and Sienna, he graduated at the latter place in law, being designed by his father for that profession; but his natural inclination led him to the cultivation of polite literature. In his native place he was assiduous in promoting letters among his countrymen, and became an active member of the newly-erected academy. His connection with this learned body occasioned his being suspected of heresy, and his quarrel with Ambib Calvo (see Carlo) contributed to his being accused to the inquisition as unfound in the faith. In 1557 he was cited to Rome, but dreading an examination, he fled from there, being condemned by a mutual council; but at length, in 1560, he repaired thither, and after being thrice examined, he thought it noth prudent to make his escape; the confiance of which was the publication of a sentence, previously pronounced against him, as a contumacious heretic. At Chiavenna, where he settled for some time, he gave private lectures to several students on Homer, and on the rhetoric addressed to Herennius. From thence he removed to the court of Maximilian II. at Vienna, and dedicated to that emperor his commentary on Aristotle's Poetics. Being driven from Vienna by the plague, he returned to Chiavenna, where he died in 1571. Castelvetro was an accurate grammarian, and an acute though somewhat too censorious critic. He took pains in perfecting the Italian language, and wrote remarks of a grammatical and critical kind on several authors, both ancient and modern, which were first published by Muratori in 1727. His "Examination of the Rhetoric addressed to Herennius,"

was printed in 1653. His "Exposition of Petrarch's Poems," which he left unfinished, was published by his nephew. He composed various pieces in Latin verse, with great elegance; and his life in Greek was mantled in his version, with a commentary, of Aristotle's Poetics, and in his Italian translation of Chrysoloras's exposition of the Goethe. He also added the Provençal tongue, and translated, in conjunction with Bubhiner, into Italian, many of the poems and lives of the Provençal poets, and gave a grammar of the language. Gen. D. de Gen. Barlow.

CASTER, in Geography, a town of Germany, in the circle of Weilphalia, and duchy of Juliers; 8 miles E.N.E. of Juliers.

CASTER, or Castor. See Castor.

CASTETS, a town of France, in the department of Landes, and chief place of a canton in the district of Dax; 7 miles N. of Dax. The place contains 877, and the canton 5429 inhabitants; the territory includes 643 kilometres and 10 communes.

CASTHANEE, or Castanea, in Ancient Geography, a town of the Thessaly, in Magnesia, at the foot of mount Pelion.

CASTIGATION, Cafigatio, among the Romans, the punishment of an offender by blows, or beating with a wand or switch. Cafigation was chiefly a military punishment, the power of inflicting which on the foledge was given to the tribune. Some make it of two kinds, one with a flick or cane, called sufigatio; the other with rods, called flagellation; the latter was most dishonourable.

CASTIGATIONS, in a Literary Sense, denote corrections, or emendations of the text of an ancient writer.

CASTIGATORY. See Cucking stool.

CASTIGLIOLA, in Geography, a town of Piedmont, in the county of Affi; 5 miles S.S.W. of Affi.

CASTIGLIONE, Baldassar, in Biography, an eminent Italian and writer of Italy, was born of noble parents at the villa of Castiglione near Mantua in 1492. He studied at Milan, and commenced his political career at an early period, as page to Lewis Sforza, duke of Milan. In 1509 he attached himself to Gonzaga, marquis of Mantua, and in 1504 entered into the service of Guidubaldo, duke of Urbino, in whose court, which was then the favourite resort of science and letters, he resided for several years. This duke sent him as his ambassador to Henry VII. king of England in 1509, and in the following year he attended in the same capacity on Lewis XII. then at Milan. On the death of Guidubaldo in 1508, he remained in the service of the new duke, Francis Maria della Rovere, whom he accompanied in several military expeditions as lieutenant-general of the army of the church under pope Julius II. He was recompensed for his services in 1513 by the castle of Nuvilara near Pescara, and the grant was confirmed to him by pope Leo X. Upon his return to Mantua, he regained the favour of the duke Gonzaga, whom he had offended by quitting his service, and in 1516 married Maria Hippolita, a lady no less illustrious for her birth than for her beauty and accomplishments. This lady was distinguished by her Latin and Italian contemporaries, both in prose and verse; and her poems are published in a collection of the works of five illustrious Italian poets. This connection terminated in 4 years by the death of Hippolita. Castiglione was afterwards employed by the marquis Frederic of Mantua as his ambassador to Rome, where he remained several years, and enjoyed that kind of literary society to which he was attached and of which he was a principal ornament. He was particularly distinguished by his researches into all the remains of antiquity, and by his exquisitely
quite taste in the fine arts. In 1522 he returned to Mantua, with a view of serving his prince in the war against the French. When he again visited Rome, he was employed by Pope Clement VII. in 1524 as museo to the emperor Charles V., but failing to terminate the difference between the imperial and papal courts, and incurring unjust suspicions on the part of Clement, his disappointment and anxiety were the occasions of an illness, of which he died at Toledo in 1529. Five years after his death, his body, which had been interred with great solemnity in the cathedral, was removed by order of his mother to a church five miles from Mantua, in which a superb mausoleum was erected to his memory, with an inscription written by cardinal Bembo. His statue has been since placed in the royal academy of Mantua. The most celebrated of his works is "Il Cortigiano" or the Courtier, *discussing the manner of living in courts, so as to be useful and agreeable to the prince, and containing a variety of reflections and maxims, delivered in an easy and elegant style, which has rendered it an original and classical work. It was finished in 1518, reviewed by his friend Bembo, but not printed till the year 1528. It passed speedily through several editions, and was translated into most of the languages of Europe. It is denominated by the Italians "the golden book," and a fine edition of it was printed to lately as 1733 at Padua, with the life of the author prefixed by Bernardino Mariani. On account of some free expressions it was in the list of prohibited books; but in 1576 the author's son, obtained for a corrected form of it a licence from the congregation of the index. The letters of Castiglione were published at Padua in 2 vols. in 1760, with annotations by the abbe Sarrafi. His Italian poetical compositions have been published separately, and his Latin productions were published in the first volume of the "Delizia Poet. Italor. by Gruter." Moreri. Gen. Biog.

CASTIGLIONE, Giovanni Benedetto, called Grechetto, an admired painter, was born at Genoa in 1616, and studied first under Battifia Pagi and afterwards in the academy of Giovanni Andrea de Ferrari; but he owed his chief improvement to the instructions of Vandyck, who at that time resided at Genoa. His manner of design, in all branches of his art, was grand; and he equally succeeded in all; in sacred and profane history, landscape, cattle, and portraiture; all which he executed with an equal degree of truth, freedom, and spirit. His predominant inclination, though he polished an universal genius, led him to select rural scenes and pastoral subjects, markets, and animals, in which he had no superior. He combined with great readiness of invention a bold and noble tint of colouring, elegant, and generally correct, drawing, a judicious touch, and a free and firm pencil; and he also happily applied the chiaro-scuro, which he thoroughly understood, through all his works. In the chapel of St. Luke's church at Genoa, is an excellent picture by this master; also in the Palazzo Brignole is a grand composition; and at Palazzo Coraglia in the same city is an historical picture of Raphael concealing the Teraphim from Laban, in which the figures and animals are very fine. The etchings of this celebrated artift, which are numerous, are spirited, free, and full of taste; and their effect is, in general, powerful and pleasing. Among his most effective plates, may be reckoned the following, all from his own compositions: viz. "Animals coming to the ark!" "Laban searching for his gods in the tent of Jacob;" "The angel appearing to Joseph in a dream;" "The nativity of Saviour;" "The flight into Egypt;" "The resurrection of Lazarus;" "Diogenes with his lanthorn!" "A magician with several animals;" "The little melancholy!" "A ruin with a vase, and two men, one of them pointing to a tomb!" "two rural subjects, with foars and satyrs;" and two "sets of heads." He died in 1670. Pilkington. Strutt.

Francisco Castiglione, the son of Benedetto, was the disciple of his father, and was born at Genoa. He inherited in a very considerable degree the talents of his father, and imitated his style and manner exactly, in composition, handling, and design. Many pictures, ascribed to Benedetto, and occurring in sales and collections, are thought to be copies after him by his son Francisco, or perhaps originals of the younger Castiglione. Pilkington.

CASTIGLIONE, in Geography, a town of Italy, belonging to the republic of Lucca, in the Medenese; 18 miles N. of Lucca.—Alfo, a town of Italy, in the republic of Lucca, 8 miles S.W. of Lucca. —Alfo, a town of Italy, in the duchy of Tuscany, situated on a lake near the sea. This lake, which is two leagues in diameter, and communicates with the sea, produces great quantities of salt. The refineries contain 4,859,000 cubic feet of water, which after evaporation, leave 14,000,000 pounds of salt.—Alfo, a town in the flat of Genoa; 23 miles E. of Genoa.—Alfo, a town of Naples, in the province of Principato Cita; 5 miles N.E. of Salerno. —Alfo, a town of Naples, in the province of Abruzzi Cita; 6 miles E.S.E. of Civita Borella. —Alfo, a town of Naples, in the province of Calabria Cita; 17 miles S.S.W. of Cofenza. —Alfo, a town of Sicily, in the valley of Demona; 9 miles W.N.W. of Taormino. —Alfo, a town of Italy, in the duchy of Mantua; 9 miles W. of Mantua.

CASTIGLIONE di Gati, a town of Italy, in the Bolognese; 20 miles S. of Bologna.

CASTIGLIONE della Stiviera, a town of Italy, and principality, in the duchy of Mantua, defended by some fortifications and a citadel; and containing about 3000 inhabitants; 20 miles N.W. of Mantua. In 1796 a battle was fought near this town between the Austrians and French, in which the latter took 6000 prisoners.

CASTILIONIA, in Botany, Flor. peruv. pl. 37. Clafs and order, polygonia monacis.

CASTIGLUNI, in Geography, a town of Naples, in the province of Principato Ultra; nine miles E.N.E. of Conza.

CASTIL BLANCO, a town of Spain, in the province of Andalusia; five leagues N. of Seville.

CASTILE, a country of Spain, comprehending the provinces of Old and New Castile; and the kingdom of Castile. Some have referred the origin of this name to a certain old Spanish tribe, or nation, called by the Romans "Catalani," who are supposed to have inhabited these parts of Spain, as well as Catalonia. But others with greater probability have traced it no higher than the recovery of this country out of the hands of the Moors; at which time, they say, there was a strong castle built for the defence of the frontier, in which the count, or great officer of the province, resided, from whence it took its name and its arms. Whilfe Old Castile, so called because it was recovered from the Moors long before that which is styled the New, remained under the dominion of the Moors, there were several great lords who
who maintained themselves in the possession of certain districts, and who, gradually increasing in wealth and power, at length threw off the yoke of the infidels, and put themselves under the protection of the kings of Oviedo. According to this account, it is probable that these lords had each of them a well fortified mansion, or castle; whence, at the emancipation of this province from the yoke of the Moors, it might well receive the name by which it has ever since been known. These lords, supported by their new protector, were not only able to defend their frontier, but to extend their little territories by their excursions against the Moors, as often as any favourable opportunity occurred, and hence assumed the title of counts; and being regarded as feudatories of the monarchs before mentioned, were summoned in time of war to repair with their vassals to attend the king's standard, and in time of peace were called to the assemblies of the estates. The title of these counts, mentioned by name in the Spanish histories, is Don Rodriguez, who assisted in the reign of Don Alfonso el Callo, or the Chaffe, about the close of the 9th century, whom he assisted in his wars against the infidels.

Castile, from being only a county, and subject to the kings of Leon, was erected in 1016 into an independent kingdom: and in 1032 the two kingdoms of Leon and Castile were united in the person of Ferdinand I. of Leon, and II. of Castile. This union was rendered perpetual in the person of Ferdinand II., after the death of Don Alfonso of Leon, A.D. 1252; from which time these two kingdoms have never been separated, but have gradually drawn to them all the other sovereignties in Spain; that of the Christians by inheritance or marriage, and that of the Moors by conquest. Upon the death of Don Juan, king of Aragon, in 1479, Aragon and its dominions were united to the crown of Castile, in the persons of their catholic majesties Ferdinand and Isabella, who, in 1474, had been proclaimed king and queen of Castile and Leon. See ARAGON. After this period the Spanish crowns were united and defended in the same line; and the kingdom of Castile was lost in that of Spain. See SPAIN.

Castile, Old, a province of Spain, with the title of kingdom, was formerly part of the Roman Tarracoensis, and borders all the way on the south to New Castile, from which it is divided by a high chain of mountains, extending directly from west to east; on the north it is separated from Alurias and Bifcaéy by another range of hills branching out from the Pyrenees; but between these two provinces it has a narrow lip of land which reaches quite to the bay of Bifcaéy: on the east it is parted by the Ebro and the mountain of Dover, for a considerable length, from Navarre and Aragon; and on the west it is bounded by Leon. The greatest extent of this province from north to south reaches from 40° 10' to 43° 15' of N. latitude, and from 2° 30' to 4° 10' of W. longitude; i.e. about 180 miles from N. to S. and about the same number from E. to W. in those parts where it has both ways the greatest extent; for its figure is very irregular, and its dimensions are in various parts very different. The principal rivers in this province are the Ebro, Duero, Pifurga, Ariançon, and Añanca; and the chief towns are Avila, Burgos, the capital, Calahorra, Segovia, Siguenza, and Valladolid. Its climate is somewhat different from that of New Castile, as it is more mountainous, in some degree that some have reprented it as a terrace formed by the mountains of Bifcaéy, or by the Pyrenees, of which there are a branch. In summer this mountain-plain is defitute of water, and burnt up with heat. But, in general, whilst the valleys are very hot, the upper grounds are proportionably cold and bleak. In this country no other means are employed to counteract the severity of the weather and the bleak winds, which, on the high open plains, are very brisk, before a large clashing dust, (brazen,) which is usually placed beneath the table. Stoves and chimneyes are never seen in common houses. Snow covers the tops of the mountains through the summer; and it is carried away and fold in the towns, for cooling their wine. The soil, though in various parts cold, is moderately good, and might be rendered much more productive by better cultivation. The wine is much extolled; and the plains are covered with cattle, and more especially with sheep, the wool of which is much valued.

CASTEL, New, called also "The kingdom of Toledo," which was formerly its capital, a province of Spain, bounded on the north by Old Castile, from which it is separated by a chain of mountains known by the name of the country through which they run; on the east it is divided by a similar ridge from Arragon and Valencia; on the south it is parted from Andalusia by the mountains called Sierra Morena, and by an imaginary line from Murcia; and on the west it is separated from Estremadura and Leon by a ridge of hills called Guadaloupe and La Sarena. Its length from north to south is about 180 miles, and its greatest breadth about the same number, though its form is very irregular. New Castile confines of three cantons, viz. La Mancha, the southern part, La Sierra, lying towards the cant, and Algaris, which is the northern part. Its principal rivers are the Tagus, Guadiana, Guadalupe, Alcar, Xara, and Guadarama, besides several others of less note. The capital of this province is Madrid. As it is inland and surrounded by high mountains, its climate is hotter in summer, and colder in winter, than other districts which lie along the sea-coasts in the same latitude. It is, however, fabulous, and the soil is generally well-tended, and needing cultivation. The northern parts produce fruits and wine, and the southern, good pastures and fine wool.

CASTELL del Oro. See TERRA FIRMA.

CASTILLAN, in Commerce, a gold coin, current in Spain, valued at fourteen reals and a half.

CASTILLAN also denotes a weight used by the Spaniards in the weighing of gold, containing the hundredth part of a Spanish pound. It is also used at Buenos Ayres, and the mines of Chili and Potofii.

CASTILLA, in Military Language, a term that was formerly made use of for the denomination of a tower or caillé. This attack became also a sort of military sport or play, in which those who carried it on used snow-balls. In 1546, the division, being surprized in one of those attacks, that was executed at Roche Galiou, became of caste, and heated, a circumstance that cost the duke d'Enghien his life, and put a period to the games or sports in France called Castilles, as that which occasioned the death of Henry III., put an end to the martial game or exercise of tournament.

Gen. Ch. Cal. perranth one-leaved, tubular, longitudinally cloven in front, more than half-way down, nerved, coloured, somewhat swelling at the base. Cor. monopetalous, gapping; upper lip long, channelled, curved inwards, emarginate, pubescent on the back; lower lip very short, trifid; segments acute, with two glands between them, inserted into the throat of the corolla. Stam. filaments four, inserted into the base of the corolla, the length of the upper lip, filiform, smooth; the lower pair a little shorter;
anthers twin, linear, oblique. 
Figg. germ superior, oblong; style bilobate, the length of the flower; stigma simple, oblate. Peric. capsule ovate, compressed, two-celled; the partition contrary to the valves. Seeds numerous, small.

Eff. Ch. 'Calix tubular, cloven longitudinally more than half-way down; lower lip of the corolla very short, trifid, with two glands between the segments; capsule two-celled.'

Sp. 1. C. fijjilhia, Smith Indic. tab. 39. Mut. Amer. vol. i. tab. 11. Lam. Illust. pl. 519. fig. 2. "Leaves pinnate-gnath near the tip." Root perennial, branched, fibrous. Stem three or four feet high, herbaeeous, or somewhat woody, erect, roundish, with few branches, pubescent. Leaves alternate, sessile, spreading, entire at the base, pinnatifid near the tip, pubescent on both sides, three-nerved; segments from three to seven; stipules none. Flowes: towards the ends of the larger branches, solitary, peduncled, pinnate, probably scarlet; proper bracts none; peduncles round, pubescent, scarcely one-third of the length of the leaves.

A native of New Granada. 2. C. integrifolia, Smith Indic. tab. 39. Mut. Amer. vol. i. tab. 12. Lam. Illust. pl. 519. fig. 2. "Leaves linear-lanceolate, entire." Stem herbaeeous, round, upright, branched, leafy, flatly rough, with hairs. Leaves alternate, sessile, spreading, obtuse, flatly channelled, nerved, pubescent on both sides, stipules none. Flowes: on the elongated ends of the branches, forming a sort of raceme, each from the axil of its own bracteate leaf, a little smaller than those of the preceding species; peduncles filiform, upright, shorter than the leaves. A native of New Granada, where both species were discovered by Mutis.

CASTILLO, CASTELLO OF CASTELLI, GIO BOTTSTA, in Biography, an eminent painter of history of the 16th century, commonly called II Bergamascus, in contradistinction to Gio. Bat. Càstelli, a Genoese, scholar of Cambiafo, and the most celebrated miniature-painter of his time, was born at Bergamo, and conducted to Genoa by Aurelio Bufo of Crema, and left by him in that city. In this forlorn state, he was patronized by the Pallavicini family, who sent him to Rome, where he was formed an architect, sculptor, and painter, not inferior to Cambiafo. At Rome, Palomino reckons him among the scholars of Michael Angelo. He was the companion of Lucas Cambiafo, and adopted his technical principles; and we discover, says Mr. Fuseli, the style of Rafaello verging already to practice, but not so mannered as that which prevailed at Rome under Gregory and Sixtus. In Cambiafo we recognize a greater genius and more elegance of design; in Castlello, greater diligence, deeper knowledge, a better colour, a colour more nearly allied to the Venetian than the Roman school. These two artists affiled each other, even on occasions where they appeared to be competitors. Thus, at the Nuntiata di Portonia, Lucas on the pannels represented the final doom of the blessed and the rejected in the last judgment; whilst G. Batilla on the ceiling, expressed the judge in an angelic circle receiving the elect. His attitude and semblance speak the celestial welcome with greater energy than the adjacent capitals of the words Venite Benedicti. This is a picture fluided in all its parts, of a vivacity, composition, and exequion, which give to the pannels of Lucas the air of a work done by a man half asleep. He also worked alone; such is the S. Jerome surrounded by monks frightened at a lion, in S. Francescô di Castello, and the crowning of S. Sebastian after martyrdom in his own church, which is a picture as rich in composition as fluided in execution, and superior, says Mr. Fuzelli, to all my praisé. This artist, though little known in Italy, passed the last years of his life at Madrid, as painter to the court. He died in 1570, at the age of 72 years. He had two sons, Fabrizio and Granello, whom he took with him to Spain as his affidants, whose works in the Fleurier are much commended. Pilkington's D. B. by Fuseli.

CASTILLO Y SAVARDA, ANTONIO DEL, a celebrated Spanish painter, was born at Cordova in 1602, and having studied under his father Angullin, perfected himself in the school of Zurbaran at Seville. On his return to his native place, he was employed in a variety of works, evincing his great skill in drawing and design, but not equal in colouring. He practiced in history, portrait, and landscape, with great reputation. In 1646, he revisited Seville, where, on seeing some of the brilliant productions of Murillo, he gazed on them with silent admiration, and then suddenly exclaimed, "Cañillo is no more." After his return to Cordova, he died in less than a year of melancholy and despair. Castillo united the talent of poetry to that of painting. Cumberland's Anecdotes of Spanish Painters. Nouv. Dic. Hist.

CASTILLO DE SANCHE ALARCA, in Geography, a town of Spain, in Navarre; 5 leagues from Tudela.

CASTILLON, a town of France, in the department of the Gironds, and chief place of a canton, in the district of Libourne; 3 leagues S.E. of Libourne. The place contains 1,750, and the canton 10,772 inhabitants; the territory includes 17½ kilometres and 16 communes.

CASTILLON, a town of France, in the department of the Ariège, and chief place of a canton, in the district of St. Girons; 7 miles S.W. of St. Girons. The place contains 742, and the canton 12,112 inhabitants. The territorial extent comprehends 350 kilometres and 25 communes.

CASTILLONES, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Villeneuve-d'Agren; 5 miles E. of Lanzun. The place contains 1,756, and the canton 7,123 inhabitants; the territory includes 17½ kilometres and 15 communes.

CASTINE, the shire-town of Hancock county, in the district of Maine, N. America, situated on Penobscot bay. It was separated from Penobscot, and incorporated in 1756. It takes its name from a French gentleman who resided here more than 150 years ago.

CASTINE River, which is about 14 miles long, is navigable for 6 miles, and has several mills at the head of it. It discharges itself into Penobscot bay.

CASTING is sometimes used for the quitting, laying, or throwing aside any thing; thus, deer cast their horns, snakes their skins, lobsters their shells, hawks their feathers, &c. annually.

Casting of feathers, is more properly called moulting, or moulting.

A horse casts his hair or coat at least once a year, viz. in the spring, when he casts his winter coat, and sometimes at the close of autumn he casts his summer coat, in cale he hath been ill kept.

Horses sometimes also cast their hoofs, which happens frequently to coach-horses brought from Holland; which being bred in a moist, marshy country, have their hoofs too flabby; so that coming into a drier soil and less juicy provender, their hoofs fall off, and others, that are firmer, succeed.

CASTING is also used for distributing or disposing the parts of a thing to the best advantage.

The casting of a building is more properly called composition.

Theatrical writers speak of casting a play, i.e. disposing the several parts or characters to proper actors.

CASTING of candles, signifies filling the moulds with tallow. See Candle.
Casting a model, in Rural Economy, is a term that implies a more of the proving abortive.

Casting of design, among Painters, denotes the distribution of the parts; and the drapery is made to be well cast, when the parts are distributed in such a manner as to appear neither the result of more chance than of art, hands or labour. In that style of painting which is called "the grand," the drapery should be great, and as few as possible, because their high simplicity is more indecent of great lights. But it is an error to design drapery that are too heavy and cumbersome, for they ought to be suitable to the figures, with a combination of ease and grandeur. Order, contrast, and variety of lines and faces, constitute the elegance of drapery; and diversity of colours in those flaps contributions extremely to the harmony of the whole in historic compositions.

Casting, in Falconry, is any thing given an hawk to purge and cleanse his gape. Of these there are two kinds, viz. plumage, i.e. feathers; and cotton, the latter wherein is generally in pellets about the big size of hazel-nuts, made of soft fine cotton, and conveyed into the gape after supper. In the morning the will have cast them out; at which time they are to be observed, and from the colour and condition they are found in, the state of their body is conjectured. If they be cast out round, white, and not flinting, nor very moity, it is an indication all is well; if otherwise, particularly if black, green, fliny, or the like, he is disrevered. The casting of plumage is observed after the same manner as that of cotton.

Casting a figure, among Architects, the erecting of a celestial theme, and dividing the heavens into houses.

Casting, in Foundry, is the running of a melted metal into a mould prepared for that purpose.

The great importance of a knowledge of casting to a mechanic, on account of the vast quantities of cast iron now used in machinery, has induced us to give a particular description of this branch of the founder's art.

There are three sorts of casting, 1. open found casting; 2. found casting between flaps; and 3. loose casting; in mould of which, an exact pattern, usually of wood, of the subject to be cast, is given to the founder.

1. Molt articles, every part of whose surface on one side is in the same plane (which we will call the horizontal plane), and every parallel section of which is of the same size in each part as the horizontal plane, or constantly decreasing as they recede downwards from it, and the edges of all which sections fall within perpendiculars, let fall from the edges of the plane immediately above it, may be cast in open found because, as the founders express it, every such pattern will lift out of the found, wherein it has been imbedded as deep as its upper or plane surface, to form the mould for the metal.

The floor of every foundry is for many feet deep composed of a loamy found (of which great quantities are brought to London from near Woolwich) so that deep pits may be dug, to bury large moulds in. [See Foundry] An example of open found casting is shown in Plate of Casting, figs. 1 and 2, which represent the arms of a large wheel, the rim of which is to be ferreted on by the flanges a, a, fig. 1; b b is the arm; d is a rib cast with it to strengthen it, the other side of the arm must be planed; e is the opening through which its shaft is to pass. In the place where the mould is to be made, a layer of sand, e d, fig. 2, is lightly sprinkled through a flute on the floor, and the pattern A is placed down into it, perfectly level; the next operation is shovelling the sand up all round, level with the top of the pattern, and ramming it down, with a trowel, fig. 4; a sponge is then used for slightly wetting the sand all round the edges of the pattern to make it adhere together; the next operation is lifting the pattern out of the sand by one or more screws, fig. 5, screwed into the wood; if the pattern is small, this is done by one or more men, but in very large works it is done by a crane; the core for the bolt holes through the flanges, a, a, fig. 1, are made by sticking pieces of dried clay in the sand in the proper places, and the core for the hole e, made of clay, is also let in his place; the workman then takes a pair of bel lows for blowing away any small pieces of sand which may have fallen into the mould. It is now ready for filling with metal; in small works this is done by ladles, and in large, by small ditches made in the sand, from the mould to the mouth of the furnace; when the mould is filled, the metal is covered up with sand to keep the air from it.

II. Sand-casting between flaps is used for those articles which if they were cut into two or more pieces (provided the cutting planes were parallel to each other) each separate piece might be cast in open sand. A specimen of this kind of casting is shown in fig. 6, which is an endless screw and pin, often composed of cast iron. A B and C D are channels called flaps, with four handles, c d, c f, to lift by; a b, l, m, are iron points fitting into holes g, b, i, k, in the other flaps C D, for securing them when they fit each other. The under flap C D is let upon a board, filled with sand, and the frame is rammed tight in it: the workman then takes the pattern E F, and presses one half of it into the sand, and smooths the sand up to the sides of the pattern with a trowel, fig. 3; he then fits the empty flap, A B, over the other, C D, putting its points a b, l, m, into the holes g, b, i, k; and after sprinkling some sand which has been burnt over the sand in the under flap, he fills the upper one with sand, and ram it down; he next with a piece of wood, put through the sand in the upper flap, makes a hole blown at p, to pour the sand through; the upper flap, A B, with the sand in it, is then lifted off by men, or in large works, by a crane, and the pattern, E F, lifted out; the flap, A B, is then put on again, and heavy weights are laid on it to keep it down, ready for casting. It must be observed, that at every highest point of large moulds a small hole must be made through the sand in the upper flap, to allow the air to pass out of the mould when the metal is poured in.

Fig. 7, 8, and 9, show the manner of casting a cog-wheel with eight arms, all of which are ribbed on both sides. The pattern is laid upon a board with the face shown in fig. 7, upwards; an empty flap is laid upside downwards over the board and pattern; it is filled with sand and rammed tight; a plain board is then laid upon the flaps, and two men turn it over, bringing the pattern to the top, as shown in fig. 10; the workman with a small trowel, fig. 3, then digs all the sand out of the space A A, fig. 10, between each arm, leaving it level with the tops of the ribs, a b, c d, &c., fig. 7; into each of these spaces thus formed, a piece of iron plate, fig. 8, cut to suit the same, is laid; it has an iron rod, a, projecting from the upper side and two points, b, d, at the under side, which are inserted into the sand between the arms, so that the two edges, c f, touch the upper edge of the arms a, b, of the wheel, fig. 7. The spaces above these plates are then filled with sand and rammed down level with the rest of the sand in the flap: burnt sand is then sprinkled over the lower flap to prevent the sand which is now to be rammed into the upper flap. C D, from adhering to that in the lower; the holes for the metal are made by means of the top flap, and then taken off; the iron plates and the sand upon them are taken out by the ends of the iron, a; the sand round the pattern is slightly wetted, and the cogs of the wheel are taken out one by one (for which purpose they are only fixed on by a dovetailed groove cut in the rim, see M) and then the whole wheel is lifted out by the screw, fig. 5; the iron 5 2 plates
plates are then put again in the place where they flood before, being determined by the holes which the points, b, d, made in the foundy. The hole H through the wheel, which is to receive the shaft, is filled in the pattern, and a projection of the same size as the intended hole is fixed on; this projection forms a recess, k, fig. 10, in the sand, which is to determine the place of the core, M, fig. 9, for the hole which is made in a separate pattern of well tempered clay or wet loam and dried. The upper flask, C, is then put on again, and loaded with weights ready for casting. In casting large cog-wheels, &c. flasks are often wanted as large as 20 feet on each side; to keep the sand from falling out, bars of wood are bolted across the flask, into which long nails are driven before it is filled, to keep the sand together. These large flasks are lifted by a crane.

III. Low-Calling is used for bulky articles, as cylinders, large pipes, boilers, cauldrons, &c. &c. We will begin by describing the manner of forming the mould for a large cylinder: A, fig. 11, is a beam of the building; B B is a spindle with three or four holes, d, e, through it, to fix an iron arm D in, at different heights by a nut; E E is a board, that can be firmly fixed between the bars D and E, by two clamps, G, H: the operation is begun by laying an iron ring L upon the ground, and adjusting it so as to be concentric to the spindle B; a cylinder of bricks and clay or wet loam, instead of mortar, is then built upon it, some inches less in diameter than the intended cylinder, for which this is to form a core; the bricks are firmly bound together with iron hoops, nailed wire, &c. and a fire is then lighted in it. When the mould used with the bricks is dry, a coating of loam is spread over it, and is smoothed by turning the board E E round it. This coat makes it of the proper size for the inside of the cylinder to be cast, and is called the core of the mould; another cylinder is built, plastered, and smoothed in the same way, except that no hoops are used, where the diameter is the same as the outside of the cylinder to be cast; when it is finished, it is covered with charcoal ground with water like paint, laid on with a brush; and a thin coating of loam is laid on; this is bound round with hoops, and to these, four hoops are fixed to lift it by; thick coat of loam and hair is then laid over it. When all these are dry, a man gets into the cylinder, and with a small pick pulls down all the bricks in the inside cylinder, and then with a trowel cuts away all the loam, leaving the inside of the external cylinder (which is called the mould) quite smooth; this is effected by the coat of charcoal, which prevents the two coats of loam from adhering together.

A deep pit is now dug, in some convenient part of the foundry, into which the core is let down by a crane; an apparatus, shown in fig. 12, is used for lifting it to the crane, A B D E is a wrought-iron cross, the arms of which are strengthened by ties going through the ring F, by which it is hooked to the crane-ropes or chain; on each of the four cross-bars, a ring with a hook, a, b, c, d, is loosely fitted; to these hooks ropes which pass through the hooks on the mould are fastened, in the core these ropes go round the flutes, i.e., of the ring L, fig. 11. The mould can always be made to hang perpendicularly, by slinging the hooks, a, b, c, d, nearer or farther from the center of the cross. When the core is let down in the pit, the mould is let down over it by the same means, and when they are adjusted, the sand is thrown in, and rammed round, about half the height; a flat cover of dried loam is then put on the top of the mould and core, and round pieces of wood are put in the holes which had before been made in the cover for pouring the metal in at. Theburying of the mould is then completed: when it is all levelled. The picks which keep open the holes for the metal are carefully pulled out, and small ditches made from the furnace to them, ready for casting.

Fig. 13, shows the method of making the mould for an air-vessel (see our article Pump); the core, A, is built of bricks, plastered with loam and turned by the machine, fig. 11, as before described; the edge of the board, E E, being cut to the proper curve; another is then built of the same size and form as the outside of the vessel to be cast, with a projecting ring or flaunch at the bottom; this, after being turned, is painted with charcoal, and the mould made upon it as in the last case; it is plain, that from the shape of the core the mould cannot be lifted off, nor can a man readily get in to take out the bricks as in the case of a cylinder; the mould must therefore be fawn in half, B G, with a fine saw, to get it off; it is then put together again round the core A, and the crack is plastered upon with loam. To describe the more complicated cases of this kind of Casting, as the nozzles or valve-boxes and pipes of steam-engines, &c. &c. would far exceed our limits.

Casting of gold, silver, or copper, in plates. See Coining.

Casting, in Foundry, &c. Wood is said to be cast or warped, when, either by its drought or moisture, or the drought or moisture of the air, or other accident, it shrinks or shrivels; in prejudice to its flatness or flatness.

Casting of lead on cloth, is the filling of a frame or mould covered with a cloth and linen over it, to call the lead into very fine sheets.

Casting of lead on sand, is done by means of a large frame or trough nearly full of sand, which is made perfectly level, and imprinted with any device from moulds pressed down in the sand: the lead is then turned out of the kettle into a receiver or trough, and poured on the sand, whilst two persons slide a gauge or lath, of such thickness as to leave a space between it and the sand answering to the substance of the lead, along the edges of the frame; the surplus runs into refiners or channels made in the sand. See Casting, in Foundry.

The goldsmiths use the bone of the cuttle-fish, to mould and cast their letters works of gold and silver; that bone, when dried, being reducible to a kind of a fine powder, very susceptible of all impressions.

Casting in lead, or platter, is the filling with fine liquid platter a mould that had been taken in pieces from off a flat or other piece of sculpture, and run together again. There are two things to be observed with regard to the mould: the first, that it be well leaked with oil before the platter be run, to prevent its sticking; the second, that each piece whereof it consists has a packthread, to draw it off the more easily when the work is dry. See Cast.

Casting of metal, of letters, belts, figures, &c. See Foundry.

Casting, in respect of Medals. See Medals.

Casting, in Rural Economy, the operation of throwing a horse down. It is done as follows: having brought him upon some even ground that is smooth and soft, or into the barn upon soft straw, take a long rope, double it, and cast a knot a yard from the bow; put the bow upon his neck, and the double rope betwixt his fore legs, about his hinder patterns, and under his fetlocks: when you have done this, slip the ends of the rope underneath the bow of his neck, and draw them quick, and they will overthrow him; then make the ends fall, and hold them down his head. This practice is necessary upon many occasions, when operations are to be performed on horses.

Casting, in Steamship, the motion of a ship in rolling off, so as to bring the direction of the wind on either side of the ship, after it had blown for some time right a-head. This term is particularly applied to a ship when her anchor firt
A first lookens from the ground, when she is about to depart from any place where she had anchored; and as it is proba-
ble the had been at anchor with her head to windward, it is
evident she must turn it off, so as to fill the sails before she
can advance in her course, which operation is called casting.
Hence, she is said to cast the right way, or the wrong way.

Casting-net, a sort of fishing-net, so called because it is
to be cast or thrown out, which when exactly done, nothing
escapes it, but walls; and everything within its extent, is
brought away.

Casting a point of traverse, among Seamen, signifies the
marking down on a chart the point of the compass any
place bears from you; or finding what point of the com-
pass the ship bears at any instant, or what way the ship has
made.

Casting of timber-work. See Casings.
CASTIGNE, in Geography, a town of Italy, in the
duchy of Milan; 8 miles S.W. of Milan.—Also, a town of
Italy, in the Lodiens; 9 miles S.E. of Lodi.
CASTLE, Casellum, in Ancient Writers, denotes a town
or village surrounded with a ditch and wall, furnished with
towers at intervals, and guarded by a body of troops.
The word is originally Latin, casellum, a diminutive of
castellum.

Casellum originally seems to have signified a smaller fort,
for a little garrison. Though Suetonius uses the word
where the fortification was large enough to contain a co-
hort.
The casella, according to Vegetius, were often like
towns, built in the borders of the empire, and where there
were confidant guards, and fences against the enemy.
Hordley takes them for much the same with what were
otherwise denominated fortifications. See Castella.

CASTLE, or CASTLE-reef, is also an appellation given
by the country people in the north to the Roman casella,
as distinguished from the casella platvs, which they usually
call chelsers. Hordley represents this as an useful criterion,
whereby to discover, or distinguishing, a Roman camp or fla-
tion.

CASTLE, in a modern sense, is a place fortified either by
nature or art, in a city or country, to keep the people in
their duty, or to resist an enemy. In the more extensive
interpretation of the word, it includes the various methods
of embattlement, see (Casigmation; ) but in its stricter
meaning, it is usually applied to buildings walled with stone,
and intended for residence as well as for defence.

Few branches of historical research have been so little at-
tended to as that which relates to Military Architecture.
Castles, indeed, such as we now see them, were of later in-
troduction to the world. Whether we may rank them with
the accommodations of life brought by the crusaders from the
East, is doubtful: but thus much seems tolerably cer-
tain, that it was in France, England, Germany, Switzerland,
and Savoy, that the system of casemate fort previ-

d. In Italy, till the Normans got possession of Naples
and Sicily, castles were comparatively few. And we may
at least date their general adoption in Europe with the feu-
dal fyltem.

The early British fortifications seem to have been little more
than mere intrenchments of earth. Cæsar, however, pen-
etrated not far enough to know the true nature of the Brit-
ish fortresses; and in his work, "De Bello Gallico," (lib.
v. s. 17;) has given only the description of a lowland camp.
In all parts of England there is a vast number of strong in-
trenchments of a very peculiar kind, situated chiefly on the
tops of natural hills, and which can be attributed to none
of the different people who have ever dwelt in the adjacent
country, but the ancient Britons. That they may have

been used at different times, and occupied upon emergen-
cies by the subsequent inhabitants of the island, is no more
than probable; but there are many, and undoubted reason,
for deeming them the strong holds and bastilles of the ab-
original letters, where they lodged their wives, formed
their garrisons, and made their land. That the Brutes
were accustomed to fortify such places, we have the au-
thority of Tacitus, who, describing the strong holds formed
and related to by Caesar, says, Time montum ar-

dis, et quia elementum accedebatur, in monte nulli
falsa pretium."

(Ann. lib. xii. § 13.) One of these en-
trenchments will make a formidable appearance on a moun-
tain hanging over the vale of Nenniworth, in Huntingdon, called
Med-Arthur.

1 But their situation being so high that they
could have no supply of water except from the clouds,
they were often liable to be untenable for a considerable
time together.

One of the most important of these fortresses in our own
country, is the Herefordshire beacon, situated on a spot
that could not but be an object of the utmost attention to the
original inhabitants of those territories, which afterwards
were deemed distinctly England and Wales, from the very
division here formed. It is on the summit of one of the
highest of the Malvern hills, and is known by the name ju-
mentioncd It has been by turns attributed to the Ro-

mans, the Saxons, and the Danes, but its construction as a
strong hold it seems to have been designed as a fort for the whole
adjacent country or any emergency. Another of these for-
tresses is at Bruff in Staffordshire; has been described by
Mr. Pennant; (Journey from Chester, p. 47,) and exactly
answers the account of Tacitus. It is on the summit of a hill, is
surrounded by two deep ditches, and has a rampart formed of stone.

Other instances are adduced by Mr. Pennant in his "Tour in Wales," and by Mr. King in the first volume of the "Monumenta Antiqua:" but a stronger
instance than all perhaps is given by Mr. Gough in the Ad-

ditions to Camden, (vol. ii. p. 423;) who shews that the
true Caer Caradoc, the very fortresses alluded to in the en-
trence we have quoted, which if not the royal castle of Carata-
sus, fums to have been at least his strong hold, was in Shrop-
shire, two miles north of Craven, and three from Cooxal, being
a large camp, three times long as it is broad, on the point of
a hill, accessible only one way, and defended on the north side
by very deep double ditches, in the solid rock: whilist on the east, the Rec преправ the ground renders it im-

pregnable. On the south it has only one ditch, for the
sake reason: and the principal entrance is on the west side,
foiced with double works; whilist on the south-west it is
even fenced with treble works. The most extraordinary,
however, of all these kinds of fortresses is situated in Caer-
narvonshire, called Tre'r Cari, or the town of fortresses.

The plan and elevation of this ancient strong hold and abode
is given by Mr. Pennant in his "Tour in Wales," (vol. ii. p.
206;) On the accessible side it was defended by three rude
walls of stone; the upper ones being lofty, about fifteen
feet high, and sixteen broad; exhibiting a grand and exten-
sive front. The space on the top is an irregular area;
but the whole is filled with cells; some round, and some oval,
and some also oblong or square. Several of the round ones
were fifteen feet in diameter; which brings to mind the
houses of the ancient Gauls described by Strabo; and of
those that were oblong, there was at least one even thirty
feet in length. Of the fame kind of fortresses were Pen-
maen-Mawr, in Caernarvonshire, Watton Cragg, in Lanca-
shire, Old Oswestry, in Shropshire; the irregular encamp-
ment of Maiden Castle high Dorcheffter; and probably Old
Saram, whose character was nio new modelled by the Romans.
Mr. King, (Monumenta Antiqua, vol. i. p. 63;) considers
the dens in the mountains, and the thickets of Scripture, as strong holds or hill-fortresses of the kind described. When Samson had made a great slaughter of the Philistines, we are told he went and built up on top of the rock Elan; where we find afterwards, three thousand men of Judah went up to confer with him. That hill-fortresses were used in the earliest ages there can be little doubt. The Frisians, when their land was invaded by Jabin, the king of Canaan, in consequence of an exhortation from Deborah the prophetess, assembled to make their stand upon mount Tabor. Among the Indians of South America, strong holds of a similar nature to those of Britain have been frequently discovered. (Uloa. Voyage to South America, i. 503, 504.) And a very curious influence of the attack and surrender of one in Sojhdiana, in All, in the time of Alexander the Great, is related by Quintus Curtius, (lib. vii. chap. xi.) The anecdote is worth the reference of the reader.

The British mode of warfare appears to have received but little alteration from the introduction of Roman tactics. Till finally subdued, their princes showed abilities both in the command of armies and in the conduct of a war; they chose their ground judiciously; formed able plans of active operation; and avoided themselves of all the advantages of local knowledge: but to the fortresses described, if we may rely on the testimonies of our ancient writers, they did not very frequently retire. Their deficiencies both in the attack, the construction, and the defence of such places, must have been very obvious even to themselves; and as they delighted to live, so they usually chose to fight in open plains. Their impatient courage, and their aversion from labour, made them unable to endure the delays and fatigues of defending or besieging the castles of their time; and they often reproached the Romans with cowardice for raising such solid works about their camps and flattons. (See Boaccia's famous speech to her army in Xiphilin, ex Dion in Nerone.)

Of the Roman military works in this country, they were for the greater part temporary; many, however, were stationary forts; and some few, to the retention of which the greatest importance was attached, became walled castles.

Caesar, in the work already quoted. (De Bell. Gall. i. vii.), describes one of his camps as fortified very much in the manner of a walled city. A few of the Roman stations in our own country afford a pleasing light on the description; and, in short, such as were so surrounded, appear to have been the link of connection between the British earth-work and the feudal castle.

Richborough, Portchester, and Pevensey, are the three greatest fortresses the Romans have left us.

Richborough, the very earliest in order of time, is supposed to have been begun in the year 43, in the reign of Claudius; but not to have been completed till 205, under the direction of the emperor Severus. There are in this distinguished fortress, says Mr. King (Munimenta Antiqua, ii. 8.) still plainly to be traced all the principal parts of one of the very greatest and most perfect of the stationary camps. The upper division for the general and chief officers; and the lower division for the legion. In the former the Praetorium with its parade; and the Sacellum or small temple for depositing the exvions. In the walls too are the traces of the four great gates; the decuman, the praetorian, and the two porticos. The great courtes of stone, with which the wall is formed, are separated from each other by alternate layers, composed entirely of a double course of bricks each; as in the walls of Verulam, Silchester, and other of our Roman towns.

The Roman remains at Portchester are not perhaps so clearly to be traced; since, having been constantly used as a fortress in succeeding ages, it has received wall and extremely various additions; and presents us with specimens of military architecture in almost every period from the Normans to the time of queen Elizabeth.

Similar alterations, to those first mentioned, have given so strong a turn to the general character of Pevensey, that its real era has been sometimes doubted; though portions of the Roman wall, as well as the Decuman gate, may be easily and accurately traced.

Here too it may not be irrelevant to observe that the castle at Colchester, in Essex, has been sometimes taken for a Roman fortress. And this not only because it has many of the same sort of walls which are found in Roman walls, but because they are laid in the same manner, with bonds. Though if the building is examined with attention, there may be traced in almost every part evident marks either of the later Saxon or Norman workmanship: and though many of the walls which are used in it may have been gathered from the remains of Roman buildings, the greater part appears to have been made on purpose. (See the Archaeologia, vol. iv. p. 33.)

That in the Roman times, however, there must have been many other such walled stations as those at Richborough, Portchester, and Pevensey, there can be little doubt. The Saxons, in the course of their long wars with the Britons, may be fairly supposed to have destroyed many of the fortifications which had been thus erected: and after their final settlement they neglected to repair those which remained, or to build many of their own. By these means the country became open and defended; which greatly facilitated the incursions of the Danes, who met with little obstruction from fortified places. That there was, however, something like a castle at Bamberough in Northumberland, we have the concurrent testimony of historians (Matth. of Wilmsh. p. 193. sub ann. 547. Sax. Chronicle, p. 19. Roger. Hoved. p. 238. B. Bede l. iii. c. vi. 12.) a castle at Castle, in Devonshire, is said to have existed in the days of Edgar (Gough's Add. to Camden, i. 49. King's Monumenta Antiqua, iii. 293.) Portchester castle during this period, probably, retained its designation. And Mr. King (Musim. Antiq. iii. 211.) has taken considerable pains to prove that the fortresses at Carlston in Derbyshire is of as high antiquity.

Alfred the Great, however, seems to have been the first of our princes with whom the building of castles became an object of national policy. Though, if Asser's authority may be received, they were not exactly what the reader at the first mention of their name might take them for; since they were composed not only of stone but of wood. (Afsler de Reb. gentis Alfredi, p. 17. 18.) Eilfca, too, his daughter, governess of Mercia, who seems to have been the only person in the kingdom who properly complied with the commands, and imitated the example of her illustrious father, and who inherited more of the wisdom and spirit of Alfred than any of his children, not only followed his steps by fighting many battles, but built not less than eight castles, in the space of three years, to check their incursions. (Hen. Hunt. Hist. p. 264.) A still more remarkable instance of the knowledge of castle-building at a short period subsequent to this, may be found in William of Malmsbury (c. vi.) When he mentions the rebuilding of Exeter by Athelstan, who died in 941, "Utrem ignem illam," says the historian, "quam contaminans gentes repurgio defecaverat, terribus munivit, muro ex quadrata lapidibus cinciat." And from the few remains of the fortifications of this period we find that the walls precisely answer Malmsbury's description. They were faced with these four-square stones both within and without, and the intermediate space, between the facings, was filled up with rubble or rough flint stones mixed together with a strong and
and permanent cement. It is to this period too that the most judicious of our writers have referred the castle at
Colchester which has been already mentioned. Its form is
four-square, flanked at the four corners with strong
towers, and it is about two hundred and twenty-four yards in cir-
cumference on the outside, all projections and windings in-
cluded; the four sides nearly facing the four cardinal
points. Some have even gone so far as to call this venerable ruin
British; others, as we have already said, have attributed it
with a greater share of plausibility to the Romans; but
Camden and our better writers acribe it to Edward the
elder, who repaired the walls and re-erected the town in the
beginning of the 10th century.

Still, however, the paucity of strong posts in the island
during every period of the Anglo-Saxon history may be
constantly observed. And it is more than probable that to
this defect we may attribute the defeat of Harold; since it
became necessary that all should be rallied upon the issue
of a sanguinary battle. The conqueror, himself, was evidently
fable that the want of fortified places in England had greatly
facilitated his conquest, and might, at any time, also
facilitate his expulsion. He therefore made all possible haste
to remedy the defect, by building magnificent and strong castles in all the towns within the royal demesne. "Wi-
lam," says Matthew Paris, "excelled all his predecessors in
building castles, and greatly harafted his subjects and vaftals
with these works." (Matthew Paris, Hist. p. 8. col. 2.)

All his ears, barons, and even prelates, imitated his ex-
ample; and it was the first care of every one who received
the grant of an estate from the crown, to build a castle upon
it for his defence and residence. The disputes about the
fiefdom, in the following reigns, kept up this spirit for
building great and strong castles. William Rufus was still
a greater builder than his father; and Henry I. was not
idle in adding to their number. "William Rufus," says
Henry Knighton (col. 2373.) was much addicted to build-
ing royal castles and castles, as the castles of Dover,
Windlor, Norwich, Exeter, the palace of Westminster,
and many others, testify; nor was there any king of Eng-
land before him that erected so many, and such noble ed-
ifices.

Though of one or two of these William Rufus was only
the improver. But the rage for building castles never
prevailed so much in any period of the English history as in
the turbulent reign of Stephen, between 1135 and 1154.
In this reign, says the writer of the Saxon chronicle (Chron.
Sax. p. 238. every one who was able, built a castle: so that
the poor people were worn out with the toil of these build-
ings, and the whole kingdom was covered with castles.
And this last expression will hardly appear too strong, when
we are informed, that besides all the castles before that time
in England, no fewer than eleven hundred and fifteen were
raised from the foundation in the short space of nineteen years.
(Rad. de Dicto, col. 528.) Stephen, says Holinhed (vol.
iii. fid. 50.) began to repent himself; although too late,
for that he had granted licence to so many of his subjeets
to build castles within their own grounds.

An art, Dr. Henry observes, (Histroy of Britain, vol. vi.
p. 188 8vo.) to much practised as architecture was in this
period, must have been much improved. That it really was
so, will appear from the following very brief description of
the most common form and structure of a royal castle, or of
that of a great earl, baron, or prelate in this period; and
as these castles served both for residence and defence, this
description will serve both for an account of the domestic
and military architecture of those times, which cannot well be
separated.

The situation of the castles of the Anglo-Norman kings
and barons was most commonly on an eminence, near
a river; a situation on several accounts eligible. The whole
site of the castle (which was frequently of great extent and
irregular figure) was surrounded by a deep and broad ditch,
sometimes filled with water, and sometimes dry, called the
vafta. Before the great gate was an outwork, called a bar-
on, or a counternial, which was a strong and high wall, with
turrets upon it, designed for the defence of the gate and
draughtwork. On the inside of the ditch stood the wall of
the castle, about eight or ten feet thick, and between twen-
ty and thirty feet high, with a parapet, and a kind of em-
braques, called crenellae, on the top. On this wall at proper
distance, square towers of two or three stories high were
built, which served for lodging some of the principal officers
of the proprietor of the castle, and for other purposes; and
on the inside were erected lodgings for the common servants
or retainers, granaries, bafe-houses, and other necessary
offices. On the top of this wall, and on the flat roofs of
these buildings, stood the defenders of the castle, when it
was besieged, and from thence discharged arrows, darts, and
stones, on the besiegers. The great gate of the castle stood
in the course of this wall, and was strongly fortified with a
tower on each side, and rooms over the passage, which was
closed with thick folding-doors of oak, often plated with
iron, and with an iron portcullis or grate let down from
above. Within this outward wall was a large open space
or court, called, in the largest and most perfect castles, the
outer bailey, or baillium, in which stood commonly a church
or chapel. On the inside of this outer bailey was another
ditch, wall, gate, and towers, inclining the inner bailey or
court, within which the chief tower or keep was built.
This was a very large square fabric, four or five stories high,
having small windows in prodigious thick walls, which ren-
dered the apartments within it dark and gloomy. This
great tower was the palace of the prince, prelate or baron,
to whom the castle belonged, and the residence of the con-
stable or governor. Under ground were dismal dark vaults,
for the confinement of prisoners, which made it sometimes be
called the dungeon. In this building also was the great hall,
in which the owner dispelled his hospitality, by entertaining
his numerous friends and followers. At one end of the
great halls of castles, palaces and monasteries, there was a
place raised a little above the rest of the floor called the
del, where the chief table stood, at which persons of the
highest rank dined. Though there were unquestionably
great variations in the structure of castles and palaces in this
period, yet the most perfect and magnificent of them seem
to have been constructed on the above plan. Such, to give
one example, was the famous castle of Bedford, as appears
from the following account of the manner in which it was
taken by Henry III., A. D. 1224, from Matthew Paris.
(Hist. Angl. p. 221, 222.) The castle was taken by four
assaults. "In the first, was taken the barbacan; in the se-
cond, the outer ballia; at the third attack, the wall by the
old tower was thrown down by the miners, where, with
great danger, they poliffeed themselves of the inner ballia,
through a chink; at the fourth assault, the miners set fire to
the tower, so that the smoke burst out, and the tower itself
was cloven to that degree, as to shew visibly some broad
chinks; whereupon the enemy surrendered."

As Britain abounded in this period in fortified towns and
castles, much of the art of war of course confeiled in defend-
ing and assaulting strong places. For the various kinds of
engines which were used both in the attack and the defence
of these, we shall refer the reader to Artillery; observing
only that a knowledge of the application of them in this
period may be obtained from the relation of the siege of
Exeter.
Exeter castle by king Stephen in the year 1136. (See the Gesta Regum Stephani apud Dugd., p. 934.) It is perhaps the most consummate specimen of the military skill of that age with which we are acquainted. And it may be enough to observe, that after this siege had lasted three months, and king Stephen had expended upon it in machines, arms, and other things, no less than 15,000 marks, equal in efficacy to 150,000 pounds of our money, the besieged were obliged to surrender for want of water. (Henry's Hist. of Britain, vol. vi. p. 317.)

Berkley, which was originally founded in the reign of Stephen, is one of the few remains we are now permitted of, of an ancient feudal castle. But the changes which almost all these buildings have undergone infolio, and in towers may be judged of by those which have taken place at Berkley. The buildings within the innermost only of the three gates are said to have been the work of Henry II. when duke of Normandy; while the two outermost, with all the buildings belonging to them, except the keep, are referred to the latter end of the reign of Henry II. and to those of the second and third Edwards. The hall and the two chapels are of the latter period; and the great kitchen, adjoining to the keep, was of the work of Henry VII.

Among the castles which Mr. King has endeavoured to appropriate to the early Norman period, are those of Nottingham, Lincoln, and Clifford's tower at York, all erected by the Conqueror. (Arch. vol. vi. p. 525.) The remains of all these, he observes, fully illustrate the Norman mode of constructing such edifices. "Tick-hill, in the neighborhood of Doncaster, appears to have been another of these castles (ibid. 269.); and Pontefract bespeaks a Norman design, with rude and imperfect alterations. All of these appear to have been erected upon artificial mounts, and nearly cover the whole area of the summit of the respective hills on which they are situated.

Tuambridge castle, in Kent, built by Richard de Clare about the time of William Rufus, is mentioned by Mr. King as a specimen of the later Norman structures; and he has been very accurate in his description of it. (Ibid. 270.) Gundolph, who directed the building of the Tower of London in 1275, and the castle at Rochester, he describes to have introduced a great many judicious alterations, and not only to have increased the security but the magnificence of our military piles; and observes that the castle at Rochester is a complete specimen of all that he effected. Newark, which Mr. King afterwards mentions, is an instance of a prelate's castle in the reign of Stephen; and the keep of Knarleborough, of the time of Henry III., completes the specimen it may be proper to mention of the irregular style of castle building which prevailed during the interval between the Norman conquest and the middle of the thirteenth century.

To these succeeded the magnificent piles of Edward I. more convenient and more florid, and containing not only many towers, but great halls, and sometimes even religious houses. The florid style of military architecture in this period was displayed in the castles of Caernarvon, Conway, and Caerphilly; and it is singular to observe that many of our more ancient castles were then increased with additions in the same florid style. After the age of Edward I. we find another kind of castle introduced, approaching nearer to the idea of modern palaces. The florid style was that at Windsor, built by Edward III. who employed William of Wykeham as his architect. This convenient and enlarged style of building was soon imitated, on a lesser scale, by the nobles of the realm; and two remarkable instances, wherein convenience and magnificence were singularly blended at this period, may be found in the castles of Harewood and Spofford in Yorkshire. The improvements at Kenilworth afford another instance of the great enlargement which our castles during this age were accustomed to receive; and Newbury in Cumberland is another of the best specimens that can probably be referred to. Calonor in Norfolk affords the style of Henry VIth's reign. It was built by John Pattof, who died in 1430.

To these venerable piles succeeded the castellated houses; mansions adorned with turrets, and battlements; but utterly incapable of defence, except against a rude mob, armed with clubs and hoes, on whom the gates might be flung; yet still mansions almost cut off, devoid of all real elegance, or comfortable convenience, and fitted only to entertain a herd of retainers wallowing in licentiousness. At the same time, however, they discover marks of economy and good management, which enabled their hospitable lords to support such rude revels, and to keep up their state, even better than many of their more refined successors. Of these buildings one of the most perfect and most curious, now remaining, is Haddon house in Derbyshire; castellated and embattled, in all the apparent forms of regular defence; but really without the least means of resistance in its original construction. The description Mr. King has given of it (Arch. vi. 537.) is, however, too long to be extracted, and too curious to be abridged.

After this kind of building, the magnificent quadrangular houses of the reign of Henry VIII. succeeded; of which the most beautiful and genuine models perhaps were those of Cowdray in Sussex, and Penshurst the seat of the Sidney family, in Kent.

Without referring to the flattery buildings of Elizabeth's reign, it may be enough to say that heredit is the history of the English castle. The block houses of Calnhot, Hurst, Sandrown, Sandgate, and South Sea, are the last instances of such buildings ever intended for a land, and seem strongly to mark the revolution which has taken place in our defensive system of war.

The total change in military tactics brought about by the invention of gunpowder and artillery, the more settled state of the nation, Scotland becoming part of the dominions of the kings of England, the respectable footing of our navy, whose wooden walls secure us from invasions, and the abolition of the feudal system, all conspired to render castles of little use or consequence, as fortresses: so the great improvements in arts and sciences, and their constant attendant, the increase of luxury, made our nobility and gentry build themselves more pleasant and airy dwellings; relinquishing the ancient dreary mansions of their forefathers, where the enjoyment of light and air was sacrificed to the consideration of strength; and whose remote rooms, according to our modern, refined notions, have more the appearance of galls and dungeons for prisoners, than apartments for the reception of a rich and powerful baron.

However, in the reign of Charles I., a little before the breaking out of the civil war, some inquiry into the state of these buildings seems to have taken place; for on the 23d of January, 1636, a commissary was instituted, appointing lieutenant colonel Francis Coningsby, commissary general of and for all the castles and fortifications in England and Wales, with an allowance of 150. a day to be paid out of the cheques and defalcations that should be made by him from time to time; or, in default thereof, out of the Treasury. Whether this office was really instituted for the purpose of scrutinizing into the state of these fortresses, as foreseeing the events which afterwards happened; or whether it
CASTLE.

it was only formed to gratify some favourite, does not appear. During the troubles of that reign, some ancient castles were pulled down and defended, several of which, particularly Corte castle in Dorsetshire, were afterwards destroyed, by order of the parliament; for that period, they have been abandoned to the mercy of time, weather, and the more unifying hands of avaricious men. The last has proved the most destructive; many of these monuments of ancient magnificence having been by them demolished for the sake of the materials: by which the country has been deprived of those remains of antiquity so essential, in the eyes of foreigners, to the dignity of a nation; and which, if rightly considered, tended to inspire the beholder with a love for the now happy establishment; by leading him to compare the present with those times when such buildings were erected;—times when this unhappy kingdom was distracted by interline wars, when the ion was armed against the father, and brother slaughtered brother; when the laws, honour, and property of the wretched inhabitants depended on the nod of an arbitrary king, or were subject to the more tyrannical and capricious wills of lawless and foreign barons.  

The few castles existing in the Saxon time, were, probably, on occasion of war, or invasions, garrisoned by the national militia, and at other times slightly guarded by the domestics of the princes or great personages who resided in them; but after the conquest, when all the castles were converted into baronies, held by knights' service, Castle-guard, coming under that denomination, was among the duties to which particular tenants were liable. From these services the bishops and abbots, who till the time of the Normans had held their lands in frank almoine, or free alms, were, by this new regulation, not exempted; they were not indeed, like the laity, obliged to personal service, it being sufficient that they provided fit and able persons to officiate in their stead. This was, however, at first vigorously opposed by Anfehn, archbishop of Canterbury; who, being obliged to find some knights to attend king William Rufus in his wars in Wales, complained of it as an innovation and infringement of the rights and immunities of the church.  

It was no uncommon thing for the Conqueror, and the kings of those days, to grant all these men of approved fidelity and valour, on condition that they should perform Castle-guard, with a certain number of men, for some specified time; and sometimes they were likewise bound by their tenures to keep in repair some tower or bulwark, as was the case at Dover castle.  

In process of time these services were commuted for annual rents. Sometimes styled ward-penny, and wayte-fee, but commonly castle-guard-rents; payable on fixed days, under prodigious penalties called fur-fizes. At Rochefort, if a man failed in the payment of his rent of castle-guard, on the feast of St. Andrew, his debt was doubled every tide, during the time for which the payment was delayed. These were afterwards restrained by an act of parliament made in the reign of king Henry VIII., and finally annihilated with the tenures by knights' service, in the time of Charles II. Such castles as were private property, were guarded either by mercenary soldiers, or the tenants of the lord or owner.  

Castles which belonged to the crown, or fell to it either by forfeiture or escheat, (circumstances that frequently happened in the distracted reigns of the feudal times), were generally committed to the custody of some trusty person, who seems to have been indifferently styled governor or constable. Sometimes also they were put into the possession of the sheriff of the county, who often converted them into prisons. That officer was then accountable to the exchequer, for the farm or produce of the lands belonging to the places entrusted to his care, as well as all other profits: he was likewise, in case of war or invasion, obliged to virtual and furnish them with munition out of the stores of his county; to which he was directed by acts of privy seal.  

Variety of these writs, temp. Edw. III., may be seen in Madden's History of the exchequer; and it appears from the same authority, that the barons of the exchequer were sometimes appointed to survey these castles, and the state of the buildings and works carrying on therein. (See Grote's Preface to the Antiquities of England and Wales.)

CASTLE, in Sea Language, denotes in elevation on the deck of a vessel; or a part of the deck, fore and aft, raised above the rest.

CASTLE, Fore, Castello di prora, &c. See Fore-castle.

CASTLE, Hind, Castello di poppa. See Pop.

CASTLE-Ward, or CASTLE-Guard, Castello d'armo, or Warden Caffie, an impetration laid on such as dwell within a certain compass about any castle, towards the maintenance of those who watch and ward the castle, which fee.

The word is sometimes also used for the circuit itself, inhabited by such as are subject to this service.

CASTLE, Water, a piece of hydraulic work finished with one or more fronts of building, with seeming windows and the like, containing a reservoir which gives play to cafades, &c. Or, a water-castle may be defined a receptacle of the public water furnished by an aqueduct, or otherwise, in which are inclosed the cocks of several water-pipes with a little bason; contrived to distribute and fend it to different parts.

The castella of the ancient aqueducts are still visible at Rome, though half ruined. They are lined with a durable kind of cement, which, according to Pliny, forbad them to harden the bones themselves. It is made of lime flacked in wine, and beaten up with hog's grease, and the juice of figs or pitch.

Modern writers on hydraulics treat of the laws of the efflux of water out of castella into pipes, canals, &c. Signior Poleni has a treatise express on castles, or reservoirs, whereby the waters of rivers are derived, the sides of which castles are made converging.

CASTLEBAR, in Geography, a market and post town of the county of Mayo, Ireland, which is also the seat town, and the most considerable in the county, having been much enlarged within a few years, in consequence of the judicious encouragement given by the proprietor, lord Lucan, to the iron manufacture and other trades. Agriculture also has improved in the neighbourhood. This town is situated on the river which runs from the lake of Castlbar, west of the town, to Lough Conn. In these and the other lakes of the neighbourhood, besides salmon and other fish, is found that kind of trout called the gillaroo, of which there is an account in the Philosphical Transactions, vol. xxiv. p. 316. 310. It is remarkable for a great thickness of stomach, which bears some resemblance to the gizzard of birds, and which is brought to table as a delicacy, under the name of gizzard. Mr. Pennant (Brit. Zoology, vol. iii.) does not think it a distinct species, but a variety occasioned by the nature of the waters, or of the food. Castlbar is a corporate town, which, before the union, lent two members to the house of commons, but has now lost that privilege. It has a barrack, and in the rebellion was a military station. When the French, under general Humbert landed at Kilkilla, in 1798, they surprized the troops at Castlbar, and taking possession of the town, held it for nine days, when
CASTLE-DERMOT, a small port town of the county of Killkenny, Ireland. remarkable for its mines of what is usually called Kilkenney coal. To the north of the town, there is a large iron mine, and a number of small iron mines, which are worked by the inhabitants. The town is situated near the point where the Monamore River enters the sea, and is about five miles from the sea. It is a thriving place, with a large trade in coal and other minerals.

CASTLE-COMER, a small port town of the county of Monmouth, England. It is situated on the north bank of the Monomor River, and is about three miles from the sea. The town is noted for its coal mines, and is a thriving place. There are also several iron mines in the vicinity, which are worked by the inhabitants.

CASTLE-CARY, an ancient city, in the county of Somerset, England. It is situated on the banks of the Monomor River, and is about five miles from the sea. The town is a centre of the coal and iron mining industry, and is noted for its beautiful scenery.

CASTLE-BELLINGHAM, a small port town of the county of Louth, Ireland. It is situated on the north bank of the Monamore River, and is about five miles from the sea. The town is noted for its coal mines, and is a thriving place. There are also several iron mines in the vicinity, which are worked by the inhabitants.

CASTLE-BLKENEY, a small port town of the county of Galway, Ireland. It is situated on the north bank of the Monamore River, and is about five miles from the sea. The town is noted for its coal mines, and is a thriving place. There are also several iron mines in the vicinity, which are worked by the inhabitants.

CASTLE-BLAYNEY, a small port town of the county of Meath, Ireland. It is situated on the north bank of the Monamore River, and is about five miles from the sea. The town is noted for its coal mines, and is a thriving place. There are also several iron mines in the vicinity, which are worked by the inhabitants.

CASTLE-CARY, an ancient city, in the county of Somerset, England. It is situated on the banks of the Monomor River, and is about five miles from the sea. The town is a centre of the coal and iron mining industry, and is noted for its beautiful scenery.
of Killdare, Ireland. St. Diarmit is said to have founded a priory here in A.D. 500, from which it got part of its name. During many centuries it was called Trilic-Dermot, for what reason is not known; but of later years it has been called Castle-Dermot, from a castle belonging to the Fitzgeralds, of which there is not a trace remaining. It was plundered by the Danes in the 9th century, taken and sacked by Edward Bruce in 1316, and taken by col. Reynolds for Cromwell in 1650. Since which times its walls have moulderd to decay; but though the gates have been destroyed, the names of two of them are still preserved. The town is situated on a flat, and surrounded with a fine level country for several miles. Of the ruins, the old church, in part of which service is still performed, with the round tower adjoining, and two crofles, are supposed to be of the 10th century. The round tower is useful as a halfryan, which seems to counteract the opinion, that this was their original deftlon. The remains of a Franciscan abbey, founded by one of the Fitzgeralds about the year 1500, show it to have been magnificent; particularly one of its windows, two of the ailes, and some of the oclon pillars, which still preserve the outlines of ancient grandeur and elegance. A parliament is said to have been held here in 1577; certainly there was such an assembly under the earl of Killdare, lord deputy in Augufl 1599, when a tax was laid on, and some regulations adopted, which however did not probably extend beyond the English pale. The present inn is generally understood to be a part of the building in which the parliament was held. The first charter school established in Ireland was in this town, A.D. 1734, for forty boys. See Charter Schools. The number of houses in 1793 was 103, of which 63 were of lime and flone, and the rest cobble. There is no manufacture, but some little buffets are occasioned by the great postal road from Dublin to Cork passing through it. It is 34 Irish miles S.W. from Dublin. N. lat. 52° 54'. W. long. 6° 52'. Philos. Survey of South of Ireland, Anthol. Hibert, &c.

CASTLE-DURROW. See Durrow.

CASTLE-FINN, a small poft town of the county of Donegal, situated on the river Finn, which is navigable for veffels of 14 tons from Derry to this place. It is 43 miles S.W. from Lifford, and 104 N.W. from Dublin. N. lat. 54° 48'. W. long. 7° 27'.

CASTLE-GUARD, a mount near Ardee, county of Louth, Ireland, which has been generally considered as a Danish fort. It is entirely artificial, and accompanied with a double ditch and vallum. It is now all planted with wood, and looks very romantic. The perpendicular height of the mount from the bed of its foundation is near 50 feet, and the depth of the main trench between 30 and 40. The circumference of the top is not less than 140; and round the foundation upwards of 600 feet. There appear to have been, from foundations yet remaining, two concentric octon-gonal buildings upon the summit of it. One seems to have been a fort of tower or castle; the other a kind of breaft-work, or gallery, by way of parapet or battlements. The use as well as origin of this, and similar mounts, has been disputed.

CASTLEHAVEN, James Toucet, lord Audley, earl of, in Biography, a nobleman who lived in the reigns of Charles I. and II. He entered into the service of the con- federated Catholics in Ireland, A. D. 1641, and had a command in their service, and afterwards under the king, till the redution of Ireland by Cromwell. In 1681, and again with some little alteration in 1684, he published "Memoirs concerning the Wars of Ireland," which occasioned much controversy, and the first edition, together with lord Angle-
Bride. It has a good market for poultry, and has large fairs. The inhabitants are about 1000, and the town seems capable of great improvement. The ruin of the castle, the residence of the earls of Barrymore, which was burned a few years ago, makes a conspicuous appearance at a great distance. Here are a neat church of modern structure, and the ruins of an abbey, the possessors of which being affiged to the first earl of Cork, were left by him "to his daughter Barrymore, to buy her gloves and pins."

CASTLETON, a small town of the county of Kerry, Ireland, situated on the river Main, or Mang, which is deep enough for vessels of 50 tons or upwards. The castle here formerly guarded the pafs over the river, which divided the earl of Desmond's possessions from those of Macarthy, and was given up to queen Elizabeth by the last earl. Though now in ruins, a confidérable is still appointed to guard it, who has some land and privileges annexed to the office. The town is very poor, which is in some measure occasioned by the badness of the harbor. There is a bar across the mouth of the entrance, and a spit of land on each side of the channel, and there are no land marks which a stranger can easily understand. It is repreffed as too large in most old maps, and has been erroneously spoken of as very fale. Near Castlemain there is a fpa, which, according to Smith, contains sulphur and iron. It is 15½ miles S.W. from Dublin. N. lat. 5° 10'. W. long. 9° 35'. Smith's Kerry, McKenzie, &c.

CASTLE-MARTYR, a market and poft town of the county of Cork, Ireland, belonging to the earl of Shannon, who resides there, and has paid great attention to its improvement, and to that of the adjoining country. It is a neat, well built town, and well watered by a canal, or artificial river, which furnards lord Shannon's demeane, as well as the town. Mr. Young mentions the combing business being carried on extensively in Cable-martyr, but this trade has since declined in every part of the country. There is a charter school for 40 boys, to the support of which lord Shannon has largely contributed. This town was made a borough in 1663, and continued to fend two members to parliament till deprived of this privilege by the union. It is 17 miles E. from Cork, on the road to Youghal, and 123 miles S.W. from Dublin. N. lat. 51° 55' 30". W. long. 8° 3'. Smith's Cork, Young, &c.

CASTLE-POLLARD, a market and poft town of the county of Watermeath, Ireland, which is 46 miles N.W. from Dublin, and 11 miles N. from Mullingar.

CASTLERA, a market and poft town of the county of Roscommon, Ireland, which is 84 miles W. by N. from Dublin, and 134 from Roscommon.

CASTLEAGH, a barony of the county of Down, Ireland, so called from a castle, the ruins of which are about two miles S.E. of Belfast bridge.

CASTLE-RISING, is an ancient, though at present a very inconfiderable borough, of Norfolk, England. It was formerly a fport of some confequence, and from its strong caftle obtained many privileges; but the fire has deferted the town, its haven is cloathed up with sand, and the caftle is in ruins. The latter, with the town, is fettled on an eminence. The caftle was built by William d'Albini, earl of Arundel and Sufle, in the time of Henry I. Three of its towers were defended and maintained by the lords Humflanton, Wutton, and R'don: and to support their men, they had a power given them by a fituate of Edward III. to take provision of the circumjacent villages, paying for it within 40 days. Caftle-rising is 100 miles N. from London, and is an ancient borough by prefcription. The burghers were formerly at fifty, but these are now reduced to two persons; who poffefs the privilege of fending two members to parliament, and each alternately assumes the mayoralty of the town. In the vicinity of Caftle-rising is a large chace, which poftesses the privileges of a forel. The church of this town is a large ancient pile, built in the conventual form, with an ornamented weft front. The rector has the privilege of proving all wills made in the parish, and also retains some other privileges, refulting from the caftles of the caftle. The markets here are defcontinued, and the town is reduced to 40 houfes and 254 inhabitants. Bloomefield's History of Norfolk.

CASTLETON, in Antiquity, a very ancient edifice in Derbyshire, leated on the summit of an almost inaccessible rock, impeding at a great height over the mouth of one of the most horrid and august caverns which nature ever formed. Mr. King, in the Archeologia (vol. vi.) has very particularly described this curious remnant of antiquity. This prefents a large niche in the wall of one of the apartments, with a fingular kind of canopy or ornament at the top, fuppoifed to have been the "idol-cell," or little idolatrous chapel in Pagan times. This suppoifion feems to receive fome support, with refpeft to Caftleton, from certain small idols which were dug up a few years ago in the neighbourhood. See CASTLE.

CASTLETON, in Geography, a townhip and river of America, in Rutland county, and State of Vermont, 20 miles S.E. of Mount Independence, at Ticonderoga. Lake Bombazon is chiefly in this town, and tranfmits its waters into Caftleton river; which, rifing in Pittsford, paffes through this town in a south-weftherly courfe, and falls into Pultney river, in the town of Fairhaven, a little below col. Lyon's iron-works. Fort Warner founds in this town. The number of inhabitants is 823.

CASTLE-TOWN, the name of a town in the isle of Man, which belongs to Great Britain, and is provincially connected with the county of Cumberland. It is the residence of the principal officers of the government, and the seat of the Manks' parliament. The houfes are fettled on the opposite fides of a small creek, that opens into a rocky and dangerous bay; the difficulty of entering which injures, in a certain degree, the commerce of the town. The streets are spacious and regular, and the houfes are mostly neat and uniform. In the centre of the town is Cable-Ruhen, a folid and magnificent structure of free-stone, erected on a rock, and confidered as the chief fortes in the ifland. According to the Manks' traditions, it was built in the year 960, by the Danish prince, Guttred, who lies obfcurely buried within its walls. The figure of the caftle is irregular, and by fome writers faid to bear a great refeemble to Elineur, in Denmark. The free glaces which furrounds it is fuppofed to have been built by cardinal Wolfey. The free-work of the keep and feveral interior porfions of the building are nearly as entire as when firft erected, but the other parts have been repaired, as the caftle has been severall times fefeged. In the keep is a deep dungeon for prisoners, who muft have been flowered into it by ropes, as there are no fteps to defend by. In this town is a neat and ancient chapel, which was erected between the years 1658 and 1701, and paid for out of the ecclefiaftical revenues. The firft ftone was laid, and the chapel consecrated, by the good bishop Wilfon in 1658. Here is also a free-school, which was eftablihcd by bishop Barrow, about 1666. The school-houfe was formerly a chapel dedicated to St. Mary, as early as the year 1230. The courts of chancery and common law are held in this town. Here are about 500 houfes.
houses. Feltham's Tour through the Isle of Man, 8vo. 1703.

Castle-town. A small town, or rather village, at the western extremity of the county of Cork, Ireland, sometimes called Castle-Defnot; it is opposite to the island of Deerhaven, and affords a facility to vessels lying in that harbour. It is 186 miles S.W. from Dublin. N. lat. 51° 17'. W. long. 9° 49'.

Castle-town, a market town of America, in Richmond county, Staten island, New York, which contains 807 inhabitants, including 114 slaves. Of its inhabitants 114 are electors.

Castle-town Delvin, a market and post town of the county of Westmeath, Ireland, the site and name of which gave rise to the surrounding barony. It is 35 miles N.W. from Dublin, and 103 miles from Mullingar.

Castle-town Rochest, a market and post-town of the county of Cork, Ireland, thus called from a castle that was formerly the seat of the lords Rochest. It is on the river Avon, 115 miles S.W. from Dublin, and about 22 miles from Cork.

Castle-townSEND, a small town of the county of Cork, Ireland, on the bay of Castle-haven. There is a good fishery off this bay, and in it are excellent oysters. It is 150 miles from Dublin, and 35 from Cork.

Castle-Wellow, formerly Called-Vellin, a market and post-town of the county of Down, Ireland, pleasantly situated on the side of a small lake of the same name. It is 65 miles N. from Dublin, and 5 W. from Downpatrick.

Castola, in Ancient Geography, a town of Italy, in Etruria, which was taken by the confidant Publius.

Castoli Campa, a mountain of Asia Minor, in the Doride, according to Xenophon.

Castologe, a people of Gaul, placed by Pliny in the vicinity of the Atrebati.

Castolus, a town of Lydia, in Asia Minor, belonging to the Dorians, called by the Lydians Castoli.

Castor, in Astronomie, a moiety of the constellation Gemini; called also Apollo. — Also, a star in this constellation, whose latitude for the year 1700, according to Hevelius, was 10° 4' 23" N.; and its longitude 16° 4' 14" of Cancer. It is also called Rafalgenus, Apollis, Apellis, Apellis, and Aetner.

Castor, in Commerce. See Beaver, and Castor in Zoology.

Castor, or Caistor, in Geography, a small town of Lincolnshire, England; having a weekly market on Monday, and three fairs annually. This place is said to have been a Roman station; but the only memorials of its fortifications and military character are the traces of an encampment on an eminence, at a place called Castle-hill, near the town. Several springs issues from this eminence, and supply the inhabitants with excellent water. The parish church is a fine old edifice, supposed to have been built out of the ruins of the castle. The latter structure is called Thong-castle, and, according to some of our old chronicles, was built by Hengist the Saxon; but this is very improbable, as the most eminent historians have endeavoured to prove, and with every degree of probability, that Hengist never penetrated so far north into England. Among the singular tenures of this country may be noticed one which belongs to this town. A proprietor of an estate in this neighbourhood holds it upon the condition of sending an agent every Palm Sunday to the north porch of the church, where he is enjoined to crack or smack, what is here called, a horrid-gad, (a whip) three times while the clergyman is reading the first lesson. He then proceeds into the church, palls the pulpit, and performs many other truly ridiculous tricks:—a proof of the fully and superfluous of the age when this ceremony was instituted. Castor is 136 miles N. from London; and contains 202 houses, with 361 inhabitants.

Castor's River, a river of Newfoundland island, which discharges itself in the harbour of St. John's. Its size is considerable for 15 miles from the sea.

Castor, Coffaeum, in the Materia Medica. This substance, which may be called an animal gum resin, is the inguinal gland of the beaver, (erroneously supposed by the ancients to be the testicle,) which has long been in use in medicine, though now but rarely. See Castor in Zoology.

The castor is brought over in roundish but flattened lumps, covered with a tough membranous film. Castor is a brittle, reddish-brown, irritable substance, of a pungent, bitter, unpleasant taste, and an intensely strong and peculiar smell, disagreeable to most organs.

By far the best castor comes from Russia, and is in rounder and harder molasses, and its smell is stronger and more diffusive. The ordinary fort, which is in flattened molasses, is imported from Canada, and other parts of North America.

The odorous and more active part of castor is taken up by alcohol, water alone dissolving chiefly the bitter extractive part; but the scent of castor is readily imparted to any liquor with which it is digested. Water diluted from castor becomes strongly impregnated with the flavour, but long keeping and heat dissipate it.

The only preparation of castor in common use is the simple tincture, made in the proportion of an ounce to a pint of the spirit. The dose is about a dram, and it is supposed to palls the present strong nerve and anti-hysterical properties, and with this view is often combined with valerian, afteetia, or tonics.

By the analysis of Bullion la Grange, it appears to consist of a mucilage, a bitter extract, a resin, and an essential oil, in which all the odorous principle seems chiefly to reside, and a fatty crystalline matter much resembling adipocere, or the similar matter contained in biliary calculi.

Castor Oil, Oleum Ricini. The seed of the Palma Christi (Ricinus communis,) is a whitish kernel enclosed in a brown acid husk, which, taken entire, excites very violent vomiting and purging. These seeds contain a large quantity of a mild nearly inipid oil, of which from a third to a fourth of the weight may be extracted, and is the common castor oil of the shops. It is imported largely from the West Indies, where it forms one of the commonest domestic medicines for most occasions.

Genuine castor oil is very thick and viscous, of a light amber or straw colour, with scarcely any smell or taste. It becomes beautifully transparent by sublimation, and a quantity of mucilage falls slowly to the bottom of the vessel.

The oil is prepared in two different ways, either by simple expression, without previous preparation, or by decoction. For the latter method, the nuts are beaten in deep wooden mortars, and then thrown into iron boilers filled with water, and slowly brought to a boiling heat with constant stirring. The oil rises as a feath at the top, which is simply strained and bottled. According to Dr. Wright, (Medical Journal for 1787,) the oil thus prepared is much milder than that obtained by pressure, on account of the mucilaginous and acid part which the compression forces out of the nut and mixes with the oil.

The very mild and finest Jamaica oil is very limpid, and nearly colourless, and has scarcely more taste and smell than fine olive oil, and its effects are proportionately milder.

Castor oil is one of the most valuable of all the purgative medicines which we possess. In the dose of about half an ounce to three quarters for an adult, it usually operates by itself.
CASTOR.

ool, speedily and mildly, with but little griping, though the measure of effect must be much determined by the parity and finesness of the oil, the strong-smelling and conjurer kind often producing some unaccords in the bowels. On account of its general mildness, it is the medicine most commonly selected for puerperal women, and those of very delicate habits, and children. Its virtues are also deftively extolled in the feverish inflammatory and spasmodic affections of the bowels, in enteritis, colic, pétition, &c. The oil, when taken unmixed, always passes through, in part undecomposed, and may be seen in the feces.

The exhibition of the oil is often attended with some difficulty, particularly as oil is so little used for culinary purposes, that most persons have an aversion to the sensation of any kind of oil clinging to the mouth and fauces. In general, if the mouth is previously well moistened with peppermint-water, or any other strong-tailed agreeable liquor, and the oil, floating unmixed in a cup of water, be swallowed quickly in large mouthfuls, it is not felt in the mouth, and all difficult is avoided. But when this cannot be well-managed, and the difficulties of the unmixed oil is insuperable, it may be readily made into an emulsion with yolk of egg and sugar, and any aromatic, which completely covers all the flight maulous taste which the raw oil leaves in the throat. In this way, however, the purgative power must be diminished, that is, all that depends on the mere oil, which is not inconsiderable, since an equal quantity of foulad oil will prove, in some degree, purgative, apparently by its mere lubricating effect.

The very frequent use of this oil is rather of late date in this country; though it has been long known and reported to in particular cases.

Where the oil is naturally unusually acid, or has become so by long keeping, it has been proposed to agitate it with warm water, with a view of dissolving out part of the acrid mucilage; a method which will probably succed to a certain degree.

CASTOR, the Beaver, in Zoology, a genus of quadrupeds which have the front teeth in the upper jaw truncated, and hollowed in a transverse angle; those in the lower jaw transverse at the tips; grinders four in each jaw: tail long, defurred, and scaly: clavicles perfect, or collar bones in the skeleton.

Two species only of this genus are at present known, Castor Fiber, the common beaver; and the Chili beaver, Castor Huicidius, or as it is called by the natives of Chili, Guillerino.

CASTOR Fiber has an ovate, flat, and naked tail, by which character it is immediately distinguished from the other species, the tail of which is long, of a lanceolate form, and hairy. The colour of this animal is susceptible of considerable variation in different climates: most commonly it is of a reddish or chesnut brown. In northern countries they are dusky, and even sometimis of an intense black; but those latter are rare. Others are grey, cream-coloured, or white; and in facets have occurred, in which those of a light-colour have been spotted with brown or black. Those of Canada are chesnut, and among the Illinois, they are yellow, or olivaceous brown.

The beaver is a native of the northern parts of Europe, Asia, and North America, abounding most in cold regions, and becoming gradually less common towards the south. In America they are found from the 50th degree of north latitude to beyond the 60th. In ancient times the beaver was a more general inhabitant of Europe than it is at present, especially in France, Spain, Italy, Greece, and Egypt, where they are now scarcely ever observed, and in Britain they have been wholly extirpated for some centuries. That it was formerly an indigenous inhabitant of this country is certain upon the credit of the most authentic records. The latest accounts we have of them is in Gildas Cambrensis, who travelled through Wales in 1889; he gives a brief history of their manners; and adds, that in his time they were only found in the Tywi river. Several pools of water in the northern parts of the Cambrian principality still bear the name of Lyn yr ongaf, the pool (or lake) of beavers. There are two, if not more, of the pools amid the wilds of the Snowdonian mountains that bear this name to the present day; there is one in particular in the vale of Nant Francon near Beddgelert, in Caernarvonshire, and another in the river Conway, a few miles above Llanrwst. These were evidently the haunts of beavers. It is however believed that the beaver was uncommon in Britain before the tenth century, for by the laws of Howel Dda (Leges Waliar) the price of the beaver's skin (Crum Llybaid) was estimated at one pence: a great sum in those days.

Beavers, when full-grown, are nearly three feet in length from the tip of the nose to the insertion of the tail; the tail itself measures almost twelve inches long; and the weight of the whole animal is from fifty to sixty pounds. Of all quadrupeds the beaver is considered as possessing the greatest degree of natural sagacity in confounding its habituations, though in other respects it is believed inferior to many. If we consider this animal in a state of nature (see Baffon) or rather in its dappled and solitary state, we shall find that his internal qualities are not superior to other animals; he has neither the genius of a dog, the sagacity of an elephant, nor the cunning of a fox, and he is rather remarkable for external singularities than for any apparent superiority of internal qualities. The beaver is the only animal that has a flat, oval tail, covered with scales, which serves as a rudder to direct his course in the water; the only one that has the hind-feet webbed, and the toes of his fore-feet separate, which he uses to convey food to his mouth; the only one which resembles a land animal in his fore-parts, and approaches the nature of an aquatic one in the posterior; in short, he forms the same shade between quadrupeds and fishes, as the bat forms between quadrupeds and birds. But these singularities would be rather defects than perfections, if the beaver did not derive from this conformation peculiar advantages adapted to its mode of life, which render it superior to all other animals. It is generally allowed, says this writer, in another place, that the beaver, far from having a superiority over other animals, seems to be inferior to many of them in his merely individual qualities, and this fact he affirms he was able to confirm, by having had a young beaver, which was sent him from Canada alive, in his possession for more than a twelve-mouth. This animal is mild, peaceable, and familiar; it was rather inclined to be gloomy and melancholy, had no violent or vehement passions, its movements were slow; it made few efforts except to gain its liberty, which it frequently attempted by gnawing the gate of its prison, but without violence or precipitation. In other respect it seemed to be perfectly indifferent; forming no attachments, and being as little inclined to offend as please. He was inferior to the dog in the relative qualities which might make him approach to man: he appeared neither formed to serve, command, or even to associate with any species but his own; his talents were repressed by solitude, and it seemed only by society with his own kind, those talents could be brought into action. When alone he had little industry, few tricks, and not sufficient skill to avoid the most obvious snares. Far from attacking any other animal, he had fearlessly the art to defend himself; always preferring flight to combat; he retired only when driven to an extremity, and then bit very hard
hard with his teeth. Such traits of the manners of this animal, in a state of caprice, are singular. We are not, however, satisfied that the observations of Buffon will apply to the beaver generally; in one respect he is evidently incorrect; we are affixed by the belief that the beaver may be easily tamed. M. Klein tells us he kept a beaver in a cellar, and when, without suspecting him, one would go in quelled of him as a dog would search for his master; Raimon pronounces decisively to the same effect; he observes, in his travels, that he has seen beavers that would go out to fish, and bring the prey home to their marks, nay, that they would even follow men and dogs, go with them into the water, jump into the water, and come up again with the fish; and M. Gmelin affirms that he saw a beaver in Siberia, which had been reared in the house, who would wander to a considerable distance, sometimes returning with a female whom he would not depart alone after the season of love.

Authors have stated that the beaver, being an aquatic animal, could not live solely on land; an opinion which Buffon endeavours to prove erroneous; he observes that the young beaver before mentioned when taken to the water was afraid of it, and refused to go in; when plunged into the basin there was a necessity to hold him there by force, though in a few minutes he became perfectly reconciled; afterwards, when left to his liberty, he would frequently return to it of himself, and even roll upon the dirt, or wet pavement. One day he escaped and defended by a flume-cafe into the subterraneous vaults in the royal garden, and swam a considerable time in the stagnant water at the bottom of them, yet no sooner did he perceive the light of the torches which were brought to search for him, than he returned, and suffered himself to be taken without the least resistance. He was familiar, not fatigued, and was sure to express his desire for something to eat from those he fancied table, which he signified by a small plaintive cry, and some gestures with his fore-paws; when he obtained a morsel he carried it off and concealed it, that he might eat it at his ease. He slept pretty often, and then laid on his belly. No food came amiss to him, meat excepted, which he refused either raw or dinned. It was remarkable, that he gnawed everything within his reach, informing that it had been found necessary to line with tine barrel in which he had been brought from Canada.

The favourite reforts of the beaver are retired woody situations on the borders of lakes, rivers, and other fresh waters, yet they are sometimes found on the sea shores near the influx of great rivers, where the waters are less saline than in the open sea.

According to Buffon, the beavers begin to assemble in the month of June or July, for the purpose of uniting into society. They arrive in numbers from all parts, and soon form a troop of two or three hundred. The place of rendezvous is generally the situation fixed for their establishment, and always on the banks of some water. If the waters be flat, and never rise above their ordinary level, as in lakes, the beaver makes no banks or dam; but in rivers or brooks, where the waters are subject to considerable risings and fallings, they construct a bank, and by this artifice form a pond, or piece of water, which remains always at the same height. The bank traverses the river from fore to aft, or from one bank to the other, like a sluice, and is often from eighty to a hundred feet long, by ten or twelve broad at the base. This pile, for animals of so small a size, appears to be enormous, and supposes an incredible labour; but the solidity with which the work is constructed is still more attesting than its magnitude. The part of the river where they erect this bank is generally shallow. If they find on the margin a large tree, which can be made to fall into the water, they begin by cutting it down, to form the principal part of their work. This tree is often thicker than the body of a man. By gnawing the foot of the tree with their four cutting teeth, they accomplish their purpose in very short time, and always make the tree fall across the river. They next cut the branches from the trunk, to its root level. These operations are performed by the whole community. Several beavers are employed in gnawing the foot of the tree, and others in lopping off the branches after it has fallen. Others at the same time traverse the banks of the river, and cut down smaller trees from the size of a man's leg to that of his thigh. These they dress and cut to a certain length to make flakes of them, and fill them by land to the margin of the river, and then by water to the place where the building is carrying on. These piles they link down, and interweave the branches with the larger flakes. This operation implies the vanishing of many difficulties; for if from the flakes, and to put them in a situation nearly perpendicular, some of the beams must elevate with their teeth the thick ends against the margin of the river, or against the cross-tree, while others plunge to the bottom and dig holes with their fore feet to receive the points that they may land on end. While some are labouring in this manner, others bring earth, which they plash with their fore feet, and transport it in such quantities, that they fill with it all the intervals between the piles. These piles consist of several rows of flakes, of equal height all placed opposite to each other, and extend from one bank of the river to the other. The flakes facing the under part of the river are placed perpendicularly; but the part of the work rises upwards to inflame the precipice of the bank, so that the bank which is ten or twelve feet wide at the base, is reduced to two or three at the top. It has therefore not only the necessary thickness and solidity, but the most advantageous form for supporting the weight of the water, for preventing its influence, and for repelling its efforts. Near the top or thinnest part of the bank they make two or three sloping holes to allow the surface water to escape, and those they enlarge or contract, according as the river rises or falls; and when any breaches are made in the bank by floods or violent inundations they know how to repair them as soon as the water subsides.—It would be superfluous after this account of their public works, to give a detail of their particular operations, were it not necessary in a history of these animals to mention every fact, and were not the first great structure made with a view to render their smaller habitations more commodious. These cabins, or houses, are built upon piles near the margin of the pond, and have two openings, the one for going to the land, and the other for throwing themselves into the water. The form of the edifices is either oval or round, some of them larger and some less, varying from four or five, to eight or ten feet in diameter. Some of them consist of three or four stories, and their walls are about two feet thick, raised perpendicularly upon planks, or plain flakes, which serve both for foundations and floors to their houses. When they conlit of but one story, the walls rise perpendicularly only a few feet, afterwards assume a curved form, and terminate in a dome, or vault, which forms an roof for a roof. They are built with amazing solidity, and neatly plastered both without and within. They are impervious to rain, and repel the most impetuous winds. The partitions are covered with a kind of flucco, as nicely plastered as if it had been executed by the hands of man. In the application of this mortar they taills serve for trowels, and their feet for plastering. They employ different materials, as wood, stone, and a kind of sandy earth, which
which is not subject to dissolution in water. The wood they use is almost all the light and tender kinds, as alder, poplar, and willow, which grow generally on the banks of rivers, and are more easily harked, cut, and transported, than the heavier and more solid species of timber. When they once attack a tree, they never abandon it till they cut it down and carry it off. They always begin the operation of cutting at a foot or a foot and a half above the ground. They labour in a fitting posture; and besides the convenience of this situation, they enjoy the pleasure of gnawing perpetually the bark and wood, which are most agreeable to their taste; for they prefer fresh bark and tender wood to most of their ordinary aliment. Of these provisions they lay up as far as possible, to supply them during the winter; but they are not fond of dry wood, and make occasional excursions during the winter season for fresh provisions in the forests. It is in the water, or near their habitations, that they embellish their magazines. Each cabin has its own magazine, proportioned to the number of its inhabitants, who have all a common right to the store, and never palliate their neighbours. Some villages are composed of 20 or 25 cabins, but such establishments are rare; and the common republic seldom exceeds 10 or 12 families, each of which has its own quarter of the village, its own magazine, and its separate habitation. They will not allow strangers to settle in their neighbourhood. The smallest cabins contain two, four, or six; and the largest eighteen, twenty, or it is said even sometimes thirty beavers. They are almost always equally paired, there being the same number of females as of males. Thus, on a moderate computation, the society is often composed of 150 or 200, which all at first laboured jointly in raising the great public building, and afterwards in select tribes or companies, in making particular habitations. In this society, however numerous, an universal peace is maintained. Their union is cemented by common labours; and it is rendered perpetual by mutual convenience, and the abundance of provisions which they amass and confine together. Moderate appetites, a simple table, an averton against blood and carnage, divest them of the idea of rapine and war. They enjoy every possible good. Friends to each other, if they have some foreign enemies, they know how to avoid them. When danger approaches, they acquiesce one another by striking their tails on the surface of the water, the noise of which is heard at a great distance, and refounds through all the vaults of their habitations. Each takes his part; some plunge into the lake, others concealed themselves within their walls, which are so firmly constructed that no animal will attempt to hurt through, or overturn them. These retreats are not only very safe, but neat and commodious. The floors are spread over with verdure; the branches of the box and fir serve them for carpets, upon which they permit not the slightest dirtiness. The window that faces the water answers for a balcony to receive the fresh air, and to bathe. During the greatest part of the day they sit on end, with their head and anterior parts of the body elevated, and their posterior parts immerged in the water. This window is made with caution, the aperture being sufficiently railed to prevent its being flopped up with the ice, which in the climates inhabited by the beaver is often two or three feet thick. When this happens, they close the window, cut obliquely the flake which supports it, and thus open a communication with the unfrozen water. This element is so necessary, or rather so agreeable to them, that they can seldom dispense with it. They often swim a long way under the ice, and it is then that they are most easily taken, by attacking the cabin on one hand, and at the same time watching at the hole made at some distance, where they are obliged to repair for the purpose of respiration. The continual habit of keeping their tail and posterior part in the water appears to have changed the nature of their flesh. That of their anterior parts, as far as the reins, has the taste and consistence of the flesh of land or air animals; but that of the tail and hinder parts has the colour and all other qualities of fish. The tail, which is a foot long, an inch thick, and five or six inches broad, is both an extremity or genuine portion of a fish attached to the body of a quadruped; it is entirely covered with scales, and with a skin perfectly similar to those of large fishes: they may be scraped off with a knife, and after falling, they leave an impression on the skin as is observable in fishes under similar circumstances.

The beavers assemble in the beginning of summer. They employ the months of July and August in the construction of their bank and cabins. In September they collect their provisions of bark and wood; and afterwards enjoy the fruits of their labour and foresight. At this season they couple, each as it is affirmed, fertilizing its mate; and abiding with her by choice rather than indigluing in a promiscuous intercourse with the rest of the females. Thus they pass the autumn and winter together, during which time they occasionally go out on excursions to bring in a supply of fresh bark, which they prefer to that, which, by remaining long in their magazine, has become dry or hard, or has been by accident moistened with water. The females are said to be pregnant for four months; they bring forth at the end of the winter, and generally produce two young, rarely three, or four, which half they seldom if ever exceed, and nature has provided the female with four teats for suckling its young. About the end of winter the females are left by the males, who retire to the country to enjoy the products of the spring. They may occasionally revisit their cabins, but never remain long in the same. The females continue in their cabins, and are occupied in nursing, protecting, and rearing their young, which at the end of a few weeks, are in a condition to follow their dams. The females now in their turns make frequent excursions, and recruit their strength with air, and fresh bark, and other herbage. Thus they pass the remainder of the summer till autumn, when the whole society again assembles. But even during the summer, while thus dispersed, should their banks or cabins be overthrown by inundations, they suddenly collect their forces, and repair the breaches which have been made. They are much more attached to some places than others, and have been observed to return every autumn, after their works have been repeatedly demolished to repair them, till harassed by this persecution, and weakened by the loss of several of their troop, they have with one consent deserted it, and retired to some more secure and less frequented neighbourhood.

Winter is the season principally allotted for hunting the beaver, as it is only then their fur is in perfection; and when, after their dwellings are demolished, a number of them are taken, their society, it is said, is never restored, but those which escape become houflefs wanderers. Their genius is overcome by apprehension, and they never more attempt to exert it, but conceal themselves in holes under ground, and reduced to the condition of other animals they lead a timid life, employing themselves only to satisfy their immediate wants, and they retain no longer those qualities which they so eminently poifefs in their fociall state. These are the unacquainted beavers mentioned by authors, who live solitary, and instead of constructing cabins, or vaulted and plastered receptacles, only form holes for their dwellings in the banks of rivers. These are commonly termed terrier beavers, and their fur is considered as far less valuable than that of the beavers.
beavers which herd together in societies. All the European beavers are solitary: it is only in the wild and scarcely habitable tracts of the northern regions these animals can be sufficiently secure from the intrusion of man, to form the commodious habitations already mentioned.

Many writers, not content with ascribing to the beaver social manners, and evident talents for architecture, have attributed to them general ideas of policy and government. They have asserted that when their society is formed, they reduce travellers and strangers of their own species into slavery; that they employ them in carrying their clay and wood; that they treat in the same manner the idle who will not, and the old who cannot, work; that is, throw them upon their backs, and use them as so many vehicles to carry their materials: that they never assemble in an even number, in order that they may have in all their deliberations a conflicting vote; that each tribe has its chief; and that they have cantinels established for the public security. Eblian, and others of the ancients have pretended further, that, when closely pursued by the huntsman, they would fly short, and tear off the secretory glands of caltor to satisfy the cupidity of the hunter; and when thus mutilated would present themselves to obtain mercy. Such reports are absurd, and are completely exploded by modern observers.

The fur of the beaver is more beautiful and thick than that of the otter; it is composed of two sorts of hair; the one, short and bushy, soft as down, and impenetrable to the water, immediately covers the skin; the other, longer, bril- liant, and shining, but thinner, serves as an upper coat, and defends the former from foot and dull. The latter is of little value, it is only the first that is used in our manufactories. The use of its fur in the hat manufactories is sufficiently well known; attempts have been also made in France to weave the hair of beavers with the Segovian wool, but which in the event was found to form a cloth of no very excellent quality. The blackest furs are generally thickest, and consequently most esteemed; nor is the fur of the solitary beavers equal to that of those who live in society. Thse animals, like all other quadrupeds, shed their hair in summer; and therefore the furs of such as are taken in that season are of little value; they are called the flage-beavers, being those which the Indians kill on their flages or journies, and are esteemed the worst skins. Beaver skins are also distinguished by the name of coat beaver, and parchment beaver, by traders; the first is that which is worn by the Indians as coverlets, and the other is so named because the lower side refellies parchment.

In hunting beavers, the favages most commonly either shoot them or take them in traps. In the first instance they always proceed against the wind, for the beavers are shy, quick in hearing, and of a keen scent. The beavers are generally taken by shooting while they are at work, or when on shore feeding on the poplar bark. If they hear any noise when at work, they immediately jump into the water, and continue there some time; and when they rise, it is at a distance from the place where they plunged in. The traps laid for them are nothing more than poplar flicks laid in a path near the water; which when the beaver begins to feed upon they cause a large log of wood to fall on their necks, which is put in motion by their moving the flicks, and of course requires an ingenion contrivance. The favages generally prefer the latter mode of capture, because it does not damage their skins. In the winter they take the beaver in another manner; they break the ice in two places at a distance from the cabins, the one behind the other; after which they take away the broken ice with a kind of racket, the better to observe where to place the flaks. To these they flatten nets, which have large meshes, and are sometimes 18 or 20 yards in length. When these are fixed, they proceed to demolish the house, and turn in a dog, which terrifying the beaver, he dives into the water, where he is soon entangled in the net and taken.

The skin of the beaver form a prodigious article of commerce; many thousands are annually imported by the Hudson's Bay company into England from North America, which is the principal though not the only source from which our beaver skins are obtained; Ruffia furnishes a vast number. But besides the fur, which is a valuable article, the beaver affords a substance of considerable utility in medicine, the drug castor oil or caltor, which see. This substance is secreted in two large cellular glands situated near the genital organs and the anus. Each animal affords about two ounces of this substance, and it is common to both sexes. It is pretended by some that the beavers extract this liquid by pressing the bladders with the feet; that it gives them an appetite when disgutted with food, and that the favages to entrapp them wet the fnares with it. Others affirm, however, with greater probability, that the animal employs this oily substance to anoint its fur and render it more impervious to the water. The American favages are faid to obtain an oil from the tail of the beaver, which they apply as a topical remedy for different complaints. The flesh is seldom eaten; though fat and delicate to appearance, it is extremely bitter and unpalatable. Beavers are faid to couple when a twelve month old, and it has been hence inferred that the beaver does not commonly live to the age of 20 years as some writers affirm. The American beavers feed principally on the magnolia glauca, fraxina americana, and a variety of roots, among which they seem to prefer those of the acorus calamus, or calamus aromaticus; the poplar, asph, and birch are the favourite food of the European beavers.

Cauror huidelbrus differs from the former in having the tail long, lanceolate, and hairy; the fore feet lobed and the hind feet palmsed.

This is the guillino beaver of Pennant, and Chili beaver of later English writers. It is a singular animal, and appears to have been first described by Molina in his Natural History of Chili. This writer (to whom later authors seem principally indebted for their account of this animal) informs us that it inhabits the deep parts of the lakes and rivers of Chili; that it feeds principally on fish, and crabs; and does not construct any regular habitation like the common beaver; nor does it afford any of the embellishments of the same called caltor. The length is about three feet. The head is nearly square; the eyes small; the ears rounded and short, and the mouth ob- fuse; in each jaw are two sharp and strong cutting teeth, and the grinders like those of the other species of beaver. The body is very broad, and covered like the beaver with two sorts of hair, the undermof which is finer than that of the rabbit, and is in much demand with the manufacturers, being wrought into a kind of cloth which has the softness of

Vol. VI.
of velvet, and is also used in the manufacture of hats. The color of this animal is cinnabrine above, and whitish on the belly. The toes of the fore feet are lobated, or bordered with a membrane, and the hind feet are webbed; the toes five in number on each foot. The tail is compressed, and is kibites distinguished from that of the common beaver in being lanceolate and hairy, a character by which the species may be easily known. This is represented as a bold, and even fierce animal, and as having the power of remaining for a considerable length of time under water. The female produces from two to three young at a birth.

The Zibethicus, or mink-rat, is arranged by some as a species of Castor; but as it appears more clearly to the rat tribe, recent naturalists refer it to the genus Mus. See Mus zibethicus.

**Castor and Pollux, in Astronomy. See Gemini.**

**Castor and Pollux, in Meteorology, a fiery meteor, which at sea appears sometimes flickering to a part of the ship, in form of one, two, or even three or four fire-balls: when one is seen alone, it is more properly called Helena; two are denominated Castor and Pollux, and sometimes Tyndarida.**

Castor and Pollux are called by the Spaniards, San Elmo; by the French, St. Elme, St. Nicholas, St. Clare, St. Helena; by the Italians, Ercole; by the Dutch, Vre Vuuren.

Castor and Pollux are commonly judged to portend a cessation of the storm, and a future calm; being rarely seen till the tempest is nigh spent. Helena alone portends ill, and indicates the fiercest part of the storm yet behind.

When the meteor flicks to the walls, yards, &c. they conclude, from the air's not having motion enough to diffuse this flame, that a profound calm is at hand; if it flutters about, it indicates a storm.

**Castor and Pollux, in Fabulous History, were two brothers, the sons of Tyndarus or Tyndarus, king of Sparta, by his wife Leda, and they had two filters, the famous Helena and Clytemnestra, the wife and murderer of Agamemnon. According to the fable, Jupiter had an amour with Leda, in the form of a swan, and she brought forth two eggs, each containing twins. From that impregnated by Jupiter proceeded Pollux and Helena, who were both immortal: from the other Castor and Clytemnestra, who being begotten by Tyndarus, were both mortal. They were all, however, called by the name "Tyndarida." These two brothers entered into an inviolable friendship; they accompanied the other noble youths of Greece in the expedition to Cuthus, and signalized themselves by their valor. The fable adds, that when Castor died, his brother Pollux, who was immortal, prayed to Jupiter that he might share his immortality with him; which being granted, they lived and died by turns, and being translated into the heavens, they formed the constellation Gemini. As they were distinguished by their courage, particularly in their contests with pirates, they received divine honours, and, cannon paid them peculiar devotion. Accordingly, the veil which covered Paul, (Acts xxvii. 11,) was called Dofcar, or Castor and Pollux, because their images were either carved or painted on the prow. There was besides some other deity on the stem, and these were regarded as the patrons and tutelary gods of the vessel.

A martial dance, called the "Pyrrhic," or "Caelorian" dance, was invented in honour of these deities, whom the Cephaleneus placed among the dii magni, and offered to them white lambs. The Romans also rendered them particular honours, on account of the assistance they are said to have given them in an engagement against the Latins; in which, appearing mounted on white horses, they turned the scale of victory in their favour, for which a temple was erected to them in the forum.

**CASTOREA, in Botany. Plum. See Duranta Plumeri.**

**CASTOREUM, in the Materia Medica. See Castor.**

**CASTORIA, in Geography, a lake of European Turkey, in the province of Macedonia, and also a town of the same name; 30 miles W. of Edessa. Also, a river of European Turkey, which empties itself into the lake which it gives name, in Macedonia; and the name is afterwards changed into Villitzer.**

**CASTORUM LACUS, in Ancient Geography, Castrorum templum, or Castrorum nemus, a place of Italy, 12 miles from Cremona, according to Tacitus; called Castoris lucus by Orofus, where Cecina, Vitellius's general, was defeated by the troops of Otho.**

**CAstra, the Latin term for a camp, has given name to a great number of places; some of the principal of which we shall mention: e.g., Caltra, a town of India, on this side of the Ganges, placed by Ptolemy in the country of the Saalacians; of place or town of Norica, in the Itin. of Anton.—A town of Macedonia, marked in Anton. Itm. on the route from Otranto to Constantinople, in passing by Macedonia, between Sciriana and Heraclea.—A place of Italy, N.E. of Terrigelo.—C. Alexandri, a place of Africa, in Marrarica; and also a place of Egypt near Pelusium.—C. Annibalis, a port of Italy, in Magna Grecia, on the peninsula formed by the gulfs Scilaceus and Tarentinus, according to Ptolemy.—C. Cacilla. Cacritas, a town of Spain, in Lusitania, S. of Rufliciana.—C. Cornelius, a place of Africa Proper, according to Ptolemy and Mela. It is called by Julius Caesar and Ptolemy, C. Cornelia; and is the place where Scipio Africanus first encamped when he landed in Africa. It occupied a tongue of land, called "Gallia," about 2 fadac broad, and was the most northern and rugged part of the promontory of Apollo, situates in Africa, N. of Carthage.—C. Cyri, the place where Cyrus encamped when he marched his army into Lydia, against Croesus, mentioned by Quintus Curtius and Arrian.—C. Delia, or Lelia, a place of Africa, near C. Cerestis and the river Bagadas, according to Mela.—C. Don, a place of Palæstine, between Ze- rah and Edhzaal, in the tribe of Dan, where the spirit of the Lord began to move Samuel. Judges xiii. 20. Josh. xix. 14.—Also, another place of Palestine, in the tribe of Judah, behind Kirjath-Jearim. Judges xviii. 12.—C. Expoloratorum, a place in the Ifle of Alitoun, mentioned in the second route of Antonine's Itinerary. If Bithium Bithium, (which fee) was really at Middakby, as Horsey renders probable, every circumstence leads us to fix the Caltra Explorationerum at Netherby, and the most at a small distance from it; for at the former there was a famous Roman town, and at the other an exploratory camp. Both these places are at a proper distance from Bithium Bithium on the one hand, and Lingualium on the other, and situated on the military way which led from the one to the other.—C. Felicitana, a place in the island of Sardina.—C. Galba, an episcopal see of Africa, in Numidia.—C. Genamis, a town of Spain, in the district of Hispalis, according to Ptolemy; which was tributary to the Romans.—C. Germoporum, a place of Africa, in Mauritania Cufariensis, according to Ptolemy; near a small river E. of the promontory of Apollo.—C. Harnbilahis, Castella, a place of Italy, in Brittanum, at a small distance N.E. of Scyllacrum. See C. Annibalis.—C. Herculis, a town of Germany, occupied, according to Ammianus Marcellinus, by the Romans. It was one of the few places on the Rhine, which Julian repaired; and was situated over against the
the place where Daunus opened a canal for discharging the
waters of the Rhune into the Illici.—C. Jula, a town of
Spain, placed by Pliny in Lusitanian.—C. Lupinarium, a
place of Egypt, in the Timbade.—C. Mavaria, a town of
Spain.—C. Munerum, a place of Asia, in Melopotamia, W.
of mount Sugarma.—C. Nova, a maritime place of Africa, in
Mauritania Cæsarea, marked in the Itinerary of Antonius
on the route from Cala to Rufaneum, between Tagis and Bollene.—C. Proserpina, the camp of Pollux, a place of Spain, in the vicinity of Ucelia, fortified
and garrisoned by Catull.—C. Praetoria, a place of Rome,
near the porta Viminalis. It was a kind of citadel, accordin
g to Pompy, where Tiberius assembled the praetorian co-
HORTS. It was enclosed by walls, ditches, and towers, and
had a temple, an arsenal, barracks, and barracks, &c.—C. Praetorium, a place of Africa, in Mauritania Cæsarea, built in the colony of Gilsa and Parthus Doria.—C. Praen, a place in Rhasia.—C. Scholion, an episcopal city of Addessar
Mauritania Cæsarea.—C. Tarac, a place in the vicinity of Kibone, a small town on the banks of the Aucus, in Dac-
ia.—C. Tiberium, a particular place of Egypt, in the vicinities of Memphis, according to Herodotus.—C. Vani, the
episcopal see in the patriarchate of Antioch, under the mi-
tropolis of Arzaratius.
